CHAPTER ONE

Sources of Law: Varied and Dynamic **1**

- 1.01 Relevance 1
- 1.02 The Federal System 1
- 1.03 Constitutions 2
- 1.04 Legislation 3
- 1.05 The Executive Branch 4
- 1.06 Administrative Agencies 4
- 1.07 Courts: The Common Law 5
- 1.08 Contracting Parties 5
- 1.09 Publishers of Standardized Documents 5
- 1.10 Restatements of the Law 6
- 1.11 Summary 6

CHAPTER TWO

The American Judicial System: A Forum for Dispute Resolution **7**

- 2.01 State Court Systems: Trial and Appellate Courts 7
- 2.02 The Federal Court System 8
- 2.03 Statute of Limitation: Time to Bring the Lawsuit 8
- 2.04 Hiring an Attorney: Role and Compensation 8
- 2.05 Jurisdiction of Courts 10
- 2.06 Parties to the Litigation 11
- 2.07 Prejudgments Remedies 11
- 2.08 Pleadings 12

- 2.09 Pretrial Activities: Discovery 13
- 2.10 The Jury 13
- 2.11 Trials: The Adversary System 14
- 2.12 Judgments 15
- 2.13 Enforcement of Judgments 16
- 2.14 Appeals: The Use of Precedent 16
- 2.15 International Contracts 17

CHAPTER THREE

Forms of Association: Organizing to Accomplish Objectives **18**

- 3.01 Relevance 18
- 3.02 Sole Proprietorships 18
- 3.03 Partnerships 18
 - A. Generally: Uniform Partnership Act 18
 - B. Creation 19
 - C. Operation 19
 - D. Fiduciary Duties 19
 - E. Performance Obligations, Profits, Losses, Withdrawal of Capital and Interest 19
 - F. Authority of Partner 20
 - G. Liability of General Partnership and Individual Partners 20
 - H. Transferability of Partnership Agreement 20
 - I. Dissolution and Winding Up 20
 - J. Limited Partnership 20
- 3.04 Profit Corporations 21
 - A. Use 21
 - B. General Attributes 21
 - C. Preincorporation Problems: Promoters 21
 - D. Share Ownership 21
 - E. Piercing the Corporate Veil 21

- F. Activities, Management, and Control:
 - Insider Misconduct 22
- G. Profits and Losses 23
- H. Life of the Corporation 23
- 3.05 Nonprofit Corporations 23
- 3.06 Professional Corporations, Limited Liability Companies (LLC), and Limited Liability Partnerships (LLP) 24
- 3.07 Joint Ventures 24
- 3.08 Unincorporated Associations 24
- 3.09 Loose Associations: Share-Office Arrangement 25
- 3.10 Professional Associations 25

CHAPTER FOUR

The Agency Relationship: A Legal Concept Essential to Contract Making 27

- 4.01 Relevance 27
- 4.02 Policies Behind Agency Concept 27
 - A. Commercial Efficiency and Protection of Reasonable Expectations 27
 - B. Relationships Between Principal and Agent 28
- 4.03 Other Related Legal Concepts 28
- 4.04 Creation of Agency Relationship 28
- 4.05 Actual Authority 29
- 4.06 Apparent Authority 29
- 4.07 Termination of Agency 30
- 4.08 Disputes Between Principal and Third Party 30
- 4.09 Disputes Between Agent and Third Party 31
- 4.10 Non-Traditional Project Delivery Systems 31

CHAPTER FIVE

Contracts and Their Formation: Connectors for Construction Participants 32

- 5.01 Relevance 32
- 5.02 The Function of Enforcing Contracts: Freedom of Contract 32
- 5.03 Preliminary Definitions 32

- 5.04 Contract Classifications 33
 - A. Express and Implied 33
 - B. Subject Matter 33
 - C. Bargain and Adhesion 33
- 5.05 Capacity to Contract 34
- 5.06 Mutual Assent 34
 - A. Objective Theory of Contracts: Manifestations of Mutual Assent 34
 - B. Offer and Acceptance in the Assent Process 35
 - C. Contracts by Correspondence 36
 - D. Reasonable Certainty of Terms 37
 - E. A More Formal Document: Preliminaries 37
 - F. Agreements to Agree 37
 - G. Agreements to Negotiate in Good Faith 38
 - H. Memorandum of Understanding 38
 - I. Letter of Intent 38
- 5.07 Defects in the Mutual Assent Process 39
 - A. Fraud and Misrepresentation: Duty to Disclose 39
 - B. Economic Duress 39
 - C. Mistake 39
 - D. Unconscionability 40
 - E. Formation Defects and Restitution 40
- 5.08 Consideration as a Contract Requirement 41
 - A. Definition 41
 - B. Reliance 41
- 5.09 Promises Under Seal 41
- 5.10 Writing Requirements: Statute of Frauds 42
 - A. History 42
 - B. Transactions Required to Be Evidenced by a Sufficient Memorandum 42
 - C. Sufficiency of Memorandum 42
 - D. Avoiding the Writing Requirement 43

CHAPTER SIX

Remedies for Contract Breach: Emphasis on Flexibility 44

- 6.01 An Overview 44
- 6.02 Relationship to Other Chapters 44
- 6.03 Judicial Remedies: Money Awards, Specific Decrees, and Declaratory Judgments 45
- 6.04 Compensation and Punishment: Emergence of Punitive Damages 46
- 6.05 Protected Interests 46

- 6.06 Limits on Recovery 47
 - A. Causation 47
 - B. Certainty 47
 - C. Foreseeability: Freak Events and Disproportionate Losses 47
 - D. Avoidable Consequences (The Concept of Mitigation) 48
 - E. Lost Profits 48
 - F. Collateral Source Rule 48
 - G. Contractual Control: A Look at the UCC 49
 - H. Noneconomic Losses 49
- 6.07 Cost of Dispute Resolution: Attorneys' Fees 50
- 6.08 Interest 51

CHAPTER SEVEN

Losses, Conduct, and the Tort System: Principles and Trends 52

- 7.01 Relevance to the Construction Process 52
- 7.02 Tort Law: Background 52
 - A. Definition 52
 - B. Function 52
 - C. Threefold Classifications 53
 - D. Historical Patterns 53
 - E. General Factors in Determining Tort Liability 55
 - F. Coverage of Chapter 55
- 7.03 Negligence: The "Fault" Concept 56
 - A. Emergence of the Negligence Concept 56
 - B. Elements of Negligence 56
 - C. Standard of Conduct:
 - The Reasonable Person 56
 - The Objective Standard and Some Exceptions* 56
 - Unreasonable Risk of Harm: Some Formulas* 56
 - Common Practice: Custom* 57
 - Violations of or Compliance with Statutes* 57
 - Res Ipsa Loquitur* 58
 - D. Legal Cause: Cause in Fact and Proximate Cause 59
 - Cause in Fact* 59
 - Proximate Cause* 60
- E. Duty 61
- F. Protected Interests and Emotional Distress 62
- G. Defenses 63
 - Acceptance Doctrine* 63
 - Assumption of Risk* 64
 - Contributory Negligence* 64
 - Independent Contractor Rule* 64
- 7.04 Nonintentional Nonnegligent Wrongs: Strict Liability 65
 - A. Abnormally Dangerous Things and Activities 65
 - B. Vicarious Liability 65
 - C. Employment Accidents and Workers' Compensation 66
 - D. Product Liability 67
- 7.05 Claims by Third Parties 67
 - A. Lost Consortium 67
 - B. Survival and Wrongful Death Statutes 68
- 7.06 Immunity 68
 - A. Charitable Organizations 68
 - B. Employers and Workers' Compensation 68
 - C. Public Officials 68
 - D. Sovereign Immunity 68
- 7.07 Misrepresentation 69
 - A. Scope of Discussion 69
 - B. Representation or Opinion 69
 - C. Conduct Classified 69
 - D. Person Suffering from Loss 69
 - E. Type of Loss 70
 - F. Reliance 70
 - G. Generalizations 70
- 7.08 Premises Liability: Duty of the Possessor of Land 70
 - A. Relevance 70
 - B. To Passersby 71
 - C. To Trespassing Adults 71
 - D. To Trespassing Children 72
 - E. To Licensees 72
 - F. To Invitees 72
 - G. Movement Toward General Standard of Care 73
 - H. Defenses to Premises Liability 73
- 7.09 Product Liability 73
 - A. Relevance 73
 - B. History: From Near Immunity to Strict Liability 74

- C. Restatement (Second) of Torts Section 402A and Restatement (Third) of Torts: Products Liability Section 2 74
- D. Product Misuse 76
- E. Parties 76
- F. Defenses 77
- G. Economic Losses 78
- H. Disclaimers 79
 - I. Design Defects and Duty to Warn: Two Restatements 79
 - J. Government-Furnished Design 80
- K. Beyond Products: Sellers of Services 81
- L. Future Developments 81
- 7.10 Remedies 82
 - A. Compensation 82
 - B. Collateral Source Rule 82
 - C. Punitive Damages 83
 - D. Attorneys' Fees: Cost of Litigation 84
 - E. Interest 84

CHAPTER EIGHT

Introduction to the Construction Process: Ingredients for Disputes 85

- 8.01 Relationship to Rest of Book 85
- 8.02 The Eternal Triangle: Main Actors 85
 - A. The Owner 85
 - B. The Contractor 88
 - C. The Design Professional 89
 - D. The Industry 89
- 8.03 The Supporting Cast on a Crowded Stage 89
 - A. The Owner Chain: Spotlight on Lender 89
 - B. The Contractor Chain 90
 - C. The Design Professional Chain 90
 - D. Insurers 90
- 8.04 The Construction Contract 90
- 8.05 The Delivery Systems 91
- 8.06 The Applicable Law 91
- 8.07 The Construction Site 92
- 8.08 Contract Administration 92
- 8.09 International Transactions 92
- 8.10 Unresolved Disputes and Litigation 92

CHAPTER NINE

Limits on Ownership: Land Use Controls 93

- 9.01 Nuisance: Unreasonable Land Use 93
- 9.02 Soil Support 94
- 9.03 Drainage and Surface Waters 94
- 9.04 Easements for Light, Air, and View 95
- 9.05 Restrictive Covenants: Common Interest Communities (CIC) 96
- 9.06 Development of Land: Expanded Public Role 98
- 9.07 Limitations on Land Use Controls: Takings 99
- 9.08 Local Land Use Control: The Process 102
- 9.09 Original Enabling Acts and Euclidean Zones: The MLDC 103
- 9.10 Flexibility: Old Tools and New Ones 104
 - A. Variances and Special Use Permits 104
 - B. Nonconforming Uses 104
 - C. Rezoning 105
 - D. Contract and Conditional Zoning 105
 - E. Floating Zones 106
 - F. Bonus Zoning 106
 - G. Planned Unit Development 106
 - H. Open Space 106
- 9.11 Aesthetics and Control 107
- 9.12 Historic and Landmark Preservation 107
- 9.13 The Environmental Movement and Owner Liability 108
 - A. National Environmental Policy Act (NEPA) 109
 - B. Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) 110
 - Overview of Statute* 110
 - Construction Industry Participants* 111
 - Insurance Coverage* 111
 - Brownfields* 112
 - C. Resource Conservation and Recovery Act (RCRA) 112
 - D. State Law 113
 - E. Environmentally Friendly Design and Construction 113
- 9.14 Judicial Review 114

- 9.15 Housing and Land Use Controls 114
 - A. Residential Zones 114
 - B. Subdivision Controls 115
 - C. Exclusionary and Inclusionary Zoning 115
 - D. Phased Growth 117

CHAPTER TEN

Professional Registration and Contractor Licensing: Evidence of Competence or Needless Entry Barrier? 119

- 10.01 Overview 119
- 10.02 Public Regulation: A Controversial Policy 119
 - A. Justification for Regulation 119
 - B. Criticism of Licensing Laws 120
 - C. Importance of Attitude Toward the Regulatory Process 121
 - D. Judicial Attitudes Toward Registration Laws 122
- 10.03 Administration of Licensing Laws 122
- 10.04 The Licensing Process 123
 - A. Admission to Practice 123
 - B. Postadmission Discipline: *Duncan v. Missouri Board for Architects, Professional Engineers and Land Surveyors* 123
- 10.05 Types of Licensing Laws 132
 - A. Licensing of Architects and Engineers: Holding Out and Practice Statutes 132
 - B. Contractor Licensing 132
 - C. Variations on the Traditional Contracting System 132
- 10.06 Statutory Violations 132
 - A. Preliminary Issue: Constitutionality 132
 - B. Holding Out 133
 - C. Practicing 133
 - D. Architecture and Engineering Compared 134
 - E. Statutory Exemptions 136
 - F. Possessor of License 136
 - G. Out-of-State Practice 137
 - H. Substantial Compliance 138
- 10.07 Sanctions for Licensing Law Violations 138
 - A. Criminal and Quasi-Criminal Sanctions 138
 - B. Recovery for Work Performed and Payment Refunds 138

- Statute Silent on Contractor's Right to Compensation* 139
 - Statute Bars Contractor's Right to Compensation* 140
 - Sophisticated Parties* 142
 - Payment Reimbursement* 142
 - C. Summary 143
- 10.08 Should Contractors Be Licensed? 143
 - A. Purpose of Licensing Laws 143
 - B. Harmful Effects 144
- 10.09 Contractor Licensing Laws 145
- 10.10 The Unlicensed Contractor: Civil Sanctions 146
 - A. Recovery for Work Performed 146
 - B. Exceptions 146
 - C. Substantial Compliance 147
 - D. Observations 148
- 10.11 Indirect Effect: Forum for Consumer Complaints 148
- 10.12 The Trained but Unregistered Design Professional: Moonlighting 149
 - A. Unlicensed Persons: A Differentiation 149
 - B. Ethical and Legal Questions 149
 - C. Recovery for Services Performed 149
 - D. Liability Problems 150

CHAPTER ELEVEN

Contracting for Design Services: Pitfalls and Advice 152

- 11.01 Authority Problems 152
 - A. Private Owners 152
 - Sole Proprietors* 152
 - Partnerships* 153
 - Corporations* 153
 - Unincorporated Associations* 153
 - Spouses or Unmarried Cohabitants* 153
 - B. Public Owners 154
- 11.02 Financial Capacity 155
 - A. Importance 155
 - B. Private Clients 155
 - Retainers and Interim Fees* 155
 - Client Resources* 155
 - One-Person and Closely Held Corporations: Individual Liability of Officers* 155

	<i>A Surety or Guarantor</i>	156
	<i>Real or Personal Property Security</i>	156
	<i>Client Identity</i>	156
	<i>Spouses or Unmarried Cohabitants</i>	156
	<i>Mechanics' Liens</i>	156
	C. Public Owners	157
11.03	Competing for the Commission: Ethical and Legal Considerations	158
	A. Competition Between Design Professionals: Ethics	158
	B. Brooks Act	158
	C. Federal-Art-in-Architecture Program	159
	D. Interference With Contract or Prospective Advantage	159
11.04	Professional Service Contracts: Some Remarks	160
	A. Profits and Risk	160
	B. Good Faith, Fair Dealing, and Fiduciary Relationships: Confidentiality	160
	C. Variety of Contracts: Purchase Orders	163
	D. Interpretation	164
	E. The Parol Evidence Rule and Contract Completeness	165
	F. Formal Requirements: Recent California Legislation	166
	<i>Existence of Cost Condition</i>	178
	<i>Standard Contracts and Disclaimers: A Look at AIA Standard Contracts</i>	179
	<i>An Illustrative Case: Griswold and Rauma, Architects, Inc. v. Aesculapius Corp</i>	181
	<i>Negligent Cost Predictions</i>	184
	D. Interpretation of Cost Condition	185
	E. Dispensing with the Cost Condition	185
	F. Nonperformance as a Breach: Recovery of Damages	186
	G. Relationship Between Principal Design Professional and Consultant	187
	H. Advice to Design Professionals	188
12.04	Assistance in Obtaining Financing	189
12.05	Economic Feasibility of Project	189
12.06	Approval of Public Authorities: Dispute Resolution	190
12.07	Services of a Legal Nature	191
12.08	Site Services	192
	A. Relation to Chapter 14	192
	B. Supervision to Observation: <i>Watson, Watson, Rutland/Architects v. Montgomery County Board of Education</i>	192
	C. Submittals: Design Delegation	202
	D. Use of Project Representative	207
	E. Use of Construction Manager	207
	F. Statutory and Administrative Regulations	207
12.09	Hazardous Materials	208
12.10	Who Actually Performs Services: Use of and Responsibility for Consultants	209
	A. Within Design Professional's Organization	209
	B. Outside Design Professional's Organization: Consultants	209
12.11	Ownership of Drawings and Specifications	211
12.12	Time	215
12.13	Cessation of Services: Special Problems of the Client-Design Professional Relationship	215
	A. Coverage	215
	B. Specific Contract Provisions as to Term	215
	C. Conditions	216
	D. Suspension	216

CHAPTER TWELVE

**Professional Design Services:
The Sensitive Issues 168**

12.01	Range of Possible Professional Services: Fees and Insurance	168
12.02	Traditional Roles of Design Professional: B101-2007	169
12.03	Cost Predictions	169
	A. Inaccurate Cost Prediction: A Source of Misunderstanding	169
	B. Two Models of Cost Predictions	170
	C. Creation of a Cost Condition: Frank Lloyd Wright and the Johnson Building and <i>Griswold & Rauma v. Aesculapius</i>	171
	<i>Contract Completeness and the Parol Evidence Rule</i>	177
	<i>Preliminary Issues</i>	177

- E. Abandonment 217
- F. Termination Clauses 217
- G. Material Breach 219
- H. Subsequent Events 219
 - I. The Lender's Perspective 220
- 12.14 Judicial Remedy for Breach: Special Problems of the Client–Design Professional Relationship 220
 - A. Coverage 220
 - B. Client Claims 220
 - C. Design Professional Claims 223

CHAPTER THIRTEEN

Compensation and Other Owner Obligations 224

- 13.01 Contractual Fee Arrangements 224
 - A. Limited Role of Law: Methods of Compensation 224
 - B. Stated Percentage of Construction Costs: Square Footage 224
 - C. Multiple of Direct Personnel Expense: Daily or Hourly Rates 225
 - D. Professional Fee Plus Expenses 226
 - E. Fixed Fee 226
 - F. Reasonable Value of Services or a Fee to Be Agreed On 227
 - G. Additional Services 227
 - H. Reimbursables 231
 - I. Fee Ceilings 231
 - J. Adjustment of Fee 231
 - K. Deductions from the Fee: Deductive Changes 231
 - L. Project Risks 232
 - M. The Fee as a Limitation of Liability 233
- 13.02 Time for Payment 233
 - A. Service Contracts and the Right to Be Paid as One Performs 233
 - B. Interim Fee Payments 233
 - C. Monthly Billings 234
 - D. Late Payments 234
 - E. Suggestions Regarding Interim Fee Payments 235
- 13.03 Payment Despite Nonperformance 235
- 13.04 Other Client Obligations 235

CHAPTER FOURTEEN

Professional Liability: Process or Product? 237

- 14.01 Claims Against Design Professionals: On the Increase 237
 - A. Changes in Substantive Law 237
 - B. Procedural Changes 237
 - C. Ability of Design Professionals to Pay Court Judgments 237
 - D. Access to Legal System 237
 - E. Societal Changes 238
 - F. Enterprise Liability: Consumerism 238
 - G. Design and Social Policy 238
 - H. Codes 239
 - I. Expansion of Professional Services 239
 - J. Site Services 239
- 14.02 Overview of Chapters 14 and 15 239
 - A. Applicable Law 239
 - B. Types of Harm 239
- 14.03 Claims Against Design Professionals: Some Illustrations 240
- 14.04 Specific Contract Standard 242
 - A. Likelihood of Specific Standard 242
 - B. Client Satisfaction 243
 - C. Fitness Standard 244
 - D. Quantitative or Qualitative Performance Standards 245
 - E. Indemnification 245
 - F. Cost Overruns Caused by Design 246
 - G. Contractual Diminution of Legal Standard 246
- 14.05 The Professional Standard: What Would Others Have Done? 246
 - A. Defined and Justified: *City of Mounds View v. Walijarvi* 246
 - B. Expert Testimony and the Professional Standard 249
 - C. Building and Housing Codes: The Americans with Disabilities Act 249
 - D. Contractual Diminution of Standard: Informed Consent 253
 - E. Tort and Contract 254
- 14.06 Expert Testimony 255
 - A. Purpose and Exceptions to General Rule 255
 - B. Admissibility of Testimony: *National Cash Register Co. v. Haak* 258

- C. Critique of System 261
- D. Advice to Expert Witnesses 263
- 14.07 Implied Warranty: An Outcome Standard 263
- 14.08 Third-Party Claims: Special Problems 265
 - A. Potential Third Parties 265
 - B. Contracts for Benefit of Third Parties 266
 - C. Tort Law: Privity and Duty 266
 - D. Negligent Misrepresentation: *Ossining Union Free School District v. Anderson LaRocca Anderson* 269
 - E. Economic Loss Rule: Losses Unconnected to Personal Harm or Damage to Property 274
 - F. Interference with Contract or Prospective Advantage—The Adviser’s Privilege 277
 - G. Safety and the Design Professional: *Pfenninger v. Hunterdon Central Regional School District and CH2M Hill, Inc. v. Herman* 278
 - H. Action Taken on Site 288
 - I. Safety Legislation 289
 - J. Summary 290
- 14.09 Special Legal Defenses 290
 - A. Approval by Client 290
 - B. Acceptance of the Project 290
 - C. Passage of Time: Statutes of Limitations 291
 - D. Decisions and Immunity 292
 - E. Recent Legislative Activities 294
- 14.10 Remedies
 - A. Against Design Professionals 295
 - B. Against Co-wrongdoers 295
- 14.11 Current Controversies: Some Observations 296
 - A. The Professional Standard: Should Professionals Be Treated Differently? 296
 - B. The Design Professional’s Duty to Workers 297
 - C. Injection of Tort Law into the Commercial World: A Wild Card 299
 - D. The Effect of Expanded Professional Liability 300
- 15.03 Contractual Risk Control 303
 - A. Scope of Services 303
 - B. Standard of Performance 303
 - C. Exclusion of Consequential Damages 303
 - D. Limiting Liability to Client 304
 - E. Immunity: Decision Making 307
 - F. Contractual Statute of Limitations 307
 - G. Third-Party Claims 308
 - H. Dispute Resolution 308
 - I. The Residue 308
 - J. Some Suggestions 308
- 15.04 Indemnity: Risk Shifting and Sharing 308
- 15.05 Professional Liability Insurance: Risk Spreading 309
 - A. Requirement of Professional Liability Insurance 309
 - B. Volatility of Insurance Market 310
 - C. Regulation 310
 - D. Premiums 310
 - E. Policy Types: Occurrence or Claims Made 311
 - F. Coverage and Exclusions: Professional Services 311
 - G. Deductible Policies 313
 - H. Policy Limits 314
 - I. Notice of Claim: Cooperation 314
 - J. Duty to Defend 314
 - K. Settlement 315
 - L. Multiparty Policies 315
 - M. Termination 316
- 15.06 Preparing to Face Claims 316

CHAPTER FIFTEEN

Risk Management: A Variety of Techniques 302

- 15.01 Sound Economic Basis: Bargaining Power 302
- 15.02 Evaluating the Commission: Participants and Project 302

CHAPTER SIXTEEN

Intellectual Property: Ideas, Copyrights, Patents, and Trade Secrets 317

- 16.01 Relevance to Design Professional 317
- 16.02 An Overview 317
 - A. Specificity of Discussion 317
 - B. Purpose of Protection 318
 - C. Exclusions from Discussion: Trademarks and Shop Rights 318
- 16.03 The Copyright Law of 1976 318
 - A. Common Law Copyright Abolished 318
 - B. Statutory Copyright 318
 - Classification of Copyrightable Works* 318

Materials 524

CHAPTER TWENTY-FOUR

Defects: Design, Execution, and Blurred Roles 526

- 24.01 Introduction: The Partnership 526
- 24.02 Basic Principles: Responsibility Follows
Control 528
- 24.03 Displacing the Basic Principle:
Unconscionability 529
- 24.04 Good Faith and Fair Dealing: A Supplemental
Principle 531
- 24.05 Acceptance of Project 532
- 24.06 Owner Claims and Divided Responsibility 533
- 24.07 Third-Party Claims 534
- 24.08 Claims Against Liability Insurer 535
- 24.09 Warranty (Guarantee) Clauses 536
 - A. Relationship to Acceptance 536
 - B. Purposes: *St. Andrew’s Episcopal Day School v. Walsh Plumbing Co.* 537
 - C. Warranty and Correction of Work
Under A201 541
- 24.10 Implied Warranties in the Sale of Homes: Strict
Liability 542
 - A. Home Buyers and Their Legal
Problems 542
 - B. The Implied Warranty Explosion
of the 1960s 542
 - C. Current Problems 543
 - D. Insurance Protection 544
 - E. Deceptive Practices Statutes 544
- 24.11 A Suggestion: Defect Response
Agreements 544

CHAPTER TWENTY-FIVE

Subsurface Problems: Predictable Uncertainty 546

- 25.01 Discovery of Unforeseen Conditions 546
 - A. Effect on Performance 546
 - B. Causes 546
 - C. Two Models 547
 - D. Enforceability of a Promise to Pay More
Money 547
 - E. Supervening Geotechnical Conditions and
Mistake Claims 548
- 25.02 Common Law Rule 548
- 25.03 Information Furnished by Owner 550
- 25.04 Risk Allocation Plans 551
- 25.05 Disclaimers—Putting Risk on Contractor 553
- 25.06 Contractual Protection to Contractor 554
 - A. Public Contracts: The Federal Approach 554
 - B. AIA Approach: Concealed Conditions 559
 - C. EJCDC Approach 560
 - D. The FIDIC Approach 561
- 25.07 Some Advice to Courts 562

CHAPTER TWENTY-SIX

Time: A Different but Important Dimension 563

- 26.01 An Overview 563
- 26.02 Commencement 563
- 26.03 Acceleration 565
 - A. Specific: The Changes Clause 565
 - B. Constructive Acceleration 565
 - C. Voluntary: Early Completion 565
- 26.04 Completion 566
- 26.05 Schedules: Simple and Critical Path Method
(CPM) 566
 - A. Approaches to Scheduling 566
 - B. The Critical Path Method (CPM) 568
 - C. Other Legal Issues 571
- 26.06 Causation: Concurrent Causes 572
- 26.07 Allocation of Delay Risks 573
 - A. Compensable vs. Noncompensable 573
 - B. Common Law 573
 - C. Fault 573
 - D. *Force Majeure* Clauses 573
 - E. Weather 574

- F. Subcontractor Caused Delay 575
- G. Role of Architect 575
- 26.08 Time Extensions 575
 - A. Role of Design Professional 575
 - B. Duration of Extension 575
 - C. Notices 576
- 26.09 Unexcused Contractor Delay 576
 - A. Actual Damages 576
 - B. Liquidated Damages: *Bethlehem Steel Corp. v. Chicago and Rohlin Constr. Co. v. City of Hinton* 577
- 26.10 Owner-Caused Delay 585
 - A. Assumed Contractual Risk: No-Damage Clauses: *Triple R Paving, Inc. v. Broward County* 585
 - B. Subcontractor Claims 591
 - C. Liquidated Damages 591
 - D. Measurement 591
 - E. Records 591
- D. Defective Performance: Correction Cost or Diminished Value? 609
- E. Delay 612
- 27.04 Certainty 613
- 27.05 Records and Notices 614
 - A. During Performance 614
 - B. After Dispute Arises 614
 - C. Notices 615
- 27.06 Consequential Damages: Lost Profits 615
 - A. Defined 615
 - B. Owner Claims 616
 - C. Contractor Claims 616
 - D. Waiver of Consequential Damages: AIA Approach 617
- 27.07 Avoidable Consequences: The Concept of Mitigation 617
- 27.08 Collateral Source Rule: Off-Setting Benefits 619
- 27.09 Noneconomic Losses: *Erlich v. Menezes* 620
- 27.10 Punitive Damages 624
- 27.11 Cost of Dispute Resolution: Attorneys' Fees 626
- 27.12 Interest 626
- 27.13 Disputes and Settlements: *Rich & Whillock v. Ashton Development, Inc.* 626
- 27.14 Claims Against Multiple Parties 629
- 27.15 Security for Claims 631
 - A. Owner Claims 631
 - B. Prime Contractor Claims 631
 - C. Subcontractor Claims 631
 - D. Summary 631
- 27.16 Claims Against Public Entities: Federal False Claims Act 631

CHAPTER TWENTY-SEVEN

Claims: By-Products of Construction Process 592

- 27.01 Introduction 592
- 27.02 Measurement: Contractor Vs. Owner 592
 - A. Illustrations 592
 - B. Cost Contracts 592
 - C. Project Never Commenced 593
 - D. Project Partially Completed: Damages 593
 - E. Project Partially Completed: Restitution 595
 - F. Project Completed: *Complete General Construction Co. v. Ohio Department of Transportation and New Pueblo Constructors v. State of Arizona* 597
 - Denial of Restitution* 597
 - Site Chaos and Productivity* 597
 - Extended Home Office Overhead: Eichleay Formula* 599
 - Productivity Loss Preferred Formulas: Measured Mile and Industry Productivity Studies* 604
 - Total Cost* 604
 - Jury Verdict* 605
- 27.03 Measurement: Owner Vs. Contractor 607
 - A. Illustrations 607
 - B. Project Never Begun 607
 - C. Project Partially Completed 608

CHAPTER TWENTY-EIGHT

The Subcontracting Process: An "Achilles Heel" 633

- 28.01 An Overview of the Process 633
- 28.02 The Subcontractor Bidding Process 637
 - A. Using Sub-Bids 637
 - B. Irrevocable Sub-Bids 637
 - C. Bargaining Situation: Shopping and Peddling 638
 - D. Avoiding *Drennan* 639
 - E. Uniform Commercial Code 640
 - F. A Suggestion 640
 - G. Teaming Agreements 640

- 28.03 Subcontractor Selection and Approval:
The Owner's Perspective 640
- 28.04 Sources of Subcontract Rights and Duties:
Flow-Through Clauses 642
- 28.05 Subcontractor Defaults 646
 - A. Claims by Contract-Connected Parties 646
 - B. Claims by Third Parties 646
 - C. Responsibility of Prime Contractor 647
- 28.06 Payment Claims Against Prime
Contractor 648
- 28.07 Payment Claims Against Property, Funds, or
Entities Other Than Prime Contractor 650
 - A. Court Judgments and Specific
Remedies 650
 - B. Statutory and Nonstatutory
Remedies 651
 - C. Public and Private Work 651
 - D. Mechanics' Liens 652
 - E. Stop Notices 656
 - F. Trust Fund Legislation: Criminal and Civil
Penalties 656
 - G. Michigan Homeowners Construction Lien
Recovery Fund 657
 - H. Texas Trapping Statute 657
 - I. Compulsory Bonding Legislation 657
 - J. Nonstatutory Claims 657
 - K. Joint Checks 659
- 28.08 Other Subcontractor Claims 659
 - A. Against Prime Contractor 659
 - B. Pass-Through Claims Against Owner:
Liquidating Agreements and *Severin*
Doctrine 660
 - C. Against Third Parties 661

CHAPTER TWENTY-NINE

**The Design Professional as Judge:
A Tradition Under Attack 662**

- 29.01 Overview 662
 - A. Introducing the Initial Decision Maker 662
 - B. Relation to Chapter 30 663
- 29.02 The Doctrine of Conditions 663
- 29.03 Excusing the Condition 663
- 29.04 The Design Professional as Judge: Reasons 664
- 29.05 Jurisdiction of Decision-Making Powers 665
- 29.06 Who Can Make the Decision? 666

- 29.07 The Contract as a Control on Decision-Making
Powers 666
- 29.08 Procedural Matters 666
 - A. Requirements of Elemental Fairness:
A201 666
 - B. Standard of Interpretation 667
 - C. Form of Decision 668
 - D. Appeal 669
 - E. Costs 669
- 29.09 Finality of Initial Decision 670
- 29.10 Finality: A Comment 672
- 29.11 The Initial Decision Maker: Some
Observations 672

CHAPTER THIRTY

**Construction Disputes: Arbitration
and Other Methods to Reduce Costs
and Save Time 674**

- 30.01 Introduction 674
- 30.02 The Law and Arbitration 674
- 30.03 Agreements to Arbitrate and Their Validity 676
 - A. Legal Controls: Submissions and Agreements
to Arbitrate Future Disputes 676
 - B. State Statutes 677
 - C. Federal Preemption 678
 - D. Unconscionability 678
 - E. Mutuality 679
 - F. Underlying Contract 679
 - G. Contract Formalities and
Nonsignatories 680
 - H. Fraud, Mutuality, Termination of Contract
and Conditions Precedent 681
- 30.04 Specific Arbitration Clauses: Jurisdiction
of Arbitrator and Timeliness of Arbitration
Requests 682
 - A. Jurisdiction Conferred by Clause 682
 - B. Timeliness of Arbitration Demand 684
 - C. Who Decides Jurisdiction and Timeliness:
Prima Paint Doctrine 685
- 30.05 Waiver of Arbitration 686
- 30.06 Prehearing Activities: Discovery 687
- 30.07 Selecting Arbitrators 688
- 30.08 Place of Arbitration 690
- 30.09 Multiple-Party Arbitrations: Joinder and
Consolidation 690

- 30.10 The Hearing 692
 - A. A Differentiation of Issues: Desirable Vs. Required 692
 - B. Waiver 693
 - C. Time 693
 - D. Proceeding Without the Presence of One of the Parties 693
 - E. The Arbitrators 693
 - F. Rules of Conducting the Hearing 693
 - G. Opening Statements 693
 - H. Production of Evidence: Subpoena Powers 693
 - I. Legal Rules of Evidence 694
 - J. Documentary Evidence 694
 - K. Questioning Witnesses 694
 - L. Visting the Site 694
 - M. *Ex Parte* Communications 694
 - N. Transcript 695
 - O. Reopening Hearing 695
- 30.11 Substantive Standards 695
- 30.12 Remedies 696
- 30.13 Award 698
- 30.14 Enforcement and Limited Judicial Review 698
- 30.15 Insurers and Sureties 701
- 30.16 Arbitrator Immunity 702
- 30.17 Arbitration and Litigation Compared 702
- 30.18 Private Systems 705
 - A. Arbitration 706
 - B. Mediation 708
 - C. Mediation-Arbitration 710
 - D. Mini-Trials 710
 - E. Dispute Review Board 710
 - F. Project Neutral 711
 - G. Project Counsel 711
 - H. Partnering 711
 - I. Conflict Manager 712
 - J. Court-Appointed Arbitrators: Adjudicator (Great Britain) 712
 - K. Multi-Tier Systems 712
 - L. Architect/Engineer Resolution 712
- 30.19 Adjuncts of Judicial Systems 713
 - A. Special Masters and Referees 713
 - B. Summary Jury Trials 713
 - C. Mediation 714
- 30.20 Public Contracts 714
 - A. Federal Procurement Contracts 714
 - B. State and Local Contracts 715
- 30.21 International Arbitration: FIDIC 716

CHAPTER THIRTY-ONE

Indemnification and Other Forms of Shifting and Sharing Risks: Who Ultimately Pays? 718

- 31.01 First Instance and Ultimate Responsibility Compared 718
- 31.02 Contribution Among Wrongdoers 718
- 31.03 Noncontractual Indemnity 719
 - A. Basic Principle: Unjust Enrichment 719
 - B. Noncontract and Contract Indemnity Differentiated 720
 - C. Some Classifications 720
 - D. Employer Indemnification 722
 - E. Comparative Negligence 723
 - F. Preemption 723
 - G. Settlements 724
- 31.04 Implied Contractual Indemnity 724
- 31.05 Contractual Indemnity 724
 - A. Indemnification Compared to Exculpation, Liability Limitation, and Liquidated Damages 724
 - B. Indemnity Clauses Classified 725
 - C. Functions of Indemnity Clauses 726
 - D. Statutory Regulation 728
 - E. Common Law Regulation: Specificity Requirements 729
 - F. Interpretation Issues 731
 - Losses and Indemnity Coverage* 731
 - Work-Relatedness of Injury* 731
 - Amount Payable* 732
 - Who May Enforce Indemnity Clause* 733
 - G. The AIA Indemnity Clause 733
 - H. Insurance 735

CHAPTER THIRTY-TWO

Surety Bonds: Backstopping Contractors 737

- 32.01 Mechanics and Terminology 737
- 32.02 Function of Surety: Insurer Compared 738
- 32.03 Judicial Treatment of Sureties 738
- 32.04 Surety Bonds in Construction Contracts 739
- 32.05 Bid Bond 740
- 32.06 Performance Bond 741
- 32.07 Payment Bond 741

- 32.08 Subcontractor Bonds 742
- 32.09 Other Bonds 742
- 32.10 Some Legal Problems 742
 - A. Who Can Sue on the Bond? 742
 - B. Validity of Bond 744
 - C. Surety Defenses: On Demand Bonds 744
 - D. Surety Responsibility 746
 - E. Bond Limits and Surety Bad Faith 748
 - F. Bankruptcy of Contractor 748
 - G. Asserting Claims: Time Requirements 749
 - H. Reimbursement of Surety 749
 - I. Regulation: Bad-Faith Claims 750

CHAPTER THIRTY-THREE

**Terminating a Construction Contract:
Sometimes Necessary but Always
Costly 752**

- 33.01 Termination: A Drastic Step 752
- 33.02 Termination by Agreement of the Parties 754
- 33.03 Contractual Power to Terminate 754
 - A. Default Termination 754
 - B. Termination or Suspension for Convenience 757
 - C. Events for Which Neither Party Is Responsible 759
 - D. Role of Design Professional 759
 - E. Waiver of Termination and Reinstatement of Completion Date 760
 - F. Notice of Termination 762
 - G. Taking Over Materials and Equipment 763
 - H. Effect on Existing Claims for Delay 763
 - I. Disputed Terminations 764
 - J. Public Contracts and Constitutional Protection 764
- 33.04 Termination by Law
 - A. Material Breach 765
 - B. Future Breach: Prospective Inability and Breach by Anticipatory Repudiation 766
 - C. Bankruptcy 767
- 33.05 Restitution When a Contract Is Terminated 768
- 33.06 Keeping Subcontractors After Termination 769

Appendix A

Standard Form of Agreement Between Owner and Architect (AIA Document B101-2007) A-1

Appendix B

Standard Form of Agreement Between Owner and Contractor (AIA Document A101-2007) B-1

Appendix C

General Conditions of the Contract for Construction (AIA Document A201-2007) C-1

Appendix D

Performance and Payment Bonds (AIA Document A312-1984) D-1

Appendix E

Standard Form of Agreement Between Contractor and Subcontractor (AIA Document A401-2007) E-1

Appendix F

Construction Industry Dispute Resolution Procedures (Including Mediation and Arbitration Rules) (American Arbitration Association, effective September 1, 2007) F-1

Appendix G

Standard Form of Agreement Between Owner and Engineer for Professional Services (EJCDC Document E-500 (2002)) G-1

Appendix H

Case Index CI-1

Preface

The primary focus of this edition, as in editions that preceded it, is to provide a bridge for students, mainly architectural and engineering students, but increasingly, those in business schools and law schools, between the academic world and the real world. We hope to provide a cushion for the inevitable shock such a transition generates. The world of the classroom, with its teachers and its books, is not the same as the world of construction with its developers, owners, design professionals, contractors, building inspectors, loan officers, and public officials that regulate the construction process.

This cushion requires that readers understand what is law, how it is created, how it affects almost every activity of human conduct, and how legal institutions operate. This cannot be accomplished through simply stating “the law.” It requires clear, concise, jargon-free text that probes beneath the surface of legal rules to uncover why these rules developed as they did, outline arguments for and against these rules, and examine how they work in practice.

This is a national textbook. We do not concentrate on the law of any particular state. It is difficult to state an American rule with fifty states and a federal jurisdiction. A few areas of law that are relevant to the Construction Process are exclusively regulated by federal law.¹ Yet most disputes are governed by the law of each state. This does not mean that there are fifty rules. Those who survey the cases will find that there is a majority rule and one or more minority rules. We will try to emphasize the majority rule without ignoring that some states have provided a different legal solution.

¹As illustrations see Sections 14.08G (Occupational Safety and Health Act) and 16.03–16.06 (Copyright and Patents).

We provide many illustrations of how the legal rules operate through summaries of actual cases and reproduction of some cases. We do this to demonstrate how legal rules work in practice, how most disputes are resolved by the facts in the case, and, in the case of actual judicial opinions, how judges decide cases.

Describing legal rules and how they operate is not an in-depth or exhaustive treatment of something as complex as Construction Law. Footnotes are one way to at least hint at greater complexity. With this in mind, let us express our footnote philosophy.

The primary role of footnotes is to provide authority for textual statements that we believe require documentation. Another function is to indicate a deeper level of complexity of a legal problem without detracting from the primary explanation provided in the text. This leads to a third function of footnotes: to provide references that will enable the student, the researcher, or the practicing attorney to dig more deeply into a particular legal problem.

Footnote references can be statutes, regulations, or cases. In addition to these primary sources of law, references can include the burgeoning secondary literature, texts and legal journals, that examine Construction Law in depth and from a practical perspective. Finally, references can include techniques used by Standard Construction Documents that have suggested solutions for many legal and practical problems.

Each of us has taught courses in Construction Law. We have found that students often wish to do research into legal problems. They are helped by footnote references we have provided. Legal research is not limited to law students. We have found that students in architecture and engineering schools also engage in legal research and

that footnote references help them. In addition, lawyers or design professionals handling legal materials in practice have informed us that these references have helped them.

The main impetus for the Eighth Edition is the publication by the American Institute of Architects (AIA) of new editions of its principal documents for design services (B101–2007), prime construction services (A101–2007 and A201–2007), and subcontracting services (A401–2007). The dual linchpins in the AIA panoply of standard form documents—for design and prime construction services—were greatly changed from their 1997 predecessors. Both documents were affected by the AIA’s introduction of a new project participant: the Initial Decision Maker (IDM). Unusually, the numbering of the design services document was changed from B141 to B101. Stylistically, the AIA in 2007 began referring to the parts of its documents as sections, whereas previously they were referred to as paragraphs. This style change is reflected in the text of this book.

AIA documents are the backbone of the contractual aspects of the American construction industry. Any book dealing with construction law should refer to the most current AIA documents. These documents reflect the AIA thinking on risk distribution and contract administration. The newest versions of these documents—the agreement between owner and architect (B101), the agreement between owner and prime contractor (A101), the “general conditions” (A201), the performance and payments bonds (A312), and the subcontract (A401)—are reproduced respectively in Appendices A, B, C, D and E.

While a major revision to the AIA standard form documents by itself justifies a new edition, new sets of standard form documents were published by two other organizations.

The Engineers Joint Contracts Documents Committee (EJCDC) publishes documents dealing with engineering services. As this book is going to press, the EJCDC has published some new documents, whereas others are still under revision. The appendix of this book contains a new “general conditions” document, C-700 (2007), and a new owner/contractor agreement, C-520 (2007). However, the existing version of the agreement between owner and engineer, E-500 (2002), is included in the appendix because its successor document is still under revision. These standard form documents are reproduced in Appendices G (E-500), H (C-520), and I (C-700).

Finally, in 2007 the Associated General Contractors of America (AGC) for the first time has refused to endorse the new AIA documents. Instead, the AGC, in combination with several other trade associations, has produced a new series of standard form documents, called ConsensusDOCS. At this point, both the market impact and judicial treatment of the ConsensusDOCS are unknown. While these new standard form documents are mentioned,² they are not reproduced in the appendix and are not discussed in depth.

Alternative dispute resolution (ADR) is of increasing importance to the construction industry. The most significant document governing ADR is the Construction Industry Arbitration Rules and Mediation Procedures of the American Arbitration Association, revised and issued on September 1, 2007. This document is reproduced in Appendix F.

Reasons other than the issuance of new standard construction documents also prompt this new edition. Law, though it seeks stability, is not static. New cases come pouring out of the courts daily. Legislatures enact new statutes in every new session.

The construction industry is also constantly changing in response to market and technological forces. This Eighth Edition amplifies on alternative project delivery methods previously discussed, such as construction management³ and design-build.⁴ More importantly, this edition introduces new project delivery methods: lean project delivery,⁵ project alliance,⁶ program management,⁷ and building information modeling (BIM).⁸

A plethora of changes have had an impact in disparate ways on the roles and rights of design professionals and on other important actors in the construction industry, particularly contractors. Changes in the roles and rights of design professionals impact on contractors and others.

As noted, one of the most significant changes made by the AIA to its standard form documents was the introduction of a new project participant, the Initial Decision Maker. The nature of this new role and its impact upon

⁷Section 17.04K.

⁸Section 17.04M.

the architect are reviewed.⁹ We explore how a new United States Supreme Court decision on patent infringement impacts an architect's intellectual property rights.¹⁰ California has passed a series of statutes directly addressing an architect's indemnity rights.¹¹ Limitation of liability clauses, most commonly used by engineers, receives expanded attention.¹² The question of whether the relationship between an architect and her client is a fiduciary one is newly reexamined.¹³

Substantive construction law is a complex amalgam of judge-made and statutory law. Looking at the latter factor first, statutory regulation of the construction industry continues unabated, as does the judicial interpretation of those laws. An unlicensed contractor's right of recovery against the client, as well as the client's right of reimbursement of payments already made, are given an updated treatment.¹⁴ A growing trend is for state legislatures to remove certain classes of disputes—in particular, those involving homeowners—from the litigation process, either by giving owners specified warranty rights or contractors a right to remedy the defects before litigation may be started.¹⁵ Risk transfer through the use of indemnity agreements is essential to the construction process. An updated review of statutory regulation of these agreements is provided.¹⁶

Changes in the general, judge-made law impacts on the law applicable to the construction industry. The material dealing with products liability,¹⁷ the economic loss rule,¹⁸ and contribution and noncontractual indemnity¹⁹ have been updated to take into consideration these broader legal developments. In addition, construction law and general contract law are intimately related. Discussion of the “plain meaning” rule of contract interpretation is greatly amplified, and a new case has been added.²⁰

The ever essential *Spearin* doctrine, imposing upon the owner an implied warranty for certain design defects,

receives an updated and expanded analysis, including a discussion of a United States Supreme Court decision.²¹

The concept of the “stigma” effect of defective construction and the effect that it may have on the owner's damages are introduced.²²

As the holder of the contract funds, the construction lender's liability to unpaid subcontractors for allegedly negligent disbursement of the funds receives updated treatment.²³

Much of the dispute resolution process in the construction industry is through alternative dispute resolution (ADR) and, in particular, arbitration. The concern that such agreements deprive consumers and homeowners of their rights remains a hotly disputed topic.²⁴ A corollary issue is whether a judge or the arbitrator decides whether the parties must arbitrate their claim.²⁵ The newest AIA documents give a greater role to mediation.²⁶

The regulatory scheme surrounding the construction industry is also updated. A leading United States Supreme Court case upheld from constitutional challenge a municipality's taking of private property for the purpose of economic development.²⁷ The environmental movement, broadly defined, affects the construction industry in a variety of ways. Statutory developments have been updated and also expanded to include so-called brown-fields legislation.²⁸ A new discussion addresses the industry's own attempts to create environmentally friendly design and construction, including the creation of LEED standards.²⁹

Although federal procurement law as a general matter is not covered, federal legislation, regulations, and decisions in federal procurement construction disputes often spearhead changes among the states. For this reason, a new Section discussing the Federal False Claims Act is added.³⁰ In addition, creation of the new Civilian Board of Contract Appeals is noted.³¹

We seek not only to accurately describe the construction industry and the applicable law, but also to provide suggestions for reform. A proposal is made for the major project participants, before commencement of the work, to enter into a Defect Response Agreement, under which they agree in advance to divide the cost of inevitable defects, thereby precluding this issue from impeding performance.³² Also, mechanics' liens are a time-honored mainstay of the construction process, meant to guarantee payment of subcontractors, yet the question is asked whether subcontractors would be better off if such liens were simply abolished.³³

Now, for our nonlawyer readers, let us outline the mechanics of citing case decisions. Although legal citations seem complicated, they are, in reality, quite simple. There are four elements to a citation. A simple citation would be *Sniadach v. Family Finance Corp.*, 395 U.S. 337 (1969). First, the name of the case is given, usually with the plaintiff (the person starting the lawsuit) listed first, followed by the defendant. "U.S." is an abbreviation of the reporter system from which the case is taken, in this case the United States Supreme Court Reports. The number preceding the abbreviation of the reporter system (395) is the volume in which the case is located. The number following the abbreviation of the reporter system (337) states the page on which the case begins. The citation concludes with the year that the court announced the decision.

Many significant reported appellate opinions come from the Federal Circuit Courts of Appeal. *Moorehead Construction Co. v. City of Grand Forks*, 508 F.2d 1008 (8th Cir.1975) is illustrative. Following the name of the parties, an abbreviation of the series of reports in which the opinion is contained (F.2d) (Federal Reporter, Second Series) is given. Again, it is preceded by the volume (508) of the report. The reporter abbreviation is followed by the page on which the case begins (1008). The particular federal circuit court (8th) deciding the case follows. The citation is completed by the year (1975) of the decision.

A third type of federal court is the district court, the trial court of general jurisdiction. Although state trial court opinions (except those from New York) are not collected and published, some trial court opinions of the federal district courts are published. An example is *Gevyn Construction Corp. v. United States*, 357 F.Supp. 18

(S.D.N.Y.1972). The opinion is collected in the Federal Supplement (F.Supp.). The name of the reporter series is preceded by the volume number of the report and followed by the page on which the opinion begins. This citation shows that the district court was the Southern District of New York (S.D.N.Y.). Larger states have different courts located in different cities. Again, the citation concludes with the date (1972) the opinion was issued.

To understand state court citations, it is essential to understand the role of the West Regional Reporter System. At one time, most state citations had two citations—one to the official reporter system selected by the court and the other to the unofficial reporter system, usually the West Regional Reporter System. West divided the states regionally and published sets of reporters based on these regional classifications. If a state still has an official report system, a typical citation would be *Anco Construction Co. v. City of Wichita*, 233 Kan. 132, 660 P.2d 560 (1983). This citation indicates that the case came from the Kansas Supreme Court (Kan.) and is also collected in the Pacific Reporter (P.2d).

States are increasingly abandoning the official reporter system and cite only to the West Regional Reporter System. An example is *Smith v. Gilmer*, 488 So.2d 1143 (La.App.1986). This citation, from the Southern Reporter, indicates that this was a decision of the Louisiana Court of Appeals (its intermediate appellate court) and that there is no official reporter system in Louisiana.

Finally, two of the more populous states—California and New York—have an unofficial reporter published by West that collects all the reported opinions from those states. In California, it is the California Reporter; in New York, it is the New York Supplement. Decisions by the highest appellate court—in California, the Supreme Court, and in New York, the Court of Appeals—are found in the California Reporter and the New York Supplement, respectively, as well in the official and regional reports. For example, the California Supreme Court case of *Pollard v. Saxe and Yolles Dev. Co.* is cited 12 Cal.3d 374, 525 P.2d 88, 115 Cal.Rptr. 648 (1974). "Cal" is the official reporter, Cal.2d being the second series of that reporter. "P.2d" is the second series of the Pacific Reporter. "Cal.Rptr." collects all California appellate cases, Supreme Court decisions as well as those of the intermediate California Courts of Appeal. Similarly, a decision by the New York Court of Appeals would be found in its official reporter (N.Y. or N.Y.2d) and the West

³²Section 24.11.

³³Section 28.07.

Regional Reports, the North Eastern Reporter (N.E. or N.E.2d) and the New York Supplement (N.Y.S., N.Y.S.2d, or N.Y.S.3d). The New York Supplement also contains decisions of the New York intermediate courts of appeal (the Appellate Division of the Supreme Court) and the Supreme Court (the New York trial court). Intermediate appellate court decisions from these states would have only two citations—one to the official reports and the other to the California Reporter and the New York Supplement. Intermediate appellate court decisions from these states are not included in the regional reports. (The Table of Abbreviations lists citation references—see the endpapers of this book.)

The number of reported appellate decisions has increased greatly. Most reporter systems have gone into a second, third, or even fourth series of reports. This is indicated by the citation in the *Pollard* case, which shows that the official reporter is in the third series, the unofficial regional reporter is in the second series, and the California Reporter was at that time still in its first series. (It now is in its third series.)

The hierarchical nature of the court system means that parties receiving a decision by a lower-level court may try to appeal the decision. The higher-level court has several options. If it accepts the appeal, it usually either affirms the lower court opinion or reverses it. This is indicated by the terms “aff’d” (affirmed) or “rev’d” (reversed) appearing after the citation of the lower court decision. If the higher-level court refuses to hear the appeal, that is indicated in various ways: “review denied,” “appeal denied,” or “cert. denied,” where “cert.” is short for the term “certiorari.” An example is *McDowell-Purcell, Inc. v. Manhattan*

Constr. Co., 383 F.Supp. 802 (N.D.Ala.1974), aff’d, 515 F.2d 1181 (5th Cir.1975), cert. denied, 424 U.S. 915 (1976). If the higher court opinion appears in the same year as the lower court opinion, the date appears only once and at the end. An example from the New York court system is: *J. P. Stevens & Co. v. Rytex Corp.*, 41 A.D.2d 15, 340 N.Y.S.2d 933, aff’d, 34 N.Y.2d 123, 312 N.E.2d 466, 356 N.Y.S.2d 278 (1974). This later case history is provided primarily for purposes of accuracy and should not concern the student reader.

On the very different stylistic matter of pronouns, we avoid the awkward “he or she” format. In many instances, the actor is a corporation or government entity and the neutral pronoun (“it”) is used. Otherwise, we alternate chapters: the male pronoun is used in odd chapters and the female pronoun in even chapters.

Finally, special thanks are given to several professors who reviewed the Seventh Edition and made suggestions for the Eighth: Lansford C. Bell, Clemson University; Steven M. Goldblatt, University of Washington; Dana Sherman, University of Southern California; Kelly Strong, Iowa State University; and Blake E. Wentz, Milwaukee School of Engineering. Preparation of this Eighth Edition was greatly enhanced by their input. These reviewers have contributed ideas, suggestions, and new perspectives. The result is an improved, newer edition.

Sources of Law: Varied and Dynamic

SECTION 1.01 Relevance

Law consists of coercive rules created and enforced by the state to regulate the citizens of the state and provide for the general welfare of the state and its citizens. Law is an integral part of modern society and plays a major role in the construction process. Because this text examines the intersection between law and the construction process, it is important to be aware of the various sources of law and the characteristics and functions of the law.

Many illustrations can be provided; suppose a man who owns property wishes to build a house to provide shelter for his family. Without assurance that stronger people will not use force to seize materials with which he is building or throw him out of the house after it is built, it would take an adventurous or powerful person to invest time and materials to build the house. Similarly, workers would be reluctant to pound nails or pour concrete if they were fearful of being attacked by armed gangs. Here, criminal law protects both the property owner from those who might take away his property and the workers from those who might harm them.

Similarly, contractors would hesitate to invest their time or money to build houses if they did not believe they could use the civil courts to enforce their contracts and help them collect for their work if owners did not pay them. Workers would be less inclined to work on a house if they were not confident they could use the civil courts to collect for work they had done, or to compensate them if they were injured on the job.

Finally, some would be unwilling to engage in construction activity if they were not confident that an impartial forum would be available if disputes arose over performance.

Were the state not to provide such a forum, participants might settle their disputes by force.

Today various sources of law seek to fill these needs. These sources of law are spotlighted in this chapter. Chapter 2 focuses on the U.S. judicial system.

SECTION 1.02 The Federal System

Very large countries, such as the United States, Canada, Australia, Nigeria, and India, employ a federal system of government. Even smaller countries, particularly those with distinct religious, linguistic, ethnic, or national communities (for example, Switzerland), may choose to live under a federal system. A federal system of government gives local entities limited autonomy to deal with cultural and other activities. The alternative would be domination by the majority or by small, often economically inefficient or weak nation-states.

In a federal system, power is shared; the exact division of power between the central government and constituent members varies. For example, Canada has a looser federal system than the United States, with Canadian provinces having more autonomy than U.S. states.

A federal system may be created in a large country where people living in one part of the country hold political, social, or economic views distinct from the rest of the country. For example, New York might choose to provide greater social benefits for its citizens than Texas. Similarly, some states may wish to execute murderers, whereas others may not. In a federal system, diverse views may be accommodated within one country.

Also, depending on its characteristics, a federal system can bring citizens closer to those who govern them. A rancher in Wyoming may resent being controlled by a legislature in Washington but may be more willing to submit to laws that come from Cheyenne. When the entities of a federal system are themselves large, such as Canadian provinces or U.S. states, citizens may see even the state capital as being too remote and may prefer to be governed by those they elect in their cities or towns.

The federal system recognizes the need for a central government to deal with certain issues on behalf of all citizens. For example, the U.S. federal government controls currency, foreign relations, and defense, to mention a few of the areas it controls exclusively. The constitutional framers did not want each state to have its own currency, foreign policy, or military forces.

Other functions, such as the enactment of tax laws, can be shared by the federal government and state governments. Similarly, federal and state laws deal with crime, labor relations, and—to use an illustration more germane to construction—worksite safety. To avoid duplication of enforcement efforts and to relieve construction contractors from inconsistent regulations, the federal government, though dominant, can delegate workplace safety standards and their enforcement to the states so long as the states meet federal standards. Similar delegations are found in environmental protection laws.

Despite general federal supremacy over the states, the U.S. Constitution reserved some authority to the states. For example, except for contracts made by the federal government or those affected with a strong federal interest, state law determines which contracts will be enforced, the remedies granted for breach of contract, the conduct that gives rise to civil liability, and the laws that relate to the ownership of property—all core legal concepts in the construction process. As a result, most law that regulates construction is determined by the state in which the project is located or in which the activities in question are performed.

This can and sometimes does lead to variations in legal rules that relate to construction. However, the dominance of standard contract forms, created by national associations for nationwide use; the willingness of courts in one state to look at and often follow the decisions from another state; and the unification of areas of private law, such as the sale of goods, have all minimized the actual

variation in state laws that relate to construction. Some laws vary greatly, such as mechanics' lien laws and licensing, both of which are regulated by state statutes.

SECTION 1.03 Constitutions

When organizations are created, whether political, economic, or social, they usually attract members because of their goals, the methods they choose to achieve the goals, and the procedures by which they operate. Often these factors are set forth in a basic set of principles or rules providing a constitutional framework that induces people to join and regulates the operations of the organization. Although this basic set of rules may be referred to by different labels, it provides a constitutional framework intended to be durable and, although not immutable, amendable only with the consent of most members of the organization.

Most organizations need rules to govern day-to-day operations. These rules, although created with less formality than constitutional rules and more responsive to changing conditions, must stay within the basic framework of the constitutional rules. For example, a business corporation will usually have articles of incorporation that operate as a constitution of the corporation and are agreed on by those who create the corporation and available to those who wish to purchase shares. The corporation is also likely to have bylaws that regulate corporate activities and that are often more detailed and more easily changed. In addition, a large corporate organization may need standard operating procedures and hierarchical authority mechanisms to control the corporate operation.

For two centuries the U.S. Constitution has regulated the power among the branches of the federal government, the federal government and the states, and all governments and their citizens. Despite universal admiration for this durable document, the wealth of federal laws that have been enacted attests to the importance of legislation as a method of dealing with changing circumstances and the varying allocation of political power.

On the whole, state constitutions are longer than the federal Constitution and are changed more frequently. Although not identical, they share common characteristics with the U.S. Constitution, mainly the separation of powers among the legislative, executive, and judicial branches

of government and the importance of protecting citizens from abuse of power by the states.

With a few exceptions, constitutional law does not play a significant role in the construction process.¹

SECTION 1.04 Legislation

Legislation, mainly at the state level, plays an increasingly large role in the construction process. Those who wish to understand how law affects design and construction must pay increasingly careful attention to legislation. Legislation is the most democratic lawmaking process. It expresses the will of the majority of the citizens of the state. (Perhaps the only source of law more democratic is the law that contracting parties create to regulate their private rights and duties.)

Legislatures are political instrumentalities. Persons and organizations seek to influence lawmakers. Although often denigrated as an area where power and money control, legislation often reflects popular attitudes. Lawmakers who vote in ways not popular with their constituents are likely to be removed from office. Also, legislation can be enacted quickly to respond to what the legislature believes to be important social and economic needs of its citizens.

The legislative process functions at different governmental levels, such as federal, state, county, and city legislative bodies.

Legislators do not have absolute freedom to enact legislation. The checks and balances so central to the American political process bar legislators from absolute power even though the legislatures do represent the political will of the citizens. Laws must be constitutionally enacted, and the constitutionality of a law is determined by the courts. In their role of interpreting legislation, the courts can indirectly control the legislature and the political desires of the majority. Similarly, local units such as counties, cities, or special districts are limited by the legislation that has created them.

Legislation—again, mainly at the state level—affects numerous aspects of the construction industry, from the

planning stage through the resolution of postperformance disputes. Local legislative bodies, exercising their power to protect the public and regulate land use, determine whether and which types of projects may be built.² Housing and building codes control the quality of construction.³ Licensing and registration laws determine who may design and who may build.⁴

Even though American law values freedom of contract, legislation increasingly regulates the content of construction contracts. Statutes preclude certain types of indemnification provisions in construction contracts.⁵ The payment process is also regulated, with statutes addressing payment conditions,⁶ payment promptness⁷ and retainage.⁸

Mechanics' liens⁹ and trust fund¹⁰ laws bestow statutory rights upon unpaid subcontractors and suppliers. Statutes affect the litigation process by encouraging arbitration.¹¹ Residential building contracts are especially regulated, with statutes specifying contract language,¹² dispute resolution procedures¹³ and warranties.¹⁴ In short, while construction law originated in the common (or judge-made) law, today legislation is an integral part of the legal framework governing the building industry.¹⁵

The Uniform Commercial Code (UCC), particularly Article 2, deals with transactions in goods. The UCC was developed by the American Law Institute and the Commissioners on Uniform State Laws, both

private organizations devoted to unification of private law. At present, all states but Louisiana have adopted the UCC. (Louisiana, influenced by its civil law tradition, has adopted only some parts of the UCC.) Article 2 regulates the sale of materials and supplies used in a project. Although it does not regulate construction itself (inasmuch as it does not govern services), it can be influential in a construction dispute. Reference is made to it in this book.

SECTION 1.05 The Executive Branch

The separation of powers central to the U.S. political system is designed to prohibit any of the three branches—executive, legislative, or judicial—from wielding dominant power. Although laws come out of the legislature, the executive and judicial branches participate in lawmaking. The executive branches—the president at the federal level, the governor at the state level, and the mayor in some municipal systems—are elected by all the citizens. Federal and state chief executives and sometimes local chief executives can veto legislation. To override a veto requires more than a simple majority of the legislature, usually two-thirds.

The chief executive can issue executive orders to those under his control. But more important, the chief executive, such as the president or the governor, has the power to appoint the heads of administrative agencies or administrative boards that play a significant role in construction. Examples of such regulatory instrumentalities are those that deal with workplace safety, registration of design professionals, and licensing of contractors, to name only some of the most important.

SECTION 1.06 Administrative Agencies

One great change in the U.S. governmental structure has been the emergence of administrative regulatory agencies at every level of government, but particularly at federal and state levels. Such agencies developed for a variety of reasons. First, special activities and industries were thought best regulated by experts in those activities and industries. Second, legislatures were often unable or unwilling to involve themselves in the details of regulation. Third, regulation through

agencies was thought to be better than no regulation (this changed in the 1980s, with some industries being deregulated) or government operation of these activities and industries.

The constitution for a regulatory agency is the legislation creating it. In that sense, the agency is a creation of the legislature. However, the chief executive usually appoints key agency officials, often with the advice and consent of the legislature. Legislatures, particularly Congress, monitor agency performance through exercising an oversight function. This is accomplished through committee hearings during which complaints are heard and agency officials are asked to give explanations.

Agencies operate through issuance of regulations and through disciplinary actions. Such activities are subject to judicial review. During the period when many of these agencies were created, courts extended almost total deference to such agencies because of presumed agency expertise. As the agencies became more active and as complaints became more vocal about their aggressiveness and preoccupation with problems that some thought trivial, the courts and legislatures looked at agencies' powers and activities more carefully.

Regulation through administrative agencies has generated intense controversy. Some agencies are attacked as being under the control of those they are supposed to regulate. This is asserted by pointing to agency employees being selected from the regulated industries or to agency employees looking forward to being hired by members of the industry after they leave agency employment. However, agencies have also sometimes been attacked for overzealous regulation, and such attacks had some success in the 1980s.

Administrative agencies play an important role in some aspects of the construction process. They are often given responsibility for implementing laws enacted by the legislatures, such as laws on licensing and registration of professionals, workplace safety (especially the federal Occupational Safety and Health Administration (OSHA)), environmental protection (especially the federal Environmental Protection Agency (EPA), discussed in Section 9.13B), and social insurance for workplace injuries (worker's compensation, discussed in Section 7.04C). At local levels, administrators play important roles in land use control and construction quality. In areas affecting public safety, the most important source of law is regulations issued by administrative agencies.

SECTION 1.07 Courts: The Common Law

Courts are an important part of the lawmaking process. Exercising their power of judicial review, they determine whether legislation is constitutional and interpret the legislative enactments. They have the principal responsibility for granting remedies under legislative systems. Courts also pass on and interpret administrative regulations and grant remedies for violations.

The sense in which courts are a source of law central to the construction process is principally based on the dual function of U.S. appellate courts. First, the appellate courts review trial court decisions by providing a forum for litigants dissatisfied with judgments of the trial courts. Second, and more important, the process by which appellate courts judge the correctness of decisions made by trial courts has had an immense impact on design and construction. To resolve disputes, American courts follow precedent. An understanding of how courts make law and resolve disputes requires an understanding of the precedent system discussed in Section 2.14.

SECTION 1.08 Contracting Parties

Sources of law usually are public bodies. Yet contract law, with the broad autonomy granted the contracting parties to determine the terms of their exchange, grants lawmaking power to those who make contracts.

Even though autonomy is seen as an inherent liberty in a free society, the state still plays a role—enough of a role to create a “partnership” between contracting parties and the state. Despite broad autonomy given the parties, the state still determines who can contract, creates the formal requirements, and provides remedies when contracts are not performed.

If the contracting parties can make their contract a source of law, this is the most democratic form of lawmaking. The contracting parties freely determine the terms of their exchange and voluntarily limit their freedom of action by agreeing to perform in the future, with the coercive arm of the state operating if they do not.

Chapter 5 is devoted to some aspects of contract law, and Chapter 6 to contract remedies. At this point, it is sufficient to mention the emergence of the bipolar analysis of contract law, which sharply distinguishes between

negotiated contracts and contracts of adhesion. The former emphasize autonomy or freedom of contract based on consent being freely given by the contracting parties. The latter involve contracts made with the terms, or at least most of them, largely dictated by one of the parties and merely adhered to by the other. This distinction is discussed in Section 5.04C.

SECTION 1.09 Publishers of Standardized Documents

Adhesion contracts, represented by printed contracts, are prepared by one party to the contract largely, if not exclusively, with its own interests in mind. Yet many printed forms used in contracts for design and construction should not be considered adhesion contracts in the sense that the term is used in Sections 1.08 and 5.04C. Contracts for design and construction services often are based largely on documents published by professional associations such as the American Institute of Architects (AIA), the Associated General Contractors of America (AGC), and the Engineers Joint Contract Documents Committee (EJCDC), a consortium of professional engineering associations, to mention some of the most important.¹⁶

These associations have no official status, and some would contend they cannot be considered sources of law. Certainly contracting parties need not use the standardized documents or, if they do use them, are free to make drastic changes. But the frequency with which these documents are used largely unchanged justifies classifying these associations as sources of law. Increasing legislative regulation of the construction contracting process may at some point necessitate the promulgation of state-specific standard documents; however, that day has not as yet arrived.¹⁷ Even if in a technical sense they should not be ranked alongside courts, the realities of construction contracting make them even more important.

¹⁶Sweet, *The American Institute of Architects: Dominant Actor in the Construction Documents Market*, 1991 Wis.L.Rev., 317 (1991). Some of the more important AIA and EJCDC standard documents are included as appendices to this book.

¹⁷Section 1.04.

SECTION 1.10 Restatements of the Law

Many of the common law rules, together with comments and examples, have been codified in a series of volumes called Restatements of the Law. They are published by the American Law Institute, a private organization made up of lawyers, judges, and legal scholars. The institute's function is to collect case law from all the states and distill it into rules. Because the common law is a dynamic and robust disputes resolution system, the legal rules generated change over time. As a result, the Restatements of the Law have been updated; for example, the Restatement (Second) of Contracts was published in 1981, while a Restatement (Third) of Torts is currently being issued.

Unless adopted by a legislature or followed by a court, Restatement rules are not law. The principal restatements for the purposes of this book are those of torts, contracts, and agency.

SECTION 1.11 Summary

Understanding how law bears on design and construction requires a recognition of the wide variety of law sources. People involved in design and construction should be aware of the laws and legal institutions that have placed their mark on these fields. And people in these fields must appreciate which sources of law predominate and the forms that legal intervention takes. A half-century ago, it could be confidently stated that the principal sources of law in design and construction were the contracting parties and the courts. Increasingly, however, other instrumentalities such as legislatures and regulatory agencies are leaving their imprint on design and construction.

The American Judicial System: A Forum for Dispute Resolution

SECTION 2.01 State Court Systems: Trial and Appellate Courts

Each U.S. state has its own judicial system. Courts are divided into the basic categories of trial and appellate courts. Within each category may be a subclassification based on amount or type of relief sought or on the nature of the matter being litigated.

The basic trial court, frequently called the court of general jurisdiction, hears all types of cases. Depending on the state, it may be called a superior, district, or circuit court. The bulk of the work before such courts consists of criminal cases, personal injury cases, commercial disputes, domestic matters (divorce, custody, and adoption), and probate (transfer of property at death).

A court of general jurisdiction may review determinations of administrative agencies (zoning, employment injuries, licensing, etc.). The presiding official will be a judge, and in certain matters there may also be a jury. The division of functions between judge and jury is discussed in Sections 2.10 and 2.11. Courts of general jurisdiction are usually located at county seats.

Many states have established subordinate courts of limited jurisdiction. Municipal or city courts often have jurisdiction to hear disputes that involve less money than a minimum figure set for courts of general jurisdiction. There can also be a jury in such cases. As a rule, the dockets are less congested in these courts of limited jurisdiction than are the dockets in the courts of general jurisdiction. The procedures in municipal or city courts are essentially the same as those in the courts of general jurisdiction.

Some state legislatures have established small claims courts that provide expeditious and inexpensive procedures for disputes involving small sums. Usually the party

seeking a remedy from such a court can start the legal proceeding by paying a small filing fee and filling out a form provided by the clerk of the small claims court. The procedures are usually informal. There are no juries. Although the judges are lawyers, attorneys are less important in such disputes, and in some states attorneys are not permitted to represent the parties.

Some states still use justices of the peace, a vestige of a rural, dispersed society. These judges often have had little or no legal training. Although they are being phased out in favor of small claims, municipal, or city courts, they still exist in sparsely populated areas of some states. The future may witness their elimination.

At least one appeal is usually possible from a decision of a trial court. Generally the appeal is to the next highest court. For example, a party losing a decision in a municipal court may have a right to appeal to the court of general jurisdiction or to an appellate division consisting of judges of the court of general jurisdiction. Appeals from courts of general jurisdiction are made to an appellate court. Beginning in the more populous states and increasingly in other states, appeals first must go to an intermediate appellate court. In states with such courts, the state supreme court generally is given the discretion to decide whether it will hear an appeal from an intermediate appellate court. In states without intermediate appellate courts, an appeal is made from the court of general jurisdiction to the supreme court of the state.

State court judges are either appointed by the governor or elected. Even states that elect judges have many judges who were initially appointed. Generally, judges are reelected and leave office only when they retire or die. Such vacancies are filled by interim appointments, and appointees are usually elected when they go before the voters.

Some states use an elective process in which all judges—or at least appellate judges—periodically submit their records to the electorate but do not run against other candidates.

SECTION 2.02 The Federal Court System

The U.S. judicial system includes two systems—federal and state—which to a degree exist side by side. Although each state has its own judicial system, the federal courts also operate in each state. The federal courts have jurisdiction to decide federal questions; that is, disputes involving the federal Constitution or federal statutes. They also have jurisdiction to hear civil disputes between citizens of different states, often called *diversity of citizenship* jurisdiction. In theory, the amount in controversy in each type of case must exceed \$50,000 exclusive of interest and costs, but the amount in controversy is important principally in diversity of citizenship cases.

Many claims brought before federal courts can also be brought in state courts, creating concurrent jurisdiction. Some matters, however, can be brought only in the federal courts. The principal areas of exclusive federal jurisdiction are as follows:

1. admiralty
2. bankruptcy
3. patent and copyright
4. actions involving the United States
5. violations of federal criminal statutes

Where exclusive federal jurisdiction exists, there is no requirement for amount in controversy.

The federal courts operate under more modern and less formal procedural rules than do most state courts. For substantive law (laws that establish legal rights and duties), the federal courts use the substantive law of the state in which they sit or some other applicable state law, unless the case involves federal law, such as a federal constitutional provision or a federal statute.

The basic trial court in the federal court system is the district court. Each state has at least one, and the populous states have a number of district courts located in the principal metropolitan centers.

The district court is presided over by a federal district court judge, and juries are used in certain cases. A party may appeal a decision of the district court to one of the

eleven circuit courts that hear appeals from that district. Another circuit court hears appeals mainly from decisions of U.S. administrative agencies. Another hears appeals from specialized federal courts.

A party dissatisfied with the result of a decision by the circuit court of appeals may ask that the U.S. Supreme Court review the case. In general, the Supreme Court determines which cases it will review. If it decides not to hear the case, the matter is ended. If it decides to hear the case, briefs and oral arguments are presented to the Court. The Supreme Court usually rejects petitions for hearings unless the matter involves either a conflict between federal circuit courts or an important legal issue.

Federal court judges are appointed by the president of the United States and are confirmed by the Senate. In essence, the judges serve for life or until voluntary retirement.

Within the federal system, a few courts deal with specialized matters. For example, the U.S. Court of Federal Claims (formerly the Claims Court) hears claims against the U.S. government, appeals from which are taken to the U.S. Court of Appeals for the Federal Circuit. Usually these cases relate to tax disputes or to disputes between government contractors and government agencies that award government contracts. Another specialized court is the Tax Court, which hears disputes between taxpayers and the government.

SECTION 2.03 Statute of Limitation: Time to Bring the Lawsuit

Statutory provisions require that legal action be commenced within a specified period of time. Such statutes in the context of the construction process are discussed in Sections 14.09C and 23.03G.

SECTION 2.04 Hiring an Attorney: Role and Compensation

Usually a person with problems that may involve the law or the legal system consults an attorney. After an inquiry into the facts and a study of the law, the attorney advises a client of her legal rights and responsibilities. Although the attorney may also give an opinion on the desirability of instituting legal action or defending against any action

that has been asserted against a client, the litigation choice is usually made by the client.

Unless the law sets the fee, which is rare, attorney and client can determine the fee. Sometimes the fee is a specified amount for the entire service to be performed, such as uncontested divorces or simple incorporations. The fee may be a designated percentage of what is at stake, such as in the probate of an estate. Often the fee is based on time spent by the attorney, typically computed on an hourly basis. If no specific agreement on the fee is reached, the client must pay a reasonable amount.

Hourly rates charged depend on the attorney's skill, the demands on the attorney's time, the amount at stake, the complexity of the case, what the client can afford, the locality in which the attorney practices, and the outcome in the event of litigation. Although hourly rates vary greatly, at present an experienced attorney located in a large city is likely to charge from \$250 to \$500 an hour. (The second edition of this book, published in 1977, stated the hourly rate as \$50 to \$75.)

Outstanding lawyers with a great deal of experience are encouraged to use "value" billing instead of an hourly rate. This is based on the possibility that in a very short period of time they can give advice that is worth much more than would be compensated under even a high hourly rate.

A potential client should ask a prospective attorney the likely charges for legal services. Such advance inquiry can avert possible later misunderstandings or disputes over the hourly rate. The client may wish to set a maximum figure for a particular legal service. Attorneys are reluctant to accept maximum figures, because it is often difficult to predict the amount of time needed to provide proper legal service.

Commonly in personal injury or death cases and occasionally in commercial disputes, attorneys use contingent fee contracts. The lawyers are not paid for legal services if they do not obtain a recovery for the client. Usually a client agrees to reimburse the attorney for out-of-pocket costs, such as deposition expenses, filing fees, and witness fees. For taking the risk of collecting nothing for time spent, the attorney will receive a specified percentage of any recovery. In personal injury cases, the percentage can range from 25 percent to 50 percent, depending on the locality, the difficulty of the case, and the reputation of the attorney. In some metropolitan areas, attorneys will charge 25 percent to 33 percent if they obtain a settlement without trial and 33 percent to 40 percent if they go to trial.

The contingent fee system is much criticized, especially where the attorney obtains an astronomical sum in a tragic injury or death case. Such a system gives the attorney an entrepreneurial stake in the claim. Some feel this is unprofessional and may influence the attorney's advice as well as raise questions when attorney and client disagree over settlement. Yet some defend the contingent fee as the only method by which poor clients can have their claims properly presented. States are beginning to regulate contingent fees.

While contingent fee contracts tend to be used in claims for personal injury, a variant on this technique has been used in commercial disputes. This variant is sometimes called a "success" or "blended or hybrid" fee. In such a contract, the attorney agrees to reduce her normal fee, usually an hourly fee, in exchange for a percentage of anything recovered. In one case, the attorney reduced her fees by 20 percent in exchange for 10 percent of any final recovery, less fees paid by the client. In such a method, the other party, rather than the client, must pay a contingent fee to the client's attorney.

A retainer is an amount paid by a client to an attorney either at the beginning of or periodically during the attorney-client relationship. Although the retainer can be an agreed-on value for the legal services performed by the attorney or an amount to pay for having a call on the attorney's services unrelated to fees for services, the retainer payment is more commonly an advance payment on any fees that the client is obliged to pay the attorney. Sometimes it covers routine services but does not include extraordinary services, such as litigation. The attorney and the client should agree on the function and operation of any retainer.

Some attorneys, particularly in criminal or matrimonial matters, label the retainer as nonrefundable. If the attorney's services are not requested under the terms of such a retainer, no refund is available. Attorneys who use nonrefundable retainers assert that once having been retained, they are barred from being retained by the other party, because retention can generate conflict-of-interest problems later. Such attorneys assert that the client has an option to use the attorney whose services she purchases by paying the retainer.

Opponents of the nonrefundable retainer assert that such a payment limits the right of the client to choose her own attorney. They also contend that it is unconscionable and unethical for attorneys to receive compensation when they do not perform services.

In the past, bar associations published schedules of recommended or minimum fees. Such schedules violate the antitrust laws and are no longer used. For a discussion of architectural and engineering fee schedules, see Section 11.03.

The high cost of legal services and an increasing use of prepaid group health plans has led some to suggest prepaid group legal service plans for those in construction, such as those available to members of many trade unions.

The law recognizes the need for a client to be as candid in communicating with an attorney as with a member of the clergy, a doctor, or a spouse. For this reason, the attorney must keep confidential any communication made by the client, unless the communication was to plan or commit a crime or if the client challenges the competence of the attorney's performance.

SECTION 2.05 Jurisdiction of Courts

Jurisdiction—the power to grant the remedy sought—means power over the person being sued and over the subject matter in question. This section discusses state court jurisdiction.

The U.S. Constitution requires that state and federal governments ensure that a defendant receives due process, the opportunity of knowing what the suit is about, who is suing, and where and when the trial will take place. Usually due process is accomplished by having a process server hand to the defendant, in the state where the trial is to take place, a summons ordering the defendant to appear and a complaint stating the reasons for the lawsuit. The power of the state to compel the defendant to appear does not extend beyond the border of the state. If the defendant does not come within the state, the state court in which the lawsuit has been brought would traditionally not have jurisdiction over the person or entity against whom the claim has been made. The plaintiff would have to sue in the state where the defendant actually could be handed the legal papers.

The requirement of physical presence in the state where the court sits can place great hardship on a plaintiff who may be forced to begin a lawsuit in a state that is far from the evidence and witnesses. For this reason, most states have enacted long-arm statutes that permit plaintiffs in certain cases to sue in their home state even though they cannot hand the legal papers to the defendant within the plaintiff's state.

Long-arm statutes are often used to sue defendant motorists who reside in a state other than the one where the accident occurred or where the injured party resides. Suppose an Iowa driver were involved in an accident in Illinois that injured an Illinois resident. The Iowa driver returns to Iowa after the accident. The injured Illinois resident can always sue in Iowa. Usually the injured party would also be given the opportunity to sue in Illinois by mailing a notice of the lawsuit to the other driver in Iowa or by filing legal papers with a designated state official in Iowa or Illinois.

Sometimes long-arm statutes are used to sue businesses that have their legal residence in a state other than that of the plaintiff. To illustrate, suppose a New York company sells, directly or indirectly, electric drills to Wyoming purchasers. A Wyoming buyer is likely to be able to sue the New York seller in a Wyoming court for injuries resulting from the purchase and use of a defective drill.

Jurisdiction may also involve the subject matter of the lawsuit. For example, if land is located in State A and there is a dispute as to the ownership of the land, only State A will have jurisdiction, even though persons who may claim an interest in the land may not be residents of State A and may not be served with the legal papers in State A.

States usually limit their jurisdiction to matters of concern to that state. A state may have jurisdiction because property is located in the state, the injury occurred in the state, the plaintiff or defendant is a resident of the state, or a contract was made or performed within the state.

Another aspect of jurisdiction relates to the type of remedy or decree sought. Early in English legal history, two sets of courts existed—law courts and equity courts. Juries were used in the former but not in the latter. In addition, equity court judges could award remedies not available in the law courts. Parties seeking equitable relief had to show that their remedy in the law courts was inadequate. As a result of this dual set of courts, two sets of procedural and substantive rules emerged. Generally, the procedures and remedies tended to be more flexible in the equity courts.

The division between law and equity was incorporated into the U.S. judicial system. However, a gradual merger of the two systems has occurred in most states. For all practical purposes, in most states only one set of courts exists, although some differences remain. The most important is that certain remedies may be given only by an equity court. The most important of these remedies are specific performance (under which one party is ordered by

a court to perform as promised in a contract), injunctions (orders by the court that persons do or do not do certain things), and reformation (rewriting of a written document to make it accord with the parties' actual intention).

As Section 2.10 explains, there are no juries when an equitable remedy is requested.

Contractual provisions sometimes specify the judicial forum for resolving disputes under the contract. Such clauses are generally upheld if they result from negotiation between contracting parties who are aware of the nature of the provision and are able to protect themselves. In the absence of any forum selection clause, the courts would apply their jurisdictional rules.

A distinction must be drawn between clauses that seek to bar a forum from one that would be available under the jurisdictional rules of the state, and clauses that seek to create jurisdiction where the state laws would not do so. The law will more likely allow a party to waive its right to use its courts if this was done deliberately and knowingly than it would allow contracting parties to create jurisdiction that would not already be present. The latter can place an unwelcome burden on the courts. Yet forum selection clauses can be the result of an abuse of power.

Increasingly, legislatures have addressed the problem of abusive forum selection clauses. For example, a Wisconsin law enacted in 1991 invalidates clauses in contracts for improving land in Wisconsin that require "that any litigation, arbitration or other dispute-resolution process on the contract occur in another state."¹ Under such a statute, a contract for building a structure in Wisconsin could not contain a provision requiring that disputes be resolved in New York.

SECTION 2.06 Parties to the Litigation

Generally, the party commencing the action is called the plaintiff, and the party against whom the action is commenced is called the defendant. In construction disputes, it is common for the defendant to assert a counterclaim

¹West Wis. Stat. Ann. § 779.135(2). Virginia also limits the place of arbitration to Virginia. Va. Code Ann. § 8.01-262.1(B). For judicial intervention into the contractual arbitration forum selection process, see *Player v. George M. Brewster & Son, Inc.*, 18 Cal.App.3d 526, 96 Cal.Rptr. 149 (1971) discussed in Section 30.02. See Lyon & Ackerman, *Controlling Disputes by Controlling the Forum: Forum Selection Clauses in Construction Contracts*, 22 Constr. Lawyer, No. 4, Fall 2002, p. 15.

against the plaintiff or to make claims against third parties arising from the same transaction. For example, suppose an employee of a subcontractor sues the prime contractor based on a claim that the prime contractor has not lived up to the legal standard of conduct and this caused a loss to the claimant. The prime contractor may, in addition to defending the claim made by the employee of the subcontractor, sue the architect and the owner, claiming that the former was negligent and the latter was responsible for failure of the architect to live up to the legal standard, or sue the subcontractor employer of the claimant based on indemnification.

The prime contractor in asserting these claims is called a cross-complainant in most state courts and a third-party plaintiff in the federal courts. Those against whom these claims are made would be called cross-defendants in most state courts and third-party defendants in the federal courts.

Cross-claims by defendants were difficult to maintain in the law courts in England and under early American procedural rules. However, equity courts freely permitted a number of different parties to be involved in one lawsuit as long as the issues did not become too confusing. They sought to resolve in one lawsuit disputes relating to the same transaction. Ultimately, the rules developed in the equity courts prevailed, and it is generally possible to have multiparty lawsuits if jurisdiction can be obtained over all the parties and if litigation can proceed without undue confusion or difficulty.

SECTION 2.07 Prejudgment Remedies

Not uncommonly, the defendant against whom a judgment has been obtained has insufficient assets to pay the judgment. A judgment may be uncollectible if assets are hidden or heavily encumbered by prior rights of other creditors. Most states have statutes creating prejudgment or, as they are sometimes called, *provisional* remedies. Plaintiffs (or defendants who are asserting counterclaims) may be able, in advance of litigation, to seize or tie up specific assets of the opposing party to ensure that if they prevail, they can collect the judgment. Such assets may be attached if in the possession of the defendant or garnished if in the hands of third parties. It is not uncommon for a plaintiff to attempt to tie up assets such as bank accounts or other liquid assets in advance of the litigation.

The party whose assets are tied up can dissolve (have removed) the attachment or garnishment by posting a sufficient bond. Parties whose assets have been tied up may ultimately prevail in the litigation. If so, they may have unfairly suffered damage from the seizure or tying up of their assets. To protect against the risk of not finding assets out of which the prevailing party can be indemnified for such losses, the law frequently requires that the attachment or garnishment be accompanied by a bond.

Even if, by posting a bond, a party can avoid having assets tied up in advance of litigation, such a protective device is often not feasible where the party whose assets are being tied up or seized is poor. As a result, great hardship can fall on poor people and their families if the wage earner's wages are seized or if before the court hearing the sheriff repossesses a car, a television set, or furniture being purchased under a conditional sales contract. Under such arrangements, the buyer takes possession, but the seller retains ownership until all payments have been made. As a result of this, the U.S. Supreme Court has looked closely at prejudgment remedies to ensure that they give the defendant wage earner or debtor due process.²

Another prejudgment remedy is a preliminary injunction—an equitable decree ordering a defendant to cease doing something that the plaintiff claims is causing or will wrongfully cause injury to the plaintiff. Such an injunction can be issued before a full trial if the plaintiff can show that it is needed to preserve the status quo until the trial, that the plaintiff would suffer irreparable loss if it were not issued, and that there is a strong likelihood that the plaintiff will prevail at the trial. The party seeking the preliminary injunction must post a bond. This provides security to the other party for damages that may result from a subsequent determination that the injunction should not have been issued.

SECTION 2.08 Pleadings

The lawsuit is usually begun by handing to the defendant a summons and complaint, called *service of process*. The defendant has a specified time to answer. The defendant's answer may assert that the plaintiff has not stated the facts correctly or that defenses exist even if the allegations of the plaintiff's complaint are true. In some states, the

legal sufficiency of the complaint may be tested by filing a demurrer—a statement that even if the facts as alleged by the plaintiff are true, the plaintiff has no valid claim.

In addition to answering the plaintiff's complaint, the defendant in some cases may assert a claim against a third party by filing a cross-complaint or may file a counterclaim asserting a claim against the plaintiff.

In some states, the plaintiff is required to submit a reply to the answer. Most states require an answer to a counterclaim. In early American legal practice, a substantial number of other pleadings might be filed. The tendency in American procedural law today is to reduce the number of pleadings.

The pleadings should inform each party of the other party's contentions and eliminate from the trial matters on which there is no disagreement. By examining the pleadings, an attorney or a judge should be able to determine the salient issues to explore in the litigation. Pleadings should streamline the litigation and avoid the proof of unnecessary matters. Trial preparation should be more efficient and settlement expedited if each side knows the issues on which the other intends to present evidence at the trial.

The complaint should be a concise statement of facts on which a plaintiff is basing a claim and the specific remedy sought. Unfortunately, complaints are often prolix and contain factual statements and serious charges that the plaintiff's attorney may not be able to prove or that have not been checked out carefully. The inexperienced litigant should understand some reasons for this.

Frequently the lawsuit is begun before the plaintiff's attorney has had enough time to investigate thoroughly and use the discovery procedures described in Section 2.09. Unsure of the facts, an attorney may plead a number of different legal theories as a protective measure. The attorney wants to be certain that the complaint will be legally sufficient; that is, that the judge will not uphold a claim made by the opposing attorney that no legal claim has been stated.

The plaintiff's attorney may decide to use the identical language of pleadings that have been held sufficient in the past. Such language may not be tailor-made to the particular case in which it is used. If the language is taken verbatim from an old pleading form book, it may contain archaic and exaggerated language.

The plaintiff's attorney may believe that the only way to get the defendant or the defendant's attorney to consider seriously a client's claim is to start a lawsuit immediately,

²*Fuentes v. Shevin*, 407 U.S. 67 (1972).

make strong accusations, and ask for a large amount of money. Unfortunately, exaggeration and overstatement are frequently used legal weapons. But when litigants are not made aware of the reasons for such language, its use may simply increase the already existing hostility between the litigants and make settlement more difficult.

If the defendant has been served with a summons and complaint, failure to answer or to receive an extension of time to answer within the time specified by law allows the plaintiff to take what is called a *default judgment*: The case is lost by default.

The plaintiff who obtains a default judgment can collect on this judgment in the manner described in Section 2.13. Most states permit the judge to set aside the default judgment. To do so, the defendant must present cogent reasons why it would be unfair to enforce the judgment despite failure to respond to the pleadings in the designated time. Modern courts are more willing than courts a generation ago to set aside default judgments if the defendant can show that there is a valid defense, that failure to answer was the result of an excusable mistake, and that the amount of the judgment is substantial. Still, default judgments are rarely set aside. For this reason, a defendant who wishes to contest a claim made in a complaint should have an attorney answer the complaint within the required time.

SECTION 2.09 Pretrial Activities: Discovery

The parties and their attorneys wish to discover all facts material to the lawsuit. Discovery is the legal process to uncover information in the hands of the other party. One method of discovery is written interrogatories. One party's attorney sends a series of written questions to the other party, who has a specified period of time in which to respond.

The other method is to take a deposition; that is, to compel the other party or its agent to appear at a certain time and place and answer questions asked by the attorney seeking discovery. The attorney is also likely to demand that the person being questioned bring all relevant documents relating to the matter in dispute. Unlimited discovery demands are being curbed in the federal courts and in some states because of time and expense burdens. Limits can include restricting the scope of the inquiry, the number of persons that can be deposed, and the durations of the deposition. Discovery, though designed to promote

settlement and avoid surprise, has become enormously expensive.

The person being questioned usually brings an attorney. Questions are asked under oath. Questions and answers are transcribed by a reporter, and a transcript is made available to both parties.

Generally the transcript does not substitute for testimony at the trial. However, the transcript can be used to impeach (that is, to contradict) the witness if the testimony at the trial is inconsistent with the statements made under oath in the discovery process.

A proper use of discovery should avoid surprise at the trial, reduce trial time, and encourage settlement. However, the sweeping range of inquiry and the wide latitude given to demand that documents be produced has made the process time consuming and very costly.

Witnesses who will be out of jurisdiction at the time of trial or who are very sick and may not be alive when the case is tried can also be examined under oath and their testimony recorded and transcribed. This deposition process can substitute for testimony that would otherwise be unavailable at the time of trial.

In many states, the pretrial conference is another step in the litigation process. Usually such a conference is conducted in the judge's chambers in the presence of the judge, the attorneys, and sometimes the parties. The main purposes of the pretrial conference are, like those of the pleadings, to narrow the issues, avoid surprise, and encourage settlement.

SECTION 2.10 The Jury

A dispute not settled or abandoned before trial will be submitted to a judge and sometimes to a jury. Generally, the right to a jury trial is constitutionally guaranteed, except in claims where decrees by an equity court are sought. The parties can agree to try the case without a jury. The principal present use of juries is in criminal and personal injury trials.

The use of juries in commercial disputes, although available, is less common. In commercial disputes, the use of juries is criticized when the case is extraordinarily complex. This problem comes up frequently in construction disputes, which often can involve jury trials of up to six months. Yet U.S. courts as a rule have been unwilling to deprive a claimant of the right to a jury trial as guaranteed by the Constitution, despite the complexity of the case

and the difficulty the jurors might have in deciding the case properly.

Historically, juries have consisted of twelve laypersons selected from the community to pass on guilt and sometimes to sentence in criminal matters and to decide disputed factual questions in civil matters. Juries have been attacked as inefficient. Jury trials take longer, cost more, and have a higher degree of reversals by appellate courts than those cases resolved by a judge. Some states reduce jury size from twelve to six members. In criminal matters, the decision must be unanimous. Some states require only a five-sixths decision in civil disputes.

In many state courts, attorneys are allowed to question prospective jurors to determine their impartiality. An attorney dissatisfied with a particular juror can ask that the juror be excused for cause. The judge rules on whether there is proper cause to excuse the juror. Usually the attorneys can strike (that is, excuse) a designated number of jurors peremptorily (that is, for no reason). But a peremptory challenge cannot be based on race. In the federal courts, jury examination is typically conducted by the judge.

Jurors need give no reason for their decision in a case. Although the judge instructs the jury as to the law, jurors are, for all practical purposes, free to do as they choose. Nullification is the name given to this informal power. Some criticize nullification; others feel it is a useful safety valve, especially in criminal matters, to allow members of the community to excuse law violators.

Until recently, jurors did not make the details of their deliberations public. But of late jurors, especially in controversial cases, openly describe the jury process to representatives of the media and anyone else who may be interested or willing to pay.

Some feel that juries are easily manipulated by clever and persuasive attorneys. Others feel that jurors are sensible and generally come to the right result. Those who prefer juries often point to the unfortunate phenomenon of judges who are incompetent but who cannot be removed because of the great difficulty of impeaching a judge. (Some states allow one peremptory challenge of a judge to whom a case has been assigned.)

SECTION 2.11 Trials: The Adversary System

In some jurisdictions, the parties are required before the actual trial to submit their dispute to nonbinding arbitration. Usually the arbitrator is a volunteer local attorney,

and usually the requirement exists only for claims within a certain dollar amount.

After the results of the nonbinding arbitration, parties generally do not seek an actual trial. They are either satisfied with the outcome, are principally concerned in having had a neutral look at their dispute, or are deterred by the cost of going to trial.

The trial is usually conducted in public and is begun with an opening statement by the plaintiff's attorney. Sometimes the defendant's attorney also makes an opening statement. In the opening statement, the attorney usually states what she intends to prove and also seeks to convince the jury that the client's case is meritorious. Opening statements are less common in trials without a jury.

After opening statements, the plaintiff's attorney may call witnesses who give testimony. Also, during this phase physical exhibits and documents can be offered into evidence. In civil actions, the other party can be called as a witness.

An attorney cannot ask leading questions of the witnesses except to establish less important preliminary matters or where the witness is of low mentality or is very young. A leading question is one that tends to suggest the answer to the witness. Such questions can be and usually are asked of witnesses called by the other party.

Witnesses are supposed to testify only to matters they have perceived through their own senses. Witnesses usually cannot express opinions on technical questions unless they are qualified as experts. Expert testimony is discussed in greater detail in Section 14.06.

The hearsay rule precludes witnesses from testifying as to what they have been told if the purpose of the testimony is to prove the truth of the statement. The danger in hearsay testimony is that the party who made the statement is not in court and cannot be cross-examined as to the basis on which the statement was made. However, there are many exceptions to the hearsay rule.

After the attorney has finished questioning the witness, the other party's attorney will cross-examine and try to bring out additional facts favorable to her client or to discredit the testimony given on direct examination. Cross-examination can be an effective tool to catch a perjurer or show that a witness is mistaken. However, used improperly it can create sympathy for the witness or reinforce testimony of the witness.

Documents play a large role in litigation. Under modern rules of evidence, it is relatively easy to introduce into

evidence documents for the court to consider. Documents are hearsay testimony. They are usually writings made by persons who are not in court. However, exceptions to the hearsay rule permit the admission of documents such as official records and business entries. Often the attorneys will stipulate to the admissibility of certain documents.

After the plaintiff's attorney has presented her client's case, the defendant's attorney will present the defendant's case. Then the plaintiff is given the opportunity to present rebuttal evidence. After all the evidence has been presented, the judge submits most disputed matters to the jury (when one is used). The judge instructs the jury on the law, using instructions sometimes difficult for a juror to understand. The jury meets in private, discusses the case, takes ballots, and decides who prevails and how much should be awarded to the winning litigant. (In controversial cases, this is often followed by a press conference. See Section 2.10.)

The adversary system, though much criticized because of its expense, its often needless consumption of time, and the hostility it can engender, is central to the American judicial process. Each party, through its attorney, determines how its case is to be presented and can present its case vigorously and persuasively. Also, each party, mainly through cross-examination and oral argument, has considerable freedom to attack the other's case. The judge generally acts as an umpire to see that procedural rules are followed.

One justification offered for the adversary system is that when the smoke has cleared, the truth will emerge. This assumes well-trained advocates of relatively equal skill and a judge who ensures that procedural rules are followed.

Another justification is that the adversary system gives the litigants the feeling they are being honestly represented by someone of their choosing and are not simply being judged by an official of the state. The system can give the litigants a sense of personal involvement in the process rather than simply being passive recipients of decisions handed them by the state. However, excessive partisanship can generate bitter wrangles and delays. Also, it can make a trial resemble military combat rather than a reasoned pursuit of the truth.

Even under the adversary system there are limits on advocacy. The law prescribes rules of trial decorum administered by the judge, who can punish those who violate these rules by citing violators for contempt. The person cited can be fined and, in some cases, imprisoned. In some court systems, an attorney can be sanctioned for certain

types of conduct that do not rise to the level required to hold the attorney for contempt of court. Usually the sanction carries a fine.

The legal profession can discipline its members who violate professional rules of conduct. As obvious illustrations, an attorney must not bribe witnesses, encourage or permit perjured testimony, or mislead the judge on legal issues. An attorney is the champion for her client yet part of the system of the administration of justice, and must not do anything that would subvert or dishonor that system.

In hotly contested litigation, attorneys frequently make objections. This is always irksome to participants, but it is often, though not always, necessary. If objections are not made at the proper time, the right to complain of errors may be lost. The judge should be given the chance to correct judicial mistakes on the spot.

The possibility of drama and tension in the litigation process can increase when a jury is used. Some attorneys employ dramatic tactics to influence the jury. Although some enjoy the combat of litigation, litigation is at best unpleasant and at worst traumatic for the litigant or witness who is not accustomed to the legal setting, the legal jargon, or the adversary process. This can be intensified if the trial attracts members of the public or is reported in the media.

A trial is an expensive way to settle disputes. In addition to attorneys' fees, witness fees, court costs, and stenographic expenses, there are less obvious expenses to the litigant. Much time must be spent preparing for and attending the trial. The litigant may have to disrupt business operations by searching through records. For these and other reasons, most lawsuits are settled out of court.

Yet extensive preparation costs are often incurred even if a case is settled out of court. The litigation process can generate huge costs. This has led to the search for and the creation of the Alternative Dispute Resolution (ADR) discussed in Chapter 30.

SECTION 2.12 Judgments

A judgment is an order by the court stating that one of the parties is entitled to a specified amount of money or to another type of remedy. Some judges rule immediately after the trial. Usually the judge takes the matter under consideration. Often judges write opinions giving reasons for their decisions.

SECTION 2.13 Enforcement of Judgments

If the plaintiff obtains a money award, the defendant should pay the amount of money specified in the judgment. However, if the defendant does not pay voluntarily, the plaintiff's attorney will deliver the judgment to a sheriff and ask that property of the defendant in the hands of the defendant or any third party be seized and sold to pay the judgment. It is often difficult to find a defendant's property. In some states, defendants can be compelled to answer questions about their assets.

Even if assets can be found, exemption laws may mean that certain assets may not be taken by the plaintiff to satisfy the judgment. Legislatures declare certain property exempt from seizure. Statutes usually contain a long list of items of property that cannot be seized by the sheriff to satisfy a judgment. Such items are considered necessary to basic existence and include automobiles, personal clothing, television sets, tools of trade, the family Bible, and other items that vary depending on the state and the time in which the exemption laws were passed.

Homestead laws exempt the house in which the defendant lives from execution to satisfy judgments. Financial misfortunes notwithstanding, a debtor and those dependent on the debtor should have shelter. Sometimes homestead rights are limited to a certain amount. Under certain circumstances, a homestead can be ordered sold.

In many cases, judgments are not satisfied, because the defendant has no property or the property in the defendant's possession is exempt. Collecting on a judgment when the defendant does not pay voluntarily can be difficult, uncertain, and costly—another reason for settlement.

SECTION 2.14 Appeals: The Use of Precedent

The party who appeals the trial court's decision is called the appellant. The party seeking to uphold the trial court decision is called either the appellee or the respondent.

The attorney for each party will submit a printed brief to the appellate court. The court can permit a typewritten brief. Courts increasingly limit the number of pages in a brief. The brief of the appellant seeks to persuade the appellate court that the trial judge has made errors, and the brief for the respondent seeks to persuade the appellate court to the contrary or that any errors committed were not serious enough to warrant reversal.

Usually the attorneys make brief oral arguments before the appellate court. To save time, some judges do not allow oral arguments in simple cases. Sometimes oral arguments consist of a summary of the briefs. Sometimes the attorneys are questioned by the judges on specific points that appear in the briefs or trouble the judge. Introducing evidence is not permitted in appeals.

In the American system, most appellate judges write opinions stating their reasons for the way they have decided the case. Decisions vary in length. Usually the legal basis for a decision in a trial court or appellate court is a statute, a regulation, or a prior case precedent. The latter requires amplification.

All decision makers seek guidance from the past. Nonjudicial decision makers, such as committees, boards of directors, and organizations of all types, often seek to determine what they have done in the past as a guide for what they should do in the present. Similarly, a refusal to make a particular decision may be based on the fear that it will be looked on as a precedent and the basis of a claim by others for similar treatment. However, in such decision making it is not likely that the precedents of the past must be followed. English and American courts must follow precedent, subject to an exception described later in this section. Within a particular judicial system, judges must decide matters in accordance with earlier decisions of higher courts within the system.

For example, all judges in the state of California must follow the precedents set by the highest member of the system—the state supreme court. Trial judges and those who serve on the intermediate appellate courts must follow decisions of the intermediate appellate courts.

As stated, most appellate judges give reasons for their decisions in written opinions. All members of the system are expected to follow the reasoning as well as the results in earlier cases decided by a higher court. However, California judges need not follow decisions from other state courts, although they may look to decisions of other state courts for guidance. Nor are they compelled to follow the decisions of federal courts except the decisions of the U.S. Supreme Court, which involve federal law.

Despite reverence for precedent, some European countries forbid following precedent, and some decision makers in this country, such as labor and commercial arbitrators, avoid it. This suggests that arguments can be made for and against following precedent.

A legal system should be reasonably predictable. To plan their activities, persons and organizations wish to know the law in advance. If they can feel confident that future judges will follow earlier decisions in similar cases, they can predict and plan more efficiently. Knowing in advance what a judge or court will do encourages settlement of disputed matters. A fair judicial system treats like cases alike.

Another argument for following precedent relates to conservation of judicial energy. If a matter has been thoroughly reviewed, analyzed, and reasoned in an earlier decision, there is no reason for a later court to replot the same ground. This reason for following precedent assumes great confidence in the decision makers of the past and assumes a relatively static political, economic, and social order in which the judicial system operates.

Those who attack the precedent system maintain that the sought-after certainty is illusory, because courts can avoid precedent. They also argue that a precedent system tends to become rigid and unresponsive to changing needs. Finally, they contend that the precedent system can be an excuse for judges avoiding hard questions that should be examined.

Precedents must be followed only in similar cases. If the facts are different, precedents can be distinguished by judges and held not to control the current case. Even under a system of following precedents, at times earlier precedents become so outmoded that they are overruled. When American judges cannot accept the result that applying precedent compels, they create exceptions to the precedent. The greater degree of dissatisfaction, the greater the number of exceptions likely to be created. When the exceptions seem to swallow up the precedent, an activist court may recognize the realities and overrule the precedent.

Good courts seek to avoid unthinking rigidity at one extreme and whimsical decision making at the other. The important feature of a precedent system is reasonable predictability that can accommodate change. The skillful attorney reads the precedents but also looks at the facts and at any relevant political, social, and economic factors that may bear on the likelihood that the precedent will be distinguished or overruled.

Usually all the members of the appellate court agree. Sometimes a dissenting judge gives reasons for not agreeing with the majority. Sometimes the majority of the court that agrees on the disposition of the case cannot agree on the reasons for the decision, and one or more majority judges may write a concurring opinion.

SECTION 2.15 International Contracts

Increased worldwide competition exists for building and engineering contracts. As a result, those who design and construct may be engaged by a foreign national, often the sovereign itself, in a foreign country where the work is to be performed. These international contracts raise special problems discussed in Sections 8.09 and 30.21. One topic deserves mention here, however.

Legal systems vary not only as to substantive law but also as to the independence of their judiciary and dispute resolution processes. In some countries, the judiciary is simply an arm of the state, and follows to a large degree the will of the head of state or the agency with whom the contract has been made.

A foreigner may not have confidence in the impartiality of such a dispute resolution process. This lack of confidence can even be a problem in the United States or within a particular state. The U.S. Constitution recognized this by allowing the removal of a case from a state court to the federal court if there is diversity of citizenship. This problem can be particularly difficult when the designer or contractor is a company from an industrialized country doing business in a less developed country.

Lack of confidence in the judiciary often necessitates a contract clause under which disputes will be resolved by some international arbitration process. Even where there is more confidence in the independence of the judiciary, such as in a transaction where disputes would normally be held before a court in the United States or a western European country, unfamiliarity with the processes and the possible application of unfamiliar law may lead to contractual provisions dealing with disputes. For example, European legal systems do not use the adversary system. They use a more inquisitorial system under which the judge is likely to be a professional civil servant who plays a more active role in resolving disputes. Similarly, laws in western European countries are often based on brief yet comprehensive civil codes quite different from those an American lawyer may encounter in domestic practice. Under such conditions, it is common for the parties to provide by contract that disputes will be resolved by international arbitration with the applicable law of a neutral and respected legal system.

Forms of Association: Organizing to Accomplish Objectives

SECTION 3.01 Relevance

People engaged in design or construction should have a basic understanding of the ways in which individuals associate to accomplish particular objectives. The professional in private practice should know the basic elements of the forms of associations that are professionally available. Anyone who becomes an employee or executive of a large organization should understand the basic legal structure of that organization. The design professional who deals with a corporate contractor on a project should understand corporate organization. Those who are shareholders in or transact business with a corporation should understand the concept that insulates shareholders from almost all liabilities of the corporation.

The following are the most important organizational forms:

1. sole proprietorship
2. partnership
3. corporation
4. limited liability entity
5. joint venture
6. unincorporated association
7. loose association

SECTION 3.02 Sole Proprietorships

The sole proprietorship, although not a form of association as such, is the logical business organization with which to begin the discussion. It is the simplest form and is the form used by many private practicing design professionals.

The creation and operation of the sole proprietorship is informal. By the nature of the business, the sole proprietor

need not arrange with anyone else for operating the business. Generally, no state regulations apply except for those requiring registration of fictitious names or for having a license in certain businesses or professions. Sole proprietors need not maintain records on the business operation except those necessary for tax purposes. Sole proprietors have complete control over the business operation, taking the profits and absorbing the losses. They rent or buy space for operating the business, hire employees, and may buy or rent personal property used in the business.

The proprietorship continues until abandonment or death of the sole proprietor. Continuity of operation in the event of death sometimes can be achieved through a direction in the proprietor's will that an executor continue the business until it can be taken over by the person to whom it is sold or given by will. This ensures that the business is continued during the handling of the estate and that there is no costly hiatus in operation.

The proprietor may hold title to property in his own name or in any fictitious name. Interest in the business can be transferred, the only exception being that in some states the spouse of the proprietor may have an interest in certain types of property used in the enterprise. Capital must be raised by the proprietor or by obtaining someone to guarantee the indebtedness. This differs from a corporation, which can issue shares as a method of raising capital.

SECTION 3.03 Partnerships

A. Generally: Uniform Partnership Act

A partnership is an association of two or more persons to carry on a business for profit as co-owners. Unlike a corporation, it is not a legal entity. All states except

Louisiana, many making minor variations, adopted the original Uniform Partnership Act (UPA), issued in 1914. The Act was revised in 1997. As of 2005, 34 states have adopted the Revised Uniform Partnership Act (RUPA). The Acts set forth the rights and duties between the partners themselves if the partners have not specified to the contrary in the partnership agreement. They also deal with claims of third parties.

A new form of partnership, limited liability partnership (LLP), is discussed in Section 3.06.

B. Creation

Although the partnership agreement need not be evidenced by a sufficient written memorandum, such a memo is advisable. In addition to reasons for having any agreement in writing, other reasons exist for expressing partnership agreements in writing. The transfer of an interest in land must be evidenced by a written memorandum, as must agreements that by their terms cannot be performed within a year. If the creation of the partnership is accompanied by a transfer of land, that portion of the partnership agreement dealing with the land should be evidenced by a written memorandum.

If the duration of the partnership expressly exceeds a year, the partnership agreement should be evidenced by a written memorandum. Agreements to answer for the debts of another must, under certain circumstances, be evidenced by a written memorandum. Partnership agreements with provisions of this type should be evidenced by a written memorandum.

In stating that certain agreements must be evidenced by a written memorandum, a distinction is frequently misunderstood. Suppose a partnership is created orally for a period of more than a year. The rights and duties of the partners will still be governed by the oral agreement and by the applicable Uniform Partnership Act. However, partners have no legally enforceable obligation to perform in the future, although they will have to perform those obligations that accrued before the decision to terminate the oral partnership.

Third parties will still have whatever rights the law would give them against the partners despite the requirement that the partnership agreement be evidenced by a written memorandum. The fact that the law required the partnership agreement to be so evidenced because it was to last over a year will have a limited impact on the partners and, in most cases, no impact on third parties.

C. Operation

Generally the partners decide who is to exercise control. Most matters can be decided by majority vote. However, certain important matters, such as amendment of the partnership agreement, must be by unanimous vote. Sometimes partners want something other than majority rule. In a large partnership, a small group of partners may be given authority to decide certain matters without requiring that a majority of the partners approve such decisions.

D. Fiduciary Duties

Partnership is an important illustration of the fiduciary relationship. As fiduciaries, each partner must be able to trust and have confidence in the other. Neither must take advantage of this trust for selfish reasons or in any way betray the partnership. For example, a partner must account to the partnership for any secret profits made. A partner must not harm the partnership because of any undisclosed conflict of interest. For example, where a partnership composed of design professionals represents the owner in dealing with a construction company, it would be improper for one of the partners to have a financial interest in the construction company unless it was disclosed in advance to the partners and to the owner-principal.

Because the fiduciary obligation is very important, it may be helpful in the partnership agreement to spell out the permissible scope of outside activities of individual partners. In the absence of an understanding among the partners as to permissible outside activities, any activity that raises a conflict of interest or competes in any way with the partnership is not proper. For further discussion, see Section 11.04B.

E. Performance Obligations, Profits, Losses, Withdrawal of Capital and Interest

In the absence of any agreement to the contrary, the partners are to devote full time to the operation of the business and to share profits and losses equally even if one works more than the others. If a specified proportion of the profits is allocated by partnership contract to specified partners, that same percentage will apply to losses. If some other arrangement is desired, it must be expressed in the partnership agreement.

Normally partners cannot withdraw capital during the life of the partnership unless permitted by the partnership agreement. A partner may collect interest for money or property lent to the partnership as well as for capital contributions advanced on request of the partnership.

F. Authority of Partner

Section 301 of the 1997 RUPA makes each partner the agent of the partnership. Acts that apparently carry on ordinary partnership business bind the partnership. If the partner had no actual authority and the person dealing with the partner knew or was notified of this, the acts do not bind the partnership. Acts that apparently do not carry on the partnership business bind the partnership only if the act was authorized by the other partners.

Apparent authority can charge the partnership with unauthorized acts by a partner. The partnership can create apparent authority by making it appear to third parties that a partner has authority he does not actually possess (see Section 4.06). Certain extraordinary acts, such as criminal or other illegal acts, are not charged to the partnership. However, because of the vast range of authority—both actual and apparent—given to the partners and the fiduciary obligation owed by each partner to the other, the character and integrity of prospective partners are of great importance.

G. Liability of General Partnership and Individual Partners

The liability of the partnership and the partners for debts of the partnership and individual debts of the partners is complicated and confusing. Clearly, creditors of the partnership can look to specific partnership property and, if this is insufficient, to the property of the individual partners. Creditors of individual partners who obtain a court judgment may satisfy the judgment out of the partner's interest in the partnership property, but the partnership can avoid losing the property by paying the judgment.

Even more complicated is the liability of an incoming partner for obligations created before becoming a partner, and of an outgoing partner for obligations incurred after leaving the partnership. Generally, the partner is not liable for obligations incurred before becoming a partner. Partners can eliminate liability for obligations that occur after leaving the partnership by informing those who have

dealt with the partnership that they have left. But because of the uncertainty of the law in this area, it is best for those who enter existing partnerships to determine what obligations exist at the time they enter the partnership and for those who leave partnerships to so notify those who have dealt with the partnership.

Because of the ease with which partnerships can be dissolved and reconstituted, considerable confusion exists as to the right of creditors of predecessor partnerships to hold successor partnerships liable for the obligations of the predecessor.

A partner who incurs liability or pays more than a proper share of a debt should receive contribution from the other partners. Similarly, a partner who incurs liability or pays a partnership debt should be indemnified by the partnership. Usually these instances are expressly dealt with in the partnership agreement.

H. Transferability of Partnership Agreement

A partner has some transferable interests. Profits can be assigned, but not specific partnership property or management and control.

I. Dissolution and Winding Up

Partnerships do not have the legal stability of corporations. Sections 601 and 602 of the RUPA list events that can dissolve the partnership or give a court the power to dissolve a partnership on application by a partner or by a purchaser of a partner's interest. Sections 801–805 of the RUPA provide rules for winding up a partnership.

J. Limited Partnership

Most states permit the creation of a limited partnership made up of one or more general partners and one or more limited partners. Such an organization permits investors to receive profits but limits their liability to their investment without having to use the corporate form. Generally, the general partner manages or controls the corporation while the limited partners are investors. The general partner owes fiduciary obligations to the limited partners.

Most states adopted the Uniform Limited Partnership Act of 1916. Most of those states adopted a new version, the Uniform Limited Partnership Act of 1976, with modifications made in 1985. Currently all states but

Louisiana have adopted one of the two versions of the Uniform Limited Partnership Act, and many states have modified the act in adopting. The details of such statutes are beyond the scope of this book.

SECTION 3.04 Profit Corporations

A. Use

The corporate form is used by most large and medium-sized businesses in the United States and has become the vehicle by which many small businesses are conducted. In addition, practicing design professionals are increasingly choosing the corporate form, where possible, for their business organization. The corporate form takes on even greater significance in light of the increasing number of design professionals employed by corporations. Because many complexities in corporation law cannot be discussed in this book, the discussion here must be brief and simple.

B. General Attributes

Although the partnership is merely an aggregate of individuals who join together for a specific purpose, the corporation is itself a legal entity. It exists as a legal person. It can take, hold, and convey property and sue or be sued in its corporate name. As shall be seen, the other important corporation attributes are management centralized in the board of directors, free transferability of interests, and perpetual duration. In addition, the corporation offers the advantage of limiting shareholder liability for debts of the corporation to the obligation to pay for corporate shares purchased.¹ Although not all these attributes are available to all types of corporations, as a general introductory statement these attributes set the corporation apart from the sole proprietorship and partnership.

C. Preincorporation Problems: Promoters

Often persons called *promoters* set into motion the creation of a corporation. Although they may continue in control, sometimes they merely organize the corporation and turn control over to others. Usually they are compensated by the corporation after the corporation has been organized.

This compensation may be cash, shares of stock, stock options, or positions within the corporation.

During the promotion phase, promoters often make contracts with third parties, who should consider the possibility that the corporation will not be formed or will not adopt the promoter's contract. Considering such possibilities may induce the third party to insist that the promoter be held individually liable if the corporation is not formed or does not adopt the promoter's contract. A third party who has doubts about the finances of the prospective corporation may wish to hold the promoter liable even if the contract is adopted by the corporation.

D. Share Ownership

The corporation is a separate legal entity owned by the shareholders, who do not own any part of specific corporation property. Shareholders have a right against the corporation that is governed by statutes, the articles of incorporation, and the wording of the shares. One great strength of modern corporation law is the variety of types of shares that can be employed by the corporation—preferred and common, par and no-par, and voting and nonvoting.

Ordinarily, shares of stock in a corporation are freely transferable (a major advantage of incorporation). Usually restrictions exist on transferability of shares in closely held corporations whose shares are not sold to the general public. This lets shareholders keep control of the company by preventing outsiders from becoming shareholders. Restrictions on transferability sometimes accompany shares purchased by executives or employees as part of a stock option plan.

E. Piercing the Corporate Veil

A principal function of the corporation is to shield shareholders from corporate obligations. Ordinarily, the liability of shareholders is limited to paying for shares they have purchased. This limitation of liability can operate unfairly where a third party relies on what appears to be a solvent corporation. The corporation thought to be solvent may be merely a shell. The assets of the corporation may not be sufficient to pay the corporate obligations. Someone injured by the acts or failure to act of a corporation may find the corporation cannot pay for damages because the amount of capital paid into the corporation was very small.

¹*Saltiel v. GSI Consultants, Inc.*, 170 N.J. 297, 788 A.2d 268 (2002).

The corporate form can be disregarded and, to use a picturesque phrase, the corporate veil pierced and shareholders held liable. A court may do so if unjust or undesirable consequences would result by interposing the corporation as an entity between the injured party (or a creditor) and the shareholders. This is more likely to be done where a person has suffered physical harm through corporate activities, where a creditor could not reasonably have been expected to check on the credit of the corporation, and where the one-person, family, or closely held corporation is used. The latter types of corporations have been popular because they combine control with limitation of liability. Ordinarily, such corporations are valid and protect the shareholders from liability. However, this is so only if the corporation is used for legitimate purposes and the business is conducted on a corporate basis. Also, the enterprise must be established on an adequate financial basis so that the corporation can respond to a substantial degree to its obligations. If not, circumstances such as those mentioned can result in piercing the corporate veil. Similar problems can arise when a corporation organizes a subsidiary corporation and holds all the shares of the subsidiary.

Sometimes owners on small projects (usually homeowners), who deal with a corporation consisting of a very limited number of individuals, seek to impose liability not just on the corporation, but also on the individual corporate officers who either did the actual work or supervised it. These owners sue the corporation for breach of contract and the officers for negligence. In *Greg Allen Construction Company, Inc. v. Estelle*, the Indiana Supreme Court refused to find the corporation's president and sole owner to be individually liable for his own negligent work. The court pointed out that, because the president was working as the corporation's agent, he could be personally liable to the homeowners only if he had committed an independent tort. (Agency is discussed in Chapter 4.) Instead, the president was simply fulfilling the corporation's contract obligations, albeit in a negligent manner.²

²798 N.E.2d 171 (Ind.2003). However, corporate officers were found liable in *Michaelis v. Benavides*, 61 Cal.App.4th 681, 71 Cal.Rptr.2d 776 (1998) (defective work created hazardous conditions) and *Fontana v. TLD Builders, Inc.*, 362 Ill.App.3d 491, 840 N.E.2d 767 (2005) (court pierced the corporate veil).

F. Activities, Management, and Control: Insider Misconduct

The state law under which the corporation was created determines the outer limits of corporate activities and organization. Because state laws generally extend considerable latitude to the corporation on such matters, as a rule, activities and organization are governed by the articles of incorporation.

The articles of incorporation are the constitution of the corporation. They generally set forth the permissible activities of the corporation, the organization and management of the corporation, and the rights of the shareholders. Sometimes these matters are phrased in general terms in the articles of incorporation and articulated more specifically in the corporate bylaws. In large corporations, a set of corporate documents is likely to delineate the chain of command and state the authority of corporate officers and employees to handle particular corporate matters. The ultimate power within the corporation lies with the shareholders, who delegate this power to an elected board of directors. In theory, the board of directors controls long-term corporate policies, the day-to-day operations being handled by the corporate officers.

This model of corporate control may vary depending on the type of corporation. In a smaller corporation, the board of directors, or even large shareholders, may influence day-to-day operations. If the corporation is a large, publicly held corporation with thousands of shareholders, the actual power rests largely with the management. Even though theoretically the shareholders can displace the board of directors, the diffusion of share ownership often makes such displacement difficult, and gives the board of directors and the officers of the corporation effective power, with the shareholders having little control over policy or corporate acts. However, this does not make the corporation immune to takeover bids by other corporations. Increasingly, investors with large blocks of shares, such as pension funds, are playing a more active role in monitoring management decisions.

Some corporations have cumulative voting of shareholders for directors. A shareholder asked to choose a slate of seven members of the board may cast all seven votes for one candidate. Cumulative voting is required in some states and has the effect of protecting minority interests in the corporation.

The directors choose the officers of the corporation. Usually they will select a president, vice president,

secretary, and treasurer. Larger corporations might also, through the board of directors, designate persons to serve as general counsel or controller or as other corporate officers.

The officers are in charge of the day-to-day running of the corporation. The larger the corporation, the more likely that many details will be delegated to other employees of the corporation.

There has been a marked development in U.S. law toward extending fiduciary obligations of fair dealing to directors and to officers. Directors and officers owe each other fiduciary duties of fair dealing and owe a fiduciary duty to the shareholders. It is not proper, for example, for a member of the board or for an officer to use inside information to purchase shares of corporate stock from shareholders who are not aware of the same inside information. Nor would it be proper (and very likely be illegal) for corporate insiders to disclose information, such as impending mergers or takeovers or other news that would inflate or depress the value of the stock not available to the general public.

Directors and officers are not permitted to take advantage of economic opportunities that should be made available to the corporation.

The articles of incorporation usually provide for annual shareholder meetings as well as for periodic meetings of the board of directors. Minutes must be kept of all board proceedings. The administrative burden of operating a corporation can be formidable.

G. Profits and Losses

Usually the board of directors determines the disposition or distribution of profits made by the corporation. Sometimes control is limited by the articles of incorporation, especially the rights of preferred shareholders. In addition, the corporation may have obligations to the creditors of the corporation based on contracts or on agreements made between the corporation and lenders such as shareholders or banks. Profits may be reinvested in the corporation and used for corporate purposes.

Subject to statutory regulations, the board determines when (and how large) a share of the profits is to be paid as dividends to the shareholders. The board may pay dividends only out of certain specified funds. Sometimes the board issues a stock dividend instead of a cash dividend. In such cases, the shareholders receive additional shares in the corporation instead of money. Statutory or

other limitations may exist relating to the redemption of shares by the corporation and to the repurchase by the corporation of its own shares.

If the board unlawfully issues dividends, the board members are liable to the corporation and to those creditors of the corporation harmed by the unlawful declaration of dividends. Normally, individual shareholders are not responsible for losses of the corporation because of the insulation from personal liability given corporate shareholders. A shareholder who paid for shares in accordance with the purchase agreement with the corporation is not liable for any obligations of the corporation.

H. Life of the Corporation

One advantage of the corporation is its perpetual life. Sole proprietorships end with the death of the sole proprietor. Often partnerships end with the death of any of the partners. The corporation will continue despite the death of shareholders. A court can dissolve a corporation in the event of a deadlock in the board of directors or under other circumstances.

The dissolution of a corporation is complicated and is governed largely by statute. The bankruptcy laws play a large role in disposing of corporation assets on dissolution. This book does not discuss dissolution.

SECTION 3.05 Nonprofit Corporations

Nonprofit corporations are similar in organization and operation to profit corporations. The major difference is that a nonprofit corporation cannot distribute profits to shareholders. Examples of nonprofit corporations are hospitals, most educational institutions, and charities.

Capital for a nonprofit corporation is raised by donations, grants, and, occasionally, the sale of shares. Usually there are members instead of shareholders. The members elect the board of directors or trustees; the board selects officers to run the corporation. Nonprofits have articles of incorporation, bylaws, meetings, and other similarities to profit corporations. Generally, the shareholders are insulated from personal liability for the debts of the corporation. Nonprofit corporations are exempt from taxes because they have no profit. Nonprofit corporations that engage in certain types of political or profit-making activities can lose their tax exemptions.

SECTION 3.06 Professional Corporations, Limited Liability Companies (LLC), and Limited Liability Partnerships (LLP)

Although design professionals traditionally have practiced as sole proprietors or partnerships, states have increasingly permitted them to practice through a professional corporation. The corporation form has been used mainly to take advantage of tax laws that allow employees of corporations to receive fringe benefits without having them included within taxable income.

Some states that have allowed professionals to incorporate have made clear that the professionals cannot use the corporate form to shield their individual assets—a principal reason for using business corporations.

Design professionals have begun to take advantage of two forms of business association that became prominent in the 1990s: the limited liability company (LLC) and the limited liability partnership (LLP). The LLC is a hybrid of the corporate and partnership forms, containing the pass-through income tax benefits of a partnership (in contrast to the two-tier tax treatment of corporations) with the limited liability protections of a corporation. The limited liability company is a legal entity, separate from its owners, who have no liability for the entity's debts. An LLP alters the rule of joint and several liability for general partners, replacing it with protection from liability of the LLP itself.

State law varies in permitting design professionals to take advantage of these new business entities. Pennsylvania allows architects to form either LLCs or LLPs, if certain requirements are met.³ By contrast, California permits design professionals to form LLPs, but not LLCs.⁴

SECTION 3.07 Joint Ventures

Joint ventures can be created by two or more separate entities who associate, usually to engage in one specific project or transaction. Such arrangements are contractual

³63 Pa.Stat. Ann. § 34.13(a)(6) & (7). The requirements pertain to the minimum number of members or managers of the LLC, or partners of the LLP, who must be licensed to practice architecture. Id., § 34.13(f) & (g).

⁴West Ann.Cal.Bus. & Prof. Code § 5535 (architects may form LLPs) and West Ann.Cal.Corp. Code § 17375 (LLCs may not render professional services). For a state-by-state survey, see Lurie & Anderson, *The Practice of Architecture and Engineering by Limited Liability Entities*, 24 Constr. Lawyer, No.1, Winter 2004, p. 24.

and can be expressed by written contracts or implied by acts. In large construction projects, two contractors may find they cannot handle a particular project individually but can if they associate in a joint venture. Another type of joint venture can be created by an organization that performs design and an organization that constructs. Sometimes joint ventures are needed to bid on “design/build” projects.⁵

Usually the agreement under which such a joint venture is created is complex and sets forth in detail the rights and duties of the joint venturers. Joint ventures created informally by acts have gaps as to specific rights and duties that are filled in by the law. When such gaps exist, it is likely that principles of partnership will be applied (see Section 3.03).

Suppose a dispute arises as to the existence of a joint venture. Because joint ventures are considered very much like partnerships for one transaction, the relationship is often examined to determine whether partnership-like attributes are present. For example, sometimes it is stated that there must be a community of interest, a common proprietary interest in the subject matter, the right of each to govern policy, and a sharing of profits and losses.

SECTION 3.08 Unincorporated Associations

Individuals sometimes band together to accomplish a collective objective without using any of the forms of association described thus far, such as partnerships or corporations. Instead they may organize an unincorporated association, such as a fraternal lodge, a social club, a labor union, or a church. Design professionals may perform professional services for these associations or may become involved in the associations themselves.

Generally, unincorporated associations are not legal entities. For this reason, early American law did not allow them to hold property in the association name, make contracts, sue in the name of the association, or be sued as a group. They were merely a group of individuals who banded together to accomplish a particular purpose.

In most states, statutes have removed many of the former procedural disabilities. Although they are still not entities, unincorporated associations are often permitted

⁵See Section 17.04F.

to contract, to hold property, and to sue or be sued in the name of the association.

Usually such groups have constitutions, bylaws, and other group-related rules that govern the rights and duties of the members. They elect officers who have specified authority, such as to hire employees and run the activities of the association. All the members generally are responsible for those contracts entered into by the officers who were authorized by the members. Liability rests on agency principles.⁶

Establishing the authority of the officers is often difficult because formalities are often disregarded in these organizations. It may be necessary to show evidence of which members voted for resolutions authorizing the officers to make a particular contract. Although the officers may have certain inherent authority by virtue of their positions, important projects, such as engaging a design professional or a contractor, usually are beyond the scope of their inherent authority.

Officers who make the contract may be individually liable if the contract was clearly made by them as individuals. It may be possible to hold the officers for having misrepresented their authority if the contract was not authorized. Because of the potential risk to officers and to members, many contracts contain provisions that limit liability to certain designated property held in trust for the association in those states where they are not permitted to own property in the association name. Where the association is permitted to hold property in its own name, liability is often limited to that property.

SECTION 3.09 Loose Associations: Share-Office Arrangement

Sometimes design professionals use the term *association* to describe an arrangement under which they are independent sole proprietors but join together to share offices, equipment, and clerical help. They may also do work for each other. Sometimes such loose associations are known as *share-office arrangements*.

During the sharing arrangement, several legal problems can develop. First, suppose one associate performs services for another and the latter is not paid by his client. In the absence of any specific agreement or well-documented

understanding dealing with this risk, the associate who performs services at the request of another should be paid.

Second, suppose the associate performing services at the other associate's request does not perform properly and causes a loss to the client. The client would have a claim against the associate who did the work and the associate with whom it dealt. If the latter settled the claim or paid a court judgment, he would have a valid claim for indemnification against the associate who did not perform properly.

Third, if those in the share-office arrangement create an impression to the outside world that they are a partnership, they will be treated as such. For example, if the letterhead, building directory, and telephone directory list them as Smith, Brown, and Jones, such listings may create an apparent partnership. If so, each member of the association can create partnership-like contracts and tort obligations.

When a loose association terminates or one participant withdraws, all associates in the first case and the withdrawing associate in the case of withdrawal can freely compete with former associates or those remaining. However, the associates in the first case and the withdrawing associate in the second cannot do any of the following:

1. take association records that belong to another associate
2. represent that they still are associated with former associates if this is not the case
3. wrongfully interfere with contractual or stable economic relationships existing at the time the association ended or one associate withdrew

SECTION 3.10 Professional Associations

Professional associations of participants in the construction process, such as the American Institute of Architects (AIA), the National Society of Professional Engineers (NSPE), and the Associated General Contractors (AGC), have had a substantial impact on design and construction. Although they are not organizations like the others mentioned in this chapter created for the purposes of engaging in design and construction, some mention should be made of their activity and some of the legal restraints on them.

These professional associations engage in many activities. They speak for their members and the professions or industries associated with them. In addition, they seek to educate their members in matters that relate to their

⁶See Sections 4.05 and 4.06.

activities. One of their most important activities is publishing standard documents for design and construction that are used not only as the basis for contracts for design and construction but also to implement the construction administrative process. Keep in mind that membership in these professional associations is not required for someone to design or build.

By and large, professional associations can choose their members. However, as these associations become more important, the law is beginning to limit their power to determine who will be admitted to membership and what the legitimate grounds are for discipline. Restraints placed on professional associations have related to attempts by public authorities to encourage competition in the professional marketplace. This has resulted in attacks by public

officials on what were called the rules of ethical conduct, which determine whether an applicant would be admitted to the association and can be disciplined for violating ethical rules of the association.

Often such ethical rules sought to limit the power of one professional to supplant another and bar or discipline members, based on “ungentlemanly conduct such as competing with a fellow member on the basis of price.” Disciplinary action based on violating these rules was found to violate agreements between an association and federal antitrust officials that the association would not limit competition.⁷

⁷*United States v. American Society of Civil Engineers*, 446 F.Supp. 803 (S.D.N.Y.1977).

The Agency Relationship: A Legal Concept Essential to Contract Making

SECTION 4.01 Relevance

Agency rules and their application determine when the acts of one person bind another. In the typical agency problem, there is a principal, an agent, and a third party. The agent is the person whose acts are asserted by the third party to bind the principal. See Figure 4.1. There can be legal problems relating to the rights and duties of the principal and agent as between themselves as well as disputes between the agent and the third party. But because in the agency triangle the third party versus principal part is most important—and most troublesome—these problems will be used to demonstrate the relevance of agency law.

The design professional, whether in private practice or working as an employee, may be in any of the three positions of the agency triangle.

For example, suppose the design professional is a principal (partner) of a large office. The office manager orders an expensive computer. In this illustration, the design professional, as a partner, is a principal who may be responsible for the acts of the agent office manager.

Suppose the design professional is retained by an owner to design a large structure. The design professional is also engaged to perform certain functions on behalf of the owner in the construction process itself. Suppose the design professional orders certain changes in the work that will increase the cost of the project. A dispute may arise between the owner and the contractor relating to the power of the design professional to bind the owner. Here the design professional falls into the agent category, and the issue is the extent of her authority.

Suppose X approaches a design professional in private practice regarding a commission to design a structure.

X states that she is the vice president of T Corporation. The design professional and X come to an agreement. Does the design professional have a contract with T Corporation? Here the design professional is in the position of the third party in the agency triangle.

The agency concept is basic to understanding the different forms by which persons conduct their business affairs, such as partnerships and corporations.

SECTION 4.02 Policies Behind Agency Concept

A. Commercial Efficiency and Protection of Reasonable Expectations

As the commercial economy expanded beyond simple person-to-person dealings, commercial necessity required that people be able to act through others. Principals needed to employ agents with whom third parties would deal. Third parties will deal with an agent if they feel assured that they can look to the principal. The agent may be a person of doubtful financial responsibility. The concept of agency filled the need for giving third persons some assurance that they can hold the principal responsible.

Agency exposes the principal to risks. The principal may be liable for an unauthorized commitment made by the agent. Suppose the principal authorizes its agent to make purchases of up to \$1,000, but the agent orders \$5,000 worth of goods. From the third party's standpoint, this \$5,000 purchase may be reasonable in light of the agent's position or what the agent had been ordering in the past. The law protects the principal from unauthorized commitments but not at the expense of reasonable expectations of

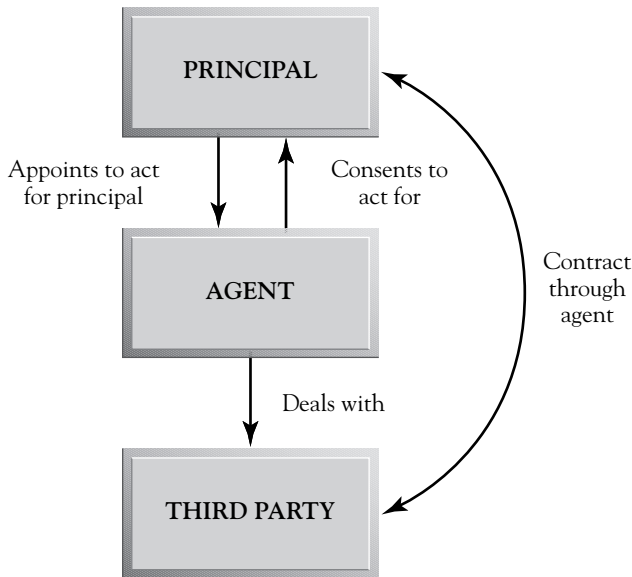

FIGURE 4.1 Agency concept illustrated.

the third person. That such problems can develop does not destroy the unquestioned usefulness of the agency concept. Such problems require the law to create rules and solutions to handle such questions that accord with commercial necessity and common sense.

Two recent cases illustrate the agency concept from the perspective of the owner. In *Shoals v. Home Depot, Inc.*, a homeowner was swindled by a dishonest employee of Home Depot, a large home improvements chain. The court found that the employee's representations made to the homeowner were binding on Home Depot, the principal. In *Shoals*, the owner was the third party who personally benefitted from application of the agency concept.¹ By contrast, in *Ciraulo v. City of Newport Beach*, the contractor assured the homeowners that it would obtain a building code variance from the city, then went ahead with the construction even though it never talked to the city. After completion, the city ordered the owners to remove the unauthorized building. The court upheld the order, because the owners, as principals, were bound by the fraudulent acts of their agent, the contractor.²

¹422 F.Supp.2d 1183 (E.D.Cal.2006).

²147 Cal.App.4th 838, 54 Cal.Rptr.3d 515 (2007).

B. Relationships Between Principal and Agent

As a rule, the relationship of principal and agent is created by a contract expressed in words or manifested by acts. The agent may be a regular employee of the principal or an independent person hired for a specific purpose and not controlled as to the details of requested activities. Several aspects of the agency relationship distinguish it from the ordinary commercial, arm's-length relationship.

An arm's-length transaction is one wherein the parties are expected to protect themselves. In such a transaction, no general duty is imposed on one party to protect the other party, nor is any duty imposed to disclose essential facts to the other party. Although there are some exceptions, generally commercial dealings are at arm's length. On the other hand, principal and agent have a fiduciary relationship—one of trust and loyalty.³ In such a relationship, one person relies on the integrity and fidelity of the other. The latter must not take unfair advantage of the trust in her by benefiting at the expense of the former.

Often the arrangement under which an agent performs services is sketchy and does not specifically delineate all the rights and duties of principal and agent. In such a case, terms often must be implied by law.

SECTION 4.03 Other Related Legal Concepts

Confusion often occurs because of the overlapping nature of terms such as principal–agent, master–servant, and employer–employee. This chapter deals only with the principal–agent relationship and the power of agency under which one person may bind another to a contractual obligation.

SECTION 4.04 Creation of Agency Relationship

Generally, agency relationships are created by a manifestation by principal to agent that the agent can act on the principal's behalf and by some manifestation by agent to principal that the agent will so act. However, these elements of consent are often informal. They need not

³See Section 11.04B.

be written, except in cases where statutes require that the agent's authority be expressed in writing if the transaction to be consummated by the agent would require a writing.

SECTION 4.05 Actual Authority

The agent is ordinarily authorized to do only what it is reasonable to believe the principal wants done. In determining this, the agent must look at the surrounding facts and circumstances. If, for example, the principal has authorized the agent to purchase raw materials to be used in a particular manufacturing process and the agent learns that the principal has decided not to proceed with the project, it is unreasonable for the agent to believe that the authority to buy the materials still exists.

The agent must consider the situation of the principal, the general usages of the business and trade, the object the principal wishes to accomplish, and any other surrounding facts and circumstances that would reasonably lead to a belief that the agent can or cannot do something. This is largely a matter of common sense. Sometimes the agent is given specific authority to do those incidental acts that are reasonably necessary to accomplish the primary act. For example, when an agent is given authority to purchase a car for the principal, it is likely that the agent also has authority to buy liability insurance for the principal. The agent, when possible, should seek authorization from the principal to perform acts not expressly authorized.

Sometimes emergencies arise that make it difficult or impracticable for the agent to communicate with the principal. In such cases, the agent has authority for necessary acts to prevent loss to the principal with respect to the interests committed to the agent's charge.

SECTION 4.06 Apparent Authority

Most difficult principal–agency cases arise under the doctrine of apparent authority, which exists when the principal's conduct reasonably leads a third party to believe that the principal consents to acts done on its behalf by the person purporting to act for it.

It may be useful to draw some initial distinctions essential to an understanding of apparent authority problems. First, suppose the asserted agent neither is an employee of the principal nor has been hired by the principal to

perform any specific task. This can be illustrated by *Amritt v. Paragon Homes, Inc.*⁴ The plaintiff homeowner sued for damages caused by faulty construction of a home built for her by Romero, a contractor. Clearly, Romero was liable but evidently could not pay a court judgment. The homeowner sued Paragon, the manufacturer of the prefabricated home erected by Romero, and Sewer, the manufacturer's local distributor.

The homeowner had arranged through Sewer to purchase the materials, plans, and drawings for such a home. Evidently Sewer represented himself to the homeowner as Paragon's agent and implied that Paragon would not be responsible unless the homeowner used Romero to construct the home. The agreement was on a form supplied by Paragon and filled in by Sewer. The homeowner borrowed money from and gave a mortgage to Paragon for the construction costs. The homeowner made payments by depositing funds in escrow with Paragon, and Paragon demanded a completion certificate before disbursing the funds. Sewer inspected the construction work for Paragon.

Paragon, Sewer, and Romero were all separate legal entities. Romero worked for himself, as did Sewer. The court held, however, that Sewer and Romero were agents for Paragon because both had "the outward trappings of apparent authority to be Paragon's agents."⁵ The court concluded that the homeowner was "reasonably led to believe they were Paragon agents."⁶

The court, quoting the Restatement of the Law of Agency,⁷ pointed to Paragon's conduct—supplying all materials and forms through Sewer, requiring that the house be inspected by Sewer and built to its plans, and disbursing all construction payments—and stated that combining of these activities could reasonably have led the homeowner to believe Paragon had authorized Sewer and Romero to be its agents. Although the court spoke in terms of apparent authority, it actually found an apparent agency.

Because of the many legal entities involved in a construction project, one party not infrequently seeks to bind an entity other than the one with whom it has dealt, on the same theory as that used in *Amritt v. Paragon Homes, Inc.*

⁴474 F.2d 1251 (3d Cir.1973).

⁵Id. at 1252.

⁶Ibid.

⁷For an explanation of the Restatements of the Law, see Section 1.10. The *Amritt* court cited to the Restatement (Second) of Agency, published in 1958. There is now a Restatement (Third) of Agency, published in 2006.

This is especially likely when consumers find that the people with whom they have dealt are unable to respond when those people have not performed in accordance with their legal obligation. The law is more likely to permit a claimant, as in the *Amritt* decision, to recover from the only solvent defendant who can be connected to the transaction if that solvent party has organized the transaction, controlled it, and sought to eliminate responsibility for a risk legitimately a part of its enterprise by using a separate legal entity that lacks the financial capability to respond for product defects. The conclusion reached in the *Amritt* decision is also more justified if the party dealing with the contractor is a consumer of limited commercial experience.

A second problem can stem from a client's engaging a professional person. For example, the owner may engage a design professional to perform services relating to design and contract administration for a particular project. The latter is rarely an employee of the owner but has certain designated authority. The contractor may claim that communications it had with the architect should be treated as if coming directly from the owner, while the owner may contest that conclusion. This matter is treated more fully in Section 17.05B.

The third and perhaps most difficult problem relates to whether an admitted employee of an employer has the authority to engage in certain acts and thereby to bind the employer. Here there is an agency relationship in that the agent has some authority to bind the principal. The problems that develop relate to the extent of that authority.

Clearly, acts of the agent that are authorized expressly or implicitly (authority implicit in the actual authority) will bind the principal. In addition, acts of the principal can cloak the agent with apparent authority beyond that actually possessed. A third party who relies reasonably on the appearance of authority can hold the principal responsible as if the acts were authorized.

SECTION 4.07 Termination of Agency

If authority is conferred for a specified period, it will terminate at the end of that period. If no time is specified, authority continues for a reasonable time. If authority is limited to performing a specified act or to accomplishing a certain result, it terminates when the act or result is completed.

Sometimes the terms of the authorization specify that the authorization is to continue until a certain event occurs. If so, the occurrence of the event will terminate the agency unless the event would not come to the attention of the agent. Sometimes the loss or destruction of certain subject matter terminates the agency.

Sometimes the agency terminates when principal and agent consent to terminate the relationship. This can occur if either principal or agent manifests to the other that the relationship will no longer continue. In some cases, the agency can also be terminated by death of the principal, and almost always by death of the agent. However, agency relationships sometimes are created by contract for fixed terms. The principal may, despite a fixed-term contract, terminate the agency and terminate the power of the agent to bind it, but such a termination will be a breach of contract with the agent.

These events effect actual authority of the agent. If termination of authority has taken place but manifestations to third parties that the agent has authority still exist, the agent may be able to bind the principal by the doctrine of apparent authority, which will continue only so long as the third party should not realize that the agent no longer has authority to bind the principal.

SECTION 4.08 Disputes Between Principal and Third Party

Sometimes the principal wishes to be bound by a transaction between the principal's agent and the third party. The latter may refuse to deal with the principal, claiming it did not know it was dealing with an agent. The agent may not have informed the third party that she was an agent, and the third party may not have had reason to know that the agent was acting on behalf of someone else. The undisclosed principal may disclose its status and hold the third party, unless the facts would make it unjust to permit the principal to assert its status. (Once the principal is disclosed, the third party can hold the principal.)

Suppose the agent did not have actual authority to enter into a transaction but the principal discovers the transaction. In such a case, the principal may ratify the transaction within a reasonable time and bind the third party (and itself) by notifying the third party and affirming the agent's unauthorized acts.

SECTION 4.09 Disputes Between Agent and Third Party

Disputes between an agent and a third party are relatively rare. If the agent is acting on behalf of an undisclosed principal, the third party has the right to sue the agent individually.⁸ The third party may lose this right if it pursues its remedy against the principal, once the principal becomes disclosed. If the agent has misrepresented her authority and the third party is unable to hold the principal, the third party may have an action (be able to press a lawsuit) against the agent for misrepresenting authority.⁹

Within the construction industry, third party claims against the agent of a disclosed principal most commonly occur when a contractor sues the project architect or engineer. The contractor usually claims that the design professional committed a tort for which she is personally liable. For example, the contractor may contend that the design professional negligently administered the project or intentionally interfered with the contractor's contractual relationship with the owner. A design professional who

acts within the scope of her agency and is not motivated by improper motive will not be liable to the contractor.¹⁰

SECTION 4.10 Nontraditional Project Delivery Systems

The discussion of agency principles to this point focused on a traditional construction project arrangement, in which the owner hires a design professional and prime contractor under different contracts, and the design and construction services are separately and sequentially performed.¹¹ An increasing number of large commercial and public projects use newer, nontraditional project delivery systems. These modern variations might include the introduction of new entities (such as construction managers or project managers) or entities that integrate the delivery of design and construction services (such as design/build).¹² The agency principles discussed in this chapter also apply to these new project delivery systems, although sorting out the principal/agency relationships may be difficult.

¹²Section 17.04.

Contracts and Their Formation: Connectors for Construction Participants

SECTION 5.01 Relevance

The private design professional makes contracts with, among others, clients, consultants, employees, landlords, and sellers of goods. In addition, contracts are made between owners and prime contractors, prime contractors and subcontractors, contractors and suppliers, employers and employees, buyers and sellers of land, and brokers and property owners.

Contracts for design and for construction are analyzed in other parts of the text. This chapter provides a framework for such analysis.

SECTION 5.02 The Function of Enforcing Contracts: Freedom of Contract

The principal function of enforcing contracts in the commercial world is to encourage economic exchanges that lead to economic efficiency and greater productivity. This is accomplished by protecting the reasonable expectations of contracting parties that each will perform as promised. Although many and perhaps most contracts are and would be performed without resort to court enforcement, the availability of legal sanctions plays an important role in obtaining performance.

Generally, American law gives autonomy to contracting parties to choose the substantive content of their contracts. Because most contracts are economic exchanges, giving parties autonomy allows each to value the other's performance.

To a large degree, autonomy assumes and supports a marketplace where market participants are free to pick the parties with whom they will deal and the terms on which they will deal. Not only are the parties in the best position to

determine terms of exchange, but the alternative—state-prescribed rules for economic exchanges—would lead to rigidity and heavily burden the state. Also, parties are more likely to perform in accordance with their promises if they have participated freely in making the exchange and determined its terms. Finally, such autonomy—often called *freedom of contract*—fits well in a free society that encourages individual enterprise. However, broad grants of autonomy assume contracting parties of relatively equal bargaining power, equal accessibility to information, and a relatively free marketplace. Such conditions place a check on overreaching. A party who believes the other party's terms to be unreasonable can deal with others. If the parties do arrive at an agreement under such conditions, the give-and-take of bargaining should ensure a contract that falls within the boundaries of reasonableness.

The development of mass-produced contracts and the emergence of large blocs of economic power often dealing with parties with limited or no bargaining power have made this earlier model of the negotiated contract the exception. If the state, through its courts, enforces adhesion contracts (contracts presented on a take-it-or-leave-it basis), the state is according almost sovereign power to those who have the economic power to dictate contract terms. For this reason, many inroads have been made on contractual freedom by federal and state legislation, regulations of administrative agencies, and courts through their power to interpret contracts and determine their validity.

SECTION 5.03 Preliminary Definitions

In the simplest terms, a contract is an enforceable bargain. A valid contract requires agreement by the parties, sometimes called manifestations of mutual assent (discussed

in Section 5.06). In addition to agreement, the parties usually exchange promises. This bargained-for exchange is called consideration, another requirement for a valid contract (discussed in Section 5.08). Often there are formal requirements for a valid contract (discussed in Section 5.10). Breach of contract generates a remedy, usually the award of damages, but in rare cases an award of specific performance (discussed in Chapter 6).

The promisor is a person who makes a promise, and the promisee is the person to whom the promise is made. In most two-party contracts, each party is a promisee and promisor, both making and receiving promises.

The offeror is a person who makes an offer, and the offeree is a person to whom the offer is made. All other definitions will be given as the particular term is discussed.

SECTION 5.04 Contract Classifications

A. Express and Implied

Sometimes contracts are classified according to the method by which they are created. Using this classification, there are express contracts and implied-in-fact contracts. In express contracts, the parties manifest their assent or agreement by oral or written words. In implied-in-fact contracts, assent is manifested by acts rather than by words.

U.S. v. Young Lumber illustrates this in a construction project context.¹ The employee of a subcontractor brought equipment he had rented to the job site. The employer admitted that the employee's equipment was on the job site and was used but contended there was no express agreement under which it would pay the employee rent for using the equipment.

In ruling for the employee, the court stated,

even if there was no express oral agreement for equipment rental, an implied contract may be inferred from the conduct of the parties. Implied contracts arise ... where there is circumstantial evidence showing that the parties intended to make a contract. Where one performs for another a useful service of a character that is usually charged for, and such service is rendered with the knowledge and approval of the recipient who either expresses no dissent or avails himself of the service rendered, the law raises an implied

promise on the part of the recipient to pay the reasonable value of such service.²

Unless the agreement is required to be in writing, the implied-in-fact agreement is as valid as an express contract.

B. Subject Matter

Sometimes contracts are classified by the transaction involved, such as sales of land, sales of goods, loans of money, leases, service contracts, professional service contracts, insurance contracts, and family contracts. Although American contract law traditionally has been thought of as a unitary system, different transactions are treated differently. For example, the seller of goods is in many instances held to a successful outcome standard, usually referred to as "implied warranty of fitness," whereas those who sell professional services are usually held to a less strict standard³ comparing what was done with what others would have done. Subject matter variations are manifested by regulatory legislation over certain types of contracts. Judicial opinions often treat one transaction differently from another.

C. Bargain and Adhesion

Contracts are sometimes classified as negotiated or adhered to. The latter are referred to as *contracts of adhesion*.

A negotiated contract arises when two parties with reasonably equivalent bargaining power enter into negotiations, give and take, and jointly work out a mutually satisfactory agreement.

The adhesion contract has no or minimal bargaining. The dominant party hands the contract to the weaker party on a take-it-or-leave-it basis. At its extreme, the weaker party who wishes to enter into the transaction must accept all the terms of the stronger party.

Sometimes important terms can be negotiated, although the balance will be dictated by one party, with little opportunity for bargaining. For example, the purchaser of a new automobile may be able to bargain on price but will have to accept the dealer's standardized terms on all or almost all other aspects of the purchase. The rare buyer who reads the standardized terms and

²Id. at 1298. Where such an arrangement is considered non-consensual, recovery can be based on unjust enrichment.

³See Section 14.05.

¹376 F.Supp. 1290 (D.S.C.1974).

objects to them will have great difficulty in persuading the dealer to change the terms.

Sometimes the adhesion contract is accompanied by monopoly power. In a competitive economy, a weaker party who does not want to accept harsh terms may deal with others. However, in many transactions the weaker party will find the same terms used by the competitors of the party whose terms were unpalatable, or will find no competitor. Frequently, such adhesion contracts are printed, and the person with whom the weaker power is dealing (such as a salesperson or clerk) lacks authority to vary the printed terms of the contract. Modern courts recognize the difference between the negotiated contract and the contract of adhesion.

The weaker party has the burden of proving the contract it entered into was adhesive. The difficulty of that task is illustrated by a recent case. Buyers of a home in a large subdivision near St. Louis asserted that their purchase agreement was adhesive. The Missouri Supreme Court was not convinced. It pointed to testimony by the developer's attorney, who stated that all the contract terms were negotiable. In the court's view, the developer's attorney's admission—that the objectionable contract clause (the arbitration provision) had never been negotiated by the developer—did not prove the negative (that negotiation would have been refused if the buyers had tried). The court also observed that there was no evidence that *all* St. Louis area builders used the same arbitration term. The court concluded the buyers did not prove their purchase agreement was a contract of adhesion.⁴

Interpretation of contracts between clients and their design professionals⁵ and between contractors and owners⁶ is discussed later in this book. It is useful, however, to note how courts have treated adhesion contracts. At the very least, ambiguous terms will be interpreted against the party who supplied the adhesion contract.⁷ Even more important are legal rules that seek to determine the reasonable expectation of the party who was presented a contract on a take-it-or-leave-it basis and that interpret the contract in accordance with that expectation. This may

even be done if the party to whom such a contract has been presented was aware of the terms and of the likely intention of the party who supplied them.⁸ Finally, it is more likely that terms in an adhesion contract than in a negotiated contract will be considered unconscionable and will not be enforced by a court before whom such a contract has been presented.⁹

SECTION 5.05 Capacity to Contract

Capacity usually relates to age and mental awareness. Because it rarely affects contracts for design or construction, it is not discussed in this book.

SECTION 5.06 Mutual Assent

A. Objective Theory of Contracts: Manifestations of Mutual Assent

Early English contract law stated there had to be a meeting of the minds—actual agreement as to the existence of a contract and its terms—before there could be a valid contract.

As a rule, each party believes it has made a contract, though perhaps the parties differ as to the exact nature of performance. Suppose one person harbors a secret intention not to be bound and yet manifests to the other party an intention to be bound. The party who relied on the objective manifestation should be protected.

The law protects the reasonable expectations of the innocent party through the objective theory. A party is bound by what it manifests to the other party. Secret intentions are not relevant. If one party, innocently or otherwise, misleads the other into thinking it has serious contractual intention, a contract exists although the parties do not actually agree. The same principle holds true if one party is only joking when entering into negotiations and making an agreement with the other party. Unless the other party should reasonably have realized that the negotiations were not serious, the party who is not serious will be held to the agreement.

⁴*State ex rel. Vincent v. Schneider*, 194 S.W.3d 853 (Mo.2006). Sections 30.02 and 30.03D discuss whether arbitration clauses are unconscionable, a concept distinct from that of adhesion contracts.

⁹Section 5.07D.

B. Offer and Acceptance in the Assent Process

Typically the process by which contracting parties make an agreement involves communications, oral and written, that culminate with one party making an offer and the other party accepting it.

Where parties exchange communications at the same time and place and an agreement is reached, rarely is it necessary to determine whether there has been an offer and acceptance. But where parties communicate with each other at a distance, it is often necessary to determine whether the parties have arrived at an agreement, and this requires an examination of whether there has been an offer and acceptance.

Offers are different from preliminary negotiations or proposals for offers. Although several abstract definitions of an offer exist, it is more useful to consider the *effect* of an offer. An offer creates a “power of acceptance in the offeree.” The offeree can create a legally enforceable obligation without any further act of the offeror. How is it determined whether the offeree has a reasonable belief that he has a power of acceptance?

Some cases scrutinize the language of the offer, especially a written offer, looking for definite words of commitment on the part of the offeror, such as “I offer” or “I promise.” However, parties only rarely express themselves in legal terms.

The entire written proposal is examined to see whether a reasonable person receiving it would think he could “close the deal.” Factors include the certainty of the terms, any indication that the proposer will not have to take further action, the past dealings between the parties, and the person to whom the offer is made. For example, if nothing is stated on essential terms such as price, quantity, or quality, the bargaining is probably in a preliminary stage. The first proposal is intended merely to start the negotiating mechanism, and more negotiating will take place before agreement is reached.

If the proposer is negotiating with a number of other people at the same time and the person to whom a particular proposal is directed knows of this, it is likely that the latter realizes, or should realize, that the proposer wants the last word rather than risk being obligated to a number of people. In such a case, the communication is not an offer.¹⁰

¹⁰*Fletcher-Harlee Corp. v. Pote Concrete Contractors, Inc.*, 482 F.3d 247 (3d Cir.2007) (prime contractor’s solicitation of bids from several subcontractors; the solicitation is not an offer and the bid is not an acceptance).

The common law concluded that offers are revocable even if stated to be irrevocable. At any time before acceptance, an offeror can withdraw the offer, provided the offeror communicates the revocation directly or indirectly to the offeree. This rule of revocability has generated many exceptions, the most important being reliance on the offer and the firm offer under Section 2-205 of the Uniform Commercial Code dealing with the sale of goods. The latter makes a firm written offer in a signed writing by a merchant irrevocable for the time stated or, if not stated, for a reasonable time not to exceed three months.

Suppose a written offer states that it will be open for a specified period; say, ten days. At the end of this period, the power of acceptance ends. If the offer is made by letter, it may not be clear when the time period begins. Does the period begin on the date of the letter offer, at the time the letter is mailed, at the time it would normally be received, or at the time it is actually received? Usually the time period begins when the letter is actually received. It is best to use a specific terminal date, such as “You have 10 days from May 1, 2008.” See subsection C later in this section.

If the duration of the offer is not stated specifically, the offer remains open for a reasonable time. Facts considered are the state of the market for the goods or services in question, the offeror’s need to be able to deal with others if the offeree does not accept, and custom and usage in the particular transaction. For example, the reasonable time period in which to accept an offer for the sale of shares of stock in a fluctuating market is usually shorter than the reasonable time to accept an offer for the sale of land. The time allowed to accept an offer to sell perishable goods is shorter than the time to accept an offer to sell durable goods. The amount of time is judged from the viewpoint of the offeree, whose reasonable belief as to the duration of the offer governs.

An offer can be revoked by the offeror. Generally, revocation must be communicated to the offeree. A few states make a revocation effective when placed in the means of communication, such as mail, telegram, fax machine, or when “send” is clicked dispatching an e-mail on its electronic way, similar to an acceptance (discussed in Section 5.06C). After a valid revocation, an offeree who is still interested must make another proposal to the original offeror.

Generally an offer terminates if the offeree rejects it. Sometimes the rejection is explicit. For example, the

offeree may communicate a lack of interest. In such a case, the offeror is free to deal with others unless the power of acceptance has been created by an option that has been purchased.¹¹ Usually rejection is implied if the offeree makes a counteroffer. The normal expectation of the offeror in the event of a counteroffer is that the offeree is no longer interested in doing business on the basis of the original offer. This implication may be negated if the counteroffer makes clear that the offeree is still considering the original offer. A counteroffer both creates a power of acceptance in the original offeror and usually terminates the power of acceptance of the original offeree.

The acceptance must be sent or communicated while the power of acceptance still exists. Any acceptance after that time does not operate to create the contract without a further act by the offeror.

Under the common law's *mirror image* rule, the acceptance must be unequivocal and must not propose new or different terms. When the offeree (the person to whom the offer is made) proposes different terms, it usually means no agreement has been reached as yet.¹² This rule often frustrated the common intentions of the parties. For example, an acceptance letter on a company standard form may contain preprinted language. This new language may defeat the formation of a contract, even though the variance in contract terms was minor and not of importance to the parties themselves.

Another complication is devising a rule of acceptance between a buyer and seller with their own standard form contracts, which rarely agree. To remedy this problem and to deal with transactions where buyer and seller in the sale of goods will sign only their own forms that rarely agree, the Uniform Commercial Code adopted Section 2-207. Including additional or different terms does not necessarily preclude the communication from being an acceptance if it appears the offeree is accepting the terms of the offer and does not condition his acceptance expressly on the offeror agreeing to additional or different terms. Those additional terms are considered proposals for additions to the contract that are sometimes binding without fur-

ther communication of the offeror.¹³ Section 2-207 also provides that if the conduct of the parties indicates the parties have made a contract although the writings of the parties do not match, a contract has been concluded on the terms that do match, with the supplemental terms being supplied by law.

As offerors usually wish to know whether their offers have been accepted, acceptance, as a rule, must be communicated to the offeror. The offeror can deprive himself of the right to receive actual notice of acceptance by stating, "If you accept, sign the letter and you need not communicate any further with me."

C. Contracts by Correspondence

Generally, to be valid, offers, revocations, and rejections must be communicated to the other party. Because contract law protects reasonable expectations, contracting parties must know where they stand. However, a special rule has been developed for acceptances.

When parties began to make contracts by correspondence, English courts adopted the mailbox, or dispatch, rule. If the offeree used the same means of communication as the offeror had employed, the acceptance was effective when placed in the means of communication. It did not have to be actually received. For example, if the offeree mails an acceptance to the offeror in response to an offer received by mail, the address on the letter of acceptance is correct, and the proper postage is placed on the letter, the contract is formed at the time the letter is mailed. This places the risk of a delayed or lost letter on the offeror and protects the offeree's expectation that when the letter has been mailed, a contract has been formed.

Although early cases scrutinized the means of communication used by the offeree, generally the mailbox rule applies if a reasonable means of communication is employed. As noted in Section 5.06F, the means of communication can include mail, fax, or electronic mail.

One aspect of this rule is often ignored. The rule applies only if the offeror has not specifically required that the communication actually be received. For example, if the offeror makes an offer by mail but states that

¹¹Restatement (Second) of Contracts § 37 (1981).

¹²*Poel v. Brunswick-Balke-Collender Co. of N.Y.*, 216 N.Y. 310, 110 N.E. 619 (1915) (letter of acceptance, containing printed provisions along the margins that differed from the offer, was not an acceptance).

¹³*Wachter Management Co. v. Dexter & Chaney, Inc.*, 282 Kan. 365, 144 P.3d 747 (2006) (construction manager's negotiated purchase of construction software became a contract when the software was ordered; a venue provision in the shrinkwrap's license agreement was disregarded as an attempt to modify the contract terms).

word must be received by a specified date as to whether the offeree accepts, the contract is not formed unless the offeror receives the offeree's acceptance by the stated date.

D. Reasonable Certainty of Terms

As mentioned in Section 5.06B, one test for determining whether an offer has been made is the clarity and completeness of the terms of the proposal. Even when an agreement on terms has been reached and no issue exists as to the existence of an offer, agreed terms that lack reasonable certainty of meaning preclude a valid contract.

Why require that even agreed terms be reasonably clear in meaning before a valid contract can exist? First, vagueness or incompleteness of terms may indicate that the parties are still in the bargaining stage. Second, a third party, such as a judge or an arbitrator, should be able to determine without undue difficulty whether the contract has been performed. But reasonable certainty does not require terms so clear that there can be no doubt as to their meaning.

*Janzen v. Phillips*¹⁴ involved an action by a landscape architect to recover his fee. The architect and his client were somewhat hazy in their initial dealings. There had been no definite discussion of costs; the defendant stated that he wanted a "first-class job," and work went ahead on this basis.

Difficulties developed when the interim billings exceeded what the client thought he would have to pay. After discussions regarding costs, the architect sent a letter to the client in which he stated that he would "substantially landscape most of your property" for \$6,500, or "nearly so."¹⁵ The court was concerned with the terms "substantially" and "nearly so." Without these terms, clearly, assent to this letter would have created a valid contract. The court stated that where it appears the parties have intended to make a contract, courts will tread lightly in concluding that their efforts were not successful because of the absence of reasonable certainty. The terms "substantially" and "nearly so," according to the court, have a definite meaning and are frequently used to indicate that the cost would be about \$6,500 and the work would be essentially completed for that price. Some latitude was expected, and the architect would have some leeway from the \$6,500 figure.

Cases often appear to be inconsistent. Many cases that involve contract formation problems, such as the certainty requirement and the effect of preliminary agreements (see Section 5.06E and I), depend on the particular facts in the case before the court. The court will examine the language of any agreement, the intention of the parties, and the surrounding facts and circumstances, such as any performance by one or both parties. In addition, the availability of any restitution remedy based on unjust enrichment (one party's performance having benefited the other party) may be a basis for concluding that a valid contract was not made.

E. A More Formal Document: Preliminaries

Suppose an informal writing, sometimes called or even labeled as a preliminary or tentative agreement, a letter of intent (see Section 5.06I), or a purchase order, is concluded, but the parties expect that a more formal document will be drawn up. Have they intended to bind themselves, with the formal written document only a memorial of their actual agreement, or did they not intend to bind themselves until assent to the more formal writing? This depends on the intention of the parties.

An expression of their intention will control the decision. But suppose specific statements of intentions do not exist. If the transaction is complicated and nonroutine and the basic agreement is sketchy, it is likely that the parties do not intend to bind themselves until the more formal writing is prepared and signed. Commencement of performance by both parties very likely means that a contract has been formed without a formal agreement. Performance by one party is more ambiguous.

Modern courts tend to find a contract at the earliest possible stage if the court is convinced that the parties intended to be bound and only minor gaps need to be filled.

F. Agreements to Agree

Parties to a contract are often unable to specifically define every aspect of their relationship in the contract, yet they may wish to create a legally enforceable agreement. To accomplish these two objectives, they may specify that certain terms will be agreed on by the parties at a later date. For example, a long-term supply-of-goods contract may specify that the shipping arrangements or delivery dates will be agreed on later. The parties have agreed to agree.

¹⁴73 Wash.2d 174, 437 P.2d 189 (1968).

¹⁵437 P.2d at 191.

In older cases, courts refused to enforce contracts that contained such provisions. Judges saw themselves as simply enforcing agreements that the parties made, rather than as making agreements for the parties. Modern courts are more willing to enforce contracts that contain agreements to agree as long as the parties are not still in the negotiation stage and the matters to be agreed on are not essential. For example, Section 2-204(3) of the Uniform Commercial Code states that a contract for sale of goods is valid even though certain terms are left open “if the parties have intended to make a contract and there is a reasonably certain basis for giving an appropriate remedy.”

Where courts have faced contracts that contain agreements to agree, as a rule the parties are not disputing the to-be-agreed-to provisions. One party contends that it is not bound, because a fatal defect rendered the contract invalid. If performance has begun and the matter to be agreed to is not so essential that it indicated the parties were still in the bargaining stage, courts are likely to enforce the agreement. The agreed-to provision will be supplied by a standard of reasonableness that will often take trade usage into account.

G. Agreements to Negotiate in Good Faith

Sometimes an agreement to agree is interpreted to be an agreement to negotiate in good faith. The parties do not state they will agree but state they will negotiate in good faith on certain matters. Although some courts will not enforce such provisions, there is an increasing tendency to enforce them by requiring the parties to negotiate in good faith. If the parties in good faith seek to agree but cannot, further performance should not continue, and any performance that has been rendered should be dealt with by principles of restitution based on unjust enrichment. However, if one of the parties does not negotiate in good faith, the court may determine what good-faith negotiation would have been produced by way of agreement.¹⁶

H. Memorandum of Understanding

In the course of a complicated and often lengthy negotiation, the parties may draw up and agree to what they call a *memorandum of understanding*, which indicates that they

have reached agreement on certain terms but are still negotiating over others. Generally, such memoranda are not binding. If the negotiations have not been concluded, all matters are open to negotiation.

The purpose of a memorandum of understanding is to give the parties some indication of those things that have come to the stage of tentative agreement, to aid the parties in seeing what still remains to be negotiated. Although one party may assert that the other party is not negotiating in good faith if it seeks to reopen terms on which there has been agreement, the agreement process should not be placed in this straitjacket.

I. Letter of Intent

During the course of a complex negotiation, the parties may wish to begin performance before there has been a final agreement. The party asked to commence performance may wish some assurance that if the negotiations are not successfully concluded, it will still be paid for what it has done. A letter of intent issued by the other party will be a directive to proceed and will provide a compensation formula for work performed that will be binding even if the parties do not reach a final agreement. If one party commences performance after the other party issues a letter of intent, the letter of intent will govern their relationship, even if they do not successfully conclude the negotiations.

*Quake Construction, Inc. v. American Airlines, Inc.*¹⁷ involved an attempt, ultimately unsuccessful, to employ the classic use of a letter of intent to get performance started while negotiations continued. The letter, while noting many of the details of the proposed subcontract, included a provision stating that the prime reserved the right to cancel the subcontract if the prime and sub could not agree on all of the terms.

The Supreme Court of Illinois concluded that the case should be sent back to the trial court. It found that other factors, such as the prime informing the sub that it had been awarded the subcontract, announcing this at a pre-construction conference and promising to send a final draft of mutually agreed terms to the sub for its signature (this was never done) made the language of the letter of intent ambiguous and allowed the use of extrinsic evidence to show the intent of the parties.

¹⁶*Purvis v. United States*, 344 F.2d 867 (9th Cir.1965).

¹⁷141 Ill.2d 281, 565 N.E.2d 990 (1990).

The *Quake* case shows that the language of the letter of intent coupled with the surrounding facts and circumstances can create a binding contract, not merely an authorization to proceed.

Yet without a letter of intent, the party performing services before the contract has been finalized, such as the design professional or the contractor, may be doing work on a risk or contingency basis or “on the come.” Was he taking his chances that the contract will never be finalized?¹⁸

SECTION 5.07 Defects in the Mutual Assent Process

A. Fraud and Misrepresentation: Duty to Disclose

The negotiation process frequently consists of promises and factual representations made by each party. If important factual representations or promises are made to deceive the other party, the deceived party may cancel the transaction or receive damages if it has reasonably relied on the representations or promises.

Sometimes such representations are made not with the intention of deceiving but are negligent or even innocent. As the conduct becomes less morally reprehensible, the remedies to the deceived party will be fewer. For example, in fraudulent representation the deceived party may receive punitive damages designed to punish the conduct and not to compensate the victim. Although the victim of negligent misrepresentation will be able to recover damages to compensate for the loss or cancel the transaction, the only relief likely to be accorded someone who relies on an innocent misrepresentation is cancellation of the contract.

Suppose one party to a contract wishes to cancel the transaction because of a claim that the other party should have disclosed important facts that, had they been known, would have persuaded the former not to enter into the

¹⁸*GSGSB v. New York Yankees*, 862 F.Supp 1160 (S.D.N.Y. 1994). The architect may be saved if he can persuade the jury that, despite there not having been a contract, the architect could recover based on *quantum meruit*. To do this, he must show that he rendered services, the owner accepted those services, the architect expected compensation, and submit the reasonable value of the services. 862 F.Supp. at 1170. In light of the conclusion that no contract had been made and that the architect did the work “on the come,” it may be hard to persuade the jury that compensation was expected. The opinion is very instructive on the issues in Section 5.06.

transaction. Although early cases rarely placed a duty to disclose on contracting parties, there is an increasing tendency to do so where the matter that is not disclosed is important and where the party knowing of the facts should have realized that the other party was not likely to ascertain them.

B. Economic Duress

A valid contract requires consent freely given. Consent cannot be obtained by duress or compulsion. Early common law duress was physical, such as obtaining a deed or a contract by threatening to kill or injure the other party.

Modern duress in the commercial world principally involves economic duress or (as it is sometimes called) business compulsion, which can exist if one party exerts excessive pressure beyond permissible bargaining and the other party consents because it has no real choice. Courts have found economic duress to exist in very few cases. Their hesitance undoubtedly relates to the inherent pressures involved in the bargaining process and the fear that many contracts could be upset if the economic duress concept were used too frequently. Yet, as indicated by *Rich & Whillock v. Ashton Development* (reproduced in Section 27.13), today some courts will set aside contractual adjustments or releases even in the hard-bargaining commercial world.¹⁹

C. Mistake

The doctrine used most often in attacking the formation process is mistake. Here again, there are no fixed or absolute rules. There may be mistakes as to the terms of the contract. One party may not read the agreement, or because of mistake or fraud the agreement may not reflect the earlier understanding of the parties. Also, parties are often mistaken as to the basic assumptions on which the contract was made. Everyone who makes a contract holds certain underlying assumptions that, if untrue, render the contract undesirable.

A few generalizations can be made. Although there is always some carelessness in the making of a mistake, the greater the carelessness the less likely that the party making the mistake will be given relief. A comparison of the values exchanged is relevant. If one party is getting something for

¹⁹*Centric Corp. v. Morrison-Knudsen Co.*, 731 P.2d 411 (Okla.1986) (collecting many cases).

almost nothing, the argument of mistake is more likely to be employed to relieve the other party from the contract. The question of when the mistake is uncovered is also important. If the mistake is discovered before the other party has relied on or performed under the contract, there is a greater likelihood that the contract will not be enforced.

In extreme cases, courts will relieve a party from certain risks. However, the law also seeks to prevent parties from avoiding performance of their promises by dishonest claims of mistake that are economically advantageous. Steering a course between these two policies as well as supporting the policy that people should be able to rely on agreements has meant that few fixed legal rules can be used to predict probable results in such cases. A determination of whether relief will be granted requires a careful evaluation of the facts, with principal scrutiny paid to the relative degree of negligence, any assumption of risk, the disparity in the exchange values in the transaction, and the likelihood that the status quo can be restored.

D. Unconscionability

Equity courts refused to enforce contracts that were unconscionable—contracts that shocked the conscience of the judge. Borrowing this concept, the Uniform Commercial Code in Section 2-302 gave the trial judge the power to strike out all or part of an unconscionable contract for the sale of goods. Gradually, the concept is being accepted in all contracts. But contracts or clauses that have been struck down (and few have) have tended to

1. be consumer rather than commercial transactions
2. involve sharp dealing in the bargaining process rather than harsh terms
3. involve clauses that exculpate a party from its obligation or make vindication of the other party's legal rights very difficult rather than price terms

As yet, the doctrine has not made much of a direct impact on contracts for design and construction except for agreements to arbitrate as discussed in Sections 30.02 and 30.03A. Yet it has been held that placing a duty on the owner to seek verification of a bid if the bid appears to have been a mistake, is done to avoid an unconscionable contract.²⁰ As noted in Section 19.02E, the doctrine's

²⁰*Sulzer Bingham Pumps, Inc. v. Lockheed Missiles & Space Co., Inc.*, 947 F.2d 1362 (9th Cir.1991), reproduced in Section 18.04(E).

development has, however, encouraged courts to examine all the circumstances that surround the making of a contract and to intervene more frequently.

E. Formation Defects and Restitution

An important use of restitution relates to the conferring of benefits when for a variety of reasons a claim cannot be based on a valid contract. There may be no one with whom a valid contract can be made. For example, suppose a doctor passing a construction site sees a passerby struck by a falling piece of lumber and rendered unconscious. The doctor administers medical aid in an attempt to save the victim. Because the doctor is a person trained in such emergencies, he should be encouraged to act. His training, the emergency, and the fact that he is not likely to be rendering services gratuitously takes him out of the volunteer category and allows him to recover.²¹

Such cases are rare. More commonly, restitution claims are made where parties intended to make a contract but did not do so. In the context of design or construction services, two principal formation defects require a person who has performed services to look to restitution. First, the contract fails because the terms lack sufficient certainty (usually in contracts for design services), the parties could not agree on terms while work progressed, or the parties did not get around to formalizing the contract by executing a formal writing where it was their intention to formalize it that way or there was a misunderstanding over the terms of the contract. In all these instances, the parties believed they had or would have a valid contract. Where benefit is conferred under these circumstances, the party who has conferred the benefit will very likely be able to recover in restitution.

The measure of recovery may vary, from the value of the expenditures to the benefit actually conferred, depending on the equities. It may even, in rare cases, be based on expenditures that did not benefit the defendant.²² In a close case as to whether a valid contract has been made, performance by both parties or even one party

²¹*Cotnam v. Wisdom*, 83 Ark. 601, 104 S.W. 164 (1907). Admiralty law allowed a recovery to the owner of a ship that altered its course to help a stricken ship that lacked a medical person. *Peninsular & Oriental Steam Navigation Co. v. Overseas Oil Carriers, Inc.*, 553 F.2d 830 (2d Cir.1977), cert. denied, 434 U.S. 859 (1977).

²²*Minsky's Follies of Florida, Inc. v. Seenes*, 206 F.2d 1 (5th Cir.1953) (failure to have a written memorandum).

may tip the scales in favor of a conclusion that a valid contract did exist. In these illustrations, neither party had breached. As a result, recovery here is more likely to be limited to actual benefit conferred.

The second defect requiring restitution that is relevant to design and construction services (more common in construction) relates to contracts made illegally, principally where public contracts require that awards be made competitively. Because of the varying judicial attitude toward the importance of rigorously enforcing those rules and the various levels of illegality (compare a bribed official awarding a contract²³ with a technical irregularity by well-meaning officials²⁴), court decisions may not appear consistent. If there is any trend, it is toward granting recovery in favor of those who have performed in good faith whose contracts were invalid because of technical irregularities.²⁵

SECTION 5.08 Consideration as a Contract Requirement

A. Definition

While an offer and acceptance result in a bargain, the added element of *consideration* is required to transform that bargain into an enforceable contract. Consideration is loosely defined as bargained-for exchange: one person giving up something of value in return for receiving a benefit from the other person to the bargain. Using more technical language, consideration is found to exist if the promisee (the recipient of the promise) suffers a legal detriment (for example, pays money) and this detriment induces the promisor to act (give the promisee an apple).

Early cases required benefit to the promisor. Later decisions, however, enforced a promise where the promisor did not receive pecuniary benefit but the promisee suffered a detriment. Nor need the detriment be economic in nature; it may include the promisee refraining from doing what he has the legal right to do. In general, courts do not look into the sufficiency of the consideration, instead leaving that valuation up to the judgment of the parties. However, the detriment must consist of more than a moral obligation to act.

²³*Manning Eng'g, Inc. v. Hudson County Park Comm'n*, 74 N.J. 113, 376 A.2d 1194 (1977) (no recovery).

²⁴*Layne Minnesota Co. v. Town of Stuntz*, 257 N.W.2d 295 (Minn. 1977) (no recovery but based on absence of benefit).

²⁵*Blum v. City of Hillsboro*, 49 Wis.2d 667, 183 N.W.2d 47 (1971).

The *preexisting duty* rule is a corollary to the element of detriment.²⁶ One who already has a legal duty to perform an act cannot claim that performing that act was a legal detriment. A firefighter is paid to save people from burning buildings and so cannot charge someone he saved from a burning building on a theory of that a contract existed between the firefighter and the saved person.

Yet another way of understanding the consideration requirement is the principle that promises motivated by benefits received *in the past* are not enforceable. If an owner and contractor have entered into a contract, the owner cannot use the already existing consideration to compel the contractor to perform new and additional work at no additional pay. In the commercial world, exceptions to the *past consideration* rule include promises to pay a debt discharged by bankruptcy²⁷ or barred by statutes of limitation.²⁸

B. Reliance

Suppose the promisor's promise foreseeably induces reliance by the promisee, but consideration is found lacking. While no contract has been formed, many courts allow the promisee to recover under the doctrine of promissory estoppel. Section 90(1) of the Restatement (Second) of Contracts states, "A promise which the promisor should reasonably expect to induce action or forbearance on the part of the promisee or a third person and which does induce such action or forbearance is binding if injustice can be avoided only by enforcement of the promise." In the construction process, promissory estoppel has primarily been used as a means of enforcing bids made by subcontractors to prime contractors, as further described in Section 28.02.

SECTION 5.09 Promises Under Seal

When most people were unable to write, a method was needed to accomplish conveyances and other legal acts. The method adopted in early English legal history was the seal, an impression made by a signet ring or other

²⁶Restatement (Second) of Contracts § 73 (1981).

²⁷Restatement (Second) of Contracts § 83 (1981). Formal requirements to pay debts barred by bankruptcy are contained in 11 U.S.C.A. § 524.

²⁸Restatement (Second) of Contracts § 82 (1981). Many states require a written promise.

similar instrument in soft wax that had been placed on the document. The seal emphasized the seriousness of the act being performed. Consideration was not necessary. A sealed instrument was a powerful document.

In the United States, the seal began to lose its power when, instead of being a formal impression in wax, it was reduced to either putting the word *seal* on the document or using some abbreviation such as *LS*. This did not have the trappings of formality possessed by the old seal. As a result, in many states the seal was denied any function in preparing documents. In other states, a document under seal creates enforceability or creates a presumption of consideration.

SECTION 5.10 Writing Requirement: Statute of Frauds

A. History

In 1677, the English Parliament passed the Statute of Frauds, which requires that a sufficient written memorandum be signed by the defendant before there can be judicial enforcement of certain specified transactions. One reason for the writing requirement is to protect litigants from dishonest claims and protect the courts from the burden of hearing claims of questionable merit. Another is that the requirement of a writing acts as a cautionary device. It warns people that they are undertaking serious legal obligations when they assent to a written agreement. The Statute of Frauds has been adopted in all American jurisdictions in one form or another. The tendency has been to expand the classifications that require a writing. See also Section 11.04F.

B. Transactions Required to Be Evidenced by a Sufficient Memorandum

Transactions singled out in the original statute were promises by an executor or administrator to pay damages out of his own estate; promises to answer for the debt, default, or miscarriages of another; agreements made on consideration of marriage; contracts for the sale of land or an interest in land; agreements not to be performed within a year from their making;²⁹ and contracts for the sale of goods over a specified value. Some states require

²⁹*J.R. Loftus, Inc. v. White*, 85 N.Y.2d 874, 649 N.E.2d 1196, 626 N.Y.S.2d 52 (1995) (oral agreement to build house and to provide a one-year warranty is subject to the statute).

contracts for performing real estate brokerage services and contracts to leave property by will to be evidenced by a written memorandum. Statutes regulating home improvements often require that there be a written contract.³⁰

Classification of the transaction has been one device by which courts have cut down the effectiveness of this statute. For example, a contract to construct a twenty-story building will not require a writing if the court concludes that the contract could be performed within a year. Many other limitations and exceptions on the various transactions have been made by the courts.

C. Sufficiency of Memorandum

The memorandum must be signed by the party to be charged. The proliferation of electronic communications led Congress to enact the Electronic Records and Signatures in Global and National Commerce Act that provides for a method of validating signatures on electronic communications.³¹ Obtaining digital signatures is simple and inexpensive. It must contain the basic terms but need not express the entire agreement. It need not have been signed at the time the agreement was made but can be signed later. For example, a letter written and signed by a party after a dispute has arisen will provide the needed memorandum if the letter contains sufficient terms. In goods transactions, the Uniform Commercial Code Section 2-201(3b) allows the writing requirement to be satisfied by an admission in the course of litigation. As technology changes, the law will have to decide whether audio or videotapes or e-mail will satisfy the requirement.³²

³⁰West Ann.Cal.Bus. & Prof.Code § 7159 (the contract and any changes to it must be evidenced by a writing and signed by all parties). Courts have allowed both contractors and homeowners to get around § 7159's writing requirement. *Arya Group, Inc. v. Cher*, 77 Cal.App.4th 610, 91 Cal.Rptr.2d 815 (2000) involved a \$4 million oral contract to build a house for Cher, the movie star; the contractor was allowed to sue under a theory of *quantum meruit*. In *Shoals v. Home Depot, Inc.*, 422 F.Supp.2d 1183 (E.D.Cal.2006), a blind homeowner who was swindled by a Home Depot employee was able to enforce the oral agreement against the company.

³¹15 U.S.C.A. § 7001.

³²*Ellis Canning Co. v. Bernstein*, 348 F.Supp. 1212 (D.Colo.1972) held that an audio tape satisfied the Statute of Frauds. While *Swink & Co., Inc. v. Carroll McEntee & McGinley, Inc.*, 266 Ark. 279, 584 S.W.2d 393 (1979) held that even assuming a tape recording is a writing, the tape recording of a conversation did not satisfy the Statute as it had not been signed. See Misner, *Tape Recordings, Business Transactions via Telephone and the Statute of Frauds*, 61 Iowa L. Rev. 941 (1976).

D. Avoiding the Writing Requirement

Sometimes oral agreements that generally require a memorandum are enforced despite the absence of a memorandum. Section 2-201 of the Uniform Commercial Code states that acceptance of part payment for the goods is sufficient to make enforceable an oral contract for those goods.

In cases involving the sale of land, the part performance doctrine developed as a substitute for a writing. For example, if the buyer took possession and made improvements, the court could order the seller to convey despite the absence of a writing. However, part payment by the purchaser was not sufficient part performance.

In service contracts, full performance by the parties would bar the use of the Statute of Frauds as a defense. However, this exception was not applied in a home improvement contract required to be in writing.³³

Some jurisdictions enforce oral agreements if one party has reasonably relied on and changed its position based on

the promised written agreement or if the other party has been unjustly enriched by the performance.³⁴

The New York Appellate Court saved an oral contract for pre-construction construction management services, and possibly the construction itself, by reversing the trial court decision that had struck down the contract claim on the basis of the one-year Statute of Frauds. It held that the case should be sent back to the trial court to determine whether the two parts of the services could be separated. If so, the part relating to pre-construction construction management services could be performed in nine months and was enforceable.³⁵

The Statute of Frauds has become eroded in many states. If a claim seems genuine, and if the claimant has relied reasonably on the oral agreement, a strong likelihood exists that the claimant will be permitted to prove the agreement.

³⁴*Monarco v. Lo Greco*, 35 Cal.2d 621, 220 P.2d 737 (1950).

³⁵*Lehrer McGovern Bovis, Inc. v. New York Yankees*, 207 A.D.2d 256, 615 N.Y.S.2d 31 (1994). The contractor sent a letter of intent and a written contract to the owner. It was never signed and returned by the owner.

³³*Caulkins v. Petrillo*, 200 Conn. 713, 513 A.2d 43 (1986).

Remedies for Contract Breach: Emphasis on Flexibility

SECTION 6.01 An Overview

Determining the remedies available for breach of contract is much more difficult than determining whether a valid contract has been made. It is exasperatingly difficult to predict before trial what the law will require that a breaching party must pay. Even after all the evidence has been produced at the trial, it can be very difficult to determine the precise remedy that the party entitled to relief should receive. This sometimes leads to a trial procedure under which remedies are considered before going into the issues of whether a valid contract has been formed and whether it has been breached. If very little can be accomplished remedially, it makes little sense to have a long, protracted lawsuit to establish the claim.

Although the function of awarding a remedy for contract breach is to compensate the injured party (the exceptions to this are discussed in Section 6.04), measuring the losses incurred and gains prevented can be very difficult. There may be agreement on general objectives, yet implementing these objectives can be difficult because of the great variety of fact situations, the different times at which a breach can occur in the history of a contract, the variety of causes that may generate the breach, and the different judicial attitudes toward breach of contract itself.

The common law has developed conventional formulas that are applied in particular cases designed to implement the basic compensation objective. These formulas may not appear to achieve a just result when they are applied. Borderline cases make it difficult to determine which formula should be applied. The range of remedies, both as to type and amount, can give discretion to juries, trial judges, and appellate courts. For example, if one party seems to have taken unfair advantage of the other, doubts may be

resolved in favor of the latter. The reason for the breach, though perhaps not exculpating the breaching party, can be influential in measuring the award. The relative abilities of plaintiff and defendant to bear the loss can be an influential factor, although often an unstated one.

Generally, when juries are used, they are given considerable latitude to determine the award. The jury award is likely to be upheld if it is based on substantial evidence or reasonable inferences from the evidence, unless the award seems to result from passion or prejudice. Although compromise can play a strong part in jury determinations, the failure to require a jury to be specific as to the reasons for its award can give the jury a mechanism for achieving what it believes to be a just result even if it would differ from what the law appears to require.

SECTION 6.02 Relationship to Other Chapters

This chapter explores generally the judicial remedies awarded for breach of contract. Succeeding chapters apply these basic principles to construction process disputes.

Usually claims by a design professional are for services rendered for which payment has not been made. Claims by the owner against the design professional usually relate to a delay caused by the design professional, defective design, or a failure to monitor the contractor's performance. These topics are considered in greater detail in Sections 12.14B and 14.10A. Claims by owners against contractors usually involve losses asserted because of unexcused contractor delay (covered in Chapter 26) or failure by the contractor to build the project as required (covered in Chapter 24).

Claims by the contractor against the owner are usually based on payment for work performed that has not been received or on increased cost of performance attributable to the owner (covered in Chapters 22, 23, and 25). Measuring the value of the claim is discussed in Chapter 27.

SECTION 6.03 Judicial Remedies: Money Awards, Specific Decrees and Declaratory Judgments

Judicial remedies can be divided into judgments that simply state that the defendant owes the plaintiff a designated amount of money (sometimes called the *money award*); judgments that specifically order the defendant to do something (specific performance) or to stop doing something (injunction); and a judgment declaring the contract rights of the parties (declaratory judgment). It is important to recognize the essential differences between money awards, specific decrees and declaratory judgments.

The ordinary court judgment (the money award) is not a specific order to the defendant to pay this amount to the plaintiff. If the defendant does not voluntarily comply with the court decree, the plaintiff must ask law enforcement officials to seize property of the defendant (now a judgment debtor) that the law does not exempt. If this is done—often a costly and frustrating process—the property is sold to satisfy the judgment. Any amount remaining after paying the judgment and costs of sale is paid to the defendant. Enforcing court judgments in this fashion is often costly where successful and often is unsuccessful.

The specific decree, a personal order or command by the judge, is a much more effective remedy. Failure by the defendant to comply with the court order can be the basis for citing the defendant for contempt of court. The defendant is brought before the judge to explain why she has not complied with the decree. If the explanation is not satisfactory, the judge can punish the defendant by fine or imprisonment or coerce the defendant into performing by stating that the defendant must pay a designated amount or stay in jail until she performs.

A declaratory judgment delineates the contract rights of the parties under stipulated facts. A party seeking a declaratory judgment is asking the court to assess the party's rights under the contract, usually as a means to preclude further litigation. Most commonly, declaratory

judgment actions are sought in insurance disputes to determine whether insurance coverage exists under the terms of the insurance policy. In one construction case, an owner's request for a declaratory judgment—that its contractor's invocation of the contract's *force majeure* clause was untimely—was disallowed.¹

With some exceptions, Sections 11.02B and 28.07D (mechanics' liens), and Section 30.12 (specific performance of arbitration award), the claims central to this book will, if successful, result in money awards—the principal remedy sought when claims are made that someone has not performed a contract for design or construction services. Courts have been very reluctant to issue orders (specific performance) requiring design professionals or contractors to perform in accordance with their contractual obligations.

The principal reason for refusing to grant specific performance is that the remedy “at law” (the ordinary money judgment) is adequate. Adequacy assumes that the party with such an award can use the money to obtain the promised performance from a third party. The party seeking specific performance must show that the remedy at law is inadequate.

This is demonstrated by *Sokoloff v. Harriman Estates Development Corp.*,² a decision of the highest court of New York. In this case, the owner sought specific performance from the contractor who had agreed to perform pre-construction services that included supplying a set of plans and specifications for a house. (The contractor had retained an architect.)

When negotiations broke down over the price to build the house, the owner sought a court decree ordering the contractor to hand over the plans and specifications to the owner. He had paid most of the promised compensation and offered to pay the balance. (The owner had participated in creating the design.) While the law usually will not order specific performance of a personal service contract—too much like court-compelled slavery and a recipe for more problems that will place a substantial burden on the court—the New York Court of Appeals sent the case back to the trial court to see whether the money award would be adequate. If the owner cannot procure a similar design from a third party, the court will issue a decree of specific performance, ordering the contractor to turn over the plans to the owner.

²96 N.Y.2d 409, 754 N.E.2d 184, 729 N.Y.S.2d 425 (2001).

SECTION 6.04 Compensation and Punishment: Emergence of Punitive Damages

As stated in Section 6.01, the basic purpose in awarding damages for breach of contract is to compensate a party who has suffered losses or who has been prevented from making gains. The common law did not view contract breach as an immoral act that might justify punishment. This view may have been based on the importance, in a market-oriented society, of people engaging in economic exchanges. Excessive sanctions may discourage people from making contracts. In the past few years, courts have been willing to award punitive damages for certain types of egregious contract breach, justifying this by concluding that a particular breach was tortious. Wrongful dismissal claims, those made by employees against their employers, have begun to generate punitive damages, which are awarded to the claimant to prevent the defendant from repeating the conduct or to make an example of the defendant to deter others. As most punitive damages are awarded in tort claims, they will be discussed again in Section 7.10C.

Punitive damage awards have been quite rare in construction disputes. However, awarding punitive damages in the construction contract context, particularly against contractors, has been increasing. Specific illustrations are given in Section 27.10.

SECTION 6.05 Protected Interests

Increasingly, law looks on the varying ways in which the party who makes a contract can be protected from breach by the other party. This protection is frequently described as encompassing restitution, reliance, or expectation.

The most protected of the three interests, restitution, seeks to restore the status quo that existed before the contract was made by awarding the plaintiff any benefit the plaintiff has conferred on the defendant. It is most protected because it is relatively easy to establish and involves both a loss to the plaintiff and a gain to the defendant. Its importance in measuring claims by design professionals and contractors for services performed justifies its inclusion in Sections 12.14C and 27.02E.

A plaintiff protects its reliance interest by obtaining reimbursement of expenses from the defendant that

have been incurred either in reliance on the contract or incurred before the contract was made and that have become valueless because of the breach. Such a remedy looks backward to a point in time even before the contract was made (somewhat similar to restitution), but also looks forward. If the defendant can establish that the expenditure sought would never have been reimbursed in the venture engaged in by the plaintiff, the plaintiff cannot recover from the defendant.

An architect brought a successful claim for reliance damages in *Designer Direct, Inc. v. DeForest Redevelopment Authority*.³ A town's redevelopment agency teamed with an architect on a three-phase project to revise the downtown area. The redevelopment agency dragged its feet through the first two phases, causing the architect to terminate the agreement before work could begin on the third phase. Finding the termination well justified, the court permitted the architect to recover the cost of his design services performed in preparation for the third-phase work as a form of reliance damages.

Suppose a contractor failed to build a building in which the owner intended to manufacture trendy, stylish pants suits created by a well-known clothing designer for the very wealthy. Suppose further that the owner invested a large amount of money to promote these suits. If the contractor can establish that market saturation or changing fashions meant not one suit would have been sold, the owner could not recover the marketing costs, as they would not have been reimbursed from sales proceeds.

The third protected interest, expectation, looks forward and seeks to place the plaintiff in the position it would have found itself had the defendant performed. One way of accomplishing this objective is to order the defendant to perform as promised, a remedy generally unavailable in contracts to perform design or construction services. The same objectives can be achieved by a money award, however.

Suppose a design professional or contractor refuses to perform a contract. Awarding an amount that would enable the owner to hire someone to perform identical design or construction services would protect the owner's expectation interest. As owners use this formula very frequently in claims, it will be discussed in greater detail in Chapter 27.

³13 F.3d 1036 (7th Cir.2002), rehearing denied, Jan. 29, 2003 (applying Wisconsin law).

SECTION 6.06 Limits on Recovery

Using rules described in this section, the law limits recovery by a claimant who has suffered losses that can be connected to the other contracting party's failure to perform in accordance with the contract. These rules often provide insurmountable obstacles to the claimant, prompting some to contend that the law does not adequately protect those who suffer losses from contract breach. Undoubtedly these obstacles can make recovery difficult. Yet they can also be looked on as rules that encourage parties to make contracts without inordinate fear that their nonperformance will expose them to unpredictable or devastating damage claims.

These doctrines can limit recovery but do not invariably do so. To the extent that any generalization can be made, modern law seems more willing to grant greater compensatory damages than in earlier periods in American legal history.

A. Causation

The claimant must show that the defendant's breach has caused the loss. Losses may be caused by more than one actor, and on occasion, causal factors can include other events and conditions. For example, the contractor's performance may be delayed by the owner, by strikes, by material shortages, and by the contractor's poor planning. It may be difficult if not impossible to establish the amount of the loss caused by contributing causes or conditions.

The defendant will be responsible for the loss if its breach was a substantial factor in bringing about the loss. It need not be the sole cause of the loss. Generally this question is determined by the finder of fact, sometimes the jury, and sometimes the trial judge. Any judicial finding regarding causation not based on guesswork will be upheld.

Causation problems can be particularly difficult when claims are made for breach of a contract to design or to construct, mainly because of the number of different entities that participate in the process and also because of the variety of conditions that may affect causation.

One common fact pattern involves tracing responsibility for a defect both to defective design and improper workmanship. Similarly, delayed performance by the contractor may be traceable to poor management by the contractor and excessive design changes made by

the design professional. These difficult problems are treated in Sections 24.06 and 26.06, respectively.

B. Certainty

A claimant must prove the extent of losses with reasonable certainty. One court described the certainty rule in these terms:

Courts have modified the "certainty" rule into a more flexible one of "reasonable certainty." In such instances, recovery may often be based on opinion evidence, in the legal sense of that term, from which liberal inferences may be drawn. Generally, proof of actual or even estimated costs is all that is required with certainty.

Some of the modifications which have been aimed at avoiding the harsh requirements of the "certainty" rule include: (a) if the fact of damage is proven with certainty, the extent or the amount thereof may be left to reasonable inference; (b) where a defendant's wrong has caused the difficulty of proving damage, he cannot complain of the resulting uncertainty; (c) mere difficulty in ascertaining the amount of damage is not fatal; (d) mathematical precision in fixing the exact amount is not required; (e) it is sufficient if the best evidence of the damage which is available is produced; and (f) the plaintiff is entitled to recover the value of his contract as measured by the value of his profits.⁴

Certainty in the context of construction claims is examined in Section 27.04.

C. Foreseeability: Freak Events and Disproportionate Losses

A series of improbable events can combine to lead to large losses. In the contract context, suppose a contractor is hired to build a high-rise office building. Shortly after the work is completed and accepted, the electrical system fails because of improper workmanship, causing the elevators to be out of service for two hours. During those two hours, the building owner has scheduled an interview with a prospective tenant who is thinking of leasing three floors of office space at a rental very attractive to the owner. Because the elevators are out of service, the prospective tenant decides to rent elsewhere. Should the contractor

⁴*M & R Contractors & Builders, Inc. v. Michael*, 215 Md. 340, 138 A.2d 350, 355 (1958).

be liable to the building owner for the extraordinary lease profits that the owner lost?

Clearly, the contractor's breach, perhaps a minor one, set off a chain of events that culminated in the loss of extraordinary rental profits. The improper installation caused an electrical failure, causing the elevators to malfunction. The prospective tenant was in the building at that very time. The prospective tenant's decision not to rent may have been caused by the tenant's irascibility or ignorance. This series of possible but improbable events has caused the building owner to suffer a loss. Is it fair to transfer this loss to the contractor?

The loss was an extraordinary loss and one that could not reasonably have been foreseen at the time the contract was made. Contrast this with an electrical malfunction that causes a fire. Such a loss falls more easily into the type of loss that can be reasonably foreseen at the time a contract is made. Also, such a risk is commonly covered by property insurance taken out by the owner and public liability insurance maintained by the contractor.

The leading common-law case dealing with what are sometimes called consequential damages is the English case, *Hadley v. Baxendale*,⁵ which gave rise to the requirement that losses be reasonably foreseeable as a probable result of the breach. A shipper claimed against a carrier when the latter's delay in returning a shaft that had been sent to the factory for repair caused the shipper's plant to be shut down. The amount paid for shipping the shaft was disproportionately small compared with the cost of an entire plant shutdown. The court concluded that the carrier is liable for losses naturally resulting from the breach and other losses, the possibility of which is brought to the carrier's attention at the time a contract is made.

Advance awareness of the risk gives the carrier the chance to adjust its rates for performance or decide to forgo the transaction. Similarly, is it fair to place the responsibility for a building shutdown on an electrician who is called to make a minor repair in a high-rise building but who fails to perform in accordance with the contract obligations? This may be too onerous in light of the small profit earned. Care must be taken, however, to distinguish risks that are insurable from the premiums paid to transfer the risk to the insurer as part of a performing party's overhead.

⁵156 Eng.Rep. 145 (1854). See Restatement (Second) of Contracts § 351 (1981).

D. Avoidable Consequences (The Concept of Mitigation)

The rule of avoidable consequences is another limitation. A claimant cannot recover those damages that the claimant could have reasonably avoided. Sometimes this rule is expressed as one that requires the victim of a contract breach to do what is reasonable to mitigate or reduce the damages. This limiting rule relates to the requirement that the breaching party is responsible only for those losses that its breach has caused. If the loss could have been reasonably avoided or reduced by the claimant, the claimant cannot transfer that loss to the breaching party.

This limitation has not been a favored one. The law not only has placed the burden of establishing that the loss could have been avoided by the claimant on the breaching party but also has been hesitant to give the rule much scope. For illustrations in the construction context, see Section 27.07.

E. Lost Profits

Claims for lost profits, extraordinary or ordinary, have caused particular difficulty. They involve the preceding limitations on contract recovery, causation, certainty, foreseeability, and avoidable consequences.

In the construction contract, owner claims are usually based upon delays. Delay can create owner liability on other related contracts, such as leases with prospective tenants and lost opportunities for resale profits (discussed in Section 27.06B). Contractor claims for profits lost on the contract for construction breached by the owner are routine parts of the basic damage formula treated in Sections 27.02B and C. Profits on future construction contracts that may be lost because of the diminished reputation or reduction in bonding capacity caused by the breach are covered in Section 27.06C.

Some states deny recovery of lost profits by new businesses, proof being too uncertain that it would have earned profits. The modern tendency has been to treat this issue like any other factual issue. Even a new business can try to prove it would have earned additional profits from other contracts.

F. Collateral Source Rule

Suppose the defendant has breached but the plaintiff has been compensated by a third party. Can the defendant show that the plaintiff has not suffered a loss?

The issue in these cases is whether the collateral source rule applies. This rule denies the right of a defendant to deduct the amounts recovered from third parties if the third party who has compensated the plaintiff is considered a collateral source. If so, the defendant cannot deduct from its obligation the amount paid by the third party. The contribution simply is not taken into account.

While some courts refuse to invoke the collateral source rule in a contract as opposed to a tort claim, there is a trend toward treating contract and tort claims similarly and basing the application of the rule on other criteria. Still, most of the cases where the collateral source rule is invoked are tort claims. The rule will be discussed in Section 7.10B dealing with tort remedies. As shall be noted there, the common-law collateral source rule increasingly is modified by statute.⁶ In the construction context, the rule is treated in Section 27.08.

G. Contractual Control: A Look at the UCC

The preceding discussion has assumed an absence of any controlling contract clauses regulating the remedy. Yet it is becoming more common for contracts to regulate the remedy. Some contracts specify or liquidate the damages when establishing actual damages would be difficult, if not impossible, to prove. Some contracts contain language insisted on by one of the contracting parties to either exculpate itself from responsibility or limit its exposure.

When remedies are specified, it is common to state in the contract that they are not exclusive. For example, the American Institute of Architects (AIA) provides remedies for termination. Yet the 2007 A201, Section 13.4.1, states that remedies specified are not exclusive. Similarly, evidence must be clear that a specified remedy is to be exclusive before it is given that effect. Contractual control of remedies is treated in other parts of this book.⁷ The Uniform Commercial Code, which governs transactions in goods, has been having increasing impact on construc-

tion contract disputes. Section 2-719 allows the parties to provide for remedies by contract but states, “Where circumstances cause an exclusive or limited remedy to fail of its essential purpose, remedy may be had as provided in this Act.”

Sellers of goods frequently seek to limit their obligation for breach to the repair and replacement of defective goods. In *Coastal Modular Corp. v. Laminators, Inc.*,⁸ a contractor was allowed to recover damages from a supplier of defective panels for a construction project despite a contract providing that the remedy was limited to repair and replacement. The court held that the remedy had failed of its “essential purpose” under Section 2-719. The contractual remedy would apply only if the defect had been discovered while the work was in progress. Here the defect had been discovered after completion. Repair and replacement would not have been a viable remedy.

H. Noneconomic Losses

To this point, with the exception of the discussion relating to punitive damages, this chapter has focused on compensatory economic losses—losses that can be established precisely or roughly in the marketplace. Increasingly, claims for breach of contract, sometimes tied with tort claims, are made for noneconomic losses, such as emotional distress, caused by a breach of contract.

Generally contract law does not grant recovery for such losses. Denial has usually been based on the lack of foreseeability. However, a more acceptable rationale is that contracting parties should not be liable for potentially open-ended and freak losses that are extremely difficult to measure in economic terms. A homeowner who cannot take possession of a new residence when promised can certainly suffer emotional distress. Similarly, a homeowner may suffer emotional distress when she occupies a very badly built house. (*Erllich v. Menezes* reproduced in Section 27.09 involves such a claim.) But the likelihood and gravity of such distress generally depends on the emotional and psychological makeup of the homeowner.

Reasons that have been given for denying recovery for such losses, even if they are established as genuine and are reasonably foreseeable, are that recovery is likely to result

⁶A description, history, and application of the New York statute that in part eliminated this common-law rule can be found in *Fisher v. Qualico Contracting Corp.*, 98 N.Y.2d 534, 779 N.E.2d 178, 749 N.Y.S.2d 467 (2002) (insurance proceeds offset amounts received from negligent contractors).

⁷Sections 15.03, 26.09B, and 26.10A.

⁸635 F.2d 1102 (4th Cir.1980).

in disproportionate compensation.⁹ Another commentator sought to explain the variant decisions by drawing a line between personal and commercial contracts, though he was not satisfied with this dichotomy.¹⁰

SECTION 6.07 Cost of Dispute Resolution: Attorneys' Fees

This text has suggested that contract remedies should compensate the injured party. Yet full compensation is rarely achieved. The rules that determine whether and how much damages are awarded sometimes make it difficult to achieve full compensation. Even more important, the winner cannot recover its cost of litigation, an item that has risen to staggering proportions. American common law (judge-made) does not transfer the prevailing party's attorneys' fees to the other party unless the claim is based on a contract that contains a provision providing for a recovery¹¹ or recovery is based on a statute granting attorneys' fees. Under extraordinary circumstances, such as commission of an intentional tort or the losing party's claim having been vexatious or frivolous, such costs can be recovered.

Denial of attorneys' fees is based on the reluctance of American law to discourage citizens from using the legal system. Although an unsuccessful claimant may have to bear the cost of its own fees, the law absolves the claimant of the responsibility of bearing the other party's costs.

This rule has led to increased legislation authorizing attorneys' fees as part of costs in consumer and civil rights cases. As shall be shown in Section 23.02J, claims by owners for defective work are often based on deceptive trade practices statutes, to expand remedies to treble damages and award attorneys' fees. Some states have enacted reciprocal attorneys' fees legislation. These statutes provide that if one party can recover attorneys' fees under a contract, the other party can do so even though the latter is not specifically granted this in the contract.

Some statutes grant attorneys' fees to the prevailing party where a mechanics' lien has been sought. Some give attorneys' fees when claims are made on surety bonds. A few statutes allow attorneys' fees *generally* for contract actions.¹²

Documents published by the AIA do not, except for indemnification, provide for attorneys' fees, each party bearing its own litigation costs.

AIA documents allow the parties to elect arbitration under the arbitration rules of the Construction Industry Dispute Resolution Procedures (CIDRP) (see Appendix F) administered by the American Arbitration Association. These rules do not specifically provide for attorneys' fees. A decision by the Supreme Court of Tennessee reviewed an arbitration award made under the CIDRP that included attorneys' fees.¹³ The court pointed to two provisions in the contract that dealt specifically with attorneys' fees while the CIDRP Rules do not, as noted earlier in this Section, provide for attorneys' fees. While as a rule (see Section 30.14), the courts give wide scope to the arbitration award, the court refused to confirm that portion of the award that awarded attorneys' fees. This issue is discussed in Section 30.12.

Local law, currently in a state of ferment, must be consulted by those who draft contracts or those who must counsel as to the availability of attorneys' fees to the prevailing party. Although discussion has centered on attorneys' fees, the other formidable costs of construction litigation—particularly complex litigation that involves defects and impact claims—cannot be ignored. These claims generate immense costs to reproduce, classify, analyze, and store documents as well as the staggering costs involved in conducting pretrial discovery. To these costs must be added the costs of preparing exhibits and retaining expert witnesses and the nonproductive costs incurred by personnel in preparing for the lawsuit. Those who draft contracts may wish to deal with these costs. Such costs should remind the parties they must make every effort to avoid litigation.

SECTION 6.08 Interest

Many cases have involved recoverability of prejudgment interest. Claimants often seek interest from a time earlier than entry of court judgment. Perhaps this is due to the ease with which a claim for interest can be tacked onto a claim for work performed or defective work. In any event, states vary considerably in their treatment of claims for prejudgment interest.

The varying legal rules dealing with prejudgment interest are caused by the differing judicial attitudes toward the desirability of complete compensation on one hand and on the other hand punishing a defendant when the latter exercised a good-faith judgment not to pay that turned out to be incorrect.

Although case holdings and statutes have many slight variations, they follow three principal rules. One limits prejudgment interest to liquidated (specific) amounts or unliquidated amounts that are easily determinable by computation with reference to a fixed standard contained in the contract without reliance on opinion or discretion. A party against whom a claim is made should be able to avoid prejudgment interest by tendering the amount due. Unless the amount is known or easily determined, tender cannot be made. This ignores the likely possibility that payment is not made because of a dispute over the validity of the claim, not the amount due were the claim held to be valid.

Some courts and statutes give the judge or jury discretion to determine whether interest should be awarded.¹⁴ Often discretion takes into account whether the refusal by the defendant to pay was vexatious (without sufficient grounds, solely to cause annoyance), what the inflation rate is, and how important money use is to the party entitled to the payment.

¹⁴West Ann.Cal.Civ.Code § 3287(b) (grants judge discretion to award interest from date no earlier than date legal action filed).

Some jurisdictions, either by court decision or increasingly by statutes, mandate prejudgment interest under certain circumstances.¹⁵ Undoubtedly this reflects increased legislative recognition that delay in payment causes a serious loss that should be compensated through interest. Again, local law must be consulted.

Special rules frequently deal with claims against public authorities. Until recently, interest could not be recovered against the federal government. This changed in 1978.¹⁶

With costs of financing now more recognizable as an important element in construction costs, contracts should specify that payments will bear interest from the time they are due. As to claims that are difficult to evaluate, the issue is not so clear. Suppose each party has a good-faith belief in the merit of its position and for that reason refuses to settle. Ultimate determination that refusal to pay was unjustified, permitting recovery of prejudgment interest, can place a heavy burden on the party who has asserted an honest reason for not paying. On the other hand, undoubtedly the loss should have been paid, and not awarding prejudgment interest denies full compensation to the party whose position was ultimately vindicated. Balancing compensation against punishment makes resolution of this issue difficult.

Unless the contract or an applicable statute states otherwise, in most states the interest rate will be the amount specified by law to be paid on legal judgments. See Section 22.02L.

¹⁵Penn.Consol.Stat.Ann., tit. 73, § 512(b) (prompt payment act), interpreted in *John B. Conomos, Inc. v. Sun Co., Inc. (R&M)*, 2003 PA Super. 310, 831 A.2d 696 (2003).

¹⁶41 U.S.C.A. § 611 allows interest from the date the claim is received until payment. The rate is set by the secretary of the treasury. From January 1, 2008 to June 30, 2008, the rate was 4.75 percent. See 72 Fed.Reg. 74408 (2007). (In 1982, it was 15.5 percent.)

Losses, Conduct, and the Tort System: Principles and Trends

SECTION 7.01 Relevance to the Construction Process

During the construction process, events can occur that might harm persons, property, or economic interests. Workers or others who enter a construction site may be injured or killed. The owner or adjacent landowners may suffer damage to land or improvements. Participants in the process may incur damage to or destruction of their equipment or machinery. The owner or other participants in the project may incur expenses greater than anticipated. Investors in the project or those who execute bonds on participants may also suffer financial losses.

After completion of a project, people who enter or live in the project might be injured or killed because of defective design, poor workmanship, or improper materials. Those who invest in the project may find investment value reduced for similar reasons.

The construction project is a complex undertaking involving many participants. It presents high risk of physical harm to those actively engaged in it. Sometimes such harm is caused by participants failing to live up to the standards of conduct required by law. Losses sometimes occur by human error that does not constitute wrongful conduct. Losses sometimes occur because of unpredictable and unavoidable events for which no one can be held accountable. Because of the varying causes of losses, the many participants in the project, and the complex network of laws, regulations, and contracts, placing responsibility is difficult.

SECTION 7.02 Tort Law: Background

A. Definition

A *tort* has been defined as a civil wrong, other than a breach of contract, for which the law will grant a remedy,

typically a money award. This definition, though not very helpful, mirrors the difficulty of making broad generalizations about tort law in the United States. One reason is the incremental or piecemeal development of tort law necessitated by new activities causing harm. For this reason, much American tort law consists of a collection of wrongs called by particular terms, which were given legal recognition in order to deal with particular problems.

Some basic distinctions are essential. Although tort law and criminal law have features in common—each regulating human conduct—they operate independently. Crimes are offenses against the public for which the state brings legal action in the form of criminal prosecution. Prosecution is designed to protect the public by punishing wrongdoers through fines or imprisonment and to deter criminal conduct.

The tort system is essentially private. Only individual victims can use the system. However, under certain circumstances a class can maintain a class action. A class allowed to bring a class action consists of those who have suffered similar harm by the same cause (silicone breast transplants, asbestosis caused by working with asbestos). Any sanctions imposed against those who do not live up to the standard of tort conduct are for the benefit of the victim. For example, the automobile driver who violates the criminal law may be fined or imprisoned. Those who are injured because of such criminal conduct are likely to institute a civil action to transfer their losses. This civil action is part of the tort system.

B. Function

Tort law has different functions. The particular function most emphasized at any given time depends on social and economic conditions in which the system operates.

The principal functions are to compensate accident victims, to deter unsafe or uneconomic behavior (to encourage investment of up to but not beyond the point at which incremental safety costs equal incremental injury costs), to punish wrongful conduct, or to protect social norms from a sense of outrage generated by perceived injustice, by providing a dispute resolution mechanism, or a combination of any of these goals.¹

In seeking to implement these functions, the law must often choose between goals and interests of individuals and groups. One person's desires may be filled at the expense of another. One person may wish to drive a car at a high speed, exposing others to danger. Property owners may wish the freedom to maintain their property as they wish. But this freedom may come at the expense of those who enter the land and are injured.² A manufacturer may wish complete freedom to design a product that will earn the highest profit. But this freedom may come at the expense of buyers who suffer harm from using the product.³ Adjusting these conflicts can reflect conscious decisions to select or favor one competing interest or goal over another—a form of social engineering.

Tort rules may severely limit a property owner's freedom or the freedom of a manufacturer to give greater protection to those who are injured on unsafe property or by defective goods. The historical description in Section 7.02D suggests trends in social engineering.

C. Threefold Classifications

Two important threshold concepts are threefold. The first concept describes the interests considered sufficiently important to merit tort protection and often described as follows:

1. *personal*, sometimes defined to include psychic or emotional interests
2. *property*, tangible and intangible
3. *economic*, unconnected to harm to a person or damage to property

¹Smith, *The Critics and the "Crisis": A Reassessment of Current Conceptions of Tort Law*, 72 Cornell L.Rev. 765 (1987). A general discussion of the aims, policies, and methods of tort law is found in D. DOBBS, TORTS, 12–25 (2000).

²See Section 7.08.

³See Section 7.09.

The second concept classifies the conduct of the person causing the loss:

1. *intentional*, including not only the desire to cause the harm but also the realization that the conduct will almost certainly cause the harm
2. *negligent*, usually defined as failure to live up to the standard prescribed by law
3. *nonculpable*, though in a sense wrongful, in which the actor neither intends harm nor is negligent

These threefold classifications play important roles in determining which victims will receive reparation from those causing the loss. On the whole, harm to a person is most deserving of protection, with harm to property being considered second in importance. At the conduct end, intentional conduct that causes harm is least worthy of protection, followed by negligent conduct. These classifications are gross, and many subtle distinctions must be made.

D. Historical Patterns

Earliest English private law developed during the feudal period, in which land dominated society. As a result, property law developed before any significant developments in tort or contract law. The feudal period was dominated by agriculture and a largely illiterate population, with little need for a developed contract or tort law system.

Although early English legal history saw the development of laws that dealt with finance, banking, and maritime matters, what is known today as *tort law*—as well as much of what is known today as *contract law*—did not develop until the Industrial Revolution in the late eighteenth and early nineteenth centuries. The Industrial Revolution moved manufacturing out of cottages and into factories, necessitating a transportation system and migration of workers from the farms and villages to the towns and cities.

The changes brought significant developments in tort law. The preindustrial agrarian society, with its emphasis on property, was most concerned with property rights and keeping the peace. The important torts were those that were intentional, as they could invite retribution, and those that invaded property interests. As a result, although persons may not have always acted at their peril in the sense that they would have to account for any damages their activities caused, much liability was “strict.”

Trespass, an invasion of a property owner's right to exclusive possession of property, did not require any showing of fault. Any trespass, whether innocent or deliberate, was wrongful. Both the importance of property rights and the inability to deal with subtle concepts such as negligence and fault contributed to the rather simple and often harsh strictures of early tort law.

Keeping the peace required protection against serious intentional torts, such as trespass, assault (apprehension of harm), battery (harmful or offensive touching), or false imprisonment (deprivation of freedom of movement). These serious matters could lead to breaches of the peace, and such conduct had to be eliminated or at least minimized through making the actor pay for the harm caused.

Unintentional or negligent conduct did not rate very high on the interest protection scale, both for reasons mentioned and because more important matters required attention. Matters such as harsh words, offensive conduct, or careless jostling were not sufficiently important in such a society to receive protection.

The Industrial Revolution generated factory and transportation accidents as well as migration to population centers. Now the law had to deal with conduct that became serious in crowded towns and cities. Many matters of an earlier day that were too trivial to be dealt with now required attention.

Even more important, difficult choices had to be made when commercial activity caused harm. The law chose to protect new and useful commercial and industrial activities from potentially crushing liability by not making liability as "strict" as it had been in preindustrial times. With some important exceptions,⁴ a person who suffered a loss could not transfer the loss to the person causing it unless the injured person was free of negligence and could establish that the person causing the harm did not live up to the negligence standard of conduct. Transferring the loss only on a showing of negligence and the development of other legal doctrines were designed to free useful activities from responsibility. These rules were less concerned with compensating victims of these activities.

Liberalization, as the term was then used, was designed to free economic activity from the shackles of heavy state mercantilistic controls. Rules that protected industrial and commercial activity may also have been generated by the belief that such activities brought long-run social and

economic advantages. Society in the nineteenth century emphasized the moral aspects of individual responsibility, and shifting a loss required wrongdoing. But as the toll in human misery and economic deprivation rose because of industrial, commercial, and transportation activities and as the automobile replaced the horse, changes were inevitable.

At the beginning of the twentieth century, many industrial countries sought to remove industrial accidents from the tort system. Workers' compensation is an example of a change to tort law brought about by legislative action.⁵

Common law judges also began to fundamentally expand the nature of tort liability. One of the most important defenses to liability created during the "liberalization" period was the *privity doctrine*, under which a party who negligently performs a contract obligation is liable only to the other party to that contract, not to third parties injured by the defendant's conduct. In the 1920s, judges began to reject the privity doctrine, making liability dependent upon the foreseeability of injury to the plaintiff arising from the defendant's conduct.

The new foreseeability rules immediately expanded liability to persons injured by negligently manufactured products. Manufacturer liability for negligence was later replaced with strict products liability. Compensating victims rather than unshackling enterprises became the predominant goal. The shift is sometimes described as *enterprise liability*. Under it an enterprise can and should bear the normal risks of its activity. These risks can be predicted, computed, and insured. The social costs of the activity can, through pricing, be spread to all who benefit from the enterprise by using its products.⁶ (Workers' compensation is an example of enterprise liability, but it is limited to injury to workers and coupled with tort immunity to employers.)

Beginning in the mid-twentieth century, the common law expanded liability to property owners for injuries to those who entered upon their property.⁷ Liability also expanded to those who furnished services, such as architects and engineers.⁸

⁵See Section 7.04C.

⁶Keating, *The Theory of Enterprise Liability and Common Law Strict Liability*, 54 Vand. L. Rev. 1285 (2001); Section 7.09 (strict products liability).

⁷See Section 7.08.

⁸See Chapter 14.

⁴See Section 7.04.

What of the postindustrial tort law? Some have advocated its abolition. They would replace it with social insurance, under which all victims of accidents would be compensated by the state or by private insurers.

Some have advocated, and many states have adopted, no-fault handling of road accidents. The victim recovers up to a threshold amount of medical expenses (which is quite low) without showing any fault. Above this threshold, the victim can use tort law. (Low thresholds have meant inflated medical expenses and very little reduction in lawsuits.)

Some have felt that enterprise liability has placed too heavy a burden on manufacturers and professionals. Much has been written about the "malpractice crisis," and legislative activity has moderated the harsh treatment given professionals and manufacturers by the courts. In addition, some have questioned the expansion of liability without fault and have suggested a return to a more negligence-oriented tort standard. Such calls for a brake on expanded liability are based on assertions either that liability cannot be insured against or that insurance premiums and claims expenses make useful services or products unprofitable. This has been seen in decisions by drug companies to pull particular drugs off the market and increased reluctance by medical professionals to pursue certain specialties, such as obstetrics and gynecology.

As noted in Section 7.02B, deterring unsafe and inefficient conduct is one goal of tort law. With the advent of liability insurance, some believe that the deterrent function is no longer accomplished by tort law. They would prefer direct control by legislation, similar to the Occupational Safety and Health Act enacted by Congress. Although much criticized mainly for obsessive interest in detailed rules, this act is a direct attempt to make industrial activities safer than would the indirect method of the tort system.

Although predictions are dangerous, the tort system in some form will likely continue to serve, if not the primary, at least an ancillary role in compensating victims and regulating activity.

E. General Factors in Determining Tort Liability

Some have examined the unruly and disparate thousands of tort cases and have attempted to articulate factors that

affect tort liability. One scholar listed the following items as important:⁹

1. the moral aspect of the defendant's conduct
2. the burden of recognizing a legal right on the judicial system
3. the capacity of each party to bear or spread the loss
4. the extent to which liability will prevent future harm

F. Coverage of Chapter

Tort law is simply too diverse and immense to cover in this text. By and large, there will be no discussion of intentional torts¹⁰ such as trespass,¹¹ assault, battery, false imprisonment, intentional infliction of emotional distress,¹² defamation,¹³ invasion of privacy, and interference with contract or prospective advantage.¹⁴ Emphasis is placed on negligence and strict liability, as those concepts relate to the construction process, starting with design and culminating with the finished project.¹⁵

⁹See W. PROSSER, TORTS, 16–23 (4th ed. 1971). A subsequent edition added "a recognized need for compensation" and "historical development." W. P. KEETON et al, TORTS, 20–26 (5th ed. 1984).

¹⁰Comprehensive treatment of intentional torts can be found in D. DOBBS, supra note 1 at 47–154.

¹¹*In re Catalano*, 29 Cal.3d 1, 623 P.2d 228, 171 Cal.Rptr. 667 (1981), held that a union official did not violate the criminal trespass statute when he refused to leave the site when ordered to do so by the owner. The official was conducting a safety inspection, a power given the union under its contract.

¹²See Section 6.06H.

¹³The tort of defamation, usually subdivided into libel and slander, sometimes arises in the construction context. See, for example, *Diplomat Elec., Inc. v. Westinghouse Elec. Supply Co.*, 378 F.2d 377 (5th Cir.1967) (subcontractor may sue its supplier for defamation); *Tutor-Saliba Corp. v. Herrera*, 136 Cal.App.4th 604, 39 Cal.Rptr.3d 21 (2006) (city attorney's allegedly defamatory remarks, made about a public contractor with whom the city was in litigation, are subject to the "official duty" privilege); and *Mishler v. MAC Systems, Inc.*, 771 N.E.2d 92 (Ind.App.2002) (sign posted by owners on their property, complaining of their contractor's poor workmanship, is protected speech).

¹⁴This intentional tort is noted briefly in Section 14.08F. See *Custom Roofing Co. v. Alling*, 146 Ariz. 388, 706 P.2d 400 (App.1985), which upheld a punitive damage award against a supplier in a claim by a contractor. The award was based on the supplier's wanton conduct and indifference to the rights of others. The supplier had failed to supply material, knowing it would cause the contractor to lose its contract.

¹⁵Most law relating to torts is called common law in that the principal sources of law are reported appellate decisions. Legislative bodies increasingly bar certain conduct, such as improper reasons for refusing to sell, rent, or hire.

SECTION 7.03 Negligence: The “Fault” Concept

A. Emergence of the Negligence Concept

The Industrial Revolution was the precipitating factor for tort law moving from principal emphasis on intentional torts and the need to keep the peace, to a system that would deal with increased accidents brought about by industrialization. This movement culminated with the recognition of negligence as the principal basis for liability. To legitimately transfer the plaintiff’s loss to the defendant, the plaintiff was required to establish that the defendant had not performed in accordance with the legal standard of conduct that, although somewhat inaccurately, was called the “fault” system.

Today the negligence concept largely governs road accident losses, losses caused by the possessor of land failing to keep the land reasonably safe, losses that occur in the home, losses caused by the activities of professionals, and, for the most part, losses caused by participants in the construction process.

B. Elements of Negligence

To justify a conclusion that the defendant was negligent, the plaintiff must establish the following:

1. The defendant owed a duty to the plaintiff to conform to a certain standard of conduct in order to protect the plaintiff against unreasonable risk of harm.¹⁶
2. The defendant did not conform to the standard required.¹⁷
3. A reasonably close causal connection existed between the conduct of the defendant and the injury to the plaintiff.¹⁸
4. The defendant invaded a legally protected interest of the plaintiff.¹⁹

C. Standard of Conduct: The Reasonable Person

The Objective Standard and Some Exceptions. Nineteenth-century English and American courts rejected a standard based on the subjective ability of the defendant. It was

not sufficient for the defendant to show that he did the best he could. To protect the community, its members are held to a standard that can exceed what they are able to do. In this sense, negligence is not synonymous with fault. The community standard requires that the defendant do what the reasonable person of ordinary prudence would have done. Such a standard can hold the defendant liable despite his having done the best he could. Negligence, then, or much of it, is not congruent with morality. The standard holds people who live in the community to an average community standard. For example, an inexperienced driver is expected to drive as well as the average driver.

Exceptions do exist, and a person can be held to a lower or higher standard than that of the community. Usually such exceptions are created by designating special subcommunities smaller than the general community and then applying an objective subcommunity standard. For example, children generally are not held to the adult standard but are held only to the standard of children of similar age and experience. Persons who, because of special training or innate skill, are expected to do better than the average person. Physicians are held to a higher standard in dealing with medical matters than are ordinary members of the community. Architects and engineers are held, as a rule, to the standards of their subcommunity (discussed in greater detail in Chapter 14). Professional truck drivers are expected to drive better than ordinary drivers. The combination of objective and subjective standards in such cases is reflected by statements that defendants are judged by what they knew or should have known or by what they did or should have done.

Because these standards are generally applied by a jury, some tolerance of human weakness and some exceptions to the objective standard other than those mentioned may find their way into jury decisions.

Unreasonable Risk of Harm: Some Formulas. Courts and commentators seek to refine vague community or reasonable person standards by articulating factors that should sharpen the inquiry into whether the standard of conduct has been met. One approach is to evaluate the magnitude of the risk, the utility of the conduct, and the burden of eliminating risk.

To determine the magnitude of risk, the relevant factors are the gravity, the frequency, and the imminence of the risk. Clearly the likelihood and the severity of

¹⁶See Section 7.03E.

¹⁷See Section 7.03C.

¹⁸See Section 7.03D.

¹⁹See Section 7.03F.

harm that can result are important factors in determining the type of conduct that, to avoid these risks, should be expected. Driving at an excessive speed on the highway clearly creates a high risk because accidents often result from excessive speed and their consequences are usually serious. Railroad crossings are dangerous because, though the likelihood of a train's striking an automobile may be small, the consequences of such an occurrence are serious. Conversely, although throwing a soft rubber ball into a crowd may not cause serious harm to anyone, it is likely to cause some harm to someone.

The other factors recognize that imposing liability on actors restricts human freedom. The social utility of the conduct being regulated is an important criterion in determining whether the legal standard has been met. Suppose a bank robber carelessly jostles a bank patron in the course of robbing the bank. If the law holds the bank robber responsible for the harm caused the patron, one factor is likely to be that bank robbing is not considered a useful activity and can be regulated by tort law as well as by criminal law. Conversely, the same carelessness by a bank security guard in performing a socially useful activity, such as organizing the patrons of the bank so that they can make an orderly retreat from a fire, would not expose the bank or guard to the same liability as the bank robber.

The burden of eliminating the risk recognizes that almost all risks can be eliminated or minimized if sufficient resources are mobilized. Undoubtedly the impact of road accidents would be minimized if guardrails were installed on all public highways. Yet doing so would involve an immense expenditure that might not be commensurate with the gain thus realized. Likewise, the burden of eliminating the risk in this manner would take into account not only the cost but also the aesthetic deprivation caused by universal installation of guardrails.

Where serious harm can be avoided by minimal effort or expenditure, failure to do so will very likely be negligent. For example, if serious burns can be avoided by installing a \$5 mixer valve in bathroom fixtures, failure to do so would very likely be negligent.²⁰

Common Practice: Custom. Suppose the defendant conformed to or deviated from common practice, or what is sometimes called "the custom in the community."

Defendants frequently attempt to exculpate themselves by showing that they performed as others do. This defense arises most frequently in claims against a manufacturer. Often the manufacturer establishes that it performs in accordance with industry practices.

Although compliance with customary practices is evidence of compliance with the legal standard of care, it is not conclusive. The customary standard itself may be careless and create unreasonable risk of harm. For example, suppose that most pedestrians jaywalk or that all workers refuse to wear hard hats in a hard-hat area. Similarly, failure to conform to customary practices is not conclusive, and a defendant may be exonerated despite deviation from customary practices if good reasons existed for deviation and the defendant conducted activities with reasonable care.

One important exception relates to the standard of conduct expected of professionals. As this is more appropriately dealt with in examining liability of design professionals, major discussion is postponed until Chapter 14. It is enough to state here that when defendants are judged by the subcommunity of their profession, customary practices of the profession become the standard.

Violations of or Compliance with Statutes. In exercising its responsibility to protect all citizens, government frequently prohibits certain conduct and attaches civil or criminal sanctions for violations. The construction process is governed by a multitude of laws dealing with land use, design, construction methods, and worker safety. What effect do violations of those statutes have on civil liability?

It is possible, though uncommon, for the statute to expressly declare that violations of the statute determine civil liability. More commonly, the statute expressly imposes criminal sanctions only. In such cases, courts can and do look at the statute as a legislative declaration of proper community conduct. To have any relevance, however, some preliminary questions must be addressed.

First, the person suffering the harm must be in the class of people that the legislature intended the statute to protect. Many statutes are intended to protect members of the community at large by achieving public peace and order rather than to protect any particular group or individual. For example, statutes sometimes prohibit certain businesses from operating on Sunday. Such statutes are not designed to protect those who suffer physical harm while a business operates in violation of the Sunday closing laws. Similarly, although statutes require that automo-

²⁰*Schipper v. Levitt & Sons, Inc.*, 44 N.J. 70, 207 A.2d 314 (1965) (builder-vendor strictly liable without need to show negligence).

biles be registered, the purpose of such laws is to raise revenue and not to impose liability on the driver of an unregistered car even though driving properly.

Sometimes the legislation is designed to protect an extremely limited class of people that may not include the injured party. For example, legislation requiring that dangerous machinery be shielded may be designed for the benefit of employees and not of those who enter the plant for other purposes. Similarly, some states hold that safety regulations imposed on a contractor-employer are not designed to protect employees of other employers on the site.

Second, did the statute deal with the particular risk that caused the injury? For example, suppose a statute limits the time a train may obstruct a street crossing. This is designed to deal with traffic delays, not with the risk of personal harm caused by the delaying train. On the whole, the tendency has been to broadly define the particular risk.

The violation of law can be excused in most instances by showing extraordinary circumstances that made compliance more dangerous than violation. For example, a statute may require that drivers always drive on the right unless they are passing another vehicle or making a left turn. Suppose the driver veers to the left lane to avoid hitting a child. This technical violation will be excused and have no bearing on negligence.

Where the policy expressed by the statute is particularly strong, the statute may expressly eliminate any possibility of a violation being excused. Violations of such statutes are conclusive on the question of negligence. Such statutes often impose liability despite assumption of risk or contributory negligence by the injured party, which, as shall be seen in Section 7.03G often is a defense. This form of strict liability may result if the statute was intended to protect someone from his own immaturity or carelessness. Illustrations are those prohibiting child labor or requiring safety measures in construction work.

Much can depend on the particular law violated. Some laws seem anachronistic and continue to exist only because the legislature lacks the energy to modernize rules. Violation of such laws may have very little impact.

Suppose it is concluded that the preliminary requirements have been met. The plaintiff is in the class of people to be protected, the statute was intended to cover the risk in question, and the violation was not excused. Most courts hold the violation to be negligence *per se* and conclusive on the question of negligence. The trier of fact,

whether judge or jury, need not decide whether there had been negligent conduct.

With the exception of special protective statutes of the type described earlier, a *per se* violation may or may not preclude a defense such as assumption of risk or contributory negligence. It does not preclude the defendant from showing that violating the statute did not cause the harm. For example, *Hazelwood v. Gordon*²¹ concerns a case in which an employee fell down a flight of stairs, which were too narrow at the bottom. The narrowness of the stairs, together with an inadequate handrail, violated a city ordinance. However, the court held that the injured party could not recover from the property owner, because her injury was not caused by a violation of the ordinance but was caused by her negligently placing her foot on the top step of the staircase, knowing the stairs were dangerous.

Some jurisdictions, however, find that a statutory violation is simply evidence of negligence to be given to the jury and weighed along with other evidence to determine whether the defendant lived up to the legal standard of care. Some states that employ negligence *per se* hold violations of local ordinances, traffic regulations, or administrative regulations to be only evidence of negligence. For example, *Bostic v. East Construction Co.*²² dealt with administrative regulations for fire safety. The court held that administrative regulations can be the basis for negligence *per se* but are less likely to be. The court also held that the regulations must be understandable, and the regulations involved in this case were not clear enough. (In any event, the court seemed to believe that the failure to comply with the fire regulations did not cause the injury.)

Compliance with the statutory standard does not necessarily preclude a finding of negligence. The statutory standard is a minimum. Additional precautions can be required. For example, it may not be a statutory violation to park a car on the shoulder of a highway as long as a tail-light functions. But under certain circumstances, such as an extremely foggy night, this conduct may be below the legal standard and be negligent. Such instances are rare.

Res Ipsa Loquitur. Proof of negligence can be by direct testimony of witnesses who testify based on their own observations of the defendant's conduct. However, sometimes this evidence is not available. Absence of

²¹253 Cal.App.2d 179, 61 Cal.Rptr. 115 (1967).

²²497 F.2d 712 (6th Cir.1974).

direct evidence does not preclude the plaintiff from establishing indirectly (that is, by circumstantial evidence) that the defendant was negligent. This can be accomplished by showing facts relating to the accident that tend to show, in the absence of an explanation by the defendant, that the defendant's negligence probably caused the accident. For example, suppose a tool falls from a scaffold and injures a passerby. Once the facts are established and it is known that the contractor's workers were working on the scaffold, it is more likely than not that the accident was caused by the contractor's negligence. The unfortunate Latin term *res ipsa loquitur*, used to describe this process of indirect proof of negligence, was employed in an English case in which a passerby was struck by a flour barrel falling from a warehouse window.²³

Much controversy has developed regarding the *res ipsa* concept, mainly centered around judicial and scholarly statements of *res ipsa* requirements. In reality, the supposed requirements are not truly requirements, because the doctrine is sometimes applied despite absence of some of them. However, the stated requirements may provide some assistance in understanding when the concept will be used. It is usually stated that *res ipsa* requires the following:

1. The event is one that ordinarily does not occur in the absence of someone's negligence.
2. The event must be caused by an agency or instrumentality within the exclusive control of the defendant.
3. The accident must not be due to any voluntary action or contribution by the plaintiff.

Some courts have suggested that the evidence must be more readily accessible to the defendant than to the plaintiff. But as stated, these requirements cannot be taken as conclusive, because they are not always found in cases where the doctrine is applied.

The use of circumstantial evidence does not, as a rule, shift the burden of proof from plaintiff to defendant. But if the facts indicate that the defendant's negligence probably caused the accident, the matter will be submitted to the jury. Applying the doctrine does not preclude defendants from introducing evidence that they

were not negligent. For example, in the illustration given earlier, the contractor can show that the tool fell because of a strong gust of wind for which it was not responsible. But the doctrine helps plaintiffs get their cases before the jury.

Sometimes the inference of negligence by the defendant is so strong it may persuade the jury that the plaintiff has met his burden of proof. Similarly, a very strong inference of negligence may justify the judge directing a verdict for the plaintiff.²⁴

D. Legal Cause: Cause in Fact and Proximate Cause

A reasonably close connection must exist between conduct of the defendant and the harm to the plaintiff. Legal cause is divided into two separate though related questions:

1. Has the defendant's conduct caused the harm to the plaintiff? (This is usually referred to as "cause in fact.")
2. Has the defendant's conduct been the "proximate cause" of the harm to the plaintiff?

Cause in Fact. The first, considered less complicated, is a factual question decided by the finder of fact, usually the jury. Even this supposedly simple question of causation can raise difficult issues. First, the defendant's conduct need not be the sole cause of the loss. Many acts and conditions join together to produce a particular event. Suppose an employee of a subcontractor suffers a fatal fall while working on a scaffold high above the ground. Any one of the following events could be considered a cause of the death in the sense that without any of these events the fatal fall would not have occurred:

1. the worker's need to pay medical bills, causing the worker to take this risky job
2. defective scaffolding supplied by a scaffolding supplier
3. failure by the subcontractor or prime contractor to remove the scaffolding when complaints were made about its unsafe condition
4. weather conditions that made the scaffold particularly slippery on the day of the accident

²³*Byrne v. Boadle*, 159 Eng.Rep. 299 (Exch.1863); Webb, *The Law of Falling Objects: Byrne v. Boadle and the Birth of Res Ipsa Loquitur*, 59 Stanf. L. Rev 1065 (2007).

²⁴*Morejon v. Rais Constr. Co.*, 7 N.Y.3d 203, 851 N.E.2d 1143, 818 N.Y.S.2d 792 (2006).

5. a low-flying plane that momentarily distracted the worker
6. the worker's refusal to wear a safety belt
7. the subcontractor's or prime contractor's failure to enforce safety belt rules

Although the list can be amplified, remove any link in the causation chain and the worker would not have been killed. Yet it would be unfair to relieve any actor whose failure to live up to the legal standard played a significant role in the injury simply because other actors or conditions also played a part in causing the fall.

Liability in such a case would depend on a conclusion that any of the defendants substantially caused the injury. Suppose a claim had been made against the scaffold supplier and the prime contractor. Each could have been a substantial cause of the injury. In an indivisible injury, each would be liable for the entire loss, and whether the party paying the claim would be entitled to recovery from the other party would depend on whether a right to contribution or indemnity existed.²⁵

Cause in fact requires that the harm would not have occurred without the defendant's failure to live up to the legal standard. Put another way, the defendant will usually be exonerated if the injury would have happened even if the defendant had lived up to the legal standard of conduct. For example, suppose the prime contractor did not supply a safety belt to the worker as required by law but the worker would have been killed because he would have refused to wear it. Under these conditions, it is likely that the prime contractor would not be held liable because the contractor's negligence did not cause the harm.

The "but for" defense has one important exception. Suppose two builders are constructing houses on adjacent lots. Each is simultaneously negligent, causing fires to begin on each building site. The fires join together, roar down the street, and burn a number of homes. Either fire would have been sufficient to burn the houses. Yet neither builder will be able to point to the "but for" rule as a defense. Each will be liable for the entire harm.²⁶

Proximate Cause. Proximate cause, though related to cause in fact, serves a different function. Cause-in-fact

judgments are factual and best made by commonsense decisions of juries. Proximate cause, in contrast, involves a legal policy that draws liability lines to relieve those whose failure to live up to the legal standard of conduct causes harm. Proximate cause serves a function similar to the requirement that there be a duty on the defendant to act to protect the plaintiff, as discussed in Section 7.03E. Both duty and proximate cause can minimize crushing liability burdens on those engaged in useful activities and can prevent liability from going "too far."

Proximate cause can involve the following:

1. harm of a different type than reasonably anticipated
2. harm caused to an unforeseeable person
3. harm caused by the operation of intervening forces

As an example of the first, suppose a contractor installs a sheltered walkway around a project. It can foresee that defective planking could cause a sprained ankle, but will it be liable if a pedestrian pushing a baby stroller falls on a defective plank, causing the baby to tumble from the stroller and fracture its skull? Suppose defective wiring in a high-rise building causes a power failure and shuts down all the elevators. A person who intends to submit a bid on a public project on the top floor cannot reach the awarding authority's office in time to submit the bid. Can the person recover the lost profits on the contract from the supplier of the electric wire or the owner of the building?

These freak accidents, though they occur infrequently, are dramatic enough to excite scholarly interest when they reach appellate courts. The most famous illustration of the second type of case was *Palsgraf v. Long Island Railroad Co.*²⁷ It involved a passenger running to catch one of the defendant's trains. Some employees of the defendant sought to help the passenger board the train but did so carelessly, dislodging a package from the passenger's arms, which fell on the rail. The package contained fireworks that exploded with some violence. The concussion overturned some scales many feet down the platform. This was unfortunate for the plaintiff, who was struck by a scale, but fortunate for legal scholars and generations of law students who dissected the subsequent appellate court decision. In a four-to-three opinion, the court held that the plaintiff was outside the zone of risk.

²⁵A discussion of concurrent liability for indivisible loss is found in Sections 24.06 and 27.14. A claim by one concurrent wrongdoer against the other is discussed in Sections 31.03 and 31.05.

²⁶See Section 24.06.

²⁷248 N.Y. 339, 162 N.E. 99 (1928).

As an unforeseeable plaintiff, the railroad company did not owe any duty toward her despite its employees being careless toward someone else.

A case illustrating the third type was *Petition of Kinsman Transit Co.*, which involved two claims and two appeals. A negligently moored ship in the Buffalo River was set adrift by floating ice, dragging along another ship on the way. Bridge attendants were warned but inexplicably failed to lift a bridge. Both ships collided with the bridge, and the bridge collapsed. The ships and ice blocked the river channel by creating a dam. Water and ice backed up, damaging factories on the bank as far up the river as the original mooring. One claim involved flood damage to the factories, and the other involved pecuniary loss caused by the necessity of transporting ship cargoes around the blockage. The court granted a recovery to the factory owners²⁸ but denied recovery for those ships incurring additional expenses to go around the blockage.²⁹

It would serve no useful function to explore the many formulas used in these cases, such as direct cause, foreseeability, hindsight, and superseding causes. It is sufficient to indicate that freak accidents cause unusual harm, and lines must be drawn. One treatise, after cataloging the various formulas, suggested that those who propose formulas are groping for something that it is difficult if not impossible to put into words. It suggested the need for a method "of limiting liability to those consequences which have some reasonably close connection with the defendant's conduct and the harm which it originally threatened, and are in themselves not so remarkable and unusual as to lead one to stop short of them."³⁰ Even though proximate cause is analytically considered an issue of law because it deals with a policy of limiting liability, juries are usually given a vague instruction relating to proximate cause similar to the instruction they are given relating to the standard of conduct. It is hoped that the jury will use common sense in deciding such freak cases.³¹

²⁸*Petition of Kinsman Transit Co.*, 338 F.2d 708 (2d Cir.1964), cert. denied, 380 U.S. 944 (1965).

²⁹*Petitions of Kinsman Transit Co. v. City of Buffalo*, 388 F.2d 821 (2d Cir.1968).

³⁰W. P. KEETON, *supra* note 9 at 300.

³¹Perhaps a layperson's view based on a gut reaction of what is going too far is the best solution to these vexatious problems. In commenting favorably on a hindsight test, one commentator suggested a line be drawn: "short of the remarkable, the preposterous, the highly unlikely, in the language of the street, the cock-eyed and far-fetched, even when we look at the event, as we must, after it has occurred." (Id. at p. 299.)

E. Duty

Under negligence law, every person has a duty to use the level of care of a reasonable and prudent person. That standard of conduct is explained in Section 7.03C. While this standard is a universal one that applies without regard to the relationship between the defendant and plaintiff, this was not always so. In particular, the common law has struggled with when a duty should be applied to a defendant whose injurious conduct occurred during the performance of a contract obligation.

The first duty cases were decided in the mid-nineteenth century in a legal climate favorable to new industries developing after the beginning of the Industrial Revolution. Like proximate cause, it was an attempt to draw a line beyond which recovery would not be granted. Unlike proximate cause, it tended to emphasize the relationship between individuals that imposes on one a legal obligation to watch out for the other. As examples, innkeepers owed legal obligations to their guests, as did landowners and business owners to their visitors.

However, as more fully explained in Section 7.09B, the privity doctrine was the primary device used by nineteenth-century courts to limit a defendant's duty of care. Under this doctrine, first devised in England, a defendant who performed a contract obligation negligently owed a duty of care only to the other parties to the contract: those with whom it was in privity. Absent privity, a defendant was not liable for injury it had caused to the plaintiff by its negligence or breach of contract with another. Recovery was denied regardless of whether the plaintiff's injury consisted of physical harm or financial losses.³² Generally speaking, the privity doctrine protected manufacturing and commercial activity.

The privity doctrine was rejected early in the twentieth century, replaced by a general rule that a defendant may be liable in negligence if its lack of due care proximately caused foreseeable harm to a foreseeable victim.³³ Otherwise stated, a victim cannot recover against the defendant under a theory of negligence unless the defendant could have reasonably anticipated that someone would be injured in *this way by this* careless conduct of the defendant.³⁴

³²*Winterbottom v. Wright*, 152 Eng. Rep. 402 (1842) (physical harm).

³³*MacPherson v. Buick Motor Co.*, 217 N.Y. 382, 111 N.E. 1050 (1916); D. DOBBS, *supra* note 1 at 334–36.

³⁴If the defendant's careless behavior results in an entirely unanticipated injury, the defendant does not owe a duty of care and is not liable. *Pulawa v. GTE Hawaiian Tel*, 112 Haw. 3, 143 P.3d 1205 (2006).

Replacement of the privity doctrine with the foreseeability doctrine led to a dramatic expansion in potential tort liability. Contracting parties have a duty not only to perform in accordance with the contract terms (both express and implied), but also to perform their obligations in a non-negligent manner. The tort duty of workmanlike conduct requires a contractor to build not only in conformity with the design, but also (where the design is silent) as would a prudent and careful contractor.³⁵ If the design specifies a manner of building the contractor believes to be dangerous or inadequate, it must bring this to the attention of the owner.³⁶

The open-ended nature of potential tort liability resulting from the adoption of the foreseeability doctrine is not always healthy for society as a whole. While expansive tort liability should ensure greater compensation to victims and encourage careful conduct, absolute safety is neither possible nor affordable and excessive risk aversion may stifle product innovation. For these reasons, courts have struggled to devise objective rules by which to limit this premise of open-ended liability.

One major limitation is to impose a narrowed duty of care when the plaintiff suffered pecuniary or financial loss, in contrast to physical harm such as death, personal injury, or damage to property.³⁷ Absent privity between the parties, liability for economic losses negligently caused was limited to those with whom the defendant had a special relationship or to whom the defendant had made representations upon which the plaintiff had relied.³⁸

Courts may also invoke amorphous policy considerations as a limitation on tort liability. Even if the plaintiff's injury was foreseeably caused by the defendant's negligent conduct, courts may disallow recovery if this would place

an unreasonable burden on the defendant or create tort exposure lacking a sensible or objective cutoff point.³⁹

Courts are also sensitive to the financial burdens that expanded tort liability may impose upon state and local governments and, by extension, taxpayers. Under the public duty doctrine, a city, whose building inspector is charged with negligence, owes no duty to individual owners above that duty owed to the general public.⁴⁰ Local law must be consulted.

F. Protected Interests and Emotional Distress

As Section 7.02C indicates, the particular loss suffered often controls liability. Even if all the requirements for negligence are met, the particular harm that has resulted may not receive judicial protection. Courts speak of whether particular interests are protectable in the process of deciding whether the defendant must respond for certain losses caused the plaintiff.

Harm to the person is most worthy of protection. Death not only ends one's life but also can have a severe financial and emotional impact on the deceased's survivors. Physical injury often means medical expenses and diminished earnings as well as pain and suffering. Often those who suffer physical harm are low-income people who may not procure insurance to protect themselves and their dependents. As a result, for these as well as for humanitarian reasons, it may be important to extend protection to those who suffer physical harm.

Harm to property such as damage or destruction is also considered worthy of protection because of the importance placed on property in modern society. But as the harm moves away from personal and property losses, the interest receives less protection. Economic harm such as diminished commercial contractual expectations, lost profits, or additional expenses to perform contractual obligations, although sometimes protected, is considered less

³⁵*Stonegate Homeowners Ass'n v. T.A. Staben*, 144 Cal.App.4th 740, 50 Cal.Rptr.3d 709, 716–17 (2006) (subcontractor has a tort duty to perform with due care).

³⁶*George B. Gilmore Co. v. Garrett*, 582 So.2d 387, 394–95 (Miss.1991) (duty to warn of soil conditions); Section 25.02 discusses a contractor's liability for defective soil conditions.

³⁷The closely related economic loss rule is discussed in Section 14.08E.

³⁸*Plourde Sand & Gravel Co. v. JGI Eastern, Inc.*, 154 N.H. 791, 917 A.2d 1250 (2007) (no special relationship between a testing company hired by the engineer and a gravel supplier); Section 14.08D discusses negligent misrepresentation.

³⁹For examples of courts using policy considerations to limit tort liability in construction cases, see 532 *Madison Ave. Gourmet Foods, Inc. v. Finlandia Center, Inc.*, 96 N.Y.2d 280, 750 N.E.2d 1097, 1103, 727 N.Y.S.2d 49 (2001); *Butler v. Advanced Drainage Systems, Inc.*, 294 Wis.2d 397, 717 N.W.2d 760, 767–69 (2006); and *Hoida, Inc. v. M&I Midstate Bank*, 291 Wis.2d 283, 717 N.W.2d 17, 31–34 (2006).

⁴⁰*Sinning v. Clark*, 119 N.C.App. 515, 459 S.E.2d 71, review denied, 342 N.C. 194, 463 S.E.2d 242 (1995); D. DOBBS, *supra* note 1 at 723–27.

worthy of protection than harm to person or to property. Even less protection is accorded emotional distress and psychic harm, sometimes called *noneconomic losses*.

A number of reasons for caution exist when claims are made for economic loss, and even more when claims are made for emotional distress. Economic losses result from many causes other than the conduct of the defendant, and are difficult to prove. Liability can place crushing burdens on the defendant. Courts have only cautiously extended protection for economic harm, and they have been even less willing to extend protection for emotional distress. This caution is partly grounded in the undoubted difficulty of establishing the genuineness of the claim. Another is the difficulty of placing an economic value on the loss. Because of these difficulties, the law has been unsettled in this area, and decisions vary from jurisdiction to jurisdiction.

With some exceptions,⁴¹ the plaintiff cannot recover for mental disturbance caused by the defendant's negligence in the absence of accompanying physical injury or consequences. Clearly, however, there can be recovery for mental disturbance if the negligence of the defendant has inflicted an immediate physical injury and the mental disturbance such as pain and suffering was caused by the physical injury. Suppose physical harm follows fright or shock of the plaintiff, such as a miscarriage suffered after negligent conduct by the defendant caused a mental disturbance. Many American cases have required the plaintiff to show that some physical impact on the plaintiff was caused by the defendant's negligent acts. Others have not. The recent cases have eliminated the requirement of impact, and the impact rule is likely to disappear.

Suppose physical injury resulting from fright occurs when the injured person feared for his own safety. Here most states allow recovery. But fear for someone else's safety has divided the courts. The classic example has involved a mother, though not in danger, seeing her child seriously harmed. Some courts allow recovery. Others do not.⁴²

Emotional distress and mental disturbance can arise in the context of construction work. Suppose a worker is on a roof. The roof partially collapses, but the worker is not injured. The worker may have suffered emotional distress from the fear that he was about to fall or that he might have

fallen. Also, suppose a worker experiences traumatic shock when he sees someone else fall from the roof of a building.

G. Defenses

Acceptance Doctrine. What is the liability of a contractor if a construction defect caused injury to a third party (whether an occupant, visitor, or passerby), but only after performance was completed and the building had been accepted by the owner? In the nineteenth century, the privity doctrine (discussed in Section 7.03E) meant that the injured person could not sue the contractor, just as an injured consumer could not sue the manufacturer of a defective product.

In the first half of the twentieth century, as privity gave way to an expanded view of tort liability, different rationales were used to continue the acceptance doctrine. One rationale was that the owner's acceptance of the completed building was an intervening cause that severed the causal link between the contractor's negligence and the injury, especially in light of the owner's affirmative duty to maintain the structure in a reasonably safe condition. Courts also feared that abandonment of the acceptance defense would subject contractors to unlimited, potential liability, since the statute of limitations for tort actions begins to run on the date of the injury.

The acceptance doctrine was criticized for shifting liability from a negligent contractor to an innocent owner. Critics pointed out that the rationale in favor of the doctrine was especially weak where the injury was caused by a latent construction defect, which the owner could not have been expected to discover and remedy. Passage of statutes of repose—which cut off liability for contractors a specified number of years after completion of their work—meant that the acceptance doctrine was no longer needed to prevent unlimited contractor liability.⁴³ Eventually, many courts began to entirely reject the doctrine as incompatible with modern tort jurisprudence. Those who continued adherence to the doctrine usually ameliorated its harsher results by creating a variety of exceptions to it; for example, that the defense would not apply to defects that were imminently dangerous to others, that were latent, or where the design was so obviously defective that no reasonable contractor would follow it. The competing reasons in favor and against continued

⁴¹See Sections 6.06H and 27.09 for claims for emotional distress based on contract breach. See also W. P. KEETON, *supra* note 9 at 361–62.

⁴²W. P. KEETON, *supra* note 9 at 365–66.

⁴³Statutes of repose are discussed in Section 23.03G.

adherence to the rule mean the common law remains in a state of flux.⁴⁴

Assumption of Risk. Assumption of risk completely bars recovery even if the defendant has been negligent. Advance consent by the plaintiff relieves the defendant of any obligation toward the consenting party. The plaintiff has chosen to take a chance. Suppose the plaintiff voluntarily entered into a relationship with the defendant with knowledge that the defendant would not protect the plaintiff from the risk. In such cases, the plaintiff implicitly assumed the risk. Sometimes the plaintiff is aware of a risk created by the negligence of the defendant but proceeds voluntarily to encounter it.

Express agreements to assume the risk are often given effect if knowingly and freely made by parties of relatively equal bargaining power.⁴⁵ But sometimes the relationship is one regulated by law and this freedom is denied. For example, workers are frequently prohibited from signing agreements to assume the risk of physical harm.

Most cases involve implied assumption of risk. Did the plaintiff know and understand the risk? Was the choice free and voluntary? Voluntariness has generated considerable controversy where workers take risks under the threat that they will be discharged if they do not continue working.⁴⁶ Under such circumstances, some American courts conclude that the worker even under such pressure has assumed the risk of performing dangerous work.⁴⁷ Although statutes often preclude assumption of risk in employment relationships, the concept can be applied in third-party actions brought by workers against persons *other* than their employers.

The assumption-of-risk defense is not favored. As a result, the defendant must plead and prove that the plaintiff assumed the risk.

⁴⁴Compare *Moglia v. McNeil Co., Inc.*, 270 Neb. 241, 700 N.W.2d 608 (2005) (recognizing the imminently dangerous and latent defect exceptions, but finding neither applicable) with *Davis v. Baugh Industrial Contractors, Inc.*, 159 Wash.2d 413, 150 P.3d 545 (2007) (rejecting the doctrine). For a compilation of the cases, see Annot., 75 A.L.R.5th 413 (2000).

⁴⁵*Delta Air Lines, Inc. v. Douglas Aircraft Co.*, 238 Cal.App.2d 95, 47 Cal.Rptr. 518 (1966). However, a release signed by a person seeking admission to a university hospital was not upheld in *Tunkl v. Regents of the Univ. of California*, 60 Cal.2d 92, 383 P.2d 441, 32 Cal.Rptr. 33 (1963).

⁴⁶*Fonseca v. Orange County*, 28 Cal.App.3d 361, 104 Cal.Rptr. 566 (1972).

⁴⁷*Mitchell v. Young Refining Corp.*, 517 F.2d 1036 (5th Cir.1975).

Contributory Negligence. Until quite recently, most states would bar the plaintiff from recovering if the defendant established that the plaintiff's negligence played a significant role in causing the injury. Juries were thought to use techniques to mitigate the harshness of this defense. Where the plaintiff's negligence was slight and much less than that of the defendant, juries sometimes decided that the plaintiff was not contributorily negligent or that the contributory negligence did not cause the harm. Where both parties were negligent but the defendant much more so, the jury may have compromised by finding that there had not been contributory negligence but by diminishing the amount of the plaintiff's award to take the plaintiff's negligence roughly into account.

The contributory negligence rule has been criticized because slight negligence bars what would otherwise appear to be a just claim. A number of states, notably Wisconsin and Louisiana, enacted legislation early in the century that modified this rule by requiring that the negligence of the plaintiff and the defendant be compared rather than automatically barring the plaintiff from recovery if the plaintiff has been negligent. Most states have enacted statutes creating comparative negligence, and a few courts have created comparative negligence without the benefit of legislation.

The details of comparative negligence laws vary considerably. The essential feature is that the plaintiff's negligence does not automatically bar recovery but only diminishes recovery. A plaintiff whose negligence reaches a specific percentage, such as 50 percent, is barred in some states. In other states, the comparison is "pure." An 80 percent negligent plaintiff would be entitled to recover 20 percent of the loss from a 20 percent negligent defendant. Comparative negligence has been used in admiralty law and in claims by employees of certain common carriers subject to the Federal Employers Liability Act.

Independent Contractor Rule. Unlike the two preceding defenses, the defense of the independent contractor rule does not involve conduct or risk taken by the party who suffered the loss. But because of its importance in construction legal problems, it merits brief mention at this point.

Suppose a homeowner hires a contractor to do remodeling work and the contractor negligently drops tools from the roof, injuring a passerby. As a general rule, the homeowner will be not liable to the passerby because the injury was

caused by an independent contractor.⁴⁸ An independent contractor is asked to achieve a result and is not controlled as to means by which this is accomplished. The homeowner's lack of control over the contractor's means and methods of performance defeats imposition of vicarious liability upon the owner (as would happen if the injury was caused by the owner's employee). The hirer of an independent contractor can be either the owner (who hires the prime contractor) or the prime contractor (who hires subcontractors).

Many exceptions to the independent contractor rule exist. Where the work to be performed involves an "inherently dangerous" activity, an injury arising out of that work will subject the hirer to vicarious liability.⁴⁹ Vicarious liability will also be imposed if the injury involved a "nondelegable duty," such as violation of a workplace safety statute.⁵⁰ (The term "nondelegable duty" is something of a misnomer; the duty to provide a safe workplace may be delegated; however, liability arising out of violation of that duty remains on the hirer.) Many other exceptions impose liability based on the hirer's own acts of negligence, including retention of control over the contractor's work.⁵¹ In the past quarter century, an increasing number of courts have refused to impose vicarious liability—and have narrowed the exceptions based upon the hirer's own negligence—where the victim was a construction worker entitled to workers' compensation benefits.⁵²

SECTION 7.04 Nonintentional Nonnegligent Wrongs: Strict Liability

A. Abnormally Dangerous Things and Activities

As indicated earlier,⁵³ preindustrial law was often strict in the sense that liability did not require negligence. Despite the emergence of negligence as the dominant basis for liability that developed in the nineteenth century, some

pockets of law found liability "strictly." One—keeping of animals—is of little importance to construction. (But watch strict liability for keeping a vicious dog on the site to deter vandals.) The other—strict liability for abnormally dangerous things and activities—does find application to modern construction problems and merits some comment.⁵⁴

Rylands v. Fletcher,⁵⁵ an 1868 English decision, held that a mill owner not shown to have been negligent was liable when he built a reservoir whose waters broke through to an abandoned coal mine and flooded parts of the plaintiff's adjoining mine.

Ultimately, most American decisions in some form or another found strict liability where the defendant owned dangerous things or engaged in dangerous activities. The prototype abnormally dangerous activity is often stated to be blasting. The activity may not be negligent, because the social utility and the high cost of avoiding the harm makes the conduct reasonable despite the high risk of serious harm. The modern rationale for strict liability for such activities is that such enterprises should pay their way and are better risk bearers than the persons who have been harmed by the activity.

As modern tort law emphasizes victim compensation and loss spreading through insurance and pricing goods and services, strict liability (liability without a need to establish negligence) has become more important in construction-related activities. Strict liability for defective products plays an increasingly important role in construction-related litigation (discussed in Section 7.09). (Also, the professional standard to which design professionals are held is increasingly under attack, the assertion being that they should be held to a "stricter" standard.)⁵⁶ This trend is reflected in federal laws that make those who generate, transport, or dispose of hazardous waste strictly liable for violating statutes and regulations that regulate these activities.⁵⁷

B. Vicarious Liability

Sometimes one person is responsible for the negligence of another. The most common illustration is the employment relationship. Despite the absence of negligence by the employer, the employer is liable for harm caused by the negligent conduct of the employee as long as that conduct

⁵⁶See Section 14.07.

⁵⁷See also Section 9.13A.

is within the scope of the employment. Sometimes the employer can be held liable for intentional torts committed by the employee. For example, a subcontractor was held liable for injuries sustained by two employees of the prime contractor as a result of a physical attack committed on them by employees of the subcontractor.⁵⁸ The ruling was made despite the physical attack having occurred after the attacking employees had completed their work shift.

One reason sometimes given for vicarious liability, or as it is sometimes called, *respondeat superior*, is the incentive it gives to an employer to choose employees carefully. The real basis for vicarious liability is that an enterprise should pay the full cost of its activities or the products it produces, such as the cost of those injured by its activities or products. Also, vicarious liability is premised on the ability to pay, or the “deep pocket.” The pocket of the employer is likely to be deeper than that of the employee.

C. Employment Accidents and Workers’ Compensation

Although the principal thrust of this chapter is the role of tort law in distributing losses, one exception is the workers’ compensation law, which was to a large degree to supplant tort law in workplace accidents. The employer’s liability under workers’ compensation is strict. Recovery against the employer does not require the latter’s negligence. For these reasons, it may be useful to briefly describe certain doctrines that deal with employment injuries.

The injured worker did not fare well under English or American common law. Expansion of the Industrial Revolution generated employment injuries but only limited legal protection to those injured. The employer’s duties were limited: to furnish the worker a safe place to work and safe appliances, tools, and equipment and to warn the worker of any known danger connected with the work. The injured worker faced, in addition to limited employer duties, obstacles to compensation. First, the worker had to prove that the employer was negligent. Many accidents occurred because of the nature of the work and not the negligence of the employer.

Even if negligence were established, the worker faced the “unholy trinity” defenses of contributory negligence,⁵⁹

assumption of risk,⁶⁰ and the fellow servant rule. The first barred a worker whose injury was substantially caused by the worker’s negligence unless the employer’s conduct had been willful or wanton. The second barred the worker from recovery if taking the job was an assumption of the risk of injuries normally incident to the employment. A worker who stayed on a job under protest after the worker knew or appreciated the danger assumed the risk. The third defense meant that with some exceptions, a worker could not recover for injuries caused by the negligence of a fellow servant.

These formidable barriers often meant hardship to injured workers and their families. Following German social insurance law, American states began in the early twentieth century to enact what were then called workmen’s compensation laws designed to replace tort law with social insurance for industrial accidents. Although some early statutes were held unconstitutional, currently all states have workers’ compensation laws.

Although there are considerable variations among the states, certain common questions have arisen. For example, are the employer and the worker covered under the workers’ compensation law? Many statutes exclude agricultural workers and domestics as well as employers who have only a few employees. The injury must arise out of the employment. Do injuries that occur on company picnics or while parking the worker’s car in the company lot arise out of the employment? Doubts generally are resolved in favor of the employee.

Some states cover occupational diseases. Others do not. The worker need not show negligence by the employer. Nor are workers precluded by their own negligence from recovering, by their having assumed the risk, or by the injury having been caused by their fellow workers.

Some states deny recovery if the worker was guilty of willful misconduct or intoxication and such misconduct caused the injury.

Most states require that the employer obtain compensation insurance. A few states have set up state funds to pay compensation awards. In some states, an employer can be a self-insurer if it makes adequate proof of financial responsibility. All these requirements are designed to ensure that there will be a financially responsible entity.

The particular problems of the construction industry have been recognized. Many states enacted “subcontractor

⁵⁸*Rodgers v. Kemper Constr. Co.*, 50 Cal.App.3d 608, 124 Cal.Rptr. 143 (1975).

⁵⁹See Section 7.03G.

⁶⁰*Ibid.*

under” or “statutory employer” statutes under which a prime contractor is the employer of subcontractor employees under certain circumstances, such as a showing that the subcontractor did not procure the required insurance. This allows recovery against the prime contractor’s compensation insurer. Special rules for the construction industry recognize that many subcontractors are not financially sound and may not obtain the requisite insurance. Compensation coverage may be diluted if a prime contractor subcontracted out work that would normally be performed by the prime contractor. This may be done to reduce the number of employees for whom the prime contractor would have to obtain insurance coverage or be exempt as having too few employees.

Typically, the award consists of a proportionate amount of the employee’s wages as well as reimbursement for medical expenses incurred. Sometimes the employee is also able to receive a specific monetary award for designated injuries. More intangible, noneconomic losses—such as amounts to compensate for the emotional distress caused by disfigurement or for pain and suffering—are generally not recoverable. Workers’ compensation awards provide part (estimated at from one-third to three-quarters of economic loss) and not full compensation. The recovery is intended to ensure that the injured worker does not become a burden on others. Compensation recoveries are less, and in many states much less, than can be recovered in a tort action. This has led to demands for federal minimum standards for compensation awards.

Workers’ compensation remedies generally supplant whatever tort remedy the worker may have had against the employer. This is accomplished by statutory immunization of the employer from tort claims by the workers. Immunity gave the employer something in exchange for giving up existing legal protection in employment accidents.

Eliminating all tort suits would create a total compensation system and keep disputes within the administrative agencies charged with the responsibility for handling such claims. This has not been accomplished. Most states permit injured workers, or compensation insurers who have paid them, to institute tort claims against most third parties whose negligence caused the injury. A factory worker may be able to recover in tort against the manufacturer of a defective product. A worker on a construction project may recover in tort against one of the many entities involved in the project other than his own employer. Because of the limited recovery available under work-

ers’ compensation, it is becoming increasingly common for injured construction workers to institute third-party actions against anyone they can connect with their injuries other than their employers.

Workers’ compensation claims are handled by an administrative agency rather than a court. Hearings are informal and usually conducted by a hearing officer or examiner. The employee can represent himself or be represented by a layperson or lawyer. Fees for representation are usually regulated by law. Although awards by the agency can be appealed to a court, judicial review is extremely limited, and very few awards are overturned. Third-party actions, on the other hand, because they involve tort claims, are brought to court, and incredibly complicated lawsuits often result.

Workers’ compensation took on political and economic dimensions in the 1990s. In many states, insurance rates jumped drastically because of the expansion of claims falling within the workers’ compensation system to claims involving, for example, job-connected stress. Employers in some states where the insurance rates were high complained that they could not compete with employers in states with lower rates and often threatened to move their operations to states that did not generate such expensive claims. Others complained that many claims were fraudulent, that too much of the ultimate payout went into the pockets of attorneys and health care providers, and that insurers charged exorbitant administration overhead. These factors have led to attempts to legislate changes designed to cure some of the problems, for better or worse. However, the efforts of those who would be adversely affected by change often thwart such attempts.

D. Product Liability

Another and perhaps more spectacular illustration of strict liability is imposed on manufacturers for defective products (discussed in greater detail in Section 7.09).

SECTION 7.05 Claims by Third Parties

A. Lost Consortium

Suppose a spouse is seriously injured. In addition to causing economic loss, the injury can cause losses of an intangible nature to the other spouse or a child of the injured person. Such losses are sometimes called *consortium*, a

term that encompasses the services and society lost and, in the case of the spouse, sexual relations.

Although the husband could recover for loss of consortium when his wife was injured, the law generally did not give corresponding rights to his wife. Slowly the courts have equalized consortium rights of husband and wife. However, a child cannot recover for lost consortium of either parent.

B. Survival and Wrongful Death Statutes

Before the mid–nineteenth century, the death of the wrongdoer precluded any claim being made against the wrongdoer’s estate. The wrong died with the wrongdoer. Similarly, death of the party harmed also barred any claim he would have had. However, statutes generally changed this common law rule. The easiest were those that allowed claims to be made against the estate of the wrongdoer.

More problems developed because of the patchwork of statutes affecting the right of the claimant. Those statutes are divided into survival statutes and wrongful death statutes. The former gave rights—often limited ones—to the estate of the deceased for harm suffered between the wrongful act and the death. The second provided compensation to the deceased person’s dependents, for their economic losses. Local statutes must be consulted.

The claim is usually measured by any loss the deceased has suffered prior to death resulting from the defendant’s negligence and, more important, any loss to the estate or survivors. Most statutes limit recovery to pecuniary losses, although some permit a limited amount of noneconomic losses to be recovered. Recovery for economic losses to the survivors is based on potential earnings of the deceased during his working life that would have been available to the survivors. The amount recovered for the death of a person with high earnings or high earning capacity is often large. A few states limit the amount of recovery for wrongful death.

SECTION 7.06 Immunity

A. Charitable Organizations

Initially, American law granted immunity from tort liability to charitable organizations. Immunity was originally based on the charitable and nonprofit characteristics of

the organization. The availability of public liability insurance, the recognition that even charitable institutions take on some of the characteristics of commercial enterprises, and the injured party’s needs are factors that led to virtual abolition of this immunity.

B. Employers and Workers’ Compensation

The worker’s sole remedy against the employer is under workers’ compensation. Employers have immunity, subject to a few exceptions, from tort claims made by their workers.

C. Public Officials

Judges and high public officials are usually granted absolute or qualified immunity from claims against them.

D. Sovereign Immunity

For various reasons—some metaphysical and some practical—English law immunized the sovereign from being sued in royal courts. This doctrine was adopted early in the nineteenth century by the U.S. federal courts, and it soon became established that the federal government could not be sued without its consent.

In 1946, the Federal Tort Claims Act (FTCA)⁶¹ was adopted. This legislation gave individuals the right to sue the United States for certain wrongs it committed. The act had two important exceptions: (1) the federal government could not be sued for certain intentional torts, and (2) certain discretionary functions or duties performed by government officials could not give rise to tort liability. *Dalehite v. United States* clarified this situation by denying liability when the conduct was a policy or planning decision, also holding that the government could not be held liable unless it was shown to have been negligent.⁶² *Feres v. United States* barred a claim by a member of the armed services against the United States.⁶³ This has been extended to a manufacturer who followed government specifications.⁶⁴ Strict liability cannot be the basis for any claim against the federal government. Negligence

⁶¹28 U.S.C.A §§ 2671–80.

⁶²346 U.S. 15 (1953).

⁶³340 U.S. 135 (1950).

⁶⁴See Section 7.09J.

under applicable state law must be established. However, government conduct that is negligent under state law may also fall within the “discretionary function” exception to the FTCA. In that situation, the federal government would be immune even though a private party might be liable under state law.⁶⁵

States generally adopted the English rule of sovereign immunity, although many states have given consent to be sued for specific claims.⁶⁶ Municipal corporations, such as counties and cities, receive immunity for governmental acts but not for those they have performed in a private or proprietary capacity. Sometimes immunity is waived for specified activities or operation or control of real property.⁶⁷

Modern justifications are usually based either on relieving already burdened public entities of serious financial responsibilities or on precluding judicial intrusion into the running of government. Those who oppose immunity contend it is better to spread the loss among all the taxpayers in the public entity than to concentrate loss on the person who has suffered it. As to the fear of judicial intrusion, opponents of immunity contend that the current trend is toward increased accountability rather than relieving persons from their negligent acts. Yet expanded liability of public entities has generated a drastic increase in the cost of the insurance they procure, and in some instances has made insurance unavailable. Although it is unlikely that the law will reverse its field and restore sovereign immunity wholesale, these concerns are likely to limit expansion of governmental liability or, in special cases, restore immunity.⁶⁸

Even when immunity has been eliminated, claims against governmental units require particular attention. Often such claims must be made within a shorter period of time than claims against private persons. In addition, such claims must be presented, as a rule, to legislative bodies of the governmental unit for their review before court action can be begun.

United States*, 290 F.3d 29 (1st Cir.2002) (worker injury claim brought on federal construction project); Schminky, *The Liability of the Government Under the Federal Tort Claims Act for the Breach of a Nondelegable Duty Arising from the Performance of a Government Procurement Contract*, 36 A.F.L.Rev. 1 (1992).

SECTION 7.07 Misrepresentation

A. Scope of Discussion

Although misrepresentation problems can occur in the contract formation process, this section treats the liability of people whose business it is to make representations. A surveyor makes representations as to boundaries, a geotechnical engineer as to soil conditions, a design professional as to costs and the amount of payment due a contractor.

B. Representation or Opinion

Representations should be distinguished from opinions. For example, an architect may give his best considered judgment on what a particular project will cost. The prediction, however, may not be intended by him or understood by the client to be a factual representation that will give the client a legal claim in the event the prediction turns out to be inaccurate. If the statement is merely an opinion and not a representation of fact, it is reasonably clear that the person making the representation will not be liable simply because he is wrong.

C. Conduct Classified

The person making the misrepresentation may have had a fraudulent intent. He may have made the representation knowing that it was false, with the intention of deceiving the person to whom the representation was made. The representation may not have been made with the intention to deceive but may have been made negligently. Finally, the representation may have been made with due care but turned out to be wrong. This is sometimes referred to as an *innocent misrepresentation*.

D. Person Suffering the Loss

Another classification relates to the person who was harmed, the person to whom the representation was made, or a third party. For example, the geotechnical engineer may make a representation of soil conditions to a client.

If the representation is incorrect, the harm may be suffered by the client or, in some cases, by third parties, such as a contractor or a subsequent purchaser or occupant.

E. Type of Loss

Cases can also be classified by the harm that resulted from the misrepresentation. A misrepresentation of soil conditions may result in a cave-in that kills or injures workers. It may also cause damage to property or economic loss unrelated to personal harm or damage to the client's property. The client may have to pay for damage caused to an adjacent landowner's property. Because of the misrepresentation, a subcontractor may incur additional costs during the excavation.

F. Reliance

In addition to the representation having to be material or serious, it must have been relied on reasonably by the person suffering the loss. If there is no reliance or if the reliance is not reasonable, there is no liability for misrepresentation. A principal application of this doctrine is discussed in Chapter 25.

Often the owner makes representations as to soil conditions to the contractor and then attempts to disclaim responsibility for the accuracy of the representation. The disclaimer is an attempt to transfer the risk of loss for any inaccurate representations to the contractor. It is intended to negate the element of reliance, a basic requirement of misrepresentation. Generally, but not invariably, as seen in Section 25.05, such disclaimers successfully place the risk of loss on the contractor. However, they cannot relieve the person making the representation from liability for fraud, and they may not be effective if the representations were negligently made.

G. Generalizations

Generally, the more wrongful the conduct by the person making the representation, the greater the likelihood of recovery against the party. For example, a fraudulent misrepresentation will always create liability to the party to whom it was made or to third parties. A negligent one, in addition to providing the basis for a claim by the party who has paid for the representation, may be the basis for a claim by third parties. An innocent misrepresentation,

being least culpable, is the most difficult on which to base a claim. Third parties are rarely able to recover, and even the other party to the recovery will be able to recover damages only if there is a warranty of accuracy.

Liability to third parties often depends on the type of harm suffered. If personal harm such as death or injury results, the absence of a contractual relationship between the person suffering the harm and the person making the misrepresentation is not likely to constitute a defense.

Where harm is economic, lack of privity (contractual relationship) between the claimant and the person who made the misrepresentation causes the greatest difficulty. One reason is the wide range of individuals who are affected by the representations of people who are in the business of making them. Such persons can be exposed to enormous liability, often disproportionately high to the remuneration paid for the services. For example, a certified public accountant may make an audit report that causes thousands of investors to buy shares in a particular company. Were the accountant accountable to all these investors, he would face enormous risk exposure.

In the construction context, the misrepresentation cases typically involve claims against surveyors and those who provide geotechnical information—but see Section 14.08D for expanded use of misrepresentation against architects and engineers. Those who provide services often are liable to third parties for economic losses when the representations made were found to be negligent, provided the professional making the representation can reasonably foresee the type of harm that is likely to occur and the people who may suffer losses. This trend is reflected in *Rozny v. Marnul*,⁶⁹ in which a surveyor was held liable to a homeowner who had built a house and garage relying on a survey the surveyor had prepared for a developer.

SECTION 7.08 Premises Liability: Duty of the Possessor of Land

A. Relevance

Tort law determines the duty owed by the possessor of land—that is, the one with operative control—to those people who pass by the land or enter on it. Before, during, or after completion of a construction project, members

⁶⁹43 Ill.2d 54, 250 N.E.2d 656 (1969).

of the public will pass by the land or, with or without permission, enter on the land with the potential of being injured or killed by a condition on the land or by an activity engaged in by the person “in control” of the land. Workers also may suffer injury or death because of the condition of the land or activities on it. People who live in or enter a completed project may suffer injury or death because of something related to the land or to the construction process. Liability for such harm depends on the particular nature of the obligation owed to the plaintiff by the possessor of land near which or on which the physical harm was suffered. It can depend on the injured party’s permission to be near or on the land and the purpose for being there.

The term *possessor of land* is used in this section without exploring the troublesome question of whether the owner, the prime contractor, or the subcontractors fall into this category during the construction process.

As the following discussion makes clear, the courts are nearly evenly split on the duty a possessor owes to those who enter on to the land. Under the traditional common law rules, followed by a slight majority of states, the possessor’s duty varies depending on the status of the entrant: trespasser, child, licensee, or invitee. However, under the minority modern rule, a duty of reasonable care extends to all entrants, regardless of their common law status.⁷⁰

B. To Passersby

Passersby can expect that the conditions of the land and activities on it will not expose them to unreasonable risk of harm. Whether the possessor has measured up to the legal standard depends on factors discussed in Section 7.03C.

C. To Trespassing Adults

The trespasser enters the land of another without permission. In so doing, the trespasser is invading the owner’s exclusive right to possess the land. Veneration for landowner rights led to a very limited protection for trespassers by English and American law. The possessor was not liable if trespassers were injured by the possessor’s

failure to keep the land reasonably safe or by the possessor’s activities on the land.

Exceptions developed as human rights took precedence over property rights. For example, possessors who know that trespassers use limited areas of their land must conduct their activities in such a way as to discover and protect trespassers from unreasonable risk of harm. Railroads were required to be aware of people who crossed the tracks at particular places. Another exception was applied frequently to railroads for dangerous activities conducted on the land.

Discovered trespassers are entitled to protection. The landowner must avoid exposing such trespassers to unreasonable risk of harm.

Despite their disfavored position, trespassers are not outlaws. Possessors cannot shoot them or inflict physical harm on them to protect their property. What steps can possessors take to protect their land from trespassers? Suppose a contractor puts up a barbed-wire fence. Suppose a contractor keeps savage dogs on a fenced-in site at night to protect the site and construction work from vandals.

A case that excited controversy was *Katko v. Briney*.⁷¹ The defendant owned an uninhabited farmhouse containing some antiques and old jars. The house had been broken into and some of the contents removed several times. After requests to law enforcement authorities were unproductive, the defendant installed a spring gun aimed at the legs of anyone who entered the house and sought to enter a particular room. The plaintiff, thinking the house uninhabited and looking for old canning jars, entered the house and was severely injured by the spring gun’s discharge. Charged with a felony, the plaintiff pleaded guilty to a misdemeanor and received a sixty-day suspended jail term.

The plaintiff then sued the defendant for having caused the injury. A jury award against the landowner for compensatory and punitive damages was upheld because the privilege to protect property did not extend to the infliction of serious bodily harm.

California has sought to immunize the possessor of land, even from intentional use of a deadly weapon when such force is justifiable, by enacting Section 847 of the California Civil Code.⁷² This approach would produce an outcome different from *Katko v. Briney* described in this Section.

⁷⁰D. DOBBS, *supra* note 1 at 591–620. Professor Dobbs’s treatise, published in 2000, lists 21 states following the modern rule, although some of those make an exception for trespassers. *Id.* at 666, notes 4 & 5. See also Section 7.08G.

⁷¹183 N.W.2d 657 (Iowa 1971).

⁷²The California attempt to immunize the possessor who uses force is described in *Calvillo-Silva v. Home Grocery*, 19 Cal.4th 714, 968 P.2d 65, 80 Cal.Rptr. 2d 506 (1998).

D. To Trespassing Children

Special rules have developed for trespassing children. Children frequently do not realize that they are entering the land of another. Sometimes they are not aware of the dangerous characteristics of natural and artificial conditions on the land that they enter. Possessors must conduct their activities in such a way as to avoid unreasonable risk of harm to trespassing children. However, controversy frequently develops regarding the extent to which limited protection given trespassers as to artificial conditions on the land should be applied to trespassing children.

The law's strong protection for landowners and their rights has, for the most part, been qualified by humanitarian concerns for children of tender years injured or killed when they confront or deal with dangerous conditions on the land of another. The Restatement (Second) of Torts reflects this diminution of landowner protection and states that the possessor of land is liable for injuries to trespassing children caused by artificial conditions on the land if

- (a) the place where the condition exists is one upon which the possessor knows or has reason to know that children are likely to trespass, and
- (b) the condition is one which the possessor knows or has reason to know and which he realizes or should realize will involve an unreasonable risk of death or serious bodily harm to such children, and
- (c) the children because of their youth do not discover the condition or realize the risk involved in intermeddling with it or in coming within the area made dangerous by it, and
- (d) the utility to the possessor of maintaining the condition and the burden of eliminating the danger are slight as compared with the risk of children involved, and
- (e) the possessor fails to exercise reasonable care to eliminate the danger or otherwise protect the children.⁷³

Children often trespass on construction sites. In doing so, they may engage in an activity that can result in injury or death.

Judges less sympathetic to trespassing children also emphasize the responsibility of even young children to know what is dangerous and of parents to keep their children away from construction sites. In many cases, part of

⁷³Section 339 (1965). For a recent case collecting many cases, see *Kessler v. Mortenson*, 16 P.3d 1225 (Utah 2000). The case involved a six-year-old child playing in a partially completed house. The court emphasized these child trespasser cases are decided on a case-by-case basis.

the responsibility for the child's injury must fall on parents who do not supervise the child properly.

E. To Licensees

A licensee has a privilege of entering or remaining on the land of another because of the latter's consent. Licensees come for their own purposes rather than for the interest or purposes of the possessor of the land. Examples of licensees are people who take shortcuts over property with permission, people who come into a building to avoid inclement weather or to look for their children, door-to-door salespeople, and social guests.

Some anomalous exceptions exist, such as the firefighter who enters a building at night to put out a fire or the police officer who enters to apprehend a burglar. Logically, such people should be considered as benefiting the possessor of land, but many cases hold that they are simply licensees.

Early cases held that the only limitation on the possessor's activity was to refrain from intentionally or recklessly injuring a licensee. However, most courts today require that the possessor of land conduct activities in such a way as to avoid unreasonable risk of harm.

The possessor has a duty to repair known defects or dangerous conditions or to warn licensees of nonobvious dangerous conditions. Licensees cannot demand that the land be made reasonably safe for them. The possessor need not inspect the premises, discover dangers unknown to the possessor, or warn the licensee about conditions that are known or should have been known to the licensee.

F. To Invitees

An invitee receives the greatest protection. The possessor must protect the invitee not only against dangers of which the possessor is aware but also against those that could have been discovered with reasonable care. Although not an insurer of the safety of invitees, the possessor is under an affirmative duty to inspect and take reasonable care to see that the premises are safe. Sometimes the possessor can satisfy the obligation by warning the invitees of nonobvious dangers.

Who qualifies for such protection? Some cases have limited invitees to those people who furnish an economic benefit to the possessor. More jurisdictions, however, seek to determine whether the facts imply an invitation to the

entrant. However, the invitation concept does not include those invited as social guests.

The line between licensee and invitee is difficult to draw and sometimes seems arbitrary. However, among the states following the common law “status” rule of possessor liability, contractors and their employees are universally viewed as invitees. This means that the owner, as possessor, owes the highest duty of care to the contractor and its employees. If the owner vacates the land and possession is assumed by the prime contractor, then the contractor owes the highest duty of care to its invitees: the subcontractors and their employees.

G. Movement Toward General Standard of Care

Undoubtedly, the various categories that determine the standard of care are difficult to administer. Exceptions develop within the categories, and the application of the categories is often uneven. For this reason, there is clear movement toward a rule that would require the possessor of land to avoid unreasonable risk of harm to all who enter on the land.⁷⁴ Those courts following the modern rule often adopt the test for possessor liability found in the Restatement (Second) of Torts: that a possessor has a general duty to take reasonable care to protect entrants from hazardous conditions of which the entrant either is not aware or, even if aware, would likely encounter.⁷⁵

H. Defenses to Premises Liability

Underlying premises liability law is a balancing of responsibility between the land possessor and the entrant. Just as the possessor must take reasonable steps to protect entrants from hazardous conditions of the premises, so too must the entrant exercise prudence while on the property. It is sometimes said that the land possessor’s liability is premised upon his *superior knowledge* of the hazard. If the entrant’s knowledge is equal to that of the possessor—or if a reasonable person in the entrant’s position would have discovered the hazard and appreciated the risk—then the possessor’s liability is either eliminated altogether or at least reduced by the degree of the entrant’s negligence.⁷⁶

⁷⁴*Rowland v. Christian*, 69 Cal.2d 108, 443 P.2d 561, 567–68, 70 Cal. Rptr. 97, 103–4 (1968); Annot., 22 A.L.R.4th 294 (1983).

⁷⁵*Jordan v. National Steel Corp.*, 183 Ill.2d 448, 701 N.E.2d 1092 (1998), adopting the Restatement (Second) of Torts §§ 343 and 343A (1965).

⁷⁶The California Supreme Court recently reformulated this rationale under the doctrine of “delegation”; see *Kinsman v. Unocal Corp.*, 37 Cal.4th 659, 123 P.3d 931, 937–38, 36 Cal.Rptr.3d 495 (2005).

This onus upon the entrant to exercise care and prudence while on the premises has congealed into a number of defenses a land possessor may assert. One defense is that the entrant was injured by a patent defect—one the entrant knew of or should have discovered. Another defense is that the invitee exceeded the scope of the invitation—that he wandered off into an area into which he was not authorized to enter.

Several states have passed “recreational use” statutes, whose purpose is to encourage property owners, both private and public, to provide the public with free access to their property for recreational use. With narrow exceptions, these statutes immunize owners from liability to entrants injured while engaging in recreational activities.⁷⁷

Of importance to the construction industry are various defenses that apply to injuries to independent contractors. An owner who turns the premises entirely over to the control of a prime contractor may argue that the contractor is now the possessor and that the landowner is therefore no longer subject to premises liability. (This defense may not be successful if the hazardous condition preexisted the prime contractor’s assumption of temporary possession.) Another defense is that the hazardous condition was itself the object of the contractor’s work or arose from its activities.⁷⁸ The reason for this defense arises directly from the “superior knowledge” rationale of premises liability law: a contractor hired to repair a hazardous condition, or who created that condition while doing its work, was obviously aware of the dangerous condition; so its knowledge was at least equal to that of the landowner.

SECTION 7.09 Product Liability

A. Relevance

The historical development of legal rules relating to the liability of a manufacturer for harm caused by its products manifests a shift from protection of commercial ventures toward compensating victims and making enterprises bear the normal enterprise risks. Manufacturer’s liability has become important in the construction process, as harm can be caused by defective equipment or materials.

⁷⁷West Ann.Cal.Civ.Code § 846; Wash.Rev.Code Ann. § 4.24.210.

⁷⁸*Blair v. Campbell*, 924 S.W.2d 75 (Tenn.1996) (contractor, hired to perform repairs on a decrepit building, knew the work site was unstable); *Baber v. Dill*, 531 N.W.2d 493 (Minn.1995) (worker fell on protruding reinforcing steel rods—a hazardous condition the contractor had created).

B. History: From Near Immunity to Strict Liability

In 1842, the English case of *Winterbottom v. Wright*⁷⁹ held that an injured party could not recover from the maker of a defective product in the absence of privity between the injured party and maker. As noted in Section 7.03E, privity was usually a contractual relationship, but it could also be based on a status that placed a duty on one party to watch out for another.

The privity requirement protected an infant manufacturing industry developing during the Industrial Revolution. It allowed contracting parties to know their liability exposure and deal with inordinate risks by contract. Privity permitted the manufacturer to be secure in the belief that it would not be held liable to people other than those with whom it dealt. It could relieve itself, by contract disclaimers, from inordinate risks to those with whom it dealt. It could not do so with the many third parties who might be injured by its products or activities.

Protection was no more tolerable than the sad plight of the uncompensated industrial accident victim who ultimately received protection through workers' compensation. By the early twentieth century, the privity rule was no longer acceptable. Injured parties needed a solvent defendant from whom they could recover. Ultimate responsibility should be on the manufacturer. The latter can insure against predictable losses and pass on the cost to those who benefited from the enterprise, such as owners or users of the enterprise's activities.

The major turning point occurred in New York in 1916. Before 1916, New York had held that a negligent manufacturer could be liable despite the absence of privity if there was a latent defect in the goods sold or if the goods sold were inherently dangerous. In 1916, the New York Court of Appeals held in *MacPherson v. Buick Motor Co.*⁸⁰ that this exception included goods that were dangerous if made defectively. The *MacPherson* case, involving an automobile, led to abolition of the privity rule in the United States.

The plaintiff still had the difficult task of establishing that goods were negligently made by the manufacturer. But the *res ipsa loquitur* doctrine proved of great assistance. It permitted the plaintiff to present its case to the jury

even though the plaintiff introduced no direct evidence of negligent conduct by the manufacturer.

Res ipsa, as noted in Section 7.03C, did not as a rule deprive the defendant of the opportunity of introducing evidence that it had not been negligent. This was typically done by seeking to establish that the defendant had followed common industry practices and had used a system designed to ensure that its products were safe. Yet juries typically ruled for victims of adulterated food or beverages or defective products.

A more efficient way of placing this risk on the manufacturer was needed. The concept that first accomplished this purpose was implied warranty. This doctrine, borrowed largely from commercial law, held sellers liable when their goods were not merchantable or, under certain circumstances, not fit for the purposes for which buyers bought them. It eliminated the need to establish negligence. Implied warranty would under certain circumstances extend protection to third parties.

Warranty first was used in food and drug cases. It then began to be employed when harm was caused by manufactured goods. This concept, at least for a time, put normal enterprise risks on the enterprise.

Early in the history of implied warranty, some courts recognized that though useful, this essentially commercial doctrine was inappropriate for determining who should bear the risk of physical harm caused by defective products. In addition, warranty carried with it technical rules more appropriate to commercial transactions. As a result, a few courts began to treat claims by injured parties against manufacturers as involving strict liability in tort.⁸¹ Soon other courts fell into line, and the strict liability concept gradually supplanted implied warranty as a risk distribution device.

C. Restatement (Second) of Torts Section 402A and Restatement (Third) of Torts: Products Liability Section 2

One factor that led to the replacement of implied warranty by strict liability in tort was the decision by the American Law Institute—a private group of judges, scholars, and lawyers—to restate the law of torts by publishing Section 402A in 1965. This section, found in the Restatement (Second) of Torts, states,

⁷⁹Supra note 32.

⁸⁰217 N.Y. 382, 111 N.E. 1050 (1916).

⁸¹The leading case is *Greenman v. Yuba Power Products, Inc.*, 59 Cal.2d 57, 377 P.2d 897, 27 Cal.Rptr. 697 (1963).

1. One who sells any product in a defective condition unreasonably dangerous to the user or consumer or to his property is subject to liability for physical harm thereby caused to the ultimate user or consumer, or to his property, if
 - a. the seller is engaged in the business of selling such a product, and
 - b. it is expected to and does reach the user or consumer without substantial change in the condition in which it is sold.
2. The rule stated in Subsection (1) applies although
 - a. the seller has exercised all possible care in the preparation and sale of his product, and
 - b. the user or consumer has not bought the product from or entered into any contractual relation with the seller.

Section 402A has had a significant impact. Courts following that section held manufacturers of defective products liable without any privity between the injured party and the manufacturer and without the injured party having to establish that the manufacturer had been negligent.

Courts have broken down the linchpin of Section 402A—“a defective condition unreasonably dangerous”—into three types of product defect: in the manufacturing, design, or marketing of the product. A manufacturing defect is a production flaw; an example is the sale of contaminated food. A design defect occurs when the design of the product is needlessly dangerous, such as a car that is prone to roll over. A marketing defect means a lack of instructions or warnings explaining to the end user how to operate the product safely. All of these defects are measured against the reasonable expectations of the ultimate consumer of the product. The precise nature of each of these defects, as well as of the consumer expectation test against which they are measured, is further discussed in Section 7.09I; however, a detailed analysis of these issues is beyond the scope of this book.⁸²

Under the common law system, plaintiffs are free to advance new theories of product defect not found in the Restatement of Torts. In *Slisze v. Stanley-Bostitch*,⁸³ a construction worker was injured by a nondefective pneumatic nail gun. At the time of the accident, the manufacturer had another, safer model, which made it harder for nails

to be discharged unintentionally. The court found the manufacturer not liable in negligence or strict products liability, based either on a duty to refrain from marketing a nondefective product when a safer model was available or on a duty to inform the consumer of the availability of the safer model.

Over the years, use of strict liability for design and marketing defects came under increasing criticism, with the result that these two defects had come to be evaluated under a negligence standard. In 1998, the American Law Institute published the Restatement (Third) of Torts: Products Liability.⁸⁴ This Restatement changed the terminology of a defective product from one that is “unreasonably dangerous” to one that is “not reasonably safe.” Section 2, titled “Categories of Product Defect,” states,

A product is defective when, at the time of sale or distribution, it contains a manufacturing defect, is defective in design, or is defective because of inadequate instructions or warnings. A product:

- (a) contains a manufacturing defect when the product departs from its intended design even though all possible care was exercised in the preparation and marketing of the product;
- (b) is defective in design when the foreseeable risks of harm posed by the product could have been reduced or avoided by the adoption of a reasonable alternative design by the seller or other distributor, or a predecessor in the commercial chain of distribution, and the omission of the alternative design renders the product not reasonably safe;
- (c) is defective because of inadequate instructions or warnings when the foreseeable risks of harm posed by the product could have been reduced or avoided by the provision of reasonable instructions or warnings by the seller or other distributor, or a predecessor in the commercial chain of distribution, and the omission of the instructions or warnings renders the product not reasonably safe.

Because the impact of the Restatement of Products Liability lies largely in the future, the following discussion is directed to Section 402A, unless otherwise indicated.⁸⁵

⁸²For a thorough introduction, see D. DOBBS, *supra* note 1 at 977–1020.

⁸³979 P.2d 317 (Utah 1999).

⁸⁴The first two Restatements of Torts were published as a single, multivolume work. The third Restatement of Torts is being published in separate volumes, each addressing individual topics. Hence, the Restatement (Third) of Torts: Products Liability is a stand-alone volume, with its own, separate title.

⁸⁵For an overview of the changes made by the Third Restatement, see Schwartz, *The Restatement (Third) of Torts: Products Liability: A Guide to Its Highlights*, 34 Tort & Ins. L.J. 85 (Fall 1998).

D. Product Misuse

A product is defective in design or marketing only if the harm was reasonably foreseeable. The manufacturer will not be liable if the consumer's unforeseeable misuse of the product was the sole cause of the harm. Unforeseeable misuse may show that the product was not defective, that the defect did not cause the injury, or that the plaintiff's recovery should be reduced by his comparative negligence. Some courts impose upon manufacturers a duty to design or warn against foreseeable product misuse, which one court has defined as "any danger inherent in normal use which is not known or obvious to the ordinary user. Normal use includes misuse which might reasonably have been anticipated by the manufacturer."⁸⁶

In *Romito v. Red Plastic Company*,⁸⁷ the California Court of Appeal addressed the policy reasons for not subjecting a manufacturer to liability for unforeseeable product misuse. In that case, a construction worker, while working on a roof, stumbled backward and fell through a plastic skylight to his death. Plaintiff provided evidence that the skylight, at the same cost to the manufacturer, could have been made from stronger plastics. The court found the manufacturer not liable, noting that it had no control over the work-place and that the stronger plastic might not have worked against a heavier worker. For policy reasons, liability should not be imposed where so many variables uncontrollable by the manufacturer contribute to a worker's death.⁸⁸

E. Parties

Many entities play significant roles in the manufacturing and distribution of products. Manufacturers buy component parts and materials from other suppliers. They may obtain independent design and testing services. The product itself may be sold or installed by independent retailers or installers. Sometimes products are distributed through wholesalers who sell to retailers. See Figure 7.1.

⁸⁶*Reilly v. Dynamic Exploration, Inc.*, 571 So.2d 140, 144 (La.1990). Under the Third Restatement, there is no duty to design or warn against unforeseeable risks and uses; see the Restatement (Third) of Torts: Products Liability § 2, comment m.

⁸⁷38 Cal.App.4th 59, 44 Cal.Rptr.2d 834 (1995).

⁸⁸*Id.*, 44 Cal.Rptr.2d at 835. For other applications of the unforeseeable misconduct defense, see *Jackson v. Tennessee Valley Auth.*, 413 F.Supp. 1050, 1058–59 (M.D.Tenn.1976), *aff'd*, 595 F.2d 1120 (6th Cir.1979); *Colvin v. Red Steel Co.*, 682 S.W.2d 243, 246 (Tex.1984); *Annot.*, 65 A.L.R.4th 263 (1988).

It is generally assumed that the manufacturer is best able to spread the loss and avoid harm. But some retailers also have this capacity. For example, many products are distributed through large national retail chains that design or set performance standards for products in contracts with smaller manufacturers.

The purchaser of the product is not the only one who may be injured by a defective product. Members of the purchaser's family may use the product. Social guests may be injured if a television set explodes in the living room. A defectively designed car can injure drivers, passengers, other vehicles, or pedestrians.

Section 402A of the Restatement of Torts took no position as to whether people other than users or consumers can use strict liability to recover against the manufacturer. Nor did it take a position as to whether the seller of a component part would be liable. The trend seems toward holding responsible all who play significant roles in product manufacture, sale or leasing. The Restatement (Third) of Torts: Products Liability makes clear that liability extends to all those who are in the business of selling or distributing products, including retailers and lessors.⁸⁹

Although there has been great expansion of manufacturer's liability, at the same time there has been some hesitation to place liability on *everyone* who can be connected in some way to the injury-creating product. This is demonstrated in the construction process by *Bay Summit Community Association v. Shell Oil Co.*⁹⁰ The developer of a condominium installed polybutylene plumbing in its individual condominium units and in the common areas. When numerous leaks appeared, the owners of condominiums and the condominium association sued U.S. Brass, a polybutylene manufacturer, and Shell, a supplier of resin for the pipes.

Shell's defense was that it merely had supplied non-defective material. But the court pointed to Shell's marketing activities, which consisted of

1. direct marketing to manufacturers
2. committing resources to obtain code approval
3. employing marketing "blitzes"

The court held Shell's liability was not based on its role as a supplier of resin. Rather, liability depended on

⁸⁹Restatement (Third) of Torts: Products Liability § 1, comment c.

⁹⁰51 Cal.App.4th 762, 59 Cal.Rptr.2d 322 (1996).

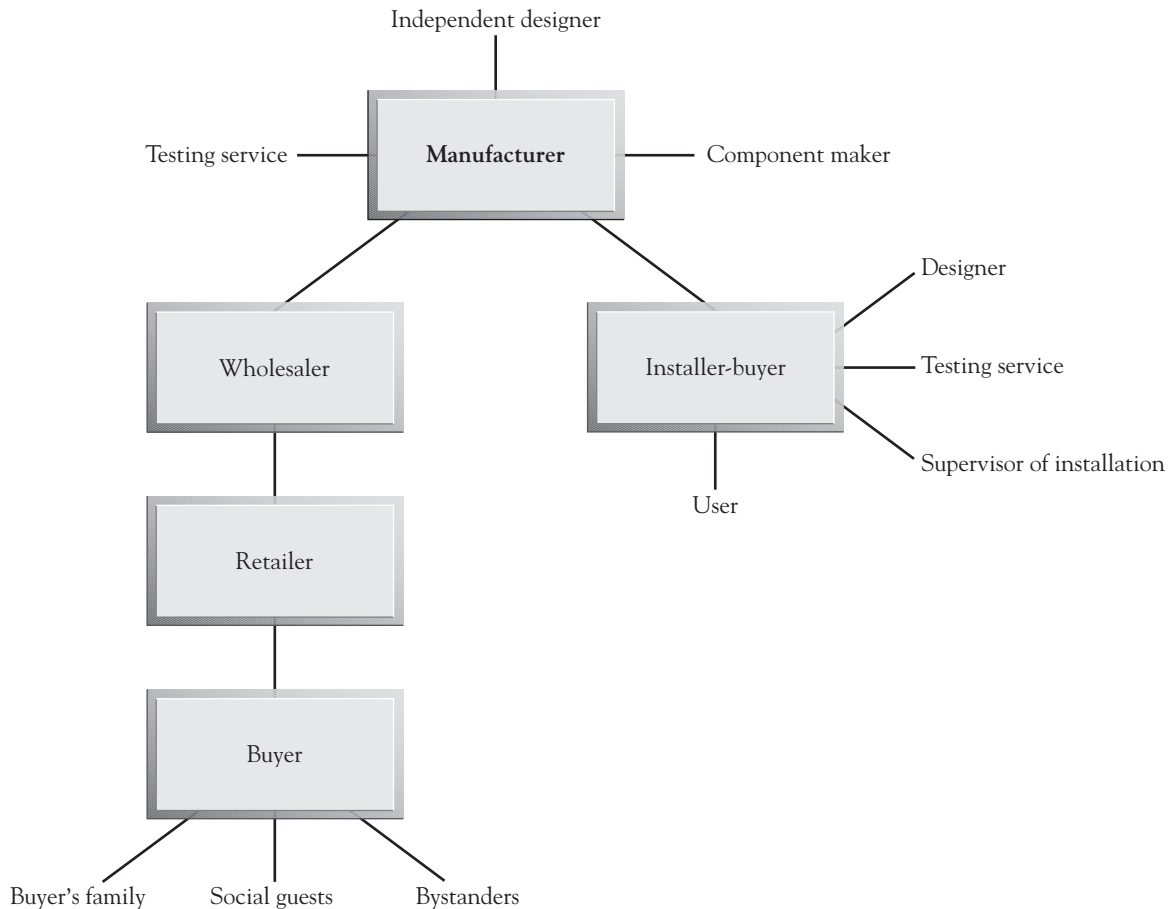

FIGURE 7.1 Two product distribution chains.

Shell's participation in marketing and distributing the plumbing system.

The *Bay Summit* case may not be followed by every court dealing with a similar issue. Different judges may draw the outer limits of responsibility for defective products differently. Therefore outcomes cannot be easily predicted and apparently inconsistent outcomes may result. Section 7.09K discusses whether strict liability extends to design professionals and contractors.

F. Defenses

The plaintiff's contributory negligence, where it still exists, is generally not a defense available to a manufacturer. If the manufacturer establishes that the injured party voluntarily assumed the risk, however, the plaintiff

cannot recover. Where comparative negligence applies, it has been applied in strict liability claims.⁹¹

Sometimes product manufacturers expect or require that those to whom they sell will take steps to ensure that the product will be used safely. For example, suppose user instructions make clear that guards are to be used around dangerous machinery. Similarly, suppose a manufacturer of automobiles requires the car dealer to prepare the car in a designated way for the customer. Some courts have held that the manufacturer's duty to make a product

⁹¹*Daly v. General Motors Corp.*, 20 Cal.3d 725, 575 P.2d 1162, 144 Cal.Rptr. 380 (1978); *Barry v. Quality Steel Products, Inc.*, 263 Conn. 424, 820 A.2d 258 (2003) (rejecting the doctrine of superseding cause in favor of comparative fault).

that is reasonably safe cannot be delegated to others.⁹² However, negligent conduct by the purchaser under some circumstances can be a superseding cause that may relieve the manufacturer. This superseding cause may consist of the purchaser making changes that would affect the way the machine was used.⁹³

Another defense manufacturers may assert is that federal government regulations preempt (that is, displace) state product liability law. For example, the U.S. Supreme Court held that a cigarette manufacturer who complied with the health warnings required by a federal statute cannot be liable under state tort law for failure to give a better warning, although liability based on express warranty or conspiracy was not preempted.⁹⁴ The New Jersey Supreme Court similarly ruled that a construction worker, injured by a forklift manufactured in conformity with federal standards, could not sue the manufacturer for failure to include in the forklift additional warning devices.⁹⁵ However, preemption will not be found if the federal regulations do not apply to the particular safety device the plaintiff claims was defective and caused the accident.⁹⁶

G. Economic Losses

Is the manufacturer liable for economic losses such as delay damages, lost profits, or injury to the product itself? Clearly, a manufacturer is responsible if there is an express warranty. After some early uncertainty, the trend is to bar recovery for economic losses in claims based on strict liability.⁹⁷

⁹²*Vandermark v. Ford Motor Co.*, 61 Cal.2d 256, 391 P.2d 168, 37 Cal. Rptr. 896 (1964); *Bexiga v. Havir Mfg. Corp.*, 60 N.J. 402, 290 A.2d 281 (1972).

⁹³*Schreffler v. Birdsboro Corp.*, 490 F.2d 1148 (3d Cir.1974).

⁹⁴*Cipollone v. Liggett Group, Inc.*, 505 U.S. 504 (1992).

⁹⁵*Gonzalez v. Ideal Tile Importing Co., Inc.*, 184 N.J. 415, 877 A.2d 1247 (2005), cert. denied sub nom., *Gonzalez v. Komatsu Forklift, U.S.A., Inc.*, 546 U.S. 1092 (2006). The Restatement (Third) of Torts: Products Liability § 4(b) states that a product's compliance with a product safety statute does not preclude a finding of product defect, but presumably the Restatement here is referring to a state (not federal) statute.

⁹⁶*Lindsey v. Caterpillar, Inc.*, 480 F.3d 202 (3d Cir.2007).

⁹⁷*Compare Santor v. A & M Karagheusian, Inc.*, 44 N.J. 52, 207 A.2d 305 (1965) (permitting recovery of economic losses in strict products liability) with *Moorman Mfg. Co. v. National Tank Co.*, 91 Ill.2d 69, 435 N.E.2d 443 (1982) (disallowing a strict liability claim for purely economic harm). However, *Santor* remained a minority position and was overruled in *Alloway v. General Marine Industries, L.P.*, 149 N.J. 620, 695 A.2d 264, 275 (1997).

As shown in Section 7.09E, which deals with which actors are responsible for defective products, it will be equally difficult to implement any rule defining the types of losses for which defendants are responsible. This difficulty is demonstrated by *Fieldstone Co. v. Briggs Plumbing Products, Inc.*⁹⁸

The *Fieldstone* case involved a claim by a developer against manufacturers of sinks it installed in its developments. The defendants manufactured inexpensive bathroom sinks. The developer sought to recover the cost of replacing sinks that very early rusted and chipped because of spot welding and inadequate coating around the steel overflow outlets. The manufacturers claimed strict liability should not apply, because the sinks only damaged themselves and caused purely noncompensable economic losses.

The economic loss rule will be discussed in Section 14.08E. However, note that at the outset the court stated,

[T]he line between physical injury to property and economic loss reflects the line of demarcation between tort theory and contract theory. [Citation.] "Economic" loss or harm has been defined as "damages for inadequate value, costs of repair and replacement of the defective product or consequent loss of profits—without any claim of personal injury or damages to other property."⁹⁹

Next the court noted the variety of outcomes when this rule is applied by stating,

Jurisdictions differ as to whether tort recovery is available where the sole physical injury is to the product itself. . . . A number of courts have allowed such recovery, finding the rationales behind the adoption of strict liability apply whether damages are to the same or other property; a large number of other courts have ruled otherwise, reasoning that warranty theories provide the exclusive remedy; and, yet "[o]ther courts have recognized that there may be particular exceptions to the rule of nonrecovery for mere economic damage to the product itself, based on an analysis of the nature of the defect and the risks involved. Accordingly, these courts have ruled that strict liability in tort could serve as a basis of recovery where the damage occurred in a sudden or calamitous manner, since this was akin to ordinary tort claims which ordinarily involve sudden injuries or damage, as opposed to mere deterioration over a length of time."¹⁰⁰

⁹⁸54 Cal.App.4th 357, 62 Cal.Rptr.2d 701 (1997).

⁹⁹62 Cal.Rptr.2d at 704.

¹⁰⁰Id. at 705.

After canvassing California cases, the court stated,

We conclude that here there was no injury to “other property” for purposes of imposing tort liability. The spot welding and inadequate coating were latent defects which made the sinks prone to rusting, chipping and premature deterioration. In other words, this case presents a routine situation in which a purchaser seeks replacement costs because a poorly designed and built product failed to meet its expectations. The doctrine of strict liability, however, is not a substitute for contract and warranty law where the purchaser’s loss is the benefit of the bargain, and unless the parties specifically agree the product will perform in a certain way, the manufacturer is not responsible for its failure. . . . Certainly, Fieldstone is a sophisticated consumer and could have specified a higher quality product; but . . . there is no justification here for imposing tort liability on manufacturers who guaranteed their products for only one year. We reject Fieldstone’s analysis, under which virtually every defective product evidencing deterioration of any nature would constitute “other property” for purposes of tort recovery. Such is not the law.¹⁰¹

The Restatement (Third) of Torts: Products Liability § 21 adopts the economic loss rule, but without using that term. Instead, it states that strict liability does not apply where the damage is only to the product itself. A comment to § 21 explains that recovery under tort law is unnecessary if there has been no physical harm to person or other property, because “the law governing commercial transactions sets forth a comprehensive scheme governing the rights of the buyer and seller.”¹⁰²

H. Disclaimers

In the commercial world, sellers frequently seek to limit their risk by disclaiming responsibility for certain losses or by limiting the remedy. One reason for shifting from implied warranty to strict liability was the desire to avoid disclaimers frequently part of the commercial transaction where the party injured was not a real participant in the transaction.

Disclaimers are likely to be given effect between the parties if the parties are business entities of relatively

equal bargaining strength. However, disclaimers are not likely to be given effect in consumer purchases.

I. Design Defects and Duty to Warn: Two Restatements

Early product liability cases involved manufacturing defects. To determine whether a product is defective, the product causing the injury is compared to either the design plans or other products made from the same design. If there is a deviation, the product is defective.

Even in the absence of negligence, some products will have unintended manufacturing defects. It is not economically feasible to eliminate all risks of randomly defective products. It is better to predict the likelihood of defects, calculate the liability exposure, insure or self-insure against these risks, and include the cost in the product price. In addition to the exasperating question of whether there was a manufacturing or design defect (was it a bad weld or cheap material that made welding difficult?), judging the design has no neat test such as does manufacturing.

The law has struggled painfully with design defect definitions. California had in 1972 rejected the Restatement definition of “unreasonably dangerous” as reinstating the discarded negligence test.¹⁰³ Then in 1978 it decided *Barker v. Lull Engineering Co.*,¹⁰⁴ a design defect case. The court held that two tests must be applied. First, did the product meet the expectations of an ordinary consumer as to product safety? Second, even if it did, the manufacturer is liable if it cannot establish (using negligence-like criteria) that on balance, benefits of the design outweighed the risks. The court allowed a hindsight look at the design and reserved judgment on whether the state of the art being followed would be a defense. The court did not decide whether products are defective because they lack adequate warnings or directions.

New Jersey has dealt with some of the issues unresolved in the *Barker* case. In 1982 the New Jersey Supreme Court decided *Beshada v. Johns-Manville Product Corp.*¹⁰⁵ The case involved the duty of a manufacturer to provide adequate warning of the dangers of its product. Duty to warn, a third type of liability in addition to an assembly-line defect and

¹⁰¹Id. at 707.

¹⁰²Restatement (Third) of Torts: Products Liability § 21, comment d, p. 294.

¹⁰³*Cronin v. J. B. E. Olson Corp.*, 8 Cal.3d 121, 501 P.2d 1153, 104 Cal.Rptr. 433 (1972).

¹⁰⁴20 Cal.3d 413, 573 P.2d 443, 143 Cal.Rptr. 225 (1978).

¹⁰⁵90 N.J. 191, 447 A.2d 539 (1982).

defective design, resembles negligence. The manufacturer is judged by the standard of reasonableness. However, in negligence claims the claimant must prove negligence. But in claims against a manufacturer based on inadequate warning, the burden is on the manufacturer to prove its conduct was reasonable.

In the *Beshada* case the court, as in the *Barker* case, employed a “hindsight” test to determine whether there had been adequate warning. It also rejected the “state of the art” as a defense. It held the manufacturer must reduce the risk of harm to the greatest extent possible consistent with the product’s utility.

Yet two years later the court decided *Feldman v. Lederle Laboratories*.¹⁰⁶ This was a duty-to-warn case against a drug manufacturer. Although not expressly overruling the *Beshada* case, the court refused to use the hindsight test. It limited the applicability of the *Beshada* case to its facts. These cases reflect the confusion and uncertainty in manufacturers’ liability, particularly those who make drugs, a product with great utility and high risk.

Courts are favoring a risk-utility analysis in design-defect cases. The court, usually done through a jury, balances the risks inherent in product design against the utility of product so designed. The inquiry requires determining whether the manufacturer acted reasonably in choosing a particular product design, given the probability and seriousness of the risk imposed by the design, usefulness of the product in that condition, and the burden on the manufacturer to take necessary steps to eliminate the risk.¹⁰⁷ In effect, this is a negligence test: the issue thought to have been eliminated in claims based upon defective products. But design-defect claims are different from those that involve manufacturing.

The Third Restatement changed the tests for both design and marketing defects. For design defects, the Restatement introduces a requirement that the plaintiff prove that a “reasonable alternative design” was available to the product manufacturer for the design to be defective.¹⁰⁸ By replacing the “reasonable consumer expectation” test with a “reasonable alternative design” requirement, the Third Restatement arguably replaces strict liability with a standard of reasonableness—a negligence concept. The existence of a reasonable alternative design is determined

using a risk/utility analysis.¹⁰⁹ According to one scholar, the view underlying the Third Restatement is that, in the law of torts, negligence law is the norm, and strict (or enterprise) liability is the rare exception.¹¹⁰

With regard to marketing defects, the Third Restatement appears to expand liability. Under the Second Restatement, a manufacturer’s warning or directions rendered an otherwise defective product nondefective.¹¹¹ The Third Restatement no longer states that instructions or warnings will make a product nondefective. Finally, the new Restatement mandates a safer design (where possible) over the use of warnings.¹¹²

Both Restatements allow an “assumption of the risk” defense to claim of inadequate warning. While the Second Restatement provides that a user who “discovers the defect and is aware of the danger . . . is barred from recovery,”¹¹³ the courts have split on whether the plaintiff’s recovery actually is barred or only diminished under principles of comparative negligence.¹¹⁴ The Third Restatement says that the plaintiff’s fault results only in a reduction in his recovery.¹¹⁵ In either event, this “sophisticated user” defense is applicable particularly to the construction industry, which is characterized by highly trained workers using complicated, and potentially dangerous, machinery.¹¹⁶

J. Government-Furnished Design

Suppose someone suffers physical harm because of a defectively designed product procured by the federal government, the design compelled by the United States in its contract with the manufacturer. The federal government is immune from tort liability except to the extent that it has deprived itself of that immunity in the

¹⁰⁸Restatement (Third) of Torts: Products Liability § 2(b) and comments d & g.

Federal Tort Claims Act. The act requires that the government be negligent, and negligence is not required to establish the liability of the manufacturer for a defective product. Inasmuch as the federal government is likely to be immune, those who have suffered personal harm, or their survivors, frequently sue the manufacturer of the product.

The manufacturer is likely to assert two defenses: (1) the government specification defense if it followed nonobviously defective government specifications¹¹⁷ and (2) the government contract defense, which gives the manufacturer the same immunity that would be given to the government.¹¹⁸

These defenses were relatively uncontroversial until the explosion of the environmental movement in the 1970s. The realization that acts committed many years ago can create serious risks led to many claims based on exposure to unsafe chemicals and hazardous wastes. The most controversial have been those that have related to Agent Orange, a defoliant used by the U.S. Armed Forces in Vietnam and manufactured in accordance with government specifications. A federal court held that the manufacturer will be given a defense if it can show that it followed government specifications in manufacturing the defoliant and that the United States knew as much as or more than the manufacturer of the hazards.¹¹⁹

K. Beyond Products: Sellers of Services

The discussion to this point addresses mass-produced products made by large-scale, commercial manufacturers. Does this paradigm extend to the construction industry, and does strict products liability also apply to individual products made by service providers?

A distinction should be drawn between design professionals and contractors. Attempts by injured persons to hold architects and engineers strictly liable or liable based

on implied warranties have been largely unsuccessful.¹²⁰ Suppose a claimant sues an independent designer of a defectively designed product, or suppose the manufacturer sues the designer. In either case, the designer would not be held to a standard of strict liability or implied warranty. Some have advocated holding designers to enlarged, more strict liability.¹²¹

Developers who mass-produce homes¹²² or lots¹²³ have been held strictly liable in some states. Contractors (or subcontractors) may be strictly liable for the delivery of defective appliances or products.¹²⁴ In some states, hybrid transactions, consisting of both services and the supply of products, will subject a contractor to strict liability if the delivery of the product is the predominate purpose of the transaction.¹²⁵

The Restatement (Third) of Torts: Products Liability § 19(b) states that services, even when provided commercially, are not products.

L. Future Developments

Considerable dissatisfaction has been expressed with the evolution of product liability law. Manufacturers have complained that the options available to them are all unsatisfactory. One alternative is simply not to insure when the cost of premiums makes the price uncompetitive or is beyond the financial capacity of the manufacturer. Another is to overdesign a product that will pass even hindsight judicial or jury review evaluation. The product

line can be dropped, which can mean diminished competition, fewer consumer choices, and higher prices.

In addition, the cost of defense is staggering, including attorneys' fees, costs of testing, and experts. As if this were not enough, courts are beginning to award punitive damages when a jury decides that design choices did not take safety or public needs into account.¹²⁶

In the 1990s, attacks were made on expanded product liability law by those who contended that such restraints on American industry made American products uncompetitive internationally. Attackers pointed to the costs incurred by manufacturers—such as increased cost of testing, ballooning insurance premiums, and the need to set aside reserves for uninsured losses and claims overhead—and compared American manufacturers to international competitors who did not face these same costs. They also pointed to manufacturers' decisions to withdraw products from the market because the costs associated with liability made the products unprofitable.

Defenders of product liability law asserted that competing manufacturers in other countries were highly regulated by government agencies. Costs to U.S. manufacturers are not much higher than those of foreign competitors, the defenders claimed. If production costs in the United States are truly higher than elsewhere, defenders said, U.S. prices should be higher and U.S. manufacturers less profitable. Yet, they claimed, this is not the case.

Defenders also pointed to the policy rationale for product liability law: that the need for safe products spurs manufacturers to develop safe products that would be attractive to consumers and acts as a *disincentive* to produce unsafe products. Defenders of U.S. product liability law further claimed that no evidence supports the argument that such laws stifle innovation.

Clearly, emphasis on competitiveness points to product liability law as a form of government regulation. When that formulation is revealed, we can see more clearly which groups are struggling over this issue. Plaintiffs' lawyers and consumer organizations argue for retaining the expanded liability of manufacturers, whereas manufacturers and many economists stress the need for a free market.

This debate has reached the attention of the courts. Although the law may not be rolled back by the courts, it is not likely to be expanded.

Many legislatures have enacted statutes that have limited common law liability. Recommendations have been made for a uniform federal statute dealing with manufacturer's liability for defective products.

SECTION 7.10 Remedies

A. Compensation

The principal function of awarding tort damages is to compensate the plaintiff for the loss. In the ordinary injury case, the plaintiff is entitled to recover economic losses and certain noneconomic losses.¹²⁷ Economic losses are, for example, lost earnings and medical expenses. The principal noneconomic loss is pain and suffering.

Recovery for emotional distress has always been given hesitantly. Where there is physical injury, however, there has been no difficulty in allowing recovery for pain and suffering. Often the plaintiff's attorney will seek to obtain a large award for pain and suffering by asking the jury to use a per diem or even per hour method to compute the pain and suffering award. Breaking down the period of pain and suffering into small units can generate a large award.

Many have suggested that pain and suffering not be recoverable or that limits be placed on recovery for pain and suffering. This has been especially attractive to those seeking to minimize malpractice liability of doctors. In the 1970s, many states reduced the liability of health care providers. One method was to cap noneconomic losses.

Recovery of pain and suffering damages, which are often open-ended, has been justified by the fact that a large amount of the damage award usually goes to pay the victim's attorney. Plaintiff advocates emphasize that pain and suffering are real and that placing an economic value on them, though difficult, can give victims a sense that the legal system has taken adequate account of the harm they have suffered.

B. Collateral Source Rule

Often an accident victim's hospitalization costs are paid by an employer, a health insurer, or the government. Many victims recover lost wages through disability insurance.

¹²⁶*Grimshaw v. Ford Motor Co.*, 119 Cal.App.3d 757, 174 Cal.Rptr. 348 (1981).

¹²⁷See Section 27.09 for this in the context of a contract breach.

Although the many types of benefits create varied results, on the whole most sources of compensation are considered collateral and are not taken into account when determining the victim's loss.¹²⁸

What is known as the collateral source rule has been considerably criticized because it can overcompensate. However, in tort cases, three principal justifications have been made for the rule. First, the defendant is a wrongdoer who should not receive any credit for benefits provided by third parties. Second, accident victims frequently must use a large share of their award to pay their attorneys. Third, accident victims often receive benefits because they have planned for them or because they are part of payment for their services.

Increasingly, state statutes reduce the scope or eliminate the common-law collateral source rule.¹²⁹ These statutes usually are enacted as part of an overall tort reform effort. This demonstrates the importance of benefits provided by third parties.

C. Punitive Damages

Tortious conduct that is intentional and deliberate—bordering on the criminal—can be punished by awarding punitive damages. Such damages are designed not to compensate the victim but to punish and make an example of the wrongdoer, to deter others from committing similar wrongs. In some areas of tort law, such as defamation, punitive damages play an important role because compensatory damages are often difficult to measure. There has been a tendency to award punitive damages for wrongful refusal to settle claims by insurance companies with their own insureds to ensure fair dealing in claim settlement. A few courts have awarded punitive damages in claims against manufacturers of defective products where the manufacturer seemed unwilling to place a high value on human life.¹³⁰

Punitive damages have become extremely controversial. Supporters of such awards say large organizations trample on weak consumers and that the threat of actual imposition of punitive damages is the only way such organizations will

take their legal obligations seriously. That is why the awards must hurt, or they will not affect conduct. As a result, the wealth of the defendant or its revenues have to be taken into account. To those that say that award by juries are often irrational and out-of-line, defenders say such awards can be upset or modified by appellate courts on review.

Attackers say that even if out-sized awards can be challenged on appeal, the threat of a horrendous punitive award will be a powerful tool in settlements. Attackers claim that there are other mechanisms to police bad conduct. They also complain that the jury can take into account the wealth of the defendants. Finally, they assert that the use of class actions (uniting claims of many people in a similar position) can generate huge awards.

Challenges by appeal also require an appeal bond that is often beyond the resources of the defendant. As a result, many large companies have filed for Chapter 11 bankruptcy. This allows the companies to reorganize and continue to operate while providing a shield against claims.

Most of the constitutional challenges to punitive damages awards have not been successful. But in 2003, the United States Supreme Court held in *State Farm Mut. Auto Insurance Co. v. Campbell* that the due process clause of the United States Constitution was violated when a state awarded 145 million dollars in punitive damages where the compensatory damages were one million dollars.¹³¹

The Court found that the award was grossly excessive or arbitrary. This violated the constitution. Such an award serves no legitimate purpose and constitutes an arbitrary deprivation of property. Also, an excessive award violates due process as the defendant is deprived of fair notice that his conduct will subject him to a defined punishment.

The amount must bear some relationship to compensatory damages. In practice, said the Court, few awards exceeding a single digit multiplier (the amount of punitive damages times compensatory damages) will satisfy due process. More than four times is close to the line, even to the point of presumptively being invalid.

But the Court created no fixed rule. If the harm is personal and not merely economic, a higher multiplier may be appropriate. If the amount of compensatory damages is substantial, a lesser ratio, even equal to the amount of compensatory damages, may be a limit on punitive

¹²⁸See this rule in the contract claim context in Section 6.06F.

¹²⁹As an illustration, see *Fisher v. Qualico Contracting Corp.*, 98 N.Y.2d 534, 779 N.E.2d 178, 749 N.Y.S.2d 467 (2002) (New York statute applied to the issue of whether insurance proceeds should offset a negligence claim against contractor).

¹³⁰See *supra* note 126.

¹³¹538 U.S. 408 (2003) (6 to 3). See note 132 *infra* for a recent important U.S. Supreme Court decision.

damages.¹³² Particularly reprehensible conduct that results in a small amount of economic losses may justify a higher ratio.

While all will depend on the circumstances, the language of the Court should place some practical limits on punitive damages by the multiplier comparison to compensatory damages.

The trial court looked at the defendant insurer's settlement practices on a national basis. This condemned the insurer for its nationwide practices. The Court found this to be an error. The award of punitive damages must be for conduct directed toward the plaintiffs.

The Court also held that the amount of punitive damages must take into account the civil fines and penalties that the conduct would have justified.

Finally, the Court held that the wealth of the defendant cannot cure any failure to satisfy other requirements for the award of punitive damages.

While this case may slow the growth of punitive damages, this decision will have to be applied in the state courts. Some will see this case as a justification to slow the advance or even roll back punitive damages. Others, though, sympathetic to the award of substantial punitive damages awards, may find ways to continue liberal awards. It remains to be seen how the controls will work out in practice.

One criticism of punitive damages is that these damages are awarded to a claimant over and above his actual losses. Because the purpose of punitive damages is essentially a

¹³²As this book went to press, the United States Supreme Court made an important decision in reviewing an award of punitive damages that resulted from a disastrous Alaska oil spill in 1989. The jury awarded five billion dollars for punitive damages (later reduced to two and one-half billion dollars) against Exxon. The Court reduced the award to one-half billion dollars as the award was excessive under common law Maritime Law. Its reduction was based on the award of one-half billion dollars as compensatory damages. *Exxon Shipping Co. v. Baker*, 128 S.Ct. 2605 (2008).

public one—that is, to deter wrongful conduct by making an example of the defendant—some have suggested that the damages should go into the public coffers and not into the pocket of the claimant. Seven states have enacted legislation requiring that a designated percentage—usually between 30 percent and 75 percent—be paid to the state. An unprecedented recent decision by the Supreme Court of Ohio held that part of a punitive damages award against a health insurer must go to a cancer research fund named after the deceased insured. The fund is to be administered by a hospital and research institute at the Ohio State University.¹³³

Punitive damages in the construction context will be discussed in Section 27.10.

D. Attorneys' Fees: Cost of Litigation

Generally, accident victims are not able to recover their attorneys' fees or other costs of litigation from the wrongdoer. This has led to expanded damages through pain and suffering and the collateral source rule as well as the contingency fee contract, under which attorneys risk their time if they do not obtain a recovery.¹³⁴

E. Interest

Because tort damages are rarely liquidatable, it is difficult to receive interest from any period of time before award of judgment. However, as indicated earlier,¹³⁵ statutes vary considerably, and in some states the trial judge has discretion to award interest from the date legal action commenced.

¹³³*Dardinger v. Anthem Blue Cross & Blue Shield*, 98 Ohio St.3d 77, 781 N.E.2d 121 (2002).

¹³⁴See Section 2.04.

¹³⁵See Section 6.08.

Introduction to the Construction Process: Ingredients for Disputes

SECTION 8.01 Relationship to Rest of Book

The rest of this book deals with the impact of law on the construction process. To provide a deeper understanding of such interaction, it is important at the outset to have an overall picture of certain salient characteristics of the construction industry, with special reference to the main participants in the construction process. This chapter provides such an introduction. Figure 8.1 provides a simplified chart of the participants in a building project organized in the traditional (design–bid–build) delivery system. Figure 8.2 is a more detailed breakdown of direct construction participants. For variants, see Section 17.04.

SECTION 8.02 The Eternal Triangle: Main Actors

A. The Owner

As a rule, the owner is the entity that provides the site, the design, the organizational process, and the money for the project. With some exceptions, such as real estate developers, owners tend to be “one-shot” players, not the repeat players found in the contractor and design professional segments of the industry. There is a wide range of those who commission construction; some differentiation between them is thus essential.

Most important is the differentiation between public and private entities. A private owner can select its design professional (by competition, competitive bid, or negotiation), its contractor (by competitive bid or by negotiation), and its contracting system (single contract or multiple prime, separate contracts) in any manner it chooses. Public agencies, in contrast, are limited by statute

or regulation. As a rule, they must hire their designers principally on the basis of design skill and design reputation rather than fee. Construction services generally must be awarded to the lowest responsible bidder through competitive bidding. Often a public entity must use separate or multiple prime contracts because of successful efforts in the legislatures by specialty trade contractors.

Other important differentiations exist between public and private owners. Public contracts have traditionally been used to accomplish goals that go beyond simply getting the best project built at the best price in the optimal period of time. Contracts to build public projects have often been influenced by the desire to improve the status of disadvantaged citizens, to remedy past discrimination, to give preferences to small businesses, to place a floor on labor wage rates, and to improve economic conditions in depressed geographical areas. Considerations exist that are not likely to play a significant role in awarding private contracts.

Public entities are more likely than are their private counterparts to be required to deal fairly with those from whom they procure design and construction services. Yet public entities, having responsibility for public monies, usually impose tight controls on how that money is to be spent. As a result, such transactions have often generated intense monitoring by public officials and by the press to avoid the possibility that public contracts will be awarded for corrupt motives or favoritism. In addition, public projects are more controversial. To whom the project is awarded, the nature of the project, and the project’s location often excite fierce public debate and occasional treks to the courthouse. Public owners are expected not to allow those from whom they procure goods and services to make profits on unperformed work or to make excessive profits.

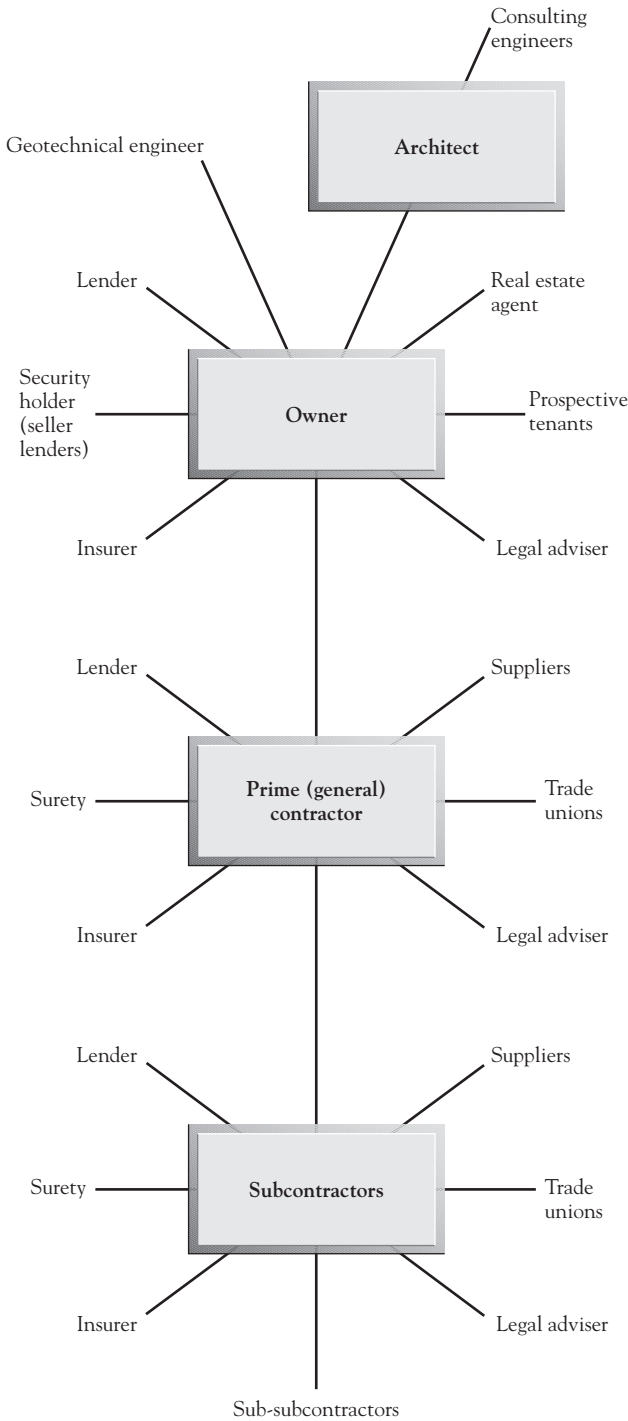

FIGURE 8.1 Organization of building project (traditional D-B-B system).

Public owners often seek to control dispute resolution, by contract or by law. Some public owners now require arbitration. Many experienced public owners, such as federal contracting agencies and similar agencies in large states, have developed a specialized dispute resolution mechanism, often using specialized regulatory, arbitral, or judicial forums.

Another differentiation is between experienced and inexperienced owners. An experienced owner engages in construction, if not routinely, at least repeatedly. This owner is familiar with common legal problems that arise, construction legal and technical terminology, and standard construction documents. It may also have a skilled internal infrastructure of attorneys, engineers, risk managers, and accountants.

An inexperienced owner, though often experienced in its business, is likely to find the construction world strange and often bewildering. Such an owner lacks the internal infrastructure and may, even if it has resources to hire such skill, not even know whether it should do so and, if so, how it can be done. The prototype, of course, is an owner building a residence for her own use.

Many other owners are “inexperienced.” Although as a general rule, public owners are more experienced than private ones, care must be taken to differentiate between, for instance, the U.S. Corps of Engineers and a small local school district. The former has experienced contracting officers, contract administrators, and legal counsel and operates through comprehensive agency regulations, standard contracts, and an internal dispute resolution mechanism. The small local school district, in contrast, may be governed by a school board composed of volunteer citizens, be run by a modest administrative staff, and have a part-time legal counsel who may be unfamiliar with construction or the complicated legislation that regulates the school district.

Similar comparisons can be made between private owners. Compare General Motors building a new plant with a group of doctors building a medical clinic or a limited partnership composed of professionals seeking tax shelters through building or renting out commercial space. The clinic or limited partnership at least can buy the skill needed to pilot through the shoals of the construction process. But a greater dichotomy can be seen if a comparison is made between General Motors and a private person building a residence she intends to occupy. The latter as a rule does not obtain technical assistance because of costs.

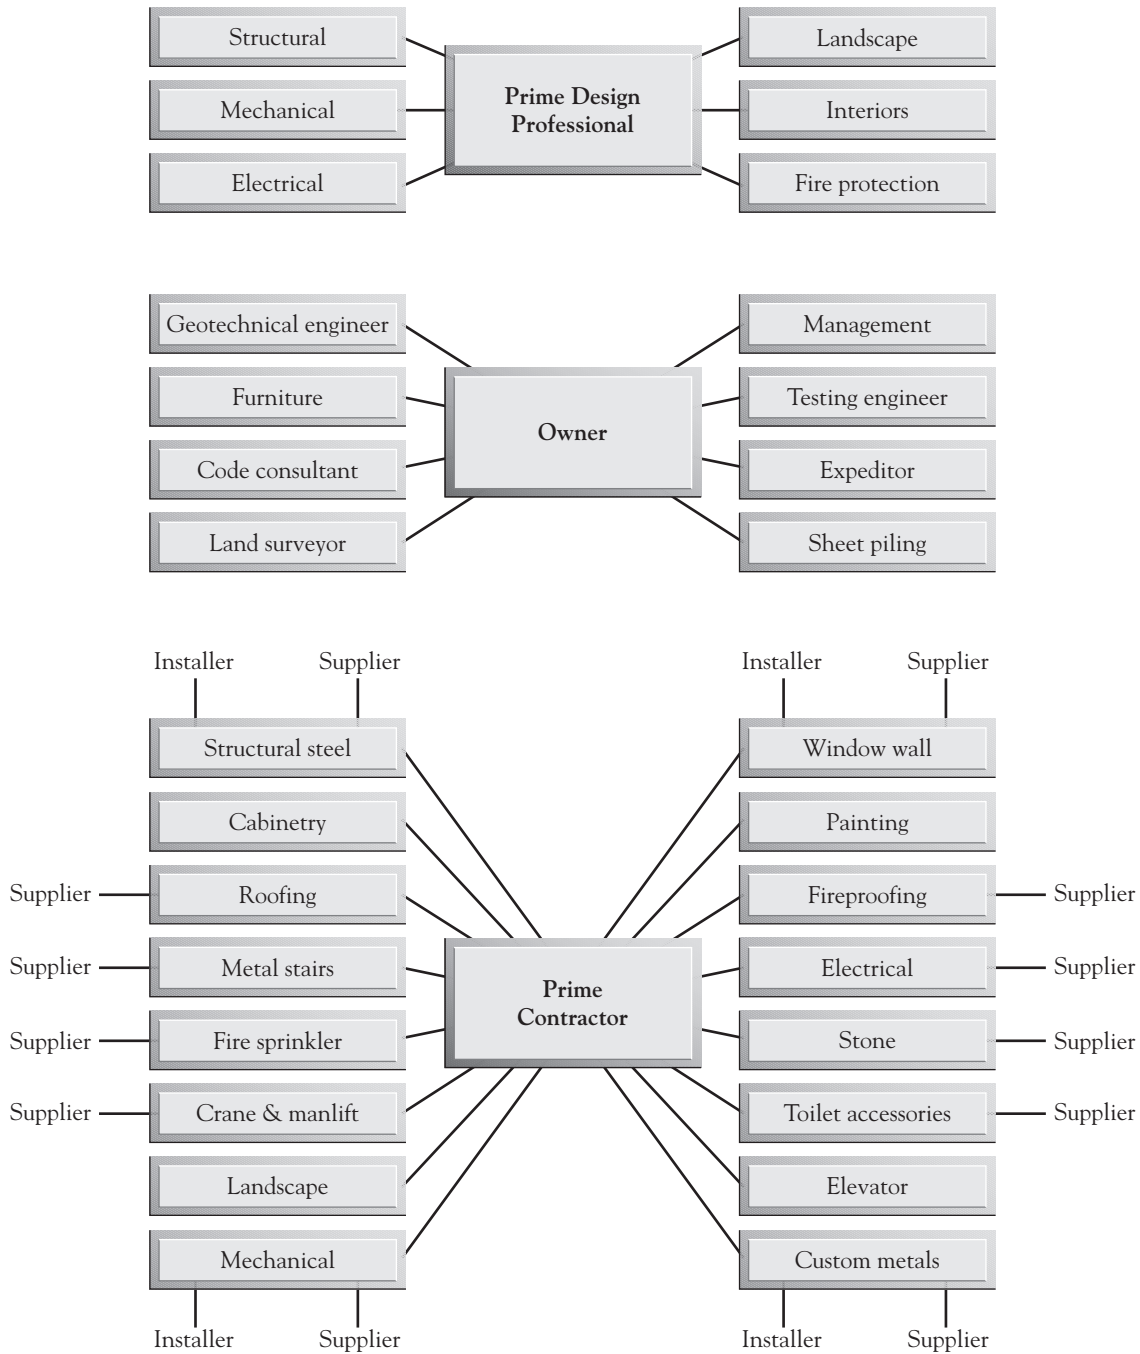

FIGURE 8.2 Technical players along the prime design professional, owner, and prime contractor chains in a building project.

Looking next to awarding construction contracts, inexperienced private owners will likely prefer competitive bidding, not because they must but because they will not know the construction market well enough to sit across the negotiating table from a contractor. In contrast, an experienced owner may be able to review the contractor's proposal and be aware of the market and other factors necessary to negotiate. (Ironically, often the public agency, which is in the best position to negotiate, must use the competitive process, a reflection of the distrust in public officials.)

Much more than an experienced owner, an inexperienced owner will need to engage an architect or engineer to design and administer the construction contract. The experienced owner may have sufficient skill within its own internal organization and not need an outside adviser experienced in construction.

An inexperienced owner will more likely use standard construction contracts such as published by the American Institute of Architects (see Appendices A through E) or the Engineers Joint Contracts Documents Committee (see Appendices G through I). It will do so because it does not wish to spend the money for an individualized contract, does not have an attorney who can draft such a contract, or wishes to acquiesce to the suggestions of its architect or engineer.

An owner's lack of experience with complex standard contract terms can generate many legal problems. The "form" may not "fit," leading to interpretation problems. In addition, if people operating under the contract are not familiar with or do not understand the contract, they are likely to disregard provisions, leading to claims that those provisions have been waived.

This differentiation may also affect performance in other ways. Inexperienced owners may make many design changes that raise the cost of construction and increase the likelihood of disputes over additional charges. They may also refuse legitimate contractor requests for additional compensation because they are unaware of those provisions of a contract that may provide the basis for additional compensation. Inexperienced owners may not keep the careful records that are so crucial when disputes arise.

Where the language must be interpreted, doubts will very likely be resolved in favor of the inexperienced owner. An experienced owner could have made the contract language clear. A claim made by a contractor that it be excused from default or be given additional compensation

because of unforeseen events during performance is less likely to be successful against an inexperienced owner.

B. The Contractor

The contracting industry is very decentralized, with a large number of small and medium-sized firms. Although concentration characterizes other industries, construction is largely local, with most contractors serving a single metropolitan area. Few construction companies are even regional, let alone national or international.

Half a million companies engage in construction. The average company is family owned, with an average of five to ten permanent employees. Most workers are hired for a particular job through unions or otherwise. Contractors obtain their work by competitive bidding. Profit margins are usually low and bankruptcies high. Because construction requires outside sources of funds, it is often at the mercy of the changing monetary and fiscal policies.

Two out of three contractors are specialty contractors, and one out of two workers plies a specialized trade, such as plumbing, electrical work, masonry, carpentry, plastering, and excavation. This means that in many construction projects, the contractor acts principally as a coordinator rather than as a builder. Its principal function is to select a group of specialty contractors who will do the job, schedule the work, police specialty trades for compliance with schedule and quality requirements, and act as a conduit for the money flow. Moreover, in a fixed-price contract the contractors provide security to the owner by giving a fixed price.

The volatility of the construction industry adds to the high probability of construction project disputes. Because the fixed-price or lump-sum contract is so common, a few bad bids can mean financial disaster. Contractors are often underfinanced. They may not have adequate financial capability or equipment when they enter into a project. They spread their money over a number of projects. They expect to construct a project with finances furnished by the owner through progress payments and with loans obtained from lending institutions.

Labor problems, especially jurisdictional disputes, are common. Many of the trade unions have restrictive labor practices that can control construction methods. Some contractors are union; others are nonunion; still others are double-breasted, having different entities for union and nonunion jobs.

Some contractors do not have the technological skill necessary for a successful construction project. Often the technological skill, if there is any, rests with a few key employees or officers. The skill is often spread thinly over a number of projects and can be effectively diminished by the departure of key employees or officers for better-paying jobs.

The construction industry has attracted a few contractors of questionable integrity and honesty. These contractors will try to avoid their contractual obligations and conceal inefficient or defective performance. Such contractors are skillful at diverting funds intended for one project to a different project.

C. The Design Professional

Design professionals, the third element of the construction triangle, find themselves in the often uncomfortable position of working for the owner yet being expected to make impartial decisions during construction. They, like the contractors, have financial problems, because there is usually not enough work to go around.

D. The Industry

All the main actors—owners, contractors, and design professionals—suffer from a chronically sick building industry particularly affected by rapid movements of the economy, changes in public spending policies, and swings of monetary policy, all of which can affect the interest rates, a formidable factor in most construction.

SECTION 8.03 The Supporting Cast on a Crowded Stage

A. The Owner Chain: Spotlight on Lender

Because owners rarely have funds to provide for major (or even minor) construction work, an important actor along the owner chain is the entity providing lending for the project. Availability of funds is essential to the participants who provide services and materials. Often the owner's inability to obtain funds is the reason a project does not proceed, despite the design professional's having spent time on the design. Similarly, available funding may not be adequate to deal with such common events in con-

struction as design adjustments, escalation of prices, changed conditions, and claims. Inadequate funding can create a breakdown in the relationship among the project's participants, which in turn leads to claims.

With regard to funding, it is important again to differentiate between public and private projects. Public projects are usually funded by appropriations made by a legislature or administrative agency. In controversial projects, challenges may be made to the project itself, to the method by which the contract was awarded, or to compliance with other legal requirements. If challenges are made to the project, funds may never become available or may generate delay in payment.

Another problem generated in public projects relates to the project's being funded by a mixture of funds from various public agencies or even a combination of public agencies and private entities. For example, the interstate road system was funded 90 percent by the federal government and 10 percent by the states, while wastewater projects were funded 75 percent by the federal government, 12.5 percent by the state, and 12.5 percent by local entities. Mixed funding can generate problems because one funding entity requires certain contract clauses that may differ from those required by another funding entity.

In private projects, funds are usually provided by construction loans made by lenders for short periods, usually only for the time necessary to complete the project. The interest rates are short term, usually floating, and generally higher than those charged by permanent lenders (most commonly insurance companies and occasionally ordinary lending sources).

The private construction lender wants the loan to be repaid and usually takes a security interest in the project that can be used to obtain repayment if the loan is not repaid. The lender makes an economic evaluation to determine whether a commercial borrower will derive enough revenue to repay the loan. Also, such decisions are made by permanent lenders.

In addition, the lender will wish to be certain that the borrower has put up enough of its own money so that if the project runs into problems, the borrower will not walk away from the project and avoid the loan obligation by going bankrupt—leaving the lender with only the security interest and the unpleasant prospect of taking over a defaulted project.

Similarly, the lender wants to be certain that advanced funds go into the project and enhance the value of the

project by the amount of money advanced. It does not wish to see the borrower diverting funds for other purposes.

The lender also wishes to be assured that there are no delays, which can often be caused by faulty design or poor workmanship. Costly design changes, claims for extras by the contractor, and additional expenses due to unforeseen conditions are events the lender wishes to avoid. Similarly, the lender wishes to be assured that those who provide services, such as contractors and subcontractors and those who provide materials and equipment, such as suppliers, are paid and do not assert liens against the project. If liens are asserted, it may be difficult for the construction lender to obtain a permanent “takeout” lender.

Finally, the lender usually wants to know how the project is proceeding and may, in addition to approving the construction contracts made at the outset, insist on receiving copies of contract addenda, modifications, requests for changes, change orders, claims, and even routine correspondence.

The seller often retains a security interest in the land. The owner may be constructing a commercial structure in which space has been leased in advance to tenants. The owner’s creditors may have an interest in the construction project. They may hope to collect their debts from profits made by the project or by having the land seized or sold to pay the owner’s debts.

B. The Contractor Chain

The contractor chain in the single-contract system involves, in addition to the prime contractor, a large number of subcontractors and possibly sub-subcontractors. Each one of these contractors, as well as the prime contractor itself, purchases supplies and rents equipment. The material and equipment suppliers also have a substantial stake in the construction project.

Using surety bonds for prime contractors, and often for subcontractors, brings a number of surety bond companies into the picture. The creditors of the contractors, other than suppliers, are often involved. Contractors may owe taxes to the authorities, and people may have lent money to the contractors. The contract chain would not be complete without reference to the trade unions, which have a substantial stake in the construction project.

C. The Design Professional Chain

In addition to the owner and contractor chains, there is a somewhat shorter chain beginning with the design professional, who may hire consultants. Some consultants, such as geotechnical engineers, may have been hired by the owner and be in the owner’s chain. In larger projects, an employee of the design professional might be on the site daily.

Consultants also have a stake in the construction project. They wish to be paid, and their negligence may cause damage to any number of people who are also affected by or involved in the construction process.

D. Insurers

Insurers are also important actors on this crowded stage. All the major participants, such as design professionals, owners, and contractors, are likely to have various types of liability insurance. In addition, either the owner or the prime contractor will carry some form of property insurance on the work as it proceeds and on materials and equipment not yet incorporated into the project.

Figures 8.1 and 8.2 illustrate the participants in a complex building project.

SECTION 8.04 The Construction Contract

Building a construction project is a complicated undertaking. The construction documents, particularly plans and specifications, should be clear and complete. At their best, they should give a good indication of the contractor’s duties. Unfortunately, even the best design professionals cannot do a perfect job of drafting the construction documents that encompass the complete construction obligation.

In American construction the contract documents must often be interpreted by the person who designed the project and who was selected and is paid by one party. The inevitable interpretation issues can induce corner-cutting contractors to bid low and submit a large bill for extras. The variety of contract documents creates additional dispute possibilities, inconsistencies, and ambiguities.

The competitive bidding process so often used to select a contractor and the frequent use of the fixed-price contract play a significant role in dispute generation. The former emphasizes price rather than quality, and the latter places

tensions on the relationship by placing the risk of many unknown and abruptly shifting factors on the contractor.

SECTION 8.05 The Delivery Systems

Although there have always been variations in construction delivery systems, construction in America in the twentieth century historically has been dominated by what is sometimes called the *traditional construction method*, also known as “design–award–build” or “design–bid–build.” Under this system, the owner acquires the right to improve land, commissions an architect or engineer to prepare the design, and engages the contractor to agree to execute the completed design, either through competitive bidding or through negotiation, under a fixed-price or lump-sum contract. The American construction delivery system commonly employs the design professional to monitor construction as it proceeds and to play a central role in interpreting the contract, resolving disputes, and issuing certificates of payment and completion. Depending on the type of project, some parts of the design are prepared by consultant design professionals, and much of the actual construction is performed by subcontractors.

Although variations on the system have always existed, increasing emphasis on the variations began after World War II, particularly in the 1970s. Principal variations include awarding the contracts for construction to separate contractors or multiple prime contractors, commencing construction before design is completed (known as “phased construction” or “fast-tracking”), inserting a new professional called a construction manager into both design and construction, and combining design and construction through the use of what has been called a turn-key or design–build. Probably the majority of large-scale public and private commercial projects currently use nontraditional project delivery systems, especially design–build and construction management. In the past twenty years, newer project delivery methods include a more collaborative approach by the main project participants (“partnering” and “project alliance”), importing modernized manufacturing delivery systems to the construction industry (“lean project delivery”) and a fundamental revamping of the design and implementation methods based upon advanced computer modeling technology (“building information modeling”). Section 17.04 deals in greater detail with these variations.

SECTION 8.06 The Applicable Law

The law that regulates the rights of parties along any of the chains should be the contracts which connect the various persons on the chain. For example, the basic law between contractor and owner should be the prime contract. Similarly, the law that regulates the relationship between design professional and owner and prime contractor and subcontractor should be found, explicitly or implicitly, in their contracts.

There is an increasing use of standard contracts such as those published by the American Institute of Architects (AIA) or the Engineers Joint Contract Documents Committee (EJCDC). It is impossible to anticipate all the problems and deal with them properly in each individual construction contract. Standard contracts rely heavily on the experiences of the past and on the expertise of people who have wide experience in construction projects.

Good standard contracts are planned carefully. However, their existence does not solve contract problems for lawyers or for design professionals. First, some standard contracts acquire the reputation for being heavily slanted in favor of one of the parties. When asked to pass judgment on these contracts, lawyers may reject them completely or substantially modify them. Second, a standard contract is often unread or misunderstood by the other party if the party to whom the contract is presented is not represented by a lawyer. A possibility exists that the contract will not represent all the law regulating the relationship between the parties.

A number of other laws regulate the construction project. Building codes and industry standards are often incorporated, expressly or implicitly, in the construction documents. Building codes lack uniformity and consist of complicated and often cumbersome rules that regulate the construction process. There are zoning laws and subdivision laws. Tort doctrines, such as those relating to nuisance and soil support, affect the use of land. Title and security problems are often difficult. Because of history and the archaic language of surety bonds, interpreting a surety’s obligation is difficult. The rights of injured persons or injured property owners are governed by tort law and the bewildering process of indemnification. If more were needed, ultimate responsibility for some losses seems to require a “slug fest” between insurance carriers, all armed with unreadable policies with hordes of special endorsements. Is it any wonder that disputes are common and litigation time consuming and costly?

SECTION 8.07 The Construction Site

The owner's choice of location for the project is important. Designing for an area where craft unions are strong is different from localities where nonunion labor is used. If the site is in a city with environmentally sensitive citizens, the project will have characteristics different from those designed for localities where this scrutiny is less intense. The site may affect the likelihood that bribes must be paid to receive contracts or permits. The site may also affect weather conditions, which can influence design and performance. The site may determine the availability of an efficient and honest judicial system to resolve disputes.

The physical site itself contributes to the likelihood of disputes and construction process difficulties. No two pieces of land are exactly alike, generating a high probability of subsurface surprises. Testing methods for soil conditions are expensive and often do not give an accurate picture of the entire site. In addition, the physical limitations of the site, together with the large number of persons and contracting parties who must perform within this limited physical area, increase the probability of difficulties.

SECTION 8.08 Contract Administration

Even if the general terms and conditions of the contract documents are well expressed, difficulties often develop because contracting parties often are sloppy in contract administration. Decisions are made on the site, modifications are agreed to, changes are ordered—all without the formal requirements frequently expressed in the general terms and conditions of the written contract documents. Telephone conversations are often used to resolve difficulties and continue the work, but a dispute may arise later as to what was said in such conversations.

In the process of the dispute, one party often points to the contract clauses requiring that certain directions be given in writing or that certain modifications be expressed in writing. The other party then states that throughout the entire course of administration these formal requirements were disregarded. From these seeds develop disputes and lawsuits.

SECTION 8.09 International Transactions

Crucial differences exist between foreign and domestic owners. Contracts made with foreign owners are most likely to involve the sovereign or one of its agencies. Under such circumstances, the people contracting to provide design or construction services must be aware of the sovereign's power to regulate foreign exchange rates, import or export of goods or money, local labor conditions, the necessity for bribes, the lack of an independent judiciary, and the risk of expropriation.

Even contracting with a private owner in a foreign country involves risks that are not significant when contracting with domestic owners. Problems may arise from unfamiliar laws, different subcontracting practices, different laws and customs regulating the labor market, and different legal solutions.

SECTION 8.10 Unresolved Disputes and Litigation

Disputes between parties may be resolved without litigation when they want to maintain goodwill in their future dealings. However, this element—the necessity of future relations—may be missing in many construction projects. A dispute may involve a number of parties, such as insurance companies and sureties, that must consent to any settlement. The uncertainty of both the law and the facts and variety of legal issues discourages settlement.

Unless the parties value the goodwill of the owner, as is not common in much construction, they need not compromise—another factor discouraging settlement and leading to the courtroom. If there is an arbitration provision, one or both of the parties may not trust the arbitration process. Even if the arbitrator makes an award, the party against whom the award is made may not perform. Such awards must be confirmed by a court.

In summary, parties in a dispute-prone process such as construction have the propensity to call on the legal system to enforce contracts or obtain compensation for losses. Participants in the process must be aware of this. They must do all they can to avoid disputes, seek to settle those that do develop, and be aware of the role law plays in the process.

Limits on Ownership: Land Use Controls

This chapter examines a variety of controls or limitations on the nature of the project. Sections 9.01 through 9.05 look at private land use controls created by contract or tort law and enforced by courts. Sections 9.06 through 9.15 deal with public land use controls enacted mainly by local entities through powers given them by the state. Administration is handled largely through local regulatory commissions or legislative bodies. Courts, though less important, play mainly a passive, oversight role, determining whether local laws or administrations meet the state legislative and constitutional requirements. Controls on the design itself, imposed by building codes and the permitting process, are discussed in Section 19.02C.

SECTION 9.01 Nuisance: Unreasonable Land Use

The law protects the rights of landowners (those protected can also include family members or tenants or employees) to enjoy their land free of unreasonable interference by landowner activities in the same vicinity. This law regulates land use by prohibiting uses that unreasonably interfere with others' land use. The unfortunate term *nuisance* has developed as the means of describing such land uses.

A landowner (as used here, *landowner* can include a tenant) must make reasonable use of the land and not deprive neighboring landowners of the reasonable use and enjoyment of their land. To a large degree, granting of legal protection through nuisance controls depends on the activity or use complained of and on its effect on other landowners.

Looked at first from the perspective of the complaining landowner, the interference can take many forms. At one extreme, the land can actually have physical damage. For

example, a neighbor's discharging solid, liquid, or gaseous matter on the land may change the physical characteristics and shape of the complaining landowner's property and seriously affect the land's use.

The offensive activity may disturb the comfort and convenience of the complaining landowner. For example, activities on the offending land can create loud noise or the emission of noxious odors that may disturb the occupants of adjacent or nearby land. Moving to even more intangible interference, the neighbor's complaint may be based on simply knowing the nature of the activities on the adjacent or nearby land. For example, a neighbor's mental tranquility may be disturbed by the knowledge that an adjacent landowner maintains a house of prostitution or a meeting place for people whose activities are bizarre or unconventional.

Moving to the outer extreme of intangible interference, one neighbor may be extremely disturbed by the appearance of a neighbor's house.

An objective standard is used. Would the acts or activities in question have disturbed a reasonable person under such circumstances? Could the interference have been avoided had the complaining landowner taken reasonable measures? For example, would closing the windows have reduced or eliminated excess noise caused by the neighbor? If so, would such protective measures unduly interfere with the use and enjoyment of the land?

Generally, the more the activity in question causes an actual physical result, such as changing the characteristics or contours of the land or making a physical impact on the land, the more likely the law will give relief. As the interference moves toward more intangible matters, such as peace of mind and aesthetic judgments, the less likely the law will accord protection. Although such interests

may be protected, the law would require that there be a significant interference with the use and enjoyment of the complaining landowner's property.

The likelihood of legal protection may depend on the extent and duration of the interference. Temporary interference or interference that occurs only at long intervals is less likely to justify relief.

Legal protection does not require the complaining party to show that the acts or activities in question were intended to interfere with the use and enjoyment of adjacent or nearby landowners. The conduct need not be negligent. However, the more intentional and more negligent the conduct, the more likely the activity in question is a nuisance.

The social utility of the activity is important. Certain commercial and industrial activities are necessary and are encouraged by society. The necessity for these activities may overcome minor inconveniences to those in the vicinity. If the activity has little social value, slight interference with the use and enjoyment of the adjacent landowner's land can constitute a nuisance.

Often the crucial issue is the remedy to be given the complaining owner when the defendant has made an unreasonable use of its land. The choice is between giving a money award for damages to the complaining party and ordering the offending party to cease the activities—an equitable injunction.

The money damage award must be inadequate before an injunction can be awarded. However, it is often difficult to establish the precise value of the damages caused in such cases. This is especially true if the offensive activity consists of noise or emission of noxious fumes or if the activity has caused losses other than physical harm. As a result, it has become relatively easy to obtain injunctive relief in nuisance cases, especially if the nuisance is a continuing one.

Suppose an industrial activity is being conducted on a large scale and has adversely affected the occupancy and use of nearby land. Some early court decisions affirmed orders that required cessation of the offensive activities. Such an order can close industrial plants on which may depend the economy of the town where the plant is located. As a result, some courts award what are called *permanent damages*, based on the diminution in the value of the land affected by the industrial activity, rather than to order that the offending activity cease.¹

¹*Boomer v. Atlantic Cement Co.*, 26 N.Y.2d 219, 257 N.E.2d 870, 309 N.Y.S.2d 312 (1970).

Class actions are increasingly being used, and some landowners maintain the action for the benefit of all landowners similarly situated. By aggregating small claims against the offending landowner, class actions can justify the often large expenses needed to mount a lawsuit against the industrial activity adversely affecting a large number of landowners in the vicinity.

SECTION 9.02 Soil Support

The owner of unimproved land has the right to lateral support by adjacent land. Because this is an absolute property right, the owner of unimproved land can receive legal relief if lateral soil support was withdrawn by excavation, and the owner need not show that the excavating landowner did not use proper methods.

This rule of property—an absolute rule as contrasted to the flexible one used in nuisance—does not apply if the affected land has been improved, adding weight to the soil. In such a case, the excavator is liable only if the adjacent landowner can show that the excavator did not comply with the legal standard of care. If the adjacent landowner can show that the soil support would have been withdrawn by the neighboring excavation regardless of the added weight caused by the improvement, the adjacent landowner can recover without showing that the excavator did not comply with the legal standard.

State legislation frequently controls the result in excavation cases. For example, in Illinois, the excavator must notify adjacent landowners of its intent to excavate, the proposed depth of excavation, and when excavation will begin. Legal rights depend on the depth of the excavation.²

The excavator should comply with any public controls such as the Illinois statute mentioned, give notice of excavation to the other party, seek to work out an advance agreement on protection and responsibility, and use reasonable care in excavating.

SECTION 9.03 Drainage and Surface Waters

Construction frequently affects and is affected by drainage at the site and adjacent land. Drainage changes can cause troublesome collection of surface waters. Three surface

²765 I.L.C.S. 140/0.01.

water rules have emerged in the United States.³ The first is the “common enemy” rule: Each landowner can treat surface water as a common enemy, with the right to deal with it as the landowner pleases, without regard to neighbors. The second is the “civil law” rule: A landowner who interferes with the natural flow of water is strictly liable for any damage to neighbors.

The preceding rules are absolute. One gave great freedom to deal with surface water. Another created absolute liability. A third rule, that of “reasonable use,” is gradually supplanting the absolute rules. Each case in jurisdictions with such a rule is decided on its own facts. The landowner affecting the water flow must act reasonably. In making this determination, the law considers the following:

1. Was there a reasonable necessity for such drainage?
2. Was reasonable care taken to avoid unnecessary damage to the land receiving the water?
3. Did the benefit accruing to the land drained reasonably outweigh the resulting harm?
4. When practicable, was the diversion accomplished by reasonably improving the normal and natural system of drainage, or if such a procedure was not practicable, was a reasonable and feasible artificial drainage system installed?

SECTION 9.04 Easements for Light, Air, and View

Light, air, and view are important considerations in constructing buildings and residences. *Fontainebleau Hotel Corp. v. Forty-Five Twenty-Five, Inc.*⁴ involved an addition built by one luxury hotel in such a way as to cut off sun, light, and view to an adjacent hotel. The hotel on which an addition was being built—the Fontainebleau—was constructed in 1955; its adjacent competitor, the Eden Roc, was constructed in 1956. The addition was to be a fourteen-story tower. During the winter months from two o’clock in the afternoon and for the remainder of the day, the tower would cast a shadow over the cabana, swimming pool, and sunbathing areas of the Eden Roc.

When the addition was roughly eight stories high, the Eden Roc sought to obtain an order restraining the Fontainebleau from proceeding with the construction of the addition.

The trial court granted the requested order, but the appellate court reversed. The court stated that no American decision, in the absence of some contractual or statutory obligation, had held that a landowner “has a legal right to the free flow of light and air across the adjoining land of his neighbor.”⁵ The court concluded that construction of a structure that serves a useful and beneficial purpose could not be restrained by the court even though it cut off light and air and interfered with the view of a neighbor. Despite the partially spiteful motivation for the structure, relief was denied the Eden Roc.

Wisconsin refused to follow the absolute property rule. It applied the flexible nuisance doctrine to preclude an owner from building in such a way as to reduce the effectiveness of a neighbor’s solar heating panels.⁶ An owner who constructs to take advantage of view should consider either obtaining easements from adjacent landowners or buying adjacent land.

Some California communities have adopted tree ordinances. An owner whose view is impeded by a tree on a neighbor’s land can request the tree be removed or trimmed. If this is done, the costs are divided. If the tree owner is unwilling, a local “tree commission” decides the dispute.

Suppose a neighbor puts up a “spite fence”—a high, unsightly fence that interferes with a neighbor’s view and the entrance of light to the neighbor’s land—and creates an eyesore. States have not been uniform in their treatment of spite fences. Some emphasize the right of a land-owner to use its land as it wishes, and permit spite fences. Other states hold that if the dominant motive in erecting the fence is malicious and if the fence serves no useful purpose, the neighbor can recover damages and be granted a court decree ordering the fence removed. In some states, statutes limit the height of any fence erected maliciously or for the purpose of annoying a neighbor. The increasing tendency is to restrict the use of spite fences.

³*Butler v. Bruno*, 115 R.I. 264, 341 A.2d 735 (1975) presents a complete discussion of the history of the three American water law rules.

⁵*Id.* at 359.

⁶*Prah v. Maretti*, 108 Wis.2d 223, 321 N.W.2d 182 (1982). This case is noted in 21 Duq.L.Rev. 1159 (1983) and 48 Mo.L.Rev. 769 (1983).

SECTION 9.05 Restrictive Covenants: Common Interest Communities (CIC)

An individual grantor (one who conveys) of land generally has no interest in how the land is used after the deed has transferred ownership. But suppose the grantor lives or will live in the vicinity of the land transferred. Or, more important, suppose the grantor is a residential developer who is selling lots or houses to a large number of buyers. In either case, the grantor may wish to control land use after the title is transferred by deed. The grantor who is not a developer may wish to control the land use to enhance or maintain the use or value of land it owns in the vicinity of the land transferred. The developer-grantor may wish to assure buyers in the development that the land will retain its residential character to protect the enjoyment of and investment in the land. Although restrictive covenants can be created in agricultural or commercial property, this section emphasizes their use in developing residential property.

To accomplish the land-planning objectives, the developer-grantor can obtain an express promise relating to land use. There are no particular legal problems between the developer and the original buyer in accomplishing this result by contract, with the exception of racial or religious restrictive covenants (mentioned later in the section). The contract in such cases can and usually does contain promises that limit the buyer's right to use the land. In land law, such promises are called *restrictive covenants*.

Land ownership in a housing development is likely to be transferred. Because use affects value, the developer wishes to assure buyers that restrictions on use will bind future buyers and to assure buyers or their successors that they will have enforcement rights if any buyers violate the restrictive covenants. As a marketing device, the protection of tightly drawn enforceable restrictive covenants can persuade buyers to buy. To accomplish this, a developer will include in the deeds restrictions that give buyers of lots or residences in the development the right to enforce these restrictions when the covenants are violated.

To be effective over a long period of time, such restrictions must be "tied to" or "run with" the land. All buyers, present and future, must be bound by the restrictive covenants. All owners, present and future, must be able to obtain judicial enforcement of these restrictive covenants. Early English land law that sought to preserve property values by limiting land use through such restrictive covenants

became unsatisfactory. A number of technical requirements often frustrated attempts to enforce these covenants.

The ineffectiveness of the system led to the nineteenth-century development of equitable servitudes in England and subsequently in the United States. In the famous case of *Tulk v. Moxhay*,⁷ the English Court of Equity held that a purchaser of land who knew of the restrictions on the use of the land would be ordered by the Court of Equity not to violate these restrictions even though nothing in the deed restricted the land use. Equitable servitudes avoided technical requirements of covenants "running with the land." They created a viable private system of land use controls that had great impact on the development of cities and that still exist despite the proliferation of public land use controls.

In the United States, an equitable servitude requires an intent to benefit the adjoining land and notice of the servitude or restriction to buyers of the burdened land; that is, the land that is limited in use. Intent to benefit is usually shown by a uniform, common scheme of restrictions. Generally this scheme is shown by a legal document recorded in the land records, although in some cases it can be shown by a uniform pattern of use throughout the development.

Courts have generally given considerable freedom to developers and buyers in creating restrictive covenants. However, contractual freedom is not absolute. In *Shelley v. Kraemer*, the U.S. Supreme Court held that state enforcement of racial restrictive covenants violated the Equal Protection Clause of the Fourteenth Amendment to the federal Constitution.⁸

Should the constitutional tests that determine the validity of *public* land use controls (as seen in Section 9.15) be applied to private restrictive covenants? Some contend that buyers do not have adequate notice of the restrictions, the agreements are contracts of adhesion and are not consensual, and *in effect*, broad-scale enforcement of private restrictive covenants is tantamount to private zoning. Private restrictions, especially those that limit construction to single-family residences, can frustrate plans to have integrated housing in urban and suburban areas.

One writer urged that constitutional requirements for zoning ordinances be applied to decisions of those who administer such systems, such as homeowner associations

⁷41 Eng.Rep. 1143 (Ch.1848).

⁸334 U.S. 1 (1948).

and architectural committees, as they often wield power analogous to local authorities.⁹ However, courts generally regard restrictive covenants as a useful private planning device and have not as yet been willing to apply public land use standards to reviewing restrictive covenants and actions of homeowner associations.

Private restrictive covenants can be rigid. Restrictions must be effective for a sufficiently long time to protect buyer investments. Yet the future is difficult to predict. To deal with the need for flexibility, many planned developments create homeowner associations composed of owners in the development. These associations can modify existing restrictions under certain circumstances and pass judgment on requests to deviate from the restrictive covenants. They are often given the power to seek injunctions for violations even though they do not own land in the affected area.

While the original reason for restrictive covenants was to protect property values, increasingly, they are created for other reasons. This is demonstrated by the names given to them. One way of referring to them is as gated or walled communities. These names show the emphasis on a sense of security to those who live in them. Those who live in them want a feeling that they will be safe in their homes and in their communities.¹⁰

At the beginning, these communities created by private restrictive communities were the domain of the more affluent. But now, they are no longer reserved for the rich but are created for different class and economic groups as long as all members share cultural bonds. As a result, they are currently called *common interest communities* (CIC). They include not only gated or walled communities but also condominiums and cooperatives. In a condominium, owners own their apartments, with common areas owned by a homeowners or community association. In a cooperative, the property is owned by a cooperative association with shares in the cooperative owned by those who live there.

CICs seek to create an authentic sense of community much like the villages in preindustrial times. While they are still interested in property values, they also want to create and maintain neighborhoods of people with like

interests. They want to create a community. Those who create CICs and those who live in them seek to develop a connectedness that many feel is absent from modern life.

The administration of these communities is done by an ownership or community association created at the outset by those who organize CICs. Ultimately, they are elected by those who live in them.

Community objectives are sought through regulations. Professor Paula A. Franzese has chronicled the life, legal and social, of these CICs. She states:

In the CIC setting, covenants have been devised to regulate everything from whether pets are limited or prohibited, to the permissibility and style of one's screen and storm doors, to the ration of grass, trees and shrubs allowed on one's property. Restrictions are imposed to regulate the mounting of basketball hoops, the retrieval of dog droppings, the posting of for-sale signs, the trimming of bushes and the color of window curtains. [Regulations] exist mandating that any doghouse must be made of the same material as the master house (either wood or brick) and hidden from view by a six-foot fence or prescribed greenery. Rules exist to prohibit wok cooking, compel 'poorly dressed guests' to ride in service elevators and ban those wearing 'flip-flops' from sitting in common-area chairs.¹¹

She chronicles the conflict and litigation that often resulted from disagreements between neighbors and between residents and the association.

This was illustrated by conflicts that developed in the exclusive enclave of Edgewater Point on a spit of land called Satanstoe on Long Island.¹² One owner replaced a wooden pier with a \$2,500 cement one. This angered one neighbor. This dispute "expanded to include everything from the placement of trash cans in the neighborhood to whether one's in-laws can live in the community."

Hundreds of thousands of dollars and a dozen or so lawsuits later the dispute continued and expanded to include allegations that garbage sheds and outbuildings violated local building rules.

The creating of a CIC through detailed regulations may not achieve its objectives.

⁹Comment, 21 UCLA L.Rev. 1655 (1974).

¹⁰Much of this draws upon the work of Professor Paula A. Franzese in *Does It Take a Village? Privatization, Patterns of Restrictiveness and the Demise of Community*, 47 Vill.L.Rev. 553 (2002).

¹¹Supra note 10 at 555-556 (footnotes omitted).

¹²Mr. Millstein's Backyard Brawl—Weil Gotshal Partner Tried to Broker Peace Among His Neighbors but Got Burned," *Wall Street Journal*, June 20, 2000, p. C-1.

Returning to restrictive covenants, they have begun to deal with aesthetic and architectural aspects of a development. In *Hanson v. Salishan Properties, Inc.*,¹³ leases for beachfront lots contained provisions dealing with design aspects that affected the view of others in the development. In addition to being required to comply with specific covenants set forth in the lease relating to these matters, tenants were referred to an architectural checklist drafted by the architectural committee that set forth general concepts relating to aesthetics and view for the development. The lease required that plans be approved by the architectural committee.

A tenant submitted preliminary plans for a home that were approved by the architectural committee. Some upland tenants sought an injunction against construction of the home that they claimed violated the restrictive covenants. The Oregon court concluded that the committee acted properly and that its decision would not be disturbed. The court did not have to articulate standards for judicial review of decisions of architectural committees because the court concluded that the architectural committee's decision was correct.

The association or committee generally must act reasonably and in good faith. It must act in accordance with predetermined standards. If there are no predetermined standards, its decisions must be consistent with the standards set forth in the original declaration of restrictions and with existing neighborhood conditions.

Sometimes private restrictive covenants prohibit owners from modifying or changing the exterior in such a way as to detract from architectural harmony or historic tradition. For example, *Gaskin v. Harris*¹⁴ involved a restrictive covenant that required all exteriors to be Old Santa Fe or Pueblo-Spanish architecture. One homeowner wished to build a modern Oriental swimming pool, and other homeowners objected. New Mexico upheld the restrictive covenant despite the pool builder's claim that the pool had already been constructed and that the restrictive covenant was too vague to be enforceable.

Other techniques, though used less often, can soften some of the rigidity of restrictive covenants. A landowner burdened by a restrictive covenant can seek relief or may resist an injunction sought by other landowners

by showing that conditions have so changed that the servitude should be removed or modified. The court will not order an injunction if the conditions in the neighborhood have so changed that enforcement of the restrictive covenant would be unreasonable. Denying enforcement on the basis of changed conditions requires a showing that enforcing the covenant would harm the burdened land much more than nonenforcement would harm the other land in the development. Reasons for denial can include a significant increase in noise and traffic, the unsuitability of the burdened land for the restricted purpose, and rezoning of the land for a more permissive use.

Servitudes can be eliminated by agreement of all the affected landowners or occasionally by benefited landowners failing to seek judicial relief for past violations. The servitude can also be eliminated if a public agency takes the land for a use inconsistent with the restriction. This taking is accomplished by condemnation, and property owners that would have benefited by continued enforcement generally receive compensation from the agency that exercises the power of eminent domain.

Despite the proliferation of public land use controls, private restrictive covenants are still important. They are often the principal land use controls in many existing developments and are used in new developments to some degree as protection from the risks of zoning law changes.

SECTION 9.06 Development of Land: Expanded Public Role

In the individualistic system preceding restrictive covenants and after the development and enforcement of restrictive covenants, the law had a minimal and mainly passive role. Individual judgment and the free market predominated. The present dominant system of land use control has expanded the law's role. Today the state itself is the biggest player in deciding the permissible use of land.

It is essential to compare the passive approval of private restrictive covenants and the more active public developmental control to understand why the latter has dominated modern land use controls. The essentially political nature of public control is discussed in Sections 9.07 and 9.08.

¹³267 Or. 199, 515 P.2d 1325 (1973).

¹⁴82 N.M. 336, 481 P.2d 698 (1971).

Other differentiations exist between private restrictive covenants and public land use controls. The principal objective of restrictive covenants is to preserve property values and maintain the characteristics of the neighborhood. Although public land use controls take these factors into account, local authorities must also concern themselves with fiscal matters. Because property taxes have been the principal revenue-raising measure available to local authorities—at least until the taxpayer revolt against property taxes in the late 1970s—permitting industrial, commercial, or expensive residential use can increase the tax base and raise revenue.

Local authorities must furnish fire and police protection, educational facilities, and parks as well as water and sewage facilities. Local authorities are also responsible for the overall quality of life within and around the community. They must consider community-wide problems such as housing and crime. Public land use planning is more complicated and difficult than private controls.

Flexibility is another differentiating aspect of public land use controls. Although some flexibility is needed in private restrictive covenants, the private system emphasizes stability. In contrast, public controls must take into account and devise methods for dealing with the changes that occur at an astounding pace in urban life.

The developer thinks mainly of profits and creates restrictive covenants to sell lots or homes. The public planning process should marshal the best thinking of many disciplines to accomplish legitimate planning of objectives. One judge described the public planning process as bringing to bear on planning decisions “the insights and the learning of the philosopher, the city planner, the economist, the sociologist, the public health expert and all the other professions concerned with urban problems.”¹⁵ For these and other reasons, the passive role did not seem adequate. As a result, the government took primary responsibility for urban land development, which then became a political process.

Legislatures, both state and local, consist of people elected by and responsible to voters. The public land use control system that evolved in the twentieth century not only was representatively democratic but also often became directly democratic through decisions made by the voters themselves.

¹⁵*Udall v. Haas*, 21 N.Y.2d 463, 235 N.E.2d 897, 900, 288 N.Y.S.2d 888, 893 (1968).

SECTION 9.07 Limitations on Land Use Controls: Takings

The power to control public land use essentially belongs to each state. But exercise of state powers is limited because property rights have received special protection in the United States. Owners cannot be deprived of their property without due process of law. If public regulation has placed too great a limit on an owner’s right to use his land, such a limitation can constitute a “taking” of the property.

Takings can take two forms. There can be a physical taking. The state may use its powers of eminent domain and condemn, that is, take over the property. If it does, the Fifth Amendment of the U.S. Constitution requires that it pay compensation. The only issues in such physical takings are whether the “takeover” is for a public purpose and the value of the land taken.

The first, the requirement of a public purpose, presents no difficulty if the state appropriated the land for schools, roads, or parks. But increasingly, the state, particularly cities, seeks to take away land from one private person and hands it over to another who it believes will make better economic use of the land. When a city seeks to take away land from one private owner and give it to another, the city will contend this appropriation is made for a “public purpose.” In *Kelo v. City of New London, Connecticut*, the U.S. Supreme Court interpreted the term “public purpose” broadly to encompass the destruction of nonblighted private homes as part of a city’s economic development plan.¹⁶ A backlash to the decision by property rights activists has led to local proposals to restrict municipalities from engaging in similar economic development plans.¹⁷ Some state courts have rejected the premise, accepted in *Kelo*, that economic benefit alone satisfies the “public use” requirement.¹⁸

Most cases in the past involved physical takings. The more recent cases have involved regulatory takings. If the

state regulates the use of land in such a way as to deprive the owner of any significant use of his land, he may assert that the state has taken his land and must pay compensation. Essentially, these regulatory taking cases have been decided on a case-by-case basis, not by any fixed rules, but by an evaluation of the facts in the case. Because of the complexity of this subject, this section will look at illustrative cases of what constitutes a taking and some recent cases on temporary takings and whether that will give the owner a right to any compensation.

In 1992 the U.S. Supreme Court examined the issue of whether land use control or environmental rules have so reduced the value of the land to the owner that they constitute a taking under the Fifth and Fourteenth Amendments to the U.S. Constitution, entitling the landowner to just compensation. *Lucas v. South Carolina Coastal Council*¹⁹ involved lots on the Isle of Palms, east of Charleston, South Carolina. Although the beachfront had been a critical area since 1977 and subject to regulation, the lots were landward of the restricted area when Lucas bought them, and were zoned for development as residential home sites.

In 1988, pursuant to a new beachfront statute, construction of improvements, with some exceptions, was prohibited in such a way as to bar Lucas from developing his property. The statute was designed to protect life and property by creating a storm barrier that dissipates wave energy and contributes to shoreline stability, both to protect the tourist industry and to provide a habitat for plants and animals. Lucas conceded that the ban was necessary to protect life and property against serious harm but asserted that the new law had completely extinguished his property's value, entitling him to compensation. The trial court found that the ban had made Lucas's lots valueless, but the South Carolina Supreme Court reversed the determination.

By a five-member majority, the U.S. Supreme Court held that compensation would be required unless "A law or decree . . . do no more than duplicate the result that would have been achieved in the courts . . . under the State's law of private nuisance or by the State's power to abate a public nuisance."²⁰ The U.S. Court remanded the case to the South Carolina Supreme Court to determine what existing law permitted.

The U.S. Supreme Court in the *Lucas* case was criticized for its failure to articulate rules that would determine

whether there had been a taking. The implementation of its holding was somewhat clarified in *Reahard v. Lee County*,²¹ which involved the creation of open space (also discussed in Section 9.10H). As that section will show, public entities sometimes seek to preserve open space by barring any development of particular space. Reahard's parents had purchased 540 acres in 1944. During the mid-1970s, the family had subdivided, developed, and sold tracts of the parcel, retaining approximately forty acres. Reahard inherited the site in 1984 and sought to continue development for single-family homes. However, in December 1984 Lee County (Florida) classified the forty acres as part of a resource protection area, which limited the forty acres to a single residence or for uses of a "recreational, open space, or conservation nature."²²

Reahard filed a complaint, contending that this had been a taking, entitling him to compensation. Among the trial court's findings was one that simply stated that as a result of the adoption of the plan, there was "a substantial deprivation of the value" of Reahard's property, resulting in a taking.²³ The federal appellate court for the Eleventh Circuit initially noted the difficulty of determining whether a regulation "goes too far."²⁴ The court must determine whether the regulation has denied an owner economically viable use of his own property. To do so, the court must determine the economic impact of the regulation on the property owner and the extent to which the regulation has interfered with investment-backed expectations. The appellate court held that the trial court neither analyzed the factors nor set forth findings necessary for such analysis. A proper taking analysis, according to the appellate court, would address certain questions:

In this case, those questions are: (1) the history of the property—when was it purchased? How much land was purchased? Where was the land located? What was the nature of title? What was the composition of the land and how was it initially used? (2) the history of development—what was built on the property and by whom? How was it subdivided and to whom was it sold? What plats were filed? What roads were dedicated? (3) the history of zoning and regulation—how and when was the land classified? How was use proscribed? What changes in classifications occurred? (4) how did development

²⁴Id. at 1135.

change when title passed? (5) what is the present nature and extent of the property? (6) what were the reasonable expectations of the landowner under state common law? (7) what were the reasonable expectations of the neighboring landowners under state common law? and (8) perhaps most importantly, what was the diminution in the investment-backed expectations of the landowner, if any, after passage of the regulation?²⁵

The court then remanded the case to the trial court to address these issues and determine whether there had been a taking. Further analysis of these questions ended when the federal court of appeals, in a subsequent appeal following the remand, decided that the owner's remedy lay with the Florida courts and that the federal courts therefore lacked jurisdiction (or authority) to rule on the matter.²⁶

Regulators must consider whether the regulations proposed will constitute a taking. If so, enacting the regulations will be costly. Yet these standards still leave a considerable amount of room for regulators to enact land use and environmental controls.

The risks of the controls so diminishing the value of the property so as to constitute a "taking" have led to new techniques, such as transferable developmental rights, known as TDRs, a technique to be noted in Section 9.12. The operation of TDRs was before the U.S. Supreme Court in *Suitum v. Tahoe Regional Planning Authority*.²⁷

In the *Suitum* case the Tahoe Regional Planning Agency barred the development of *Suitum's* undeveloped land near Lake Tahoe to protect runoff into the watershed. But owners whose land was barred from development for environmental reasons could receive a TDR. Such rights make it easier to develop other undeveloped land. TDRs can be transferred. In effect, they have economic value. Granting TDRs to those who are not allowed to build on their land is designed to avoid the restriction being a "taking." (The majority held the case was "ripe" for adjudication but did not rule on the validity of the TDR method to avoid the control amounting to a "taking" entitling the owner to compensation.)

Lake Tahoe generated another important U.S. Supreme Court decision. This issue before the court in *Tahoe-Sierra*

*Preservation Council, Inc. v. Tahoe Regional Planning Agency*²⁸ was whether two moratoria totaling thirty-two months on any development in the Lake Tahoe basin (the dissent concluded that the land was tied up for almost six years) was a taking requiring that the landowners be compensated. The moratoria were to give the regional planning authority time to formulate a land use plan for the area.

The challengers claimed the taking question was governed by *Lucas v. South Carolina Coastal Council*²⁹ discussed earlier in this section. In the *Lucas* case the Court found there had been a total taking of *Lucas's* land. The challengers in the *Tahoe-Sierra* case asserted that the *Lucas* case established a categorical *per se* rule. If a regulation permanently denies the owner all productive use of an entire parcel, this is a taking. Even if this denial is temporary, as in the *Tahoe-Sierra* case, the owner must be compensated. Under a categorical *per se* rule, there is no inquiry into the owners' investment-backed expectations, the actual impact on the individual landowner, the importance of the public interest served by the regulation, or the reasons for the temporary restriction.³⁰

The Court, in a six-to-three opinion, rejected this contention. Instead, it chose to follow an *ad hoc* balancing approach used by the court in the *Penn Central* case.³¹ While the Court did not overrule the *Lucas* case, it limited the categorical *per se* rule announced there to extraordinary circumstances when no productive or economically beneficial use is permitted. This *ad hoc* balancing approach is illustrated by the *Reahard* case³² discussed earlier in this section.

The Court rejected the landowners' contention that the 32-month moratoria removed a segment of the landowner's fee simple (total ownership). If any use during such a segment is barred by the moratoria, there is a taking, claimed the landowners. The Court stated that the temporary nature of the restriction does not control the taking question one way or the other.³³ The Court thought thirty-two months a long time, but the trial court found that period reasonable, especially as the regional authority was considering a comprehensive plan for an environmentally sensitive area.³⁴

The case-by-case approach, the immense variety that regulation can take, and the different impact such regulation can have on land ownership means that “taking” questions will continue to be a complex, controversial area of constitutional law.³⁵

To avoid these complicated taking issues, most public control over land use is predicated on the police powers of the state to protect its citizens and the state’s concern for the general health, safety, and welfare of the community. To bring legislated land use controls within the police powers of the state, the state legislation stresses objectives such as reduced street congestion, better fire and police protection, and promotion of health and general welfare as the reasons for restricting land use.

SECTION 9.08 Local Land Use Control: The Process

Land use control was authorized by state enabling acts. They expressed goals in general terms and allowed local authorities to make specific rules and administer them. Generally, local authorities exercised this power. They enacted and administered ordinances to regulate land development. The traditional method for accomplishing this was to create districts in which only certain activities are permitted.

The enabling acts passed in the 1920s recognized that much of the work needed to create and administer public land use controls could not be done by the local legislative governing bodies. These bodies generally are composed of unpaid or modestly paid citizens elected to local legislative bodies. The elected officials would not have the time or expertise to actually draft and administer a development system.

The enabling acts allowed two agencies to be created to deal with these matters. A planning commission was authorized to draft a master plan and detailed ordinances. A board of adjustment was authorized to deal with appeals from decisions by the local administrator or public

officials. The structures, personnel, and names of these agencies varied considerably from locality to locality.

Members were generally given tenure for a specific number of years to insulate them from improper pressures. Beyond tenure requirements, localities varied in the attributes of such agencies. Compensation, qualifications, staff, and support largely depended on the size of the locality. Even in larger cities, however, members of planning commissions frequently were interested citizens who served without pay and often with minimal staff. The final local authority in enacting ordinances and appeals from decisions was usually vested in the local governing body such as the city council.

At this point and in other parts in this chapter, reference is made to the Model Land Development Code (MLDC),³⁶ a model enabling act approved in 1975 by the American Law Institute, a group of scholars, lawyers, and judges. The MLDC gives greater responsibility to the local development authority (LDA), the agency implementing and operating the development program. The code removed the local governing body, such as the city council, from decisions relating to specific development plan proposals and day-to-day operation of the system given to the LDA.

Development control is given to local authorities because land use is largely a local matter. Local decision makers are expected to be knowledgeable about the community and its needs and represent the people who will be most affected by the development rules. Should an increasingly interdependent urban society give such controls to often small political units? Insularity and unwillingness to take metropolitan social needs into account have led to increased demands for regional or statewide controls. The MLDC has recognized this, and certain provisions are designed to encourage increased activity by regional and statewide authorities.

In contrast, criticism has been made of control by governing bodies of large cities that can be insensitive to the needs of local neighborhoods. Although local neighborhoods were not given decision-making powers in the MLDC, neighborhood organizations were recognized and given greater stature.

The Copley Place project in Boston, a private project costing half a billion dollars, demonstrated the increased

³⁵*Lingle v. Chevron U.S.A. Inc.*, 544 U.S. 548 (2005) is the most recent Supreme Court takings case. It dealt with an attempt by Hawaii to limit the rent dealers paid Chevron to 15% of the dealer’s gross profits on gasoline sales and a similar cap on other sales. The Court held that a test used in many cases, “substantially advances legitimate state interests,” would no longer be used in takings cases. The Court stated that earlier takings cases would not be affected by its decision.

³⁶This will also be referred to as “the code.” This code is not law. It can be adopted in whole or in part by state legislatures. Sometimes such model codes have great influence; sometimes they are ignored.

activity of neighborhood groups in the 1970s. Before the state authorities would grant needed air rights over a freeway, they required the developer to negotiate agreements with surrounding neighborhoods. From 1977 to 1980, fifty public hearings were held with neighborhood groups representing a wide range of interests. Issues thrashed out related to the scale of the project and its effect on neighborhoods, traffic, parking, shadows, wind generation, and jobs. Such processes are repeated in many cities where large-scale development is proposed.

Land use legislation and administration engender controversy. Much of land value depends on use, and land can involve large economic stakes. Such decisions often polarize the community. Land use debates frequently feature clashes between those who favor growth and those who oppose it and between those who advocate the rights of landowners and those who champion social control through the political process. Land use controls can exclude certain people and activities (discussed in greater detail in Section 9.15). From a business vantage point, controls can restrict competition.

*Udall v. Haas*³⁷ illustrates some of these features. The municipality had enacted a building zoning ordinance that reclassified a landowner's property from business to residential. The new classification would have permitted only public and religious buildings and residences with a designated minimum size. The event that led to the rezoning appears to have been the submission to local authorities of a preliminary sketch for a bowling alley combined with either a supermarket or a discount house to be built on a vacant lot zoned for business use. The powerful economic effect of zoning on property value can be demonstrated by the observation made by the New York Court of Appeals that more than 60 percent of the value of the land, or over \$260,000, was wiped out by the rezoning. Describing the process by which the rezoning was accomplished as a "race to the statute books," the court invalidated the rezoning as not being in compliance with the master plan.

Although the basic power to regulate land use resides in local legislative bodies, citizens are given greater direct power over such decisions, a power used increasingly to limit growth. Sometimes local voters can use the initiative process. This is direct enactment of law by the voters. The process requires the filing of a designated

number of signatures—usually 5 percent to 25 percent of the voters—on petitions to place a proposed local ordinance on the ballot. Voters then determine whether the proposed ordinance will be adopted.

Sometimes after a local ordinance is passed by the local legislative body, direct voter power can be exercised by a referendum that submits the ordinance to the voters for review. The process can begin by presenting a petition with a designated number of voter signatures within a certain number of days after the passage of the challenged ordinance or permit decision. Typically, the petition must be filed before the effective date of the ordinance or permit. The petition compels the local governing body to repeal the ordinance, change its decision on the permit, or place the issue on the ballot for voter decision.

Both initiative and referendum can be costly and not likely to be undertaken unless stakes are high or citizens are greatly distressed with decisions made by their city council or board of supervisors.

Increasingly, attacks are made on land use controls as unconstitutional. See "takings" discussed in Section 9.07.

SECTION 9.09 Original Enabling Acts and Euclidean Zones: The MLDC

Most zoning enabling statutes passed in the 1920s dealt mainly with the physical characteristics of development. They tended to divide the territory of the municipality into districts of different contemplated uses. Each district was to have uniform regulations. This system was sometimes called Euclidean zoning after the U.S. Supreme Court case that first validated a zoning plan.³⁸ Euclidean zones required homogeneous use. Only particular uses were permitted in each district. For example, residential districts permitted only residences, commercial districts only commercial activities, and industrial districts only industrial activity. Major categories were further divided. For example, industry would be divided into heavy industry and light industry. Commercial use was divided into different categories. Residential use was divided into single-family homes, two-family homes, and multiple-family uses. Homogeneous districts were based on the assumption that differing uses within a district would harm property values.

³⁷Supra note 15.

³⁸*Village of Euclid v. Ambler Realty Co.*, 272 U.S. 365 (1926).

Some cities allow multiuse districts, or what is sometimes called *cumulative zoning*. For example, residences only might be permitted in the residential zones, but commercial zones would also permit residences and industrial zones would permit residential and commercial uses as well.

In addition to creating districts of permitted use, the enabling acts of the 1920s regulated matters such as height, bulk, and setback lines. Rigid patterns of land and development were assumed. Single homes were to be placed on gridlike lots.

The assumption of most early enabling acts was that landowners could develop their land as they wished provided they did not contravene specific restrictions expressed in the ordinances. The statutes authorized but did not compel the local authority to control development decisions. There was no exhortation or incentive to owners to undertake desirable development. The statutes expressed prohibitions designed to avoid undesirable development.

The original enabling acts were relatively indifferent to the effect of no or poor local planning on areas outside the municipality. Local public interest dominated.

Much has changed since the 1920s, and the development of the MLDC was a response to such changes. The code seeks to go beyond simply prohibiting poor planning and establish guidelines for desirable planning. The code recognizes the need for regional and statewide planning. It seeks to develop flexibility and new planning methods (discussed in Section 9.10) to replace the rigid district techniques of the original enabling statutes. The code more openly recognized aesthetics, environmental problems, and the preservation of historical sites as proper planning and developmental factors (discussed in Sections 9.11, 9.12, and 9.13).

SECTION 9.10 Flexibility: Old Tools and New Ones

As stated in the preceding section, the controls of early zoning rarely went beyond height, bulk, and setback regulations. But the ugly, inefficient, and expensive explosion of urban sprawl just before and after World War II compelled planners to find methods to improve the quality of urban life. Planners were asked to enact land use controls that would create and preserve a healthy, aesthetic community with proper regard for the finite quality of resources and the historical patrimony of the community. This and the following two sections deal with traditional

and new methods to accomplish these more ambitious objectives.

A. Variances and Special Use Permits

A variance permits the parcel of land to be used otherwise than prescribed in the zoning ordinance. Issuance requires the landowner to meet requirements that will appear in the cases discussed later in this subsection. Usually the landowner asserts that the use permitted by the ordinance was not economically feasible and this would cause great hardship.

Zoning ordinances often allow permits to be issued for a special use. These permits can be issued by the local land development authority only if the special uses are set forth in the ordinance. Sometimes the zoning ordinances spell out specific uses that can justify the issuance of a special use permit. Sometimes the standards for issuing these permits are described in general terms.

Ordinances often distinguish use and area variances. To avoid an unconstitutional confiscatory ordinance, use variances are given if the land as zoned cannot yield a reasonable return. But because a use variance is a more drastic disruption of planning, a stronger burden is placed on the landowner who seeks a use variance than where an area variance is sought.

B. Nonconforming Uses

Although not considered a technique for avoiding the overrigidity of the Euclidean grid, the nonconforming use has had that effect. Most zoning enactments created carefully segregated districts, but the cities on which these grids were to be imposed did not follow such a neat arrangement. Junkyards existed in residential or shopping areas. Stores were found in residential areas and factories next to retail sales stores. To ensure similarity of use within districts, early planners sought to eliminate nonconforming uses. Although planners felt that police powers of the state could justify elimination of existing uses as well as prohibition of future uses, the political process dictated that the two be treated differently. To avoid entire zoning plans being turned down by local governing bodies, a system for protecting existing lawful uses was developed.

At first rules were adopted based on the hope that time would eliminate nonconforming uses. These rules precluded nonconforming uses from being changed. Nonconforming

structures could not be altered, repaired, or restored, and a use could not be reinstated after it had been abandoned. Implementing these rules was difficult. Defining a nonconforming use was not easy. Things became more complex when courts sought to differentiate a nonconforming use in a conforming building, from a nonconforming use in a nonconforming building.

In any event, nonconforming uses did not wither away. Permission for a nonconforming use created a monopoly, such as a small grocery store in a residential neighborhood. The next attack was to enact amortization ordinances ordering nonconforming uses to cease after a period of time during which the nonconforming user could recover its investment. Amortization periods ranged from one year for billboards to twenty-five years for gas stations to from fifty to sixty years for substantial buildings.

Although courts generally enforced amortization ordinances, judicial opinions expressed skepticism about the fairness of such ordinances. Research revealed a patchwork quilt created by variances and special use permits rather than homogeneity of uses. Some expressed doubt regarding the desirability of homogeneous zones. As a result of these factors, elimination of nonconforming uses by amortization looked less attractive. Put another way, can there really be nonconforming uses in an urban environment that essentially was nonconformist?

C. Rezoning

The only alternatives for a landowner who cannot meet the often stringent requirements for a variance and who does not wish or is not able to obtain a conditional use permit is to seek rezoning. Rezoning can cause a hardship to the neighboring property owners, and under rigid Euclidean theory, an all-or-nothing choice must be made between the landowner and the neighboring property owners. As to conditions for rezoning, see Section 9.10D.

D. Contract and Conditional Zoning

Some have proposed increased use of contract or conditional zoning. Suppose the developer wishes to build a shopping center. The governing body or administrative agency can rezone the land or issue a permit. Contract zoning allows the governing body to obtain in exchange for its action the applicant's promise to do certain things. In conditional zoning or issuance of a special permit, the effectiveness of rezoning or the permit is conditional

on the applicant's doing certain things required by local authorities. The promised acts or conditions can deal with noise abatement, traffic control, setback lines, erection of fences, or any other devices to enable the center to blend into the surrounding neighborhood. As an alternative to making promises to do these things, the developer can promise to pay to have these designated things done by the local authority.

Currently, conditions for approval of a large-scale project such as a mixed-use development or a high-rise office building may include protection of historic views, employment preferences to local citizens and minorities, inclusion of low-income housing units or subsidy for them elsewhere, or a promise of child care facilities at the proposed project or elsewhere.

Although contract or conditional zoning gives flexibility, courts have divided as to its validity. Contract zoning is especially vulnerable to attack, because it appears the lawmaking power is being traded away. As a result, conditional zoning is more likely to be the method selected.

As to development conditions, the U.S. Supreme Court requires that the condition be directly related to a detrimental aspect of the project and that it must substantially advance a legitimate state interest.³⁹ This ruling has raised concern among city planners that cities could be liable for monetary damages to developers if they impose conditions that the court subsequently finds to have no substantial connection to the burdens caused by the development project. Other recent cases have passed judgment on this "connection" issue. *Dolan v. City of Tigard* involved approval of an owner's plan to expand her store and pave her parking lot conditioned on her dedicating some of her land for a public greenway and for a pedestrian/bicycle pathway.⁴⁰ *Ehrlich v. City of Culver City* involved imposing a mitigation fee as a condition to rezone a private tennis club and recreational facility to permit construction of a condominium project. The fee would be to provide recreation facilities and to provide for art in public places.⁴¹ *Town of Flower Mound v. Stafford Estates Ltd. Partnership*

³⁹*Nollan v. California Coastal Commission*, 483 U.S. 825 (1987) (California Coastal Commission granted a permit to an owner of a beachfront lot with a small house on it to build a larger house on condition the owner allowed the public an easement to pass across its beach, which was located between two beaches: action of commission constituted a "taking," permit condition struck).

⁴⁰512 U.S. 374 (1994) (required dedication an unconstitutional taking.)

⁴¹12 Cal.4th 854, 911 P.2d 429, 50 Cal.Rptr.2d 242, cert. denied, 519 U.S. 929 (1996) (art exaction upheld but not recreation fund fee).

involved requiring a builder of a housing development to destroy a functioning, asphalt abutting road and rebuild it as a concrete road.⁴²

Section 2-103 of the MLDC allows the imposition of conditions for issuing a special development permit. These conditions can include the requirement that the developer set up mechanisms for future maintenance of the property, such as a homeowner association.

E. Floating Zones

Floating zones provide flexibility within fixed ones. The boundaries of such districts are not determined by ordinance but are fixed by approval of a petition by a property owner to develop a specific tract for a specifically designated use.

F. Bonus Zoning

The developer may claim its apartment has special features that justify an area variance. In some cities, a developer can receive dispensation from normal development requirements by providing bonus features. For example, in 1971, the Bankers Trust Building in New York City was given certain planning dispensations in tower height and floor area in exchange for including a large, elevated open plaza with desirable architectural features and a two-level covered arcade of shops. The bonus features were attractive to the developer not only because it could get dispensation mainly in floor area but also because those features provided amenities that could make the project more attractive to tenants and obtain a higher rental.

G. Planned Unit Development

The gridlike Euclidean zoning, with its emphasis on individual lots, is inappropriate for planning large developments on unimproved land. Section 2-211 of the MLDC authorizes the designation of specialized planned areas in which development will be permitted only in accordance with a plan of development for the entire area. The drafters of the code contemplated relatively undeveloped land where local planners anticipate some development in the

future but wish to discourage small scattered uncontrolled developments. The designation can also be applied to urban areas anticipating major development.

If a specially planned area has been designated, no development can take place until the local development agency adopts a precise plan for the area, which may include street locations, utilities, dimensions and grading of parcels, and siting of structures as well as the location and characteristics of permissible types of development. Developers owning land in the area can obtain a development permit if their development is consistent with the plan specified in the planned area ordinance.

H. Open Space

Various techniques have evolved to preserve open space. Greenbelts, developed in England, are buffer zones of open space between developed areas. Cluster zoning allows more than concentrated density, usually in the form of high-rise multiple dwellings, in exchange for commonly used open space. The overall density does not exceed density limits.

A Seattle greenbelt ordinance constituted a taking (later overruled) of private property without just compensation, violating the Washington constitution and the Fifth Amendment of the U.S. Constitution. The ordinance deprived landowners of all profitable use of a substantial portion of their land. Under the ordinance, 50 percent to 70 percent of greenbelt zone lots had to be preserved in or returned to a natural state. The owner of a lot located within the greenbelt zone could not make any profitable use of that portion of land required to be preserved under the ordinance.⁴³

For a decision involving an attempt to create open space, refer to *Reahard v. Lee County*,⁴⁴ discussed in Section 9.07. The *Reahard* case noted the desire on the part of local authorities to limit land development and to preserve open space, often at the expense of property owners. As in many of these taking cases, the issue is whether the loss in value should be borne by the property owner or whether the city should exercise its power of eminent domain and pay just compensation. What cannot be

⁴²135 S.W.3d 620 (Tex.2004) (rebuilding road using concrete was not proportionate to the town's legitimate interests and so was an unconstitutional taking).

⁴³*Allingham v. City of Seattle*, 109 Wash.2d 947, 749 P.2d 160 (1988). Overruled by *Presbytery of Seattle v. King County*, 114 Wash.2d 320, 787 P.2d 907 (1980) (holding that barring use of part of a parcel was not a "taking"), cert. denied, 498 U.S. 911 (1990).

⁴⁴Supra note 21.

ignored, however, is the potential impact that a requirement of just compensation would place on environmental protection.

SECTION 9.11 Aesthetics and Control

Early in the history of public land use control, doubts existed as to the constitutionality of limits on property rights designed to create a more aesthetic and pleasing environment. Police powers could be used to restrict development property rights to protect public health, safety, and welfare. But could property rights be limited to accomplish aesthetic objectives?

Berman v. Parker, a 1954 decision of the U.S. Supreme Court that upheld an urban redevelopment program, ended any doubt over the validity of regulation designed to create a more aesthetically pleasing environment. Although aesthetics were not directly involved, the opinion included language that was later used to justify aesthetics as a land use control objective: "It is within the power of the legislature to determine that the community should be beautiful as well as healthy, spacious as well as clean, well-balanced as well as carefully patrolled."⁴⁵ In residential developments, regulations have been enacted to promote uniformity by specifying certain design requirements, such as attached garages, two-level houses, or styles of exteriors. Sometimes ordinances sought to avoid subdivision monotony by prohibiting a house from looking too much like the surrounding houses.

An ordinance passed by the Village of Olympia Fields, Illinois, combined both uniformity and nonuniformity by requiring that a permit would not be issued in the case of a design that was excessively similar, dissimilar, or inappropriate in relation to nearby property.⁴⁶

An increasing number of cities have sought to protect views from developers' projects. Illustrations of views protected have been Seattle's nearby bay and mountains, the state capitol in Austin, Texas, the rolling hills outside Cincinnati, the view of the Capitol in Washington, D.C., and the view of the Rocky Mountains from downtown

⁴⁵348 U.S. 26, 33 (1954).

⁴⁶The ordinance was found to be invalid as an improper delegation of decision making to the architectural advisory committee without providing adequate standards. See *Pacesetter Homes, Inc. v. Village of Olympia Fields*, 104 Ill.App.2d 218, 244 N.E.2d 369 (1968).

Denver.⁴⁷ But the Scottsdale, Arizona, attempt to ban building from a nearby mountain partly within the city was successfully challenged.⁴⁸

SECTION 9.12 Historic and Landmark Preservation

National concern has been increasing over the destruction of historically significant buildings. A survey of historic buildings made in 1933 included 12,000 buildings. By 1970, over half had been razed. The pressure to demolish or substantially alter historic structures is especially strong in fast-changing urban areas. The response has been activity at every governmental level, but especially at the local level of government.

The principal steps taken have been to survey historic landmarks, create historic preservation districts, acquire ownership of historically significant structures or easements over their facades, and grant tax concessions to owners who will preserve the historic character of their structures. Illustrations of historic district designations are Vieux Carré in the city of New Orleans;⁴⁹ a four-block area surrounding the Lincoln house in Springfield, Illinois;⁵⁰ and the Old Town district of San Diego, California.⁵¹

In addition to creating historic districts, some local entities have designated specific buildings as historic landmarks despite the possibility that the designation could be considered spot zoning. Illustrations of buildings that could justify such a designation are New York City's Grand Central Terminal;⁵² Lincoln's home in Springfield, Illinois; and Monticello, Jefferson's home outside Charlottesville, Virginia.

⁴⁷Upheld in *Landmark Land Co., Inc. v. City and County of Denver*, 728 P.2d 1281 (Colo.1986), appeal dismissed sub nom. *Harsh Inv. Corp. v. City and County of Denver*, 483 U.S. 1001 (1987).

⁴⁸*Corrigan v. City of Scottsdale*, 149 Ariz. 538, 720 P.2d 513 (1986) (owner entitled to damages as well as invalidation of ordinance), cert. denied, 479 U.S. 986 (1986).

⁴⁹Upheld in *Maher v. City of New Orleans*, 516 F.2d 1051 (5th Cir.1975), cert. denied, 426 U.S. 905 (1976).

⁵⁰Upheld in *Rebman v. City of Springfield*, 111 Ill.App.2d 430, 250 N.E.2d 282 (1969).

⁵¹Upheld in *Bohannon v. City of San Diego*, 30 Cal.App.3d 416, 106 Cal.Rptr. 333 (1973).

⁵²Upheld in *Penn Central Transp. Co. v. New York City*, 438 U.S. 104 (1978).

Designation usually means that the landowner may not demolish or alter the existing structure. To alleviate possible hardship from such limitations, the ordinances can provide that the owner is expected to realize at least a designated return on the property. If the designation proves an economic hardship because of a lower return, a commission is given discretion to ease the hardship by rebating the real estate tax or the commission is afforded the additional right of producing a buyer or lessee who can profitably use the premises without the sought-for alteration or demolition. If these remedies prove unrealistic or unobtainable, the city is given the power to condemn the property.

The most serious constitutional attack on ordinances creating historical districts or designating landmark buildings has been the claim by the landowner that the use limitation created by the ordinance or designation violates the constitutional prohibition against taking private property without paying just compensation. If the action by local authorities is considered a taking, the owner must be compensated. Because compensation can be costly, especially at a time when local government faces continuing fiscal problems, ordinances and designations are usually based on the police powers. Courts have been hesitant to consider anything short of actual appropriation to be a taking as long as the law can be justified as an exercise of police powers.

Yet the Pennsylvania Supreme Court, in *United Artists Theatre Circuit, Inc. v. City of Philadelphia*,⁵³ showed some dissatisfaction with the flexibility given public entities to designate a particular building as historic. The Boyd Theater had been designated historic because it was an example of art deco architecture, was done by an important architectural firm, and “represent[ed] a significant phase in American cultural history and in the history of Philadelphia.”⁵⁴ The four-judge majority of the court asked whether the cost of designation—that is, the reduction in the property owner’s value—should be borne by all taxpayers or by the owner. This particular ordinance, according to the court, would prohibit any change except painting or papering—including even the moving of a mirror from one wall to another—without a permit. The majority held that this constituted an unconstitutional taking under the Pennsylvania Constitution. Three concurring judges would

have focused attention on the radical nature of the ordinance and would have limited the ordinance to requiring a permit only for changes to the exterior and to the interior only if they affected the exterior.

After the case was reargued, the court held that designation of a historic building without the owner’s consent was not a taking; the court followed the decision of the U.S. Supreme Court in the *Penn Central* case.⁵⁵ But the court held that the Philadelphia Historic Commission acted outside its statutory authority when it designated the interior of the Boyd theatre as “historic”. The case does reflect concern that the power to declare property as historic can be abused.

A method of relieving against the hardship of placing the entire burden on the owner of the landmark building has been the development in New York City of transferable development rights (TDRs) as a means of preserving historic buildings without incurring the high cost of condemnation. Under this plan, a landmark owner who is prevented from using its property to its full permitted use, such as the maximum floor area ratio permitted by law, is compensated by being given a transferable developmental right for a specific transfer district. The developmental right equals the excess potential the landowner was precluded from using because its building had been designated a historical landmark. The landowner can use this excess potential in the transfer district building even if it exceeds normal density limits for the building. An owner who does not wish to use the development right can transfer it. See Section 9.07 for discussion of this method to protect Lake Tahoe.

SECTION 9.13 The Environmental Movement and Owner Liability

During the late 1960s, the American public began to demand that government make strong efforts to protect the natural environment. The goals of the environmental movement are evident in the preamble of the National Environmental Policy Act (NEPA),⁵⁶ enacted by Congress in 1969:

The Congress, recognizing the profound impact of man’s activity on the interrelations of all components of the natural environment, particularly the profound influences of popula-

⁵³528 Pa. 12, 595 A.2d 6 (1991).

⁵⁴595 A.2d at 8.

⁵⁵535 Pa. 370, 635 A.2d 612 (1993).

⁵⁶42 U.S.C.A. §§ 4321–4375.

tion growth, high-density urbanization, industrial expansion, resource exploitation, and new and expanding technological advances and recognizing further the critical importance of restoring and maintaining environmental quality to the overall welfare and development of man, declares that it is the continuing policy of the Federal Government, in cooperation with State and local governments, and other concerned public and private organizations, to use all practicable means and measures, including financial and technical assistance, in a manner calculated to foster and promote the general welfare, to create and maintain conditions under which man and nature can exist in productive harmony, and fulfill the social, economic, and other requirements of present and future generations of Americans.⁵⁷

The strength of this movement has led Congress to enact several key pieces of environmental legislation, including the Clean Air Act,⁵⁸ the Clean Water Act,⁵⁹ the Resource Conservation and Recovery Act (RCRA),⁶⁰ and the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA).⁶¹ Although these laws provide much-needed protection of our natural resources, they also create significant obligations and liabilities for landowners and developers.

Given their complexity, it would be impractical—if not impossible—to provide a comprehensive discussion of environmental laws and regulations. The following statutes provide insight into the kinds of obligations and liabilities that environmental laws impose on owners and developers.⁶²

A. National Environmental Policy Act (NEPA)

NEPA is a broad-based environmental statute that imposes continuing responsibility on the federal government “to improve and coordinate Federal plans, functions, programs, and resources” to protect the natural and human

environment.⁶³ As a means to that end, Section 102 of NEPA requires all federal agencies to

include in every recommendation or report on proposals for legislation and other major Federal actions significantly affecting the quality of the human environment, a detailed statement by the responsible official on—

- (i) the environmental impact of the proposed action;
- (ii) any adverse environmental effects which cannot be avoided should the proposal be implemented;
- (iii) alternatives to the proposed action;
- (iv) the relationship between local short-term uses of man’s environment and the maintenance and enhancement of long-term productivity; and
- (v) any irreversible and irretrievable commitments of resources which would be involved in the proposed action should it be implemented.⁶⁴

This detailed statement—commonly known as an environmental impact statement (EIS)—must be made available to the public, the president, and the Council on Environmental Quality and must accompany the proposal through the agency review process.⁶⁵

An owner or developer making a proposal that requires approval by a federal agency faces a number of potential hurdles under NEPA. First, to determine whether the action will “significantly” affect the environment, the appropriate federal agency typically prepares a shortened EIS—commonly known as an environmental assessment (EA). If the agency determines that the proposed action will not significantly affect the environment, the project may proceed without a full-scale EIS. Citizens’ groups or other parties may, however, challenge the agency’s determination, thereby delaying the project.

Second, if the agency determines that the proposed action *will* significantly affect the environment, the owner or developer must await completion of a comprehensive EIS. The EIS process can be extremely costly and time consuming. Moreover, once the EIS is completed, the federal agency may decide to cancel or significantly alter the proposed action. In addition, if the agency decides to proceed with the action as proposed, citizens’ groups or other parties may once again challenge the decision in court.

⁵⁷Id. § 4331(a).

⁵⁸42 U.S.C.A. §§ 7401–7671q (also known as the Federal Air Pollution and Control Act).

⁵⁹33 U.S.C.A. §§ 1251–1387 (also known as the Federal Water Pollution and Control Act).

⁶⁰42 U.S.C.A. §§ 6901–6992k, amending the Solid Waste Disposal Act.

⁶¹42 U.S.C.A. §§ 9601–9675.

⁶²For a comprehensive survey of environmental risks facing contractors, see P. BRUNER & P. O’CONNOR, JR., BRUNER & O’CONNOR ON CONSTRUCTION LAW, §§ 7:89–:105 (1992).

⁶³42 U.S.C.A. § 4331(b).

⁶⁴Id. § 4332(C).

⁶⁵Id.

Since its enactment in 1969, NEPA has created considerable litigation; still, very few projects have been enjoined under the statute. When agency determinations are challenged, courts usually extend great deference to agencies, based on the latter's expertise and experience. Therefore, the most significant burden of NEPA appears to be the time and expense of preparing the EA and EIS.

B. Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA)

Overview of Statute. CERCLA, commonly known as Superfund, governs the cleanup of hazardous waste sites. Sections 104 and 106 of CERCLA give the federal government broad power to clean up contaminated sites. Under Section 104, the president is authorized to take removal and remediation action whenever

- (A) any hazardous substance is released or there is a substantial threat of such a release into the environment, or
- (B) there is a release or substantial threat of release into the environment of any pollutant or contaminant which may present an imminent and substantial danger to the public health or welfare.⁶⁶

Similarly, under Section 106, the president is authorized to “require the Attorney General of the United States to secure such relief as may be necessary to abate such danger or threat” and to “take other action . . . as may be necessary to protect public health and welfare and the environment.”⁶⁷

Section 107 of CERCLA imposes liability on four categories of “potentially responsible parties” (also known as PRPs):

- (1) the owner and operator of a vessel or a facility,
- (2) any person who at the time of disposal of any hazardous substance owned or operated any facility at which such hazardous substances were disposed of,
- (3) any person who by contract, agreement, or otherwise arranged for disposal or treatment . . . of hazardous substances . . . and
- (4) any person who accepts or accepted any hazardous substances for transport to disposal or treatment facilities, incineration vessels or sites selected by such person, from

which there is a release, or a threatened release which causes the incurrence of response costs, of a hazardous substance. . . .⁶⁸

Courts have interpreted these categories to make up a broad range of parties. For example, the first category of PRPs—owner and operator—has been held to include “current owners and operators of a facility . . . bankruptcy estates, absent landowners/lessors, lessees, foreclosing banks, corporate officers, parents, and successors.”⁶⁹ As potentially liable parties, owners and developers should be aware of any hazardous substances that may exist on their property.

The costs of liability under CERCLA can be extremely high. Potentially responsible parties are liable for the removal or remedial costs incurred by the federal government, other necessary response costs, damages for injury to or destruction or loss of natural resources, and the costs of certain health assessments.⁷⁰ In addition, parties who fail to provide for proper removal or remedial action may be liable for punitive damages of up to three times the amount of costs incurred by the federal government as a result of such failure.⁷¹ Moreover, parties may be subject to costly civil and criminal penalties for violating CERCLA's notification, recordkeeping, or financial responsibility requirements and for violating or refusing to obey settlement agreements, administrative orders, consent decrees, or interagency agreements.⁷²

CERCLA provides few defenses to liability. The statutory defenses—an act of God, an act of war, and certain acts or omissions of a third party other than an employee or agent⁷³—are very narrowly interpreted. Liability is both joint and several, and traditional notions of causation carry little weight in CERCLA case law. Consequently, even *de minimis* (very little) contributors may be held liable for the entire cost of cleaning up a hazardous waste site. Moreover, because liability is strict and retroactive, “liability attaches regardless of the time when the material was deposited.”⁷⁴

⁶⁸42 U.S.C.A. § 9607(a).

⁶⁹McSlarrow et al., *A Decade of Superfund Litigation: CERCLA Case Law from 1981–1991*, Environmental Law Reporter 10367, 10390 (1991).

⁷⁰42 U.S.C.A. § 9607(a).

⁷¹Id. § 9607(c)(3).

⁷²Id. § 9609.

⁷³Id. § 9607(b).

⁶⁶42 U.S.C.A. § 9604(a).

⁶⁷Id. § 9606(a).

May a PRP who remediates a site seek to recoup those costs from other PRPs? Under the Superfund Amendments and Reauthorization Act of 1986, which amended CERCLA, a PRP who is subject to a civil action under Section 106 has a right of contribution against other PRPs.⁷⁵ Under CERCLA itself, a PRP who voluntarily remediates the site may seek to recoup those expenses from other PRPs.⁷⁶

Construction Industry Participants. The wide-ranging scope of CERCLA's strict liability has ensnared prime contractors who unknowingly worked on contaminated land. In a 1992 decision, a federal appeals court ruled that an excavating and grading contractor, who quite unknowingly moved some contaminated soils in the course of his work and who stopped work as soon as he noticed something amiss, was nevertheless a responsible party under CERCLA. Liability was imposed because the contractor was found to be both a "transporter" of hazardous substances and as an "operator" of a facility (the construction site), and his dispersal of the contaminated soil was a "disposal" within the meaning of the statute.⁷⁷

In contrast, design professionals have not been found to be PRPs because they lack control over actual disposal or movement of the hazardous materials. For example, an architect who designed a wood treatment plant that released hazardous wastes when operated, was found not to be a responsible party.⁷⁸ Another court found that a consulting engineer, who provided not only the design, but also substantial technical assistance during the construction phase, still lacked the requisite control to merit PRP status.⁷⁹

Insurance Coverage. Are owners and developers, compelled to perform cleanup under CERCLA entitled to

coverage (reimbursement) of those costs under their commercial general liability (CGL) policies? Under these policies, the insurer generally provides coverage for "all sums which [the insured] shall become legally obligated to pay as damages because of . . . property damage to which this policy applies." [Ed.: Italics added.] Owners and developers, who were ordered by the EPA or equivalent state agencies to clean up hazardous wastes, sought coverage under their CGL policies. Insurers denied coverage, claiming that their insured's cleanup costs were not "damages" within the meaning of the policy. In a leading 1990 decision, the California Supreme Court, in *AUI Insurance Company v. Superior Court*, ruled that the costs of complying with a government remediation order are "damages" within the meaning of CGL policies.⁸⁰ This ruling has been universally adopted.

Must policyholders wait to be sued by the EPA to obtain coverage? The question here is whether an owner's or developer's voluntary remediation cost are "sums . . . legally obligated to pay as damages" within the meaning of the policy. Limiting the term "damages" to money that a court orders an insured to pay, the California Supreme Court found no coverage in this situation.⁸¹ However, most states have held that an owner or developer, who receives a PRP letter from the EPA⁸² and in response undertakes cleanup efforts, is entitled to coverage under their CGL policies. In *Johnson Controls, Inc. v. Employers Insurance of Wausau*, the Wisconsin Supreme Court explained why receipt of an EPA letter marks the beginning of an adversarial relationship between the insured and the EPA, in effect exposing the insured to liability for "damages" within the meaning of the policy:

PRP notice letters expose an insured to agency action that is not inconsequential to its liability interests. In this case, if Johnson Controls had refused to respond to these letters and refused to become involved in remediation efforts with the EPA or comparable state agencies, then, inevitably, the cleanup and remediation work would have been done by the EPA, the state agencies, or by settling responsible parties, any of whom could have sued Johnson Controls for

⁸¹*Certain Underwriters at Lloyd's of London v. Superior Court (Powerine Oil Co.)*, 24 Cal.4th 945, 16 P.3d 94, 103 Cal.Rptr.2d 672 (2001).

⁸²A PRP letter is a letter issued by the EPA notifying the recipient that the EPA considers it to be a potentially responsible party for contamination at a given site. 42 U.S.C.A. § 9622(e).

its share of the costs. PRP letters, which are more analogous to a civil complaint than a traditional demand letter, alerted Johnson Controls that the EPA had begun a legal process to conclusively and legally determine the appropriate “response activities” that liable parties must perform or pay for to abate the pollution at the sites in question. [Citation omitted.]

This is why many courts have concluded that a PRP letter is so adversarial that it constitutes the functional equivalent of a suit and triggers the insurer’s duty to defend. In the absence of such a conclusion, the insured has a perverse incentive not to cooperate with government remedial actions until the EPA or a state agency files a civil action in court “to force the insured’s compliance with CERCLA.” [Citation omitted.] Deliberate non-compliance for the purpose of obtaining a defense from the insurer is completely contrary to public policy.⁸³

Brownfields. CERCLA’s onerous liability provisions had the unintended effect of causing developers to shy away from potentially contaminated urban sites—popularly called “brownfields”—opting instead to pursue unpolluted green space at the outskirts of towns and cities. In response, CERCLA was amended through passage of the Small Business Liability Relief and Brownfields Revitalization Act of 2001, also known as the Brownfields Act.⁸⁴ The Brownfields Act seeks to promote development of these urban sites by creating defenses (“safe harbors”) to CERCLA’s strict liability.

Three significant safe harbors exist: for innocent owners, for contiguous (neighboring) owners, and for prospective purchasers. Under the first safe harbor provision, an owner will be exempted from CERCLA’s joint and several liability scheme if it acquired the land not knowing it was polluted, even after having conducted an appropriate inquiry into its history.⁸⁵ The contiguous owner defense applies to owners and developers of property that is adjacent to contaminated land. It protects these persons from responsibility for contamination that was not originally on the property, but rather migrated there from another contaminated site.⁸⁶ Both innocent

owners and contiguous owners, in order to partake of the safe harbor provisions, must cooperate with EPA cleanup programs, including granting access to the land.

The final safe harbor provision seeks to exempt future purchasers of contaminated property so long as they do not hinder existing or future cleanup operations. This bona fide prospective purchaser defense does not require the purchaser to be unaware of the contamination in the same way that the innocent owner and contiguous owner defenses do.⁸⁷ Moreover, a prospective purchaser who discovers contamination during its due diligence inquiry remains protected so long as it does not hinder any EPA cleanup response.⁸⁸ By allowing a prospective purchaser to develop a contaminated site without threat of CERCLA liability, this final safe harbor provision may do the most to stimulate brownfield development.⁸⁹

C. Resource Conservation and Recovery Act (RCRA)

Enacted as amendments to the Solid Waste Disposal Act of 1965, RCRA regulates solid waste—primarily hazardous solid waste—“from cradle to grave” (from generation to disposal). RCRA provides specific, albeit confusing, definitions of solid waste⁹⁰ and hazardous waste.⁹¹ RCRA directs the EPA to promulgate regulations for these hazardous wastes but provides exemptions for domestic sewage, legal source point discharges, irrigation return flows, and other potentially hazardous materials.

RCRA regulates three categories of hazardous waste handlers: (1) generators, (2) transporters, and (3) owners and operators of treatment, storage, and disposal (TSD) facilities. Hazardous waste generators are required to keep accurate records, store the waste in particular containers, label the waste in a specific manner, provide information about the waste and its characteristics, and use a manifest system to track the hazardous waste until it is delivered to a TSD facility. Similarly, transporters are required to ensure that the manifest system is accurate, that spills are minimized and properly handled, and that hazardous wastes are not mixed or stored in violation of RCRA.

⁸⁴ Public Law No. 107-118, H.R. 2869 (2002), codified at 42 U.S.C.A. § 9601 et seq.

⁸⁵42 U.S.C.A. § 9601(35).

⁸⁶42 U.S.C.A. § 9607(q).

⁸⁷42 U.S.C.A. § 9601(40).

⁸⁸42 U.S.C.A. § 9607(r)(1).

⁸⁹Vanderberg, *The Brownfields Revitalization Act of 2001: New Hope for Urban Development*, 23 Constr. Lawyer, No. 3, Summer 2003, p. 39.

⁹⁰42 U.S.C.A. § 6903(27).

⁹¹Id. § 6903(5).

Owners and operators of TSD facilities are the most closely regulated parties under RCRA. In addition to recordkeeping, storage, labeling, information, and manifest requirements, TSD owners and operators must meet financial responsibility standards and provide records of past regulatory compliance. These additional criteria are intended to ensure that the owners will not become insolvent, leaving behind “orphan” sites for the government to clean up.

Like CERCLA, RCRA presents owners and developers with potentially significant costs and penalties. RCRA authorizes the EPA to issue administrative orders to comply with the law and to assess civil penalties of up to \$25,000 per day for violations of the statute. The exact penalty is determined based on a variety of factors, including the potential for harm and the extent of deviation. The scope and severity of liability often make it difficult for businesses to obtain liability insurance. Moreover, federal prosecutors have become increasingly willing to pursue criminal convictions for violations of RCRA and other environmental laws. Although RCRA is primarily targeted at owners and operators of TSD facilities, contractors are not immune from statutory liability. In one case, a demolition contractor soon after beginning work found two canisters in the building. The canisters were marked with a skull and crossbones and had the word “poison” written on them. The contractor did nothing about the canisters for three weeks, at which point they were stolen. The contractor was found criminally liable under RCRA as a storer of hazardous waste without a permit.⁹²

D. State Law

The environmental movement has also led state legislatures to enact environmental laws often based on, if not more protective than, federal environmental laws. For example, roughly three-fourths of the states have enacted NEPA-type laws. In California, the law includes detailed requirements for agency procedures, substantive requirements for environmental impact reports (EIRs) and agency review, and judicial review standards.⁹³ Similarly, many

⁹²*United States v. Sims Brothers Constr., Inc.*, 277 F.3d 734 (5th Cir. 2001). For an empirical analysis of environmental crime prosecutions (including RCRA), see Brickey, *Charging Practices in Hazardous Waste Crime Prosecutions*, 62 Ohio St. L.J. 1077 (2001).

⁹³California Environmental Quality Act, West Ann.Cal.Pub.Res. Code §21000 et seq.

states have enacted stringent hazardous waste laws, modeled after CERCLA and RCRA, that may create additional regulatory burdens for owners and developers. For example, under Massachusetts state law parties liable for hazardous waste cleanup are required to pay the Commonwealth of Massachusetts for costs of assessment, containment, and removal of hazardous wastes and for damages for injury to and destruction of natural resources. Unlike CERCLA, however, Massachusetts law also holds such parties liable to any third party for damages to its real or personal property.⁹⁴

Some states have moved beyond the federal legislation in their regulation of environmental risks. California has responded to “sick building” complaints through enactment of the Toxic Mold Protection Act of 2001.⁹⁵ The Act requires the state Department of Health Services to convene a task force to develop permissible exposure levels to mold and to devise remediation standards. A second, new law requires a different task force to study and publish its findings on fungal contamination of indoor environments.⁹⁶

E. Environmentally Friendly Design and Construction

The environmental movement is not limited to imposition of statutory liability, but encompasses as well promotion of environmentally friendly design and construction. This movement first came to national attention with passage—in response to an oil embargo by the Organization of Petroleum Exporting Countries (OPEC) in the early 1970s—of the federal Energy Policy and Conservation Act.⁹⁷ California followed suit through amendment of its building codes.⁹⁸

While these statutes focused on individual consumer products (including many found in buildings), a newer approach is to promote efficiency through manipulation of the design itself. The United States Green Building

⁹⁴Mass.Gen.Laws Ann. ch. 21E, § 5.

⁹⁵West Ann. Cal. Health & Safety Code §§ 26100 et seq.

⁹⁶Id. §§ 26200 et seq.

⁹⁷42 U.S.C.A. §§ 6201 et seq., passed in 1975. Sections 6291–6295 addresses the energy efficiency of consumer products other than cars; for example, § 6294(a)(E) advocates energy-efficient products, and § 6295(k) addresses low-flush toilets.

⁹⁸West Ann. Cal. Health & Safety Code § 17921.3 mandates the use of low-flush toilets.

Council (USGBC), an organization of industry participants, has established a Leadership in Energy and Environmental Design (LEED) rating system establishing design components for environmentally friendly buildings.⁹⁹ A Connecticut statute requires most new state facilities to be designed to comply with or exceed compliance with the LEED rating system, or an equivalent system.¹⁰⁰ Thus, the promoters of this new approach are industry participants, with government mandates coming later.

SECTION 9.14 Judicial Review

Although action or inaction of a local governing body can be challenged politically, such as by initiative, referendum, or the election process, the opponents of an ordinance or those who wish to contest a permit decision often go to court. A preliminary and often serious obstacle is whether the challenger has “standing” to challenge the ordinance judicially.

If there is standing, the principal grounds for legal challenge have been the following:

1. The enabling act did not authorize the act in question.
2. The ordinance or permit decision was unconstitutional.
3. The making of decisions by nonelected officials, such as an architectural review commission, was invalid because the local governing body delegated power without proper standards. Successful judicial challenges to decisions of local authorities have been rare.¹⁰¹

In *Village of Belle Terre v. Boraas*,¹⁰² Belle Terre, New York, a village of less than one square mile consisting of

⁹⁹According to the USGBC’s website, “LEED promotes a whole-building approach to sustainability by recognizing performance in five key areas of human and environmental health: sustainable site development, water savings, energy efficiency, materials selection, and indoor environmental quality.” See <http://www.usgbc.org/DisplayPage.aspx?CMSPageID=222>, last visited April 2, 2008. An alternative to the LEED system is the Green Globes assessment and rating system, promulgated by the Green Building Initiative. See 31 Constr. Contracts L.Rep., No. 2, Jan. 19, 2007, ¶ 21.

¹⁰⁰Conn.Gen.Stat. Ann. § 16a-38k(a). See generally, Montez & Olsen, *The LEED™ Green Building Rating System and Related Legislation and Governmental Standards Concerning Sustainable Construction*, 25 Constr. Lawyer, No. 3, Summer 2005, p. 38.

¹⁰¹The most successful attacks have been in New Jersey and Pennsylvania. See Section 9.15.

¹⁰²416 U.S. 1 (1974).

700 people and 220 houses, restricted the entire village to single-family dwellings. The village prohibited three or more unrelated people from living together. The ordinance was challenged by six unrelated students from a nearby university who wished to live together. In upholding the challenged ordinance, the Supreme Court stated,

A quiet place where yards are wide, people few, and motor vehicles restricted are legitimate guidelines in a land-use project addressed to family needs. . . . The police power is not confined to elimination of filth, stench, and unhealthy places. It is ample to lay out zones where family values, youth values, and the blessings of quiet seclusion and clean air make the area a sanctuary for people.¹⁰³

The court concluded that the ordinance was a rational means of achieving these objectives. This decision will make constitutional attacks on local development control even more difficult than in the past.

SECTION 9.15 Housing and Land Use Controls

A. Residential Zones

When zoning took center stage in the 1920s, one justification for local control was the need to develop and maintain residential neighborhoods that would keep their value and enable people to live among their own kind. In the early days of zoning, this was accomplished principally by limiting residences in certain districts to single-family detached homes and severely curtailing the multifamily living unit.

Social aspects of residential zoning were revealed in the first opinion of the U.S. Supreme Court that passed on the validity of zoning laws. In *Village of Euclid v. Ambler Realty Co.*,¹⁰⁴ the U.S. Supreme Court, after justifying the limitation of property rights by the police power to provide a safe and more pleasant community, expressed the American deification of the single-family home and disdain for apartment living.

Home ownership has always been a prized goal for upward mobile classes and a status symbol of achievement. Before the advent of modern public land use controls, private mechanisms existed to develop and maintain quality residential neighborhoods of individually owned

¹⁰³416 U.S. at 9.

¹⁰⁴Supra note 38.

homes. Affluent Americans wanted and were able to buy homes in districts exclusively devoted to attractive, well-built homes on spacious lots. Such home buyers generally sought to live with people of their own socioeconomic background. They built or bought in neighborhoods where their children could play and go to school with children of their own cultural background and social class. The free market encouraged the development and maintenance of such neighborhoods. Only the affluent could afford fine residential homes because, at least in normal times, the demand for such homes was large and the supply limited. As a result, high prices kept out people of low or moderate income.

Buyers wanted assurance that there would be no change in the residential environment. To induce them to buy in such neighborhoods, developers used restrictive covenants. Buyers would be willing to pay higher prices to live in districts that were carefully restricted to quality single-family homes. Buyers wanted assurance that property values would be maintained, that schools would be kept high quality, and that neighbors shared their interests and values.

Political power of local communities to control land use enabled communities to resist market forces that might otherwise have impinged on the model of the single-family detached home. Unlike restrictive covenants, public land use controls clash with free-market concepts. This is demonstrated by the frequent alliance of developers and low-income groups who unite to attack zoning laws.

From its inception, residential zoning excluded certain types of people from designated districts. This was justified as a proper planning control designed to encourage investment and the development of good residential neighborhoods. Not until the 1960s were strong attacks made on zoning laws as excluding low and moderate income families from districts reserved to the more affluent, as discussed in greater detail in Section 9.15C.

B. Subdivision Controls

Many communities grew when developers subdivided raw land for homes. Subdividing increased population and placed added burdens on the community to provide streets, fire and police protection, schools, parks, and other municipal services. Although many of these costs could have been provided by special property assessments, many local communities often exacted conditions for

approving subdivisions. These conditions could include dedication of part of the raw land for public use for streets, schools, and recreation. Sometimes in-lieu payments were conditions for subdivision approval. These payments—sometimes called “exactions” or “impact fees”—were used to reimburse the community for providing facilities and services in the subdivision or services that the community had to furnish to residents of the subdivision.

Some states have gone further and have permitted local communities to require land or a money exaction for parks and recreation facilities “to bear a reasonable relationship to the use of the park and recreational facilities by the future inhabitants of the subdivision.” Such an exaction was upheld with the suggestion that a city could exact a fee to purchase park land some distance from the subdivision but that could be used by subdivision residents.¹⁰⁵

Subdivision exactions place on new subdivision residents the cost for additional municipal services they will require. But if exactions substantially increase construction costs and prices of subdivision houses, they can, in addition, be exclusionary, (as discussed in greater detail in Section 9.15C).

C. Exclusionary and Inclusionary Zoning

Attacks on zoning laws began with changing demographic patterns during the mid-1950s. In *Oakwood at Madison, Inc. v. Madison Township*, the court recognized this and stated,

Madison Township, among other municipalities, is encouraging new industry. Industry is moving into the county and region from the central cities. Population continues to expand rapidly. New housing is in short supply. Congestion is worsening under deplorable living conditions in the central cities, both of the county and nearby. The ghetto population to an increasing extent is trapped, unable to find or afford adequate housing in the suburbs because of restrictive zoning.¹⁰⁶

Focusing on zoning laws as a cause for social injustice took the form of describing white suburbs surrounding central cities as “tight little islands” that refused to do their fair share of housing the poor.¹⁰⁷

¹⁰⁵*Associated Home Builders etc., Inc. v. City of Walnut Creek*, 4 Cal.3d 633, 484 P.2d 606, 94 Cal.Rptr. 630, appeal dismissed, 404 U.S. 878 (1971). See also Annot., 97 A.L.R.5th 123 (2002).

¹⁰⁶117 N.J. Super. 11, 17, 283 A.2d 353, 356 (Law. Div. 1971).

¹⁰⁷Sager, *Tight Little Islands: Exclusionary Zoning, Equal Protection, and the Indigent*, 21 Stan.L.Rev. 767, 791–92 (1969).

The decline of central cities and the flight to the suburbs caused fiscal problems for central cities. (Beginning in the 1980s, and continuing into the 21st century, some cities saw a reversal of this trend as the middle classes moved back and gentrified decaying inner-city neighborhoods.) Cities were left with the increased costs of social services for the poor and a declining tax base because the middle classes, along with many businesses, moved to the suburbs. Central cities looked on the suburbs as parasite communities composed of people who earned their livings in central cities and used the central cities' cultural and recreational facilities. These parasite communities, however, did not bear their proper share of the urban costs that were increasing because of the need to care for poor people.

Suburbs sought to attract light industry that paid high property taxes but did not require many employees of low or moderate income. The latter were to be avoided. They lived in modest homes or apartments that brought in less revenue than the expenditures—mainly in social services and education—required to take care of such people. People of middle income and above wanted to live with others who shared their social and cultural values. Some techniques used to accomplish these purposes were as follows:

1. large lot requirements
2. minimum house size requirements
3. exclusion of multiple dwellings
4. exclusion of mobile homes
5. unnecessarily high subdivision requirements or in-lieu exactions¹⁰⁸

Judicial attacks have been made on many ordinances by those who wish to build or those who wish to be able to live in suburbs. Usually these attacks are based on claims that such ordinances violated federal and state constitutions.

In 1965, the Pennsylvania Supreme Court, in *National Land and Investment Co. v. Kohn*,¹⁰⁹ invalidated a four-acre minimum lot requirement. Noting that evaluating the constitutionality of a local zoning ordinance was not easy and declining to be “a super board of adjustment” or “a planning commission of the last resort,” the court nevertheless

¹⁰⁸*Building the American City*, Report of National Commission on Urban Problems, H.R.Doc. No. 91-34, 91st Cong., 1st Sess. 211–16.

¹⁰⁹419 Pa. 504, 215 A.2d 597 (1965). For a more recent case, see *C & M Developers, Inc. v. Bedminster Township Zoning Hearing Bd.*, 573 Pa. 2, 820 A.2d 143 (2002).

saw itself as a judicial overseer “drawing the limits beyond which local regulation may not go.”¹¹⁰

Pennsylvania and New Jersey have gone far toward what some have called “socioeconomic public land use controls.” Courts in these states have taken an active role in attempting to compel local communities to confront and deal with housing problems. This activist approach has been criticized as an undue interference in local affairs and an unwarranted attempt by courts to venture into complicated social and fiscal problems more appropriate for legislative treatment. There has been some question regarding the right of courts and legislative bodies to frustrate the desires of people to choose the types of people near whom they wish to live.

Other courts have not yet been as willing as Pennsylvania and New Jersey courts to step into local land use decisions. This is demonstrated by cases discussed in Section 9.15D that permit local communities to limit growth through the land use control process.¹¹¹

The introduction of the term *exclusionary* has been accompanied by increasing use of what is called *inclusionary zoning*. New Jersey compelled each community to do its fair share to house persons of low or moderate income.¹¹² Failure by local communities in New Jersey to do so can result in the communities' zoning laws being invalidated. This, in a sense, is similar to affirmative action employment programs. The court is asking local communities not simply to refrain from excluding certain people but to affirmatively use efforts to include them. In 1969, Massachusetts attempted to require municipalities to provide for such housing by an “anti-snob” zoning law.¹¹³

Efforts have been made at local levels of government to include those often excluded. Typically, such ordinances require that developers of more than a certain number of units include a designated percentage for low- and moderate-income tenants. Developers challenge these ordinances as a taking or an unconstitutional deprivation of their due process rights. Courts that uphold inclusionary zoning view these ordinances as a valid exercise of the local government's police powers.¹¹⁴

D. Phased Growth

In the 1960s, the once accepted goal of growth as the proven road to prosperity and social mobility began to be questioned seriously. Some people advocated goals that would look less at material measurements such as the gross national product and more at measurements of the quality of life. Different measurement processes and the realization of the finite nature of resources were factors that led to the development of the environmental movement discussed in Section 9.13.

From the standpoint of urban planning, growth became synonymous with urban sprawl—the often uncontrolled development of land at the outskirts of major American cities. What often resulted was an unplanned, market-oriented development of isolated and scattered parcels of land on the fringes of suburbia followed by the gradual urbanization of the intervening undeveloped areas. Urban sprawl has been criticized as unaesthetic, wasteful of valuable land resources, and unduly increasing the cost of providing municipal services.

Rethinking of goals and priorities reflected themselves in public land use planning. Communities sought to avoid the disruptive effect of an influx of people into their communities.

Plans attacked as exclusionary and defended as phased growth often have common characteristics. However, a crude comparison can be made between these two classifications. Suburbs whose plans are exclusionary seek to be tight little islands. They wish to keep out low- and moderate-income families for social and fiscal reasons. However, phased growth plans such as those discussed in this subsection are designed to keep out all people, not simply undesirable ones.

Another preliminary caution is that all land use controls tend to exclude, because density control is a legitimate and frequent objective. For this reason, terms such as *exclusionary* and *phased growth* must be looked at in light of their value-laden characteristics. *Exclusionary zoning* has been the label that critics of suburbs developed when they attacked homogeneous suburbs as tight little islands. Yet *phased growth*, though frequently a label used to justify an exclusionary plan, carries with it socially desirable goals of protecting nature and wildlife and preserving the values and attributes of small-town life.

The first significant case to pass on a phased growth plan involved a system devised by Ramapo, New York, a suburb of New York City some twenty-five miles from

downtown Manhattan. The master plan adopted in 1966 contemplated an eighteen-year period during which public facilities would be built and after which the town would be fully developed. In 1969, an ordinance was passed to control residential development on any vacant lots or parcels. Applications for permits were to be made to the town board, which was to take into account the availability of major public improvements and services such as sewers or approved substitutes, drainage facilities, parks, or recreational facilities including public school sites, improved roads, and firehouses. The degree of availability of each facility to the site was to be measured and scored on a scale of 0 to 5, and no permit could be issued unless a minimum of fifteen points were obtained. A developer could advance the date for development by providing facilities itself or by obtaining a variance. Defenders of the Ramapo approach pointed to the advantage of each parcel owner's knowing the eventual use and density classification of every parcel. The plan only postponed development. Backers of the Ramapo approach pointed to specific criteria governing planning board decision making rather than the fuzziness of most permit-issuing criteria.

The Ramapo approach was upheld by the New York Court of Appeals.¹¹⁵ The court held that the plan was within the powers given the town by the state enabling laws, with the effective end to be served by the time controls within the state's police powers, and was not so unreasonable as to constitute a taking without compensation. (By the 1980s, the economic slowdown forced Ramapo to substantially modify the plan to encourage development.)

A second case involved an attempt by a suburban community to limit growth by controlling the number of units that could be built. The plan was upheld,¹¹⁶ but again by the 1980s the plan was too effective and changes had to be made to encourage growth.

A third case citing the fragile ecology of a small rural town upheld an ordinance drastically increasing the minimum lot size to block a large development of second homes for urban residents.¹¹⁷

¹¹⁵*Golden v. Planning Bd. of Town of Ramapo*, 30 N.Y.2d 359, 285 N.E.2d 291, 334 N.Y.S.2d 138, appeal dismissed, 409 U.S. 1003 (1972). Both majority and dissent called for regional land use planning.

¹¹⁶*Construction Indus. Ass'n v. City of Petaluma*, 522 F.2d 897 (9th Cir.1975), cert. denied, 424 U.S. 934 (1976).

¹¹⁷*Steel Hill Dev., Inc. v. Town of Sanbornton*, 469 F.2d 956 (1st Cir.1972).

While these three phased growth plans were upheld by the courts, the Massachusetts high court struck down a town zoning bylaw of unlimited duration that regulated the number of building permits issued annually for the construction of single family homes. The court found that restrictions of unlimited duration on a municipality's rate

of development are in derogation of the general welfare and therefor unconstitutional.¹¹⁸

Professional Registration and Contractor Licensing: Evidence of Competence or Needless Entry Barrier?

SECTION 10.01 Overview

Legal requirements for professional practice is the logical place to begin a study of how law intersects with design and the design professions. This chapter deals with professional registration laws. It also examines state occupational licensing that can and often does include contractors, a latecomer into the field of occupational regulation.

Registration and licensing laws are enacted by state legislatures. They are implemented and enforced by administrative agencies. Because of the political nature of these laws, they often are changed. A Tennessee decision handed down in 1995 stated that the Tennessee contractor licensing law had been changed seventeen times since its original enactment in 1931.¹ This is not uncommon.

Similarly, as shall be seen in Section 10.02, the controversial nature of these laws and regulations means that court decisions can seem contradictory and occasionally are reversed by later decisions.

For these reasons, textual statements must be regarded as general and even tentative. Local laws must be consulted when planning to perform design and construction services or in actual cases that involve the legality of performing these services.

SECTION 10.02 Public Regulation: A Controversial Policy

Public regulation of professional activity can take many forms. One form of indirect public regulation—professional liability—is discussed in Chapter 14. This chapter

discusses the direct legal requirements that determine whether a particular person or business entity may use a particular title or perform design or construction services.

Statutes enacted by legislative bodies and regulations promulgated by state administrative agencies set criteria for professional practice and administer systems that determine who may legally perform these services.

In the United States, the states control registration. Generally, the factors considered by a state before granting the contractor a license are similar to those considered by the federal government when it selects contractors to perform services. But state licensing laws are not applied to those contractors who work exclusively for the federal government.² To give effect to the supremacy clause of the U.S. Constitution, the federal government must operate free of interference by the states.

There is no federal regulation system for registering and licensing design professionals. Local regulation, where it exists, is designed principally to raise revenue and not to regulate the professions. A few states have given local authorities the power to impose competence requirements on contractors.

A. Justification for Regulation

The police and public welfare powers granted to states by their constitutions permit states to regulate who may practice professions and occupations. States exercise this power by setting requirements for those who wish to

¹*Winter v. Smith*, 914 S.W.2d 527, 536 (Tenn.App.1995), appeal denied Dec. 18, 1995

²*Gartrell Constr. Inc. v. Aubry*, 940 F.2d 437 (9th Cir.1991), following *Leslie Miller, Inc. v. Arkansas*, 352 U.S. 187 (1956).

practice professions or occupations. Such requirements are usually expressed in licensing or registration laws.³

Some members of the public who seek to have design or construction work performed are unable to judge whether those who offer to perform design or construction services have the necessary competence and integrity. One purpose of licensing laws, whether they apply to architects, engineers, surveyors, or contractors, is to give members of the public some assurance that those with whom they deal will have at least minimal competence and integrity. The public generally may suffer property damage or personal harm because of poor design or construction. In denying recovery to an architect licensed where he practiced but not where the project was located, one court refused to allow an exception for an isolated transaction and stated, “One instance of untrained, unqualified, or unauthorized practice of architecture or professional engineering—be it an isolated transaction or one act in a continuing series of transactions—may be devastating to life, health or property.”⁴ In passing judgment on a contractor licensing law, one court stated that the law was designed to

prevent unscrupulous or financially irresponsible contractors from deceiving and taking advantage of those who engage them to build. . . . It often happens that fly-by-night organizations begin a job and, standing in danger of losing money, leave it unfinished to the owner’s detriment. Or they may do unsatisfactory work, failing to comply with the terms of their agreement. The licensing requirement is designed to curb these evils; the license itself is some evidence to the owner that he is dealing with an honest and qualified builder.⁵

Society seeks to accomplish these undeniably desirable objectives by requiring that those who wish to perform certain services have had specified education and experience and are able to demonstrate competence by passing examinations. People in business occupations may also have to establish financial responsibility. Evidence of immoral or illegal conduct goes to the issue of integrity

and provides an independent reason to deny licensing.⁶ In addition, after entry into the profession, professional misconduct or gross incompetence may justify suspending or revoking a license.

Another objective was revealed when states began to require comprehensive occupational licensing. When this occurred, licenses were needed not only by doctors, lawyers, architects, and engineers but also by barbers, beauticians, auto mechanics, and shoe repairers, to name but a few. Such laws were designed to bring status and dignity to those in useful occupations.

B. Criticism of Licensing Laws

Occupational licensing laws can deny some people their only means of livelihood. As a result, imposition or tightening of licensing laws is often accompanied by “grandfathering in” those who already are in those occupations. This can relieve the hardship caused by denying people the right to perform their best and often only skill. It can also dilute standards.

More important, even in the early history of occupational licensing, critics attacked the state’s role of determining who and how many people would be allowed to enter professions or occupations. Occupational licensing laws can be viewed as “fence me in” legislation designed to limit competition and protect those already in the profession or occupation.⁷ This criticism became even more strident when the states went, as noted in Section 10.02A, into “wholesale” licensing. Licensing as a method of “turf protection” surfaced again in the 1980s as the architectural profession sought to stop interior designers from being licensed. Any group with sufficient organization and political strength to demand that standards be set for its group can generate a new licensing law.

The competition-inhibiting aspect of licensing laws was demonstrated in 1973 when 2,149 general contractors took and failed the Florida Construction Industry Licensing Board examination. Either all Florida applicants were incompetent, or the board was seeking to limit competition

³The term *registration* is commonly used for the design professions and is used in this chapter interchangeably with the term *licensing*, except in the sections dealing with contractors.

⁴*Food Management, Inc. v. Blue Ribbon Beef Pack, Inc.*, 413 F.2d 716, 723–24 (8th Cir.1969).

⁵*Sobel v. Jones*, 96 Ariz. 297, 394 P.2d 415, 417 (1964).

⁶*Hughes v. Board of Architectural Examiners*, 17 Cal.4th 763, 952 P.2d 641, 72 Cal.Rptr.2d 624 (1998); *Nye v. Ohio Bd. of Examiners of Architects*, 165 Ohio App.3d 502, 847 N.E.2d 46 (2006).

⁷*People v. Johnson*, 68 Ill.2d 441, 369 N.E.2d 898 (1977) (registration rules, which have the practical effect of perpetuating a monopoly of those already licensed, are unconstitutional).

by barring new entrants to the field. After indignant protest from builders who had failed, the board abruptly reversed itself and curved the grades so that 88 percent were given passing marks and contractors' licenses.⁸

In 1987 Florida again moved into the spotlight. After many complaints about shoddy workmanship performed by contractors, the state overhauled its licensing examinations, upgraded tests, and added new sections in accounting, business administration, and insurance. Some 93 percent of contractors failed the new examination.⁹

Critics also note that the agencies that administer licensing laws are often dominated by members of the profession being regulated. This can generate practices that keep down the number of practitioners, to improve the economic status of those already in their profession.

The Florida experiences also demonstrate the difficulty of determining the proper level of competence necessary to receive state permission to engage in a particular occupation. This issue has triggered protest and lawsuits from minority groups, who contend that their low representation in the professions results, among other things, from examination questions and grading that either are designed to limit their entry or have that effect. The long experience requirements for designers have been criticized as either inadequate for proper training or as solely designed to provide registered designers with cheap labor.

New criticism of licensing and registration laws surfaced during the galloping inflation of the mid-1970s. Many pointed to professional licensing laws, among other protections given to the professions, as causing the high cost of professional services. Educational and experience preexamination requirements mean many unproductive years at great expense. This can lead to fees designed to recoup these losses after entry. Similarly, education, practice, and testing requirements limit the number of people who can perform these professional services. This reduces supply and increases fees. Another undesirable by-product is that high professional fees tend to limit design services to those clients who can afford to pay these fees and to high-cost projects.

Yet the regulatory process, despite such criticism, continues to proliferate.

In Arizona the winds of deregulation blew fiercely, if fitfully. In 1981, Arizona concluded that licensing laws

were not needed in commercial and industrial construction, where the market could provide a cheaper and more effective regulatory mechanism. The legislature stated,

The legislature finds that regulation of the commercial and industrial construction business, including public works, . . . is not necessary for the protection of the public health, safety and welfare, and that it is in the public interest to deregulate such business. It is the purpose and intent of the legislature to continue the registrar of contractors agency in order to protect the public health, safety and welfare by providing for the continuing licensing, bonding and regulation of contractors engaged in residential construction.¹⁰

Yet in 1987 Arizona restored much of the regulation eliminated in 1981.¹¹ The Arizona experience illustrates not only the controversial nature of occupational licensing, but also the apparently inexorable movement toward greater state control.

Finally, wholesale occupational licensing laws can be a method by which the state can exercise pervasive control over its economy and its citizens. Enterprises or individuals thought to be operating against the public interest but not reachable by the penal laws can be put out of business by license suspension or revocation.

C. Importance of Attitude Toward the Regulatory Process

The attitude of lawmakers toward the regulation process clearly is influential. Legislators who take a beneficent view are likely to enact more licensing laws. Similarly, such legislators may seek to bar judicial doctrines—such as substantial compliance, discussed in Section 10.10C—that reduce the effectiveness of such laws. Of course, the attitude of courts that must often pass on these laws will influence decisions. For example, courts are often called on to determine the constitutionality and meaning of the legislation. They also decide whether particular conduct has violated the statute, whether substantial compliance with licensing laws is adequate to excuse a violation, and whether a party who has performed work, though unlicensed, will be able to recover compensation.

¹¹*Ariz.Rev.Stat.Ann.* § 32-1101 *et seq.*

D. Judicial Attitudes Toward Registration Laws

Courts in different states express variant attitudes. For example, one court passing judgment on a particular licensing practicing system noted that it expressed “grave policy.”¹² Yet in that same year, another granted recovery to a contractor who through technical default had allowed his license to lapse, stating, “It performed in all other respects competently and without injury to any person. . . . We are not involved in aiding an incompetent or dishonest artisan. . . . The defendant received full value under the terms of the contract. The licensing law should not be used as a shield for the avoidance of a just obligation.”¹³

Even a particular state over time can change its attitude toward licensing laws. For example, in 1957, California precluded an unlicensed subcontractor from collecting from the prime contractor who knew it was unlicensed despite the latter’s having been paid by the owner.¹⁴ Yet cases decided by the California courts in 1966, 1973, and 1985 were more tolerant toward technical contractor noncompliance.¹⁵ As noted in Section 10.10C, in 1989 the legislature responded negatively toward these pro-contractor decisions. Finally, in 2001, it added Section 7031(b) to its Business and Professions Code. That section permits a person who has dealt with an unlicensed contractor to recover any payments that she made.

On the whole, licensing laws still are considered to express important and desirable policy. Criticism that has been made, however, has begun to be reflected in judicial decisions.

SECTION 10.03 Administration of Licensing Laws

Modern legislatures articulate rules of conduct by statute and create administrative agencies to administer and implement the laws. Agencies created to regulate the professions can make rules and regulations to fill deliberate gaps left by

the statutes and particularize the general concepts articulated by the legislature. For example, the licensing laws state that there must be examinations to determine competence. The details of the examinations, such as the type, duration, and frequency, are determined by the agency.

In addition to having quasi-legislative powers, the agencies have quasi-judicial power. They may, subject to judicial review, decide disputed questions, such as whether a particular school’s degree will qualify an applicant to take the examination or whether certain conduct merits disciplinary sanction. They also have power to seek court orders ordering that people cease violating the licensing laws.

These agencies generally possess expertise in the fields of activity being regulated. Members of these agencies who must perform quasi-judicial functions, such as deciding whether an architect or engineer should have her license suspended or revoked, traditionally are members of the professions being regulated, such as architects or engineers. But there is an increasing tendency to appoint some lay persons to these boards.

*Martin v Sizemore*¹⁶ is instructive on the issue of whether certain charges made by the agency and contested by the person whose registration or license is being challenged must be supported by expert testimony. As shall be seen in Sections 14.05B and 14.06, a claim made in a judicial proceeding against a professional person must usually be supported by the testimony of experts unless common knowledge is sufficient to determine whether the professional has acted properly.

The case catalogued the different bases for disciplinary action. It noted that breach of contract under Tennessee law may be the basis for a license suspension or revocation. If breach of contract is the basis for the disciplinary action, expert testimony to sustain the charge is not required.

But if the basis for the disciplinary action is gross negligence, incompetence, malpractice, commission of excessive errors or misconduct, expert testimony must be submitted by the agency to justify the disciplinary action. Though the court extends considerable deference to agencies on technical matters within their expertise, the court held that due process requires a level of fairness to the person whose livelihood is at stake.

The court recognized that members of the agency performing quasi-judicial functions are professionals, though

¹⁴*Lewis & Queen v. N. M. Ball Sons*, 48 Cal.2d 141, 308 P.2d 713 (1957).

¹⁵*Latipac, Inc. v. Superior Court*, 64 Cal.2d 278, 411 P.2d 564, 49 Cal.Rptr. 676 (1966); *Vitek, Inc. v. Alvarado Ice Palace, Inc.*, supra note 13; *Asdourian v. Araj*, 38 Cal.3d 276, 696 P.2d 95, 211 Cal.Rptr. 703 (1985).

¹⁶78 S.W.3d 249 (Tenn.Ct.App.2001).

in Tennessee, as well as in many states, lay members serve as well. This was not enough to satisfy due process requirements where the basis of the challenge relates to professional competence. But, as in litigation, expert testimony is not needed if the issue can be resolved on the basis of common knowledge.

Grounds for disciplinary action will be discussed in Section 10.04B.

SECTION 10.04 The Licensing Process

A. Admission to Practice

Requirements imposed by states or territories vary considerably. Some states and territories require citizenship and residency. Most have minimum age requirements, usually ranging from 21 to 25. All require a designated number of years of practical experience that can be substantially reduced if the applicant has received professional training in recognized professional schools. All states require at least one examination, and some require two. Most inquire into character and honesty. Some require

interviews. As to interstate practice, see Section 10.06G. Section 10.08A covers contractors.

B. Postadmission Discipline: *Duncan v. Missouri Board for Architects, Professional Engineers and Land Surveyors*

Although the regulatory emphasis has been on carefully screening those who seek to enter the professions, all states can discipline people who have been admitted. Discipline can be a reprimand or suspension or revocation of the license.

Grounds for disciplinary action vary considerably from state to state, but they are generally based on wrongful conduct in the admissions process, such as submitting inaccurate or misleading information, or conduct after admission that can be classified as unprofessional or grossly incompetent.

Yet the disciplinary action in the aftermath of the Hyatt Regency tragedy of 1981 in which many people were killed and injured shows that in spectacular accidents, courts will back up strong sanctions imposed by a licensing authority. The decision of the intermediate Missouri court follows.

DUNCAN V. MISSOURI BOARD FOR ARCHITECTS, PROFESSIONAL ENGINEERS AND LAND SURVEYORS

Missouri Court, Eastern District, Division Three, 1988. 744 S.W.2d 524.
[Ed. note: Footnotes have been renumbered and some omitted.]

SMITH, Judge.

On July 17, 1981, the second and fourth floor walkways of the Hyatt Regency Hotel in Kansas City collapsed and fell to the floor of the main lobby. Approximately 1500 to 2000 people were in the lobby. The walkways together weighed 142,000 pounds. One hundred and fourteen people died and at least 186 were injured. In terms of loss of life and injuries, the National Bureau of Standards concluded this was the most devastating structural collapse ever to take place in this country. That Bureau conducted an investigation of the tragedy and made its report in May 1982. In February 1984, the Missouri Board for Architects, Professional Engineers and Land Surveyors filed its complaint seeking a determination that the engineering certificates of registration of Daniel Duncan and Jack Gillum and the engineering certificate of authority of G.C.E. International were subject to dis-

cipline pursuant to Sec. 327.441 RSMo 1978. The Commission, after hearing, found that such certificates were subject to suspension or revocation. Upon remand for assessment of appropriate disciplinary action, the Board ordered all three certificates revoked. Upon appeal the trial court affirmed. We do likewise.

G.C.E. is a Missouri corporation holding a certificate of authority to perform professional engineering services in Missouri. Gillum is a practicing structural engineer holding a license to practice professional engineering in Missouri. He is president of G.C.E. Duncan is a practicing structural engineer holding a license to practice professional engineering in Missouri and is an employee of G.C.E.

Gillum-Colaco, Inc., a Texas corporation, contracted with the architects of the Hyatt construction to perform structural engineering services in connection with the erection of that

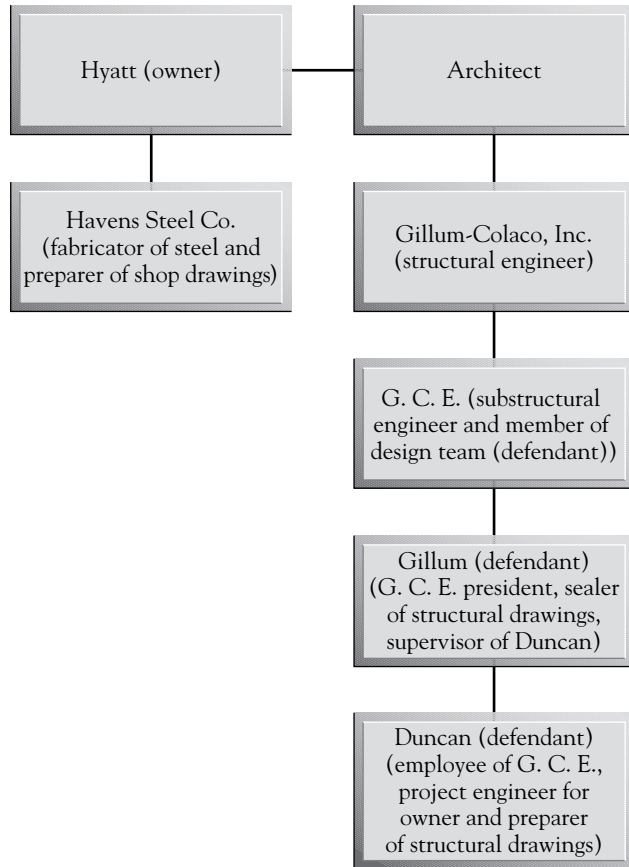

FIGURE 10.1 Participants in structural design, Hyatt Regency project.

building. By subcontract the responsibility for performing all of such engineering services was assumed by G.C.E. The structural engineer, G.C.E., was part of the “Design Team” which also included the architect, and mechanical and electrical engineers. Gillum was identified pursuant to Sec. 327.401.2(2) RSMo 1978, as the individual personally in charge of and supervisory (sic) of professional engineering activities of G.C.E. in Missouri. His professional seal was utilized on structural engineering plans for the Hyatt. Duncan was the project engineer for the Hyatt construction in direct charge of the actual structural engineering work on the project. He was under the direct supervision of Gillum. [Ed. note: See Figure 10.1.]

* * *

We will not attempt to set forth in detail the extensive evidence before the Commission. Some review of that evidence is,

however, required. The atrium of the Hyatt was located between the 40 story tower section of the hotel and the function block. Connecting the tower and function block were three walkways, suspended from the atrium ceiling above the atrium lobby. The fourth floor walkway was positioned directly above the second floor walkway. The third floor walkway was to the east of the other two walkways. As originally designed the fourth and second floor walkways were to be supported by what is referred to as a “one rod” design. This consisted of six one and one quarter inch steel rods, three on each side, connected to the atrium roof and running down through the two walkways. Under this design each walkway would receive its support from the steel rods and the second floor walkway would not be supported by the fourth floor walkway. At each junction of the rods and the walkways was a box beam–hanger rod connection. These were steel to steel connections and the design of such connections is an engineering function, because the design includes the performance of engineering calculations to determine the adequacy of the connection to carry the loads for which it is designed. [Ed. note: See Figure 10.2.]

Connections are basically of three kinds, simple, complex, and special. All connections are the responsibility of the structural engineer. Simple connections are those which have no unusual loads or forces. They may be designed by looking up the design in the American Institute of Steel Construction (AISC) Manual of Steel Construction and following directions found therein. This can be done by a steel fabricator utilizing non-engineering personnel. Complex connections are those where extreme or unusual loads are exerted upon the connection or where the loads are transferred to the connection from several directions. These connections cannot be designed from the AISC manual and require engineering expertise to design.

Special connections are a hybrid having characteristics of each of the other two. A simple connection becomes special where concentrated loads are placed thereon and the AISC manual no longer provides all the information necessary to properly design the connection. Such connections may also become special where the connections are “non-redundant.” A “redundant” connection is one where failure of the connection will not cause failure of the entire system because the loads will be carried by other connections. A “non-redundant” connection which fails will cause collapse of the structure. The box beam–hanger rod connections were “non-redundant.” The Commission found the box beam–hanger rod connections to be special connections.

The steel fabricator on the Hyatt project, Havens Steel Company, had engineers capable of designing simple, complex or special connections. The structural engineer on a project

FIGURE 10.2 Schematic of walkways as viewed from north wall of atrium.

may, as a matter of custom, elect to have connections designed by the fabricator. To do this, he communicates this information to the fabricator by the manner in which he portrays the connection on his structural drawings. The adequacy of the connection design remains the responsibility of the structural engineer. The Commission found that the structural drawings (S405.1 Secs. 10 and 11) did not communicate to the fabricator that

it was to design the box beam–hanger rod connection, and did communicate to the fabricator that those connections had been designed by the engineer. Duncan testified that he intended for the fabricator to design the connections. Havens prepared its shop drawings on the basis that the connections shown on the design drawings had been designed by the structural engineer. Certain information concerning loads and other aspects of the box beam–hanger rod connections which appeared on Duncan’s preliminary sketches was not included on the final structural drawings sent to the fabricator. The Commission also found that Duncan’s structural drawings did not reflect the need for a special weld, did not reflect the need for stiffeners and bearing plates, and reflected that the hanger rods should be of regular strength steel rather than high strength. These factual findings are not contested. The hanger rods and the box beam–hanger rod connections shown on the structural drawings did not meet the design specifications of the Kansas City Building Code. That finding of fact by the Commission is also not contested.

Because of certain fabricating problems Havens proposed to Duncan the use of a “double rod” system to suspend the second and fourth floor walkways. [Ed. note: See Figure 10.3.] Under this system the original six rods would be connected only to the fourth floor walkway. A second set of rods would then connect the second floor walkway to the fourth floor walkway. The effect of this change was to double the load on the fourth floor walkway and the box beam–hanger rod connections on that walkway. There was evidence that one of the architects contacted Duncan to verify that the double rod arrangement was structurally sound and was advised by Duncan that it was. Appellants dispute that the architect’s testimony clearly establishes such an inquiry and contend that the conversation dealt rather with the aesthetic nature of the change. Our review of the record causes us to conclude that the architect did testify to receiving assurances that the new design was structurally safe. It is difficult to understand why the architect would consult the structural engineer if his only concern was the aesthetics of the new design. The Commission further found that the records of G.C.E. failed to contain a record of a web shear calculation which Duncan testified he made and which would normally be a part of the G.C.E. records. Duncan’s testimony reflected the need for such a calculation before approval of the double rod arrangement. The Commission also found certain additional necessary tests or calculations were not made. Appellants do not challenge that finding. It is a reasonable inference from the evidence that Duncan did not make the engineering calculations and tests necessary to determine the structural soundness of the double rod design.

Havens prepared the shop drawings of the structural steel fabrication. These drawings were returned to Duncan for review

Original detail

As built

FIGURE 10.3 Comparison of interrupted and continuous hanger rod details.

and approval. They contained the fabrication of the box beam–hanger rod connections based upon the structural drawings previously submitted by Duncan and bearing the seal of Gillum. The Commission found, and appellants do not dispute, that its own internal procedures called for a detailed check of all special connections. The primary reason for such a procedure is to provide assurance for the owner that the fabricator is conforming to the contract and that any engineering work conforms to acceptable standards. A technician employed by G.C.E. checked the sizes and materials of the structural members for compliance with design drawings. He called to Duncan’s attention questions concerning the strength of the rods and the change from one rod to two. Duncan stated to the technician that the change to two rods was “basically the same as the one rod concept.” Duncan did not “review” the fourth floor box beam connection shown on the Havens shop drawings nor did he, in accord with usual engineering practice, assemble its components to determine what the connection looked like in detail. The Commission found, again not disputed, that appellants did not review the shop drawings for compliance of the box beam–hanger rod connection with design specifications of the Kansas City Building Code; did not review the shop drawings for conformance with the design concept as required by the contract of G.C.E. and the specifications on the Hyatt project nor for compliance with the information given in the contract documents. Duncan and Gillum approved the shop drawings.

While construction of the Hyatt was in progress the atrium roof collapsed. Investigation into that collapse established that the cause was poor construction workmanship. During the course of their investigation of the atrium roof collapse, appellants discovered that they had made certain errors in their design drawings and that they had failed to find discrepancies in their review of shop drawings involving the atrium. These errors and discrepancies were in areas other than the walkway design. The owner and architect directed G.C.E., for an additional fee, to check the design of the entire atrium. G.C.E. undertook that review. Gillum assured the owner’s representative that “he would personally look at every connection in the hotel.” Appellants were also specifically requested by the construction manager to inspect the steel in the bridges including the connections. Duncan subsequently advised him that had been done. In their report to the architects, appellants advised “we then checked the suspended bridges and found them to be satisfactory.” This report was a culmination of a design check of the “structural steel framing in the atrium as per the request of Crown Center [the owner].” Appellants did not do a complete check of the design of all steel in the atrium nor a complete check of the suspended bridges. Gillum reviewed the report prepared by Duncan and

took no exception. At a meeting with the owner and architect, Gillum stated that his company had “run a detailed, thorough re-analysis of all of the structure. And to determine if there was any other areas that were critical or had any kind of a design deficiency or detail deficiency.” Duncan reported at that meeting: “We went back, myself and another engineer, and checked all the atrium steel. . . . Everything in the atrium checked out very well [with one non-relevant exception].” Appellants checked only the atrium roof steel.

Approximately a year after completion of the Hyatt Regency the second and fourth floor walkways collapsed. The cause of the walkway collapse was the failure of the fourth floor box beam–hanger rod connections.

[Ed. note: The engineers challenged the constitutionality of the licensing laws. They contended that the “gross negligence” standard was so vague as to deny them due process under the U.S. Constitution. The court rejected this contention, concluding that the “phrase provides a guideline sufficient to preclude arbitrary and discriminatory application.” See Section 10.06A.]

The Commission rejected the definition utilized in the first category of cases (difference in degree) and utilized a definition recognizing that gross negligence is different in kind from ordinary negligence. Appellants do not disagree with this selection of category. The Commission defined the phrase in the licensing context as “an act or course of conduct which demonstrates a conscious indifference to a professional duty.” This definition, the Commission found, requires at least some inferred mental state, which inference may arise from the conduct of the licensee in light of all surrounding circumstances. Appellants have posited a definition purportedly different that would define the phrase as “reckless conduct done with knowledge that there is a strong probability of harm, and indifference as to that likely harm.” We are not persuaded that the two definitions are in fact different. An act which demonstrates a conscious indifference to a professional duty would appear to be a reckless act or more seriously a willful and wanton abrogation of professional responsibility. The very nature of the obligations and responsibility of a professional engineer should appear to make evident to him the probability of harm from his conscious indifference to professional duty and conscious indifference includes indifference to the harm as well as to the duty. The structural engineer’s duty is to determine that the structural plans which he designs or approves will provide structural safety because if they do not a strong probability of harm exists. Indifference to the duty is indifference to the harm. We find no error in the definition utilized by the Commission. It imposes discipline for more than mere inadvertence and requires a finding that the conduct is so egregious as to warrant an inference of a mental state unacceptable in a professional engineer.

The appellants also challenge the Commission’s findings that each of several different acts or omissions constituted gross negligence justifying discipline. These findings were apparently made by the Commission in an abundance of caution for in a footnote it recognized that “it is only after a complete analysis of their overall performance within the system that any judgment of their conduct can be made under the terms of the licensing statute.” This is clearly true. It is the combination of a series of acts and omissions which created the structurally unsound walkways. Any one of those acts or omissions alone might well not have compromised the structural integrity of the walkways if the series of acts and omissions had not existed in combination. For the Commission to require a finding that each of these acts or omissions had to be grossly negligent to support discipline (if in fact the Commission so required) would place upon the Board a greater burden than was required. It is apparent, however, that the Commission found the overall conduct of appellants grossly negligent and if that finding is supported by competent and substantial evidence we are bound by it.

* * *

Appellants in this connection challenge one of the Commission’s findings on the basis that the collapse of the walkways was not caused by a certain specific failure. This is raised in connection with the finding that the failure to delineate special strength steel for the rods was grossly negligent. The rods themselves did not fail. In making this assertion appellants rely on the elements of a common law cause of action for negligence, i.e., duty, breach, proximate causation, and injury or damage. They assert that proximate causation is not present. In the first place we are not dealing with a civil cause of action for negligence. We are dealing instead with a determination of whether appellants negligently breached their duty in the design of the walkways. That breach occurred at the latest when their design was incorporated into the building with their approval and they were subject to discipline whether or not any collapse subsequently occurred. It is the appellants’ conscious disregard of their duty for which discipline is being imposed not the result of that breach. . . . Damage or injury is not an element of this disciplinary proceeding and proximate cause is the legal concept that authorizes civil recovery for damage resulting from negligence. It is not in and of itself an aspect of “negligence,” only an aspect of a civil cause of action for negligence. Related to that concept is the fact that indeed there was damage caused by the breach. By statute and under the contract the owner of the building was entitled to a building structurally safe and sound. . . . The owner did not receive such a building because of appellants’ breach of their professional responsibility. The owner received a defective

building. Whether the walkways collapsed or not, the owner was damaged because it received less than it was entitled to and that damage was proximately caused by appellants' acts and omissions. Further we have previously stated that gross negligence is not required in each act of appellants; it is their overall conduct in regard to the Hyatt construction which justifies discipline.

* * *

The statutory provisions make clear that Missouri has established a stringent set of requirements for professional engineers practicing in the state. The thrust of those requirements is professional accountability by a specific individual certified engineer. These requirements establish the public policy of the state for the protection of the public. They require that plans for construction of structures in this state which require engineering expertise be prepared by or under the direct supervision of a specified certified engineer and that that engineer bear personal and professional responsibility for those plans. The affixing of his seal on the plans makes him responsible for the entire engineering project and all documents connected therewith unless he specifically disclaims responsibility for some document relating to or intended to be used for any part of the engineering project. It would be difficult to imagine statutory language more clearly evidencing the total responsibility imposed upon the engineer, and accepted by him when he contracts to provide his services. The statutory statement that the right to engage in the profession is a personal right based upon the individual's qualifications in no way impacts upon the responsibilities imposed upon an engineer. Rather the assessment of the individual "qualifications" of the engineer include his willingness and ability to accept the responsibilities imposed on him by the statutes.

[Ed. note: The court rejected the engineers' contention that the custom of relying on the fabricators to design the connections precluded any finding they were grossly negligent. The court noted that the employees of the fabricator are exempt from licensing requirements.]

* * *

The public policy of this state as it pertains to the responsibility of engineers has been established by the General Assembly in Chapter 327. That Chapter imposes upon the engineer a non-delegable duty of responsibility for projects to which he affixes his seal. . . . The purpose of disciplinary action against licensed professionals is not the infliction of punishment but rather the protection of the public. . . . Chapter 327 has established the responsibility a certified engineer bears when he undertakes a contract in his professional capacity. Sec. 327.191 authorizes

noncertificated engineers to perform engineering work "under the direction and continuing supervision of and is checked by" a certificated engineer. It is a misdemeanor for a certified engineer to affix his seal to plans which have not been prepared "by him or under his immediate personal supervision." Sec. 327.201. A corporation may engage in engineering activities if it has assigned responsibility for proper conduct of its professional engineering to a registered professional engineer. Sec. 327.401. Gillum was the engineer designated by G.C.E. as having that responsibility. An engineer affixing his seal to plans is personally and professionally responsible therefor. Sec. 327.401. Affixing his seal to plans imposes upon the engineer responsibility for the whole engineering project unless he, under seal, disclaims such responsibility. Gillum made no such disclaimer here. The entire thrust of Chapter 327 is to place individual personal and professional responsibility upon a known and identified certificated engineer. This is the responsibility the engineer assumes in exchange for the right to practice his profession. It is the assumption of this responsibility for which he is compensated. The statutory framework is established to protect the public and to hold responsible licensed engineers who fail to afford that protection. It is clear that the statute expresses the intent to impose disciplinary sanctions on the engineer responsible for the project whether the improper conduct is that of himself or attributable to the employees or others upon whom he relies. This case differs, therefore, from the cases relied upon by Gillum and G.C.E. where the statute did not impose such non-delegable responsibility. The Commission did not err in finding that Gillum and G.C.E. were subject to discipline for the acts or omissions of Duncan.

* * *

We now turn to the sufficiency of the evidence to support the Commission's findings that discipline was warranted. In so doing we note again the concession of appellants that except for five findings the findings of fact of the Commission are supported by evidence. We have previously stated our analysis of the five disputed findings. We review the sufficiency within the legal principles and framework heretofore explicated.

We look first to Duncan. He was the project engineer for the Hyatt and as such had primary responsibility within his company for designing and approving those aspects of the Hyatt which required structural engineering expertise. The design of the connections in the walkways and the design of the walkways themselves were included in that responsibility. The walkways were intended to carry pedestrian traffic. They were suspended above the main lobby of the hotel, recognized to be the main

point of congregation within the hotel. The walkways each weighed approximately 35 tons and were comprised of heavy and largely non-malleable materials such as steel, concrete, glass and wood. The connections in the walkway were nonredundant so that if any one within a single walkway failed they all would fail and the walkway would collapse. Duncan had never designed a system similar to the Hyatt walkways. It is self-evident that the walkways offered a potential of great danger to human life if defectively designed. The Commission could properly consider the potential of danger in determining the question of gross negligence. That which might constitute inadvertence where no danger exists may well rise to conscious indifference where the potential danger to human life is great. This is simply to say that the level of care required of a professional engineer is directly proportional to the potential for harm arising from his design and as we have previously stated indifference to harm and indifference to duty are closely related if not identical.

The structural drawings of Duncan furnished to the fabricator contained several serious errors. Under standard engineering practice Duncan could either design the box beam-hanger rod connections or cause the drawings to reflect his intention that they be designed by the fabricator. These drawings did neither. They appeared to be connections fully designed by the engineer and were reasonably so interpreted by the fabricator. Duncan testified that he intended the fabricator to design the connections. The drawings did not contain information indicating that the connections were to be designed by the fabricator and omitted important engineering load calculations necessary to enable the fabricator to design the connections. The drawings failed to properly identify the type of weld required, the need for bearing plates and/or stiffeners, and erroneously identified the hanger rods as standard rather than high-strength steel. The box beam-hanger rod connections and the hanger rods themselves on all three walkways, as shown by the structural drawings, did not meet the design specifications of the Kansas City Building Code. That Code is intended to provide a required level of safety for buildings within the City. It is difficult to conclude that gross failure to comply with that Code can constitute other than conscious indifference to duty by a structural engineer.

Because of certain difficulties in fabrication Havens requested a change to the double rod configuration. This request was transmitted to Duncan who approved it and verified its structural soundness and safety to the architect. He did so without having conducted all necessary engineering tests and calculations to determine the soundness and safety of the double rod arrangement. His concern was with its architectural acceptability not its structural acceptability. The result of this change was to

double the load on the fourth floor walkway and impose a similar increase on the connections which were already substantially below Code requirements.

Havens supplied Duncan with its shop drawings. Under the contract, and under the statute, review and approval of the shop drawings is an engineering function. Appellants' normal in-house procedures called for detailed check of all special connections during shop drawing review. Duncan was aware of the change to the two-rod system but did not review the box beam-hanger rod connection on the fourth floor walkway. Duncan did not, as is standard practice, look for an assembled detail of the connection and did not assemble the components, either in his mind or on a sketch, to determine what the connection looked like in detail. The shop drawings did not reflect the use of stiffeners or bearing plates necessary to bring the connections within Code requirements. No review was made nor calculations performed to determine whether the box beam-hanger rod connection shown on the shop drawings met Code requirements. Shop drawing review by the engineer is contractually required, universally accepted and always done as part of the design engineer's responsibility. The box beam-hanger rod connections and the hanger rod shown on the shop drawings did not meet design specifications of the Code.

Following the atrium roof collapse appellants were requested by the architect and owner to recheck all the steel in the atrium. They reported that they had done so and included in that report was the statement "we then checked the suspended bridges and found them to be satisfactory." In fact appellants did not do a complete check of the design of all steel in the atrium and did not do a complete check of the suspended "bridges," i.e., walkways. As finally built, the hanger rods and the box beam-hanger rod connections did not meet the requirements of the Code. The walkway collapse was the result of the failure of the fourth floor box rod connections. The third floor walkway, which did not collapse, had a "high probability" of failure during the life of the building.

The determination of conscious indifference to a professional duty, i.e., gross negligence, is a determination of fact. The conduct of Duncan from initial design through shop drawing review and through the subsequent requested connection review following the atrium roof collapse fully supports the Commission's finding of conscious indifference to professional duty. The responsibility for the structural integrity and safety of the walkway connections was Duncan's and that responsibility was non-delegable. . . .

He breached that duty in continuing fashion. His reliance upon others to perform that duty serves as no justification for his indifference to his obligations and responsibility. The findings of the Commission as to Duncan's gross negligence are fully supported by the record.

The Commission also found Duncan subject to discipline for misconduct in misrepresenting to the architects the engineering acceptability of the double rod configuration when he performed no engineering calculations or other engineering activities to support his representation. The Commission found such representation to have been made either knowing of its falsity or without knowledge of the truth or falsity. The Commission found Duncan's misrepresentation to be the willful doing of an act with wrongful intention which it had defined as misconduct. We find no error in either the factual findings or legal conclusion of the Commission. Duncan's representation to the architect concerning a material fact, without a basis for knowledge of its truth or falsity, could properly be viewed as either misconduct as an engineer or gross negligence. In either event it subjected Duncan to disciplinary action.

The Commission found Gillum subject to discipline for gross negligence under the vicarious liability theory and also personally grossly negligent in failing to assure that the Hyatt engineering designs and drawings were structurally sound from an engineering standpoint prior to impressing thereon his seal and in failing to assure adequate shop drawing review. It further found Gillum to be subject to discipline for unprofessional conduct and gross negligence in his refusal to accept his responsibility as mandated by Chapter 327 and his denial that such responsibility existed. All of these findings arise from the same basic attitude of Gillum that the responsibility imposed by Chapter 327 is not in keeping with usual and customary engineering practices and that that responsibility did not mandate his personal involvement in the design of the Hyatt. In essence he placed the responsibility for the improper design of the connections on Havens and took the position that the structural engineer was entitled to rely on Havens' expertise. What we have heretofore said in regard to the requirements of Chapter 327 and the responsibility imposed upon an engineer thereby sufficiently deals with Gillum's contentions.

His argument here that utilization of his seal without disclaimer could not impose responsibility upon him for the

shop drawings of another entity prepared after impression of the seal is clearly rejected by the language of the statute. By Section 327.411.2 the owner of the seal is responsible for the "whole . . . engineering project" when he places his seal on "any plans" unless he expressly disclaims responsibility and specifies the documents which he disclaims. The shop drawings were part of the documents comprising the engineering project and were "intended to be used for any part or parts of the . . . engineering project. . . ." Gillum was by statute responsible for those drawings and he accepted such responsibility when he entered into the contract and utilized his seal. His refusal to accept a responsibility so clearly imposed by the statute manifests both the gross negligence and unprofessional conduct found by the Commission. These findings are further bolstered by the evidence of Gillum's participation in the misrepresentations concerning, and nonperformance of, a review of the atrium design upon direct request of the architect and owner. Although we have found that a specific finding of misconduct and discipline therefor cannot be based upon the atrium design review because not charged in the complaint, the evidence is relevant and persuasive on Gillum's overall mental approach to his responsibilities as an engineer and the cavalier attitude he adopted concerning the Hyatt project.

Appellant G.C.E. is, for reasons heretofore stated, subject to discipline for the conduct of its employees and particularly for the conduct of the engineer assigned the responsibility for the "proper conduct of all its . . . professional engineering . . . in this state. . . ."

The finding of misconduct against Gillum arising from the "atrium design review" is reversed.¹⁷ In all other respects the order of the Commission and the discipline imposed by the Board is affirmed.

KAROHL, P. J., and KELLY, J., concur.

¹⁷[Ed. note: This ground for discipline was not alleged in the complaint.]

Other cases have also involved sufficiently flagrant misconduct or incompetence to justify a drastic agency decision. For example, a court affirmed an agency decision revoking the license of a professional engineer who had performed welding without being certified as required by the state administrative code.¹⁸ In the same case, however,

¹⁸*Vivian v. Examining Bd. of Architects, etc.*, 61 Wis.2d 627, 213 N.W.2d 359 (1974).

the court would not affirm the agency's revocation where the professional engineer designed and supervised the construction of a garage that collapsed. The court held that the incompetence did not have to consist of continued and repeated acts. However, incompetence must refer to some demonstrated lack of ability to perform professional functions. Although recognizing that there was an admitted error in the design of the roof supports for the garage, the court noted that the error was not obvious and

that this was the first failure the engineer had experienced in eleven years of practice.

A revocation of an architect's license was affirmed based on serious design errors leading to the failure of the basement wall.¹⁹ The architect also caused construction delay, failed to obtain a building permit, misplaced the building in reference to the lot line, and secured the owner's endorsement of payment without informing him of the facts. Another court affirmed a six-month suspension based on a deficient ventilation plan, a superficial inspection of the premises, a superficial scanning of the architectural plan, and reliance on the judgment of two relatively inexperienced employees.²⁰ In addition, the engineer, after finding that the original certifications were in error and serious defects existed, did not disclose this to appropriate city officials.

Many members of the design professions operate under economically unstable conditions. Swings in the economic cycle can prove devastating. As a result, individual bankruptcies of architects and engineers are not uncommon when the economy turns for the worse. Those in the contracting business face similar risks.

The California experience illustrates how difficult it can be to reconcile the state's right to protect the public through its licensing laws with the interest of the federal government in effectuating the bankruptcy laws designed in part to give the bankrupt a fresh start. Section 7113.5 of the California Business and Professions Code had stated that grounds for disciplinary action existed if the contractor had settled a lawful obligation for less than the full amount of the obligation by having all or part of the debt discharged in bankruptcy. Yet *Grimes v. Hoschler*²¹ held that this would frustrate the fresh-start purpose of the federal bankruptcy law. Risking one's license could discourage a contractor from discharging its business debts in bankruptcy. The contractor would very likely pay its discharged business debts to avoid losing its license. The licensing law would not

¹⁹*Kuehnel v. Wisconsin Registration Bd. of Architects & Professional Engr's*, 243 Wis. 188, 9 N.W.2d 630 (1943).

²⁰*Shapiro v. Bd. of Regents*, 29 A.D.2d 801, 286 N.Y.S.2d 1001 (1968). See also *Martin v. Sizemore*, supra note 16. It sustained a holding that omission of fire alarms, exit lights, and emergency lighting were grounds for disciplinary action. This case was discussed in Section 10.03. Cases involving architect license revocations and suspensions are collected in Annot. 58 A.L.R.3d 543 (1974) and those involving engineer licenses in Annot. 64 A.L.R.3d 509 (1975).

²¹12 Cal.3d 305, 525 P.2d 65, 115 Cal.Rptr. 625 (1974), cert. denied, 420 U.S. 973 (1975).

only discourage contractors from availing themselves of the provisions of the Bankruptcy Act but also deny a fresh start to those licensees who are adjudicated bankrupts.

Shortly after this decision, the California legislature bowed to the federal law and the court decision by modifying Section 7113.5, barring disciplinary action being taken against a contractor who settled his debts for less than the full amount by bankruptcy.

The issue surfaced again in 1986. In *Parker v. Contractors State License Board*,²² the licensing board sought to suspend a bankrupt contractor who had deducted benefit contributions from his employees' wages but did not forward them to the union. However, the union trust fund claim against him had been discharged by bankruptcy. The court held that the board could not discipline the contractor for going bankrupt, as that would prevent him from obtaining a fresh start. But disciplinary action could be based on fraud or a violation of the California Labor Code. Factors other than the bankruptcy could indicate the contractor was unsuitable to hold a license. The court sent the case back to the trial court to determine whether the activity of the contractor was fraudulent or simply failure to pay for lack of money.

Usually, attempts to discipline an architect or engineer relate to conduct after the license was issued. But California held that conduct before admission to practice could be misconduct that justified revocation of the license.²³ The architect in this case had difficulties with Virginia architectural board authorities that led to criminal charges. The architect did not report this when he applied for admission in California. The Supreme Court rejected the contention by the architect that the registration statutes were penal and must be strictly construed. The court held that the registration statutes were not penal but were designed to protect the public.

The effectiveness of postadmission disciplinary powers has been limited. Attempts to suspend or revoke are almost always challenged by the design professional or contractor whose means of livelihood are being taken away. Challenges often mean costly appeals. Often administrative agencies charged with responsibility for regulating the profession or occupation are underfunded and understaffed. Suspension and revocation are unpleasant tasks. Even when action is taken, courts closely scrutinize

²²187 Cal.App.3d 205, 231 Cal.Rptr. 577 (1986).

²³*Hughes v. Board of Architectural Examiners*, supra note 6.

decisions of administrative agencies. As an example, Washington held that the board findings must be based on “clear, cogent, and convincing evidence”, a more demanding standard than the usual civil law standard of preponderance of the evidence.²⁴

Courts *should* extend considerable deference to the agency decision. In matters as important as these, however, courts seem to redetermine what is proper. The combination of agency lethargy and overextensive judicial scrutiny when agencies do act may be one reason, among many, for increased professional liability. The latter can supplement or even replace the regulatory licensing process as a means by which incompetent practitioners are eliminated.

SECTION 10.05 Types of Licensing Laws

It must be emphasized again that each state determines licensing rules. As a result, considerable variety exists in the regulatory controls in both prohibited conduct and sanctions for violations. Also, legislation frequently changes. Case decisions cannot always be relied on because subsequent legislation may change the result in a particular case. However, some broad patterns have emerged as to the types of controls enacted.

A. Licensing of Architects and Engineers: Holding Out and Practice Statutes

Licensing laws fall into two main categories. Some statutes regulate the professional title and are called “holding out” statutes. For example, in 1965 Ohio enacted such a statute stating that “[n]o person shall use the title ‘landscape architect’ . . . unless he is registered . . . or holds a permit.” A court passing on the validity of this legislation stated,

A practitioner, upon qualifying, becomes entitled to use the label, “landscape architect.” Only the title, not the practice or profession, is restricted to licensees. Unregistered members may continue to practice, but without employing the title. Thus, appellant’s allegation that the law prohibits him from practicing his profession is not well taken; only his use of the title “landscape architect” is proscribed.²⁵

²⁴*Nims v. Washington Bd. of Registration*, 113 Wash.App. 499, 53 P.3d 52 (2002).

²⁵*Garono v. State Bd. of Landscape Architect Examiners*, 35 Ohio St.2d 44, 298 N.E.2d 565, 567 (1973).

Projects that affect the public generally are more likely to require the services of a licensed design professional. A licensed design professional is more likely to be required where the project is one for human habitation or one in which large numbers of persons will gather. Some states exclude less complex structures, such as single-family residences, agricultural buildings, or warehouses and commercial buildings below specified sizes and heights.²⁶ See Section 10.06E. Local laws must be checked.

B. Contractor Licensing

The proliferation of occupational licensing has led to an increased number of state licensing statutes for contractors. Until recently, only half of the states had such statutes, although the number seems to be increasing steadily. The statutes raise different problems and are discussed in Sections 10.08 through 10.11.

C. Variations on the Traditional Contracting System

The traditional system for delivering construction services, discussed in Section 8.05, will be discussed again in Section 17.03A. Modern variations on this system are covered in Section 17.04. Some of these variations, such as the use of construction management (Section 17.04D) and combining designing and building (Section 17.04F), have raised difficult licensing and registration problems, which are discussed in those sections.

SECTION 10.06 Statutory Violations

A. Preliminary Issue: Constitutionality

Because of the controversial nature of professional regulation, constitutional attacks are common. By and large, such legislation is upheld based on the police powers granted by state constitutions and constitutional provisions permitting the state to legislate in the interest of public welfare.²⁷ Some successful attacks have been made that have usually involved language or procedural problems and

²⁶Iowa Code Ann. § 544A.18.

²⁷*Richmond v. Florida State Bd. of Architecture*, 163 So.2d 262 (Fla.1964); *State v. Beck*, 156 Me. 403, 165 A.2d 433 (1960); *State v. Knutson*, 178 Neb. 375, 133 N.W.2d 577 (1965); *Pine v. Leavitt*, 84 Nev. 507, 445 P.2d 942 (1968); *Chapdelaine v. Tennessee State Bd.*, 541 S.W.2d 786 (Tenn.1976) (state required surveyors but not engineers to register).

not the power of the state to regulate the professions and occupations.²⁸

B. Holding Out

Rodgers v. Kelley involved an action by the plaintiff for design services for a project that was abandoned because of excessive costs. The clients claimed the plaintiff violated the Vermont holding-out statute. The plaintiff contended that he had never signed his name or in any way represented that he was an architect. He testified that he had twelve years of experience in the architectural field but contended that so long as he did not label himself, his plans, or his business with the title “architect” he had not violated the statute. However, the court stated,

But “holding oneself out as” an architect does not limit itself to avoiding the use of the label. The evidence is clear that, in the community of Stowe, this plaintiff was known as a proficient practitioner of all of the architectural arts with respect to homebuilding, at least. It was a business operation from which he received fees. He presented himself to the public as one who does the work of an architect. This constitutes holding oneself out as an architect, and is part of the very activity sought to be regulated through registration.²⁹

C. Practicing

Which activities fall within architectural practice? Design services can range from simply sketching a floor plan or planning to place a residence on a designated site all the way to construction documents with sufficient detail to obtain a bid from the contractor. In addition to the varying design activities, a differentiation can be made between those services that are part of the design process and those services performed by a design professional during construction.

The differentiation between services performed during the designing phase and those performed during

construction can be difficult. It has been stated that services performed during the design phase are more likely to be considered within the licensing laws than those performed during the construction phase.³⁰ This tendency is undoubtedly based on the specialized training and professional skill possessed by a design professional being manifested mainly in the design phase.

The design professional does bring skill to the construction process by interpreting documents, advising on changes, and judging performance. Some of these skills are intimately connected to other design process skills. The generalization may be true if emphasis is placed on construction methods and organization, more properly the province of the contractor.

This differentiation may be of little practical importance. Design professionals rarely perform services connected only with construction. They perform services connected either with design and construction or with design alone. However, as shall be seen in Section 17.04D, the problem may come to a head when the law is asked to determine whether construction managers must have a design professional license, a contractor’s license, or neither.

Sometimes the person performs design services for registered design professionals and does not deal directly with the public. For example, a Mississippi case involved an unsuccessful attempt by the state registration board to restrain Rogers from performing engineering services or holding himself out as a mechanical designer.³¹ Rogers was not a registered engineer. He operated a small office and did all his work for other architects and engineers and never in any way dealt with members of the public. Mississippi exempted people who performed design services, such as drafters, under the direct control of a registered design professional.

Sometimes the design services are incidental to the selling of equipment or mechanical systems. For example, in *Dick Weatherston’s Associated Mechanical Services, Inc. v. Minnesota Mutual Life Insurance Co.*,³² an insurance company was dissatisfied with advice received from its architects regarding the air-conditioning system. It approached Weatherston, a mechanical contractor with a degree in engineering, for advice. Weatherston made some design

²⁸*H&V Eng’g, Inc. v. Idaho State Bd. of Professional Eng’r and Land Surveyors*, 747 P.2d 55 (Idaho 1987) (“gross negligence” standard for disciplinary action too vague). But see *Duncan v. Missouri Bd. for Architects, Professional Eng’r and Land Surveyors* reproduced in Section 10.04B (upheld such a standard against constitutional challenge).

²⁹128 Vt. 146, 259 A.2d 784, 785 (1969). See also *Carlson v. SALA Architects, Inc.*, 732 N.W.2d 324 (Minn.App.2007), review denied Aug 31, 2007; Annot., 13 A.L.R.4th 676 (1982).

³⁰Annot., 82 A.L.R.2d 1013 (1962).

³¹*State Bd. of Registration v. Rogers*, 239 Miss. 35, 120 So.2d 772 (1960).

³²257 Minn. 184, 100 N.W.2d 819 (1960).

changes but made clear that he was not a registered engineer. These changes were ultimately accepted by architects and engineers retained by the insurance company.

Weatherston claimed and proved he had a valid contract with the insurance company to supply air-conditioning systems. He brought legal action, claiming the insurance company had repudiated the contract. The insurance company claimed Weatherston had been practicing engineering without a license. However, the court concluded after noting that the company knew he was not licensed that his action was brought on the contract to supply the air-conditioning equipment and not a contract for engineering services. The court seemed to assume that those who sell or install mechanical equipment often provide some engineering advice to buyers. When it appears that the principal basis for the claim is the sale of the equipment, the absence of a license under these circumstances should have no effect.

Does testifying as an expert constitute professional practice? For example, in one case a party challenged a lower court verdict because an unlicensed architect had been permitted to testify.³³ The claim was made that testifying was practicing, and violated the licensing laws.

Possession of a license generally does not, however, determine whether a witness will be permitted to testify as an expert. The court permitted the testimony by concluding that testifying was not practicing. However, registration or absence of it goes to the weight of the testimony (how persuasive it is to judge or jury) and not to its admissibility. Expert testimony is discussed in Section 14.06.

D. Architecture and Engineering Compared

States generally regulate architecture and engineering separately. Each profession and the agencies regulating them sometimes differ over where one profession begins and the other ends. These conflicts demonstrate the economic importance of registration as well as the secondary role sometimes played by the public interest.

The two professions can be differentiated by project types and their use. One court stated,

One prominent architect, in explaining the difference between architecture and engineering, said in effect that

³³W. W. White Co. v. LeClaire, 25 Mich.App. 562, 181 N.W.2d 790 (1970).

the entire structure and all of its component parts is architecture, if such structure is to be utilized by human beings as a place of work or assembly. He pointed out that, if the authorities were going to erect a courthouse as the building in which the [case] was being tried, they would obtain the service of an architect; but, if it was proposed to construct a power plant . . . they should employ an engineering firm. . . .

All of the architects and those who were registered as both architect and engineer agreed that the overall plan of a building and its contents and accessories is that of the architect and that he has full responsibility therefor. As one witness answered it, he is the commander in chief.³⁴

In *State v. Beck*,³⁵ the Maine Supreme Court stated aesthetics to be the principal difference between engineering and architecture. To that court an architect was “basically an engineer with training in art.” The court also stated,

While categorically an engineer, the architect—without disparagement toward the professional engineer—is required to demonstrate that he possesses and utilizes a particular talent in his engineering, to wit, art or aesthetics, not only theoretically but practically, also, in coordination with basic engineering.³⁶

The court then cited a Louisiana case that stated that an engineer “designs and supervises the construction of bridges and great buildings, tunnels, dams, reservoirs and aqueducts.”³⁷ The Maine court then described architectural projects:

Architects are commonly engaged to project and supervise the erection of costly residences, schools, hospitals, factories, office and industrial buildings and to plan and contain urban and suburban development. Health, safety, utility, efficiency, stabilization of property values, sociology and psychology are only some of the integrants involved intimately. Banking quarters, commercial office suites, building lobbies, store merchandising salons and display atmospheres, motels, restaurants and hotels eloquently and universally attest to the decisive importance in competitive business of architectural science, skill and taste. A synthesis of the utilitarian, the efficient, the economical, the healthful, the alluring and the blandished is often the difference between

³⁴*State Bd. of Registration v. Rogers*, supra note 31, 120 So.2d at 774.

³⁵Supra note 27.

³⁶165 A.2d at 435.

³⁷*State v. Beck* quoted from *Rabinowitz v. Hurwitz-Mintz Furniture Co.*, 19 La.App.811, 133 So. 498, 499 (1931).

employment and unemployment, thriving commerce and a low standard of existence. Basic engineering no longer suffices to satisfy many demands of American health, wealth or prosperity.³⁸

Statutes sometimes use definitions that recognize some differences between architecture and engineering. For example, in New York the practice of architecture is defined as “rendering or offering to render services which require the application of the art, science, aesthetics of design and construction of buildings, groups of buildings, including their components and appurtenances and the spaces around them wherein the safeguarding of life, health, property, and public welfare is concerned.”³⁹ The practice of engineering is defined as “performing professional service such as consultation, investigation, evaluation, planning, design or supervision of construction or operation in connection with any utilities, structures, buildings, machines, equipment, processes, works, or projects wherein the safeguarding of life, health and property is concerned, when such service or work requires the application of engineering principles and data.”⁴⁰

Some statutes permit engineers to perform architectural services incident to engineering work. For example, one case allowed an engineer to seal drawings that, in the words of the Kansas statute, he is qualified by education, training and experience to prepare, in effect recognizing the overlap between architecture and engineering.⁴¹

Yet another case involved an attempt by the state licensing authorities to restrain two officers of a construction company, who were licensed engineers, from designing a seventy-eight-bed nursing home.⁴² The engineers contended that the design work they were performing was incident to their engineering services to build the structure. The court recognized that some design services are required for any structure and that this is the proper function of the exemption for architectural services incident to engineering work. However, the building of a nursing home, with both the aesthetic considerations of the human beings who would live there and the aesthetic

aspects of positioning the project, was architectural, and the defendants could not perform these services.

The lack of a clear demarcation between the practice of architecture and the practice of engineering means that friction is endemic to the design professions. By far the most common scenario is for an architect to complain to the architectural licensing board that a nonarchitect (usually an engineer) is engaged in the unauthorized practice of architecture on a particular project. If the board finds against the engineer and assesses a penalty, the engineer challenges the administrative action in court.

The vast majority of courts view these complaints as a turf war between the professions and rule in favor of the accused. Little deference is given to the licensing board, which is not a disinterested examiner. Given the overlap between the two professions, expert testimony is rarely helpful. As observed by one court:

We are concerned that, on the testimony entered in this record, had Mr. Lomax [the architect who brought the initial complaint] been awarded the project, the Engineers' Board could have assessed civil penalties against him for the unauthorized practice of engineering. It is noted that the engineering expert witnesses testified that the project comprised 80% engineering and 20% architecture, even though the architectural expert witnesses testified that the project was 80% architectural and 20% engineering.⁴³

However, the Arkansas Supreme Court came to the opposite conclusion in *Holloway v. Arkansas State Board of Architects*.⁴⁴ It rejected the argument of Mr. Holloway, the accused engineer, that the statutes distinguishing architecture from engineering were unconstitutionally vague. It then upheld the board of architecture's assessment of the maximum civil penalty, finding that Holloway's conduct threatened public health and safety.

Sometimes these disputes are resolved by the legislatures, with some intervention by the courts and regulatory agencies. For example, the Michigan constitution required that a majority of the members of any regulatory board be members of the profession being regulated. Subsequently, Michigan passed a statute that required only three members of the seven-member board regulating architects

³⁸165 A.2d at 437.

³⁹N.Y.Educ.Law § 7301.

⁴⁰Id. § 7201.

⁴¹*Schmidt v. Kansas State Bd. of Technical Professions*, 271 Kan. 206, 21 P.3d 542 (2001).

⁴²*Dahlem Constr. Co. v. State Bd. of Examiners*, 459 S.W.2d 169 (Ky.1970). The result was undoubtedly assisted by a special Kentucky statute requiring that architects design nursing homes.

⁴³*Rosen v. Bureau of Professional and Occupational Affairs*, 763 A.2d 962, 969 (Pa.Comm.w.2000), appeal denied, 566 Pa. 654, 781 A.2d 150 (2001). Other courts reaching the same conclusion include *Schmidt v. Kansas Bd. of Examiners*, supra note 41.

⁴⁴352 Ark. 427, 101 S.W.3d 805 (2003).

to be architects. To deal with the prior constitutional requirement, the legislature simply declared architects and engineers to be members of the same profession.

Such a legislative declaration was rejected by a Michigan court that stated the legislature could not declare something that is not so.⁴⁵ The court noted that architects and engineers have different educational requirements and serve different functions.

That these turf fights can be resolved harmoniously between the two professions was demonstrated in New Mexico in 1992 by an agreement made among the agencies regulating engineers, surveyors, and architects. The agreement recognized that architecture and engineering overlap and that in some projects either an architect or an engineer can meet the owner's needs and provide a safe, serviceable building. The agreement defined the incidental practice of architecture and engineering "as those services performed on buildings which have a construction valuation of no more than \$250,000 or an occupant load of no more than 50." According to the agreement, a single professional seal would meet the requirement on building plans submitted for permits within these limits. The agreement resulted from an order by a court in 1985 that an architect-engineer joint practice committee be established to resolve these turf disputes.

For several years, the committee worked on an agreement, which resulted in the agreement made in 1992 and adopted by the regulatory agencies on March 2, 1992. The agreement was also designed to permit the regulatory boards to focus their efforts on unlicensed practice rather than interdisciplinary disputes.⁴⁶

The issue of the relationship of architecture and engineering, along with other allied professions, surfaces in the issue of who can testify in malpractice claims against certain design professionals. This will be discussed in Section 14.06B.

E. Statutory Exemptions

Small projects do not necessarily merit an architect. In the 1960s, several states by statute exempted projects that did not cost more than a designated amount of money, from a require-

⁴⁵*Nemer v. Michigan State Bd.*, 20 Mich.App. 429, 174 N.W.2d 293 (1969).

⁴⁶Press release, Office of the Governor, Santa Fe, New Mexico (May 13, 1992).

ment to be designed by a licensed architect.⁴⁷ Such statutes generated interpretation problems because the cost of a project evolves through various stages. The statutes must also be periodically updated to take inflation into consideration.⁴⁸

Rather than exempt projects based upon their cost, contemporary statutes more commonly exempt projects based upon their size (square footage), height, and type (single-family dwellings are more likely to be exempted). For example, California Business and Professions Code § 5537 exempts "single-family dwellings of woodframe construction not more than two stories and basements in height," multiple-family dwellings with no more than four units of a similar size and construction unless the units form apartment and condominium complexes of over four units, garages and structures appurtenant to exempt dwellings, and agricultural or ranch buildings—unless public officials deem "that an undue risk to the public health, safety or welfare is involved."⁴⁹

F. Possessor of License

Design professionals traditionally performed as sole proprietors or partners. Increasingly, for tax and other reasons, design professionals are being permitted to perform design services through the corporate structure, a concept discussed in Section 3.06.

Most regulation of the design professions assumes individual practitioners. Yet increasingly, design professionals practice in what is known as "firm practice," such as partnerships, corporations, and limited liability companies. Compliance within a state can be difficult, as the rules and regulations often do not keep up with new forms of practice. But since many firms practice in more than one state, the problems become extraordinarily complex. While there is general similarity of regulations of individual practitioners, there are confusingly complex and often contradictory rules for firm practice.

Although a number of issues must be addressed, one commentator states that many states "require licensees

⁴⁷A collection of these statutes, now virtually all repealed, may be found in *State v. Spann*, 270 Ala. 396, 118 So.2d 740 (1960).

⁴⁸For example, as of October 1, 2007, North Carolina increased from \$700,000 to \$1,000,000 the value of a project that may be built by a general contractor holding an "intermediate license." N.C.Gen.Stat. Ann. § 87-10, amended, 2007 N.C. Laws, S.L. 2007-247.

⁴⁹Similar statutes are Iowa Code Ann. § 544A.18 and Tenn. Code Ann. § 62-6-103(a)(2)-(5).

to hold certain defined positions with the firm.” This, he states, “is the area of greatest variation.” He states that the issue that requires closest attention is whether the right people in the firm have the right licenses, with particular reference to who is in charge of services and who can seal and sign drawings.⁵⁰

G. Out-of-State Practice

The practice of architecture and engineering as well as the performance of construction services increasingly crosses over state lines. As a result, a person licensed in one state often performs services in another.

Sometimes design professionals who perform services on a multistate basis obtain licenses in each state in which they perform services or in which projects for which they perform services are located. This has become easier because of standardized examinations and increased reciprocity.

Some registration laws do not require professionals licensed in a foreign state to become registered if they perform work only for an isolated transaction or perform work not to exceed a designated number of days. Often such exemption requires an easily obtained temporary license.

As interstate practice has become more common, an increasing number of cases have dealt with attempts by design professionals licensed in one state to recover for services related to a project in another. For example, in *Johnson v. Delane*⁵¹ an engineer licensed in the state of Washington obtained a commission to prepare plans and specifications for a project to be built in Idaho. The engineer was not to perform any supervisory function. He obtained the commission while visiting in Idaho. He performed the requisite design services in Washington and delivered the plans and specifications to the client in Idaho. The court held that he was not practicing architecture in Idaho, and he recovered for his services.

Some state laws do not require a license for performance of services by out-of-state design professionals if they are licensed in the state where they practice principally and as long as there is a licensed design professional in overall charge of the project. However, the licensed

local design professional must not be a figurehead but must actually perform the usual design professional functions. Sometimes, as in *Food Management, Inc. v. Blue Ribbon Beef Packing, Inc.*, out-of-state architects or engineers “associate” a local architect as a means of ensuring that they will be able to collect their fee.⁵²

In *Hedla v. McCool*,⁵³ a Washington architect performed design services for a project to be built in Alaska and had the plans approved by an Alaskan engineer. The court emphasized the importance of the policy expressed in Alaska’s licensing law. The court distinguished this case from *Johnson v. Delane*⁵⁴ (discussed earlier) by noting that the Alaska statute was broader, that this was not an isolated transaction, and that conditions in Alaska were different from those in the state of Washington. The court was more persuaded by the holding in the *Food Management* case, which had not looked kindly on out-of-state architects associating a local architect when the out-of-state architects were principally responsible for design decisions.⁵⁵

One important consideration permeating these cases is whether the unlicensed person seems to have performed properly. If so, denial of recovery, despite the importance of license compliance, may seem unjust. For example, in *Delane* the work appears to have been performed correctly. But in *Hedla v. McCool*, where recovery was denied, the costs overran considerably and the design was never used—factors that make recovery less attractive.

The expansion of reciprocity and the ease with which out-of-state design professionals who are registered in their home states can be allowed to practice in other states may make it more difficult for design professionals to recover if they do not use these techniques for legitimating their projects in states where they are not licensed. In any event, any design professionals considering performing design services either in another state or for a project that will be built in another state should receive legal advice on the proper process for ensuring that they are not violating the laws of the state where the services are being performed or the project is located.

⁵⁰Noble, “DON’T LEAVE HOME WITHOUT IT—A Strategy for Complying with Interstate Architectural Practice Rules,” *UNDER CONSTRUCTION*, Newsletter of the ABA Forum on the Construction Industry, p. 1 (Dec. 2001).

⁵¹77 Idaho 172, 290 P.2d 213 (1955).

⁵²413 F.2d 716 (8th Cir.1969).

⁵³476 F.2d 1223 (9th Cir.1973). Similarly, a local association failed in *O’Kon and Co., Inc. v. Riedel*, 588 So.2d 1025 (Fla. Dist. Ct. App. 1991).

⁵⁴Supra note 51.

⁵⁵Supra note 52.

H. Substantial Compliance

Increasingly, attempts by unlicensed contractors to recover have been based on asserted “technical” noncompliance with the law. This is not, strictly speaking, a contention that the law has not been violated. As a result, this doctrine is discussed in Section 10.07B and, inasmuch as contractors have been the principal users of this approach, in Section 10.10C.

SECTION 10.07 Sanctions for Licensing Law Violations

A. Criminal and Quasi-Criminal Sanctions

Licensing laws usually carry criminal sanctions. Violations can be punished by fine or imprisonment. However, use of the criminal sanction is relatively rare. Perhaps occasional instances have occurred where fines have been imposed, although it is quite unlikely, though possible, that imprisonment will be ordered. Where a penal violation is found, it is likely that sentence will be suspended or probation granted.⁵⁶

Increasingly, states are permitting victims of crimes to receive restitution for losses caused by those who commit crimes. For example, Washington has allowed restitution as a condition of probation.⁵⁷ Where restitution is denied, denial is based upon the defendants not having protections available in civil actions, such as pleading requirements, discovery, and a jury trial. The Washington court only allowed restitution to correct dangerous defects.

Arizona provides a constitutional right to restitution to the victim of crime and has implemented statutes to provide the details. The statute allows lost earnings and interest but not recovery for pain and suffering, punitive damages, or consequential damages.⁵⁸

In *State v. Wilkinson*,⁵⁹ the Arizona Supreme Court applied this statute in a criminal action against an unlicensed contractor (criminal fine was \$2,500 while the claims for restitution were for \$45,000). The court held the statute was designed to force the criminal to yield up to the victim the fruits of his crime. To do this, the victim

can recover payments made but not the cost of remedying the defective work or completing the work.

A quasi-criminal sanction can be invoked. If the licensing authorities obtain a judgment from the court ordering that the unlicensed design professional cease practice and the order is disobeyed, failure to comply will be contempt of court and punishable by a fine or imprisonment. Just as law enforcement officials rarely have the staff or resolve to seek criminal sanctions, the regulatory agencies rarely seek a judicial order that the violator is in contempt.

In 1985, the California Code of Civil Procedure Section 1029.8 added another quasi-criminal sanction. It *trebles* any actual damages (additional damages cannot exceed \$10,000) and allows the court to award attorneys’ fees if an unlicensed person negligently “causes injury or damage to another person.” This sanction does not apply to people who believe in good faith that they are licensed and to people who have failed to renew their license when renewal would have been automatic.

Although the statute appears directed to personal injury claims, it can be read broadly to include damage to property and even economic losses. (Section 253 of the California Insurance Code was added at the same time, stating that coverage of such a treble damage award cannot be insured against.) Such a statute will encourage smaller claims to be taken to court.

B. Recovery for Work Performed and Payment Refunds

The infrequent use of criminal or quasi-criminal sanctions means that the principal sanction for unlicensed practice of architecture, engineering, or construction work has been to deny recovery for work performed. Attempts by unlicensed persons to recover for their work has been the main legal battleground.

Generally, neither party can enforce an illegal contract. The law provides no help if the parties are equally guilty. If a citizen bribes a public official, the citizen cannot sue to have the promised performance made nor can the public official sue to recover the promised bribe.

Courts do not view parties who hire unlicensed contractors as analogous to those who bribe public officials. In the former situation, not only are the parties not equally guilty, they might both be ignorant of the violation (for example, if the contractor lets its license lapse through inadvertence). Also, the illegality of the two situations is

⁵⁶However, in *Huffman v. State*, 356 Md. 622, 741 A.2d 1088 (1999) the unlicensed contractor was sentenced to jail, given probation, and also fined.

⁵⁷*State v. Bedker*, 35 Wash.App. 490, 667 P.2d 1113 (1983) (crime was failure to procure a bond).

⁵⁸Ariz.Rev.Stat. Ann. § 13–105.14.

⁵⁹202 Ariz. 27, 39 P.3d 1131 (2002).

not comparable in terms of intention of the parties, morality, or public policy. In legal parlance, bribing officials is a *malum in se*—intrinsically illegal—while violating a licensing law is a *malum prohibitum*: admittedly a prohibited act, but disallowing enforcement of the contract would be entirely disproportionate to the illegality. For these reasons, the client can enforce its contract against the unlicensed architect or contractor and maintain an action for faulty performance.⁶⁰ The more difficult questions are whether the contractor may recover for work properly performed and whether the client may recoup payments already made under the contract.

An unlicensed contractor's right of recovery *on the contract* for work properly performed depends on the wording of the statute the contractor violated. Three types of statutes exist: those that specify the contractor's right to compensation; those that are silent on the contractor's right to compensation; and those that expressly prohibit the contractor's right to compensation. Tennessee Code Section 62-6-103(b) is an example of the first type of statute, one that specifies a remedy for the contractor. It allows an unlicensed contractor to recover in a court of equity if it can show clear and convincing proof of actual documented expenses. Profits cannot be recovered. Very likely overhead would not be recoverable.⁶¹

Statute Silent on Contractor's Right to Compensation.

Where the statute does not specify that its violation will deprive the contractor of its right to compensation, courts generally view the illegality as a *malum prohibitum* and will not impose upon the contractor the penalty of forfeiture. One case from California and another from Massachusetts illustrate the courts' reasoning.

In *MW Erectors, Inc. v. Niederhauser Ornamental and Metal Works Co., Inc.*,⁶² a sub-subcontractor on a hotel construction project entered into an *ornamental steel* contract with the defendant, a metal works company. (The sub-subcontractor's second, *structural steel* contract is discussed later in this Section.) The sub-subcontractor was unlicensed when it *signed* the ornamental steel contract but licensed when it *performed* the work.

The defendant argued that it was illegal for the sub-subcontractor to sign the contract while unlicensed. The defendant relied upon California Business and Professions Code Section 7028(a), which makes it a misdemeanor for a person to “engage in the business or act in the capacity of a contractor within this state without having a license therefor.” The defendant took the position that the contract was illegal and therefore void; that is, entirely unenforceable by the sub-subcontractor.

The California Supreme Court allowed the sub-subcontractor recovery under the contract. It agreed that, as a general rule, a contract made in violation of a regulatory statute is void. The contractors' licensing law is regulatory because its purpose is to protect the public. For this reason, courts will not enforce an agreement for contractor services executed by a person who was not licensed to perform them. But that rule, the court continued, did not compel the conclusion that a contractor should be denied any recovery where it was licensed at all times during performance, even though not licensed when it signed the construction contract. In addition, a statute which makes conduct illegal and also provides for a fine or administrative discipline (as do the licensing laws) by implication precludes the court from imposing additional penalties. Also, where a contract's illegality was not a *malum in se*, it is voidable but not necessarily void; courts will declare the contract void only if public policy compels such a harsh measure. The court concluded:

We see no such necessity [for forfeiture] here. As indicated, the CSLL [Editor: Contractors' State License Law] expressly provides multiple means of enforcing the general ban on acting as an unlicensed contractor, insofar as that prohibition includes the mere execution of contracting agreements while unlicensed. Though the Legislature barred recovery of compensation by unlicensed contractors under certain circumstances, it did not impose this bar against contractors who, though licensed at all times during performance of contracting work, had executed agreements for the work while unlicensed. No compelling reason exists to conclude that the public protective purposes of the CSLL can only be served by deeming such contracts illegal, void, and unenforceable on that basis alone.⁶³

Town Planning & Engineering Associates, Inc. v. Amesbury Specialty Co., Inc. involved a contract for design services

⁶⁰*Hedla v. McCool*, supra note 53; *Domach v. Spencer*, 101 Cal. App.3d 308, 161 Cal.Rptr. 459 (1980) (unlicensed contractor); *Cohen v. Mayflower Corp.*, 196 Va. 1153, 86 S.E.2d 860 (1955).

⁶¹The statute was applied in *Roberts v. Houston*, 970 S.W.2d 488 (Tenn.App.1997).

⁶²36 Cal.4th 412, 115 P.3d 41, 30 Cal.Rptr.3d 755 (2005).

⁶³*Id.*, 115 P.3d at 59.

made by an unlicensed designer who had been approached by a client. The unlicensed designer retained two registered professional engineers as well as a registered land surveyor to perform services related to the project. However, much of the work was done by the designer and his six drafters. The project was ultimately abandoned when the bids were too high. At first the client told the unlicensed designer to renegotiate the bids or get lower ones, but shortly thereafter the client terminated the contract, claiming it was illegal. Subsequently, the client negotiated directly with a contractor, obtained a reduced bid for a somewhat scaled-down project, and to some degree used the unlicensed designer's plans.

The court noted that the plaintiff's work had been properly performed. In holding that the plaintiff could recover, the court stated,

If there was a violation here, it was punishable as a misdemeanor under the statute. Violation of the statute, aimed in part at least at enhancing public safety, should not be condoned. But we have to ask whether a consequence, beyond the one prescribed by statute, should attach, inhibiting recovery of compensation, and we agree with the judge in his negative answer to the question in the present case. To find a proper answer, all the circumstances are to be considered and evaluated: what was the nature of the subject matter of the contract; what was the extent of the illegal behavior; was that behavior a material or only an incidental part of the performance of the contract (were "the characteristics which gave the plaintiff's act its value to the defendant . . . the same as those which made it a violation . . . of law"); what was the strength of the public policy underlying the prohibition; how far would effectuation of the policy be defeated by denial of an added sanction; how serious or deserved would be the forfeiture suffered by the plaintiff, how gross or undeserved the defendant's windfall. The vector of considerations here points in the plaintiff's favor.

Our cases warn against the sentimental fallacy of piling on sanctions unthinkingly once an illegality is found. As was said in *Nussenbaum v. Chambers & Chambers, Inc.*, 322 Mass. 419, 422, 77 N.E.2d 780, 782 (1948): "Courts do not go out of their way to discover some illegal element in a contract or to impose hardship upon the parties beyond that which is necessary to uphold the policy of the law." Again the court said in *Buccella v. Schuster*, 340 Mass. 323, 326, 164 N.E.2d 141, 143 (1960), where the plaintiff was allowed to recover his compensation for blasting ledge on the defendant's property although he had not given bond or secured a blasting permit

as required by law: "We do not reach the conclusion that blasting without complying with the requirements . . . is so repugnant to public policy that the defendant should receive a gift of the plaintiff's services." Professor Corbin adds: "The statute may be clearly for protection against fraud and incompetence; but in very many cases the statute breaker is neither fraudulent nor incompetent. He may have rendered excellent service or delivered goods of the highest quality, his non-compliance with the statute seems nearly harmless, and the real defrauder seems to be the defendant who is enriching himself at the plaintiff's expense. Although many courts yearn for a mechanically applicable rule, they have not made one in the present instance. Justice requires that the penalty should fit the crime; and justice and sound policy do not always require the enforcement of licensing statutes by large forfeitures going not to the state but to repudiating defendants." 6A A. Corbin, *Contracts* § 1512, at 713 (1962) [footnote omitted].⁶⁴

Statute Bars Contractor's Right to Compensation.

California Business and Professions Code § 7031(a) is an example of a statute that prohibits an unlicensed contractor from suing the client for compensation for work performed. Section 7031(a) states that no contractor

may bring or maintain any action, or recover in law or equity in any action, in any court of this state for the collection of compensation for the performance of any act or contract where a license is required by this chapter without alleging that he or she was a duly licensed contractor *at all times during the performance* of that act or contract, regardless of the merits of the cause of action brought by the person . . . [italics added].

The California Supreme Court in the *MW Erectors* case also addressed Section 7031(a), this time when discussing the *structural steel* contract signed by the sub-subcontractor. Here, the sub-subcontractor was *unlicensed* when it signed the structural steel contract *and also during the first month of work*. So part of the actual work was done while the sub-subcontractor was unlicensed. Applying the plain wording of § 7031(a), the court ruled that, because the sub-subcontractor was not licensed "at all times" during performance of the structural steel contract, it could not recover *any* compensation under that contract.

⁶⁴369 Mass. 737, 342 N.E.2d 706, 711–712 (1976).

The effect of the court's decision is that a contractor who becomes unlicensed any time during performance faces the threat of forfeiture. The *MW Erectors* court had before it briefs from amici curiae ("friends of the court" who file briefs in addition to those filed by the parties). These amici curiae cautioned the court that its ruling would encourage contractors to abandon a project once they discovered even a momentary gap in licensure, because they will have forfeited the right to any compensation under the contract. In response, the court noted that Section 7031 does not prevent the owner from paying for work voluntarily and that "[b]usiness considerations may persuade the beneficiary to ignore license lapses it deems insignificant, and to continue compensating the contractor, in order to avoid disruption of progress on the project."⁶⁵

The court's reasoning is brought into question by the legislature's passage in 2001 of Section 7031(b), which allows the owner to obtain reimbursement of payments it had made to the unlicensed contractor. Under § 7031(b), a devious owner may coax the contractor to continue performance by paying it. Once the work is nearly complete, the owner could then recoup these payments based upon the contractor's lack of a license for even a brief time (assuming the substantial compliance doctrine does not apply).

The complications from the court's ruling do not end there. One argument not mentioned by the court is that a contractor who abandons a project fearing it has lost its right to compensation would subject itself to loss of its license.⁶⁶ The threat of losing its license should prevent most contractors from choosing abandonment.

When faced with a statute that expressly bars an unlicensed contractor's right to compensation (such as California Business and Professions Code § 7031(a)), the contractor may attempt recovery not under the contract, but based on restitution. The contractor claims it has conferred a benefit on the other party and that leaving the parties in status quo could cause unjust enrichment.⁶⁷ The unlicensed contractor might also claim that the hiring party knew of its unlicensed status but represented that

this would not be a problem. Under these facts, denial of restitution could be viewed as the courts assisting in the furtherance of a fraud.

In *Hydrotech Systems, Ltd. v. Oasis Waterpark*,⁶⁸ the California Supreme Court rejected both the restitution and fraud arguments. A California corporation wished to build a waterpark in California using a New York vendor's wave-generating equipment. The vendor wanted to sell but not install the equipment, because it was not licensed in California. The prime contractor insisted the vendor install the equipment, and it did so. When the vendor later sued for payment, the owner and prime contractor raised its unlicensed status as a defense. Even under these compelling facts, the California high court refused to recognize either a fraud or an "isolated transaction" exception to Section 7031. Nor was an exception made because the vendor was a subcontractor who dealt with a prime contractor, not with a member of the public.

In *Stokes v. Millen Roofing Company*,⁶⁹ homeowners knowingly hired an unlicensed contractor to install a roof. When the unpaid contractor filed a mechanics' lien, the owners asked the court to have it discharged because the contractor was unlicensed. The licensing statute provided that a "person . . . shall not bring or maintain an action . . . for the collection of compensation for the performance of an act or contract for which a license is required by this article. . . ."⁷⁰

The court denied even reimbursement of the costs of the contractor's supplies, finding that such a recovery would constitute "compensation" within the meaning of the statute. But the case produced four opinions: the majority, two concurrences, and a dissent. All four opinions addressed the same issue: the equity of preventing payment based solely on the contractor's unlicensed status, where the contractor produced quality workmanship and the owners hired him knowing he was unlicensed. Most troubling was evidence that in a *separate* case involving the same improvement, the owners had hired another unlicensed contractor and then refused to pay him because he was unlicensed. It appeared that the owners were abusing the statutory scheme: hiring unlicensed contractors and then hiding behind their lack of a license in order to deny them payment.

⁶⁵Supra note 62, 115 P.3d at 51 n. 10.

⁶⁹466 Mich. 660, 649 N.W.2d 371, reh'g denied, 467 Mich. 1202, 651 N.W.2d 920 (2002).

⁷⁰Mich.Comp.Laws § 339.2412(1).

Sophisticated Parties. While claims by and against unlicensed contractors will be discussed in Section 10.10, one difficulty faced by the law is revealed when the claim is made by an unlicensed subcontractor against a prime contractor who knew the subcontractor was unlicensed. If the purpose of the law is to protect homeowners who may not be able to determine the competence of contractors, the unlicensed subcontractor should recover. But if the state enacts licensing laws to limit those who perform construction services to those who have met the competence required by the state and to encourage contractors to become licensed, the unlicensed subcontractor should not recover for her work even if the prime knew she was not licensed.

The difficulty of reconciling these objectives is shown by the different judicial attitudes when the contract is made between contractors rather than between a contractor and an owner.⁷¹ Although this factor may not be determinative, recovery by the unlicensed contractor is more likely if the other party was also a contractor.

Despite some recent criticism of licensing laws noted in Section 10.02B, the laws generally are still received favorably by the courts. Even in the absence of an express statutory provision dealing with the right to collect, unlicensed persons generally are not able to recover either on the contract or on unjust enrichment.⁷²

Payment Reimbursement. May a client recoup payments already made during performance to an unlicensed contractor? As always, analysis of this question must begin with the governing statute. In 2001, the California legislature added subsection (b) to California Business and Professions Code § 7031, which allows “a person who utilizes the services of an unlicensed contractor [to] bring an action . . . to recover all compensation paid to the unlicensed contractor for performance of any act or contract.” Although no appellate court has interpreted this statute, its intention to grant the client a right of reimbursement seems clear.

⁷¹Compare *Enlow & Son, Inc. v. Higgerson*, 201 Va. 780, 113 S.E.2d 855 (1960); (granted recovery) with *Opp v. St. Paul Fire & Marine Ins. Co.*, 154 Cal. App.4th 71, 64 Cal.Rptr.3d 260 (2007); *Triple B Corp. v. Brown & Root, Inc.*, 106 N.M. 99, 739 P.2d 968 (1987) and *Frank v. Fischer*, 108 Wash.2d 468, 739 P.2d 1145 (1987) (denied recovery). See Section 10.10A.

⁷²*Food Management, Inc. v. Blue Ribbon Beef Pack, Inc.*, supra note 52. The decision cites many cases from a number of jurisdictions denying recovery. See also *Southern Metal Treating Co. v. Goodner*, 271 Ala. 510, 125 So.2d 268 (1960). An earlier edition of this book is cited in *Gerry Potter's Store Fixtures, Inc. v. Cohen*, 46 Md.App. 131, 416 A.2d 283, 285 (1980).

Some states allow the owner to recover payments it already made based on common law principles.⁷³ Also, as seen in Section 10.07A, another method to recover payments made has been in those states that allow a victim of crime to recover restitution from the criminal.⁷⁴

Taken together, these statutes and cases may signal the increased importance of registration and licensing laws and a tougher attitude toward those who perform under such illegal contracts. However, the Washington Supreme Court has taken a contrary view, holding that an unlicensed contractor “may assert completion of the work under the contract as a defense to a claim by a customer for reimbursement.”⁷⁵

Some courts give partial relief to the unlicensed person, permitting her to set off compensation for work that has been performed against any claim made against the unlicensed person. For example, suppose an unlicensed architect had furnished services for which she was still owed \$10,000. Suppose that the client on an unrelated matter had \$15,000 coming from the unlicensed architect. In such a case, if the client brought a claim for the \$15,000, some courts would permit the setoff of \$10,000 for work performed under the illegal contract to reduce the claim against the unlicensed architect to \$5,000.⁷⁶

A claim usually seeks a money award. But other uses can be made of the claim. For example, suppose the unlicensed person files a mechanics' lien based on a statute giving security to the person who has improved another's property. Although it can be asserted that this remedy is given to avoid unjust enrichment, some courts, pointing to the need for a valid contract, have denied the right to impose a lien.⁷⁷ Yet one court allowed a lien despite the illegality of the contract when the obligation was restitutionary based on unjust enrichment.⁷⁸ If the Mechanics'

Lien statute itself requires that the lien claimant be licensed, the court will deny a lien even if there are “equities” in favor of the lien claimant.⁷⁹

Suppose the parties to the contract arbitrate the dispute and the arbitrator grants an award to the unlicensed person. Will a court confirm it? One court, stressing the importance of the licensing statute (the case was decided in 1949) refused to confirm the award.⁸⁰ Another case, decided in 1982, stressing that the arbitrator could resolve the legal issues, confirmed the arbitration award.⁸¹

In a 1988 case, the owners discovered soon after the arbitration hearing had ended that their contractor was unlicensed. The arbitrator denied the owners’ request to reopen the hearing and entered an award in favor of the contractor. The court affirmed the award, stressing the need for finality in the arbitration process and observing that the contract, while illegal, was not so repugnant to public policy as to be void *ab initio* (“from the start”).⁸²

Suppose the claimant presents its claim to the bankruptcy court when the other party to the contract has been adjudged a bankrupt. An opinion allowed the claim, for whatever it will be worth, based on the broad discretion given to the bankruptcy court.⁸³ The court was influenced by the bankrupt having been enriched and having acquiesced in continued performance by the claimant after the bankrupt knew the performing party was not licensed. (This claim will come at the expense of the other unsecured creditors, not of the bankrupt.)

C. Summary

Although it must still be generally stated that unlicensed persons are not able to recover based on either the contract they have made or unjust enrichment, some factors may motivate a court to determine that the statute was not violated, substantial compliance is sufficient, or recovery will be had despite a licensing violation. Such factors are as follows:

1. The work for which recovery is sought conforms to the contract requirements.
2. The party seeking a defense based on a violation of the licensing law is in the same business or profession as the unlicensed person.
3. The unlicensed person apparently had the qualifications to receive the license.

SECTION 10.08 Should Contractors Be Licensed?

A. Purpose of Licensing Laws

To protect the public, the state regulates professions, occupations, and businesses. Those who wish to build must retain a contractor and often a designer. Licensing laws should provide a representation to the public that the holder meets a minimal level of competence, honesty, and financial capacity. The state wishes to protect the general public from being harmed by poor construction work and seeks to accomplish this by allowing only those who meet state requirements to design and to build. Yet as seen in this chapter, these efforts are not costless. Educational and experience requirements and the administration of these regulatory systems increase the cost of providing these services. They also reduce the pool of contractors.

Professional designers usually must meet certain educational and training requirements before they are allowed to take the examination that will determine whether they will be registered. Although these requirements do raise the cost of entering the profession, it can be contended that they improve the quality of designers.

As a rule, contractors need meet only experience requirements and not educational ones. (The California application fee is \$300.)⁸⁴ In California, for example, they must have four years of experience in the last ten years in the trade they wish to enter. Under certain circumstances, particular education courses taken can fulfill up to three years of this four-year experience requirement.⁸⁵ Applicants in California take a one-day written examination, half of which is devoted to law and the other half to trade practices. As seen in the Florida experiences described in Section 10.02B, the “pass” line can be drawn

arbitrarily. Can examiners determine what is a reasonable level of classroom performance? Can the classroom simulate actual construction? Even these minimal examination requirements can be waived under certain circumstances under the California Business and Professions Code Section 7065.1.

How will the examiners determine the integrity of the person who applies for a license? This is undoubtedly accomplished by letters of reference (of dubious value) and perhaps other investigations. Yet will investigations uncover much that will reflect the integrity of the contractor? How will the regulatory agency determine financial responsibility? In California financial solvency currently requires a working capital that exceeds \$2,500.⁸⁶ An applicant must post a bond for \$12,500 in California.⁸⁷ Is this bond, which covers more than complaints by homeowners, adequate to establish financial capacity?

California has augmented these relatively modest bond requirements. The California Business and Professions Code requires a contractor to post a bond that equals any unsatisfied final judgment against the contractor that is substantially related to the qualifications, functions, or duties of the license applied for.⁸⁸ Again, as seen in Section 10.04B, respecting the supremacy of the federal bankruptcy law, if there has been a discharge of the unsatisfied judgment in a bankruptcy proceeding, the bond need not be furnished.⁸⁹ Finally, a contractor who has been disciplined by having had its license suspended or revoked can be forced to file an additional bond of not less than \$15,000 or ten times the ordinary bond if it seeks to have its license restored.⁹⁰

What must a contractor do to keep a license in effect? In California, the license must be renewed every two years.⁹¹ The cost of renewal for an active contractor is \$360.⁹² An inactive contractor can renew for \$180.⁹³ There is no provision for periodic examination or continuing education.

Are the undeniable costs that such a system imposes more than balanced by helping *those who need help* to determine who is competent? This raises additional questions. Who needs the protection, and who gets it? Clearly, such legislation was intended to protect those who are inexperienced in the world of construction or who cannot without great cost obtain sufficient information to make judgments. Owners that fall into either category are more likely to make judgments based on whether a contractor is licensed and bonded.

The inexperienced owner building a residence, a duplex, or a four-unit apartment or the naive owner about to engage in home improvement may be helped by the existence of licensing laws. But does that justify an across-the-board licensing requirement and an expensive licensing apparatus? Particular abuses can be dealt with by already abundant consumer legislation.

In addition to these questions, does this system deter unlicensed persons from building? As seen in Section 10.10, often an unlicensed contractor can use the courts to recover for services performed.

B. Harmful Effects

Suppose contractor licensing laws neither screen out the incompetent nor only protect those who need protection. Do they do any harm?

Contractor licensing laws can artificially reduce the pool of contractors, as demonstrated by the Florida experience described in Section 10.02B.

Contractor licensing statutes usually draw lines one cannot exceed between prime contractors and the specialized trades. In addition to the difficulty of drawing these lines, the segregation of specialty trades by licensing tends to reduce the likelihood of better organized, more efficient organizational structures—something so needed in construction.

Other dangers exist. It is not uncommon for licenses to be “bought” and “sold” like any other valuable commodity. An owner who wishes to build a residence or small commercial structure and avoid the cost of a full-time prime contractor sometimes engages an individual with a license, gives that person very little overall control, and limits her activity to periodic visits. This is done to avoid the owner’s being liable for violating the licensing laws and gives a licensed contractor a saleable commodity for a relatively small investment.

⁸⁶West Ann.Cal.Bus. & Prof.Code § 7067.5.

⁸⁹Ibid.

⁹⁰Id. § 7071.8.

⁹¹Id. § 7140.

⁹²Id. § 7137.

⁹³Ibid.

The issuance of a license can be a false representation by the state that may deceive the unwary consumer, that is, state-sponsored “consumer fraud.” Consumers may believe they are dealing with a competent, honest, and financially reliable builder because the builder is licensed. To obtain business from a gullible public, many builders advertise that they are licensed and bonded. Eliminating contractor licensing laws might induce consumers to protect themselves.

SECTION 10.09 Contractor Licensing Laws

Along with the general proliferation in occupational licensing, there has been an increase in contractor licensing laws. At present about half of the states have such laws. Perhaps the deregulation spirit seen briefly in Arizona⁹⁴ may signal a slowdown or even a rollback. But ideological movements such as deregulation often lack the staying power of organized groups, such as consumer groups and contractors, both prime movers in occupational licensing.

Yet inevitably, licensing laws demonstrate the tradeoffs inherent in the political process. Even though in 1987 Arizona went back to a traditional contractor licensing law, it specified sixteen exemptions. For example, owners who improve their own property by themselves or jointly with a licensed contractor are exempt if the structure is not intended for sale or rental. Similarly, employees of owners of condominiums, townhouses, cooperatives, or apartments of four units or fewer need not have a contractor’s license. Also, a surety company that undertakes to complete a contract under the terms of a bond needs no license, provided the work is performed by licensed contractors.⁹⁵

Many states exempt certain projects from the ambit of the contractor licensing laws. For example, North Carolina exempts “furnishing or erecting industrial equipment, power-plant equipment, radial-brick chimneys, and monuments”⁹⁶ Alabama exempts emergency work for public utility or power activity as long as the work is performed under the supervision of a licensed architect or engineer.⁹⁷

Evidently, these states believe that owners in these projects can protect themselves from incompetent contractors

or have persons with construction skills who can supervise the work.

The sanctions imposed on the unlicensed contractor are discussed in detail in Section 10.10. However, many states have statutes that specifically bar an unlicensed contractor from recovering for work performed, something usually not found in architectural and engineering registration laws.

Yet some legislatures have sought to induce contractors to become licensed by granting benefits only to licensed contractors. For example, California permits only a licensed contractor to hold a supplier of goods to any orally communicated price proposal made under certain circumstances.⁹⁸

Contractor licensing laws have also regulated the formation and performance of construction contracts. For home improvement contracts, California requires registration of door-to-door salespersons⁹⁹ and prescribes the contracts’ essential terms. For example, these contracts must identify the contractor, list a start and estimated ending date, notify the owner of lien provisions and methods to avoid liens, and provide notice of a right to cancel within three days after contract signing.¹⁰⁰ Violation of these provisions is grounds for disciplinary action against the contractor by the Contractors Licensing Board.¹⁰¹

More important, California licensing laws include grounds for disciplinary action against the contractor that appear to be no more than simple breach of contract. For example, the following can be grounds for disciplinary action:

1. abandonment of project¹⁰²
2. willful departure from accepted trade standards or “from or disregard of plans and specifications in any material respect.”¹⁰³
3. material failure to complete project for price stated¹⁰⁴
4. failure to prosecute work diligently¹⁰⁵

These provisions can cause public intervention into relations between owner and contractor (discussed in greater detail in Section 10.11).

SECTION 10.10 The Unlicensed Contractor: Civil Sanctions

A. Recovery for Work Performed

The chief sanction for violating licensing laws has been to bar the use of the courts to collect for services.¹⁰⁶ Yet for reasons noted in Section 10.10D, denials of recovery, although still common, are less likely when a contractor seeks judicial relief than when such relief is sought by a design professional. This occurs despite the specific legislative direction in many contractor licensing laws to bar the state courts to unlicensed contractors.

These specific legislative directives, such as found in California or Washington, do not mean contractors never recover. Such a harsh sanction has led these states to create a substantial compliance doctrine to avoid unjust enrichment (discussed in Section 10.10C). Courts have divided on the use of such laws as a defense by a knowledgeable participant in the construction industry.¹⁰⁷ The cases show the usual variant results when unlicensed contractors seek recovery.¹⁰⁸

Unwillingness by the courts in some states to impose the harsh sanction of barring recovery for work performed may have led Tennessee to enact a statute that permits an unlicensed contractor to recover if it can show clear and convincing proof of actual documented expenses.¹⁰⁹

The construction industry, particularly the portion that consists of contractors and subcontractors, witnesses chronic financial difficulties and frequent bankruptcies. The tension between protecting consumers from financially insecure or irresponsible contractors and the policy in the federal bankruptcy law to give debtors a fresh start has led to disputes over whether bankruptcy is grounds for taking away the contractor's license. As noted in Section 10.04B, this conflict has been resolved in favor of the bankruptcy policy's permitting a fresh start.

¹⁰⁶Another California sanction is trebling the award against an unlicensed contractor and giving the court discretion to award attorneys' fees. See Section 10.07A.

¹⁰⁷See Section 10.07B; note 71.

Ozark Country Club, Inc.*, 339 So.2d 1023 (Ala.1976) (had been paid \$35,000, sought \$28,000 more: denied); *United Stage Equipment, Inc. v. Charles Carter & Co.*, 342 So.2d 1153 (La.App.1977) (paid all but \$1,300: denied); *Revis Sand & Stone, Inc. v. King*, 49 N.C.App. 168, 270 S.E.2d 580 (1980) (need to protect public).

¹⁰⁹Tenn.Code Ann. § 62-6-103.

B. Exceptions

Barring the unlicensed contractor from using the courts to recover for services it has performed does not mean that the unlicensed contractor cannot use other avenues.

In states that bar the unlicensed contractor from using the courts to recover under the contract, unlicensed subcontractors have been allowed to sue a prime contractor (or vice versa) for delay damages, defective work or negligent administration of the contract, which caused the unlicensed contractor to suffer increased costs of performance.¹¹⁰ The reasoning of these cases—that recovery is not sought for performance—should allow an unlicensed prime contractor to recover from an owner for delay damages.

Similarly, an unlicensed minority subcontractor could not recover for work it performed but was not barred from bringing a civil rights claim based upon what it contended were illegal racial conditions in the contract and racially motivated retaliation.¹¹¹

Other cases demonstrate the ambivalence of courts when asked to deny recovery to unlicensed contractors who have done their work properly. For example, courts have divided as to the effect of noncompliance when the dispute does not involve an ordinary member of the public but involves those knowledgeable about construction.¹¹²

Another evidence of the greater solicitude shown unlicensed contractors is reflected by *Moore v. Breeden*.¹¹³ The applicable law required that the owner give notice to the contractor that a license is required before the owner can defend any claim made against it based on the contractor's having been unlicensed. It was held that this notice requirement applies even if the contractor knew it was required to be licensed. This interpretation allowed the court to grant a recovery of almost \$300,000 to an unlicensed contractor.

A similar judgment in favor of the claimant was based on the claimant's not being a contractor at all but simply

¹¹⁰*E. C. Ernst, Inc. v. Contra Costa County*, 555 F.Supp. 122 (N.D.Cal.1982) (subcontractor suffered delay damages); *American Sheet Metal, Inc. v. Em-Kay Eng'g Co., Inc.*, 478 F.Supp. 809 (E.D.Cal.1979) (recovery by an unlicensed contractor for the defective work of a subcontractor); and *Gaines v. Eastern Pac.*, 136 Cal.App.3d 679, 186 Cal.Rptr. 421 (1982) (same). The continued viability of these cases is in doubt; see *Pacific Custom Pools, Inc. v. Turner Constr. Co.*, 79 Cal.App.4th 1254, 94 Cal.Rptr.2d 756, 764–65 (2000).

¹¹¹*Holland v. Diesel-Morse Intern., Inc.*, 86 Cal.App.4th 1443, 104 Cal. Rptr. 2d 239 (2001).

¹¹³209 Va. 111, 161 S.E.2d 729 (1968).

a foreman who had been engaged by the owner to perform construction work.¹¹⁴ These cases should not convey the impression that courts simply disregard contractor licensing laws. They do show the difficulty some courts have had in reconciling the legislative requirement for a license with the merits of a particular claim, the denial of which would appear to create unjust enrichment.

C. Substantial Compliance

A number of states recognize the substantial compliance doctrine. In these states, excusable errors by the contractor relating to obtaining or renewing a license will not preclude a recovery.¹¹⁵ The California experience is instructive.

In *Latipac, Inc. v. Superior Court*,¹¹⁶ failure to renew a license was due to the inadvertence of an office manager who had had a mental breakdown. California has struggled with this doctrine but on the whole has used it to allow recovery where it appears that the work was properly performed and failure to obtain a license did not relate to competence but to bureaucratic error.¹¹⁷

Finally, the California Supreme Court decided *Asdourian v. Araj*¹¹⁸ in 1985. The contractor had made a contract in his own name instead of the business under which he had obtained his license. Nor had he made a written contract for home improvements as required by California law. Yet the court allowed him to recover by a liberal use of the substantial compliance doctrine and a narrow reading of the statutory requirements for a written contract. The court, over one dissenting opinion, showed little respect for the public policy supposedly behind contractor licensing laws. It also scolded intermediate appellate courts, which had not made broad use of the substantial compliance doctrine and which were more inclined to follow the literal meaning of the statutes.

¹¹⁴*Sobel v. Jones*, 96 Ariz. 297, 394 P.2d 415 (1964).

¹¹⁵*McCormick v. Reliance Ins. Co.*, 46 P.3d 1009 (Alaska 2002); *Lignell v. Berg*, 593 P.2d 800 (Utah 1979); *Murphy v. Campbell Investment Co.*, 79 Wash.2d 417, 486 P.2d 1080 (1971); *Expert Drywall, Inc. v. Brain*, supra note 78. For Washington law, see Comment, 14 Gonz. L.Rev. 647, 659–61 (1979). For a case vehemently rejecting the substantial compliance doctrine, see *Brady v. Fulghum*, 309 N.C. 580, 308 S.E.2d 327 (1983).

¹¹⁶64 Cal.2d 278, 411 P.2d 564, 49 Cal.Rptr. 676 (1966).

¹¹⁷See *Vitek, Inc. v. Alvarado Ice Palace, Inc.*, 34 Cal.App.3d 586, 110 Cal.Rptr. 86 (1973).

¹¹⁸38 Cal.3d 276, 696 P.2d 95, 211 Cal.Rptr. 703 (1985).

The court noted that the substantial compliance doctrine had been followed for almost five decades without any response by the legislature. The legislature took up the challenge in 1989, amending Section 7031 of the California Business and Professions Code to make clear that the doctrine of substantial compliance would not permit an unlicensed contractor to recover for its services.

But an amendment to Section 7031 enacted in 1994 shows the ambivalence of the California legislature toward contractor licensing laws: This attitude is shared by many legislatures and courts. After stating in subsection (e) that the substantial compliance doctrine cannot be applied by the courts if the contractor has never been licensed, the statute allows a court to apply the doctrine under specified conditions. The contractor must show that it had been licensed prior to doing the work, that it acted “reasonably and in good faith” to maintain its license, and that it did not or should not have known that it was unlicensed.¹¹⁹

California’s inability to decide what to do when an unlicensed contractor performs work is again demonstrated by the amendment to Section 7031 enacted in 2001 and noted in Section 10.07B. That amendment allows the person who has paid for work done by an unlicensed contractor to recover payments it has made.¹²⁰ This goes beyond barring the unlicensed contractor from using the courts to collect for its work.

To sum up, in 1989 the Legislature stated it did not want substantial compliance to be used. In 1994, it decided to allow it under limited circumstances. In 2001, it went farther in punishing an unlicensed contractor by not only barring it from recovering for work done but allowing the person who has paid for work to recover payments made. Such are the twists and turns of contractor licensing laws.

The California Supreme Court’s most recent analysis of the substantial compliance doctrine is *MW Erectors, Inc. v. Niederhauser Ornamental and Metal Works Co., Inc.*¹²¹ Recall that a sub-subcontractor entered into two contracts: a structural steel contract followed, one month

¹¹⁹Two cases came to opposite conclusions on the question of whether the contractor met the stringent statutory definition of substantial compliance. See *ICF Kaiser Engineers, Inc. v. Superior Court*, 75 Cal.App.4th 226, 89 Cal. Rptr.2d 88 (1999) (substantial compliance was found where a computer snafu kept even the state licensing board from knowing the contractor’s license suspended) and *Pacific Custom Pools, Inc. v. Turner Construction Co.*, supra note 110 (substantial compliance not found where contractor knew for five months its license was suspended).

¹²⁰West Ann.Cal.Bus.&Prof. Code § 7031(b).

¹²¹Supra note 62.

later, by an ornamental steel contract. It was unlicensed when it signed both contracts and obtained its license only after it had begun work on the structural steel contract. The court ruled that the sub-subcontractor may not apply the substantial compliance doctrine to the structural steel contract because it did not hold a California license prior to performance. Under the statutory definition, the substantial compliance doctrine is limited to contractors who, prior to commencement of the job, had previously held a valid license.¹²²

That the substantial compliance doctrine still is troublesome is illustrated by *Crow v. Hickman's Egg Ranch, Inc.*¹²³ The Arizona Statute was much like California's 7031 discussed above. It required that the contractor have a license when the contract is made. The contractor (an experienced contractor) was not licensed when the contract was made. The owner knew this. The contractor performed a small amount of work. Then it became licensed.

A dispute over quality then developed. The contractor sued only for the work done after it was licensed. In denying recovery, the majority stated that substantial compliance requires that the contractor attempt to become licensed before entering into the contract. In this case it did not, although it was aware of the license requirement.

Again, showing the controversial nature of the substantial compliance excuse for not being licensed, the dissenting judge stated that substantial compliance should be applied where it satisfies the general purpose of the licensing laws. The judge noted that the contractor sought recovery only for work done after it became licensed.

Those jurisdictions that are quick to employ the substantial compliance doctrine are inclined to see contractor licensing laws as traps for unwary contractors who perform proper work and then face what appears to be a technicality that may bar them from recovering for their work. Yet those same jurisdictions are often emphatic in their desire to protect consumers from those who might prey on them. Again, as noted in Section 10.07B, the absence of a license may not bar a contractor from recovering where it appears that it did not mislead the owner and did its work properly.

¹²²This same reasoning was applied to find the substantial compliance doctrine not applicable in *Opp v. St. Paul Fire & Marine Ins. Co.*, supra note 71.

¹²³202 Ariz.113, 41 P.3d 651 (App.2002), review denied Jun. 25, 2002.

D. Observations

The contractor licensing laws and cases that interpret them demonstrate different attitudes from those that involve architects, engineers, and surveyors. More appears to be expected of design professionals than of contractors. Contractors are often small businesses that may not be aware of the existence of licensing laws and may not have the staff to ensure that they are always in compliance. The recent enactment of many contractor licensing laws and the difficulty of formulating standards for determining competence may play a part in some judicial reluctance to bar a contractor. Even in cases where contractors are precluded from recovery, generally all that has been lost has been part payment, with contractors often having collected most of their compensation.

SECTION 10.11 Indirect Effect: Forum for Consumer Complaints

Some make a case for contractor licensing laws by pointing to the power they give the consumer-homeowner when a contractor is not responsive to complaints that work has been done poorly. A criminal sanction, though rarely imposed, can be the basis for restitution, at least in aggravated cases. More important, a threat to go to the licensing authorities may provide an incentive for the contractor to take the complaint seriously. If the dispute cannot be resolved amicably, there is likely to be an informal hearing before a representative of the state licensing agency. In effect, these agencies have become small claims courts.

The consumer protection aspect of contractor licensing would be more effective if licensing agencies made available a record of complaints against particular contractors. Although perhaps not typical, California's experience is instructive. In 1986, California permitted the registrar of contractors to make public information related to complaints on file against a licensed contractor that have been referred for legal action (very few are referred) but not those complaints that were resolved in favor of the contractor.¹²⁴ The registrar may set reasonable limits on the number of requests for information per month from any one requestor.¹²⁵

¹²⁴West Ann.Cal.Bus. & Prof.Code § 7124.6.

¹²⁵16 Cal.Code Regs. § 863

But a true consumer protection system would allow a consumer to learn of the number of complaints against a contractor whom the consumer plans to use. The California public information system does not approach this.

To be sure, this indirect function has dangers. It can provide too powerful a tool to an owner who abuses it to obtain more than promised under the contract or required by law. The system can be costly to operate, particularly where a high level of consumer dissatisfaction exists. This induced California to require arbitration of certain disputes.¹²⁶

SECTION 10.12 The Trained but Unregistered Design Professional: Moonlighting

A. Unlicensed Persons: A Differentiation

This chapter has spoken of persons who violate the registration for licensing laws as if they all can be placed in the same category. Yet differentiation can be made between those who violate these laws who have been educated and trained as design professionals and others, such as contractors, developers, designer-builders, or self-styled handypersons.

A long period ordinarily elapses between the beginning of architecture or engineering training (architecture will be used as an illustration) and registration. As a result, there are many people with substantial education and training as design professionals but who for various reasons do not work under the supervision of a registered architect yet engage in the full spectrum of design services. To be sure, the law does not differentiate these people from those without design education and training. Yet that these people often do perform these services in violation of the law demonstrates not only the financial burden involved in education and training before registration but also that a market exists for such services.

This section is directed toward some of the legal problems faced by what is referred to as the *moonlighter*, who is likely to be a student, a recent graduate, or a teacher. Some of the discussion anticipates material to be discussed in greater detail in the balance of the book, such as professional liability, exculpation, and indemnification.

However, a focus on the range of legal problems that such individuals face is also useful.

B. Ethical and Legal Questions

A threshold issue before the discussion of collection for services performed by moonlighters (Section 10.12C) and liability of moonlighters (Section 10.12D) is whether such work should be performed. A differentiation will be drawn between work by a moonlighter that does not violate the law because the project is exempt and the requirement that a registered designer perform services that do violate the registration laws. The former course raises no ethical or legal questions; the latter does.

The discussion in this section should not be taken as a suggestion that moonlighters should violate the law by engaging in design services prohibited by law. However, two factors necessitate discussion of moonlighting. First, arrangements between clients and moonlighters demonstrate that each group feels it will benefit from such an arrangement or such arrangements would not be made. That there is a good deal of moonlighting demonstrates either that the registration laws only make illegal conduct that should not be prohibited or that there is great disrespect for the registration laws.

Second, the many cases that involve attempts by unlicensed people to recover for services that they have performed, and the periodic success of their claims, indicate some dissatisfaction with the registration laws even by those charged with the responsibility of enforcing them indirectly by denying recovery for services performed in violation of them.

Anyone tempted to moonlight and violate registration laws must take into account—in addition to the risk of criminal and quasi-criminal sanctions—the risks discussed in the balance of this section: going unpaid for services rendered or being wiped out financially because of claims by the client or third parties.

C. Recovery for Services Performed

Clearly, the safest path is to design only those projects exempt from the registration laws. Undertaking nonexempt projects creates substantial risks. This subsection looks at these risks and ways of minimizing the likelihood that the moonlighter will not be able to recover for services performed.

¹²⁶West Ann. Cal.Bus. & Prof.Code § 7085.

Because payments made generally cannot be recovered by the client,¹²⁷ it is best to specifically provide that interim fee payments will be made and to make certain that they are paid. If payment has not been made in full, it is possible at least in some jurisdictions to recover for services in a restitutionary claim based on unjust enrichment. Such a claim is more likely to be successful if the client is aware of the moonlighter's nonregistered status, if the moonlighter has had substantial education and training in design, if the work appears to have been done properly, and if it appears that the client has benefited by a lower fee. The stated purpose of registration laws is to deter unqualified people from performing design services and to protect the public from hiring unqualified professionals. A client who is aware of the status of the designer engaged has given up protection accorded by law, and to allow the client to avoid payment where the services have been properly rendered can create unjust enrichment.

If the project will expose the general public to the risk of physical harm, it is more difficult to justify either entering into such an arrangement or allowing recovery for services performed under one. But as a practical matter, this is not the type of project that moonlighters will design. The uncertainty of recovery and the high cost of litigation even if there is a recovery should deter moonlighters as a whole from doing nonexempt work. If the deterrent function will be accomplished, assuming that is one of the desirable results of these laws, there appears to be no reason to deny recovery where services have been performed by someone with the requisite education and training.

D. Liability Problems

This discussion assumes that the moonlighter will not be carrying professional liability insurance. As a result, any liability that moonlighters incur will be taken out of their pockets if there is anything in their pockets to take.

As shall be seen in Section 14.05, the professional is generally expected to perform as others in the profession would have performed. Should this standard be applied when a moonlighter is knowingly engaged by a client?

Differentiation must be made between an express agreement dealing with a standard of performance and an agreement implied by law. Suppose the parties agree that the standard of performance will be greater or lesser than

that usually required of a registered design professional. Would the court enforce any agreement under which the standard would be less than that required by a registered professional? This depends on a balancing of laws favoring autonomy, which would enforce such an agreement, and the strength of the policy expressed in the registration laws, which would deny enforcement of such an agreement. Although resolving such a question would not be easy, the law would probably not give effect to an express agreement under which someone performing services in violation of law would be judged by some standard less than would be used in the event that the person doing the design were registered.

If no express agreement is made regarding the standard of performing, a case can be made for judging the performance by what the parties are likely to have intended. If the client knowingly engaged a moonlighter who received a lower fee, should the client get what she pays for—a lower level of performance for a lower price? However, again it is unlikely that the court in determining the implied terms of such an illegal agreement would prefer autonomy to a result that might appear to frustrate the registration laws.

Another approach, related to but somewhat different from the one discussed in the preceding paragraphs, would be for the moonlighter to seek to persuade the client to exculpate the moonlighter from the responsibility for any performance that would violate the contract or to limit the moonlighter's exposure to a designated portion of the entire fee. Because by definition the moonlighter is not insured, the moonlighter may be able to persuade the client that she would not be in a position to pay for any losses she caused, and this is taken into account in setting the fee.

Suppose the client will agree to exculpation or liability limitation. The moonlighter must take particular care to express these provisions very clearly, as courts will at the very least construe them against the moonlighter. Even more, there is a risk that a court that feels strongly about the registration laws will not enforce such a clause if it would frustrate those laws. Keep in mind, however, that because the moonlighter is not likely to have either insurance or assets, a claim by the client is likely to be rare.

Third-party liability raises different problems, inasmuch as any arrangement for exculpation or a liability limitation between the moonlighter and the client will not affect the rights of third parties. But again, the moonlighter without insurance or assets is unlikely to be sued by

¹²⁷Section 10.07B.

a third party. A moonlighter concerned about the liability to third parties either because of moral considerations or because the moonlighter does have assets should attempt to seek indemnification from the owner. But as shall be seen, such clauses are also narrowly interpreted and in some states are unenforceable.¹²⁸

¹²⁸See Sections 31.05D and E.

From the standpoint of liability either to the client or to third parties, it does not appear that there is a great risk if moonlighters do not have assets of their own. However, if moonlighters do have assets or if they are concerned about causing loss to someone for which they ought to pay, the liability problems of moonlighters are likely to mean that the moonlighters will be judged by the standard of registered professionals.

Contracting for Design Services: Pitfalls and Advice

SECTION 11.01 Authority Problems

A. Private Owners

Negotiations to provide design services are always made with individuals. It is important to determine whether the individual with whom a design professional negotiates has authority to make binding representations and to enter into a contract. The general agency doctrines that regulate these issues were discussed in Chapter 4. Reference should be made to that chapter, particularly the material in Section 4.06 that deals with apparent authority.

Design professionals will be motivated by many considerations when they decide whether to enter into a contract to perform design services. One factor will be representations made by the prospective client. For example, a design professional may be influenced by representations that relate to the likelihood that the project will be approved by appropriate authorities, that adequate financing can be secured, and that the design professional will work out the design with a particular representative of the client or to other facts that will influence the design professional to contract to perform design services for the client.

In the best of all worlds, the people at the top of the client's organization would be contacted to determine the authority of the person with whom the design professional is directly dealing. However, it may not be easy to determine who is at the top of the client's organization, and it may not always be politic to take this approach. The realities of negotiation mean that the design professional will have to rely largely on appearances and common sense to determine whether the person with whom he is dealing can make such representations. This may depend on the position of the person in the corporate structure, the importance of the representation, and the size of the

corporation. The more important the representation and the more important the contract, the more likely it is that only a person high up in the organizational structure will have authority to make representations that will bind the corporation. If the corporation is particularly large, a person in a relatively lower corporate position may have authority to make representations. For example, in a large national corporation, the head of the purchasing department may be authorized to make representations that would require a vice president's approval in a smaller organization.

One useful technique is to request that important representations be incorporated in the final agreement. If the person with whom the design professional is dealing is unwilling to do so, that person may not have authority to make the representations that have been made.

This approach has an additional advantage. In the event of a dispute that goes to court, the parol evidence rule (discussed in Section 11.04E) may make it difficult to introduce evidence of representations that are not included in the final agreement. Even if such evidence is admitted, failure to include such representations in the written agreement may make it difficult to persuade judge or jury that the representations were made if the client denies making them.

Next it is important to examine the authority to contract for design services. This problem will be approached by looking at the principal forms of private organizations that are likely to commission design services.

Sole Proprietors. The sole proprietor clearly has authority to enter into the contract. Dealings with an agent of the sole proprietor are controlled by concepts of agency and scope of actual or apparent authority. Generally, sole

proprietorships are small business operations. For a sole proprietorship, a contract for design services or construction is probably a serious and important transaction. For that reason, agents of a sole proprietor are not likely to have such authority.

Partnerships. Partnerships are usually not large businesses. Generally only the partners have authority to enter into contracts for design services or construction. The partners may have designated certain partners to enter into contracts. Unless this comes to the attention of the design professional, it is unlikely that such a division of authority between the partners will affect him. Although partners have authority to enter into most contracts, it is advisable to get all the partners to sign the contract.

If the partnership is a large organization, agents may have authority to enter into a contract for performance of design services and construction. It is probably best, however, to have some written authorization from a partner that the agent has this authority.

Corporations. The articles of incorporation or the bylaws of a corporation generally specify who has authority to make designated contracts and how such authorization is to be manifested. The more unusual the contract or the more money involved, the higher the authority needed. Contracts that deal with land, loans, or sales or purchases not in the normal course of business frequently must be authorized by the board of directors. Lesser contracts may require authorization by higher officials, whereas for contracts involving smaller amounts of money or those in the usual course of business, subordinate officials may be authorized to contract.

Contracts needing board approval are passed by resolution and entered into the minutes of the board meeting. In addition, bylaws or any chain-of-authority directive frequently states which corporate officials must actually sign the contract. Again, the importance of the contract usually determines at what echelon the contract must be signed and how many officials must sign it. The corporate bylaws or state statutes may require that the corporate seal be affixed to certain contracts.

For maximum protection, the design professional should check the articles of incorporation, bylaws, and any chain-of-authority directive of the corporation. The design professional should see who has authority to authorize the contract and whether the proper mechanism,

such as the appropriate resolution and its entry into the minutes, was used. Then the design professional should determine whether the person who wants to sign or has already signed for the corporation has authority to do so.

In very important contracts, it may be wise to take all these steps. It is not unreasonable for the design professional to request that the corporation attach to the contract a copy of its articles and bylaws and a copy of the resolution authorizing the particular project in question. The design professional can request that the contract itself be signed by the appropriate officers of the corporation, such as the president and secretary of a smaller corporation or the vice president and secretary of a larger corporation.

Sometimes such precautions need not be taken. The project may not seem important enough to warrant this extra caution. The design professional may have dealt with this corporation before and is reasonably assured there will be no difficulty over authority to contract. However, laziness or fear of antagonizing the client is not a justifiable excuse.

For the risks involved in dealing with the promoter of a corporation not yet formed, see Section 3.04C.

Unincorporated Associations. Dealing with an unincorporated association seems simple but may involve many legal traps. To hold the members of the association liable, it is necessary to show that the people with whom the contract was made were authorized to make the contract. In such cases, it is vital to examine the constitution or bylaws of the unincorporated association and to attach a copy of the resolution of the governing board authorizing the contract. The persons signing the contract should be the authorized officers of the association. It may be wise to obtain legal advice when dealing with an unincorporated association, unless the unincorporated association is a client for whom the design professional has worked in the past and in whom the design professional has confidence.

Spouses or Unmarried Cohabitants. A design professional may deal with a married or unmarried couple living together. Even with spouses, no presumption exists that one is agent of the other.¹ But one can bind the other if

¹*Oldham & Worth, Inc. v. Bratton*, 263 N.C. 307, 139 S.E.2d 653 (1965).

the former acts to further a common purpose or if unjust enrichment would result without a finding of agency.² It is advisable to have both spouses or members of an unmarried couple sign as parties to the contract.

A recent case from Utah demonstrates the potential risks of dealing with spouses.³ The wife owned a house that had been damaged. She contracted with a contractor to repair the damage and to make some improvements. Both husband and wife negotiated with the contractor. A written contract for the work was made that contained a general arbitration clause. The house was listed in the title page as the house of husband and wife, but the signature page contained one line and that was signed only by the wife.

Problems developed and the contractor demanded arbitration with the husband and the wife. The husband refused, claiming he was not a party to the contract with its arbitration clause.

The Utah Supreme Court agreed with the husband. It held that the contract was ambiguous and would be resolved against the contractor that had prepared it. The court recognized that there are exceptions to the usual requirement that before a party could be compelled to arbitrate, it must be clear that he had agreed to arbitrate.⁴ Illustrations of these exceptions under which a nonsigner can be required to arbitrate are seeking to enforce the contract or receiving a direct benefit from the contract, but the court concluded that none applied here.

Most important, the court held that the husband could not be held to the contract based upon the wife being the agent of the husband. It concluded that the mere status of husband and wife does not entitle one to bind the other on principles of agency.⁵ More facts need to be shown, and none was shown here.

The court did recognize the special requirements for an agreement to arbitrate, stating the husband could be held to be a party to the contract but not to the agreement to arbitrate. For that reason the decision could be limited to agreements to arbitrate. Yet the court's holding that there is no presumption that one spouse can bind the other is in accord with general agency law.

²*Capital Plumbing & Heating Supply Co. v. Snyder*, 2 Ill.App.3d 660, 275 N.E.2d 663 (1971) (wife agent for lien purposes).

³*Ellsworth v. American Arbitration Ass'n*, 148 P.3d 983 (Utah 2006).

⁴See Section 33.03A.

⁵See Section 4.06.

B. Public Owners

See Section 8.02A, which deals with public owners and describes some of the special rules for dealing with public entities. Authority issues arise with some frequency because of the need to protect public funds and preclude improper activity by public officials.

The law has generally provided little protection to those who deal with public entities, rarely invoking the apparent authority doctrine. Similarly, it also rarely applies the concepts of estoppel (a party whose representations are reasonably relied upon by the other party is barred from asserting a defense to the other party's claim), which would bar the public entity from establishing that representations were unauthorized or that contracts were not made by proper persons or in accordance with law.⁶ Yet some relaxation of the protections has been accorded to public entities. Restitution claims based on unjust enrichment are beginning to have some success,⁷ as are assertions that a public entity cannot rely on provisions of a contract where it has misled the contractor.⁸

This relaxation should not encourage carelessness in dealing with public entities. Substantial risks still attend reliance on representations by government officials and entering into contracts with public entities. Immunity of public entities as a defense to a claim for breach of contract will be discussed in Section 23.03I.

SECTION 11.02 Financial Capacity

A. Importance

A crucial factor in determining whether to undertake design work is the client's financial capacity. The relationship between the design professional and client can deteriorate when the latter cannot or will not pay interim fee payments as required, is unable or unwilling to obtain funds for the project, or lacks the financial capacity to absorb strains on the budget caused by design changes or market conditions that increase the cost of labor and materials. If the client will not have the financial resources to pay any court judgment that may be awarded, the contract is risky and should be avoided.

Despite constant warnings, many design professionals enter into contracts, perform work, and then find they cannot collect for services. Professionals do not like to confront financial responsibility openly. They prefer to assume that clients are honorable people who will meet their obligations, and usually this is the case. However, there are too many instances of uncollected fees to justify cavalier disregard of this problem. Design professionals must seriously confront the problem of financial capacity.

B. Private Clients

Retainers and Interim Fees. Most standard contracts published by the professional associations provide for initial retainers to be paid by the client at the time the contract is signed and for interim fee payments to be made during performance. A major purpose of such provisions is to give the design professional working capital.

Another purpose is to limit the scope of the financial risk taken by the design professional. If services and efforts do not run very far beyond the money paid, risk of nonpayment is substantially reduced. The difficulty is that design professionals frequently do not insist that the client comply with these contract terms. This is absolutely essential. If the matter is explained properly to the client, there should be no difficulty. It should alert the design professional to possible danger when the client seems to be insulted when businesslike requests are made for advance retainers and interim fee payments when due. Clients who react adversely to such requests are often clients who either do not have the money or will not pay even if they do have the money.

Client Resources. Until 1997 (more later on the change), AIA Document B141, Paragraph 4.3, permitted the architect to ask the client to furnish evidence that financial arrangements had been made to fulfill the owner's obligations. The power to request this evidence could be exercised at any time during the contract period. Such a provision created both a promise and a condition to the architect's continued performance. Failure by the client to comply permitted the architect to suspend performance. If suspension continued or if the client indicated an inability or unwillingness to furnish this information, the architect could treat it as a material breach terminating the obligation to perform and giving remedies for breach of contract. (See Sections 27.02 and 33.04.) The design professional can and should ask for this information before deciding whether to perform services. If the client is new or if the information furnished does not appear trustworthy, it may be useful to run a credit check.

In 1997, the AIA dropped this provision from B141-1997. Although the Institute realized that such a power was exercised on occasion, it believed the standard contract should reflect "positive" aspects of the architect-client relationship. Of course, architects are free to add such a provision to B101-2007. Very likely many will, though exercise of the power will still be rather infrequent.

One-Person and Closely Held Corporations: Individual Liability of Officers. Many small businesses are incorporated, and the shares of the business are held entirely by the proprietor of the business. The proprietor is permitted to do this by law. One purpose is to insulate personal assets from the liabilities of the corporation. Some corporations are small, closely held corporations, with the shares owned by a family or by the persons actually running the business. As noted in Section 3.04E, the law can pierce the corporate veil and treat the inadequately capitalized one-person or closely held corporation as a sole proprietorship or partnership. If this is done, the design professional can recover from the shareholder or shareholders. Piercing a corporate veil is rarely done, however. If a credit check reveals that the corporation is merely a shell with very few assets, it may be necessary to demand that the shareholders assume personal liability. To do so, the sole shareholder or shareholders should sign both as representatives of the corporation and as individuals. If those signing as individuals are solvent, this is a reasonably secure method of assuring payment if the corporation is unable to pay the

contractual obligations. If the individuals signing are not solvent, individual liability will be of little value. A refusal to sign as an individual may be a warning that the corporation is in serious financial trouble.

A Surety or Guarantor. Chapter 32 discusses the role of the surety in the construction phase of the project. If the design professional believes the person with whom he is dealing is not financially sound, the design professional may wish to obtain a financially sound person to guarantee the obligation of the corporation or the individual before entering into the contract. Subject to some exceptions, promises to pay the debt, default, or miscarriages of another must be in writing. The design professional who requests and obtains a third person to act as surety for the client should make certain that the surety signs the contract or a separate surety contract. When a surety or guarantor is involved, legal advice should be obtained.

Real or Personal Property Security. Another method of securing the design professional against the risk that the client will not pay is to obtain a security interest in real or personal property. This can be done by obtaining a mortgage or a deed of trust on the land on which the project is to be constructed or on other assets owned by the client. This measure may seem drastic. If that much insecurity is involved, it may be advisable not to deal with the client at all. The law regarding creating and perfecting security interests is beyond the scope of this book. If such protection is needed, legal advice should be obtained.

Client Identity. Some clients move quickly in and out of various different but related legal forms. What appears to be a partnership turns out to be a corporation of limited resources. The design professional may find that the corporation with whom he dealt is insolvent, whereas other, solvent, related corporations are controlled by the client. It can be difficult for the design professional to know for whom he is working or who has legal responsibility. This can be complicated by the different entities described in the preliminary correspondence, the contracts, and the communications during performance. Design professionals should know the exact identity and legal status of the client.

Spouses or Unmarried Cohabitants. As mentioned in Section 11.01A, dealing with spouses or cohabiting persons can raise agency questions. Design professionals may

discover that the person with whom they dealt has no assets, whereas that person's spouse or other cohabitant owns all the assets. It is important to have both spouses or cohabitants sign the contract.

Mechanics' Liens. Mechanics' liens—more important to contractors and suppliers—are treated in Section 28.07D. Their occasional utility to professional designers can tempt those who are about to perform design services to avoid some of the techniques previously mentioned for fear of losing a client. For that reason, they are discussed here briefly.

State statutes often give persons a security interest in property that they have improved to the extent of any debt owed to the improver by the owner of the property or someone who has authority to bind the owner. The lien holder can demand a judicial foreclosure of the property and satisfy the obligation out of the proceeds.

Design professionals face two problems when they assert a mechanics' lien. Both problems relate to improvement of the owner's property as the basis for awarding a specific remedy of foreclosure against the land itself rather than simply giving the design professional a money award as described in Sections 2.12 and 2.13.

The first problem—a problem not faced by contractors—involves whether or not design services have improved the land. This problem generally has been surmounted by mechanics' lien legislation that specifically names design professionals as lien recipients. However, not all states have done this.

The second issue recognizes the unstable world of design. It is not uncommon for the design professional to perform design services for a project that is abandoned before site work is initiated. (The beginning of the site work warns those who might advance credit to the owner that there may be a lien that will take precedence against any subsequent security interest.) As noted, improvement of the land is the basis for awarding mechanics' liens.

Courts have not been uniform when faced with the issue of whether a lien can be asserted despite the project's having been abandoned. Most courts have ruled that no lien has been created. But some cases go in the other direction.

The cases from Kansas are instructive, showing the complexities of lien laws and the uncertain efficacy of liens as a reliable security interest for those who perform services, such as architects or engineers, before construction begins. Decided in 1990 in *Mark Twain Kansas City Bank*

v. Kroh Bros. Development Co. et.al.,⁹ a Kansas intermediate court of appeals held that a claimant who had performed off-site architectural and engineering services was not entitled to a lien where no construction ever commenced. The court required that there be visible improvements so that the world would know that a lien was a possibility.

But in 1996 the Kansas Supreme Court in *Haz-Mat Response Inc. v. Certified Waste Services, Inc.* concluded that the opinion of the Kansas intermediate court in the *Mark Twain* case had been incorrect.¹⁰ The Supreme Court held that there need not be a physical addition or actual construction. The court concluded that the lien claimant did not succeed because the work was part of routine maintenance.

The Kansas intermediate appeals court in 2003 decided *Mutual Savings Association v. Res/Com Properties LLC*.¹¹ The court stated that the *Mark Twain* case had been in effect overruled by subsequent cases, that there need not be physical addition, and that preliminary stakes and surveying could be the basis for a lien.

To demonstrate the complexity of lien laws, the court in the *Mutual Savings* case stated that mechanics' liens were a creature of statute and that the claimant must clearly bring itself within the statute. In other words, the statute must be strictly followed. But if this standard were met, the remedial nature of the statute meant that the law is construed liberally in favor of the claimant.

In a number of states, the mechanics' lien laws have been amended to grant liens even though the project is never begun.¹² Such laws are usually supported by professional associations of architects and engineers who assert that design professionals perform services and should be paid. Clearly, design professionals would have a right to recover an ordinary court judgment unless they have

assumed the risk that they would not be paid if the project did not go forward.¹³ However, the professional associations seek to go further and create a specific remedy, that is, a lien against the property for which the design was commissioned. Often ignored is the fact that this specific remedy places design professionals ahead of those ordinary unsecured creditors who may have also performed services or supplied goods and have not been paid. Participants in the construction industry have sought to enlarge their lien rights, but it should not be ignored that this enlargement often comes at the expense of unsecured creditors.

Lien rights cannot be asserted against public improvements. Many technical requirements exist to create a valid lien. Notices have to be given, filings have to be made, and foreclosure actions must be taken within specified times. Without strict compliance, there is no lien. Other persons may have equal or prior security rights in the land. The land value may not be enough to pay the lien claims in their entirety.

Mechanics' lien statutes vary considerably from state to state and are frequently changed by legislatures. Design professionals should seek legal advice to see whether they are within the class of persons accorded liens and to ascertain the steps needed to perfect a lien. It is unwise to undertake work for a client who may not be able to pay, hoping that in the event of nonpayment, there will be a right to a mechanics' lien. The possibility of being able to assert a mechanics' lien is never a substitute for a careful consideration of the financial responsibility of the client and collection of interim fee payments.

C. Public Owners

Those who deal with public entities run the risk that money will not be appropriated or bonds not issued to pay for the project or design services. An Illinois decision held that an architect could not recover for his services where the evidence showed he was risking compensation on the passage of a bond issue.¹⁴ The court pointed to a statement made by the architect during negotiations that he was gambling with the county, which convinced the court that he took this risk.

The best protection against risks is to check carefully on the availability of funds and make certain that work does not begin until it is relatively certain that funds will be available to compensate the design professional.

SECTION 11.03 Competing for the Commission: Ethical and Legal Considerations

A. Competition Between Design Professionals: Ethics

Associations of design professionals historically have sought to discipline their members for ungentlemanly competition, both in obtaining a commission for design services and in replacing a fellow member who has been performing design services for a client. As an illustration, AIA Document J330 in effect in 1958 listed, among its mandatory standards of ethics,

9. An Architect shall not attempt to supplant another Architect after definite steps have been taken by a client toward the latter's employment.
10. An Architect shall not undertake a commission for which he knows another Architect has been employed until he has notified such other Architect of the fact in writing and has conclusively determined that the original employment has been terminated.

In addition, J330 stated that the architect would not compete on the basis of professional charges.

These restraints were considered part of ethics. Undoubtedly they are traceable to the desire to preserve these professions as professions and to avoid certain practices that would be accepted in the commercial marketplace. Although the associations must have recognized that there will be competition for work, it was hoped that competition would be conducted in a gentlemanly fashion and would emphasize professional skill rather than price.

Beginning in the 1970s, attacks were made on these ethical standards by public officials charged with the responsibility of preserving competition. One by one, association activities that were thought to impede competition came under attack, particularly those that dealt with fees. Fee schedules, whether required or suggested, were found to be illegal.¹⁵ Disciplinary actions for competitive bidding were also forbidden.¹⁶

Standard 9 in J330 attempted to inhibit competition before any valid contract had been formed.¹⁷ The extent

¹⁵*Goldfarb v. Virginia State Bar*, 421 U.S. 773 (1975) distinguished in *Arizona v. Maricopa County Medical Society*, 457 U.S. 332 (1982).

¹⁶*Nat'l Soc'y of Professional Eng'rs v. United States*, 435 U.S. 679 (1978).

¹⁷*United States v. American Soc'y of Civil Eng'rs*, 446 F.Supp. 803 (S.D.N.Y.1977) (barred society from disciplining members who sup-
planted another member).

to which the law will protect a valid contract or a prospective contractual relationship by imposing liability on those who seek to or do interfere with such legitimate expectations will be discussed in Section 11.03D. Standard 10, though less susceptible to the charge that it is anticompetitive, could have had the effect of limiting the client's power to replace one architect with another.

B. Brooks Act

Design professionals do not like to compete on the basis of price. Although their associations cannot use their disciplinary power to attack this practice, current federal legislation precludes head-to-head fee competition.

In 1972, Congress enacted the Brooks Act.¹⁸ The Act determines how contracts for design services can be awarded by federal agencies. It declares that the policy of the federal government is to negotiate on the basis of "demonstrated competence and qualification for the type of professional services required and at fair and reasonable prices."

Those who perform design services submit annual statements of qualifications and performance data. The agency evaluates the statements, together with those submitted by other firms requiring a proposed product, and discusses with no fewer than three firms "anticipated concepts and the relative utility of alternative methods." The agency then ranks the three most qualified to perform the services. It attempts to negotiate a contract with the highest qualified firm and takes into account "the estimated value of the services to be rendered, the scope, complexity, and professional nature thereof."

If a satisfactory contract cannot be negotiated with the most qualified, the agency will undertake negotiations with the second most qualified, and if that fails, with the third. The U.S. Justice Department has proposed repeal, arguing that the statute restricts competition. Many states have enacted comparable legislation regulating the award of contracts for design services by state agencies.

Despite the Brooks Act and various state statutes adopting the same approach, some procurement agencies have sought to incorporate price at the first level—that of determining competence and qualification. A well-reasoned and researched opinion of the Colorado attorney general concluded that a public entity cannot require cost proposals in connection with selecting the most qualified architects,

¹⁸40 U.S.C.A. §§ 1101-04.

engineers, or land surveyors for a project.¹⁹ However, an Ohio intermediate appellate court upheld a decision by the governor of Ohio that there can be two most qualified firms and that a tie in such a case may be broken at the first stage by using competitive price proposals. The low bidder then becomes the most qualified firm.²⁰

One commentator, although obviously despairing at the prospect, made the following suggestions to design professionals forced to compete on price:

1. Make bids only on projects where there is a clearly defined scope of work.
2. Select your clients carefully.
3. Bid only on projects where your experience would favor selection in the absence of price competition.
4. Evaluate your competition.
5. Plan to use the most competent and qualified people you have.
6. Define your work with great precision.
7. Make detailed cost estimates.

The commentator also suggested that it is crucial to know when to walk away from a prospective commission and to be prepared to do so.²¹

One troubling question that arose as a result of the increased use of construction management in the 1970s related to whether contracts for the performance of these services were more like those for design, which did not require competitive bidding, or more like contracting, which did. This aspect of construction management is discussed in Section 17.04D.

C. Federal Art-in-Architecture Program

The General Services Administration (GSA) administers the design and construction of buildings occupied by many federal employees. GSA regulations require that a designated percentage of the budget for federal buildings (originally one and one-half percent) be set aside for artistic work for new buildings. This became known as

¹⁹Op.Colo.Att'y Gen., Sept. 2, 1992.

²⁰*Ohio Ass'n of Consulting Eng'rs v. Voinovich*, 83 Ohio App.3d 601, 615 N.E.2d 635 (1992). The state and national professional societies filed an appeal to the Supreme Court of Ohio based on the Ohio mini-Brooks Act, which they asserted bars a procedure under which price is a factor in the selection of the most qualified firm. This appeal was denied. 66 Ohio St.3d 1459, 610 N.E.2d 423 (1993) (over three dissents).

²¹Lekamp, *Professional Liability Perspective*, vol. 10, no. 11 (November 1991).

the Art-in-Architecture Program (AIA). Many public entities have similar programs.

The GSA has created a complex competitive process to select the artist and approve the work. This process involves a delicate balancing of the views of the community and the artistic freedom of the artist selected.²²

D. Interference With Contract or Prospective Advantage

In the competitive market system, persons are allowed and even encouraged to seek commercial advantages by claiming they can do better than their competitors. The classic example of competition is the auction. Each bidder seeks to win the item being auctioned by offering more than others or to perform the work for less than others, such as in competitive bidding. The latter method is often used in construction and will be discussed in detail in Chapter 18.

But at a certain point, attempting to persuade someone to use one's services or buy one's goods will run afoul of the protection tort law accords valid contracts: a commercial relationship, such as a stable supplier-customer relationship, or a negotiation that has proceeded so far that it is very likely it will be concluded successfully. In such cases, the person who makes the claim has the reasonable expectation of commercial gain that has been frustrated wrongfully.

Whether a third party has interfered wrongfully requires balancing protection given a commercial relationship with the freedom given persons to seek to persuade others that they can perform services better than the one who has been retained to perform them.

The two issues that surface when claims are made against third parties are whether the interest affected merits protection of the law and whether the conduct in question has risen to the necessary level of wrongdoing.

As to the first, a federal trial court opinion demonstrates this in the context of a construction contract.²³ A catastrophic discharge of water occurred during performance. The contractor sought to find out what had caused the problem and to fix it. The defendant, an architect who was not the original architect in the project, urged

²²Gandhi, *The Pendulum of the Art-in-Architecture Program's Struggle to Balance Artistic Freedom and Public Acceptance*, 31 Pub.Cont.L.J. 535 (2002) (describing procedures and case studies).

²³*RCDI Constr., Inc., v. Spaceplan/Architecture, Planning & Interiors, P.A.*, 148 F.Supp.2d 607 (W.D.N.C. 2001) (affirmed by the Court of Appeals for the 4th Circuit in an unpublished opinion. 2002 WL 53927).

the owner to terminate the plaintiff contractor so that the defendant architect could provide a method of repairing the damage. The owner terminated the contractor.

The plaintiff contractor settled with the owner and brought a claim against the defendant for interfering with its contract.²⁴

The court held that the contract made by the contractor and the owner was illegal as the contractor was not licensed. Since the contractor could not bring legal action based upon this contract, it had no reasonable expectation for the law to protect. Also, the court held that the contractor could not create a legal right, that is, to have its contract protected from third parties, based upon its having committed an unlawful act.

As to the second type of conduct, early cases required malicious intent or bad faith.²⁵ But the trend has been toward requiring merely an intent to do the act that will have the effect of interfering with a legally protected interest of the plaintiff.²⁶

SECTION 11.04 Professional Service Contracts: Some Remarks

A. Profits and Risk

Ordinarily, professional advisers do not have potentially high profit returns. They serve their client and expect to be paid for their services. This does not mean that advisers are *always* paid for their work. Nonpayment because the client does not have the financial resources is a risk taken by all who perform services.

This section is directed toward defenses by the client to any claim for compensation for services rendered based on an assertion that no money is due. Such defenses are usually predicated on an asserted understanding that if the project did not go forward—usually because public approval or funds could not be obtained—the professional designer would not be paid for the work.

Although autonomy gives contracting parties the power to make an arrangement under which the professional

designer may risk the fee, any conclusion that this risk has been taken should be arrived at only if weighty evidence supports this conclusion. This is based not only on customary practices but also on the conclusion that professional designers do not as a rule recover profits but recover only payment for services they render.²⁷

B. Good Faith, Fair Dealing, and Fiduciary Relationships: Confidentiality

The law increasingly finds that all contracting parties owe each other the responsibility of good faith and fair dealing.²⁸ This is particularly so when objectives sought by the design professional and the client require close cooperation. Each party should help the other achieve its goals under the contract.

While the obligations of good faith and fair dealing have become more or less universal in contract law and are applied in all contracts, the fiduciary concept is much more particular, one that is created in specific and limited contexts.

The fiduciary relationship is a complex doctrine created originally by English Courts of Equity. There are many facets to this doctrine, and it can occur in many contexts. Generally speaking it involves the duty of the finest loyalty.²⁹ Put another way, the fiduciary owes certain persons strict fidelity. One court stated that a relationship is fiduciary when one party has superior knowledge and authority and that party is in a position of trust and confidence over the weaker party.³⁰ Another way of putting it is that the relationship places one party in the hands of another. The fiduciary is expected to act in the best interests of the other party. Obviously, this concept is fluid and expresses bare bones concepts. The normal rules of conduct in the commercial world allow parties to act at arm's length. Each actor in that world can think mainly of its own interest.

²⁷*Designer Direct, Inc. v. DeForest Redevelopment Auth.*, 313 F.3d 1036 (7th Cir.2002), rehearing denied Jan. 29, 2003, appeal after remand, 368 F.3d 751 (7th Cir.2004).

²⁸Restatement (Second) of Contracts § 205 (1981): Uniform Commercial Code § 1-304 (formerly 1-203). See Section 19.02D.

²⁹*Meinhart v. Salmon*, 164 N.E. 545 (N.Y.1928). Though this case was decided in 1928, many cases have continued to cite it. See Rosen, *Meador Lecture Series: Fiduciaries*, 58 Ala. L.Rev. 1041 (2007).

³⁰*Carlson v. SALA Architects, Inc.* 732 N.W.2d 324 (Minn.App. 2007), review denied (Minn. Aug. 21, 2007). The court held that the relationship between architect and his client does not create *per se* a fiduciary relationship. More is needed to show such a relationship.

²⁴Had the defendant been the architect of the project under which he could advise the owner on termination, the architect would have had the advisor's privilege as this was his function. See Section 14.08F.

²⁵*Dehnert v. Arrow Sprinklers*, 705 P.2d. 846 (Wyo.1985).

²⁶*Blivas Page, Inc. v. Klein*, 5 Ill.App.3d 280, 282 N.E.2d 210 (1972); *Williams v. Chittenden Trust Co.*, 145 Vt. 76, 484 A.2d 911 (1984).

But this changes drastically when the fiduciary relationship is created. These general concepts must be fleshed out with examples that show the concept in operation.

The best and clearest example of a fiduciary relationship is between the trustee of a trust and its beneficiaries. The trustee is to act with the interests of the beneficiaries in mind, not the interests of the trustee. Similarly, the attorney-client relationship automatically (*per se*) creates a fiduciary relationship. For example, the attorney's advice must be based solely on the best interests of the client, not his own. There can be dealings between the attorney and client, but the law will look very carefully at any transaction to make sure it is fair to the client in light of the greater knowledge of the attorney and the trust the client places in his attorney. Similarly, the trustee of an express trust can contract with the trust, but again the law examines any such transaction carefully to make sure it is a fair one.

Of course, parties to a contract can create a fiduciary relationship or one that resembles one. The AIA cost-type construction contract documents³¹ include Article 3. While it does not state that such a relationship has been created, it states that "The Contractor accepts the relationship of trust and confidence established by this Agreement." The contractor also promises to cooperate with the architect and to "exercise the Contractor's skill and judgment in furthering the interests of the Owner. . . ." The contractor also promises "to perform the Work in an expeditious and economical manner consistent with the Owner's interests." In light of the contractor's control of the performance, this language is crucial in a contract in which the owner promises to pay the cost of the work.³²

Yet in the design and construction context, the issues usually relate to the relationship between the design professional (more commonly the architect) and the client. As noted, one court held that the relationship between architect and client does not in itself (*per se*) create a fiduciary relationship.³³ Nor is it an arm's length relationship.

The difficulty of fitting the architect or engineer into the fiduciary relationship is shown by the unwillingness of the law to scrutinize the contract between a design professional and the client at the same intensity as it would a contract between the attorney and client. Even without a fiduciary

relationship between the parties, the law would most likely construe any ambiguities against the architect both because the architect in most cases drafted the contract and because the balance of knowledge tilts toward the architect despite the owner often having superior bargaining power.³⁴

This question is complicated by the various roles played by the architect in both the design and the construction phases. In the design phase the architect can act as the agent of the client. The architect who acts as agent for the client owes the client a fiduciary obligation when playing that role. He must act in the best interests of the client, not his own. The architect, as a rule, is not the general agent of the client.³⁵ In AIA document A201-2007 the architect is not the general agent of the client, but an agent whose authority is limited to the extent provided in the contract documents.³⁶

The architect can also be a professional advisor, particularly in design matters that concern cost. For example, it has been held that the architect must warn his client if costs are likely to overrun.³⁷ Another case, while concluding that the trial court properly refused to give an instruction that in essence was one based on a fiduciary relationship, held that the architect must disclose information that the client would want to know.³⁸ Some contracts require the architect to warn the owner of possible cost overruns, but the outcome would be similar without such a provision based on the concept of implied terms.

During the construction phase, the architect or engineer has other roles. He may be given the power by the parties to the construction contract to certify payment certificates³⁹ or certificates of completion.⁴⁰ They may also give him the power to initially resolve disputes.⁴¹ In these

³²That this does not always create such a relationship is shown in Section 17.02B.

³³See *supra* note 30.

capacities he acts in a quasi judicial role, not as agent for the client. Certainly there is no place for any fiduciary duties even if there were such a relationship.

Two other issues that can be part of or at least related to the fiduciary concept concern confidentiality and conflict of interest. These ancillary issues often arise in construction. The parties may learn information that one party wishes to stay confidential. Also, any decision making can be affected by a conflict of interest.

The client should be able to trust its professional adviser and receive honest professional advice. Both parties—design professional and client—should be candid and open in their discussions, and each should feel confident that the other will not divulge confidential information to third parties.

In 2007 the AIA changed B141-1997 to B101-2007, renumbered old Paragraph 1.2.3.4 and made it Section 10.8 (Article 10 captioned “Miscellaneous”). The new B101-2007 made the promise of confidentiality reciprocal. The new Section 10.8 expanded the core obligation. It added “business proprietary” to “confidential” and required that such information be kept strictly confidential compared to the earlier requirement of maintaining the confidentiality of information.

The confidentiality obligation in B101-2007 was also given greater scope by reducing the exceptions to the obligations found in B141-1997. In 1997 there were exceptions that permitted disclosure of confidential information that would violate the law or confidential information that “would create the risk of significant harm to the public or prevent the Architect from establishing a claim or defense in an adjudicatory proceeding.” These were deleted in 2007. In their place the receiver of the information can disclose it to its employees, to those who need it to perform services or construction on the project, and to its consultants whose contracts “include similar restrictions on the use of confidential information.”

B101-2007, Section 10.7 continued the permission to the architect to use certain representations of the design in promotional and professional material. The architect can include the owner’s confidential or proprietary information unless the owner “had previously advised the Architect in writing of the specific material considered by the Owner to be confidential or proprietary.” This had been Paragraph 1.3.7.7 in B141-1997. Putting this burden on the owner limits the confidentiality protection of the owner, but requiring advance notice does protect the

architect, who may not realize what information is proprietary or confidential.

These changes show the importance of careful review of new AIA documents. The change to reciprocal obligations gives protection to the architect not found in B141-1997. Yet the tightening up of the core obligation of confidentiality shows the increasing stress on protection of intellectual property, often at the heart of nondisclosure commitments.

Do the deletions in B101-2007 of exceptions that had been included in B141-1997, those that had allowed disclosures that would violate the law or create a risk of significant harm to the public, adversely affect any architect that uses B101-2007? This is at best uncertain. In any event, even without the 1997 exceptions, any architect who plans to withhold confidential information or proprietary data or withhold information that could violate the law or harm the public should seek competent legal advice before taking this step.

Some aspects of the fiduciary relationship are obvious. Design professionals should not take kickbacks or bribes. They should not profit from professional services other than by receiving compensation from the client.

Funds held by the design professional that belong to the client should be kept separate. Commingling is a breach of the fiduciary obligation. In such a case, any doubts about to whom the money belongs or for whom profitable investments were made is resolved in favor of the client.

Financial opportunities that come to the attention of the design professional as a result of the services he is performing for the client should be disclosed to the client if the services would be an opportunity falling within the client’s business.

One of the most troubling concepts in law relates to conflict of interest. A person cannot serve two masters. The client should be able to trust its design professional to make judgments based solely on the best interests of the client. Advice or decisions by the design professional should be untainted by any real or apparent conflict of interest. The client must believe the design professional serves it, and it alone.

Design professionals should not have a financial interest in anyone bidding on a project for which they are furnishing professional advice. Likewise, they should not have a financial interest in any contractor or subcontractor who is engaged in a project for which the professionals have

been engaged. Design professionals should not have any significant financial interest in manufacturers, suppliers, or distributors whose products might be specified by them. Products should not be endorsed that could affect specification writing, nor should designated products be specified because manufacturers or distributors of those products have furnished free engineering. The purpose of these restrictions is to avoid conflict of interest. Design professionals cannot serve their clients loyally if they might personally profit by their advice.

Generally, a client who is fully aware of a potential conflict of interest can nevertheless choose to continue to use the design professional. Consent to a conflict of interest should be binding only if it is clear that the client knows all the facts and has sufficient understanding to make a choice. A design professional who intends to rely on consent by the client must be certain that such requirements are met.

The client clearly can avoid responsibility for any act by the design professional that is tainted by a breach of the fiduciary obligation. For example, if a contract is awarded to a bidder with whom the architect or engineer colluded, the contract can be set aside by the client. If the architect or engineer issued a certificate for payment dishonestly or in violation of his fiduciary obligation, the certificate can be set aside if the client so desires.

While the mere retention of a design professional may not establish a fiduciary relationship, the design professional–client relationship is not one at arm’s length. Though neither extremity fits this relationship, the nature of the relationship has many attributes of a fiduciary relationship because of the client’s lack of the specialized skills possessed by the design professional and the power the design professional has to affect the interests of his client. The client must have confidence in the loyalty of his design professional and the two must trust each other.

The breach of a fiduciary obligation can give the client grounds to dismiss the design professional. Any bribes or gifts taken by the design professional can be recovered by the client. Any profit the design professional has made as a result of breaching the fiduciary obligation must be given to the client even if the profit was generated principally by the skill of the design professional. Obviously, the design professional must take his fiduciary obligation seriously and make every effort to avoid its breach or the appearance of such a breach.

The AIA recognized conflict of interest in its B101-2007, Section 2.4. It provides that, unless the owner knows and consents, “the Architect shall not engage in any activity, or accept any employment, interest or contribution that would reasonably appear to compromise the Architect’s professional judgment with respect to this Project.”

This demonstrates the fluidity of these concepts. Clearly these restraints would bind the architect were there a fiduciary relationship. Yet even without one, such conflict of interest can be barred by the contract or would be implied by the law.

C. Variety of Contracts: Purchase Orders

Some professional relationships are not accompanied by careful planning in a contractual sense. Such relationships sometimes are created by a handshake without any exploration of important attributes of the relationship. If such attributes are discussed and resolved, the resolution is often not expressed in tangible form.

At the other extreme, the relationship often is cemented by assent to a preprepared standardized form frequently supplied by architect or engineer and occasionally by the client. Often the client does not understand these standardized agreements. On occasion the actual agreement of client and design professional may differ from provisions of the standardized form. Under any of the circumstances mentioned, difficulties can exist if disagreements arise between client and design professional over the services the latter is to perform.

Another contracting system that can create problems, particularly for the design professional, involves the use of purchase orders as a method for commissioning professional services by architects and engineers. A client will send a purchase order to the design professional and ask that a copy be signed and returned to the client. Purchase orders ordinarily contain a set of standard terms and conditions that relate more to delivery of “off-the-shelf” goods than to professional services. Their use may cause the design professional and his client to fail to achieve a clear mutual understanding as to the services to be performed, the compensation to be received, and responsibility if things go wrong.

From a substantive standpoint, the use of a purchase order more geared to the delivery of goods may impose on the design professional stricter warranties as to the outcome of the services than are required normally of design

professionals. As shall be seen in Sections 14.05 and 14.07, such warranties and guarantees may be excluded from professional liability insurance coverage.

The best approach for a design professional who receives a standard purchase order is to send the form back unsigned and begin discussions with the client over scope and responsibilities before commencing performance.

D. Interpretation

Contracts between owners and contractors and between contractors and subcontractors generate more interpretation disputes than those between design professionals and clients. For this reason, the bulk of the discussion in this book relating to contract interpretation is found in Chapters 19 and 20. However, a few interpretation guides relating to contracts between design professionals and clients may be useful here.

One attribute of the design professional–client relationship that sets it apart from ordinary commercial contracts is the relative inexperience of many clients in design and design services. Another is the way such agreements are made. Not uncommonly, such relationships are created by a vague, informal agreement sometimes followed by assent to a preprepared contract form supplied by the design professional. These two attributes frequently generate honest misunderstandings between design professionals and clients.

The most important lodestar—the common intention of the parties at the time the contract was made—is determined by examining any discussions the parties may have had before entering into the agreement, the language in any written contract to which both parties have assented, the facts and circumstances surrounding the making of the agreement, the conduct of the parties after the relationship has begun, and any custom or usage of the trade of which both parties were aware or should have been aware.

Although discussion between the parties—the admissibility of which is determined by the parol evidence rule described in Section 11.04E—and surrounding facts and circumstances are important, emphasis here is on the language of the contract. Although courts still invoke the “plain meaning” rule discussed in Section 20.02—the search for evidence outside the writing requiring a preliminary determination that the meaning is not “plain” on its face—by and large courts today will look at any

relevant evidence to determine the meaning of language selected by the parties.

As a rule, the most important evidence of the intention of the parties is any written agreement to which the parties have assented. This is true whether the agreement is a carefully negotiated contract between client and design professional of relatively equal bargaining power and experience, or an agreement between an unsophisticated client and an experienced design professional where the latter has supplied a preprepared form contract.

In the former, there is likely to be a neutral reading of the language. In the latter, the interpretation guide that contract terms are generally interpreted against the party who has prepared the agreement will be used (*contra proferentum*).⁴² This interpretation guide can be justified either because the drafter carelessly or deliberately caused the language ambiguity or because the law assumes that the party who prepares the agreement is in a position to force unfair or onerous terms on the other party. This doctrine may be an implicit recognition that the party who does not prepare the language may not take the time or have the ability to examine carefully the language selected by the other party.

This discussion assumes that either both or at least one party had an intention as to specific language. When the parties use lengthy standard contracts published by a third party such as the AIA, it is possible that neither party had any idea of the purpose of a particular clause, often an important datum invoked to interpret the clause. As this “absence of intention” can arise in construction contracts, discussion of this topic is postponed until Section 20.02.

The interpretation guide that resolves the dispute against the party who supplied the ambiguous terms will also be applied to contracts published by the professional association of the design professional.⁴³ Ambiguous language is likely to be interpreted to be consistent with the reasonable expectations of the client rather than with the literal interpretation that the language might otherwise bear.

Suppose a design professional is retained by a large institutional client such as a public agency or large private corporation. In such a case, the client often prepares the contract for professional services and presents

⁴²*Williams Eng'g, Inc. v. Goodyear*, 496 So.2d 1012 (La.1986).

⁴³*Malo v. Gilman*, 177 Ind.App. 365, 379 N.E.2d 554 (1978); *Durand Assoc., Inc. v. Guardian Inv. Co.*, 186 Neb. 349, 183 N.W.2d 246 (1971).

it to the design professional on a take-it-or-leave-it basis. Ambiguous language in such a case should be interpreted in favor of the design professional.

As to other interpretation guides, handwritten portions of a contract are preferred to typewritten portions or printed portions, and typewritten portions are given more weight than printed provisions in a form contract. Where parties choose language in connection with a particular transaction, the language is more likely to reflect their common intention.

Specific provisions are given more weight than general provisions. For example, suppose a contract between architect and client states that the architect will perform services in accordance with normal architectural professional standards. Suppose further that the same agreement provides that the architect will visit the site at least once a day. If normal professional standards would not require that the architect visit the site this often, a conflict exists between the two provisions. In such a case, the provision specifically relating to the number of site visits will control the general provision requiring that the architect perform in accordance with accepted professional standards.

Words are generally used in their normal meanings unless both parties know or should know of trade usages that have grown up around the use of certain terms. This rule is important in the design professional's relationship to the client. Often a word used in an agreement will have a definite meaning to the design professional but have a different meaning, or at least an indefinable meaning, to the client. For example, suppose that the agreement between design professional and client states that the design professional will make periodic visits to the site during construction. Suppose further that the design professional shows evidence of a custom that visits customarily occur at weekly intervals during a certain stage of the project. If the client does not know or have reason to know of this custom, the custom cannot be used to interpret the phrase "periodic visits." Although parties can be said to contract with reference to established usages in a trade, if one party is not or should not have been aware of the usage, it would be unfair to permit evidence of usage to be used to interpret the language in question.

Another interpretation guide—that of practical interpretation—looks at the practices of the parties. Such practices may give good evidence of what the parties intended. For example, suppose the language to be inter-

preted is "periodic visits." Suppose the architect visited the site weekly and this was known by and acquiesced to by the client. A court would consider this persuasive evidence that the parties agreed that the visits would be weekly.

E. The Parol Evidence Rule and Contract Completeness

One aspect of the parol evidence rule relates to the provability of asserted prior oral agreements when the parties have assented to a written agreement. A client may contend that the design professional agreed to perform certain services that were not specified in the written agreement. The latter's attorney may contend that the writing expressed the entire agreement and that parol evidence or oral evidence is not admissible to "add to, vary, or contradict a written document." Sometimes such oral agreements are provable. Sometimes they are not.

Courts generally do not consider written agreements between clients and design professionals to be complete expressions of the entire agreement.⁴⁴ Undoubtedly, one reason why clients are usually allowed to testify as to promises not found in the written contract is the close relationship between the design professional and the client. Under such circumstances, the client may have been reasonable in not insisting that oral promises be included in the writing.⁴⁵

This emphasis on the close relationship between the contracting parties can be demonstrated by a Mississippi case in which the principal issue was whether a contractor should have read an addendum that contained a provision that the architect told the contractor would be deleted.⁴⁶ In excusing the contractor's failure to read the addendum and his relying solely on the statement of the architect, the court noted that the contractor had been assured that the provision had been removed by the senior architect in the firm, "a man in whom he reposed considerable

⁴⁴*Spitz v. Brickhouse*, 3 Ill.App.2d 536, 123 N.E.2d 117 (1954); *Malo v. Gilman*, supra note 43.

⁴⁵*Lee v. Joseph E. Seagram & Sons, Inc.*, 552 F.2d 447 (2d Cir.1977).

⁴⁶*Godfrey, Bassett & Kuykendall, Architects, Ltd. v. Huntington Lumber & Supply Co.*, 584 So.2d 1254 (Miss.1991). The *Godfrey* case has been distinguished in a number of insurance cases on a variety of grounds. See *Ross v. Citifinancial, Inc.*, 344 F.3d 458 (5th Cir.2003); *Reed v. American Soc. Group, Inc.*, 324 F. Supp.2d 798 (S.D.Miss.2004). This indicates that the *Godfrey* case was one of a kind and has little value as a precedent.

confidence following over a decade of business dealings.”⁴⁷ The contractor, according to the court, expected to have been told the truth and not to have been misled. The court concluded stating that this was “a case of dealings between gentlemen, two honorable men.”⁴⁸

Sometimes a court will refuse to listen to any evidence outside the writing if it is convinced the writing is so clear in meaning it needs no outside assistance. Most courts will permit either party, especially the client, to show prior oral agreements not included in the writing.

Although attorneys for design professionals frequently rely on the parol evidence rule, such reliance is often misplaced. This is especially so if the agreement is sketchy and does not spell out the details adequately and if the client was not represented by an attorney during the negotiations.

Reducing an arrangement to writing does not necessarily protect the design professional from assertions of additional oral agreements. However, the more detail included in the agreement and the greater the likelihood that the client understood the terms or had legal counsel, the greater the probability that the client will not be allowed to prove the claimed oral agreement. The parol evidence rule does not apply to agreements made after the written agreement has been signed by the parties.

The parol evidence rule relates only to the provability of antecedent or contemporaneous agreements. If such agreements are admitted into evidence, the trial court or the jury—depending on who makes the determination of fact—must decide whether the evidence shows that such an agreement was made. Very often the attorney for the design professional places heavy reliance on the parol evidence rule and does not adequately prepare for the more important question of whether the asserted agreement took place.

Most parol evidence cases require a determination of whether the writing was intended to be the complete and final repository of the entire agreement of the parties. To preclude the court from determining that a particular writing was not intended to be complete, contracts prepared by attorneys or by professional associations often contain integration or merger clauses.

Before 1966, the AIA Standard Documents for professional services did not contain an integration clause,

reflecting the then emphasis on the close professional relationship between architect and client. Beginning in 1966, the AIA documents tended to become more concerned with liability and litigation, and this undoubtedly was the reason for including B141, Paragraph 9.6, which had stated, “This Agreement represents the entire and integrated agreement between the Owner and the Architect and supersedes all prior negotiations, representations or agreements, either written or oral.” In B141-1997 this became Paragraph 1.4.1 and in B101-2007 it became Section 13.1. In commercial contracts, such clauses are generally successful in accomplishing the drafter’s objective unless the party attacking the clause asserts that the other party fraudulently induced the agreement.

F. Formal Requirements: Recent California Legislation

Formal requirements for contracts in general were discussed in Section 5.10. Statutes of Frauds, though with some local variations, have been enacted in all states. They require a written memorandum for certain transactions. As a practical matter, none of the transactions required by the Statute of Frauds include transactions between a design professional and his client.

Yet increasingly, legislatures single out for special treatment other transactions that have generated disputes often ending in court, usually requiring that they be in writing. In addition, statutes often require conspicuousness, such as requiring a particular size type or all capital letters.

It was inevitable that legislatures would turn their attention to contracts between architects and their clients. The culmination of fragmentary discussions between a professional and his client, the likelihood that the client has never made a transaction like this one, and the complexity of the transaction and the lack of clarity of scope of services—these factors and undoubtedly others make it rare for clear and complete contracts to be made by architect and client.

The most complete contracts available are standard contracts published by professional associations of professional designers, such as the American Institute of Architects (AIA). Though the AIA claims its contracts are fair to both parties and reflect existing practices, such pre-prepared contracts are designed with the best interests of architects in mind. Such contracts rarely are gone over in detail by the architect and his client. Even language

⁴⁷Godfrey, Bassett & Kuykendall, *Architects, Ltd. v. Huntington Lumber & Supply Co.*, supra note 46 at 1257.

⁴⁸Ibid.

that deals with issues that come up frequently, such as cost estimates, scope of services, additional services, ownership of documents, and compensation, may not be reviewed carefully. Clients, as a rule, do not understand the terms used, are not given much time to review the contract, and rarely engage a lawyer to review the contract.

The realities of the contract making process led the California legislature in 1995 to add Section 5536.22 to its Business and Professions Code. It requires that an architect use a written contract executed by both architect and client before the architect begins work, unless the client (in writing) directs that the work can begin before the contract is made. At the very least, the contract must contain language dealing with the scope of services, basis for compensation, method of payment, procedures for additional services, and procedures for termination. There are some exceptions.

Another legislative interference with contracts is the Connecticut Home Improvement Act.⁴⁹ A valid contract

for a home improvement requires a writing signed by both parties. This amplifies the Statute of Frauds.⁵⁰ The Act also requires written change orders. But it made an exception for a claim for the reasonable value of services if the court decides it would be inequitable to deny recovery to the claimant.

Enactment of this statute raises many questions. Are transactions that do not comply with this statute valid? Is failure to comply only a breach of the architect's professional responsibility and the basis for professional discipline? Will the AIA or local architects develop a standard contract that will meet the statutory requirements? What effect will this statute have on existing AIA documents, such as AIA Document B101-2007 reproduced in Appendix A? Will other states enact similar legislation?

Yet enactment of these statutes does reflect public concern over the way architects and their clients create the architect–client relationship.

⁴⁹Conn.Gen.Stat. § 20-429(a).

⁵⁰See Section 5.10.

Professional Design Services: The Sensitive Issues

SECTION 12.01 Range of Possible Professional Services: Fees and Insurance

The range of potential professional services, already substantial because of the complexity of design and construction and the centrality of the design professional's position, has expanded. The range of potential services performed by the design professional has expanded because of:

1. Increased public control over design and construction. See Section 12.06.
2. Greater participation by the design professional in financial and economic aspects of the project. See Sections 12.04 and 12.05.
3. Greater demand by the owner that the design professional play a role in selecting or drafting the construction documents. See Section 12.07.
4. Greater participation by the design professional in disputes that culminate in arbitration or litigation. See Section 29.04.
5. Greater desire by the client to involve the design professional in activities prior to actual design or those which are performed after completing construction. See Section 12.02.

The reaction of the AIA to this expanded range of professional services will be discussed in Section 12.02.

Compensation is discussed in Chapter 13, but one aspect of compensation relates to the potential list of professional services. Although the percentage-of-construction-cost method of compensating the design professional is beginning to be replaced by time-based compensation, it is still common to compute the fee by the percentage formula. However, and not without occasionally surprising the

client, this amount is called the *basic fee*. Other services are frequently designated as “additional services,” which entitle the design professional to compensation in addition to the basic fee. In many cases, the design professional is willing to perform any services the law allows and within her professional skill, provided she is compensated for performing these services. But disputes may arise over whether the services requested fall under the basic fee or entitle the design professional to additional compensation. As shall be seen in Section 13.01G, the American Institute of Architects (AIA) in its B141-1997 eliminated the concept of additional services and substituted Paragraph 1.3.3, “Change in Services.”

Ten years later, the AIA brought back the term “additional services.” Document B101-2007 Article 3 lists the architect's basic services, and Article 4 lists the architect's additional services. This book uses the terms *basic services* and *additional services*.

Another factor—professional liability insurance (discussed in Section 15.05)—must be taken into account in planning services. Design professionals should be aware of which services can be covered by professional liability insurance and which are generally excluded. As a general rule, insurers wish to insure only those services routinely performed and connected to the professional training and experience of the insured design professional. Such services include analyzing the client's needs, preparing a design solution, and performing site services to see that the design is executed properly. Services that go beyond these may very well be excluded unless there is a special endorsement.

Similarly, the client should be aware of which services are included. Although it is possible to agree that services be rendered that are excluded from insurance coverage,

this should be a deliberate choice made by the contracting parties, not inadvertent.

At the outset of the professional relationship or as soon as possible thereafter, the client and design professional should determine in advance which of the possible professional services the design professional is to perform and whether those services fall within the basic fee. After this is done, the written agreement should reflect the actual agreement, and performance should accord with the contract requirements or any subsequent modifications.

SECTION 12.02 Traditional Roles of Design Professional: B101-2007

Before proceeding to the 2007 AIA changes to the “Basic Agreement for Design Services,” it is advisable to look at the traditional model of design professional services.¹

Usually the client comes to the designer with a problem it hopes the designer can solve. The client describes its needs and, as a rule, what it wishes to spend. After consulting the client, the designer develops a schematic design and may revise the client’s budget.

Next the designer studies the design and prepares drawings and possible models that illustrate the plan, site development, features of construction equipment, and appearance. The designer is also likely to prepare outline specifications and possibly again revise the predicted costs. In small projects, schematic design and design development are still designated as “preliminary studies.”

After the client approves the design development, the designer prepares working drawings and specifications that cover in detail the general construction, structure, mechanical systems, materials, workmanship, site development, and responsibility of the parties. Often the designer supplies or drafts general conditions and bidding information (discussed in Section 12.07, dealing with services of a legal nature).

The final preconstruction phase is generally called the *bidding or negotiation phase*. The designer helps the client obtain a construction contractor through bidding or negotiation. These phases are discussed again in Section 13.02, as phases often determine timing of interim fee payments.

¹The traditional model described here contrasts with the impact on design services brought about by digital information technology. See Section 19.01.

During construction, the designer interprets the contract documents, checks on the progress of the work to issue payment certificates, participates in the change order process, and initially resolves disputes. As shall be noted in Section 29.01, A201-2007 Article 15 introduces a new actor, the Initial Decision Maker (IDM). She makes initial decisions. If an IDM is not specifically designated, then initial decisions are made by the architect.

In creating B141-1997, the AIA sought to emphasize the expanding range of services that the architect might perform. It divided B141-1997 into two components. Both were labeled as B141-1997 but were physically divided: the “Standard Form of Agreement Between Owner and Architect” (Articles 1.1-1.5) and the “Standard Form of Architect’s Services: Design and Construction Administration” (Articles 2.1-2.9). The latter document listed seven categories of architect’s services.

With B101-2007, the AIA returns to the traditional one-document “Standard Form of Agreement Between Owner and Architect.” Article 3, dealing with basic services, divides these services into five components:

1. schematic design phase (§ 3.2)
2. design development phase (§ 3.3)
3. construction documents phase (§ 3.4)
4. bidding or negotiation phase (§ 3.4)
5. construction phase (§ 3.6)

SECTION 12.03 Cost Predictions

A. Inaccurate Cost Prediction: A Source of Misunderstanding

The relative accuracy of cost predictions is crucial to both public and private clients. Clients may be limited to bond issues, appropriations, grants, loans, or other available capital. Unfortunately, many clients think that cost estimating is a scientific process by which accurate estimates can be ground out mechanically by the design professional. For this reason, design professionals should start out with the assumption that cost predictions are vital to the client and that the client does not realize the difficulty in accurately predicting costs.

The close relationship between design professional and client often deteriorates when the low bid substantially exceeds any cost figures discussed at the beginning of the relationship or even the last cost prediction made by the

design professional. Not uncommonly the project is abandoned, and the client may claim that it should not have to pay the design professional. The design professional contends that cost predictions are educated guesses and that their accuracy depends in large part on events beyond the control of the design professional. Clients frequently request cost predictions before many details of the project have been worked out. Clients frequently change the design specifications without realizing the impact such changes can have on earlier cost predictions. Design professionals point to unstable labor and material costs. The amount a contractor is willing to bid often depends on supply and demand factors that cannot be predicted far in advance. Design professionals contend they are willing to redesign to try to bring costs down but unless it can be shown they have not exercised the professional skill that can be expected of people situated as they were, they should be paid for their work.

The terminology relating to *cost predictions* indicates this is a sensitive area. The most commonly used expression, though used less frequently in contracts made by professional associations, is *cost estimates*. The term *estimate* is itself troublesome. In some contexts it means a firm proposal intended to be binding, and in others it is only an educated guess. Probably many clients believe that cost estimates will be in the ballpark, whereas design professionals may look on such estimates as educated guesses.

Professional associations seek to minimize the likelihood that their members will go unpaid if a project is abandoned because of excessive costs (explored in greater detail in Section 12.03C). Part of this effort is reflected in the terminology chosen. For example, in its 1977 B141 the AIA sought to differentiate between “statements of probable construction costs, detailed estimates of construction costs, and fixed limit of construction costs.” Only the latter, according to the AIA, created a risk assumption by the architects that they will go unpaid if the project is abandoned because of excessive costs. In 1987, the AIA changed to *preliminary cost estimates*. In B141-1997, Paragraph 2.1.7.1 stated that the architect will prepare “a preliminary estimate of the Cost of the Work.”

In B101-2007, Section 3.2.6 states that the architect will submit to the owner “an estimate of the Cost of the Work prepared in accordance with Section 6.3.” Section 6.3, in turn, states that the estimate may be based on “current area, volume, or similar conceptual estimating techniques.” If the owner asks for “detailed cost estimating services,” this will be charged as an additional service.

The Engineers Joint Contracts Document Committee (EJCDC) in EJCDC E-500 (2002), Paragraph 5.01, refers to “opinions of probable construction costs.” The potential for misunderstanding is demonstrated in the reported appellate decision reproduced in Section 12.03C.

B. Two Models of Cost Predictions

The many reported appellate cases demonstrate not only the frequency of misunderstanding but also the difficulties many design professionals have predicting costs. Recognition of this, along with other factors explored in Chapter 17, has led the sophisticated client to seek more refined ways to control and predict costs. It is important at the outset to distinguish between what can be called the *traditional method* and these more refined methods.

The traditional method usually involves the design professional’s using rough rules of thumb based on projected square or cubic footage, modulated to some degree by a skillful design professional’s sense of the types of design choices a particular client will make. Cost predictions are likely to be given throughout the development of the design, but they are usually based on these rough formulas, refined somewhat as the design proceeds toward completion.

As time for obtaining bids or negotiating with a contractor draws near, the cost predictions should become more accurate. In this model, there is a great deal of suspense when bids are opened or when negotiations become serious. Under this system, a greater likelihood exists of substantial if not catastrophic differences between the costs expected by the client and the likely costs of construction as reflected through bids or negotiations. This model gives rise to the bulk of litigation.

The other model—that of more efficient techniques—is likely to be used by sophisticated clients who are aware of the difficulties design professionals have using the model just described. Clients are likely to engage someone who can more accurately predict costs as the design evolves. Sometimes they hire a skilled cost estimator—someone close to the quantity surveyor used in England—as a separate consultant. Sometimes they hire a construction manager (CM), who is supposed to have a better understanding of the labor market, the materials and equipment market, and the construction industry, as well as of the construction process itself. Using a CM is intended not only to free the designer from major responsibility for cost predictions but also to keep an accurate,

ongoing cost prediction. Sometimes the CM agrees to give a guaranteed maximum price (GMP) that may vary as the design evolves. To do so, the CM may obtain firm price commitments from the specialty contractors.

This second model—a fine-tuned model—is designed to avoid the devastating surprises common under the traditional model. To determine whether the design professional bears the risk of losing the fee, differentiating between the two models is vital, the risk being greater in the traditional model.

C. Creation of a Cost Condition: Frank Lloyd Wright and the Johnson Building and *Griswold & Rauma v. Aesculapius*

When clients assert they have no obligation to pay the design professional because the low bid exceeded predicted costs, they are asserting a cost condition. They are claiming

their obligation to pay was conditioned on the accuracy of a design professional's cost prediction. A cost condition is a gamble by the design professional that the cost prediction will be reasonably accurate. If it is not, the fee is lost unless the client prevented the condition from occurring, such as making excessive design changes, or is willing to dispense with the cost condition. In such a case, the client need not show that the design professional has not lived up to the professional standard of care.

Clients sometimes contend the design professional not only gambled the fee but also promised that the project will be brought in at or below a designated price. Failure to perform as promised makes the design professional responsible for any damage to the client that was reasonably foreseeable as a probable result of the breach at the time the contract was made. Section 12.03C emphasizes the question of whether a cost condition has been created, while Section 12.03F discusses the question of damages for breach.

FRANK LLOYD WRIGHT AND THE JOHNSON BUILDING: A CASE STUDY

Much can be learned from case studies. They provide a picture of how the design professional and the client interact over costs. The case studies in a book dealing with law are usually actual cases that have reached an appellate court. One such case, *Griswold*, is reproduced in Section 12.03C. It very likely involved the use of AIA documents.

The Frank Lloyd Wright case study did *not* culminate in a written contract, a lawsuit, and a reported appellate decision. Yet much can be learned from it. The human side of the architect–client relationship is not always depicted in actual cases. This case study involved Frank Lloyd Wright and one of his most famous projects, the Johnson Building in Racine, Wisconsin (see photos A–C). In 1986 it ranked ninth on the list of best architectural designs by the College of Fellows of the American Institute of Architects. For the portion of this case study that deals with costs, we are indebted to Professor Stewart Macaulay,² who gained access to records and obtained testimony from witnesses.

Macaulay writes that at the time Wright received his commission, his practice was falter due to scandals involving Wright and the onset of the Great Depression. Wright managed to survive this period by lecturing, writing, and forming the Taliesin Fellowship. There young architects and artists paid to work with Wright. Macaulay continues,

The Johnson Building was Wright's next major commission. He was eager to get it, and it marked a major turning point for him. Wright was nearing seventy, and after more than five years when he had no significant commissions, the publicity provoked by "Fallingwater" and the Johnson Building reminded people that Frank Lloyd Wright was not merely an important figure in the history of architecture. He began about twenty years more of highly productive work. This last phase of Mr. Wright's career ended in 1959 when he died at age ninety-one with New York's Guggenheim Museum under construction.

...

The company needed a new administration building. It hired a local architect named Matson who offered a traditional design. Jack Ramsey [general manager of Johnson] was dissatisfied. Several people suggested Frank Lloyd Wright. Ramsey and Bill Connolly, the Advertising Manager, went to Taliesin to meet Wright on July 17, 1936. Ramsey knew Wright's reputation as an

architect from Ramsey's experience in Europe, but he also knew Wright's negative reputation in Wisconsin. People there thought about the scandals related to Wright's domestic situation, how seldom Wright paid bills on time, his unconventional houses, and the cost of his work. The commission could be a great opportunity for Wright, after having so little work for a number of years. Wright was at his most persuasive, and Ramsey was impressed. He wrote a memorandum to Hibbard Johnson who was at his cottage in Northern Wisconsin. Ramsey's memo strongly recommended that Johnson meet Wright. A Frank Lloyd Wright building became Ramsey's cause within the company. In effect, he committed his reputation to a project by the controversial architect. Ramsey said:

Regarding the new building, I had a day Friday that so confirmed and crystallized my feeling about Matson's present offering and that at the same time so inspired me as to what can be done that I was on the point of sending you wild telegrams Friday night when I got home, or getting you out of bed on the telephone.

... Honest, Hib, I haven't had such an inspiration from a person in years. And I won't feel satisfied about your getting what you want until you talk to him—to say nothing of not feeling justified in letting \$300,000 be clothed in Matson's designs.

...

He's an artist and a little bit "different," of course, but aside from his wearing a Windsor tie, he was perfectly human and very easy to talk to and most interested in our problem and understood that we were not committing ourselves, but, gosh, he could tell us what we were after when we couldn't explain it ourselves.

...

And he asked about what we thought this building would cost us. I said, when we got through with the building, landscaping, furnishings, etc., we'd be investing around \$300,000. He asked how many people it would house. I said about 200. He snorted and said it was too damn much money for the job and he could do a better functional job in a more appropriate manner for a lot less. . . .

He is very easy to talk to, much interested in our job whether he has anything to do with it or not, because it hits his ideas of modern building, because it is a Wisconsin native proposition, and because it seems to hurt his artistic conscience to see so much money spent on anything ordinary. . . . Will you see him?

On July 21, 1936, Johnson drove to Taliesin to meet Wright. At first, the two men argued. Johnson later said, "I showed him pictures of the old office, and he said it was awful. . . . He had a Lincoln-Zephyr, and I had one—that was the only thing we agreed on. On all other matters we were at each other's throat." Johnson described his goals for the new building. He wanted it to symbolize the progressive company that his grandfather and father had built. Wright then "described the kind of building he would design, unconventional, imaginative, trend-setting, a visual symbol of a great company."

On July 23rd, Johnson wrote Wright:

I am now asking you to proceed with plans and sketches of a \$200,000 office building for us in Racine on the basis of 2½% or \$5,000 to be paid you when sketches and plans are submitted. . . .

It is my understanding that the remaining commission of 7½% or \$15,000 will not be paid to you unless your plans are used wholly and under your supervision. Also, that we are free to use any or all the ideas you offer—either ourselves, or other architect. . . .

I want to take this opportunity of expressing my appreciation, as well as Mr. Ramsey's, for your gracious hospitality, and for the inspiration and education we received.

. . .

Wright and his associates then worked around the clock to produce his proposal. He presented it to Johnson, Ramsey and several other executives on September 15, 1936. On that same day, Johnson and Wright presented the plan to the firm's Board of Directors. The Board approved the project.³

³On August 18, 1936, Johnson wrote Wright,

Some time ago the Directors approved a sum of \$200,000 for a new office building. No mention was made of furnishings, fees, etc. At the next meeting I will advise them of your goal—the building complete at \$250,000—which I feel will be acceptable to them, considering the plus value we will receive by having you do it for us.

[The author of a book on Wright and the Johnson Building] also quotes John Howe, Mr. Wright's chief draftsman, as saying, "From the start, the money they were talking about wouldn't have done the most ordinary kind of building. Mr. Wright always started doing what he thought was right for the building. He didn't burden himself with undue considerations of cost."

The company hired a contractor on the basis of cost plus an agreed upon percentage for overhead and profit. There is no record of any detailed written contract signed by Wright and the Johnson firm.⁴

Macaulay then describes the building of the structure. Problems developed, such as

1. Would the structure serve its business needs?
2. Discovery of two major structural problems
3. Greater than expected delay and
4. "The building cost far more than Mr. Wright's various estimates."

As to the latter, Macaulay continued, summarizing the facts already given:

Responsibility for delay strained the relationship, but the real arguments focused on the cost of the building. When Jack Ramsey had first visited Wright, Ramsey said that the Johnson company was planning to spend about \$300,000 on the local architect's plan. Ramsey reported to Hib Johnson that Wright "snorted and said it was too damn much money for the job and he could do a better functional job in more appropriate manner for a lot less. . . ." Johnson's letter offering the commission to Wright suggested a \$200,000 building. Later, Johnson wrote to Wright and quoted a total cost of "\$250,000 including furnishings, fees, etc." Wright's fee was to be ten percent of the total cost of the building. As the cost of the building increased so did the architect's fee. Although the final cost was not announced by S. C. Johnson & Son, it was clearly many times Mr. Wright's original target of \$250,000. One speculation was \$750,000, Mr. Wright's figure was \$850,000, and another estimate was \$900,000.

⁴Wright wrote Ramsey:

I am sorry you had to break off the thread of continuity so abruptly next day. I tried to get . . . you to stay until we could get formalities over with so we might proceed with Mr. Johnson's decision to build immediately. But we are so proceeding anyway without formalities so that no time will be lost. When you return we can get things straight. The first part of the service according to our agreement is practically rendered and a letter of acceptance from the company closing the preliminary episode and opening the second phase is in order when you get around to it.

. . . Later, Jack Ramsey wrote Frank Lloyd Wright about the Johnson firm's arrangement with Wright. He mentioned Hibbard Johnson confirming "our verbal agreement" in a letter of July 23, and Mr. Wright's "long-hand note" of August 15 "assuring and driving at the Building complete at a cost of \$250,000 including an appropriation of \$20,000 for furnishings. Architect's fee is included and also the Clerk of the Works fee." Letter from Ramsey to Wright, Dec. 11, 1936."

Wright and Ramsey first debated fees in December of 1936. Wright wrote to Ramsey, addressing him as “My dear Jack,” with a “proposition” about designing the furniture for the building. He said that he had charged others twenty percent for designs of furniture and equipment. However, he offered to do it for ten percent if Ramsey would send him \$3,000 “on furniture designs you have not yet seen . . .” Wright noted that “Christmas is coming and the best way for me to get a good one is to pay up the thousand and one petty accounts nagging my footsteps.”

Ramsey responded the next day, noting that he was “the Scotchman in this picture.” This letter was the only time that either Johnson or Ramsey turned to the language of their contract with Wright. Ramsey referred to the parties’ agreement for designing the building:

[A]fter various conferences, you finally wrote him [Hib Johnson] on August 15 (long-hand note so maybe not in your files), “I am assuring and driving at building complete at a cost of \$250,000 including an appropriation of \$20,000 for furnishings. Architect’s fee is included and also the Clerk of the Works fee.”

Ramsey said that they had not added to the original plans except a squash court over the garage. “But now you tell me it will run about \$300,000 and that apparently exclusive of furnishing and fees!” Ramsey thought that Johnson’s Wax might not be able to “splurge” on new furnishings, and they could not commit to Wright’s designs without seeing them. “Money is an irritating part of this world, but we’ve got to take it into account—not for piling up gold for its own sake, but just so that this business continues to run properly and serve the very human destiny that it has for fifty years.” He concluded:

In any case, it seems to me that there are a lot of things about the building itself that have to be completed first [before the Johnson firm agrees to Wright-designed furniture]. Do you realize that Hib has advanced, to be exact \$20,964 on an extreme expectation of something under \$25,000 [in total architect’s fees] and we have not yet the completed construction plans, to say nothing of final interior layout and approved plans on heating, ventilating, lighting—even the glass to be used in wall construction? That is confidence beyond anything I can say in words, so I know you will not take my plain words wrong.

Wright responded over a month later, beginning, sarcastically: “Dear Mr. Ramsey. Thanks a Lot Anyway.” He noted that he had had pneumonia, and Ramsey’s letter had been kept from him because it was “considered disturbing.” Wright justified the

increased costs by pointing to what had been added to the structure. He wrote of what he had saved the project by battling state regulators. He said that commercial buildings usually carried separate fees for a “structural engineer, sanitary engineer, heating and ventilating engineer as well as architect.” He argued that the creative work of planning had been completed. “I would be then entitled to 7½% of the revised est. of \$300,000 or \$22,000.” He noted that he felt free “to throw away details . . . and make others when I find I can improve the structure or save something. . . . This will never . . . [stop] until it is finished if I can keep my form.” He ended, “So you see, Jack, Scotch though you may be, your architect is no longer trespassing on his client.”

Shortly before Christmas in 1937, Hibbard Johnson indicated his concern about the mounting costs of the building. Wright responded in a long letter. He pointed out that he was not profiteering from the project. “No architect creating anything worth naming as creative work ever made or can make any money on what he does.” He then asserted that the company could afford what Wright was providing. Johnson had “the privilege of paying for something way beyond money value.” Wright had saved money on the project in various ways. The building would benefit the company as a symbol that could be advertised.

He then turned to the costs. He said, “if the office building runs to \$450,000 (as it will) including furnishing:—it will have cost the Company about 33 cents per cubic foot, which is the price of any ordinary well-built, fire proof, air-conditioned factory building.” The structure was bigger and built under more expensive conditions than Wright had imagined. The total costs were not extravagant “considering the resources of the owners and what they are getting for their outlay. . . . The labor scale and shorter hours and prices for materials, all these are higher than any previous work of mine.” Wright said that the demands on him in supervising construction had been excessive. Wright ends by asking Johnson to send him a check “to help get started in the [Arizona] desert.”

Hibbard Johnson was surprised by the new cost estimate of \$450,000, and he responded with some heat:

I know it does no good to complain as you are an artist so in love with your work that nothing will make you change your ideas of what the . . . [building] ought to be, even though it works a hardship on your client. You would rather tell the client whatever comes into your head as to the cost and the time to construct, at the start, just to sell the job and give satisfaction to your art to create something worthwhile, rather than be accurate in cost estimates. Why didn’t you put me wise long ago as to the true costs and time to construct? Would that be

unreasonable to ask? That is water over the dam now and I am going to have to take it, but I will never like it. That is, the way you have handled me; the buildings . . . I am going to love. . . .

Now, Frankie, this reply to your letter is no complaint as it would do no good to complain. You have us hooked and we can't get away. Rather, it is written to show you how I feel and, if possible, spur you on to economize on matters still undecided in the building. . . .

Most people called Frank Lloyd Wright, "Mr. Wright." Hib Johnson was a special client and called him, "Frank." "Frankie" should be taken as an expression of annoyance.

A writer on the staff of Architectural Forum was visiting Taliesin in 1938. He overheard a meeting between Mr. Wright and Johnson officials.

[We could hear the loud voices raised on the client's side, and afterward Mr. Wright came out . . . and said that the client was unhappy . . . [because] the building was going over budget. . . . [H]e said . . . "You know, they really don't understand this building at all." He said, "They're acting as if this were a normal office building and you calculate this the way you would a normal office building. But they have forgotten what they told me initially, which was that this was a memorial to Grandpa, the founder of this great industrial enterprise, and you don't build memorials with the same materials, or the same spirit, or the same budget, you know as you do speculative office buildings." He said, "One of these days . . . you're going to see . . . tourists from all over the country . . . come and see this building."

Almost a year later, Jack Ramsey and Frank Lloyd Wright again debated the delays and cost of the building. Mr. Wright wrote Ramsey while traveling on the train to Arizona. He remarked that the original plans were only "a crude unfinished sketch" of what was in process in Racine. He said, "I realize fully the strain the growth of this great landmark in new-world architecture has thrown on you—and do not resent the breakdown of good feeling and consequently of good sense."

Ramsey replied that he appreciated the letter. However, "I can't subscribe to the statement that we ever lost 'good sense'; but I freely admit that 'good nature' took an awful long vacation." Then Ramsey sought to justify the Johnson company's concern with the costs of the building:

Cost, as measured in money, is a most difficult thing to argue with you. Idealistically you despise the idea of money

as a measure of anything. It probably has not occurred to you that Hib and I and probably 90% of the rest of the world also realize the imperfection of such a measuring stick. Nevertheless, it remains a fact that it is a universal yardstick used even to measure happiness. Wastefulness of dollars in the construction of our building did not grieve us because each dollar came off of a cold figure concerning a bank balance, but offended our sense of justice in that such wasted dollars were a measure of some other constructive accomplishment that thereby must be omitted from the scheme of things.

It is, I believe, only a matter of proportion on which we have differed with you. If a farmer has a hundred dollars and has a certain aim in view concerning the raising of poultry, he might be justified in spending twenty dollars on a chicken coop, or even twenty-five dollars with the extra five dollars as a measure of additional content and happiness afforded the chickens and the eyes of all beholders, but he would be morally unjustified in spending ninety-nine dollars on his chicken coop and thereby starving his horses and cows. And if he hired a chicken-coop specialist to build the finest coop in the world at an estimated cost of thirty dollars and the cost ran up to ninety-nine dollars, moral responsibility would be upon aforesaid specialist.

That is not a pretty example and it is probably crude and exaggerated but I am impelled to try to illustrate our side somehow.

Mr. Wright did not accept Ramsey's position. He said that if the chicken house simile were apt, "[w]e would all be written off for damn'd fools and sent over the hills to the poor house. I've felt (as I know you and Hib have felt) that there were human values involved, in this building way beyond any that could be measured by money."

. . . .

One sanction usually available to a dissatisfied party to a contract is refusing to interact again with the other party. Wright and Johnson had become friends, but Hib Johnson felt that Mr. Wright had manipulated him with an unreasonably low estimate to get the job. This strained the relationship. Wright wrote Ramsey after Wright had prepared a revised edition of his autobiography: "I've heard nothing from Hib since I sent on the piece on the building now appearing (soon) in *An Autobiography*. . . I thought he would like the piece very much. But I guess he didn't. . . We expected Hib to invite us to dinner sometime this winter—but no."

After the Johnson Administration Building was completed in 1939, the firm decided to build facilities for research and development of new products. World War II delayed the project. In October of 1943, Hibbard Johnson wrote Frank Lloyd Wright, asking for comments. Johnson said:

To be frank, Frank, we simply will not consider a financial and construction nightmare like the office building. It is a plain factory kind of job that should be built by an engineer or contractor like our other factory buildings. Yet because of its proximity to your masterpiece, it should have a relationship thereto and we feel it would be unfair to you and a mistake on our part if we didn't ask how you think you would want to fit into such a picture.

After several letters and a proposed design, Johnson changed his mind and hired Wright to build the Research Tower. Mr. Wright's plan was not for "a plain factory kind of job." The Company attempted to be more cautious and formal in its dealings with Frank Lloyd Wright. Hib Johnson wrote Wright: "We want this building built on a contract basis, if at all possible; if not that, then on a basis where the cost would not vary 10% over estimates." Nonetheless, they went ahead on a cost-plus basis without the ceiling that Mr. Johnson wanted. Mr. Wright was to be paid his usual commission of 10% of the costs of the project.

The tower's estimated cost rose from \$750,000 to over \$2 million. In May of 1948, Johnson accepted this estimate but again bargained to cap Mr. Wright's commission at \$200,000 to be paid over two years.

Contract Completeness and the Parol Evidence Rule.

The issue that has arisen most frequently in cost cases relates to the parol evidence rule (discussed in Section 11.04E). This rule determines whether a writing assented to by contracting parties is the sole and final repository of the parties' agreement. If so, testimony relating to agreements made before or at the time of the written contract is not admitted into evidence by the judge. In the context of a cost condition, the issue is whether the client will be permitted to testify that it had made an earlier oral agreement or had an understanding that it could abandon the project and not pay for design services if the low construction bid substantially exceeded the cost prediction of the design professional.

The client generally will be permitted to testify that such an agreement had been made if the agreement between the design professional and the client is oral, if the agreement is written but nothing is stated as to the effect of accurate cost predictions, or in some cases even if this problem is dealt with in the agreement. Permitting such testimony is based on the conclusion that such agreements are not, as a rule, the final and complete repository of the entire agreement between design professional and client.⁵

⁵*Stevens v. Fanning*, 59 Ill.App.2d 285, 207 N.E.2d 136 (1965). Many cases are collected in Annot., 20 A.L.R.3d 778 (1968).

Standardized contracts prepared by the AIA or EJCDC include language that seeks to protect the design professional from assertions of the existence of a cost condition. Although such language has been useful to design professionals,⁶ its presence is not ironclad protection against clients being permitted to testify to their understanding that if the costs were excessive they could abandon the project and not pay the design professional for services.⁷ The case reproduced later in this section involved a clause that sought to make the writing complete. Yet, as shall be seen, testimony seems to have been freely admitted. (The current AIA language is discussed later in this section.)

Keep in mind that permitting the testimony does not end the matter. Issues are still likely to exist as to whether the agreement took place, the nature of the agreement, and whether the condition has occurred or been excused.

Preliminary Issues. Before discussing cost conditions and their legal effect, other issues should be addressed. Are cost and cost control essential elements of professional service? What is the legal effect of giving

⁶*Anderzhon Architects v. 57 Oxbow II*, 250 Neb. 768, 553 N.W.2d 157 (1996) (AIA language requiring a writing to create a cost condition justified summary judgment in favor of the architect).

⁷*Kahn v. Terry*, 628 So.2d 390 (Ala.1993) (despite the use of an AIA contract both parties permitted to testify and issue sent to jury: architect prevailed).

a cost estimate? Do other obligations exist relating to cost and cost control?

Two cases, each involving identical AIA documents that required the architect to give preliminary cost estimates when requested, came to different conclusions. Texas held that the fiduciary relationship did not require the architect to take cost into account and advise the owner as to estimated cost.⁸ Michigan held giving cost estimates and, presumably, monitoring costs are inherent in the client–design professional relationship.⁹ The unusual facts in the Texas case, the increased responsibility placed on fiduciaries, and the usual expectations of the client make it likely that the Michigan result will be followed.¹⁰

Although a cost estimate usually is simply an opinion and not a *guarantee*,¹¹ it can be a factual representation by the design professional. (This may be the reason the AIA in 1987 changed from “a statement of probable construction cost” to “a preliminary cost estimate,” in 1997 to “a preliminary estimate of the Cost of the Work,” and in 2007 to “an estimate of the Cost of the Work.”) If it is sufficiently certain to be relied on reasonably by the client, an inaccurate estimate is a misrepresentation by the design professional. New York held that a cost prediction could constitute an intentional misrepresentation if it was guaranteed or if the client relied on the architect’s opinion as an expert.¹² A Florida court ruled that a contract disclaimer, stating that the architect’s estimate of probable cost was not a guarantee, meant the trial court erred in instructing the jury that “it is the general duty of an engineer to be reasonably accurate in providing estimated costs of a project.”¹³

An innocent misrepresentation that induces the making of the contract permits rescission of the contract. If the contract is made, the design professional cannot recover for services and must repay any amounts received. If her design

was used by the client, the design professional can recover in restitution based on unjust enrichment. If the representation was negligently made, the client would also have a claim for damages (discussed in Section 12.03F).

Even if an estimate is not a guarantee or even if a cost condition is not created, there can be other cost-related obligations. For example, the Louisiana Supreme Court held that the engineer who designed a water slide was liable for damages despite a contractual provision stating that the engineer was simply giving opinions to be used only as a guide.¹⁴ The court concluded that the engineer had breached the contract “not by giving an inaccurate initial estimate, but by failing to employ a professional estimator, failing to look at other water slides, failing to advise the owners about other contractual possibilities and failing to provide revised cost estimates.”¹⁵

Existence of Cost Condition. Although cost condition cases generally involve the client claiming an express agreement based on a cost agreed to or set forth in the contract under which it could abandon the project and not pay a fee, a cost condition can be created by implication without any specific agreement as to the effect of inaccurate costs.¹⁶

Certainly design professionals do not operate in the dark. If they know what funds are available and are aware of the remoteness of obtaining additional funds, any cost specified may be “hard.” In such a case, a cost condition may be created despite the absence of an express agreement under which this risk is taken.

Evidence that bears on the softness or hardness of any projected costs discussed by the design professional and the client or expressed in their agreement is crucial. This evidence, such as labeling the amounts as merely an estimate or using a cost range, may indicate that the amount or range specified is what is hoped for rather than a fixed-cost limitation. Where the amount is

¹⁶*Stanley Consultants, Inc. v. H. Kalicak Constr. Co.*, 383 F.Supp. 315. (E.D.Mo.1974) (dictum). In *George Wagschal Assoc., Inc. v. West*, 362 Mich. 676, 107 N.W.2d 874 (1961), a cost condition was found in a consultant contract because the consultant knew of the client’s budget limit. But if the contract expressly negates a cost condition, it will not be implied. *Kurtz v. Quincy Post Number 37, Am. Legion*, 5 Ill.App.3d 412, 283 N.E.2d 8 (1972).

“soft,” design professionals are being exhorted to use their professional skill to bring the project in for the amount specified. Where it is “hard,” the client may be informing the design professional that the latter is risking the fee on ability to accomplish this objective. This distillation of appellate cases appeared in a legal journal dealing with architectural cost predictions:¹⁷

Courts have admitted evidence of custom in the profession. Architects have been permitted to introduce evidence that customarily architects do not assume the risk of the accuracy of their cost predictions. Also, courts have been more favorably disposed toward holding for the architect if the project in question has involved remodeling rather than new construction, because estimating costs in remodeling is extremely difficult. The same result should follow if the type of construction involves experimental techniques or materials.

Courts sometimes distinguish between cases and justify varying results on the basis of the amount of detail given to the architect by the client in advance. Generally, the greater the detail, the easier it should be for the architect to predict accurately. However, it is much more difficult for the architect to fulfill the desires of the client within a specified cost figure if the client retains a great deal of control over details, especially if these controls are exercised throughout the architect’s performance. For this reason, some courts have held that a cost condition is not created where the architect is not given much flexibility in designs or materials.

Some courts have looked at the stage of the architect’s performance in which the cost condition was created. If it is created at an early stage, it is more difficult for the architect to be accurate in his cost predictions. Generally, the later the cost limit is imposed in good faith, the more likely it is to be a cost condition. But courts should recognize that if it is imposed later, creation—or, more realistically, imposition—may be an unfair attempt by the client to deprive the architect of his fee.

Occasionally the courts have applied the rule that an ambiguous contract should be interpreted against the person who drew it up and thus created the ambiguity. If the client is a private party, the contract is usually drafted or supplied by the architect. Courts have looked at the building and business experience of the client. If the client is

experienced, he should be more aware of the difficulty of making accurate cost estimates. If he has building experience, the client is more likely to be aware of the custom that architects usually do not risk their fee on the accuracy of their cost estimates.

Courts have sometimes cited provisions for interim payments as an indication that the architect is not assuming the risk of losing his fees on the accuracy of his cost estimates. However, standard printed clauses buried in a contract are not always an accurate reflection of the understanding of the party not familiar with the customs or the forms. If payments have actually been made during the architect’s performance, this is a clearer indication that the client is not laboring under the belief that he will not have to pay any fee if the low bid substantially exceeds the final cost estimate. A few cases have looked for good faith on the part of the client. For example, if the client has offered some payment to the architect for his services, this may impress a court as a show of fairness and good faith. [Ed. note: Footnotes omitted.]

Standard Contracts and Disclaimers: A Look at AIA Standard Contracts. Professional associations have dealt with cost problems by including language in their standard contracts to protect design professionals from losing fees when cost problems develop. The protective language has ranged from the brief statement that cost estimates cannot be guaranteed to the elaborate contract language beginning with the 1987 AIA Document B141 and carried forward to the present.

To understand the changes the AIA made in 1997, it is important to look at the treatment this sensitive topic received in 1987.

Paragraph 5.2 required the client to include in its budget amounts that take into account the possibility that the bids may substantially exceed the budget. Paragraph 5.2.1 required the architect to use her best judgment to evaluate any client-supplied project budget or architect-created cost estimates but stated that the architect does not warrant accuracy. In addition to Paragraph 9.6 stating that the writing is complete, Paragraph 5.2.2 stated that a project budget is not a fixed-cost limit and *requires that any such limit be in writing and signed by the parties*. If such a *fixed-cost limit* (not an ordinary budget) is established, the architect has the right to determine “materials, equipment, component systems, and types of construction” to be included and to make reasonable adjustments in

¹⁷Sweet & Sweet, *Architectural Cost Predictions: A Legal and Institutional Analysis*, 56 Calif.L.Rev. 996, 1006–1007 (1968).

project scope. The architect can include pricing contingencies and alternate bids.

Paragraph 5.2.3 required an adjustment if bid or negotiation is delayed more than ninety days after submission of construction documents. Finally, Paragraph 5.2.4 is a contractual expression of the obligation of good faith and fair dealing. It states that if the lowest bona fide bid exceeds any fixed-cost limit, the owner must do one of the following:

1. approve an increase in the fixed limit
2. authorize rebidding or renegotiating
3. terminate and pay for work performed and termination expenses if the project is abandoned
4. cooperate in project revision to reduce cost

If option 4 is chosen, under Paragraph 5.2.5 the architect must bear the cost of redesign, specified as the limit of the architect's responsibility, and she is to be paid for any other service rendered.

In 1997 the AIA revised its treatment of cost predictions in B141-1997. It linked the owner's budget with preliminary cost estimates furnished by the architect. Now the owner must specify its budget for the project and the cost of the work at the time the architect is engaged¹⁸ and must keep the budget current as the architect works.¹⁹ It may not change the budget or budget contingencies "without the agreement of the Architect to a corresponding change in the Project scope or quality."²⁰ If the budget is exceeded by the lowest bona fide bid or negotiated proposal, the owner must take one of the steps set forth in the 1987 Paragraph 5.2.4, the most important being to cooperate in contract revision to reduce the cost.²¹

Also, in 1997 the AIA deleted the phrase "fixed limit of construction cost," which had required a separate writing signed by the parties. The trigger for the four methods of resolving the problem was no longer the hard-to-establish fixed-cost limitation (cost condition) but the budget being exceeded by the bids or proposal. This emphasis on the budget accented the need for cooperation of the owner and the architect. It also eliminated reference to the possibility of a cost condition being created under which the architect

would risk her fee on the cost coming close to the cost estimates.

Presumably the AIA felt that the contract integration clause²² would protect against assertions by the owner that an oral cost condition had been created, often the chief battleground of these cost prediction cases. That such clauses can help the architect is shown by *Torres v. Jarmon*,²³ a Texas case decided in 1973. Earlier cases, such as *Stevens v. Fanning*,²⁴ and some others reflect a different attitude toward such protective clauses. Much will depend on the facts surrounding the transaction, especially the degree of variance, the extent of client changes in the design, and the way each party behaved before and after the problem surfaced.

In 2007, the AIA sought to shift responsibility for the budget more squarely onto the owner. The owner's Initial Information must include its "budget for the Cost of the Work."²⁵ The Cost of the Work includes not only the cost to build, but also the contractor's overhead and profit. The Cost of the Work does not encompass the architect's compensation or costs that are the owner's responsibility, including a contingency.²⁶

Section 6.2 enigmatically says that this budget provided as part of the Initial Information "may be adjusted throughout the Project as *required* under Sections 5.2, 6.4 and 6.5." Notwithstanding Section 6.2's use of the permissive "may," Sections 5.2 and 6.4 make clear that periodic updating of the budget is a mandatory duty of the owner.

The AIA envisions the owner updates occurring with input from the architect.²⁷ If the architect's estimate exceeds the owner's budget, the architect will make recommendations to adjust the project's size or quality, and the owner will cooperate with the architect.²⁸ At the same time, the AIA emphasizes that the architect's inputs are estimates, not guarantees. Section 6.3 allows the architect to base her estimates on "conceptual estimating techniques" without providing a detailed cost estimate. More

directly, Section 6.2 warns that “the Architect cannot and does not warrant or represent” that her cost evaluations will not vary from bids received.²⁹

As with the 1987 and 1997 versions of B141, if the lowest bona fide bid or negotiated price exceeds the budget, the owner must either take one of the four steps previously allowed or, as of 2007, may also “implement any other mutually acceptable alternative.”³⁰ The integration clause seeks to prevent the owner from using parol evidence to establish oral agreements of a cost condition.³¹

The current EJCDC treatment of a “construction cost limit” is found in its 2002 E-500, optional Exhibit F, paragraph F5.02. The owner and engineer agree to a “construction cost limit.” If the bids exceed the limit, the owner will either increase the limit, rebid, or renegotiate the project, or work with the engineer to revise the project’s scope, extent, or character, consistent with sound engineering practices.

An Illustrative Case: Griswold and Rauma, Architects, Inc. v. Aesculapius Corp. A case very likely involving an earlier AIA standard document is reproduced here.

GRISWOLD AND RAUMA, ARCHITECTS, INC. v. AESCULAPIUS CORP.

Supreme Court of Minnesota, 1974. 301 Minn. 121, 211 N.W.2d 556.
[Ed. note: Footnotes omitted.]

PETERSON, Justice.

Plaintiff brought this action to enforce and foreclose a lien for \$19,438.65 for architectural services provided defendant. Defendant answered by denying that it owed plaintiff anything and filed a counterclaim to recover \$17,436.04 already paid plaintiff, defendant’s theory being that plaintiff was entitled to no fee because it breached its contract by grossly underestimating the probable cost of construction of the as-yet-unbuilt building. The trial court found for defendant. We reverse, for reasons requiring an extended recital of the factual setting out of which the litigation arose.

Plaintiff is a corporation engaged in providing architectural services. Defendant is also a corporation, the principal stockholders of which are Drs. James Ponterio, P. J. Adams, and A. A. Spagnolo. Defendant owns a medical building in Shakopee which it rents to the Shakopee Clinic, which in turn is operated by Drs. Ponterio, Adams, and Spagnolo.

In early 1970 defendant decided to expand the Shakopee Clinic to allow for a larger staff of doctors. As a result the members of the corporation and their business manager, Frank Schneider, contacted various architectural firms and selected plaintiff.

At his first meeting with the doctors in February or March 1970 David Griswold, one of plaintiff’s senior architects, was shown a rough draft of the proposed addition and given a very

general idea of what the doctors wanted. Although the evidence is conflicting, it appears that at this meeting the doctors talked in general terms of a budget of about \$300,000 to \$325,000.

After a number of subsequent conferences with the doctors and Mr. Schneider, plaintiff prepared and delivered to the doctors on May 8, 1970, a document entitled “Program of Requirements.” This document, which outlined and discussed the requirements of the project as then contemplated, contained the following final section:

BUDGET:

The design to evolve from this program will indicate a certain construction volume that can be projected to a project cost by the application of unit (per square foot and per cubic foot) costs; and eventually, as the design is developed in detail, by an actual materials take-off. Inevitably the projected cost must be compatible with a budget determined by available funds. It is obvious that adjustment of either the program or the budget may be necessary and that possibility must be recognized.

The project budget established, as currently understood, is \$300,000. It has not been stated if this is intended to include non-building costs such as furnishings, equipment and fees—which may be approximately 25% of the total expenditure—as well as construction costs. Advice in this respect will eventually be necessary.

The essential principle to be considered in the design development is as previously stated in the paragraphs of the section titled PROJECT OBJECTIVES.

²⁹This disclaimer language has been repeated virtually verbatim since B141-1977, ¶ 3.2.1.

³⁰AIA Doc. B101-2007, § 6.6.5.

³¹Id. at § 13.1.

The construction shall be as economical as possible within the limitations imposed by the desire to build well and provide all of the facility required for a medical service.

In spite of the suggestion at the end of the second paragraph quoted above, neither party at any time thereafter sought to define more particularly what the budget was intended to include. Mr. Schneider testified, however, that he believed the original budget figure included the cost of construction, architects' fees, and the remodeling of the old building. In contrast, Dr. Ponterio testified that it was his belief that the original budget figure did not include a communications system valued at \$12,755, architects' fees, or the \$20,000 remodeling of the existing building.

On or about May 22, 1970, plaintiff submitted to defendant two alternate preliminary plans, designated SK-1 and SK-2. Plan SK-1 projected the programmed services to be housed partly in the existing building and partly in the new building. Plan SK-2 projected the programmed services as being housed entirely in the new building. Plan SK-2, as specifically shown on the plans, involved a larger plan in terms of area than SK-1. Defendant indicated its preference for plan SK-2, the larger and more elaborate of the two.

On June 1, 1970, plaintiff provided defendant with a "Cost Analysis" of the plan chosen by defendant. This cost analysis showed the dimensions of the project in square feet as then contemplated, and computed the cost of the project at two different rates per square foot. At the higher rate per square foot, the cost came to \$322,140, plus an estimated \$20,000 for remodeling the old building, totaling \$342,140. At the lesser rate per square foot, the cost came to \$284,575, plus \$15,000 for the remodeling of the old building, totaling \$299,575. The cost analysis memorandum also noted that "the best procedure for projecting costs is by a materials take-off" which was to be done "when sufficient information is available."

It is undisputed that subsequent to the June 1, 1970, cost estimate, no further cost estimates were ever conveyed to defendant. What is disputed is whether in the ensuing months there was any discussion as to whether the project was coming within the budget. According to the testimony of Mr. Schneider, defendant was assured at all times during the preparation of the building plans and in all discussions with Griswold that the construction would come within the budget. Dr. Ponterio also emphasized that Griswold constantly mentioned the budget figure of \$300,000 at their meetings. Griswold, however, denied that he had ever assured defendant that the project was coming within the budget.

Although the architectural services began in March and the first billing was May 6, 1970, no written contract was forwarded until June 23, 1970. At that time a standard American Institute of Architects (AIA) contract was forwarded, calling for payment at plaintiff's standard hourly rate and for reimbursement of expenses and recognizing that a lump sum fee for the construction phase would be negotiated prior to its commencement. The following provisions of the contract have relevance to this case:

SCHEMATIC DESIGN PHASE

1.1.3 The Architect shall submit to the Owner a Statement of Probable Construction Cost based on current area, volume or other unit costs.

DESIGN DEVELOPMENT PHASE

1.1.5 The Architect shall submit to the Owner a further Statement of Probable Construction Cost.

CONSTRUCTION DOCUMENTS PHASE

1.1.7 The Architect shall advise the Owner of any adjustments to previous Statements of Probable Construction Cost indicated by changes in requirements or general market conditions.

THE OWNER'S RESPONSIBILITIES

2.8 If the Owner observes or otherwise becomes aware of any fault or defect in the Project, or nonconformance with the Contract Documents, he shall give prompt written notice thereof to the Architect.

CONSTRUCTION COST

3.4 . . . Accordingly, the Architect cannot and does not guarantee that bids will not vary from any Statement of Probable Construction Cost or other cost estimate prepared by him.

3.5 When a fixed limit of Construction Cost is established as a condition of this Agreement, it shall include a bidding contingency of ten per cent unless another amount is agreed on in writing.

3.5.1 If the lowest bona fide bid . . . exceeds such fixed limit of Construction Cost (including the bidding contingency) established as a condition of this Agreement, the Owner shall

- (1) give written approval of an increase in such fixed limit,
- (2) authorize rebidding the Project within a reasonable time, or
- (3) cooperate in revising the Project scope and quality as required to reduce the Probable Construction Cost.

In the case of (3) the Architect, without additional charge, shall modify the Drawings and Specifications as necessary to bring the Construction Cost within the fixed limit. The providing of this service shall be the limit of the Architect's responsibility in this regard, and having done so, the Architect shall be entitled to his fees in accordance with this Agreement.

PAYMENTS TO THE ARCHITECT

6.3 If the Project is suspended for more than three months or abandoned in whole or in part, the Architect shall be paid his compensation for services performed prior to receipt of written notice from the Owner of such suspension or abandonment, together with Reimbursable Expenses then due and all terminal expenses resulting from such suspension or abandonment.

Between June 1, 1970, and November 25, 1970, when the bids were opened, plaintiff worked actively with defendant both in the design development and construction documents phases of the project, plaintiff continuing to bill defendant on an hourly basis without objection by defendant. Although the project was substantially increased in size and scope during this period, plaintiff did not furnish and defendant did not request any up-to-date cost projections. Significantly important changes in the project made during this period include:

1. Replacement of offices with examining rooms necessitating additional plumbing;
2. More extensive X-ray space;
3. A doubling of the size of the laboratory;
4. Addition of a sophisticated communications system;
5. Addition of 2,100 feet of finished space in the basement (to provide facilities originally projected for the remodeled old building);
6. Enlargement of the structure as follows:
 waiting area 1710' to 1724'
 first floor 5880' to 6650'
 basement 6260' to 6814'

All of the changes were discussed, approved, and understood by defendant. Defendant alleges, however, that it was under the impression that all such changes would be included in the original budget figure.

Bids were opened on November 25, 1970. The low construction bid was Kratochvil Construction Company at \$423,380. Deductive alternates agreed to by defendant would bring the total low bid cost, including carpeting, down to \$413,037.

Subsequent to the opening of the bids, the doctors called a meeting with Griswold at which the doctors informed Griswold

that they could not complete the building according to the cost evidenced by the bids. Thereafter, Griswold met with the doctors and offered suggestions as to how the low bid figure could be reduced. Approximately \$42,000 of reductions were projected, so that the final bid as reduced totaled \$370,897. This figure included construction, carpeting, and remodeling of the old building and would meet the program of requirements without reducing size in any way. Griswold also pointed out to the doctors that the project cost could be further reduced by eliminating "bays" (series of examination rooms) from the building at a saving of approximately \$35,000 per bay. Defendant was willing to accept the \$42,000 reduction but was not in favor of eliminating any bays from the proposed project.

From November 25, 1970, when the bids were opened, until October 12, 1971, plaintiff and defendant met and corresponded many times in connection with various possible revisions of the project. During this time defendant never indicated that the project was abandoned and in fact, in January 1971 made a payment of \$12,000 on its bill. During this time defendant never asked to be excused from the balance of the bill, and defendant offered to help plaintiff by paying interest on the open account if plaintiff required bank financing by reason of nonpayment. During this time defendant advised plaintiff that ground breaking would be deferred for 6 months, and that request by plaintiff for a further payment was "well taken" but that no further payment would be recommended until construction began.

The building, in fact, was never constructed. Plaintiff filed its lien on April 30, 1971, and commenced this action to enforce it in October 1971.

In analyzing the facts of this case we have considered Minnesota decisions as well as decisions from other jurisdictions. From these decisions we have extracted a number of factors which we believe are relevant to a determination of what the effect on compensation of an architect or building contractor should be when the actual or, as here, probable cost of construction exceeds an agreed maximum cost figure.

One very significant factor is whether the agreed maximum cost figure was expressed in terms of an approximation or estimate rather than a guarantee. Where the figure was merely an approximation or estimate and not a guarantee, courts generally permit the architect to recover compensation provided the actual or probable cost of construction does not substantially exceed the agreed figure.

Another significant factor is whether the excess of the actual or probable cost resulted from orders by the client to change the plans. Where the client ordered changes which increased the

actual or probable construction costs, courts are more likely to permit the architect to recover compensation notwithstanding a cost overrun.

A third factor is whether the client has waived his right to object either by accepting the architect's performance without objecting or by failing to make a timely objection to that performance.

A fourth factor, applicable in a case such as this where the planned building was never constructed, is whether the architect, after receiving excessive bids, suggested reasonable revisions in plans which would reduce the probable cost. Courts have held that if the architect made such suggestions and the proposed revisions would not materially alter the agreed general design, then the architect is entitled to his fee, again provided that the then probable cost does not substantially exceed the agreed maximum cost figure.

Considering this case in light of these factors, we conclude that the trial court erred in denying plaintiff's motion for amended findings of fact, conclusions of law, and order for judgment.

First, it does not appear that plaintiff guaranteed the maximum cost figure. The trial court did not expressly state whether the agreed cost figure of \$300,000 to \$325,000 was an established estimate or a guarantee. However, the intention of the parties, as evidenced by the record, especially by contract provision 3.4, quoted earlier, more reasonably supports an established cost estimate than a guaranteed cost figure. Secondly, the probable cost of the project in our view did not substantially exceed the cost figure. At trial architect Griswold testified and Mr. Schneider agreed, that the project could be completed for approximately \$360,000 to \$370,000 without reducing the

square footage of the project. A probable construction cost of \$370,000 exceeds the agreed cost estimate maximum found by the trial court, \$325,000, by only 13 percent. It seems difficult to classify such a degree of cost excess as substantial. A review of cases cited in Annotation, 20 A.L.R.3d 778, 804 to 805, suggests that most courts would not consider such a degree of cost excess substantial.

Thirdly, we think it relevant that defendant approved substantial changes beyond the original plans. Defendant not only adopted and acknowledged these changes but was often active in advocating them (especially in expanding the X-ray facilities and changing the doctors' offices into extra exam rooms). It is true that defendant contends that it was under the impression at all times that such changes were within the original cost estimate. However, this impression seems unreasonable and unjustified in view of the scope of the changes.

Finally, we think it relevant that plaintiff showed defendant how they could reduce the cost of the lowest bid below \$370,000. For example, defendant would have reduced the cost drastically by simply agreeing to eliminate one of the "bays" or a fraction of a bay from the project. Provision 3.5.1 of the contract required the parties to revise the project scope and quality if necessary to reduce the probable construction cost. While it might be against public policy to allow an architect, under such a provision, to reduce substantially the area of a proposed project, it seems that, barring a specifically guaranteed area, a reasonable reduction in the size of the project should be allowed when necessary to meet the construction cost. Reversed and remanded. SHERAN, C. J., took no part in the consideration or decision of this case.

Negligent Cost Predictions. If a cost condition is created, it is not necessary to determine whether the design professional met the appropriate standards of performance. However, in many cases where the cost estimate is wide of the mark, it is likely that a design professional did not live up to the legal standard of performance.

If the client does show that the design professional has been negligent in preparing the cost estimates, it is not necessary to establish that a cost condition has been created. It is implied that the design professional will perform in accordance with the standards of her profession. If she does not do so and if the project is abandoned, the client can recover any fees it has paid and need not pay any additional fees. However, if the client uses the design prepared by the design professional, the client must pay

the net benefit of the architect's work. This is computed by subtracting any damages caused by the breach from the amount the client has been benefited by use of the design.

Even if the state law will permit the owner to maintain a tort claim based on professional negligence, one court said that "the contract may control the scope of the duty undertaken" by the architect.³² The contract, according to the court, will determine whether there has been a breach. In that case the court concluded that the architect was to be relieved from responsibility for costs (the owner intended to use a contractor to check costs) in exchange for the architect making more frequent inspections than usual.

³²*Getzschman v. Miller Chemical Co.*, supra note 10, 443 N.W.2d at 270.

Stanley Consultants, Inc. v. H. Kalicak Construction Co.,³³ illustrates a clear case of a failure to estimate properly. The project was a sixty-one-unit housing project to be built in Zaire, Africa. The cost estimate was \$8 million, and the only bidder submitted a bid of \$16 million. The design professional had prepared cost estimates without data from Zaire when such data were available. The driveways contained impassable grades. The sewer lines were twenty feet above the surface with eight-foot supports, and the sewer lines were to be fifty feet above a river without any supports being designated. Structures were located outside the property lines, and the design professional failed to take into account an easement to a religious shrine and created an encroachment. The court found ample evidence that the design professional had not lived up to the reasonable standard of professional skill. Such a finding could be the basis not only for denying the design professional compensation for services rendered but also for holding the design professional responsible for damages. See Section 12.03F.

D. Interpretation of Cost Condition

Is the design professional allowed some tolerance in determining whether the cost condition has been fulfilled? One court required a reasonable approximation.³⁴ Roughly 10 percent seems to be accepted, although this tolerance figure may be reduced if the project is large and the fee justified continual detailed pricing takeoffs. B141-1997, Paragraph 1.2.2.2 required contingencies in the budget.³⁵ The degree of tolerance permitted may also depend on the language used to create the cost limitation. The more specific the amount, the more likely a small tolerances figure will be applied.

One court spoke of a “relaxed version,” presumably there also being a “strict version.”³⁶ The former apparently requires that the amount be *substantially* exceeded before the architect loses her fee. Presumably the “strict” version requires the amount not be exceeded *at all*. The

relaxed version, much like the doctrine of substantial performance,³⁷ resembles the common use of some amount of tolerance.³⁸

The AIA requires the owner to include a contingency in its budget. While one purpose of a contingency is to accommodate changes in the work made during performance, a contingency may also cushion a discrepancy between the owner’s and architect’s anticipated cost of construction and the bids or negotiated offers the owner receives.³⁹ The architect too may include contingencies in her cost estimates.⁴⁰ The size of the contingency is not specified.

E. Dispensing with the Cost Condition

A cost condition generally is created for the benefit of the client. If it so chooses, the client can dispense with this protection. Courts that conclude the client has dispensed with the cost condition usually state that the condition has been waived. Where this occurs, the condition is excused and the design professional is entitled to be paid even if the cost condition has not been fulfilled.

Excusing a condition can occur in a number of ways. A condition is excused if the client had prevented or unreasonably hindered its occurrence. For example, if the client does not permit bidding by contractors or limits bidding to an unrepresentative group of bidders, the condition is excused. The most common basis for excusing the condition has been the client’s making excessive changes during the design phase.⁴¹

The client proceeding with the project despite the awareness of a marked disparity between cost estimates and the construction contract price can excuse the condition. By proceeding, the client may be indicating it is willing to dispense with the originally created cost conditions. However, proceeding with the project should not automatically excuse the condition. It may be economically disadvantageous to abandon the project. Proceeding in such cases may not indicate a willingness to dispense with

³³383 F.Supp. 315 (E.D.Mo.1974).

³⁴*Durand Assoc., Inc. v. Guardian Inv. Co.*, 186 Neb. 349, 183 N.W.2d 246 (1971).

³⁵Despite a 10 percent tolerance figure, a court allowed the architect to recover where there was a 13 percent difference in *Griswold and Rauma, Architects, Inc. v. Aesculapius Corp.* (reproduced in Section 12.03C). But this factor was taken with others in ruling for the architect.

³⁶*Peteet v. Fogarty*, 297 S.C. 226, 375 S.E.2d 527 (App.1988).

³⁷See Section 22.06B.

³⁸In *Peteet v. Fogarty*, *supra* note 36, the court found that the relaxed version had been applied. (The maximum cost was \$150,000 and the low bid \$307,000.)

³⁹AIA B141-1997, ¶ 1.2.2.2; AIA B101-2007, § 6.1.

⁴⁰AIA B141-1997, ¶ 2.1.7.3; AIA B101-2007, § 6.3.

⁴¹*Koerber v. Middlesex College*, 128 Vt. 11, 258 A.2d 572 (1969). See also *Griswold and Rauma, Architects, Inc. v. Aesculapius Corp.* (reproduced in Section 12.03C).

the condition. In such cases, any recovery of the design professional should be based on restitution measured by any benefit conferred.

F. Nonperformance as a Breach: Recovery of Damages

The client occasionally seeks damages based on the breach of a promise of accuracy or negligence in making the cost prediction. An understanding of the basis of such claims requires that promises be differentiated from conditions. See Section 12.03C.

Creating a cost condition does not necessarily mean the design professional promises to fulfill it. Design professionals can risk their fees on the accuracy of the cost prediction, although they may not wish to be responsible for losses caused by nonperformance.

Courts seem to assume, however, that a fixed-cost limit constitutes a promise by the design professional that the project would cost no more than the designated amount. Under this assumption, if costs substantially exceed predicted costs, the design professional has breached even though she has lived up to the professional standard in making cost predictions. The breach entitles the nonbreaching party to recover foreseeable losses caused by the breach that could not have been reasonably avoided by the nonbreaching party.

Suppose the project is abandoned. The client can recover any interim fee payments based on restitution.⁴² Despite this, restitution of fees paid does not occur often. Denial of a design professional's claim does not necessarily mean services have been performed without any remuneration.

Abandoning the project may cause other client losses, such as wasted expenditures in reliance on the design professional's promise to bring the project in within a designated cost.⁴³

Redesign followed by construction very likely causes delay. Delay damages are recoverable if they can be proved

⁴²*Peteet v. Fogarty*, supra note 36 (plans worthless as project abandoned).

⁴³The client's claim in *Durand Assoc., Inc. v. Guardian Inv. Co.*, supra note 34, included excavation costs and losses suffered on a steel prepurchase made to avoid an anticipated price rise. These losses should have been recovered if they were reasonably foreseeable and not avoidable. Because they were incurred by an affiliated company of the client and not by the client, they were denied.

with reasonable certainty and were reasonably foreseeable at the time the agreement was made.⁴⁴

Suppose the project is constructed and the client seeks to recover the difference between the cost prediction and the actual cost. The property may be worth its cost. If so, the client has suffered no loss. Proceeding with the project knowing the costs would substantially exceed the predictions may show that the loss could have been reasonably avoided by abandoning the project.

Kellogg v. Pizza Oven, Inc.,⁴⁵ involved a client who rented space for a restaurant. The lease provided that the landlord would pay up to \$60,000 for the cost of an improvement to the landlord's building. The architect had negligently estimated costs at \$62,000, but the project cost \$92,000. The tenant-client had to pay the balance of approximately \$30,000. The tenant recovered this amount less a 10 percent tolerance for errors from the design professional because of the excess cost.⁴⁶

Where the project is built, the architect should not be held for the excess of actual costs over predicted costs. This is not based on the client's having proceeded despite its knowledge that the costs will be more than anticipated. The client should not be required to give up the project to reduce damages for the design professional. However, the client benefits by ownership of property presumably of a value equal to what the client has paid for the improvement. Damages should not be awarded unless the client can prove the economic utility of the project was reduced in some ascertainable manner because of the excessive costs.

Williams Engineering, Inc. v. Goodyear, Inc.,⁴⁷ also involved a claim for damages in a commercial context similar to *Kellogg*, noted earlier in this section. Williams, the engineer, had been retained to design a recreational water slide. Time was important, as the client hoped to

⁴⁴*Impastato v. Semer*, 190 So.2d 111 (La.App.), appeal denied, 249 La. 833, 191 So.2d 639 (1966), denied recovery for delay, but *Hedda v. McCool*, 476 F.2d 1223 (9th Cir.1973), allowed recovery. AIA Doc. B101-2007, § 6.7, states that redesign is the limit of the architect's responsibility. This should not relieve the architect from responsibility for delay damages caused by negligence.

⁴⁵77 Colo. 295, 402 P.2d 633 (1965). Similarly, see *Kaufman v. Leard*, 356 Mass. 163, 248 N.E.2d 480 (1969).

⁴⁶The landlord ended up with improvements probably worth considerably more than the \$60,000 he spent. Perhaps the design professional should have claimed against the landlord based on unjust enrichment. The unjust enrichment argument was rejected in *Kaufman v. Leard*, supra note 45.

⁴⁷Supra note 10.

open for business in the summer of 1979. Williams gave a preliminary estimate of some \$409,000 but suggested that the client proceed on a “fast track” basis to expedite completion.⁴⁸ Also, he suggested the contractor be hired on a cost-plus basis.

The design phase was completed on April 18, 1979. During design and construction, the engineer submitted written invoices for his fee based on a percentage of the estimated cost of \$409,000. On August 1, 1979, three days before the slide opened, the engineer’s bill still showed the cost as \$409,000. But twenty days after the water slide was opened for business, the client was billed for construction costs of almost \$888,000. The project was still only 82 percent complete. Even worse, the engineer submitted a new bill based on the projected cost of almost \$1,000,000. The client paid \$824,000 for the water slide. The water slide turned out to be a financial failure; the client lost its lease and had to pay to have the slide removed. Although the basic reason for the failure was lack of customers, the delayed opening and some design features contributed to the financial disaster.

In addition to resisting the engineer’s claim for additional fees, the client claimed and testimony supported that the engineer breached by failing to employ a professional estimator, failing to look at other water slides, failing to advise the client about the other contract possibilities, and failing to provide revised cost estimates. The client contended that it would have modified the design or given up the venture had it been apprised of ultimate cost.

The client initially sought damages of \$634,000. As the trial proceeded, it reduced its claim to \$409,000, by chance the amount it thought it was going to have to pay for the completed water slide. After an eight-day trial, the jury awarded the engineer additional professional fees of \$25,000, attorneys’ fees of \$23,000, \$2,800 in litigation costs, and expenses of expert witnesses of \$6,000. It also decided the engineer had breached the contract and the client should have damages of \$125,000 plus expert witness fees of \$3,000. This created a net award of \$71,200 in favor of the client.

The intermediate court of appeals reversed the jury’s award granting the engineer additional fees and increased the damages to the client to \$205,000.⁴⁹ The Louisiana Supreme Court, though noting the engineer did not operate in bad faith, held he had committed a misrepresenta-

tion by his failure to reveal “even an approximation of the true cost of the project until after the construction was completed.”⁵⁰ The court could not use the frequently used damage measure of the difference between the market value of the project and the excess cost, as the water slide had become worthless and had to be removed. The court affirmed the decision of the intermediate court, denying any additional engineering fees to the engineer and awarding the client over \$205,000 in damages.

The intermediate appellate court’s decision induced representatives of the design professions to submit briefs as “friends of the court.” The briefs contended the engineer did not guarantee the cost and could not be responsible for damages for the overrun. In response, the Louisiana Supreme Court stated damages were awarded not because of any guarantee of estimates but because the engineer was negligent, as shown by the testimony at the trial.

The case illustrates not only the difference between a cost condition and a promise but also the risk involved in designing for commercial ventures. Also, the protective language in the contract, much the same as the court commonly found in contracts prepared by design profession associations or by design professionals with good bargaining power, did not protect the design professional when he did not watch costs.

What damages might an owner suffer if the design professional overestimates the cost of the project? In *Post, Buckley, Schuh & Jernigan, Inc. v. Monroe County*,⁵¹ a county, relying on its engineer’s estimate of the cost of a public improvement, floated a bond issue to pay for the work. The bids received were so low that the county could have financed the project with its existing funds. The county then released its bond obligations and sought reimbursement from the engineer for the unnecessary financing expenses.

G. Relationship Between Principal Design Professional and Consultant

Section 12.10B discusses the use of consultants by the prime design professional. One problem that can arise is whether the consultant bears the risk that the prime design

⁴⁸See Section 17.04B.

⁴⁹480 So.2d 772 (La.App.1985).

⁵⁰496 So.2d at 1018.

⁵¹Supra note 13. The judgment in favor of the county was reversed because of an erroneous jury instruction addressing the engineer’s duty of care.

professional will not be paid by the client. Although nonpayment can result from many causes, often this occurs when a project is abandoned because of excessive costs. *George Wagschal Associates, Inc. v. West*⁵² involved a legal action by the consulting engineer against the principal design professional (the architect) for services he had performed in the design of a school that was never built to these plans because of excessive cost. The cost overrun apparently was due to engineering overdesign.

The architect evidently had not been paid by the school district and contended that the engineer should share this loss with him. The court upheld this contention and seemed to hold that the principal design professional and consulting engineer were jointly engaged in the project. The architect risked his fee by his contract with the school district, and the engineer risked his fee because he knew of the budgetary constraints.⁵³

The AIA, representing mainly prime design professionals, and the Engineers Joint Contract Documents Committee (EJCDC), representing professional engineers, have differed as to the right of a consulting engineer to be paid if the architect has not been paid. The EJCDC argues that consultants generally do not take this risk. It notes that the prime design professional selects the client and has the best opportunity to evaluate its capacity to pay,⁵⁴ also points to AIA Document B141, Paragraph 4.3, which allows the architect to request that the client provide a statement of funds available for the project and of the source of funds. (This was deleted in 1997.)

The AIA contends that a long-term relationship frequently exists between prime design professionals and consultants that resembles a partnership even if not cast in legal terms. It believes that under such conditions, the risk of nonpayment should be shared.

The chronic instability of the construction industry means this problem will occur repeatedly. Most prime design professionals are aware of the difficulties that may arise if the project is abandoned for excessive costs. They should discuss this potential problem with their consultants and seek a commonly accepted allocation

of risk. When this is successfully accomplished, the contract should make the result *quite* clear. As shall be seen in Section 28.06, dealing with subcontracts, the risk of nonpayment taken by the consultant must be very clearly expressed or the court will not enforce it.

H. Advice to Design Professionals

Many design professional–client relationships deteriorate because of excessive costs. Design professionals should try to make the cost prediction process more accurate. The chief method chosen by the professional associations has been to use the contract to protect their members from losing their fees where their cost predictions are inaccurate. The professional associations have included provisions in their contracts that are supposed to ensure that fees will not be lost when cost predictions are inaccurate and that fees will be lost only where the cost predictions are made negligently.

Protective language should be explained to the client. Design professionals who give a reasonable explanation to a client are not likely to incur difficulty over this problem. They should inform the client how cost predictions are made and how difficult it is to achieve accuracy when balancing uncontrollable factors. They should state that best efforts will be made but that for various specific reasons, the low bids from the contractors may be substantially in excess of the statement of probable construction costs. The suggestion should be made that under such circumstances, the design professional and the client should join to work toward a design solution that will satisfy the client's needs. In helping the client be realistic about desires and funds, the design professional should ask the client to be as specific as possible as to expectations about the project.

The design professional who takes these steps may lose some clients. It may be better to lose them at the outset than to work for many hours and then either not be paid or be forced to go to court to try to collect. Without honest discussion with the client at the outset, the design professional takes these risks.

Design professionals should also consider greater flexibility in fee arrangements. If the stated percentage of construction costs is used, it may be advisable to reduce or eliminate any fee based on construction costs that exceed cost predictions.

During performance, the design professional should state what effect any changes made by the client will have

⁵²Supra note 16.

⁵³If the lost fee resulted from engineering overdesign, should the architect be able to transfer his lost fee to the engineer?

⁵⁴Until 1997, the EJCDC could point to AIA Doc. B141-1987, ¶ 4.3, which allowed the architect to request that the client provide a statement of funds available for the project and of the source of funds. This was deleted in 1997 and not renewed in 2007.

on any existing cost predictions. It is hoped that not every change will require an increase in the cost predictions. If the client approves any design work, the request for approval should state whether any change has occurred in cost predictions.

SECTION 12.04 Assistance in Obtaining Financing

A building project frequently requires lender financing. To persuade a lender that a loan should be granted, the client generally submits schematic designs or even design development, economic feasibility studies, cost estimates, and sometimes the contract documents and proposed contractor. This submission includes materials prepared by the design professional.

Must the design professional do more than permit the use of design work for such a purpose? Does the basic fee cover such services as appearing before prospective lenders, advising the client as to who might be willing to lend the client money, or helping the client prepare any information that the lender may require? Must such work be done only if requested as additional service and paid for accordingly?

The professional education and training of a design professional do not include techniques for obtaining financing for a project. Nor is it likely that the design professional will be examined on this activity when seeking to become registered. It should not be considered part of basic design services.

Clearly this is true if the design professional has been retained by a large institutional client with personnel experienced in financial matters. The result does not change, however, even if the client does not have the skill within its own organization. Rarely does the client engage a professional designer because the client expects the designer to have and use skills relating to obtaining funds for the project.

Most firms give financing advice to some clients, many furnish financial contacts, and almost all occasionally arrange financing. Yet extra charges for such services are rare. Perhaps the activity is not burdensome, or merely reflects economic realities of practice.

Clearly the AIA does not consider services related to project financing to be part of basic services. They should also not be viewed as additional services. As noted in Section 12.01 and more fully discussed in Section 13.01G, B101-2007 distinguishes between “basic” and “additional”

services. Additional services are addressed in Article 4, with specific examples listed in Sections 4.1, 4.3.1, and 4.3.2. Financing advice is not in any of these lists. The closest comparable service is “site evaluation and planning” in 4.1.5. This language should not be viewed as including a duty to help procure financing.

An architect who agrees to provide financing advice creates a risk of liability exposure if she does the job badly.⁵⁵ For this reason it is better to view such a service as provided pursuant to a separate agreement, not as an additional service. If financing advice is an additional service under Section 4.1, this would mean the architect would have to perform the service if the owner requests, albeit for additional compensation.

SECTION 12.05 Economic Feasibility of Project

AIA B141-1997 Paragraph 2.8.3.6 included “economic feasibility studies” as a service that the architect must provide if requested by the owner. This was dropped from B101-2007 which, as noted,⁵⁶ does not include any form of financing advice in the list of additional services.

The AIA’s decision to drop economic feasibility studies from B101-2007 is wise. The determination by a lender will be affected by the general economic feasibility of the venture. But if the architect should hesitate before making representations as to the availability of funds, she should certainly avoid venturing into economic feasibility studies. These are not part of basic services. If such studies are requested and made, and the venture is unsuccessful, the design professional will be exposed to claims by the client. Such predictions are treacherous, ones for which design professionals are rarely trained by education and experience.

In *Martin Bloom Associates, Inc. v. Manzie*,⁵⁷ the plaintiff architect sued the defendant clients for design services he rendered to the defendants before the project was abandoned by the clients because they could not obtain financing. The clients owned land in Las Vegas, Nevada, land that they wished to develop for investment purposes.

⁵⁵See *Herkert v. Stauber*, 106 Wis.2d 545, 317 N.W.2d 834 (1982) (citing and following earlier edition of this book).

⁵⁶See Section 12.04.

⁵⁷389 F.Supp. 848, 852 (D.Nev.1975).

The architect produced a written contract under which he was to provide design services and contract administration for a designated compensation fee. Here the issue was not the architect's right to additional compensation but his responsibility for the accuracy of his representations as to financing and profitability.

The clients claimed that the architect had represented that the clients would have no difficulty in obtaining financing and that the project would be profitable. The architect's version differed. He contended that the entire agreement was in the letter and that no representation had been made as to profitability.

First, the trial judge concluded that the written agreement was not the complete contract between the parties. The judge then stated,

Throughout the two days of trial, the Court had the opportunity to observe the manner of the witnesses while they testified, the consistency of their versions, both internally and compared to those of other witnesses, the probability or improbability of their versions and their interest in the outcome of the lawsuit. Based on these factors, the Court credits the testimony of Manzie [the client] that representations of Bloom [the architect], both express and implied, induced Manzie to enter into the agreement and also constituted part of the agreement itself.

The case illustrates the danger of exceeding one's professional capabilities. If the architect had, as determined by the trial judge, made representations relating to financial feasibility and profitability, he may very well have ventured into an unpredictable area beyond his professional skill, services excluded from coverage under his professional liability policy. As noted in Section 12.03C, architects and engineers often lose fees when their cost predictions are inaccurate. But at least cost predictions, though certainly difficult, should be within the professional competence of a design professional. Economic feasibility goes beyond this boundary and should be avoided.

SECTION 12.06 Approval of Public Authorities: Dispute Resolution

Greater governmental control and participation in all forms of economic activity have meant that the design professional increasingly deals with federal, state, and local agencies. Also, it is more likely that the design professional

will help the owner prepare for third-party dispute resolution such as arbitration or litigation. Must the design professional help the client or its attorney prepare a presentation for the planning commission, zoning board, or city council? Must she appear at such a hearing and act as a witness if requested? Is the design professional who does these things entitled to compensation in addition to the basic fee? Must she help in arbitration or litigation?

Reasonable cooperation by the design professional in matters relating to public land use control can be expected by the client. Design professionals are expected to have expertise in matters that are often at issue in these public hearings. It may be within the client's reasonable expectations that the architect or engineer will render reasonable assistance and advise the client on these matters. Each contracting party should do all that is reasonably necessary to help achieve the objectives of the other. The same can be said for dispute resolution. But are these part of basic services?

The increased likelihood that the owner will ask for help on permit matters or on dispute resolution has led the associations of design professionals to seek to make clear that these services are not part of basic services and merit additional compensation. Each new issue of standard documents makes more clear that such services require added compensation. For example, B101-2007, Section 4.3.1.7 states that "preparation for, or attendance at, a public presentation, meeting or hearing" is an additional service for which the architect is entitled to additional compensation beyond the basic fee.

Reflecting the different nature of engineering projects and their funding sources, EJCDC E-500 (2002) states in Exhibit A (Engineer's services) Paragraph A2.01A(1), the following are additional services requiring advance authorization:

Preparation of applications and supporting documents (in addition to those furnished under Basic Services) for private or governmental grants, loans or advances in connection with the Project; preparation or review of environmental assessments and impact statements; review and evaluation of the effects on the design requirements for the Project of any such statements and documents prepared by others; and assistance in obtaining approvals of authorities having jurisdiction over the anticipated environmental impact of the Project.

* * *

20 Preparing to serve or serving as a consultant or witness for Owner in any litigation, arbitration or other dispute resolution process related to the Project.

Again, it may be useful or desirable to perform such services without requesting additional compensation. This section deals solely with the questions of whether design professionals are obligated to perform the services and whether they are legally entitled to additional pay for doing so.

SECTION 12.07 Services of a Legal Nature

Some design professionals volunteer or are asked to perform services for which legal education, training, and licensure may be required. This may be traceable to the high cost of legal services, and the uncertainty as to which services can be performed only by a lawyer.

Undoubtedly, one of the most troublesome activities is drafting or providing the construction contract. It may not be wise for laypeople to draw contracts for themselves, although the law allows professional designers to supply or draft contracts for their own services. Suppose the designer drafts or selects the construction contract for a client. Lawyers often contend that when design professionals perform such activities, they are practicing law. To meet such complaints, the AIA includes language on its standard forms of agreement stating that the document has important legal consequences and that “consultation with an attorney is encouraged with respect to its completion or modification.”

B101-2007 states,

§ 3.4.3. During the development of the Construction Documents, the Architect shall assist the Owner in the development and preparation of: (1) bidding and procurement information that describes the time, place and conditions of bidding; including bidding or proposal forms; (2) the form of agreement between the Owner and Contractor; and (3) the Conditions of the Contract for Construction (General, Supplementary and other Conditions). The Architect shall also compile a project manual that includes the Conditions of the Contract for Construction and Specifications and may include bidding requirements and sample forms.

In addition, Section 5.8 requires the owner to furnish legal services as necessary. The AIA clearly wants architects not to perform legal, insurance, and accounting services. Some provisions in construction contracts can be considered “architectural” or “engineering” in that architectural or engineering training and experience are essential to reviewing or even drafting such provisions. This may tempt professional designers to play an aggressive role rather than realize that their *advice* will certainly be useful to the client or its lawyer.

A blurred border exists between legal and nonlegal services in the land use area. Although land use matters can and do involve legal skills, the architect may be knowledgeable about the politics and procedures in land use matters, particularly if she has had experience in dealing with land use agencies.

Another illustration of the overlap in matters relating to land use can be demonstrated by the hearings required before public agencies charged with the responsibility of issuing permits. On the whole, such hearings tend to be political rather than legal. Such a hearing may be best orchestrated by someone with political skill and experience. This is the responsibility of the owner, although the architect or engineer can be of great value in advising the owner or even in orchestrating the hearing and the strategy for it.

The line between legal and nonlegal services can also be demonstrated by the not uncommon phenomenon of the design professional being asked to advise the client as to whether a surety bond should be required. Because of their experience, design professionals may be put in the position of being able to determine whether a particular contractor should be bonded. Their experience may also lead them to have strong opinions on the general desirability of surety bonds. Repeated involvement with such matters may give design professionals confidence that they can handle them.

Here the balance tips strongly in favor of considering these legal services. Sometimes bonds are required for public projects. Using surety bonds may largely depend on other legal remedies given subcontractors and suppliers, such as the right to assert a mechanics’ lien or to stop payments. The design professional should simply answer specific questions of a nonlegal nature, rather than advise generally on such matters. If asked to advise on nonlegal issues, the services a design professional provides in response to such a request are additional (such services are excluded from professional liability insurance coverage).

SECTION 12.08 Site Services

A. Relation to Chapter 14

Section 12.08 concentrates on the reasonable expectations of the client as to the design professional's role on the site while construction proceeds. The section focuses on the belief that the client may have that the design professional has been paid to ensure that the client receives all it is entitled to receive under the construction contract. The client may expect the design professional to accomplish this by watching over the job, seeing that the contractor performs properly, and being responsible if the contractor does not so perform. As noted in Section 12.08B, a design professional may take a different view of her function. The purpose of Section 12.08 is to explore this problem by examining what the law has done when faced with resolving the often different expectations of client and design professional.

Site services are but a part of the total professional services performed by the design professional. Disputes over design performance may involve determining whether the design professional has performed in accordance with her professional or contractual obligation.

The architect's site services and the frequently used disclaimers of responsibility for the work of the contractor or for safety often play a significant part in the architect's liability to clients or third parties who have suffered losses that they can trace to the failure of the design professional to perform site services properly. Liability will be discussed in Chapter 14.

B. Supervision to Observation:

Watson, Watson, Rutland/Architects v. Montgomery County Board of Education

Contracts between design professionals and their clients include, as noted in Section 12.01, a lengthy list of services. This section treats the general role of the design professional during construction with special reference to site visits. The details of site visits are often handled in the contract between the design professional and her client. Provisions dealing with this topic can include requiring the design professional to take an active role in the process, performing such tasks as solving execution problems, directing how work is to be done, searching carefully to determine failure to follow the design, and seeing that safety regulations are followed. They

can also limit the design professional to a passive role under which she "walks the site" periodically to check to see how things are going, perhaps measures progress for payment purposes, and reports to the client about work in progress. If the design professional takes an active role, she will be diluting the authority and responsibility of the contractor and exposing herself and her client to liability. Yet some clients may prefer this route because they see it as a means of ensuring a more successful project.

The professional associations representing design professionals have favored placing the authority and responsibility for executing the design solely on the contractor and limiting the architect or engineer to a more passive role. To implement this separation, the standard documents published by professional associations include language that clearly gives sole responsibility for executing the design to the contractor. Such language disclaims any responsibility on the part of the design professionals for how the work is to be done or for the contractor's failure to comply with the contract documents. The effect of such disclaimers, discussed later, can generate concern both by clients ("What am I getting for my money?") and by courts ("Is the design professional taking any responsibility?").

As noted, the AIA has, like the EJCDC, selected a passive mode for architects and engineers. This can be demonstrated by a brief look at the history of AIA documents.

Before 1961, the architect had general supervision of the work. In response to the specter of the expanded liability to third parties, the AIA dropped the phrase "general supervision" in favor of language under which the architect observed rather than supervised, made visits "at intervals appropriate to the stage of construction or as otherwise agreed"⁵⁸ (in B141-1997 this became "the Contractor's operations") rather than conducted exhaustive on-site inspections, and did her best. She was not responsible, however, for the contractor's failure to perform in accordance with the contract documents or for methods of executing the design.

The AIA justified these language changes by suggesting that the architect was no longer the master builder exercising almost total domination of the construction

⁵⁸AIA Doc. B141-1987, ¶2.6.5; B141-1997, ¶2.6.2.1; B101-2007, § 3.6.2 (changed to "as otherwise required in Section 4.2.3").

process from beginning to end.⁵⁹ Instead, said the AIA, the architect has turned over the responsibility for executing the design to the contractor, who presumably has the necessary skill to accomplish this properly and safely. Even more, in sophisticated construction the architect may simply be part of the management team that may consist of a project manager, a construction manager, and a field representative of owner or lender. This shift in role and function, though principally a response to increased liability to third parties, was also designed to recognize the shift in organization for most construction, the architect no longer being master builder but being called in to interpret or decide disputes and making periodic observations to check on the progress of the work, mainly to issue certificates for progress payments.

The design professional associations contend that such terminological changes simply reflect actual practices and were not intended to change design professional site responsibilities. Yet it seems clear that such changes were directed toward the courts with the hope they would provide defenses against what the professional associations thought were unmeritorious claims against design professionals. The AIA's approach is explored in the *Watson* case (reproduced in this section).

The following issues can arise as to the specific obligation to visit the site:

1. When must the design professional be on the site (continuous presence versus periodic visits)?
2. What is the intensity level of checking for compliance (intense inspection to ferret out deficiencies versus casual observation)?
3. If a deficiency or noncompliance is discovered, what must the design professional do (direct work be corrected versus report to owner)?

The following issues can arise as to the contractual disclaimers:

1. Do they totally exculpate the design professional from any responsibility for failure by the contractor to comply with the design documents? (Are they a basis for summary judgment resolving the issue of responsibility without a full trial?)

⁵⁹See Sweet, *The Architectural Profession Responds to Construction Management and Design-Build: The Spotlight on AIA Documents*, 46 *Law & Contemp.Probs.* 69 (1983).

2. Do they exculpate the design professional even if she discovers the noncompliance by the contractor?
3. Do they exculpate the design professional if she has failed to comply with her contractual obligation? (Is she responsible for what she would have detected had she complied with her contractual commitment?)

The exact nature of the design professional's site visits depends, of course, on the contract, both its express and implied terms. The contract may specify continuous versus noncontinuous presence, the frequency and timing of visits, the intensity of inspection, and action to be taken on discovery of deficiencies.

Factors likely to be examined to determine whether the duration, frequency, and timing of site visits are adequate are as follows:

1. owner's absence during construction and contractor's reputation for corner-cutting⁶⁰
2. size of the project⁶¹
3. distance between the site and the design professional's home office⁶²
4. when crucial steps are undertaken, such as pouring concrete or covering works⁶³
5. type of construction contract (cost contracts require more monitoring)
6. experimental design or unusual materials specified
7. extent to which owner has a technical staff that will take over some of these responsibilities
8. observation of contractor's performance during visits⁶⁴
9. contractor's record of performance on the project

The *Watson* case (reproduced here) notes the important cases dealing with the responsibility of the design professional for failure of the contractor to comply with the contract documents, with special reference to the effect of disclaimers. *Watson* also demonstrates the complexity of a defect claim with multiple parties and multiple claims.

**WATSON, WATSON, RUTLAND/ARCHITECTS, INC. v.
MONTGOMERY COUNTY BOARD OF EDUCATION, et al.**

Supreme Court of Alabama, 1990. 559 So.2d 168.

MADDOX, Justice

This case arises out of property damage incurred when the roof of Brewbaker Junior High School in Montgomery leaked. The Montgomery County Board of Education (hereinafter “the School Board”) filed this action against Bear Brothers, Inc., the general contractor; United States Mineral Products Company (hereinafter “U.S. Mineral”), the manufacturer of the roofing membrane; and W. Murray Watson, W. Michael Watson, and J. Michael Rutland, the architects for the school project. Bear Brothers joined Dixie Roof Decks, Inc. (hereinafter “Dixie”), the roofing subcontractor, as a third-party defendant. The trial court substituted the corporate entity Watson, Watson, Rutland/Architects, Inc. (hereinafter “the Architect”), for the individually named architects.

The School Board alleged negligence and breach of contract against the Architect and breach of contract and breach of guaranty against Bear Brothers and U.S. Mineral. The Architect filed a cross-claim against U.S. Mineral and Dixie for indemnity in case the Architect were held liable to the Board. The trial court entered summary judgment for U.S. Mineral and Dixie on that cross-claim, holding that a one-year statute of limitations applied to that cross-claim and that the statute barred the claim. [Ed. note: The legal complications as to parties in this simple claim are shown in Figure 12.1.]

The School Board settled with Bear Brothers and U.S. Mineral for a total of \$100,000. At trial against the Architect, the court granted the Architect’s motion for a directed verdict as to the School Board’s negligence claim, on the ground that the statute of limitations had expired. The breach of contract claim was submitted to the jury, and the jury returned a verdict of \$24,813.08 against the Architect. The court entered a judgment based on that verdict.

* * *

At the center of this dispute is the architectural agreement between the Architect and the School Board; it included the following language:

ARTICLE 8. Administration of the Construction Contract. The Architect will endeavor to require the Contractor to strictly adhere to the plans and specifications, to guard the Owner against defects and deficiencies in the work of Contractors, and shall promptly notify the Owner in writing of any

significant departure in the quality of material or workmanship from the requirements of the plans and specifications, but he does not guarantee the performance of the contracts.

* * *

The Architect shall make periodic visits to the site and as hereinafter defined to familiarize himself generally with the progress and quality of the Work and to determine in general if the Work is proceeding in accordance with the Contract Documents. On the basis of his on-site observations as an Architect, he shall endeavor to guard the Owner against defect and deficiencies in the work of the Contractor. The Architect shall not be required to make continuous on-site inspections to check the quality of the Work. Architect shall not be responsible for construction means, methods, techniques, sequences or procedures, or for safety precautions and programs in connection with the Work, unless spelled out in the Contract Documents, and he shall not be liable for results of Contractor’s failure to carry out the work in accordance with the Contract Documents.

* * *

The Architect shall not be responsible for the acts or omissions of the Contractor, or any Subcontractors, or any of the Contractor’s or Subcontractor’s agents or employees, or any other persons performing any of the Work.

The following issues respectively have been argued orally and in the parties’ briefs:

On the Architect’s appeal:

1. Does the exculpatory language in the architectural agreement absolve the Architect from liability for damages arising from the failure of the contractor to follow the plans and specifications?
2. If the answer to Issue 1 is no, then is the Architect entitled to cross-claim for indemnity against the roofing subcontractor and the manufacturer of the roofing membrane?

On the School Board’s cross-appeal:

3. When did the statutory period of limitations applicable to the school board’s negligence claim begin to run?

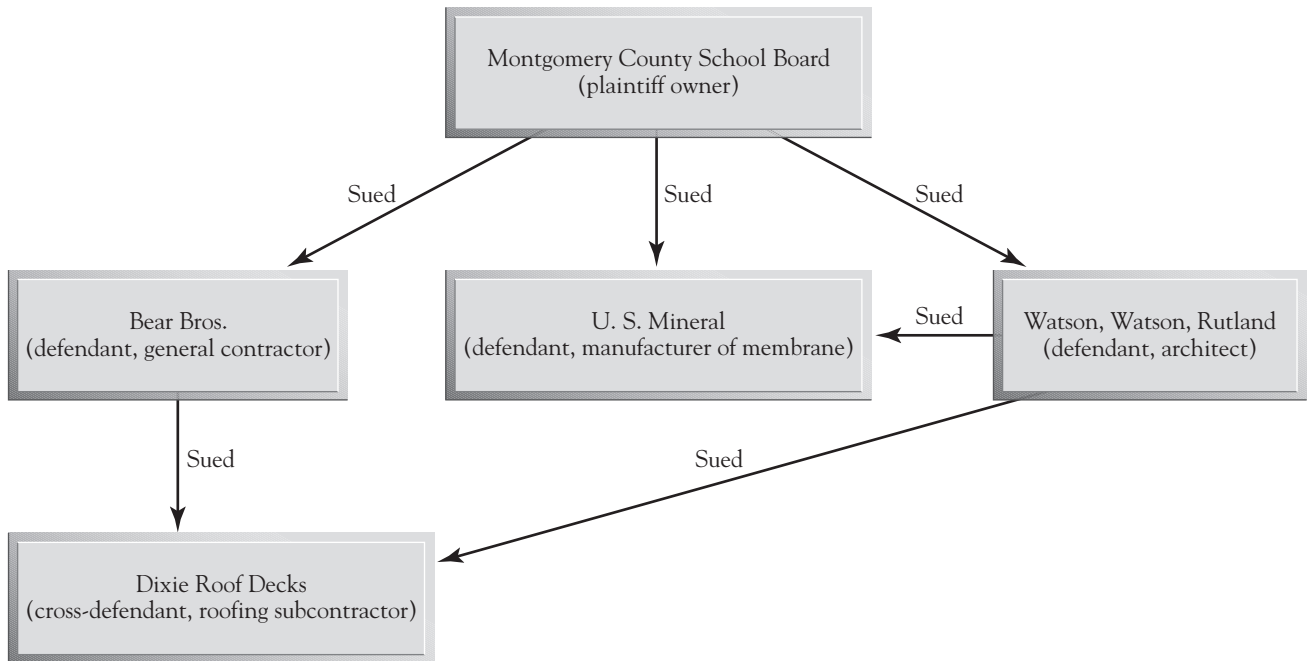

FIGURE 12.1 Original parties in *Watson, Watson, Rutland* case.

I

The Architect argues that the exculpatory language in Article 8 of the architectural agreement absolves the Architect from liability to the School Board because all roof leaks involved were attributable to the faulty workmanship of the contractor. The Architect points out that Article 8 provides for two types of inspection services by the Architect; that is, the owner could elect to receive only general site inspection by the Architect, or the owner could elect to pay an additional fee for continuous on-site inspections (known as the “clerk of the works” alternative); the School Board elected not to pay for the second options.⁶⁵

This Court has construed language virtually identical to that at issue here, in *Sheetz, Aiken & Aiken, Inc. v. Spann, Hall, Ritchie, Inc.*, 512 So.2d 99 (Ala.1987). In that case, the contract in question contained the following language:

The ARCHITECT shall not be responsible for the acts or omission of the contractor, or any subcontractors, or any other contractor or subcontractors, agents or employees, or any person performing any work.

⁶⁵Article 8 is modeled after language found in American Institute of Architects (AIA) contracts used throughout the country.

The Court, in *Sheetz* stated: “The contract expressly states that Spann is not responsible in any fashion for the acts or omission of the contractor, subcontractors, agents, or employees performing the work.” 512 So.2d at 102.

A case analogous to this one is *Moundsview Indep. School Dist. No. 621 v. Buetow & Associates, Inc.*, 253 N.W.2d 836 (Minn.1977), where the contract language regarding inspection duties was virtually identical to that used here; the trial court entered a summary judgment for the architect, and the Minnesota Supreme Court affirmed. The supreme court found it significant that the school district had elected not to obtain continuous supervisory services from the architect through the “clerk of the works” clause. The court held that the contractual provisions “absolved [the architect] from any liability, as a matter of law, for a contractor’s failure to fasten the roof to the building with washers and nuts.” 253 N.W.2d at 839.

Other courts have also held that similar language absolved the architect from liability as a matter of law. [Citing cases.]

The Architect contends that imposition of liability on it here would be nothing short of a holding that the Architect was the guarantor of the contractor’s work.

The School Board responds to the Architect’s argument by saying that it has never contended that the Architect should be a

guarantor of the contractor's work, but the School Board strongly contends that where a contract is for work and services, there is an implied duty to perform with an ordinary and reasonable degree of skill and care, citing, *C. P. Robbins & Associates v. Stevens*, 53 Ala. App. 432, 301 So.2d 196 (1974). The School Board also argues that its claim was covered under the terms of the agreement because its claim was limited to those deviations from the plans and specifications that should have been obvious to one skilled in the construction industry. According to the School Board, if the Architect's construction of the contract language is accepted, the Architect would not be accountable to anyone for its failure to make a reasonably adequate inspection so long as it made an "inspection," no matter how cursory, on a weekly basis. The School Board points out that the contract also included the following language:

On the basis of his on-site observations as an Architect, he shall endeavor to guard the Owner against defects and deficiencies in the work of the Contractor.

The Architect shall have authority to reject Work which does not conform to the Contract Documents.

The administration of the contract by the Architect is not normally to be construed as meaning the furnishing of continuous inspection which may be obtained by the employment of a Clerk of the Works. However, the administration shall be consistent with the size and nature of the work and must include, at least, one inspection each week, a final inspection, and an inspection at the end of the one year guarantee period shall be required on all projects.

It is apparent that our focus must be drawn to the exculpatory language contained in Article 8 of the agreement. Most courts in other jurisdictions that have considered similar exculpatory clauses have recognized that while such clauses do not absolve an architect from all liability, an architect is under no duty to perform continuous inspections that could be obtained by the employment of a "clerk of the works."

The critical question in most of the cases we have reviewed from other jurisdictions seems to focus on the extent of the obligation owed when an architect agrees to perform the type of inspection that the architect agreed to perform in this case. Some of the courts hold, as a matter of law, that the agreement does not cover particular factual situations, and at least one court makes a distinction based on whether a failure of a contractor to follow plans and specifications is known *to the architect during the course of the construction*.

A fair reading of Article 8 obviously operates to impose certain inspection responsibilities on the architect to view the ongoing construction progress. The frequency and number of

such inspections is made somewhat specific by the contractual requirement that these visits to the site be conducted at least once each week. The difficulty arises in construing the particular terminology used, such as "endeavor to require," "familiarize himself generally with the progress and quality of the work," and "endeavor to guard the owner against defect and deficiencies." When coupled with the contract language stating that "[t]he administration of the contract by the Architect is not normally to be construed as meaning the furnishing of continuous inspection which may be obtained by the employment of a Clerk of the Works," these phrases make it obvious that the Architect's duty to inspect is somewhat limited, but we cannot agree with the argument on appeal that there could never be an imposition of liability under an agreement similar to Article 8 no matter how serious the deviation of the contractor from the plans and specifications.

We begin our interpretation of Article 8 by stating the general rule that one must look at the contract as a whole in order to determine the intent of the parties. In this case, the School Board presented some evidence by persons knowledgeable of construction practices, and they testified concerning the cause of the leaks and gave general testimony concerning the conditions at the construction site, which, they allege, should have put the Architect on notice that the plans and specifications were not being followed. However, the only testimony in the record we find concerning the obligation of the Architect to conduct an inspection pursuant to the agreement was to the effect that, according to one architect witness who had read the agreement, it did not call for an inspection to discover the defect alleged in this case.

Some courts have determined, as a matter of law, that certain factual situations are not covered under an agreement to inspect like that agreement involved here, and some courts have emphasized that the contract is one with a professional and have appeared to apply a rule requiring the presentation of expert testimony in order to prove the contract meaning. For example, the *Moundsview* court said, "An architect, as a professional, is required to perform his services with reasonable care and competence and will be liable in damages for any failure to do so." 253 N.W.2d at 839. In *Mayor v. City Council of Columbus v. Clark-Dietz & Associates-Engineers, Inc.*, 550 F.Supp. 610 (N.D.Miss. 1982) the court held that the architect's liability was limited by the contract language, but also held that the architect still had a duty to supervise construction by observing the general progress of the work. The court did not impose liability on the architect, because it explicitly found that the architect had not been negligent in its limited duties.

The same AIA contract language was involved in *First Nat'l Bank of Akron v. Cann*, 503 F.Supp. 419 (N.D. Ohio 1980), aff'd, 669 F.2d 415 (6th Cir. 1982), where the court wrote:

That exhaustive, continuous on-site inspections were not required, however, does not allow the architect to close his eyes on the construction site, refrain from engaging in any inspection procedure whatsoever, and then disclaim liability for construction defects that even the most perfunctory monitoring would have prevented. 503 F.Supp. at 436.

Although the contract here clearly made the Architect's inspection duty a limited one, we cannot hold that it absolved the Architect from all possible liability or relieved it of the duty to perform reasonably the limited contractual duties that it agreed to undertake. Otherwise, as the School Board argues, the owner would have bought nothing from the Architect. While the agreement may have absolved the Architect of liability for any negligent acts or omissions of the contractor and subcontractors, it did not absolve the Architect of liability arising out of its own failure to inspect reasonably. Nor could the Architect close its eyes on the construction site and not engage in any inspection procedure, and then disclaim liability for construction defects that even the most perfunctory monitoring would have prevented, or fail to advise the owner of a known failure of the contractor to follow the plans and specifications.

The issue here is whether the Architect can be held liable for its failure to inspect and to discover the acts or omissions of the contractor or subcontractors in failing to follow the plans and specifications. Under the terms of the contract, the Architect had at least a duty to perform reasonable inspections, and the School Board had a right to a remedy for any failure to perform that duty. There is no question that the Architect performed inspections; the thrust of the School Board's argument is that these inspections were not as thorough as the Architect agreed they would be.

As we have already stated, the only evidence concerning the Architect's duty under the agreement was from an architect who stated that under his interpretation of the contract the Architect was not under a duty to inspect for the specific defect that was alleged in this case.

As was pointed out in *Moundsview*, an architect is a "professional," and we are of the opinion that expert testimony was needed in order to show whether the defects here should have been obvious to the Architect during the weekly inspections. Just as in cases dealing with an alleged breach of a duty by an attorney, a doctor, or any other professional, unless the breach is so obvious that any reasonable person would see it, then expert

testimony is necessary in order to establish the alleged breach. The nature and extent of the duty of an architect who agrees to conduct the inspection called for by the subject agreement are not matters of common knowledge. The rule of law in Alabama concerning the use of expert testimony is as follows: "[E]xpert opinion testimony should not be admitted unless it is clear that the jurors themselves are not capable, from want of experience or knowledge of the subject, to draw correct conclusions from the facts. The opinion of the expert is inadmissible on matters of common knowledge." *Wal-Mart Stores, Inc. v. White*, 476 So.2d 614, 617 (Ala. 1985) (quoting—C. Gamble, *McElroy's Alabama Evidence* § 127.01(5) (3d ed. 1977)).

The breach alleged in this case involved architectural matters that would not be within the common knowledge of the jurors, yet the School Board presented no expert testimony regarding the Architect's inspections and any deficiencies in those inspections. The School Board presented no expert testimony regarding the standard of care imposed within the architectural profession by the weekly inspection provision contained in this contract, and there was no expert evidence that that standard was breached by the Architect. In fact, the only expert that testified concerning the "weep holes" (which were the source of the leaks) was an architect who stated that it was not within the standard of care under the weekly inspection provision to keep track of each and every weep hole.

In a case startlingly similar to this one, a New York court, while holding that an architect could be found liable under the AIA contract for a failure to notify the board of education about leaks in a school's roof, did so only after finding that there was evidence that the architect had knowledge during the course of the construction that the contractor was not following the plans and specifications. In *Board of Educ. of Hudson City School Dist. v. Sargent, Webster, Crenshaw & Folley*, 146 A.D.2d 190, 539 N.Y.S.2d 814, 817–18 (1989), the court stated:

While this very clause in the standard AIA architect/owner contract [the clause absolving the architect from responsibility for the contractor's failures] has been given exculpatory effect in this State and other jurisdictions [citations omitted] *none of the cases involved defects known by the architect during the course of construction*, which he failed to apprise the owner of under the contractual duty to keep the [School District] informed of the progress of the work. We decline to extend the application of the clause in question to an instance such as this, *where the trier of facts could find that the architect was aware of the defect and failed to notify the owner of it.* [Emphasis added.]

The key distinction between that case and this one is that in *Sargent, Webster* there was evidence that the architect knew of the defects during construction and failed to notify the owner. Clearly, the architect there would have breached his contractual duty if he failed to notify the owner of a known defect. It is undisputed in this case that during construction the Architect did not know of the defects with the weep holes. In fact, the School Board does not suggest that the Architect did know, only that under the provisions of the contract the trier of fact could have found that the Architect should have conducted an inspection that would have discovered the defect.

We conclude that, although the Architect had a duty under the contract to inspect, exhaustive, continuous on-site inspections were not required. We also hold, however, that an architect has a legal duty, under such an agreement, to notify the owner of a known defect. Furthermore, an architect cannot close his eyes on the construction site and refuse to engage in any inspection procedure whatsoever and then disclaim liability for construction defects that even the most perfunctory monitoring would have been prevented. In this case, we hold, as a matter of law, that the School Board failed to prove that the Architect breached the agreement.

In making this judgment, we would point out the value, and in some cases, the necessity, for expert testimony to aid the court and the trier of fact in resolving conflicts that might arise.

II

We now address the School Board's argument on its cross-appeal that the negligence claim should have been submitted

to the jury. The School Board stated at oral argument that its negligence claim was asserted as an alternate theory of recovery in case its contract claim was not allowed. The trial court ruled that this negligence claim was barred by the statute of limitations.

* * *

The trial court was correct, therefore, in directing a verdict for the Architect on the School Board's negligence claim.

III

Because we hold for the Architect on the School Board's contract and negligence claims, we determine that the issue of whether the Architect should be allowed to assert its cross-claim against the roofing subcontractor and the manufacturer of the roofing membrane is moot.

IV

For the above-stated reasons, that portion of the judgment based on the jury's verdict against the Architect on the School Board's contract claim is reversed, and a judgment is rendered for the Architect on that claim. That portion of the judgment based on the directed verdict in the Architect's favor on the School Board's negligence claim is affirmed.

88-220 REVERSED AND JUDGMENT RENDERED.

88-273 AFFIRMED.

HORNSBY, C. J., and JONES, SHORES, HOUSTON and STEAGALL, J. J., concur.

Some observations on the *Watson* decision and some discussion of other important decisions (some of which were noted in *Watson*) may be useful in understanding the legal aspects of the general obligation of the design professional to perform site services.

After concluding that the exculpatory language did not completely shield the architect, the court faced the question of whether the inspections were as thorough as the architect agreed they would be. First, note that the AIA documents do not specifically require the architect to make inspections until the contractor claims that the work has been substantially completed. Prior to that point, the architect's site visits are observations, not inspections.⁶⁶

⁶⁶AIA Doc. B101-2007, §§ 3.6.2.1, 3.6.6.1.

The *Watson* decision spoke of the duty to *inspect* and discover the acts or omissions of the contractor in failing to follow the plans and specifications. Yet the court was not able to determine whether the architect had conducted a proper inspection in the absence of expert testimony showing whether the defects should have been obvious to the architect during his weekly inspections. Because the school board had the burden of providing this expert testimony, but did not, it failed to prove that the architect had breached the contract.

The *Watson* case illustrates the interrelationship that often exists between a breach of contract claim involving a design professional and the professional standard applicable to a claim of professional negligence (malpractice).⁶⁷

⁶⁷The professional standard is discussed in Section 14.05.

An architect or professional engineer owes her client a duty, not only to act in conformity with the contract requirements, but also in a non-negligent manner. For this reason, an owner who has hired a design professional to inspect the project during the construction phase, but who ends up with a defective building, can sue the design professional for breach of contract and for tort.

Whether the claim is approached as one based on breach of contract or professional malpractice, evidence will have to be introduced that bears on whether the design professional did what she promised or what the law requires. Depending on the nature of the contractual obligation, the evidence necessary to establish breach of contract or malpractice may be identical,⁶⁸ or it may be very different.

In comparing the proof necessary to establish a breach of contract and that necessary to establish a tort, an initial distinction must be drawn between two types of contract terms. Where the standard of performance dictated by the contract is unambiguous and readily discernible, expert testimony is not necessary to establish its breach. The reason is that the contract creates its own standard of expected performance, so that failure to meet that standard (absent excuse) results in a breach of contract. A party who breaches an unambiguous contract term cannot raise as a defense that it acted in a non-negligent manner.⁶⁹ The modified AIA contract addressed in *Watson*, for example, required the architect to provide “at least one inspection each week, a final inspection, and an inspection at the end of the one year guarantee period . . .” An architect who fails to inspect at least weekly would be in breach of contract, even if the professional standard did not require that many inspections. Here, a corollary exists with tort law: Expert testimony is not necessary when a design professional’s negligence is so obvious that it is a matter of common knowledge. For example, expert testimony would not be necessary to show that a supervising

professional engineer who never showed up at the project while it was being built was negligent.⁷⁰

Sometimes a contract establishes a standard of performance which is not easily discernible. For example, the contract addressed in *Watson* requires not only weekly inspections, but also that “the administration [of the contract by the Architect] shall be consistent with the size and nature of the work” and that the architect through her inspections shall “endeavor to guard the Owner against defects and deficiencies in the work of the Contractor.” These contract requirements create no objective, readily discernible, and unambiguous standards of conduct. Must the court turn to the professional standard and ask what inspections would the reasonable architect make in an effort to protect the owner from defective work by the contractor? A corollary to that inquiry is: Must that contractual standard of conduct be proved by expert testimony?

Here, the *Watson* court created a distinction by way of its citation to *Board of Education of the Hudson School District v. Sargent, Webster, Crenshaw & Folley*.⁷¹ The *Sargent* case also involved an architect’s duty of inspection under an AIA contract. A newly installed roof failed, and the school district sued the inspecting architect. Evidence revealed that the architect’s representative saw the roof being installed improperly; nonetheless, at the close of the evidence, the trial court had entered a judgment for the architect. The appellate court reversed and entered judgment for the school board, ruling that the architect breached the contract when she did not inform the owner of a defect known to the architect from her inspections.

Citing *Sargent*, the *Watson* court adopted the rule that an architect with a contractual duty of inspection breaches that contract when it fails to notify the owner of a known defect. The fact that the contractual duty itself does not contain a readily discernible, objective standard of conduct does not mean that in *all* cases the owner must present

⁶⁸In *Adobe Masters, Inc. v. Downey*, 118 N.M. 547, 883 P.2d 133 (1994), the court stated that the evidence the owner needed to prove either breach of contract or negligence against its architect was identical.

⁶⁹*Jowett, Inc. v. United States*, 234 F.3d 1365 (Fed.Cir.2000) (contractor must insulate ceiling ducts as required by the contract, notwithstanding industry custom of not doing so) and *R.B. Wright Constr. Co. v. United States*, 919 F.2d 1569 (Fed.Cir.1990) (contract calling for three coats of paint is enforced, notwithstanding a trade custom of applying two coats of paint).

⁷⁰*Seven Tree Manor, Inc. v. Kallberg*, 688 A.2d 916 (Me.1997). Accord, *Town of Breckenridge v. Golfcourse, Inc.*, 851 P.2d 214, 216 (Colo. App. 1992), cert. denied, (Colo. May 17, 1993) (court refuses to allow expert testimony on whether golf course designer breached the contract, as the contract itself establishes the standard of performance) and *Turney Media Fuel, Inc. v. Toll Bros., Inc.*, 725 Pa.Super. 836, 725 A.2d 836 (1999) (in breach of contract action, expert’s testimony as to why the work did not meet industry standards was properly excluded).

⁷¹146 A.D.2d 190, 539 N.Y.S.2d 814, appeal denied, 75 N.Y.2d 702, 551 N.E.2d 107, 551 N.Y.S.2d 906 (1989).

expert testimony to prove a breach of contract. However, excluding this narrow exception of a known defect in the contractor's work, the owner cannot prove the architect's breach of her duty of inspection absent expert testimony.

One more point needs to be made concerning breach of a contract obligation which is readily discernible. As noted above, an architect's failure to make *any* inspections would constitute a breach of contract without any need to resort to expert testimony as to the professional standard of care. However, even when the design professional performs an inspection in conformity with the contract requirement—or with the professional standard—expert testimony still may be necessary to establish whether the inspection itself was carried out properly. Such testimony must prove that a reasonable architect or engineer, performing that inspection, would have perceived that the contractor was performing in an improper manner and that such improper conduct caused the defect.⁷²

A second issue relates to the troublesome question of the interrelation of claims based on breach of contract and those based on the tort of negligence. In the *Watson* case, the school board alleged negligence and breach of contract against the architect. It lost its claim based on negligence because the claim had not been filed within the time required by the statute of limitations. Typically, the claimant has a longer period to file a claim based on breach of contract than one based on negligence. But a claim based on tort may provide a larger judgment than one based on breach of contract. Although this distinction is relatively unimportant in defect cases, it would not be if the claimant sought recovery for emotional distress or if the claim were argued under a legal theory that might provide for punitive damages.⁷³

Third, *Watson* seeks to impose an objective standard in determining whether there has been a breach of the obligation to inspect and discover. The court's call for expert testimony is designed to determine what other architects would have done under similar circumstances. The court noted that the language could not exculpate the architect "no matter how serious the deviation of the contractor from the plans and specifications."

The AIA sought to employ a subjective standard to measure performance even if the disclaimers do not

exculpate the architect. Yet the court was frustrated by the AIA's attempt to provide a loose standard as exemplified by phrases such as "endeavor to require," "familiarize himself generally with the progress and quality of the work," and "endeavor to guard the owner." Frustration with the imprecision of these terms undoubtedly motivated the court to employ an objective standard. (In B141-1997 the phrases are slightly modified in Paragraph 2.6.2.1 but are essentially the same. In B101-2007, Section 3.6.2.1, the "endeavor to guard the owner" language has been dropped.)

Fourth, the contract in *Watson*, a modified AIA Document B141, specified that the "inspection" would be made at least once a week. Although the B141 in effect at the time this contract was made used somewhat different language, it is useful to note that in 1987, B141, Paragraph 1.5.4, required the architect to visit the site "at intervals appropriate to the stage of construction or as otherwise agreed." (In 1997 this became in Paragraph 2.6.2.1 "the stage of the Contractor's operations" and in 2007 this became in Section 3.6.2.1 "the stage of construction.") Parties commonly reject this formulation and include a requirement that visits be made at specific times. However, requiring weekly visits can generate excessive costs because of visits being made when they are not necessary. Document B101-2007, Section 4.3.3.2, seeks to solve this number-of-visits schedule problem by providing a blank that sets a limit on the number of visits as part of basic services.

At the time of the *Watson* decision, other courts were dealing with these issues. *Hunt v. Ellisor & Tanner, Inc.*,⁷⁴ cited in many subsequent decisions, held that the disclaimer is simply designed to ensure that the architect is not held to be a guarantor for the mistakes of the contractor. It rejected the *Moundsview* decision and its conclusion that the disclaimers, as a matter of law, relieved the architect. *Moundsview* held that it was proper to grant the architect a summary judgment (a resolution of the case without a full trial). In doing this, *Hunt* pointed to the responsibility of the architect "to visit, to familiarize, to determine, to inform and to endeavor to guard" and found these obligations to be nonconstruction responsibilities of the architect to provide information and not to perform work. It then concluded that the exculpatory paragraph emphasized the architect's nonconstruction responsibility and that the architect as a provider of information does not ensure or guarantee the contractor's work.

⁷²*City of York v. Turner-Murphy Co., Inc.*, 317 S.C. 194, 452 S.E.2d 615 (App.1994).

⁷³See Sections 27.09 and 27.10.

⁷⁴739 S.W.2d 933 (Tex.Ct.App.1987), writ denied Mar. 23, 1988.

Although it is likely that the AIA intended to provide a contractual method by which the architect would obtain summary judgment solely by virtue of the exculpatory language, the method of arriving at the result in *Hunt* is an imaginative but strained interpretation of the contract provisions. Undoubtedly, reactions such as those shown in *Watson* and *Hunt*, as well as others to be noted shortly, reflect a negative reaction against this attempt by the AIA to shield the architect from responsibility for the work of the contractor.

A New York case demonstrates an attitude toward disclaimers similar to that in *Hunt*. The *Sargent* case⁷⁵ (noted earlier in this section) concluded that the exculpatory language was designed to avoid the architect's being held as a guarantor for the work of the contractor. It conceded that cases had concluded that the exculpatory language could be the basis for granting a summary judgment to the architect, but distinguished them by noting they did not involve cases where the architect had known of the defects during construction and where the architect failed to keep the owner informed of the progress of the work.

Note that *Sargent* did not go as far as *Watson*. It did not hold the architect responsible where she has not been paid for the type of close supervision that would reveal most if not all defects in the contractor's performance. It noted that the owner bargained and paid for the architect to make periodic inspections and to convey information relating to defects the architect discovered as a result of her visits that would enable the owner to ameliorate the problems.

These decisions indicate a trend toward making the issue of the architect or engineer's performance a factual one that must be resolved by evidence. This trend appears to reverse the tendency of some earlier decisions, which had used exculpatory language to justify awarding the architect a summary judgment, making a trial unnecessary.

The cases reproduced and summarized provide some generalizations regarding the site role of design professionals who perform services under contracts such as published by the AIA. First, the design professional breaches her contract if she does not do as she has promised regarding site visits, their frequency, and their intensity. Second, if her breach is a substantial cause of harm to the client, she must compensate the client for its losses. (Third-party claims are discussed in Section 14.08.) Third, if she *exceeds* her contractual commitment, such as visiting more frequently,

more intensively examining the contractor's work, directing the contractor as to how work should be performed, or acting positively as to safety, she has led the client to believe she would continue to perform those services even if not contractually obligated to do so. She must compensate the client if she is negligent in performing these services or if the client relies to its detriment on her performance by not having others perform those services. Fourth, the exculpatory provisions will not protect the design professional if she became aware of the contractor's failure to perform properly—performance including both compliance with the contract and laws such as building or safety laws—and did not take reasonable action to eliminate or minimize the likelihood that the finished project would not comply with the contractual requirements, that third persons on or about the site might suffer physical harm, or that others nearby would suffer damage to their property.

Fifth, language protecting the design professional in the contract between the design professional and her client will not be effective in a claim by a contractor against an architect if the specifications in the construction contract provided that the architect would supervise the work. This has been interpreted to include giving instructions when problems develop and inspecting the work as it is being performed.⁷⁶

The cases discussed here demonstrate the inherent difficulties of standard form contracts. It is difficult to quarrel with the basic allocation expressed in AIA documents of responsibility for executing the design. That the architect checks the work periodically and issues certificates of payment should not disturb the division of authority and responsibility under which the architect designs and the contractor builds. However, general language often cannot take into account unforeseen circumstances. If the architect has not breached her obligation to observe (or inspect) and has not learned of defects, the exculpatory language should be sufficient to grant her a summary judgment. But where she has learned of defects and not reported them or where she has not complied with her contractual obligations, the exculpatory language should not provide a shield. Although it must be recognized that contracts drafted by the professional associations will inevitably be designed to favor members of those associations, such standard contracts cannot anticipate every problem.

⁷⁵Supra note 71.

⁷⁶*Colbert v. B. F. Carvin Constr. Co.*, 600 So.2d 719 (La.App.), writ denied, 604 So.2d 1309, 1311 (La.1992).

Also, the AIA's attempt to employ a subjective standard and to avoid the requirement of inspections until substantial completion has clearly not been successful in court. This may be due to the recognition that such contracts as those published by the AIA seek to give marginal advantages to the architect or due to the feeling that the owner pays for a service and should receive it. But also note that the courts recognize the owner should not receive more than the services for which it has paid. If the owner wishes a continuous presence on site, it will have to pay for it.

C. Submittals: Design Delegation

The contractor is usually required to submit information generally known as *submittals* to the design professional. The best-known submittals are shop drawings. (The term comes from the fabrication process: Shop drawings instruct the fabrication “shop” how to fabricate component parts.) AIA Document A201-2007, Section 3.12.1, defines shop drawings as data especially prepared for the work that is “to illustrate some portion of the Work.” Submittals also include product data, defined in Section 3.12.2 as including “illustrations, standard schedules, performance charts, instructions, brochures, diagrams and other information” that illustrate the materials or equipment the contractor proposes to use. Finally, Section 3.12.3 defines samples as physical examples that illustrate “materials, equipment or workmanship and establish standards by which the Work will be judged.”

An owner who is aware of the submittal system sees the process as a double- and even triple-checking system that should reduce the likelihood of defects or accidents. Often submittals are prepared by the subcontractor and reviewed by the contractor and the design professional or her consultant. See Figure 12.2. Although submittals should reduce potential loss, they also generate additional expense.

The prime design professional is even more concerned about submittals. Submittal review exposes the design professional to claims and even liability when people are injured, often the result of construction methods that are not within her expertise and not her responsibility in many if not most construction contracts. In addition, project failure often can be traced to submittal review.⁷⁷

The prime design professional must rely heavily on the expertise of her consultants and will be held accountable to her client or to third parties if the consultant does not perform properly.⁷⁸

Finally, the submittal process can expose the prime design professional to claims by the client and the contractor that improper delay in reviewing submittals delayed the project or disrupted the contractor's planned sequence of performance.⁷⁹

The consultant who reviews submittals, such as a structural engineer, sees the submittal process as one that exposes her to the risk of license revocation or other disciplinary action. The *Duncan* case reproduced in Section 10.04B dealt with disciplinary action against a licensed engineer based on shop drawing review, among other things.

In addition, the consultant may, like the prime design professional, be exposed to liability to the owner or to third parties. She may also have to indemnify the prime design professional against whom a claim has been made.

The contractor often relies on the subcontractor to prepare submittals. Just as the prime design professional will be held responsible for the acts of her consultant, the contractor will be held responsible for the acts of the subcontractors.⁸⁰ More important, the contractor may believe that approval of its submittals transfers certain risks and responsibilities to the owner, a position often contrary to contract language.

Subcontractors and prime contractors see submittals as forcing them to fill in gaps in the design created by the design professional as well as exposing them to liability.

It has always been recognized that specialty subcontractors often design parts of the project within their expertise, in addition to supplying and installing parts of the structure. This is most commonly done in steel fabrication, window walls, and vertical transportation. In effect, part of the design has been delegated to contractors. The question of allocating risk when this is done has troubled the construction industry.

The controversy surfaced when the AIA issued its 1987 A201. Paragraph 3.12.11 briefly recognized the possibility of the contractor, through its specialty subcontractors or separate contractors (multiple primes) being given a set of performance specifications and asked to design in a way

⁷⁷Rubin & Ressler, “To Build a Better Mousetrap”—*The Search to Define Responsibility for Shop Drawing Review*, 5 *Constr. Lawyer*, No. 4, April 1985, p. 1.

⁷⁸See Section 12.10B.

⁷⁹See Section 26.10.

⁸⁰See Section 28.05C.

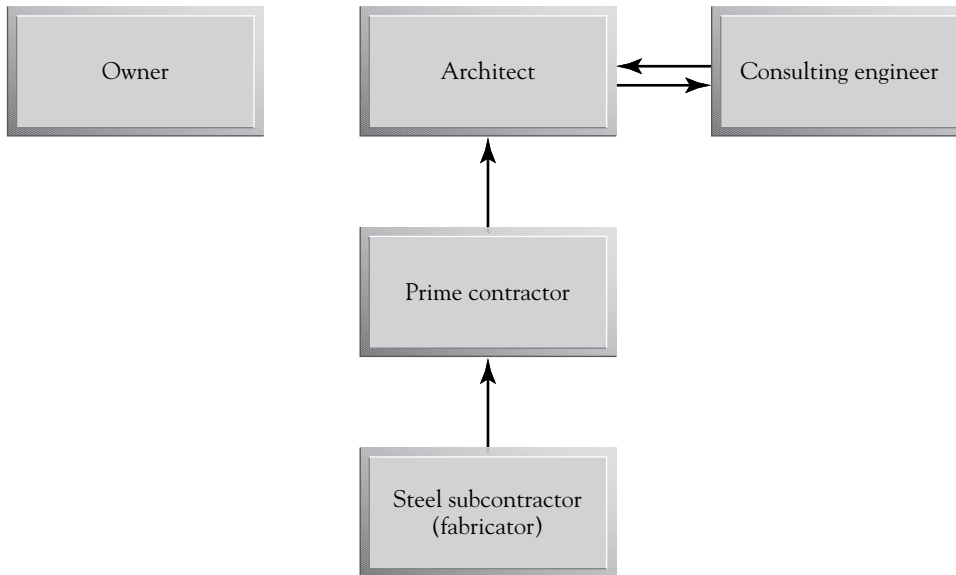

FIGURE 12.2 Path of a steel fabrication submittal.

that would accomplish these goals. That paragraph stated that when this is required by the contract, the architect can rely on the accuracy of the certification; in essence, on the professional quality of the design furnished by others.

This brief provision was the center of controversy.⁸¹ Many attacked it as allowing the architect to relieve herself from design responsibility, often contrary to the understanding of the owner; that design is often excluded by the contractor's liability insurance; and that dual responsibility will create risk allocation problems. The AIA defended the provision, stating that it simply reflected industry practices that some skills, such as providing prefabricated trusses, rest with specialty subcontractors, and that specialty contractors compete by promising to deliver complete service.

This controversy was addressed in A201-1997, Paragraph 3.12.10, and the 1997 language remained virtually unchanged in A201-2007, Section 3.12.10. It states that the contractor is not required to provide professional architectural or engineering services, "unless such services are specifically required . . . for a portion of the Work." The contractor need not provide professional

services that violate law. When such services are required, the contractor must be given performance and design criteria, and the contractor must see to it that "a properly licensed design professional signs and seals the drawings." The owner and architect can rely on the services and the certifications and the architect's review is for "the limited purpose of checking for conformance with the information given and the design concept expressed in the Contract Documents."

In essence this provision allows the owner (and the architect) to delegate the responsibility for the design quality of specified parts of the project to the contractor. The latter must use a licensed design professional to do the design and be responsible for it.

It remains to be seen how the division of responsibility for design will work, particularly with respect to the understanding of the client, licensing, insurance, risk allocation, and indemnification.

Before noting the varied purposes of the submittal process, imagine a building project without a submittal process. The contractor would build in accordance with its beliefs as to its contractual obligations. It would not have to state in advance what it proposes to do. It would simply be judged by what it does. If it fulfilled its contract commitment, it would earn the contract price. If it did not,

⁸¹J. SWEET & J. SWEET, SWEET ON CONSTRUCTION INDUSTRY CONTRACTS, § 10.08 (4th ed.1999).

the owner could exercise legal remedies. But submittals, like the site monitoring performed for the owner by the design professional, should reduce the likelihood that the project will not be built as required.

Although submittals have ancillary purposes, such as to persuade a vendor to process a purchase order⁸² or allow different manufacturers to show their products and how such products join and relate to other products,⁸³ the principal purpose of a submittal is to obtain a representation from the contractor as to how it plans to execute the aspects of the design for which submittals are required.

In traditional construction projects,⁸⁴ such as those for which AIA documents are used, the contractor determines how the design is to be executed. The architect does not control the contractor's methods of executing the design. The architect monitors performance by site visits mainly to determine progress in order to issue certificates for payments. Until substantial completion, however, the architect makes visits to determine whether she sees anything to indicate that the completed project will not comply with contract requirements. Similarly, as to submittals, AIA Document A201-2007, Section 4.2.7, describes the architect's review to be only for "the limited purpose of checking for conformance with information given and the design concept." The architect does not check the methods by which the contractor intends to execute the design in accordance with Section 3.3.1. It states that the contractor is solely responsible for and controls the "construction means, methods, techniques, sequences and procedures." (In 1997 and continuing in 2007, A201 adds language to Section 3.3.1 that recognizes the possibility that the contract may give the contractor specific instructions as to execution.)

The submittals do not, however, lend themselves to a neat breakdown between design and its execution. As a result, information may be submitted (or omitted) that relates to execution of the completed project or the temporary work needed to accomplish the completed project. *Waggoner v. W. & W. Steel Co.*⁸⁵ demonstrates this. An accident resulted from inadequate temporary connections while the structural steel was being assembled and erected,

⁸²*Day v. National U.S. Radiator Corp.*, 241 La. 288, 128 So.2d 660 (1961).

⁸³*Alabama Society for Crippled Children & Adults, Inc. v. Still Constr. Co., Inc.*, 54 Ala.App. 390, 309 So.2d 102, 104 (1975).

⁸⁴See Section 17.03.

⁸⁵657 P.2d 147 (Okla.1982).

a choice made by the contractor. The court commenced its opinion by stating the issue to be whether the architect was responsible for ensuring "that the contractor employ safe methods and procedures in performing his work."⁸⁶ Under the AIA contract used in that project, this was the responsibility of the contractor. The site visits by the architect did not change this.

The plaintiffs contended the shop drawings that were submitted and approved by the architect "should have included specifications for temporary bracing and connections."⁸⁷ They contended the architect was negligent when he approved shop drawings that did not provide for proper temporary connections on the expansion joints. They asserted the architect or his structural engineer reviewing the submittal should have refused to approve it until the reviewer determined that the contractor would use proper temporary connections.

The court pointed to contract language stating that the *contractor* was solely responsible for construction methods and that it was not the architect's responsibility to require this information be furnished.

The court stated it was the duty of the contractor, not of the architect, to see that the shop drawings included how the temporary connections were to be made. It would be more correct to state there was no requirement that the contractor communicate its plan as to temporary connections to the architect through submittals. The architect could assume that a failure to include provisions in the shop drawings for temporary connections did not indicate that the contractor would use unsafe connections but indicated only that this was not information required by the submittal process. (Had the architect known unsafe methods were to be employed, she should have taken some affirmative action to avoid structural collapse and harm to workers.)

Another less well-known function of the submittal process is to make more definite the contract document requirements for which submittals are required. Language and even graphic depiction have communication limitations. (Try to describe or draw even a simple house!) As the contractor plans its actual performance rather than review the design prior to making its bid, its submittal indicates its interpretation of the contract, particularly in sensitive areas such as steel detailing. Submittal review

⁸⁶*Id.* at 148.

⁸⁷*Id.* at 151.

can be the process by which some potential interpretation disputes are exposed.

In addition, submittals as to product data and samples may be the method by which the contractor proposes substitutions if they are permitted by the contract. For example, AIA Document A201-1987, Paragraph 3.12.8, stated that the contractor will be relieved of responsibility for deviations if it specifically informs the architect of the deviation at the time of the submittal and the architect approves the specific deviation. In 1997 language was added making clear that the deviation must be a minor change under Paragraph 7.4.1, or a change order or a construction change directive, the latter two requiring consent of the owner. This language was continued unchanged in 2007.

Finally, although the contractor is not entitled to technical advice from the design professional on how to execute the design, the submittal process can be the method by which the contractor seeks information from the prime design professional or her consultants, particularly as to engineering techniques. (More on this later in this section.)

Much of what has been suggested regarding the submittal process and its use in construction is reflected in AIA documents. For example, B101-2007, Section 3.6.4.2 contained in the AIA document for design services, states that the architect's review and approval are only for the "limited purpose of checking for conformance with information given and the design concept." It also states that the review "shall not constitute approval of safety precautions or, unless otherwise specifically stated by the Architect, of construction means, methods, techniques, sequences or procedures." Similar language appears in A201-2007, Section 4.2.7.

B101 and A201 reflect the AIA's desire to avoid exposing the architect to liability. One liability exposure generated by the submittal process is the architect being responsible for defects or accidents that can be traced to her approval of submittals, as in *Waggoner*.

Another method the AIA uses to avoid liability exposure is A201-2007, Section 3.12.4, which states that submittals are not contract documents but merely demonstrate how the contractor proposes to conform to the design concept expressed in the documents. Yet Section 3.12.8 states that the contractor is relieved from responsibility for deviations if it informs the architect in writing of these deviations and the architect approves them. If after receiving the architect's approval the contractor

performs as it has proposed, the owner should not be able to claim a breach by pointing to Section 3.12.4 and its declaration that submittals are not contract documents. (The troublesome question of the legal effect of compliance with approved submittals is discussed later in this section.)

Finally, A201-2007, Section 3.12.4, recognizes that some submittals are not intended to be reviewed and approved but are simply for information.

B101 and A201 also focus on other liability exposure. The AIA seeks to minimize the likelihood of successful contractor claims that it has suffered losses because the architect unreasonably delayed passing on submittals. B101-2007, Section 3.6.4.1, states that the architect shall act with reasonable promptness and should be given "sufficient time" in her professional judgment "to permit adequate review." Similar language is found in A201-2007, Sections 4.2.7 and 3.12.5. More important, A201-2007, Section 3.10.2, requires that the contractor and architect agree to a schedule of submittals that allows the architect reasonable time for review.

The effect of review and approval of submittals depends on the purpose of the submittal. In making a submittal, the contractor can be asking one or a number of different questions. It can be asking whether what it proposes to do "is okay." If the contractor performs as it says it will, has it performed its contractual obligation?

As mentioned earlier, this can create an interpretation issue. The submittal process can flush out problems and make the contractual obligations of the contractor more concrete or specific. Relieving the contractor if it complies can be based on A201-2007, Section 4.2.11, which gives the architect the power to interpret the requirements of the contract documents on request of either party. To be sure, Section 4.2.11 looks to interpretation issues that arise on the site and not in the submittal process. Also, interpretations during the submittal process may bypass the process in Article 15 for resolving disputes. Yet the submittal process can also serve a concretization function. The architect has no power to change the contract, except under those contracts such as A201 that give her the power to make minor changes that do not affect time or price.⁸⁸ If concretization is accomplished and the contractor performs in accordance with the proposal it makes in the submittal, it has complied with the contract documents.

⁸⁸AIA Doc. A201-2007, § 7.4.

Yet the preceding conclusion—that the contractor who complies with an approved submittal has performed in accordance with its contract commitments in A201-2007—is troublesome. Section 3.12.8 states that the contractor is not relieved from responsibility for deviations in the contract documents by the architect’s approval of submittals unless the architect has been given specific notice of the proposed deviation and gives written approval to it. It also states that the contractor shall not be relieved of responsibility for errors or omissions in the submittals even if approved by the architect.

Other provisions of A201-2007 are relevant, however. Section 3.1.2 states that the contractor will perform the work in accordance with the contract documents. Yet Section 3.1.3 states that the contractor will not be relieved from its obligation to perform in accordance with the contract documents by approvals required, presumably approved submittals. Section 3.12.7 states that the contractor will not perform any work that requires submittal and review until the architect has given approval.

These provisions place the contractor on the horns of a dilemma. The contractor cannot perform certain work until submittals have been approved, because it must perform in accordance with approved submittals. Yet apparently the contractor’s noncompliance with the contract documents will be a breach even if its submittals have been approved unless it can point to the deviation under Section 3.12.8 and the architect has given written approval to the specific deviation. Other than that, the contractor’s work can be challenged even if its submittals indicate how it proposes to do the work and those submittals have been approved.

The specific exception of Section 3.12.8 undoubtedly recognizes that review of submittals can often be perfunctory. Yet it does not seem fair to deny any legal effect to approval and allow the owner to challenge the work as not complying with the contract documents only if the limited exception of Section 3.12.8 applies.

This analysis assumes that the information submitted is data that the contractor must furnish and the architect must review. (The architect should, however, inform the owner of any approval that is in effect an interpretation ruling of which the owner would want to be aware.)

A submittal may be a request by the contractor for technical advice from the design professional. The contractor may be stating what it proposes to do and asking the design professional, “What do you think?” or “Can

you help me out?” If this request relates to construction means, methods, or techniques, the design professional need not respond. But if the design professional knows that the contractor proposes to proceed in a way that will lead to project failure or accidents, the design professional must draw attention to this danger. This duty to act is similar to her obligation when she visits the site. During site visits, the design professional need not search for potential trouble in operations under the contractor’s control, but she cannot close her eyes to obviously dangerous conditions or to information that clearly indicates project failure.⁸⁹ Similarly, she should not be able to close her eyes to such information revealed during the submittal process even though she has no obligation to review that information. For example, had the submittal in the *Waggoner* case discussed earlier in this section been a clear signal to the architect that unsafe temporary connections were to be used or if industry custom required this information be shown in the submittals and it was not, the architect should have directed attention to this problem.

Whether such a duty to speak out exists depends on the balance of expertise. For example, if the subject of the submittals relates to steel detailing largely within the expertise of the structural engineer, there is a clear duty to take some action.⁹⁰ However, if the submittal relates to an activity in which the balance of expertise lies on the contractor’s side, such as vertical transportation, approval by the design professional should not relieve the contractor from responsibility. Similarly, the design professional need not answer any questions on such matters that the submittals may ask.

Finally, some information contained in submittals is simply to inform the design professional of what the contractor intends to do but is not a request for approval or even a request for information or advice. This is what is contemplated by A201-2007, Section 3.12.4, which speaks of information submittals. In such a case, only a clear indication of the almost certain likelihood of project failure or harm to third parties would place on the design professional a duty to take action.

⁸⁹ See Sections 14.08G and 14.11B.

⁹⁰ *Duncan v. Missouri Bd. for Architects, Professional Eng’rs and Land Surveyors*, reproduced in Section 10.04B.

D. Use of Project Representative

The standard contracts published by the professional associations do not require the design professional to have a continuous presence on the site. If such presence is required, parties can agree to have a permanent representative such as a project representative or a resident engineer on the site continually. Although the principal problems involved in using a project representative relate to the representative's authority,⁹¹ such use can bear on the responsibility of the design professional.⁹²

At the very least, the presence of a full-time project representative means the design professional is not expected to be on the site continuously. It should also mean that frequency of visits may be diminished. However, this should not mean the design professional need not visit the site at times when it would otherwise be appropriate.⁹³ Also, the design professional must select competent representatives and must monitor their work.⁹⁴

E. Use of Construction Manager

Although newer construction organization methods are discussed in Chapter 17, mainly in Section 17.04, it may be useful at this point to note the development of construction management. The role of the design professional has been substantially changed by standard contracts, particularly in the area of predicting costs, scheduling, safety, visiting the site, and passing on submittals. This has left a vacuum that in some projects has been filled by a construction manager (CM).

A CM should provide construction experience and skill, particularly at the design stage but also during design execution. There are two models of cost estimating: One uses rough formulas, and the other does a continuous evaluation of those elements that construction costs comprise. Similarly, during construction the CM should bring greater skill than the design professional in monitoring contract compliance and schedules. Is work being done in

accordance with safety regulations? Will or does the end product meet the contract document requirements? It is likely that the future will see increased use of specialized professionals, unconnected with design creation, to perform many services mentioned in this chapter.

F. Statutory and Administrative Regulations

Increasingly, state statutes and regulations have dealt with design professional services, mainly those related to site services. Florida requires that a structural inspection plan be submitted to public authorities prior to issuing a building permit for any building greater than three stories or 50 feet in height or that has an assembly occupancy classification that exceeds 5,000 square feet in area and an occupant content of greater than 500 people.⁹⁵ The plan must be prepared by the engineer or architect of record. Its purpose is to provide specific inspection procedures and schedules so the building can be adequately inspected for compliance with the permitted documents.⁹⁶ The public agency must require that a state-certified inspector perform structural inspections of the shoring and reshoring for conformance with plans submitted to public authorities. The architect or engineer of record can perform these special inspections if she is on the list of those qualified. The costs of the special inspector are borne by the owner.

California enacted statutes in 1971 for engineers,⁹⁷ and in 1985 for architects⁹⁸ that deal with site services. The former currently requires that where supervision by a licensed engineer is required, the engineer must perform periodic observations "to determine general compliance." Supervision does not include responsibility "for the superintendence of construction processes, site conditions, operations, equipment, personnel, or the maintenance of a safe place to work or any safety in, on, or about the site." Periodic observation by an engineer is defined by the statute as a visit by the engineer to the site of the work. The statute regulating architects states that those who sign plans are not obligated to observe the construction of the work but the architect and client are not precluded from making a contract dealing with these services. The statute defines construction observation services as "periodic observation of completed work

⁹¹See Section 17.05B.

⁹²*Deyo v. County of Broome*, 225 A.D.2d 865, 638 N.Y.S.2d 802 (1996) (use of project representative with authority to report on safety can make architect supervisor and liable to injured worker).

⁹⁴*Town of Winnsboro v. Barnard & Burk, Inc.*, 294 So.2d 867 (La. App.), cert. denied, 295 So.2d 445 (La.1974).

⁹⁵West Ann.Fla.Stat. § 553.71(7).

⁹⁶Id. § 553.79(5)(a).

⁹⁷West Ann.Cal.Bus.&Prof.Code § 6703.1.

⁹⁸Id. § 5536.25(b).

to determine general compliance with the plans, specifications, reports, or other contract documents.”⁹⁹ The statute states that these services do not encompass construction processes, site conditions, and activities similar to those set forth in the statute dealing with engineers.

Unlike California, which uses a statutory approach, Hawaii requires, by administrative regulation, an application made for a building or construction permit “involving the public safety or health” to state that all plans and specifications shall include a warranty by the certificate holder stating that construction would be under her supervision. If she cannot make such a warranty, she must notify the registration board within fifteen days and include the name of another licensed professional who will continue with construction supervision.¹⁰⁰

State control over every aspect of the construction process is increasing.¹⁰¹ People who engage in that process should obtain legal advice on the requirements for performing particular activities. In addition, the legislative definitions such as those found in the California statutes show an attempt by the design professions to obtain statutory language that seeks to limit the obligations of design professionals. However, those statutory definitions relate only to the public law aspects of construction. Those statutes do harmonize with language in standard contracts published by associations of design professionals. (Very likely the statutes were “pushed” by those associations.) But those statutes would not bar design professionals and their clients from making contracts that place a greater responsibility on the design professional than found in the statutes.

SECTION 12.09 Hazardous Materials

The environmental movement noted in Section 9.13 has had a significant effect on the construction process. A proposed site might be found to have been contaminated by hazardous or even toxic materials stored there years ago or leaking from an adjacent site. Similarly, during a renovation project, asbestos or other hazardous materials might be encountered that could prove dangerous to workers or others in the building. Even in new projects, greater emphasis on sensitivity to environmental factors

could generate concern over materials and equipment to be incorporated in the project.

As the public has become more concerned over environmental matters, regulatory efforts have been directed toward this problem. Although this is not the place to discuss these regulations in detail, we can point to some of the factors involved in such regulation.

Regulation has often included requirements that reports be submitted before certain work involving hazardous materials can be performed and that only people certified by state or local authorities can perform dangerous work, such as asbestos removal. Also, the uncertain liability connected with environmental problems has led insurers to exclude many hazardous material activities from liability coverage. Much of the difficulty encountered by insurers relates to the uncertainty of what could be considered safe exposure levels and the fact that the claims may come many years after work has been performed.

These factors have led those actively involved in the construction process, such as design professionals and contractors, to seek methods to exculpate themselves from responsibility for these environmental concerns, in the hope that liability would fall on the owner. Illustrations can be found in the AIA Document B101-2007. For example, Section 5.5 requires the owner on request of the architect to furnish geotechnical information that includes “evaluations of hazardous materials.” In addition, Section 5.7 requires the owner to furnish tests for air and water pollution and tests for hazardous materials. Finally, Section 10.6 states that “unless otherwise required in this Agreement, the Architect shall have no responsibility for the discovery, presence, handling, removal or disposal of or exposure of persons to, hazardous materials or toxic substances in any form at the Project site.”

The uncertainties created by the uncovering of environmental risks has led participants in the construction process to use contract language to avoid responsibility. The hope is that these clauses will be effective, at least to contracted connected parties, even though liability exposure of other sorts, such as claims by third parties or public officials, may not be affected. Because the owner has both the upside and downside risks of ownership, it is not unreasonable to place ultimate responsibility on the owner and let the owner deal with transferring or distributing this risk through insurance.¹⁰²

SECTION 12.10 Who Actually Performs Services: Use of and Responsibility for Consultants

A. Within Design Professional's Organization

The design professional may operate through a corporation or a partnership or be a sole proprietor.¹⁰³ The actual performance of the work may be done by the sole proprietor, a principal¹⁰⁴ with whom the client discussed the project, another principal, employees of the contracting party (whether the contracting party is a sole proprietor, a partnership, or a corporation), or (as discussed in Section 12.10B), a consultant hired by the design professional. Are the client's obligations conditioned on the performance being rendered by any particular person? Can certain portions of the performance be rendered by people other than the design professional without affecting the obligation of the client to pay the fee?

Services of design professionals, especially those relating to design, are generally considered personal. A client who retains a design professional usually does so because it is impressed with the professional skill of the person with whom it is dealing or the firm that person represents. The client is likely to realize that licensing or registration laws may require that certain work be done by or approved by people who have designated licenses.¹⁰⁵ Yet the client is also likely to realize that some parts of the performance will be delegated to other principals in the firm with whom the client is dealing, employees of that firm, or consultants retained by the design professional organization.

As to design, unless indicated otherwise in the negotiations or in the contract, the client probably expects the design professional with whom it has dealt to assemble and maintain a design "team" and to control and be responsible for the design. The fleshing out of basic design concepts, such as the construction drawings and specifications, is likely to be actually executed by other employees of the design professional's organization. Although contract administration is probably less personal than design, the client will still probably expect that the principal contract

administration decisions will be made, if not by the person with whom it has dealt, at least by another principal in the design professional organization. However, just as in design, the client is likely to realize that the person who has overall responsibility will not actually perform every aspect of contract administration. (As to interpretations and disputes, see Section 29.06.)

These conclusions can depend on the client's knowledge of the size and nature of the design professional's organization. They may also depend on whether the client has ever dealt with design professionals before and whether it knew of the division of labor among principals, employees, and consultants.

B. Outside Design Professional's Organization: Consultants

Because of the complexity of modern construction, the high degree of specialization, and the proliferation of licensing laws,¹⁰⁶ design professionals frequently retain consultants to perform certain portions of the services they have agreed to provide. Although the principal legal issues have been whether consultant fees are additional services not covered by the basic fee¹⁰⁷ and whether the design professionals are responsible for the consultants they hire—a point to be mentioned later in this subsection—inquiry should be directed initially to whether the design professional can use a consultant to fulfill the obligations owed the client.

Clients generally prefer that highly specialized work be performed by highly qualified specialists, often outside the design professional's organization. Suppose, though, the client insists that all design services be performed within the design professional's organization. The client may believe that it would not be able to hold the design professional accountable if the consultant did not perform properly. In such a case, the client might feel at a serious disadvantage if forced to deal with or institute legal action against a consultant it has not selected and with whom it has no direct contractual relationship. Clearly, the client can insist on this in the negotiations, and the contract could so provide. But suppose nothing is discussed or stated specifically in the agreement.

It is unlikely that any client who is or should be aware of the customary use of consultants for certain types of

¹⁰³New variations on these business organizations are limited liability partnerships (LLPs) and limited liability companies (LLCs). See Section 3.06.

¹⁰⁴The term *principal* is defined as a partner in a partnership or a person with equivalent training, experience, and managerial control in a corporation.

¹⁰⁵For discussion of the effect of licensing laws on who is permitted to do the work, refer to Section 10.05A.

¹⁰⁶See Section 10.02.

¹⁰⁷See Sections 12.01 and 13.01G.

work can insist on consultants not being used. Standard contracts published by professional associations contain language relating to professional consultants. Such language usually does not directly relate to the question of whether consultants may be used but deals indirectly by providing that certain consulting services are covered under the basic fee and others are additional services. Inclusion of such language should indicate to the client the likelihood that some consultants will be used and that possibly others will be used if the client consents.

One person can be held liable for the wrongdoing of another. The most common example is the liability of an employer for the negligent acts of its employee committed in the scope of employment. Although many reasons exist for vicarious liability, one reason sometimes given is that the employer controls or has the right to control the details of the employee's activities.

If the negligent actor is not controlled or subject to the control of the person who has hired the actor, the actor is an independent contractor and not an employee. Subject to many exceptions, the employer of an independent contractor is generally not liable for the negligence of the latter. For example, the businessperson who hires an independent garage to service its fleet of trucks generally will not be held liable for the negligence of the garage. An opposite result would follow if the businessperson had a repair service as part of its organization.

Generally the consultant is an independent contractor. As a rule, the consultant is asked to accomplish a certain result but can control the details of how it is to be accomplished. If an architect retains a structural engineer as a consultant, the latter's negligent conduct that causes injuries to third persons will generally not be chargeable to the architect.

The client who retained the architect is not a third party in the same sense. Permitting the architect to use a consulting engineer as a substitute to perform certain portions of the work should not relieve the architect of responsibility to the client for proper performance of that work. The architect's obligation to the owner is based on their contract.¹⁰⁸

¹⁰⁸*Harold A. Newman Co. v. Nero*, 31 Cal.App.3d 490, 107 Cal. Rptr. 464 (1973). Similarly, see *South Dakota Bldg. Auth. v. Geiger-Berger Assoc.*, 414 N.W.2d 15 (S.D.1987) (architect denied indemnification against consulting engineer because it fixed its seal to the engineer's drawings and it failed to comply with its contractual obligations to prepare architecturally sound plans), and *Brooks v. Hayes*, 133 Wis.2d 228, 395 N.W.2d 167 (1986) (prime liable to owner for negligence of subcontractor even though latter was independent contractor).

A trilogy of consultant cases decided by the Supreme Court of Oregon are instructive. The first, *Scott & Payne v. Potomac Insurance Co.*,¹⁰⁹ involved a claim by an owner against an architect based on failure in the heating system that the owner claimed was caused by defective design. The architect's insurer refused to defend, claiming that the negligent act occurred in a period not covered by the policy. The architect settled the claim and brought an action against his insurance company when it refused to reimburse him. To recover, the architect found himself in the strange position of claiming he was liable. One argument made by the insurer was that the architect was not negligent because he relied on the advice of a heating engineer. In rejecting this argument, the court stated that the architect should possess skill in all aspects of the building process and cannot shift responsibility to a consultant.

The second case in the trilogy was *Johnson v. Salem Title Co.*¹¹⁰ in which an injured third party sued an architect when a wall defectively designed by the consulting engineer collapsed. The court concluded that the engineer was an independent contractor, which would normally give the architect a defense. However, the court held the architect liable because of an exception to the independent contractor rule for nondelegable duties created by safety statutes. In this case, the architect was required to comply with building codes, and this duty could not be delegated to the engineer. By nondelegation, the court did not mean that the architect could not use the engineer to fulfill code requirements but meant that the architect could not divest himself of ultimate responsibility if the code were not followed.

The action was brought not by the client against the architect but by an injured party. Had the action been brought by the client for its losses, the independent contractor rule would not have been relevant.

The third case in the Oregon trilogy, *Owings v. Rosé*,¹¹¹ involved the owner suffering a loss when the floor cracked because of defective design by the consulting engineer. In passing on the indemnity claim, the court stated that the architect was liable to the owner on the basis of *Scott & Payne v. Potomac Insurance Co.*¹¹²

¹⁰⁹17 Or. 323, 341 P.2d 1083 (1959).

¹¹⁰246 Or. 409, 425 P.2d 519 (1967).

¹¹²Supra note 109.

Prime design professionals can exculpate themselves from liability to clients for errors of their consultants. One method—a novation—is a tripartite contract under which the consultant is substituted for the prime design professional for that part of the work. Another is to seek and obtain from the client exculpation from any responsibility for the conduct of the consultants. This is more likely to be obtainable if the client designates that particular consultants be used. It does not seem unreasonable for the principal design professional in such a case to seek exculpation from the client.

Following this approach to its logical extreme, the principal design professional can suggest or insist that the client contract directly with consultants. Clearly, this would relieve the principal design professional unless she had information regarding the consultant that should have been communicated to the owner. Although this approach is often used in retaining geotechnical engineers, principal design professionals frequently prefer to keep overall professional control and are not anxious for clients to contract separately with consultants.¹¹³

It is likely that the principal design professional will not be relieved from liability to the client for the acts of consultants. Probably the best the principal design professional can do is to ensure that the consultant is obligated to perform in an identical manner to the principal design professional's obligation to the client. The principal design professional must consider the financial responsibility of consultants. Having a good claim against a consultant may be meaningless if the consultant is not able to pay the claim. The principal design professional should undertake an investigation of the financial capacity of consultants employed. If the consultant is a small corporation, the principal design professional should bind the individual shareholders to the contract so that they are personally liable. The principal design professional probably should require that the consultant carry and maintain adequate professional liability insurance.

Does the consulting engineer assume the risk of not being paid if the principal design professional—the architect—is not paid by the client? See Section 12.03G.

¹¹³Even if the owner retained the consultant, the architect must exercise due care in relying on that consultant's report. *Kerry, Inc. v. Angus-Young Assocs.*, 280 Wis.2d 418, 694 N.W.2d 407 (App.), review denied, 286 Wis.2d 98, 705 N.W.2d 659 (2005).

SECTION 12.11 Ownership of Drawings and Specifications

Who owns—or, more properly, who has use rights of—the tangible manifestations, usually written but increasingly computer generated, created by the design professional and necessary to build the project?

Clients sometimes contend, and many agencies of state and local government insist, that the party who pays for the production of drawings and specifications should have exclusive right to their use.¹¹⁴

However, design professionals contend they are selling their ideas and not the tangible manifestations of these ideas as reflected in drawings and specifications. This, along with the desire to avoid implied warranties to which sellers of goods are held, is the basis for calling the tangible manifestations “instruments of service.” Design professionals contend that the subsequent use of their drawings and specifications may expose them to liability claims. If another design professional completes the project, the original designer may be denied the opportunity to correct design errors as they surface during construction. Design professionals contend that most projects are one of a kind and that in reality design is a trial-and-error process. Similarly, liability exposure can result if the design is used for an addition to the project, or a new project, for which it may not be suitable. Even if the design professional is absolved, absolution may not come until after a lengthy and costly trial.¹¹⁵ (As discussed later in this section, this risk can be dealt with by indemnification.) In addition, reuse without adaption may compromise the aesthetics or structural integrity of the original design.

Another reason a design professional may wish to retain ownership of the design is to receive credit as an author and to protect her professional reputation whenever her

¹¹⁴A Louisiana statute specifies that all plans, designs, and specifications “resulting from professional services paid for by any public entity shall remain the property of the public entity.” La.Rev.Stat § 38:2317. The State of Georgia has considered creating “stock” plans to be used on all school construction projects at an anticipated savings of nine million dollars annually in architectural fees. See Roberts, *After the Ball: Subsequent Use of Construction Documents After the Project for Which They Were Originally Prepared: A Sketchy Area of the Law*, 17 Constr. Lawyer No. 2, April 1997, p. 35.

¹¹⁵See *Kama v. Byron Reed Syndicate*, 374 F.Supp. 687 (D.Neb.1974) (designer absolved when project's use unforeseeably changed). See also West Ann.Cal.Bus.&Prof.Code § 5536.25(a), which gives the architect a defense if her design is changed without her approval.

creative works are displayed to the public.¹¹⁶ In addition, employees of the architect want recognition for their work. Draftspeople, project designers, and others often wish to make copies of their work to show prospective employers and clients.¹¹⁷ Perhaps most important to design professionals is that the actual use by the owner is an important factor in determining the value of design professionals' services and, correspondingly, their fee—a factor recognized by the frequent use of the percentage of construction cost to determine compensation. (See Section 13.01B.) Had the design professional known that drawings and specifications would be used again, a larger fee would have been justified.¹¹⁸

In the absence of any specific provision in the contract dealing with reuse, the client who has paid for the services has the exclusive right to use the tangible manifestations of the design services performed by design professional. Although cases are rare, this result stems from the analogy to a sale of goods. In ownership terms, the client “owns” the drawings and specifications.¹¹⁹

Suppose a design professional establishes a custom that drawings and specifications belong to the person creating them and that the client is allowed their use only for the particular project. The client would not be bound by it

¹¹⁶By way of contrast, Peter Eisenman, architect of the Wexner Center for the Arts in Columbus, Ohio, has reportedly expressed another view. “My feelings about buildings is this: You make it and you give it to the client and it is theirs. They can tear it down for all I care.” *Wall Street Journal*, p. W14 (July 13, 2001).

¹¹⁷Ellickson, *Ownership of Documents: Does It Matter Who Owns the Drawing or the Design?* AIA Documents Supplement Service, July 1991, at 1–4.

¹¹⁸*Garcia v. Cosicher*, 504 So.2d 462 (Fla. Dist. Ct. App.), review denied, 513 So.2d 1060 (Fla. 1987) (contract provided for repeat fees in event of owner reuse).

¹¹⁹Leading commentators early in the twentieth century were in agreement that architectural plans, paid for by the owner, are the property of the owner, notwithstanding assertions of a contrary custom in the architectural community. See J. WAIT, *ENGINEERING AND ARCHITECTURAL JURISPRUDENCE* § 815 (1907) and C. BLAKE, *THE LAW OF ARCHITECTURE AND BUILDING* 90 (1916) (“[U]nless there be a specific provision in the contract whereby it is agreed that the plans are to be and remain the property of the architect, they must be legally considered, it seems, as the property of the employer who has ordered, accepted, and paid for them.”). However, both commentators cite rather obscure case law in support of this proposition, such as *Windrim v. City of Philadelphia*, 9 Phila. 550, 552, 1872 Westlaw 15115 (Pa. Com. Pl. 1872).

unless it knew or should have known of such a custom.¹²⁰ It has been held that an AIA design services document supports the establishment of a custom that in the architectural profession the architect retains ownership of the plans unless there is an express agreement to the contrary.¹²¹

In both of the cases referred to in the preceding paragraph, the architect retained the original blueprints, and the owner (in *Meltzer*) or contractor (in *Aitken*) were provided copies. Retention by the architect of the physical plans may indicate that they are her personal property, and a person is not entitled to take or use the plans without the architect's consent. However, in *Sokoloff v. Harriman Estates Development Corporation*,¹²² the New York Court of Appeals (that state's highest court) granted the homeowners “specific performance”—a court order—requiring their design/build contractor to turn over to them the design the contractor had obtained from an architect. (The owners had decided not to proceed with construction with the contractor when its low bid greatly exceeded their budget.) The owners had argued successfully that the architectural plans were unique, and that specific performance was warranted because the plans were based on a design conceived by them.

Consecutive editions of the AIA documents have shown increasing attention to the issue of ownership of the design documents. In B141-1987, Paragraph 6.1, the design and other documents prepared by the architect are instruments of service and the architect is described as the author. The owner could not use the design on other projects without agreement with and compensation of the architect.

This simple scheme was greatly expanded in B141-1997, Paragraph 1.3.2. The documents covered include those prepared by consultants and created in electronic format. The architect and consultants are owners of their respective instruments of service. The owner is given a nonexclusive license to reproduce the documents for the purpose of building, using, and maintaining the project. The owner cannot use the documents on another project without the architect's permission. Unauthorized use of the documents is at the owner's risk and without liability to the architect. A201-1997, Paragraph 1.6.1, provides similar protection to the architect and her consultants and provides methods for handling the instruments of service.

¹²⁰*Meltzer v. Zoller*, 520 F.Supp. 847, 856 (D.N.J. 1981).

¹²¹*Aitken, Hazen, Hoffman, Miller, P.C. v. Empire Constr. Co.*, 542 F.Supp. 252, 261 (D.Neb. 1982).

¹²²96 N.Y.2d 409, 754 N.E.2d 184, 729 N.Y.S.2d 425 (2001)

B101-2007 addresses instruments of service in Article 7. Under Section 7.2, the architect and her consultants are deemed the authors and owners of their respective instruments of service. Documents in electronic format, mentioned in 1997, are not referred to in 2007. Under Section 7.3, the architect grants the owner a nonexclusive license to build, alter, or maintain the project. If the owner uses the documents without employing the architect, the owner will hold the architect harmless against any liability. The owner cannot assign or grant the nonexclusive license to another party without the architect's prior written consent, and unauthorized use is at the owner's sole risk. A201-2007, Section 1.5.2, addresses the use of the instruments of services by the contractor, subcontractors, and material or equipment suppliers.

The relationship between contractually created use rights and copyright law will be discussed in Section 16.04D.

Legitimate reasons exist for giving the design professional exclusive right to reuse the drawings and specifications, mainly on the basis of use determining value of the professional services. Yet the prohibition against the client's using the materials for additions to or for completing the project can be looked on as a device to discourage the client from retaining a new architect or at least to make the client pay compensation if it replaces the original architect. It is as if an implied term of the original retention agreement gave the design professional an option to perform any additional design services required by an addition to the original project. Hiding such "options" in the paragraph dealing with ownership of drawings and specifications can make courts suspicious of the fairness of such standardized contracts.¹²³

The Engineers Joint Contracts Documents Committee (EJCDC), a consortium made up of the Professional Engineers in Private Practice, a division of the National Society of Professional Engineers, the American Council of Engineering Companies, and the American Society of Civil Engineers, published an edition of its standard form of agreement between owner and engineer for professional services in 2002. In this document, E-500, Paragraph 6.03 is headed "Use of Documents." Paragraph 6.03E states that the documents are not intended to be suitable for reuse on extensions

of the project or on any other project. The owner who uses the documents without written verification or adaptation by the engineer does so at its own risk and will indemnify and hold harmless the engineer or her consultants from claims and other expenses, including attorneys' fees relating to this use. Any verification or adoption entitles the engineer under Paragraph 6.03F to further compensation at "rates or in an amount to be agreed upon by Owner and Engineer."

The EJCDC also deals more extensively with electronic data generated. For example, Paragraphs 6.03B and C deal with electronic data furnished by the owner to the engineer and the engineer to the owner. Such data are furnished for the convenience of the recipient but only the hard copies may be relied upon. Any conclusion or information from such data is "at the user's sole risk." Under Paragraph 6.03B if there is a discrepancy between "electronic files and hard copies, the hard copy governs." Finally, Paragraph 6.03C deals with the possible deterioration of data stored in electronic media format, and Paragraph 6.03D covers transferring of documents in electronic media format.

The EJCDC is slated to publish a new version of E-500 in 2008. That new edition must be examined to determine the EJCDC's most current approach to this issue.

The EJCDC's concern with the interface between electronic and written data is well merited. Digital technologies that increasingly are used to create the design may well have the effect of redefining the basic relationships between designer, contractor, and owner. For example, when subcontractors and suppliers electronically participate in the creation of the original design components, who at that point is the overall "designer" of the project? In addition, the ease with which electronic data may be altered (without leaving a "paper trail") raises concerns as to what constitutes the actual design. (The EJCDC's response is that the hard copy governs if it conflicts with the electronic version.) These issues (and others) undermine the basic concept of ownership so vital to the AIA's idea of the design as the architect's "instruments of service." A recent article compared the adequacy of the AIA A201-1997 Paragraph 1.6.1 in light of these technological changes:

The "Ownership of Documents" clause will have to be rethought in the digital age. For one thing, it completely ignores intellectual property rights in those portions of project documentation that are furnished by or through the Contractor or subs. In a collaborative design process, is the entire project database a joint work, in which the copyright is

¹²³*Foad Consulting Group, Inc. v. Azzalino*, 270 F.3d 821, 829, n. 12 (9th Cir. 2001) and *Eiben v. A. Epstein & Sons International, Inc.*, 57 F.Supp.2d 607, 612, n. 5 (N.D. Ill. 1999) (interpreting earlier AIA language).

owned by many participants or are different parts of the database owned by different parties? If portions of the Architect's contribution consist of digital "objects" imported from third party sources, to what extent is the Architect the compiler of a collective work rather than the author of an original work? With respect to control of multiple copies, there will be myriad digital files maintained in multiple storage media, not simply "one record set" retained by the Contractor. The Contractor will probably not be able to "suitably account for" all of these files to the Architect at the end of the Project. What will the "statutory copyright notice" look like in a collaboratively-generated 3D or 4D electronic file?¹²⁴

Returning to more conventional technologies, even if the design professional obtains ownership of the design documents, the owner may have a statutory right to use them. For example, in 1992 the California legislature enacted legislation providing that in the event of damage covered by insurance to a single-family home as a result of a declared natural disaster, the architect must release a copy of the plans to the homeowner's insurer or to the homeowner on request and verification that the plans will be used solely for verifying the fact and amount of damage for insurance purposes. Under this legislation, the homeowner cannot use the plans to rebuild without the prior written consent of the architect. If the architect does not consent, the architect who has drafted the original plans and released them is not liable for any property damage or personal harm if the plans are subsequently used by the owner to rebuild all or a part of the residence.¹²⁵

Are there any limitations on the design professional's right to reuse the drawings and specifications? Suppose the design professional plans to use the documents to build an identical residence near the completed residence that would diminish the exclusivity of the original residence. Although the owner could obtain exclusivity by contractual protection, as done in the Trump Plaza contract noted later in this section, this event is rarely anticipated in the negotiations. It is likely that the law would imply a promise by the design professional not to reuse the drawings and

specifications in any way that would significantly diminish the value of the original residence.

The AIA reports that Donald Trump obtained an out-of-court settlement against his architect barring the architect and a competing developer from using the design of Trump Plaza in developing a site one block south of the plaza. According to the AIA, the written agreement stated that the drawings were not to be used for any other buildings, although it allowed the architect to retain ownership of the drawings. The settlement required changes in the façade of the second building to distinguish it from Trump Plaza.¹²⁶

This section has dealt with contractual provisions designed to protect the design professional's exclusive right to use the documents she has prepared. Claims by design professionals may have other substantive bases. As noted in Sections 16.03 and 16.04, a design professional, as author, can be given federal copyright protection. In some jurisdictions, unauthorized use by a third party may be a tortious conversion, which can be the basis for a claim.¹²⁷ Remedially, generous protection is provided by the federal copyright law, as seen in Section 16.04D. If the claim is based on a breach of contract, in addition to a possible injunction (also permitted under the federal copyright law), the design professional would be able to recover the market value of her services that have been used improperly by the defendant—very likely the cost of producing the documents. A claim based on the tort of conversion would be more expansive than one based on breach of contract. The remedy could include not only the cost to prepare the documents but also, in the case of an intentional conversion, any enrichment or benefit the defendant has received as a result of the conversion and, under extreme circumstances, punitive damages.

The discussion to this point has assumed that the architect or engineer was an independent contractor hired by the owner. But on the increasingly popular design-build projects, discussed in Section 17.04F, the contractor, not the owner, retains the architect. Who owns the design documents on a design-build project, the designer or the contractor? This question is resolved under the work for hire doctrine. If the designer was an employee of the contractor, and the design was created within the scope of the employment, then the design would be a work for hire and the employer/contractor would be the owner of the documents.¹²⁸

SECTION 12.12 Time

If no specific provision deals with time for performance, the parties must perform within a reasonable time. However, the cooperative nature of design, the client providing a program, and the design professional creating a design subject to client approval make it difficult to determine who is responsible for delay. Delay may be caused by public officials failing to move the administrative process along or by lenders deciding whether to make a loan. Even if a schedule is created, it is likely to require frequent adjustment.

For these reasons, claims for a delay during design are difficult to sustain. For delays in contract administration, claims are more likely to be made by contractors. This is dealt with in Section 26.10.

Starting in 1977, the AIA included language in B141 dealing with scheduling of design services. Document B101-2007, Section 2.2, requires the architect to perform services as “expeditiously as is consistent with the professional skill and care and the orderly progress of the project.” Section 3.1.3 requires the architect to submit a schedule for the owner’s approval. The schedule may be adjusted as necessary and must allow time for owner review, performance by the owner’s consultants, and approvals by public authorities. Time limits may not be exceeded by either party “except for reasonable cause.”

There is much fluidity in performing design work. It is unlikely that any schedule will be the basis for a successful claim. Yet the mere existence of a schedule approved by both parties should help move the process along.

SECTION 12.13 Cessation of Services: Special Problems of the Client–Design Professional Relationship

A. Coverage

Contracts to perform design or construction services are service contracts, and many of the same legal rules apply. Principles discussed in Chapter 33 dealing with construction contracts also apply to contracts for design services. However, some aspects of the client–design professional relationship have generated special legal rules discussed in this section.

B. Specific Contract Provision as to Term

Often contracts specifically define the duration of the contract relationships. However, this rarely exists in contracts to perform design services because of the high likelihood of delay traceable to the large number of participants in the construction process, including not only owners, designers, and contractors but also lenders and public authorities. (See Section 12.12, dealing with time and schedules.)

At the outset, a number of issues must be differentiated. First, when do the contractual obligations between client and design professional end? Second, when does delay in the performance of design services entitle the design professional to additional compensation? Third, when has the design professional’s dispute resolution power ended? The first is discussed in this section, the second in Section 13.01G, and the third in Section 29.05.

Usually the design professional’s services are divided into phases. Because the construction phase is last, it is the focal point for determining when the client–design professional relationship has terminated. Also, the construction phase is itself divided into segments, principally to enable the contractor to be paid as it works. Phases are important for other purposes as well.

Generally, the owner would like the design professional to perform until the project is “completed.” At this point, the owner takes possession of the work. After that point, except for postcompletion services such as furnishing or reviewing as-built drawings, the owner no longer needs the design professional’s services.

In most construction contracts executed on standard documents published by the professional associations, completion has two stages: substantial and final. AIA Document B101-2007, Section 3.6.1.3, states that the obligation of the architect to provide administration “terminates on the date the Architect issues the final Certificate for Payment.” This end date corresponds to A201-2007, Section 4.2.1, which provides that the architect will perform until she issues the final certificate for payment. Compare these two provisions with B101-2007, Section 4.3.2.6, which entitles the architect to additional compensation if services extend sixty days after substantial completion.

Clearly some time will pass between the dates of substantial and final completion. It is during this time that the contractor performs a so-called punch list of relatively minor items to wrap up the project. But the AIA recognizes

that issuance of a final certificate may be delayed because of the contractor's unwillingness to correct the punch list items. That services performed after the sixty-day period are considered additional may surprise the client.

C. Conditions

A condition is an event that must occur or be excused before a party is obligated to begin or continue performance. Often contracting parties do not wish to begin or continue performance unless certain events occur or do not occur. For example, an owner may not wish to start construction until it has obtained a loan or permit. Design professionals may wish to condition their obligations on their ability to rent additional space or hire an adequate staff. Yet each party may wish to make a binding contract in the sense that neither can withdraw at its own discretion.

A condition that is within the *sole* power of one of the parties may prevent a valid contract from being formed. Such a conclusion is avoided by implying an obligation to use good faith to seek occurrence of the condition. However, the creation of a condition does not affect the validity of the contract as long as the condition is described with reasonable certainty.

In contracts for design services, the client frequently asserts conditions the nonoccurrence of which gives the client power to end the relationship and, depending on the language of the condition, precludes the design professional from being compensated for services rendered before termination.

Sometimes the client asserts that a condition was created though not expressed in the written contract (discussed in Section 12.03C, dealing with costs). Generally, the client can testify as to an oral condition so long as the condition does not directly contradict the written contract or unless the written contract is clearly the final and complete repository of the entire agreement. Even if the condition is expressed in the written agreement, problems of reconciling it with other contractual provisions may exist. *Parsons v. Bristol Development Co.*¹²⁹ is instructive in this regard. The contract provided that a condition precedent to payment by the owner was the owner's obtaining a loan to finance the project. The architect commenced work and was paid part of his fee. He then began to draft

final plans and specifications for the building. However, the owner was unable to obtain a construction loan and abandoned the project.

The owner pointed to the condition in the contract as a basis for its refusal to pay for any unpaid services that the architect had rendered. The architect pointed to language in the contract stating that if any work designed by the architect is abandoned, the architect "is to be paid forthwith to the extent that his services have been rendered." Such language frequently appears in documents published by the AIA and is known as a "savings clause." (In B101-2007, see Sections 9.3 and 9.6.) However, the court interpreted the two apparently inconsistent provisions in favor of the more specific one dealing with the condition of obtaining a construction loan.

The case demonstrates the tendency of courts to construe language against the parties that supplied the language and to protect clients from having to pay for design services when the project is abandoned. Such client protection is based on the understandable reluctance of the client to pay for services that it ultimately does not use. But professionals generally expect to be paid for their work. Fee risks can be taken, but any conclusion that the risk was taken should be supported by strong evidence that the design professional assumed the risk.

Courts facing claims of finance conditions often come to different results depending on the language, the surrounding circumstances, and judicial attitude toward outcomes that either deny any payment for work performed or force a party to pay for services it cannot use.¹³⁰

D. Suspension

Suspension of performance in contracts for design and construction is not uncommon. The owner may wish to suspend performance of either design professional or contractor if it is having financial problems or it wishes to rethink the wisdom of the project. Those who perform services in exchange for money, such as the design professional and the contractor, may wish to have the power to suspend performance if they are not paid. Suspending performance can provide a powerful weapon to obtain

¹²⁹62 Cal.2d 861, 402 P.2d 839, 44 Cal.Rptr. 767 (1965).

¹³⁰Compare *Campisano v. Phillips*, 26 Ariz.App. 174, 547 P.2d 26 (1976) (architect assumed risk), with *Vrla v. Western Mortgage Co.*, 263 Or. 421, 502 P.2d 593 (1972) (architect recovered).

payment for work that has been performed. Also, suspending performance reduces the risk that further performance will go uncompensated.

The common law did not develop clear rules that allowed suspension. The performing party either must continue performing or under proper circumstances could discharge its obligation to perform.

An interim remedy—suspension—was not well recognized until states adopted the Uniform Commercial Code, beginning in the early 1950s. Section 2-609 of the code allowed a party to a contract involving goods to demand assurance under certain circumstances and withhold its performance until reasonable assurance was provided. This doctrine has carried over to contracts that do not fall within the jurisdiction of the Uniform Commercial Code, such as those that involve design or construction.¹³¹

Contracts for design services frequently include provisions granting the client the power to suspend the performance of the design professional. Usually such clauses give the design professional an immediate right to compensation for past services and a provision stating that suspension will become a termination if it continues beyond a certain period. If the design professional has enough bargaining power, she will seek to include a provision stating that she can suspend if she is not paid and that if suspension continues for a designated period, she can terminate her performance under the contract. Because of the uncertainty of the common law as to suspension, it is desirable to include specific provisions granting this power to either party.

Document B101-2007, Section 9.2, gives the owner the power to suspend the architect's performance. If suspension continues for more than thirty consecutive days, the architect is paid for past work. If work is resumed, she is paid for "expenses incurred during the interruption and resumption." Also, fees and schedules are "equitably adjusted." Under Section 9.3, suspension for over ninety consecutive days gives the architect the power to terminate.

B101-2007, Section 9.1, gives the architect the power to suspend or terminate if the owner fails to make payment. The election to suspend is effective after seven days' written notice to the owner. The seven-day period allows for cure by the owner and continuation of performance. Before resuming services, she must be paid "all sums due." Fees and time are "equitably adjusted."

¹³¹Restatement (Second) of Contracts, § 237, illustration 1, §§ 251, 252 (1981).

E. Abandonment

Because of the uncertainties inherent in the construction process, project abandonment is not rare. When it occurs, some clients refuse to pay for services that have been performed by their design professional. Sometimes, as seen in the *Bristol* case described in Section 12.13C, the client points to language in the contract or an oral agreement under which the design professional forfeits her compensation in case of project abandonment.

In the absence of any contract provision giving the owner the power to abandon or any common law power to abandon based on changed circumstances or frustration of purpose, abandonment by the client is a breach of contract. The design professional is entitled to recover for the work she has performed and to any profit that would have been earned had the work been performed, if that can be established. See Section 27.02E. For that reason, contracts usually deal with abandonment, the client usually wishing to reduce its exposure if it does abandon and the design professional wishing to protect her right to be paid for work performed if there is an abandonment.

Document B101-2007 eliminated abandonment in favor of more detailed coverage of suspension and insertion of Section 9.5, which gives the owner the power to terminate for its own convenience.

F. Termination Clauses

Contracts frequently contain provisions under which one or both parties can terminate their contractual obligations to perform. Termination does not necessarily—nor usually—extinguish any claim either party may have for the other's failure to perform. Termination clauses vary. Some provide that one party can terminate if the other commits a serious breach of the contract. Some allow termination powers for any breach, a method intended to foreclose any inquiry into the seriousness of the breach. However, such a power can be abused. For that reason, careful judicial inquiry is likely to be made into the way in which the contract was made. If such a clause would operate unfairly, at the very least it will be interpreted against the stronger party to the contract and may be found unenforceable.

Some contracts provide that either party can terminate by giving a specified notice without any need to show that the other party has breached the contract. This

codifies what the common law called “contracts at will,” under which the contract regulates rights and duties of the parties only as long as both wish to continue. For a close, confidential relationship, such as one created when a design professional is retained by a client, such a provision may be reasonable.

However, AIA Document B101-2007, Section 9.4, is a “default” termination clause requiring a substantial failure to perform through no fault of the terminating party. As shown in Section 12.13H, the owner’s failure to make payments is considered substantial nonperformance and cause for termination. Section 9.5 allows the owner to terminate for its convenience.¹³²

Remedies for breach of contract will be discussed in Section 12.14C. Generally the law allows the parties to provide contractual remedies for breach of contract. AIA Document B101-2007 provides for remedies in the event of a breach by the owner. Section 9.6 gives the architect payment for services performed and not yet paid for and reimbursement for certain expenses incurred prior to termination. It also allows termination expenses set forth in Section 9.7. These include expenses for which the architect has not been compensated and profit on services not performed.

Termination of a contract can result from a material breach without any specific power to terminate. Although the same result may not be reached in every jurisdiction, it is likely that a contractual termination clause will not be exclusive and will not limit any common law right to terminate.¹³³

In that regard, note that AIA Document A201-2007, Section 13.4.1 states that remedies provided in the contract do not supplant or preempt common law remedies. There is no comparable provision in B101-2007. This could mean that termination remedies provided by contract in B101-2007 *do* preempt common law remedies. Usually, though, preemption requires clear language to that effect. But the expansion of remedies seen in B101-2007, Section 9.7, seems to finesse the preemption possibility.

Default termination clauses often specify that the breaching party be allowed time to cure any default. As this opportunity to cure arises more frequently in construction contracts, it is discussed in Section 33.03F.

Termination clauses often require written notice of termination. For example, AIA Document B101-2007, Section 9.4, allows termination “upon not less than seven days’ written notice.” Although it is clear that termination does not actually become effective until expiration of the notice period, it is not always clear what the rights and duties of the contracting parties are during the period between receipt of notice and the effective date of termination. This may depend on the purpose of the notice.

The notice period can serve as a cooling-off device. Termination is a serious step for both parties. If it is ultimately determined that there were insufficient grounds for termination, the terminating party has committed a serious and costly breach. A short notice period can enable the party who has terminated to obtain legal advice and to rethink its position.

If the notice period provides a cooling-off period, performance should continue during the notice period but cease when the notice period expires. Only if the termination is retracted during the notice period should the parties continue performance after the effective date of termination.

If the right to terminate requires a contract breach, notice can have an additional function. It may be designed to give the breaching party time to cure past defaults and provide assurances that there will be no future defaults. If cure is the function of the notice period, actual termination should occur only if the defaults are not cured by the expiration of the notice period. During the notice period, the parties should continue performance. If it appears there is no reasonable likelihood that past defaults can be cured and reasonable assurances given, performance by the defaulting party should continue only at the option of the party terminating the contract. The latter should not be forced to receive and perhaps pay for substandard performance.

Probably the principal purpose of a notice is to wind down the work to allow the parties to plan new arrangements made necessary by the termination. A short continuation period can avoid a costly shutdown of the project or the unavoidable expenses that can result if the design professional must stop performance immediately. The notice period can enable the client to obtain a successor design professional while retaining the original

¹³²This is dealt with in a construction contract context in Section 33.03B.

¹³³*North Harris County Junior College Dist. v. Fleetwood Constr. Co.*, 604 S.W.2d 247 (Tex.Ct.App.1980) (dictum). Cf. *Glantz Contracting Co. v. General Elec.*, 379 So.2d 912 (Miss.1980).

professional for a short period. It can also enable the design professional to make workforce adjustments, get employees back to home base, cancel arrangements made with third parties, and allow time to line up new work for employees.

If making adjustments is the principal reason for the notice period, each party should be able to continue performing during the notice period. However, if relations have so deteriorated that continued performance would likely mean deliberately poor performance by either or both parties during the notice period, neither should be compelled to perform during the notice period. Certainly work that cannot be finished before the effective date of termination should not be begun.

Contracting parties should decide in advance what function the notice period is to serve and what will be the rights and duties of the parties during this period. Once this determination is made, the contract should reflect the common understanding of the parties, and any standardized contracts should be modified accordingly.

G. Material Breach

Commission of a material (that is, serious) breach empowers the other party to terminate the contract. Whether a breach is material will depend on a number of factors discussed in Section 33.04A. Generally, a material breach by the client is an unexcused and persistent failure to pay compensation or cooperate in creating the design. A material breach by the design professional is likely to be negligent performance or excessive delays. As in construction contracts, termination of contracts to perform design services—the principal problem involving client abandonment of the project—is relatively rare.

H. Subsequent Events

Contract law normally places the risk of performance being more difficult or expensive than planned, on the party promising performance. But sometimes after the contract is made events go far beyond the assumptions of the parties at the time of contract making. If so, the law will relieve a party who is affected by these events unless the contract clearly allocates this risk to the performing party. This is more commonly a problem in construction contracts and is dealt with in Section 23.05A. However, the highly personal nature of the performance of design

services makes it important to discuss one problem that infrequently surfaces in the performance of construction contracts, as follows.

Suppose a key person is no longer available to perform professional services. Is that person's continued availability so important that her inability to perform—because of either disability, death, or an employment change—will terminate the contract? The issue usually arises if the client wishes to terminate its obligation because a key design person is no longer available. That key person can be the sole proprietor, a partner, or an important employee of a partnership or professional corporation.

Contract obligations generally continue despite the death, disability, or unavailability of people who are expected to perform. Only in clear cases of highly personal services will performance be excused.

Unavailability of key design people can frustrate contract expectations. For example, in the absence of a contrary contractual provision, the death of a design professional who is a party to the contract, such as a sole proprietor or partner, will terminate the obligation of each party. The personal performance of that particular design professional was very likely a fundamental assumption on which the contract was made. A successor to the design professional can, of course, offer to continue performance, and this may be acceptable to the client. However, continuation depends on the consent of both successor and owner. Without agreement, each party is relieved from further performance obligations.

Suppose the person expected to actually perform design services is an employee of a large partnership or professional corporation. That person's unavailability may still release each party, but it would take stronger showing that the unavailable design professional was crucial to the project and that her continued performance was a fundamental assumption on which the contract was made.

The parties should consider the effect of the unavailability of key design personnel and include a provision that states clearly whether the contract continues if that person dies, becomes disabled, or for any other reason becomes unavailable.

AIA Document B101-2007, Section 10.3, binds owner and architect and their successors to the contract. Under this obscure language it appears that the parties contemplate successors stepping in if for some reason a contracting party, such as the architect, can no longer perform. This appears to require that the client continue dealing

with the partnership if the partner with whom the client had originally dealt dies, becomes disabled, or leaves the partnership.

Continuity may be desirable. However, the close relationship required between design professional and client may mean that the client does not wish to continue using the partnership if the person in whom it had confidence and with whom it dealt is no longer available. Similarly, a successor may not want to work for the client. Specific language should be included dealing with this issue.

I. The Lender's Perspective

In the course of constructing the project, the owner may have difficulty paying its construction loan. If so, two events can occur. First, the owner defaults and the lender may decide to take over the project to salvage something from the financial disaster. Second, cutting off the money flow may give the design professional, usually the architect, the power to terminate her obligation to perform further under the contract.

It may be important to the lender to keep the architect on the project. The architect may no longer wish to continue performing or may believe she is entitled to additional compensation. Even if the lender can persuade the architect to continue and even if the renegotiation is successfully completed, costly delay is likely to result.

The lender would prefer as part of the takeover to receive an assignment of the owner's rights to the architect's services without the need for renegotiation. However, either the law or a contractual provision barring assignment without the architect's consent may make this course of action unavailable.

In 1997 the AIA sought to meet these lender concerns. It added to its general nonassignment clauses, B141-1997, Paragraph 1.3.7.9, an exception for an "institutional lender providing financing for the Project." This exception was continued in B101-2007, Section 10.3, "if the lender agrees to assume the Owner's rights and obligations under this Agreement." Such a lender can take an assignment by the owner of the architect's contract without the consent of the architect. In such a case the lender agrees to assume all the owner's obligations under the contract. A similar provision in the construction contract is found in A201-2007, Section 13.2.2. Neither provision makes clear that the assignee (the lender) must pay any amounts owed the architect or the contractor. Although the lender must

agree to assume the obligations of the owner, it is not clear whether this covers only future obligations but not those that arose in the past. It is likely that neither the architect nor the contractor will work for the lender without being paid unpaid bills.

SECTION 12.14 Judicial Remedy for Breach: Special Problems of the Client-Design Professional Relationship

A. Coverage

Basic judicial remedies for contract breach were discussed in Chapter 6. Chapter 27 discusses claims in the context of the construction contract. This section applies basic legal doctrines to special problems found in the relationship between client and design professional.

B. Client Claims

The principal claims that clients make against professionals relate to defective design. A breach of contract by the design professional entitles the client to protect its restitution, reliance, and expectation interests. (Refer to Section 6.05.)

Although clients occasionally seek to protect their restitutionary interest by demanding return of any payments made, the principal problem relates to the client's expectation interest. If the project is designed defectively, the client is entitled to be put in the same position it would have been had the design professional prepared a proper design. The first issue that can arise is whether the client can measure its expectation loss by proving the cost of correcting the defective work or whether it is limited to the difference between the project as it should have been designed and the project as it was designed. Claims against contractors that involve this issue are discussed in Sections 22.06B and 27.03D.

This issue can be demonstrated by looking at *Bayuk v. Edson*.¹³⁴ In this case, the owner complained about faulty design consisting of, among other things, an improperly designed floor, closets too small, outside doors constructed for a milder climate than where the house was built and of an unusual type that could not be constructed by artisans

¹³⁴236 Cal.App.2d 309, 46 Cal.Rptr. 49 (1965).

in the area, unaesthetic kitchen tile, sliding doors that did not fit properly in their tracks, and a fireplace that became permanently cracked.

A number of witnesses testified that it would not have made economic sense to repair the defects. One witness testified that tearing out and repairing would cost more than the cost of rebuilding the house in its entirety. The plaintiff produced an expert real estate appraiser who fixed the value of the house without the defects at \$50,000 to \$60,000 and with the defects at \$27,500 to \$31,500. The trial court awarded a judgment of \$18,500, the least of the possible remainders. This was affirmed by the appellate court.

Suppose, however, that it would not have been economically wasteful to correct the defective work. This would entitle the owner to the cost of correction. In claims against a design professional for improper design, application of this standard involves the betterment rule, based on the cost of correction sometimes unjustly enriching the owner. For example, in *St. Joseph Hospital v. Corbetta Construction Co., Inc.*,¹³⁵ the hospital sued its architect, the contractor, and the supplier of wall paneling that had been installed when it was disclosed that the wall paneling had a flame spread rating some seventeen times the maximum permitted under the Chicago Building Code.

After the hospital had been substantially completed, it was advised that it could not receive a license because of the improper wall paneling. The city threatened criminal action against the hospital for operating without a license. The hospital removed the paneling and installed paneling that met code standards. The jury awarded \$300,000 for removal of the original paneling and its replacement by code-complying paneling and an additional \$20,000 for architectural services performed in connection with removal and replacement.

In reviewing the jury award of \$320,000, the appellate court noted that had the architect complied with his obligation to specify wall paneling that would have met code standards, the construction contract price for both paneling and cost of installation would have been substantially higher. The court stated that the hospital should not receive a windfall of the more expensive paneling for a contract price that assumed less expensive paneling.

The paneling that should have been specified together with installation would have cost \$186,000, whereas the paneling specified with installation cost \$91,000. This, according to the court, should have reduced the judgment by \$95,000. The court reduced the award an additional \$21,000 for items installed when the panels were replaced that were not called for under the original contract. As a result, the judgment was reduced some \$116,000.

That awarding the full cost of correction would put the client in a better position than it would have been had there been full performance is an affirmative defense that must be established by the design professional. The design professional must show that the owner would have proceeded with the project at the same site and under the same conditions regardless of the increased cost.

A variation of the betterment rule is one sometimes called the *extended life rule* or *added value*. For example, if a roof must be replaced after the repairs turn out to be ineffective, the client has received a new roof instead of a roof that would have used up some of its useful life value. If the design professional can prove that the client now has an asset with an extended life value, this can be deducted from the damages.

Under either the betterment or the extended life rule, the client is entitled to any additional cost incurred because the corrected work has taken place after the initial work has been performed if the price for the cost of correction has increased.

Although the betterment and extended life rules have a logical attractiveness, they are not always applied, particularly if the party who must pay for the cost of correction is a consumer or a client of limited financial capacity. In addition, any close questions as to whether the work would have been done and cost incurred originally or as to the extended life value may be resolved in favor of such a client. Similarly, the law sometimes offsets the cost to the client of having to correct a defective condition many years before it would have had to correct this condition had there not originally been a design defect.

Another claim sometimes made by clients is unexcused delay in preparing the design or performing administrative work during construction. Delay can harm the contractor, and most delay disputes are between an owner and a contractor. Claims for delay during the design phase are difficult to establish because of the likelihood of multiple causes. But suppose the project is completed late because of negligence by the architect in passing on submittals of

¹³⁵21 Ill.App.3d 925, 316 N.E.2d 51 (1974). See also *Lochrane Eng'g, Inc. v. Willingham Realgrowth Investment Fund, Ltd.*, 552 So.2d 228 (Fla.Dist.Ct.App.1989), rev. denied, 563 So.2d 631 (Fla.1990); Bales, O'Meara & Azman, *The "Betterment" or Added Benefit Defense*, 26 Constr. Lawyer, No. 2, Spring 2006, p. 14.

the contractor. There are two main damage items. First, the owner will lose the use of its project for the period of unexcused delay. Second, the contractor may make a claim against the owner or design professional for any loss suffered because of delay wrongfully caused by the design professional. (The second claim is discussed in Section 26.10.)

The first damage item, that of loss of use caused by the delay, was before the court in *Miami Heart Institute v. Heery Architects & Engineers, Inc.*¹³⁶ This case demonstrates the liability exposure of design professionals when they have delayed completion of a project without justification. In the case, the architect had agreed to design plans for the building of a new hospital structure that would house patients. During construction, the patients were housed in older buildings on the premises. The architect's failure to comply with code requirements caused a ten-month delay in the issuance of a certificate of occupancy.¹³⁷

The court rejected the contention by the architect that damages for loss of use can be recovered only when there is a delay by the contractor. It also rejected the contention that lost use value can be recovered only if the project itself was to be rented to others. The court concluded that the proper measure of recovery should be measured by the reasonable rental value of the structure during the period of delay.

The court was faced with the fact that the patients who would have been in the new structure were housed in the old structure for the period of the delay. With this in mind, the court concluded that the proper measure of recovery was the difference between the reasonable rental value of the new structure and that of the old structure for the period of delay. The patients were undoubtedly inconvenienced in still being housed in the old structure, and the quality of the medical services may have been poorer than if they had been in the new structure. Yet to establish the actual economic value of such losses would be almost impossible. Of course, some of this may be factored into the reasonable rental value amounts. Clearly, this is one case where it would have been helpful to have

had liquidated damages—(discussed in Section 26.09B, dealing with unexcused delay by the contractor).¹³⁸

There were other claimed damages. The court held that the betterment rule would prevent the owner from recovering for additional expenses incurred to make the building meet code requirements. It noted that the plans called for 2 feet of electrical wire, but proper plans would have required 12 feet of wire. But the owner's expense in purchasing the additional 10 feet cannot be chargeable to the architect. The owner would have incurred this expense regardless of the architect's defective plans.

Finally, the court concluded that the owner could also recover any delay damage claims it paid to the contractors and subcontractors as a result of the architect's breach.

Delay can also cause less direct, or what are sometimes called *consequential*, damages. For example, delay in completing an industrial plant may generate losses caused by the inability of the plant owner to fill the orders of its customers, exposing the plant owner to claims by the customers and causing it to lose profits on the transactions. (Such losses were discussed in Section 6.06.)

AIA Document B101-2007, Section 8.1.3, provides that each party "waives consequential damages . . . due to either party's termination." This is also included in A201-2007, Section 15.1.6. Since Section 15.1.6 is more complex and involved greater controversy, detailed discussion will be postponed until Section 27.06. But it should be noted that in the *Miami Heart Institute* case damages for lost use would not be recoverable nor would the losses caused by delay in completing the industrial plant were such a waiver clause in the contract.

As noted in Section 15.03C, design professionals faced with such losses and having sufficient bargaining power may seek to deal with this problem by limiting the liability of the design professional in such a way as to preclude consequential damages from being recoverable. Clients with strong bargaining power sometimes insist that contracts contain provisions stating that the design professional will be liable for consequential damages. In the absence

¹³⁶765 F.Supp. 1083 (S.D.Fla.1991), aff'd, 44 F.3d 1007 (11th Cir.1994).

¹³⁷The court's opinion in this case was in response to a preliminary dispute relating to the measure of recovery. The opinion made the assumption that the owner can establish that the architect was liable. This had not yet been established.

¹³⁸See *E.C. Ernst, Inc. v. Manhattan Constr. Co. of Texas*, 387 F. Supp. 1001 (S.D.Ala.1974) aff'd in part, vacated in part, 551 F.2d 1026, reh'g granted in part and opinion modified, 559 F.2d 268 (5th Cir.1977), cert. denied sub nom. *Providence Hosp. v. Manhattan Constr. Co. of Texas*, 434 U.S. 1067 (1978) (court measured damages for delay by the liquidated damages clause in the contract between the owner and the contractor, the court noting that the architect had participated in selecting the liquidated damages amount).

of such a provision, the law would determine whether consequential damages can be recovered. The inclusion of such a provision will create greater liability exposure for the design professional.

Suppose the client claims its design professional exceeded her authority in ordering changes in the work or accepting defective work without authority of the client. As this usually involves claims by the contractor as well, this topic and the measure of recovery for a valid claim are discussed in Section 21.04D.

Whether a client can invoke state consumer protection legislation with its expanded remedies is discussed in Section 23.02J.

C. Design Professional Claims

The principal claims made by a design professional against the client relate to the latter's failure to pay for services performed. These claims have not raised difficult valuation questions. Design professionals commonly seek to protect

their restitution interests and recover the reasonable value of their services.¹³⁹ Occasionally, clients have resisted this claim by contending that they did not use the plans and specifications drafted and thereby have not been enriched. Such defenses have been generally unsuccessful.¹⁴⁰ (The more difficult problem—the problem of a contractor who seeks to protect its restitution interest when the owner has breached—is discussed in Section 27.02E.)

Suppose the design professional seeks to protect her expectation interest. To do so, she must be put in the position she would have been had the client performed as promised. This could be computed by what she could have earned had she fully performed less the expense she has saved or her expenditures in part performance plus her profit, less what she has already been paid.

¹³⁹*Getzschman v. Miller Chemical Co.*, supra note 10.

¹⁴⁰*Barnes v. Lozoff*, 20 Wis. 2d 644, 123 N.W.2d 543 (1963) (measured by rate of pay in community).

Compensation and Other Owner Obligations

SECTION 13.01 Contractual Fee Arrangements

A. Limited Role of Law: Methods of Compensation

A number of different fee arrangements are available to design professionals and owners. The choice among these arrangements is principally guided by criteria that are professional, not legal. Put another way, design professionals are generally in a better position to determine the type of fee structure than are their attorneys. Nevertheless, the law does play a limited role.

Principally, the law interprets any contractual terms that bear on fee computation when the contracting parties disagree. If no fee arrangement is specified in the contract and the parties cannot determine an agreed-on fee subsequent to performance, the law may be called on to make this decision.

Despite this limited role, certain legal principles must be taken into account in choosing a fee arrangement or in predicting the legal result if a dispute arises. For example, faced with the question of whether certain services come within the basic design fee, the law may choose to protect the reasonable expectation of the client if the design professional selected the language.

Likewise, any fee arrangement that measures compensation by a stated percentage of construction cost may be interpreted to favor the client. This can result from the belief that such a fee formula can be unfair to the client, given the design professional's incentive to run up costs. In rare cases, the contractual method selected will be disregarded because supervening events occur that neither party contemplated.

In its instructions to B101-2007, the AIA states there are at least ten ways to compute compensation for architectural services. Four are based on cost and time:

1. multiple of direct salary expense
2. multiple of direct personnel expense
3. professional fee plus expenses
4. hourly billing rates

In the first the multiple represents benefits, overhead, and profit. In the second the multiple represents overhead and profit. In the third salaries, benefits, and overhead are expenses and the fee represents profit. In the fourth, salaries, benefits, overhead, and profit are included in the hourly rates.

The other methods, though indirectly related to time and expenses spent, are related more directly to the project costs or attributes of the project. They are

1. stipulated sum
2. percentage of the cost of the work
3. multiple of consultants' billing
4. square footage
5. unit cost (apartment, rooms, acres, etc., times a price factor)
6. royalty (share of owner income or profit)

These methods may be used in combination. This chapter comments on those used most often.

B. Stated Percentage of Construction Costs: Square Footage

Although no longer universal (fixed-fee and cost methods of compensation being used increasingly), the stated percentage of construction costs is still a common method

of fee computation. In such a method, the fee is determined by multiplying the construction costs by a designated percentage set forth in the contract. (A close variant of this method used in real estate residential developments is a stated dollar amount per square foot of the residence.) Because the stated percentage of construction cost typically covers only basic design services, this amount is often augmented by payments for additional services and reimbursable expenses. (However, see Section 13.01I on fee limits.)

This method has been criticized. It can be a disincentive to cut costs and may reward the design professional who is less cost conscious. It can be too rigid, because projects and time spent can vary considerably. It may not reflect time spent. It also tends to subsidize the inefficient client at the expense of the efficient one.

Despite constant criticism, the fee method is still used. Clients seem accustomed to it. The method can avoid bargaining over fee. In normal projects it may accurately reflect the work performed. Although it may undercompensate on some projects and overcompensate on others, some design professionals feel the fees average out. The fee method can avoid extensive recordkeeping. It also is much less likely to generate a client demand to examine the design professional's records, a common feature of a cost type of fee formula.

Percentages vary, with the figure selected in major part reflecting the amount of work the design professional must perform and, increasingly these days, the risk of failure. Such risk is addressed in greater detail in Chapter 14. The amount of work depends on a number of factors.

If the design professional has worked for the client before, past experience may be relevant in determining the stated percentage. An inexperienced, inefficient client may require more work than an efficient client who has dealt with construction before. Sometimes the percentage is based on whether the project is residential or commercial, whether the construction contracts are single or separate, and whether the construction contract price is fixed or a cost type. Smaller projects may have a minimum fee.

To avoid criticism that the fee method encourages high costs and discourages cost reduction, some design professionals use a flexible percentage. One method is a percentage that declines as the costs increase. The actual percentage for the entire project is determined from a

schedule that has variable percentages depending on the ultimate construction cost. For example, a fee schedule may provide for a 5 percent fee if the costs do not exceed \$1 million, a fee of 4 percent if the ultimate cost is between \$1 million and \$1.5 million, and 3 percent if the cost is over \$1.5 million.

Another method to encourage cost consciousness is to employ a sliding scale under which the highest percentage is applied to a cost up to a specified amount and then the percentage reduces on succeeding amounts. For example, the fee can be 8 percent on the first \$1 million of cost, 7 percent on the next \$4 million, and 6 percent on all amounts over \$5 million.

As to the construction cost that is multiplied by the percentage, see AIA Document B101-2007, Section 6.1, in Appendix A.

Suppose responsibility for an increase in construction cost is shared by the design professional and the contractor, based on the contractor's not having directed attention to obvious design errors. Apportionment of responsibility may be appropriate, with the design professional's fee increased by that portion of the corrected work cost chargeable to the contractor. However, the difficulty of making such allocation, and primary responsibility for design being that of the design professional, will likely preclude such an apportionment. The major issue is likely to be who bears responsibility for the cost of correction, the design professional or the contractor. If an apportionment is made for this purpose, that apportionment can be used to determine the design professional's fee.

Courts have interpreted fee provisions, but because of the different provisions that can be or are employed, generalizations are perilous. In close cases, courts are likely to favor the position of the client if the design professional selected the contract language.

Techniques for imparting flexibility to what otherwise can be a rigid fee method are mentioned in Section 13.01J.

C. Multiple of Direct Personnel Expense: Daily or Hourly Rates

Personnel multipliers determine the fee for basic and additional services by multiplying direct personnel expense by a designated multiple ranging from 2 to 4, the average being 2.5 to 2.7. AIA Document B141-1997, Paragraph 1.3.9.4, defined direct personnel expense as "the direct salaries

of the Architect's personnel engaged on the Project and the portion of the cost of their mandatory and customary contributions and benefits related thereto, such as employment taxes and other statutory employee benefits, insurance, sick leave, holidays, vacations, employee retirement plans, and similar contributions." Once fringe benefits were truly on the "fringe." Today, they can constitute as much as 25 to 40 percent of the total employee cost. The contract must clearly specify personnel compensation cost beyond the actual salaries or wages.

In AIA Document B101-2007 this paragraph has been deleted. The AIA believes that this method is less significant. In its Instructions to B101-2007, it merely defines Multiple of Direct Personnel Expense as "salaries plus benefits . . . multiplied by a factor representing overhead and profits." Multiples are still common in contracts for engineering services.

There are obvious disadvantages to daily or hourly rates. Because a day is a more imprecise measurement than an hour, if either method is used it is likely to be the hourly rate. Such a method requires detailed cost records that set forth the following:

1. the exact amount of time spent
2. the precise project on which the work was performed
3. the exact nature of the work
4. who did the work

Different hourly rates may be used for work by personnel of different skills.

When compensation is based on cost incurred by the design professional, the client often prescribes the records that must be kept, how long they must be kept, and that they be made available to the client. The B141 published in 1977 stated that the architect would keep records based on GAAP (generally accepted accounting principles).¹

B101-2007 does not prescribe accounting standards for records that must be kept. Many owners will insist on contract language that requires the architect to keep any relevant cost records based on GAAP standards, as in earlier editions of AIA Documents. They are also likely to require that language deal with where records will be maintained, the power to inspect and make copies, and the period of record retention.

¹For a criticism of this gap and a listing of the ways this topic is dealt with in other contracts, see J. SWEET & J. SWEET, 1 SWEET ON CONSTRUCTION INDUSTRY CONTRACTS § 6.06 (4th ed. 1999), Aspen Law & Business.

B101-2007, Section 11.10.4, simply provides that "Records of Reimbursable Expenses, expenses pertaining to Additional Services and services performed on the basis of hourly rates shall be available to the Owner at mutually convenient times."

D. Professional Fee Plus Expenses

The form of fee arrangement known as "professional fee plus expenses" is analogous to the cost type of contracts discussed in greater detail in Section 17.02B. One advantage of a cost type of contract for design services is that the compensation is not tied to actual construction costs and there should be incentive to reduce construction costs. It can be a disincentive, however, to reduce the cost of design services.

The cost type of contract, or what the AIA calls "professional fee plus expenses," necessitates careful definition of recoverable costs. Costs, direct and indirect, can be an accounting nightmare. Disputes can arise over whether certain costs were excessive or necessary. In cost contracts, advance client approval can be required on the size of the design professional staff, salaries, and other important cost factors. Cost contracts require detailed recordkeeping. (As noted in Section 13.01I, a ceiling can be placed on costs.)

Suppose the design professional estimates what the costs are likely to be in such a contract. Although the client may wish to know approximately how much the design services are likely to cost, an estimate can easily become a cost ceiling. If an estimate is given that is not intended as a ceiling, it should be accompanied by language that indicates the assumptions on which the estimate is based and that it is not a fixed ceiling or a promise that design costs will not exceed a designated amount.

E. Fixed Fee

Design professional and client can agree that compensation will be a fixed fee determined in advance and incorporated in the contract. Before such a method is employed, a design professional should have a clear idea of direct cost, overhead, and profit as well as appreciate the possibility that contingencies may arise that will affect performance costs. A fixed fee should be used only where the scope of design services is clearly defined and the construction project well planned. It works best in repetitive work for the same client.

Does the fixed fee cover only basic design services? Does it include additional services and reimbursables? Standard contracts published by professional associations usually limit the fixed fee to basic design services. A design professional who intends to limit fixed fees to basic services should make this clear to the client. See Section 13.01I for discussion of fee provisions that place an absolute ceiling on compensation.

A recent study indicates that there has been a significant rise in the number of design professionals using what it calls “lump-sum/fixed-fee contracts” between 1998 and 2002.² In all markets, except industrial facilities and private environmental, the percentages of those markets using these contracts rose from 48 percent in 1998 to 68 percent in 2002.

This increase reflects the greater desire on the part of owners and those providing financial resources for price certainty “up-front” and a great fear of uncertainty caused by cost overruns and claims. This also is reflected in the use of no-damage clauses (see Section 26.10A), saddling design/build contractors with responsibility for cost overruns due to owner mistakes (see Sections 17.04F and I) and the greater use of caps on fees of design professionals (see Section 13.01I). While cogent arguments can be made for not placing these risks on contractors and architects, the seemingly insatiable need by some for “front-end” certainty can trump them.

A recent unreported federal district court case demonstrates the risk of such a contract made by a project manager (PM). It gave a fixed price without any provisions for additional services. Despite an eighteen month delay in completion and more delay after completion when a flood resulted from a burst sprinkler head, the PM received no additional compensation.³

F. Reasonable Value of Services or a Fee to Be Agreed On

The fee will be the reasonable value of the services where the parties do not agree on a compensation method. If there is no agreed valuation method for additional services, compensation is the reasonable value of the services. The reasonable value of a design professional’s services will take into account the nature of the work, the degree of risk to

the design professional, the novelty of the work, the hours performed, the experience and training of the design professional, and any other factors that bear on the value of these services, including overhead and a reasonable profit. Proving the reasonable value of services requires detailed cost records. Leaving the fee open is generally inadvisable.

Where this issue does arise, each party usually introduces evidence of customary charges made by other design professionals in the locality as well as evidence that bears on factors outlined in the preceding paragraph. In many cases, great variation exists among the testimony given by the expert witnesses for each party. It is not unusual for the court or jury to make a determination that falls somewhere in between.

The parties can agree to jointly determine the fee at the completion of performance. Where the project has gone well, where the parties wish to work with each other again, and where adequate records have been kept, agreement on fees may be reached easily. However, when such fortunate events have not occurred, an agreement on fees may prove difficult.

At one time, as noted in Section 5.06F, such agreements were considered unenforceable as simply “agreements to agree.” However, if the work has been performed, it is likely that the parties must negotiate in good faith to determine a fee or, more likely, to determine what the parties would have agreed to had they bargained in good faith and made an agreement on compensation. The same result can follow if the parties cannot agree and the matter is submitted to arbitration.

G. Additional Services

The scope of services is a central component of the design professional–client relationship. What does the contract require as to scope of services, sometimes called basic services, performed by the design professional and encompassed by the basic fee? Do these match the expectations of design professional and client? These issues are at the heart of the concept of additional services.

Sections 12.01 and 12.02 referred to the distinctions between basic and additional services. The importance of this distinction depends on the compensation system used. If the system is tied to costs incurred, such as multiples of direct personnel expenses, a daily rate, or an hourly rate, the distinction is less important. When those systems are used, the only issues are whether the work was required under the contract and the expenses incurred.

²Zweig White, 2002 *Fee & Billing Survey of A/E/P & Environmental Consulting Firms*.

³*Plante & Moran Cresa, L.L.C. v. Kappa Enterprises, L.L.C.*, 2006 Westlaw 1676411 (E.D.Mich.2006).

But if the system used is a percentage of construction cost or per-unit formula, the question of basic versus additional becomes a central issue and often a contentious one. The client may believe that the services in question are part of basic services. If there are too many additional services that require compensation in addition to the basic fee, the client may believe that it is not getting much for the basic fee and that the basic fee is only a “sticker” price unrelated to the ultimate payout. Finally, as shall be seen, procedures required by additional compensation clauses, such as written orders and notices, are often ignored by the parties. This generates claims by the design professional that these formal requirements were met or waived by the client.⁴

If the services are part of basic services under compensation systems, such as a percentage of construction cost or a fixed fee, the design professional receives no additional compensation. These services are compensated under the basic fee. But if the services are not part of basic services, if authorized, they become additional services and earn the design professional additional compensation.

The principal difficulty is generated by the increasing number of services that must be performed by someone, whether the design professional, the owner, or a consultant retained by either. One reason for the expansion of services is the increased public controls over construction, the emphasis on the environment, and the increasing likelihood of disputes that often end up in arbitration or litigation. These new services can be needed in the design or construction phase. Additionally, each project can be handled differently, depending upon the client’s capacity to do them itself and the specific nature of the project. In this regard in AIA Document B101-2007, Section 4.1 lists twenty-seven specific services that can be done by the architect, done by the owner, or not be provided.

Contracts for design services generally set forth the basic services in the scope of services section. As a rule they specify services that are additional in a separate section labeled “Additional Services.” Such services are listed to recognize that these listed services are often but not always performed. If ordered by the owner, they must be performed, and the design professional earns additional

compensation. In that sense the list of additional services is similar to a “changes clause” in a contract for construction services. Both grant unilateral power to the owner to demand that certain services be performed. In the case of a contract for design services, they are designated as additional services. In the case of construction services, they must be within the general scope of the work.

The list of additional services in a contract for design services serves another function. Listing a service as “additional” makes clear that it is not part of basic services. Even if the contract seeks to describe basic services in the “scope” section, it is not always clear what falls within the ambit of such services.

Two cases demonstrate the effect of not having a clause detailing additional services. In a case noted in Section 13.01E, the absence of an additional services clause was pointed to by the court when it denied any additional compensation to a project manager (PM) when inordinate delay and a flood drastically increased the PM’s cost of performance.⁵

Another involved a claim by the client that its architect should have alerted the client that a report by an engineer retained by the client was inadequate. It did not show underwater deficiencies in the substructure.⁶

The contract with the architect required the architect to provide normal structural services. The architect pointed out that one of the optional services that could have been performed by the architect but was not chosen by the client was to investigate existing conditions or facilities for which an extra fee would be paid.

Yet this argument was rejected in favor of the client’s contention that, even though the architect had not breached his contract, he had been negligent. He should have recognized the inadequacy of the engineer’s report. This conclusion was also supported based upon expert testimony presented by the client. That expert testified that the requirement to provide normal structural services included the obligation to check the adequacy of the engineer’s report.

Usually the basic-versus-additional issue controls the compensation to the architect but not whether liability is transferred from the architect to the owner. Also, the architect knows what information is needed to design properly. The report did not relieve the architect from his responsibility to determine whether the information needed to

⁴*Belot v. Unified School Dist. No. 497*, 27 Kan.App.2d 367, 4 P.3d 626 (2000) (additional services claim was denied because architect failed to segregate costs of additional services from costs incurred for basic services); *Newman Marchive Partnership, Inc. v. City of Shreveport*, 944 So.2d 703 (La. App.2006), writ denied, 940 So.2d 448, 452 (La.2007) (failure to get advance authorization barred claim because this showed that the architect viewed the services as basic).

⁵*Plante & Moran Cresa, L.L.C. v. Kappa Enterprises, L.L.C.* supra note 3.

⁶*Kerry, Inc. v. Angus-Young Assocs.*, 280 Wis.2d 418, 694 N.W.2d 407, review denied, 286 Wis.2d 98, 705 N.W.2d 659 (2005).

execute the design was provided properly. Had the issue been whether the architect was entitled to additional compensation for doing work that the owner chose not to have him perform, the outcome might have been different.

Some of these difficulties in distinguishing basic from additional services are reflected in the history of AIA design service documents. Until 1958 there was no list of additional services. From 1958 to 1963 there were nine specified additional services. Steady increases culminated in twenty-two additional services in 1977. The AIA is not alone in listing many additional services. In E-500 Exhibit A (2002), the EJCDC lists twenty-two *optional* additional services that require owner's written authorization (Paragraph A2.01) and seven *required* additional services not requiring owner's written authorization (Paragraph A 2.02).

In 1987 the AIA divided additional services into nine *contingent* and twenty *optional* additional services. The latter were classic additional services, requiring a written order in advance of performance. Contingent additional services had a different mechanism, as follows. The architect would inform the owner he was going to perform these services. The need for such services had to be caused by events beyond control of the architect. Unless the owner ordered the architect *in writing* not to perform the services, he performed them. These services were contingent in the sense that they were to be performed *contingent* on the owner writing that it *did not* want them performed. This division was made to help the architect who was ordered to perform such services in writing but was unable to supply the paperwork when time came for billing. The AIA also noted that it would be rare for an owner not to want these services performed.

In B141-1997 additional services, at least in name, were eliminated. They were replaced by provisions scattered around the document that could be the basis for a bill for services in addition to the basic fee.⁷

⁷AIA Doc. B141-1997, ¶ 1.1.6 (information changes require adjustments in compensation); ¶¶ 1.3.3.1, 1.3.3.2 (circumstances beyond architect's control, such as code changes, owner changes of mind, poor administration by owner, significant project changes, testifying at hearings or dispute resolution); ¶ 1.5.9 (delay in completion of design services contract through no fault of architect); ¶ 2.8.1 (number of specified services, such as submittal reviews, site visits, inspections, exceeding the designated number specified in the contract); ¶ 2.8.2 (designated services beyond normal services, such as submittal reviews out of sequence, evaluating an extensive number of claims, evaluation of substitutions, and administrative services provided sixty days after substantial completion); ¶ 2.8.3 (twenty-two specified services [increased in 2007 to twenty-seven] ordered, much like earlier optional services).

In 2007 additional services were reorganized. Provisions that had been scattered around B141-1997 were consolidated into Article 4 entitled "Additional Services." There were some substantive changes, mostly classifying more services as additional.

Services were divided into those that were agreed upon at the time the contract for design services is made (Section 4.1) and those made during project performance (Section 4.3). Section 4.2 provides a blank space to describe additional services itemized in Section 4.1 unless they are described in an exhibit to the contract. Section 4.1 lists twenty-seven specific services (up from twenty-two) that can be performed by the architect, by the owner, or not be provided. If the architect performs these services, he is paid additional compensation.

Some services are not included in B101-2007 that had been included in B141-1997, such as land survey services (the owner provides an expanded survey, including legal limitations under Section 5.4), geotechnical services (the owner provides geotechnical engineering services under Section 5.5), economic feasibility studies, special bidding and negotiations, and construction management. If something appears to be deleted, it can, though not here, show up elsewhere.

As noted earlier in this section, listing additional services distinguishes those services from basic services. Another less apparent purpose is demonstrated when services are removed from the list of additional services, such as removal of economic feasibility services from the list of additional services in 2007. Removal makes clear that the architect need not perform these services even if requested by the owner.

The list of additional services is similar to changes in construction contracts. Just as the contractor must perform changes that are properly ordered under the changes clause, the architect must perform additional services. To be sure, he is compensated beyond the basic fee when he performs the additional services. But he is not compelled to perform services not listed as additional.

The purpose of removing specified services from the list of additional services reflects the AIA's view that the architect should not perform these services. As noted in Section 12.05, it is best for the architect not to make economic feasibility studies because they are beyond his training and experience.

Some services were added, such as environmental-related services,⁸ BIM,⁹ as-designed and as-constructed

⁸AIA Doc. B101-2007, §§ 4.1.2.3, 4.1.2.4.

⁹Id. at § 4.1.6.

record drawings,¹⁰ coordination of owner consultants,¹¹ security design,¹² and fast-track design services.¹³

Section 4.3.1 lists eleven specific services that are provided after the agreement has been made. When the architect recognizes the need to perform these services, he must “notify the Owner with reasonable promptness and explain the facts and circumstances giving rise to the need.” The architect does not perform these services until he receives “the Owner’s written authorization.”

Some new items found in Section 4.3.1 deal with environment-related services,¹⁴ BIM,¹⁵ dealing with bidding alternates,¹⁶ preparing for and attending a variety of public hearing or meetings,¹⁷ preparing and attending dispute hearings,¹⁸ evaluating bidders,¹⁹ and assisting the Initial Decision Maker (IDM) if he is not the architect.²⁰

Another six services are listed under Section 4.3.2. The architect performs these services “To avoid delay in the Construction Phase.” Concurrent with performance of these services, he must “notify the Owner with reasonable promptness, and explain the facts and circumstances giving rise to the need.” If the owner subsequently determines that these services “are not required the Owner shall give prompt written notice to the Architect, and the Owner shall have no further obligation to compensate the Architect for those services.” Because Section 4.3.2 includes “no *further* obligation” (emphasis added), services performed before notification that they not be performed are compensated as additional services.

The complete list of services in Sections 4.1 and 4.3 can be found in Appendix A. In Sections 4.3, both Sections 4.3.1, which requires advance authorization before performance, and 4.3.2, relating to services that are performed subject to not receiving notice not to perform them, contain changes from earlier documents.

Some changes expand or clarify the list of additional services. For example, Section 4.3.1.1 states that services caused by material changes in the project are not limited

to “size, quality or complexity, the Owner’s schedule or budget.” Section 4.3.1.6 makes services that relate to alternate bids or proposal requests additional services. Similarly, Section 4.3.1.9 makes services that evaluate bidders additional services. “Assistance to the Initial Decision Maker, if other than the Architect,” under Section 4.3.1.11 is additional.

Similarly, changes of this nature can be found in Section 4.3.2, the section that allows the architect to perform and then notify the owner. For example, preparing change orders or construction change directives that require evaluation of the proposal and supporting data are additional services under Section 4.3.2.3. Services that affect basic construction phase services by the architect performed sixty days after substantial completion or the “anticipated date of Substantial Completion” are additional under Section 4.3.2.6.

Section 4.3.3 sets up a system to control the frequency of performance of certain services performed by the architect. A blank is provided for limits as to the number of shop drawing reviews,²¹ site visits²² and inspections.²³ When the limit is reached, the architect must notify the owner. Services that exceed the limit are additional.

Finally, Section 4.3.4 makes services performed after a designated date (a blank is provided) not the fault of the architect additional services.

To sum up this intricate method of providing for additional services, Section 4.1 requires an agreement in advance of who is responsible for specified services. Section 4.3.1 creates a list of services that require advance authorization by the owner. Section 4.3.2 lists services that the architect can perform until ordered not to do so. Section 4.3.3 makes additional those services that exceed a designated number.

The AIA system dealing with additional services demonstrates that there can be a substantial difference between the basic fee and the ultimate fee payout where the compensation is not one based on cost. Inefficient or incompetent contractors, unforeseeable or even foreseeable events that affect performance adversely, and dithering or mind-changing owners can, under B101-2007, turn a percentage of construction cost or a fixed price contract into a cost contract.

H. Reimbursables

B101-2007 Section 11.8.1 illustrates reimbursable expenses. As for changes, B101-2007 makes reimbursable taxes levied on professional services and on reimbursables,²⁴ as well as site office expenses.²⁵ The catch-all “Other similar Project-related expenses”²⁶ makes clear that the list is not exclusive. The list always seems to grow.

Incurring obligations for the client and paying them can impose an administrative burden on the design professional. Sometimes design professionals charge the client a markup for handling reimbursables. For example, suppose the design professional incurred expenses of \$1,000 for traveling in connection with the project and long-distance calls. Under a markup system, the design professional might bill the client \$1,000 plus an additional 10 percent or \$100, making a total of \$1,100. The markup percentage can depend on the number of reimbursables and the administrative overhead incurred in handling them. A design professional who wishes to add an overhead markup should explain this to the client in advance and obtain client approval.

B101-2007, Section 11.8.2, added to the amounts incurred by the architect a blank percentage for expenses incurred, in effect a markup.

I. Fee Ceilings

Owners are often concerned about the total fee, particularly if the fee is cost based. But even in a compensation plan under which the design professional is paid a fixed fee or a percentage of compensation, the client may be concerned about additional services, reimbursables, or increases based on an unusual jump in the construction cost. Public owners with a specified appropriation for design services may seek to limit the fee to a specified amount. It may be useful to look at two cases that have dealt with fee limits.

In *Hueber Hares Glavin Partnership v. State*,²⁷ the contract limited the fee. It also excluded recovery for work to correct design errors. The Appellate Division held the language unambiguous and the fee limit not an estimate. The fee limit could not be exceeded by costs attributed to design errors. By dictum, the court stated that the city would have

been precluded from asserting the fee limit had it ordered extra services knowing the fee limit had been reached.

*Harris County v. Howard*²⁸ involved an AIA document. The upset price was also held to unambiguously include additional services and reimbursables. The public owner inserted a detailed recital on the fee limit and what it included. The court rejected the architect’s contention that his having been paid \$20,000 over the limit showed the limit did not include additional services or reimbursables.

Substantial changes in project scope should eliminate any fee ceiling that may have been established.²⁹

J. Adjustment of Fee

Generally, the law places the risk that performance will cost more than planned on the party who has promised to perform. Careful planners with strong bargaining power build a contingency into their contract price that takes this risk into account. Suppose a client directs significant and frequent changes in the design. Suppose for any reason the design services must be performed over a substantially longer period than planned. It is unlikely that the law will give the design professional a price adjustment under a fixed-price contract. However, the AIA has sought to protect architects from these risks and others in B101-2007, Article 4, dealing with additional services. This has been discussed in Section 13.01G.

K. Deductions from the Fee: Deductive Changes

Acts of the design professional may cause the client to incur expense or liability, and the client may wish to deduct expenses incurred or likely to be incurred from the fee to be paid to the design professional. Suppose a design professional commits design errors that cause a claim to be made by an adjacent landowner or by the contractor against the client. Suppose the client settles any claims or wishes to deduct an amount to reimburse itself in the event it must pay the claims.

The right to take deductions or offsets in such cases can be created either by the contract or by law. An illustration of the first is the frequent inclusion of provisions in construction contracts that give the owner the right to

²⁴§ 11.8.1.9.

²⁵§ 11.8.1.10.

²⁶§ 11.8.1.11.

²⁷75 A.D.2d 464, 429 N.Y.S.2d 956 (1980).

²⁸494 S.W.2d 250 (Tex.Ct.App.1973).

²⁹*Herbert Shaffer Assoc., Inc. v. First Bank of Oak Park*, 30 Ill.App.3d 647, 332 N.E.2d 703 (1975).

make deductions and offsets against the contractor. This is usually not found in contracts between design professionals and clients. However, even in the absence of such provisions, the client may be able to take deductions for expenses incurred or likely to be incurred by the client as a result of any contractual breach by the design professional. The amount deducted must not be disproportionate to the actual or potential liability of the client.

It is likely that the construction contract price will be increased or decreased during actual performance through issuance of change orders. AIA Document B141-1997, Paragraph 1.3.9.1, had stated that no payments will be withheld from the architect “on account of the cost of changes” unless the architect is “adjudged to be liable.” Presumably, this would encompass only judicially determined negligent design. Deductive changes, though they may reduce the construction contract price, do not affect the architect’s fee even if the fee is based on a stated percentage of construction costs. Deductive change orders not only are not likely to reduce the extent of the architect’s services but also may increase it.

In addition, B141-1997 Paragraph 1.3.9.1 had stated that there will be no reduction from the architect’s compensation if the total contractor payout is reduced because of deductions for liquidated damages or other sums withheld from the contractor, such as deductions for damages suffered because of the contractor’s breach. Such deductions do not reduce the contract price; they only reimburse the client for its losses when it does not receive performance it has been promised by the contractor.

B101-2007 Section 11.10.3 continued and clarified this policy. There is to be no deduction in the architect’s compensation because of a reduction in the payout to the contractor because of deductive changes. In a change from 1997, a reduction of the architect’s fee results if “the Architect agrees or has been found liable for the amounts in a binding dispute resolution procedure.” This makes clear that a binding arbitration award that the architect has breached, rather than as in 1997 the need for a court judgment, can reduce his compensation.

The effect on the architect’s fee of a reduction in the payout to the contractor because of the contractor’s breach of contract is puzzling. In B101-2007, instead of dealing with breach by the *contractor* that reduced the amount paid to the contractor when this is used to compute the

architect’s fee, Section 11.10.3 speaks of a “penalty of liquidated damages on the *architect*” (emphasis added). What is the purpose of this change?

Suppose the architect is guilty of a breach of contract that delayed completion. This would be rare because usually delayed completion is caused by the contractor. Delay is often dealt with by liquidating damages in the construction contract because actual damages are very difficult to prove.³⁰ Also, unlike the frequent use of damage liquidation in the construction contract, it is almost unheard of for a contract between the architect and his client to include a liquidation of damages clause.

The only possible justification in B101-2007 for this language is to prevent the owner from reducing the architect’s fee by arbitrarily liquidating any claim it has against the architect. This would be rare. It is important to include language making clear that the architect’s fee will not be reduced if amounts are deducted from the payout to the contractor to compensate the owner for the contractor’s breach. This makes a return to the language of B141-1997 useful.

L. Project Risks

In determining appropriate compensation, the design professional should consider the projected risk the commission creates. Although risk management is discussed in greater detail in Chapter 15, it is important to note in this chapter that the scope of risk should play an influential if not dominant role in determining whether a project should be undertaken and the appropriate compensation for it. Risk means the likelihood that claims will result and the cost of dealing with such claims.

One factor that should be taken into account, particularly in a fee structure not based on cost, is the likelihood that the client will be cooperative and efficient in performing its part of the contract for design services. Another relates to the technical problems that may be encountered relating to both design and administration. Design professionals should be aware of the Architecture and Engineering Performance Information Center headquartered at the University of Maryland. The center collects, analyzes, and disseminates information about the

³⁰See Section 26.10C.

performance of buildings, civil structures, and other constructed facilities. It uses its data to analyze trends over time relating to insurance claims. It also notes the likelihood particular clients will press claims and the organizational structures (the traditional method, cost projects, design–build) that seem prone to increased claims. It can also give information on the likelihood of particular types of problems in particular projects.

M. The Fee as a Limitation of Liability

Looking ahead to professional liability, the fee can serve another function. Some design professionals seek to limit or actually limit their liability exposure to their client, to the amount of their fee.³¹

SECTION 13.02 Time for Payment

A. Service Contracts and the Right to Be Paid as One Performs

In service contracts, the promises exchanged are payment of money for performance of services. Unless such contracts specifically deal with time for payment to occur, the performance of all services must precede the payment of any money. Put another way, the promise to pay compensation is conditioned on the services being performed.

Such a rule operates harshly to the person performing services. First, if the performance of services spans a lengthy time period, the party performing these services may need a source of financing to perform. Second, the greater the performance without being paid, the greater the risk of being unpaid. For these reasons, the law protects manufacturers and sellers of goods by giving them the right to payment as installments are delivered. However, this protection was not accorded to people performing services. If the hardships and risks described are to be avoided, contracts for professional services must contain provisions giving design professionals the right to be paid as they perform.

State statutes generally provide that employees are to be paid at designated periodic intervals. However, such

statutes do not protect those who perform design services who are not employees of the owner.

B. Interim Fee Payments

Design professionals commonly include contract clauses giving them the right to interim fee payments. This avoids the problems described in the preceding section. From the client's standpoint, interim fee payments can create an incentive for the design professional to begin and continue working on the project.

Usually, interim payments in design professional contracts become due as certain defined portions of the work are completed. Although AIA Document B101-2007, Section 11.5, leaves blanks for interim fee payments, the 1977 B141a ("Instruction Sheet") suggested interim fee payments as follows:

- schematic design phase 15 percent
- design development phase 35 percent
- construction documents phase 75 percent
- bidding or negotiation phase 80 percent
- construction phase 100 percent

Any schedule used should depend on the breakdown of professional services and the predicted work involved in each phase.

Dividing the design services and allocating a designated percentage of the fee to each service can make the contract appear divisible. A divisible contract matches specified phases of the work to specified compensation or a specified portion of the total compensation. In a truly divisible contract, the amount designated is earned at the completion of each phase and the value of the work for each completed phase cannot be revalued.

As an illustration, suppose the contract were considered divisible and the design professional unjustifiably discharged after completing the construction documents phase. In such a case, the design professional will recover 75 percent of the fee if this were the amount specified even if the reasonable value of services exceeded this amount. Conversely, the client would not be permitted to show that the reasonable value of the services was less than 75 percent of the fee. Interim fee payments provisions should not make these contracts divisible. The amounts chosen are usually rough approximations and not

³¹See Section 15.03D.

agreed final valuations for each phase. This is especially true if the standard form contract specifies the phases and allocates a percentage of the fee for each phase. Such payment should be considered only provisional.³²

C. Monthly Billings

In many projects, months may elapse before a particular phase is completed. To avoid overly long periods between payments, contracts for such projects should provide for monthly billings within the designated phases.³³

D. Late Payments

Financing costs are an increasingly important part of performing design professional services. Late payments and reduced cash flow can compel design professionals to borrow to meet payrolls and pay expenses. The contract should provide that a specified rate tied to the actual cost of money be paid on delayed payments.³⁴

In the absence of a contractually specified rate or formula, the interest is the “legal rate.” In most states, this is the amount of interest payable on court judgments, see Section 6.08. During the inflationary period of the 1970s, the actual cost of borrowing was substantially in excess of the legal rate. As a result, many states increased the legal rate to better reflect the actual costs of borrowing money. But in the 1990s inflation dropped drastically, and as a result the legal rate currently may be substantially greater than the actual cost of borrowing money. (This is not likely to be the case for short-term commercial loans.)

Among the welter of consumer protection legislation that has spewed forth from Congress is the federal Truth in Lending Act. This act requires those who lend money to disclose the details of the cost of the loan. The AIA has expressed concern over this law. It has pointed to the law’s possible application in a note to AIA Document B141-1997, Paragraph 1.5.8, which provides for late payments. The note states that certain consumer protection laws may affect the validity of the late payment provision and

suggests that specific legal advice be obtained if changes are made in the clause or if disclosure must be made.

An early draft of B101-2007, Section 11.10.2, continued the cautionary note. This was dropped in the final version. But design professionals who face tardy payments and the need to “carry” the client should be aware of this risk.

It is possible to conceive of the architect or the engineer—although generally not thought of as being a lender—as extending credit by allowing payments to be made after services are performed. If the amounts specified are considered a finance charge rather than a charge for late payment, disclosure requirements must be made in accordance with the Truth in Lending Act.

This situation is illustrated by *Porter v. Hill*,³⁵ a case decided by the Oregon Supreme Court in 1992. An attorney had included at the end of a billing statement a provision stating that a late payment charge of 1.5 percent per month would be added to the balance due if the amounts were more than thirty days overdue. The client challenged this provision, claiming it was a financing charge and required disclosures in accordance with the Truth in Lending Act.

The court held that two factors are examined to determine whether the charge is a late payment charge to which the disclosure requirements do not apply: (1) whether the terms of account require the consumer to pay the balance in full each month and (2) whether the creditor acquiesces in the extension of credit by allowing the consumer to pay the account over time without demanding payment in full.

The court concluded here that under these standards, this was a late payment charge and not a financing charge. It pointed to the fact that the amount was described as a late payment charge and not a finance charge. It also noted that the written agreement required the client to pay the balance in full on billing and that the attorney had not given his client the option of paying over time, subject to the 1.5 percent payment charge. Instead, the court noted, the attorney demanded full payment each month and, when he was not paid, brought legal action to collect the full amount due.

Design professionals should make sure their bills state that the client is required to pay the balance in full each month. Also, if the design professional allows clients to pay the accounts over time without demanding payment

³²*Herbert Shaffer Assoc., Inc. v. First Bank of Oak Park*, supra note 29. But see *May v. Morganelli-Heumann & Assoc.*, 618 F.2d 1363 (9th Cir. 1980) (architect contract divisible).

³³B101-2007, §11.10.2.

³⁴B101-2007, §11.10.2, provides blank spaces to be filled in for the rate of interest and when payable. If the blanks are not filled, late payments invoke the legal rate at the architect’s principal place of business.

³⁵314 Or. 86, 838 P.2d 45 (1992).

in full and no effort is made to collect the full amount due, any late charge may be considered a finance charge, invoking the onerous disclosure requirements of the Truth in Lending Act. Legal advice should be sought on this issue.

E. Suggestions Regarding Interim Fee Payments

When clients delay payments, the design professional should make a polite and sometimes strong suggestion that payments should be made when due. If the design professional, as noted in Section 13.02D, acquiesces to a pattern of delayed payments, he may find he has extended credit and is subject to the Truth in Lending Act. Also, a pattern of delayed payments should make the design professional seriously consider exercising any power to suspend further performance until payments are made.³⁶ If the suspension continues for a substantial time period, the design professional should consider terminating the contract.

In cases of suspension or termination of performance, it is desirable to notify the client of an intention to either suspend or terminate unless payment is received within a specified period of time. This gives the client an opportunity to make the payment. It also shows the client that failure to make interim fee payments as promised will not be tolerated.

SECTION 13.03 Payment Despite Nonperformance

Denying a contracting party recovery for services performed unless it has performed all the obligations under the contract can create forfeiture (loss of contractual payment rights substantially exceeding harm caused by breach) or unjust enrichment (the other party retaining and using the performance without paying for it). Legal doctrines have developed that minimize the likelihood of forfeiture and unjust enrichment.

Where it is not clear from the contract whether exact performance is a promise or a condition, the law is likely to classify the nonperformance as a breach creating a right to recover damages, rather than as a failure of a condition that bars recovery for work performed under

the contract. The party who has breached can recover if it has substantially performed. Failure to fully perform does not bar recovery if caused by the other party's prevention or hindrance of performance or if the latter has failed to extend reasonable cooperation necessary to performance. Sometimes the party to whom performance is due may have waived its right to performance by indicating that it was satisfied with less than exact performance.

Repudiating the contract, denying its validity, or communicating an unwillingness or inability to perform excuses full performance. It would make little sense for the party to complete performance when the other party has indicated it does not wish performance and will not accept it.

Increasingly, the law is recognizing the right of a party in default to recover despite failure to perform under the contract. These problems arise more commonly in construction contracts, and legal doctrines have been developed with those contracts in mind. For this reason, a detailed discussion of these doctrines is postponed until Section 22.06D.

SECTION 13.04 Other Client Obligations

Contracts for design usually place a number of obligations on the owner. These usually relate to furnishing information that is within its knowledge as owner and obligations that it is in the best position to perform.

Sometimes the owner's role in the construction process is forgotten. It is clear that in a design-bid-build plan the design is the responsibility of the design professional, and construction is the responsibility of the contractor. When design-build is selected, the contractor both designs and builds.

Yet the owner plays a large role in the design and in construction. This is recognized in B101-2007, Article 5, captioned "Owner's Responsibilities." The owner is required to provide information through a written program.³⁷ It establishes and updates its budget.³⁸ It designates a representative to act on its behalf.³⁹ It provides surveys that "describe physical characteristics, legal limitations . . . and a written legal description of the site."⁴⁰

³⁶Restatement (Second) of Contracts § 237, illustration 1; §§ 251, 252 (1981) (power to suspend until adequate assurance given). See Section 12.13D.

³⁷B101-2007 § 5.1.

³⁸Id. at § 5.2.

³⁹Id. at § 5.3.

⁴⁰Id. at § 5.4.

It furnishes the services of geotechnical engineers,⁴¹ furnishes tests and inspections required by law,⁴² as well as legal, insurance, and accounting services.⁴³ Article 5 includes other operational responsibilities, but the items listed show the significant role played by the owner.

In addition to express provisions, obligations can be implied into contracts. The client impliedly promises not to interfere with the design professional's performance and to cooperate. For example, the client should not refuse the design professional access to information necessary

for performing the work. Refusal to permit the design professional to inspect the site would be prevention and a breach of the implied obligation owed by the client to the design professional.

Positive duties are owed by the client. The client should exercise good faith and expedition in passing judgment on the work of the design professional and in approving work at the various stages of the latter's performance. It should request bids from a reasonable number of contractors and should use best efforts to obtain a competent bidder who will agree to do the work at the best possible price. If conditions exist that will require acts of the client, such as obtaining a variance or obtaining financing, the client impliedly promises to use best efforts to cause the condition to occur.

Professional Liability: Process or Product?

SECTION 14.01 Claims Against Design Professionals: On the Increase

The possibility that a design professional will find herself in court has increased dramatically. One out of every three practicing architects is likely to find herself in litigation. Sometimes litigation is necessitated by the client's failure to pay fees for professional services. This chapter concentrates on claims made by clients and others that they have suffered losses that should be transferred to the design professional. This section explores the many reasons for increased claims against design professionals.

A. Changes in Substantive Law

Some defenses that had proved useful when claims were made by parties other than the client (collectively referred to as *third parties*) have proved of diminished value or have largely disappeared. For example, the requirement of privity between claimant and design professional and acceptance of the project terminating liability of the design professional—both valuable in avoiding third-party claims—have proved much less effective. Courts have loosened the requirement that expert testimony be introduced to establish that a professional has not lived up to the standards of her profession. These substantive changes have resulted from increasing emphasis on ensuring that victims receive compensation and on deterring wrongful conduct, rather than on protecting socially useful activities.

B. Procedural Changes

With little difficulty and minimal costs, a claimant can bring legal action against a number of defendants in the

same lawsuit. Similarly, those against whom claims have been brought can bring other defendants into that lawsuit with relative ease and without much expense. The result has been complicated lawsuits with a host of parties defending and asserting claims. Also, statutes of limitations designed to protect defendants from stale claims, based on activities that took place many years before the claims, have provided increasingly less protection.

C. Ability of Design Professionals to Pay Court Judgments

Claimants usually do not assert legal action against people who they believe will be unable to pay for a court judgment or are not insured. Although expanded liability and increased cost of insurance premiums have begun to reduce the percentage of design professionals who carry insurance, many will have professional liability insurance or sufficient resources to respond to court judgments. As a result, claims increase.

D. Access to Legal System

A person who seeks relief through the legal system usually engages a lawyer. Easier access to legal services will mean more claims and litigation. Increased accessibility to lawyers began by giving those charged with major crimes a lawyer even if they cannot afford to hire one. Programs were later developed to give legal representation to the poor when they sought to use the legal system. This development was accompanied by increased emphasis on informing people of their legal rights. For example, construction trade unions routinely inform their members of their legal rights and encourage them to use the legal

process. Increasingly, prepaid legal insurance plans provide legal services to union members.

Another reason for easier access to the legal system is the much-maligned contingent fee contract (discussed in Section 2.04). Under such a contract, the client pays the lawyer for her time only out of any recovery obtained, and the client's investment is generally limited to expenses (in injury cases often paid by the attorney).

Another reason for more claims is that the prevailing party does not recover its costs of defense, including attorneys' fees, unless it can point to a contract providing for such recovery or to a statute granting attorneys' fees to the prevailing party. This can encourage legal claims by assuring the claimant that it does not run the risk of having to pay the other party's legal expenses if the claim fails.

E. Societal Changes

Americans today are less willing to accept their grievances silently. They are more inclined to use the legal system if they feel they have a grievance. The high ratio of lawyers to population in the United States, perhaps the highest in the world, demonstrates this.

American society has become increasingly urban and impersonal. There is much less likelihood that disputants will be part of a cohesive social unit. Such units usually provide informal mechanisms for adjustment of rights and discourage resort to outside processes.

A sense of alienation in a large impersonal society makes people feel powerless, with no one to protect them or help them. This was undoubtedly one element prompting the rise of consumerism in the 1960s. Aggressive use of the legal system responded to this phenomenon.

F. Enterprise Liability: Consumerism

Compensating victims rather than protecting enterprises has been the dominant modern tort motif. This has led to liability rules based on the belief that it is best that victims recover from the enterprise that is in the best position to avoid or spread the losses to those who benefit from the enterprise. Much of this tendency drew unconsciously from the emphasis on security that became dominant after World War II. Much was accomplished through social welfare legislation, such as unemployment insurance, public housing, public welfare, and job security, and compensating victims by expanding tort rights was a useful adjunct.

Liability expansion is also traceable to the consumer movement of the 1960s. Those who felt consumers were being supplied shoddy goods and services advocated increased liability as a means of bringing home to the business sector the importance of dealing fairly with consumers. Consumer protection legislation with its expanded remedies is discussed in Section 23.02J.

In the 1990s, a backlash resulted from the belief by some that expanded liability and increased litigation placed too heavy a burden on commercial enterprises and insurers. As noted in Section 7.08L, much of this backlash was cloaked in the garb of competitiveness as American enterprises increasingly competed with products and services performed by enterprises in foreign countries. This backlash in the product liability field was demonstrated by the increased tendency of state legislatures to enact legislation that would limit the exposure of those who manufacture products. In the field of professional services, some states enacted legislation designed to limit the liability of health care providers. Still the strong tendency toward compensating victims continues to play a significant (perhaps even dominant) role in American tort law.

G. Design and Social Policy

Societal concerns with the quality and nature of the built environment naturally focuses on the design as a promoter of public safety and an allocator of resources. Emergency service agencies view design as the first step in promoting safety. Public officials have stated that much of the responsibility for avoiding fires or minimizing fire losses falls on those who design structures. One fire chief, for example, commented that "good fire protection in high-rise buildings begins on the architect's drawing board." He also said it was the builder's responsibility to design "a safe building, not a firetrap."¹

Law enforcement officials have asserted that assaults can be reduced if those who design business and residential areas plan properly. A director of the National Institute of Law Enforcement and Criminal Justice said,

Better environmental design can do much more [to reduce crime]. New housing projects, schools, shopping centers and other areas can be designed, for example, with more

¹*New York Times*, August 4, 1974, p. 11.

windows looking out on streets, fewer hidden corridors, and other crime discouraging features.²

Law enforcement concerns recently have shifted from everyday crimes to designing buildings to withstand terrorist attacks.³ Claims alleging the design of unsafe buildings also include prisons, where both prison guards and families of suicidal inmates have sought to hold the design professional responsible.⁴

As discussed in Section 9.13E, environmental concerns have spawned industry and statutory efforts to implement “green” design and construction techniques.

H. Codes

Liability has also expanded because detailed building and housing codes have proliferated. Violating these codes, although not conclusive on the question of negligence, makes it relatively easy to establish that the design professional is liable not only to the client but also to third parties who suffer foreseeable harm because of the violation.

Although most building codes are enacted by local authorities, the enactment of the federal Americans with Disabilities Act will also be used as the basis for extending liability to design professionals. See Section 14.05C.

I. Expansion of Professional Services

Design professionals are expected to either provide or volunteer to provide services that go beyond core design services. These services can relate to availability of funds for the project, likely profitability of the project, and likely

²Ibid. See also O. NEWMAN, DEFENSIBLE SPACE: CRIME PREVENTION THROUGH URBAN DESIGN (1973).

General Services Admin.*, GSBICA No. 14340, 99-1 BCA ¶30,280, recon. denied, GSBICA No. 14340-R, 99-2 BCA ¶30,393; appeal dismissed, 230 F.3d 1372 (Fed.Cir.1999) (redesign of new Federal Bureau of Investigation building in Washington D.C. in response to the Oklahoma City bombing of the Alfred P. Murrah Federal Office Building); *The Times of London*, September 6, 2002, p. 1 (Scotland Yard is working with Israeli architects to design shopping centers to be less vulnerable to suicide bombings after the September 11, 2001 attacks on the World Trade Center and the Pentagon).

⁴*State v. Gathman-Matotan*, 98 N.M. 740, 653 P.2d 166 (1982) (a claim by security guards confronted by a prison riot). The following cases involved inmates who committed suicide while in their cells: *Easterday v. Masiello*, 518 So.2d 260 (Fla.1988); *La Bombarbe v. Phillips Swager Assoc.*, 130 Ill.App.3d 896, 474 N.E.2d 942 (1985); *Tittle v. Giattina, Fisher & Co., Architects, Inc.*, 597 So.2d 679 (Ala.1992).

approval by public officials and agencies who control building and construction. This can increase claims when clients suffer disappointments or losses.

J. Site Services

A design professional’s varied site services discussed in Section 12.08 and in the balance of the book make the design professional more vulnerable to a claim traceable not only to design but also to the way in which the design was executed, both as to compliance with the design and the methods of accomplishing it.

SECTION 14.02 Overview of Chapters 14 and 15

The preceding section outlined the reasons why professional liability has expanded and the likelihood that more claims will therefore be made against design professionals. Chapter 14 deals with professional liability claims mainly by clients but also by third parties. Chapter 15 discusses risk management techniques to avoid or reduce liability risks.

A. Applicable Law

Professional liability is usually determined by state law. Depending on various factors, professional liability rules will be those of the state in which the design professional has its principal place of business, where the actual design is created, or where the project is located. Because both legal rules and actual outcomes may vary depending on the applicable state law, discussion of liability must be general and not directed to a particular state except to the extent that illustrative cases may do so.

B. Types of Harm

It is useful to divide claims into those that involve personal harm, those that involve harm to property, and those that involve economic loss not connected to personal harm or property damage. As a general rule, the law is more likely to sustain claims based on personal harm than claims based on harm to property or economic loss, and more likely to sustain claims related to property harm than those involving economic loss. Traditionally, though less so today, tort law dealt with harm to person or property.

This hierarchy of protection can help predict the outcome of any lawsuit, particularly where a court is asked to veer from established rules and recognize new legal rights. This recognition is more likely when a claim is based on personal harm and the need for compensation is more urgent. Once this inroad has been made, some courts stop at that point. But more often, courts decide that there is no particular reason to limit the extension to cases involving personal harm. Over time, what was once an established rule may disappear through this process. Disappearance is usually gradual, however. This preserves the appearance of stability while accommodating the need for change.

SECTION 14.03 Claims Against Design Professionals: Some Illustrations

Another way to demonstrate the liability explosion described in Section 14.01 is to note the types of claims that have been made against design professionals. Although most claims noted were successful, some cautionary remarks are essential.

Any conclusion that particular conduct gave rise to a valid claim was made in the context of a particular contract and particular facts. Conduct held to fall below the legal standard required in a particular case does not mean such conduct will always fall below.

Many appellate opinions simply conclude that the determination made by the finder of the facts—either the trial judge or jury—was within its discretion. An appellate court reviewing a lower court decision may not agree with the decision but will respect the differentiation between the role of trial and appellate courts, the former resolving factual disputes and the latter, as a rule, deciding questions of law.

As to negligence in the design phase, one writer stated,

Architects might fail to use due care in various ways. The architect may inadequately consider the nature of the soil under the building; he may design an inadequate foundation; he may design a roof too weak to support the weight it will foreseeably have to bear; he may insulate or sound-proof the building inadequately. The architect may negligently design a sewer so that waste is carried toward rather than away from the house, he may design windows too small or too large, he may fail to put a handrail on a stairway, or he may specify that nails rather than bolts be used

to secure a sundeck. . . . In addition the architect may negligently fail to notice a defect in the work of a consultant he has hired to help prepare the plans and specifications. The architect would also probably be liable for damage caused by his failure to hire a consultant where a reasonable architect would have done so.

Negligence in design can be based on negligently incomplete specifications as well as on complete but erroneous ones. The plans and specifications must be complete and unambiguous. For example, specifications are negligently prepared if they are so indefinite that a contractor can bid as if he were going to use first-class materials and then build using inferior materials. If measurement of a material is involved, the specification must distinguish between dry and liquid states, or loose or tight packing, where there is any chance of ambiguity.⁵

Since that analysis, judicial opinions have provided other illustrations. For example, cases have involved the following claims, many of which were successful:

1. misrepresenting existing topography⁶
2. relying on an out-of-date map and building on land not owned by the owner⁷
3. specifying material that did not comply with building codes⁸
4. positioning the building in violation of setback requirements⁹
5. failing to inform client of potential risks of using certain materials¹⁰
6. failing to advise client about potential problems with new product¹¹

⁵Comment, 55 Calif.L.Rev. 1361, 1370–71 (1967). The author's footnotes to cases are omitted. Cases involving surveyors' mistakes are collected in Annot., 117 A.L.R. 5th 23 (2004).

¹¹*White Budd Van Ness Partnership v. Major-Gladys Drive Joint Venture*, 798 S.W.2d 805 (Tex.Ct.App.1990), cert. denied, 502 U.S. 861 (1991).

7. failing to inform the client that it could not make a reliable judgment as to materials, and failing to collect information about such materials¹²
8. failing to inform the client that the design professional had acquired information that water temperature was too low for operating a pump¹³
9. drafting ambiguous sketches, which caused extra work¹⁴
10. designing a house that could not be built by tradespeople in the community where the project was to be built¹⁵
11. designing closets too small for the clothing to be contained in them¹⁶
12. designing a project that greatly exceeded the client's budget¹⁷
13. specifying untested material solely because of seller's representations¹⁸
14. designing inadequate solar heating system¹⁹
15. failing to consider energy costs²⁰
16. failing to disclose an underground high-voltage live wire²¹
17. failing to include owner as named insured and omitting indemnity clause²²
18. failing to advise a need for use permit²³
19. failing to design a prison that would make it "take-over proof"²⁴
20. failing to design a prison that would avoid prisoner suicide²⁵
21. failing to know of local building codes and safety laws²⁶
22. specifying a competition diving board for a grade school and failing to warn users of dangers²⁷
23. failing to design a road sign which would cause lesser injuries if crashed into by a motorist²⁸
24. failing to identify a deficiency in an engineer's report obtained by the owner²⁹
25. failing to design an apartment building so that it is accessible by the disabled³⁰
26. failing to design a preengineered metal building so that it can be built using an autowelder, the standard industry equipment³¹

Claims, relating to the construction process phase, again mostly successful, were as follows:

1. allowing material not approved by code to be installed³²
2. ordering excess fill to be placed without consulting a soil tester³³
3. failing to make changes needed to comply with codes³⁴
4. failing to condemn defective work³⁵
5. scheduling and coordinating incompetently³⁶

6. failing to properly exercise supervisory powers³⁷
7. failing to warn an experienced contractor of general precautions not known in the industry³⁸
8. failing to engage and check with a consultant³⁹
9. failing to stop work after discovering contractor using unsafe methods⁴⁰
10. issuing payments or certificates negligently⁴¹
11. failing to warn of bankruptcy when paying for materials in contractor's possession⁴²
12. failing to observe design deviation when checking shop drawings⁴³
13. failing to give instructions, issue change orders, and conduct inspections⁴⁴
14. allegations of gross negligence: allowing trusses to be erected without first inspecting the welds, not fixing discrepancies between the shop drawings and the trusses as fabricated, not ensuring that the trusses were actually tested, and not discovering that the fabricator had never fabricated steel trusses before⁴⁵

The remainder of this chapter discusses the different types of claims brought against design professionals. Before reading about these different theories of recovery, it is helpful to know the nature of claims brought against design professionals. Victor O. Schinnerer & Company, the largest insurer of design professionals, has reviewed its internal files dating back to the late 1950s to analyze the type, frequency, and severity of claims filed. It determined that slightly over 75 percent of claims are for property damage or economic loss, with nearly 55 percent of those brought by the owner/client. Of the remaining quarter consisting of personal

injury claims, one-third are brought by construction workers and the other two-thirds involve nonworker injury.⁴⁶

The frequency of claims peaked between 1978 and 1985 and has leveled off between 1998 and 2004 (the last year available). The frequency and severity of claims are greatest on projects involving houses or townhouses, schools or colleges, and condominiums. About half of all claims are brought before project completion, and 95 percent are brought within five years of completion.⁴⁷

SECTION 14.04 Specific Contract Standard

A. Likelihood of Specific Standard

Contracting parties can by agreement determine the standard of performance. Because the client–design professional relationship is created by agreement, a primary source of any agreed-on standard is the contract itself. Most disputes between the client and the design professional do not involve a specific contractually designated standard. Rather, they involve a general standard not set forth in the contract, such as the professional standard to be described in Section 14.05, or an outcome-oriented standard, such as implied warranty described in Section 14.07.

Why do most contracts fail to specifically state how the design professional is to perform? First, many relationships are created without any written agreement—by handshake arrangements. Second, many are made by casual letter agreements drafted by the design professional that are not likely to describe specific standards. Third, those relationships created by assent to standard contracts published by professional associations such as the American Institute of Architects (AIA) do not, despite their completeness as to services and what the design professional is not responsible for, specifically describe how the work will be done. However, in 2007, the AIA for the first time by contract specified that the architect is subject to the professional standard. Document B101, Section 2.2, reproduced in Appendix A, states that the “Architect shall perform its services consistent with the professional

⁴⁶M. SCHNEIER, CONSTRUCTION ACCIDENT LAW: A COMPREHENSIVE GUIDE TO LEGAL LIABILITY AND INSURANCE CLAIMS, 262 (1999).

⁴⁷Jones, Jr., *Looking Back to Look Ahead: Benchmarking Design Professional Liability Claims*, 28 Constr.Litg.Rep., No. 3, March 2007, p. 103.

skill and care ordinarily provided by architects practicing in the same or similar locality under the same or similar circumstances.” Similarly, the Engineers Joint Contracts Documents Committee (EJCDC) in Paragraph 6.01A of its 2002 E-500 (owner–engineer contract), reproduced in Appendix G, states that the standard of care “will be the care and skill ordinarily used by members of the subject profession practicing [engineering] under similar circumstances at the same time and in the same locality,” and that the engineer “makes no warranties, express or implied, under this Agreement or otherwise. . . .”

Even if the standard of performance is discussed in advance—something that is rare—it may not be included in the written contract: The design professional may not want it included, or the client may think it unimportant. Both may believe that any assurances as to outcome are simply nonbinding opinions or expectations.

Large architectural and engineering firms commonly include in their standard agreements language specifying the professional standard described in Section 14.05. They do so for two reasons. First, the design professional may wish to refine elements of the professional standard that may operate to her advantage. For example, she may include a provision stating that she is to be compared to other design professionals *in her community*, to avoid any contention that she is to be compared to design professionals *with whom she competes*. Second, and more commonly, the specification of the professional standard is accompanied by language stating that the architect will not be held to any express or implied warranty standard, a standard often more rigorous than the professional standard.⁴⁸ Clients who are in a powerful bargaining position and experienced in design work, such as public entities, often resist such clauses, seeking to preserve the possibility of later claiming the design professional should be held to a stricter standard.

If challenged, the design professional will justify such a clause by stating that its professional liability insurance coverage will not include contractual risks that deviate from the professional standard. If the matter cannot be resolved one way or the other, the language may be omitted, leaving the standard to that applied by law. Yet sometimes contractually specified standards of performance are created. Looking at some of them can provide a useful backdrop to the nonspecific standards described in Sections 14.05 through 14.07.

B. Client Satisfaction

Sometimes the client’s obligation to pay arises only if the client is satisfied with the work of the design professional. Such a contract may be interpreted to be a promise by the design professional to satisfy the client. Although design professionals generally seek to avoid such relatively one-sided agreements, if clear evidence exists of such an agreement it will be enforced.

If satisfaction is a condition of the client’s obligation to proceed and to pay, the client need not pay unless it is satisfied or waives this performance measurement. Any legal obligation that may arise must then be based on unjust enrichment created by the client using the work of the design professional.

If satisfaction has been promised, failure to perform requires the design professional to compensate the client for any losses the latter may have suffered because of the breach. For example, if a breach caused the project to be delayed or abandoned, the design professional is accountable for any foreseeable losses that can be established with reasonable certainty and that could not have been reasonably avoided.

Although the design professional may, however unwisely, risk the fee, strong evidence of such a risk assumption should be produced before she must respond for losses caused by her failure to satisfy the client.

There are two standards of satisfaction.⁴⁹ If performance can be measured objectively, the standard is reasonable satisfaction. Would a reasonable person have been satisfied? Objective standards are more likely to be applied where performance can be measured mechanically. For example, if an engineer agreed with a manufacturer that the manufacturer would pay if satisfied with the performance of a particular machine designed by the engineer, the obligation to pay would require that a reasonable manufacturer be satisfied.

More personal performance invokes a subjective standard. Suppose an artist agrees to paint a portrait that will satisfy the person commissioning the portrait. The latter must exercise a good-faith judgment and must be genuinely dissatisfied before she is relieved of the obligation to pay. If, for example, the person refused to view the portrait

⁴⁸See Section 14.07.

⁴⁹*First Nat’l Realty v. Warren-Ehret Co.*, 247 Md. 652, 233 A.2d 811 (1967) (collecting authorities). For a careful analysis, see *Morin Building Products Co. v. Baystone Constr. Co.*, 717 F.2d 413 (7th Cir.1983).

or give it sufficient light to judge its quality, any judgment was not exercised in good faith.

In practice, the two standards may not operate differently. In the preceding example, if judge or jury thought the performance satisfactory it would take a strong showing by the person commissioning the portrait that she was genuinely dissatisfied. As a rule, the subjective satisfaction standard arises in the design phase, particularly in aesthetic matters. However, in standard commercial projects an objective standard may be invoked.

What about a design professional's performance during construction? If the performance related to delicate matters, such as how the design professional handled the contractor or public officials or how she dealt with site conflicts, a subjective standard may be applied. Roughly speaking, though, design is more likely to be measured subjectively, whereas contract administration is more likely to be measured objectively—another illustration of the important difference between design and nondesign site services.⁵⁰

Suppose the client is justified in refusing to pay. This may create a forfeiture (performance by one party for which she is not compensated). In such a case, the loss to the design professional may substantially exceed the loss to the client that would occur if the client, though dissatisfied, were required to accept the design professional's work. Various legal doctrines, among them waiver (party entitled to performance accepted less than full or proper performance) and estoppel (party misled into not performing in accordance with contract by other party's representation that it would accept performance other than that promised), can be employed to avoid forfeiture. But if the language makes clear that the risk of forfeiture was clearly assumed by one party to the contract, the clause will be enforced even if this would create a forfeiture. (In some jurisdictions exceptions to this rule exist in transactions involving the purchase of land.)

C. Fitness Standard

A more specific performance standard than satisfaction can be contractually created: The parties may agree that the completed project will be suitable or fit for those purposes for which the client entered into the project.

For example, the client who plans a luxury residence usually wants a house suitable for a person of her means and taste. In addition to wanting the normal requirements for any residence, such as structural stability, shelter from the elements, and compliance with safety and sanitation standards, the client may want a house that is admired by those who enter it or a residence that can facilitate closing business deals or making business contracts. The client may hope that the opulence of the residence will make social events successful.

The client who plans a commercial office building wishes to profit from renting space. To do so, suitable tenants at an economically adequate rent must be found. Such a client assumes that the planned use of the structure will be permitted under zoning laws and that the structure will comply with the applicable building codes and zoning regulations relating to materials, safety, density, setback regulations, and other land use controls. In addition, the client who builds an unusually designed office building may hope the structure will attract national architectural interest.

The client who wishes to build an industrial plant generally assumes that the plant when completed will be adequate to perform anticipated plant activities. The building is expected to comply with applicable laws relating to public health and safety.

Proper design requires that the design professional consider client objectives such as those discussed in the preceding paragraphs. Some items mentioned in those paragraphs will be discussed and included in the client's program. Some of the matters discussed in the preceding paragraphs would be assumed and probably not discussed. One would not expect client and design professional to discuss the necessity of complying with building codes or regulations dealing with health and safety. Yet beyond these basic objectives, discussions may have taken place of economic and social goals less directly connected with basic design objectives.

One possible standard to measure the performance of the design professional is whether the project accomplishes the client's objectives. Put another way, is the structure suitable for the client's anticipated needs, or is it fit for the purpose for which it was built? Is the building an architectural success? Has the client attracted good tenants? Has plant production increased? Are the social events successful?

To determine whether suitability or fitness performance standards will be used to measure the design professional's obligation, it is important to look at any antecedent

⁵⁰*Jaeger v. Henningson, Durham & Richardson, Inc.*, supra note 43. (expert testimony not needed for claim based on site services).

negotiations, discussions, or understandings that may have preceded the client–design professional contract or may have occurred during the course of the design professional’s activities.

Suppose client objectives were discussed during precontract negotiations or during the design professional’s design performance. Did the design professional give any assurances relating to the fitness or suitability of her design to accomplish particular client objectives, promises that the design would accomplish the objectives or just statements of opinion that these objectives would be achieved?

Suppose the design professional made statements relating to such matters. The design professional may have stated that a particular luxury residence would create an artistic stir within the client’s social circle. The design professional may have expressed a belief that suitable tenants could be found or that someday a particularly unusual office building would be considered an architectural landmark. She may have assured the client that the client could conduct certain activities on the premises.

To determine whether a statement makes a promise or expresses an opinion, the law looks at the definiteness with which the statement was made (“I am certain your cost per unit will decrease” versus “It’s my considered opinion you will improve productivity”), the degree to which the design professional’s performance can bring about that objective (“People will like the exterior design” versus “Your parties will be great successes”), and the degree and reasonableness of any reliance by the client on the statement (using certain types of machinery in a plant versus redecorating the interior of a house at great expense for the new social season). The more definite the statement, the more the outcome is within the control or professional expertise of the design professional, and the more likely the client has justifiably relied on the statement, the more likely it is that the law will find there has been a promise.

If the statement was made before a contract was formed, a design professional may contend that because of the parol evidence rule, such statements cannot be proved. Although results are not always consistent, by and large the client will be permitted to testify as to these statements.

The design professional should avoid assuring the client that particular objectives will be achieved unless she is willing to risk the possibility of being held accountable if they are not. Assurances of certain matters should be given; for example, that the design will meet public land use controls, such as zoning laws and building codes. The design professional should avoid venturing into areas that

are beyond her expertise and require difficult predictions of the future.

D. Quantitative or Qualitative Performance Standards

Sometimes the contract between design professional and client contains a specific performance standard. For example, an engineer may make a contract with a manufacturer under which it was specifically agreed that the machine designed by the engineer would produce a designated number of units of a particular quality within a designated period of time.

Suppose the performing party finds that meeting the performance standard is extremely difficult or that the performance standard will require more time and money than it anticipated. In some extreme cases, the performance standard may be impossible to meet.

In such cases, two legal issues may arise. First, is the design professional entitled to be paid for the effort made in trying to perform to specifications? The contract may be onerous, but if this risk is assumed, the professional will not recover. As in satisfaction contracts, to avoid forfeiture interpretation doubts are resolved in favor of the performing party. If this cannot be done, the performing party will go uncompensated unless she can show that efforts she expended, although not fulfilling the performance standards, have benefited the other party. In most cases there will be no unjust enrichment and no recovery for the performing party—although it may benefit the other party to be shown that the performance standards were not possible.

Second, has the performing party breached by not accomplishing the objective? Again, this is a question of whether accomplishing the objective is not merely a condition on the client’s obligation to pay but also a promise by the performing party.

Obviously, performance standards place a heavy risk on the performing party. Yet they are attractive to clients because they objectively measure whether the client is getting what was promised. Such a standard can be an effective sales device for the designer.

E. Indemnification

The frequency of indemnification (process by which indemnitor promises indemnitee that indemnitor will see to it that the indemnitee will not suffer a loss when a claim

is made against indemnitee which should be responsibility of indemnitor) in construction contracts necessitates more complete treatment, which Chapter 31 provides. For the purposes of this section, note that clients increasingly demand that the design professional indemnify them against claims the client believes to be the responsibility of the design professional. Any design professional indemnification creates another specific contractual obligation, one potentially broader than the professional standard.

F. Cost Overruns Caused by Design

An Ohio public entity made a proposal requiring design professionals to pay the cost of construction change orders caused by the design professional. The professional societies and professional liability insurers objected, saying that the policy erroneously assumed that change orders are necessarily caused by negligence of the design professional and that the professional liability insurance policies would not cover such a form of strict liability. After these objections were made, the Ohio agency withdrew the proposal. However, this is probably not the last such attempt to charge cost overruns to the design professional.

Attempts have been made—mainly by clients but also by design professionals—to recognize the likelihood of cost overruns due to design and to deal with them in various ways in the contract. One public contract in Virginia specified that the design professional would be responsible for cost overruns related to design if the overruns exceeded three percent of the contract price, without any need to show that the design professional had not performed in accordance with the professional standard. Even more, as noted in the preceding paragraph, some clients insist that all overruns due to design be the responsibility of the design professional whether or not the designer has failed to perform in accordance with the professional standard. This form of strict liability would almost certainly not be insurable under normal professional liability policies.

It would be unfair to the contractor if the contractor submitted its bid without knowing that the architect was strictly responsible for all design overruns. If the contractor knew of such strict liability, it could infer that all questions of interpretation that arise during performance would be resolved against the contractor. This would affect its bid.

Looking at this problem from the standpoint of a design professional, people interested in limiting design professional liability have suggested including provisions

stating that the design will inevitably contain errors, omissions, conflicts, and ambiguity, all of which will require clarification and correction during construction. They suggest the client be advised that producing perfect documents is impossible and that some design decisions are more efficiently deferred for the benefit of the client until construction is underway and actual field conditions exist. Finally, such people advise that a contract contain a provision relieving the design professional from liability for all cost overruns up to a stated percentage of the construction cost.

G. Contractual Diminution of Legal Standard

Specific contractual standards are usually higher than the professional standard. Suppose, however, that the agreement between the client and the design professional specifies a lower standard. Because this situation more directly involves the extent to which the legal standard can be varied, it is discussed later, in Section 14.05D.

SECTION 14.05 The Professional Standard: What Would Others Have Done?

A. Defined and Justified:

City of Mounds View v. Walijarvi

In *City of Eveleth v. Ruble*⁵¹ the Minnesota Supreme Court stated,

(1) In an action against a design engineer for negligence, the applicable legal principles are held to be:

(a) One who undertakes to render professional services is under a duty to the person for whom the service is to be performed to exercise such care, skill, and diligence as men in that profession ordinarily exercise under like circumstances.

(b) The circumstances to be considered in determining the standard of care, skill, and diligence to be required include the terms of the employment agreement, the nature of the problem which the supplier of the service represented himself as being competent to solve, and the effect reasonably to be anticipated from the proposed remedies on the balance of the [water] system.

⁵¹302 Minn. 249, 225 N.W.2d 521 (1974).

(c) Ordinarily, a determination that the care, skill, and diligence exercised by a professional engaged in furnishing skilled services for compensation was less than that normally possessed and exercised by members of that profession in good standing and that the damage sustained resulted from the variance requires expert testimony to establish the prevailing standard and the consequences of departure from it in the case under consideration.⁵²

Four years later, the same court was invited to jettison this standard and replace it with the implied warranty standard, an outcome-oriented standard (discussed in Section 14.07). A portion of that second opinion is reproduced here.

⁵²225 N.W.2d at 522.

CITY OF MOUNDS VIEW v. WALIJARVI

Supreme Court of Minnesota, 1978. 263 N.W.2d 420.
[Ed. note: Footnotes omitted.]

TODD, Justice.

[Ed. note: The city became apprehensive because of dampness in the basement of an addition that was being added to a city building. The architect wrote to the city that its design would, if executed properly, generate a “water-tight and damp-free” basement. But problems grew worse, and corrective work was needed.]

The city sued the architect, based on claims of negligence, express warranty, and implied warranty.

The trial court held that the language in the letter asserted to constitute a warranty to be merely an expression of opinion and that Minnesota did not recognize implied warranty of a perfect plan or an entirely satisfactory result in an architectural service contract. The trial court granted the architect’s motion for summary judgment (no trial needed) on the warranty claims. The Minnesota Supreme Court held that the express warranty claim failed because the contract required that modifications be written and signed by both parties and no evidence had been introduced of any written agreement by the city. The opinion then dealt with implied warranty.]

. . . As an alternative basis for recovering damages from the architects, the city urges that we adopt a rule of implied warranty of fitness when architectural services are provided. Under this rule, as articulated in the city’s brief, an architect who contracts to design a building of any sort is deemed to impliedly warrant that the structure which is completed in accordance with his plans will be fit for its intended purpose.

As the city candidly observes, the theory of liability which it proposes is clearly contrary to the prevailing rule in a solid majority of jurisdictions. The majority position limits the liability of architects and others rendering “professional” services to

those situations in which the professional is negligent in the provision of his or her services. With respect to architects, the rule was stated as early as 1896 by the Supreme Court of Maine (*Coombs v. Beede*, 89 Me. 187, 188, 36 A.104 [1896]):

In an examination of the merits of the controversy between these parties, we must bear in mind that the [architect] was not a contractor who had entered into an agreement to construct a house for the [owner], but was merely an agent of the [owner] to assist him in building one. The responsibility resting on an architect is essentially the same as that which rests on the lawyer to his client, or on the physician to his patient, or which rests on anyone to another where such person pretends to possess some skill and ability in some special employment, and offers his services to the public on account of his fitness to act in the line of business for which he may be employed. The undertaking of an architect implies that he possesses skill and ability, including taste, sufficient to enable him to perform the required services at least ordinarily and reasonably well; and that he will exercise and apply in the given case his skill and ability, his judgment and taste, reasonably and without neglect. But the undertaking does not imply or warrant a satisfactory result.

The reasoning underlying the general rule as it applies both to architects and other vendors of professional services is relatively straightforward. Architects, doctors, engineers, attorneys, and others deal in somewhat inexact sciences and are continually called on to exercise their skilled judgment in order to anticipate and provide for random factors which are incapable of precise measurement. The indeterminate nature of these factors makes it impossible for professional service people to gauge them with complete accuracy in every instance. Thus, doctors cannot

promise that every operation will be successful; a lawyer can never be certain that a contract he drafts is without latent ambiguity; and an architect cannot be certain that a structural design will interact with natural forces as anticipated. Because of the inescapable possibility of error which inheres in these services, the law has traditionally required, not perfect results, but rather the exercise of that skill and judgment which can be reasonably expected from similarly situated professionals. As we stated in *City of Eveleth v. Ruble*, 302 Minn. 249, 253, 225 N.W.2d 521, 524 (1974): "One who undertakes to render professional services is under a duty to the person for whom the service is to be performed to exercise such care, skill, and diligence as men in that profession ordinarily exercise under like circumstances." See, also, *Kostohryz v. McGuire*, 298 Minn. 513, 212 N.W.2d 850 (1973).

We have reexamined our case law on the subject of professional services and are not persuaded that the time has yet arrived for the abrogation of the traditional rule. Adoption of the city's implied warranty theory would in effect impose strict liability on architects for latent defects in the structures they design. That is, once a court or jury has made the threshold finding that a structure was somehow unfit for its intended purpose, liability would be imposed on the responsible architect in spite of his diligent application of state-of-the-art design techniques. If every facet of structural design consisted of little more than the mechanical application of immutable physical principles, we could accept the rule of strict liability which the city proposes. But even in the present state of relative technological enlightenment, the keenest engineering minds can err in their most searching assessment of the natural factors which determine whether structural components will adequately serve their intended purpose. Until the random element is eliminated in the application of architectural sciences, we think it fairer than [sic] the purchaser of the architect's services bear the risk of such unforeseeable difficulties.⁵³

The city suggests that many of the design-related tasks performed by modern architects are routine and carry no risk of error

⁵³Our decision in *Robertson Lumber Co. v. Stephen Farmers Co-op Elev. Co.*, 274 Minn. 17, 143 N.W.2d 622 (1966), does not compel a different result. In that case, we affirmed an award of damages for a defectively constructed grain storage building on a theory of implied warranty. The contract in question, however, was treated as a construction contract and not an architectural contract. This distinction for warranty purposes between "professional" and general contracting services is well established in other jurisdictions. See, e.g., *Kriegler v. Eichler Homes, Inc.*, 269 Cal.App.2d 224, 74 Cal.Rptr. 749 (1969); *Stuart v. Crestview Mutual Water Co.*, 34 Cal.App.3d 802, 110 Cal.Rptr. 543 (1973); *Schipper v. Leavitt & Sons, Inc.*, 44 N.J. 70, 207 A.2d 314 (1965); *Weeks v. Slavick Builders, Inc.*, 24 Mich.App. 621, 180 N.W.2d 503, aff'd, 384 Mich. 257, 181 N.W.2d 271 (1970).

if they are performed with professional due care. It is argued that with respect to such tasks, the premise on which the traditional rule rests is inoperative, making the adoption of the implied warranty theory fully proper. We note, however, that architectural errors in relatively simple matters are quite easily handled under the existing cause of action for professional negligence.

Moreover, if implied warranties are held to accompany only uncomplicated architectural endeavors, the finder of fact will be forced in every case to determine, as a preliminary matter, whether the alleged architectural error was made in the performance of a sufficiently simplistic task. Defects which are found to be more esoteric would presumably continue to be tried under the traditional rule. It seems apparent, however, that the making of any such threshold determination would require the taking of expert testimony and necessitate an inquiry strikingly similar to that which is presently made under the prevailing negligence standard. We think the net effect would be the interjection of substantive ambiguity into the law of professional malpractice without a favorable tradeoff in procedural expedience.

In addition, we observe that the ills which spurred the creation and expansion of the implied warranty/strict liability doctrine are not really present in this case or in the architect-client relationship generally. The implied warranty of fitness originated primarily as a means of facilitating the legitimate interests of the consuming public and bringing common-law remedies into step with the practicalities of modern industrialism. The outmoded requirement of contractual privity, coupled with manufacturers' sweeping disclaimers of liability, frequently operated to deny effective remedies to those who purchased commercial products at the t of a multi-tiered production and distribution network. See, generally, Prosser, *Torts* (4 ed.) §§ 97, 98. The introduction of the implied warranty doctrine created an effective remedy by allowing plaintiffs to proceed directly against the offending party without reliance on express contractual warranties.

The relationship between architect and client is markedly different. For a client, architectural services are hardly produced by a faceless business entity, insulated by a network of distributors, wholesalers, and retailers. Architects and clients normally enjoy a one-to-one relationship and communicate fairly extensively during the course of the relationship. When a legal dispute arises, the client has no trouble locating the source of his problem, and a remedial device like the implied warranty is largely unnecessary.

Finally, while it is undoubtedly fair to impose strict liability on manufacturers who have ample opportunity to test their products for defects before marketing them, the same cannot be said of architects. Normally, an architect has but a single chance to create a design for a client which will produce a defect-free

structure. Accordingly, we do not think it just that architects should be forced to bear the same burden of liability for their products as that which has been imposed on manufacturers generally.

For these reasons, we decline to extend the implied warranty/strict liability doctrine to cover vendors of professional services. Our conclusion does not, of course, preclude the city

from pursuing its standard malpractice action against the architects and proving that the basement area of the new addition was negligently designed. That issue remains for the trier of fact in the district court.

Affirmed.

OTIS, J., took no part in the consideration or decision of this case.

That the court felt compelled to justify at some length its decision made four years earlier in *City of Eveleth v. Ruble* demonstrates some dissatisfaction with the professional standard. This is reflected in Section 14.06A, dealing with exceptions to the requirement of expert testimony; in Section 14.07, comparing the professional standard with that of implied warranty (including claims under consumer protection laws); and in Section 14.11A, analyzing some of the current controversies relating to professional liability.

Some refinements should be made in the professional standard rule. First, against whom is the conduct of the professional measured? Usually it is assumed that such conduct is measured against the conduct of others in the professional's locality. For example, if the professional practices in a small town, it is usually assumed that she should not be compared with professionals who practice in a large city. To some degree, this is based on the reasonable expectations of the client, and to some degree, on the likelihood that advances in the profession come first to large urban areas. The AIA Document B101-2007, Section 2.2, uses the locality standard.

It is more appropriate, however, to measure the conduct against those professionals with whom the defendant competes. Some design professionals in smaller cities compete against design professional firms in large metropolitan areas. Similarly, the choice made by the client may be one based on a comparison of those design professionals who are established in a particular specialty, and those specialty firms may be scattered in small towns, cities, and large urban areas. Some courts have held that an architect would not be measured solely against those in the locality in which she practices.⁵⁴ This may set a trend for a more refined application of the professional standard.

⁵⁴*Hill Constr. Co. v. Bragg*, 291 Ark. 382, 725 S.W.2d 538 (1987), opinion after remand on different issue, 297 Ark. 537, 764 S.W.2d 44 (1989); *Underwood v. WaterSlides of Mid-Am., Inc.*, 823 S.W.2d 171 (Tenn.App.1991); *Parsons Main, Inc.*, ASBCA Nos. 51355, 51717, 02-2 BCA ¶31,886.

Similarly, differentiations are not always made regarding the precise nature of the standard to which the design professional will be held. Two authors developed a classification system for determining whether engineers are liable for design errors. They divided the state of the art into the cutting edge, the open literature, acceptance by the profession, and what they refer to as "the undergraduate horizon." The authors concluded that in the ordinary case, the challenged engineer should be measured against the "informed" engineer, who, they assert, practices in accordance with the state of the art accepted by the profession.⁵⁵

The burden of establishing a failure to comply with the professional standard is generally on the claimant who seeks to transfer her loss to the professional.⁵⁶

B. Expert Testimony and the Professional Standard

As noted in the preceding section, expert testimony is usually required to support a finding that the professional standard has not been met.⁵⁷ Because this has been a central issue in professional liability claims, it is discussed in Section 14.06.

C. Building and Housing Codes: The Americans with Disabilities Act

Design professionals are generally expected to consider and comply with building and housing codes.⁵⁸ Failure

⁵⁵Peck & Hoch, *Liability of Engineers for Structural Design Errors: State of the Art Considerations in Defining the Standard of Care*, 30 Vill.L.Rev. 403 (1985).

⁵⁷See Farrug, *The Necessity of Expert Testimony in Establishing the Standard of Care for Design Professionals*, 38 DePaul L.Rev. 873 (1989) (attacking Illinois law, which does not require expert testimony in cases of professional malpractice).

⁵⁸See Sections 14.03, 14.05C.

to design in accordance with such codes is almost always considered to violate the obligation the design professional owes her client. Code compliance is considered one aspect of meeting the professional standard imposed by law on design professionals. In addition, the code violation may grant private rights to those who are damaged by the violation. This occurs if the statute specifically designates that a violation gives private rights to individuals damaged by the violation or if the statute is so interpreted.⁵⁹

Building codes can determine design, materials, and construction methods. Design specifications, performance standards, or a combination of the two is used. Codes provide minimum standards to protect against structural failures, fire, and unsanitary conditions.

Housing codes are of relatively recent vintage. They have gone beyond structure, fire, and basic sanitation to include light, air, modern sanitation facilities, maintenance standards, and occupancy density rules. Sometimes they are used to measure the implied warranty of habitability owed tenants by landlords.

Although there is some movement toward statewide and even federal building codes, local codes predominate. In addition to reflecting extreme local variations in subsurface conditions and climate, local control reflects strong democratic roots in the local community. (Yet, as noted in this subsection, the federal government recently enacted the Americans with Disabilities Act, part of which deals with building requirements.)

Codes generally fall into one of three major types developed by various private associations, such as fire underwriters and local building officials. Choice within these types is often regional, with one part of the country choosing a particular type. Yet frequent local modification and variant local interpretation have made for variations. These, along with unrealistic and unneeded standards, often dictated by local special interest groups, have undoubtedly raised construction costs.

As shall be seen in some of the cases noted in this section, codes are often difficult to understand and are subject to uneven if not whimsical local interpretation. Unrealistically high code standards often exclude low- and moderate-income people from certain communities.

Moreover, the codes are not always enforced and can lead to bribery.

Some of the strengths and weaknesses of local building codes can be demonstrated by two cases. *Greenhaven Corp. v. Hutchcraft & Associates*, an Indiana case,⁶⁰ involved a claim by an architect against a client for fees for providing plans for remodeling a building. The preliminary plans called for two exits from the top floor, but the owner's representative, a contractor, requested that the plans be altered to provide for only one exit. The architect complied with this request. This would have violated the building code, but the project was abandoned.

The court noted that the architect impliedly promises to draw plans and specifications that comply with local codes. But it held that parties can contract for nonconforming plans—that contracting parties can make any agreement, as long as it is not illegal or contrary to public policy.

The court stated that neither party contended that an agreement permitting nonconforming plans was contrary to public policy. Also, the court stated that the public was not harmed by such an agreement. Before the building could have been occupied, the fire marshal would have had to approve by issuing an occupancy permit. If the fire marshal had not issued such a permit, the parties might have been able to obtain a variance or change the plans to conform to the requirements. In either case, the court found the public was protected regardless of the agreement between the parties. It also noted that the availability of variance procedures encourages nonconforming plans.

The court showed little respect for the building codes, but its language also recognized the flexibility achieved through the variance process. Although variance provides for flexibility—very useful if codes become too rigid and out of touch with reality—such a system can also lead to corruption.

The second case, *Edward J. Seibert, A.I.A., Architect and Planner, P.A. v. Bayport Beach and Tennis Club Association, Inc.*,⁶¹ arose in Florida. The issue was whether the architect had designed in accordance with the local building code. The dispute also involved a fire exit. The architect had designed each second-floor dwelling unit with one independent unenclosed set of stairs leading directly from the front door of each unit to the ground.

⁵⁹*Huang v. Garner*, 157 Cal.App.3d 404, 203 Cal. Rptr. 800, 804–06 (1984), rev'd on other grounds, *Aas v. Superior Court*, 24 Cal.4th 627, 12 P.3d 1125, 101 Cal.Rptr.2d 718 (2000).

⁶⁰463 N.E.2d 283 (Ind.Ct.App.1984).

⁶¹573 So.2d 889 (Fla.Dist.Ct.App.1990), review denied, 583 So.2d 1034 (Fla.1991).

The completed plans were submitted to the city's chief building inspector, who was also the chief code enforcement officer. The inspector's interpretation of the building code led him to conclude that because of the size of the units and because the exit was unenclosed, the single unenclosed exit design complied with the code. After the fire department approved the plans, the building inspector issued a building permit, and the units were ultimately built according to these plans.

Two years later, the individual condominium owners assumed control of the association and filed a claim against a number of parties, including the architect, for various defects. Although the jury exculpated the architect for many defects, it found him liable for the improperly designed fire exit.

To determine whether there had been a violation, the court extensively examined the testimony of experts called by the parties. The association presented an expert witness—a structural engineer who testified that in his interpretation the exit did not comply with the code.

The architect presented two experts who testified to the contrary. One was a professional engineer who testified he had been employed by the Southern Building Code Congress, which had promulgated the code, and that during his employment he was responsible for building code changes, hearings, plans, reviews, and code interpretation. The engineer testified that the architect's design complied with the code and was consistent with safe design as intended by the code. Yet the jury, as noted, found the architect liable for the cost of adding a second exit.

The appellate court noted that the jury needed to know what the code required and that such information could be presented to the jury by means of expert testimony. The court stated that expert testimony could be presented if the jury needed to understand the evidence better or to determine a key issue in the case, but experts could not testify as to how the code should be interpreted. This was a question of law. The court held that the trial court should have interpreted the meaning of the code and instructed the jury concerning that meaning.

Finally, the appellate court held the trial judge should have concluded that the architect had complied with the code, because the chief building inspector and chief code enforcement officer stated the design did comply. This was relied on by the architect, and the building was constructed with the approved design. The court noted that even though a code could be interpreted in more than one

way, the law will follow the interpretation of the agency that has authority to implement the code. The appellate court concluded by stating a judgment should have been entered in favor of the architect.

It is difficult to quarrel with the conclusion that the architect can rely on the interpretation of the building inspector. However, the fact that codes can be interpreted in various ways can make compliance difficult and encourage corruption.

The Americans with Disabilities Act (ADA)⁶² enacted in 1990 generated building standards as part of an overall policy to protect disabled persons, a group that has long been subjected to discrimination in employment, housing, education, transportation, public accommodations, recreation, and health services. The act comprehensively defines the treatment of disabled persons, imposes significant new obligations on employers, and (most importantly for design professionals) mandates that commercial and public accommodations be accessible to people with disabilities.

Title 3 of the ADA states that existing buildings, new constructions, and alterations are governed by the requirement that individuals with disabilities have access to almost all businesses and public places. The rules exempt private clubs, religious institutions, residential facilities covered by fair housing laws, and certain owner-occupied inns.

Many of the details will be expressed in regulations (Americans with Disabilities Accessibility Guidelines) provided by the U.S. Architectural and Transportation Barriers Compliance Board. The guidelines are based largely on existing American National Standards Institute (ANSI) standards. Construction completed after January 26, 1993, must be readily accessible to and usable by people with disabilities. Even more important, the ADA requires removal of architectural barriers in existing buildings if the structure is considered a place of public accommodation. There are some exceptions, such as removal not being readily achievable. Achievability is defined by the guidelines as "easily accomplishable and able to be carried out without much difficulty or expense." The regulations take into account the nature and cost of removal, the financial resources of the party involved, and the impact of removal on the operation of the site and on profitability. These factors permit a case-by-case approach.

⁶²Pub.L. No. 101-336, 104 Stat.327 (1990) codified in 42 U.S.C.A. § 12101 et seq.

Alterations to a place of public accommodation built after January 26, 1992, must ensure to the maximum extent feasible that the altered portions are readily accessible to and usable by disabled people, including those who use wheelchairs. The ADA defines certain areas of a building as having a “primary function.” In those areas there are additional requirements. Not only must the design conform to Title 3 requirements, but the path of travel to the altered area to the maximum extent feasible must be accessible to and usable by the disabled. But if alterations to the path of travel cost more than 20 percent of the cost of the alterations, this is considered disproportionate and not required. The barriers are not limited to mobility impairments but can include those that impair vision, hearing, and reading.

If there is a violation of Title 3, the court can issue an order requiring the owner to modify physical facilities. The court can award monetary but not punitive damages, civil penalties, and attorneys’ fees. In considering civil penalties up to \$100,000 under Title 3, the court can take into account any good-faith efforts to comply.

Many state and local laws deal with the same topic. A state or locality can ask the federal attorney general to certify that its code complies with the ADA. If the certification is given, compliance with local or state building codes will also comply with the federal act. If local and state requirements are less stringent, the federal act will supersede them.

In effect, the ADA has created a form of national building code, but no entity is obligated under the ADA to review and approve drawings and specifications for compliance. Thus parties seeking to comply may not know whether they have discharged their obligation until a complaint is filed.

This legislation should provide a significant market for the services of design professionals. Some clients may seek to shift the ultimate risk of compliance to the design professional by providing that the design professional must certify that the design complies with the law. This certification may be uninsurable. Although liability resulting from negligent failure to produce a design that complies with codes is clearly insurable, contract provisions that turn the duty of compliance into a guarantee of compliance can create the possibility of exclusion from coverage.

May disabled persons who believe a building is not in compliance with the ADA sue the architect for violation of the act? That straightforward question does not yield a simple answer because the statute is unclear as to: the category of persons potentially liable under the act; the types of buildings subject to the act; and the types of activities for which one may be liable.

Two “liability” provisions of the ADA are inconsistent as to both the category of persons potentially liable under the act and the types of buildings subject to it. Section 302 broadly prohibits discrimination on the basis of disability “by any person who owns, leases (or leases to), or operates a place of public accommodation.”⁶³ A simple reading of this provision would exclude liability for architects (or contractors) by limiting liability to those who own, lease, or operate places of public accommodation.

However, § 303 (titled “Application”) appears to create a wider net of liability. In describing the conduct which constitutes “discrimination” under § 302, § 303 states:

As applied to *public accommodations and commercial facilities*, discrimination for purposes of Section 12182(a) of this title includes—

(1) a failure to *design and construct* facilities for first occupancy . . . that are readily accessible to and usable by individuals with disabilities. . . .⁶⁴ [Emphasis added.]

Section 303 appears to expand the universe of potentially liable persons and buildings from that described in § 302 in two respects: (1) § 303 adds a reference to “commercial facilities” and (2) § 303 imposes liability upon those who fail to “design and construct” conforming buildings. The “design and construct” language itself is ambiguous: will liability attach only to those who both design and construct the buildings (in which case the act would not apply to architects), or does it apply to those who either design or construct the buildings (in which case architects who design buildings not in conformity with the act and its regulations could be liable)? Not surprisingly, the courts have reached differing conclusions on the question of design professional liability under the ADA.⁶⁵

D. Contractual Diminution of Standard: Informed Consent

As noted in Sections 14.04 and 14.05, the professional standard is residual, applying only where the parties have not contractually agreed to a different standard. Usually any specific standard is more strict; the fact that the design professional did what others would have done will not in itself relieve the design professional. Suppose the design professional can point to a lower specific standard in the contract. Although rare, exploration of this possibility uncovers difficult problems.

Suppose the design professional would have selected X, a material that would have been designated by other professional designers because of its combination of durability, low maintenance, cost, and appearance. But the client, being aware of the tradeoffs orders that Y be used simply because it is the least expensive material. Suppose the material selected needed replacement earlier than the client expected. The client should not be able to recover any correction costs against the designer. The client and the designer agreed to a standard different from the professional standard—in this case, a lower standard. Assuming that this choice does not expose others to unreasonable risk of harm, the law will let the contracting parties decide whether the professional standard or something less will satisfy the designer's contractual obligations.

But suppose an applicable building code requires X, and Y is thought to be unsafe. The design professional makes the client aware of the code but the client insists on Y. What are the consequences? Several issues are presented:

1. Will the design professional be denied recovery for services that relate to selection of this material?
2. Will the design professional be given a defense if the client sues her for the cost of corrective work?
3. Will this selection expose the design professional to negligence claims by any third parties who suffer losses because of this choice?
4. Will the client and the design professional who violated the building laws (and any contractor who knowingly violates the code) be exposed to criminal prosecution?
5. Will this selection be grounds for disciplining the design professional under the registration laws?

The answers to these questions should be yes. Because of the importance of design, the transaction cannot, like the preceding one, be simply regarded as a private one

between client and design professional. In matters of safety, public protection takes precedence. *Bowman v. Coursey*⁶⁶ illustrates the difficulty in determining whether a particular agreement required performance less than that called for by the professional standard and whether such an agreement is simply a private arrangement or one that involved public safety.

Coursey hired Bowman to design a warehouse. Bowman's original plans included pilings beneath the walls in the floor slab. Because Coursey wanted to reduce the cost, the plans were revised. Coursey wanted to eliminate the pilings beneath the floor area. Bowman told Coursey the revisions would very likely mean the floor would be subject to settlement. Coursey asked how long it would take for the expected settlement to occur and, when it occurred, how the settlement could best be handled. After consulting with the soils engineer and an engineer for the lender, Bowman revised the design so that the floor slab would be reinforced to minimize the effect of any settlement. The revised plans were submitted to and approved by the local regulatory agency.

After construction began, problems developed with the quality of the construction work. Experts criticized the wall construction and the foundation design. A dispute arose over whether the architect Bowman had been negligent in determining the capacity of the piles beneath the wall area. Work on the project ceased. Coursey brought legal action against Bowman. A number of experts testified at the trial, most of whom testified that they would not have designed as did Bowman. They agreed that some settlement was inevitable, but none would say that the design was necessarily wrong or that the building was inadequate. One testified that the owner should be made aware of the possibility of settlement. An expert testifying for Bowman stated that although this was not the best design possible, it was adequate. He indicated that as long as Coursey knew what he was getting, allowing the floor to float was not a bad condition. Settlement, according to that witness, would occur in a controlled fashion because of the stiffness of the walls. This might be acceptable to the owner.

The court concluded that if the warehouse were built according to the revised plans, it would be less than perfect but the imperfections were not caused by a breach by the architect Bowman but by the client Coursey's preferring the imperfections to further financial outlays. When warned that the structure would settle, Coursey's response

⁶⁶433 So.2d 251 (La.App.), cert. denied, 440 So.2d 151 (La.1983).

had been that he could live with it. The court noted that additional pilings would have been necessary to prevent settlement, but none of the witnesses concluded the design was clearly wrong or engineeringly unsound. The design did not violate the building code, nor would it present a danger or hazard to people working within the building. The court concluded that the problems Coursey would face were a tradeoff for reduced building expenses.

Although the court concluded Bowman had not been negligent, its conclusion was based principally on Bowman's having pointed out all the problems to Coursey and Coursey's deciding to accept certain risks in exchange for a lower construction cost. The court emphasized that the controlled settlement that was likely would not present a danger or hazard to persons within the building and that the design did not violate the building codes. Yet the expert testimony indicated that the experts, though testifying in careful and guarded terms, indicated that they would not have designed the warehouse in the way chosen by Bowman with Coursey's concurrence. In essence, the parties agreed to a design below the standard other professionals would have used.

This problem also exposes another issue—one increasingly debated. Must any client's consent be informed? Taking a leaf from the law regulating the relationship between physician and patient, one writer advocated that architects be required to inform their clients of the costs and benefits of design choices.⁶⁷ This can, under certain circumstances, be related to the requirement of good faith and fair dealing, which augments the express obligations required of contracting parties. The uncertain dimensions of such a duty and the increasing concern for expanded liability even under the generally more protective professional standard may be why informed consent has not as yet received overt approval.

E. Tort and Contract

Often the claimant prefers tort law, with its more limited foreseeability defense and its more potent remedies. For example, if the claim is based on breach of contract it is very difficult to recover for emotional distress and almost impossible to recover punitive damages. However, a tort claim may justify recovery of damages for emotional distress and, if a breach of contract is also considered a tort, may justify recovery of punitive damages.

Yet there are advantages to bringing the claim for breach of contract if that alternative exists. The time limit for commencing a lawsuit is longer—often very much longer—when the claim is based on a breach of contract rather than on a tort theory. (However, if the period to start a tort claim does not begin until the claimant discovers it has a claim against the defendant, the time period may, in states with a short contract period, be longer than for a breach of contract.)

Unlike claims by patients against their doctors, claims by clients against their design professionals are more likely to involve specific provisions of a contract. If the client is permitted to bring its claim in tort, it may be able to bypass certain contract defenses, such as the parol evidence rule, the statute of frauds, or exculpatory provisions found in the contract between the client and its design professional.

In addition, claims based on commission of a tort sometimes run afoul of the economic loss rule. Although this is more commonly a problem when claims are made by third parties, as discussed in Section 14.08E, it can also be a problem when the claim is by one party to a contract against the other. Usually there is no difficulty when patients sue their doctors, because there will be a claim for physical harm to which claims for economic losses can be attached. Claims by owners or contractors against design professionals usually do not involve physical harm but are more likely to involve purely economic losses, those based on disappointed expectations. In such cases, a tort claim for economic losses may not be sustained.

Also, claims against design professionals are generally based on the failure of the design professional to perform in accordance with the professional standard discussed in Section 14.05A. Although there is some tendency toward incorporating into the contract language that deals with how the services are to be performed, claims are most commonly based on a term implied by law—the professional standard. In such cases, it has been relatively easy for courts to focus on the professional relationship, to assert that the relationship creates the duty, and to conclude that the contract is simply a way to implement the relationship. Although a tort claim requires that negligence be established, whereas a breach of contract claim is, at least in theory, “strict,” claims by clients against their design professionals, as mentioned earlier, usually employ the same standard—the professional standard—whether based on tort or contract. Only if the contract contains a refinement of the professional standard or imposes some

⁶⁷Note, 30 *Hastings L.J.* 729 (1979).

form of strict liability will liability be based on a standard other than the professional standard.

However, courts are careful not to allow clients to convert descriptions of the architect's services into either express warranties or independent representations. Otherwise, every breach-of-contract claim also would be a breach of warranty or a misrepresentation.⁶⁸

Although some courts seem to look for the gravamen, or essence, of the claim,⁶⁹ the client will likely be able to assert a claim based on the commission of a tort or the breach of a contract, whichever is more advantageous to the client. Very likely the client will be able to assert alternative claims. Only at the stage when the judge determines that the client must choose a remedy must the client choose the theory on which it is basing its claim.

Yet, as seen in Section 12.08B, many contracts between clients and design professionals, especially those published by the AIA, clearly express the rights and obligations of both parties and also provide contractual exculpation for the design professional. Where such exculpations appear unfair, the client will likely be given the option of maintaining the claim under tort law.

As noted earlier in this Section, the law gives the claimant the widest possible berth when bringing a claim against a professional whom it has retained, thus allowing the claimant to maintain an action either in contract or in tort, depending on which theory is most advantageous. Although this is accomplished by stating that the duty exists independent of the contract and the contract is only a means of executing the duty—a doubtful fiction at best—it seems clear that their contract is the underlying basis for claims by a client against the design professional. As indicated in Section 14.04A, the contract may be explicit as to specified duties and how they are to be performed or it may be explicit as

to duties but silent as to the standard. Many retention arrangements are silent as to specific duties and how they are to be performed.

A contract that details the duties of each party and allocates the risks of likely losses is a plan under which the parties agree to exchange their performance and apportion risks in a specific manner. To disregard that plan by allowing tort claims exposes design professionals to risks they did not plan to undertake and for which they were not paid. Clients should not have a choice of bringing their actions in contract or tort. In planned transactions, they should be required to base their claims on breach of the contract.

This suggestion is compatible with a desire to encourage people to plan their transactions by freeing them from the risk of open-ended tort exposure. Contracting parties who have suffered emotional distress can be protected by classifying their claims (though based on contract) as torts. Similarly, if there is a need to punish or deter, the claim can be based on tort law. Other claims based on failure to perform under the design professional–client relationship should be based solely on the contract.

SECTION 14.06 Expert Testimony

One important component of the professional standard is the need, at least as a general rule, for expert testimony. Section 14.06A looks at the exceptions to that requirement, 14.06B examines expert testimony generally and particularly in the context of claims against design professionals, 14.06C looks at criticism of the current system, and 14.06D approaches the problem from the vantage point of the expert witness.

A. Purpose and Exceptions to General Rule

In the judicial system, judges and juries make decisions. To do so, they may have to hear, evaluate, and judge testimony and exhibits that relate to technical matters unfamiliar to them. To help them, the law permits evidence of opinion testimony as an exception to the rules of evidence that generally bar opinion testimony. But before such opinion testimony can be admitted, the issue must be too difficult for a judge or jury to decide without technical assistance. Also, the person permitted to give opinions must possess the necessary education and experience to

⁶⁸See *Dickerson Internationale, Inc. v. Klockner*, 139 Ohio App.3d 371, 743 N.E.2d 984, 987-91 (2000) (architect's breach of contract is not also a misrepresentation, breach of warranty, or fraud); *SME Industries, Inc. v. Thompson, Ventulett, Stainback & Assocs., Inc.*, 28 P.3d 669, 676-77 (Utah 2001) (contract's description of architect's services is not an express warranty); *Howard v. Usiak*, 172 Vt. 227, 775 A.2d 909, 913-14 (2001) (no negligent misrepresentation); and *Rochester Fund Municipals v. Amsterdam Municipal Leasing Corp.*, 296 A.D.2d 785, 746 N.Y.S.2d 512, 515-16 (2002) (no express warranty or intentional misrepresentation).

⁶⁹*Lesmeister v. Dilly*, 330 N.W.2d 95 (Minn.1983); *Mac-Fab Products, Inc. v. Bi-State Dev. Agency*, 726 S.W.2d 815 (Mo.Ct.App.1987). See generally, W. P. KEETON et al., *TORTS*, 664-667 (5th ed. 1984).

be an “expert” on the issue for which the judge or jury needs help. Yet the expert is generally not allowed to give opinions that could determine the outcome of the case. This power is still retained by the judge and (when used) the jury. The importance of limiting expert testimony can be seen by the *Seibert* case, discussed in Section 14.05C, where the court held that the expert would not be allowed to testify on the proper interpretation of a building code.

The professional standard—generally—requires expert testimony to support any conclusion that the design professional has not performed in accordance with ordinary professional standards. There are important exceptions to this general rule. For example, in *City of Eveleth v. Ruble*, discussed in Section 14.05A, the plaintiff city had retained defendant engineer to design a new water treatment plant. After completion, two difficulties developed. First, the intake system that took water from a lake and processed it for distribution into the city’s transmission lines and storage reservoir proved inadequate. Second, pressure in the cast-iron distribution lines leading from the water treatment plant to users and storage facilities caused some leaded joints in the line to give way. Without any expert testimony, the trial court awarded the city damages against the engineer.

As to the diminished intake capacity, the court noted that the engineer knew the city had decided to build a new water plant to increase the intake capacity to a designated number of gallons per minute. The intake capacity was inadequate because there was a failure to anticipate changes in the lake level. The existing intake line that was laid on the bottom of the lake in approximately 40 feet of water was not the 18-inch line expected by the engineer but in some places was 16 inches and in other places only 12 inches in diameter.

The Minnesota Supreme Court concluded that the trial judge was able to assess the validity of these excuses “without the aid of expert testimony.” In drawing this conclusion, the court stated,

In our judgment, no expert opinion is needed to demonstrate that a design engineer charged with the responsibility of analyzing the piping and other structural characteristics of an existing plant should be as certain of the dimensions of the intake line as circumstances would possibly permit before recommending a plan the function of which depended on this critical measurement. It would seem clear that the examination of a photograph of the line would be of little value. Incomplete drawings made available to the Engineer at its request indicate that

the intake line was 18 inches in diameter at the point of terminus with the old plant, but we believe that common knowledge would reject this as adequate basis for careful analysis. We find the explanation given for the failure of the Engineer’s employees who entered the lake for the purpose of measuring the intake line unsatisfactory when the record shows that others employed for this same purpose by the City were able to obtain the true dimensions of the intake line without difficulties disproportionate to the importance of the task.⁷⁰

As to the excess pressures in the distribution lines causing the joints to give way, the trial court found that the high-service pumps that distributed the clear water to the storage tanks caused sudden surges “with consequent water hammer,” blowing out the lead-sealed joints. Evidently, the cast-iron distribution lines were buried in the ground and had been in use for approximately sixty years. The court concluded it would not be fair to hold the engineer to any “express or implied commitment that the City’s transmission lines would be trouble-free following the installation of the new facility.”⁷¹ The court stated that “it would not be reasonable to expect the Engineer to guarantee the performance of these lines under these circumstances.” The court relieved the engineer by concluding that expert testimony was required, because determining what type of pressure system should be used with pipes of this age was a technical question. In employing the professional standard, the court concluded,

Would a design engineer, in the exercise of that degree of care, skill, and diligence to be expected from this profession, knowing the line pressures which would be created by the operation of the high service pumps and knowing the age of the line and the character of its construction, have reasonably anticipated that it would fail in use? If uncertain, would he have employed tests or techniques of inspection which could have been employed and which would have been employed by a design engineer applying the requisite standards of skill and care which should have revealed the deficiencies in the line? If not, would such an engineer, being unable to ascertain the facts, have recommended the installation of devices such as those now recommended as a precaution against possible but unpredictable ruptures? We do not think that common knowledge affords answers to these questions.⁷²

⁷²Id. at 530.

The wide range of services often performed by the design professional in both design and construction phases will inevitably raise questions as to which services are sufficiently technical to require expert testimony and which are sufficiently nontechnical that the lay judge or jury needs no assistance. In many cases, the plaintiff cannot or chooses not to offer expert testimony and claims it is not needed, whereas the defendant contends that the lack of expert testimony bars any judgment of professional malpractice.

Claims based on design services as a rule require expert testimony. Choices that involve excavation,⁷³ design,⁷⁴ foundation sufficiency, structural stability, equipment and components,⁷⁵ protection against the elements,⁷⁶ energy efficiency,⁷⁷ surface water disposal,⁷⁸ and designing a sidewalk for a slope⁷⁹ are all matters that require expert testimony. Often they are technical areas for which the prime design professional will retain consultants. Whether such services are performed in-house or by outside consultants, they require decisions that should be made by professionals with specialized education and experience. Often these services must be performed only by people registered by the state, although this is not determinative.

Yet even where the services seem to be technical in nature, such as a defective soils report, one case excused the requirement for expert testimony, stating it would not be needed

when the conduct of [the professional] is so unprofessional, so clearly improper, and so manifestly below reasonable

⁷³*Harbor Ins. Co. v. Schnabel Foundation Co.*, 992 F.Supp. 419 (D.D.C.1997) (design of sheeting and shoring system intended to stabilize the excavation walls and protect adjacent properties), vacated after settlement by the parties, 992 F.Supp. 437 (D.D.C.1997).

⁷⁴*Nauman v. Harold K. Beecher & Assoc.*, 24 Utah 2d 172, 467 P.2d 610 (1970). But a claim based on a failure to discover a structural barrier in a renovation project did not require expert testimony. See *Milton J. Womack, Inc. v. State House of Representatives*, 509 So.2d 62 (La.App. 1987), cert. denied, 513 So.2d. 1208 (La.1987).

⁷⁸*National Cash Register Co. v. Haak*, 233 Pa.Super. 562, 335 A.2d 407 (1975), reproduced in part in Section 14.06B. For a collection of cases, see Annot. 3 A.L.R.4th 1023 (1981).

⁷⁹*Seaman Unified Sch. Dist. v. Casson Constr. Co.*, 3 Kan.App.2d 289, 594 P.2d 241 (1979).

standards dictated by ordinary intelligence, as to constitute a prima facie case of either a lack of the degree of skill and care exercised by others in the same general vicinity or failure to reasonably exercise such skill and care.⁸⁰

Laypeople can infer negligence by applying common sense.

As to site services unconnected to design, the issue becomes more cloudy. Is expert testimony needed to help a judge or jury decide whether the design professional should have certified a particular amount to be paid, detected a design deviation in a shop drawing or submittal, noted a deviation from an approved schedule, verified a changed condition, or coordinated the work of separate contractors, to name some of the tasks often given to the design professional?

In two cases, courts held that no expert testimony was needed to support claims based on construction-phase services, which, according to the courts, did not require specialized technical skill possessed only by people who have particular education and training.⁸¹ These courts lumped all construction-phase services into the uninformative “supervision” category, failing to differentiate activities that require professional skill, such as preparing change orders, interpreting contract documents, or resolving disputes.

A federal district court interpreting Louisiana law did not need expert testimony to find an engineering firm negligent in failing to discover overbilling and other fraudulent conduct by the contractor it was supervising.⁸²

At the other extreme, Virginia held that expert testimony would be required to support a claim by the owner against its architect based on the architect’s asserted failure to detect defects in a complex project and the latter’s alleged delay in processing proposed change orders.⁸³

The increasing number of claims against design professionals based on their site services should develop rules that separate services requiring professional education and training from services that can be and often are performed by people without such training, such as

⁸⁰*Nicholson & Loup., Inc. v. Carl E. Woodward, Inc.*, et al., 596 So.2d 374, 381 (La.App.1991), writ denied, 605 So.2d 1098 (La.1992). Accord, *Zontelli & Sons, Inc. v. City of Nashwaak*, 373 N.W.2d 744 (Minn. 1985) (massive errors meant that expert testimony not necessary to establish that a bid for municipal street work was negligently prepared).

⁸¹*Jaeger v. Henningson, Durham & Richardson, Inc.*, supra note 43 (approval of shop drawings); *Bartak v. Bell-Galyardt & Wells, Inc.*, 629 F.2d 523 (8th Cir.1980) (checking on contractor compliance).

⁸²*City of Houma, La. v. Municipal & Industrial Pipe Service*, 884 F.2d 886, 890 (5th Cir.1989).

⁸³*Nelson v. Commonwealth*, 235 Va. 228, 368 S.E.2d 239 (1988).

inspectors and even construction managers. The former services should require expert testimony; the latter should not. Care must be taken to distinguish activities that are part of the design professional's "judging" role. In attacking a decision made by a design professional, expert testimony may not be needed, because the issue is not whether the design professional did as others would have, but the finality of her decision. This is discussed later, in Section 29.09.

Claims by those who engage one entity to both design and build, or who buy from a builder-vendor, raise special problems. At the outset, a claim based on professional malpractice must be differentiated from one based on implied warranty, a standard that usually measures the obligation of the builder-vendor or developer. In the latter, negligence is not the standard.⁸⁴ As a result, no expert testimony is required.

B. Admissibility of Testimony: *National Cash Register Co. v. Haak*

Before proceeding to the principal focus of this section—who can testify and what type of testimony is needed—a few preliminary remarks relating to admissibility generally must be made.

NATIONAL CASH REGISTER CO. v. HAAK

Superior Court of Pennsylvania, 1975. 233 Pa.Super. 562, 335 A.2d 407.
[Ed. note: Footnotes omitted.]

SPAETH, Judge.

[Ed. note: After construction of a manufacturing plant was completed, sinkholes adjacent to dry wells developed, threatening the integrity of the building. The problem was diagnosed by Gannett-Fleming, an engineering firm. Corrective work was done. The owner brought a claim against the architect for negligent design. The controversy on this appeal centers around the adequacy of the testimony of the four expert witnesses called by appellant owner].

Charles W. Pickering was admitted as an expert in "civil engineering in hydraulics" (the court's characterization) or as a "civil engineer familiar with hydraulics" (defense counsel's characterization). He was employed by Gannett-Fleming and

First, a party intending to call an expert witness must notify the other party before trial of the identity and qualifications of the expert and the issues on which expert testimony will be elicited. This lets its opponent investigate or use the deposition process to check on the qualifications of the experts the other side plans to use.

Second, the expert must give her opinion based on firsthand knowledge (such as an expert medical witness who has conducted her own examination), on facts admitted into evidence, or on a combination of firsthand knowledge and evidence. If the expert has no firsthand knowledge, in many states the opinion of the expert is based on a set of hypothetical facts included in the question and based on evidence that has been admitted or evidence the party calling the expert plans to introduce. Sometimes the expert can observe the testimony of witnesses and be asked to assume the truth of previous testimony as a basis for her opinion. This can simplify the often bewilderingly complex hypothetical question.

Third, a witness who is not registered in accordance with the registration laws of the state very likely will be permitted to testify.⁸⁵ Local law must be consulted.

The qualifications of an expert to give an opinion—an increasingly difficult issue because of overlapping specialization in professions—are discussed in the following opinion written by an outstanding state court judge.

was the one who had examined the site for that firm and had recommended the removal of the dry wells and the installation of the new system. His opinion on the cause of the sinkhole activity was unequivocal:

It is my opinion that the Surface Water System as was installed on the NCR site has accelerated the formation of sinkhole activity on the site.

⁸⁵*Corcoran v. Sanner*, 854 P.2d 1376 (Colo.App.1993); *Thompson v. Gordon*, 221 Ill.2d 414, 851 N.E.2d 1231 (2006); *Owens v. Payless Cashways, Inc.*, 670 A.2d 1240 (R.I.1996); *Martin v. Barge, Waggoner, Sumner & Cannon*, 894 S.W.2d 750 (Tenn.App.1994), appeal denied, Mar. 9, 1992. For a review of the rules of evidence as applied to construction litigation, see Cohen, *Obstacles to Admitting Evidence in Construction Cases*, 20 *Constr. Lawyer*, No. 1, Jan. 2000, p. 36.

⁸⁴See Section 24.10.

[I]f the present system were to be continued in use, . . . the formation of sinkholes would continue and with the ultimate possibility or ultimate meaning at sometime, some point in time, because it is a natural phenominal [sic] it cannot be predicted, that at sometime there may be serious damage caused to the major facilities on the site.

Q. Would that include the building?

A. Yes.

Timothy Saylor was admitted as an expert in geology. He was also employed by Gannett-Fleming, and his testimony, where relevant to the issues to be considered here, corroborated Mr. Pickering's.

Professor Jacob Freedman of Franklin & Marshall College also testified as an expert in geology. His qualifications indicated extensive experience in his field covering over 25 years, including being frequently called in as a consultant on the geology of Lancaster County, especially with regard to "water problems, foundations problems, [and] studies of quarries." His testimony corroborated Mr. Pickering's and Mr. Saylor's with regard to the causal relationship between the dry wells and the sinkholes. He then added the following at the end of re-direct examination:

I probably ought to say and I probably haven't said this in my discussion so far along these lines, that I have and I know no geologist who has ever recommended dry wells for construction in an area like this; that, in fact, we urge people not to use this kind of system; and if they have French drains—in fact, as I say, we frequently get calls at school; and anytime anybody mentions a French drain we tell them they are in for trouble, and French drains and dry wells are very similar in their properties. So these are systems that should not have been installed because they lead to trouble.

This brief statement (which was not given in direct response to any question, but which also was not objected to) was immediately explored on recross-examination:

Q. This is your opinion, Professor, is that correct?

A. Let's say it is not only opinion. It is an observation.

Q. And I understand you to say that no geologist that you know of recommends this system for this type of area?

A. I know all my colleagues invade [sic; "inveigh"?] against them.

Q. These are all of your colleagues at Franklin & Marshall?

A. Everybody I have talked to.

Q. At Franklin & Marshall?

A. No, at other places too.

Q. Pardon me?

A. Other places, other colleagues. We discuss these at meetings and I have been a consultant on a situation where I have seen the result of one of these things.

That was the complete recross-examination of this witness.

Appellant's final witness was F. James Knight, a registered engineer, who was qualified as an "engineering geologist." He was employed by Gannett-Fleming and had supervised the repairs of the sinkholes on appellant's site. He testified as to the extent of the damage and the extent of the repairs necessary, and expressed his professional opinion that the dry wells had "contributed significantly to the accelerated formation of sinkholes . . . on that tract."

At the close of appellant's case an oral motion for compulsory nonsuit was made on the ground that appellant had failed to present sufficient expert testimony to establish the standard of care required of an architect in that locality with respect to the design of surface water disposal systems. The court granted the motion, ruling that "while [appellant] has presented testimony of experts in the field of geology and engineering, they have not presented any testimony in the field of architecture tending to prove that [appellees'] professional services departed from accepted practice in this profession or that [appellees] failed to meet the standards of their professional duties." A motion to take off the nonsuit was denied by the court en banc with an opinion by Judge BUCHER, who was also the trial judge. In that opinion the court held that "testimony in the field of architecture" was necessary. It also suggested a second reason for the nonsuit, by asking, "[D]id [appellant] prove any negligence on the part of [appellees] that justified submitting the case to the jury?" Both of these issues are before us on this appeal.

I.

The failure to present an architect as an expert witness was not fatal to appellant's case.

The court below states the general rule as being that "expert testimony is necessary to establish negligent practice in any profession." *Wohlert v. Seibert*, 23 Pa.Super. 213 (1903), is cited for this proposition (as it has been in other opinions), but in fact its test is more analytical:

The crucial test of the competency of a witness offered as an expert to give testimony as such is the resolution of the question as to whether or not the jury or persons in general who are inexperienced in or unacquainted with the particular subject of inquiry would without the assistance of one who possesses a knowledge be capable of forming a correct judgment on it. *Id.* at 216.

The opinion then goes on to restate the rules for the standard of care to which a physician is held; it does not discuss any other profession or professions in general. The same observation may be made of the section of Wigmore most cited by professional experts:

On any and every topic, only a qualified witness can be received; and where the topic requires special experience, only a person of that special experience will be received [cross-reference omitted]. If therefore a topic requiring such special experience happens to form a main issue in the case, the evidence on that issue must contain expert testimony or it will not suffice. Wigmore on Evidence (3d ed. 1940) ¶2090A at 453.

We have no doubt that expert testimony was required in this case. The “subject of inquiry” was the standard to be applied to one who holds himself out as competent to design and supervise the construction of a surface water disposal system in Lancaster County. This is certainly a subject that “requires special experience.” However, there is nothing inherent in the nature of that experience that makes it unique to architects. What the jury needed was not “the assistance of one who possesses a knowledge” of architecture but of surface water disposal systems. Whether the person offering that assistance happened to be an architect, or engineer, or geologist, or something else, was unimportant; what was important was what he knew.

The error committed by the court below was that it literally analogized the instant case to one of medical malpractice. The court reasoned that in medical malpractice cases there must be expert testimony from physicians as to the appropriate standards of medical practice. From this the court reasoned that in a suit against architects, only architects are competent to testify as to the appropriate architectural standards. However, in medical malpractice cases the expert generally must be a physician because only a physician is trained to perform the medical functions that are the subject matter in controversy. In the instant case the subject matter in controversy (the design and installation of a surface water disposal system on the site in question) is not within the exclusive realm of one profession. To the contrary, it is within the realm of at least three professions: architects, engineers, and geologists. Therefore, a member of any of these professions (if otherwise qualified) was competent to state what the appropriate design and installation standards were.

A case similar to this one is *Bloomsburg Mills, Inc. v. Sordoni Construction Co.*, 401 Pa. 358, 164 A.2d 201 (1960). There the plaintiff hired some architects to design and supervise the construction of a weaving mill for nylon and rayon. This type of manufacturing requires a constant temperature and humidity.

It was thus necessary to build the roof with a “vapor seal” to prevent condensation and leakage of moisture. The plaintiff alleged that the roof was defective in that the vapor seal did not function properly, and that the roof was otherwise inadequately sealed. The defendant appealed a verdict in favor of the plaintiff, claiming insufficient evidence of negligence. As part of this claim the defendant attacked the competency of the plaintiff’s expert witness. The expert had had extensive experience with a large roofing manufacturing company and was at the time of the trial a professional roofing consultant. (He had, in fact, been requested by the defendants to submit a bid on the project in question but had declined.) He was not, however, an architect. Nevertheless the Supreme Court held him qualified to testify against the defendant architects. For other decisions in accord, see *Abbott v. Steel City Piping Co.*, 437 Pa. 412, 263 A.2d 881 (1970) (witness with extensive experience in masonry competent to testify as to how a certain wall should be built despite lack of formal engineering degree); *Willner v. Woodward*, 201 Va. 104, 109 S.E.2d 132 (1959) (heating engineer competent to testify against architect regarding a heating and air conditioning duct); *Cuttino v. Mimms*, 98 Ga.App. 198, 105 S.E.2d 343 (1958) (engineer and contractor both competent to testify against architect in case based on faulty construction); *Covil v. Robert & Co. Associates*, 112 Ga.App. 163, 144 S.E.2d 450 (1955) (engineer competent to testify against architect who had drawn plans for water works where issue was whether a certain pipe joint was properly secured).

The court below dismissed *Bloomsburg Mills*, saying that the improper design of a roof is a “common problem” that “would hardly require expert testimony.” As suggested by our preceding statement, however, in fact the problem was quite complex and involved a special type of structure. This is further apparent from the Supreme Court’s quite lengthy and detailed discussion of the construction problems presented, and of the expert witness’s qualifications, none of which would have been appropriate had the case presented only a “common problem,” requiring no expert testimony at all. We thus find *Bloomsburg Mills* persuasive authority, and conclude that the failure of appellant to present an architect as an expert witness was not fatal to its case.

II.

As noted above, the opinion of the court below asks the question, “[D]id [appellant] prove any negligence . . . that justified submitting the case to the jury?” In fact that question is not there addressed. Instead, the entire opinion deals only with whether the trial judge was correct in holding that in an action against an architect acting in his professional capacity, the plaintiff must produce testimony

by another architect, which is the issue that we have just disposed of. In these circumstances we have made our own examination of the record, and have concluded that appellant did prove sufficient evidence of negligence to send the case to the jury.

Messrs. Pickering, Saylor, and Knight all testified unequivocally that in their respective professional opinions the sinkholes were aggravated by the dry well system, and that considerable damage to appellant's property resulted. However, none of them testified as to the standards of skill required of one who undertakes to design and supervise the installation of a surface water disposal system in the particular area in question, and, as observed in the preceding section of this opinion, it was essential to appellant's case that there be some testimony by a qualified expert on that point.

Appellees have contended that there was no such testimony. (They do not challenge the testimony of Messrs. Pickering, Saylor, and Knight.) This contention, however, overlooks the

testimony of Professor Freedman, which we have already quoted in relevant part, ante at 409. It is indeed true that Professor Freedman's testimony was not developed in an orderly manner, and in fact it appears to have emerged almost by chance. It is, nevertheless, in the record, and the professor was cross-examined with respect to it. Summarized, the testimony was that neither the professor, nor any other geologist, nor anyone consulted about surface water disposal, "has ever recommended dry wells for construction in an area like this . . . [W]e frequently get calls . . . and . . . we tell them they are in for trouble . . . [T]hese are systems that should not have been installed because they lead to trouble." When we bear in mind that we must give appellant every reasonable benefit from the evidence, *Shirley v. Clark*, supra, this testimony may fairly be read as a statement of opinion, by a qualified expert, that appellants violated the professional standards of care to which they were obliged to conform. Order reversed.

Although other recent cases have also been liberal in admitting expert testimony,⁸⁶ three recent cases refused to admit expert testimony where the expert was not of the same discipline as the person charged with being negligent.⁸⁷

⁸⁶*Tomberlin Assoc., Architects, Inc. v. Free*, 174 Ga.App. 167, 329 S.E.2d 296 (1985), cert. denied May 1, 1985 (civil engineer allowed to testify in claim against architect based on soil erosion); *Keel v. Titan Constr. Corp.*, supra note 19 (physics professor could testify as to adequacy of design of solar system); *Edgewater Apartments, Inc. v. Flynn*, 216 A.D.2d 53, 627 N.Y.S.2d 385 (1995) (architect may testify in claim against engineer for water intrusion), subsequent appeal, 268 A.D.2d 227, 701 N.Y.S.2d 357 (2000); *Wessel v. Erickson Landscaping Co.*, 711 P.2d 250 (Utah 1985) (structural engineer allowed to testify in claim against landscape architect as to design of retaining wall); *Perlmutter v. Flickinger*, 520 P.2d 596 (Colo.App.1974) (engineer and contractor permitted to testify about skylight design); *White Budd Van Ness Partnership v. Major-Gladys Drive Joint Venture*, supra note 13 (noting overlap between engineering and architecture permitted engineer to testify as expert in a claim against architect).

⁸⁷*IMR Corp. v. Hemphill*, 926 S.W.2d 542 (Mo.Ct.App.1996) (civil engineer not allowed to testify as to the standard of care required for a general contractor); *Brennan v. St. Louis Zoological Park*, 882 S.W.2d 271 (Mo.Ct.App.1994), transfer denied Sept. 20, 1994 (engineer not allowed to testify as to the standard for architects despite 35 years "of working closely with and overseeing architects"; member of one profession cannot testify against an entirely different profession based on special experience); and *Walker v. The Bluff's Apartment*, 324 S.C. 350, 477 S.E.2d 472 (1996). The latter case was a malpractice claim against an architect. A licensed residential builder and building inspector who taught building codes was not allowed to testify as to architectural design. He had never built a structure and had had no architectural experience or training.

As noted in Section 14.09D, this problem can also arise when a claimant must support his claim for professional negligence with a certificate from a fellow professional that the claim is meritorious.

C. Critique of System

The expert testimony system has been severely criticized. The complex "hypothetical" question has led to overtechnical appellate review and confusion of jurors. In addition, complexity has made errors more likely because the professions are increasingly specialized, a point demonstrated by *Haak*. When the system is administered too strictly, experts may not be found—a particular difficulty when expert testimony is required. The pool of experts being limited to local experts not only has made it more difficult to obtain experts but also has not taken into account the increasingly statewide or national standards of practice.

Even more criticisms have been made of the entire system itself, based largely on the adversary system discussed in Section 2.11. Each party looks not for the best-qualified experts but for the experts who will best support its case. This, coupled with the high compensation paid to experts, has led to skepticism about the professional honesty of many experts.

Not many years ago intense criticism was leveled against the "conspiracy of silence," the unwillingness of

professionals to testify against one another. This problem was particularly difficult where local standards were employed. This led to the development of professional expert witnesses (called forensic design professionals because of their ability to persuade judges and juries of the soundness of their professional conclusions). Although this development has certainly helped overcome the “conspiracy of silence,” it has had some unfortunate results.

Such experts have been looked on as “hired guns”—too quick to find fault. Of course, the design professional charged with malpractice can produce other experts. But in the end, both judge and jury are often confused. How can experts with such outstanding credentials differ so sharply as to the cause of the harm and the standards of professional practice?

The junk science debate that surfaced in 1991 relates to the power of trial court judges to admit scientific testimony by witnesses whose work has not been subject to peer review or published in professional journals but is often generated solely for use in litigation, mainly in claims against pharmaceutical houses. In *Daubert v. Merrill Dow Pharmaceuticals, Inc.*, the trial judge refused to hear expert testimony, presented by the plaintiffs, that was based on research that had not been published or subjected to peer review. Refusal was based on the *Frye*⁸⁸ test for the admissibility of expert testimony: that to be admissible, the proffered evidence must be “generally accepted” by scientific experts in the field. This was affirmed by the Ninth Circuit Court of Appeals.

The U.S. Supreme Court reversed, ruling that the *Frye* test was too limiting and in any event had been supplanted by the subsequently enacted Federal Rules of Evidence. These rules permitted scientific evidence if the testimony will help the trier of fact, judge or jury.⁸⁹

However, the trial judge must act as a gatekeeper to ensure that the scientific evidence admitted is not only relevant but reliable. She must determine whether the testimony rests on scientific principles. The testimony and methodology must be based on generating hypotheses and testing to see if they can be falsified. The theory or technique must be subject to peer review, which as a rule is required for publication. Actual publication is not a prerequisite to admissibility. The Court sought to leave

some room for innovative theories yet at the same time placed some obstacles in the path of such testimony.

In *Kumho Tire Co. Ltd. v. Carmichael*, the Supreme Court held that a district court’s duty to screen the reliability and relevance of expert testimony is not limited to “scientific” testimony but applies to all expert testimony, including that provided by engineers.⁹⁰ The Court gave great latitude to the district court’s role as gatekeeper, stating that the factors for determining the reliability of scientific evidence listed in *Daubert* were neither a definitive checklist nor a test.

The Court buttressed the district court’s gatekeeper role by limiting review of its decision to admit or exclude expert testimony by the appellate courts. In *General Electric Co. v. Joiner*, the Court ruled that the district court’s decision to admit or exclude expert testimony is reviewable under the “abuse of discretion” standard, even when the decision to exclude such evidence is outcome-determinative.⁹¹

Although the junk science debate has centered around pharmaceutical drugs, it can also arise in construction litigation. The reliability of expert testimony is most likely to be challenged when the claim is *not* that defective construction caused immediate damage to the building, but rather that it sickened the building’s occupants years later. These “sick building” or toxic-mold claims especially are prone to “junk science” charges in the absence of federal or state standards on permissible levels of mold within habitable spaces, and where the causal link between exposure to mold and personal injury has yet to be proven conclusively.⁹²

This dispute and the high cost of producing expert witnesses have again revived calls for greater use of expert panels from which trial court judges can select expert

⁹⁰526 U.S. 137 (1999).

⁹¹522 U.S. 136 (1997).

⁹²In *Mondelli v. Kendel Homes Corp.*, 262 Neb. 263, 631 N.W.2d 846, opinion modified on denial of rehearing, 262 Neb. 663, 641 N.W.2d 624 (2001), the court ruled that the homeowners’ expert could testify that their injuries were caused by exposure to mold in their home. California has taken the lead in establishing safe mold levels by enacting legislation to monitor mold-related health complaints and to devise exposure standards. The Toxic Mold Protection Act of 2001 requires the state Department of Health Services to convene a task force to develop permissible exposure levels to mold and to devise remediation standards. See West Ann. Cal. Health and Safety Code §§ 26100 *et seq.* A second, new law requires a different task force to study and publish its findings on fungal contamination in indoor environments, see *Id.*, §§ 26200 *et seq.* For a general discussion of sick building litigation, see O’Neal, *Sick Building Claims*, 20 Constr. Lawyer, No. 1, Jan. 2000, p.16.

⁸⁸*Frye v. United States*, 293 F. 1013 (D.C.Cir.1923).

⁸⁹509 U.S. 579 (1993).

witnesses rather than rely on the testimony of experts called by the parties. Yet a report indicates that only 20 percent of the federal court judges have appointed their own experts. A system of court-appointed experts also raises problems. Not only does it interfere with the adversary system, but questions arise as to how judges will select the experts, whether the parties will be able to cross-examine the experts or offer their own expert testimony, and who will pay the fees of the experts.

D. Advice to Expert Witnesses

Space does not permit a detailed discussion of all the problems seen from the perspective of a design professional asked to be an expert witness. Some brief comments can be made, however. A clear, written understanding should precede any services being performed. Such a writing should include the following:

1. Specific language making clear that the expert will give her best professional opinion.
2. Language that covers all aspects of compensation for time to prepare to testify, travel time, and actual time testifying before a court, board, or commission. (Many experts use an hourly rate for preparation time and a daily rate for travel and testimony time.)
3. Specification of expenses to be reimbursed, using a clear and administratively convenient formula for reimbursing costs of accommodations, meals, and transportation.
4. A minimum fee if the expert is not asked to testify. Some attorneys retain the best experts, use the experts whose opinions best suit their case, and, by having retained the others, preclude them from testifying for the other parties.

The attorney calling the expert usually provides details as to appearance, description of qualifications, methods of answering questions, explanations for opinions, and defending opinions on cross-examination. It is important to recognize who is being addressed and the reason for seeking expert opinions. The expert should help the judge or jury—people often inexperienced in evaluating technical material. So opinions and explanations must be understandable by the people who must evaluate them. The expert should never speak down to judge and jurors.

A client who loses its case, or who recovers less damages than anticipated, may place the blame on the

experts—whether its own or those of the opposing party. An expert sued by a client for malpractice may invoke “witness immunity”—a defense designed to ensure that witnesses testify freely and without fear of civil liability. Witness immunity has been extended both to adverse witnesses sued for statements made either in preparation of trial or during trial, as well as to a client’s claim against its own expert for in-court testimony.⁹³ However, one court permitted a client to sue its expert, an engineer, for negligence in pretrial litigation support services.⁹⁴

SECTION 14.07 Implied Warranty: An Outcome Standard

As noted in Section 14.05A, the law generally looks at the process by which the services were to be performed by a design professional—the professional standard. Where a professional is retained to provide design services, American law has concluded (not without criticism, as explored in Section 14.11A) that the likely understanding between the client and the professional designer is not that a successful outcome will be achieved when professional services are purchased, but that the professional will perform as would other professionals.⁹⁵

A minority view has developed under which the design professional must design to achieve the communicated or understood expectations of the client. The issue in such cases is whether the design professional has met the client’s purposes of which she was aware or should have been aware. Under this doctrine, liability—like the liability for any breach of contract or any manufactured product—is strict. There is no need to compare what the challenged design professional did to what other design professionals similarly situated would have done, and no need to introduce expert testimony.

⁹³*Western Technologies, Inc. v. Sverdrup & Parcel, Inc.*, 154 Ariz. 1, 739 P.2d 1318 (App.1986) (claim against adverse witness); *Middlesex Concrete Products & Excavating Corp. v. Carteret Indus. Ass’n*, 68 N.J.Super. 85, 172 A.2d 22 (App.Div.1961) (same); and *Bruce v. Byrne-Stevens & Assocs. Engineers, Inc.*, 113 Wash.2d 123, 776 P.2d 666 (1989) (claim against own witness, an engineer, for negligence in testifying).

⁹⁴*Murphy v. A.A. Mathews, a Div. of CRS Group*, 841 S.W.2d 671 (Mo.1992).

⁹⁵Quoted and followed in *Konkel & Kemper Architects v. McFall*, 843 P.2d 1178, 1186 (Wyo.1992).

Courts invoke a variety of rationales in support of a decision to apply an implied warranty or result-oriented standard. One rationale is that the design professional is being sued by her client for breach of contract, not negligence. Courts invoke this rationale usually in the context of either a design-build contract or a contract in which the architect or engineer agreed to both design the building and supervise its construction.⁹⁶

Another rationale is that, contrary to other professions such as medicine or the law, design professionals deal in exact sciences and so can be held to a strict standard of compliance. Courts employing this rationale either extend it to both architects and engineers⁹⁷ or distinguish between types of design professionals⁹⁸ or types of design services.⁹⁹

A third rationale, usually limited to cases involving design defects, involves the consideration of fairness. These courts observe that the architect holds herself out as the expert, while the client (and sometimes even the

contractor) is both ignorant and wholly dependent upon the design for the successful execution of the project.¹⁰⁰

Finally, clients may invoke consumer protection and deceptive trade practices laws when suing their design professionals, thereby benefiting from the relaxed standard for recovery (and increased penalties) specified in those laws. A Texas court of appeals applied the Texas Deceptive Trade Practices Act (DTPA) with its strict liability to an architect.¹⁰¹ Although the continued viability of that decision is in doubt in light of subsequent legislative and judicial developments,¹⁰² the Kansas Supreme Court has recently ruled that its state's consumer protection law applies to a client's claim against his engineer,¹⁰³ and a New York court applied that state's consumer protection law to a homeowner's contract with an architect.¹⁰⁴

Once a jurisdiction has adopted an implied warranty standard in the context of a claim between the client and its design professional, it may extend that warranty to third parties. South Carolina, for example, has extended the implied warranty of design to subsequent owners¹⁰⁵ and contractors.¹⁰⁶

⁹⁶J. Ray McDermott & Co. v. Vessel Morning Star, 431 F.2d 714, 721–22 (5th Cir. 1970), reversed on rehearing en banc on other grounds, 457 F.2d 815 (5th Cir.), cert. denied, 409 U.S. 948 (1972) (admiralty; breach of contract to design and build fishing boats); Hill v. Polar Pantries, 219 S.C. 263, 64 S.E.2d 885 (1951) (contract to design and supervise); and Board of Educ. v. Del Bianco & Assocs., 57 Ill.App.3d 302, 372 N.E.2d 953, 957–58 (1978) (same, court finds implied contractual terms). One court noted in dicta that the design professional could contract to perform a higher duty than that imposed by law. Tamarac Dev. Co., Inc. v. Delamater Freund & Assocs., P.A., 234 Kan. 618, 675 P.2d 361, 364 (1984). But see Adobe Masters, Inc. v. Downey, 118 N.M. 547, 883 P.2d 133 (1994) and SME Industries, Inc. v. Thompson, Ventulett, Stainback & Assocs., Inc., supra note 68, 28 P.3d at 678–80, as both cases distinguish breach of contract from implied warranty.

⁹⁷Tamarac Dev. Co., Inc. v. Delamater Freund & Assocs., P.A., supra note 96, 675 P.2d at 365.

⁹⁸Broyles v. Brown Eng'g Co., 275 Ala. 35, 151 So.2d 767 (1963) (court extends implied warranty to civil engineer who designed drainage system, while stating that architects would not be subject to an implied warranty). Alabama may be shifting away from an implied-warranty standard; in K.B. Weygand & Assocs., P.C. v. Deerwood Lake Land Co., 812 So.2d 1165 (Ala.2001), rehearing denied, Jul. 6, 2001, a divided court found a civil engineer not strictly liable where a road failed because of unique soil conditions.

⁹⁹The Eighth Circuit Court of Appeals has ruled that no expert testimony is necessary to support claims based on construction-phase services, thereby in effect creating a strict liability standard. Jaeger v. Henningson, Durham & Richardson, Inc., supra note 43 and Bartak v. Bell-Galyardt & Wells, Inc., supra note 81.

¹⁰⁰Hill v. Polar Pantries, supra note 96 (claim by client); Bloomsburg Mills, Inc. v. Sordoni Constr. Co., 401 Pa. 358, 164 A.2d 201 (1960) (claim by client); and Eastern Steel Constructors, Inc. v. City of Salem, 209 W.Va. 392, 549 S.E.2d 266, 276–77 (2001) (claim by contractor).

¹⁰¹White Budd Van Ness Partnership v. Major-Gladys Drive Jt. Venture, supra note 11.

¹⁰²In Chapman v. Paul R. Wilson, Jr., D.D.S., 826 S.W.2d 214, 217 (Tex.Ct.App.1992, writ denied), the court expressly rejected White Budd's holding that the DTPA applies to "purely professional services." Then, in 1995, the DTPA was amended to exclude damages based on the rendering of a professional service, defined as the providing of advice, opinion, or judgment, see Tex. Bus. & Com. Code § 17.49(c).

¹⁰³In Moore v. Bird Eng'g Co. P.A., 273 Kan. 2, 41 P.3d 755 (2002), the court stated that to recover under the Act, the homeowner/consumer was required to show only that the engineer had reason to know that its design did not comport with the consumer's expectations, not that the engineer had an intent to deceive. The court rejected the engineer's contention that consumer protection laws are limited to mass-produced products and do not apply to face-to-face transactions.

¹⁰⁴Ragucci v. Professional Constr. Services, 25 A.D.3d 43, 803 N.Y.S.2d 139 (2005).

¹⁰⁵Beachwalk Villas Condominium Ass'n, Inc. v. Martin, 305 S.C. 144, 406 S.E.2d 372 (1991) (claim by condominium association).

¹⁰⁶Tommy L. Griffin Plumbing & Heating Co. v. Jordan, Jones & Goulding, Inc., 320 S.C. 49, 463 S.E.2d 85 (1995), subsequent appeal, 351 S.C. 459, 570 S.E.2d 197 (App.2002) (issue of expert testimony in negligence claim), rehearing denied Aug. 22, 2002, and cert. denied Mar. 19, 2003. Accord, Eastern Steel Constructors, Inc. v. City of Salem, supra note 100, 549 S.E.2d at 276–77.

Until recently the standardized contracts prepared by the design professional associations did not specify how the design professional's performance would be measured. As noted in Section 14.04A, however, both the AIA and the Engineers Joint Contracts Documents Committee (EJCDC) have included language stating that the professional standard applied. This was done to exclude any outcome-oriented express or implied warranties that would measure the engineer's performance.¹⁰⁷

Some clients, both public and private, have sought to include language under which the design professional will perform to some successful outcome standard, such as provisions stating that the design professional will perform in accordance with the "highest standards of professional service." This could be taken to create an express warranty of a successful outcome or at least to require that it be determined whether the challenged design professional had done better than others would have. Usually in such cases the design professional who is aware of the risk will seek to persuade the client not to include such language, by stating that the liability is contractually assumed and would not be covered under the professional liability insurance policy. However, the realities of the market often mean the design professional must accept this language if the client insists.

Some case decisions are confusing, mixing professional standard language and implied warranty language.¹⁰⁸ One case stated that the implied warranty standard did not require a favorable result but simply required a reasonable result.¹⁰⁹ Another case required expert testimony to establish breach of the engineer's implied warranty of design.¹¹⁰ Neither of these cases differs much from the professional standard. Finally, some claims for implied warranty are rejected when the implied warranty sought was one over which the design professional had no control.¹¹¹

¹⁰⁷AIA Doc. B101-2007, § 2.2 and EJCDC E-500, ¶ 6.01A (2002).

¹⁰⁹*E. C. Ernst, Inc. v. Manhattan Const. Co. of Texas*, 551 F.2d 1026, 1035, rehearing denied in part, granted in part, 559 F.2d 268 (5th Cir.1977), cert. denied *sub nom. Providence Hosp. v. Manhattan Constr. Co. of Texas*, 434 U.S. 1067 (1978) (applying Alabama law).

¹¹⁰*Tommy L. Griffin Plumbing & Heating Co. v. Jordan, Jones & Goulding, Inc.*, supra note 106.

¹¹¹*Allied Properties v. John A. Blume & Assocs.*, 25 Cal.App.3d 848, 102 Cal.Rptr. 259 (1972).

But is there much difference in outcome between the two standards? Although this issue is discussed in greater detail in Section 14.11A, it should be noted here that the design professionals, their professional associations, and their insurers think there is a difference. Much of their polemical work is devoted to protecting the professional standard. In many cases, failure by the design professional to design in accordance with the known or foreseeable purposes of the client will be a breach of the professional standard. Yet the struggle between the process-oriented professional standard and the outcome-oriented implied warranty is likely to continue.¹¹²

SECTION 14.08 Third-Party Claims: Special Problems

Third-party claims raise problems that do not arise when the claimant is connected to the design professional by contract. The proliferation of third-party claims has generated more litigation, varying state rules, and judicial opinions of divided courts than have claims by clients against design professionals. This reflects rules in transition, with inevitable strains and contradictions.

A. Potential Third Parties

The centrality of the design professional's position in construction—both designing and monitoring performance—generates a wide range of potential third-party claimants. At the inner core are the other major direct participants in the process who work on or enter the site itself, such as contractors, construction workers and delivery people. Around the core cluster those who supply money, materials, or equipment, such as lenders and suppliers. Next are those who "backstop" direct participants, such as sureties (persons who promise to perform another's obligations) and insurers. Still farther from the core are those claimants who will ultimately take possession of the project, such as subsequent owners, tenants, and their employees. Situated farthest from the core are people who may enter

¹¹²See Jones, *Economic Loss Caused by Deficiencies: The Competing Regimes of Tort and Contract*, 59 U. of Cinn.L.Rev. 1051, 1070, 1073 (1991) (argues for result-oriented standard if probability of success is high); Note, 20 Mem.St.U.L.Rev. 611 (1990) (argues against implied warranty and strict liability).

or pass by the project during construction or after completion, such as members of the public or patrons. See Figure 14.1 and please review Figures 8.1 and 8.2.

The wide variety of potential claimants, the varying distance from core participants, the type of harm, the difference between those who have other sources of compensation, such as workers—all combine to ensure complexity.

B. Contracts for Benefit of Third Parties

Section 14.08 spotlights tort claims by third parties who suffer losses related to the construction process. Yet some claims by third parties are based on the assertion that the claimants are intended beneficiaries of contracts to which they are not parties. Until the mid-nineteenth century, American law generally did not permit persons who were not party to a contract to maintain legal action for the contract's breach, even though they may have suffered losses from the breach. But U.S. law has steadily expanded the rights of third parties to recover for contract breach.¹¹³

The use of this doctrine has found its way into construction claims. In the context of claims against the design professional, the doctrine is sometimes employed by contractors and subcontractors who assert that they are intended beneficiaries of the contract made between the owner and the design professional.

Such claims have had spotty success,¹¹⁴ with most cases concluding that contracting parties usually intend

¹¹³Restatement (Second) of Contracts § 302 (1979).

¹¹⁴*John E. Green Plumbing & Heating Co. v. Turner Constr. Co.*, 742 F.2d 965 (6th Cir.1984), cert. denied, 471 U.S. 1102 (1985) (contractor v. construction manager). But see *A. R. Moyer v. Graham*, 285 So.2d 397 (Fla.1973) (contractor could sue architect in tort but not as intended contract beneficiary). The cases, including those involving construction contracts, are canvassed in Prince, *Perfecting the Third Party Beneficiary Standing Rule Under Sec. 302 of the Restatement (Second) of Contracts*, 25 B.C.L.Rev. 919 (1984). See also Burch, *Third-Party Beneficiaries to the Construction Contract Documents*, 8 Constr. Lawyer, No. 2, April 1988, p. 1. Accord, *A.H.A General Construction, Inc. v. Edelman Partnership*, 291 A.D.2d 239, 737 N.Y.S.2d 85 (2002) (contractor cannot sue architect as third-party beneficiary) and *Eastern Steel Constructors, Inc. v. City of Salem*, supra note 100, 549 S.E.2d at 277–78 (same). Third-party beneficiary claims are not limited to contractors and subcontractors. In *The Ratcliff Architects v. Vanir Construction Management, Inc.*, 88 Cal. App.4th 595, 106 Cal.Rptr.2d 1 (2001), a construction management contract expressly disavowed the creation of rights “in persons not party

to benefit only themselves. Yet the possibility of such a theory being invoked successfully has led contracting parties to seek to use the contract itself to bar claims by third parties as intended beneficiaries.¹¹⁵

Even if a claimant can establish that it is an intended beneficiary, its claim may fail because of provisions in the contract.¹¹⁶ To complicate matters further, an architect sued by a contractor was allowed to use a provision in the contract between the contractor and the owner as a defense.¹¹⁷ (Many of these problems could be avoided if owner, contractor, and design professional were all parties to one contract.)

C. Tort Law: Privity and Duty

Sections 14.08C, 14.08D, and 14.08E all relate to attempts by third parties, usually contractors or subcontractors, to assert tort claims against design professionals. Section 14.08C approaches the problem from the perspective of privity, the absence of which has been the principal justification for denying such claims in the past and, to some degree, today. Section 14.08D examines negligent misrepresentation, one avenue by which the requirement of privity has been avoided. Section 14.08E discusses the economic loss rule, a traditional principle of tort law that

to this agreement, whether third-party beneficiaries or otherwise.” The court relied upon this clause to reject the architect’s indemnity claim against the CM. In *Jenne v. Church & Tower, Inc.*, 814 So.2d 522 (Fla. Dist.Ct.App. 2002), the court ruled that the county sheriff was not a third-party beneficiary to a contract between the county and a design-build contractor to build a new detention facility. See also *F. H. Paschen/ S. N. Nielsen, Inc. v. Burnham Station, L.L.C.*, 372 Ill.App.3d 89, 865 N.E.2d 228, appeal denied sub nom. *Paschen v. Burnham Station, LLC*, 225 Ill.2d 631, 875 N.E.2d 1111 (2007) (unsuccessful claim by investor, who lost its investment in a real estate development designed by the architect).

¹¹⁵See AIA Docs. B101-2007, § 10.5 and A201-2007, § 1.1.2. The latter gives third-party rights to the architect. The court in *SME Industries, Inc. v. Thompson, Ventulett, Stainback & Assocs., Inc.*, supra note 68, 28 P.3d at 684–85, relied upon a clause similar to B141-1997, ¶1.3.7.5 (the predecessor of B101-2007, § 1.1.2) in rejecting a subcontractor’s third-party beneficiary claim against the architect and engineer.

¹¹⁶*Prichard Bros., Inc. v. Grady Co.*, 407 N.W.2d 423 (Minn.App. 1987) reversed 428 N.W.2d 391 (Minn.1988) (contractor can bring tort claim against architect and is not limited to third-party beneficiary claim).

¹¹⁷*Bates & Rogers Constr. Corp. v. Greeley & Hanson*, 109 Ill.2d 225, 486 N.E.2d 902 (1985) (architect sued by contractors could invoke “no damage” clause in prime contract as defense).

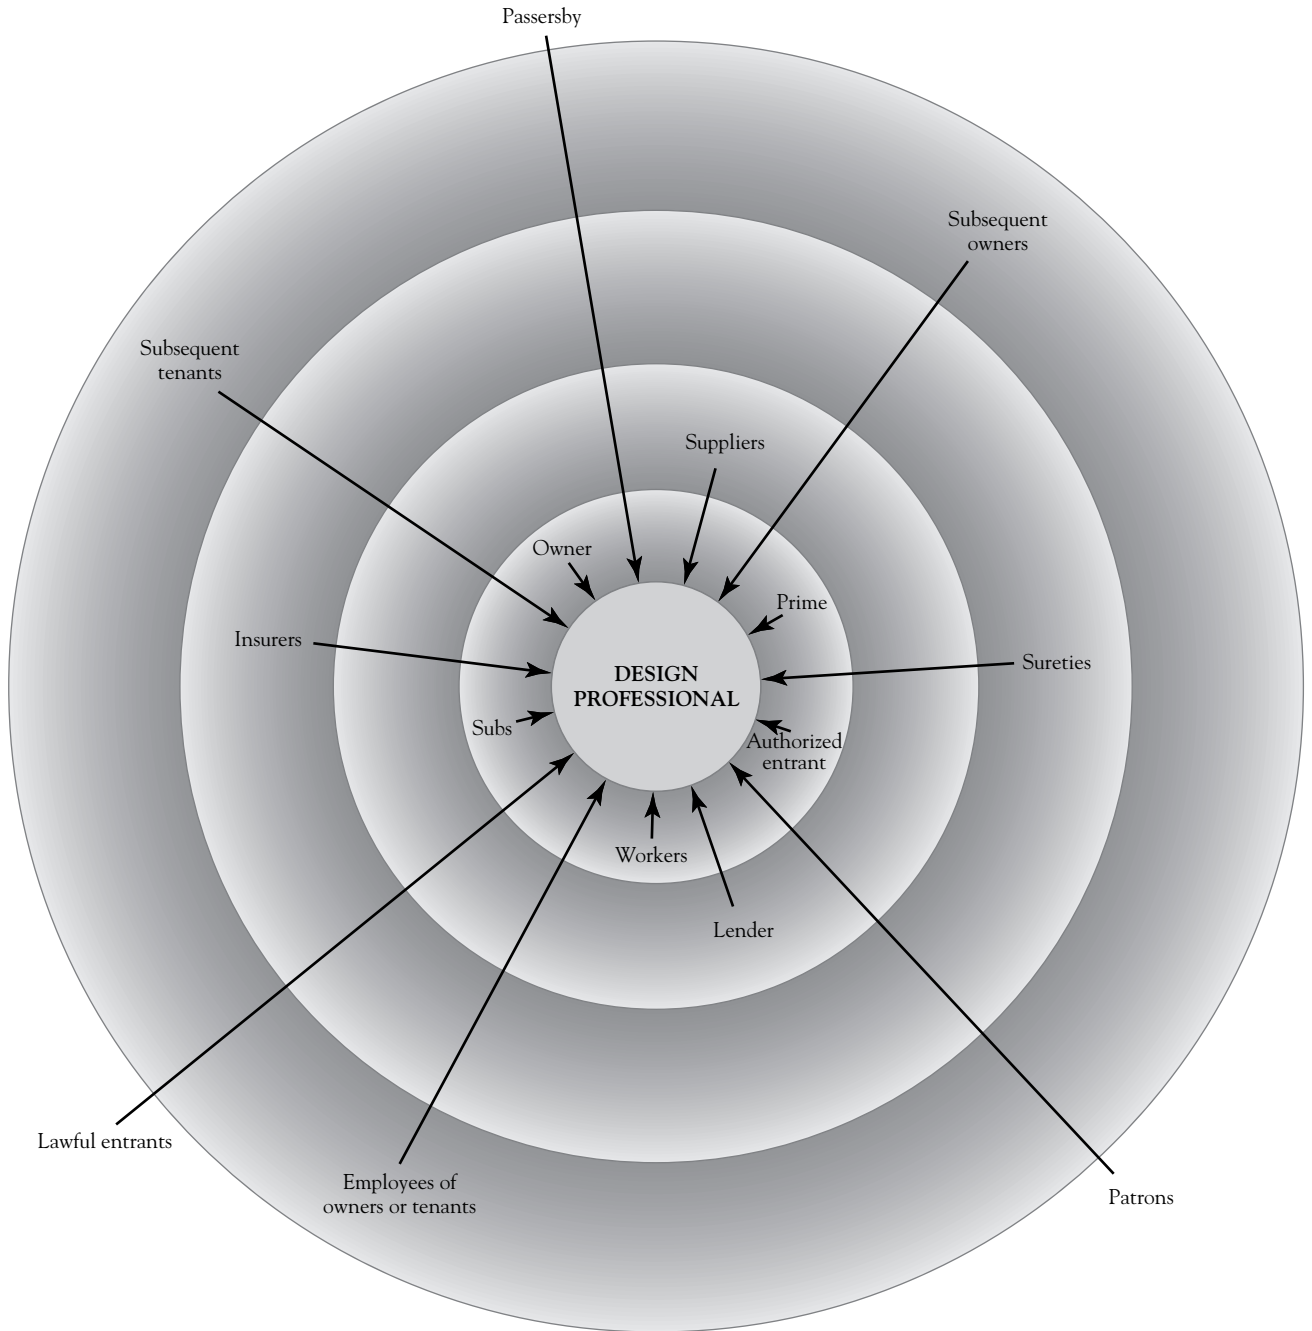

FIGURE 14.1 Potential third-party claimants against design professional.

limited tort law to the protection of person and property. Although this can also be applied in disputes between contract-connected parties, as noted in Section 14.05D, in most disputes today those against whom claims have been made assert the economic loss rule as a reason to bar the claimant from basing its claim on tort law. Because these doctrines interrelate, some overlap will occur in the three sections.

These sections all document the conflicting worlds of contract law, with its emphasis on planning and certainty, and tort law, with its emphasis on preventing harm and compensating victims.

A claimant employing tort law as a basis of transferring its loss to another must show that the latter owed a duty to protect the claimant from the unreasonable risk of harm. Often, particularly where the wrongful conduct was breach of contract, the duty concept was phrased as one requiring privity between claimant and the person against whom the claim was made. Usually, though not exclusively, privity was based on a contract between the claimant and the person against whom the claim was made. The defense of absence of duty or lack of privity seeks to avoid unlimited liability and to free people from the fear of being held accountable for any harm they might cause. As noted in Section 7.09B, in the nineteenth century and early twentieth century the requirement of privity was an insurmountable obstacle even to a claimant who suffered personal harm because of another's negligence. However, that section noted that the privity defense was eliminated in personal injury claims early in the twentieth century. The early cases doing so were claims against manufacturers by those injured from negligently manufactured products. By the mid-twentieth century, participants in the construction process, such as design professionals, could no longer invoke the privity doctrine as a defense to claims based on personal harm.¹¹⁸

Tort law is not limited to claims for personal harm or damage to property. In the construction process, claimants often suffer economic losses unconnected with personal harm or damage to property. Often they seek to recover such losses from participants with whom they do not have a contract. For example, contractors and sureties assert claims against design professionals, sometimes (as noted in Section 14.08B) by claiming to be intended beneficiaries of a contract that the design professional has breached,

and increasingly by invoking tort law. When tort law is invoked, in many states the economic loss rule is a barrier. While that rule will be discussed in Section 14.08E, it should be addressed briefly here.

States that permit third-party claims saw no reason to distinguish purely economic losses from harm to person or property. They were willing to compensate those who suffered economic losses because of the negligence of those against whom claims were made.¹¹⁹ The leading case pointed to the life-or-death power the architect has over the contractor.¹²⁰ Requiring that the harm and the person suffering it be reasonably foreseeable was the method such courts felt would protect the person against whom a claim would be made from unlimited liability.

Not all states permit contractors or subcontractors to sue design professionals for economic losses. Some states find the design professional owes a contract duty solely to the owner and does not owe a tort duty of care to the contractor or subcontractor.¹²¹ Other states still require privity in claims for purely economic losses.¹²² They point to tort law's historic function of protecting personal and property rights and the need to draw some lines beyond which the law should not compel a person to pay for another's loss. Foreseeability was considered insufficient protection from third party claims. Also, decisions barring such claims frequently pointed to the claimant's often having a contractual right against the party with whom it contracted. One method of avoiding the privity rule has been to invoke the doctrine of negligent misrepresentation, which can apply to those who furnish information on which third parties have relied (discussed in Section 14.08D).

¹¹⁹*E. C. Ernst, Inc. v. Manhattan Constr. Co. of Texas*, supra note 109 (subcontractor v. architect); *Donnelly Constr. Co. v. Oberg/Hunt/Gilleland*, 139 Ariz. 184, 677 P.2d 1292 (1984) (contractor v. architect); *Forte Bros., Inc. v. National Amusements, Inc.*, 525 A.2d 1301 (R.I.1987) (contractor v. architect). Many cases followed the influential opinion of the federal trial court judge in *United States v. Rogers & Rogers*, 161 F.Supp. 132 (S.D.Cal.1958). For surety claims, see Section 22.07. See also Annot., 65 A.L.R.3d 249 (1975).

¹²²*Bagwell Coating, Inc. v. Middle South Energy, Inc.*, 797 F.2d 1298 (5th Cir.1986) (Mississippi law) (contractor v. construction manager); *Peyronnin Constr. Co. v. Weiss*, 137 Ind.Ct.App. 417, 208 N.E.2d 489 (1965) (contractor v. engineer).

¹¹⁸*Miller v. DeWitt*, 37 Ill.2d 273, 226 N.E.2d 630 (1967).

D. Negligent Misrepresentation: *Ossining Union Free School District v. Anderson LaRocca Anderson*

The design professional's performance consists in part of supplying information. Sometimes representations are made to the client, such as those involving cost estimates,¹²³ the availability of funds for the project,¹²⁴ and the likelihood that the project will meet the client's needs.¹²⁵ This Section emphasizes claims by third parties, such as contractors and subcontractors, that they relied on negligent misrepresentations made by the design professional.¹²⁶

In 1991 the Supreme Court of Tennessee decided *John Martin Co., Inc. v. Morse/Diesel, Inc.*¹²⁷ The case was considered sufficiently important by participants in the construction process that an *amicus curiae* (friend of the court) brief was submitted on behalf of the defendant construction manager (CM) by the American Institute of Architects, the National Society of Professional Engineers, the American Consulting Engineers Council, and state chapters of those organizations. A similar brief was submitted on behalf of the contractor by two Tennessee contractor associations.

John Martin was engaged by the CM, Morse/Diesel, on behalf of the owner as a specialty concrete supplier. A dispute arose during performance over the concrete work. The issue was who had caused the need for additional concrete. John Martin and the CM blamed each other. After settling with the owner, John Martin sued the CM, charging negligent misrepresentation.

The CM, supported by briefs of architectural and engineering associations, asserted the economic loss rule as its principal defense. This rule, to be discussed later in Section 14.08E, bars tort claims unless the loss included harm to person or property. The CM admitted there was an exception for claims of negligent misrepresentation. But the CM and the associations supporting him claimed the exception applied only to a professional supplying information that induces a person to enter into a business transaction.

The court stated there was no clear majority of states on the scope of the exception. It then held the specialty trade concrete supplier could sue the CM for negligent misrepresentation, despite the absence of privity, provided

1. The defendant is acting in the course of his business, profession or employment . . . ; *and*
2. The defendant supplies faulty information meant to guide others in their business transaction; *and*
3. The defendant fails to exercise reasonable care in obtaining or communicating the information; *and*
4. The plaintiff justifiably relies on the information.¹²⁸

The court emphasized foreseeability of the plaintiff's use of the information. Further comment on this case will be made later in this section.

It is important to note that misrepresentations in the *John Martin* case are not limited to professional opinions such as surveyor reports or those made by geotechnical engineers. This decision would appear to allow the negligent misrepresentation exception to the privity requirement to be used in cases involving almost anything that a design professional does in the course of her professional services.

A person supplying information may be inhibited from doing so if she would be exposed to indeterminate liability to a large number of third-party claimants. Historically, the principal professionals who have sought legal protection have been accountants and others who supply financial information on which many may rely. As a result, liability for negligent misrepresentation has been more limited than claims based on ordinary negligence. Most important, the defense of foreseeability (i.e., the party supplying the information could not reasonably foresee that it would be relied on by particular persons) is more likely to be available if a claim is based on negligent misrepresentation than if it is based on ordinary negligence.

Some of the uncertainties created by the negligent misrepresentation exception to the privity rule are demonstrated in New York. *The Ossining Union* case addressed the policy issues in third party claims and clarified New York law. It is reproduced at this point.

OSSINING UNION FREE SCHOOL DISTRICT v. ANDERSON LaROCCA ANDERSON

Court of Appeals of New York, 1989. 73 N.Y.2d 417, 539 N.E.2d 91, 541 N.Y.S.2d 335.

OPINION

KAYE, Judge.

[Ed. note: Footnote omitted.]

At issue is a question that has long been a subject of litigation: in negligent misrepresentation cases, which produce only economic injury, is privity of contract required in order for plaintiff to state a cause of action? Whether defendants are accountants (as in several recent cases) or not (as here), our answer continues to be that such a cause of action requires that the underlying relationship between the parties be one of contract or the bond between them so close as to be the functional equivalent of contractual privity. Such a bond having been alleged in the present action against engineers, we reverse the Appellate Division order and deny defendants' motion to dismiss the complaint.

Viewing the facts presented in a light most favorable to plaintiff, as we must at this stage of the proceeding, plaintiff school district alleges that in 1984, it began a general study and structural evaluation of its buildings. To that end, it entered into a written agreement with an architectural firm, co-defendant Anderson LaRocca Anderson, whereby Anderson was hired to provide an evaluation and feasibility study of plaintiff's buildings; the contract authorized Anderson's retention of consultants. Anderson retained the defendants, Thune Associates Consulting Engineers and Geiger Associates, P.C., as engineering consultants to assist in various aspects of the work it had undertaken for the school district. Although the school board authorized the retention of Thune and Geiger, neither defendant had a contract with the school district.

[Ed. note: See Figure 14.2.]

This litigation arises from certain reports made by defendants following tests done on school district premises in order to determine the structural soundness of the high school annex. Specifically, defendant Thune and thereafter, at the school district's request to Anderson, second engineering firm—defendant Geiger—tested the concrete at various locations throughout the building. Both reported that there were serious weaknesses in the building, particularly the concrete slabs that formed the building's superstructure, and Anderson informed the school district of those findings.

It is alleged that defendants were aware that plaintiff would rely on their findings and that the intended purpose of

defendant's reports was in fact to enable the school district to determine what measures should be taken to deal with structural problems in its buildings. For safety reasons, the school district closed the annex and, purportedly at substantial expense, obtained other facilities for the dislodged activities. The school district, however, later retained a third independent expert to check the results, and that expert advised plaintiff that the annex had been constructed with a lightweight concrete known as "Gritcrete" rather than the 2,500 pound per square inch cement defendants had assumed and reported. According to plaintiff, this information was available to defendants in the original building design drawings and specifications which had been furnished to them. Had defendants read these materials rather than acting on their mistaken assumption as to the type of concrete used, they would not have made the reports and rendered the advice that eventuated in the unnecessary and expensive closing of the annex.

The school district then began this lawsuit against Anderson and both engineering consultants. Claims of negligence and malpractice were asserted against all three. A claim for breach of contract was also asserted against Anderson, the only party with which plaintiff school district had a contract. [The court gave the procedural history and summarized the decision of the intermediate appellate court. The decision dealt with the tort claim by the school district against the consulting engineers.]

Courts have long struggled to define the ambit of duty or limits of liability for negligence, which in theory could be endless. While much of this struggle has been couched in the rhetoric of foreseeability of harm, under some circumstances foreseeability has appeared particularly inadequate for defining the scope of potential liability. In negligent misrepresentation cases especially, what is objectively foreseeable injury may be vast and unbounded, wholly disproportionate to a defendant's undertaking or wrongdoing. . . . In reaching the policy judgment called "duty," courts have therefore invoked a concept of privity of contract as a means of fixing fair, manageable bounds of liability in such cases.

[The court gave a history of the privity rule in cases involving personal harm, starting with *Winterbottom v. Wright* and highlighting *MacPherson v. Buick Motor Co.*, 217 N.Y. 382, 111 N.E. 1050 (1916). See Section 7.09B.]

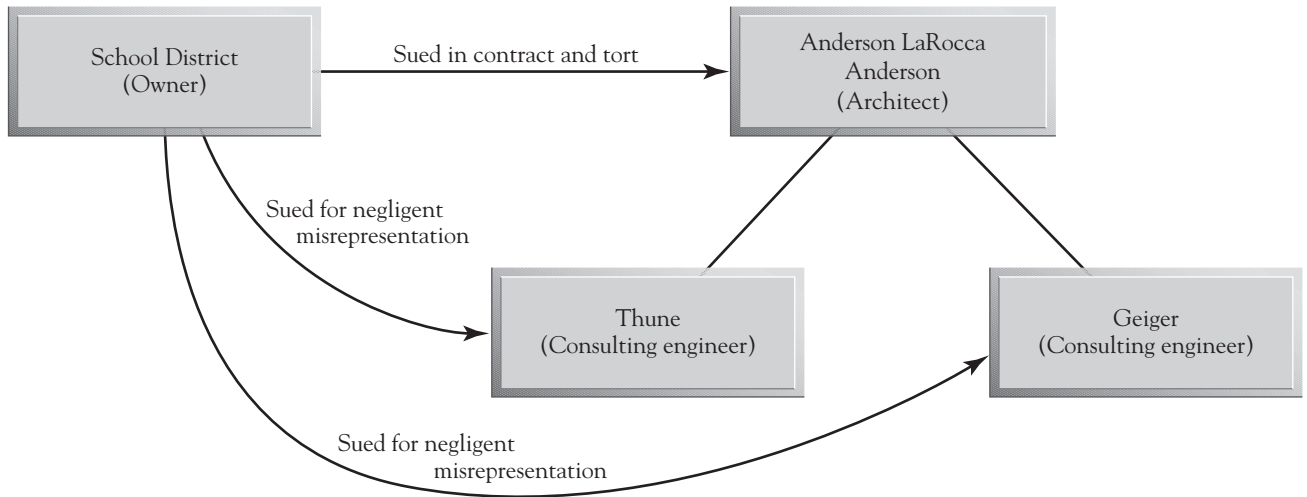

FIGURE 14.2 *Ossiaing Union Free School District v. Anderson LaRocca Anderson.*

In theory, there appeared to be no reason why the privity bar should be dispensed with in cases such as *MacPherson* but retained in certain other types of negligence cases, and in *Glanzer v. Shepard*, 233 N.Y. 236, 135 N.E. 275 we said as much. The defendants in *Glanzer* were public weighers hired by the sellers of beans to provide plaintiff with a certificate stating the weight of the beans. When defendants negligently misstated the weight, the buyers sued for the overpayment they had made in reliance on defendants' inaccurate statement. Rejecting defendants' claim that *MacPherson* applied only to products posing a risk of physical danger, Judge Cardozo wrote: "We do not need to state the duty in terms of contract or of privity. Growing out of a contract, it has nonetheless an origin not exclusively contractual. Given the contract and the relation, the duty is imposed by law." (*Id.*, at 239, 135 N.E. 275.)

In *Glanzer*, the particular relationship that was held to warrant imposition of a legal duty of care was found in the fact that "[t]he plaintiffs' use of the certificates was not an indirect or collateral consequence of the action of the weighers. It was a consequence which, to the weighers' knowledge, was the end and aim of the transaction" and that a copy of the certificate was sent to plaintiffs "for the very purpose of inducing action." (*Id.*, at 238–239, 135 N.E. 275.) While noting that the plaintiffs might be analogized to third-party beneficiaries of the contract between the bean sellers and the defendants, the opinion stressed that the result was reached more simply by analyzing the duty owed by the defendants under the circumstances: "The defendants, acting, not casually nor as mere servants, but in the pursuit of an

independent calling, weighed and certified at the order of one with the very end and aim of shaping the conduct of another. Diligence was owing, not only to him who ordered, but to him also who relied." (*Id.*, at 242, 135 N.E. 275.)

The ambit of duty was not, however, determined simply by the class of persons who relied on the negligent misrepresentations. As Chief Judge Cardozo wrote in *Ultramares Corp. v. Touche*, 255 N.Y. 170, 174 N.E. 441, what was determinative in *Glanzer* was that there was a bond between plaintiff and defendant that was "so close as to approach that of privity, if not completely one with it." (*Id.*, at 182–183, 174 N.E. 441.) In *Ultramares*, by contrast, the range of potential plaintiffs was "as indefinite and wide as the possibilities of the business that was mirrored in the summary." (*Id.*, at 174, 174 N.E. 441.) That distinction led Chief Judge Cardozo to observe: "If liability for negligence exists, a thoughtless slip or blunder, the failure to detect a theft or forgery beneath the cover of deceptive entries, may expose accountants to a liability in an indeterminate amount for an indeterminate time to an indeterminate class. The hazards of a business conducted on these terms are so extreme as to enkindle doubt whether a flaw may not exist in the implication of a duty that exposes to these consequences." (*Id.*, at 179–180, 174 N.E. 441.)

While plaintiffs' reliance might have been objectively foreseeable both in *Glanzer* and in *Ultramares*, the court chose to circumscribe defendants' liability for negligent misstatements by privity of contract or its equivalent, because of concern for the indeterminate nature of the risk. That very concern, which has

echoed in the law since *Winterbottom*, was also at the root of our recent decisions. . . .

In none of these cases, however, has the court erected a citadel of privity for negligent misrepresentation suits. Thus, the rule is not, as erroneously stated by the Appellate Division, that “recovery will not be granted to a third person for pecuniary loss arising from the negligent representations of a professional with whom he or she has had no contractual relationship.” (135 A.D.2d at 520, 521 N.Y.S.2d 747.) The long-standing rule is that recovery may be had for pecuniary loss arising from negligent representations where there is actual privity of contract between the parties or a relationship so close as to approach that of privity.

Nor does the rule apply only to accountants. We have never drawn that categorical distinction, and see no basis for establishing such an arbitrary limitation now. It is true that in many of the cases involving claims for negligent misrepresentation, the defendants are accountants. Indeed, in attempting to fashion a rule that does not expose accountants to crippling liability, we have noted the central role played by that profession in the world of commercial credit. But while the rule has been developed in the context of cases involving accountants, it reflects our concern for fixing an appropriate ambit of duty, and there is no reason for excepting from it defendants other than accountants who fall within the narrow circumstances we have delineated. Notably, *Glanzer* itself did not involve a suit against accountants.

The remaining question, then, is whether under *Glanzer* and our subsequent cases, defendants owed a duty of care to plaintiff that was breached by their alleged negligent performance. We have defined this duty narrowly, more narrowly than other jurisdictions (see, e.g., *Rosenblum, Inc. v. Adler*, 93 N.J. 324, 461 A.2d 138). We have declined to adopt a rule permitting recovery by any “foreseeable” plaintiff who relied on the negligently prepared report, and have rejected even a somewhat narrower rule that would permit recovery where the reliant party or class of parties was actually known or foreseen by the defendants (*Credit Alliance Corp. v. Andersen & Co.*, 65 N.Y.2d at 553, n.11, 493 N.Y.S.2d 435, 483 N.E.2d 110). It is our belief that imposition of such broad liability is unwise as a matter of policy (see Siliciano, *Negligent Accounting and the Limits of Instrumental Tort Reform*, 86 Mich.L.Rev.1929) or, at the least, a matter for legislative rather than judicial reform.

Instead, we have required something more, and we have articulated the requirement in various ways. In *Glanzer*, it was described as reliance by the plaintiff that was “the end and aim of the transaction.” (233 N.Y.2d, at 238–239, 135 N.E. 275; see

also *White v. Guarente*, 43 N.Y.2d 356, 362, 401 N.Y.S.2d 474, 372 N.E.2d 315 [“one of the ends and aims of the transaction”].) In *Ultramares*, we spoke of a bond “so close as to approach that of privity.” (255 N.Y. at 182–182, 174 N.E. 441.) Most recently, in *Credit Alliance*, we spelled out the following criteria for liability: (1) awareness that the reports were to be used for a particular purpose or purposes; (2) reliance by a known party or parties in furtherance of that purpose; and (3) some conduct by the defendants linking them to the party or parties and evincing defendant’s understanding of their reliance (*Credit Alliance Corp. v. Andersen & Co.*, 65 N.Y.2d at 551, 493 N.Y.S.2d 435, 483 N.E.2d 110).

For present purposes, the facts asserted in plaintiffs’ submissions satisfy these prerequisites. Plaintiff alleges that through direct contact with defendants, information transmitted by Anderson, and the nature of the work, defendants were aware—indeed, could not possibly have failed to be aware—that the substance of the reports they furnished would be transmitted to and relied on by the school district. Plaintiff asserts that that was the very purpose of defendants’ engagement.

Though under contract to Anderson, defendants allegedly undertook their work in the knowledge that it was for the school district alone, and that their findings would be reported to and relied on by the school district in the ongoing project—the evaluation of the structural soundness of the school buildings. Defendants were retained to visit plaintiffs premises, examine its buildings, and prepare reports of their findings on which action would be taken. The engagement of consultants was provided for in the contract between the school district and Anderson; the retention of defendants specifically was authorized by the school board, and they were so informed; in seeking compensation, Geiger itself wrote “we were hired by [the school district],” and it sent a bill directly to the school district. Given plaintiff’s factual allegations of known reliance on the findings of both engineering consultants, Geiger’s argument that it was not engaged until after the school district had decided to close the annex, and thus could not be liable for plaintiff’s losses, does not at this juncture entitle it to dismissal of the complaint. Plaintiff further alleges that defendants had various types of contact directly with the school district. That, as well as the contents of some of Anderson’s communications with defendants, constitutes conduct linking defendants to plaintiff and evidencing their understanding of plaintiff’s reliance.

Not unlike the bean weighers in *Glanzer*, defendants allegedly rendered their reports with the objective of thereby shaping this plaintiff’s conduct, and thus they owed a duty of

diligence established in our law at least since *Glanzer* not only to Anderson who ordered but also to the school district who relied.

Accordingly, the order of the Appellate Division should be reversed, with costs, the motions to dismiss the complaint as against defendants Thune Associates Consulting Engineers

and Geiger Associates, P.C. denied, and the certified question answered in the negative.

SIMONS, ALEXANDER, TITONE, HANCOCK and BELLACOSA, J. J., concur.

WACHTLER, C. J., taking no part.

Order reversed, etc.

Although both the *John Martin* and the *Ossining* decisions claim to be following the leading New York decisions, there is a clear distinction between them. The *John Martin* decision followed the Second Restatement of Torts, Section 552, requirements: first, that liability be restricted to the limited number of persons for whose benefit and guidance the defendant “intends to supply the information,” and second, that supplier “intends the information to influence or knows that the recipient so intends.” Yet the opinion itself appears to base protection principally on foreseeability of use, a relatively broad standard.

In the *Ossining* decision, the court took pains to reject both a rule permitting recovery by any foreseeable plaintiff and “a somewhat narrower rule that would permit recovery where the reliant party or class of parties was actually known or foreseen by the defendants.” It thought these two standards would impose overly broad liability. Instead, the court required that the information be used for a particular purpose, that the reliance be by a known party in furtherance of that purpose, and that there be some conduct by the defendants linking them to the party or parties.

The court then found this necessary bonding in the direct contact between the engineers and the school district, in the undoubted awareness by the engineers that their reports would be submitted and relied on, that they were retained to visit the premises, examine the buildings, and repair reports, and finally that the retention by the architect of the consulting engineers was authorized by the owner. One of the consulting engineers himself wrote that he was hired by the school district, had sent a bill directly to the district, and had had various other types of direct contact with the district.

The differentiation noted between the *John Martin* and *Ossining* decisions is crucial in determining whether contractors and subcontractors will be allowed to sue the design professional for economic losses caused by a

defective design. Those courts find Section 552 of the Second Restatement of Torts applicable to contractor and subcontractor claims for economic losses caused by defective design, which permits these parties to sue the architect or engineer for negligent misrepresentation,¹²⁹ while such a lawsuit is not allowed under the New York rule.¹³⁰

Another position adopted by some courts is to refuse to apply Section 552 to third-party negligent design claims, even though these same jurisdictions apply the Restatement rule to claims against other professionals, such as accountants and attorneys. These courts refuse to apply Section 552 to the construction industry, which is characterized by contractual relationships in which the parties are free to negotiate the risk of economic losses caused by parties associated with the project, but with whom there is no privity.¹³¹

E. Economic Loss Rule: Losses Unconnected to Personal Harm or Damage to Property

As seen in Section 14.08C, in some states the requirement of privity can bar a third party's claim for economic loss. However, the economic loss rule not only bars third-party claims but also bars the use of tort law where claimant and defendant are contractually connected, such as in a claim by a client against its design professional. For convenience this doctrine is treated in this section dealing with third-party claims. Examples of economic losses relating to defective products (or buildings) are

1. damage to the defective product itself
2. diminution in the value of the product
3. natural deterioration of the product
4. cost of repair or replacement of the product
5. loss of profits caused by use of a defective product

Although the economic loss rule has long been a part of English and American tort law,¹³² its modern development stems from the 1960s explosion of product liability. During that period, the courts had to face claims by purchasers of defective products against manufacturers when the product itself did not function properly and caused economic losses to the purchaser. In the leading case of *Seely v. White Motor Co.*, the court barred recovery of lost profits suffered by a purchaser of a defective truck.¹³³ In rejecting this claim, Chief Justice Traynor stated that the manufacturer can protect itself from liability for physical harm by meeting the tort standard. But it should not be charged for the performance level in the purchaser's business without showing a breach of warranty. The user cannot charge the success of her venture to the manufacturer.

In *East River Steamship Corp. v. Transmercal Delaval, Inc.*, an admiralty case, the U.S. Supreme Court held that a charterer of a supertanker could not recover in tort from the turbine manufacturer who had designed and manufactured the turbines installed in the charterer's vessels, for damage to the turbines themselves.¹³⁴ Speaking for the Court, Justice Blackmun stated that three views had developed in the state courts. The first would not allow tort to be used in such a claim, preserving a proper role for the

law of warranty if a defective product causes purely monetary harm. At the other end of the spectrum, a minority of courts would allow recovery where the product itself was injured; those courts saw no distinction between harm to person and property and purely economic loss. Those jurisdictions are not concerned about unlimited liability, because a manufacturer can predict and ensure against product failure. Some courts sought a compromise solution, allowing recovery if the defective product creates a situation potentially dangerous to people or property.

The Supreme Court followed the majority rule, concluding that the intermediate position was too indeterminate to allow manufacturers to structure their business behavior. When harm to the product itself occurs, the resulting loss due to repair costs, decreased value, and lost profit is the failure of the purchaser to receive the benefit of its bargain, a reason to reject the minority rule allowing such a claim to be brought in tort. Also, the minority view did not adequately keep tort and contract law in their proper compartments and failed to maintain a realistic limitation on damages.

Justice Blackmun stated that tort law was concerned with safety but not with injury to the product itself. In such a case, the commercial user

stands to lose the value of the product, risks the displeasure of its customers who find that the product does not meet their needs, or, as in this case, experiences increased costs in performing a service. Losses like these can be insured. Society need not presume a customer needs special protection.¹³⁵

In these transactions, as had been suggested by Chief Justice Traynor, contract law and the law of warranty function well.

The Supreme Court was not persuaded that the limitations set forth in the minority of cases granting recovery for economic losses—that of foreseeability—would be an adequate brake on unlimited liability. The Supreme Court stated, “Permitting recovery for all foreseeable claims for purely economic loss could make a manufacturer liable for vast sums. It would be difficult for a manufacturer to take into account the expectations of persons downstream who may encounter its product.”¹³⁶ The *East River* Court's definition of economic loss, as involving damage to the

product itself, was adopted in the Restatement (Third) of Torts: Products Liability, Section 21(c).

While having its modern origin in products liability law, the economic loss rule has subsequently spread to virtually all aspects of construction defects litigation. The rule has been applied to claims (1) brought by third parties and between contracting parties and (2) by and against both commercial parties and unsophisticated homeowners. Thus, while this Chapter 14 addresses design professionals and this Section 14.08 discusses third-party claims, the following discussion is not limited to either category.

In truth, there is no one economic loss rule. While there is consensus as to what economic losses are (see the list at the beginning of this Section 14.08E), courts apply the rule (or find it inapplicable) in different situations and for different reasons. A comprehensive discussion of the economic loss rule is beyond the scope of this text, and what follows is intended simply as illustrations of this complex topic.¹³⁷

The most expansive use of the economic loss rule is by states that apply the rule in a literal and mechanistic manner, flatly refusing to allow the recovery of economic losses under theories of nonintentional torts. In these states, such as Illinois, the rule applies whether the parties are in privity, regardless of whether the plaintiff has a contract remedy, and to claims against design professionals.¹³⁸ Other states permit third-party claims if the relationship between the parties approximates that of privity or if the parties have a “special relationship.”¹³⁹ Colorado permits recovery of economic losses between parties in privity if the defendant breached a tort duty that was independent

of its contract obligations.¹⁴⁰ Wisconsin goes so far as to bar a homeowner’s claim against a subcontractor—that is, a claim by a noncommercial party not in a contractual relationship with the defendant.¹⁴¹ At the same time, Wisconsin does not extend the economic loss rule to services contracts, including between commercial parties in privity.¹⁴² One approach gaining increasing acceptance is to disallow third-party claims if there exists a scheme of interrelated contracts that affords the claimant a contract remedy, even if not against the actual tortfeasor. Under this rationale, for example, a subcontractor will be denied a tort claim against the project’s architect, on the grounds that the subcontractor has a contract remedy against the prime contractor for the economic losses caused by the architect’s negligence.¹⁴³

Other jurisdictions are more willing to allow the recovery of economic losses in tort. These states apply the economic loss rule only under narrow circumstances. As a general rule, these courts refuse to allow the economic loss doctrine to swallow up the preexisting law of torts by eliminating a defendant’s duty to act with due care.¹⁴⁴

The California Supreme Court has repeatedly addressed the recovery of economic loss damages claims in construction defect cases. It has approached this issue *not* through a mechanistic application of the economic loss rule, but instead has viewed it through the lens of the 1958 *Biakanja v. Irving* decision (discussed shortly), which devised a test

¹³⁷For a listing of the different rationales underlying the economic loss rule and its exceptions as applied to construction industry disputes, see Analysis, *Economic Loss Rule—Concentric Circles of Rationales*, 26 Constr.Litg.Rep., No. 5, May 2005, p. 216. For a generalized review of the doctrine from many perspectives, see *Symposium: Dan B. Dobbs Conference on Economic Tort Law*, 48 Ariz.L.Rev., No. 4, Winter 2006, pp. 689 et seq.

¹³⁸2314 *Lincoln Park West Condominium Ass’n v. Mann, Gin, Ebel & Frazier, Ltd.*, 136 Ill.2d 302, 555 N.E.2d 346 (1990) (client must sue its architect in contract); *Anderson Elec., Inc. v. Ledbetter Erection Corp.*, 115 Ill.2d 146, 503 N.E.2d 246 (1986) (claim barred despite lack of contract remedy).

¹³⁹*Ossining Union Free School Dist. v. Anderson LaRocca Anderson*, reproduced in Section 14.08D (relationship approximating privity); *Eastern Steel Constructors, Inc. v. City of Salem*, supra note 100 (“special relationship” between architect and contractor).

¹⁴⁰*Town of Alma v. AZCO Construction, Inc.*, 10 P.3d 1256 (Colo.2000).

¹⁴¹*Linden v. Cascade Stone Co., Inc.*, 283 Wis.2d 606, 699 N.W.2d 189 (2005). The question of whether the economic loss rule applies to an owner’s tort claim against a subcontractor is particularly divisive; compare *A.C. Excavating v. Yacht Club II Homeowners Ass’n, Inc.*, 114 P.3d 862 (Colo.2005) (claim permitted) with *Corporex Development & Construction Mgt., Inc. v. Shook, Inc.*, 106 Ohio St.3d 412, 835 N.E.2d 701 (2005) (claim denied).

¹⁴²*Insurance Co. of North Am. v. Cease Elec. Inc.*, 276 Wis.2d 361, 688 N.W.2d 462 (2004).

¹⁴³*BRW, Inc. v. Dufficy & Sons, Inc.*, 99 P.3d 66 (Colo.2004) (subcontractor has remedy against the prime contractor, who has a remedy against the owner under the *Spearin* doctrine discussed in Section 23.05); *SME Industries, Inc. v. Thompson, Ventulett, Stainback & Assocs., Inc.*, supra note 68. By the same logic, an owner’s remedy lies in a contract claim against the prime contractor, not a tort claim against the negligent subcontractor; see *Corporex Development & Construction Mgt., Inc. v. Shook, Inc.*, supra note 141.

¹⁴⁴*Indemnity Ins. Co. of North America v. American Aviation, Inc.*, 891 So.2d 532 (Fla.2004); *Kennedy v. Columbia Lumber & Mfg. Co., Inc.*, 299 S.C. 335, 384 S.E.2d 730 (1989).

for determining when a contracting party is liable to third parties for economic losses caused by his negligent performance of his contract obligations. In *Aas v. Superior Court*,¹⁴⁵ the court also confronted the vexing question of whether the economic loss rule should be suspended when a hazardous construction defect (which has not yet caused any personal injury) prompted the litigation.

In *Aas*, homeowners sued a developer and its subcontractors for multiple construction defects. Some of those defects—such as improper shear walls meant to stabilize the building in an earthquake and failure to build fire protection in party walls—implicated safety concerns. However, because the owners alleged no damage to other property or personal injury, their claim presented the issue of whether the economic loss rule should extend to hazardous defects. The trial court applied the economic loss rule, and a divided California Supreme Court affirmed.

The majority placed the issue before it—a builder's liability for construction defects which have not caused physical injury—in the wider context of circumstances under which a defendant's negligent performance of a contract obligation could subject it to liability in tort for economic losses foreseeably suffered by the plaintiff. The supreme court first addressed that issue in *Biakanja v. Irving*,¹⁴⁶ a case in which the plaintiff was denied a testamentary gift because the defendant, a notary public practicing law without a license, had negligently prepared a will by not having it properly solemnized. Applying a six-factor test, the *Biakanja* court concluded that the relationship between the defendant and plaintiff was such that the defendant owed plaintiff a duty to perform his contract obligation nonnegligently. These factors included the foreseeability of harm to the plaintiff, “the degree of certainty that the plaintiff suffered injury,” and the public policy of preventing future harm.

In the early 1960s, the court extended the *Biakanja* test to the construction industry, ruling that both prime contractors and subcontractors owed a duty of care to homeowners for defective construction work.¹⁴⁷ However, in 1965, the court in the *Seely* decision, discussed earlier in this section, invoked the economic loss rule to bar a strict product liability claim. Whether the economic loss rule

extended as well to negligence claims was brought into doubt nineteen years later. In *J'Aire Corp. v. Gregory*,¹⁴⁸ a restaurant owner who was a tenant in a building suffered lost business allegedly caused by construction delays by a contractor hired by the landlord. Applying *Biakanja*—especially the foreseeability of harm factor—the supreme court found that a “special relationship” existed between the tenant and contractor, allowing the tenant to sue the contractor for negligent interference with contract in order to recover lost profits.

Going back to the *Aas* case, the majority concluded that the homeowners did not satisfy the *Biakanja* test for tort liability. Plaintiffs did not meet the factor that looks to “the degree of certainty that the plaintiff suffered injury,” because the builders' negligence caused only the threat of future harm. The homeowners also did not meet the foreseeability of harm factor, because they have suffered no actual harm. Most troublesome, though, was the *dissent's* view that under the final *Biakanja* factor—the public policy of preventing future harm—it is (in the words of the dissent) “economically efficient” to allow the homeowners to make the repairs, then charge that cost to the builders. The *majority* disagreed, stating:

In some sense, that policy [of preventing future harm] might be served by a rule of tort liability making builders, in effect, the insurers of building code compliance, even as to defects that have not caused property damage or personal injury. Moreover, as plaintiffs argue, to require builders to pay to correct defects as soon as they are detected rather than after property damage or personal injury has occurred might be less expensive. On the other hand, such a rule would likely increase the cost of housing by an unforeseeable amount as builders raise prices to cover the increased risk of liability. Such a rule should also be unnecessary to the extent buyers timely enforce their contract, warranty and inspection rights, and to the extent building authorities vigorously enforce the applicable codes for new construction.¹⁴⁹

An increasing number of courts have held, as did the *Aas* court, that the economic loss rule should bar both homeowners and commercial owners from a tort remedy when they perceive their building contains hazardous defects which have not (yet) caused either property

damage or personal injury. As indicated in the discussion of *East River Steamship*, the Supreme Court rejected the so-called “intermediate position” (allowing recovery for hazardous defects) as too indeterminate a standard of manufacturer liability.¹⁵⁰ The experience of the Maryland Court of Appeals (that state’s highest court) is instructive. In *Council of Co-Owners Atlantis Condominium, Inc. v. Whiting-Turner Construction Co.*,¹⁵¹ the court held that the economic loss rule does not apply to hazardous defects: in that case, building code violations. However, less than a decade later, in *Morris v. Osmose Wood Preserving*,¹⁵² it applied the economic loss doctrine and barred a builder’s claim that deteriorating roof trusses, allegedly caused by the defendant manufacturer’s wood preservative, led to the possibility of roof collapse.¹⁵³

F. Interference with Contract or Prospective Advantage—The Adviser’s Privilege

Intentional interference with a contract or prospective advantage is increasingly invoked in claims against design professionals. This intentional tort was discussed in Section 11.03 in the context of retaining a

design professional. This section will refer to its use when the construction contract is awarded or during its performance.

In the award stage, the design professional can play a pivotal role. She may advise the owner as to which bid should be accepted when a contract is to be awarded by competitive bidding. She may also give advice when a contract is awarded by negotiation. During performance, the design professional plays a significant role both in advising the owner and in making decisions. The immunity sometimes granted to the design professional when she makes decisions is discussed in Section 14.09D. The design professional’s role generally in the decision-making process is discussed in Chapter 29.

During performance, the design professional may be asked to advise the owner on subcontractor selection or removal. She may be asked to advise the owner during a negotiation with the contractor over compensation for changes. She may also be required to certify, as in AIA Document A201-2007, Section 14.2.2, that there is sufficient cause to terminate the contractor. Other illustrations can be given, but these are enough to show the design professional in her advising role and the capacity her advice may have to harm others. However, much of the complexity in claims against the design professional stems from the varied roles she plays—agent, quasi-arbitrator, and individual architect.¹⁵⁴

Because of the open-ended exposure the tort can create, the law has tended to protect only against intentional interference. However, the important case of *J’Aire Corp. v. Gregory* discussed in Section 14.08E permitted the tenant in an airport to maintain an action for negligent interference with its restaurant business against a contractor whose negligence delayed the installation of an air-conditioning system.¹⁵⁵

The substantive basis for an intentional interference claim can range from actual malice or bad faith to simply intending to perform an act that interferes with the contract or prospective advantage. As illustrations, a subcontractor sued the architect who advised the owner not to approve that particular subcontractor.¹⁵⁶ Similarly, a rejected bidder

¹⁵¹308 Md. 18, 517 A.2d 336 (1986).

¹⁵²340 Md. 519, 667 A.2d 624 (1995).

¹⁵³For other courts coming to the same conclusion, see *Moorman Mfg. Co. v. National Tank Co.*, 91 Ill.2d 69, 435 N.E.2d 443, 449–50 (1982); *Determan v. Johnson*, 613 N.W.2d 259 (Iowa 2000); and *Bellevue South Assocs. v. HRH Constr. Corp.*, 78 N.Y.2d 282, 579 N.E.2d 195, 574 N.Y.S.2d 165 (1991). Where the hazardous defect is the installation of asbestos-containing materials, application of the economic loss rule turns on whether the asbestos fibers have spread. If they have, courts find that the building has suffered property damage and so do not apply the economic loss rule. *City of Greenville v. W.R. Grace & Co.*, 827 F.2d 975 (1987), rehearing denied, 840 F.2d 219 (4th Cir.1988) (South Carolina law); *80 South Eighth Street Ltd. Partnership v. Carey-Canada, Inc.*, 486 N.W.2d 393, 397, rehearing denied Sep. 11, 1992, amended by 492 N.W.2d 256 (Minn. 1992); and *Northridge Co. v. W.R. Grace & Co.*, 162 Wis.2d 918, 471 N.W.2d 179, 186 (1991). Where there is no evidence that the asbestos fibers have escaped, the courts are less likely to find the defendant liable in tort since the harm remains speculative; see *Adams-Arapahoe School Dist. v. GAF Corp.*, 959 F.2d 868 (10th Cir. 1992) and *San Francisco Unified School Dist. v. W.R. Grace & Co.*, 37 Cal.App.4th 1318, 44 Cal.Rptr.2d 305, 309–12 (1995). A California court, analogizing to the law applicable to asbestos contamination, ruled that contamination of a utility’s pipeline by polychlorinated biphenyls (PCBs) constitutes “property damage” for purposes of the economic loss rule. *Transwestern Pipeline Co. v. Monsanto Co.*, 46 Cal.App.4th 502, 53 Cal.Rptr.2d 887 (1996).

¹⁵⁴*Lundgren v. Freeman*, 307 F.2d 104 (9th Cir.1962) (a leading case).

¹⁵⁵Supra note 147.

¹⁵⁶*Kecko Piping Co., Inc. v. Town of Monroe*, 172 Conn. 197, 374 A.2d 179 (1977) (architect given defense of adviser’s privilege).

sued the architect.¹⁵⁷ Another case involved a claim by a contractor against an architect who did not confirm a preliminary approved product substitution by issuing a change order. When the architect ordered the contractor to remove the substituted product, the contractor refused, and on the architect's advice the owner terminated the prime contractor.¹⁵⁸ Another case involved a claim by a mechanical subcontractor and its supplier against an engineer for arbitrarily requiring equipment specifications the supplier could not have met.¹⁵⁹ Another involved a claim by the contractor that the engineer communicated directly with the contractor's suppliers, encouraged the suppliers to threaten to terminate or actually terminate their delivery of supplies, and encouraged the owner to treat nondelivery by the suppliers as grounds to terminate the contract.¹⁶⁰ Finally, an investigating engineer was sued by a soils engineer when he claimed that the report the investigating engineer gave the owner was false and interfered with anticipated future relations with the owner.¹⁶¹

By and large these claims have not been successful. Some defendants have been able to invoke the Restatement (Second) of Torts, Section 772,¹⁶² which states that interference has not been improper if the person against whom the claim has been made has in good faith given honest advice when requested to do so. Another defense granted has been the privilege given to a person who is asked to prepare for litigation.¹⁶³

Despite the relative lack of success of such claims, the claims still expose design professionals to liability for an intentional tort with the possibility of punitive damages.¹⁶⁴

G. Safety and the Design Professional: *Pfenninger v. Hunterdon Central Regional School District and CH2M Hill, Inc. v. Herman*

The responsibility of design professionals for safety has become a contentious issue. Does the design professional engaged to perform the normal site services have any responsibility for harm to people or to property when the principal cause of the harm has been negligence by the contractor or a subcontractor? This problem has surfaced principally in two forums. The first is the judicial system, where the problem is triggered by a claim by or on behalf of an injured worker, a member of the public, or an adjacent landowner that seeks to transfer to the design professional losses it has suffered, claiming negligence. This negligence usually consists of not taking reasonable steps to prevent contractors from performing work in a way that unreasonably exposes the claimant to personal harm or property damage.

The other forum in which this issue arises is workplace safety laws, such as the Occupational Safety and Health Act (OSHA), or equivalent state regulatory agencies. Agencies charged with administering such laws increasingly charge design professionals with responsibility for unsafe workplaces.

Claims for compensation by those who have suffered losses often involve the effect of contract language that seeks to exculpate the design professional from any responsibility for safety. This is similar to the language discussed in Section 12.08B that seeks to exculpate the design professional from responsibility for the contractor not performing properly under its contract. Tort claims brought through the judicial process on behalf of people who seek to transfer their losses to the design professional are examined first.

A tort claim requires that the defendant owe a duty to the claimant to act in a way that avoids exposing the claimant to unreasonable risk of harm. When the privity requirement was dropped in the late 1950s, design

¹⁶⁴*Custom Roofing Co., Inc. v. Alling*, 146 Ariz. 388, 706 P.2d 400 (App.1985) (punitive damages justified by wanton conduct and indifference to the rights of others). The cases are cataloged and discussed by Schneier, *Tortious Interference with Contract Claims Against Architects and Engineers*, 10 Constr. Lawyer, No. 2, May 1990, p. 3.

professionals switched to another defense. They asserted that they owed no duty to third-party claimants, because their project monitoring was directed toward a project's fulfilling the contract obligations promised to the owner. (Of course, it was more complicated than that, as demonstrated in the cases reproduced next and in the analysis in Section 14.11B.)

Design professionals complained that courts were unjustifiably placing responsibility on them if anything went wrong in the construction process. Courts did this by focusing on the construction contract, with its many powers given the design professional, such as to reject work, stop the work, and provide general supervision. These powers, they contended, existed only to implement their "monitoring" function. The design professional, they asserted, had no right or duty to tell the contractor how the work was to be done. Nor was she paid, in the ordinary project, to be a "safety" engineer.

As a result of adverse court decisions, standard agreements made by the professional associations were changed in the 1960s to seek to make clear that the contractor, not the design professional, decided how the work was to be done and that the design professional did not provide continuous on-site observation and certainly did not supervise the work. These changes, designers claimed, simply reflected the true allocation of responsibility for work on the site.¹⁶⁵

Most courts find that contracts which (1) reserve to the architect or engineer responsibility only to "observe" (not supervise) the work, (2) impose upon the contractor responsibility for the manner or method of performance and for job-site safety, and (3) grant the owner (not the architect) the authority to stop the work, do not impose a duty of care upon the design professional for the safety of the construction workers. For example, in *Krieger v. J. E. Greiner Co.*,¹⁶⁶ a construction worker was injured when a steel beam collapsed. He claimed that the erection subcontractor did not support the 780-pound reinforcing bars and the steel column. He asserted that the work was performed under the supervision of defendant Greiner, the prime engineer, and defendant Zollman, a consulting engineer. He sued Greiner and Zollman, claiming that they should have known that the subcontractor was

performing in a defective and dangerous manner and that the defendants previously had stopped the work when they perceived it being performed in a dangerous manner. The Maryland Court of Appeals (the state's highest court) rejected the worker's claim:

We have carefully examined each of the contracts in question. We find no provisions in these contracts imposing any duty on the engineers to supervise the methods of construction. Some mathematics instructors have been heard to observe that there is more than one solution to a given problem and thus they are unable to say that any given method of solving a problem is the only correct solution, being able only to determine that the correct answer is produced. The same reasoning would apply to methods of construction. One skilled contractor may prefer one method for performing a given task while another such contractor may choose what seems to him a simpler, less expensive way of reaching the same end result, either of which procedures would be a proper method. It could well be, however, that one method might not have occurred to an engineer or another contractor.

We likewise find nothing in the contracts imposing any duty on the engineers to supervise safety in connection with construction.

The duty of the engineers under their contracts is to assure a certain end result, a completed bridge which complies with the plans and specifications previously prepared by Greiner. It will be observed that many of the cases which have held architects and engineers responsible for safety have done so on the basis of the construction by the courts of the contracts existing between the engineer or architect and the owner. We hold that a fair interpretation of the contracts between the Commission and Greiner and Zollman is that the duties of those engineers do not include supervision of construction methods or supervision of work for compliance with safety laws and regulations. Hence, the Kriegers may not recover from the engineers under the contracts between the owner and its engineers.¹⁶⁷

In *Krieger*, the construction worker argued that the engineers "should have known" of the erection subcontractor's unsafe manner of performance. He essentially was saying that, while the engineer did not know of

¹⁶⁵M. SCHNEIER, CONSTRUCTION ACCIDENT LAW, *supra* note 46 at 282–85 (detailing the changes made to AIA documents).

¹⁶⁶282 Md. 50, 382 A.2d 1069 (1978).

¹⁶⁷382 A.2d at 1079. Accord, *Baumeister v. Automated Products, Inc.*, 277 Wis.2d 21, 690 N.W.2d 1 (2004) (under AIA Doc. B141-1987, architect had no duty to supervise installation of roof trusses and was not liable to workers injured during that process).

the unsafe practice of the subcontractor, he was negligent in not knowing and should be liable for that negligence. Suppose, however, that the inspecting architect or engineer *knew* of the hazardous condition beforehand and did not act to have that condition ameliorated. Historically, courts were more inclined to find the inspecting design professional liable in such a situation.¹⁶⁸

In the 1990s, courts began extending the rule of nonliability under the modern standard form contracts to “actual knowledge” cases. These courts reasoned that a design professional does not owe a duty of care to construction workers absent a duty assumed by contract or conduct. The engineer’s mere knowledge of the hazardous condition, without more, does not create a duty of care where previously none had existed.¹⁶⁹

New Jersey’s experience with the question of an inspecting architect’s or engineer’s liability for workplace

accidents is instructive. In *Carvalho v. Toll Brothers & Developers*,¹⁷⁰ an engineering firm designed a sewer line for a township, and provided a site representative to observe and inspect the construction on a daily basis. The various contracts made clear that the general contractor alone was responsible for worksite safety, although the engineer had the authority to stop the work. A subcontractor’s employee was killed when a 13-foot deep trench in which he was standing collapsed. The engineering firm’s representative knew before the accident that the trench lacked shoring and was unstable. The estate sued the engineering firm for wrongful death. The supreme court ruled that the engineer owed a duty of care to the construction workers, even though it had no contractual responsibility for site safety. Five years later, the New Jersey Supreme Court, in yet another case involving a trench cave-in, sought to restrict *Carvalho* to its facts. That decision is reproduced here.

PFENNINGER v. HUNTERDON CENTRAL REGIONAL HIGH SCHOOL

Supreme Court of New Jersey, 2001. 167 N.J. 230, 770 A.2d 1126.

[Ed. note: Footnotes omitted.]

PER CURIAM

[Ed. note: Pfenninger was killed in a trench collapse while installing drainage pipes on a school athletic field. The trench was eight feet deep and was not shored or braced, in violation of the Occupational Safety and Health Administration (OSHA) safety regulations, which Pfenninger was obligated by his contract to follow. The school board had hired defendant O’Sullivan to design and inspect the work. See Figure 14.3

Plaintiff, Pfenninger’s wife, sued O’Sullivan for negligence. The trial court entered a summary judgment (a pre-trial ruling) in favor of the architect, but the appellate division reversed. The supreme court unanimously affirmed the trial court ruling in favor of O’Sullivan. Rather confusingly, it did so in a *per curiam* opinion (i.e., an opinion of the court as a whole, not authored by a particular judge) in which it adopted the dissenting opinion of Justice Coleman (a justice on the New Jersey Supreme Court) as the opinion of the entire court. (Justice Coleman dissented on a separate issue: whether the school board owed a duty of care to Pfenninger.) So the following is a reproduction of Justice Coleman’s dissent, which—on the question of O’Sullivan’s liability—is the opinion of the court as a whole.]

* * *

In 1994, Hunterdon Central Regional High School District Board of Education (“Board”) commenced several construction projects at Hunterdon High School, including a drainage system, an underground electrical system, a new scoreboard, and renovation of the school’s existing fountain. Although the

Horrocks Engineers, Inc.*, 106 F.3d 949 (10th Cir.1997) (predicting the Utah Supreme Court would adopt the rule of non-liability).

¹⁷⁰143 N.J. 565, 675 A.2d 209 (1996).

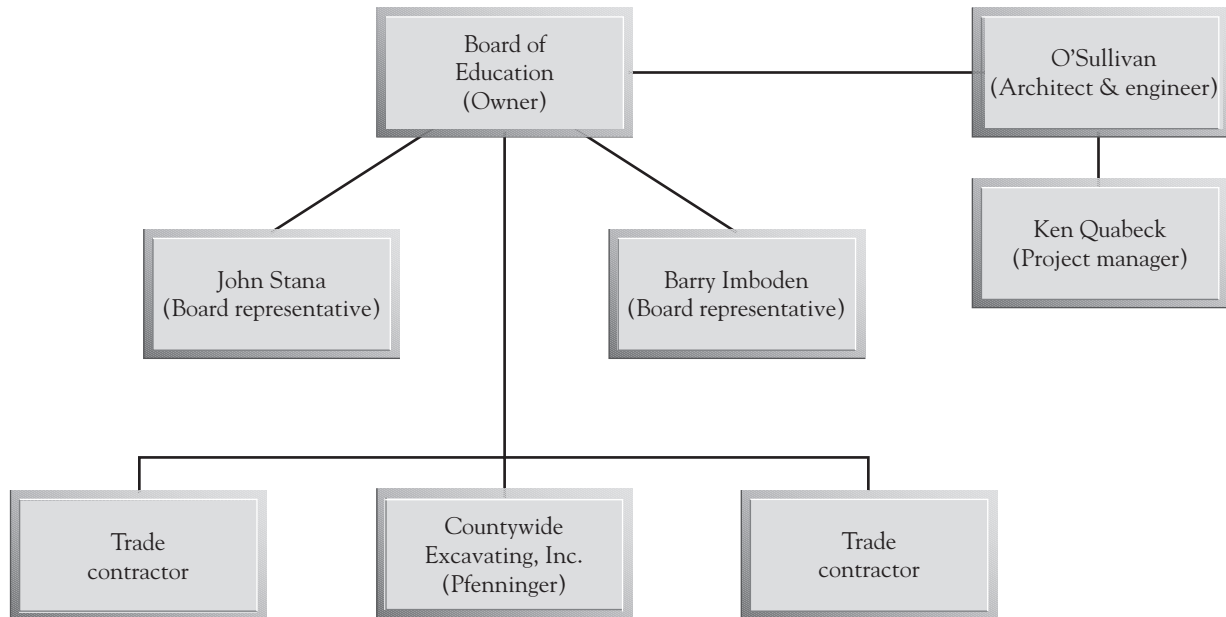

FIGURE 14.3 *Pfenninger v. Hunterdon Central Regional High School.*

Board hired multiple contractors to perform the various projects, it did not retain a general contractor. Responsibility for coordinating and scheduling the projects was shared by the Board and A.J. O'Sullivan Architects, P.A. ("O'Sullivan"), an architectural firm hired by the Board to provide architectural and engineering services.

The project involved in the present litigation involved the installation of a drainage system for the varsity baseball field. That required excavating an eight- to nine-foot deep trench to install drainage piping underneath the field. O'Sullivan contacted several excavating companies on the Board's behalf to solicit bids for the drainage project. The contract was ultimately awarded to Countywide Excavating, Inc. ("Countywide"), the owner and principal officer of which was the decedent, Matthew Pfenninger.

It was agreed that Countywide would supply labor and equipment and that the Board would supply the necessary materials, including the drainage pipe. According to the design specifications prepared by O'Sullivan, Countywide was "responsible for all safety precautions on the job." The design specifications also stated:

The contractor shall furnish, place and maintain all sheeting, bracing, lagging, shoring and miscellaneous supports, as required to support and prevent movement of earth which could injure

persons in or around the work areas, and/or endanger any adjacent structures, tanks or utilities. . . .

. . . All preventive safety measures shall be in compliance with OSHA and the requirements of the local municipality and the owner.

The design plans further specified that O'Sullivan did "not have field inspection responsibilities for the job" and that Countywide was "responsible for the methods and means of construction."

The Board's representatives were John Stana, director of plants and facilities, and Barry Imboden, supervisor of grounds and maintenance. Although Stana was the self-acknowledged liaison between the Board, O'Sullivan, and Countywide, he did not visit the athletic field after Countywide commenced the excavation project. Barry Imboden, on the other hand, was on campus daily and recalls having at least two conversations with Matthew Pfenninger after the project began. Imboden peered into the trench on occasion, but never saw it in a fully exposed state because Countywide "backfilled" completed sections of the trench with gravel before moving on to the next section.

O'Sullivan appointed Ken Quabeck as its project manager. Quabeck communicated with Countywide on several occasions

after the excavation began. For example, Quabeck instructed Countywide that it would have to erect a temporary fence around the exposed trench during the project for the students' safety. Quabeck may have visited the excavation site once after the project commenced, but there is no evidence that he looked into the trench or was aware that Countywide was not using bracing or shoring. There is evidence that shortly before the trench collapsed O'Sullivan was aware that Countywide was having difficulty completing the excavation work due to inclement weather, machinery problems, and soil conditions. O'Sullivan frequently requested that the project commence and be completed as soon as possible.

* * *

On August 24, 1994, Matthew Pfenninger was working in the trench when the walls suddenly caved in and killed him. The walls were not braced or shored at the time of the accident as required by the contract.

* * *

In an attempt to impose liability on the architect, plaintiff relies on the Court's discussion of an engineering firm's duty of care to an independent contractor in *Carvalho*, *supra*, 143 N.J. 565, 675 A.2d 209. In *Carvalho*, the township of West Windsor hired an engineering firm to prepare plans for a sewer construction project. Although the general contractor was responsible for safety measures and the methods of construction, the engineer was contractually required to maintain an on-site representative, who was to monitor work progress and ensure that the construction complied with the design specifications. To this end, the engineer's on-site representative had the contractual authority to stop construction. An excavation subcontractor's employee was killed when the trench in which he was working collapsed. Notwithstanding the fact that the contract required excavation protection systems, the trench was not shored or braced at the time of the accident. Notably, the engineering firm's on-site representative was standing near the trench on the day of the accident, observing the decedent perform his work.

The decedent's widow sued the engineering firm, arguing that it owed the decedent a duty to provide reasonably safe premises. The Court first determined that the accident was foreseeable because the contract provided for trench safety precautions and other trenches had previously collapsed at the construction site. The Court then observed that it was fair to impose a duty on the engineer because it had assumed a contractual responsibility

to monitor work progress and to ensure compliance with the design plans, which implicated safety concerns because the use of trench boxes would slow down the project. [Ed. note: Citations omitted.] The Court also stressed that the engineer "had the authority and control to take or require corrective measures to address safety concerns," when safety conditions affected work progress. [Ed. note: Citations omitted.] Finally, the Court emphasized that the engineer's representative was present at the job site on the date of the accident and had actual knowledge that work was being conducted in the trench without the protection of a trench box. For all of those reasons, the Court concluded that imposing a duty to exercise reasonable care to protect against the risk of injury on the construction site was consistent with considerations of fairness and public policy. [Ed. note: Citations omitted.]

Relying on the Court's decision in *Carvalho*, plaintiff contends that O'Sullivan owed Matthew Pfenninger a duty of care because it was foreseeable that the trench walls could collapse. I agree that there is a risk in nearly every excavation project that the walls of an unshored trench may cave in. Those who doubt this statement need only canvass New Jersey's case law, which is replete with lawsuits arising from trench collapses. [Ed. note: Citations omitted.]

The risk of a cave-in can be eliminated, however, through the use of adequate protection systems, such as bracing, shoring, or trench boxes. Therefore, plaintiff is not correct that it was foreseeable that the walls would collapse on Matthew Pfenninger. O'Sullivan, like the engineering firm in *Carvalho*, inserted a clause into the design specifications requiring Countywide [the construction company employing Pfenninger] to adequately brace or shore the trench. In contrast to an unbraced trench, it is not foreseeable that a braced trench will collapse. Nor did O'Sullivan have reason to believe that Countywide would deviate from the design specifications and fail to secure the trench walls with a protection system.

The same can be said, of course, about the engineer in *Carvalho*. The critical difference, however, is that the engineer in *Carvalho* was contractually required to maintain an on-site representative who had the authority to ensure compliance with safety requirements and to stop work, if necessary, to ensure compliance. Furthermore, the engineer's representative in *Carvalho* was observing the decedent work in the trench at the time of the accident, and was, therefore, aware that neither a trench box nor any other safety system was being used.

O'Sullivan, in contrast to the engineer in *Carvalho*, was neither required to maintain an on-site representative nor did it

have the authority to halt the project to remedy safety violations. The design specifications explained that O'Sullivan did not have "field inspection responsibilities" and that Countywide was "responsible for safety precautions on the job." An architect's duty to foresee and prevent harm is generally "commensurate with the degree of responsibility which the engineer [or architect] has agreed to undertake." *Sykes v. Propane Power Corp.*, 224 N.J.Super. 686, 694, 541 A.2d. 271 (App.Div.1988). Furthermore, the summary judgment record lacks evidence that O'Sullivan, or the Board for that matter, had actual knowledge that Countywide

failed to brace the walls of the trench. Although O'Sullivan's project manager, Ken Quabeck, visited the excavation site at least once, there is no competent evidence in the record establishing that he looked into the trench or was told that the walls were not braced. Absent contractual responsibility for on-site safety and actual knowledge that the trench was not braced, O'Sullivan could not foresee that the trench would cave in on Matthew Pfenninger.

* * *

Future New Jersey cases involving claims by injured construction workers or their estates will have to contend with the state legislature's response to the *Carvalho* decision. N.J.S.A. § 2A:29B-1 provides that a professional engineer or engineering firm is not liable for a worksite accident unless (1) the engineer expressly assumed responsibility for worksite safety, or (2) on a multi-prime project, the engineer is the owner's representative and no contractor has been designated responsible for site safety, or (3) the engineer "had actual knowledge" of site conditions involving "an imminent danger" and failed, within a reasonable time, to notify the contractor or construction workers. Section 2A:29B-2 creates an exception for acts of willful misconduct or gross negligence. While the statute refers only to engineers, it presumably applies to architects as well. It modifies the common law "actual knowledge" rule by imposing upon the design professional a duty to warn of hazardous conditions involving an imminent danger.¹⁷¹

The *Krieger*, *Carvalho* and *Pfenninger* decisions all involved a design professional's liability to construction workers arising out of the architect's or engineer's presence on the job site. An architect who only provided the design and had no involvement in the actual construction would not be liable under such a theory. However, workers may also allege liability arising out of the architect's design duties. In *Waggoner v. W&W Steel Co.*,¹⁷² the death of two workers and the injury of another resulted from the

contractor's failure to provide interior columns and cross beams that would have provided lateral bracing for the outside columns. While the steel was being erected, a gust of wind hit the unsecured and unbraced steel, causing it to collapse. The claimants asserted that the architect owed a duty to workers. They claimed the architect was negligent in approving shop drawings that did not provide for temporary connections on the expansion joints.

The court held that although privity was not required before a tort claim could be brought in claims for physical injuries to third parties, the actual liability depends on whether a duty has been created, and this depends on the nature of the architect's undertaking and his conduct.

The court then quoted extensively from general conditions of the contract for construction, very likely those of the American Institute of Architects (AIA). The contract provided that the responsibility for executing the contract and reasonable precautions for safety belonged to the contractor, not to the architect. The fact that the architect periodically visited the site did not remove the responsibility from the shoulders of the contractor. As to the plaintiffs' contention that the architect's approval of shop drawings that did not provide for temporary connections on the expansion joints constituted negligence, the court pointed to language in the contract stating that the contractor represented that he had checked all shop drawings for the requirements of the contract and also noted that the contract makes the contractor solely responsible for "construction means, methods, techniques, sequences and procedures."¹⁷³ But the contract specified that the

¹⁷¹Other statutory protections of design professionals against injured worker claims are discussed in Section 14.09E.

¹⁷³*Id.* at 151.

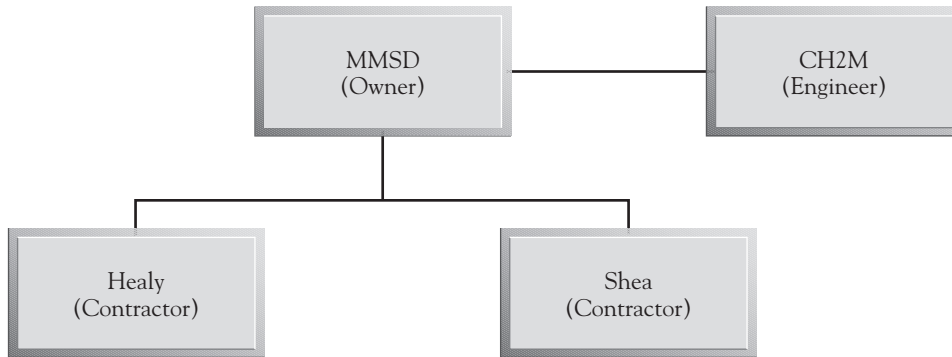

FIGURE 14.4 *CH2M Hill, Inc. v. Herman.*

architect's approval was only for conformance with the design concept and the information given in the contract documents.

Most important from the perspective of design professionals, relying mainly on the exculpatory provisions in the contract the court found there was no question of fact for the jury to decide. The design professional was able to receive a summary judgment and avoid the cost of a full trial and the uncertain outcome of a jury verdict.

As mentioned earlier, another forum where this question has become controversial is the Occupational Safety and Health Review Commission (OSHRC), which passes on violations of OSHA. In 1977, the commission held that an architect who does not perform construction work is exempt from OSHA job site regulations and extended this to a consulting structural engineer in 1992.¹⁷⁴

However, in 1997, the OSHRC for the first time extended the OSHA regulations (called "construction standards") to an engineering firm. *Secretary of Labor v. CH2M Hill Central, Inc.*¹⁷⁵ involved a massive project by the Milwaukee Metropolitan Sewerage District (MMSD) to upgrade its sewer and treatment facilities. MMSD hired two general contractors—Healy and J. F. Shea—to build

one tunnel each. MMSD also hired *CH2M Hill Central, Inc.*, an engineering firm, to perform administrative and supervisory duties. See Figure 14.4. CH2M's contract with MMSD specified that the engineering firm's supervisory duties did not relieve a construction contractor of its sole responsibility for the method or means of construction. If an engineer discovered defects or nonconformance, MMSD alone had the right to stop the work.

When a contractor discovered methane gas in one of its tunnels, it filed a differing site conditions ("DSC") claim (seeking guidance for an unanticipated site condition). CH2M worked with the contractor to devise a safety program. However, when methane was again discovered, three employees went back into the tunnel after only a quarter of an hour (in violation of the safety program, which required a one-hour wait) and were killed when the gas exploded, presumably because the workers attempted to operate their equipment.

CH2M was cited for violation of the OSHA construction standards. The administrative law judge, applying the *Skidmore* and *Simpson* decisions cited in footnote 159, found the engineering firm not subject to the safety regulations because it did not engage in actual construction work. The Review Commission found CH2M liable only by devising a new test, holding that an architect or engineer may be subject to statutory liability if it (1) possessed broad responsibilities, both contractual and *de facto*, over the construction activities and (2) was directly and substantially engaged in activities that were integrally connected with safety issues. CH2M appealed to the federal Court of Appeals, and that decision is reproduced here.

¹⁷⁴*Secretary of Labor v. Skidmore, Owings & Merrill*, 5 O.S.H.Cas. (BNA) 1762 (O.S.H.Rev.Comm'n.1977); *Secretary of Labor v. Simpson, Gumpertz & Heger, Inc.*, 15 O.S.H.Cas. (BNA) 1851 (O.S.H.Rev.Comm'n.1992), *aff'd* on other grounds, *Reich v. Simpson, Gumpertz & Heger, Inc.*, 3 F3d 1 (1st Cir.1993).

CH2M HILL, INC. v. HERMAN

United States Court of Appeals, Seventh Circuit, 1999. 192 F.3d 711.

Before BAUER, MANION and KANNE, Circuit Judges
KANNE, Circuit Judge

[Ed. note: Some footnotes omitted and footnotes renumbered.]
Whenever accidental death occurs, it is human nature to place blame. During a massive construction project on the Milwaukee sewer system, three men died when methane gas located in the tunnel in which they had been working exploded. During the aftermath, the Secretary of Labor (“Secretary”) issued a citation to CH2M Hill Central, Inc. (“CH2M Hill”), the firm that Milwaukee had hired as consulting engineer. On administrative review, CH2M Hill argued vigorously that the construction standards under which it had been cited did not apply to it as a professional firm not “engaged in construction” and the initial Occupational Safety and Health administrative law judge agreed with CH2M Hill. However, on review, the Occupational Safety and Health Review Commission (“Commission”) concluded the standards did apply to CH2M Hill. On remand, a second Occupational Safety and Health administrative law judge found CH2M Hill had violated the regulations and imposed a series of fines. We agree with the initial administrative law judge’s conclusions and reverse.

* * *

II. Analysis

The primary issue presented by this case is whether OSHA’s construction standards apply to professional firms with responsibilities similar to those exercised by CH2M Hill in regard to tunnel CT-7. While we offer no opinion as to the “new” test proposed by the Commission and that amici [Ed. note: “friends of the court”] urge us to find invalid, we do conclude that all professionals operating in the field of construction are not per se exempt from complying with these construction standards. Under the facts of this case, we find that because CH2M Hill’s responsibilities did not rise to a level that constituted being engaged in construction work, the regulations do not apply to it. Accordingly, we need not determine whether its actions conformed to these standards.

* * *

A. Scope of the Construction Standards

CH2M Hill first urges us to reject the Secretary’s interpretation of the construction standards that permits their

application to professionals, such as engineers and architects. It contends that the plain meaning of the term “construction” creates a per se exclusion of professionals working on or as part of a construction project. In its view, “construction” should be strictly construed according to its dictionary meaning of building, erecting, or putting together. [Ed. note: The court rejects that argument, concluding its discussion as follows:]

While a blanket per se exclusion of professionals entering into construction contracts might promote efficiency by avoiding this often expensive and always time consuming process, the broader approach is also more consistent with congressional intent. The Act’s purpose is “to assure so far as possible every working man and woman in the Nation safe and healthful working conditions and to preserve our human resources. . . .” 29 U.S.C. § 651 (b). Congress designed the Act to enhance compliance with standards and to reduce safety hazards in the workplace, not to punish employers. See *Anning-Johnson Co. v. OSHRC*, 516 F.2d 1081, 1088 (7th Cir.1975). With these points in mind, this Court has concluded that “[t]he underlying rationale in effectuating these purposes by placing primary responsibility on employers is that employers have primary control of the work environment and should therefore insure that it is safe and healthful.” *Id.* (citing S.Rep. No. 91-1282, at 9 (1970), U.S. Code Cong. & Admin. News at 5177, 5186; H.R.Rep. No. 91-1291, at 21 (1970)). Thus, Congress did not intend the Act, or the regulations flowing from it, to apply only to some employers and not others, but rather to those employers who were best suited to alleviate hazards at the construction site. A per se exception excluding professionals, regardless of their duties, from liability under the Act and its regulations would diminish the aims of Congress in enacting this legislation. Therefore, the Secretary’s goal of adopting a balance as to whom the regulations apply is a reasonable approach. We do not find the Commission’s decisions regarding the general applicability to professionals in some cases arbitrary or capricious.

B. Applicability of the Construction Standards to CH2M Hill

Prior to its decision in regard to CH2M Hill, the Commission had explained that it would apply the construction standards “to employers who perform no physical trade labor,

such as [the respondent], only to the extent that such employers have actual and direct responsibility for the specific working conditions at the jobsite and for any hazards resulting from the actions of any trade contractor.” *SGH*, 15 O.S.H. Cas. (BNA) at 1867. [Ed. note: “SGH” refers to the *Simpson* decision in footnote 174.] Or, stated more succinctly, professionals only have to comply with the standards if they exercise “substantial supervision over actual construction.” *SOM*, 5 O.S.H. Cas. (BNA) at 1764. [Ed. note: “SOM” refers to the *Skidmore* decision in footnote 174.] This inquiry has become known as the “substantial supervision” test.

As part of its evaluation of CH2M Hill’s responsibilities with regard to the Program, however, the Commission adopted a new test. It stated that an engineering or architectural firm would “engage in construction work” if it:

(1) possesses broad responsibilities in relation to construction activities, including both contractual and de facto authority directly to the work of the trade contractors, and (2) is directly and substantially engaged in activities that are integrally connected with safety issues . . . notwithstanding contract language expressly disclaiming safety responsibility.

As we noted in an earlier consideration of this case, this test means:

architects, engineers, and similar professionals should be treated as joint employers with the firms actually carrying out the construction, even if the contracts assign to the project owner full responsibility for directing the work, and to the general contractor sole responsibility for implementing the owner’s decisions.

CH2M Hill Central, Inc. v. Herman, 131 F.3d 1244, 1245 (7th Cir.1997). However, in *Secretary of Labor v. Foit-Albert Assoc.*, 17 O.S.H. Cas. (BNA) 1975, 1978 (1997), the Commission admitted that it could not always hold professionals responsible for compliance with construction standards.

In an amicus brief, several professional engineering and architecture associations and societies urge us to accept CH2M Hill’s arguments and reject the Commission’s expanded interpretation of “engaged in construction work.” They claim the new test is arbitrary, vague and too broad, making it inconsistent with the Act. They argue for a return to the “old” test under which the regulations applied only to engineers and architects who exercised “substantial supervision over actual construction.” See *SOM*, 5 O.S.H. Cas. (BNA) at 1764. Their views certainly are well supported; however, we need not reach this issue. Even if this “new” test were appropriate, OSHA still fails to establish that CH2M Hill contractually or on a de facto basis exercised direct

authority and control over, or substantially engaged in activities integrally connected with, the safety measures for CT-7.

Even though we refrain from basing our decision on the validity of the “new” test, we, however, note our concern as to at least one aspect of the new test—specifically, the Commission’s decision to ignore contract language in evaluating to whom the regulations apply. While perfunctory language that does not represent the true responsibilities of a particular employer should not absolve it from complying with the regulations, language exempting an employer from particular responsibilities that the facts confirm that the employer does not actually retain control cannot be casually thrown aside. Contracts represent an agreed upon bargain in which the parties allocate responsibilities based on a variety of factors. To ignore the manner in which the parties distributed the burdens and benefits is contrary to our notion of contract law. When an owner, such as MMSD, contracts for outside services relating to a construction contract, it’s usually the owner who bargains from the position of strength, making it easier for it to shift liability away from itself. *Cf. Anning-Johnson Co. v. OSHRC*, 516 F.2d 1081, 1089 (7th Cir. 1975) (stating that general contractors often bargain from the position of strength when contracting with subcontractors). Thus, the owner’s retention of such liability may, in fact, be a significant indicator of the relationship between the parties. The Secretary and Commission cannot ignore the fact that parties to a contract bargained for one to maintain safety responsibilities and for the other to refrain from such responsibility. As one of our colleagues aptly noted:

Congress, whose underlying rationale in adopting the statute . . . was that the employer has control of the work environment and should therefore be responsible for making it safe, could not have intended that the employer be sanctioned for failure to correct conditions he could not correct.

Anning-Johnson, 516 F.2d at 1092 (Tone, J. concurring). Ignoring the language of the contract or an attempt to create blanket liability for professionals regardless of their ability to control the safety aspects of a construction site would be, as Judge Tone explained, contrary to the very intent of Congress when it drafted OSHA. The question as to what responsibilities a particular defendant maintained should turn on a factual inquiry based on a review of the record, including the language of the contract.

In this case, no significant evidence in the record supports the factual findings of the Commission that CH2M Hill exercised substantial supervision or control such that it was “directly and substantially engaged in activities that [were] integrally connected with safety issues.” . . .

A review of the Commission's prior considerations of this matter supports this conclusion as well. The cases in which the Commission has concluded that a "professional" employer is engaged in construction work it has found that the employer, either contractually or in actuality, had substantial control over the safety program at the construction site. In *Secretary of Labor v. Bechtel Power Corp.*, 4 O.S.H. Cas. (BNA) 1005, 1007 (1976), the Commission found that the construction standards applied to a construction manager who, among other things, coordinated the safety program, was an integral part of the total construction system and functioned in a manner "inextricably intertwined" with the actual physical labor of the construction. Similarly, the Commission concluded that the construction standards applied to an architectural firm that also managed the construction project because it had the authority to stop work until problems were resolved. See *Secretary of Labor v. Bertrand Goldberg Assoc.*, 4 O.S.H. Cas. (BNA) 1587, 1588 (1976). In *Secretary of Labor v. Cauldwell-Wingate Corp.*, 6 O.S.H. Cas. (BNA) 1619, 1621 (1978), the Commission stated that the construction standards applied to a firm employed as a construction manager had significant responsibilities that gave it "substantial supervision over actual construction," including the authority to act on behalf of the owner of the project. Finally, the Commission, in *Secretary of Labor v. Kulka Constr. Management Corp.*, 15 O.S.H. Cas. (BNA) 1870, 1871-73 (1992), decided that the construction standards applied to a management corporation that exercised substantial supervisory authority over the construction work because it reviewed the safety programs of each contractor, was responsible for giving general instructions to contractors as to how the work would proceed and its own employee assured compliance officers that he would make sure the safety measures would be completed. In all of these cases, the employer in question had authority to direct and control what was occurring at the construction site.

On the other hand, the Commission has also concluded that the construction standards do not apply to professional firms who do not maintain such authority or control. In SOM, the Commission vacated a citation issued to a firm finding that the construction standards did not apply to it due to its lack of "substantial supervision over actual construction" because of its limited functions and authority over the work, 5 O.S.H. Cas. (BNA) at 1764. While the firm inspected the work of various contractors to ensure that they met design specifications, employed field representatives to observe the work and could require that work be redone or repaired if it did not conform, the contract expressly denied the firm "the responsibility for or the authority to direct or supervise construction methods, techniques, procedures or

safety methods." *Id.* at 1762-63. Similarly, the Commission, again applying the "substantial supervision test," concluded that an architectural/engineering firm was not subject to the construction standards because it did not engage in construction work. See *SGH*, 15 O.S.H. Cas. (BNA) at 1869. The firm's duties included: preparing contract drawings and specifications to conform to local regulations and codes subject to approval by the owner, assisting the owner with the bidding process, undertaking measures to ensure that contractors conformed with the necessary codes and regulations, making on-site inspections and assisting the owner with resolving disputes between it and the contractors. Its responsibilities, like those of SOM, were limited by a contractual disclaimer, which stated it would not "be responsible for, construction means, methods, techniques, sequences or procedures, for safety precautions and programs in connection with the Work . . ." *Id.* at 1854. The Commission concluded that, while the firm was informed of the safety hazard, it "did not assume substantial supervisory authority over" the project, and, thus, it did not come within the scope of the regulation. *Id.* at 1870.

The responsibilities of CH2M Hill are more like those in these latter cases—SOM and SGH—than they are like those in which the Commission found the employers to be engaged in construction work. Like those of SOM and SGH, CH2M Hill's contract severely limited its authority and responsibility over safety programs. CH2M Hill, while it exercised some authority, had only limited authority that was always subject to final approval by MMSD. While CH2M Hill drafted the DSC changes, MMSD (whether it exercised its responsibility attentively or not) had to approve any changes made. CH2M Hill was required to consult with MMSD before such decisions were final. Unlike the employers found to come within the domain of the regulations, CH2M Hill lacked the necessary authority or supervisory responsibilities. CH2M Hill did not function as a coordinator of the safety program; the contract specifically removed this responsibility from CH2M Hill. Nor did it make representations that it would ensure the safety regulations were met. The firm through its drafting of contract modifications did not function in a manner that was "inextricably intertwined" with the actual construction. It could not instruct Healy how to perform the construction work, nor halt the work if the required regulatory safety measures were not met. In fact, in its explanation to Healy, it told the company to seek the advice of the manufacturer of the equipment for compliance. It did not accept that role itself. Thus, based on the Commission's own line of cases, CH2M Hill should not be subject to the construction standards for its work on the Program.

The Commission, in its evaluation of CH2M Hill, appears to have not only departed for no apparent reason from the “substantial supervision” test but also from its own precedent, which clearly supports the original ALJ’s findings that CH2M Hill was not engaged in construction work. We find with all due deference to the Commission that its findings cannot be supported by the record, especially in light of its previous decisions on the subject.

III. Conclusion

We conclude that while the construction standards may apply to some professionals working on construction projects, they do not apply to CH2M Hill in this case because the firm did not engage in construction work based upon its contractual and actual responsibilities. Accordingly, the findings of violations and the imposition of fines are VACATED.

Efforts by public regulatory agencies to place more responsibility for workplace safety on design professionals have not been successful where the design professional performs site services in the traditional manner, such as that outlined in AIA or EJCDC documents. But it is likely that we will see an increasing number of attempts to place responsibility on design professionals.

That the design professional’s duty to workers continues to be hotly debated is demonstrated not only by scholarly comment,¹⁷⁶ but also in the varied conclusions in the case law. As emphasized elsewhere in this book, however, *factual* differences, such as different contract terms, different actual practices, and whether *obviously* unsafe practices were occurring, may account for different conclusions. Yet even when these *are* taken into account, judicial opinions can still reflect different emphases, whether on the contract language and disclaimers of responsibility or on tort concepts of compensation, foreseeability, and avoiding harm to persons.

Cases have tended to exonerate the design professional when the contractor, not the design professional, is responsible for means, method, and sequences by which the design is accomplished or for safety.¹⁷⁷ In addition,

design professionals whose site activities are of a more passive nature, such as those outlined in AIA documents, will not be held responsible for personal harm occurring to workers. If nothing further is alleged, the design professional is entitled to a summary judgment without a trial on the issue of negligence. But if the claimant alleges that (1) the contract obligated the design professional to take an active role in overseeing construction safety, (2) she undertook these functions even though her contract did not require her to do so, or (3) she was aware of obviously unsafe practices, the dispute must proceed to trial. If those allegations are established, the trier of fact—jury or judge—must determine whether the design professional has been negligent.¹⁷⁸

H. Action Taken on Site

*Pastorelli v. Associated Engineers, Inc.*¹⁷⁹ involved an injury to an employee of a racetrack caused by a falling heating duct. The accident occurred after the work had been completed and accepted by the injured employee’s employer.¹⁸⁰ The injured employee sued the prime contractor, the sheet metal subcontractor who installed the duct, and engineers who prepared the plans and who agreed to “supervise the contractor’s work throughout the job.”

¹⁷⁶ See Sweet, *supra* note 168; Goldberg, *Liability of Architects and Engineers for Construction Site Accidents in Maryland—Krieger v. J. E. Greiner Co.; Background and Unanswered Questions*, 39 Md.L.Rev. 475 (1980); Comment, 30 U.Kan.L.Rev. 429 (1982); and Precella, *Architect Liability: Should an Architect’s Status Create a Duty to Protect Construction Workers from Job-Site Hazards?* 11 Constr. Lawyer, No. 3, August 1991, at p. 11. The last author suggests the best theories for claimants are assumption of duty and knowledge of the dangerous condition. She does not approve of finding a duty simply on the basis of status.

¹⁷⁷ As examples, see *Ramey Constr. Co., Inc. v. Apache Tribe of Mes-calero Reservation*, 673 F.2d 315 (10th Cir.1982) (no duty to contractor); *Yow v. Hussey, Gay, Bell & DeYoung Int’l, Inc.*, *supra* note 168; *Becker v. Tallamy, Van Kuren, Gertis & Assoc.*, 221 A.D.2d 1014, 634 N.Y.S.2d 282 (1995).

¹⁷⁸ *Phillips v. United Eng’rs and Constructors, Inc.*, 500 N.E.2d 1265 (Ind.App.1986) (CM assumed responsibility by conducting safety meetings, touring the site, and noting safety violations and unsafe practices.); Annot., 59 A.L.R.3d 869 (1974).

¹⁷⁹ 176 F.Supp. 159 (D.R.I.1959). This federal trial court case, interpreting Rhode Island law, was cited with approval by the state’s high court in *Maggi v. De Fusco*, 107 R.I. 278, 267 A.2d 424, 427 (1970).

¹⁸⁰ Earlier American law immunized architect and contractor from most accidents that occurred after the project was completed and accepted by the owner. In *Pastorelli v. Associated Eng’rs, Inc.*, *supra* note 178, the court rejected this rule and held that completion and acceptance did not furnish a defense to the architect. This is discussed in Section 14.09B.

The duct was 20 feet long and weighed 500 pounds. It had not been attached directly to the roof itself or to the joists of the clubhouse but had been suspended from the ceiling of the clubhouse by the attachment of semirigid strips of metal called *hangers*, which were then attached to the ceiling. The ceiling was of sheathing and was nailed to the joists, leaving a considerable air space between sheathing and roof. The specification required that sheet metal work be erected “in a first class and workman-like manner” and that “the ducts be securely supported from the building construction in an approved manner.”¹⁸¹

The trial judge concluded that the duct had not been properly installed. The engineer prepared and submitted periodic inspection reports while the work was in progress. The trial judge stated that the engineer’s employee who prepared the reports

testified that his employer assigned to him the task of supervising the installation of said systems, and that in pursuance of his duties he visited the job site on one, two or three occasions each week to inspect the work of the contractor as it was being done. He also testified, however, that he never observed any of the ducts being hung from the ceiling in said clubhouse, stating that whenever he visited the clubhouse the ducts were either on the floor or already installed. He also admitted that he never climbed a ladder to determine whether the hangers by which they were suspended were attached by nails or lag screws and never tested any of the hangers to see how securely they were attached.¹⁸²

After holding prime and subcontractor negligent, the judge noted that the engineer’s employee knew the safety of people in the clubhouse required that the ducts be attached to the joists, and that he made no attempt to ascertain whether they were so installed. The judge also noted that the employee made no visits at a time when he could determine how they were being installed. Holding the engineer negligent, the judge stated, “In other words, he failed to see that they were properly installed and took no steps after their installation to ascertain how and by what means they were secured. In my opinion he failed to use due care in carrying out his undertaking of general supervision.”¹⁸³

Suppose the engineer’s employee had determined that the ducts were not properly secured. What should she have done? Should she have directed the employees of the sheet metal subcontractor to correct the work? Should she have gone to the superintendent of the prime contractor with a similar request? Should she have ordered the work terminated until proper corrective measures were taken? Should she have suggested to a building inspector that the latter order the work corrected? These questions show the difficult position in which the design professional can find herself when she does determine that work is not being properly performed, especially when people could be injured or killed as a result.

If the design professional simply observes, one would think that in a case such as *Pastorelli* her principal responsibility would be to call the defective work to the attention of the contractor, and have the contractor transmit this to the subcontractor. Yet if it is likely that correction will not come quickly enough and if it is likely that persons will be injured, registering a complaint indirectly would not be sufficient. The owner should be given the information, along with advice as to what should be done. The owner can then determine the course to be followed. If the danger was imminent and the situation urgent, perhaps the building inspector should be called, or if the design professional has the power, she should stop the work. (Until 1970 the AIA empowered the architect to stop the work. Since then this power has been given only to the owner. See AIA Document A201-2007, Section 2.3.1.)

I. Safety Legislation

Often legislation is enacted after a tragic construction site accident. The L’Ambiance Plaza in Hartford, Connecticut, collapsed during construction in 1987. Twenty-eight workers died and sixteen were injured. As a result, Connecticut enacted Section 29-276b of its general statutes. After setting forth criteria for significant structures, it requires that for those structures local building officials hire an independent engineering consultant to review the plans and specifications for code compliance. The prime contractor and major subcontractors are required to keep a daily log and keep it available to both local building officials and engineers or architects involved with the building. All design professionals and general contractors must give signed approval that completed construction substantially complies with the plans. If a building has

¹⁸¹ 176 E.Supp. at 162.

¹⁸² *Id.* at 162–63.

¹⁸³ *Id.* at 167.

more than three stories, Section 29-276c requires the design professional to review the implementation of her design and observe the construction.

J. Summary

Increasingly, third parties, including public safety officials, have been asserting claims against design professionals. Claims based on the assertion that the claimant is an intended beneficiary of the contract between the design professional and the owner, though occasionally successful, have not proved as successful as tort claims. But although third-party claims in tort have met obstacles (as noted in this section), the trend except in site accident claims is clearly toward increased liability exposure for design professionals. Finally, safety legislation is becoming more common, and this poses new legal problems for design professionals.

SECTION 14.09 Special Legal Defenses

The principal issue in claims against design professionals relates to the standard of performance and whether there has been compliance. This section briefly outlines a number of defenses that have been used by the design professional when claims are made by the client or third parties. In addition to the special defenses discussed here, a design professional, of course, has available standard defenses to any claim, such as lack of causation.¹⁸⁴

A. Approval by Client

Suppose the design professional asserts that the design has been approved by the client and this relieves her of any liability, even for negligent design. Ordinarily, such a defense is not successful.¹⁸⁵

¹⁸⁴*Outlaw v. Airtech Air Conditioning and Heating, Inc.*, 366 U.S.App. D.C. 374, 412 F.3d 156, 164 (D.C.Cir.2005) (Roberts, J., later Chief Justice of the United States Supreme Court) (“When there is a construction defect, the architect is one of the usual suspects, but [the architect’s] proximity to the problem and [the owner’s] accusation alone are not enough to survive summary judgment.”)

¹⁸⁵*C.H. Guernsey & Co. v. United States*, 65 Fed.Cl. 582 (2005); *Eichler Homes, Inc. v. County of Marin*, 208 Cal.App.2d 653, 25 Cal. Rptr. 394 (1962); *Bloomsburg Mills, Inc. v. Sordoni Constr. Co.*, supra note 100.

The client retains a design professional because of the latter’s skill in design, a skill not usually possessed by the client. The very purpose of engaging an expert would be defeated if the approval by the nonexpert client relieved the expert design professional from her negligence. Approval does authorize the design professional to proceed with the next phase of services, and client-directed changes after approval may justify the design professional who is compensated by a method unrelated to costs receiving additional compensation.

There may be an unusual circumstance that could justify approval relieving the design professional. Suppose the design professional points out a design dilemma to the client. The designer may inform the client that particular material may prove unsatisfactory for specified reasons but asks the client’s approval of that material because it is less costly. If the client is apprised of all the risks and authorizes that particular material to be used, the client assumes the risk. Even if the design professional has not done what others would have done, approval by the client with full knowledge of the risks and with the ability to evaluate them should relieve the design professional.¹⁸⁶

Claims by third parties raise other problems. Even if approval by the client would bar its claim, this would not bar a third-party claim against the design professional. If approval by the client were itself negligent, any third party who suffered harm could recover against the client as well and may give the design professional an indemnification claim against the client.

B. Acceptance of the Project

Acceptance of the project usually involves the owner’s taking possession of the completed project. It can—although under standard contracts it usually does not¹⁸⁷—imply that the owner is satisfied with the work and bar any claim for existing defects or defects that may be discovered in the future.

For purposes of this chapter, acceptance can affect any claim third parties have against those who have participated in design. Although some early cases¹⁸⁸—and

¹⁸⁶*Bowman v. Coursey*, supra note 66, discussed in Section 14.05D.

¹⁸⁷AIA Doc. A201-2007, § 9.10.4 (final payment does not bar most owner claims).

¹⁸⁸*Sherman v. Miller Constr. Co.*, 90 Ind.App. 462, 158 N.E. 255 (1927).

occasionally recent ones¹⁸⁹—have barred some such claims after acceptance, the modern tendency is to hold that acceptance does not bar third-party claims against design professionals.¹⁹⁰ If acceptance bars claims, it is because the intervening act of the owner—that of acceptance—is a superseding cause relieving even negligent participants of liability. This rationale is particularly weak when the claim is asserted against the design professional—the person who often decides whether the project has been completed and should be accepted. Even if the owner decides to accept, acceptance may not be negligent. Although acceptance by the owner can be looked on as an intervening cause, it is in most cases a nonnegligent one that should not immunize a design professional from her negligence.

Suppose, though, that acceptance by the owner precluded the design professional from correcting design errors. Should the design professional be immunized from third-party claims? If the owner knew that there were defects and barred their correction, the owner's intentional acts operate as an intervening cause to immunize the design professional from a third-party claim. The owner's acceptance should give the design professional a claim for contribution or indemnity against the owner if the latter's acceptance precluded correction of defects.

Immunization because of the acts of others—even negligent acts—is not favored today. Acceptance rarely bars third-party claims against a design professional.

C. Passage of Time: Statutes of Limitations

Sometimes the design professional can defend by establishing that legal action was not started within the time required by law. This is usually accomplished by invoking the statute of limitations as a bar to the claim. Because this bar can apply to all claims—not only to those against design professionals—and because most construction-related claims are brought against other participants such as the owner or contractors, full discussion of this defense is postponed until Section 23.03G. A few observations, dealing with claims against design professionals, should be made in this section.

Statutes of limitations usually prescribe a designated period of time within which certain claims must be brought. One of the troublesome areas in construction claims relates to the point at which that period begins. This can be a formidable problem in all construction-related claims, inasmuch as the defect may be discovered long after the design is created and executed. As a result, even in claims that do not involve the design professional, the law has had difficulty selecting from a number of base points, such as project completion, the wrongful act, the occurrence of damage, discovery of a substantial defect, or discovery of any defect.

This troublesome question is exacerbated when claims are made against the design professional. The latter usually develops the design, obtains approval by the client, gives it to the contractor to execute, and often issues a certificate that there has been substantial or final completion. In addition, the changes process often means that the design is changed during construction. All this means there are additional base points that can be used to determine when the period commences.

Essentially, design is a trial-and-error process. Although some states hold that the period commences when the negligence occurs, the trial-and-error aspects of design could, along with the continuation of the professional relationship between client and design professional, lead to a determination that the period commences on completion of the project.¹⁹¹

New York refused to apply this rule in a claim by a third party who brought a tort action based on professional negligence against a designer, with the court holding that the period began when the wrongful act was discovered (usually the time of injury).¹⁹² The court held that the completion base point is proper in dealing with claims between client and design professional but not those brought by third parties.

In addition to the complexity resulting from a differentiation between claimants drawn in New York, additional confusion can result because the period for beginning action is usually longer for claims based on breach of contract than for those based on other wrongful conduct,

¹⁸⁹*Phifer v. T. L. James & Co., Inc.*, 513 F.2d 323 (5th Cir. 1975); *Easterday v. Masiello*, 518 So.2d 260 (Fla.1988) (defense as to patent defects); *McBride v. Cole Assocs., Inc.*, 753 N.E.2d 730 (Ind.App. 2001).

¹⁹⁰*Pastorelli v. Associated Engr's., Inc.*, supra note 179; *Theis v. Heuer*, 264 Ind. 1, 280 N.E.2d 300 (1972); *Totten v. Gruzen*, 52 N.J. 202, 245 A.2d 1 (1968).

¹⁹¹*Sears, Roebuck & Co. v. Enco Assocs.*, 43 N.Y.2d 389, 372 N.E.2d 555, 401 N.Y.S.2d 767 (1977). The court's choice of the six-year statute of limitations for contract claims was almost immediately replaced by the legislature with a three-year limitation period; see N.Y. Civ. Prac. Law & Rules § 214(6).

¹⁹²*Cubito v. Kreisberg*, 69 A.D.2d 738, 419 N.Y.S.2d 578 (1979), aff'd, 51 N.Y.2d 900, 415 N.E.2d 979, 434 N.Y.S.2d 991 (1980).

such as negligence. This becomes a serious issue because claimants against design professionals are often given the option of bringing actions in tort or in contract.¹⁹³

Another complication is when the statute of limitations should begin for an owner who continues to use the project architect in dealing with defects that are discovered after completion of the project. Owners often turn to their architects and contractors for initial help in determining the source of the problem. Yet an owner faced with a defective building must know that the architect's design may be the cause of the defect, even if the architect places the blame elsewhere. A court which finds that the owner reasonably relied upon the architect's advice so as to delay filing suit against her may invoke the "continuous treatment" doctrine to "toll" (temporarily suspend) running of the statute of limitations.¹⁹⁴

The discussion to this point has been focused primarily on owner claims against its design professional. When does the limitations period begin when a contractor sues the design professional for economic losses caused by a defective design? The design professional would argue that the limitations period commenced when the contractor signed the contract and began to use the design. However, courts instead find that the limitations period begins when the contractor incurs economic loss with certainty.¹⁹⁵

Generally, a defense based on the passage of time—though still of value to the design professional—has provided limited protection. This has led to the enactment of statutes of repose that seek to cut off liability after a designated period

¹⁹³In *re R.M. Kliment & Frances Halsband, Architects (McKinsey & Co., Inc.)*, 3 N.Y.3d 538, 821 N.E.2d 952, 788 N.Y.S.2d 648 (2004), the court applied N.Y. Civ. Prac. Law & Rules § 214(6), the statute of limitations for malpractice claims, even though the owner claimed its architect breached a contract duty to comply with the building code. See Section 14.05E.

¹⁹⁴Compare *Greater Johnston City School Dist. v. Cataldo & Waters, Architects, P.C.* 159 A.D.2d 784, 551 N.Y.S.2d 1003 (1990) (tolling doctrine applied where architect worked with the owner for several years to identify cause of insulation problem and devise a solution) with *Saint Alexander's Church v. McKenna*, 294 A.D.2d 695, 742 N.Y.S.2d 165 (2002) (doctrine not applied absent evidence the architect remained actively involved with the owner to rectify problems). See also *Lake Superior Center Auth. v. Hammel, Green & Abrahamson, Inc.*, 715 N.W.2d 458 (Minn.App.2006), review denied Aug 23, 2006 (architect who participated in repair efforts is precluded from arguing the owner's claim against it is time-barred).

¹⁹⁵*Hardaway Co. v. Parsons, Brinckerhoff, Quade & Douglas, Inc.*, 267 Ga. 424, 479 S.E.2d 727 (1997); *MBA Commercial Constr., Inc. v. Roy J. Hannaford Co.*, 818 P.2d 469 (Okla.1991).

of time following substantial completion of the project. (The statutes are discussed in Section 23.03G.)

The dubious utility and confusion engendered by application of the statutes determining when an action must be commenced have led to contractual attempts to create a private statute of limitations. If reasonable, these provisions can regulate the relationship between client and design professional. Contractual provisions dealing with this problem can, as do AIA Documents B141-1997, Paragraph 1.3.7.3, and A201-1997, Paragraph 13.7, seek to control the commencement of the statutory period.¹⁹⁶ These 1997 AIA provisions, which started the limitations period from the date of either substantial or final completion, were dropped in the 2007 AIA documents. Under the new AIA Documents B101-2007, Section 8.1.1 and A201-2007, Section 13.7, suit must begin within the period specified by applicable law (usually the law of the state where the project is located), but in any case not more than 10 years after the date of substantial completion. In addition, some contract clauses stipulate the period during which the claim must be asserted as well as the commencement of the period. If the clause is reasonable, it will be enforced.¹⁹⁷

D. Decisions and Immunity

The design professional is frequently given the power to interpret the contract documents, resolve disputes, and monitor performance. When claims are brought against a design professional by the client or others for activity that can be said to resemble judicial dispute resolution (such as deciding disputes or issuing certificates),¹⁹⁸ design professionals sometimes assert they should receive quasi-judicial immunity.

This is based on the analogy sometimes drawn between judges and the design professionals performing judge-like functions. For example, the judge is given absolute immunity from civil action, even for fraudulent or corrupt

¹⁹⁶*Harbor Court Assocs. v. Leo A. Daly Co.*, 179 F.3d 147 (4th Cir.1999) (beginning commencement from the date of substantial completion, even though the state statute specifies the limitations period begins when the harm is discovered or should have been discovered).

¹⁹⁷*Therma-Coustics Mfg., Inc. v. Borden, Inc.*, 167 Cal.App.3d 282, 213 Cal.Rptr. 611 (1985). See also U.C.C. § 2-725(1), which allows the parties to reduce the four-year period to "not less than one year." The parties cannot extend the period.

¹⁹⁸See Section 22.07.

decisions. The corrupt judge may be removed from office or subject to criminal sanctions. But a disappointed party cannot institute civil action against a judge. Immunity protects judges from being harassed by vexatious litigants and encourages them to decide cases without fear of civil action being brought against them.

Quasi-judicial immunity for design professionals has had a troubled history both in England and in the United States. The English House of Lords reversed an earlier decision and held that the architect can be sued by the owner for a negligently issued certificate.¹⁹⁹

American decisions have not been consistent. Some have granted quasi-judicial immunity, but others have not.²⁰⁰ Where immunity is given, the design professional cannot be sued for decisions made unless they were made corruptly, dishonestly, or fraudulently. However, immunity does not protect against negligent delay in making a decision.²⁰¹

Again, the peculiar position of the design professional—-independent contractor as designer, agent of the owner, decider of disputes, and an individual participating in construction projects—has caused difficulty. If immunity is granted, it should be based on both parties to the contract—owner and contractor—agreeing to give certain judging functions to the design professional.²⁰² Yet the cases in which courts have been quickest to deny immunity have been actions instituted against a design professional by the client—the party who has selected and paid the design professional. Courts that have denied immunity in such cases seem more impressed with the client's selection of and payment to the design professional as indicating that the design professional's principal responsibility is to protect the owner. This, in addition to the increasing tendency to hold professional people accountable, may not mean that immunity will never be available when the design professional claims it but reduces the likelihood that it will succeed.

¹⁹⁹*Sutcliffe v. Thackrah*, 1974 A.C. 727.

²⁰⁰Authorities are collected in *City of Durham v. Reidsville Eng'g Co.*, 255 N.C. 98, 120 S.E.2d 564 (1961). See also *Blecick v. School Dist. No. 18*, 2 Ariz.App. 115, 406 P.2d 750, 755–56 (1965), overruled on other grounds, *Donnelly Constr. Co. v. Oberg/Hunt/Gilleland*, 139 Ariz, 184, 677 P.2d 1292 (1984); Annot., 43 A.L.R.2d 1227 (1955).

²⁰¹*E. C. Ernst, Inc. v. Manhattan Constr. Co. of Texas*, 551 F.2d 1026, rehearing denied in part and granted in part, 559 F.2d 268 (5th Cir.1977), cert. denied sub nom. *Providence Hosp. v. Manhattan Constr. Co. of Texas*, 434 U.S. 1067 (1978).

²⁰²*Newton Inv. Co. v. Barnard & Burk, Inc.*, 220 So.2d 822 (Miss.1969).

There has been criticism of immunity even where limited to good-faith decisions. Can the design professional truly be neutral in rendering a decision when she has been selected and paid by the client? Also, as indicated earlier, the contractor rarely has much choice in these matters. The English House of Lords in *Sutcliffe v. Thackrah*²⁰³ dealt with a claim by the client that the architect had negligently overcertified. Lord Reid drew a distinction between a dispute resolver who is a judge or arbitrator and an architect. According to Lord Reid, a true dispute resolver is a passive recipient of information and arguments submitted by the parties. An architect, in contrast, is a professional engaged to act at her client's instructions and to give her own opinions. The judge or true arbitrator does not investigate but simply decides matters submitted to her. Lord Reid concluded that deciding whether work is defective is not judicial. He noted there had been no dispute, the architect was not jointly engaged by the parties, the parties did not submit evidence to the architect, and the architect made his own investigation and came to his own decisions.

Lord Reid's reasoning may not be applicable in the United States because of different, though perhaps marginal, American practices. First, in the United States, the architect is "approved" by both parties, but engaged by the owner. Although the owner retains the design professional, when the contractor enters its bid or negotiates to perform the work, the contractor knows who the design professional will be. Under AIA Document A201-2007, the contractor has a limited power of veto over any successor architect.²⁰⁴ Also, A201-2007 seems to contemplate the parties submitting evidence (supporting data) to the Initial Decision Maker (who by default is the architect).²⁰⁵

The desirability of immunity was also passed on by an American court in *E. C. Ernst, Inc. v. Manhattan Construction Co. of Texas*.²⁰⁶ The case involved a claim against the architect based on his rejection of certain equipment proposed by the contractor. The court stated,

The arbitrator's "quasijudicial" immunity arises from his resemblance to a judge. [The court here is speaking of the architect as arbitrator.] The scope of his immunity should be no broader than this resemblance. The arbitrator serves as a private vehicle for the ordering of economic relationships.

²⁰³Supra note 198.

²⁰⁴AIA Doc. A201-2007, § 4.1.3.

²⁰⁵Id. §15.2.4.

²⁰⁶Supra note 201.

He is a creature of contract, paid by the parties to perform a duty, and his decision binds the parties because they make a specific, private decision to be bound. His decision is not socially momentous except to those who pay him to decide. The judge, however, is an official governmental instrumentality for resolving societal disputes. The parties submit their disputes to him through the structure of the judicial system, at mostly public expense. His decisions may be glossed with public policy considerations and fraught with the consequences of *stare decisis* [a Latin phrase for precedent]. When in discharging his function the arbitrator resembles a judge, we protect the integrity of his decision-making by guarding his fear of being mulcted in damages. . . . But he should be immune from liability only to the extent that his action is functionally judge-like. Otherwise we become mesmerized by words.²⁰⁷

The court then concluded that such immunity as possessed by the architect as arbitrator did not extend to unexcused delay or failure to decide, with immunity limited to “judging.”

Determining whether to grant immunity must also take into account the finality of the design professional’s decision (taken up in greater detail in Section 29.09). Under many contracts, the initial decision by the design professional can be taken to arbitration. If so, any wrong or even negligent decision can be corrected by the arbitrators. However, if arbitration is not used and the dispute goes to court, the decision by the design professional is likely to have a certain degree of finality. Giving the decision substantial finality and the decision maker immunity may be granting too much power to the design professional—power that can be abused. In Section 29.10, the suggestion is made that the process under which the design professional interprets the contract and decides disputes can be justified principally by expediency—the need to move construction along. This justification will not be adversely affected even if the decision were given very little finality and even if the design professional is stripped of any immunity.

It is often difficult to determine whether the design professional is acting as agent or judge. Perhaps it is simply better to jettison immunity, as the English have done. Such immunity as exists protects only against the negligent decision and not against one made in bad faith. Also, as noted in Section 15.03E, one way of dealing with this problem is to provide immunity by contract.

²⁰⁷Id. at 1033.

E. Recent Legislative Activities

Legislatures have been more receptive to pleas by associations representing design professionals that expanding liability has had an undesirable effect not only on the professions but also on the public. Much of the legislative effort came in the backwash of similar legislative protection given health care providers in the 1970s and 1980s. Some, such as the requirement specified in Section 1029.5 of the California Code of Civil Procedure, that the claimant must post bond if a malpractice claim is made against a design professional under certain circumstances, may not extend much protection. A \$500 bond must be posted for each defendant, with a total bond limit of \$3,000.

Legislative protections for design professionals fall into two broad categories. Some statutes do not limit liability but impose special procedural or evidentiary requirements on the claimant with the intended goal of preventing frivolous claims. The second category of statutes limits the design professional’s liability.

Certificate of merit statutes are the primary device for weeding out frivolous lawsuits through the imposition of special pleading burdens on claimants. These laws generally require the plaintiff to attach to the complaint a certificate from her attorney declaring that the attorney has consulted with an expert and that the attorney or expert has concluded that the suit is meritorious.²⁰⁸ For example, California Code of Civil Procedure Section 411.35, enacted in 1979, requires the attorney for a claimant who files a claim for damages or indemnity arising out of the professional negligence of a licensed architect, a licensed engineer, or a licensed land surveyor, to file a certificate stating that the attorney has reviewed the facts of the case; that she has consulted and received an opinion from a licensed design professional in the same discipline as the defendant,²⁰⁹ who she reasonably believes is knowledgeable in the relevant issues; and that she has concluded “that there is reasonable and meritorious cause for the filing of this action and that the person consulted gave an opinion that the person against whom the claim

²⁰⁸Hawaii and Kansas also require the plaintiff to present her “case” to an independent panel to obtain an advisory opinion. For a discussion of both types of statutes, see Davis, *Certificates of Merit and Review Panels: Conditions Precedent to Civil Actions Against Design Professionals*, 15 Constr. Lawyer, No. 2, April 1995, p. 88.

²⁰⁹*Ponderosa Center Partners v. McLellan/Cruz/Gaylord & Assoc.*, 45 Cal.App.4th 913, 53 Cal.Rptr.2d 64 (1996), review denied Aug. 14, 1996, held that a certificate by a structural engineer in a claim made against an architect in a roof collapse was sufficient.

was made was professionally negligent.” Provisions seek to protect the identity of the design professional who has been consulted.

Georgia has gone farther, enacting legislation requiring that a complaint charging professional malpractice be accompanied by an affidavit of an expert setting forth at least one negligent act or omission.²¹⁰

Pennsylvania’s certificate of merit statute has been interpreted to apply only to negligence claims, not to intentional torts of fraud or misrepresentation.²¹¹ A unique Pennsylvania law permits a design professional sued for negligence to file an “affidavit of noninvolvement,” in which she asserts that she is “misidentified or otherwise was not involved with regard to the cause of the injury or damage” alleged by the plaintiff.²¹²

Other statutes seek, at least to a limited degree, to limit the liability of design professionals. A significant number of states have enacted “Good Samaritan” laws to protect design professionals from potential liability when they provide expert services in emergencies. The statutes vary as to the type of emergency that will invoke the protective legislation and who can benefit from such legislation. As an illustration, under California law an architect or engineer who, at the request of a public official but without compensation or expectation of compensation, voluntarily provides structural inspection services at the scene of a declared emergency “caused by a major earthquake, flood, riot, or fire” is not liable for any harm to person or property caused by her good faith but negligent inspection of the structure. Protection does not extend to gross negligence or willful misconduct. The inspection must occur within thirty days of the “declared emergency.”²¹³ Some states have extended this protection to those who provide inspection or other services following any natural disaster.²¹⁴

²¹⁰The Georgia statute was interpreted in *Kneip v. Southern Eng’g Co.*, 260 Ga. 409, 395 S.E.2d 809 (1990).

²¹¹*McElwee Group, LLC v. Municipal Auth. of Borough of Elverson, Pa.*, 476 F.Supp.2d 472 (E.D.Pa.2007).

²¹²Pa. Consolidated Stat. Ann. Tit. 42 § 7502(e), which the superior court likened to a motion for summary judgment but permitted earlier in the litigation. *Herczeg v. Hampton Municipal Auth.*, supra note 169, 766 A.2d at 869–70.

²¹³West Cal. Ann. Bus. & Prof. Code §§ 5536.27, 6706.

²¹⁴Tenn. Code Ann. § 62-2-109; Mo. Rev. Stat. § 44.023. Protection under the Missouri statute does not extend to those guilty of willful misconduct or gross negligence. The latter also provides that volunteers can receive their incidental expenses for up to three days’ performance of voluntary services.

Most significantly, beginning in the mid-1980s associations of design professionals were successful in persuading a number of states to grant immunity to design professionals from third-party claims by injured workers who are covered by workers’ compensation for site services unless the design professional has contracted to oversee safety or undertook to do so.²¹⁵ The injured worker has rights under workers’ compensation laws. Limitation of third-party actions—that is, tort claims that can be made by the injured worker against those who are not immunized by workers’ compensation laws—may be of considerable importance in reducing liability.

SECTION 14.10 Remedies

A. Against Design Professionals

The remedies available when the design professional does not perform in accordance with the contract or tort obligations were set forth in Sections 7.10 and 12.14B.

B. Against Co-Wrongdoers

In construction losses are commonly caused by a number of participants and conditions. As to defective work, see Section 24.06. However, a few generalizations can be made in this section.

First, suppose the client asserts a claim against the design professional, but the loss has been caused in part by the client’s negligence. If the client is allowed to pursue a tort claim, generally the negligence of the client and that of the design professional will be compared, and the amount recoverable by the client will be reduced by the amount attributable to its own negligence, as noted in Section 7.03G. For example, if the loss was \$100,000 and a determination was made that 30 percent of the loss should be chargeable to the client, the client would

²¹⁵Conn. Gen. Stat. Ann. § 31-293(c); West Fla. Stat. Ann. § 440.09(6); Kan. Stat. Ann. § 44-501(f); West Okla. Stat. Ann. Tit. 85, § 12; West Wash. Ann. Rev. Code Ann. § 51.24.035 (immunity not granted if responsibility is specifically assumed by contract terms that were mutually negotiated or the design professional actually exercised control over the portion of the premises where the worker was injured). None of these statutes grant immunity for negligent design. In *Edwards v. Anderson Eng’g, Inc.*, 284 Kan. 892, 166 P.3d 1047 (2007), the court interpreted Kan. Stat. Ann. § 44-501(f) as overruling *Balagna v. Shawnee County*, supra note 168, an actual knowledge case, and as not applying to a negligent design claim.

recover \$70,000. A few states apply the contributory negligence rule to bar the entire claim.

Suppose the claim by the client is based on breach of contract. Some states would still make an apportionment, whereas other states would not.²¹⁶ Those that do not apportion place the loss on the party whose breach substantially caused the loss.

Apportionment becomes more complicated when responsibility falls on a number of defendants and, in some instances, on the claimant itself. If a particular loss can be connected principally to a particular defendant, that defendant will pay the loss that it has caused. However, if the loss is indivisible and cannot be apportioned among the wrongdoers, it is likely that a tort claimant will be able to recover the entire loss from any of the defendants, with the ultimate responsibility determined by contribution laws and indemnification.²¹⁷

SECTION 14.11 Current Controversies: Some Observations

It would be impossible to comment at length on the issues related to professional liability addressed in this chapter. But this section highlights issues that have generated heated controversies.

A. The Professional Standard: Should Professionals Be Treated Differently?

The professional standard in essence permits local professional practice, at the time the defendant's services were rendered, to be the legal standard. It has been subjected to intense criticism. Manufacturers of products and those who build and sell homes²¹⁸ are held to strict liability. Owners warrant to the contractor that the design they have supplied will be sufficient.²¹⁹ Should professionals be given special dispensation when they have caused harm?

²¹⁶For cases allowing an apportionment, see *S. J. Groves & Sons Co. v. Warner Co.*, 576 F.2d 524 (3d Cir.1978); *Grow Constr. Co. v. State*, 56 A.D.2d 95, 391 N.Y.S.2d 726 (1977). For cases refusing to employ apportionment, see *Hunt v. Ellisor & Tanner, Inc.*, 739 S.W.2d 933 (Tex. Ct.App.1987), writ denied Mar. 23, 1988.

²¹⁷*Northern Petrochemical Co. v. Thorsen & Thorshov, Inc.*, 297 Minn. 118, 211 N.W.2d 159 (1973).

²¹⁸See Sections 7.09 and 24.10.

²¹⁹See Section 23.05E

This specialized treatment may have had some justification, according to its attackers, when professionals were practicing in one-person offices or in small firms and in times when the professionals largely learned from those practicing in their localities. Today, professionals such as doctors, lawyers, and many of the design professionals practice in large organizations, make large profits, compete nationally, and receive education and training that use state or national, not local, practices. Those who attack the professional standard point to this as a reason why professionals today do not deserve special treatment. They argue that design professionals must accomplish the objective for which they are retained. Any increased liability that may result can be handled by insurance and the cost spread to those who use the professional services. Even if insurers generally exclude contractual risks that go beyond negligence, those who insure are part of a competitive industry that will respond to market pressures. In any event, critics argue that insurance practices should no more determine the appropriate legal standard than professional practices. Attackers also stress the following:

1. Antitrust laws are increasingly applied to the professions. The law views their members as businesspeople rather than professionals.
2. The relationship between design professional and client has taken on a more commercial character. This should permit design professionals to reduce what they perceive to be open-ended liability by allowing them to contract for a standard lower than the professional standard, by limiting their liability, and by exculpating themselves from certain liability. See Section 15.03D.
3. The current standard greatly increases the cost of litigation by requiring a parade of well-paid experts.
4. The line between design, to which the professional standard applies, and site monitoring, where it may not, is blurred and creates an added dimension of uncertainty.
5. To obtain a commission, the design professional often stresses that it is better than others with whom it competes yet asserts it should be measured by the professional standard that looks to average local practices.
6. The professional standard is often unrefined, with insufficient attention devoted to clear analysis that takes into account the differences among parties on the cutting edge of the profession, the material

available in the literature, what becomes accepted in the profession as part of the knowledge possessed by an informed professional, and what is taught at the undergraduate level.²²⁰

Indictment of the professional standard has had an effect on the law, such as the loosened requirements for expert witnesses²²¹ and the beginning of a tendency to hold that some design professionals are engaged in ultra-hazardous activities for which they are strictly liable.²²²

Counterarguments must exist that have persuaded courts to hold to the professional standard in the face of more strict standards being applied to others. Even modern cases in an atmosphere in which compensation is emphasized, have still applied the professional standard. Why? Perhaps most important is the belief that professionals operate amid great uncertainty. Will the professional be judged harshly in the event of an unsuccessful outcome when even the best professional services would not have been able to create a satisfactory outcome? Does any outcome standard run the risk of holding the professional to professional performance that was more appropriate at the time of trial than at the time the professional services were performed?²²³ Defenders contend that the client expects good professional service rather than insurance. Those who defend the professional standard fear that any warranty standard will expose design professionals to unreasonable expectations of the client that will be resolved in favor of the client by a jury, particularly if the client is unsophisticated in the world of design and construction. Also, what will be the exact nature of the warranty if an outcome standard is used? Might it not extend far beyond the function of design services?

²²⁰Peck & Hoch, *Liability of Engineers for Structural Design Errors: State of the Art Considerations in Defining the Standard of Care*, 30 Vill. L.Rev. 403 (1985). Prof. Jones, whose paper is cited at supra note 112, argues for a result-oriented liability if the probability of success is high. He contends that most services performed by a design professional fall into this category. Most design professionals would dispute this.

²²¹See Section 14.06A.

²²²See Section 7.04A

²²³One study concluded that, even when applying the professional standard, defendants are at risk of being judged by current standards, rather than the standard in existence when they provided the services. The reason lies in the bias of witnesses to recall accurately the prior standard of care in light of current practices. See Miller, *What is the Standard of Care?*, 41 J. of Management in Engineering, No. 6, Nov./Dec. 1996, p. 40.

Defenders of the professional standard argue that an outcome standard will generate overdesign at unneeded costs to reduce or avoid the risk of liability. Increased liability also means higher cost of service, resulting in fewer practitioners, higher prices, and more uninsured professionals.

Those who defend the design professions state that the high compensation some professionals receive is rare in the design professions. Only “strong” design professionals will be able to “contract out” of any outcome standard. The ordinary professional designer lacks the bargaining power to obtain a more limited standard, or believes it is inappropriate to begin a professional relationship by demanding or requesting one.

So it stands. The reason for announcements of the professional standard in clear terms by courts means it is unlikely that the standard will be abolished in the near future. Dissatisfaction at the privileged position accorded professionals is likely to result in chipping away at its protections as well as in sophisticated clients demanding contractual protection beyond the standard.

B. The Design Professional’s Duty to Workers

The cases cited in Section 14.08G demonstrate the contrary perspectives from which this hotly contested issue can be viewed. It is important to recognize that this is a multilevel problem. The *Pfenninger* decision reflects the majority rule, that the issue in the ordinary retention should be viewed almost exclusively as contractual. Design professionals are retained and paid to use their best efforts to see that the project is built in accordance with the contract documents. The contract makes clear that the contractor, not the design professional, is responsible for how the design is executed. This approach requires an examination of the contracts, mainly the ones for design services but also for construction. If they do not reveal that the design professional was accepting responsibility for construction methods, the design professional has no duty to workers, and there need be no inquiry into her conduct. As noted, some courts adhere to this contract-based perspective even in the face of allegations that the design professional knew of the hazardous condition which caused the worker’s injury.²²⁴

²²⁴See supra note 169.

The other perspective is to start with tort law, with its function of compensating victims, deterring wrongful conduct, and avoiding harm. That body of law jettisoned the privity rule to ensure that claimants can find a person from whom compensation can be recovered and to avoid technical defenses that bar scrutiny into the conduct of those people who very likely caused the harm. Why reinstitute this barrier by looking mainly at the purpose for engaging a design professional and focusing almost exclusively on the contract?

To be sure, the contract for design services is important. Without it, vague or detailed, the design professional would have no business on the site and would not be in a position to look out for danger to workers or anyone else. The contract plays a significant role in determining what the design professional should have seen. The design professional cannot be expected to look for problems—that is not her function. If she sees unsafe practices or would have seen them had she done what the contract obligated her to do, her conduct will be judged. Did she act reasonably? She may satisfy this obligation by complaining to the contractor's superintendent, by bringing this matter to the client's attention, or even by inviting public officials who deal with safety matters to deal with the question. If the issue is viewed as a tort problem, however, she has a responsibility to act reasonably.²²⁵

Although most material dealing with this troublesome problem is found in case decisions and legal journals, there is other relevant material. For example, a California attorney general opinion addresses the duty of a registered engineer, retained to investigate the integrity of a building, who determines there are structural deficiencies but who is advised by the owner that no disclosure or corrective action is intended and that the professional information is to remain confidential. Does the professional engineer have a duty to warn occupants or notify local building officials that she has uncovered evidence of structural deficiencies that create imminent risk of serious injury to the occupants? The attorney general could not find any duty to warn based on the registration laws but concluded that there was such a duty, because the common law has imposed a duty on the part of professionals to protect third

parties whose lives may be endangered when the professional becomes aware of this risk.²²⁶

A divergence—at first glance, counter-intuitive in nature—appears to be emerging in the law governing design professional liability to third parties. Tort law traditionally affords greater protection where personal harm rather than commercial interests are involved. However, a review of the cases cited in Sections 14.08C, 14.08D, and 14.08E dealing with claims for economic losses suffered by contractors shows an increased willingness to find the designer liable notwithstanding the economic-loss rule, while at the same time courts are less willing to find architects or engineers liable to injured construction workers.

This divergence may be more apparent than real. A common thread in both types of cases is the willingness of courts to place liability on the party in the best position to prevent the harm. The architect controls the quality of the design, and if that design is gravely defective, the resulting economic losses to the contractor and subcontractors are immediate and real. By contrast, the contractor—not the designer—is in the best position to ensure a safe project; accordingly, imposition of liability upon the design professional for a workplace accident is not merited. That basic allocation of responsibility is not altered by the designer's awareness of a dangerous site condition.

A second level looks at judicial procedures. Those who support the “no duty to workers” rule seek a defense that will bar a full trial and have the issue decided by looking solely at the pleading or the pleadings and affidavits submitted to support a motion for summary judgment. They wish to escape the high cost of trial even if they believe that the design professional will ultimately prevail if her conduct is judged.

Those who support the tort orientation see no reason why the design professional should escape being judged. They contend that if the facts clearly show that she could not have been expected to know of the unsafe practices or that she did what was clearly adequate, she will be able to avoid a full-scale trial. But they object to a rule of law

²²⁵A fuller expression of one author's views can be found in Sweet, supra note 168.

²²⁶68 Op.Cal.Att'y Gen. 250 (1985). But see *Burg v. Shannon & Wilson, Inc.*, 110 Wash.App. 798, 43 P.3d 526 (2002) (engineering firm, hired by the city to analyze the stability of a cliff, had no duty to warn homeowners living under the cliff of its results) and *Butler v. Advanced Drainage Systems, Inc.*, 294 Wis.2d 397, 717 N.W.2d 760 (2006) (no duty to warn of flooding hazard to owners of lakefront properties threatened by rising lake levels).

that relieves her. They prefer this question be treated as a factual question like any other.

A third level relates to workers' compensation law. As noted, a main function of modern tort law is to see that victims are compensated. Most workers will be compensated under workers' compensation law—a social insurance system that pays a certain portion of the economic losses through an administrative process that does not focus on wrongful conduct. Workers cannot sue their employers in tort; workers' compensation is their exclusive remedy. Those who feel the compensation system is inadequate seek to encourage the development of third-party claims that the injured worker can make to fully recover for the harm suffered. This is usually more than the often inadequate amounts recovered under workers' compensation law.

However, workers' compensation is sometimes used as an argument by those who oppose the design professional's having a duty to workers.²²⁷ Those opposing such a duty argue that the worker will not be uncompensated, and they see no reason why a worker in a construction-related accident should be placed in a better position than a worker in an industrial accident who may not have as many third parties from whom she can seek tort recovery. They contend that the broadening of third-party claims has hopelessly overcomplicated often simple accident cases and has generated lawsuits with horrendous costs to all participants.

At a fourth level, operations on a construction site are stressed. Those who support the duty state that safety is everyone's business, and the more people concerned, the less likely injuries will occur.

Those who oppose a "duty to workers" rule claim it will induce design professionals to venture into areas where they do not have expertise, which can only cause blurred lines of responsibility as well as expose the design professional and the client to claims that intervention into these matters breaches the contract between owner and contractor.

Probably the best solution in an ideal world would be to have a total, enclosed social insurance system under which all workers receive adequate compensation without the necessity of going to court but without having rights against third parties. (Currently workers' compensation

laws are extraordinarily controversial, in light of the high workers' compensation premiums, the large percentage of awards and costs that go to attorneys and doctors, the large overhead and profit of some insurers, and the relatively low amounts that end up in the pockets of injured workers or dependents of those killed.) Until this utopia is achieved (it may be a long way off), it is hard to support a result that would revive the dead privity doctrine and put professional designers in a favored position under which their principal function precludes their conduct being judged.

C. Injection of Tort Law into the Commercial World: A Wild Card

The commercial world—the world of business dealings between merchants where much of the world's work is accomplished—certainly does not escape tort law intervention. For example, under certain limited circumstances the tort law will enter when a person has wrongfully induced another to breach a contract or impede a prospective economic advantage. On the whole, tort law interferes here only when there has been intentional wrongdoing or where there has been harm to people or property.²²⁸ Tort law, at least in some states (see Sections 14.08C and 14.08E), has been reluctant to shift economic losses caused by negligent conduct and has left that largely to contract and commercial law.

In the construction world, as in others, tort law has begun to play an increasingly important role in allocating purely economic losses. For example, as noted in Section 14.08D, negligent representation has been the basis of claims made by people who have relied on the representations of those in the business of furnishing information, such as surveyors or geotechnical engineers and even architects, engineers, and construction managers.²²⁹ Even more, there has been the tendency to expose the design professional, among other participants, to claims by other participants, particularly contractors, sureties, and even prospective occupiers of projects, such as buyers or tenants.

Perhaps these tendencies cannot be rolled back in a legal world where tort law and accountability have become

²²⁷*Balagna v. Shawnee County*, supra note 168, 668 P.2d at 170–72 (dissent).

²²⁸A subsequent tenant was allowed to bring a tort claim against the architect when the floor settled, walls became damaged, and premises became untenable. See *A. E. Inv. Corp. v. Link Builders, Inc.*, 62 Wis.2d 479, 214 N.W.2d 764 (1974).

²²⁹*Rozny v. Marul*, 43 Ill.2d 54, 250 N.E.2d 656 (1969).

dominant factors in private law even in commercial disputes. Those courts faced with these decisions or asked to expand existing rules should consider the effect of introducing this wild card.

For example, some courts allow a contractor to maintain a tort action against a geotechnical engineer for misrepresentation.²³⁰ The context was a transaction in which the construction contract clearly placed the entire risk of unforeseen subsurface conditions on the contractor.²³¹ Allowing the tort action induces the geotechnical engineer to request indemnity from the client, to increase her contract price to take this risk into account, or to price her work to encompass performance designed to ensure that her representations are accurate even if “excessive” caution would not be justified. Either way, the system of allocating risks is frustrated, with the client perhaps paying twice for the same risk by increased contractor bids (tort recovery is too uncertain to permit the prudent contractor to reduce the bid because of potential tort recovery) and the higher compensation to the geotechnical engineer.

Perhaps even worse, one court allowed a tenant who lost full use of its premises because of delays caused by the contractor, to establish negligence and to use that as the basis for a claim against the contractor.²³² What effect does this holding have on the potential risk of construction contract participants?

Delay is dealt with at length in the construction contract with its time extensions, damage liquidations, or no-damage clauses. Will these clauses apply to tort claims? How can contractors or design professionals faced with this risk deal with it? They can hope the law will protect them. They may decide to build a contingency into their contract price to deal with this risk or demand indemnification if they have the bargaining power. They may, if they can identify potential claimants, seek exculpation from them or demand that the owner do so. All these approaches add transaction costs and must increase contract prices. It must also be kept in mind that the party who has suffered economic losses usually can transfer such

losses to the party with whom it has contracted—the tenant to the landlord or the contractor to the owner.

The tort wild card has caused chaos in the construction legal world. It is bad enough to allow major participants, such as the design professional, owner, and contractors, to sue each other in tort. It is much worse to allow more remote participants, such as suppliers, potential buyers, tenants, lenders, or even sureties, to use tort law as a means of shifting their economic losses to the major participants in the construction process.

The law should encourage people to enter into commercial transactions. One way is to limit the exposure for consequential damages suffered by the other party. However, this protection is diminished in claims by third parties in tort. The fact that tort in this area usually requires negligence does not compensate for this added exposure, particularly when claims against design professionals usually use a tortlike standard anyway.²³³

D. The Effect of Expanded Professional Liability

This section has outlined some of the arguments for and against expanded professional liability. The focus of this subsection is on the effect of this expansion.

Expanded liability can be looked on as a method of eliminating incompetent practitioners from the professions, to supplement the unarguably ineffective registration laws or, at least in this area, the inefficient marketplace. But does it have this effect?

Does expanded liability drive out the practitioner who should be removed from the profession? Are incompetents sued more often than those who are competent? Are they likely to be forced out by increased insurance rates, decisions by insurers not to insure them, or unwillingness of prospective clients to engage them if they cannot be insured? At best, these are unprovable. Very likely the answer to all three is no.

Has expanded liability improved professional practice? Undoubtedly, design professionals are now more careful—perhaps too careful. The result can be overdesign, an unwillingness to take design risks, and mediocre design. Again, it will be difficult to assemble anything beyond anecdotal evidence and polemics to uncover the truth.

²³⁰*M. Miller Co. v. Central Contra Costa Sanitary Dist.*, 198 Cal. App.2d 305, 18 Cal.Rptr. 13 (1961). But see *Texas Tunneling Co. v. City of Chattanooga*, 329 F.2d 402 (6th Cir.1964).

²³¹See Section 25.05.

²³²*J'Aire Corp. v. Gregory*, supra note 148. The Aas decision, supra note 145, appears to limit the reach of *J'Aire*.

²³³See Sections 14.05–14.07. Jones, supra note 112 at 1070–73, 1092–93, also suggests tort may not be available to these claimants.

Of course, expanded liability can be and has been justified as a process for allocating responsibility to the people who are responsible and who can best spread the loss. The construction process, with its wealth of participants, its overlapping functions, and its unclear lines of responsibility, makes unlikely that expanding professional liability will place responsibility on the party who should take it. All that can be certain is that expanded liability has led to hopelessly complicated and unpredictable lawsuits, with an inevitable rise in the overhead of performing professional services.

What is also certain is that expanded liability has generated overprotective contract language that may simply drive prospective clients to others, such as those who design and build or manage construction. Along with other causes of high operational overhead, such as taxes and other regulations, expanded liability has slowly reduced the ranks of sole practitioners and small partnerships and has led to increased specialization. Expanded liability has led to an emphasis on risk management (explored in Chapter 15).

Risk Management: A Variety of Techniques

Chapter 14 chronicled the expansion of professional liability. Although often ignored, one technique for avoiding claims is to cultivate a good client relationship. Honesty in approach, respect for the client's intelligence, appreciation of the proper role of a professional adviser, and common courtesy (answering phone calls, letters, and e-mails) are perhaps the best techniques to avoid claims. These are nonlegal considerations. This chapter suggests legal and planning approaches to deal with risk management.

SECTION 15.01 Sound Economic Basis: Bargaining Power

This book is not an appropriate place to discuss in detail the economics of the design professions. To implement some if not most of the approaches suggested in this chapter, the design professional must be able to choose which commissions to accept and to request or even demand that particular contract language be excluded or included. Doing so requires sufficient economic strength to pick and choose among projects and contracts. Although this chapter cannot deal with methods to achieve this power, the approaches suggested will be of no value unless economic strength can be attained and mobilized.

SECTION 15.02 Evaluating the Commission: Participants and Project

As a rule, there are more design professionals than commissions. Therefore, most design professionals usually take whatever work they can get. Some design profes-

sionals can pick among projects, and this section is directed to them.

It is very important to evaluate the client and its financial resources. A client with limited resources, particularly one with extravagant expectations, may not be able to withstand the shocks of added costs generated by design changes, delays, claims, or other circumstances that will increase the ultimate contract payout. Such a client will be more inclined to abandon a project before construction. If construction does begin, the client may be quicker to point at the design professional and other participants if the project does not proceed as planned. From 1966 to 1997 (not in 2007), the AIA gave architects the power to request information about the financial resources of the owner at any time during their performance. Yet probably most architects did not exercise this power, particularly at the start of the professional relationship. Although an architect may understandably wish to make these inquiries at the beginning of performance, such inquiries may be crucial during performance if financial troubles appear imminent.

Another important client criterion is experience in design and construction. An inexperienced client may be more likely to make claims, because it does not realize the uncertainties inherent in construction and the likelihood that adjustments will have to be made. Such a client may also be mesmerized by a fixed-price contract and be unduly rigid as to price adjustments. Although construction contract pricing disputes principally affect the relationship between owner and contractor, when that relationship sours, more administrative burdens will be placed on the design professional and claims will be more likely.

The project, too, must be evaluated. Projects that involve new materials, untested equipment, and novel construction techniques must be viewed as creating special

risks. If disappointments develop, claims (including those against the design professional) are more likely.¹

It is important to evaluate the other key participants, such as the prime contractor, the principal subcontractors, and consultants, for technical skills, financial capacity, and integrity. The construction contract is another factor that must be taken into account. A tight fixed-price contract, a rigid time schedule with a stiff liquidation of damage clause for delay, a multiple prime contractor arrangement, and a fast-track sequence all contain the seeds for controversy and, possibly, liability exposure.

It may be helpful to develop a point system for evaluating these factors. If the points reach a certain level, the project should not be undertaken without careful executive review. Beyond the next numerical benchmark, the commission should be refused unless changes are made. At a point beyond even that, the commission should be refused.

SECTION 15.03 Contractual Risk Control

Section 15.02 noted the importance of a general appraisal of the contract. This section looks at specific contract clauses that can be useful in risk management.

A. Scope of Services

The contract should make clear exactly what the design professional is expected to do. Sections 12.01 and 13.01G referred to the difference between basic and additional services. Here the emphasis is on services the client may expect the design professional to perform that the design professional does not feel are part of his undertaking. Perhaps most important is the design professional's role in determining how the work is being performed and the responsibility of the design professional for the contractor not complying with the contract documents.

B. Standard of Performance

Usually the design professional wishes to be held to the professional standard discussed in Section 14.05. This is

¹The resources of the Architectural and Engineering Performance Information Center at the University of Maryland might be useful in evaluating problems that may arise on a project.

demonstrated by the AIA's inserting the professional standard for the first time in AIA Document B101-2007, Section 2.2. When this is the case, the contract language as well as any other communications should not use words such as *assure*, *ensure*, *guarantee*, *achieve*, *accomplish*, *fitness*, or *suitability* or any language that appears to promise a specific result or achievement of the client's objectives. It is even better to include language that specifically incorporates the professional standard and, where possible, language that justifies it.

Section 15.03D deals with liability limitations, but one suggestion that relates to the standard of performance should be mentioned here. Many cost overruns result from design changes. Some have suggested a toleration figure—an amount usually based on some percentage of the construction contract for which the design professional would not be responsible. This suggestion is based on the assumption that design is essentially a trial-and-error process and some things truly cannot be discovered until the design is actually being executed. The design professional would be responsible over any such toleration figure if performance does not measure up to the obligation imposed on him by the contract or by law.² (Usually the amount specified is approximately 3 percent.)

C. Exclusion of Consequential Damages

The law does not charge a breaching party with all the losses caused by its breach. Usually the breaching party is not chargeable with what are sometimes called *consequential* or *less direct* damages. This limits a contracting party's responsibility.

Yet the foreseeability requirement—the standard used most frequently in determining whether consequential damages can be recovered—has been applied by modern courts in such a way as to diminish protection given by earlier courts. For that reason, the design professional should seek to exclude his liability for consequential damages in the contract.³ This can be done expressly or by limiting

²EJCDC E-500, Exhibit I, ¶ 1.6.11(B)(3)(2002), which can be added to ¶ 6.11, is entitled "Agreement Not to Claim for Cost of Certain Change Orders."

³Upheld in *Dept. of Water and Power of City of Los Angeles v. ABB Power, T. & D. Co.* 902 F.Supp. 1178 (C.D.Cal.1995) and *Wood River Pipeline Co. v. Willbros Energy Services Co.*, 241 Kan. 580, 738 P.2d 866 (1987).

the responsibility of the design professional to correcting work caused by defective design or, when that is not economically feasible, to the diminished value of the project.

In AIA Documents A201-2007, Section 15.1.6, and B101-2007, Section 8.1.3, its major standard documents for design and for construction, provisions under which each contracting party waives consequential damages against the other. The EJCDC in its E-500 dealing with engineering services provides a similar provision in its Paragraph 6.10(E) (2002). It can be supplemented by Exhibit I, Paragraph I.6.11(B)(2).

Undoubtedly general judicial expansion of the recovery of consequential damages and the judicial tendency to consider all AIA documents as adhesion contracts⁴ will mean likely judicial challenge to the validity of such waivers.

D. Limiting Liability to Client

Beginning in the 1970s, professional associations of engineers, particularly the American Society of Foundation Engineers and the National Society of Professional Engineers, advocated that their members seek to get their clients to agree to provisions in their contracts that would limit the liability of the engineer. Efforts to obtain such provisions were also spurred on by professional liability insurers that offered a reduced premium for those who obtained these limitations in their contracts.

Before discussing techniques to obtain approval by the client and the types of clauses, traditionally client claims were the only claims that the design professional had to anticipate. But the growing risk of third-party claims has generated a new issue. From whom does the design professional seek a limitation of liability?

There are two ways of dealing with this problem. The first is to anticipate the likelihood and identity of third-party claimants. This can be a problem in the world of complex real estate development transactions. A good example is an Illinois case decided in 2007. Although the architect ultimately was absolved from a third-party claim, the facts show the difficulty of anticipating third-party claims.⁵

The developer, JDL, and its partner sought to develop condominiums and townhouses for speculative sales. JDL orally retained TMA, the architect, to design the project. To develop, market, and sell the units, JDL and its partner formed Burnham Station, a limited liability corporation. JDL and its partner were officers in Burnham. The project failed, and a major investor in Burnham sued TMA for breach of contract and in tort to recoup its lost investment.

As JDL and TMA had made an oral retention agreement, it is likely that TMA did not consider a liability limitation. But had it sought to limit its exposure, from whom should it have sought such protection in this tangled web of entities?

A second approach for a design professional to manage third-party claims is to seek and obtain an agreement with its client under which the latter will indemnify the design professional from third-party claims, to obtain a total cap on the design professional's liability exposure. Some refer to such an approach as a hybrid clause as it covers both direct liability to the client and protection from third-party claims. This total cap approach was used in a recent California case.⁶

From an operational standpoint, the next obstacle to this method of managing the risk is to persuade clients to agree to such a provision. Private clients may be reluctant to accept this risk. They may be persuaded by insistence upon such a clause by the design professional only if they think the design professional can do the job properly. They may also be persuaded if inclusion merits a fee reduction

⁶*TSI Seismic Tenant Space, Inc. v Superior Court*, 149 Cal.App.4th 159, 56 Cal.Rptr.3d 751 (2007). In this case the owner of an apartment complex sued the prime, the structural engineer, and the geotechnical engineer. The prime and the structural engineer cross-complained against the geotechnical engineer. The owner settled with the geotechnical engineer for the amount of the liability limitation of \$50,000. The geotechnical engineer waived its claim for \$259,000 of attorneys' fees. Under California law if the settlement is in good faith, the settling defendant, here the geotechnical engineer, is shielded from claims by the cross-complainants, here the prime and structural engineer. The trial court held that the liability limitation was valid. It also held that the settlement was in good faith. But the appellate court held that the settlement was not in good faith because it did not bear a reasonable relationship to the geotechnical engineer's proportionate share of liability. The loss claimed by the owner was \$6.4 million, and experts testified that the geotechnical engineer's share was over \$3 million. The statute is designed to advance the goal of equitable allocation among wrongdoers. See Section 27.14 for claims against multiple parties.

⁴See Section 5.04 C.

⁵*F. H. Paschen/S. N. Nielson, Inc. v. Burnham Station L.L.C.*, 372 Ill. App.3d 89, 865 N.E.2d 228 (2007), rehearing denied, Apr. 18, 2007. The court held the third-party claimants, investors in a failed venture, were not third-party beneficiaries of the architect's contract, and the tort claim was barred by the economic loss rule. See Sections 14.08B, D, and E.

based upon any saving in insurance premiums paid by the design professional. Finally, they may see the allocation of risk as a fair one if the design professional is exposed to very large risks for a modest fee. Acceptance may get the professional relationship off to a positive start, but public clients, with their emphasis on accountability, are unlikely to accept this risk.

The enforceability of such clauses has stirred controversy. Many recent cases have passed upon the validity of such clauses. Some will be noted in this section. But before that discussion, it is crucial to recognize the many variables that present themselves in any individual case that makes the law murky and enhances the difficulty of predicting outcomes.

The limitation can take many forms.⁷ Some limit exposure to the design professional's fee, to his professional liability coverage or to a designated amount. The amounts may be nominal or substantial. If two methods are selected, the clause may state that the amount is the greater or the lesser, usually the greater.

Some clauses allow the client to buy out of the liability limitation by giving the client the choice of paying a premium to obtain full liability or to accept the liability limitation. It will be rare for the client to buy out, and the principal reason to give the client an alternative is to enforce the liability limitation.⁸

As noted earlier in this section, the cap may be a total cap, under which the design professional is indemnified by the owner from any third-party claims.

Some courts examine the relationship between the amount of the fee and the predicted or actual damages.⁹ The greater the discrepancy between the liability limit and actual or potential damages, the less likely the clause will be enforced.

Clauses can vary as to the type of conduct controlled by the liability limitation clauses. They apply to a claim

for breach of contract, negligence, gross negligence, or willful misconduct. The more culpable the conduct, the less likely the court will uphold the clause. Here the tort principle of deterring wrongful conduct that is more culpable than simple negligence takes precedence over freedom of contract to apportion risks by contracting parties.

Another variable is the nature of the transaction, commercial or consumer. Even within this variable there can be differences in the ability of the client to know what risk it is taking. For example, a small business owner may not be able to evaluate the risk of limiting the amount it can recover, in effect taking this risk upon itself. This variable will be analyzed later in this section.

Another factor that must be taken into account is the scope of services provided by the design professional. It may be a discrete one-off transaction (though, as will be seen, with the potential for damages greatly exceeding the fee) or one where the scope of services provided is broad and diverse, such as an architect who designs, predicts costs, and plays a significant role during construction. Many types of losses may occur in such a transaction.

Many arguments are made for and against the enforceability of liability limitation clauses. Focus upon them as a means of controlling risk to design professionals has stirred great debate. The powerful principle of freedom of contract, a pillar of any free market economy, collides with the tort principles of deterring wrongful conduct and protecting victims. This collision has made the law uncertain and controversial.

Proponents also give other reasons for enforcing such clauses. The centrality of design, as noted in Section 14.01G, exposes the design professional to great risks for which he does not receive compensation comparable to the risk.

Proponents also assert that judicial unwillingness to enforce such clauses can affect the willingness of engineers to perform services in quick, high-risk-low-cost transactions. For example, in *Estey v. Mackenzie Engineering, Inc.* a structural engineer was retained to make a limited, visual review of a house his client was considering purchasing. His fee was \$200, and the contract limited his liability for negligence to that amount. The client claimed the engineer had been negligent. At the time of trial, the client proved losses of \$190,000 due to needed repairs with an estimated cost of \$150,000 yet to be incurred. The engineer pointed to the limit of liability.

⁷EJCDC E-500 (2002) includes optional Exhibit I, ¶1.6.11(B)(1). It lists alternative formulas. They include the engineer's compensation, insurance proceeds or a specified amount. The limitation can be added to ¶6.10.

⁸See *Cregg v. Ministor Ventures*, 148 Cal. App.3d 1107, 196 Cal. Rptr. 724 (1983) (upheld in a consumer rental space contract).

⁹*Fort Knox Self Storage, Inc. v. Western Technologies, Inc.*, 140 N.M. 233, 142 P.3d 1 (2006) (cap 28 times fee enforced). The court compared this ratio to another case which enforced a cap where the loss was seven times the fee. *Valhal Corp. v. Sullivan Assocs., Inc.*, 44 F.3d 195 (3d Cir. 1995).

Although the intermediate Oregon court enforced the clause,¹⁰ the Oregon Supreme Court would not.¹¹ It stated that the client probably did not intend to take this risk.

Although it would seem unfair for the innocent client to suffer this loss, refusing to enforce such a clause in this context may mean that fewer engineers will perform this service even if they are insured, or will drastically increase the fee. Without enforcement, a quick, cheap inspection is very likely not possible.

Ricciardi v. Frank reflects the uncertainty of enforcing liability limitations in consumer transactions that involve discrete but crucial services. The facts are similar to the *Estey* case already noted. A consumer sued an inspecting engineer who performed a house inspection for \$375. The New York trial court in a lengthy opinion refused enforcement of the limitation of liability to the fee when the actual damages were close to \$3,000.¹² The ratio of \$375 to \$3,000 in the *Ricciardi* case was not as disproportionate as in the *Estey* case, a \$200 fee compared to \$190,000 proven losses and another \$150,000 yet to be incurred. The appellate division within the New York trial system enforced the liability limit.¹³ It should be clear from these cases that prediction in consumer cases with low fees and large exposure will be hazardous.

If the clause specifies a small sum, such as the \$200 in the *Estey* case, it may appear that the clause exculpates the user from its negligence, not simply places a cap on liability exposure where it would seem reasonable to do so.

An indemnification clause must be compared to a liability limitation clause. Indemnification is a process by which one party, the indemnitee, receives a promise from the other party, the indemnitor, that the latter will take care of any claim against the indemnitee that results from conduct, usually negligent but not necessarily, of the indemnitor.¹⁴ Often the conduct of the indemnitee plays some role in causing the loss. When this happens some such clauses may exculpate the indemnitee from its own

negligence. To avoid this most states have statutes that place limits on such clauses, particularly if they indemnify the indemnitee when its negligence has been the sole cause of the loss.¹⁵

The similarities between an exculpatory clause, an indemnification clause, or one that limits liability to a specified amount have caused difficulties.¹⁶ To be sure, all have an element of exculpation; the exculpation clause exonerates entirely, the indemnity clause may in part or completely exonerate, and the liability limitation can exonerate in part, for any amount of damage in excess of the liability amount.

With this similarity in mind, those who seek to bar enforcement of a limitation of liability often claim that a statute that bars indemnification for certain negligence precludes enforcement of a limitation of liability clause. While such a claim has had some success,¹⁷ most courts see the difference and hold that the statute does not affect the limitation of liability.¹⁸

Cases have enforced¹⁹ and rejected²⁰ such clauses. This is understandable in light of the newness of such clauses,

¹⁵See Section 31.05D.

the wide variety of contexts in which they are used, and the collision of powerful legal principles.

Opponents of enforcement claim these risks can be insured against. The added cost of insurance, if obtainable at a price justified by the revenues generated, may not be easy to pass on. Also, the insurance often includes high deductibles and limited protection. Finally, even if there is insurance coverage, the design professional will have to spend uncompensated time to defend the claim.

Those who oppose enforcing such clauses assert that enforcement will create a moral hazard by encouraging carelessness, particularly if the limitation is merely nominal. If so, the clause is actually an exculpation that relieves the design professional from tort liability. Opponents point out that design professionals are licensed by the state and perform a public service. Such an argument assumes that people who deal with these professionals usually lack the ability to assess the risks and make any meaningful decision, often the victims of adhesion contracts.²¹ They see refusal to enforce as a needed form of consumer protection.

Yet the strong policies of protecting consumers and discouraging negligent performance are very powerful. They may trump freedom of contract. For example, in 1996 California enacted Business and Professions Code Section 7198 that made liability limitations invalid in contracts to inspect a home that limits liability to “the cost of the home inspection report.”

Some struggles over this method of risk management are reflected in the enactment of statutes dealing with liability limitations, mainly in the context of design professional services. These statutes are in addition to the many anti-indemnification statutes found in most states. The statutes take a wide range of approaches. Wisconsin forbids eliminating tort liability in a construction contract.²² California allows them if there is an opportunity to bargain.²³ Texas enforces them.²⁴ The statutes should settle the question in states that have them, but courts may inject their own ideas when interpreting the statutes, again leading to uncertainty.

Liability limitation clauses will continue to play a significant role in risk management for design professionals.

If the specified amount does not amount to complete exculpation, if the parties appear to know what they are doing and if the context is truly commercial, such clauses will very likely be enforced.

But other factors can play a role in deciding whether such a clause will be enforced. If there is a chance to buy out of the clause, there is a greater likelihood of enforcement. But suppose the ratio between the liability limitation created by the clause and the likely loss is so extraordinarily great as to constitute an almost total exculpation that can create an incentive not to perform properly. This can lead to rejection of the clause. Finally, if the clause is used in a consumer context, this seriously diminishes the likelihood of enforcement. But if the proponent of the clause makes a strong showing that important consumer needs will not be met unless such a clause is enforced, the clause has a good chance of enforcement.

E. Immunity: Decision Making

As noted in Section 14.09D, some American courts grant design professionals quasi-judicial immunity when they decide disputes under the terms of the construction contract. Many standard agreements published by the professional associations incorporate language that relieves the design professional from any responsibility if decisions are made in good faith.²⁵ They attempt to incorporate into the contract limited quasi-judicial immunity. To be effective, such clauses must be incorporated in the contracts both for design services and for construction services.

F. Contractual Statute of Limitations

As noted earlier, judicial claims can be lost simply by the passage of time, via statutes of limitations. Parties to a contract can include a private statute of limitations as long as it is reasonable and does not deprive one party of any viable judicial remedy. Some design professionals incorporate in their contracts language stating when the period begins and specifying the period itself.²⁶ Such

²⁵AIA Doc. B101-2007, § 3.6.2.4 grants the architect immunity for his interpretations and decisions made in good faith.

²⁶AIA Docs. B141-1997, ¶1.3.7.3, and A201-1997, ¶13.7.1, sought to control commencement of the statutory period of limitations. In 2007 this was changed. Now all claims must be brought within the time specified by law but in no case more than 10 years after substantial completion. AIA Docs. B101-2007, § 8.1.1, and A201-2007, § 13.7. See Section 23.03G.

²¹See Section 5.04C.

²²West Ann.Wis.Stat. § 895.49.

²³West Ann.Cal.Civ.Code § 2782.5.

²⁴Tex.Civ.Prac. & Rem.Code Ann. § 130.004.

statutes of limitations can be useful as risk management tools.

G. Third-Party Claims

Third-party claims are sometimes based on the assertion that the claimant is an intended beneficiary of the contract. This contention can be negated by appropriate contract language.²⁷ Such language is unlikely to provide a defense to a tort claim.

H. Dispute Resolution

Some believe that the most important risk management tool is to control the process by which disputes will be resolved. Many American standardized construction contracts give first-instance dispute resolution to the design professional and frequently provide for an appeal to arbitration. Because arbitration has become such an important feature of construction contract dispute resolution, it is covered in detail in Chapter 30.

I. The Residue

Although a wish list could be created,²⁸ the realities of contract bargaining necessitate that emphasis be placed on those tools most useful in risk management. It makes little sense to spend precious negotiation time and bargaining power on seeking to obtain concessions that in actuality mean very little.

J. Some Suggestions

The clauses noted in this section are more likely to be enforced if they are drafted clearly and express specific reasons for their inclusion, if the client's attention is

directed to them, and if suggestions are made to the client to seek legal advice if it has doubts or questions about them.

SECTION 15.04 Indemnity: Risk Shifting or Sharing

The important risk management device of risk shifting usually involves all key participants in the construction process. From the vantage point of the design professional, this tool seeks to shift any or a part of any loss he suffers related to claims by third parties—such as workers, members of the public, or owners of adjacent land—to another participant, usually the contractor, but possibly the client. See Figure 15.1. This process is discussed in Chapter 31.

The indemnification in AIA Document A201-2007 that will be discussed in greater detail in Section 31.05G stemmed from attempts by owners and architects to receive indemnification from contractors in the construction contract. AIA Document B101-2007—the standard form of agreement for design services—does not contain any indemnification provisions. Yet owners increasingly demand indemnification from their design professionals, and design professionals, where they have the bargaining power to do so, increasingly seek indemnification from the owner in the contract for design services.

In 1992, the EJCDC inserted indemnification clauses in its 1910-1, Standard Form of Agreement Between Owner and Engineer, at Paragraphs 8.7.1 and 8.7.2. Under the EJCDC approach, the owner indemnifies the engineer and the engineer indemnifies the owner. Indemnification applies only if the claim was caused solely by the negligent act or omissions of the indemnitor.

In its 1992 Guide Sheet to 1910-1, the EJCDC did not recommend that the engineer indemnify the owner as it would extend the engineer's liability "beyond that it would be at common law." But indemnity was included as strong owners demanded it. The EJCDC urged engineers not to go beyond the limited indemnity found in 1910-1. It can be found in EJCDC E-500 issued in 2002 at Paragraph 6.10. See Appendix G.

Many owner-drafted indemnity clauses expand indemnification far beyond that found in EJCDC agreements. Indemnification in construction contracts will be treated in Chapter 31.

²⁷AIA Docs. B101-2007, § 10.5, and A201-2007, § 1.1.2, (with a limited exception for the architect), seek to bar those not parties to the contract from asserting rights as intended beneficiaries. Usually these clauses are successful. See Section 14.08B. But in *Gilbane Bldg. Co. v. Nemours Foundation*, 606 F.Supp.995 (D.Del.1985), a tort claim was allowed despite contractual negation of third-party rights. See Section 14.08E.

²⁸Examples are an exculpation for consultants, a favorable choice of applicable law, waiver of a jury trial, a power to suspend work for nonpayment, insurance premiums as a reimbursable, and a stiff late payment formula, to mention a few.

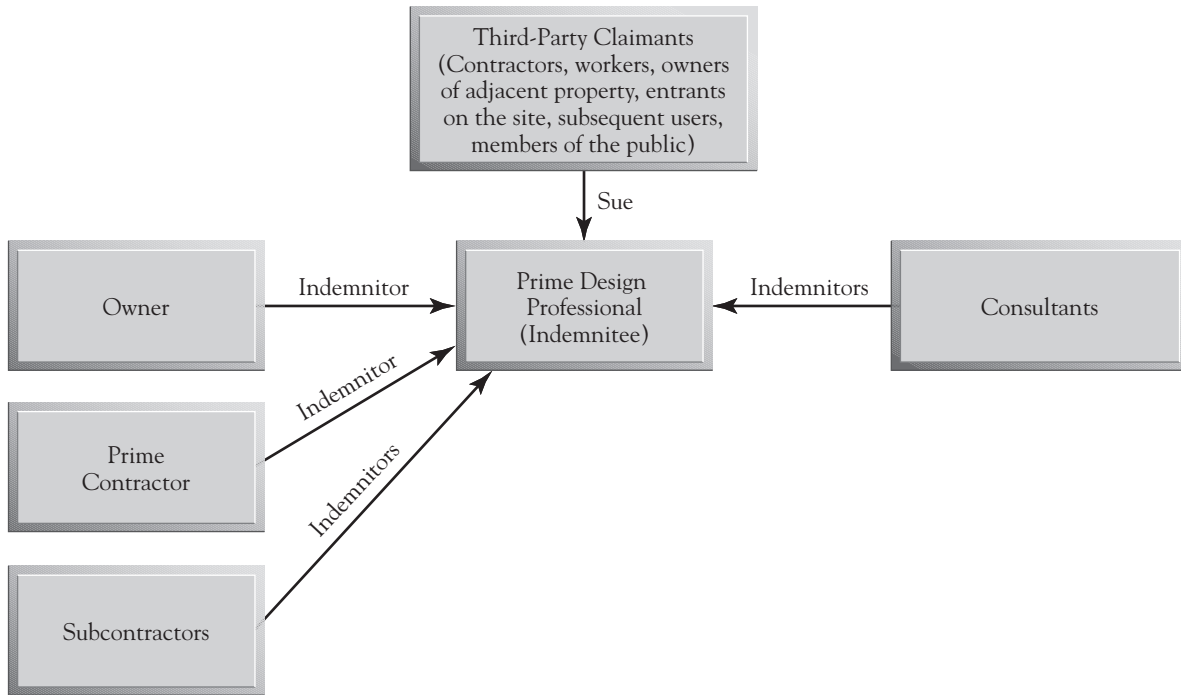

FIGURE 15.1 Indemnification to prime design professional.

SECTION 15.05 Professional Liability Insurance: Risk Spreading

A. Requirement of Professional Liability Insurance

The law does not require design professionals to carry professional liability insurance.²⁹ However, clients increasingly require that design professionals have and maintain professional liability insurance. Until 2007, the AIA did not specifically require insurance but stated that “expense of professional liability insurance dedicated exclusively to this Project or the expense of additional insurance coverage or limits requested by the Owner in excess of that normally carried by the Architect and the Architect’s consultants” is a reimbursable.³⁰

AIA Doc. B101-2007, Section 2.5, currently requires that the architect maintain general liability, automobile, workers’ compensation, and professional liability

insurance. This change may be in response to client demands for requiring such coverage and the hope that this would reduce the large number of architects “going bare.” Architects that go bare may do so not only to avoid the cost of professional liability insurance but in the hope that lack of such insurance will mean they will not be sued. Even without insurance their nonexempt property, if substantial, will make them a target for claims. If they do not carry insurance, they run the risk of seeing those who have suffered losses caused by their negligence uncompensated. This is not a pleasant prospect for anyone, let alone professional architects.

Section 2.5 also states that “if any of the requirements set forth below exceed the types and limits the Architect normally maintains” any additional cost is reimbursable by the owner. Section 2.5 also requires that the types of limits and coverage carried by the architect be identified. This should avoid surprises when the architect requests that any coverage not normally carried be reimbursed by his client.

As noted earlier, before 2007 the cost of any insurance coverage dedicated exclusively to a specific

²⁹This term will be used instead of the more commonly used “errors and omissions insurance.”

³⁰AIA Doc. B141-1997, ¶1.3.9.2.6.

project or beyond that usually carried by the architect or his consultants is reimbursable by the owner. In 2007 this issue relating to the normal insurance coverage of the *architect* is dealt with in Section 2.5. Any coverage dedicated exclusively to this project or beyond that usually carried by any *consultants* is reimbursable under Section 11.8.1.8.

To avoid any misunderstandings, the architect should provide information as the insurance coverage of his consultants as well as his own insurance coverage.

Clients may have a claim against the design professional for losses relating to the project or because they have satisfied claims of third parties that are directly traceable to the design professional's failure to perform in accordance with the legal standards. To make any claim collectible, they may require the design professional to carry professional liability insurance. If the design professional has adequate professional liability insurance, third parties injured as a result of his conduct may choose to bring legal action against the design professional directly rather than against the owner.

Even if not required to, many design professionals carry such insurance. One reason is to protect their nonexempt assets from being seized if a judgment is obtained against them. Another is that many design professionals do not wish to see people go uncompensated who suffer losses because of the design professional's failure to live up to the legal standard.

B. Volatility of Insurance Market

This section describes certain characteristics of professional liability insurance policies. Yet these characteristics, particularly coverage, exclusions, and premiums, are not static. Sometimes many entrepreneurs want to enter the insurance market. At these times, entrants are tempted by the investment of front-end premiums that can earn large returns. Payout by such entrants can be postponed to far into the future. In such a market, premiums are cut to obtain business.

However, when the investment portfolio does not generate large returns and claims begin to come in, the insurance business looks much less attractive. When this occurs, some insurers drop out of the market, and those that remain limit coverage, broaden exclusions, and raise premium rates. In addition, these insurers carefully select those for whom they will issue insurance and they defend claims more vigorously.

The cyclical nature of the insurance market means that after such a period of retrenchment and caution, entrants will again be tempted into the insurance market. Thus it is difficult to describe with any certainty the types of policies available over an extended period. Those who want to insure must obtain expert advice on the particular state of the market, coverage, and premiums. Similarly, those who impose contractual requirements for insurance must seek to determine whether any such insurance is available.

C. Regulation

All states regulate insurance, with varying details. State laws usually provide requirements of capital and financial capacity to ensure the solvency of insurers, and they increasingly regulate claims settlement practices. State insurance regulatory agencies determine which insurers will be permitted to do business in the state. In some states, regulators can determine coverage, exclusions, and premiums.

Courts have also regulated insurance, mainly through interpreting insurance policies when disputes arise. The law interprets ambiguities against the insurer unless the insurance policy is negotiated between a strong insured, such as a group of hospitals, and an insurer. Some courts seek to determine the reasonable expectations of the insured or some average insured. They will protect that expectation, some courts even disregarding insurance policy language in order to protect that expectation. Finally, there are many technical contractual requirements before the insurer's obligation to defend and indemnify matures, such as complying with warranties or representations as to activities, giving notice of claims, furnishing proof of loss, or cooperating with the insured in defending claims, to name some. Technically, a failure to comply with any of these requirements can result in loss of coverage. But the law often, though not always, protects the insured by requiring the insurer to show that the failure to comply prejudiced the insurer.

D. Premiums

Premiums have become an increasingly important overhead cost for design professionals. For example, a recent study stated that architects who carry insurance pay approximately 3 percent of their gross billings for insurance premiums and structural engineers currently pay

some 6 percent of their gross billings for insurance premiums. The amount of premiums for any individual insured is determined by a number of factors, such as type of services performed, experience of the insured, locality in which work or projects are located, gross billings of the insured, contracts under which services are performed (one insurer states it reduces the premium if the contractual limitations of liability discussed in Section 15.03D are incorporated in a certain percentage of the insured's contracts), and claims record of the insured.

Premiums can rise because of underwriting predictions (selection of risks) by insurers, a decline in the value of the insurer's portfolio, a downturn in the economy that can induce insureds to cancel coverage, high claims payouts, and increased cost of defending claims.

E. Policy Types: Occurrence or Claims Made

In the construction process, a long time lag can exist between the act or omission claimed to be the basis for liability and the making of the claim. Coverage in cases depends on whether the policy is a "claims-made" or an "occurrence" policy. Claims-made policies cover only claims made during the policy period, regardless of when the act giving rise to the claim occurred. An occurrence policy, in contrast, gives coverage if the act or omission occurs during the policy period.

Professional liability insurance is currently written on a claims-made basis. This avoids the "tail" at the end of any occurrence policy. Proper insurance underwriting and rate making require the insurer to predict payouts in a designated period. Particularly in states that do not begin the statutory period for bringing claims until discovery that there is a claim and against whom it can be made, occurrence policies can result in coverage many years after the premium has been fixed. This led the professional liability insurers to base policies on claims made. It is easier to predict the value of claims that will be made during the period of the policy than to look far into the future, a prediction needed for setting premiums under an occurrence policy.

At any given time, a variety of claims-made policies can be available. Some are hybrid. Such policies specifically protect against claims made during the policy period and require that the act giving rise to the claim occur during the policy period. California rejected a challenge to such a policy, noting that the policy terms were

conspicuous and that the insured could expect only the coverage provided.³¹

Insurers usually offer retroactive, or prior acts, coverage, giving coverage regardless of when the act occurs. Retroactive coverage usually requires the insured to represent that he is unaware of any facts that could give rise to a claim or that he was insured when the act occurred and that he has carried insurance throughout his career.

Although most courts have sustained claims-made policies,³² one case struck down a claims-made clause because its retroactive coverage applied only if the insured had carried a policy for an earlier period with the company that was insuring the insured at the time the claim was made.³³

F. Coverage and Exclusions: Professional Services

In the absence of a special endorsement, professional liability insurance policies generally cover liability for performing normal professional services.³⁴ Conversely, coverage under commercial general liability (CGL) policies carried by contractors usually excludes professional services. Often, claims against the professional liability carrier are denied because the insurer asserts that the services in question were not professional.

Similarly, claims against a CGL carrier are denied because the carrier asserts that the services were professional and not covered. If one insurer pays the claim, it often brings a claim against the other carrier based upon its having paid a claim that should have been paid by the other. Examples will be seen in the cases described ahead.

³¹*Merrill & Seeley, Inc. v. Admiral Ins. Co.*, 225 Cal.App.3d 624, 275 Cal.Rptr. 280 (1990). In that regard, the California Insurance Code Section 11580.01 requires that an application or proposal for a claims-made policy must "recite prominently and conspicuously at the heading thereof that it is an application or proposal for a claims-made policy." Also, each policy must contain a prominent and conspicuous statement to that effect, along with language suggesting that the insured carefully study the policy and discuss coverage with his insurance agent or broker.

³²*Zuckerman v. National Union Fire Ins.*, 100 N.J. 304, 495 A.2d 395 (1985) (describing history and analysis of claims-made policies). Similarly, see *Guidrey v. Lee Consulting Eng'g Inc.*, 945 So.2d 785 (La.App.2006) (enforcing hybrid claims made and occurrence policy). Both cases enforced clauses that required both the claimed act and claim to be within policy period.

³³*Jones v. Continental Cas. Co.*, 123 N.J.Super. 353, 303 A.2d 91 (Ch.1973).

³⁴See Annot., 83 A.L.R.3d 539 (1978).

At one time “professional” referred to the learned professions, such as medicine, law, and the clergy. Because this proved too limiting, the law began to look at persons who are licensed by the state. But since the state has gone wholesale into licensing, these days the law requires almost everyone to be licensed; so that test is useless. This classification requires that actual cases be examined.

The professional activities covered are core design services, such as preparing drawings and specifications.³⁵ Coverage can also encompass site services, such as monitoring the work as it proceeds for issuing payments and completion certificates.

*American Motorists Insurance Co. v. Republic Insurance Co.*³⁶ involved the question of whether the architect’s preparation and submission of a competitive design–build bid is a professional service and covered under the architect’s professional liability policy. The case involved a competitive design system, with the insured being the successful bidder. After the award of the bid, an unsuccessful bidder sued the insured for misrepresentations and other tortious conduct. The insured’s professional liability insurer refused to defend, but the action was defended successfully by the insured’s CGL insurer. The latter then sought to recover a pro rata share of its defense costs from the professional liability insurer.

The professional liability insurer argued that bid preparation and submission are merely preparation to render professional services and not the actual rendering of such services. However, the Alaska Supreme Court did not accept this contention, noting that only an architect using his specialized knowledge, labor, or skills could have prepared the bid. The bid consisted of two booklets approximating 160 pages in length and considerable detail as to the design. The court noted that the policy did not define professional services and that in such cases the term was considered ambiguous, requiring a construction that favored coverage.

Although coming under an exclusion for professional services in a CGL policy, the same issue came before the court in *Camp Dresser & McKee, Inc. v. Home Insurance Co.*³⁷ The original claim was made by an injured worker at a plant who attempted to throw ash onto a head pulley

of a conveyor that was missing a safety guard, thus exposing the worker’s hand and arm to injury. Camp Dresser, the insured, acted as a project manager to coordinate the work and perform services similar to that of a construction manager. Camp Dresser’s professional liability insurer defended the case and paid for the settlement in excess of the \$150,000 deductible under the professional liability policy. But Camp Dresser also notified its CGL insurer because that policy had no deductible.

The court held in favor of Camp Dresser, noting that the fact that the services performed by Camp Dresser are usually performed by engineers or other professionals does not compel the conclusion that the contracts are those for professional services. The court held that professional services require specialized knowledge and mental rather than physical skills. Claims of ordinary negligence or negligent management and control were not expressly precluded, and the word “supervisory” in the exclusion is reasonably susceptible to ambiguous interpretation. The word can be construed narrowly, as describing supervision of purely professional activities, or broadly, as describing management or control of the aspects of a project involving professional and nonprofessional activities. Because the policy did not make clear in what sense the term was used, Camp Dresser received coverage.

These cases demonstrate that the borderline between professional and nonprofessional services can mean that there is coverage in both types of policies. Yet it can also mean that under certain circumstances, neither policy will cover. An insured who can anticipate this event and can be concerned that it will have to pay the formidable costs of defense might consider procuring business legal expense insurance.

As new actors enter the construction process, issues may arise as to whether their services are professional. For example, in a recent Louisiana case³⁸ a project manager (PM) was hired to act as a liaison between the owner and the prime contractor. He hired an engineer to perform engineering services because the PM was not a licensed engineer. The PM was to provide professional services required for design, engineering, construction management, and operations management for construction and operation of the plant being built. A subcontractor was negligent and damages occurred.

³⁵*Stone v. Hartford Cas.Co.*, 470 F.Supp.2d 1088 (C.D.Cal.2006) (California law).

³⁶830 P.2d 785 (Alaska 1992).

³⁷30 Mass.App.Ct. 318, 568 N.E.2d 631 (1991).

³⁸*North American Treatment Systems, Inc. v. Scottsdale Ins. Co.*, 943 So.2d 429 (La.App.2006), writ denied 949 So.2d 423, 424 (La.2007).

The owner's property damage insurer compensated the owner, and that insurer brought a subrogation claim against the PM. The PM sought a defense from its CGL insurer. The issue was whether the PM's services were professional and not covered because it was excluded by the CGL policy. The court on appeal held that the PM was performing professional services because its work took particular skill and training. Clearly, the PM should have gotten professional liability insurance.

Another court stated that professional services are those that are predominantly mental, not physical or manual. It held that drafting involved specialized intellectual labor and that the exclusion for professional services applied.³⁹

More important are the long lists of exclusions incorporated in policies. Coverage excludes contractually assumed risks. One policy excluded work not customarily performed by an architect as well as activities relating to boundary surveys, subsurface conditions, ground testing, tunnels, bridges, and dams. Also excluded were failure to advise on or require insurance or surety bonds and failure to complete construction documents or to act on submittals in the time promised unless those losses were due to improper design. In addition, the policy excluded liability for guarantees, estimates of probable construction costs (currently, one leading professional liability insurer does not exclude this, thereby demonstrating the changing nature of the insurance market and liability coverage), and copyright, trademark, and patent infringements.

Coverage for activity related to the handling of hazardous materials is fluid. Initially, it was almost impossible to obtain such coverage. Currently, insurers are increasingly willing to cover pollution claims relating to alleged design negligence of a design professional. Again, consultation with a competent insurance counselor is vital in such a market.

The insured should review his contractual commitments to determine whether they are covered by his professional liability insurance policy. Some insureds submit unusual contracts to the insurer for its approval or to discuss coverage.

The usual professional liability insurance is not likely to cover many services performed by a construction manager or by those who both design and build. Special endorsements or specially tailored policies for these activities will be needed.

A complicated coverage problem can develop when several causes contribute to the loss. In some states, if one cause is covered and the other excluded, the insured receives coverage. This is demonstrated by *Comstock Insurance Co. v. Thomas A. Hanson & Associates, Inc.*,⁴⁰ in which the architect was held liable to the owner because of negligent design, which was covered, and negligent cost estimates, which was excluded under that policy. (As noted earlier, some professional liability insurers currently do not exclude this.) Under the Illinois law, which governed this transaction, if one cause is covered and the other excluded, there is coverage.

Increasingly, the contractor and specialty subcontractors participate in collaborative-designed projects. If so, these contractors should insure against claims based upon design. Usually, this risk is excluded from liability insurance coverage carried by contractors. To insure against design-based claims, the contractor should procure separate insurance or obtain a special endorsement on its liability insurance to cover design-based claims.⁴¹

G. Deductible Policies

Insurance companies increasingly seek to reduce their risk by excluding from coverage claims, settlements, or court awards below a specified amount. Policies that exclude smaller claims are called *deductible policies*. Generally, the higher the deductible, the lower the premium cost. A high deductible means that the insured bears substantial risks. The recent tendency to raise deductible amounts makes the insured increasingly a self-insurer for small claims. Some policies include in the deductible the cost of defense. For example, if the deductible is \$5,000 and a claim of \$3,000 is paid to a claimant, the insured bears any cost of defense up to the deductible amount.

Under some policies, the insured must pay all claim expenses until the deductible is reached. Other policies do not require payment until the claim is resolved.

Deductible policies can create a conflict of interest between insurer and insured. When small claims are made, the insurer may prefer to settle the claim rather than incur

⁴⁰77 Md.App. 431, 550 A.2d 731 (1988). Some states use a proximate or dominant cause analysis.

⁴¹*Harbor Ins. Co. v. OMNI Constr. Inc.*, 912 F.2d 1250 (D.C.Cir.1990) (exemption for professional services precluded coverage under a CGL policy despite design and construction responsibilities given to a single subcontractor).

³⁹*Stone v. Hartford Cas. Co.*, supra note 35.

the cost of litigation. The insured may oppose such a settlement, believing that it is an admission of negligence and that payment to the claimant will come out of the insured's pocket. One insurer gives the insured the right to veto a settlement recommended by the insurer but provides that if the insured's ultimate liability exceeds that settlement proposal, the insurer's liability will not exceed the amount of the proposed settlement and any expense costs incurred prior to the settlement. In effect, such a provision gives the insurer the right to determine settlement.

Usually the deductible amount applies to each occurrence. Where the policy was not clear in this regard, however, one court applied the deductible of \$10,000 to each claim, and in an accident with eight claimants, the total deductible amounted to \$80,000.⁴²

H. Policy Limits

American policies generally limit insurance liability.⁴³ Suppose a claim for \$50,000 is made and the policy limits are \$100,000. The claimant offers to settle for \$40,000. The insurance company exercises its right to veto settlement and refuses to settle. The claim is litigated, and the claimant recovers \$125,000. The insured may contend that had the insurer settled, it would not have had to pay amounts in excess of the \$100,000 policy limit. Insurance companies are generally liable for amounts over the policy limit if their refusal to settle was unreasonable in light of all the circumstances.⁴⁴

Policies also contain an aggregate limit that applies to all claims made during the policy period. The maximum amount available to settle all claims arising out of one negligent act is usually the limit of liability per claim, but the maximum amount for all claims is the policy's aggregate limit of liability.

Some policies apply cost of defense to the aggregate limit. With the cost of defense so high, an insured who wishes to continue reasonable coverage might find it useful to increase its aggregate limit if defense costs are charged off against the aggregate limit.

⁴²*Lamberton v. Travelers Indem. Co.*, 325 A.2d 104 (Del.Super.Ct. 1974), aff'd, 346 A.2d 167 (Del.1975).

⁴³For discussion of whether the surety can be liable for more than the bond limits, see Section 32.10E.

⁴⁴*Comunale v. Traders & General Inv. Co.*, 50 Cal.2d 654, 328 P.2d 198 (1958); *Crisci v. Security Ins. Co.*, 66 Cal.2d 425, 426 P.2d 173, 58 Cal.Rptr. 13 (1967) (insured also recovered for her emotional distress).

I. Notice of Claim: Cooperation

Insurance policies usually state that the insured must notify the insurance company when an accident has occurred or when a claim has been made. The notice is to enable the insurer to evaluate the claim and gather evidence for a possible lawsuit.

In addition to requiring that the insured notify the insurer, policies usually require the insured to cooperate with the insurer in handling the claim. The insured must give honest statements (a false swearing clause may make any dishonest statement the basis for denying coverage). He must also make reasonable efforts to identify and locate witnesses and supply the insurer with material that may be important in defending the claim. The insured must also comply with any notice to attend hearings that have to do with the claim, such as depositions and trials.

Although insurance policies often state that coverage will be denied if there is a failure to cooperate (as stated in Section 15.05C and 15.05I), courts are not always willing to make failure of cooperation a sufficient basis to deny coverage unless the insurer can prove it was prejudiced by the lack of cooperation. Note, however, that the insured design professional has a disincentive for failure to cooperate. The design professional may be liable to the extent of the deductible and in certain unusual cases may be liable for any amount that exceeds the policy limits.

J. Duty to Defend

In most liability insurance policies, the insurer promises to defend and indemnify. One of the most difficult areas of law surrounds the question of when the insured has a duty to defend. The duty to defend is broader than the duty to indemnify, as policies usually state that the insurer will defend claims that are groundless, false, or fraudulent. Whether or not there is a duty to defend first depends on the complaint made against the insured. If coverage appears likely from the complaint, the insurer must defend. However, the complaint does not limit the duty to defend. The insured will have to defend if facts brought to its attention indicate a possibility of coverage.

Suppose a claim is made or liability determined that is less than the deductible specified in the policy. Some policies provide for the cost of defense in such a case, but if the amount paid on the claim is less than the deductible amount, defense costs are considered part of the deductible up to the deductible amount.

Suppose the policy limit is \$100,000 and a claim is made for \$200,000. Any recovery over \$100,000 must be paid by the insured. If the insurer is willing to pay the policy limits, will the insurer be obligated to defend the claim?

Professional liability policies generally require the insurer to defend even though the latter is willing to pay the policy limit. The professional liability policy is designed to furnish the dual protection of paying the claim and defending the claim, subject to policy limits and deductibles.

Policies may differ as to claim expenses. Some provide “first-dollar defense” coverage. Under such provisions, the company will pay all claim expenses. In some of these policies, the amount of claim expenses reduces the aggregate limit of liability coverage. (As noted in Section 15.05G, some policies require the insured to pay for the claims defense costs up to the amount of any deductible.) Some policies provide that the insurer will pay 80 percent of claim expenses and the design professional 20 percent. It has been held that the cost of defense can be prorated between acts that are covered under the policy and acts that are not covered.⁴⁵ But a court held that where proration of defense costs between those claims covered and those not covered cannot be made, the insurer must pay the entire cost of defense.⁴⁶ The insured must evaluate any options available as to the cost of defense, which is often high.

In addition to the often formidable attorneys’ fees involved in defending claims, there are other expenses. Exhibits must be prepared, and expert witness fees must be paid. Sometimes transcripts must be made of testimony taken before or at the trial. Bonds sometimes may have to be provided at stages of the legal action. The insured should determine whether the insurer is obligated to pay for these expenses.

Claim defense can raise questions about conflict of interest between insurer and insured. As noted in Section 15.05H, claims that can be settled within the policy limits can create a conflict of interest. The insured may wish to settle to avoid the possibility of a judgment that exceeds his insurance coverage. Similarly, as noted in Section 15.05G, a claim within any deductible can also raise conflict of interest as to settlement.

In addition, the insurer need not indemnify the insured if the trial reveals liability based on acts excluded from

coverage. For example, suppose the claimant’s loss could be attributable either to defective plans and specifications, which would be covered, or to an express warranty of a successful outcome, which would not. As the defense is within the control of the insurer, the insurer’s attorney could use that control to obtain a judicial conclusion that placed liability on conduct not covered. (Also, the attorney is ordinarily more concerned with preserving his relationship with the insurer than with the interests of the insured.) This led a California court to conclude that if conflict of interest arises, the insurer must pay for an independent attorney for the insured.⁴⁷ Even if the insurer need not pay for the cost of an independent attorney for the insured, it may be advisable for the insured to retain independent counsel at his own expense.

K. Settlement

As mentioned in Section 15.05I, the typical professional liability policy, although granting the power to settle to the insured, places sharp restraints on that power by making the insured take certain risks if he refuses to settle when the insurer suggests he do so.

Settlement provisions typically state that the insurer will not settle without consent of the insured. If the insured fails to consent to a recommended settlement and elects to contest the claim and continue legal proceedings, the insurer’s liability for the claim does not exceed the amount for which the claim would have been settled, plus claims expense incurred up to the date of such refusal. In other words, the insured will take the risk of the settlement having been a good one.

L. Multiparty Policies

In a transaction as complex as construction, with its host of participants, inefficiencies can develop if each party carries its own liability insurance. This situation has led some owners to require “wrap-up” policies for those engaged in construction and projectwide professional liability insurance for all the professionals involved in the project. Such insurance is relatively rare.

⁴⁵*Insurance Co. of North America v. Forty-Eight Insulations, Inc.*, 633 F.2d 1212 (6th Cir.1980).

⁴⁶*National Steel Constr. Co. v. National Union Fire Ins. Co. of Pittsburgh*, 14 Wash.App. 573, 543 P.2d 642 (1975).

⁴⁷*San Diego Federal Credit Union v. Cumis Ins. Soc’y, Inc.*, 162 Cal. App.3d 358, 208 Cal.Rptr. 494 (1984). Shortly after this decision, the California legislature enacted Civil Code Section 2860, which codifies the right to independent counsel where there is certain conflict of interest but also regulates who can be appointed as independent counsel and his fees.

M. Termination

Most insurance policies permit the insurer to terminate by giving a designated notice, often as short as thirty or forty-five days. Increasingly, legislatures and courts deny the insurer an absolute right to terminate.

SECTION 15.06 Preparing to Face Claims

Design professionals should anticipate the likelihood that claims will be made against them. With this in mind, the design professional must be able to document in the clearest and most objective way that a proper job was done. For example, expanded liability should not deter design professionals from using new designs, materials, or products. Design professionals must, however, prepare for the possibility that if things go wrong, they will be asked to explain their choice.

Using new materials as an example, the design professional should accumulate information directed toward predicting the performance of any contemplated new materials. Information should be obtained from unbiased people who have used the materials on comparable projects. A list of such people can be requested from manufacturers, whose representatives should be questioned about any bad results. The manufacturer can be notified as to intended use of the project, and asked for technical data that include limitations of the materials. Sometimes it is possible to have a manufacturer's representative present when new material is being installed to verify installation procedures. Any representations or warranties obtained should be kept readily accessible.

Design professionals should be able to reconstruct the past quickly and efficiently. A system for efficient making, storing, and retrieving of memoranda, letters, e-mails, and contracts is essential. Legal advice should determine the proper time to preserve records. If major design decisions have to be made, the design professional should indicate the advantages and disadvantages and obtain a final written approval from the client. Records should show when all communications are received and responses made. If work is to be rejected, the design professional should support his decision in communications to client and contractor. Similarly, if any previous approvals are to be withdrawn, written notice should be given to all interested parties. Records should be kept of all conferences, telephone calls, and discussions that may later need to be reconstructed in the event of a dispute.

In regard to recordkeeping, the instability of many design professional relationships can be troublesome. Design professionals dissolve partnerships frequently. Where dissolution occurs, records that should be kept are often lost or destroyed. When rearrangements occur, those involved should separate records and see that those who may need them, have them.

At all stages of their practice, design professionals need competent legal services at prices they can afford. Certainly, legal advice only after disputes have arisen is insufficient. Younger groups of design professionals should consider negotiating with those who provide legal services, for prepaid legal services plans.

Finally, the operations of the design professional, including contracts used, records kept, and compliance with laws regulating employers, should be evaluated periodically.

Intellectual Property: Ideas, Copyrights, Patents, and Trade Secrets

SECTION 16.01 Relevance to Design Professional

Design professionals use their training, intellect, and experience to solve design, construction, and manufacturing problems of their clients and employers. Usually design professionals reduce the proposed design solution to tangible form. These forms, whether sketches, renderings, diagrams, drawings, specifications, computer software, or models, communicate the design solution to the client or employer and others concerned. Often the design solution is followed by completion of the product being designed, such as the construction project, the industrial process, or the machine. In addition, some aspects of the design solution, such as the floor plans, sketches, diagrams, or pictures, may be used to advertise the project or the product. To sum up, the three steps are as follows:

1. the intellectual effort by which the solution is conceived
2. communication of the solution
3. development of the end product¹

If the client owns the tangible manifestation of the design solution or the end product itself, the client may wish that the manifestation not be copied or used without permission. To preserve uniqueness of the project, whether a residence or a commercial building, the client

¹For a thorough and provocative examination of the application of copyright law to architecture, see Newsam, *Architecture and Copyright—Separating the Poetic from the Prosaic*, 71 Tul.L.Rev. 1073 (1997). The author examines the design process and separates the unprotectible design ideas from the protectible expression of them. He suggests that the core of protectible design expression is what he calls the “poetic language.” His approach would narrow protection but would, he says, assist the creative design process and advance design.

may not want another project constructed to an identical design. The client may feel wronged if the construction documents are used by others without payment if the client paid for and received exclusive ownership rights.

Similarly, the manufacturer who invests funds to develop a product or process may not want others to copy it without permission. The manufacturer may wish to recoup the money invested to develop the process or product, either directly, through royalties, or by retaining a competitive advantage the research investment has given.

The design professional may want to obtain similar protection. Dealings with the client were discussed in Section 12.11. Likewise, the design professional may want protection against third parties copying the construction documents, diagrams, or drawings to be used in developing a product or copying the end products themselves.

The subject of this chapter is the protection accorded those who create or hire others to create tangible manifestations of intellectual effort.

SECTION 16.02 An Overview

A. Specificity of Discussion

In this section, certain legal concepts relating to intellectual ideas will be explored in greater detail than others. For example, patents, though of great importance to engineers, will be discussed only briefly. Patent law is a highly technical area. Inventors who wish to obtain or enforce a patent require a patent lawyer. For this reason, only the basic principles and certain salient features of patent law will be mentioned.

Obtaining copyright protection, in contrast, is relatively simple. People who want copyright protection, in contrast

to legal enforcement of copyright remedies, can generally get it without the help of an attorney. For this reason, more detail will be given to copyrights than to patents.

B. Purpose of Protection

Copyrights and patents are given to authors and inventors for their writings and discoveries. The primary purpose of granting them is to foster social and industrial development for the public good. This development is accomplished by granting people monopoly rights to reward them for their contributions, rights that would otherwise be antithetical in a competitive system. One judge stated,

The economic philosophy behind the clause empowering Congress to grant patents and copyrights is the conviction that encouragement of individual effort by personal gain is the best way to advance public welfare through the talents of authors and inventors. . . . Sacrificial days devoted to such creative activities deserve rewards commensurate with the services rendered.²

Yet society can suffer from excessive protection. Much intellectual and industrial progress depends on free interchange of ideas and free use of others' work. Commercial and industrial ventures can be frustrated or impeded if entrepreneurs are compelled to pay tribute to others who claim that their ideas, designs, or inventions have been used in some way by those entrepreneurs. The law seeks to reward truly creative and inventive work without unduly limiting the free flow of ideas and use of industrial and scientific technology. Patent law, for example, gives a twenty-year monopoly to the inventor of a novel, original, and not obvious invention, in exchange for disclosure to the public. This period was chosen as a compromise that adequately rewards an inventor but does not unduly perpetuate the stagnation that can accompany monopoly.

C. Exclusions from Discussion: Trademarks and Shop Rights

Creating an effective and universally recognized trademark or trade name is an intellectual act. However, design professionals are less concerned with trademarks and trade names than they are with copyrights and patents. For this

reason there will be no discussion of common law or statutory trademarks or trade names.³

The doctrine under which an employer under certain circumstances has shop rights—limited rights in the inventions of employees—will also not be discussed. For all practical purposes it has been preempted by near-universal use of standard form employment contracts.

SECTION 16.03 The Copyright Law of 1976⁴

A. Common Law Copyright Abolished

Section 301 of the federal Copyright Act of 1976 has preempted state laws “that are the equivalent to any of the exclusive rights within the general scope of copyright.”⁵ Preemption was intended to promote uniformity both by replacing state law with federal law and by preempting common law copyright, eliminating the frequently difficult question of when the work had become dedicated to the public, an act that deprived the author of a common law copyright.

Common law copyright remains only for works of authorship not fixed in a tangible medium of expression that can nevertheless be copyrighted. Such works include choreography that has never been filmed or put into notation, extemporaneous speech, original works of authorship communicated solely through conversations or live broadcasts, and dramatic sketches or musical compositions improvised or developed from memory and without being recorded or written down.

B. Statutory Copyright

Classification of Copyrightable Works. The classification of works that can be copyrighted was changed by the Copyright Law of 1976 from the close-ended thirteen to

³The Lanham Act, 15 U.S.C.A. § 1051 *et seq.*, a federal statute, permits registration of trade names, trademarks, and service marks as well provides for remedies. State law also deals with trademarks.

⁴In 1976 Congress enacted Pub.L. No. 94-553, 90 Stat. 2541, which replaced the 1909 Copyright Act and went into effect in 1978. References are to sections in the current act. The statute is also found in 17 U.S.C.A. § 101 *et seq.*

⁵17 U.S.C.A. § 301(a). Preemption has become more difficult than anticipated. For example, *Balsamol Olson Group v. Bradley Place Ltd. Partners.*, 950 F.Supp. 896 (C.D.Ill.1997), though citing authorities to the contrary, held that the Copyright Act preempted the Illinois Uniform Deceptive Trade Practices Act and Illinois tort law, which protects prospective economic advantage.

²*Mazer v. Stein*, 347 U.S. 201, 219 (1954).

an open-ended seven. Section 102 permits copyright of the following categories:

1. literary works
2. musical works, including any accompanying words
3. dramatic works, including any accompanying music
4. pantomimes and choreographic works
5. pictorial, graphic, and sculptural works
6. motion pictures and other audiovisual works
7. sound recordings; and
8. architectural works

Drawings or plans fall in category 5, whereas specifications fall under category 1. In that regard, literary works need not be “literary” as long as they express concepts in words, numbers, or other symbols of expression. “Architectural works” refers to copyright protection of the built structure. This category was added with passage of the Architectural Works Copyright Protection Act of 1990, discussed in Section 16.04D.

Copyright Duration: More Protection. The Copyright Act of 1909 protected the copyright holder from others reproducing, creating derivative works, and distributing copyrightable works. Protection lasted for twenty-eight years, with the right to renew for an additional twenty-eight years. Much criticism had been made of copyright duration, and longer life expectancy made it inadequate. To bring American law in line with that of most foreign countries, Section 302 of the 1976 act gives copyright protection for the life of the author plus fifty years thereafter. However, if a work was made for hire (discussed in greater detail in Section 16.04D), the duration of the copyright is seventy-five years after the year of its first publication or one hundred years from the year of its creation, whichever expires first.

In 1998, the Congress again extended copyright duration by enacting the Copyright Term Extension Act.⁶ It extended copyright duration twenty years for all copyrights, existing and future. The period commences from copyright creation. As extended, the duration for individual copyrights is the life of the author plus seventy years. Works for hire are now ninety-five years from time of creation or one hundred and twenty years from time of

publication, whichever occurs first. This harmonizes with directives of the European Union issued in 1993 and puts the United States in conformity with international norms.

Codification of Fair Use Doctrine. Section 107 of the Copyright Act of 1976 expressly recognizes fair use. It permits reproduction “for purposes such as criticism, comment, news reporting, teaching (including multiple copies for classroom use), scholarship or research.” Factors described as bearing on whether the use is a fair one include the following:

1. the purpose and character of the use, including whether such use is of a commercial nature or is for nonprofit educational purposes
2. the nature of the copyrighted work
3. the amount and substantiality of the portion used in relation to the copyrighted work as a whole
4. the effect of the use on the potential market for or value of the copyrighted work

Obtaining a Copyright. Although the form of copyright notice was not changed, Section 405(a) of the 1976 act gives some relief where the notice has been omitted in certain circumstances,⁷ and Section 406 gives relief if the notice contains an error in name or date.

Section 411(a) requires registration with the Copyright Office before commencement of an infringement action. In addition, Section 412 precludes recovery of statutory damages or attorneys’ fees if the copyrighted work is not registered within three months after first publication of the work.⁸ Registration need not be difficult or expensive. Even the pre-1976 copyright regulations permitted substitutions for the original materials themselves if they were bulky or if it would be expensive to require deposit.

Section 407 stiffens the 1909 act requirement that copyrighted works be deposited with the Library of Congress. The act requires that two complete copies of the best edition be deposited, although failure to deposit will not affect the validity of the copyright. A person who fails to deposit within three months after a demand is subject to a fine of

⁶17 U.S.C.A § 302(a), upheld by seven to two decision in *Eldred v. Ashcroft*, 537 U.S. 186, rehearing denied, 538 U.S. 916 (2003) (within legislative power granted by U.S. Constitution).

⁷Relief from the requirement of attaching a copyright notice was denied because § 405(a) grants relief only if the notice is omitted from a relatively small number of copies. *Donald Frederick Evans & Assoc., Inc. v. Continental Homes, Inc.*, 785 F.2d 897 (11th Cir.1986).

⁸Section 412 provides authors with a practical incentive to register and also encourages potential infringers to check the federal register. *Johnson v. Jones*, 149 F.3d 494, 505 (6th Cir.1998).

not more than \$250 for each work and a fine of \$2,500 if refusal is wilful or persistent.

However, the 1976 act also gives authority to the Register of Copyrights to specify by regulation the nature of copies required to be deposited. These regulations can allow deposit of identifying material rather than copies. One rather than two copies can be permitted.

Remedies for Infringement. The 1976 act provides copyright authors with two broad remedies: injunctive relief (ordering the performance of a specific act) and damages.

Under the common law, an injunction is an extraordinary remedy given only in exceptional circumstances. However, Congress authorized the federal courts to grant both copyright and patent owners injunctive relief. Section 502 of the 1976 act allows a court to grant an injunction “to prevent or restrain infringement of a copyright.” Under Section 503, a court may order impounding or destruction of infringing copies and articles by which infringement has been accomplished.

Copyright and patent owners traditionally have argued that, if they establish infringement, they should automatically be entitled to injunctive relief. In a patent infringement case, the United States Supreme Court rejected that view. In *eBay, Inc. v. MercExchange, L.L.C.*,⁹ the Court ruled that the patent holder must prove the same four-part test of entitlement to injunctive relief as is required under the common law: (1) that the patent holder suffered an irreparable injury; (2) that a monetary award will not adequately compensate it; (3) that the balance of hardships between the plaintiff and defendant militates in favor of injunctive relief; and (4) that the public interest would not be disserved by a permanent injunction.

The *eBay* decision has been extended to copyright cases. In *Christopher Phelps & Associates, LLC v. Galloway*,¹⁰ an owner built his house using infringed plans. The architect established the infringement and was awarded damages (the cost he would have charged to create the plans). The architect then sought a permanent injunction to prevent the owner from profiting from his infringement by either renting or selling the house within the period of plaintiff’s copyright—95 years. The court refused to issue an injunction on the ground that the architect failed to prove the last two elements of the *eBay* test. With regard to the

third element (balance of hardships), an injunction would be unduly harsh because it would deprive the owner of his rights of ownership. With regard to the fourth element (the public interest), an injunction would undermine the public policy of allowing land to be productively used (including selling it). As the *Christopher Phelps* decision makes clear, an architect seeking injunctive relief faces an uphill battle after *eBay*.

Section 504 allows recovery of actual damages and profits made by the infringer attributable to the infringement. In establishing the infringer’s profits, the copyright owner is required to present proof only of the gross revenue, and the infringer must prove deductible expenses and elements of profit attributable to factors other than the copyrighted work.¹¹ Statutory damages can now be awarded up to \$30,000, with \$150,000 for wilful infringement. The statutory damages for an innocent infringer can be reduced to \$200.

A federal trial court opinion illustrates the difficulty of proving actual damages.¹² A developer paid an architect \$13,000 (based on an hourly rate) to prepare plans and specifications for an apartment complex, which the developer built.

Without permission of the architect, the developer copied and revised the plans to produce another set of plans, from which he built another apartment complex. The architect sued the developer for copyright infringement, claiming \$36,000 as his actual damages. The architect’s damages claim was based on the estimated construction cost of the second apartment complex and a percentage fee of 7.5 percent.

The trial court rejected the architect’s damages claim of \$36,000, as the 7.5 percent was based not only on the preparation of the drawings and specifications but also on the “supervision” of the contract award and construction, which the architect did not do. The judge stated that the architect instead was entitled to the fair market value of the infringed architectural plans, which was defined as what the developer would have paid the architect and what the architect would have expected to receive as the fair market value for those plans. Plaintiffs’ expert witnesses testified that the fair market value of the

¹¹*Johnson v. Jones*, supra note 8, 149 F.3d at 506 (architect is entitled to infringing architect’s entire profit of \$16,500 where the defendant proved no expenses to deduct from that amount).

¹²*Aitken, Hazen, Hoffman, Miller, P.C. v. Empire Constr. Co.*, 542 F.Supp. 252 (D.Neb.1982).

⁹547 U.S. 388 (2006).

¹⁰492 F.3d 532 (4th Cir.2007).

architectural services ranged from \$24,000 to \$37,000. Each expert testified that he did not know that the plaintiff had received only \$13,000 for the original drawings and specifications. The judge found that it would be inconceivable for the developer to pay more than the \$13,000 he paid for the first set, and so concluded that the reasonable value was \$13,000. The judge then reduced that amount by the cost of revising the original plans, as the architect had not incurred that expense. This reduced the actual damages to \$10,000.

The architect also sought the developer's profits. The developer made a gross profit of \$60,000 on the project. After deducting a portion of the project's administrative and general overhead expenses, his net profit was some \$17,000.

The final judgment awarded the architect \$10,000 actual damages and the profits of \$17,000 earned by the developer. It is likely that this judgment came after a long and costly trial. The costs may have far exceeded the amount of the judgment. This should not be taken to mean that a copyright claim by a design professional will never produce a significant damage award. In another case, the architect recovered the fair market value of the plans (\$11,968) plus the profit (\$42,250) made by the party who infringed the architect's copyright in building a residence.¹³ Nevertheless, a careful calculation must be made of the likely recovery, because those against whom infringement claims are brought often attack the validity of the claim. In addition, any settlement or recovery in a breach of contract action alleging unauthorized use of the architect's work product would be deducted from a copyright claim involving the same injury.¹⁴

Works Commissioned by U.S. Government. Some had advocated that there be no copyright in works commissioned by the U.S. government. However, Congress rejected this position and gave procuring agencies discretion to determine whether to give the design professional copyright ownership. Copyright protection will be denied only if the copyrighted work is authored by an employee of the government.

¹³*Eales v. Environmental Lifestyles, Inc.*, 958 F.2d 876 (9th Cir.), cert. denied sub nom. *Shotey v. Eales*, 506 U.S. 1001 (1992).

¹⁴*Sparaco v. Lawler, Matusky & Skelly, Engineers LLP*, 303 F.3d 460, 469 n.2 (2d Cir.2002), cert. denied, 538 U.S. 945 (2003). Upon remand, the district court ruled that the designer's settlement of his contract claim precluded the recovery of statutory damages. *Sparaco v. Lawler, Matusky & Skelly, Engineers LLP*, 313 F.Supp.2d 247 (S.D.N.Y.2004).

SECTION 16.04 Special Copyright Problems of Design Professionals

A. Attitude of Design Professionals Toward Copyright Protection

Design professionals vary in their attitude toward the importance of legal protection for their work. Some design professionals want their work to be imitated. Imitation may show professional respect and approval of work. When credit is given to the originator, imitation may also enhance the professional reputation of the person whose work is copied. Some design professionals are messianic about their design ideas and would be distressed if their work were not copied. Many design professionals believe that free exchange and use of architectural and engineering technology are essential to advancing the art of design.

Even design professionals who want imitation or who do not object to it draw some lines. Some design success is predicated on exclusivity. Copying the interior features and layout of a luxury residence or putting up an identical structure in the same neighborhood is not likely to please the architect or client. The same design professional who would want her ideas to become known and used might resent someone going to a public agency and without authorization copying construction documents required to be filed there. This same design professional is likely to be equally distressed if a contractor were to copy plans made available for the limited purpose of making a bid. Much depends on what is copied, who does the copying, and whether appropriate credit is given to the originator.

B. What Might Be Copied?

Design professionals may wish protection for ideas, sketches, schematic and design drawings, computer software, two-dimensional renderings, three-dimensional models, construction documents sufficiently detailed to enable contractors to bid and build, and the completed project itself. Ideas themselves cannot receive legal protection, and legal protection for the executed project, as noted in Section 16.04D, only recently has received limited protection. The principal problems relate to tangible manifestations of design solutions that are a step toward the project. These tangible manifestations vary considerably in the amount of time taken to create them and in the amount of time and money saved by the infringer who copies them. The tangible manifestations of the ideas in

the architectural drawings must be sufficiently detailed to merit copyright protection.¹⁵

C. Common Law Copyright and Publication

Traditionally, design professionals sought protection through common law copyright. This may have been traceable to a lack of understanding of statutory copyright. Some design professionals believed, incorrectly, that statutory copyright protection against infringement requires the expensive registration of often formidable construction documents after they are created. Whatever the reason, the bulk of the cases involving design works involve claims of common law copyright. Common law copyright was abolished by the 1976 federal Copyright Act. For historical reasons, a brief comment on common law copyright is adequate.

The principal difficulty in perfecting a common law copyright had been the frequent claim made by the alleged infringer that the work copied had already been published. If dissemination of and the facts and circumstances surrounding the work indicated to a reasonable person that the creator had dedicated the work to the public, common law copyright was lost.

Common law copyright did not provide much protection. Design professionals should welcome its abolition. Now they are limited to statutory copyright, which, although it too has its weaknesses, is substantially better.

D. Statutory Copyright

If we look first at the beginning (creation of ideas) and end (execution of completed projects) of a design professional's services, it is clear that the former does not receive copyright protection. Before the 1976 act, the copyright holder of technical drawings had no exclusive right to complete the project. However, drawings or models for an unusual structure that could be classified as a work of art, such as the Washington Monument or the Eiffel Tower, gave the copyright holder the exclusive right "to complete, execute and finish it." On the one hand, the Copyright Office took the position that works of design professionals were copy-

rightable only as technical drawings and not as works of art. On the other hand, if a structure incorporated features such as artistic sculpture, carving, or pictorial representation that could be identified separately and were capable of existing independently as works of art, such features were eligible for registration. Thus, limited aspects of a building received copyright protection as a work of art. Under some circumstances, certain features of design could be sufficiently novel to justify a design patent.

Architectural Works Copyright Protection Act of 1990. Until the enactment of the Architectural Works Copyright Protection Act of 1990, the AWCPA,¹⁶ architects were not given copyright protection of the actual three-dimensional design, that is, the completed project itself.¹⁷ Change resulted from the desire of the Congress to bring U.S. law into line with the requirements of the Berne Convention, which provides the most comprehensive protection for copyright. Signatories to the convention agree to protect the copyright of citizens of other signatories to the convention. To bring America into line with the Berne Convention, it was necessary that U.S. law protect works of architecture and recognize the moral rights of artists, as noted in Section 16.05.

Under the AWCPA, an architectural work is the abstract three-dimensional design for a building. The law provides copyright protection for original design elements of such buildings. In addition, the new act makes clear that injunctive relief can be granted to enforce a copyright even if it means destruction of buildings.

Protection does not extend to all work designed by design professionals. It covers designs for buildings that are habitable, such as houses and office buildings.¹⁸ It also

¹⁵Compare *Attia v. Society of the New York Hospital*, 201 F.3d 50 (2d Cir.1999), cert. denied, 531 U.S. 843 (2000) (highly preliminary design concepts do not receive copyright protection) with *Sparaco v. Lawler, Matusky & Skelly, Engineers LLP*, supra note 14 (site plan containing detailed proposed physical improvements receives copyright protection).

¹⁸A store in a mall is not a "building" subject to copyright protection. *Yankee Candle Co., Inc. v. New England Candle Co., Inc.*, 14 F.Supp.2d 154, vacated pursuant to settlement, 29 F.Supp.2d 44 (D.Mass.1998).

includes structures not inhabited by human beings but used by them, such as churches, pergolas, gazebos, and garden pavilions. It does not cover structures designed by engineers such as interstate highway bridges, cloverleaves, canals, dams, and pedestrian walkways. The Berne Convention does not require such extended protection, and Congress determined that protection is not necessary to stimulate creativity in those fields. Extensive monuments or commemorative structures, such as the Washington Monument and Statue of Liberty, are protected if they permit entry and temporary use by people.

The protections accorded by the 1990 act have limitations. The act does not cover features of architectural works required by utilitarian function. An architectural work does not include “individual standard features.” This would preclude protection for features such as common windows, doors, and other staple building components. Protection does not extend to forbidding use of pictures of buildings if the building is located in or ordinarily visible from a public place. As a result, people can use and reproduce photographs, posters, and other pictorial representations of architectural works.¹⁹ The copyright owner cannot prevent the owner of a building embodying the work from altering or destroying the building or authorizing others to do so. Similarly, the new act ensures that local entities can exercise their police powers to enforce laws regarding landmarks, historical preservation, and zoning or building codes.

The new act applies to all architectural works created after December 1, 1990.²⁰ It also applies to architectural works created before that date that were unconstructed and embodied in unpublished plans or drawings on that date. However, such protection expires unless the building is constructed before December 31, 2002.

Copyright Owner: Work for Hire Doctrine. Before the 1976 act, it was assumed, in the absence of an agreement to the contrary, that the person commissioning copyrightable works was entitled to the copyright. This was one of the reasons for the frequent inclusion of clauses, in contracts between design professionals and their clients, giving ownership rights to the former.

¹⁹*Leicester v. Warner Brothers*, 232 F.3d 1212 (9th Cir.2000).

²⁰*Richard J. Zitz, Inc. v. Dos Santos Pereira*, 232 F.3d 290 (2d Cir.2000) (AWCPA not applicable to building substantially complete as of December 1, 1990).

Section 201 of the 1976 act gives copyright protection to the author of the work. However, if the work is made for hire, the employer or other person for whom the work was prepared is considered the author unless the parties have agreed otherwise in a signed written agreement. Section 101 defines a “work for hire” as prepared by an employee or a work specially ordered or commissioned. The legislative history did not include as work for hire a client commissioning a design professional.

Yet the law that has emerged since the 1976 act has made clear that the design professional who operates independently and is retained by a client to prepare the design, owns the copyright in the absence of an agreement to the contrary. The standard that applies is the common law of agency. Was the work prepared by an employee or by an independent contractor?²¹ If the design professional is an independent contractor, she owns the copyright.

A number of factors are used in making this determination. The ones that seem to have emerged as most significant in the cases involving independent design professionals are whether the skills involved are beyond the capacity of a layperson; whether the client paid employee benefits such as health, unemployment, or life insurance benefits; and whether the client paid employment taxes and withheld federal and state income taxes.²²

Ownership of Documents and Copyright: License to Use. Section 12.11 of this book discussed the ownership of drawings and specifications. There it was noted that associations of design professionals include language in their contracts reserving the ownership or re-use rights in the design professional. As seen in that section, the 2007 AIA Document B101, Section 7.3, states the architect grants the owner a nonexclusive license to use the plans and specifications to construct, use, and maintain the project. If the owner exceeds the limited use of the license by using the architect’s design on other projects without

²¹*Community for Creative Non-Violence v. Reid*, 490 U.S. 730 (1989).

²²*Kunyia v. Melville Realty Co.*, 755 F.Supp. 566 (S.D.N.Y. 1990) (architect retained by client entitled to copyright, as copyrightable drawings were not made pursuant to a work for hire); *M.G.B. Homes, Inc. v. Ameron Homes, Inc.*, 903 F.2d 1486 (11th Cir.1990) (home-builder is not the owner of a floor plan created by a draftsman, an independent contractor), appeal after remand, 30 F.3d 113 (11th Cir.1994); *Trek Leasing, Inc. v. United States*, 62 Fed.Cl. 673 (2004) (architect of design-build contractor was an employee and the architectural work was a work for hire).

permission and payment of a reuse fee, the architect may ask the court to order the owner to stop this conduct.²³

But strong owners, particularly public owners, insist on owning the plans and specifications. In Section 12.11 it was also noted that if the contract did *not* deal with ownership or re-use rights, common law gives ownership to the person who commissioned and paid for them, unless a valid custom to the contrary can be established by the design professional.

What is the effect of copyright law on ownership rights? The copyright law gives an independent author the copyright. When federal copyright law and common law contract law clash, what is the outcome?

Clearly, contract law—at least that which deals with use of the design documents—has been preempted by federal copyright law. Yet as noted,²⁴ preemption issues are complicated and preemption should be invoked sparingly. Certainly Congress sought to avoid the confusion and uncertainty of state common law copyright. But it does not follow that Congress intended to preclude contractual control of re-use rights. Certainly the AIA and EJCDC do not believe so. If they did, they would not treat this topic so extensively in their standard contracts.²⁵

Can we reconcile the two sources of law by dividing their functions? Copyright law bars reproducing, preparing derivative works, or distributing copies of copyrighted work.²⁶ That could be the ambit of copyright law. Infringement would invoke statutory remedies. Contract law could deal with *use* by others, invoking contract law remedies, including a restitution claim against a wrongful user. But this interpretation seems too artificial and confusing to implement. Use inevitably involves reproduction.

Another more promising method seeks to accommodate both sources of law. When two legitimate sources of law appear to clash, the law seeks to reconcile them. It is never assumed that one seeks to destroy the other. Clearly, an author can assign her copyright to another. In their contracts with their authors, publishers customarily require authors to assign the copyright. If the client knew that the Copyright Act gives the copyright to the design professional, it might also demand a written assignment of the

²⁶17 U.S.C.A. § 106.

copyright as permitted by the Copyright Act in Section 204(a). The most effective way to preserve contract autonomy in the face of copyright law is to conclude that a contract that does not deal with ownership of documents gives a nonexclusive license to the owner to copy for a limited purpose, namely, execution of the design. This would also provide a legitimate reason for design professionals to include a provision preserving their ownership rights.

Since the mid-1990s, courts increasingly have grappled with the question of whether a “nonexclusive license” may be found in the absence of a writing and, if so, the scope of that license. A “nonexclusive license” is a grant by the copyright holder allowing a third person to use the copyrighted materials for a limited purpose. The nonexclusive license may be granted expressly—that is, in writing—or the grant may be implied from the circumstances of the relationship between the copyright holder and the third person.

The issue of whether a nonexclusive license was granted typically arises in the context of an architect who performed preliminary design work for an owner, only to be replaced by another architect who completes the design or administers the project’s construction. May an owner who purchases the preliminary design work use those documents for further development and actual construction (in which case the owner has a nonexclusive right to the design) or must the owner compensate the original architect for the later use of the preliminary design (in which case a nonexclusive license has not been granted)?

The federal Fourth Circuit Court of Appeals in *Nelson-Salabes, Inc. v. Morningside Development, LLC*,²⁷ recently addressed that question as applied to architectural drawings. It stated that a key factor in determining the existence and scope of a nonexclusive license is whether the architect intended the owner to copy, distribute, or modify its work without further involvement of the architect. The court used a “totality of the circumstances” test to discern the architect’s intent. It then reviewed application of that test by three other circuit courts—the Ninth Circuit in *Foad Consulting Group, Inc. v. Azzalino*,²⁸ the Sixth Circuit in *Johnson v. Jones*,²⁹ and the Seventh Circuit in *I.A.E., Inc. v. Shaver*,³⁰—and summed up:

²⁷284 F.3d 505 (4th Cir.2002).

²⁸270 F.3d 821 (9th Cir.2001).

²⁹See supra note 8.

³⁰74 F.3d 768 (7th Cir.1996).

Our analysis of these decisions thus suggests that the existence of an implied nonexclusive license in a particular situation turns on at least three factors: (1) whether the parties were engaged in a short-term discrete transaction as opposed to an ongoing relationship; (2) whether the creator utilized written contracts, such as the standard AIA contract, providing that copyrighted materials could only be used with the creator's future involvement or express permission; and (3) whether the creator's conduct during the creation or delivery of the copyrighted material indicated that use of the material without the creator's involvement or consent was permissible. In *Johnson*, the architect was retained with the understanding that he would develop the project to completion, and his contracts and conduct suggested that any use of his architectural work without his involvement or consent was impermissible. As a result, no implied license was found to exist. On the other hand, as we have pointed out, implied licenses were found to exist in *Foad Consulting* and *Shaver*, where the architects were hired for discrete tasks, with no indication of their further involvement in the project, and where they did not suggest in their proposed contracts or by their conduct that use of the copyrighted material without their involvement was impermissible.

The situation in this case, based on the record presented, falls somewhere between the situation in *Johnson*, on the one hand, and those in *Shaver* and *Foad Consulting*, on the other. Unlike the architect in *Johnson*, NSI [Ed. note: The architect] was not retained to develop plans for the entire Project and, like the architects in *Shaver* and *Foad Consulting*, NSI created the NSI Drawings pursuant to task-specific contracts. Moreover, as in *Shaver* and *Foad Consulting*, neither of those task-specific contracts contained language prohibiting future use of the architectural drawings without NSI's involvement or consent. In this instance, however, like the architect in *Johnson*, NSI and Strutt [Ed. note: The developer] plainly contemplated NSI's long-term involvement in Satyr Hill [Ed. note: The project], and they engaged in ongoing discussions for more than nine months concerning NSI's development of the Project. And during those discussions, NSI submitted contracts to Strutt that, similar to those in *Johnson*, contained the standard AIA prohibition against use of the NSI Drawings without NSI's future involvement or its express consent. Indeed, NSI never expressed to Strutt by its representations or conduct that Strutt could utilize NSI's plans without NSI's future involvement or express consent; in fact, NSI specifically advised Strutt to the contrary on at least two occasions.

Reviewed and evaluated in its totality, therefore, Strutt and NSI were engaged in an ongoing relationship that contemplated NSI's future involvement in Satyr Hill. Although the Project was performed in component parts, the facts found by the district court in its Opinion demonstrate that NSI created the NSI Drawings with the understanding that it would participate in the further development of Satyr Hill. Opinion at 17–18. Unlike the architects in *Foad Consulting* and *Shaver*, NSI eventually submitted an AIA agreement to Strutt, and it negotiated for more than nine months with Strutt concerning the work covered by the AIA agreement. In these circumstances, we agree that NSI did not intend for Strutt to utilize the NSI Drawings in the construction of Satyr Hill without NSI's future involvement in the Project or its express consent. Therefore, like the district court, we are "satisfied that these facts do not support a finding that [NSI] granted Strutt [an implied] nonexclusive license."³¹

In the *Nelson* case, no design contract was signed by the owner (Strutt); however, the court discerned the intent of the architect (NSI) by examining the AIA contract (apparently B141-1987) sent by NSI to Strutt for signature. Paragraph 6.1 of B141-1987 stated that the design documents created by the architect "are instruments of the Architect's service for use solely with respect to this Project" and that the architect is the owner of the documents and retains all rights, including copyright. Although Paragraph 6.1 did not expressly address the issue of license, it did prohibit the owner's use of the design to complete the project, if done without the architect's consent.

By contrast, B101-2007, Section 7.3, expressly addresses the issue of nonexclusive license. It states that the architect grants the owner "a nonexclusive license to use the Architect's Instruments of Service solely and exclusively for purposes of constructing, using, maintaining, altering and adding to the Project." The license remains in effect only if the owner substantially performs its contract obligations (including prompt payment of the architect) and is terminated if the architect "rightfully terminates this Agreement for cause as provided in Section 9.4."

Missing from Section 7.3, is an explanation of what would excuse the owner from continuing to be subject to the license's restrictions. That absence is conspicuous because AIA B141-1997, Paragraph 1.3.2.2, addressed

³¹*Nelson-Salabes, Inc. v. Morningside Development, LLC*, supra note 27, 284 F.3d at 516–17.

this question directly. Under the 1997 document, if the architect was “adjudged in default,” the license would be terminated and replaced with a second license allowing the owner to use the design to complete, use, and maintain the project.

In the absence of contract language addressing this issue, an owner’s rights would be determined under contract law. Suppose an owner believes the architect has breached the contract. The owner terminates the B101-2007 agreement and uses the design to complete the project. If a court later finds that the termination was justified, then the owner’s use of the design to complete the project will also have been justified. But if the court finds in favor of the architect, then the owner will have violated Section 7.3 by continuing to use the design after the termination date.

What rights does the owner have under AIA B101-2007 to use the plans after project completion? A distinction must be drawn between the owner’s use of the design on the same building for which the plans were made and its use of the plans to construct new buildings.

Section 7.3 allows the owner to use the design not only for the purpose of constructing the building, but also for purposes of “using, maintaining, altering and adding to the Project.” This broad language should permit the owner to use the plans to modify or alter the completed project. In *Eiben v. A. Epstein & Sons, International, Inc.*,³² the contract permitted the owner to retain the specifications “in connection with [the owner’s] use and occupancy of the Project.” The court ruled that this language authorized the owner, ten years after the original construction, to use the original architect’s drawings on a new project that included renovating a small part of the project designed by that architect.

An owner could also argue that changes made in the 1997 and 2007 documents show that the AIA *intended* the owner to be able to use the architect’s plans on future alterations to the completed project. AIA B141-1997 Paragraph 1.3.2.3 prohibited the owner from using the Instruments of Service “for future additions or alterations *to this Project*” without the architect’s prior written agreement. (Emphasis added.) By deleting this language from AIA B101-2007, the AIA may have indicated it no longer intended to limit the owner’s use in this manner.

As for the owner’s use of the architect’s design on other projects, AIA B101-2007, Section 7.3, is a nonexclusive license “solely and exclusively” for use on the project designed by the architect. Section 7.4 says that the owner may not transfer the license to any other person “without the prior written agreement of the Architect.” This protects the architect from the owner of a store chain buying one design and paying for it once, but then using it multiple times. The owner would be in breach of the license if it did so without prior written agreement of the architect (presumably at least to determine a fee for reuse of her design). Finally, under Section 7.3.1, an owner who uses the design without retaining the architect who prepared it must indemnify and hold harmless the architect from any consequences.

Infringement: Sturdza v. United Arab Emirates. The owner’s claim of a nonexclusive license is a defense to a copyright infringement claim. Even if the architect defeats that defense, she still must establish that the defendants—usually both the owner and the replacement architect—infringed her copyright. The following case examines proof of a copyright infringement claim involving design documents.

STURDZA v. UNITED ARAB EMIRATES

United States Court of Appeals, District of Columbia Circuit, 2002. 350 U.S.App.D.C. 154, 281 F.3d 1287 [Ed. note: Some footnotes omitted and footnotes renumbered.]

TATEL, Circuit Judge
[Ed. note: In 1993, the United Arab Emirates (UAE) held a competition for the architectural design of a new embassy in Washington D.C. The UAE informed the competitors that the building should express the “richness and variety of traditional

Arab motifs.” Plaintiff Sturdza and defendant Demetriou both submitted designs. The UAE informed plaintiff that she had won.

Over the next two years, plaintiff and the UAE exchanged eight contract proposals. Although plaintiff agreed to the final proposal, the UAE ceased all communications with her. In 1997, plaintiff learned that the UAE had hired Demetriou to design the embassy. Plaintiff sued the UAE and Demetriou for

³²57 F.Supp.2d 607 (N.D.Ill.1999).

copyright infringement. The district court granted summary judgment in favor of the defendants and the plaintiff appealed.]

* * *

III

To prevail on a copyright claim, a plaintiff must prove both ownership of a valid copyright and that the defendant copied original or “protectible” aspects of the copyrighted work. *Feist Publ'ns, Inc. v. Rural Tel. Serv. Co.*, 499 U.S. 340, 348, 361, 111 S.Ct. 1282, 1289, 1296, 113 L.Ed.2d 358 (1991). “Not all copying, however, is copyright infringement.” *Id.* at 361, 111 S.Ct. at 1296. The plaintiff must show not only that the defendant actually copied the plaintiff’s work, but also that the defendant’s work is “substantially similar” to protectible elements of the plaintiff’s work. See generally 4 MELVILLE B. NIMMER & DAVID NIMMER, NIMMER ON COPYRIGHT § 13.01 [B], at 13-8 to 13-10 (2001) (explaining that while few courts clearly differentiate between actual copying and substantial similarity, both are clearly required, and the latter inquiry concerns whether actual copying is illegally actionable). In their motions for summary judgment, the UAE and Demetriou disputed neither Sturdza’s ownership of a valid copyright nor that Demetriou actually copied Sturdza’s design. Instead they argued, as they do here, that Sturdza cannot prove substantial similarity.

The substantial similarity inquiry consists of two steps. The first requires identifying which aspects of the artist’s work, if any, are protectible by copyright. “[N]o author may copyright facts or ideas. The copyright is limited to those aspects of the work—termed ‘expression’—that display the stamp of the author’s originality.” *Feist Publ'ns*, 499 U.S. at 350, 111 S.Ct. at 1289 (internal quotation marks and citation omitted) (alteration in original); see also 17 U.S.C. § 102(b) (“In no case does copyright protection for an original work of authorship extend to any idea, procedure, process, system, method of operation, concept, principle, or discovery. . . .”). Using Shakespeare as an example, Judge Learned Hand explained the distinction between protectible expression and unprotectible ideas:

If Twelfth Night were copyrighted, it is quite possible that a second comer might so closely imitate Sir Toby Belch or Malvolio as to infringe, but it would not be enough that for one of his characters he cast a riotous knight who kept wassail to the discomfort of the household, or a vain and foppish steward who became amorous of his mistress. These would be no more than Shakespeare’s “ideas” in the play, as little capable of monopoly

as Einstein’s Doctrine of Relativity, or Darwin’s theory of the Origin of Species.

Nichols v. Universal Pictures Corp., 45 F.2d 119, 121 (2d Cir.1930); see also, e.g., *Country Kids ‘N City Slicks, Inc. v. Sheen*, 77 F.3d 1280, 1286 (10th Cir.1996) (holding that “wooden form of the traditional paper doll” is idea not expression). “[N]o principle,” Judge Hand said, “can be stated as to when an imitator has gone beyond copying the ‘idea,’ and has borrowed its ‘expression.’ Decisions must therefore inevitably be ad hoc.” *Peter Pan Fabrics, Inc. v. Martin Weiner Corp.*, 274 F.2d 487, 489 (2d Cir.1960).

Also relevant to this case, copyright protection does not extend to what are known as *scènes à faire*, i.e., “incidents, characters or settings which are as a practical matter indispensable, or at least standard, in the treatment of a given topic,” *Atari, Inc. v. North Am. Philips Consumer Elecs. Corp.*, 672 F.2d 607, 616 (7th Cir.1982) (internal quotation marks and citation omitted), or elements that are “dictated by external factors such as particular business practices,” *Computer Mgmt. Assistance Co. v. Robert F. DeCastro, Inc.*, 220 F.3d 396, 401 (5th Cir.2000). For example, because “[f]oot chases and the morale problems of policemen, not to mention the familiar figure of the Irish cop, are venerable and often-recurring themes of police fiction[,] . . . they are not copyrightable.” *Walker v. Time Life Films, Inc.*, 784 F.2d 44, 50 (2d Cir.1986).

* * *

Once unprotectible elements such as ideas and *scènes à faire* are excluded, the next step of the inquiry involves determining whether the allegedly infringing work is “substantially similar” to protectible elements of the artist’s work. “Substantial similarity” exists where “the accused work is so similar to the plaintiff’s work that an ordinary reasonable person would conclude that the defendant unlawfully appropriated the plaintiff’s protectible expression by taking material of substance and value.” *Country Kids*, 77 F.3d at 1288 (internal quotation marks and citation omitted). Substantial similarity turns on the perception of the “ordinary reasonable person” or “ordinary observer,” *id.* As the Second Circuit explained:

[t]he plaintiff’s legally protected interest is . . . his interest in the potential financial returns from his [work] which derive from the lay public’s approbation of his efforts. The question, therefore, is whether defendant took from plaintiff’s works so much of what is pleasing to the . . . lay . . . audience . . . that defendant wrongfully appropriated something which belongs to the plaintiff.

Arnstein v. Porter, 154 F.2d 464, 473 (2d Cir.1946).

The substantial similarity determination requires comparison not only of the two works' individual elements in isolation, but also of their "overall look and feel." *Biosson*, 273 F.3d at 272 (internal quotation marks and citation omitted).

* * *

Finally, and of particular importance to this case, "[b]ecause substantial similarity is customarily an extremely close question of fact, summary judgment has traditionally been frowned upon in copyright litigation." *A.A. Hoehling v. Universal City Studios, Inc.*, 618 F.2d 972, 977 (2d Cir.1980). . . .

In assessing whether Sturdza's claim of substantial similarity presents a genuine issue of material fact, the district court first eliminated from consideration those elements of Demetriou's 1997 design that were present in his 1993 competition submission. These include the building's overall volume, backyard garden, and atrium. *See Sturdza*, No. 98-2051, slip op. at 11 (Oct. 30, 2000) (listing elements). The district court excluded these features because Sturdza's amended complaint alleges that Demetriou copied her design after preparing his original, 1993 competition entry. Because Sturdza does not challenge this aspect of the summary judgment decision, we too will exclude these elements of Demetriou's 1997 design from our consideration.

The district court next "filter[ed] out" those elements of Sturdza's design it viewed as unprotectible ideas: "domes, wind-towers, parapets, arches, and Islamic patterns." *Id.* at 6, 12. According to the district court, Sturdza's expression of these elements, but not her use of them, is protectible. We agree with this aspect of the district court's decision. In and of themselves, domes, wind-towers, parapets, and arches represent ideas, not expression. . . . Indeed, to hold otherwise would render basic architectural elements unavailable to architects generally, thus running afoul of the very purpose of the idea/expression distinction: promoting incentives for authors to produce original work while protecting society's interest in the free flow of ideas. [Ed. note: Citation omitted.] We also agree that "Islamic" patterns are not protectible, though we would characterize them as *scènes à faire* dictated by the UAE's desire that the building "express[] the richness and variety of traditional Arab motifs." Particular shapes such as diamonds or circles that comprise a given pattern, however, do constitute ideas.

Proceeding item by item, the district court then meticulously compared how the concepts of domes, wind-towers, parapets, arches, and decorative patterns (referred to by the district court as "Islamic" patterns) are expressed in the two designs. "[A]t the level of protectable expression," the district court concluded,

"the designs are decidedly different." *Sturdza*, No. 98-2051, slip op. at 13 (Oct. 30, 2000).

Here we part company with the district court. Although we agree that Demetriou's design differs from Sturdza's, we think the district court overlooked several important respects in which Demetriou's design expresses particular architectural concepts quite similarly to Sturdza's. We also see significant similarities in the "overall look and feel" of the two designs. To help explain these two points, we attach as appendices to this opinion selected "elevations," i.e., views, of Sturdza's and Demetriou's designs. Appendices A and B show front and side elevations of Sturdza's design. Appendices C and D show front and side elevations of Demetriou's 1997 design.

We begin with the ways in which Demetriou's expression of architectural concepts mirrors Sturdza's. Consider the domes. Although we agree that Demetriou's dome differs from Sturdza's in some respects—Demetriou's is opaque and positioned toward the front of the building, while Sturdza's rises directly over the building's central section and is made of "glass[,] . . . allowing light in through the pattern," P1.'s Suppl. Answer to Def. Demetriou's Interrogs. at 4—in other respects Demetriou's dome appears quite similar. Viewed from the front, both domes appear to rise from the center and toward the front of the buildings. Both domes rise to essentially the same height, correspond in width to the buildings' midsections, and taper gently upward to a point. Although the domes have different decorative patterns, the patterns create a similar effect. Sturdza encircles her dome with three bands of pointed arches: largest at the dome's base and becoming progressively smaller toward its top. Her arches' decreasing size and pointed shape create a feeling of upward movement from the dome's base toward its top. Demetriou creates a similar effect by covering his dome with diamonds whose upper points correspond to Sturdza's pointed arches and that (like Sturdza's arches) become progressively smaller toward the top of the dome. Finally, Sturdza gives her dome a ribbed effect by raising the edges of the arches above the dome's surface; Demetriou creates a similar effect by accenting his diamonds' edges.

Like the domes, Demetriou's wind-towers differ in some respect from Sturdza's: Sturdza's are three-dimensional, emerge from the building's roof, and are decorated with diamond patterning; Demetriou's are essentially two-dimensional extensions of the building's front facade and are decorated with three vertical bands. Viewed from the front, however, the wind-towers appear quite similar in terms of size and placement. Indeed, because the wind-towers are essentially the same height and width and rise on either side of the domes, they create extremely similar building contours. Moreover, by placing diamonds atop

the three vertical bands, Demetriou creates a decorative effect similar to Sturdza's.

[Ed. note: The court then applies its analysis to the two architects' use of parapets and arches.]

The final concept—decorative patterning that covers the facades of the two buildings—is the idea Demetriou expresses most differently. As the district court pointed out, Demetriou's patterning has sixteen-sided stars on the upper levels and shapes somewhere between a circle and a diamond on the ground level; Sturdza's has diamond shapes throughout. Demetriou also uses significantly less patterning overall than Sturdza, who covers the entire facade of her building with decoration. Even with these differences, however, we see a significant similarity: like Sturdza, Demetriou covers his building's facade with a grid of diamonds that creates a diamond motif and emphasizes the facade's division into horizontal and vertical planes.

Moving on to our second basis for questioning the district court's conclusion that the designs are "decidedly different," *id.* at 13, we see no indication that, in addition to comparing the ways in which the two architects express individual concepts, the district court considered the two buildings' "overall look and feel." *Biosson*, 273 F.3d at 272. Examining the two designs ourselves, we are struck by the significant extent to which Demetriou's design resembles Sturdza's. The size, shape, and placement of Demetriou's wind-towers, parapets, and pointed domes, when viewed from the front, give his building a contour virtually identical to Sturdza's. Contributing to the similarity in overall look and feel, both buildings have a pyramid-like clustering of pointed arches around the front entrances, prominent horizontal bands and vertical

columns demarcating the windows, slightly protruding midsections, diamond grids, and similar latticework patterning inside the arches. Finally, Demetriou achieves the "Islamic" effect sought by the UAE by expressing and combining his wind-towers, arches, dome, parapet, and decorative patterning in ways quite similar to Sturdza's expression and combination of these elements.³³

To sum up, we think Demetriou's design, though different in some ways from Sturdza's (as the district court thought), is sufficiently similar with respect to both individual elements and overall look and feel for a reasonable jury to conclude that the two are substantially similar. Unless the jury "set out to detect the disparities" between the two works, it might well "be disposed to overlook them, and regard their aesthetic appeal as the same." *Biosson*, 273 F.3d at 272 (internal quotation marks and citation omitted). Because Sturdza's copyright claim presents an extremely close question, and because "summary judgment has traditionally been frowned upon in copyright litigation, *A.A. Hoehling*, 618 F.2d at 977, we will reverse the grant of summary judgment.

At the beginning of its analysis, the *Sturdza* court noted that Demetriou and the UAE did not dispute either Sturdza's ownership of a valid copyright or that Demetriou actually copied Sturdza's design. Those elements of a copyright claim can, of course, provide the defendant with significant defenses to the plaintiff's claim. For example, in *LZT/Filling Partnership, LLP v. Cody/Braun & Assocs., Inc.*,³⁴ the district court rejected the original architects' copyright claim against the successor architect on the same project. The court concluded that the similarity in the two architects' designs was explained by the owners' extensive input into both designs.

E. Advice to Design Professionals

If copyright protection is to be sought, design professionals should comply with the statutory copyright requirements. First, they should be certain they have not assigned to others their right to copyright ownership. There is still utility, as suggested in Section 16.04D, in including a contract clause giving ownership rights to the plans and specifications to the design professional.

Second, design professionals should comply with the copyright notice requirements. The word *Copyright* can be written out, or the notice can be communicated by abbreviation or symbol. The authorized abbreviation is "Copr.," and the authorized symbol is the letter "C" enclosed within a circle (©). The year of first publication

should be given, and the name of the copyright owner or an abbreviation by which the name can be recognized or generally known can be used. The notice must be affixed to the copies in such a manner and location as to give reasonable notice of the copyright claim. The Register of

³³[Ed. note: Other federal courts also state that proof of improper copying extends not only to particular details in the two designs, but also to the "overall form" or "look and feel" of the two designs. See *T-Peg, Inc. v. Vermont Timber Works, Inc.*, 459 F.3d 97 (1st Cir.2006) ("overall form" standard) and *Shine v. Childs*, 382 F.Supp.2d 602 (S.D.N.Y.2005) ("total concept and feel" standard).]

Copyrights is given authority to specify methods by which copyright notice can be given.³⁵

If the design professional wishes to take advantage of the statutory damage award and to recover attorneys' fees, she should register the copyrighted work within three months of publication. Methods are available to minimize this burden. The Copyright Office should be consulted.

SECTION 16.05 Moral Rights of Artists

The moral rights of artists were recognized by the enactment of the Visual Artist Rights Act of 1990, which was also designed to bring America into line with the Berne Convention.³⁶ Two kinds of rights are protected: the right of attribution and the right of integrity. Works protected are limited to graphic, sculptural, and photographic works.

³⁵As indicated, 17 U.S.C.A. §§ 405 and 406 provide relief if the copyright notice is omitted or erroneously made. See Section 16.03B.

³⁶17 U.S.C.A. §§ 101, 106A, 113(d). See DRATLER, *supra* note 16, at Section 6.01(6).

Although generally this topic is beyond the scope of this book, one aspect should be mentioned.

The right of integrity consists of the artist's right to prevent certain distortions, mutilations, or other modifications of her work as well as the right to prevent destruction of work of recognized stature. This protection relates only to acts that will be prejudicial to the author's honor or reputation.

The act has a number of limitations, one of which relates to visual art incorporated in buildings. If an artist has consented to the incorporation of her visual art in a building, the owner of the building can remove the art even if it cannot be removed without destroying it or otherwise violating the artist's right of integrity. Consent given after June 1, 1991, must be evidenced by a written instrument signed by the artist and the owner and must specifically give the owner the right to remove even if removal destroys the work of art.

If the incorporated art can be removed without destruction, the building owner may still avoid infringing on the artist's moral rights by notifying the artist and giving her a chance to remove the art and pay for its removal within ninety days of receiving notice. The owner who is unable

to notify the artist despite a good-faith attempt to do so can proceed to remove the incorporated visual art. The Register of Copyrights provides a method of recording names and addresses of artists and permits building owners to record their efforts to locate an artist. For the interface between statutes granting artists moral rights and modification of the design, see Section 21.04C.

SECTION 16.06 Patents: Some Observations and Comparisons

A. Scope of Coverage

A design professional who wishes to institute legal action for infringement of a patent or a copyright should retain an attorney. Although the steps for perfecting a copyright are simple, an inventor who wishes to obtain a patent must secure the services of a patent attorney. A patent attorney is needed to guide the inventor through the maze of patent law and the complexities of a patent search. As a rule, perfection of a copyright will not require the services of an attorney.

B. Patent and Copyright Compared

The subjects of patents generally are products, machines, processes, and designs.³⁷ Copyright generally protects writings.

The principal protection accorded by copyright law is the exclusive right to reproduce, prepare derivative works, or distribute the copyrighted material. Copyright law does not protect against someone who, without knowledge of the copyrighted work or access to it, creates a similar work. A patent gives the patent holder a monopoly. The patent holder can exclude anyone from the field covered by the patent even if the same invention has been developed independently and without any knowledge of the patented device.

The most important difference between patent and copyright law is the higher degree of creativity required for issuance of a patent. Copyright law requires only that the work have some originality and be the independent labor of the author. Patent law requires that the work

be original, inventive, useful, novel, and not obviously derived from the prior art in the particular field.

Protecting an invention begins with the issuance of a patent, which is supposed to presumptively establish that the patent is valid. In the bulk of patent infringement cases, the defendant attacks the validity of the patent. The defendant has a good chance of establishing that the patent is not valid.

As the United States economy has shifted over the past century from heavy manufacturing to information processing, a debate has emerged over the need to reform the Patent Act of 1952.³⁸ Critics are concerned with the ease with which patent claims may be filed in an information-based technology, in which a single “product” may include numerous patentable processes or inventions. Another criticism is that patent owners (in particular of software processes) do not use their patents to create a product, but bring an infringement action only when someone uses that process to make and market a product. In addition, statistics appear to support the view that increased infringement claims and escalating damages awards threaten to stifle industry innovation.³⁹

Patent infringement suits are lengthy, complicated, and expensive. The plaintiff can recover damages and, in some cases, a compulsory royalty for patent infringement. In some flagrant infringement cases, the plaintiff can recover treble damages and attorneys’ fees.

A patent’s duration is twenty years from the date the patent application is filed. This is substantially less than copyright protection. The limited protection accorded copyright and the monopoly protection accorded a patent are probably why the patent protection is more limited in duration.

Generally, patent protection is harder to acquire than copyright but once acquired is worth much more.

SECTION 16.07 Trade Secrets

A. Definition

The First Restatement of Torts has defined a trade secret as

any formula, pattern, device, or compilation of information which is used in one’s business, and which gives him an opportunity to obtain an advantage over competitors who

³⁷For an instructional design patent case in an architectural context, see *Blumcraft of Pittsburgh v. Citizens & Southern Nat’l Bank of South Carolina*, 407 F.2d 557 (4th Cir.1969).

³⁸35 U.S.C.A. §§ 1–376 (2000).

³⁹“Industries Brace for Tough Battle Over Patent Law,” *Wall Street Journal*, June 6, 2007, at A1.

do not know or use it. It may be a formula for a chemical compound, a process of manufacturing, treating or preserving materials, a pattern for a machine or other device. A trade secret is a process or device for continuous use in the operation of the business. Generally it relates to the production of goods, as, for example, a machine or formula for the production of an article.

* * *

The subject matter of a trade secret must be secret. Matters of public knowledge or of general knowledge in an industry cannot be appropriated by one as his secret. Matters which are completely disclosed by the goods which one markets cannot be his secret. Substantially, a trade secret is known only in the particular business in which it is used. It is not requisite that only the proprietor of the business know it. He may, without losing his protection, communicate it to employees involved in its use. He may likewise communicate it to others pledged to secrecy.

The Restatement sets forth the following factors that are considered in determining whether particular information is a trade secret:

1. the extent to which the information is known outside of the proprietor's business
2. the extent to which it is known by employees and others involved in the proprietor's business
3. the extent of measures taken by the proprietor to guard the secrecy of the information
4. the value of the information to the proprietor and her competitors
5. the amount of effort or money expended by the proprietor in developing the information
6. the ease or difficulty with which the information could be properly acquired or duplicated by others⁴⁰

B. Context of Trade Secret Litigation

Trade secret litigation can arise when an employee leaves an employer either to go into business or to work for a new, and frequently competing, employer. If the former employee has commercial or technical information, the prior employer may seek a court decree ordering the former employee not to

disclose any trade secrets "belonging" to the prior employer and a decree ordering the new employer not to use the secret information. Such a court order can be justified by a confidential relationship between the prior employer and the former employee or the breach of an employment contract between the prior employer and the former employee.

Trade secret litigation can result when the proprietor of a trade secret learns that someone to whom a trade secret has been disclosed on a basis of confidentiality intends to make or has made unauthorized use of the information. For example, the developer of a new product may give technical information relating to the product, to the contractor building the plant in which the product is to be manufactured, or to the manufacturer who is to build the machinery needed to make the product.

Similarly, a confidential disclosure of the information may be made to a manufacturer by an inventor who seeks to interest the manufacturer in a process or product developed by the inventor. The unauthorized use of such a precontract disclosure can lead to trade secret litigation.

Developers of technology sometimes try to recover research costs by licensing others to use the data. To protect the secrecy of the technology and to enable them to sell the data to others, developers usually obtain a promise from the licensee not to disclose the data to anyone else. Breach or a threatened breach of such a nondisclosure promise may cause the proprietor of the trade secret to seek a court decree forbidding any unauthorized use or disclosure.

C. Contrast to Patents: Disclosure vs. Secrecy

Patent law requires public disclosure of the process, design, or product that is the subject of a patent. In exchange for this public disclosure, the patent holder obtains a twenty-year monopoly. Trade secret protection, in contrast, requires that the data asserted to be a trade secret be kept relatively private and nonpublic.

A patent requires an invention to be original, inventive, useful, and not obvious from the prior art. The trade secret need not meet these formidable requirements. Although the courts are not unanimous on the point, it seems clear that the person who asserts ownership of a trade secret must show she has made some advance on what is generally known. If the information is generally known or generally available, the information is not a trade secret.

⁴⁰Restatement (First) of Torts § 757 comment b. The Second Restatement of Torts omitted this topic. Although less authoritative, the First Restatement still provides a useful summary.

Roughly, trade secret protection has the same relationship to patent protection that common law copyright had to statutory copyright. Both the doctrine of common law copyright and the doctrine of trade secrets are predicated on extending legal protection to creative people by giving them the right to determine when, how, and if the fruits of their intellectual labor should be made generally available. Patent and statutory copyright are predicated on disclosure. Trade secret protection is accorded by state law and suffers from the same lack of uniformity that common law copyright had. In contrast, patent law is governed by federal law, resulting in general uniformity throughout the United States.

D. Adjusting Competing Social Values

The doctrine of trade secrets, like many other legal doctrines, must consider and adjust various desirable, yet often antithetical, objectives. This can be shown by examining these objectives from the viewpoints of the various persons affected.

Those who seek trade secret protection—primarily inventors and research-oriented organizations—want to be rewarded economically for their creativity. Restricting others from using the information and technology that they have developed can make their information more valuable. Without adequate economic incentives, scientific and industrial progress is likely to be impeded. Protection of trade secrets can discourage industrial espionage and corruption.

Trade secret protection can restrain the freedom of choice and action for research employees. Creative employees can be prevented from making the best economic use of their talents. An employer's failure to consider or develop an employee's research ideas can destroy the employee's creativity. Many high-tech industries developed when creative people banded together to start new companies. Had they been tied to older, established companies unwilling to engage in experimental research, many of these industries might not have developed or might have taken considerably longer to do so.

Overzealous protection of trade secrets can hamper commercial, scientific, and industrial progress. To a great extent, such progress is made possible by free dissemination of technical and scientific information. Disseminating such information can avoid costly duplication of research efforts.

Expansive protection of trade secrets can also have an anticompetitive effect. Protection of trade secrets can give the developer a virtual monopoly that can hinder the development of competitive products and can result in higher prices to consumers.

Trade secret law has had to consider and adjust all these competing objectives—not an easy task.

E. Availability of Legal Protection

Duty Not to Disclose or Use: Confidential Relationship and Contract. The circumstances surrounding the disclosure and the nature of the information disclosed are relevant in determining whether a duty exists not to use or disclose the information. If the disclosure is accompanied by an express promise not to use or disclose, a general duty exists not to disclose. It may still be necessary to interpret the agreement to determine what cannot be disclosed, to whom disclosure is prohibited, and the duration of the restraint. Section 10.8 of AIA Document B103-2007 states that if the architect or owner receives information designated as “confidential” or “business proprietary,” the information will be kept strictly confidential. B103 is the owner/architect agreement for large or complex projects. Confidentiality is also discussed in Section 11.04B.

Suppose a licensing agreement exists by which the licensor permits the licensee to use technological data disclosed by the licensor to the licensee. Does the restraint on disclosure include information that the licensee knew before the disclosure? Does it include information developed by the licensee from the disclosed information? Does the restraint include parts of the technological data disclosed that are known at the time of disclosure or become generally known? Can disclosure be made to an affiliated or successor company? Is there a continuing obligation for either or both parties to communicate new technology? These questions should be and usually are covered in the licensing agreement. If not, courts must interpret the agreement and, if necessary, imply terms.

In some circumstances, no express provision prohibits unauthorized use or disclosure. The method by which the information is acquired often determines whether the disclosure is made in confidence and whether the person to whom it is made obligates herself not to disclose the information to others. This is similar to the process by which the law implies certain promises between contracting parties not expressed in the written contract. The communication

may be part of a contractual arrangement. For example, the possessor of the information may communicate it to a consulting engineer who has been retained to advise the possessor on the type of machinery to be used in the process. If a written contract exists, the possessor will usually require a promise by the consulting engineer not to divulge certain specified information. Even without such an express promise not to disclose, the law would probably imply such a promise, based on surrounding facts and circumstances. The same is true if the disclosure is made to the manufacturer of the machine or to a building contractor.

In some circumstances, no contractual relationship exists between the possessor of the information and the person to whom it is disclosed. For example, an inventor may disclose information to a manufacturer in order to interest the manufacturer in buying the information. It is possible for the inventor to obtain a promise from the manufacturer not to disclose the information. Even without such a promise, if it is apparent from the surrounding facts and circumstances that the disclosure is made in confidence, any disclosure of the information by the manufacturer would be a breach of confidence and remedies would be available to the inventor.

Nature of Information. Courts look at the type or nature of the information itself to help decide whether the information is a trade secret. A plaintiff who invested considerable time and money to create the information and then keep it secret from competitors is more likely to receive legal protection.

While trade secret litigation in the construction industry is rare, the recent case of *San Jose Construction, Inc. v. S.B.C.C., Inc.*,⁴¹ presented an issue unique to the industry. The plaintiff and defendant, both prime contractors, were local competitors in the business of commercial construction. Mr. Foust, a project manager for the plaintiff, left that company to work for the defendant. Foust secretly copied and took with him the bidding documents on five prospective projects on which the plaintiff was ready to begin work if awarded the contracts.

Plaintiff sued the defendant and Foust, claiming its bidding information was a trade secret. One defense raised by the defendants was that the information had already been revealed to third parties, such as the project owners and subcontractors. The court rejected that defense, stating:

We can readily infer . . . that the information contained in [plaintiff's] project binders, viewed as a whole, derived economic value from being kept secret from competitors such as [defendant]. As [plaintiff] describes it, "only [plaintiff] had the completed puzzle for each project, contained in the Project Binders. . . . No third party had it. The subcontractors each had a piece, and the owners had a piece, but no one except [plaintiff] had it all."⁴²

With regard to the effort expended by plaintiff to create the bidding documents, the court accepted plaintiff's testimony that it can take from six months to over a year to create such information, at a cost of tens of thousands of dollars.

If the person to whom the information is disclosed—whether a contractor hired to build a plant, a manufacturer hired to build a machine, or a consulting engineer hired to furnish technical services—knows that the information is not generally known in the industry, this is likely to persuade a court that a confidential relationship was created or that a nondisclosure promise should be implied.

The nature of the information will also determine the legal remedy for a breach of confidence or a breach of contract. Under U.S. law, the normal remedy for a breach of contract is a judgment for money damages. Only if that remedy is inadequate will the law specifically order that a defendant do or not do something. This is crucial in trade secret cases. Typically, if the information is truly valuable and not generally known, the most important remedy is the court decree ordering the person who has the information to not disclose it to anyone else. Violating such an order is punishable by a fine, or even imprisonment, under the contempt powers of the court. Such a decree puts the plaintiff in a good position to demand a substantial royalty or settlement price if the defendant needs to use the trade secret information.

To obtain such an extraordinary remedy, the plaintiff must show that irreparable injury would occur without such a court order and, as mentioned, that a judgment for money damages would be inadequate. In a trade secret case, the plaintiff seeks to show that irreparable economic harm would be suffered if the information claimed to be a trade secret is broadly disseminated. The plaintiff usually asserts that such broad disclosure will enable competitors to "catch up" despite the plaintiff's research expenditure to turn out a better product or develop a better process. The plaintiff will also claim that it is difficult, if not impossible, to establish

⁴¹155 Cal.App.4th 1528, 67 Cal.Rptr.3d 54 (2007).

⁴²Id., 67 Cal.Rptr.3d at 63.

the actual damages suffered by general dissemination of the secret information. A court concluding that the information is a trade secret usually gives injunctive relief.

The principal defense in trade secret cases is that the information was not secret. Often defendants point to the existing literature in a given scientific or technical area, with a view toward showing that a person diligently searching for this information could put it together and arrive at the process independently. Courts have not been particularly receptive to this defense. Usually the defendant has not gone through the literature to ferret out the secret. The information is often obtained from an employee of the trade secret possessor, paid for its disclosure by virtue of a licensing agreement, or received through a confidential, limited disclosure. On the whole, the defense has not succeeded. Part of the difficulty in arguing for this defense is that sometimes information and data are available, but not in a collected, organized, convenient, and usable form. These factors are the principal advantages of the trade secret. Sometimes the data are collected and organized in readily accessible form, but most people in the industry are unaware of this fact or unable to locate the material easily.

Employee Cases. There are special aspects to cases in which the information has been learned or developed by an employee and that employee goes into business herself, joins in a venture with others, or is hired by an existing or potential competitor of the prior employer. In addition to using the confidentiality theory, the former employer often points to an employment contract under which the employee agreed not to disclose the information after leaving the employment. Sometimes the limitation on disclosure far exceeds what is reasonable. Often the employee has little bargaining power in deciding whether to sign such an agreement. Some courts have recognized the adhesive (nonbargaining) nature of such agreements and have refused to give these agreements literal effect. However, the employer who has an agreement by the employee not to divulge information is in a better position to obtain a court decree ordering the employee not to disclose particular information.⁴³

On the one hand, in addition to recognizing the take-it-or-leave-it nature of most employment contracts, some

⁴³In *San Jose Constr., Inc. v. S.B.C.C., Inc.*, supra note 41, the court pointed to the plaintiff's use of confidentiality agreements (which Mr. Foust had signed) to show that the employer made reasonable efforts to keep its information secret.

courts feel that agreements under which employees cannot practice their trade or profession or use the information that is their principal means of advancement are unduly oppressive to employees. Such courts are not likely to sympathize with claims for trade secret protection. On the other hand, other courts manifest great concern with immorality and disloyalty on the part of employees and look on employee attempts to cash in on information of this type as morally indefensible. These courts are likely to deal harshly with employees in trade secret cases.

To sum up, a former employee will be restrained from using confidential information if that restraint is reasonable, taking into account the legitimate needs of the former employer, the former employee, and the public.

F. Scope of Remedy

A trade secret claimant can recover damages suffered, profits made by the infringer resulting from the infringement, and a court decree prohibiting her from using or divulging the information. The injunctive relief usually does not exceed the protection needed by the plaintiff. An injunction may be only for a period of time commensurate with the advantage gained through the technological information improperly acquired or used. If the defendant could have ascertained the information within a designated period, the court decree may require that she not use the information for that period of time. Unless the defendant has made the information public, the court order for non-disclosure will apply only until the information is generally known. Some courts take a more punitive attitude and order that the trade secret not be used even if it becomes generally known. Generally, the more reprehensible the conduct by the defendant, the broader the injunction.

G. Duration of Protection

The trade secret is protectible as long as it is kept relatively secret. This unlimited time protection has caused some to advocate protecting trade secrets for a limited period of time by according a patentlike monopoly to the developer of a trade secret.

Some trade secrets are patentable. Unlimited duration of protection for a trade secret can frustrate the twenty-year patent monopoly policy. To the extent that states frustrate patent law by protecting trade secrets, such trade secret protection may be unconstitutional.

H. Advice to Design Professionals

Design professionals who invent processes, designs, or products should, wherever possible, use contracts to give them protection against the possibility that people to whom they divulge the information may disclose the information to others or use it themselves.

Design professionals who occupy managerial positions in companies where trade secrets are important should use all methods possible to keep the information secret. Only those who have an absolute need to use the information should be given access to it, and these people should expressly agree in writing not to disclose the information. Management should also realize that

employee loyalty is probably the best protection against the loss of trade secrets. Reasonable treatment of employees is likely to be a better method of preserving trade secrets than litigation.

Design professionals who are technical employees and who wish to take their technological information to start their own businesses, join in a business venture, or work for a competitor of their present employers should realize that their departure under these circumstances may result in litigation, or at least the threat of litigation. Legal advice should be sought to examine the legality of any asserted restraints and to determine the scope of risk involved to the employee who chooses to leave her present employment.

Planning the Project: Compensation and Organization Variations

SECTION 17.01 Overview

A. Some Attributes of the Construction Industry

Industry characteristics are central to this chapter, so please review Chapter 8, with special attention to Sections 8.01 and 8.02.

B. Owner's Objectives

In the design phase, quality, price, and completion date are interrelated. An owner who wishes the highest quality may have to make tradeoffs among quantity, price, and completion date. If early completion is crucial, the owner may need to sacrifice price and probably quality and quantity.

After these choices have been made, the owner may have to make additional choices when it decides how to select a contractor, which contractor or contractors to select, and the type of construction contract or contracts. These choices should be made in a way that maximizes the likelihood that the owner will receive quality that complies with the contract documents and on-time completion at the lowest ultimate cost. Compromises may be needed. The contractor who will do the highest-quality work is not likely to be cheapest and quickest. The quickest contractor may not be the one who will provide the best quality. The importance the owner attaches to these objectives will affect the process the owner uses to select the contractors and how construction contracts are organized. This chapter looks at pricing and organizational variations. Chapter 18 focuses on competitive bidding.

C. Blending Business and Legal Judgments

This book examines law in the context of the construction industry. A sharp line cannot always be drawn between business and legal considerations.

Clearly, choices as to the pricing of a construction contract and how the project is to be organized must seek to achieve the owner's objectives. Choices made in these crucial matters should seek to obtain the best on-time work at the best price. To a significant degree, this will depend on each participant's knowing what it is supposed to do and being able to do so in the most efficient way. Modern methods designed to bring efficiency to what can be a chaotic process are described in Section 17.04. Although Chapter 8 describes some characteristics of the construction industry, one characteristic—operational inefficiency—is relevant to this chapter. Section 17.05 looks at internal efficiency—mainly authority and communication.

An empirical study dealt with “the pervasive and distressing inefficiency” in construction work. One writer stated that the study indicated that only 32 percent of the total time spent on a construction site involved actual work on the project.¹ He quoted the study as showing that the remainder of the work was divided in the following manner:

1. 7 percent for equipment transportation delays
2. 13 percent for traveling on the job site
3. 29 percent consumed by waiting delays

¹Foster, *Construction Management and Design-Build/Fast Track Construction: A Solution Which Uncovers a Problem for the Surety*, 46 *Law and Contemp.Probs.* 95, 116 n. 119 (1983).

4. 8 percent for late starts and early quits
5. 6 percent for receiving instructions
6. 5 percent for personnel breaks

Quoting these statistics, the writer concluded that much inefficiency is caused by the many contractual relationships and parties all working on the same structure, each “under a different management and each marching to the beat of a different drummer.”²

Choices of the type described in this chapter that deal with these matters are to a great extent best made by people who know design and construction. What role does the law play? The answer can be divided into two categories: direct and indirect legal controls.

Direct legal controls involve such matters as registration and licensing laws, legal controls dealing with how a construction contract is awarded, the standard to which a contracting party is held, and the way in which the law will treat claims by a party who has suffered losses that it seeks to transfer to someone else.

Indirect legal considerations are often as important. For example, where lines of authority are blurred and risk allocations unclear, the law will frequently be called on to pass on claims. Similarly, inefficiency and other matters that cause losses are likely to lead to claims that, although usually settled, are done so against the backdrop of what the law would provide if the dispute ended in court.

It is increasingly being recognized that one overhead cost in construction work that is incurred by all participants is the cost of making, avoiding, preparing for, and resolving claims. Choices of the type described in this chapter must be made carefully and intelligently. Failure to do so can only increase the cost of construction.

D. Public vs. Private Projects

An important criterion is the status of the owner—whether it is a private party or a public entity. A private party who wishes to build can choose any type of compensation plan it can persuade a contractor to accept. It can award a contract in any way it chooses. It can make one contract with a prime contractor or a number of separate contracts with individual contractors.

Public entities may be limited by laws and regulations in making these choices. Public entities commonly must award their construction contracts by competitive bidding

under which contractors are all given a chance to submit a bid for particular work. That design professionals for public projects do not—at least at the first round—compete on the basis of price³ causes problems when a public entity wishes to use the design–build system, as noted in Section 17.04F.

Some states and cities require separate contracts for certain types of public work. Limitations are often placed on cost contracts used in public works. A public entity may be limited in the way it resolves disputes with its contractors. Early in this century, public entities frequently took the position that they could not arbitrate disputes, as this would delegate power to private arbitrators. Increasingly, however, public entities are being required, by law or regulation, to use arbitration or some other method of resolving disputes.

People working on public contracts must first examine the applicable statutes and regulations to determine what restraints are placed on them in awarding or organizing construction contracts. This chapter largely assumes that there are no restraints and that the owner and contractor can make any type of contract they wish and the owner is not limited how it chooses to organize participants contractually and administratively.⁴

SECTION 17.02 Pricing Variations

Selecting a compensation system must take into account the responsibility for certain risks. Although many variations are possible, each major category deals with risk allocation.

A. Fixed-Price or Lump-Sum Contracts: Some Variations

In American usage, fixed-price and lump-sum contracts are used interchangeably. Under such contracts, the contractor agrees to do the work for a fixed price. Almost all performance risks—events that make performance more costly than planned—fall on the contractor. For example, when the construction industry experienced a sudden and sharp increase in the price of steel, after many years of price stability, contractors who had entered into fixed-price

²Ibid.

³See Section 11.03.

⁴For an instructional case study on planning for construction of a hospital, see Macomber, *You Can Manage Construction Risks*, Harv. Bus. Rev., March–April 1989, p. 155.

contracts were unable to pass these unanticipated costs on to the owner.⁵

Only if the contract itself provides a mechanism for increasing the contract price can the contractor receive more than the contract price. Although not common in ordinary American contracts (English and international contracts often use fluctuations clauses), some contracts have price escalation clauses under which the contract price is adjusted upward (and sometimes downward), depending on market or actual costs of labor, equipment, or materials. Such a provision protects the contractor from the risks of any unusual costs that play a major part in its performance. The provision usually requires the contractor to use its best efforts to obtain the best prices.

Many construction contracts contain changed-conditions clauses that allow a price increase if conditions under the ground or in existing structures are discovered that are substantially different from those anticipated by the parties.

Sophisticated procurement systems sometimes provide variant fixed-price formulas even in fixed-price contracts. For example, one is the federal fixed-price incentive firm (or FPIF) contract used in negotiated contracts. Before contract finalization, owner and contractor negotiate the following items:

1. target cost estimate—against which to measure final costs
2. target profit—a reasonable profit for the work at target cost
3. ceiling price—the total dollar amount for which the owner will be liable
4. sharing formula—the arrangement for establishing final profit and price

After the work is completed, the contractor and the owner negotiate the final costs of the contract, sharing the overruns or underruns according to the agreed formula.

This form of contract has the advantage of establishing a price ceiling similar to the guaranteed cost to the owner under the fixed-price contract. By penalizing the contractor for cost overruns above the target estimate (which is always something less than the price ceiling) and by

rewarding it for cost savings, this type of contract provides financial motivation to the contractor to perform at the most economical cost.

A contract of this type is appropriate where the owner's plans are not sufficiently detailed to allow fixed-price bidding without excessive provision for contingencies yet are sufficiently advanced that a reasonably accurate target estimate can be made. Such a contract can also, if desired, include monetary incentive provisions to the contractor for early completion.

A fixed-price contract has the obvious advantage of letting the owner and those providing funds for the project know in advance what the project will cost. It works best when clear and complete plans and specifications are drawn. Incomplete contract documents are likely to cause interpretation questions that can lead to cost increases that under a "cost plus overhead and profit changes" clause can convert what appears to be a fixed-price contract into a cost contract. The fixed-price contract is used most efficiently when a reasonable number of experienced contractors are willing to bid for the work. This is less likely where the design is experimental or where work is abundant.

Another advantage to the fixed-price contract is that the owner need not be particularly concerned with the contractor's recordkeeping. If changed work or extra work is priced on a cost basis, there may have to be some inquiry into the contractor's cost. On the whole, the fixed-price contract avoids excessive owner concern with the contractor's cost records. Conversely, such a contract is attractive to the contractor, which need not expose its cost records, something that occurs in a cost contract, as noted in the next subsection.

The fixed-price contract has come under severe attack for its inherent adversarial nature. A contractor that reduces costs increases profits. As long as the cost is not reduced at the expense of the owner's right to receive performance specified in the construction contract, the owner cannot object.

In construction, however, the performance required and whether such performance has been rendered are often difficult to establish. In this gray area of compliance, the interests of owner and contractor can clash. Unless the contractor seeks a reputation for quality work or values goodwill, it is likely to perform no more than the contract demands. This has led to some of the variations described in Section 17.04, particularly the cost contract with a guaranteed maximum price (GMP), sometimes called a guaranteed maximum cost (GMC).

⁵See *Holder Constr. Group v. Georgia Tech Facilities, Inc.*, 282 Ga.App. 796, 640 S.E.2d 296 (2006), reconsideration denied, Dec. 8, 2006 (*force majeure* clause inapplicable); *Spindler Constr. Corp.*, ASBCA No. 55007, 06-2 BCA ¶33,376 (subcontract not commercially impracticable to perform); Guidry, *The Steel Price Explosion: What Is an Owner or a Contractor to Do?* 24 Constr. Lawyer, No. 5, Summer 2004, p. 5.

Another disadvantage to the fixed-price contract is that the risk of almost all performance cost increases falls on the contractor. A prudent contractor will price these risks and include them in its bid. However, in a highly competitive industry the prudent contractor may not receive the award because others may be more willing to gamble with a low price and either hope that problems will not develop or recoup any losses by asserting claims for extras and delays. Even if a prudent contractor does take these risks into account and does receive the award, if the risks do not materialize the owner may be paying more than if the risk had been taken out of the contractor's bid.

B. Cost Contracts

When prospective contractors cannot be relatively certain of what they will be expected to perform, or where they are uncertain as to the techniques needed to accomplish contractual requirements, they are likely to prefer to contract on a cost basis. For either reason, projects that involve experimental design, new materials, work at an unusual site, or in which the design has not been thoroughly worked out, are likely to be made on a cost basis.⁶

Usually a cost contract allows the contractor to be paid costs plus an additional amount for overhead and profit. This arrangement should be distinguished from what is sometimes called a "time and materials" contract, which at least in one case was held to preclude recovery by the contractor of overhead on direct labor costs.⁷

The cost contract has two principal disadvantages. First, at the time it engages the contractor the owner does not know what the work will cost. Second, as a general rule a cost contract does not give enough incentive for the contractor to reduce costs.⁸ These factors have led, in

both public and private contracting systems, to variants on a pure cost contract.

Cost contracts often contain provisions that require the contractor to use its best efforts to perform the work at the lowest reasonable cost. Provisions are often included requiring the contractor who has reason to believe that the cost will overrun any projected costs to notify the owner or its representative and give a revised estimate of the total cost. Sometimes these provisions state that failure to give notice of prospective cost overruns will bar recovery of any amounts higher than any cost estimates given.

Another method of keeping costs down is to include provisions in the contract stating that a fiduciary relationship has been created between owner and contractor that requires that each use its best efforts to accomplish the objectives of the other and to disclose any relevant information to the other.

AIA Document A102-2007 (formerly A111-1997) is intended for a transaction where compensation is to be cost plus a fixed fee with a Guaranteed Maximum Price (GMP). Since the cost is, to a large degree, within the control of the contractor, the AIA sought to create a fiduciary relationship between the owner and the contractor; the contractor obligating itself to protect the owner's interest. Article 3 states in part that "the Contractor accepts the relationship of trust and confidence" and will seek to do the work "in an expeditious and economical manner consistent with the interests of the Owner."⁹

Yet this attempt by the AIA in A111 (now A102) to create a fiduciary obligation was not successful in *Eastover Ridge, LLC v. Metric Constructors, Inc.*¹⁰ While the case did not deal with cost control, the usual issue in cost-type contracts, its analysis shows that the fiduciary concept can become blurred when the owner uses an independent architect.

The owner sought recovery against the contractor under the North Carolina Unfair and Deceptive Trade

⁶See Rosenfeld & Geltner, *Cost-Plus and Incentive Contracting: Some False Benefits and Inherent Drawbacks*, 9 Constr. Mgmt. & Econ. 481 (1991) (argues that at a macro level, widespread use of cost-plus contracts on the average and over time contributes to adverse selection, blunts incentives for production efficiency, leads to higher costs and prices in the industry, and helps mediocre contractors win jobs against efficient ones).

⁷*Colvin v. United States*, 549 F.2d 1338 (9th Cir.1977).

⁸In *Smith v. Preston Gates Ellis, LLP*, 135 Wash.App. 859, 147 P.3d 600 (2006), review denied, 161 Wash.2d 1011, 166 P.3d 1217 (2007), an owner who entered into a cost plus contract to build his dream home had such disastrous results that he (unsuccessfully) sued his lawyer for malpractice for allowing him to enter into the contract.

⁹In 2007, the AIA also published A103, a cost plus fixed fee without a GMP (formerly A114-2001). The language in A103 Article 3 is identical to that in A102 Article 3.

¹⁰139 N.C.App. 360, 533 S.E.2d 827, review denied, 353 N.C. 262, 546 S.E.2d 93 (2000). But see *Jones v. J.H. Hiser Constr. Co., Inc.*, 60 Md.App. 671, 484 A.2d 302 (1984), cert. denied, 303 Md. 114, 492 A.2d 616 (1985) (contractor in cost contract promises to inform owner of prospective overruns). See also Holloway, *Pitfalls in Cost-plus Contracts*, ABA Forum on the Construction Industry Newsletter, March 2003.

Practices Act. That statute allows treble damages. To use the statute as the basis for recovery, the owner must show constructive fraud based on trust and confidence, the usual standards in a fiduciary relationship. Constructive fraud, unlike actual fraud, does not require specific fraudulent representations. It only requires a transaction where the contractor took advantage of its position of trust in a confidential relationship.

The parties used A111 with the trust and confidence language noted previously. An employee of the contractor testified that it would look after the owner's interest.

Despite this, the court refused to find a relationship of trust and confidence. It pointed to the fact that Article 3.1 (now A102-2007, Article 3) was never discussed. More important, it directed attention to the parties having used A201: the AIA General Conditions that is to be used with A111. A201, as shown in Section 12.08, gives the architect administrative powers and responsibilities during construction that in part are to protect the owner. The architect's close involvement, according to the court, meant that the contractor did not owe the owner the obligation of trust and confidence. Therefore, there was no constructive fraud and no violation of the Deceptive Trade Practices Act.

To be sure, the breach of a cost-type contract should not automatically constitute a violation of the Trade Practices Act with its treble damages provision. Yet the AIA sought to create a fiduciary relationship in a cost-type contract mainly as a cost-control device. Its use of A201 as the general conditions with its architect involvement did not change the clear language of A111, Article 3.1.

The role of the architect as described in A201 should not eliminate the trust and confidence spelled out in A102-2007, Article 3. Were this a case involving an abuse of the contractor's power to determine costs, it is likely the court would have concluded that there has been an abuse of the relationship of trust and confidence created by A102.

Even without specific provisions designed to protect the owner from excessive costs, the design professional and the contractor should keep the owner informed of costs based either on the covenant of good faith and fair dealing noted in Section 19.02D, or on an obligation inherent in the fiduciary relationship created by such a contract.¹¹

¹¹*Williams Eng'g, Inc. v. Goodyear, Inc.*, 496 So.2d 1012 (La.1986) (engineer responsible for cost overrun because he did not update estimates, did not advise of other types of contracts, and did not hire a cost estimator).

One type of cost contract gives the contractor cost plus a percentage of cost for overhead and profit. Obviously, such a contract not only creates little incentive to cut costs but also grants a reward for increasing costs. For this reason, it is not used in federal procurement. However, sometimes it is used to price changed work in private contracts. It provides a readily accepted guideline for determining the percentage in contrast to the less readily definable negotiated fixed fee—its alternative for compensating overhead and profit. With a contractor of the highest integrity, this type of cost contract is useful.

Another type is the "cost plus a fixed fee" contract. The parties agree that the contractor will be reimbursed for allowable costs and paid a fee that is fixed at the time the contract is made. The fee is normally not affected when actual cost exceeds or is less than the estimated cost. However, if the scope of the work is substantially changed, sometimes the fee is renegotiated. Because the contractor's fee is not affected by cost savings, the contractor has no compensation incentive to reduce costs. For this reason, in federal procurement this type of contract has largely been superseded by cost contracts that create incentives to reduce costs.

An incentive contract took a disastrous twist for the contractor in *Koppers Co. v. Inland Steel Co.*¹² The contractor agreed to design, procure materials for, and construct an industrial plant for the owner. At the time of the award, the contractor estimated that the project would cost \$267 million. Because of the likely number and scope of changes, a fixed price was not feasible. As a result, the contract contained targeted costs and an adjustment provision for agreed changes. The contract also provided a bonus under which the contractor would receive 50 percent of any cost underrun up to \$6.3 million. In the event of an overrun, however, the contractor would refund up to \$4.8 million.

The project cost nearly \$444 million. The owner brought suit, charging that the contractor should be liable for much of the excess cost. Although there had been numerous design changes, the owner alleged that the actual cost far exceeded what should have resulted from these changes, because the contractor failed to use reasonable care in design and construction.

The contractor contended that the incentive bonus/penalty provision was the owner's sole remedy for cost overruns, regardless of why or how they occurred. The issue was

¹²498 N.E.2d 1247 (Ind.App.1986), transfer denied Nov. 25, 1987.

whether a distinction should be drawn between increased costs attributable to errors and omissions by the contractor and those that occurred for other reasons. The court held that only clear language can deprive the contracting party of normal rights accorded by law. The incentive bonus/penalty provision was not intended, according to the court, to supplant the owner's remedies for any failure by the contractor to use due diligence in performance. As a result, the owner was awarded some \$64 million in damages from the contractor.

Another method of providing cost reduction incentives is value engineering, discussed in the next subsection.

These methods of seeking to keep costs down, although sometimes successful, still do not accomplish the objective of letting the owner or anyone supplying funds for the project know that the costs will not exceed the particular designated amount. To deal with this problem, owners sometimes insist that the contractor give a guaranteed maximum price (GMP) or that an "upset" price be included in the contract. These techniques are designed to give some assurance that the project will not cost more than a designated amount. These should be differentiated from any cost estimates given by the contractor, although there is always a risk that any cost figures discussed will end up being a GMP.

Construction managers are frequently asked to give a GMP if they engage the specialty trade contractors or perform some of the work with their own forces. For that reason, discussion of a GMP is postponed until Section 17.04D. However, a GMP may not be worth much if the design is quite incomplete at the time the GMP is given. If costs exceed the GMP, the contractor is likely to claim that the scope of the work has so changed that the GMP no longer applies.¹³

The owner has additional administrative costs in a cost contract. Usually the design professional will seek a higher fee than for a fixed-price contract because many more changes are made in a cost contract as the work progresses. The design professional may have additional responsibilities for checking on the amount of costs incurred by the contractor and for ensuring that the costs claimed actually went into the project and were required under the contract. Determining costs involves not only the often exasperating problems of cost accounting but also the creation

of record management and management techniques for determining just what costs have been incurred.

Innumerable variations of allowable costs exist. Usually no question arises on certain items, such as material, labor, rental of equipment, transportation, and items of the contractor's overhead directly related to the project. However, sometimes disputes arise over such matters as whether the cost of visits to the project by the contractor's administrative officials, the cost of supervisory personnel employed by the contractor, and the preparatory expenses or delay claims by subcontractors, are allowable costs.

The drafter must try to anticipate all types of costs that can relate directly or indirectly to the project. A determination should be made as to which will be allowable costs for the purposes of the contract. Some troublesome areas can be highlighted by comparing Articles 7 and 8 of AIA Document A102, which deal with cost-plus arrangements. Article 7 lists reimbursable costs, and Article 8 specifies certain costs that are not to be reimbursed. EJCDC C-525, an agreement form for a cost-type contract, also illustrates cost issues. The years of experience of federal procurement have generated complicated allowable cost rules, yet problems still arise in this troublesome area.

C. Value Engineering

Owners are always seeking methods of reducing costs in both fixed-price and cost contracts. Value engineering, a method developed by the federal procurement system, attempts to provide an incentive to the contractor to analyze each contract item or task to ensure that its essential function is provided at the lowest overall lifetime cost. The federal method states that an owner who accepts a value engineering change proposal initiated and developed by the contractor grants the contractor a share in any decrease in the cost of performing the contract and in any reduced costs of ownership.¹⁴

Although it is difficult to quarrel with the concept and objectives of value engineering, the actual operation of the system has generated a significant amount of litigation. Two federal procurement cases are instructive. The first, *John J. Kirlin, Inc. v. United States*,¹⁵ involved a contract for renovating the Pentagon's heating, ventilating, and air-conditioning system. The contractor was required,

¹³C. *Norman Peterson Co. v. Container Corp. of America*, 172 Cal. App.3d 628, 218 Cal.Rptr. 592 (1985).

¹⁴48 CFR § 52.248-1 (2007)

¹⁵827 F.2d 1538 (Fed.Cir.1987).

among other things, to replace certain minimum dampers but was not required to replace the “maximum” outside air dampers.

One month after the contract had been awarded, the contractor submitted a proposal suggesting that the maximum outside air dampers be replaced. The contractor asserted this would reduce the government’s annual energy costs by \$1.6 million. This proposal was rejected, the contracting officer believing that the estimate of energy savings was not valid.

Nevertheless, about three months after completion of the contract, the agency awarded another contract to a different contractor under which the maximum outside dampers were to be replaced. The original contractor then asserted it was entitled to share in the energy and maintenance cost savings the agency would realize. The U.S. Claims Court denied recovery, concluding that the value engineering proposal must be for the purpose of changing any requirement of the contract and does not deal with work beyond the scope of the contract that could not be accomplished by change order. Because the contractor could not be ordered to perform such a drastic change, the court rejected the claim.

The U.S. Circuit Court of Appeals agreed that value engineering does not cover cardinal changes, ones beyond the scope of the project. Yet it did not find necessary to determine whether this would have been a cardinal change. It concluded that the original contractor’s claim required that its proposal be accepted. The court rejected the contractor’s contention that the proposal had been constructively accepted when the government agency decided to do the work as the original contractor had suggested after the original contract had been completed. The original contractor had no right to savings based on a subsequent contract to which this contractor was not a party. The court would not follow a decision by the Armed Services Board of Contract Appeals (ASBCA), which had granted recovery on the theory of an implied contract, in effect a conclusion that denying the claim would create unjust enrichment.¹⁶

The second case, *ICSD Corp. v. United States*,¹⁷ involved a contract to supply night vision field sights. The value engineering clause provided that the contractor would receive 50 percent of the government “contract”

savings, that is, those realized on future purchases of essentially the same item as that to be acquired under the contract. The contractor would receive only 20 percent of the savings, however, for cost reductions considered “collateral,” that is, reductions of operation costs and government-furnished property costs. Under ICSD’s contract for night vision gunsights, batteries, although a major component of the sights, were not to be manufactured or delivered to the army.

ICSD submitted a value engineering change proposal (VECP) to substitute alkaline batteries for the mercury batteries specified. The contracting officer determined that the savings were over \$1 million per year and awarded ICSD a share of the savings. However, the contracting officer concluded that these savings were collateral to the contract and that the amount owed ICSD was 20 percent, not the 50 percent it had sought. Also, the contracting officer made no award for savings based on the increased safety of alkaline batteries, reduced disposal costs, reduced logistics costs, and the elimination of the need for a cold-weather adapter.

While ICSD’s proposal was under consideration, another government contractor submitted a similar VECP. The government evaluated both proposals and decided that ICSD’s was superior in three areas, while the other contractor’s was superior in one. This led the contracting officer to split the savings share award, giving 75 percent to ICSD and 25 percent to the other contractor.

The court held that to be considered contract savings, there must be a reduction in the cost of the item or essentially the same item as that to be acquired under the contract. But because batteries were not acquired under the ICSD contract, the proper award was 20 percent of the government’s savings. As to the other collateral savings not recognized by the government, the court found that the savings were not measurable, documentable, or ascertainable and that ICSD’s estimates were neither reasonable nor credible. Finally, the court held that splitting savings awards between contractors is permissible.

The court rejected the argument that granting only 20 percent thwarts the policy of the incentive clause, noting that although the 50 percent award would provide greater incentives, less incentive to make proposals is needed where the reduced cost does not relate to items furnished under the contract.

In 1990, the Federal Acquisition Regulations (FAR), which regulate federal procurement, adopted value

¹⁶*Alan Scott Indus.*, ASBCA No. 24729, 82-1 BCA ¶15,494.

¹⁷934 F.2d 313 (Fed.Cir.1991).

engineering principles and procedures for architect/engineer contracts. When authorized by the contracting officer, such studies will be made after completion of 35 percent of the design stage or such other stages as the contracting officer determines. However, unlike value engineering for contractors, the government and the contractor do not share savings of costs. Instead, the design professional provides a fee breakdown schedule for the services relating to value engineering activities, and when approved, these services are compensated.¹⁸

D. Unit Pricing

One risk of a fixed-price contract relates to the number of work units to be performed. This risk can be removed by unit pricing. The contractor is paid a designated amount for each work unit performed.

A number of factors must be taken into account in planning unit pricing. First, the unit should be clearly described. The cost of a unit should be capable of accurate estimation. Best unit pricing involves repetitive work in which the contractor has achieved skill in cost predicting. Second, it must be clearly specified whether the unit prices include preparatory work such as cost of mobilizing and demobilizing apparatus needed to perform the particular work unit.

Third, it is important to decide whether the invitation to bidders will include an “upset” or maximum price or whether the invitation will include a minimum price. The reason for an upset price is obvious. However, the reason for a minimum price involves understanding the use of an unbalanced bid. Under such a bid, the contractor does not actually base its unit bid price on its prediction of the cost to be incurred for performing work on that unit. Commonly the contractor bids high for unit work that will be performed early, and low for later work. In a competitive bid evaluation, such a contractor suffers no disadvantage by this distortion. The award is based on the total unit prices multiplied by the total estimated quantities. As a result, such a bidder takes no apparent risk when it unbalances the bid.

The reasons for an unbalanced bid, sometimes called “pennying,” were revealed in a New Jersey decision,

Boenning v. Brick Township Municipal Utilities Authority.¹⁹ The case involved a bidding invitation that set minimum unit prices for certain portions of work connected with installing a municipal sewer system. The issue was whether the municipality could set minimum unit prices.

The court first distinguished *fixed* from *discretionary* items. It described a fixed unit as one that can be measured with certainty by reference to the plans and specifications, such as sewer pipe whose size and length are shown on the plans. (This type forms the basis of what the English call “measured contracts,” with the price based on so many board feet of lumber, doors, windows, etc.)

Discretionary items (an unfortunate term)²⁰ are a type of work whose quantities cannot be accurately measured or ascertained in advance of the work itself being performed. The contract before the court involved two discretionary items: underground and restoration work. The underground work required laying sewer pipes in trenches ranging from 6 to 20 feet in depth. Although test borings had been taken before design, the soil conditions that would be encountered could not be determined with certainty. Some soil conditions would require specified material or a concrete cradle to support the pipe. Timber or steel shoring left in place might be needed to shore up the trench. Similarly, it could not be determined in advance how much restoration work, such as asphalt paving or landscaping, would be required after the sewers had been installed.

In what the court called “discretionary work,” engineers for the awarding authority usually estimate units that will be required based on the borings, their knowledge of local conditions, and their experience. (The problem of mistaken estimates is taken up later in this subsection.) An unbalanced bid—or what the court referred to as *penny bidding*—can encourage the contractor who has pennied certain discretionary items to challenge an engineer’s orders because the contractor may not want to incur the expenses of doing work for which it made a nominal bid. This can increase the number of disputes and interfere with timely completion of the project. Yet according to the court, it had become common

¹⁹150 N.J.Super. 32, 374 A.2d 1214 (App.Div.), cert. denied, 75 N.J. 537, 384 A.2d 516 (1977).

²⁰Most disputes involve excavation. The units are not, as a rule, discretionary or fixed. The issues usually are overruns or underruns (discussed later in this subsection).

¹⁸48 CFR § 52.248-2 (2007).

practice in New Jersey bidding for utility work to penny units of discretionary work.

The court then dealt with how a pennying contractor can compete with one who does not penny units. The former may simply gamble that such work will not be needed or may believe that the engineer has overestimated the need for such items. Such a contractor will gain a competitive advantage by pennying and can afford to increase its bid on items that are certain, which can give it a windfall.

Another, more unsavory, reason for pennying may be the prospect of collusion between the contractor and the engineer, the latter finding the pennying units low and the excessively priced units high. Even without a specific “deal,” the contractor may believe that the prospective gains might make it worthwhile to attempt to influence or even bribe the engineer.

The contractor may submit an unbalanced bid to obtain progress payments more quickly, called “front-end loading.” This can mean a greater chance of late-finishing subcontractors and suppliers not being paid.

The court noted that the minimum prices were fixed below the estimated cost so that a contractor cannot reap a windfall if there is an overrun on any high-priced item. Establishing a minimum at a figure less than the likely cost will encourage competition among bidders. The minimum ensures that a contractor who has bid that price will be paid at least a part of its cost and can minimize gambling by contractors and potentially unnecessary disputes. It can also inhibit front-end loading by using the unbalanced bid.

The court rejected an argument that if the contractors gamble and lose, their sureties will complete the job and the local authority will receive a cheaper price. The court held that the local authority could use the minimum bid for units inasmuch as it could, if it chose, reserve the right to reject unbalanced bids.²¹

As to the effect of an unbalanced bid on pricing deleted work, the New Jersey Supreme Court refused to penalize a contractor who had submitted an unbalanced bid in an attempt to incorporate a last-minute subcontract offer into its overall bid proposal. Finding none of the evils associated with the unbalanced bid present in this case,

the court refused to allow the government to rely upon the bid values to calculate a work deletion. Instead, the contractor was entitled to an equitable adjustment, that is, the Department of Transportation must preserve the contractor’s profit margin while making the deletion.²²

The second legal issue, and perhaps one that arises most frequently, relates to inaccurate estimates of units to be performed. These usually involve excavation cases in which the actual units substantially overrun or underrun the estimates. Pricing the unit work usually assumes that there will not be a substantial deviation from the estimates. If the actual units substantially underrun, the cost cannot be spread over the number of units planned and will cost more per unit than the contractor expected. If the unit is overrun, the contractor may be expected to perform more unit work in the same period of time, another factor that can increase planned costs.

Often contracts specifically grant price changes if costs overrun or underrun more than a designated amount. For example, the federal procurement system grants an equitable adjustment if costs overrun or underrun more than 15 percent above or below the estimated quantity.²³

AIA Document A201-2007 deals with this problem in a more limited way. Section 7.3.4 (formerly Paragraph 4.3.9) grants an equitable adjustment to either party if the quantities “are materially changed in a proposed Change Order or Constructive Change Directive” and applying the unit prices will cause “substantial inequity.” This does not grant an automatic adjustment for overruns or underruns.

Many contracts provide equitable adjustments if the subsurface conditions actually encountered vary from the conditions stated to exist or usually encountered (see Section 25.06).

Some of the more difficult cases have involved claims where the owner simply gives an estimate that turns out to be inaccurate (most commonly grossly inaccurate) without any showing of negligence chargeable to the owner or any contractual adjustment method.

As a rule, the mere existence of a variation does not entitle the contractor to additional compensation or a change in the unit price. Such a result would be based on the contractor’s having assumed the risk or, occasionally,

²¹See also *Department of Labor and Industries v. Boston Water and Sewer Comm’n*, 18 Mass.App.Ct. 621, 469 N.E.2d 64 (1984) (agency could not refuse a bid that had pennied some items, especially where bid was not unbalanced, front-end loaded, or otherwise inflated).

²²*M. J. Paquet, Inc. v. New Jersey Dep’t of Transp.*, 171 N.J. 378, 794 A.2d 141 (2002).

²³48 CFR § 52.211-18 (2007).

on an express provision in the contract stating that estimates cannot be relied on. For example, in *Costanza Construction Corp. v. City of Rochester*,²⁴ the drawings showed 20 cubic yards of rock, and the specifications estimated 100 cubic yards. The actual amount of rock to be removed was 600 cubic yards. The contractor claimed it bid below cost because it expected to encounter only a small amount of rock. It tried to avoid the unit price by claiming that the actual amount of rock found constituted a cardinal change that altered the essence of the contract. However, it was not granted relief, because the contract included the city's disclaimer of responsibility as to the accuracy of the estimate and required the contractor to make its own inspection. The court brushed off a claim that there was no time for an independent inspection and that the cost would have been excessive.

The dissent stated that normal variations in quantities can be dealt with by a unit price. Here, however, the difference was so great (the contract price was \$936,000, the actual cost for excavation was alleged to be \$800,000, and the contractor's estimate was \$2,500) that the estimates became meaningless. Applying the unit price, the dissent argued, could economically ruin a good-faith bidder through no fault of its own.

Reasonable reliance on the estimate, however, may justify reforming the contract to grant a price readjustment. For example, in *Peter Kiewit Sons' Co. v. United States*,²⁵ the contractor estimated its unit prices for three types of work of varying difficulty but then learned that the specifications required it to submit a combined unit price bid. It computed and submitted a unit price bid by averaging the three types of excavation and based its bid on the units estimated by the government.

When the work was in progress, the government ordered a reduction in one excavation type—a change that, because of the averaging used, the contractor claimed would increase the composite unit cost of the work. The claim was denied, on the contention that the estimates did not bind the government and could not be relied on, pointing to language to that effect in the specifications.

²⁴147 A.D.2d 929, 537 N.Y.S.2d 394, appeal dismissed, 74 N.Y.2d 714, 541 N.E.2d 429, 543 N.Y.S.2d 400 (1989).

²⁵109 Ct.Cl. 517, 74 F.Supp. 165 (1947). See also *Timber Investors, Inc. v. United States*, 218 Ct.Cl. 408, 587 F.2d 472 (1978) (dictum: reformation allowed if estimated quantities “grossly and unreasonably inaccurate” and reliance reasonable, such as inability to verify).

One basis for the contractor's claim was that each party had made a mutual mistake of fact as to the quantity of work required. The Court of Claims upheld the claim, stating that the contract was intended not to be speculative but to be capable of proper computation and conservative bid. The composite bid being required meant that a great variation in the actual quantities performed either could be ruinous to the contractor or could cause the government to pay far more than the work was worth. The court concluded that the government did not intend to contract on such an irrational basis. If the parties each believe the estimates to be accurate, a mutual mistake to that effect would be a basis for reforming the contract.

As to language stating that estimates are not guaranteed, the court first pointed to language granting an equitable adjustment in the event of changed conditions, noting that such a provision conflicted with the one stating that estimates are not guaranteed. Perhaps more important, the court stated that the disclaimer did not mean “that all considerations of equity and justice are to be disregarded, and that a contract to do a useful job for the Government is to be turned into a gambling transaction.”²⁶

In addition, this case demonstrates the not uncommon conflict between clauses that grant relief under certain circumstances and clauses that seek to place on the contractor risks closely related to those circumstances (explored in greater detail in Section 25.04). The case also reflects a recognition of the contractual doctrine of mutual mistake sometimes applied in extreme cases despite language that appears to place the risk of unexpected quantities on the contractor.

*Davidson & Jones, Inc. v. North Carolina Department of Administration*²⁷ employed the mutual mistake doctrine in a case involving a claim for delay damages. The contract stated that the unit price for rock excavation would apply to “all rock removed above or below these quantities.” The contractor was required to include 800 cubic yards of rock excavation in its basic bid. However, early in the excavation it became clear this estimate was grossly inaccurate. The contractor actually excavated 3,714 cubic yards. It was also delayed six months while doing this excavation. It did not seek an adjustment in its unit price but sought delay damages.

²⁶74 F.Supp. at 168. For a similar result based on misrepresentation that induced a particular composite bid, see *Acchione & Canuso, Inc. v. Pennsylvania Dept. of Transp.*, 501 Pa. 337, 461 A.2d 765 (1983).

²⁷315 N.C. 144, 337 S.E.2d 463 (1985).

The court rejected the owner's argument that the contractor assumed the risk of delay and stated,

The trial court found that the plaintiff had inspected the site as required in the bidding documents and had seen nothing to indicate the presence of such an excess. The court further found that it was neither customary nor reasonable for a contractor to order his own subsurface investigation. Contractors customarily relied on the State's figures; plaintiff here had actually relied on them. Some variation was to be expected. Based on the evidence presented at the trial, the trial court found that ten to fifteen percent was a reasonable variation. The court's findings of fact were based on competent evidence and may not be disturbed on appeal.²⁸

E. Cash Allowance

Sometimes after the prime contract has been awarded the owner wants to select certain items. For example, it may wish the right to select particular hardware or fixtures after a contractor is selected. A cash allowance can be specified to cover the cost of the items selected. If the cost of the items ultimately selected varies from the cash allowance, an appropriate adjustment in the contract sum is made.

Disputes sometimes arise relating to what is encompassed within the allowance. The contract should specify whether the cash allowance encompasses only the net cost of the materials and equipment delivered and unloaded at the site, including taxes, or whether it also includes handling costs on the site, labor, installation costs, overhead and profits, and other expenses. Commonly, the allowance includes only the cost of the items selected.²⁹

F. Contingencies

Contingencies are often included in contracts to deal with uncertainties. For example, in a bid contract the contractor might be told to include in its bid a specific sum to cover the cost of contingencies (defined as items necessary or desired to complete the project in accordance with the owner's wishes). These contingencies might be items related to latent conditions discovered after work begins, items omitted from the documents, or items the owner feels are necessary for a complete project. Under a contingency clause, if the contractor runs into no unexpected problems

and completes the job in accordance with the plans and specifications, it receives the contract price but not the contingency amount. If it encounters unexpected expenses or conditions, the contingency amount is expected to be spent on them.

As shall be seen in Section 17.04D, contingencies (as discussed in Section 17.02F) are often included in cost contracts with a guaranteed maximum price (GMP).

SECTION 17.03 Traditional Organization: Owner's Perspective

This chapter looks at compensation and organizational aspects of the construction process mainly from the owner's perspective. It is generally assumed that contractors who engage in the process are individual legal entities, usually corporations. However, some projects may be beyond the capacity of an individual contractor, who may seek to associate with other contractors in a joint venture. This organizational method—roughly, a partnership for one project—was discussed in Section 3.07.

A. Traditional System Reviewed

The traditional system separates design and construction, the former usually performed by an independent design professional and the latter by a contractor or contractors. The sequencing used in this system is creation of the design followed by contract award and execution. Two processes are available to the owner when choosing a contractor. Under design-bid-build (DBB), the owner provides the design to several contractors and they competitively bid to perform the work. The owner usually hires the contractor who offers to do the job at the lowest price. (Competitive bidding is discussed in detail in Chapter 18.) If the owner wants a particular contractor to perform the work, the owner will use the design-award-build (DAB) approach and give the design to a contractor it has already chosen.

The contractor to whom the contract is awarded is usually referred to as the *prime* or *general contractor*. It will perform some of the work with its forces but is likely to use specialized trades to perform other portions of the work. The prime contractor is both a manager of those whom it engages to perform work and a producer in the sense that it is likely to perform much or some of the work

²⁸337 S.E.2d at 468.

²⁹AIA Doc. A201-2007, § 3.8.2.1 (less applicable trade discounts).

with its own forces. The traditional system used in the United States usually gives certain site responsibilities to the design professional who has created the design (discussed in detail in Section 12.08B).

The principal advantages of this system are as follows:

1. The owner can select from a wide range of design professionals.
2. For inexperienced owners, an independent professional monitoring the work with the owner's interest in mind can protect the owner's contractual rights.
3. Not awarding the contract until the design is complete should enable the contractor to bid more accurately, making a fixed-price contract less likely to be adjusted upward except for design changes.
4. Subcontracting should produce highly skilled workers with its specialization of labor and should create a more competitive market because it takes less capital to enter.

B. Weaknesses

The modern variations to the traditional system described in Section 17.04 developed because, despite its strengths, the traditional system developed weaknesses. It is important to see these weaknesses as a backdrop to Section 17.04.

Separating design and construction deprives the owner of contractor skill during the design process, such as sensitivity to the labor and material markets, knowledge of construction techniques, and their advantages, disadvantages, and costs. A contractor would also have the ability to evaluate the coherence and completeness of the design and, most important, the likely costs of any design proposed.

Sequencing the work in the traditional system not only precludes work from being performed while the design is being worked out but also deprives the contractor of the opportunity of making forward purchases in a favorable market. Although the leisurely pace that often accompanies the traditional construction process at its best can produce high-quality work, it is almost inevitable that such a process will take more time than a process that allows construction to begin while the design is still being completed.

The frequent use of subcontractors selected and managed by the prime contractor causes difficult problems. Subcontractors complain that their profit margins are unjustifiably squeezed by prime contractors demanding

they reduce their bids and, more important, reducing the price for which they will do the work after the prime contractor has been awarded the contract. Subcontractors also complain that contractually they are not connected to the owner—the source of authority and money. They also complain that prime contractors do not make enough effort to move along the money flow from owner to those who have performed work and that they withhold excessive amounts of money through retainage.

The traditional system tends to keep down the number of prospective prime contractors who could bid for work and thereby reduces the pool of competitors. The traditional system, with its emphasis on a fixed-price contract and competitive bidding, also can create an adversarial relationship between owner and contractor (described in Section 17.04A).

Also, the traditional system with its linked set of contracts—owner–design professional, owner–contractor, contractor–subcontractors—did not generate a collegial team joining together with a view toward accomplishing the objectives of all the parties. Some note that the designer and the contractor often generate a semiadversarial mood, which can generate accusatory positions when trouble develops. The designer acting as the owner's representative can generate administrative costs, papers having to pass through many hands. All this can increase the likelihood of disputes. Some of the variations noted in Section 17.04 emphasize better organization, the creation of a construction team, and the need for all involved to pull together to accomplish the objectives.

Another weakness of the traditional system relates to the role of the design professional during construction. For the reasons outlined in Section 12.08B, modern design professionals seek to exculpate themselves from responsibility for the contractor's work and to limit their liability exposure. Perhaps even more important, many design professionals lack the skill necessary to perform these services properly.

Under the traditional method, the managerial functions of the prime contractor may not be performed properly. The advent of increasing, pervasive, and complex governmental controls over safety often found many contractors unable to perform in accordance with legal requirements. In addition, the managerial function of scheduling, coordinating, and policing took on greater significance as pressure mounted to complete construction as early as possible and as claims for delay by those who participate in the project

proliferated. A good prime contractor should be able to manage these functions, as its fee is paid to a large degree for performance of these services. Not all prime contractors were able to do this managerial work efficiently. Some owners believed the managerial fee included in the cost of the prime contract could be reduced.

The division between design and construction, although at least in theory creating better design and more efficient construction, had the unfortunate result of dividing responsibility. When defects develop, as noted in Chapter 24, the design professional frequently contends that such defects were caused by the contractor's failure to execute the design properly, whereas the contractor asserts that the design was defective. This led to bewildered owners not being certain who was responsible for the defect as well as to complex litigation.

SECTION 17.04 Modern Variations

A. Introductory Remarks

Modern project delivery systems are becoming the norm, especially in large commercial projects, but increasingly in public contracting as well. The most popular modern variations on the traditional system are construction management (CM) (Section 17.04D) and design-build (DB) (Section 17.04F), with these methods sometimes incorporating phased construction (fast-track) (Section 17.04B). Other new delivery systems, such as program management (PM) (Section 17.04K), teaming arrangements (Section 17.04H), and project alliance (Section 17.04J), have also made significant inroads, although to a lesser extent than CM and DB. Yet other new delivery systems, in particular building information modeling (BIM) (Section 17.04M), have yet to be fully utilized.

The traditional system, which separates design from construction, has relatively clear lines of responsibility. Risk allocation methods—insurance, indemnity, and contract disclaimers—are easy to devise. By contrast, all of the modern variations have as a common denominator: a blurring of the lines of responsibility. This blurring has led (and will continue to lead) to the creation of new risk allocation methods, including new insurance products and new forms of indemnity.

The law, too, must adapt to these changing commercial realities. Some changes may be accomplished through legislation, such as allowing the use of CM or DB on

public contracts.³⁰ Common law changes occur more gradually. The common law functions to a large degree through crude categories aided by analogies, largely for administrative convenience. Law often lags behind organizational and functional shifts in the real world. New project delivery systems described in this section inevitably create temporary disharmony in the law. Over time, predictable legal rules emerge.

Much standardization in the traditional system is attributable to general acceptance of construction contract documents, in particular those published by the American Institute of Architects (AIA). As alternative project delivery systems have become more accepted, industry groups have begun issuing standard form documents for these newer systems as well. The AIA has published standard form documents for CM and DB, sometimes with endorsement from the Associated General Contractors of America (AGC), but not for the 2007 AIA documents. The AGC, in turn, has very recently created a standard form contract for PM. Even with these developments, descriptions of newer project delivery methods must be viewed as nothing more than generalizations. The reason is that these projects are almost always undertaken by sophisticated owners who are likely to tailor the agreement to meet their individual needs.

Many legal rules are premised on the traditional system, as described in Section 17.03. Modern variations change this system. Using separate contracts (multiple primes) (to be discussed in Section 17.04C) shifts responsibility for coordination from a prime contractor to someone else, often an independent professional adviser retained by the owner or a principal (not a prime) contractor who has no direct contracts with those contractors whose work it must, as a manager, coordinate.

Phased construction (fast-tracking, discussed in Section 17.04B) allows construction to proceed during design. When the spotlight is placed on construction management (in Section 17.04D), a new adviser or coordinating contractor is engaged (not, as a rule, after the design is completed but during design) by the owner, who also plays a significant monitoring role during construction. Here the owner, through at least some permutations of construction management, has a more active role in managing the project and is not simply turning over the design to the contractor, a businessperson engaged in the venture to earn a profit.

³⁰N.C.Gen.Stat. § 143-128.1 (CM); Wash.Rev.Code § 47.20.780 (DB).

In turnkey and design–build (discussed in Sections 17.04E and 17.04F), the owner has not engaged an independent adviser to prepare the design but has turned over everything to a businessperson who represents that he has paid or can pay for the skill to both design and build, and in the case of a turnkey contract even more, such as providing financing, furnishing interior furnishings, and providing a computer system. Even more difficult, the DB owner can, as noted in Section 17.04F, span a wide range of owners.

Partnering (Section 17.04G) seeks to close the gaps among owner, designer, and contractor by having all three of these project participants work as a team to accomplish a project or series of projects. Teaming agreements (Section 17.04H) were promoted primarily by the federal government to allow would-be competitors with complementary skills to bid together on a project. While one team member is sometimes contractually described as the prime contractor and the other as the subcontractor, teaming agreements envisage more equal relationships between the two team members.

Lean project delivery (Section 17.04I) looks to the production industry—specifically the principles of the “Toyota Way” used by the Toyota Motor Company—to bring greater efficiency to the construction process. The project participants seek to deliver a high-value project through collaborative efforts. This is also true for project alliance (Section 17.04J), where a high degree of collaboration and commitment is required by the parties’ agreement. As a general rule, partnering, lean project delivery, and project alliance all seek to convert the construction process into a collaborative venture, in which the major project participants subsume their own interests to the goals of the project itself.

Program management (Section 17.04K) is perhaps the next evolutionary stage following the CM as advisor. The PM provides the large commercial or public owner with the type of support the owner would have received from an in-house construction or engineering department.

The build-operate-transfer (BOT) system of project delivery (Section 17.04L) began with large infrastructure projects in developing countries. Here, a consortium with the financial means builds the project and operates it, with the ultimate goal of transferring it back to the country in which the project is located. Most BOT projects are turnkey projects.

Finally, building information modeling (BIM) (Section 17.04M) is unique among the many project delivery systems

in that it is a technology-driven organizational model. BIM is premised upon the creation of a computer model of the project that is both information-rich and information-integrative. Virtually all the project participants play an interactive role in the design and implementation of the building, thereby erasing the traditional system’s sharp boundary between design and construction.

B. Phased Construction (Fast-Tracking)

Phased construction, or what has come to be known as “fast-tracking,” is not an organizational variation. It differs from the traditional method in that construction can begin before design is completed. There is no reason it cannot be used in a traditional single contracting system, although it is likely to mean that the contract price will be tied to costs.

Construction can begin while design is still being worked out. Ideally this means that the project should be completed sooner.³¹ If a contractor is engaged during the design phase and knows which material and equipment to use, it can make purchases or obtain future commitments earlier and often cut costs.

Another advantage to the owner is the early activation of the construction loan. In traditional construction, an owner, particularly a developer, does not receive loan disbursements until the construction begins. Yet it must pay for investigation and acquisition of the project site. It may have had to pay either the purchase price for the land or installments of ground rent, as well as insurance premiums, real estate taxes, design service fees, or legal expenses. If it must make these expenditures before it starts to receive construction loan funds, it must draw on its personal unsecured credit line, necessitating monthly interest payments and reducing its credit line, which could be used for other purposes. If construction can begin through fast-tracking, the owner need not use its personal funds but can employ loan disbursements.

³¹Some recent studies have indicated that these ideals do not always mature. One study indicates that very low percentages of design completion before commencement of construction may result in considerable construction delays. See Laufer & Cohenca, *Factors Affecting Construction-Planning Outcomes*, 116 J. of Constr. Eng’g. & Mgmt. 135 (1990). Similarly, another study states that fast-tracking is of much less value than it appears to be. The benefit of early completion, it stated, is more than half offset by the consequent shift in the timing of construction expenditures. It not only may wipe out any benefits gained by an early start but also may lead to the accumulation of losses. Rosenfeld & Geltner, *supra* note 6.

The principal disadvantage of fast-tracking is the incomplete design. The contractor will be asked to give some price—usually after the design has reached a certain stage of completion. Very likely the contract price will be cost plus overhead and profit, with the owner usually obtaining a guaranteed maximum price (GMP).³² However, the evolution of the design through a fast-tracking system is likely to generate claims. Completing the design and redesigning can generate a claim that the contract has become one simply for cost, overhead, and profit and that any GMP has been eliminated.³³ The owner may be constrained in making design changes by the possibility that the contractor will assert that the completed drawings must be consistent with the incomplete drawings.³⁴

Two other potential disadvantages need to be mentioned here. First, there is greater likelihood that there will be design omissions—items “falling between the cracks.” Needed work is not incorporated in the design given to any of the specialty trade contractors or subcontractors. Although such omissions can occur in any design, they are more likely to occur when the design is being created piecemeal rather than prepared in its entirety for submission to a prime contractor.

Second, in fast-tracking there is a greater likelihood that one participant may not do what it has promised, and thus adversely affect the work of many other participants. For example, an opinion of a federal contract appeals board, discussing fast-tracking in the context of construction management and multiple primes, stated,

“Phased” construction has been analogized to a procession of vehicles moving along a highway. Each vehicle represents a prime contractor whose place in the procession has been pre-determined. The progress of each vehicle, except that of the lead vehicle, is dependent on the progress of the vehicle ahead. The milestone dates have been likened to mileage markers posted along the highway. Each vehicle is required to pass the mileage markers at designated times in order to insure steady progress.³⁵

³²See Sections 17.02B, 17.04D, and 17.04F.

³³*Armour & Co. v. Scott*, 360 F.Supp. 319 (W.D.Pa.1972), *aff'd*, 480 F.2d 611 (3d Cir.1973); see *C. Norman Peterson Co. v. Container Corp. of America*, *supra* note 13.

³⁴*City Stores Co. v. Gervais F. Favrot Co.*, 359 So.2d 1031 (La.App. 1978), overruled on other grounds, *St. Tammany Manor, Inc. v. Spartan Bldg. Corp.*, 509 So.2d 424 (La.1987).

³⁵*Pierce Assoc., Inc.*, GSBGA No. 4163, 77-2 BCA ¶12,746, citing *Paccon, Inc. v. United States*, 185 Ct.Cl. 24, 399 F.2d 162 (1968).

When any of the vehicles do not pass the mileage markers assigned to them, claims for delays and complex causation problems are likely to result.³⁶

C. Separate Contracts (Multiple Primes): *Broadway Maintenance Corp. v. Rutgers, State University*

Separate contracts (using multiple prime contractors) consist of the owner contracting directly with the principal subcontractor trades. It developed because of owner concern over the subcontracting process briefly described in Section 17.03B. See Figure 17.1. Separate contractors give the owner greater control in specialty contracting and avoid the subcontractor complaints that they are a contract away from the source of power and funds. Separate contracts were used if owners were not confident of prime contractor management skill. Their use was also spurred by successful legislative efforts by subcontractor trade associations to require that state and sometimes local construction procurement use separate contracts.

Another factor, though of less significance, was the hope that separate contracts could develop lower contract prices. Breaking up the project into smaller bidding units allows more contractors to bid. Owners hoped the managerial fees could be reduced by taking this function from the prime contractor. These hoped-for pricing gains can compensate for the additional expense of conducting a number of competitive bids.

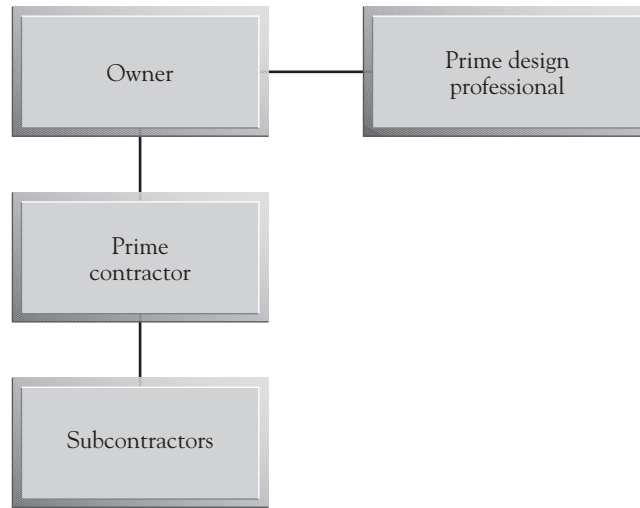

In the traditional contracting system, the linked set of contracts determines communication and responsibility. If subcontractors have complaints, they can look to the prime contractor. If the prime has problems, it can look to the subcontractors or the owner.³⁷

Separate contractors are required to work in sequence or side by side on the site, but they do not have contracts with one another. Disputes among them must be worked

³⁶The use of construction management often accompanied by fast-tracking in federal projects led to an inordinate number of delay claims. See U.S. General Accounting Office, *Federal Construction: Use of Construction Management Services*, U.S. General Accounting Office GAO/GGD-90-12 (January 1990).

³⁷Even in the traditional system, lines were becoming blurred as owners and subcontractors sued each other. See Sections 28.05B, 28.07H, and 28.08B. AIA prime contracts give the owner power to intervene to a degree in the prime-subcontractor relationship. See AIA Doc. A201-2007, §§ 5.2.2, 5.3, 9.3.1.2, 9.6.2, and 9.6.3.

Traditional (design-bid-build or design-award-build)

Separate contracts (multiple primes)

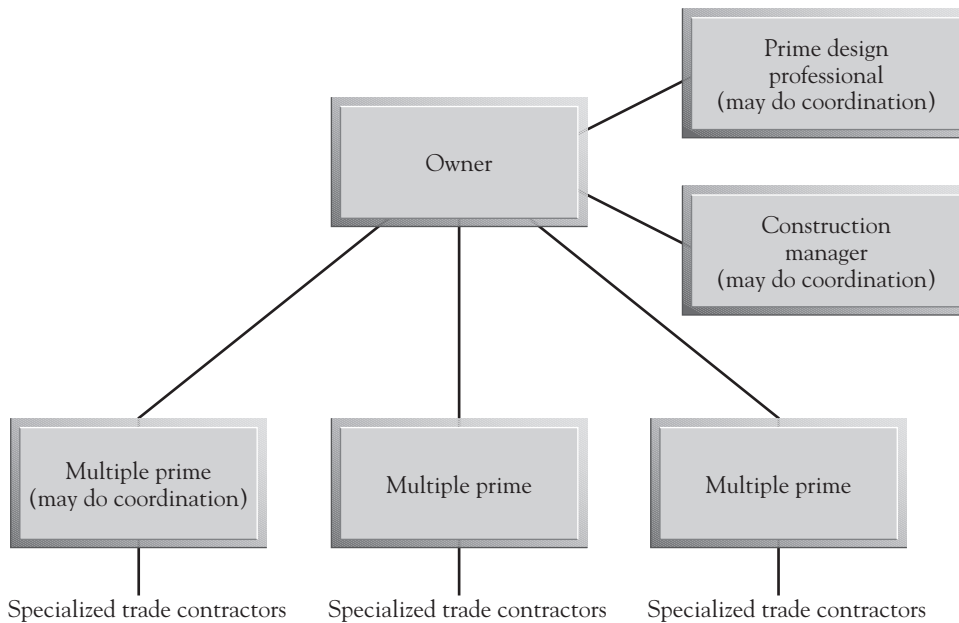

FIGURE 17.1 Traditional and separate contract systems compared.

out by the participant performing the coordination function, something that is not as neat in the separate contract system as in the single-contract system. To be sure, even in the traditional system this problem can arise if disputes develop between subcontractors who have no contract with each other. The traditional system handled this with relative clarity by requiring that the prime contractors deal with these matters as part of its managerial function and that the owner remove itself from these problems.

Who performs the managerial function? Who has legal responsibility? Under the construction management system, these often fall to the construction manager (CM). But the managerial function can be performed by the design professional if he has the skill and willingness to do so, by a staff representative of the owner, by a program manager, or by a managing or principal separate contractor. If it is not clear who will coordinate, police, and be responsible in any system, the project will be delayed and claims made. A case that generated all these problems is reproduced here.

BROADWAY MAINTENANCE CORP. v. RUTGERS, STATE UNIVERSITY

Supreme Court of New Jersey, 1982. 90 N.J. 253, 447 A.2d 906.
[Ed. note: Footnotes renumbered and some omitted.]

SCHREIBER, J.

Two contractors engaged in the construction of the Rutgers Medical School in Piscataway Township sought to recover damages from Rutgers, The State University (Rutgers), for its failure to coordinate the project and to compel timely performance by a third contractor. Rutgers asserts that it allocated the sole duty to coordinate the work of the prime contractors on the project and ensure their timely performance to Frank Briscoe Co., Inc. (Briscoe), its general contractor. Plaintiffs deny their right to sue Briscoe as third party beneficiaries of Briscoe's contract with Rutgers. We must determine first, whether plaintiffs were intended to be beneficiaries of that contract. Even if they were, we must determine whether Rutgers, as owner, retained any duty to coordinate or supervise which could give rise to a cause of action in plaintiffs. Finally, we must determine whether Rutgers is excused from any such liability by an exculpatory clause in the contract.

On October 31, 1966, Rutgers signed contracts for general construction work with Briscoe for \$7,392,000, electrical work with plaintiff, Broadway Maintenance Corp. (Broadway), for \$2,508,650, and plumbing and fire protection with plaintiff, Edwin J. Dobson, Jr., Inc. (Dobson), for \$998,413. Six other contracts, also entered into, covered precast concrete; structural steel; elevators; heating, ventilating and air conditioning; laboratory furniture and independent inspection and testing. In contrast with construction projects in which the owner contracts with a general contractor who undertakes the entire project and coordinates operations of subcontractors, Rutgers entered into contracts with each of several prime contractors. In Rutgers'

agreement with Briscoe, Briscoe agreed to act as the supervisor on the job and coordinator of all the contractors. [Ed. note: See Figure 17.2.]

After the work was finished, at a date well beyond the scheduled time for completion, Dobson and Broadway filed separate complaints against Rutgers in the Superior Court, Law Division, asserting a variety of claims, including damages due to delays and disruptions caused by Rutgers' failure to coordinate the activities of the various contractors on the site. Rutgers filed third party complaints seeking indemnification from Briscoe and its surety. The two actions were consolidated for trial with a pending third suit brought by Briscoe against Rutgers for money due under the Rutgers-Briscoe contract. Dobson and Broadway never added Briscoe as a party defendant in their actions. The suit between Rutgers and Briscoe was settled before trial, except for two claims for indemnification. Briscoe is not a party to this appeal.

The non-jury trial proceeded for 43 days. Rutgers produced no evidence and rested at the end of plaintiffs' case. The trial court in an extensive written opinion granted plaintiffs judgments for some of their claims, but denied recovery against Rutgers for failure to coordinate the activities of the prime contractors, including Briscoe. 157 *N.J. Super.* 357, 384 A.2d 1121 (Law Div.1978). Dobson and Broadway appealed to the Appellate Division, which affirmed. 180 *N.J. Super.* 350, 434 A.2d 1125 (App.Div.1981).

Each plaintiff petitioned for certification. We granted both petitions to consider three questions: (1) in a multi-prime contract, is each prime contractor liable to the other, (2) in such a contract, does the owner have a duty to coordinate the work of

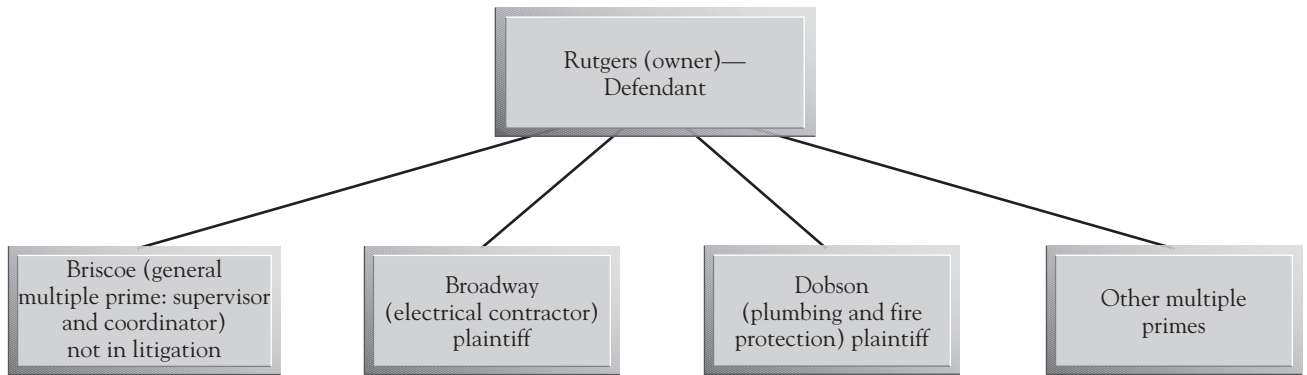

FIGURE 17.2 The relationships among parties in *Broadway Maintenance v. Rutgers*.

the contractors, and (3) does the exculpatory clause in the prime contracts at issue here shield Rutgers from liability for damages due to delay. The Mechanical Contractors Association of New Jersey, Inc. and the Building Contractors Association of New Jersey were granted leave to file briefs as amici curiae [“friends of the court,” allowed to present their views by court permission].

[Ed. note: The court noted that jurisdictions had reached different results when faced with the question of whether one separate contractor could sue another. It concluded that the record supported the findings of the trial court holding that all parties had agreed the separate contractors could maintain legal action against each other for damage due to unjustifiable delay. In determining this question, the court held that the terms and conditions of the contract should be examined to determine the intent of the parties.]

The existence of a third party claim does not necessarily extinguish all claims between the parties to the contract. Here plaintiffs argue that Rutgers breached its agreement with them and is liable irrespective of any third party claims they may have against the general contractor, Briscoe. The plaintiff’s contention is sound at least with respect to those matters that Rutgers had contractually obligated itself to do and for which it would be responsible. The trial court did award damages to the plaintiffs against Rutgers for certain contractual breaches. Rutgers has not appealed from those determinations.

The narrow questions before us on this appeal are whether Rutgers had agreed to synthesize the operations of the prime contractors, including Briscoe, and, if so, whether Rutgers breached that duty and would be liable for the delay flowing from that breach. The order granting the petitions for certification was limited to the subject matter of coordination of the operations of all

the prime contractors including Briscoe. Damages flowing therefrom involve only delay on the job and its consequential costs.

Plaintiffs urge various claims that they relate to delay such as additional expenses incurred because of lack of elevators and stairs. These particular claims were disallowed by the trial court, which pointed out, among other things, that Briscoe’s delay did not cause the asserted damages. Though these items are not before us on this appeal, we have reviewed the record and are satisfied that the trial court’s findings have adequate factual support.

Plaintiffs also continue to press before us matters such as Rutgers’ alleged default in not withholding funds due Briscoe in order to satisfy plaintiff’s claims for delay against Briscoe, and Rutgers’ non-fulfillment of its supposed duty to place the site in condition so that plaintiffs could proceed. On this appeal we are concerned solely with the general supervision over the contractors. What duties Rutgers had in this respect depends on what obligations were imposed on it by the contract.

In the absence of any compelling public policy, an owner has the privilege to eliminate a general contractor and enter into several prime contracts governing the construction project.³⁸ In that event the owner could engage some third party or one of the contractors to perform all the coordinating functions. Where all the parties enter into such an arrangement the owner would have no supervisory function. The situation would be analogous to one where a general contractor had been engaged to construct

³⁸Use of multiple prime contracts assumes the owner will benefit from savings that will accrue from eliminating the overhead and profits of the general contractor. Provisions for construction of any public buildings by the state provide for separate bids for different major aspects of the job and bids for all work in one contract, the award to be made to whichever method results in a lower cost. N.J.S.A. 52:32-2.

the project on a turnkey basis. Surely the subcontractors would have no claim against the owner for failure to coordinate.

If no one were designated to carry on the overall supervision, the reasonable implication would be that the owner would perform those duties. In so doing, the owner impliedly assumes the duty to coordinate the various contractors to prevent unreasonable delays on the project. See, e.g., *Born v. Malloy*, 64 Ill.App.3d 181, 184, 21 Ill.Dec. 117, 120, 381 N.E.2d 52, 55 (1978); *Carlstrom v. Independent School District No. 77*, Minn., 256 N.W.2d 479 (1977). That is a reasonable assumption because the contracting authority has the power to use its superior position and to invoke its contractual rights to compel cooperation among contractors. *Shea-S & M Ball v. Massman-Kiewit-Early*, 606 F.2d 1245, 1251 (D.C.Cir.1979). The owner is impliedly obligated to act in good faith and to do that which it reasonably can to ensure that the other contractors adhere to the time schedules established for the project. *Paccon, Inc. v. United States*, 399 F.2d 162, 169-70 (Ct.Cl.1968). An owner's failure to take action in the face of unnecessary and unreasonable delays by one of the contracting parties would ordinarily evidence bad faith and constitute a breach of its implied duty to coordinate.

It is, of course, also possible that the owner might fractionalize those supervisory functions. Where the owner has chosen to engage several contractors directly, the bottom line is to ascertain who the parties agreed would orchestrate and harmonize the work. The answers may be found in the contract language as illuminated by surrounding circumstances.

The complications that arise in this case are due in part to the unclear nature of who was to perform what supervisory function. Briscoe had agreed to supervise the job generally. It was entrusted with the "oversight, management, supervision, control and general direction" of the project. It was to control "the production and assembly management of the building construction process." Briscoe was obligated to have sufficient executive and supervisory staff in the field so as to handle these matters efficiently and expeditiously. The General Conditions also recited that Rutgers relied on Briscoe's management and skill to supervise, direct and manage Briscoe's own work and the efforts of the other contractors; indeed, the agreements stated that the contractors also relied on Briscoe's supervisory powers to deliver the building within the scheduled time.

However, Rutgers also designated its Department of New Facilities to represent it in technical and administrative negotiations with the contractors and the Department could stop the work if necessary. Rutgers also selected a critical path method consultant whose progress chart was to be followed, but could be amended with the consultant's approval. Further, Rutgers

engaged an architect. The architect agreed to "[s]upervise the construction of work by periodic inspections sufficient to verify the quality of the construction and the conformity of the construction to the plans and specifications . . . and by which supervision the architect shall coordinate the work of the various contractors and expedite the construction of the Project." If a contractor were delayed in completing the work whether due to the owner, any other contractor, the architect, or other causes beyond the contractor's control, the architect alone was authorized to determine extensions of time to which a prime contractor would be entitled. In this respect the trial court found that the architect acted as an impartial and independent umpire, and as such was not the agent of either Rutgers or the contractor.

Plaintiffs contend that Rutgers retained supervisory control because Briscoe had not been given the power to enforce its coordinating authority. They argue that Rutgers had the economic weapons of terminating the contracts and withholding payments, so that only Rutgers could effectively cause the prime contractors, particularly Briscoe, to keep up to schedule. Though this contention has some surface appeal, it fails to account for the entire contractual structure governing the project. Rutgers' power to terminate a contract or withhold funds did not alter its expressed intent to have someone else supervise the work. Rutgers had delegated that overall responsibility to Briscoe. Rutgers never intervened to coordinate the operations. It never assumed control.

The plaintiffs also claim that Rutgers retained coordination and supervision over the job because of the roles of the Department of New Facilities and critical path method consultant. These contentions are misconceived. The Department's functions were primarily quality control and only incidentally affected time of performance. The consultant plotted actual progress as against the scheduled performance, but did not supervise and coordinate the work. Nor does the architect's supervisory role support plaintiffs' position. First, the architect's agreement was not incorporated in the contractors' contracts. Second, Rutgers' delegation of coordinating functions to the architect confirms, if anything, that Rutgers itself was not engaged in any such undertaking. Lastly, plaintiffs rely on an indemnity clause in each contract that provided that if a contractor or subcontractor sued Rutgers, the contractor would defend, indemnify and save Rutgers harmless. However, that provision simply confirms the intent that Rutgers was not to be responsible for defaults of other prime contractors, including Briscoe.

When viewed in its entirety, the contractual scheme contemplated that if a contractor were adversely affected by delays, it could maintain an action for costs and expenses against the

fellow contractor who was a wrongdoer. Furthermore, a contractor had a right to obtain extensions of time to complete the work when delayed by “any act or neglect” of any other contractor. Other than those remedies, the contractor could not look to Rutgers for recourse because of its failure to coordinate the work.

[Ed. note: The court reviewed the enforceability of a “no damage” (no pay for delay) clause and concluded that it would be given effect in this case. The court rejected an argument that the clause be given effect only when the delays are reasonable and concluded that Rutgers did not actively interfere with the progress of the work nor did it act in bad faith.]

In summary then, we hold that a third party beneficiary may sue on a contract when it is an intended and not an incidental

beneficiary. Resolution of that issue depends on examination of the contractual provisions and the attendant circumstances. In a construction project where the owner directly hires the various contractors, the owner may engage a separate contractor to coordinate and supervise the project and agree with the several contractors that the general supervision will be carried out in that manner. Lastly, the owner may exculpate itself from liability for damages to the extent delineated in the contract, in the absence of any public policy reasons to the contrary.

The judgment is affirmed.

For affirmance—Justices PASHMAN, CLIFFORD, SCHREIBER, HANDLER and O’HERN—5.

For reversal—None.

The *Rutgers* decision exposes some of the administrative and legal difficulties inherent in the separate contracting system. Injecting a new “entity” into the process—in that case, a CPM consultant (perhaps a limited CM)—without a well-defined role or clearly delineated responsibility can create problems. The case demonstrates the administrative difficulties of giving one entity managerial responsibilities without the tools to effectively manage—one reason why the *Rutgers* decision has been criticized.³⁹

This problem is recognized in North Carolina public contracts. The statute dealing with separate contracts gives the coordination to a project expeditor selected by the state.⁴⁰ The expeditor can be a contractor. But the expeditor can make recommendations to the state for payments to the contractors and can prepare the schedule (with input from the contractors). This gives the expeditor some power over payments and scheduling (both significant factors in policing coordination).

If managerial functions are given the managing contractor, what effect does this have on any owner responsibility? For example, had that power been given to the architect or even a CM, it is likely that the owner would be responsible if either had failed to coordinate properly.

AIA Document A201-2007, Section 6.1.1, allows the owner to award separate contracts but only on conditions “identical or substantially similar” to A201. That paragraph requires any separate contractor claim for delay

or added cost be handled by Article 15, a complicated disputes process in A201-2007. The process will deal with two disputes: the claimant separate contractor against the owner and the owner against the separate contractor whose acts were alleged to have generated the claim.

A201-2007, Section 6.1.3, requires the owner to provide coordination.⁴¹ Each separate contractor agrees to cooperate. A separate contractor can claim another has damaged or destroyed its work or property. Most important, a separate contractor can claim that another has failed to perform in accordance with the latter’s contractual obligation and adversely affected the former’s scheduling and performance.

A201-2007, Section 6.2.3, makes the owner responsible for a contractor’s costs incurred because of delayed or defective performance by another contractor. The at-fault contractor must then reimburse the owner. Under this system, an injured contractor looks to the owner for relief instead of trying to sue the coprime contractor. This system contrasts with that of the EJCDC, which gives the separate contractors rights against each other.⁴²

Many cases have involved who can sue whom when separate contracts or multiple prime contracts are used. Sometimes the owner, as in the *Rutgers* case, can persuade the court that the separate contract system insulates the owner from any claims by a separate contractor. As demonstrated in that case, much depends on the language of the

³⁹Bynum, *Construction Management and Design-Build/Fast Track Construction from the Perspective of a General Contractor*, 46 *Law & Contemp.Probs.* 25, 33 (1983).

⁴⁰N.C. Gen. Stat. § 143-128 (e).

⁴¹This coordination is not substantially different in A201 CMA-1992 ¶6.1.3 and B801 CMA-1992 ¶2.3.6, its CM agency documents.

⁴²EJCDC Doc. C-700, ¶7.03 (2007).

contract and any right that one separate contractor has to maintain a direct action against the other. Although one case held that the owner is insulated from responsibility,⁴³ another did not.⁴⁴ Even if the owner is not absolved from responsibility, it is not clear whether the owner's obligation is "strict" or whether its obligation is simply to use its best efforts, in effect a negligence standard.⁴⁵ Finally, as to the right of one separate contractor to maintain a direct action against the other, although Illinois held that one cannot sue the other,⁴⁶ Tennessee, in *Moore Construction Co., Inc. v. Clarksville Dept. of Electricity*,⁴⁷ came to a contrary conclusion in a case involving AIA Document A201. The court reviewed the cases and pointed to what it saw as an emerging trend:

Unless the construction contracts involved clearly provide otherwise, prime contractors on construction projects involving multiple prime contractors will be considered to be intended or third party beneficiaries of the contracts between the project's owner and other prime contractors. They have been permitted to recover when the courts have found that their fellow prime contractor assumed an obligation to the owner to them (the "duty owed" test) or

⁴³*Hanberry Corp. v. State Bldg. Comm'n*, 390 So.2d 277 (Miss.1980).

⁴⁴*Shea-S & M Ball v. Massman-Kiewit-Early*, 606 F.2d 1245 (D.C.Cir.1979).

⁴⁵The Court of Claims was not able to resolve this issue squarely. Compare *Fruehauf Corp. v. United States*, 218 Ct.Cl. 456, 587 F.2d 486 (1978) (warranty based on suspension of work clause), with *Paccon, Inc. v. United States*, 185 Ct.Cl. 24, 399 F.2d 162 (1968) (not liable if owner takes reasonable steps). In *Blinderman Constr. Co. v. United States*, 695 F.2d 552 (Fed.Cir.1982), only best efforts were required. In *Amp-Rite Elec. Co. v. Wheaton Sanitary Dist.*, 220 Ill.App.3d 130, 580 N.E.2d 622 (1991), appeal denied, 143 Ill.2d 635, 587 N.E.2d 1011 (1992), the owner was held liable to two multiple primes, despite one of the multiple primes being required to coordinate the work. Although the court did not find that the owner had warranted (strict liability) that delays would not occur, the owner owed an implied duty to coordinate. This was breached when the owner actively created or passively permitted to continue a situation over which it had control. It alone had the power to control cooperation by withholding payments or terminating or taking over the work. This demonstrates that whatever pains the owner takes to relieve itself from responsibility for coordination, the owner is likely to be held responsible because of its other powers. See Goldberg, *The Owner's Duty to Coordinate Multi-Prime Construction Contractors, A Condition of Cooperation*, 28 Emory L.J. 377 (1979), for an exhaustive treatment.

⁴⁶*J. F., Inc. v. S. M. Wilson & Co.*, 152 Ill.App.3d 873, 504 N.E.2d 1266, appeal denied, 115 Ill.2d 542, 511 N.E.2d 429 (1987).

⁴⁷707 S.W.2d 1 (Tenn.Ct.App.1985), aff'd March 24, 1986 (thorough discussion).

that their fellow contractor assumed an independent duty to them in their own contract with the owner (the "intent to benefit" test). The courts have generally relied on the following factors to support a prime contractor's third party claim: (1) the construction contracts contain substantially the same language; (2) all contracts provide that time is of the essence; (3) all contracts provide for prompt performance and completion; (4) each contract recognizes the other contractor's rights to performance; (5) each contract contains a non-interference provision; and (6) each contract obligates the prime contractor to pay for the damage it may cause to the work, materials or equipment of other contractors working on the project.⁴⁸

The court found these requirements present in the A201 contract to which both separate contractors had assented.

Suppose one separate contractor can sue the other for the latter's breach of contract. Should this have any bearing on the separate contractor's right to sue the owner? Under A201-2007, Section 6.1.3, the owner provides coordination. If it does not do so, the separate contractor has a claim against the owner. Suppose, however, that an agreed schedule provides for coordination but one separate contractor does not perform as agreed. Under the *Moore* case, the separate contractor whose work has been disrupted can sue the separate contractor whose failure to perform properly has caused the disruption. But can the separate contractor also sue the owner? Can it assert that the owner has impliedly warranted that each separate contractor's work would be properly coordinated with the work of others? If so, the separate contractor has claims against the owner and the other separate contractor. Under A201-2007, these claims would then have to be processed through Article 15 dealing with disputes.

Wisconsin blends these problems by a statute regulating state public contracts. The state is not liable to a separate contractor for delay caused by another if the state took reasonable steps "to require the delaying prime contractor to comply with its contract." If the state is exonerated, the prime delayed can sue the delaying prime.⁴⁹

The coordination complexities are revealed in *Beltrone Construction Co., Inc. v. State of New York*.⁵⁰ A subcontractor to a separate contractor asserted a claim against

⁴⁸Id. at 10.

⁴⁹West Ann.Wis.Stat. § 16.855(14)(b). Presumably, if the state is not exonerated, the state can still sue the delaying prime contractor.

⁵⁰256 A.D.2d 992, 682 N.Y.S.2d 299 (1998).

a public agency (through its separate prime) that it had been delayed by two other separate contractors. In rejecting the claim, the court noted that the contract had stated that the state owner could not guaranty the unimpeded progress of contractors in this multiple prime contract project. The court held that the trial court ruled correctly in concluding that the state fulfilled its obligation, as it acted promptly to address disruptions. The state made significant and meaningful attempts to move the project along. The court stated that the state could not have been expected to terminate the contracts of those contractors causing delay to the claimant.

Suppose one separate contractor damages the work or property of the other separate contractor. Under the *Moore* case, a properly drafted construction contract would give the separate contractor harmed a legal claim against the separate contractor causing the harm. But does the former also have a claim against the owner? Such a claim could be based on the owner's breach of an express or implied provision to indemnify a separate contractor if its property is damaged by another separate contractor.

Finally, can a separate contractor maintain a direct action against the surety of the other separate contractor? New Jersey faced this in a state public contract.⁵¹ State contracts usually require a bond be furnished to protect unpaid subcontractors, suppliers, or laborers. In this case, each separate contractor furnished a performance bond (one not required by statute) and a payment bond (one required by statute). The statute specifically gave rights to people who perform work under the contract of the contractor who furnished the bond, such as suppliers and subcontractors, but not to those who perform under their own contracts, such as other separate contractors. Consequently, New Jersey did not allow the separate contractor to sue on the bond. Also, it held that only the owner could maintain an action on the performance bond. As a result, the separate contractor was left with a claim against a bankrupt separate contractor. Although New Jersey stated it was following the majority rule, much depends on the language of any statute compelling that a bond be furnished, on the bond language itself, and on any language in the contract requiring the bond, as well as on the common law.

Owners contemplating a separate contract system should consider these problems. Clearly, a separate contract system

ought not to be used unless the managerial function can be better performed and at a lower cost than if performed by a prime contractor under a single contract system. If the separate contract system is selected, all contracts should make clear who has the administrative responsibility and who has the legal responsibility if a contractor has been unjustifiably delayed. More particularly, if this responsibility is to rest solely in the hands of the people who are given the responsibility for managing the contract, all contracts should make clear whether the owner is exculpated.

D. Construction Management

Before seeking to define construction management (CM), the reasons for its development must be outlined. Principally, CM developed because of perceived weaknesses and inefficiencies in the traditional construction process with special reference to the inability of design professionals and contractors to use efficient management skills. Design professionals were faulted for their casual attitude toward costs, their inability to predict costs, and their ignorance of the labor and materials market, as well as of the costs of employing construction techniques. Owners were also concerned about the tendency of design professionals to take less responsibility for quality control, policing schedules, and monitoring payments. Contractors also came in for their share of blame. Some lacked skills in construction techniques and the ability to work with new materials. Others did not have the infrastructure to comply with the increasingly onerous and detailed workplace safety regulations.

Construction management instead would be an *efficient* tool for obtaining higher-quality construction at the lowest possible price and in the quickest possible time. A limited study by the U.S. General Accounting Office of certain federal agencies' use of construction management records some problems in the past, mainly caused by delay claims in fast-track projects.⁵² It notes the difficulty of using CM concepts in federal construction and reports that projects using the CM concept experienced time delays exceeding six months more often than projects that did not use the concept. From a cost standpoint, the CM projects less often had cost increases that exceeded 10 percent. Obviously, there are many ways of accounting for these differences other than simply the CM process.

⁵¹*MGM Constr. Corp. v. N.J. Educ. Facilities Auth.*, 220 N.J. Super. 483, 532 A.2d 764 (Law Div. 1987). For a case that came to a different conclusion, see *Hanberry Corp. v. State Bldg. Comm'n*, supra note 43.

⁵²U.S. General Accounting Office, supra note 36.

In any event, spotlighting the CM process should lead to more studies of its effectiveness.⁵³

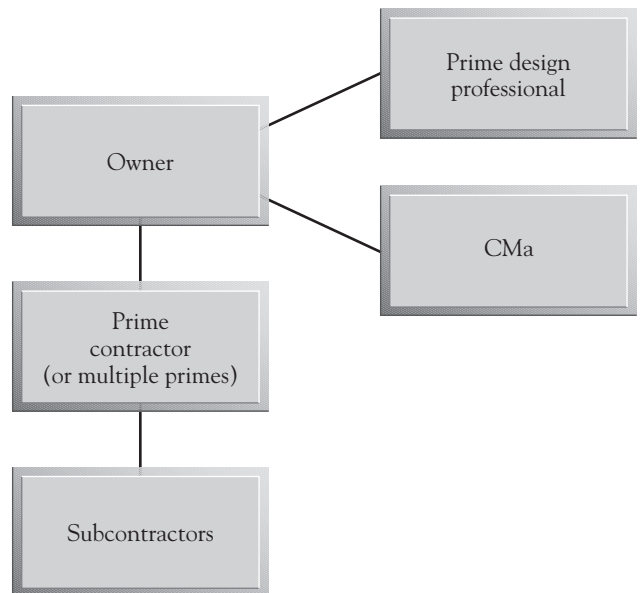

A great variety of approaches may be used to achieve the objectives promised by construction management. For this reason, this book can provide only generalizations. That having been said, a broad division of two types of CMs has been developed in response to the widespread use of standard form contracts: the CM as agent (CMA) and the CM as constructor (CMc).

Until 1992, the AIA and AGC published competing CM documents, the former emphasizing the CM as agent and the latter emphasizing the CM as constructor. This divide between the two organizations was bridged in 1992. The AIA published a set of CMA documents (A101/CMA, A201/CMA, B141/CMA, and B801/CMA) that are recommendations for how the CM fits into the contract system when acting as an adviser to the owner. At the same time, the AIA published A121/CMc, and the AGC published AGC 565, a joint product to be used when the CM acts as constructor.

In 1993, the AIA published B144/ARCH-CM, an amendment to B141 to be used when the architect also performs CM services. The cooperation between the AIA and AGC continued with the joint publication of AIA A121/CMc-2003 and AGC 565 (CMc with a GMP) and also A131/CMc-2003 and AGC 566 (CMc with no GMP). This cooperative period ended in 2007 when the AGC joined several other trade associations in the publication of ConsensusDOCS 500 (owner/CM agreement with a GMP) and 510 (owner/CM agreement without a GMP).

The divide between CMA and CMc is illustrated in Figure 17.3. The CMA contracts only with the owner and has no contract relationship with the subcontractors. (There is rarely any contract between design professional and CM.) By contrast, the CMc contracts with both the owner and the specialty trades. The CM acting as a professional adviser can be compensated by any of the various methods used to compensate a design professional, such as percentage of construction costs, personnel multiplier, cost plus fee, or fixed price.⁵⁴ As noted, the CM acting as

CM as Adviser (CMA)

CM as Constructor (CMc)

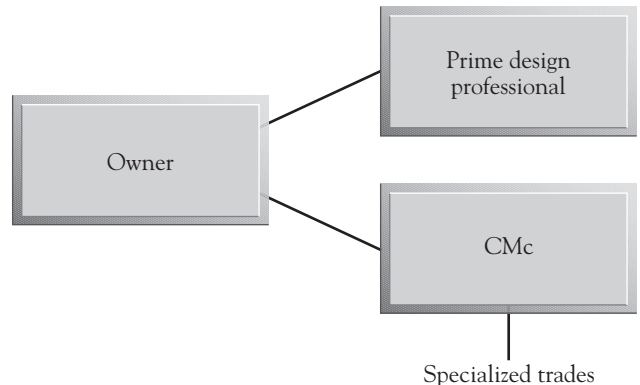

FIGURE 17.3 Construction management systems. (See Figure 14.2 for another CMA illustration.)

a constructor can be paid either by guaranteed maximum price or on a cost plus fee basis without a GMP. The CMc looks very much like a prime contractor.

While the risk of unforeseen subsurface conditions will be discussed in Chapter 25, it is helpful to note the effect of having a CMc rather than a prime contractor and its effect on the federal government's obligation when a differing site condition (DSC) is encountered. As will be

⁵³For a series of articles on construction management, see 46 *Law & Contemp.Probs.*, Winter 1983. See also Spangler & Hill, *The Evolving Liabilities of Construction Managers*, 19 *Constr. Lawyer*, No. 1, Jan. 1999, p. 30.

⁵⁴For a case describing functions and compensation of a CM, see *Gibson v. Heiman*, 261 Ark. 236, 547 S.W.2d 111 (1977).

noted in Section 25.06A, the contractor is entitled to an equitable adjustment if the actual conditions are materially different from those represented.

In *Whiting-Turner/A. L. Johnson Jt. Venture v. General Services Administration*,⁵⁵ the claimant acted as a CM during the design phase and later made a contract to build the project for a cost-plus a fixed fee with a GMP. One of the CMc's subcontractors encountered water all around the project rather than the limited places indicated in the subsurface information given the CMc. Even though the CMc was involved in assembling the information that turned out to be inaccurate, the board rejected the government's contention that the CMc made the representations. It held that they were made by the government and relied upon by the CMc. The use of the CMc did not relieve the government of its DSC obligations. The decision shows that the injection of the CM system could have had an effect upon the owner's obligations to furnish accurate subsurface information. But the board, though admitting that the CMc was involved in planning in a way that a normal contractor would not have been, concluded that the CMc was basically a contractor.

Another illustration of the ambiguous status of the CM can be shown by a recent case in which the CM sought to assert a mechanics' lien on property whose construction he had supervised. Were he a laborer, a subcontractor, or a design professional, he would have been entitled to a lien. But the court held that the CM had not designed, or built, but had merely supervised and was not entitled to a lien under the laws of Indiana.⁵⁶ In other states, the CM might have succeeded, as mechanics' lien laws vary greatly.

CMs who contract on their own usually guarantee a maximum price (GMP)—a cost contract with a “cap.” The courts have taken a strict attitude toward the GMP. Rejecting a contention by the CM that the GMP was a “target figure,” an Indiana court held the CM to the GMP, despite the fact that one of the trade contractors gave a price quotation substantially higher than planned and the CM decided to do the work itself.⁵⁷ In such arrangements,

CMs may also perform some construction with their own employees. As noted, in 2003 the AIA and the AGC jointly drafted CM documents in which the CM acts as constructor.⁵⁸

When CMs give a GMP, they usually agree to give it after the design has been worked out to a designated portion of finality, say 75 percent. They protect themselves by getting as many fixed-price contracts from specialty trades as they can and usually build enough into their GMP to take into account not only their fees but also contingencies that may arise from both design changes and unforeseen circumstances.

Despite this caution, one risk inherent in a GMP is that the specialty trades or the CM who gives a GMP may claim drastic scope changes have eliminated any contractual price commitments made. Usually, though not invariably, a construction management system uses a fast-track approach, a principal justification for construction management, to complete the project in a shorter time. Yet it is possible to have a CM without having a fast-track system. The dangers of fast-tracking—sloppier work and uncontrolled costs—may persuade an owner who wishes to use the construction management system not to fast-track the job.

The legal issues have at their core whether the CM is more like a design professional or an entrepreneurial contractor. For example, must the CM be registered or licensed by the state, and if so, which type of registration or license is needed?⁵⁹ The answer may depend on which form of CM is used, whether the CM is engaged solely as a professional adviser, or whether the CM undertakes to perform some construction himself.

Must awards for CM services in public contracts be made in the same manner as other professional services? Most courts view CMs as providing primarily professional services and permit public agencies to hire them through the negotiation process.⁶⁰ Others require use of the competitive bidding statutes when hiring CMs.⁶¹

The role of the CM in awarding construction contracts also raises the issue of analogies. For example, one case held

⁵⁵GSBCA No. 15401, 02-1 BCA ¶31,708.

⁵⁶*Murdock Constr. Management, Inc. v. Eastern Star Missionary Baptist Church, Inc.*, 766 N.E.2d 759 (Ind.App.), transfer denied, 783 N.E.2d 694 (Ind.2002).

⁵⁷*TRW, Inc. v. Fox Dev. Corp.*, 604 N.E.2d 626 (Ind.App.1992), transfer denied May 21, 1993.

⁵⁸The AIA version is A121/CMc, and the AGC version is AGC 565.

⁵⁹See Bynum, *supra* note 39 at 27–28; Lunch, *infra* note 74 at 86–87.

⁶⁰*Shivley v. Belleville Township High School Dist. No. 201*, 329 Ill. App.3d 1156, 769 N.E.2d 1062 (2002) and *Malloy v. Boyertown Area School Bd.*, 540 Pa. 915, 657 A.2d 915 (1995).

⁶¹*City of Inglewood-L.A. County Civic Center Auth., v. Superior Court*, 7 Cal.3d 861, 500 P.2d 601, 103 Cal.Rptr. 689 (1972).

that the CM represented the owner when he awarded a contract, thereby allowing the trade contractor to demand arbitration with the owner.⁶² If he is simply a professional adviser who, unlike most design professionals, has been given the authority to award contracts, the contractor has made a contract with the owner *through* the CM. Here he looks more like a design professional than a contractor.⁶³ (Usually the design professional does *not* have authority to award contracts.) However, if he contracts on his own with specialty trade contractors, he looks like a prime contractor.⁶⁴

Liability problems also involve analogies. For example, it has been held that a contractor can bring a negligence claim against the CM just as a negligence claim can be instituted against a design professional.⁶⁵ If the CM is analogized to a design professional or performs services usually performed by a design professional,⁶⁶ will the CM be given the benefit of the professional standard described in Section 14.05 or quasi-judicial immunity noted in Section 14.09D?

As shown in Section 14.05, the professional standard has its greatest application when the design professional is performing design rather than administrative services. Inasmuch as the services performed by a CM are connected more to administration than to design, it is possible that the *ordinary* but not *professional* negligence standard will be applied, meaning that no expert testimony will be required. But if the CM is simply an adviser performing administrative tasks for the owner, he looks less like a design professional. As a result, the CM may be able to defend himself more successfully if sued by other participants by asserting that he was simply advising the owner and not acting as an independent professional.

Yet an architect was not allowed to assert a negligence claim for economic losses against the CM. The court held that the CM had no duty to the architect, that his sole duty was to the owner who had engaged him, and that the contract between owner and CM was not made for the benefit of the architect.⁶⁷ The court held that the architect could not satisfy the California requirements for a negligence claim for economic losses. Such claims are dealt with in detail in Section 14.08E.

A CM is also exposed to claims by construction workers injured on the job. Liability under the common law may be based on analogies to injured worker claims against design professionals.⁶⁸ If CMs instead look like prime contractors, either because they are managing the work of the specialty trades, have overall safety responsibility, or are performing some of the construction work with their own forces, they may be found to be contractors with contractor-like liability.⁶⁹ Liability may also arise under safety statutes. New York imposes a duty on all contractors and owners “and their agents” to make sure workers are furnished with safety equipment. A CM acting as the owner’s advisor who has authority over the work may be liable under this statute as an agent of the owner.⁷⁰ Under federal law, a CM with a pervasive job site presence and authority to stop unsafe work may be liable for a worker’s injury under the Occupational Safety and Health Act, even if the CM did no actual construction work.⁷¹

In some states, being a “contractor” CM can be advantageous in the event of worker claims. For example, such a CM may be considered a “statutory employer” entitled to immunity under the workers’ compensation laws as described in Section 7.04C.⁷² This was unsuccessful where

⁶²*Seither & Cherry Co. v. Illinois Bank Bldg. Corp.*, 95 Ill.App.3d 191, 419 N.E.2d 940 (1981).

⁶³See *Bagwell Coatings, Inc. v. Middle South Energy, Inc.*, 797 F.2d 1298 (5th Cir.1986) (contractor cannot sue CM who was owner’s agent).

⁶⁴But see *Turner Constr. Co.*, ASBCA No. 25171, 81-1 BCA ¶15,070 (trade contractor engaged by CM could sue public agency who maintained significant direct involvement in award and performance despite disclaimer of any contractual relationship between public agency and trade contractor).

⁷²*O’Brien v. J.C.A. Corp.*, 372 Pa.Super. 1, 538 A.2d 915 (1988).

the CM did not construct anything but was simply hired to manage and inspect, more like a design professional than a contractor.⁷³

Those planning to engage a CM or those about to engage in CM work must also determine whether the insurance coverage of the CM will be adequate. The CM who is principally a contractor will find his commercial (formerly called “comprehensive”) general liability (GGL) coverage does not include design, whereas a CM who is essentially a design professional may find his professional liability insurance excludes any coverage relating to the construction process or the work of the contractor.⁷⁴ For this reason, CMs should carry professional liability insurance (as should design professionals).⁷⁵

Owners contemplating hiring CMs must consider the advantages and disadvantages of inserting this new actor into an already crowded assemblage of project participants. CMs claim to make the construction process more efficient (and hence faster and cheaper) by bringing sophistication and modern management techniques to the construction process. CMs hired as advisors, however, may be viewed by the courts as acting as the owner’s agent. As explained in Section 4.02A, this could expose the owner (as principal) to liability to trade contractors who claim they were injured by the CM’s actions.⁷⁶ In addition, employing a CMA, together with an architect and prime contractor, invariably will add cost to the owner and may also cause confusion as to the chain of command. On the other hand, an owner who hires a CM may, if problems arise, find itself in the same adversarial relationship as it would with a prime contractor, especially if a GMP is involved.

E. Turnkey Contracts

The discussion in this subsection must be taken together with the material in subsection F dealing with design–build. Both subsections involve the owner contracting

with an entity who agrees to both design and build. However, because turnkey contracts have other functions, they should be taken separately, both on their own and as an introduction to design–build.

There are a great variety of turnkey contracts. At its simplest, the contract is one in which the owner gives the turnkey builder some general directions as to what is wanted and the turnkey builder is expected to provide the design and construction that will fill the client’s communicated or understood needs. In theory, once having given these general instructions, the owner can return when the project is completed, turn the key, and take over.

Many turnkey projects are not that simple. The instructions often go beyond simply giving a general indication of what is wanted. They can constitute detailed performance specifications.⁷⁷ Also, the obligation to design and build may depend on the owner furnishing essential information or completing work on which the turnkey contractor relies to create the design and to build. Finally, the owner who has commissioned a turnkey project is not likely to remain away until the time has come to turn the key. As in design–build, the owner may decide to check on the project as it is being built and is almost certain to be making progress payments while the project is being built. The most important attribute of the turnkey project is that one entity both designs and builds, a system discussed in greater detail in Section 17.04F.

Some turnkey contracts require the contractor not only to design and build the building but also to provide the land, the financing, and interior equipment and furnishings.

A turnkey contract looks more like a sale than a contract for services. As a result, one court held that a turnkey contract created warranties that made the seller-contractor responsible for any defects.⁷⁸ This is something that may also be found in any design–build contract.

⁷³*Brady v. Ralph Parsons Co.*, 308 Md. 486, 520 A.2d 717 (1987), subsequent appeal, 327 Md. 275, 609 A.2d 297 (1992).

⁷⁶*Aladdin Constr. Co., Inc. v. John Hancock Life Ins. Co.*, 914 So.2d 169 (Miss.2005) (CM was agent of the owner for purposes of paying the trade contractors).

⁷⁷Another definition is given in *Smithco Eng’g, Inc. v. Int’l Fabricators, Inc.*, 775 P.2d 1011, 1015 (Wyo.1989), citing Vol. 1 B. J. MCBRIDE, & I. WACHTEL, *GOVERNMENT CONTRACTS*, § 9.120[12] (1980) as follows: “A turnkey project is one in which the developer builds in accordance with plans and specifications of his own architect subject to performance specifications for quality and workmanship, and with limited guidance for features as style of house, number of bathrooms, etc.”

⁷⁸*Mobile Housing Environments v. Barton & Barton*, 432 F.Supp. 1343 (D.Colo.1977).

F. Combining Designing and Building (DB)

In addition to the weakness of the traditional design–bid–build method outlined in Section 17.03B, there are other weaknesses that led the explosion of the design–build (DB) system in the 1990s. One commentator states that it can no longer be assumed that “the most advanced construction technology and knowledge of the most construction methods lie with architects and engineers.”⁷⁹ He goes on to state that this knowledge lies increasingly with “specialty contractors and building-product manufacturers.” He also notes that it increasingly has become difficult to prepare complete and accurate drawings and specifications, hereby exposing owners to claims based on defective specifications. He also points to increased cost and delay in determining who is responsible for defects, the designer or the contractor, and the need for “single point” responsibility. Finally, he states that the traditional method simply takes too long and costs too much in preconstruction services.

As a result, it is increasingly popular for one entity to both design and build, an important variation from the traditional method of organizing for construction. See Figure 17.4. DB can encompass at one extreme the homeowner building a single-family home patterned on a house that the builder has already built and at the other a large engineering company agreeing to both design and build highly technical projects, such as petrochemical plants. The former is likely to be a builder with an in-house architect on its staff or one that engages an independent architect where it is required by law that design be accomplished by a registered architect or engineer. At the more complex extreme, the D/builder may employ a large number of construction personnel and licensed architects and engineers in-house to offer a total package for projects such as power plants, dams, chemical processing facilities, and oil refineries. Between these extremes, DB is often used for less technical repetitive work such as warehouses or small standard commercial buildings.

Organizationally, DB has variations. One method is an architect promising to design and build and employing a contractor to execute the design. Because of the capital needed, a more common technique is for the D/builder to be a contractor who engages a design professional to create the design. Finally, a DB project can be

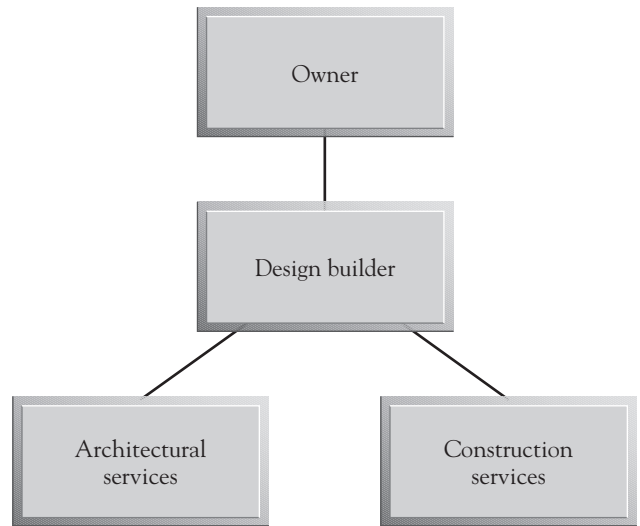

FIGURE 17.4 Design–build (DB) system.

a joint venture between a design professional and a contractor. As shall be noted, each form raises licensing and insurance issues.

The second method, that of a contractor engaging an architect to do the design work, is illustrated by the case of *C. L. Maddox v. Benham Group, Inc.*⁸⁰ That case involved a \$10 million contract made by Maddox, the plaintiff D/builder. Maddox engaged the defendant architectural firm under a “subcontract” to complete the drawings and specifications (both used the same marketing agent). The architect must have had some site role. Language in the “subcontract,” Paragraph 2.1.6, stated that the architect would keep the contractor “informed of the progress and quality of the Work, and shall endeavor to guard [Maddox] against defects and deficiencies in the Work of [Maddox].”⁸¹

The D/builder admitted that it and the owner had caused a substantial amount of the damages, but claimed that Paragraph 2.1.6 required the architect to guard the D/builder against its own deficiencies.

The court, however, pointed to Paragraph 2.1.7, which stated that the architect was not responsible for those performing construction, including the D/builder. This exonerated the architect.

⁷⁹Hinchey, *Karl Marx and Design-Build*, 21 Constr. Lawyer, No. 1, Winter 2001, p. 46.

⁸⁰88 F.3d 592 (8th Cir.1996).

⁸¹Id. at 602.

Both Paragraphs 2.1.6 and 2.1.7 are identical to language in AIA standard documents used for the performance of design services in the traditional design–bid–build system. This raises the question of the responsibility of the “subcontractor” architect in a DB contract. Is it the same as when he performs these site services under a contract with the owner? This, of course, should be controlled by the contract between the D/builder and its architectural “subcontractor” when the latter is not his employee. But the public interest, as noted later in this section, as well as the expectations of the owner may expand the architect’s responsibility.

Increased use of the DB system led the professional and trade associations to publish standard documents for design as part of their DB document packages. Documents developed by these associations, such as the American Institute of Architects (AIA), the Associated General Contractors of America (AGC), the Design–Build Institute of America (DBIA), and the Engineers Joint Contract Documents Committee (EJCDC), reflect a wide variation in approaches often dictated by the policies of the associations and the persons they represent. A recent thorough and insightful study has been made of these documents.⁸²

These standard documents (or any individualized contract between the D/builder and the designer) regulate the relationship between the D/builder and the person it engages to create the design.

But what is the relationship between the owner and the designer, whether an independent design professional retained by the D/builder or one on the D/builder’s staff? Even though the designer works for the D/builder and owes his primary allegiance to the one who has selected him and pays him, the owner may believe the design professional has some obligation to the owner. The owner indirectly pays him, and as a licensed design professional, he has obligations to the public and to the owner even though the owner has no contract with him. In a vague and undefined way, the owner may believe that a registered architect or engineer will make independent decisions that take his

interests and those of the public into account even though the D/builder has engaged him and pays him. This is demonstrated by some successful owner claims against design professionals with whom they had no contract.⁸³

To give the owner more direct control over the design, some have advocated the “bridging” method. This technique, as described by one commentator,⁸⁴ blends the traditional design–bid–build (DBB) or the design–award–build (DAB) system with DB. Under it, the owner’s consultant, generally an architect or an engineer, develops the schematic design and budget. He then develops the design and “prepares an extensive legal and technical request for proposal (RFP) for a design-build contract.” Once the D/builder has been selected under whatever pricing is mutually acceptable, the D/builder provides the design through its own designer either as a subcontractor, as in the *Maddox* case, or as a member of its staff.

The D/builder’s designer prepares the construction documents, “with the owner’s consultant monitoring the work.” The D/builder’s A/E is the architect or engineer of record and is responsible for the design. But the owner’s consultant administers the project. The D/builder’s A/E checks submittals but submits them to the owner’s consultant. The D/builder’s A/E issues payments and completion certificates.

Such a “bridging” method may solve some problems but may create others. If the owner’s consultant in effect controls the designing after the DB contract is made, the single-point responsibility, a main reason for DB, may be lost. In addition, the owner may be found to have provided design specifications to the D/builder, not performance specifications as in a pure DB project. As explained in Section 23.05E, an owner impliedly warrants to the contractor the constructability of design specifications, but a warranty does not attach to performance specifications. So by using the “bridging” method, the owner shifts liability for

⁸²Noble, *The Design-Build-A/E Contract: A Comparison of Standard Forms*, 21 *Constr. Lawyer*, No. 1, Winter, 2001, p. 1. The most recent AIA documents are A141-2004 (owner and D/builder), A142-2004 (D/builder and contractor), B142-2004 (owner and consultant), and B143-2004 (D/builder and architect). For a discussion, see Quatman, *The AIA’s New (and Improved) Design-Build Contracts*, 25 *Constr. Lawyer*, No. 2, Spring 2005, p. 37.

⁸³*Keel v. Titan Constr. Corp.*, 639 P.2d 1228 (Okla.1981); *Nicholson & Loup v. Carl E. Woodward, Inc.*, 596 So.2d 374 (La.App.), writ denied, 605 So.2d 1098 (La.1992) (though in-house architect did not select negligent soils engineer nor had input into the structural work, he did seal the documents representing that either he had done the design or it was done under his responsible supervision); and *Cunningham Hamilton Quiter v. M. L. of Miami*, 776 So.2d 940 (Fla.Dist.Ct.App.2000), rehearing denied Jan. 21, 2001 (owner’s claim against D/builder’s architect met with successful defense by latter that the claim must be arbitrated based on arbitration clause in DB contract).

⁸⁴See Hinchey, *supra* note 79.

defects in the design from the D/builder to itself.⁸⁵ From the D/builder's perspective, this method may create uncertainty as to where the owner's design parameters end and where the D/builder's design responsibility begins.⁸⁶

The relative newness of the DB concept can cause confusion as to whether the contract is a classic DB contract, with the D/builder given general parameters and providing the design. Such a classic DB contract makes the D/builder responsible for a successful implementation of the owner's expectations. But, as noted earlier, this risk allocation assumes that the owner has not taken control of the design.

*FSEC, Inc.*⁸⁷ demonstrates how difficult it may be to determine whether a classic DB contract has been created. The contract included drawings that required four exhaust fans and dust collectors. An amendment to the contract required the contractor to supply design drawings and project specifications. This left the contractor unsure of its obligation.

An amendment, in addition to describing the project as a DB contract, stated that the contractor was to complete design details for approval by the government. This labeling of the contract as a DB contract persuaded the contractor that it could design a system as long as it met performance criteria.

A specialty subcontractor determined that the performance specifications could be met with two exhaust fans. The contracting officer ordered the contractor to install four exhaust fans. The contractor's claim was rejected. The Armed Services Board of Contract Appeals held that all elements of the contract must be considered. It pointed to the bid documents requiring four fans and that design was subject to the government's approval. In essence, though described as a DB contract, it was not. It was a hybrid design-award-build contract with design specifications but labelled DB contract.

Even more than in construction management, the DB system has generated a large number of legal problems that must be confronted before the choice can be made to use such a system. In public projects, the principal problem is the usual requirement that construction work be competitively bid by the contractor. As seen in Section 11.03, the

design professional is chosen either entirely on the basis of demonstrated competence and experience or in a two-stage process where the design professional competes with others as to competence and, once that has been determined, enters into a negotiation with the public entity.

The difficulty of classifying the project for determining whether a DB contract is a construction contract that must be competitively bid or one for professional services that can be negotiated is shown by *C&C/Manhattan v. Government of the Virgin Islands*.⁸⁸ The project was a prison to be done on a DB basis. The statutes allowed an exception for professional services, such as architecture design work. The government negotiated a DB contract relying on the design exception.

The contractor who had received the DB award pointed to cases that had held that DB contracts were an exception to the requirement for competitive bidding. The court stated that the exemption applied to highly technical contracts where the crux of the work was exempt services, the nonexempt services merely being incidental. The court would not make a blanket exception for DB contracts. It noted that 70 percent of the price was for construction services. The court was fearful that exempting all DB projects could swallow up the requirement that, generally, public works contracts should be bid competitively.

In the traditional competitive bidding process by which contractors are selected (discussed in greater detail in Chapter 18), the design is completed and given to potential contractors to bid for the work. The lowest responsible bidder is usually selected. Bids of this sort cannot be made unless the design is relatively worked out.

Often a fast-track system is used for a design-build project. Thus prospective bidders cannot be given a detailed set of plans and specifications on which to make their bids. Although the DB system can be used competitively,⁸⁹ it does not fit comfortably with the requirement that the competitive bidding process be used to award construction work.⁹⁰ As a result, many barriers hinder the use of DB projects for public work. Some states have not allowed this method, whereas other states allow it, usually because it has been authorized for specific projects or because the state has enacted legislation that allows—or

even requires—the design–build system to be used for certain types of construction.⁹¹

Because of the increased use of DB in federal procurement and the uncertainties of its legality in that system, in 1996 the Congress enacted the Federal Acquisitions Reform Act (FARA) of 1996.⁹² It authorizes a two-step system under which the first step looks primarily at competence and qualifications. After the most qualified offerors are selected, they are asked to submit proposals for the second phase, which includes cost or price.

This two-step process is intended to avoid focus on low cost to the detriment of technical qualifications. This process resembles the Brooks Act, noted in Section 11.03, under which professional designers are selected by the federal government, and “little Brooks Acts,” which are used by some states.

Another problem in public contracts is that the design for a design–build project may be made by a designer who has not been selected in accordance with the state laws for selecting design professionals for public works. Florida met this problem in 1989 by enacting legislation that sets forth specific standards when a public agency seeks to use the DB system.⁹³ These standards include a requirement that the agency engage a licensed professional to prepare a design criteria package. Also, the agency must select no fewer than three DB firms and specify criteria procedures and standards for evaluating the proposals. The agency must consult with the retained design criteria professional concerning the evaluation of bids.

A public entity wishing to use design–build must pilot through the shoals of the competitive bidding laws and the laws under which design professionals are selected before such a method can be used.⁹⁴

⁹¹*State ex rel. Citizens Against Tolls (CAT) v. Murphy*, 151 Wash.2d 226, 88 P.3d 375 (2004).

⁹²Enacted as part of the Defense Authorization Act of 1996, P.L. 104-106. See FARA § 5105. For a description, see Baltz & Morrissey, *Procuring Design-Build Construction Services: Federal Government's New Approach*, 31 *Procur. Lawyer*, No. 4, Summer 1996, p. 12.

⁹³West Ann.Fla.Stat. § 287.055.

⁹⁴According to the Design-Build Institute of America, as of April 2006, 45 states and the District of Columbia permit DB in some or all public contracts. For a survey, see THE DESIGN/BUILD DESKBOOK (Ed. Heisse, 2d ed., 2000). See also Buesing, *The Law Struggles to Keep Pace with the Trend of State and Local Government Experience with Design/Build*, 11 *Constr. Lawyer*, No. 4, Oct. 1991, p. 22; Halsey & Quatman, *Design/Build Contracts: Valid or Invalid?* 9 *Constr. Lawyer*, No. 3, Aug. 1989, p. 1 (focusing on private contracts); Comment, 17 *U.Dayton L.Rev.* 109 (1991).

In private contracting, the principal problem in design–build again relates to licensing laws. Under Missouri law, a contractor who did not have an architect's license could not recover for work performed under a DB contract, even though the architect it used was licensed.⁹⁵ As noted, the D/builder may be a business organization that will either furnish the design services needed in-house or retain an independent design professional to perform these design functions.⁹⁶ In addition, many states bar business corporations from performing architectural services. As a result, design–build contracts have been challenged, even if the design portion was to be fulfilled by the engaging of a licensed design professional.⁹⁷ Although the trend has been toward permitting such contracts despite the absence of a registered independent design professional, legal opinion should be sought if the design–build system is to be employed.

Finally, the liability insurance of a design professional usually excludes construction and work performed under a joint venture, whereas the liability insurance of a contractor usually excludes design. An entity planning to engage in a DB venture must check insurance carefully.

Despite the legal obstacles to the DB system, DB has clearly been found to be useful. The principal advantage of DB (called in England a “package” job), usually associated with fast-tracking, is speed. One entity replaces different entities who design and build with the inevitable delay caused by using two entities whose work intersects. Those who design and build frequently do repetitive work and acquire specialized expertise.⁹⁸ Perhaps most important from the standpoint of an unsophisticated owner, the system concentrates responsibility on the D/builder. Owners are often frustrated when they look to the designer who claims that the contractor did not follow the design, with the latter claiming that the problem was poor design.

⁹⁵*Kansas City Community Center v. Heritage Industries, Inc.*, 972 F.2d 185 (8th Cir.1992).

⁹⁶Such a contract was upheld in New York in a 4–3 decision in *Charlebois v. J. M. Weller Assocs.*, 72 N.Y.2d 587, 531 N.E.2d 1288, 535 N.Y.S.2d 356 (1988). The dissent worried about the effect on the public and the registration laws when the design professional is engaged by the D/builder.

⁹⁷See *supra* note 95.

⁹⁸The Federal Highway Administration has reported a 14 percent reduction in project duration using DB, as well as slightly lower costs, with no reduction in quality. See *Design-Build Effectiveness Study* (Jan. 2006), found at <http://www.fhwa.dot.gov/reports/designbuild/designbuild.htm>.

Another impetus for the use of design–build occurred when the AIA, at first on a provisional basis, decided that its members could engage in business without running afoul of ethical constraints. The AIA did this because it felt economic realities in the construction industry dictated that architects be given the opportunity of engaging in DB ventures. After a study of how this was working, the AIA approved its members engaging in DB work and published a series of design–build documents.⁹⁹

DB has weaknesses. The absence of an independent design professional selected by the owner can deprive the owner of the widest opportunities for good design. (One English architectural critic ascribed the recent low level of English design to increasing use of the package or DB system.) An unsophisticated owner often lacks the skill to determine whether the contractor is doing the job well or as promised. This can reflect itself not only in substandard work but also in excessive payments being made early in the project or in slow payment or nonpayment of subcontractors.

Owners, such as developers, do not like to make cost-plus contracts with D/builders. Clear and complete drawings and specifications protect a developer who uses a cost-plus contract. Although the price is not defined, unless there is an effective GMP the project is defined. In design–build, however, the owner may not even know what is to be built when it enters into the contract.

The contractor is reluctant to give a fixed price on a design–build project. It cannot know with any certainty what it will be expected to build. If the design has not been worked out at the time the contract is made, the design must be completed later. Very likely there will be redesign. As a result, the owner will prefer a fixed price, whereas the contractor would like an open-ended cost contract.

To ameliorate this possible impasse, the owner may find it helpful to prepare a set of performance specifications. Even if these specifications cannot define the elements of the building in detail, they may be able to prescribe intelligent criteria for performance in advance.

Another useful technique is to prepare a budget for each phase of the work and designate the budget estimate as a target price. If the actual cost is greater or less than the estimate, the contract price can be adjusted.

Progress payments also provide problems in design–build contracts. Under traditional methods, the architect certifies progress payments. Although some complain that the architect cannot be impartial when he does this, the architect's professional stature gives hope that he will be impartial.

In design–build, payment certificates issued by an architect who has been retained by the contractor may not be reliable. Owners who use design–build often take control of the progress payment process, a method that can operate to the disadvantage of the contractor. As a result, it may be useful for each party to agree on an independent certifier for progress payments.

One advantage of combining designing and building is the ability to fast-track the project. However, the two need not go together. One entity who both designs and builds may create the complete design before starting construction.¹⁰⁰

An owner building a single-residence home, a warehouse, or simple commercial building relies entirely on the contractor for design and construction. Here warranties of fitness are appropriate. The owner is buying not services but a finished product. If the D/builder is held to have sold a “product” and given seller-like warranties, it may hold its design professional only to the professional standard as noted in Section 14.05A, unless the contract between the D/builder and the design professional it engages provides for a different standard.

The sophisticated owner who employs DB and has within its own organization the services of skilled professionals to control design or monitor performance has bought, not a product, but rather expert services to prepare and execute the design it chooses. Such an owner should not receive a sale-of-goods–like warranty.

The differentiation between the two types also reflects itself in pricing. It is likely that the homeowner commissioning a builder to design and build a house will contract on a fixed price. The sophisticated owner building a petrochemical plant will contract on a cost basis with a GMP, at least until the design is put in final form.¹⁰¹ Such projects create immense exposure for consequential damages. It is likely that the D/builder will limit its obligation to correction of defects.

G. Partnering

“Partnering” has been receiving increasing attention in the construction process world. Although it is not strictly speaking a form of organization, partnering is an approach that can remedy some of the stiffness and adversary tendencies that are so commonly part of the construction process.

Partnering is a team approach in which owners, contractors, architects, and engineers form harmonious relationships among themselves for the express purpose of completing a single project or group of projects. The partnering process usually is initiated when the principal project participants are assembled. It can also be used to steer a troubled project back on course. These relationships are to be structured on trust and dedication to the smooth operation of the project. Those who advocate this concept hope that it will accomplish the project successfully and minimize the likelihood of claims. Partnering, then, is a method of building a closeness that transcends organizational boundaries. This closeness should be premised on a shared culture and the desire to maximize the likelihood of attaining the common goals.

Although the objectives of partnering can be sought and achieved on an informal basis, focus on this concept has led to the designation of a facilitator and development of an agreement designed to highlight the goals of partnering and the methods by which they are to be achieved. These can be done after contracts have been awarded to the major participants: the owner, design professional, prime contractor, and key subcontractors. The agreement can make concrete the often nebulous partnering commitments.

What is important is that the parties express as clearly as possible what each party expects and what each party is willing to undertake. Clearly, expressions of this sort are difficult to make sufficiently specific and concrete. But some commitments, such as confidentiality and the agreement not to profit at the other “partner’s” expense, may be worth expressing in the contract.

Partnering can suffer unless the entities involved in the effort are willing to make sacrifices to keep the team intact. This is particularly a problem in dealing with design professionals, because clients often express concern when design professionals with whom they have been working are assigned to other work. But it can also be a problem in large engineering firms and the organizations that employ them. Contacts among people working at different operational levels of the various entities must

be developed, and a sense of confidence and trust among these workers must be built up and maintained.

It is likely that resort to litigation will be rare in partnering arrangements. Judicial intervention will almost never take the form of ordering people to continue such arrangements or compensating one party—particularly as to acts in the future—because of the other’s refusal to continue. There may, however, be resort to legal action if one party has breached confidentiality or has stolen business opportunities that should go to the other. For this reason, it is useful to deal with the possibility of litigation in the contract. Finally, legal action may be taken if one party has incurred expenses that it feels the other should bear or at least share. Again, these matters may be appropriate for contractual resolution.¹⁰²

One often unrecognized danger in partnering is the possibility the partnership can become “too successful.” Understanding the other party’s problems and desiring to implement common goals can make an employee forget for whom he works. At its worst, it can be an avenue for corruption. For example, an employee may allow an unmeritorious claim by the other party to gain favor with an employee of the latter or to take a bribe. These possibilities, however, do not destroy the value of the concept.

H. Teaming Agreements

Teaming agreements have been used when the federal government has embarked on programs to fulfill procurement needs, mainly in high-tech defense. A teaming agreement is a contract between a potential prime contractor and another firm that agrees to act as a potential subcontractor. The prime, sometimes with the assistance of the potential subcontractor, draws up a proposal for a federal agency contract in competition with other prospective contractors. Typically, the prime promises that if awarded the prime contract, it will reward its “teammate” with an implementing subcontract in return for the often unpaid support given in making the bid.

Most litigation has involved claims by aggrieved teammates against the prime when they have not been awarded the implementing subcontract. Such agreements generally

¹⁰²See Roberts & Parisi, *Partnering: Prescriptions for Success*, 13 *Constr. Litig.Rep.*, No. 11, Nov. 1992, p. 298 (contains suggestions and cites relevant literature). See also Stipanowich, *The Multi-Door Contract and Other Possibilities*, 13 *Ohio St. J. on Disp. Resol.* 303, 378-384 (1998). See also Section 30.18H.

use such phrases as “best efforts” and “reasonable efforts” as well as other nonspecific terminology. Often the question of whether the prime is actually committed to award the implementing subcontract to the potential subcontractor is left vague and uncertain. These arrangements resemble in some ways the normal prime contractor–subcontractor relationship discussed in Chapter 28. As noted in Section 28.02, the primes seek to retain as much flexibility as possible while still keeping their teammate interested in supporting the arrangement. However, the prime would like to ensure that any commitments made by the teammate can be legally enforced if necessary.

Moreover, similar to the prime–subcontract relationship discussed in Chapter 28, the terms that would govern the relationship if the prime wins the award and awards the subcontract to its teammate frequently have not been fully worked out. Sometimes such agreements include express covenants of good faith and fair dealing, but such terms do not necessarily mean the two parties will always agree on more substantive questions. Also, the twilight area between unenforceable agreements to agree and enforceable agreements to negotiate in good faith can create difficult legal questions.¹⁰³

I. Lean Project Delivery

As described by one commentator,¹⁰⁴ lean project delivery involves extending the business principles of Toyota Motor Company to the construction process. The three principles underlying the “Toyota Way” are: (1) allowing anyone, including factory workers, to stop production in the face of a defect; (2) just-in-time delivery of materials; and (3) subsuming the individual production units within output of the entire project.

The organizational foundation for lean delivery is the Integrated Agreement, which is signed by the owner, architect, and construction manager (CM) or prime contractor *before* creation of the final design. These three participants are the project team. Major project-related decisions are made by consensus of these three members

with the owner having the final word in the event of an impasse. Selection of additional project members is made by requests for proposal, rather than based strictly on price. New members must agree to participate in the project based on a level of responsibility and collaboration described in the Integrated Agreement:

By forming an Integrated Team, the parties intend to gain the benefit of an open and creative learning environment, where team members are encouraged to share ideas freely in an atmosphere of mutual respect and tolerance. Team members shall work together and individually to achieve transparent and cooperative exchange of information in all matters relating to the Project, and to share ideas for improving project delivery as contemplated in the Project Evaluation Criteria. Team members shall actively promote harmony, collaboration and cooperation among all entities performing on the Project.¹⁰⁵

Rather than the architect’s presenting a completed design to the construction participants, the Integrated Agreement calls for the core group to create a “target value design.” The target value design makes explicit the value, cost, schedule, and constructability of basic components of the design criteria. This process allows the major participants to have input into the design during its creation, where problems (whether with goals, constructability, or cost) can be identified and dealt with as early into the process as possible. Also, the major trade contractors (such as mechanical, electrical, and plumbing) participate in the design of their segments of the work.

The project team creates a “phase plan” for each segment of the work. A six-week look-ahead plan is prepared in which the team identifies the prerequisites each phase must meet for the work not to be defective. Each week, the team screens upcoming work assignments for defects (broadly including unanswered requests for information, incomplete prerequisite work, and missing materials or labor resources) and releases work to the field only if that work has no constraints. Work commitments are then obtained from the relevant subcontractors who are to perform the next segment of work. Because the Toyota Way values reliability over speed, the subcontractors are expected to decline a work assignment if the work is defective or if they lack confidence they can timely perform the work. By saying “no,” the

¹⁰³For further discussion, see M. MUTEK, CONTRACTOR TEAM ARRANGEMENTS—COMPETITIVE SOLUTION OR LEGAL LIABILITY (2006), Killian & Fazio, *Creating and Enforcing Teaming Agreements*, 25 Constr. Lawyer, No. 2, Spring 2005, p. 5, and Note, 91 Colum.L.Rev. 1990 (1991).

¹⁰⁴Lichtig, *The Integrated Agreement for Lean Project Delivery*, 26 Constr. Lawyer, No. 3, Summer 2006, p. 25.

¹⁰⁵*Id.* at 29.

subcontractors avoid the creation of defective work and allow the project team to replan the work and avoid the creation of waste. The subcontractors must stay in constant communication with each other and the project team to know whether their commitment to perform new work can be kept.

Compensation of the prime contractor (or CM) is on a cost plus fee basis with a guaranteed maximum price (GMP). The prime contractor and major subcontractors agree to limit the basis for requested change orders to a few, predesignated conditions: material changes in the scope of the work, changed site conditions and unforeseen regulatory or code interpretations. Disputes are decided not by the architect, but through participation of the project team. If resolution is still not possible, an outside expert is brought in.

The Integrated Agreement seeks to eliminate negligence as the measure of the architect's financial responsibility. Instead, the owner and core group members negotiate a deductible as a percentage of the construction costs and allocate it to design defects, without investigation of underlying fault. Above that deductible, the parties negotiate a percentage for which the designer is responsible without proof of negligence. Above that amount, the owner must prove negligence to recover.

In short, the Integrated Agreement seeks to create a system of shared risk, rather than shifting it. Value is increased by emphasizing collaboration, early detection and correction of defects, and early involvement by the project team to understand the project's goals and produce a target value design.¹⁰⁶

J. Project Alliance

Project alliancing shares with lean project delivery the establishment of collaborative relationships among the owner and the major project participants. Unlike lean project delivery, project alliance does not seek to mimic the Toyota Way and does not draw its theoretical framework from the manufacturing sector.

In project alliance, the owner, design team, prime contractor and major trade contractors and suppliers all sign the same contract, the Project Alliance Agreement (PAA). The PAA has as its goal the benefit of the

project as a whole. The financial success of the project participants is contingent upon the financial success of the project. Financial goals are set forth in the PAA; each party is financially rewarded or penalized based upon whether the project as a whole meets or fails to meet these predetermined goals. In addition, the parties agree in advance to release one another from all liability arising out of the project, except for willful misconduct. In short, the alliance participants:

- assume collective responsibility for delivering the project
- take collective ownership of all risks associated with the delivery of the project
- agree to performance targets
- share in the financial pain or gain, depending on how actual project outcomes compare with the preagreed targets that they have jointly committed to achieve, and
- release one another from negligence liability¹⁰⁷

The owner chooses the major project participants through a rigorous selection process, in which their technical skill, performance capacity, and ability to get along are all taken into consideration. Because of the full commitment demanded of the alliance participants, senior management must be brought into the project early in the design process. They must be able to sign off on the performance and scheduling targets, then maintain a hands-on approach during the performance period so that disputes are quickly identified and resolved.

The project alliance delivery system is reserved for particularly difficult, large-scale projects. It was developed by the petrochemical industry, but it then spread to large public works and commercial projects. At present, it seems to be used primarily in Australia and New Zealand.¹⁰⁸ Initial results show that these projects have been brought in ahead of schedule and under budget.¹⁰⁹

¹⁰⁶For further discussion, see the website for the Lean Construction Institute, www.leanconstruction.org.

K. Program Management

The demand for program management arises not from dissatisfaction with the traditional model for project delivery, but from company downsizing and budget constraints, which have led large commercial owners to eliminate their in-house engineering and construction departments.¹¹⁰ A program manager (PM) promises to bring to commercial owners the expertise that these owners need to manage and expand already existing large facilities. The PM's role has been described as "doing for the owner what it would do for itself if it had the in-house capacity or if it chose to divert its resources to the project(s)."¹¹¹

Akin to a CM as advisor,¹¹² the PM does not undertake responsibility for actual construction work. One commentator lists likely services a PM would offer as including:

- analysis of owner's current facilities and needs
- assisting in project site evaluation and acquisition
- identifying regulatory and permitting requirements
- documenting the existing site's conditions
- managing a public/community relations program
- developing risk management and insurance program
- prequalifying the design and construction team members
- developing design criteria
- developing and updating project budgets
- managing project communications, documenting flow, and record keeping during the construction phase
- monitoring quality assurance and safety programs¹¹³

Either large design firms or construction companies may market themselves to owners as qualified to provide program management services. Both AIA and EJCDC standard form documents allow either architects or engineers to offer many of these services, with the exception of assuming responsibility for site safety.¹¹⁴ Contractors, by contrast, may have more experience with constructability, pricing, and scheduling services.

Is a PM's liability assessed under a standard negligence standard or under the professional standard? Where the PM is a licensed design firm, courts will probably conclude that the professional standard applies. Would the result change if the PM is not originally a design professional company?

Much like construction management thirty years ago, program management is still an evolving concept. One impediment to a clearer definition of PM has been the lack, until quite recently, of a standard form contract available for those providing such services. Only in 2007, with the Associated General Contractor's publication of ConsensusDOCS Document 800 (owner/PM agreement and general conditions), has a standard form contract been made available to the marketplace. The impact of this recent development remains to be seen.

L. Build-Operate-Transfer (BOT)

In the international field, most developing countries are not able to finance large infrastructure projects. As a result, after competitive bidding they may make an agreement with a consortium under which the latter operates the project and then ultimately transfers it back to the state. See Figure 17.5. The consortium that seeks to enter such a contract usually must provide the financial backing to build the project, get it operating, and keep it running so that it can be transferred. The consortium expects to be repaid mainly from revenues generated. BOT projects are used in large infrastructure projects such as energy generation, bridges, and transportation (roads, rails and waterways) systems. Most BOT projects are turnkey contracts, which makes financing more secure and easier to obtain. Increasingly, these privately financed projects are being considered and used by developed countries and some American states, mainly for toll roads and high-speed rail systems. When this is done, the government may put up a part of the funds needed.

The principal actors involved in a simple BOT project are

1. the granting authority (usually a sovereign state)
2. the project sponsors (the entity that has put together the principal actors)
3. the financiers
4. the users of the project

The granting authority wants to be certain the project is built properly, because its citizens are likely to use the

¹¹⁴*Id.* at 6–7 (comparing PM services with AIA Doc. B141 and EJCDC Doc. 1910-1). B141 is now B101, and EJCDC 1910-1 is now E-500.

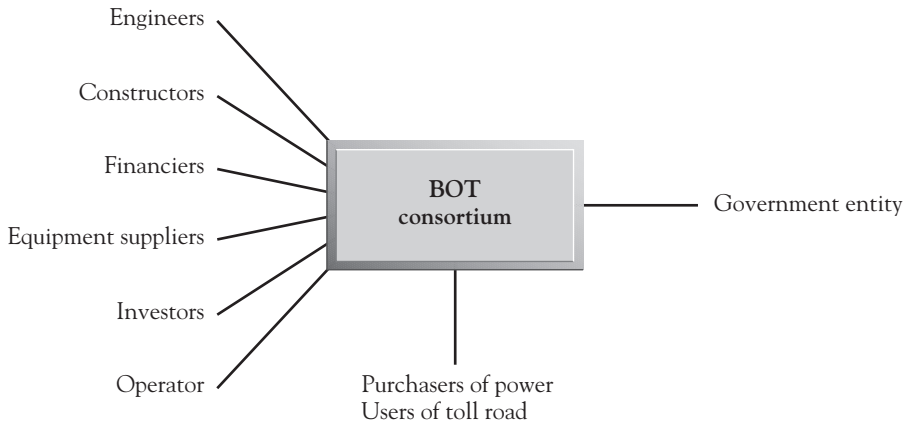

FIGURE 17.5 Build–operate–transfer (BOT) organization.

project directly or indirectly and because it will be the recipient of the project at the end of the designated period. For their part, the project sponsors and financiers—who are operating in a highly regulated environment—want to ensure that the project finances are sufficient, through assurances from the granting authority that there will be no rate decreases for electricity or tolls to please its citizen users.

Increasingly, the BOT classification is being replaced by the term “privately financed infrastructure projects.” This shift is due to the proliferation of variations on the same basic concept: The sponsors find the money, rather than the government. In addition to BOT, there are, to name some,

1. BOO (build-own-operate)
2. BOOT (build-own-operate-transfer)
3. BOLT (build-own-lease-transfer)
4. BRT (build-rent-transfer)

Also, the propensity for disputes in construction contracts noted in Chapter 8, the much increased dispute potential in international contracts, as seen in Section 8.09, the BOT contract can generate new problems.

There are business risks. Will users choose free roads rather than pay tolls? If there is no choice, such as a bridge connecting two parts of the city as in Istanbul, Turkey, will there be citizen user complaints, that the tolls are too high? Everyone uses energy. Will citizens say the electricity rates are exorbitant when furnished by a BOT power-generation plant? Some contracts contain guarantees by

the state that revenues will reach a certain amount, and this type of guaranty may also be unpopular.

There are political risks other than disgruntled users. The opposition party may charge that the agreement was a “sweetheart” deal and seek to have it annulled or cite it as the basis to oust the governing party.

Since those who build and operate are relying on revenue generated by users, they are subject to the risk of currency fluctuations.

Finally, those who finance the BOT project want the costs to be certain and “up front.” They may insist upon the inclusion of language in the construction contract that places all risks on contractors, even those that normally would not be contractor risks, to protect the contract price by avoiding claims and cost overruns.

Yet despite these problems, contractor-financed projects, of which the BOT is the best known, are used increasingly. The United Nations Commission on International Trade Law (UNCITRAL) has been preparing voluminous and useful materials on these contracts.¹¹⁵

Rev.*, pt 1, p. 80; Huse, *Use of the FIDIC Silver Book in the Context of a BOT Contract*, [2000] *Int'l Constr. L. Rev.*, 384; and Merna et al., *Benefits of a Structured Concession Agreement for Build-Own-Operate-Transfer (BOT) Projects*, [1993] *Int'l Constr. L. Rev.*, 32.

M. Building Information Modeling (BIM)

The modern variations discussed up to now involved organizational changes to the design-bid-build (DBB) and design-award-build (DAB) systems. The mechanics of the construction process remained the same. Efficiencies were promoted through the introduction of new entities (such as construction managers or program managers) or, more commonly, through changes in the contractual relations among the project participants (such as multiple prime, design-build, teaming, project alliances, etc.).

By contrast, building information modeling (BIM) is a technology-driven organizational model. The key to BIM is the creation of a computer model of the project that is both information-rich and information-integrative. It is information-rich in that, by clicking on any object in the model (such as a steel beam), the viewer is provided information about the object, such as the beam's size and structural characteristics (the structural forces acting on the beam and its capacity). It is information-integrative, because the object will automatically adjust to changes in other parts of the model. The design power of BIM, as compared with the traditional computer-aided design (CAD) software, was explained in a recent article:

The difference between BIM and traditional design approaches is most striking when changes are made to the design. For example, if a steel structure is designed with traditional CAD tools, the drafted design might contain columns and beams with specific connections. If a column is removed to create a larger bay, the designer must recalculate the size of adjacent columns, resize beams, reanalyze load paths, and re-detail the connections. In object-oriented [i.e., BIM] design packages, . . . if a column is removed, the model will communicate with the remaining columns, adjust their size as necessary, change beam dimensions, and change the beam/column connections. . . . Thus, a change in the architectural requirements can ripple through the structural design without direct engineering involvement. The model can "design" itself based on rules embedded in the objects themselves. . . . Not only is this process efficient, it sharply reduces inconsistencies unforeseen when the design was modified.¹¹⁶

¹¹⁶Ashcraft, Jr., *Building Information Modeling: Electronic Collaboration in Conflict with Traditional Project Delivery*, 27 *Constr.Litig.Rep.*, Nos. 7–8, July–Aug. 2006, pp. 335, 336–37. For further discussion, see Wheatley & Brown, *An Introduction to Building Information Modeling*, 27 *Constr. Lawyer*, No. 4, Fall 2007, p. 33.

The goal of BIM is a paperless project in which changes to the specifications are seamlessly integrated with the rest of the design and simultaneously communicated to all the project participants. The BIM could also incorporate the project schedule (associating each phase of construction with when it is to be accomplished) and thus adjust the schedule if necessary (because of a delay in delivery of supplies or equipment, for example).

Widespread adoption of BIM by the construction industry faces serious legal impediments. BIM project delivery in many ways erases the distinctions among designer, builder, and component supplier. While the model is created in the architect's or engineer's office, it integrates contractor, vendor, and fabricator information into a seamless whole. BIM is a collaborative effort; yet the law allocates responsibility upon individuals. Who is responsible for design defects on a collaborative design? How is insurance coverage allocated?¹¹⁷ Who owns the copyright in a BIM model? All of these fundamental questions are exacerbated by the absence of standard form contracts governing BIM projects. As noted in Section 24.01, existing standard form contracts make written documents paramount over electronic information—an approach entirely inimical to the BIM process.

Practical considerations must also be addressed. The level of detail in a BIM model means that the design process must start much earlier than on a design-bid-build (or even fast-track) projects, with the key trades joining in the design collaboration process. Each of the many participants must have the software and know-how for dealing with the BIM model. Financial considerations also must be addressed. A BIM model creates an informational database of such detail as to eliminate the need for shop drawings, thereby eliminating the primary compensation methods of most architectural offices.¹¹⁸ For now, AIA B101-2007, Section 4.1.6, specifies that

¹¹⁷For example, a contractor's commercial general liability policy typically excludes coverage for professional services performed by the contractor. Would the contractor's input into the BIM model constitute professional services?

¹¹⁸"The economic *lingua franca* of most professional firms is the billable hour. The economic foundation of many design firms is built around the hordes of souls hunched over drafting tables creating drawing after drawing. BIM will render this practice obsolete." P. O'Connor, Jr., *Productivity and Innovation in the Construction Industry: The Case for Building Information Modeling*, 1 *J. A.C.C.L.*, No. 1, Winter 2007, pp. 135, 165.

architectural services performed on a BIM project are additional services deserving compensation separate from the basic fee.

To date, BIM projects have been limited to large owners, whether private or governmental.¹¹⁹ As experience grows and larger numbers of design firms adopt the technology, BIM's spread to smaller projects appears likely.

N. Summary

The modern variations described in this section developed because of weaknesses in the traditional system, particularly leisurely performance, divided responsibility, and complaints of subcontractors. However, time and the courts will test these new systems and reveal their deficiencies. This does not in any way diminish the utility of these variations, although it does impose a serious burden on those who wish to engage in them, to anticipate the problems in deciding whether to use a variant from the traditional process and to plan in such a way so as to minimize the difficulties, both administrative and legal.

SECTION 17.05 Administrative Problems

A. Overview

This chapter has examined how a construction project can be organized, mainly the problems of selecting the type of contract (fixed-price or cost), the type of contract system to use (single, separate, DB), and methods to bring efficiency to the management of the process (prime contractor, design professional, or construction manager). Throughout this chapter, reference has been made to the need for efficient organization of any project, principally emphasizing coordination of the activities of the various participants.

Yet another factor essential to construction efficiency must be examined. A successful construction project recognizes the importance of clear and efficient lines of

communication among the main participants. It is particularly important to know who has authority to bind the owner (with the hope that such a person can be identified and found), how communications (and there are many) are to be made, to whom they should be directed, and what the rules are for determining their effectiveness (effective when posted or when received?).

Communications are essential elements in the responsibility for defects (Chapter 24) and delays (Chapter 26) as well as equitable adjustments for unanticipated subsurface conditions (Chapter 25). (When those topics are discussed, communications problems will be addressed.) After a contract has been awarded and before performance begins, the participants must address these administrative issues openly and seek to make clear at the outset who speaks for whom, to whom and how communications are to be directed, and what the rules are for their implementation. Usually these issues are addressed at a preconstruction meeting attended by the representatives of the major participants in the process. This section deals with some of these problems.

B. Authority: Special Problems of Construction Contracts

Were the construction contract an ordinary one, it would be enough simply to read Chapter 4, dealing with agency and authority. However, special characteristics of the construction project make additional discussion essential. One factor relates to the multifaceted roles of an independent design professional engaged to design and monitor performance, to act as agent of the owner, to interpret and judge performance, and in general to be the central hub around which the process revolves. Using a construction manager does not clear up the problems, because the process revolves around two participants of often unclear responsibilities.

In construction projects that justify doing so, the owner may have a full-time site representative who observes, records, and reports the progress of the work. The representative (called a *clerk of the works*, *project representative*, *resident engineer*, or otherwise) can be a regular employee of the owner, an employee of the design professional, or CM and paid for either by the employer or by the owner, or an independent entity retained to perform this service. The representative's permanent presence invites difficulties, with the contractor often contending that he directed the work, knew of deviations, accepted defective work, or knew

¹¹⁹BIM has so far been used on large, complex projects such as stadiums, entertainment venues, and large commercial facilities. O'Connor, *supra* note 118 at 160. It was also used on the Denver Art Museum project. Cunz & Larson, *Building Information Modeling*, Under Construction, Dec. 2006, p. 1. The federal government's use of BIM is discussed in Silberman & McKee, *GSA's Building Information Modeling Program Raises Cutting-Edge Construction, Contracting, and Procurement Issues*, 41 *Procur. Lawyer*, No. 4, Summer 2006, p. 4.

of events that would be the basis for a contractor claim for a time extension or additional compensation.¹²⁰

Communication is vital to construction. Problems often develop that should be brought to the attention of the appropriate party. For example, any design difficulties should be reported to the design professional. If there are interventions by public authorities, clashes among participants, material shortages, or strikes—to name only a few problems—the owner and design professional or construction manager should be made aware of them. Early discussion of problems or potential difficulties should bring prompt corrective action, efficient readjustments, and the gathering of necessary information for the ever-present “claim.” A successful construction project requires clear lines of communication and their use.

Looking first at the traditional organization (CMs are discussed later), the design professional, though an agent of the owner, has limited authority;¹²¹ the authority of a project representative is even more limited.¹²² Which acts of the design professional or project representative will be chargeable to the owner? Before looking at that question, it is important to differentiate between acts of the design professional that bind the owner by principles of agency from those decisions made by the design professional as interpreter of the contract and judge of its performance. Although courts sometimes blur this distinction, this section concentrates on the first. Chapter 29 examines the second.

Generally the owner retains a design professional to provide professional advice and services, not to make or modify contracts or issue change orders. Although design professionals may enter into discussions with prospective contractors or even assist in administering a competitive bid, participants in the construction industry recognize that design professionals do not have authority to make contracts, modify them, or issue change orders on behalf of owners.

¹²⁰See Section 21.04H.

¹²¹*Crown Constr. Co. v. Opelika Mfg. Corp.*, 480 F.2d 149 (5th Cir. 1973). But an actual employee may have more authority. *Grand Trunk Western R. Co. v. H. W. Nelson Co.*, 116 F.2d 823 (6th Cir.1941) (employee design professional authorized to make important contract).

¹²²*Lemley v. United States*, 317 F.Supp. 350 (N.D.W.Va.1970), aff'd, 455 F.2d 522 (4th Cir.1971); *Samuel J. Creswell Iron Works, Inc. v. Housing Auth. of the City of Camden*, 449 F.2d 557 (3d Cir.1971); *Acoustics, Inc. v. Trepte Constr. Co.*, 14 Cal.App.3d 887, 92 Cal.Rptr. 723 (1971).

This does not mean that a design professional will never bind the owner. First, a design professional may be given express authority to perform any of these functions. For example, the design professional is frequently given authority to make minor changes in the work.¹²³ In addition, the design professional may be vested with certain authority that by implication includes other authority. For example, an architect who had the power to require that a contractor post a payment bond was authorized to represent to a subcontractor that such a bond would be required.¹²⁴

Similarly, the owner may, by its acts, cloak the architect with apparent authority. For example, suppose the architect directs major changes for which he does not have express authority. If the owner stands by and does not intervene to deny such authority or pays for the changes, either may represent to the contractor that the architect has apparent authority to order that work be changed.¹²⁵

Care must be taken to determine whether the principal—that is, the owner—has authority that can be exercised through its agent, the design professional. For example, suppose the engineer directs the contractor as to how the work is to be performed where this choice by contract is given the contractor. The owner would not have the authority to direct the methods. Any directions given by the engineer would not have to be followed any more than any direction by the owner. This is not an agency issue but one of contract interpretation.

Accepting defective work raises problems that are discussed in Section 24.05. A few points need to be made in this chapter, however. First, the design professional, when he is interpreter and judge of performance, decides whether work complies. If he decides the work is proper, he has not accepted defective work. Of course, his determination may be reversed by arbitrators or a court. However, if he determines that the work has not conformed, any acceptance by him constitutes changing the contract or waiving the owner's right to proper performance, neither of which he has authority to do, at least in the ordinary case.

Because of the failure to make this distinction, it is more likely that a design professional's acceptance of the

¹²³AIA Doc. A201-2007 § 7.4.

¹²⁴*Bethlehem Fabricators, Inc. v. British Overseas Airways Corp.*, 434 F.2d 840 (2d Cir.1970).

¹²⁵See Section 21.04C.

work, even defective work, will be considered to bind the owner. To preclude this result, many contracts provide that acts of the design professional, such as issuing certificates, will not be construed as accepting defective work.¹²⁶

As indicated earlier in this section, the construction process requires many communications among the participants. Clearly, a contract can provide that a notice can or must be given to the design professional. If this is the case, the notice requirement has been met if notice has been given to the design professional. The notice need not come to the owner's attention. In the absence of specific contract language of this type, will a notice that should go to the owner be effective if it is delivered to the design professional?

Because owner and design professional are closely related, and the law tends to be impatient with notice requirements if they appear to bar a meritorious claim, a notice given to the design professional will very likely be treated as if given to the owner. For example, in *Lindbrook Construction, Inc. v. Mukilteo School District Number 6*,¹²⁷ the contractor discovered unanticipated subsurface conditions substantially at variance with the contract documents. The contractor notified the architect and claimed an equitable adjustment in the price and additional time. The architect denied that the contractor was entitled additional compensation and directed it to proceed. The contractor completed the work and sued the owner.

The issue before the appellate court was whether the contract requirement of notice to the owner had been satisfied by giving notice to the architect. The court held that the architect was the only representative of the owner with whom the contractor had contact. It noted that the architect had complete knowledge of the changed condition and of the fact that the contractor was going to claim additional compensation. There was no evidence of a breakdown in communication between the architect and the owner, and the court noted that it would be unbelievable to assume that the architect did not notify the owner. The court held that the notice to the architect was imputed to the school district.

The dissenting judges argued that the architect's knowledge of the extra work could not be imputed to the owner because the architect had no authority to modify the con-

tract that required that notice be given to the owner. The architect was therefore, according to the dissenters, not operating within the scope of his authority, and the school district should not be bound. The dissenters also pointed to specific language stating that the architect could not commit the district to cost allowances and noted the importance of protecting public funds from unlawful expenditure.

Sometimes the notice problem is dealt with specifically by statute, such as provisions in mechanics' lien laws stating that notices can be given to the architect.

Are facts known to the design professional as if they were known by the owner? One case held that the notice of a limited warranty by a seller given to a mechanical engineer consultant bound the owner-buyer.¹²⁸ Similarly, a design professional's knowledge of the construction industry custom was held to be chargeable to the owner.¹²⁹

As noted earlier in this section, if the design professional has limited authority, the project representative has even less. Usually the project representative is simply authorized to observe, keep records, and report.¹³⁰ Use of a project representative is often accompanied by a document that describes these functions and limits the authority of any project representative.¹³¹ There is always a risk that a project representative will become overactive and seek to perform unauthorized activities, such as directing or accepting work. Although these are clearly unauthorized and the contractor should realize it, the contractor may submit and then later claim that these acts bind the owner. Usually, such assertions are not successful.¹³²

This section has assumed the traditional construction delivery system. However, the problem of authority may have to take into account the way in which an architect or engineer, in a traditional system, may differ from a CM. Again, great caution must be exercised in making generalizations because construction management is fluid and imprecise.

¹²⁸*Trane Co. v. Gilbert*, 267 Cal.App.2d 720, 73 Cal.Rptr. 279 (1968).

Nevertheless, the difference in professional status between a design professional and a CM will probably reflect itself in the extent to which acts of the CM may be held to bind the owner. In many instances, it may be difficult to distinguish the activities of regular employees of a sophisticated owner, such as members of an engineering department, from the activities of a program manager (PM) or CM. Even if the PM or CM is an independent entity, much of what either does, though resembling what design professionals were expected to do in the traditional system, is more geared toward the efficiency expected from the owner's own employees. As a result, it may be easier to establish apparent authority of a PM or CM than of a design professional.¹³³

To sum up, independent advisers such as design professionals, PMs, CMs, and project representatives, though agents of the owner, do not have actual authority to make contracts, modify existing contracts, accept defective work, or waive contract requirements on behalf of the owner. Yet doctrines such as apparent authority or ratification may, in a proper case, justify a conclusion that acts of these professional advisers will be chargeable to the owner.¹³⁴

C. Communications

A communication can be made personally, by telephone, or by a written communication. It is advisable to specify in the contract that a facsimile (fax) or electronic mail (e-mail) is a written communication. Generally, written communications should be required where possible. If it is not possible for a written communication to be made, at the very least a person making the oral communication should give a written confirmation as soon as possible. If the contract provision that deals with communications of notices does not state how communications are to be made, the communication can be made in any reasonable manner.

Usually, communications are signed. There may be challenges to fax communications, as the signature is not original. But the almost universal use of fax communications should not cause rejection of any fax as a valid communication on that basis.

Similar problems can accompany electronic mail. Electronic signatures can be made valid by compliance with the Electronic Records and Signatures in Global and National Commerce Act, effective October 1, 2000.¹³⁵ Digital signatures are simple to obtain and inexpensive.

Section 17.05B discussed the problems of authority and noted that it is essential to have designated persons with authority for each party to make decisions and to take responsibility. With regard to communications, each party should know to whom it should direct any particular communication. The authorized person should be designated by name in the contract and his address given. It is important to notify the other party if there has been a change in personnel and notices are to be sent to someone else.

If the contract does not designate time requirements for notices, any notice or communication required must be given within a reasonable time. Commonly the construction contract specifies time requirements. For example, AIA Document A201-2007, Section 15.1.2, requires a notice "within 21 days after the occurrence of the event giving rise to such Claim or within 21 days after the claimant first recognizes the condition giving rise to the Claim, whichever is later."

It is also important to designate whether days are working days or calendar days. Using working days raises problems because of weekends and various holidays and possible delays due to inclement weather. It is usually best, as AIA Document A201-2007, Section 8.1.4, states, to specify calendar days.

The absence of a base point, such as simply stating that a twenty-day notice must be given, can create difficulties. Does the notice period begin to run when the event occurred, when the contractor found out about its occurrence, when it could have found out about its occurrence, or when the event had sufficient impact on the work to cause the delay? Such a dispute would be best resolved by concluding that the period of time for giving notice began when it was reasonably clear that a delay would occur.

Suppose the owner justifiably notifies the contractor that the contract will be terminated unless the contractor pays certain subcontractors within ten days. When does the ten-day period begin? Suppose the letter was dated September 1, mailed September 2, and received September 4. Under such circumstances, when does the time period begin?

¹³³Turner Constr. Co., *supra* note 64 (owner bound by notice to CM).

¹³⁴See Section 21.04C.

¹³⁵15 U.S.C.A. § 7001 et seq.

It is likely that the time would begin when the letter is received. Doubts will be resolved against the letter sender because that party could have clarified any possible uncertainty. The receiver would probably expect the time period to begin to run when the letter was received, unless the receiver knew there had been an inordinate delay in the mail.

At the other end of the notice, suppose a contractor is asked to respond to a communication within ten days. The contractor posts the letter on the tenth day but the letter is not received until the twelfth. Has the contractor complied?

American law generally follows what is called the *mailbox*, or *dispatch*, rule. Posting a reply within the time period is effective unless it is made clear that actual receipt must be had within the time period. The mailbox rule will apply if the communication is sent by a reasonable means of communication. The mailbox concept, though developed in cases involving formation of contract, would very likely be applied to construction project communications.

Many difficulties discussed can be avoided by careful contract drafting. It is best to make absolutely clear when periods begin, when they conclude, and whether receipt will be effective when placed in the means of communication or whether a communication must be actually received.

Systems should be developed that make it likely that communications will be received and that proof exists that communications were sent and received. Although false claims of dispatch and receipt are rare, a carefully conceived and administered construction project should consider the importance not only of proving that notices

were sent or received but also of knowing when these events occurred.

Communications received and copies of communications dispatched should be logged and kept in readily accessible files. Such records should be kept for a substantial time after project completion, to deal with the possibility of long-delayed claims being asserted.

Contracts frequently set forth formalities to avoid difficult proof problems. During the course of contract administration, parties often dispense with formal requirements. If they do, there is a serious risk that the formal requirements have been eliminated by the conduct of the parties. For this reason, formal requirements should be complied with throughout contract administration. If the formal requirements must be dispensed with, it is important for the party who wishes to rely on the formal requirements at a later date to notify the other party that the dispensation of requirements on this occasion will not eliminate the formal requirements for the rest of the contract. Sometimes general conditions contain provisions stating that waiver of formal requirements in one or more instances will not operate to eliminate formal requirements in the future. These clauses may not mean much if the parties, by their conduct, show an intention to generally dispense with formal requirements.

Sometimes legal rights, such as the right to a mechanics' lien, may require compliance with statutory provisions for notices. Many problems that have been discussed in this section can arise when statutory notices are required. Particularly in the area of mechanics' liens, it is necessary to obtain and follow legal advice regarding notice requirements.

Competitive Bidding: Theory, Realities, and Legal Pitfalls

SECTION 18.01 Basic Objectives Reconsidered

The owner wishes to obtain a completed project that complies with the contract requirements as to quality, quantity, and timeliness at the lowest possible cost. Just as the organizational method and pricing discussed in Chapter 17 must take this into account, so must the method selected to designate the contractor.

In looking at cost—the factor most commonly emphasized in competitive bidding—attention must be directed not only to the bid price but also to other costs. For example, it is likely to cost more to conduct a competitive bid than to negotiate a contract. Similarly, the ultimate cost must take into account any administrative costs (called increasingly these days “claims overhead”) incurred to obtain the promised performance and resolve disputes. These costs are likely to be greater under competitive bidding because the low bidder’s performance and administration can increase the cost of monitoring performance and resolving disputes as well as create a greater likelihood of claims, thus increasing the ultimate contract price because of extra work.

The ultimate cost of a project should take into account the cost of maintenance and the durability of the project. Methods exist that take these factors into account.¹

Although many of these costs are difficult to quantify, any owner who can *choose* to have competitive bidding should take them into account. Techniques within the competitive bidding system can reduce some of these risks.²

¹Vickrey & Nicol, *Total-Cost Bidding—A Revolution in Public Contracts?* 58 Iowa L.Rev. 1 (1972) (bidders bid initial cost, guarantee maintenance costs, and give a price to repurchase goods: variables totaled and bid made to lowest total cost bidder).

²Comment, 130 U.Pa.L.Rev. 179 (1981) (competitive negotiation).

SECTION 18.02 Competitive Bidding: Theories and Some Pitfalls: Corruption

A succinct formulation of the principles that underlie competitive bidding are “competition in bidding sufficient to insure that the owner gets a fair price for the work; uniformity in the treatment of contractors to avoid favoritism; and the use of objective criteria and methods of evaluating contractor credentials.”³

Another more fleshed out description of these principles employed by an Ohio court states that competitive bidding “gives everyone an equal chance to bid, eliminates collusion, and saves taxpayers money. . . . It fosters honest competition in order to obtain the best work and supplies at the lowest possible price because taxpayers’ money is being used. It is also necessary to guard against favoritism, imprudence, extravagance, fraud and corruption.”⁴ This is a tall order.

Before examining competitive bidding as a mechanism to get the best work at the best price, it is helpful to look at the final objective noted by the Ohio court: that of guarding against corruption. As corruption can play a significant role in frustrating the goal of getting the best value for public funds, it strikes at the heart of public governance.

Competitive bidding is often used in private construction projects. This is done not only to get the best price but also because a private owner, often inexperienced in construction, may not be able to negotiate efficiently with a contractor whose business is to build.

³McMillan & Luschei, *Prequalification of Contractors by State and Local Agencies: Legal Standards and Procedural Traps*, 27 Constr. Lawyer, No.2, Spring, 2007, pp. 21, 27.

⁴*United States Constructors & Consultants, Inc. v. Cuyahoga Metro. Housing Auth.*, 35 Ohio App.2d 159, 300 N.E.2d 452, 454 (1973).

But emphasis will be placed in this discussion of corruption in public contracts. Here, the fear of corruption is greater and the need to account for public funds more crucial. Also, as a rule, construction work in the public sphere requires competitive bidding. Private projects can be made in any manner that the owner chooses.

Of late, much attention has been paid to corruption, particularly in international transactions. No longer is it winked at or easily dismissed as endemic to certain societies, as a method to bypass useless and burdensome rules, or as an efficient method to get public officials to do what they are supposed to do. Corruption is seen increasingly as a generator of useless infrastructure projects or senseless industrial projects. Corruption is expensive, adding greatly to the cost of all projects. It not only holds back economic progress in lesser developed countries, but can bring down governments and create regional instability.

Unfortunately, corruption is seen as endemic to construction, particularly public construction. It is, as seen above, one reason for competitive bidding. Why is corruption so readily linked to construction?

Construction is a risky business. Contractors operate on small profit margins. Yet there is, as a rule, no shortage of those who seek construction contracts. The press will announce that a particular contractor has “won” or been awarded a contract. Certainly, the bidders think that profit can be made despite a fixed-price contract placing the risk on the contractor of almost all events that increase construction cost. How does corruption enter the picture?

In the course of construction, many events occur that can be the basis of a contractor asking for more money. Design is an ongoing process. Often, there is the need for redesign coupled with a contractor request for more money through the changes process. Interpretation of construction documents raises issues that must be resolved by the parties. It is almost impossible to express clearly and completely what the designer seeks. Events occur that are unforeseen and raise costs. Compliance control requires inspections. These and other events often generate claims in fixed-price contracts. Even in cost-type contracts there can be disputes over allowable costs.

How claims are handled depends on the honesty and intelligence of those officials administering the contract. Corruption can generate interpretation decisions that

favor the contractor at the expense of the public agency that result in over-generous settlements.

Of course, there can be corruption even when there is competitive bidding. There can be a corruption-generated decision to exempt a project from competitive bidding. The corrupt official may reveal submitted bids to a bidder before the deadline for bid submission. She may be induced by a bribe to decide whether a bid conforms or whether to waive an irregularity in the bidding. A particular alternative can be selected because an official has been bribed.

Despite the corruption in the competitive bidding process itself, competitive bidding creates transparency and openness that, along with a free and vigorous press, can create an atmosphere that discourages or exposes corruption.

Moving back to assumptions that underlie competitive bidding, it assumes that goods or services requested can be objectively evaluated or compared, preferably before award, or at least after. An award for pencils of a standardized type is an illustration. All pencils would be comparable, and all that would be needed would be to compare prices. If a number of competing sellers will bid, the price should be as low as can be obtained.

Even here, performance uncertainties exist. Will the party awarded the pencil contract deliver as promised? But if it does not, replacement pencils could be obtained and the excess procurement cost charged to the contractor or its surety.

As an example of different approaches, California held that a public award for a construction manager must be made competitively,⁵ whereas Massachusetts held that competitive bidding was not required to purchase an existing vessel for use as a ferry boat.⁶ The Massachusetts court noted that competitive bidding does not work well where the various properties offered for purchase are not identical, as in the sale of real property. This non-comparable factor is a reason given for holding that turnkey contracts for public housing are not subject to the requirement for competitive bidding.⁷ However, the same

⁵*City of Inglewood—L.A. County Civic Center Auth. v. Superior Court*, 7 Cal.3d 861, 500 P.2d 601, 103 Cal.Rptr. 689 (1972). But see Section 17.04D.

⁶*Douglas v. Woods Hole, Martha's Vineyard, & Nantucket S.S. Auth.*, 366 Mass. 459, 319 N.E.2d 892 (1974).

⁷*United States Constructors & Consultants, Inc. v. Cuyahoga Metro. Housing Auth.*, supra note 4. See Section 17.04E.

argument can be made in favor of permitting a negotiated contract for a construction manager. Yet the California court was more impressed with the need for competition as a method of reducing costs.

A procurement for the award of police cars that would meet designated standardized performance specifications would fit the competitive bidding model. Either before or after award, testing can be done to determine whether the bidders have prototype vehicles that will comply or have complied with the specifications. Again, there can still be the problem of predicting whether all the cars will conform and be delivered on time.

The principal objective of the awarding agency will be frustrated if the performance standards are not met. Time has been lost and the objective is not yet accomplished. Even if the successful bidder is financially solvent or has furnished a surety bond, the objective has still not been achieved. Collecting for nonperformance certainly was not the objective of the procurement.

The difficulty of predicting whether a prospective bidder will be able to meet the performance standards is an important reason why competitive bidding is rarely used in research and development contracts. In these procurements, the agency must find a contractor who has the technological skill to perform properly. Unless accompanied by some preselection process, competitive bidding may not be the best method to select a process in such a procurement.

Although most construction work is not as sophisticated or experimental as building nuclear submarines or space capsules, some elements in construction work do not make it perfectly suitable for competitive bidding. First, how likely are prospective bidders to be willing and able to do the work they promise? Second, how difficult is it to determine whether they have done the work they promised? Third, what is the likelihood that the actual price will substantially exceed the contract price for reasons other than owner-directed changes or circumstances over which neither party had control?

The competitive bidding process can be structured to minimize some of these risks. The invitation may state that the contract will be awarded to the lowest *responsible* or lowest and *best* bidder. Preselection can screen out bidders who do not have the requisite competence or capacity. Nevertheless, despite these provisions, the likelihood of success depends on the integrity and ability

of the contractor—often difficult to measure in competitive bidding, where the tendency is to look solely at price.

Competitive bidding also assumes free bids and true competition. If bidders collude to “take turns” or submit fictitious bids, antitrust laws are violated and competitive bidding cannot accomplish its objective of obtaining the lowest price. Although construction is, on the whole, fiercely competitive, collusion between competitors in the competitive bidding process is not unknown.

James Cape & Sons Co. v. PCC Construction Co. was recently decided by a federal court of appeals.⁸ It illustrates corruption in competitive bidding as well as the remedial difficulty for the contractor who has been victimized by the bid riggers.

A group of road contractors, not including the plaintiff Cape, created a group that rigged the state transportation department’s bidding process from 1997 to 2004. The group discussed projects soon to be bid, shared information, discussed potential competitors, and “set bids amongst themselves in an attempt to allocate projects between them.”⁹ (All later pleaded guilty to criminal charges.)

One member of the group contacted Beaudoin, a key Cape official, the plaintiff in the case. Beaudoin gave confidential information to the group often just before bid submission. The group members used this information to make their bids and further the bid rigging. Cape sued the group members and Beaudoin.

The court rejected Cape’s claim under the antitrust laws and the Racketeering Influenced and Corrupt Practices Act (RICO). The latter statute was aimed at organized crime but has been used in many civil claims. Other than a claim, probably worthless, against its employee Beaudoin, what avenues are open to Cape who should have received the award? Can it challenge the award as one obtained by corruption, though not the corruption of the awarding authority? It appears that Cape waited too long to do this. Can it make a claim for lost profits based upon unjust enrichment against any member of the bid rigging group that won contracts it should not have gotten?¹⁰

⁸453 F.3d 396 (7th Cir.2006).

⁹Id. at 398.

¹⁰This has had mixed success. See *infra* notes 159, 160.

Anticompetitive devices can be found in competitive bidding. If product specifications do not provide for alternative products and a viable method for substitutes, competitive pricing may be unduly restricted. Also, specifying a particular product may create a warranty of commercial availability by the awarding authority to the bidder. New Jersey prohibits specifications in local public contracts that limit free and open bidding, such as specifying brand names without allowing equivalent products to be substituted.¹¹

Another weakness of competitive bidding is the difficulty of involving the contractor in the design process. This can be alleviated by using a construction manager¹² or, in the extreme case, the design–build process.¹³ But the traditional contract system, where the owner supplies a design prepared by the design professional and submits it to the contractors for competitive bidding, generally fails to employ any design skills of the contractors.

Some competitive bidding systems permit *alternative bidding*.¹⁴ The design professional prepares a design for one method of conventional construction and, in addition, prescribes parameters and other specific configurations or finish requirements for the alternate. Performance specifications for allowed alternates are usually included in the contract documents. The contractor can select the alternative design or bid on the design supplied. However, this method is limited to those projects where the design professional is aware of another viable design solution. Another limitation to alternative bidding is the greater likelihood of disputes as to responsibility and liability.

Prebid design, or what federal procurement calls “two-step” formal advertising (discussed in Section 18.03D), is another method of involving the contractor in the design. This employs a competition first on design, then on price, similar to the Brooks Act, under which design services are procured for federal projects.¹⁵

To sum up, the competitive bidding system is presently, and is likely to continue to be, the major method of obtaining construction contractors. However, competitive bidding has pitfalls, and in the proper circumstances,

serious thought should be given to another method of obtaining a contractor.

SECTION 18.03 The Competitive Bidding Process

A. Objectives

Competitive bidding should result in contract awards made impartially at the lowest price. Nonconforming bids are usually disregarded because conformity is needed for a proper comparison of bids and to give each bidder an equal opportunity. The competitive bidding system cannot function properly unless honest and capable bidders have enough confidence in the fairness of the system to submit bids. Submitting a bid proposal is expensive and time consuming. The bidders are entitled to reasonable assurance that they will be treated fairly and that the owner will follow its own rules.

No effort will be made here to cover every aspect of the competitive bidding process. Most public agencies have standard forms for the competitive bidding process, and they are often regulated by statutes, regulations, and ordinances. Private owners often have engaged in substantial construction work and have also developed their own forms and methods. Design professional associations have developed standard or recommended forms for bidding documents. They are usually available to the design professional. The principal objective of the following subsections is to present an overview of the process.

B. Invitation to Bidders

The initial step in conducting a competitive bid is the *invitation to bidders*. In federal procurement, this is known as *the request for bids (RFB)*. Public agencies are frequently required to invite bids by public advertising. By using the broadest dissemination, such as trade newspapers, professional journals, and government publications, the largest number of bidders can participate. This gives all bidders a chance and should obtain the lowest price.

Although inviting the maximum number of competitors should result in a lower price, dangers exist in having too many bidders. Good bidders may be discouraged if the large number of bidders makes their chances of winning quite remote.

¹¹N.J.Stat.Ann. § 40A:11-13.

¹²See Section 17.04D.

¹³See Section 17.04E.

¹⁴See Section 18.03G.

¹⁵See Section 11.03.

Ordinarily, the invitation to bidders is not an offer and does not create a power of acceptance in the bidders. It is a request that bidders make offers to the owner that can be accepted or rejected.

But the invitation is an important document and must be drafted carefully. It sets up the ground rules for the competitive bid. If a contract is formed with one of the bidders or if the successful bidder refuses to enter the contract, the invitation may have legal significance. Of course, the invitation can be modified by formal agreement between the owner and the successful bidder, but as noted in Section 18.04G, the formal contract may simply create a memorandum of what has been agreed to in the invitation and the bid proposal.

C. Prequalification

Devices are available to avoid the competence risks inherent in the price-oriented competitive bid. In addition to a statement that the award will be made, if at all, to the lowest responsible or the lowest and best bidder, a prequalification system can be used. Increasingly prequalification is used in public projects, extremely large projects, high-profile projects, and projects that use new construction techniques.

The owner selects a group of bidders, all of whom are likely to have the capability of doing a competent job. The design professional or construction manager may request information from specific contractors on prior jobs completed, capital structure, machinery and equipment, and personnel (including supervisory personnel). After evaluating this information, the owner's professional adviser usually decides which contractors should be permitted to receive an invitation to bid.

Three choices need to be made to implement the prequalification system. One is to delineate exclusive from nonexclusive bidding for a particular project. On an exclusive project the owner receives bids only from prequalified bidders. Nonexclusive projects are those on which the owner will receive bids from both prequalified bidders and those not prequalified. The cost to bidders of the prequalification process may deter bidders that will have to face those who are not prequalified. But the openness of the nonexclusive system can avoid the charge of limiting competition and increasing the risk of corruption.

Another choice is between specific and programwide qualification. Specific means preselected for specific projects. Programwide means qualification for certain types, such as expressways or subways. Programwide can sharpen the criteria and also act as an incentive to incur the expense of participation.

The program may be full or limited. Full means unconditional prequalification. Limited prequalification may apply conditions to qualification, such as financial capacity, bonding capacity, or limits on the dollar amount.¹⁶

The advantage to prequalification is that there is a better chance of finding a good contractor. However, administrative time and expense will be expended in making this preselection or prequalification, and the competitive aspect is likely to be diminished. Similarly, experience requirements that are too narrowly drawn or drawn to favor a particular bidder can also be an indication of corruption and may infect the entire prequalification process.

D. Two-Step Process

The federal procurement regulations sometimes permit a two-step formal advertising procedure. This is used where definite specifications cannot be prepared and offered for fixed-price competitive bids. As a first step, unpriced technical proposals are solicited to meet certain requirements specified in the solicitation for proposals. Typically, these requirements are for an end product. All proposals received are evaluated, and those considered to be within the range of acceptability are discussed with the proposers to obtain clarification and more detailed definition.

The second step is a request for price bids from all those whose first-step proposals met the criteria specified in the original solicitation for proposals. Award is then made in accordance with the procedures for awarding a fixed-price contract, with each bidder pricing its own technical proposal previously approved as having met the specified criteria.

E. First Article

In procuring products or equipment, the federal government can protect itself from having to wait for a product that may not be adequate by inserting a "first article"

¹⁶For a thorough canvassing of prequalification, see McMillaan & Luschei, *supra* note 3.

clause. This clause requires the contractors to deliver for government testing a preproduction model of what the contractor has agreed to furnish.

F. Deposits

In public procurement and occasionally in private procurement, the invitation requires the bidder to deposit a bid bond, a cashier's check, or a certified check to provide security in the event that the bidder to whom the award is made does not enter into the contract. The amount is either a stated percentage of the bid or a *fixed* amount determined by a designated percentage of the estimated costs made by the design professional.

The invitation should also state how long the securities will be held, which is important to bidders. After award, the owner should release the securities of all but the lowest three or four bidders. The bidder to whom the award is made may not enter into the contract. It still may be possible under some circumstances to hold the next lowest bidder. However, there is no justification for holding the securities of bidders who are not likely to be awarded the contract. After the successful bidder signs the contract, all securities should be released.

Usually the bidders must make a small monetary deposit when they request information to study a possible proposal. This may discourage people who are not serious about making a bid proposal from obtaining the plans and specifications merely out of curiosity. The deposit is usually refunded when the bidding documents are returned.

G. Alternates

Sometimes larger projects can be divided into designated stages. The owner may decide not to build the entire project if it does not have the money or if bids are too high for certain portions of the work. For this reason, the invitation to bidders can be divided into the stages or project alternates. But alternates can mean that favoritism can be accomplished by the award. For example, there may be an invitation to bidders involving a hospital, housing for staff, and a parking structure. One alternate could be the hospital alone. A second could be the hospital with the parking structure, and a third the hospital with the staff housing. One bidder may be low on the total bid. Another

bidder may be low on the first alternate, another on the second, and another on the third. The determination of which alternate is to be awarded may be based on favoritism to one of the bidders. To avoid this difficulty, the invitation to bidders should state the preferred alternate choices.

The same type of award manipulation is possible if the alternates consist of different methods of construction or materials. A list of preferences within price limits should avoid suspicion of possible favoritism.

H. Information to Bidders

Information to bidders—called in federal procurement *the information for bids (IFB)*—accompanying the invitation usually consists of drawings, specifications, basic contract terms, general and supplementary conditions, and any other documents that will be part of the contract. Sometimes soils test reports are included. Alternatively, the information to bidders may state that designated reports are available in the office of a particular geotechnical engineer or the design professional, for examination by bidders. Subsurface information is discussed in Section 25.03.

Bidders should be given adequate opportunity to study the bidding information, to make tests, to inspect the site, and to obtain bids from subcontractors and suppliers. For example, under AIA Document A201-2007, Section 3.2.1, the contractor represents that it “has visited the site, become generally familiar with local conditions . . . and correlated personal observations with the requirements of the Contract Documents.” Even when there is adequate time, bidders often wait to complete their bids until the bid closing deadline is imminent. Generally, this is due to reluctance on the part of subcontractors to give sub-bids to bidders until shortly before the deadline for bid submissions. (The reasons for this reluctance are explored in Section 28.02C.) Even if bidders do not make proper use of the time available to them, having allowed reasonable time for bid preparation can be helpful to the owner if a dispute arises over claimed computation errors or unforeseen subsurface conditions.

The drawings and specifications should be detailed and complete so that bidders can make an intelligent bid proposal. Imprecise contract documents and much discretion to the design professional may discourage honest bidders from submitting bids and may encourage bidders of doubtful integrity who make low proposals in the hope

that they will later be able to point to ambiguities and make large claims for extras.

The information to bidders can specify that any uncertainties observed by the bidder must be resolved by a written request for a clarification to the design professional before bid opening. Any clarification issued should be in writing and sent to all people who have been invited to bid. The law increasingly requires that under certain circumstances the party conducting the competitive bid must disclose information in the bidding documents (discussed in Section 18.04B).

I. Bid Proposals: Changes

Bid proposals should be submitted on forms provided by the owner. To properly compare bids, all bidders must be proposing to do the same work under the same terms and conditions. The bid proposal form should include or refer to any important disclaimers contained in the bidding information. Such disclaimers include denying responsibility for subsurface information and specifying any rules that seek to govern the rights of the bidder to withdraw the bid, such as limiting withdrawal to clerical errors or setting forth other requirements, such as a deadline for claiming mistake.

The bid proposal should be signed by an authorized person. If the bidder is a partnership, the entire name and address of the partnership should be given. If the bidder is a corporation, the bid should be signed by appropriate officers and the corporate seal should be attached. It may be desirable to attach to the bid a resolution of the board of directors approving the bid.

Invitations can preclude bids from being changed, corrected, or withdrawn after submission. However, there is a tendency toward more flexibility. More commonly, invitations permit changes, corrections, and withdrawals of submitted bids before bid opening.

Permitting changes can help the owner by permitting and encouraging reduction of bids in a changing market. However, overliberality in permitting changes, corrections, and withdrawals may cause bidders to lose confidence in the honesty of the bidding competition. Where the right to change is given, it may be limited to reducing the bid. If changes, corrections, or withdrawals are to be permitted, the invitation can limit such a right to a designated time period and require that any change, correction, or withdrawal be expressed in writing and received by the owner by a designated time.

The owner should keep all the records connected with the bidding process. Time logs should be kept that show exactly when the bidder obtained the bidding information. Changes in bidding information should be sent to all people who have picked up bidding information, with copies of the changes kept for future reference. After the bidding information is disseminated, changes should be kept to a minimum.

J. Bid Opening

Bid proposals are sent or delivered in a sealed envelope to the owner or the person designated to administer the competitive bidding, such as a design professional or construction manager. In public contracts, bids are opened publicly at the time and place specified in the invitation to bidders. Usually the person administering the process announces the amount of the bids and the bidders. The invitation specifies a designated period of time in which the owner can evaluate the bids. At bid opening, care must be taken to avoid any impression that the low bidder has been awarded the contract. Often the person administering the process states that a particular bidder is the “apparent low bidder.”¹⁷

In private competitive bids, the invitation can state that bids need not be opened in public. When the bid opening is private, the bidders, at least at that time, are not able to compare their bids with the others. This minimizes the likelihood that the low bidder will begin to suspect a bidding error if its bid is much lower than the others. One case involved the successful bidder not finding out that its bid had been much lower until it was well into the project. At that time, it threatened to walk off the project unless it was given a price adjustment, claiming that the owner must have known its bid was erroneous. Although the court did not grant relief to the contractor, its determination to grant the contractor relief on another theory was probably affected by the belief that the owner should have notified the contractor of the wide discrepancy between its bid and the others.¹⁸ This may reflect the law beginning to impose on contracting parties, or even those in the process

¹⁷In *McCarty Corp. v. United States*, 204 Ct.Cl. 768, 499 F.2d 633 (1974), the contracting officer stated that the plaintiff was the “apparent low bidder.” This, among other facts, precluded a finding that the plaintiff’s bid had been accepted.

¹⁸*Paul Hardeman, Inc. v. Arkansas Power & Light Co.*, 380 F.Supp. 298 (E.D.Ark.1974). This case is discussed again in Section 33.01.

of making a contract, an obligation of good faith and fair dealing, such as drawing attention to a possible mistake. A private bid opening may tempt the owner not to notify a bidder when it is apparent that a mistake has been made.

K. Evaluations of Bids

Some legal problems relating to bid evaluations and awards are discussed in Sections 18.04E and F. This section outlines some steps that should be taken when evaluating bids.

First, the owner or its representative should follow the procedures set forth in the invitation to bidders. The bids should be checked to see whether they conform. A nonconforming bid is a proposal based on performance not called for in the invitation or information or offering performance different from that specified. A deviation is material if “it gives the bidder a substantial competitive advantage and/or prevents other bidders from competing on an equal footing.”¹⁹ Nonconformity may relate to the work, the time of completion, the bonds to be submitted, or any requirements of the contract documents. Bidding documents sometimes allow the owner to waive bidding technicalities. This allows the owner to accept the lowest bid despite minor irregularities. However, advance notice that technicalities can be waived can encourage careless proposals and may also create the impression that favoritism may be shown to certain bidders. If a bid is not in conformity and the defect cannot be waived, the bid must be rejected. This will be discussed in Section 18.04D.

Second, the owner should examine the invitation to bidders to determine whether any bid must be accepted. Typically, the invitation reserves the right to reject all bids. The invitation must be reviewed to determine the basis for making an award if one is made. Commonly, the award is to be made to the lowest responsible or lowest and best bidder. Responsible means the bidder must have “the necessary technical, managerial and financial capability and integrity to perform the work.”²⁰

To determine the lowest responsible bidder, the owner can take into account the following factors as well as any others that bear on which bidder would be most likely to do the job properly:

1. expertise in type of work proposed
2. financial capability

3. organization, including key supervisory personnel
4. reputation for integrity
5. past performance

These examples relate to the basic objectives of obtaining a contractor who is likely to do the job properly at the lowest price and with the least administrative cost to the owner.

A recent federal procurement case demonstrates the inclusion of integrity and business ethics as an evaluation criterion applied to bidders. The regulations in effect at the time of the invitation required the contracting officer (CO) to make an affirmative determination that the bidder has “a satisfactory record of integrity and business ethics.”²¹ A federal appeals court ruled that this determination by the CO can be reviewed by the court under the difficult to overturn “rational basis” standard.²²

Experience in the type of construction work being procured is an important selection criterion. However, overemphasis on experience or drawing the experience factor too narrowly carries great risk. It can result in a loss of qualified bidders that will increase the price. It can also generate a corrupt award and violate the competitive bidding laws.²³

In contracts for the purchase of machinery, bid evaluation should take into account the following factors:

1. length and extent of warranty
2. availability of spare parts
3. service and maintenance
4. cost of replacement parts
5. cost of installation
6. durability

Although the owner should evaluate criteria other than price in selecting a contractor, awarding the bid to someone other than the low bidder raises a substantial risk of a lawsuit challenging the award. Sometimes bid awards in public contracts can be judicially challenged. This should not deter even a public owner from awarding the

¹⁹48 CFR § 9.104-1(d) (2007).

²²*Impresa Construzioni Geom. Domenico Garufi v. United States*, 238 F.3d 1324 (Fed.Cir.2001).

²³See *Gerzof v. Sweeney*, 16 N.Y.2d 206, 211 N.E.2d 826, 264 N.Y.2d 376 (1965), discussed in Section 18.04J. In that case, experience requirements were so tightly drawn that only one bidder qualified. This made the award illegal.

¹⁹Construction Briefings, Jan. 2005, p. 7.

²⁰Construction Briefings, Jan. 2006, p. 10.

contract to someone other than the low bidder. However, compelling reasons for not awarding it to the low bidder must exist and be documented.

Third, if bidders were asked to bid separately on project alternates, the owner should determine whether any bidders had made “all-or-nothing” bids. Such a bid indicates an unwillingness on the part of the bidder to perform any part of the project except the entire project. An all-or-nothing bid is permitted unless the invitation specifically precludes it.

L. Notification to Bidders

When the successful bidder is selected, the successful and unsuccessful bidders should be officially notified. However, sometimes with or without legal justification, the successful bidder will not enter into the contract. For this reason, the notification to unsuccessful bidders should state that their bids still remain available for acceptance by the owner for the period of time specified in the invitation to bid. This is done to preclude any later contention that awarding the contract released the unsuccessful bidders.

M. Postaward Changes

If the owner changes the contract terms after the bid has been awarded and the change makes the obligation less burdensome to the successful bidder, this can be unfair to the other bidders. For this reason, such changes should be done with caution. (*See Conduit and Foundation Corp. v. Metropolitan Transportation Authority*, reproduced in Section 18.04D.)

N. Signing the Formal Contract

The successful bidder is sent to the formal contract for signature or requested to meet at a specified time and place to sign the formal documents. Records of all correspondence should be kept in the event that subsequent disputes arise between the owner and the contractor relating to the bidding process and awarding of the contract.

The successful bidder must enter into the formal contract awarded unless legal grounds exist for refusal (discussed in Section 18.04E). The effect of signing the formal contract, as well as such signing’s effect on bidding documents and the function of the formal contract, is discussed

in Section 18.04G. Because the date the contract has been made can measure the time commitment, this is discussed in Sections 26.02 and 26.04.

O. Readvertising

Sometimes the bids are all too high and the owner decides to readvertise the project. In public contracts, there are procedures for readvertising, which require time and administrative expense. Some feel that readvertising without reducing the scope or quality of the project is unfair because it is an attempt to beat down the bids of the contractors, often resulting in deficient workmanship and substandard materials. Readvertising frequently means higher bids from all bidders because the less skillful bidders have seen what the more skilled bidders have bid.

P. Special Rules for Public Contracts

Owners generally seek a construction contract that will give them the balance they choose among quality, timely completion, and cost. On the basis of these criteria, the owner looks for a contractor who will do the best work at the best price.

Looking only at the project and these goals, the owner will not be concerned with the racial or gender characteristics of the contractor’s labor force, the wages the contractor pays its employees, and the source of the supplies. Obviously, this lack of concern is not absolute. The owner could be concerned with the wages if it felt that workers who were not paid the prevailing rate would not perform properly. The source of the supplies could be important if the owner felt that supplies from certain sources were higher quality. But on the whole, the owner who wishes to obtain the best price through competitive bidding or through negotiation must give broad latitude to the contractor in these matters.

Public contracts, however, involve billions of taxpayer dollars. Elected officials frequently look to the procurement process and public spending as ways of accomplishing goals that go beyond the best quality at the best price. In doing so, they often respond to interest groups who also see procurement as a means of obtaining their objectives. The federal government has been the pioneer in using the procurement process to achieve social and economic objectives. State and local public agencies and

even some private owners have also begun to see procurement in this light.

This book cannot deal in detail with the many rules that seek to achieve a variety of objectives through the public contract process. However, some goals sought to be achieved by the public contract process are as follows:

1. Providing employment opportunities to disadvantaged minorities, women, handicapped persons, or disabled war veterans.
2. Setting aside certain procurement awards for small businesses or disadvantaged minorities.²⁴
3. Favoring contractors, suppliers, or workers who reside in a particular state or city.²⁵
4. Awarding contracts to bidders located in economically depressed areas.
5. Ensuring that workers are paid at the local prevailing wage rate (Davis-Bacon Act).²⁶
6. Avoiding corruption in procurement.
7. Protecting American manufacturers.²⁷

²⁴The leading case is *Adarand Constructors, Inc. v. Peña*, 515 U.S. 200 (1995) (racial classifications require strict judicial scrutiny). The *Adarand* case generated considerable litigation. The last opinion was *Adarand Constructors, Inc. v. Mineta*, 534 U.S. 103 (2001). The litigation is catalogued in 23 Constr.Litig.Rep. 26 (2002). State affirmative action programs that comply with federal regulation, such as the Federal Highway Act, are likely to be enforced. There is a compelling governmental interest in dealing with past discrimination in the national construction market. These programs will be allowed if they are narrowly tailored. *Northern Contracting, Inc. v. Illinois*, 473 F.3d 715 (7th Cir.2007). See generally, Day, *Retelling the Story of Affirmative Action: Reflections of a Decade of Federal Jurisprudence in the Public Workplace*, 89 Cal.L.Rev. 59 (2001).

²⁵As to local workers on a state funded project, see *United Building & Constr. Trades Council v. City of Camden, et al.*, 465 U.S. 208 (1984). The Court held that the city cannot discriminate against out-of-state residents on matters of fundamental concern. That the city is putting up some of the money is an important factor, that permits them to prefer locals. If it can demonstrate a substantial reason for different treatment (to reverse white flight, help depressed city, etc.), this might be lawful. The court sent the case back to the trial court for findings on this issue.

²⁶Many states also have such laws. As an illustration, the Massachusetts law was interpreted in *Teamsters Joint Contract No. 10 v. Director of Dep't of Labor and Workforce Development, etc.*, 447 Mass. 100, 849 N.E.2d 810 (2006).

²⁷For a discussion of the Buy America Act and the difficulties of determining what is foreign content, see West & Handwerker, *How the BAA Affects Construction Contractors*, 32 Proc.Lawyer, No. 3, Spring 1997, p. 3. Many states require that preference be given to materials made in that state in state contracts.

8. Encouraging trade unions.²⁸
9. Ensuring compliance with workplace, environmental, and civil rights laws.²⁹

Another component of the public bidding process is to obtain the best price for the materials used on the project. Specifications which are overly restrictive as to the type of materials or products to be used can result in an individual manufacturer becoming the sole source for the project. To avoid placing manufacturers in a monopoly position, the federal government and many states require that the specifications on public works projects permit the supply of brands "equal" to those specified.³⁰

Public entities, particularly cities, have sought and increasingly seek to influence the conduct of domestic and even foreign business through their procurement policies.

At the domestic level some public entities give preference to those with child care facilities on the premises, or refuse to do business with companies that do not give rights to domestic partners. As an unusual example, an Illinois county awarded a slightly more expensive food-service contract for inmates to a nonprofit agency that also provided food-service training for the mentally handicapped.³¹ At the foreign level the invitation may bar those who deal with certain foreign countries.

Often these policies are challenged, sometimes successfully. In any event, these attempts to use public procurement to influence foreign and domestic policies make doing business with public entities more tenuous and fraught with uncertainty.

Clearly, such rules have their costs. In addition to higher bid prices, administrative costs are likely to be incurred by all participants to see that these rules are followed. These costs may be worth incurring if they accomplish the objectives sought. However, attempts to use the

²⁸See Section 23.05B dealing with Project Labor Agreements (PLAs).

²⁹Toward the end of the Clinton administration, the president issued regulations requiring federal contracting agencies to consider the bidder's history of compliance with federal laws before awarding the bidder any government contracts. The bidder would have to certify that for three years it had been in compliance with federal laws and had a satisfactory record of integrity and business ethics. President Bush rescinded these rules shortly after he entered office. See Sherrill & McQueen, *The High Price of Campaign Promises: Ill-Conceived Labor Responsibility Policy*, 30 Pub.Cont.L.J. 267 (2001).

³⁰Federal Acquisition Regulation (FAR) §§ 52.211–216 (2007); West Ann. Cal. Pub. Cont. Code § 3400.

³¹*Court Street Steak House, Inc. v. County of Tazewell*, 163 Ill.2d 159, 643 N.E.2d 781 (1994) (within discretion of county).

public contract process for these objectives have generated intense controversy, both as to the fairness of the programs and as to whether the objectives can be accomplished in a different way at a lower cost.

Every aspect of awarding public contracts, especially competitively bid awards, must avoid even the appearance of impropriety. For example, public officials who make procurement decisions are expected to have the interests of their agencies in mind and avoid conflict of interest.³²

As a result of public concern over contract awards, public officials often are rigid and unbending in such matters as bidding irregularities and withdrawal of bids.

SECTION 18.04 Some Legal Aspects of Competitive Bidding

Some sections in this chapter describe issues that are encountered before the actual construction process begins, such as the requirement that the award be made by competitive bidding³³ and the duty of the awarding authority to disclose information to prospective bidders.³⁴ Some deal with the bidding and award processes.³⁵ Others examine mistakes made by bidders (the most litigated issue) and whether they should be given some relief.³⁶ One section relates to the need for a formal contract.³⁷ Another discusses the legal nature of the bidding documents.³⁸ Others treat security given the awarding authority,³⁹ the process of judicial review,⁴⁰ and the effect of an illegal award.⁴¹

Where the owner has the choice of whether to select a contractor by competitive bidding or by negotiation, it must take into account the likelihood of disputes that may develop in competitive bidding. To those who must be a part of the competitive bidding process, the legal issues should be understood and methods developed to avoid litigation.

A. Obstacles to Competitive Bidding

Generally, public contracts must be awarded through competitive bidding. An improper use of the exceptions that allow negotiation can frustrate this. This can be an issue if change orders are given to the contractor performing the work. To get the best price, statutes often specify that changes over a specified amount must be awarded through competitive bidding.⁴² (This can create site access, delay, and operation problems, just some of the reasons why awarding authorities often seek a way to avoid the need for competitive bidding on existing projects.)

As noted in Sections 18.02 and 18.03A, competitive bidding should enable the awarding authority to get the best price and the greatest assurance of a successful completion. To do this the process assumes that all qualified bidders will be given a chance to bid and that the award will be made on objective criteria and not favoritism.⁴³

Opening the process to all qualified bidders can be frustrated if some potential bidders are excluded. A pre-selection process can unduly restrict the number of bids received.⁴⁴

A relatively new challenge to this objective can be posed by the use of a Project Labor Agreement (PLA).⁴⁵ PLAs are designed to keep labor peace. All contractors and subcontractors, union or nonunion, are required to enter into the PLA. Uniform terms and conditions of employment are achieved by requiring that all contractors designate a particular union to be the collective bargaining representative of all workers on the project.

Nonunion contractors often claim, usually without success, that a PLA restricts competition to union contractors, reducing the pool of bidders and depriving the awarding entity of getting the best price.⁴⁶

B. Duty to Disclose

The early common law rarely obligated a contracting party to disclose information that the other party would want to know. Contracting parties were generally expected to

⁴²Section 21.04B.

⁴³Section 18.03G (selection between alternates can be based on favoritism).

⁴⁴Section 18.03B.

⁴⁵For more discussion see Section 23.05B.

⁴⁶*Ibid.*

look out for themselves. They could not make deliberate misrepresentations but could conceal matters within their knowledge, even if they knew that the other party would want to know these matters.⁴⁷ But currently the common law is likely to require disclosure of vital information that the other party is not likely to discover.⁴⁸

This has been reflected in an increasing tendency to require that the party conducting a competitive bid disclose certain information to bidders. The Court of Claims has held that a federal procurement agency must disclose procurement plans of other federal agencies of which it knows and which may affect the pricing assumption of bidders.⁴⁹ Similarly, it has held that the procuring agency must disclose technical information that it had relating to the manufacturing process that it knew the contractor intended to use.⁵⁰ The court noted that on many occasions each party has an equal opportunity to uncover the facts. But where one party knew much more than the other and knew the other was proceeding in the wrong direction, it could not betray the contractor into a “ruinous course of action by silence.” State courts have also recognized a duty to disclose.⁵¹

Finally, a Federal Court of Appeals decision held that a federal government agency breached its requirements contract when it failed to notify the contractor before the bid that it knew that the orders would be significantly below (about 10 percent) of the estimate.⁵²

Yet contractors cannot rely too heavily on the possibility of legal protection. Generally parties who *can* protect themselves must do so.⁵³ Contracting parties, although expected to cooperate, do not owe each other fiduciary obligations to look out for each other.⁵⁴

C. Bid Proposal

The bid proposal is an offer and creates a power of acceptance in the owner. The owner has a right to close a deal and bind a bidder without a further act of the bidder.⁵⁵ Subject to many exceptions,⁵⁶ offers are generally revocable even if stated to be irrevocable for a specified period of time. This raises an issue that does not usually surface in construction litigation. Suppose either *before* bid opening or *after*, but before the formal contract is signed, the bidder revokes its bid. It is generally assumed, at least in public contracts, that despite the common law rule of revocability, the bid is irrevocable for the period stated in the invitation unless the invitation permits withdrawal before bid opening. What is the justification for such an assumption?

Sometimes public contract competitive bidding is authorized by statutes or regulations that state bids to be irrevocable. This may supersede the common law rule of revocability.⁵⁷ Sometimes the bid is revocable, but any deposit made with it is forfeited.⁵⁸ One argument for irrevocability is that the bidder receives the benefit of having the bid considered by the owner. Another is the bid may become irrevocable if the owner has justifiably relied on the bid. The owner may have given up the opportunity of negotiating a contract, having relied on the bidders' stating that their bids would be irrevocable or, at the very least, expended considerable time and money in conducting the competitive bid process.⁵⁹ If

the transaction is governed by the Uniform Commercial Code (transactions in goods), the bid will be irrevocable as a “firm offer.”⁶⁰ If the procurement involves the sale of goods with installation incidental, the Code would govern.⁶¹ Even if it does not, it may be possible to use the code by analogy.⁶²

Once the bid has been opened, it has become irrevocable and can be withdrawn only if legal grounds exist for doing so—usually, a mistake in preparing the bid.⁶³

Can the owner hold bidders to whom the bid has not been awarded for the period specified in the invitation to bidders? The not uncommon refusal of the bidder to whom the contract has been awarded to enter into the contract makes it imperative that no expectation be created that the unsuccessful bids are no longer binding when an award has been made. Of course, the period of time cannot be extended, but it should not be shortened simply because the award appears to have been made to someone else.

D. Award and Waiving of Irregularities—Remedies—*Conduit and Foundation Corp. v. Metropolitan Transportation Authority*

Usually the owner promises to award the contract to the lowest responsible or lowest and best bidder, reserving the right to reject all bids. Although these two standards for determining to whom a contract should be awarded are often used as if they dictated the same outcome, a careful study of the language shows that this is not always the case. Being the *lowest responsible* bidder would not be the same as being the *lowest and best bidder*. The California Supreme Court emphasized that “responsible” simply means that the low bidder has the quality, fitness, and capacity to satisfactorily do the required work. In other words, according to the court, a contract must be awarded to the low bidder unless it has been found to be not

responsible, that is, “not qualified to do the particular work under consideration.”⁶⁴

This distinction is demonstrated by *KAT Excavating, Inc. v. City of Belton*.⁶⁵ The standard for making the award was the “lowest and best bidder.” The city accepted the second lowest bid. It was \$4,000 higher than the low bid in a contract of about \$500,000. The court held the “best bidder” takes into account honesty and integrity, skill and business judgment, experience and facilities, and previous work. The city had discretion to select the best bidder, but discretion had to be exercised “in good faith, in the interests of the public, without collusion or fraud, nor corruptly, nor from motives of personal favor or ill will. . . .”⁶⁶

Here, the bidder to whom the contract was awarded had a good track record, especially as to timely performance. That the bids were so close, along with this factor, meant that the city exercised its discretion properly. There might have been a different outcome had the standard been “lowest responsible bidder.”

Before making the award, the owner must evaluate the bids. This is done between bid opening and award, if any. Yet this evaluation period is not open ended. Bids are irrevocable for the period specified in the invitation to bidders. This restriction is illustrated in *Hennepin Public Water District v. Petersen Construction Co.*,⁶⁷ where the invitation had stated that the awarding authority would have to obtain financing within sixty days from bid opening. There was a tentative acceptance before the awarding authority obtained financing. Then, sixty-seven days after bid opening, the awarding authority forwarded the formal contract to the successful bidder. The court held the acceptance to have been too late, and the bidder was released.

Before examining legal constraints on the awarding authority when it considers bids, the following case reviews some of the purposes of competitive bidding in the public sector discussed in Section 18.02 and passes on the conditions under which the awarding authority can reject all bids and rebid the project.

CONDUIT AND FOUNDATION CORP. v. METROPOLITAN TRANSPORTATION AUTHORITY

Court of Appeals of New York, 1985. 66 N.Y.2d 144, 485 N.E.2d 1005, 495 N.Y.S.2d 340.
[Ed. note: Footnotes omitted.]

JASEN, Judge.

The narrow issue presented on this appeal is whether the evidence on the record supports a holding that the Metropolitan Transportation Authority and the New York City Transit Authority acted unlawfully in rejecting all bids submitted in an initial round of bidding on a public works project.

The relevant facts are not in dispute. Respondents, the Metropolitan Transportation Authority and the New York City Transit Authority (Transit Authority), solicited bids for a public works contract for the massive rehabilitation of part of New York City's subway system. Three bids were received, including that of petitioner, a joint venture, whose bid was the lowest and fell within the advertised estimated cost between \$120 [million] and \$140 million. Shortly after opening the bids, the Transit Authority met with each of the three bidders for the stated purpose of determining why the prices submitted were as high as they were and whether the project costs might be reduced. Although the bidders were met separately, each was informed that the meetings with the others were taking place.

Subsequent to the meetings, the second lowest bidder advised the Transit Authority by letter that significant cost reductions were possible and suggested another meeting to discuss the possibility of preparing revised contract documents. Several days thereafter, it was petitioner that met again with the Transit Authority. Petitioner was informed that its bid, though the lowest, was far in excess of the revised estimated cost and that, therefore, all the bids might be rejected. Nevertheless, petitioner was told that it was deemed technically and financially qualified to undertake the project and, indeed, was afforded the opportunity to reduce its bid for consideration. Within the next two weeks, petitioner once again met with the Transit Authority and offered to reduce its bid price by two million dollars, a proportionately small amount. The reduction was deemed insufficient by the Transit Authority's Chief Engineer who, on the following day, recommended that all the bids be rejected and that the contract, with modifications, be readvertised for a second round of bidding. The recommendation was adopted by the President of the Transit Authority and the three bidders were notified. Thereafter, the Transit Authority circulated a notice soliciting new bids for the project and indicating an estimated cost range

between \$100 [million] and \$120 million, \$20 million lower than that originally advertised.

Petitioner commenced this article 78 proceeding seeking an injunction against a second round of bidding and a judgment directing respondents to award the contract to petitioner as the lowest responsible bidder. Special Term granted the petition concluding that the Transit Authority's postbid communications with the three bidders, its revision of the advertised cost estimate and its purpose of obtaining bid prices lower than that originally received rendered the decision to reject all first round bids arbitrary and capricious. The Appellate Division agreed with Special Term, two justices dissenting, that the contract should be awarded to petitioner, but modified the judgment to reduce the contract price by two million dollars on the basis of petitioner's prior offer to the Transit Authority to so lower its bid. The court held that the record demonstrates an "appearance of impropriety" on the part of the respondents which "might have" a detrimental effect "on the broad interest of the public in the entire public bidding process." (111 A.D.2d 230, at p. 234, 489 N.Y.S.2d 265.) The two dissenters argued that the mere "appearance" of impropriety is not sufficient ground to disturb the decision of the Transit Authority absent a showing of actual favoritism, fraud or similar evil which competitive bidding is intended to prevent. We agree and now reverse the order below.

As this court has stated on prior occasion, the purpose of the laws in this State requiring competitive bidding in the letting of public contracts is "to guard against favoritism, improvidence, extravagance, fraud and corruption." (*Jered Contr. Corp. v. New York City Tr. Auth.*, 22 N.Y.2d 187, 193, 292 N.Y.S.2d 98, 239 N.E.2d 197; . . .

These laws were not enacted to help enrich the corporate bidders but, rather, were intended for the benefit of the taxpayers. They should, therefore, be construed and administered "with sole reference to the public interest." (10 McQuillin, *Municipal Corporations* § 29.29, at 302 [3d rev ed]; . . . This public interest, we have noted, is sought to be promoted by fostering honest competition in the belief that the best work and supplies might thereby be obtained at the lowest possible prices. . . .

Indeed, this policy is reflected explicitly in the statutory provisions which mandate that public work contracts be awarded "to the

lowest responsible bidder.” (Public Authorities Law § 1209[1]; General Municipal Law § 103[1]; *see also*, General Municipal Law § 100-a.) Dishonesty, favoritism and material or substantial irregularity in the bidding process, which undermines the fairness of the competition, impermissibly contravene this public interest in the prudent and economical use of public moneys. . . .

Nevertheless, where good reason exists, the low bid may be disapproved or, indeed, all the bids rejected. Neither the low bidder nor any other bidder has a vested property interest in a public works contract . . . and statutory law specifically authorizes the rejection of all bids and the readvertisement for new ones if deemed to be “for the public interest so to do” (Public Authorities Law § 1209[1]; . . .

Although the power to reject any or all bids may not be exercised arbitrarily or for the purpose of thwarting the public benefit intended to be served by the competitive process . . . the discretionary decision ought not to be disturbed by the courts unless irrational, dishonest or otherwise unlawful. . . .

Moreover, it cannot be gainsaid that a realistic expectation of obtaining lower contract prices on a second round of bidding constitutes a reasonable, bona fide ground for rejecting all first round bids and serves the public’s interest in the economical use of public moneys. . . .

Nor is the decision to reject all bids rendered arbitrary and capricious solely on the basis of nondiscriminatory postbid changes in the contract specifications . . . or postbid communications with individual bidders for the bona fide purpose of ascertaining how contract costs might be reduced. . . .

Only on a showing of actual impropriety or unfair dealing—i.e., “favoritism, improvidence, extravagance, fraud and corruption”

(*Jered Contr. Corp. v. New York City Tr. Auth.*, *supra*, 22 N.Y.2d at p. 193, 292 N.Y.S.2d 98, 239 N.E.2d 197)—or other violation of the statutory requirements, can the decision to reject all bids and readvertise for a second round of bidding be deemed unlawful. . . .

Consequently, where the party challenging the decision does not satisfy the burden of making such a demonstration, that decision should remain undisturbed. . . .

Here, where the court below found only that the postbid activity of the Transit Authority created an “appearance of impropriety” and “cast a doubt” on its fair dealing with the bidders, the respondents’ decision to seek a rebid ought not to have been disturbed. It may be true, as the majority at the Appellate Division found, that it would have been wiser for the Transit Authority to meet with all the bidders at the same time, instead of separately, in order to avoid the possible appearance of unfair dealing. Likewise, other bid interactions between the Transit Authority and certain bidders may have been more discreet. Nevertheless, as noted in the dissenting opinion of Justice Niehoff absent some finding that the respondents had, in fact, engaged in some unfair or unlawful practice tainting the impartiality of the competitive bidding process, it was error to grant the petition.

The Transit Authority clearly was empowered to reject all the first round bids, and its expectation of obtaining lower bid prices on readvertisement was a rational basis for deciding to do so. . . .

Accordingly, the order of the Appellate Division should be reversed, with costs, and the petition dismissed. WACHTLER, C. J., and MEYER, SIMONS, KAYE, ALEXANDER and TITONE, J. J., concur.

The U.S. Court of Claims has held that a bidder is entitled to honest consideration of its bid. To show that the bid was not properly considered, the bidder must establish that the government acted arbitrarily and capriciously and that there was no reasonable basis for the government’s decision.⁶⁸

⁶⁸*Keco Indus. Inc. v. United States*, 192 Ct.Cl. 773, 428 F.2d 1233 (1970). Absence of fraud or palpable abuse of discretion is required in *Mississippi Warren G. Kleban Eng’g Corp. v. Caldwell*, 361 F.Supp. 805 (N.D.Miss. 1973), vacated on other grounds, 490 F.2d 800 (5th Cir.), on remand dismissed petition, 492 F.2d 1200 (5th Cir. 773, 1974). New Jersey requires a bona fide judgment. *Mendez v. City of Newark*, 132 N.J.Super. 261, 333 A.2d 307 (Law Div.1975).

On the other hand, California rejected a bidder’s contention that the awarding authority must consider bids in good faith.⁶⁹ The court stated,

Such a promise would be contrary to a well established rule which allows a public body where it has expressly reserved the right to reject all bids, to do so for any reason and at any time before it accepts a bid. If the entity so decides, it may return all bids unopened. The courts have consistently refused to interfere with the exercise of a public body’s right to reject bids, however arbitrary or capricious.⁷⁰

⁶⁹*Universal By-Products, Inc. v. City of Modesto*, 43 Cal.App.3d 145, 117 Cal.Rptr. 525 (1974).

⁷⁰117 Cal.Rptr. at 529.

The court also rejected a claim based on misrepresentation because of immunity granted the public entity. But the awarding authority cannot solicit a bid without any intention of considering it.⁷¹

Although the California rule gives maximum discretion to the awarding authority, there is an undeniable trend toward holding government agencies accountable for their acts.

Where the low bidder is rejected, procedures vary. For example, New Jersey precludes the local awarding authorities from rejecting the high bid for property or low bid for work without giving a hearing to the disappointed bidders.⁷² California, however, does not require a full-fledged courtlike hearing if the low bid is rejected. Rather, the awarding authority must give the low bidder access to any evidence that has reflected on its responsibility received from others or produced as a result of an independent investigation. The bidder must be afforded an opportunity to rebut such adverse evidence and present evidence that it is qualified to perform the contract.⁷³

California imposes stricter due process requirements on the awarding authority when the bidder is claimed by the awarding authority not to be responsible. It must receive some level of due process, such as notice and an opportunity to be heard. But if a dispute is whether the bid is responsive, the facts are generally undisputed and the decision does not involve agency discretion. In such a case, the bidder is not entitled to the same due process level.⁷⁴

States vary as to the requirement for a hearing and its nature. But again, with the emphasis on greater accountability, it is likely that low bidders who are not awarded the contract can at least demand that reasons be given and that they be given an opportunity to rebut adverse evidence.

As for specific reasons for rejecting a bidder, New Jersey held that disputes over a previous job were insufficient to deny award to the low bidder.⁷⁵ But Mississippi upheld

a provision in the invitation that allowed the awarding authority to reject a bidder for being in arrears on an existing contract or in litigation with the awarding authority for having defaulted on a previous contract.⁷⁶ The bidder's wholly owned subsidiary was suing the awarding authority on another matter, and on this basis the bidder's bid was rejected. The court recognized the provision as possibly coercing contractors from asserting their legal rights but held that the standard of rejecting bidders was one within the discretion of the authority. This holding allows an awarding authority to use the procurement process for an improper purpose.

Massachusetts upheld rejection of a subcontractor who had had a dispute with the prime contractor on an earlier job and had made misstatements of its previous work experience.⁷⁷ A federal court applying Mississippi law upheld rejection of a bidder because of the bidder's poor reputation for quality work.⁷⁸

An awarding authority or owner conducting a competitive bid should be able to reject a bidder if a good-faith determination has been made that the bidder is not likely to be able to complete the required performance.

The evaluation may proceed even in the face of the awarding authority having informed the low bidder that it had been awarded the contract. This is demonstrated by *Hadaller v. Port of Chehalis*.⁷⁹ The plaintiff was one of three apparent low bidders. Next, the awarding authority, the Port, had to determine who was the lowest qualified bidder. The plaintiff was selected and informed of this. The Port then informed the plaintiff that it was awarded the contract.

But a formal contract was not drawn up. The Port requested more information about the metal building system. It asked the plaintiff to provide a list of satisfactory installations, a certificate from the manufacturer, and the manufacturer's 20-year warranty. The instructions to bidders specified that the successful bidder would furnish this information. When the required information was not submitted, the Port awarded the contract to another bidder.

⁷⁴*D. H. Williams Constr., Inc. v. Clovis Unified School Dist.*, 146 Cal. App.4th 757, 53 Cal.Rptr.3d 345 (2007), rehearing denied Jan. 31, 2007, review denied May 9, 2007 (bid responsive despite listing an unlicensed subcontractor, as the proposed subcontractor must be licensed only when it enters into the subcontract).

⁷⁵*D. Stamato & Co. v. Township of Vernon*, supra note 72.

⁷⁶*M.T. Reed Constr. Co. v. Jackson Mun. Airport*, 227 So.2d 466 (Miss.1969).

⁷⁷*Kopelman v. Univ. of Massachusetts Building Auth.*, 363 Mass. 463, 295 N.E.2d 161 (1973).

⁷⁸*Warren G. Kleban Eng'g Corp. v. Caldwell*, supra note 68.

⁷⁹See supra note 55.

The plaintiff contended that it had made an oral contract with the Port. As no formal contract had been made and as the facts showed that the award process was not yet completed, this contention was rejected by the court.

Nevertheless, officials of the awarding authority should be careful to avoid any indication that the process had been completed and a contract awarded. It would have been better had the awarding authority made more clear that the award was conditioned on the requested information being furnished.

To the extent that the reason for rejection departs from evaluation of the bidder's experience, financial ability, integrity, and availability of facilities necessary to perform the contract, it is more likely that the rejection has not been made in good faith.⁸⁰ Bidder evaluation was discussed earlier.⁸¹

The preferred remedy by a disappointed bidder is an injunction barring the public entity from awarding the contract to another.⁸² Sometimes, it is too late for an injunction, or it is not available for another reason. If this is the case, the only remedy left is damages.

The *Kajima* case dealt with the money award remedy accorded a bidder who should have received the award but did not because of errors of the awarding authority.⁸³ This case merits attention both because of its holding on the remedy issue and its thorough canvassing of the cases dealing with the money award remedy throughout the United States.

Kajima sought recovery for its first and second round bid and protest expenses totaling \$143,000, its unabsorbed overhead expenses of \$1,300,000 and \$1,500,000 in lost profit on the contract, plus prejudgment interest. (All numbers approximate.) The trial court considerably reduced the amounts but awarded a judgment for all items claimed.

The intermediate appeals court, noting the equitable nature of the basis for the claim, concluded that each case

should be judged on its merits. It held that the trial court acted within its discretion.

On appeal to the California Supreme Court, the issue was whether Kajima would be limited to its bid preparation costs. In essence, the issue was lost profits. (Bid protest costs and overhead were not contested by the Transit Authority.)

Kajima's claim was based upon promissory estoppel. The bidder relied on the Transit Authority's promise that when it solicited bids it would award the contract to the lowest responsible bidder. The court held there could be no claim based on tort nor one for breach of contract.

The court would not award Kajima lost profits, limiting Kajima's remedy to the costs of preparing its bid. It pointed to the uncertainty connected to the bidding process and the speculative nature of profits on such a contract. Finally, it was concerned that too expansive a remedy could "encourage frivolous litigation and further expend public resources."⁸⁴

It rejected Kajima's contention that limiting the disappointed bidder to its bid preparation expenses would provide little incentive to challenge an improper award and would ultimately lead to a decline in bidding for public work. The court pointed to the many cases where awards were challenged in court.

The issue of the remedy for a reliance-based claim has always been a troublesome one. But the real basis for the holding, protection of public entities, is revealed by the court's refusal to follow a case that had awarded lost profits by stating it involved private parties.⁸⁵

Its canvas of cases from other jurisdictions reveals that a few states bar any cause of action against a public entity. Most limit recovery to bid preparation expenses.⁸⁶ A few allow recovery of lost profits.⁸⁷

The limited remedy and the broad scope accorded public agencies to award contracts reflects judicial hesitance to interfere with the operations of a public entity.⁸⁸

⁸⁶*Cementech, Inc. v. City of Fairlawn*, 109 Ohio St.3d 475, 849 N.E.2d 24 (2006) (reversing an intermediate appellate court that had allowed lost profits, noting that awarding lost profits would punish the taxpayers and that injunctive relief is preferable to damages).

⁸⁷1 P.3d at 70–72.

⁸⁸See Section 18.04I on standing to judicially contest an award.

Suppose there are irregularities in the proposal or process. The awarding authority may believe them minor and wish to waive them and accept the bid. The legal issues have been whether the irregularity in question is minor and whether waiver would encourage carelessness, create opportunity for favoritism, and operate unfairly to other bidders.

The awarding authority's discretion to waive deviations in a nonresponsive bid depends on the importance of the deviation,⁸⁹ possible prejudice to the other bidders, and prejudice to the public authority. For example, in deciding whether an irregularity in the low bid was minor and could be waived, the court allowed the awarding authority to take into consideration that the award to the next lowest bidder would mean the same work was being done for nearly \$8 million dollars more.⁹⁰

Yet a different, less flexible method of dealing with nonresponsive bids can be seen in Louisiana. Earlier Louisiana decisions had sought to limit the power to waive irregularities to formal ones, not those of substance. Yet this did not satisfy the legislature. It constantly revised its statutes to make it clear that no waiver would ever be permitted.⁹¹ Constant revision indicated a battle between some lower courts and the public agencies on one side and the legislature on the other.⁹²

Many cases involve bid submission deadlines. *H. R. Johnson Construction Co. v. Board of Education of Painsville Twp., etc.*⁹³ held that an awarding authority could not accept a bid made one minute late. The court was not persuaded

that one minute could not give a bidder a competitive advantage over other bidders. The court felt that if the awarding authority is given the discretion to allow a one-minute deviation, it could stretch this power to even fifteen minutes or an hour.

In *William F. Wilke, Inc. v. Department of Army*,⁹⁴ the bids were to be opened at 3 P.M. At that time, a representative of the low bidder was in the room, but he neglected to put the sealed bid in the receptacle designated for that purpose. At 3:04, the contracting officer gathered the receptacle and started to sort out the bids. During the sorting, the low bidder's representative added his sealed bid to the box of yet unopened bids. The awarding authority awarded the bid to the low bidder, and the next low bidder complained.

The court concluded that the bid should not have been accepted, as it had been deposited four minutes late. But because it did not appear that the low bidder had obtained any competitive advantage, the court would not order the bid to be awarded to the next low bidder but limited the disappointed bidder to recovery of its bidding expenses. Other cases have allowed the awarding agency discretion to waive such irregularity, especially if the bidding information permitted this.⁹⁵

These time deadline cases, simple though they seem, are a microcosm of the tensions in the competitive bidding process set forth in Section 18.02. It is easy to look at one minute late as a technical deficiency that should not preclude an awarding authority from accepting the lowest bid, thus saving the public money.

But laxness in enforcement of this plain rule can lead to favoritism and even corruption. Waiver of the time deadline can be easy to justify, such as the discretion given the awarding authority to waive minor deficiencies, or by concluding that the late bidder was not at fault.

⁸⁹*Albano Cleaners, Inc. v. United States*, 197 Ct.Cl. 450, 455 F.2d 556 (1972). The court held that a substantial deviation affects price, quality, or quantity. In *Rosetti Contracting Co. v. Brennan*, 508 F.2d 1039 (7th Cir.1975), the court held that nonconformity as to affirmative action hiring was not correctable. Here the court was facing a substantial deviation but one that the bidder offered to correct. The court was fearful that allowing a correction would give the bidder an option exercisable after seeing the other bids.

⁹⁰*Hill Bros. Constr. & Eng'g Co. Inc. v. Mississippi Transp. Comm'n*, 909 So.2d 58, 69–70 (Miss.2005).

⁹¹La. R.S. § 33-2212A(1)(b).

⁹²The Louisiana history is outlined in *Hamp's Constr. L.L.C. v. City of New Orleans*, 924 So.2d 104 (La.2006) (legislature has made its will clear: no waivers).

⁹³16 Ohio Misc. 99, 241 N.E.2d 403 (1968). But see *Mickey O'Connor General Contractor, Inc. v. City of Westwego*, 804 So.2d 128 (La. App.2001), writ denied, 811 So.2d 908 (La. 2002) (bid deadline could be waived). See also *PHC, Inc. v. Kelleys Island*, 71 Ohio App.3d 277, 593 N.E.2d 386 (1991) (would not go by clock in public office that was 2–3 minutes fast).

⁹⁴485 F.2d 180 (4th Cir.1973). See also *Mickey O'Connor General Contractor, Inc. v. City of Westwego*, supra note 93 (city could accept bid stamped one minute after deadline as bidder in line with three other bidders before deadline).

⁹⁵*William M. Young & Co. v. West Orange Redevelopment Agency*, 125 N.J.Super. 440, 311 A.2d 390 (App.Div.1973) (two minutes late preceded by a telephone call from the bidder stating he would be a few minutes late because of inclement weather); *Gostovich v. City of West Richland*, 75 Wash.2d 583, 452 P.2d 737 (1969) (three days late due to mail mixup). *Quinn Constr. Co., L.L.C. v. King County Fire Protection Dist.*, 111 Wash.App. 19, 44 P.3d 865 (2002) (award to lowest bidder, who missed filing deadline by 5 to 10 seconds, upheld).

Also, accepting a late bid can mark the beginning of the tolerance of sloppy procedures throughout the performance of the contract. It can give the impression that the contractor need not perform “to the letter.” It too can lead to favoritism and even corruption.

Finally, this can be unfair to other bidders and make them hesitant to submit bids in the future. It can, in the end, cost the awarding authority money.⁹⁶

E. Withdrawal or Correction of Mistaken Bids: *Sulzer Bingham Pumps, Inc. v.* *Lockheed Missiles & Space Company, Inc.*

Sometimes a bidder will seek to withdraw or correct a bid. Such a request usually occurs just after bid opening or, more rarely, after the formal award. Usually the basis for the request is computation errors, such as omitting a large item, making a mathematical miscalculation in determining an item price, or making an error in adding bid price components.⁹⁷

Early cases would not relieve a bidder for these mistakes.⁹⁸ A reason given for denying relief was that the mistake was “unilateral,” one made only by the bidder and not shared in by the owner. There was, as a rule, negligence in computing the bid. The fear of false claims and the integrity of the bidding system were other reasons for denying relief.

Some courts began to moderate the strictness of this doctrine. They pointed to the rule that a person to whom an offer has been made cannot accept the offer if she knows or should know that the offer was made by mistake. This is known as the “snap-up” doctrine. For example, if the owner or design professional knew or should have known that an entire item had been left out of the bid

or that there had been a mistake in adding the total, it would be unfair to accept the proposal and seek to bind the bidder. The courts usually focus on the knowledge or constructive (what it should have known) knowledge of the owner before the formal award and execution of the formal contract, most commonly at the time the bids are open. Some courts have required that there be actual knowledge on the part of the owner,⁹⁹ whereas others appear to require constructive knowledge that the mistake was known or ought to have been known.¹⁰⁰ In practice, the difference between actual and constructive knowledge will rarely control the outcome of a case.

The typical case involves the low bidder claiming that it had made a mistake at the time of bid opening or shortly thereafter. The “snap-up” doctrine noted earlier is demonstrated in *Santucci Construction Co. v. Cook County*¹⁰¹ in which the awarding authority had estimated that the cost of drain work would be \$1.9 million.¹⁰² The cost of the drainpipe, including labor, was expected to be \$1.4 million. Santucci submitted a total bid of \$1.1 million, with \$775,000 for the drainpipe, including labor. Three other contractors submitted total bids between \$1.7 million and \$1.8 million, with their bids for the drainpipe, including labor, being between \$1.2 million and \$1.4 million. The engineer for the awarding authority had thought that Santucci’s bid was “cheap, low.” A day after bid opening, Santucci claimed a clerical error and sought to withdraw his bid. The request was refused, and Santucci would not enter the contract. The awarding authority retained Santucci’s bid deposit. Santucci brought legal action to recover it.

Noting that ultimately the work was let for \$1.6 million, the appellate court affirmed the finding of the trial court that Santucci had made a mistake and that the awarding authority should have known of this mistake. It rescinded Santucci’s bid and ordered that the deposit be returned to him. The court emphasized that Santucci’s bid was \$600,000 less than the next lowest bidder and over

⁹⁶For further discussion of this topic, see Waagner & Evans, *Agency Discretion in Bid Timeliness Protests: The Case for Consistency*, 29 Pub. Cont.L.J. 713 (2000).

⁹⁷Occasionally, claims for relief are based on a sub-bidder’s refusal to contract at the price proposed or for an error of judgment relating to performance cost.

⁹⁸*Steinmeyer v. Schroepfel*, 226 Ill. 9, 80 N.E. 564 (1907). This case was distinguished in *Rushlight Automatic Sprinkler Co. v. City of Portland*, 189 Or. 194, 219 P.2d 732 (1950) (reasonable excuse for error and awarding authority accepted the bid even if it thought the bid was too good to be true). At most, the *Steinmeyer* case is important today for historical reasons. Yet the concept of no relief has some attraction in light of the complexities and uncertainties generated by opening the gates to mistake claims.

⁹⁹*Westinghouse Elec. Corp. v. New York City Transit Auth.*, 735 F.Supp. 1205 (S.D.N.Y.1990) (interpreting *Iversen Constr. Corp. v. Palmyra-Macedon Central Sch. Dist.*, 143 Misc.2d 36, 539 N.Y.S.2d 858 (1989) as requiring actual knowledge).

¹⁰⁰*Bromley Contracting Co. v. United States*, 219 Ct.Cl. 517, 596 F.2d 448 (1979).

¹⁰¹21 Ill.App.3d 527, 315 N.E.2d 565 (1974).

¹⁰²Amounts are approximations.

\$800,000 less than the awarding authority's estimate for the project.

The "snap-up" concept used by the court in the *Santucci* case has been the vehicle for bidder relief where courts have thought it appropriate. Yet an appraisal of the cases and an awareness of the immense variation of the bids for many types of construction work leads inescapably to the conclusion that the courts have emphasized, not the fact that the awarding authorities should have known of the mistake, but the unfairness of holding a bidder who has made an honest mistake when the next bid can still be accepted.¹⁰³

Increasingly fewer jurisdictions deny relief.¹⁰⁴ These jurisdictions emphasize the need to protect the process from possible favoritism that may accompany the power to allow withdrawal. Such decisions reflect skepticism that the fact-finding process can determine whether honest mistakes have been made. Even in these jurisdictions, relief can be granted if the facts appear to make it inequitable to hold the bidder to its bid.¹⁰⁵

Most jurisdictions will relieve the bidder if the mistake is clerical rather than an error of judgment and involves a substantial portion of the total bid or a large amount of

money and if the owner has not relied to its detriment on the mistaken bid.

The Federal Acquisitions Regulations (FAR) permit the awarding agency to correct clerical mistakes before an award is made.¹⁰⁶ The regulations provide a systematic method of dealing with clerical and other bidding mistakes "apparent on its face in the bid." A correction may be made if the bidder requests permission to correct a mistake and if there is "clear and convincing evidence" of a mistake and of the "bid actually intended." However, if the correction would displace one or more bids, correction "shall not be made unless the existence of the mistake and the bid actually intended are ascertainable substantially from the invitation and the bid itself."¹⁰⁷ If the evidence of the mistake is clear and convincing but the bidder does not provide clear and convincing evidence of the bid actually intended, the public agency may decide that the bidder may withdraw the bid.

Suppose the bidder wishes to withdraw the bid rather than correct it. If the evidence is clear and convincing, both as to the existence of a mistake and as to the bid actually intended, and if the bid as corrected would be the lowest received, the agency may correct the bid and not permit its withdrawal.

The regulations govern the relationship between bidders and the federal agency conducting the bidding competition. They may also control bidding mistakes in disputes between a subcontractor and a prime contractor. If the subcontract selects federal procurement law as governing, the FAR will be applied.¹⁰⁸

State legislation increasingly regulates attempts by those who bid on public contracts to withdraw bids because of mistake after bid opening. In 1945, California adopted legislation that allowed a bidder to be relieved from a bid if it established to the satisfaction of the court that

1. "A mistake was made."
2. It gave the department "written notice within five working days . . . after the opening of the bids of the mistake, specifying in the notice in detail how the mistake occurred."

¹⁰⁶48 CFR § 14.407-2 (2007).

¹⁰⁷The Federal Procurement Regulations are discussed in Rudland, *Rationalizing the Bid Mistake Rules*, 16 Pub.Contract L.J. 446 (1987), and Hagberg, *Mistake in Bid, Including New Procedures Under Contract Disputes Act of 1978*, 13 Pub.Cont.L.J. 257 (1983).

¹⁰⁸*Sulzer Bingham Pumps, Inc. v. Lockheed Missile & Space Co., Inc.*, 947 F.2d 1362 (9th Cir.1991) (reproduced in part later in this subsection).

¹⁰³Similarly, cases holding that a right to rescind exists and that the claimant met the standards required for rescission are *Marana Unified School Dist No.6 v. Aetna Cas. & Sur. Co.*, 144 Ariz. 159, 696 P.2d 711 (1984) (bidder did not need to forfeit bond despite statute); *Powder Horn Constructors, Inc. v. City of Florence*, supra note 57 (reversed intermediate court's requirement that bidder show it was not negligent). See Jones, *The Law of Mistaken Bids*, 48 U.Cin.L.Rev. 43 (1979); Cavico, *Relief for Unilateral Mistake in Construction Bids*, 10 Thurgood Marshall L.Rev. 1 (1985). The many cases are collected in Annot., 2 A.L.R.4th 991 (1980).

¹⁰⁴*Alaska Int'l Constr., Inc. v. Earth Movers of Fairbanks, Inc.*, 697 P.2d 626 (Alaska 1985) (no loss on contract; strong dissent), called into doubt a year later by *Jensen & Reynolds Constr. Co. v. State Dep't of Transp. & Public Facilities*, 717 P.2d 844 (Alaska 1986); *Anco Constr. Co. Ltd. v. City of Wichita*, 233 Kan. 132, 660 P. 2d 560 (1983), disagreed with by *Marana Unified School Dist. No. 6 v. Aetna Cas. & Sur.*, supra note 103; *Nelson Inc. of Wis. v. Sewerage Comm'rs of Milwaukee*, 72 Wis.2d 400, 241 N.W.2d 390 (1976) (despite statute), disagreed with and for all practical purposes overruled by *James Cape & Sons v. Mulcahy*, 285 Wis.2d 200, 700 N.W.2d 243 (2005). Care must be taken to distinguish cases that refuse relief because the elements are not established from those that hold that no relief can be granted in any case.

¹⁰⁵See *Travelers Indem. Co. v. Susquehanna County Commr's.*, 17 Pa. Commw. 209, 331 A.2d 918 (1975) (the court refused to forfeit the bid bond because the bidder had not actually withdrawn his bid but had simply requested to do so and the awarding authority had failed to present the bidder with contract papers for execution).

3. “The mistake made the bid materially different” from what was intended.
4. “The mistake was made in filling out the bid and not due to error in judgment or to carelessness in inspecting the site of the work or in reading the plans or specifications.”¹⁰⁹

The statute reflects a more mechanical method of dealing with the problem, particularly in barring relief unless notice is given within five days after bid opening specifying in detail how the mistake occurred. There is no requirement under the statute that holding the bidder would be unconscionable¹¹⁰ or that the city must have had knowledge before the bid was accepted that there had been a clerical mistake making it unjust and unfair for the city to take advantage of the bidder’s error. Nor does the statute require any evaluation of the degree of negligence.

The evolution of legal rules dealing with bidding mistakes reflects a slow process, starting first in those transactions where it is determined that the awarding authority knew or should have known of the mistake but limiting mistake to clerical errors.¹¹¹ Yet suppose a mistake has been made that is not a simple clerical error. Cases have differed as to whether relief is confined to clerical mistakes. Some cases refuse to draw this distinction.¹¹²

Again the California experience is instructive. Early California cases relieved bidders from good faith, unilateral, clerical mistakes.¹¹³ Implicit in those cases was that demand by the awarding authority that the bidder perform at the bid price was unconscionable.¹¹⁴ Much depended on when the mistake claim was made, whether the next lowest bid could still be accepted, and the size and cause of the error.

¹⁰⁹West Ann.Cal.Pub.Cont.Code § 5103.

¹¹⁰See Sections 5.07D and 19.02E for discussion of unconscionability.

¹¹¹See also *Osberg Constr. Co. v. City of The Dalles*, 300 F.Supp. 442 (D.Or.1969); *Elsinore Union Elementary School Dist. v. Kastorff*, supra note 63.

¹¹³*M.F. Kemper Constr. Co. v. City of Los Angeles*, infra note 125; *Elsinore Union Elementary School Dist. v. Kastorff*, supra note 63.

¹¹⁴Please note the discussion of unconscionability in the *Sulzer* case reproduced in this section.

In 2001, California faced the issue of unilateral mistake in a case involving a mistake in a newspaper advertisement.¹¹⁵ The car agency making the mistake offered to pay the claimant the cost of his fuel, time, and effort expended in traveling to the agency to examine the car. The claimant refused and brought a lawsuit.

The court agreed with the trial court that had refused to allow the claim. The court specifically adopted Section 153 (a) of the Second Restatement of Contracts. It authorizes relief from the mistaken bid where the mistake pertains to an important element of the bargain, the mistake materially alters the bargain, the risk is not one borne by the party seeking relief, and enforcement would be unconscionable.

A commentator, while recognizing that unconscionability is an important element in these cases, worried about the subjective and difficult to define nature of this standard. She preferred relief for good faith unilateral clerical errors if “the mistaken party compensates the non-mistaken party for detrimental reliance.”¹¹⁶

Were this applied in the usual bid mistake cases, the bidder who made a good faith unilateral clerical error would be relieved if the bidder compensated the awarding authority any costs it had incurred. If it were too late to accept the next low bidder, the bidder seeking relief would receive relief only if it paid for the difference in bid prices. If the mistake were caught early, more likely the case, and communicated in time to accept the next lowest bid, the awarding entity would be entitled to whatever administrative costs it incurred in processing the mistaken bid. This would raise troublesome proof questions, unlike the car ad case before the court.

The best solution lies in a standard like the California statute noted earlier in this section.

Yet another method of relieving from large forfeitures exists, though it is often ignored. It looks at the *security* that bidders are usually requested to deposit, such as a certified check, a cashier’s check, or a bid bond, based on a designated percentage of the bid. Suppose a bidder who has posted security seeks to withdraw its bid based on an asserted clerical or mathematical error of the type discussed in this section.

¹¹⁵*Donovan v. RRL Corp.*, 26 Cal.4th 261, 27 P.3d 702, 109 Cal. Rptr.2d 807 (2001), rehearing denied and modified, Sep. 12, 2001.

¹¹⁶*Recent Cases*, 115 Harv.L.Rev. 724 (2001).

In some of the early cases allowing relief, the courts pointed to the large discrepancy between the low bidder who claims a mistake and the next low bidder. When this amount was large, courts allowed relief for what was essentially unilateral mistake, noting that the difference, if awarded, would constitute a large forfeiture and was unconscionable. In the landmark California *Kemper* case, the successful bidder omitted a \$301,000 item. Its bid was \$780,000 and the next low bid was \$1,049,000 (amounts approximations).¹¹⁷

The bidder sought to have its bid bond cancelled. The city sought to recover on the bond and recover damages as well, a remedy provided by the Los Angeles City Charter. The damages would be the difference between the two bids, here \$257,000. The court reasoned that to allow damages here would be unconscionable and it relieved the bidder from its bid.

Suppose the city asked only for enforcement of the 10 percent bid bond or \$78,000. This would have been one-third the damages sought by the city. Whether this would have led the court to refuse cancellation of the bond is, of course, uncertain. But the amount of the forfeiture certainly played a large role in the court's decision.

This is often the outcome under statutes regulating competitive bidding. If the successful bidder refuses to enter into the contract, its deposit, usually a bid bond, is forfeited. In effect the statute providing the forfeiture has created a liquidated damages clause, or more realistically, a limitation of liability.¹¹⁸ By limiting the remedy to forfeiture of the bid bond, there might not be the need to relieve the bidder from its bid.

This would seem a fair solution to the vexatious bidding mistake cases. The contractor's exposure would be the deposit. Although one court drew this distinction,¹¹⁹

most generally have held that the contractor is relieved from its performance entirely if the requirements for relief are established. In such a case, the contractor is entitled to recover the deposit. Although the deposit may be only 5 to 10 percent of the bid, in large jobs this amount is substantial. Where the facts are sufficient to allow the mistake doctrine to be applied, most courts would prefer to relieve the bidder entirely.¹²⁰

Courts generally have been reluctant to allow a bidder to correct a mistake, particularly if the claim to reform the contract is made after performance has begun or been completed.¹²¹ Yet some cases, particularly in the federal procurement system, do permit the bidder to correct its mistake.¹²² Some courts outside the federal procurement system have also permitted correction through the equitable doctrine of reformation.¹²³ Yet clearly rescission (cancellation) is easier to obtain than reformation.¹²⁴

A case that involves the application of the Federal Acquisition Regulations (FAR) deals with what appears to be a mistaken bid created by errors of judgment and employs an equitable solution when the contract has been partly performed. This instructive case is reproduced here.

**SULZER BINGHAM PUMPS, INC. v.
LOCKHEED MISSILES & SPACE COMPANY, INC.**

United States Court of Appeals, Ninth Circuit, 1991. 947 F.2d 1362.
Before KILKENNY, GOODWIN and SCHROEDER, Circuit Judges.

SCHROEDER, Circuit Judge.

This appeal arises out of an unusual dispute between a major government contractor and a subcontractor providing components for the United States Navy's Trident II nuclear submarines. The contractor, Lockheed Missiles & Space Company, awarded a subcontract to the low bidder for the subcontract, the appellee Sulzer Bingham Pumps, Inc. Sulzer Bingham's bid, however, was in fact millions of dollars lower than it would have been if Sulzer Bingham had not committed a series of errors in preparing the bid. According to the findings of the respected district judge who heard the evidence, Lockheed doubted that Sulzer Bingham could perform the contract at that price, but nevertheless awarded the contract for the bid price, resulting in an unconscionably low price. The district court concluded that Lockheed's conduct amounted to overreaching in violation of basic contractual principles, and that its failure to ask the subcontractor to verify its bid violated the terms of the subcontract. The district court declined to rescind the contract. The district court did, however, award Sulzer Bingham some equitable relief in the form of the actual costs it incurred above the contract price, in a total amount which was not to exceed the next lowest bid. Lockheed appeals.

* * *

FACTUAL BACKGROUND

The facts as determined by the district court are not seriously disputed on appeal. They can be summarized as follows.

Lockheed is the prime contractor for the Navy's Trident II nuclear submarines. The subcontract at issue involved the production of ballast cans. When the submarines are not carrying nuclear missiles, they need ballast cans for stability. Each ballast can weighs 64,000 pounds and stands 15 feet high.

In 1988, Lockheed sent out a request for quotation to potential subcontractors, seeking bids for the manufacturer of 124 ballast cans. In February 1989, Lockheed received eight bids, including one from Sulzer Bingham. Sulzer Bingham was the lowest bidder at \$6,544,055. The next lowest bid was \$10,176,670, and the bids ranged up to \$12,940,540, with one high bid at \$17,766,327. Lockheed estimated that the job would cost about \$8.5 million.

Lockheed's employees were shocked by Sulzer Bingham's bid and thought it was surprisingly low. Price extensions, submitted to Lockheed by Sulzer Bingham, revealed no arithmetic errors. Lockheed then asked Sulzer Bingham to verify that its bid included shipping charges and First Article Compatibility Testing, but did not ask for verification of the entire bid. Sulzer Bingham informed Lockheed that its bid was complete. Lockheed then inspected Sulzer Bingham's Portland facility to evaluate Sulzer Bingham's technical capabilities. The inspection revealed that Sulzer Bingham would have to make many modifications to its existing facility in order to complete the contract. The turntable Sulzer Bingham anticipated using for machining and assembling the ballast cans was inadequate, and an entirely new lead pouring facility needed to be constructed. None of these shortcomings were revealed to Sulzer Bingham by Lockheed.

At no time did Lockheed notify Sulzer Bingham that it suspected a mistake in Sulzer Bingham's bid. Lockheed did not inform Sulzer Bingham that its bid was significantly lower than the next lowest bid, and lower than Lockheed's own estimate of the cost of the job as well. Lockheed never informed Sulzer Bingham that it suspected that Sulzer Bingham would not be able to complete the contract at the bid price.

Sulzer Bingham made a variety of errors in its bid. It had underestimated the number of hours the job would require, and had used hourly labor rates that were below cost. Sulzer Bingham had not realized that its existing facilities were inadequate for the job, and had overlooked certain costs of the job. Sulzer Bingham's bid broke down to \$30,707 per ballast can. The next lowest bid broke down to \$58,137 per can, and Lockheed estimated at least \$40,000 per can.

In late February 1989, Lockheed accepted Sulzer Bingham's bid and Sulzer Bingham started work. In November 1989, Sulzer Bingham revised its estimate of the cost of the job and asked Lockheed for additional \$2,111,000 in compensation. Lockheed rejected Sulzer Bingham's request for additional compensation.

* * *

The district court . . . concluded that under section 14.406-3 [Ed. note: Now 14.407-3] of the Federal Acquisition Regulation,

Lockheed had a duty to notify Sulzer Bingham when it suspected a mistake in Sulzer Bingham's bid. The district court further concluded that Lockheed breached this duty, and Sulzer Bingham was therefore entitled to equitable relief.

The district court denied rescission because Sulzer Bingham had delayed its request for rescission and because Sulzer Bingham had already completed about half of the contract. The district court then concluded that it could award Sulzer Bingham other equitable relief because Lockheed had breached its duty to verify Sulzer Bingham's bid, and the resulting contract was unconscionable. The district court required Sulzer Bingham to complete the contract, and ordered that Sulzer Bingham could "recover its actual costs only, including a reasonable amount for depreciation and overhead. Under no circumstances may [Sulzer Bingham's] recovery exceed the amount of the next lowest bid."

THE APPLICABILITY OF FEDERAL ACQUISITION REGULATIONS REGARDING BID VERIFICATION

Lockheed argues that the district court erred in holding that the Federal Acquisition Regulations ("FAR") imposed specific verification duties on Lockheed. [Ed. note: The court held that the subcontract imposed these duties on Lockheed.]

Section 14.406-3 [Ed. note: now 14.407-3] of the Federal Acquisition Regulation requires a contracting officer to take the following steps if a bidding mistake is suspected:

1. The contracting officer shall immediately request the bidder to verify the bid. Action taken to verify bids must be sufficient to reasonably assure the contracting officer that the bid as confirmed is without error, or to elicit the allegation of a mistake by the bidder. To assure that the bidder will be put on notice of a mistake suspected by the contracting officer, the bidder should be advised as appropriate—

i. That its bid is so much lower than the other bids or the Government's estimate as to indicate a possibility of error;

* * *

iv. Of any other information, proper for disclosure, that leads the contracting officer to believe that there is a mistake in bid.

48 C.F.R. § 14.406-3G (1) [Ed. note: now § 14.407-3G(1)] The district court held that Lockheed breached its duty to Sulzer Bingham by not notifying Sulzer Bingham that it suspected a mistake, and not informing Sulzer Bingham that the bid was much lower than all other bids.

* * *

The district court correctly concluded that FAR governed the parties' conduct during the bid acceptance and award period, and that Lockheed breached its duty under FAR by failing to notify Sulzer Bingham that it suspected a mistake in the bid.

THE APPROPRIATE REMEDY FOR LOCKHEED'S BREACH

Lockheed argues that even if FAR applies and Lockheed breached its duty to properly verify Sulzer Bingham's bid, nevertheless Sulzer Bingham is not entitled to relief. In support of this argument Lockheed relies on cases holding that the terms of a substantially performed contract may not be changed through reformation if the bid mistake is not attributable to an arithmetic or clerical error.

It is apparently well settled government contract law that reformation, based on a mistake in bidding, is available to correct only "clear cut clerical or arithmetical error, or misreading of specifications." *Aydin Corp. v. United States*, 229 Ct.Cl. 309, 314, 669 F.2d 681, 685 (1982) (quoting *Ruggiero v. United States*, 190 Ct.Cl. 327, 335, 420 F.2d 709, 713 (1970)). According to the district court's findings, errors in judgment predominated in this case. It is apparently well settled government contract law that such errors in judgment do not, by themselves, justify the award of equitable relief in the form of a change in the contract price. . . . Such a conclusion is consistent with the understanding that contracting entities should live up to their contractual obligations when bidding errors are based on economic misjudgment, and not attributable to the other contracting party's conduct.

In this case, however, the district court did not fashion equitable relief solely on the basis of the bidder's economic misjudgments. Rather, the district court awarded relief because Lockheed, in failing to follow contractual provisions requiring bid verification, accepted an unconscionably low bid. The verification procedures Lockheed ignored were designed to ensure that such unconscionably priced contracts would not be awarded.

None of the authorities relied on by Lockheed involve such a situation. In *Aydin Corp.*, 229 Ct.Cl. at 318, 669 F.2d at 687, for example, the disparity in bids was not sufficient to put the contracting officer on constructive notice of any mistake in the bid, whereas in this case, Lockheed had actual notice. In *Hamilton Enterprises*, 711 F.2d at 1045, the bidder underestimated the number of hours needed to perform the contract, and the government failed to adequately verify the bid. The bidder defaulted on the contract. The court denied the claims of both

parties, describing the case as one of “mutual fault to the extent that neither party is entitled to recover on the claims asserted against the other.” There was no finding of unconscionability. In this case, unlike *Hamilton Enterprises*, Lockheed is reaping the rewards of Sulzer Bingham’s performance at an unconscionably low price. The Defense Department’s own adjudicatory

arm has itself recognized in contract disputes that equitable principles do apply to prevent the enforcement of an unconscionable contract.

* * *

AFFIRMED.

Suppose the invitation to bidders states that bidders will not be released for errors. One court interpreted this language to cover errors of judgment and not clerical errors.¹²⁵ Another refused to employ this interpretation technique to give relief for a clerical error.¹²⁶ The former approach is preferable. If the invitation *clearly* covers clerical errors, the risk of even clerical errors should be placed on the contractor. However, it is more likely that such language will not tie the hands of courts to grant relief for such mistakes if the enforcement of the mistaken bid would be unconscionable.

Mirroring increased judicial activism in other fields, constitutional principles have been invoked in bid mistake cases. In *Midway Excavators, Inc. v. Chandler*,¹²⁷ the court rejected the claim by the bidder that the failure by the public entity to develop guidelines determining the type of technical mistakes that would justify relief violated the bidder’s constitutional right of not being deprived of property without due process of law.

On rare occasions unjustified refusal by the bidder to whom the contract has been awarded results in a benefit to the awarding authority. This occurred in *Macon-Bibb County Water & Sewer Authority v. Tuttle/White Constructors, Inc.*¹²⁸ The court invoked the concept of *offsetting benefits*. In this case the defendant submitted the low bid of \$8.7 million for the incineration of waste sludge. The next low bid was \$9.9 million or a difference of about \$1.2 million. The defendant, without legal justification, refused to sign the contract. After it refused, a third party advised the awarding authority of a new type of boiler that would save the awarding authority \$1.2 million

in capital costs and \$155,000 in annual costs. The defendant was able to offset the benefits its breach had generated. Without its breach, the new information could not have been obtained and used.

F. Bid Deposit

The bidders are usually requested to submit deposits with their proposals. Is the deposit a security deposit out of which the owner can take whatever damages it has incurred? Does the payment limit the damages to a specified figure that still obligates the owner to prove damages up to that figure? Is the deposit submitted in an attempt to set damages in advance by agreement of the parties?

Suppose Bidder A submits a proposal for \$1 million and the invitation to bidders requires it to submit a bid bond for 5 percent of its bid. A bid bond for \$50,000 is deposited. The bids are opened, and A is lowest. The next lowest bidder has submitted a bid of \$1.1 million. A is offered the contract but without any legal justification declines to enter into it. The contract is offered to the next lowest bidder, who bid \$1.1 million. Is the owner entitled to \$100,000 in damages, with \$50,000 of that amount as a security deposit out of which it can assure itself that it will be able to collect at least a part of its damages? Or is the owner limited to \$50,000, because this is what the parties have agreed will be the actual damage amount whether the actual damages are higher or lower?

Suppose the next lowest bidder had been \$1,025,000 instead of \$1.1 million. In such a case, can the owner keep the entire \$50,000 or must it be limited to \$25,000?

To a certain extent, the parties are free by their contract to determine whether the amount submitted or the bid bond deposited liquidates (agrees in advance on the amount of) damages, is a security deposit, or is a limitation of liability. A security deposit is an amount of money deposited with one party, out of which the latter can satisfy whatever damages to which it is entitled. If the 5 percent deposit is merely a security deposit, the owner

¹²⁵*M.F. Kemper Constr. Co. v. City of Los Angeles*, 37 Cal.2d 696, 235 P.2d 7 (1951). See also *Jobco, Inc. v. Nassau County*, 129 A.D.2d 614, 514 N.Y.S.2d 108 (1987) (disclaimer in bid bond did not preclude rescission for mistake).

¹²⁶*City of Newport News v. Doyle & Russell, Inc.*, 211 Va. 603, 179 S.E.2d 493 (1971).

¹²⁷128 N.H. 654, 522 A.2d 982 (1986).

¹²⁸530 F.Supp. 1048 (M.D.Ga.1981).

can retain this amount and sue for any balance to which it is entitled, or it must return the excess of the deposit over damages.

If the deposit is a valid liquidated damages clause, the parties have agreed in advance that whatever the amount of the actual damages, the breaching party will pay the amount stipulated in the clause. The owner could retain the \$50,000 whether the damages were \$200,000 or \$1.

A valid liquidated damages clause requires that it be difficult to ascertain the damages at the time the contract is made and that the amount agreed be a genuine pre-estimate of the potential damages.

An amount disproportionate to the actual or anticipated damage chosen merely to coerce performance is a penalty, and unenforceable. For example, if the deposit were 50 percent of the bid and if it were most unlikely that there would be damages approaching this amount, the clause would be a penalty and unenforceable. The owner would be entitled only to actual damages without regard for the amount of the deposit, and it would have to refund the excess of the deposit over its actual damages.

Legislation, state or local, may give the public agency damages based on the difference between the low bid and the next lowest bid if the low bidder does not enter into the contract awarded to it. In such a case, the deposit is for security and is not an attempt to liquidate damages. A liquidated damages clause *establishes* the damages.

Legislation sometimes provides that the public agency may retain the amount deposited but only to the extent of the difference between the defaulting bidder's bid and the amount for which the contract is ultimately awarded. For example, suppose the amount deposited was \$50,000 or 5 percent of the \$1 million bid and the next bidder was awarded the contract at \$1,025,000. In such a case, the owner would be entitled to retain \$25,000. Such statutes set up a liquidation of damages that will apply only if actual damages are greater than the amount deposited. If actual damages are less, the deposit is simply security.

Is it desirable to liquidate damages? From the owner's standpoint, the chances of collecting an amount in excess of the deposit from the contractor are remote. In addition, the owner would like to retain the amount deposited without having to show actual damages. For these reasons, it is preferable to liquidate damages rather than use the deposit solely as security. The pure security deposit does allow the owner to seek to recover an amount beyond the deposit. This would occur if the discrepancy between the

defaulting bidder's bid and the next bidder is more than the deposit. In such a case, there is a strong likelihood of a mistake that would permit the bidder to withdraw its bid. Many contractors would not be able to satisfy a large court judgment. This is a reason for providing the security deposit. Liquidated damages protect the contractor from the risk of excessive damages and guarantee the owner a reasonable amount of collectible damages.

A properly drafted liquidated damages clause is likely to be enforced if created by legislation that specifically permits the awarding authority to forfeit the deposit.¹²⁹ In the absence of such legislation, courts divide. Some enforce such a clause; others do not.^{130, 131}

The uncertainty as to the amount of damages must exist at the time the contract is made and at the time of the deposit. Some courts ignore this requirement and seem to look at whether the amount of damages can be easily ascertained at the time of breach. These courts seem unwilling to forfeit an amount in excess of actual damages. This approach does not take note of the long-haul aspects of denominating the forfeiture clause as stipulated damages. Over the long haul of many competitive bids, the losses to the public agency probably average per competition the amount stipulated in each competitive bid. Although the long haul may seem unfair to the particular bidder who must lose more than what it *appears* the agency has been damaged in this competitive bid, the *particular* bidder is relieved from any risk *beyond* the deposit amount.

There are administrative costs when the next lowest bidder is selected. Admittedly, that loss often seems much less than the amount forfeited. But again, the parties expect the amount to be deposited to be forfeited, and the bidder is relieved from the risk of loss beyond the deposit. As long as the amount selected is reasonable, the

¹²⁹*A & A Elec., Inc. v. King City*, 54 Cal.App.3d 457, 126 Cal.Rptr. 585 (1976) (awarding authority limited to forfeiture of bid bond, no damages). See also *Emma Corp. v. Ingleside Unified School Dist.*, 114 Cal. App.4th 1018, 8 Cal.Rptr.3d 219 (2004), review denied, Apr. 21, 2004 (no damages, only forfeiture of bid bond). Cf. *Powder Horn Constructors, Inc. v. City of Florence*, supra note 57.

¹³⁰*Jobco, Inc. v. Nassau County*, supra note 125 (dictum); *Bellefonte Borough Auth. v. Gateway Equip. & Supply Co.*, 442 Pa. 492, 277 A.2d 347 (1971); *City of Fargo v. Case Dev. Co.*, 401 N.W.2d 529 (N.D.1987) (failure to develop property).

forfeiture clause should be considered a valid liquidated damages clause.

The clause should be *clearly enforceable* if it is necessary to rebid the entire project. Rebidding entails substantial additional administrative expense.

Suppose both low bidder and the next lowest bidder unjustifiably refuse to enter into the contract. Can the owner retain the deposit by both bidders? Although it may seem unfair to retain both bidders' deposits, it is not logically indefensible. Each bidder has breached, and each has been to some degree relieved from the risk of excessive damages by using an agreed damages provision. However, goodwill and the avoidance of litigation may necessitate some solution, such as retaining one-half of each deposit rather than trying to retain both.¹³²

G. The Formal Contract

The culmination of a successful competitive bidding process is the award by the awarding authority to the successful bidder. Usually, a formal contract is forwarded or given to the successful bidder for its execution.

Suppose the award is made *before* the expiration of the period during which the bid is irrevocable but the formal contract is not executed within that period. Although one case discussed earlier held that a tentative acceptance within the period was not a sufficient acceptance,¹³³ two Wisconsin cases held that the validity of the contract did not require execution of the contract. In one,¹³⁴ the awarding authority had voted, in the presence of the bidder, to accept the bid. In the other,¹³⁵ approval by a federal regulatory agency that conditioned the award was not received until the morning of the final day of the period during which the bid was irrevocable. On that morning (a Friday), the engineer notified the contractor that the formal contracts would be in the mail that day. The following day (Saturday), the contractor wrote that it was withdrawing its

bid, because the forty-five-day period during which its bid was irrevocable had expired. The contracts were received on the following Monday. The court could have held that the acceptance took place on the forty-fifth day—when the contracts were put in the mail. But the court held for the awarding authority by concluding that contracts had been formed, and the formal contracts merely memorialized the agreement that had already been made.

An Iowa case, noting the contrary holdings as to the requirement that a formal contract was needed to form the contract, held that written, formal acceptance created a valid contract despite the failure to execute the formal written contract.¹³⁶

The difficulties generated by this issue are shown in a recent Arizona case. The intermediate Arizona appellate court held the contract was valid even though the parties did not execute a formal contract.¹³⁷ Yet this opinion was vacated by the Arizona Supreme Court. It held there was no valid contract until the parties had executed a formal agreement.¹³⁸

Cases may come out differently where the test is the intention of the parties and factual patterns vary. If the transaction is a “one-off” and not a routine transaction, the amounts at stake are substantial, the transaction is a complicated one, and attorneys are involved at some stage of the transaction, it is likely that the parties have not bound themselves until they have signed a formal, written agreement.

Suppose the formal contract is not consistent with earlier communications exchanged between the successful bidder and the awarding authority. The Court of Claims held that the formal contract, while typically superseding all previous negotiations, documents, etc., is merely a reduction to form of the actual agreement made by the advertisement, bid, and its acceptance.¹³⁹ This is another recognition of the formal contract often being simply a memorial of the agreement that has been made. However, the date of the formal contract *may* set into motion any time commitment of the contractor.

H. Bidding Documents

The culmination of the complex competitive process usually is assent by both parties to the construction contract. This process has generated a series of many long and complex writings, such as the invitation to bidders, information to bidders, and the bid proposal. Included among these are other materials, such as plans, specifications, general conditions, supplemental conditions, addenda, and the agreement forms. Chapters 19 and 20 deal with the problems generated by this wealth of written material. But what about the materials generated by the bid process itself?

AIA Document A201-2007, Section 1.1.1, seeks to deny the bidding materials any legal effect by excluding bidding requirements as contract documents.¹⁴⁰ Bidding materials have been superseded by execution of the construction contract. It is important to avoid contradiction in the voluminous contract documents. But a provision can state that in the event of conflict, the construction contract takes precedence over the bidding documents. Although implementing provisions of this type is not as simple as it appears, the solution AIA has selected—excluding bidding documents—is undesirable.

Most participants in the process believe that the bidding documents do have legal efficacy.¹⁴¹ Information is given in the bidding documents that is relied on by the bidders. For example, subsurface information is frequently included in the information to bidders. Under AIA Document A201-2007, Section 3.7.4, unless this information is found in the specifications, it cannot be the basis of any claim by the contractor for an equitable adjustment for subsurface conditions different from those usually encountered or disclosed by the contract documents. Similarly, AIA Document A701-1997 (instructions to bidders) imposes many contractual terms intended to survive, such as liquidating damages for failure to enter into the construction contract and requiring that a particular type of surety bond be used. If the award is made and the construction contract documents are signed without these provisions, if taken literally, A201-2007 would discharge any obligations the contractor may have that are expressed in the instruction to bidders. There may be

factual material in the bidding instructions or information to which the owner may wish to point at some later date if a claim has been made.¹⁴²

The bidding material was useful to the contractor in *Village of Turtle Lake v. Orvedahl Construction, Inc.*¹⁴³ Here the bidding material was a contract document. Because the arbitration clause included disputes relating to the contract documents, the bidder was given a chance to submit its claim of mistake to arbitration even if it could not meet the requirements of the statute regulating bidding mistakes in public contracts.

Attempts to deny any legal effectiveness to the bidding documents may not be in the owner's best interest and may frustrate the reasonable expectations of both parties.

I. Judicial Review of Agency Action

Public procurement encompasses a vast number of social and economic goals. The result has been a complicated set of statutes and regulations with the increasing likelihood of irregularities. At the state and local level standing to contest the agency award in court does not seem to have been the problem it has been at the federal level.

Before 1970, disappointed bidders were not granted standing to challenge federal agency decisions based on *Perkins v. Lukens Steel Co.*,¹⁴⁴ which held that the government has the sole right to choose with whom and under what terms it will contract. A disappointed bidder has only a privilege and not a right to do business with the government. In addition to this wooden logic, the court was concerned that judicial interference with government procurement would cause delay and involve the courts in decision making beyond their competence.

But in *Scanwell Laboratories, Inc. v. Shaffer*,¹⁴⁵ a federal appeals court cited the Administrative Procedure Act,¹⁴⁶ a statute passed after *Perkins v. Lukens Steel Co.*, and held

¹⁴²D.A. *Collins Constr. Co., Inc. v. State*, 88 A.D.2d 698, 451 N.Y.S.2d 314 (1982) (information regarding possible delay barred contractor delay claim).

¹⁴¹*Jack B. Parson Constr. Co. v. State Dep't of Transp.*, 725 P.2d 614 (Utah 1986) (effect given to bidding information).

that a disappointed bidder had standing to seek a judicial order stopping an allegedly invalid procurement order.

The *Scanwell* case seemed to open some federal courthouse doors to disappointed bidders seeking federal contracts. This would involve courts in difficult procurement problems. A year later, the same court had second thoughts. It held that judicial interference with a procurement award required the challenger to demonstrate that there was no “rational basis” for the award. In addition, trial courts were given broad discretion to refuse to interfere with the procurement.¹⁴⁷ It is easier for a disappointed bidder to recover damages that are usually limited to bidding expenses if it can establish a defect in procurement procedures.¹⁴⁸

The authority of the federal district courts to hear protests by disappointed bidders became the subject of congressional action. In 1996, Congress gave both the U.S. Court of Federal Claims (formerly the United States Claims Court, located in Washington, D.C.) and the federal district courts concurrent jurisdiction over bid protests.¹⁴⁹ At the same time, however, it enacted a “sunset” provision which stated that the district courts’ jurisdiction granted by this statute would terminate on January 1, 2001, unless extended by Congress.¹⁵⁰ Congress did not extend the district courts’ jurisdiction by the announced deadline. One court has interpreted Congress’s failure to act to mean that the federal district courts are entirely divested of jurisdiction over bid protests involving federal contracts.¹⁵¹ A contrary view is that the district courts are divested of their jurisdiction under the 1996 law, but not under the Administrative Procedure Act—the statute relied upon by the *Scanwell* court.¹⁵²

¹⁵²Note, 32 Pub. Cont. L.J. 393 (2003).

J. Illegal Contracts

The imposing number of legal controls on public contracts, the interest generated by public projects, and the staff inadequacies in small public entities all create a substantial risk that an award may be made illegally. Suppose the party to whom the award had been made partly or fully performed.

Clearly, recovery cannot be made under an illegal contract. But two other issues can arise. First, and most frequently, can the contractor who has performed under an illegal contract recover for the work it has performed based on restitution? Second, can any payments made to a contractor be recovered by the awarding authority?

These issues of unjust enrichment, like attempts by bidders to withdraw their bids, generate sharp differences of opinion. Those who would deny recovery or even require repayment stress the importance of an honest competitive bidding system and the need to protect public funds. Although a recognition exists of the occasional unfairness of denying, because of technical irregularities, a contractor recovery for work it has performed, those who take a hard line cite the difficulty of making these judgments and the importance of not allowing any loopholes in the laws regulating public contracts.

Those who take a softer approach are willing to concede that there should not be recovery or that there should even be repayment where there is venality or corruption, but they draw a distinction between those cases and ones that do not involve serious criminal misconduct. Where corruption is pervasive, they would concede that only harsh and unremitting punishment has a chance of deterring such corruption. In other jurisdictions, inefficiency is common and corruption rare. In such jurisdictions, there should be greater willingness to allow payment to a contractor where the award was not tainted with bad faith, fraud, or corruption.

Generally, illegally awarded contracts cannot be the basis for restitution. But in 1971, restitution was allowed in *Blum v. City of Hillsboro*.¹⁵³ Immediately after acceptance of the \$47,000 contract, council members of the awarding authority asked the contractor if it would be willing to do additional work for a designated price. The contractor stated it would, and the awarding authority, through its mayor and city council, specified the work

¹⁵³49 Wis.2d 667, 183 N.W.2d 47 (1971).

to be done and drew up an amendment to the original contract.

The contractor performed the additional work, which increased the amount of the contract to \$154,000. The awarding authority paid \$82,000 but refused to pay the balance of \$72,000. The contractor sought to recover the balance, and the awarding authority counterclaimed for the amount it paid in excess of the original contract price. This claim was based on the failure to follow state law, which required that the additional work be competitively bid.

The court held that recovery of restitution based on benefit conferred (though a minority view) was justified in this case. According to the court, failure to allow profits would be sufficient deterrence. If recovery is not granted, a claim will very likely be made on the municipality to use its discretionary power to pay moral claims. The court limited recovery to actual costs, including overhead not exceeding actual benefit, but denied profit. Nor could recovery exceed the unit cost of the original contract that had been properly awarded.

This issue continues to plague the courts. *Bozied v. City of Brookings*, decided by the Supreme Court of South Dakota in 2001, involved facts similar to those in the *Blum* case just described.¹⁵⁴ The court held that the additional work performed by the contractor should have been awarded by competitive bidding. This made the change order illegal. But the contractor had received most of what it would have been entitled to for performing the additional work. The court held the contractor cannot get any more but it need not return what it had received. Were that to be done, the city would have been unjustly enriched. The court held the parties should be left where they were.

But the court was quick to point out that this solution assumes that there was no evidence of fraud or collusion, that the public entity was authorized to make the contract but did so in an unlawful manner, that the payments were received, and the amounts paid were reasonable.

The remedy is crucial in these cases. The flexibility provided by remedial choices can provide a way of reaching a fair result. This will be seen again in the *Gerzof* case discussed shortly in this sub-section.

In 1977, the Minnesota Supreme Court followed the *Blum* case in a well-drilling contract that was illegally

awarded because it violated the competitive bidding statute. Whether there had been a violation was a close question, inasmuch as the awarding authority thought there had been a sufficient emergency that granted it an exemption from the competitive bidding requirements. Yet because the contractor had not actually found water, the court denied recovery because there had been no benefit to the awarding authority.¹⁵⁵

Other jurisdictions have taken a much harder line. *Manning Engineering, Inc. v. Hudson County Park Commission*¹⁵⁶ involved pervasive corruption in the awarding of contracts in Jersey City, New Jersey. The court not only denied the engineering company recovery for work that it had performed but also indicated that the awarding authority would have had a good claim had it sought repayment of funds that had been paid. It cited a New York case¹⁵⁷ that had involved a contractor convicted of conspiring to violate state bribery laws through a kickback system. When the contractor sued for the unpaid balance, the city successfully defended the claim and recovered payments that it had made.

*Gerzof v. Sweeney*¹⁵⁸ demonstrated not only the difficulty of fashioning an appropriate remedy but also how the “tough” New York court can be persuaded to relax its harsh rules. In this case, the Village of Freeport (New York) had advertised for bids for a 3,500-kilowatt generator. Enterprise bid \$615,000, and Nordberg bid \$674,000. After an advisory committee had recommended acceptance of Enterprise’s bid, a new village election was held at which a new mayor and two new trustees were elected. Shortly thereafter, Nordberg’s higher bid was accepted.

Enterprise obtained a court order setting the award aside. The board of trustees then drew up new specifications for a 5,000-kilowatt generator with the active participation of Nordberg. The specifications were so rigged that only Nordberg could comply. As expected, Nordberg was the only bidder, and its bid of \$757,000 was accepted. Nordberg installed the generator and was paid.

¹⁵⁵*Layne Minnesota Co. v. Town of Stuntz*, 257 N.W.2d 295 (Minn. 1977).

¹⁵⁶74 N.J. 113, 376 A.2d 1194 (1977).

¹⁵⁷*S.T. Grand, Inc. v. City of New York*, 32 N.Y.2d 300, 298 N.E.2d 105, 344 N.Y.S.2d 938 (1973).

¹⁵⁸22 N.Y.2d 297, 239 N.E.2d 521, 292 N.Y.S.2d 640 (1968).

¹⁵⁴638 N.W.2d 264 (S.D.2001)

After a court declared the second award invalid, the trial court held that the village should retain the generator and recover the \$757,000 from Nordberg. The intermediate appellate court modified that judgment by providing that Nordberg could retake the machine on posting a bond for \$357,000 to secure the village against damages from removal and replacement of equipment. New York's highest court, the Court of Appeals, first emphasized the importance of protecting the public against corruption and collusion between public officials and bidders.

In the *normal* case it would make no difference whether the village was defending a claim brought by Nordberg or was seeking to recover the money paid Nordberg. But this was not a normal case. Granting recovery of payments made would cost Nordberg three-quarters of a million dollars, and the village would have its generator. Motivated by the enormity of the forfeiture, the court awarded a remedy different from that awarded by the trial court or the intermediate appellate court. The Court of Appeals stated that the award should have been made to Enterprise. Had this been done, the village would have had a 3,500-kilowatt generator for \$615,000. The court awarded judgment against Nordberg based on the difference between the \$757,000 paid Nordberg and the \$615,000 that the village would have paid Enterprise. To this was added \$37,000, the difference between what it cost the village to install the Nordberg generator and what it would have cost to install the one offered by Enterprise. In addition, the village was awarded interest.

Suppose the contract should have been awarded to X but was awarded illegally to Y. Suppose X seeks the profits

from Y that Y made on the contract. Although some cases have denied recovery,¹⁵⁹ a federal court decision applying Iowa law employed unjust enrichment to award a bidder who should have been awarded the contract the profit of the contractor who had been awarded the contract improperly.¹⁶⁰

SECTION 18.05 Subcontractor Bids

The relationship between prime and subcontractor is discussed in greater detail in Section 28.02B. However, one aspect of that relationship should be mentioned briefly here. A legal problem that has surfaced frequently relates to the right of a prime contractor to hold a subcontractor to its bid after the former has used that bid in computing its own bid and submitting it to the owner. Although the cases are by no means unanimous,¹⁶¹ the clear trend is toward holding the subcontractor's bid irrevocable after it has been used by the prime contractor.¹⁶²

Sources of Construction Contract Rights and Duties: Contract Documents and Legal Rules

SECTION 19.01 Contract Documents: An Electronic Age

As noted in Sections 17.03 and 17.04, there have been changes in the way construction delivery services are organized. Under traditional systems, design–bid–build (DBB) or design–award–build (DAB), the design was done by design professionals and constructed by constructors, usually called contractors. The law has been slow to respond to these new organizational arrangements.

Similarly, the design traditionally is expressed through plans and specifications on paper and is prepared or reviewed by the design professional. The legal documents that organize the project and allocate responsibilities are set forth on paper. Collectively, all of these papers are called the Contract Documents.

Figure 19.1 gives an idea of the complexity of construction contract documents.

But technological changes have created an electronic age.¹ Design is increasingly created and expressed electronically. Communications, including elements of and comments on the design, are electronic. This made it necessary for the Congress to enact legislation making electronic documents and signatures legally binding.²

But the stunningly rapid advances in technology far outstrip the willingness and ability of the legal world,

including those who publish standard documents and the construction bar, to adapt to them.³

Major issues relevant to this chapter (others will surface in other chapters) are what is and who creates the design? The design will no longer be done solely by the design professional and expressed on paper. Specialty subcontractors, vendors, and software manufacturers will be involved in design. Design is fluid and collaborative. Much of the coordination and communication will be electronic.

Yet this will not eliminate paper. While some may disagree,⁴ one commentator thinks that the electronic documents will be treated as drafts or copies. Paper has many advantages. It is better for archival purposes, more secure, and more easily used by those who must review it.⁵

Yet the electronic world is quicker and more efficient. There will have to be methods of blending the two worlds. These things must be taken into account in dealing with the sources of construction contract rights and duties, the subject of this section.

A. Bidding Documents

Section 18.04 discussed bidding documents.

¹This is discussed in detail in Ashcraft, *New Paradigms for Design Professionals: New Issues for Construction Lawyers*. This unpublished paper was presented at a meeting of the American Bar Association Forum on the Construction Industry, Scottsdale, Arizona, October 12, 2000. It was not bound into the book of program materials. The author can be reached at hashcraft@hansonbridgett.com

⁴Stein, Alexander & Noble supra note 3, state “contracts for construction of Frank Gehry’s buildings provide that the information in the 3D electronic files takes precedence over information contained in hard copies.” Id. at 4. See Section 20.03B.

⁵Ashcraft, supra note 1 at 18–19.

B. Basic Agreement

The basic agreement is the culmination of competitive bidding or negotiation. As an illustration, AIA Document A101, set forth in Appendix B, identifies the parties and the architect and contains provisions dealing with the work to be performed, time of commencement and completion, the contract sum, and provisions for progress payments and final payment. In essence, the basic agreement sets forth the principal incentives of each contracting party. The owner seeks a project completed on schedule, and the contractor seeks agreed compensation for its performance.

The construction project is a complex undertaking. The basic agreement forms are but one part of the total package of construction documents. See Figure 19.1. Frequently the other documents are incorporated by reference in the basic agreement. For example, A101-2007, Article 9, includes as contract documents the general and supplementary conditions, drawings, specifications, addenda issued before execution of the basic agreement, and all modifications issued later. Section 9.1.7 provides space to list the documents incorporated by reference.

Contracts frequently incorporate industry standards. The parties can even incorporate a document not yet in existence. For example, in *Randolph Construction Co. v. Kings East Corp.*,⁶ the basic agreement incorporated plans that had not yet been completed. But according to the court, if the completed plans differ substantially from those anticipated, no contract exists unless the parties agree to the completed plans.

Incorporation by reference—a technique for giving legal effectiveness to writings not physically attached to the contract—should be differentiated from reference to other writings. Often reference is made to other writings for informational purposes, without any intention of making them part of the contract obligations. Classifying a writing referred to in the contract as simply providing information can be a technique to avoid binding a party to a writing of which it was unaware. Although such binding can occur when an owner signs an A201, it is more of a problem for subcontractors. Subcontracts frequently refer to the prime contract, and serious questions can arise as to whether the prime contract provisions are incorporated into the subcontract as well as how to reconcile contrary provisions in prime and subcontracts. For that reason, incorporation into subcontracts is discussed in Section 28.04.

⁶165 Conn. 269, 334 A.2d 464 (1973).

C. Drawings (Plans)

The drawings graphically depict the contractor's obligations. Together with the other contract documents, particularly the specifications, they define and measure the contract obligation.

Drawings are of great importance to the construction process. Complying with them, as shall be seen in Section 24.02, usually relieves the contractor of liability if the project is unsuccessful or is not in accord with the owner's expectations. Drawings that are incomplete or inconsistent with the specifications almost always generate increased construction costs. As discussed in Section 14.03, defective drawings or drawings that do not fit with the specifications usually result in liability to the design professional.

A common construction process problem is inconsistency between the drawings and specifications (dealt with in Section 20.03).

D. Specifications—*Fruin-Colnon v. Niagara Frontier* and *Blake v. United States*—Work Preservation Clauses

Specifications use words to describe the required quantity and quality of the project.⁷ They also provide information that helps the contractor plan price and performance, such as subsurface conditions, site access for heavy equipment, and availability of temporary power. They should be clear and complete and should “fit together.” Otherwise there are likely to be defects, disputes, increased costs, and litigation.

Specifications are classified by type. The most important types are design, performance, and purchase description.

Design specifications (sometimes called *materials and methods* or *detail specifications*) state precise measurements, tolerances, materials, construction methods, sequences, quality control, inspection requirements, and other information. They tell the contractor in detail the material it must furnish and how to perform the work.

Performance specifications state the performance characteristics required; for example, the pump will deliver fifty units per minute, a heating system will heat to 70°F within a designated time, or a wall will resist flames for a designated period. As long as performance requirements are met, design and measurements are not stated or considered important.

⁷See Sections 23.05E and F for more on specifications.

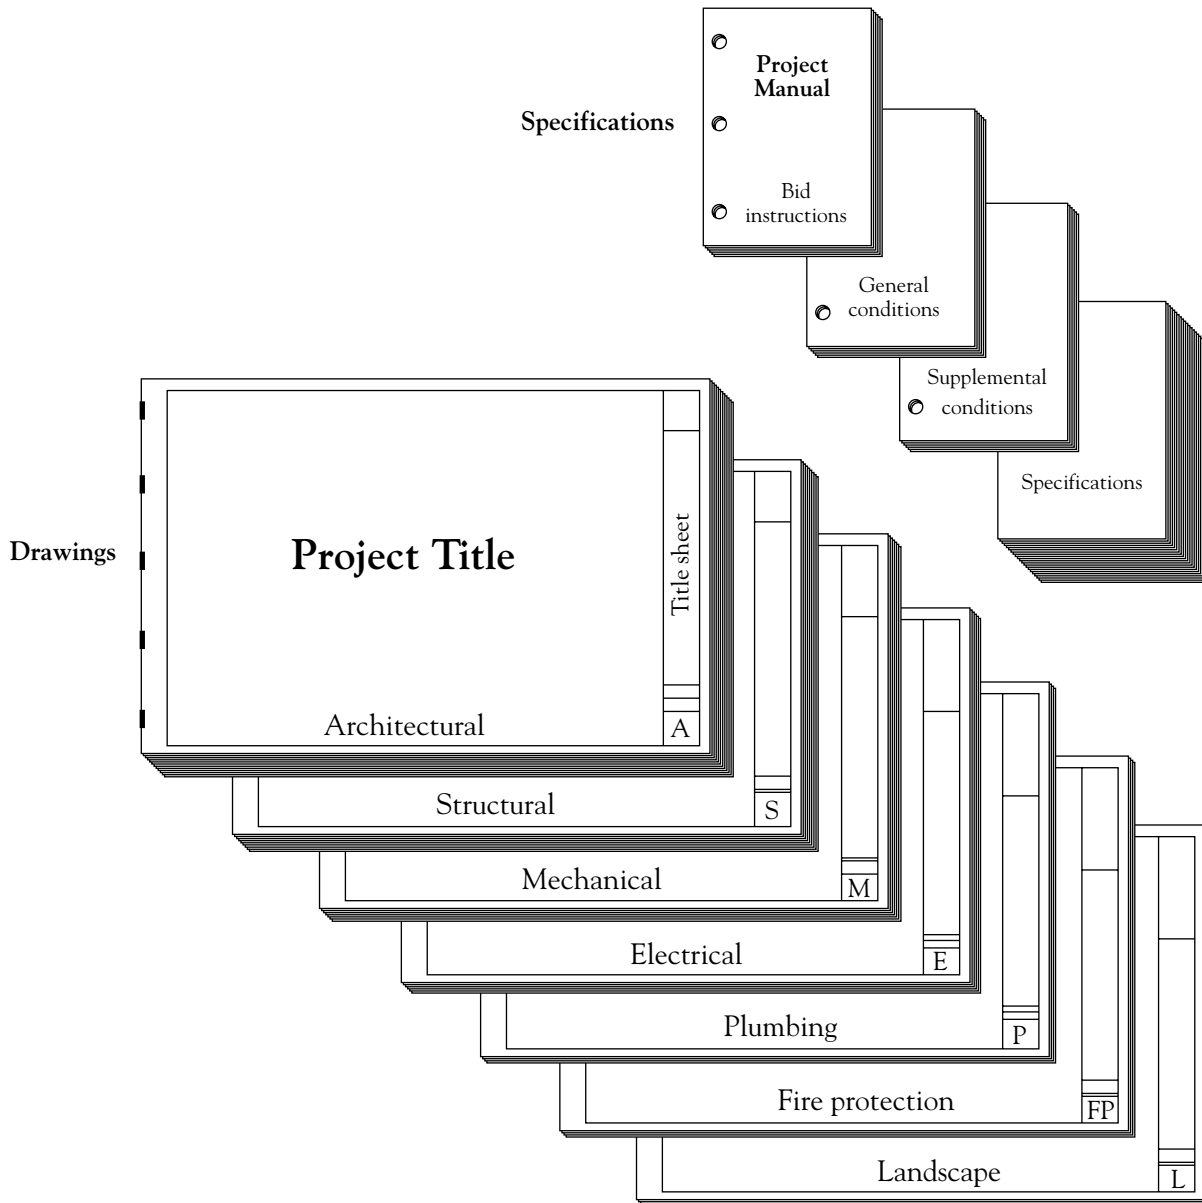

FIGURE 19.1 Construction documents.

Under a pure performance specification, the contractor accepts responsibility for design, engineering, and performance requirements, with general discretion as to how to accomplish the goal. Sometimes the contract documents give the contractor suggestions for foundation work. They may be clearly labeled as indicative of

“general requirements” or accompanied by a statement that the foundation shall be redesigned to suit subsurface conditions.

Performance specifications are more common in large-scale industrial work where the contractor agrees to design and build a plant that will turn out a designated number

of units of a particular quality in a specified period of time. However, performance specifications may also be used in residential or commercial work.

The following case excerpts differentiate performance from design specifications and indicates how a contract should be interpreted to determine whether

performance or design specifications have been created. The first case involved tunnel construction and a claim by the contractor that it was entitled to additional compensation. The owner asserted that the contractual requirement of watertightness was a performance specification.

FRUIN-COLNON CORP. ET AL v. NIAGARA FRONTIER TRANSPORTATION AUTHORITY

Supreme Court of New York, Appellate Division, 4th Department, 1992.
180 A.D.2d 222, 585 N.Y.S.2d 248.

[Ed. Note: The contractor agreed to construct twin subway tunnels, each approximately two miles long, as a part of the Buffalo Light Rail Rapid Transit System.]

* * *

A performance specification requires a contractor to produce a specific result without specifying the particular method or means of achieving that result. . . . Under a performance specification, only an objective or standard of performance is set forth, and the contractor is free to choose the materials, methods and design necessary to meet the objective or standard of performance. . . . Concomitant with control over the choice of design, materials and methods is the corresponding responsibility to ensure that the end product performs as desired. . . . In other words, the contractual risk of non-performance is on the contractor. . . . That is in contrast to a design specification, where the owner specifies the design, materials and methods and impliedly warrants their feasibility and sufficiency. . . . A contractor must follow a design specification without deviation and bears no responsibility if the design proves inadequate to achieve the intended result. . . . In that instance, the contractor's guarantee, even if framed in "absolute" terms, is limited to the quality of the materials and workmanship employed in following the owner's design. . . . Whether a provision is a performance specification or a design specification depends on the language of the contract as a whole. . . . Other factors to consider include the nature and degree of the contractor's involvement in the specification process, and the degree to which the contractor is allowed to exercise discretion in carrying out its performance under the contract.

* * *

In arguing that the watertightness requirement was a performance specification that plaintiff assumed the responsibility of

meeting, defendant relies primarily on the language of article 3.12 (§ 03300) of the contract, the watertightness clause. Read in isolation, article 3.12 appears to be a performance specification; it specifies the end objective (watertightness) and the standards for measuring that objective, but does not specify the methods of achieving watertightness. Nevertheless, the language and structure of the contract as a whole, as well as the parties' usage and course of performance under the contract, support the conclusion that a design specification was created.

Although the watertightness clause itself does not set forth a particular method for achieving watertightness, the contract as a whole establishes complex and exacting standards for design and construction of the tunnel. Plaintiff was to construct an unreinforced, cast-in-place concrete liner of precise dimension. The type and mix of the concrete was precisely specified, as were detailed requirements for placing, curing, protecting, and finishing the concrete. Plaintiff was given no discretion to deviate from those specifications, whether for the purpose of waterproofing or otherwise. For example, plaintiff had no discretion to install an impermeable outer limit to resist the hydrostatic pressure that both parties knew would exist following completion of construction.

Other provisions of the contract contemplate that waterproofing would be accomplished by means of fissure grouting, which also was to be carried out pursuant to detailed specifications. Additionally, the payment and warranty provisions of the contract support the conclusion that, as a whole, it created a design specification. The contract explicitly provides that "all measures necessary for achieving the degree of watertightness specified in . . . article 3.12, including remedial treatments to stem leaks," would be paid for at the contract unit prices. It is unlikely that defendant would have agreed to pay

plaintiff on a per unit basis if, as defendant contends, plaintiff had assumed the responsibility of achieving watertightness. Further, unlike the general warranty set forth in the contract, the extended watertightness warranty did not provide that plaintiff would remedy water leaks at its own expense, as it would have if plaintiff had assumed the responsibility of achieving watertightness.

The parties' course of dealing prior to construction also supports the inference that a performance specification was not intended. Bidders had no input into the design of the tunnel, nor did plaintiff exercise any independent design judgment after it was awarded the contract. Defendant relies heavily on plaintiff's March 5, 1980 letter submitted in support of its Value Engineering Change Proposal (VECP), a type of bilateral change order. In that letter, plaintiff asserted, as a reason why it should be permitted to change the design of the tunnel liners to a "full circle pour," that plaintiff bore the risk of meeting the watertightness requirement. In relying on the language of that letter, defendant overlooks the context in which it was sent. If the contract had created a performance specification with respect to watertightness, it would have been unnecessary for plaintiff to obtain defendant's approval for a design change, and it would have been improper for defendant to withhold such approval.

Similarly, the parties' course of dealing during and following construction illustrates that the contract did not establish a performance specification. As evidence that plaintiff undertook the responsibility of waterproofing, defendant cites the fact that plaintiff, on its own initiative, developed and carried out a course of chemical grouting, a method not mentioned in the contract and for which plaintiff did not bill defendant. It is far more significant, however, that defendant routinely denied plaintiff's

numerous requests to implement various other waterproofing methods. Even before the concrete liners were put in place, and while the water diversion system was operating, plaintiff repeatedly requested permission to grout the numerous water-bearing fissures that were present in the exposed rock. Those requests consistently were denied based on defendant's erroneous view that fissure grouting was not intended to achieve watertightness. After the tunnel was constructed and the water diversion system turned off, plaintiff unsuccessfully requested permission to fissure grout, plug the deep wells and piezometer testing holes, and construct a permanent dewatering system. Those requests were denied by defendant, which maintained an uncooperative and obstructive attitude. Plaintiff nonetheless proceeded to fissure grout under protest, based on its proper interpretation of the contract. It would have been unnecessary for plaintiff to seek defendant's consent for such measures, and contractually impermissible for defendant to withhold such approval, if plaintiff were in fact responsible for achieving watertightness and had discretion to choose the means to achieve that objective.

* * *

For the foregoing reasons, the court properly awarded judgment to plaintiff on its watertightness claim. Because the contract did not create a performance specification, plaintiff was not contractually responsible for making the tunnels watertight at its own expense. Consequently, plaintiff is entitled to reimbursement for the work performed in an attempt to achieve watertightness.

* * *

Accordingly, the judgment and subsequent order of the court should be affirmed.

Judgment unanimously affirmed without costs.

Another instructive look at the difference between design and performance specifications can be found in

Blake Construction Co., Inc. v. United States. Part of the decision is reproduced at this point.

BLAKE CONSTRUCTION COMPANY, INC. v. UNITED STATES

United States Court of Appeals, Federal Circuit, 987 F.2d. 743, rehearing denied: suggestion for rehearing in banc declined, April 13, 1993, cert. denied, 510 U.S. 963 (1993).

[Ed. Note: The drawings depicted the electrical conduits as installed overhead. Notes on the drawings stated that the drawings were "diagrammatic." They also stated that the

contractor would "relocate . . . conduits to coordinate with all others trades." Blake's subcontractor began to install the electrical feeder system in an underground concrete duct bank.

The Navy ordered that the conduits be installed overhead. Blake complied but claimed this order was a constructive change that entitled it to an equitable adjustment. The U.S. Court of Federal Claims agreed with Blake, and the Navy appealed.

Like the decision in the *Fruin-Colnon* case reproduced above, the court first distinguished design and performance specifications, noting that the design specifications do not allow deviation but must be followed as if they were a road map. Blake contended that it faced a performance specification. This would give discretion to Blake or its subcontractor to choose an underground location for installing the electrical feeder system. The conduit was to be installed to avoid interference with other trades. But it did not detail the manner that this was to be done. It also contended that the system could not be installed exactly as depicted on the drawings as alterations were needed to avoid conflict with other trades. Also, the specifications did not provide a road map “characteristically associated with a design specification.”]

* * *

This reasoning obscures the real question in the case. Taking the second argument first, the mere fact that a specification cannot be followed precisely does not, in and of itself, indicate that it is “performance” and not “design.” Were this true, any specification intended to be a design specification would be transformed into a performance specification if it were faulty. This is nonsensical; common sense dictates that the contractor does not acquire unfettered discretion to complete the contract in any manner it sees fit, just because one aspect of the specification might be defective. See *J.L. Simmons*, 412 F.2d 1360 (contractor brought flaws in design specifications to government’s attention, proceeded under government’s direction, and was entitled to equitable adjustment); *S.W. Elecs. & Mfg. Corp. v. United States*, 228 Ct.Cl. 333, 655 F.2d 1078, 1081 (Ct.Cl. 1981) (same). The fact that the electrical conduits could not be installed overhead in the precise manner depicted by the drawings, and at some points had to be installed outside the corridor itself, did not automatically relieve Blake of the obligation to install them overhead.

More generally, the problem with both of Blake’s arguments is that the distinction between design and performance specifications is not absolute, and does not dictate the resolution of this case. Contracts may have both design and performance characteristic. See, e.g., *Utility Contractors, Inc. v. United States*, 8 Cl.Ct. 42, 50 n. 7 (1985) (“Certainly one can find numerous government contracts exhibiting both performance and design specifications.”), *aff’d mem.*, 790 F.2d 90 (Fed.Cir.1986); *Aleutain Constructors v. United States*, 24 Cl.Ct. 372, 379 (1991)

(“Government contracts not uncommonly contain both design and performance specifications.”). It is not only possible, but likely that a contractor will be granted at least limited discretion to find the best way to achieve goals within the design parameters set by a contract. See, e.g., *Penguin Indus., Inc. v. United States*, 209 Ct.Cl. 121, 530 F.2d 934, 937 (1976). “On occasion the labels ‘design specification’ and ‘performance specification’ have been used to connote the degree to which the government has prescribed certain details of performance on which the contractor could rely. However, those labels do not independently create, limit, or remove a contractor’s obligations.” *Zinger Constr. Co. v. United States*, 807 F.2d 979, 981 (Fed.Cir.1986) (citations omitted). These labels merely help the court discuss the discretionary elements of a contract. It is the obligations imposed by the specification which determine the extent to which it is “performance” or “design,” not the other way around.

The real issue is not whether the drawings and diagrammatic notes in their entirety should be labeled design specifications or performance specifications, but how much discretion the specifications gave Blake in the placement of the electrical feeder system. This is a question of contract interpretation which is a matter of law for this court to decide. *R.B. Wright Constr. Co. v. United States*, 919 F.2d 1569, 1571 (Fed.Cir.1990). Although the trial court’s opinion may be helpful, we are not bound by it. *J.B. Williams, Co. v. United States*, 196 Ct.Cl. 491, 450 F.2d 1379, 1388 (1971). There is no question that the diagrammatic notes gave the electrical contractor some discretion to work around the other trades, but we think the Claims Court defined too broadly the amount of discretion permitted under the contract.

“Contracts are viewed in their entirety and given the meaning imputed to a ‘reasonably intelligent contractor’ acquainted with the involved circumstances, regardless of whether labeled ‘design,’ ‘performance,’ or both.” *Zinger Constr.*, 807 F.2d at 981 (citing *J.B. Williams*, 450 F.2d at 1388). We believe that a reasonable contractor would understand that the contract required more than mere avoidance of conflict with the other trades. The specifications, viewed as a whole, additionally required installation of the conduits overhead within the confines of the corridor. This is the only conclusion that gives meaning to the drawings. An interpretation which gives reasonable meaning to all parts of a contract is preferred to one which renders part of it insignificant or useless. *Hill Materials Co. v. Rice*, 982 F.2d 514, 517 (Fed.Cir.1992). All the drawings depicted overhead installation of the electrical conduits and, more specifically, showed either an exposed or concealed installation depending on their position along the length of the corridor. An interpretation

permitting underground installation renders these drawings meaningless. Accordingly, the government's interpretation of the specifications is the only reasonable one.

Contrary to Blake, we do not revisit the Claims Court's fact findings to reach our conclusion. The Claims Court thought the specifications were "performance" for several nondispositive reasons—first, the diagrammatic notes indicated the drawings need not be followed exactly; second, the evidence showed an underground installation was better than an overhead installation; and third, industry practice favored underground installation. As we have observed, the meaning of the diagrammatic notes is a matter of law. Because we conclude

the contract did not permit Blake to install the electrical conduits underground, whether or not this method would have been "better" is irrelevant. Finally, whether local trade custom was to install electrical conduits underground is also irrelevant here. Contracting parties may freely choose to have work performed in a specified manner; here, the government opted to install the electrical conduits overhead, even if this was not the usual mode.

CONCLUSION

Accordingly, the judgment of the Court of Federal Claims is reversed.

Purchase description specifications designate the required product or equipment by manufacturer, trade name, and type. Sometimes the contractor can select from an approved list. These specifications usually increase contract cost, because they limit the contractor's ability to use materials or equipment that may be just as good as specified and that may cost less. For this reason, public contracts and many private contracts frequently create a method by which the contractor can seek approval to use alternative products or materials.

When such methods are used, a number of legal problems can arise. First, as discussed in Section 24.03, does use of substitute materials or products transfer the risk of design failure? Second, does unreasonable delay in passing on such a request expose the design professional to liability to the owner or contractor?⁸ Third, will the contractor have a claim for intentional interference with its contract if the design professional rigs the specifications and methods for approving alternates in favor of a particular manufacturer?⁹

The contractor's proposal to use an alternate is most commonly made before bid opening but occasionally is made during performance. When such proposals are made, the design professional should be prompt and fair in passing judgment on whether the alternate product or material is the equal or equivalent of the brand

specified. If the design professional has a reputation for intransigence or unreasonably delayed decisions, a contractor is likely to assume that alternates will not be available, and to bid accordingly. Unreasonable delay in passing on requests for alternates can result in liability to the design professional.¹⁰

Specifications should state that the determination of whether a proposed alternate is the equivalent of that specified can take into account not only function and performance but also aesthetics, manufacturer's warranty, and the reputation of the manufacturer for servicing the product and supplying spare parts.

Another question that can arise with purchase description specifications, particularly those that do not provide for authorized substitutions, is whether the owner who uses such specifications makes any warranties regarding the commercial availability of the designated materials or equipment. Although such a warranty has been found to have been created, as a rule, it is very limited. The owner warrants that the supplier is capable but does not warrant its willingness to meet time requirements, nor does the owner warrant that the supplier designated will accede to the terms and conditions the contractor insists on. Finally, the warranty does not include an assurance that the supplier will perform. In the case where this limited warranty was recognized, the court simply concluded that it would not change the normal rights and responsibilities that attend the use of subcontractors and suppliers.¹¹

Specification writing can play an important part in relations between contractors and any labor union representing employees. Traditionally, most of the labor in a construction project is performed at the site. The relatively high wages paid to unionized craft workers, as noted in Section 23.05B, the frequent disruption caused by labor disputes at the site, and delays caused by weather conditions have encouraged systems under which more work is done in factories.

Construction specifications increasingly require integrated units or prefabricated materials, designed to reduce the amount of labor performed at the site.¹² But reducing work at the site affects job security of people in the construction craft trades. As a result, many craft unions have won what are called “work preservation” clauses in their collective bargaining agreements with employers, under which the employers, mainly subcontractors, agree not to handle products on which labor is performed at the factory when that labor traditionally was performed at the site. Under these work preservation clauses, unions are given the right to strike if there is a violation.

*Enterprise Association of Steam, etc., Local Union Number 638 v. NLRB*¹³ involved the construction of the Norwegian Home for the Aged in New York City. The prime contractor prepared the specifications, which required that climate control units manufactured by a designated supplier be installed as integrated units. These units contained factory-installed internal piping. If the units were installed complete with factory prepiping, the supplier guaranteed all units for a year.

The subcontractor who had agreed to install the heating, ventilating, and air-conditioning had had a collective bargaining agreement for many years with the plumbers’ local that contained a provision requiring the subcontractor employer to preserve certain cutting and threading work for performance at the job site by its own employees. That agreement would have required the internal piping

already installed in the climate control units to be cut and threaded at the job site.

When the units arrived at the job site, the union’s business agent inspected them and informed both prime contractor and subcontractor that the union employees would not install them. The dispute delayed completion, and the prime contractor filed an unfair labor practice charge with the National Labor Relations Board (NLRB), alleging that the union could not instruct members to refuse to handle the units, because their object would have been to force a “neutral”—the prime contractor—to cease using the supplier’s products.

In dealing with work preservation cases, the NLRB and some of the federal circuit courts of appeals had adopted a “right to control” test. If the struck employer (here the subcontractor) had the right to control work assignments, the strike is legal. The pressure must be on the employer in such a case, as it can control work assignment. But if it does not have the right to control, the pressure must be on a “neutral”—the prime contractor. Then the strike is illegal.

Applying the right-to-control test to the Local 638 case, the NLRB concluded that the subcontractor never had the power to assign the disputed piping work to its union employees. This, according to the NLRB, made the subcontractor a neutral. The union’s principal target was the prime contractor, inasmuch as the subcontractor had no right to control the work assignment. Pressure was being put on the subcontractor to force the prime contractor to stop buying the units and restore the work. Such pressure was a secondary boycott and an unfair labor practice.

However, the Federal Circuit Court of Appeals for the District of Columbia, following opinions in other federal circuit courts, refused to follow the right-to-control test and concluded that the subcontractor was not a neutral, inasmuch as the union was simply attempting to enforce its lawful work preservation clause with the employer subcontractor. The court also suggested that the pressure could have been placed on the subcontractor to negotiate a compromise or to terminate the contract with the prime contractor. Because the core of the union’s grievances was with the subcontractor, the court held the strike lawful. However, the U.S. Supreme Court reversed the circuit court and concluded that this was an illegal secondary boycott.¹⁴

¹²The subject matter of work preservation clauses illustrates some of the technologically motivated decisions being made by those drafting specifications. For example, cases have involved precast walls, *NLRB v. Carpenters Dist. Council of Kansas City and Vicinity*, 439 F.2d 225 (8th Cir.1971); a prepiped sink unit, *Associated General Contractors of California, Inc. v. NLRB*, 514 F.2d 433 (9th Cir.1975); prefabricated fireplaces, *Western Monolithics Concrete Products, Inc. v. NLRB*, 446 F.2d 522 (9th Cir.1971); and prepiped heating and ventilating controls discussed in the text of this subsection.

¹³521 F.2d 885 (D.C.Cir.1975).

¹⁴*NLRB v. Enterprise Ass’n of Steam, etc., Local Union No. 638*, 429 U.S. 507 (1977).

Design professionals drafting specifications must take work preservation clauses into account. Craft unions will oppose specifications that reduce their work. Various steps, some legal and some probably illegal, are likely to be taken by the craft union if substantial work traditionally performed by their members will be performed by others. This does not mean the best and cheapest technology should never be specified. However, in taking into account the advantages of specifications that involve prefabricated products or sealed-at-the-factory components, the disadvantages of potential work stoppages and legal battles must be considered.

Specifications can also play a role in avoiding sales taxes on material and equipment needed for the project. A nonprofit owner may be exempt from sales taxes. If this is so, the specifications should state that the prime or subcontractors purchase as agents for the owner.¹⁵

E. Conditions: General and Supplementary

Construction is a complex and dispute-prone activity. Guidelines are needed to spell out clearly and completely the rights and duties of the parties. For these reasons, most construction documents include general conditions (often supplemented by supplementary conditions) of the contract. These ground rules, under which the project will be constructed, are often lengthy and deal with the following subjects:

1. scope of contract documents and resolution of conflicts between them
2. roles and responsibilities of the principal participants in the project
3. subcontractors and separate contractors
4. time
5. payments and completion
6. protection from and risk of loss to persons and property
7. changes
8. corrections
9. termination
10. disputes
11. insurance

Differentiations should be made among a *legal condition*, *general conditions*, and *supplementary conditions*. The first is a legal classification. It is an event that must occur or be excused before an obligation to perform arises. Whether a particular event—sometimes all or part of a promised performance and sometimes an event not within the control of a contracting party—is a condition depends on any contractual language manifesting this conclusion, the probable intentions of the parties, and elements of fairness. However, this is not the sense in which the term *conditions* is used in this subsection.

General conditions are usually expressed in standardized prepared printed contract documents often published by professional associations such as the American Institute of Architects (AIA) or the Engineers Joint Contract Documents Committee (EJCDC). Usually the court seeks to determine how terms should be interpreted by ascertaining the intention of the parties. Because documents prepared by the AIA or EJCDC are in essence prepared by third parties—not the contracting parties—as noted in Section 20.02, they raise difficult interpretation questions.

Sometimes general conditions are prepared by owners who are “repeat players” in the world of construction. These owners may enter into many similar transactions. As shall be seen in Section 20.02, unclear general conditions are likely to be interpreted against the owner that has prepared them.

Although frequently called *general conditions*, its provisions are almost never automatically considered legal conditions, although nothing prevents language within a general condition from creating a legal condition. General conditions are prepared in a way that lets them be used in many types of transactions, either by different contract makers or by a single contract maker.

Any individual construction contract, however, may have attributes that make supplementary conditions necessary. For example, the indemnity provisions in general conditions prepared for national use may not be enforceable or desirable in states that have specific statutes regulating indemnification. Similarly, the frequent existence of specialized statutes dealing with arbitration may make it essential to add supplementary conditions if those requirements are to be met. Finally, because of the individualized aspects of insurance, specific insurance requirements are always found in supplementary conditions. Not all contract makers wish to use general conditions drafted by others, such as the AIA. As a result, these contract makers may use AIA

¹⁵*F. Miller & Sons, Inc. v. Calcasieu Parish School Bd.*, 838 So.2d 1269 (La.2003) (successful in avoiding sales tax).

Document A201 but either modify it or attach their own supplementary conditions and make those conditions take precedence over the general conditions.

Two further observations must be made. First, some owners or design professionals may lull contractors into a false sense of security by prescribing general conditions with which the contractors are familiar and comfortable, but may make many changes in the supplementary conditions that destroy some of the protection accorded contractors by the general conditions.

Second, as noted in Section 20.03B, the law is frequently called on to sort out inconsistencies between general conditions and supplementary conditions. Although it is best to delete from general conditions any provisions supplemented by the supplementary conditions, often this deleting requires more work than the attorney wants to do. As a result, the attorney may simply state that the supplementary conditions take precedence over the general conditions. This ploy often requires a judge or arbitrator to try to reconcile apparently conflicting language. This problem is endemic to construction, with its wealth of contract documents.

Section 12.07 discussed the role of the design professional in drafting or suggesting that particular general conditions be used.

F. Site Subsurface Test Reports

Invitations to bidders frequently contain subsurface test reports or site data or a reference that such data are available in the office of a geotechnical consultant engaged by the owner. This information and data are of great importance in the construction project. Chapter 25 discusses the legal effect of furnishing this information.

G. Prior Negotiations and the Parol Evidence Rule

The parol evidence rule relates to the provability of oral agreements made before or at the same time as a written contract. This rule is based on the concept of “completeness of writings.” If the written agreement and other written documents incorporated by reference or attached to it are the complete agreement of the parties, prior or contemporary oral agreements are not binding on the parties. Even if they were made, they were integrated, or merged, into the written, complete document.¹⁶

Most construction contracts are complete. Nevertheless, a possibility exists that oral agreements have been made before or at the same time as the final written agreement. If the written agreement contains an integration or merger clause—one that specifies that the written agreement is the complete and final agreement—it will be difficult for either party to prove a prior oral agreement.¹⁷ It will not be impossible, however, because doctrines that attack the validity of the contract, such as fraud, permit proof of an oral agreement even if provisions specify that the written agreement is the complete document. Also, in one construction case the court permitted evidence of an antecedent oral agreement despite the presence of an integration clause by concluding the oral agreement was separate and not integrated into the written contract.¹⁸ If no contract provision deals with the question of completeness, testimony claiming an oral agreement generally will be admitted.

It is important to incorporate the entire agreement into the writing. Even if the writing is prepared and ready for execution, the design professional, and certainly the owner’s attorney, should insist on incorporating any changes or additions into the writing itself. The entire document need not be retyped if time does not permit (word processing has made this easy). If the oral agreement is not included in the writing, a substantial risk exists that it cannot be proved.

Suppose a dispute arises over meaning of terms used in the writing. If the words chosen by the parties are ambiguous, the court can look at the surrounding facts and circumstances to determine how the parties used those particular words. These circumstances include the setting of the transaction, the contracting parties’ objectives in making the contract, and any conversations they may have had. Even if a writing is considered complete, antecedent or subsequent conversations may be admissible to interpret the writing.

Two cases are instructive, both involving the parol evidence rule in the design and construction context. The first, *Godfrey, Bassett & Kuykendall, Architects, Ltd. v. Huntington Lumber & Supply Co., Inc.*,¹⁹ was discussed in Section 11.04E. That case noted the closeness

¹⁶See Sections 11.04E and 12.03C for further discussion.

¹⁷*Lower Kuskokwim School Dist. v. Alaska Diversified Contractors, Inc.*, 734 P.2d 62 (Alaska 1987), denied motion for reconsideration, 778 P.2d 581 (Alaska 1989), cert. denied, 493 U.S. 1022 (1990).

¹⁸*C. L. Maddox, Inc. v. Benham Group*, 88 F.3d 592 (8th Cir.1996).

¹⁹584 So.2d 1254 (Miss.1991).

of the relationship between the contracting parties as one basis for determining whether one party could claim there had been an antecedent agreement not expressed in the writing, despite a failure by that party to have read the agreement. In the case, the court looked carefully at the background and relationship between the parties to determine whether failure to include an asserted promise precluded the party from testifying as to its existence.

Before discussing the second case, some background is in order. There are many expectations to the parol evidence rule. Many scholars and important judges have expressed hostility toward the rule's continued existence. This situation has led some to believe that in no case will a party be prevented from testifying of an asserted antecedent oral agreement despite its not having been included in the writing.

These beliefs would certainly have been supported by cases decided in California in the 1960s.²⁰ However, *Brinderson-Newberg Joint Venture v. Pacific Erectors, Inc.*,²¹—a construction contract dispute decided in 1992 by the Ninth Federal Circuit Court applying California law—shows there is still vitality in the parol evidence rule.

H. Modifications

Modifications are different than changes. Changes occur frequently during a construction project. They are generally governed by carefully drawn and complete provisions under which the owner has the right to order changes and the contractor must perform them, with appropriate contract language dealing with compensation for deletions or additions caused by the changes. A modification is a change agreed on by both parties in the basic obligation not based on any contractual provision giving the owner the right to order changes.
