While student loans must be repaid, they enable borrowers to attain an education they likely would not have accessed otherwise. Sallie Mae's lending increases the overall education level of the population, enabling millions to gain skills and certifications that would otherwise not be feasible. This investment in education is often considered wise. Most people who take out student loans can ultimately repay them with income from jobs that they could only attain with education. Because of increasing demand for skilled labor in the U.S. workforce, attaining an education is generally regarded as a necessity for Americans to ensure their financial stability. Many economists recognize a "spill-over" benefit to society from increases in education levels. While most economists espouse the net benefit of student lending, several controversies involving Sallie Mae have emerged. In 2007, a class-action lawsuit claimed that Sallie Mae had discriminated against minority loan applicants. The case was settled in 2011 with Sallie Mae making a $500,000 donation to the United Negro College Fund. In 2014, federal regulators fined the corporation almost $100 million for employing discriminatory lending practices. Sallie Mae was reported to have overcharged active-duty U.S. military personnel.

Alongside these specific examples, a more general complaint has emerged with the rise of student debt levels. There have been claims that Sallie Mae is profiting from higher and higher levels of student borrowing. Most economists suggest that students choose to borrow despite knowing the challenges of paying off the debt, suggesting their decisions are rational. Furthermore, Sallie Mae's increased profit could be attributed to an increasing number of borrowers and the increasing cost of a college education.

SUBJECTIVE EXPECTED UTILITY

Expected utility theory is a framework widely used by economists who study decision-making under conditions of uncertainty. The theory assumes that individuals assign subjective values (utilities) to all possible outcomes and make choices that yield the highest "expected" utility, that is, the greatest weighted sum of utilities, where the weights are the probabilities that the specified outcomes will occur. In its classical form (and in much of contemporary applied economic research), the probabilities implicit in the decision problem were assumed to be objective (observable) and known to the decision-maker.

Suppose, for example, that I find myself standing on a street corner next to a café. I happen to know that the coffee in this café is not very good, but if I want a better cup I will need to cross the street, which entails some possibility of injury due to the fast-moving traffic. Notice that if I choose to cross the street, the outcome is uncertain: I may arrive safely and enjoy a superior cuppa, but there is a positive probability that I will be injured en route (and get no coffee at all!). Expected utility theory requires that I make the decision as follows: If the utility of visiting the lesser café is U_L (an arbitrary number), of safely reaching the superior café is U_S (a number larger than U_L), and of being injured in the street is U_I (a much smaller number!), then expected utility theory requires that I cross the street if and only if [INLINE EPS], where p is the probability of injury, given that I have chosen to cross the street.

The casual observation that most people are unable to state the probabilities of even common everyday events (much less rare events such as injuries incurred during street crossings) led to the development of subjective expected utility theory (SEU), which allows for the possibility that people might apply personalistic or subjective probabilities when faced with uncertainty. In the preceding example, the fact that I (say) chose to cross the street would imply to an observer that some combination of a sufficiently high subjective value (U_S) and a sufficiently low subjective probability of injury (p) were enough to justify the crossing. Proponents of SEU often emphasize its status as a normative theory, meaning it can be shown that people who follow a relatively simple and (mostly) intuitive list of behavioral rules (which can be stated as mathematical axioms) will in fact behave as if they are maximizing subjective expected utility.

Though SEU is a powerful theoretical tool widely used by economists in empirical studies, it has been noted that individuals often seem to violate its axioms, and the violations are in some cases systematic and predictable.

SUBPRIME MORTGAGE BUBBLE AND CRISIS

The United States subprime mortgage bubble and crisis was a nationwide banking emergency that coexisted with the U.S. recession of December 2007 to June 2009. The recession began in December of 2007 with the root cause being the bursting of the housing bubble and the resulting credit crisis. The combination of the Department of Housing and Urban Development (HUD) regulations, low down payment requirements, and the Fed's low interest policy of 2002–2004 resulted in the rapid growth of both subprime and adjustable rate mortgage (ARM) loans during the first five years of this century. Initially, the effect was positive. The policy changes created encouraging short-term effects, such as a strong demand for housing prices, increased housing prices, and a construction boom. The long-term effects of these policies were catastrophic. The increasing share of subprime loans began to push default rates upward.

The low short-term interest rates that made adjustable rate mortgages so attractive in the past soon reversed and led to higher monthly payments as the interest rates on the ARM loans were reset. With the encounter of these two elements, the negative ramifications created falling house prices coupled with lofty mortgage default and foreclosure rates.

To fully understand the crisis, it is vital to investigate how the events leading up to it resulted in a devastating blow to the U.S. economy. In the early 1990s, housing prices were relatively stable and began to rise rapidly in the last decade of the century. Housing prices continued to boom between January 2002 and mid-year 2006 before they finally started to wane at the end of 2006. Housing prices began to level off but were falling by the end of 2006. What was once a boom had now turned into a bust, and prices continued to fall well into 2008.

The reason for this significant decline in housing prices can be attributed to several factors that occurred within that time span, resulting in the crisis itself. One factor was the federal policy designed to promote more home ownership among households with below-median incomes. The federal government imposed several regulations and mandates that forced lending institutions to extend more loans to low-income households.

The Federal National Mortgage Association and Federal Home Loan Mortgage Corporation commonly known as Fannie Mae and Freddie Mac, respectively, played a central role in the relaxation of these lending standards. Fannie Mae and Freddie Mac serve as government-sponsored enterprises purchasing mortgages originated by banks, mortgage brokers, and other lenders. The two entities are able to borrow funds at a much cheaper rate than private lenders, giving them a competitive advantage. As a result of their cheaper access to funds, both Fannie Mae and Freddie Mac grew extremely popular and dominated most of the secondary mortgage market. In 1995, HUD mandated regulations requiring that Fannie Mae and Freddie Mac extend a larger share of their loans to low-income families. To illustrate, under the HUD regulations, 56 percent of new loans financed in 2008 by Fannie Mae and Freddie Mac had to go to borrowers below the median income. In 1999, HUD guidelines required Fannie Mae and Freddie Mac to accept smaller down payments and extend larger loans relative to income.

The Community Reinvestment Act (CRA) of 1995 also loosened mortgage-lending standards. Under this act, banks were required to meet numeric goals based on the low-income and minority population in the area they served when extending loans. In order to meet these requirements, many banks were forced to lower their lending standards in order for their population of service to meet the borrowing criteria.

The lowering of standards resulting from the HUD and CRA regulations essentially lowered lending standards universally. The number of subprime loans, those made to borrowers with low credit scores or who provided limited creditworthiness documentation, increased significantly. The subprime loans coupled with Alt-A loans, loans extended with little documentation or verification of their ability to repay, meant a majority of the loans issued in 2005–2006 were to borrowers with poor or questionable credit. Individuals were getting approved for mortgages they could not afford.

Another contributing factor to the bursting of the housing bubble was the artificially low short-term rates established by the Fed. These extremely low rates increased the demand for interest-sensitive goods as well as the attractiveness of ARMs. An ARM is a home loan in which the interest rate is tied to a short-term rate and then is reset at various intervals. The interest rate and monthly payment will vary over the life of the loan. The low initial interest rates on the adjustable rate mortgages made it possible for homebuyers to afford monthly payments for larger, more expensive home. Because interest rates were so artificially low, homebuyers would face a much higher monthly payment down the road. This is precisely what happened.

In 2005, the Fed shifted to a more restrictive monetary policy, pushing interest rates higher. Many of those who had purchased homes with little to no down payment and adjustable rate loans when interest rates were low were now faced with substantially higher monthly payments. With virtually no equity invested in their homes, many people simply walked away. The Fed policy encouraging ARM loans, the increasing proportion of these loans issued, and their high default and foreclosure rate contributed heavily to the housing boom and bust.

SUNK COST FALLACY

The sunk cost fallacy (or sunk cost effect) is a decision bias that "is manifested in a greater tendency to continue an endeavor once an investment in money, effort, or time has been made" (Arkes and Blumer 1985, 124). Arkes and Blumer (1985) designed an experiment in which participants were asked if they would invest $1 million in developing a new airplane that cannot be detected by conventional radar systems. They had just learned that a competitor would bring a similar plane to market that was even more efficient than the model their own company had planned. When participants were told that $9 million had already been invested, 85 percent were willing to invest, but only 17 percent would do so if no sunk costs were mentioned. Hence, prior investments seem to increase the commitment to a project, even if it would be more advisable to quit, based on standard economics. Sunk costs are also known to affect decisions by increasing the willingness to take risks (Thaler 1980), particularly if a risky outcome would allow a firm to break even (Thaler and Johnson 1990). The sunk cost phenomenon violates the economic principle that only incremental costs and benefits should be considered in decisions.

Regarding nonmonetary sunk costs, Zeelenberg and van Dijk (1997) criticize that the majority of studies deal with sunk costs of a financial nature. They found risk aversion to be more pronounced if behavioral sunk costs, such as workload and effort, had been invested. Soman (2001) reports that no effects of sunk time are observable unless the invested time units can be easily converted into money, by providing an hourly wage rate, for example.

One example of the sunk cost fallacy in the real world is the supersonic airplane Concorde, which, despite rather modest financial expectations, was built anyway because a lot of money had already been invested in its development. Other examples include the observation that more people attend plays when theater subscription prices are higher and the U.S. government's decision to continue the Vietnam and the Gulf wars (Hastie and Dawes 2001).

A variety of explanations for the sunk cost fallacy have been proposed. Decision-makers who honor sunk costs may not want to appear wasteful (Arkes and Blumer 1985), and by continuing investments they justify their initial choice (Brockner 1992). Future investments may appear smaller than they are in light of large prior expenditures (Garland 1990), and furthermore, sunk costs may induce a loss frame for the investment decision, which results in more risk-seeking choices (Thaler 1980).

SUNSTEIN, CASS

Born: September 21, 1954, in Concord, Massachusetts; Nationality: American; Professional Interests: law and economics, behavioral economics; Major Works: *After the Rights Revolution* (1990), *Risk and Reason: Safety, Law, and the Environment* (2002), *Worst-Case Scenarios* (2007), *Nudge: Improving Decisions about Health, Wealth, and Happiness* (with Richard H. Thaler, 2008), *Republic.com 2.0* (2009), *Simpler: The Future of Government* (2014).

Cass Sunstein is the administrator of the Office of Information and Regulatory Affairs (OIRA), part of the Office of Management and Budget. OIRA was created by Congress in the 1980 Paperwork Reduction Act and is an agency within the Executive Office of the President. Sunstein was nominated to the position by President Barack Obama and confirmed by the U.S. Senate. In this position, Sunstein and his colleagues review and collect information. They also develop and oversee the implementation of government policies in many areas, including statistical standards and the quality of information.

Cass Robert Sunstein was born on September 21, 1954, in Concord, Massachusetts. After graduation from Middlesex School in Concord in 1972, he attended Harvard University. He graduated from Harvard with his BA magna cum laude in 1975. He then attended Harvard Law School, obtaining his JD in 1978, graduating magna cum laude. During this time, he served as the executive editor of the *Harvard Civil Rights-Civil Liberties Law Review.*

After finishing law school, Sunstein worked as a law clerk. His first position was with Hon. Benjamin Kaplan of the Supreme Judicial Court of Massachusetts. Next he worked as law clerk for Hon. Thurgood Marshall of the U.S. Supreme Court. He then worked as an attorney-adviser in the Office of the Legal Counsel of the U.S. Department of Justice from 1980 through 1981.

Following his work in government, Sunstein entered academia. He joined the faculty of the University of Chicago Law School in 1981 and remained there until 2008. He held visiting professor positions at Harvard Law School and Columbia Law School before joining the faculty of Harvard Law School in 2008. He assumed the position of Feliz Frankfurter Professor of Law.

While at Harvard, Sunstein was also the director of the Program on Risk Regulation. The focus of the program was on how law and policy deal with some of the central hazards of the 21st century. Among the topics for study were climate change, terrorism, occupational safety, natural disasters, infectious diseases, and other high-consequence events that have a low probability of happening.

Sunstein has been a prolific writer. He has written hundreds of scholarly articles and more than 15 books. Topics cover many aspects of public law, including rights, judicial decision-making, environmental and constitutional doctrine, the regulation of risk, and the relationship between the law and human behavior. He has also authored articles that have appeared in newspapers and magazines such as the *Boston Globe*, *New York Times*, *Washington Post*, *Harper's*, and *The New Republic*. He has testified before congressional committees on many subjects and has been involved in the law reform activities of countries including Russia, South Africa, Poland, Ukraine, and China.

In the book *Nudge: Improving Decisions about Health, Wealth, and Happiness*, Sunstein studied legal questions using information from research on human behavior. He explored these issues in several areas, including family law, environmental protection, and the stock and mortgage markets.

In the position he currently holds as administrator at OIRA, Sunstein oversees extensive research and the implications of various governmental measures on society. He and his colleagues explore the costs and benefits of various governmental agencies' regulations. Data analysis may predict the number of lives saved or resources spent on a specific course of action designed to prevent a particular type of emergency, for example. Such analysis is applied to many sectors of society and influences policy decisions.

SUPPLY

Of all the concepts in the world of economics, *supply* (along with its partner, *demand*) is arguably the most famous and most used term. Supply (and demand) is used to describe economic actions of producers and to predict future prices and further actions of the producers. All other things being equal, supply describes the behavior of the producers and how they respond to changes in prices.

Law of Supply

The law of supply describes the relationship between price and quantity supplied by producers. The law of supply states that price and quantity supplied have a positive relationship, all other things being equal. As the price of a good or service increases, the producers' willingness and ability to produce the good or service increases. Conversely, as the price lowers, the producers are less willing to produce their product.

Supply Schedule

For each product or service there is a relationship between price and quantity supplied, also known as the law of supply. The relationship is determined through surveying the willingness and ability of producers to produce their product at various prices. The results of the survey create a data set of the quantity producers are willing to supply at each price. The law of supply states this relationship will be positive. As price rises, quantity supplied will also rise, and vice versa, all other things being equal. The data set is the supply schedule. For an analogy, think of a product's supply schedule as its "story."

Supply Curve

The relationship between a set of prices and the quantities producers are willing to produce at each price, the supply schedule, allows one to graphically depict the price/quantity supplied relationship. The graphical depiction is called the supply curve. From the law of supply, to the supply schedule, the graphical supply curve will illustrate this relationship by being upward sloping to the right. To extend the analogy, if the supply schedule is the story, the supply curve is the picture. The story/picture analogy is useful in determining whether a change is a change in quantity supplied or a change in supply. To do this, it is necessary to identify whether the "story" changes or just the price.

Determinants of Supply

Determinants of supply are those elements that change a producer's willingness and ability to produce the product at all prices. These determinants change the "story."

Examples of these determinants include:

- *Costs of production:* may be defined as all those costs related to the production of the good or service; further, costs of production are the sum of all direct and indirect costs
- *Raw materials:* the materials that are used to create the product (steel, oil, wood, etc.)
- *Subsidies:* economic support from the domestic government to help pay for the production of a domestic good
- *Tariffs or quotas:* government actions to protect a domestic producer

Supply versus Quantity Supplied

One confusing aspect of supply is the difference between supply and quantity supplied. To determine whether a change was in quantity supplied or supply, think in terms of the earlier analogy. If the change is only price, the producers' willingness did not change. The story remains the same. Since the story did not change, the picture did not change. When the picture does not change, it reflects a movement of price and quantity supplied along the original curve.

However, if one of the determinants identified earlier creates the change, producers' willingness at each price changes and we have a new story. The new story creates a new picture (i.e., a change in supply and a new supply curve).

T

TAX DEFERRAL

Tax deferral is a useful financial strategy for putting off payment of tax until a future date, ideally a time when the tax bill will be lower.

There are two primary tax deferral methods. The first method postpones income until a future period, thus deferring when the tax will be due on that earned income.

In the second method, funds are transferred to a special type of account where access to the funds and the tax payment itself is deferred. Specifically, this method requires the individual to place the income in a special retirement account for many years.

In determining whether tax deferral is appropriate, one must take into account income and current budgetary requirements, current and future tax rates, and an assessment of future retirement goals and what the tax scenario might be in those coming years.

Deferring Income

When facing a potentially large tax bill, a common approach is to defer some of the taxable income into the future. This can be done by delaying receipt of income or by accelerating tax-deductible expenses.

Most salaried employees have little control over when they receive their regular compensation. However, they may have workplace options that allow them to transfer receipt of income to a later period. Self-employed individuals have more control over when income is received by how they bill their customers.

Retirement Accounts for Tax Deferral

The most popular tax-deferral strategy is enrolment in a workplace retirement savings plan. The plans are known as defined contribution plans because workers put a specific amount of their pay into the accounts. In some cases, the employer matches a portion of the money workers contribute to these retirement accounts.

The most common type of defined contribution account is the 401(k) plan, named after the section of the tax code that created the retirement savings option.

The primary benefit of a 401(k) plan is that one regularly saves for retirement. But there is a tax benefit too. The worker contributions are made with pretax dollars; that is, the 401(k) money is automatically deducted from the paycheck before federal and state income taxes are withheld. This reduces the worker's taxable take-home pay, lowering tax liability.

Take, for example, a single worker making $40,000 in 2012 who contributes 6 percent of his salary to a 401(k). That $2,400 annual contribution total lowers the worker's taxable salary to $37,600. Assuming all of the $40,000 income was taxable, the individual's tax bill in 2012 would be $6,024. After contributing $2,400, the single taxpayer's federal tax bill on an income of $37,600 is $5,436. By saving in a tax-deferred retirement account, the worker reduced his tax bill by almost $600 and deferred paying taxes on that money until retirement.

Many workers find that the tax savings of 401(k) contributions can help ease the blow of reduced take-home pay.

Compounded Earnings

Both the worker's contributions and any amount put into the account by the employer grow tax deferred. In other words, no tax is due on the principal or earnings until the funds are withdrawn.

The combination of compounding earnings and no taxes being collected works to dramatically increase retirement savings. This principle also applies to a traditional individual retirement account (IRA), or Roth IRA, another type of tax-deferred retirement account.

In 2013, a worker younger than age 50 could put up to $5,000 (or as much as the worker earned for those making less than $5,000) into a traditional IRA. IRA contribution amounts are adjusted annually to reflect inflation.

If a worker invests $3,000 into a traditional IRA or 401(k) at the beginning of each tax year with a hypothetical 8 percent investment return, compounded annually with reinvestment of dividends and capital gains, in 30 years the investment will be worth $367,038.

The end return value of this tax-deferred retirement account far surpasses the identical taxable investment account whose final value after 30 years is $173,181. Even after taxes are due, the tax-deferred account is worth $264,267 or $91,086 more than the retirement account.

Deferring Taxes

With a 401(k), traditional IRA, or any tax-deferred account, it is important to remember that taxes eventually will be due. Delaying the withdrawal of the retirement account money until the account owner is older and likely receiving less taxable income usually means the taxes due on the distributions are taxed at a lower rate.

The tax code calls for specific withdrawals, known as required minimum distributions (RMDs), from certain tax-deferred retirement accounts once the account holder turns 70.5. These annual withdrawal amounts are calculated as a percentage of the total tax-deferred account based on the account owner's age. The RMD amount is then taxed at the owner's ordinary income tax rate.

If an account holder fails to take an RMD, he or she could face a penalty of 50 percent of the amount that was to have been withdrawn.

And while the Internal Revenue Code demands that money eventually be withdrawn from tax-deferred accounts so that the federal government can finally begin collecting taxes on the funds, early distributions are penalized.

Money taken from a tax-deferred retirement account before age 59.5 could be subject to a penalty of 10 percent of the amount withdrawn.

Tax-Rate Crystal Ball

A lower future tax bill, however, is not necessarily a given. While a taxpayer might expect to be in a lower tax bracket in the future when the deferred tax amount is paid, that cannot be guaranteed.

An older owner of a tax-deferred retirement account might be working in retirement or have other investments that add to his or her overall taxable income amount, pushing the older taxpayer into a higher tax bracket.

It is also possible that individual income tax rates could increase in coming years.

Because each person's tax situation is unique, tax-deferral strategies must be carefully evaluated based on individual tax and financial goals and needs. Before contributing to a tax-deferred account, it is important to examine current budgetary requirements to determine how much one can afford to reduce daily living expense cash flow. And always be aware of the possibility of future tax rate hikes.

TECHNOLOGICAL INNOVATION

Technological innovation can lower the cost of achieving climate-change mitigation objectives. As such, understanding the links between market conditions, policy context, and technological innovation is important. Innovation relates to both the invention of new climate-change mitigation technologies (CCMTs) as well as their adoption in the marketplace by firms, households, and other market participants. Examples include energy-efficient appliances, renewable energy technologies, carbon capture, and storage. In developing countries, some of the most significant mitigation opportunities relate to technologies that also yield important local environmental and health benefits (e.g., improved indoor cooking stoves). The benefits of such technological innovation can be supported by organizational innovations that encourage the more efficient use of such technologies, as well as substitution between different economic activities (e.g., between transport modes).

Unfortunately, in the context of CCMTs, there are at least three reasons to expect that innovation will not be optimal in the absence of public policy interventions. First, the costs associated with greenhouse gas emissions (GHGs) are externalized by the emitter, resulting in insufficient incentives for the invention and adoption of mitigating technologies. Innovation will bend in the direction of GHG-emitting technologies since they are not priced. Second, there are important positive information and knowledge spillovers associated with the invention and adoption of CCMTs, which means that the benefits are imperfectly captured by investors. This results in a slower rate of innovation in CCMTs (and other technologies) than would otherwise be the case. Third, many of the most important GHG-emitting sectors exhibit additional market failures (e.g., imperfect competition, network externalities, split incentives, etc.), which can adversely affect innovation in different ways. For example, there can be important barriers to entry and exit in the electricity or transport sectors.

The first problem is specific to CCMTs and requires a targeted policy of internalization. All climate policies impose a price on polluting, whether implicitly or explicitly. The change in opportunity costs of emitting GHGs, then, translates into increased cost of some factors of production and thus incentives to innovate in a manner that saves on the use of these factors. Clearly, the choice of policy instrument has an effect on innovation. Different measures of equal stringency (i.e., with equivalent environmental objectives) may have very different effects on both the rate and direction of innovation.

In the theoretical literature, a strong case has been made for the use of market-based instruments (e.g., taxes, emissions trading), rather than direct regulation (e.g., technology-based controls) in order to induce innovation in CCMTs. The hypothesis is that if more prescriptive policies are applied, technology invention and adoption decisions are constrained by the precise characteristics of the standard. Thus, in order to induce a search for the optimal technology to meet a given environmental objective, governments should allow for more flexibility in their policy regimes when this can be achieved at reasonable administrative cost.

Unfortunately, the empirical evidence on the benefits of market-based instruments to promote the development of CCMTs is scant. This may be due in part to the greater difficulty associated with assessing the innovation impacts of more flexible policy instruments. Indeed, the very nature of the advantages of flexible market-based instruments gives rise to difficulties associated with assessing the innovation effects of their implementation: the innovations induced can take on a myriad of forms and come from a myriad of sources. In many cases, the climate-change mitigation benefits of a particular technology may have been incidental to the motivation for its development and adoption. Nonetheless, recently there has been increased empirical evidence to support the theoretical findings that flexible market-based instruments are more innovation friendly.

The second and third problems should be addressed primarily through more general policy framework conditions that are not specific to CCMTs. Support for basic research, protection of intellectual property, higher education policy, and other measures will at least partially overcome the positive information and knowledge externalities. Similarly, general structural policy conditions, such as competition policy, will help to ensure that market failures are obviated.

Given the long-run and potentially catastrophic impacts associated with climate change, increased attention has been paid to the need to induce breakthrough (or radical) innovations in CCMTs, such as advanced nuclear power, third-generation biofuels, and even geo-engineering innovations. There are good reasons to think that the mere pricing of GHGs will not be sufficient to call forth the kinds of innovation needed to stabilize concentrations to safe levels, even if knowledge and market failures are addressed. Indeed, it is significant that assumptions about the timing and cost of backstop technologies are often the most important determinants of macroeconomic modeling assessments of the costs of climate-change mitigation.

Since the time frame for the development of breakthrough technologies is long, the predictability of the policy framework is vital. For example, investments in R&D for breakthrough are (approximately) irreversible. The costs of such investments cannot usually be recovered should policy (or market) conditions change. As a consequence, policy uncertainty can serve as a significant brake on invention.

Moreover, with respect to adoption, many of the most GHG-intensive sectors have long-lived capital, for which investment decisions are only reversible at great cost or after a significant lapse of time. Adoption will also be slower than optimal.

The uncertainty of the policy framework is also partially a consequence of the global nature of climate change. Since all countries benefit from GHG mitigation irrespective of the location of emission, investors need to assess the credibility and viability of policy initiatives against a backdrop of unpredictable international negotiations. For this reason, increased attention is being paid to the use of international technology-oriented agreements as a complement to emissions-based agreements. Such agreements can result in more efficient allocation of invention efforts as well as encourage the wider global diffusion of knowledge and technologies.

TENNESSEE VALLEY AUTHORITY

The Tennessee Valley Authority (TVA) was established in 1933 to deliver low-cost electricity to the Tennessee Valley and manage the region's natural resources. The Tennessee Valley Authority includes all or parts of the states of Tennessee, Georgia, Alabama, Kentucky, Virginia, Mississippi, and North Carolina, encompassing 80,000 square miles and serving over 9 million people. The TVA has grown to be the largest provider of power by a public entity in the United States. Originally funded as part of Roosevelt's New Deal, the Tennessee Valley Authority is now totally financed through power delivery sales.

History

On May 18, 1933, Congress passed and President Franklin D. Roosevelt signed the Tennessee Valley Authority Act. A novel business structure in 1933, the TVA Act created a government agency with the characteristics of a private business.

As part of President Roosevelt's New Deal recovery programs, the TVA built dams in the Tennessee River to turn the river's power into electricity. The TVA aimed to create much more than just electricity. It was also intended to enrich the land; to create fish-filled lakes that would, in turn, increase tourism; and to provide jobs for the residents of the Tennessee Valley. Although the TVA achieved some of these goals, it was not well received by everyone. Farmers whose lands were permanently flooded by the backwaters the dams created were unhappy. Also, some business leaders considered the government-sponsored agency an unfair competitor in the electric industry. They argued that the TVA could charge extremely low rates with which private industries could not compete.

The Tennessee Valley was a microcosm of the Great Depression. The valley's farmland had been depleted. Farmers had smaller-than-normal crop yields, and thus smaller incomes than normal. Timberlands had been laid bare. The one resource remaining was the rivers in the region. One role of the TVA was to build dams to generate electricity, control flooding, and allow for better navigation of the rivers. As Roosevelt's New Deal job creation unfolded, the TVA was a prime component. The TVA included an educational unit, teaching farmers how to use fertilizers and improve crop yields. Jobs were created to plant trees for forests, recreate wildlife and fish habitat, and operate the dams to generate electricity. These many efforts attracted new industry and more jobs to the region.

By the 1950s, 650 miles of navigation had been channeled through the Tennessee River. The TVA was the largest supplier of electricity in the United States.

By 1959, the TVA had become a self-financing public-private corporation. By the 1960s, the Tennessee Valley had seen significant economic growth in agriculture and industry. The TVA continued to grow and adapt as the region grew. Through private financing and growth, electricity costs were some of the lowest in the nation.

Additional change came to the TVA during the 1990s when it was forced to reduce operating costs and workforce and delay its nuclear plant plans while increasing power generation. As the 21st century began, the TVA focused on combining environmental issues and economic development in the region. In 2004, the TVA corporate structure was changed by Congress to a nine-member part-time board, replacing the full-time three-member board. The TVA returned to building a nuclear plant in 2007 with the approval of the Watts Bar Nuclear Unit 2. The TVA supported new environmental policies with lower carbon emission standards in 2008 and worked closely with regional leaders to improve the region's environment.

Present-Day TVA

The Tennessee Valley Authority has continued to improve its business model. The TVA's vision for the future focuses on cleaner air, increased nuclear production, and improved efficiency in power delivery. The Bellefonte nuclear plant was approved for completion by 2020. In regards to improving the environment, beyond the continuation of the nuclear plant construction, the TVA began working with the EPA to disconnect 59 coal-fired plants by 2017. Since 1977, the TVA has spent $5.3 billion on clean-air technology, reaching new heights in the reduction of sulfur dioxide and nitrogen oxide emissions.

THALER, RICHARD

Born: September 12, 1945, in East Orange, New Jersey; Nationality: American; Professional Interests: behavioral finance, behavioral economics; Major Works: *Quasi-Rational Economics* (1991), *The Winner's Curse: Paradoxes and Anomalies of Economic Life* (1991), *Nudge: Improving Decisions about Health, Wealth, and Happiness* (2008), *Misbehaving: The Story of Behavioral Economics* (2015).

Richard Thaler, an American economist, is one of the pioneering theorists in the field of behavioral finance and behavioral economics. He is the Ralph and Dorothy Keller Distinguished Service Professor of Behavioral Science and Economics at the University of Chicago, Booth School of Business. He also serves the university as the director of the Center for Decision Research and teaches MBA courses in behavioral economics and managerial decision-making.

Richard H. Thaler was born on September 12, 1945, in East Orange, New Jersey. He received his bachelor's degree from Case Western Reserve University in 1967 and his master's from the University of Rochester in 1970. He pursued a doctorate degree at the University of Rochester, which culminated with his dissertation "The Value of Saving a Life: A Market Estimate," under the supervision of Sherwin Rosen. While pursuing the PhD, he worked as an instructor with the Graduate School of Management, then as program associate with the Rochester-Monroe County Criminal Justice Pilot City Program. He accepted a position as assistant professor upon graduation.

Early in his 20 years of research, from 1976 to 1977, Thaler partnered with ASPER (Assistant Secretary for Policy and Research) with the U.S. Department of Labor as principal investigator in the research project "An Equalizing Difference Model of Employment." Thaler continued his inquiries in a 1983 project for the U.S. Department of the Navy that explored descriptive choice models, followed by research in psychology and economics for the Alfred P. Sloan Foundation. A seven-year research stint financed by the Alfred P. Sloan Foundation and Russell Sage Foundation furthered the study of behavioral economics in a project titled "Continued Research in Psychology and Economics." Another example was the 1995 project "Myopic Loss Aversion," sponsored by the National Science Foundation.

Widely recognized for his independent and collaborative research, Thaler has published a plethora of articles in revered journals such as the *American Economic Review*, *Journal of Finance*, *Journal of Political Economy*, *and University of Chicago Law Review*. Thaler was editor of the publication *Advances in Behavioral Finance* (1992) and a successive volume by the same name in 2005.

In the leading-edge *Nudge: Improving Decisions about Health, Wealth, and Happiness* (2008), Thaler and coauthor Cass Sunstein offered forward-thinking answers to society's most perplexing conundrums. Thaler's other major works include *Quasi-Rational Economics* (1991) and *The Winner's Curse: Paradoxes and Anomalies of Economic Life* (1991). The content of *The Winner's Curse* was expertly distilled from his "Anomalies" columns, previously published in the *Journal of Economic Perspectives* from 1987 to 1990.

His research questioned established economic theories by exposing inconsistencies from actual case studies. Thaler ingeniously morphed his findings into a fresh perspective ideal for the everyday consumer. A resurgent thread in Thaler's work is the view of economics through a human lens, whereby he projects people as emotional creatures rather than hardwired, data-driven machines. Consequently, Thaler submits that humans are inclined to behave or make decisions based on a combination of factors, such as emotion or attachment, even if to do so is irrational. The humanist element of his research and writings has led to the emerging acceptance of behavioral economics. Thaler's attempts to narrow the gap between the worlds of psychology and economics is evidenced in a recent collaborative effort titled *Deal or No Deal?: Decision Making under Risk in a Large-Payoff Game Show*, in which Thaler and others illustrate the distinctive role of psychology in the economic choices of game-show contestants.

Thaler served as a research economist for the Public Research Institute and the Center for Naval Analyses and as professor of economics at Cornell University Johnson Graduate School of Management. He has been a visiting professor and scholar at several distinguished institutions, including Cornell, the Massachusetts Institute of Technology, the Russell Sage Foundation, and Stanford University's Center for Advanced Study in Behavioral Sciences. He currently serves as director of the Center for Decision Research, University of Chicago, a position he previously held for six years.

In 2009, Thaler began writing a column for the *New York Times* on an assortment of economic-minded and finance-related themes to address challenging issues plaguing the United States. Most notably, Thaler infused the earlier notions of Thomas Hazlett to craft a solution to the nation's monstrous deficit in his piece "Selling Parts of the Radio Spectrum Could Help Pare US Deficit." Thaler proposed a strategy for the Federal Communications Commission (FCC) to leverage existing broadcast frequency as an income channel for the United States to cut national spending and strengthen future technological prospects.

In May of 2012, Thaler was chosen as the Nicholas Molodovsky Award recipient by the CFA Institute, a worldwide membership organization of investment professionals. Thaler is the founder of Fuller & Thaler Asset Management, which applies research-driven methods to wealth creation and management.

Richard Thaler maintains a conversation on behavioral economic topics in a grant-funded lecture series for the National Bureau of Economic Research with Robert Shiller.

THRIFT INSTITUTIONS

Thrift institutions include savings and loan associations, mutual savings banks, and credit unions. Savings and loan associations (S&Ls) and mutual savings banks obtain funds primarily from long-term, fixed-rate assets and have relied principally on time and savings deposits for their funding. Thrift institutions, along with commercial banks, are depository institutions and are referred to as financial intermediaries. S&Ls and mutual savings banks accept deposits on which checks can be written and make long-term loans primarily on home mortgages.

In contrast to thrifts, commercial bank assets are predominately short-term commercial loans, and their liabilities are more diverse. In the past, regulations restricted thrifts' activity primarily in regard to mortgage loans. Over time, the differences between thrifts and commercial banks became blurred.

Credit unions are another form of thrift institution. They are typically small cooperative lenders organized by a particular group such as a union or for the employees of a firm. Credit unions acquire their funding from deposits and primarily make loans to their members. Savings and loan associations can be chartered by the federal government or by individual states. Most are members of the Federal Home Loan Bank System (FHLBS) styled after the Federal Reserve System. The FHLBS provides members with long-term loans that are financed by selling bonds. The loans are offered to member S&Ls at interest rates lower than they could borrow in the open market on their own.

The slow demise of the thrift industry started three decades ago. In 1980, there were 4,000 thrift institutions. As of 2010, there are just 734. After originating almost two-thirds of the country's home mortgages in the 1960s, by 2010 thrifts accounted for less than 25 percent of the nation's mortgage volume.

The S&Ls experienced a serious crisis in the 1980s. In 1982, Congress passed the Depository Institutions Deregulation and Monetary Act of 1982 (DIDMCA) and Depositary Institutions Act of 1982. These acts deregulated the thrifts, giving them the ability to grow but at the same time assume greater risk. The DIDMCA also increased the amount of federal deposit insurance from $40,000 per account to $100,000. The new deregulations allowed S&Ls to take riskier positions than they had in the past. After deregulation, thrifts were allowed to hold up to 40 percent of their assets in commercial loans and leases, up to 30 percent in consumer lending, and up to 10 percent in high-risk junk bonds or in direct investment. When loans began to fail, the excessive risk resulted in significant losses and failures with over 200 bank failures per year by the late 1980s. Many attribute the failures to adverse selection and moral hazard problems created by deregulation.

After the great recession of 2008, new financial regulations were created called the Dodd-Frank Wall Street Reform and Consumer Protection Act (Dodd-Frank). Dodd-Frank rules make life even more difficult for thrift institutions. On July 21, 2011, thrift institutions began a new regulatory structure; the regulatory responsibility for these institutions shifted from the Office of Thrift Supervision (OTS) to the other federal banking agencies. Other Dodd-Frank reforms include increased capital requirements and examinations from up to three new regulators. These changes brought thrifts and bank charters closer together. Though the thrift charter and thrift holding company framework survived Dodd-Frank, the act has significantly eroded previous regulatory and business benefits. The result is that thrifts have found it increasingly difficult to remain competitive with bank holding companies.

TIME VALUE OF MONEY

Time value of money refers to the famous notion that a dollar today is worth more than a dollar tomorrow. This statement is true because of the interest or return earned by the money. There are two types of interest: simple interest and compound interest. Simple interest is interest earned on the original amount invested (e.g., money deposited in a bank). For example, if one deposits \$100 in a bank savings account earning 5 percent per year, the interest earned for the first year is \$5 (100×0.05). Interest earned is the same amount each year. Given that the investor earns interest only on the original \$100 invested, the deposit grows in the following manner; year 1 (\$105), year 2 (\$110), year 3 (\$115), and so forth.

But that is a rather naïve method of calculation, because we don't only earn interest on the original amount; rather, we earn interest on the original amount and on the interest earned. Earning interest on interest is referred to as compound interest. According to this method, the deposit in the previous example will grow at a slightly higher rate. In the first year, the deposit will grow to \$105, but in the second year it will reach \$110.25 (\$105 x 0.05 = \$5.25 interest + 105 = \$110.25).

If we think of money as we would any other commodity, it should have a price. And the price of money is the interest rate. When companies or individuals need to buy money (borrow), they will pay interest as the cost, and when companies or individuals want to sell money (save/invest), they receive interest from the buyer as a return on the investment. Inflation must be accounted for when investing or borrowing. An increase in inflation decreases the amount a dollar will purchase. With inflation, today's dollar buys more goods than that same dollar tomorrow.

Now, we know that a dollar today is worth more than a dollar tomorrow, but how much more? That question is answered with time value calculations. Time value calculations have two basic concepts: present value and future value. In order to determine present value and future value using time value calculations, one must determine an expected rate of interest during the time period in question.

Present Value

Present value calculation determines today's value of a future amount of funds, to be received at a certain date in the future. So if an investment pays \$1,000 in one year, present value answers the question, What is the maximum amount an investor will be willing to pay now in order to receive this future sum? To answer this question, we need to identify the interest rate (referred to as the discount rate) expected to prevail during that year and reduce the \$1,000 by that rate. If the interest rate expected is 3 percent, the maximum amount an investor will be willing to pay is equal to $\frac{1000}{(1+0.03)^1} = \$970.90$. This amount is referred to as the present value of the \$1,000. The previous process is referred to as *discounting*, and it simply means the act of removing the interest effect period by period from a future sum of money.

As a general rule:

$$PV = \frac{FV}{(1+i)^n}$$

Where:
PV: Present value
FV: Future Value
i: Interest or discount rate
n: Number of time periods

The cash flow pattern may differ. Instead of receiving a future sum as a lump sum amount, we could receive it in equal installments. In this case, the cash flow pattern is referred to as an *annuity*. Calculating the present value of an annuity is a bit different and uses the following equation (the Internet offers many online present value calculators that will complete the calculations):

$$PVA = PMT \times \left[\frac{1-(1+i)^{-n}}{i} \right]$$

Where:
PVA: Present value of the annuity
PMT: Cash flow per period
i: Interest rates
n: Number of periods

Future Value

Future value is the opposite of present value. Rather than calculating the present value of a future sum now, it calculates the future value of a sum invested now after a period of time. For example, future value calculations can help estimate the future value of a sum of money deposited today in a savings account after a specified period of time. The interest rate is the key component in the calculation. Simply, future value calculation builds interest into a certain amount of money invested. The process is referred to as *compounding*. Following from the previous formula of present value is the future value formula:

$$FV = PV \times (1+i)^n$$

In cases when the cash flow pattern is an annuity, we use this formula to obtain the future value:

$$FVA = PMT \times \left[\frac{(1+i)^n - 1}{i} \right]$$

Sometimes the cash flow is neither an annuity nor a lump sum amount. If an investment makes different payments every period, it is said to be following a mixed stream cash flow pattern. If that is the case, one can use lump sum amount calculations every period and sum them all at the end to obtain present or future value.

In perpetuity refers to cash flows that occur periodically but without a given maturity. Thus, a perpetuity is an annuity without an identified number of years. A good example of a perpetuity is retirement benefits. The beneficiary receives a monthly sum for an unknown amount of time into the future.

The key idea to understanding present value and future value calculations is to understand that we cannot compare different investments unless we place them all at one point in time; whether that point is in the future or the present is irrelevant. That way one can compare investments with different life spans and cash flow patterns to choose the best-paying investment.

Time Value Importance

Time value is important because it explains why one would give up consumption now in favor of investing for future returns. If there was no advantage to saving and investing, people would not give up consumption. People give up consumption now for a promise to consume more in the future, and that can only be possible if the amount saved or invested today will grow into a larger sum through compounding of returns (i.e., interest).

Consumers use time value calculations to decide between taking a lump sum payout or an annuity. For example, if you were offered $50,000 today or $5,500 per year for 10 years, which would you choose? A time value calculation would determine the potential present value of each of those sums. The one with the higher present value would be the optimal choice. The decision is not perfect as the consumer must choose an accurate discount (interest) rate by which to calculate the present value of the future cash flows. For example, calculate the present value of a $5,500 per year cash flow for 10 years with an interest rate of 3 percent and the result is $48,324. Use a discount rate of 7 percent and the present value falls to $41,334. The higher the discount rate employed, the riskier the present value calculation. It's more difficult to obtain higher rates of return than lower. In either case, the consumer is better served taking the $50,000 today than $5,500 each year for the next 10 years.

For a corporation, time value is very important for capital budgeting. Capital budgeting is the process by which a corporation decides among long-term investments such as expansion, research and development, or purchasing equipment. Given the nature of the decisions, cash flows may take years to materialize and thus a corporation needs to estimate if the expected cash flows will be worth the initial investment or not. Time value calculations answer that question.

TIPPING

Tipping is a social norm that exists in many countries and in many service occupations, where the customer voluntarily gives money to the service staff without a legal obligation to do so. In the United States and many other countries, the economic magnitude of tipping is largest in restaurants. Most recently, Azar estimates the annual tips left in the U.S. food industry to be around $46.6 billion. However, tipping is also common in many other occupations, as many as 33, according to Lynn, Zinkhan, and Harris (1993). The prevalence of tipping in many countries, and the large international diversity of social norms about who should be tipped and how much, cause many travel guides to include guidelines about the tipping customs for a country. There are even books dedicated to international comparisons of tipping customs in different countries, such as by Star (1988).

Tipping is an old social norm that evolved over time. Tipping in Europe initiated hundreds of years ago and in the United States over a century ago. During the early 1910s, it was estimated that 5 million workers in the United States, more than 10 percent of the labor force, had tip-taking occupations. Over the years, tipping has spread to additional countries and occupations. In some countries, workers who were not tipped in the past try to encourage tipping by putting out tip jars, a phenomenon that annoys many consumers who feel uncomfortable with the pressure to tip in more and more places. Interestingly, however, tipping is not on the rise everywhere. Some European countries where restaurant tipping was common previously have switched to service charges that are included in the bill, with no tipping or relatively low tips (only rounding up the bill).

Azar (2007) divides tipping into six main categories:

1. Reward tipping: Post-service tipping, for example, tipping servers in a restaurant; because tips are given after the service and may be higher when service is better, reward tips may encourage higher service quality because they are given after the service is completed
2. Price tipping: Tips that are the actual price of service, where no formal price is charged, such as tipping skycaps who carry one's luggage in an airport
3. Tipping in advance: Tips that are given before the service is provided to induce good service, for example, tipping the hotel concierge in advance
4. Bribery tipping: Tips that are given before service as bribery (to get better service at the expense of others), for example, when tipping a maître d' to get a table quickly when customers with reservations are waiting in line
5. Holiday tipping: Tips that are given to workers, such as the newspaper boy or the building doorman, during holidays for a longer period of service (often a year)
6. Gift tipping: Tips that are nonmonetary, for example, giving chocolates to nurses who took good care of a patient

The academic research on tipping is published in psychology and economics and includes several main research methods. One method is customer field surveys, where the researcher approaches customers (e.g., diners who exit a restaurant) and asks them questions related to the service and their tipping behavior. A related research method also employs customer surveys but asks more generally about their tipping habits or about a hypothetical scenario. Another common approach is to collect data from the establishment (e.g., a restaurant) and examine empirically how tips vary with different factors, such as the tipper's gender or age and the service worker's appearance. Another version of this method involves service staff cooperating with the researcher to document how certain behaviors (e.g., touching the customer) affect tips. Another methodology, mostly used by economists, employs formal mathematical models to analyze certain tipping aspects, such as the economic and social welfare implications of tipping or how future service considerations should affect tipping. Tipping research also includes lab experiments that mimic tipping situations, meta-analyses, cross-country comparisons, and literature reviews.

Tipping has attracted the interest of researchers not only because of its economic magnitude but also because it is a prominent example of how psychological and social considerations affect economic behavior, which is key to behavioral economics. Without incorporating noneconomic motivations into our models, it is hard to explain why people tip voluntarily even in places to which they do not plan to return.

TOTAL QUALITY MANAGEMENT

Total quality management is a method of quality control popularized by U.S. government agencies like the Department of Defense and the army. It employs statistical methods to ensure the quality of products, focusing on meeting consumers' demands. The method arose in the 1970s and 1980s in Western countries facing stiff economic competition from Japan and remained popular into the 1990s. Because Japan could manufacture goods at lower cost than most Western nations, it was able to offer lower prices on goods and services than U.S. and British producers. This led these nations to seek alternative means of increasing efficiency, with the total quality management system developing from earlier methods, including some popularized by the Japanese. Developed in highly hierarchal organizations like the military, the method of total quality management became renowned for its use of inspection at every level of the production process. These thorough analyses of both the physical production of goods and the management that oversaw production led to widespread gains in efficiency. This success attracted private-sector firms, which adopted many aspects of total quality management throughout the 1980s and 1990s.

Seeking to improve efficiency, the first U.S. entities to adopt total quality management discovered it through investigation of Japanese methods in productivity. Finding that much of the efficiency in Japanese organizations came from dedicated quality control, these U.S. organizations began to adopt this approach to total efficiency. This led to a process of continuous statistical analysis of all levels of production, including management and overall organizational structure. Employing standardized evaluations of each of these methods, organizations like the U.S. Department of Defense began seeking the permanent improvement of each phase of production. As the ultimate goal was to match consumer (or government) demands, this required assessment of not just internal production but also firm interaction with the market. By seeking to improve all aspects of production, these U.S. departments began to see improved productivity, reduced costs, and increased ability to meet consumer demands at a lower price. This led to increases in overall efficiency, allowing organizations to produce more while using fewer resources.

Seeing the success of government agencies in adopting total quality management, private corporations in the United States and the United Kingdom began adopting the system's conventions as well. These companies were able to reduce prices using total quality management to assess how efficiently goods and services were produced while also analyzing consumer demands. This allowed for increased market competition with efficient firms from nations like Japan. This was particularly true in the private sector, where target consumers are generally individuals rather than the government. The reduction in production costs led to increased opportunities for innovation, allowing for the creation of new services and ultimately leading to the general increase in standards of living.

Since the late 1990s, total quality management as a system of quality control has been replaced by other quality control methods, including "lean manufacturing" and "ISO 9000 family" systems. These newer systems include added dimensions of analysis. ISO 9000 also includes a focus on meeting regulatory requirements. However, the key aspects of these systems, increasing the efficiency of production and focusing on consumer demands, match the central themes of total quality management.

TRADEMARKS AND PATENTS

Even though in the Unites States monopolies are illegal under the Sherman Antitrust Act, the government can grant some firms monopoly power through issuing trademarks and patents. Trademarks distinguish a producer's good from other goods, preventing other firms from selling the same good. A patent gives the creator a 20-year monopoly on a good or service. The government allows trademarks and patents to encourage progress through new ideas and inventions.

Trademarks

A trademark is a word, name, symbol, or device used in trade with goods to indicate the source of the goods and to distinguish them from other goods. A trademark may be used to prevent competitors from using a similar mark but not to prevent others from making and/or selling the same good. An example of a trademark would be the "swoosh" of the Nike logo. Even though there are many shoe and clothing makers in the marketplace, no other maker of these items can use the same logo on its shoes or clothing. Technically speaking, this gives the Nike Company a monopoly on its particular product since no competitors are able to produce the exact same product using the same image and name.

Patents

A patent is a government-granted monopoly of a good or service for 20 years. In order to encourage new ideas and inventions, the U.S. government allows inventors to control, sell, and reap the rewards of their invention without competition. Progress would be limited if someone could steal or copy a person's idea, since inventing a good or service consumes a lot of time, energy, and resources.

Whenever a new product first enters the market, most likely the inventor has obtained a patent so no one else can replicate the product. One of most famous patents recorded is the patent Thomas Edison received for the incandescent light bulb in 1880. Edison has been considered one of the most active inventors, with over 1,000 patents.

In 2010, over 500,000 patents were filed with the U.S. Patent and Trademark office. Patents for new drugs are the lifeblood of pharmaceutical companies. Patents provide companies incentives to invest millions of dollars and thousands of hours in research and development. Once a drug receives final approval by the government for production and distribution, the company has approximately half of the 20 years remaining to recover those costs by producing the drug under its brand name, such as Lipitor for cholesterol. Once the patent expires and generic drugs from other companies are allowed to enter the market, the patent-holding pharmaceutical company can, and often does, reapply for a renewed patent with a newer version of the original patent.

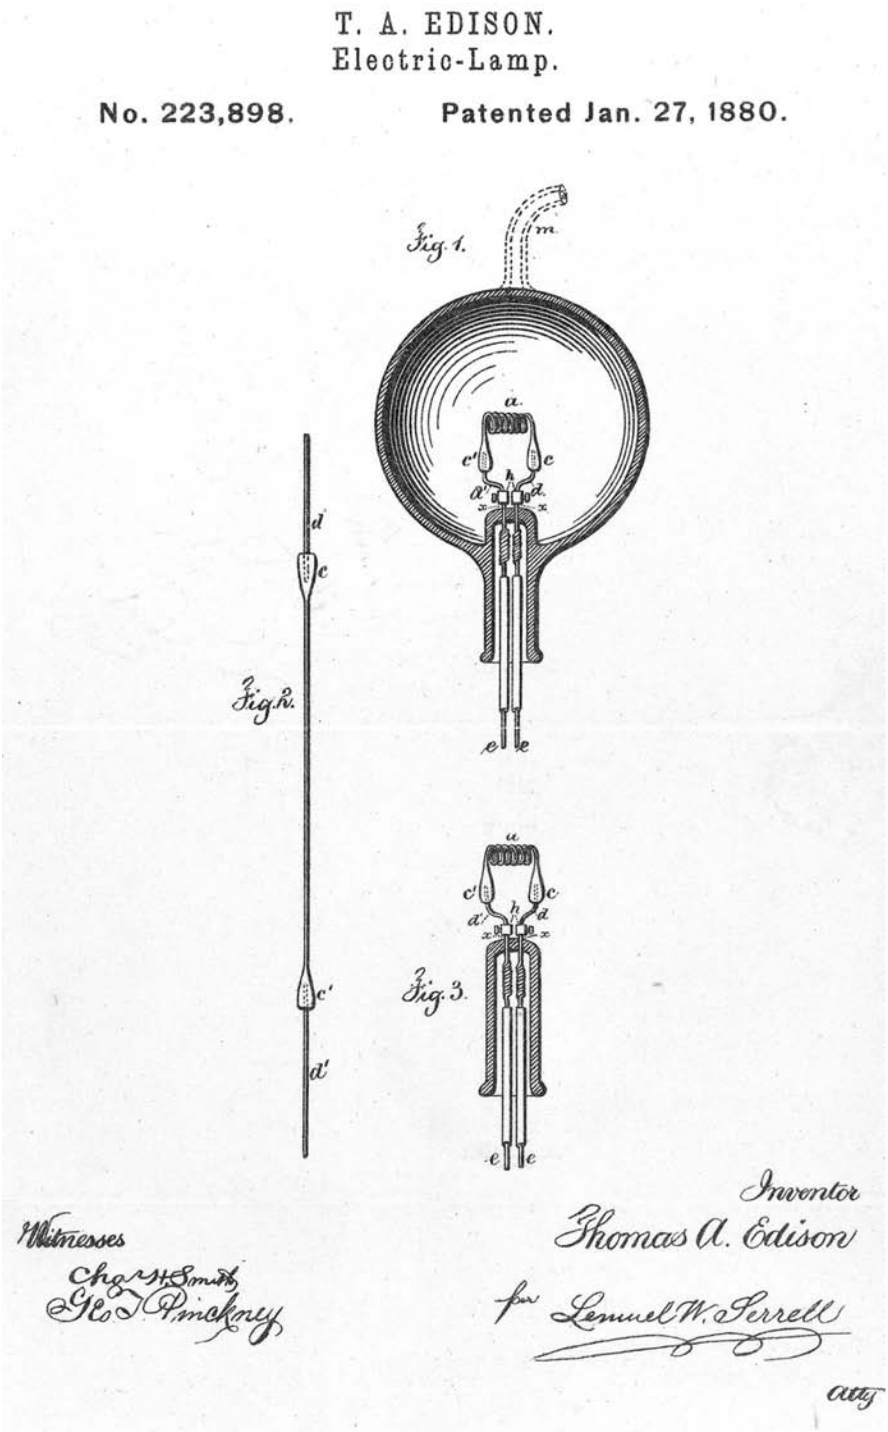

Figure 1. Thomas Edison's patent drawing and application for an improvement in electric lamps, patented January 27, 1880; Records of the Patent and Trademark Office; Record Group 241; National Archives.

Effects of Trademarks and Patents

There are positive and negative effects of the government's issuance of trademarks and patents. From the perspective of the inventor/business owner, he or she is allowed a government monopoly and will be able to have complete control over the good or service. Therefore, the inventor will be able to charge a higher price for the good or service than what would normally be the equilibrium price if there were competitors. Another positive effect is that with the issuance of these types of government monopolies, the financial incentive encourages others to create new goods and services, which benefits both the business owner and the consumer. It is also a positive for the nation, since progress is being made and encouraged.

When a drug company is issued a patent for a new drug, it will also be encouraged to continue researching new drugs, benefitting consumers in the long run. On the other hand, trademarks and patents can cause higher prices, since the producer has a monopoly for the goods and services. Consumers are price takers if they want the particular good or service.

Consumers' lack of choice does not mean the patent- or trademark-holding monopolist can charge any price for his or her good or service. Even a monopolist faces a choice of whether to increase output or price, but not both. Typically, once someone is issued a patent or trademark, he or she will want to maximize profit. The patent or trademark holders had to spend time, money, and resources to create the product or idea. They will want to reap the financial reward of their new good or service. In order to maximize profit, the firm will need to produce fewer products at a higher price. Since the firm has market power, the business owner will use price discrimination in order to maximize profits.

TRAGEDY OF THE COMMONS

First introduced by Garrett Hardin in a 1968 *Science* article of the same name, "the tragedy of the commons" has become synonymous with society's overuse of common-pool resources. Common-pool resources are resources that can be used by a large group of individuals but are not owned by any one person. These resources have features of both private and public goods. As with public goods, access is open to all. Because a rationing mechanism is not used to prohibit access by potential users of the resource, these goods are characterized as nonexcludable in provision. But as with private goods, the benefit is enjoyed individually. Because use by one individual diminishes the quantity or quality of the resource available for others, these goods exhibit rivalry in consumption. Examples of common-pool resources include fishing grounds, public forests, groundwater aquifers, nonrenewable energy resources, and the atmosphere.

According to Hardin, the tragedy arises when the characteristics of common-pool resources are coupled with individual self-interest. Left to their own devices, humans will overuse the commons because the individual benefit exceeds the cost paid by that individual. Costs imposed on other users by an individual's own use are ignored. Self-interest provides a compelling incentive to continue to use the commons, even if continued use by all may lead to depletion.

Hardin used the parable of a common pasture shared by self-interested herdsmen to describe this incentive and the resulting unsustainable outcome. He suggested that the tragedy manifests itself today in overgrazing on national lands, overfishing in the world's oceans, and overuse of national parks. The tragedy of the commons has been used to explain species extinction, water supply depletion, climate change, and other environmental threats. Many forms of pollution are likewise understood by considering the individual utility calculations associated with using the commons as a means of disposal.

Hardin ascribed the underlying cause of the tragedy to exponential population growth, an issue to which he dedicated much of his essay. Population growth, Hardin argued, was one of a special class of societal problems: those without technical solutions. Suggesting that a world with finite resources can support only a finite population, Hardin inferred that population growth must at some point equal zero. Noting that the associated maximum population level would be uncomfortably compromised, Hardin suggested that the optimal population level is below this maximum. He proposed that a laissez-faire approach to human reproduction cannot be expected to result in the optimal rate of population growth.

Hardin did not just describe the dilemma in his essay; he suggested solutions. Appeals to conscience are decidedly not among those suggestions. In fact, Hardin argued that appeals to conscience will tend to eliminate from the human race those who have a conscience. His logic is simple. Those who voluntarily restrain themselves from overexploiting the common resource will receive fewer resources. Those who do not succumb to appeals to conscience will gain more resources. Those with more resources will outcompete those with fewer and will produce offspring with similar tendencies.

If people cannot be convinced to voluntarily restrain themselves from overgrazing, what can be done? One possibility is privatization of public resources. Enclosure laws that converted common grazing areas to fenced, individually owned parcels led to better stewardship of the land because each landowner had a private incentive to maintain his or her own property. Some find this market approach appealing, but it cannot easily be applied to oceans, the air, or other widely dispersed commons. Hardin preferred the coercive power of laws, arguing that rules that limit our freedom, but to which we have mutually agreed, can help us avoid the tragedy of the commons. He admitted that regulation has its drawbacks but argued that we must do something and all other available mechanisms are worse.

It is interesting to note, as Hardin did, the contrast between the prevailing sentiment of the tragedy and that which Adam Smith noted in *An Inquiry into the Nature and Causes of the Wealth of Nations* (1776) regarding the outcome of individual self-interest in the context of markets. Smith can be interpreted as suggesting that individual interest can lead to maximum social benefit, which stands in stark contrast to Hardin's suggestion that individual interest leads to ruin. Understanding that Smith's proposition applies in the context of market goods, while Hardin's thesis applies to common property, helps us see that both positions hold merit.

The tragedy of the commons is easily seen as an application of the prisoner's dilemma, whereby the actions that each individual is compelled to undertake due to self-interest result in suboptimal conditions for society at large, thereby implying that cooperative action would be preferred. According to Hardin, because individuals behave opportunistically, to avoid the tragedy, use of the commons must be governed by some form of regulation, including private property rights, resource allocation, or taxation.

While Hardin's simple examples and unflinching language are compelling, his essay is not without controversy or criticism. We do observe examples of sustained, cooperative use of common-pool resources. In recent years, behavioral economists have chipped away at the starkest assumptions about self-interest on which some of Hardin's claims rest, providing arguments against the inevitability of overuse. Elinor Ostrom (winner of the Nobel Prize in Economic Sciences in 2009) argued that collective institutions and polycentric governance could serve as an effective alternative to government control or privatization of the commons. Ostrom presents numerous case studies illustrating that collective rules and norms can achieve environmentally sustainable and economically efficient outcomes for common-pool resources.

In addition to misjudging the capacity of communities to establish and enforce rules for governing the commons, Hardin underestimated the impact that technology would have on crop yields. Hardin also did not foresee the impending declinations in population growth that would result from advances in health care and social welfare systems in developed nations. In later years, Hardin wrote that he should have specified that the tragedy followed from unmanaged commons. The commons can be managed sustainably, and in his original 1968 essay Hardin advocated for rules designed to manage the commons.

TRUST GAME

The trust game (also referred to as the investment game) is a two-player one-shot sequential game with salient fairness considerations. Trusting and trustworthy behavior in the game allows players to reap the benefits from cooperation and increase their earnings. The game was first introduced to the literature by Berg, Dickhaut, and McCabe (1995), who designed it to experimentally study trust and reciprocity behavior in an investment setting.

The game is played by two players, the first mover (FM; also referred to as *trustor*) and the second mover (SM; also referred to as *trustee*), both endowed with \$10 from the experimenter. In stage one, the FM decides how much of his or her initial endowment to send to his or her counterpart. The remaining portion of the endowment is his or hers to keep. The amount sent is tripled by the experimenter while the amount kept is not transformed. In stage two, the SM observes the tripled amount and decides how much of it to return to the FM and how much to keep. The amount kept by the SM is added to his or her own endowment (if any). Each dollar returned by the SM to the FM costs the SM one dollar. Following the SM's choice, the game ends and the payoffs are realized.

The unique subgame perfect Nash equilibrium of the trust game for the self-regarding preferences (or *economic man*) model with perfect information can be solved for using backward induction: In stage two, a selfish SM will return zero. Realizing this, a selfish FM will send zero in stage one. Such play yields equilibrium payoffs of (\$10, \$10). This subgame perfect Nash equilibrium is Pareto-inferior to some alternative feasible allocations in which the FM sends a positive amount to the SM, which increases the stake to be divided between them. For example, if the FM sends all \$10 and the SM receives \$30 and returns \$20 to the FM, the players end up with final payoffs of (\$20, \$20).

In experiments, human participants in the role of FMs identify the possibility of creating a surplus by sending positive amounts to paired SMs, which has been interpreted as using trust for mutual gain. Moreover, many SMs share the created surplus with FMs by returning positive amounts to FMs, which has been interpreted as the existence of trustworthiness. For example, in the original Berg, Dickhaut, and McCabe (1995) experiment, FMs sent \$5.15 on average, while as many as 30 out of 32 sent at least some money. These amounts were then tripled by the experimenters and thus FMs' actions resulted in higher total payoffs to the pair. Of the 30 SMs who received a positive amount, only 6 responded with returning zero, while all other SMs returned positive amounts, \$15.48 on average.

Explanations for this behavior have incorporated alternative motives for other-regarding behavior, including trust, reciprocity, and other-regarding preferences. In particular, the FM could send a positive amount because of trust that the SM will return some of the money and/or because of unconditional other-regarding preferences, for example, altruism. The SM could return some money because of positive reciprocity and/or because of unconditional other-regarding preferences, for example, altruism or inequality aversion. Cox (2004) presents an experiment that distinguishes between these explanations. His design includes the standard trust game and two specially designed dictator games that eliminate the possibility of trust and reciprocal behavior by FMs and SMs, respectively. By comparing subjects' behavior in the three games, Cox finds that the FMs in the trust game exhibit both trust and other-regarding behavior and that the SMs exhibit both reciprocity and other-regarding behavior as well.

Extensions and modifications: In some experimental settings, the choices of both players are restricted to whole-dollar amounts or to a binary decision, endowments and the multiplicative factor are varied, or multiplicity of players is introduced. Other experiments vary procedures: participants have to earn the initial endowments, the game is played repeatedly, players change roles, or the degree of anonymity can vary and communication is allowed.

U

UMBRELLA INSURANCE

An umbrella insurance policy is the next personal finance asset protection a consumer may need after homeowner (or renters) and vehicle insurance coverage. This policy, as its name suggests, is a broad protection against the cost of losing a lawsuit over a vehicle accident or an accident on one's property. Umbrella insurance provides additional coverage over that of the consumer's home and vehicle insurance protection.

The umbrella policy protects the consumer's existing assets as well as future potential assets (such as wages, future inheritance, or lottery winnings) against the cost of losing a lawsuit from a car accident or accident on one's property. Even if the consumer currently has few assets, umbrella insurance may be recommended to avoid the potential loss of future wages.

If the consumer loses the lawsuit, he or she would be responsible for paying the winning party for medical expenses, lost wages, and other costs.

How Does Umbrella Insurance Work?

Because this is an additional insurance policy, after homeowners and vehicle insurance, there are certain minimum insurance coverage requirements for the vehicle and homeowners policies.

For example, let's assume that your vehicle insurance pays $300,000 per person per accident for medical expenses and you have a $1 million umbrella insurance policy. If you are in an accident and sued for $900,000 and lose the suit, your auto insurance will pay $300,000 and the umbrella policy will cover the remaining $600,000 ($300,000 + $600,000 = $900,000).

The typical umbrella policy covers from $1 million to $5 million (or more if you have more assets to protect). As with all insurance, there will be a deductible or amount that the insured (or policyholder) pays before the insurance pays out.

What Level of Vehicle and Homeowners Insurance Is Necessary with an Umbrella Policy?

Umbrella insurance requires the policyholder to purchase a baseline amount of both vehicle and homeowners (if property is owned) insurance along with the umbrella policy. Although vehicle insurance is required by law in most states and homeowners is required by mortgage companies, the levels of coverage are specified by the umbrella insurance policy.

According to Amy Fontinelle (2012) in "It's Raining Lawsuits: Do You Need an Umbrella Policy?" umbrella insurance requires the vehicle policy to provide a minimum level of coverage; typically, at least $250,000 per person bodily injury coverage and $500,000 per accident. Auto insurance property damage minimum coverage is usually at least $100,000 per accident. And homeowners insurance personal liability coverage must be at least $500,000.

These minimum vehicle and homeowners policy amounts may vary depending on the specific umbrella policy. The examples above provide an idea of how the three types of insurance policies interrelate.

Additional Benefits of Umbrella Insurance Coverage

The umbrella policy may also cover the policyholder's dependent children. For example, when 16-year-old Amelia causes a car accident, the umbrella policy can protect her as well.

Depending on the specific provisions of the policy, it may cover the holder and family from lawsuits arising from slander, libel, defamation of character, false arrest, detention or imprisonment, abuse of process, malicious prosecution, shock/mental anguish, and more, although the consumer's umbrella policy should not be considered insurance for business-related liability.

Additionally, the umbrella policy can be written to cover accidents caused by the policyholder and family while driving a boat or accidents that happen on one's rental property.

Limitations of an Umbrella Insurance Policy

There are many exclusions to an umbrella policy, and as with any insurance policy, the consumer needs to understand the policy exclusions.

As stated in the prior section, umbrella insurance is personal coverage and won't protect one from lawsuits related to a business the policyholder owns. For example, if you offer childcare in your home, an umbrella policy is not the appropriate liability coverage.

Umbrella insurance isn't for risky activities such as drag racing or piloting an airplane. It may not cover all types of vehicles, such as recreational motor vehicles, tractor trailer trucks, farm vehicles, or other vehicles that exceed a particular weight limit.

Umbrella insurance does not cover damage to the policyholder's own car or property; that coverage is provided by standard vehicle and homeowners coverage.

If you lose a liability suit after committing a crime, the umbrella insurance will not cover the damages. If Jamal is convicted of driving under the influence and required to pay restitution, an umbrella insurance policy will not pay. Other illegal acts such as sexual harassment, discrimination, intentional harm to another person or property, or malicious acts aren't covered.

Umbrella insurance does not supplement health insurance nor pay health insurance–related claims. For additional health-related coverage, the consumer should purchase a policy designed to compensate for medical-related concerns.

Some umbrella insurance policies require the policyholder to use the same insurance carrier not only for the umbrella policy but for the vehicle and homeowner policies as well. In general, premium rates are usually less expensive the more policies the consumer has with the same insurance company.

Who Needs an Umbrella Policy?

If you ride the bus and don't own a home, you probably don't need an umbrella liability policy.

Consumers with a pool, a dog, and a long commute are more likely to encounter a scenario where they are sued. If one is at greater risk, purchasing an umbrella policy will provide peace of mind and additional protection.

In general, umbrella policies are reasonably priced due to the fact that they are supplemental to home and auto insurance. As consumers acquire greater income and assets, this type of insurance may be an important addition to their insurance protection suite of products.

UNDERGROUND ECONOMY

An underground economy consists of illegal and legal activities that are either not reported or underreported to the proper authorities. An underground economy exists where goods and services are traded or bartered for without the payment of taxes. The underground economy is also frequently referred to as a shadow, parallel, or informal economy. These types of dealings are also frequently correlated with the black market. The black market refers specifically to the illegal trading of goods and services. This sort of trade is usually related to restricted or banned items or services. However, the illegal trade of legal items can also be considered a part of the underground economy. Seemingly nonthreatening activities such as a poker game among friends or paying a babysitter in cash could also be considered aspects of an underground economy.

The underground economy can be particularly hard to track and enforce. Since most dealings are made in cash and unreported, regulatory forces have difficulty assessing their effect with relation to the real economy.

As the International Monetary Fund also points out, crime and unreported activity are a way of life, but there are multiple potentially hazardous consequences

Table 1. Types of Underground Economic Activities

Type of Activity	Monetary Transactions		Nonmonetary Transactions	
ILLEGAL ACTIVITIES	Trade in stolen goods; drug dealing and manufacturing; prostitution; gambling; smuggling; fraud.		Barter of drugs, stolen, or smuggled goods. Producing or growing drugs for own use. Theft for own use.	
	Tax Evasion	**Tax Avoidance**	**Tax Evasion**	**Tax Avoidance**
LEGAL ACTIVITIES	Unreported income from self-employment. Wages, salaries, and assets from unreported work related to legal services and goods.	Employee discounts, fringe benefits.	Barter of legal services and goods.	All do-it-yourself work and neighbor help.

Source: Structure of table from Lippert and Walker, *The Underground Economy: Global Evidence of Its Size and Impact*. Vancouver, B.C., The Fraser Institute, 1997.

of growing shadow economies. First, it is often difficult to identify a shadow economy, so the size and scope of the shadow economy is hard to calculate with reliable accuracy. This type of misinformation can lead to over- or under-sighted policies. Second, shadow economies can become a vicious cycle where the growth of these activities represents an increase in tax avoidance. Therefore, the tax base of the real economy is lower, which may lead officials to raise taxes. Subsequently, this may lead to a further increase in underground economic activities. Last, growing shadow economies may attract labor and resources away from the real economy. Ironically, more than two-thirds of money earned in the shadow economy is quickly spent within the real economy.

There are many potential causes for the growth of underground economies. Most poignantly, whenever a regulatory agency or government extends restrictions or laws, more businesses or individuals are likely to move toward underground economic activities. Furthermore, the increase of illegal migration can lead to more under-the-table paid work. The underground economy has increased in recent times mainly due to continued government restrictions, the legal business environment, tax structures, and immigration (legal and illegal). Conversely, nations with relaxed tax requirements and fewer (but well-established) laws have smaller shadow economies.

Shadow economies are larger proportions of the total economy in developing nations. This is mainly due to the lack of enforcement strength of governments. Many developing nations do not have the same tax and regulatory restrictions but also lack well-established and enforced laws. For example, in developing nations, contract work for infrastructure and construction may include the transaction of bribes or pay-offs to gain first-mover advantage, cut corners, reduce labor costs, or gain necessary legal permits. This type of corruption is a major issue in developing economies and is directly attributable to how well structured systems can remedy underground economic activities. Developed nations also face challenges in restricting the shadow economy.

In 2013, it was estimated that the underground economy of the United States reached $2 trillion (Koba 2013). This massive number could be due to corporate greed in tax evasion or necessity for small businesses facing increased legal restrictions and requirements. It could be due to an increase in shadow economic labor due to unsustainably low wages, or an increase in supply and demand for day laborer work. There are many factors and iterations of the shadow economy. The underground economy is therefore a crucial item to understand when deciphering national economies and determining relative strength or future fiscal or legal policies.

UNIONS

The origins of organized labor can be found in medieval Europe where labor guilds parsed workers by specialization and took in apprentices in order to educate them with a skill so as to perpetuate the trade.

The earliest establishment of what could be called *the union* can be traced to 1794 in Philadelphia where the federal society of journeyman cordwainers (shoemakers) organized in the interest of consistent earnings for all in the trade. As industrialization spread in the young United States and the United Kingdom, workers began to express concern that the introduction of new technologies would supplant them. In the United Kingdom, Ned Lud was said to rail against new machines in factories, smashing looms out of fear that they would displace workers. An actual federation of workers' groups finally met in Baltimore in 1866 to form the National Labor Union, which organized to push for political and social reform more so than wages (Tindall and Shi 2007, 765).

The first recorded job action, a strike, occurred in New York in 1768 when tailors stopped work to protest a cut in wages (History.com 2014). A strike occurs when employees of a firm refuse to work, endeavoring to bring the firm's operations to a halt until their demands in terms of working conditions or pay are met.

Issues over pay and working conditions arose elsewhere after the American Civil War, including in the building of railroads and in the coal-mining industry. Both experienced strikes that sometimes turned violent in their confrontations between labor and business owners.

The Knights of Labor, founded in 1869, extended across state lines and pushed for reforms such as an eight-hour workday, the elimination of convict labor, and equal pay fr equal work. In 1886, a number of craft unions formed the American Federation of Labor (AFL), and with the advent of the 20th century, labor leaders such as Samuel Gompers and Mother Jones emerged as national and forceful advocates for workers' rights.

Worker concerns led to more unionization with the increased industrialization of the automotive sector. As Ziegler and Gall note in their chronicle of American labor, "in 1914, Henry Ford's Highland Park, Michigan, plant had 15,000 power-driven machines on site that outnumbered its 13,000 workers" (Ziegler and Gall 2002, 2).

The migration north of thousands of African Americans in the early 20th century swelled blue-collar ranks in major cities. Ziegler and Gall explain that the labor movement did not embrace these new workers. "White unionists, with some notable exceptions, remained steadfast in their unwillingness to include black coworkers in the common struggle" (Ziegler and Gall 2002, 35). The economic turmoil of the Great Depression brought new energy to unions, prompting them to protest the closure of factories in the face of reduced demand for goods such as Henry Ford's. In 1935, Congress passed the National Labor Relations Act, also known as the Wagner Act, which moved litigation of labor issues into the courts.

By the end of World War II, unions made up 35 percent of the civilian labor force with over 14 million members (Ziegler and Gall 2002, 144). A major economic and political force at the time was the AFL-CIO. The aforementioned AFL had merged with the Congress of Industrial Organizations. So emboldened were unions at this point that strikes in industries such as steel and coal mining were common. The scope of these job actions was such that more than once President Harry Truman threatened to draft striking workers in these industries in the event that their job actions did not end. McCarthyism of the 1950s fostered a link in many minds between union activities and communism.

In geographic areas where union membership was traditionally strong, it has often been insisted that the benefits and wages that unions earned for the employees were key in building the middle class in states such as Michigan, Ohio, and Pennsylvania. The historical record supports this sentiment to some degree. In

2011, the Service Employees International Union (SEIU) touted a Bureau of Labor Statistics analysis concluding union employees earn an average of 28 percent more than their nonunion counterparts in the same line of work (Long 2013).

Other economic interests cite problems that unions have wrought in the course of their growth. In 1919, the Boston police went on strike, which led to several days of lawlessness and thousands of dollars of damage to the city. President Truman suggested that strikes in the coal-mining and steel industries threatened national security during the Cold War, and in the 1981 air-traffic controllers strike in the United States it was necessary for the government to limit air travel to 2 percent of its normal capacity to accommodate the striking controllers. Some have also criticized educators who have taken job actions on several occasions, such as teachers in Detroit who struck in 2006 and their counterparts in Chicago in 2012.

A more educated generation entered American business in the 1950s thanks to the college opportunities provided by the GI Bill. A more educated baby boom population emerged in the 1960s, turning away from career paths one would associate with the labor movement. The size and pursuits of this demographic led to the emergence of a white-collar middle class in America, resulting in a decreasing percentage of American workers who were traditionally unionized. Sloan Wilson's 1955 *The Man in the Gray Flannel Suit* was made into a film showcasing a new American worker who was definitely not a union man.

Organized labor was dealt a setback by President Ronald Reagan in 1981 when he fired striking air-traffic controllers who had brought the national airline industry to a halt. During the same decade in the United Kingdom, the British government began closing unproductive coal mines, which left thousands of unionized miners unemployed with few other skills to offer the economy.

As globalization gained steam in the 1990s, organized labor felt threatened with the prospect of offshoring. Offshoring is the relocating of jobs from an original domestic site to one in another nation. Often the other nation was considered to have fewer work safety standards and a lower wage structure that combined to lower business costs. The main union issue of offshoring was the loss of jobs, many of them unskilled.

Widespread and violent protests about this trend involving U.S. union members erupted in Seattle during a World Trade Organization meeting in 1999. Labor's struggles continued into the 21st century when in 2005 America's largest service employees' union and the Teamsters (national union representing various manual trades) split from the AFL-CIO. This separation ended a 50-year alliance of labor groups.

As the Gen X and Gen Y generations entered the workforce, they continued the trend of seeking careers in sectors of the economy where unions were scarce, such as finance, communications, and technology. By the end of the first decade of the 21st century, the Bureau of Labor Statistics reported that union membership in the nation had reached the "lowest figure ever since the bureau started collecting data" (Bureau of Labor Statistics 2011).

While the early years of the 20th century saw the union movement gaining steam nationally, trends of the early 21st century are not as promising for organized labor.

Globalization has sent many manufacturing jobs that were normally unskilled union jobs in the United States to developing nations where union membership is uncommon and American business owners have no incentive to inspire it. As the capital-intensive information-driven economy continues to incentivize workers to be more technologically literate, there is no evidence the transient and educated workforce has interest in joining unions within firms or across sectors as their ancestors in the historically more labor-intensive careers once did.

UNITED FARM WORKERS

The United Farm Workers is a major organized agricultural labor union in the United States. Founded in 1966 with the merger of the Agricultural Workers Organizing Committee (AWOC) led by Larry Itliong and the National Farm

Workers Association (NFWA) founded by Cesar Chavez, the union organized for the rights of hard-working farm workers, mostly in the southwest. The two groups officially combined on August 22, 1966, and became known as the United Farm Workers.

An agreement between the United States and Mexico, the Bracero program, allowed millions of Mexican workers to migrate to U.S. farms on short-term contracts to fill in for the low-supplied farm work that most Americans dreaded doing. The program became Public Law 78 in 1951. The law specified that temporary workers from the Bracero programs could not replace domestic workers. However, the farm employers rarely enforced the law. The laborers worked long hours and were compensated with very low wages and living standards.

In the early 1960s, Cesar Chavez began organizing farm workers in central California. Over the next decade, Chavez allied with churches, community groups, and other organizations associated with the civil rights movement. This alliance group was able to force the government to terminate the Bracero program in 1964.

Despite the end of the Bracero program, conditions still did not meet workers' expectations. In 1965, many of the workers, such as grape pickers, were only compensated \$0.90 every hour with an additional \$0.10 for every full basket picked. Also, workers often had to pay for their housing, which consisted of a metal shack with no power or sanitation. They were required to pay \$2 a day or more as well as a quarter for every cup of water they wished to drink. The average lifespan for a farm worker was only 49 years.

Since 1966, the United Farm Workers have been a major influence, representing farm workers in several industries, including grape and vineyard growers along with vegetable, fruit, and tomato workers. Their geographical influence extends beyond their original California roots to Florida, Washington, and Texas.

They have succeeded in achieving rights to assemble and unionize and collective bargaining rights for farm workers. Increasingly the UFW fights for the rights of undocumented farm workers to earn legal residency rights in the United States. The UFW was a major influence in the passage of the AgJobs Bill in 2005. The United Farm Workers has also gained political influence, gathering grassroots support for candidates who support pro-farm-worker initiatives.

UNITED MINE WORKERS

Founded in Columbus, Ohio, in 1890, the United Mine Workers of America (UMWA) was originally known for its representation of coal miners. It was also known to represent other public employees in the United States, such as health care workers and truck drivers. Trade associations the Knights of Labor Trade Assembly No. 135 and the National Progressive Union of Miners and Mine Laborers merged to create the UMWA.

Leaders of the union were John L. Lewis (who was the president of the UMWA from 1920 until 1960 and also the founding president of the Congress of Industrial Organizations), Phil Murray (vice president of the UMWA), William “Bill” Green (elected secretary of the Coshocton Progressive Miners Union in 1891, which became one of the locals of the UMWA), William B. Wilson (served as secretary-treasurer of the UMWA from 1900 to 1908 and served as a chairman in the House Committee on Labor from 1911 to 1913), John Mitchell (subdistrict organizer of the UMWA in 1894, vice president in 1898, and president in 1899), and Mother Jones (an advocate for union workers in the early 1900s and became known as the Miners’ Angel).

The United Mine Workers’ constitution focused on eliminating discrimination because of religion, race, or national origin. Leaders of the UMWA took note of the acceptance of discrimination in America and realized its destructiveness. Not only did the UMWA struggle with discrimination, miners faced many other challenges in reaching their goals.

Major accomplishments of the UMWA during its long history include the eight-hour workday (1898), collective bargaining (1933), health benefits (1946), and health and safety protections for miners (1969). Miners also faced struggles during the Great Depression, when brief competition set in against the radical West Virginia Mine Workers Union and the National Miners Union. With the development of the New Deal, created by President Roosevelt, federal legislation put a stop to contracts between workers and employers in which workers agree to not remain in or join a union. It also limited antiunion injunctions and gave workers the right to bargain collectively.

The UMWA was influential in the mass-production industry, with things such as steel and automobiles. With the creation of health and retirement benefits in 1946, the union permanently changed health care throughout all coal mines in the nation and established clinics and recruited young doctors into the rural coal areas. Seeing as the UMWA works around so much dust, they became experts in occupational lung diseases like silicosis and pneumoconiosis and pushed for the protection of miners’ safety and compensation for those suffering from black lung disease.

The UMWA continues to have a strong voice in the American labor movement by pioneering new fields of mass production and advocating strongly for better health care and workers’ rights.

UNITED STATES V. SOUTH-EASTERN UNDERWRITERS ASSOCIATION

The Supreme Court's responsibility in *United States v. South-Eastern Underwriters Association*, 322 U.S. 533 (1944), was to determine whether insurance constitutes commerce, and if so, if insurance companies can be regulated by the power the commerce clause grants to Congress to regulate transactions across state lines. Until this case in 1944, insurance was not considered commerce as defined by the commerce clause of the U.S. Constitution and interpreted by the courts. However, the business of providing financial stability through insuring property for monetary loss was comparable to the auto and coal industries in size and employment.

Monopolies were a national concern in the late 19th century. Congress passed the Sherman Antitrust Act in 1890 in an attempt to prevent monopolies, collusion, price-fixing, conspiracy, and intimidation tactics that would discourage competition and fair trade. Insurance was not considered commerce and therefore did not adhere to the laws and regulations of the Sherman Act. This case established that insurance was indeed commerce. In addition, transactions of the insurance industry took place between various states and therefore were subject to the regulation of the federal government.

Case Summary

Historically, the timing for this case is set well into the United States' fight against fascism, when patriotic values and national attitudes of unity to win World War II were prevalent. By 1944, the insurance industry had grown to represent a substantial portion of the economy. The *South-Eastern Underwriters Association* case challenged the American free-enterprise principles of fair trade, honest prices, and true competition. The case dealt with collusion, conspiracy, price-fixing, and whether or not insurance was a form of commerce.

Insurance refers to a contract in which one party agrees to indemnify (compensate for loss or damage) another for a previously agreed-upon category in exchange for a premium (payment). This was significant in regard to U.S. industrial development because it provided an economic stabilizer. The Great Depression had underscored the importance of this stabilizing mechanism. It spread the loss from an individual or a few to a greater number of people, or a collection of premium payers. The insurance company is the safe-keeper of these pools of money. By the 1940s, the insurance industry generated revenue comparable to an average of all-revenue receipts for the federal government. Within the previous decade, it had employed as many people as the automobile and coal-mining industries combined. Insurance touched almost every home and person, as well as places of employment, constituting a significant portion of the U.S. economy.

Several decades earlier, and coincidental to the growth of the insurance industry, was the growth of trusts and monopolies. These monopolies in steel, railroads, and oil had the power to restrict production, crush small businesses, and concentrate power in the hands of a few to the detriment of the many. In 1890, the U.S. Congress passed the Sherman Antitrust Act in response to this era of great fear and corruption. It was named after its author, Senator John Sherman, and signed by President Benjamin Harrison. The goal of this federal legislation was to protect competition, and consequently, consumers. The Sherman Act was passed almost unanimously in both the House and the Senate, giving antitrust or competition law nonpartisan status in the Congress of 1890.

The South-Eastern Underwriters Association (SEUA, underwriters evaluate potential risk for insurance companies and review applications for coverage, giving either approval or denial) and its affiliates were indicted in a district court in northern Georgia for alleged violations of the Sherman Antitrust Act. The defendants failed to deny any activities of colluding to fix prices or intimidation tactics to limit competition. SEUA simply demurred (a demurrer does not dispute the facts, just objects on the grounds that there is not sufficient cause of action) with the intention of getting away with these activities.

The insurance industry claimed that fire insurance was not included as interstate commerce according to the commerce clause of the Constitution and therefore could not be prosecuted under the Sherman Antitrust Act of 1890. *Paul v. Virginia*, 75 U.S. 168 (1869) had established this precedent. The rationale in the *Paul* case maintained that insurance policies were not commodities that were transported, bartered, or traded from state to state. They did not represent a tangible commodity that could be taken to market. On the contrary, insurance policies were intangible, personal contracts. The parties involved may live in different states, but when any actual transaction took place, it was as a contract within a local setting subject to state laws. The defendants obtained a judgment sustaining the demurrer. Under the Criminal Appeals Act, the federal government appealed this case to the Supreme Court.

On January 11, 1944, the Supreme Court heard the case. There were two alleged conspiracies. First, the fixing and maintaining of arbitrary and noncompetitive premium rates on fire and other allied lines (allied lines include sprinkler leakage, explosion, tornado, riot, and civil commotion coverage, as well as water damage, etc., which are usually purchased together with fire protection) within several of the southern states (Alabama, Florida, Georgia, North Carolina, South Carolina, and Virginia). The second alleged conspiracy involved monopolizing trade and commerce in the same lines of insurance in and among the same states, since SEUA had orchestrated the actions. Tactics included boycotts and other types of intimidation and coercion. SEUA did not argue otherwise.

It was the majority opinion of the Supreme Court in *United States v. South-Eastern Underwriters Association* that insurance was commerce. Justice Black referred to Chief Justice Marshall's definition of commerce in *Gibbons v. Odgen* (1824). This definition included more than just traffic and trade of goods. Chief Justice Marshall employed a comprehensive definition that it had to be such, otherwise Congress may lack the power necessary to discharge its constitutional duty to govern interstate commerce. The Constitution did not have to name every industry in its text to include it in its intent. The transmission of an electronic impulse over a telegraph line between two states was considered commerce and subject to vital federal regulation (*Pensacola Telegraph Co. v. Western Union Telegraph Co.*, 1877). Furthermore, it held that insurance, even though it might transpire locally, did in fact happen over state lines and therefore functioned as interstate commerce, making it subject to federal regulation and statutes. The dissenting opinion argued that this was an issue more appropriately regulated by state law. Chief Justice Stone and Justice Jackson, in their separate dissenting opinions, expressed their desire to use judicial restraint.

In March 1945, following the ruling on *United States v. South-Eastern Underwriters Association*, Congress passed the McCarran-Ferguson Act, addressing where and when it was appropriate and applicable to have state regulation and taxation versus federal regulation with regard to the insurance industry.

UTILITY, EXPERIENCED

Experienced utility is the moment-to-moment experience of life as it is being lived. The concept has become popularized by the work of Nobel laureate psychologist Daniel Kahneman, who draws the distinction in the psychological literature between experienced utility and decision utility, sometimes referred to as remembered utility. Experienced utility is closely aligned with Francis Edgeworth's (1845–1926) concept of the "hedonimeter," where each moment-to-moment experience of pleasure is able to be evaluated and displayed on a fictional instrument (Edgeworth 1881, 101). Edgeworth—inspired by the psychophysics of his day—suggested that the sum happiness of an episode could be measured by the area under the curve between two periods as captured by the ebbs and flows of a hedonimeter in much the same way physiological recordings display peaks and troughs of bodily activity. Decision utility, by contrast, is concerned with the rational assessment of choices. Kahneman suggests that decision theorists and economists apply decision utility as a way of conceptualizing "wantability," a term originally coined by Irving Fisher (1867–1947) (Fisher 1918, 336).

Remembered utility has been shown to be a poor representation of actual experienced utility. In an influential investigation on the differences between these concepts—known as "the cold hand experiment"—researchers conducted two trials in which participants were asked to immerse one hand in painfully cold water. The first trial lasted for 60 seconds; the second trial was identical to the first except that it was extended by a further 30 seconds, during which the water was gradually warmed by one degree—still painfully cold but slightly less so than during the first episode. When given the choice of which trial to repeat, 69 percent of participants said they would prefer to repeat the second trial, despite this experience involving a longer exposure to pain than in the shorter trial. What this experiment and many others like it show is the influence of a cognitive bias called the *peak-end rule* on decision utility when applied to remembered experience. Because the longer immersion trial was less painful at its conclusion it was remembered more favorably, causing more participants to prefer to repeat that experience than the shorter, more rational choice. Experienced utility as life is actually lived is not always how it is represented during decision-making.

Global assessments of experienced utility—such as traditional measures of life satisfaction—have also been shown to be sensitive to local effects of mood and circumstance. For example, in one experiment participants' life satisfaction ratings were shown to be positively influenced by finding a dime on a photocopier that was planted there by an experimenter. In another experiment, researchers asked participants the number of dates they had been on in the previous month, a measure otherwise unrelated to life satisfaction, before they asked about life satisfaction—a technique known as *priming*. When they did this, the two answers were found to be highly correlated.

In order to measure experienced utility, researchers have increasingly turned to techniques that resemble Edgeworth's hedonimeter. In the experience sampling methodology (ESM), participants are frequently prompted, often via an electronic beeper or cellular phone, to report their momentary experience. This technique is credited to psychologist Mihaly Csikszentmihalyi (1934–), and it has the advantage of providing high *ecological validity*, meaning that the findings are based on real-world responses that can be generalized.

Another technique called the day reconstruction method (DRM) asks participants to systematically break down their previous day into episodes, which are then rated on areas of interest. These techniques, including conventional daily diary studies, attempt to measure more directly experienced rather than remembered utility to avoid the biases and distortions that relying on decision utility and memory typically produce.

UTILITY, REMEMBERED

Remembered utility describes the pleasure, happiness, sorrow, or pain that people associate with a past event or episode. A distinction is often made between remembered utility and experienced utility. The distinction derives from the well-established finding that remembered and experienced utility do not correspond particularly well. There are situations under which the remembered utility of event A is higher than that of event B, even though taken over the duration of the events the experienced utility of event B was higher.

Most research on remembered utility has focused on relatively brief events, for example the painfulness of a medical intervention or the pleasantness of a task or a film clip, in part because the quality of brief events is much easier to manipulate experimentally. The usual method of research has been to obtain some moment-to-moment record of experienced utility during the event and then to see how the overall remembered utility depends on these records. It has been consistently found that the duration of the event is unimportant, and for many brief experiences the overall evaluation is quite well predicted from its peak and end moments. This phenomenon is known as the peak-end rule. Other factors, for example, whether the experience increases or decreases in pleasantness over its course, can also be important. An important general finding is that only a few moments or features of the experience contribute to the overall evaluations and that remembered utility is reconstructed from this small number of components. For example, an observer may have actually found watching waves on a beach more pleasant than watching a puppy playing with a flower but the latter may be remembered as pleasanter because the idea is more appealing.

Although the factors that affect remembered utility are easier to investigate with brief events, it is more important to investigate their influence with longer events. What makes people remember a long episode of their life, for example, a marriage, a particular job, or indeed their lives to date, as enjoyable or satisfying? One would not expect simple formulae such as the peak-end rule to apply so well to such events, in part because longer experiences vary so much more in experienced pleasantness, and indeed the research done with longer events bears out this expectation. However, for longer events too, it has been found that remembered utility does not depend much on duration, does not always correspond with experienced utility, and can often be well predicted from a small sample of the original experience. It is well known in the autobiographical memory field that few details of past events can be recalled or even recognized, and a large part of our memory for such events is reconstructed. The limited research on the remembered utility of longer events is consistent with the autobiographical memory findings.

It is clear that remembered and experienced utility are different. Which of the two is more important for how one conducts one's life does not seem readily answerable. But there are important question that can be addressed, such as which of the two is more important for how people choose to behave in the future. The presumption may be that remembered utility is more causally significant, but arguments could be mounted on the other side. Also important is the extent to which remembered events are products of context, the circumstances of recall, and the quality of remembered events. Such questions make it clear that there is still much to learn about how we remember utility.

V

VEBLEN, THORSTEIN

Born: July 30, 1857, in Cato, Wisconsin; Died: August 3, 1929, in Menlo Park, California; Nationality: American; Professional Interests: evolutionary and institutional economics; Major Works: *The Theory of the Leisure Class: An Economic Study of Institutions* (1899), *The Theory of Business Enterprise* (1904).

Thorstein Veblen was best known for his theories on conspicuous consumption in the area of evolutionary economics and sociology. He believed that technological advances were the driving forces behind cultural change but refused to automatically connect change with progress. His most famous work was *The Theory of the Leisure Class* (1889). Veblen died in 1929.

Thorstein Bunde Veblen was born on July 30, 1857, in Cato, Wisconsin. He grew up in a small Norwegian community of central Wisconsin speaking very little English. Veblen began his formal higher education at Carleton College Academy, completing his undergraduate degree at Johns Hopkins University. Veblen earned his PhD from Yale University in 1884. While at Yale, Veblen was greatly influenced by Charles Darwin. During his graduate work he rejected the views of John Bates Clark, a neoclassical, and William Graham Sumner, founder of the pragmatist school of philosophy. Veblen's interest in Darwin was the springboard for his later interest and study in economics as an evolutionary science. Unable to find work after graduating from Yale, he returned to the family farm. Six years later he entered Cornell University to study economics.

Thorstein Veblen began his professional career with an appointment to the University of Chicago, where he also edited the *Journal of Political Economy*. In 1906, Veblen left the University of Chicago for Stanford University. This began a series of professional moves for Veblen, moves often initiated for personal reasons or because of relationship issues with colleagues. Veblen's credibility was often negatively influenced by a somewhat tumultuous personal life.

It is often thought that major contributors to a discipline are necessarily lifelong academics. This was not the case with Veblen, who evolved from sociologist to economist. Veblen's most prominent work was *The Theory of the Leisure Class* (1899). In it, he first offered two new theories both contrary to the capitalist thinking of the day. First, he countered the prominent premise of private property of the period with his own idea that ownership brought excessive consumption beyond meeting basic economic wants. This excessive consumption Veblen named *pecuniary emulation*. He went on to claim that pecuniary emulation would eventually spread from a personal issue to an issue for an entire economic system.

From his idea of pecuniary emulation, Veblen broadened his theory to his second major contribution to economic thought. Due to pecuniary emulation, he theorized that people sought excessive wealth beyond satisfying their basic economic wants because they liked the social prestige it gained them. One's ownership of the large estate, the fancy carriage, and the expensive suit, according to Veblen, were used as symbolic of one's wealth. It was Veblen who identified this consumption pattern as the theory of conspicuous consumption. With *The Theory of the Leisure Class*, Veblen and his ideas of pecuniary emulation and conspicuous consumption became conceptual models in historical, sociological, and economic disciplines.

It was quite clear through his writings that Veblen did not accept the economic theory of his day. He did not support the marginalist solutions or proposed economic cures for the capitalist economy. Veblen believed the orthodox economic theories of his day were incorrect in their approaches by addressing the economy's ills directly. Through his sociological background, Veblen submitted that it was the culture and society that needed to be fixed, which in turn would solve the ills of the economy. To achieve this result, Veblen favored a complete restructuring of the capitalistic economy, not just reforming it, which could be accomplished only with extensive government exploitation through a socialistic economic system.

To call Veblen unconventional would be a gross understatement. As sociologist Alan Wolfe writes, Veblen "skillfully . . . wrote a book that will be read so long as the rich are different from the rest of us; which, if the future is anything like the past, they always will be."

Thorstein Veblen died on August 3, 1929, in Menlo Park, California, at the age of 72.

VENTURE CAPITAL

Venture capital is an alternative form of funding for organizations. Instead of being publicly traded through an initial public offering (IPO) and subsequent secondary trade on the stock market, some firms may opt for funding from a venture capital firm. A venture capital firm is a private equity organization that raises money from a small number of high-wealth investors. Venture capital fills a need for investment in unproven, new companies that cannot secure funding from traditional methods like commercial bank loans or public trading. The first venture capital firm, called American Research & Development, came into existence in 1946. In the 1950s and 1960s, venture capital helped in the development of real estate and the oil industry. Now, venture capital is highly influential in the technology industry. Many start-ups fail; therefore, venture capital is an extremely high-risk, high-reward type of investing.

Venture capital firms typically operate by gaining capital commitments from pension funds, corporations, and wealthy individuals. A typical investment for a partner is relatively high, out of reach for the normal investor. Venture capital investments are long term and may not see returns for a number of years. Generally, an investor may hope to see returns on investment in the 7- to 10-year range. Venture capital firms will normally pool funds together to invest in a number of ventures, since success by a small number of these investments can prove very profitable for the venture firm and its partners. Generally, venture funds are specialized in a particular market segment, either by industry or even geographical location. A venture capital firm can be active in the invested company's development. The experience and knowledge gained from the market can be used to help avoid common mistakes made by start-ups.

There are three types of venture investing: seed, early stage, and later stage. Around 60 percent of venture capital goes toward seed investments, which represents investing in an organization before it has an established product or even company. Conversely, later-stage investing is more focused on growing an established company in the final stages of development into an organization that can transition into public financing. If a company has an initial public offering or is purchased through mergers and acquisitions with another organization, the venture capital process ends. Once an organization "goes public," the venture capitalist gains a portion of the profits from the public offering and frequently receives stock options in the organization. If an organization is purchased by another organization, the partners in the venture will gain a portion of the profits.

Most start-ups are not successful. It is estimated that 30 to 40 percent of high-potential U.S. start-ups fail to the extent of liquidating assets and losing investment funds. An even larger amount, between 75 and 95 percent, fail to reach targeted returns on investment. Therefore, the right combination of organization and venture capital firm can be key in increasing chances of success.

A venture capital firm can be attractive as financing for a number of reasons. Many venture capitalists write in conditions where they sit on the board of directors of the given investment, allowing them to actively guide, advise, and connect the organization to necessary business resources. This business acumen and active investment can represent a broader perspective on what it will take for the start-up to succeed. They may combine multiple complementary ventures into one organization to increase chances of success. A venture fund may also wish to instill controlled dispersion of financing in order to guide the organization through growth phases; this provides protection for the given investment and also incentivizes certain growth initiatives. Some notable venture firms include newer market entrants Andreessen Horowitz and Google Ventures, who have funded projects such as Uber, Facebook, Airbnb, and Twitter. Other established firms such as Kleiner Perkins Caufield & Byers and Sequoia Capital have invested in PayPal, Google, Instagram, Amazon, and Snapchat.

One of the recent developments in venture funding was the creation of crowdsourcing. Crowdsourcing is where a large number of public investors can commit money to help develop an organization. However, the advantage of venture capital is that it frequently comes with years of business experience and advice. Furthermore, having a few active, knowledgeable investors can often make the difference in successfully incubating a new firm. Recent trends in the venture capital environment have also seen the number of venture capital firms continue to rise. Previous successes and increased social media attention have made start-ups more visible than ever. As a result, competition over who gets to fund these ventures has greatly increased in recent years. Furthermore, there has been expansion in the amount of corporate investments in start-ups with an eye to future collaborations or partnerships. This represents a change from previous venture investments coming mainly from pension funds and before that wealthy individuals (Calhoun 2016). Many of the major venture firms are looking for larger commitments in terms of capital from both investors and in what the organization will require in funds. This leaves room for smaller start-ups and their needs for private financing from either individuals, crowdsourcing, or emerging venture firms.

W

WALRAS, LEON

Born: December 16, 1834, in Evreux, France; Died: January 5, 1910, in Claren, Switzerland; Nationality: French; Professional Interests: equilibrium theory, quantitative economics; Major Work: *Elements of Pure Economics* (1874, 1877).

Leon Walras greatly contributed to economic thought by introducing what we call today general equilibrium theory. Walras explained how the economy fits together with many goods using mathematical modeling. His seminal work was published in 1874 and 1877: *Elements of Pure Economics*. He is also credited as one of the founders of the "marginal revolution," developing the idea of marginal utility and the Lausanne School of economics. Walras died in 1910.

Marie-Esprit-Leon Walras (pronounced Valrasse) was born on December 16, 1834, in Evreux, France. His father, Auguste Walras, was a proto-marginalist economist and schoolteacher who encouraged his son to study mathematics. Walras was heavily influenced by his father's socialist views regarding taxation and land reform. The senior Walras particularly influenced his son regarding the application of mathematics to economics. Augustin Cournot, a friend of Walras's father, also influenced the young Walras.

As a young man, Walras was enrolled in the Paris School of Mines to study engineering. Not content with engineering, Walras worked in banking and journalism. He was a published romance novelist and a railway clerk. However, when Walras finally turned to economics, he experienced professional pleasures he had never before felt from his previous endeavors. He had found his professional calling. In 1870, Leon Walras was appointed to the Academy of Lausanne in Switzerland. This was his first and only academic appointment.

The dominant economic thinking of the time was centered in Great Britain and published works in English. Walras's work *Elements of Pure Economics* (in French), published in 1874 and 1877, was largely ignored because he wrote in French and was in Switzerland at the Academy of Lausanne training lawyers. He founded the Lausanne School of economics with the help and support of Vilfredo Pareto.

In what we call today general equilibrium theory, Walras devised a mathematical model using simultaneous equations to describe an entire economy. He attempted to show how an entire economy fits together, leading to equilibrium. In his model there was an equation for each unknown leading to an equilibrium price and quantity for each commodity. Through his system of equations, a unique price and quantity was hypothesized (determined) for each good in the economy.

Although he was not successful in showing how the economy fit together, he is considered the founder of general equilibrium theory. The system of equations developed by Walras led to the idea that if all the markets of an economic system are in equilibrium, the economic system as a whole must be in equilibrium.

Walras made a major contribution to the concept of marginal utility. Marginal utility is the study of the change in consumer satisfaction that results from adding (or subtracting) one more unit of a good or service. Marginal analysis is also used to determine the results of adding (or subtracting) one more unit of a productive resource (land, labor, or capital) in the production process. Walras's study of marginal utility came three years after William Stanley Jevons and Carl Menger described the same theory. Walras had developed the idea of marginal utility in complete isolation while in Switzerland. Yet along with Jevons and Menger, today he is considered one of the pioneers of the marginal economic way of thinking.

Walras retired in 1892, at the age of 58, very disillusioned by the neglect of his work. Walras's legacy to the world is the transformation of economics to a mathematical-based discipline from its literacy roots. He explained how all markets are interrelated and that relationships between variables (e.g., commodities) can be described and analyzed mathematically.

Later in Walras's life, with his health failing, he attempted to enlarge on his writings in *Elements*. In 1896, he wrote *Social Economics* and *Studies in Applied Economics*. Walras himself considered these along with *Elements* as one integrated series devoted to his general equilibrium theory models. However, the academic world of economists rejected his final two works as substandard. Some economists even regarded them as a political statement for socialism.

Joseph Schumpeter hailed Leon Walras as one of the greatest of all economists for his equations in *Elements*. Walras has been claimed to be the third-most-read 19th-century economist, behind David Ricardo and Karl Marx.

Leon Walras died on January 5, 1910, in Claren, Switzerland, having spent his last years living with loneliness and dementia.

WATER CONSERVATION

Water conservation has subjective meanings: some define it as an unmitigated good—that is, a reduction in water loss, waste, or use. Others define it as a reduction in measured water use, which may, if forced, actually reduce utility. A third group will note that measured water conservation in one place may increase water use on an unmeasured margin; for example, the conserved yield from lining an earth canal may be used to irrigate golf courses when it formerly recharged aquifers. Regardless of the definition, water conservation can be encouraged with price or nonprice instruments. Price increases reduce quantity demanded; nonprice instruments can shift the demand curve.

Water prices are more often directed at cost recovery than water conservation. They vary with location and use. A farmer pays one price to receive water from an irrigation ditch; a family pays a different price to receive drinking water at its tap; an organization might pay a variety of prices to buy water that is then left to flow in-stream for environmental purposes. Prices may be found in an auction, determined by the average cost of utility service, or set through an administrative procedure. An increase in price often results in a reduction in quantity demanded, but the elasticity of this response varies with the price level, use of water, availability of substitutes, and incidence of water prices (i.e., who actually bears their burden). Incidence results from political or regulatory decisions to use block prices, social tariffs, sectorial cross-subsidies, regulatory exemptions, and other adjustments. These adjustments target particular goals, but they also distort consumption decisions and conservation investments.

Suppose for simplicity that it costs $1 to receive one cubic meter of drinking water (265 gallons), a number that is close to $3 per ccf (hundred cubic feet of water, or 748 gallons). Wholesale water buyers usually pay far less for water (e.g., $100 for 1 million liters, or 0.81 acre foot) because the water is neither suitable for drinking nor typically pressurized for 24/7 delivery through a distribution system.

A 20 percent price increase, from $1.00 to $1.20 per cubic meter, may be too low for retail users to notice. The same percentage increase may produce a noticeable response from a farmer who can pump his own groundwater or no response from a farmer who needs water to finish his crop.

These responses can be attributed to sliding up a demand curve to a point of lower quantity demanded. A direct increase in water conservation (a decrease in water consumption) results from shifting the demand curve inward. Shifts occur, all else being equal, from changes in income, technology, or taste. Most of these are beyond the control of the utility. Higher income increases direct and indirect water demand via respective increases in irrigated landscaping or meat consumption; environmental awareness reduces demand by lowering consumption of all resources. Utilities can encourage inward shifts by subsidizing replacement of water-intensive appliances or landscaping; "education" on the value of water can lead people to shut off faucets while brushing their teeth. Utilities can reinforce changes in taste by ensuring that water prices are high enough to remind consumers of its scarcity. Note that the net conservation impact of each response is affected by offsetting forces. A low-flush toilet may take two flushes to clear the toilet bowl. Low-flow showerheads may lead people to shower more to remove soap or merely enjoy their virtue. Others may wash their car more often. These responses will not be easy to predict in cases where people lack a water meter or do not receive feedback on their water use very often, due to our psychological tendency to put more weight on virtuous acts and less weight on vices.

Water meters, in fact, improve water conservation by making volumetric pricing relevant (nonzero price elasticity) and triggering a behavioral response to measurement of use. Smart water meters that deliver consumption data on short intervals inside one's house strengthen this response by increasing the frequency with which price signals are received and behavior is noted. They also make it easier to spot leaks and change prices in response to surges or drops in demand.

It is possible to promote water conservation without meters by mandating the installation of high-efficiency appliances, banning outdoor watering, or educating people to use less, but these command-and-control methods are less efficient than meters. A higher price for metered water will reduce use; a mandated low-flow showerhead in the guest bathroom does little. That said, meters might not be efficient where the opportunity cost of water use or price of water is low relative to the cost of installing meters. In those circumstances, it makes sense to ignore water use or rely on nonprice mechanisms, respectively. A master meter on a multifamily building and some neighborly coercion may be more efficient than meters on each apartment.

Rebound effects can be even stronger with wholesale or bulk water consumption. Farmers who install drip irrigation systems often divert conserved water to other crops or other land parcels (Ward and Pulido-Velazquez 2008). Such diversions must be put into the proper context. For example, dividing off-stream use into consumed water, nonconsumed recoverable water, and nonconsumed, nonrecoverable water will clarify that consumed water reductions may be beneficial while reductions in recoverable water that reduce return flows thereby impairing the rights of downstream users may not be. Meters that reduce diversions at the trunk canal give farmers an incentive to minimize or eliminate tailwater flows that previously percolated into groundwater or flowed downstream to neighbors and ecosystems. Meters or higher prices for thermoelectric or industrial users can make it cost-effective to invest in recirculating cooling systems or closed-loop processes.

These investments may not be socially efficient if they are exceptions to an otherwise lax attitude to conservation (in a service area or watershed where industry shares water with urban and agricultural users) for two reasons. First, conservation investments may conserve water at a high cost per unit. Second, investments may crowd out or distort substitutions to or from labor, energy, capital, and other resources.

People often want examples of successes and failures in water conservation. Las Vegas is a notable failure, not because of its program to subsidize lawn removal (and thus reduce water used for outdoor irrigation), but because it charges one of the lowest prices for water in the western United States (about $0.30 per cubic meter) at the same time as the threat of imminent water shortage is used as a justification to spend $800 million to bore a deeper third straw intake into Lake

Mead. For examples of successes, consider how Australians dramatically reduced their water consumption mostly through demand reduction in the middle of their 10-year drought, or how water managers in Santa Barbara used a combination of very steep prices and public awareness to reduce demand by 50 percent in the middle of their 1987–1991 drought; demand returned to 60 percent of predrought levels when water supplies returned and prices were reduced.

WELFARE AND EQUITY

Welfare in economics means either the well-being of individuals or the aggregation of individual welfare into the well-being of society. One of the great philosophical questions, and a question of everyday political importance, is whether a society's welfare will be improved following a reallocation of resources. This question appears regularly: Is society better off by switching energy production methods; by educating more people; by putting more criminals in jail? The question can also be asked in hindsight (retrospectively): Were we made better off by an action? Economics has reached a carefully qualified answer in theory and applies practical methods that are severely limited versions of that theory through benefit-cost analysis. It is the problem of a bridge between welfare and a sense of fairness or equity, which is unresolved by more exactly answering the question of social welfare.

What economists call efficiency is maximizing the welfare of society when it is assumed that such welfare depends on the sum (a very specific form of aggregation) of the welfare of individuals who only care about themselves. Society views each of these individuals as equally important. Economists further assume that each person receives the same additional welfare from added income. The result is that applied welfare analysis, called benefit-cost analysis, generally adds benefits or subtracts costs from affected individuals regardless of their position or characteristics within the society, especially, but not limited to, their income status.

While the default social welfare analysis based on the earlier assumptions is transparent to those knowledgeable of these assumptions, it may give undue credence to a result said to be efficient when these assumptions are not generally viewed as being globally accepted. In addition, the well-known Arrow impossibility theorem establishes that an aggregate social welfare function cannot exist without violating seemingly reasonable criteria.

These assumptions may not be so burdensome if perfectly competitive markets are universal. Generations of economists have learned the first welfare theorem of economics, that a society with perfectly competitive markets will achieve an efficient social outcome. However, the confounding (and somewhat more restrictive) second welfare theorem of economics states that a completely different but still efficient market outcome can result if there is a change in the distribution of income. Thus efficiency, the well-being of a society, is not uniquely determined without consideration of the distribution of income.

The many sources of market failure, such as externalities, imperfect competition, and incomplete markets with uncertainty, removes the presumption that even a market-based society begins at an efficient point. Further, it would be convenient if policy proposals were of the win-win type; in this case, it is clear that society would be better off taking the action (called a Pareto improvement in honor of Vilfredo Pareto, the economist who first formalized the criterion). The problem results when virtually all changes involve both some winners and losers. If the winners fully compensated the losers, then the win-lose problem is changed into a win-win problem. In the absence of such compensation, a potential for compensation may exist, but uncompensated outcomes with both winners and losers may not qualify as a clear improvement.

The default approach taken in benefit-cost analysis is termed the (Kaldor-Hicks) potential compensation criteria. In effect, analysts state that society's welfare is improved if the winners could potentially compensate the losers, although such compensation is not required. Hence a policy that benefits the rich at the expense of the poor could be assessed as efficient.

If social welfare is assessed using a transparent but likely incorrect set of assumptions, assuming equal social welfare and equal marginal utility of income across individuals, how can equity concerns be integrated into applied welfare analysis? Several supplemental analyses to basic welfare analysis have been advanced, and new approaches are being investigated.

A supplemental analysis can be done for a subgroup of concern. The subgroup might be disadvantaged youths receiving training in an employment program, those people below some income level, a minority, the government, or the residents of a smaller area such as a state or locality. Analysis can reveal whether the identified subgroup appears to gain or lose from an action, and a decision-maker can choose whether or how to take such a result into consideration regarding a project. Further, legal constraints or policies may suggest that some group should not be made worse off as the result of a policy action. A subjective, but explicit, weighting can be applied to the gains or losses of identified subgroups. The most common application is to weight gains or losses received by different income groups according to assumptions about the incremental utility (satisfaction) from income.

The U.S. Census Bureau reports poverty information by weighting information using such Atkinson weights, which imply a ratio, such as 2:1 or 4:1, between those in low- or high-income groups. The World Bank and the U.K. government have supported weighting approaches at various times. Alternative weighting approaches such as those based on relative marginal tax rates, relative income, or more complex measures such as the Lorenz curve have been suggested. New analysis is pursuing the concept that equity is a value some individuals place on the well-being of others, which should not be treated any differently than other values included in a welfare analysis. There are theoretical complications as to whether double counting may occur when preferences are of a particular form, but survey research is beginning to investigate and quantify the monetary value people place on the well-being of others. General equilibrium or multimarket analysis, as has been carried out in regard to allocating the legal right to emit pollution, has also indicated a fairly direct trade-off between efficiency and equity when property rights are being allocated.

Few topics divide analysts as much as does the debate about the separation of efficiency and equity, the equity assumptions of benefit-cost analysis, and methods to integrate equity into an analysis.

WEST COAST HOTEL CO. V. PARRISH

The Great Depression set the stage for the *West Coast Hotel Co. v. Parrish*, 300 U.S. 379 (1937), case in 1937. The specific circumstances of the case involve the constitutionality of minimum wage laws. The case served as an early example of a shift in thought regarding the role of government in the economy from the traditional laissez faire (an economic environment where transactions are free from government intervention) to more active participation (e.g., Roosevelt's New Deal legislation).

In a broader social view, this case was about women as socioeconomically disadvantaged workers; the responsibility of businesses to adhere to wages that allow people to meet basic living demands; the extent to which the U.S. Constitution guarantees individuals freedom of contract (the liberty to contract with another without government restrictions); and the appearance of political manipulation of the Supreme Court by the president to realign review powers safeguarding New Deal policies.

Case Summary

The West Coast Hotel Company owned the Cascadian Hotel in Wenatchee, Washington, where Elsie Parrish and her husband were employed in 1933. Elsie Parrish was paid a weekly wage of $12 for 48 hours of cleaning hotel rooms. A couple of decades earlier, in 1913, the state of Washington had passed an act establishing working standards for businesses hiring women and minors. The particular vulnerability of women to be potentially exploited by employers was deemed by the Washington State Legislature as meriting legal protection.

The 1913 act established the state-based Industrial Welfare Commission to set minimum standards for working conditions, hours, and wages. A minimum wage of $14.50 for 48 hours of work was stipulated in the law. Washington was not the only state to pass such legislation. New York, Washington, D.C., and others had also passed similar minimum wage standards for women. Elsie Parrish requested compensation in the amount of $216.96. This accrued amount was the difference in wages actually paid to her and what should have been paid to her during her employment from 1933 to 1935, according to the state minimum wage statutes.

The West Coast Hotel Company did not adhere to these state standards on the grounds that the standards infringed upon its freedom of contract as an employer and were oppressive to its business operations. Elsie Parrish sued the West Coast Hotel Company in Washington's Chelan County Superior Court. Judge Parr heard the case and ruled in favor of the respondent, West Coast Hotel. The court held that minimum wage legislation for women was an unconstitutional infringement on the freedom of contract, as protected by the due process clause of the Fifth Amendment to the U.S. Constitution, which limits the power of the federal government. The judge stated that the Supreme Court's ruling in *Adkins v. Children's Hospital* (1923) had established that minimum wage laws for women were unconstitutional. The *Adkins* case involved a Washington, D.C., statute regarding minimum wage for women and was, according to Judge Parr, appropriate to this case as well. Elsie Parrish appealed her case to the Washington State Supreme Court, which upheld the legislature's statute supporting minimum wage for women and declared that *Adkins* was not applicable in the case of Washington's law. West Coast Hotel Company appealed its case to the U.S. Supreme Court and in 1936 was granted certiorari (a writ to the lower court to send the case for review). The question for the Supreme Court was whether or not to overrule *Adkins*.

The following events happened to coincide with these legal proceedings and should be noted due to the contribution they made to the lasting significance of this case. In November 1936, Franklin Roosevelt was reelected president. Roosevelt's New Deal policy continued, though several programs were struck down by the Supreme Court as unconstitutional. Subsequently, President Roosevelt submitted to Congress a proposal for legislation to add one federal judge for every federal judge over the age of 70, which would allow the president to add six justices of his political ideology to the Supreme Court. This would change the composition of the Supreme Court from 9 justices to 15, gaining a majority of New Deal like-mindedness on the Court. This proposal was announced on December 19, 1936. Of the nine justices on the Supreme Court who heard this case, four were over 70 years old and voted against President Roosevelt's New Deal policies (Justices Sutherland, Van Devanter, Butler, and McReynolds). In addition, Justice Owen Roberts voted with these four conservative justices, constituting a conservative majority that determined much of President Roosevelt's New Deal legislation unconstitutional.

The Supreme Court heard the arguments in *West Coast Hotel Co. v. Parrish* on December 16, 1936, and announced the opinion of the Court in March 1937. Justice Roberts, who prior to this case voted in favor of *Adkins*, changed his vote to the opposite opinion, leaving the four older justices in the dissenting opinion. The dissenting opinion affirmed the *Adkins* case, using the argument that freedom of contract made minimum wage laws unconstitutional. The majority opinion was written by Chief Justice Hughes, who included the current conditions of the economy as a reason to revisit *Adkins*. Thus he gave insight into the capacity of the Constitution to adapt to changing times, which was a clear indication of a change in judicial philosophy. In addition, the majority argued that minimum wage laws for women were not arbitrary, due to the fact that denial of a living wage cast a direct burden for their support on the community and harmed the general welfare. The Court also distinguished the fact that the Constitution did not speak of freedom of contract; rather, it spoke of freedom only in the context of liberty, which is not absolute and uncontrollable. Within the context of a society, liberty is safeguarded, but these limitations to individual liberty are what allow a government to enact laws to protect the general welfare. The Court also noted that due to practical realities, employers and employees did not share equal freedom in negotiating contracts.

The Supreme Court overruled the *Adkins* case and the judgment of the Supreme Court of the state of Washington was affirmed. This case had enduring significance in that it gave a green light to states to pass minimum wage laws. Furthermore, it opened the floodgates to other New Deal legislation. Two weeks later, the Supreme Court upheld the National Labor Relations Act of 1935 (Wagner Act), and six weeks later, the Social Security Act, which gave the appearance of a simultaneous change of judicial ideology coinciding with Roosevelt's plan to add six federal judges to the Supreme Court who agreed with his New Deal philosophy.

Whether or not President Roosevelt's idea to stack the court with judges who favored his New Deal politics affected the decision of Justice Roberts is unclear. After the *West Coast Hotel Co. v. Parrish* decision, President Roosevelt's plan to add federal judges lost steam. However, Roosevelt encouraged the justices who were 70 years old and older to take advantage of the Judiciary Act of 1869, where Congress voted to fund pensions for retiring judges at their full salary. Whatever conclusions may be drawn from these coincidental events, the fact remains that after this case, there was a marked change in Supreme Court majority opinions from a conservative judicial philosophy to increased government regulation and participation in the economy and no increase in the number of judges on the Supreme Court.

WHALE OIL SHORTAGE: THE FIRST ENERGY CRISIS, 1850

From 1760 to 1860, whale oil was America's main energy source for lighting and lubrication. Its use started with the production of spermaceti candles in the 1750s, which were known for their superior lighting. Spermaceti is waxy oil found only in the heads of sperm whales. The clear white light produced by these candles would become the standard of light measurement in the unit known as a *lumen*. A lower-grade, less-expensive oil, known as *whale oil*, was made by boiling blubber from baleen and bowhead whales. Whale oil was the most popular in lamps for homes. It was also used to lubricate machines and make soap. Sperm whale blubber produced a higher grade of oil that found key applications in lighthouses, street lamps, and public buildings because of its stronger lighting characteristics. Sperm oil was also the superior lubricant.

By 1850, whale oil and sperm oil were necessities for a growing United States. In fact, the world had become dependent on whale oil for lighting and lubrication. The appetite for oil forced whalers to search the world's seas for more whales. As the searches extended, the price of whale oil went from $0.30 a half gallon in 1831 to $0.63 in 1843 to its peak of $1.92 a half gallon in 1854. The rising prices and concerns about shortages of whale oil created what many have called America's first energy crisis.

By the early 1800s, whaling had become one of America's largest industries. The industry was centered in New Bedford, Massachusetts. Of the more than 700 whaling ships around the world in 1840, about 400 considered New Bedford their home port. The Americans overtook the British in whaling by building ships that could manufacture oil while on the water versus bringing the blubber back to port.

An American whaling ship was a floating factory that caught whales and boiled blubber into oil. Whalebone was also harvested and modified to be used as springs and needles.

The better design and efficiency of American whalers had given them dominance in the world market by the 1840s. Whalers could produce 25 to 45 barrels of oil per whale depending on the type; sperm whales had the highest dollar yield. Just as whaling was in its golden years in the late 1840s, many doomsayers started to talk about whales being hunted to extinction. Such fears clearly added to the rapid rise in price. The cost of the oil was also increasing because whalers were literally spending years at sea to bring the precious oil to port. Demand was also increasing because of population growth, industrialization, and the growth of cities.

The rise in whale oil prices and fear of future supply shortages created a search for alternatives. Oil from lard, linseed oil, alcohol, and coal all entered the market but at higher prices. The prediction of whale extinctions would be proven wrong but helped fuel investment in alternative energy sources. In the 1850s, experiments in coal distillation produced cheaper oil but only in limited amounts. One source was rock oil, which seeped out of the ground in Pennsylvania and sold for $0.50 a half pint as a medicine for tuberculosis and other ailments. At the time it was known as Seneca oil because the local Seneca Indians had long used it as a medicine. Pennsylvania distillers experimented with the rock oil, producing a lighter oil called kerosene.

The double distillation process of producing kerosene became a matter of speculative investment, and many of the investors were from New England. The lighter oil (kerosene or "illuminating oil") could be used to replace whale oil in lamps. The discovery was very timely, as whale hunting could not keep up with the demand for whale oil. Even so, these early kerosene stills could only produce about three to four gallons a day. In 1854, Samuel Kier improved the distillation process by opening up a Pittsburgh refinery at Seventh and Grant Street, the present location of the United States Steel Building. The refinery was considered the first in the Western Hemisphere and had a capacity of six barrels a day. Kier had expanded capacity to 15 gallons a day by 1857. Illuminating oil sold for $1.50 a gallon (the equivalent of about $40 today) versus $2.50 a gallon for whale oil. One early and small investor, Andrew Carnegie, would make his first fortune in this Pittsburgh oil refinery.

Petroleum-based kerosene now had a price advantage over whale oil, but a day's production was about that of the oil from a single whale. Investors, however, lined up to invest in new petroleum technology. All the crude oil Samuel Kier was getting was as a by-product of salt mining. The market for lamp oil seemed limitless. Kier had created demand and incentive for profit, which spurred exploration and technology. The abundance of oil in the woods north of Pittsburgh was a well-known fact, but a method was needed to increase the volume of its production.

That method came from the drilling operation of Edwin Drake in Titusville, Pennsylvania, in 1857. This new source of crude oil was followed by improvements in refining technology. The first real commercial refinery with extensive condensing equipment and chemical treatment capabilities was built in 1861. Though the capacity was 250 barrels of oil a day, this still was only a small amount of the total lamp oil market. The price differential favored kerosene, but it would take another decade for kerosene to fully overtake whale oil.

The American whaling industry saw the handwriting on the wall and downsized quickly. The real reason for the decline of the whaling industry was the high cost of hunting whales, not the shortage of whales. The demand for whale oil continued; wealthier consumers preferred the brighter light of whale oil. It was still favored for many years as a lubricant and was even used by Henry Ford in Model T transmissions. Whale oil also found a niche as cooking oil.

WILDCAT BANKING

Wildcat banking, also known as free banking, was the practice of state-chartered banks operating without U.S. federal government oversight from 1836 to 1863. The defining characteristic of this period was the establishment of banks in remote places that were not readily accessible. This made it difficult for note holders to redeem their savings. These banks often issued notes without a federal bank and issued their own currencies without adequate security, which led to many cases in which note holders lost their savings.

The period of wildcat banking began when the federal charter for the Second National Bank of the United States was allowed to expire in 1836. In the absence of a national direction in banking, states began regulating banks themselves. This created a variety of standards for factors like minimum capital requirements to open and the process of opening banks. This continued until the National Bank Act of 1863 reestablished national banks, bringing some state-run banks under federal control.

Under state laws dictating the procedures and requirements for chartering banks after federal regulations expired in 1836, banks in less-regulated states opened with less bureaucratic oversight, including a lower minimum amount of capital and fewer restrictions on factors like location. This led many financiers to establish banks without sufficient levels of capital. To discourage redemption, these banks were often opened in places that were far away from population centers and difficult to access. Over almost three decades of free banking, many banks established under state regulation closed, often due to default.

This turnover caused great hardship for note holders. Note holders first had to contend with the unreasonable locations in which many banks opened. This made accessing savings much more difficult, decreasing frequency of withdrawal.

When savers did arrive to make withdrawals in states that facilitated free banking, the possibility of their bank having failed was much higher than under stable national rules. State regulations first adjusted factors like the reserve requirement, decreasing the amount of capital that banks had to maintain as they loaned out their clients' savings. Having less cash on hand at any time magnified the risk of being unable to fulfill savers' requests to withdraw their assets. This often led to "bank runs" in which economic scares would lead many people to try and withdraw their savings at the same time, often unsuccessfully. The banks made riskier investments than typically allowed under federal regulations. Thus, the risk of borrowers defaulting (being unable to return note holders' money to the banks) also increased.

Many banks failed, losing their clients' entire savings. Decades of such monetary uncertainty and bank failure led to pressure for the reestablishment of oversight. Finally, Congress passed the National Bank Act of 1863. This act established a single national currency to replace the multitude of state currencies and created some national banks. The next year, this act was superseded by the National Banking Act of 1864, further increasing national regulation of banks by removing all state control in banking. The second act removed states from the business of chartering banks altogether. Upon passage, it became the responsibility of only the federal government to issue bank charters. This standardized the regulations to establish new banks. To accelerate the implementation of these changes, over 1,500 state banks were converted to national banks, providing immediate stability to the nation's banking climate.

The era of free banking lasted through many turbulent times, including the beginning of the Civil War. The lack of consistency and deregulation of many banks during the era of free banking served to amplify the need for federal regulation. When decades of banking futility led Congress to act, the return to a national currency standard and the reestablishment of national banks helped resolve this instability. This served not only the interests of private savers but also of the U.S. government as it sought to finance and later recover from the Civil War. Ultimately, many tenets of the National Bank Acts of 1863 and 1864 have grown into today's banking laws, including the presence of national banks and federal control of currency production.

Y

YIELD CURVE AND ITS ROLE

The yield curve is a graph that plots time from shortest to longest maturity date on the horizontal axis and yield on the vertical axis. It is used to show the relationship between yield and maturity. In particular, the yield curve works best when different maturity dates are plotted for the same type of bond; this displays that the major difference in the securities is their maturity date. For example, a yield curve could plot maturities and the corresponding yields for treasury bonds, corporate bonds with high credit ratings, municipal bonds, or any other type of bond. Thus, by comparing the yield of bonds that are similar, but with different maturities, economists can generate a graph that shows how yields change as the maturity date lengthens.

Moreover, there are several different types of yield curves, all with different meanings. For example, a normal yield curve is upward sloping and shows that a bond with a longer maturity pays a higher yield than the same bond with a shorter maturity. This slope pattern tends to be the normal situation because generally speaking, individuals and institutions lend money for shorter rather than longer periods of time. The risk that the lender will need the funds, or the borrower will be unable to pay, increases with time. In other words, the longer the term of the loan or bond, the greater the chance of an unforeseen event happening. To compensate for the risk associated with lending money for longer periods of time, lenders generally demand a higher rate of interest.

Another type of yield curve is the steep yield curve. This curve signals that investors are expecting interest rates to rise in the future, thus they are going to demand a higher rate of return when buying longer-term bonds. If longer-term bonds did not pay a higher rate of interest in this situation, investors would simply buy shorter-term bonds with the expectation that when the bonds mature, they could obtain a higher return on the next purchase. Oftentimes, when the economy is coming out of a recession, future interest rate expectations will increase. This is due to the fact that during economic recoveries, corporations normally want to borrow more, which increases the demand for money, putting upward pressure on interest rates. This will result in a steep yield curve.

The third type of curve is the flat yield curve. This occurs when yields of all maturities are close to one another, or when inflation expectations have decreased to the point that investors are demanding no premium for borrowing for longer periods of time. When the yield curve moves from normal to flat, it is an indication that the economy will experience a slowdown.

Humped yield curves occur when short- and long-term rates are closer to each other than medium-term rates. This happens when there is either an increase in demand or a decrease in supply for longer-term bonds. For example, say there has been a larger increase in demand for 30-year treasury bonds than 20-year treasury bonds; this would result in the yield curve for treasuries forming a humped shape.

The final type of yield curve is an inverted yield curve, which occurs when longer-term rates are actually lower than short-term interest rates. This is a rare occurrence, but it is one of the surest signs of an economic slowdown on the horizon considering investors anticipate less future demand for money, resulting in lower interest rates.

YOUNGSTOWN SHEET & TUBE CO. V. SAWYER

In *Youngstown Sheet & Tube Co. v. Sawyer*, 343 U.S. 579 (1952), the executive branch of government, which is constitutionally charged with enforcing the law rather than making it, in effect made policy that tipped the scales in favor of government control of the means of production in the name of national security. The case addressed whether the president of the United States could, by executive order, essentially nationalize an industry in the name of national defense. The Supreme Court upheld the means of production as private property and the relationship between ownership and labor in a market economy.

In a capitalist system, private ownership of the factors of production is a foundational principle. In the case of *Youngstown Sheet & Tube Co. v. Sawyer*, the president of the United States seized operations of a private steel manufacturing company by executive order. For President Truman, the decision came on the heels of the Korean conflict and was essential to keep armaments necessary for national security in production. The police action in Korea was, at worst, a potential World War III, and at best a test of American resolve during the Cold War era. This case is commonly referred to as the Steel Seizure Case, and it begs the question of how much power the federal government has in a free-enterprise system.

In September 1950, Congress passed the Defense Production Act in response to the military involvement in Korea. This act authorized the president to, among other things, requisition property, impose wage and price controls, and settle wage disputes in the course of national defense. Congress did not declare the conflict in

Korea a war. President Truman engaged Secretary of Commerce Charles Sawyer to take authority over the steel industries to avoid a labor strike that, in the president's opinion, would delay production of steel vital to the defense effort. The Steelworkers Union, which was invited to speak at the trial as an *amicus curiae* (friend of the court), had submitted a wage proposal that was met by the steel industry with the demand for a commensurate increase in the price of steel. The president's Wage and Price Stabilization Commission feared the impact this would have on inflation and did not approve the price increase. The extent to which a market economy is free and the degree to which rules defining private property are secure is a matter of politics and public policy. The term *mixed economy* has been used to describe this balance between market forces and governmental power.

Case Summary

In a surprise move by Kim Il Sung in June of 1950, North Korea invaded South Korea. The United Nations voted to condemn this invasion and provide assistance to South Korea. On June 25, 1950, President Harry Truman sent U.S. troops to support the United Nations. There were no congressional measures or wartime controls in place to stabilize the economy at this time, and the nation was experiencing a post–World War II inflationary period. In September 1950, Congress passed the Defense of Production Act. This act had several parts, but in one major section, it authorized the president to requisition property, force industry to expand production, and impose wage and price controls.

The allocation of raw materials to national security was also a part of this legislation. Hence, President Truman created the Wage Stabilization Board in an effort to control prices and avoid inflation. This, however, did not work well with the steel industry. The United Steelworkers Union offered a wage increase that the steel industry rejected. The steel industry's request for higher prices to meet wage increases was rejected as well by the government's Wage Stabilization Board. In response, the union prepared to strike.

The Truman administration believed that this interruption of steel production would jeopardize the strength of the U.S. Navy and Air Force in the current police effort in South Korea and the domestic economy in general. Therefore, on April 8, 1952, he ordered Charles Sawyer, his secretary of commerce, to take possession of and operate most of the nation's steel mills. It was announced on television and radio. The lawyers for the steel industry filed an immediate restraining order (legal barrier to an action) with a U.S. district judge, and the hearing took place the following day.

The motion was denied, and the case was assigned to another district judge, who heard the steel companies' motion for a preliminary injunction (legal stop to an action) and asked the assistant attorney general where the president's authority to seize private property came from; the response was Article II of the Constitution and all the powers implied therein. The plaintiffs began with a persuasive summary of what the constitutional framers had outlined executive power to include and ended with the image of a president overreaching those intentions. An injunction was issued, and thereafter the steelworkers' union began its strike.

The government appealed immediately to a D.C. Circuit Court of Appeals. On April 30, the appellate court held in favor of the government, placing a stay on the action of the district court. Meanwhile the steel companies had already filed and were granted certiorari (request for a lower court to send the records of the case to a higher court) by the Supreme Court.

The case was heard on May 12, 1952. The government pointed to the long record of seizures of private property during wartime, from the Revolutionary War to Lincoln during the Civil War, Wilson during World War I, and Roosevelt during World War II. The steel industry argued that only Congress had the power to enact laws that allowed the seizure of private property. John W. Davis gave an extensive speech on behalf of the steel industry, saying that too much power in the hands of an executive is exactly what the framers wanted to safeguard against when they wrote Article II of the Constitution. Meanwhile, the solicitor general for the Truman administration concluded the respondent's argument by claiming that this was wartime and the president did have the power to seize the mills. Unfortunately, the justices responded with the statement that Congress had in fact not declared war. The Supreme Court heard additional statements from the steelworkers' union and railroad unions.

The court ruled in a surprising 6–3 vote in favor of the steel industry. Justice Black delivered the opinion of the court. He stated that Congress had been informed by the president of the danger a strike would pose on national defense yet chose to take no action, signaling that the legislative branch thought that action was not necessary. Indeed, no action was necessary, due to legislation already in place to handle such national crisis: the Defense Production Act. However, Justice Black continued, the government admitted that it did not meet the conditions necessary in this act for the president to take possession of private property. Justice Black added that the president's power as commander in chief of the armed forces also did not justify such a broad interpretation, whereby military authorities could settle a labor dispute using possession of private property. In conclusion, Justice Black stated that if previous presidents had acted in such a capacity without authority from Congress, it did not discount the fact that only Congress has the vested power to make all laws necessary and proper to carry out the functions of the government. The Supreme Court upheld the judgment of the district court.

Although Justice Black wrote the opinion of the court, each of the justices who voted in the majority wrote individual opinions. Justice Jackson's concurring opinion, frequently referenced by legal scholars, agrees with Justice Black but warns that presidents and judges alike cannot confuse the issue of a power's legitimacy with the grounds it is called upon to endorse, making policies that deal with wages or price stabilization and forgetting that the Constitution established the legislative powers to do just that. Five different concurring opinions contributed to future difficulty in interpreting executive power.

In his dissent, Chief Justice Vinson wrote for all three justices that were not in the majority. He stated that the power of future presidents to act in times of national crisis and military emergency was crucial, and therefore they could not agree with the majority, who in their numbers could agree on the ruling but not on the reasoning. As the last chief justice appointed by a Democratic president (Truman), Fred M. Vinson warned that extraordinary measures were needed when the nation was experiencing extraordinary times, as it was in 1952. In addition, he stated that when Congress approved Truman's defense budget, by funding the president's policies, it had given approval of them for all intents and purposes. To limit the president's power to statutes could endanger the nation and have global effects as well. In contrast, Justice Frankfurter speculated that history does more than teach us nothing; rather, in his concurring opinion he emphasizes the appropriate use of government's use of power within the necessary system of checks and balances. The *Youngstown* case was a check on executive power and a weight on the side of property rights.

Volume 3: Microeconomics

Preface

When I was in graduate school a professor described the subject of economics as the "clothesline of life." There were several meanings to his phrase. One, there are many ways to approach the world of economics. Two, economics is a living, breathing discipline we use to play out our lives every day. Economics is part art, part science, part history, and all human behavior. If one digs down into the subjects of life, one will find a component of economics in virtually every subject. Economics surrounds us daily. *Economics: The Definitive Encyclopedia from Theory to Practice* has been created in a way to make economics come alive. Within our four volumes, including the comprehensive glossary, document excerpts, and other appendices, *Economics: The Definitive Encyclopedia from Theory to Practice* explores all corners of economic history, the individuals who gave economics life, the economic events that have shaped our world, and the foundational concepts and ideas that make, define, and sculpt our economic world.

We began this project with several goals. Our first, and most important, was to assemble a comprehensive and varied collection of entries on economic history, personal finance, money and banking, environmental, and behavioral economics, to name a few of the subdisciplines that hang from the "economics clothesline." An extension of that first goal was to provide a comprehensive, readable, one-stop resource for the general reader as well as for students, teachers, and researchers of economics, personal finance, and entrepreneurship.

To do so required assembling a diverse collection of economics material. Contained within the four volumes of the *Definitive Encyclopedia* are the people who laid the groundwork for economics as a science, the historical events upon which economics grew, and the concepts and ideas on which they built their legacy. I strongly believe we have accomplished these goals.

Volume 1, Foundations of Economics, is the "economics clothesline." In Volume 1 we present the people, concepts, history, the events, and places and institutions on which economics is built. It includes basic economic concepts such as opportunity cost and marginal analysis. Also included are the business tycoons who shaped the early U.S. economy, such as Henry Ford and John D. Rockefeller. No book on foundations of economics would be complete without the economists who laid the groundwork for economics such as Adam Smith, John Maynard Keynes, and Friedrich Hayek. Not to be forgotten are the political leaders whose contributions to their respective economies during their lives is still with us today, including U.S. president Ronald Reagan, Great Britain's Margaret Thatcher, and the Soviet Union's Joseph Stalin.

Volume 2, Macroeconomics, is our big picture volume. As the title suggests, Volume 2 focuses on the institutions, people, events, and places that have shaped the roles and responsibilities of the economy as a whole—the macroeconomy. Volume 2 presents the different methods and ways in which economies are measured and also explores government's role in the economy. Macroeconomics is about the institutions that measure our economies, such as the Bureau of Economic Analysis (BEA) or the Bureau of Labor Statistics (BLS). Key political figures such as Winston Churchill and President Franklin D. Roosevelt are featured for their economic contributions to world history.

Volume 3, Microeconomics, takes on markets, prices, and looking at the economy under the proverbial microscope. Volume 3 presents how markets function and the institutions that allow markets to work more efficiently and equitably for both the producer and the consumer. In Volume 3 you will find the concepts, economists, institutions, and historical events along with major market events such as the transitioning of the automobile industry and the economic bubbles, such as the "dot-com" bubble, that have determined the behavior and interaction of producers and consumers in today's modern economy. In Volume 3 we explore subfields such as environmental economics with entries such as "Tragedy of the Commons," "Clean Water Act," and "Clean Air Act," along with other environmental issues. Personal finance is a highlighted subfield in the "Annuity," "Debt Credit Counseling," and "Health Insurance" entries.

Volume 4, Global Economics, is the volume of the future. Volume 4 encapsulates the first three volumes in the context of an ever-growing global economy. Barring a cataclysmic event, today's world will continue to get smaller and smaller, translating into a more global economic community. Volume 4 includes concepts such as "Comparative Advantage" and "Balance of Payments." Volume 4 introduces the reader to the individuals changing the world, such as Muhammad Yunus and his Grameen Bank. As the new rules of a global community take shape to include all of the world's 7 billion inhabitants, at the forefront of those conversations and debates are the global institutions: the International Monetary Fund (IMF) and the World Bank, along with the United Nations.

Of equal value to the teacher, student, and researcher are primary documents in economic history; a list of Nobel laureates in economics; a timeline of economic events; and a glossary. The Primary Documents section includes 27 documents, such as the Tariff Act of 1930 and the Financial Reform Act of 2010, better known as the Dodd-Frank Act. The *Definitive Encyclopedia* would not be complete without highlighting some of the most important documents that have shaped the economic landscape of the United States. The Appendix of Nobel laureates highlights those individuals who have changed the course of economics. The Timeline presents key events in the global economy from 1776 to 2016. The Glossary presents a second layer to the all-inclusive nature of the *Definitive Encyclopedia*. Approximately 1,000 additional concepts, people, and events in the Glossary go beyond the four volumes' 850-plus entries.

Throughout my career in economics and economic education one of my main concerns has been that economics often has been presented as a subject beyond the scope of the average reader. In compiling *Economics: The Definitive Encyclopedia from Theory to Practice* we took aim at that notion head-on. Our goal was to bring to both the general and experienced student of economics a readable source to better understand the economic world around them. I strongly believe we have succeeded in this goal.

Of course, a project of this magnitude would not be possible without a team of highly dedicated contributors. I owe a huge debt of gratitude and big thank-you to the contributors without whose efforts this project would not have succeeded. My team of contributors possessed the quality and expertise needed for this project. As some of the best college professors and high school AP economics teachers anywhere, they represent all that is good about economic education. I am humbled they would give of their precious time to be part of the team. I owe them a major debt of gratitude. I owe a debt of gratitude as well to Jillian Davidson for her research and editing assistance.

I would like to thank Brian Romer for bringing me onto this project and then passing the baton into the capable hands of Hilary Claggett, Patrick Hall, and the rest of the ABC-CLIO team who had a hand in this project's development. Thanks for making us look good. I also need to thank my many colleagues, students, and friends who also provided support, feedback, and a kick in the pants when necessary. Most of all I need to thank my family and friends for putting up with me during this time. There were times I was a bit like the candy bar commercial. I owe a big thanks to each and every one of them for their patience and understanding. Finally, I dedicate this project to my mom and my four daughters—Branda, Laura, Jillian, and Mary. They say behind every successful man is a woman. Well, I don't know about being successful but I do have five very precious women behind me. This is for you.

David A. Dieterle

Introduction to Volume 4: Global Economics

The global economy is here to stay. In reality, the "global" economy has always been with us. The United States' participation in it has waxed and waned during our more than 200 years of history but a link to the economies of other nations has always existed. Global economics is the future of economics because our world continues to grow smaller and smaller as communication and travel make connecting with each other easier and easier. Like every economic system, the global economy has growing pains. Two are particularly significant.

There are two major battles going on today as the global economy continues to grow and find its way. They are battles in which not very many people are involved, however, or about which many even care. We see glimpses of them in political discussions and debates around the world but mostly from a microeconomic "what's in it for me?" attitude. Whether the battles are acknowledged or not, they are upon us and they are happening on several fronts.

One battle is that of participation in the ever-growing global economy between nations considered the developed and already participating against the emerging and developing nations who want to participate and be part of the global economic community. The second is the battle within developed nations as to whether they remain in the old industrial model of a labor-intensive economy or elevate themselves to the new model of a capital-intensive economy. Both battles have benefits and costs every that nation has to deal with internally. The two battles are interdependent as well.

The battle between the haves and the have-nots is an age-old tale. As the new rules of the global economy evolve, however, the battle is very real and for very high stakes. For emerging and developing nations such as China, Brazil, Zambia, and Vietnam, the results can be economic growth and higher standards of living for their citizens, or economic stagnation and continued nation-wide poverty. Yes, China is still considered an emerging nation. For developed nations such as the United States and those in Western Europe, the battles can mean major, permanent shifts in their domestic economies that will have life-changing consequences for many of their citizens.

Developing and emerging nations are eager to participate in the global economy. But they want to do so as equal partners. This position is made quite clear by the stances they have taken on trade at World Trade Organization (WTO) meetings. Developed nations, however, while expressing enthusiasm for the developing and emerging nations to join the world market, are not making it easy for them to do so. Case in point is the global microeconomics of agriculture.

Participation in the global economy is based on one major aim, trade. A key economic principle is that trade creates wealth. Whether it's two neighbors trading garden equipment or two nations trading wheat for computers both trades leave everyone better off after the trade. Adam Smith's "invisible hand" works even for a global economy. How this translates to the battle between developed and developing nations is that one market in which the developing nations have a comparative advantage to trade is the one market most of the Western world, including the United States, protects from foreign competition: agriculture. Microeconomics states when there is market intervention by a third party the decisions made by the buyers and sellers are altered. The developed countries' use of subsidies and price floors in the agricultural markets prohibit developing countries from participating. Therein lies the battle. The developed countries choose to protect their domestic sellers at the expense of the foreign sellers, most notably in the developing and emerging countries.

This battle leads to a second significant battle—more an internal domestic battle within the developed nations with developing and emerging nations the potential winners. Most nations that are considered part of the developed world today rose to that level of economic growth and standard of living from their economic participation in the Industrial Revolution. From the Industrial Revolution well into the 20th century economic growth relied on the growth of the industrial and manufacturing complex, a mostly unskilled labor-intensive economic sector. Enter the computer and technology.

With the advent of the computer and technology, the industrial manufacturing complex began to change. The trade-off between the use of labor and the use of capital became an issue. The second issue became the cost of unskilled labor. Economics states low-cost, unskilled labor, will always find its least-cost position. For industries where low-cost, unskilled labor was still a key resource, developing nations had a role in the manufacturing process.

Within the developed countries the labor–capital trade-off became increasingly more intense. As labor costs rose and the cost of technology decreased, the point of cost equality was reached. At that point in the technology revolution developed nations became more capital-intensive economies and the labor-intensive industries continued to relocate to other nations with a more labor-intensive industrial base. Many of the unskilled jobs were replaced by technology and the job disappeared. Turmoil within the developed nations increased as more and more unskilled domestic laborers were replaced by capital, that is, technology, or the jobs were moved to other nations. The short-run winners in the global economy were the developing and emerging nations who were able to take advantage of the technological transitions such as those that occurred in the automobile industry. Again, with the auto industry in the developed nations as an example, the short-run losers were the unskilled laborers who lost their jobs to the auto industry's technological changes. The global economy was now becoming more interconnected than ever before.

Both of these battles continue to play out and probably will for some time to come. They will play out in many forums and on different fronts. Political leaders in several developed nations have expressed concern over the costs of globalization, specifically the loss of jobs. Most, though not all, of the jobs lost have been unskilled jobs replaced by technology or outsourced to developing or emerging countries. In more than one developed nation politicians have gone so far as to suggest an isolationist posture to world trade and globalization. The continued growth of the global economy and global influence on domestic economies strongly suggest being an isolationist in this new global economy is not an option. A nation must be willing to be a global player if the nation intends to grow and improve the standard of living of its citizens.

Trade makes the world go 'round. Even with all its growing pains and the internal problems within the developed nations, the global economy is the future. The world will not get larger but continually smaller as we as a global community with the use of technology get better and better at communicating. Peruvian economist Hernando de Soto notes a word of caution. While he promotes capitalism as the way out for many in the developing world, he suggests the global economy not leave behind over roughly 1 billion of the world's population in the developing nations.

A

ABSOLUTE ADVANTAGE

An *absolute advantage* exists when a nation or other economic region is able to produce a good or service more efficiently than a second nation or region. Adam Smith, who penned *An Inquiry into the Nature and Causes of the Wealth of Nations* (1776), used the principle of absolute advantage to defend regional specialization and free trade in global markets. There are two main ways to measure a region's absolute advantage.

First, a region has an absolute advantage if it can produce the same quantity of a product as another region while using fewer resources in the process. Resources, or factors of production, include natural resources, human resources, and capital goods. Economists often measure a region's absolute advantage in terms of labor inputs used in the production of a good. Consider the production of wheat by farmers in Australia and South Africa, as shown in *Absolute Advantage: Daily Production of Wheat.* In this hypothetical example, Australia enjoys an absolute advantage over South Africa in the production of wheat. Measured in terms of labor inputs, Australia is able to produce 10,000 bushels of wheat per day with 100 workers, while South Africa needs 200 workers to produce the same amount of daily output.

Second, a region has an absolute advantage if it can produce a greater quantity of a product than another region using the same amount of resources. Consider the production of coffee by farmers in Brazil and China. *Absolute Advantage: Daily Production of Coffee Beans* shows that Brazil enjoys an absolute advantage over China in the production of coffee beans. Brazil's absolute advantage stems from its ability to produce 1,000 bushels of coffee beans per day with 10 laborers, while China can produce just 500 bushels of coffee beans per day with 10 laborers.

Nations or other regions achieve an absolute advantage in the production of a good in different ways. In some cases, the absolute advantage stems from conscious policies or business practices. For example, a nation that invests heavily in education is likely to create a skilled labor force. This type of investment in human resources may result in the nation's absolute advantage in the production of sophisticated manufactured goods, such as computers and software, and commercial services in the realms of banking and finance, insurance, consulting, and so on. Complementing a skilled work force are a society's investment in capital goods, research and development (R&D), a solid economic infrastructure, and other forces that contribute to a stable business climate. In today's global economy many of the advanced economies of the world have pumped significant amounts of money into public education, infrastructure construction, and so on. Predictably, these advanced economies also have an absolute advantage over most developing economies in the production of many types of consumer goods, capital goods, and commercial services.

A nation's absolute advantage in the production of a certain product might also be derived from its supply of natural resources, such as large tracts of arable land, plentiful rainfall and sunlight, expansive forests, or generous mineral deposits. Because the earth's natural resources are unevenly distributed, production advantages vary from one geographic region to another. For example, some Middle East nations such as Saudi Arabia, Kuwait, and the United Arab Emirates harbor large reserves of crude oil. Not surprisingly, nations with large reserves of oil have chosen to specialize in the production of this valuable primary energy source. The major oil-producing nations have an absolute advantage in the production of oil over countries such as Japan, France, and Germany, which have scant oil reserves. A similar argument can be made for nonpetroleum commodities. For instance, favorable soil conditions and climate give other nations an absolute advantage in the production of certain agricultural goods such as cocoa from Ghana, coffee from Brazil, cotton from China, natural rubber from Indonesia, sugar from Cuba, timber from Canada, and wheat from the United States.

The concept of absolute advantage underscores the economic benefits associated with specialization. First, specialization channels scarce resources into a nation's most productive areas at a moment in time. This is not to say that a nation's economic future is eternally bound to a single commodity or a narrow range of productive activity, however. Dynamic economies that support innovation, entrepreneurship, business formation, and other forward-looking endeavors can alter their competitive advantages over time. Many development economists even caution against overspecialization, viewing most "one-crop economies" as economically unstable. Second, specialization promotes international trade. Specialization requires nations to import items that are not produced domestically and to export their surpluses. Specialization promotes economic integration in the global economy. Economists generally agree that open trade is an engine of global growth.

British economist David Ricardo took the free trade argument one step further. Ricardo popularized the theory of comparative advantage in his classic *The Principles of Political Economy and Taxation* (1817). Comparative advantage extols the benefits of free trade between two countries even when one country has an absolute advantage in the production of both traded products.

AFRICAN DEVELOPMENT BANK GROUP

The African Development Bank Group (ADB Group) is a regional development bank that serves the continent of Africa. It is one of four major regional development banks currently operating in the global economy. Today, the ADB Group comprises three institutions: the African Development Bank (ADB), which was founded in 1964 and began operations in 1966; the African Development Fund (ADF), which was founded in 1972 and began operations in 1974; and the Nigeria Trust Fund (NTF), which was established by the government of Nigeria in 1976. The ADB Group is headed by a Board of Governors, which sets the bank's general policies. The Board of Governors, in turn, selects a Board of Directors, which, in conjunction with the bank's management, conducts the bank's business. The ADB Group's permanent headquarters is located in Abidjan, Cote d'Ivoire, but was temporarily relocated to Tunis, Tunisia, in the early 2000s.

The ADB Group, like other regional development banks, is owned and operated by member countries to support the development efforts of regional member countries (RMCs). Today, the ADB Group consists of 77 member countries—53 regional member countries located on the continent of Africa and 24 nonregional member countries located in Asia, Europe, North America, and South America. The bank's mission, as stated in Article 1 of the Agreement Establishing the Bank, is to "contribute to the economic development and social progress of its regional members—individually and jointly." Today, the overarching goals of poverty reduction and sustainable economic development reflect this mission statement.

To break the vicious cycle of poverty in Africa, the ADB Group extends development loans to RMCs, encourages investment in the private and public sectors, and supplies technical assistance. In recent years, the bank's resources have focused on achieving several key objectives. First, at the country level the bank's efforts emphasize agricultural and rural development, including the construction of roads, irrigation systems, and other elements of an economic infrastructure; investments in human capital, including education and health care services; and reforms to create an attractive environment for entrepreneurship, business formation, and domestic and foreign investment. Second, on a broader regional level the bank has given high priority to programs that support good governance and the rule of law; gender equity, especially in the realms of education, health needs, and employment; environmental protection, including efforts to prevent resource depletion, land degradation, and the loss of bio-diversity; and regional cooperation, including the reduction of tariffs and other barriers to trade and investment among RMCs. Loan and grant approvals in 2015 reflected these bank priorities. The top three categories—finance, transport, and water supply and sanitation—accounted for one-half of all bank operations. Other major categories of loan and grant approvals included agriculture and rural development, education, power, and poverty reduction and microfinance.

Today the three institutions of the ADB Group address a variety of development needs of African countries. The African Development Bank extends loans on a non-concessional basis to the more creditworthy RMCs. Non-concessional loans are made at prevailing interest rates. In 2015, total ADB loans and grants to RMCs totaled $8.8 billion.

The African Development Fund (ADF), on the other hand, provides development loans with concessional terms to the low-income RMCs. Concessional loans are often interest free, have longer repayment periods of 40 to 50 years, and include financial grants to the poorer RMCs. Low-income RMCs not eligible for loans through the normal ADB channels obtain these "soft loans" from the ADF. In 2015 total ADF soft loans and grants to poorer RMCs was $1.5 million. The Nigeria Trust Fund (NTF) also extends loans on highly favorable concessional terms to low-income RMCs to stimulate economic development. In 2015 the NTF offered $12.5 million in new loans to poorer RMCs.

Since the commercial operations of the ADB Group began in 1967 the bank has approved $112 billion in loans and other assistance to African countries. The ADB Group has coordinated its development projects with a variety of outside groups.

The ADB Group raises funds in four main ways. First, operating capital is raised through subscriptions or assigned contributions by RMCs and non-regional member countries through a General Capital Increase. Second, the bank collects interest payments on past loans. Interest rates vary, depending on the income status of the RMC. The interest rate charged by the ADB to middle-income RMCs is comparable to prevailing market interest rates in the economy. The ADF, on the other hand, normally extends interest-free loans to low-income countries. Third, the bank negotiates replenishments, or financial commitments from donor countries, to bolster bank coffers. Replenishments usually span three years and are a main source of revenue for the ADF. In the Ninth Replenishment (2002–2004) donor countries pledged an additional $2.4 billion to support the ADF's concessional lending to Africa's poorest countries. Fourth, the bank borrows money in global capital markets. The ADB borrows money by selling bank bonds to international investors. Traditionally, the security of ADB bonds has enabled the bank to borrow on favorable terms.

Regional and sub-regional development banks are a major source of development loans and other development assistance in the global economy. The four main regional development banks are the African Development Bank Group, Asian Development Bank, European Bank for Reconstruction and Development, and Inter-American Development Bank Group. Smaller, sub-regional development banks also dot the economic landscape and include the Caribbean Development Bank, Central American Bank for Regional Integration, East African Development Bank, and West African Development Bank.

AFRICAN UNION

Former president of Ghana, Kwame Nkrumah, founded the Organization of African Unity (OAU) that also became known as the African Union (AU). Prime Minister Nkrumah's idea of a united Africa was re-introduced by Colonel General Muammar Gaddafi in the mid-1990s.

The African Union, also known as the AU, was officially founded on September 9, 1999, and consists of 54 member nations. Morocco is the only African nation not a member and it removed itself from the AU. The African Union is headquartered in Addis Ababa, Ethiopia, with additional offices in Lagos, Nigeria, and Johannesburg, South Africa. The AU promotes the process of integration on the continent of Africa to enable it to play its rightful role in the global economy while addressing topics of social, economic, and political problems that have serious consequences, positively or negatively impacting the rest of the world.

The main objectives of the AU are to rid the continent of the remaining vestiges of colonization and apartheid; to promote unity and solidarity among African states; to coordinate and intensify cooperation for development; to safeguard the sovereignty and territorial integrity of the member states; and to promote international cooperation within the framework of the United Nations.

The African Union envisions a continent of nations integrated, peaceful, and economically prosperous led by Africans, and an economic force in the global economy. The AU has further elaborated its vision as a new, forward-looking, dynamic, and integrated Africa that will be fully realized through relentless struggle on several fronts as a long-term endeavor. The African Union has transitioned its focus from supporting liberation movements in the African territories under colonialism and apartheid to an organization that is now focused on spearheading Africa's development and integration.

The mission of the African Union Commission is the creation of institutions that are efficient and add value to African integration and development. AU nations strive for African integration and collaboration among African Union member states and the African citizens.

The African Union's core values are:

- Respect for diversity and team work
- Think Africa above all
- Transparency and accountability
- Integrity and impartiality
- Efficiency and professionalism
- Information and knowledge sharing

Under the umbrella of the AU there are smaller, topical divisions whose scope is represented by the subject matter of its divisions: the assembly; the executive council; the commission; the permanent representatives committee; the peace and security council (PSC); pan-African parliament; the Economic, Social and Cultural Council (ECOSOCC); the court of justice; the Specialized Technical Committees; the Financial Institutions; the AU Commission; Members of the Commission; and Portfolios of the Commission. These divisions are expertise driven and serve the AU in various forms, as checks and balances and to increase the levels of productivity while achieving the AU's goals.

The AU has four major bodies: executive, legislature, judiciary, and advisory and financial body. These bodies help the AU operate efficiently and effectively. For the purpose of geographical identification the AU has grouped its members into four geographic categories: North, East, West, and South. In addition to this the AU has formed geographical financial bodies that create inter-communities within the African Union. These communities have objectives such as serving as a peacekeeper, promoting free trade, and the movement of goods and employment. As a result there have been 17 communities formed. The Economic Community of West African States (ECOWAS) is a notable community, and consists of the following members: Benin, Burkina Faso, Cape Verde, Gambia, Ghana, Guinea, Guinea-Bissau, Ivory Coast, Liberia, Mali, Niger, Nigeria, Senegal, Sierra Leone, and Togo. The Eastern African Community (EAC) is another popular community and is also known as the African Great Lakes region. The EAC consists of the following countries: Burundi, Kenya, Rwanda, Tanzania, and Uganda. The African Central Bank (ACB) has been created in hopes of taking over responsibilities from the African Monetary Fund in the future. The goal is for the ACB to handle all financial transactions on behalf of the African nations in hopes of having a single currency in the future.

The African Union has an annually appointed chairperson, who is always a president of one of the 54 member nations. The chairperson of the African Union is elected by the assembly of heads of state for a period of one year. The chairmanship rotates within the continent's regions. Notable recent chairs included the president of the Republic of Zimbabwe, His Excellency Robert Mugabe; the president of Malawi Her Excellency Dr. Joyce Hilda Mtila Banda, who was the first female president in southern Africa and the second female president in all of Africa; the former president of the Republic of South Africa, Thabo Mbeki; John Kufuor, the former president of Ghana; and Muammar Gaddafi, the former president of Libya.

ANCIENT TRADE ROUTES

A trade route is a complex system of managed passageways and endpoints employed in commerce. A singular transport course may contain long separate veins of trade, which may further be associated with smaller byways permitting merchandise to achieve distance business. Ancient trade routes trace their origins to as far back as the middle of the second millennium BCE and extend to the start of the Common Era (CE). The development of significant transportation systems for commercial exchange is seen earliest in Western Asia, East Asia, South Asia, and the Mediterranean region.

During the initial long-distance stages of trade, travel was possible via beasts of burden. The trade networks of the Sumerians may have been at the center of a burgeoning regional trade, but it was patrolled by Arab merchants situated between the Far East and the Arabian Peninsula that significantly improved trade in part through the domestication of the camel. Large numbers of pack animals carried highly valued commodities. The advances in bronze and iron metallurgy helped further increase trade during this period.

Ocean-going trade extending across early civilizations dates back two millennia. It is known that maritime trade already existed in Sumer between 4000 and 3000 BCE and was likely utilized by people in the Indian subcontinent and the China prior to the Sumerians. Further, the Red Sea allowed Egyptians to import spices from east Africa and the Arabian Peninsula.

Early oceanic trade developed along coasts and adapted to the monsoon seasons bringing interregional commerce across the Indian Ocean and Arabian Sea. Multiple networks of sea routes interlaced Southeast Asia and India. In the Mediterranean, due to more constant wind conditions, Roman merchants transported cheaper and more sizeable commodities across a greater surface area at a significantly cheaper price.

The Incense Road was the major early trade route from around the third century BCE to the second century CE connecting primarily spice-producing and spice-consuming civilizations through interlinking land- and ocean-based pathways. The goods exchanged consisted of various spices and high-value commodities. Cross-cultural regional trade meant that the Mediterranean Sea was linked to Arabic, South Asian, and East Asian sources of goods. Ancient trade flourished, facilitating the transportation of products such as frankincense and myrrh from the Arabian Peninsula; silk, textiles, and spices from the Indian subcontinent; and east African goods.

Pre-Columbian trade in the Americas dates back to the second millennium BCE. As early as 1600 BCE, portions of southern modern-day Mexico were involved in trade networks in luxury goods and exotics included obsidian. A golden age for the section of the Americas within the scope of the Yucatan Peninsula occurred from the first century BCE to about 800 CE. Relatively homogenous inland lowland regions traded extensively with the highlands and coastal regions, ushering in prosperity to the region.

ARAB OIL EMBARGO CRISIS, 1973

The Arab oil embargo would be the true beginning of the American energy crisis. The root cause of the crisis was the rising power of the Organization of Petroleum Exporting Countries (OPEC), which was formed by Arab countries so they could use oil as a political force. The industrialized nations were heavily dependent on Arab oil producers for supplies of oil for their economies. In October 1973, however, U.S. support of the Israeli military in the Yom Kippur War created a political backlash in the Arab nations. Arab oil-producing countries imposed an oil embargo on the United States and increased prices to its European allies by 70 percent. Oil jumped from $3 a barrel to more than $5 a barrel overnight. By the end of the embargo, it had reached $11 a barrel.

In 1973, the United States relied on foreign countries for 36 percent of its oil. The embargo caused consumer panics, with stations running out of gas and mile-long lines of cars waiting to refuel. Gas trucks were followed by long lines of automobiles as drivers hoped to find the gas station that was to be refueled. Millions of Americans were forced to carpool and rationing became necessary. The American auto industry was caught off guard with large gas-guzzlers in their showrooms. Sales of imported gas-efficient cars surged.

Even though the embargo lasted only six months, American car-buying patterns changed forever. At the end of the embargo, oil would be $18 a barrel. The shock of the embargo helped the Congress pass the Trans-Alaska Pipeline Bill in 1973 and expanded oil exploration. Mass transit projects, carpooling, and other conservation projects came into vogue. In addition, the huge jump in oil prices created a worldwide recession. The real problem for the United States had been growing for years. American dependence on foreign oil had increased through the 1960s from under 20 percent to 32 percent. Demand for oil was growing at 5 percent annually. By 1973, about 7 percent of oil in the United States came from the Arab states. The root of the 1973 oil crisis goes back to the formation of OPEC in 1960 as a cartel to control the supply and the price of oil. In 1973 OPEC members were Algeria, Indonesia, Iran, Iraq, Libya, Nigeria, Kuwait, Qatar, Saudi Arabia, United Arab Emirates, and Venezuela, and OPEC nations were supplying 45 percent of the world market. The price of oil had remained around $1.00 a barrel for most of the 1960s and was $1.30 a barrel at the start of 1970. President Nixon's decision to end the convertibility of dollars into gold in 1971 caused a devaluation of the dollar, to which OPEC, paid for its oil in dollars, was unable to adjust. The inflation of the 1970s was putting pressure on OPEC to increase their prices, but it would be politics more than supply or demand that created the energy crisis. Thus far, OPEC had proved ineffective in holding or raising oil prices because cartel members could cheat by secretly selling extra oil on the world market. In 1967, OPEC had failed to embargo the United States over the Six-Day War between Israel and the Arab nations surrounding it.

On October 6, 1973, Syria and Egypt launched a surprise attack on Israel, beginning what became known as the Yom Kippur War. A week later, the United States began an airlift to supply Israel in response to the Soviet Union supplying Syria and Egypt. In response, on October 16, OPEC raised the price of oil to $5.11 a barrel. The Arab States of OPEC announced that they would continue to increase the price of oil in 5 percent increments until their political goals (to pressure Israel) were met. When Congress voted for a $2.2 billion relief package for Israel on October 20, the Arab States quickly announced a boycott against the United States. Oil prices rose to $12 a barrel and continued at this level through the 1970s. Prices at the pump went from 30 cents a gallon to $1.30 a gallon. The United States initially absorbed the impact of higher prices with limited pain. On November 5, however, the Arab states announced a 25 percent output cut, which started to put serious pressure on supplies in the United States.

The November output cut took the crisis to the main streets of the United States as gasoline station lines grew and reports of stations running out of gas created panics. President Nixon responded with a ban on Sunday gasoline sales, and daylight saving time was extended into winter to save fuel. Because consumers were topping off and keeping gas tanks full, odd-even sales days were implemented based on license plate numbers. Various other voluntary conservation moves were also implemented. Still, local panics occurred in highly populated areas. The government prepared to use ration coupons but never had to use the system as the embargo ended in March 1974.

Secondary effects of the embargo included a national trucker strike over the cost of fuel and toilet paper panics based on oil shortages in the paper industry. Eventually the government imposed a 55 mph speed limit on the nation's interstate highways. The 45 percent increase in fuel prices also caused a recession and helped contribute to what would be called "stagflation." The higher fuel costs rippled throughout the U.S. economy, resulting in higher food costs and high inflation. The 1970s will always be remembered for its out-of-control inflation. A number of energy acts were passed in the late 1970s to address conservation and energy usage, and the Department of Energy was created in 1977.

The bigger and longer-lasting impact of the oil embargo was its effect on the automotive industry. The embargo was the beginning of the end of the popularity of big six-cylinder and V8 cars. Japanese four-cylinder cars, such as the Toyota Corona, the Toyota Corolla, the Honda Civic, and the Datsun 510, became popular. American manufacturers suffered from their inventory of large cars and strategic line of designs. The Big Three were forced to develop four-cylinder and smaller models such as the Ford Pinto, Chevy Vega, and Plymouth Valiant. The oil crisis would allow a huge influx of foreign autos into the market and start the decline of American dominance in auto manufacturing.

Light cars required by the Clean Air Act and the increase in oil prices changed the very infrastructure and customs of the city of Detroit. Woodward Avenue was the heart and soul of the Motor City. In the morning, Woodward brought automotive executives to their offices from Detroit's best suburbs in their large Bonnevilles and New Yorkers. In the evening, Detroit's youth cruised the endless avenue of diners and gasoline stations in their muscle cars. Woodward's wide lanes made it ideal for urban racing of Mustangs, Plymouth Road Runners, T-Birds, and Corvettes. Many executives looked to Woodward as a marketing test site. By the late 1970s, the muscle cars were gone and Woodward Avenue, like Detroit, would show the destruction of deindustrialization. Woodward Avenue was an augur of the change in the automotive industry and Detroit. By 1979, Japanese cars were appearing on Woodward Avenue.

ARCTIC CIRCLE NATURAL RESOURCES

Much of the Arctic Circle lays undiscovered. Several countries, including Canada, Russia, Greenland, Norway, Finland, and the United States, claim the Arctic Circle. More than half of the Arctic has not been discovered. This as-yet undiscovered territory could create a huge economic boom by the discovery of certain minerals.

The Arctic minerals could be a great resource for these countries. As the Arctic continues to melt more minerals will be available within the Arctic for the nations involved. Though scientists are still uncertain as to the extent of the minerals available in the Arctic, the Arctic is known to be full of minerals for today's use.

With new waterways opening up in the Arctic, shorter travel time between continents is now a reality. Traders can now travel through the Arctic Circle instead around it. This shorter access will save fuel and allow for greater imports and exports. This will be an asset to many businesses and economies will grow as a result. Because the waterways will be more open, the trade of all resources will be more easily distributed. Economies will increase, businesses will get more money, and countries will have more oil or gas.

The Arctic also holds valuable amounts of oil and natural gas. The melting of the Arctic will make these resources more readily available. The competition between countries for these resources has already begun. Russia has started the licensing process to begin drilling for the offshore oil. Access to these oil reserves could be a big economic boom to the countries who can access it first and most efficiently.

It will be a time-consuming process and costly but also very profitable to those who can mine the natural resources successfully. The resources will not be retrieved in the near term. For starters the Arctic needs to melt further for the minerals to be accessible. Once they are accessible, however, the demand and competition for them will be fierce.

The Arctic is a massive landmass with huge potential energy resources. If accessible, one day it will certainly improve the economies of the nations that will be to access the resources. Oil and natural gas continue to be heavily in demand by the developed world and also more and more by developing and emerging nations as their economies become more advanced. The resources of the Arctic could make a significant difference in the energy supply of the globe in the future.

ASIA-PACIFIC ECONOMIC COOPERATION

The Asia-Pacific Economic Cooperation (APEC) is an organization that includes 21 nations located in or around the Pacific Ocean. The explicit goal of the organization is to promote and foster cooperative efforts among its members to engage in liberalized trade policies and to promote free trade principles. The organization was founded in 1989 and its administrative headquarters is located in Singapore.

APEC includes some of the world's most significant economies, including the United States, Japan, China, and Russia. Interestingly, it is one of the few worldwide organizations where the disparate Chinese political entities of the People's Republic of China (mainland China), the Republic of China (Taiwan), and Hong Kong are members at the same table. This interesting arrangement is possible because the organization allows membership for a geographical unit deemed to be a distinct "economy" instead of being basing membership on the concept of a political state possessing a distinct national sovereignty.

APEC's potential impact is significant. If all of its member populations are added together, the organization comprises approximately 37 percent of the global population. The only formal economic organization representing a larger constituency is BRICS (Brazil, Russia, India, China, and South Africa).

However, APEC's accomplishments since its inception have been somewhat limited. In large part, this can be attributed to the significantly different economic environments among its most significant members. While the United States and Japan have long-standing economic cultures that embrace liberalized principles and, with some notable exceptions, have advocated against protectionist trade policies, both China and Russia have historically endorsed very different traditions. The Russian and Chinese experiments with Communism in the 20th century have been largely replaced in the early part of the 21st century, but neither country has fully embraced economic liberalism. The Russian economy features close relations between the state and a private sector dominated by economic oligarchy. China's government retains significant control over the nation's production and has also been accused of currency manipulation.

Some economists have encouraged APEC to consider creating a free trade zone that, to some extent, mirrors the European Union. In 2014, at the annual meeting in Beijing, APEC members committed to a study considering the establishment of a Free Trade Area of the Asia-Pacific (FTAP). The initiative's likelihood for success will be challenged by the fact that the United States has persistently resisted including either Russia or China in a free-trade zone in the past. Similarly, proposals to create free-trade zones within APEC without Russia and/or China have likewise been offered in the past, but have languished and never reached a point of serious consideration.

APEC's membership composition has also generated contention. India has requested membership, but been denied and instead has been granted observer status. Guam, a Pacific island territory governed by the United States, also has requested membership on the grounds that it is a distinct economy, a position that the United States opposes. Although a number of smaller Pacific Rim countries have been discussed for membership, the membership roll has not been added to since 1998.

Although APEC has not achieved some of its most lofty strategic objectives, it nonetheless has made important contributions to making private sector commerce within member countries more efficient and user friendly. The organization has made measurable progress on reducing trade barriers and harmonizing quality standards, regulations and customs procedures throughout its member nations. Further, member countries succeeded in meeting established goals of reducing border transaction costs by 5 percent between 2004 and 2006, and then again by 5 percent between 2007 and 2010. APEC estimates that these initiatives have saved businesses $58.7 billion.

APEC's most recent initiative is the *Ease of Doing Business Action Plan*, which was started in 2009. The *Plan*'s goal has been to expedite the time and cost associated with doing transnational businesses within the organization's member entities. By its internal measures, APEC has improved the ease of business in these benchmark categories by 11.3 percent between 2009 and 2013. As a specific example, the time needed to procure construction permits was reduced from 169 day to only 134.

Ultimately, APEC's long-term influence and effectiveness rests upon the willingness of its members to engage in meaningful efforts to encourage more transnational commerce and to reduce trade barriers. Because the organization includes some of the most economically powerful nations in the world, the results of greater cooperation can be significant. In light of the great geo-political tensions and rivalries along the western Pacific Rim, increased economic cooperation can also potentially create the benefit of reduced political and military rivalry within the region as well.

ASIAN CRISIS, 1997–1998

The Asian financial crisis of 1997–1998 was one of the most dramatic economic downturns of the 20th century. Investors were unprepared for both how quickly it happened as well as how deeply it impacted what were thought to be robust Asian economies. While most Asian economies were adversely affected, the focal point of the crisis revolved was Indonesia, Thailand, and South Korea. The crisis ultimately was short-lived, in part due to successful intervention by the International Monetary Fund (IMF), which supplied bailout loans to the three aforementioned countries.

One of the key causes of the crisis was the fact that several Southeast Asian nations were engaged in the monetary policy of pegging their domestic currency to the US dollar. The effect of these policies was an attempt to create a fixed exchange rate relationship since these respective governments guaranteed to pay a fixed quantity of dollars in exchange for their own currency. The potential danger of this type of policy is that if too many investors present domestic currencies in a short period of time, and there are insufficient dollars within that nation's foreign currency to make good on redemption, the peg policy will collapse, accompanied by bad economic consequences.

Southeast Asian economies enjoyed very robust growth rates throughout the early 1990s, and foreign investors were attracted by high rates of return. The surge in investment capital, in turn, spurred speculative activity, particularly in real estate.

In 1996 and 1997 the United States Federal Reserve (the Fed), chaired by Alan Greenspan, began to raise interest rates in response to fears of potential inflation. This strategy had the side-effect of shifting expected investment returns, as investments in American markets now became relatively more attractive than those available in Southeast Asia. In addition, many private-sector enterprises in the Southeast Asian countries utilized U.S. dollar denominated debt, and the Fed policy moves made the cost of debt more expensive to Southeast Asian borrowers.

In July 1997, Thailand ran low on its inventory of foreign currencies and consequently could not meet its obligations for a scheduled debt repayment. This forced the country to "de-peg" off of the U.S. dollar. The result was a financial crisis that was brought about by a very quick drop in investor confidence in many Southeast Asian nations, causing a rapid withdrawal of capital by foreign investors. The Southeast Asian countries were unable to adequately respond to the run on their capital markets and they were forced to abandon their pegged relationship to the U.S. dollar and float their currencies. This necessary action compounded the problems as investors became even more panicked.

To make matters worse the rapid economic growth in Thailand, Indonesia, and South Korea were primarily export driven, and a significant portion of these national exports were sent to American consumers. When the pegged relationship between the U.S. dollar and the various domestic Asian currencies was broken, and the domestic currencies weakened between 30 and 80 percent to the dollar, a huge debt bomb was created. The region's economic rapid growth pattern over the previous decade quickly devolved into a bust situation. Investors liquidated their investments and shifted them elsewhere; the United States was a favorite destination.

In response to these developments, the International Monetary Fund (IMF) was forced to quickly intervene and bailout a number of the impacted nations in order to stabilize and restore investor confidence. The IMF loans came with "conditionality" requirements, which were terms that the IMF imposed on borrower nations to force them to adopt economic policies that would stabilize the situation and restore the economies of those nations to a more sound footing.

The IMF loans were successful in stemming the panic that had gripped international capital markets. In late 1997 the IMF advanced $20 billion to Thailand, $23 billion to Indonesia and arranged a $58 billion bailout package for South Korea. The respective economies stabilized. The three bailout nations, which had combined GDPs of $2,006 billion in 1997, suffered a 9.5 percent reduction in production to $1,875 billion in 1998, but rebounded to $1,999 billion by 1999.

There are mixed interpretations of what caused the Asian financial crisis. Some blame American monetary policy and the risk taken by the major Asian countries in pegging their currencies to the American dollar. Others suggest that the Asian episode was a classic boom-bust event brought about by excessive speculation.

Ultimately, the Asian crisis was short-lived. The impacted nations stabilized quickly, were largely recovered within a few years, and were able to repay the IMF ahead of schedule. The long-term impact was actually more significant in political terms, as the crisis led to the downfall of the authoritarian Suharto regime in Indonesia in 1998. The Asian financial crisis also indirectly exacerbated the international economic problems that arose in late 1998 through Russia's default on its debt and the Long Term Capital Management Crisis. In retrospect, the Asian crisis of 1997–1998 remains an important example of how delicate international economic relationships can be, as well as the volatility and risk present in the contemporary global economy.

ASIAN DEVELOPMENT BANK

The Asian Development Bank (ADB) is a regional development bank that serves Asia and the Pacific region. It is one of four major regional development banks currently operating in the global economy. The ADB was founded in 1966. The main operations of the ADB are conducted by the bank and its Special Funds, which include the Asian Development Fund (ADF), Technical Assistance Special Fund, Japan Special Fund, and ADB Institute Special Fund. The ADB also administers other funds and grants to support bank goals. A Board of Governors, which convenes once each year at the annual meeting, is the bank's highest decision-making body. The Board of Governors elects a 12-member Board of Directors to conduct the day-to-day operations of the bank. The ADB headquarters is located in Manila, the Philippines.

The ADB is owned and operated by member countries. Since its founding in 1966 the ADB has expanded from 31 member countries to 67 members—45 countries located within the Asia and Pacific region and 18 countries from outside the region. Most of the regional members are low-income or middle-income developing countries, often referred to as Developing Member Countries (DMCs). According to the Agreement Establishing the Asian Development Bank, the purpose of the bank is "to foster economic growth and co-operation in the region of Asia and the Far East . . . and to contribute to the acceleration of the process of economic development of developing member countries in the region, collectively and individually." In 1999 the ADB sharpened its central mission to emphasize poverty reduction in the region.

With poverty reduction as the centerpiece of the ADB's mission, the bank's main operations—development loans, public and private investments, and technical assistance—are designed to address the causes of poverty. In recent years the ADB's development strategy has stressed economic growth; infrastructure building, including transportation and communications; human resources development, including education and health care; gender equity; environmental protection; good governance; regional cooperation, including the reduction of trade barriers; social development; and private sector development, including support for small- and medium-sized firms and microcredit.

The institutions of the ADB are sensitive to the different development needs of its Developing Member Countries. The ADB, for example, makes loans from the bank's ordinary capital resources (OCRs) to members deemed capable of repaying the loan, plus interest, on schedule. The bank evaluates the creditworthiness of a member country by its per capita income and current external debt burden. These non-concessional loans carry interest rates comparable to prevailing market interest rates. In 2015 total ADB topped $27.17 billion. The ADF, sometimes called the ADB's "soft window," offers loans with concessional terms—lower interest rates and longer repayment schedules, perhaps 40 to 50 years. Concessional loans are reserved for the poorer countries that already suffer from higher external debt burdens.

The funding for ADB and ADF operations is derived from four main sources. First, ordinary capital resources (OCR) are raised through country subscriptions. Subscriptions represent the assigned monetary contribution that each regional and nonregional member country pays into the ADB. By paying their subscriptions, member countries become shareholders, or owners, of the bank. Second, the ADB raises funds through borrowing in global capital markets. The bank borrows by selling bank bonds to a variety of investors such as foreign banks and governments. ADB bonds, which carry an AAA rating, are typically viewed as an attractive investment. Third, the bank earns interest from loan repayments and profits from its other investments. Finally, additional funds are solicited regularly by the ADF from donor countries. These donations are called replenishments. Donor countries have also contributed money to the ADB's Special Funds.

Regional and sub-regional development banks are a major source of development loans and other development assistance in the global economy. The four main regional development banks are the African Development Bank Group, Asian Development Bank, European Bank for Reconstruction and Development, and Inter-American Development Bank Group. Smaller, sub-regional development banks also dot the economic landscape and include the Caribbean Development Bank, Central American Development Bank for Regional Integration, East African Development Bank, and West African Development Bank.

ASIAN TIGERS

Asian Tigers has become a term to denote the fast industrialized growth of several Pacific rim nations. There are prominent growth economies in Asia, including Singapore, South Korea, Taiwan, and other Southeast Asia nations such as Vietnam. These economies have steadily flourished since the 1960s and hence they have been revered as some of the most stable economies. Hong Kong and Singapore are very important to the world of finance and trade and have made a name for themselves in that regard, whereas South Korea and Taiwan are better renowned for their manufacturing of goods mainly in the automobile, vehicle parts, and technology industries. Vietnam is second only to China with the fastest per capita economic growth rate at 7 percent in the 1990s.

The Asian Tigers are also known as the Asian Dragons. They all mainly focus on goods that are shipped out of the country, better known as exports. Each country containing these prominent economies also has a bright economic future ahead of them. They have very high educational standards and therefore will have good, smart people in charge.

Since the U.S. established the open door policy in China and countries from around the world claimed their own spheres of influence to trade inside the country, China's ability to trade has not been the same. The entire world has looked to China for exported goods and investment. In subsequent years, China has moved its exporting industry to the mainland in search of cheap labor, which is still used today for most of their exports.

When it first became an independent nation in 1965, Singapore was a very poor third-world country, hardly seeming worthy of being known as a great economy. However, it soon faced this problem head on. The small island's biggest problem was unemployment. In order to create new jobs for their people, an environment conducive to industrial development was formed, putting people to work in the factories to make toys and woodcrafts to sell while the government was busy convincing the rest of the world that Singapore was a good place to do business.

Between 1960 and 2014 South Korea made more financial progress than any other country in history. In 1961 the country had a national GDP of 2.36 billion U.S. dollars. As of 2014, the national GDP was 1,410.38 billion U.S. dollars. How has the country created such a growth over the years? The Korean War (1950–1953) devastated the country and the people rebelled to overthrow their corrupt leader 10 years later. This is when they decided to start working on economic development. South Koreans mostly worked on heavy and chemical exports, but later had to switch to light exports due to an oil shock that struck the country in 1979. They also had a monopoly on tobacco and ginseng products and made many important government enterprises.

In the 1950s Taiwan relied mostly on American aid. This actually worked in its favor because it was able to have a large military presence and not have overburdened their economy by having to pay for it. In the late 1950s an industrial boom hit the small country due to a growing interest in exporting manufactured goods and a large change in governmental policy.

ASSOCIATION OF SOUTHEAST ASIAN NATIONS

The Association of Southeast Asian Nations (ASEAN) is a regional association of 10 countries designed to foster regional economic growth, cultural development, social progress, and peace among its members. The Asean Declaration, more commonly referred to as the Bangkok Declaration, established ASEAN in 1967. This founding document declared that ASEAN "represents the collective will of the nations of Southeast Asia to bind themselves together in friendship and cooperation and, through efforts and sacrifices, secure for their peoples and posterity the blessings of peace, freedom and prosperity." ASEAN's five original members were Indonesia, Malaysia, the Philippines, Singapore, and Thailand. Since ASEAN's founding, five additional countries have joined the association, including Brunei Darussalam (1984), Vietnam (1995), Laos and Myanmar (formerly Burma) (1997), and Cambodia (1999). In 1999 ASEAN negotiated a Joint Statement on East Asia Cooperation with Japan, the Republic of Korea, and the People's Republic of China to widen the spirit of cooperation throughout the East Asia region. In 2013 the ASEAN region had a population of about 625 million people and average per capita GDP of $3,832.

ASEAN has a multi-tiered organizational structure. At the top of the power pyramid is the Meeting of the ASEAN Heads of State. The first Heads of State meeting took place in 1976. An annual ASEAN Summit and an annual ASEAN Ministerial Meeting also discuss issues of critical concern to the region. Regular sectoral meetings discuss more specialized topics such as agriculture and forestry, energy, the environment, poverty, and social welfare. ASEAN maintains a permanent headquarters in Jakarta, Indonesia, and diplomatic missions in 15 capital cities around the world. The chief official of ASEAN is the secretary-general, who has a five-year term of office. The secretary-general and staff are responsible for coordinating ASEAN's activities and programs and overseeing work of the association's 15 missions, 29 committees, 122 working groups, and communications with numerous agencies, nongovernmental organizations, and related groups.

The Bangkok Declaration identified a series of goals for the association. First, member countries pledged to promote economic growth and social progress in the region. To stimulate economic growth and prosperity, ASEAN approved a number of agreements to build economic relationships and use scarce resources wisely. For example, member countries have liberalized trade and investment among association members. In 1977 ASEAN adopted a Preferential Trading Arrangement (PTA) to reduce tariffs in intraregional trade. Additional trade agreements were concluded in the following years, including the 1988 Enhanced PTA Program, the 1992 Framework Agreement on Enhancing Economic Cooperation, and the 1997 ASEAN Vision 2020, which promised the creation of a "highly competitive ASEAN Economic Region in which there is a free flow of goods, services and investments." The creation of the ASEAN Free Trade Area (AFTA) in 1993 was one important step toward the goal of regional economic integration. Between 1993 and 2003 the average tariff for ASEAN-6 nations—Brunei Darussalam, Indonesia, Malaysia, the Philippines, Singapore, and Thailand—dropped from 12.8 percent to just

1.5 percent on listed items. AFTA stimulated trade within the region and helped the ASEAN-6 nations more than double their exports. ASEAN negotiated separate trade agreements with the People's Republic of China, Japan, and India in the early 2000s.

The liberalization of investment also progressed during the 1990s and early 2000s. Following closely on the heels of ASEAN Vision 2020, the association approved the 1998 Framework Agreement on the ASEAN Investment Area (AIA). This framework liberalized investment by reducing barriers to foreign investment, outlawing discriminatory practices against foreign firms or output produced by foreign firms, expanding cross-border flows of skilled labor, increasing the transparency of rules and policies, and encouraging flows of technology among association members. Under the provisions of the AIA most investment restrictions on goods-producing and agricultural industries will be phased out by 2020. Most FDI inflows have come from the European Union (EU), the United States, Japan, and other ASEAN countries. Current negotiations are focused on expanding the more liberalized investment rules to the services-producing industries such as health care, insurance, telecommunications, and banking and finance.

A second major ASEAN goal identified in the Bangkok Declaration was to promote peace in the region. Many of the principles underlying this pledge of peaceful relations among association members are found in the 1976 Treaty of Amity and Cooperation. In this treaty, members agreed to respect each nation's sovereignty and territorial integrity. The treaty also reaffirmed earlier commitments to peaceful methods of conflict resolution. The 1994 ASEAN Regional Forum (ARF) was established to expand the use of diplomacy, rather than armed conflict, to reconcile differences. Parties to the ARF include all 10 members of ASEAN plus Australia, Canada, the European Union, India, Japan, Mongolia, New Zealand, Papua New Guinea, Russia, and the United States. In 2003 the Declaration of ASEAN Concord II, also called the Bali Concord II, created the ASEAN Security Community (ASC), which committed members to "rely exclusively on peaceful processes in the settlement of intraregional differences."

A third ASEAN goal outlined in the Bangkok Declaration was to promote and expand regional cooperation in a variety of other areas of common interest, such as science and technology, education, transportation and communications, and culture and cultural studies. Concrete progress has been achieved in these areas. For example, in 1996, the Framework for Elevating Functional Cooperation to a Higher Plane was approved to create specific plans of regional action in the areas of social development, culture and information, science and technology, the environment, drug control, and international crime. Calls for additional cooperation were made in later documents including ASEAN Vision 2020 and the Bali Concord II of 2003. Association members have also strengthened their bonds by designing regional transportation networks, communications systems, and power grids.

AUSTRALIA: GENERAL ECONOMY

The Australian economy exists as a mixed market economy and enjoys some of the highest rankings in the world. This is largely due to sensible banking policies, a long-standing fiscal surplus, and growth areas in mining, natural resources, and the service sector. Furthermore the national banks have been able to successfully curtail inflation rates in order to keep monetary value stable and experience very little corruption.

Australia's economy is largely based in the service industry with estimates from 2014 of total gross domestic product composed of approximately 67 percent from the service industry. (CIA, n.d.). The Australian economy faces a unique challenge with the majority of the labor force and population based in coastal cities such as Sydney, Melbourne, Perth, and Canberra. Yet there is a vast amount of landmass which is uninhabitable or very sparsely utilized. Supplementing the service industry, the next most important product comes from mining. In the early 21st century Australia experienced a boom in demand for minerals being mined. These commodity markets make up a large part of Australia's export base.

One of the largest challenges to the Australian economy is geographical location. Due to the distance between it and many of the world's largest economies, importing and exporting is a difficult and potentially costly process due to transportation costs. Despite Australia's continued economic growth there is increasing concern regarding the recent growth of the national deficit. This national deficit originated from a stimulus package offered by the government during the 2008 financial crisis that was largely considered to have had little effect on Australia, aided especially by its natural gas and energy resources.

However, with the highest reported trade deficit in 40 years there is a growing concern. The trade deficit identifies the difference in exports and imports. It defines the balance of trade and the overall deficit or surplus of a nation. The trade deficit may be largely due to the dropping of commodity prices.

In major cities in Australia the cost of living is high but so is the minimum wage. The median household income was estimated around AU$222,000 a figure that is relatively large compared to most major economies. As a result of this relative strength Australia also consistently rates high for GDP per capita purchasing power parity (PPP). The PPP measures the relative price of a basket of goods purchased in a given economy relative to other nations in long run consideration. It is a reflection of relative strength of the economy and cost of living.

Even with the difficulty of transportation Australia has continued to grow its economy over the past 20 years and control its inflation rate. The cost of living is high but the quality of life and jurisprudence of financial practices has supplemented Australia's relative strength. To that end Australia has continually increased its quantity of trade with various global partners. In connection with economic indicators it also boasts a reasonable low unemployment rate. These factors have all contributed in solidifying Australia as a top 20 nation across the board in economic measures.

B

BALANCE OF PAYMENTS

The *balance of payments* refers to net monetary transactions by a nation. By definition, the balance of payments for any specified period must balance and net out to zero. In this regard, the balance of payments differs from a country's balance of trade, which can be either positive or negative.

There are three major categories that comprise the balance of payments: (a) the current account, (b) the financial account, and (c) the capital account. Each of these three accounts can operate on a surplus or deficit, but in sum they must net each other out.

The current account, in very general terms, reflects the net cash flows of a country in the exchange of goods and services with other nations. In a similar manner as a double entry accounting system income statement, credit entries act like revenues and debit entries act like expenses. The current account is positively impacted by exported goods, which require payment from a foreign source. A second major source in the current account is returns from investments made in foreign countries. In contrast, imports, which require payment to foreign sources and returns on investment in the domestic nation to foreign sources both act negatively on the current account balance. A final component of current account activity are transfers of currency either in or out between the domestic country and foreign countries. A good analogy for this fifth item would be the settling up on accounts receivable or accounts payable arising from exchanging goods, services, or investment opportunities on credit between nations.

The financial account primarily measures the amount of money invested by individuals in the domestic country abroad as well as monies that flow in the opposite direction from foreign nations that are invested in the domestic country. Both of these items could potentially be either an inflow or outflow. First, consider monies invested from the domestic nation to foreign countries. If we consider just the investment, that would be a financial account outflow.

However, it is also possible to withdraw invested monies from foreign nations as well. If a domestic country invests more than it withdraws in foreign nations, there is a net cash flow out in the balance of payments. Inversely, when withdrawals exceed investments made, this results in a net positive impact. The same principles work in reverse in terms of foreign investments into a domestic country. When foreign sources make more investments than withdrawals, then the financial account is positively impacted. When foreign sources withdraw more money than they invest, the financial account is negatively impacted. Lastly, the financial account is impacted by changes in financial derivative contracts arising from fluctuations in exchange rates. This line item is typically small relative to other line items.

The capital account is the third category and is usually a small item as well. This category largely reflects changes in real asset ownership or transfer of personal property between nations. An example of this would be transfer of ownership of a house or commercial real estate. If a domestic nation citizen purchased a residence in a foreign country and shipped a car and furniture there the domestic country would experience a capital account outflow.

Although the balance of payments must theoretically net to zero, the tools used to measure each of the three major categories is imperfect. There is simply no way to capture all of the transactions and events that take place. As a result, the estimates that result from statistical samples used to measure each category almost always create three category results that don't net out to zero. The difference is always assigned to a last line described as the "Statistical Discrepancy." Ideally, this line item is not relatively large.

All of the above descriptions can be summarized as follows:

Balance of Payments

1. Current Account
   a. Add: Exports
   b. Add: Investment income from foreign sources
   c. Less: Imports
   d. Less: Investment income to foreign sources
   e. Add transfers in less transfers out
2. Financial Account
   a. Add: Net foreign investment in the domestic economy
   b. Less: Net domestic investment in foreign economies
   c. Net change in financial derivatives
3. Capital Account
   a. Changes in real and personal property
4. Statistical Discrepancy
5. Sum Total = Zero

Some people mistakenly believe that running a deficit current account is bad for a country. The United States has been experiencing an excess of imports over exports for several decades, which creates negative current account activity. Yet, the United States is considered a successful and stable economy. Although the American current account is negative it is always offset by an equal amount of positive activity in the financial and capital accounts. There are a number of factors that might explain why foreign capital is attracted to the United States. These reasons include, but are not limited to, a broad array of quality investment opportunities, expectations of good returns on investment, as well as a stable legal, business, and economic environment.

Another way in which to view the contemporary American balance of payments situation is that the country, on a net basis, imports goods and services and, in exchange, exports investment opportunities. In general, more developed countries such as the United States are often more likely to run current account deficits and financial/capital account surpluses. Conversely, less developed economies tend to run their balance of payments in the opposite direction.

A good understanding of how the balance of payments operates allows an individual to gain greater insight into the dynamics of how individual nations interact within the context of a global economy.

BALANCE OF TRADE

The balance of trade refers to the net movement of goods and/or services to and from a country through imports and exports. If a nation exports more goods/services than it imports, it is functioning with a trade surplus (also referred to as a "positive trade balance"). If it imports more goods/services than it exports, then it is functioning with a trade deficit (also referred to as a "negative trade balance").

Up to the 18th century the predominant economic thought about national trade was expressed through mercantilism. Mercantilism's core premise was that national power was derived from wealth. Wealth, in turn, was measured by the possession of gold and silver. This line of thought logically led to a viewpoint that any successful, powerful, and wealthy nation must maintain a trade surplus. Because the monetary medium of exchange at that time in history was metallic coin, the optimal mercantilist economy would export goods in exchange for specie currency. In fact, this worldview was a motivating factor in the 15th through 18th centuries among western European nations that tried to establish colonial empires in order to become economically self-sufficient with the raw materials necessary to support their respective economies.

In theory, the balance of trade is a zero-sum game in the sense that one country's imports are another's exports. However, individual nations can run long-term trade surpluses or deficits. In contrast to mercantilism, modern economic theory holds that a trade surplus is not necessarily a good thing and a trade deficit is not necessarily bad. This assertion is empirically demonstrated by the experience of the United States over more than two centuries. From the nation's founding in 1789 through World War I (1914–1918), the United States consistently ran a trade deficit. It was during this same time frame that the American economy transitioned from being a backwater, agricultural nation to becoming a leading economic world power. From World War I through the 1960s the United States consistently ran a trade surplus, only to see another long-term trade deficit run that began in the 1970s and has persisted into the second decade of the 21st century. In spite of these three long-range trends that include both surpluses and deficits the American economy has consistently produced long-term economic growth over the course of more than two centuries.

How a nation can possibly sustain long-term economic growth in spite of trade deficits can be partially explained by understanding how the related "balance of payments" works. The balance of payments, by definition, must be in balance. As a result, if a nation sustains long-term trade deficits, the cash outflows associated with more imports than exports must be counterbalanced. This occurs when foreign sources send compensating cash flows into a country in the form of IOUs or capital investments. In the earliest stages of American economic history, foreign investors invested significant amounts of capital into emerging American business enterprises, and in particular railroads. More recently, American trade deficits have been possible because foreign sources continue to positively view the opportunities to invest their capital within the United States, whether in the private sector or through the purchases of United States Treasury securities. In summary, the United States is able to sustain long-term trade deficits because foreign investors believe that there are good investment opportunities there. In contrast to the American historical example, nations that do not present opportunities for foreign investment are generally unable to maintain trade deficits for long-term periods.

As a general rule, more advanced economies are more likely to run trade deficits and less economically developed nations tend to run trade surpluses. Although these generalized trends are the result of differing circumstances in the case of every individual country, one of the more significant variable factors is that advanced economies produce more wealth, which can be used to purchase goods and services both domestically and internationally. Conversely, poorer nations often have only natural resources or basic goods to trade while offering fewer investment opportunities for foreign-sourced capital. Consequently, these poorer nations frequently run trade surpluses.

Since World War II, the relative volume of international trade has steadily increased. Consequently, the balance of trade is an increasingly important element in every nation's economic outlook. This trend is likely to continue as a result of growing international support of trade through the World Trade Organization (WTO), regional agreements such as the North American Free Trade Agreement (NAFTA) and regional integration as exemplified by the European Union (EU).

BANK FOR INTERNATIONAL SETTLEMENTS

The Bank for International Settlements (BIS) is a bank that is collectively owned by the world's major central banks. It provides a wide array of services to its members. As of 2015 a total of 60 central banks make up the member ownership and the organization's headquarters are located in Basel, Switzerland. Two other branch offices are located Hong Kong and Mexico City. The BIS's overall mission and objective is to facilitate global financial stability.

The BIS's mission is primarily accomplished through two major functions. First, it facilitates information exchange in order to promote cooperation and coordinated action by its members. Second, the BIS serves as a counterparty or trust agent for certain transactions carried out by member banks. These functions are particularly important in light of the very large volume of international currency exchange occurring in the 21st century global economy. The BIS estimates that in 2010 almost $4 trillion in currency exchange took place on a daily basis.

Its efforts to promote knowledge exchange and coordinated activities are primarily accomplished through conferences and a series of subcommittees in which member banks participate. In particular, the BIS promotes transparency and adequate reserve level policies within the private banking sectors acting within each member's borders that actively participate in international finance. These goals are best exemplified by its participation in establishing the Basel Capital Accord agreements of 1988, 2004 (Basel II), and 2010 (Basel III).

The BIS offers member banks services including such examples as accepting foreign exchange reserves for deposit, creating unique portfolio pools that central banks can invest excess reserves in, and providing short-term advances to members on a collateralized basis. The BIS only offers these services to central banks. It does not transact directly with national government or private sector individuals or organizations.

Founded in 1930 the original purpose of the BIS was to coordinate German war reparations for World War I. However, with the forgiveness of war debts in 1932 pursuant to the Lausanne Agreement, the BIS quickly redirected its focus to research and promoting cooperation by central banks. During World War II the BIS suspended board meetings but continued limited operations. Immediately after the war, the members of the Bretton Woods conference initially decided to close the BIS down, but it soon began to be used as a vehicle to support cooperative European monetary policy in the post-war era. Beginning in the early 1960s, the BIS became increasingly involved in fulfilling its goals on a global basis.

In the wake of the 1971 Smithsonian Agreement and the collapse of the Bretton Woods system in the early 1970s the BIS became an increasingly important entity. The creation of global currency markets primarily operating under a floating exchange rate system gave rise to greater uncertainties and risks. In response the

BIS has focused its mission on compiling and sharing significant global banking information for use by central banks, fostering communication and cooperation by the various central bank members, other relevant research, and establishing best practices standards for international banks to use to reduce chances of disruptive financial failures and contagion effects.

One of the most relevant areas where the BIS has made a serious contribution to contemporary international banking is in its role with the Basel Accords. These agreements, the result of consensus agreement among the world's leading economic nations from discussions dating back to the 1970s, have sought to establish prudent capital reserve benchmarks for private sector banks. The Basel Accord administrative offices are housed at BIS headquarters and the BIS has assumed a leading role in producing data and disseminating information relative to the Basel initiatives.

In addition to the Basel Accords the BIS mission has taken on an added sense of urgency in the wake of an increasing number of global financial crises. These include, but are not limited to, the Asian Crisis (1997), Russia's debt default (1998), and the global financial crisis of 2007–2009. Collectively, BIS activities are acknowledged as important contributions in the efforts to reduce risk and the likelihood of unanticipated banking failures in an ever growing and more deeply integrated global economy. The organization's ability to produce high-quality information helps leading officers within both central banks and the private sector in their daily responsibilities.

BANK OF JAPAN

The Bank of Japan is the central bank of Japan and has been established since 1882. When it was established it came up with core objectives and they still have and use those objectives today. The Bank of Japan plays a key role in the economy and its distribution of the yen. Over the decades it has grown and flourished all thanks to Matsukata Masayoshi.

The Bank of Japan is located in Tokyo. The bank's founder, Matsukata Masayoshi was born on February 25, 1835, in Shimoarata, and died on July 2, 1924, in

Tokyo, Japan. Masayoshi belonged to the independent politician party. He had one child, Kojiro Masayoshi. Masayoshi established the Bank of Japan in June of 1882. It then became the nation's central bank on October 10, 1882. The Bank of Japan was created to be the only bank to print money because the country had a problem with inflation. Money was changed to the yen when the Bank of Japan was established. The Bank of Japan became widely known in February of 1942 because of the Bank of Japan Act. The act of 1942 reflected war being waged at that time but it had four objectives in Article One to regulate the currency, facilitate and control credit, maintain the credit system, and to enhance the general economic welfare. After World War II, in June of 1949, the act of 1942 established a policy board to increase the scope of the Bank of Japan's policy-making. The original building only had 55 employees and it was modeled after the national Bank of Belgium. Japanese government moved the Bank of Japan in 1896 to three new buildings.

The bank has three main objectives: to issue the official Japanese banknotes and coins, to achieve price stability, and to maintain a stable financial system by facilitating smooth funds settlements between the Japanese financial institutions. The Bank of Japan's monetary policy aims to secure price stability by manipulating the money supply in the economy and influence interest rates. The Bank of Japan changes the money volume in the economy by buying and selling Japanese government securities. This is called money market operations. To make sure Japanese financial markets, banks, and other institutions run smoothly the Bank of Japan came up with the financial system stability. It watches all the activity and if something seems to slip the Bank of Japan is there to help and be the lender of last resort. The Bank of Japan is the only bank that can issue banknotes and coins. It strives to maintain confidence in the yen and is responsible for the circulation of the economy.

The Bank of Japan now has three buildings: the new building, which is ten stories high, built in 1973; the Annex Building, which holds the currency museum; and the old building in Nakanoshima. The policy board of Japan recently voted to continue to the program of quantitative easing. The Bank of Japan is printing about ¥80 trillion ($660 billion) a year to buy bonds. In 2016, the Bank of Japan was in a mild deflation and was trying to create a 2-percent inflation by printing a large amount of yen. In July 2016 it published a new index of inflation called the "new core CPI."

Even though the Bank of Japan has been around for long time it has maintained its core objectives and main goals to the present day. Despite its small beginnings, with only 55 employees, the Bank of Japan plays a crucial role in the Japanese economy through its monetary policy.

BHAGWATI, JAGDISH

Born: July 26, 1934, in Bombay (now Mumbai), India; Nationality: Indian-American; Professional Interests: international trade, economic policy reforms, immigration; Major Works: *India: Planning for Industrialization* (1970), *India* (1975), *In Defense of Globalization* (2004), *Termites in the Trading System: How Preferential Agreements Undermine Free Trade* (2008).

Jagdish Bhagwati joined the faculty at the Massachusetts Institute of Technology (MIT) where he was the Ford International Professor of Economics from 1968 to 1980. His early work at MIT is credited for laying the foundation for the current economic reforms in India. Bhagwati stresses that global trade is a two-way exchange benefiting both parties (countries). Of note is his argument against critics of offshoring. Bhagwati suggests that offshoring is only one facet of free trade and with time the United States will benefit from other countries offshoring labor back to the United States, particularly India. The end result will be higher standards of living for citizens in both India and the United States.

Jagdish Natwarlal Bhagwati was born in Mumbai (formerly Bombay), India, on July 26, 1934. He did his undergraduate work at Sydenham College in Mumbai. He then attended Cambridge University and MIT where he received his doctorate in 1967. His early works included a number of publications, two of which were *India: Planning for Industrialization* (1970) and *India* (1975). It was during his tenure at MIT that he founded and edited the *Journal of International Economics*. Bhagwati left MIT to join the faculty at Columbia University.

During his time at Columbia, Bhagwati continued as a prolific writer and a vociferous defender of free trade. He wrote many of his most popular works during this period including *Protectionism, World Trading System at Risk, A Stream of Windows: Reflections on Trade, Immigration and Democracy, The Wind of the Hundred Days*, and, in 2004, *In Defense of Globalization,* which he wrote to combat an antiglobalization sentiment gaining supporters and momentum. In his follow-up book, *Termites in the Trading System,* Bhagwati discusses the harmful consequences that can result from preferential trade agreements.

Bhagwati is also a regular contributor to the *New York Times*, the *Wall Street Journal,* and the *Financial Times*, writing on trade policy and trade issues. He also founded and edited another academic journal, *Economics and Politics,* while at Columbia. He also provides reviews for *New Republic* and the *Times Literary Supplement.* He also contributes to the blogs *Project Syndicate* and *The American Interest.*

As a professor, Bhagwati has worked with a great many students. Two of his former students include Dartmouth professor Douglas Irwin and Princeton professor, writer, and Nobel laureate Paul Krugman.

Bhagwati has been the economic policy adviser to the director-general for the General Agreement on Tariffs and Trade (GATT) from 1991 to 1993. He served as special policy adviser to the United Nations on globalization in 2000, and as external adviser to the director-general of the World Trade Organization in 2001. He has served as a member of UN Secretary-General Kofi Annan's advisory group of the New Partnership for Africa's Development (NEPAD) process in Africa. Additionally, Bhagwati serves as a senior fellow in international economics at the Council of Foreign Relations where he also publishes and as a director at the National Bureau of Economic Research where he has authored a large number of articles over the years.

In a professional capacity, Bhagwati is a fellow of the Econometric Society. He is a member of the American Philosophical Society and the American Academy of Arts and Sciences. He has been honored as a distinguished fellow of the American Economic Association. As a result of his research and advisory efforts, Bhagwati has been awarded honorary degrees at a number of schools including Erasmus University (Netherlands), Sussex University in the United Kingdom, and the London School of Economics.

He was chosen as one of the world's 100 Most Influential Policy Intellectuals by the respected periodicals *Prospect* (United Kingdom) and *Foreign Policy* (United States). Internationally, he has received the Padma Vibhushan award from the government of India, and the Order of the RisingSun, Gold and Silver Star from the government of Japan.

BOSERUP, ESTER

Born: May 18, 1910, in Copenhagen, Denmark; Died: September 24, 1999, in Geneva, Switzerland; Nationality: Dutch; Professional Interests: economic development; Major Works: *The Conditions of Agricultural Growth: The Economics of Agrarian Change under Population Pressure* (1965).

Ester Boserup is renowned in the post–World War II era for positing and challenging the neo-Malthusian view that food supply can only grow slowly and is the main factor governing the rate of population growth. She proposed that the primary stimulus to agricultural productivity is population growth itself by developing a model of economic development that groups land use into five different types in order of increasing intensity. For her works on agricultural change, gender, and development, she received three honorary doctorate degrees in the agricultural (Wageningen University), economic (Copenhagen University), and human sciences (Brown University). Boserup was elected foreign associate of the National Academy of Sciences, United States, in 1989. Boserup died in 1999.

Ester Boserup was born Ester Børgesen on May 18, 1910, in Copenhagen, Denmark. She was the only daughter of an engineer who died when Boserup was two years old. After his death, financial hardship forced her mother to move the family to live with other family members and to take up menial work to support the family. With encouragement by her mother, and knowing she would have a better prospect in life through education, Ester studied diligently and entered the university when she was 19. During university, against the background of the Great Depression, her search for alternatives to the prevailing theories of equilibrium and marginal utility led her to join a Socialist intellectual debating group and to her choice of two divergent topics (American Institutionalist School and the Marxian theory of crises) for a multidisciplinary degree in theoretical economics, sociology, and agricultural policy.

Following her graduation, she published her first article, which compared Keynes's theory of propensity to consume with the Marxist theory of underconsumption and began her research work at the United Nations and its agencies on agricultural trade policy in the late 1940s. In the early years of her career, her unconventional views attracted attention.

From 1957 to 1960, she and her economist husband, Mogens Boserup, worked on a joint project assessing the future of India using Western models of development. While traveling about the country, she observed women working in the fields, noted the agricultural impact of various forms of tenure, and learned about the flexibility of agricultural labor, which made her question many of the Western-based assumptions about agricultural production, particularly the theories relating to surplus labor, population density, and migration. This experience transformed her view of development and she became increasingly convinced that the prevailing theory of zero marginal productivity and agrarian surplus population in densely populated developing countries was an unrealistic theoretical construction.

Returning to Denmark, Boserup combined consultancies with her research and writing as she penned her most important work, *The Conditions of Agricultural Growth: The Economics of Agrarian Change under Population Pressure* (1965). Boserup offered a powerful set of ideas that had far-reaching impacts on interdisciplinary research and real-world practice and became the subjects of intensive academic scrutiny. Based mainly on the experience of Asian countries, the book challenged the dominant Malthusian paradigm (accepted by the majority of classical economists) that at any given time there is in any given community a warranted rate of population increase with which the actual growth of population tends to conform.

In this work, Boserup proposed using a new approach in which population growth rather than the impact of new technologies is the primary mechanism of agrarian development within traditional communities. She maintained that population pressure can lead to agricultural intensification as the principal means of increasing agricultural output and to the adoption of improved methods of production. Population growth, Boserup argued, is independent of food supply, and population increase is a cause of changes in agriculture. This theory of agricultural development is more subtle and complex than that of any of her predecessors.

More than a simple rejection of Malthus's economic development theory, Boserup aimed at explaining all the characteristics of agriculture in any specific area and time according to the resource endowment–the land-labor ratio. Boserup asserted that the more dense population is the more intensive cultivation becomes. Thus she grouped land use into five different types in order of increasing intensity: (1) forest-fallow or slash and burn (15–20 years of fallow), (2) bush-fallow (6–10 years), (3) short-fallow (1–2 years), (4) annual cropping (a few months), and (5) multicropping (no fallow). For Boserup, this land use typology is not just a classification scheme but also a characterization of the main stages of the evolution of agriculture from prehistoric times to the present.

Boserup asserted that methods of cultivation and fertilization to produce more crops per acre become more labor intensive with the shortening of fallow periods. This increase requires far more human labor to produce these higher yields. Although Boserup's central argument was not widely accepted, the ideas put forward in the book are an insightful interpretation of agrarian change.

In addition to this landmark book, Boserup also made other major contributions to the literature on development: *Woman's Role in Economic Development* (1970) and *Population and Technological Change: A Study of Long-Term Trends* (1981). Both books addressed the two major topics to which she had devoted most of her research and writings in the 1970s and 1980s.

In the *Woman's Role in Economic Development*, Boserup argued that although gender is one of the main criteria for the division of labor in all societies, there is a great diversity in this division of labor between the sexes across societies. She emphasized population density and the availability of land as the primary factors that are related to the work and subsequent status of women. This division of labor is not limited to farming systems; it carries over into nonfarm activities as well.

Boserup's main contribution to economics was a more complex picture of the relationships between population, agricultural production, and the environment than was initially put forward by the English economist Thomas Robert Malthus. Her model had great influence on the social evolutionary theory of Mark Cohen, Marvin Harris, and Gerhard Lenski.

Ester Boserup died on September 24, 1999, in Geneva, Switzerland, at the age of 89.

BRAIN DRAIN

The brain drain refers to the migration of skilled professionals from one country to another country for an extended period of time. Implied in this definition is that the exodus of this professional elite has a direct, negative impact on the sending country and a corresponding positive impact on the receiving country. The brain drain is sometimes called human capital flight. The term human capital refers to human labor that has been enhanced by knowledge and skills acquired through education or training. Thus, human capital flight highlights the loss of skilled labor from an economy. It is commonly assumed that the brain drain applies only to the departure of skilled professionals from poorer, developing countries to greener pastures in the advanced countries. The brain drain, however, is also a concern for some advanced countries. In fact, the term brain drain was first used by the British Royal Academy to describe the immediate post–World War II migration of scientists and researchers from the United Kingdom to the United States. Today, heated discussions about the brain drain have focused on the loss of skilled professionals from countries in the developing world. These discussions often pit countries of the global South, which incur a net loss of professionals through emigration, against the countries of the global North, which incur a net gain through immigration. Categories of skilled professionals involved in cross-border migrations include scientists and researchers, information technology (IT) technicians, physicians and other medical personnel, educators, and business managers or consultants.

Measuring the brain drain in today's global economy is a tricky business. Credible organizations such as the World Bank, International Monetary Fund (IMF), and the International Organization for Migration have only recently initiated scholarly research on the brain drain and its impact, both positive and negative, on the global economy. The research relies mainly on data from the U.S. Census and the Organisation for Economic Co-operation and Development's (OECD's) Continuous Reporting System on Immigration. This data tend to concentrate on immigrants with a tertiary education—formal education beyond the high school level. While incomplete, the data shed some light on the main motivations for emigration, the most popular destinations, the direct and indirect impact of cross-border migrations, and the types of enticements needed to lure skilled professionals back to their homelands.

Skilled professionals are motivated to uproot themselves and their families by a number of push-pull factors. In the developing and transition economies the "push" factors are compelling and include relatively poor wages or salaries; a poor quality of life, marked by limited educational opportunities, inadequate health care, and the lack of basic services such as clean water and sanitation systems; unemployment and underemployment; an underdeveloped economic and IT infrastructure; government corruption and cronyism; and political instability and civil conflict. The "pull" factors focus on a wide variety of economic and social opportunities that are readily accessible in a different country. Pull factors attract skilled professionals from high-income and low-income countries to the advanced countries. Pull factors include attractive wages and salaries, thus a higher standard of living; increased access to education, particularly for advanced degrees; the availability of extensive social services; a solid economic and technological infrastructure; higher social and economic mobility; and a stable and secure political environment. Some governments in advanced economies also recruit talented foreign professionals. Germany, for example, loosened its immigration policies to recruit thousands of IT specialists, mainly from Eastern European countries. The United States relaxed its H1B Specialty Occupation Visas to attract additional university-educated specialists from other countries.

A relatively small number of advanced economies attract most of the world's skilled immigrants, including Australia, Canada, France, Germany, and the United States. The IMF estimates that over 90 percent of all inflows of skilled professionals migrating to advanced countries select one of these five nations. The world's leading country of destination is the United States. The OECD reported that the United States had attracted roughly 1 million skilled professionals, many in the field of information technology, from the early 1990s to the early 2000s. A sizable proportion of these skilled workers came from India, China, and Russia. Recent data suggest that migrations of professionals from the world's poorer regions to the

United States and other advanced countries is one way because only a small percentage of these people return to their homelands. The migration of professionals from one advanced economy to another tends to be more temporary, however. It is not unusual for professionals from Canada or the United Kingdom to work in the United States for a number of years and then return to their homelands.

This temporary migration is often called "brain circulation" rather than "brain drain" to emphasize the mutual benefits to sending and recipient countries. The brain drain among developing countries also occurs. In recent years professionals from Eritrea, Ethiopia, Somalia, and Sudan were pushed from the Horn of Africa to escape the carnage of bloody civil war or domestic unrest. Professionals from India, on the other hand, were often "pulled" to jobs in the oil-rich countries of the Middle East such as Bahrain, Kuwait, Qatar, and the United Arab Emirates.

The impact of the brain drain on countries, particularly developing and transition countries, is difficult to assess. On the one hand, the migration of significant numbers of skilled professionals from poorer nations is a major impediment to economic growth in less developed regions. The depletion of a nation's talent pool affects some countries more than others. For example, over half of all college-educated professionals from Jamaica and Haiti—two of the Western hemisphere's poorest countries—live and work in the United States or United Kingdom. The brain drain from other Latin American countries, including the Dominican Republic, El Salvador, Guatemala, Guyana, and Mexico, depletes these countries' human capital. The United States also attracts disproportionately high percentages of highly educated people from Africa.

On the flip side there are benefits derived from the exodus of human capital. First, significant remittances return to professionals' homelands. Remittances are monetary sums that are earned by workers in one country but sent to relatives, friends, business associates, or others in the home country. According to the International Organization for Migration, total remittances by skilled and unskilled workers in the global economy surpassed $100 billion in 2003.

Remittances stimulate consumer demand for goods, provide seed money for business investments, and otherwise support business activity in developing countries. Second, the availability of sophisticated information and communications technologies encourage professionals to network with one another, within nations and between nations. Networking between expatriates and their colleagues back home promotes positive transfers of knowledge to developing countries. Further, globalization has relaxed many barriers to cross-border travel and the movement of labor. In time, the brain drain from the developing world might be replaced with the brain circulation—the return of skilled nationals to their land of origin. This influx of human capital could be a significant step toward sustainable economic development.

The brain drain has been a sensitive topic in relations between the global North and global South for many years. To lure expatriates back to their homelands and retain professionals already residing in developing countries, national governments must create a suitable economic and social climate in which to nurture their talents. Key ingredients in this new environment include real opportunity for social and economic advancement, substantial investment in research and development

(R&D), guarantees for security of person and property, and provision of public goods to satisfy vital social needs in education, health and nutrition, communications and transportation, and information.

BRAZIL: GENERAL ECONOMY

Brazil is the largest country in South America. It has the largest economy and gross domestic product (GDP) of all countries in South America. In 2015 Brazil's economy is the ninth largest economy in the world. The Brazilian economy has been stagnant for much of the early 21st century. The Brazilian real has been the currency of Brazil since 1993.

Iron ore is the country's top export. However, petroleum-based products and agricultural goods are similar in their economic impact. In sports, the 2014 FIFA World Cup and the 2016 Olympic Games were held in Rio de Janeiro.

The geographic size of Brazil allows for many different resources to be found within the country. These resources are key for Brazil to be a major player in the economic world. As South America's largest economy its role is global as well as regional. Brazil's economic growth ignited an economic boom in South America. The growth of Brazil has benefited its people and has become one of the most powerful nations in the economic world.

The economy of Brazil has developed in a very short period, from approximately 2006 to 2010. Its economy is mainly based on agriculture, mining, manufacturing, and service jobs. About one-fifth of the workforce in Brazil is based in agriculture. Brazil is one of the world's largest suppliers of iron ore, its top export. Brazil is also a world leader and exporter in coffee and soybeans. These three goods account for about a quarter of all of Brazil's exports. Brazil's economy has struggled since the global recession of 2008. In 2014 Brazil's economy only grew at a minimal 0.1 percent but had a relatively high 6.4 percent inflation rate. Inflation continued to be an economic problem in 2015 with an 8.7 percent rate.

It was anticipated these events would significantly help the future Brazilian economy. The government set aside over 1 trillion US dollars to build 12 arenas and stadiums throughout the country. It was estimated these two major global events would boost the country's economy and be a showcase for private investors. The two events were expected to add thousands of jobs to the economy.

BRETTON WOODS AGREEMENT

The Bretton Woods Agreement was an international monetary contract for exchanging one currency for another. In 1944, representatives from 44 nations came together in Bretton Woods, New Hampshire, to establish an agreement to monitor exchange rates and lend funds to member nations with trade deficits. The agreement was followed by the creation of the International Monetary Fund (IMF) and the International Bank for Reconstruction and Development, now known as the World Bank. In 1971, President Richard Nixon put an end to the Bretton Woods Agreement by discontinuing the link between gold and the dollar, known as the gold standard.

In 1944, as World War II was drawing to a close and after more than two years of planning and negotiation, 44 allied nations came together in Bretton Woods, a resort village in New Hampshire, to discuss postwar monetary reconstruction. Two competing plans dominated the meeting: that of Henry Dexter White, from the United States, and that of John Maynard Keynes, from England. Except for differences on issues related to future access to international liquidity, the two plans were almost identical. The final agreement, Bretton Woods Agreement however, was much closer to the one offered by the United States, which, considering the increasing power of the United States at that time, was not surprising.

The Bretton Woods Agreement was based on four fundamental factors. First, the negotiators agreed on a new par value exchange rate system, which allowed member countries to declare a par value for their national currencies and, if required, to limit exchange rate fluctuations within a certain set of margins. All participating nations agreed that the unrestricted floating exchange rates of the 1930s would not attract trade and investment in the post–World War II era. On the other hand, they knew that the fixed exchange rates of the 19th century would not be applicable either. The par value system was basically a compromise between a completely fixed and a floating exchange rate, where nation members could, based on agreed-upon procedures, change their par value for reasons such as a domestic financial crisis or reserve currency crisis.

Second, because exchange rates were not to float freely (as they had in the past), member countries needed a guarantee of enough emergency supply of monetary reserve. Negotiators did not change the international liquidity system, which was mainly based on national stocks of gold or gold exchange (currencies that could easily be converted to gold). Therefore, the Bretton Woods Agreement created a system of subscriptions and quotas, which was a fixed basket of national currencies and gold subscribed to by each member country. Accordingly, each country had to pay 25 percent in either gold or currency convertible into gold (at the time, only the dollar had this status) and 75 percent in the member country's currency. Thus, if needed, each member country was entitled to borrow foreign currency based on the size of its quota.

Third, in order to prevent the economic conflicts of the 1930s, all member countries were prohibited from getting involved in discriminatory currency or exchange regulation. The Bretton Woods Agreement removed the pre–World War II exchange control, which limited currency convertibility between the member nations. There were two exceptions to this agreement: (1) the agreement only applied to existing international transactions in goods and services, not the capital account, and (2) if the member country decided, the agreement could be put off during the post–World War II transitional period.

Fourth, all members agreed that there was a need for an institutional assembly to monitor and regulate international monetary issues. The member countries decided to set up a voting system among participant countries based on the proportion of each country's quotas. Therefore, the United States, providing 75 percent of the Institute of Monetary Fund (IMF) quotas, gained tremendous international power over all other member countries.

In summary, the Bretton Woods Agreement was an international monetary policy based on the same gold standard of the past but with a new par value exchange rate system; it created the IMF as an international institution to centralize a reserve of gold and national currencies for emergency monetary needs of the member countries. The IMF was the result of the Bretton Woods Agreement and had three important tasks: (1) administrative and regulatory responsibilities, (2) financial responsibilities, and (3) advisory responsibilities.

As it turned out, contrary to what members of the Bretton Woods Agreement expected, the transition period during the post–World War II era was long and unstable, and the IMF's initial fund was not enough to cover various funding requests. Hence, for over a decade, the IMF's lending power declined to a minimal amount. Due to its financial and economic power, the United States became the only global monetary stabilizer for decades after World War II.

Despite the fact that Bretton Woods was an international agreement, in practice, its initiation, its future developments, and finally its termination were directly under the influence of the United States. The agreement offered strong evidence of the growing international power of the United States in the post–World War II arena. The U.S. dollar enjoyed a powerful position in international trade for a long period of time after the agreement. However, it was the United States that put an end to the Bretton Woods Agreement. On August 15, 1971, President Nixon ended the convertibility of the dollar into gold by setting it free to float independently in the global currency market. Eighteen months later, all industrial countries followed suit.

BRETTON WOODS SYSTEM

The Bretton Woods System refers to the institutions and operation of the international monetary system from 1946 to 1973. The Bretton Woods System takes its name from Bretton Woods, New Hampshire, which hosted the groundbreaking Bretton Woods Conference from July 1–20, 1944. At this conference representatives from 44 countries met to discuss the creation of three multilateral institutions: the International Monetary Fund (IMF), International Bank for Reconstruction and Development (World Bank), and International Trade Organization (ITO).

Conference proceedings were dominated by the United States and the United Kingdom. Harry Dexter White, U.S. Secretary of the Treasury, headed the American delegation, and John Maynard Keynes led the British team. The final Bretton Woods Agreement was successful in establishing the IMF and World Bank, but set aside ITO negotiations for a later date. The Bretton Woods Agreement also established overarching goals for the post–World War II era. These goals included the reconstruction of Allied and Axis economies, long-run economic growth and stability, and world peace. Shortly after the San Francisco Conference of 1945 established the United Nations (UN), the IMF and World Bank joined the UN system as autonomous specialized agencies.

The Bretton Woods System was based on multilateral cooperation rather than the traditional bilateral agreements that dominated the pre-war era. Multilateral cooperation through supranational institutions, such as the IMF and World Bank, was necessarily balanced with national interests, however. The IMF promoted economic stability and worked to create an orderly, predictable environment for international trade. Delegates to the conference agreed that a fixed exchange rate system would best support a stable global trading system. Under the fixed exchange regime, the value of national currencies was "pegged" to the U.S. dollar, a practice that permitted only small fluctuations in currency values. The value of the U.S. dollar, in turn, was set at $35 per ounce of gold. Soon, the noncommunist countries of the world recognized the U.S. dollar as the dominant, international currency against which all other currencies would be measured. The IMF also held reserves, partly paid in gold and partly in national currencies, which were contributed by member nations through subscriptions. Subscriptions were used to stabilize currencies and assist struggling nations with their balance of payments deficits. The IMF, with supranational authority, also reminded nations of their responsibilities to avoid protectionist trade measures and to support one another in times of financial crisis. The IMF's headquarters is located in Washington, D.C.

The second major Bretton Woods institution was the World Bank. Originally, the World Bank consisted of a single institution, the International Bank for Reconstruction and Development (IBRD). Its primary mission was to make loans to support the post-war recovery of European and Asian nations. The World Bank's initial pool of loanable funds was derived from subscriptions, which were assigned in rough proportion to each member nation's economic clout.

This meant that the United States was assigned the largest subscription quota. In 1947 the government of France received the World Bank's first loan, a tidy $250 million. During the 1950s World Bank lending gradually shifted from post-war reconstruction to economic development in the third world. In later decades four complementary institutions were added to IBRD to form the World Bank Group. These institutions were the International Finance Corporation (1956), International Development Association (1960), International Centre for Settlement of Investment Disputes (1966), and Multilateral Investment Guarantee Agency (1988). The World Bank's headquarters is located in Washington, D.C.

The Bretton Woods Conference also laid the groundwork for a third multilateral institution, the International Trade Organization (ITO). The ITO's mission was to promote free trade in the post-war global trading system. Despite being shelved at the Bretton Woods Conference, high-level negotiations continued at separate conferences in London, Geneva, and finally in Havana. In 1948 delegates from 54 countries signed the ITO Charter, also called the Havana Charter. In several leading countries enthusiasm for yet another multilateral institution had cooled, however, by the late 1940s. In the United States, Congress failed to ratify the Havana Charter, and by 1950 the idea of an ITO was abandoned. The provisional General Agreement on Tariffs and Trade (GATT), which had provided a forum for multilateral trade negotiations since 1947, now took center stage in global free trade efforts. GATT, an agreement rather than a multilateral institution, was less threatening to many nations. From 1947 to 1994, eight trade rounds were conducted under the auspices of GATT. Delegates to GATT's eighth and final trade round founded the World Trade Organization (WTO) in 1994. The WTO commenced operations in January 1995.

The Bank for International Settlements (BIS) was another multilateral organization that supported the Bretton Woods System from 1946 to 1973. The BIS headquarters is in Basel, Switzerland. The BIS was established in 1930 to promote international monetary and financial cooperation among central banks and to serve as a bank for the world's central banks. Its founding was instigated by the global depression, which began in some countries during the late 1920s and continued into the 1930s. The BIS accepts deposits from member central banks to create a reserve of funds. These reserves are loaned to central banks to meet local banking needs and to avert financial crises. Cooperation between the BIS, IMF, World Bank, and GATT advanced their mutual goals.

The Bretton Woods System collapsed in 1973, but signs of its demise were present by the 1960s. One major weakness was an over-reliance on the United States to promote economic growth and stability in the global arena. During the post-war years foreign countries relied on open U.S. markets to sell their exports, extensive U.S. aid programs such as the Marshall Plan to fund their reconstruction, and a continuous flow of U.S. loans to jump-start development.

These significant outflows of money, plus massive expenditures for the Vietnam War and Great Society Programs during the 1960s, increased American debt. In the United States these stresses showed up in the form of inflation, sluggish growth, and large federal budget deficits. In the global economy there was also an oversupply of U.S. dollars stashed in foreign central banks as foreign reserves. Complicating U.S. economic woes was its pledge to convert U.S. dollars into gold on request by foreign governments. U.S. gold supplies dwindled as foreign governments cashed in their dollars for gold. In 1971 President Richard Nixon ordered an end to the conversion of dollars into gold, a policy that weakened confidence in the U.S. dollar and in the Bretton Woods System. The economic turmoil in the U.S. economy by the early 1970s, coupled with the U.S. refusal to convert foreign-held dollar reserves into gold, doomed the fixed exchange rate system. In 1973 a flexible exchange rate system was introduced to replace the fixed exchange rate system.

Despite the collapse of the gold standard and the introduction of a flexible exchange rate system, the Bretton Woods institutions survived the traumas of the early 1970s. Institutions such as the IMF, World Bank, BIS continued their work to promote international trade, economic growth and stability, and global peace. GATT organized additional multinational trade rounds, including the Tokyo Round (1973–1979) and the Uruguay Round (1986–1994). The WTO was born in 1995, joining the IMF and World Bank as one of the Big Three global institutions to guide economic relations among nations. The spirit of a multilateralism is, in large measure, the legacy of the Bretton Woods System.

BRICS: BRAZIL, RUSSIA, INDIA, CHINA, AND SOUTH AFRICA

BRICS is an abbreviation for the countries Brazil, Russia, India, China, and South Africa. These countries are expected to be the world's largest suppliers of manufactured goods and services. With their emerging markets and large population the BRICS countries are expected to have the highest GDP in the world. South Africa joined the BRIC group in 2010, making it BRICS.

Starting in the year 2001, the GDP of the then-BRIC countries (Brazil, Russia, India, and China) was set to rise 1.7 percent per year and grow from there. Economist Jim O'Neill, chief of management for Goldman Sachs, predicted that this would be the fastest growing economic market by 2050 (O'Neill, 2001). This is due to the countries' natural resources and industries. For example, Russia and Brazil are recognized by their raw materials such as fossil fuels and uranium, which they send over to China and India where they are made into products to be distributed around the world, becoming the world's top producers of goods and services. These countries will set up economic blocks so they can cooperate with each other, and begin a chain of growth that is expected to develop over the decades.

Based on the Population Reference Bureau, the population of the BRICS countries is a major reason for their growth and economy size. The BRICS countries rank in the top 10 largest populated countries in the world. However, a slowdown in population growth of the BRICS countries is anticipated. The average population of people over the age of 15 is about 78 percent. The current percentage of population under the age of 15 is about 22 percent. This will impact the labor force participation rate. Now that jobs are opening up, more people who are looking for jobs will be able to work. With this kind of large working-age population the BRICS economies should surely grow. The BRICS countries combined to account for 40 percent of the world's population and 25 percent of the world's GDP. The group has also been trying to alter the unemployment rate. The bigger the labor force and labor participation, a lower unemployment rate and increased national income can be anticipated for the BRICS.

The original four BRIC countries, with representatives from Brazil, Russia, India, and China, first gathered formally on June 16, 2009, in Yekaterinburg, Russia. BRICS summits have been held each year since, in Brasilia, Brazil (2010); Sanya, China (2011); New Delhi, India (2012); Durban, South Africa (2013); Forteleza, Brazil (2014); Ufa, Russia (2015); and Goa, India (2016). Topics discussed at the summits include terrorism, the environment, agriculture, trade, and new economic development projects. During the 2016 summit the organization's New Development Bank, created in 2015, discussed funding projects in the nations including research centers in agriculture, transportation, and sports.

Taken together the five nations are nations to be taken seriously in the future. Their increase in GDP and their emerging economies are only some of the impressive things the BRICS will accomplish throughout the decades.

BRITISH PANIC, 1825

The panic of 1825 was a British phenomenon that would affect the United States in a series of mild recessions in the later part of the 1820s. It would show the interrelationships of global finances and economies and would also highlight the dual nature of the American economy. The collapse of British banks affected the cotton and slave trade of the South more than the rest of the United States, and cotton prices declined to depression levels over the period. The divide between the economies of the North and South would lead to major political battles over tariffs. New England felt the effect of the British panic on its triangular trade with the West Indies. Generally, however, American manufacturing was affected slightly favorably.

The panic of 1825 started in Great Britain after a stock market crash fueled speculation, much of which was in South American debt. Most of the speculation centered on mining stocks in Mexico and South America. After Spain left its South American colonies, Britain looked to invest in the region's gold and silver resources. British banks lowered the margin for borrowing money to make investments in South America to a mere 5 percent, creating a mania throughout the general population. In Great Britain this mania would approach the levels of the South Sea Bubble. British speculation fueled a burst in commodity prices, which affected the United States. Coffee prices rose as much as 80 percent. Spice, silk, wool, and other goods tripled in price. In the United States, these price increases especially affected the South, which remained highly dependent on British goods. In addition, the European recession, which resulted from the collapse of British banks when this investment mania ended, created a crash in the cotton market. Until the Civil War, the South often suffered as much from British panics and recessions as those of the United States.

Years of economic expansion had made Great Britain ripe for a contraction. At the time, the Bank of London was a private bank with responsibilities to its shareholders. Furthermore, the bank's investors had formed partnerships to invest in high yielding but risky South American notes. The bank's notes became a target for speculators as a bubble grew. When the bubble burst, the Bank of London and many private banks suffered a run on deposits from members of the general public who were depositors. A true panic quickly spread through the country. With no central bank, Great Britain could not contain the panic, which spread quickly throughout the British banking system. The public demanded gold, and the British banks soon ran short. As bank after bank fell, the panic spread.

Unlike the Bank of the United States, the large Bank of London was not a central bank. Instead of acting as a lender of last resort, the Bank of London had tried to protect itself. Eventually, more than 60 banks would fail in Great Britain in 1825, and more than 200 in the next few years. The panic would spread to European banks and other countries as Latin American notes collapsed, British banks failed, and investor bankruptcies spread. By 1826, the panic had created a shortage of credit and an unsold inventory of goods built up with the country's merchants. Merchants started to dump these goods on America at huge discounts, which suppressed manufacturing in the states.

More problems soon crossed the Atlantic to North America. The South was being squeezed on many fronts. The plantation cotton system depended on the availability of credit on both sides of the Atlantic. The panic of 1825 had severely restricted British sources of credit for southern plantation owners. The recession in Great Britain had naturally reduced the amount of cotton purchased from America. American tariffs had slowed imports of British goods into the United States, which upset the South's whole system of trade. In addition, cotton was beginning to be replaced by wool in Great Britain.

Additional pressure not to buy American cotton was coming from British abolitionists, who did not want British money to support the South's slave-dependent plantation system. The price of cotton and tobacco continued to fall. The British recession caused prices of imported goods to fall and flood American markets. Again, New England and the Mid-Atlantic states called for additional tariffs in response. The tariffs were increased, only furthering the economic slide in the South. Some of the very conditions pushing the South into depression were actually causing manufacturing to expand in the North. The huge economic divide only further enlarged the country's political divide. In America, many of the results of this British panic of 1825 would lay the economic background for the Civil War.

BUNDESBANK

In May 1949 the German government was required by its Basic Law to create a central bank for the issuing of a German currency. The Bundesbank was founded on July 26, 1954, as the central bank for the Federal Republic of Germany, located in Frankfurt, Hesse, Germany.

After World War II, hyperinflation had rendered the Reichsmark worthless. A currency change became necessary. The German government created the Bundesbank originally to replace the old Reichsmark. In later years, once the European System of Central Banks had emerged, however, the Bundesbank's role has been mostly one of communicating and being the German point of contact with the other central banks of the European Union.

Known as the Deutsche Bundesbank its singular charge was price stability within Germany. With the creation of the European monetary union and implementation of the euro in 1999 the European Central Bank (ECB) became the central bank responsible of price stability not only in Germany but also throughout the Eurosystem. The European Central Bank and the national central banks of the European Union (EU) member states that adopted the euro from the Eurosystem.

The Bundesbank keeps track of Germany's national accounts, calculating the economy's gross domestic product (GDP). The bank provides data needed for continual economic analysis. Most notably the Bundesbank issues quarterly and annual data on Germany's GDP along with current price stability data on inflation or deflation. Because of the rules set by the Eurosystem, the Bundesbank also offers various services to other central banks, international organizations, and monetary authorities outside the euro area. Within Germany it also conducts functions similar to other central banks including issuing banknotes for general cash circulation and checks for and removes counterfeit money from circulation.

The Bundesbank has nine regional offices and 35 branches. The regional offices organize events for people to inform the general public about issues related to money, financial markets, and monetary policy. The central bank works with the regional offices to control their region's banks.

C

CANADA'S ECONOMY: OIL, GAS, TAR SANDS

For years, countries such as Kuwait and Saudi Arabia have been the leading exporters of crude oil, allowing them to set the global cost of oil per barrel. Many countries, including Canada, have worked on finding ways to both mine their oil and do their own refining. It is not always a good thing to have an abundance of a resource if you are the producer. Canada very well may suffer economic damage based on having too much crude oil, falling victim to the one resource trap.

Canada is the world's 11th largest economy. In 2015 it was ranked as the sixth freest and the eighth wealthiest based on per capita income. In 2016 Canada's economy was a slow growth economy at below 2 percent, with a relatively small trade deficit.

Of its many trading partners, the United States is the country that Canada both imports the most goods from and to which it exports the most goods, by far. Canada's number one export customer is the United States, exporting 77 percent of all its exports to the United States in 2015. While not quite as staggering, at 53.1 percent, the United States supplied the majority of Canadian imports in 2015.

The global economy is driven by the ability of companies to make a profit and consumers to get the goods and services they want and need. One of the resources that causes an uproar for many people is oil. Even if you do not own an automobile the price of oil is a driving force in the global economy. Canada is no different than the United States when it comes to the role that the price and availability of oil plays in its economy. Canada is using a different type of oil recovery to help meet its need for oil in order to not be dependent on other countries for this resource.

The western province of Alberta, Canada, is home to the Alberta oil sands, which is where tar sand deposits are found, mined, and refined. The projected amount of tar sand available for mining is calculated to be over 170 billion barrels. Tar sand is a combination of sand, clay, water, and bitumen. Bitumen is an organic byproduct mixture of hydrocarbons as a tar-like substance and nonmetallic byproducts. One can argue that the availability of tar sand to be mined and refined is a good thing for the consumer; however the other side of that coin has environmentalists upset due to the effects of this mining on the environment.

The question is whether the ability to provide oil to the consumers is more important than stopping or slowing down global warming. Those opposed to mining tar sand are more concerned with protecting the environment and not allowing these "carbon bombs" into the air than with the price of the oil. The critics of mining tar sand suggest it is worse for the climate than drilling for oil.

The major oil companies in Canada that are part of the tar sand mining industry are now losing money or are just breaking even. There are many factors to why this is happening. First the United States is now able to drill for oil using fracturing through shale ("fracking").

The United States was planning on building a pipeline (Keystone XL) through Nebraska to connect with the existing Keystone pipeline. In 2016 President Obama halted construction of the new pipeline. However, there is another proposed pipeline, the Dakota Access or Bakken Pipeline, which will extend from North Dakota to Illinois. It is similar in length to the Keystone XL and crosses four states, although this pipeline project has been met by protests from environmental groups in all four of the states. Also, the price of oil that the Unites States is importing from other countries has been at a very low price per barrel. With these factors, the need for tar sands from Canada has decreased.

The Canadian government has in the past supported the tar sand expansion in Calgary. Yet there is a good chance that some political leaders will be affected by the fact that these oil companies are losing money and profits are diminishing. This has been a platform for the businesses that profit from tar sand mining. However, with the decrease in demand there most likely will be an increase in unemployment of tar sand miners. This will then have a trickle-down effect through all of the businesses. Which in turn will make those political leaders who have supported the tar sand expansion vulnerable in elections.

Because of Canada's strong trade connection to the United States, the Canadian economy felt the effects when its oil sales to the United States fell 2.8 percent. This decrease affected Canada's growing trade gap in a negative way. Due to the loss of petroleum sales, several of Canada's other exports also took a significant dip, including farm, fishing, and intermediate food products, which declined by 7.3 percent. Overall the country's trade deficit is 2.3 billion U.S. dollars.

Not only did its exports decrease, but Canada's imports also took a hit during 2015. Imports sank about 0.8 percent. While this percentage isn't quite as large as the export fall, it still impacts the country's economy. The main area that took a fall in imports was its consumer goods, falling 3.3 percent.

CAPITAL ACCOUNT

The capital account is one of the three accounts used to make up a nation's balance of payments, which is used to track international transactions. The current account and the financial account are the two other accounts that round out the balance of payments for a nation. All three accounts give a summary of the net flow of both private and public investment into an economy. The capital account is often the minor of the three accounts for most countries, accounting for specialized types of relatively small capital flows.

The major transactions encompassed in the capital account are capital transfers and acquisition/disposal of nonproduced, nonfinancial assets. Capital transfers consist of transfers of ownership of fixed assets; transfers of funds connected to, or accompanying an acquisition or disposal of fixed assets; or elimination of liabilities by creditors. This does not cover land in a specific economic territory. Capital transfers include two components. First, general government, subdivided into debt forgiveness, and second, other subdivided into migrants' transfers, debt forgiveness, and other transfers.

The capital account presents the flow of assets during the year, rather than the stock of assets that have accumulated over time. Additionally all flows are "net" changes rather than "gross" changes. Net changes are informative because they measure the monetary value of the change in a country's financial stake in foreign economies. Under standard accounting procedure used to tabulate credits and debits, outflows of capital assets are debits (negative) and inflows are credits (positive).

A surplus in a nation's balance of payments capital account occurs when payments received by the country for selling domestic assets exceed payments made by the country for purchasing foreign assets. This is generally a desirable situation for a domestic economy. Conversely, looking at a capital account surplus through international economics, it is often balanced by a current account deficit, which is not generally considered a desirable situation. If, however, the current account does not balance out the capital account, then a capital account surplus contributes to a balance of payments surplus. For reference, the United States' capital account at the end of the first quarter for 2014 was $0.04 billion.

The financial account is often intertwined with the capital account because they both record international capital flows. Today's economy is seemingly growing more and more open to world trade and according to theory, will lead to a greater prosperity for all. This being said, many developing economies have "open" capital and financial account policies as a part of their economic reform program, which is often in concurrence with the International Monetary Fund.

CENTRAL AMERICAN COMMON MARKET

The Central American Common Market (CACM) is a five-nation multilateral trade organization. The General Treaty on Central American Economic Integration established the CACM in 1960. The CACM's founding members included El Salvador, Guatemala, Honduras, and Nicaragua. Costa Rica joined in 1962. The General Treaty on Central American Economic Integration outlined an ambitious five-year plan to create a Central American free trade area (FTA), a customs union, and eventually a common market. The notion that these goals could be met within a five-year period was bolstered by the nations' success in negotiating earlier treaties, such as the Multilateral Treaty of Central American Free Trade and Economic Integration (1958), and the Central American Agreement on the Equalization of Import Duties and Charges (1959).

During the 1960s, the CACM made significant progress in reducing intra-region trade barriers, and by instituting a common external tariff (CET), a uniform tariff that is levied on imports from nonmember nations. The elimination of tariffs and other trade barriers within the CACM resulted in a tenfold increase in intraregional trade during the decade. Thus, a solid groundwork for a Central American FTA was laid by the mid-1960s. Also during the 1960s, the CACM took giant steps toward forming a customs union by successfully implementing a CET. The daunting task of creating a common market remained.

The CACM's plan to create a common market has been pitted with detours, false starts, and dead ends since the 1960s. In fact, the goal of forming a true common market never materialized. A common market is a higher form of economic integration. It is based on a functioning free trade region, the CET, and free cross-border movements of all factors of production—natural resources, human resources, and capital goods. To create a common market, the CACM solicited the support and cooperation of the larger Latin American Free Trade Association. This association consisted of Mexico and the economies of most South American countries. Negotiations stalled during the 1970s, and in 1980 the dysfunctional Latin American Free Trade Association dissolved. Its successor organization, the Latin American Integration Association, refocused its energies on creating a Latin American FTA rather than a common market.

The inability of the CACM to maintain its free trade area and customs union during the turbulent 1970s and 1980s was largely the result of intraregional tensions and conflicts during the period. For instance, open warfare between El Salvador and neighboring Honduras erupted in 1969. At the root of this war was unbalanced economic development in the region, which favored El Salvador and Guatemala over some of their Central American neighbors. The growing development gap between El Salvador and Honduras, coupled with a widening Honduran trade deficit with El Salvador, boiled over into armed conflict. This conflict was not the only violence in the region, however. Prolonged and bloody civil wars in El Salvador and Nicaragua during the 1970s and 1980s, rampant government corruption, capital flight, protectionist trade policies, and intense competition among some Central American economies for limited export markets eroded popular support for regional integration. By the early 1990s the door had been nailed shut on proposals for a Central American common market.

In 1993, however, the five original CACM economies rekindled the idea of economic integration by forging a new Central American Free Trade Zone. Under the provisions of this agreement, tariffs and other trade barriers among member nations were once again eliminated. In addition, members of the new agreement became more outward-looking, seeking new economic alliances. The most significant outward-looking initiative was the successfully negotiated U.S.–Central America Free Trade Agreement, or CAFTA, which was signed in Washington, D.C., in May 2004. Soon thereafter, the Dominican Republic (DR), the largest Central American economy, also joined CAFTA. With the entry of the Dominican Republic, the DR-CAFTA region created the second largest U.S. export market in Latin America, second only to Mexico. The Office of the U.S. Trade Representative reported that two-way trade between the United States and the DR-CAFTA nations totaled $53 billion in 2015. The U.S. Senate approved CAFTA on June 30, 2005, with the House of Representatives following suit on July 28. The agreement took effect on January 1, 2009.

CHINA AND INDIA EMERGE AS WORLD ECONOMIC POWERS, 2005

The year 2005 marked the rise of China and India as powerhouse emerging markets in the world economy. After years of economic reform, political challenges, and private enterprise growth, both countries achieved new economic heights. The International Monetary Fund (IMF) (2007) estimates that the economies of China and India grew 11.3 percent and 9.1 percent, respectively, in 2005 as measured by GDP growth. In contrast, during the same time period the GDP of the United States grew 3.5 percent. The exceptional growth drew interest from businesses around the world that wanted to enter these dynamic markets with expanding consumer and government spending. The increased number of international firms entering these markets also increased job opportunities in these two countries, which further helped to increase the size of the middle class and its buying power, thus improving its standards of living.

China

In 2005, as China completed its 10th Five-Year Economic Program, its emergence as a world economic power solidified. The economy continued to grow with its GDP increasing 11.3 percent, a rate not seen since in the previous 10 years. The reasons for China's economic growth stem from major changes in government policies, such as the valuation of China's currency and private firm regulations.

Currency Policy Change

Until 2005, the Chinese currency, the renminbi (RMB), was pegged to the dollar. The government changed its valuation of the RMB to be compiled in reference to a floating basket of currencies. At that time, the currency was revalued about 2 percent against the U.S. dollar and allowed to fluctuate. The currency valuation change gave the government more power in fiscal policy, specifically, inflation control, interest rate instabilities, and market economics.

Private Firms

Although the government was practicing more control in the financial arena, it moved to reduce its intervention in some market activities. State-owned enterprises (SOEs) were favored by the government in China across almost all industries. In

2004, the government removed multiple regulations that in effect had impeded non-SOEs from entry into industries such as infrastructure and financial services. Although the result was not uniform or perfect, the relaxation of the dominance by SOEs created opportunities for non-SOEs to diversify into upstream and downstream industries. Also, these changes facilitated the efficiency of production, which could reduce prices for consumers and increase profit margins for firms. In total, private firms contributed more to the country's GDP than SOEs for the first time.

International Relationships

China's diplomatic and trading relationships with other countries improved during the early years of the 21st century. The country was admitted to the World Trade Organization (WTO) in 2001, which opened foreign direct investment (FDI) opportunities for China by allowing firms from other countries to wholly own enterprises in many industries. At the end of 2004, China entered into the Agreement on Trade in Goods of the Framework Agreement on Comprehensive Economic Co-operation between the Association of Southeast Asian Nations and the People's Republic of China (China-ASEAN Agreement on trade in goods) with 10 member nations of the Association of Southeast Asian Nations: Indonesia, Malaysia, the Philippines, Singapore, Thailand, Brunei, Cambodia, Laos, Myanmar, and Vietnam.

The agreement on trade in goods reduced tariffs on more than 500 products and took effect in July 2005. In an unprecedented move, the leader of Taiwan's National Party, Lien Chan, visited China in April 2005. This was the first time leaders from the Republic of China's Nationalists (in Taiwan) and the Communist Party of China met since the end of their civil war in 1950. In total, exports from China increased over 25 percent and imports increased almost 20 percent. China's Ministry of Commerce reported that FDI into China grew almost 20 percent from 2004 to $72.4 billion with an additional $11.8 billion FDI in banking, insurance and securities.

India

In 2005, the economy of India grew faster than ever before with the GDP increasing 9.1 percent (International Monetary Fund). The increase in India's economic growth was due to a combination of many factors including government fiscal changes, foreign direct investment reform, and infrastructure industries investment. These changes were facilitated by the 2004 election of Manmohan Singh from the Indian National Congress political party as prime minister. This election marked a substantial change in political power from the incumbent National Democratic Alliance party. In April 2005 the "Open Skies Agreement" was signed between the U.S. and India, which eliminated restrictions between the countries. This was followed by Prime Minister Singh's visit to the United States in July, which initiated the 123 Agreement, also known as the U.S.–India Civil Nuclear Agreement. Confirmation of India's economic rise was provided when U.S. Secretary of State Condoleezza Rice visited in October 2008.

Fiscal Reform

The India government passed the Fiscal Responsibility and Budgetary Management (FRBM) Act in 2003 and the FRBM Rules in 2004. The FRBM aimed to increase transparency in the Indian financial system, decrease the fiscal deficit, and balance the budget. The FRBM took effect at the beginning of 2004 and by 2005 had made an impact. The Organisation for Economic Co-operation and Development (OECD) found that the FRBM reduced the governmental prevention of national savings and substantially reduced the fiscal deficit. India replaced the sales tax with a value added tax (VAT) to simplify tax collection and improve efficiency.

FDI and Infrastructure Industries

In 2005, India enacted policy reform to improve the ability of foreign firms to invest in the country. For one, India changed its FDI policy to allow foreign firms to own up to 100 percent of ventures in some industries including textiles, construction, telecommunications, and domestic civil aviation. New regulations reduced the licensing requirements for firms and improved access to foreign technology. The federal government also lowered tariffs, which motivated the increase of market entry by foreign firms from multiple countries. As a result, those living in India enjoyed lower prices. Additionally, firms found it easier to import machinery into their new manufacturing facilities, thus supporting further economic growth. Overall, the changes in industrial policies increased the level of FDI into the country.

Employment Reform

Changes in the Indian government were also evident in the employment reform. The Mahatma Gandhi National Rural Employment Guarantee Act (MGNREGA) was enacted in 2005 to provide jobs to semiskilled and unskilled adults in rural areas of the country for at least 100 days each year. The Act was launched in 2006.

Summary

The year 2005 was an early signal of the growth ahead. Over the next few years, the growth in the economies of China and India continued to escalate until the global economic downturn in 2009. However, according to the International Monetary Fund (2007) both countries remained strong through 2012 with annual GDP growth over 5 percent, even in the face of GDP contraction in the United States and the European Union. Likewise, the governments are seeking new ways to maintain economic growth and prosperity as the world becomes more interconnected.

CHINA: GENERAL ECONOMY

In 1949, after a long civil war Mao Zedong and his Communist Party took power in China. Zedong remained in power till his death in 1976. Government planners controlled every aspect of the Chinese economy by giving ownership of all land, resources, and enterprises to the government. All key decisions regarding the economy were made by government planners, with the intent of the government controlling heavy industries, but eventually the government also took over the agricultural industry.

The government tried to build small factories to produce goods to be sold within China. These goods were expensive to produce and of very poor quality. In the 1950s the government forced many peasants onto farming communes and within a few years farm production dropped sharply. Facing food shortages the government eased its control over farming decisions made by workers on the communes. It also sent many factory workers to work on farms. These actions did help resolve the food crisis but China's economy continued to fall.

The Great Leap Forward

In the mid-1950s Mao Zedong began to implement a policy of using the state monopoly on agriculture to finance industrialization of China. The policy was the gradual establishment of agricultural cooperatives comprising 5 to 15 households in the early 1950s to 100 to 300 cooperative agricultural households by the mid-1950s. Additionally, in 1954 peasants were encouraged to form and join collectives in hopes of increasing their efficiency without taking away their land ownership. Mao saw grain and steel production as the key pillars to economic development and his goal was for China's steel production to surpass that of the United Kingdom. The agricultural sector of China would feed and fund the industrial sector. The first phase of collectivization was not a great success and there was widespread famine by 1956.

In 1958 private ownership of land was completely abolished and households all over China were forced into state-operated communes. Zedong ordered that the communes must produce more grain for the cities. Millions of Chinese became state workers as a consequence of this industrial goal with 21 million Chinese workers added to the non-agricultural state payroll by 1958.

By 1960, total state employment reached a peak of 50.44 million, which placed a major strain on China's food rationing system, which led to an increased and unsustainable demand on rural food production. With so many people employed by the state and with such high demand on agriculture to feed the people and help to finance the steel industry the Great Leap Forward led to the deadliest famine in the history of China. In the Great Chinese Famine roughly 5 percent of the population died.

Effects of the Great Leap Forward

During the Great Leap Forward, the Chinese economy initially grew. Iron production increased by 45 percent in 1958 and a combined 30 percent by 1960. Unfortunately by 1961, the steel industry had plummeted and did not reach its 1958 growth rates again until 1964.

Not only did the Great Leap Forward lead to massive famine, it also led to the greatest destruction of property in human history. Approximately 30 to 40 percent of all houses were destroyed in order to make fertilizer, to build other goods, for industrialization, or to relocate villages.

Due to the massive starvation by the mid-1960s collectivism began to crumble and the Great Leap Forward became known as a serious loss to the people and country of China. China was in a state of agricultural stagnation, industrial production was low, and people's living standards had not increased in 20 years.

Reforms in China

After Mao Zedong's death in 1976, China began using the tools of the free market to increase productivity. The new leader, Deng Xiaoping, gave farmers and factory managers more freedom to make decisions about what to produce, investments, and how much to charge for their products. Farmers were able to own more land and factory managers were offered bonuses for making higher quality products. Deng also began to reward farmers, managers, and workers who increased output. With new incentives, productivity increased and the Chinese economy began to grow.

To further help the Chinese economy, Deng set up four free market centers along China's east coast. Local governments were allowed to offer tax incentives to foreign investors and foreign businesses could operate within these special economic zones. Even though the government still owns firms in major industries and government planners continue to control many key economic decisions, hundreds of special economic zones now exist in China because of the success of the first four.

China Today

The economic changes brought about by Deng Xiaoping led to significant economic growth in certain regions and cities of China. The country that once lagged behind most nations of Europe and North America now has the world's second most productive economy after the United States. Many Chinese citizens today enjoy a wide variety of consumer goods and an extensive amount of economic freedom compared to the days of Mao Zedong. Today's major challenges for the Chinese government include how to expand China's economic growth to more Chinese citizens and to do so within the context of a Communist government rule.

COMMERCIAL POLICY

Commercial policy is often referred to as trade policy or international trade policy. It is a set of rules or regulations that are intended to change international trade flows, in particular to restrict imports. Every nation has a form of commercial policy with public officials formulating the policy they think is the most appropriate for their country. It is one of the oldest divisions of economic thought and is debated to this day.

There are two opposing views of commercial policy. The first is mercantilism or economic nationalism. This position was the dominant view between the 16th and 18th centuries in Europe. Mercantilism supported an active government within a nation's policy. The general outlook was to keep foreign competition out to protect domestic industries, products, and services. The main goal was to increase national wealth by exporting much and importing very little, if at all. Trade was viewed as a "zero sum game" with the exporting country participating in a trade deal being the winner and the other country paying for the goods being the loser. There are many forms of protectionist measures to achieve the desired trade outcome as the exporting country. Tariffs, a tax on imports, are one of the main tactics used to keep foreign competition out.

The other view of commercial policy is a laissez-fare or free trade approach. While mercantilism ruled in the 1500s through the 1700s, enlightenment during the 1600s gave birth to this opposing view. Adam Smith, author of *Wealth of Nations* (1776), spearheaded the thought of trade being mutually beneficial to both participating nations. For Adam Smith and other free trade proponents, trade was more than a zero sum game. Smith preached of an economy based on the actions and interactions of individuals, not governments. An economy would follow the invisible hand of supply and demand.

David Ricardo built upon Adam Smith's theory tying value to labor (industrialization) with the concept of comparative advantage, an important concept in supporting the theory of free trade. Comparative advantage proposes that regardless of a country's wealth it can participate in trade by efficiently allocating its available productive resources while trading for goods it cannot produce efficiently. Applying the concept of comparative advantage to trade it is beneficial to both countries involved.

Today there are assemblies worldwide that help the policymakers make the best decisions for their country. The Bretton Woods Conference in 1944 led to the creation of the International Monetary Fund (IMF) and the International Bank for Reconstruction and Development that would later become the World Bank. The consensus of these institutions was that high levels of protectionism were a bad idea.

The creation of the General Agreement on Tariffs and Trade (GATT) in 1948 was successful in gradually bringing down trade barriers. GATT functioned through a series of trade rounds in which countries periodically negotiated sets of incremental tariff reductions. One of the most influential trade rounds was what is known as the "Uruguay Round," which led to the creation of the World Trade Organization on January 1, 1995.

The World Trade Organization (WTO), European Union (EU), North American Free Trade Agreement (NAFTA), and Voluntary Export Restraints (VERs) are all examples of committees and/or policies that aid in the regulation of international trade and various nations' commercial trade policy. However, these groups only regulate the countries that are members. The largest and oldest of the groups is the WTO with 160 member countries as of June 2014.

Nations must decide their commercial policy on the amount of tariffs, embargos, quotas, or subsidies for domestic producers. An embargo is the complete stoppage of trade with a particular country. A quota is a limitation on the number or amount of imports a country will accept for a particular good or service, and a subsidy is when a government pays domestic producers to give them an advantage over foreign competition.

Trade barriers today are generally frowned upon due to the creation of deadweight loss. Deadweight loss is a concept that takes into account the resulting loss of competition of a protectionist policy. Less competition means domestic producers have less incentive creating less-efficient production and technology. Trade barriers of all kinds can and often do end up hurting domestic consumers.

The global economy is becoming increasingly integrated. Since the Great Depression and the end of World War II trade barriers have significantly reduced. Globalization is now directly associated with a country's economic success while failure to open up markets is viewed as a cause of economic stagnation. The growth of globalization can be attributed to the significant reduction of trade barriers over the past six years; specifically the pursuit of a liberal commercial policy by many countries, with the United States being the current front runner of the movement.

COMPARATIVE ADVANTAGE

A comparative advantage exists when a nation or economic region is able to produce a product at a lower opportunity cost compared with another nation or region. Key to understanding comparative advantage is that mutually beneficial trade between two nations can take place even if one country enjoys an absolute advantage in the production of both traded products.

The theory of comparative advantage has been the single most influential justification for free trade since the early 1800s. Robert Torrens introduced the theory of comparative advantage in his *Essay on the External Corn Trade* (1815). But it was David Ricardo who popularized the theory in his book, *The Principles of Political Economy and Taxation* (1817). The theory of comparative advantage is a natural complement to the earlier theory of absolute advantage, which Adam Smith defended in his famous *An Inquiry into the Nature and Causes of the Wealth of Nations* (1776). Smith explained that trade between two nations was mutually beneficial when one nation was superior in the production of one good and a second nation was superior in the production of a different good. Smith argued that each nation should specialize in its area of superiority, and then trade its surpluses with the other nation. Torrens and Ricardo expanded on the theory of absolute advantage by arguing that specialization and trade should occur even if one nation is superior in the production of both traded products.

There are different ways to measure one country's comparative advantage over a second country. One way is to compare different rates of output generated by the two countries. The United States has an absolute advantage in the production of both flashlights and disposable cameras over Mexico. That is, using the same resources, the United States is able to produce 100 flashlights (compared to just 50 flashlights in Mexico), or 100 disposable cameras (compared to just 20 in Mexico). It is important to remember that the United States is able to produce 100 flashlights or 100 disposable cameras, but not both at the same time. Similarly, Mexico is able to produce 50 flashlights or 20 disposable cameras, but not both at the same time. This either-or situation stems from the fact that there are fixed resources. Thus, if the United States produces 100 flashlights, zero disposable cameras are produced. If Mexico produces 50 flashlights, zero disposable cameras are produced. For simplicity's sake, in most measurements of comparative advantage, it is assumed that labor is the sole cost of production.

Despite the advantage of the United States in both products, it is still mutually beneficial for each nation to specialize in the production of the product that it produces "most best." That is, each country should produce the product in which it has the greatest advantage, or at least the lesser disadvantage. From an economic perspective, the United States should specialize in the production of disposable cameras, where it enjoys the greatest advantage, and Mexico should specialize in the production of flashlights, where it has the lesser disadvantage. In reality, both countries would likely produce some flashlights and cameras, but would tend to devote more resources to products in which they enjoyed a comparative advantage.

Another way to illustrate the theory of comparative advantage is to compare the relative input costs, measured in labor hours, needed to produce two goods from different countries. This second measurement is concerned with the amount of an input (labor hours) needed to produce a good, rather than with the quantity of output generated by each nation. For example, in Ghana, one unit of cocoa can be produced using just two hours of labor, compared to four hours of labor in Sierra Leone. Similarly, Ghana produces one unit of soybeans in two hours, while Sierra Leone requires ten hours of labor to produce the same quantity. Ghana has an absolute advantage in both cocoa and soybean production

While the labor inputs required in the production of cocoa and soybeans favors Ghana, Ghana enjoys the greatest advantage over Sierra Leone in the production of soybeans. That is, measured in labor hours needed to produce soybeans, Ghana is five times as efficient as Sierra Leone. According to the theory of comparative advantage, Ghana should specialize in the production of soybeans. Sierra Leone, on the other hand, has its least disadvantage in the production of cocoa, and, thus, should specialize in cocoa.

The theory of comparative advantage supports national and regional specialization. Specialization promotes the most efficient utilization of the world's scarce resources and generates maximum global output. Yet there are certain assumptions that complicate the application of comparative advantage in the global trading system. First, the theory assumes that resources within nations are easily transferable from one industry to a second industry. For example, if Ghana specializes in the production of soybeans, it is assumed that the workers, capital goods, and land previously used in cocoa production are effortlessly transferred to soybean production. Second, transportation costs are not accounted for in the theory of comparative advantage. Production efficiency might be maximized through specialization, but the added costs of transporting raw materials, intermediate goods, or finished products may reduce or eliminate any cost advantage. Third, a variety of impediments to international trade, such as tariffs or import quotas, may upset the cross-border exchanges of goods and services. Because trade barriers restrict exports, stockpiles of surplus commodities could rot in warehouses or storage bins. Fourth, comparative advantage does not consider the terms of trade for goods exchanged between nations. If specialization creates an over-supply of certain goods, such as coffee or sugar, the value of these commodities declines relative to other goods such as computers or software. Arriving at fair terms of trade has been a contentious issue in the global economy in recent decades and has contributed to North–South tensions. Fifth, comparative advantage discourages diversification in an economy. In extreme cases, regional specialization could result in the creation of a "one-crop economy," which places the nation at the mercy of sudden global shifts in demand or catastrophic losses in supply through drought, infestation, or other blight.

CORN LAWS

"Corn Laws" refer to early British regulations on the importation of any grain products. Restrictions existed as early as the 12th century but they became famous during a period at the end of the Napoleonic Wars (1803–1815). The purpose of the regulation was to keep the domestic price of corn and grains high.

Despite their early origins, the Corn Laws are widely believed to have come into serious contention and scrutiny with the revisions in 1815. The historical importance of the laws, and opposition to them, was the economic debate between detractors and supporters. The high prices boosted the agricultural industry that was widely supported by landowners and producers of foodstuffs. The Corn Laws were vehemently opposed by the industrial manufacturers because the high cost of food created a need to raise wages. In the absence of this raise the growing population of Britain found itself with insufficient ability to provide food for families, or to provide other life necessities such as clothes.

To protect English farmers, Parliament passed the Corn Laws in 1815. The Corn Laws placed severe restrictions grain imports. Tariffs on imported grain, including wheat, were applied to imported grains until domestic prices reached a price of 80 shillings per quarter weight (approximately 28 pounds) (Bloy 2010). The increased prices of foodstuffs decreased the purchasing power of the population. The Corn Laws are said to have been the inspiration for David Ricardo's model of comparative advantage. Ricardo argued that by restricting trade with other nations

Britain was denying itself the opportunity to access lower prices. With the growing population and industry in Britain it was inefficient for Britain to emphasize production of wheat and corn when both could be accessed through importation.

Comparative advantage advocates that countries specialize in the product that they can produce most efficiently and thereby create a balance between markets on the basis of labor hours (Rothbard 2012). Ricardo recognized that the concept of free trade was more sustainable and economically stable through comparative advantage. It is the Ricardian model of comparative advantage that forms the basis of many economists' belief in free trade today.

The Corn Laws also led to the formation of various opposition groups such as the Anti-Corn Law League founded in 1839. This organized dissent aided in the creation of a London news and opinion magazine called *The Economist* in 1843. Eventually, public opinion and the failure of the Irish potato crop in 1845 led to the repeal of all Corn Laws in 1846 by Prime Minister Robert Peel.

CRAWLING PEG

A *crawling peg* refers to an exchange rate system in which a country fixes its currency to another currency and is allowed to make regular periodic adjustments in the nominal exchange rate in order to offset or control movement in the real exchange rate. A crawling peg system originates from a general pegged exchange rate system.

A pegged exchange rate system allows a nation to set the value of its currency against others. The value of the nation's currency is set equal to a fixed amount of another country's currency, such as the U.S. dollar or European euro. Less often a currency may be set to a collection of several currencies usually based on the home country's major trading partners. If the exchange rate is not allowed to vary it's called a hard peg. If the fixed exchange rate is allowed to fluctuate within a set band it is called a soft peg.

Crawling pegs are soft pegs that are fixed but periodically adjusted. The idea is to offset any differences in inflation through regular adjustments in the nominal exchange rate. If correctly handled the real exchange rate remains constant and the impact of inflation differences never show up as a change in competitiveness. A crawling peg recognizes that there are likely many occasions when exchange rate movements should be constrained in the short run, but not in the long run.

A crawling peg is often put in place as a result of high inflation in one country (Country A) compared with another trading country (Country B). It appears as a faster rate of change in Country A's price level which in turn leads to appreciation, or increase in value, in its respective currency. Under these circumstances Country A's producers are less competitive and Country B's producers are more so in Country A. If this persists investors will most likely begin to sell Country A's currency in the expectation that the pegged nominal rate will be devalued to offset appreciation in the real rate. A crawling peg will prevent this from happening.

For example, in the 1990s Mexico had a pegged exchange rate system and had fixed its peso with the U.S. dollar. Due to significant inflation in Mexico compared with the U.S., it became apparent the peso would need to be severely devalued in order to stay competitive. Because a rapid devaluation of the peso would create instability in Mexico, Mexico put a crawling peg exchange rate adjustment system into place and the peso was slowly devalued toward a more appropriate exchange rate.

Maintaining the crawling peg requires a country's monetary authority to exercise self-restraint in the creation of new money. Countries frequently try to reinforce the anti-inflation tendency of a crawling peg by intentionally devaluing at a slower pace than the difference between home and foreign inflation, as evident in the U.S.–Mexico example. This creates real appreciation in the exchange rate and is intended to act as a brake on domestic inflation as foreign goods steadily become cheaper in real terms, limiting the price increases that domestic producers were able to impose.

However, the use of the crawling peg exchange rate system increases a country's vulnerability to crisis. Sometimes it is politically difficult to exit the system if it becomes overvalued. Consequently when a government announces a change in the system it runs the risk of losing its credibility. Both domestic and foreign economic agents accommodate the existing system and a sudden large devaluation leads to economic losses as well as a loss of confidence in the country's policymakers. It is common for countries to delay addressing the problem of overvaluation and when the correction occurs it has to be larger than if it was addressed initially.

CURRENCY APPRECIATION AND DEPRECIATION

The relationship between different currencies is a dynamic one. As a result, national currencies invariably appreciate or depreciate against one another over long periods of time. This fact has remained true even as world currencies have transitioned from the gold standard that was in place during the 19th and early 20th centuries to the floating and pegged systems that are in place today. In order to fully understand how currencies change their values relative to one another, it is worthwhile to consider the variables that impact change under any of the three currency practices.

Under the gold standard, which was a customary worldwide practice until the time of the Great Depression, nations would promise to convert their currency back to gold at a fixed rate. These conversion rates represented a pledge by each sovereign nation to physically exchange gold if anyone presented currency and requested an exchange. For example, in the United States between 1834 and 1933, the government established an exchange rate of $20.67 for an ounce of gold, and the public could turn in dollars for gold or vice versa. During that same time, Great Britain had an exchange rate of £3, 17 schillings, and 10.5 pence per ounce of gold. These two relationships, because they were fixed, established a fixed exchange rate of $4.867 per £1.00.

The gold standard system created a relatively stable system of international currency exchange for almost a century due to the fact that the world's gold supply increased annually at very modest rates. However, during the 19th century, nations operating under the gold standard system occasionally were forced to rescind the convertibility of their currencies to and from gold. This usually occurred during times of war. Wars are expensive and nations are generally unable to finance them through taxation. Instead, the typical manner in which nations financed wars was to either borrow or print money. When these events happened, countries often ceased gold redemption temporarily in order to gradually contract the currency supply before restoring redemption. This was because there was too much currency in circulation relative to physical gold reserves. Otherwise, there would be a rush by currency holders to redeem their paper for gold. This situation is a classic example of Gresham's Law in practice. As a historical example, the United States did this during and after the American Civil War, and the paper money "greenbacks" issued during the war could not be redeemed until 1879.

From the 1880s to the 1910s, major economic powers worked under the gold standard. Currencies traded at fixed rates with one another. Occasionally, when a nation's money supply became permanently enlarged, that nation would be forced to devalue its currency relative to gold to prevent investors from redeeming paper money for gold.

The gold standard was severely tested in the early 20th century. World War I (1914–1918), in addition to its tragic human cost, stressed the financial resources of virtually every major combatant, forcing them to suspend gold redemption. Although some countries attempted to return to the gold standard after the war, the Great Depression of the 1930s and then World War II (1939–1945) largely prevented any return to the gold standard.

At the Bretton Woods Conference in 1944, the Allies attempted to restructure the world's currency protocol. The United States returned to the gold standard on an international basis at an exchange rate of $35 per ounce of gold, allowing foreign nations to redeem United States dollars that they held for gold. Other major nations pegged their currencies to the U.S. dollar. This arrangement was an effort to return to a fixed exchange rate relationship between major countries, as different currencies could be traded with each other based on their fixed relationship to the U.S. dollar.

The Bretton Woods era came to an abrupt end with the Smithsonian Agreement in 1971. The United States was unable to repay in gold due to a dwindling gold reserve brought on by the costs of the Vietnam War and social programs. President Richard Nixon, as a result of this agreement, rescinded the Bretton Woods arrangement and effectively took the United States off of the gold standard.

Since 1971, the majority of the world's nations have operated under a floating exchange system, where each country issues fiat money, which is not convertible to any real asset such as gold. The floating exchange system allows each nation's central bank to print as much currency as it deems appropriate. As a result, exchange rates between currencies since 1971 have been subject to a dynamic relationship where the rate is in a perpetual state of movement based on investor expectations.

Critical variables that determine floating exchange rates include, but are not limited to, the quantity of national currency in circulation, the rate of return that can be earned through an investment in that currency, and the general economic outlook for each nation. In general, an expansion in the supply of a given currency will cause it to depreciate versus others, while a contraction in the currency supply will cause appreciation. When central banks increase the rate of return on their sovereign debt, the underlying currency appreciates. The opposite applies when they lower rates.

Now, the vast majority of nations float their currencies. However, some developing nations still peg their currencies, most often to the U.S. dollar, attempting to project a level of confidence in their national currency through the promise to ultimately exchange it for U.S. dollars if demanded. However, just as was the case under the gold standard and Bretton Woods, excessive growth in circulated currency can create a crisis. A prominent example is the Mexican Peso Crisis of 1994–1995, when Mexico maintained insufficient dollar reserves while expanding its currency in circulation, necessitating its withdrawal from its peg promise.

The floating system in place today requires that currency traders actively and astutely study all of the factors that cause the value of individual currencies to appreciate or depreciate versus one another.

CURRENCY DEVALUATION AND TRADE

A nation is capable of stimulating its export trade by devaluing its currency in the international marketplace. The process to accomplish this, all other variables remaining constant, is to increase the supply of a domestic currency versus all other currencies. In a floating exchange rate system, this will cause the exchange rates to move.

By way of example, suppose a situation where the total supply of euros is €200 and the total supply of dollars is $225. The exchange rate of euros to dollars would be 1.125 (225/200) and the exchange rate of dollars to euros would be the inverse, where the cost of a dollar to a European source would require 0.889 euros (200/250).

If the European central bank were to increase the supply of euros to €250, the exchange rate for the euro to the dollar would become 0.875 (225/250). The inverse relationship of the dollar to the euro would move from 0.889 to 1.111 (250/225).

A movement in the exchange rate has a direct impact on the cost of goods and services exchanged between nations. Suppose that the European Union produces 200 units of various goods and services and the United States produces 225 units of goods and services. Before devaluation, a European consumer can purchase a domestic good or service for €1.00 and an American consumer can purchase a domestic good or service for $1.00. In this situation, if a European consumer wanted to purchase an American good or service it would require only €0.889 (200/225) to do so, as previously demonstrated above.

Taking the example further, consider the implications of a currency devaluation on an American consumer purchasing European goods or services. Pre-devaluation, an American consumer would need to spend $1.125 in order to buy a European good or service worth €1.00. Post-devaluation, an American consumer would need only to spend $0.875 in order to buy a European good or service worth €1.00.

Tactically, the most common way in which modern nations devalue their currency within a floating exchange rate system is to use their own currency to buy foreign currencies. In the early 21st century, China has aggressively utilized this approach in order to support its export-focused economic strategies.

However, using currency devaluation as a strategy for economic growth has potential costs and consequences. For one, any currency devaluation will eventually lead to a change in domestic pricing in order to maintain economic equilibrium. For example, within the European Union example above, the impact of added currency will eventually cause a change in domestic pricing due to inflation in order to reach equilibrium. Whereas the price of a European good or service was €1.00 prior to devaluation (€200/200) the domestic price would eventually migrate to equalize at €1.25 per good or service (€250/200), with all other factors remaining unchanged. A second consequence, as the above example demonstrates, is that while the increase in the supply of euros would cause the euro to devalue and therefore make European exports less expensive to foreign consumers, this scenario also makes foreign imports more expensive for domestic consumers.

The empirical evidence suggests that while currency devaluation can be an effective economic strategy in the short term, it is an approach that often entails possible risks, both short term and/or long term. A historical example is Great Britain's struggles during the 1960s under the Bretton Woods fixed exchange rate system. The country was experiencing a highly unfavorable balance of trade with imports far exceeding exports, which had the effect of draining British pounds (the domestic currency) out of the country. In 1967 the British government devalued the pound in order to promote exports, curb imports, and alleviate the trade imbalance. The unanticipated short-term impact was a widespread loss of confidence in international markets for the British pound. In the long term, the weakened pound and the more volatile international exchange markets in part led to the crisis that forced the United States off of the gold standard in 1971, putting an end to the Bretton Woods System.

The theoretical and empirical evidence clearly suggests that nations must carefully consider both the benefits and costs associated with a devaluation strategy. While currency devaluation will in the short term stimulate economic activity through increased exports, the longer term consequences have the potential to cause more economic damage than benefits.

CURRENCY WARS

Currency wars occur when several nations simultaneously try to devalue their respective currencies at the same time. The motivation for devaluing a nation's currency relative to other currencies is that a devalued currency will promote a nation's exports for purchase abroad. This type of policy is typically enacted in order to stimulate national economic activity.

The best historical example of a currency war occurred the 1930s. The onset of the Great Depression caused tremendous stress on the economies of all of the world's great economic powers, including the United States, Great Britain, France, Germany, and Italy. In response, these nations took themselves off of the existing gold standard and attempted to devalue their currencies in order to jump-start their economies through increased exports. Economic historian Douglas Irwin notes that France in particular contributed to the currency wars through hoarding its gold reserves during this period. These policies failed for two major reasons. The first was that all of the major economic powers tried to devalue at the same time. A devaluation policy can only succeed in the short term if other nations do not do the same thing. The second reason was that most major powers also enacted protectionist tariffs to discourage foreign imports. The American example of this was the 1930 Smoot Hawley Tariff.

The currency wars of the 1930s likely helped prolong the Great Depression. The devaluation policies created distortions in the marketplace and also contributed to a sharp decline in international trade activity. It could even be argued that these policies in small part contributed to the rise of National Socialism in Germany in 1934 and, consequently, played a part in bringing about World War II.

Although there has been no period since the 1930s that can be legitimately characterized as a full-fledged currency war, many economists contend that similar devaluation policies in the early 21st century could give rise to currency wars in the future. There are a few examples to support this assertion. For instance, the Chinese government's policy in the early part of the century has been to support an export-based economic policy that has been manipulated to an extent by using China's domestic currency, the yuan, to purchase foreign currencies. This policy approach has the effect of devaluing the yuan, supporting Chinese exports, and discouraging foreign imports to China. Another example is the quantitative easing policies enacted in Japan, the United States, and the European Union in the wake of the 2008 global economic recession. The impact of quantitative easing is to increase the amount of domestic currency in circulation in order to stimulate economic activity and one of the policy consequences is that an affected domestic currency will, in theory, devalue against other world currencies.

While the above policies have not overtly been declared by respective nation-states as attempts to promote exports, the fact that so many countries are employing pro-monetary growth tactics creates a result where no nation individually accrues the full benefits of its policy goals. This is due to the fact that other nations are trying to accomplish the same goals at the same time. Just as in the 1930s, when multiple nations pursuing currency devaluation at the same time produced no benefit to any individual nation, so too the policies of the 2000s and 2010s are not fully producing intended economic results. In the 1930s, collective devaluation policies prolonged the Great Depression. The global economic recovery from the Great Recession has likewise been slow and prolonged, though not to the same degree. In part, this can be attributed to the fact that the world's leading economic powers have again tried to employ devaluation policies at the same time.

The empirical evidence strongly suggests that currency wars are bad for all nations involved. While governments may find political expediency in pursuing deflationary monetary policy in the short term, the long-term danger of instigating a currency war can produce devastating economic consequences. Political leaders need to carefully consider the potential ramifications of becoming entangled in currency wars when implementing certain domestic monetary policy.

CURRENT ACCOUNT

When countries buy and sell goods and services an accounting balance called the balance of payments is used to keep track of the value of these goods and services. The balance of payments is composed of three subcategories: the current account, the capital account, and the financial account. These accounts detail not only the value of imported and exported goods and services, but the flow of investment dollars to finance the purchases of real property, plant, equipment, and to purchase financial assets as well.

The current account records the transactions in four distinct categories: goods, services, income, and current transfers (transfer payments). The value of these payments is noted in the accounting terms of debits (which represent a decrease) and credits (which represent an increase). When money flows into a country as a payment from the sale of an exported item a credit is recorded. Conversely when citizens of a country buy an item imported from a foreign country this transaction is recorded as a debit in the current account representing the flow of money to the country's trading partner.

The first two categories, goods and services, compose what is commonly known as the balance of trade which represents all physical goods (movable goods) traded between nations, such as cars, soybeans, and computers. Additionally, the value of services (intangible items), such as tourism dollars being spent abroad by U.S. tourists visiting Germany or Japanese tourists visiting the United States, or banking services performed by overseas banks in Grand Cayman Island or Switzerland. The import and export of goods and services represent a large component of the value of the current account

The third component of the current account is income. When citizens who work overseas send income (wages/salaries) to their home country this affects the current account. For example, when an American teacher working in an international teaching program in China sends (remits) wages back the United States this transaction is recorded as a credit in the current account. Income not only refers to wages or salaries earned by citizens supplying their labor but to investment income as well. Investments include purchases of foreign stocks (ownership) and bonds (loans). When a Canadian citizen purchases bonds in the Finnish company Nokia, the receipt of the bond interest is considered income and represents a credit in the current account of Canada. When the Brazilian airplane manufacturer Embraer pays dividends to stockholders in Portugal this represents a debit in the current account of Brazil.

The fourth and final component is current transfers. This category represents the flow of money between nations but not for goods, services, or investment income. This transaction is known as a unilateral transfer. It accounts for money given as a gift by either a foreign government as some type of "aid" or by citizens of one country to residents in a different country. These transfers are not directly tied to economic production but they increase the disposable income of foreign citizens if money is flowing abroad or increase the disposable incomes if money is flowing into the home country. When Mexicans working in the United States send money to their families in Mexico this is represented as a credit in the current account of Mexico. If the government of France provides money to the Central African Republic in the form of "aid" this is represented as a debit in France's current account.

CUSTOMS UNION

A customs union (CU) is a form of regional trade agreement (RTA). A CU includes the elements of a free trade agreement (FTA) that grant member countries preferential tariff-free market access to member country products. The largest customs union is the European Union. Other large custom unions include MERCOSUR (Brazil, Argentina, Uruguay, Paraguay, and Venezuela) and the Andean community (South America, Bolivia, Colombia, Ecuador, and Peru).

A customs union also contains a common set of external tariffs to imported goods from nonmember countries. More coordination is required among members of a customs union than members of a FTA. In a CU member countries must agree to the negotiated external tariff in addition to the establishment of a means to collect and distribute tariff revenues. There is a tradeoff for members of a CU. They must be willing to relinquish a degree of national sovereignty and give up the right to sign trade agreements independently. Trade negotiations must be conducted and signed by the bloc as a whole. In exchange, members secure access to a much larger market. Many times tiny nations join CU's in order to trade with a larger neighbor.

The three main advantages of a customs union are:

1. Trading among members is increased by the elimination of, or a reduction in tariffs, making domestic goods more competitive in other member country markets.
2. It gives manufacturers and traders of domestic goods protection from nonmember goods by means of tariffs or quotas on all nonmember goods.
3. All members of the CU share in the collected tariff revenues that have been generated from nonmember imports. This is especially important to small countries that might not otherwise generate the same amount of tariffs due to their lower level of trade.

The three main disadvantages of a customs union are:

1. As mentioned members give up some degree of sovereignty and the ability to control their own actions, such as reduced control of their monetary policy, reduced control of the ability to spend and tax as they choose, and members must agree on negotiated tariffs, duties, taxes and quotas on non-member goods.
2. While a customs union can protect domestic industries from nonmember producers, they do not protect domestic industries from their neighbor member producers who are able to trade uninhibited by barriers to trade.
3. The larger member countries have economies of scale advantage over the smaller member of a customs union. Smaller members will have access to lower cost goods but at the expense of their own domestic producers.

The next level of an RTA above a customs union is a common market. It has all the attributes of a customs union but also includes an agreement that allows for free movement of inputs such as labor and capital between member countries. The final level of an RTA is an economic union. An economic union has all the characteristics of a common market but also includes a common currency and a common macroeconomic policy that includes defense policy, fiscal policy, and common citizenship rights. The best example of an economic union is the United States.

D

DE SOTO, HERNANDO

Born: 1941 in Arequipa, Peru; Nationality: Peruvian; Professional Interests: property rights; Major Works: *The Other Path* (1987), *The Mystery of Capital: Why Capitalism Triumphs in the West and Fails Everywhere Else* (2000).

Hernando de Soto is a Peruvian economist who believes that property rights are key to a working capitalist society. De Soto believes that the poor in Third World countries are unable to realize their economic potential because of their inability to obtain property rights. He founded the Institute for Liberty and Democracy in 1981 to act as a platform for research and to communicate his economic findings and beliefs. De Soto has won numerous awards for his work and has been an adviser to many world leaders.

Hernando de Soto Polar was born in Arequipa, Peru, in 1941 to a Peruvian diplomat father. His father was exiled in 1948 after a military coup, and moved the family to Europe. Raised in Europe with his younger brother, Alvaro, de Soto was educated in Switzerland, where he completed his postgraduate work at the Graduate Institute of International Studies. He became a successful economist, executive, and consultant in Europe before he earned enough money to retire at the age of 38. In 1979, de Soto returned to his native Peru to devote his life to solving the issue of global economic inequality.

De Soto had long wondered why, given intellectual and skill equality, Western nations in Europe, North America, and elsewhere thrived while Third World nations remained poor. When he moved back to Peru, he set out to research what made the difference. De Soto found that in Third World countries, the legal system, in particular access to property rights, was not available to everyone. Third World citizens are subject to a legal system that will not allow them to accumulate and transfer capital. This, de Soto claims, is the key to making capitalism work as well in Third World countries as it does in other areas of the world.

In 1981, de Soto created the Institute for Liberty and Democracy (ILD) in Lima, Peru. The ILD's mission is to equip governments with knowledge, expertise, and resources to employ institutional reforms in property and business rights allowing citizens to be participants in using the market economy to elevate them out of poverty. De Soto and his fellow ILD researchers initiated an investigation into the process of obtaining property rights in countries such as Peru, Egypt, and the Philippines. They discovered that it was extremely difficult. They found that in Lima, Peru, it would take more than 200 bureaucratic steps and 21 years to obtain the title to a piece of land. In Egypt, it would take 17 years to get authorization to build on a sand dune, and in Manila, Philippines, it might take 50 years to receive a land title.

In Peru in the 1980s, many of the poor were joining the murderous terrorist group the Shining Path to combat the government. De Soto published his book *The Other Path* in 1987 to reach out to potential Shining Path members and the Peruvian government. In his book, he tries to persuade Peru's farmers that they are future entrepreneurs and should join the legal economy instead of fighting it. Because they did not have access to the capitalist system, the poor would operate extralegally in black or shadow markets. De Soto argued that if the black markets were legalized and provided the same protection that was given to legal markets, the free market could thrive. His efforts were unpopular with the terrorist group, and several attempts were made against his life before the group finally lost most of its power in 1992.

In his book *The Mystery of Capital* (2007), de Soto explains the political responsibility of implementing a legal process for making property systems work for all citizens. He finds that because the poor do not own their land and cannot access capital, they are unable to expand their businesses. If the poor were given the land that they occupy, they would have the collateral needed for a loan and therefore could enjoy business growth. He also points out that the system that works so well in the United States has been established for only 100 years and contends that now that the formula is known, it can be copied expeditiously in other countries.

De Soto was chosen one of the five leading Latin American innovators of the century in 1999, and was named in the top 100 most influential people in the world in 2004 by *Time* magazine. He was named one of the 15 innovators in *Forbes* magazine's 85th anniversary edition. He has won numerous prizes for his work including the Freedom Prize (Switzerland), the Fisher Prize (United Kingdom), the Goldwater Award (United States), the Adam Smith Award (United States), the CARE Canada Award for Outstanding Development Thinking (Canada), the Americas Award (United States), the Academy of Achievement's Golden Plate Award in 2005, and the Most Outstanding of 2004 by the Peruvian National Assembly of Rectors.

De Soto gained early support from Margaret Thatcher, Richard Nixon, and Dan Quayle. He has also been an adviser to governments in Mexico, Egypt, Peru, El Salvador, Ghana, Russia, Afghanistan, and the Philippines. His foundation, the Institute for Liberty and Democracy, has been responsible for more than 400 laws and regulations in Peru that have opened up its economic system to the majority of citizens. De Soto's plans are being adopted by the unrecognized Eurasian country of Pridnestrovie and are gaining the attention of leaders worldwide.

DELORS REPORT

The Delors Report, named after the French economist and politician Jacques Delors, outlined a three-step plan to implement a single European economic and monetary unit. Delors was the president of the European Commission from January 7, 1985, to January 24, 1995, and was the first person to serve three terms. This report recommended the European monetary unit would become the euro. The Delors report originated in June 1988 and was created with the intent of managing and controlling exchange rates. A manageable and consistent exchange rate creates greater fertility of investments and capital flows.

With that in mind, the Delors Report outlined a plan to implement a single monetary unit that would lead to a free trade approach within Europe and provide a less volatile environment for investments between European nations. The report was submitted to the European Council of central bankers in April 1989 with unanimous consent and with the intent to integrate financial markets, currency conversion, and fixing exchange rates (European Commission n.d.).

The idea was inspired by the need for a unified European monetary system (EMS). Due to the numerous currencies and monetary policies of individual central banks in the European countries, exchange rates were increasingly unpredictable. By creating a cohesive combined system, national inflation—along with interest rates—converged, leading to greater stability of exchange rates. Therefore the fluidity of goods, services, people and capital could be allowed to increase.

The watershed moment was the Maastricht Treaty, also known as Treaty on European Union (TEU), approved in December 1991 by the European Council. The Maastricht Treaty was signed February 7, 1992. The treaty is named after the city of Maastricht in the Netherlands, where the meetings took place to discuss the implementation of a single currency and the three-stage plan outlined by the Delors Report. The approval of the treaty signified the start of transitioning to the euro.

Stage one of the transition consisted of instituting complete freedom of capital transactions. This meant the liberation of trade between nations in the European

Council. Furthermore it released the requirements of localized tariffs and quotas through the removing of physical, technical, and fiscal barriers. This was achieved with an emphasis on reducing disparities through budgetary consolidations and creating a structured and stable unified system (Delors 1989). It also called for the collaboration of central banks, which to this point had operated independently with multiple currencies. It asserted the use of the European currency unit (ECU), which was the predecessor of the euro, which also promoted economic convergence of nations (European Central Bank, n.d.).

The second stage created the European Monetary Institute (EMI), banned the granting of central bank credit and started the process of creating the European System of Central Banks. The EMI would oversee the creation of the euro and eventually become the European Central Bank (ECB) once the euro was launched. It continued integration of cooperation from the various national banks and was comprised mostly of its members. Crucially, in this stage the EMI began to take over operational control and monitor macroeconomic requirements. In doing so, it placed value on the process of developing collective decision making (Delors 1989).

The final stage of implementing a single European economic and monetary unit started in January 1999 and involved fixing conversion rates, introducing the euro, and outlining the conduct of policy of the European System of Central Banks. The final stage completed the merging of monetary policy to an inclusive system of the European Community. The Stability and Growth Pact was also initiated to prevent, or at least correct, budget deficiencies and debt burdens. The Stability and Growth Pact consisted of a set of rules on stable finances and fiscal policies for the EU members in order for the members to coordinate fiscal policies. Another crucial aspect of the last stage allowed for relative autonomy in the shaping of regional fiscal goals as a supplement to the overarching strategies of the ECB (Delors 1989).

DENG XIAOPING

Born: August 22, 1904, in Guang'an, China; Died: February 19, 1997, in Beijing, China; Nationality: Chinese; Professional Interests: China statesman; Major Work: Leader of China following Mao Zedong; incorporating market economic systems in China.

Deng Xiaoping was an important Chinese revolutionary, leader, and reformer. Deng received his early education in local schools in China, and he continued his studies in France and the Soviet Union during the 1920s. Later in the 1920s, he returned to his homeland to support the fledgling Chinese Communist Party (CCP). Deng endured the prolonged and costly civil war between the Communists and the ruling Kuomintang. In 1949, the Communists, headed by Mao Zedong, claimed victory over the Kuomintang. For the next five decades Deng helped mold China's economic future. Deng is widely viewed as the chief architect of China's gradualist economic reforms—reforms that eventually established China as a more market-oriented and globally connected powerhouse in Asia.

Deng assumed a number of key leadership roles in the newly formed People's Republic of China during the 1950s. He was often caught in the shifting tides of Maoist dogma and irrational CCP policies. In the mid-1950s, Deng sat comfortably as the secretary-general of the CCP and a member of the ruling Politburo. During the Great Proletarian Cultural Revolution of the 1960s, however, he was publicly disgraced, tossed out of the CCP, and forced to work as a manual laborer. By the early 1970s, he had regained favor within the CCP hierarchy and steadily rebuilt his power base. In 1978, two years after Mao's death, Deng emerged as China's leader.

Deng immediately set a new course for China's economic development. High on the economic agenda was the implementation of the Four Modernizations, reforms necessary to upgrade industry, agriculture, science and technology, and national defense. Deng slowly introduced policies to restore private incentives, encourage entrepreneurship, and rejoin the global economy. He established a dual-track economy to test the viability of market-oriented economic reforms. One track was the state-planned sector, a sector dominated by central planners and production quotas. The other track was a series of experiments in free-market economics. The household responsibility system was introduced on this second track. The household responsibility system enabled peasants to lease agricultural land from the government for farming. Farmers were required to sell a portion of their output to the state at a fixed price. The remainder could be sold at a market price for private profit. The success of the household responsibility system paved the way for additional market reforms, including profit-oriented township and village enterprises (TVEs), private entrepreneur-ship, joint ventures between foreign and domestic businesses, free trade zones, and numerous regional development zones. Deng often referred to his gradualist approach to economic reform as "crossing the river by feeling the stones." His gradualism created a hybrid economy which, by the 1990s, the Chinese labeled a "socialist market economy with Chinese characteristics."

Largely because of the market-oriented, outward-looking policies of Deng Xiaoping, China has a dominant position in today's global economy. Since the 1990s China has attracted more foreign direct investment (FDI) than any other country in the developing world. China was the world's second largest producer in 2011, ranked by gross domestic product (GDP) on a purchasing power parity (PPP). In 2014 China was the largest exporter and third-largest importer of goods and services in the entire global economy.

Economic problems remain, many of them connected with China's failed centrally planned economy. Weaknesses in China's economy include dysfunctional state-owned enterprises (SOEs), massive nonperforming loans in the state-run banking system, uneven regional development, pervasive corruption, and an authoritarian political system. Yet Deng's vision for a more globally connected, prosperous China has gradually taken root in the world's most populous country.

DEPENDENCY THEORY

The dependency theory is a theory of how developing and developed nations interact. The theory was first developed in the 1950s; it follows a Marxian analysis of the global economy and can be viewed as a contradictory theory to the free market theory. The dependency theory is built on the assumption that a developing country's resources would flow to an internal core of wealthy countries, leaving it poorer. This results in the improvement of wealthy developed nations at the expense of poor underdeveloped nations.

The dependency theory was established under the guidance of the director of the United Nations Economic Commission for Latin America, Raul Prebisch. Prebisch and his colleagues were puzzled by the fact that the growth experienced by industrialized nations did not necessarily lead to economic growth in poorer countries. Contrary to the free market ideology theory, which assumes that economic growth was beneficial to all, Prebisch's studies found that economic activity in richer and more developed countries often leads to serious economic problems in other countries.

Initially Prebisch described the situation in a very straightforward manner. Simply put, Prebisch described how poor nations were the main exporters of primary commodities to the rich countries in which the commodities were manufactured and then sold back to the poorer countries. The additional value added by manufacturing products costs more than the primary goods used to create the product. Thus, the poorer nations would never be earning enough from exporting goods to be able to pay for their imports.

Prebisch's solution to this included poorer countries adopting programs of import substitution in order to avoid purchasing manufactured products from the more developed and richer nations. The idea was this would be accomplished while still selling primary products throughout the world market but without using foreign exchange reserves in the purchasing of manufactured goods abroad.

Although this may seem like a rather simple solution and end to a viscous cycle there are several issues which make this solution improbable. The first issue is economies of scale. The poor nations were not large enough to implement the same economies of scale processing that the rich nations did in order to keep prices low. The second issue is the political environment of poorer counties. Not all of the poor nations possess the necessary governance to transform into primary product producers. The final issue was the level of control that poorer nations had over their primary products, specifically in selling these products abroad.

The research done by Prebisch and his colleagues encouraged others to think more creatively and historically about the relationship between rich and poor nations. The dependency theory is also helpful in attempting to explain the persistent poverty in poor nations. The traditional beliefs surrounding free market ideology suggests that open markets and free trade benefit developing nations by helping them to eventually join in the global economy as equal players. Once this happens it is implied that poverty will subside. In contrast the dependency theory is built on the belief that developing nations are continually feeding the developed nations by sending their wealth to the developed nations with minimal compensation. In dependency theory the developed nations are firmly keeping poorer nations in a subservient position though economic force such as issuing sanctions, or by excluding trade policies attached to loans granted by the World Bank.

DEVELOPING COUNTRIES

Developing countries are the poorer, less industrialized countries in the global economy. In 2004 the International Monetary Fund (IMF) revised its classification of economies to include two main categories: advanced economies and other emerging market and developing countries. Prior to 2004 the IMF and other multilateral organizations had identified three categories of countries: advanced, developing, and countries in transition. The developing countries are often referred to as the global South, mainly due to the geographic concentration of poorer countries in the southern hemisphere. The global North comprises 29 advanced economies. The remaining 179 economies in the world are classified as emerging market and developing countries.

The term *least developed countries* (LDCs) is reserved for the 50 poorest developing countries. As a group, the LDCs have the lowest average gross national incomes (GNIs) in the global economy. They are also most likely to be trapped in the vicious cycle of poverty. Low savings and investment rates, sluggish or negative economic growth per capita, and a deteriorating quality of life characterize the cycle of poverty.

While unique histories and cultures dot the developing world, most developing countries share several common characteristics. One common feature is a relatively low gross national income (GNI). GNI measures the nation's total income by adding up annual spending by households, businesses, and the government. The GNI per capita is the GNI divided by the country's population. The World Bank introduced the GNI per capita in 2000 to replace a similar measurement, the gross national product (GNP) per capita. Today, the World Bank and other international institutions classify countries by their GNI per capita. The four categories of countries include low-income, lower middle-income, upper middle-income, and high-income countries.

The low-income and middle-income countries are generally called developing countries. Income status is not a definitive statement of a country's development status, however. While the GNI per capita is a useful tool for cross-border statistical comparisons, there are limitations to using this measurement of economic well-being. For instance, GNI per capita does not include unreported business activity in the informal sector, or account for unreliable data collection methods, skewed income distribution within countries, or regional differences in purchasing power.

A second common characteristic of developing countries is high population growth. World population grew dramatically during the 20th century, and according to United Nations estimates world population will reach nearly 9 billion people by 2050. The burst in world population that occurred over the past half century is often called the population explosion. The great majority of population growth since 1950 has taken place in the developing world. Demographic trends indicate that nearly all population growth between 2000 and 2050 will occur in the global South. As a result, the population of the developing world will swell by an additional 3 billion people. Population growth creates a number of development challenges for poorer countries including unemployment and underemployment; internal migrations to overcrowded urban areas; degradation of local ecosystems; intense competition for resources such as fresh water, farmland, and mineral rights; and reduced saving and investment in private and public capital goods.

A third feature of many developing countries is limited natural resources. Limited natural resources might result from exploitation during a country's colonial period, few natural endowments, or current resource mismanagement. The scarcity of natural resources, and the desire to specialize in the production of goods in which a comparative advantage exists, steer some developing countries toward one-crop economies. In a one-crop economy, producers supply one or a few primary commodities, such as foods, beverages, agricultural raw materials, or minerals. One-crop economies are inherently unstable, as volatile commodity prices in global markets lead to periods of boom and bust. The mismanagement of resources, past and present, further erodes ability of countries to break the vicious cycle of poverty. Self-serving colonial regimes in the past, and widespread government corruption in the present, have squandered precious resources and retarded the growth process. Inefficient practices such as overgrazing, overfarming, and overtimbering have also wreaked havoc with fragile ecosystems. As a result, deforestation, desertification, and other forms of environmental decay wrack many developing countries. In addition, landlocked developing countries (LLDCs) and small island developing states (SIDS) are often cut off from essential resources by political borders or their remote location.

Finally, developing countries typically face high external debt obligations. External debt, also called foreign debt, is the money owed by one country to foreign creditors including governments, commercial banks, and multilateral organizations. Developing and transition countries accumulate the lion's share of external debt. In 2005 these poorer economies owed more than $475 billion in debt service payments to foreign creditors. The World Bank identified 56 low- and middle-income countries in 2014. Severely indebted countries were saddled with unsustainable external debt, a debt that could not be serviced without crippling the domestic economy and public services.

In recent years the topic of sustainable economic development in poorer world regions has become a front-burner issue for governments, multilateral organizations, non-governmental organizations, and others. In 2000 the UN General Assembly adopted the UN Millennium Declaration, which pledged to reduce global poverty and improve people's quality of life. The accompanying Millennium Development Goals (MDGs) outlined an agenda for global development, with specific targets to achieve by 2015. Of the eight MDGs, poverty reduction became the centerpiece of the global development agenda. The fact that 1.1 billion people lived on $1 or less per day in the early 2000s, and nearly 3 billion people lived on $2 or less, underscored the need for a global response to poverty. The seven other MDGs support poverty reduction. Other goals include universal public education, gender equity, reduced child mortality, improved maternal health, disease prevention, environmental protection, and the expansion of global partnerships in the economic development process. The MDGs have become a rallying point for development efforts by the United Nations System, World Bank, International Monetary Fund, regional multilateral development banks, national governments, and others in the global economy.

Developing countries often draft development plans to plot a strategy for sustainable growth and development. Development plans can be based on a command or a market model. A development plan based on the command model relies on government decision making. A development plan based on the market model puts most decision making into the hands of individuals and businesses. All development plans establish goals and set national priorities for development. At the heart of most development plans are policies to increase long-term productivity and growth, and improve the quality of people's lives. One common priority is to nurture the transition from traditional subsistence agriculture into industry and commercial services.

A second priority is capital formation—the expansion of a nation's capital stock. A third priority is human capital development and entrepreneurship. Human resources are often viewed as the wellspring of innovation and business creation. A fourth priority is trade expansion. Failed import substitution policies have given way to more successful export promotion policies in recent decades. Export promotion encourages efficient production based on a nation's comparative advantage, and the export of surplus output ranging from basic commodities to high-tech capital goods.

DEVELOPMENT ECONOMICS

Development economics is a specialized field of study in economics that deals with sustainable economic development. Development economics investigates a broad range of economic, political, and cultural topics that pertain to the nature and causes of economic growth and the quality of people's lives. Development economics, broadly defined, applies to sustainable economic development in all countries, advanced, emerging market, and developing alike. Yet, over the past half century, most of the work of development economists has focused on the prospects for sustainable development in the world's poorer regions.

Development economics straddles traditional lines between macroeconomics, microeconomics, and international economics. On the macroeconomic level, it deals with a country's gross domestic product (GDP), unemployment and underemployment rates, price levels, gross savings, investment, and capital formation. On the microeconomic level, it probes the issues of productivity, wage rates, income distribution, access to technology and knowledge, and the uses of society's factors of production—natural resources, human resources, and capital goods. Development economics also delves into the role of government in providing public goods such as schools and infrastructure; social services such as health care and financial assistance to the needy; and honest, competent leadership that protects the rule of law.

Development economics is also vitally connected with issues of connectivity in the global economy. Relevant topics include international trade, foreign direct investment, global capital markets, and economic assistance from national governments and multilateral organizations. Finally, development economics delves into social and cultural issues, institutions, and policies, including population growth, work ethic, entrepreneurial attitudes, and a host of other social or cultural norms that affect a country's prospects for development.

Development economics gained popular acceptance as a legitimate field of study after World War II. The spread of independence movements after the war forced government leaders and economists to consider the impact of decolonization on developing countries. Some early development theories during the 1950s and 1960s stressed linear development. Linear development models outlined uniform, sequential, and predictable stages of economic development. Walt W. Rostow was the leading advocate of the linear theory of development. In his book, *The Stages of Economic Growth: A Non-Communist Manifesto* (1960), Rostow identified five developmental stages. The first stage, the "traditional society," was characterized by subsistence agriculture and primitive barter exchanges. The second, "preconditions for take-off," was a transitional period that witnessed the rise of saving and investment, entrepreneur-ship, commerce, and national governments. Public investments in education and infrastructure also emerged during this transitional period. In the third stage, the "takeoff" was marked by industrialization, technological change, and still higher rates of savings and investment. As a result, higher productivity and economic growth became the norm during the nation's take-off stage. In the fourth, the "drive to maturity" widened the circle of enterprises that employed advanced capital and technology in production. A highly educated work force, pro-growth social values, and expanded international trade also supported rapid industrialization and economic growth. The fifth stage, the "age of mass consumption," witnessed the triumph of capital-intensive production. During this stage businesses produced a wide variety of capital goods and consumer goods, and households purchased the comforts of life.

Other early development theorists stressed the primacy of saving and investment in attaining economic development without relying on a linear framework. During the 1950s and 1960s, economic development was viewed mainly through the narrow lens of national output and economic growth. William A. (Sir Arthur) Lewis, a British economist, argued that the transition from a traditional subsistence agricultural economy to a modern economy was founded on productive investments in sophisticated capital goods, the infusion of foreign capital through foreign direct investment and entrepreneurial business activity. Lewis believed that sustained capital formation, and the use of surplus labor from the bloated agricultural sector, would increase business productivity, profits, and savings for reinvestment. At about the same time, American economist Robert M. Solow argued that the main drivers of economic growth were new technologies and knowledge. Solow's widely respected views stressed the need for sustained investment in research and development, education, and the application of new technologies to production in all economic sectors—agricultural, industrial, and services.

In the 1970s and 1980s other strands of development economics emerged. The dependency theory, for example, was widely acknowledged, especially among development economists and intellectuals in the third world. According to the dependency theory, developing countries were hopelessly dependent on the more powerful advanced countries for their economic survival. As a result, the poorer countries were relegated to an inferior, and static, position in the global economy. Dependency theorists often argued that discriminatory trade practices by the rich countries, abuses by powerful transnational corporations (TNCs), limited access to international capital markets, and other barriers explained the slow pace of economic development in the Third World. To counter the power of the world's leading capitalist countries, dependency theorists supported external debt forgiveness for the poorest developing countries, greater self-reliance, government controls over foreign investment, and inclusion in global decision making—particularly in multilateral organizations such as the World Bank and International Monetary Fund (IMF). In more extreme cases, dependency theorists supported aggressive nationalization or expropriation of domestic and foreign businesses, the collectivization of agriculture, and the creation of state-owned enterprises (SOEs) to replace private sector business activity.

A new direction in development theory emerged in the mid-1980s, one based on laissez-faire principles of government noninterference in the economy. Under the banner of a neoclassical revolution, development economists argued that government intervention in economic activity usually resulted in government failures, particularly the misallocation of resources. The neoclassicals opposed state planning and SOEs, which misallocated resources and distorted prices. They also opposed restrictive trade barriers, which thwarted prospects for global connectivity. Over the past 20 years the neoclassical economists have favored policies to promote good governance and the rule of law, enforceable private property rights, privatization, liberalized trade and investment, and market-determined prices. Today, the World Bank, International Monetary Fund, World Trade Organization, and other multilateral organizations share the neoclassicals' support for free-market answers to development questions.

Over the past 50 years the field of development economics has adapted to changes in the global economy, to different political currents, to world events, and to the expanded perception of sustainable economic development. Early development economists typically measured economic development by changes in national output. Today's version of sustainable economic development is more comprehensive. It measures sustained economic growth and improvements in people's quality of life such as higher adult literacy rates, longer life expectancies, better diet and nutrition, greater access to new technologies, increased consumption, and better social services. Not surprisingly, competing theories of economic development have risen and fallen over time. The linear development model so popular in the 1950s and 1960s has been largely discarded by economists in today's fast-paced, technologically connected global environment.

As time marched on, development economists emphasized different aspects of growth and development in their prescriptions for prosperity. Early economists focused on savings, investment in capital goods, and technology. Later economists added to and refined earlier work in the field. In time, other theorists stressed investment in human capital through public education, health care, nutrition, and access to economic opportunity. In the 1990s and early 2000s the groundbreaking work of Peruvian economist Hernando de Soto sought to expand opportunities by extending property rights to the poor. He argued that the inclusion of people from the informal sector, and their productive assets, was the key to capital formation and prosperity for all people. Today, another dominant theme in development economics is the need to infuse information and communications technologies (ICTs) into developing economies. ICTs are viewed as essential to a country's ability to leapfrog into the 21st century. A technology-driven approach to economic development is possible only if the global community initiates development policies to bridge the digital divide.

DRAGHI, MARIO

Born: September 3, 1947, in Rome, Italy; Nationality: Italian; Professional Interests: deficit financing, risk management, monetary policy; Major Works: *Public Debt Management: Theory and History* (coedited with Roger Dornbusch) (1990), *Transparency, Risk Management and International Financial Fragility: Geneva Reports on the World Economy 4* (with Francesco Giavazzi and Robert C. Merton) (2004).

Mario Draghi is an Italian banker and economist who succeeded Jean-Claude Trichet as president of the European Central Bank on November 1, 2011. Draghi served as governor of the Bank of Italy from 2006. He was awarded the Knight Grand Cross of the Order of Merit of the Italian Republic in April of 2000. Draghi was named a fellow of Harvard University's Institute of Politics at the John F. Kennedy School of Government in 2001.

Mario Draghi was born on September 3, 1947, in Rome, Italy. He studied at the Massimiliano Massimo Institute, later graduating from La Sapienza University of Rome in 1970 with a degree in economics. In 1977, he received his PhD in economics from the Massachusetts Institute of Technology (MIT). He wrote his dissertation, *Essays on Economic Theory and Applications*, under the supervision of Franco Modigliani and Robert Solow.

Draghi began his career in academia with the universities in Trento, Padua, and Venice from 1975 to 1981. He accepted a professorship at the University of Florence with the Cesare Alfieri Faculty of Political Science, where he remained until 1994. Concurrently, Draghi served as the Italian executive director of the World Bank until 1990.

Draghi's public service began when he became director general of the Italian Treasury in 1991. Beginning in 1993, Draghi chaired the Italian Committee for Privatisations. By 1997 and 1998, he had drafted legislation aptly known as "Draghi Law." The law sought to reform finance and corporate governance. From 1999 to 2001, Draghi chaired the Organisation of Economic Co-operation and Development's (OECD) Working Party No. 3 while also chairing the European Economic and Financial Committee in 2000 and 2001. He was also a member of the G7 Deputies.

In 2002, Draghi moved from government to private investment banking with Goldman Sachs International, serving as vice chairman and managing director. In 2006, he was elected to oversee the Bank of Italy as governor. His duties included the governing and general councils of the European Central Bank (ECB) and the board of directors of the Bank for International Settlements. During the subsequent five years, Draghi acted as chairman of the Financial Stability Board. Draghi was poised for perhaps the role of a lifetime as head of one of the world's most important central banks. He assumed his role as president of the European Central Bank on November 1, 2011.

Mario Draghi's rise as ECB's president was not without its challenges. Draghi was touted as a prospective suitor, but his early support from the French was delayed by their desire to have a Frenchman replace Trichet. Another obstacle arose when questions surfaced concerning Draghi's prior affiliation with Goldman Sachs.

With an alarming debt crisis looming, Mario Draghi inherited a tough job. He took immediate action akin to the efforts of his U.S. counterpart, Ben Bernanke, the chairman of the Federal Reserve Bank. Under Draghi's leadership, the ECB released 490 billion euros, a massive amount, to member institutions of the European Union, intended to ease the credit crunch. Like Bernanke, Draghi authorized bond purchases to aid member nations. He also reversed the actions of his predecessor, a move some opposed given the recessive climate and doomsday forecasts.

Though his swift actions were largely favored, some critics believed Draghi's laissez-faire approach to Greece's loan defaults presented a windfall to those institutions insuring bad debts. Likewise, dissenters argued that the ECB's and other central banks' additional round of debt financing would actually spark inflationary rises in key markets such as oil. As the European Central Bank's lead monetarist, Draghi's every action is followed and documented by the global press.

While presiding over ECB affairs, Draghi also serves as chair of the European Systemic Risk Board. He has held other distinguished posts such as an honorary trustee of the Brookings Institution in Washington, D.C., and as member of the board of trustees of Princeton University's Institute for Advanced Study. Draghi has been an instrumental adviser to a number of banking institutions and corporate entities, which included Eni, Istituto per la Ricostruzione Industriale, Banca Nazionale del Lavoro, and IMI.

Draghi has authored countless articles on a range of financial subject matter, specifically international finance and monetary policy. Draghi functioned as editor of *Public Debt Management: Theory and History* with Rudiger Dornbusch, which was first published in 1990. In alliance with Francesco Giavazzi and Robert C. Merton, Draghi wrote *Transparency, Risk Management and International Financial Fragility: Geneva Reports on the World Economy 4* in 2004. This fourth installment examined government guarantees to banks and the inherent risks imposed on the respective government's financial picture.

Draghi has received a host of awards and honors. In 2000, he received the Knight Grand Cross of the Order of Merit of the Italian Republic. He was named a fellow of Harvard University's Institute of Politics at the John F. Kennedy School of Government in 2001. Draghi was awarded an honorary distinction in statistics from the University of Padua in 2009. In 2010, he was awarded an honorary MBA from the CUOA (University Center of Business Administration) Foundation in Vicenza, Italy.

DUFLO, ESTHER

Born: October 25, 1972, in Paris, France; Nationality: French; Professional Interests: development economics, social economics; Major Works: "The Experimental Approach to Development Economics" (with Abhijit V. Banerjee) (2009); *Poor Economics: A Radical Rethinking of the Way to Fight Global Poverty* (2011); *Poor Economics: Barefoot Hedge-Fund Managers, DIY Doctors and the Surprising Truth about Life on Less Than 1 Dollar a Day* (2012).

Esther Duflo is a French economist with an international reputation for her pioneering work in development economics. An economics professor at MIT, Duflo is noted for her work literally out in the field to discover and address causes of and cures for poverty. Duflo founded and was the first director of the Jameel Poverty Action Lab (J-PAL). She is credited for pioneering the study of development economics with the application of randomized control trials like those conducted in medicine. Duflo explores the causes and cures of the microeconomic issues such as education, health, and finance in developing countries.

Esther Duflo was born on October 25, 1972, in France. She studied history and economics at the Ecole ormale Superieure in Paris, receiving her BA in 1994. During her time at Ecole ormale Superieure, she studied in Moscow, Russia, working with development economist Jeffrey Sachs. A year later in 1995, she earned her master's in economics from DELTA in Paris. She came to the United States to pursue her PhD in economics. She received her doctorate in economics from MIT in 1999.

Upon graduation, MIT appointed her an assistant professor of economics. Duflo also was a one-year visiting professor at Princeton University during the 2001–2002 academic year and served a six-month leave at the Paris School of Economics in 2007. By age 29, she was a tenured associate professor. In 2005, Esther Duflo founded J-PAL at MIT and was named the Adbul Latif Jameel Professor of Poverty Alleviation and Development Economics. Through J-PAL, Duflo and her colleagues initiate research that evaluates the microeconomic issues of developing countries. J-PAL concerns itself with evaluating through randomized control trials social programs (health, education, finance) that directly impact the poverty-stricken people and families in less developed countries.

Esther Duflo's professional activities go beyond J-PAL. She serves on the board of the Bureau for Research and Economic Analysis of Development (BREAD), is a research associate for the National Bureau for Economic Research (BER), and directs the Center of Economic Policy Research's development economics program. Duflo was the founding editor of the *American Economic Journal: Applied Economics.* She is also a coeditor for the *Review of Economics and Statistics* and the *Journal of Development Economics,* and a member of the Human Capital Research Programme for the International Growth Center.

Duflo's research incorporated field experiments in developing countries on several social fronts to identify causes so they could prescribe solutions. Her J-PAL teams investigated areas including the behavior involved in household decision making, educational issues such as school uniforms and absentee teachers, access (or lack thereof) to financial resources, and financial decision making regarding health issues including immunizations. They also evaluated public policies as they applied to these microeconomic issues.

In 2011, Esther Duflo and Abhijit Banerjee (J-PAL cofounder and colleague) published *Poor Economics: A Radical Rethinking of the Way to Fight Global Poverty. Poor Economics* was awarded Business Book of the Year by both the *Financial Times* and Goldman Sachs. Duflo and Banerjee addressed the small microeconomic questions of economic development. They revealed the results on a series of 18 countries' sets of data and topics researched using their pioneering randomized control trials methodology. Many of the causes and effects they revealed were counterintuitive, which raised the debate of effective prescriptions for developing countries.

Two topics they explored were microfinance and malnutrition. They launched a debate on the effectiveness of microfinance though they were still positive on it. Their observations and trials revealed that most individuals would trade, without hesitation, their small business for a factory job. They are "reluctant entrepreneurs." Duflo and Banerjee also found discrepancy with business funding in developing countries as medium-size businesses have limited access to financial resources. They also argued that the problem with the diet of malnourished people in different countries was not the quantity of food but the quality, an issue of nutrition and not hunger.

Esther Duflo has received countless honors and awards for her work, including the John Bates Clark Medal in 2010. In 2009, Duflo was a John D. and Catherine

MacArthur Fellow and was awarded the inaugural Calvo-Armengol International Prize. In 2005, she was honored as the *LeMonde/Cercle des economistes* (*LeMonde*/The Circle of Economists) best young French economist. *Foreign Policy* magazine recognized Duflo as one of the top 100 intellectuals in 2008, and there were similar recognitions by *The Economist* and *Time* magazine. In 2009, Duflo became an American Academy of Arts and Sciences fellow. She was nominated by President Obama to serve as a member of the President's Global Development Council.

Esther Duflo has been labeled a left-of-center redistributionist in achieving global equity and prosperity. She has been criticized as an activist whose activism blurs her economics. She is unapologetic and views her role as vital to achieving a better future. Duflo has been a pioneering presence and driving force in furthering the use of field experiments as a methodology to identify solutions and advocate for the poor.

DUMPING

Dumping is an illegal trade practice that occurs when a company from one nation sells its output in a second country at a price lower than its production costs, or lower than the price charged in its own domestic market. Under the World Trade Organization's (WTO's) Anti-Dumping Agreement, countries can defend domestic industries against dumping with prescribed anti-dumping measures.

Exporting companies dump products in foreign markets at artificially low prices for two main reasons. First, dumping is used to reduce or eliminate unsold inventories of certain goods. This often happens when the exporting country is in recession and domestic demand for output is low. Reluctant to fire workers or close plants, exporting companies continue to produce goods at a loss for overseas markets. Second, exporters dump products in foreign markets to undercut competitors in the second country. In this respect dumping involves predatory pricing and is designed to gain a foothold in the second country. Whichever the motive, dumping threatens the survival of some firms and jeopardizes job security for workers in the targeted country.

The WTO's Anti-Dumping Agreement established the world's most recognized guidelines for anti-dumping actions. Before a government can retaliate against an exporter for alleged dumping, the government must satisfy three requirements. First, the government must prove that dumping has taken place. Proof of dumping may involve a price comparison with prevailing market prices in the exporter's home country, or with the market price of the exported product in a third country. Second, the government must calculate the magnitude of the dumping. This calculation is normally expressed as the difference between the normal market price of the product in the exporter's home country and the market price in the second country. Third, the government must prove that the dumping has damaged domestic producers, or at least has the potential to damage domestic producers.

It may appear that existing rules and procedures to identify and deal with dumping are in place, but the application of existing regulations is subject to interpretation. There are many gray areas in determining what constitutes dumping, and in what constitutes an appropriate response to dumping. The WTO's Anti-Dumping Agreement was the culmination of a quarter century of debate and litigation, first under the General Agreement on Tariffs and Trade (GATT) and later under the WTO. Yet, even today, the issue of dumping remains a challenge to the stability of the global trading system. One celebrated anti-dumping action involved U.S. retaliatory duties on Russian and Japanese steel during the late 1990s and early 2000s. Cases of dumping that make the headlines represent just the tip of the iceberg. With more than 40 active disputes under review by the WTO, 2014 was one its most active years, with an additional 34 actions still being investigated and six actions under appeal.

Dumping, and resulting anti-dumping actions, creates instability in the global trading system. When exporters dump their wares in foreign countries, they disrupt normal pricing mechanisms, threaten domestic producers, and invite retaliation by foreign governments. Anti-dumping actions also pose a significant obstacle to international trade. By the early 2000s, anti-dumping actions were used by governments in the advanced and developing countries as a type of trade barrier, a loophole in the WTO's prohibitions against other forms of trade protectionism. Anti-dumping actions included exorbitant tariffs on disputed products. Tariffs topping 300 percent of the value of disputed items were not uncommon. Some economists see aggressive anti-dumping actions as a form of disguised protectionism, which can not only disrupt international trade but can also reward production inefficiency in domestic markets.

E

EAST ASIA: GENERAL ECONOMIES

The East Asia economies include those Asian nations who border the Pacific Ocean. The dominant economy in the region immediately after World War II was Japan, but by the late 20th century the success of the Asian Tiger economies also attracted significant attention. Most recently, China's early 21st-century transition to a relatively more liberalized economy has ensured its position as a major regional power.

The story of the East Asian economies during the post–World War II era has been one of dramatic economic advancement in comparison to most of the rest of the world. This process has sometimes been dubbed the Asian Miracle. In more recent years, however, these nations have experienced challenges in maintaining their rates of growth.

In the 1950s the economies of East Asia significantly lagged behind those of North America and Europe. Japan was still in the process of recovering from the destruction of the war. Other nations within the region, in addition to post-war recovery, were in the process of breaking away the bonds of colonial relations that they had lived under for several centuries.

The Japanese economy was the first to recover, initially resulting from American aid, but later almost exclusively due to the cooperative effort of the Japanese government and private sector industry. In 1950, Japanese gross domestic product (GDP) per capita (measured in 1990 Geary-Khamis/International dollars) was only $1,921, approximately 33 percent less than it had been in 1941 when the nation had declared war on the United States. Japan rapidly reindustrialized and the government relaxed antitrust laws to allow companies to expand and integrate both horizontally and vertically. Further, the government established protectionist trade policies that were intended to encourage net manufactured exports.

Japan's performance over the next several decades was impressive, as the nation regained its status as a major world economic power. The nation's automobile manufacturing industry, which produced less than 50 thousand automobiles in 1950, grew to produce 11 million units by 1980. The Japanese economy grew at an annual rate of 8.8 percent in the 1950s, 10.5 percent in the 1960s, 4.5 percent in the 1970s, and 4.0 percent in the 1980s.

In the wake of Japan's success, other regional nations also experienced economic expansion. The nations of Hong Kong, Singapore, South Korea, and Taiwan became known as the Asian Tigers as a result of their successes. Each country followed the Japanese example of a coordinated economic policy that featured significant cooperation between the government and private sector. The tiny and resource-scarce nations of Hong Kong and Singapore specialized as major financial centers while South Korea and Taiwan more closely resembled the Japanese example of promoting manufactured exports. The remarkable growth of the Asian Tigers is exemplified by Hong Kong's, Singapore's, South Korea's, and Taiwan's annual economic growth rates of 9.0 percent, 9.0 percent, 8.4 percent, and 9.8 percent, respectively, in the 1970s, as well as rates of 6.5 percent, 7.1 percent, 9.1 percent, and 7.9 percent, respectively, in the 1980s.

Subsequent to the rise of the Asian Tigers, another wave of Asian economies enjoyed takeoff during the 1980s. The nations of Indonesia, Malaysia, the Philippines and Thailand are referred to as the Asian Cubs. During the 1980s these four countries experienced healthy annual growth rates, but at far more modest levels than the Asian Tigers had.

The substantial growth rates of Japan, the Asian Tigers and the Asian Cubs over extended periods of time created an economic boom climate that ultimately could not be sustained. There were a number of causal factors, but the most important was the policy of many East Asian countries to peg their currencies against the United States dollar. A second contagion factor was the rapid increase in prices of real assets, and particularly real estate. In 1997, a financial panic gripped Thailand and eventually spread to all of the major economies in the region. The situation became so dire that the International Monetary Fund was forced to provide direct assistance to Thailand and Indonesia. All of the region's economies suffered as a result of the 1997 crisis.

Remarkably, the region's recovery was relatively fast. Thailand and Indonesia quickly repaid their International Monetary Fund loans. As of 2013, the World Bank lists Japan and the Asian Tigers among the top thirty wealthiest economies in the world base on a GDP per capita basis.

The most recent economic development within the region over the past twenty years has been the growth of the Chinese economy. China possesses the largest regional economy in terms of gross GDP. However, in terms of GDP per capita it still lags significantly behind its regional partners. In 1995, the nation's GDP per capita was US$608. Its estimated GDP per capita in 2015 is $7,594, representing an astounding 13.5 percent annual growth rate over a 20-year period. In 2015, the Chinese economy experienced an abrupt slowdown. Whether this slowdown is temporary or long-term in nature is still undetermined.

EASTERLY, WILLIAM

Born: September 7, 1957, in Morgantown, West Virginia; Nationality: American; Professional Interests: economic development, growth in developing countries; Major Works: *The Elusive Quest for Growth: Economists' Adventures and Misadventures in the Tropics* (2001), *The White Man's Burden: Why the West's Efforts to Aid the Rest Have Done So Much Harm and So Little Good* (2006), *A Tyranny of Experts: How the Fight Against Global Poverty Suppressed Individual Rights* (2014).

William Easterly is a professor of economics at New York University (NYU) and the codirector of NYU's Development Research Institute. His main fields of interest are economic development and growth, foreign aid, and the macroeconomics of developing countries. He authored two books: *The Elusive Quest for Growth* (Massachusetts Institute of Technology, 2001) and *The White Man's Burden* (Penguin, 2006); edited three books: *What Works in Development, Reinventing Foreign* Aid, and *The Limits of Stabilization;* and published more than 60 peer-reviewed academic papers. In 2008 and 2009, *Foreign Policy* magazine named him among the top 100 global public intellectuals.

William Russell Easterly was born in West Virginia on September 7, 1957, and raised in Bowling Green, Ohio. He received his BA from Bowling Green State University in 1979 and his PhD in economics from Massachusetts Institute of Technology (MIT) in 1985. He worked for 16 years as a research economist and senior adviser at the Macroeconomics and Growth Division at the World Bank. From 2001 to 2003, he worked at the Institute for International Economics and the Center for Global Development. Since 2003, he has been a professor of economics and codirector of the Development Research Institute at NYU. His work in the developing world has been mainly focused on Africa and Latin America, and it is widely reviewed by major media outlets.

In *The Elusive Quest for Growth* (2001), Easterly discusses the main factors behind the lack of developmental growth in Third World countries since World War II. He is specifically critical of governments and institutions such as the World Bank and the International Monetary Fund who try to implement various economics policies without understanding the culture and native people's financial incentives. He argues that without the financial motivation of local people, policies toward capital accumulation, education, and population control not only are useless but also, over time, add to the corruption, high debt, and financial crisis in poor countries. The key, he discusses, is not in applying the planned theories of development economics but rather is in understanding the local economy, increasing the demand for product and services that help poor countries move forward, and enhancing poor countries' abilities to implement productive and profitable lines of market activities. In this case, the market would automatically determine the optimum level of important economic indicators, such as education and population size, that undeveloped countries are battling with.

In *The White Man's Burden* (2006), Easterly discusses two different approaches to providing aid to poor countries: a planner's approach versus a searcher's approach. According to Easterly, planners are those who think they already know the answers. Searchers acknowledge they do not know the answer. Searcher sees poverty as an intricate interdependence of social, historical, political, institutional, and technological factors. He argues that searchers offer a piecemeal problem-solving approach: collecting detailed information from the locals to first understand the culture and the problems, then applying different methods to solve the problems. Finally, searchers collect feedback from the community they are serving to analyze the method(s) used to find the optimum solution(s) to specific problems. Planners, however, measure the success of aid programs by the amount of money spent by the rich countries, not by their effectiveness in solving the locals' problems. Easterly submits that in the fight against global poverty, sometimes the best plan is to have no plan at all.

Easterly was the principal writer of the *Aid Watch* blog, a project of New York University's Development Research Institute. No longer active, the main idea behind the *Aid Watch* blog was to raise awareness of the aid programs because the authors believed that if more people watched and scrutinized the aid programs, more aid would reach the intended population.

Easterly's opponents criticize him for his rhetorical thrashing of those who he describes as ill-intended enemies of the poor. They argue that the ineffectiveness of Western-initiated developmental aid should encourage more dialogue and more scrutiny over the implementation of these programs to make them more effective, not dismiss such programs altogether as Easterly suggests.

Easterly has his detractors, who support the increase in international aid to poor countries while concurrently canceling their debt, but are critical of Easterly's pessimism and assert that Easterly disregards foreign aid even where it was successful in the past. Easterly's counterpoint, however, is that while for the past 50 years foreign aid to poor countries has increased dramatically, global poverty, especially in the areas that received the most amount of aid, has increased sharply as well. While others agree with Easterly regarding the ineffectiveness of past aid programs, they contribute this failure not to foreign aid but to an insufficient amount of foreign aid. Regardless, the majority of developmental economists agree that because of corruption among high-level officials in poor countries, most foreign aid did not reach the intended recipients.

William Easterly has written two books, coedited three others, and published more than 60 academic papers in peer-reviewed journals. His work has been addressed in many media outlets such as the *New York Times*, the *Wall Street Journal,* and the *Washington Post,* to name a few. He is one of the best-known development economists of the 21st century.

ECONOMIC COMMUNITY OF WEST AFRICAN STATES

The Economic Community of West African States (ECOWAS) is a 15-member multilateral organization designed to promote economic integration, sustainable growth and development, and regional political stability in West Africa. The Treaty of Lagos (Nigeria) established ECOWAS on May 28, 1975. The organization's original fifteen members included Benin, Burkina Faso, Cote d'Ivoire, Gambia, Ghana, Guinea, Guinea-Bissau, Liberia, Mali, Mauritania, Niger, Nigeria, Senegal, Sierra Leone, and Togo. Cape Verde joined ECOWAS in 1977, and Mauritania withdrew from the organization in 2002. The principal institutions of ECOWAS include the Authority of Heads of State and Government, the Council of Ministers, the Community Parliament, the Social and Economic Council, the Community Court of Justice, the Mediation and Security Council, and the Executive Secretariat.

ECOWAS's original mission centered on regional economic integration and shared development. During the organization's early years, there was also a drive for greater self-reliance by the newly independent West African nations, nations that were anxious to distance themselves from their colonial past. In the early 1990s, revisions in the ECOWAS agreement established specific regional economic goals, including the creation of a common market and a unified currency. In addition, a series of protocols were enacted to support conflict resolution and regional stability. In recent years ECOWAS's peacekeeping protocols have been tested repeatedly in nations such as Liberia, Guinea-Bissau, Sierra Leone, and Cote d'Ivoire. The creation of the Mechanism for Conflict Prevention, Management, Resolution, Peacekeeping and Security in 1999 formalized the organization's commitment to regional harmony.

Recent high-level ECOWAS meetings have accelerated plans for regional integration. The Bamako (Mali) Declaration of 2000, for example, pledged support for free cross-border movements of goods, investments, and people; monetary integration; human resources development; and intraregional infrastructure development. To jump-start the implementation of these goals, five member nations—Gambia, Ghana, Guinea, Nigeria, and Sierra Leone—agreed to fast-track the process. This group initiated formal discussions to create a single ECOWAS currency, the Eco, an initiative scheduled for implementation in 2005. Under the leadership of Nigeria, the region's largest country, the group also planned to create a West African free trade area (FTA) and construct intraregional infrastructure projects such as highways, telecommunications systems, railroad and shipping lines, and electricity grids.

Progress toward regional economic development and stability in ECOWAS countries has been pitted with obstacles. Over the past 30 years, ECOWAS members have dealt with extreme poverty, poor governance, civil unrest and international conflict, rapid population growth, unstable commodity prices, high external debt, and the lack of a sophisticated physical and technological infrastructure. Oil-rich Nigeria remained ECOWAS's dominant member nation, accounting for over half of the region's total population and gross domestic product in the early 2000s.

EMBARGO

An embargo is a type of economic sanction that a government or other political entity imposes on another country. A comprehensive economic embargo halts all trade, investment, and other commercial contacts between two countries. More selective embargoes can also stop trade in a specific good or type of technology. In recent years arms embargoes have been widely used to reduce the availability of munitions to governments that sponsor terrorism, violate people's human rights, or otherwise impose their will on other peoples. Many embargoes are politically motivated, designed to pressure another government to change a domestic or international policy. During the past few decades embargoes have been initiated by individual countries, such as the United States; multilateral organizations, such as the United Nations (UN); producer cartels, such as the Organization for Petroleum Exporting Countries (OPEC); and regional trade blocs, such as the European Union (EU).

The comprehensive U.S. embargo on Cuba is among the world's most contentious economic sanctions. The embargo began in 1960 in response to Fidel Castro's successful ouster of a U.S.-backed government in Cuba. The embargo stopped virtually all trade, investment, and other business dealings between the United States and Cuba. The U.S. embargo on Cuba was strengthened in 1996 when Congress passed the Cuban Liberty and Democratic Solidarity Act, also called the Helms Burton Act. Under the Helms Burton Act, the United States pledged to extend the existing embargo to any company, foreign or domestic, caught trafficking U.S. properties that had been confiscated by the Castro regime. The Helms-Burton Act created a firestorm of protest throughout the world, and its enforcement was suspended repeatedly by President Bill Clinton during the late 1990s and by President George W. Bush in the early 2000s. The U.S. embargo crippled economic development in Cuba, but failed to weaken the resolve or authority of the Cuban dictator Fidel Castro. In 2004, the UN General Assembly approved a resolution condemning the U.S. embargo of Cuba by a 179 to 4 vote—the thirteenth official UN condemnation of the embargo. In 2016, President Barack Obama and Cuban President Raul Castro called for an end to the U.S. trade embargo as part of a broader effort to normalize relations between the two nations. Obama lifted some travel and financial restrictions, however Congress strongly opposed the presidents' calls to lift the embargo. Over the years, other U.S. embargoes were imposed on countries that sponsor terrorism, including Iran, Iraq, Libya, and Sudan.

UN embargoes support the organization's peacekeeping and humanitarian functions. For example, UN Resolution 661, which was approved in August 1990, slapped a comprehensive trade embargo on Iraq. The UN embargo was designed to end Iraq's illegal occupation of neighboring Kuwait. The failure of UN sanctions prompted a military response early in 1991. After a UN coalition force liberated Kuwait in early 1991, the embargo was resumed to help ensure Iraqi compliance with the conditions of peace. Shortly thereafter, modifications in the embargo permitted Iraq to export limited qualities of oil on the condition that oil revenues were used for humanitarian purposes, a concession referred to the oil-for-food agreement. The UN embargo on Iraq during the 1990s and early 2000s yielded uncertain benefits. Corruption in the oil-for-food program, and certain confrontational postures by Iraqi dictator Saddam Hussein, led to a U.S. invasion of Iraq in March 2003. Soon after Hussein's regime collapsed, the UN embargo was lifted. Other UN embargoes were previously placed on Rhodesia (1970s) and South Africa (1980s) to pressure white minority governments to end racist domestic policies, and on Serbia (1990s) in response to horrific human rights violations.

The sting of an economic embargo was felt by the United States and other advanced economies during the 1970s. In 1973, the Arab members of OPEC imposed an oil embargo on the United States, Japan, and several Western European countries to punish certain advanced economies for their support for Israel during the Yom Kippur War. The United States and the Netherlands, each staunch supporters of Israel, bore the brunt of the oil embargo. Shortages of gasoline, home heating oil, and other petroleum-based products caused hardships for consumers and businesses. The embargo was lifted in March 1974. The embargo provided a rallying point for OPEC. By flexing its collective muscle in 1973–1974, the OPEC cartel was able to quadruple oil prices in global markets during the period.

EMERGING MARKET ECONOMIES

Emerging market economies are countries that have made significant strides toward capitalism and sustainable economic development. The term emerging market economies has been used for decades. The International Monetary Fund's (IMF's) 2004 reclassification of world economies brought new attention to the term emerging market economies. The IMF's classification of economies during much of the 1990s and early 2000s identified three main categories of economies: advanced economies, developing economies, and transition economies. The IMF's 2004 reclassification scheme eliminated the transition economy category. The two categories of economies include advanced economies, and emerging market and developing countries.

The emerging market economies (EMEs) are countries that successfully implement market-oriented economic reforms, and make steady gains in economic growth and development. There is no definitive economic, geographic, or political line that separates the EMEs from other developing countries. Yet, there are some generally recognized characteristics that help make the distinction.

First, EMEs are generally classified as lower middle-income or upper middle-income countries. Most low-income countries were classified as developing economies. Second, EMEs are growth-oriented. Economic growth, in this context, is typically measured by sustained increases in the country's real gross domestic product (GDP) per capita. Third, some EMEs are transitional countries, shifting from closed or static economies to open market-based economies.

The former communist countries of eastern and central Europe, such as Hungary, Poland, and Russia, illustrate this type of transition. Other countries not previously part of the communist world, such as India, South Africa, and Mexico, are also transitioning. Fourth, EMEs are active participants in the global economy. They liberalize trade, court foreign direct investment (FDI), develop sophisticated capital markets, and stabilize the value of their currencies. They tend to be members of, and solicit technical assistance from, multilateral organizations such as the World Bank, IMF, and regional development banks. China, Malaysia, and Thailand, for example, embrace globalization as a key element in their economic development. The May 2004 enlargement of the European Union (EU) also reflects the outward-looking mentality of nine European EMEs, including the Czech Republic, Estonia, Hungary, Latvia, Lithuania, Malta, Poland, the Slovak Republic, and Slovenia (the tenth accession country, Cyprus, is classified as an advanced economy). Finally, EMEs support good governance and the rule of law. EMEs institute political reforms to democratize the political system, establish and enforce business codes to protect market institutions, and guarantee transparency in public and private sector business activities. Examples include the EU accession countries, Chile, and Argentina.

EMEs exist in all world regions. Emerging Europe, for example, includes most of the former communist nations of eastern and central Europe, such as the Czech Republic, Hungary, and Poland. It also includes several countries that were "republics" within the former Soviet Union, such as Estonia, Latvia, and Lithuania. Since the early 1990s, the 28 countries of eastern and central Europe, and central Asia were commonly called the transition countries. Their economic transition was from centrally planned communist economies to market-oriented economies. Their political transition was from single-party totalitarian regimes to democracy. Emerging Asia includes several of the world's largest emerging market economies, such as China and India. Measured by purchasing power parity (PPP), China and India account for more than 19 percent of total world output, more than the 12-country European Monetary Union (EMU), and nearly triple the output of Japan. Other major emerging market economies exist in Africa, such as South Africa, and the Americas, such as Argentina, Brazil, Chile, and Mexico.

The EMEs and developing countries face similar types of economic and political challenges. The main difference between the two groups is one of degree—the EMEs recording significant gains in economic freedom and development and the developing economies victimized by extreme poverty, poor quality of life, sluggish or negative economic growth, and corrupt or repressive governments. The progress of EMEs toward sustainable economic development is sometimes pitted with obstacles. For example, extreme poverty confronts EMEs such as India and Indonesia. Financial crises in East Asia, Russia, and Brazil during the late 1990s threw many EMEs into an economic tailspin. The lethargic pace of democratic reforms in China, and questionable electoral practices in Russia, are also challenges to the process of development. Still, the economic and political progress of EMEs far outpace that of other developing countries such as Liberia, Somalia, and Sudan in Africa; Cambodia, Myanmar, and North Korea in Asia; Azerbaijan, Tajikistan, and Uzbekistan in Central Asia; and Haiti and Cuba in the Americas.

EURO (EUROPEAN CURRENCY UNIT)

The introduction of one currency (euro) in the European Community originated from the final point of the Maastricht Treaty. The Maastricht Treaty was composed of 12 nations (United Kingdom, France, Germany, Italy, Ireland, Belgium, Denmark, the Netherlands, Spain, Portugal, Greece, and Luxembourg) that had interest in discussing the steps towards creating a single monetary currency for the European Union. The treaty obtained its name because of where the meetings were being held, the Dutch town of Maastricht. The Maastricht Treaty was a significant step towards the implementation of the Euro currency and economic monetary union. The euro was adopted on January 1, 1999.

During the transition of the currencies from the 12 countries to the Euro, individual countries were asked to follow strict orders to make the transition to the euro a smooth one. Countries were asked to adhere to several rules: nations should not exceed more than 3 percent of gross domestic product (GDP); public debt must be kept under 60 percent of GDP; inflation rates within a 1.5 percent of the three lowest inflation rates in Europe and exchange rate stability.

Nineteen of the 28 member states of the European Union use the banknotes and coins, including the overseas departments, territories, and islands that are associated with the euro area countries. These countries form the Euro Area. The microstates of Andorra, Monaco, San Marino, and Vatican City also use the euro on a formal arrangement with the European Community. Also, the countries of Montenegro and Kosovo use the euro without a formal arrangement from the European Central Bank.

Implementation of the single currency was a three-step process. The first step consisted of eliminating controls on capital movements within the EU. The second step was the establishment of the European Monetary Institute, and finally the third step was the introduction and implementation of the euro.

During the transition to the euro there were growing concerns from a wide group of groups and individuals. Concerns regarding the change of currency included concerns about the costs and benefits of monetary union. One benefit that was well recognized was that of not having to convert currencies between neighboring countries; another benefit was to reduce the effects of exchange-rate uncertainty on investment and trade. In the wake of the capital market liberalization required under the Single European Act, the political economy of a single currency created problems of floating rates and caused Fortune 500 companies to relocate in other countries were they felt their investments were safe.

The expansion of the European Union brought its own issues, such as the process by which new members would be added and expansion of the migration of people between nations. Expansion also posed limitation problems on the EU governance structures. Expansion of the EU put pressure on the government structures, especially with the EU voting system.

EUROPEAN BANK FOR RECONSTRUCTION AND DEVELOPMENT

The European Bank for Reconstruction and Development (EBRD) is a regional development bank that serves 65 shareholder nations in five continents. EBRD operates in south-eastern Europe, central Europe and the Baltic States, eastern Europe and the Caucasus, southern and eastern Mediterranean, and central Asia, along with Russia and Turkey.

EBRD was founded in May 1990, and began its commercial operations in June 1991. It is one of four major regional development banks currently operating in the global economy. Its 60 member countries, the European Community, and the European Investment Bank, own EBRD by virtue of their purchase of shares in the bank. The largest shareholders are the United States, France, Germany, Italy, Japan, and the United Kingdom. Combined, these six countries own about one-half of all subscribed capital. Each member country has voting power in proportion to its ownership of bank shares. At the top of EBRD's power structure is its board of governors, which represents the bank's members. The board of governors delegates most of its authority to a board of directors, however. The board of directors conducts bank operations from its headquarters in London, United Kingdom.

Of EBRD's 65 member countries, 36 are eligible to borrow money from the bank. These countries are called "countries of operations." Nonregional EBRD members hail from Asia and the Pacific, Europe, the Middle East, North America, and Northern Africa. According to EBRD's Establishing Agreement, the purpose of the bank is to promote regional economic development and to "foster the transition toward open market-oriented economies and to promote private and entrepreneurial initiative in the central and eastern European countries committed to and applying the principles of multiparty democracy, pluralism and market economics." The break-up of the Soviet Union in December 1991 hastened the growth in EBRD. The 15 republics of the Former Soviet Union (FSU) became independent countries and joined EBRD. By 2005 there was some discussion about ending EBRD operations in countries that had successfully transitioned from communism to capitalism.

EBRD promotes regional economic development through its lending operations, policy advice, and technical assistance. EBRD raises most of its funds by borrowing in global capital markets. In 2015, private sector projects account for 78 percent of the EBRD's operations. Public sector projects account for the remaining 22 percent of the bank's business activity. In 2015, the EBRD provided €9.4 billion (approximately $10.5 billion) for over 381 projects in 35 emerging nations. The main categories of bank operations included lending for financial institutions accounting for one-third of EBRD loan activity. EBRD also made loans for infrastructure, municipal water and waste treatment, transportation including roads, and energy including fuel production, oil, coal, and natural gas. The EBRD is also active financial participant in the industrial sector of manufacturing, heavy industries, aircraft, steel, cement and bricks, and agricultural sector. Tourism also benefits from EBRD loans.

Like other development banks, EBRD borrows by selling bank bonds and other securities to international investors such as central banks, commercial banks, insurance companies, and pension funds. EBRD also raises funds through capital subscriptions, interest payments and other profits from its business operations, and donations from governments and organizations. Unlike other regional development banks, the EBRD does not fund commercial operations from its pool of subscribed capital. Instead, the EBRD's subscribed capital of 20 billion euros serves as a type of collateral to back the integrity of bank bonds—bonds that currently carry the highest AAA rating.

In 2015, the EBRD earned a tidy 0.9 billion euros ($1 billion) from its commercial operations. Over the years, it has also solicited billions of euros in donations from member governments and the European Community. Donations finance technical assistance to promote a sound business climate, environmental protection, hazardous waste cleanup, entrepreneurship, microenterprises, applied technology, and modern business practices in marketing, finance, and other fields. A number of special funds have been established to deal with nuclear waste treatment and disposal.

Regional and sub-regional development banks are a major source of development loans and other development assistance in the global economy. The four main regional development banks are the African Development Bank Group, Asian Development Bank, European Bank for Reconstruction and Development, and Inter-American Development Bank Group. Smaller, subregional development banks also dot the economic landscape and include the Caribbean Development Bank, Central American Bank for Regional Integration, East African Development Bank, and West African Development Bank.

EUROPEAN CENTRAL BANK

The European Central Bank (ECB) is the central bank of the eurozone. The eurozone includes 19 members of the European Union. The European Central Bank has the single charge of maintaining price stability through monetary policy.

The European Central Bank (ECB) is part of a larger system of banks called the European System of Central Banks (ESCB). Established in January 1994, the forerunner of the ECB, the European Monetary Institute (EMI), began operation in preparation for the beginnings of the European Central Bank (ECB). The ECB officially began on June 1, 1998, replacing the EMI and their headquarters in Frankfurt, Germany. Two years later, the euro bank note was officially introduced into public circulation.

The European Central Bank is a central bank with one mandate; price stability to maintain low inflation rates. Similar to most central banks the ECB exercises the buying and selling of currencies to maintain stable exchange rates. The ECB also conducts supervisory functions of eurozone's financial markets.

The leadership of the European Central Bank includes a General Council, the Executive Board, and the Governing Council. The General Council is like an advisory and coordinating body for the ECB. It includes all of the European Union's central bank governors, the president, and the vice president of the ECB. The Executive Board includes the president, vice president, and four other members. The Governing Council is the main decision-making body of the ECB. It is made up of the Executive Board and the governors of the national central banks of the 19 countries that use the euro. The Governing Council meets twice a month to improve and make adjustments to monetary policy.

Since 2009 several eurozone countries have struggled with debt issues including Greece, Ireland, Portugal, Cyprus, and Spain. The causes of the debts vary from crisis to crisis to include joining the eurozone without financial stability, poor financial sector supervision, loss of competition, and no exit mechanisms.

One of the ECB's main priorities has been to solve the several debt crisis. To do so, they have created rescue programs like the European Stability Mechanism (ESM) and introduce the Single Supervisory Mechanism (SSM). The SSM grants the ECB a supervisory role to monitor financial stability of countries in the eurozone. The ECB is still working to help these countries recover. The European Central Bank is important, not only in Europe, but also to the global economy.

EUROPEAN ECONOMIC COMMUNITY

The European Economic Community (EC), later to become the European Union, was established by the Treaty of Rome in 1957. There were six original member countries: Belgium, France, Italy, Luxembourg, the Netherlands, and West Germany. In 1993, the Economic Community was renamed the European Community.

The EC is a combination of three communities: the European Coal and Steel Community (ECSC, established in 1951); the European Atomic Energy Community (EURATOM, formed in 1957); and the European Economic Community (EEC, created by the Treaty of Rome in 1957).

The Economic Community (EC) was formed in the post–World War II era in an effort to unify and preserve Europe. The organization sought to provide both political and economic stability to the region rather than fostering competition among European nations. The original member countries sought to create a closer union among themselves as well as to rid Europe of the barriers that had once existed and divided them. This was necessary in order for the countries to become strong and powerful again, and it was believed that a union of several countries was the best way to accomplish this.

The member nations developed a treaty that outlined the main elements of the Economic Community. Those provisions included: economic cooperation and stability among member nations, including a common economic policy; the elimination of customs duties and taxes on both imports and exports among member nations; common agricultural and transport policies; the establishment of a European Investment Bank to aid developing regions; the free movement of people, services, and capital among member nations; maintaining relationships with overseas territories and allowing the goods of these countries to enter free of tariffs; and the creation of several institutions, including an assembly, a council, a commission, and a court of justice.

One of the most significant accomplishments of the EC was the abolition of all customs duties. By 1968, the six member nations did not impose tariffs or quotas on one another and established a common tariff on the rest of the world. In 1973, Great Britain, Ireland, and Denmark joined the EC. In 1993, the Treaty of Maastricht established the European Community, replacing the Treaty of Rome. Today, the European Community has evolved into the European Union (EU), and is composed of 28 member nations that share common political and economic features.

EUROPEAN FREE TRADE ASSOCIATION

The European Free Trade Association (EFTA) is an intergovernmental organization that consists of four nations, Iceland, Liechtenstein, Norway, and Switzerland. Its mission is to promote free trade among member states, economic cooperation with the European Union (EU), and economic contacts with other regions of the world.

The Stockholm Convention, also called the EFTA Convention, established the EFTA on January 4, 1960. The EFTA Convention is a statement of member states' goals and obligations. Primary goals listed in the EFTA Convention included "sustained expansion of economic activity, full employment, increased productivity and regional use of resources, financial stability, and continuous improvement in living standards." Its founding members were Austria, Denmark, Norway, Portugal, Sweden, Switzerland, and the United Kingdom. Since 1960, three nations have joined the EFTA, including Finland (1961), Iceland (1970) and Liechtenstein (1991); and six member states have left the Association, including Denmark and the U.K. (1973), Portugal (1986), and Austria, Finland, and Sweden (1995). In 2001 the Vaduz Convention updated the original Stockholm Convention.

The EFTA's organizational structure consists of several institutions, each with its own set of responsibilities. Much of the Association's decision-making authority rests with the EFTA Council, and the Standing Committee of the EFTA States. The EFTA Council deals with issues within the four-nation Association, and between the Association and non-member countries. The Standing Committee of the EFTA States deals specifically with EFTA relations with the European Union (EU). The EFTA headquarters, including the secretariat, is located in Geneva, Switzerland. The EFTA Court, the Association's highest judicial authority, interprets and clarifies legal issues. The EFTA Surveillance Authority monitors compliance with existing rules within the Association and its EU neighbors.

The Agreement on a European Economic Area was originally approved on May 2, 1992, and went into effect on January 1, 1994. The creation of the EEA set the stage for expanded regional economic cooperation between the EFTA and EU. By May 2004 the European Economic Area (EEA) consisted of the 25 EU countries and three EFTA countries—Iceland, Liechtenstein, and Norway. The fourth EFTA country, Switzerland, rejected EEA participation, favoring bilateral agreements with the EU instead. The EEA established a single market promising free cross-border flows of goods, services, capital, and persons—also called the four freedoms. The EEA Agreement also guaranteed "equal conditions of competition, and the respect of the same rules" within the region. By 2002, about 70 percent of all EFTA members' trade was with EU nations. The single or internal market created by the EEA also extended into other areas of cooperation including education, research and technological development, the environment, and social policy.

Participation in the EEA promotes regional cooperation, but does not tie the three EFTA member states into other EU commitments. For example, EU member nations subscribe to a unified foreign policy and security policy, which EFTA members are free to reject. The EU is also a customs union, which sets uniform tariffs and other trade restrictions on imports from non-member nations—restrictions that EFTA members are not bound to follow. Further, the EFTA maintains its own decision-making institutions, such as the EFTA Council and the Standing Committee of the EFTA States.

Today, the EFTA is an outward-looking association. The EFTA has 26 free trade agreements that include 37 countries. In the EFTA agreement—the Vaduz Convention (2001)—member states strengthened protections for intellectual property rights; liberalized investment and trade in services; expanded opportunities for cross-border migrations of workers and their families; and agreed to recognize professional certificates from member countries. Since the Vaduz Convention, additional amendments from 2013–2015 were enforced including air and land transport, mutual recognition, agriculture, and social security.

EUROPEAN SOVEREIGN DEBT CRISIS, 2012

The appearance of the European sovereign debt crisis was an artifact, to some degree, of the U.S. banking crisis and highlights the interconnectivity of the world's economies. European banks had heavy exposure to the failed, subprime mortgage debt bundles of the United States. The underlying issue of the size of European sovereign debt was a much larger problem. The European debt was the result of decades of socialist policies in countries like Spain, Greece, Portugal, and Italy, in particular the high wages and benefits given to unions. In 2012, the European nations as a group generated gross national product of $12.2 trillion compared with the $15.7 trillion of the United States. The 17 eurozone nations account for 17 percent of the world's economy.

The European crisis is still not fully resolved, but estimates of the impact can be made. The eurozone is the third-largest export destination for American goods, accounting for 22 percent of export goods and 33 percent of export services. U.S. companies also had $2 trillion invested in European factories at the time of the crisis. The heart of the European debt crisis was the national debt of the sovereign European nations. Greece faced bankruptcy and required massive bailouts. Spain and Italy were also considered to be on the edge of defaulting. Major American banks faced more bailouts should the European banking system fail.

The formation of the European Union (EU) brought together a mix of sovereign countries into one economic system. Four of those countries, Greece, Spain, Portugal, and Italy, had for decades been giving generous wages and benefits to their workers. Moving into the new century, these countries borrowed heavily to cover mounting debts. The EU actually made that borrowing more feasible as Germany and the other fiscally sound countries of the EU acted as lenders of last resort to the more profligate countries within the EU. Germany, however, became frustrated about supporting the liberal spending of nations such as Greece and Spain. When the EU began discussions to create a rescue plan for its weaker members, the difficulty became demands from Germany and France for austerity programs in Greece.

The potential failure of Greece to pay its sovereign debt created the first challenge. In 2010, negotiations about a bailout package started among the EU countries. Greece's unions and parliament initially stood firm against any requirements to reduce wages and benefits in the package. People took to the streets, and unions stormed parliament, refusing any cuts in pay, hours, or benefits. As Greece struggled, credit markets tightened for other EU countries with debt problems, such as Spain, Portugal, and Italy. With the American banking crisis ongoing, money was tight for subprime nations. The EU required a $1.4 trillion rescue fund in this difficult period and had difficulty meeting requirements for such a loan. Eventually, the EU negotiated a 50 percent repayment plan for private loans to Greece. The country's debt load remained an ongoing problem. The size and interconnectivity of world economies made the Greek debt problem a major threat to the United States as it struggled to move out of its own recession.

The direct exposure of U.S. banks in 2011 included $16.7 billion at Bank of America, $14 billion at JPMorgan, and $13.5 at Citigroup. The total exposure of

U.S. banks in Europe was estimated at $700 billion. Most of this exposure was in European countries not immediately on the edge of bankruptcy. Although large, this amount was much less than that of the earlier American banking crisis. American banks continued to reduce investment in Europe through 2013. The exposure of international companies was actually more threatening to the world economy. Europe accounted for more than 20 percent of American exports, behind only Canada and Mexico. Though America did see a drop in exports to Europe during the Greece crisis, it was offset by the recovery at home.

The bigger drain on the world economy was the direct impact on multinationals with investments in Europe. The U.S. government estimated that one quarter of the earnings of America's top 25 companies came directly or indirectly from Europe. American automakers were hit hard, but again the recovery at home helped stave off major problems. Overall auto sales in Europe were at a 20-year low. Ford's losses in Europe were more than $1.4 billion in 2012, and it was predicted to lose $2 billion in 2013. The European recession, created by reductions in government spending required by the rescue fund agreement, continued to be a drag on the U.S. economy in 2013. The crisis in Europe also continued in 2013 as Germany and the other strong countries demanded austerity in the weaker countries such as Greece. The crisis still threatens the political union.

EUROPEAN UNION

The European Union (EU), as it is known today, developed slowly over time into what is now a union of many European nations that have the freedom to travel, work, trade, and have political support throughout the region.

History of the European Union

With two world wars behind them, and hopes of preventing a third, the formation of the European Coal and Steel Community was created in 1950 to unite European countries economically and politically in order to secure lasting peace. The six founding nations of Belgium, France, Germany, Italy, Luxembourg, and the Netherlands become the leaders of open trade throughout Europe.

In 1957 the Treaty of Rome created the Common Market to coordinate economic and trade policies after World War II. The primary goal of the Common

Market was to foster economic cooperation with the idea being that countries that trade with one another become economically interdependent and so more likely to avoid conflict.

Throughout the 1960s the European Union did not charge customs duties when trading with one another. They also agreed to joint control over food production in hopes that all cooperating nations have enough to eat.

In 1973, Denmark, Ireland, and the United Kingdom joined the European Union. In 1981, Greece became the 10th member of the EU with Spain and Portugal joining five years later.

In 1986, the Single European Act is signed which provides the basis for a vast six-year program that focused on sorting out the problems with free trade that spread across EU borders. Member nations agreed to eliminate tariffs on one another's exports, thereby creating a single market called the European Economic Community (EEC).

What was once a group of several nations coming together to focus on trade has evolved into an organization made up many European nations in both the eastern and western regions and has expanded its focus to much more than economics.

In 1993 the focus of the European Union expanded to include protecting the environment, security, and defense amongst all member nations. By 1995 three new members, Austria, Finland and Sweden, joined the EU. Millions of young people are allowed to study in other member countries with EU support.

The 2000s brought 12 new members to the European Union and many of the EU members begin using a new common currency known as the euro. By the beginning of the 2010s member nations of the EU are now free to travel without the use of passports, citizens are studying and working freely amongst nations and the euro has been adopted as the only currency in the majority of the member nations. Roughly 330 million Europeans use the euro on a daily basis.

The European Union Today

With 28 countries now a part of the European Union and the majority of them using one common currency, the euro, the EU is operating as a single market and is a major trading power.

The current structure of the European Union is very similar to the structure of the United States government. The EU has a European Parliament, which represents the EU's citizens and is directly elected by the people. They also have a Council of the European Union, which represents the governments of the individual member countries. The Presidency of the Council is shared by the member nations on a rotating basis. As a whole, the EU has a European Commission that manages the day-to-day business of implementing EU policies and spending the EU funds. They also represent and uphold the interests of the EU as a whole and draft proposals for new European laws. There is also a Court of Justice of the EU, which upholds the rule of European law. And a Court of Auditors that is in charge of checking the financing of EU activities.

The European Union acts much like the federal government of the United States. The nations are independent, much like the 50 states, but form a common union with a common governing body, court of law, ability to travel freely and a common currency. They are even regulated by a central bank known as the European Central Bank.

The European Union also has its own flag, anthem and celebrates Europe Day on May 9 each year.

Funding and Budgeting of the European Union

The European Union is funded through the combined efforts of all member nations. Each nation provides a percentage of their gross national income, usually around 0.7 percent per nation. They also received funds from import duties and a percentage of the value-added tax levied by each country. The revenue is used on efforts such as raising the standard of living in poor regions, ensuring food safety throughout the EU, rural development, environmental protection, external border protection and promotion of human rights.

The Commission, Council and Parliament of the EU all have a say in how big the budget is and how the revenue is allocated.

The Future of the European Union

The EU is focusing on sustaining economic growth by investing in transport, energy and research. Their GDP has surpassed the United States and trade with the rest of the world accounts for about 20 percent of global exports and imports. Roughly two-thirds of EU nations' total trade is conducted with other EU nations.

EXCHANGE RATES

Exchange rates state the value of one currency compared to a second currency. Four pieces of information are included in published exchange rates: the country, the name of the currency, the U.S. equivalent, and the currency per U.S. dollar.

The "U.S. equivalent" expresses the value of a foreign currency in terms of the U.S. dollar. The "currency per U.S. dollar" states how many units of a foreign currency it would take to equal $1. The exchange rates for June 1, 2016, show it would take about 18 Mexican pesos or 109 Japanese yen to equal $1, but it would take just 90 euro cents to equal $1. Exchange rates are published daily in major newspapers such as the *Wall Street Journal* and the *New York Times.* The most popular exchange rates published daily are the exchange rates between the major reserve currencies: U.S. dollar, British pound sterling, Japanese yen, and European Union euro.

In today's *flexible exchange rate system*, also called the floating exchange rate system, the forces of supply and demand are mainly responsible for determining exchange rates. Every day, national currencies are bought and sold by thousands of financial institutions around the world. Collectively, these financial institutions are called the foreign exchange market. Investors buy or sell currencies much like they trade stocks, bonds, or other securities. Much of the currency trade on foreign exchange markets is highly speculative—short term and risky.

Investors earn profits from slight changes in exchange rates. When the demand for a currency is high, the exchange rate tends to rise. High demand for a currency might result from strong demand for a nation's exports, robust economic growth, or a positive investment climate. Positive economic performance strengthens investors' confidence in an economy and its currency, causing the currency to appreciate in value. Economists say that a currency gains strength, or becomes stronger, when it appreciates over time. When the demand for a currency is low, however, the exchange rate tends to fall. Large trade deficits, an unstable investment climate, recession, and other negative performance indicators weaken the demand for a currency. Sagging demand, in turn, causes a currency to depreciate, or weaken relative to other currencies. Periodically a national government, through its central bank, buys or sells its currency to influence the currency's value, a process called *managed float.*

A value of one country's currency might also be *pegged* or *fixed* to another country's currency or a commodity such as gold. Often, pegging is designed to stabilize the value of the second currency in global markets. China changed from a pegged exchange rate to a managed float. In July 2005 China announced its intension to end the yuan's fixed peg to the U.S. dollar. China's decision to end the fixed peg and initiate a managed float system was viewed as a positive step toward building a more globally integrated and market-based economy.

Exchange rates are used in many types of international transactions. This is because an exchange rate is the means by which one currency is converted into an equivalent amount of another. International trade relies on exchange rates to ensure that exporters receive proper payment for the goods or services they sell to importers in other countries. To facilitate currency conversions all countries hold cash reserves of foreign currencies, called foreign reserves. A country's stash of foreign reserves consists mainly of hard currencies, or currencies that are commonly accepted throughout the world. Leading hard currencies include the U.S. dollar, the euro, British pound, and the Japanese yen. Many countries in the developing world use only hard currencies in international exchanges because of the uncertain value of their local currencies in global markets. Some currencies in the world's poorer regions are considered non-convertible due to monetary instability.

Changes in exchange rates affect international trade, tourism, and other cross-border transactions in the global economy. In early 2002 the exchange rate between the Japanese yen and the American dollar was 132.4 yen to $1. Thus, in 2002 a $10 American-made razor would sell for about 1,324 yen in Japan ($10 x 132.4 = 1,324). Since 2002 the Japanese yen appreciated against the U.S. dollar. On June 1, 2016 it took just 109.21 yen to equal $1. Thus, in 2016 the same $10 American-made razor would sell for just 1,092.10 yen in Japan ($10 x 109.21 = 1,092.10 yen). The drop in the razor's price in Japan from 1,324 yen to just 1,092 yen was caused by the stronger Japanese yen, or, from a different perspective, by the weaker U.S. dollar.

As a general rule, when a currency strengthens, this movement discourages exports, which become more expensive in foreign markets. At the same time the stronger currency encourages imports, which become less expensive in domestic markets. Conversely, when a currency weakens, this movement encourages exports, which become less expensive in foreign markets, and discourages imports, which become more expensive in domestic markets.

EXPORT-IMPORT BANK OF THE UNITED STATES

The Export-Import Bank of the United States, Ex-Im Bank, is the official credit agency of the United States government. The mission of the Export-Import Bank of the United States is to finance U.S. exports of goods and services. It contains a reasonable assurance of repayment and does not compete with private capital businesses. The Ex-Im Bank is under the supervision of the Organisation for Economic Co-operation and Development (OECD).

The bank was established during the presidency of President Franklin D. Roosevelt in 1934. In 1945 it was an independent agency in of the executive branch of the United States government. Its was created as part of Roosevelt's New Deal programs to create jobs by promoting the exporting of U.S. products.

The key function of the bank is to step in when commercial banks will not make loans to help foreign companies buy U.S. goods. The creation of the Ex-Im

Bank was to improve the ability of U.S. businesses to participate in exporting thus creating more jobs. It guarantees both working capital loans for the U.S. exporters and the repayment of loans by foreign purchasers of the U.S. goods and services around the world. Export-Import Bank supports the sales of U.S. exports worldwide. In recent years its focus shifted to the developing nations whose economics are growing at twice the rate of other nations. The Ex-Im Bank finances many types of goods and services for export. The bank also helps promote small businesses through its various programs.

The Ex-Im Bank is known for the development of projects even though it is not a foreign aid or development agency. This bank provides a variety of services. It provides capital guarantee programs, export credit insurance policies, and commercial loans.

Many people have a negative outlook on the Ex-Im bank because loans can possibly make taxpayers vulnerable and left with the bill. Corruption has also been an issue with the Bank. Many of the U.S. political leaders are no longer in favor of maintaining the Bank. Critics have contended that the Ex-Im Bank is ripe with crony capitalism citing a high proportion of credit activity devoted to some of America's largest exporters. Even with its critics Congress continues to renew the existence of the Export-Import Bank.

In 2014, Ex-Im Bank reported authorizing about $20.5 billion for 3,746 transactions of finance and insurance to support an estimated $27.5 billion in the U.S. exports of goods and services and 164,000 U.S. jobs around the world.

EXPORTS

An export is any resource, intermediate good, or final good or service that producers in one country sell to buyers in another country. An import is any good or service that is purchased from another country. International trade involves the export and import of merchandise and commercial services. The major categories of merchandise exports include capital goods, such as heavy machinery and equipment; industrial supplies and materials; automotive vehicles and auto parts; agricultural products, including animal feeds; and petroleum. The main categories of commercial services include travel, passenger fares, the transport of goods, financial services and insurance, and business and professional services.

The World Trade Organization (WTO) reported that exports of merchandise and commercial services hit $19.13 trillion in 2014. Merchandise exports accounted for 47 percent of global gross domestic product (GDP). From 2006 to 2014, the total value of exports passing through the global trading system increased by over 50 percent from $12 trillion to $19 trillion.

In 2014 the majority of global exports were produced in three world regions. Europe and central Asia led with $6.3 trillion in exports (39.97 percent of world exports), followed by $4.0 trillion from east Asia and the Pacific (25.6 percent of world exports), and $2.4 trillion from North America (15.3 percent of world exports). The remaining $2.4 trillion, or 16 percent of world exports, was spread across developing Africa, Central and Eastern Europe, Latin America, and the Middle East. The world's six leading exporting countries are the United States, China, Germany, France, United Kingdom, and Netherlands. Combined, these six countries accounted for about 35 percent of the world's total exports in 2014.

Trade liberalization has encouraged nations to import and export products in the global trading system. Economists generally agree that international trade, an important pillar of globalization, contributes to economic growth and sustainable development. Trade expansion is particularly important in developing countries, which often lack the global connectivity to share in globalization's benefits. Export earnings are used for a number of development purposes. Export earnings can be reinvested in businesses, saved for future investments, or stored as foreign reserves.

Nearly two centuries ago economist David Ricardo popularized the theory of comparative advantage, which supported free trade. Ricardo's theory encouraged regional specialization to promote efficiency and the export of surplus output to other countries. Mainstream economists have since used Ricardo's theory of comparative advantage to support free trade—the freedom to import and export goods and services without fear of trade barriers. The WTO supports the free flow of exports in today's global economy. Regional trade blocs, such as the Asia-Pacific Economic Cooperation, European Union (EU), North American Free Trade Agreement, and the Southern Common Market have also reduced or eliminated restrictions on exports among member nations.

Over the past 50 years, "export promotion" has accelerated economic growth and development in a number of countries. Export promotion is a trade strategy designed to increase the export of goods by offering incentives, such as tax breaks and subsidies, to export industries. Japan's miraculous economic recovery during the post–World War II period was due in large measure to aggressive export promotion policies. Japan's Ministry of International Trade and Industry (MITI), a quasi-public institution, arranged low-interest loans, government subsidies and grants, and tax breaks to support export industries. Today, Japan's economy ranks second only to the United States in terms of real GDP. The meteoric rise of several other East Asian economies, including Chinese Taipei, the Hong Kong SAR, Singapore, and South Korea, also relied on export promotion. Today, these four newly industrialized economies (NIEs) of Asia are counted among the world's 29 advanced economies.

Export issues are hotly debated in today's global economy. One current issue involves restrictions on exports through anti-dumping measures. Dumping is an illegal trade practice that occurs when a firm from one country sells a product in another country at a price below production costs, or below the market price in the exporter's own economy. Governments enact anti-dumping measures, including high tariffs, to raise the price of dumped items. Since the mid-1990s, governments have initiated thousands of formal anti-dumping actions to restrict imports of products ranging from Russian steel to Vietnamese catfish.

A second export issue is instability in the global commodities trade. The commodities trade is mainly concerned with the export of primary products, such as coffee, cocoa, sugar, timber, or minerals from developing countries. The specialized production and export of commodities by developing countries is inherently unstable. Fluctuations in the global supply of or demand for a commodity affect the commodity's price, contributing to periods of feast or famine in commodity-dependent economies. A third export issue concerns voluntary quotas, a type of backdoor trade barrier. Governments negotiate voluntary quotas, often called voluntary restraint agreements (VRAs), to restrict the quantity of a good that can be exported from one country to another country. The WTO specifically forbids VRAs, but these export restrictions lingered in the global trading system until 2005. One leading example was the VRA that limited Chinese textile and clothing exports to the United States, a VRA that remained in effect until early 2005.

A fourth export issue is economic localization. Localization favors economic self-reliance, a return to small-scale community-based production, and sustainable consumption. Localization is, in large measure, a grassroots rejection of globalization. Localization rejects an over-reliance on international trade, foreign investment, and other types of global connectivity.

F

FINANCIAL ACCOUNT

When countries buy and sell goods and services, an accounting balance called the balance of payments is used to keep track of the value of these goods and services. The balance of payments is composed of three subcategories: the current account, the capital account, and the financial account. These accounts detail not only the value of imported and exported goods and services, but the flow of investment dollars to finance the purchases of real property, plant, equipment, and to purchase financial assets as well.

In an effort to create better harmonization between a country's system of national accounts and the balance of payments, the capital account was renamed the capital and financial account. The financial account is divided into three subcategories: direct investment, portfolio investment, and other investments.

In addition to the purchase of goods and services, foreign citizens purchase and sell real and financial assets of other countries. The records of these transactions—such as buying a hotel, manufacturing plant, office building, or other factors of production—are recorded in the financial account. The account records the value of ownership in the exchange of these items, no goods or services change hands. When Chinese investors purchase a clothing manufacturing plant in Indonesia the only exchange is the change in ownership of which the value is recorded in the financial account. The only flow between countries is represented in currency trading to make the purchase created a credit or debit in the financial account.

The two largest components of investment are direct investment and portfolio investment. A direct investment (or foreign direct investment, FDI) is when an investor in one country buys or sells ownership in an overseas company. Ownership may take several forms. It could be buying or building a factory outright or purchasing a significant amount of a company's stock. In order to determine whether the transaction represents a debit or credit in the financial account, the flow of funds must be examined. If a Mexican investor purchases a significant ownership stake in a Brazilian airplane manufacturer, a credit would be recorded in the financial account of Brazil, and a debit would be recorded in the financial account of Mexico, representing the flow of funds from Mexico to Brazil. If a Chinese investor purchased a significant interest in a Mexican beverage company from a Mexican investor, this is represented as a credit in the financial account of Mexico as a result of investment dollars flowing from China to Mexico.

These exchanges represent a change in ownership between citizens of different countries and the flow of funds to settle the transactions are recorded in the financial account. When investors receive interest and dividend payments from their investments these are recorded in the current account under income because they do not represent a change in ownership.

A portfolio investment (or foreign portfolio investment, FPI) is when a small investor buys or sells ownership shares (stock) of a foreign company as part of an investment portfolio. The investment may also include foreign debt both public and private. The primary difference between and FPI and an FDI is FPI investors are not involved in the active management of the companies day-to-day operations. They do not have the same long-term interest as FDI investors. FPI investors may sell or exchange ownership more easily than in an FDI offering greater liquidity. To determine whether there should be a debit or credit in the financial account we must examine the flow of funds. If a French investor purchases shares in the Finnish cell phone maker Nokia, a debit would be recorded in the financial account as financial capital flows from France to Finland. However, if a German investor sells bonds to a foreign investor in South Africa, it would be represented as a credit because money is flowing into Germany from South Africa.

Other investments cover short-term and long-term loans, currency, savings, and time deposits. Domestic banks lend to foreign borrowers and domestic households save money in foreign banks. When a Canadian banks lends to a borrower in Costa Rica this represents a flow of funds from Canada to Costa Rica creating a credit in the financial account of Costa Rica and a debit for Canada. When an American borrower pays back a loan to an Irish bank it is recorded as a credit in Ireland's financial account and a debit in the United States'.

Income or interest earned in other investments, as in foreign direct investments or foreign portfolio investments, is measured in the current account, and loan balances or savings are measured in the financial account.

FINANCIAL IMBALANCES IN THE 2000s

Financial imbalances refer to the process where nations run long-term current account deficits. In the context of a global economy, since the sum total of global current account balances is by definition zero, other countries are experiencing corresponding current account surpluses at the same time. These patterns, where certain nations are perpetually generating an ongoing excess of imports over exports, cannot be sustained indefinitely. In the early 21st century there has been an acceleration of the size of the gap between current account surplus and current account deficit nations.

The primary generators of current account deficits since 2000 have included a wide array of nations. As of 2015, this group includes wealthy first world countries such as the United States, the United Kingdom, France, and Australia. It also includes rapid growth BRICS nations India, Brazil, and South Africa. The deficit list further includes a number of third world nations, including many in Africa.

The list of nations that possess large current account surplus balances is also varied. First world countries on this list include Germany and Japan. The other BRICS nations, China and Russia, maintain large current account surplus balances, highlighting some of the randomness associated with current capital account balances. A few less affluent nations such as Algeria, Iraq, and Nigeria also maintain modest surplus balances.

The fact that divergent surplus and deficit balances exist does not necessarily mean that there is a serious problem or that a global economic crisis is imminent. There are many historical examples that prove this point. The best example is the United States, which regularly produced current account deficits throughout the entire 19th century. In this instance, there was no inevitable crisis. The most important reason this situation actually benefited the global economy was that the United States economy was growing throughout the 1800s and, as a result, foreign investors were very willing to invest both equity and debt capital into the United States. Ultimately, the United States emerged as a leading global economic power and those significant current account deficits changed into surpluses during World War I and later continued a positive trend for more than a half century before turning negative again during the last quarter of the 20th century. In the American case, long-term economic growth more than offset any detrimental impact of running long-term account deficits during the nation's initial development as well as during recent times.

Economists have conducted studies that seek to determine the correlation between account imbalances and financial crises. In general the results of these studies have been inconclusive. There is some evidence to suggest that individual nations can experience an economic crisis as a result of sudden large changes in their current accounts. Less developed economies are the most vulnerable to this type of scenario. On a global scale, the evidence tends to suggest that widespread international recessions such as the panics of 1873, 1893, and 1907; the Great Depression; and the Great Recession of 2008 are more likely caused by the booms and busts of business cycles than by international capital flows.

In the current era of increased globalization, including trade and capital investment between nations, it is likely that account imbalances will become an increasingly studied issue. While the evidence over the past century suggests that account imbalances are somewhat benign, the fact that intervention by the International Monetary Fund has been required in numerous instances over recent decades confirms that individual nations, most often second- and third-world economies, can be vulnerable to financial imbalances. International policy makers and private sector investors are increasingly studying this issue in order to create prudent governmental and central bank policies and to achieve efficient and prudent private sector capital deployment.

FOREIGN AID

Foreign aid is a grant of money, technical assistance, food, capital equipment, or other assistance from one country to another. In most cases richer countries extend foreign aid to poorer countries. The three main categories of foreign aid are development assistance, humanitarian and emergency assistance, and military assistance. Foreign aid is derived from a number of sources. Bilateral aid travels between two governments. Multilateral aid travels from international organizations to national governments or other agencies. Individuals and groups such as private foundations, corporations, private voluntary organizations, colleges and universities, and other elements of civil society also supply foreign aid to needy regions.

Foreign aid is categorized by its intended purpose. Development assistance directly supports economic growth and sustainable economic development. Development assistance targets infrastructure projects, good governance, and long-term investments in education and health care. Humanitarian and emergency assistance responds to national or regional crises such as natural disasters, civil conflict, or war. Humanitarian and emergency assistance consists of food, medical personnel and supplies, and temporary shelter. For example, in 2004–2005, billions of dollars in humanitarian and emergency assistance flowed from the global community to nations ravaged by a catastrophic tsunami in western Asia. Military assistance promotes stability in a region. Military assistance supports peacekeeping efforts, internal security, and the transport of emergency supplies to stricken regions. Military assistance does not include money, materials, or personnel that are directly involved in invasions or other military campaigns.

Foreign aid is a hot issue in the global economy. The foreign aid debate centers on the amount, uses, and effectiveness of foreign aid. Much of the world's foreign aid comes from the countries that comprise the Organisation for Economic Co-operation and Development (OECD). Within the OECD is the Development Assistance Committee (DAC), which coordinates assistance from the richer countries. The two types of DAC assistance are official development assistance (ODA) and official aid (OA). ODA includes food aid, emergency relief, capital projects, technical aid, and peacekeeping activities. ODA also includes contributions to multilateral institutions, including the specialized agencies and programs within the UN System, and the World Bank. Official aid (OA), which has many of the same functions as ODA, targets 34 other emerging market economies, especially those in central and eastern Europe and the countries of the former Soviet Union (FSU).

The OECD's Development Assistance Committee coordinates the distribution of ODA and OA. ODA and OA are dispersed among several project categories: economic infrastructure, production, education, health and population, debt relief, program assistance, emergency aid, social infrastructure, and multi-sector projects. Ranked by world region, the top recipient of bilateral ODA in 2013–2014 was sub-Saharan Africa ($28.1 billion), followed by South and Central Asia ($17.5 billion), Other Asia and Oceania ($12.5 billion), Middle East and North Africa ($10.7 billion), Latin America and the Caribbean ($7.4 billion), and Europe ($3.1 billion). About $2.9 billion was unspecified. Ranked by countries' income classification, the highest percent of bilateral ODA was allocated to least developed countries (28.3 percent), lower middle-income countries (22.8 percent), followed by upper middle-income countries (13 percent) and other low-income countries (2.5 percent). However, the largest percentage (33.4) of ODA in 2013–2014 was unallocated.

The total ODA was $131.6 billion in 2015, an almost 7 percent increase from 2014. The top three recipients of ODA in 2015 were Afghanistan, India, and Viet Nam.

In real terms the official flow of foreign aid to poorer regions has not kept pace with income growth in the rich countries. Measured as a percent of gross national income (GNI), DAC assistance has declined over the past few decades.

There are different measurements of foreign aid. The narrowest measure considers just the official flows of ODA and OA. The U.S. Agency for International Development (USAID) uses a broader measure of foreign aid, which includes other types of government and private assistance. In 2014, for example, U.S. ODA totaled $33 billion. The major components of U.S. ODA allocations include education and health (29.6 percent), humanitarian aid (21.6 percent), and other social infrastructure (19.2 percent). Other government assistance included contributions to the International Monetary Fund (IMF) and other international agencies, certain security assistance to countries, and official aid (OA) to countries in central and eastern Europe, Israel, and elsewhere.

The USAID measurement of foreign aid also includes private aid sources. Accurately accounting for private foreign aid sources can be tricky. Depending on the source the data can be quite subjective, arbitrary, or inaccurate through double counting or differences in definitions. Private sources include cross-border aid from private foundations, corporations, private and voluntary organizations (PVOs), colleges and universities, religious groups, and individual remittances.

The uses and effectiveness of foreign aid are widely debated. The debate tends to raise more questions than answers. One issue is whether foreign aid promotes sustainable economic development or a culture of dependency. A second issue concerns the applicability of foreign aid models. For instance, the massive infusion of money into Europe under the Marshall Plan during the late 1940s and early 1950s was successful in reconstructing a continent ravaged by World War II. This model has been less successful in many regions of the developing world, however. A third issue involves the dissemination of foreign aid. Today, foreign aid is dispersed to governments, multilateral organizations, private companies, nongovernmental organizations, and other elements of civil society. A fourth issue is the absence of good governance in many recipient countries. The lack of good governance, marked by a lack of transparency and a weak system of justice, invites corruption, cronyism, and other abuses of the public trust—including the misallocation of foreign aid.

Finally, coordination issues plague the effectiveness of foreign aid. The OECD's Development Assistance Committee assists in the dispersal of ODA and OA. Yet, private aid flows are sometimes disrupted by organizational redundancies and ineffective delivery systems. These types of issues raise legitimate concerns among donors about the impact of their contributions on long-term economic development and on people's quality of life.

FOREIGN DIRECT INVESTMENT

Foreign direct investment (FDI) is a cross-border investment that results in one company gaining ownership or control of productive facilities in another country. FDI is long term in nature. The two types of FDI are mergers and acquisitions (M&As) and greenfield investments. M&As represent a legal joining of two existing companies under a single ownership. M&As are the dominant type of FDI in the advanced countries. The 1998 "merger of equals" between auto giants Daimler-Benz (Germany) and Chrysler (United States) illustrates this process. Greenfield investments occur when transnational corporations (TNCs) construct new production facilities, such as factories or retail stores, in a foreign country. The construction of Hyundai Motor's (South Korea) $1.1 billion auto manufacturing plant in Alabama—a plant that opened in May 2005—was a greenfield investment. A TNC, also called a multinational corporation, comprises a parent company and its foreign affiliates. Foreign affiliates are businesses in which a TNC has controlling interest. By the early 2000s, greenfield investments were fast becoming the preferred type of FDI in the developing world. In recent years liberalized FDI regimes in some countries have also encouraged foreign investment in real estate and other properties. FDI, international trade, and cross-border financial flows are the three pillars of globalization.

FDI grew rapidly during the 1990s, peaked in 2000, and declined during the early 2000s. FDI is measured by inflows of FDI into a country, and by outflows of FDI out of a country. In its *World Investment Report 2015,* the United National Conference on Trade and Development (UNCTAD) summarized global FDI trends. According to UNCTAD the global inflows of FDI during 2015 fell by 16 percent to $1.23 trillion in 2014. However, in the developing countries FDI increased 2 percent reaching $681billion, its highest level ever. In 2014 the advanced economies experienced a decline of 28 percent to $499 billion. The top FDI recipient was China ($129 billion), followed by the Hong Kong, China ($103 billion), United States ($92 billion), United Kingdom ($72 billion), Singapore ($68 billion), and Brazil ($62 billion). In 2014 the advanced economies accounted for two-thirds of all FDI outflows, compared with one-third for the developing countries. The largest FDI outflows in 2014 came from the United States ($337 billion), Hong Kong, China ($143 billion), China ($116 billion), Japan ($114 billion), and Germany ($112 billion).

FDI, a pillar of globalization, creates a more integrated and interdependent global economy. The liberalization of trade and investment also encouraged production sharing in recent years. Production sharing occurs when a business produces a good in stages in a number of different locations around the world. Production sharing is motivated by a firm's desire to minimize production costs. Technological advances in communications and transportation support production sharing.

The rapid expansion of FDI during the 1990s was fueled by new telecommunications technologies, changes in financial regulations, trade and investment liberalization, and the perceived financial benefits to TNCs and host countries. Advanced telecommunications allowed TNCs to tap a broader pool of financial resources in global financial markets, money that was used to fund M&As and greenfield investments. Many countries relaxed regulations governing banks and other financial institutions. These regulatory changes reduced restrictions on cross-border financial transactions; permitted mergers of banks with insurance and investment companies; and encouraged economies of scale through consolidation in the banking industry. The trend toward trade and investment liberalization stimulated FDI by increasing cross-border mobility of natural, human, and capital resources, and the output produced by these resources. In the vanguard of trade liberalization were the General Agreement on Tariffs and Trade (GATT) (1947–1994) and the World Trade Organization (1995–present). Supporting investment liberalization were bilateral investment treaties (BITS) and double taxation treaties (DTTs). BITS are formal agreements between two countries designed mainly to promote mutually beneficial investment opportunities.

A responsible FDI benefits both the TNC and the host economy. Through FDI, TNCs gain access to low-cost natural and human resources in the global economy. Lower production costs, in turn, increase the competitiveness of TNCs in the global marketplace. TNCs also gain access to foreign markets. By producing goods or services in foreign countries, TNCs' foreign affiliates circumvent import restrictions, and reduce shipping costs to these markets. Historically, many TNCs set up shop in the United States and other advanced countries to gain a foothold in profitable markets in the richer countries.

Host countries also derive benefits from FDI. Responsible FDI expands the nation's capital stock, infuses new technology into the economy, and supports human capital development by improving the skills of workers and management. FDI advances the competitiveness and connectivity of firms by expanding their access to credit, and linking them with other participants in the global economy. Many countries enact policies to attract FDI. The International Labor Organization (ILO), a specialized agency within the UN System, reported that 116 countries operated 3,000 export processing zones (EPZs) to bring FDI to their shores. Countries also establish investment promotion agencies (IPAs) to compete for FDI. Countries use tax breaks, subsidies, infrastructure improvements, and other incentives to sweeten the investment climate for TNCs.

Irresponsible FDI can also inflict heavy costs on a nation. Irresponsible FDI is exploitative. It uses a country's resources for short-term gain, but contributes little to the country's long-term development. Signs of irresponsible FDI are the wanton destruction of forests, the pollution of rivers and lakes, and other forms of environmental degradation. The abuse of labor in sweatshops, or in other substandard workplaces, is another sign of irresponsible FDI. A sweatshop is typically an industrial workplace characterized by excessive work hours, unsafe or unhealthy working conditions, abusive bosses, and the absence of worker associations.

During the 1980s and 1990s, cases of irresponsible FDI by TNCs or their subcontractors raised the ire of non-governmental organizations (NGOs), governments, and multilateral organizations. Today, most TNCs have a well-defined "corporate code of conduct" to protect overseas laborers. The International Labor Organization (ILO), Organisation for Economic Co-operation and Development (OECD), and other groups have also devised recognized "codes of conduct for multinationals." Despite these codes, cost-cutting pressures on major TNCs endanger the quality of workers' lives, especially workers at the bottom of the supply chain. Labor advocates such as the ILO, the International Confederation of Free Trade Unions (ICFTU), and Oxfam International monitor global labor conditions with an eye toward stopping exploitative, race-to-the-bottom corporate policies.

FOREIGN EXCHANGE MARKET

The foreign exchange market, also called the forex market, is a network of commercial banks, investment banks, brokerage houses, and other financial institutions that buy and sell currencies for profit. The currencies that are traded are called foreign exchange, or, more simply, forex (fx). The process of trading foreign exchange is called forex trading. In 2016, for example, the daily turnover in the forex market was $5.1 trillion, which was a significant jump from daily trading of $1.9 trillion in 2004. This means that six days of business activity on the forex market was roughly equivalent to value of all goods and services that flowed through the global trading system for an entire year.

The forex market represents the institutions and practices of banks, brokerage firms, securities dealers, and other participants in forex trading. Commercial banks assume a central role in forex trading through "interbank" or "direct dealing" transactions. Many large commercial banks operate globally, and keep at least one forex trading station open at all times. Forex markets operate nonstop, 24 hours a day, seven days a week. A sophisticated electronic transfer system called SWIFT (Society for Worldwide Interbank Financial Telecommunications) records all financial transactions. The most authoritative accounting of forex trading is the Bank for International Settlements (BIS), located in Basel, Switzerland. Most forex trading is short term and highly speculative.

The foreign exchange market is spread across all populated continents. In 2010, however, half of all forex trading took place in just two countries, the United Kingdom and the United States. The dominant financial center in the United Kingdom was London, and the dominant financial center in the United States was New York City. Other important countries in the global forex market were Japan, Singapore, Germany, the Hong Kong SAR, and Australia.

The modern foreign exchange market has changed significantly since its inception in 1946. Under the Bretton Woods System from 1946 to 1973, the main role of the foreign exchange market was currency conversion for purposes of trade. Under Bretton Woods, the process of converting currencies was relatively simple due to the prevailing fixed exchange rate system. Under the fixed exchange rate system, the value of national currencies was "pegged" to the U.S. dollar, the world's dominant currency, or to gold. The U.S. dollar was also fixed to gold, with the value of a dollar equal to one thirty-fifth of an ounce of gold. Because national currencies were not permitted to fluctuate beyond a very narrow range, the foreign exchange market easily converted major currencies. Major currencies were often called "hard currencies" because they held their value over time. Most international trade was conducted with hard currencies. Pegging currencies to the U.S. dollar and to gold stabilized the post–World War II global financial system. Yet, over time, destabilizing cracks appeared in the fixed exchange rate system. For example, a nation could officially devalue its currency to gain a competitive edge in foreign trade. Nations could also cash in their reserves of U.S. dollars for gold, which, by the early 1970s, had put a severe strain on U.S. gold supplies.

The foreign exchange market was transformed in 1973, when a flexible exchange rate system replaced the crumbling fixed exchange rate system. Countries tinkered with different exchange rate models during the mid-1970s. In 1978 the International Monetary Fund (IMF) stepped in and mandated a full implementation of flexible exchange rates. Under the flexible exchange rate system, also called the floating exchange rate system, the forces of supply and demand determine the value of national currencies. When the demand for a country's currency rises, the currency tends to appreciate in value compared to other currencies. When a currency appreciates in value, economists say that it has gained strength in global markets. When the demand for a country's currency falls, however, the currency depreciates or weakens relative to other currencies. By adopting the flexible exchange rate system, the global community opened the door to a new foreign exchange market. In the new forex market, the buying and selling of national currencies for profit supplanted currency conversion as the market's primary business.

Over the past three decades, governments have occasionally intervened in the forex market to stabilize their currencies or the currency of another country. For example, in the mid-1990s, the U.S. government, through the Federal Reserve System (Fed), purchased billions of U.S. dollars to prop up the dollar's value in international markets. More than a dozen other governments supported the Fed's actions by purchasing dollars in the foreign exchange market. Other industrialized countries, often in cooperation with one another, have also traded in the forex market to stabilize the global financial system. Periodic government intervention in the forex market is often called “managed float.” In addition, the value of one currency might be “pegged” to a different currency. From 1995 to 2005, China’s yuan was pegged to the U.S. dollar at a rate of 8.28 yuan to $1 U.S. Pegging is often used to stabilize the value of a currency in global markets.

In recent years the IMF and other multilateral organizations have labored to reform the global financial architecture to support monetary stability. Reforms included structural changes in countries’ banking and securities industries. Global financial crises such as the East Asian Financial Crisis of 1997–1998 underscore some of the vulnerabilities in the global financial and economic system.

FOREIGN PORTFOLIO INVESTMENT

Through foreign portfolio investment (FPI) the investor does not have direct ownership of the financial assets and thus no direct management of the company. FPI include securities such as stocks and bonds and other financial instruments held by foreign investors.

The time horizons differ for foreign portfolio and foreign direct investment. Foreign portfolio investments are relatively liquid, compared with foreign direct investment. Stocks and bonds are typically easier to sell off compared to capital expenditures like tools and machines. Foreign direct investment typically has a longer time horizon than foreign portfolio investment. Foreign portfolio investment is similar to domestic investments. Many domestic firms have international subsidiaries.

An investor could invest in the same firm domestically and hold financial instruments in its foreign subsidiaries. Foreign portfolio investment differs from foreign direct investment. In foreign direct investment the domestic company runs the foreign firm. The domestic company assumes more liability in foreign direct investment. Foreign direct investment allows the investor to have greater control over the foreign firm. foreign direct investment and foreign portfolio investment are similar because they both give their holders a claim on the future output of the foreign economy.

In the balance of payments, foreign portfolio investment is measured as a flow, not a stock measure. When one reads a country's balance of payments statement the level of foreign portfolio investment is recorded as the total amount of investment that has occurred during a specific period of time. This is different than a stock measure that provides a measure on a specific date.

FOREIGN TRADE VERSUS FOREIGN INVESTMENT

Foreign trade and foreign investment sound similar but are actually very different enterprises. Foreign trade is the process of the trading of goods and services between two or more countries. Foreign investment is the when there is a controlling ownership in a business in one country by an entity that is based in another country. Both foreign investment and foreign trade have become necessary for countries to have a healthy economy in today's global economy.

Foreign Investment

Foreign investment is typically done by a company establishing operations in another country that is not its home country. Foreign investment differs from portfolio foreign investment by the amount of control that is exerted. Investors that have foreign investments in their portfolio are not considered to meet the requirements of foreign investment because these investments are usually stock in companies overseas and do not typically meet the threshold of 10 percent ownership. Companies that engage in foreign investment acquire tangible assets by building a new building in another country or by acquiring an existing company to add to their company.

Foreign investment is done on a horizontal, vertical, or conglomerate basis. Horizontal foreign investment is when a company carries out the same activities in the new country as in its home country, such as car companies that have assembly plants in multiple different countries. Vertical foreign investment involves the company adding a process that is a different stage in development from the activities that the company does in their home country. An example of vertical integration that is often done is companies that ship textiles overseas to produce clothing. The last example of foreign investment is conglomerate investment. It is when a company purchases an unrelated business in another country. Because acquiring an unrelated company forces a purchasing company to tackle both the issues of a new enterprise that it does not have knowledge of and the issues relating to a new country it is not often that companies will attempt conglomerate investment. Most companies that invest in a new country face issues that they may not have faced in their home country. Attempting to start a new unrelated business in a new country it makes it more difficult and expensive for companies because they do not already have procedures on how things should be done.

Historically, foreign investment has been when developed nations have invested in developing countries as a way to increasing profitability through increased productivity combined with lower costs. There are both advantages and disadvantages to foreign investment for developing countries. For many companies investment in foreign countries is seen both as a way improve their companies' costs and to break into new markets. For the country in which a company is investing this provides jobs for its citizens and a boost to the economy. One of the disadvantages for the country that is invested in is that while the investing company can pay higher wages, many of the other companies in the country are unable to match the wages without reducing the overall number of their employees, which can increase unemployment within the country. Developing countries that have companies invest in them also find that over time the profits that the company receives are sent back over to the home country rather than remaining in the invested country.

Foreign Trade

Foreign trade allows countries to trade with each other to receive goods and services they would not have without the trade. This allows companies in other countries to expand their customer base as they provide goods and services to customers in countries that do not have comparable goods and services available. Because each country has different resources foreign trade allows countries to efficiently use their labor, technology, and capital, rather than attempting to produce everything that the customer is asking. Countries are able to specialize in certain items while trading for the other items that they would be unable to efficiently produce.

Trade can also improve the products in a country if another country's products are considered superior. In can drive companies to produce better products for their customers in their home country rather than lose customers to companies that are based in another country. Countries that have open trading policies usually have higher wages than countries that have trade restricted because the country is able to focus on the goods and services that are most efficient for it and create a reputation of a superior good or service over another country.

Foreign trade does not require that there be an even trade between two countries, however. Sometimes countries will export more items than they import or import more items than are exported. Generally wealthier countries will have excess savings and invest in capital-poor countries but not always. China is considered to have a trade surplus because it exports more than it imports. The United States is considered to have a trade deficit because it imports more than it exports. Trade surpluses and deficits are not necessarily good or bad—it depends on the state of the economy behind the trading.

FRANCE: GENERAL ECONOMY

France is a developed country with a stable economy and a relatively high standard of living. Since the 1940s France has made a number of large changes to its government and economy that have gotten it to where it is today.

France's economy suffered many ups and downs in the past. During the 18th century France became one of the world's wealthiest and most powerful nations. Its industrial development was comparable to England's, which was considered the most powerful. Industrialism continued to grow into the 19th century. France, however, maintained its agricultural base and began to fall behind in economic standards leading to one of its historical economic lows. France continued agriculture and small businesses as its form of economy nearly until the beginning of World War II.

After World War II France began to modernize its economy. New methods of manufacturing were developed and new trading partners were established through a series of national plans. During this period of modernization most of the businesses in France were privately owned. Economic fortunes in France have often shifted between a socialist government that promotes significant government involvement in the economy and a more conservative political front that embraces less government participation in the economy.

However, France has retained its position in the agriculture business and it has used advances in agricultural technology to increase its production. France continues to provide much of the agricultural products to its fellow European countries. France's major agricultural products include sugar beets, veal, beef, milk, cereals, and wine, for which France is among the top producers in the world markets. France has expanded its businesses to more than just agriculture but it continues to be one of the leading factors in France's economy.

While France is one of the world's largest agricultural producers it also ranks as one of the world's leading manufacturing nations. Paris is the country's main manufacturing location (tourism being another major industry in the city). France remains one of the world's top producers of automobiles, behind countries such as the United States, Germany, and Japan. France also thrives in selling military and space equipment, weapons, iron, steel, electronics, chemicals, machinery for other factories, and much more.

France is often overlooked and not considered to be a world economic power. While it may not necessarily compete with nations such as China or the United States, it is still a leading or competitive producer in many fields, especially agriculture. For a country that began its economy with small farms and homemade businesses, France has come a long way. In large part because of its successful use of fertile soil for agriculture and its advances in technology, France has gone from being a weak economic country to one of the top economies in the world.

FREE TRADE AREA

A free trade area is one of five types of regional trade agreements (RTAs). A free trade agreement exists when multiple, but not necessarily all nations (as in a multilateral organization such as the World Trade Organization or United Nations), trade goods and services across international boundaries without the limitations of tariffs or quotas. Most free trade agreements however reserve some limitations on trade normally relating to health, safety, and technical standards (Gerber 2014).

This represents an expansion on the first type of RTA, called a partial trade agreement, which is where nations agree to eliminate trade barriers in a specific industry, as the United States and Canada did with automobiles before 1994 and the beginning of the North American Free Trade Agreement (NAFTA). A further step to economic integration above the free trade area is the customs union. A customs union includes a common external tariff which is an agreed upon tariff that the area imposes on imports from nonmember nations. The next level of economic integration is called a common market. In a common market the member nations agree upon free movement of labor and capital. An example of this is the early development of the European Union, particularly the Schengen Agreement. The final level is the economic union. This occurs when nations collaborate on macroeconomic policies, for example adopting a common currency and harmonization of standards and regulations (Gerber 2014). With any type of regional trade agreements there are usually provisions and restrictions relative to the given agreement. Similarly, in any agreement there are benefits and criticisms.

Free trade agreements create greater competition for goods and services. This benefits the end consumer by creating greater purchasing power from more buying options. A wider competitive scope drives prices down and increases quality of goods. Similarly, for producers free trade agreements expand markets to offer opportunity for a greater customer base. Furthermore, they open production capabilities in different countries where there may be more efficient means of labor and materials (Griffin n.d). These agreements can also be beneficial to developing countries as they allow the countries to both compete in other markets and potentially attract investment and jobs from businesses. Similarly, free trade agreements benefit developed nations because they can compete in a larger market space and utilize production factors in creating a lower cost and higher quality product to gain competitive advantage.

In general, critics of regional trade agreements have a number of different perspectives. Critics argue that regional trade agreements limit and polarize nations into regions rather than promoting a true free market global environment through multilateral agreements with the WTO. A second viewpoint of the critics is that many regional trade agreements unjustly benefit developed nations. Agreements with developing nations represent little threat to established nations and only serve to further advance the developed nation's benefits from trade (Gerber 28). Furthermore, the relaxing of barriers to trade has precipitated a "race to the bottom" in terms of businesses using these agreements to locate the lowest costs of production, often by avoiding established labor rights and environmental and safety standards in their host nations. The pursuit of lower costs within the constructs of free trade agreements has suppressed wages in the United States and lowered the bargaining power of U.S. labor unions. Businesses seek out facilities in developing nations with workers who have little experience in labor rights, work safety, and environmental regulations (Amadeo 2016).

There are a number of prominent free trade areas, including the Asian Free Trade Area-Southeast Asian Nations (AFTA-ASEAN), the Australia New Zealand Closer Economic Agreement (ANZCERTA), and the Asia-Pacific Economic Cooperation

(APEC). However, the most well-known free trade agreement is NAFTA. Before NAFTA, the United States had a partial trade agreement with Canada in the automotive industry and with Mexico in the maquiladora industry. The maquiladora represented a specialized intra-business export processing zone that allowed firms to trade between operations in a specific region of Mexico and the United States without paying tariffs on imported parts and materials (Gerber 2014). NAFTA essentially shifted the trade benefits of the maquiladora program to include more regions, industries, and productions across Mexico. NAFTA has specifically boosted agricultural, automotive, and textiles industries. However, Mexican farmers particularly suffered in the wake of NAFTA due to inability to compete. One of the specific limitations of NAFTA is the restriction of Mexican trucks to a specified commercial zone rather than free access in transportation. Furthermore, restrictions on customs, regulations, and immigrations remain. Whether NAFTA should remain or ever truly was a free trade area is debatable. NAFTA has elements of a common market with allowances for the free movement of capital, but with restrictions on labor movements. Furthermore, NAFTA does not include a common external tariff. An argument for further integration might include the adoption of the U.S. dollar as a single currency between the United States, Canada, and Mexico in a process called dollarization. This would expand the benefits of trade, but it would require considerable collaborations in terms of fiscal policies and it presents plenty of risk for each participant (Gerber 2014). Without further policies aimed at integrating economic systems, NAFTA is likely to remain an in-principle free trade area.

FREE TRADE AREA OF THE AMERICAS

The Free Trade Area of the Americas (FTAA) was a proposed free trade area of 34 democracies in the Western hemisphere. A free trade area reduces or eliminates trade barriers such as tariffs and import quotas among member nations. In addition, the proposed FTAA liberalized foreign direct investment (FDI), permitting transnational corporations greater cross-border investment opportunities throughout the hemisphere. If enacted, the FTAA would extend from Canada to Chile.

The proposed Free Trade Area of the Americas stirred considerable debate during the 1990s and early 2000s. FTAA supporters viewed its creation as the next logical step in the Western hemisphere's economic integration. That is, the FTAA would extend the benefits of economic interdependence beyond the borders of existing regional trade blocs such as the Andean Community, which consists of Bolivia, Colombia, Ecuador, Peru, and Venezuela; the Caribbean Community, which consists of 15 nations located in the Caribbean, Central America, and South America; the Dominican Republic-Central American Free Trade Agreement (DR-CAFTA), which consists of Costa Rica, Dominican Republic, El Salvador, Guatemala, Honduras, and Nicaragua; MERCOSUR, which consists of Argentina, Brazil, Paraguay, Uruguay, and associate members Bolivia and Chile; and the North American Free Trade Agreement (NAFTA), which consists of Canada, Mexico, and the United States. The most obvious benefits of the FTAA agreement were the expansion of trade and FDI, job creation, economic growth, and global connectivity.

Initial discussions to create a single free trade area for the Western hemisphere's 34 democracies began at the Summit of the Americas in 1994. At the Summit of the Americas, held in Miami, Florida, the heads of state and government of the 34 democratic governments pledged support for the FTAA. In 1998, at the Second Summit of the Americas, held in Santiago, Chile, formal negotiations were initiated to create the free trade area. The Santiago summit also stressed the need for balanced and sustainable development throughout the 34-nation region. In 2001 the Third Summit of the Americas, held in Quebec City, Canada, brought the heads of state and government together to endorse a draft version of the FTAA agreement. The draft version of the agreement proposed a free trade region that would "generate economic growth and prosperity." The deadline for a final FTAA agreement was set for January 2005.

Government leaders also pledged to cooperate to remedy other hemispheric problems, including drug trafficking, poverty, environmental degradation, and violations of worker and human rights. In 2004 the 34 heads of state and government met in Monterrey, Mexico, to reaffirm their support for the FTAA. In Monterrey, leaders also reaffirmed their commitment to economic growth, poverty reduction, social development, and democratic governance. Despite proclamations of support for the FTAA, the final version of the FTAA agreement was not formally adopted by the January 2005 target date.

Opponents of the FTAA stressed the potential economic and social costs of an expanded free trade and investment regime. FTAA opponents argued that earlier regional free trade agreements, especially NAFTA, had opened a Pandora's box of economic woes for workers, the environment, and people's quality of life. Opponents claimed that the liberalization of international trade and FDI in the Americas had revived sweatshop production methods in some Latin America and Caribbean countries. Further, opponents argued that lax or nonexistent environmental safeguards invited environmental abuse by transnational corporations (TNCs). To FTAA opponents, the low-wage, low-skill assembly work in Mexican maquiladoras, many of which border the United States, illustrated the failure of NAFTA to improve people's quality of life. Opponents also noted that a growing competitiveness in global markets only reinforced the dreaded "race to the bottom," because TNCs cut production costs at the expense of indigenous peoples and the environment.

G

GENERAL AGREEMENT ON TARIFFS AND TRADE

The General Agreement on Tariffs and Trade (GATT) was a multilateral agreement that established rules for international trade from 1948 to 1994. The overriding goal of GATT was to promote free trade among nations. In 1947, 23 countries met in Geneva, Switzerland, to negotiate the first set of trade rules and tariff reductions. The result of these initial trade negotiations was the General Agreement on Tariffs and Trade. GATT, which took effect on January 1, 1948, consisted of 45,000 tariff concessions. History refers the 1947 negotiations as the first GATT trade round. From 1948 to 1994, four directors-general led GATT: Sir Eric Wyndham-White (1948–1968), Olivier Long (1968–1980), Arthur Dunkel (1980–1993), and Peter Sutherland (1993–1994).

GATT's 23 founding countries, headed by the United States and the United Kingdom, assumed that GATT would soon be absorbed into a new International Trade Organization (ITO)—an institution that was also under negotiations during the late 1940s. The ITO was intended to be the third pillar of the Bretton Woods System, joining the newly formed World Bank and International Monetary Fund (IMF) in maintaining an orderly and prosperous post–World War II global economy. Negotiations to create the ITO stalled at the Bretton Woods Conference in July 1944 but continued in a series of conferences in London, Geneva, and, finally, Havana, Cuba. In 1948 delegates from 54 countries signed the Havana Charter, also called the ITO Charter. By the late 1940s, however, interest in yet another multilateral organization had waned in some industrialized countries, most notably the United States. The U.S. Congress shelved the Havana Charter in 1950. Without U.S. participation, plans for the ITO were abandoned.

Multilateral trade negotiations continued despite the collapse of the proposed ITO. The original GATT agreement became a rallying point for non-Communist countries that supported trade expansion as a means of achieving economic growth and development. Under the auspices of GATT, a series of eight multilateral trade negotiations took place from 1947 to 1994. Multilateral trade negotiations were called trade rounds. Early trade rounds concentrated on reducing tariffs on merchandise. A tariff is a tax on an imported good. Tariffs discourage imports by raising their price. Later trade rounds, especially the Tokyo Round and the Uruguay Round, expanded trade negotiations to reduce trade barriers on merchandise and services. Later trade rounds also responded to changes in the global economy. The Uruguay Round (1986–1994) involved 123 nations. The Uruguay Round tackled issues related to tariff and non-tariff trade barriers, subsidies, dumping, trade in services, intellectual property rights, and other issues in the global trading system.

Although successive trade rounds expanded the scope of the original GATT agreement, through the years, the main GATT principles provided an anchor for an orderly evolution of the global trading system. The most fundamental GATT principle was embodied in the most-favored-nation (MFN) clause. MFN required that a trade concession granted to one country automatically applied to other GATT members. The second principle—national treatment—required that foreign and domestic output be treated in a fair and equal manner within nations. In practice this meant that imported goods, once appropriate tariffs had been paid, could not be penalized through the imposition of additional taxes or regulations. The third principle—the reporting of trade barriers—supported transparency in the global trading system. Under this principle, nations were required to justify the imposition of tariffs, import quotas, or other trade restrictions. Combined, GATT principles provided a global framework for the progressive reduction of trade barriers. The rapid expansion of GATT membership during the 1960s, 1970s, 1980s, and early 1990s indicated that many of the newly independent third-world countries saw advantages in a more open and inclusive global trading system.

Over time, the GATT agreement was viewed as one of the three primary gatekeepers of the global economy. The GATT agreement expanded global trade, the World Bank promoted global development, and the IMF stabilized the global financial system. Yet GATT, by design, was not founded as a multilateral institution. GATT lacked the organizational structures of the World Bank or IMF. Unlike the World Bank and IMF, GATT was never recognized as specialized agency within the United Nations system. GATT also lacked the authority to effectively arbitrate trade disputes and, if necessary, enforce its decisions on unwilling member nations.

During the Uruguay Round, lengthy negotiations addressed the need for a more powerful international organization to maintain the trend toward trade liberalization into the 21st century. The final GATT meeting took place in Marrakesh, Morocco, in the spring of 1994. On April 15, 1994, delegates from many of the 123 participating nations signed the Marrakesh Declaration, which established the World Trade Organization (WTO). On January 1, 1995, the WTO officially replaced GATT as the world's leading advocate for free trade—and enforcer of trade rules—in the global economy. Many existing trade rules that had been created under the GATT system were renamed GATT 1994, and absorbed into Article 1 of the WTO charter.

GERMANY: GENERAL ECONOMY

Germany has the largest economy in all of Europe and, according to purchasing power parity (PPP) terms, it is the fifth largest economy in the world. Germany is a prominent exporter of vehicles, machinery, chemicals, and household equipment. Although its ability to export large quantities is supported by a highly skilled national labor force, Germany continues to face significant demographic challenges like many of its Western European neighbors. Issues such as low birth rates and declining immigration are affecting sustained long-term growth, increasing pressure on the country's social welfare system, and necessitating structural reforms.

Germany faces the task of improving its extremely high unemployment rate and its low average growth. Reforms launched by former German chancellor Gerhard Schroeder helped decrease the amount of unemployment in the nation. Due to Germany's open economy and industrial base, exports account for approximately one-third of its gross domestic product (GDP). Subsequently, Germany is extremely competitive in the world on several fronts including the product markets, and the international free movement of capital in the financial markets, and technology used in the production of goods and services.

A fundamental feature of Germany's economic system is the Bundesbank, the central bank of the Federal Republic of Germany. Founded on July 26, 1954, it is responsible for retaining close contact with the central banks of the European Union (those that form the European System of Central Banks). Also known as the Deutsche Bundesbank, it alone was responsible for ensuring price stability within Germany until the launch of the European Monetary Union. Upon the introduction of the euro in the beginning of 1999, this task was transferred to the European System of Central Banks (Eurosystem).

Currently, the Bundesbank keeps track of national accounts, calculations of domestic product, and provides data needed for ongoing economic observations and analysis. Most notably, data is analyzed quarterly and annually on the creation, use, and distribution of gross domestic product at its current price or to adjust it for inflation or deflation. Finally, because of the rules set by the Eurosystem, the Bundesbank offers a wide range of services to central banks, international organizations, or monetary authorities outside the Euro area to enable them to invest their euro-denominated monetary reserves.

To maintain its position as a leading power in the world of exports and trade, economic decisions in Germany are based on sustaining a competitive edge in the world market. Germany's competitiveness and openness in global markets instills further global competitiveness that provides consumers assurances they are buying products at low prices and high quality. Many of Germany's tactics to remain a leader in the world economy have resulted in Germany being considered to be one of the strongest countries, not only in Europe, but also around the globe.

GLASNOST

"Glasnost," or openness and transparency, was part of Mikail Gorbachev's reform policies for the Soviet Union during the late 1980s. Glasnost is often paired with the concept "perestroika"—a broader idea including the restructuring and democratization of the USSR. Past Communist Russian leaders had also used these words but it was Gorbachev's December 1984 speech before he became the general secretary in which he identified these ideas with "uskorenie" or acceleration as key themes for Russian reform. During the next five years Gorbachev's glasnost would bring profound change, and the end of the Cold War, not only for the Soviet Union but also for the satellite Eastern European Communist governments as well.

Gorbachev's philosophies introduced significant social and political reforms and changes in economic practice and foreign relations. When Gorbachev took office in 1985 he inherited a struggling economy, a second-world standard of living, and a lack of freedom. Gorbachev believed that the only way to revitalize and modernize the USSR was to allow change. Perestroika was used to restructure and overhaul the Communist party at the top levels and eliminate the centralized government planning in favor of the free market. Glasnost allowed an easing of strict government control.

These ideas encouraged the introduction of genuinely contested elections and other measures to promote democracy within the Communist party and political system. They also encouraged the legalization of cooperatives and other semi-private business ventures, the end of government price controls, and the election of enterprise managers.

Glasnost in particular was meant to allow greater freedom of expression for Soviet citizens. Religious groups, journalists, and media were now able to speak and report freely their opinions and even to criticize the government. Soviet people could listen to foreign radio programs and music without fear of arrest, Soviet newspapers could report without censure, and the Communist party could be criticized.

Through glasnost and perestroika Gorbachev oversaw reforms that allowed Eastern European countries formerly under Communist control to choose their own governments. He also significantly reduced the number of troops and tanks based within these countries.

These ideas had unintended consequences and ultimately helped to undermine public confidence in the Soviet Union. The media uncovered many unflattering even brutal truths about previous leaders such as Joseph Stalin, Leonid Brezhnev, and Konstantin Chernenko—school history exams were cancelled in 1988 as much conventional wisdom was overturned. Many stories of the failures and wrongdoings of previous Soviet regimes, as well as the shortcomings of perestroika, swayed much of the Soviet society towards Western ideas. As many Communist regimes began to dissolve, Gorbachev returned to more conservative policies and advocated to maintain the Soviet republics as one nation. Ultimately Mikhail Gorbachev resigned from the presidency when the USSR collapsed in 1991 into 15 individual republics.

GLOBAL CONTAGION

"Contagion" means the diffusion of either economic growth or economic decline throughout a specific region. Contagions can occur within a country or be spread out through multiple geographic regions. As the economy has become increasingly global, contagions have also become more global. The world is connected more now than ever before, as are the economies of the world and the successes and downfalls of those economies.

Contagions are usually associated with a financial crisis. They can go from one crashing economy to another. Within a single country's market a contagion can occur if one large bank sells its assets quickly and people's trust in other large banks goes down. In 1997 when Thailand's market crashed, market shocks quickly spread to nearby East Asian countries, resulting in widespread economic crises in the region. This crisis spread so far that it negatively affected growing markets in Latin America and Eastern Europe.

Contagions are named for their ability to spread quickly and almost unexpectedly. The crash or success of an economy in today's world is contagious. Global investment and international trade make financial contagions more expected to occur than ever before, especially in developing countries where emerging markets are in a fragile state. These negative contagions can very quickly harm such economies on a much larger scale than that of developed countries and countries that are world powers such as the United States. Larger and more established markets are better equipped to handle contagions than emerging economies. Referring back to the Thailand crisis, China did not feel as much of an effect during and after that crisis because its market was bigger and more stable than that of most of the smaller Asian countries.

Financial crises and contagions had been affecting global economies, although on a smaller scale than now, since the 19th century. A banking crisis that began in London in 1825 spread to all of Europe and Latin America. After most of Latin America was liberated from Spain, European investors poured money into the region. The Bank of England raised its discount rates in fear. This sparked a crash of the stock market, which spread panic and economic turmoil to the rest of Europe and eventually to the place that sparked the trouble in the first place, Latin America.

The Great Depression that started with the crash of the U.S. stock market in 1929 is one of the more recent examples of the effect of contagion on global economy. Not only was the Depression of the most catastrophic economic events in U.S. history, it was catastrophic to the entire world because the U.S. economy was and is so big and the United States is a world superpower.

Global contagions also can be a positive thing, but, as history proves, they are more often negative. They are also much more likely to occur in today's world economies because of how connected the economies are. Countries such as the United States that export much of their work and investments overseas should especially expect to feel the effects of global contagions.

GLOBAL CURRENCIES

Currency plays an important role in the global economy. For a currency to be considered a global currency, it has to be able to be traded internationally. With the growth in international investment it is important for many countries to be able to trade currencies. These transactions are called currency internationalization or currency substitution (Cohen 2012). The need for these activities has created the global foreign exchange market. If you have ever traveled to another country you have probably exchanged money in order to making the process of making purchases in that country easier for you. Although the concept of global currency has proven to boost the global economy by allowing the exchange of participating currencies, there also have been currency wars between countries throughout history.

Having different global currencies and trading them on the foreign exchange market is a tool that can be beneficial in growing the global economy. The foreign exchange market has grown to be one of the largest markets in the world, estimated in 2010 to have traded $3,981 billion of currency per day (Gerber 2014).

When trading currency, those making a transaction have to keep in mind the amount they are exchanging is subject to the current exchange rate. Exchange rates are the price of trading one country's currency for another (Brown 2008). The exchange rate shows us what a country's currency is worth compared with other global currencies. For example, when someone takes a vacation to Mexico, they will want to exchange U.S. dollars for Mexican pesos. If the exchange rate of U.S dollars is 1.00 to 10 Mexican peso, then 100 dollars would be exchanged for 1000 pesos. Exchange rates change on a daily basis, so for investors it is very important to keep an eye on these rates in order to get the most out of a transaction. Some countries have tried to eliminate dealing with exchange rates by adopting other currencies. This is called dollarization. This practice may seem like a good idea, in an effort to simplify the act of purchasing goods and services. However, without the use of exchange rates, countries cannot use their currency as a way to grow economically.

Despite how popular the foreign exchange market has become, there also have been currency wars. Currency wars have been created by a country devaluing its currency against another currency, and they have proven to be very destructive (Rickards 2011). There are a number of factors that create an environment for a currency war to occur. Currency wars happen when a country is going through a time of insufficient economic growth. Three events led to the occurrence of Currency War I: the classical gold standard from 1870 to 1914, the creation of the Federal Reserve in 1913, and World War I (1914–1918) and its conclusion with the Treaty of Versailles (1919) (Rickards 2011, 34). The currency war lasted for more than a decade, between World War I and World War II including the Depression Era (1921–1936). Currency War II occurred between 1967 and 1987. Currency wars continue to be a threat to today's global economy. Currently, the Chinese yuan has been declining at a fast pace, and has the potential to hurt the global economy (Cui 2016). Economists fear that China is on the verge of starting another currency war.

GLOBAL ECONOMY

The global economy is the international network of individuals, businesses, governments, and multilateral organizations that collectively make decisions about the production, consumption, and distribution of goods and services. There are 208 individual "economies" within the global economy. The world's largest economy is the United States. In 2014 the gross domestic product (GDP) of the United States was $17.4 trillion. Among the world's smallest economies are Nauru ($139.7 million), and Tuvalu ($35.3 million). The GDP measures the value of all newly produced final goods and services in an economy each year.

Global capitalism has created unprecedented prosperity in some countries, especially in the world's 29 advanced economies. The remaining 179 economies are categorized as other emerging market and developing economies. The benefits of global capitalism have eluded some countries in this broad group, especially the world's 50 least developed countries (LDCs). The CIA's World Factbook reported a 2014 global gross domestic product of $110.4 trillion. Using the purchasing power parity (PPP) method, global per capita GDP stood at $16,700 in 2014.

The global economy is highly integrated and interdependent. Among the key players in the global economy are transnational corporations and other business firms with a global reach; international financial institutions (IFIs) such as the World Bank and regional multilateral development banks; multilateral organizations that monitor global economic activity such as the International Monetary Fund (IMF) and the World Trade Organization (WTO); national governments, and groups of governments such as the Organisation for Economic Co-operation and Development (OECD), G8, G20, and G77; and thousands of non-governmental organizations (NGOs) and civil society organizations (CSOs). The United Nations, through its specialized agencies and programs, also promotes sustainable economic development and economic justice in the global economy.

Technological advances stimulate cross-border business activity and global interdependence. During the 1800s, the application of steam power to railroads and ships sped the transport of resources, goods, real capital, and people to distant locations. Early communications systems, such as the telegraph and telephone, also prompted cross-border transactions. Today, innovative information and communications technologies (ICTs) create a more integrated world linked by computers, the Internet, communications satellites, cell phones, and so on. ICTs permit people to store, process, and transmit enormous quantities of information. Similarly, transportation technologies such as supersonic airplanes, supertankers, automobiles, and high-speed rail transport, have advanced the connectivity of peoples in ways unimagined just a few decades ago. Global connectivity, enabled by technological advances, is most apparent in the expansion of international trade, foreign direct investment (FDI), and cross-border financial flows.

International trade is the cross-border exchange of goods or services. International trade occurs when individuals, businesses, governments, or others import or export goods or services. An import is a product that is purchased from another country. An export is a product sold to buyers in another country. The CIA's World Factbook reported that total exports of merchandise and commercial services reached $18.5 trillion in 2014 while imports measured $18.1 trillion. International trade enables one country to specialize in the production of goods that it can produce more efficiently than another country. That is, specialization and trade encourage a country to produce goods in which it enjoys a comparative advantage. The efficient use of scarce resources increases the global supply of goods and services. International trade also expands the range of consumption choices for buyers. Imports from other countries increase the availability of goods that could not be produced efficiently by domestic producers. A number of multilateral agreements and institutions have facilitated trade expansion since World War II, including the General Agreement on Tariffs and Trade (GATT), the International Monetary Fund (IMF), and the World Trade Organization (WTO). The end of the Cold War and the rise of transition economies in eastern and central Europe during the 1990s and early 2000s opened new doors to international trade.

Transnational corporations (TNCs) are a second important feature of today's global economy. TNCs, sometimes called multinational corporations (MNCs), are businesses that own and operate production facilities in more than one country. A TNC consists of a parent company and its foreign affiliates. TNCs foster connectivity in the global economy. TNCs invest heavily in foreign countries, a process called foreign direct investment (FDI). The two types of FDI include greenfield investments and mergers and acquisitions. Greenfield investments involve the building of entirely new production facilities, such as factories or office buildings, in another country. In addition, the foreign affiliates of TNCs employed 54 million workers, exported $3 trillion in goods and services, and owned $30 trillion in productive assets.

Cross-border financial flows are a third component of the global economy. Cross-border financial flows consist of short-term investments in stocks, bonds, other securities, and national currencies. Stock trading occurs on established stock exchanges such as the NASDAQ Stock Market and New York Stock Exchange in the United States; Shanghai Stock Exchange in China; London Stock Exchange in the United Kingdom; and Sao Paolo Exchange in Brazil. Highly speculative currency trading occurs on the foreign exchange market. The foreign exchange market is a complex network of commercial banks, investment banks, brokerage firms, and other financial institutions that buy and sell national currencies for profit. The Bank for International Settlements (BIS) reported a daily turnover of $5.3 trillion in the foreign exchange market in 2013. Cross-border financial flows are enhanced by sophisticated ICTs, which speed financial transactions throughout the global economy. Financial transactions occur 24 hours a day, seven days a week.

Multilateral organizations are key institutions of the global economy. Multilateral organizations are institutions designed to deal with global issues. Most multilateral organizations are comprised of representatives selected by member governments. Multilateral organizations have grown in size and power, especially since World War II. Today, the Big Three multilateral organizations in the global economy—the IMF, the World Bank, and WTO—monitor economic relations between countries. The IMF promotes currency stability and macroeconomic stability in nations. The World Bank extends loans and grants to fund development projects in the emerging market and developing economies. The WTO oversees trade relations and supports free trade. Other important multilateral organizations include the specialized agencies and programs of the United Nations System, regional development banks, and regional trade agreements (RTAs). Grassroots organizations, including thousands of international NGOs and CSOs, coordinate global action to support a more stable global financial architecture and responsible foreign investment. NGOs and CSOs protect human and worker rights, the environment, and the cultural identity of indigenous peoples.

In recent years governments have supported global integration and interdependence by liberalizing trade and investment regimes. Trade liberalization promotes free trade. Trade liberalization policies reduce or eliminate trade barriers, such as tariffs and import quotas. Trade liberalization is enhanced by membership in the WTO, which guarantees most-favored-nation (MFN) status to member countries, and in regional trade agreements (RTAs) such as the North American Free Trade Agreement (NAFTA). Liberalized investment regimes attract FDI. Export processing zones (EPZs) attract FDI by offering investment incentives, including tax breaks, to TNCs.

Bilateral investment treaties (BITs) are formal agreements between countries that foster mutually beneficial investment opportunities. Double taxation treaties (DTTs) establish fair tax regimes for individuals and firms that profit from overseas investments. Finally, liberalized financial investments in stocks, bonds, and other investment instruments increased capital flows between nations. Advanced ICTs solidified links among brokerage firms, banks, and other institutions in global capital markets.

GLOBALIZATION

Globalization is the exchange that occurs from country to country, that spreads goods and services around the world. Globalization occurs at all times and everywhere. As well as many other things, the markets around the world depend on globalization. Globalization is not only involved in business, but also in life as we know it. The spread of technology, relationships, and politics worldwide have globalization to thank.

Imagine if technology was at a standstill. Societies would be very limited in what they could do, explore, and accomplish. There would be no such thing as the modern age because everything would stay the same for decades and decades. Luckily the globalizing of ideas and inventions are what allow societies to come up with such things like touch screens and wireless Internet. Globalization has spread technologies to third-world countries allowing them to be able to take advantage of solar power and electricity that they would not be able to live without.

Globalization creates relationships between people on opposite sides of the Earth. Countries like the United States have been able to help foreign countries in need and to form relationships with their people. The 2010 earthquake in Haiti is a good example. Without contacts with foreign nations, such as the United States, Haiti would not have received as much aid as it did following the devastating earthquake. Globalization has helped people connect all over the world, and helped developing countries far away. Globalization has circulated more money into developing countries to help those in poverty. Globalization brings the people on this earth closer and closer together as years pass.

It seems that every country has its nose in another country's politics at one time or another. A presidential election is a good example; other countries want to know who the candidates are and who wins because it could affect their country's relationship with another. They also want to know about new laws that may be passed, those especially concerning imports and exports. Globalization takes the important topic of politics in one country and shares it with the rest of the world.

Globalization has been around for quite awhile. Globalization can happen in many different ways, the biggest being trade. Globalization goes back to the time when our ancestors traded goods and services for other goods and services. Trading has been around as long as people. It is nothing new but through trade and many other things globalization improves the place we call home by making it into the modern world we know it as today.

Globalization links technology, relationships, and politics. Without globalization none of these things would exist, or would but on a smaller scale. Globalization has made today how we know it to be, and will continue to change and upgrade our world for the rest of time.

GORBACHEV, MIKHAIL

Born: March 2, 1931, in Privolnoye, Stavropol Krai, Russia; Nationality: Ukrainian-Russian; Professional Interests: president of Soviet Union, 1990–1991; Nobel Peace Prize recipient (1990).

Mikhail Sergeyevich Gorbachev continues to be a very influential person in the world's economic and political scene. He was a strong reformer in the former Soviet Union and continues to work in support of his belief in democratization. Gorbachev is truly an inspiration in both the economic and political worlds.

Gorbachev was born on March 2, 1931, in the small village of Privolnoye, a rural community in Stavropol Krai, Russia. He was born into a Ukrainian-Russian family of peasants and didn't have an easy upbringing. In 1941 Nazi Germany invaded his homeland, the Soviet Union. Gorbachev's father was drafted into the war and the family soon received a telegram that he had been killed in battle. The family was informed three days later that this was a mistake.

Despite a rough upbringing Gorbachev excelled in his studies. He had a passion for knowledge and learning. He graduated from his high school with a silver medal. Gorbachev was then encouraged to attend university and chose the prestigious Moscow University where he received his law degree. It was here he developed an interest in the Communist Party. He returned home and worked his way up the political hierarchy.

During these years in Stavropol, Russia, Gorbachev worked as head of the krai's administration. While working for Stavropol he implemented a long-term program for the region's development, especially agriculturally. By 1970 Gorbachev had been elected to the Supreme Soviet, serving on commissions dealing with youth policy, foreign affairs, and conservation. After being elected to the Central Committee of Stavropol he made his way up until he was First Secretary, and eventually a full member of the Politburo, the principal policymaking committee of the Communist Party.

After the death of three Communist Party leaders in line to be the General Secretary of the Communist Party, the position was Gorbachev's for the taking. For a few years, Gorbachev was balancing his role between containing the demand for change from radical reformers both within and outside the Communist Party and forcing reforms on an uncooperative old guard. Gorbachev made changes such as a policy of glasnost, or "openness," expanding the freedoms of many. He also executed the policy of perestroika, or restructuring, an attempt to democratize the Soviet Union. Perestroika also introduced limited free-market mechanisms into the Soviet economy. But even these small economic changes were met with much resistance from party and government bureaucrats who were unwilling to hand over their control of the nation's economic life.

Gorbachev decided to sign a pact with President Ronald Reagan as part of an attempt to maintain a warm relationship between the East and the West. In 1989 Gorbachev sought to change the Soviet Union's stance on world power and withdrew nearly all USSR troops from Afghanistan. In 1990 he won the Nobel Peace Prize for his efforts.

Since leaving office with the breakup of the Soviet Union, Gorbachev has continued to advocate for the development of private ownership in a market economy. He founded the International Foundation for Socio-Economic and Political Studies, also known as the Gorbachev Foundation. Gorbachev has attempted many times to change Russia's negative feelings toward democratization. In 2008 he joined with billionaire Aleksandr Lebedev in the purchasing of half of the *Novaya Gazeta*, an independent newspaper. Gorbachev has been a strong critic of many in his paper, including Prime Minister Vladimir Putin and President Dmitri Medvedev. He has also been known to critique the United States' economic policy toward Russia and the International Monetary Fund's role in the Russian default.

Through his rags-to-riches story and his efforts in the political and economic world of the Soviet Union, Mikhail Gorbachev has earned recognition as one of the most influential political leaders of the 20th century.

GREECE: SOVEREIGN DEBT AND FISCAL CRISIS

In 2010 the Greek economy emerged as the first casualty of a global sovereign debt crisis. Greece was unable to pay its public debt as the result of high debt levels and low economic growth. The crisis in Greece poses a large threat to the rest of the European monetary union, or eurozone, of which it is a part. Greece could destabilize the eurozone and the fragile recovery of the European economy from the recession of 2009. Some even speculate that the collapse of Greece could plunge the entire world into a financial crisis.

Greece was living beyond its means even before it adopted the euro. The roots of its crisis can be traced back to 2001, when Greece adopted the euro as its currency. After it adopted the single currency, public spending soared. Although Greece had been a member of the European Union since 1981 its annual budget deficit was never low enough to satisfy the eurozone's convergence criteria.

For several years Greece benefited from the power of the euro, including lower interest rates and an inflow of investment capital and loans. While money flowed out of the government's treasury, income suffered from widespread tax evasion. After years of overspending the budget deficit, the difference between government spending and government income per year had spiraled out of control. Much of Greece's borrowing was concealed in order to comply with the 3 percent of gross domestic product (GDP) borrowing cap that was required of eurozone members. As a result the debt in Greece continued to rise until the crisis erupted.

The Greek fiscal situation came to the center of international attention in October 2009 when the fiscal deficit worsened significantly during the financial crisis. Additionally after many years of experiencing significant economic growth, in 2009 along with other southern countries of the European Union the Greek economy entered a prolonged recession, the end of which is not yet visible.

The fundamentals of the Greek economy had improved significantly in the 20 years leading up to its entry into the eurozone. Since Greece's entry into the eurozone, its public finances and international competitiveness have remained a significant and persistent problem for Greece and the world economy. Up until the end of 2008 Greece had no problem refinancing its debt. However, amid the international financial crisis, refinancing its debt became an issue. Debt levels reached the point where the country was no longer able to repay its debt.

There are several likely reasons for this, the first being Greece's high public debt. In the early 1990s Greece's public debt had stabilized at roughly 100 percent of GDP, versus the 70 percent average for the rest of the eurozone. The start of Greece's crisis can be traced back to 2009 when it admitted its budget deficit would be 12.9 percent of GDP, far exceeding the 3 percent European Union limit. As an attempt to warn investors, Greece's credit ratings were lowered. Despite efforts this drove up the cost of future loans making it even more unlikely that Greece would be able to find the funds to repay its debt (Alderman, 2015).

In 2010 Greece announced an austerity package designed to reassure agencies it was financially responsible by planning to lower the deficit to 3 percent of GDP by 2012. However four months later Greece cautioned it might default.

The European Union and the International Monetary Fund provided two bailout payments to a total of €240 billion in emergency funding in exchange for austerity measures. Unfortunately these measures only further slowed the Greek economy and reduced the tax revenues needed to repay the debt. The funding only gave Greece enough money to pay the interest in its debt and keep banks capitalized.

Greece's 2015 debt-to-GDP ratio is estimated to be over 177 percent. This is actually a 2 percent decrease from the 175 percent debt-to-GDP ratio in 2002. Both are well over the European Union's limit of 60 percent.

GROUP OF EIGHT

Officially formed in 1975 with the first summit in France, the group was originally known as the Group of Six (G6), which included France, Germany, Japan, the United Kingdom, Italy, and the United States. It became the Group of Seven (G7) with the addition of Canada in 1976. The G7 nations were the seven wealthiest developed nations by global net wealth on the planet. Russia joined in 1998 to expand to the Group of Eight (G8). As the G8, these nations represent more than 63 percent of net global wealth. In 1999, a group of 20 nations (Group of 20 or

G20) formed to address issues regarding the international financial system as the global economy expanded.

The G8 summits have consistently dealt with macroeconomic management, international trade, and relations with developing countries. Questions of East-to-West economic relations, energy, and terrorism have also been of recurrent concern. From its initial foundation, the agenda of the summit has broadened considerably to include microeconomic issues such as employment and the information highway, transnational issues such as the environment, crime and drugs, and a host of political-security issues ranging from human rights to regional security to arms control. The summit also provides the international community with help in prioritizing and defining new issues and providing guidance to established international organizations.

The attendees at the G8 summits include finance ministers and central bankers from the eight member nations. The G8 holds meetings three or four times a year. Presidents of the G8 countries also meet among themselves. There is no official legal status to the G8 and it does not have a permanent home like other similar organizations, for example, the World Bank, the International Monetary Fund, and the United Nations.

The G8 meetings are geared toward discussing the main issue of economic interdependence. The discussions have led to an informal, interdependent, international financial system amongst the G8 members. The discussions of the ministers and central bankers focus on such issues as national currencies, national financial systems, and global financial stability have led the G8 countries to formulate joint positions.

The members of the G8 also discuss issues of energy, terrorism, economic development, drug-related money laundering, nuclear safety, and transnational organized crime. In order for the topics to be moved forward, leaders of G8 countries have created their own study groups to help them on particular issues that require urgent response. The G8 summits give leaders of the eight nations an opportunity to discuss complex issues as well as an opportunity to interact on a personal level.

Each calendar year, the responsibility of hosting the G8 rotates through the member states in the following order: France, United States, United Kingdom, Russia, Germany, Japan, Italy, and Canada. The holder of the presidency of the host member state sets the agenda, hosts the summit for that year, and determines which ministerial meetings will take place.

The G8 also influences international communities by setting the necessary trade and energy standards to be adhered to by the membership. Compliance with the agreed-upon standards has been high.

THE GRUBEL-LLOYD INDEX

The Grubel-Lloyd index, introduced by economists Herbert Grubel and Peter Lloyd in 1971, measures the level of intra-industry trade of a country. Intra-industry trade occurs when a country imports and exports, at the same time, similar types of goods or services. Goods and services are classified in sectors and also by which level of aggregation is being used. Accordingly, there are three types of intra-industry trade.

First, there is the vertical intra-industry trade, which refers to the simultaneous exports and imports of goods or services at different stages of the production process but classified in the same sector. This can be explained by the increasing ability to carry out the production process in different stages, each of them being performed at different locations depending on their advantages.

Second, there is horizontal intra-industry trade, which refers to the simultaneous exports and imports of goods or services at the same stage of production process classified in the same sector. This can be explained by development of product differentiation.

Finally, there is homogeneous or non-differentiated goods or services trade.

Grubel, a Canadian economist and senior fellow at the Fraser Institute, and Lloyd, a New Zealand economist and professor emeritus of the University of Melbourne, developed the most commonly used method to estimate the extent of intra-industry trade. The index now known as the Grubel-Lloyd index is a simple formula to calculate the extent of this type of trade. Having the value of a country's export and import for a specific sector and period, the index is calculated as illustrated in the figure.

If the country in question either imports or exports goods or services within the same sector, that is, there is no intra-industry trade, either the import or export value would be zero making the second term on the right-hand side of the equation equal to one, which means that the Grubel-Lloyd index becomes zero. On the other hand, if the export value is exactly equal to the import value ($export_{\text{sector i}} = import_{\text{sector i}}$), the second term on the right-hand side of the equation is equal to zero, which means that the Grubel-Lloyd index becomes one. Therefore, the range of the Grubel-Lloyd index goes from zero (meaning inter-industry trade only) to one (meaning intra-industry trade only).

$$GL_{sector\ i} = 1 - \left(\frac{|\, export_{sector\ i} - import_{sector\ i} \,|}{|\, export_{sector\ i} + import_{sector\ i}} \right)$$

To some extent intra-industry trade, as measured by the Grubel-Lloyd index, can be considered a problem of classification, as different types of goods and services are grouped together in the same sector.

H

HECKSCHER-OHLIN THEORY OF TRADE

The Heckscher-Ohlin theory of trade explains why countries trade and specialize depending on their factors of production. This model mathematically evaluates trade equilibriums and comparative advantage between countries, building on the work of David Ricardo. Countries that engage in factor specialization will experience a higher standard of living.

Bertil Ohlin, along with his teacher, economics historian Eli Heckscher, developed the Heckscher-Ohlin theory in the 1920s at the Stockholm School of Economics. Ohlin published his book, *Interregional and International Trade*, explaining his ideas in 1933. Heckscher is credited as well because of his earlier work involving international trade and his supervision of Ohlin's doctoral thesis.

The Heckscher-Ohlin theory expands the Ricardo model from one factor of production to two. It also assumes that trade will be between two countries in which the major factors of production—labor and capital—are not available in the same proportion. In addition, the ownership of capital is private and will generate income for the owner. In this model, two goods will be produced that require either more capital or more labor. For example, the steel industry might be capital intensive and the clothing industry might be labor intensive. There are no transportation costs between countries and citizens of the two countries have the same needs. In addition, each country has the same production technology with a constant return to scale. The two countries with two commodities and two factors of production lead many to call this the "2 x 2 x 2 model."

Because labor and capital are not available in the same proportion, each country must specialize either in labor-intensive goods or capital-intensive goods. The more different the countries are in this proportion, the greater their economic gain from specialization will be. As countries develop and incur greater costs for labor, they should then shift to capital-intensive goods. The international trade allows gains for all participants.

In 1977, Bertil Ohlin won the Nobel Prize for his contribution to international trade. Other notable economists also have used this theory as a foundation for further models. In his Factor Price Equalization Theorem Paul A. Samuelson showed mathematically that initial wage differences between countries disappear with trade in the Heckscher-Ohlin model. Wassily Leontief also added to the Heckscher-Ohlin theory explaining that highly skilled labor within the United States allows more exports even with its very abundant capital. The Rybczynski theorem added the idea that the greater use of a countries factor of production would cause an increase in the production of that good and decrease the output of the converse good.

It is important to note that even though countries benefit from specialization and trade, groups within the countries benefit differently. If a country produces goods with many workers and little capital, this would lead to increased wages and benefit workers. It would, however, also decrease the income of the capital owners. Economists often focus on whether the overall gain is larger than the loss to determine a positive outcome.

HIGH PERFORMANCE ASIAN ECONOMIES

Before 1960, the economies of East Asia lagged far behind most other countries. Since 1960, however, the economies in the countries of East Asia have become some of the fastest growing economies in the world. The World Bank classified these countries, including Hong Kong (now part of China), Indonesia, Japan, Malaysia, Singapore, South Korea, Taiwan, and Thailand, as High Performance Asian Economies (HPAE) (Gerber 2014). It is well known that these relatively small countries in geography have large populations and since 1960 have had a significant impact on the global economy. Studies have found that the economic growth rates in many individual countries have been unstable over the years; but the countries of the HPAE seem to be an exception to this (Page 1994).

There are many factors that can be contributed to the HPAE's economic growth. Perhaps the most important reason the HPAE were able to take off was because of their savings and investments in education and health care (Hollingsworth 2008).

Saving and investing are interrelated. As savings increase, there is more capital to invest, which leads to more economic growth. The HPAE seem to have a good grasp of this concept. By investing capital into education countries can create a higher production level in labor. With good education, people are able to work more efficiently and be more effective. The government also put time and energy into working against income inequality because it was found that there was an inverse correlation between decreasing poverty and the rate of economic growth (Hollingsworth 2008). Meaning, as the poverty level decreased, the rate of economic growth in those countries increased. Low poverty rates had many positive effects, as one could imagine, and led to even more growth.

The promotion of exports was another factor in sustaining economic growth for the HPAE. The HPAE initially focused on import substitution industrialization (ISI) policies. Not all of the countries that are part of the HPAE switched their focus to exports at the same time. In fact, the switch took place over nearly 30 years from the late 1950s to the early 1980s (Gerber 2014). There are some who are skeptical to the suggestion that the promotion of exports creates economic growth for a country. However, growth-theory literature has shown that the two are related, primarily because the growth of exports stimulates productivity growth because of its effect on the ability to gain capital (Lee and Huang 2002). Despite this, there are still those who dispute the connection between the two concepts.

A stable macroeconomic environment has also been a key to the HPAE's successful economic growth. The HPAE did suffer an economic crisis in 1997, but they were quick to respond and were able to bounce back (Gerber 2014). They were able to successfully manage the most recent global financial crisis as well. There are many factors that contribute to maintaining a stable macroeconomic environment. Of these factors, the HPAE have been able to successfully control inflation rates and keep foreign debt and budget deficits within the boundaries set by the government (Gerber 2014). This stability has helped the HPAE continue down the path of sustainable growth over the last 50 years.

HONG KONG: GENERAL ECONOMY

Hong Kong is a free market economy where the prices of goods and services are not set through government intervention but determined by interactions between buyers and sellers. Hong Kong's economy is dependent on trade and finance from other countries. Mainland China is a main trading partner, accounting for about half of the country's trade. Hong Kong does not impose taxes on imported goods, resulting in a market based on open trading.

In 2008, Hong Kong's open economy resulted in economic problems. Heavily reliant on international trade and business, the country was left vulnerable and was hurt in the economic slowdown. Although Hong Kong was able to bounce back because of trade, tourism, and business with China, it was still exposed to problems of the global economy; a consequence of an economy heavily dependent on international business and trade.

Being such a small island, natural resources are very limited in Hong Kong. It has very little room for agriculture, not much fresh water, and scarce mineral or natural resources. The only natural resource of significance for Hong Kong is its building stones and sand deposits offshore. Virtually all food and raw materials are imported, mostly from China.

Tourists and travelers in Hong Kong mainly consist of people from China due to China's reduced travel restrictions. The number of tourists from China to Hong Kong has increased from 4.5 million in 2001 to 34.9 million in 2012. China's policy change and the resulting increase in Chinese tourists provided a major boost to Hong Kong's economy.

Hong Kong also attracts businesspeople because it serves as a large regional center. Many regional headquarters and representative offices are located in Hong Kong. Additionally, Hong Kong is a main telecommunication hub for the region and is home to one of the busiest international cargo airports and one of the largest container ports.

Because Hong Kong is dependent on the global economy this makes it vulnerable to bad times if its trading and investment partners have trouble. Its economy also very much depends on China because this is its main trading partner. If mainland China is doing well chances are so is Hong Kong.

The economy of Hong Kong ranks high in a couple areas. It is considered to be one of the world's freest economies. It is also considered to have the best service-oriented economy, with 90 percent of gross domestic product accounted for by service sectors. Furthermore, Hong Kong ranks high in foreign investments, second behind mainland China. Hong Kong's strong economy reflects its status as a major world trade center and world investment center. Despite its small size, it is still able to have a strong economy.

I

IMPERIALISM

Imperialism is the practice of having economic and political power over a region or territory. It is often associated with control by power or force. Imperialism or control of other foreign territories was especially prevalent during the 19th and 20th centuries on the continents of Africa and Asia during the imperialistic occupation by Great Britain. In today's global economy imperialism is often seen as a negative economic policy of control of one country over another country or territory.

Imperialism stretches back to ancient times. Empires existed in Ancient China, other parts of Asia, and the Mediterranean, and from the Persians to the Romans to the ancient Greeks, most ancient peoples lived under or were influenced by imperial regimes. Alexander the Great assembled one of history's earliest and most notable empires. Alexander's empire was followed by the Roman Empire of Europe and the Middle East.

The academic definition imperialism has always been one of constant discussion and confusion. One issue in defining imperialism has been identifying the degree to which imperialism is instituted. The first of degree of imperialism is total and complete control of the territory through military or complete legislative power. A second, or lesser, degree of imperialism does not involve military power and control. Instead, a territory is controlled financially and economically, including through unfair trade practices, technology, or ownership of the territory's productive resources.

This second-degree imperialism, that of financial and economic imperialism, has emerged as a modern form of imperialism. It can be argued that the first modern era of imperialism was between the 15th and 18th centuries. The age of discovery was a time of historical empire building and imperialism. Christopher Columbus, Vasco da Gama, Ferdinand Magellan, to name a few of the period's explorers, were instrumental in expanding the empires of Portugal, Spain, France, and England. Imperialism expanded as the New World was explored and exploited by Europeans. The 13 colonies that would become the United States began as part of the imperialistic territory of England.

Prior to World War I a second era of global imperialism emerged. Imperialism in Russia, Germany, and Italy arose as they began to expand their financial and economic power and control through Europe. Europe experienced empires following World War I with several of the same nations. This time political power and control was combined with economic and financial control. These countries included most notably Nazi Germany, Fascist Italy, as well as Communist Soviet Union. Japan also emerged as a new imperialistic power prior to World War II.

The pros and cons of imperialism have been debated for as long as the definition of imperialism has been. In theory the debate has four fronts. First, there are the economic arguments. Proponents point to the vast land, labor, and capital resources available and the many different markets an empire provides for the overproduction of consumer goods and investment capital imperialism generates. The empires of Spain, England, and France were prime examples of how they viewed imperialism to be successful.

Karl Marx and his disciples, including Vladimir Lenin, considered imperialism and capitalism as one in the same. Marxists consider imperialism a final stage of capitalism when the capitalist economy is forced to conquer other nations for new markets for their productive goods and to provide new resources. Historically opponents of imperialism include the "father of modern economics" Adam Smith and David Ricardo. They believed imperialism only benefits an elite few but not the entire empire as a whole.

The second argument regarding imperialism focused on the nature and spirit of the human being both individually and as a nation-state. The proponents ranged from Machiavelli and Francis Bacon to the likes of Adolf Hitler and Benito Mussolini. While having different views on the why, their various viewpoints all led to the same conclusion. Ultimately, they viewed imperialism as a sort of survival of the fittest and the strongest shall rule the weakest. This was definitely evident in the actions of Hitler and Mussolini.

A third, related to the humanity, is the argument for or against imperialism on moral grounds. This focuses on the use of imperialism as a method to free people from tyranny and dictators. A form of informal imperialism (neoimperialism) may arise when resources such as foreign aid or other forms of assistance are given to nations in need. The final front in the discussion of the pros and cons of imperialism includes the need to provide security or protection. Again conflict may arise as the protected territory may see the action as a form of imperialism.

The fourth strategy for imperialism was the security of a nation. Empires would consist of strategic and protective defensive states within their empire. These strategic nation-states would serve the empire both as a defense against potential attacks and offensive points of attack if needed. One point against this argument is that this may also lead to resistance from the occupied nation-states causing friction between the nations. History shows us a nation may use the security argument to extend its power and influence. Again, Hitler and Mussolini are prime examples of using imperialistic overreach purely to extend their power and influence.

IMPORT QUOTAS

An *import quota* is a type of trade barrier that limits the quantity of a product a government will allow into a country during a specified time period. An import quota specifies a quantity limit by number of items, weight, volume, or other measurement. In the United States, an import quota can be established by congressional action or by presidential decree. Over the past several decades, the United States has used import quotas to restrict the amount of sugar imported from Caribbean countries, lamb from New Zealand and Australia, automobiles from Japan, and clothing from China. The primary motive for imposing import quotas is to protect domestic industries, and jobs, from foreign competition. An import quota on a product tends to increase the price of the item in domestic markets.

The two main types of import quotas are absolute quotas and tariff rate quotas (TRQs). An absolute quota establishes a specific quantity of a good that can be imported into a country during a period of time, typically one year. An absolute quota can be bilateral or global. A bilateral quota sets a limit on the import of a good from a single country. In 1999 the United States imposed a bilateral quota on lamb from Australia, a quota that remained in effect until 2001. A global quota sets a limit on the import of a good from all foreign producers. In the early 1980s, the United States imposed a global quota on sugar imports from the Caribbean and other low-wage nations. The second type of import quota, the TRQ, permits the import of a specific quantity of a product at a reduced tariff rate during a period of time. Imports beyond the quota limit, however, face a higher tariff. The U.S. absolute quota on sugar evolved into a TRQ by the late 1980s, largely to comply with trade rules negotiated under the General Agreement on Tariffs and Trade (GATT).

Two types of "voluntary" restrictions also influence the flow of imports in the global economy. The voluntary export restraint (VER) is a bilateral agreement that limits the quantity of a product that can be exported from one country to another country. VERs are typically negotiated at the insistence of the importing country to reduce a surge of imports from the exporting country. For example, the United States negotiated a VER with Japan in 1981 to reduce the flow of Japanese automobiles to U.S. markets. The voluntary quota, initially set at 1.68 million automobiles, was raised to 1.85 million autos in 1984 and 2.3 million autos a year later. The VER was eliminated in the early 1990s. A second type of voluntary restriction is a voluntary import expansion (VIE). A VIE is a bilateral agreement that requires one country to purchase more of a certain product from another country. Often, VIEs are negotiated to counterbalance trade barriers that prevent fair trade between two nations. During the 1980s, the United States pressured Japan to voluntarily import a greater quantity of automobiles and auto parts, semiconductors, and other goods, a move that created tensions between the two economic titans. VERs and VIEs were exempt from GATT rules and, thus, were a type of backdoor protectionism during the 1970s, 1980s, and early 1990s.

Among the most contentious import issues over the past 50 years was the use of VERs to limit textile and clothing exports from low-wage countries. In the 1950s, the United States and Japan negotiated the first textile VER to reduce the flow of Japanese cotton textiles to America. Within a decade, similar textile VERs were negotiated between the United States and other Asian nations, including South Korea and Chinese Taipei. European nations, under the umbrella of the European Economic Community (EEC), followed suit by negotiating VERs with low-wage Asian countries.

In the early 1970s the hodgepodge of textile VERs were absorbed into a global Multi-Fiber Agreement (MFA), which set specific quantity restrictions on exports from the major textile-producing countries and listed specific import quotas for major textile-importing countries. Often referred to as a system of managed trade, the MFA stabilized the global textile and clothing trade for a couple of decades. At the close of the Uruguay round of GATT negotiations in 1994, the MFA was replaced with the Agreement on Textiles and Clothing (ATC). The ATC established a 10-year phase-out period for the complex network of VERs. On January 1, 2005, under the watchful eye of the World Trade Organization (WTO), all textile and clothing VERs in the global economy were terminated. Most experts agreed that the biggest winners in the global textile and clothing industry are China and other low-wage Asian economies. The biggest losers are textile and clothing producers in high-wage industrialized countries and in less efficient low-wage African and Latin American economies.

Multilateral organizations and regional trade agreements (RTAs) have promoted free trade and the reduction of trade barriers in recent decades. The core principles of the General Agreement on Tariffs and Trade (1948–1994) and the World Trade Organization (1995–present), such as most favored nation (MFN) and national treatment, have helped level the playing field in the global trading system. Many import quotas and other trade barriers on merchandise and commercial services have been reduced or eliminated. Under the WTO, new VERs were banned. WTO members also pledged to eliminate existing bilateral VERs by the late 1990s. Regional trading blocs such as the European Union (EU), North American Free Trade Agreement (NAFTA), and Southern Common Market (MERCOSUR) have significantly reduced or eliminated import quotas among member nations.

IMPORTS

An import is any resource, intermediate good, or final good or service that buyers in one country purchase from sellers in another country. Exports, on the other hand, are goods or services that are sold to another country. International trade involves the import and export of merchandise and commercial services. The most important categories of merchandise imports include capital goods, such as machinery and heavy equipment; industrial supplies and materials; automotive vehicles and auto parts; agricultural products, including animal feeds; and petroleum. The most important categories of commercial services include travel, passenger fares, transportation, and a variety of financial and professional services. From 2010 to 2014 the value of imports in the global trading system grew from $14.9 trillion to $16.3 trillion.

Three world regions accounted for the great majority of global imports in 2014. The World Trade Organization (WTO) identified Europe and central Asia as the top importing regions, accounting for 39.1 percent of global imports. East Asia and the Pacific (29.3 percent) is next, followed by China (13.2 percent) and North America and the United States (11.2 percent). The remaining 8.2 percent of global imports flowed to Africa, Latin America, central and eastern Europe and the former Soviet Union, and the Middle East.

Trade liberalization promotes the import and export of goods and services in the global economy. After World War II, the International Monetary Fund (IMF), World Bank, and the General Agreement on Tariffs and Trade (GATT) supported trade liberalization. Under the auspices of GATT, eight trade rounds progressively reduced tariff and non-tariff trade barriers between 1947 and 1994. Since 1995, GATT's successor organization, the World Trade Organization (WTO), has carried the free trade torch. In addition, regional trade agreements (RTAs) have reduced trade barriers. The Asia-Pacific Economic Cooperation (APEC), European Union (EU), North American Free Trade Agreement (NAFTA), Southern Common Market (MERCOSUR), and other trade blocs have negotiated reductions in traditional barriers to trade and cross-border investments.

Countries sometimes adopt trade policies to improve their trade position in the global economy. Shortly after World War II, many newly independent developing countries adopted an import substitution policy. Import substitution challenged domestic businesses to produce substitute goods for items normally imported. The goal of import substitution was to reduce dependence on foreign exports, especially manufactured items, and achieve a trade surplus. Import substitution was a dismal failure in most cases. Developing countries lacked the resources to produce and market sophisticated industrial goods. Expensive capital goods, inadequate research capabilities, an underdeveloped infrastructure, and an inexperienced labor force created roadblocks to industrialization. Government subsidies to domestic businesses, and high protective tariffs, only rewarded production inefficiencies. Over the past couple of decades, developing countries abandoned import substitution policies, favoring instead more stable export promotion strategies.

IMPORT-SUBSTITUTION AND EXPORT-LED GROWTH INDUSTRIALIZATION

After World War II, industrialization became a goal of many developing countries. This process had a great deal of influence on trade between countries. Two major types of industrialization are import-substitution and export-led growth. Trade policy has always been, and will continue to be, a huge factor in the global economy. There have been many changes in these policies throughout the years. Varying degrees of imports and exports have a huge effect on the global economy. As with all factors of economic growth, there are criticisms associated with the different types of trade policy. However, these policies have the same common goal of economic growth.

Import-substitution industrialization (ISI) is a policy that promotes producing domestic goods instead of importing them (Ekeh 2010). ISI policies are used by countries to help develop their manufacturing sector. ISI trade policies were extremely popular following World War II until the 1980s (Gerber 2014). This strategy promoted tax breaks, some degree of nationalization, and low-interest loans. There also was a high degree of protectionism. Taking protective measures was thought to lead to more potential for gaining more sophisticated technology for the expanding international market, incomes, and investment (Ekeh 2010). Most countries, with the exception of Great Britain, have gone through a phase of ISI polices early on in their development (Dasgupta and Mäler 2000). An example of a country that really embraced these policies is Mexico. Mexico implemented ISI polices from the 1950s until the early 1980s, and experienced consistent growth throughout that time period (Gerber 2014).

There are a number of benefits that come with ISI trade policies. These types of policies help a country's domestic market grow. ISI policies promote people learning by doing, increase employment opportunities, help put income back into society, and protect against foreign competition (Ekeh 2010). The benefits of this kind of industrialization sound great; however there are also disadvantages. The obvious one is that ISI policies discriminate against exports by focusing more on import production. Other disadvantages are the misallocation of resources as part of production decisions, the overvaluation of exchange rates, the policies being biased by favoring urban areas, increase in income inequality, and encouraged rent seeking (Gerber 2014).

The opposite of import-substitution industrialization is export-led growth industrialization. Export-led growth policies focus on the exporting of goods as a driver for economic growth. There have been many studies that have found it to be true that most episodes of growth share a common characteristic of high export growth (Yang 2008). Mexico is an example of a country that moved toward export-led growth trade policies. It has done so successfully and is now one of the top exporting countries. Countries that have been able to make the move toward export-led growth from import-substitution are more labor intensive and have higher rates of economic growth, productivity growth, and export growth (Dasgupta and Mäler 2000). Export-led growth countries utilize the theory of comparative advantage by exporting those good that they specialize in producing.

INDIA: GENERAL ECONOMY

The Indian economy is one of the fastest growing economies in the world. According to the International Monetary Fund (IMF), India is the 10th largest economy in terms of nominal gross domestic product (GDP) and the third largest by purchasing power parity (PPP) (IMF 2014). India is a member of the BRICS (Brazil, Russia, India, China, South Africa) nations and the G20 nations.

India's economic history can be classified into three phases: The precolonial period, which lasted until the 17th century; the colonial period, which marked the colonization of the Indian subcontinent by the British and lasted until 1947; and the postcolonial period, or the postindependence era, 1947 to present. During the precolonial period, India had a self-sustaining economy with agriculture as the predominant occupation. The colonial rule by the British drained India of its resources and economic development stalled.

After India gained independence from Great Britain, the country followed socialist practices characterized by large public sectors, protectionism, and extensive regulations leading to widespread corruption and a slow-growing economy. The private sector consisted only of small- and medium-scale businesses. Most of the consumer service sectors such as transportation, communication, and social services were under the control of the government. This paved way for widespread rent seeking and corruption practices.

The collapse of the Soviet Union in 1991 had a significant impact on the Indian economy, as India and Russia were major trading partners. This led to a near collapse of the Indian economy. India ran out of isolationist options for its economy to recover. India's then–prime minister Narasimha Rao and his finance minister Manmohan Singh (who later became prime minister) began the process of leading India to a market economy.

They implemented various economic liberalization measures, such as industrial deregulation, opening up the market for foreign investments, and privatization of state-owned enterprises, has accelerated the nation's economic growth. During the mid-2000s India recorded its highest growth rates, becoming one of the fastest growing economies in the world. The rapid growth was due to the increase in the size of its middle class population, expertise in information technology, higher investments, and a large labor force.

The major sectors of the country's economy are agriculture, banking, finance, industry and services, textiles and handicrafts, and energy and power. The agriculture sector employs 52.1 percent of the total workforce. Major industries include textiles, software, steel, pharmaceuticals, telecommunications, mining, cement, petroleum, food processing, and machinery. While half of India's work force still engage in agriculture, the services and manufacturing sector of the economy contributes nearly half of the country's economic growth. India has become a major exporter of business outsourcing and information technology–related services, taking advantage of its young, educated, English-speaking population.

India's international trade has improved greatly since opening up its borders to free trade and liberalizing its domestic economy in the early 1990s. According to the World Trade Organization's (WTO's) statistics for 2015, India ranks 19th in world trade for exports and 13th for imports. The country's major trading partners are Germany, United States, China, and United Arab Emirates. India is a favorite destination for foreign direct investment (FDI). The liberalized FDI policies have attracted more investments into the country. Many of the developed foreign countries are shifting their research and development departments to India. The country is a major exporter of outsourcing business and Western countries prefer India because of its expertise in the information technology and lower labor and production costs. Since 2011, India has shown a decrease in investment due to high interest rates and uncertainty by investors about the future direction of the Indian government relative to trade rules and trade tariffs.

Some of the challenges that India faces are poverty, unemployment, population explosion, corruption, poor infrastructure, discrimination, violence against women and girls, inadequate availability of quality education, high spending, ineffective power generation and distribution systems, and inefficient utilization of nation's natural resources. Another problem faced by the country is the regional variation between its 29 states and territories in terms of infrastructure, literacy rates, income, development, and poverty. India's long-term growth looks to be positive because of its young population, higher investment and savings rates, and integration into the global economy.

INFANT INDUSTRY

Infant industries are new industries that are just starting out and may have a difficult time competing on the global market with already established industries.

New industries typically need time during the early stages of development to become efficient producers. One strategy used to protect infant industries is to impose trade tariffs. The tariff would cause the imported goods to have a higher price making the national good more appealing. This strategy allows infant industries a competitive edge against more developed competitors and sometimes less expensive goods. It also gives the infant industry time to produce at a more efficient level. After a period of time during which the infant industry has had a chance to become more efficient and competitive with other global industries, the tariff can be eliminated.

There are two primary difficulties associated with using tariffs to allow infant industries a chance to become more efficient and competitive. The first is that some infant industries might not develop the incentive to become more efficient if they are being protected by tariffs. Another negative effect is once the infant industry becomes reliant on the tariff to protect it from global competition it is difficult to take away the protection.

INTER-AMERICAN DEVELOPMENT BANK

The Inter-American Development Bank (IDB) is a regional development bank that serves Latin America and the Caribbean. It is one of four major regional development banks currently operating in the global economy. The IDB comprises three institutions: the Inter-American Development Bank (IDB), which was founded in 1959; the Inter-American Investment Corporation (IIC), which began operations in 1989; and the Multilateral Investment Fund (MIF), which was created in 1993.

The three institutions within the IDB are autonomous but have complementary roles in promoting sustainable economic development in the Western hemisphere. The organizational structures of these institutions vary. For example, the highest decision-making body in the IDB and IIC is a board of governors, while a donors committee coordinates the operations of the MIF. Member countries own and operate each of the three institutions of the Inter-American Development Bank . The headquarters for all three institutions of the IDB are located in Washington, D.C.

The IDB comprises 48 member countries—26 Latin American and the Caribbean countries, 19 nonregional countries, the United States, and Canada. The Republic of Korea, the newest member country, joined the IDB and its sister institutions in November 2004. The Organization of American States (OAS) created the IDB in 1959 to "contribute to the acceleration of the process of economic and social development of the regional developing member countries, individually and collectively." To achieve this goal, the IDB provides loans, grants, guarantees, policy advice, and technical assistance to government and private sector decision makers. The IDB's board of governors delegates most of the bank's operations to a board of executive directors.

The bank's priorities have included support for poverty reduction and social equity, sustainable economic growth, modernization of the state, improving competitiveness, social sector reforms, regional and global economic integration, environmental protection, private sector development, and good governance. In 2015, the bank committed $38.2 billion to public sectors to support 387 lending and other operations in 12 countries. Most loans granted by the bank are non-concessional and carry interest rates appropriate to prevailing market conditions. An exception to this rule are loans granted through the bank's Intermediate Financing Facility (IFF), which offers lower interest rates to some low-income countries including the Dominican Republic, Ecuador, El Salvador, Guatemala, Jamaica, Paraguay, and Suriname. The bank can also "guarantee" the repayment of development loans granted through private financial institutions, and thus encourage borrowing and productive investment in member countries. The bank's Fund for Special Operations (FSO) chipped in the final $578 million to finance 23 concessional loans. These concessional loans are designed to meet the needs of the region's poorest countries—Bolivia, Guyana, Haiti, Honduras, and Nicaragua. FSO loans typically carry an interest rate of less than 2 percent and have a repayment period of 40 years. Since 1961, the three largest recipient countries—Argentina, Brazil, and Mexico—have garnered about one-half of all bank loans and guarantees.

The Inter-American Investment Corporation (IIC) is the second institution of the IDB. It is an autonomous multilateral organization comprising 43 countries—26 borrowing countries from Latin America and the Caribbean, 13 European countries, Japan and the Republic of Korea, Israel, and the United States. The IIC was established in 1989. The IIC's board of governors delegates most of its authority to a board of executive directors to run the corporation. According to its Establishing Agreement, the purpose of the IIC is "to promote the economic development of its regional developing member countries by encouraging the establishment, expansion, and modernization of private enterprises, preferably those that are small and medium-scale, in such a way as to supplement the activities of the Inter-American Development Bank." The IIC extends development loans, makes equity investments in private enterprises, and expands credit opportunities. IIC support for private businesses was designed to strengthen firms, create jobs, expand exports and regional integration, nurture productive domestic and foreign investment, and cultivate technological advance in regional developing countries. In 2003, the IIC approved $194 million to support 26 projects in 15 countries, along with one regional project. These projects benefited nearly 3,000 small- and medium-size firms, and created nearly 10,000 jobs. The IIC also supports co-financing, joint ventures, and other collaborative projects with international and local financial institutions, business firms, and other entities.

The Multilateral Investment Fund (MIF) is the third institution of the IDB. The MIF comprises 32 member countries, including all of the 26 borrowing countries of the IDB. Each of the 32 member countries is represented on the donors committee that governs the MIF, with voting shares apportioned by the size of donors' contributions to the MIF. Because the United States and Japan have each contributed $500 million to the $1.2 billion fund, these two countries dominate the voting shares. In practice, decisions about how to use the organization's funds are often by consensus rather than a formal vote. The MIF is designed to support investment reforms to bolster private investment, including foreign direct investment (FDI); stimulate business activity and job creation; and encourage microenterprises and entrepreneurship. By supporting private investment and business creation the MIF also supports poverty reduction, economic growth, gender equity, human capital development, and responsible treatment of the natural environment.

The MIF's technical assistance also stresses project clusters, such as micro finance, environmental management, and information and communications technology. MIF financial resources are distributed through grants and investments, typically in conjunction with partners such as non-governmental organizations (NGOs), chambers of commerce, and public sector agencies.

Regional and sub-regional development banks are a major source of development loans and other development assistance in the global economy. The four main regional development banks are the African Development Bank, Asian Development Bank, European Bank for Reconstruction and Development, and the Inter-American Development Bank. Smaller, sub-regional development banks also dot the economic landscape, and include the Caribbean Development Bank, Central American Bank for Regional Integration, East African Development Bank, and West African Development Bank.

INTERNATIONAL ASSOCIATION FOR ENERGY ECONOMICS

The International Association for Energy Economics (IAEE) was founded in 1977 in response to the energy crisis in the 1970s. The IAEE is an independent, worldwide, nonprofit organization based in the United States, with more than 4,157 members in over 100 nations, providing an interdisciplinary forum for the exchange of ideas among professionals interested in energy economics.

The IAEE's main objective is to bring together professionals from business, government, and academia to advance the knowledge, understanding, and application of economics across all aspects of energy. To achieve this goal, the IAEE strives to facilitate worldwide information flow and exchange of ideas on energy issues, publish high-quality research, and develop and educate students and energy professionals.

The IAEE publishes three periodicals. *The Energy Journal* is the official quarterly journal of the IAEE. It was founded in 1980 to promote the advancement and dissemination of new knowledge concerning energy and related topics. It publishes a blend of theoretical, empirical, and policy-related papers in energy economics. Each quarterly issue contains original refereed articles, short notes, and book reviews. Nontechnical articles on important policy issues are published in the Energy Perspectives section. A Research Forum section reports on the emergence of new analytical methods for economic analysis of energy.

The Economics of Energy & Environmental Policy (EEEP), established in 2011, is a semiannual energy policy publication. It focuses on all policy issues in the interface between energy and environmental economics. EEEP provides a research-based, scholarly, yet easy to read and accessible source of information on contemporary economic thinking and analysis of energy and environmental policy. EEEP publishes a blend of policy papers and notes, organized symposia on specific policy issues, feature articles, book reviews, and commentaries on current energy and environment.

The *IAEE Energy Forum* is a newsletter that delivers the latest information on the association, and contains articles that appeal to a general audience interested in the energy field.

In order to meet the association's objectives, periodic conferences are held that focus on energy economics. The IAEE sponsors annual conferences in North America, Europe, Asia, and Latin America. Past meetings have taken place in cities such as San Francisco, Stockholm, Venice, Kyoto, Santiago, Abuja, Moscow, and Taiwan. The conferences attract delegates and speakers from around the world, and from some of the most influential government, corporate, and academic circles.

The IAEE takes pride in developing and educating students in the energy field. There are student chapters in 12 countries, and many student activities are held at the annual conferences, including a Best Student Paper award and student PhD days. A student member also sits on the IAEE Council.

The IAEE operates through a 17-member council of elected and appointed international members. Council and officers serve on a voluntary basis for a term of one to two years.

The IAEE has several awards to recognize exemplary energy economics research. Since 1981, the IAEE has awarded an annual prize for outstanding contributions to the field of energy economics and its literature. Past recipients have included Morris Adelman, Dale Jorgenson, Robert Pindyck, and Jean Tirole. *The Energy Journal* Best Paper Award was created in 1989 for the paper designated as the most outstanding of the papers published in *The Energy Journal* the previous year, and the Journalism Award was created in 1983 to reward excellence in written journalism on topics relating to international energy economics.

INTERNATIONAL BANK FOR RECONSTRUCTION AND DEVELOPMENT

The International Bank for Reconstruction and Development (IBRD) is a member-owned development institution that provides low-interest loans and technical assistance to middle-income developing countries. The overarching goals of the IBRD are global poverty reduction and sustainable economic development. IBRD was founded at the Bretton Woods Conference in 1944 and was operational by 1946. IBRD and the International Monetary Fund (IMF), which was also founded at the Bretton Woods Conference, are often referred as the Bretton Woods institutions. IBRD is part of the World Bank Group. In 2015, IBRD consisted of 188 member countries.

IBRD is one of five institutions that the World Bank Group comprises. The other development institutions within the World Bank Group include the International Finance Corporation (IFC), the International Development Association (IDA), the International Centre for Settlement of Investment Disputes (ICSID), and the Multilateral Investment Guarantee Agency (MIGA). IBRD and its closest partner (the IDA) are called the World Bank. The work of the World Bank Group is coordinated by a board of governors and by the bank's executive directors. The bank is headquartered in Washington, D.C. The bank also has country offices in more than 100 member nations throughout the world.

The IBRD's mission to reduce poverty and promote sustainable economic development in the global economy is consistent with United Nations' Millennium Development Goals (MDGs). During the late 1940s and early 1950s, most IBRD loans went toward the reconstruction of Europe, a continent devastated by World War II. Since the 1950s, most IBRD development loans, guarantees, and technical assistance have flowed to more creditworthy middle-income developing countries. By World Bank classifications, middle-income countries have gross per capita national incomes of $1,026 to $12,475 (in U.S. dollars). They range in diversity from the BRICS (Brazil, Russia, India, China, South Africa) nations to countries such as Guatemala, Costa Rica, Namibia, and Bulgaria. IBRD's partner institution, the IDA, extends loans and other assistance to the less creditworthy low-income developing countries.

IBRD's loans are divided into two categories: investment loans and development policy loans. Investment loans are long-term loans of five to 10 years. Investment loans target infrastructure projects such as the construction of housing, schools, health clinics, and irrigation and sanitation systems. Investment loans also promote institution building and social reforms. Investment loans represent 75 percent to 80 percent of IBRD's total loans. Development policy loans are short-term loans of one to three years. Development policy loans, previously called adjustment lending, support policy reforms conducive to sustainable economic growth and development. These loans support good governance, the rule of law, privatization, and competitive markets, by reforming nations' financial systems, legal systems, tax and investment codes, civil service, social services, and trade policies. Between 1946 and 2014, IBRD's cumulative loans to member nations totaled over $500 billion.

Most IBRD development loans are financed with World Bank Bonds. IBRD issues World Bank Bonds, which carry an AAA credit rating in global capital markets.

IBRD's secure position in the global financial system makes the bank's bonds an attractive investment. IBRD also earns limited revenues through interest payments on past loans. Unlike commercial banks and most other financial institutions, IBRD is not designed to earn profits. The bank's loans carry low interest rates compared with prevailing interest rates in global markets.

Since 1946 quota subscriptions have also generated operating capital for IBRD. Each member nation is required to ante up a subscription payment in rough proportion to the size of its economy. Each subscription quota also equated to approximately one voting share. The five largest subscription quotas (and voting power) in 2015 were assigned to the United States (16.5 percent voting power), Japan (7.8 percent), Belgium (4.7 percent), Germany (4.5 percent), United Kingdom (4.3 percent), and France (4.3 percent).

The bank's 188 member countries own IBRD and the other four institutions of the World Bank Group. The voting power of each country is determined by the size of its economy. The United States, the world's largest economy, holds 16.39 percent of the bank's voting power, or 265,219 total votes. The small island nation of Palau, on the other hand, holds just .02 percent of the voting power, or 266 total votes. Member countries are often called shareholders in the bank, and the votes of member countries are called shares. The bank's highest decision-making group is the board of governors, which consists of the finance minister or other official of comparable rank from each member country. At its annual meeting, the board of governors establishes broad policies and sets priorities for the bank. The board of governors then delegates responsibility for running the bank to the executive directors, a 24-member group. One executive director is selected by each of the largest economies including the United States, Germany, United Kingdom, France, Japan, and China. Member countries elect the remaining 19 executive directors. A staff of nearly 10,000 professionals assists in the implementation of bank policies, programs, and projects.

Over the years, non-governmental organizations (NGOs), civil society organizations (CSOs), and other stakeholders in the global economy have criticized IBRD and the other institutions of the World Bank Group. Some critics cite flaws in past structural adjustment programs (SAPs). Critics argue that SAPs, guided by the bank's heavy market-oriented hand, undermined the authority of local governments and oversimplified the complex problems of the world's poor nations. Others have criticized the bank's structure, which they view as undemocratic and self-serving for the rich nations of the global North. Many of the bank's critics view the bank as the top cheerleader of globalization. Some in the anti-globalization movement accuse the bank of being unresponsive to the abuse of workers, the environment, and indigenous peoples by powerful transnational corporations (TNCs). Anti-globalization demonstrations against the gatekeepers of the global economy—the World Bank, IMF, World Trade Organization—swelled during the early 2000s, especially after protestors successfully disrupted the WTO's ministerial meeting in Seattle, Washington in 1999.

INTERNATIONAL CARTELS AND MONOPOLIES

A monopoly is when a single business controls the market for a particular good or service and is able to set prices and quality levels without the pressure of competition. In order to be considered a monopoly the company must have control of the marketplace and be willfully maintaining that power by eliminating any potential competition through acquisition of competitors or barriers that prevent other businesses from competing. Governments work to eliminate monopolies due to the fact that usually monopolies are not in the best interests of the public and primarily benefit the businesses that have control over a particular product or industry. When a company has monopolistic control over a product or industry it can set unfairly high prices that the public is forced to accept because there is no other company competing to drive prices down. Monopolies can encourage companies to become lax in their production and begin producing inferior products and cease innovating.

Although it may seem that a monopoly is always a problem for customers, sometimes monopolies exist because a product is superior or because the market naturally does not allow for competition. In some cases a monopoly can be created due to the government creating a law that prevents other businesses from competing in a particular industry or granting a company the exclusive right to a particular area. The most common example of government allowing for monopolies in a particular area is cable companies that are allowed to operate without competition from another cable company. Monopolies can also help companies recoup costs of innovation through patents. This helps to drive innovation because for a set period of time other companies are unable to compete using the same methods. Because companies know they will be protected when new products are brought to market, it allows companies to compete without fear that their efforts will be immediately undermined as other companies use their methods and formulas to their own competitive advantage.

Cartels, when competing firms set an agreement to control prices or prevent the entry of a competitor into the marketplace, are another form of monopoly. These companies form an alliance that allows the companies to benefit by raising prices that the public is forced to accept because there are no competitors in the industry. Cartels have less control over a marketplace than a monopoly, however, and each member of a cartel relies on the other members to continue to operate in the best interests of the group rather than in the best interests of the company. Cartels are generally considered illegal because they are similar to a monopoly and are not usually in the best interests of the consumer. An example of a legal cartel that is protected by trade laws is the Organization of Petroleum Exporting Countries (OPEC). This cartel, which is comprises 12 countries that have oil as one of their major exports, sets production levels and prices for the oil in these countries. This allows the countries to thrive even if it causes problems for the countries that they export to since it can drive demand.

Illegal cartels can create a great deal of harm for the economy and the consumer. Cartels create barriers for companies that are looking to compete in an industry and they discourage innovation because a cartel is more concerned with preserving the status quo. There has been an increase in the number of cartels in recent years, as technology has made it easier for companies to collude with each other with less chance of being caught. These firms collude by setting prices that affect the consumers or by artificially driving prices down to eliminate a competitor that may offer better services to the customers of the companies in the cartel.

One of the issues that has arisen with increased globalization is that it can be difficult to bring charges against these companies because most companies operate on a global scale. Proving that companies are engaging in a cartel can be difficult, and with multiple laws in multiple countries protecting these companies, it can be almost impossible. Because it may be impossible to prosecute companies for a larger crime, governments are forced to accept lesser charges against these companies. Lesser charges result in lesser fines for the companies involved, which does not discourage the companies from engaging in price fixing and other such problems in the future.

INTERNATIONAL CHARITIES

An international charity is a non-profit organization that raises money to support causes that benefit humanity. The non-profit designation indicates that any funds raised or surplus in profits must be reinvested into the organization. Charities raise funds from public giving. Public gifts to charities are generally tax deductible. Another major source of revenue for charities is philanthropic giving from government funds for the purpose of advancing socially beneficial causes. Because the purpose and size of charities vary greatly, strategies of fundraising have to be tailored to the specific fund. For example, public charitable organizations associated with museums, music venues, or historical landmarks often rely on private benefactor donations in order to cover costs. Other methods of fundraising include the sales of goods and services, canvassing, and holding events.

In most cases charitable status allows the organization to operate with exemption from income tax, corporation tax, and capital gains tax. In the United States a tax exempt organization is classified under section 501(c)(3) of the Internal Revenue Code. This section of the Code specifically states that a charity's earnings may not benefit any individual. The charity also cannot lobby to influence legislation, perform the duties of a political lobbyist, or campaign for a specific politician.

Outside of the tax status and not-for-profit structure, most charitable organizations operate like a standard business. This includes a leadership structure featuring a board of directors, management, and workers. Due to the philanthropic nature of charities, unpaid volunteer work is paramount to operations.

International charities experience many of the same challenges facing international corporations in that the political, environment, and social factors vary in different countries. Like non-profits, charities can come under criticism for their activities and causes. In the international environment what may be considered a charity cause to some may not be viewed in the same light by others. Similarly, organizational influence on international governing bodies may be seen as controversial given the cause, be it social, religious, or economic. Furthermore, charities can incur criticism and mistrust over the efficiency in the application of funds. A charitable organization may include some paid employees who work to manage and advance the cause. However, their payment may be seen as a point of contention given the nature of charitable work.

The structural effectiveness of charities is often scrutinized due to a number of factors. First, the leadership organization of a charity is normally a board of directors. The leadership and management of the board can come under criticism for representing other interests, such as those of governments, largely associated with a charity gaining government funds. An over-involved board can also become disillusioned by the cause and suffer the inability to view the organization's needs empirically. Therefore, the leadership, organizational structure, and transparency of a charitable organization are crucial. Another challenge to effectiveness of a charitable organization is competition. The number of charities is continually expanding, making it more difficult to gain funds. Although public giving has continually increased, many people find it difficult to know which charity to choose for their donations. Understanding market segmentation in marketing and fundraising strategies has become essential for organizations. Understanding the market and specific social concerns can help charities to become more effective in supporting their causes.

INTERNATIONAL CLIMATE AGREEMENTS

Climate change is arguably one of the greatest challenges facing the global community. Most scientists agree that our climate is changing as a result of anthropogenic greenhouse gas emissions, and while there remains great uncertainty regarding the effects on our planet, recent studies suggest that the cost of unchecked climate change may be devastating. It is no surprise then that nations have spent significant resources over the past few decades attempting to jointly manage greenhouse gas emissions.

The idea that climate change must be managed jointly is an important one. Carbon dioxide, the most significant greenhouse gas, is a stock pollutant that mixes uniformly in the atmosphere. Thus, the resulting concentration of carbon emissions in the atmosphere is independent of the source of the emissions. This reality means that every country can contribute to the climate change problem through their emissions. It also means that every country can contribute to the climate change solution through emissions abatement activities. In this way, atmospheric concentrations of carbon emissions constitute a transboundary environmental externality.

When externalities cross national borders, unilateral management of carbon emissions is not an effective option. The benefits from actions taken by one country to reduce carbon emissions will be trivial if other countries fail to reduce their emissions (or if they respond by increasing theirs). And if the benefits of emissions abatement are enjoyed by all nations, then there is an incentive for countries to attempt to free ride on the abatement activities of other countries. Moreover, sovereign nations do not answer to a global authority that can ensure all countries participate by externally imposing and enforcing greenhouse gas regulations. Rather, nations must coordinate voluntarily to negotiate international treaties.

Nations began serious efforts to manage climate change in the early 1990s through the United Nations General Assembly. An Intergovernmental Negotiating Committee was formed to conduct the negotiation process, and in less than two years the body drafted the United Nations Framework Convention on Climate Change (UNFCCC). The objective of the convention (or treaty) was to stabilize greenhouse gas concentrations in the atmosphere at a level that would prevent dangerous anthropogenic interference with the climate system. The UNFCCC, however, did not require specific emissions abatement responsibilities for the parties. Rather, it established a framework through which nations convene to negotiate binding protocols that set mandatory emissions limits. The convention entered into force in March 1994. Today 195 countries are ratifying members to the convention.

During the third annual conference of the parties to the UNFCCC in 1997, the Kyoto Protocol was adopted. The treaty, the first of its kind, established binding emissions limits for developed (Annex 1) countries. Through negotiations, Annex 1 countries agreed to reduce their greenhouse gas emissions by an average of 5.2 percent relative to 1990 levels over a period from 2008 to 2012. Although almost all countries signed the treaty soon after its adoption, the treaty only entered into force when certain participation thresholds were met. Specifically, at least 55 of the parties to the conference had to ratify the agreement and those member countries had to account for at least 55 percent of global greenhouse gas emissions. When Russia ratified the Kyoto Protocol in late 2004, the treaty satisfied the 55 percent requirement, which triggered it entering into force in February 2005.

As of today, the Kyoto Protocol remains the only international treaty requiring binding greenhouse gas emissions limits. Unfortunately, the treaty has been largely unsuccessful. The failure of Kyoto can be largely attributed to two major shortcomings. First, the treaty failed to motivate the two biggest greenhouse gas emitters to commit to reducing, or even stabilizing, their emissions. The United States, at the time the biggest emitter (now second biggest), chose not to ratify the treaty. One of the fundamental reasons for this was that the United States felt its participation would be futile without China, then the second biggest emitter (now the biggest), also taking on emissions abatement responsibilities. While China is a signatory to the protocol, its classification as a developing country precluded it from any emissions abatement responsibilities.

The second major failure is that the treaty fails to provide the correct incentives to motivate countries to comply with their commitments. The enforcement mechanism for the protocol, established at the seventh conference of the parties in Marrakesh, Morocco, is essentially nondeterrent. It states that a member country found in violation of their commitments will be required to further limit their emissions during the next commitment period (which began in 2013) to both meet their original target plus an additional 30 percent emissions reduction. In short, the penalty for exceeding emissions limits is more stringent emissions limits. There is no reason to believe that a noncompliant country would take this punishment seriously in the second commitment period of Kyoto. Without an enforcement mechanism that can deter noncompliance, any treaty to reduce greenhouse gas emissions will fall short of its objective.

Economists, through the study of human behavior and institutions, have an important role to play in designing a more effective climate agreement. The underlying incentives that countries face when making emissions decisions are commonly illustrated as a variant of the well-known prisoners' dilemma game. In this game, the collection of countries is strictly better off by jointly limiting their emissions levels. However, individually, countries are better off not restricting their own emissions. The result, or equilibrium, of the game is that all countries choose not to restrict their emissions. They pursue their own self-interests at the expense of the collective interest.

The goal of international climate agreements is to craft a set of rules that align individual interests with the collective interest. Some provisions of the Kyoto Protocol attempted to accomplish this. The minimum participation rule (the 55 percent rule) served as a commitment device in which countries would not take on emissions responsibilities until a critical number of other countries agreed to do the same. However, the 55 percent rule made it possible for the treaty to enter into force without the United States or China taking on any emissions responsibilities. Regardless of whether this was purposeful or coincidental, it is a poor design feature.

Looking beyond Kyoto, an effective international climate agreement must simultaneously address two problems. First, it must address the problem of participation, that is, motivating critical countries to join the agreement (like the United States and China) and take on meaningful emissions abatement responsibilities. Second, it must address the problem of maintaining compliance with the agreement. Economists typically encourage using a combination of carrots (e.g., technology transfers) and sticks (e.g., trade sanctions) as mechanisms to nudge countries in the direction of achieving these goals. Although these problems are challenging, there is reason to be hopeful. Nations are increasingly engaged on the topic of managing climate change. If nations can collectively benefit from mitigating climate change, then it must be possible to design a set of rules that can make it individually worthwhile to participate. The hope is that such a treaty will be created in time to thwart the most costly effects of a changing climate.

INTERNATIONAL DEBT

Debt is a part of everyday life for just about everyone. Government organizations, commercial banks, and other financial institutions are no exception. Being in debt is a situation where money is owed and must be paid back, most of the time with interest. International debt is money that is owed to a foreign country. This is also known as external debt. The external debt of a country grows as it receives loans from other countries. Just like an individual's credit card debt, a country's external debt results in debt service obligations that require the borrower to pay interest payments along with repaying the principle amount (Gerber 2014). International debt is not a new concept, even though it has been given more attention in recent years due to the financial crisis of 2008. As long as there is debt the global economy will be at risk for international debt crises. Having the ability to manage international debt is very important in the overall health of the global economy. International debt continues to be a problem, especially for developing countries.

A debt crisis occurs when a country is unable to repay its debt. A number of international debt crises have occurred in recent years. There was the debt crisis of the 1980s, which centered on Latin America, and the Asian Crisis of 1997 and 1998. The most recent example of an international debt crisis happened during the global financial crisis of 2008, which began in the United States. This debt crisis on an international scale started getting attention in 2010 and is considered to be the second phase of the global financial crisis following the 2008 subprime housing crisis in the United States (Hieronymi and Stephanou 2013). The debt crisis in the United States stemmed from homeowners being unable to repay their mortgages. At the time, there was a large market for issuing subprime loans. This had a global effect because loans were being grouped together and financial institutions were selling shares to foreign institutions that were willing to buy them (Gerber 2014). When homeowners started to default on those loans, the effects were felt at the global level because of foreign investment in the subprime market.

Managing international debt is an evolving concept. As long as debt crises continue to emerge, managing of international debt is a concern for the global economy. Not all debt is harmful, however. As long as debt is managed properly, and debt obligations are honored, debt can be beneficial. The purpose of debt management policy is to allow countries to benefit from external financing without causing issues globally (Klein 1994). There are several ways to manage international debt. The standard way is by looking at some measures of external debt. This can be done by looking at specific ratios such as, debt service to export ratios, debt service to government revenue, debt to export and debt to gross national product (Klein 1994). These values will vary depending on the country because of the wide range of economies.

INTERNATIONAL ECONOMICS

The origins of international economics can be traced to the adventures of the ancient Greeks and Romans who set sail in the interest of furthering their quality of life through trade or conquest. The Kush and Mali Kingdoms of ancient Africa in the first millennium CE also engaged in trade over vast expanses of territory on that continent, and European explorers of the 15th and 16th centuries clearly had economic gain in mind among other incentives as they undertook their global ventures. A significant event occurred in 1793 when Lord Earl Macartney of Britain was sent to China to secure terms for trade between the British Empire and the Qing dynasty. Rejected, Britain developed its opium interests in colonial India and endeavored to foist this commodity as a currency of trade on China again in the

1830s. China preferred silver instead, and these tensions led to the Opium Wars that followed.

In the 1850s, America made an overture to establish trade with Japan, and this relationship led to Japan modernizing faster than its Asian neighbors, owing to the introduction of Western technology, a development that had military consequences in mid-20th century.

In the closing months of World War II, Western nations gathered in New Hampshire to draw up guidelines for a post-war global economy. The Bretton Woods system, named for the location of the meeting, established a basis for international currency exchange as well as the International Monetary Fund and what is now known as the World Bank.

In an effort to promote postwar trade and development, at Bretton Woods the 44 nations agreed to tie their exchange rates to the U.S. dollar, which the U.S. government linked to gold, one U.S. dollar equaling 35 ounces of gold bullion at the time. Three years later, one incentive for the U.S. Congress to approve the $13 billion Marshall Plan for post–World War II Europe was that American aid was needed to get the war-ravaged economies on their feet so that they could then proceed to engage in trade with the United States.

Global trade agreements have continued to evolve, from the General Agreement on Tariffs and Trade (GATT) and the World Trade Organization (WTO) to the G7, G8, and G20 conferences, the "G" representing the number of major world economies participating in these conferences. The North American Free Trade Agreement (NAFTA), which came into effect in 1994, stirred political as well as economic tensions, raising issues such as globalization, outsourcing, and sweatshops, which have since become standard terms in the lexicon of international economics.

What must underscore any understanding of this global system is that, with some exceptions, nations do not actually trade with each other, but rather firms in different nations sell their goods and services to individuals and interests in other nations. The United States government, for example, does not buy automobiles from Toyota, but rather Toyota has dealerships in United States to sell Japanese-made cars to American consumers. Automobile manufacturers within the United States obviously prefer to have as large a share of the American market as they can get, and would prefer to pursue that market without competition from abroad. Domestic interests in many nations often appeal to their governments for certain measures, such as higher tariffs—taxes imposed on goods produced in another nation—on imported vehicles or strict safety or product performance measures that could make it difficult for a foreign producer to compete in terms of price and standards.

Similarly, agricultural interests in Japan and microchip firms in Taiwan lobby their governments for political support and pressure their governments to make imports of U.S.-grown rice or U.S.-manufactured technology more expensive and harder to sell in their nations. The concept of goods and services flowing unfettered between peoples in different nations is known as free trade, and steps to impede free trade, which are usually promoted by commercial interests within a nation hoping to protect their share of their domestic markets, are called *protectionist measures*. Proponents of free trade often contend that wide-open international trade benefits consumers as well as manufacturers everywhere, while some producers maintain that their financial interests are endangered when items from abroad enter their markets.

The economies of the world's nations are currently classified two ways: developed and developing. Developed nations throughout history have consistently generated a larger share of the cumulative gross domestic products (GDP) in the world, and British economist Angus Maddison has shown how the nations in this club and their shares of total global productivity have changed over time.

Not only do developing nations have lower GDP and literacy rates than developed ones, but commonly upwards of 50 percent or more of their populations work in agriculture. Developed nations are also referred to as industrial economies, where technology and strong communication and transportation infrastructures are in place. The 2013 GDP of agrarian Bolivia was just under $30 billion, while the 2013 GDP of Germany, a nation with a strong manufacturing sector, was $3.593 trillion (CIA 2014).

Because of their unique economic paths the past three decades, Russia and China must be considered independently of these categories. The transition of Russia following the collapse of the Soviet Union to a free-market economy has not yet been accomplished in Russia assuming a new leadership role in a free-market international economy. News stories regarding governmental corruption and cronyism that have made some people very rich still persist. China, on the other hand, began its turn toward state-sponsored capitalism in 1984, and by the second decade of the 21st century has become the second largest economy in the world. The unsettled issues regarding the currencies of these nations and state of the environment, particularly in the case of China's increasing consumption of fossil fuels to foster its growth, makes these two nations new economic paradigms unto themselves.

A variety of factors allow certain nations to develop manufacturing sectors, including access to natural resources, either by location, or trade; the ability to educate the workforce in the technological age; and societal respect for the rule of law, which is usually instituted by a government, which allows for and supports a free-market economy.

Such supports can take the form of an open immigration policy, which allows the labor force to grow as needed, as well as through reciprocal trade agreements with other nations. The first of these can impede growth in developing economies, however, if educated citizens emigrate to developed nations in the interests of their own careers. This is known as "brain drain." Conversely, economic activity that requires fewer skills and less education might be exported from a developed country by the owners of firms, who might also decide to relocate in a developing nation where a lesser trained workforce can be employed for less, reducing the firm's costs. This outsourcing can result in lower costs to producers and ultimately lower prices to consumers. There are negative consequences for labor forces in the nations that jobs have left and can involve dangerous working conditions and low wages in the developing nations, conditions characterized as sweatshop conditions generating political and societal tensions as well.

INTERNATIONAL ENVIRONMENTAL AGREEMENTS

There are thousands of international environmental agreements, ranging from relatively straightforward bilateral accords that manage borders to global agreements on toxics, endangered species protection, and global climate change. Some agreements that manage global commons that do not exclusively belong to any nation, such as deep-sea fisheries, Antarctic research and preservation, and others, attempt to internalize externalities that cross borders. From an efficiency perspective, it is ideal to have the scale of the agreement equal to the scale of the externality, such that the agreement can cover everyone contributing to and affected by choices in regard to an environmental amenity or problem. This allows for agreements to be improved so that those harmed by collectively agreed environmental management choices can be compensated by those who gain (called a Pareto improvement).

There are political complications to reaching economically efficient solutions to international environmental issues. Some nations may see opportunities to catch a free ride on the costly environmental management efforts of others, and participating nations may have incentives to cheat on agreements that can be difficult to monitor and enforce; typically the specifics of implementing agreements are left to the signatories to manage within their own borders, and they report their own compliance to the treaty organization. Selecting relatively easily observed outcomes, even if they do not directly correspond to the environmental benefit the treaty aims to secure, can improve transparency and compliance as well as trust among member countries. If income and development disparities are large within the group of member countries and collective efforts are economically significant, mechanisms to share the costs of compliance and management for poorer countries may be agreed to and implemented. Many such transfer programs are administered by the Global Environment Facility (GEF), initially established by the World Bank but now operating independently.

The GEF coordinates some administrative work; however, no global environmental management organization exists, so interactions between the environmental and health outcomes of treaties with differing memberships, rules, and procedures present challenges. Climate and ozone, for instance, interact physically—many regulated ozone-depleting chemicals and substitutes are also powerful greenhouse gasses—and decisions made under one agreement can have large effects on outcomes monitored by the other. Rules on toxics and invasive species can come into conflict, and global fisheries rules and Antarctic preservation efforts are not harmonized. These conflicts can sometimes be managed on a case-by-case basis, as in the decision of the Stockholm Convention on Persistent Organic Pollutants to allow dichlorodiphenyltrichloroethane (DDT, an insecticide) use that would otherwise be impermissible under the treaty in settings where the danger of malaria outweighs the danger of continued persistent organic pollutant (POP) exposure. More complete integration may be needed for more complex or pervasive interactions.

There are key issues that stand out for environmental agreements in contrast to other international treaties. Typically ecosystems do not have a set and fixed ideal state; they consist of overlapping and interacting dynamic processes, and simple metrics for ecosystem health are not always conveniently available. Success is more likely for agreements that have processes and expertise in place to incorporate new information and scientific assessments over time. The efforts of the Intergovernmental Panel on Climate Change (IPCC) to update climate science in support of ongoing efforts to reach agreement on global climate policy are a highly visible example, but many major agreements, including the Stockholm Convention on Persistent Organic Pollutants and the Montreal Protocol on Substances that Deplete the Ozone Layer, have relied on ongoing scientific assessments of environmental risks and policy progress to manage global public goods.

Efforts of the IPCC go hand in hand with information and technology dissemination and facilitating burden sharing across member countries. Because many environmental amenities are nonmarket goods, valuation is important in developing and administering international environmental agreements. Valuation agreements including signatories at different development levels can be complicated for both technical and political reasons. Many methods of valuing environmental goods and services, including contingent valuation based on willingness to pay and hedonic estimation based on wage rates, are tied to the income and life expectancy of exposed populations. Where some member states are poor or have large populations who do not work in the market economy, the effects on their populations may be assessed as less valuable using these methods. Alternatives include measuring and reporting outcomes like cases of illness or decrease in life expectancy or acres protected, but not aggregating the various categories up into monetized values, which limits the use of benefit-cost analysis but may be more politically palatable.

Many environmental problems are long-term problems, and thus decision makers confront the difficulty of evaluating the wisdom of intergenerational transfers; discounted benefit-cost analysis implicitly assumes that borrowing and saving are possible across the life of the project, but for amenities like global climate those impacted by the choice to invest now or wait for the future are not able to participate in the negotiation of agreements today, and this presents a political and ethical problem without a clear economic solution. Some environmental economists argue for the application of the precautionary principle in such settings. Others argue that this in effect commits societies to the existing system by default even when it is not working to solve the environmental problems at hand.

INTERNATIONAL FINANCE

As broad a term as "international finance" is for economists, it has customarily meant the study of exchange rates. For policymakers and lawyers, it means much more. It commonly involves the study of international financial transactions, transactions that have some cross-border element with respect to payment, credit or investment, or a financial contract. International finance as a whole can be broken down into the trade and balance of payments, exchange rates and exchange rate systems, open economy macroeconomics, and international financial crisis.

Every nation's transactions with the rest of the world are summarized in its balance of payments. The balance of payments has three components: the current account, the capital account, and the financial account, the two most important of these being the current and financial accounts. There is a fundamental economic identity that total private and public saving in an economy must be equal to domestic investment plus net foreign investment. The current account balance is equivalent to net foreign investment, and a negative balance is equivalent to disinvestment abroad. Foreign investment has costs and benefits for the host country. While it may lead to technology transfer and higher investment levels it can also become a mechanism for spreading a crisis and giving foreigners a voice in the nation's internal political affairs.

The exchange rate system as it relates to the topic of international finance has become an important and critical feature as globalization becomes more evident. People hold on to foreign currency to buy goods and services to take advantage of interest rate differentials and to speculate. Exchange rates can be analyzed with supply and demand analysis, as if they are just another commodity in the economy. Investors watch the real appreciation and depreciation of currencies and future predictions, yet exchange rates consistently are seemingly unpredictable. Exchange rates are simultaneously influenced by long-run, medium-run, and short-run factors—long-run factors being purchasing power, medium-run being general business cycles, and short-run being interest-rate differentials and speculation.

Open economy macroeconomics begin with households. Households supply all the factors of production that businesses need to produce the nation's output. In return, they receive all the factor payments, payments for the use of their land, labor, and capital. The income received by households is equivalent to the value of the output produced by businesses. Businesses in turn use financial institutions to borrow household savings that they use to invest. Businesses also produce the nation's output. Governments spend on goods and services using tax revenues from the income flow going to households. The government manages fiscal and monetary policies for the nation and in turn it directly affects the economy. Fiscal policies are government tax and expenditure policies and monetary policies are for interest rates and the money supply. Within both fiscal and monetary policies, expansionary policies raise gross domestic product (GDP) and national income while contractionary policies do the opposite. Both fiscal and monetary policy influence exchange rates and the current account balance. In each case the effect is through a change in interest rates brought on by fiscal or monetary policy. Neither policy is likely to have long-run effects on income.

A significant concern with international finance is the occurrence of international financial crises, which are generally characterized by financial disintermediation in the crisis country, a collapsing currency value, and a steep recession. One type of crisis is caused by severe macroeconomic imbalances such as large budget deficits, hyperinflation, overvalued real exchange rates, and large current account deficits. Another type of crisis results from speculative attack on a currency that prompts large outflows of financial capital and a run on the country's international reserves. This can actually be self-fulfilling because economic agents who believe an attack on a currency is imminent will abandon the currency, which is the same as an actual attack on the currency. The optimal response to a crisis depends on its causes. If it is caused by macroeconomic imbalances then changes in macroeconomic policies are essential. If it is caused by sudden unexplained capital flight then the optimal response is less certain. Some economists believe that stabilizing the currency with high interest rates will lead to a quicker recovery even though it intensifies the contractionary elements of the crisis in the short run. Others favor expansionary fiscal and monetary policies to minimize the short-run effects of a recession.

There is pressure to harmonize the rules of international finance and to delegate more power to international organizations to formulate and enforce such rules. Due to concerns with international stability, economic efficiency, and the drawbacks of alternative approaches, harmonization and multinational authority have greatly increased since the end of World War II. Sovereign debt has been the leading edge of this trend, with the central role that of the International Monetary Fund (IMF). Banking has followed, with the work of the Basel Committee and the supplementary role of the IMF and World Bank in monitoring and enforcing banking standards in the developing world.

INTERNATIONAL FINANCIAL INSTITUTIONS

International financial institutions (IFIs) are multilateral organizations and national agencies that use public funds to finance foreign investment, trade, and economic development. The three main categories of IFIs are the Bretton Woods institutions, regional development banks, and export credit agencies. The Bretton Woods institutions include the World Bank Group and the International Monetary Fund (IMF). The main regional development banks include the African Development Bank Group, Asian Development Bank, European Bank for Reconstruction and Development, and Inter-American Development Bank Group. All advanced economies, as well as some emerging market and developing economies, have at least one government-controlled export credit agency (ECA) to promote foreign investment and trade. IFIs provide over $100 billion in loans, loan guarantees, grants, investment insurance, and other financing to governments and businesses each year.

The Bretton Woods institutions were established at the Bretton Woods Conference in New Hampshire in 1944 to promote global economic growth and stability in the post–World War II period. The World Bank extends loans to support sustainable economic development. At its inception, the World Bank was a single institution called the International Bank for Reconstruction and Development (IBRD). The World Bank initially channeled development loans to war-ravaged Europe.

The IBRD's mission changed course during the 1950s to accommodate the rising development needs of newly independent countries in Africa and Asia and other developing regions. Over time, IBRD spawned four affiliated institutions, collectively called the World Bank Group. Today, the five institutions of the World Bank Group make loans and grants and provide technical assistance and investment insurance to support the United Nations' Millennium Development Goals (MDGs). The overarching aim of the MDGs is global poverty reduction. IBRD loans money to creditworthy middle-income developing countries. IBRD's closest partner, the International Development Association (IDA), extends zero-interest, long-term loans to less creditworthy low-income and lower middle-income developing countries. The IBRD and IDA, which today compose the World Bank, make development loans to governments. The World Bank's three affiliates also support the MDGs. The International Finance Corporation (IFC) makes loans to private businesses in the world's poorer regions. The International Centre for Settlement of Investment Disputes (ICSID) provides a mechanism for resolution of conflicts between foreign investors and host governments. The Multilateral Investment Guarantee Agency (MIGA) insures foreign investors from noncommercial losses that might be incurred in developing countries. The IFC, ICSID, and MIGA encourage private sector development, including foreign direct investment (FDI).

The IMF works to promote economic growth and stability in the global economy. The IMF's responsibilities are divided into three categories: financial assistance, technical assistance, and surveillance. Financial assistance includes IMF loans, known as credits, made to countries in need. IMF credits are used to help countries pay for imports, stabilize currencies, or service external debt. Technical assistance consists of policy advice the IMF offers to governments. Technical assistance promotes macroeconomic stability. IMF policy advice stresses good governance, institution building, banking regulation and supervision, and responsible monetary and fiscal policies. Surveillance deals with IMF consultations and oversight of nations' financial and economic policies. Surveillance seeks to identify weaknesses in public policies or institutions before serious problems arise. Surveillance assists the IMF in allocating its financial and technical assistance.

The second type of IFI is the regional development bank. A regional development bank extends development loans to poorer member countries within its region. Regional development banks are owned and operated by regional member countries and nonregional member countries. For example, the Asian Development Bank consists of 63 member countries—45 regional member countries from Asia and the Pacific and 18 nonregional countries from outside of Asia. The major regional development banks service the development needs of Africa, Asia, eastern and central Europe, and Latin American and the Caribbean.

A third type of IFI is the export credit agency (ECA). ECAs are typically government agencies that assist private companies finance trade or investment opportunities in other countries, especially the poorer countries. ECAs are bilateral agencies. That is, they deal one-on-one with foreign governments to encourage profitable export and investment venues for private firms. ECAs support export firms and transnational corporations (TNCs) through direct loans, loan guarantees, and investment insurance. All advanced economies, and some developing and emerging market economies, have ECAs to help domestic firms gain an upper hand in matters of trade or foreign investment. The amount of financial support that flows from nations' ECAs each year dwarfs the combined financial flows from the World Bank, IMF, and regional multilateral development banks. The Export-Import Bank of the United States, or Ex-Im Bank, is America's ECA. Over the past 70 years, the Em-Im Bank has financed export firms to the tune of $400 billion, $65 billion between 1999 and 2003 alone. Several other ECAs in the global economy include the Export Finance Insurance Corporation (Australia), Export Development Corporation (Canada), Hungarian Export-Import Bank (Hungary), Japan Bank for International Cooperation (Japan), Export Risk Guarantee (Switzerland), and the Export Credits Guarantee Department (United Kingdom). ECAs, like other IFIs, are highly controversial. Governments view ECAs as a way to stimulate foreign trade and investment and to protect domestic jobs. Opponents view ECAs, which often lack standards or stipulations for responsible corporate behaviors, as an invitation for business abuse of the environment, workers, and indigenous peoples.

INTERNATIONAL LABOR ORGANIZATION

The International Labor Organization (ILO) is an international organization that promotes worker rights and decent work in the global economy. The ILO is not an international labor union. Instead, the ILO is a specialized agency of the United Nations system. It brings workers, employers, and governments together to discuss ways to improve workers' quality of life. Collaboration among the three groups—workers, employers, and governments—is often called the ILO's tripartite partnership.

The ILO is the world's oldest and most recognized international authority on labor issues, and the most powerful voice for global justice for working men and women. The ILO was established in 1919 under the Treaty of Versailles, largely to support decent work for millions of workers in the post–World War I world. In 1946, the ILO became the first specialized agency within the new United Nations system. Since then, the ILO has initiated numerous conventions and recommendations to set global standards for workers' rights, and to influence labor laws and practices by companies and governments. From 1919 to 2005 ILO membership more than quadrupled, from 42 to 178 countries. The ILO headquarters is located in Geneva, Switzerland. The ILO also maintains 33 field offices around the world.

The Governing Body and the International Labor Conference are the ILO's two main decision-making groups. The Governing Body coordinates ILO programs and activities, assists countries develop labor laws, monitors compliance with labor standards, and disseminates the results of labor research to the global community. The Governing Body also advises the director-general, the ILO's chief executive. The Governing Body consists of 46 members: 14 representing workers, 14 representing businesses, and 28 representing governments. Some advanced economies hold permanent seats on the Governing Body. The annual International Labor Conference, or Conference, is a global decision-making forum. The Conference passes all conventions and recommendations. A convention is a formal, binding labor standard, right, or protection. Signatory nations are expected to uphold ILO conventions by passing legislation or imposing regulations to support labor standards. A recommendation is a less formal ILO statement. Recommendations set guidelines for desirable labor practices or conditions. Each of the 178 member nations has four delegates in the Conference—one worker representative, one employer representative, and two government representatives. Since 1919, the ILO has passed 184 conventions and numerous recommendations. In the early 2000s, the Governing Body was actively promoting just 71 conventions. Of the remaining 113 conventions, 5 were discarded and 108 were under review.

In the early 2000s, the ILO identified eight "fundamental conventions" as pivotal to workers' well-being in the global economy. These key conventions are listed in the ILO's *Promoting Better Working Conditions: A Guide to the International Labor Standards System* (2003). Conventions No. 87 and No. 98 protect workers' freedom of association and right to bargain collectively with employers. Conventions No. 29 and No. 105 prohibit forced labor as a form of punishment for workers' political views or labor activities, or as an expression of any form of discrimination. Conventions No. 100 and No. 111 ban discrimination in wages, employment, training, and working conditions based on race, gender, religion, or political views. Conventions No. 138 and No. 182 prohibit child labor, especially the more vile forms of child exploitation such as child prostitution. Four additional conventions were selected as "priority conventions" to strengthen key policy protocols. Priority conventions promote decent employment, global oversight of labor standards, and cooperative tripartite consultations among workers, employers, and governments.

The ILO's Declaration on Fundamental Principles and Rights at Work (1998) is the centerpiece for global labor reform. The principles outlined in the declaration are gleaned from earlier conventions, and include the right to free association and collective bargaining, and prohibitions against forced labor, child labor, and discrimination. Many corporate "codes of conduct" are rooted in the declaration's principles. Government labor laws and regulations are often based on ILO conventions.

Consultations with the United Nations Development Program, UNESCO, the World Bank, International Monetary Fund, and Organisation for Economic Cooperation and Development have spread the gospel of decent work throughout the global economy. The goal of decent work for the global labor force is challenged by economic globalization, and by the unique political and economic environments in some countries. For example, globalization encourages trade and investment liberalization. Some of the world's poorest nations have relaxed labor and environmental standards to court foreign direct investment (FDI). Lower standards weaken worker rights and protections, particularly at the bottom of the supply chain where workers are most vulnerable. The ILO continues to monitor gross violations of labor rights in countries such as China, Colombia, Venezuela, and

Myanmar (formerly Burma). The ILO, labor organizations, and others, fear that substandard labor conditions in some countries could snowball into a more generalized global race to the bottom in the highly competitive global economy.

INTERNATIONAL MONETARY FUND

The International Monetary Fund (IMF) was part of the Bretton Woods Agreement following World War II. The IMF was officially founded in July 1944 in the city of Bretton Woods, New Hampshire. The architects of the IMF were John Maynard Keynes (1883–1946), a British economist, and Harry Dexter White (1892–1948), an American delegate. Their goal was to build a framework for multilateral international economic cooperation that would avoid a repetition of the disastrous economic policies that had contributed to the Great Depression of the 1930s and the global conflict that followed.

The agreement led to the formation of the IMF and the International Bank for Reconstruction and Development (IBRD). The IMF began operations on March 1, 1947, with the goal to "foster global growth and economic stability." Each member of the IMF is charged a fee or quota as the price of membership. By December 1945, the International Monetary Fund had 29 member countries, and by the end of 1946, it had 39 members. France was the first country to borrow from the International Monetary Fund.

The IMF provides policy advice and financing to member nations in economic difficulties, and also works with developing nations to help them achieve macroeconomic stability and reduce poverty. The IMF promotes international monetary cooperation and exchange rate stability, facilitates the balanced growth of international trade, and provides loans to help member nations that are having balance of payments difficulties. A nation has balance of payments problems when it does not have enough money to pay for the goods and services imported into the country, or the value of the nation's currency has dropped so low that other nations refuse to accept it as payment for those imports. The IMF also tracks global economic trends and performance, and alerts member countries when it sees a potential for balance of payments problems on the horizon. The IMF can also provide a forum for policy dialogue, and advise governments on how to tackle economic difficulties.

The International Monetary Fund provides loans to its members under different programs for the short, medium, and long term. The size of the quota varies with the size of the nation's economy and the importance of its currency in world trade and payments. Decisions made by the IMF are determined by vote, with the weight of each nation's vote proportional to its quota. This gives the high-income countries of the world a voting advantage that is disproportionate to their population. For example, the United States alone controls 17 percent of the total votes, and the six other largest industrial economies (Canada, Italy, France, Germany, Japan, and the United Kingdom) control almost 45 percent. Various votes on IMF policy require a "super majority" of 85 percent.

The IMF has its own currency, called a special drawing right (SDR). SDRs are based on a country's quota and are part of a nation's international reserves. If a country lacks reserves, it cannot pay for its imports, nor can it pay the interest and principal it owes on its international borrowings. Some of the IMF requirements for lending money require the borrower to make fundamental changes in the relationship between government and markets in order to quality for IMF funds. These requirements are known as IMF conditionality. Currently, the IMF comprises 188 countries and is headed by Christine Lagarde, a French labor lawyer and politician.

INTERNATIONAL NON-GOVERNMENTAL ORGANIZATIONS

In 1945 the United Nations needed to differentiate between intergovernmental specialization agencies and international private organizations to determine participation rights and the "non-governmental organization" (NGO) label was created. For the United Nations, an NGO is a non-profit voluntary organization. The organization can be organized at any governmental level (local, national, and international) but not part of a government. The term is generally reserved for social, cultural, environmental, or legal advocacy.

NGOs, especially international NGOs (INGOs) frequently work with intergovernmental organizations (IGOs) such as the United Nations or the World Trade Organization to advance myriad social issues. NGOs operate as social movements within civil societies and are often seen as a counter balance to IGOs by representing social and ethical causes, rather than capitalist or business-driven policies. As such, they have representation and lobbyist abilities with IGOs. To become an official NGO as classified by the United Nations an organization must apply and meet the following criteria: support and respect the Charter of the United Nations, be a reputable NGO with national, regional or international standing, be a tax-exempt not-for-profit, have been operating for at least two years, and have a history with the United Nations Information Centre. Being accepted as an official NGO can allow an organization to gain association with a relevant agency of the United Nations. It can allow for networking with other like-minded NGOs and become an interconnected resource of information sharing through the United Nations Department of Public Information (UNDPI). The UNDPI estimates there are approximately 1,300 associated NGOs.

There are many different types of NGOs. An NGO might operate in an advocacy role where a specific cause can be brought to the attention of policy makers. An NGO might be religious, with the motive of spreading goodwill through the vessel of religion. There are environmental NGOs that specifically represent concerns regarding sustainability, recycling, and pollution. The myriad purposes and forms of NGOs demonstrate the versatility and use of these organizations in their connectivity with governments and intergovernmental organizations. The structure and operations of NGOs also vary dramatically. One organization may be funded through community fundraising and grassroots organizations, where another may be privately funded. NGOs can be small or large in structure For example, the NGO Human Rights Watch received and spent $21.7 million in 2003.

Due to their influence on global politics, NGOs can also be controversial. Because they represent advocacy and ideals of their members, the purpose and legitimacy of an NGO is debatable. Generally these organizations are accepted as being representative of the concerns of people and are generally geared towards globally beneficial policies. However, because NGOs can represent such a variety of viewpoints there can some conflict of interest. NGOs can influence WTO decision-making processes. Non-developed nations are against this influence because most NGOs are established in developed nations and come from a developed perspective. This may lead to a skewed perception on how to offer foreign aid and how to aid in social issues in other nations. There is also a general argument that an advocacy or lobbyist group may not best represent the desires of the populous.

Another example of the potential pitfalls of NGOs can be seen in international sports governing bodies such as Fédération Internationale de Football Association (FIFA) or more recently, the Association of Tennis Professionals (ATP). Both organizations are international NGOs and operate to provide sports entertainment. Recently the ATP has come under fire for a match-fixing scandal. While it is not a legal body, it does govern certain aspects of tennis and its associated events. In the case of FIFA, allegations of payoffs with relation to the selection of future World

Cup hosts are a serious indication of corruption. These organizations operate in an international environment and on the fringes of legal systems. Combined with the economic power of a global event such as the World Cup or the Olympics, they have tremendous influence on economies and policymakers. As such, allegations of corruption demonstrate perversion of power and organizational problems at the world's largest NGOs.

International NGOs can experience difficulties in management due to their global nature and differences in culture. In many cases, organizations that are looking to provide aid or build structures in underdeveloped nations experience difficulties because they do not have experience or members who work and understand the socioeconomic conditions in the countries they are working. Diversity management represents a managerial tactic where cultural considerations help guide strategy, training, and staffing. Another trend in management of international NGOs is participatory management, which tries to embody a learning organization mentality that allows for greater flow of innovations and ownership in the organization.

INTERNATIONAL TRADE

International trade is the cross-border exchange of goods or services. International trade occurs when an individual, business, government, or other entity imports or exports products. An *import* is a product that is purchased from another country, while an *export* is a product that is sold to another country. The benefits of international trade are built on the principle of mutual benefit and the theory of comparative advantage. The principle of mutual benefit emphasizes the benefits received by both parties in a voluntary exchange. Trade expands the range of consumer choice, and also sparks technological advance, innovation, and entrepreneurship in competitive global markets. The theory of comparative advantage, which was popularized by David Ricardo nearly two centuries ago, stresses regional specialization to promote production efficiency. International trade is viewed as a major pillar of globalization in today's global economy. The United Nations Conference on Trade and Development (UNCTAD) reports total global trade, measured by global exports, in 2015 was $21.1 trillion.

Since World War II, trade liberalization has encouraged international trade. Trade liberalization refers to the reduction or elimination of trade barriers such as import quotas, tariffs, and a variety of non-tariff trade barriers. Since the mid-1940s, the International Monetary Fund (IMF) and the World Bank, often called the Bretton Woods institutions, have supported free trade to stimulate global economic growth and stability. In addition, the General Agreement on Tariffs and Trade (GATT) worked to liberalize trade from 1948 to 1994. Eight GATT trade rounds dismantled many trade barriers during the period. The World Trade Organization (WTO), GATT's successor organization, has strengthened the institutional framework for free trade since 1995. The WTO's core principles include most favored nation (MFN), which extends a trade concession granted to one WTO member to all member nations; national treatment, which guarantees equal treatment of foreign and domestic goods in markets; and transparency, which requires the timely reporting of new or existing trade barriers.

Regional trade agreements have also encouraged free trade in the post-war global economy. A regional trade agreement (RTA) creates a trade bloc. Member countries within a trade bloc reduce or eliminate trade barriers. The WTO identified nearly 300 bilateral and multilateral RTAs in the global economy in 2005. The four types of RTAs include the free trade area (FTA), customs union, common market, and economic and monetary union. An FTA is a trade bloc that eliminates trade barriers among member nations, but allows members to determine their own trade policies with non-member countries. The North American Free Trade Agreement (NAFTA) is the world's leading FTA. A customs union establishes an FTA and common trade policies, such as the common external tariff (CET), with non-member countries. The Andean Community is an example of a customs union. A common market combines the qualities of a customs union with deeper economic integration among member nations, including free cross-border flows of resources and investments. An economic and monetary union is the highest form of economic integration. The European Union (EU) is an example of an economic and monetary union with a common currency—the euro—and common policies on dealing with banking, labor, energy, foreign aid, foreign policy and security, and so on.

The balance of trade measures the difference between the value of a country's imports and exports. A country's balance of trade rarely settles at a break-even point, a position in which the value of its imports and exports is equal. Instead, most countries experience a trade deficit or a trade surplus. A trade deficit occurs when the value of a country's imports is greater than its exports. A trade surplus occurs when the value of a country's exports is greater than its imports. The United States has incurred trade deficits since the mid-1970s.

Trade liberalization promotes sustainable growth and development in some countries. There are challenges to an equitable, universally accessible global trading system. First, the expanded use of antidumping measures restricts fair and free trade. Anti-dumping measures are often a form of backdoor protectionism designed to sidestep existing WTO prohibitions against tariffs and non-tariff trade barriers. Second, rising global competitiveness threatens decent work for low-skilled labor. Competitiveness depresses some wages, especially wages in the poorest countries, and contributes to the dreaded "race to the bottom." Third, offshoring and production sharing shift production facilities and jobs from high-wage countries to low-wage countries. Liberalized trade and investment regimes contribute to the export of capital and jobs and lower the standard of living for some households. Fourth, the terms of trade turn against producers of primary commodities such as sugar, natural rubber, cocoa, and coffee. Depressed commodity prices contribute to trade deficits, and balance of payments problems, in some poorer nations. Fifth, the lack of global connectivity in poorer world regions excludes the least developed countries (LDCs) from sharing in the benefits of globalization. To advance global prosperity for all countries, international trade must be fair and inclusive.

INTERNATIONAL TRADE AND THE ENVIRONMENT

The complex relationship between trade and the environment can be divided along three broad dimensions: (1) the impact of environmental policy on trade, (2) the effect of trade on the environment, and (3) the impact of trade policy on the environment.

The first dimension relates to the effect of environmental policy on international trade patterns. There exist two primary mechanisms by which this may occur. First, domestic environmental regulation affects the production costs of firms located in the country. Facing higher production costs due to stricter regulation, firms are at a competitive disadvantage relative to firms located in countries with relatively lax regulation. Consequently, net imports may rise as consumers at home and abroad substitute toward products produced more cheaply in environmentally lax countries. The magnitude of this effect depends on the difference in environmental stringency across countries, and the importance of environmental costs in total production costs.

Second, environmental policy may impact trade patterns through foreign direct investment (FDI). FDI occurs when a multinational firm in one country, known as the source, shifts some or all production activities to another country, known as the host. One motivation for FDI is to take advantage of lower production costs in the host. As environmental regulation is one component of a firm's production cost, greater stringency in the source may cause a firm to shift production to a host with relatively lax regulation. Known as the pollution haven hypothesis (PHH), its practical importance again depends on the difference in environmental stringency across countries, and the importance of environmental costs in total production costs. If the PHH holds, environmental policy will affect international trade. For example, if the shift of production activities to the host is limited to the intermediate stage of production and accompanied by shipments of intermediate goods back to the source, then regulation increases the volume of trade.

The second dimension along which trade and the environment intersect relates to the effect of trade on the environment. Such an effect may arise through scale, technique, and composition effects. The scale effect refers to the overall volume of production that occurs. Since production invariably produces some pollution and waste, trade tends to degrade the environment by increasing the volume of production. Production volume may increase, among other reasons, due to the more efficient use of resources when countries specialize in goods for which they have a comparative advantage.

The technique effect concerns the amount of environmental degradation inflicted per unit of production. While trade raises the overall scale of production, the resulting economic growth raises demand for a clean environment. Consequently, stricter regulation is likely to be implemented, resulting in cleaner production processes. In essence, trade raises a country's wealth, and wealthier countries demand a cleaner environment via less damaging production techniques.

The composition effect refers to trade's impact on environmental degradation due to changes in a country's output mix. With trade, countries specialize in the production of certain goods, perhaps those in which they have a comparative advantage, and then trade these goods for products produced elsewhere. If a country specializes in goods that are harmful to the environment (e.g., paper or chemical goods) then the composition effect of trade will result in greater environmental damage. The converse is true if a country specializes in goods that are relatively cleaner to produce (e.g., textiles).

The net effect of trade on a country's environmental quality depends on the relative magnitudes of the scale, technique, and composition effects. Empirical studies indicate that greater trade generally has a modest beneficial impact on environmental quality.

Before continuing, three subtle issues also bear consideration. First, trade entails the transport of goods; this also generates pollution. Empirical evidence highlights the importance of transportation-related pollution. Second, trade may impact the environment through the introduction of so-called invasive species, which may threaten biodiversity, agricultural productivity, marine resources, and other ecosystem services. Third, the interaction between trade and the environment is not limited to international trade. Trade between regions within a country also generates scale, technique, and composition effects. However, one salient difference does arise. With international trade, domestic firms with market power will pass some of the higher production costs due to environmental regulation on to consumers (through higher prices) in foreign countries. For subnational trade, however, higher prices harm consumers located in the same country. Consequently, the technique effect is likely to be weaker, yielding a less beneficial effect of trade on the environment, when trade is across regions within the same country rather than across countries.

The final dimension along which trade and the environment intersect relates to the effect of trade policy, rather than trade *per se*, on the environment. Trade policies, such as regional trade agreements (e.g., the North American Free Trade Agreement) or membership in the World Trade Organization (WTO), affect the environment via two mechanisms. First, they limit protectionist measures designed to stunt free trade, most notably tariffs or quotas. Consequently, countries may turn to so-called secondary trade barriers, such as environmental regulation, to protect domestic firms from foreign competitors. For example, a country may attempt to circumvent a trade agreement and limit imports of, say, foreign agricultural goods by banning imports of goods using a certain pesticide. Even if this policy has legitimate benefits to the environment, it may be disallowed under existing trade policy as it affects trade. In essence, concern over the unfair usage of secondary trade barriers may prevent countries from implementing desirable pro-environment regulations.

Second, trade agreements may impede environmental protection by prohibiting a crucial enforcement mechanism available to international environmental agreements (IEAs): trade sanctions. IEAs addressing global environmental problems, such as ozone depletion or global warming or protection of the oceans, have few sticks available to punish violators. Imposing trade sanctions on countries in violation of an IEA is one of the few enforcement mechanisms available. However, the fear is that trade agreements in general, and the WTO in particular, will preclude the use of such sanctions. This, in turn, threatens the ability of IEAs to achieve their desired effect.

ISOLATIONISM

The idea that a nation should not involve itself politically or economically with another nation is known as isolationism. This foreign policy is used by those that believe by limiting international involvement it will keep their nation from being drawn into dangerous conflicts or unfavorable situations for their own nation. This concept was strongly supported by citizens of the United States at the beginning of World War II.

Many Americans were not in favor of entering World War II, the primary reason being the vivid memories of World War I, little more than 20 years earlier. The United States was also struggling with the Great Depression and didn't want to use its limited resources to support another nation's war and participating in another possible global conflict would drain the nation of more lives, resources, and finances.

Extreme isolationists believe that their country is best served by not entering into international trade agreements or other mutual pacts. This extreme action was taken by the Ming dynasty of China in the 15th century in order to preserve China's culture. China was an extremely strong and successful nation and believed it could be self-sufficient, cutting itself off from all trade and interaction with the outside world. China then began to fall behind those nations that were trading and interacting with one another.

Some nations believe in isolationism in order to protect their infant industries, resources, and labor forces/wages. Countries such as North Korea and Cuba used isolationism to protect themselves from Western imperialism. Many of the young African nations of the 1960s practiced isolationism to protect themselves from their European colonizers. Isolationism has shown short-run success for some nations; in a global economy, however, isolationism has shown to produce economic stagnation in the long run.

J

JAPAN: GENERAL ECONOMY

Despite its relatively small geographic size, Japan is a major economic power in the modern world. As of 2013 Japan had the third-largest economy in the world by nominal gross domestic product; only the United States and China are larger. Japan also has the fourth-largest economy by purchasing power parity.

Japan has had three main effective economic and political periods in its very long history. The first of these periods, called Edo (ancient name for Japan), began in 1603 and ended in 1867. The Edo Period was the last period of the Tokugawa shoguns. The second period then began with the Meiji Restoration in1868. This was the first era of modern government. The third effective economic and political period commenced after World War II. One of Japan's third period main focuses is the manufacturing industry. It is recognized for being at the forefront in technological industries such as consumer electronics, optical fibers, semiconductor manufacturing, and optoelectronics.

Global trade of imports and exports contribute to the success of the Japanese economy. Since Japanese land is not suitable for most agriculture, importing raw materials is very important. Japan uses these materials for the production of machinery and vehicles. Japan also imports key foods such as meat and wheat. The United States and the People's Republic of China are Japan's largest import partners. Japan also has a large volume of exports. The two leading exports from Japan are consumer electronics and automobiles. Once again, Japan's largest export partners are the United States and China. Because Japan is not able to have a high rate of agricultural production it focuses on the production of high technology goods such as hybrid vehicles, optical instruments, and robotics. Finance is one of Japan's largest service sectors.

Japan faced a difficult time after World War II, due to the fact that millions of its people had dies in the war and one-third of its wealth was lost. All large cities, industries, and transportation networks were severely damaged. Surprisingly Japan still managed to become the second largest economy in the world by the 1980s. To help Japan get back on its feet the occupation of Japan was established by the Allied powers and led by the supreme commander of the army forces in the Pacific theater, General Douglas MacArthur. Although much of Japan's infrastructure had been brutally destroyed by the bombings of World War II, important industries and facilities were identified for postwar growth. For example, industries and engineers that made machinery, war tools, and optical sights during the war were converted to the manufacturing and production of sewing machines, vehicles, and cameras, which helped fuel economic growth in Japan after the war.

Japan suffered economic losses in the 1990s due to the collapse of stock and real estate prices. To compensate for its losses Japan began a system of massive budget spending on large public works programs. Unfortunately, this system proved inefficient to stimulate the economy. Japan then began a new approach, called quantitative easing, meaning Japan increased its money supply to raise expectations for inflation.

Since the inception of quantitative easing monetary policies by the Bank of Japan, Japan has experienced economic growth beyond expectations. Japan's growth rate has exceeded the projections of most economists. Economists now project Japan's growth rate in the 3-4 percent range from the 1 percent range projected earlier.

K

KRUGMAN, PAUL

Born: February 28, 1953, in Albany, New York; Nationality: American; Professional Interests: neo-Keynesian, trade theory, economic geography, economies of scale, author, columnist, Nobel Prize in Economic Sciences (2008); Major Works: *Rethinking International Trade* (1990), "Does the New Trade Theory Require a New Trade Policy?" (1992).

Paul Krugman is one of the most admired and influential economists of modern times. Krugman is known for his work on international trade theory. Among his many notable contributions, Krugman showed that international trade flourishes where trading partners can take advantage of economies of scale and consumers' preference for diversity. His theory explained the persistence of international trade in the absence of distinct comparative advantage. His theory has been influential on research related to issues surrounding free trade, globalization, and worldwide urbanization. In 2008, Krugman won the Nobel Prize in Economic Sciences.

Paul Robin Krugman was born on February 28, 1953, in Albany, New York. He was born into a Jewish family and grew up on Long Island in New York, graduating from John F. Kennedy High School in Bellmore. He received his BA in economics from Yale University in 1974 and PhD from the Massachusetts Institute of Technology (MIT) in 1977. During 1982 and 1983, Krugman was the senior international economist for the President's Council of Economic Advisers under Ronald Reagan.

Prior to his appointment at Princeton in 2000, Krugman taught at Yale University, MIT, the London School of Economics, Stanford University, and the University of California, Berkeley. Krugman also served as a consultant to the Federal Reserve Bank of New York, the World Bank, the International Monetary Fund, and the United Nations, as well as to a number of countries, including Portugal and the Philippines.

In contrast to traditional Ricardian trade theories, which assume that trade occurs mainly between economically unequal countries so some countries export agricultural products (e.g., Mexico) whereas others export industrial goods (e.g., the United States), Krugman's approach is based on the premise that trade occurs between relative equals as consumers demand a varied supply of goods that can lead to efficient economies of scale in industrial production.

Consequently, a few countries that not only have similar conditions but also trade in similar products dominate the worldwide trade. Krugman first published his new trade theory, which deals with the analysis of trade patterns and location of economic activity, in 1979 in the *Journal of International Economics*. His trade theory has become the model of most international trade today, and in 2008 he was honored for his work with the Nobel Prize.

A proponent of globalized free trade in his theories for modern trade, Krugman formulated a model explaining how economies of scale plays a critical role in developing a comparative advantage for countries such as Sweden, which both exports and imports cars (like the domestically produced Volvo). For example, with a large domestic market for Volvos, Sweden also becomes a leading exporter of Volvos to countries such as the United States. Thereby, Sweden gains more profits and even more production. This theory further helps explain why production is concentrated in just a few large countries and why cities within those countries become densely populated, attracting workers and consumers.

Before the Enron scandal happened in 2001, Krugman had served as one of the many economists on a panel that advised Enron on economic and political issues. He ended his affiliation with Enron when he accepted the offer to become a columnist at the *New York Times* in 1999. When news of the Enron scandal broke out, he disclosed his Enron affiliation to his readers and he emphatically denied all the charges of conflict of interest.

In addition to Krugman being a distinguished economist and nationally known columnist for the *New York Times,* he has written 20 books, including *The Return of Depression Economics and the Crisis of 2008* (2009), and *The Conscience of a Liberal* (2007), and has published more than 200 scholarly articles. In 2003, he published his book *The Great Unraveling,* a collection of his columns, which became a best seller.

In recognition of his work, Krugman received the John Bates Clark Medal from the American Economic Association in 1991, an award given every two years to the top economist under the age of 40.

Apart from his prominence in academia, Krugman is also an outspoken and vocal critic on issues of politics and the economy through his *New York Times* column and his related blog, *The Conscience of a Liberal,* one of the most quoted and widely referred to blogs in the econoblogosphere.

KYOTO PROTOCOL

The Kyoto Protocol is an agreement between members of the United Nations to comply with uniform emission standards. The aim of this treaty is to limit the emission of harmful substances into the atmosphere and thus prevent climate conflict. Adopted in Kyoto, Japan, in 1997, the agreement took effect in February 2005. Under the Kyoto Protocol, country members are limited in their emissions of greenhouse gases, which trap radiation in the atmosphere and can lead to conditions such as global warming. The gases under the most consideration are carbon dioxide, nitrous oxide, methane, perfluorocarbons, hydrofluorocarbons, and sulfur hexafluoride. These gases come primarily from industrial activities and are created, for example, through the production of electricity and chemical reactions involved in production.

The Kyoto Protocol defined an emissions target. This target is divided into units called AAUs, which are individual allowances for each United Nations member country. The protocol tends to be stricter toward developed countries because of their prolonged history of harmful industrial emissions. Each country's allowance is made up of a granted number of units, in which one unit is equal to one ton of carbon dioxide. Because carbon dioxide is the principal greenhouse gas, it is used as a common measurement in the allowance market. However, these allowances were redefined in 2012 when the protocol was amended in Doha, Qatar. This amendment set new standards for its defined second period, 2013 through 2020, and increased the targeted emissions reduction rate from 5 to 18 percent.

Use of such emission restrictions was intended to motivate countries to reduce their individual emissions, and thus reduce overall emissions globally. The primary measures that member countries can take to reduce the production of greenhouse gases include the implementation of technology and fossil fuels that are greater in efficiency and environmental safety. Although use of these methods can help make significant leaps towards the reduction of fossil fuel emissions, it cannot always be enough to help countries meet the Kyoto Protocol's standards, which is why market-based improvements were implemented into the agreement,

Market-based improvements are ways in which United Nation member countries can supplement their emission allowances or work towards meeting their targets. There are three types of market-based improvements that received approval by the United Nations. These include international emissions trading, a mechanism for clean development, and joint implementation. International emissions trading is the practice of buying unused emissions allowances from other countries. This action is economically driven, and only available to countries that can negotiate toward this. The clean development mechanism is a method in which countries can earn a greater emissions allowance through implementing emission reduction projects in developing countries. Aid in these countries may use technology such as solar panels or more energy efficient devices. Similarly, joint implementation also allows countries to earn a larger emissions allowance. However, this is achieved through emission reduction or removal projects within the country. All three of these transactions are logged and tracked by both the United Nations and member countries to ensure that emission standards are met and that the Kyoto Protocol's purpose is being enacted.

L

LAGARDE, CHRISTINE

Born: January 1, 1956, in Paris, France; Nationality: French; Professional Interests: international finance; Major Works: *Ármales d'Economie Politique, N° 56/2008-2009* (2009), "Of Rules and Role Models" (2012).

Christine Lagarde, French lawyer and politician, was the first female minister of finance in France from 2007 to 2011. On July 5, 2011, she became the first woman leader of the International Monetary Fund (IMF) as managing director. She has been heralded as an influential leader, powerful businesswoman, and prominent figure in international finance.

Christine Madeleine Odette Lagarde was born on January 1, 1956, in Paris, France. Her father, Robert Lallouette, was an English professor and her mother taught Latin. She completed her early years of study in Le Havre at the Lycée François 1er and Lycée Claude Monet. In 1973, at the age of 17, Lagarde moved to Washington, D.C., to study for a year at the esteemed Holton-Arms, an all-girls college preparatory school in Bethesda, Maryland. During this time Lagarde interned for Representative William Cohen (R-Maine) at the Capitol. She assisted his office during the beleaguered Watergate hearings, an experience that piqued her interest in politics. Lagarde earned a law degree in 1980 from the University Paris X Nanterre (now called Paris West University Nanterre La Défense), specializing in antitrust and labor law. She went on to earn a master's degree in political science at the Institute of Political Studies at Aix-en-Provence in southern France.

Upon completion of her law degree, Christine Lagarde stayed on as a law lecturer at the University Paris X Nanterre. In 1981, Lagarde joined Baker & McKenzie, a Chicago-based international law firm with major operations in Asia and Europe. Lagarde's proven record in the legal specialties of antitrust and labor law and mergers and acquisitions helped elevate her to partner by 1987. In 1999 Lagarde was made chairman of the Global Executive Committee (reelected in 2002) and moved to Chicago. In 2004, Lagarde was named chairman of the Global Strategic Committee.

Lagarde returned to France in June 2005 when she joined the French government as minister of foreign trade in President Jacques Chirac's cabinet. She maintained this position into Nicolas Sarkozy's presidency. Sarkozy later named her minister of agriculture a month before designating her the new minister of finance. Known for her robust work ethic, Lagarde advocated for a workweek lengthier than customary 35 hours. In her ministerial role, Lagarde was instrumental in much-needed pension reforms. She was chair of the Economic and Financial Affairs Council (ECOFIN) for six months in 2008. As a member and later chair of the G20, she gained recognition on the world stage for her part in managing the financial crisis, addressing weaknesses in international monetary policies, and instituting stronger financial regulation, supervision, and global economic governance.

Because Lagarde's background is in law rather than economics, she was an unlikely choice to lead the International Monetary Fund. Her nomination was further complicated by developing countries seeking the post for one of their own. Lagarde campaigned for support in emerging nations such as India, Brazil, and China, to whom she promised an enhanced role in IMF relations and actions under her leadership. Agustín Carstens, the governor of Mexico's central bank, was her primary adversary, but he did not gain the backing of these nations. Eventually, Lagarde's expertise in European affairs, coupled with her ministerial experience, earned her the position. She is the 11th consecutive European to hold the position.

Lagarde serves as the chairman of the board of governors for the European Bank for Reconstruction and Development. She is a member of the board of governors at the European Investment Bank Group. She also works as a member of the board of governors at the European Investment Bank and the Inter-American Development Bank. Even with an impressive history and a cautious demeanor, the IMF chief has been challenged by the European Union debt crisis, the precarious financial situation around the world, and the growing needs of developing nations.

With a number of "firsts" in holding top-ranked positions typically held by men, Lagarde lends her voice and power as an ally to women. Lagarde has been recognized for her contributions to the world of international finance and law. In July 2000, Lagarde was named chevalier in the French Legion of Honor and was named commander for the National Order of Agricultural Merit. In 2009, Christine Lagarde was ranked as the 17th most influential woman in the world by *Forbes* magazine, the fifth best European executive woman by the *Wall Street Journal Europe*, and one of *Time* magazine's top 100 world leaders. In 2016, Lagarde was listed by *Forbes* magazine as the sixth most powerful woman in the world.

In 2016, the IMF Executive Board re-elected Lagarde as IMF Managing Director to a second five-year term.

LATIN AMERICA: GENERAL ECONOMY

After many of its countries gained independence in the early 19th century, Latin America was on a quest for economic growth and stability. Latin America consists of the 10 countries in South America, the six countries in Central America, and the Caribbean countries (Bulmer-Thomas 2014). Just like other developing areas, countries in Latin America struggled for centuries to grow economically. There have been many different policies implemented throughout their economic histories to help facilitate growth; however, these countries continue to be plagued with slow growth. Not only has the economic growth in Latin America been a slow process, these countries also suffered a financial crisis in the 1980s, which was a major setback. In the last 12 years, there have been a lot of economic reforms that increased faith in the governments to support the economies (Gerber 2014, 358).

Overall, Latin America's economic growth has taken quite a bit of time, but there was a period of time when taken together the countries of Latin America had one of the fastest growing economies in the world. From 1900 until 1960, Latin America's combined real gross domestic product (GDP) per capita grew faster than the economies of the United States', or Europe's, or and Asia's (Gerber 2014, 358). Latin America's economy seemed to be on the right track for this time period.

The countries of Latin America contain a diverse combination of major industries. One economic constant among the nations is tourism. Mexico is a major world tourist destination, along with Brazil, Dominican Republic, Peru, Chile, and Argentina. Other key products produced by Latin America nations include tobacco, cacao, vanilla, maize, and rubber. These products are also their major trading exports.

Trade is an important component of the Latin America economy. The nations have created several trade blocs including the Southern Common Market (MERCOSUR). Although most of the nations are not friendly trading partners with the United States, Mexico is through the North American Free Trade Agreement (NAFTA), and the U.S. has trade agreements with Peru, Colombia, and Chile.

Unfortunately, the rate of growth Latin American countries experienced 1900–1960 did not last. After the 1960s, economic growth slowed at a global level and then disaster struck. Several Latin American countries including Mexico, Bolivia, and Chile found themselves unable to repay their debts and the debt crisis of 1982 was upon them (Devlin 2014, 2).

Economists have labeled this time period of the debt crisis of 1982 the Lost Decade because they estimated that by 1990 Latin America's per capita income would barely exceed the level it was at in 1980 (Devlin 2014, 1).

Many economists have examined causes of the debt crisis of 1982. There was an apparent lack of borrowing discipline by the countries on the macroeconomic environment. The misguided macroeconomic environment has taken most of the blame, over import substitution industrialization (ISI), for being the number one cause of the debt crisis. This is because unstable macroeconomic environments have the potential to lead to hyperinflation, depression, and balance of payments crises (Gerber 2014, 367). There has also been an argument that the debt crisis happened in response to Latin American countries being unable to overcome their external financing dependence on countries like the United States or the International Monetary Fund (IMF) and their income inequality (Stiglitz and Heymann 2014, 91). The mix of a poor macroeconomic environment and external economic factors set the stage for the debt crisis of 1982 to take place.

In response to the debt crisis, Latin America countries set out to implement multiple changes to their policies. The United States also tried to help Latin America get back on its feet. The Baker Plan, named for the then U.S. treasury secretary, James Baker, was proposed in 1985 (Gerber 2014, 371). The Baker Plan was an attempt to increase investments from Latin American banks. Despite efforts of the Baker Plan, it was not successful. Four years later, the Brady Plan, again named after the treasury secretary, then Nicholas Brady, switched the focus from investments to debt relief (Gerber 2014, 372). The Brady Plan was much more successful than the Baker Plan and was able to help the economies of Latin America get moving in the right direction. Policy reforms in Latin America did not stop there. The IMF applied the Washington Consensus reforms to many of the Latin American countries as conditions for receiving loans. The Washington Consensus was a set of reform policies that focused on the stability of the macroeconomic environment (Miller 2006, 32). These policies included open trade policies, inflation control and protecting special interests groups.

LEAST DEVELOPED COUNTRIES

The least developed countries (LDCs) are among the world's poorest developing countries. Most LDCs are low-income developing countries. A few LDCs, mainly small island nations in the South Pacific, are categorized as lower middle income.

Of the world's 30 landlocked developing countries (LLDCs), 16 are classified as LDCs. Of the world's 37 small island developing states (SIDS), 12 are also LDCs. In 2016 the United Nations Committee for Development Policy classified 48 countries in the global economy as LDCs.

The Economic and Social Council of the United Nations uses three criteria to distinguish the least developed countries from other developing countries. First, to qualify as an LDC a country's gross national income (GNI) per capita must be less than $750. Second, LDCs share certain weaknesses in their human resources base. These weaknesses stem mainly from inadequate nutrition, health care, and education. Third, LDCs routinely experience many types of economic instability. Unstable commodity export prices, a reliance on subsistence agriculture, underdeveloped manufacturing and services sectors, susceptibility to natural disasters, and other weaknesses are considered. In addition, the UN standard excludes large economies and countries with a population of 75 million or more.

By the early 2000s, 700 million people, or 11 percent of the world's population, lived in LDCs. In 2015 the population growth rate of LDCs exceeded the world at 2.2 percent growth per year.

In 2014 the average gross domestic product (GDP) per capita growth rate in LDCs was 3.3 percent, compared with an average GDP per capita growth rate in all developing countries of only .8 percent and world per capita growth rate of 2.1 percent.

LDCs are trapped in a vicious cycle of poverty. This vicious cycle stymies economic growth and sustainable economic development. The root causes of the vicious cycle of poverty are complex and intertwined. First, LDCs are unable to save sufficient money for investment in private physical capital, such as farm equipment, factories, or business computers. The lack of physical capital limits worker productivity and economic growth. In *The Least Developed Countries Report 2015,* the United Nations Conference on Trade and Development (UNCTAD) reported that LDCs, as a group, continued to experience negative growth in 2012 with 5.5 percent annual growth rate. This was below the 2013 growth rate of 6.3 percent. However, the 2012 growth rate is still higher than the 4.4 percent rate of growth experienced by the developed countries.

The vicious cycle of poverty in LDCs also stems from poor governance and scant public resources. Extreme poverty, inefficient or corrupt tax regimes, and weak institutions reduce the government's support for long-term investments in education, a necessary component in human capital development.

UNCTAD reported that less than two-thirds of primary school age children were enrolled in school in LDCs. Only about one-quarter of secondary age students were enrolled. In addition, LDCs suffer from an inadequate infrastructure, which disconnects the world's poorest citizens from the national and global economy. In the early 2000s, more than 70 percent of all people in LDCs lived in rural areas, only 5 percent of people had a television set, and just 1 percent of people had a mainline telephone, cell phone, or access to the Internet. Other roadblocks to development include human rights abuses and horrific civil conflicts, which discourage foreign investment, foreign trade, and foreign aid.

Sustainable economic development pertains not only to economic growth but also to people's quality of life. Indicators of a poor quality of life in LDCs abound. LDCs are plagued by extreme poverty, underdeveloped health and sanitation facilities, and low calorie intake. As a result, life expectancy is just 50 years. One out of every six children will die by age five. Over 13 million people in the LDCs were living with HIV/AIDS at the end of the 20th century, and more than one-third of all children were not immunized against measles, diphtheria, and other preventable diseases. One positive trend is that 76 percent of the adult young adults age 15–25 are literate, up from 69 percent in 2000. The literacy of women has grown even more, from 58 percent in 2000 to 68 percent in 2010.

Effective strategies to reverse the vicious cycle of poverty in LDCs have been elusive. Multilateral organizations have shouldered much of the responsibility for helping LDCs break the vicious cycle. The World Bank and regional development banks extend loans to support good governance, public and private capital formation, and human capital development. These international financial institutions (IFIs) also provide technical assistance to support institution building.

Most of the loans and grants earmarked for LDCs are made on concessional terms, often long-term and interest-free. The International Monetary Fund (IMF) extends loans to support financial and economic stability. IMF loans, like some World Bank loans, are contingent on a nation's ability to show measurable progress in instituting governance and financial reforms. The joint World Bank–IMF Heavily Indebted Poor Countries (HIPC) Initiative supplies billions of dollars in external debt relief to some of the world's poorest nations. The United Nations Millennium Development Goals (MDGs), which were established in 2000, provide direction to most multilateral development aid. The Development Assistance Committee (DAC), a group within the larger Organisation for Economic Co-operation and Development (OECD), also funnels billions of dollars in official development assistance (ODA) from rich countries to poorer countries each year. In 2014, LDCs received over $137 billion in ODA.

LOST DECADE, 1980s

The "Lost Decade" of the 1980s refers to the economic crises that happened in many Latin American nations during the time period roughly defined by the 1980s. The crises were a consequence of regional politics and the economic policies made by regimes that had been in power throughout most of the 1970s and 1980s. The damage done by the crises went beyond just politics and economics. The economic hardships that followed were largely borne by the citizen populations, causing social unrest.

Latin American politics throughout the 20th century were unstable, including during the years leading up to the Lost Decade. Most regimes were authoritarian to some degree, including those under military control, long-standing political oligarchies, and even some socialist examples. More specifically, in 1970, the most significant Latin American economies, Brazil and Argentina, were controlled by military strongmen; Mexico had been dominated by the Institutional Revolutionary Party for the previous four decades; and Chile and Cuba were controlled by socialist and communist regimes, respectively.

The economies of most Latin American countries in the years before the Lost Decade were dominated by raw material exports. In turn, most imports were finished goods purchased from first-world trading partners. In a sense, this trading pattern resembled the patterns that had characterized European imperialism in Africa, Asia, and the Americas throughout the 19th and 20th centuries. The region's political leaders, despite varying national political structures, embraced economic policies that emphasized national economic independence. Specifically many Latin American nations embraced the policies of import substitution industrialization (ISI). In short, ISI involved policies designed to make a sovereign nation as self-sufficient as possible. One of the key objectives in achieving economic self-reliance was to significantly increase a nation's levels of industrialization in order to process raw materials and products instead of exporting them. Another objective was to improve domestic infrastructure to support industrialization.

In order to achieve ISI objectives many large Latin American governments began to borrow on a large scale. Aggregate Latin American debt increased from $29 billion in 1970 to $159 billion in 1978 and further to $327 billion in 1982. During this time period there also was a sharp increase in worldwide oil prices. Western banks, flush with deposits, were very willing to provide debt capital under the assumption that sovereign national debt represented very modest levels of risk.

Unfortunately, the 1970s proved to be an economically volatile decade. In addition to the sharp increase in oil prices, the post-war Bretton Woods system collapsed when President Richard Nixon took the United States off of the gold standard. Many nations, including the United States, experienced significant inflation. Latin American countries were particularly impacted, and a number of them experienced hyperinflation. These combined events negatively impacted many of the Latin American nations, causing economic contraction and recession.

The combination of increased debt and poorly performing economies in the 1970s set the stage for a full-blown economic crisis in the 1980s. The first major shock occurred in 1982, when Mexico defaulted on $80 billion of its debt. Many Latin American countries were now unable to repay their loans as scheduled. These defaults sent shock waves through global markets. Ultimately the problem required intervention by the International Monetary Fund (IMF) and leading Western nations such as the United States to refinance and/or replace outstanding balances owed to private banks. Loans were typically renegotiated to provide longer payback periods.

The loans were made under the condition that Latin American borrower nations implement significant policy reforms. These reforms included a number of austerity measures designed to improve the ability of the impacted countries to repay their outstanding loans. Unfortunately the associated terms caused many impacted Latin American nations to reduce infrastructure and development projects, leading to increased unemployment.

The resulting economic contraction was felt almost universally throughout the region. Four of the five largest economies in the region experienced significant productivity losses during the Lost Decade running roughly from the early 1980s through the early 1990s. Between 1980 and 1990 Venezuela's real gross domestic product per capita (measured in 1990 international GKs) fell from $10,139 to $8,313 (–18 percent); Argentina's from $8,206 to $6,433 (–22 percent); Mexico's from $6,320 to $6,085 (–4 percent); and Brazil's from $5,195 to $4,920 (–5 percent). Only Chile's economy grew, increasing from $5,680 to $6,401 (+13 percent) during the same time period. It should be noted that Chile, influenced by the influential Chicago Boys economists who had previously studied under Milton Friedman at the University of Chicago, employed far different neo-liberal economic policies during this time period in comparison with its Latin American peers.

Despite the efforts to reset Latin American debts and implement austerity, most Latin countries continued to encounter difficulties in repaying their debt obligations as they struggled with stagnant economies. By the mid-1990s, lenders were forced to write off approximately $61 billion in loans. Despite these steps Latin American countries continued to recover at a very slow pace.

Ultimately, recovery did take place. By 2000 all five of the above countries were producing real GDP per capita in excess of 1980 levels. In retrospect the Lost Decade was the result of serious economic miscalculations by both governments and private sector capital markets and should serve as a reminder to avoid excess optimism in international capital markets.

M

MAASTRICHT TREATY

The Maastricht Treaty, formally known as the Treaty on European Union, created a more economically integrated Europe in the late 20th century. On December 9–10, 1991, the European Council debated and drafted what would become the Maastricht Treaty. The treaty was signed on February 7, 1992. This treaty created the singular universal currency of Europe, the euro.

The creation of the euro was a big step toward a much more continental way of managing the European economies. There were qualifications for nations to be a member of the Maastricht Treaty and gain access to this new currency, the euro. Members had to maintain sound fiscal policies, a debt limited to a maximum of 50 percent of its gross domestic product (GDP), and an annual deficit not greater than 3 percent of GDP.

The significance of the Maastricht Treaty earned it the nickname of being the "Pillar Structure" of the European Union. The nickname came from the three pillars the treaty represented of the European Union. The most relevant pillar was the continuation of the European Economic Community, which included several different economic groups in Europe. The two pillars this superior pillar rested on were the Common Foreign and Security pillar and the Justice and Home Affairs pillar. The creation of this system of pillars resulted from the desire of many of the member states for an extension of the European Economic Community to the areas of focus in foreign policy, military, criminal justice, and judicial cooperation.

The process of ratifying the Maastricht Treaty had complications, particularly in Denmark, which held its first Maastricht Treaty referendum on June 2, 1992. After ratification of the treaty fell short by 50,000 votes, amendments were added to the treaty through the addition of the Edinburgh Agreement (which contained four Danish exceptions). The treaty was ratified by Denmark the following year, on May 18, 1993.

In September 1992, a vote in France chose to support the ratification of the treaty, but with only 51.05 percent in favor. A result of the uncertainly surrounding the Danish and French votes were the upheavals in the currency markets in September 1992. This led to the expulsion of the British pound sterling from the Exchange Rate Mechanism. While Parliament narrowly approved the Treaty and the U.K. was still a member of the European Union, the United Kingdom opted out from the Maastricht Treaty's single currency provision (the euro) retaining the British pound sterling as its official currency.

MAQUILADORA

In 1965 the Mexican government introduced the Border Industrialization Program (BIP), or “maquiladora” program, as a response to growing unemployment and global need for low-cost labor. The objective was to stimulate employment in Northern Mexico following the termination of the bracero program. The bracero program, which ran from 1942 through 1964, had allowed Mexicans to legally work seasonally in the United States without citizenship or green card. The Border Industrialization Program intended to create employment for former braceros by introducing the concept of maquiladoras. Maquiladoras, or “twin plants,” would allow for a parent company outside of Mexico (e.g., in the United States) to have a corresponding plant in Northern Mexico to which it could send raw materials, equipment, machinery, and other production materials without incurring import tariffs or duties. These production facilities could use these items and then export the finished products to a third party or back to the raw materials’ nation of origin.

Originally the Border Industrialization Program was seen as mutually beneficial as it would create jobs in Northern Mexico and also help to curtail illegal immigration to the United States. For immigration, maquiladoras had mixed consequences. Although availability of employment in these border regions should theoretically create less need for immigration, the impact of maquiladoras on the Mexican economy also shifted industrial hubs to border cities such as Juarez and Tijuana and away from domestic and political centers like Mexico City and Guadalajara. Furthermore, initially maquiladoras did not necessarily fill the employment void for braceros, who were mainly males. Maquiladoras instead tended to hire more young women.

The maquiladora industry represents an export processing zone (EPZ). Until 1980 Mexico’s government focused on the implications of advancing its economy through job creation and domestic products. This meant increasing domestic products and services and limiting foreign competition through tariffs. In a shift in ideology, the government then eased tariffs, creating greater foreign competition domestically and incentivizing domestic firms to compete globally through exports. This shift in ideology directly correlated to the growth and potential of the maquiladora industry and represented a shift towards free-trade thinking.

The North American Free Trade Agreement (NAFTA) has also highlighted the importance of maquiladoras. The North American Free Trade Agreement enacted in 1994 signified a further reduction of trade barriers between the United States, Canada, and Mexico. This agreement encouraged the growth of the maquila program. As a result, initial production from maquiladoras increased as trade became even more fluid and less costly. However, NAFTA also paved the way for expansion of trade with other sectors of the Mexican economy. Other non-maquiladora plants became more attractive to multinational operations because they could operate at even lower costs and environmental regulations.

Maquiladoras represent an evolution in the application of free trade theory, specifically within multilateral trade agreements. However, a number of criticisms arose from this dynamic. The ability to produce at low costs in other nations draws attention to ethical dilemmas in global business. Specifically, critics claim that these policies have embodied a "race to the bottom" mentality where multinational firms continually search for the cheapest labor and the lowest safety and environment regulations in order to become more profitable. Poor working conditions and long hours are hotly debated topics of universal human rights within Mexico–U.S. trade dynamics.

MEADE, JAMES

Born: June 23, 1907, in Bath, England; Died: December 22, 1995, in Cambridge, England; Nationality: English; Professional Interests: Keynesian, international economic policy, Nobel Prize (1977); Major Works: *The Theory of International Economic Policy* (two volumes, 1951, 1955).

James Meade is best known for being awarded the Nobel Prize in Economics in 1977 for his work on a theory of international trade. He shared the prize with Bertil Ohlin. He is credited with applying Keynesian economics to international trade and the flow of capital in the mid-20th century. Most of his working career was dedicated to teaching economics at Oxford and Cambridge Universities, and writing economics textbooks. Meade died in 1995.

James Edward Meade was born in Bath, England, on June 23, 1907. He enjoyed a classical education at Lambrook School and Malvern College between 1917 and 1926. He began studying at the School of Philosophy, Politics, and Economics at Oxford University in 1926. He chose to study economics because of his disgust at the high unemployment in Great Britain following World War I, and because of his belief that he knew how to fix it. In 1931, he began a one-year fellowship at Cambridge University, where he became acquainted with John Maynard Keynes and other accomplished economists in the group known as the "Circus."

Meade returned to Oxford University in 1931 as a lecturer in economics and would continue to develop his interpretation of Keynesian economics. In 1936, he wrote one of the first textbooks to systematically explain Keynes's ideas in the *General Theory* (1936), a textbook called *An Introduction to Economic Analysis and Policy.* In 1933, he married Margaret Wilson, and in 1937 he took his young family to Geneva to work as editor of the *World Economic Survey* with the Economic Section of the League of Nations. Meade edited the seventh and eighth editions, which originally began in 1930 as *The Course and Phases of the World Depression,* put together by Bertil Ohlin.

Meade and his family left Geneva in 1940, fleeing the advancing German army, and returned to England where Meade went to work in the Economic Section of the War Cabinet. His role during the war was to deal with any number of economic questions facing England. Along with Richard Stone in 1940–1941, he was the first to create an account of the United Kingdom's national income and expenditures, which would be important for creating a workable economic policy. In 1944, he was a major contributor to the white paper titled *Economic Policy,* which led to the United Kingdom's commitment to low unemployment levels after the war as a matter of governmental obligation. At the end of the war he was influential in discussions to establish an aborted International Trade Organization that was supposed to work with International Monetary Fund (IMF) and the World Bank. However, the treaty to create the organization was not ratified, though the principles of the organization would be used to create the General Agreement on Tariffs and Trade (GATT) and the original intentions would be very similar to the current World Trade Organization (WTO). He became director in 1946 but resigned in 1947 over differences with other ministers who wanted to stick with wartime controls and rationing.

In 1947 James Meade began a 10-year tenure as professor of commerce at the London School of Economics (LSE). During this time he wrote his two-volume set *The Theory of International Economic Policy*, which began as a rewriting of his earlier *An Introduction to Economic Analysis and Policy.* Meade's Nobel Prize was awarded due to his work in this series. The first volume, *The Balance of Payments* (1951), focused on the relationships of countries using the Keynesian economic model. In it he stated the need for countries to focus on using fiscal policy to maintain full employment (what he called internal balance) and using monetary policy to maintain a balance of payments equilibrium (external balance). Out of this work came *A Geometry of International Trade* (1952), which provided diagrams to solve problems associated with international economics.

The second volume, *Trade and Welfare* (1955), focused on international transactions and the general welfare of nations where perfectly competitive trade was not present. It stated that the nation's best welfare may result from allowing some trade barriers and not moving toward totally free trade. This was developed in the "theory of second best," which promoted trade barriers to result in higher economic welfare in general, although some individuals might be hurt. One point from these two volumes that would eventually lead to arguments for such devices as the European Union is the need for countries to be able to work together in some way to achieve balance. In order to avoid the problem of overdetermination between countries attempting their own ability to balance, some kind of cooperation is necessary.

In 1957, Meade left the London School of Economics to take the chair of political economy at Cambridge and continue his writing career. His major work during this time was a four-volume set called *Principles of Political Economy,* which focused on domestic economic issues. At Cambridge, he often failed to see eye-to-eye with other faculty members on Keynesian interpretation. His emphasis was on trying to create stable prices and full employment in a fair and efficient national system through the means of moderate reforms. His opponents in his department did not believe that the market could create these conditions, so they supported the use of sweeping government-led planning. This issue led to his resignation in 1968 to begin a senior research fellowship at Cambridge's Christ's College, which he held until 1974.

Meade worked in the 1970s studying the effects of direct taxation in the United Kingdom and maintained an influential role regarding U.K. economic policy for many years afterward. In 1978, he chaired a report known as "The Meade Report on Taxation," which identified the "poverty trap" that contributed to unemployment and also advocated a progressive tax on expenditures instead of income. He continued to write until the year of his death, with his final work being *Full Employment Regained?* (1995), which continued his emphasis on promoting full employment.

In one of his final works, the fictional tale of *Agathotopia* (1989), he describes a society that employs economics to create a society that is not perfect but still a "good place to live." This book emphasizes Meade's outlook on life that economics should be used to improve the conditions of all and not just to further the careers of economists.

James E. Meade died on December 22, 1995, in Cambridge, England.

MERCOSUR

MERCOSUR, or *Mercado Comun del Sur,* is a four-nation regional trade association. The Mercado Comun del Sur, or Southern Common Market, consists of Argentina, Brazil, Paraguay, and Uruguay. Chile and Bolivia are associate members. The Treaty of Asuncion established MERCOSUR in 1991. The treaty began a formal phase-in of policies to integrate the four-nation economic region. By the early 2000s, MERCOSUR had evolved from a free trade area to a customs union.

As a customs union, MERCOSUR eliminated most trade barriers among member nations, and established a common trade policy with non-member nations.

MERCOSUR's common external tariff (CET) is its most visible sign of regional unity. Its common trade policy also synchronizes member nations' policies on import quotas, licensing requirements, and responses to unfair trade practices such as dumping. The Treaty of Ouro Preto in 1994 strengthened MERCOSUR's institutional framework and its resolve to create a comprehensive common market modeled on the European Union (EU) by 2006. The Committee on Permanent Representatives and the Dispute Settlement Court were both established in 2003. The creation of these institutions was hailed as a positive step toward further economic integration.

MERCOSUR's organizational structure rests on two main institutions, the Common Market Council and the Common Market Group. The Common Market Council is MERCOSUR's highest authority. It is responsible for maintaining the momentum toward full economic integration among member countries. The council consists of member nations' top ministers of economic and foreign affairs. It meets at least once every year, and its decisions are made by consensus. The second tier in MERCOSUR's organizational structure is the Common Market Group. The Common Market Group implements the policy directives of the Common Market Council. The group also has the authority to devise and implement its own policies to further the goal of economic integration. The group consists of representatives of member nations' central banks and economic and foreign affairs ministries. The group meets regularly, but at least once every three months. Decision making by the group is also based on consensus. The administrative office, and numerous advisory and working groups, handle MERCOSUR's day-to-day operations.

Trade liberalization within MERCOSUR, and between MERCOSUR and other regional trade agreements (RTAs), has increased members' international trade since the early 1990s. In its *International Trade Statistics 2014* the World Trade Organization (WTO) reports from 1995 to 2014, trade between MERCOSUR nations and other world regions rose to 1.7 percent from 1.4 percent.

MERCOSUR remains a work in progress. Challenges include promoting greater intraregional cooperation, expanding trade relationships with the EU and other partners, and pondering the implications of the proposed Free Trade Area of the Americas (FTAA).

MEXICAN PESO CRISIS OF 1994–1995

The North American Free Trade Agreement (NAFTA) took effect in 1994 and seemingly ended the difficult times of the Mexican economy in the 1980s. Shortly thereafter the Mexican government devalued the peso, which sent inflation soaring and began a severe recession. This series of events is commonly referred to as the Mexican Peso Crisis or Tequila Crisis.

The North American Free Trade Agreement lowered trade barriers between Canada, the United States, and Mexico, and encouraged foreign investors to take advantage of Mexico's U.S. market. In addition, the U.S. Federal Reserve set a low policy rate encouraging investors to search for higher yields in places like Mexico. The Mexican government had also recently restructured foreign debt with the Brady Plan, reduced its budget deficit and inflation rate, cut protectionist trade barriers, and privatized various government-owned enterprises. Unfortunately, Mexico's current account deficit continued to grow causing some to worry about the overvaluation of the peso.

The peso was tied to a crawling peg exchange rate system at this time. The government kept the exchange rate to the U.S. dollar within a narrow target band, but raised the upper limit of the band slightly each day. In real terms however, the peso was appreciating and the real exchange rate was rising relative to U.S. goods. This discouraged exports and encouraged Mexicans to buy imports.

To stop the currency outflow Mexico issued short-term dollar denominated debt called tesobonos. These were protected for a potential devaluation of the peso. This stopped the outflow of foreign currency and stabilized the foreign exchange rate. Later the finance minister denied that Mexico would devalue the peso, which unfortunately caused money to continue to leave Mexico—even with an increase in the upper band of the exchange rate. This decreased the foreign exchange reserves. Finally, on December 22, 1994, the peso was allowed to float freely.

In addition, Mexico suffered a series of political shocks during this same time period. There was a rebellion in the south province of Chiapas raising doubts about political stability. The ruling party's presidential candidate, Luis Donaldo Colosio, was assassinated on March 23, 1994, creating more fear about political instability. This resulted in a sharp rise in interest rates and depreciation of the peso. Later, Minister of the Interior Jorge Carpizo resigned and a prominent Mexican businessman, Alfredo Harb, was kidnapped—all of which caused shocks within the economy. After the August 1995 presidential election another political official—Jose Francisco Ruiz Massieu—was assassinated and Deputy Attorney General Mario Ruiz Massieu (Jose's brother) made political accusations and then resigned.

In the financial sector many fraudulent loans from the recently privatized banks were exposed. Thousands of Mexicans defaulted on loans as interest rates increased. The gross domestic product (GDP) decreased by 6.2 percent in 1995. Real wages fell by about 20 percent.

After these events Mexico continued to lose value in its reserves and the government decided to devalue the peso. The country found itself in a financial crisis and sought aid from the international community and specifically the United States. The International Monetary Fund offered a rescue package of 7.8 billion U.S. dollars.

NAFTA, with the weight of the United States behind it, proved to be a welcome help for the Mexican government. President Bill Clinton stated that as Mexico was the third-largest trading partner its well-being greatly influenced the security of American jobs and investment. The United States loaned Mexico $40 billion. This allowed Mexico to roll over its short-term dollar denominated debt.

The Mexican government announced a stringent austerity package popular with investors. The Mexican economy ultimately grew by 5 to 6 percent in each of the three years after the crisis. In the years following the crisis the current account deficit declined and unemployment rose and then declined. Inflation remained a problem for many years.

MEXICO: GENERAL ECONOMY

The Mexican economy has not always been on the growth trajectory it is today. It has had struggles along the way and there will continue to be struggles as there are with any country. Among these hardships were a debt crisis and a currency crisis. As a result of these crises, Mexico has gone through multiple economic policy changes (Gerber 2014). Mexico has moved from an import substitution industrialization (ISI) trade policy to an export-led growth substitution trade policy. The global financial crisis has also taken its toll on Mexico. Mexico is a part of the North American Free Trade Agreement (NAFTA) along with the United States and Canada. The main objective of NAFTA was to promote trade between the North American countries and promote economic growth. Currently, despite being affected by the recent global financial crisis, Mexico has continued its economic growth, even if it has been slower than its potential.

There was a long period of time when Mexico was experiencing economic growth under ISI polices, which focused on imports rather than exports. The debt crisis it experienced was a global crisis that started in Mexico in 1982 as a result of over borrowing and not being able to service its debt (Gerber 2014). By not earning any revenue from exports, Mexico was unable to make payments to lenders. It was clear that many policy changes were needed to get out of the debt crisis. Most of the changes that were made at that time were in an effort to privatize firms and move towards trade liberalization (Villarreal 2011). Economic reform in Mexico definitely helped, but soon after Mexico would face another setback. In late 1994, Mexico was faced with a currency crisis (Villarreal 2011). The peso had lost much of its value. Yet again, the government was faced with the need for economic restructuring. During this time, negotiations for NAFTA were happening. The implementation of NAFTA and Mexico's move toward an export-based economy lessened the effects of the currency crisis (Villarreal 2011). The implementation of NAFTA increased trade flows by a significant amount. NAFTA had many good effects on Mexico. In addition to promoting free trade between the United States and Canada, there were also fewer restrictions on foreign investment. This resembled an insurance policy for Mexico because it relied heavily on foreign investment capital from the United States as a source of revenue (Folsom 2014).

Today, Mexico has become more oriented toward the manufacturing sector as a result of NAFTA. Despite the recent global financial crisis, which began in the United States, Mexico has become the second-largest export market and the third-largest source imports for the Unites States (CIA 2016). Mexico has strong ties with the United States because of NAFTA, so there is no question that Mexico felt some of the effects of the global financial crisis. There was a decline in Mexico's gross domestic product and there were fluctuations in the export market (Villarreal 2010). In the last few years, Mexico has continued its slow growth. This growth can be attributed to a high demand for exports and increasing investments (CIA 2016). At this time, Mexico's slow economic growth is expected to continue.

MICROFINANCE INSTITUTIONS

Microfinance institutions (MFIs) are organizations that provide a range of financial services to the poor, mainly in the developing world. MFIs accept savers' deposits, extend loans, transfer money, and sell insurance to clients. An MFI's most important financial service is to make microcredit loans. Microcredit loans, or microloans, are small loans, perhaps $50 to $100, made to small businesses called microenterprises. Microenterprises use microloans to finance business start-ups or to grow existing businesses. Common microenterprises include repair shops, bakeries, farms, and handicraft shops. MFIs are sometimes formal financial institutions such as rural banks, credit unions, or even commercial banks. Most MFIs are less formal organizations, including nongovernmental organizations (NGOs) and private voluntary organizations (PVOs). Thousands of MFIs provide financial services to millions of low-income entrepreneurs in the global economy.

MFIs generally share certain common characteristics. Most MFIs are nonprofit organizations, mainly NGOs and PVOs. Many MFIs provide microloans and a variety of microfinance services. MFIs require repayment of microloans, plus interest. The high interest rates charged by MFIs, sometimes an annual rate of more than 50 percent, are necessary to cover the high costs of processing large numbers of small loans. MFI interest rates are considerably lower than rates charged by moneylenders in the informal economy, however. Microloans are short term, usually less than one year. Microloan repayments of principal and interest are often made in weekly installments. Collateral is not required to obtain microloans. Instead, peer supervision by assigned peer groups of five to eight people monitor compliance. In some cases, peer groups are collectively responsible for the repayment of microloans should the borrower default. Most borrowers are women entrepreneurs. MFIs obtain initial start-up funds from a variety of sources, including governments; multilateral donors, such as regional development banks; or bilateral donors, such as the United States Agency for International Development (USAID).

The Grameen Bank in Bangladesh is the world's largest MFI. Nobel laureate Muhammad Yunus experimented with microloans in the mid-1970s. In 1983, special legislation was passed to formally establish the Grameen Bank. Yunus's goal was to supply financial resources to the poor on reasonable terms. He reasoned that microloans could bring millions of marginalized people, who had had been shunned by commercial lenders, into the economic mainstream. In 1976, Yunus dispersed just $498 in microloans. In 2003, the Grameen Bank made $369 million in microloans. Since its founding, the Grameen Bank has extended $8.7 billion in microloans to 7.9 million borrowers. Ninety-seven percent of all microloan recipients were women. By 2009, the Grameen Bank provided services to 83,458 villages through the bank's 2,562 branches.

MFI resources and visibility have increased since the 1990s. The success of the Grameen Bank in Bangladesh, and greater financial inflows from multilateral institutions and other donors, established microfinance as a priority development strategy. The Inter-American Development Bank's (IDB) Small Project Program pioneered microfinance lending as early as the 1970s. By the mid-1990s, the Small Project Program had assisted hundreds of thousands of microenterprises, which accounted for more than a million new jobs. In 1997, the IDB introduced its MICRO 2001 initiative, a $500 million microenterprise development program. The African Development Bank Group and the Asian Development Bank also initiated microfinance support programs. The UNCDF Microfinance program, which is administered by the United Nations Capital Development Fund, is another recent microenterprise development initiative. The UNCDF Microfinance program funds MFIs and related support services in the least developed countries (LDCs). Since 1997, the UNCDF has also teamed with the United Nations Development Program (UNDP) in the MicroStart program. The MicroStart program provides funding and technical assistance MFIs in twenty additional developing countries. MFIs are an important component in a larger global poverty-reduction strategy. The mission of MFIs is supportive to the UN Millennium Development Goals (MDGs), which put poverty reduction at the center of the global development agenda.

MILLENNIUM DEVELOPMENT GOALS

The United Nations Millennium Development Goals (MDGs) consist of eight specific objectives for human and economic development in the global economy. The MDGs were a key component in the Millennium Declaration, a more inclusive document that received unanimous approval from the United Nations' 189 member states in 2000. The Millennium Declaration established a series of broad commitments to guide the planet toward a more prosperous and secure future.

UN member nations pledged to promote peace, security, and disarmament; economic development and poverty reduction (the Millennium Development Goals); responsible environmental standards; human rights, democracy, and good governance; respect for vulnerable groups; constructive assistance to Africa; and a stronger United Nations system. The MDGs are the world's most recognized roadmap toward sustainable economic development.

The MDGs roadmap consists of eight mutually supporting goals. Accompanying each development goal is at least one target. The target establishes a standard by which success or failure is measured. For example, the first MDG is to "eradicate extreme poverty and hunger" by 2015. To achieve success, two targets must be met. First, the proportion of people living on less than $1 per day must be cut in half. Second, the proportion of people who suffer from hunger must be cut in half. Similar targets are set for the other seven MDGs, as shown in "Millennium Development Goals: Goals, Targets and Indicators."

The MDGs sharpened the development strategies of nations and focused economic assistance from the World Bank and the regional development banks. Progress toward achieving the MDGs has been mixed. For example, the World Bank reported there were 100 million fewer people living in extreme poverty in 2000 than in 1990 and that rapid progress was being made to reduce extreme poverty in East Asia and the Pacific, Europe, and Central Asia. Extreme poverty in South Asia and sub-Saharan Africa was still rampant, however. Uneven global progress in the prevalence of extreme poverty and hunger dimmed global prospects for meeting the 2015 MDG number one goal. According to World Bank projections, a similar story unfolds for the other MDGs. Global progress has been uneven in achieving educational goals, gender equity, health care improvements, disease prevention, and environmental sustainability. Particularly vulnerable were the least developed countries (LDCs), where the crushing burden of poverty weakened nations' prospects for sustainable development.

MONETARY UNIONS

Monetary unions are groups of countries that share a common currency and turn over control of monetary policy to a common authority. Generally countries in a monetary union share geographical borders, but it is not necessary. The countries involved often have close trade and other financial relationships. The conventional practice of monetary unions is to limit the term to agreements among units recognized as fully sovereign states under international law.

In the strictest sense monetary union means complete abandonment of separate national currencies and full centralization of monetary authority in a single joint institution. Several variations exist of this strict definition. There are institutional provisions for issuing currency and the management of decisions. Currencies may continue to be issued by individual governments but tied together in an exchange-rate union. Currencies may also continue to be replaced by the money of a larger partner such as the U.S. dollar. This is called dollarization. Similarly monetary authority may continue to be exercised to some degree by individual governments or delegated by a joint institution.

A monetary union in many ways resembles a fixed-exchange rate regime. Countries retain their distinct national currencies but agree to adjust the relative supply to maintain a desired rate of exchange. As a form of a fixed-exchange rate system, monetary unions have at least two distinctions. First, because the countries switch to a new currency, the cost of abandoning the new system would be much higher than the typical fixed-exchange rate system. This gives people more confidence that the system will last. Second, a monetary union eliminates the transaction costs incurred when people exchange currencies in international transactions. This is especially helpful for countries with common borders and trade.

The most dramatic display in the history of monetary unions is the European Monetary Union (EMU). The EMU is a unique display of a monetary union because it is composed of fully independent states that have all voluntarily agreed to replace existing national currencies with one newly created currency, the euro. The euro was first introduced in 1999 in electronic form, with notes and coins following in 2002. Despite maintaining political sovereignty, member governments formally delegated all monetary sovereignty to a single joint authority. For the European Monetary Union this authority is in the European Central Bank. The EMU comprises established long-standing nations consisting of some of the largest national economies in the world, including Germany and France. The European Monetary Union is engaging in a gigantic experiment in monetary policy. The success of the EMU to date has encouraged other groups of nations to explore the costs and benefits of a monetary union in other corners of the world.

N

NATIONALIZATION

Nationalization has been a controversial topic in economics for many years. Opposing viewpoints on the subject are very common. These opposing viewpoints are associated with different types of governments. *Nationalization* is defined as the government takeover of a firm or industry (Gottheil 2013). Though the topic of nationalization has been debated consistently throughout history, the most recent financial crisis sparked even more conversation about it. Nationalization makes it possible for governments to control prices and employment (O'Connor 2006), which some view as being for the common good, while others look at government control as a risk for corruption and unfair competition.

Democratic socialists are said to be in favor of nationalization (O'Connor 2006). They believe that nationalization will protect the economy and ensure the quality of goods and services. Another reason for favoring nationalization is that government-owned firms are able to absorb continuing losses without the threat of closure (Gottheil 2013). An example of a country that believed nationalization would be beneficial is Mexico. In the early 1900s Mexico was making moves towards nationalization, which was welcomed by companies and workers. Twelve countries had nationalized by 1930 (Cavendish 2002). That was only the beginning. Nationalization of companies in Mexico grew at a rapid pace after that and continued into the late 20th century. Mexico also saw economic growth for a good portion of time. Things were looking up for a while. However, things began to change in the 1970s. Faith was lost in nationalization. In response, Mexico's president pushed for more government intervention in hopes to strengthen Mexico's economy even more (Cavendish 2002). Unfortunately, there was much resistance from companies and Mexico began to move towards privatization.

In contrast to democratic socialists, capitalist are opposed to nationalization. The United States is a capitalist country. Another country that has opposed nationalization is Germany. Germany believes that nationalization is a push toward communism, and would rather have government "guidance" instead of government control (Stathakis and Vaggi 2006). Germany was aware that too much government regulation could carry major consequences, including corruption, inefficiency in production, and the creation of oligopolies (Gottheil 2013). For those reasons, a policy of laissez-faire, without government regulation, is more desirable.

Nationalization was not very popular from the late 20th century until the recent global financial crisis. Before the crisis there was no talk of nationalization of major banks like Citigroup and Bank of America. Even if it were proposed, it would have been brushed off for being naïve, not feasible, or lacking of theoretical basis

(Cahill 2014). However, these perceptions have changed a great deal since then. After the global financial crisis, it is not uncommon to hear talk of instilling more government regulation of huge banks. In fact, some banks have actually become nationalized; however, to assume these conditions are permanent would be foolish. Nationalization has had an impact in many countries but that does not mean it is there to stay. Political and economic views are constantly changing from year to year, and from country to country, so there is no surprise that views on nationalization have changed throughout the years, too.

NEW TRADE THEORY

The new trade theory starts with the observation that while traditional trade theories explain some of world trade they also miss much. The new trade theory was developed in part by Paul Krugman, who won a Nobel Prize for his work on "new trade theory" and "new economic geography." While his Nobel Prize was awarded in 2008, his work on new trade theory (NTT) was done more than three decades earlier.

New trade theory suggests that there are critical factors in determining international patterns of trade that up until now have been left out, such as economies of scale and network effects. Economies of scale and network effects can be so significant that they can outweigh the more traditional theory of comparative advantage. For example if two countries have no discernible differences in comparative advantage opportunity costs in a specific industry, there will be no trade between the two in that sector. But if one country specializes in this particular industry and gains economies of scale it will benefit from its specialization. As a result of these economies of scale advantages, one country will now have an advantage and can become dominant in the market, which will likely limit competition and could eventually lead to a form of monopolistic competition. NTT further suggests that government intervention has a role to play in promoting new industries or to protect existing industries in order to offset this unfair advantage, especially in cases where countries wish to support growth of key industries. It is further argued that if an industry receives support for a few years it may be able to exploit economies of scale and then be competitive without government support.

In order to understand NTT it may be helpful to briefly discuss traditional trade theories. Early trade theory began with the Ricardian model by David Ricardo (1817), which identifies gains from trade between two countries based on comparative advantage. The Heckscher-Ohlin Trade model (HO model, 1919) builds on comparative advantage by adding factors of endowment, stating that each country has various levels of inputs (factors), some abundant and some scarce, and trade will be most beneficial when using abundant factors.

The Stolper-Samuelson theorem (1941) builds on the HO model, stating that increases in the price of goods will raise income earned by factors that are used intensively in its production. Classical Trade Theories also included International Product Life Cycles (Ray Vernon 1966) that explain the evolution of manufactured goods and technology and how production and consumption of inputs change over time.

Traditional trade theory argues that countries gain from exporting those goods and services that they are relatively good at producing while importing goods and services that other countries are relatively good at producing, but actual trade patterns do not match the theory. NTT explains why intra-industry trade has grown between developed nations that do not fit in traditional theories. While NTT suggests the importance of government intervention, the idea of government supporting new industries is controversial. Many economists believe governments are likely to have poor information about which industry to support and how to go about it, in addition to potentially creating powerful private businesses that rely on state support to remain competitive in the world market, which may encourage inefficient allocation of resources in the long run.

In the early 21st century a "new new trade policy" (NNT) emerged. This new new trade policy was based on the earlier works of Krugman and Melitz exploring a shift in international trade. NNT goes beyond the new trade policy and looks at individual firms and links trade opportunities with the firm's productivity. Firms must commit significant resources to compete in foreign markets, and there are many risks that are not present in domestic trade, such as lack of information in foreign markets, exchange rate risk, and foreign market regulatory uncertainty. NNT recognizes the resistance in some developed nations to let traditional trade models operate as expected. This new approach to trade offers new insights by analyzing public attitudes toward protectionism for specific industries instead of looking at sentiment toward traditional free trade principles.

NORTH AMERICAN DEVELOPMENT BANK

The North American Development Bank (NADB) was created by the governments of the United States and Mexico in a joint effort to preserve and enhance environmental conditions and the quality of life of the people living along the U.S.–Mexico border. NADB was created alongside a sister organization, the Border Environment Cooperation Commission (BECC). The NADB concentrates on project financing and oversight for putting projects into place. In short the NADB is in charge of the money.

The NADB was created interdependent, but it works as a team with BECC. The NADB was created in San Antonio, Texas, and started its operations on November 10, 1994. The NADB's mission is to serve as a bi-national partner and catalyst with the goal of enhancing the operation and financing of border infrastructure to promote a cleaner and healthier border environment.

The NADB is made up of nine sections with the board of directors being the very top of the other eight sections. The NADB helps local governments and other projects sponsors put in place sound financial and business practices in hopes of creating well-managed debt financing. There are limits imposed on NADB projects, such as they must be within an area 62 miles north of the U.S. border and 186 miles south of the Mexican border. The NADB plays a role in improving many aspects of life along the U.S.–Mexico border, these aspects include water, waste management, cleaner and renewable energy, air quality, industrial/hazardous waste, and energy efficiency.

Originally the NADB was focused on wastewater treatment. Since treated wastewater amounts have increased, NADB has changed its focus to the development of renewable energy and transportation infrastructure to improve air quality. These new projects have led the NADB to the edge of its lending capacity. To accomplish these projects the NADB needs funding and capital, which it gets from both the U.S. and Mexican governments. Together the two countries pay the NADB $3 billion a year—both countries pay $225,000 in capital and they each give $1,275,000,000 in callable capital. Callable capital is a guaranty for any bonds issued by the bank to raise funds in the capital markets for its lending program. Recently, to raise investments, the NADB created a plan to merge with its sister organization, the BECC; it believes this merger will give it more resources to work with, as well as more support, but this plan still has to be agreed upon by both the U.S. and Mexican governments. Recently the NADB and BECC have been forced to rapidly expand due their own success and the changing nature of the challenges facing the border regions.

The NADB is an organization that has been trying to improve the U.S.–Mexico border region, environmentally and economically, since 1994. The NADB plays a role in both the U.S. and Mexican governments, and by helping both their border regions it is improving the well-being and happiness of their citizens, as well as improving the economies of local governments.

NORTH AMERICAN FREE TRADE AGREEMENT

On January 1, 1994, trade in North America took a significant step toward more open trade and globalization. The North American Free Trade Agreement (NAFTA) created a trilateral trade bloc between the United States, Canada, and Mexico. NAFTA is the second-largest trade bloc in the world behind the United States–European trade bloc. NAFTA impacts more than 460 million people and is the largest trade bloc in land size. NAFTA's combined GDP is calculated at $21.81 trillion GDP (based on purchasing power equity). The Council of Foreign Relations reports NAFTA's regional trade in 2016 at $1.1 trillion, up from $290 billion when NAFTA began in 1993. NAFTA has three headquarters: Washington, D.C.; Ottawa, Canada; and Mexico City, Mexico.

The roots of NAFTA are grounded in the Canada–United States Free Trade Agreement (CUSTA). In 1988 CUSTA was ratified and initiated in 1989. Following CUSTA lengthy negotiations began on creating a trilateral trade agreement. U.S. President George H. W. Bush, Mexican President Carlos Salina de Gortari, and Canadian Prime Minister Brian Mulroney ceremonially signed the North American

Free Trade Agreement in San Antonio, Texas, on December 17, 1992. However, NAFTA would not become an official trade bloc until each nation's legislature or parliament had approved the agreement.

Approval by the three governments was not a foregone conclusion, especially in Canada and the United States. Canadians were never very pleased with NAFTA's predecessor, the Canada–United States Free Trade Agreement. In the 1993 Canadian election, more people voted against free trade than for it. But the two separate parties opposing free trade split the votes, leaving the party of free trade proponents with the ability to pass NAFTA. However, the Canadian story was not quite finished.

In the United States, although NAFTA had many supporters, there was a very vocal anti-NAFTA contingent led by labor unions and environmental groups. When President George H. W. Bush lost his reelection bid to Bill Clinton in 1992, the future of NAFTA in the United States became doubtful. Bill Clinton's major support during his candidacy had come from labor unions and groups opposed to NAFTA. His election made it a real possibility that NAFTA might lose support.

Back in Canada, the political landscape had also changed regarding NAFTA approval. Prime Minister Brian Mulroney had been replaced by the more conservative Kim Campbell. But in the 1993 election, Canadians chose Liberal Jean Chrétien as their new prime minister. Between the new U.S. president and the newly elected Canadian prime minister, NAFTA's survival was in serious doubt. However, President Clinton and Prime Minister Chrétien negotiated two new addenda to NAFTA. One was the North American Agreement on Environmental Cooperation, to protect the environment and force companies doing business in Mexico to adhere to environmental standards as if they were in the United States. The second addendum was the North American Agreement on Labor Cooperation, aimed at protecting U.S. labor, especially union labor, with the right to join a union and the right to collective bargaining. With these two addenda added, both Canada and the United States approved NAFTA, and on January 1, 1994, the economic landscape of North America took on a whole new, globalized look.

The aim of NAFTA as the trade law of North America was to break down the trade and investment barriers between Canada, the United States, and Mexico. Since virtually all trade between the United States and Canada was already free of barriers, when NAFTA took effect on January 1, 1994, the first noticeable effect was the elimination of U.S. tariffs on approximately one-half of the United States' imports from Mexico, and the removal of Mexican tariffs from approximately one-third of Mexico's imports from the United States. The window for total elimination of U.S. and Mexican tariffs was 10 years, or 2004, with the exception of some U.S. agricultural products, for which the timeframe was set at 15 years. NAFTA also addressed the sensitive issue of protecting intellectual property and removing all nontariff barriers to trade.

With the elimination of many, if not all, of the tariffs between the United States, Canada, and Mexico, trade between the nations definitely increased for many products, from durable goods such as automobiles and televisions to agricultural products such as corn and meats. Imports and exports increased across all the borders.

Has the North American Free Trade Agreement been a positive or negative for the U.S. economy? Judging by the pure amount of trade between the three nations, NAFTA has been very successful. Regarding environmental or labor issues, judging the success or failure of NAFTA depends on which side of the issue one is speaking. Some jobs have been lost in the U.S. labor market, but others have been created. Environmental groups would argue environmental standards have not been upheld and the United States has exported its environmental issues to Mexico. Certainly, NAFTA has changed the way business is conducted in the three nations. The age of globalization makes it very likely that NAFTA will continue to set the rules of trade and investment between the United States, Canada, and Mexico.

O

ODIOUS DEBT

The concept of *odious debt* refers to determining who is responsible for illegitimate uses of capital. When the dictator of a regime uses state funded money to finance inhumane activities, wars or a personal gain considered illegitimate, the question becomes who must pay for this debt in the subsequent governments. Commonly, odious debt is defined as, "contracted against the interests of the population of a State, without their consent, and with awareness of the creditor" (Jubilee 2008). There are numerous challenges with the practical application of odious debts in law and the topic is still debated on the international level.

The concept of odious debts has taken form throughout history surrounding the issue of debt responsibility as a political regime changes. In 1898 it was said that after the Spanish-American War, Spain took responsibility of the debts under the American claims that neither the United States nor Cuba should be responsible because the debt was incurred by the colonial rulers without the permission of the Cuban people. In the 1920s, Soviet Union debt incurred by a previous regime without the benefit of the people that it was meant to serve was refused (Kremer 2003). Today odious debt tends to occur after a coup of a previous dictatorship where the prior regime financed war or inhumane activities.

The controversy surrounding this type of debt is the difficulty to enforce, especially across multinational laws. International courts of law have limited power in ruling against nations who have their own autonomous systems. The other problem is that many of these nations receive funds from third-party creditors and while odious debt may be claimed on a prior regime it may also be a condition those same third-party lenders are the ones who could finance the restructuring and rebuilding of the succeeding government. So while poor decision-making can be at the center of the debt, the actual financing may have existed from a creditor who also assists in the rebuilding of countries.

This paradox specifically has a restrictive impact on third-world nations and the foreign aid they receive. This occurs when the foreign aid of a new regime in a third-world country then has to be used in the repayment of the previous debt.

Due to the financial abilities of Western nations there are many criticisms of foreign aid policies. The criticism exists that foreign aid boosts creditors and keeps the money with first world industries rather than actually being used to create positive change in the third-world nations that use them, thereby creating a larger dependence on foreign goods and aid.

These theories represent the third aspect of what creates odious debt. It requires creditors to be aware of the misappropriation of the funds but proceed with the loan anyway (Gulati 2010). By knowingly supplying funds for malicious purposes creditors are thereby partially responsible for the debt. This distinguishing factor helps bridge the gap between odious debt and illegitimate debt (which is more actionable through law). The difficulty of lawful action is first in the ability to prove fraudulent knowledge from lenders. Second, where will the money to pay back this debt ultimately come from? Last, because these inequities occur on the international level, legal action is difficult and government actions such as sanctions are also often ineffectual because funds and frequently weaponry are consistently supplied in spite of the sanctions. Movements to create actionable results with the intention to punish these debts and aid in rebuilding nations have been weak because of these challenges.

OFFSHORING

Offshoring is the practice of moving a business practice within a company to another country or to another business in a different country. Oftentimes, the term offshoring is paired with the term outsourcing—the practice of moving an internal process to an external business. Outsourcing can occur within a country's borders; offshoring implies a change in country. It is possible to both outsource and offshore. For example, a company in the United States could subcontract IT work to a company in India.

David Ricardo's idea of comparative advantage is often cited when businesses choose to offshore or outsource. Companies specialize in the good or service they can produce at the lowest opportunity cost and trade for everything else. The increased amount of trade brings greater satisfaction to all participants.

Advocates of offshoring cite the promotion of free trade and therefore positive global political relations, an increased number of jobs within the destination country, lower costs and increased choices for consumers in the host country, and an increase in both countries' gross domestic product (GDP). Offshoring also helps to alleviate shortages for specific highly skilled jobs. For example, several U.S. companies have complained that they are unable to hire workers from the global talent pool because they have limited access to working visas. It is possible that offshoring allows a firm to decrease its costs and thereby increase the demand for its products. This increased demand may then increase the demand for skilled workers in tasks that have not been outsourced. As long as labor remains cheaper abroad, offshoring remains a smart cost-cutting choice and the new normal.

When least cost production occurs within a country's borders it does not draw much attention. Offshoring, however, draws controversy as it goes beyond a country's borders. Critics state that offshoring promotes job losses and a downward wage trend in developed countries and the low wages of jobs created in foreign countries. In addition there are concerns of foreign government manipulation of currency to only create an illusion of comparative advantage gains. Offshoring raises concerns for displaced unemployed workers and their cost on the social safety net. In addition, there are many ethical questions when the health and safety or environmental standards differ greatly between the two countries.

There is an impression that large numbers of Americans have lost their jobs to outsourcing. Research, however, points that this is true for some highly visible large manufacturers but not for jobs in services, health care, public agencies, and small firms that are domestically oriented. Much of the offshoring activity of businesses in the United States is to Canada and Western Europe, which are the largest and oldest trading partners that have investments themselves within the United States.

Other factors also influence the success of offshoring. The large communication infrastructure led to growth of IT offshoring within English-speaking India for U.S. companies. Companies with strong patent systems, culture connections, collaborative relationships with universities abroad, and the advantage of trade associations like NAFTA or CAFTA, are more likely to offshore.

OHLIN, BERTIL

Born: April 23, 1899, in Klippan, Sweden; Died: August 3, 1979, in Are, Sweden; Nationality: Swedish; Professional Interests: economist, politician, international trade, monetary policy, political economy, Nobel Prize (1977); Major Work: *Interregional and International Trade* (1933).

Bertil Ohlin was a well-known early 20th-century economics professor, lecturer, and well-known politician in Sweden during the period of World War II. Awarded the Nobel Prize in 1977, Ohlin is famous for his work in international trade and monetary policy. He was professor at University of Copenhagen and Stockholm Business School. Ohlin became a member of the Swedish Parliament in 1938 and served as leader of the Liberal Party in Sweden. Ohlin died in 1979.

Bertil Gotthard Ohlin was born on April 23, 1899, in Klippan, a village in southern Sweden in an upper-middle-class family of seven children. He attended the University of Lund to study mathematics, statistics, and economics, the latter of which became his expertise. He obtained the degree *fil kand*, the equivalent of a bachelor of arts, after two years of study in 1917 under Smil Sommarin. Intrigued by the writing of Eli Heckscher about the economics of the world war, Ohlin decided to take up studies at the Stockholm Business School. He studied there for two years before moving to the philosophy department at Stockholm University under the teaching of Gustav Cassel and Gosta Bagge.

Ohlin became a member of the Political Economy Club, formed in 1918, a group of trained economists that met to discuss theories and opinions about scientific work in economics. In 1922, he visited Cambridge, England, with a stipend from the Swedish-American Foundation. The following year, Ohlin attended Harvard University, where he received his master's degree in 1923. He returned to Sweden and received his doctorate degree under Cassel as adviser in 1924 from Stockholm University. Later that year he accepted the position of assistant professor at the University of Copenhagen with the aid of his teacher at Stockholm, Heckscher, in 1925. He taught there until 1930 when he moved back to Sweden to succeed Heckscher at the Stockholm School of Business where he would remain until 1965.

Ohlin's expertise led him to prepare a report titled *The Course and Phases of the World Economic Depression* for Geneva in late 1931. He also gave a lecture at the

Nordic Economic Conference in 1931 about combining deficit financial and monetary policies to help remedy the world depression.

In 1933, Ohlin published his most well-known work, *Interregional and International Trade*. In this work, Ohlin discussed the international trade problem, expanding on the work of Heckscher about foreign trade and distribution of income. Ohlin asserted that trade between economies works based on the price systems relative to the labor and capital resources of nations and its comparative advantages. According to Ohlin's work, nations will export goods that use relatively cheap and abundant resources, while importing goods in which capital and labor resources are relatively more scarce. Some economists believed Ohlin was exaggerating Heckscher's work, a claim that Ohlin disputed. Together their ideas became known as the Heckscher-Ohlin model, widely used by economists to analyze international trade.

By invitation, Ohlin delivered the Marshall Lectures at Cambridge in 1936. He encapsulated the Swedish theory of economics, making considerable connections to the work of John Maynard Keynes. Parts of his lectures were published in 1937 in the *Economic Journal* in an article titled "The Stockholm Theory of Saving and Investment." By 1938, Ohlin's political involvement accelerated by his membership into the Riksdag, the Swedish parliament. As World War II was erupting, his scope turned from scientific to political.

In 1944, Ohlin became leader of the Liberal Party, the opposition to the Social Democratic Party in Sweden. During his tenure as leader, he was a regular contributor of articles to leading Swedish newspapers. Ohlin served as the minister of trade from 1944 to 1945. His conviction with the Liberal Party did come into conflict with the more classical liberal views of his former teacher Heckscher. Ohlin asserted in his writings to Heckscher that among his motivations for loyalty to the Liberal Party were to help the poorest. Ohlin remained with the Liberal Party, which leaned toward social reform measures, the opposite of free-market economics, but he was not favorable toward the nationalization of industry in Sweden. He remained a member of the Riksdag until 1970, afterward returning lecturing and scientific work in monetary theory and international economic problems.

Ohlin published nearly 1,200 articles during his career. He was awarded the Sveriges Riksbank Prize in Economic Sciences in Memory of Alfred Nobel in 1977 jointly with James E. Meade for their contributions to international trade and monetary policy.

Bertil Ohlin died on August 3, 1979, in Are, Sweden.

OPEN ECONOMY

In the 1930s, during the Great Depression, it was common for countries to close their borders and eliminate the movement of goods, capital, and labor. Countries were trying to protect themselves from risk. The effort to isolate themselves proved to be catastrophic, and ultimately worsened the global economy, and contributed to World War II (Gerber 2014, 244). Open economies, as opposed to closed economies, have a history of providing more desirable outcomes.

One of the goals that most countries have in common is to achieve economic growth. A way to move toward that goal is to have an open economy. An open economy is defined as an economy that participates in the trading of good and services with other countries (Rodseth 2000). Open economies interact freely with other countries. International trade has proven to be a driver for economic growth. By using the theory of comparative advantage, countries with open economies are able to successfully trade and grow. The idea that open economies are more beneficial is not a new concept. Adam Smith, an economist in the 18th century, was a huge advocate for free trade and open economies. Smith spoke out against the common practice of mercantilism and opposed the belief that trade resulted in a zero-sum game (Magnusson 2015). A zero-sum game simply means that one country gains from trading and the other suffers a loss. Smith explained that this concept was not true, and in fact, both countries involved can benefit from free trade.

No country has a completely open economy. Most countries have monetary policies in place in an effort to strengthen their economies; and no country gives completely free access to all of its markets. Besides the obvious implementation of tariffs, there have been a number of organizations that have affected open economies and international trade. After World War II, there was a proposal to create an organization to set rules for international trade, business practices, and foreign investment. The organization proposed would have been called the International Trade Organization (ITO), but the idea of the ITO was shot down by the United States (Gerber 2014, 20). Despite being rejected, many countries liked the idea and proceeded to find ways to reduce tariffs that were restricting free trade. Reducing these tariffs was a move toward open economies. The General Agreement on Tariffs and Trade (GATT) has been a successful force in reducing tariffs and promoting free trade since

1950 (Gerber 2014, 21). After the idea of the ITO was abandoned, the GATT was implemented as a way for countries to negotiate and eliminate trade barriers in an effort to increase support for free trade. These sessions of negotiations are called trade rounds. A particular trade round worth noting is the Uruguay Round, which began in 1986. The Uruguay Round is significant because it led to the establishment of the World Trade Organization (WTO) in 1995; which has played a continuing role in international trade since its founding (Martin and Winters 1995, 2).

Even though there is evidence that suggests open economies are more efficient and beneficial for a country, there is still some opposition. It is difficult to transition from a closed economy to an open economy because the transition not only affects a country as a whole, it affects individuals too. There is a risk of harm to some domestic industries and unemployment. It is important for a country to have a stable economy before making the change from a closed economy to an open economy. Those countries with stable economies will have a higher chance of success when converting to an open economy.

ORGANISATION FOR ECONOMIC CO-OPERATION AND DEVELOPMENT

The Organisation for Economic Co-operation and Development (OECD) is a 34-member intergovernmental organization that collects and analyzes statistical data, discusses global trends and issues, and forms binding and non-binding economic and social policies. The OECD, originally called the Organisation of European Economic Co-operation (OEEC), was established in 1947. The OEEC's primary mission was to administer the Marshall Plan, a massive U.S. and Canadian aid package designed to rebuild Europe after World War II. In 1961 the Organisation for Economic Co-operation and Development (OECD) replaced the OEEC. The original OECD consisted of 20 signatory nations. The OECD charter identified key goals for member nations, including sustainable economic growth and employment, international trade, rising living standards, financial stability, and economic development. The OECD charter also pledged support for policies to promote the process of economic development in non-member countries. The OECD headquarters, and secretariat, are located in Paris, France.

OECD membership consists of 34 countries. OECD member countries are required to maintain a functioning market economy and democratic political institutions. Originally, the OECD was composed exclusively of advanced economies. Membership has expanded to include a number of emerging market and developing economies from Asia, Latin America, and Eastern and Central Europe. OECD member states hold a dominant position in the global economy. OECD per capita gross domestic product (GDP) is $40150 compared to $750 per capita of least developed countries (LDCs).

The OECD is a global forum for discussion and policymaking on issues or problems broadly related to sustainable economic development. The OECD, often in consultation with non-member countries, devises binding agreements and nonbinding agreements. OECD members are required to comply with binding agreements. Examples of binding agreements include the OECD Anti-Bribery Convention, the OECD Code of Liberalization of Capital Movements, and the agreement on National Treatment for Foreign Controlled Enterprises. OECD members are expected, but not required, to adhere to the organization's nonbinding agreements. One important nonbinding agreement is the OECD Guidelines for Multinational Enterprises. This document outlines certain expectations for transnational corporations in the areas of business ethics, human and labor rights, transparency, fair competition, respect for the environment, and other areas of corporate social responsibility. Nonbinding agreements are sometimes called "soft" agreements because compliance is voluntary. Multilateral surveillance and peer pressure are the most significant enforcement mechanisms for member and non-member countries that sign OECD agreements. The OECD's binding and nonbinding agreements help define "best practice" in today's rules-based global economy.

The OECD also promotes sustainable economic development through its 23-member Development Assistance Committee (DAC). The DAC coordinates foreign aid from 22 major donor countries and the Commission of the European Communities. Neither the OECD nor the DAC collects money or extends loans or grants to recipient nations. Most of the DAC foreign aid is distributed in the developing world to support pro-growth programs and projects, which ranged from peacekeeping activities to infrastructure construction. Underpinning DAC aid is the understanding that recipient nations, ultimately, must accept responsibility for their own development.

ORGANIZATION OF PETROLEUM EXPORTING COUNTRIES

The Organization of Petroleum Exporting Countries (OPEC) is an 11-member producer cartel comprising major petroleum-producing countries. A producer cartel is a formal agreement between or organization of producers, in this case oil producers, which coordinates and harmonizes production decisions by member states. OPEC was founded in 1960. Since 1982, the OPEC cartel has increased or decreased the supply of petroleum by assigning each member country a production quota, or production ceiling. OPEC's collusive behavior increased its power to influence the price of petroleum in global petroleum markets.

In March 2000 the OPEC oil ministers established a price range of $22 to $28 per barrel as the official target price for a "basket" of seven crude oils. The announced OPEC basket price range, and the assignment of subsequent production quotas, attempted to stabilize the volatile oil market. The OPEC basket price range was abandoned in January 2005 as prices soared, topping $70 per barrel in August 2005. According to the U.S. Energy Information Agency, OPEC controls about two-thirds of the world's proven petroleum reserves.

The composition of OPEC has changed over the past several decades. OPEC was formed on September 24, 1960, in Baghdad, Iraq. OPEC's five Founding Members were Iran, Iraq, Kuwait, Saudi Arabia, and Venezuela. OPEC was established mainly to present a united front against giant oil companies, which, up to 1960, dictated oil prices to the oil-producing nations. In the mid-1970s, OPEC membership peaked at 13 nations, with Qatar (1961), Indonesia and Libya (1962), the United Arab Emirates (1967), Algeria (1969), Nigeria (1971), Ecuador (1973), and Gabon (1975). Ecuador and Gabon withdrew from OPEC in 1992 and 1995, respectively, leaving the cartel with 11 full members. Membership is open to countries that are capable of exporting petroleum in quantity and that share certain core values and interests with existing member nations.

OPEC's organizational structure consists of the OPEC Conference, a board of governors, a secretariat, and a number of committees and commissions. The conference is OPEC's highest authority. At its semi-annual meetings, the conference forms the cartel's policies and acts on other recommendations made by the board of governors. The conference consists of delegations from member nations, each headed by the nation's oil minister, or minister of oil, mines, and energy of member countries. The board of governors is the second tier in OPEC's structure. The board of governors attends to the day-to-day operation of OPEC and implements the policies and resolutions of the conference. The board of governors also proposes the annual budget and makes recommendations to the conference on matters of concern to the cartel. The board of governors consists of representatives from each member nation. The secretariat is OPEC's administrative and research hub. The secretariat serves as the cartel's headquarters, and is located in Vienna, Austria. The secretary-general heads the secretariat. The secretariat is funded by mandatory contributions from each member nation.

The OPEC cartel has been a dominant player in global petroleum markets for decades. Over the years, the use of production quotas has successfully bolstered oil prices, especially when members complied with agreed upon production ceilings. OPEC has also used oil as a political weapon. For example, OPEC slapped an oil embargo on the United States in 1973–1974 in protest over U.S. support for Israel during the Yom Kippur War. The power of OPEC has wavered over the years, however. Cracks in the cartel's armor appeared regularly. Most breakdowns in OPEC's unity have stemmed from faltering oil prices and subsequent cheating on assigned production quotas. Over time, volatile oil prices have created periods of boom and bust, which aggravate underlying tensions among member nations. Disputes over production quotas, for example, contributed to the withdrawal of Gabon and Ecuador from OPEC during the 1990s. Rumblings of dissatisfaction were also heard in Indonesia and Nigeria in the early 2000s. Cheating by member nations in the late 1990s contributed to oil's free fall in 1999 when the price dipped to just $11 per barrel. In contrast, greater OPEC unity and rising demand for petroleum increased the price of oil to more than $70 per barrel in the summer of 2005.

Despite the oil-price spike in 2005, long-term projections indicated a moderating in oil prices. Checks on OPEC's power include the availability of substitute primary energy sources, such as natural gas and coal; new, less expensive extractive technologies; increased production capacities among OPEC members; and the rise of additional non-OPEC oil production in West Africa, Russia, the Caspian Sea, deep-water areas in the Atlantic Ocean, and elsewhere. According to OPEC, as of 2014 it still controlled 81 percent of the world's crude oil reserves at 1.2 billion barrels.

OSTER, EMILY

Born: February 14, 1980, in New Haven, Connecticut; Nationality: American; Professional Interests: development economics, econometrics, health economics; Major Works: "Hepatitis B and the Case of the Missing Women" (2005), "Sexually Transmitted Infections, Sexual Behavior, and the HIV/AIDS Epidemic" (2005), "Hepatitis B Does Not Explain Male-Biased Sex Ratios in China" (with Gang Chen, Xinsen Yu, and Wenyao Lin) (2010), *Expecting Better: Why the Conventional Pregnancy Wisdom Is Wrong—And What You Really Need to Know* (2013).

Emily Oster is an American economist best known for her unorthodox analysis of data and her innovative use of economic tools. In 2002, she published her groundbreaking PhD dissertation, "Hepatitis B and the Case of the Missing Women," earning a great deal of publicity and notoriety. After later analysis, she retracted her initial thesis in the publication "Hepatitis B Does Not Explain Male-Biased Sex Ratios in China" (2008), and her peers praised her response. Oster has also researched, published, and lectured extensively about HIV in Africa as well as other health and social issues. She is an associate professor at the University of Chicago Booth School of Business and remains a respected authority with great promise and potential within the profession.

Emily Fair Oster was born on February 14, 1980, in New Haven, Connecticut. Her parents, Sharon M. Oster and Ray C. Fair, are both Yale economists specializing in the regulation of business and business strategy and econometric models that show how the economy helps to determine elections. At a young age, Oster's parents noticed that she continued talking after they tucked her into bed. Young Oster became the subject of the book *Narratives of the Crib* (2006), wherein researcher Katherine Nelson analyzed the taped monologues of the two-year-old Oster. Nelson's analysis offered insight into the psychology of early childhood. Oster went on to graduate magna cum laude with a BA in economics from Harvard in 2002. She continued on to earn her PhD in economics in 2006. She earned a Harvard graduate fellowship (2003–2005) and then an International Security Program fellowship from the Belfer Center Kennedy School of Government (2005–2006). In 2006, she was a Becker fellow as part of the Initiative on Chicago Price Theory at the University of Chicago. She began as an assistant economics professor at the University of Chicago in 2007, and then became an assistant professor in the Business School in 2009, before becoming associate professor in 2011.

Oster believes economics provides a powerful set of tools for understanding how the world works. In her dissertation "Hepatitis B and the Case of the Missing Women" (2005), Oster offered an explanation for why 100 million women were statistically missing from the developing world. Well-known economist Amartya Sen had previously claimed that this occurred due to poor medical care and sex-selected abortions. Oster's work analyzing medical data indicated that countries with higher hepatitis B infections produced more boys and accounted for 50 percent of the missing females. Later research from Avraham Ebenstein concluded that sex-selective abortion accounts for most of the male-heavy data for nonfirstborn children. Oster retracted her initial thesis in "Hepatitis B Does Not Explain Male-Biased Sex Ratios in China" (2010), which has been praised for demonstrating integrity within the profession.

Oster's continued work centered on HIV infections in Africa. She questioned the known facts about AIDS to determine a more effective use of public policy. Oster compares health and mortality as an economic investment with costs and benefits. In places where mortality is high due to problems such as malaria and high maternal mortality, public policy campaigns to change personal behavior to prevent AIDS are unsuccessful. Rather than focusing singularly on pet projects such as the abstinence-oriented plan used in Uganda, she advocates a more effective and multitargeted use of policy resources. In addition, she outlines the connection between exports and economic activity with increased new HIV infections, again suggesting that this knowledge can help policy makers make better use of their limited resources. Oster continues to investigate minority social issues such as the role of menstruation and school attendance for African females.

Oster is also noted for her innovative thinking and analysis of other atypical topics for economists such as Powerball lotteries, witchcraft, weather, and economic growth in Renaissance Europe. She has appeared in Ted Talks and worked since 2006 as a faculty research fellow for the National Bureau of Economic Research. Oster continues to write about numerous public policy issues with an emphasis on health and women's issues.

OUTSOURCING

Outsourcing is the practice of moving an internal business process to an external business. Oftentimes the term outsourcing is paired with the term *offshoring*, the practice of moving a business practice within a company to another country or another business in a different country. Outsourcing can occur within a country's borders. Offshoring implies a change in country. It is possible to both outsource and offshore. For example, a United States company could subcontract IT work to another company in India.

David Ricardo's idea of comparative advantage is often cited when businesses choose to offshore or outsource. Companies specialize in the good or service they can produce at the least opportunity cost and trade for everything else. The increased amount of trade brings greater satisfaction to all participants.

Outsourcing is a cost savings strategy. Businesses may choose to outsource when an outside company or vendor can provide the same good or service at a lower cost. It allows businesses budget flexibility and control using labor or specialized staff only when needed.

Outsourcing also comes with some costs. Firms who outsource report concerns of loss of security or exposure of confidential data. Employees no longer have a long-term financial interest in the well-being of the company. Workers themselves face a loss of job security. They are employed for only the length of the contract or particular job they agreed to. Outsourcing can also potentially contribute to the loss of taxes and domestic jobs within a country. It is also cited as a reason for loss of bargaining power for outsourced workers.

The informational technology (IT) industry has seen much outsourcing as foreign workers from India or China are able to perform the job tasks at significantly lower labor costs than workers within countries like the United States. Outsourcing is also possible because of technology gains from the Internet and the flexibility of working hours for the labor force.

OWNERSHIP-LOCATION-INTERNALIZATION THEORY

The Ownership-Location-Internalization (OLI) theory, also known as the eclectic paradigm, provides a framework to analyze a company's decision to undertake foreign direct investment (FDI). The basic assumption is that firms will avoid transactions in the open market when internal transactions carry lower costs. OLI is a further development of the internalization theory by John H. Dunning, based on the transaction cost theory.

The OLI model combines different theories of international economics into one. Based on three factors or advantages (the ownership, locational, and internalization advantages) three distinct forms of international undertakings can be determined: licensing, exporting, and FDI.

Ownership-specific advantages (OSA) refer to the competitive advantages, such as trademarks, production methods, returns to scale, and entrepreneurial skills, of the enterprises seeking to engage in foreign direct investment (FDI). A multinational enterprise (MNE) operating a plant in a foreign country faces additional costs in comparison with local competitors. The additional costs could be explained by cultural, legal, institutional, and language differences and also by the lack of knowledge about local market conditions or the increased costs of operating at a distance. Therefore, to be successful in another country, a foreign firm must have competitive advantages that can overcome those additional costs. Either the MNE is able to earn a higher level of revenue for the same level of costs, or have a lower level of costs for the same level of revenue, than competing domestic firms.

Location advantages refer to the existence of raw materials, cheap labor, and favorable taxes or tariffs in specific countries or regions. The less mobile, either natural or created, resources that firms need to use, combined with their competitive advantages, the more foreign firms will choose to increase or exploit their OSA through FDI. The country-specific advantages (CSA) that influence where an MNE will invest can be divided in three categories: economic, social, and political. Economic advantages include the quantities and qualities of the productive factors, market size and scope, costs of transportation and telecommunications, among others. Socio-cultural advantages include "perceived distance" between the home and host country, language and cultural differences, and the general attitude towards foreigners and free enterprise. Political advantages include general and specific government policies related to incoming FDI, international production, and intra-firm trade. An MNE would be more attracted to a country that has a large, growing, high-income market; low costs of production; a large endowment of factors not available or scarce in the home country; political stability; favorable policies toward FDI; and cultural and geographical closeness to the home country.

Internalization advantages refer to the advantages of producing internally versus producing through a partnership agreement (licensing, joint venture). When the benefits of internalizing cross-border intermediate product markets are larger, it would be more likely that a firm will prefer to produce in the foreign country itself instead of providing a license to a local firm. Internalization within an MNE occurs to overcome market failures by replacing missing or imperfect external markets within the hierarchy of the multinational firm.

The OLI paradigm attempts to explain the existence of multinationals. The "O" factor answers why the firm goes abroad. That is, to exploit its firm specific advantages in other markets and countries; these FSAs make it possible to overcome higher costs of transacting and producing in a foreign country. The "L" factor answers where to operate. International production requires foreign factors in conjunction with the firm's specific advantages. An MNE decides where to operate by comparing different countries' locational advantages. Finally, the "I" factor answers what approach the firm uses to enter into a foreign location. There are different contractual arrangements available to an MNE, ranging from simple international trade to a 100-percent-owned foreign subsidiary, and their relative costs and benefits are compared to decide which one will be used, which certainly can change as the conditions (or advantages) vary over time. A successful MNE combines the OLI advantages to determine its network of operations, subsidiaries, and partners in a way that maximizes its market shares and growth.

P

PERESTROIKA

As the economy of the Soviet Union began to stagnate in the 1980s President Mikhail Gorbachev introduced a series of policies known as *perestroika* (restructuring). The policies introduced both political and economic changes to Soviet life. As Soviet life changed the new policies spread throughout Eastern Europe. Perestroika's changes have been credited for being the key component of ending the Cold War.

Through perestroika the Soviet Union began to change from within. Persecutions of churches ended and different religions began to appear. Travel to other countries was more available. Freedom of speech, press, and academics expanded throughout the Soviet Union as strict Marxist ideas disappeared. Elections were held in which the candidates had differing views, so that for the first time voting could make a difference.

The economy began to reform under perestroika. Governmental restrictions such as price controls that had been in place for generations were ended. A free market economy began to develop. Private businesses and markets became more the norm than the exception. Market interactions began to define the economic landscape.

Gorbachev's actions were an attempt to develop the economy of the Soviet Union like the economies of the United States, Japan, and Germany. The Soviet Union's transition did not develop as planned, however. The transition was too long in developing for many Soviet citizens and Gorbachev had to deal with uprisings of civil unrest.

While he was dealing with the changes within the Soviet borders, Gorbachev also worked to build relations with Western nations such as the United States. Perestroika spread to the Eastern European nations of the Soviet bloc such as Poland and Romania. To the dismay of his fellow Communist Party leaders, Gorbachev let the results of the free elections within these countries stand. There were attempts to have him removed from office.

In time, countries such as Poland and Romania voted the Communists out of office, ultimately toppling the Communist regimes. The dissolution of the Soviet Union was not far behind.

Perestroika contributed to the dissolution of the Soviet Union and is a major part of Russia's modern history. The social and economic reforms known as perestroika changed not only the Soviet Union but the global landscape as well. It was the beginning of the end of the Cold War.

POLO, MARCO

Born: September 15, 1254, in Venice, Italy; Died: January 8, 1324, in Venice, Italy; Nationality: Italian; Professional Interests: merchant, explorer, journalist; Major Work: *The Description of the World or the Travels of Marco Polo* (1300).

Marco Polo was born September 15, 1254, in Venice, Italy to Niccolo Polo and Nicole Anna Defuseh. While still a young boy, Marco's mother passed away and young Marco lived with his uncle, Maffeo Polo. Marco Polo's impact on economic history stemmed from his extensive reporting and records of his travels throughout Asia and China during the 14th century. Polo was the most famous early European who travelled the Silk Road.

Marco's father Niccolo and uncle Maffeo operated a successful family trading business located in Venice, Italy. The two brothers decided to go on a long trading journey to the East in 1253. Travel was very difficult and uncomfortable. They were traveling to Constantinople (now Istanbul) by ship and had to endure crowded conditions with cockroaches, lice, and rats. After a month of living in these deplorable conditions they finally arrived safely. During their stay they found Constantinople was not what they thought it would be. The economy was very poor. The two brothers wanted to return home to Venice but travel in those times was too unsafe to return home.

Sixteen years passed before the two brothers would return home. In 1271 Marco Polo left Venice with his father Niccolo and uncle Maffeo on another trading journey throughout Asia. They continued to travel throughout Asia, visiting the Indian subcontinent and Sri Lanka, among other areas.

In 1287 it is documented that the Polos traveled to Beijing, China. While in China Marco Polo became a close friend and confidant of Kublai Khan. It was during his time in China that he was first introduced to paper currency. Mercantile European economies were based on currencies made out of precious metals such as gold or silver. The idea of a paper currency backed only by the faith and credit of the government (Kublai Khan) was a new concept to a European.

Marco Polo also saw coal and asbestos being used as fuel for the first time, even though coal was not new to Europe. China's porcelain bowls and silk garments exhibited a wealth in China that Europe at the time did not equal.

Marco Polo was the first European to report on the vast wealth and power in 13th-century China. Polo recorded that China produced 125,000 tons of iron a year during the Yuan dynasty. He also marveled that the advanced transportation system in China, with its extensive canals linking China's cities. In 1277 Kublai Khan appointed Polo a tax inspector in the Chinese city of Yanzhou, a position he held for three years.

Kublai Khan was aging and the Polos believed that if they did not leave Beijing soon they may never be allowed to leave by future Chinese leaders. Eventually the Polos returned home to Italy.

In the war against Genoa in 1298, Marco Polo, who commanded a galley ship for Venice, was captured and imprisoned. While in prison he met a writer named Rustichello. Marco was able to have Rustichello write down his descriptions of his travels throughout Asia, describing his experiences and the vast economic wealth and customs of China and India. The book was published as *The Description of the World or the Travels of Marco Polo*. The book became popular in Medieval Europe, known as *II Milione* (Italian for *The Million*). Most Europeans did not believe his stories were based on facts but fictional tales.

Released from prison after the war, Marco Polo returned to Venice. He had three daughters and continued to work as a merchant for the rest of his life. Marco did not leave much wealth for his family when he died at the age of 70.

Through the centuries there have been both academic supporters of his accounts and critics who have suggested either he never travelled to China or his travels only took him to what we now call the Middle East. Many 18th- and 19th-century travelers, however, were able to confirm many of his accounts and his contributions to economic history continue to be confirmed by today's scholars.

POST-WASHINGTON CONSENSUS

The term *Washington Consensus* comes from neoliberal economic ideas that have characterized development policy since the early 1980s. The ideas of the Washington Consensus were shared by power circles in Washington, D.C., including the

U.S. Congress and president. The ideas were also shared by the International Monetary Fund (IMF) and the World Bank, both headquartered in Washington, D.C.

The organizing principle was the notion of a minimal state whose primary functions were to secure law and order, ensure macroeconomic stability, and provide the necessary physical infrastructure. The Washington Consensus has given way to what appears to be a new paradigm of development. This new line of thinking became known as the *Post-Washington Consensus* (PWC). It is a return to Keynesian economics aimed at integrating social and economic dimensions of development while paying attention to broader goals such as sustainability and challenging reliance on free market economics.

In 1989 economist John Williamson identified a set of 10 objectives of the Washington Consensus:

1. fiscal discipline;
2. redirecting public expenditure;
3. tax reform;
4. financial liberalization;
5. adoption of a single, competitive exchange rate;
6. trade liberalization;
7. elimination of barriers to foreign direct investment;
8. privatization of state owned enterprises;
9. deregulation of market entry and competition; and
10. secure property rights.

The basis of these ideas was rooted in neoclassical economics of Adam Smith's "invisible hand," the rationality of economic actors' choice, and a minimalistic vision of the states' regulation of economies.

Washington Consensus policies have been criticized since the 1990s by a significant number of leading economists. Joseph Stiglitz, the chief economist at the World Bank from 1997 to 2000, criticized the policies prescribed by the IMF in response to the financial crises in Russia and Asia. Many of the ideas associated with the so-called Washington Consensus have been discredited and a new respect for the political and social benefits of a sensible social policy has arisen. Before, the crisis policymakers tended to downplay social insurance and safety net programs in favor of strategies that emphasized economic efficiency. One outcome of this changing view has been a move away from the heavy reliance on foreign capital, and by 2008 most emerging-market countries had reduced their exposure to the foreign financial markets by accumulating large foreign currency reserves and maintaining regulatory control of their banking systems.

Another aspect of the Post-Washington Consensus has been a renewed Keynesian focus on industrial policy and strategies to develop specific industrial sectors within a country. Industrial policy traditionally has been sponsored through cheap credit, subsidies, or direct state management. This strategy addresses coordination problems and other barriers that discourage private investment in new industries and technologies. Some believe that industrial policy addresses difficulties that market forces alone are unlikely to overcome.

The success and spread of free market approach in developed countries has had a self-perpetuating effect reinforcing the view that there was no alternative. Criticism from the emerging Post-Washington Consensus represents a crack in the neoliberal thought and has led to fresh thinking and accelerated the search for viable alternatives. The question remains as to whether the Post-Washington Consensus will bring about such a change, and how quickly.

PRODUCT CYCLE THEORY

Product cycle theory was developed by Raymond Vernon in the 1950s to help explain international trade from the Heckscher-Ohlin model and the process of a product from concept of undesirability. The product cycle theory is based on a period of time divided into the phases of product introduction, product growth, maturity, and decline. There is no set amount of time for each stage, every product is different and may take more or less time in each stage than another.

The product cycle theory states that a firm will begin to establish itself locally then eventually extend to foreign countries. The goal of managing a product's life cycle is to maximize its value and profitability at each stage. At the start of a product's life firms will experiment with their products creating a higher demand. As goods are being invented and tested in markets, more time, costs, and labor are needed to design the process.

The process creates comparative advantage for those who can adapt the process quickly. As the demand grows the process enters the middle of its life cycle and it becomes more standardized, unskilled labor and lower costs can begin to take over the build, where the process can be exported and competitors can gain market shares from their process. Once the product begins to mature, sales growth begins to slow down.

The business will then have to put more and more money into marketing to further entice consumers to buy the product. Late in the cycle the product can be built or performed at minimum cost, opening up the process for the most consumption. This begins the decline and revenues will drop to the point where it is no longer economically feasible to continue making the product. The product may simply be discontinued, or it can be sold to another company.

PROTECTIONISM

Protectionism is a government acting to discourage the importing of a good or service by a company in another country. Protectionist measures can also be applied to encourage domestic production to favor a domestic industry and create a market that discourages foreign competition. Protectionism by a country can be either transparent or nontransparent. The three main forms of protectionism are tariffs, quotas, and subsidies. These are transparent types of protectionism. All three are overt means of a government to protect an industry.

Tariffs are a tax on a country's imports. Because tariffs generate revenue, they can have several uses, depending on the country imposing the tariff. Developed nations use tariffs for protective purposes. Tariffs are not as much of a protectionist measure for less developed countries (LDCs). For an LDC a tariff is usually the main source of tax revenue. Because income, consumption levels, and property values are small relative to the size of the economy, imports remain the main source of generating tax revenue.

Quotas are another form of protection limiting the number of imports. Quotas are not a tax and therefore do not generate tax revenue. As a result, they are almost exclusively instituted by developed countries to protect a domestic industry. The United States used quotas in the 1970s to protect the U.S. automobile industry from the early introduction of Japanese imports. Another form of quota is the voluntary export restraint (VER). This type of quota, as the name suggests, is the exporting nation voluntarily limiting an export to an importing nation. President

Ronald Reagan used this type of protection for the automobile industry by persuading Japan to voluntarily restrict its exporting of automobiles to the United States.

Tariffs and quotas are considered transparent protective barriers. Transparent protective measures are an overt act of the domestic government and clearly visible to everyone. Less visible types of barriers such as patents, copyrights, certain manufacturing rules, licenses, or fees are nontransparent.

Governments institute protectionism measures for several reasons. An industry might be protected because it is considered important to a nation's national defense. In addition, if an industry is young and developing, it may lobby government to be protected from the competition of more mature foreign industries or companies. A government may institute a tariff or quota to protect a specific labor group.

The politics of protectionism can be quite sensitive. A government may institute a tariff or quota in retaliation for the imposition of a similar protected measure by another country. Retaliation is a downside to protectionism. This was evident in the United States in the 1930s, with the response of the rest of the world to the passage of the Smoot-Hawley Tariff Act. When a government decides to impose a tariff, quota, or some other form of protectionism, it must take into consideration the possibility of retaliations.

The benefits of tariffs and quotas can be identified by the reason for the protective measure or the specific industry or labor group being protected, but the costs are more expansive as they are spread out among a wide number of people. This idea of narrowly focused beneficiaries against the very broad base of those paying the costs is the theory behind Mancur Olson's *The Logic of Collective Action*. Market costs of protectionism include an inefficiency of production, additional costs to domestic businesses, and increased prices to consumers. While import substitution policies of developing nations have the intent to promote domestic production, they cut off developing nations from outside trade and new technologies.

The enactment of subsidies is also a form of protectionism. Direct subsidies to producers often lead to overproduction or restricting imports from a market. These types of subsidies are implemented especially in the agricultural industry. In a global economy, the benefits and costs of subsidies are often hard to identify. While some subsidies may benefit consumers with lower prices, the lower prices hurt producers in developing countries. Yet in some developing countries, the lower world prices raise their standard of living. Economists usually measure the benefits and costs of subsidies based on a nation-by-nation study.

R

RACE TO THE BOTTOM

Race to the bottom is a concept that suggests a downward spiral of socio-economic conditions as businesses search for the lowest wages, taxes, and environmental and social regulations. Without these regulations companies move from country to country in search of the cheapest resources until they devastate all worldwide economies. The phrase was first attributed to United States Supreme Court Justice Louis Brandeis in the 1933 *Liggett Co. v. Lee* case.

One fear in regard to globalization and free trade is that governments will allow deregulation of business or taxes to keep economic activity within their borders, resulting in low wages, depraved working conditions, and little environmental protection. In the early stages, a race to the bottom can be invisible, as trade appears beneficial with low costs and increased foreign investment. As competition continues, a developing country might find it difficult to pass improved labor laws and enforce them as companies have the financial prowess to move to another country with lower standards. As a result countries are forced to enact downward leveling whereby they reduce costs through lower environmental standards, worker wages and salaries, health care, and education.

Opponents of race-to-the-bottom conditions cite the power of federal governments to enforce and enact legislation. They may also enlist the aid of international organizations that can create environmental and labor rules. Governments may enact purchasing policies on moral grounds. This involves forbidding or applying heavy taxes, tariffs, and trade sanctions to nations that permit the export of offensive goods. They may also use standard based tariffs designed to protect national standards. A product imported from a country with low labor and environmental standards faces a higher tariff upon entry.

Current research suggests that labor rights for workers fell during the 1980s and 1990s. Nations compete with one another by not enforcing labor laws. Competition between countries occurs in the lack of application of rather than compliance with what is law.

Race to the bottom theory suggests strong competition for foreign investment would encourage developing nations to lower their domestic environmental standards. Developing countries would then become regions of pollution and corruption. Interestingly nations such as the United States with the highest environmental standards seem to attract the most investment. The cost of compliance with environmental standards still remains low compared with the total cost of doing business.

Race to the bottom is not yet occurring on a large global scale that would destroy a domestic economy. The use of fair trade standards with strong regulations and controls set in place meant to protect the economy and encourage the world market can eliminate or at least cap a potential race to the bottom.

REAL EXCHANGE RATES

The real exchange rate measures the relationship of exchanging goods and services between nations. It differs from a simple nominal currency exchange rate between countries. The technical formula for determining the real exchange rate involves the currency exchange rate, as well as the domestic prices for the good or service in each nation.

As an example, assume that the existing nominal exchange rate between the United States and the European Union is $1.15 U.S. dollars to €1.00 European euros. Further assume that Belgian beer can be purchased for €2.50 and American beer for $2.65. In a simple example the real exchange rate would be calculated by using the following formula:

$$(\text{nominal exchange rate} \times \text{domestic price}) \,/\, \text{foreign price}$$

Or, put into numerical form, the real exchange rate would be:

$$[(\$1.15 \,/\, €1.00) \times €2.50] \,/\, \$2.65 = 1.085$$

As a result, while the nominal exchange rate above is 1.15 the real exchange rate is 1.085. While the above example provides uncomplicated calculations, and therefore a relatively clear demonstration of how to calculate a real exchange rate as well as how it differs from a nominal exchange rate, in real world application calculating the real exchange rate is far more challenging.

The first issue is that the real exchange rate does not apply to a sole good as demonstrated in the above example. Instead, it should use a basket of goods that, in theory, should relate to the total goods and services that an individual consumer is likely to consume in the ordinary course of life. The challenge with this is that individuals do not all buy the same goods and services. Each of us has different tastes and goals impacted by a number of variables, which include, but are not limited to, socio-economic background, education, age, and health status. As a result, the creation of a basket is to some degree subjective.

A second consideration deserving attention is added transaction costs. Examples of these would include transportation costs, trade barriers such as tariffs, and local taxes such as sales tax. These added costs would need to be added to the cost of a good in the above calculation.

In theory the real exchange rate and the nominal exchange rate should be in relative equilibrium to one another. If that were not the case, an arbitrage situation would exist and informed investors would apply Gresham's Law by purchasing the overvalued currency and using it to acquire goods in other countries. Such a strategy would be short lived, however, as market forces in a floating exchange rate world would quickly react and nominal exchange rates would move towards reestablishing equilibrium.

Real exchange rates are of increasing interest to economists and private sector participants as the modern world continues toward deeper global economic integration. Thanks to technology, increasingly sophisticated methodologies are being used to create and measure baskets of goods and services. The result of these efforts has been to identify purchasing power parity (PPP) among various nations. PPP is an offshoot of real exchange rate theory, and it attempts to measure the true purchasing power of various currencies.

The real rate of exchange is, and will continue to be, an important area of interest and research in today's globalized world. It has important ramifications for international policy by such organizations as the World Trade Organization and the International Monetary Fund, domestic governmental policies, and also for multinational private sector businesses. It is also an area where, because of new possibilities in the areas of data collection and processing now available through technology, new research and insights are likely to be discovered and developed well into the future.

REGIONAL TRADE AGREEMENTS

A regional trade agreement (RTA) is an agreement that creates preferential trade concessions among member countries. The most common form of trade preference is the reduction or elimination of tariffs. RTAs promote regional economic integration by dropping trade barriers. Many RTAs also promote regional integration by establishing common standards or protocols governing labor rights, environmental protection, foreign investment, and fair competition. RTAs include multilateral and bilateral trade agreements. In many cases, RTAs establish a trade bloc, which cements preferential trade and investment concessions among members. Membership in a trade bloc is often limited to countries located in a certain geographic region, such as Europe, North America, South America, or Southeast Asia. The World Trade Organization (WTO) identified about 416 RTAs in the world economy as of February 2016.

RTAs are categorized by level of economic integration. The World Bank identifies four RTA categories, including the free trade area, customs union, common market, and economic and monetary union.

A free trade area is a trade bloc that eliminates trade barriers among members but permits individual members to devise their own restrictions on imports from non-member nations. Many regional trade blocs are organized as free trade areas. Examples of free trade areas include the North American Free Trade Agreement (NAFTA), ASEAN Free Trade Area (AFTA), and Economic Community of West African States (ECOWAS). Steps toward creating a U.S.-Central American Free Trade Agreement (CAFTA), and an even more expansive Free Trade Area of the Americas (FTAA) among the 34 democracies of the Western Hemisphere, were also underway during the early 2000s. Ranked by combined gross domestic product, NAFTA, which comprises Canada, Mexico, and the United States, is the world's largest free trade area.

A customs union creates a free trade zone for members and a common external trade policy with non-member countries. The common external tariff (CET) is a custom union’s most visible external trade policy. A CET requires RTA members to levy the same import tariffs on goods entering the customs union. Examples of a customs union include the Southern Common Market (MERCOSUR) and the Andean Community, each of which evolved from a free trade area to a customs union in the early 2000s. MERCOSUR comprises Argentina, Brazil, Paraguay, and Uruguay. The Andean Community comprises Bolivia, Colombia, Ecuador, Peru, and Venezuela. All Andean Community member nations, except Peru, implemented a CET in 2004.

The final two categories of RTA require progressively larger degrees of economic integration. A common market expands on the common internal and external trade policies of the custom union by opening national borders to other resource flows—especially labor and capital. An economic and monetary union completes the process of regional economic integration by establishing a common currency and a variety of common policies related to banking and finance, investment, labor standards and mobility, agriculture, energy, tourism, foreign aid, and other economic activity. Over time, the European Union (EU) evolved from a free trade area, to a customs union, to a common market, and finally to an economic and monetary union. Today, the EU is the most highly integrated RTA in the global economy. In 2002 the euro replaced the national currencies of 12 of 15 EU countries. On May 1, 2004, an EU enlargement brought 10 more countries into the EU family, expanding the EU from 15 to 25. Nineteen of the 25 EU countries use the euro as their national currency.

The causes of the growth of RTAs are varied. One factor is the reintegration of former Soviet republics and Eastern bloc countries into the global economy. Another is the explosion of RTAs among different classifications of countries, such as North-North agreements, North-South, and South-South. Nearly every country in the global economy belongs to at least one RTA. Developing countries, on average, belong to five RTAs. The web of RTAs is complex, even cumbersome, for some countries.

RTAs have also stirred some controversy because trade and investment preferences in RTAs are inherently discriminatory against non-member countries. Yet, the WTO, the global guardian of free and fair trade, tolerates certain trade and investment preferences. The WTO's Article 24 permits preferential trade arrangements among members as long as RTAs do not impose additional trade restrictions on non-member nations.

ROSTOW, WALT W.

Born: October 7, 1916, in New York City; Died: February 13, 2003, in Austin, Texas; Nationality: American; Professional Interests: National Security Advisor, 1966–1969; Major Work: *Rich Countries and Poor Countries: Reflections on the Past, Lessons for the Future* (1987).

Walt W. Rostow was a prominent American development economist and economic historian. He pioneered the linear stages theory of economic development and staunchly supported free enterprise solutions to development problems. Rostow was born in New York City, the son of Russian immigrants.

After earning his doctorate from Yale University (1940), Rostow began a distinguished career in teaching and public service. Rostow taught economics at Columbia University, the Massachusetts Institute of Technology, and the University of Texas. He also served as a top advisor to former U.S. presidents Kennedy and Johnson. Rostow's most influential book, *The Stages of Growth: A Non-Communist Manifesto* (1960) was written during his tenure at MIT.

In *The Stages of Economic Growth* Rostow identified five development stages. As an economic historian, Rostow generalized about countries' linear progression from one stage of economic development to the next. He recognized, however, that unique features within countries could disrupt an orderly progression toward economic development. Underpinning Rostow's linear model was a premise that free markets, self-interest, and profit incentives would set developing countries on the right path toward modernization. Rostow offered his linear development model as an alternative to Marxist theory, which stressed class struggle as the impetus for economic change.

Rostow's five stages of development included the traditional society, preconditions for take-off, take-off, drive to maturity, and age of high mass consumption. The first stage, traditional society, is dominated by small-scale subsistence agriculture. Limited technology and capital goods, and parochial attitudes, block substantive gains in productivity and economic growth. The second stage, preconditions for take-off, features advances in technology, capital formation, entrepreneurship, institution building, and commerce. Business activity during this transitional stage grows parallel to, but does not replace, society's dominant agricultural base.

The third stage, take-off, is defined by industrialization, technological advances, aggressive entrepreneurship, and expanded commercial opportunities. Modernization and economic growth dominate the take-off stage. In the fourth stage, the drive to maturity, scientific and technological advances are widened to all realms of economic activity. Entrepreneurs, motivated by profit incentives, expand production to meet society's rising wants and needs. The fifth stage, the age of mass consumption, is marked by capital-intensive enterprise, rising productivity, and higher real incomes. Higher incomes and expanded social programs improve people's standard of living. This journey toward economic development could take hundreds of years to complete.

Interest in linear development theories has faded over time. Later development economists dismissed the linear model as being too rigid. Instead, they searched for underlying obstacles to economic development and strategized about how to speed progress toward economic growth and human development. However, Rostow's pioneering work in the field of development economics jumpstarted a wider, ongoing development debate.

RUSSIA: GENERAL ECONOMY

Russia's economy has changed and transformed dramatically over the past few decades. The Soviet Union government took Russia from an agriculturally-based economy to an industrial giant. However, since the collapse of the Soviet Union in the early 1990s the Russian economy has experienced some severe setbacks as well as successes. Russia's economy is largely dependent on exporting oil. When oil prices fall significantly the Russian economy falls proportionately.

Before it became part of the Soviet Union, the Russian economy was largely dependent upon farming. When Soviet leadership took over it set Russia in motion to produce chemicals, construction materials, machine tools, and steel. It set quotas for workers to meet and told them where their goods were to be sold. Although this pushed the economy to a more modern, better level, the oppression of the Soviet government discouraged new ideas and creativity.

After the collapse of the Soviet Union, Russia's economy was in complete disarray. The new government set up a better banking system and allowed the Russian currency, the ruble, to be exchanged internationally for the first time. When the government lifted the price controls in 1992 prices rose sharply while incomes remained unchanged, putting many goods out of the reach of the Russian people reach. Russia's economy is largely fueled by its abundance of natural resources. It has some of the world's largest forests, massive mineral deposits, extensive farmland, and many sources of energy. Manufacturing is mainly in the eastern, more developed part of Russia and plays an important role in the stability of the economy. The nation's capital, Moscow, is the central location of manufacturing. The oil refining industry is an extremely important one in Russia. It is largely set in the Volga River–Ural Mountains region. The paper industry is on the southern edge of the forests in Russia, obviously playing another important role in the economy.

Russia's economy began to flourish in the early 2000s. An increase in the income tax of 13 percent gave the economy a siginificant boost. Between 2000 and 2008 Russia's gross domestic product (GDP) grew 7 percent annually. The number of people living in poverty dropped from 30 percent to 14 percent. Although inflation remained a rising concern, the World Bank, in a rare decision, declared Russia stable in 2007.

After 16 years of negotiation Russia was accepted into the World Trade Organization in 2011. The World Bank also declared Russia a high-income economy. In 2012 Russia continued to realize the need to diversify its economy because of its dependence on oil and gas. It wanted to expand its technology sector. In 2013 the Russian GDP in United States dollars was over $2.1 billion.

After the annexation of Crimea in 2014 the Russian economy began to experience a downturn. In response to the annexation, the United States, the European Union, Japan, and Canada put restrictions on Russia's financial, energy, and defense sectors. The restrictions on the financial sector led to the decline of the ruble. In 2014 although the Russian GDP grew by only 0.6 percent, but growth was higher than expected. However, the economy decreased by 4.6 percent through the first two quarters of 2015. The value of oil had also dropped making it cheap in countries such as the United States. Oil went from $104 a barrel to below $50 a barrel, severely hurting the Russian economy. The Russian economy continues to fluctuate depending largely on the price of oil.

S

SACHS, JEFFREY

Born: November 5, 1954, in Detroit, Michigan; Nationality: American; Professional Interests: environmental sustainability, economic development, globalization; Major Works: *The End of Poverty: Economic Possibilities for Our Time* (2005), *Escaping the Resource Curse* (with Macartan Humphreys and Joseph E. Stiglitz) (2007), *Common Wealth: Economics for a Crowded Planet* (2008), *The Price of Civilization: Reawakening American Virtue and Prosperity* (2011), *To Move the World: JFK's Quest for Peace* (2013).

Jeffrey Sachs is an American academic in the field of political economics. He is best known for his work on developing international economies and alleviating poverty while promoting sustainability with respect to the environment. He has worked to affect change in economic policy and well-being in developing countries across the world. His work transforms the theoretical into the practical, and his writing is recognized by both scholars and the general public. He writes a monthly newspaper column appearing in over 80 countries. Sachs is widely considered the leading international economic adviser of his generation.

Jeffrey D. Sachs was born on November 5, 1954, in the Detroit, Michigan, suburb of Oak Park. He completed his undergraduate degree at Harvard College in 1976 and earned both an MA and a PhD in economics at Harvard University by age 28. He spent the next 22 years as a professor of economics at Harvard, most recently as the Galen L. Stone Professor of International Trade. He also served as Harvard's director of the Center for International Development. During his early years as a student and then professor at Harvard, he concentrated mostly on the problems of the developing world.

A turning point in Sachs's career came after he attended a lecture on Bolivia's problem of hyperinflation. Sachs was invited to visit Bolivia to explore the problem further. From the moment he arrived in the South American country, his worldview was altered and his priorities shifted. His experience in Bolivia prompted him to help the Bolivian government tighten its budget to avoid taking on less new debt while simultaneously negotiating debt forgiveness. Sachs determined that countries cannot be coerced to repay debts without political and civil consequences. He also advised the Bolivian government to implement shock therapy fiscal and monetary policies to quickly eliminate the burgeoning monetary chaos.

Economic shock therapy, first championed by Milton Friedman, is a process of using fiscal and monetary policies to combat the government's over-involvement in the economy. While Friedman's model promoted rapid privatization of all public industries, Sachs's model did not see government programs as the villains. Sachs's model claimed that a quick shock to a nation's monetary system could jump-start development in a very short period of time.

After his work in Bolivia, Sachs was invited to nations and organizations around the world as a special adviser. He worked with Poland to transition from a command economy to a capitalist economy after the fall of communism. Using the same method of shock therapy, the nation was able to achieve great success. When he worked with other Eastern European nations to achieve the same goal, success was not always clearly achieved; for example, Russia saw devastating effects when he helped them take the same course of action. In Asia, he helped rapidly developing nations such as India and China design economically and environmentally sustainable development solutions. In Africa, he has focused his attention on eradicating communicable diseases, which prevent citizens from contributing as productive members of society.

Some of the most important work of Sachs's career has been in conjunction with the United Nations where he has served as special adviser under UN secretaries General Ban Ki-Moon and Kofi Annan. From 2002 to 2006, he was director of the UN Millennium Project. The Millennium Declaration, signed in 2002, asserts that every individual has the right to dignity, freedom, equality, and a basic standard of living that includes freedom from hunger and violence while encouraging tolerance and solidarity. The purpose of Millennium Goals is to create practical ideas to improve infrastructure and increase social, economic, and political rights, improving quality of life. The project dedicates the resources of the UN to eight goals, with 21 targets to be met by the year 2015. In this role, Sachs has been able to implement his theories focused on debt reduction and the link to poverty elimination. By convincing the G8 governmental political forum to provide funds to the World Bank and International Monetary Fund, the UN has been able to help the poorest countries channel their money into health and education initiatives rather than paying off debt. Funding for the project has come in the form of aid from the many developed UN member nations. While the goals are considerable and the obstacles are numerous, Sachs maintains the optimistic conviction that extreme poverty can be eliminated worldwide.

Sachs left Harvard in 2002 to become the director of the Earth Institute at Columbia University and to serve as their distinguished Quetelet Professor of Sustainable Development. In this role, he creates and promotes large-scale efforts to mitigate human-induced climate change. Through the Earth Institute he works with developing nations to simultaneously develop their economy while protecting their environment. He also founded a not-for-profit group—the Millennium Promise Alliance—aimed at ending extreme poverty.

He has twice been named as one of *Time* magazine's 100 most influential leaders. He has been called the most important economist in the world by the *New York Times*. Currently, he continues to serve at Columbia University as the director of the Earth Institute and the distinguished Quetelet Professor of Sustainable Development.

SCHENGEN AGREEMENT

The Schengen Agreement is an accord put in place originally by five member states of the European Economic Community to eliminate customs and passport control at shared borders. It was signed in the town of Schengen, Luxembourg, in 1985. The five countries that originally signed the agreement were Belgium, France, Germany, Luxembourg, and the Netherlands. The agreement serves to create more efficient movement of labor, goods, services, and capital across borders. It has also demonstrated a level of trust between member nations. The burden of customs and immigration control is shifted to the outside area—in this case, the outside border of the European Union territory. This agreement was instrumental in creating the foundations set out by the Delors Report, which came to be accepted in 1987 as the Single European Act.

These foundations set the stage for the European Union and its members' unified market approach. In 1999, the Schengen Agreement was incorporated into European Union Law. The Schengen Agreement was an example of changes that would help complete the internal market as set out by the Delors Report. This sort of international cooperation, trust, and communication eventually led to the Maastricht Treaty, the inception of the European Central Bank, the implementation of a single currency (the euro), and the European Union as we understand it today.

The Schengen Area is made up of 26 countries. Liechtenstein, Iceland, Norway, and Switzerland are non-European Union members that are a part of the Agreement.

Further, there are 6 EU members that are not a part of the Schengen Agreement: Bulgaria, Croatia, Cyprus, Ireland, Romania, and the United Kingdom.

The challenges of the Schengen Area are mainly the control and organization of such a large area. Within that, there are security concerns. For this reason, the United Kingdom and Ireland chose to abstain from the agreement. As members of the European Union, countries must extend the rights of all other EU citizens to travel freely and reside inside their borders, even as they maintain passport checks at the border. Another challenge of the agreement is creating a strong, cohesive data system that can be accessed across the large region. The Schengen Information System enables enforcement organizations to share data on missing persons, stolen items, and court proceedings. The United Kingdom and Ireland participate in this aspect of the Schengen Agreement.

The elimination of passport control and customs reduces time and restrictions on movement of labor, goods, services, and capital. These freedoms of the Single European Act aimed to combine Europe's many markets into one unified Free Trade Area. The potential gains from market unification should be experienced through expanded trade. In particular, the Schengen Agreement reduces transportation costs and inefficiencies. The increase in production capabilities and the free flow of labor forces should lead to greater competition and should therefore strengthen the consumer economy. Concurrently, the harmonization of regulations and standards allows for lower risk and greater versatility in international trade, which should strengthen the overall economy of the area.

The Schengen Agreement has come under pressure due to emerging terrorist threats. Concurrently, the security of the area has been challenged by issues of how to respond ethically to refugee crises. Under the Schengen Agreement, the entry of migrants to the European Union is largely the responsibility of the external borders of the zone. The recent expanse of illegal immigrations has called for greater cohesion from the European Union to strengthen the external borders against illegal migration. As a condition of the European Union and Schengen Agreement, there are commonalities on the treatment of asylum-seeking refugees from conflict zones. As such, this has been a difficult issue to control. The agreement does allow a signatory reimplementation of border and passport controls for 10 days initially and then a renewal of 20 days for public policy or national security reasons. However, it is clear that the impetus is to keep open borders within the area and that these measures should be used only as a last resort.

SILK ROAD

The Silk Road, or Silk Routes, was one of the first and most influential trade routes in history. It represented some of the first interaction and exchange of cultures, technologies, art, languages, goods, and ideologies between the West and the East. The passages transcended empires and dynasties and reflected the mutually beneficial components of international trade—for example, it brought to the West the invention of paper as an effective mode of transcribing history. Similarly, glass manufacturing spread east into China from the Islamic world. The Silk Routes traversed an incredible amount of geographical space: traveling through China around both the northern and southern borders of the Taklimakan Desert, diverting south into India and further west across modern day Kyrgyzstan into Northern Iran and across the Middle East to the Mediterranean Sea and across Turkey into Europe.

The Silk Road is formally described as existing between 130 BCE, when the Han Dynasty opened trade to the West, to 1453 CE, when the Ottoman Empire closed trade to the West. However, the Silk Road's conception and practices can be traced back to earlier accounts. During the Achaemenid Empire, from 500 to 330 BCE, a postal and communications route called the Persian Royal Road stretched from the Mediterranean Sea to modern-day northern Iran, which would later become an integral part of the Silk Road. The conquests of Alexander the Great spread to this region and left behind a legacy of a hybridized Greco-Bactrian culture. Meanwhile, in the East the Qin Dynasty had brought the Chinese states together, unifying the language and the system of governing. The Qin Dynasty had frequent conflicts with the Xiongnu tribe (who became the Huns) of the northern Taklimakan Desert, and the Qin Dynasty started construction of the Great Wall to deter its adversaries. Upon collapse of the Qin Dynasty, the Han Dynasty continued efforts against the Xiongnu tribe. Similarly, the regions of modern-day Pakistan and Afghanistan had come under the control of the Yuezhi people, who had been forced out of their homelands by the Xiongnu tribe. Under the leadership of Zhang Qian, the Han Dynasty decided to try to collaborate with the Yuezhi in order to defeat the Xiongnu. While the intended purpose of these missions was largely unsuccessful, the acquired knowledge and discoveries to the West inspired the Han Dynasty to pursue further missions and signal the formal beginning of the Silk Road.

The name "Silk Road" comes from later research on these early trade routes. It is largely due to the popularity of silk cloth in the Roman Empire that succeeded Ancient Greece. Chinese silk became extremely popular and even controversial for its extravagance in Roman culture. However, the true value of the Silk Road was the spread and hybridization of early cultures and technologies. Trade itself was not extensive, despite its legacy; the real exchanges that took place along the Silk Road were those of people. Refugees, artists, craftsmen, missionaries, bandits, and many others traveled the Silk Road, all sharing the reach of technologies and ideologies. Along the route, many smaller kingdoms welcomed these displaced peoples with tolerance. This dynamic led to collaborative and highly educated people coexisting and spreading Buddhism, Manicheism, Zoroastrianism, and later Islam and Christianity. The Silk Road reached its heights during the Tang Dynasty. However, its influence withered as new sea routes were developed and Chinese Ming and Qing Dynasties adopted more isolationist policies.

More recently, the Silk Road has experience a revival. Discovery of oil beneath the Taklimakan Desert and trade partnerships between Russia and former Soviet states have led to the redevelopment of Silk Road routes. In addition, technological advances in road building, rail systems, and infrastructure have allowed China to revisit the traditional routes. In 2015, China proposed to create a high-speed rail line to Iran through Kazakhstan, Kyrgyzstan, Uzbekistan, and Turkmenistan. This comes as a part of the One Belt, One Road initiative, which aims to increase China's economic connectivity. Along with the 21st Century Maritime Silk Road initiative, One Belt, One Road appears to connect with Iran as a major trade partner for the Chinese economy and open up a mutually beneficial trade between the two nations, centered on the transference of energy, oil, goods, and people. However, the traditional Silk Road was not heavily traveled for the purpose of commerce. The Silk Road legacy came about because the people who travelled it brought their cultures and way of life to the new land. Whether the modern-day Silk Route succeeds in restoring trade in Asia remains to be seen.

SINGLE CURRENCY AREA

Single currency areas form when a group of countries share the same currency. A good example of this is the European Union's (EU) euro zone. The euro zone consists of a group of countries that are a part of the EU and have adopted the euro as a common currency; however, not every country in the EU has met the criteria to be a part of this monetary union. Currently, 19 countries have adopted the euro as their official currency (Adam and Douglas 2016).

There are several reasons why a country may desire to share a common currency with other countries. Being a part of a single-currency area can help do away with transaction costs. For example, having a single currency reduces deadweight loss caused by currency transactions and exchanges (Ricci 1997, 9). Out-of-country transactions are easier, and they do not have an additional cost when both countries use the same currency. In addition to a reduction in transaction costs, single-currency areas benefit from efficiency gains because there is no threat of changing exchange rates and price changes due to transaction costs (Ricci 1997, 9). Adopting a single currency helps build trust between countries because of the reduced threat of exchange rates. Without exchange rates, the process of buying and selling between countries in a single currency area is very simple and easy. For example, a resident of France can travel to Germany and make a purchase without exchanging any currency.

Developing countries can benefit from being a part of a single-currency area because doing so can increase their credibility (Gerber 2014, 237). Developing countries are not viewed as stable; so by adopting a common currency, like the euro, the country will have a better chance of becoming developed and more stable. Despite the benefits that come with single-currency areas, there is a downside. Countries that adopt a common currency give up the ability to have their own money supply and they can no long influence economic growth (Gerber 2014, 237). Those countries will grow only as fast as the other countries that share that common currency.

How do countries determine whether sharing a common currency is beneficial? Certain conditions have been determined by Robert Mundell, who developed the theory of optimal currency areas in the 1960s (Blejer et al. 1997, 7). According to Mundell, there are four conditions that should be met when determining if a country will benefit from adopting a common currency.

1. The country that is considering adopting another country's currency should have an aligned business cycle; that is, the economies should be entering recessions and expansions around the same time (Gerber 2014, 238). This is important because if all countries are on the same timeline there is more potential for the countries to grow. One country in the single-currency union going through a recession may be detrimental to other countries.
2. There should be a high degree of capital and labor movement (Gerber 2014, 238). This is so these two elements can leave and be used in other countries.
3. The country entering into the monetary union must be open to regional polices that may develop (Gerber 2014, 238). These policies exist to help with imbalances of the movement of labor and capital.
4. The country adopting the currency must be willing to harmonize more than just free trade (Gerber 2014, 238). The adopting country needs to be open to harmonizing and integrating economic and political goals, in addition to the free movement of goods and services.

SOVEREIGN WEALTH FUNDS

In times of financial crisis, most countries would like to have their own highly liquid financial assets. These government savings are called sovereign wealth funds (SWF). A more formal definition of a sovereign wealth fund is a government-owned fund that is invested outside the home country (Truman 2014). As a result of the Asian crisis of 1997–1998, many countries started to increase their SWFs as a way to remain as stable as possible, because countries lacking in these financial assets seemed to suffer the most (Gerber 2014). The increasing number of SWFs can be looked at as a government's effort to cope with severe financial hardships. A good example of this is Singapore's position during the 1997–1998 Asian crisis: Singapore had large quantities of liquid financial assets on hand, and that proved to be very helpful during that time (Clark, Dixon, and Monk 2013).

There are different types of SWFs, and they come from different sources. It is important to keep in mind the effect that SWFs have on a country's economy, and how these funds are regulated. The idea of government savings seems like a good one, but in order for a country to have these savings, the assets have to come from somewhere. A number of sources can contribute to SWFs. These sources include capital inflows, fiscal budget and revenue surpluses, and privatization receipts (Das, Mazarei, and Van Der Hoorn 2010). All of these sources are means to increase government reserves. Having these reserves helps in reducing the impact of financial crises. Being in the position to use financial assets in the event of a crisis can be very beneficial for a country. Since there has been much growth of SWFs, they are now more diverse than in previous years. There are four different categories, including stabilization funds, pension reserve funds, reserve investment corporations, and development funds (Das, Mazarei, and Van Der Hoorn 2010). Stabilization funds are a means of stabilizing the economy in the event of a financial crisis. The purpose for the pension reserve funds are for pension liabilities. Reserve investment corporations help with the cost of foreign reserves. Finally, development funds are investments in the domestic economy.

Due to the great influence that SWFs have on the economy, they are regulated in the same way as hedge funds and private equity funds. One example of SWF regulation is the Securities Exchange Act of 1934 (Epstein and Rose 2009, 117). They also must abide by antitrust laws and other securities laws. In addition, SWFs are highly regulated and always reviewed by the Committee of Foreign Investment in the United States (CFIUS) and the Foreign Investment and National Security Act of 2007 to ensure that national security is not threatened (Epstein and Rose 2009). If it is found that an SWF could impact national security in a negative way, the CFIUS can make the SWF address their concerns before going forward. There has been some skepticism toward SWFs, and some public figures have called for more regulation of them. Some fear they are a danger to the capitalist economic system (Epstein and Rose 2009, 119). In recent years, the International Monetary Fund and the U.S. Treasury have been looking more closely at the SWFs, and it would be no surprise to see more regulation in the future.

SPAIN: GENERAL ECONOMY

Spain's current economy has overly emphasized the services sector in an effort to spur economic growth. In 2015 it was estimated that almost three-quarters of Spain's economy relied on the services sector, with only one-quarter relying on agriculture or industry. Additionally, Spain has had very liberal pension, national health, and tax policies. Spain's eventual economic contraction would not have been hard to predict. In 2009 the economy contracted almost 4 percent, and continued to do so—until it recorded positive growth in 2014.

During the 16 years prior to 2015, Spain had a consistent annual growth trend. Spain's major industrial production included textiles and apparel, metals and metal manufacturers, chemicals, shipbuilding, tourism, machine tools, and automobiles—along with food and beverages. Spain's agricultural production is just as diverse, with grain, olives, wine grapes, sugar beets, beef, pork, poultry, fish, and dairy products. Approximately one-third of Spain's goods are exported. Exports maintained their levels during the financial crisis, even creating a trade surplus in 2013,—the first trade surplus since 1986.

From approximately 2000 to 2007, Spain experienced widespread growth, credit, and expansion. Immigration accounted for about 80 percent of Spain's population growth. Attracted by a housing and construction boom and large tourist sectors, immigrants came from around the European area. Spain's economic growth continued for 14 years, and the fiscal position improved approximately 3.7 percent.

The number of real estate transactions increased to almost 1 million in 2006 and 2007. House construction increased at a rate of 2.7 percent per year—an increase in housing units from 18.3 million to 25.1 million.

Beginning in 2008, the global housing bubble had reached Spain. Construction and real estate contraction were the two main reasons for Spain's debt accumulation. By 2009, the Spanish banks had accumulated significant amounts of bad debt, and socialist government policies made the recession worse.

Investors stopped buying financial products related to mortgages. To improve the situation created by this financial crisis, the Spanish government needed to cut its spending by 60 percent to address a growing budget deficit and an accumulated government debt problem. In 2011, after a change in government leaders, significant debt reduction and bank regulation reforms were instituted. Spanish banks were also helped by a significant loan from the European Union. In 2014, Spain achieved its biggest increase in GDP since the recession began in 2008.

To restabilize the economy, Spain's government implemented a number of reforms. First, the pension system gradually increased the retirement age from 65 to 67. Spain's government approved the age increase by a two-thirds vote. Second, the government established labor reforms to improve labor contracts, working hours, and wages. Third, collective bargaining reform helped increase the development of firms' level of collective bargaining and permitted firms to opt out of collective bargaining agreement under certain circumstances. This policy was aimed at decreasing the unemployment rate by reallocating 4 percent of the total labor force that had become unemployed as a result of the housing market crash. Product market policies were aimed at increasing corporate tax rates to 20–30 percent.

Spain has been able to lower its borrowing costs since 2012, and its government has been able to reduce inflation in 2013 too far into deflationary territory in 2015 (–0.6%).

Saving the nation's banks has also helped the economy. Most banks, private and government, had suffered harsh casualties as a result of the housing market collapse. Government banks, known as *cajas*, historically had stuck to areas where they knew their clients, making their loan ratios very low and helping them avoid the use of shareholders. These government banks, which were preferred by customers, tried to compete with the private banks and their loan ratios reached levels that were too high. As a result many Spanish banks were merged or recapitalized.

In summary, the economy of Spain shows that deep financial crisis tends to produce a sovereign debt crisis. Spain's government recovered from this crisis by lowering the costs of public programs and increasing foreign direct investment, yet these solutions have also created new problems with slower growth and deflationary expectations.

SPECIAL ECONOMIC ZONES

Special economic zones (SEZs) are geographical areas within a country's national borders where business and trade laws and special economic regulations differ from the rest of the country. These policies are typically related to investment, taxation (such as tax incentives and lower tariffs), trading, quotas, and customs and labor regulations. Customs administration, improved fiscal administrative environment, and a more accessible and reliable infrastructure are also benefits of SEZs. The zones overcome barriers that limit investment in the whole economy, including restrictive rules, poor governance, inadequate infrastructure, and limited and insecure access to land.

Usually, the goal is to encourage businesses to establish within an SEZ, attempting to attract export-oriented investors and foreign direct investment (FDI), in particular. The benefits offered to the firms are the gains that can be realized by producing and trading goods at a globally competitive price.

In this way, the country hopes to bring about increased trade, increased investment, job creation and effective administration, foreign exchange earnings, economic diversification (often as a step in the processes of industrialization and industrial upgrading), and access to foreign manufacturing technology and know-how.

The SEZs were a key component of trade and investment policy in countries shifting away from import-substitution and in favor of integrating into global markets. SEZs were designed to attract investment in labor-intensive assembly and manufacturing from multinationals.

The results have been mixed. SEZs have been an important instrument for economic growth and structural transformation in some countries, particularly in East Asia. At the same time, there have been many failures of SEZs, where investments in infrastructure became underutilized "white elephants," or where zones have mostly generated an industry taking advantage of or dependent on tax breaks without achieving the expected employment or export goals.

Furthermore, in many cases short-term successes have failed to remain sustainable once labor costs have increased or when preferential trade access stops being an advantage. (A case in point is the end of the Multi-Fiber Arrangement, or MFA, which allowed bilateral quota restrictions on textile and apparel imports, usually between a developed nation and a developing one; the arrangement ended at the end of 2004.) SEZ failures can be the result of a variety of factors. Very often, SEZs are still affected by the same problems as the rest of the country: inefficient and corrupt customs, burdensome bureaucracy, and unreliable utilities—all of which discourage investment. Additionally, more general competitiveness challenges—like weak national governance, policy instability, and low productivity levels—typically constrain the potential of these zones.

At first, the activities within an SEZ were limited to manufacturing, restricting opportunities for investing in the key services sector, in particular for middle-income and even low-income economic growth. The design tended to create an enclave separated from the rest of the national market, severely limiting its potential to develop effective domestic linkages. Finally, traditionally the model depends heavily on unsustainable fiscal incentives to attract investment.

As a result, SEZs now cover larger land areas, offer greater flexibility for services and other nonmanufacturing activities (including residential and tourism development), and include a greater mix of export and domestic-market focused activities.

SPECIFIC FACTOR MODEL

The Specific Factor Model attempts to explain the relationship between different cost factors. Its origin can be traced to David Ricardo's writings in *The Principles of Political Economy and Taxation* (1817). Ricardo's concept was further refined into what is now termed the Specific Factor Model by University of Chicago economist Jacob Viner in the 1920s and 1930s. The model also served as a foundational forerunner to the Heckscher-Ohlin Theorem developed in the 1930s and the Stolper-Samuelson Theorem developed in the 1940s.

The basic presentation of the theory by way of example is to imagine two distinctly different industries that use machinery that can be used only to make each industry's product. For example, assume that one industry brews beer and the other industry makes baseballs. The beer machinery, which includes large vats, can be used only to make beer; it cannot be used to make baseballs. Likewise, the machinery that takes cork and leather and yarn and sews them all together to make a baseball cannot be used to brew beer. The financial capital that was expended to create these machines is not mobile, since they can be used only in the manufacture of a single specific product.

Next, as an additional part of the model, assume the existence of a third input that, instead of being unique to just one industry, is perfectly mobile and can move effortlessly between the two. The classic example of this would be labor. Further assume that labor can be employed incrementally in the production of either product, but the productivity of each incremental unit of labor will occur subject to the law of diminishing returns.

These various logical assumptions naturally lead to important observations. One is that there is a point at which each specific industry can no longer profitably add more labor. Since added labor becomes more costly per unit produced, due to diminishing returns on that labor, marginal profits begin to diminish. Thus, eventually the additional marginal costs eliminate any remaining profits, and maximum rational production is reached.

Another important conclusion to be drawn from the model occurs when the selling price of one of the two products increases while the selling price of the second product remains unchanged. The impact of the price increase will be to create additional marginal profits. This, in turn, will cause the producers of the first product to seek additional labor in order to actualize the opportunity to take in more profit. The increased demand—and likely increased wages as well, to act as an incentive—will cause a portion of the available labor to shift away from the second product and to the first product.

Aside from theory, the general principles of the model can be demonstrated empirically by historical observations. During much of the 19th century, Europe was rich in labor supply while at the same time constrained in land. In contrast, the United States was short of adequate labor supply and over-endowed with land resources. The result of this situation, consistent with the features of the Specific Factor Model above, was that labor wages in Europe were low and were unable to rise beyond a certain point. In contrast, wages were much higher in the United States due to a shortage of labor combined with an abundance of financial capital and natural resources. The long-term natural consequence of this situation would be for mobile labor to eventually transfer from Europe to the United States. In fact, this actually occurred. In the mid-19th century there was significant migration from Western Europe to the United States, particularly from Ireland. During the latter part of the century, significant numbers of eastern and southern Europeans, as well as Asians, immigrated to the United States.

In a well-ordered and fluid world, the Specific Factor Model is helpful in explaining international resource allocation and price behavior. It also suggests that over long periods of time, differences in the pricing of variable cost factors such as labor will converge due to migration transfers. However, this process is never assured, due to a range of potential factors, including war, political and legal barriers, and cultural issues. While the latter 19th century was a time of great convergence, wars and depressions from 1914 through 1945 severely interrupted any convergence forces. Ultimately, the implications of the Specific Factor Model are helpful in understanding international pricing and investment disparities, and they also help to explain long-term shifts in such variable production factors as labor and financial capital.

SPENCE, MICHAEL

Born: November 7, 1943, in Montclair, New Jersey; Nationality: American; Professional Interests: job market signaling model, Nobel Prize (2001); Major Works: *Market Signaling* (1974), *The Next Convergence: The Future of Economic Growth in a Multispeed World* (2011).

Michael Spence is perhaps most notable in the 21st century for his job market signaling model, for which he, along with George Akerlof and Joseph Stiglitz, received the 2001 Nobel Prize in Economics. In *Market Signaling* (1974), Spence examines the information exchange between employees and employers. He argues that employees signal their skills to employers via their education credentials, and employers are willing to pay higher wages to more-educated employees because it is assumed that greater education correlates with greater ability. His current work on economic policy in emerging markets, the economics of information, and the impact of leadership on economic growth led to his appointment of chairman of the independent Commission on Growth and Development, where he served from 2006 to 2010.

A. Michael Spence was born on November 7, 1943, in Montclair, New Jersey. Spence grew up in Canada during and after World War II until leaving for college in the United States. His father was a member of the War Time Prices and Trades Board based in Ottawa, the Canadian version of wartime price controls. Spence graduated from Princeton University in 1966 with a degree in philosophy; he went on to study mathematics at Oxford University as a Rhodes Scholar before he received his PhD from Harvard University in 1972. Spence is also the former dean of the Stanford University Graduate School of Business and is a professor of economics at New York University's Stern School of Business.

Spence began his work on job market signaling in his doctoral thesis, for which he was awarded the David A. Wells Prize for outstanding doctoral dissertation at Harvard University in 1972. His market signaling model essentially led to more research and literature in the branch of contract theory. According to Spence, marketplace signals exist so that people with a high-quality product in the marketplace will have lower costs of emitting the signal than people with a low-quality product. In this model, Spence shows how qualified workers can signal their worth in the job market. The basic premise is that due to an information asymmetry during the hiring process, the worker knows more about his productivity than a potential employer knows. Since employers cannot sufficiently determine a worker's productivity by the interview alone, highly productive workers "signal" their productivity by getting formal education. For the model to work, it is not even necessary for education to have any intrinsic value because, Spence asserted, the education is less important for what particular knowledge that worker might have learned and more important as a signal of the worker's inherent worth.

Spence's market signaling model was significant because it was new to the study of economic behavior. For instance, people send signals to other people by the clothes they wear, the cars they drive, the food they eat, the movies/TV they watch, the people they socialize with, or the work they do.

As chairman of the independent Commission on Growth and Development, a global policy group launched by the World Bank and focused on growth and poverty reduction in developing countries, Spence spent time studying the shifting patterns of economic activity in developing countries. Following the end of his chairmanship in 2010, he published his latest work based on this experience: *The Next Convergence: The Future of Economic Growth* (2011).

In *The Next Convergence*, Spence writes that the industrialized West benefited much from economic growth before World War II, which led to enormous gaps in wealth and living standards between the West and the rest of the world. However, after the war this pattern of divergence reversed; emerging economies are reshaping the international order. Spence argues that although globalization has been critical to the rapid growth of emerging markets, it has also led to rising inequality in the rich countries, and they may respond by raising protectionist barriers, leading to frictions when the world tries to accommodate both rapidly growing emerging giants like India and China and slow-growing developed countries like the United States.

Spence discusses in detail the growth of the emerging markets, which he calls the "dynamics of high-speed growth." According to Spence, the dynamics of high-speed growth require these emerging markets to invest at very high rates; increase the size of the modernizing parts of the economy; employ surplus labor, which has little cost to them; and then sell into a global economy.

Spence emphasizes the importance of the role of the government in the economy as opposed to a laissez-faire economy. He believes that the United States needs to spend more on unemployment insurance, industrial policy, and public infrastructure. He advocates for "enhanced coordinated oversight" and "global effective government" for the world economy and the replacement of the current hybrid of floating and fixed exchange rates with "a new hybrid."

Among his many honors, Spence was elected a fellow of the American Academy of Arts and Sciences in 1983; was awarded the John Kenneth Galbraith Prize for excellence in teaching in 1978; and received the John Bates Clark Medal in 1981, for a "significant contribution to economic thought and knowledge." He has served as member of the boards of directors of General Mills, Siebel Systems, Nike, and Exult, and a number of private companies. From 1991 to 1997, he was chairman of the National Research Council Board on Science, Technology, and Economic Policy.

Spence's contribution on market signaling helped lay the foundation for research in contract theory. His current research interests focus on the study of economic growth and development, dynamic competition, and the economics of information. He is a senior fellow at the Hoover Institution, a professor of economics at the Stern School at New York University, and the Philip H. Knight Professor Emeritus of Management in the Graduate School of Business at Stanford University.

SPOT EXCHANGE RATES

Spot exchange rates are the prices at which currencies contracts are trading in real time. In a floating exchange rate system, these rates will be subject to change at any time based upon supply and demand.

The foreign currency exchange market (forex) has grown increasingly active in the post–Bretton Woods era due to increased global trade and to improved technological developments. Evidence of both influences can be seen in the rapid increase in global currency trading. The Bank for International Settlements reports that average daily trade volumes, as measured in U.S. dollars, were $3.3 trillion in April 2007, $4.0 trillion in April 2010, and $5.3 trillion in 2013.

The majority of currency trading takes place through banks. There are no formal exchange floors where currency transactions are conducted and settled. Instead, banks act as dealers and offer both bid and ask prices. The difference between the two creates revenue for the bank. In that sense, the system for forex trading is logistically similar in many ways to virtual stock exchanges such as the NASDAQ.

How spot exchange rates are quoted begins with what is referred to as the fixed rate followed by the variable rate. The fixed rate is always assigned a valuation of one. For example, a standard quote designated as EUR/USD has the euro as the fixed rate and the U.S. dollar as the variable rate. This quote will produce the number of dollars that a single euro can buy. Accordingly, if it takes $1.35 to exchange for €1.00, the above standard quote would be quoted at 0.7407 (1.00/1.35).

Just as in stock markets, there is a time lapse between when foreign currency exchange transactions are agreed to and when they are settled. Currency contracts typically settle within two business days from the date that the transaction was entered into.

There are still some exceptions to the floating exchange rate systems. Although there is not a single nation that ties its currency to the gold standard any more, several nations elect to peg their currencies to another currency at a fixed exchange rate. In doing so, these countries operate in a middle ground between a fixed and floating exchange system. The peg to another currency has all the elements of a fixed exchange system, yet at the same time the pegged currency is indirectly impacted by changes in what is almost always a sponsor currency's floating rate on world markets.

As of 2015, Cuba, Jordan, Panama, Saudi Arabia, and Venezuela are among the nations that peg their currencies to the U.S. dollar. Bulgaria, Chad, Denmark, and Senegal are examples of nations that peg their currencies to the euro. The primary reason for a country to peg is to create international credibility and instill a degree of confidence in its domestic currency. Thus, a peg strategy is typically employed by nations that are Second- or Third-World economies.

There have been historical examples of smaller nations using foreign exchange and foreign exchange swap contracts to carry out domestic monetary policy. In entering into a foreign exchange transaction, these nations are able to create an expansionary monetary policy outcome. Winding out the contract has the opposite effect. In contrast to a large nation, such as the United States, these nations are faced with very thinly traded short-term securities markets. In the past, Switzerland has used this technique, and Germany and the Netherlands used it before joining the European Union. In present times, Third-World nations are the most likely candidates for this creative way of using foreign exchange markets to achieve a monetary policy outcome.

STATE CAPITALISM

State capitalism dates back to the East India Company and its relationship with the British government. Throughout history, young rising international powers have relied on the state for early economic growth. For example, the United States after the Revolutionary War and Japan after World War II relied on the state to protect their economies.

State capitalism has taken on a new look in the modern era. No longer do nations begin businesses with the idea of converting them to private businesses. Modern state capitalism involves businesses that are owned or backed by the government with the behavior of a private-sector multinational company. Today's modern state business develops into a full-fledged business model owned and operated by the state yet participating in the private global marketplace. The state-owned or state-partnered business model has become an influential economic structure in nations around the globe. The Europeans and Asians have incorporated state capitalism to create industrial centers and welfare states.

State capitalism has its proponents and practitioners in both the developed world and the developing world. France owns 85 percent of Europe's largest energy company, and Germany owns 32 percent of Europe's largest telecommunications company. In Asia, since 2003 Japan owns 50 percent of the Japan Tobacco Company (Economist Staff 2012). The state-owned businesses in the rich developed nations of the Organisation for Economic Co-operation and Development (OECD) have over 6 million employees and a total value of almost $2 trillion (Economist Staff 2012).

Modern state capitalism came of age with three global events. One was the growth of Singapore as an Asian economic powerhouse. A second was the transformation of China when it embraced globalization and instituted economic incentives with Chinese special economic zones, then welcomed foreign private companies to China. This new, more 21st-century form of state capitalism created in Asia was described as capitalism with "Asian values" (Economist Staff 2012). *Asian values* were defined as a combination of family values with authoritarianism state oversight. Deng Xiaoping, who led China into the era of state capitalism, promoted its economic transformation. He required China's new government-led enterprises to embrace the business model of the Western world. Importantly, he supported and sponsored large amounts of investment in research and development.

A third global event leading to the rise of modern state capitalism was the fall of the Soviet Union. Even though the fall was initially seen as a victory for personal freedom, liberty, and economic capitalism, soon former Communist leaders and oligarchs literally stole massive amounts of the commanding heights and economic base. This economic theft left the new countries of the former Soviet Union severely in debt as they attempted to transform themselves from command economies to capitalist economies. This disarray led to a return to state-owned enterprises under Russian president Vladimir Putin. Putin promoted and endorsed an all-encompassing combination of private businesses making up a private sector with a strong presence of state capitalism enterprises.

Modern state capitalism is different from the state capitalism of history. China's state-capitalistic companies are global companies with business operations around the globe. The Chinese government focuses its state-owned industries in countries where those industries can have a significant economic impact. The Chinese new modern economic position is that state capitalism is a viable, long-term business model and not just a bridge from a command economy to a market economy.

The new view of state capitalism has supporters in many emerging and transitional nations, such as Brazil and South Africa. As emerging nations strive to compete and participate in the global economy, state capitalism is a very appealing model for growth. With government support, the young economic nation gains instant credibility and clout, as if it were a mature privately held company.

State capitalism has strident supporters as well as critics. Supporters of state capitalism strongly promote it as a business model that can provide both growth and stability. State capitalism promotes a strong link between government and business.

State capitalism's critics are many. They believe state capitalism as an economic model is more a danger than a solution. One concern the critics cite is that state-capitalist governments are often unpredictable. Regardless of the business sector that the state-owned business is operating, if the government backing the business is not stable, the likelihood of a stable business greatly lessens. Another concern is the government protection and favoritism that are provided to government entities, making domestic competition unlikely. When the government supports and subsidizes one set of companies, the other companies in the sector are hurt. Supporters of market capitalism point to the resources used by state-owned enterprises that could have been used by privately owned enterprises. Finally, critics of state capitalism refer to the imbalance of the global trading community when a state-owned business enjoys government support regarding trade policy and foreign exchange policies, which creates an uneven trading environment.

STIGLITZ, JOSEPH

Born: February 9, 1943, in Gary, Indiana; Nationality: American; Professional Interests: asymmetric information, taxation, international development, monetary theory, Nobel Prize (2001); Major Works: *Globalization and Its Discontents* (2001), *Making Globalization Work* (2006), *Freefall: America, Free Markets, and the Sinking of the World Economy* (2010), *The Price of Inequality: How Today's Divided Society Endangers Our Future* (2013).

Joseph Stiglitz is a voracious scholar of economics, specializing in the study of how to use multiple perspectives to a given problem to reach a reasoned solution. He was a member of the Clinton administration's Council of Economic Advisers from 1993 to 1995 and then its chairman from 1995 to 1997. He served as chief economist and senior vice president of the World Bank from 1997 to 2000. In 2001, with George Akerlof and Michael Spence, he was awarded the Nobel Prize for his analysis of markets with asymmetric information. He was also the lead author of the 1995 report of the Intergovernmental Panel on Climate Change, which shared the 2007 Nobel Peace Prize. At Columbia University, Stiglitz holds appointments at the Business School, the Department of Economics, and the School of International and Public Affairs (SIPA).

Joseph E. Stiglitz was born on February 9, 1943, in Gary, Indiana. Stiglitz attended public school, where he also learned the printing and electric trades. He thrived in his extracurricular activity of debate, which he states helped to shape his later interest in public policy. His most formative intellectual experiences took place during the period from 1960 to 1963, when he attended Amherst College on a full scholarship. His teachers favored the use of the Socratic seminar, which Stiglitz credits with helping him organize his thoughts and learn to ask useful questions. Late in his third year at Amherst College, Stiglitz decided to leave the field of physics to study economics—and put his mathematical ability to use to solve social problems.

Stiglitz's decision to pursue economics led him to leave Amherst before earning his degree (although Amherst later gave him one) and immediately begin his graduate studies at the Massachusetts Institute of Technology (MIT) to avoid repetition of studies. His modest last-minute fellowship from MIT gave Stiglitz $1 a day to live on after he paid the rent. Among his professors at MIT were four Nobel laureates: Paul Samuelson, Robert Solow, Franco Modigliani, and Kenneth Arrow. Notably, he worked to edit Paul Samuelson's collected papers. During the summer he moved to the University of Chicago to work with Hirofumi Uzawa. Stiglitz later received a Fulbright fellowship to Cambridge for 1965–1966. He later returned to Cambridge for a one-year appointment as an assistant professor at MIT while he worked on his PhD. Throughout his career, Stiglitz has also taught at Yale University, Oxford University, Princeton University, Stanford University, and Columbia University.

During the next few years, Stiglitz continued to develop his new Keynesian ideas. His work laid the foundation for the study of asymmetric information, including new ideas like adverse selection and moral hazard. When buyers and sellers have unequal knowledge about the markets, they may not use resources efficiently. According to Stiglitz, governments may then intervene as a third party to increase the information to all market participants in order to achieve a more efficient use of resources. He tempers this recommendation of government intervention with the need for a watchful eye on incentives of government's intervention, so that the buyers and the sellers are both better off as a result of this government intervention. His continued work also centers on further development of macroeconomic and monetary theory, development economics and trade theory, public and corporate finance, theories of industrial organization and rural organization, and theories of welfare economics and of income and wealth distribution.

In 1992, Stiglitz joined the Clinton administration as a member and then chairman of the Council of Economic Advisers and was able to put his ideas into practice. His research on adverse selection and moral hazard helped him to create a self-titled “third way” for limited government intervention within the market when markets do not work well.

Stiglitz served as the senior vice president for development policy and the chief economist for the World Bank in 1997–2000. Ultimately, he left this job as he felt the World Bank and the International Monetary Fund were using models that failed to incorporate advances in economic theory such as his work on imperfect information and incomplete markets. He advocated the use of openness, broad consensus building, and widespread consultations with parliaments or civil society to assist countries in need. Stiglitz credits his time in Washington with the founding of his initiative for policy dialogue to enhance democratic processes for decision-making in developing countries. He continues to advise foreign governments on a broad range of issues.

In 2008, Stiglitz chaired the Commission on the Measurement of Economic Performance and Social Progress at the request of French president Nicolas Sarkozy. The president of the United Nations General Assembly appointed Stiglitz chair of the Commission of Experts on Reform of the International Financial and Monetary System in 2009. Stiglitz has been a fellow of the Econometric Society since age 29, and he is a member of the National Academy of Sciences.

In addition to his work at Columbia University, Stiglitz is the editor of *The Economists' Voice* journal, and he chairs the Brooks World Poverty Institute at the University of Manchester. He co-chairs Columbia University's Committee on Global Thought. Stiglitz continues to publish an impressive number of economic works. At present, he has authored 54 books, including several textbooks on the principles of micro- and macroeconomics. *Globalization and Its Discontents* has been translated into 35 languages.

In 2011, *Time* magazine named Stiglitz one of the 100 most influential people in the world.

STOLPER-SAMUELSON THEOREM

The Stolper-Samuelson Theorem (SST) was introduced in 1941 by Wolfgang Stolper and Paul Samuelson. It represents a derivative insight that branches off from the earlier Heckscher-Ohlin Model (HO), a work written in 1933 to provide further insights connected to David Ricardo's theory of comparative advantage. Although the theorem may seem simple at first, its implications are significant. The focus of SST is to explain how an increase in the price of a particular good might impact the values of such subordinate inputs as materials, labor, and capital (e.g., machinery, factories, and/or other infrastructure used in the production of finished goods). These collective inputs are also referred to as factors.

In simple terms, SST posits that when the price of a good rises, the prices of the factor inputs will rise as well, but not necessarily in an equal pro-rata fashion. A significant consequence of this insight is that a change in technology or economic policy will likely impact certain industries directly, and will also impact other industries that draw upon the same factors. Taking this concept a step further, since most factors are interchangeable between industries, the rise in cost of an individual factor input set in motion by changes in one industry will likely impact other industries as well. This scenario causes economic winners and losers when change occurs to the prices of outputs.

The above assertions can be illustrated by way of historical example. In the early 20th century, American manufacturing increased dramatically across many industries, but particularly within automotive manufacturing. Very quickly, there was a significant need by the new automotive manufacturers for both engineering talent and a reliable force of unskilled but reliable workers to work the assembly lines. Henry Ford and his company experienced very high levels of employee turnover, which was very problematic. Many of these workers, a portion of whom came to the city from agricultural backgrounds, were simply not prepared for the repetitiveness and monotony of the assembly line. As a result, they quit. Ultimately, Ford was forced to introduce the "$5 working day," an extraordinary wage for the time, in order to induce workers economically to stay with the company and reduce turnover.

In the above example, the input factor of labor started to cost more. Ford was willing to pay that wage, because he was selling a lot of cars (a new technology) and it made economic sense to pay higher wages to workers in order to keep the assembly line running. An important consequence of Ford's decision was to cause labor wages to eventually rise in other industries as well. Workers now had the chance to earn a higher wage at Ford, and if companies in other industries wanted to keep good workers, they needed to pay competitive wages.

Another beneficial application of SST has been the impact of international trade and trade policy on such private-sector production factors as labor, materials, and capital. If one drills down further to split the labor factor into two subsets, skilled and unskilled, some of the ramifications of increased globalization can be readily seen. In the post–World War II era, many Asian nations have developed significant domestic manufacturing industries. The domestic labor factor in these countries is often less expensive than in the United States, allowing these exported manufactured goods to be offered to consumers in the United States at prices that are lower than what U.S. producers can charge.

Two significant consequences arise from the above situation. The first is that consumers are motivated to purchase the competing foreign product due to its better price. Domestic producers get placed in a quandary. They must lower their cost structure or lose business, or even go out of business. This process ultimately has the effect of lowering domestic factor inputs. Historically, this has been the case in the United States during the late 20th and early 21st centuries. A significant number of U.S. unskilled labor jobs have been lost or the prevailing wage has been reduced as a result of less expensive foreign imports. The second consequence ties to the first. In the face of less expensive foreign competition, those economic sectors that have sufficient critical mass exert political influence in support of trade restrictions. This was the case when American automotive producers and labor unions cooperated in calling for foreign import quotas in the 1970s and 1980s.

From one perspective, this example demonstrates that SST can work both ways: It can explain upward pressures on the cost of inputs, but it can also explain instances of downward pricing pressures. Although simply stated, SST's implications are significant. Business leaders need to understand these very well if they are to employ sound strategic planning in an era of expanding trade and technological change.

SUBSIDIES

A *subsidy* is a government payment to consumers or producers to encourage the consumption or production of a good or service. Subsidies are generally used for two primary purposes: to help consumers and producers compete in a market, and to correct for positive externalities. Subsidies are funded by taxpayers—and they can often lead to political debates, because the government selects the producers and consumers who receive subsidies, which provide them with a competitive advantage compared to the consumers and producers who do not receive subsidies.

Consumers who lack the ability to pay for necessary goods and services such as food, electricity, health care, and education often receive subsidies to pay for these essentials. These subsidies are antipoverty policies that are used to decrease the gap between the rich and the poor. Many people view these subsidies as necessary to promote the general welfare of society; and without the subsidies many people who live in poverty would most likely experience a rapid decline in their quality of life and their upward mobility.

Producers in highly competitive industries such as agriculture and in industries that compete against foreign companies with low production costs often receive subsidies that enable them to compete and sell their goods and services at a profit. Market prices are determined by the supply and demand of a specific good or service, and if production costs are higher than total revenue or if average total costs are higher than marginal revenue, the producer will earn a negative profit, or a loss. When firms suffer losses, they are encouraged to exit the market in search of other opportunities that will earn them a profit. For agricultural goods and other essential goods and services, society and the government have an incentive to keep firms producing—because the goods and services they produce are viewed as essential. To offset these firms' losses, the government often provides them with subsidies that give them a direct monetary incentive to produce.

An *externality* is an unintended side effect of a decision, and it can be positive or negative. In the case of a positive externality, individual consumers consume only the amount that maximizes their marginal benefit, despite the existence of the positive externality. The classic example of a positive externality is post-secondary education. It is a well-established fact that communities that have a populace with advanced education degrees often experience lower crime rates and improved social outcomes. It is important to note that when individual students make the decision to pay for education beyond high school, they are considering only their own benefit from the higher education, which is most often a higher-paying job and a higher quality of life in the future for themselves. They do not consider the social benefits of lower crime rates, or their positive impact on society based on their high level of education.

This creates a situation in which society would prefer having more students make the decision to pay for higher education; but because the price of education, like all goods and services, is determined by supply and demand, some students cannot afford the tuition of higher education and society is faced with the loss of the societal benefit for every student who chooses not to pay for advanced education. To entice consumers to consume more education to reach the preferred societal quantity, the government often offers subsidies to low-income students to enable them to purchase higher education, which corrects for the positive externality. The government can also offer subsidies to the producers of higher education; this increases the supply of education and drives down the price, which allows consumers to consume education at the preferred societal quantity.

SUSTAINABLE CONSUMPTION

Sustainable consumption is the ability to satisfy people's present consumption needs without undermining the world's capacity to meet the consumption needs of future generations. Sustainable consumption applies to the purchase or use of resources, such as water or petroleum, as well as final goods, such as food, household appliances, and motor vehicles. It also applies to the decisions made by all consumptive units, including households, businesses, and governments. The overriding objective of sustainable consumption is to guarantee a high and sustainable quality of life for all people, today and in the future.

The movement toward sustainable consumption in the global economy was bolstered by a number of international agreements during the 1990s. The landmark Agenda 21, which was adopted by the UN Earth Summit held in Rio de Janeiro in 1992, propelled sustainable consumption into the international limelight. Agenda 21 made a compelling link between unsustainable consumption and production on the one hand, and global poverty and environmental degradation on the other. Agenda 21 recommended a global shift in lifestyles and consumption patterns, particularly in the industrialized countries. Agenda 21 noted that richer countries accounted for the lion's share of global consumption. Agenda 21 called for more efficient and "green" production methods; the use of new and renewable energy resources; the development and sharing of green technologies; the creation of recycling and waste reduction programs; and the dissemination of information about ethical consumption through education, public awareness programs, advertising, and other means.

Sustainable consumption was formally added to the UN Guidelines for Consumer Protection in 1999. Consumers International (CI), a nonprofit federation of consumer groups and non-governmental organizations (NGOs), was instrumental in framing the sustainable consumption addendum to the UN guidelines. Under the revised Guidelines for Consumer Protection, the United Nations challenged consumers, governments, businesses, labor organizations, environmental groups, and other stakeholders to join in common cause behind sustainable consumption.

The revised guidelines also called for governments to provide a suitable environment for sustainable consumption through appropriate regulations, prohibitions, and incentives to achieve desired results. The guidelines asked governments to lead by example by introducing sustainable consumption practices into their own operations, financing green research and development (R&D), ending subsidies to wasteful or inefficient producers, and forcing businesses to pay for external production costs such as pollution.

The goal of sustainable consumption requires a significant change in attitudes and lifestyles, particularly in the richer industrialized countries. In the early 2000s, the United Nations Environment Program (UNEP) reported slow progress in implementing the sustainable consumption recommendations outlined in the UN Guidelines for Consumer Protection. A UNEP survey cited high compliance with sustainable consumption guidelines in Australia, Belgium, Brazil, the Czech Republic, Denmark, Hungary, Korea, Mexico, Nicaragua, Sri Lanka, and Sweden. Lower compliance with the UN guidelines was recorded in Bulgaria, Burundi, Costa Rica, Cote d'Ivoire, Cyprus, Ecuador, Haiti, Kenya, and Zambia.

SUSTAINABLE ECONOMIC DEVELOPMENT

Sustainable economic development occurs when an economy achieves sustained economic growth and substantive improvements in people's quality of life. Economic growth results from increases in a country's total output of goods and services over time. The two most common measurements of economic growth are gross domestic product (GDP) and GDP per capita. Quality of life deals with the overall conditions under which people live. Quality-of-life indicators consider people's consumption levels; access to education, health, and social services; degree of personal security; and respect for civil and human rights.

The concept of sustainable economic development has expanded in recent years. The landmark Agenda 21 was an important outcome of the 1992 UN Conference on Environment and Development, also called the Rio Earth Summit. Agenda 21 is one of the world's most authoritative statements on sustainable development. Agenda 21 embraces a broad view of sustainable economic development, which includes economic growth and a series of protections for the natural environment, for worker and human rights, and for indigenous cultures. The UN's Millennium Declaration (adopted in 2000) solidified the link between sustainable economic development and global poverty reduction. The declaration established eight Millennium Development Goals, which rallied global support for poverty reduction, universal primary education, gender equity, health care, protection of the natural environment, and partnerships for development.

Economists often classify countries by level of economic development. The most recent International Monetary Fund (IMF) classification established two broad categories of economies. The 29 advanced economies, also called the developed countries, are the rich industrialized economies. The remaining 179 economies are considered emerging market and developing economies. A country's level of economic development is determined partly by its income status. All of the 29 advanced economies, for example, are high-income countries. Development status also considers the size and sophistication of the economy's three economic sectors: agricultural, goods-producing, and services-producing. The advanced economies have well-developed economic sectors, typically dominated by services-producing industries. Less-developed countries are obliged to devote more resources to agriculture and goods-producing industries to satisfy society's basic needs.

A convergence of many mutually supporting economic, political, and social factors is necessary if the virtuous cycle of development is to replace the vicious cycle of poverty in the developing world. The effective management of productive resources—natural resources, human resources, and capital goods—is one important step toward creating the virtuous cycle. The sustainability of natural resources is enhanced by policies to reduce environmental degradation, increase the use of renewable resources, and apply the principles of sustainable consumption. Human resources, or labor, are enhanced by education, job training, adequate food and fresh water, and health care. Investments in human resources expand society's human capital. Policies to reverse the "brain drain," and nurture domestic entrepreneurship, are also essential to human capital development. Finally, the accumulation of capital goods increases the productivity of labor and prospects for economic growth. Capital-deepening, the expansion of real capital per worker, is a key feature of sustainable development.

The virtuous cycle of development is also enhanced by a pro-growth business climate. A favorable business climate includes stable, transparent, and inclusive economic and political institutions and practices. A favorable economic environment relies on a well-developed economic infrastructure, a respect for private property and market institutions, and macroeconomic stability. A well-developed economic infrastructure includes transportation and communications systems, basic services in sanitation and water supply, health and educational facilities, and a system of justice that is capable of enforcing contracts and administering the rule of law. The infrastructure also includes institutions to attend to the specific needs of the poor and other marginalized segments of society. Respect for market institutions provides incentives to work, save, invest, and produce goods. Macroeconomic stabilization policies foster price stability, full employment, and growth.

A stable political environment is based on good governance. *Good governance* refers to honest and competent public service by government officials. Democratic practices and the rule of law underpin good governance. Good governance supports equal opportunity and protects private property rights and profits. Good governance has proven elusive for many developing countries, particularly those victimized by extreme poverty, dictatorship, corruption, and civil conflict. In recent years, international development institutions such as the World Bank and the IMF have extended financial and technical assistance to promote good governance. In addition, governments and multilateral organizations have encouraged participation by non-governmental organizations (NGOs) and civil society organizations (CSOs) to help devise and monitor compliance with the principles of good governance.

Foreign aid is another ingredient in attaining sustainable economic development. Foreign aid refers to cross-border grants, loans, technical assistance, and emergency aid. Foreign governments and multilateral organizations provide most economic assistance. Other sources of assistance include transnational corporations, NGOs, CSOs, and individual philanthropists. The five most important sources of economic assistance are the five mutually supporting institutions of the World Bank Group; the regional development banks and subregional banks; the IMF; the Development Assistance Committee, within the Organisation for Economic Co-operation and Development; and the specialized agencies and programs of the United Nations System. Today, the network of multilateral institutions is increasingly attentive to economic and human development in the world's poorer regions.

SWEATSHOPS

The term *sweatshop* originated between 1830 and 1850 as a specific type of workshop. The term was coined as a generic term for factories where workers were exposed to dangerous working conditions, long working hours, low pay, and/or little or no security. A certain type of middleman, the "sweater," directed others in clothes-making under unfavorable conditions. Throughout history there have been workplaces that were crowded, dangerous, low-paying, and without benefits. Between 1850 and 1900, sweatshops attracted the rural poor and immigrants to rapidly growing cities such as London and New York City to work in the garment industry. Labor leaders cited the industries as crowded, poorly ventilated, infested with rats, and prone to fires.

Criticism of garment sweatshops became a major force behind workforce labor laws and safety regulations. In 1910, the International Ladies' Garment Workers Union was founded to try to improve the working conditions of garment workers. Journalists as well as the government tried to intervene with sweatshops.

In the United States, journalists known as "muckrakers" wrote exposés of business practices and described factory working conditions that were dangerous and disgusting. One of the most notable journalists of this time, Upton Sinclair, wrote *The Jungle*, in which he described the unsafe and unhealthy working conditions in the meat-packing industry in Chicago.

To further the negative image of sweatshops, in 1911 the New York City Triangle Shirtwaist factory fire killed 145 workers when they were trapped inside the factory. The exit doors were locked, which drew public outrage for the working conditions within the factory. The fire made the public aware of fire hazards and the lack of safety codes in the factory.

It wasn't until the mid-1930s—with help from Franklin D. Roosevelt and pressure from trade unions—that much-needed changes were brought about in sweatshops, including minimum wage laws, fire safety codes, and labor laws. With these changes, the majority of sweatshops in the developed world have been eliminated.

Employers violate federal or state labor law if they disregard laws such as minimum wage, overtime, child labor, workers' compensation, or safety and health codes; if they're found guilty of these violations, they are considered to be sweatshops in the modern sense. Sweatshops have not been eliminated completely, especially for vulnerable populations such as migrant workers in the agricultural industry. Immigrant workers, both legal and illegal, work in conditions that include long daylight hours in extreme heat with few breaks. Wages are very low, and sometimes even illegal. Since the workers rarely have the means or education to improve their situation, they work under these conditions due to their desperation for money.

Sweatshops in the less-developed world have been even more difficult to eliminate because of their role in the global economy. Developing countries in Central and South America and Asia, with their lack of restrictions and regulations on sweatshops, encourage offshoring from the developed world. The offshored jobs from the industrial world can bring some wealth to extremely poor nations, where citizens struggle to provide the basic needs for their families. Low wages in the sweatshops are better than no wages at all.

The governments of many developing nations are reluctant to enforce strong worker-protection laws. These nations view cheap labor as one of their major assets to attract multinational corporations to create jobs for their citizens. Governments of these nations further argue that most countries in the developed world had sweatshops early in their economic histories as well. The goal of these government leaders is to achieve prosperity by offering jobs in multinational corporations that provide the best wages and working conditions available to their workers. These jobs are better than the other jobs that exist, such as begging, subsistence farming, and prostitution.

T

TARIFFS

A *tariff* is a tax levied by a government with the intent of either raising public revenue or restricting trade in order to protect domestic industries from foreign competition. Tariffs may be specific or ad valorem. Specific tariffs are imposed in relation to the quantity of the good. Ad valorem tariffs are levied according to the value of a good. Justification for tariffs includes the need to increase revenue, protect domestic jobs and infant-industries, reduce foreign dependency on essential goods in the event of war or international conflict—or as retaliation against tariffs imposed by other countries. Tariffs also have the unintended consequences of price increases for consumers and producers, inefficient allocation of resources, reduction in quality and variety of goods, retaliatory practices that reduce exports, decreased incentive to innovate, and an overall reduction in standard of living.

Least-developed countries (LDCs), which lack the adequate economic structure to produce a sufficient tax income, may impose tariffs in order to finance their budget. LDCs may use tariffs for poverty reduction, redistribution, and structural development. An excess of tariffs, however, would have negative effects and reduce tariff revenues by creating a disincentive for foreign producers to import, because the costs are too restrictive.

Tariffs may also be imposed with the intent of protecting new and developing industries, or infant-industries. The goal is to reduce competition until the industry grows to a size that allows it to compete internationally. Advocates of this type of tariff argue that the tariffs will no longer be needed when this level is achieved and that the income produced by the established industries will offset the costs that are imposed on society by restricting trade. Protecting infant-industries through tariffs has many unintended consequences. Creating trade barriers in order to become internationally competitive may compromise trade relations and thus hamper efforts to increase to large-scale industries exporting. If these industries fail to attain international competitiveness, they will be unable to achieve self-sufficiency outside of these protective tariffs. Countries will often continue tariffs in order to sustain the industry, which will keep prices high for consumers and permit small-scale, inefficient industries to survive.

In the United States, tariffs are often favored by industries that are experiencing heavy competition from foreign producers. Special interest groups representing these industries lobby the U.S. Congress to create legislation that benefits their specific interests. The benefits are realized by a relatively narrow percent of the population in comparison to the costs, which are spread throughout society. For example, the sugar industry was first protected by tariffs in the United States in

1789, and it continues to be protected through legislation. These regulations allow less-efficient domestic producers to control more of the market than more-efficient foreign producers. The costs are paid by U.S. consumers, who pay nearly double the world price for sugar. The increased costs are harmful to industries that use sugar as an input by making them less competitive with foreign confectioners, who pay far less for world sugar and then import their final products to the United States (Perry 2013).

Countries have an interest in protecting industries that provide goods that are essential to national security and defense. In the event of war or international conflict, a country may be militarily vulnerable if it does not have a steady source of defense materials. Without protection, inefficient industries may close as a result of foreign competition, which would leave a shortage in materials if supply is disturbed.

Sometimes, foreign producers have an unfair advantage due to subsidies or concessions they receive within their countries that allow these producers to keep their prices artificially low. Efficient domestic companies may be eliminated in competition, because they don't receive the same concessions as the foreign producers. Over time, this may create monopolistic tendencies—and as subsidies are eliminated, prices will rise.

The effect of income-producing tariffs depends on the price elasticity of the imported good. If there is low substitutability and the increase in price has little or no effect on the demand for the good, the tariff will have the desired income-producing result. If consumers respond greatly to an increase in price, the reduced demand for the good will overturn the intended income benefit.

Tariffs create distortions in the market. Trade barriers protect domestic producers by reducing the foreign supply of a good. When supply is limited in this way, an artificial price level is created and production begins to shift from unprotected industries to protected ones. The consequences of this include the reduction of supply in industries that may be more efficient but aren't protected. This increases consumer prices and unemployment levels in unprotected markets as resources are reallocated to less efficient, but protected, markets. Diverting production away from a nation's most efficient and competitive markets and toward lesser ones results in a lower standard of living. In addition, incentives to innovate are reduced.

The beneficiaries of tariffs are domestic producers and foreign consumers. Domestic consumers benefit because they have less competition from foreign producers. They are able to increase sales, price, profit, and employment levels. Some domestic producers are harmed, however, because they are forced to pay higher prices for input goods. The increased cost leaves them at a disadvantage to foreign producers, who pay less for inputs and can therefore charge less for their finished product. Foreign consumers benefit because the additional quantity of goods not exported reduces their prices domestically.

Those harmed by tariffs are domestic consumers and foreign producers. For both domestic and imported goods, the reduction of supply forces up the prices, which are paid by consumers. The variety of goods from which to choose is reduced, and quality suffers. Consumers will see an effective income decrease and a lower standard of living. Foreign producers are harmed because the decrease in demand may reduce the world price for goods, making the industry less profitable. In addition to the far-reaching consequences that tariffs impose on consumers, countries may impose retaliatory tariffs, which hamper trade relations and the profitability of exporting industries.

TERMS OF TRADE

Terms of trade is a measure of the relative prices of a country's exports and imports. The terms of trade is expressed as a ratio of a country's export price index to its import price index, multiplied by 100. These price indexes are linked to a base year. In the base year, the terms of trade index is set at 100. A favorable movement in a country's terms of trade occurs when the terms of trade index rises above 100. A favorable movement indicates that the price of a country's exports has risen relative to the price of imported goods. A country's terms of trade deteriorates when the index falls below 100. This occurs when the price of its exports has fallen relative to the price of imported goods.

For decades, the terms of trade has been a major trade issue in the global economy. It is particularly contentious in trade relations between the nations of the Global South and the Global North. The World Bank and other multilateral institutions have encouraged developing countries to specialize in the production of goods in which they have a comparative advantage. Poorer countries have responded by specializing in the production of such basic commodities as cocoa, coffee, cotton, rubber, sugar, and tobacco. However, an economy's overreliance on one crop, or several crops, contributes to unbalanced growth and economic instability. When a certain commodity is in oversupply, its price plummets in global markets. When there is a shortage of the commodity, its price rises. Over time, the price of exported commodities from many developing countries, especially the least developed countries (LDCs), has fallen relative to the price of imported manufactured goods from the advanced countries. The deterioration in the terms of trade for these commodity-reliant countries often means that export earnings decline, and trade deficits rise. The Group of 77 (G77) and other voices from the developing world have expressed concerns about the worsening terms of trade, the lack of access to markets in the industrialized world, and other trade issues.

The terms of trade index cannot be used as the sole measure of a country's strength in the global trading system. For example, the deterioration of a country's terms of trade could reflect greater production efficiency in export industries. Greater efficiency by domestic producers could lower the average price of exported goods and vastly increase the quantity of exports sold in global markets. The terms of trade measures the average price of exports, but it does not measure the volume of exports or the reasons for an increase or decrease in the terms of trade index. Conversely, a favorable movement in a country's terms of trade could mean nothing more than that higher priced exports are being offered for sale in global markets. The higher prices, however, may reduce the demand for these exported goods.

THIRD WORLD SOCIALISM

Third World socialism refers to the application of socialist principles to developing economies. Most experiments in Third World socialism spanned a 40-year period between the mid-1940s and the mid-1980s. Key features of the socialist agenda included the redistribution of society's wealth and central economic planning, each designed to promote economic justice and sustainable economic development. Interest in Third World socialism faded during the 1980s, as unmet development objectives pushed developing countries toward market-oriented strategies.

Third World socialism faced many obstacles, most of which were associated with countries' low level of economic development. The success or failure of socialism became intertwined with the success or failure of nations' development efforts. Economic development was stymied by economic factors, including underdeveloped productive resources, infrastructure, and social services; political factors, including ineffective tax and regulatory regimes, rampant corruption, and political instability; and cultural factors, including population issues, tribal or clan conflict, and conflicting perceptions of modernity. Countries that embraced Third World socialism typically offered development plans based on land reform, nationalization, and central planning.

Land reform involved a change in ownership or control of productive farmland from a landed aristocracy to village groups. Land reform was viewed as pivotal to the socialist agenda due to the centrality of agriculture in developing economies. Tanzanian president Julius K. Nyerere initiated one bold experiment in land reform in the late 1960s when he introduced the "villagization" process, called *ujamaa.* Under *ujamaa,* tracts of land were transformed into community-based farming collectives. Clusters of families jointly worked the collectives and shared the output. Under the banner of "African socialism," Tanzania and other African countries sought to capitalize on the traditional, communal concept of land tenure that had existed in some precolonial African societies. Unfortunately, in Tanzania and elsewhere, collectivized agriculture failed to increase crop yields or the self-reliance of the people. At the same moment in time, a similar socialist experiment was underway in the South American country of Chile. Under legislation sponsored by the Socialist and Communist parties, the Chilean government expropriated uncultivated lands and established peasant cooperatives to work them. *Expropriation* is the government seizure of private property without compensation to the previous owner. Plans to expand Chile's agrarian reform during the early 1970s were cut short when, in 1973, Socialist president Salvador Allende was killed in a military coup d'état.

A second feature of the socialist agenda was the seizure of the economy's commanding heights. The commanding heights of an economy are its essential industries, such as transportation, communications, energy resources and production facilities, and financial services. Government seizures of property, through nationalization or expropriation, were intended to advance economic justice. After India gained its independence from Great Britain in 1947, the newly elected government of Socialist prime minister Jawaharlal Nehru instituted large-scale nationalization of mining, heavy industries, transportation, communications, and financial services. Egypt, under the leadership of Gamal Abdel Nasser, undertook an aggressive program of nationalization during the 1950s and 1960s. Nasser brought most major industrial and financial enterprises under the control of the government. Similar government seizures occurred in the North African nations of Tunisia and Algeria during the 1950s, Chile in the early 1970s, and dozens of other countries during the post-colonial era. The state-owned enterprises in the developing countries encountered predictable problems, such as poor work incentives, distorted price signals, and bloated bureaucracies.

A third feature of the socialist agenda was central economic planning. The scope and rigidity of economic plans varied. For example, India's indicative plans guided the nation's economic development, but they did not dictate production quotas or resource use for all industries. In fact, Indian five-year plans barely touched the agricultural sector, which remained in private hands and employed the vast majority of all workers in the country. More rigid five-year plans were formed in the one-party states and those run by military dictatorships. Socialist planning in these states more closely resembled that of the authoritarian socialists, such as the former Soviet Union. Central plans, usually called "development plans," stressed the collectivization of agriculture and the large-scale nationalization or expropriation of major industries to jump-start modernization. Economic planning also solidified the government's control over a country. One-party or military governments in the socialist camp were led by President Julius K. Nyerere in Tanzania, President Kwame Nkrumah in Ghana, President Gamal Abdel Nasser in Egypt, and President Sekou Toure in Guinea. Socialist economic planning was largely unsuccessful in the developing world. It was plagued by inaccurate or unreliable economic data, poor coordination of programs, and unrealistic expectations for progress.

In the early 2000s, Third World socialism surfaced in Venezuela, an upper-middle-income developing country. Under the elected president Hugo Chavez, Venezuelan socialism embraced workers' cooperative enterprises and expanded social programs and universal public education. Venezuela's "socialism for the 21st century" features a strong government presence in the economy. Government interventions include the creation of state-owned enterprises (SOEs) in transportation, communications, and other key industries; limited expropriation of undeveloped land from large estates; some restrictions on private enterprise; and control over Petroleos de Venezuela (PDVSA), the state-owned oil monopoly.

In 2005, President Chavez demanded a restructuring of some foreign transnational corporations (TNCs) into joint ventures, a proposal designed to increase the voice of the government in the local operations of ChevronTexaco (U.S.), BP (U.K.), and other TNCs. Revenues from Venezuela's petroleum exports help fund President Chavez's socialist agenda. When President Chavez died in 2013 he was succeeded by Nicholas Maduro. Maduro continued the policies of Chavez and Venezuela continued its economic and political decline.

Venezuela's recent experimentation with socialism has done little to reverse the pendulum swing away from command-oriented socialist approaches and toward market-oriented development strategies. Exemplars of successful market-based economic development include the newly industrialized economies (NIEs) of East Asia: Chinese Taipei, Hong Kong SAR, Singapore, and South Korea. Significant progress along the development continuum has also been made by the other emerging market economies, including Chile, the Czech Republic, Hungary, Poland, Slovenia, and the former Soviet republics of Estonia, Latvia, and Lithuania.

THREE-WAY ARBITRAGE

Three-way arbitrage describes trading opportunities in foreign currency exchange markets (forex) where an investor may be able to achieve arbitrage profits through trades that utilize the relationships between three separate currencies. The claim, which is supported by empirical examples, is that there are instances when the exchange rate relationship between two currencies may not be aligned in the same manner as the exchange rate between the two would be if it were conducted through intermediate trading of a third currency. During the early 20th century, a time of fixed exchange rates, exchange rate arbitrage did happen, in part due to the slowness of information transfer and associated administrative costs.

In contemporary times, even with floating exchange rates and active forex markets, exchange arbitrage is still possible. If this premise is true, then investors have an opportunity to generate a risk-free profit in the forex market. Consider the following scenario: Suppose that currency A trades for currency C at an exchange rate of 2.00 to 1.00. Also suppose that there is a currency B, which currency A trades at a rate of 2.00 to 1.50. Further suppose that currency B trades to currency C at a rate of 1.49 to 1.00. Under this three-point scenario, a trader could achieve a risk-free profit by doing the following:

1. Using 2.00 of A to purchase 1.50 of B.
2. Then using the 1.50 of B to purchase 1.007 of C.
3. Finally, using the 1.007 of C to purchase 2.013 of A (note the rounding on the calculations).

In the above series of transactions, by taking advantage of the very slight differences in forex relationships, an investor achieves a risk-free profit of .013.

While three-way arbitrage is theoretically possible, traders need to consider significant caveats when assessing whether it can be applied on a widespread basis. First and foremost, modern forex markets are highly active. They are very efficient at correcting any mispricing that occurs. As a result, any arbitrage opportunities that arise can occur with only very slight profit margins and in a very brief window of time. Markets will self-correct immediately once knowledge of the arbitrage is known. In summary, when arbitrage opportunities arise, they are temporary in a market that experiences rapid trading patterns.

The advent of computers has created new opportunities for traders to find and take advantage of arbitrage opportunities. However, the same technologies also ensure that any potential opportunity is short-lived as other traders become involved. In these instances, market equilibrium is quickly restored.

Another consideration is the transaction costs associated with making trades. Even if a theoretical arbitrage opportunity occurs, the administrative costs of executing a trade may be more than the profits available from the arbitrage. Thus, even though arbitrage may exist, due to transaction costs an investor may not be able to produce an actual profit.

Three-way arbitrage is theoretically possible, and there is empirical evidence that opportunities for arbitrage can occur in the marketplace. However, the combination of thin potential margins, the challenges to execute trades quickly, and the associated transaction costs all lead to the reality that actual arbitrage opportunities are few and far between.

THUROW, LESTER

Born: May 7, 1938, in Livingston, Montana; Died: March 25, 2016, in Westport, Massachusetts; Nationality: American; Professional Interests: global economy, income distribution; Major Works: *The Zero-Sum Society: Distribution and the Possibilities for Economic Change* (1980), *Head to Head: The Coming Battle among Japan, Europe, and America* (1992), *Building Wealth: The New Rules for Individuals, Companies and Nations in a Knowledge-Based Economy* (1999), *Fortune Favors the Bold: What We Must Do to Build a New and Lasting Global Prosperity* (2003).

Lester Thurow was a global economist, author, and professor. He was the Jerome and Dorothy Lemelson Professor of Management and Economics Emeritus at the Sloan School of Management at the Massachusetts Institute of Technology (MIT). He served as dean of the school from 1987 to 1993. Thurow served as a staff economist for President Lyndon Johnson. He wrote several books on the global economy and the distribution of income. He also contributed as a columnist for news magazines.

Lester Carl Thurow was born in Livingston, Montana, on May 7, 1938. Thurow earned his BA from Williams College in 1960 in political economy. As a Rhodes Scholar, he received his MA in philosophy, politics, and economics from the Balliol College at Oxford University in 1962. Thurow earned his PhD in economics from Harvard University in 1964.

After serving as a staff economist for President Lyndon Johnson's Council of Economic Advisers, Thurow taught at Harvard from 1966 to 1968. Beginning in 1968, Thurow served on the faculty of MIT. From 1987 to 1993, Thurow served as dean of the Sloan School of Management.

Thurow's academic work focused on global economy, the distribution of income and wealth, and public economic policy. In his 1980 book *The Zero-Sum Society: Distribution and the Possibilities for Economic Change*, Thurow argues that the economic turnaround needed from a slow-growing economy will not take place until the zero-sum theory in macroeconomics is applied, meaning that members of society will have to face taxation in order for government economic actions to work. His subsequent book, *Dangerous Currents: The State of Economics* (published in 1983), critiques academic economics as the only reliable tool for government policy.

Thurow's advocacy for the U.S. economy to change from an individual capitalism to a more communitarian form of capitalism is the basis of his 1992 *New York Times* best seller, *Head to Head: The Coming Battle among Japan, Europe, and America.* In *Head to Head*, he calls on government to play a leading role to help businesses become efficient in developing new processes and skill development to stay competitive in the global economy, with regard to Europe and Japan as economic superpowers. Further writing on globalization is the topic of Thurow's 2003 book, *Fortune Favors the Bold: What We Must Do to Build a New and Lasting Global Prosperity*. In this work, Thurow asserts that companies that want to succeed in the changing global economy must take bold financial risks.

In addition to his books, Thurow contributed as a columnist and editor. He wrote articles for the *Boston Globe* and *USA Today.* He served on the editorial board for the *New York Times* and on the board of economists for *Time* magazine. Thurow appeared on the television program *Nightly Business Report*, and he was featured on *60 Minutes.* He was a board of director member for such companies as Analog Devices and E-Trade. Thurow was a member of the American Academy of Arts and Sciences, and he served as vice president for the American Economic Association in 1993. He died March 25, 2016, in Westport, Massachusetts, at the age of 77.

TRADE INTERFERENCE BY BARBARY COAST PIRATES, 1800

After the American Revolution, the United States was plagued by shipping problems. The British, the French, and pirates preyed on U.S. merchant ships. The lack of a strong navy made the ships of the United States the favorite targets of 18th-century pirates. Barbary pirates, or corsairs, were an early type of state-supported terrorists. Their home ports, which were known as the Barbary Coast, consisted of the African ports of Tunis, Algiers, and Tripoli in the Mediterranean, which were under the rule of the Ottoman Empire. Although the cargo raids were economically significant, their main purpose was to capture Christian slaves for the Islamic market of Africa.

The outcry of the New England states in response to the threat of piracy had led to the creation of the United States Navy in 1794. In addition, through treaties and in practice, America had adopted a policy of appeasement by paying ransom for captured ships and their crews and tributes to the local governments. By 1800, ransom and tribute payments had reached 20 percent of the American government's annual expenditures. The loss of ships and goods had also depressed the value of American trading companies, and rising insurance rates on American ships were becoming detrimental to the shipping industry. With only a few infant manufacturing firms, the United States was dependent on shipping and trade for its economic survival.

The Barbary pirates operated from the 16th to the 19th century, imprisoning more than a million slaves and capturing thousands of ships. Over the centuries, British ships, protected by treaties and Britain's naval power, had less trouble with these pirates than the ships of most countries. The merchant ships of the American colonies had benefited from British protection until the American Revolution, after which the pirates attacked American ships freely. The Barbary pirates controlled the Mediterranean Sea, raided the Atlantic coasts of Europe and Africa, and even sailed into the America-to-West Indies shipping lanes. Barbary pirate ships often posed as British vessels to avoid capture.

The New England shipping concerns forced Congress to pay ransom and tribute when necessary to free captured sailors, but the companies lost ships and cargo at high rates, driving up insurance costs. The inflationary results affected all of the United States. In 1784, Congress ratified a treaty with Morocco that effectively codified the practice of appeasement and ransom payments. Morocco, however, was only one of the Barbary States, and the others continued the piracy. The treaty cost the United States $30,000, and it gained the country very little in the long term.

Secretary of State Thomas Jefferson tried to form an alliance with France and Great Britain to confront the Barbary pirates, but America's weak navy offered little to the proposed alliance, so no agreement was reached. The British also believed it was to Great Britain's advantage to allow the Barbary pirates to disrupt American trade.

America's lack of naval power made frequent violations of the Moroccan treaty common. From 1793 to 1794, more than 11 U.S. ships and 200 sailors were captured. Congress passed a ransom payment of $642,000 and promised an annual tribute to Morocco of $21,000. As the federal government's costs rose, the nation called for more action. Congress passed the Naval Act of 1794 to build six new warships to combat the Barbary pirates. Ransom payments and increased military spending wiped out the government surplus that Alexander Hamilton had worked so hard to build, and it put the country $80 million in debt. Besides the economic cost, this piracy led citizens who lived on America's seacoasts to constantly ask the government for protection.

President Jefferson viewed the piracy crisis as a long-term economic problem. Jefferson differed with Washington and Hamilton on the root of American wealth. He believed in an agrarian society that would thrive on exporting agricultural products and importing manufactured goods. Such a view necessitated the existence of a strong merchant marine and navy. War, however, was not a popular option within Jefferson's party, the Democratic-Republicans.

Paying ransom was not popular either, but it was tolerated until the pasha of Tripoli launched a number of verbal insults against the United States and demanded a new treaty with new annual payments. This time he wanted $225,000 in tribute immediately, with annual payments of $25,000 to follow. Tripoli was only one of the Barbary States making demands on the United States. Jefferson, who had just been elected president, refused to negotiate. As a result, the pasha of Tripoli declared war on the United States. This, for Jefferson, was going too far. He did not even wait for congressional approval before responding, as required under the Constitution; instead, he launched a naval and marine campaign against Tripoli and its pirates in 1801 under the constitutional clause that the president could unilaterally take action to protect American commerce. Congress would eventually vote to support Jefferson's action.

The initial military campaign did not go well. Tripoli captured the warship *Philadelphia* and held the crew hostage. After this setback, Jefferson sent another naval and land expedition against Tripoli. American marines captured Tripoli and rescued the crew of the *Philadelphia*. Under pressure, Tripoli negotiated the release of sailors still in the hands of the other Barbary States, but at a cost of $60,000 per sailor. The final treaty would cost the United States millions of dollars. After this success, Jefferson cut military spending and other government spending to reduce the country's debt to $45 million in 1806. The piracy problem improved but continued to be a danger for shipping, until 1815 when Europe joined in the effort to stop piracy on the Barbary Coast.

TRADE POLICY

Over the past two decades, there has been considerable debate about the connection between trade and environmental policy. A specific concern of the environmental lobby has been that with increased trade liberalization, governments will not be able to set appropriate environmental policies because their use of complementary trade policies may be constrained by General Agreement on Tariffs and Trade (GATT) rules. A key implication to be drawn from this is that, without the ability to apply border measures such as tariffs, industries in countries that apply tough environmental standards will be hurt, either through loss of market share or by their total displacement to countries with weaker environmental standards—thereby creating pollution havens.

The ongoing policy discussion on how to address climate change is clearly characterized by this same set of concerns. Developed countries, including the United States and the European Union (EU) member countries, are pursuing national efforts to reduce carbon emissions. The expectation is that if they do this, their energy-intensive industries will face increased costs of production. As a consequence, much of the proposed climate legislation also includes some type of border measure targeted at energy-intensive imports, popularly referred to as carbon tariffs. The argument for needing such border measures is twofold: First, there likely will be carbon leakage; that is, production by domestic energy-intensive industries such as steel will simply be replaced by production in countries with less restrictive climate policies. Second, there likely will be a reduction in competitiveness of firms in those industries most affected by domestic climate policies.

The inclusion of border adjustments in proposed climate legislation can be rationalized as follows: Imposing import tariffs (export subsidies) on all energy-intensive traded goods will reduce carbon leakage (competitiveness restored) by worsening the terms of trade for countries that do not implement a tough climate policy. While there is considerable debate among legal observers as to whether such border measures will be treated as trade-distorting under current GATT rules, the principle for their use is actually well founded in the literature on origin taxation systems versus destination-based taxation systems. As long as a domestic tax is applied uniformly across all goods, and as long as legally termed "border tax adjustments" (BTAs) are set no higher than the domestic tax, there will be no effect on relative prices.

It is likely, however, that BTAs for domestic climate policy will be applied to only a small set of energy-intensive industries, including steel, aluminum, and paper production, in which case relative prices could be affected. Notwithstanding this, the GATT has rules in place on the level at which BTAs can be set: GATT Article II: 2(a) allows members of the World Trade Organization (WTO) to place on the imports of any good, a BTA equivalent to an internal tax on the like good. However, under GATT Article III: 2, the BTA cannot be applied in excess of that applied directly or indirectly to the like domestic good; that is, they have to be neutral in terms of their impact on trade, their objective being to preserve competitive equality between domestic and imported goods. In addition, with respect to exported goods, GATT rules allow rebate of the domestic tax on the exported good; as long as the border adjustment does not exceed the level of the domestic tax, it is not regarded as an export subsidy under the GATT Subsidies Code. In other words, the key underlying principle of the GATT rules is that a border measure cannot be used to provide domestic firms with a competitive advantage; that is, allowing BTAs for domestic climate policy would be motivated not by environmental concerns, but to ensure that competitive equality in international trade is preserved.

While the principle of border adjustments is recognized in the GATT rules, their application will likely be complex legally in the case of climate policy. Specifically, it is unclear whether a BTA will be allowed on imports of a final energy-intensive good such as steel, when domestic climate policy directly affects a nontraded input into steel production, such as electricity, which is not physically present in the final good. It could be argued that if a carbon tax on electricity production is designed to ensure that the price domestic consumers pay for an energy-intensive product such as steel reflects the social cost of producing steel, then a BTA on imported steel should be permitted. Importantly, though, if a BTA is constrained by GATT rules to restoring competitive equality between domestically produced and imported steel, it should be based on the implied tax on domestic steel production. In other words, the appropriate benchmark for BTAs is the carbon content of domestic steel production, and not that of imports. Interestingly, a precedent has already been set for this: BTAs levied on U.S. imports of goods that contain ozone-depleting chemicals (CFCs) are set with regard to the CFC content of U.S.-produced goods and not that of imports.

This discussion clearly highlights the tension between environmental lobbyists who regard trade policy as a means of pursuing environmental goals, and trade policy analysts who are concerned about the potential for protection through border measures for domestic environmental policy. This is borne out in recent empirical work by the World Bank. The World Bank evaluated what the effects would be, by 2020, of three border measures targeted at developing country imports if Organisation of Economic Co-operation and Development (OECD) countries were to unilaterally reduce their 2005 level of carbon emissions by 17 percent in 2012.

Based on current 2016 projections the United States needs to cut emissions 2–3 percent to meet 2020 goals and EU almost 3 percent. China and India base their 2020 goals on emissions ratio to gross domestic product instead of achieving a specific level of reduction.

These results show that a BTA based on the carbon content of developing country imports would have a significantly trade-distorting impact compared to a BTA based on the carbon content of domestic production. In addition, a BTA for both imports and exports based on the carbon content of domestic production would be the least trade-distorting outcome, a result that bears out the analysis of origin versus destination based tax systems. However, the latter would likely be difficult and complex to implement, which suggests that having no border measures might actually be the best policy if countries want to avoid costly trade disputes in applying their climate policies.

TRADE, MEASURES OF

Trade measurement is the regulation of the buying and selling of goods and services. Since countries first began trading with each other, there have been opposing arguments on trade measurement. There will always be an argument for trade openness, as well as an argument for restrictions on trade.

There are many types of trade measures. A couple of the most common ones are tariffs and nontariff measures. *Tariffs* are a measure of trade that indirectly limits imports by taxing them (Gerber 2014). This is an effective way to control the amount of foreign goods being brought into a country. Tariffs also generate revenue for the government. The level of domestic employment and the balance of payments are also affected (Stern 1973). *Nontariff measures* can be defined as a means of regulating prices or affecting trade flow between countries—sometimes unintentionally (McLinden et al. 2011). This type of trade measure is nontransparent, which means it is not obvious and usually is not presented as a trade barrier.

Other forms of trade measures include trade ratios, adjusted trade flows, price-based measures, and composite indices (David 2007, 7–8). *Trade ratios* are just that: ratios. They are the most popular measurement of trade and often are calculated as imports plus exports divided by gross domestic product. This measurement is popular because in most countries this data is easy to obtain (David 2007, 9). Another trade measure, *adjusted trade flow*, uses deviations of actual trade flow from predicted free-trade flows to create measures (David 2007, 13). *Price-based measures* are measures that attempt to regulate price distortion. Arguments in favor of price-based measures claim that economic interpretation is easier when price-based measures are used than when flow-based measures are used (David 2007, 16). Finally, *composite indices* are measures that are based on three different factors: evaluations of trade barriers, structural characteristics, and institutional arrangements (David 2007, 22). Again, these are just a few of the types of trade measures. There are many more that can be considered, each one with its own advantages and disadvantages.

The trading of goods and services has been a common international practice for centuries, and it will continue to be a part of the global economy. Opposing viewpoints on trade are very common. The argument in favor of trade openness is that it promotes economic growth. On the other hand, there are arguments calling for more trade measures to aid in climate control; to protect the environment; and to address human rights issues, including child labor. There is also an argument for protecting domestic industries (Gerber 2014, 143). While all of those factors are important, most countries have a common goal of sustainable economic growth.

In the United States, advocates of trade measures believe that the measures help prevent a decline in output from U.S. producers, help prevent carbon leakage, and make it possible for other countries to reduce emissions (Yager 2009, 1–2). However, many studies have found that open trade has a positive correlation with economic growth (Ulaşan 2012, 13–14). Finding a balance between trade openness and trade measures—one that ensures economic growth while continuing to be ethical and doing the least harm to the environment—would be a desirable outcome.

TRADE-RELATED ASPECTS OF INTELLECTUAL PROPERTY

The Trade-Related Aspects of Intellectual Property (TRIPS) agreement is an international agreement designed to protect intellectual properties in global markets. The TRIPS agreement was negotiated during the Uruguay Round (1986–1994) of trade talks, the eighth trade round conducted under the auspices of the General Agreement on Tariffs and Trade (GATT). The formal agreement, officially called the Agreement on Trade-Related Aspects of Intellectual Property Rights, came into effect on January 1, 1995. The World Trade Organization (WTO), GATT's successor organization, administers TRIPS.

TRIPS is the world's most comprehensive set of protections for intellectual property rights (IPRs). The agreement outlines minimum standards for the protection of intellectual properties from unauthorized duplication, broadcast, or other forms of intellectual piracy. Specific protections guard against the pirating of copyrighted materials, including computer programs, software, books, scripts, broadcasts, movies, and music; trademarks, including signs or symbols, personal names, letters, numbers, or color combinations that are registered to businesses; industrial designs; patents on new inventions, whether products or processes, in the realm of technology; and other innovations such as the layout designs of integrated circuits. The agreement also establishes specific procedures for monitoring compliance with TRIPS rules, settling disputes, and enforcing the ruling of the WTO. Noncompliance with TRIPS could result in the imposition of WTO trade sanctions.

The agreement is binding on WTO member nations. Compliance with the terms of the TRIPS agreement was phased in during the 1990s and early 2000s.

Advanced countries were required to make the necessary adjustments to national regulations and legislation by 1996. In most cases, the IPRs spelled out in the TRIPS agreement were already in effect in the advanced economies. A transition period for emerging markets and developing countries mandated compliance by 2000. Some of the world's least developed countries (LDCs) were given until 2006 to fulfill the terms of the agreement. The TRIPS agreement also respected the past work of the World Intellectual Property Organization (WIPO), a specialized agency within the United Nations System. WIPO administers 23 international treaties that deal with the protection of intellectual properties. In 2004, WIPO's Patent Cooperation Treaty recorded its one-millionth patent filing.

Economists view protections for patents and copyrights as essential to invention, innovation, and the spirit of entrepreneurship in the global economy. Violations of IPRs, on the other hand, reduce business profits and investments and cheat governments out of legitimate tax revenues. The United States initiated several legal actions related to TRIPS in recent years, mainly against piracy of copyrighted materials in other advanced economies. In 2005, however, the biggest IPR showdown was emerging between the United States and China. High-level negotiations between the economic giants resulted in assurances that rampant IPR piracy in China would be curtailed through improved legal rules, enforcement, and a national education campaign. In 2004, the administration of President George W. Bush pledged to monitor the piracy issue vigorously under its Strategy Targeting Organized Piracy (STOP!) initiative.

TRANSNATIONAL CORPORATIONS

A transnational corporation (TNC) is a company that is based in one country but owns or controls other companies, called affiliates, in one or more additional countries. From its headquarters in one country, this parent company exercises direct control over the policies of its affiliates, including policies related to the production and distribution of goods. The ownership of TNCs might be private, public, or some mixture of the two. Also called multinational corporations (MNCs), or multinationals, TNCs have strengthened the economic web that binds the global economy. The United Nations Conference on Trade and Development (UNCTAD) reported that about 62,000 TNCs, with 927,000 foreign affiliates, operated in the global economy by the early 2000s. In 2003, TNCs' foreign affiliates employed 54 million workers and controlled assets in excess of $30 trillion.

Ranked by total revenues, in 2016 Walmart Stores was the world's largest TNC (for the 11th time since 1995), with sales receipts of $482 billion, according to *Fortune*'s Global 500 List of the World's Largest Corporations. Walmart was also the world's largest corporate employer, with 2.3 million employees. Walmart is a privately owned U.S. company, with its corporate headquarters located in Bentonville, Arkansas. The corporation's primary business is retail trade, which encompasses four main divisions: Walmart Stores, Walmart Supercenters, SAM's Clubs, and Walmart Neighborhood Markets. Since the opening of the first Walmart store in 1962, the retail empire has focused on high-volume, low-margin retailing to guarantee low prices for consumers. In recent years, Walmart has come under increased scrutiny for exerting pressure on producers in global supply chains to reduce production costs, regardless of the impact on low-wage foreign labor. In 2004, about 11,500 Walmart retail outlets operated in 23 countries.

Top Transnational Corporations by Revenues, 2015 lists the world's top 10 TNCs, ranked by total revenues (in millions):

1. Walmart ($482,130)
2. State Grid ($329,601)
3. China National Petroleum ($299,271)
4. Sinopec Group ($294,344)
5. Royal Dutch Shell ($272,156)
6. Exxon Mobil ($246,204)
7. Volkswagen ($236,600)
8. Toyota Motor ($236,592)
9. Apple ($233,715)
10. BP ($225,982)

All but four of the world's top 100 corporations are headquartered in the advanced economies.

Ranked by the number of employees, Walmart was again the world's top transnational corporation in 2015 with 3.2 million employees followed by McDonalds (1.9 million), China National Petroleum (1.6 million), State Grid Corporation (1.5 million), and Hon Hai Precision Factory (Foxxcon) (1.2 million).

TNCs are also ranked by the dollar value of their foreign assets. Foreign assets include manufacturing or assembly plants, warehouses, equipment, and so on. According to the *World Investment Report 2016,* Royal Dutch Shell, Toyota Motor Corporation, General Electric, Total SA, BP, Exxon Mobil, Chevron, Volkswagen Group, Vodaphone Group, and Apple Computer held the 10 largest values of foreign assets, as shown in *World's Top TNCs by Foreign Assets, 2015*. Ranked by foreign assets, 99 of the top 100 TNCs hailed from advanced economies. Heavily represented in the top 100 TNCs were firms headquartered in European Union countries, North America, and East Asia and the Pacific. The United States entered 26 TNCs on the top 100 list, the largest total for a single country. The lone developing country penetrating the top 100 was Mexico, with America Movil SAB occupying the 95th position in the ranking.

Some TNCs are conglomerates. A *conglomerate* is a highly diversified corporation. For example, Unilever is one of the world's most diverse conglomerates, founded in 1930 and headquartered in the United Kingdom and the Netherlands. During the 1960s, Unilever acquired numerous firms in areas such as food, home care, and personal care. During the 1990s, the company reversed course by divesting itself of certain brand names and discontinuing others. Several popular

Unilever-owned brands in U.S. markets include Ben & Jerry's ice cream, SlimFast diet products, Lipton tea and soft drinks, Birds Eye frozen foods, Bertolli Mediterranean cuisine, Wish-Bone salad dressing, Dove soaps, and Pond's skin creams.

TNCs are a favorite target of antiglobalization activists, nongovernmental organizations, and other elements of civil society. Activists argue that TNCs put corporate profits ahead of corporate social responsibilities. In the process, they say, TNCs sacrifice people's quality of life by lowering workers' wages, ruining local environments, and disrespecting local cultures.

In effect, anti-globalization activists view trade and investment liberalization as an invitation for TNCs to exploit human and natural resources at the bottom of the supply chain. Pro-globalization forces, including major multilateral organizations and TNCs, counter that TNC investment and other cross-border business activity stimulate job and business creation. Pro-globalization forces also note the positive impact of TNC investment on technology transfers, capital formation, and the infusion of modern management skills to economies in the developing world. TNCs conclude that foreign investment is an important engine of sustainable economic growth.

TREATY OF ROME, 1957

On March 25, 1957, France, the Federal Republic of Germany (West Germany), the Netherlands, Belgium, Italy, and Luxemburg signed the Treaty of Rome, establishing the European Economic Community (or EEC, also known as the Common Market) and customs union. Also on that day, these same countries signed the European Atomic Energy Community Treaty (EAEC, or Euratom), created for the purpose of developing peaceful applications of atomic energy. Collectively, the treaties are known as the Treaties of Rome. National parliaments then ratified the treaties, with their full effect beginning on January 1, 1958. The EEC has since grown into the European Union (EU).

Before establishing this treaty, political and social leaders had spent many years trying to reconstruct Europe after the devastation of World War II. Sir Winston Churchill even posed the idea of a United States of Europe in 1946. In 1951, the creation of the European Coal and Steel Community (ECSC) opened the markets for those products between several countries in continental Europe. Robert Schuman (Germany) and Jean Monet (France), along with Paul-Henri Spaak (Belgium) and others, saw this as a beginning for a common Europe. They believed that greater cooperation between France and Germany would bring greater prosperity for all and would end any chance of war between these nations. Benelux (Belgium, the Netherlands, and Luxemburg) suggested a meeting in Messina, Sicily, in June 1955 with West Germany, France and Italy—the members of the ECSC.

This meeting, chaired by Paul-Henri Spaak, established four institutions: a commission, a council of ministers, a European parliament, and a European court of justice. It led to a proposal for a general common market and a European atomic energy authority. The common market zone was founded on the "four freedoms"—the free movement of persons, services, goods, and capital. It would create a large space in Europe with the same trading policy, challenge the economic might of the United States, combine resources for expansion and greater prosperity, and raise the standard of living for participants.

The treaty included the adoption of a Common Agricultural Policy between members. This enacted a free market for agricultural products within the EEC with protectionist policies for European farmers. The treaty also prohibited monopolies, some transport common policies, and some commercial privileges for the colonial territories of the member states. There was no agreement on how to treat nonmembers relative to both import duties to the common zone or a common agricultural policy from nonmembers. Great Britain also sent representatives to the Messina Conference in July, but ultimately did not join as it was concerned about loss of independence.

The treaty would lay the foundation of a progressive political integration between member nations. It established a gradual approach to building the EU in 1993. The EEC's treaty remained a key document for the new EU, and the organization was renamed the European Community (EC). The treaty was retained until the Lisbon Treaty of 2009, when it was eliminated and the Treaty of Rome was formally renamed the Treaty on the Functioning of the European Union.

TRIANGLE TRADE

The term *triangle trade* refers to a historic transatlantic trading pattern involving the import and export of goods. The three sides of the route—or triangle—involve sea voyages from Europe to Western Africa, from Western Africa to the Americas, and from the Americas back to England. Trade centered on manufactured products from Europe, including guns, cloth, and beads; slaves from West Africa; and such raw materials and natural resources as sugar, tobacco, and cotton from the Americas. The natural ocean currents and trade winds across the Atlantic also made this route easier to navigate. Cross-Atlantic trade existed prior to this system; however, triangle trade carried a higher risk and therefore a greater potential profit. This system was invaluable for England's mercantilism, through which the colonies helped their parent country to prosper.

The first leg of the triangle consisted of travel from England to Africa. On this part of the voyage, slave ships would leave from English ports with English goods such as cloth, guns, munitions, ironware, and drink. In the beginning, these goods were traded for gold, other metals, feathers, and ivory tusks along the West African coast.

Later it became more profitable to trade with slave traders or African chiefs for men, women, and children. African dealers would kidnap people from inland villages, then force-march these people to the coast and trade them for European goods. The traders would hold the enslaved people until a ship arrived. It often took several months for a captain to completely fill his ship. Many times, the kidnapped Africans violently resisted the slave ship crews; "free" Africans also attacked these ships from shore. Slavery had existed within Africa for hundreds of years prior to triangle trade. The Spanish and Portuguese had used slaves extensively during this period. The English did not join this practice until 1562, when Sir John Hawkins tried the triangular route and made a profit on every leg.

The second leg of the triangle—often called the Middle Passage—involved travel from West Africa to the West Indies or the Americas. Slaves were densely packed onto ships and transported under horrible, subhuman conditions. The mortality rate for these people was 12 percent or higher; traders referred to this simply as "the cost of the business." Once in the Americas, slaves were sold to the highest bidder at slave auctions or were traded for tobacco, cotton, sugar, and molasses. These people were then enslaved to work on plantations as the property of the plantation owners. They had no rights, and many times their work and living conditions included harsh and violent punishment.

The last leg of the triangle was travel from the West Indies or the Americas back to England. Goods and produce such as sugar, tobacco, and cotton from the plantations were taken back to Europe for sale.

An alternate triangle involved the trade of rum and goods from New England to West Africa, the trade of slaves from West Africa to the West Indies, and the trade of sugar from the West Indies to New England.

The triangle trade route is estimated to have been used to sell 10–12 million people into slavery. It lasted for about 300 years, until many countries abolished the practice of slavery.

TRICHET, JEAN-CLAUDE

Born: December 20, 1942, in Lyon, France; Nationality: French; Professional Interests: monetary policy, public administration; Major Works: unpublished papers and speeches.

Jean-Claude Trichet is a former president of the European Central Bank (ECB). He was instrumental in establishing the euro system and the ECB when it began in 1999. In the 1970s, Trichet was France's general inspector of finance. He became director of France's Treasury Department in 1987. Trichet was France's head central banker as governor of the Bank of France in 1993. He served as president of the ECB from 2003 to 2011.

Jean-Claude Trichet was born on December 20, 1942, in Lyon, France. He obtained a degree in civil engineering from the École des Mines de Nancy in 1964. In 1966, he graduated from the University of Paris with a degree in economics and certificate in political studies.

Trichet began his career as an engineer before joining the French government in 1971. Prior to becoming president of the ECB, Trichet held positions in several French government agencies, including the general inspector's office; the Treasury Department, in which he held several positions; and Economic Affairs. In 1987 he became director of the Treasury Department, and in 1993 he began his first term as governor of the Bank of France, France's central bank.

Jean-Claude Trichet's tenure as director of the French Treasury was marred with scandal in 2002. In what was labeled the Credit Lyonnais Affair, several banking officials, including Trichet, were charged with fraud for manipulating financial reports to suppress the real business health of Credit Lyonnais. The reports were presumably altered to hide the actual losses on some property investments by Credit Lyonnais. The French government was the majority owner of Credit Lyonnais; the government used public monies to supply emergency funding, and the crisis was averted. Trichet was cleared of any wrongdoing in 2003. If any legal charges had been brought against Trichet and he had been convicted of them, he would not have been eligible for the ECB presidency.

Trichet was an active participant in the euro system's development and the launching of the ECB in 1999. Prior to his appointment as governor for the Bank of France, he served as chairman of the European Monetary Committee in 1992 and 1993. As governor, he also served as governor for the Bank of International Settlements and for the World Bank, furthering his experience and expertise in international banking. In 1994, he chaired the Council of the European Monetary Institute, and in 2003, as chairman of the Group of Ten Governors, he was a leading choice for president of the ECB.

Jean-Claude Trichet's term as president of the ECB began with expectations that he was a much better and more experienced policy maker and consensus builder than his predecessor, Wim Duisenberg. With the ECB, Trichet had a new single-currency region consisting of a wide diversity of countries. One of Trichet's early successes came in 2004, when he was able to slow the appreciation of the euro without a significant rise in interest rates.

Trichet was often faced with conflicts between what he thought was best for the euro region versus what each country thought was best for its own situation. This conflict was especially noticeable in 2004, when Trichet apparently felt a rate cut was warranted. In his transparent fashion of management, he made his assessment known to the press and the public, only to have it denounced and rejected at the bank's meeting. The politics of the euro zone had won out over the region's economic interests. Not only did his credibility take a hit, but so did the ECB's.

Debate and discussions over the Common Agriculture Policy (CAP) were another example of the interests of the European Union (EU) clashing with the interests of each sovereign nation member. Since well before the EU came into being, the direct subsidies and revenues generated through the tariffs imposed on non-EU goods as part of CAP have been a valuable source of revenue to EU countries. Thus, each attempt to revise or even repeal the subsidies or tariffs from CAP is met with stiff opposition.

In 2011, Jean-Claude Trichet stepped down as president of the ECB.

TROPICAL RAIN FORESTS

Tropical rain forests are located between the Tropic of Cancer and Tropic of Capricorn, primarily in developing nations within Central and South America, West and Central Africa, and Southeast Asia, where annual rainfall averages more than 2,500 mm annually.

These forests cover only a small part of the Earth's surface, but they contain well over half of the world's terrestrial plant, insect, and animal species, providing biodiversity levels unmatched by any other biome.

Tropical deforestation increased from approximately 7.75 million hectares per year in the 1920s, to a high point of approximately 14.67 million hectares per year in the early 1980s, to the recent level of approximately 7.43 million hectares per year through 2010. The rate of deforestation for the last three decades has been highest in Asia (1.1 percent, 2.9 percent, and 4.1 percent in the 1980s, 1990s, and 2000s, respectively). Latin America and Africa are behind this figure with annual losses of between 0.7 percent and 2.1 percent, but also increasing over this time period. In absolute terms, the total amount of primary forest lost has been greatest in Brazil, India, and Mexico, totaling over 374 million, 261 million, and 132 million hectares by 2005, respectively. The largest source of tropical deforestation is the conversion of primary forest to cropland and pasture.

Tropical deforestation is of global concern, because these ecosystems are critical for hydrological and carbon cycles; they provide habitat for rare species; and they generate local and regional benefits, including soil and erosion control and nontimber and timber forest products. These ecosystems have environmental impacts that reach far beyond political borders. For example, approximately 8 trillion tons of water evaporates from Amazonian forests each year, affecting atmospheric circulation and precipitation patterns that span continents and hemispheres.

The public good characteristics of tropical forests create a market failure that motivates economic policy aimed at forest protection and sustainable use. Unlike temperate forests, because of the inherent low fertility of the soils and slow growth rate of tropical timber species, tropical forests are often treated as a nonrenewable resource in policy. Policy analysis distinguishes between the sources, immediate causes, and underlying causes of deforestation to better identify the appropriate targets for policy and to develop the means by which these effects can be empirically measured. The sources of deforestation are described as the land uses that replace forest cover (such as agriculture, ranching, plantations, and urban land) and the activities that result in loss of forest cover (such as charcoal production and logging at high intensities). Policies to address the sources of deforestation target landowners, firms, and households. The immediate causes of deforestation include the set of existing choices as determined by agent characteristics and other exogenous factors (including tax incentives, market prices of goods produced on cleared land, laws, and regulations) that can be confounded by population dynamics.

Policies to address the immediate causes of deforestation target regional markets, transportation, and marketing infrastructure. The underlying causes of deforestation include the macroeconomic policies that promote or support deforestation through the design and implementation of specific laws and regulations (such as migration policies, industry level subsidies, and other government policies that directly or indirectly impact deforestation rates). These policies affect the immediate causes of deforestation and the sources of deforestation through regional and national markets that are impacted by social, political, and cultural norms and technological ability. Policies to address the underlying causes of deforestation target macroeconomic conditions and/or national and international markets.

Efforts to reduce deforestation and preserve biodiversity are often complicated by government policies that encourage economic development (such as road, dam, and settlement projects) to address poverty, foreign debt, and international trade deficits. Agricultural subsidies, tax breaks, and illegal logging have also contributed to forest clearing in many nations. Thus, given the inherent trade-offs between deforestation and development, strategies to reduce deforestation rates face the challenge of encouraging preservation while respecting national sovereignty to advance populations and tap natural resources for economic development. Some market-based interventions include timber certification programs, roundtables on sustainable production (such as for acai and palm oil), and moratoria (e.g., on beef).

At the local level, polices are focused on the sources of deforestation. In this case, government and nongovernmental organization policy goals can be divided between those that aim to stabilize agriculture (such as shade farming and agroforestry) and policies that seek to increase returns of the forest (such as the harvest of nontimber forest products, including rubber and native fruits and nuts). Government support for ecotourism can address the sources and the immediate and underlying causes by providing employment opportunities for local peoples as well as creating a national revenue source supported by federal preservation and park designations.

Internationally, programs that provide monetary incentives for developing countries to avoid deforestation and reduce deforestation rates are the most promising option to date. These programs that fall under REDD and REDD+ (Reducing Emissions from Deforestation and Forest Degradation). REDD "is an effort to create a financial value for the carbon stored in forests, offering incentives for developing countries to reduce emissions from forested lands and invest in low-carbon paths to sustainable development." These payments are made for conservation (or avoiding deforestation), sustainable management of forests, and the enhancement of carbon stocks.

U

U.S. AID FOR INTERNATIONAL DEVELOPMENT

The United States Aid for International Development (USAID) is the lead U.S. government agency that works to end extreme global poverty and enable resilient, democratic societies to realize their potential. The international development assistance program began after World War II ended in 1945. The USAID employs has more than 3,000 employees worldwide. USAID can be described as a hierarchy organization with multiple departments, such as office of the administrator, bureaus (which consist of various functionalities and geographic locations for USAID), independent offices, advisory committees, a board for international food and agricultural development, coordinators, and a global development council.

George C. Marshall was appointed secretary of state under President Franklin D. Roosevelt and continued under President Harry S. Truman, from 1947 to 1949. Marshall was responsible for providing significant financial and technical assistance to Europe after the war. Later on, this assistance became to be known as the Marshall Plan. The goal of the Marshall Plan was to rebuild Europe's infrastructure, strengthen its economy, and stabilize the region.

President Truman began expanding the Marshall Plan and proposed an international development assistance program in 1949. Immediately following this change, two goals were established: creating markets for the United States by reducing poverty and increasing production in developing countries, and diminishing the threat of communism by helping countries prosper under capitalism.

From early 1952 to 1961, programs supporting technical assistance and capital projects continued as the primary form of U.S. aid. They became a key component of U.S. foreign policy. Without delay, the U.S. government began adding key departments to what we now know as the USAID. In 1961, President John F. Kennedy signed the Foreign Assistance Act into law and created USAID by executive order. USAID's efforts to help combat poverty globally were in high demand, and this time became to be known as the "decade of development."

USAID is headquartered in Washington, D.C. The stated mission and vision of the USAID is to end poverty while promoting democratic societies, human dignity, and economic prosperity. USAID's values include integrity, inclusion, empowerment, and commitment to learning.

USAID has two distinctive branches. One is a presidential initiative, and the second is known as "divisions." The divisions consist of U.S. global development lab, agriculture and food security, democracy, human rights and governance, economic growth and trade, education, ending extreme poverty, environment and global climate change, gender equality and women's empowerment, global health, water and sanitation, and working in crises and conflict.

It is important to highlight that the USAID plays an active and critical role in the promotion of U.S. foreign policy interests. The various investments that the USAID makes in developing nations are considered to have long-term benefits for the United States of America and its citizens. American foreign policy has two strong components: defense and diplomacy. A third component is development. USAID devotes its resources to working in the following areas of the world: Afghanistan and Pakistan, Africa, Asia, Europe and Eurasia, Latin America and the Caribbean, and the Middle East.

UNITED KINGDOM: GENERAL ECONOMY

The U.K. economy is a market economy with an interesting history. Despite rough times in the past, today the U.K. economy is recovering. The United Kingdom is one of the oldest governments in the world, and it laid the foundation for the capitalist economic system. Early in its history, paired with Ireland the United Kingdom had the largest economy in the world, reaching its peak in the 19th century.

The United Kingdom's position of dominance in the world economy ended after World War I and World War II. The British economy was in shambles after the wars, and it would never be the same. Its economic influence declined, but it was still a key player in world economics.

Margaret Thatcher's time as prime minister, from 1978 to 1990, was a period of economic turmoil. Thatcher was a strong advocate for the market economy, espousing the economic theories of Friedrich von Hayek. She believed very strongly in privatizing many of Britain's government controlled industries. The special attention she devoted to privatizing Britain's coal industry often brought about violent confrontations with coal industry unions. In time, Thatcher prevailed and many of Britain's commanding heights industries became members of the private sector.

After Thatcher left office, the United Kingdom was no longer known as the "Sick Man of Europe." A more recent decline—the global financial crisis in 2007 and 2008—forced the United Kingdom into a deep recession.

Today the United Kingdom's economy is recovering. In the Economic Freedom scores that came out for 2015, the United Kingdom is ranked fifth out of the 43 European countries. The Index of Economic Freedom is a ranking system that reveals the advancement of economic systems in such categories as rule of law, government size, regulatory efficiency, and market openness. The United Kingdom improved on four of the ten Economic Freedoms.

The United Kingdom has had the fastest growing economy among the G7 countries. The G7 is a group of finance ministers and central bank governors—from Canada, Germany, Japan, Italy, France, the United States, and the United Kingdom—who gather to discuss economic issues. From 2012 to 2014 the United Kingdom had relatively strong growth even with weak consumer spending and business investment. In 2015 the Bank of England began discussing raising interest rates.

However, in June 2016, Great Britain voted to leave the European Union. The 52 percent to 48 percent vote by the voters in England, Wales, Scotland, and Northern Ireland was a referendum for Great Britain to separate itself from the EU. The Brexit vote, as it became known, raised concerns about Great Britain's economy going forward. Great Britain has significant trade and economic ties to the other countries of the EU and London has been a major financial center for EU activities. Great Britain's economic future not being an EU member is still to be written.

UNITED NATIONS CONFERENCE ON TRADE AND DEVELOPMENT

The UN Conference on Trade and Development, or UNCTAD, is a body of the United Nations that deals with problems that have to do primarily with international trade, a major part of economic development. The UNCTAD can be described by three words: think, debate, and deliver. One of the major fields in which the UNCTAD excels is data collection and statistics.

Created in 1964, the UNCTAD has played a huge role in the development of countries, and it has a major influence on international trade. The UNCTAD is made up of 194 member states that meet every four years to discuss trade and development issues.

UNCTAD also is concerned about investments. Every two years it holds a world investment forum to promote investments that assist in global development. The investments and international trade not only contribute to the economy, but also contribute in building up countries that are not yet where the organization feels they need to be.

Development is a main goal of UNCTAD. The other issues, like trade and investment, have end goals of helping to develop countries. A forum of experts focuses on development through three key tasks: (1) building, researching, and analyzing different policies; (2) collecting data to present for debate and discussion; and (3) providing assistance designed for specific developing countries. The UNCTAD gives special attention to countries that are the least developed, plus the countries whose economy is going through a transition.

Not all development and growth is good, though. UNCTAD's analyses provide information about the consequences of globalization for countries that are being developed. UNCTAD conducts its research through data and statistics. Statistics strengthens the UNCTAD, which serves as a middleman between those who provide statistical data and those who use that data.

UNCTAD has a goal of helping the world achieve sustainable development by 2030. UNCTAD assists in progressing 52 specific targets categorized under 10 of the 17 sustainable development goals. UNCTAD's goal is to help achieve the future of prosperity.

UNCTAD is a key player in the world of macroeconomics. The organization views how different trades and investments help expand the world economy and benefit the developing economies of the world. UNCTAD also wants to ensure that the economies keep going in the right direction; thus, most of UNCTAD's activities are aimed at moving toward the goal of sustainable development.

V

VINER, JACOB

Born: May 3, 1892, in Montreal, Canada; Died: September 12, 1970, in Princeton, New Jersey; Nationality: American; Professional Interests: public policy, international trade, history of economic thought; Major Works: *Dumping: A Problem in International Trade* (1921), *The Customs Union Issue* (1950).

Jacob Viner was an accomplished economist of international stature, covering topics that span the spectrum from pure theory to public policy. His major fields of research and influence were in the theory of international trade and the history of economic and social thought. Viner died in 1970.

Jacob Viner was born on May 3, 1892, in Montreal, Canada, and he later became a naturalized citizen of the United States. He graduated from McGill University in 1914, came to the United States, and received his doctorate from Harvard University in 1922, where he was a pupil of Frank W. Taussig; the two men later became close friends and colleagues.

Viner was an instructor at the University of Chicago for nine years, beginning in 1916, while writing his dissertation on international trade under the direction of Taussig. He subsequently held professorships at the University of Chicago from 1925 to 1946 and later at Princeton University from 1946 until 1960, when he was given emeritus status.

It was at the University of Chicago that he developed his seminal theories of international trade. Viner's first work, *Dumping: A Problem in International Trade*, was published in 1923. His thorough analysis of the economic significance of dumping as a method of international competition laid the groundwork for subsequent studies in international trade—including Viner's doctoral dissertation, which was published in 1924 as *Canada's Balance of International Indebtedness: 1900–1913*.

Among Viner's works are his lecture to commemorate the sesquicentennial of the publication of *The Wealth of Nations,* titled "Adam Smith and Laissez Faire," in 1927; his *Studies in the Theory of International Trade*, a history of trade theories and policies, in 1937; and his *Guide to John Rae's "Life of Adam Smith."* These established him, along with Joseph A. Schumpeter, as one of the leading economic historians of his time. Viner's 1940 Harris Foundation lecture "International Economic Relations," published in 1941 as *The Foundations of a More Stable World Order*, called for an international cooperation of political and economic resistance to all forms of dictatorship.

In 1950 Viner, by that time teaching at Princeton University, published *The Customs Union Issue*, a groundbreaking analysis of the trade-creating and trade-destroying effects of customs unions throughout the 19th and 20th centuries. Also in 1950, he delivered a series of lectures at the National University of

Brazil (published in 1952 as *International Trade and Economic Development*) that applied international trade theory to present-day problems. In 1958, *The Long View and the Short: Studies in Economic Theory and Policy* was published in commemoration of Viner's 65th birthday. This compilation of his previously published essays, ranging from economic theory and policy to the history of economic thought, and shorter book reviews also contained his famous 1931 essay "Cost Curves and Supply Curves," making an important micro-contribution by helping to simplify the Marshallian long-run average cost, or planning, curve.

Viner, along with Frank Knight and Henry Simons, has been identified as a cofounder of the Chicago school of economics. Additionally, he was editor of the *Journal of Political Economy* for 18 years, and he served on the U.S. Tariff Commission and the Shipping Board during World War I. He participated in the early planning of the Social Security program of the 1930s and was a consultant to the U.S. State Department and the board of governors of the Federal Reserve.

Jacob Viner served as president of the American Economic Association in 1939. He was a permanent member of the Institute for Advanced Study at Princeton and an honorary fellow at the London School of Economics. In 1962, Jacob Viner was awarded the Frances A. Walker Medal by the American Economic Association.

Jacob Viner died on September 12, 1970, in Princeton, New Jersey.

VOLUNTARY QUOTAS

A *voluntary quota* is a bilateral trade agreement that limits the import of a specific good or expands the export of a certain good. Thus, a voluntary quota is a type of trade barrier. A voluntary quota is an alternative to imposing an import quota by law or decree. Once a voluntary quota is negotiated, the terms are binding. Voluntary quotas were often viewed as a type of backdoor protectionism. That is, for decades voluntary quotas sidestepped free trade pledges made under the General Agreement on Tariffs and Trade (GATT) and the World Trade Organization (WTO). The two types of voluntary quotas are voluntary export restraint and voluntary import expansion agreements.

The voluntary export restraint (VER) is a bilateral agreement that restricts the quantity of a product that can be exported from one country to another. Weight, number, volume, and other units are used to measure the quantity of an exported good. The United States negotiated a VER with Japan during the early 1980s to protect the ailing U.S. auto industry from a surge of Japanese auto imports. The VER set a number limit of 1.68 million Japanese auto imports in 1981. The VER was raised to 1.85 million Japanese autos in 1984, and to 2.3 million autos in 1985. This VER was eventually removed in the early 1990s. During the 1950s and 1960s, many other VERs were negotiated between the advanced countries and such East Asian countries as South Korea and Chinese Taipei in the textile, clothing, and footwear industries.

A second type of voluntary quota is voluntary import expansion (VIE). VIE is a bilateral agreement that requires one country to accept additional imports from a second country. VIEs are sometimes negotiated to level the playing field in international trade by counteracting nontariff trade barriers in the first country. Nontariff trade barriers include licensing and excessive product-testing requirements. In the mid-1990s, the United States negotiated a VIE agreement that required Japan to open its doors to additional U.S.-produced automobiles and auto parts. VIE agreements might also be negotiated to help correct a severe trade imbalance between two countries.

Voluntary quotas, like other trade barriers, are a form of trade protectionism. VERs, for example, were used extensively by advanced economies over the past 50 years to restrict imports of clothing and textiles from low-wage developing countries. During the 1950s and 1960s the United States and the European Economic Community (EEC) negotiated VERs with emerging Asian economies to limit their clothing and textile exports. Later, many VERs were absorbed into multilateral agreements, such as the Multi-Fiber Agreement in the early 1970s and the Agreement on Textiles and Clothing in the mid-1990s.

The WTO, which began operations on January 1, 1995, banned new VERs, and set in motion a phaseout of existing VERs. The Agreement on Textiles and Clothing was formally terminated in January 2005. In May 2005, President George W. Bush invoked the "safeguard clause" to limit the annual growth of some Chinese imports to the United States. Under the safeguard clause, which was built into China's WTO accession agreement, the U.S. president can restrict the growth of certain imports to 7.5 percent per year. The safeguard clause offers some protection for U.S. industries threatened by imports from China.

W

WASHINGTON CONSENSUS

The Washington Consensus refers to a series of 10 economic policy priorities put forth by economist John Williamson in an article published in 1989 and disseminated by the Institute for International Economics. The motivation for this document came from a desire for sound economic policy recommendations to Latin American countries seeking to establish long-term economic growth in the wake of the Lost Decade of the 1980s. Williamson's policy recommendations addressed what he believed were the steps that developing nations which experienced economic distress needed to consider in order to position themselves for economic success in the future. The Washington Consensus is important because it has deeply influenced the typical structures of conditionality that international organizations such as the International Monetary Fund (IMF) had mandated when extending credit to struggling nations.

The Washington Consensus highlights 10 key points, ranging from fiscal policy and monetary policy to trade, exchange rate stabilization, and domestic market-oriented rules. The key points include a nation's ability to create small, manageable budget deficits and to spend public monies on services that provide greater returns, such as primary education, health care, and infrastructure investment.

One of the main fiscal policy changes under the Washington Consensus is tax reform. According to the Consensus, it is important for the nation both to broaden its tax base and to reduce its marginal tax rates. It is also important to free up interest rates so they more accurately reflect current market interest rates.

A second series of Consensus objectives revolve around a nation's exchange rate manipulations and trade policies. The Consensus advocates an export-friendly exchange rate, so that additional domestic products have the possibility of being exported. Along trade-policy lines, it is also important for the nation to replace quota restrictions with temporary tax revenue tariffs on imports. The tariffs would be gradually reduced to a more uniform rate for all protected imports. Trade policy adjustments also include the reduction or total elimination of any barriers that restrict or are disincentives for foreign direct investment.

The final set of Consensus goals focuses on the nation developing a more market-oriented domestic market. These goals include privatizing any state-owned enterprises and reducing or eliminating any regulations that restrict new businesses or competition in an existing market. Finally, the goal that some consider most important is to work toward an economy based on private property and property rights protection through a creditable court system with the rule of law. For developing nations, this last goal is especially important in the less-organized, or informal, sector of the nation's economy.

The above points all coalesce around a central theme: If developing second-world nations wish to promote long-term economic growth, they need to embrace liberalized economic policies. At the time the Washington Consensus was written, Latin American nations tended to trend toward such economic interventions as the Import Substitution Industrialization (ISI) policies that had been prevalent during the 1970s and 1980s. The Consensus advocated a move toward a more market-oriented approach.

Many commentators suggest that the Washington Consensus implicitly endorses a strong free market approach. It is safe to say that the above points incorporated such concepts as the rule of law and private property rights. In addition, countries should refrain from activist economic intervention in the economy. In areas where government has a proper role in administrating national resources, the Consensus advocates directing those resources toward efforts such as providing education to as many citizens as possible, in order to build up the intellectual capital of the country.

In the years since the Washington Consensus was authored, the historical economic track record for Latin American nations has been mixed. Although a great number of Latin American countries initiated policies called forth in that document, and have successfully lowered their levels of sovereign debt, brought down inflation, and expanded their levels of international trade, there simply has not been a wave of economic prosperity.

Some nations, such as Chile, have enjoyed relatively strong economic growth. Other nations, most notably Argentina, have struggled to achieve consistent and positive economic growth rates. There are some factors that partially explain why Latin America has not enjoyed widespread economic success, despite its attempts at economic liberalization. These shortcomings relate back to elements of the Consensus that have not been successfully achieved. In particular, Latin American countries have not successfully moved forward on efforts to invest in their domestic human capital. Overall education levels, an important part of the Consensus, still lag. One of the byproducts of this shortcoming is continuing high levels of poverty.

The Washington Consensus remains a relevant and important document. Although its authors never intended for it to represent a complete economic program, the document nonetheless blueprints key elements for second world countries to consider in their pursuit of further economic development. The evidence for this lies in the fact that many of the recommendations used in current times by the IMF when negotiating conditionality with nations that require IMF assistance.

WATER IN DEVELOPMENT

Most readers of this entry probably woke up this morning and turned on a tap to get water for their first cup of coffee (or tea) or reached into a refrigerator for a beverage. Unfortunately, for billions of people around the world, obtaining drinking water is much more challenging. It probably involves a family member walking a few miles, standing in line to collect just one jerrican of water from an unreliable public source, hauling this awkward container all the way home under the unrelenting sun, storing the water in a somewhat clean vessel, and finally maybe filtering and or boiling some of the water to provide for several family members. Does economics have any insights on these two very different realities—that is, why an environmental resource such as water is obtained and consumed in such strikingly different ways around the world?

While water is an essential input for agriculture and various manufacturing and other industries, we focus on the use of water for drinking and human consumption because the benefits (for human health) relative to the costs are perhaps most striking. Additionally, many of the arguments discussed later also apply to the demand for and supply of water in agriculture and industry in the developing world. We do not need a lecture on how to resolve the diamond–water paradox—the fact that diamonds are less useful but more expensive than water—to realize that the willingness to pay for clean sufficient regular water (i.e., high demand primarily because of health benefits) usually exceeds the costs of supply. Thus, the task of providing abundant, clean, and reliable water to large populations was tackled head-on by planners in the United States, Europe, and many newly industrialized countries. Western governments decided early in the development process to invest in centralized water treatment plants from which water is distributed to individual houses through a network of underground pipes, and that each of these houses has a meter by which to compute consumption and generate bills to partially cover the operating costs.

Unfortunately, in much of the developing world it has been virtually impossible to replicate this strategy because of a combination of reasons related to (1) lack of resources, including information; (2) tropical ecology and climate, leading to frequent and high incidences of disease (including water-borne diseases); and (3) historical factors influencing governance and institutional evolution (or the lack thereof). More recent studies offer deeper reasons for why policy analysts appear to have consistently overestimated benefits and underestimated the cost of supplying clean water in developing countries.

On the demand side, the common assertions are that the citizens of developing countries are simply too poor to pay for clean water and/or are misinformed about the dangers of drinking water that is contaminated with microbial and other pollutants. Further probing suggests at least four deeper and complementary reasons for low realized demand:

1. Households exposed to contaminated water also face a host of environmental and other exposures, such as high levels of air pollution. Thus, even if people pay for clean water, their health may not noticeably improve because of a myriad of exposures.
2. Even noticeable improvements in health might not translate into higher human capital returns, because of missing educational and labor markets; that is, healthy bright future workers may have limited earning potential.
3. Without clear market signals, potential users may pay too much attention to other preference modifiers, including such sociological factors as peer pressure (i.e., because everyone else in their community is consuming water from traditional sources), or to psychological drivers such as high discount rates or risk aversion that lead to a down-weighting of future uncertain benefits.
4. Demand may be low for the service that is delivered (few hours, low volume, contaminated water) compared with the conceived service, subject to benefit–cost analysis for planning.

On the supply side, costs are likely underestimated for at least three reasons:

1. For all intents and purposes, water supply is a quasi-public good that requires costly coordination among users leading to high transaction costs for sustained provision. For example, if all households in a remote village do not make timely financial or labor contributions, the system will break and maintenance and upgrading will cease.
2. Improving public source water quality leads to limited health benefits, unless accompanied by other complementary (but costly) behaviors such as safe water handling and handwashing by a majority of households. Prevention and infection externalities dominate and make household coordination unlikely and/or very costly.
3. Dysfunctional governance and weak accountability result in inefficient implementation, with corruption as a primary source of leakage or high effective unit costs of delivery.

The academic and practitioner communities are working hard to fill our knowledge gaps regarding many of the demand and supply questions surrounding water. Applied economists are conducting field experiments and/or relying on quasi-experiments around the developing world to understand, for example, how provision of information on the quality of drinking water changes demand and how community-level social capital and collective efficacy reduce the average cost of water supply. Drawing on some of these findings, increasingly, donors and aid agencies have broadened their objectives from a narrow focus on physical infrastructure to a sustainable service provision through three types of programs:

1. Donors have focused on helping utilities reduce costs and increase revenues to become financially viable, thereby improving and extending service delivery.
2. We have witnessed a rise in large-scale projects in which corporate entities, with private equity, assume operating risk and/or develop under a license or contract to deliver water.

3. The community is being put front and center in the planning, design, implementation, and operations processes—replacing career bureaucrats with qualified technocrats as project guides. This philosophy is typically captured in reflecting community needs through participatory planning, decentralized delivery, cost-sharing (typically 10 percent of capital and 100 percent of operations costs), and strengthening local institutions.

The jury is still out—that is, there are few rigorous impact evaluations—on whether these reforms will remove the large disparities in drinking water needs around the world.

WOLFSON ECONOMICS PRIZE

The Wolfson Economics Prize was announced on October 18, 2011. Simon Wolfson, Baron Wolfson of Aspley Guise and a Conservative life peer, offered a £250,000 reward for proposals on how to safely dismantle the euro. The prize was organized by the Policy Exchange think tank, an independent, nonpartisan educational charity that seeks free market and localist solutions to public policy questions.

Wolfson voiced the concern that political or economic pressure would force a state to leave the euro, possibly causing catastrophe for European savings, employment, and international banking stability. The winning plan should describe what a post-euro zone would look like; how a smooth transition would be achieved; and how the interests of employment, savers, and debtors would be balanced. In addition, prize entries were to address the impact of their proposal on the international banking system.

The 2012 winner, Roger Bootle, led the Capital Economics team to win with an entry titled “Leaving the Euro: A Practical Guide.” In their proposal the team concluded that even though there would be some loss with the exit of one or more members from the euro, the overall effect would be positive for future growth and prosperity. Bootle recommended that if a single member such as Greece were to leave, a new currency should be introduced at parity with the euro on the first day for wages, prices, loans, and deposits to be redenominated into the new currency on a one-to-one ratio. The Capital Economics team also recommended allowing existing euro notes and coins to be used for small transactions for six months, and for the exiting country to announce a system of inflation-targeting, adopt tough fiscal rules monitored by independent experts, outlaw wage indexation, and issue inflation-linked government bonds. In addition, the leaving country should redenominate its debt into the new national currency and renegotiate the terms of the debt. These actions might incur substantial default, reducing the ratio of debt to gross domestic product (GDP) to 60 percent.

Other of the team's ideas were for the key officials of the leaving country to meet in secret one month before making their intentions public. Other euro zone partners and international monetary organizations would be notified three days before, preferably on a Friday. At that notification, it would be announced publicly that the currency change would occur the following week; then, in order to prevent capital flight, all domestic banks and financial markets should close. The exiting country and other EU institutions would then work to minimize any legal uncertainty.

The 2014 Wolfson Economics Prize was awarded to David Rudlin, the director of the urban design and research consultancy URBED (Urbanism, Environment and Design), located in Manchester and London. The 2014 competition sought solutions to this question: "How would you deliver a new Garden City which is visionary, economically viable, and popular?" The concept of a "garden city" was created in England as an urban planned community with green areas (greenbelts) and a planned mix of industry, agriculture, and homes. The winning proposal recommended the abolition of new garden cities and proposed instead to allow existing cities to expand and use a portion of the greenbelt. The British government has rejected the idea, however, stating that it is committed to protecting the greenbelt from development and urban sprawl.

WORLD BANK

The World Bank, formerly known as the International Bank for Reconstruction and Development (IBRD), was founded in July 1944 in the city of Bretton Woods, New Hampshire. The agreement to form the IBRD was largely brought about by representatives from the United Kingdom and the United States.

The World Bank is a cooperative made up of 189 member countries. These member countries can also be considered as shareholders. They are represented by a board of governors that is the ultimate policy maker at the World Bank. The governors are member countries' ministers of finance or ministers of development. They meet once a year at the annual meetings of the boards of governors of the World Bank Group and the International Monetary Fund. The World Bank is headed by a president who is nominated by the board of executive directors and is entitled to a renewable five-year term. The World Bank is made up of two independent organizations, the International Bank for Reconstruction and Development (IBRD) and the International Development Association (IDA), which assist the poorest countries with their development needs.

The World Bank is recognized as an international financial institution with a goal of ending poverty in the world. Headquartered in Washington, D.C., the organization has more than 10,000 employees and has 120 offices worldwide. Its staff members come from various professional backgrounds, including economists, public policy experts, sector experts, and social scientists. The World Bank's mission is to work toward ending poverty by providing loans to developing nations for capital programs.

The World Bank has established different methods of ending poverty in developing nations. The different methodologies include investments in environmental and natural resource management, education, health, public administration, infrastructure, and financial and private sector development. Most projects are jointly funded in conjunction with private investors, commercial banks, governments, and other interested institutions.

A focus on innovative knowledge sharing by the World Bank has brought programs and educational tools to developing nations. Through innovative knowledge sharing, the World Bank supports developing countries with policy advice, research and analysis, technical assistance, investment advice, and capacity development. The World Bank sponsors, hosts, and participates in a wide range of conferences and forums on issues pertaining to development, usually with the help of outside partners.

To help developing nations end poverty, the World Bank has worked continuously through five of its internal institutions:

1. The International Bank for Reconstruction and Development (IBRD) was founded in 1944. It aims to reduce poverty in middle-income countries and creditworthy poorer countries by promoting sustainable development through loans, guarantees, risk management products, and analytical and advisory services.
2. The International Development Association (IDA), founded in 1944, aims to reduce poverty by providing loans—also referred to as "credits" and grants—for programs that boost economic growth, reduce inequalities, and improve people's living conditions.

3. The International Finance Corporation (IFC) was launched in 1950. It is the largest global development institution focused exclusively on the private sector. The IFC helps developing countries achieve sustainable growth by financing investment, mobilizing capital in international financial markets, and providing advisory services to businesses and governments.
4. The Multilateral Investment Guarantee Agency (MIGA), founded in 1988, aims to promote foreign direct investment into developing countries to support economic growth, reduce poverty, and improve people's lives. MIGA fulfills this mandate by offering political risk insurance (guarantees) to investors and lenders.
5. The International Centre for Settlement of Investment Disputes (ICSID) was created as an impartial international forum, providing facilities for the resolution of legal disputes between eligible parties through conciliation or arbitration procedures.

WORLD ECONOMIC FORUM

The World Economic Forum (WEF) is a nonprofit foundation committed to improving people's quality of life and improving the state of the world. WEF members and partners come from the global business community. Today, WEF consists of about 1,200 member companies, mostly large transnational corporations (TNCs). Partner companies share WEF's commitment to building a stronger, more prosperous global economy. Members and partners work closely with other stakeholders in economic growth and development. Key stakeholders include governments, academics, nongovernmental organizations (NGOs), and civil society organizations (CSOs). WEF's headquarters is located in Cologny, Switzerland. The forum's largest meeting, the Annual Meeting, is held in Davos, Switzerland.

Klaus Schwab, a business professor at the University of Geneva, founded WEF in 1971. Schwab created the European Management Forum, the precursor to WEF, after hosting a successful conference attended by business leaders. The organization's name was changed to World Economic Forum in 1987, largely to reflect its more global outlook. WEF provides a forum for communication among leaders in the private and public sectors of the global economy. WEF members, partners, and other invited leaders discuss issues related to the business and investment climate and to sustainable growth and development. Recent discussions have focused on the importance of good governance and the rule of law, gender equity in education, entrepreneurship, and environmental protection. At the 2005 annual meeting, measures were proposed to reduce global poverty, including improved foreign aid delivery systems, reduced trade barriers, and strengthened anticorruption partnerships.

Through the WEF's publications, its research staff complements the work conducted at meetings and summits. WEF research on global competitiveness identifies strengths and weaknesses in nations' economies. WEF's flagship publication, *The Global Competitiveness Report*, is among the world's most authoritative statements on the competitiveness of nations. Businesses, scholars, governments, labor organizations, multilateral organizations, and aid agencies use WEF's research to form policies in the public and private sectors. The two barometers of competitiveness shown in the annual report are the Growth Competitiveness Index and the Business Competitiveness Index. The Growth Competitiveness Index is mainly concerned with macroeconomic stability and the strength of nations' public institutions and infrastructure. The Business Competitiveness Index is mainly concerned with such microeconomic indicators as business management and corporate strategies. Combined, the indexes paint a portrait of hospitable and inhospitable economic environments under which economic activity occurs in the global economy. The advanced economies are clustered at the top of each index ranking, and the poorer developing countries are clustered near the bottom.

In recent years, WEF has come under fire from a number of NGOs and others that are opposed to globalization and the dominance of the industrial global North over the poorer regions of the global South. Critics point out that membership in WEF is highly selective, not elected, and not representative of the diverse interests of the peoples of the world. Critics argue that the WEF is more concerned with the profits of TNCs than with improving people's quality of life. During the early 2000s, antiglobalization demonstrations targeted WEF annual meetings in Davos and WEF's regional meetings. Similar protests disrupted summits, conferences, and meetings of the World Trade Organization, the International Monetary Fund, and the World Bank during that period.

WORLD HEALTH ORGANIZATION

The World Health Organization (WHO) is a multilateral organization dedicated to improving the health of all people. Under the WHO constitution, *human health* is defined as "a state of complete physical, mental and social well-being and not merely the absence of disease or infirmity." The WHO constitution also establishes human health as a "fundamental right" to which all people are entitled.

The WHO was founded on April 7, 1948, as a specialized agency within the United Nations system. The main goals of WHO are to provide guidance for nations on health issues, to set global health standards, to strengthen nations' health programs, and to develop and share new health technologies with the peoples of the world. Between 1948 and 2015, WHO membership grew from the original 26 signatory countries to 194 countries.

The World Health Assembly (WHA), the supreme decision-making body for WHO, consists of representatives from all member nations. It meets once each year to establish priorities and policies. The WHA also elects the director-general, WHO's top official, and approves the biennial budget. WHO's 2016 director-general is Dr. Margaret Chan of the People's Republic of China. She began her first five-year term of office in 2006. She was reelected to a second term in 2012 through June of 2017. Numerous boards and commissions convene throughout the year to implement WHO policies—a process supported by 3,500 administrative staff. WHO's secretariat is located in Geneva, Switzerland.

WHO has helped eradicate diseases such as smallpox and yaws. It has led successful campaigns to reduce other diseases such as leprosy, guinea-worm disease, and river blindness. Currently, the major challenges for the WHO are the global epidemic of HIV/AIDs, which had claimed more than 20 million lives by the early 2000s; a resurgence of tuberculosis (TB); the perennial battle with malaria; and periodic outbreaks of ebola and Severe Acute Respiratory Syndrome (SARS).

The WHA approves a biennial budget, called a Program Budget, every second year. It is part of the most recent 12th General Programme of Work, which covers years 2014–2019. In its Draft Proposed Programme Budget for 2018–2019, the WHA proposes $4.6 billion to attend to its global health commitments. Only 30 percent of the WHA funds are generated from assessed contributions from member states. The remaining 70 percent of all funds are derived from voluntary contributions. The biennial budget for 2006–2007 allocated roughly half of all funds to "essential health interventions," which is mainly concerned with the prevention and treatment of diseases. The remaining funds were allocated to research, the dissemination of health information, health personnel, food safety, administrative costs, and other programs.

WORLD TRADE ORGANIZATION

The intent of the World Trade Organization (WTO) is to supervise and liberalize international trade. The organization was officially introduced on January 1, 1995, under the Marrakesh Agreement. The WTO replaced the General Agreement on Tariffs and Trade (GATT), which was established in 1948. The WTO is headquartered in Geneva, Switzerland. The leader of the WTO is referred to as a director-general. The WTO secretariat consists of experts in various professional fields of lawyers, economists, statisticians, and communications experts.

As of July 2016, the WTO had a membership of 164 countries. Besides the 164 members of the WTO, there are also observing members. The current number of observing members is 20. To apply for membership in the WTO, a country has to meet certain criteria set by the WTO. The economic development of a country applying for membership has a significant impact on whether the WTO approves that nation for membership.

As the global economy developed and evolved, one main issue was the lack of an international organization to serve as arbiter when two countries had a trade conflict. One of the WTO's responsibilities is to serve as a liaison to settle trade disputes between countries. Similarly, the WTO operates as a system of trade rules monitoring national trade policies. The WTO ensures that countries and governments are adhering to its rules, such as protecting consumers and preventing the spread of diseases between nations. Further, the WTO provides technical assistance and training for developing countries and cooperates with other international organizations. The WTO can also aid nations by serving as a place where governments negotiate trade agreements.

The WTO is a complex organization that is responsible for various trade topics. The WTO considers trade negotiations, including agreements that cover goods, services, and intellectual property. It continually discusses the importance of the principles of liberalization with member nations, with allowable exceptions. The WTO promotes individual countries' commitments to lower their customs tariffs and various trade barriers.

All WTO members are obligated to have their trade policies and practices reviewed by the WTO to ensure that proper procedures are met. Implementing and monitoring WTO agreements requires governments to make their trade policies known by notifying the WTO about laws and measures they've adopted. WTO councils and committees ensure that these requirements are being followed and that WTO agreements are being properly implemented.

The WTO has implemented procedures for resolving trade quarrels under the organization's dispute settlement understanding. This understanding is vital for enforcing the rules and thereby ensuring that trade among countries is flowing smoothly.

WTO agreements contain special provisions for developing countries to use in building their trade capacity. These provisions may include longer time periods to implement agreements and commitments, measures that help increase trading opportunities, support to help developing nations build their trade capacity, and assistance to handle disputes and implement technical standards. The WTO is responsible for organizing technical cooperation missions for developing countries annually.

The WTO ensures that aid for trade is geared toward helping developing countries develop the skills and infrastructure necessary to expand their trade. The WTO enforces regular dialogue with nongovernmental organizations, parliamentarians, and other international organizations. The WTO regularly educates the media and the general public on various aspects of the WTO and the ongoing negotiations among nations, with the aim of enhancing cooperation and increasing awareness of WTO activities. This is one of the biggest tasks the WTO undertakes, in order to keep its members informed on current trade issues that need to be shared to the general public.

The WTO's secretariat organizational structure has subsidiary committees that help oversee various departments. A ministerial conference has the following subsidiary groups:

- The Council for Trade in Goods is made up of 14 committees, and each committee has a specific task. Members of the WTO participate in the committees. The body has its own chair and 10 members. The body also has several groups relating to textiles.
- A second major group, the Council for Trade-Related Aspects of Intellectual Property Rights, centers on information regarding intellectual property and the WTO. It also provides news and official records of the activities on intellectual property. The WTO's work with other international organizations in this field is critical because other international organizations share information with the WTO in order to enhance trade security measures.

- The Council for Trade in Services and the Trade Negotiations Committee, also referred to as TNC, is the committee that deals with current trade talks. Because of the importance of this committee, WTO's director-general serves as the chair of the TNC.

In addition to trading policies, the WTO has initiated principles of national treatment and nondiscrimination. *National treatment* is the requirement that foreign goods be treated similarly to the same domestic goods once the foreign goods enter a nation's markets. *Nondiscrimination*, also known as nondiscriminatory trading, is embodied in the concept of most-favored nation (MFN) status. MFN status requires all WTO members to treat each other the same way the other nations treat their most-favored trading partner. This prohibits trade discrimination. It is the intent of the WTO that all members consider all other members as a MFN regarding trade relations.

Y

YEN

The yen, which means “circle” or “round object,”’ is the official currency of Japan. Its currency symbol is ¥. The yen is the third most traded currency in the world and the most heavily traded in Asia. Its low interest rates make it a popular choice to carry trades between the U.S. dollar and the Australian dollar.

In the eighth century, Japan minted the *Wado Kaichin*, or silver and copper coins, which imitated Chinese coins. Japan continued to import Chinese currency when it could no longer produce its own coins. The *Toraisen* and *Shichusen*, two privately minted Japanese coins, entered circulation from the 14th to 16th centuries, when there were not enough Chinese coins for Japanese use. *Koshu Kin*, provincial minted gold coins, became the new standard currency. During the 15th century, the Japanese government established a unified monetary system, including gold currency and silver and copper coins.

Spanish dollars and local currencies were used in Japan during the 19th century. The Spanish coins were minted in Mexico City and came from Manila galleons from Acapulco, Mexico. Later, other silver dollars were used, similar to the Mexican peso and obtained from Latin American countries. To unify and centralize the different currencies, the Meiji government introduced the yen on May 10, 1871.

The New Currency Act of 1871 established a Japanese monetary system with a decimal account similar to the European one, with the hope of stabilizing Japan’s rocky currency situation. Silver was devalued in 1873, and by 1897 the yen moved solely to the gold standard. The value of the yen was frozen at US$0.50. The value fell in subsequent years, and World War II inflation continued to reduce the value of the yen.

The U.S. occupation government as part of the Bretton Woods System stepped in to stabilize the value of the yen. Japan fixed its exchange rate to the U.S. dollar until 1971, when the Japanese government signed the Smithsonian Agreement and agreed to a new fixed exchange rate. The agreement proved difficult to maintain. Three years later, Japan switched to the floating exchange rate, where it remains today. In the early 1980s, the yen was undervalued compared to the U.S. dollar, resulting in a Japanese trade surplus. In 1985, the Group of Five industrialized nations (now the G7) agreed that the U.S. dollar was overvalued and signed the Plaza Accord to prompt the yen to appreciate. Japan saw a period of depreciation after the asset price bubble burst. The work now of the Bank of Japan is to move Japan from deflation to an inflation rate of 1 percent to 2 percent as well as steady economic growth.

YUAN/RENMINBI

China uses three forms of active currency: the renminbi, derived from the yuan and used in mainland China; the Hong Kong dollar, used in Hong Kong; and the Macanese pataca, used in Macau. The modern Chinese yuan is also called the renminbi and is noted with the symbol ¥.

The renminbi (RMB), meaning "the people's currency," has been used in China for many years. China is notably one of the first countries to use currency in place of a barter system. Original coins from the fourth century were made from bronze with a round hole in the middle so they could be kept on a string. The first Chinese emperor, Qin Shi Huang, who began his reign in 221 BCE, began a uniform monetary system using the copper coin as China's official currency, and this did not change for 2,000 years. Researchers believe the first bank note used by any nation was the Chinese leather bank note in 118 BCE, made from white deerskin about one square foot in size. The Chinese were the first to introduce paper currency, during the ninth century, far earlier than the European paper money of the 13th century. In 1889, the yuan—a silver coin derived from the Spanish dollar—replaced copper cash and silver ingots called *sycees*. The yuan was also issued in bank notes.

The Chinese Communist Party's People's Bank of China first issued the renminbi on December 1, 1948, to stabilize Communist areas during the civil war with the Chinese Nationalist Party. When the Communists won mainland China in 1955, the People's Bank of China issued the second series of renminbi to stabilize the high inflation. Its rate of one new RMB to 10,000 old renminbi has not changed. In 1962, multicolor printing and hand-engraved printing plates were introduced in a third series of renminbi. Many underground foreign exchange transactions then began to occur due to an unrealistic exchange rate. This problem was eliminated with other Chinese economic reforms during the 1980s. Later series of renminbi included watermarks, magnetic and fluorescent ink, and images of Mao Zedong on all notes.

The renminbi was fixed to the U.S. dollar for many years, until July 21, 2005. China now allows the renminbi or yuan to trade on spot interbank markets. This helps promote trade, and it decreases the cost of currency conversion and reliance on the U.S. dollar. The yuan is projected to rise slightly against the dollar in the next few years.

Economists believe that China undervalues its currency by 25 percent to 40 percent. The Chinese deny that this is a form of trade protectionism, helping to keep domestic prices low and protect Chinese jobs. The Chinese limitations of the yuan against the U.S. dollar are now leading to inflation. Economists also predict that the yuan could become a major reserve currency in the future.

YUNUS, MUHAMMAD

Born: June 28, 1940, in Chittagong, Bengal, India; Nationality: Bangladesh; Professional Interests: development economics, banker, social entrepreneur; Major Works: founded Grameen Bank and Yunus Centre, PlaNet Finance, Microcredit Summit Campaign.

Muhammad Yunus is a prominent Bangladeshi development economist and social reformer. Yunus, the founder of the Grameen Bank in Bangladesh, introduced microcredit as a viable antipoverty and development strategy. Yunus was born in Chittagong, Bengal, India. In 1947, Chittagong became part of East Pakistan, and, in 1971, part of an independent Bangladesh.

Yunus exhibited exceptional intellectual abilities as a child. Born to a middle-class family, Yunus attended the best schools. He earned a bachelor's degree (1960) and a master's degree (1961) from Dhaka University. Yunus traveled to the United States for his advanced studies in development economics, and he earned a PhD from Vanderbilt University in 1970. From the United States, Yunus supported East Pakistan's independence movement and eventual break from West Pakistan. Soon after independence was achieved, and Bangladesh established, Yunus returned to his homeland to teach and to initiate radical reform in the country's rural development.

As a social scientist, Yunus was committed to finding solutions to development problems. After Yunus returned to Bangladesh in the early 1970s, he accepted a position in government service in Dhaka, and an economics professorship at Chittagong College, neither of which satisfied his desire to bring positive change to his desperately poor country. In 1976, Professor Yunus developed the concept of microcredit to fit local conditions in Bangladesh. Microcredit had existed on a small scale in other world regions for decades. Yunus argued that microcredit could accelerate the pace of rural development by jump-starting entrepreneurship on the farms and in the small villages. Microloans of $50 or $100 could start a new business enterprise and improve the quality of life for an entire household.

Yunus based his microcredit program on several key principles. First, microloans would be made mainly to landless, marginalized peoples who did not qualify for conventional commercial loans. Second, microloans were loans, not grants. Repayment of principal plus interest was required in weekly installments. Third, most microloans would be made to women, mainly to develop this untapped reservoir of entrepreneurial talent. Fourth, small groups of borrowers would take collective responsibility for microloans. The success or failure of each borrower would directly affect future loans to other group members. The experiment in microfinance expanded rapidly, spurred on by near-perfect loan repayments and by outside assistance from such international donors as the International Fund for Agricultural Development and the Ford Foundation. In September 1983, Yunus officially established the Grameen Bank, jointly owned by private shareholders and the government of Bangladesh.

Today, the Grameen Bank is the world largest microfinance institution (MFI). In 2003, the Grameen Bank made $369 million in loans. Since its founding, the Grameen Bank has extended $8.7 billion in microloans to 7.9 million borrowers. Of all microloan recipients, 97 percent have been women. By 2009, the Grameen Bank provided services to 83,458 villages through the bank's 2,562 branches.

In addition, Yunus's experiment in microcredit inspired the creation of microfinance institutions throughout the developing world. Over time, multilateral organizations, including the World Bank and regional development banks, embraced microcredit as a viable development strategy. The United Nations proclaimed 2005 the Year of Microcredit.

Microcredit is widely acclaimed as a success story in Bangladesh and in other countries of the developing world. Some criticisms have been leveled at microcredit practices, however. One criticism is that microcredit, which often carries a high interest rate, creates additional debt for the world's poorest citizens. Second, some research suggests that microcredit obtained by women sometimes ends up in the hands of their husbands. Third, some experts suggest that microfinance institutions are inherently unstable. The financial challenges faced by the Grameen Bank after the devastating 1998 floods in Bangladesh illustrate the pitfalls of collateral-free loans. The impact of microcredit on households' financial security and on economic development will be fertile ground for research in the coming years.

Z

ZOELLICK, ROBERT

Born: July 25, 1953, in Evergreen Park, Illinois; Nationality: American; Professional Interests: diplomat for international trade, president of the World Bank (2007); Major Works: "Campaign 2000: A Republican Foreign Policy" (2000), *America and Russia: Memos to a President* (co-edited with Philip Zelikow) (2000), *America and the East Asian Crisis: Memos to a President* (co-edited with Philip Zelikow) (2000), *America and the Balkans: Memos to a President* (co-edited with Philip Zelikow) (2001), *Trauma, Triumph, Transition* (2008).

Robert Zoellick became the 11th chief executive of the World Bank in 2007. A career public servant, Zoellick served in the U.S. State Department and the U.S. Treasury, was a U.S. trade representative, and worked in the offices of the Federal National Mortgage Association (FNMA, or Fannie Mae) and in the White House for the president. The main focus of Zoellick's public service was in economic policy and diplomatic affairs. He was the lead diplomat in many U.S. trade treaties. Zoellick was an adviser to U.S. presidents Ronald Reagan, George H. W. Bush, and George W. Bush. He was a personal adviser to President George H. W. Bush. Zoellick was a major player in the U.S. post–Cold War economic policy.

Robert Bruce Zoellick was born on July 25, 1953, in Evergreen Park, Illinois. In 1975, he graduated from Swarthmore College. He earned his JD degree from Harvard Law School, graduating with honors. He stayed at Harvard, receiving a master's degree in public policy from Harvard's Kennedy School of Government in 1981.

Following graduation from Harvard, Zoellick entered U.S. government public service. Between 1985 and 1993, he served Treasury Secretary James Baker as a deputy assistant secretary for financial institutions policy and counselor to the secretary, and as an undersecretary of state within the State Department; he also spent time in the White House as a deputy chief of staff. Zoellick led the U.S. delegation for the German reunification in 1989 and 1990, and he assisted the president in preparing for the 1991 and 1992 G7 Economic Summits.

In 1993 Zoellick left the White House and joined Fannie Mae as executive vice president. In 1997, he made a temporary career change when he left Fannie Mae to join the U.S. Naval Academy.

Zoellick returned to public service and economic policy diplomacy in 2001, when he served in President George W. Bush's administration as the nation's 13th U.S. trade representative, a cabinet position in the White House. In his new role as trade representative, Zoellick negotiated free-trade agreements with many countries. He was instrumental in developing policies for global, regional, and bilateral agreements and launching the Doha Development Agenda of the World Trade Organization (WTO). He had significant influence in many countries becoming members of the WTO, including China, Chinese Taipei, Cambodia, Vietnam, Russia, and Saudi Arabia.

Zoellick was highly influential in the negotiations of many free-trade agreements for the United States. He also served as an advisor to the U.S. Congress in many trade and economic policy agreements with developing countries. He brought free-trade agreements to completion with many South American countries and developing countries in Africa. He had a leadership role in initiating U.S. free-trade relations with a number of other countries, including Peru, Colombia, and Panama.

In 2005, Zoellick returned to the State Department as a deputy secretary for a year. In 2006, he entered the private sector as a vice chairman at Goldman Sachs. In 2007, President George W. Bush appointed Robert Zoellick to be the 11th chief executive of the World Bank.

Robert Zoellick retired from the World Bank on July1, 2012. He joined the faculty at the Harvard Kennedy School's Belfer Center for Science and International Affairs.

Embargo Act of 1807

The Napoleonic Wars can be viewed as the origin of the Embargo Act. The Embargo Act of 1807 was signed by Thomas Jefferson on December 22, 1807 effectively restraining American trading overseas until March 1809. The Embargo Act of 1807 was created as an attempt to stop warring France and Britain from restricting American Trade. The Act introduced a form of non-violent resistance to the British and French interference of U.S. merchant ships.

An Act laying an Embargo on all ships and vessels in the ports and harbors of the United States

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That an embargo be, and hereby is laid on all ships and vessels in the ports and places within the limits or jurisdiction of the United States, cleared or not cleared, bound to any foreign port or place; and that no clearance be furnished to any ship or vessel bound to such foreign port or place, except vessels under the immediate direction of the President of the United States: and that the President be authorized to give such instructions to the officers of the revenue, and of the navy and revenue cutters of the United States, as shall appear best adapted for carrying the same into full effect: Provided, that nothing herein contained shall be construed to prevent the departure of any foreign ship or vessel, either in ballast, or with the goods, wares and merchandise on board of such foreign ship or vessel, when notified of this act.

And be it further enacted, That during the continuance of this act, no registered, or sea letter vessel, having on board goods, wares and merchandise, shall be allowed to depart from one port of the United States to any other within the same, unless the master, owner, consignee or factor of such vessel shall first give bond, with one or more sureties to the collector of the district from which she is bound to depart, in a sum of double the value of the vessel and cargo, that the said goods, ware, or merchandise shall be relanded in some port of the United States, dangers of the seas excepted, which bond, and also a certificate from the collector where the same may be relanded, shall by the collector respectively be transmitted to the Secretary of the Treasury. All armed vessels possessing public commissions from any foreign power are not to be considered as liable to the embargo laid by this act.

National Bank Act of 1863

The National Bank Act of 1863 was the third attempt for the United States to create a national banking system. In the past banks were chartered only by the states. Signed into law by President Abraham Lincoln the Act had three goals to benefit the Union; create a system of national banks under the influence of the federal government; establish a new national currency to help finance the Civil War; help finance the Union's Civil War effort by establishing a secondary market so the federal government could sell war bonds and treasury securities. None of these goals were very popular with Congress at the time. The National Bank Act of 1863 and 1864 had great difficulty getting passed through Congress. The Act also established a mechanism for creating the national currency and the national banking system.

The National Bank Act

The Act entitled "An Act to provide a national currency secured by a pledge of United States bonds, and to provide for the circulation and redemption thereof," approved June 3, 1864, shall be known as "The National Bank Act." (June 20, 1874, ch. 343, §1, 18 Stat. 123.)

§ 39. Reservation of rights of associations organized under Act of 1863 Nothing in title 62 of the Revised Statutes shall affect any appointments made, acts done, or proceedings had or commenced prior to the third day of June 1864, in or toward the organization of any national banking association under the act of February 25, 1863; but all associations which, on the third day of June 1864, were organized or commenced to be organized under that act, shall enjoy all the rights and privileges granted, and be subject to all the duties, liabilities, and restrictions imposed by title 62 of the Revised Statutes, notwithstanding all the steps prescribed by title 62 of the Revised Statutes for the organization of associations were not pursued, if such associations were duly organized under that act. (R.S. §5156.)

CODIFICATION R.S. §5156 derived from act June 3, 1864, ch. 106, §62, 13 Stat. 118, which was the National Bank Act.

Interstate Commerce Act of 1887

Originally designed to legislate and regulate the monopolistic behavior of the railroad industry the Interstate Commerce Act of 1887 created the Interstate Commerce Commission (ICC). Its importance in the economic history of the United States is that it was the first federal law to regulate a private industry. The key purpose of the law was to force the railroads to offer "reasonable and just" rates to their customers and to publicize those rates. It also prohibited price discrimination between the rate differences of short- and long-haul rates, a common practice of the railroads at the time.

The ICC was the first independent agency established by the federal government for the express purpose of regulating a private industry. The ICC presided over complaints lodged against the railroad companies, issue cease-and-desist orders against practices the ICC deemed unfair and contest any unfair practices of the railroads. The ICC scope of *enforcement was limited to railroads that operated across state lines. From 1903 through 1910 amendments increased the scope of the ICC to include bridges, ferries, oil pipelines, cable, telephone, and telegraph companies. The Motor Carrier Act in 1935 added the trucking industry and bus lines to ICC oversight.*

That the provisions of this act shall apply to any common carrier or carriers engaged in the transportation of passengers or property wholly by railroad, or partly by railroad and partly by water when both are used, under a common control, management, or arrangement, for a continuous carriage or shipment, from one State or Territory of the United States, or the District of Columbia, to any other State or Territory of the United States, or the District of Columbia, or from any place in the United States to an adjacent foreign country, or from any place in the United States through a foreign country to any other place in the United States, and also to the transportation in like manner of property shipped from any place in the United States to a foreign country and carried from such place to a port of trans-shipment, or shipped from a foreign country to any place in the United States and carried to such place from a port of entry either in the United States or an adjacent foreign country: *Provided, however*, That the provisions of this act shall not apply to the transportation of passengers or property, or to the receiving, delivering, storage, or handling of property, wholly within one State, and not shipped to or from a foreign country from or to any State or Territory as aforesaid.

The term "railroad" as used in this act shall include all bridges and ferries used or operated in connection with any railroad, and also all the road in use by any corporation operating a railroad, whether owned or operated under a contract, agreement, or lease; and the term "transportation" shall include all instrumentalities of shipment or carriage.

Sherman Antitrust Act of 1890

Signed in 1890 by President Benjamin Harrison it was not until 1901 under President Theodore Roosevelt the Act was first enforced to limit the monopoly and cartel behavior of businesses. Named for Senator John Sherman (R-OH) the Sherman Antitrust Act forbids certain business practices that would diminish the competitiveness of a market. The Act gave the federal government the right to investigate and bring federal suits against businesses if the federal government deemed a business practice in violation of the act. The act focused primarily on monopoly behavior by businesses and the collusion of companies through cartels. It was the first federal act to interfere in a private market sharply limiting or making illegal monopolies and cartels. There were three key sections to the Sherman Antitrust Act; defining noncompetitive behavior by businesses; defining which market results would constitute noncompetitive behavior; extended the reach of the act to include U.S. territories and the District of Columbia.

Sec. 1. Every contract, combination in the form of trust or otherwise; or conspiracy, in restraint of trade or commerce among the several States, or with foreign nations, is hereby declared to be illegal. Every person who shall make any such contract or engage in any such combination or conspiracy, shall be deemed guilty of a misdemeanor, and, on conviction thereof, shall be punished by fine not exceeding five thousand dollars, or by imprisonment not exceeding one year, or by both said punishments, in the discretion of the court.

Sec. 2. Every person who shall monopolize, or attempt to monopolize, or combine or conspire with any other person or persons, to monopolize any part of the trade or commerce among the several States, or with foreign nations, shall be deemed guilty of a misdemeanor, and, on conviction thereof, shall be punished by fine not exceeding five thousand dollars, or by imprisonment not exceeding one year, or by both said punishments, in the discretion of the court.

Sec. 3. Every contract, combination in form of trust or otherwise, or conspiracy, in restraint of trade or commerce in any Territory of the United States or of the District of Columbia, or in restraint of trade or commerce between any such Territory and another, or between any such Territory or Territories and any State or States or the District of Columbia, or with foreign nations, or between the District of Columbia and any States or States or foreign nations, is hereby declared illegal. Every person who shall make any such contract or engage in any such combination or conspiracy, shall be deemed guilty of a misdemeanor, and, on conviction thereof, shall be punished by fine not exceeding five thousand dollars, or by imprisonment not exceeding one year, or by both said punishments, in the discretion of the court.

Sec. 4. The several circuit courts of the United States are hereby invested with jurisdiction to prevent and restrain violations of this act; and it shall be the duty of the several district attorneys of the United States, in their institute proceedings in equity to prevent and restrain such violations. Such proceedings may be by way of petition setting forth the case and praying that such violation shall be enjoined or otherwise prohibited. When the parties complained of shall have been duly notified of such petition the courts shall proceed, as soon as may be, to the hearing and determination of the case; and pending such petition and before final decrees, the court many at any time make such temporary restraining order or prohibition as shall be deemed just in the premises.

Sec. 5. Whenever it shall appear to the court before which any proceeding under Section four of this act may be pending, that the ends of justice require that other parties should be brought before the court, the court may cause them to be summoned, whether they reside in the district in which the court is held or not; and subpoenas to that end may be served in any district by the marshal thereof.

Sec. 6. Any property owned under any contract or by any combination, or pursuant to any conspiracy (and being the subject thereof) mentioned in section one of this act, and being in the course of transportation from one State to another, or to a foreign country, shall be forfeited to the United States, and may be seized and condemned by like proceedings as those provided by law for the forfeiture, seizure, and condemnation of property imported into the United States contrary to law.

Sec. 7. Any person who shall be injured in his business or property by any other person or corporation by reason of anything forbidden or declared to be unlawful by this act, may sue therefor in any circuit court of the United States in the district in which the defendant resides or is found, without respect to the amount in controversy, and shall recover threefold the damages by him sustained, and the costs of suit, including a reasonable attorney's fee.

Sec. 8. That the word "person," or "persons," wherever used in this act shall be deemed to include corporations and associations existing under or authorized by the laws of either the United States, the laws of any of the Territories, and the laws of any State, or the laws of any foreign country.

Pure Food and Drug Act of 1906

President Theodore Roosevelt signed the Pure Food and Drug Act in 1906. Prior to the Act the United States did not have a statute for the provision requiring compositional food standards. The Pure Food and Drug act of 1906 outlawed any food that was an imitation of another food or advertised under the name of another food. However, food was considered legal if packaging mentioned that imitations or blends of the contents inside.

SEC. 1. MANUFACTURE OF ADULTERATED FOODS OR DRUGS.[2]

That it shall be unlawful for any person to manufacture within any Territory or the District of Columbia any article of food or drug which is adulterated or misbranded, within the meaning of this Act; and any person who shall violate any of the provisions of this section shall be guilty of a misdemeanor, and for each offense shall, upon conviction thereof, be fined not to exceed five hundred dollars or shall be sentenced to one year's imprisonment, both such fine and imprisonment, in the discretion of the court, and for each subsequent offense and conviction thereof shall be fined not less than one thousand dollars or sentenced to one year's imprisonment, or both such fine and imprisonment, in the discretion of the court.

SEC. 2. INTERSTATE COMMERCE OF ADULTERATED GOODS.

That the introduction into any State or Territory or the District of Columbia from any other State or Territory or the District of Columbia, or from any foreign country, or shipment to any foreign country of any article of food or drugs which is adulterated or misbranded, within the meaning of this Act, is hereby prohibited; and any person who shall ship or deliver for shipment from any State or Territory or the District of Columbia to any other State or Territory or the District of Columbia, or to a foreign country, or who shall receive in any State or Territory or the District of Columbia from any other State or Territory or the District of Columbia, or foreign country, and having so received, shall deliver, in original unbroken packages, for pay or otherwise, or offer to deliver to any other person, any such article so adulterated or misbranded within the meaning of this Act, or any person who shall sell or offer for sale in the District of Columbia or the Territories of the United States any such adulterated or misbranded foods or drugs or export or offer to export the same to any foreign country, shall be guilty of a misdemeanor, and for such offense be fined not exceeding two hundred dollars for the first offense and upon conviction for each subsequent offense not exceeding three hundred dollars or be imprisoned not exceeding one year, or both, in the discretion of the court: *Provided*, That no article shall be deemed misbranded or adulterated within the provisions of this Act when intended for export to any foreign country and prepared or packed according to the specifications or directions of the foreign purchaser when no substance is used in the preparation or packing thereof in conflict with the laws of the foreign country to which said article is intended to be shipped; but if said article shall be in fact sold or offered for sale for domestic use or consumption, then this proviso shall not exempt said article from the operation of any of the other provisions of this Act.

Federal Reserve Act of 1913

Following a history of depressions, bank runs, and a couple of failed attempts of a national bank, in May 1908 Congress passed the Aldrich-Vreeland Act, establishing a bipartisan National Monetary Commission to study central banking and monetary reform. At issue was the debate between the conservative "money trust" financiers of New York City who supported a banker-controlled plan and the "progressives" who supported a more publicly controlled central bank.

The result was the Federal Reserve Act of 1913. The Act called for a central bank with the power to make decisions regarding the nation's money and money supply without political or private pressure. This was the first compromise to what would become the Federal Reserve System. A second compromise was for at least 8 but no more than 12 private regional Federal Reserve banks each with their own branches, board of directors, and district boundaries. On December 23, 1913, President Woodrow Wilson signed the Federal Reserve Act into law.

An Act To provide for the establishment of Federal reserve banks, to furnish an elastic currency, to afford means of rediscounting commercial paper, to establish a more effective supervision of banking in the United States, and for other purposes.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the short title of this Act shall be the "Federal Reserve Act."

Wherever the word "bank" is used in this Act, the word shall be held to include State bank, banking association, and trust company, except where national banks or Federal reserve banks are specifically referred to.

The terms "national bank" and "national banking association" used in this Act shall be held to be synonymous and interchangeable. The term "member bank" shall be held to mean any national bank, State bank, or bank or trust company which has become a member of one of the reserve banks created by this Act. The term "board" shall be held to mean Federal Reserve Board; the term "district" shall be held to mean Federal reserve district; the term "reserve bank" shall be held to mean Federal reserve bank.

Section 2. Federal Reserve Districts.

As soon as practicable, the Secretary of the Treasury, the Secretary of Agriculture and the Comptroller of the Currency, acting as "The Reserve Bank Organization Committee," shall designate not less than eight nor more than twelve cities to be known as Federal reserve cities, and shall divide the continental United States, excluding Alaska, into districts, each district to contain only one of such Federal Reserve cities. The determination of said organization committee shall not be subject to review except by the Federal Reserve Board when organized: Provided, That the districts shall be apportioned with due regard to the convenience and customary course of business and shall not necessarily be coterminous with any State or States. The districts thus created may be readjusted and new districts may from time to time be created by the Federal Reserve Board, not to exceed twelve in all. Such districts shall be known as Federal reserve districts and may be designated by number. A majority of the organization committee shall constitute a quorum with authority to act.

Clayton Antitrust Act of 1914

President Woodrow Wilson signed the Clayton Antitrust Act into law in 1914. It was a supplement to the earlier legislated Sherman Antitrust Act. The Clayton Antitrust Act made price-cutting, rebates, or exclusive contracts specifically for the purpose of eliminating the competition illegal. The act excluded two groups: labor unions and agricultural cooperatives. The Clayton Antitrust Act of 1914 was written to further strengthen the government's control of monopolies and monopolistic activities that had been accused of weakening trade in the United States. The Clayton Act also further strengthened the antitrust laws originally expressed in the Sherman Antitrust Act of 1890. It allowed a person to sue if he or she could prove damage by an illegal arrangement to restrain trade. According to the Clayton Act, a successful plaintiff in such a case would be allowed to recover three times the damages sustained. The purpose of the triple damages rule was to encourage private lawsuits against conspiring oligopolists.

Section 2. That it shall be unlawful for any person engaged in commerce, in the course of such commerce, either directly or indirectly to discriminate in price between different purchasers of commodities, which commodities are sold for use, consumption, or resale within the United States or any Territory thereof or the District of Columbia or any insular possession or other place under the jurisdiction of the United States, where the effect of such discrimination may be to substantially lessen competition or tend to create a monopoly in any line of commerce: Provided, That nothing herein contained shall prevent discrimination in price between purchasers of commodities on account of differences in the grade, quality, or quantity of the commodity sold, or that makes only due allowance for difference in the cost of selling or transportation, or discrimination in price in the same or different communities made in good faith to meet competition: And provided further, That nothing herein contained shall prevent persons engaged in selling goods, wares, or merchandise in commerce from selecting their own customers in bona fide transactions and not in restraint of trade.

Section 3. That it shall be unlawful for any person engaged in commerce, in the course of such commerce, to lease or make a sale or contract for sale of goods, wares, merchandise, machinery, supplies or other commodities, whether patented or unpatented, for use, consumption or resale within the United States or any Territory thereof or the District of Columbia or any insular possession or other place under the jurisdiction of the United States, or fix a price charged therefor, or discount from, or rebate upon, such price, on the condition, agreement or understanding that the lessee or purchaser thereof shall not use or deal in the goods, wares, merchandise, machinery, supplies or other commodities of a competitor or competitors of the lessor or seller, where the effect of such lease, sale, or contract for sale or such condition, agreement or understanding may be to substantially lessen competition or tend to create a monopoly in any line of commerce.

Tariff Act of 1930 (Smoot-Hawley Tariff Act)

With consumer spending on the decline and many workers losing their jobs Congress passed the Tariff Act of 1930 (Smoot-Hawley Tariff Act) in an attempt to help the economy. President Hoover signed the Tariff Act of 1930 despite the objections of over 1,000 economists. The legislation became known as the Smoot-Hawley Tariff Act for the legislation's chief sponsors, Senator Reed Smoot of Utah and House Representative Willis Hawley of Oregon. Senator Smoot was chairman of the Senate's Finance Committee, and Representative Hawley was chairman of the House Ways and Means Committee. The Smoot-Hawley Tariff Act was the last legislative act in which the United States imposed definitive tariff rates. The Act raised the average tariff on all imported products to 50 percent and started a trade war between the United States and its trading partners around the world.

(a) Authority of President; modification and decrease of duties; altering import restrictions
(1) For the purpose of expanding foreign markets for the products of the United States (as a means of assisting in establishing and maintaining a better relationship among various branches of American agriculture, industry, mining, and commerce) by regulating the admission of foreign goods into the United States in accordance with the characteristics and needs of various branches of American production so that foreign markets will be made available to those branches of American production which require and are capable of developing such outlets by affording corresponding market opportunities for foreign products in the United States, the President, whenever he finds as a fact that any existing duties or other import restrictions of the United States or any foreign country are unduly burdening and restricting the foreign trade of the United States and that the purpose

above declared will be promoted by the means hereinafter specified, is authorized from time to time—

(A)

To enter into foreign trade agreements with foreign governments or instrumentalities thereof:

Provided, That the enactment of the Trade Agreements Extension Act of 1955 shall not be construed to determine or indicate the approval or disapproval by the Congress of the executive agreement known as the General Agreement on Tariffs and Trade.

(B)

To proclaim such modifications of existing duties and other import restrictions, or such additional import restrictions, or such continuance, and for such minimum periods, of existing customs or excise treatment of any article covered by foreign trade agreements, as are required or appropriate to carry out any foreign trade agreement that the President has entered into hereunder.

(2) No proclamation pursuant to paragraph (1)(B) of this subsection shall be made—

(A)

Increasing by more than 50 per centum any rate of duty existing on July 1, 1934; except that a specific rate of duty existing on July 1, 1934, may be converted to its ad valorem equivalent based on the value of imports of the article concerned during the calendar year 1934 (determined in the same manner as provided in subparagraph (D)(ii)) and the proclamation may provide an ad valorem rate of duty not in excess of 50 per centum above such ad valorem equivalent.

(B)

Transferring any article between the dutiable and free lists.

(C)

In order to carry out a foreign trade agreement entered into by the President before June 12, 1955, or with respect to which notice of intention to negotiate was published in the Federal Register on November 16, 1954, decreasing by more than 50 per centum any rate of duty existing on January 1, 1945.

(D) In order to carry out a foreign trade agreement entered into by the President on or after June 12, 1955, and before July 1, 1958, decreasing (except as provided in subparagraph (C) of this paragraph) any rate of duty below the lowest of the following rates:

(i)

The rate 15 per centum below the rate existing on January 1, 1955.

(ii)

In the case of any article subject to an ad valorem rate of duty above 50 per centum (or a combination of ad valorem rates aggregating more than 50 per centum), the rate 50 per centum ad valorem (or a combination of ad valorem rates aggregating 50 per centum). In the case of any article subject to a specific rate of duty (or a combination of rates including a specific rate) the ad valorem equivalent of which has been determined by the President to have been above 50 per centum during a period determined by the President to be a representative period, the rate 50 per centum ad valorem or the rate (or a combination of rates), however stated, the ad valorem equivalent of which the President determines would have been 50 per centum during such period. The standards of valuation contained in section 1401a of this title (as in effect, with respect to the article concerned, during the representative period) shall be utilized by the President, to the maximum extent he finds such utilization practicable, in making the determinations under the preceding sentence.

(E)

In order to carry out a foreign trade agreement entered into by the President on or after July 1, 1958, decreasing any rate of duty below the lowest of the rates provided for in paragraph (4)(A) of this subsection.

(3)

(A)

Subject to the provisions of subparagraphs (B) and (C) of this paragraph and of subparagraph (B) of paragraph (4) of this subsection, the provisions of any proclamation made under paragraph (1)(B) of this subsection, and the provisions of any proclamation of suspension under paragraph (5) of this subsection, shall be in effect from and after such time as is specified in the proclamation.

(B) In the case of any decrease in duty to which paragraph (2)(D) of this subsection applies—

(i)

if the total amount of the decrease under the foreign trade agreement does not exceed 15 per centum of the rate existing on January 1, 1955, the amount of decrease becoming initially effective at one time shall not exceed 5 per centum of the rate existing on January 1, 1955;

(ii)

except as provided in clause (i), not more than one-third of the total amount of the decrease under the foreign trade agreement shall become initially effective at one time; and

(iii)

no part of the decrease after the first part shall become initially effective until the immediately previous part shall have been in effect for a period or periods aggregating not less than one year.

(C)

No part of any decrease in duty to which the alternative specified in paragraph (2)(D)(i) of this subsection applies shall become initially effective after the expiration of the three-year period which begins on July 1, 1955. If any part of such decrease has become effective, then for purposes of this subparagraph any time thereafter during which such part of the decrease is not in effect by reason of legislation of the United States or action thereunder shall be excluded in determining when the three-year period expires.

(D) If (in order to carry out a foreign trade agreement entered into by the President on or after June 12, 1955) the President determines that such action will simplify the computation of the amount of duty imposed with respect to an article, he may exceed any limitation specified in paragraph (2)(C) or (D) or paragraph (4)(A) or (B) of this subsection or subparagraph (B) of this paragraph by not more than whichever of the following is lesser:

(i)

The difference between the limitation and the next lower whole number, or

(ii)

One-half of 1 per centum ad valorem.

In the case of a specific rate (or of a combination of rates which includes a specific rate), the one-half of 1 per centum specified in clause (ii) of the preceding sentence shall be determined in the same manner as the ad valorem equivalent of rates not stated wholly in ad valorem terms is determined for the purposes of paragraph (2)(D)(ii) of this subsection.

(4)

(A) No proclamation pursuant to paragraph (1)(B) of this subsection shall be made, in order to carry out a foreign trade agreement entered into by the President on or after July 1, 1958, decreasing any rate of duty below the lowest of the following rates:

(i)

The rate which would result from decreasing the rate existing on July 1, 1958, by 20 per centum of such rate.

(ii)

Subject to paragraph (2)(B) of this subsection, the rate 2 per centum ad valorem below the rate existing on July 1, 1958.

(iii)

The rate 50 per centum ad valorem or, in the case of any article subject to a specific rate of duty or to a combination of rates including a specific rate, any rate (or combination of rates), however stated, the ad valorem equivalent of which has been determined as 50 per centum ad valorem.

The provisions of clauses (ii) and (iii) of this subparagraph and of subparagraph (B)(ii) of this paragraph shall, in the case of any article, subject to a combination of ad valorem rates of duty, apply to the aggregate of such rates; and, in the case of any article, subject to a specific rate of duty or to a combination of rates including a specific rate, such provisions shall apply on the basis of the ad valorem equivalent of such rate or rates, during a representative period (whether or not such period includes July 1, 1958), determined in the same manner as the ad valorem equivalent of rates not stated wholly in ad valorem terms is determined for the purpose of paragraph (2)(D)(ii) of this subsection.

(B)

(i)

In the case of any decrease in duty to which clause (i) of subparagraph (A) of this paragraph applies, such decrease shall become initially effective in not more than four annual stages, and no amount of decrease becoming initially effective at one time shall exceed 10 per centum of the rate of duty existing on July 1, 1958, or, in any case in which the rate has been increased since that date, exceed such 10 per centum or one-third of the total amount of the decrease under the foreign trade agreement, whichever is the greater.

(ii)
In the case of any decrease in duty to which clause (ii) of subparagraph (A) of this paragraph applies, such decrease shall become initially effective in not more than four annual stages, and no amount of decrease becoming initially effective at one time shall exceed 1 per centum ad valorem or, in any case in which the rate has been increased since July 1, 1958, exceed such 1 per centum or one-third of the total amount of the decrease under the foreign trade agreement, whichever is the greater.
(iii)
In the case of any decrease in duty to which clause (iii) of subparagraph (A) of this paragraph applies, such decrease shall become initially effective in not more than four annual stages, and no amount of decrease becoming initially effective at one time shall exceed one-third of the total amount of the decrease under the foreign trade agreement.
(C)
In the case of any decrease in duty to which subparagraph (A) of this paragraph applies (i) no part of a decrease after the first part shall become initially effective until the immediately previous part shall have been in effect for a period or periods aggregating not less than one year, nor after the first part shall have been in effect for a period or periods aggregating more than three years, and (ii) no part of a decrease shall become initially effective after the expiration of the four-year period which begins on July 1, 1962. If any part of a decrease has become effective, then for the purposes of clauses (i) and (ii) of the preceding sentence any time thereafter during which such part of the decrease is not in effect by reason of legislation of the United States or action thereunder shall be excluded in determining when the three-year period or the four-year period, as the case may be, expires.

Banking Act of 1933 (Glass-Steagall Act)

The Banking Act of 1933 is also known as the Glass-Steagall Act. It was introduced as a response to the stock market crash of 1929 in hopes of providing some security to the banking system. The Act combined two congressional projects; one, the creation of a federal system of bank deposit insurance and two, the regulation of commercial and investment banking. It addressed the first objective through the creation of the Federal Deposit Insurance Corporation (FDIC). One focus on banking industry regulation addressed by Glass-Steagall was that commercial banks limit their lending only to short-term loans to finance only the production and sale of goods and not for investments such as stocks or bonds.

The Committee on Banking and Currency, to whom was referred the bill (H.R. 5661) to provide for the safer use of the assets of banks, to regulate interbank control, to prevent the undue diversion of funds into speculative operations, and for other purposes, having considered the same, report favorably thereon, and recommend that the bill do pass.

STATEMENT

This bill provides for salutary reforms of our banking system and the laws governing it along three important lines.

It makes provisions for strengthening the restrictions upon banks and bank officers in the making of loans for speculative purposes and in investing bank funds.

It makes provision for expediting the liquidation of hundreds of banks now in receivership, but providing for the purchase of the good but frozen assets belonging to such receivership, or the lending of funds on such assets as collateral security, so as to enable prompt distribution to the distressed depositors in these closed banks.

. . .

The bill makes provision for insuring deposits both in national and other member banks and in nonmember State banks, which it is believed will provide absolute indemnity against loss for depositors in banks insured. The bill does not provide that the Government shall guarantee the payment of deposits; but it does provide and require that the banks under Government supervision and regulation shall mutually guarantee the deposits of each other through the medium of a Government controlled instrumentality designed for that purpose; and that the banks shall make such contributions to the insurance fund provided for, from time to time, as may be necessary to provide for the payment of all deposits in banks which may be closed; and that such contributions shall be made by the banks in proportion to the amount of their deposits.

Securities Exchange Act of 1934

The Securities Exchange Act of 1934 was the government's initial intervention in the securities market that would place regulation on companies who offer various types of investment products including stocks, bonds, and other securities. The goal of the Act was to impose a set of rules and guidelines for companies who offered such products. It sought to increase transparency, organization and order as well as confidence in the market following the 1929 stock market crash. The Securities Exchange Act of 1934 created the Securities and Exchange Commission (SEC). The SEC enforces the rules of the securities market including the rules established through the Exchange Act and Sarbanes-Oxley Act with other various regulations and rules established by the SEC. The SEC's direct responsibilities include ensuring that companies meet the disclosure requirements established in the Exchange Act, creating and enforcing rules for the conduct of market participants, *and oversee self-regulatory organizations. The Act sought to decrease the level of fraud and insider trading regarding the sale of securities.*

The Act focuses on the transactions and exchanges that occur after a company's initial public offering (IPO). Several mandates of the Act included that public corporations register their stock sales and distributions, provide periodic financial disclosures, and made it possible for the SEC to in fact regulate exchanges, brokers, over-the-counter markets and proper disclosure of financial data reporting. It also gave the SEC the power to disseminate any public utility companies that became too large and too powerful.

REGULATION OF THE USE OF MANIPULATIVE AND DECEPTIVE DEVICES

SEC. 10. It shall be unlawful for any person, directly or indirectly, by the use of any means or instrumentality of interstate commerce or of the mails, or of any facility of any national securities exchange—

(a)(1) To effect a short sale, or to use or employ any stop loss order in connection with the purchase or sale, of any security other than a government security, in contravention of such rules and regulations as the Commission may prescribe as necessary or appropriate in the public interest or for the protection of investors.

(2) [31] Paragraph (1) of this subsection shall not apply to security futures products.

(b) To use or employ, in connection with the purchase or sale of any security registered on a national securities exchange or any security not so registered, or any securities based swap agreement[32] any manipulative or deceptive device or contrivance in contravention of such rules and regulations as the Commission may prescribe as necessary or appropriate in the public interest or for the protection of investors.

(c)(1) To effect, accept, or facilitate a transaction involving the loan or borrowing of securities in contravention of such rules and regulations as the Commission may prescribe as necessary or appropriate in the public interest or for the protection of investors.

(2) Nothing in paragraph (1) may be construed to limit the authority of the appropriate Federal banking agency (as defined in section 3(q) of the Federal Deposit Insurance Act (12 U.S.C. 1813(q))), the National Credit Union Administration, or any other Federal department or agency having a responsibility under Federal law to prescribe rules or regulations restricting transactions involving the loan or borrowing of securities in order to protect the safety and soundness of a financial institution or to protect the financial system from systemic risk.

Rules promulgated under subsection (b) that prohibit fraud, manipulation, or insider trading (but not rules imposing or specifying reporting or recordkeeping requirements, procedures, or standards as prophylactic measures against fraud, manipulation, or insider trading), and judicial precedents decided under subsection (b) and rules promulgated thereunder that prohibit fraud, manipulation, or insider trading, shall apply to security-based swap agreements to the same extent as they apply to securities. Judicial precedents decided under section 17(a) of the Securities Act of 1933 and sections 9, 15, 16, 20, and 21A of this title, and judicial precedents decided under applicable rules promulgated under such sections, shall apply to security-based swap agreements to the same extent as they apply to securities.

SEC. 10A. AUDIT REQUIREMENTS.

(a) IN GENERAL.—Each audit required pursuant to this title of the financial statements of an issuer by a registered public accounting firm shall include, in accordance with generally accepted auditing standards, as may be modified or supplemented from time to time by the Commission—

(1) procedures designed to provide reasonable assurance of detecting illegal acts that would have a direct and material effect on the determination of financial statement amounts;

(2) procedures designed to identify related party transactions that are material to the financial statements or otherwise require disclosure therein; and

(3) an evaluation of whether there is substantial doubt about the ability of the issuer to continue as a going concern during the ensuing fiscal year.

(b) REQUIRED RESPONSE TO AUDIT DISCOVERIES.—

(1) INVESTIGATION AND REPORT TO MANAGEMENT.—If, in the course of conducting an audit pursuant to this title to which subsection (a) applies, the registered public accounting firm detects or otherwise becomes aware of information indicating that an illegal act (whether or not perceived to have a material effect on the financial statements of the issuer) has or may have occurred, the firm shall, in accordance with generally accepted auditing standards, as may be modified or supplemented from time to time by the Commission—

(A)(i) determine whether it is likely that an illegal act has occurred; and

(ii) if so, determine and consider the possible effect of the illegal act on the financial statements of the issuer, including any contingent monetary effects, such as fines, penalties, and damages; and

(B) as soon as practicable, inform the appropriate level of the management of the issuer and assure that the audit committee of the issuer, or the board of directors of the issuer in the absence of such a committee, is adequately informed with respect to illegal acts that have been detected or have otherwise come to the attention of such firm in the course of the audit, unless the illegal act is clearly inconsequential.

(2) RESPONSE TO FAILURE TO TAKE REMEDIAL ACTION.—If, after determining that the audit committee of the board of directors of the issuer, or the board of directors of the issuer in the absence of an audit committee, is adequately informed with respect to illegal acts that have been detected or have otherwise come to the attention of the firm in the course of the audit of such accountant, the registered public accounting firm concludes that—

(A) the illegal act has a material effect on the financial statements of the issuer;

(B) the senior management has not taken, and the board of directors has not caused senior management to take, timely and appropriate remedial actions with respect to the illegal act; and

(C) the failure to take remedial action is reasonably expected to warrant departure from a standard report of the auditor, when made, or warrant resignation from the audit engagement; the registered public accounting firm shall, as soon as practicable, directly report its conclusions to the board of directors.

(3) NOTICE TO COMMISSION; RESPONSE TO FAILURE TO NOTIFY.—An issuer whose board of directors receives a report under paragraph (2) shall inform

the Commission by notice not later than 1 business day after the receipt of such report and shall furnish the registered public accounting firm making such report with a copy of the notice furnished to the Commission. If the registered public accounting firm fails to receive a copy of the notice before the expiration of the required 1-business-day period, the registered public accounting firm shall—

(A) resign from the engagement; or

(B) furnish to the Commission a copy of its report (or the documentation of any oral report given) not later than 1 business day following such failure to receive notice.

(4) REPORT AFTER RESIGNATION.—If a registered public accounting firm resigns from an engagement under paragraph

(3)(A), the firm shall, not later than 1 business day following the failure by the issuer to notify the Commission under paragraph (3), furnish to the Commission a copy of the report of the firm (or the documentation of any oral report given).

(c) AUDITOR LIABILITY LIMITATION.—No registered public accounting firm shall be liable in a private action for any finding, conclusion, or statement expressed in a report made pursuant to paragraph (3) or (4) of subsection (b), including any rule promulgated pursuant thereto.

(d) CIVIL PENALTIES IN CEASE-AND-DESIST PROCEEDINGS.—If the Commission finds, after notice and opportunity for hearing in a proceeding instituted pursuant to section 21C, that a registered public accounting firm has willfully violated paragraph (3) or (4) of subsection (b), the Commission may, in addition to entering an order under section 21C, impose a civil penalty against the registered public accounting firm and any other person that the Commission finds was a cause of such violation. The determination to impose a civil penalty and the amount of the penalty shall be governed by the standards set forth in section 21B.

(e) PRESERVATION OF EXISTING AUTHORITY.—Except as provided in subsection (d), nothing in this section shall be held to limit or otherwise affect the authority of the Commission under this title.

(f) DEFINITIONS.—As used in this section, the term “illegal act” means an act or omission that violates any law, or any rule or regulation having the force of law. As used in this section, the term “issuer” means an issuer (as defined in section 3), the securities of which are registered under section 12, or that is required to file reports pursuant to section 15(d), or that files or has filed a registration statement that has not yet become effective under the Securities Act of 1933 (15 U.S.C. 77a et seq.), and that it has not withdrawn.

(g) PROHIBITED ACTIVITIES.—Except as provided in subsection (h), it shall be unlawful for a registered public accounting firm (and any associated person of that firm, to the extent determined appropriate by the Commission) that performs for any issuer any audit required by this title or the rules of the Commission under this title or, beginning 180 days after the date of commencement of the operations of the Public Company Accounting Oversight Board established under section 101 of the Sarbanes-Oxley Act of 2002 (in this section referred to as the “Board”), the rules of the Board, to provide to that issuer, contemporaneously with the audit, any nonaudit service, including—

(1) bookkeeping or other services related to the accounting records or financial statements of the audit client;

(2) financial information systems design and implementation;

(3) appraisal or valuation services, fairness opinions, or contribution-in-kind reports;

(4) actuarial services;

(5) internal audit outsourcing services;

(6) management functions or human resources;

(7) broker or dealer, investment adviser, or investment banking services;

(8) legal services and expert services unrelated to the audit; and

(9) any other service that the Board determines, by regulation, is impermissible.

(h) PREAPPROVAL REQUIRED FOR NON-AUDIT SERVICES.—A registered public accounting firm may engage in any non-audit service, including tax services, that is not described in any of paragraphs

(1) through (9) of subsection (g) for an audit client, only if the activity is approved in advance by the audit committee of the issuer, in accordance with subsection (i).

(i) PREAPPROVAL REQUIREMENTS.—

(1) IN GENERAL.—

(A) AUDIT COMMITTEE ACTION.—All auditing services (which may entail providing comfort letters in connection with securities underwritings or statutory audits required for insurance companies for purposes of State law) and non-audit services, other than as provided in subparagraph

(B), provided to an issuer by the auditor of the issuer shall be preapproved by the audit committee of the issuer.

(B) DE MINIMIS EXCEPTION.—The preapproval requirement under subparagraph (A) is waived with respect to the provision of non-audit services for an issuer, if—

(i) the aggregate amount of all such non-audit services provided to the issuer constitutes not more than 5 percent of the total amount of revenues paid by the issuer to its auditor during the fiscal year in which the non-audit services are provided;

(ii) such services were not recognized by the issuer at the time of the engagement to be non-audit services; and

(iii) such services are promptly brought to the attention of the audit committee of the issuer and approved prior to the completion of the audit by the audit committee or by 1 or more members of the audit committee who are members of the board of directors to whom authority to grant such approvals has been delegated by the audit committee.

(2) DISCLOSURE TO INVESTORS.—Approval by an audit committee of an issuer under this subsection of a non-audit service to be performed by the auditor of the issuer shall be disclosed to investors in periodic reports required by section 13(a).

(3) DELEGATION AUTHORITY.—The audit committee of an issuer may delegate to 1 or more designated members of the audit committee who are independent directors of the board of directors, the authority to grant preapprovals required

by this subsection. The decisions of any member to whom authority is delegated under this paragraph to preapprove an activity under this subsection shall be presented to the full audit committee at each of its scheduled meetings.

(4) APPROVAL OF AUDIT SERVICES FOR OTHER PURPOSES.—

In carrying out its duties under subsection (m)(2), if the audit committee of an issuer approves an audit service within the scope of the engagement of the auditor, such audit service shall be deemed to have been preapproved for purposes of this subsection.

(j) AUDIT PARTNER ROTATION.—It shall be unlawful for a registered public accounting firm to provide audit services to an issuer if the lead (or coordinating) audit partner (having primary responsibility for the audit), or the audit partner responsible for reviewing the audit, has performed audit services for that issuer in each of the 5 previous fiscal years of that issuer.

(k) REPORTS TO AUDIT COMMITTEES.—Each registered public accounting firm that performs for any issuer any audit required by this title shall timely report to the audit committee of the issuer—

(1) all critical accounting policies and practices to be used;

(2) all alternative treatments of financial information within generally accepted accounting principles that have been discussed with management officials of the issuer, ramifications of the use of such alternative disclosures and treatments, and the treatment preferred by the registered public accounting firm; and

(3) other material written communications between the registered public accounting firm and the management of the issuer, such as any management letter or schedule of unadjusted differences.

(l) CONFLICTS OF INTEREST.—It shall be unlawful for a registered public accounting firm to perform for an issuer any audit service required by this title, if a chief executive officer, controller, chief financial officer, chief accounting officer, or any person serving in an equivalent position for the issuer, was employed by that registered independent public accounting firm and participated in any capacity in the audit of that issuer during the 1-year period preceding the date of the initiation of the audit.

(m) STANDARDS RELATING TO AUDIT COMMITTEES.—

(1) COMMISSION RULES.—

(A) IN GENERAL.—Effective not later than 270 days after the date of enactment of this subsection, the Commission shall, by rule, direct the national securities exchanges and national securities associations to prohibit the listing of any security of an issuer that is not in compliance with the requirements of any portion of paragraphs (2) through (6).

(B) OPPORTUNITY TO CURE DEFECTS.—The rules of the Commission under subparagraph (A) shall provide for appropriate procedures for an issuer to have an opportunity to cure any defects that would be the basis for a prohibition under subparagraph (A), before the imposition of such prohibition.

(2) RESPONSIBILITIES RELATING TO REGISTERED PUBLIC ACCOUNTING FIRMS.—The audit committee of each issuer, in its capacity as a committee of the board of directors, shall be directly responsible for the appointment, compensation, and oversight of the work of any registered public accounting firm employed

by that issuer (including resolution of disagreements between management and the auditor regarding financial reporting) for the purpose of preparing or issuing an audit report or related work, and each such registered public accounting firm shall report directly to the audit committee.
(3) INDEPENDENCE.—
(A) IN GENERAL.—Each member of the audit committee of the issuer shall be a member of the board of directors of the issuer, and shall otherwise be independent.
(B) CRITERIA.—In order to be considered to be independent for purposes of this paragraph, a member of an audit committee of an issuer may not, other than in his or her capacity as a member of the audit committee, the board of directors, or any other board committee—
(i) accept any consulting, advisory, or other compensatory fee from the issuer; or
(ii) be an affiliated person of the issuer or any subsidiary thereof.
(C) EXEMPTION AUTHORITY.—The Commission may exempt from the requirements of subparagraph (B) a particular relationship with respect to audit committee members,
as the Commission determines appropriate in light of the circumstances.
(4) COMPLAINTS.—Each audit committee shall establish procedures for—
(A) the receipt, retention, and treatment of complaints received by the issuer regarding accounting, internal accounting controls, or auditing matters; and
(B) the confidential, anonymous submission by employees of the issuer of concerns regarding questionable accounting or auditing matters.
(5) AUTHORITY TO ENGAGE ADVISERS.—Each audit committee shall have the authority to engage independent counsel and other advisers, as it determines necessary to carry out its duties.
(6) FUNDING.—Each issuer shall provide for appropriate funding, as determined by the audit committee, in its capacity as a committee of the board of directors, for payment of compensation—
(A) to the registered public accounting firm employed by the issuer for the purpose of rendering or issuing an audit report; and
(B) to any advisers employed by the audit committee under paragraph (5).

National Labor Relations Act of 1935 (Wagner Act)

President Franklin D. Roosevelt signed the National Labor Relations Act in 1935. It affected labor laws in the United States protecting the rights of employees in the private sector to organize themselves into labor unions. The unofficial name of the act is the Wagner Act recognizing the efforts of New York senator Robert F. Wagner. The Act was a response to the Supreme Court striking down the National Industrial Recovery Act as unconstitutional. The goal of the Act was to remedy an inequality of bargaining power. NLRA gave employees the freedom to organize and form a legally protected bargaining unit, or trade union, meant to collectively bargain terms and conditions of employment.

Section 1.[§151.] The denial by some employers of the right of employees to organize and the refusal by some employers to accept the procedure of collective bargaining lead to strikes and other forms of industrial strife or unrest, which have the intent or the necessary effect of burdening or obstructing commerce by (a) impairing the efficiency, safety, or operation of the instrumentalities of commerce; (b) occurring in the current of commerce; (c) materially affecting, restraining, or controlling the flow of raw materials or manufactured or processed goods from or into the channels of commerce, or the prices of such materials or goods in commerce; or (d) causing diminution of employment and wages in such volume as substantially to impair or disrupt the market for goods flowing from or into the channels of commerce.

The inequality of bargaining power between employees who do not possess full freedom of association or actual liberty of contract and employers who are organized in the corporate or other forms of ownership association substantially burdens and affects the flow of commerce, and tends to aggravate recurrent business depressions, by depressing wage rates and the purchasing power of wage earners in industry and by preventing the stabilization of competitive wage rates and working conditions within and between industries.

Experience has proved that protection by law of the right of employees to organize and bargain collectively safeguards commerce from injury, impairment, or interruption, and promotes the flow of commerce by removing certain recognized sources of industrial strife and unrest, by encouraging practices fundamental to the friendly adjustment of industrial disputes arising out of differences as to wages, hours, or other working conditions, and by restoring equality of bargaining power between employers and employees.

Experience has further demonstrated that certain practices by some labor organizations, their officers, and members have the intent or the necessary effect of burdening or obstructing commerce by preventing the free flow of goods in such commerce through strikes and other forms of industrial unrest or through concerted activities which impair the interest of the public in the free flow of such commerce. The elimination of such practices is a necessary condition to the assurance of the rights herein guaranteed.

NATIONAL LABOR RELATIONS BOARD

Sec. 3. [§ 153.] (a) [Creation, composition, appointment, and tenure; Chairman; removal of members] The National Labor Relations Board (hereinafter called the "Board") created by this Act [subchapter] prior to its amendment by the Labor Management Relations Act, 1947 [29 U.S.C. § 141 et seq.], is continued as an agency of the United States, except that the Board shall consist of five instead of three members, appointed by the President by and with the advice and consent of the Senate. Of the two additional members so provided for, one shall be appointed for a term of five years and the other for a term of two years. Their successors, and the successors of the other members, shall be appointed for terms of five years each, excepting that any individual chosen to fill a vacancy shall be appointed only for the unexpired term of the member whom he shall succeed. The President shall designate one member to serve as Chairman of the Board. Any member of the Board may be removed by the President, upon notice and hearing, for neglect of duty or malfeasance in office, but for no other cause.

Social Security Act of 1935

President Franklin D. Roosevelt signed the Social Security Act in 1935. The Act established a system to benefit older workers who had accidents while on the job or became unemployed and to support handicapped and single mothers with children. The original act also provided benefits for the blind and the physically handicapped. The Social Security Act has many components. It provided universal support to the elderly. The act provided aid to states for children abandoned during the Depression and orphans. It provided states with funds to provide for the health and well-being of crippled children. The federal government provided funds to the states to set up public health facilities and the personnel training so that facilities and health care would be adequately and professionally administered. The most unique aspect of the new law was a system that would be financed by both employers and employees. The Act also specified who would be exempt from the law and established a Social Security Board to oversee the new program.

An act to provide for the general welfare by establishing a system of Federal old-age benefits, and by enabling the several States to make more adequate provision for aged persons, blind persons, dependent and crippled children, maternal and child welfare, public health, and the administration of their unemployment compensation laws; to establish a Social Security Board; to raise revenue; and for other purposes.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,

TITLE II-FEDERAL OLD-AGE BENEFITS OLD-AGE RESERVE ACCOUNT

Section 201. (a) There is hereby created an account in the Treasury of the United States to be known as the Old-Age Reserve Account hereinafter in this title called the Account. There is hereby authorized to be appropriated to the Account for each fiscal year, beginning with the fiscal year ending June 30, 1937, an amount sufficient as an annual premium to provide for the payments required under this title, such amount to be determined on a reserve basis in accordance with accepted actuarial principles, and based upon such tables of mortality as the Secretary of the Treasury shall from time to time adopt, and upon an interest rate of 3 per centum per annum compounded annually. The Secretary of the Treasury shall submit annually to the Bureau of the Budget an estimate of the appropriations to be made to the Account.

(b) It shall be the duty of the Secretary of the Treasury to invest such portion of the amounts credited to the Account as is not, in his judgment, required to meet current withdrawals. Such investment may be made only in interest-bearing obligations of the United States or in obligations guaranteed as to both principal and interest by the United States. For such purpose such obligations may be acquired

(1) on original issue at par, or

(2) by purchase of outstanding obligations at the market price. The purposes for which obligations of the United States may be issued under the Second Liberty Bond Act, as amended, are hereby extended to authorize the issuance at par of special obligations exclusively to the Account. Such special obligations shall bear interest at the rate of 3 per centum per annum. Obligations other than such special obligations may be acquired for the Account only on such terms as to provide an investment yield of not less than 3 per centum per annum.

(c) Any obligations acquired by the Account (except special obligations issued exclusively to the Account) may be sold at the market price, and such special obligations may be redeemed at par plus accrued interest.

(d) The interest on, and the proceeds from the sale or redemption of, any obligations held in the Account shall be credited to and form a part of the Account.

(e) All amounts credited to the Account shall be available for making payments required under this title.

(f) The Secretary of the Treasury shall include in his annual report the actuarial status of the Account.

OLD-AGE BENEFIT PAYMENTS

SEC. 202. (a) Every qualified individual (as defined in section 210) shall be entitled to receive, with respect to the period beginning on the date he attains the age of sixty-five, or on January 1, 1942, whichever is the later, and ending on the date of his death, an old-age benefit (payable as nearly as practicable in equal monthly installments) as follows:

(1) If the total wages (as defined in section 210) determined by the Board to have been paid to him, with respect to employment (as defined in section 210) after December 31, 1936, and before he attained the age of sixty- five, were not more than $3,000, the old-age benefit shall be at a monthly rate of one-half of 1 per centum of such total wages;

(2) If such total wages were more than $3,000, the old-age benefit shall be at a monthly rate equal to the sum of the following:

(A) One-half of 1 per centum of $3,000; plus

(B) One-twelfth of 1 per centum of the amount by which such total wages exceeded $3,000 and did not exceed $45,000; plus

(C) One-twenty-fourth of 1 per centum of the amount by which such total wages exceeded $45,000.

(b) In no case shall the monthly rate computed under subsection (a) exceed $85.

(c) If the Board finds at any time that more or less than the correct amount has theretofore been paid to any individual under this section, then, under regulations made by the Board, proper adjustments shall be made in connection with subsequent payments under this section to the same individual.

(d) Whenever the Board finds that any qualified individual has received wages with respect to regular employment after he attained the age of sixty-five, the old-age benefit payable to such individual shall be reduced, for each calendar month in any part of which such regular employment occurred, by an amount equal to one month s benefit. Such reduction shall be made, under regulations prescribed by the Board, by deductions from one or more payments of old-age benefit to such individual.

TITLE IX—TAX ON EMPLOYERS OF EIGHT OR MORE

IMPOSITION OF TAX

SECTION 901. On and after January 1, 1936, every employer (as defined in section 907) shall pay for each calendar year an excise tax, with respect to having individuals in his employ, equal to the following percentages of the total wages (as defined in section 907) payable by him (regardless of the time of payment) with respect to employment (as defined in section 907) during such calendar year:

(1) With respect to employment during the calendar year 1936 the rate shall be 1 per centum;

(2) With respect to employment during the calendar year 1937 the rate shall be 2 per centum;

(3) With respect to employment after December 31, 1937, the rate shall be 3 per centum.

CREDIT AGAINST TAX

SEC. 902. The taxpayer may credit against the tax imposed by section 901 the amount of contributions, with respect to employment during the taxable year, paid by him (before the date of filing of his return for the taxable year) into an unemployment fund under a State law. The total credit allowed to a taxpayer under this section for all contributions paid into unemployment funds with respect to employment during such taxable year shall not exceed 90 per centum of the tax against which it is credited, and credit shall be allowed only for contributions made under the laws of States certified for the taxable year as provided in section 903.

CERTIFICATION OF STATE LAWS

SEC. 903 (a) The Social Security Board shall approve any State law submitted to it, within thirty days of such submission, which it finds provides that—

(1) All compensation is to be paid through public employment offices in the State or such other agencies as the Board may approve;

(2) No compensation shall be payable with respect to any day of unemployment occurring within two years after the first day of the first period with respect to which contributions are required;

(3) All money received in the unemployment fund shall immediately upon such receipt be paid over to the Secretary of the Treasury to the credit of the Unemployment Trust Fund established by section 904;

(4) All money withdrawn from the Unemployment Trust Fund by the State agency shall be used solely in the payment of compensation, exclusive of expenses of administration;

(5) Compensation shall not be denied in such State to any otherwise eligible individual for refusing to accept new work under any of the following conditions:

(A) If the position offered is vacant due directly to a strike, lockout, or other labor dispute;

(B) if the wages, hours, or other conditions of the work offered are substantially less favorable to the individual than those prevailing for similar work in the locality;

(C) if as a condition of being employed the individual would be required to join a company union or to resign from or refrain from joining any bona-fide labor organization;

(6) All the rights, privileges, or immunities conferred by such law or by acts done pursuant thereto shall exist subject to the power of the legislature to amend or repeal such law at any time. The Board shall, upon approving such law, notify the Governor of the State of its approval.

(b) On December 31 in each taxable year the Board shall certify to the Secretary of the Treasury each State whose law it has previously approved, except that it shall not certify any State which, after reasonable notice and opportunity for hearing to the State agency, the Board finds has changed its law so that it no longer contains the provisions specified in subsection (a) or has with respect to such taxable year failed to comply substantially with any such provision.

(c) If, at any time during the taxable year, the Board has reason to believe that a State whose law it has previously approved, may not be certified under subsection (b), it shall promptly so notify the Governor of such State.

UNEMPLOYMENT TRUST FUND

SEC. 904. (a) There is hereby established in the Treasury of the United States a trust fund to be known as the Unemployment Trust Fund, hereinafter in this title called the Fund . The Secretary of the Treasury is authorized and directed to receive and hold in the Fund all moneys deposited therein by a State agency from a State unemployment fund. Such deposit may be made directly with the Secretary of the Treasury or with any Federal reserve bank or member bank of the Federal Reserve System designated by him for such purpose.

(b) It shall be the duty of the Secretary of the Treasury to invest such portion of the Fund as is not, in his judgment, required to meet current withdrawals. Such investment may be made only in interest-bearing obligations of the United States or in obligations guaranteed as to both principal and interest by the United States. For such purpose such obligations may be acquired

(1) on original issue at par, or

(2) by purchase of outstanding obligations at the market price. The purposes for which obligations of the United States may be is- sued under the Second Liberty Bond Act, as amended, are hereby extended to authorize the issuance at par of special obligations exclusively to the Fund. Such special obligations shall bear interest at a rate equal to the average rate of interest, computed as of the end of the calendar month next preceding the date of such issue, borne by all interest-bearing obligations of the United States then forming part of the public debt; except that where such average rate is not a multiple of one eighth of 1 per centum, the rate of interest of such special obligations shall be the multiple of one-eighth of 1 per centum next lower than such average rate. Obligations other than such special obligations may be acquired for the Fund only on such terms as to provide an investment yield not less than the yield which would be required in the case of special obligations if issued to the Fund upon the date of such acquisition.

(c) Any obligations acquired by the Fund (except special obligations issued exclusively to the Fund) may be sold at the market price, and such special obligations may be redeemed at par plus accrued interest.

(d) The interest on, and the proceeds from the sale or redemption of, any obligations held in the Fund shall be credited to and form a part of the Fund.

(e) The Fund shall be invested as a single fund, but the Secretary of the Treasury shall maintain a separate book account for each State agency and shall credit quarterly on March 31, June 30, September 30, and December 31, of each year, to each account, on the basis of the average daily balance of such account, a proportionate part of the earnings of the Fund for the quarter ending on such date.

(f) The Secretary of the Treasury is authorized and directed to pay out of the Fund to any State agency such amount as it may duly requisition, not exceeding the amount standing to the account of such State agency at the time of such payment.

Commodities Exchange Act of 1936

Passed in 1936 the Commodity Exchange Act established federal regulation on all future trading activities. It also served as the successor to earlier legislation that proved ineffective in stopping the manipulation of commodity prices. The Commodity Exchange Act prohibited the manipulation of commodity future prices while maintaining that commodity futures be traded strictly on licensed contract markets. Fraud was prohibited and brokerage firms handled customer orders. Future commission merchants were required to be registered with the federal government. The Commodity Exchange Commission was in charge of administering the Commodity Exchange Act composed of the attorney general and the secretaries of agriculture and commerce.

SEC. 2. The Grain Futures Act (U. S. C., 1934 ed., title 7, sets. 1 to 17, inclusive) is amended by striking out the word "grain" amended wherever it appears in such Act and inserting in lieu thereof "commodity", "any commodity", or "commodities", as the case may require, and by striking out the phrase "cash grain" wherever such phrase appears and inserting in lieu thereof "any cash commodity".

SEC. 3. Section 2 of the Grain Futures Act (U. S. C. 1934 ed. title 7, sees. 2, 3 and 4) is amended by—

(a) striking out the third sentence of paragraph (a) and inserting in lieu thereof the following : "The word 'commodity' shall mean wheat, cotton, rice, corn, oats, barley, rye, flaxseed, grain sorghums, mill feeds, butter, eggs and Solanum tuberosum (Irish potatoes)"; and

(b) adding at the end of paragraph (a) the following sentences:

"The words 'cooperative association of producers' shall mean any cooperative association, corporate or otherwise, not less than 75 per centum in good faith owned or controlled, directly or indirectly, by producers of agricultural products and otherwise complying with an Act of Congress of February 18, 1922 (U. S. C., 1934 ed., title 7, secs. 291 and 292), as now or hereafter amended, including any organization acting for a group of such associations and owned or controlled by such associations, provided that business done for or with the United States of America, or any agency thereof, shall not be considered either member or nonmember business in determining the compliance of any such association with said Act of Congress of February 18, 1922. The words 'member of a contract market' shall mean and include individuals, associations, partnerships, corporations, and trusts owning or holding membership in, or admitted to membership representation on, a contract market or given members' trading privileges thereon. The words 'futures commission merchant' shall mean and include individuals, associations, partnerships, corporations, and trusts engaged in soliciting or in accepting orders for the purchase or sale of any commodity for future delivery on or subject to the rules of any contract market and that, in or in connection with such solicitation or acceptance of orders, accepts any money, securities, or property (or extends credit in lieu thereof) to margin, guarantee, or secure any trades or contracts that result or may result therefrom".

Bretton Woods Agreement (1944)

Following World War II the Bretton Woods Agreement was an international monetary contract for exchanging one currency for another. In 1944 representatives from 44 nations came together in Bretton Woods, New Hampshire to establish an agreement to monitor exchange rates and lend funds to member nations with trade deficits. The agreement was followed by the creation of the International Monetary Fund (IMF) and the International Bank for Reconstruction and Development, now known as the World Bank. In 1971, President Richard Nixon put an end to the Bretton Woods Agreement by discontinuing the link between gold and the dollar, known as the gold standard.

The Bretton Woods Agreement was based on four fundamental factors. First, the negotiators agreed on a new par value exchange rate system allowing member countries to *declare a par value for their national currencies. Second, because exchange rates were not to float freely member countries needed a guarantee of enough emergency supply of monetary reserve. Third, in order to prevent the economic conflicts of the 1930s all member countries were prohibited from getting involved in discriminatory currency or exchange regulation. And fourth all members agreed there was a need for an institutional assembly to monitor and regulate international monetary issues.*

a) Articles of Agreement of the International Bank for Reconstruction and Development, July 22, 1944

INTRODUCTORY ARTICLE

The International Bank for Reconstruction and Development is established and shall operate in accordance with the following provisions:

ARTICLE I. PURPOSES

The purposes of the Bank are:

(i) To assist in the reconstruction and development of territories of members by facilitating the investment of capital for productive purposes, including the restoration of economies destroyed or disrupted by war, the reconversion of productive facilities to peacetime needs and the encouragement of the development of productive facilities and resources in less developed countries.

(ii) To promote private foreign investment by means of guarantees or participations in loans and other investments made by private investors; and when private capital is not available on reasonable terms, to supplement private investment by providing, on suitable conditions, finance for productive purposes out of its own capital, funds raised by it and its other resources.

(iii) To promote the long-range balanced growth of international trade and the maintenance of equilibrium in balances of payments by encouraging international investment for the development of the productive resources of members, thereby assisting in raising productivity, the standard of living and conditions of labor in their territories.

(iv) To arrange the loans made or guaranteed by it in relation to international loans through other channels so that the more useful and urgent projects, large and small alike, will be dealt with first.

(v) To conduct its operations with due regard to the effect of international investment on business conditions in the territories of members and, in the immediate post-war years, to assist in bringing about a smooth transition from a wartime to a peacetime economy.

The Bank shall be guided in all its decisions by the purposes set forth above.

b) Articles of Agreement of the International Monetary Fund, July 22, 1944

The Governments on whose behalf the present Agreement is signed agree as follows:

INTRODUCTORY ARTICLE

The International Monetary Fund is established and shall operate in accordance with the following provisions:

ARTICLE I. PURPOSES

The purposes of the International Monetary Fund are:

(i) To promote international monetary cooperation through a permanent institution which provides the machinery for consultation and collaboration on international monetary problems.

(ii) To facilitate the expansion and balanced growth of international trade, and to contribute thereby to the promotion and maintenance of high levels of employment and real income and to the development of the productive resources of all members as primary objectives of economic policy.

(iii) To promote exchange stability, to maintain orderly exchange arrangements among members, and to avoid competitive exchange depreciation.

(iv) To assist in the establishment of a multilateral system of payments in respect of current transactions between members and in the elimination of foreign exchange restrictions which hamper the growth of world trade.

(v) To give confidence to members by making the Fund's resources available to them under adequate safeguards, thus providing them with opportunity to correct maladjustments in their balance of payments without resorting to measures destructive of national or international prosperity.

(vi) In accordance with the above, to shorten the duration and lessen the degree of disequilibrium in the international balances of payments of members.

The Fund shall be guided in all its decisions by the purposes set forth in this Article.

Servicemen's Readjustment Act of 1944 (GI Bill)

When World War II came to a close there was a need to help returning servicemen acclimate back to civilian life. President Franklin Roosevelt signed the Servicemen's Readjustment Act into law in 1944. The "GI Bill" included benefits ranging from loans to start a business, tuition reimbursements for those who wanted to return to school either to finish high school or attend a postsecondary school, living expenses including one year of unemployment compensation, and below-market interest mortgage loans to buy homes without a down payment. The Servicemen's Readjustment Act of 1944 clearly had as significant an impact on the U.S. economy as any legislation before it or since.

An Act to Provide Federal Government Aid for the Readjustment in Civilian Life of Returning World War II Veterans

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That this Act may be cited as the Servicemens Readjustment Act of 1944.

Title II
Chapter IV Education of Veterans
Sec. 400. (a) Subsection (f) of section 1, title I, Public Law Numbered 2, Seventy-third Congress, added by the Act of March 24, 1943 (Public Law Numbered 16, Seventy-eighth Congress), is hereby amended to read as follows:
(f) Any person who served in the active military or naval forces on or after September 16, 1940, and prior to the termination of hostilities in the present war, shall be entitled to vocational rehabilitation subject to the provisions and limitations of Veterans Regulation Numbered 1 (a), as amended, part VII, or to education or training subject to the provisions and limitations of part VIII.
(b) Veterans Regulation Numbered 1 (a), is hereby amended by adding a new part VIII as follows:
Part VIII
1. Any person who served in the active military or naval service on or after September 16, 1940, and prior to the termination of the present war, and who shall have been discharged or released there-from under conditions other than dishonorable, and whose education or training was impeded, delayed, interrupted, or interfered with by reason of his entrance into the service, or who desires a refresher or retraining course, and who either shall have served ninety days or more, exclusive of any period he was assigned for a course of education or training under the Army specialized training program or the Navy college training program, which course was a continuation of his civilian course and was pursued to completion, or as a cadet or midshipman at one of the service academies, or shall have been discharged or released from active service by reason of an actual service-incurred injury or disability, shall be eligible for and entitled to receive education or training under this part: Provided, That such course shall be initiated not later than two years after either the date of his discharge or the termination of the present war, whichever is the later: Provided further, That no such education or training shall be afforded beyond seven years after the termination of the present war: And provided further, That any such person who was not over 25 years of age at the tune he entered the service shall be deemed to have had his education or training impeded, delayed, interrupted, or interfered with.
2. Any such eligible person shall be entitled to education or training, or a refresher or retraining course, at an approved educational or training institution, for a period of one year (or the equivalent thereof in continuous part-time study), or for such lesser time as may be required for the course of instruction chosen by him. Upon satisfactory completion of such course of education or training, according to the regularly prescribed standards and practices of the institutions, except a refresher or retraining course, such person shall be entitled to an additional period or periods of education or training, not to exceed the time such person was in the active service on or after September 16, 1940, and before the termination of the war, exclusive of any period he was assigned for a course of education or training under the Army specialized training program or the Navy college training program, which course was a continuation of his civilian course and was pursued to completion,

or as a cadet or midshipman at one of the service academies, but in no event shall the total period of education or training exceed four years: Provided, That his work continues to be satisfactory throughout the period, according to the regularly prescribed standards and practices of the institution: Provided, however, That wherever the additional period of instruction ends during a quarter or semester and after a major part of such quarter or semester has expired, such period of instruction shall be extended to the termination of such unexpired quarter or semester.

3. Such person shall be eligible for and entitled to such course of education or training as he may elect, and at any approved educational or training institution at which he chooses to enroll, whether or not located in the State in which he resides, which will accept or retain him as a student or trainee in any field or branch of knowledge which such institution finds him qualified to undertake or pursue: Provided, That, for reasons satisfactory to the Administrator, he may change a course of instruction: And provided further, That any such course of education or training may be discontinued at any time, if it is found by the Administrator that, according to the regularly prescribed standards and practices of the institution, the conduct or progress of such person is unsatisfactory.

4. From time to time the Administrator shall secure from the appropriate agency of each State a list of the educational and training institutions (including industrial establishments), within such jurisdiction, which are qualified and equipped to furnish education or training (including apprenticeship and refresher or retraining training), which institutions, together with such additional ones as may be recognized and approved by the Administrator, shall be deemed qualified and approved to furnish education or training to such persons as shall enroll under this part: Provided, That wherever there are established State apprenticeship agencies expressly charged by State laws to administer apprentice training, whenever possible, the Administrator shall utilize such existing facilities and services in training on the job when such training is of one year's duration or more.

5. The Administrator shall pay to the educational or training institution, for each person enrolled in full time or part time course of education or training, the customary cost of tuition, and such laboratory, library, health, infirmary, and other similar fees as are customarily charged, and may pay for books, supplies, equipment, and other necessary expenses, exclusive of board, lodging, other living expenses, and travel, as are generally required for the successful pursuit and completion of the course by other students in the institution: Provided, That in no event shall such payments, with respect to any person, exceed $500 for an ordinary school year: Provided further, That no payments shall be made to institutions, business or other establishments furnishing apprentice training on the job: And provided further, That if any such institution has no established tuition fee, or if its established tuition fee shall be found by the Administrator to be inadequate compensation to such institution for furnishing such education or training, he is authorized to provide for the payment, with respect to any such person, of such fair and reasonable compensation as will not exceed $500 for an ordinary school year.

6. While enrolled in and pursuing a course under this part, such person, upon application to the Administrator, shall be paid a subsistence allowance of $50 per month,

if without a dependent or dependents, or $75 per month, if he has a dependent or dependents, including regular holidays and leave not exceeding thirty days in a calendar year. Such person attending a course on a part-time basis, and such person receiving compensation for productive labor performed as part of their apprentice or other training on the job at institutions, business or other establishments, shall be entitled to receive such lesser sums, if any, as subsistence or dependency allowances, as may be determined by the Administrator: Provided, That any such person eligible under this part, and within the limitations thereof, may pursue such full time or part-time course or courses as he may elect, without subsistence allowance.

7. Any such person eligible for the benefits of this part, who is also eligible for the benefit of part VII, may elect which benefit he desires: Provided, That, in the event of such election, subsistence allowance hereunder shall not exceed the amount of additional pension payable for training under said part VII.

8. No department, agency, or officer of the United States, in carrying out the provisions of this part, shall exercise any supervision or control, whatsoever, over any State educational agency, or State apprenticeship agency, or any educational or training institution: Provided, That nothing in this section shall be deemed to prevent any department, agency, or officer of the United States from exercising any supervision or control which such department, agency, or officer is authorized, by existing provisions of law, to exercise over any Federal educational or training institution, or to prevent the furnishing of education or training under this part in any institution over which supervision or control is exercised by such other department, agency, or officer under authority of existing provisions of law.

9. The Administrator of Veterans Affairs is authorized and empowered to administer this title, and, insofar as he deems practicable, shall utilize existing facilities and services of Federal and State departments and agencies on the basis of mutual agreements with them. Consistent with and subject to the provisions and limitations set forth in this title, the Administrator shall, from time to time, prescribe and promulgate such rules and regulations as may be necessary to carry out its purposes and provisions.

10. The Administrator may arrange for educational and vocational guidance to persons eligible for education and training under this part. At such intervals as he deems necessary, he shall make available information respecting the need for general education and for trained personnel in the various crafts, trades, and professions: Provided, That facilities of other Federal agencies collecting such information shall be utilized to the extent he deems practicable.

11. As used in this part, the term educational or training institutions shall include all public or private elementary, secondary, and other schools furnishing education for adults, business schools and colleges, scientific and technical institutions, colleges, vocational schools, junior colleges, teachers colleges, normal schools, professional schools, universities, and other educational institutions, and shall also include business or other establishments providing apprentice or other training on the job, including those under the supervision of an approved college or university or any State department of education, or any State apprenticeship agency or State board of vocational education, or any State apprenticeship council or the Federal Apprentice Training Service established in accordance with Public, Numbered

308, Seventy-fifth Congress, or any agency in the executive branch of the Federal Government authorized under other laws to supervise such training.

Employment Act of 1946

Enacted by Congress and signed by President Truman the Employment Act of 1946 was enacted as a result of the high unemployment rate in the United States in the 1930s. This Act held the government was responsible to maintain both high employment and price stability. The Council of Economic Advisors was established to assist the President in preparing an annual economics report, collect economic data and report economic growth and trends within the U.S. economy while advising the President on economic policies. Truman's proposed 1945 program included required full employment legislation, and increasing minimum wage, plus better unemployment and social security benefits.

ECONOMIC REPORT OF THE PRESIDENT Sec. 3. (a) The President shall transmit to the Congress within sixty days after the beginning of each regular session (commencing with the Tear 1947) an economic report (hereinafter called the "Economic Report") setting forth (1) the levels of employment, production, and purchasing power obtaining in the United States and such levels needed to carry out the policy declared in section 2; (2) current and foreseeable trends in the levels of employment, production, and purchasing power; (3) a review of the economic program of the Federal Government and a review of economic conditions affecting employment in the United States or any considerable portion thereof during the preceding year and of their effect upon employment, production, and purchasing power; and (4) a program for carrying out the policy declared in section 2, together with such recommendations for legislation as he may deem necessary or desirable. . . .

COUNCIL OF ECONOMIC ADVISERS TO THE PRESIDENT Sec. 4. (a) There is hereby created in the Executive Office of the President a Council of Economic Advisers (hereinafter called the "Council"). The Council shall be composed of three members who shall be appointed by the President, by and with the advice and consent of the Senate, and each of whom shall be a person who, as a result of his training, experience, and attainments, is exceptionally qualified to analyze and interpret economic developments, to appraise programs and activities of the Government in the light of the policy declared in section 2, and to formulate and recommend national economic policy to promote employment, production, and purchasing power under free competitive enterprise. . . .

JOINT COMMITTEE ON THE ECONOMIC REPORT Sec. 5; (a) There is hereby established a Joint Committee on the Economic Report, to be composed of seven Members of the Senate, to be appointed by the President of the Senate, and seven Members of the House of Representatives, to be appointed by the Speaker of the House of Representatives. The party representation on the joint committee shall as nearly as may be feasible reflect the relative membership of the majority and minority parties in the Senate and House of Representatives. (b) It shall be the function of the Joint Committee— (1) to make a continuing study of matters relating to the Economic Report; (2) to study means of coordinating programs in order to further the policy of this Act; and (3) as a guide to the several committees of the Congress dealing with legislation relating to the Economic Report, not later than May 1 of each year (beginning with the year 1947) to file a report with the Senate and the House of Representatives containing its findings and recommendations with respect to each of the main recommendations made by the President in the Economic Report, and from time to time to make such other reports and recommendations to the Senate and House of Representatives as it deems advisable.

Economic Opportunity Act of 1964

The Economic Opportunity Act (EOA) of 1964 was passed by Congress and signed by President Lyndon B. Johnson. The EOA was one component of President Johnson's Great Society programs and war on poverty. Some of the more successful programs of the Act included Job Corps and Head Start. The Act was designed to provide people in poverty with decent wages and standard of living. It provided funding to Community Action Agencies, public government organizations to directly serve the needs of the low-income families providing job training, adult education, and loans to small businesses to replenish the United States from the harsh poverty.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled. That this Act may be cited as the "Economic Opportunity Act of 1964".

FINDINGS AND DECLARATION OF PURPOSE

SEC. 2. Although the economic well-being and prosperity of the United States have progressed to a level surpassing any achieved in world history, and although these benefits are widely shared throughout the Nation, poverty continues to be the lot of a substantial number of our people. The United States can achieve its full economic and social potential as a nation only if every individual has the opportunity to contribute to the full extent of his capabilities and to participate in the workings of our society. It is, therefore, the policy of the United States to eliminate the paradox of poverty in the midst of plenty in this Nation by opening to everyone the opportunity for education and training, the opportunity to work, and the opportunity to live in decency and dignity. It is the purpose of this Act to strengthen, supplement, and coordinate efforts in furtherance of that policy.

TITLE I—YOUTH PROGRAMS

PART A—JOB CORPS

STATEMENT OF PURPOSE

SEC. 101. The purpose of this part is to prepare for the responsibilities of citizenship and to increase the employ ability of young men and young women aged sixteen through twenty-one by providing them in rural and urban residential centers with education, vocational training, useful work experience, including work directed toward the conservation of natural resources, and other appropriate activities.

ESTABLISHMENT OF JOB CORPS

SEC. 102. In order to carry out the purposes of this part, there is hereby established within the Office of Economic Opportunity (hereinafter referred to as the "Office"), established by title VI, a Job Corps (hereinafter referred to as the "Corps").

JOB CORPS PROGRAM

SEC. 103. The Director of the Office (hereinafter referred to as the "Director") is authorized to—

(a) enter into agreements with any Federal, State, or local agency or private organization for the establishment and operation, in rural and urban areas, of conservation camps and training centers and for the provision of such facilities and services as in his judgment are needed to carry out the purposes of this part, including but not limited to agreements with agencies charged with the responsibility of conserving, developing, and managing the public natural resources of the Nation and of developing, managing, and protecting public recreational areas, whereby the enrollees of the Corps may be utilized by such agencies in carrying out, under the immediate supervision of such agencies, programs planned and designed by such agencies to fulfill such responsibility, and including agreements for a botanical survey program involving surveys and maps of existing vegetation and investigations of the plants, soils, and environments of natural and disturbed plant communities;

(b) arrange for the provision of education and vocational training of enrollees in the Corps: Provided That, where practicable, such programs may be provided through local public educational agencies or by private vocational educational institutions or technical institutes where such institutions or institutes can provide substantially equivalent training with reduced Federal expenditures;

(c) provide or arrange for the provision of programs of useful work experience and other appropriate activities for enrollees;

(d) establish standards of safety and health for enrollees, and furnish or arrange for the furnishing of health services; and

(e) prescribe such rules and regulations and make such arrangements as he deems necessary to provide for the selection of enrollees and to govern their conduct after enrollment, including appropriate regulations as to the circumstances under which enrollment may be terminated.

COMPOSITION OF THE CORPS

SEC. 104. (a) The Corps shall be composed of young men and young women who are permanent residents of the United States, who have attained age sixteen but have not attained age twenty-two at the time of enrollment, and who meet the standards for enrollment prescribed by the Director. Participation in the Corps shall not relieve any enrollee of obligations under the Universal Military Training and Service Act (50 U.S.C. App. 451 et seq.).

(b) In order to enroll as a member of the Corps, an individual must agree to comply with rules and regulations promulgated by the Director for the government of the Corps.
(c) The total enrollment of any individual in the Corps shall not exceed two years except as the Director may determine in special cases.
(d) Each enrollee must execute and file with the Director an affidavit that he does not believe in, and is not a member of and does not support any organization that believes in or teaches, the overthrow of the United States Government by force or violence or by any illegal or unconstitutional methods, and (2) each enrollee must take and subscribe to an oath or affirmation in the following form: "I do solemnly swear (or affirm) that I will bear true faith and allegiance to the United States of America and will support and defend the Constitution and laws of the United States against all its enemies foreign and domestic". The provisions of section 1001 of title 18, United States Code, shall be applicable with respect to such affidavits.

Auto Pact of 1965

The Auto Pact of 1965 was a free trade agreement between the United States and Canada focusing specifically on both the intermediate goods production and final assembled automobile. There were many positive outcomes of this trade agreement but perhaps the most meaningful was the evidence free trade creates wealth through comparative advantage and specialization. The Pact allowed the major North American (United States and Canada) automotive manufacturers to integrate production processes to engage in a greater degree of specialization between both countries. The specialization resulted in greater economies of scale leading to reduced production costs for all manufacturers integrating the United States and Canadian automotive markets creating a single automotive market with increasing the consumer base for each market. Many consider the Auto Pact of 1965 as the launch of greater trade pacts leading to the North American Free Trade Agreement (NAFTA).

Sec. 101. Short Title
This Act may be cited as the "Automotive Products Trade Act of 1965".

Sec. 102. Purposes
The purposes of this Act are—
(1) To provide for the implementation of the Agreement concerning Automotive Products between the Government of the United States of America and the Government of Canada signed on January 16, 1965 (hereinafter referred to as "the Agreement"), in order to strengthen the economic relations and expand trade in automotive products between the United States and Canada; and
(2) To authorize the implementation of such other international agreements providing for the mutual reduction or elimination of duties applicable to automotive products as the Government of the United States may hereafter enter into.

Sec. 201. Implementation of the Agreement

(a) The President is authorized to proclaim the modifications of the Harmonized Tariff Schedule of the United States provided for in title IV of this Act.

(b) At any time after the issuance of the proclamation authorized by subsection (a), the President is authorized to proclaim further modifications of the Harmonized Tariff Schedule of the United States to provide for the duty-free treatment of any Canadian article which is original motor-vehicle equipment (as defined by such Schedules as modified pursuant to subsection (a)) if he determines that the importation of such article is actually or potentially of commercial significance and that such duty-free treatment is required to carry out the Agreement.

TITLE III—Tariff Adjustment and Other Adjustment Assistance

Sec. 301.

(a) Subject to section 302 of this act, a petition may be filed for tariff adjustment or for a determination of eligibility to apply for adjustment assistance under title III of the Trade Expansion Act of 1962 [19 U.S.C. 1901 et seq.] as though the reduction or elimination of a duty proclaimed by the President pursuant to section 2011 or 2012 of this title were a concession granted under a trade agreement.

(b) For purposes of applying chapter 3 of Title III of the Trade Expansion Act of 1962, adjustment assistance shall be available to a worker covered by a certification made concerning a petition files pursuant to subsection (a) only with respect to a total or partial separation which occurs after the date specified by the President in such certification as the date on which the unemployment or underemployment began or threatens to begin, and a readjustment allowance may be paid only for a week of unemployment which begins after that date.

Bankruptcy Reform Act of 1978

President Jimmy Carter signed the Bankruptcy Reform Act of 1978 on November 6, 1978, taking effect in October of 1979. The Act was intended to lighten the burden for businesses and individuals to file bankruptcy and/or reorganize their economic lives. The Act was a major change from past bankruptcy practices. The Act authorized three main types of bankruptcies: Chapter 7 which allows to liquidation of a business and discharge of debts; Chapter 11 which allows for corporations to continue operations after reorganizations; and Chapter 13 which restructures debt but does not forgive it. While these important changes helped bankruptcy law in the United States the Act created several controversies in the process. A 1982 Supreme Court ruling led to the Bankruptcy Amendment Act of 1984 but the Bankruptcy Reform Act of 1978 was a first major transformation of bankruptcy law in the United States.

§ 109. Who may be a debtor H USC 109.

(a) Notwithstanding any other provision of this section, only a person that resides in the United States, or has a domicile, a place of business, or property in the United States, or a municipality, may be a debtor under this title.

(b) A person may be a debtor under chapter 7 of this title only if Post, p. 2604. such person is not—

(1) a railroad;
(2) a domestic insurance company, bank, savings bank, cooperative bank, savings and loan association, building and loan association, homestead association, or credit union; or
(3) a foreign insurance company, bank, savings bank, cooperative bank, savings and loan association, building and loan association, homestead association, or credit union, engaged in such business in the United States.

(c) An entity may be a debtor under chapter 9 of this title if and Post, p. 2621. only if such entity—

(1) is a municipality;
(2) is generally authorized to be a debtor under such chapter by State law, or by a governmental officer or organization empowered by State law to authorize such entity to be a debtor under such chapter;
(3) is insolvent or unable to meet such entity's debts as such debts mature;
(4) desires to effect a plan to adjust such debts; and
(5) (A) has obtained the agreement of creditors holding at least a majority in amount of the claims of each class that such entity intends to impair under a plan in a case under such chapter;
(B) has negotiated in good faith with creditors and has failed to obtain the agreement of creditors holding at least a majority in amount of the claims of each class that such entity intends to impair under a plan in a case under such chapter;
(C) is unable to negotiate with creditors because such negotiation is impracticable; or
(D) reasonably believes that a creditor may attempt to obtain a preference.
(d) Only a person that may be a debtor under chapter 7 of this title, except a stockholder or a commodity broker, and a railroad may be a debtor under chapter 11 of this title. Post, p. 2626.
(e) Only an individual with regular income that owes, on the date of the filing of the petition, noncontingent, liquidated, unsecured debts of less than $100,000 and noncontingent, liquidated, secured debts of less than $350,000, or an individual with regular income and such individual's spouse, except a stockbroker or a commodity broker, that owe, on the date of the filing of the petition, noncontingent, liquidated, unsecured debts that aggregate less than $100,000 and noncontingent, liquidated, secured debts of less than $350,000 may be a debtor under chapter 13 of this title.

Monetary Control Act of 1980

The Depository Institutions Deregulation and Monetary Control Act of 1980 was signed by President Jimmy Carter to strengthen the financial sector regulation which was still considered weak from the Great Depression. It is considered one of the most important *changes financial institutions since 1933. This Act has nine components covering many areas of financial institutions. It revised previous regulations regarding bank reserves, Federal Reserve services, and deposit requirements. It changed the operations of all financial institutions and many businesses.*

POWERS OF DEPOSITORY INSTITUTIONS

General

The Act authorizes banks to continue to provide automatic transfer services from savings to checking accounts; authorizes savings and loan associations to establish remote service units to credit and debit savings accounts, or credit payments on loans, and provide related financial transactions; and authorizes federally insured credit unions to offer share draft accounts. The Act also extends nationwide the authority for depository institutions to offer NOW accounts, effective December 31, 1980. NOW accounts may consist solely of funds in which the entire beneficial interest is held by one or more individuals or by an organization operated primarily for religious, philanthropic, charitable, educational, or other similar purposes and not operated for profit. The insurance of accounts of federally insured banks, savings and loan associations, and credit unions has been increased from $40,000 to $100,000.

Thrift Institutions

The Act also authorizes various new investment authorities for federally chartered savings and loan associations and permits them to offer credit card services and to exercise trust and fiduciary powers; expands authority to make real estate loans; authorizes Federal mutual savings banks to make commercial, corporate and business loans, subject to limitations, and to accept demand deposits in connection with a commercial, corporate, or business loan relationship; and in other ways expands the powers of thrift institutions.

Schengen Agreement (1985)

The Schengen Agreement put in place the elimination of customs and passport control at shared borders. Signed in the town of Schengen, Luxembourg in 1985 the five original countries were Belgium, France, Germany, Luxembourg, and the Netherlands. The agreement serves to create more efficient movement of labor, goods, services, and capital across borders. It also demonstrated a level of trust between member nations. The burden of customs and immigration control is shifted to the outside of the area in this case the outside border to the European Union territory. These foundations set the stage for the European Union and their unified market approach.

The Governments of the Kingdom of Belgium, the Federal Republic of Germany, the French Republic, the Grand Duchy of Luxembourg and the Kingdom of the Netherlands, hereinafter referred to as 'the Parties', Aware that the ever closer union of the peoples of the Member States of the European Communities should find its expression in the freedom to cross internal borders for all nationals of the Member States and in the free movement of goods and services,

Anxious to strengthen the solidarity between their peoples by removing the obstacles to free movement at the common borders between the States of the Benelux Economic Union, the Federal Republic of Germany and the French Republic,

Considering the progress already achieved within the European Communities with a view to ensuring the free movement of persons, goods and services, Prompted by the resolve to achieve the abolition of checks at their common borders on the movement of nationals of the Member States of the European Communities and to facilitate the movement of goods and services at those borders, Considering that application of this agreement may require legislative measures which will have to be submitted to the parliaments of the Signatory States in accordance with their constitutions,

Having regard to the statement by the Fontainebleau European Council on 25 and 26 June 1984 on the abolition of police and customs formalities for people and goods crossing intra-Community frontiers,

Having regard to the agreement concluded at Saarbrücken on 13 July 1984 between the Federal Republic of Germany and the French Republic,

Having regard to the conclusions adopted on 31 May 1984 following the meeting of the transport ministers of the Benelux States and the Federal Republic of Germany at Neustadt/Aisch, Having regard to the memorandum of the Governments of the Benelux Economic Union of 12 December 1984 forwarded to the Governments of the Federal Republic of Germany and the French Republic,

HAVE AGREED AS FOLLOWS:

TITLE I

MEASURES APPLICABLE IN THE SHORT TERM

Article 1 As soon as this agreement enters into force and until all checks are abolished completely, the formalities for nationals of the Member States of the European Communities at the common borders between the States of the Benelux Economic Union, the Federal Republic of Germany and the French Republic shall be carried out in accordance with the conditions laid down below.

Article 2 With regard to the movement of persons, from 15 June 1985 the police and customs authorities shall as a general rule carry out simple visual surveillance of private vehicles crossing the common border at reduced speed, without requiring such vehicles to stop. However, they may carry out more thorough controls by means of spot checks. These shall be performed where possible off the main road, so as not to interrupt the flow of other vehicles crossing the border.

Article 3 To facilitate visual surveillance, nationals of the Member States of the European Communities wishing to cross the common border in a motor vehicle may affix to the windscreen a green disc measuring at least 8 centimetres in diameter. This disc shall indicate that they have complied with border police rules, are carrying only goods permitted under the duty-free arrangements and have complied with exchange regulations.

Article 4 The Parties shall endeavour to keep to a minimum the time spent at common borders in connection with checks on the carriage of passengers by road for hire or reward. The Parties shall seek solutions enabling them by 1 January 1986 to waive systematic checks at their common borders on passenger waybills and licences for the carriage of passengers by road for hire or reward.

Article 5 By 1 January 1986, common checks shall be put in place at adjacent national control posts insofar as that is not already the case and insofar as physical-conditions so permit. Consideration shall subsequently be given to the possibility of introducing common checks at other border crossing points, taking account of local conditions. 1. AGREEMENT + CONVENTION + ACCESSIONS 21

Article 6 Without prejudice to the application of more favourable arrangements between the Parties, the latter shall take the measures required to facilitate the movement of nationals of the Member States of the European Communities resident in the local administrative areas along their common borders with a view to allowing them to cross those borders at places other than authorised crossing points and outside checkpoint opening hours. The persons concerned may benefit from these advantages provided that they transport only goods permitted under the dutyfree arrangements and comply with exchange regulations.

Article 7 The Parties shall endeavour to approximate their visa policies as soon as possible in order to avoid the adverse consequences in the field of immigration and security that may result from easing checks at the common borders. They shall take, if possible by 1 January 1986, the necessary steps in order to apply their procedures for the issue of visas and admission to their territories, taking into account the need to ensure the protection of the entire territory of the five States against illegal immigration and activities which could jeopardise security.

Article 8 With a view to easing checks at their common borders and taking into account the significant differences in the laws of the States of the Benelux Economic Union, the Federal Republic of Germany and the French Republic, the Parties undertake to combat vigorously illicit drug trafficking on their territories and to coordinate their action effectively in this area.

Article 9 The Parties shall reinforce cooperation between their customs and police authorities, notably in combating crime, particularly illicit trafficking in narcotic drugs and arms, the unauthorised entry and residence of persons, customs and tax fraud and smuggling. To that end and in accordance with their national laws, the Parties shall endeavour to improve the exchange of information and to reinforce that exchange where information which could be useful to the other Parties in combating crime is concerned. Within the framework of their national laws the Parties shall reinforce mutual assistance in respect of unauthorised movements of capital.

Article 10 With a view to ensuring the cooperation provided for in Articles 6 to 9, meetings between the Parties' competent authorities shall be held at regular intervals.

Article 11 With regard to the cross-border carriage of goods by road, the Parties shall waive, as from 1 July 1985, systematic performance of the following checks at their common borders: 22 The Schengen acquis — control of driving and rest periods (Council Regulation (EEC) No 543/69 of 25 March 1969 on the harmonisation of certain social legislation relating to road transport and AETR); — control of the weights and dimensions of commercial vehicles; this provision shall not prevent the introduction of automatic weighing systems for spot checks on weight; — controls on the vehicles' technical state. Measures shall be taken to avoid checks being duplicated within the territories of the Parties.

Article 12 From 1 July 1985 checks on documents detailing transport operations not carried out under licence or quota pursuant to Community or bilateral rules shall be replaced at the common borders by spot checks. Vehicles carrying out transport operations under such arrangements shall display a visual symbol to that effect when crossing the border. The Parties' competent authorities shall determine the features of this symbol by common agreement.

Article 13 The Parties shall endeavour to harmonise by 1 January 1986 the systems applying among them to the licensing of commercial road transport with regard to cross-border traffic, with the aim of simplifying, easing and possibly replacing licences for journeys by licences for a period of time, with a visual check when vehicles cross common borders. The procedures for converting licences for journeys into licences for periods of time shall be agreed on a bilateral basis, account being taken of the road haulage requirements in the different countries concerned.

Article 14 The Parties shall seek solutions to reduce the waiting times of rail transport at the common borders caused by the completion of border formalities.

Article 15 The Parties shall recommend to their respective rail companies: — to adapt technical procedures in order to minimise stopping times at the common borders; — to do their utmost to apply to certain types of carriage of goods by rail, to be defined by the rail companies, a special routing system whereby the common borders can be crossed rapidly without any appreciable stops (goods trains with reduced stopping times at borders).

Article 16 The Parties shall harmonise the opening dates and opening hours of customs posts for inland waterway traffic at the common borders.

TITLE II

MEASURES APPLICABLE IN THE LONG TERM

Article 17 With regard to the movement of persons, the Parties shall endeavour to abolish checks at common borders and transfer them to their external borders. To that end they shall endeavour first to harmonise, where necessary, the laws, regulations and administrative provisions concerning the prohibitions and restrictions on which the checks are based and to take complementary measures to safeguard internal security and prevent illegal immigration by nationals of States that are not members of the European Communities.

Article 18 The Parties shall open discussions, in particular on the following matters, account being taken of the results of the short-term measures: (a) drawing up arrangements for police cooperation on crime prevention and investigation; (b) examining any difficulties that may arise in applying agreements on international judicial assistance and extradition, in order to determine the most appropriate solutions for improving cooperation between the Parties in those fields; (c) seeking means to combat crime jointly, inter alia by studying the possibility of introducing a right of hot pursuit for police officers, taking into account existing means of communication and international judicial assistance.

Article 19 The Parties shall seek to harmonise laws and regulations, in particular on: — narcotic drugs; — arms and explosives; — the registration of travellers in hotels.

Article 20 The Parties shall endeavour to harmonise their visa policies and the conditions for entry to their territories. Insofar as is necessary, they shall also prepare the 24 The Schengen acquis harmonisation of their rules governing certain aspects of the law on aliens in regard to nationals of States that are not members of the European Communities.

Article 21 The Parties shall take common initiatives within the European Communities: (a) to achieve an increase in the duty-free allowances granted to travellers; (b) in the context of Community allowances to remove any remaining restrictions on entry to the Member States of goods possession of which is not prohibited for their nationals. The Parties shall take initiatives within the European Communities so that VAT on tourist transport services within the European Communities is collected in the country of departure on a harmonised basis.

Article 22 The Parties shall endeavour both among themselves and within the European Communities: — to increase the duty-free allowance for fuel in order to bring it into line with the normal contents of bus and coach fuel tanks (600 litres); — to approximate the tax rates on diesel fuel and to increase the duty-free allowances for the normal contents of lorry fuel tanks.

Article 23 In the field of goods transport the Parties shall also endeavour to reduce stopping times and the number of stopping points at adjacent national control posts.

Article 24 With regard to the movement of goods, the Parties shall seek means of transferring the checks currently carried out at the common borders to the external borders or to within their own territories. To that end they shall take, where necessary, common initiatives among themselves and within the European Communities to harmonise the provisions on which checks on goods at the common borders are based. They shall ensure that these measures do not adversely affect the necessary protection of the health of humans, animals and plants.

Article 25 The Parties shall develop their cooperation with a view to facilitating customs clearance of goods crossing a common border, through a systematic, automatic exchange of the necessary data collected by means of the single document.

Article 26 The Parties shall examine how indirect taxes (VAT and excise duties) may be harmonised in the framework of the European Communities. To that end they shall support the initiatives undertaken by the European Communities.

Article 27 The Parties shall examine whether, on a reciprocal basis, the limits on the duty-free allowances granted at the common borders to frontier-zone residents, as authorised under Community law, may be abolished.

Article 28 Before the conclusion of any bilateral or multilateral arrangements similar to this agreement with States that are not Parties thereto, the Parties shall consult among themselves.

Article 29 This agreement shall also apply to Berlin, unless a declaration to the contrary is made by the Government of the Federal Republic of Germany to the Governments of the States of the Benelux Economic Union and the Government of the French Republic within three months of entry into force of this agreement.

North American Free Trade Agreement (NAFTA) (1994)

In 1994 trade in North America took a significant step toward more open trade and globalization with the North American Free Trade Agreement (NAFTA). It created a trilateral trade bloc between the United States, Canada, and Mexico. NAFTA became the third-largest trade bloc in the world impacting over 460 million people and is the largest in land size. With the elimination of many, if not all, of the tariffs between the United States, Canada, and Mexico trade between the nations definitely increased for many products, from durable goods such as automobiles and televisions to agricultural products such as corn and meats. Imports and exports increased across all the borders. NAFTA also addressed the sensitive issue of protecting intellectual property and removing all nontariff barriers to trade.

Chapter Seventeen: Intellectual Property
PART SIX: INTELLECTUAL PROPERTY

Article 1705: Copyright

1. Each Party shall protect the works covered by Article 2 of the Berne Convention, including any other works that embody original expression within the meaning of that Convention. In particular:

(a) all types of computer programs are literary works within the meaning of the Berne Convention and each Party shall protect them as such; and
(b) compilations of data or other material, whether in machine readable or other form, which by reason of the selection or arrangement of their contents constitute intellectual creations, shall be protected as such.

The protection a Party provides under subparagraph (b) shall not extend to the data or material itself, or prejudice any copyright subsisting in that data or material.
2. Each Party shall provide to authors and their successors in interest those rights enumerated in the Berne Convention in respect of works covered by paragraph 1, including the right to authorize or prohibit:

(a) the importation into the Party's territory of copies of the work made without the right holder's authorization;
(b) the first public distribution of the original and each copy of the work by sale, rental or otherwise;
(c) the communication of a work to the public; and
(d) the commercial rental of the original or a copy of a computer program.

Subparagraph (d) shall not apply where the copy of the computer program is not itself an essential object of the rental. Each Party shall provide that putting the original or a copy of a computer program on the market with the right holder's consent shall not exhaust the rental right.
3. Each Party shall provide that for copyright and related rights:

(a) any person acquiring or holding economic rights may freely and separately transfer such rights by contract for purposes of their exploitation and enjoyment by the transferee; and
(b) any person acquiring or holding such economic rights by virtue of a contract, including contracts of employment underlying the creation of works and sound recordings, shall be able to exercise those rights in its own name and enjoy fully the benefits derived from those rights.

4. Each Party shall provide that, where the term of protection of a work, other than a photographic work or a work of applied art, is to be calculated on a basis other than the life of a natural person, the term shall be not less than 50 years from the end of the calendar year of the first authorized publication of the work or, failing such authorized publication within 50 years from the making of the work, 50 years from the end of the calendar year of making.
5. Each Party shall confine limitations or exceptions to the rights provided for in this Article to certain special cases that do not conflict with a normal exploitation

of the work and do not unreasonably prejudice the legitimate interests of the right holder.
6. No Party may grant translation and reproduction licenses permitted under the Appendix to the Berne Convention where legitimate needs in that Party's territory for copies or translations of the work could be met by the right holder's voluntary actions but for obstacles created by the Party's measures.
7. Annex 1705.7 applies to the Parties specified in that Annex.

Article 1708: Trademarks

1. For purposes of this Agreement, a trademark consists of any sign, or any combination of signs, capable of distinguishing the goods or services of one person from those of another, including personal names, designs, letters, numerals, colors, figurative elements, or the shape of goods or of their packaging. Trademarks shall include service marks and collective marks, and may include certification marks. A Party may require, as a condition for registration, that a sign be visually perceptible.
2. Each Party shall provide to the owner of a registered trademark the right to prevent all persons not having the owner's consent from using in commerce identical or similar signs for goods or services that are identical or similar to those goods or services in respect of which the owner's trademark is registered, where such use would result in a likelihood of confusion. In the case of the use of an identical sign for identical goods or services, a likelihood of confusion shall be presumed. The rights described above shall not prejudice any prior rights, nor shall they affect the possibility of a Party making rights available on the basis of use.
3. A Party may make registrability depend on use. However, actual use of a trademark shall not be a condition for filing an application for registration. No Party may refuse an application solely on the ground that intended use has not taken place before the expiry of a period of three years from the date of application for registration.
4. Each Party shall provide a system for the registration of trademarks, which shall include:

(a) examination of applications;
(b) notice to be given to an applicant of the reasons for the refusal to register a trademark;
(c) a reasonable opportunity for the applicant to respond to the notice;
(d) publication of each trademark either before or promptly after it is registered; and
(e) a reasonable opportunity for interested persons to petition to cancel the registration of a trademark.

A Party may provide for a reasonable opportunity for interested persons to oppose the registration of a trademark.
5. The nature of the goods or services to which a trademark is to be applied shall in no case form an obstacle to the registration of the trademark.
6. Article 6bis of the Paris Convention shall apply, with such modifications as may be necessary, to services. In determining whether a trademark is wellknown, account shall be taken of the knowledge of the trademark in the relevant sector of the public, including knowledge in the Party's territory obtained as a result of

the promotion of the trademark. No Party may require that the reputation of the trademark extend beyond the sector of the public that normally deals with the relevant goods or services.

7. Each Party shall provide that the initial registration of a trademark be for a term of at least 10 years and that the registration be indefinitely renewable for terms of not less than 10 years when conditions for renewal have been met.

8. Each Party shall require the use of a trademark to maintain a registration. The registration may be canceled for the reason of non-use only after an uninterrupted period of at least two years of non-use, unless valid reasons based on the existence of obstacles to such use are shown by the trademark owner. Each Party shall recognize, as valid reasons for non-use, circumstances arising independently of the will of the trademark owner that constitute an obstacle to the use of the trademark, such as import restrictions on, or other government requirements for, goods or services identified by the trademark.

9. Each Party shall recognize use of a trademark by a person other than the trademark owner, where such use is subject to the owner's control, as use of the trademark for purposes of maintaining the registration.

10. No Party may encumber the use of a trademark in commerce by special requirements, such as a use that reduces the trademark's function as an indication of source or a use with another trademark.

11. A Party may determine conditions on the licensing and assignment of trademarks, it being understood that the compulsory licensing of trademarks shall not be permitted and that the owner of a registered trademark shall have the right to assign its trademark with or without the transfer of the business to which the trademark belongs.

12. A Party may provide limited exceptions to the rights conferred by a trademark, such as fair use of descriptive terms, provided that such exceptions take into account the legitimate interests of the trademark owner and of other persons.

13. Each Party shall prohibit the registration as a trademark of words, at least in English, French or Spanish, that generically designate goods or services or types of goods or services to which the trademark applies.

14. Each Party shall refuse to register trademarks that consist of or comprise immoral, deceptive or scandalous matter, or matter that may disparage or falsely suggest a connection with persons, living or dead, institutions, beliefs or any Party's national symbols, or bring them into contempt or disrepute.

Article 1709: Patents

1. Subject to paragraphs 2 and 3, each Party shall make patents available for any inventions, whether products or processes, in all fields of technology, provided that such inventions are new, result from an inventive step and are capable of industrial application. For purposes of this Article, a Party may deem the terms “inventive step” and “capable of industrial application” to be synonymous with the terms “non-obvious” and “useful”, respectively.

2. A Party may exclude from patentability inventions if preventing in its territory the commercial exploitation of the inventions is necessary to protect ordre public

or morality, including to protect human, animal or plant life or health or to avoid serious prejudice to nature or the environment, provided that the exclusion is not based solely on the ground that the Party prohibits commercial exploitation in its territory of the subject matter of the patent.

3. A Party may also exclude from patentability:

(a) diagnostic, therapeutic and surgical methods for the treatment of humans or animals;
(b) plants and animals other than microorganisms; and
(c) essentially biological processes for the production of plants or animals, other than non-biological and microbiological processes for such production.

Notwithstanding subparagraph (b), each Party shall provide for the protection of plant varieties through patents, an effective scheme of *sui generis* protection, or both.

4. If a Party has not made available product patent protection for pharmaceutical or agricultural chemicals commensurate with paragraph 1:

(a) as of January 1, 1992, for subject matter that relates to naturally occurring substances prepared or produced by, or significantly derived from, microbiological processes and intended for food or medicine, and
(b) as of July 1, 1991, for any other subject matter, that Party shall provide to the inventor of any such product or its assignee the means to obtain product patent protection for such product for the unexpired term of the patent for such product granted in another Party, as long as the product has not been marketed in the Party providing protection under this paragraph and the person seeking such protection makes a timely request.

5. Each Party shall provide that:

(a) where the subject matter of a patent is a product, the patent shall confer on the patent owner the right to prevent other persons from making, using or selling the subject matter of the patent, without the patent owner's consent; and
(b) where the subject matter of a patent is a process, the patent shall confer on the patent owner the right to prevent other persons from using that process and from using, selling, or importing at least the product obtained directly by that process, without the patent owner's consent.

6. A Party may provide limited exceptions to the exclusive rights conferred by a patent, provided that such exceptions do not unreasonably conflict with a normal exploitation of the patent and do not unreasonably prejudice the legitimate interests of the patent owner, taking into account the legitimate interests of other persons.

7. Subject to paragraphs 2 and 3, patents shall be available and patent rights enjoyable without discrimination as to the field of technology, the territory of the Party where the invention was made and whether products are imported or locally produced.

8. A Party may revoke a patent only when:

(a) grounds exist that would have justified a refusal to grant the patent; or
(b) the grant of a compulsory license has not remedied the lack of exploitation of the patent.

9. Each Party shall permit patent owners to assign and transfer by succession their patents, and to conclude licensing contracts.

10. Where the law of a Party allows for use of the subject matter of a patent, other than that use allowed under paragraph 6, without the authorization of the right holder, including use by the government or other persons authorized by the government, the Party shall respect the following provisions:

(a) authorization of such use shall be considered on its individual merits;
(b) such use may only be permitted if, prior to such use, the proposed user has made efforts to obtain authorization from the right holder on reasonable commercial terms and conditions and such efforts have not been successful within a reasonable period of time. The requirement to make such efforts may be waived by a Party in the case of a national emergency or other circumstances of extreme urgency or in cases of public non-commercial use. In situations of national emergency or other circumstances of extreme urgency, the right holder shall, nevertheless, be notified as soon as reasonably practicable. In the case of public non-commercial use, where the government or contractor, without making a patent search, knows or has demonstrable grounds to know that a valid patent is or will be used by or for the government, the right holder shall be informed promptly;
(c) the scope and duration of such use shall be limited to the purpose for which it was authorized;
(d) such use shall be non-exclusive;
(e) such use shall be non-assignable, except with that part of the enterprise or goodwill that enjoys such use;
(f) any such use shall be authorized predominantly for the supply of the Party's domestic market;
(g) authorization for such use shall be liable, subject to adequate protection of the legitimate interests of the persons so authorized, to be terminated if and when the circumstances that led to it cease to exist and are unlikely to recur. The competent authority shall have the authority to review, on motivated request, the continued existence of these circumstances;
(h) the right holder shall be paid adequate remuneration in the circumstances of each case, taking into account the economic value of the authorization;
(i) the legal validity of any decision relating to the authorization shall be subject to judicial or other independent review by a distinct higher authority;
(j) any decision relating to the remuneration provided in respect of such use shall be subject to judicial or other independent review by a distinct higher authority;
(k) the Party shall not be obliged to apply the conditions set out in subparagraphs (b) and (f) where such use is permitted to remedy a practice determined after judicial or administrative process to be anticompetitive. The need to correct anticompetitive practices may be taken into account in determining the amount of remuneration in such cases. Competent authorities shall have the authority to refuse termination of authorization if and when the conditions that led to such authorization are likely to recur;
(l) the Party shall not authorize the use of the subject matter of a patent to permit the exploitation of another patent except as a remedy for an adjudicated violation of domestic laws regarding anticompetitive practices.

11. Where the subject matter of a patent is a process for obtaining a product, each Party shall, in any infringement proceeding, place on the defendant the burden of establishing that the allegedly infringing product was made by a process other than the patented process in one of the following situations:

(a) the product obtained by the patented process is new; or
(b) a substantial likelihood exists that the allegedly infringing product was made by the process and the patent owner has been unable through reasonable efforts to determine the process actually used.

In the gathering and evaluation of evidence, the legitimate interests of the defendant in protecting its trade secrets shall be taken into account.

12. Each Party shall provide a term of protection for patents of at least 20 years from the date of filing or 17 years from the date of grant. A Party may extend the term of patent protection, in appropriate cases, to compensate for delays caused by regulatory approval processes.

Gramm-Leach-Bliley Act (Financial Modernization Act of 1999)

The Gramm-Leach-Bliley Act is also known as the Financial Modernization Act of 1999. The Act controls the ways in which financial institutions handle the private information of individuals. The Act has three sections; "The Financial Privacy Rule" regulating the collection and disclosure of private financial information; "The Safeguards Rule" guaranteeing financial institutions must implement security programs to protect such private information; and "The Pretexting Provisions" prohibiting the practice of accessing private information under false pretenses. The Act also requires financial institutions to give customers a written privacy notice that details all aspects of the institutions information-sharing practices.

An Act

To enhance competition in the financial services industry by providing a prudential framework for the affiliation of banks, securities firms, insurance companies, and other financial service providers, and for other purposes. Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,

SECTION 1. SHORT TITLE; TABLE OF CONTENTS. (a) SHORT TITLE.—This Act may be cited as the "Gramm-Leach-Bliley Act"
SEC. 101. GLASS-STEAGALL ACT REPEALS.

(a) SECTION 20 REPEALED.—Section 20 of the Banking Act of 1933 (12 U.S.C. 377) (commonly referred to as the "Glass-Steagall Act") is repealed. (b) SECTION 32 REPEALED.—Section 32 of the Banking Act of 1933 (12 U.S.C. 78) is repealed.

SEC. 102. ACTIVITY RESTRICTIONS APPLICABLE TO BANK HOLDING COMPANIES THAT ARE NOT FINANCIAL HOLDING COMPANIES.
(a) IN GENERAL.—Section 4(c)(8) of the Bank Holding Company Act of 1956 (12 U.S.C. 1843(c)(8)) is amended to read as follows: "(8) shares of any company

the activities of which had been determined by the Board by regulation or order under this paragraph as of the day before the date of the enactment of the Gramm-Leach-Bliley Act, to be so closely related to banking as to be a proper incident thereto (subject to such terms and conditions contained in such regulation or order, unless modified by the Board);”.

(b) CONFORMING CHANGES TO OTHER STATUTES.—

(1) AMENDMENT TO THE BANK HOLDING COMPANY ACT AMENDMENTS OF 1970.—Section 105 of the Bank Holding Company Act Amendments of 1970 (12 U.S.C. 1850) is amended by striking “, to engage directly or indirectly in a nonbanking activity pursuant to section 4 of such Act,”.
(2) AMENDMENT TO THE BANK SERVICE COMPANY ACT.— Section 4(f) of the Bank Service Company Act (12 U.S.C. 1864(f)) is amended by inserting before the period at the end the following: “as of the day before the date of the enactment of the Gramm-Leach-Bliley Act”.

SEC. 103. FINANCIAL ACTIVITIES.
(a) IN GENERAL.—Section 4 of the Bank Holding Company Act of 1956 (12 U.S.C. 1843) is amended by adding at the end the following new subsections:
“(k) ENGAGING IN ACTIVITIES THAT ARE FINANCIAL IN NATURE.—
“(1) IN GENERAL.—Notwithstanding subsection (a), a financial holding company may engage in any activity, and may acquire and retain the shares of any company engaged in any activity, that the Board, in accordance with paragraph (2), determines (by regulation or order)—
“(A) to be financial in nature or incidental to such financial activity; or
“(B) is complementary to a financial activity and does not pose a substantial risk to the safety or soundness of depository institutions or the financial system generally.

Sarbanes-Oxley Act (2002)

President George W. Bush signed the Sarbanes-Oxley Act (SOX) in 2002. At the time of enactment, the United States was the largest economy in the world and entangled in a crisis surrounding the fraudulent reporting of corporate financial data by a number of publicly traded companies. Illegal accounting methods had cost billions of dollars. The Sarbanes-Oxley Act contains 11 sections including the establishment of a public company accountability board, requirements for auditor independence, details concerning corporate responsibility, enhanced conflict of interest provisions, and new criminal penalties for corporate fraud. The Act boosted the reliability of corporate disclosures and changed the way securities analysts interact with corporate management. In the wake of such financial losses directly due to fraud SOX even required top management to personally certify corporate financial information.

An Act
To protect investors by improving the accuracy and reliability of corporate disclosures made pursuant to the securities laws, and for other purposes. [NOTE: July 30, 2002 - [H.R. 3763]]
Be it enacted by the Senate and House of Representatives of the United States of America in Congress

SEC. 103. [NOTE: 15 USC 7213.] AUDITING, QUALITY CONTROL, AND INDEPENDENCE STANDARDS AND RULES.

(a) Auditing, Quality Control, and Ethics Standards.—

(1) In general.—The Board shall, by rule, establish, including, to the extent it determines appropriate, through adoption of standards proposed by 1 or more professional groups of accountants designated pursuant to paragraph (3)(A) or advisory groups convened pursuant to paragraph (4), and amend or otherwise modify or alter, such auditing and related attestation standards, such quality control standards, and such ethics standards to be used by registered public accounting firms in the preparation and issuance of audit reports, as required by this Act or the rules of the Commission, or as may be necessary or appropriate in the public interest or for the protection of investors.

(2) Rule requirements.—In carrying out paragraph (1), the Board—

(A) shall include in the auditing standards that it adopts, requirements that each registered public accounting firm shall

(i) prepare, and maintain for a period of not less than 7 years, audit work papers, and other information related to any audit report, in sufficient detail to support the conclusions reached in such report;

(ii) provide a concurring or second partner review and approval of such audit report (and other related information), and concurring approval in its issuance, by a qualified person (as prescribed by the Board) associated with the public accounting firm, other than the person in charge of the audit, or by an independent reviewer (as prescribed by the Board); and

(iii) describe in each audit report the scope of the auditor's testing of the internal control structure and procedures of the issuer, required by section 404(b), and present (in such report or in a separate report)—

(I) the findings of the auditor from such testing;

(II) an evaluation of whether such internal control structure and procedures—

(aa) include maintenance of records that in reasonable detail accurately and fairly reflect the transactions and dispositions of the assets of the issuer;

(bb) provide reasonable assurance that transactions are recorded as necessary to permit preparation of financial statements in accordance with generally accepted accounting principles, and that receipts and expenditures of the issuer are being made only in accordance with authorizations of management and directors of the issuer; and

(III) a description, at a minimum, of material weaknesses in such internal controls, and of any material noncompliance found on the basis of such testing.

(B) shall include, in the quality control standards that it adopts with respect to the issuance of audit reports, requirements for every registered public accounting firm relating to—

(i) monitoring of professional ethics and independence from issuers on behalf of which the firm issues audit reports;

(ii) consultation within such firm on accounting and auditing questions;

(iii) supervision of audit work;

(iv) hiring, professional development, and advancement of personnel;

(v) the acceptance and continuation of engagements;

(vi) internal inspection; and

(vii) such other requirements as the Board may prescribe, subject to subsection (a)(1).

(3) Authority to adopt other standards.—

(A) In general.—In carrying out this subsection, the Board—

(i) may adopt as its rules, subject to the terms of section 107, any portion of any statement of auditing standards or other professional standards that the Board determines satisfy the requirements of paragraph (1), and that were proposed by 1 or more professional groups of accountants that shall be designated or recognized by the Board, by rule, for such purpose, pursuant to this paragraph or 1 or more advisory groups convened pursuant to paragraph (4); and

(ii) notwithstanding clause (i), shall retain full authority to modify, supplement, revise, or subsequently amend, modify, or repeal, in whole or in part, any portion of any statement described in clause (i).

(B) Initial and transitional standards.—The Board shall adopt standards described in subparagraph (A)(i) as initial or transitional standards, to the extent the Board determines necessary, prior to a determination of the

Commission under section 101(d), and such standards shall be separately approved by the Commission at the time of that determination, without regard to the procedures required by section 107 that otherwise would apply to the approval of rules of the Board.

(4) Advisory groups.—The Board shall convene, or authorize its staff to convene, such expert advisory groups as may be appropriate, which may include practicing accountants and other experts, as well as representatives of other interested groups, subject to such rules as the Board may prescribe to prevent conflicts of interest, to make recommendations concerning the content (including proposed drafts) of auditing, quality control, ethics, independence, or other standards required to be established under this section.

(b) Independence Standards and Rules.—The Board shall establish such rules as may be necessary or appropriate in the public interest or for the protection of investors, to implement, or as authorized under, title II of this Act.

(c) Cooperation With Designated Professional Groups of Accountants and Advisory Groups.—

(1) In general.—The Board shall cooperate on an ongoing basis with professional groups of accountants designated under subsection (a)(3)(A) and advisory groups convened under subsection (a)(4) in the examination of the need for changes in any standards subject to its authority under subsection (a), recommend issues for inclusion on the agendas of such designated professional groups of accountants or advisory groups, and take such other steps as it deems appropriate to increase the effectiveness of the standard setting process.

(2) Board responses.—The Board shall respond in a timely fashion to requests from designated professional groups of accountants and advisory groups referred to in paragraph (1) for any changes in standards over which the Board has authority.

(d) Evaluation of Standard Setting Process.—The Board shall include in the annual report required by section 101(h) the results of its standard setting responsibilities during the period to which the report relates, including a discussion of the work of the Board with any designated professional groups of accountants and advisory groups described in paragraphs (3)(A) and (4) of subsection (a), and its pending issues agenda for future standard setting projects.

SEC. 104. [NOTE: 15 USC 7214.] INSPECTIONS OF REGISTERED PUBLIC ACCOUNTING FIRMS.

(a) In General.—The Board shall conduct a continuing program of inspections to assess the degree of compliance of each registered public accounting firm and associated persons of that firm with this Act, the rules of the Board, the rules of the Commission, or professional standards, in connection with its performance of audits, issuance of audit reports, and related matters involving issuers.

(b) Inspection Frequency.—

(1) In general.—Subject to paragraph (2), inspections required by this section shall be conducted—

(A) annually with respect to each registered public accounting firm that regularly provides audit reports for more than 100 issuers; and

(B) not less frequently than once every 3 years with respect to each registered public accounting firm that regularly provides audit reports for 100 or fewer issuers.

(2) Adjustments to schedules.—The Board may, by rule, adjust the inspection schedules set under paragraph (1) if the Board finds that different inspection schedules are consistent with the purposes of this Act, the public interest, and the protection of investors. The Board may conduct special inspections at the request of the Commission or upon its own motion.

(c) Procedures.—The Board shall, in each inspection under this section, and in accordance with its rules for such inspections—

(1) identify any act or practice or omission to act by the registered public accounting firm, or by any associated person thereof, revealed by such inspection that may be in violation of this Act, the rules of the Board, the rules of the Commission, the firm's own quality control policies, or professional standards;

(2) report any such act, practice, or omission, if appropriate, to the Commission and each appropriate State regulatory authority; and

(3) begin a formal investigation or take disciplinary action, if appropriate, with respect to any such violation, in accordance with this Act and the rules of the Board.

(d) Conduct of Inspections.—In conducting an inspection of a registered public accounting firm under this section, the Board shall—

(1) inspect and review selected audit and review engagements of the firm (which may include audit engagements that are the subject of ongoing litigation or other controversy between the firm and 1 or more third parties), performed at various offices and by various associated persons of the firm, as selected by the Board;

(2) evaluate the sufficiency of the quality control system of the firm, and the manner of the documentation and communication of that system by the firm; and

(3) perform such other testing of the audit, supervisory, and quality control procedures of the firm as are necessary or appropriate in light of the purpose of the inspection and the responsibilities of the Board.

(e) Record Retention.—The rules of the Board may require the retention by registered public accounting firms for inspection purposes of records whose retention is not otherwise required by section 103 or the rules issued thereunder.

(f) Procedures for Review.—The rules of the Board shall provide a procedure for the review of and response to a draft inspection report by the registered public accounting firm under inspection. The Board shall take such action with respect to such response as it considers appropriate (including revising the draft report or continuing or supplementing its inspection activities before issuing a final report), but the text of any such response, appropriately redacted to protect information reasonably identified by the accounting firm as confidential, shall be attached to and made part of the inspection report.

(g) Report.—A written report of the findings of the Board for each inspection under this section, subject to subsection (h), shall be—

(1) transmitted, in appropriate detail, to the Commission and each appropriate State regulatory authority, accompanied by any letter or comments by the Board or the inspector, and any letter of response from the registered public accounting firm; and

(2) made available in appropriate detail to the public (subject to section 105(b)(5)(A), and to the protection of such confidential and proprietary information as the Board may determine to be appropriate, or as may be required by law), except that no portions of the inspection report that deal with criticisms of or potential defects in the quality control systems of the firm under inspection shall be made public if those criticisms or defects are addressed by the firm, to the satisfaction of the Board, not later than 12 months after the date of the inspection report.

Patient Protection and Affordable Care Act (2010)

In 2010, Congress passed the Patient Protection and Affordable Care Act (ACA). Congress crafted the legislation and the accompanying taxes to deal with the negative externalities and social issues related to the health care market. In March 2010, the ACA became law, creating considerable changes in health insurance. The goals of the act included making affordable health insurance available for all Americans and reducing the costs of health care for individuals and the government. It proposed mandates, subsidies, and insurance exchanges as mechanisms to reach these goals. The main tools for increasing insurance coverage were creating state-based insurance exchanges and expanding Medicaid eligibility.

A central component of this legislation was the health insurance mandate, requiring all Americans to buy health insurance or pay a fine for not participating. Soon after President Obama signed ACA Florida and 25 other states, two individuals, and the National Federation of Independent Business (NFIB), among others, filed lawsuits against the federal government challenging the constitutionality of the individual mandate. After legal battles where the U.S. Federal Court for the Northern District of Florida agreed with the plaintiffs that the commerce clause of the Constitution limits Congress's authority declaring the entire law unconstitutional and upheld upon appeal in the Eleventh Circuit Court of Appeals the stage was set for a showdown in the U.S. Supreme Court.

SEC. 2715. DEVELOPMENT AND UTILIZATION OF UNIFORM EXPLANATION OF COVERAGE DOCUMENTS AND STANDARDIZED DEFINITIONS.

(a) IN GENERAL.—Not later than 12 months after the date of enactment of the Patient Protection and Affordable Care Act, the Secretary shall develop standards for use by a group health plan and a health insurance issuer offering group or individual health insurance coverage, in compiling and providing to enrollees a summary of benefits and coverage explanation that accurately describes the benefits and coverage under the applicable plan or coverage. In developing such standards, the Secretary shall consult with the National Association of Insurance Commissioners (referred to in this section as the 'NAIC'), a working group composed of representatives of health insurance-related consumer advocacy organizations, health insurance issuers, health care professionals, patient advocates including those representing individuals with limited English proficiency, and other qualified individuals.

(b) REQUIREMENTS.—The standards for the summary of benefits and coverage developed under subsection (a) shall provide for the following:

(1) APPEARANCE.—The standards shall ensure that the summary of benefits and coverage is presented in a uniform format that does not exceed 4 pages in length and does not include print smaller than 12-point font.
(2) LANGUAGE.—The standards shall ensure that the summary is presented in a culturally and linguistically appropriate manner and utilizes terminology understandable by the average plan enrollee.
(3) CONTENTS.—The standards shall ensure that the summary of benefits and coverage includes—
   (A) uniform definitions of standard insurance terms and medical terms (consistent with subsection (g)) so that consumers may compare health insurance coverage and understand the terms of coverage (or exception to such coverage);
   (B) a description of the coverage, including cost sharing for—
      (i) each of the categories of the essential health benefits described in subparagraphs (A) through (J) of section 1302(b)(1) of the Patient Protection and Affordable Care Act; and
      (ii) other benefits, as identified by the Secretary;
   (C) the exceptions, reductions, and limitations on coverage;
   (D) the cost-sharing provisions, including deductible, coinsurance, and co-payment obligations;
   (E) the renewability and continuation of coverage provisions;
   (F) a coverage facts label that includes examples to illustrate common benefits scenarios, including pregnancy and serious or chronic medical conditions and related cost sharing, such scenarios to be based on recognized clinical practice guidelines;
   (G) a statement of whether the plan or coverage—
      (i) provides minimum essential coverage (as defined under section 5000A(f) of the Internal Revenue Code 1986); and
      (ii) ensures that the plan or coverage share of the total allowed costs of benefits provided under the plan or coverage is not less than 60 percent of such costs;
   (H) a statement that the outline is a summary of the policy or certificate and that the coverage document itself should be consulted to determine the governing contractual provisions; and

(I) a contact number for the consumer to call with additional questions and an Internet web address where a copy of the actual individual coverage policy or group certificate of coverage can be reviewed and obtained.

Financial Reform Act of 2010 (Dodd-Frank Act)

The Financial Reform Act of 2010 was an effort to reform financial regulation following the financial crisis of 2008. Signed by President Obama on July 21, 2010 the law is also known as the Dodd-Frank Wall Street Reform and Consumer Protection Act, or simply "Dodd-Frank" in reference to the significant work of Senator Christopher J. Dodd (D-CT) and Representative Barney Frank (D-MA). Dodd-Frank is one of the most extensive financial reforms since the Banking Act of 1933 (Glass-Steagall Act). The Act established the Financial Stability Oversight Council. The role of the council is to identify risks for U.S. financial stability from financial and nonfinancial organizations, promote market discipline, and respond to emergency risks to the U.S. financial system.

Two components of Dodd-Frank seemed especially popular with the public. One is what became known as the "Volcker Rule." Proposed by former chair of the Federal Reserve Paul Volcker the rule restricts the trading financial companies can do with their own accounts limiting their ability to take excessive risks. It also restricts banks from owning, investing, sponsoring hedge funds, private equity funds, or proprietary trading for their own profit. The second popular component was the new Consumer Financial Protection Bureau. Housed and funded within the Federal Reserve this new Bureau consolidates the functions of many different agencies to write rules, supervise companies, and enforce federal consumer financial protection laws as well as serving to promote financial education and monitor financial markets for consumers.

Subtitle A—Financial Stability Oversight Council

SEC. 111. FINANCIAL STABILITY OVERSIGHT COUNCIL ESTABLISHED.

(a) Establishment- Effective on the date of enactment of this Act, there is established the Financial Stability Oversight Council.

(b) Membership- The Council shall consist of the following members:

(1) VOTING MEMBERS- The voting members, who shall each have 1 vote on the Council shall be—

(A) the Secretary of the Treasury, who shall serve as Chairperson of the Council;
(B) the Chairman of the Board of Governors;
(C) the Comptroller of the Currency;
(D) the Director of the Bureau;
(E) the Chairman of the Commission;
(F) the Chairperson of the Corporation;
(G) the Chairperson of the Commodity Futures Trading Commission;
(H) the Director of the Federal Housing Finance Agency;

(I) the Chairman of the National Credit Union Administration Board; and
(J) an independent member appointed by the President, by and with the advice and consent of the Senate, having insurance expertise.

(2) NONVOTING MEMBERS- The nonvoting members, who shall serve in an advisory capacity as a nonvoting member of the Council, shall be—
(A) the Director of the Office of Financial Research;
(B) the Director of the Federal Insurance Office;
(C) a State insurance commissioner, to be designated by a selection process determined by the State insurance commissioners;
(D) a State banking supervisor, to be designated by a selection process determined by the State banking supervisors; and
(E) a State securities commissioner (or an officer performing like functions), to be designated by a selection process determined by such State securities commissioners.

(3) NONVOTING MEMBER PARTICIPATION- The nonvoting members of the Council shall not be excluded from any of the proceedings, meetings, discussions, or deliberations of the Council, except that the Chairperson may, upon an affirmative vote of the member agencies, exclude the nonvoting members from any of the proceedings, meetings, discussions, or deliberations of the Council when necessary to safeguard and promote the free exchange of confidential supervisory information.

TITLE XI—FEDERAL RESERVE SYSTEM PROVISIONS

SEC. 1101. FEDERAL RESERVE ACT AMENDMENTS ON EMERGENCY LENDING AUTHORITY.

(a) Federal Reserve Act- The third undesignated paragraph of section 13 of the Federal Reserve Act (12 U.S.C. 343) (relating to emergency lending authority) is amended—

(1) by inserting '(3)(A)' before 'In unusual';

(2) by striking 'individual, partnership, or corporation' the first place that term appears and inserting the following: 'participant in any program or facility with broad-based eligibility';

(3) by striking 'exchange for an individual or a partnership or corporation' and inserting 'exchange,';

(4) by striking 'such individual, partnership, or corporation' and inserting the following: 'such participant in any program or facility with broad-based eligibility';

(5) by striking 'for individuals, partnerships, corporations' and inserting 'for any participant in any program or facility with broad-based eligibility'; and

(6) by striking 'may prescribe.' and inserting the following: 'may prescribe.

'(B)(i) As soon as is practicable after the date of enactment of this subparagraph, the Board shall establish, by regulation, in consultation with the Secretary of the Treasury, the policies and procedures governing emergency lending under this paragraph. Such policies and procedures shall be designed to ensure that any emergency lending program or facility is for the purpose of providing liquidity to the financial system, and not to aid a failing financial company, and that the security for emergency loans is sufficient to protect taxpayers from losses and that any such program is terminated in a timely and orderly fashion. The policies and procedures established by the Board shall require that a Federal reserve bank assign, consistent with sound risk management practices and to ensure protection for the taxpayer, a lendable value to all collateral for a loan executed by a Federal reserve bank under this paragraph in determining whether the loan is secured satisfactorily for purposes of this paragraph.

'(ii) The Board shall establish procedures to prohibit borrowing from programs and facilities by borrowers that are insolvent. Such procedures may include a certification from the chief executive officer (or other authorized officer) of the borrower, at the time the borrower initially borrows under the program or facility (with a duty by the borrower to update the certification if the information in the certification materially changes), that the borrower is not insolvent. A borrower shall be considered insolvent for purposes of this subparagraph, if the borrower is in bankruptcy, resolution under title II of the Dodd-Frank Wall Street Reform and Consumer Protection Act, or any other Federal or State insolvency proceeding.

'(iii) A program or facility that is structured to remove assets from the balance sheet of a single and specific company, or that is established for the purpose of assisting a single and specific company avoid bankruptcy, resolution under title II of the Dodd-Frank Wall Street Reform and Consumer Protection Act, or any other Federal or State insolvency proceeding, shall not be considered a program or facility with broad-based eligibility.

'(iv) The Board may not establish any program or facility under this paragraph without the prior approval of the Secretary of the Treasury.

'(C) The Board shall provide to the Committee on Banking, Housing, and Urban Affairs of the Senate and the Committee on Financial Services of the House of Representatives—

'(i) not later than 7 days after the Board authorizes any loan or other financial assistance under this paragraph, a report that includes—

'(I) the justification for the exercise of authority to provide such assistance;

'(II) the identity of the recipients of such assistance;

'(III) the date and amount of the assistance, and form in which the assistance was provided; and

'(IV) the material terms of the assistance, including—

'(aa) duration;

'(bb) collateral pledged and the value thereof;

'(cc) all interest, fees, and other revenue or items of value to be received in exchange for the assistance;

'(dd) any requirements imposed on the recipient with respect to employee compensation, distribution of dividends, or any other corporate decision in exchange for the assistance; and

'(ee) the expected costs to the taxpayers of such assistance; and

'(ii) once every 30 days, with respect to any outstanding loan or other financial assistance under this paragraph, written updates on—

'(I) the value of collateral;

'(II) the amount of interest, fees, and other revenue or items of value received in exchange for the assistance; and

'(III) the expected or final cost to the taxpayers of such assistance.

'(D) The information required to be submitted to Congress under subparagraph (C) related to—

'(i) the identity of the participants in an emergency lending program or facility commenced under this paragraph;

'(ii) the amounts borrowed by each participant in any such program or facility;

'(iii) identifying details concerning the assets or collateral held by, under, or in connection with such a program or facility,

shall be kept confidential, upon the written request of the Chairman of the Board, in which case such information shall be made available only to the Chairpersons or Ranking Members of the Committees described in subparagraph (C).

'(E) If an entity to which a Federal reserve bank has provided a loan under this paragraph becomes a covered financial company, as defined in section 201 of the Dodd-Frank Wall Street Reform and Consumer Protection Act, at any time while such loan is outstanding, and the Federal reserve bank incurs a realized net loss on the loan, then the Federal reserve bank shall have a claim equal to the amount of the net realized loss against the covered entity, with the same priority as an obligation to the Secretary of the Treasury under section 210(b) of the Dodd-Frank Wall Street Reform and Consumer Protection Act.'.

(b) Conforming Amendment- Section 507(a)(2) of title 11, United States Code, is amended by inserting 'unsecured claims of any Federal reserve bank related to loans made through programs or facilities authorized under section 13(3) of the Federal Reserve Act (12 U.S.C. 343),' after 'this title,'.

(c) References- On and after the date of enactment of this Act, any reference in any provision of Federal law to the third undesignated paragraph of section 13 of the Federal Reserve Act (12 U.S.C. 343) shall be deemed to be a reference to section 13(3) of the Federal Reserve Act, as so designated by this section.

America Invents Act of 2011 (Leahy-Smith Act)

The America Invents Act of 2011, also known as the Leahy-Smith Act, was sponsored by House Judiciary Committee chairman Lamar Smith (R-TX) and Senator Patrick Leahy (D-VT) and signed by President Obama. The Act updates the patent system to encourage innovation, job creation, and economic growth. The America Invents Act affects three main parts of the economy: job creation, patent office reforms, and legal reform. The Act protects the rights of inventors for their original inventions and encourages business growth by speeding up the patent process so entrepreneurs and innovators can quickly turn their inventions into businesses. It also permits universities and small businesses to keep title to their inventions in exchange for fulfilling a series of obligations: disclosing the invention to the federal agency funding the research, electing to retain title, and filing patent applications. The Act influences legal reform creating an administrative program for review of business method patents.

§ 102. Conditions for patentability; novelty

(a) NOVELTY; PRIOR ART.—A person shall be entitled to a patent unless—

(1) the claimed invention was patented, described in a printed publication, or in public use, on sale, or otherwise available to the public before the effective filing date of the claimed invention; or

(2) the claimed invention was described in a patent issued under section 151, or in an application for patent published or deemed published under section 122(b), in which the patent or application, as the case may be, names another inventor and was effectively filed before the effective filing date of the claimed invention.

(b) EXCEPTIONS.—

(1) DISCLOSURES MADE 1 YEAR OR LESS BEFORE THE EFFECTIVE FILING DATE OF THE CLAIMED INVENTION.—A disclosure made 1 year or less before the effective filing date of a claimed invention shall not be prior art to the claimed invention under subsection (a)(1) if—

(A) the disclosure was made by the inventor or joint inventor or by another who obtained the subject matter disclosed directly or indirectly from the inventor or a joint inventor; or

(B) the subject matter disclosed had, before such disclosure, been publicly disclosed by the inventor or a joint inventor or another who obtained the subject matter disclosed directly or indirectly from the inventor or a joint inventor.

(2) DISCLOSURES APPEARING IN APPLICATIONS AND PAT- ENTS.—A disclosure shall not be prior art to a claimed invention under subsection (a)(2) if—

(A) the subject matter disclosed was obtained directly or indirectly from the inventor or a joint inventor;

(B) the subject matter disclosed had, before such subject matter was effectively filed under subsection (a)(2), been publicly disclosed by the inventor or a joint inventor or another who obtained the subject matter disclosed directly or indirectly from the inventor or a joint inventor; or

(C) the subject matter disclosed and the claimed invention, not later than the effective filing date of the claimed invention, were owned by the same person or subject to an obligation of assignment to the same person.

(c) COMMON OWNERSHIP UNDER JOINT RESEARCH AGREEMENTS.—Subject matter disclosed and a claimed invention shall be deemed to have been owned by the same person or subject to an obligation of assignment to the same person in applying the provisions of subsection (b)(2)(C) if—

(1) the subject matter disclosed was developed and the claimed invention was made by, or on behalf of, 1 or more parties to a joint research agreement that was in effect on or before the effective filing date of the claimed invention;

(2) the claimed invention was made as a result of activities undertaken within the scope of the joint research agreement; and

(3) the application for patent for the claimed invention discloses or is amended to disclose the names of the parties to the joint research agreement.

(d) PATENTS AND PUBLISHED APPLICATIONS EFFECTIVE AS PRIOR ART.—For purposes of determining whether a patent or application for patent is prior art to a claimed invention under subsection (a)(2), such patent or application shall be considered to have been effectively filed, with respect to any subject matter described in the patent or application—

"(1) if paragraph (2) does not apply, as of the actual filing date of the patent or the application for patent; or

(2) if the patent or application for patent is entitled to claim a right of priority under section 119, 365(a), or 365(b), or to claim the benefit of an earlier filing date under section 120, 121, or 365(c), based upon 1 or more prior filed applications for patent, as of the filing date of the earliest such application that describes the subject matter.".

(2) CONTINUITY OF INTENT UNDER THE CREATE ACT.—The enactment of section 102(c) of title 35, United States Code, under paragraph (1) of this subsection is done with the same intent to promote joint research activities that was

expressed, including in the legislative history, through the enactment of the Cooperative Research and Technology Enhancement Act of 2004 (Public Law 108–453; the “CREATE Act”), the amendments of which are stricken by subsection (c) of this section. The United States Patent and Trademark Office shall administer section 102(c) of title 35, United States Code, in a manner consistent with the legislative history of the CREATE Act that was relevant to its administration by the United States Patent and Trademark Office.

Timeline of Key Events in the Global Economy, 1776–2016

1776	Adam Smith publishes *An Inquiry into the Nature and Causes of the Wealth of Nations*, a treatise that underpins the free enterprise system.
1798	Thomas R. Malthus publishes *An Essay on the Principle of Population as It Affects the Future Improvement of Society*, a major treatise on the consequences of unbridled population growth.
1817	David Ricardo publishes *Principles of Political Economy and Taxation*, defending free trade based on the theory of comparative advantage.
1848	Karl H. Marx and Friedrich Engels publish *The Communist Manifesto*, a fundamental treatise on communism.
1850s	The first modern "age" of globalization begins (1850s to 1914).
1867	The first of three volumes of Marx's *Das Kapital* is published.
1883	The Paris Convention creates protections for industrial property rights.
1886	The Berne Convention creates protections for copyrights.
1895	The International Co-operative Alliance (ICA) is founded.
1914	World War I breaks out in Europe, paralyzing global trade and investment.
	The first modern "age" of globalization ends.
1917	Russian Bolsheviks stage a successful communist revolution in Russia under the leadership of Vladimir I. Lenin.
1919	The League of Nations is formed.
	The International Labor Organization (ILO) is formed to protect workers' rights.
1920	Arthur Pigou publishes *The Economics of Welfare*, marking the birth of welfare economics.
1921	The New Economic Policy restores some private enterprise in the Union of Soviet Socialist Republics (USSR).
1922	The USSR is formally established as the world's first communist country.
1928	Joseph Stalin introduces the five-year plan to dictate the use of productive resources in the Soviet Union.
1929	The Stock Market Crash signals the beginning of the Great Depression in the United States.
1930	Most of the industrialized world sinks into a global economic depression.

The Smoot-Hawley Tariff is passed in the United States, severely restricting foreign trade and touching off trade wars.

The Bank for International Settlements (BIS) is founded to promote international financial stability and cooperation.

World population hits 2 billion people.

1939 World War II erupts in Europe, crippling the global economy.

1941 The Freedom House is founded in the United States.

1942 Joseph A. Schumpeter publishes *Capitalism, Socialism, and Democracy*, stressing the role of innovation and creative destruction in economic growth.

1944 The Bretton Woods Conference is held in New Hampshire, creating the Bretton Woods institutions: the International Monetary Fund (IMF) and the precursor to the World Bank.

The fixed exchange rate system is established.

Friedrich August von Hayek publishes *The Road to Serfdom*, a passionate defense of capitalism and *laissez-faire* economics.

1945 The United Nations (UN) is created at the San Francisco Conference to promote world peace, economic development, and human rights.

The UN Educational, Scientific, and Cultural Organization (UNESCO) is founded.

World War II ends in Europe (May) and Asia (September).

1946 The Bretton Woods System goes into effect.

The International Labor Organization (ILO) joins the UN system.

The Iron Curtain divides the East from the West, and the Cold War begins.

The second modern "age" of globalization begins (1946–present).

1947 The General Agreement on Tariffs and Trade (GATT) negotiations begin.

The Organization of European Economic Cooperation (OEEC) is founded.

1948 The Marshall Plan provides massive U.S. aid to war-torn Europe.

The World Health Organization (WHO) is formed to advance human health—the physical and mental well-being of all people.

Delegates to the Havana Conference support the International Trade Organization (ITO), but governments do not ratify the agreement.

1949 The People's Republic of China is established under Mao Zedong.

1951 The European Coal and Steel Community (ECSC) Treaty begins European economic integration.

Japan creates the Ministry of International Trade and Industry (MITI) to support export industries.

1956 The International Finance Corporation (IFC) joins the World Bank Group.

1957 The Rome Treaties create the European Economic Community (EEC) and the European Atomic Energy Community (Euratom).

1959 The Inter-American Development Bank begins operations.

Fidel Castro establishes communism in Cuba.

1960 The European Free Trade Association (EFTA) is formed.

The Organization of Petroleum Exporting Countries (OPEC) is founded.

The Central American Common Market (CACM) is founded.

Consumers International (CI) is founded as a federation of consumer organizations and an advocate for consumer rights in the global economy.

The International Development Association (IDA) joins the World Bank Group.

W. W. Rostow's *The Stages of Economic Growth: A Non-Communist Manifesto* popularizes linear development theory.

The U.S. embargo of Cuba is established.

1961 The Organisation for Economic Co-operation and Development (OECD) is founded to replace the OEEC.

The Peace Corps, an agency within the U.S. federal government, is created to foster mutual understanding and economic development throughout the world.

1964 The African Development Bank (ADB) is founded.

The G77 is formed to promote a new and just world economic order.

1965 Mexico establishes the Border Industrialization Program, later renamed the Maquiladora Program, to attract U.S. investment.

1966 The Asian Development Bank (ADB) is founded.

The International Centre for Settlement of Investment Disputes (ICSID) joins the World Bank Group.

1967 The Association of Southeast Asian Nations (ASEAN) is founded.

Julius K. Nyerere commits Tanzania to *ujamaa* socialism, a type of African socialism based on traditional tribal communalism.

The World Intellectual Property Organization (WIPO) is founded; it will enter into force in 1970.

1968 Karl Gunnar Myrdal publishes *Asian Drama: An Inquiry into the Poverty of Nations*, which rekindles debate about development strategies in the third world.

1969 The ARPANET, later to be called the Internet, is invented by the U.S. Department of Defense as an "inter-networking of networks."

1971 The Generalized System of Preferences is implemented.

The World Economic Forum (WEF) is founded (originally called the European Management Forum; its name was changed to WEF in 1987).

1972 The United Nations Environment Programme (UNEP) is formed.

The African Development Fund (ADF) joins the African Development Bank Group.

The Freedom House begins its annual freedom rankings of countries.

1973 The Bretton Woods System collapses, and a flexible exchange rate system replaces the fixed exchange rate system.

The Caribbean Community and Common Market (CARICOM) is formed.

Some OPEC members place an oil embargo on Western countries in retaliation for Western support for Israel in the Yom Kippur War.

E. F. Schumacher publishes *Small Is Beautiful: Economics as if People Mattered* to defend localized production and appropriate technology.

1975 The Economic Community of West African States (ECOWAS) is founded.

The G7, comprising leading industrialized nations, is formed.

World population climbs to 4 billion people.

1976 The Nigeria Trust Fund (NTF) joins the African Development Bank Group.

1978 Deng Xiaoping adopts a gradualist approach to initiating market-oriented economic reforms in China.

1983 Muhammad Yunus formally establishes the Grameen Bank in Bangladesh.

1985 The United Nations Guidelines for Consumer Protection are adopted.

Mikhail Gorbachev introduces *perestroika* to restructure the Soviet economy, and *glasnost* to open the Soviet political system.

1986 The Uruguay Round (1986–1994) of trade negotiations commences.

1987 The Montreal Protocol is established to reduce emissions of ozone-depleting substances into the Earth's atmosphere.

1988 The Multilateral Investment Guarantee Agency (MIGA) joins the World Bank Group.

The U.S.–Canada Free Trade Agreement is created.

1989 Poland becomes the first Soviet bloc nation to elect a noncommunist government.

The Asia-Pacific Economic Cooperation (APEC) group is founded.

The Inter-American Investment Corporation joins the Inter-American Development Bank Group.

Hernando de Soto publishes *The Other Path: The Invisible Revolution in the Third World*, which supports inclusion of the poor in the formal economy.

Tim Berners-Lee invents the World Wide Web.

1990 A Human Development Index is introduced by the United Nations Development Programme (UNDP) to measure progress toward sustainable economic development.

The European Bank for Reconstruction and Development (EBRD) is founded, and begins operations in 1991.

1991 MERCOSUR, the Southern Common Market, is formed.

The USSR is dissolved.

The Council on Mutual Economic Assistance (COMECON) is disbanded.

Transition economies begin an epic transformation toward market-based economies and democracy.

1992 The Rio Conference generates *Agenda 21*, a plan for global development; it approves the United Nations Framework Convention on Climate Change (UNFCCC).

The Commonwealth of Independent States (CIS) is formed.

1993 The Maastricht Treaty creates the European Union (EU).

The Andean Free Trade Area is formed.

The Multilateral Investment Fund joins the Inter-American Development Bank Group.

1994 The European Economic Area (EEA) creates a single market for EU and EFTA nations (only Switzerland votes not to join the EEA).

The Marrakesh Treaty is approved at the conclusion of the Uruguay Round; it creates the World Trade Organization (WTO) to replace GATT.

The Western Hemisphere is introduced to the idea of a free trade area for the 34 democracies of North and South America.

The North American Free Trade Agreement (NAFTA) takes effect.

The International Conference on Population takes place in Cairo, Egypt.

1995 The WTO officially replaces GATT.

James D. Wolfensohn becomes World Bank president, beginning the first of his two five-year terms of office in the World Bank's top spot.

About 25,000 non-governmental organizations (NGOs) operate globally.

The Trade-Related Aspects of Intellectual Property (TRIPS) agreement is implemented.

1996 The Heavily Indebted Poor Countries (HIPC) Initiative is launched by the IMF and the World Bank.

The Helms-Burton Act strengthens the U.S. embargo on Cuba.

1997 Hong Kong becomes a Special Administrative Region (SAR) of China.

Kofi Annan begins his first term as UN secretary-general.

The East Asian financial crisis begins (1997–1998), destabilizing the global economy and illustrating the dangers of financial contagion.

The Kyoto Protocol targets greenhouse gases and global warming.

1998 The G8 is formed by including Russia alongside the G7 countries.

The ILO announces its *Declaration of Fundamental Principles and Rights at Work*.

The Russian financial crisis begins (1998–1999), another example of financial contagion.

1999 Macao is returned to China by Portugal.

The Poverty Reduction and Growth Facility (PRGF) is established.

The so-called Millennium Round of trade negotiations fails completely at the WTO's ministerial conference in Seattle, Washington.

The Treaty of Amsterdam paves the way for an EU enlargement.

The euro is introduced as the EU's common currency, beginning a three-year phase-in period.

The Global Compact is adopted by the United Nations.

The Global Sullivan Principles are introduced by the Rev. Leon H. Sullivan.

The "banana war" trade dispute erupts between the United States and the European Union.

The G20 is created to promote the inclusion of key developing countries in global decision-making.

Sustainable consumption is formally added to the UN Guidelines for Consumer Protection.

2000 Foreign direct investment inflows peak at $1.4 trillion.

The UN Millennium Summit adopts the UN Millennium Development Goals (MDGs).

The *Global Entrepreneurship Monitor* (*GEM*) is launched.

The World Resources Institute publishes *World Resources 2000–2001*, which warns against continued abuse of natural ecosystems by human populations.

The World Bank introduces the gross national income (GNI) per capita, a new measurement of economic well-being.

China moves from low-income status to lower-middle-income status.

The G77 adopts the Havana Program of Action, a sign of improved South–South communication and consensus.

World population hits 6 billion people.

2001 The Summit of the Americas is held in Quebec City to lay the groundwork for the creation of a 34-nation Free Trade Area of the Americas (FTAA).

The United States and the European Union quietly settle the banana war.

The September 11 terrorist attacks on the United States jolt international markets.

The Ministry of Economy, Trade and Industry (METI) replaces MITI in Japan.

The Doha Development Round of trade negotiations begins—a WTO trade round stressing economic development in the world's poorer regions.

Argentina defaults on $81 billion in government bonds, the largest default in history.

2002 The euro replaces the national currencies of 12 EU countries in the eurozone.

Hong Kong SAR is named the world's freest economy by leading think tanks.

About 3,000 export processing zones operate in the global economy.

2003 The third annual World Social Forum attracts over 100,000 participants from 156 countries.

The United Nations drafts the UN Convention Against Corruption.

The WTO's 2003 ministerial meeting in Cancun, Mexico, makes little progress in implementing the Doha Development Agenda.

Official Development Assistance (ODA) and Official Aid (OA) hit $76 billion.

62,000 transnational corporations control 927,000 foreign affiliates in the global economy.

Foreign direct investment (FDI) inflows tumble to $560 billion, less than half of the $1.4 trillion in FDI inflows during the 2000 peak year.

2,265 bilateral investment treaties (BITS) and 2,361 double taxation treaties (DDTs) define the rules of cross-border investment.

2004 The IMF creates two classifications for economies: advanced economies, and emerging market and developing countries.

The U.S. trade deficit hits a record $617 billion.

The nominal gross domestic product (GDP) of the United States reaches $11.7 trillion; the United States remains the world's largest economy.

Freedom House reports that 119 democracies exist in the world.

An EU enlargement adds 10 countries to the EU.

The value of world exports hits $11 trillion.

Foreign exchange (forex) trading hits $1.9 trillion per day.

Global GDP hits $42 trillion (exchange rate method), or $56 trillion (PPP method).

More than half a trillion dollars is spent on advertising in the global economy.

A catastrophic tsunami rips through Western Asia and East Africa; billions of dollars in humanitarian aid flow to the effected regions.

Walmart is the world's largest corporation, measured by total revenues and by total employees.

2005 The proposed Free Trade Area of the Americas fails to gain formal approval by the January target date.

World oil prices spike at more than $70 per barrel.

France and the Netherlands reject the proposed EU Constitution.

The average annual growth rate for the world economy is 3.8 percent between 1996 and 2005.

The Kyoto Protocol, which limits greenhouse gas emissions, enters into force after Russia signs the multilateral environmental treaty.

The external debt of emerging market and developing countries reaches $3 trillion.

The UN's Millennium Ecosystem Assessment proposes global policy changes to reverse environmental degradation.

The UN is made up of 191 member countries.

208 economies operate in the global economy.

The UN proclaims 2005 the Year of Microcredit.

About 300 regional trade agreements (RTAs) operate in the global economy.

About 1.1 billion people live in extreme poverty.

Jeffrey Sachs publishes *The End of Poverty: Economic Possibilities for Our Time*, a comprehensive blueprint for economic development.

About 50,000 NGOs operate globally.

World population hits 6.5 billion people.

2008 China hosts the 2008 Summer Olympics.

2009 The controversial Three Gorges Dam in China is scheduled for completion.

The British economy is officially in recession.

President Obama signs the $787 billion economic stimulus package into law.

The American Recovery and Reinvestment Act of 2009 includes a variety of spending measures and tax cuts intended to promote economic recovery.

President Obama unveils the Homeowner Affordability and Stability Plan.

U.S. Treasury Secretary unveils the Public–Private Investment Program.

Chrysler files for bankruptcy.

General Motors files for bankruptcy.

Fiat completes its acquisition of Chrysler assets.

The Cash-for-Clunkers program ends.

2010 The Senate confirms Federal Reserve chairman Ben Bernanke's second term.

The Federal Reserve raises the discount rate charged to banks for direct loans by a quarter point to 0.75 percent.

President Obama signs a landmark health care overhaul bill.

President Obama signs extension of jobless benefits.

The Wall Street Reform and Consumer Protection Act is signed into law by President Obama.

Obama signs a six-month extension of emergency jobless benefits for the long-term unemployed.

The Federal Reserve announces a second round of quantitative easing through the purchase of $600 billion in long-term Treasury bonds.

Obama signs into law an extension of the existing federal income tax cuts and long-term unemployment benefits. The bill also includes a 2 percent rollback of Social Security payroll taxes.

2011 Commodity prices soar.

Uprisings occur in the Middle East.

A powerful earthquake and tsunami devastate Northern Japan.

Debt problems in Europe and the United States weigh on U.S. stocks.

President Obama signs free-trade agreements with South Korea, Colombia, and Panama.

Six Central Banks take joint action to enhance global liquidity.

Obama signs a two-month extension of the payroll tax cut.

2012 The city of San Bernardino, CA, files for bankruptcy.

European Central Bank plans to launch an "outright monetary transactions" program.

Spain's credit rating is downgraded by S&P.

The Federal Reserve extends "Operation Twist" through the end of 2012.

2013 Ten U.S. banks settle with the Securities and Exchange Commission to stop mortgage foreclosure process audits.

Ukraine signs a shale gas deal with Royal Dutch Shell.

The eurozone slides into deeper recession, making 2012 the first year with no growth in any quarter since tracking began in 1995.

Japan records the first trade deficit since 1979 for January 2013.

Moody's downgrades the United Kingdom's credit rating from AAA to AA1.

President Hugo Chavez of Venezuela dies.

The UN passes more sanctions against North Korea.

Fitch downgrades Italy's credit rating from A– to BBB+.

The European Parliament rejects an EU budget for the first time in its history.

Xi Jingping becomes president of China.

Cyprus is in financial crisis.

Bank of Japan to pump monetary stimulus into economy.

Former U.K. prime minister Margaret Thatcher dies.

European Union lifts oil trade embargo to Syria.

United States announces new sanctions against Syria.

Japan suspends imports of U.S. wheat after the discovery of genetically modified wheat on a U.S. farm.

United States expands sanctions against Iran.

Croatia becomes the 28th member of the European Union.

Detroit files for Chapter 9 bankruptcy protection, the largest municipal bankruptcy in U.S. history.

China institutes business tax breaks and export liberalization in an effort to boost its economic growth.

United States and Japan announce they are moving closer to tapping a new energy source: methane hydrate.

The eurozone returns to growth in the second quarter, led by Germany and France.

China unveils its Atmospheric Pollution Prevention Action Plan.

Saboteurs blow up an export oil pipeline in Yemen.

The Affordable Care Act's health insurance exchanges debut.

China's real GDP grows 7.8 percent in the third quarter of 2013.

Iran agrees with the United States, Great Britain, France, Germany, China, and Russia to limit its nuclear development program in exchange for sanctions relief.

Greece is demoted to "emerging market" status by the MSCI Emerging Markets Index.

Former president of South Africa Nelson Mandela dies.

Latvia becomes the 18th country to join the eurozone.

Congress approves a budget deal raising taxes and postponing automatic spending cuts (sequestration), avoiding the "fiscal cliff."

2014 Janet Yellen takes over as chair of the Federal Reserve.

Minimum wage for federal contract workers is raised to $10.10 an hour.

Russia formally annexes Crimea.

The U.S. Supreme Court allows the EPA to regulate air pollution from power plants that crosses state lines.

The World Bank announces that India has become the world's third-largest economy in purchasing power parity after the United States and China, moving ahead of Japan.

China and Russia sign a 30-year natural gas export contract.

Italian GDP is set to include underground economy.

Russia, Kazakhstan, and Belarus sign treaty forming Eurasian Economic Union.

EPA issues new regulations aiming to cut carbon emissions in the U.S. power sector by 2030—to be decreased from 2005 levels by 30 percent.

The European Central Bank cuts its prime interest rate to 0.15 percent and sets the deposit rate at –0.10 percent.

Crisis continues in Iraq.

Chinese and Japanese shipping companies announce they will start a regular service to carry Siberian natural gas across the Arctic Ocean to East Asia.

Russia bans imports of beef, pork, fruit, vegetables, poultry, fish, cheeses, and milk from the United States, the European Union, Australia, Canada, and Norway.

The European Central Bank cuts its prime interest rate to 0.05 percent from a previous record low of 0.15 percent.

China's third-quarter GDP grows by 7.3 percent year-over-year, its slowest pace in more than five years.

Russia and Ukraine reach an agreement to resume deliveries of natural gas from Russia to Ukraine until March 2015.

Bank of Japan announces expanded monetary stimulus.

China and the United States reach an agreement on climate change; China commits to stop its CO_2 emissions from increasing by 2030, and the United States commits to cutting CO_2 emissions 26–28 percent below 2005 levels by 2025.

Japan announces a drop in its third-quarter GDP following a contraction in the second quarter; a sales tax increase is deferred and a snap election on December 14 is announced.

China cuts its benchmark one-year loan rate for the first time since July 2012.

OPEC decides not to cut its oil production output amid falling oil prices; the West Texas Intermediate benchmark oil price falls to $65.94 a barrel, marking the first time it has been below $70 since May 2010.

The Russian ruble falls to a historic low of 73 against the U.S. dollar; Apple Inc. halts online sales in Russia.

The Bank of Russia hikes its key interest rate for a sixth time this year.

The United States restores full diplomatic relations with Cuba and plans to open an embassy in Havana; in addition, the United States eases restrictions on remittances, travel, and banking relations.

Crisis in Ukraine.

2015 Eurozone consumer prices fall in December for the first time since 2009, by 0.2 percent.

Switzerland's Central Bank announces that it is dropping the three-year old cap on the value of its currency, the franc, against the euro.

China reports that its economy grew 7.4 percent in 2014, its slowest growth in 24 years.

European Central Bank announces monetary stimulus of 60 billion euros a month—to start in March and intended to run through to September 2016.

Saudi Arabia's King Abdullah dies.

The European Central Bank agrees to lend 3.3 billion euros more in emergency funds to Greece, extending the amount of time available for negotiations with creditors.

The European Central Bank begins buying public and private sector debt at a pace of 60 billion euros per month.

Deutsche Bank agrees to pay a $2.5 billion fine to settle U.S. and U.K. investigations into its role in rigging the London Interbank Offered Rate (LIBOR).

Inflation in the United Kingdom turns negative for the first time since 1960.

Greece announces a referendum on the bailout program for July 5 and imposes capital controls to stop money from leaving the country.

Puerto Rico's governor declares that the commonwealth cannot pay its estimated $72 billion debt.

Greece misses a payment of €1.5 billion to the IMF.

Greek voters reject bailout terms from international creditors.

The Shanghai Composite Index drops by more than 30 percent from its peak in June 2015 after surging by more than 150 percent from mid-2014.

Greece reaches a new bailout agreement with international creditors.

Greek banks reopen, but capital controls remain.

The Greek parliament approves the bailout reform package.

Puerto Rico fails to make a $58 million bond payment.

Greece's stock market reopens after a five-week closure over the country's debt crisis. Shares fall more than 16 percent at closing.

China devalues its currency by nearly 2 percent against the U.S. dollar, the largest movement since 1994.

The U.S. embassy reopens in Cuba after 54 years.

Japan's economy shrinks by 1.6 percent in the second quarter due to weak consumer spending and exports.

China cuts interest rates and lowers minimum requirements for bank reserves for the second time in two months to support its slowing economy and falling stock market.

Canada is in recession. According to Statistics Canada, GDP fell 0.8 percent in the first quarter and 0.5 percent in the second quarter.

The immigration crisis in Europe intensifies as the number of refugees from Africa, the Middle East, and South Asia rises to an estimated 360,000 in August and September, bringing the total for the year so far to 710,000.

The Trans-Pacific Partnership (TPP) trade agreement wins approval of the United States and 11 other nations, and now requires separate legislative approval from each.

China's third-quarter GDP grows by 6.9 percent year-over-year, its slowest pace in more than six years.

China cuts interest rates and lowers minimum requirements for bank reserves for the third time in four months to support its slowing economy.

China announces that it will end its one-child policy, allowing all families to have two children for the first time since the policy was instituted 30 years ago.

The IMF approves adding the Chinese renminbi to its basket of reserve currencies, which includes the U.S. dollar, the euro, the British pound, and the Japanese yen.

Officials from 195 nations approve a global climate accord in Paris.

Lithuania becomes the 19th country to join the eurozone.

2016 Saudi Arabia ends its diplomatic relations with Iran.

Iran sanctions are lifted by the United States and European nations after inspections show that Iran has adequately dismantled its nuclear weapons program.

China's economy grows by 6.9 percent in 2015, its slowest pace since 1990.

Bank of Japan cuts benchmark interest rate below zero.

U.K. citizens vote to drop out of the European Union; the formal process has taken the name "Brexit," for "British exit."

Glossary

Abatement policies—Policies created to propose a reduction in the amount or degree of pollution.

Absolute advantage—A situation in which one party can produce more using a given quantity of resources (or the same amount using fewer resources) than another party can.

Accounting profit—Business profit created when revenues exceed explicit costs (wages, rents, materials cost, etc.)

Adjustable rate mortgage (ARM)—A home loan in which the interest rate is tied to a short-term rate and is reset at various intervals. The interest rate and monthly payment will vary over the life of the loan.

Affirmative action—Policies intended to counter discrimination in employment, education, and business by taking into account such factors as race, skin color, religion, gender, national origin, and sexual orientation.

***Affluent Society, The*—**The 1958 book by John Kenneth Galbraith, Harvard economist, regarding the post–World War II United States and the growth of the private sector at the expense of the public sector.

Affordable Care Act (ACA)—Passed in 2010, this act provides for all citizens to have access to health insurance.

AFL-CIO—Union created in 1955 by the merger of the American Federation of Labor (AFL) and the Congress of Industrial Organizations (CIO).

Africa Union—An international organization created to promote cooperation among the independent nations of Africa; headquartered in Addis Ababa, Ethiopia.

Aggregate demand—The sum of all expenditures (household consumption, business investment, government spending, and net exports) in a nation's economy.

Aggregate supply—The sum of all production in a nation's economy.

Agreement—An agreed-upon arrangement between several parties.

Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPS)—Created by the World Trade Organization (WTO), this agreement protects the ideas and creations of innovators relating those rights to the global trading environment.

Agricultural Adjustment Act—A legislative law passed by Congress as part of the New Deal. The act restricted agricultural production, paying subsidies to farmers for not planting or for killing off livestock. The Supreme Court struck the act down in 1936.

Air Pollution Control Act of 1955—One of the first laws to define the role of federal and state governments in addressing air pollution when state boundaries are crossed. It was followed up by the CAA of 1963 and the Air Quality Act of 1967.

Alaska Department of Environmental Conservation (ADEC)—State agency whose mission is to conserve and protect the state's natural resources and environment.

American Academy of Arts and Sciences—A leading center for independent policy research; election to the academy is one of the nation's highest honors; the center is headquartered in Cambridge, Massachusetts.

American Economic Association (AEA)—Established in 1885, AEA is the learned society in the field of economics; headquartered in Nashville, Tennessee, AEA publishes the prestigious academic journal, the *American Economic Review*.

American Enterprise Institute—A conservative think tank founded in 1943 as an independent nonprofit organization to defend American freedom and democratic capitalism, including limited government, private enterprise, and individual liberty and responsibility; headquartered in Washington, D.C.

American Federation of Labor—Founded in 1886 in Columbus, Ohio, by craft unions, the AFL was one of the first federations of labor unions.

American Finance Association—A professional, academic organization to study, promote, and expand the knowledge of financial economics.

American Recovery and Reinvestment Act—The goal of the act, passed in 2009, was to create new jobs and save existing jobs as part of an economic stimulus package in response to the 2008–2009 financial crisis.

American Revenue Act—*See* Sugar Act of 1764.

American Temperance Society and the Woman's Christian Temperance Union (WCTU)—Led by Francis Willard; held that alcoholic beverages were the cause of many of the country's social ills.

Amicus curiae—Someone who is not a party to the case, but believes the court's decision may have a relevant impact on them.

Anglo-Irish Agreement of 1985—Signed in 1985; gave the government of Ireland an official voice in governing Northern Ireland.

Annual percentage yield (APY)—The effective annual rate of return (APR), calculated using simple interest. It does not pay interest on the prior interest received; thus, APY is higher than APR.

Annuity—Type of insurance contract that pays the owner a stream of payments for a fixed term or lifetime, in return for an up-front payment or payments.

Antidumping duty—A tariff levied on imports, usually in retaliation for selling a product below fair value.

Anti-Injunction Act—A federal act that prohibited a federal court, in most cases, from issuing an injunction against a state court.

Anti-Saloon League—Founded in 1893, lobbying group that worked to create political support for Prohibition.

Antitrust—Government legislation to prevent monopolies and deter companies from conducting business in a collusive or anticompetitive manner.

Apprenticeship—The entry-level position for some trades or professions that includes both on-the-job and classroom training and education for new entrants into the trade or profession.

Aristotle—An ancient Greek philosopher whose early knowledge and teachings have been the basis for much of modern Western thought.

Article II of the Constitution of the United States—Article that creates the executive branch of the federal government and establishes criteria for, election of, and powers of the branch.

Article V of the Constitution of the United States—Establishes how amendments to the Constitution are created; requires a two-thirds vote of both houses of Congress to propose an amendment and three-fourths of the states to ratify such proposals.

Asian Dragons—Term describing the four modern economies of Hong Kong, Singapore, Taiwan, and South Korea; also called Asian Tigers.

Asian financial crisis—Economic crisis that officially began in Thailand when the Thai government decided to stop pegging its local currency to the U.S. dollar; also called the Asian Contagion.

Asian Tigers—a Term describing four modern economies of Hong Kong, Singapore, Taiwan, and South Korea; also called Asian Dragons.

Asymmetric information—When two parties to a transaction have different amounts of information concerning the transaction.

Austrian School of economics—A school of economic thought that focuses on the actions of the individual and the study of human behavior; its main tenets include the theses that economic models are unreliable and that prices are best determined by the equilibrium of supply and demand when markets function freely.

Automatic stabilizers—Government policies, such as taxes and spending, that take effect to reduce economic impacts.

Automatic teller machine (ATM)—A convenient way to deposit funds and withdraw cash. A debit card, issued by the bank, gives consumers ready access to their bank funds and can be used at ATMs as well as to make purchases from merchants.

Average cost pricing—Policy often used by regulators in setting prices for monopolists or for allowing for small price increases.

Average fixed cost (AFC)—The costs found by dividing total fixed cost by output.

Average tax rate—The total tax paid, divided by the total income.

Average total cost (ATC)—Total Costs (TC) divided by Quantity (Q) produced.

Average variable cost (AVC)—Total Variable Costs (TVC) divided by Quantity (Q) produced.

Baby boomers—According to the U.S. Census Bureau, the generation of the U.S. population that was born between the years 1946 and 1964.

Baht—Official currency of Thailand; its devaluation was considered the beginning of the Asian financial crisis.

Baker Plan—Proposed in 1985, and named after U.S. Treasury Secretary James Baker. This was an attempt to increase investments from Latin American banks. Despite the efforts of the Baker Plan, it was not successful.

Bakeshop Act of 1895—An act passed by the New York state assembly, establishing minimum sanitation standards that prohibited domestic animals from being kept in bakeries and prohibited workers from using the bake room as a sleeping room.

Balance of payments—A system of accounts that measures the trade, financial, and foreign aid transactions between a nation's domestic economic components during a specific period of time.

Balance of trade—The difference between a nation's exports and imports of goods and services.

Bandwagon behavior—When people copy the decisions of others, regardless of what their own internal signals are telling them, leading to what some refer to as irrational or bounded rational decisions; also known as informational cascade.

Bangkok Declaration—The document that formed the Association of Southeast Asian Nations, including Thailand, Singapore, Malaysia, Indonesia, and the Philippines; also known as the ASEAN Declaration.

Bank Holding Company Act of 1956—An act regulating bank expansion and protecting the separation of banking and nonbanking activity; considered by some to be the most important banking legislation after World War II.

Banking crisis—Failure in banks that causes further failure and disintermediation to spread to other banks; a common feature when an international financial crisis occurs.

Bank of International Settlements (BIS)—An international organization that serves as a central bank for national central banks.

Bankruptcy—The condition of financial failure, when the assets of a person, company, or nation are less than its liabilities.

Banks—Regulated by the Federal Reserve Board of Governors, financial intermediary institutions that provide checking and savings accounts, investment and retirement planning and products, commercial and business banking, mortgages, and credit cards.

Bargaining table—Term used for collective bargaining.

Barriers of entry—Defines how easy or difficult it is to enter or exit an industry.

Barriers to trade—Transparent forms of protectionism include tariffs and quotas, while nontransparent forms include specific manufacturing standards, licenses, fees, or patents.

Barter system—Market interactions between a buyer and seller conducted without a form of money but on a duo coincidence of wants.

Basel Capital Accord Agreements—Established by the Basel Committee on Bank Supervision to recommend banking regulations on risk (capital, market, operational), and to assure that financial institutions have sufficient capital during periods of financial stress.

Baumol and Bowen cost of disease (or paradox)—Economists Baumol and Bowen challenged classical economic thought by suggesting that some salaries rise without a rise in productivity.

Bayesian games—A game, designed by economic game theorists, in which players have incomplete information about other players and/or the payoffs for various actions.

Beef War of 1999—European Union banned the import of U.S. beef from cows raised using hormones. The U.S. responded by placing tariffs on European clothing and certain foods.

Behavioral bias—Describes investors who hold on to losing investments, preventing them from selling at a loss, and then reinvesting the proceeds into another investment.

Behavioral economics—A study of economics that emphasizes human behavior and the psychological aspects of decision-making.

Behavioral finance—The field of research that studies how investors make judgments and choices in financial markets.

Belief perseverance—People tend to hold onto the original opinion they form, even when they're presented with contrasting evidence; this often leads to economic bubbles.

Bell, Alexander Graham—Inventor of the telephone, in 1876.

Belovezh Accords—The agreement signed on December 8, 1991, that declared the Soviet Union effectively dissolved and established the Commonwealth of Independent States in its place.

Benz, Karl, and Gottleib Daimler—First to use the gasoline-powered internal combustion engine in the production of the automobile.

Berkshire Hathaway—A U.S.-based multinational holding company owned by Warren Buffett and headquartered in Omaha, Nebraska.

Beta—Measures stock volatility and risk.

Bitcoin—Conceptualized by Satoshi Nakamoto, an innovative virtual currency and payment network.

Black blizzards—In 1935, during the Dust Bowl, these weather conditions turned day to night and reduced visibility to five or six feet; responsible for many deaths from dust pneumonia.

Black Friday—September 24, 1869, when the gold market in New York crashed, the stock market plummeted 20 percent, and agricultural products plummeted 50 percent—the result of economic scam and political scandal. It was considered a natural contraction of the economy after the Civil War.

Black market—A market where goods and services are interchanged illegally; also known as an underground economy.

Black Monday—A stock market crash on October 19, 1987; the first major financial catastrophe of the second half of the 20th century.

Black-Scholes model—A mathematical model of financial markets and derivative investment instruments that is widely used to price options; introduced by Fischer Black and Myron Scholes in 1973.

Black Thursday—October 24, 1929, the first day of the 1929 stock market crash; often considered to be the start of the Great Depression.

Black Tuesday—October 29, 1929; the day on which the stock market volume traded was a record volume and market loss of $14 billion.

Bolshevik Revolution—The armed military seizure of governmental power by the socialist Bolshevik political party in October 1917; also known as Red October or the October Uprising.

Bond—A loan to a company or government in exchange for periodic interest payments. Bonds rated BB and lower are considered high-yield bonds (also known as junk bonds); bonds rated C or below are considered to have very high default risk.

Bond funds—Funds based on different types of bond holdings, including federal government, municipal, corporate, asset backed securities, mortgages, and bond derivatives; these funds may be bond mutual funds or exchange-traded funds.

Bond issuer—The company or government entity issuing a bond and setting the bond's payment schedule.

Bond price—Varies depending on the coupon rate, time to maturity, and credit quality of the issuer, and on the current level of interest rates. When interest rates increase, bond prices fall, and when interest rates decrease, bond prices increase.

Bootleggers—People smuggling alcohol into the United States from Canada, the Caribbean, and Europe, leading to a rise in organized crime and corruption in the United States.

Border Industrialization Program—Established by the Mexican government to address high unemployment along the U.S.–Mexico border and also to save Mexican industries.

Border Tax—A tax on both imports and exports between countries of the Common Market.

Bounded rationality—Concept that the cognitive or brain's processing and information-gathering capacity is limited, making rational economic decisions costly.

Boycott—The act of intentionally not participating in the buying or using a good or service from a business, person, or organization as an expression of dissatisfaction or protest, usually for a social, ethical, or political reason.

Breach of contract—Not honoring an agreed-upon legal contract through noncompliance or noncompletion.

Bread-winner hypothesis—A rarely confirmed hypothesis that the partner who is more highly educated or has an occupation of more prestige has a better-paid job and consequently more influence in decisions.

Bretton Woods Conference—A conference held in Bretton Woods, New Hampshire, in July 1944. The conference established the international financial and economic order after World War II. The foundations for both the World Bank and International Monetary Fund began here.

Brokered CD—A CD purchased in an investment brokerage account and issued by a national bank. Because a bank issues the CD, FDIC insurance applies.

Brookings Institution—A liberal think tank based in Washington, D.C., that conducts research and education regarding the global economy and development to make recommendations to strengthen American democracy, improve social welfare, and support cooperation on public policy issues.

Bryan, William Jennings—Democratic congressman from Nebraska; three-time Democratic presidential candidate; Secretary of State under President Woodrow Wilson. Known for supporting the 1893 Free Silver policy, which attempted to pump more silver into the economy to combat inflation.

Budget Enforcement Act of 1990—Federal legislation creating new budget controls, spending caps, and a pay-as-we-go process for entitlements and taxes.

Budget Sequestration—Automatic spending cuts of the U.S. federal budget.

Burden of taxation—The level of taxation on individuals or businesses.

Bureau of Economic Analysis (BEA)—An agency of the U.S. Department of Commerce that provides economic data, including the U.S. gross domestic product.

Bureau of Labor Statistics (BLS)—An agency of the U.S. Department of Labor whose responsibilities include collecting, analyzing, and distributing important economic data regarding employment, inflation, and economic growth.

Burger, Chief Justice Warren E.—Chief Justice of the Supreme Court from 1969 to 1986.

Business cycle—The stages of an economy over time, including contraction, peak, expansion, and trough; also known as the economic cycle.

Business economics—Field of economics specializing in the use of quantitative economic methods and economic theory to analyze businesses and business practices.

Business Employment Dynamics (BED)—Set of statistics created by the Quarterly Census of Employment and Wages program of the Bureau of Labor Statistics.

Business structures—Vary based on number of owners, access to capital, length of life, and level of liability.

Cable Television Consumer Protection Act—Competition was again allowed in hopes of stabilizing rates and brining improved service.

Callable CD (Liquid CD)—Allows investors greater flexibility to withdraw part of the account without penalty but receive a lower interest rate for the option.

Call option—The option to buy at a predetermined price. Options can be a cheap way of speculating, instead of buying the underlying security.

Capital account—One of the three Balance of Payments subaccounts that records, on a net basis, capital transfers and changes in financial assets of migrants and debt forgiveness of the United States. (*See also* Balance of payments; Current account; Financial account.)

Capital financial asset—An investment in a financial asset such as a stock, bond, mutual fund, or other investment vehicle, including real estate.

Capital inflow—An increase in money available for investment from foreign sources.

Capitalism—The economic system—also known as free enterprise and the market economy—where the answers to the key economic questions (what to produce, how to produce, and for whom to produce) are answered in the marketplace in the interaction between buyers and sellers.

Capital losses—Offset capital gains eliminating any tax implications.

Capital outflow—When financial assets leave a country.

Capital resources—All human-made tools, machines, buildings, and technology used in the production of final goods.

Carson, Rachel—Biologist and science writer, author of *Silent Spring* (1962); considered a pioneer of the environmental movement.

Cartels—Countries or businesses that collaborate their business decision-making in an effort to generate monopoly power in an industry.

Cash flow—Movement of cash coming into a household or business and cash going out of the business or household.

Cato Institute—A Washington, D.C., think tank that promotes free markets, free trade, and a conservative political philosophy.

Central American Free Trade Agreement (CAFTA)—A free trade agreement the United States has with the countries of Central America.

Central bank—The national bank that serves other banks and is responsible for a nation's money supply, monetary policy, and commercial bank regulations.

Centrally planned economy—An economy where the three main questions (what to produce, how to produce, and for whom to produce) are addressed, answered, and implemented by a central authority (government); also known as a command or planned economy.

Certificate of deposit (CD)—Common type of interest-bearing investment instrument for a fixed time duration; usually for a large denomination with an interest rate higher than available in a more conventional savings account.

Certified financial manager (CFM)—Professional certification of financial professionals.

Certified fraud examiner (CFE)—A professional designation of fraud examiners.

Certified government financial manager (CGFM)—The certification of government financial managers.

Certified internal auditor (CIA)—A key professional designation of the Institute of Internal Auditors.

Certified management accountant (CMA)—An accountant who combines skill in accounting and strategic management. The holder of this certification must have attended a CMA program and passed a series of tests.

Certified public accountant (CPA)—A prestigious qualification signifying ethical and professional accounting standards with a level of professional expertise earned by completing an examination and fulfilling specific work requirements.

Certiorari—A writ to the lower court to send the case to it for review.

Chain-store paradox—An apparent game-theory paradox that refutes standard game-theory reasoning.

Chapter 7—Bankruptcy chapter also known as the liquidation bankruptcy.

Chapter 11—Bankruptcy chapter also known as the rehabilitation bankruptcy.

Chapter 12—Bankruptcy chapter specifically designed for family farmers and fisherman.

Chapter 13—Bankruptcy chapter, also known as the wage-earners bankruptcy.

Cheap money—Money without intrinsic value and without backing by gold or silver.

Checks—A form of financial transaction for a demand deposit account; also known as demand deposits.

Chicago Board of Trade—One of the oldest exchanges, specializing in futures and options trading; founded in 1848 in Chicago, Illinois.

Chicago Boys—A group of young Chilean economics students from the University of Chicago who returned to their home country and were instrumental in transitioning Chile to a market economy.

Chicago School—A neoclassical school of thought that rejected Keynesianism in favor of monetary policy popularized by economists and faculty of the University of Chicago.

Children's Health Insurance Program (CHIP)—Begun in 1997, a program that covers approximately eight million children in families whose incomes are too high to be eligible to receive Medicaid benefits but who cannot afford private medical insurance coverage.

Circuit Court of Appeals—Twelve regional circuits of the federal United States court system that hear appeals from lower district courts within their specific circuit, or hear appeals from federal administrative agencies.

Circular flow of economic activity—A pictorial depiction of an economy, identifying the key markets (product, resource, financial, foreign) and the interaction of the key participants (households, businesses, government, financial institutions, and foreign companies) within each of the markets.

Civil Aeronautics Board (CAB)—Federal agency responsible for regulating air transportation within the United States, including airfares and interstate routes by commercial airlines; disbanded in 1984.

Civilian labor force—Sum of civilians who are employed and the civilians age 16 or over who are unemployed but are actively pursuing employment.

Civilian noninstitutional population—U.S. population of those 16 years of age and older residing in the 50 states and the District of Columbia.

Classical economics—Widely regarded as the first modern school of economic thought; major figures include Adam Smith, Jean-Baptiste Say, David Ricardo, Thomas Malthus, and John Stuart Mill, all of whom generally agreed that free markets will regulate themselves.

Classical liberalism—A political ideology that promotes limiting government involvement in the economy so that the government is restricted to providing rule of law and economic freedom.

Clean Air Act of 1963—The first federal legislation aimed at reducing air pollution.

Clean Air Act of 1970 (CAA)—Initiated more sophisticated and comprehensive regulations to reduce air emissions from industrial and mobile sources.

Cliometrics—Originating in 1958, the systematic application of economic theory and econometrics and mathematical methods to the study of history; also known as new economic history or econometric history.

Closed Shop—Under the Wagner Act, once a union was certified, workers were required to join the union to maintain their employment. In 1947, the Taft-Hartley Act limited the application of a true closed shop.

Coase theorem—Describes the economic efficiency that can be achieved by an economic allocation or outcome in the presence of externalities; first presented by Nobel laureate Ronald Coase.

Cobb-Douglas Production Function—Signifies the relationship between inputs (land, labor, capital) and outputs (goods and services).

Coinage Act of 1792—Legislation that established the United States Mint and the U.S. coinage system; also known as the Mint Act.

Coincident indicators—Measurements of current economic activity, such as employment and average weekly hours worked.

Cold War—From approximately the late 1940s to the early 1990s, a continual global condition of both political and military tensions between primarily the United States and the Soviet Union.

Collateral—A real asset such as a building, or a financial asset such as a stock or a bond. This asset secures one's borrowing in case of default. If a borrower defaults on the loan, the lender can sell this collateral to collect the value of the loan.

Collective bargaining—Negotiation process between employer and employees to establish acceptable working conditions, including wages, benefits, and conditions of the workplace.

Collusion—An agreement between parties to restrict competition of a market; the agreement may be legal but collusion is most often illegal and done in secrecy.

Command economy—An economy in which the three main questions (what to produce, how to produce, and for whom to produce) are addressed, answered, and implemented by a central authority (government).

Commander-in-chief—Leader of a nation's armed forces; in the United States the commander-in-chief is the president of the United States.

Commanding heights—Term used by Lenin to identify the major sectors of an economy, such as steel, manufacturing, and transportation.

Commerce Clause—A provision in the U.S. Constitution that gives Congress power over interstate trade and trade with foreign countries; also includes trades with Indian tribes.

Commercial bank—A financial institution that participates in individual and business banking activities, including taking deposits and making personal and business loans.

Committee for Industrial Organization (CIO)—Eight international unions under the guidance of John Lewis, formed to take on U.S. companies.

Commodities—The generic term to describe the natural resources—such as coal, oil, and natural gas—used in the production of final goods.

Commodity-backed money—When the value of a currency is based on the value of the resource on which it is backed, such as gold, silver, other metal, or even seashells, tobacco, or beads; also known as specie money.

Common carrier—A company that transports goods—such as communication—for the general public.

Common good—Term referring to an act or policy that has benefit for all of society.

Common market—Group of countries that form an alliance to promote free trade and labor mobility.

Common-pool resources—Resources owned by no one and yet by everyone in the absence of property rights. They are rival and nonexcludable, which often leads to their overuse—and consequently to the "tragedy of the commons" concept.

Common stock—A stock that confers voting rights to the stockholder, on top of the stockholder receiving cash payments called dividends.

Communications Act of 1934—Act of Congress that transferred the regulation of the interstate telephone service from the Interstate Commerce Commission (ICC) to the Federal Communications Commission (FCC).

Communism—A political system of government where the state holds authoritarian control and one political party holds power; the economy and all resources of the economy are owned and controlled by the government.

Communist League—Established in 1847 in London, the Communist League is considered the first Marxist political party; it promoted the political and economic philosophies of Karl Marx and was disbanded in 1852.

***Communist Manifesto, The*—**An 1848 work by Karl Marx and Friedrich Engels; the most influential book on theories of class struggle and capitalism's shortcomings, it became the foundation of the Communist Party; it was originally titled the *Manifesto of the Communist Party*.

Community Reinvestment Act (CRA)—Under this act, when extending loans banks are required to meet numeric goals based on the low-income and minority populations in the area in which they serve.

Comparative advantage—A situation in which one person, company, or nation can produce a good or service with lower opportunity costs than another person, company, or nation; useful for determining the most efficient allocation of resources; when two entities specialize and trade according to their comparative advantages, it benefits both.

Comparative economic systems—The study of different economic organizations, including market, command, and mixed economies.

Competition—In economics, the act of several persons, businesses, or nations vying to be the most efficient, the most effective, or the most favorable for the allocation of resources.

Compound interest—Earning interest on interest earned.

Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA)—Act of Congress that established Superfund, a federal government program designed to fund the cleanup of sites contaminated with hazardous substances and pollutants.

Compromise Tariff of 1833— Congressional act intended to gradually lower tariffs over 10 years back to 1816 levels.

Conditionality—Conditions that a country must meet in order to receive debt relief from an international organization such as the International Monetary Fund (IMF).

Congressional Budget Office (CBO)—A federal agency within the U.S. legislative branch of government, established in 1974, to provide timely, nonpartisan economic data and analysis to Congress.

***Congressional Quarterly*—**Privately owned publication that reports on the actions of the U.S. Congress.

Congressional Research Service (CRS)—Provides the U.S. Congress and its committees with analyses on legal and policy issues.

Congress of Industrial Organizations (CIO)—Founded in 1935, a United States labor union organization based on industrial industries; was part of the American Federation of Labor.

Consideration—In law, an act or a promise intended to persuade one party to enter into a contract.

Conspicuous consumption—The consumption of goods and services by individuals in a manner beyond basic utility, such as driving a Rolls Royce instead of a Buick.

Consumer credit—A loan offered to the borrower to buy now and pay later; money that is borrowed, using a credit card or through a payment plan, to purchase consumer goods that depreciate (decline) in value over time. For example, a credit card gives the holder credit to buy goods and services up to a certain amount.

Consumer debt—The amount of debt a consumer accumulates through borrowing money to purchase goods or services in the present and pay for those goods or services in the future.

Consumer directed health plan (CDHP)—Often referred to as a high deductible plan, it usually requires greater initial out-of-pocket expenses; this type of plan may require a consumer to pay $2,500 to $5,000 out of pocket before the health plan payments take effect.

Consumer Expenditure Survey (CES)—A program of the Bureau of Labor Statistics (BLS) consisting of surveys that provide information on the buying habits of U.S. consumers.

Consumer Price Index (CPI)—Index indicating monthly changes in the prices paid by consumers for a representative basket of goods and services.

Consumer rights—Various laws and organizations designed to promote consumer education and safety; also known as consumer protection.

Consumers—Purchasers of final goods or services.

Consumers International (CI)—A nonprofit federation of consumer groups and nongovernmental organizations.

Consumer sovereignty—Term expressing the freedom of consumers to choose the goods and services they desire, which determines which goods and services will be produced in a market economy.

Consumer surplus—The difference between the amount consumers would be willing and able to pay and the amount they pay upon market interaction with sellers.

Consumption—A household consumer's spending of current income on a good or service.

Consumption function—An economics mathematical expression of consumer spending—the relationship between total consumption and gross national income.

Continentals—Bills of credit or paper currency issued by the states in the early years of the United States; helped to finance the Revolutionary War, but depreciated and lost their value because they were not backed by gold or silver.

Contingent valuation method (CVM)—Employs the use of surveys outlining a hypothetical market or referendum to elicit people's willingness to pay (WTP) for the preservation of a particular species.

Contract—A voluntary, lawful agreement between two or more parties.

Contraction, economic—The portion of the business cycle in which a nation's economy slows down.

Coordination costs—Transaction costs.

Cooperative federalism—System under which national, state, and local governments would interact collectively to solve problems.

Copyright—The legal protection of a creative work, giving the originator of the work exclusive rights for a period of time.

Core Inflation—An inflation rate measure consisting of the current Consumer Price Index (CPI) amount excluding price measures for food and energy.

Corn Laws—Trade laws implemented between 1815 and 1846 to protect the cereal producers in Great Britain and Ireland against foreign imports.

Corporate Average Fuel Economy (CAFE)—Regulations enacted by the U.S. government in 1976 as part of its environmental movement and fuel-saving efforts.

Corporate bonds—Bonds issued by corporations; considered riskier than Treasury and municipal bonds, so they result in a higher bond yield.

Corporate Deficit—A corporate deficit occurs when a company is not selling enough to cover its costs. The revenue minus costs is less than what is needed to pay the bills.

Corporation—A business structure that protects the personal assets of the business owners from liability brought against the business. Various corporate structures exist, including C-, S-, LLC, and nonprofit.

Cost-benefit analysis—An economic decision-making methodology that weighs the possible positive consequences of an action against the possible negative consequences.

Cost of goods sold (COGS)—An accounting term referring to the direct costs attributable to the production of the goods sold by a company. This amount includes the cost of the materials used in creating the good along with the direct labor costs used to produce the good.

Cost of Living Index (COLI)—A measure based on the relative cost of living of typical mid-management households in more than 300 cities in the U.S.

Cost-push inflation—Inflation caused by increases in the cost of resources (land, labor, capital), causing a decrease in aggregate supply.

Costs—The trade-off of using a resource for the production or consumption of a good or service.

Council of Economic Advisers—Established in 1946 as an agency of the Executive Office of the President of the United States; responsibilities include advising the president on economic policies, providing objective empirical research, and preparing the annual Economic Report of the President.

Creative destruction—Made famous by Joseph Schumpeter, an economy's inability to protect goods, services, or industries whose resource allocation has become more costly than a newer, more efficient allocation of resources.

Credit bureau—A company that compiles a record of a consumer's borrowing and payment history; also known as a credit-reporting agency.

Credit card—Small plastic card, issued by a bank, financial institution, or merchant, that enables the cardholder to purchase goods and services with borrowed funds and repay the owed amount at a later date.

Credit check—Determines the applicant's ability to make the payments accumulated and due on a credit card.

Credit crunch—General economic condition in which financial institutions restrict lending practices for business loans, mortgages, and automobile lending.

Credit markets—A market for selling and buying interest-bearing investment instruments such as Treasury bonds, notes, and bills; also known as the bond market.

Crédit Mobilier—A company created in 1846 in a fraud to set the price of supply contracts for the railroads.

Credit-rating agencies—Agencies, such as Standard &Poor's and Moody's, that rate the bond universe based on the quality of the issuer; the ratings form the basis for the classification that Standard &Poor's and Moody's assigns to an issuer.

Credit ratings—A score determined by the financial strength of the debt issuer; also called debt ratings or bond ratings.

Credit report—A tool used by lending institutions such as banks to determine if a potential borrower is a good credit risk and will pay back the loan.

Credit union—A type of financial institution with services similar to a bank; the main organizational difference is that credit unions have a nonprofit status.

Cultural economics—The study of economics decision-making relative to and the influences of a society's culture; it is a field of economics that relates to the arts and heritage of cultural industries.

Currency—Term referring to the money used as a nation's medium of exchange, store of value, or standard of value.

Currency Act of 1764—Enacted by Great Britain at a time when the American colonies had low reserves of gold and silver; used to strengthen Britain's restriction on the printing of paper currency in the colonies.

Currency swaps—Used by companies whose revenue comes from multiple countries (that is, multiple currencies) in order to protect a company's exposure to various currency fluctuations.

Currency wars—Currency relationships between countries when one country attempts to create trade advantages for itself through the exchange rate.

Current account—One of the three Balance of Payments subaccounts that measures a nation's balance of trade (exports to imports) and net changes in earnings and transfer payments. (*See also* Balance of payments; Capital account; Financial account.)

Current Employment Statistics (CES)—Monthly program that surveys businesses and government agencies to provide industry data on employment and earnings.

Current Population Survey (CPS)—Survey conducted jointly by the U.S. Census Bureau and Bureau of Labor Statistics (BLS) to provide labor force data on the U.S. population.

Cyclical unemployment—The component of the unemployment rate determined by the economic growth or recession in the business cycle.

Daimler, Gottleib, and Karl Benz—First to use the gasoline-powered internal combustion engine in the production of the automobile.

Damages—In legal terms, an award issued in a legal suit; usually the award is monetary.

***Das Kapital*—**First published in 1867, Karl Marx' influential work on his critique of the political economy.

Dead capital—Any capital or land resources that do not have distinct ownership title.

Deadweight Loss—Costs created by an inefficient market; often used to explain society's economic loss due to such protectionist trade measures as tariffs.

Debt—The financial condition when revenues are less than expenses over a period of time (usually several years).

Debt ceiling—A congressionally declared limit on the amount of debt that the Department of the Treasury can accrue that is greater than its revenues; also known as the debt limit.

Deficit spending—When a governmental unit's spending more than its revenue during a fiscal year.

Debt to equity—The ratio of a company's debt to the company's equity.

Deferred annuity—This type of annuity has two phases: accumulation and withdrawal/distribution. *Accumulation* is the time period during which the annuity is funded. While the funds in the annuity are being accumulated, they grow tax-free and may be invested in a variety of financial assets. In the *withdrawal/distribution* phase, the annuitant can take income monthly or in a one-time lump sum payment.

Deferring income—When one is facing a potentially large tax bill, a common approach is to defer some of the taxable income into the future. The taxpayer can do this by delaying receipt of income or by accelerating tax-deductible expenses.

Defined benefit plan—An employer-sponsored retirement plan that promises the employee a specified monthly benefit at retirement; the benefit may be an exact dollar amount, such as $100 per month, or one calculated through a plan formula that considers such factors as salary and length of service.

Defined contribution plans; 401(k) and 403(b)—Retirement plans that do not promise a specific amount of benefits at retirement. The employee, employer, or both contribute to the employee's individual account, sometimes at a set rate—for example, 5 percent of earnings annually.

Deflation—A constant general decrease of the average price level of an economy over a period of time.

Deflationary spiral—The continued decreasing of the general price level of an economy over time, resulting in significant decreases in resource and investment values.

Delors Report—A 1989 report on the European Community's monetary and economic union.

Demand—A schedule reflecting a set of prices that consumers are willing and able to pay in order to purchase a good or service, other things being equal.

Demand curve—A graphical picture of a demand schedule reflecting the demand for a good or service, other things being equal.

Demand-pull inflation—Inflation caused by increases in aggregate demand that are not matched by comparable increases in aggregate supply.

Demand-side—The Keynesian idea of focusing fiscal policies on the behavior of the consumer in the product market (i.e., demand).

***Democracy in America*—**Alexis de Tocqueville's 1835 critique of the United States' political, social, and economic ideas.

Demographics—The population statistics reflected by data used to describe the gender, age, race, mobility, and employment characteristics of a population (from the Greek word *demos*, meaning "people").

Demur—In legal terms, to object or delay.

Dependent-care flexible spending account (FSA)—The ability of an individual or a family to set aside a portion of income pre-tax to cover dependent-care expenses.

Depository Institutions Deregulation and Monetary Control Act of 1980—Act of Congress that allowed savings and loan associations to issue credit cards, make consumer loans, invest in real estate, and offer interest-earning checking accounts—putting them in competition with commercial banks, but without many of the regulations that governed banking activity.

Depression—Term used to describe an extremely severe economic recession in negative economic growth, very high unemployment, and deflation over an extended period of time.

Deregulation—Freeing an industry from regulations imposed on it by government.

Derivative—A unique financial instrument whose value is received from an underlying asset, typically stocks, bonds, or loans. Investors in derivatives do not own the underlying assets, but they profit (or lose) from the movement up or down in the price of the underlying asset.

Derived demand—When the demand for inputs is dependent on the demand for the final products that the inputs are used to produce.

Detariffing—The act of removing tariff regulations by a country.

Developed countries—Nations with highly developed technological resources and an advanced economy.

Developing countries—Nations whose per capita income (GNI per capita) is $11,905 (U.S. dollars) or less.

Development economics—The branch of economics that studies the conditions and variables conducive to economic growth, especially for developing nations.

Diamond–Mirrlees efficiency theorem—A thesis—based on observations of market and government revenue-generating situations—that suggests there should be no taxes on intermediate goods and imports.

Digital currencies—Currencies (or crytocurrencies) such as bitcoin, that are created by a complex algorithm and stored electronically, without government control or monitoring.

Diminishing marginal returns (utility)—The principle that at some point, the returns or utility of a good or service consumed diminishes with each additional use during a given time period.

Direct investment (or foreign direct investment, FDI)—When an investor (a company) in one country buys or sells ownership within an overseas country, such as buying or building a factory.

Disability insurance—Insurance that protects a worker's current and future earnings.

Discount rate—Interest rate that the regional banks of the Federal Reserve System charge their member banks for overnight loans.

Discouraged workers—Individual of working age who are unemployed and are not pursuing a position in the current job market; usually these persons are willing and able to work but have given up finding gainful employment for a variety of reasons..

Discrimination—When individuals of different social, economic, or political groups are not treated equally.

Diseconomies of scale—Increases in the long-run average costs (per unit costs) as production increases.

Disincentive—A regulation or policy that deters companies or individuals from taking a particular action.

Disinflation—A lower rate of inflation from a previous inflation measure as opposed to the negative measure deflation.

Disintermediation—A failure on the part of the banking system that prevents savings from individuals being directed into business investment.

Diversification—Investing in unrelated equities to provide security to the investor.

Dividends—Cash payments that public corporations pay to their public investors as a return on their capital investment in the firm.

Division of labor—Division of labor occurs because human beings have a tendency to “truck, barter, and exchange one thing for another,” that is, to trade. This causes people to become dependent on one another.

Doctrine of secondary—Legal protection of an otherwise unprotected trademark that arises when advertising and time make that mark signify a particular product.

Dodd-Frank Wall Street Reform and Consumer Protection Act—Enacted in 2010 in response to the financial crisis that began in 2007.

Dollarization—When a country other than the United States uses the U.S. dollar as its domestic currency.

Domestic capital markets—Financial markets that focus on the economy of the home nation.

Double taxation—Corporate profits are taxed twice: the taxes are paid by the corporation as corporate profits, and are paid again when those already-taxed corporate profits are distributed to shareholders and the shareholders pay tax on the dividends (distributed from corporate profits) they receive.

Dow Jones—Company that publishes business and financial news through different media sources.

Due Process Clause of the Fifth and Fourteenth Amendments—Amendments to the U.S. Constitution that restrict states from violating a person’s right of due process.

Durable goods—Consumer goods with a life three years or longer, including a variety of goods from cookware to automobiles to airplanes.

Durable medical power of attorney—A document contained within an estate plan that names an individual to make medical decisions for an individual in the event that the individual is not able to make those decisions for him- or herself; also referred to as a health care proxy or health care surrogate.

Dust Bowl—In the 1930s, a decade-long series of dust storms, with winds blowing tons of plowed topsoil, created storm clouds of dust and destroyed agricultural resources across the North American Great Plains.

Dynamic economic view—A view of the economy's condition over time.

Earned Income Tax Credit (EITC)—When workers whose income is considered low or moderate file a tax return, they may qualify for this IRS tax credit to reduce their taxes or provide them a refund.

E-commerce—A business model in which individuals or companies buy and sell services or products electronically, usually over the Internet. E-commerce can have the advantages of convenience and selection.

***Econometrica*—**A prestigious academic journal of the Econometric Society that publishes articles highlighting the research of economic issues through econometrics.

Econometrics—A branch of economics that combines economics, mathematics, and statistics to develop quantitative and empirical analysis to economic theory and economic data.

Econometric Society—An international society to advance the study of economic theory through mathematics, statistics, and econometrics; publishes the journal *Econometrica*.

***Economic Consequences of the Peace*—**A book by John Maynard Keynes, written in 1919, regarding the British delegation to negotiate the peace following World War I; in it, Keynes reflects on his experiences and predicts the economic aftermath of the decisions taken.

Economic conservatism—An economic philosophy that promotes minimal government involvement and spending in the economy; a belief in free trade and a balanced federal budget with no national debt.

Economic demography—Applying economic concepts to the study of populations.

Economic development—A measure of an economy, usually attributed to growth in such major economic factors as manufacturing and agriculture; with regard to job growth, it deals with measurable improvements in people's quality of life.

Economic forecasting—The process of making economic predictions regarding future unemployment, inflation, economic growth activity, and other data for a specific time period.

Economic goods—An economic item for which the resources used to produce the item have opportunity costs.

Economic growth—Increases in real per capita GDP over a given period of time.

Economic history—The branch of economics that studies past events and people.

Economic index—A statistical measure of the economy that highlights changes in a specific group of individual data derived from numerous sources; Dow Jones, GDP deflator, and Consumer Price Index (CPAI) are examples of economic indices.

Economic institutions—Nonhuman entities of an economy, including businesses, governments, and unions.

Economic liberalism—An economic belief that the best economic decisions are those made by individuals in the marketplace and not collectively by institutions.

Economic model—A theoretical construct of a defined section of the economy for the purposes of studying economic behavior.

Economic Opportunity Act (EOA) of 1964—Key piece of legislation in President Lyndon Johnson's War on Poverty, it created the Office of Economic Opportunity, established Community Action Agencies, and provided for job training, adult education, and loans to small businesses to help address the causes of unemployment and poverty.

Economic philosophy—A normative economic ideology that defines the main structures of an economy, including its means to achieving specific ends or goals.

Economic planning—A central government's process of deciding what will be produced, how production will occur, and whether the goods and services will be available to the public or for private consumption.

Economic profit—Business profit that not only includes the explicit costs of the company but also recovers the opportunity costs of the resources used by the business.

Economic Recovery Tax Act of 1981—Allowed savings and loans to sell their mortgage loans to Wall Street firms and allowed losses to be offset against taxes.

Economic rent—A payment for the use of a resource above its opportunity cost.

Economic restructuring—When an economy's structure changes from labor-intensive industries to capital-intensive industries—that is, from a manufacturing economic base to a service sector one.

Economics—The science of the decision-making behind how individuals, institutions, and nations allocate their limited resources to satisfy their unlimited wants.

Economics of crime—A subgroup of economics that studies the economic effects and impacts of crime on an economy.

Economics of environment—A subgroup of economics that studies the economic effects and impacts of environmental policies and environmental conditions on an economy.

Economics of family—A subgroup of economics that studies the economic effects and impacts of a family culture in an economy.

Economics of government—A subgroup of economics that studies the economic effects and impacts of government and government policies on an economy.

Economics of health—A subgroup of economics that studies the economic effects and impacts of health-related issues and policies on an economy.

Economics of information—A subgroup of economics that studies the economic effects and impacts of information gathering and technology on an economy.

Economics of law—A subgroup of economics that studies the economic effects and impacts of a nation's laws on an economy.

Economics of the arts—Subgroup of cultural economics involving art, antiques, and collectibles.

Economics of war and peace—A subgroup of economics that studies the economic effects and impacts of a nation's conditions of war and peace on an economy.

Economic system—An economy's method of allocating its resources, goods, and services; which system a country uses is determined by who (markets, central authority, or some combination) answers the main economic questions (what to produce, how to produce, for whom to produce).

Economies of scale—Decreases long-run average costs (per unit costs) as output increases.

Edgeworth Box—Represents various combinations of resource distributions that can be achieved in an economy; often used in general equilibrium analysis; named for Francis Ysidro Edgeworth.

EE/E Bonds—Type of U.S. government savings bonds. EE/E bonds purchased between May 1997 and April 2005 earn a variable market-based rate of return, with the interest rate changing every six months; EE/E bonds issued after May 2005 earn a fixed rate of interest, determined at time of purchase.

Effective rate of protection—A measure of a country's net trade based on the level of the nation's trade protections, such as tariffs on imports or tariffs imposed on exports.

Efficiency—Using the least effort and energy in the production of goods and services.

Efficiency wage theory—Suggests that workers who are paid less for discriminatory reasons retaliate by working less hard, reducing their productivity.

Elasticity—The measure for the responsiveness of quantity demanded or quantity supplied to changes in price; if the percentage change in response (either demand or supply) is greater than the percentage change in price, the product is deemed elastic; if the percentage change is less, then the product is deemed inelastic; if the percentage change is equal, then the product is deemed unitary.

Elasticity of demand—A measure of how consumers' quantity demands respond to changes in price.

Elasticity of supply—A measure of how producers' quantity supplied responds to changes in price.

Electronic Funds Transfer Act (EFTA)—Banking through electronic means, such as direct-deposit paychecks and automated teller machines (ATMs).

Elementary and Secondary Education Act (ESEA) of 1965—Part of the War on Poverty legislation, it provided grade schools and high schools with federal funding for the first time.

Embargo—Prohibition on trade imposed on one country by another country.

Embezzlement—Theft of money or property from a company or an organization by a person who is in a position of power or authority.

Emergency Home Finance Act of 1970—Federal legislation that created the Federal Home Loan Mortgage Corporation (FHLMC, or Freddie Mac).

Eminent domain—Term to define government's right to require the sale of privately held property for a government-defined common good use.

Empirical economics—General term used to describe econometrics, mathematical economics, or experimental economics whose means to economic solutions is quantitative.

Employee—Person whose wages are paid by a second source such as another individual, business, or corporation.

Employee Retirement Income Security Act (ERISA)—Federal law that protects employees' benefit rights in private pensions.

Employee Stock Ownership Plan (ESOP)—Form of defined contribution plan in which the investments are primarily in employer stock, similar to a profit-sharing plan.

Employer—Individual, business, or corporation that hires employees.

Employer Excise Tax—From the Social Security Tax Act, a tax on employer-sponsored health care plans that applies to a failure to comply with specific coverage mandates and prohibitions.

Employer Shared Responsibility Payment (ESRP)—A tax payment that employers (applicable large employers, or ALEs) with least 50 full-time employees (or equivalents) would pay in place of meeting the Affordable Care Act requirement to offer health insurance coverage to their full-time employees (and their dependents).

Endowment effect—Attaching a higher value to a good in our possession that we intend to "consume" than the same good in our possession that we intend to "sell."

Enhancing Financial Institution Safety and Soundness Act of 2010—Title III of the Dodd-Frank Act; transfers oversight of savings and loan holding companies, federal savings associations, and state savings associations to the Board of Governors of the Federal Reserve System, and eliminates the Office of Thrift Supervision.

Enlightenment, Age of—An 18th-century cultural movement in Europe and the American colonies to create societal reforms through reason and science.

Entrepreneurship (Entrepreneurs)—A component of human resources; the willingness and ability of an individual to use productive resources (land, labor, capital) to raise financial capital, organize, take risks, manage, and otherwise combine resources to create a business or organization.

Environmental Defense Fund—U.S.-based nonprofit that advocates using science, economics, and law to find environmental solutions, and often advocates market-based solutions to environmental problems.

Environmental economics—A study of economics concerned with creating and promoting economic solutions to environmental issues.

Environmental Protection Agency—Federal agency whose mission is to protect the environment and promote environmental quality.

Equal Employment Opportunity Commission (EEOC)—Federal agency charged with the enforcement of federal laws that prohibit discrimination against a job applicant due to race, gender, age, or national origin.

Equal Pay Act—Amended the Fair Labor Standards Act to prohibit unequal pay based on gender.

Equation of Exchange—The equation of exchange identifies the relationship between an economy's money supply (M), price level (P), velocity of money (V), and value of its goods and services (Q) as $PQ = MV$; also known as the Quantity Theory of Money.

Equilibrium—The condition in which the quantity demanded and quantity supplied of a good or service is equal at a given price; equilibrium also describes the balance of an economy's aggregate demand and aggregate supply.

Equilibrium price—The price determined when quantity demanded equals quantity supplied.

Equity—A financial security that represents an ownership stake in a publicly listed corporation's equity. (*See also* Stock.)

Equity financing—A company or business selling equity or other equity means to generate capital.

Equity index annuities—A combination of fixed and variable annuities where the funds are invested in a broad stock market index and the annuity value is tied to the growth of the index with a set minimum payout.

Equity market—The aggregation of buyers and sellers exchanging stocks. (*See also* Stock market.)

Equity portfolios—Investing in many stocks at the same time to diversify investments and reduce the risk of holding one very volatile security.

Estate planning—A formal plan for distribution of one's financial and personal assets upon death.

Euler's theorem—A theorem in number theory sometimes used in economic theory named for Leonhard Euler.

Euro—The monetary unit of the European Union (€) first appearing in January 2002.

Euronext Exchange—The first equity market in Europe, including France, United Kingdom, Netherlands, and Portugal.

European Central Bank—The central bank responsible for the monetary policies of the Eurozone Monetary Union; located in Frankfurt, Germany.

European Debt Crisis—A debt crisis since 2009 in several member countries of the European Union.

European Economic Community—Organization created following the 1957 Treaty of Rome; creating a currency "snake in the tunnel" in 1972 where all currencies were held within tight limits; also known as the EEC or Common Market.

European Monetary Union (EMU)—The monetary union (also known as the eurozone) for those members of the European Union who chose to join; the euro is the monetary unit of the EMU.

European Recovery Plan—Known as the Marshall Plan; initiated by the United States in 1947 in the wake of World War II to provide grants rather than loans.

European Stability Mechanism (ESM)—A policy to provide financial stability and financial assistance to European Union members.

European Union—Group of European member-states, acting together as a political and economic union; formally established through the Maastricht Treaty in 1993.

Evolutionary economics—A subgroup of economics that focuses on interdependence, growth, competition, and economic structural changes.

Exchange, voluntary—Willingness of two individuals, organizations, or businesses to trade a good or service.

Exchange rate—The price of one nation's currency expressed in terms of another nation's currency.

Exchange rate system—Fixed (pegged), Flexible (floating), or Managed to identify the relationship between a domestic currency and a commodity or second currency.

Exchange traded fund (ETF)—Similar to a mutual fund, ETF index funds comprise a basket of underlying securities representing an index; but unlike a mutual fund, ETFs trade on a stock exchange throughout the day.

Exchequer—The British department responsible for collecting and managing the nation's revenue.

Exclusion principle—Key principle identifying public goods such national defense or police protection, where people cannot be denied use of the good.

Experimental economics—Applying experimental methods to the study of economic issues such as the functioning of markets or exchange structures.

Experimental Science Association (ESA)—A professional organization for scientists and educators who use controlled experiments to learn about economic behavior. The ESA started the journal *Experimental Economics*, which publishes high-quality papers to advance experimental research in economics and related disciplines.

Explicit cost—For a business or an organization, the costs that involve spending money, such as rent, production materials, and wages.

Export-Led Growth Industrialization—An economic approach focusing on exporting goods; often implemented by developing nations.

Export processing zone (EPZ)—Type of free-trade zone mostly specifically used by developing countries.

Exports—The outflow of goods and services from one nation to another nation.

Externality—The positive or negative consequence of an economic transaction that impacts a third party.

Extralegal markets—Term defining the markets in developing countries that poor people need since those people do not or cannot participate in the legal economic system; popularized by Peruvian economist Hernando de Soto.

Fabian Society—A British Socialist organization founded to advance democratic socialism through marginal means and not revolutionary action; the modern organization operates like a think tank.

Factors of production—Resources used to produce goods or services; the three main factors of production are natural resources, human resources, and capital goods.

Fair Debt Collection Practices Act (FDCPA)—Law that governs how debt is collected; the law was enacted to eliminate abusive debt collection practices.

Fair Employment Practices Agencies (FEPAs)—State or local equivalents of the federal Equal Employment Opportunities Commission.

Fair Labor Standards Act of 1938—Federal statute that established minimum wage.

Fair trade—The practice of a business buying goods directly from a producer in the developing world at a guaranteed price.

Fair Trade Movement—An economic movement that promotes higher export prices along with improved environmental and labor standards to enable developing countries to better participate in the global economy.

Fannie Mae—*See* Federal National Mortgage Association.

Fascism—A system of government where all authority is centralized, ruled by a dictator.

Fat tax program—Aims at raising the relative price of calorie-dense foods so as to create an incentive for switching to low-calorie alternatives. In particular, the program seeks to tax junk foods.

Federal Communications Commission (FCC)—Federal commission that regulates interstate and international communications of television, cable, satellite, radio, and wire in the 50 states, the District of Columbia, and U.S. territories.

Federal Deposit Insurance Corporation (FDIC)—An independent federal agency created in 1933 to ensure stability and confidence in the U.S. financial system by insuring deposits and providing regulatory and receivership oversight.

Federal Election Campaign Act of 1974 (FECA)—The primary U.S. federal law for regulating political campaign spending and fundraising; the law originally focused on increased disclosure of contributions for federal campaigns.

Federal Election Commission (FEC)—Federal commission to administer and enforce federal campaign finance statutes.

Federal Funds Rate—The overnight interest rate that banks charge each other when funds are needed to adhere to the Federal Reserve's reserve requirement for financial institutions. The rate is established by Fed actions of buying or selling Treasuries to regulate the money supply.

Federal Home Loan Bank System (FHLBS)—Created by Federal Home Loan Bank of 1932 to increase funding to financial institutions so they can increase mortgage funding.

Federal Home Loan Mortgage Corporation (FHLMC, or Freddie Mac)—A quasi-government-sponsored enterprise (GSE) created to support the housing mortgage market by purchasing mortgages from financial institutions, packaging them, and selling the packages of mortgages on the private investment market.

Federal Housing Administration (FHA)—Federal agency that provides mortgage insurance for loans on single-family homes and multifamily projects.

Federalism—A system of government that consists of a federal political unit and lower political units; the United States is a federalist system with a national government and lower state governments.

***Federalist Papers*—**A series of articles, essays, and pamphlets written by Alexander Hamilton, John Jay, and James Madison to promote ratification of the U.S. Constitution.

Federal Medical Assistance Percentage (FMAP)—The percentage rate used to determine matching funds allocation to U.S. social and medical programs; currently the rate is 57 percent, but it ranges from a low of 50 percent in wealthier states to 75 percent in states with lower revenues.

Federal National Mortgage Association (FNMA, or Fannie Mae)—A quasi-government-sponsored enterprise (GSE) created to support the housing mortgage market, supporting mortgage lenders to provide affordable mortgages.

Federal Open Market Committee (FOMC)—A body of the Federal Reserve System responsible for the decisions regarding interest rates and quantity of U.S. money supply through the buying and selling of U.S. securities (bills, notes, bonds).

Federal Poverty Level (FPL)—In 2016, the FPL for a family of four was $24,250; the level is changed annually. Many state minimum eligibility levels exceed the federal minimum.

Federal Reserve System—The central banking system of the United States since 1913; responsible for the monetary policies and money supply and regulation of the U.S. banking system.

Federal Savings and Loan Insurance Corporation (FSLIC)—The federal insurer of savings accounts at thrift institutions; the thrift industry's equivalent of the Federal Deposit Insurance Corporation (FDIC).

Federal Surplus Relief Corporation (FSRC)—Established during the Depression, this agency purchased six million pigs to stabilize prices as meat prices were falling and production costs were rising.

Federal Trade Commission (FTC)—Independent government agency established to protect consumers against identity theft and inappropriate business practices, and to protect markets from monopoly or cartel activity.

Federal Trade Commission Act of 1914—Act of Congress signed into law by President Woodrow Wilson that established the Federal Trade Commission.

Feudal system—An economic and political system of medieval Europe that emphasized the ownership of property by a peasant or vassal in return for labor or service to a lord or monarch.

Fiat money—Fiat money does not have the same intrinsic value as commodity-backed money. Its legality and value is based on the confidence of the government issuing the money. Fiat money is the most common type of money and monetary system in use by nations today. Real value of fiat money is based on the demand and supply of the fiat money, with the nominal value based on an economy's monetary policy.

Fiduciary money—When banks or financial institutions promise payment in a second form of money the monetary system is called fiduciary money. The payment by the institution could be gold, silver, checks, or other form of bank note.

Fifth Amendment—As part of the U.S. Constitution's Bill of Rights, the Fifth Amendment protects people from being compelled to be a witness against themselves in a criminal case. It allows witnesses to decline to answer questions where the answers might incriminate them, and generally without having to suffer a penalty for asserting the privilege.

Final goods—Goods and services produced to be sold in the product market and consumed by households; not used to produce other final goods.

Finance economics—The discipline of economics that studies the effects and impacts of the financial markets and financial institutions on an economy's functioning.

Financial account—One of the three Balance of Payments subaccounts that measures nation's financial assets, including gold, currency, special drawing rights, bonds, and derivatives. (*See also* Balance of Payments; Capital account; Current account.)

Financial crisis—Economic event in which investors and depositors create a financial run or panic, causing the asset values of financial institutions to decrease significantly.

Financial institutions—Private businesses or government-sponsored organizations that act as financial intermediaries between savers and borrowers; includes banks, credit unions, and mortgage intermediaries such as Fannie Mae or Freddie Mac.

Financial Institutions Reform, Recovery, and Enforcement Act (FIRREA)—Congress-enacted legislation in response to the savings and loan crisis of the 1980s; among the changes enacted, the act abolished the Federal Savings Loan Insurance Corporation, and created the Resolution Trust Corporation (RTC) and the Savings Association Insurance Fund (SAIF).

Financial market—Marketplace of buyers (consumers) and sellers (producers) of financial products, including stocks, bonds, equities, and currencies.

Financial Planning Association (FPA)—Professional organization of Certified Financial Planners (CFPs) and other financial-planning professionals.

Financial Reform Act of 2010 (Dodd-Frank Wall Street Reform and Consumer Protection Act)—Signed into law in 2010 by President Barack Obama, the act called for significant changes to regulations of the financial markets resulting from the financial crisis of 2007–2009.

Financial Services Modernization Act of 1999—Repealed the Banking Act of 1933. Also known as the Gramm-Leach-Bliley Act (GLBA), this act allowed commercial banks, investment banks, securities firms, and insurance companies to consolidate.

Financial Stability Board (FSB)—Group of the world's central bankers and finance ministers that work together toward international financial stability.

Financial Stability Oversight Council—Established as part of the Dodd-Frank Act to create an oversight of financial markets and identify possible financial threats.

First Bank of the United States—Established in 1791 by Treasury Secretary Alexander Hamilton; located in Philadelphia, Pennsylvania.

Fiscal policy—The discretionary actions and policies of a government through taxation and spending to achieve the economic goals of a nation's economy.

Fixed costs (FC)—Short-run costs that are independent of the output produced. Examples include rent on property, rental agreements on equipment with a time restriction, and labor costs as part of a labor contract. In the long run, fixed costs do not exist, because the terms of any agreements and contracts eventually expire.

Fixed exchange rate—The exchange rate when the value of a nation's currency is pegged to a second currency or commodity, such as gold or silver. (*See also* Pegged exchange rate.)

Fixed income—Income that does not fluctuate with economic conditions or labor wage rates. Many retirees' annual income is a fixed income.

Flexible exchange rate system—System in place when the forces of supply and demand are mainly responsible for determining the exchange rate of a currency. Currencies are traded in the foreign exchange market in much the same way that equities are traded in the stock market. (*See also* Floating exchange rates.)

Flexible saving account—A workplace-provided account into which employees contribute money before federal income taxes to pay for specific items such as health insurance deductibles or child care; also called a flexible spending account.

Floating exchange rates—When the value of a nation's currency is based on the supply and demand of the currency relative to a second currency. (*See also* Flexible exchange rate system.)

Floating rate notes (FRNs)—A new addition to the government's portfolio of debt offerings. An FRN has a floating interest rate, or one that fluctuates.

Focal point—In game theory, the point at which both players believe they are most likely to reach a common agreement or understanding.

Fordney-McCumber Tariff Act of 1922—Federal tariff on many imported goods, implemented by the United States to protect U.S. factories and farms.

Foreign aid—Payments by developed nations to developing nations for which no repayment is required.

Foreign debt—When a nation's repayment loan obligations to another nation exceed its ability to repay the loan over time.

Foreign direct investment (FDI)—A controlling ownership in a business enterprise in one country by an entity based in another country. Creates opportunities by allowing firms from other countries to wholly own enterprises in many industries.

Foreign Exchange Market (forex)—Financial markets that focus on global currency markets; the buying, selling, exchanging, and speculating on currencies.

Foreign exchange peg—When one currency's value is fixed relative to a second currency or commodity.

Foreign exchange swap—A currency exchange between two foreign companies.

Foreign Investment and National Security Act of 2007—Law enacted to promote foreign investment and create jobs through national security.

Formal contract—A contract where the parties have signed formal documents.

Form 1040EZ—The most basic tax form used to pay taxes through the Internal Revenue Service (IRS).

Form W-2—The tax form that individuals receive from the U.S. Internal Revenue Service (IRS) reporting taxable income and amounts withheld for paying annual taxes.

Forward exchange rate—When a bank (or other financial intermediary) agrees to pay an agreed-upon exchange rate in the future.

Four horsemen in the American auto industry—In the 1970s, the four reasons behind increased imports of foreign-made cars: free trade, old plants and assets, global labor competition, and increases in the price of gasoline as a result of the energy crisis.

Fourteenth Amendment to the U.S. Constitution—Amendment giving citizenship rights and equal protection of the laws to all U.S. citizens regardless of race; includes the Due Process Clause and Equal Protection Clause.

Fractional reserve banking—A system of banking where financial institutions are required to maintain reserves that are only a percentage of total deposits.

Fraser Institute—A Canadian nonpartisan think tank that conducts research on the impacts of education, entrepreneurship, and economic government policies.

Frazier-Lemke Farm Bankruptcy Act—Enacted by Congress in 1934, a government attempt to limit the banking industry's ability to repossess farms.

Freddie Mac—*See* Federal Home Loan Mortgage Corporation.

Free banking—Agreement in which banks have no regulations, laws, or specifications.

Free market economy/free enterprise system—The economic system, also known as capitalism and the market economy, where the answers to the key economic questions (what to produce, how to produce, for whom to produce) are answered in the marketplace in the interaction between buyers and sellers.

Free-rider problem—A condition where the users of a public good assume that others will pay the costs of the public good; one example is a user of a city park who lives in another city and does not pay taxes in the city where the park is located to contribute to the park's maintenance and upkeep.

Free-trade agreements—Agreements by countries to provide open borders for free trade and population movements, creating a free-trade area; the North American Free Trade Agreement (NAFTA) is an example of a free-trade agreement.

Free-trade area—Geographic or political regions that create a trade bloc free from protectionist policies such as tariffs or quotas.

Frictional costs—Transaction costs or coordination costs.

Frictional unemployment—The component of the unemployment rate that is determined by the continual portion of the labor force that is actively looking for employment.

Full employment—When the unemployment rate is equal to the frictional unemployment.

Fuller court (1888–1910)—U.S. Supreme Court under Chief Justice Melville Fuller; Court's decision in *Adair v. United States* prohibits states from interfering with most employment contracts.

Futures—Different classes of assets that the market allows to be used for speculative purposes by individuals who are not directly involved (users or producers are those directly involved) in the commodities market, including agriculture futures such as coffee, wheat, corns, soybeans, lean hogs, and feeder cattle.

Future value—The opposite of present value. Rather than the present value of a future sum being calculated now, the future value of a sum invested now is calculated after a period of time.

Game theory—The study of interactive decision-making; game theory tries to understand the various probable outcomes when two or more individuals with limited knowledge of their situation try to calculate best outcomes.

General Agreement on Tariffs and Trade (GATT)—Established in 1947, an international agreement to reduce barriers of trade in world trade; was followed by the World Trade Organization (WTO).

General equilibrium theory—In macroeconomics, the study of consumer and producer behaviors that result in market equilibrium as an economy of the whole. *General equilibrium* is the condition in which aggregate supply is equal to aggregate demand.

Generally Accepted Accounting Principles (GAAP)—Accounting principles and procedures accepted by the accounting profession for creating financial and audit statements.

General partnership—An unincorporated business involving two or more individuals; the business is not taxed separately from the individuals.

***General Theory of Employment, Interest, and Money, The*—**Work by John Maynard Keynes (published in 1936) that changed the way government is viewed as a participant in the economy; considered the beginning of macroeconomics.

Giffen good—A good that violates the law of demand; as price increases, so does quantity demanded.

Gilded Age—Generally referring to the period from the 1870s to 1900, the term was derived from the novel *The Gilded Age: A Tale of Today* (1873), by Mark Twain and Charles Dudley Warner, which satirized greed and corruption of the time. The Gilded Age was a time of rapid industrialization and wage growth, but also severe poverty (especially for millions of immigrants) and high concentrations of wealth.

Gini Coefficient—An index measure of a nation's distribution of income based on household income or wealth, from perfect equality to maximum inequality.

Ginnie Mae—*See* Government National Mortgage Association.

Glass ceiling—A nontransparent barrier to entry into certain levels of leadership; term used when describing discrimination of women to top levels of corporate leadership.

Global economics—The study of the world economy (also known as the global economy) and how national economies interact with each other in a global marketplace.

Globalization—The process of integrating national economies into one global economy through improved technology in telecommunications, including the Internet, and transportation.

Gold standard—A fixed exchange rate system that uses gold as its standard of value.

Government Accountability Office (GAO)—Formerly the General Accounting Office; a government agency that works for Congress to ensure financial accountability of government policies, providing nonpartisan financial reports of government actions and government negligence and waste.

Government budget constraint—A relationship between monetary policy options and fiscal policy options at a point of time.

Government failure—Failure in which government program costs outweigh benefits, resulting in misallocation of resources; also known as nonmarket failure; similar to market failure.

Government National Mortgage Association (GNMA or Ginnie Mae)—Government-sponsored corporation to advance home ownership, based within the Department of Housing and Urban Development (HUD).

Government sponsored enterprises (GSEs)—Corporations created by the U.S. Congress as public-service entities but operating as privately held corporations; Fannie Mae and Freddie Mac are examples of GSEs.

Granger Laws of 1874—Series of laws passed in several Midwestern U.S. states to create a price ceiling for costs of freight shipment.

Great Depression—The worldwide economic depression of the 20th century, with significant decreases in wealth, employment, and industrial production; began in the United States in 1929, had spread to Europe by 1931, and lasted until the beginning of World War II.

Great Leap Forward—A 1958 effort by Chinese leader Mao Zedong to upgrade and modernize China; led to a national famine.

Greenbacks—Because the back of the note is printed in green, these were the first non-interest bearing notes printed by the U.S. government to pay for the war debt.

Greenhouse gas emissions (GHG)—Any of the atmospheric gases, such as carbon dioxide and methane, that contribute to the greenhouse effect and climate change.

Gresham's law—Commonly known as "bad money driving out good"; occurs when a government overvalues one money and undervalues the second money so that the undervalued money disappears and the overvalued or bad money overwhelms the economy.

Gross domestic income (GDI)—A measure of a nation's economy: the value of wages, profits, interest, and rents income within a nation's borders over a given period of time.

Gross domestic product (GDP)—A measure of a nation's economy: the final market value of goods and services produced by businesses, households, government, and the effects of net trade (exports minus imports) within a nation's borders over a given period of time.

Gross national product (GNP)—A measure of a nation's economy: the final market value of goods and services produced by the nation's businesses, households, government, and the effects of net trade (exports-imports) regardless of where geographically.

Group life insurance—A type of term life insurance that covers a group of people, usually employees of a company or members of a union or an association.

Group of Seventy-Seven (G77)—Loose association of developing nations, created in 1964 to preserve the nations' independence and sovereignty after they expressed fears of deteriorating terms of trade and lack of market access to the developed nations.

Harrod-Domar model—A measure of the growth rate of an economy through its savings and the productivity of its capital.

Hazardous waste—Materials that pose a public health threat to the environment.

Headline inflation—Inflation rate that includes all components of the Consumer Price Index, including food and energy.

Health care REITs—Real Estate Investment Trusts that invest in properties related to the health care industry, like senior housing communities, assisted living communities, medical offices, hospital buildings, research facilities, and skilled nursing facilities.

Health insurance—Type of insurance that provides the financial means to pay for products and services in the health care market.

Health insurance mandate—Requirement that an employer or an individual have private company insurance or participate in a national plan such as Medicaid or Medicare.

Health maintenance organization (HMO)—Frequently charges lower monthly premiums and out-of-pocket costs in exchange for allegiance to a predetermined group of medical providers. Normally, HMO participants have a primary care physician, and any referrals and treatment needed from specialists must go through the gatekeeper primary care physician.

Health savings account (HSA)—A tax-advantaged account (with special tax benefits regulated by the Treasury Department), available to participants with CDHP plans, that allows users to pay for medical care with pre-tax dollars. This type of plan may be offered in conjunction with an HMO or a PPO.

Heavily Indebted Poor Country (HIPC) Initiative—A debt relief program originally established in 1996 and co-sponsored by the International Monetary Fund (IMF) and the World Bank. Debt relief under the HIPC Initiative involves the reduction of certain external debts owed by poorer countries to foreign creditors.

Heckscher-Ohlin theory—A trade theory that predicts a country's ability to export goods and services based on abundant factors of production and predicts a country's import goods and services when the factors of production are relatively scarce.

Hedge funds—Private pooled funds that make investments in equities, bonds, and derivatives. Hedge funds are similar to mutual funds in that they are pools of capital collected from investors and the capital is invested on behalf of the investors.

Helms–Burton Act—The Cuban Liberty and Democratic Solidarity Act (also known as the Libertad Act); 1996 legislation that tightened existing trade sanctions with Cuba.

Heritage Foundation—A conservative think tank located in Washington, D.C., created to promote conservative public policies based on free enterprise, individual freedom, strong national defense, and limited government.

Heterogeneity—Differences across individuals in preferences and capabilities and across non-economics variables for understanding decision-making and outcomes.

Heterogeneous product—A product that is unique and does not have any notable substitutes.

Hidden economy—In the broadest sense, refers to economic activities that take place outside the official economy and are not declared for tax purposes. (*See also* Shadow economy; Underground economy.)

Higher Education Act—Federal law, first signed in 1965 as part of the Great Society agenda, that provides financial assistance to students wishing to attend college.

"History of the Standard Oil Company"—A series of 19 articles published in *McClure* magazine from 1902 until 1904 detailing the history of Standard Oil under John D. Rockefeller. In 1904, the articles were compiled in a book titled *The History of the Standard Oil Company*.

Homeowners insurance—Insurance policies that protect homeowners against damage from such perils as hail, wind, lightning, falling trees, tornadoes, vandals, water, theft, fire, explosion, vandalism, riot, and perhaps even a falling aircraft.

Homestead Act—A law signed in 1862 by President Abraham Lincoln to promote migration to the western United States.

Homogenous product—A product that is not unique and has many substitutes, none of them distinguishable from the others.

Hope Now Alliance—A cooperative of government personnel, housing counselors, and lenders to help struggling homeowners avoid foreclosure.

Hot-Hand Fallacy—Sometimes called the Gambler's Fallacy, a belief that future outcomes are biased in the *same* direction as a previous sequence.

Housing and Urban Development (HUD), Department of—Federal agency responsible for the Federal Housing Administration, Fannie Mae, and Freddie Mac.

***Human Action: A Treatise on Economics*—**The second and most popular work of Austrian economist Ludwig von Mises; the work, published in 1949, became the definitive explanation of Austrian economic thought.

Human capital—The productive resource of labor in the production of goods and services; human capital is based on several variables, including education, experience, and the market demand for education and experience in particular skills.

Human resources—The component factor of production that includes individuals in the production of goods and services; also known as human capital.

Human rights—Term used to define the fundamental rights of individuals simply by their being global human citizens.

Hyperinflation—Exceptionally swift growth of a nation's money supply, leading to immeasurable inflation rates.

Identity theft—Also identity fraud, terms used to refer to all types of crime in which an individual wrongfully obtains and uses another person's personally identifiable information in some way that involves fraud or deception, typically for economic gain.

IMF conditionality—Conditions placed on nations by the International Monetary Fund in order for those nations to receive funding assistance from the IMF.

Immediate annuity—The simplest type of annuity, in which investors pay a lump sum and receive guaranteed monthly payments for life or for a predetermined time period.

Immigrant—An individual who leaves a home country and comes to a new country for the purpose of establishing a new residence.

Immigration—The movement of people to a country or region where they are not native.

Immigration Reform and Control Act of 1986—The first major revisions of immigration laws aimed to preserve U.S. jobs for U.S. citizens and other qualified individuals.

Imperfect competition—A market condition where perfect competition characteristics are not fulfilled; forms of markets with imperfect competition include monopolistic competition, oligopoly, and monopoly.

Imperialism—Economic imperialism results when a nation's rates of consumption outpace production, forcing the country to export capital to foreign countries in order to exploit foreign markets and labor forces to supply its needs.

Implementation lag—The time between when a government passes a law or policy and when the law or policy can be put into effect.

Implicit cost—The opportunity costs of the resources being used by a business or an individual.

Import and Export Price Indices (IEPI)—Bureau of Labor Statistics (BLS) data reporting increases or decreases of price indices on imports and exports.

Imports—The inflow of goods and services from one nation to another nation.

Import substitution industrialization policies (ISI)—An economic theory implemented by developing economies or by government-dictated economies to decrease their reliance on goods and services imported from developed nations and/or to protect their domestic infant industries.

Incentives—Positive rewards for participating in an activity.

Income distribution—A measurement of different income levels in an economy and the percentage of income earners in each income level.

Income effect—When market changes create a change in the quantity demanded in a good or service, which alters the purchasing power of the consumer, either increasing or decreasing the consumer's ability to purchase goods and services.

Index (indices)—A statistical measure of an economy, such as a stock market index or consumer price index.

Index fund—A type of mutual fund or unit investment trust (UIT) whose investment objective typically is to achieve approximately the same return as a particular market index, such as the S&P 500 Composite Stock Price Index, the Russell 2000 Index, or the Wilshire 5000 Total Market Index.

Index of Openness—Ratio measure of an economy's willingness to engage in free trade, calculated by summing up its exports and imports and dividing that result by its gross domestic product (GDP).

Index of Sustainable Economic Welfare (ISEW)—Corrects a standard measure of per capita consumption for a wide array of social and environmental costs, suggesting the robust economic growth of the 1970s through the 2000s led to relatively little improvement in social welfare.

Indifference curve—A curve composed of a set of consumption alternatives that yield the same amount of utility (satisfaction).

Individual retirement accounts (IRA)—Retirement savings accounts that accumulate capital tax-deferred. Account-holders pay the tax when they receive the capital during retirement. Roth IRA, SEP (IRA), 401(K), and 403(b) are the most common retirement accounts.

Industrialization—The transformation of an economy from agrarian to industry-based.

Industrial Revolution—Period during the 18th and 19th centuries when many economies transitioned from being agricultural-based to being manufacturing-based; included improved transportation and communication technology.

Infant-industry argument—The idea that governments should impose tariffs to protect start-up industries from import competition.

Inferior goods—Economic goods whose demand decreases as income increases.

Inflation—A general rise in the price level of all goods and services (demand-pull) in an economy; the general rise in the costs of resources (supply-push) in an economy; when the quantity of the money supply exceeds the current price level of the quantity of goods and services produced (monetary inflation).

Inflation–unemployment rate trade-off—First proposed by A. W. H. Phillips, the idea that during times of economic growth a nation experiences either inflation with low unemployment or relative price stability with high unemployment.

Informal contract—A contract that is legal and binding, even if it has not been formally consummated.

Informal economy—Consists of business activity that is not reported to the government. (*See also* Shadow economy; Underground economy.)

Information economics—A branch of microeconomics that studies how information and information technology impact an economy.

Infrastructure—An economy's major public services, including roads, sewers, water, schools, medical facilities, and updated telecommunications.

Inheritance taxes—Taxes paid by a person who inherits money or property, or taxes levied on the estate (money and property) of a person who has died.

Initial public offering (IPO)—The primary market offering, orchestrated by investment bankers, of a company selling its stock for the first time.

Initial share price—Price of a company's stock at the time of the stock's initial public offering (IPO).

Injunction—Legal stop to an action.

Input-output (I-O) model (analysis)—A quantitative economic technique that studies, analyzes, and models the interdependence between the inputs (land, labor, capital) and the outputs (goods and services) of a national economy or between different regional economies; originally developed by Wassily Leontief (1905–1999).

Inputs—Land, labor, capital; natural resources, human resources, capital resources.

Insider trading—Trading of a company's stock by an individual who has access to information not available to the general trading public.

Installment loan—Type of loan that has a fixed loan amount, a fixed payment, and a fixed payoff date; examples are auto loans and mortgages.

Institutional economics—The study and analysis of the role of institutions in developing economic behavior.

Institutions—A formal or informal set of rules of behavior, limits, or constraints on an economic, social, and political society.

Insurance companies—Businesses used by individuals and companies to transfer risk of loss in life, property damage, injury, or hardship.

Insurance liability—Refers to fault or legal responsibility.

Intellectual property rights—Protecting artists' creative works, such as books, music, and movies, through copyright law.

Interdependence—The reliance of two resources or economies on each other.

Interest—The price/cost of money expressed in nominal terms (stated interest rate) or real (foundation interest rate) terms.

Interest groups—Groups assembled to promote and influence public policy and public opinion in their favor and create economic rents for their membership; also known as lobbies, campaigns, or special interest groups.

Intermediate goods—Goods produced to be used entirely in the production of final goods.

Internal Revenue Service (IRS)—U.S. government revenue collection agency of the Department of the Treasury.

International Bank for Reconstruction and Development (IBRD)—Established during the Bretton Woods Conference to enable reconstruction of war-torn Europe by loans and securities; the IBRD is now one of five institutions that constitute the World Bank.

International economics—A branch of economics that studies the interdependence of economic activity between nations and the economic development of nations, including resource movements, trade, and investment.

International finance—A branch of economic study concerned with the money flows between nations and the international monetary systems, including balance of payments, exchange rates, international trade, and foreign direct investment.

International Monetary Fund (IMF)—Founded during the Bretton Woods Conference to administer an international foreign exchange rate system and lend to member countries having balance-of-payments problems; lender of last resort for national governments and central banks.

International policy reform—A future state or condition determined by government action and policy to stimulate future international trade or development.

International trade—Trade between companies from different nations; the flow of goods, services, and productive resources between international boundaries.

International Trade Organization (ITO)—International pioneer that later became the World Trade Organization (WTO); also, parts of its charter were incorporated in the General Agreement on Tariffs and Trade (GATT).

Intrapreneurs—Individuals who adapt or improve existing products or introduce new product lines to the firm.

Investing—Act of purchasing economic goods (antiques, art, etc.) or using financial products (stocks, bonds, etc.) to create future wealth.

Investment—Use of today's resources to fund future production or future consumption.

Investment banking—The operations of a financial institution that focus on raising capital to accommodate transactions such as mergers, acquisitions, derivatives, foreign exchange, and the issuance of securities.

Investment risk—Involves both the chance of a financial loss and, unlike pure risk, the possibility of a financial gain on an investment.

Irrevocable trusts—Trusts in which the trustor is not allowed to revoke the trust or make changes to it once it has been created.

Isolationism—Protectionist policy in which a nation intentionally refuses to form alliances, treaties, or other economic partnerships.

Job Openings and Labor Turnover Survey (JOLTS)—Bureau of Labor Statistics (BLS) survey that generates data on job openings, separations, and hires.

John Bates Clark Medal—A prestigious award bestowed by the American Economic Association to an economist under 40 who has made significant contributions to economic knowledge and economic thought; considered second only to the Nobel Prize in Economics in prestige.

Joint-life with last survivor annuity—Annuity that makes a payment to the annuitant and, upon the annuitant's death, continues to make the payments to a second designated party, usually the annuitant's spouse, until that second person's death.

Journeyman—In some trades or professions, a middle-level position that includes both on-the-job and classroom training and education. A journeyman has completed the requirements for apprentice, and is at the level just prior to the master designation.

Judicial review—The prerogative of the courts to review the actions of the legislative and executive branches of government.

***The Jungle*—**Novel written by Upton Sinclair in 1906; this portrayal of the life of an immigrant working in the Chicago, Illinois, meat packing industry led to health, sanitation, and working reforms in the meat-packing industry.

Keynesianism—The school of economic thought influenced by the writings of John Maynard Keynes.

Knights of Labor—A labor union known for participating in an April 1894 strike that involved more than 200,000 miners nationwide; the two-month-long strike turned violent, and at least 11 miners were killed.

Knowledge-based economy/industry—An economy or industry whose resource advantage is in the advanced application of human capital through technology and advanced production and management operations.

Kyoto Protocol—An international treaty requiring binding greenhouse gas emissions limits; to date, the treaty has not been successful.

Labor—Contributions to a nation's economy by humans who work.

Labor economics—A branch of study in economics that focuses on the function of labor markets, including the interaction of workers and employers, the supply of labor, the demand for labor, and labor patterns of an economy.

Labor force participation rate—Ratio of the total number of people participating in a nation's labor market who are employed relative to the size of the total labor force.

Labor movement—A formal action by workers to organize into a labor union to call for improved working conditions, including better wages and benefits.

Labor theory of value (LTV)—Economic theory that submits that the value of a commodity or an economic good or service is based on the labor needed either to produce the commodity, good, or service or to acquire it.

Labor union—A formal organization of wage earners gathered for the express purpose of improving wages, benefits, and working conditions.

Laffer curve—Based on the ideas of supply-side economics, the Laffer curve supposes that government revenues will increase to a specific marginal tax rate, at which time the incentive to work supposedly will decrease, which in turn will decrease tax revenues.

Lagging indicators—Economic and financial measurement data points that describe economic or financial trends after changes in the economy have occurred, such as unemployment and per unit labor cost.

Laissez-faire—An economic term used to describe an economy that is free from government intervention in economic activity, including trade and market transactions; a French phrase for "let us do," generally translated as "let it be" or "to leave alone."

Land—The natural resources available from nature, including resources on the land, from the land, or located beneath the land.

Lausanne School of Economics—A neoclassical school of thought known for developing the general equilibrium theory; also known as the Mathematical School.

Law, John—Scottish banker and financier who created the French General Bank in 1716 and originated the "Mississippi Scheme." Using the bank and the newly formed Mississippi Company, he became wealthy committing fraud against many French investors in the French territories in the Mississippi Valley (the "Mississippi Bubble"). He died poor in Venice, Italy.

Law of Large Numbers—The belief that a sample randomly drawn from a population is highly representative; thus, each sample must be similar to each other sample and to the population.

Law of Small Numbers (the Gambler's Fallacy)—A bias judgment that assumes the characteristics of a sample population can be estimated from a small number of observations or data points.

Leading indicators—Economic and financial measurement data points that describe economic or financial trends that reflect economic changes to come in the future, such as bond yields and the stock market.

Least (or lesser) developed countries (LDCs)—Countries that have an inability to service their foreign debt; usually countries with a small per capita gross domesic product (GDP) and a less developed economy, infrastructure, and industrial base.

Legal tender—A currency that is recognized by law as legal and must be accepted in payment of debts.

Legal Tender Act—Enacted in 1862, the act permitted the use of paper money, took the government off the gold standard, and authorized the printing of more than $150 million in paper money, known as "greenbacks," without gold or silver backing. Such a rapid expansion of the currency created massive inflation.

Lender of last resort—The role of a central bank or financial institution that is willing and able to lend to a bank with temporary liquidity problems in order to keep the position from spreading to a general loss of confidence in other banks or financial institutions.

Liabilities—All obligations or amounts owed, including funds borrowed and formalized with a written contract; also known as debt.

Liability insurance—Insurance that protects the policyholder from a variety of personal and business risks.

Liability risk—When someone's actions result in a loss to another's property; can arise under statute law, common law, and the law of contract.

Libertarianism—A political philosophy that emphasizes freedom, voluntary association, and liberty of the individual, which includes small government.

Liberty of contracts—The freedom of individuals, organizations, and corporations to enter into formal legal contracts without government interference.

Life cycle—Stages of life, for person or product, from birth to death.

Life insurance—A product with various forms to protect family members from the loss of income due to the death of the insured person, who is usually the family's primary earner.

Limited liability company (LLC)—A hybrid legal business structure whose members have a limited liability as a corporation but receive the tax advantages of a partnership.

Limited liability partnership (LLP)—A business with partners whose personal liability is limited to their personal investment in the business.

Liquidity—Individual's or corporations' access to assets that can be quickly converted into cash.

Liquidity crisis—A financial crisis of a business or an economy based on a severely limited or negative cash flow.

Living wage—An income level essential for a wage earner to meet the basic needs of housing, clothing, and food; also known as a subsistence wage.

Living will—Advance health care directive addressing end-of-life medical treatment wishes.

Lobbyists—Individuals involved in the act of lobbying to promote and influence policy, laws, and regulations to benefit their constituencies.

Lockner Era—Named for the *Lockner v. New York Supreme Court* case, a time in American history when the Supreme Court struck down several laws interfering with personal property rights and individual economic liberties.

London School of Economics (LSE)—A public research university in London, England; founded by Sidney Webb, Beatrice Webb, and George Bernard Shaw in 1895 to conduct research and teaching in the social sciences, mathematics, and statistics.

Long-run equilibrium—A situation in which aggregate demand and aggregate supply are equal during a time period when all resources are variable.

Long-Term Disability—Insurance covering wages lost due to injuries and treatments, lasting for an extended period of time.

Lorenz curve—A graphical illustration of a nation's cumulative wealth distribution compared to a diagonal line representing perfect distribution.

Loss aversion—When investors don't like to lose money: people's tendency to prefer avoiding losses to acquiring equivalent gains.

Love Canal—A neighborhood in Niagara Falls, New York, that gained international fame when it was disclosed that the site was a formal major toxic waste site.

Maastricht Treaty—approved in 1991 by the European Council to discuss the implementation of a single currency and the three-stage plan outlined by the Delors Report. The approval of the treaty signified the start of transitioning to the euro. Also known as the Treaty on European Union (TEU).

Macroeconomics—The study of a nation's economy as a whole, measuring changes in unemployment, money supply, national income, and general price level.

Madison, James—Fourth president of the United States, "Father of the Constitution," and author of the Bill of Rights.

Magnuson-Stevens Fishery Conservation and Management Act—Individually transferable quota program that set the total catch based on biological assessment and divided the catch between resource users into shares that could be traded. Individually transferable quotas were used in only a handful of other U.S. fisheries but appeared to be successful in managing.

Mahatma Gandhi National Rural Employment Guarantee Act (MGNREGA)—Indian labor law enacted in 2005 and launched in 2006 to provide jobs to semi- and unskilled adults in rural areas of the country for at least 100 days each year.

Majority rule—Process of electing an alternative by receiving one vote more than half the population voting.

Malthus theory—The theory named after Thomas Malthus that predicted a return to subsistence living when food production cannot keep pace with population growth.

Managed float—Process for a central bank to manage its domestic currency exchange rate.

Management science—The interdisciplinary study of human organizations, strongly associated to economics.

Mandates—In law, a formal notice of a decision being made by an appeals court.

Mao Zedong—Powerful Chinese leader who initiated China's Great Leap Forward in the 1950s to modernize China's economy; also known as Mao Tse-Tung.

***Marbury v. Madison* (1803)—**A landmark Supreme Court decision that laid the foundation for judicial review under Article III of the U.S. Constitution.

Marconi, Guglielmo—Italian inventor and electrical engineer; his experimentation with wireless electricity in 1895 led to the discovery of the radio.

Margin—Several different meanings and applications from business profit to economics; adding one more unit.

Marginal benefit—The increase in total benefit when output increases by one unit. It can be calculated by dividing the change in total benefit by the change in quantity.

Marginal cost—The increase in total cost when output increases by one unit. It can be calculated by dividing the change in total cost by the change in quantity.

Marginal cost of production—Changes in total production costs from the addition of one more unit of labor, capital, or land to the production process.

Marginal cost pricing—Setting a product's price equal to the additional cost added to the production of one more unit.

Marginalism—Studying the economic impact on outputs by changing one input unit at a time.

Marginal physical product—The increased output (goods, services) created due to the addition of one additional input (land, labor, capital); also known as marginal product.

Marginal propensity to consume (MPC)—Ratios of consuming of the additional dollar, resulting in MPC + MPS = 1.

Marginal propensity to save (MPS)—Ratios of saving of the additional dollar, resulting in MPC + MPS = 1.

Marginal rate of substitution—The rate at which a consumer is willing and able to give up one good or service for a complementary good or service without forfeiting satisfaction (utility).

Marginal revenue product—The additional revenue from the additional of one additional input.

Marginal tax rate—The change in tax payment divided by the change in income; percentage of additional dollars to be paid in taxes.

Marginal utility—The change in utility (satisfaction) of an activity obtained by adding one more unit to the total consumed.

Mark-to-market accounting—Uses the fair value of the current market price of an asset or a liability for balance sheet valuation; also known as fair value accounting.

Market—The interaction of a buyer (consumer, household) and a seller (producer, business) exchanging goods or services in a variety of different settings.

Market distortions—Third-party (usually government) involvement to alter a market decision, such as a price ceiling or price floor.

Market economy—An economy where the key economic questions (what to produce, how to produce, for whom to produce) are addressed, answered, and implemented in the marketplace in the transactions between buyers and sellers.

Market failure—An economic situation or transaction in which too few or too many resources are going to a specific economic activity.

Market price—The price offered in the marketplace; also known as the economic price.

Market structure—Structure of a competitive industry or market, based on the number of firms, product differentiation, and barriers to entry; market structures include perfect competition, monopolistic competition, oligopoly, and monopoly.

Marshall, Alfred—Economist who first introduced the concept of efficiency wages in his *Principles of Economics* (published in 1890).

Marshall Plan—A massive U.S. and Canadian aid package designed to rebuild Europe after World War II.

Marxism—A worldview for social, political, and economic change based on the division between social classes and influenced by the writings of Karl Marx.

Mass Layoff Survey—A Bureau of Labor Statistics (BLS) monthly survey of wage earners who have been laid off by corporations for which more than 50 initial claims for unemployment insurance have been submitted during any five-week period.

Mathematical economics—The application of mathematical methods to study, analyze, and represent economic theories through such empirical approaches as statistics, econometrics, calculus, and differential equations.

Medicaid—Health insurance program for the poor, jointly funded by the federal and state governments.

Medicare—The federal government health insurance program for citizens aged 65 and older as well as the disabled.

Medium of exchange—A function of money in an economy to make transactions efficient and to avoid barter.

Mercantilism—The economic system of 16th-century Europe that stressed the importance of exports, and not imports, for accumulating trade surpluses to boost a nation's revenues; the modern mercantilism approach is to promote exports but stay closed to imports.

Microcredit loans—Small loans ($50 to $100) made to small businesses called microenterprises in developing countries; also known as microloans.

Microeconomics—The study of decision-making by individuals, firms, and organizations.

Microenterprises—Small businesses with 10 or fewer employees.

Microfinance—A term to describe financing services provided to low-income entrepreneurs who cannot access regular financial services.

Millennium Development Goals (MDGs)—Goals established by the United Nations in 2000, agreed to by all UN members and intended to be achieved by 2015; the eight goals are to eradicate extreme hunger and poverty; achieve universal primary education; promote gender equality and empower women; reduce child mortality; improve maternal health; combat HIV/AIDS, malaria, and other diseases; ensure environmental sustainability; and develop a global partnership for development.

Minimum efficient scale—A scale to show a business where it achieves economies of scale and efficient operation.

Minimum wage—A legislated price floor set by a government to determine the lowest possible hourly wage rate that can be legally paid to workers.

Mixed economy—An economy in which the key economic questions (what to produce, how to produce, for whom to produce) are addressed, answered, and implemented through a combination of transactions between buyers and sellers and a central authority (government).

Modeling—Economic real world representations to explain and/or predict economic changes and conditions.

Molasses Act of 1733—An act of the Parliament of Great Britain that required merchants to submit customs forms; the law actually cut the tax rate on molasses in half for better compliance but also required stricter enforcement.

Monetarism—An ideology of economic thought most prominently held by Milton Friedman that views the money supply as the key variable in measuring a nation's economic output and measure of price level.

Monetary economics—A branch of economics that studies and analyzes the functions of money as a medium of exchange, store of value, and unit of account; studies the roles of central banks and the money in an economic system.

Monetary policy—Macroeconomic policies related to interest rates and money supply; usually determined by the nation's central bank.

Monetary unions—A currency trade bloc where a group of countries uses a common currency.

Money—The currency of a nation's economy used as a medium of exchange, a store of value, and a unit of account.

Money market account—A type of savings account that promises higher interest payments in exchange for a larger deposit; also known as a money market demand or deposit account (MMDA).

Money multiplier—Result of the Federal Reserve's fractional reserve banking system that reflects the mathematical growth of the money supply based on the Fed's reserve requirement (1/rr).

Money supply—The quantity of money circulating in an economy, measured by the Federal Reserve through several different measures (the base measures are M1 and M2).

Monopolistic competition—A market with fairly easy entry in which a large number of firms produce comparable but not the same products.

Monopoly—A one-firm industry that can determine the market price of a good.

Moody's Investors Service—One of the premier rating agencies; rates all types of debt instruments, including short-term government bonds, commercial paper, and bank deposits.

Moral hazard—The prospect of riskier behavior when borrowers know they may not have to be responsible for a loan; behavior that generates significant social costs.

Moral philosophy—The defining and defending of conduct that is considered right or wrong; also known as ethics.

Morgan, John Pierpont (J. P.)—Powerful early 20th-century banker and financier involved in many large mergers; also a key player in the founding of United States Steel.

Morse, Samuel F. B.—American inventor who invented the telegraph (1838) and soon thereafter a communications code, called Morse code, to speed communications.

Mortgage—A debt instrument by which a loan is made to a borrower who pledges their interest in property (real estate) to the lender as collateral to secure the repayment of the loan. Once the loan has been repaid in full, the lender no longer has a claim on the property.

Mortgage-backed securities (MBS)—Investments based on packaged mortgages of various risks offered to investors to receive rates of returns similar to bonds; can include collateralized mortgage obligations (CMOs) and collateralized debt obligations (CDOs).

Mortgage REITs—These differ from equity REITs as the investment is in real estate mortgages and real estate debt, both residential (housing-related) and commercial (non-residential property types).

Most favored nation (MFN)—Requires that trade concessions granted to one country automatically apply to other GATT/WTO members.

Muckraking—A term coined by Theodore Roosevelt in 1906, comparing journalists who expose corruption or scandal in business or politicians to John Bunyan's character in *Pilgrim's Progress*, whereby the man with the muck rake foregoes paradise to focus on the bad things.

Multilateral institutions—Organizations, formed by several nations, that act together to achieve a common goal.

Multilateral trade negotiations—Called trade rounds; negotiations by several nations simultaneously to promote fair and free trade among all the nations involved.

Multinational enterprise (MNE)—A company that operates globally.

Multiplier effect—Ratio reflecting results of fiscal policy changes of taxes or government spending on the aggregate economy; 1/(1 – MPC) (Marginal Propensity to Consume) or 1/MPS (Marginal Propensity to Save).

Mungbeans—A lesser-known commodity, also available in the futures market.

Municipal bond interest payments—Generally, these are tax-exempt and provide a tax advantage to investors; depending on the certainty around revenues associated with a municipal bond, most municipal bonds have lower interest rates than corporate bonds.

Municipal bonds—Often, an income tax–free investment instrument offered by municipalities such as states, cities, schools, or other public agencies; can be offered either for general obligation or for specific purposes such as building roads, bridges, or schools.

Muth, John—An Indiana University economist who is credited with the theory of rational expectations, which he introduced in the 1960s.

Mutual funds—Pooled investment vehicles used by investors to invest in a variety of asset classes. Instead of an individual investing in a specific stock or a bond, mutual funds collect a pool of capital from many investors and invest on behalf of these investors. Investors are charged a management fee for this service, referred to as the expense ratio.

Mutual savings banks—Financial institutions that obtain funds primarily from long-term, fixed-rate assets and rely principally on time and savings deposits for their funding. (*See also* Savings banks.)

NANA—A for-profit corporation owned by more than 14,000 Inupiat, indigenous people who inhabit northwest Alaska. NANA was created as a result of the Alaska Native Claims Settlement Act, which was signed into law in 1971. The Northwest Alaska Native Association, a nonprofit formed in 1966 to advocate for Native American issues, was the precursor to NANA. *Note*: NANA is not an acronym for Northwest Alaska Native Association and should not be referred to as such.

NASDAQ Stock Market—National Association of Securities Dealers Automatic Quotation System; the first electronic stock market; the largest U.S. stock exchange in volume of trading, specializing in technology and information companies.

Nash equilibrium—A game-theory solution where each player has a chosen strategy and no player can gain by changing strategy, such that none of the players change their strategies and the resulting choices and payoffs are accepted; named for John Nash.

National Academy of Sciences—A U.S.-based private, nonprofit organization of the country's leading researchers; its members, who are elected based on their original research achievements, serve as independent, objective scientific advisers to the United States.

National Ambient Air Quality Standards (NAAQS)—Established in 1970 to protect public health in polluted areas.

National Bureau of Economic Research (NBER)—The largest American private nonprofit research organization, providing unbiased research in economics for policymakers, businesses, and the academic community.

National Compensation Survey (NCS)—A Bureau of Labor Statistics (BLS) survey that provides comprehensive measures of occupational earnings, compensation cost trends, benefit incidence, and detailed plan provisions; its data is available through the Employment Cost Index (ECI) and Employer Costs for Employee Compensation (ECEC).

National Credit Union Association (NCUA)—Agency of the federal government that charters and provides supervision over federal credit unions and provides savings insurance to both federal and some state chartered credit unions.

National Credit Union Share Insurance Fund—Government insurance fund insuring credit union deposits operated by the National Credit Union Association.

National debt—Includes public debt of a nation, such as the Treasury securities (Treasury bonds, notes, and bills) issued by the government.

National Environmental Policy Act (NEPA)—Law that requires federal agencies to include environmental values and environmental impact studies in their decision-making when considering governmental actions.

National income accounting—An estimated measure of an economy's national income and its components, including wages, profits, rents, and interest income; one approach to measuring an economy's aggregate performance.

National Industrial Recovery Act—Enacted in 1933 during the Great Depression, this act authorized President Franklin Roosevelt to regulate industry in an effort to stimulate the economy through establishment of several governmental public works programs.

National Labor Relations Board (NLRB)—An independent U.S. government agency, located in Washington, D.C., that oversees elections of labor union representatives and investigates charges of unfair labor practices.

National Prohibition Act in 1920—Act that legislated the implementation of the prohibition of alcohol as directed by the 18th Amendment of the U.S. Constitution. Also known as the Volstead Act.

National Recovery Administration (NRA)—Established by President Franklin D. Roosevelt in 1933, had sweeping powers to control wages and prices; intended to reduce "destructive competition" and to help workers by setting minimum wages and maximum weekly hours as well as minimum prices at which products could be sold; in 1935, unanimously declared unconstitutional by the U.S. Supreme Court.

National War Labor Board (NWLB)—Government agency created by President Woodrow Wilson in 1918 to handle labor disputes in the war industries during World War I; it was terminated in 1919 and reinstated in 1942 by President Franklin D. Roosevelt for essentially the same purpose and terminated in 1945.

Natural rate of unemployment—The idea that there is always some level of unemployment in an economy, even when levels are considered to be at full-employment.

Natural Resource Conservation Service (NRCS)—Federal agency that works with private landowners, providing technical assistance and special programs to conserve, improve, and maintain natural resources.

Natural resources—Those resources that originate from the environment, such as air or water; are extracted from the ground or water, such as oil; or are taken from natural habitats, such as fish.

Natural rights, natural law—Components of a political order based on a social contract (rather than on divine right or monarchic rule); foundational elements of government during the Age of Enlightenment.

Navigation Acts—A series of English laws that restricted foreign shipping trade between foreign countries and British colonies.

Negative externality—A third-party effect from an economic exchange where the external costs of the exchange are greater than the external benefits.

Negative-sum game (exchange)—A game in which players as a group lose during the process of the game and are worse off at the game's conclusion than when the game began.

Neoclassical—A school of economic thought in microeconomics that posits that individuals and firms make decisions so as to maximize their utility or profits; emphasizes that people act independently based on varying amounts of information and make decisions based on rational calculation.

Neo-Keynesians—Economists such as Paul Samuelson who combined neoclassical economic models with new interpretations of Keynes's writings.

Neo-Ricardian—A modern interpretation, offered by Piero Sraffa, of David Ricardo's case against marginal theory of value.

Net profit margin—Measures profitability after subtracting taxes and interest expense resulting from debt incurred by a corporation, as well as the exclusions from gross and operating profit margins.

Net worth—The net worth of a business or an individual is determined by adding the total of the things the business owns (assets) and then subtracting from this amount the total of what the business owes (liabilities).

Net worth statement—A document that shows the financial worth of a business or an individual by showing assets minus liabilities.

Neuroeconomics—Interdisciplinary field of study that brings together neuroscience, economics, and psychology.

New Currency Act of 1871—In Japan, established a Japanese monetary system with a decimal account similar to the European one, hoping to stabilize Japan's economy.

New Deal—Economic programs in the United States during the 1930s, designed to combat the Great Depression.

New York Stock Exchange (NYSE)—The largest and oldest stock exchange market in the United States.

Nobel laureate—Title bestowed on a recipient of the Nobel Prize. (*See list in* "Nobel Laureates in Economics.")

Nobel Prize in Economics—Considered by many to be the most prestigious award for outstanding contributions to the field of economics; endowed in 1968 and first awarded in 1969; officially, the Sveriges Riksbank Prize in Economic Sciences in Memory of Alfred Nobel.

Non-Accelerating Inflation Rate of Unemployment (NAIRU)—A very low unemployment rate, so that the number of employed and their purchasing power places a demand that exceeds the current production of goods and services.

Non-exclusion principle—Principle that an individual cannot be excluded from receiving the benefits of such goods or services as national defense, public education, or local police or fire protection.

Non-performance risk—When financial losses occur as a result of one party agreeing to perform a certain service for another and then failing to perform this service completely.

Non-systematic or firm-specific risk—Measured by the company's volatility, which is commonly calculated as the standard deviation of historical returns.

Normal goods—Economic goods whose demand increases as consumer income increases.

Normative economics—Value-based economic statements; keywords of a normative economics statement are "should" and "ought to."

North American Free Trade Agreement (NAFTA)—Created on January 1, 1994, between the United States, Canada, and Mexico and signed by President Bill Clinton, Mexican President Carlos Salinas, and Canadian Prime Minister Jean Chretien. NAFTA created the largest free-trade area in the world, eliminating most tariffs on products traded among the three nations of 450 million people and producing $17 trillion worth of goods and services.

Office of Financial Research (OFR)—Established as part of the Dodd-Frank Wall Street Reform and Consumer Protection Act in 2010 to help promote financial stability through research, data-gathering, and risk-analysis of financial markets.

Office of Management and Budget (OMB)—The largest office within the executive office of the president of the United States; assists the president in the preparation, oversight, and administration of the federal budget.

Office of the Comptroller of the Currency—Created with the National Currency Act of 1863 as an independent government bureau to ensure safe operations of banks and federal savings banks.

Offshoring—The actions of individuals and businesses to conduct part of their transactions outside their domestic borders.

Oil Producing Exporting Countries (OPEC)—An organization of oil-producing nations with the goal of influencing and creating a stable global market price of oil; members include Algeria, Angola, Ecuador, Gabon, Iran, Iraq, Kuwait, Indonesia, Libya, Nigeria, Qatar, Saudi Arabia, the United Arab Emirates, and Venezuela; OPEC's headquarters are in Vienna, Austria.

Okun's law—The relationship between the unemployment rate and economic growth as measured by gross domestic product (GDP); a 1-percent decrease in the unemployment rate translates into a 3-percent increase in GDP; named for economist Arthur Okun.

Oligopoly—A market structure with few sellers in which each seller is aware that the other sellers will respond to any changes in prices, quantities, or qualities of products on the market.

Open debt—The least common among the types of debt; includes debts that must be paid in full every month.

Open economy—An economy that is free of such protectionist barriers as tariffs, quotas, and other, similar regulations.

Operating profit margin—Measures profitability after all overhead costs (such as rent and utilities), administrative costs (such as salaries), and selling expenses (such as vehicles and advertising) have been excluded.

Opportunity cost—The next best alternative cost (trade-off) of a decision; every decision has a cost, because every decision involves forgoing an alternative good, service, or activity.

Option contract—An agreement between a buyer and a seller that gives the buyer of the option the right to buy or sell a particular asset at a later date at an agreed upon price; these contracts fall into two categories: puts and calls.

Orderly Liquidation Authority—As part of the Dodd-Frank Act, a provision that oversees the sale of the assets of a business, with the proceeds being used to pay creditors and any leftovers distributed to shareholders.

Organisation of Economic Co-operation and Development (OECD)—Established in 1961, an international organization of developed nations committed to free trade and democracy, with the goal of stimulating global trade and global economic growth; the OECD's headquarters are in Paris, France.

Organizational behavior—Field of study on the behavior of humans within organizations, and the structures of organizations.

Otto, Nikolaus—Inventor of the gasoline-powered internal combustion engine in 1876.

Outputs—Goods and services.

Outsourcing—A firm's employing of resources, either domestic or foreign, outside the firm.

Outstanding debts—Debts that have not been paid off in full; examples are mortgages, car loans, student loans, and credit cards.

Over the counter (OTC)—Stock-trading that is conducted outside such formal stock exchanges as the New York Stock Exchange (NYSE) and the American Stock Exchange (AMEX).

Ownership—The process of possessing the rights to defined property, including the ability to defend and sell a property item as one wishes.

Panic of 1873—An international financial crisis; in some countries it lasted as long as a decade.

Paper notes—Paper money issued by the U.S. government without having intrinsic value or without being backed by gold or silver; also known as greenbacks. (*See also* Greenbacks.)

Paradox of thrift—First popularized by John Maynard Keynes, the notion that during times of economic slowdown and contraction people increase their savings, reducing economic activity further, when to help economic recovery they should be spending.

Paradox of value—An expression that stresses the dichotomy between "use" value and "exchange" value for a good or service.

Pareto optimality—A concept which holds that efficient economic allocation is achieved when no one can be made better off without someone else becoming worse off; named after the Italian engineer and economist Vilfredo Pareto.

Pareto principle—When 80 percent of the results are created by 20 percent of the sources; also known as the 80–20 rule.

Partial equilibrium analysis—Equilibrium analysis of just a single market within an economy.

Partnership—A non-incorporated business structure in which there are two or more owners and business profits are treated as ordinary income.

Patent—An exclusive right, granted by a government, that provides an inventor with private property protection for an invention for a specified period of time.

Patent and Trademark Office—A federal office responsible for granting patents and trademarks and for protecting the holders of patents and trademarks against infringement.

Pay discrimination—Differences in per-unit pay for time worked that cannot be explained by traditional variables such as education and work experience.

Payment history—A credit report showing whether payments have been made on time or 30 days late, 60 days late, or 90 days or more late.

Peer-to-peer (P2P)—A lending and investing platform in the United States where individuals can both borrow and lend money without using the traditional U.S. financial system; also known as social lending.

Pegged currencies—When the value of one country's currency is fixed to another country's currency in an effort to stabilize the value of the second currency in global markets.

Pegged exchange rate—The exchange rate when a domestic currency's value is set relative to a foreign currency. (*See also* Fixed exchange rate.)

Pension—A contract between an employer and an employee for a fixed sum of income to be paid to the employee after a defined term of service (usually in years), in a one-time payment upon the employee's retirement or regularly in set amounts during the employee's retirement.

Pension Benefit Guaranty Corporation (PBGC)—An independent federal insurance agency that protects employee benefits in most traditional defined benefit plans.

Pension plan—A type of retirement plan, usually tax-exempt, under which an employer makes contributions to a pool of funds that is invested on behalf of an employee and is set aside for an employee's future benefit; two main types of pension plans are (1) defined benefit plans and (2) defined contribution plans.

Per capita income—Measure of a nation's standard of living, based on a nation's total income divided by its population.

Perestroika—The economic restructuring of the Soviet economic system during the late 1980s, initiated by Soviet leader Mikhail Gorbachev.

Perfect competition—A market structure with many buyers and sellers, in which individual decisions do not affect market price.

Perfectly elastic—Price elasticity of demand measures how demand changes in response to changes in price for a particular good; demand is perfectly elastic when the change in demand by consumers is equal in percentage to the change in price.

Perfectly inelastic—Price elasticity of demand measures how demand changes in response to changes in price for a particular good; demand is perfectly inelastic if demand by consumers does not change when the price changes,

Permanent insurance—Life insurance policies that remain in effect for the life of the insured; popular forms are whole life and endowment policies.

Personal Consumption Expenditures (PCE)—A report of the Bureau of Economic Analysis (BEA), which reports changes in personal expenditures of households.

Peso—Official currency of Mexico; symbol MXN$.

Philanthropy—Promoting the welfare of others, often by donating money to nonprofit organizations, charities, and benevolent organizations.

Phillips curve—A curve that shows the trade-off or inverse relationship between unemployment and inflation; named for A. W. H. Phillips.

Physiocrats—A group of economists originating in France during the late 18th century whose economic theory was based on productive work as a source of national wealth.

Pigou effect—A term that defines the relationships among wealth, consumption, output, and employment; as wealth increases it leads to increases in consumption, which in turn stimulates output and employment; named for A. C. Pigou.

Planned economy—An economy where the three main questions (what to produce, how to produce, and for whom to produce) are addressed, answered, and implemented by a central authority (government); also known as a command economy.

Political economy—Early terminology from moral philosophy, used to describe the study of buying, selling, and producing, along with the related governmental laws and societal customs; used to describe the relationship between government and economy in a national context.

Pollution—A negative externality; contaminating the air, water, or ground environment

Ponzi scheme—An investment fraud scheme of promising and paying high returns on funds received from investors not by actually investing the funds but by taking them from funds received from newer investors; named after Charles Ponzi.

Portfolio management—Defining or identifying investment objectives, identifying resources and limitations, constructing an investment portfolio, and monitoring and revising the portfolio.

Portfolio theory—A mathematical approach to investing in which diversification (coordinated selection of diverse assets) plays a major role; the theory has been challenged in recent years by behavioral economists.

Positive economics—Analysis limited to factual statements or scientific predictions; economic analysis that aims to describe "what is" rather than "what ought to be."

Positive externality—A third-party effect from an economic exchange where the external benefits of the exchange are greater than the external costs.

Positive-sum game (exchange)—A game in which players as a group are better off at the end of the game than when the game began.

Post-Keynesian—A school of economic thought based on the writings of John Maynard Keynes, specifically his seminal work *The General Theory of Employment, Interest and Money*, in an effort to reestablish Keynesianism within economic theory; post-Keynesians include Joan Robinson, Michal Kalecki, and Nicholas Kaldor.

Pound Sterling—Official currency of the United Kingdom; symbol £.

Poverty—Defined in absolute terms as the inability to satisfy basic needs through income, or described in relative terms as a measure of income inequality, where an individual's or family's income is below a predetermined income level (this level differs from one society or nation to another).

Power of attorney—An agreement that legally gives one individual decision-making powers for another individual or party.

Predatory pricing—An illegal act of lowering prices in an attempt to force the competition out of business through mergers, acquisitions, or liquidation.

Preferential trading arrangement (PTA)—An agreement for preferential trade conditions that reduce protectionist policies between countries.

Preferred provider organization (PPO)—A health care network of member doctors, specialists, and hospitals; offers more flexibility than an HMO.

Preferred stockholders—Stockholders who have seniority over common stockholders in receiving dividend payments without voting rights and are paid first in case of bankruptcy or liquidation.

Present value—Calculation that determines today's value of a future amount of funds, to be received at a certain date in the future.

Price ceiling—A market distortion implemented by a government entity when it considers the market price too high for a particular market, such as rents; implementation can lead to a market shortage.

Price controls—Controls imposed by a government, establishing either minimum or maximum prices to be charged for goods or services.

Price discrimination—Occurs when the pricing by businesses is differentiated based on the ability to identify a specific market segment, such as children or senior citizens.

Price fixing—An agreement between businesses to set a common price on their good or service.

Price floor—A market distortion implemented by a government entity when it considers the market price too low for a particular market, such as minimum wage or agricultural price supports; implementation can lead to a market surplus.

Price maker—A monopoly, monopolistic competition, or oligopoly where a firm has the power to influence the price it charges, because there are no substitutes for the good(s) it produces.

Price searcher—A firm that can set or influence the price of the product, good, or service that it sells by the amount of units sold, often because there is a single price market for these commodities.

Price theory—A theory in economics in which market price, determined by supply and demand, is the key signal of future economic actions.

Prices—Signals the relative allocation of the distribution of productive resources to goods and services.

***Principles of Political Economy and Taxation*—**The major work on economics of the early 19th century authored by David Ricardo in 1817.

Prior restraint—Censorship imposed, usually by a government, on expression before the expression actually takes place, for example, on a speech before the speech can be delivered to an audience.

Prisoner's dilemma—Game of strategy in which both parties choose to protect themselves at the expense of the other, which then actually benefits neither; analogous to the situtation in which two prisoners, interrogated separately, have a choice between confessing and not confessing to a crime.

Private costs—Costs of production that are borne by a private individual or business.

Private goods—Goods that produced by privately owned businesses or by private individuals.

Private property—The ownership of an economy's productive resources (land, labor, capital) by the private sector of an economy.

Private property rights—Exclusive rights of ownership that allow the use, transfer, and exchange of property.

Probate—In the first part of probate, the will is submitted to the probate court in order to be proved valid. In the second part of the process, an estate administrator is appointed to collect and distribute the assets to the designated heirs.

Producer Price Index (PPI)—An index produced by the Bureau of Labor Statistics (BLS) that measures the average change of prices of output being charged by domestic producers during a specified period of time.

Producers—The buyers of the productive resources of land, labor, and capital (inputs) of an economy, who then use those resources to create and sell the goods and services produced (outputs).

Producer surplus—The difference between what producers would be willing and able to produce and the amount they receive from their market interaction with buyers.

Product differentiation—The process through which a firm differentiates its product from that of its competitors; variables for differentiation include quality, price, or design for a specified target market.

Production possibility curve (frontier)—A curve representing all possible combinations of maximum outputs being produced using a full complement of inputs, assuming a specific point in time, a fixed amount of productive resources, and fixed technology; also reflects the trade-offs a nation must make in order to change or alter a given allocation of resources for a specified output.

Productive capital—Financial assets that earn interest.

Productive resources—The land, labor, and capital of an economy used by producers to create goods and services.

Productivity—Measuring the economic growth of an economy through the relationships of inputs and outputs: increased outputs using the same inputs, or same outputs using fewer inputs.

Productivity report—A quarterly report of the Bureau of Labor Statistics (BLS) that measures the level of output per unit of labor.

Product standardization—Establishing consistent features for a good or service.

Profit—Difference between the cost of business and the total revenues received. (*See also* Accounting profit; Economic profit.)

Profit maximization—A microeconomic condition where a firm determines maximum price and production levels by measuring the relationship between the firm's marginal cost and marginal revenues.

Profit-sharing plan—A defined contribution plan under which the plan or the employer may determine, annually, how much will be contributed to the plan (out of profits or otherwise); also known as a stock bonus plan.

Progressive Era—Time period from the 1890s to the 1920s that saw some of the most aggressive reforms on trusts, the breaking-up of monopolies, laws passed to protect consumers, and the creation of the Federal Reserve System.

Prohibition Bureau—Inside the U.S. Treasury Department, a special agency that enforced the 18th Amendment on the prohibition of alcohol.

Prohibition Era—Period from 1920 to 1933 when the 18th Amendment to the U.S. Constitution made the sale or transport of alcoholic beverages illegal; repealed by the 21st Amendment in 1933.

Propensity to consume—The rate at which a consumer spends on goods and services.

Propensity to save—The rate at which a consumer saves.

Property rights—The rights of property owners to legally define their property, to protect their property, and to sell or use their property as they see fit.

Property risk—Risk that typically occurs when physical assets are stolen, damaged, or destroyed. Two types of property risks are direct property losses and indirect property losses.

Prospect theory—Theory that explains how an investor is influenced by how a scenario is framed; suggests that people are risk-averse in the domain of gains but are risk-seeking in the domain of losses; also called loss-aversion theory.

Protectionism—A nation's ability to limit imports (quotas) or tax imports in order to keep domestic industries competitive (tariffs).

***Protestant Ethic and the Spirit of Capitalism, The*—**Max Weber's classic 1904 work, in which he argued that the rise of the Protestant work ethic led to economic development of the Protestant regions of Europe starting in the 16th century.

Public choice theory—The use of economic analysis and economic tools to study the behavior of public officials and the behavior of citizens as voters; public choice theory often uses such tools as game theory or decision theory.

Public debit—All debt of governments and public institutions (public schools et al.) held by individuals, corporations, state and local governments, Federal Reserve Banks, foreign governments, and other entities outside of a government. Classified into two categories: debt held by the public and intragovernmental holdings. Public debt is created by the act of borrowing. In the United States, the federal government auctions Treasury securities such as bonds and treasury bills to foreign and domestic investors to raise money.

Public finance—Revenue generated through taxes, fees, fines, and levies, to be used by public institutions for the purpose of providing public goods.

Public goods—Goods and services offered by a public institution that are non-excludable (individuals cannot be prohibited from receiving the benefits of these goods); consumption of public goods and services is shared without diminishing the benefits to the users.

Public policy—A government law or regulation imposed by a governmental unit on its constituency.

Public utility pricing—A pricing scheme in which a government subsidy is necessary in order to maintain production because the price is equal to marginal costs and is below the average cost.

Purchasing power parity—When exchange rates are converted, an adjustment made to account for the differences in the true cost of living between countries.

Pure Food and Drug Act 1906—Beginning of major consumer protection initiatives by the federal government; led to the establishment of the Food and Drug Administration.

Pure risk—A risk with a certain negative outcome and no possible positive outcome.

Quantitative easing—A monetary policy of a central bank by which the bank purchases private market securities (primarily mortgages) to increase the money supply and lower interest rates.

Quantitative economics—The use of mathematical tools to address and analyze economic problems; includes calculus, differential equations, and econometrics; also known as mathematical economics.

Quantity demanded—A specific price along a demand curve at which a buyer is willing and able to purchase a good or service.

Quantity supplied—A specific price along a supply curve at which a seller is willing and able to produce a good or service.

Quantity Theory of Money—Identifies the relationship between an economy's money supply (M), price level (P), velocity of money (V), and value of its goods and services (Q) as $PQ = MV$; the number of monetary units (M) times the number of times each unit is spent (V) equals the quantity of goods and services sold (Q) times the prices paid for the goods and services (P); also known as the Equation of Exchange.

Quasi-banking entities—PayPal and peer-to-peer or social lending are two banking-related services that fill a banking need with nontraditional quasi-banking entities. PayPal provides payment transfer services for electronic money transfers; used to pay merchants and individuals online, this nonbank entity also links an individual's credit card and bank accounts to offer a myriad of payment transfer options.

Quid pro quo—A Latin phrase referring to doing something for someone or giving something to someone in exchange for receiving something or having something done in return.

Quota—A restriction that one nation imposes on another country on the quantity of an imported good.

Railway Act of 1864—Passed by Congress in 1864, the second Pacific Railway Act doubled the size of the land grants to railroad companies for the construction of the Transcontinental Railroad and allowed the railroads to sell their own bonds. After the railroad was completed, investigation revealed illegal profiteering and a system of corruption among speculators facilitated by the act.

Random choices—Along with erratic and whimsical behaviors, defined by Gary Becker as irrational.

Random walk—Investing theory that selecting stocks and equities without an investment plan can generate a rate of return as good as the selections made in a formal plan.

Rational expectations—A theory based on future policy changes and effects on economic variables founded on past experiences.

Rationality assumption (of rationality)—In economics, assumption that rational individuals make decisions to make them better off.

Rationing—Distributing scarce resources (land, labor, capital) or economic goods and services in a predetermined plan, as opposed to the market allocating the resources or goods.

Reaganomics—Term used to describe the economic policies of President Ronald Reagan, including low marginal tax rates, minimal government regulations, and reduced government spending.

Real Estate Investment Trust (REIT)—Financial security that combines the ownership of many real estate properties (shopping centers, office buildings, or even just the mortgages) and then sells off individual slices of ownership, or shares to individuals.

Rebalancing decision—Action that returns asset class percentages to their original proportions.

Recency effect—Causes individuals to assign a heavier weight to recent events than to events further in the past; also known as forecasting error or memory bias.

Recession—The declining economic growth portion of the business cycle, measured by two consecutive quarters of negative economic growth.

Reciprocal Trade Agreements Act (1934)—Law signed by President Franklin D. Roosevelt that promoted the United States entering into tariff agreements with other nations.

Recycling—Reusing materials such as paper, glass, plastic, and rubber from previously produced products to produce newer products.

Reducing Emissions from Deforestation and Forest Degradation (REDD)—An effort by the United Nations to create a financial value for the carbon stored in forests, offering incentives for developing countries to reduce emissions from forested lands and invest in low-carbon paths to sustainable development.

Regional Clean Air Incentives Market (RECLAIM)—California emissions program to reduce urban air pollution; adopted in 1993, a federally approved cap-and-trade program.

Regional trade agreements—An agreement between groups of nations for the express purpose of granting special trade benefits and access to each domestic market; for example, NAFTA.

Regulation Q—Part of the Banking Act of 1933 (Glass-Steagall Act), regulating and prohibiting banks from paying interest on checking account deposits.

Reichsmark—German currency used from 1924 to 1948, replaced after World War II with the Deutsche Mark; symbol RM.

Renminbi—Official currency of China; symbol ¥.

Renter's insurance—Insurance for renters that provides the same coverage for household contents as homeowner's insurance; also known as tenant's insurance.

Rent-seeking—An action of lobbyists and special interest groups to increase the value of clients' or members' actions without increasing productivity; that is, receiving additional compensation without performing additional labor.

Representative heuristics—Explains how individuals can extrapolate too much information from small samples of data; individuals may conclude that if the price of a stock, house, or tulip has recently increased, it will continue to increase.

Required reserve—In a fractional reserve banking system, the fraction of daily deposits that a bank is required by law to keep on its books at the conclusion of each working day.

Reserve ratio—The percent of deposits a bank must keep as cash reserves as determined by the Federal Reserve policy.

Resolution Trust Corporation (RTC)—During the 1980s savings and loan crisis, a U.S. government–owned management company whose purpose was to liquidate assets of financial institutions, specifically savings and loan associations, that had been declared insolvent by the Office of Thrift Supervision.

Resource Conservation and Recovery Act (RCRA)—A 1976 law enacted with the goal of conserving natural resources and energy through recycling.

Restraining order—In law, a court order to a person or entity to either stop an action or prevent a party to pursue an act. A legal order issued against an individual to restrict or prohibit access or proximity to another specified individual.

Retained earnings—The part of earnings that a corporation keeps and does not pay out to shareholders.

Retirement account—A type of investment account allowing workers to invest today's dollars tax-deferred for use later in retirement; common types of retirement accounts include 401(k), 403(b), traditional IRA, and Roth IRA.

Return—A profit or rent earned by the owner of a factor of production (land, labor, capital).

Revenue—The amount received by a business through the sale of a good or service; a government total of taxes, fees, and fines received.

Revenue Act of 1921—Law that changed the tax treatment of capital gains and losses by dividing assets into short-term and long-term.

Revenue Act of 1942—Law that changed the treatment of capital losses and consolidated the tax treatment of short-term and long-term losses. A five-year carryforward was created so that net capital losses could be used to offset capital gains.

Revenue Act of 1964—Law that repealed the five-year loss carryover for capital losses and replaced it with an unlimited loss carryover.

Reversal test—Test based on imagining a change in the opposite direction as the deviation from the status quo.

Revocable trust—Trust that allows the trustor to retain control of all the assets in the trust and to revoke or change the terms of the trust at any time.

Revolving credit—When there is not a final end date for paying of the debt, and the credit holder is allowed to continually use the credit, pay it off, and then use it again.

Revolving debt—Gives the borrower, either a corporation or an individual, access to credit if it is needed in the future; also known as revolving credit or a line of credit.

Riegle-Neal Interstate Banking and Branching Efficiency Act of 1994—Federal law allowing banks to open branch banks across state lines and purchase banks in other states, removing restrictions that had been in place since 1927.

Right to Work laws—Statutes ensuring that a worker cannot be ordered or forced to join a union as a condition of employment and cannot be forced to pay union dues.

Risk—The potential that an economic action (or lack of action) will leave a person worse off than before the action was taken.

Risk premium—The excess return an investor gets in order to compensate for the excess risk born by investing in any particular security other than the risk-free Treasury bill.

Rival consumption—A principle where the consumption of a good by one prevents the consumption of the good by another. Only one person can enjoy or benefit from the good, for example, food. Contrast with goods such as public parks, roads, golf courses (public or private), and theaters that have no consumption rivalry and several people can enjoy the benefits simultaneously without impeding others to enjoy the same benefit.

***Road to Serfdom, The*—**Work by Friedrich von Hayek (published in 1944) that expounds on the dangers of central planning as an economic system, leading to further state control and the loss of individual freedoms.

Rockefeller, John D. (1839–1937)—Founder of the Standard Oil Company; became one of the world's wealthiest people and most influential philanthropists.

Roosevelt, Theodore—The 26th president of the United States; known as the "trust-buster" for his efforts to break up the Standard Oil Trust.

Roth IRA—A retirement account distinct from the other types of retirement account in that the contributions are made after income taxes are paid, so that no tax is due when the Roth IRA contributions are withdrawn.

Royal Economic Society in London (U.K.)—One of the oldest professional associations promoting the study of economics (established in 1902); it is the publisher of *The Economics Journal* and *The Econometrics Journal*.

Royal Swedish Academy of Sciences—Founded in 1739; since 1969, the organization that awards the Sveriges Riksbank Prize in Memory of Alfred Nobel (the Nobel Prize in Economics).

Rule of law—System of laws where all people, public and private, are equal under a set of transparent laws administered fairly and efficiently.

Sarbanes-Oxley Act (SOX)—Law designed to protect shareholders from fraudulent accounting practices and to upgrade corporate disclosures; passed by the U.S. Congress in 2002 and signed into law by President George W. Bush.

Savings—The amount of current income that an individual has set aside for use at a later time.

Savings account—A very safe type of financial account that offers a low interest rate; savings accounts are protected against loss up to $250,000 for each Social Security number; bank savings accounts are insured by the Federal Deposit Insurance Corporation (FDIC) and credit union accounts are insured by the National Credit Union Share Insurance Fund (NCUSIF).

Savings and loan associations (S&Ls)—Financial institutions that obtain funds primarily from long-term, fixed-rate assets, and rely principally on time and savings deposits for their funding. (*See also* Mutual savings banks.)

Savings and loan crisis (S&L crisis)—A major event in modern money management in the 1980s and early 1990s that tested the entire financial system in a way not seen since the Great Depression (1929–1939).

Savings bond—Most popular U.S. Treasury note, available in denominations up to $5,000; offered by the Treasury in several varieties: EE/E bonds, HH/H bonds, and I bonds.

Savings–investment relationship—An identity relationship signaling that an economy's investment is dependent on the nation's savings.

Savings vehicles—Saving accounts, checking accounts, and certificates of deposit (CDs).

Say's law—An economic rule stating that supply creates its own demand; named for Jean-Baptiste Say.

Scarcity—The basic economic problem of allocating limited resources (land, labor, capital) to satisfy the unlimited desires for goods and services.

Seasonal unemployment—The component of the unemployment rate that is determined by jobs that are performed only during specific seasons of the year and jobs that are weather-dependent.

Second National Bank of the United States—Second federally authorized national bank; its charter was allowed to expire in 1836; in the absence of a national direction in banking, the states began regulating banks themselves.

Secondary effects—Consequences of a decision that was not anticipated, considered, or expected prior to the decision being made.

Secured debt—A loan, such as a mortgage, that requires the borrower to give the lender collateral or real goods or property (security) if the borrower fails to repay the debt.

Securities—Stocks and bonds.

Securities Act of 1933—After the 1929 stock market crash, legislation enacted to require more truthful financial statements and to establish laws against fraud in the securities stock markets.

Securities and Exchange Commission (SEC)—Government agency established to protect investors and to enforce rules and laws of the securities markets.

Securities Industry and Financial Markets Association (SIFMA)—Professional industry trade organization representing broker-dealers, asset managers, and banks.

Seligman, Edwin R. A.—Columbia University professor of political science and economics; co-founder of the American Economics Association (AEA).

Sequestration—In law, the seizure of property to be distributed to creditors.

Service Mark—A trademark such as a company logo, name, or slogan for a service or a nonprofit.

Shadow economy—Refers to both legal and illegal economic activities that take place outside the official economy and are not declared for tax purposes. (*See also* Hidden economy; Underground economy.)

Shared consumption—The concept that more than one individual can enjoy the benefits of a good or service simultaneously without diminishing the benefits received by other users; a key criteria of a public good.

Shays' Rebellion—An 1787 uprising of Massachusetts farmers and ex-soldiers who were overwhelmed by debt and by strict new laws being imposed by a new state government, reacting much as colonists had a decade earlier; named after Daniel Shays, a Continental Army veteran.

Shock therapy—The use of aggressive and dramatic fiscal and monetary policies to turn a state-controlled economy into a free-market economy.

Short run—Economic time period when one input (land, labor, and capital) cannot be altered.

Short-selling—A strategy where an investor believes the price of a security will go down, so the investor borrows the security and sells it at its current price, anticipating being able to buy it back at a lower price and earn a profit.

Short-term disability—Policies that have a waiting period of between 0 (zero) and 14 days before the benefit becomes available to the claimant, with a maximum benefit period of two to five years.

Signaling—A strategy adopted by individuals who have private information upon which they take actions that are costly to themselves but which individuals with different characteristics don't have an incentive to follow.

***Silent Spring*—**Best-selling book written by Rachel Carson in 1962 that helped begin the environmental movement in the United States.

Single European Act—Revised the 1957 Treaties of Rome to increase the pace of European integration to create one market.

Single life annuity—Annuity in which payment continues until the annuitant's death.

Sin taxes—Term used to identify taxes levied by governmental entities on goods deemed to be unhealthy; for example, taxes on smoking products and alcohol.

Sixteenth Amendment—The amendment to the U.S. Constitution that gave the federal government the power to levy and collect taxes, including the income tax; ratified in 1913.

Small Business Health Options Program (SHOP)—Health care marketplace that offers plans designed for small businesses and their employees; businesses with fewer than 25 employees may also qualify for tax credits if they buy insurance through SHOP.

Smith, Adam—Considered the "Father of Classical Economics"; wrote *An Inquiry into the Nature and Causes of The Wealth of Nations* (1776) and *Theory of Moral Sentiments* (1759).

Smithsonian Agreement—Adjusted the fixed exchange rates established during the Bretton Woods Conference; devalued the U.S. dollar, raising the price of gold to $38 per ounce.

Social accounting—The process of keeping corporations accountable for their environmental impacts.

Social choice theory—A framework for collective decision-making using individual values in the aggregate; combines the fundamentals of voting theory and welfare economics.

Social economics—A comprehensive term for a branch of economics that uses economic tools and analysis to study society, ethics, or philosophy.

Social institutions—A person's external environment, such as school, religious organization, family, and network of peers.

Social insurance—A government program that transfers risk to an organization that provides benefits to those who represent a defined population; such programs have defined eligibility requirements and are funded through taxes or shared public–private funding.

Socialism—An economic system, known as a command economy, where a central authority answers the key economic questions (what to produce, how to produce, for whom to produce).

Social liberalism—The view that the government has a social foundation, and that therefore the proper role of government includes addressing social issues like health and education, as well as defending the rule of law.

Socially responsible corporation—Corporation that has initiatives within its business plans that reflect sensitivity to and concern for environmental and social issues.

Social science—The academic disciplines of economics, history, sociology, political science, geography, and the like that involve studying human behavior (both individually and collectively), society, and social groups.

Social Security—A federal program of the Social Security Act of 1935 to provide income to qualifying retired individuals such as Old-Age, Survivors, and Disability Insurance (OADI); funded through Social Security tax (Federal Insurance Contributions Act, or FICA) paid by American workers and their employers.

Social Security Administration (SSA)—Initially called the Social Security Board (SSB); created in 1935 with the passage of the Social Security Act under President Franklin Roosevelt.

Social Security Disability Insurance—Initiated in 1957, provides monthly payments to disabled workers who cannot work due to a major disability that is expected to last at least a year or to result in death within a year.

Social Security Retirement Benefits—Funded through Social Security tax (Federal Insurance Contributions Act, or FICA); a qualifying retired worker receives retirement income at age 62 or later based on years participating and level of income earned while working.

Socrates (ca. 470–399 BCE)—A Greek philosopher who was influential in creating many of the philosophical foundations of Western thought.

Sole proprietorship—A business structure with only one owner.

Solicitor General—An appointee of the federal government, designated to represent the United States before the Supreme Court.

Sovereign debt—Money that a government owes its bondholders; U.S. debt (bonds) offered by the U.S. Treasury.

Special drawing rights (SDRs)—A reserve asset created by the International Monetary Fund (IMF) for countries, specifically developing countries, to use in settling international payments.

Specialization—Refers to economic resources when a worker performs only one component of the production process, or when businesses provide only one good or service.

Special-purpose vehicles (SPVs)—Legal entities created to make a company's obligations secure even if the company goes bankrupt; can also be used to hide debt by keeping loans off the company's balance sheet, allowing financial institutions to increase their debt levels even further; also called special purpose entities, or SPEs.

Specie currency/money—Money created (minted) from a precious metal such as gold, silver, or copper, with the amount in circulation based on government declaration; for example, many ancient Spanish or Roman coins were specie money.

Speculative risk—Risk that involves both the chance of a financial loss and the possibility of a financial gain; also known as investment risk.

Spillover benefits (spillover costs)—When people besides the buyer and seller benefit from (or bear some of the costs of) the production or consumption of a good; also known as an externality.

Spot exchange rate—The real-time value of a domestic currency in terms of a second currency.

Square Deal—Programs developed by President Theodore Roosevelt to address social issues during his presidency (1901–1909).

Stagflation—Term coined to describe an economy experiencing stagnant economic growth (lower real GDP) and inflation at the same time.

Stamp Act of 1765—During colonial hard times, the act directly taxed all printed materials moving within the colonies, including legal papers, deeds, newspapers, and playing cards.

Standard and Poor's—The first credit rating scale; the scale begins with AAA and grades downward to C and D; ratings below BBB are considered to be the riskiest and apply to speculative or junk bonds. Began over 100 years ago by Henry Varnum. On April 28, 2016, the name Standard & Poor's Ratings Services was changed to S&P Global Ratings.

Standard and Poor's 500 stock index—Measures the price movements of the 500 most important companies in the United States; widely duplicated by stock index mutual fund companies.

Standard of living—A term to describe a level of material well-being, including income, employment factors, poverty rate, affordable housing, gross domestic product, hours of work needed for living basics, access to health care, availability of education, infrastructure, safety, and other metrics related to a nation's quality of life.

State Children's Health Insurance Program (SCHIP)—A special type of health insurance for children; even if parents do not meet income thresholds for Medicaid, SCHIP ensures that children's medical needs are covered; also known as the Children's Health Insurance Program (CHIP).

State-owned enterprises (SOEs)—Government-owned companies, mostly in transportation, communications, and other key industries.

Static economic view—A view of the economy's condition at a specific point in time.

Statistical discrepancy—Concluding line item component of the Balance of Payments to insure that the Current Account + Capital Account – Financial Account equals zero; also used to balance the difference between gross domestic product (GDP) and gross domestic income (GDI).

Steel Tariff of 2002—To protect the domestic steel industry, the United States imposed temporary tariffs on imported European steel. Europe sued, and in 2003 the tariffs were ruled illegal.

Stock—Shares of ownership that companies offer in order to raise additional sources of capital; also known as equity shares. (*See also* Equity.)

Stockholm Convention— Meeting held on January 4, 1960, to establish the European Free Trade Association (EFTA), a regional trade organization and free trade area consisting of Iceland, Liechtenstein, Norway, and Switzerland.

Stockholm School of economics—A group of Scandinavian economists who influenced Swedish economic policy post–World War II; led by Knut Wicksell, Gunnar Myrdal, Eli Heckscher, and Bertil Ohlin.

Stock market—The aggregation of buyers and sellers exchanging stocks; also called equity market.

Stock market crash—A sudden and dramatic drop in stock prices across the market. On October 29, 1929, Black Tuesday, the U.S. stock market volume traded for a loss that is believed to have signalled the start of the Great Depression. October 19, 1987, Black Monday, was the first major financial catastrophe of the second half of the 20th century.

Stolper-Samuelson Theorem—A theory that states that changes in import or export prices of final goods lead to a change in the same direction of the income generated by the resources used in the production of those goods.

Strict construction doctrine—The idea of limiting the federal government's usurpation of state powers, a position held by President James Madison.

Structural unemployment/Cyclical unemployment—The component of the unemployment rate determined by the economic growth or recession in the business cycle.

Subprime mortgage—A mortgage that is financed based on below-normal lending standards.

Subprime mortgage crisis—An economic crisis that occurs when financial institutions finance too many mortgages below the normal or standard lending practices.

Subsidy—Government aid or payment to a domestic producer to encourage infant industries or to protect domestic industries, and make them more competitive with foreign competition.

Substitutes—Economic goods or services that are different from each other but have the same value to a consumer, so the consumer's satisfaction is met with either one.

Substitution effect—Economic concept that when the price of a good or a service rises, consumers will search for a substitute good or service.

Sugar Act of 1764—Act that placed import duties on sugar, wine, coffee, indigo, and textiles brought into the British colonies in America; also known as the American Revenue Act.

Sunday laws—Laws designed to restrict or ban some or all shopping on Sunday for religious reasons; also called blue laws.

Sunk cost—A cost that has already been incurred and cannot be recovered.

Sunk cost effect—Belief that paying for the right to use a good or service will increase the rate at which the good will be utilized; also the tendency of people to continue use a product or service despite it not meeting expectations because of the cost(s) already incurred.

Supply—The willingness and ability of producers to produce a good or service at a set of prices.

Supply curve—The graphical representation of a supplier's willingness and ability to produce a good or service at a set of prices.

Supply-side—A school of economic thought that contends that economic growth is best generated through low marginal income tax rates and low capital gains tax rates with reduced government regulation.

Supply-side economics—The proposition that incentives for producers will increase productivity, shifting the aggregate supply curve outward.

Suspicious activity report (SAR)—A document filing by a financial institution when money fraud or money laundering is suspected.

Swaps—Derivative instruments that allow for transfer of an asset or a liability between two counterparties. The most common types of swaps are interest rate swaps and currency swaps.

Swiss Franc—Official currency of Switzerland.

Switching test—Requires one to imagine the alternative option (opting out) as the status quo, and then to consider the arguments for changing back to the actual status quo.

Symmetric information—When everyone involved knows all applicable information before a decision is made.

Systematic risk—Risk applicable to the total market, and common to all stocks; refers to how a stock moves when the market fluctuates.

Tarbell, Ida—American teacher, author, and journalist; one of the leading "muckrakers" of the late 19th and early 20th centuries. Published a series of articles systematically chronicling the misdeeds of the Standard Oil Co. and John D. Rockefeller.

Tariff—A tax on imports, usually levied by developed nations to protect domestic industries and by developing nations to generate revenue.

Tariff Act of 1832—Legislation enacted by President Andrew Jackson in his second term to reduce high tariffs being imposed in 1828.

Tariff rate quota (TRQ)—A type of import quota that permits the import of a specific quantity of a product at a reduced tariff rate during a period of time.

Tax deferral—A financial strategy for putting off payment of tax until a future date.

Taxes—One form of revenue generated by governments, used to produce public goods or redistribute income.

Taxpayer Relief Act of 1997—Legislation that changed the capital gains tax treatment by lowering the maximum tax rate on long-term capital gains income to 20 percent (and creating a 10 percent maximum capital gains tax rate for individuals in the 15 percent tax bracket).

Tenth Amendment—Last amendment to the Bill of Rights in the U.S. Constitution; gave powers not assigned to the federal government to the states.

Term life (temporary) insurance—A life insurance policy for a set death benefit for a set number of years, after which the insurance is no longer in force.

Testamentary trust—Created by the terms of a will; goes into effect only after the person's death.

***Theory of Moral Sentiments, The*—**The first of Adam Smith's two major works, published in 1759, the other being *The Wealth of Nations* (published in 1776).

Theory of public choice—The study of how groups participate in decision-making.

Theory of the firm—A combination of economic theories intended to identify and explain the nature of firms, companies, and corporations and their structures.

Thrifts—A shortened term for savings and loan associations and savings banks that focus on making home mortgage loans and accepting savings deposits.

Time value of money—The idea that a dollar today is worth more than a dollar tomorrow, because a dollar today can earn interest into the future, whereas a dollar in the future will be reduced in value through inflation.

"Tin Lizzy"—The nickname of the Model T Ford automobile built by Henry Ford; considered the first affordable car for the average consumer, due to Ford's use of the assembly line.

Title VII of the Civil Rights Act of 1964—Federal law that identified as illegal the practice of discriminating on the basis of race, ethnicity, religion, gender, or national origin.

Title IX of the Education Act—Federal law that prohibits discrimination in educational institutions.

Tobin's q—The ratio between the market value and the replacement value of an economic good; the ratio can be used to identify a relationship between financial markets and the markets for goods and services; developed by James Tobin.

Tobin tax—A tax on the spot conversion of a currency to a second currency to penalize short-term currency transactions.

Tools of the Fed—The three tools the Federal Reserve System can use to achieve its monetary policy goals: discount rate, reserve requirement, and open market operations.

Total Cost (TC)—For a company, the sum of total variable costs and total fixed costs (TC = TFC + TVC).

Total Quality Management (TQM)—A holistic management approach to production and quality in business organizations; developed by William Deming.

Townshend Acts—Acts passed by Great Britain in 1767, taxing imported goods such as paper, glass, and tea to raise revenue in the colonies.

Toxic waste—A liquid, gas, or solid that can harm humans, animals, and/or the environment.

Trade—The voluntary exchange between two entities for the express purpose of improving the standard of living for both.

Trade agreements—Trade pacts between nations to promote free trade, or preferential trade, or to identify a tariff, quota, or other trade restriction.

Trade barriers—Protectionist policies implemented by domestic governments to protect domestic industries; the policies include tariffs, quotas, subsidies, or other, less transparent obstacles to trade.

Trademark—A unique or innovative logo, picture, phrase, or emblem to identify a business, corporation, or manufacturer; filed with the U.S. Patent and Trademark Office.

Trade-offs—Another term for opportunity costs.

Trade union—A formal organization of workers that share a common professional or semi-professional skill, such as electricians, plumbers, and airline pilots.

Trade war—When two or more nations create trade barriers or protectionist measures against each other as a retaliatory response to imposed protectionist measures.

Traditional economy—An economy based on culture and heritage.

Traditional IRA—Type of tax-advantaged retirement account where an individual and spouse (if filing joint tax returns) can contribute income on a tax-deferred basis if they have taxable compensation and are younger than age 70½.

Tragedy of the Commons—The overuse of public goods with no regard for the costs of use.

Tranche—Part of a larger unit, such as a group type of mortgages packaged in a mortgage-backed security or a partial payment for a loan to a nation by an international financing organization.

Transaction costs—The costs related to making, reaching, and enforcing agreements.

Transfer payments—Distribution of income from governments to individuals by way of money payments with no goods or services in return.

Transitional economy—Once-developing economies whose economic measures reflect significant growth yet are still too low to be considered a developed nation; the BRIC nations of Brazil, Russia, India, and China are examples of transitional economies.

Transportation Revolution—A wave of new and better modes of transportation experienced by the United States in the early 19th century; improvements included steamboats, canals, railroads, and better travel roads.

Treasury bills—Short-term U.S. Treasury obligations issued with a term of less than one year.

Treasury bonds—Long-term U.S. Treasury obligations with a term of 10 years or longer.

Treasury Inflation-Protected Securities (TIPS)—Government savings bonds introduced by the U.S. Treasury in 1997 as a hedge against inflation.

Treasury marketable securities—Debt securities issued by the U.S. government, similar to bond investments.

Treasury notes—Intermediate to long-term U.S. Treasury investments with maturities of typically 2, 3, 5, 7, and 10 years.

Treaty of Maastricht—Established the Treaty on European Union, or TEU, in 1993, replacing the Treaty of Rome.

Treaty of Rome—Established the European Economic Community (EEC) in 1957; was replaced by the Treaty of Maastricht in 1993.

Treaty of Versailles—Peace treaty that ended World War I and imposed heavy war reparations on Germany, ultimately leading to Germany hyperinflation.

TRICARE—Administers civilian health benefits for military personnel, retirees, and their dependents; managed by the Defense Health Agency (DHA).

TRIPS agreement—Officially called the Agreement on Trade-Related Aspects of Intellectual Property Rights; came into effect on January 1, 1995, negotiated during the Uruguay Round (1986–1994) of the General Agreement on Tariffs and Trade (GATT) trade talks; administered by the World Trade Organization (WTO).

Trotsky, Leon (1879–1940)—Marxist revolutionary and politician; a key figure in the early Communist Party in Russia and leader of the Bolshevik (Red Army) Russian Revolution.

Troubled Asset Relief Program (TARP)—A program created by the federal government and administered by the Treasury Department in an attempt to short-circuit the growing financial crisis of 2007–2008.

Truman, Harry S. (1884–1972)—The 33rd president of the United States (1945–1953); he initiated a broad legislative agenda known as the Fair Deal.

Trust—A new business arrangement, emerging in the early 1880s, in which shareholders assigned their shares in a company to trustees who held the decision-making power of the company.

Trustor or settlor—The person who creates a trust is known as the trustor or settlor, who in turn may name an individual to act as the trustee to oversee how the assets in the trust are managed.

Umbrella insurance policy—A broad protection against the cost of losing a lawsuit over a vehicle accident or an accident on one's property.

Underemployment—Status where employed participants in the labor force are in positions below their optimum experience and education level.

Underground economy—Economic activities that take place outside the official economy and are not declared for tax purposes. (*See also* Hidden economy; Shadow economy.)

Unemployment—The total number of adults age 16 and over who are not working but are willing and able to work and are actively looking for work.

Unemployment insurance—A transfer payment to those who are willing and able to work but currently are not working.

Unemployment rate—A measure of the number of people who are not working but are willing and able to do so.

Unfair trade practice—A trade practice that is considered to favor one party over another, giving one party an advantage within a trading partnership.

Unintended consequences—Effects of a decision that were not anticipated, considered, or expected prior to the decision being made.

United Auto Workers (UAW)—Founded in the 1930s as part of the Congress of Industrial Organizations; a unified labor union of the International Union, United Automobile, Aerospace and Agricultural Implement Workers of America; most noted for its representation of labor in the automobile industry.

United Mine Workers—Labor union founded in 1890 that represents coal miners.

United Nations Conference on Trade and Development (UNCTAD)—Established in 1964 as a UN intergovernmental body; assists and serves developing nations with trade, investment, and development opportunities.

United Nations Framework Convention on Climate Change (UNFCCC)—International environmental treaty. In 1997, the Kyoto Protocol, a legally binding extension of the UNFCCC, was adopted to establish emissions limits for developed countries.

United Nations International Conference on Population and Development (ICPD)—Addresses population issues, adopting a 20-year Program of Action that creates a global blueprint for reducing the population growth rate and advancing social and human development.

United Nations Millennium Project (Goals)—An initiative to implement operational means to achieve the Millennium Development Goals (MDGs) developed by the United Nations in 2000 to address poverty reduction, hunger, disease, illiteracy, discrimination against women, and environmental degradation with a target date for achieving these goals of 2015.

United Nations Population Fund (UNFPA)—A UN organization that issued a progress report on the state of human population in the world with promising developments in integrating population policies with countries' development plans, expanding reproductive health programs and women's rights; formerly called the United Nations Fund for Population Activities.

Unit elasticity—Equal corresponding consumer response relative to a price increase; the percent change in quantity demanded is equal to the percent change in price.

Universal Declaration of Human Rights (UDHR)—Declaration that human rights are also legal entitlements; adopted and proclaimed by the UN General Assembly in 1948 and now endorsed by virtually all countries in the world.

Unlimited liability—The responsibility of business owners to pay debts and obligations has no financial limits.

***Unsafe at Any Speed*—**Best-selling book written by Ralph Nader in 1962; its major impact was the unanimous passage of the 1966 National Traffic and Motor Vehicle Safety Act.

Unsecured loan—Type of loan, such as credit card debt, that is not secured by an underlying asset such as real estate, jewelry, or other physical property; carries a higher risk than secured debt.

Unskilled labor—The component of the workforce characterized by jobs with low skill levels and low education levels, paying low wages and offering limited advancement.

Urban areas—Regions with high population density; sometimes also referred to as the inner city.

Urban planners—Land use designers who seek to increase the efficiency and effectiveness of urban areas relative to population and land specialization.

Uruguay Round—Multilateral trade round of negotiations of the General Agreement on Tariffs and Trade (GATT).

U.S. Department of Agriculture—A Cabinet-level department responsible for issues related to food, natural resources, and agriculture, including nutrition, agricultural science, and economics; made up of 29 separate agencies that provide research, consulting, and management leadership.

U.S. Department of Agriculture's Food Safety and Inspection Service (FSIS)—The public health agency responsible for ensuring that the nation's commercial supply of meat, poultry, and egg products is safe, wholesome, and correctly labeled and packaged.

U.S. Department of Commerce—A Cabinet-level department responsible for promoting economic growth and creating jobs by collecting, analyzing, and reporting economic and demographic data.

U.S. Department of Commerce and Labor—A department of the federal government created in 1903; in 1913, it was divided into two separate departments: Department of Commerce and Department of Labor.

U.S. Department of Labor—A department of the federal government charged with promoting the welfare and working conditions of wage earners, job seekers, and retirees, especially, to administer the many programs intended to protect, educate, or provide access for the U.S. labor market.

U.S. Department of the Interior—A department of the federal government charged with protecting the country's natural resources and cultural heritage while also conducting scientific studies and providing information on the nation's resources.

U.S. Department of the Treasury—Established by Congress in 1789, this Cabinet-level department was created to manage government revenue, print paper currency, mint coins for circulation, collect federal taxes, and manage U.S. government debt instruments.

U.S. Department of Veterans Affairs (VA)—Cabinet-level agency charged with overseeing the benefit system for military veterans.

U.S. Energy Information Administration—Agency responsible for collecting, analyzing, and disseminating energy information to facilitate sound decision-making by policymakers and to enhance the public's understanding of energy and its interaction with the environment.

U.S. Food and Drug Administration (FDA)—Federal agency responsible for protecting the public health; regulates and approves the safety of many products and drugs, including food, dietary supplements, over-the-counter medications, vaccines, cosmetics, and tobacco products.

Usury—The charging of interest when loaning money.

Utilitarianism—An early theory of ethics, promoted by John Stuart Mill and Jeremy Bentham; utilitarianism promotes the idea that the good is whatever has the most utility in maximizing overall happiness.

Utility—A representation of the satisfaction one experiences, according to one's various preferences, when consuming a good or service.

Value (theory of)—A generic term that includes all economic theories regarding the value of prices for goods and services.

Value added—The price of a final good minus the value of intermediate inputs used to produce it.

Value of the marginal product—The value of additional revenue generated from a one-unit change in an input.

Variable cost (VC)—Variable costs are dependent on total output; they include a company's cost for commodities, raw materials used in the production process, and possibly some labor costs not determined by a union or other form of labor contract.

V-Chips—Devices that enable parents to keep their children from accessing offensive content on television or the computer.

Veblen goods—Goods with an upward-sloping (to the right) demand curve; as price rises, so does the quantity purchased; named after Thorstein Veblen.

Vector auto regression (VAR) model—A theoretical construct designed to test cause-and-effect relationships, such as the impact of increases in interest rates on the money supply or the consequences of tax cuts on growth and inflation.

Velocity of money—Measure of the number of times a currency revolves completely through the economy.

Vertical integration—Merger between businesses at different levels of the supply chain to increase production efficiency and effectiveness.

Vesting period—Period of time employees are required to work before they are eligible to receive benefits in a defined benefit plan, or to receive the employer's contribution of a defined contribution plan.

Veterans Health Administration (VHA)—Government agency charged with providing health care for veterans, overseen by the U.S. Department of Veterans Affairs.

Victorian Era—A period in British history named for Queen Victoria's reign, from 1837 to 1901.

Volcker Rule—A component of the Financial Reform Act of 2010 proposed by Paul Volcker to limit U.S. banks' ability to make certain speculative investments that do not profit their customers.

Voluntary exchange—Elective trade between a buyer and a seller in which both parties expect to be better off as a result of the exchange.

Voluntary export restraint (VER)—In this type of quota the exporting nation voluntarily limits an export to an importing nation.

Voluntary import expansion (VIE)—A bilateral agreement that requires one country to accept additional imports from a second country.

Wage and price controls—Income policies implemented to freeze wages and prices.

Wages—Compensation to the labor resource components in the production of intermediate capital resources or final goods and services.

Wall Street—Street in Lower Manhattan that is home to the New York Stock Exchange; often used as a nickname for the financial markets and financial system.

***Wealth of Nations: An Inquiry into the Nature and Causes of the Wealth of Nations, The*—**Written by Adam Smith in 1776, the work that altered the study of economics and changed economic thought from mercantilism; considered the beginning of classical economics.

Welfare economics—The branch of economics that uses microeconomic tools, methods, and theory to assess the economic well-being of individuals and their economic activities as groups, societies, and communities.

Welfare state—A political unit where a government has a major role in the protection and promotion of the individual through specific government economic and social organizations; modern welfare states include Iceland, Sweden, and Norway, where significant revenue transfer from individuals to the state funds such public services as education and health care.

Welfare theory—Field of economics that uses microeconomics to study aggregate social good.

Wetlands—Areas of land covered by water year-round or for a significant period of the year.

Will—A legal document in which a person states who should receive his or her possessions after the person dies.

Wilson, Woodrow (1856–1924)—The 28th president of the United States (1913–1921), and a leader of the Progressive Movement.

Woman's Christian Temperance Union (WCTU)—Organization led by Francis Willard, who argued that alcoholic beverages were the cause of many the country's social ills.

Workfare—A system of welfare in which adults are required to perform some form of work in order to receive aid.

Working poor—Individuals who work but whose income level is below the poverty level.

Workplace retirement savings plans—Retirement saving plan in which workers put a specific amount of their pay into the accounts, and in some cases the employer matches a portion of the money the workers contribute; also known as defined contribution plans.

Works Progress Administration (WPA)—Part of President Franklin D. Roosevelt's New Deal; the federal government directly hired several million unemployed Americans to do work ranging from raking leaves to building airports.

World Bank—A multinational agency whose purpose is to make loans to developing nations; the loans are to be used to build and improve a nation's schools, hospitals, sanitation, roads, and other infrastructure; established during the Bretton Woods Conference following World War II.

World Health Organization (WHO)—Agency of the United Nations charged with assessing, promoting, and monitoring global outbreaks of disease and determining the effectiveness of global health initiatives.

World Trade Organization (WTO)—An independent organization created during the GATT talks for the express purpose of serving as the main international body to promote international trade among developed and developing nations; also serves as the refereeing body for international trade disputes.

Writ of error—A writ issued by an appellate court, directing the court of record to send a trial record to the appellate court to be looked at for potential errors.

Yen—Official currency of Japan; symbol ¥.

Yield Curve—Graph relating interest rate and maturity of a bond.

Yom Kippur War—On October 6, 1973, Syria and Egypt launched a surprise attack on Israel; the United States began an airlift to supply Israel in response to the Soviet Union's supplying of Syria and Egypt; OPEC raised the price of oil to $5.11 a barrel.

Zero coupon CD—CD bought at a discount to the final redemption value; the CD does not pay annual interest and generally promises a higher interest rate.

Zero-sum game (exchange)—A game in which the players as a group have the same (equal) value at the conclusion of the game as they had at the beginning.

About the Editor

David A. Dieterle, PhD, is professor of economics at Walsh College, Troy, MI, and director of the Center for Economic Education. He is a national teaching fellow for the Foundation for Teaching Economics. Formerly, he served as director of economic education centers and councils in Ohio, Nebraska, Illinois, Wisconsin, and Michigan. His published works include Greenwood's *Economic Thinkers: A Biographical Encyclopedia* and *Government and the Economy: An Encyclopedia* (with Kathleen Simmons). He also authored *Economic Experiences: Teachers Manual* and *Energy and Economics: An Activities Book*. Dieterle holds a doctorate from Michigan State University.
