- Contract terms, for example, whether it is a continuous supply contract or a contract to meet immediate demands, and
- Information about infrastructure or other delivery mechanisms.

Depending on the entity's assessment of the facts and circumstances of the contract and whether the contract indicates that the customer will simultaneously receive and consume benefits, revenue related to the sale of a commodity may or may not be recognized over time.

**Reperforming the Work.** The customer receives and consumes the benefits if another entity would not need to substantially reperform the work completed to date. The assessment of benefit can be subjective. The fact that reperformance is not necessary is an objective basis for determining whether the customer receives a benefit. In determining whether another entity would need to substantially reperform the work completed to date, the vendor is required to:

- Disregard any contractual or practical barriers to the transfer of the remaining performance obligations to another entity, and
- Presume that any replacement vendor would not benefit from an asset that it currently controls (such as work-in-process balance).

**Criterion 2—Entity's Performance Creates an Asset That the Customer Controls as the Asset Is Created or Enhanced.** The customer's control of an asset as it is being created or enhanced indicates that the customer is getting the benefits of the asset. Thus, the entity's performance transfers the assets to a customer over time. This Criterion is consistent with the rationale for using the percentage-of-completion method in previous standards. In effect, the entity agrees to a continuous sale of assets as it performs.

**Criterion 3—Entity's Performance Does Not Create an Alternative Use, But Entity Has an Enforceable Right to Payment for Performance Completed.** In some situations, applying the first two criteria might be challenging, and it might be unclear whether the asset is controlled by the customer. So, the Boards developed Criterion 3 for entities that create assets with no alternative use, but where the entity has the right to payment. This Criterion might be useful for goods or services that are specific to a customer.

Criterion 3 may be the criterion most relevant to long-term contracts accounted for under the percentage-of-completion method, although the standard does not use that term. Instead, the standard looks to the terms of the contract. Thus, a reporting entity may not be able to use the same measure of progress as under the percentage-of-completion method. The criterion also puts even greater importance on the way a contract is drafted.

In applying this Criterion, entities should consider contractual restriction and practical limitations, but not possible termination.

**Alternative Use.** What is meant in Criterion 3 by "alternative use"? An alternative use might be selling the asset to another customer. An asset is considered *not* to have an alternative use if there are:

- Contractual restrictions preventing the entity from readily directing the asset to another use during the creation or enhancement of the asset, or
- Practical limitations to readily directing the completed asset to another use.

(ASC 610-10-25-28)

**Contractual Restrictions.** A contract may restrict the entity from readily directing the asset for another use, such as sale to a different customer, while creating or enhancing the asset. Another type of restriction might be where the entity has to deliver the first 100 items of an otherwise standard item to the customer. The contractual restriction has to be substantive—and customer's right to the promised asset enforceable. The restriction is not substantive if the asset is interchangeable with other assets and could be transferred to another customer without breach of contract or significant incremental costs. The possibility of the customer terminating the contract is not relevant to the consideration of whether the entity could redirect the asset for another use.

**Practical Limitations.** Practical limitations, such as incurring significant cost to repurpose the asset or the asset having specifications unique to the customer, preclude the entity from readily directing the completed asset for another use. Entities should consider the characteristics of the asset that will transfer. Customization might be a factor in assessing alternative use, but it is not determinative. Some goods, for example real estate, might be standardized, but not have an alternative use because the entity is legally obligated to transfer the asset to the customer.

The alternative use assessment requires judgment and is made at contract inception and is not updated unless the parties agree to a contract modification that substantially alters the performance obligation.

**Right to Payment for Performance Completed to Date.** Alternative use is necessary, but it is not enough to demonstrate control. An entity must also have an enforceable right to payment for performance completed to date. The second part of Criterion 3 is the "enforceable right to payment for performance completed to date." The entity may have a contract to construct an asset with no alternative use, constructing at the direction of the customer. If the entity is also entitled to payment completed to date at all times during the term of the contract and if the contract is terminated for reasons other than nonperformance, Criterion 3 is met. (ASC 606-10-25-29) As with many aspects of the standard, readers must be judicious in carefully considering the terms of the contract. Factors to consider when assessing whether a right to payment exists include:

- Amount of payment
- Payment terms
- Payment schedule
- Contractual terms
- Legislative or legal precedent.

**The Amount of Payment.** To protect itself from the risk that the customer will terminate the contract and leave the entity with an asset of little or no value, the contract will often provide some compensation. Requirement to pay for performance suggests that the customer has obtained the benefits from the entity's performance. This payment does not need to be a fixed amount, but the amount:

- At a minimum must compensate the entity for performance to date at any point if the contract is terminated for reasons other than failure to perform.
- Should reflect the selling price of the items transferred to date covering the entity's cost plus a reasonable profit margin.

The margin does not have to equal the margin the entity would have gotten if the contract was fulfilled. It should reflect the extent of the entity's effort or a reasonable return on the entity's capital costs if the contract's margin is higher than the return the entity usually generates. In

calculating a net amount that covers costs incurred and a reasonable profit, deposits and other upfront payments should be considered. (ASC 606-10-55-11)

If the entity is only entitled to reimbursement of costs, then the entity does not have a right to payment for the work to date.

**Payment Terms.** The Boards believe that a customer's obligation to pay for performance indicates that the customer obtained benefit from the performance. The right to payment does not have to be a present unconditional right, but the entity must have an enforceable right to demand or retain payment. For example, the payment may only be required at specified intervals or upon completion. The entity must assess whether it has the right to demand or retain payment if the customer cancels the contract for other than nonperformance. Even if the contract does not explicitly give the entity the right to payment, the entity would also have a right to payment if the customer does not have an explicit right to cancel the contract, but the contract entitles the entity to fulfill the contract and demand payment if the customer tries to terminate the contract.

**Payment Schedule.** A right to payment for performance to date in a contract is not the same as a payment schedule that specifies milestone or progress payments. A payment schedule may be based on milestones not related to performance.

A right to payment for performance schedule gives the entity a contractual right to demand payment if the customer terminates the contract prior to completion. These terms may not always align with the entity's rights to payment for performance obligation completed to date. For example, the contract might specify that consideration is refundable for reasons other than failure to perform.

**Contractual Terms.** A customer may terminate a contract without having the right to terminate at that point in time, for example, if the customer has failed to fulfill its obligations under the contract. In such cases, law or legal precedent may allow the entity to fulfill its performance obligation and require the entity to pay the appropriate consideration. The entity could also have an enforceable right to payment in a case where the customer might not have the right to terminate the contract or might have the right to terminate only at specified times.

**Legislative or Legal Precedent and Customary Practices.** In making the right to payment assessment, the entity should look at legal precedents and customary business practices. The entity may have the right to payment even if the right is not specified in the contract. On the other hand, relevant legal precedent for similar contracts may indicate that entity has no right to payment. Because the entity has a customary business practice of not enforcing a right to payment, the right to payment may be unenforceable.

### Performance Obligations Satisfied at a Point in Time

By default, if the performance obligation is not satisfied over time, it is satisfied at a point in time. How does the entity determine the point in time?

**Determining the Point in Time at Which a Performance Obligation Is Satisfied.** To determine the point in time, the entity must consider when control has transferred and the customer has control of the assets. (Control is discussed earlier in this chapter. Remember, control is determined from the customer's perspective.) Also, the standard provides indicators (not conditions that must be met) that help the entity assess when the customer has the ability to direct the use of the asset, tangible or intangible, and obtains the benefits from the asset. Indicators of control include when the customer has:

- Present obligation to pay
- Legal title

- Physical possession
- Risks and rewards of ownership
- Accepted the asset.

Not all of the indicators need to be met. These indicators are not hierarchical, and there is no suggestion that certain indicators should be weighted more heavily than others. (ASC 606-10-25-30) Below is more information about the indicators.

**The Entity Has a Present Right to Payment.** This may indicate that the customer has the ability to direct the use of, and obtain substantially all of, the remaining benefits from an asset.

**The Entity Has Transferred Legal Title to the Asset.** The entity with legal title typically can direct the use of the asset and receive the benefits from an asset, such as selling or exchanging the asset or secure or settle debt. If the entity retains legal control only to protect against the customer's failure to pay, those rights would not mean that the customer does not have control of the asset.

**The Entity Has Transferred Physical Possession.** Physical possession does not always mean more control. For example, in a consignment arrangement or under a repurpose agreement, the entity may have control. On the other hand, in some bill-and-hold arrangements where the entity has physical possession, the customer controls the assets.

**The Customer Has the Significant Risks and Rewards of Ownership.** In considering the risks and rewards, the entity should exclude any risks that give rise to a separate performance obligation. For example, an entity may have transferred a computer to a customer, but has not performed an additional performance obligation to perform maintenance services. Notice that although the standard is a control-based model rather than the legacy risk and rewards model, the Boards did include risks and rewards as one of the factors to consider.

**The Customer Has Accepted the Asset.** Some contracts contain an acceptance clause that protects the customer, enabling the customer to force corrective actions for items that do not meet the contract's requirements. In some cases, the clause may be a mere formality. The entity must exercise judgment to determine if control has transferred. In making the assessment, the entity should look at its history of customer acceptance. The acceptance clause may be significant if the product is unique or there is no product history. An acceptance clause that includes a trial before payment does not indicate control. This, however, is different from a right of return as discussed later in this chapter.

## Measuring Progress Toward Complete Satisfaction of a Performance Obligation

For each performance obligation satisfied over time:

*. . . the objective when measuring progress is to depict an entity's performance in transferring control of goods or services promised to a customer (that is satisfaction of an entity's performance obligation). (ASC 606-10-25-31)*

Once the entity determines that a performance obligation is satisfied over time, it measures progress toward completion to determine the amount and timing of revenue recognition.

The entity must apply a single method of measuring progress for each performance obligation that best reflects the transfer of control, that is, a measure that is consistent with the objective of depicting its performance. The entity should apply the method consistently to enhance comparability of revenue in different reporting periods. The entity must apply that method consistently to "similar performance obligations in similar circumstances," and the entity must be able to apply that method reliably. (ASC 606-10-25-32)

**Adjusting the Measure of Progress.** Circumstances, like changes in costs, can affect the measure of progress. The progress toward completion must be measured at the end of each reporting period. (ASC 606-10-25-35) If the measure of progress changes, the resulting changes should be accounted for as changes in accounting estimate per FASB ASC 250-10.

**Practical Expedient.** If an entity has a right to consideration for an amount that corresponds directly to the value transferred to the customer of the entity's performance obligation completed to date, the entity may, as a practical expedient, recognize revenue for the amount the entity has a right to invoice. (ASC 606-10-55-18) A common example of this is a service contract where the entity bills a fixed amount for each block of time provided. Assessing whether an entity's right to consideration corresponds directly with the value to the customer requires judgment.

The TRG<sup>4</sup> examined a question regarding situations where an entity may change the price per unit transferred to the customer over the term of the contract. TRG members generally agreed that the resolution depends on the facts and circumstances of the arrangement. The TRG further opined that in contracts with changes in rates, it is possible to meet the practical expedient requirement as long as the rate changes reasonably represent the changes in value to the customer. For example, an IT support services contract where the level of service decreases as the level of effort decreases might qualify. The TRG gave another example: A contract to purchase electricity at prices that change each year based on the forward market price of electricity would qualify for the practical expedient if the rates per unit reflect the value of the provision of those units to the customer. Note of caution to SEC reporters: the SEC observer at the TRG meeting noted that entities need to have strong supporting evidence that variable prices represent the value to the customer.

In assessing whether the practical expedient can be applied, entities should also evaluate significant upfront payments or retrospective adjustments to determine if they have a right to invoice for each incremental good or service that corresponds directly to the value to the customer. In addition, entities should be aware that the presence of an agreed-upon customer payment schedule does not mean that the amount an entity has the right to invoice corresponds directly with the value to the customer of the entity's performance completed to date. In addition, the existence of specific contract minimums or volume discounts does not necessarily preclude use of the practical expedients if those clauses are nonsubstantive.

**Methods for Measuring Progress.** To determine the best method, the entity should look at the nature of the promised goods and services and the nature of the entity's performance. The standards do not prescribe any particular methods, but do present two broad methods to consider. Progress measures may be input or output methods.

Output methods are:

- Based on the value to the customer of the goods or services transferred,
- The results of the efforts expended, and
- Directly measure the value to the customer relative to the total goods or services provided.

"Value to the customer" is an objective measure of the entity's performance. As seen below by the types of output method, value to the customer is not assessed on market prices or standalone selling prices.

Input methods use the entity's efforts, or inputs, devoted to satisfying performance obligation.

Two common methods are the cost-to-cost method (input) and units of delivery method (output).

---

<sup>4</sup> IASB, July 2015 Meeting—Summary of Issues Discussed and Next Steps.

**Output Methods.** Output methods include:

- Surveys of work performed to date
- Appraisals of results achieved
- Contract milestones reached
- Time elapsed
- Units produced
- Units delivered.

The Standard does not list all possible methods. Entities need to exercise judgment when choosing an output method. The entity should consider whether the method faithfully depicts progress toward complete satisfaction of the performance obligation. For example, an entity may choose to base its assessment on units delivered. However, if the entity has produced a material amount of work in process or finished goods that belong to the customer, those units are ignored and the method may result in units delivered or units produced that are not included in the measurement. The units delivered method would then distort the entity's performance by not recognizing revenue for assets controlled by the customer but created before delivery or before production is complete. The units-delivered or units-produced methods would be acceptable if the value of any work in process or units produced but not delivered at the end of the period is immaterial to the contract or to the financial statements as a whole. (ASC 606-10-25-33)

The units-of-delivery and units-of-production methods may not be appropriate where the contract includes design and production services. Each item transferred may not have an equal value to the customer. Items produced earlier in the process will probably have a higher value. However, in the case of a long-term manufacturing contract, for standard items that individually transfer an equal amount of value to the customer, a units-of-delivery method might be appropriate.

Likewise, the contract milestone measure is not appropriate if material amounts of goods or services transferred between milestones would be excluded, even though the next milestone has not been met.

It is clear from the discussion above that the entity must be careful in its selection of measurement method. The standard emphasizes the need for an entity to consider the contract's facts and circumstances and select the best method to depict performance and transfer of control. For example, an output measure may be the most faithful depiction of an entity's performance. However, it may be difficult to directly observe the outputs used to measure, and it may be costly to gather the output information. An entity may need to use an input method.

**Input Methods.** Inputs are measured relative to total inputs expected to be used. Inputs may include:

- Resources consumed
- Labor hours expended
- Costs incurred
- Timing elapsed
- Machine hours.

Input methods that use costs incurred may not be proportionate to the entity's progress. For example, if the performance obligation includes goods or services, the customer may control the goods before the services are provided.

A challenge with input methods is connecting the input to the transfer of control of goods or services to the customer, that is, making a direct relationship between inputs and the transfer of control. There may not be a direct relationship between inputs and the transfer of goods or services. Only those inputs that depict the entity's performance toward fulfilling the performance obligation should be used. Other inputs should be excluded. Judgment is needed in making these determinations. The entity may need to adjust the measure of progress and to exclude from the end inputs:

- Costs incurred that do not contribute to the entity's progress in satisfying the obligation, for example, set-up costs. (Such costs may need to be capitalized as fulfillment costs. See information later in this chapter on contract costs.)
- Cost that are not proportionate to the entity's progress.

In the latter case, to achieve a faithful representation, the entity may recognize revenue to the extent of cost of goods incurred. This may be done at contract inception, if the entity expects all of the following conditions would be met:

- The good is not distinct.
- The customer is expected to obtain control significantly before receiving services related to the goods.
- The cost of the transferred good is significant relative to the total expected cost to completely satisfy the performance obligation.
- The entity procures the good from the third party and is not significantly involved in designing and manufacturing the good, but the entity is acting as a principal.

(ASC 606-10-55-21)

**Uninstalled Materials.** Because of diversity in practice, the standard includes guidance related to uninstalled materials. To ensure that the input method faithfully measures progress toward completion of a performance obligation, the standard clarifies the adjustment for uninstalled materials. If a customer obtains control of goods before they are installed, the entity should not continue to carry them as inventory. It would not be appropriate for the entity to include the uninstalled goods in a cost-to-cost calculation. That could overstate the entity's performance, and, therefore, revenue. The entity should recognize revenue for the transferred goods, but only for the cost of those goods. The goods should be excluded from the cost-to-cost calculation. This adjustment should generally apply to goods that have a relatively significant cost and only if the entity is essentially providing a procurement service to the customer.

**Cost-to-Cost Method.** As mentioned previously, one common input method is the cost-to-cost method. Costs included in the cost-to-cost method might be:

- Direct labor
- Direct materials
- Subcontractor costs
- Those allocation costs, directly related to contract activities, that depict the transfer of control to the customer
- Cost chargeable to the customer under the contract
- Costs incurred solely because of the contract.

Direct labor and direct materials are relatively straightforward to identify and associate with a contract. It may be more difficult to decide whether other costs contribute to the transfer of control

to the customer. For example, the following generally would not depict progress toward satisfying a performance obligation:

- General and administrative expenses not related to the contract, unless the terms call for reimbursement
- Selling and marketing costs
- Research and development costs not specific to the contract
- Depreciation of idle plant and equipment
- Wasted materials, unless budgeted when negotiating the contract
- Abnormal costs, again unless budgeted when negotiating the contract.

The standard does not provide guidance on how to identify unexpected costs. Entities must, therefore, exercise judgment to distinguish normal wasted materials or inefficiencies from those that do not dictate progress toward completion.

**Inability to Estimate Progress.** It may be possible that an entity cannot reasonably estimate its progress toward completion of a performance obligation, for example, if it does not have reliable information or is in the early stages of the contract. In that case, the entity may recognize revenue as the work is performed, but only to the extent of cost incurred if the entity expects to recover costs. However, no profit can be recognized. Once the entity is able to make a reasonable estimate of performance, it should make a cumulative catch-up adjustment for any revenue not previously recognized. This adjustment should be made in the period of the change in the estimate. (ASC 606-10-25-36 and 25-37)

**Measuring Progress Toward Satisfaction of a Stand-Ready Obligation.** The promise in a stand-ready obligation is the assurance that the customer will have access, not delivery, to a good or service. If the stand-ready obligation is satisfied over time, a time-based measure of progress, like a straight line, may be appropriate. Often, this might be the case for unspecified upgrade rights. However, entities should examine the contract and not automatically default to a straight-line attribution model. For example, straight-line attribution would not be appropriate if the benefits are not spread evenly over the life of the contract. An example of this is a contract with a snow removal provision that obviously provides more benefit in winter.

**Determining the Measure of Progress for a Combined Performance Obligation.** For a performance obligation consisting of two or more goods or services that is satisfied over time, an entity must select a measure of progress that faithfully depicts the economics of the transfer. Such a determination may be difficult and require significant judgment. Entities should not merely default to an approach, like final deliverable, where revenue would be recognized over the performance period of the last promised goods or services. When choosing a method, entities should consider the reason why the goods or services were bundled in the first place. If a good or service was bundled because it was not capable of being distinct, it may not provide value on its own, and the entity may not want to consider that good or service when determining the pattern of transfer. If a measure of progress does not faithfully depict the economics of the transfer, the entity should consider whether there may actually be more than one performance obligation.

## OTHER ISSUES

---

### Right of Return

Rights of return affect the transaction price by creating variability in the transaction price. It is not uncommon for an entity to transfer control of a product while granting to the customer the right

to return the product for reasons such as defective product or dissatisfaction with the product. The refund might include:

- A full or partial refund
- A credit that can be applied against amounts owed or which will be owed in the future to the vendor
- Another product in exchange.

The Standard does not apply to exchanges for another product of the same type, quality, condition, and price. The guidance for warranties applies to returns of faulty goods or replacements.

At the time of initial sale, when revenue is deferred for the amount of the anticipated return, the entity recognizes a refund liability and a return asset. The asset is measured at the carrying amount of the inventory less expected cost to recover the goods. If the realizable value of the item expected to be returned is expected to be less than the cost of the related inventory, the entity makes an adjustment to cost of goods sold. The realizable value includes:

- Any adjustment, for example, costs of recovering the item, and
- Any potential decrease in value.

At the end of the reporting period, the entity reassesses the measurement and adjusts for any changes in expected level of returns and decreases in the value of the returned products.

In summary, the entity should recognize all of the following for the transfer of products with right of return and the services subject to refund:

- Revenue in the amount of consideration to which the entity expects to be entitled,
- A refund liability, and
- A return asset and corresponding adjustment to cost of sales for its right of return products from customers upon settling the refund liability.

The entity applies the revenue recognition constraint and does not recognize the revenue until the constraint no longer applies, which could be at the end of the return period. (ASC 606-10-55-25 through 27)

In some cases, the entity may charge the customer a restocking fee to compensate for repackaging, shipping, or reselling the item at a lower price. At the March 2015 TRG meeting, TRG members generally agreed that those costs should be recorded as a reduction of the amount of the return asset when or as control of the good transfers.<sup>5</sup>

To recap, rights of return are not considered a performance obligation in the revenue model. They are a form of variable consideration. Entities must estimate rights of return using the guidance on estimating variable rights and apply the variable constraint. Once the entity determines it has rights of return amounts, it records a liability (balance sheet) and net revenue (income statement) amount. In the revenue model, all variable consideration must be included in the top line revenue number. In addition, the entity must record a returned asset outside of inventory and a contra amount against cost of sales. To measure the returned asset, the entity looks at the value of the inventory previously held and reduces it by the expected costs to recover that inventory. The entity also must test the returned asset for impairment, not as part of inventory, but as its own separate asset. This test must be done periodically, and estimates must be updated at each reporting period.

<sup>5</sup> TRG Agenda Paper 34, *March 2015 Meeting—Summary of Issues Discussed and Next Steps*, dated July 13, 2015.

## Warranties

**Overview.** As any consumer knows, there are different types of warranties. Some warranties may simply provide assurance that the product will function as expected in accordance with certain specifications—assurance-type warranties. Other warranties provide customers with additional protection—service-type warranties. The type of warranty and the benefits provided by the warranty dictate the accounting treatment. So, the entity must first assess the nature of the warranty.

Warranties can be:

- Explicit—written in the contract, or
- Implicit as a result of customary business practices or law.

Warranties can also be standard or extended.

**Assessing the Warranty.** A warranty purchased separately is a separate performance obligation. Revenue allocated to the warranty is recognized over the warranty period. A warranty not sold separately may still be a performance obligation. Entities have to assess the terms of the warranty and determine under which category below the warranty falls:

- Category 1. These warranties, called assurance-type warranties, provide assurance that the product will function. A warranty that only covers the compliance of the product with agreed-upon specifications is termed “an assurance warranty.” These warranties obligate the entity to repair or replace the product and are accounted for under the guidance in ASC 460, *Guarantees*.
- Category 2. These warranties, called service-type warranties, provide a service in addition to product assurance. For example, this category of warranty offers additional protection against wear and tear or against certain types of damage. The additional service is accounted for as a separate performance obligation.

When assessing whether the warranty, in addition to product assurance, provides a service that should be accounted for as a separate performance obligation, an entity should consider factors such as:

- a. Whether the warranty is required by law—if the entity is required by law to provide a warranty, the existence of the law indicates that the promised warranty is not a performance obligation because such requirements typically exist to protect customers from the risk of purchasing defective products.
- b. The length of the warranty coverage—the longer the coverage period, the more likely it is that the promised warranty is a performance obligation because it is more likely to provide a service in addition to the assurance that the product complies with agreed-upon specifications.
- c. The nature of the tasks that the entity promises to perform—if it is necessary for an entity to perform specific tasks to provide the assurance that the product complies with agreed-upon specifications (for example, a return shipping service for defective products), then those tasks likely do not give rise to a performance obligation.

(ASC 606-10-55-33)

**Warranty Is a Performance Obligation.** If a warranty is determined to be a performance obligation, the entity applies Step 4 of the revenue recognition model and allocates a portion of the transaction price to the warranty. The entity will have to exercise judgment to determine the appropriate pattern of revenue recognition. For example, an entity may determine it is appropriate to recognize revenue on a straight-line basis over the term of the warranty, or based on historical fact patterns, the entity may recognize revenue in the latter part of the term.

**Contract Includes Both Types of Warranties.** Some contracts may include both an assurance-type and a service-type warranty. If the entity cannot reasonably account for the service element separately from the assurance amount, it should account for the assurance and service elements as a single performance obligation. Revenue is allocated to the combined warranty and recognized over the warranty period. The guidance does not make clear how the entity should interpret the “reasonably account” threshold.

### Principal versus Agent

**Overview.** More than one party may be involved in providing goods or services to a customer. In those situations, the Standard requires the entity to determine whether for each specified good or service it is a principal or an agent, whether the nature of its promise is a performance obligation:

- To provide the specified goods or services (principal), or
- To arrange for another party to provide them (agent).

### Exhibit—Principal versus Agent

	Performance obligation to:	Report:
Principal	Provide the specified goods or services	Gross, when or as the performance obligation is satisfied, for the consideration received from the customer
Agent	Arrange for the specified goods or services to be provided by the other party	Net for the fee the entity expects.

(ASC 606-10-55-37B and 55-38)

As with other issues in the Standard, whether an entity is a principal or an agent depends on control. Before assessing control, the entity must identify the unit of account, that is, the specified good or service being provided to the customer. An entity may be a principal for one or more specified goods or services in a contract and an agent for others in the same contract. The entity must also determine the nature of each specified good or service:

- A good
  - A service
  - A right to a good or service from the other party that it then combines with other goods or services to provide a specified good or service to the customer.
- (ASC 606-10-55-37A)

The entity must determine whether it has control of the goods or services before they are transferred. If the entity has control before transfer to the customer, it is the principal. The Standard includes indicators to support the assessment of whether an entity controls the specified good or service before it is transferred. These include but are not limited to:

- a. The entity is primarily responsible for fulfilling the promise to provide the specified good or service.
  - b. The entity has inventory risk before or after the goods have been transferred.
  - c. The entity has discretion in establishing prices for the specified goods or services.
- (ASC 606-10-55-39)

These indicators are meant to support the entity's assessment. They should be considered in context and not be used as a checklist. The relevance of individual indicators to the control evaluation may vary from contract to contract.

Control of inventory is an indicator that one entity is the principal. Having substantive inventory risk may indicate the entity is the principal. An entity may fulfill the performance obligation or it may engage another party to do so.

If control of the specified goods or services is unclear, the entity should recognize revenue net.

### Customer Options to Purchase Additional Goods or Services

Some contracts give customers the option to purchase additional goods or services. These options may include:

- Sales incentives
- Customer awards
- Contract renewal options
- Other discounts on future goods or services.

These options may be offered at a discount or for free. These options are separate performance obligations if they provide a *material right* to the customer. A right is material if it results in a discount that the customer would not receive if not for entering into the contract, that is, it must be incremental to the discounts typically given for the good or service, to that class of customer, in that geographical area. (ASC 606-10-55-42) This provision acknowledges that customers are implicitly paying for the option as part of the transaction—the old accounting theory that there is no such thing as a free lunch.

**Assessing Whether the Customer Has a Material Right.** When assessing whether a customer has a material right, the entity should consider quantitative and qualitative factors. Qualitative factors might be:

- What a new customer would pay for the same service
- The availability and pricing of competitors' alternatives
- Whether the average customer life indicates the fee is an incentive to stay beyond the stated contract term.

In addition, entities should consider not only the current transaction, but also accumulations in programs, such as loyalty programs.

Some contracts restrict customers from selling a good or service. The entity may, therefore, conclude that the customer cannot benefit from a good or service because it cannot resell the good or service for more than scrap value. On the other hand, the entity may conclude that the customer can benefit from the good together with other readily available resources. The Boards concluded that the assessment should be based on whether the customer could benefit from the good or service on its own rather than how the customer may actually use the good or service. Therefore, in making the assessment, the entity should disregard any contractual limitations.

On the other hand, if the option price reflects the standalone selling price, the entity is deemed to have made a marketing offer. (ASC 606-10-55-43)

Entities must carefully assess contract terms to distinguish between options and marketing offers.

**Recognition.** Revenue is recognized when future goods and services are transferred or when the option expires. The transaction price is allocated to the performance obligations (including the option based on relative standalone selling prices). The estimate of the standalone selling price of

an option reflects the discount a customer receives when exercising the option, adjusted for the discount a customer receives without exercising the option and the likelihood the option will be exercised.

**Practical Alternative.** Estimating the standalone selling price may be difficult because the option may not be sold separately. The Standard provides a practical alternative. Instead of estimating the standalone selling price of the option, the entity can use the practical alternative and evaluate the transaction assuming the option will be exercised. The transaction price is determined by including any consideration estimated to be received from the optional goods and services. The transaction price is then allocated to all goods and services, including those under option. The alternative can be applied if the additional goods or service meet both of the following conditions:

- They are similar to the original goods and services in the contract, and
- They were provided in accordance with the original contract's terms.

(ASC 606-10-55-44)

### **Customer's Unexercised Rights (Breakage)**

*Breakage are rights unexercised by the customer.*

Under some arrangements, a customer may make a nonrefundable prepayment. For that prepayment, the customer has a right to a good or service in the future, and the entity stands ready to deliver goods or services in the future. However, the customer may not actually exercise those rights. The most common examples of this situation are gift cards or vouchers. These unexercised rights are known as breakage.

**Recognition.** Upon receipt of the customer's advance payment, the entity records a contract liability for the amount of the payment. When the contract performance obligations are satisfied, the entity recognizes revenue. A portion of the payment may relate to contractual rights that the entity does not expect the customer to exercise. The timing of revenue recognition related to breakage depends on whether the entity expects to be entitled to a breakage amount. To determine whether it expects to be entitled to a breakage amount, the entity should look to the guidance on constraining amounts of variable consideration found earlier in this chapter. The entity should recognize revenue for breakage proportionately as other balances are redeemed. The assessment of estimated breakage should be updated at each reporting period. Any changes should be accounted for by adjusting the contract liability.

---

**Technical Alert.** In March 2016, the FASB issued ASU 2016-04, *Liabilities—Extinguishment of Liabilities (Subtopic 405-20) Recognition of Breakage for Certain Prepaid Stored-Value Products*, a consensus of the FASB's Emerging Issues Task Force. Prepaid stored-value products contain stored monetary value that can be redeemed for goods, services, or cash, e.g., gift cards. ASU 2016-04 requires entities that record financial liabilities related to prepaid stored-value products to follow the breakage model in the new revenue Standard. This ASU aligns the breakage model for financial and nonfinancial liabilities.

---

**Unclaimed Property (Escheat) Laws.** Legal rights related to unexercised rights vary by jurisdiction. Entities may be required to remit payment related to unexercised rights to a governmental entity. These requirements may fall under unclaimed property or "escheat" laws. If the entity must remit unclaimed property to a governmental entity, the entity should not recognize breakage as revenue. In these situations, it is important for the entity to understand its legal rights and obligations.

## Nonrefundable Upfront Fees

**Overview.** In some industries, it is common to charge an upfront fee. An upfront fee relates to an activity that the entity must undertake to fulfill the contract. The activity occurs at or near inception of the contract, and the upfront fee is an advance payment for future goods or services. Examples of upfront fees are:

- Joining, for example, a gym membership,
- Activation, for example, a cell phone,
- Other initial set-up fees.

**Recognition.** Upon receipt of the fee, the entity should not recognize revenue, even if the fee is nonrefundable, if it does not relate to the performance obligation. Upfront fees are allocated to the transaction price and should be recognized as revenue when the related goods or services are provided. If there is an option to renew the contract and the option provides a material right, the entity should extend the revenue recognition period beyond the initial contract. (ASC 606-10-55-51)

**Practical Alternative.** If it is determined that the upfront fee should be accounted for as an advance payment for future goods or services, the entity may make use of the practical alternative mentioned in the previous section of this chapter on Customer Options to Purchase Additional Goods or Services. (ASC 606-10-55-45)

**Set-Up Costs.** Some nonrefundable fees are intended to compensate an entity for costs incurred at the beginning of the contract. These costs may be, for example, for the hiring of additional personnel, systems set-up, or moving assets to the service site. These efforts usually do not satisfy performance obligations because goods or services are not transferred to the customer. The fees are advance payment for future goods or services. The underlying costs should not be factored into the measure of progress used for performance obligations satisfied over time if they do not depict the transfer of services to the customer. Some set-up costs might not meet the criteria for capitalization as fulfillment costs.

**Renewal Options.** In some situations, for instance, a gym membership, a customer does not have to pay an additional upfront fee when the contract is renewed. Thus, the renewal option may give the customer a material right.

If a material right is not provided, the fee would be recognized over the contract term.<sup>6</sup> If a material right is provided, it is a performance obligation and the entity should allocate part of the transaction price to the material right. The entity has the option to apply the practical alternative for contract renewal if the criteria are met.

As with other aspects of the Standard, the entity has to exercise judgment when determining the amount to allocate to a material right. To make its assessment, the entity should look at historical data, expected renewal rates, marketing analysis, customer input, industry data, etc.

## Licenses

Because of its challenging nature, the guidance in the Standard on licenses was one of the last items finalized. Experts had different views of the underlying economics of licensing issues, and those issues did not end with the release of the Standard in May 2014.

**Sale of Intellectual Property.** An agreement that calls for the transfer of control of all the worldwide rights, exclusively, in perpetuity, for all possible applications of the intellectual

---

<sup>6</sup> Ibid.

property (IP) may be considered a sale rather than a license. If the use of the IP is limited by, for instance, geographic area, term, or type of application or substantial rights, then the transfer is probably a license. If the agreement represents a sale, the transaction is treated as a sale subject to the five-step model, including the guidance on variable constraint and the recognition constraint to any sale- or usage-based royalties.

**Licenses of Intellectual Property.** A license arrangement establishes a customer's right to an entity's intellectual property and the entity's obligations to provide these rights. With the prevalence of technology in every business, accounting for IP licenses has become more critical than ever. In addition to the software industry, IP licenses are common in other industries, such as:

- Entertainment and media
- Pharmaceuticals
- Retail and consumer
- Franchise.

Licenses may involve patents, trademarks, and copyrights. Licenses can:

- Be term-based or perpetual
- Be exclusive or nonexclusive
- Carry fixed to variable terms
- Require upfront payments or over time installments.

**Assessing Whether a License Is Distinct.** As with other performance obligations, entities should assess if a license represents a distinct performance obligation, including whether the customer can benefit from the license on its own or together with other readily available resources and whether the license is separately identifiable from other goods or services in the contract. Assessing whether a license is distinct may require significant judgment. (For more on determining whether a performance obligation is distinct, see the discussion earlier in this chapter.) If a license is not distinct, the entity should apply the guidance in Step 5. (ASC 606-10-55-57) The guidance in this section only relates to distinct licenses. Licenses that are not distinct include those that:

- Form a component of a tangible good and that is integral to the functionality of the item
- The customer can benefit from only in conjunction with a related service.

(ASC 606-10-55-56)

If a license is not distinct, entities should look to the guidance in Step 5.

If a license in a bundle of goods or services is the dominant component of that bundle, the entity should account for the bundle of goods and services as a license. (ASU 2014-09 BC 407)

**Nature of the Entity's Promise.** Before identifying when the customer takes control of an asset, it is necessary to identify the nature of the entity's promise. Therefore, when accounting for a performance obligation that includes a license and other goods or services, the entity should consider the nature of its promise in granting a license. (ASC 606-10-55-57) The Standard classifies all distinct licenses of intellectual property into two categories:

- a. *A right to access* the entity's intellectual property throughout the license period (or its remaining economic life, if shorter)
- b. *A right to use* the entity's intellectual property as it exists at the point in time at which the license is granted.

(Emphasis added.)

(ASC 606-10-55-58)

When assessing whether a license is a right to use IP or a right to access IP or when identifying the promises in a contract, the entity does not consider restrictions of time, geography, or use of the license and guarantees provided by the licensor that it has a valid patent to the industry IP and that it will maintain and defend the patent. Those attributes define the scope of the customer's rights and not whether the entity satisfies its performance obligation at a point in time or over time. (ASC 606-10-55-64)

#### **Exhibit—Comparison of Right to Access and Right to Use**

	<b>Right to Access</b>	<b>Right to Use</b>
<b>Description</b>	The customer simultaneously receives and consumes the benefit of the IP license as the entity performs.	The license does not meet the criteria for a right to access the license.
<b>Recognition</b>	Recognize over time, with an appropriate method, because the customer simultaneously receives and consumes the benefit of the IP.	Recognize at a point in time because the customer has control: it can direct the use of and benefit from the license at the point in time at which the license transfers.
(ASC 606-10-55-58A and 58B)		

The entity should assess whether the IP is expected to change during the term of the license. A customer does not meet the criteria for control if the IP is expected to change. If the entity is expected to be involved in the IP and undertake activities that significantly affect the licensed IP, this may be an indication the IP is expected to change.

To determine if a customer could expect the entity to undertake activities that significantly affect the IP, the entity should consider:

- Customary business practices, published policies, or specific statements
- Shared economic interest, such as a sales-based royalty.

To determine whether a license is a right to use or a right to access IP, the FASB provides clarified guidance about the nature of the license. The FASB's approach looks to the nature of the IP and focuses on whether activities undertaken by the entity significantly affect the IP. Utility relates to the IP's ability to provide value or benefits. Entities must determine if the license is either functional or symbolic and that category determines whether the license is a right to access or a right to use. For both types of IP, the entity cannot recognize revenue before the beginning of the period in which the customer is able to use and benefit from the license.

#### **Exhibit—Categories of Distinct Licenses of Intellectual Property—FASB's Alternative Approach**

	<b>Symbolic IP</b>	<b>Functional IP</b>
<b>Description</b>	This IP does not have significant standalone functionality. It represents something else. The lack of standalone functionality indicates that substantially all of the utility is derived from the entity's past or ongoing activities of the entity.	Customer derives a substantial portion of its benefit from standalone functionality. The licensor's ongoing activities do not significantly affect the utility of the IP.

	<b>Symbolic IP</b>	<b>Functional IP</b>
	It is assumed that the entity will continue to support and maintain the IP.	
Examples	Brand, team or trade names, logos, franchise rights	Software, biological compounds, drug formulas, and completed media content (films, TV shows, music)
Recognition	Over the license period using a measure of progress that reflects the licensor's pattern of performance.	At a point in time* when control of the IP transfers to the customer, that is, when the IP is available for the customer's use and benefit. (*Unless the functionality of IP is expected to substantively change the form or functionality as a result of activities performed by the entity that are not separate performance obligations and the customer would be required or compelled to use the latest version of the IP. This would indicate that the customer has a right to access the IP. In such cases, the activities significantly affect the customer's ability to benefit from the IP and revenue would be recognized over time.)

**Symbolic License.** With a symbolic license, the IP may change over the course of time. This can occur because of the entity's continuing involvement with activities that affect its IP. Even if the right is unchanged, the benefit or value to the customer may be affected by the licensor's activities during the license period. With symbolic IP, the entity fulfills its obligation over time, as the entity:

- a. Grants the customer rights to use and benefit from the entity's intellectual property by making it available for the customer's use
  - b. Supports or maintains the intellectual property.
- (ASC 606-10-55-60)

The customer has an expectation that the entity will undertake positive activities to maintain the value of the IP and avoid actions that would reduce the value of the IP.

**Functional License.** A functional IP license generally grants the customer the right to use the IP at a point of time. However, if both of the following criteria are met, the license grants a right to access the IP:

- a. The functionality of the intellectual property to which the customer has rights is expected to substantively change during the license period as a result of activities of the entity that do not transfer a good or service to the customer, and
  - b. The customer is contractually or practically required to use the updated IP resulting from criterion "a."
- (ASC 606-10-55-62)

The IP's utility may be significantly affected when:

- The expected activities are expected to change the form or the functionality of the IP, or
- The value for the customer of the IP is substantially derived from or dependent on the expected activities of the entity.

Examples of these might be when the ability to perform a function or the value of a logo changes.

**Sales- or Usage-Based Royalties.** For related information on sales- and usage-based royalties, see the section on Step 3.

**Recognition.** Revenue from a license of IP that is a right to access should be recognized over time. The entity should use a recognition method that reflects its progress towards completion of the performance obligation. Revenue from a license of IP that is a right to use should be recognized at a point in time. Once the entity determines that the revenue from the license should be recognized over time or at a point in time, the entity should apply the guidance in Step 5 to determine the point in time or to select the appropriate method to measure the revenue over time.

In any case, revenue cannot be recognized from an IP license before:

- The entity has made available a copy of the IP to the customer, *and*
  - The license period has begun.
- (ASC 610-10-55-58C)

### Repurchase Agreements

A repurchase agreement is a contract in which an entity sells an asset and also promises or has the option (either in the same contract or another contract) to repurchase the asset. (ASC 606-10-55-66)

The repurchased asset may be:

- The asset that was originally sold to the customer,
- An asset that is substantially the same as that asset, or
- Another asset of which the asset that was originally sold is a component.

Agreements come in three forms:

1. A forward—the entity has an obligation to repurchase the asset.
2. A call option—the entity has a right to repurchase the asset.
3. A put option—the customer has the option to require the entity to repurchase the asset at a price that is lower than the original selling price.

(ASC 606-10-55-67)

**A Forward or Call Option.** When the entity has an obligation (forward option) or right (call option) to repurchase the asset, the customer may have physical possession, but is limited in its ability to:

- Direct the use of the asset, and
- Obtain substantially all of the remaining benefits from the asset.

Therefore, the conditions as discussed in Step 5 for the customer to have control of the asset are not present, and the customer is deemed not to have control of the asset. The accounting

treatment depends on the repurchase amount required. The entity should account for the contract as:

- A lease if the entity can or must repurchase the asset for a lower amount than the original selling price unless the contract is part of a sale-leaseback transaction. If a sale-leaseback transaction, the entity should account for the contract as a financing transaction and not as a sale-leaseback in accordance with ASC 840-40.
- A financing arrangement if the entity can or must repurchase the asset for an amount equal to or more than the original selling price of the asset.  
(ASC 606-10-55-68)

**Recognition.** When assessing the repurchase price, the entity should consider the time value of money. If the contract is accounted for as a financing arrangement, the entity should continue to recognize the asset. The entity also recognizes a financial liability for any consideration received. Interest and processing and holding costs, if applicable, are recognized for the difference between the consideration received and the amount of consideration to be paid to the customer. The entity derecognizes the asset and recognizes revenue if the option is not exercised. (ASC 606-10-55-69 through 55-71)

**Put Options.** A put option gives the customer the right to require the entity to repurchase the asset. If the repurchase price is lower than the original selling price of the asset, the entity must evaluate at contract inception whether the customer has a significant economic incentive to exercise the option. The entity makes that judgment by considering the relationship of the repurchase price to the expected market value of the asset and the amount of time until the right expires.

If the entity concludes that the customer has a significant economic interest and anticipates that the option will be exercised, the option is accounted for as a lease, unless the agreement is part of a sale-leaseback transaction. (ASC 606-10-55-72) If not, the entity accounts for it as a sale with a right of return.

If the repurchase price is greater than or equal to the original selling price and is more than the expected market value of the asset, the entity accounts for the contract as a financing arrangement. The time value of money should be considered when comparing the repurchase price with the selling price. If the option expires unexercised, the entity derecognizes the liability and recognizes revenue.

### Consignment Arrangements

A consignment arrangement occurs when an entity ships goods to a distributor, but retains control of the goods until a predetermined event occurs. Because control has not passed, the entity does not recognize revenue upon shipment or delivery to the consignee. The Standard includes the following indicators to evaluate whether a consignment arrangement exists:

- a. The product is controlled by the entity until a specified event occurs, such as the sale of the product to a customer of the dealer, or until a specified period expires.
- b. The entity is able to require return of the products or transfer the product to a third-party (such as another dealer).
- c. The dealer does not have an unconditional obligation to pay for the product (although it might be required to pay a deposit).  
(ASC 606-10-55-80)

The Standard provides these indicators, but the entity is not limited to just them. Once control transfers, the entity recognizes revenue.

---

**Practice Pointer:** A distributor may have physical control of the goods, but if the entity has enforceable rights to require return of the goods, the distributor may not have control.

---

### Bill-and-Hold Arrangements

Bill-and-hold situations arise when:

- The entity bills the customer for goods that are ready for shipment, but
- The entity does not ship the goods until a later date.

In these cases, the entity must determine if the customer has control of the goods. These arrangements may sometimes be used to manipulate revenue. The Standard provides four criteria, all of which an entity must meet in order to decide that control has passed to the customer:

1. The reason for the bill-and-hold is substantive. For example, a customer may request that an entity hold a shipment because of a lack of warehouse space or because the customer does not yet need the goods in its production process.
2. The product must be identified in some way as belonging to the customer.
3. The product must be ready for physical transfer upon request from the customer.
4. The entity cannot have the ability to use the product or to direct it to another customer. The goods cannot be used to fulfill orders for other contracts. Doing so may indicate the goods are not controlled by the customer.

(ASC 606-10-55-83)

The entity needs to consider whether it meets those criteria and if it is providing custodial services. If the entity is providing custodial services, part of the transaction price should be allocated to that performance obligation.

### Contract Modifications

*A contract modification is a change in the scope or price (or both) of a contract that is approved by the parties to the contract. (ASC 606-10-25-10)*

Parties to an arrangement frequently modify the scope or price or both of an ongoing contract. Such a change is sometimes called a change order, a variation, or an amendment.

---

**Technical Alert.** For an entity with a significant volume of contract modifications occurring over a long period of time, the Standard's guidance for accounting for modified contracts at times could be costly and complex. Subsequent to release of the Standard, the Boards clarified the guidance related to implementing contract modifications and provided for a practical expedient related to:

- Accounting for a modification that occurred before transition to the standard.
- 

For contracts modified before transition to the standard, the practical expedient allows an entity to determine and allocate the transaction price on the basis of all satisfied and unsatisfied performance obligation as of the beginning of the earliest period presented. The entity may aggregate the effect of the modifications. This practical expedient relieves entities from having

to separately evaluate the effects of each contract modification. Entities should note that the expedient, if used, must be applied consistently to similar types of contracts. (ASC 606-10-65-1f.4)

**Approval.** A contract modification must be approved by the parties. Like the original contract, the modification should be approved:

- In writing,
- Orally, or
- Implied by customary business practice.

---

**Practice Pointer:** Entities must exercise judgment when assessing whether a change is a modification or should have been anticipated at the outset because of the entity's customary business practice.

---

Until the modification is approved, the entity should continue to apply the guidance to the existing contract. (ASC 606-10-25-10)

**Disputes.** A modification may exist even if the parties have a dispute as to scope or price. The revenue standard focuses more on enforceability of the contract than on finalization of the modification. If the change in scope has been agreed to, but the price is not settled, the entity should estimate the change to the price in accordance with the guidance on estimating variable consideration and constraining estimates of variable consideration. (ASC 606-10-25-11)

**Recognition.** Recognition of contract modifications can be complex and requires careful analysis. The following sections explain the recognition process in detail.

When a modification occurs, entities must determine:

- If the modification has created a new contract and performance obligations, or
- If the existing contract has been modified.

If the entity determines that an existing, ongoing contract has been modified, then it must further analyze the modification to determine if the modification should be accounted for as:

1. A separate contract,
2. Effectively, a termination of the contract and execution of a new contract resulting in a prospective treatment,
3. Part of the original contract, which could result in a catch-up adjustment, or
4. A combination of 2 and 3 above.

The accounting treatment depends on what was changed. Under the Standard, to faithfully depict the rights and obligations of a contract modification, entities must account for modifications on a:

- Prospective basis—when the additional goods or services are distinct, or
- Cumulative catch-up basis—when the additional goods or services are not distinct.

**Contract Modification Represents a Separate Contract.** The concept underlying accounting for a modification as a separate contract is that there is no substantive economic difference under the given set of circumstances between a new contract and a modification. Therefore, the entity must analyze the agreement and account for the modification as a separate contract if:

1. The scope of the contract increases because of the addition of *distinct* promised goods or services, *and*

2. The price of the contract increases by an amount of consideration that reflects the entity's standalone selling prices of the additional promised goods or services and any appropriate adjustment to that price to reflect the circumstances of the particular contract.

(ASC 606-10-25-12)

Further, to be distinct, two criteria must be met:

1. The customer could benefit from the goods or services.
2. The promise to transfer a good or service is separately identifiable from other promises in the contract.

(ASC 606-10-25-19)

(See earlier in this chapter for further information on determining whether performance obligations are "distinct.")

When these criteria are met, there is no economic difference between an entity entering into a separate contract for the additional goods or services and an entity modifying an existing contract.

Note that only modifications that *add* distinct goods or services can be treated as separate contracts. Modifications that reduce the amount of good or service or change the scope, by their nature, cannot be considered separate contracts. They would be modifications of the original contract.

If the entity determines that the modification should be accounted for as a separate contract, the next step is to assess the agreement using the five contract criteria detailed earlier in this chapter. If the contract meets the criteria, the company should account for the change prospectively, accounting for the change in the current period and in any future period affected. Previously reported results are not changed.

**Contract Modification Does Not Represent a Separate Contract.** If the new goods or services are not distinct or not priced at the proper standalone selling price according to the criteria above, the changes are not treated as a separate contract. They are considered changes to the original contract, and the entity must then determine how to account for the remaining goods or services. That accounting depends on whether or not each of the remaining goods or services is distinct from the goods or services transferred on or before the date of the modification. The Standard describes three possible scenarios and the accounting under each:

- Scenario 1—Remaining goods or services are distinct
- Scenario 2—Remaining goods or services are not distinct
- Scenario 3—Remaining goods or services are a combination of distinct and not distinct goods or services.

Account for the remaining goods or services, that is, for the goods or services not transferred as an adjustment to the existing contract, as follows.

**Scenario 1—Remaining Goods or Services Are Distinct.** The remaining goods or services are distinct from the goods or services transferred on or before the date of the contract modification, but the consideration for those goods or services does not reflect the standalone selling price.

This type of modification is accounted for in the same way as a modification considered a new contract. In this scenario, the modification is negotiated after the original contract and is based on new facts and circumstances. Accounting for these changes using a cumulative catch-up basis would be complex and might not reflect the economic substance of the modification. Account for this type of modification prospectively as if it were effectively a termination of the existing contract and the creation of a new contract.

The amount of consideration already recognized under the contract is not adjusted. The amount of consideration allocated to the remaining performance obligations is the sum of:

1. Consideration promised by the customer under the original terms of the contract and included in the estimate of the transaction price and that had not yet been recognized as revenue. This amount includes amounts already received from customers and creates contract assets or receivables.
2. The consideration promised as part of the contract modification.  
(ASC 606-10-25-13a)

***Series of Distinct Goods or Services.*** The Scenario 1 accounting treatment also applies to situations where the entity determines that after the modification it has the same single performance obligation as before but that performance obligation represents a series of distinct goods or services. This situation typically may be found in energy contracts, mobile phone airtime services, or service contracts.

***Scenario 2—Remaining Goods or Services Are Not Distinct.*** The remaining goods or services are not distinct and, therefore, form part of a single performance obligation that is partially satisfied at the contract modification date.

Account for the modification as if it were a part of the existing contract:

- Retrospectively through a cumulative catch-up adjustment.

Recognize the modification as an increase or decrease in revenue at the contract modification date, measured at the effect that the modification has on the transaction price and on the entity's measure of progress toward satisfaction of the performance obligation. (ASC 606-10-25-13b)

However, as explained above, modifications of contracts with a single performance obligation that is actually a series of distinct goods or services are accounted for prospectively, not by using a cumulative catch-up adjustment.

***Scenario 3—Remaining Goods or Services Are a Combination of Distinct and Not Distinct Goods or Services.*** The remaining goods or services are a combination of (a) and (b), that is, a combination of distinct and not distinct goods or services.

In this scenario, a change in the contract is treated as a combination of the first and second scenarios: a modification of the existing contract and the creation of a new contract. So, the entity does not adjust the accounting for completed performance obligations that are distinct from the modified goods or services, but adjusts revenue previously recognized for the effect of the modification on the transaction price allocated to performance obligations that are not distinct and the measure of progress. Account for the effects of the modification on the unsatisfied performance obligations following the guidelines above for (a) goods and services that are distinct and (b) goods and services that are not distinct. (ASC 606-10-25-13c)

---

**Practice Pointer:** The amount of consideration allocated to the remaining performance obligation includes amounts received but not yet recognized and amounts the customer has promised to pay that had not yet been recognized. There are situations where the entity may have recognized promised considerations but not yet received those amounts. Those amounts create a contract asset or receivables. Those amounts have to be deducted from the consideration allocated to the remaining performance obligation. Otherwise, the entity would recognize revenue twice.

---

**Change in Transaction Price Resulting from Modification.** If a change in transaction price occurs as a *result* of a contract modification, the Standard takes an approach that is consistent with other modifications. That is, a contract modification that only affects the transaction price is accounted for like other contract modifications:

- Prospectively if the remaining goods or services are distinct.
- As a cumulative catch-up adjustment if the remaining goods or services are not distinct.

A change in transaction price may occur *after* a modification, but before fulfillment of performance obligations is completed. In that case, the Standard provides the following guidance:

- a. If the modification is accounted for as if it were a termination of the existing contract and the creation of a new contract, the entity allocates the change in the transaction price to the performance obligations identified in the contract before the modification if and to the extent that the change in transaction price is attributable to an amount of variable consideration promised before the modification.
- b. If the modification was not accounted for as a separate contract, the entity allocates the change in the transaction price to the performance obligations in the modified contract. These are the performance obligations that were not fully satisfied at the date of the modification.

(ASC 606-10-32-45)

For more information on changes in transaction price, see the section on transaction prices earlier in this chapter.

### Onerous Contracts

Onerous obligations occur when the entity expects to incur a loss on a single performance obligation (onerous performance obligation) or on a contract (onerous contract). That is, the costs of the contract are higher than its economic benefit. The FASB and IASB discussed whether to include guidance on onerous contracts in the Standard, but ultimately decided against it. The current accounting treatment in U.S. GAAP and IFRS remains and is not converged.

GAAP contains no general authoritative standard that addresses onerous contracts. However, some industry-specific topics include guidance on this issue. This results in potential differences in practice.

### Disclosures Required by the Standard

The standard requires entities to disclose both quantitative and qualitative information that enables users of financial statements to understand the nature, amount, timing, and uncertainty of revenue and cash flows arising from contracts with customers. The additional disclosures are partially driven by the increased judgment related to estimates required in the new guidance. The requirements are comprehensive and include quantitative and qualitative information. The ASU includes some exceptions for disclosure by nonpublic entities. More information on disclosures can be found in Appendix B to this book.

### AICPA Industry Committees

In response to the issuance of the Standard, the AICPA established sixteen industry task forces. The task forces are charged with identifying implementation issues and aiding in the development of an AICPA accounting guide on revenue recognition.

## Changes to Industry-Specific Guidance

The table below lists the changes made by the ASU to industry-specific guidance.

### Exhibit—Status of Industry-Specific Guidance in ASU 2014-09 for Affected Industries

ASC Section	Status	Comments
905-605 Agriculture—Revenue Recognition	Retains a portion of the 905-605 guidance	
908-605 Airlines	Superseded	
910-605 Contractors—Construction	Superseded	
912-605 Contractors—Federal Government	Superseded	For guidance on the presentation of a loss on a termination of a contract for default, see paragraph ASC 912-20-25-4
920-605 Entertainment—Broadcasters	Superseded	
922-605 Entertainment—Cable Television	Superseded	
924-605 Entertainment—Casinos	Superseded	
926-605 Entertainment—Films	Superseded	
928-605 Entertainment—Music	Superseded	
932-605 Extractive Activities—Oil and Gas	Superseded	
940-605 Financial Services—Brokers and Dealers	Superseded	
942-605 Financial Services—Depository and Lending	Superseded	
944-605 Financial Services—Insurance	Superseded	For guidance on recognizing revenue from contracts that are not within the scope of this Topic by insurance entities, see ASC Subtopic 944-605
946-605 Financial Services—Investment Companies	Superseded	
948-605 Financial Services—Mortgage Banking	Superseded	
952-605 Franchisors	Superseded	
954-605 Health Care Entities	Retains a portion of the 954-605 guidance	For guidance on determining whether a liability should be recognized for a continuing care retirement community for its obligation to provide future services and the use of facilities to current residents, see Sections 954-440-25 and 954-440-35.

ASC Section	Status	Comments
		For guidance on determining when to recognize a loss under prepaid health care services contracts, see paragraph 954-450-30-4
958-605 Not-for-Profit Entities	Retains a portion of the 958-605 guidance	For guidance on recognizing revenue from contracts that are not within scope of this Topic by not-for-profit entities, see Subtopic 958-605
970-605 Real Estate—General	Superseded	
972-605 Real Estate—Common Interest Realty Associations	Superseded	
974-605 Real Estate—Real Estate Investment Trusts	Superseded	
976-605 Real Estate—Retail Land	Superseded	
978-605 Real Estate—Time-Sharing Activities	Superseded	
980-605 Regulated Operations	Retains a portion of the 980-605 guidance	For guidance on recognizing a loss on long-term power sales contracts, see paragraph 980-350-35-3
985-605 Software	Superseded	

### Transition Resource Group Issues

Over ninety issues were brought to the Transition Resource Group (TRG). For most of those issues, the TRG decided that they did not need action by the Boards or the issues were discussed with and resolved with the FASB and IASB staff.

At its January 2016 meeting, the IASB stated that it does not plan to schedule any more meetings of the IFRS constituents of the IASB. The TRG will not be disbanded. It will be available for consultation if needed. The IASB will continue to collaborate with the FASB and monitor future FASB discussions with the U.S. GAAP constituents of the TRG.

At its April 2016 meeting, the TRG discussed five issues:

- Class of customer
- Scoping considerations for incentive-based capital allocations
- Scoping considerations for financial institutions
- Evaluating how control transfers over time
- Contract asset treatment in contract modifications.

The documents related to these issues can be found on the FASB website and are referenced in the Appendix below.

See Appendix below for more detail on TRG issues. For the most recent developments, readers should consult the FASB project pages.

## Appendix—Status of Issues Brought to the Boards

The table that follows summarizes the issues and the path forward chosen by the FASB. Additional information and background papers can be found on the FASB website.<sup>7</sup>

Date of Mtg.	TRG Agenda Ref. #	TRG Paper Ref.	Topic	Next Steps
7/18/2014	1	1	Gross versus net revenue—determining principal versus agent	FASB issued ASU 2016-08, <i>Revenue from Contracts with Customers (Topic 606): Principal versus Agent Considerations (Reporting Revenue Gross versus Net)</i> .
	2	2	Gross versus net revenue—certain amounts billed to customers (e.g., shipping, handling, sales taxes)	FASB issued ASU 2016-12, <i>Revenue from Contracts with Customers (Topic 606): Narrow-Scope Improvements and Practical Expedients</i> .
7/18/2014, 1/26/2015	3	3, 21	Licenses—sales-based and usage-based royalty exception—scope and application	FASB issued ASU 2016-10, <i>Revenue from Contracts with Customers (Topic 606): Identifying Performance Obligations and Licensing</i> .
7/18/2014	4	4	Impairment testing of capitalized contract costs—assumption of renewal or extension of the contract	The FASB concluded that stakeholders can understand and apply the guidance as it exists. However, the FASB compiled this with similar issues and proposed to clarify the intent. In May 2016, FASB issued an ED on proposed ASU <i>Technical Corrections and Improvements to Update 2014-09, Revenue from Contracts with Customers (Topic 606)</i> .
10/31/2014	5	6	Options to acquire additional goods/services and provision of material right	The FASB concluded that stakeholders can understand and apply the guidance as it exists. No further action is anticipated.
	6	6	Upfront nonrefundable fees, Example 53 questions	The FASB concluded that stakeholders can understand and apply the guidance as it exists. No further action is anticipated.

<sup>7</sup> [http://www.fasb.org/cs/ContentServer?c=Document\\_C&pagename=FASB%2FDocument\\_C%2FDocumentPage&cid=1176167264401](http://www.fasb.org/cs/ContentServer?c=Document_C&pagename=FASB%2FDocument_C%2FDocumentPage&cid=1176167264401).

Date of Mtg.	TRG Agenda Ref. #	TRG Paper Ref.	Topic	Next Steps
	7	7	Offsetting of contract positions in the statement of financial position	The FASB concluded that stakeholders can understand and apply the guidance as it exists. No further action is anticipated.
	8	7	Offsetting of contract positions in contracts with multiple performance obligations as entity satisfies obligations	The FASB concluded that stakeholders can understand and apply the guidance as it exists. No further action is anticipated.
	9		Licenses—evaluation of usage restrictions, ability of underlying IP to change in order to be right to access IP, nonexclusive licensing arrangements, evaluation of the significance of activities expected to be undertaken.	FASB issued ASU 2016-10, <i>Revenue from Contracts with Customers (Topic 606): Identifying Performance Obligations and Licensing</i> .
	10	9, 22	Separation—Distinct within the context of the contract—evaluating if goods or services are distinct within the context of the contract	FASB issued ASU 2016-10, <i>Revenue from Contracts with Customers (Topic 606): Identifying Performance Obligations and Licensing</i> .
	11	9, 22	Distinct within the context of the contract—determining whether goods or services are dependent on or interrelated with other goods or services in the bundle	FASB issued ASU 2016-10, <i>Revenue from Contracts with Customers (Topic 606): Identifying Performance Obligations and Licensing</i> .
3/30/2015	12	27	Separation—guidance on series of distinct goods or services with the same pattern of transfer applicability beyond repetitive service contracts	FASB issued ASU 2016-10, <i>Revenue from Contracts with Customers (Topic 606): Identifying Performance Obligations and Licensing</i> .
10/31/2014	13	10	Variable consideration—asset manager performance-based fees, carried interest, recognition of termination provisions on an interim basis	The FASB concluded that stakeholders can understand and apply the guidance as it exists. No further action is anticipated.
	14		Enforceable rights and obligations—considered from customer's perspective in Step 1	Staff discussed with submitter directly. No further action anticipated.
1/26/2015	15	13	Collectibility—group of combined contracts with portion that is not probable for collection	The FASB concluded that stakeholders can understand and apply the guidance as it exists. No further action is anticipated.

(Continued)

(Continued)

Date of Mtg.	TRG Agenda Ref. #	TRG Paper Ref.	Topic	Next Steps
	16	13	Collectibility—when decline in customer's financial condition warrants reassessment	The FASB concluded that stakeholders can understand and apply the guidance as it exists. No further action is anticipated.
1/20/2017	17		Impairment—sales commission, triggers to test capitalized costs for impairment	FASB decided to address in ED on proposed ASU <i>Technical Corrections and Improvements to Update 2014-09, Revenue from Contracts with Customers (Topic 606)</i> .
	18		Impairment—correct order of impairment testing between ASC 350, ASC 360, and ASC 330	FASB decided to address in ED on proposed ASU <i>Technical Corrections and Improvements to Update 2014-09, Revenue from Contracts with Customers (Topic 606)</i> .
1/26/2015 3/30/2015 7/13/2015	19	14, 28, 37	Variable consideration and consideration payable to a customer from a planned coupon drop—account for when the performance obligation is satisfied or when the entity promises to pay consideration	The FASB concluded that stakeholders can understand and apply the guidance as it exists. No further action is anticipated.
1/26/2015	20	15	Noncash consideration received from a customer—measurement date	FASB issued ASU 2016-12, <i>Revenue from Contracts with Customers (Topic 606): Narrow-Scope Improvements and Practical Expedients</i> .
	21		Portfolio method—assessment of materiality at contract level or consolidated financial statement level in determining whether the effects of applying new guidance to a portfolio of contracts would not materially differ from application at the contract level	Staff discussed with submitter directly. No further action anticipated.
	22		Standalone selling price—in a contract with a bundle of goods and services	Staff discussed with submitter directly. No further action anticipated.
1/26/2015	23	20	Significant financing component—arrangement	The FASB concluded that stakeholders can understand

Date of Mtg.	TRG Agenda Ref. #	TRG Paper Ref.	Topic	Next Steps
			with upfront deliverable and monthly fee—determining whether period is less than one year—applying FIFO approach or proportion between equipment and services	and apply the guidance as it exists. No further action is anticipated.
	24		Amortization of contract costs—should amortization be classified as sales if an entity presents the analysis of expenses using a classification based on their nature	Staff discussed with submitter directly. No further action anticipated.
1/26/2015	25	13	Collectibility—cash received when entire transaction price is not probable of collection	FASB issued ASU 2016-12, <i>Revenue from Contracts with Customers (Topic 606): Narrow-Scope Improvements and Practical Expedients</i> .
1/26/2015	26	15	Noncash consideration received from a customer—recognition of changes in fair value due solely to the form of consideration	FASB issued ASU 2016-12, <i>Revenue from Contracts with Customers (Topic 606): Narrow-Scope Improvements and Practical Expedients</i> .
3/30/2015	27	29	Separation—insurance element in a warranty covering post-transaction failure	The FASB concluded that stakeholders can understand and apply the guidance as it exists. No further action is anticipated.
1/26/2015	28	12	Identifying promised goods or services	FASB issued ASU 2016-10, <i>Revenue from Contracts with Customers (Topic 606): Identifying Performance Obligations and Licensing</i> .
1/26/2015	29	22	Shipping service—separate obligation?	FASB issued ASU 2016-10, <i>Revenue from Contracts with Customers (Topic 606): Identifying Performance Obligations and Licensing</i> .
1/26/2015	30	13	Collectibility—circumstances to determine at contract inception that collectibility is probable but concurrently record an impairment loss and when to record revenue for out of scope arrangement due to collectibility concerns	The FASB concluded that stakeholders can understand and apply the guidance as it exists. No further action is anticipated.
1/26/2015	31	14	Variable consideration—constraint applied at the	The FASB concluded that stakeholders can understand

			contract level or the performance obligation level	and apply the guidance as it exists. No further action is anticipated.
1/26/2015 3/30/2015 7/13/2015	32	14, 19, 28, 37	Consideration payable to a customer—apply guidance on a contract level or to entire customer relationship, distribution chains, timing of consideration anticipated but not yet promised, reclassification of negative revenue to expense	The FASB concluded that stakeholders can understand and apply the guidance as it exists. No further action is anticipated.
1/26/2015	33	16	Stand-ready obligations—determining the pattern of recognition	The FASB concluded that stakeholders can understand and apply the guidance as it exists. No further action is anticipated.
	34	17	Islamic Financing Transactions	The FASB concluded that stakeholders can understand and apply the guidance as it exists. No further action is anticipated.
1/26/2015 3/30/2015	35	18, 32	Material right—accounting for the customer's exercise of the right, considering a significant financing component, accounting for an upfront activation fee not a performance obligation	The FASB concluded that stakeholders can understand and apply the guidance as it exists. No further action is anticipated.
1/26/2015	36	20	Significant financing component—consistency of factor in ASC 606-10-32-17(c) with example 30, implied zero interest rate, adjusting the time value of money when consideration is received upfront with revenue recognized over multiple years	The FASB concluded that stakeholders can understand and apply the guidance as it exists. No further action is anticipated.
	37	23	Costs to obtain a contract—capitalization of commission payments earned after the initial contract is obtained or that are contingent upon events	The FASB concluded that stakeholders can understand and apply the guidance as it exists. No further action is anticipated.
	38	24	Transition—contract modification occurring prior to	FASB issued ASU 2016-12, <i>Revenue from Contracts with</i>

Date of Mtg.	TRG Agenda Ref. #	TRG Paper Ref.	Topic	Next Steps
	39		the date of initial application of the Standard and when it is impracticable to do so Contract balance disclosures—related to IFRS.	<i>Customers (Topic 606): Narrow-Scope Improvements and Practical Expedients.</i> Staff discussed with submitter directly. No further action anticipated.
10/31/2014	40	9, 22	Identifying performance obligations—application of factors in ASC 606-10-25-21	Refer to submission No. 10.
3/30/2015	41	26	Contributions—contribution to nonprofits in scope of ASC 606	The FASB concluded that stakeholders can understand and apply the guidance as it exists. No further action is anticipated.
	42		Gross versus net—gift card consideration payable to a customer or a performance obligation, if a performance obligation, is the entity a principal or agent	Staff discussed with submitter directly. No further action anticipated.
	43		Amortization of contract fulfillment costs—request for a practical expedient to expense costs where the amortization period for the asset is one year or less	Staff discussed with submitter directly. No further action anticipated.
	44		Presentation of contract assets or liabilities—systems challenge in calculating net contract asset or liability on a contract by contract basis	Staff discussed with submitter directly. No further action anticipated.
7/13/2015	45	40	Application of the practical expedient for measuring progress—minimum payment requirement or volume discount	The FASB concluded that stakeholders can understand and apply the guidance as it exists. No further action is anticipated.
	46		Gross versus net revenue—IFRS issue	Staff discussed with submitter directly. No further action anticipated.
3/30/2015	47	28	Consideration payable to a customer—payments that flow through from the entity to an intermediary	The FASB concluded that stakeholders can understand and apply the guidance as it exists. No further action is anticipated.
7/31/2015	48	41	Measure of progress—when a single performance obligation	The FASB concluded that stakeholders can understand and apply the guidance as it

3/30/2015	49	33	contains multiple promises or activities Partially satisfied performance obligation	exists. No further action is anticipated. The FASB concluded that stakeholders can understand and apply the guidance as it exists. No further action is anticipated.
7/31/2015	50	38	Portfolio method and constraint—timing of evaluation of variable consideration constraint and appropriate transaction price for multiple similar and independent contracts	The FASB concluded that stakeholders can understand and apply the guidance as it exists. No further action is anticipated.
3/30/2015	51	31	Allocation of variable consideration	The FASB concluded that stakeholders can understand and apply the guidance as it exists. No further action is anticipated.
	52		Measure of progress—input measure used to measure progress toward completion, specifically in a real estate development—include land acquisition costs	Staff discussed with submitter directly. No further action anticipated.
	53		Presentation gross or net of excise taxes on a jurisdiction-by-jurisdiction basis	Refer to submission No. 2.
	54		Licenses—timing of recognizing revenue for a multi-year license when access for all years is delivered upfront	Staff discussed with submitter directly. No further action anticipated.
	55		Satisfaction of performance obligation—what constitutes satisfaction	Staff discussed with submitter directly. No further action anticipated.
	56		Performance obligations satisfied over time—degree of evidence to establish existence and enforceability of right to payment, level of legal certainty needed, court decisions, legal option	Staff discussed with submitter directly. No further action anticipated.
7/31/2015	57	35	Restocking fees—products expected to be returned,	The FASB concluded that stakeholders can understand and apply the guidance as it

Date of Mtg.	TRG Agenda Ref. #	TRG Paper Ref.	Topic	Next Steps
1/26/2015	58	13	products with the right of return and accrual of costs Implicit price concession—distinguishing between “failure to collect” and “implicit price concessions”	exists. No further action is anticipated. See Memo No. 13.
	59		Disclosure requirements—IFRS issue	Staff discussed with submitter directly. No further action anticipated.
	60		Scope—contract within scope of ASC 944	Refer to submission No. 62.
7/31/2015	61	40	Application of the practical expedient for measuring progress—considering market price or standalone selling prices when assessing value to the customer, applicability of practical expedient to a contract with tiered precise or an upfront fee, guidance in ASC 606 sufficient	The FASB concluded that stakeholders can understand and apply the guidance as it exists. No further action is anticipated.
7/31/2015	62	36	Scope—card issuing bank’s contract with the cardholder and cardholder reward program performance obligations	The FASB concluded that stakeholders can understand and apply the guidance as it exists. No further action is anticipated.
	63		Satisfaction of performance obligations—evaluation of significant nonrefundable advance payments in Step 5	Staff discussed with submitter directly. No further action anticipated.
1/26/2015	64	22	Distinct performance obligation—shipping	Refer to submission No. 29.
	65		Satisfaction of performance obligations—alternative use—assessment of contractually or practically restricted	Staff discussed with submitter directly. No further action anticipated.
7/13/2015	66	43	Over time recognition—consideration of commodity characteristics or immediate consumption	The FASB concluded that stakeholders can understand and apply the guidance as it exists. No further action is anticipated.
11/9/2015	67	48	Determining the enforceable rights and obligations in a contract—optional goods, optional purchases, right to terminate contract and incur a penalty	The FASB concluded that stakeholders can understand and apply the guidance as it exists. No further action is anticipated.

## PERSPECTIVE AND ISSUES

---

### Subtopic

Topic ASC 610 was created by ASU 2014-09, *Revenue from Contracts with Customers*, to offer guidance for revenue generated by transactions outside the scope of ASC 606, that is, from transactions other than with customers in the ordinary course of business.

ASC 610, *Other Income*, contains three subtopics:

- ASC 610-10, *Overall*, which defines the scope of guidance on revenue recognized that is *not* in the scope of:
  - ASC 606, that is, it is not from a contract with a customer,
  - Other topics, such as ASC 840 or 842 on leases and ASC 944 on insurance, or
  - Other revenue or income guidance.
- ASC 610-20, *Gains and Losses from the Derecognition of Nonfinancial Assets*, applies to derecognition of nonfinancial assets with the scope of ASC 350 on intangibles and ASC 360 on property, plant, and equipment that is not in the scope of ASC 606. Nonfinancial assets are, for example, real estate, intangible assets, property, plant, and equipment.
- ASC 610-30, *Gains and Losses on Involuntary Conversions*, applies to events and transactions in which nonmonetary assets are involuntarily converted to monetary assets that are then reinvested to other nonmonetary assets.

### Scope and Scope Exceptions

**ASC 610-10, Overall.** ASC 610-10 applies to all entities. (ASC 610-10-15-2)

**ASC 610-20, Gains and Losses from the Derecognition of Financial Assets.**<sup>1</sup> ASC 610-20 applies to all entities and the gain or loss recognized upon:

- The derecognition of a nonfinancial asset in the scope of ASC 350 or 360, unless the entity sells or transfers the nonfinancial asset in a contract with a customer

---

<sup>1</sup> As this volume goes to press, the FASB is deliberating proposed changes to clarify: what constitutes an insubstance nonfinancial asset; Partial sales of nonfinancial assets; 610-20 scope exceptions; Acquisition (or disposals) of assets or businesses. Please consult [fasb.org](http://fasb.org) for the latest developments.

- The transfer of financial assets that are in substance nonfinancial assets within the scope of ASC 350, *Intangibles—Goodwill and Other*, or 360, *Property, Plant, and Equipment*.  
(ASC 610-20-15-2)

The term “in substance nonfinancial asset” is a concept that is not defined in the Codification. The Codification does give the example of a legal entity that holds only nonfinancial assets, for example, real estate.

The guidance does not apply to the derecognition of:

- A nonfinancial asset, including an in substance nonfinancial asset, in a contract with a customer
- A subsidiary or group of assets that constitutes a business or nonprofit activity, except for an in substance nonfinancial asset.

It also does not apply to:

- Real estate sales-leaseback transactions which are covered under ASC 360-20, 840-40, and 842 (the last upon implementation of ASU 2016-02),
- Conveyance of oil and gas mineral rights under ASC 932-360, and
- Transfer of nonfinancial assets to another entity in exchange for a noncontrolling ownership interest in that entity under ASC 845-10-30.  
(ASC 610-20-15-3)

**ASC 610-30, Gains and Losses on Involuntary Conversions.** ASC 610-30 applies to all entities and to events and transactions in which nonmonetary assets are involuntarily converted to monetary assets that are then reinvested in other nonmonetary assets.

## DEFINITIONS OF TERMS

---

Source: ASC 610, *Glossaries*. See Appendix A, *Definitions of Terms*, for terms relevant to this chapter: Business, Contract, Customer, Disposal Group, Nonprofit Activity, Performance Obligation, Revenue, and Transaction Price.

## CONCEPTS, RULES, AND EXAMPLES

---

**ASC 610-10, Overall.** This subtopic establishes the pervasive scope of ASC 610 and provides a glossary. It does not include measurement, presentation, or other guidance.

**ASC 610-20, Gains and Losses from the Derecognition of Financial Assets.** ASC 610-20 does not create presentation or measurement guidance, but rather requires entities to apply the principles in ASC 606, *Revenue from Contracts with Customers*, and points to that guidance. Thus, for calculation of the gain or loss upon derecognition of a nonfinancial asset, entities should look to the guidance in ASC 606. This Subtopic covers the following transactions if *not* in the entity’s ordinary course of business:

- Sales of intangible assets within the scope of ASC 350, and
- Property, plant, and equipment within the scope of ASC 360.

Such sales may occur with customers and if they are in the ordinary course of business, they fall under the guidance in ASC 606.

This Subtopic also requires entities to apply ASC 606 to the transfer of a subsidiary or a group of assets that is, in substance, a nonfinancial asset within the scope of ASC 350 or 360. However,

the transfer of a group of assets that is a business and does not also qualify as an in substance nonfinancial asset continues to be accounted for under existing guidance, such as ASC 810, *Consolidation*.

**ASC 610-30, Gains and Losses on Involuntary Conversions.** This subtopic applies to gains and losses on involuntary conversions. It provides guidance when nonmonetary assets are destroyed, stolen, condemned, or otherwise lost and the entity receives monetary assets such as insurance proceeds. The guidance makes clear that this type of transaction is a monetary transaction that results in a gain or loss.

**Recognition, measurement, and presentation.** The cost of nonmonetary assets acquired is measured by the consideration paid, not affected by previous transactions. (ASC 610-30-30-1) The gain or loss recognized is classified under the provisions in ASC 225-20. (ASC 610-30-45-1)

If a nonmonetary asset is destroyed or damaged in one period and the amount of monetary assets to be received will not be determinable until a later period, gain or loss is recognized per the guidance in ASC 450. (ASC 610-30-25-4)

# 40 ASC 705 COST OF SALES AND SERVICES

<b>Perspective and Issues</b>	<b>711</b>	<b>Concepts, Rules, and Examples</b>	<b>711</b>
Subtopics	711	ASC 705-20, <i>Accounting for</i>	
<b>Definitions of Terms</b>	<b>711</b>	<i>Consideration Received from a Vendor</i>	<b>711</b>

## PERSPECTIVE AND ISSUES

This Topic previously merely linked to guidance in other Codification Topics because the asset liability model generally results in the inclusion of guidance on costs of sales and services in other Topics. However, ASU 2014-09 created specific guidance related to consideration received from a vendor.<sup>1</sup>

### Subtopics

ASC 705 contains two subtopics:

- ASC 705-10, *Overall*, which merely links to guidance in other Codification topics on costs of sales and services.
- ASC 705-20, *Accounting for Consideration Received from a Vendor*.

## DEFINITIONS OF TERMS

See the Appendix A, *Definitions of Terms*, for terms related to this topic: Cash Consideration, Contract, Customer, Probable, Reseller, Revenue, Standalone Selling Price, and Vendor.

## CONCEPTS, RULES, AND EXAMPLES

### ASC 705-20, *Accounting for Consideration Received from a Vendor*

In some arrangements, an entity may receive consideration from a vendor. The consideration may be in the form of cash, credit, coupons, etc. This consideration should be accounted for by reducing the purchase price of goods or services acquired from the vendor, except if it is received:

- In exchange for a distinct good or service transferred to the vendor. In this case, the consideration should be accounted for in the same manner as other revenue from contracts with customers. The entity must look to the standalone selling price of the good or service transferred. If the amount of consideration received from the vendor is greater than the standalone selling price, the excess should be accounted for as a reduction of the purchase price of any goods purchased from the vendor. (ASC 705-20-25-02)

<sup>1</sup> For additional information on ASU 2014-09, including effective dates, see the chapter on ASC 606.

- As a reimbursement of costs incurred to sell the vendor's products. The consideration should represent a reduction of these costs and be specific, identifiable, and incremental. If the amount of the reimbursement is greater than the cost, the excess should be accounted for as a reduction of cost of sales. (ASC 705-20-25-03)
- As consideration for sales incentives offered to customers by manufacturers. These may be in the form of coupons or rebates offered to the end buyer by the manufacturer. (ASC 705-20-25-01)

In order to exercise the last exception, the sales incentives must meet *all* of the following criteria:

- The consumer can use the incentive at any reseller.
  - The vendor reimburses the reseller directly based on the face amount of the incentive.
  - The time of the reseller's reimbursement is determined only by the terms of the customer's incentive.
  - The reseller is an agent of the vendor in the incentive transaction between vendor and customer.
- (ASC 705-20-25-05)

If an entity meets these criteria, it should account for the transaction based on the guidance for revenues from contract with customers. If the criteria are not met, the incentive is a reduction of the purchase price of goods or services acquired from the vendor. (ASC 705-20-25-05)

The entity's ability to estimate the amount of future rebates or refunds may be hampered by the following:

- The rebate or refund relates to purchases that will occur over a relatively long period.
  - The entity has no historical experience with similar products.
  - The entity is not able to apply historical experience because circumstances have changed.
  - In the past, the entity had to make significant adjustments to expected cash rebates or refunds.
  - The product is susceptible to technological obsolescence, changes in demand, or other significant external factors.
- (ASC 705-20-25-11)

A change in estimate is recognized using cumulative catch-up adjustment.

# 41 ASC 710 COMPENSATION—GENERAL

<b>Perspective and Issues</b>	<b>713</b>	Vesting	714
Subtopics	713	Sick pay	714
Scope and Scope Exceptions	713	Other types of paid time off	715
<b>Definitions of Terms</b>	<b>714</b>	Bonus Payments	715
<b>Concepts, Rules, and Examples</b>	<b>714</b>	Deferred Compensation Contracts	715
Compensated Absences	714	Example of a deferred compensation contract	716
Compensated absences	714	Deferred Compensation—Rabbi Trusts	716

## PERSPECTIVE AND ISSUES

---

### Subtopics

ASC 710, *Compensation—General*, contains one subtopic:  
ASC 710-10, *Overall*, which is divided into two subsections:

- General, which provides guidance on compensated absences, deferred compensation, and lump-sum payments under union contract
- Deferred Compensation—Rabbi Trusts.

### Scope and Scope Exceptions

ASC 710 applies to all entities, but as listed in 710-10-15-5, it does *not* apply to the following transactions:

- Benefits paid to active employees other than compensated absences
- Benefits paid at retirement or provided through a pension or postretirement benefit plan including special or contractual termination benefits payable upon termination from a pension or other postretirement plan are covered by Subtopics 715-30 and 715-60
- Individual deferred compensation contracts that are addressed by Subtopics 715-30 and 715-60, if those contracts, taken together, are equivalent to a defined benefit pension plan or a defined benefit other postretirement benefit plan, respectively
- Special or contractual termination benefits that are not payable from a pension or other postretirement plan are covered by Topic 712
- Stock compensation plans that are addressed by Topic 718
- Other postemployment benefits (see Topic 712) that do not meet the conditions in paragraph 710-10-25-1 and are accounted for in accordance with Topic 450.

In addition, the Deferred Compensation—Rabbi Trusts Subsection does not address the accounting for stock appreciation rights even if they are funded through a rabbi trust. (ASC 710-10-15-8)

## DEFINITIONS OF TERMS

---

**Compensated Absences.** Employee absences, such as vacation, illness, and holidays, for which it is expected that employees will be paid.

**Full Eligibility Date.** The date at which an employee has rendered all of the service necessary to have earned the right to receive all of the benefits expected to be received by that employee (including any beneficiaries and dependents expected to receive benefits). Determination of the full eligibility date is affected by plan terms that provide incremental benefits expected to be received by or on behalf of an employee for additional years of service, unless those incremental benefits are trivial. Determination of the full eligibility date is not affected by plan terms that define when benefit payments commence or by an employee's current marital or dependency status.

**Rabbi Trusts.** Rabbi trusts are grantor trusts generally set up to fund compensation for a select group of management or highly paid executives. To qualify as a rabbi trust for income tax purposes, the terms of the trust agreement must explicitly state that the assets of the trust are available to satisfy the claims of general creditors in the event of bankruptcy of the employer.

**Sabbatical Leave.** A benefit in the form of a compensated absence whereby the employee is entitled to paid time off after working for an entity for a specified period of time. During the sabbatical, the individual continues to be a compensated employee and is not required to perform any duties for the entity.

## CONCEPTS, RULES, AND EXAMPLES

---

### Compensated Absences

**Compensated absences.** Refer to paid vacation, paid holidays, paid sick leave, and other paid leaves of absence. ASC 710 requires an employer to accrue a liability for employee's compensation for future absences if all of the following conditions are met:

1. The employee's right to receive compensation for future absences is attributable to employee services already rendered.
2. The right vests or accumulates.
3. Payment of the compensation is probable.
4. The amount of the payment can be reasonably estimated.

(ASC 710-10-25-1)

**Vesting.** If an employer is required to compensate an employee for unused vacation, holidays, or sick days even if employment is terminated, then the employee's right to this compensation is said to vest. Accrual of a liability for nonvesting rights depends on whether the unused rights either expire at the end of the year in which they are earned (often referred to as a "use it or lose it" policy) or accumulate and are carried forward to succeeding years. If the rights expire, a liability for future absences is not accrued at year-end because the benefits to be paid in subsequent years would not be attributable to employee services rendered in prior years. If all or a portion of the unused rights accumulate and increase the benefits otherwise available in subsequent years, a liability is accrued at year-end to the extent that it is probable that employees will be paid in subsequent years for the increased benefits attributable to the accumulated rights and the amount can be reasonably estimated. (ASC 710-10-25-2)

**Sick pay.** ASC 710-10-25-7 allows an exception for employee paid sick days that accumulate but do not vest. No accrued liability is required for sick days that only accumulate.

However, an employer is permitted to accrue these benefits if the four conditions are met. FASB believed that these amounts are rarely material and the low reliability of estimates of future illness coupled with the high cost of developing these estimates indicates that accrual is not necessary. The required accounting is to be determined by the employer's actual administration of sick pay benefits. If the employer routinely lets employees take time off when they are not ill and allows that time to be charged as sick pay, then an accrual is required. (ASC 710-10-25-6)

**Other types of paid time off.** Pay for other employee leaves of absence that represent time off for past services (jury duty, personal days) are considered compensation subject to accrual. Pay for employee leaves of absence that will provide future benefits and that are not attributable to past services rendered are not subject to accrual.

ASC 710-10-25-4 and 5 govern the accounting for sabbatical leaves or other similar benefit arrangements that require the completion of a minimum service period, and for which the benefit does not increase with additional years of service. Under these arrangements, the individual continues to be a compensated employee and is not required to perform duties for the entity during their absence. Assuming the four conditions set forth above are met, the compensation cost associated with a sabbatical or other similar arrangement must be ratably accrued over the pre-sabbatical periods of service.

### Bonus Payments

Bonus payments may require estimation since the amount of the bonus may be affected by the entity's net income for the year, by the income taxes currently payable, or by other factors. Additional estimation is necessary if bonus payments are accrued on a monthly basis for purposes of interim financial reporting but are determinable only annually by using a formula whose values are uncertain until shortly before payment.

### Deferred Compensation Contracts

If the aggregate deferred compensation contracts with individual employees are equivalent to a pension plan, the contracts are accounted for according to ASC 715-30. All other deferred compensation contracts are accounted for according to ASC 710.

ASC 715-60 states that the terms of the individual contract will govern the accrual of the employee's obligation for deferred compensation and the cost is to be attributed over the employee service period until full eligibility is attained.

Per ASC 710, the amount to be accrued is not to be less than the present value of the estimated payments to be made. This estimated amount is accrued in a systematic and rational manner. When elements of both current and future employment are present, only the portion attributable to the current services is accrued. (ASC 710-10-25-9) All requirements of the contract, such as continued employment for a specified period, availability for consulting services, and agreements not to compete after retirement, need to be met in order for the employee to receive future payments. Finally, the total amount is amortized to expense over the period from the date the contract is signed to the point when the employee is fully eligible to receive the deferred payments.

One benefit that may be found in a deferred compensation contract is for periodic payments to employees or their beneficiaries for life, with provisions for a minimum lump-sum settlement in the event of early death of one or all of the beneficiaries. The estimated amount to be accrued is based on the life expectancy of each individual concerned or on the estimated cost of an annuity contract, not on the minimum amount payable in the event of early death. (ASC 710-10-25-11)

### Example of a deferred compensation contract

The Clear Eye Corporation enters into a deferred compensation contract with its president, Dr. Smith. Under the terms of the agreement, Clear Eye will pay Dr. Smith an amount equal to twice his annual salary in a lump sum on the date of his mandatory retirement from Clear Eye, which is four years in the future. His salary is currently \$120,000. In addition, Clear Eye will pay Dr. Smith an annual pension of \$45,000 beginning on his mandatory retirement date, or a minimum \$200,000 lump-sum payment in the event of his early death. However, these payments are contingent upon his working the remaining four years prior to his mandatory retirement. The actuarial present value of a lifetime annuity of \$45,000 that begins at Dr. Smith's expected retirement date is \$392,000.

Clear Eye makes the following entry each year to record its annual expense under the lump-sum payment agreement, which is based on a lump-sum payment of \$240,000:

Deferred compensation expense	60,000
Deferred compensation liability	60,000

After two years, Dr. Smith receives a pay raise to \$140,000, which increases the amount of his guaranteed lump-sum payment to \$280,000. Since Clear Eye has thus far recognized a deferred compensation expense of \$120,000, it must now increase its annual expense recognition to \$80,000 in order to recognize additional expense totaling \$160,000 over the remaining two years prior to the payment date. It makes the following entry to record the actual cash payment to Dr. Smith:

Deferred compensation liability	280,000
Cash	280,000

Clear Eye must also record the \$392,000 present value of the lifetime annuity over the remaining four years of Dr. Smith's employment rather than the smaller \$200,000 early death payment, which it does with the following annual entry:

Deferred compensation expense	98,000
Deferred compensation liability	98,000

Note that all of the foregoing entries assume that Clear Eye Corporation chooses to record the full (i.e., nondiscounted) amount of the estimated future liability pro rata each year. It would also have been acceptable under ASC 710 to record the discounted present value amounts. In that case, while the charge for deferred compensation would have been lower in the earlier years, the accrued amounts would have to be further accreted to reflect interest on the obligation, so the overall charge over the four-year accrual for the lump-sum payment would have still equaled \$280,000. The charge for the lifetime annuity over the four years until the payments commence would have been less than the estimated \$392,000 obligation, since the amount recorded as of the inception of the annuity (i.e., retirement date) would be the present value of the future estimated payments.

### Deferred Compensation—Rabbi Trusts

The chart below gives an overview of the guidance for rabbi trusts.

Trust	Description (ASC 710-10-25-15)	Accounting (ASC 710-25-16 through 25-18)
Plan A	Does not permit diversification. Must be settled by delivery of a fixed number of shares of employer stock.	Classify stock held by trust in equity, similar to treasury stock.

Trust	Description (ASC 710-10-25-15)	Accounting (ASC 710-25-16 through 25-18)
Plan B	Does not permit diversification. May be settled by delivery of cash or shares of employer stock.	Classify employee stock in equity in a manner similar to treasury stock. Classify deferred compensation obligation as a liability.
Plan C	Permits diversification; however, the employee has not diversified.	
Plan D	Permits diversification, and the employee has diversified.	Assets accounted for in accordance with GAAP for the particular assets. The allocation is classified as a liability.

# 42 ASC 712 COMPENSATION— NONRETIREMENT POST- EMPLOYMENT BENEFITS

<b>Perspective and Issues</b>	<b>719</b>	<b>Definitions of Terms</b>	<b>719</b>
Subtopic	719	Concepts, Rules, and Examples	720
Overview	719		

## PERSPECTIVE AND ISSUES

---

### Subtopic

ASC 712, *Compensation—Nonretirement Postemployment Benefits*, contains one subtopic:

- ASC 712-10, *Overall*, which provides guidance and links to other topics containing guidance on nonretirement postemployment benefits.

### Overview

ASC 712 provides guidance for employers that provide benefits for former or inactive employees after the employees' termination. These benefits may include counseling, pay continuation, continuation of health care benefits, etc. The FASB sees these as benefits provided in exchange for service.

## DEFINITIONS OF TERMS

---

**Inactive Employees.** Employees who are not currently rendering service to the employer and who have not been terminated. They include those who have been laid off and those on disability leave, regardless of whether they are expected to return to active status.

**Nonretirement Postemployment Benefits.** All types of benefits, other than those provided through a pension or other postretirement plan (see Subtopics 715-30 and 715-60), provided to former or inactive employees, their beneficiaries, and covered dependents.

**Other Postemployment Benefits.** Benefits, other than special or contractual termination benefits, that are provided by an employer to former or inactive employees after employment but before retirement including benefits provided to beneficiaries and covered dependents.

**Special Termination Benefits.** Benefits that are offered for a short period of time in exchange for employees' voluntary termination of service.

**Termination Benefits.** Benefits provided by an employer to employees in connection with their termination of employment. They may be either special termination benefits offered only for a short period of time or contractual benefits required by the terms of a plan only if a specified event, such as a plant closing, occurs.

## CONCEPTS, RULES, AND EXAMPLES

---

ASC 712 applies the criteria set forth by ASC 710, *Compensation—General*, to accrue an obligation for postemployment benefits other than pensions if:

- Services have been performed by employees,
- Employees' rights accumulate or vest,
- Payment is probable, and
- The amount can be reasonably estimable.

If these benefits do not vest or accumulate, ASC 450, *Contingencies*, applies. If neither ASC 710 nor ASC 450 is applicable because the amount is not reasonably estimable, this fact must be disclosed.

## PERSPECTIVE AND ISSUES

### Subtopics

ASC 715, *Compensation-Retirement Benefits*, contains six subtopics:

- ASC 715-10, *Overall*, sets the objectives and the scope for ASC 715
- ASC 715-20, *Defined Benefit Plans—General*, provides guidance on the presentation and disclosure requirements for single-employer defined benefit pension and other postretirement plans
- ASC 715-30, *Defined Benefit Plans—Pension*, provides accounting guidance related to single-employer defined benefit pension plans
- ASC 715-60, *Defined Benefit Plans—Other Postretirement*, provides guidance on single-employer defined benefit plans other than postretirement benefit plans
- ASC 715-70, *Defined Contribution Plans*, provides guidance on defined contribution plans
- ASC 715-80, *Multiemployer Plans*, provides guidance on multiemployer plans as opposed to multiple employer plans.

### Scope and Scope Exceptions

ASC 715 applies to all entities and many types of compensation arrangements including any arrangement that is in substance a postretirement benefit plan (regardless of its form or means or timing of funding), written and unwritten plans, deferred compensation contracts with individuals which taken together are the equivalent of a plan, and health and other welfare benefits for employees on disability retirement.

ASC 715 does *not* apply to contracts with “selected employees under individual contracts with specific terms determined on an individual-by-individual basis.” It also does not apply to postemployment benefits paid after employment, but before retirement, like layoff benefits. (ASC 715-10-15-5)

The ASU also provides guidance on the accounting treatment of contributions to the plan and significant events requiring a remeasurement occurring during the interim period between the month-end measurement date and the fiscal year-end.

### Overview

This chapter focuses on accounting for postretirement benefits, including single-employer and multiemployer plans, defined benefit pension plans, defined contribution pension plans, and postretirement benefit plans other than pensions, such as those that help fund retiree costs of health care benefits. The accounting for such arrangements has historically been difficult, in large part because the accounting standard setters, influenced by preparers and issuers, have seen fit to include a variety of “smoothing” features that—whatever merits they may have—necessitated the use of various accruals and deferrals, and the reporting of certain elements within other comprehensive income. Thus, presentation of benefit plan expense and related items has involved lengthy and complex footnotes, and generally at least some “off the financial statement” measurements.

Although the Codification is generally based on an asset and liability model, the foundation content of ASC 715 is based on an expense recognition model. Expense recognition models focus on remeasurement. Therefore, much of the guidance in ASC 715 is found in the subsequent measurement sections. (ASC 715-10-05-3)

ASC 715-20, *Compensation—Retirement Benefits, Defined Benefits Plans, General*, provides disclosure and presentation guidance for deferred benefit pension and other retirement benefit plans. It:

- eliminates less useful information,
- requires some additional data deemed useful by analysts, and
- allows some aggregation of presentation.

Disclosure requirements for multiemployer and deferred contribution plans are included in those Subtopics.

ASC 715-30, *Compensation—Retirement Benefits—Defined Benefit Plans—Pension*, specifies the accrual basis of accounting for pension costs. It includes three primary characteristics:

1. Delayed recognition (changes are not recognized immediately but are subsequently recognized in a gradual and systematic way)
2. Reporting net cost (various expense and income items are aggregated and reported as one net amount)
3. Offsetting assets and liabilities (assets and liabilities are sometimes shown net).

Estimates and averages may be used as long as material differences do not result. Explicit assumptions and estimates of future events must be used for each specified variable included in pension costs and disclosed in the notes to the financial statements.

ASC 715-30 focuses directly on the terms of the plan to assist in the recognition of compensation cost over the service period of the employees. The full amount of under- and over-funding of pension plans is reported in the statement of financial position.

The principal emphasis of ASC 715-30 is the present value of the pension obligation and the fair value of plan assets. The main accounting issues revolve around the amount of expense to recognize on the income statement and the liability to be accrued on the statement of financial position. As noted above, because of the substantial use of smoothing, the periodic expense to be recognized under GAAP is a modified version of the actual economic consequence of the employer's commitment to pay future benefits. (Theoretically, over the full time horizon, which is measured in decades, all the expense should be recognized in results of operations.)

ASC 715-30 also establishes standards to be followed by sponsors of defined benefit pension plans when:

- obligations are settled,
- plans are curtailed, or
- benefits are terminated.

Although there are some major differences in terminology and measurement, other postretirement benefits (commonly referred to as OPEB) accounting (ASC 715-60) basically follows the fundamental framework established for defined benefit pension accounting and applies to all forms of postretirement benefits other than pensions. In most cases, the main focus is on postretirement health care benefits, since that is by far the most costly commitment made by employers to retirees. The guidance considers OPEB to be a form of deferred compensation and requires accrual accounting. The terms of the individual contract govern the accrual of the employer's obligation for deferred compensation and the cost is attributed to employee service periods until full eligibility to receive benefits is attained. The employer's obligation for OPEB is fully accrued when the employee attains full eligibility for all expected benefits.

Some or all of the underfunded postretirement benefit obligations must be displayed in the statement of financial position.

## **DEFINITIONS OF TERMS**

---

Source: ASC 715, *Glossaries*. See also Appendix, *Definition of Terms*, for additional terms related to this chapter: Cash Equivalents, Conduit Debt Security, Nonpublic Entity, Operating Segment, Publicly Traded Entity, and Related Parties.

**Accumulated Benefit Obligation.** The actuarial present value of benefits (whether vested or nonvested) attributed, generally by the pension benefit formula, to employee service rendered before a specified date and based on employee service and compensation (if applicable) before that date. The accumulated benefit obligation differs from the projected benefit obligation in that it includes no assumption about future compensation levels. For plans with flat-benefit or non-pay-related pension benefit formulas, the accumulated benefit obligation and the projected benefit obligation are the same.

**Accumulated Postretirement Benefit Obligation.** The actuarial present value as of a particular date of all future benefits attributed to an employee's service rendered to that date assuming the plan continues in effect and that all assumptions about future events are fulfilled. The accumulated postretirement benefit obligation generally reflects a ratable allocation of expected future benefits to employee service already rendered in the attribution period. Before an employee's full eligibility date, the accumulated postretirement benefit obligation as of a particular date for an employee is the portion of the expected postretirement benefit obligation attributed to that employee's service rendered to that date; on and after the full eligibility date, the accumulated and expected postretirement benefit obligations for an employee are the same.

**Active Plan Participant.** Any active employee who has rendered service during the credited service period and is expected to receive benefits, including benefits to or for any beneficiaries and covered dependents, under the postretirement benefit plan. See Plan Participant.

**Actual Return on Plan Assets (Component of Net Periodic Pension Cost).** For a funded plan, the actual return on plan assets is determined as the difference between the fair value of plan assets at the end of the period and the fair value at the beginning of the period, adjusted for contributions and payments of benefits during the period.

**Actual Return on Plan Assets (Component of Net Periodic Postretirement Benefit Cost).** The change in the fair value of the plan's assets for a period including the decrease due to expenses incurred during the period (such as income tax expense incurred by the fund, if applicable), adjusted for contributions and benefit payments during the period. For a funded plan, the actual return on plan assets shall be determined based on the fair value of plan assets (see paragraph 715-60-35-107) at the beginning and end of the period, adjusted for contributions and benefit payments. If the fund holding the plan assets is a taxable entity, the actual return on plan assets shall reflect the tax expense or benefit for the period determined in accordance with s (GAAP). Otherwise, no provision for taxes shall be included in the actual return on plan assets.

**Actuarial Funding Method.** Any of several techniques that actuaries use in determining the amounts and incidence of employer contributions to provide for pension benefits.

**Actuarial Gain or Loss.** See Gain or Loss.

**Actuarial Present Value.** The value, as of a specified date, of an amount or series of amounts payable or receivable thereafter, with each amount adjusted to reflect the time value of money (through discounts for interest) and the probability of payment (by means of decrements for events such as death, disability, withdrawal, or retirement) between the specified date and the expected date of payment.

**Assumed per Capita Claims Cost (by Age).** The annual per capita cost, for periods after the measurement date, of providing the postretirement health care benefits covered by the plan from the earliest age at which an individual could begin to receive benefits under the plan through the remainder of the individual's life or the covered period, if shorter. To determine the assumed per capita claims cost, the per capita claims cost by age based on historical claims costs is adjusted for

assumed health care cost trend rates. The resulting assumed per capita claims cost by age reflects expected future costs and is applied with the plan demographics to determine the amount and timing of future gross eligible charges. See Gross Eligible Charges and Per Capita Claims Cost (by Age).

**Attribution Period.** The period of an employee's service to which the expected postretirement benefit obligation for that employee is assigned. The beginning of the attribution period is the employee's date of hire unless the plan's benefit formula grants credit only for service from a later date, in which case the beginning of the attribution period is generally the beginning of that credited service period. The end of the attribution period is the full eligibility date. Within the attribution period, an equal amount of the expected postretirement benefit obligation is attributed to each year of service unless the plan's benefit formula attributes a disproportionate share of the expected postretirement benefit obligation to employees' early years of service. In that case, benefits are attributed in accordance with the plan's benefit formula. See Credited Service Period.

**Allocated Contract.** A contract with an insurance entity under which payments to the insurance entity are currently used to purchase immediate or deferred annuities for individual participants. See Annuity Contract.

**Amortization.** The process of reducing a recognized liability systematically by recognizing gains or by reducing a recognized asset systematically by recognizing losses. In accounting for pension benefits or other postretirement benefits, amortization also means the systematic recognition in net periodic pension cost or other postretirement benefit cost over several periods of amounts previously recognized in other comprehensive income, that is, gains or losses, prior service cost or credits, and any transition obligation or asset.

**Annuity Contract.** A contract in which an insurance entity unconditionally undertakes a legal obligation to provide specified pension benefits to specific individuals in return for a fixed consideration or premium. An annuity contract is irrevocable and involves the transfer of significant risk from the employer to the insurance entity. Annuity contracts are also called allocated contracts.

**Asset Group.** An asset group is the unit of accounting for a long-lived asset or assets to be held and used, which represents the lowest level for which identifiable cash flows are largely independent of the cash flows of other groups of assets and liabilities.

**Assumptions.** Estimates of the occurrence of future events affecting pension costs and other postretirement benefit costs (as applicable), such as turnover, retirement age, mortality, withdrawal, disablement, dependency status, per capita claims costs by age, health care cost trend rates, levels of Medicare and other health care providers' reimbursements, changes in compensation and national pension benefits, and discount rates to reflect the time value of money.

**Attribution.** The process of assigning pension or other postretirement benefits or costs to periods of employee service.

**Benefit Approach.** A group of basic approaches to attributing pension benefits or costs to periods of employee service.

Approaches in this group assign a distinct unit of benefit to each year of credited service. The actuarial present value of that unit of benefit is computed separately and determines the cost assigned to that year. The accumulated benefits approach, benefit-compensation approach, and benefit-years-of-service approach are benefit approaches.

**Benefit-Years-of-Service Approach.** One of three benefit approaches. Under this approach, an equal portion of the total estimated benefit is attributed to each year of service. The actuarial present value of the benefits is derived after the benefits are attributed to the periods.

**Captive Insurer.** An insurance entity that does business primarily with related entities.

**Career-Average-Pay Formula.** A benefit formula that bases benefits on the employee's compensation over the entire period of service with the employer. A career-average-pay plan is a plan with such a formula.

**Cash Balance Plan.** A plan with the following characteristics:

1. A defined principal-crediting rate as a percentage of salary
2. A defined, noncontingent interest-crediting rate that entitles participants to future interest credits at a stated, fixed rate until retirement.

A cash balance plan communicates to employees a pension benefit in the form of a current account balance that is a function of current and past salary-based principal credits and future interest credits thereon at a stated rate based on those principal credits.

In a cash balance plan, individual account balances are determined by reference to a hypothetical account rather than specific assets, and the benefit is dependent on the employer's promised interest-crediting rate, not the actual return on plan assets. The employer's financial obligation to the plan is not satisfied by making prescribed principal and interest credit contributions—whether in cash or as a hypothetical contribution to participants' accounts—for the period; rather, the employer must fund, over time, amounts that can accumulate to the actuarial present value of the benefit due at the time of distribution to each participant pursuant to the plan's terms. The employer's contributions to a cash balance plan trust and the earnings on the invested plan assets may be unrelated to the principal and interest credits to participants' hypothetical accounts.

A cash balance plan is a defined benefit plan.

**Collateral Split-Dollar Life Insurance.** A split-dollar life insurance arrangement in which the employee (or the employee's estate or a trust controlled by the employee, referred to as the employee) owns and controls the insurance policy.

**Component of an Entity.** A component of an entity comprises operations and cash flows that can be clearly distinguished, operationally and for financial reporting purposes, from the rest of the entity. A component of an entity may be a reportable segment or an operating segment, a reporting unit, a subsidiary, or an asset group.

**Contributory Plan.** A plan under which retirees or active employees contribute part of the cost. In some contributory plans, retirees or active employees wishing to be covered must contribute; in other contributory plans, participants' contributions result in increased benefits.

**Cost-Compensation Approach.** Net pension costs under this approach are attributed to periods so that they are a constant percentage of compensation for each period.

**Cost-Sharing (Provisions of the Plan).** The provisions of the postretirement benefit plan that describe how the costs of the covered benefits are to be shared between the employer and the plan participants. Cost-sharing provisions describe retired and active plan participants' contributions toward their postretirement health care benefits, deductibles, coinsurance, out-of-pocket limitations on participant costs, caps on employer costs, and so forth.

**Credited Service Period.** Employee service period for which benefits are earned pursuant to the terms of the plan. The beginning of the credited service period may be the date of hire or a later date. For example, a plan may provide benefits only for service rendered after a specified age. Service beyond the end of the credited service period does not earn any additional benefits under the plan. See Attribution Period.

**Curtailment (of a Postretirement Benefit Plan).** An event that significantly reduces the expected years of future service of active plan participants or eliminates the accrual of defined benefits for some or all of the future services of a significant number of active plan participants.

**Defined Benefit Plan.** A defined benefit plan provides participants with a determinable benefit based on a formula provided for in the plan.

1. Defined benefit health and welfare plans—Defined benefit health and welfare plans specify a determinable benefit, which may be in the form of a reimbursement to the covered plan participant or a direct payment to providers or third-party insurers for the cost of specified services. Such plans may also include benefits that are payable as a lump sum, such as death benefits. The level of benefits may be defined or limited based on factors such as age, years of service, and salary. Contributions may be determined by the plan's actuary or be based on premiums, actual claims paid, hours worked, or other factors determined by the plan sponsor. Even when a plan is funded pursuant to agreements that specify a fixed rate of employer contributions (for example, a collectively bargained multiemployer plan), such a plan may nevertheless be a defined benefit health and welfare plan if its substance is to provide a defined benefit.
2. Defined benefit pension plan—A pension plan that defines an amount of pension benefit to be provided, usually as a function of one or more factors such as age, years of service, or compensation. Any pension plan that is not a defined contribution pension plan is, for purposes of Subtopic 715-30, a defined benefit pension plan.
3. Defined benefit postretirement plan—A plan that defines postretirement benefits in terms of monetary amounts (for example, \$100,000 of life insurance) or benefit coverage to be provided (for example, up to \$200 per day for hospitalization, or 80% of the cost of specified surgical procedures). Any postretirement benefit plan that is not a defined contribution postretirement plan is, for purposes of Subtopic 715-60, a defined benefit postretirement plan. (Specified monetary amounts and benefit coverage are collectively referred to as benefits.)

**Defined Contribution Plan.** A plan that provides an individual account for each participant and provides benefits that are based on all of the following: amounts contributed to the participant's account by the employer or employee; investment experience; and any forfeitures allocated to the account, less any administrative expenses charged to the plan.

1. Defined contribution health and welfare plans—Defined contribution health and welfare plans maintain an individual account for each plan participant. They have terms that specify the means of determining the contributions to participants' accounts, rather than the amount of benefits the participants are to receive. The benefits a plan participant will receive are limited to the amount contributed to the participant's account, investment experience, expenses, and any forfeitures allocated to the participant's account. These plans also include flexible spending arrangements.
2. Defined contribution postretirement plan—A plan that provides postretirement benefits in return for services rendered, provides an individual account for each plan participant, and specifies how contributions to the individual's account are to be determined rather than specifies the amount of benefits the individual is to receive. Under a defined contribution postretirement plan, the benefits a plan participant will receive depend solely on the amount contributed to the plan participant's account, the returns earned on investments of those contributions, and the forfeitures of other plan participants' benefits that may be allocated to that plan participant's account.

**Dependency Status.** The status of a current or former employee having dependents (for example, a spouse or other relatives) who are expected to receive benefits under a postretirement benefit plan that provides dependent coverage.

**Discount Rate.** A rate or rates used to reflect the time value of money. Discount rates are used in determining the present value as of the measurement date of future cash flows currently expected to be required to satisfy the pension obligation or other postretirement benefit obligation. See Actuarial Present Value.

**Endorsement Split-Dollar Life Insurance.** A split-dollar life insurance arrangement in which the entity owns and controls the insurance policy. The employer enters into a separate agreement that splits the policy benefits between the employer and the employee. The employer owns the policy, controls all rights of ownership, and may terminate the insurance policy (and, in turn, the policy benefits promised to the employee). To effect the split-dollar arrangement, the employer endorses a portion of the death benefits to the employee (the employee designates a beneficiary for this portion of the death benefits). Upon the death of the employee, the employee's beneficiary typically receives the designated portion of the death benefits directly from the insurance entity and the employer receives the remainder of the death benefits.

**Expected Long-Term Rate of Return on Plan Assets.** An assumption about the rate of return on plan assets reflecting the average rate of earnings expected on existing plan assets and expected contributions to the plan during the period.

**Expected Postretirement Benefit Obligation.** The actuarial present value as of a particular date of the postretirement benefits expected to be paid by the employer's plan to or for each employee, the employee's beneficiaries, and any covered dependents pursuant to the terms of the plan.

**Explicit Approach to Assumptions.** An approach under which each significant assumption used reflects the best estimate of the plan's future experience solely with respect to that assumption. See Implicit Approach to Assumptions.

**Final-Pay Formula.** A benefit formula that bases benefits on the employee's compensation over a specified number of years near the end of the employee's service period or on the employee's highest compensation periods. For example, a plan might provide annual pension benefits equal to 1% of the employee's average salary for the last 5 years (or the highest consecutive 5 years) for each year of service. A final-pay plan is a plan with such a formula.

**Flat-Benefit Formula.** A benefit formula that bases benefits on a fixed amount per year of service, such as \$20 of monthly retirement income for each year of credited service. A flat-benefit plan is a plan with such a formula.

**Full Eligibility (for Benefits).** The status of an employee having reached the employee's full eligibility date. Full eligibility for benefits is achieved by meeting specified age, service, or age and service requirements of the postretirement benefit plan. See Full Eligibility Date.

**Full Eligibility Date.** The date at which an employee has rendered all of the service necessary to have earned the right to receive all of the benefits expected to be received by that employee (including any beneficiaries and dependents expected to receive benefits). Determination of the full eligibility date is affected by plan terms that provide incremental benefits expected to be received by or on behalf of an employee for additional years of service, unless those incremental benefits are trivial. Determination of the full eligibility date is not affected by plan terms that define when benefit payments commence or by an employee's current marital or dependency status.

**Fully Eligible Plan Participants.** Collectively, that group of former employees (including retirees) and active employees who have rendered service to or beyond their full eligibility date and who are expected to receive benefits under the plan, including benefits to their beneficiaries and covered dependents.

**Fund.** Used as a verb, to pay over to a funding agency (as to fund future pension benefits or to fund pension cost). Used as a noun, assets accumulated in the hands of a funding agency for the purpose of meeting pension benefits when they become due.

**Funding Method.** See Actuarial Funding Method.

**Funding Policy.** The program regarding the amounts and timing of contributions by the employers, plan participants, and any other sources (for example, state subsidies or federal grants) to provide the benefits a pension plan or other postretirement benefit plan specifies.

**Gain or Loss.** A change in the value of either the benefit obligation (projected benefit obligation for pension plans or accumulated postretirement benefit obligation for other postretirement benefit plans) or the plan assets resulting from experience different from that assumed or from a change in an actuarial assumption, or the consequence of a decision to temporarily deviate from the other postretirement benefit substantive plan. Gains or losses that are not recognized in net periodic pension cost or net periodic postretirement benefit cost when they arise are recognized in other comprehensive income. Those gains or losses are subsequently recognized as a component of net periodic pension cost or net periodic postretirement benefit cost based on the recognition and amortization provisions of Subtopic 715-30 or Subtopic 715-60.

**Gain or Loss (Component of Net Periodic Pension Cost).** The sum of the difference between the actual return on plan assets and the expected return on plan assets and the amortization of the net gain or loss recognized in accumulated other comprehensive income. The gain or loss component is the net effect of delayed recognition of gains and losses in determining net periodic pension cost (the net change in the gain or loss) in accumulated other comprehensive income except that it does not include changes in the projected benefit obligation occurring during the period and deferred for later recognition in net periodic pension cost.

**Gain or Loss (Component of Net Periodic Postretirement Benefit Cost).** The sum of all of the following:

- a. The difference between the actual return on plan assets and the expected return on plan assets
- b. Any gain or loss immediately recognized or the amortization of the net gain or loss recognized in accumulated other comprehensive income
- c. Any amount immediately recognized as a gain or loss pursuant to a decision to temporarily deviate from the substantive plan.

The gain or loss component is generally the net effect of delayed recognition in determining net periodic postretirement benefit cost of gains and losses (the net change in the net gain or loss recognized in accumulated other comprehensive income) except that it does not include changes in the accumulated postretirement benefit obligation occurring during the period and deferred for later recognition in net periodic postretirement benefit cost.

**Gross Eligible Charges.** The cost of providing the postretirement health care benefits covered by the plan to a plan participant, before adjusting for expected reimbursements from Medicare and other providers of health care benefits and for the effects of the cost-sharing provisions of the plan.

**Health Care Cost Trend Rate.** An assumption about the annual rates of change in the cost of health care benefits currently provided by the postretirement benefit plan, due to factors other than changes in the composition of the plan population by age and dependency status, for each year from the measurement date until the end of the period in which benefits are expected to be paid. The health care cost trend rates implicitly consider estimates of health care inflation, changes in health care utilization or delivery patterns, technological advances, and changes in the health

status of the plan participants. Differing types of services, such as hospital care and dental care, may have different trend rates.

**Implicit Approach to Assumptions.** An approach under which two or more assumptions do not individually represent the best estimate of the plan's future experience with respect to those assumptions. Instead, the aggregate effect of their combined use is presumed to be approximately the same as that produced by an explicit approach. See Explicit Approach to Assumptions.

**Incurred Claims Cost (by Age).** The cost of providing the postretirement health care benefits covered by the plan to a plan participant, after adjusting for reimbursements from Medicare and other providers of health care benefits and for deductibles, coinsurance provisions, and other specific claims costs borne by the retiree. See Net Incurred Claims Cost (By Age).

**Insurance Contract.** A contract in which an insurance entity unconditionally undertakes a legal obligation to provide specified benefits to specific individuals in return for a fixed consideration or premium. An insurance contract is irrevocable and involves the transfer of significant risk from the employer (or the plan) to the insurance entity.

**Interest Cost (Component of Net Periodic Pension Cost).** The amount recognized in a period determined as the increase in the projected benefit obligation due to the passage of time.

**Interest Cost (Component of Net Periodic Postretirement Benefit Cost).** The increase in the accumulated postretirement benefit obligation to recognize the effects of the passage of time.

**Loss.** See Gain or Loss.

**Market-Related Value of Plan Assets.** A balance used to calculate the expected return on plan assets. The market-related value of plan assets is either fair value or a calculated value that recognizes changes in fair value in a systematic and rational manner over not more than five years. Different ways of calculating market-related value may be used for different classes of assets (for example, an employer might use fair value for bonds and a five-year-moving-average value for equities), but the manner of determining market-related value is required to be applied consistently from year to year for each asset class. For a method to meet the criteria of being systematic and rational, it must reflect only the changes in the fair value of plan assets between various dates.

**Medicare Reimbursement Rates.** The health care cost reimbursements expected to be received by retirees through Medicare as mandated by currently enacted legislation. Medicare reimbursement rates vary by the type of benefits provided.

**Mortality.** The relative incidence of death in a given time or place.

**Mortality Rate.** The proportion of the number of deaths in a specified group to the number living at the beginning of the period in which the deaths occur. Actuaries use mortality tables, which show death rates for each age, in estimating the amount of pension benefits that will become payable.

**Net Incurred Claims Cost (by Age).** The employer's share of the cost of providing the postretirement health care benefits covered by the plan to a plan participant; incurred claims cost net of retiree contributions. See Incurred Claims Cost (by Age).

**Nonparticipating Annuity Contract.** An annuity contract that does not provide for the purchaser to participate in the investment performance or in other experience of the insurance entity.

**Nonparticipating Insurance Contract.** An insurance contract that does not provide for the purchaser to participate in the investment performance or in other experience of the insurance entity. See Insurance Contract.

**Participant.** Any employee or former employee, or any member or former member of a trade or other employee association, or the beneficiaries of those individuals, for whom there are pension plan benefits or other accumulated plan benefits.

**Participating Annuity Contract.** An annuity contract that provides for the purchaser to participate in the investment performance and possibly other experience (for example, mortality

experience) of the insurance entity. Under a participating annuity contract, the insurance entity ordinarily pays dividends to the purchaser.

**Participating Insurance Contract.** An insurance contract that provides for the purchaser to participate in the investment performance and possibly other experience (for example, morbidity experience) of the insurance entity. See Insurance Contract.

**Participation Right.** A purchaser's right under a participating contract to receive future dividends or retroactive rate credits from the insurance entity. See Participating Annuity Contract.

**Pay-Related Plan.** A plan that has a benefit formula that bases benefits or benefit coverage on compensation, such as a final-pay or career-average-pay plan.

**Pension Benefit Formula.** The basis for determining payments to which participants may be entitled under a pension plan. Pension benefit formulas usually refer to the employee's service or compensation or both. Sometimes referred to as a plan's benefit formula or benefit formula.

**Pension Benefits.** Periodic (usually monthly) payments made pursuant to the terms of the pension plan to a person who has retired from employment or to that person's beneficiary.

**Pension Fund.** The assets of a pension plan held by a funding agency.

**Per Capita Claims Cost (by Age).** The current cost of providing postretirement health care benefits for one year at each age from the youngest age to the oldest age at which plan participants are expected to receive benefits under the plan. See Assumed per Capita Claims Cost (By Age).

**Plan.** An arrangement that is mutually understood by an employer and its employees, whereby an employer undertakes to provide its employees with benefits after they retire in exchange for their services over a specified period of time, upon attaining a specified age while in service, or a combination of both. A plan may be written or it may be implied by a well-defined, although perhaps unwritten, practice of paying postretirement benefits or from oral representations made to current or former employees. See Substantive Plan.

**Plan Amendment.** A change in the existing terms of a plan or the initiation of a new plan. A plan amendment may increase benefits (a positive plan amendment), or reduce or eliminate benefits (a negative plan amendment), including those benefits attributed to years of service already rendered.

**Plan Assets.** Assets—usually stocks, bonds, and other investments—that have been segregated and restricted, usually in a trust, to provide for pension benefits. The amount of plan assets includes amounts contributed by the employer, and by employees for a contributory plan, and amounts earned from investing the contributions, less benefits paid. Plan assets ordinarily cannot be withdrawn by the employer except under certain circumstances when a plan has assets in excess of obligations and the employer has taken certain steps to satisfy existing obligations. Assets not segregated in a trust or otherwise effectively restricted so that they cannot be used by the employer for other purposes are not plan assets even though it may be intended that such assets be used to provide pensions. If a plan has liabilities other than for benefits, those nonbenefit obligations may be considered as reduction of plan assets. Amounts accrued by the employer but not yet paid to the plan are not plan assets. Securities of the employer held by the plan are includable in plan assets provided they are transferrable.

**Plan Assets Available for Benefits.** See Plan Assets.

**Plan Curtailment.** An event that significantly reduces the expected years of future service of present employees or eliminates for a significant number of employees the accrual of defined benefits for some or all of their future services.

**Plan Demographics.** The characteristics of the plan population including geographical distribution, age, sex, and marital status.

**Plan Participant.** Any employee or former employee who has rendered service in the credited service period and is expected to receive employer-provided benefits under the

postretirement benefit plan, including benefits to or for any beneficiaries and covered dependents. See Active Plan Participant.

**Plan Suspension.** An event in which the pension plan is frozen and no further benefits accrue. Future service may continue to be the basis for vesting of nonvested benefits existing at the date of suspension. The plan may still hold assets, pay benefits already accrued, and receive additional employer contributions for any unfunded benefits. Employees may or may not continue working for the employer.

**Plan Termination.** An event in which the pension plan or postretirement benefit plan ceases to exist and all benefits are settled by the purchase of insurance contracts (for example, annuities) or by other means. The plan may or may not be replaced by another plan. A plan termination with a replacement plan may or may not be in substance a plan termination for accounting purposes.

**Plan's Benefit Formula.** See Pension Benefit Formula.

**Postretirement Benefit Plan.** See Plan.

**Postretirement Benefits.** All forms of benefits, other than retirement income, provided by an employer to retirees. Those benefits may be defined in terms of specified benefits, such as health care, tuition assistance, or legal services, that are provided to retirees as the need for those benefits arises, such as certain health care benefits, or they may be defined in terms of monetary amounts that become payable on the occurrence of a specified event, such as life insurance benefits.

**Postretirement Health Care Benefits.** A form of postretirement benefit provided by an employer to retirees for defined health care services or coverage of defined health care costs, such as hospital and medical coverage, dental benefits, and eye care.

**Prior Service Cost.** The cost of retroactive benefits granted in a plan amendment. Retroactive benefits are benefits granted in a plan amendment (or initiation) that are attributed by the benefit formula to employee services rendered in periods before the amendment.

**Probable.** The future event or events are likely to occur.

**Projected Benefit Obligation.** The actuarial present value as of a date of all benefits attributed by the pension benefit formula to employee service rendered before that date. The projected benefit obligation is measured using assumptions as to future compensation levels if the pension benefit formula is based on those future compensation levels (pay-related, final-pay, final-average-pay, or career-average-pay plans).

**Reporting Unit.** The level of reporting at which goodwill is tested for impairment. A reporting unit is an operating segment or one level below an operating segment (also known as a component).

**Retirees.** Collectively, that group of plan participants that includes retired employees, their beneficiaries, and covered dependents.

**Service.** Employment taken into consideration under a pension plan. Years of employment before the inception of a plan constitute an employee's past service; years thereafter are classified in relation to the particular actuarial valuation being made or discussed. Years of employment (including past service) before the date of a particular valuation constitute prior service; years of employment following the date of the valuation constitute future service; a year of employment adjacent to the date of valuation, or in which such date falls, constitutes current service.

**Service Cost (Component of Net Periodic Pension Cost).** A component of net periodic pension cost recognized in a period determined as the actuarial present value of benefits attributed by the pension benefit formula to services rendered by employees during that period.

The service cost component is a portion of the projected benefit obligation and is unaffected by the funded status of the plan.

**Service Cost (Component of Net Periodic Postretirement Benefit Cost).** The actuarial present value of benefits attributed to services rendered by employees during the period (the portion

of the expected postretirement benefit obligation attributed to service in the period). The service cost component is the same for an unfunded plan, a plan with minimal funding, and a well-funded plan.

**Settlement of a Pension or Postretirement Benefit Obligation.** A transaction that is an irrevocable action, relieves the employer (or the plan) of primary responsibility for a pension or postretirement benefit obligation, and eliminates significant risks related to the obligation and the assets used to effect the settlement.

**Single-Employer Plan.** A pension plan or other postretirement benefit plan that is maintained by one employer. The term also may be used to describe a plan that is maintained by related parties such as a parent and its subsidiaries.

**Sponsor.** In the case of a pension plan established or maintained by a single employer, the employer; in the case of a plan established or maintained by an employee entity, the employee entity; in the case of a plan established or maintained jointly by two or more employers or by one or more employers and one or more employee entities, the association, committee, joint board of trustees, or other group of representatives of the parties that have established or that maintain the pension plan.

**Substantive Plan.** The terms of the postretirement benefit plan as understood by an employer that provides postretirement benefits and the employees who render services in exchange for those benefits. The substantive plan is the basis for the accounting for that exchange transaction. In some situations an employer's cost-sharing policy, as evidenced by past practice or by communication of intended changes to a plan's cost-sharing provisions, or a past practice of regular increases in certain monetary benefits, may indicate that the substantive plan differs from the extant written plan.

**Termination Benefits.** Benefits provided by an employer to employees in connection with their termination of employment. They may be either special termination benefits offered only for a short period of time or contractual benefits required by the terms of a plan only if a specified event, such as a plant closing, occurs.

**Termination Indemnities.** Arrangements, usually or more frequently encountered outside the United States, that are also referred to as termination allowances or severance indemnities. Termination indemnities are amounts payable to eligible employees upon termination of employment. Eligibility may be determined by law, by local custom, by the employer's policy, or by contract with the employer. Plans may or may not be in writing. Termination indemnities are normally, but not exclusively, associated with preretirement severance of employment. They are usually payable as a lump sum, or occasionally in a few payments over a short period of time.

**Transition Asset.** The amount, as of the date Subtopic 715-60 was initially applied, of the fair value of plan assets plus any recognized accrued postretirement benefit cost or less any recognized prepaid postretirement benefit cost in excess of the accumulated postretirement benefit obligation.

**Transition Obligation.** The amount, as of the date Subtopic 715-60 was initially applied, of the accumulated postretirement benefit obligation in excess of the fair value of plan assets plus any recognized accrued postretirement benefit cost or less any recognized prepaid postretirement benefit cost.

**Turnover.** Termination of employment for a reason other than death or retirement.

**Unallocated Contract.** A contract with an insurance entity under which payments to the insurance entity are accumulated in an unallocated fund (not allocated to specific plan participants) to be used either directly or through the purchase of annuities, to meet benefit payments when employees retire. Funds held by the insurance entity under an unallocated contract may be withdrawn and otherwise invested.

**Unfunded Accumulated Postretirement Benefit Obligation.** The accumulated postretirement benefit obligation in excess of the fair value of plan assets.

**Unfunded Projected Benefit Obligation.** The excess of the projected benefit obligation over plan assets.

**Vested Benefit Obligation.** The actuarial present value of vested benefits.

**Vested Benefits.** Benefits for which the employee's right to receive a present or future pension benefit is no longer contingent on remaining in the service of the employer. (Other conditions, such as inadequacy of the pension fund, may prevent the employee from receiving the vested benefit.) Under graded vesting, the initial vested right may be to receive in the future a stated percentage of a pension based on the number of years of accumulated credited service; thereafter, the percentage may increase with the number of years of service or of age until the right to receive the entire benefit has vested.

## CONCEPTS, RULES, AND EXAMPLES

---

The principal objective of ASC 715-30 is to measure the compensation cost associated with employees' benefits and to recognize that cost over the employees' service period. This Subtopic is concerned only with the accounting aspects of pension costs. The funding (assets set aside to meet future payment obligations) of the benefits is not covered and is considered to be a financial management matter.

When an entity provides benefits that can be estimated in advance to its retired employees and their beneficiaries, the arrangement is a pension plan. The accounting for most types of retirement plans is covered by ASC 715-30. These plans include unfunded, insured, trust fund, defined contribution and defined benefit plans, and deferred compensation contracts, if equivalent. Independent deferred profit sharing plans and pension payments to selected employees on a case-by-case basis are not considered pension plans. The typical plan is written and the amount of benefits can be determined by reference to the associated documents. The plan and its provisions can also be implied, however, from unwritten but established past practices.

The establishment of a pension plan represents a long-term commitment to employees. Although some companies manage their own plans, this commitment usually takes the form of contributions made to an independent trustee. These contributions are used by the trustee to invest in plan assets of various types (treasury bonds and bills, certificates of deposit, annuities, marketable securities, corporate bonds, etc.). The plan assets are expected to generate a return generally in the form of interest, dividends, and/or appreciation in asset value. The return on the plan assets (and occasionally the proceeds from their liquidation) provides the trustee with cash to pay the benefits to which the employees are entitled. These benefits, in turn, are defined by the plan's benefit formula. The benefit formula incorporates many factors including employee compensation, employee service longevity, employee age, and the like, and is considered to provide the best indication of pension obligations and costs. It is used as the basis for determining the pension cost recognized in the financial statements each fiscal year.

### Net Periodic Pension Cost

A pension plan creates long-term obligations. It is assumed that a company will continue to provide retirement benefits well into the future. The accounting for the plan's costs is reflected in the financial statements, and these amounts are not discretionary. All pension costs incurred are recognized as expenses but, under the smoothing approach taken by ASC 715-30 and ASC 715-60, recognition of some elements of pension and postretirement benefit expense may be partially deferred until later periods.

Because pension obligations are long-term liabilities, some current period effects should not be fully recognized in earnings as they occurred. Short-term fluctuations in interest rates, market

prices of plan investments, and other factors could, if recognized as incurred, cause material swings in the net periodic pension cost and net income to be reported in the financial statements of the employer/sponsor. Such fluctuations would quite likely be offset by reversals in subsequent periods—for example, market declines in one period would be followed by market upward movements in later periods.

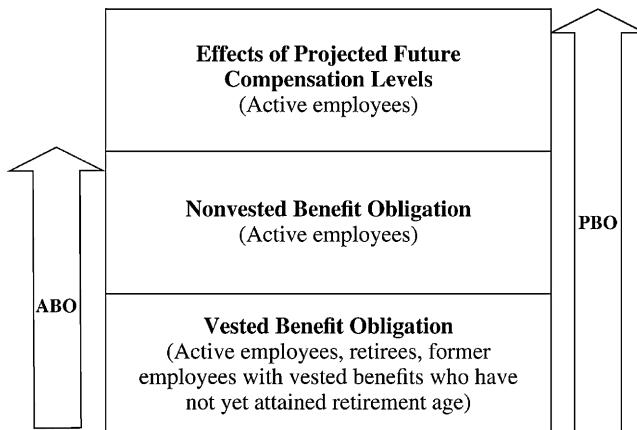

This possibility has traditionally been cited to justify the use of smoothing techniques in order to recognize certain of these changes in a systematic and rational manner (e.g., by amortization) instead of recognizing them immediately.

The benefits earned and costs recognized over the employees' service periods are computed by reference to the pension plan's benefit formula. Net periodic pension cost consists of the sum of the following five components:

1. Service cost
2. Interest cost on projected benefit obligation
3. Actual return on plan assets
4. Gain or loss
5. Amortization of unrecognized prior service cost.

Pension plans may or may not be sensitive to future salary progression. The obligation, in present value terms, for future pension payments including the effects of future compensation adjustments is referred to as the *projected* benefit obligation. The obligation computed without regard to salary progression is called the *accumulated* benefit obligation. For those plans that do not depend on salary progression, the accumulated and the projected benefit obligations are the same.

### Exhibit

To calculate the net periodic pension cost, the accumulated benefit obligation (ABO) and the projected benefit obligation (PBO) must both be computed. Both of these obligation amounts are actuarially determined using the actuarial present value of benefits earned that are attributable to services rendered by the employee to the date of the computation. Under the provisions of most pension plans, PBO provides a more relevant measure of the estimated cost of the benefits to be paid upon retirement. This is because the benefit formula set forth in the plan normally results in increases in future pension benefits based on increases in the employee's compensation.

Pay-related, final-pay, or career-average-pay plans are examples of plans where future payments are based on future compensation levels. These plans measure benefits based on service

performed to date but include assumptions as to future compensation increases, staff turnover rates, etc. In non-pay-related or flat-benefit plans, both obligations (ABO and PBO) are the same.

The following discussion employs a component-by-component analysis, providing a series of examples that cumulatively build to the comprehensive summary of net periodic pension costs and the sample pension disclosures that follow. Key amounts are cross-referenced between examples using parenthesized lowercase letters [(a), (b), etc.]. In accordance with accounting convention, obligations and increases thereto are presented in parentheses.

### Example

<u>January 1, 20X3</u>	
Accumulated benefit obligation	\$ (1,500)
Progression of salary and wages	(400)
Projected benefit obligation	<u>\$ (1900)</u>

The expected progression of salary and wages is added to the accumulated benefit obligation to arrive at the projected benefit obligation. These amounts are provided by the actuary in a pension plan report.

Computation of the amounts to be presented on the statement of financial position requires the determination of plan assets. Plan assets include contributions made by the employer that sponsors the pension plan (sponsor) plus the net earnings on the plan's investments (dividends, interest, and asset appreciation, less asset depreciation), less benefits paid to retired participants.

### Example

Plan assets, January 1, 20X3	\$1,376
Investment earnings during 20X3	158
Sponsor's contributions during 20X3	145
Benefits paid to retired participants	(160)
Plan assets, December 31, 20X3	<u>\$1,519</u>

**Service costs.** This component of net periodic pension cost is the actuarial present value of benefits attributed to the current period. The plan's benefit formula is the key to attributing benefits to employee service periods. In most cases, this attribution is straightforward.

If the benefit formula is ambiguous, the accounting for pension service costs must be based on the substantive plan. In some cases, this means that if an employer has committed to make future amendments to provide benefits greater than those written in the plan, that commitment is the basis for the accounting. The relevant facts regarding that implicit commitment should be disclosed.

**Vesting.** Employers use pensions as a compensation tool to aid in the recruitment and long-term retention of employees. To provide incentives for employees to continue their employment with the company over time, plan participants' rights to receive present or future pension benefits are often conditioned on continued employment with the employer/plan sponsor for a specified period. As the conditions are satisfied, the employee is said to "vest" in that portion of the future benefits that become unconditional.

Vesting schedules can result in a disproportionate share of plan benefits being attributed to later years of employment. In this situation, instead of applying the benefit formula, proportions or ratios are used to attribute projected benefits to years of service in a manner that more equitably reflects the substance of timing of earning of the employee benefits. Normally, the actuary

accomplishes this by attributing plan benefits to completed years of service by multiplying total benefits by the following ratio:

$$\frac{\text{Number of years of service completed by the employee}}{\text{Number of years of service required to be completed for full vesting}}$$

Certain types of benefits are not includable in vested benefits (e.g., death or disability benefit) and, thus, require a different allocation formula to attribute them to years of service. If the plan's benefit formula does not specify how to relate the benefit to years of service, the following formula is used by the actuary to attribute the benefits to years of service:

$$\frac{\text{Number of completed years of service}}{\text{Total projected years of service}}$$

**Actuarial assumptions.** ASC 715-30 actuarial assumptions must:

- reflect plan continuation,
- be consistent as to future economic expectations, and
- be the best estimate in regard to each individual assumption.

It is not acceptable to determine that the aggregate assumptions are reasonable if any of the individual assumptions are unreasonable.

**Discount rate.** The discount rate used in the calculation of service costs is the rate at which benefits could be settled. Examples include:

- those rates in current annuity contracts,
- those published by the Pension Benefit Guaranty Corporation (PBGC), and
- those that reflect returns on high-quality, fixed-income investments.

**Future compensation.** Future compensation is considered in the calculation of the service cost component to the extent specified by the benefit formula. To the degree considered in the benefit formula, future compensation includes changes due to:

- advancement,
- longevity,
- inflation, etc.

Indirect effects, such as predictable bonuses based on compensation levels and automatic increases specified by the plan, also need to be considered.

The effect of retroactive amendments is included in the calculation when the employer has contractually agreed to them. Service costs attributed to the period increase both the ABO and PBO, since they result in additional benefits to be payable in the future.

### Example

	<u>January 1, 20X3</u>	<u>20X3 Service cost</u>
Accumulated benefit obligation	\$ (1,500)	\$ (90)
Progression of salary and wages	(400)	(24)
Projected benefit obligation	<u>\$ (1,900)</u>	<u>\$ (114) (a)*</u>

\* Component of net periodic pension cost.

The current period service cost component is found in the actuarial report.

**Interest on PBO.** The PBO is a discounted amount. It represents the discounted actuarial present value, at the date of the valuation, of all benefits attributed under the plan's formula to employee service rendered prior to that date. Each year, when the actuary calculates the end-of-year PBO, it is one year closer to the year in which the benefits attributed in prior years will be paid to participants. Consequently, the present value of those previously attributed benefits will have increased to take into account the time value of money. This annual increase is computed by multiplying the assumed settlement discount rate times the PBO at the beginning of the year. It increases net periodic pension cost and PBO.

Since this "interest" cost is accounted for as part of pension cost, it is not treated as interest for the purposes of computing capitalized interest under ASC 835-20.

#### Example

	<u>January 1, 20X3</u>	<u>20X3</u>	<u>20X3</u>
	<u>Service cost</u>	<u>Interest cost</u>	
Accumulated benefit obligation	\$(1,500)	\$ (90)	\$(120)
Progression of salary and wages	(400)	(24)	(32)
Projected benefit obligation	\$(1,900)	\$(114) (a)*	\$(152) (b)*

\* Component of net periodic pension cost.

The interest cost component is calculated by multiplying the start of the year obligation balances by an assumed 8% settlement rate. This amount is found in the actuarial report.

**Benefits paid.** Benefits paid to retirees are deducted from the above to arrive at the end-of-the-year statement of financial position amounts of the accumulated benefit obligation and the projected benefit obligation.

#### Example

	<u>January 1,</u>	<u>20X3</u>	<u>20X3</u>	<u>20X3</u>	<u>December 31,</u>
	<u>20X3</u>	<u>cost</u>	<u>cost</u>	<u>paid</u>	<u>20X3</u>
Accumulated benefit obligation	\$(1,500)	\$ (90)	\$(120)	\$160	\$(1,550)
Progression of salary and wages	(400)	(24)	(32)	—	(456)
Projected benefit obligation	\$(1,900)	\$(114) (a)	\$(152) (b)	\$160	\$(2,006)

Benefits of \$160 were paid to retirees during the current year. This amount is found in the report of the pension plan trustee.

**Actual return on plan assets.** This component is the difference between the fair value of the plan assets at the end of the period and the fair value of the plan assets at the beginning of the period adjusted for contributions and payments during the period. Another way to express the result is that it is the net (realized and unrealized) appreciation and depreciation of plan assets plus earnings from the plan assets for the period.

#### Example

	<u>January 1,</u>	<u>20X3</u>	<u>20X3</u>	<u>20X3</u>	<u>December 31,</u>
	<u>20X3</u>	<u>Actual return</u>	<u>Sponsor</u>	<u>Benefits</u>	<u>20X3</u>
Plan assets	\$1,376	\$158 (c)*	\$145	\$(160)	\$1,519

\* Component of net periodic pension cost.

The actual return on plan assets of \$158, cash deposited with the trustee of \$145, and benefits paid (\$160) are amounts found in the report of the pension plan trustee. These items increase the plan assets to \$1,519 at the end of the year. The actual return on plan assets is adjusted, however, to the expected long-term rate (9% assumed) of return on plan assets ( $\$1,376 \times 9\% = \$124$ ). The difference ( $\$158 - \$124 = \$34$ ) is a return on asset adjustment and is deferred as a gain (loss). The return on asset adjustment is a component of net periodic pension cost and is discussed in detail in the following section.

Measurements of defined benefit plan assets and obligations must (with limited exceptions) be as of the date of the statement of financial position of the respective reporting entity.

**Gain or loss.** Gains (losses) result from:

1. changes in plan assumptions,
2. changes in the amount of plan assets, and
3. changes in the amount of the projected benefit obligation.

As discussed previously, even though these gains or losses are economic events that impact the sponsor's obligations under the plan, immediately upon their occurrence, their instantaneous recognition in the sponsor's results of operations is not permitted by ASC 715-30. Instead, to provide "smoothing" of the effects of what are viewed as short-term fluctuations, the net gain (loss) is amortized if it meets the criteria specified below.

Actuarial gains and losses must be recognized in other comprehensive income as they occur, thus affecting statement of financial position display in full, even as the expense recognition is deferred and amortized. If actuarial gains are realized, this will give rise to a pension- or other benefit plan-related asset (or reduction in a pension- or benefit plan-related liability). If actuarial losses are incurred, these will give rise to a benefit plan liability, or reduction in an extant plan asset.

**Actuarial gains and losses.** Since actuarial cost methods are based on numerous assumptions (employee compensation, mortality, turnover, earnings of the pension plan, etc.), it is not unusual for one or more of these assumptions to be invalidated by changes over time. Adjustments will invariably be necessary to bring prior estimates back into line with actual events. These adjustments are known as actuarial gains (losses). The accounting issue regarding the recognition of actuarial adjustments is their timing. All pension costs must eventually be recognized as expense. Actuarial gains (losses) are not considered prior period adjustments since they result from a refinement of estimates arising from obtaining subsequent information. These are considered changes in an estimate, and are to be recognized in current and future periods (i.e., prospectively only).

**Plan asset gains and losses.** Plan asset gains (losses) result from both realized and unrealized amounts. They represent periodic differences between the actual return on assets and the expected return. The expected return is generated by multiplying the expected long-term rate of return by the market-related value of plan assets. Market-related value is a concept unique to pension accounting. It results from the previously discussed actuarial smoothing techniques under ASC 715-30.

Market-related value consists of two components. The first component is the fair value of the plan assets. The second component is an adjustment for the unrecognized portion of previous years' market gains or losses that are being amortized over a period of five years or less using a consistently applied method. Consistently applied means from year to year for each asset class (i.e., bonds, equities), since different classes of assets may have their market-related value calculated in a different manner (i.e., fair value in one case, moving average in another case). Thus,

the market-related value may be fair value, but it also may be other than fair value if all or a portion of it results from calculation.

Plan asset gains (losses) include both (1) changes in the market-related value of assets (regardless of definition) from one period to another and (2) any changes that are not yet reflected in market-related value (i.e., the difference between the actual fair values of assets and the calculated market-related values). Only the former changes are recognized and amortized. The latter changes are recognized over time through the calculated market-related values.

**Projected benefit obligation or loss.** Differences between the actual amount of PBO from the assumed amount will also result in gain (loss).

**10% corridor.** Irrespective of the income smoothing techniques used, if this unrecognized net gain (loss) exceeds a “corridor” of 10% of the greater of the beginning balances of the market-related value of plan assets or the projected benefit obligation, a minimum amount of amortization is required. The excess over 10% is divided by the average remaining service period of active employees and included as a component of net pension costs. Average remaining life expectancies of inactive employees may be used if that is a better measure due to the demographics of the plan participants. ASC 715-30 sets forth a methodology for the deferred recognition of the income statement effects of actuarial changes pertaining to plan assets and obligations.

**Net pension costs—gain or loss.** Net pension costs include only the expected return on plan assets. Any difference between actual and expected returns is deferred through the gain (loss) component of net pension cost. If actual return is greater than expected return, net pension cost is increased to adjust the actual return to the lower expected return. If expected return is greater than actual return, the adjustment results in a decrease to net pension cost to adjust the actual return to the higher expected return. If the unrecognized net gain (loss) is large enough, it is amortized. Conceptually, the expected return represents the best estimate of long-term performance of the plan’s investments. In any given year, however, an unusual short-term result may occur given the volatility of financial markets.

**Expected long-term rate of return.** The expected long-term rate of return used to calculate the expected return on plan assets is the average rate of return expected to be earned on invested funds to provide for pension benefits included in the PBO. Present rates of return and expected future reinvestment rates of return are considered in arriving at the rate to be used.

**Summary.** To summarize, net periodic pension cost includes a gain (loss) component consisting of both of the following, if applicable:

1. As a minimum, the portion of the unrecognized net gain (loss) from previous periods that exceeds the greater of 10% of the beginning balances of the market-related value of plan assets or the PBO, usually amortized over the average remaining service period of active employees expected to receive benefits.
2. The difference between the expected return and the actual return on plan assets.

An accelerated method of amortization of unrecognized net gain (loss) is acceptable if it is applied consistently to both gains and losses, and if the method is disclosed in the notes to the financial statements. In all cases, at least the minimum amount discussed above must be amortized.

**Example**

	<i>January 1, 20X3</i>	<i>20X3 Return on asset adjustment</i>	<i>20X3 Amortization</i>	<i>December 31, 20X3</i>
Unrecognized actuarial gain (loss)	\$(210)	\$34 (d)*	\$2 (d)*	\$(174)

\* Components of net periodic pension cost.

The return on asset adjustment of \$34 is the difference between the actual return of \$158 and the expected return of \$124 on plan assets. The actuarial loss at the start of the year (\$210 assumed) is amortized if it exceeds a “corridor” of the larger of 10% of the projected benefit obligation at the beginning of the period ( $\$1,900 \times 10\% = \$190$ ) or 10% of the fair value of plan assets ( $\$1,376 \times 10\% = \$138$ ). In this example, \$20 ( $\$210 - \$190$ ) is amortized by dividing the years of average remaining service (twelve years assumed), with a result rounded to \$2. The straight-line method is used, and it is assumed that market-related value is the same as fair value.

**Amortization of unrecognized prior service cost.** Prior service costs are incurred when the sponsor adopts plan amendments that increase plan benefits attributable to services rendered by plan participants in the past. These costs are accounted for as a change in estimate. Prior service costs are measured at the amendment date by the increase in the projected benefit obligation. The remaining service period of every active employee expected to receive benefits is estimated, and an equal amount of prior service cost is assigned to each future period. This is called the years-of-service amortization method.

**Example of the years-of-service amortization method**

The ABC Company amends its pension plan, granting \$40,000 of prior service costs to its 100 employees. The employees are expected to retire in accordance with the following schedule:

<u>Group</u>	<u>Number of employees</u>	<u>Expected year of retirement</u>
A	10	20X4
B	15	20X5
C	20	20X6
D	20	20X7
E	35	20X8
	100	

The calculation of the service years to be recognized from this group is as follows:

<u>Year</u>	<u>Service years</u>					<u>Total</u>
	<u>A</u>	<u>B</u>	<u>C</u>	<u>D</u>	<u>E</u>	
20X4	10	15	20	20	35	100
20X5		15	20	20	35	90
20X6			20	20	35	75
20X7				20	35	55
20X8					35	35
	10	30	60	80	175	355

Consequently, there are 355 service years over which the \$40,000 prior service cost can be spread, which equates to \$112.68 per service year. The following table shows the annual amortization expense based on the standard charge of \$112.68 per service year.

<u>Year</u>	<u>Total service years</u>	$\times$	<u>Cost per service year</u>	=	<u>Annual amortization</u>
20X3	100		\$112.68		\$11,268
20X4	90		112.68		10,141
20X5	75		112.68		8,451
20X6	55		112.68		6,197
20X7	35		112.68		3,943
	355				<u>\$40,000</u>

The example above illustrates the years-of-service amortization method. Consistent use of an accelerated amortization method is also acceptable and must be disclosed if used.

If most of the plan's participants are inactive, remaining life expectancy is used as a basis for amortization instead of estimated remaining service period. If economic benefits will be realized by plan participants over a shorter period than the remaining service period, amortization of costs is accelerated to recognize the costs in the periods that the participants benefit. If an amendment *reduces* the projected benefit obligation, unrecognized prior service costs are reduced to the extent that they exist and any excess is amortized in the manner described above for benefit increases.

#### Example—Amortization of unrecognized service cost

	<u>January 1, 20X3</u>	<u>20X3 Amortization</u>	<u>December 31, 20X3</u>
Unrecognized prior service cost	<u>\$320</u>	<u>\$(27) (e)*</u>	<u>\$293</u>

\* Component of net periodic pension cost.

Unrecognized prior service cost (\$320) is amortized over the years of average remaining service (twelve years assumed) at the amendment date with a result rounded to \$27. The straight-line method was used. These amounts are found in the actuarial report.

While the vast preponderance of changes to plans increase benefits with credit for prior service, there may be plan amendments that reduce benefits, also with reference to past service. In such instances, under ASC 715, the decreases to the projected benefit obligation are given immediate recognition. The reduction in benefits is to be recognized as a credit (referred to as a prior service credit) to other comprehensive income, which is to be used to offset any remaining prior service cost included in accumulated other comprehensive income (i.e., from previous plan amendments increasing benefits). Any remaining prior service credit is to be amortized as a component of net periodic pension cost on the same basis as the cost of a benefit increase.

Thus, under requirements established by ASC 715, changes in prior service costs (and in certain other components affecting pension and other postretirement benefit costs) arising in a given reporting period, but not included in current period pension or other benefit costs (e.g., due to the above-described amortization requirements) are fully reported in other comprehensive income.

### Summary of net periodic pension cost

The components that were identified in the above examples are summed as follows to determine the amount defined as net periodic pension cost:

		<u>20X3</u>
Service cost	(a)	\$114
Interest cost	(b)	152
Actual return on plan assets	(c)	(158)
Gain (loss)	(d)	36
Amortization of any prior service cost or credit	(e)	27
Total net periodic pension cost		<u>\$171</u>

One possible source of confusion is the actual return on plan assets (\$158) and the unrecognized gain of \$36 that net to \$122. The actual return on plan assets reduces pension cost because, to the extent that plan assets generate earnings, those earnings help the plan sponsor subsidize the cost of providing the benefits. Thus, the plan sponsor will not have to fund benefits as they become due, to the extent that plan earnings provide the plan with cash to pay those benefits. This reduction, however, is adjusted by increasing pension cost by the difference between actual and expected return of \$34 and the amortization of the excess actuarial loss of \$2, for a total of \$36. The net result is to include the expected return of \$124 (\$158 – \$34) less the amortization of the excess of \$2 for a total of \$122 (\$158 – \$36). In recognizing the components of net periodic pension costs, the entity must disclose this expected return of \$124 and the loss of \$2.

The prior service cost is included in accumulated other comprehensive income, and then amortized to pension cost. The amortization of gain or loss (which pertains to actuarially driven changes to the projected benefit obligation, as well as to asset valuation adjustments not recognized in current income) is associated with an item incorporated in accumulated other comprehensive income.

Thus, under ASC 715 there is *display* of both prior service costs and actuarial gains or losses immediately upon the occurrence or determination of the item, but there is still *deferred recognition in expense* via the ASC 715-30-prescribed amortization process, set forth above.

Under ASC 715, there is *both* the componentized periodic pension expense *and* changes to the amounts reported in other comprehensive income, although for nonpublic entities the components of pension cost may be omitted. The suggested footnote form of disclosure consists of two tables, and is as follows for a publicly held reporting entity (these amounts, which assume partial funding of other postretirement benefits, are not related to the earlier examples):

#### ***Components of net periodic benefit cost and other amounts recognized in other comprehensive income***

	<i>Pension benefits</i>		<i>Other benefits</i>	
	<u>20X2</u>	<u>20X3</u>	<u>20X2</u>	<u>20X3</u>
<b><i>Net periodic benefit cost</i></b>				
Service cost	\$ 95	\$102	\$49	\$57
Interest cost	80	88	58	59
Expected return on plan assets	(70)	(86)	(12)	(14)
Amortization of prior service cost	11	12	(3)	(5)
Amortization of net (gain) loss	14	9	2	2
Net periodic benefit cost	<u>\$130</u>	<u>\$125</u>	<u>\$94</u>	<u>\$99</u>

***Other changes in plan assets and benefit obligations recognized in other comprehensive income***

	<i>Pension benefits</i>	<i>Other benefits</i>	
	<u>20X2</u>	<u>20X3</u>	<u>20X2</u>
Net loss (gain)	\$ 86	\$102	\$27
Prior service cost (credit)	60	10	(70)
Amortization of prior service cost	(11)	(12)	3
Total recognized in other comprehensive income	<u>135</u>	<u>100</u>	<u>(40)</u>
Total recognized in net periodic benefit cost and other comprehensive income	<u>\$265</u>	<u>\$225</u>	<u>\$54</u>
			<u>\$11</u>

Finally, the assumptions used in computing projected and accumulated benefits and expected return on plan assets must be disclosed. For postretirement health benefits, so-called sensitivity data must also be presented, since the amount of this often significant and most commonly unfunded future obligation is highly responsive to changes in health care cost levels. The following tables set forth these key parameters:

***Assumptions******Weighted-average assumptions used to determine benefit obligations at December 31***

	<i>Pension benefits</i>	<i>Other benefits</i>	
	<u>20X2</u>	<u>20X3</u>	<u>20X2</u>
Discount rate	6.75%	7.25%	7.00%
Rate of compensation increase	4.25	4.50	7.50%

***Weighted-average assumptions used to determine net periodic benefit cost for years ended December 31***

Discount rate	7.25%	7.50%	7.50%	7.75%
Expected long-term return on plan assets	8.00	8.50	8.10	8.75
Rate of compensation increase	4.50	4.75		

***Assumed health care cost trend rates at December 31***

	<u>20X2</u>	<u>20X3</u>
Health care cost trend rate assumed for next year	12%	12.5%
Rate to which the cost trend rate is assumed to decline (the ultimate trend rate)	6%	5%
Year that the rate reaches the ultimate trend rate	20X0	20X0

Assumed health care cost trend rates have a significant effect on the amounts reported for the health care plans. A one-percentage-point change in assumed health care cost trend rates (not required for nonpublic reporting entities) would have the following effects:

	<i>1-percentage-point increase</i>	<i>1-percentage-point decrease</i>
Effect on total of service and interest cost	\$ 42	\$ (35)
Effect on postretirement benefit obligation	185	(176)

### Reconciliation of Beginning and Ending ABO, PBO, and Plan Assets

The following table summarizes the 20X3 activity affecting ABO, PBO, and plan assets and reconciles the beginning and ending balances per the actuarial report:

	<i>Accumulated benefit obligation</i>	<i>Progression of salaries and wages</i>	<i>Projected benefit obligation</i>	<i>Fair value of plan assets*</i>
Balance, January 1, 20X3	\$ (1,500)	\$ (400)	\$ (1,900)	\$ 1,376
Service cost	(90)	(24)	(114) (a)	
Interest cost	(120)	(32)	(152) (b)	
Benefits paid to retired participants	160		160	(160)
Actual return on plan assets				158 (c)
Sponsor's contributions				145
Balance, December 31, 20X3	\$ <u>(1,550)</u>	\$ <u>(456)</u>	\$ <u>(2,006)</u>	\$ <u>1,519</u>

\* Assumed to be the same as market-related value for this illustration.

Disclosure is required regarding the portfolio assets maintained to pay future pension and other postretirement benefits. This information should be presented in a tabular format illustrated as follows:

### Exhibit—Disclosure of Plan Assets

**Plan assets.** The entity's pension plan weighted-average asset allocations at December 31, 20X2 and 20X3, by asset category are as follows:

<i>Asset category</i>	<i>Pension plan assets at December 31</i>		<i>Other benefit plan assets at December 31</i>	
	<i>20X2</i>	<i>20X3</i>	<i>20X2</i>	<i>20X3</i>
Equity securities	50%	48%	60%	52%
Debt securities	30	31	30	27
Real estate	10	12	5	13
Other	<u>10</u>	<u>9</u>	<u>5</u>	<u>8</u>
Total	100%	100%	100%	100%

The foregoing allocation information should be accompanied by an entity-specific narrative description of investment policies and strategies for plan assets, including weighted-average target asset allocations, where such are used as part of those policies and strategies. If the reporting entity holds its own shares in the trusted assets of the plan(s), this fact, and the amounts held at each reporting date, should also be set forth.

### Employer's Liabilities and Assets under ASC 715-30

The full amount (measured by projected or accumulated benefit obligations, for pensions and other postretirement benefits, respectively) of over- or underfunding is recognized in the statement of financial position recognition, with the offsetting entry being to other comprehensive income.

Fair value is determined as of the financial statement date. The amount is that which would result from negotiations between a willing buyer and seller not in a liquidation sale. Fair value is measured in preferred order by market price, selling price of similar investments, or discounted cash flows at a rate indicative of the risk involved.

A schedule showing the variables of the above example in accordance with ASC 715-20, reconciling the statement of financial position amounts with the funded status of the plan, is shown below. Assumed activity for 20X3 is provided for comparative purposes. This example is to illustrate the information required for publicly held entities; see comments below for reduced disclosure requirements applicable to nonpublic companies. Also, this example combines information about pension plans and other benefit plans, the latter of which are assumed data not detailed in the foregoing discussion.

#### Example—Reconciliation Disclosure—Publicly Held Entities

	<i>Pension benefits</i>		<i>Other benefits</i>	
	<u>20X2</u>	<u>20X3</u>	<u>20X2</u>	<u>20X3</u>
<b><i>Change in benefit obligation</i></b>				
Benefit obligation at beginning of year	\$ 1,800	\$ 1,900	\$ 612	\$ 662
Service cost	111	114	22	30
Interest cost	144	152	35	43
Plan participant's contributions	—	—	33	13
Amendments	—	—	—	—
Actuarial loss	—	—	—	—
Acquisition	—	—	—	—
Benefits paid	(155)	(160)	(40)	(60)
Benefit obligation at end of year	<u>1,900</u>	<u>2,006</u>	<u>662</u>	<u>688</u>
<b><i>Change in plan assets</i></b>				
Fair value of plan assets at beginning of year	1,241	1,376	87	206
Actual return on plan assets	150	158	24	5
Acquisition	—	—	—	25
Employer contribution	140	145	152	137
Plan participants' contributions	—	—	13	20
Benefits paid	(155)	(160)	(70)	(90)
Fair value of plan assets at end of year	<u>1,376</u>	<u>1,519</u>	<u>206</u>	<u>303</u>
Funded status [plan over (under) funded]	\$ <u>(524)</u>	\$ <u>(487)</u>	\$ <u>(456)</u>	\$ <u>(385)</u>

Note that since this example disclosure addresses both pension and other postretirement plans, the captions are generically worded, but it is implicit that they refer to projected benefits for pension plans and accumulated benefits for other defined benefit plans.

**Statement of financial position presentation.** The funded status of defined benefit plans must be reported in the statement of financial position, using a simple table identifying the locations in the statement of financial position where the net funded amounts are presented, as follows.

**Nonpublic entity disclosures.** Nonpublic reporting entities are not required to provide the information in the above tables. Instead, they are only required to disclose the employer's contributions, participants' contributions, benefit payments, and the funded status. Of course, expanded disclosures are not precluded under such circumstances.

#### Example—Disclosure of Net Funded Amounts

	<i>Pension benefits</i>		<i>Other benefits</i>	
	<u>20X2</u>	<u>20X3</u>	<u>20X2</u>	<u>20X3</u>
Noncurrent assets	\$ 133	\$ 18	\$ —	\$ —
Current liabilities	(225)	(125)	(150)	(99)
Noncurrent liabilities	(432)	(380)	(306)	(286)
Net amount recognized	<u>\$ (524)</u>	<u>\$ (487)</u>	<u>\$ (456)</u>	<u>\$ (385)</u>

**Example—Amounts recognized in accumulated other comprehensive income**

Amounts recognized in accumulated other comprehensive income must also be identified; for the example above, these consist of:

	<i>Pension benefits</i>	<i>Other benefits</i>	
	<u>20X2</u>	<u>20X3</u>	<u>20X2</u>
Net loss (gain)	\$ 94	\$ 18	\$ (11)
Prior service cost (credit)	<u>210</u>	<u>160</u>	<u>(92)</u>
	<u>\$304</u>	<u>\$178</u>	<u>\$(103)</u>
			<u>\$(70)</u>

As illustrated above, the *actual* underfunded or—for the first time—overfunded status of defined benefit pension plans is reported without limitation in the statement of financial position of reporting sponsoring entities. For defined benefit pension arrangements—under- or overfunding is defined by the differences between plan assets and the corresponding *projected* benefit obligations. Thus, the measure is derived from the (almost inevitably) larger projections of future benefit payments, including the effects of anticipated salary progressions.

### Additional ASC 715-30 Guidance

In situations not specifically addressed by ASC 715-30, ASC 715-30-35 states that the vested benefit obligation can be either (1) the actuarial present value of the vested benefits that the employee is entitled to if the employee separates immediately, or (2) the actuarial present value of the vested benefits to which the employee is currently entitled, but based on the employee's expected date of separation or retirement.

Pension plans sometimes are coupled with life insurance plans with the employer as beneficiary. According to ASC 325-30-35, it is not appropriate for the purchaser of life insurance to recognize income from death benefits on an actuarially expected basis.

Some employers have terminated classic defined benefit pension plans and replaced them with "cash balance" plans, the accounting for which has not been well understood. These hybrid plans typically describe the pension benefit by reference to an account balance rather than a monthly annuity at retirement. ASC 715-30-15 considers plans that are characterized by defined principal-crediting rates as percentages of salary, and offer defined, noncontingent interest-crediting rates that entitle participants to future interest credits at stated, fixed rates until retirement. The standard states that "cash balance" plans with the foregoing attributes are to be deemed defined benefit plans, consistent with definitions set forth in ASC 715-30. This is true because an employer's contributions to a cash balance plan trust and the earnings on the invested plan assets may be unrelated to the principal and interest credits to participants' hypothetical accounts.

Also, the benefit promise in the cash balance arrangement is not pay related and, accordingly, use of a projected unit credit method is neither required nor appropriate for purposes of measuring the benefit obligation and annual cost of benefits earned. The appropriate cost attribution approach, therefore, is the traditional unit credit method.

### Reporting Funded Status—Other Issues

Additional information must be presented in the notes to financial statements about certain effects on net periodic benefit cost for the upcoming fiscal year that arise as a consequence of the delayed recognition of actuarial gains or losses, and prior service costs or credits.

Determination of funded status varies between defined benefit pension plans and all other defined benefit arrangements (that is, those addressed by ASC 715-60). For the former, funded

status is measured by the difference between the fair value of plan assets and the *projected* benefit obligation (explained earlier in this chapter). For the latter, it is the spread between the fair value of plan assets and the *accumulated* benefit obligation that measures funded status.

The difference between plan assets and the *projected* benefit obligation must be used to gauge the liability to be reported.

The net obligations associated with underfunded plans (which will likely describe virtually all postretirement benefit plans other than pensions, as well as some pension plans) must be displayed in the statement of financial position. In contrast with the requirement for defined benefit pension plans, for these arrangements the measure is based on the *accumulated* postretirement benefit obligation, which is the actuarial present value of benefits attributed to employees as of the date of the statement of financial position, which until full eligibility is achieved, will be a lesser amount than the *projected* benefit obligation.

**Reporting when there are multiple plans.** When the reporting entity has multiple plans, it is not acceptable to display one single net amount of over- or underfunding. Rather, all overfunded plans must be separately aggregated, as must underfunded plans. The amount of overfunding is included in noncurrent assets, with no portion of the overfunding permitted to be displayed as a current asset. On the other hand, total underfunding is allocated between current and noncurrent liabilities, with the current portion computed (on a plan-by-plan basis) as the sum of the actuarial present value of benefits included in the benefit obligation payable over the ensuing twelve months, to the extent that it exceeds the fair value of plan assets.

Conceivably, an employer may have the right to use the assets of an overfunded plan to pay the obligations of another, underfunded plan. Only in such circumstances would it be acceptable to offset the overfunding asset and the underfunding liability. Such a situation would be highly unlikely to occur, however.

To illustrate, if the reporting entity has three postretirement benefit plans, one of which is overfunded and two of which are underfunded, the amount of overfunding must be included in noncurrent assets. The amount of underfunding of the two other plans must be reported in liabilities, but a portion of this total might have to be included in current liabilities. This is illustrated in the following table:

	<i>Overfunded plan</i>	<i>Underfunded plan #1</i>	<i>Underfunded plan #2</i>	<i>Statement of financial position totals</i>
FV of plan assets	\$400,000	\$700,000	\$20,000	
PV of benefit obligation (total)	340,000	874,000	240,000	
PV of benefit obligation (due in next twelve months)	28,000	32,000	31,000	
Overfunding asset (noncurrent)	60,000			\$60,000
Underfunding liability (noncurrent)		174,000	209,000	383,000
Underfunding liability (current)			11,000	11,000

In the table above, note that the overfunded plan results in the reporting of a noncurrent asset, and this is not mitigated by the simultaneous existence of underfunded plans. Also note that underfunded plan #1 has sufficient assets to satisfy the amounts due within one year, and therefore the sponsoring entity's statement of financial position will not report any current liability with respect to this plan. However, plan #2, which is also underfunded, has benefit payments due over the twelve months following the statement of financial position date that exceed the amount of plan assets, and thus the sponsor will have to provide additional funding in the current period. That amount must be reported as a current liability. Finally, observe that the noncurrent obligations

pertaining to both underfunded plans are combined into a single statement of financial position amount.

**Reporting of benefit plan transactions and events in comprehensive income.** An employer must recognize all transactions and events affecting the overfunded or underfunded status of a defined benefit postretirement plan in comprehensive income (or changes in unrestricted net assets, if the entity is a not-for-profit enterprise) in the year in which they occur.

The reporting entity must recognize as a component of other comprehensive income the gains or losses and prior service costs or credits arising during that reporting period that are not recognized as components of net periodic benefit cost of the period pursuant to ASC 715-30 and ASC 715-60. For example, if a plan amendment is adopted that credits employees with prior service, this is not reflected immediately in benefit costs, but rather is subject to amortization (i.e., it is recognized as part of pension or other postretirement benefit plan cost over an extended period of time). These requirements do not alter the piecemeal recognition of expense (that is, smoothing) under current GAAP, but they do make it necessary to record in other comprehensive income, in the year the amendment is effected, the full amount of the prior service cost less what is recognized in pension cost in that period.

The effect of recording this debit in comprehensive income is balanced by recording an additional underfunding liability. In accordance with ASC 740, this is treated as a temporary difference, since the liability has a different basis (carrying value) for financial reporting purposes than it does for tax purposes. Hence, it must be tax effected within accumulated other comprehensive income, and a deferred tax asset (in the normal circumstances) will be recorded. The tax asset, in turn, will be subject to the “more likely than not” test for realizability, to determine whether it needs to be reduced or offset fully by an allowance.

### Example

If Varga Corp., which is in the 30% tax bracket, grants its workers an amendment to a defined benefit pension plan that increases its obligation by \$60,000, to be reflected in pension expense over fifteen years (i.e., amortized at \$4,000 per year), under ASC 715 the following entry would be made (assuming the amendment is granted at year-end, and thus amortization will begin in the next period):

Accumulated other comprehensive income	42,000
Deferred tax asset	18,000
Pension liability	60,000

As noted earlier, the elements that will be reported in accumulated other comprehensive income, until taken into benefit expense as required under ASC 715-30 or ASC 715-60, include:

- gains and losses (i.e., those due to differences between expected and actual returns on plan assets, and those arising from actuarially determined adjustments), and
- prior service cost or credits from plan amendments.

For new amounts (e.g., actuarial adjustment in the current period), there will be an entry similar to the above, whereby accumulated other comprehensive income is adjusted to reflect the full amount of the item, as well as the (offsetting) deferred tax effect thereof.

In subsequent periods, there will be opposite direction adjustments to the amount provided in other comprehensive income as amortization occurs. For example, if the prior service cost recognized by

Varga Corp. above is to be amortized based on average remaining service lives of current employees and the amount so determined for 20X2, the first period after the amendment, is \$5,000, the following entry would be recorded:

Pension cost	5,000
Deferred tax asset	1,500
Accumulated other comprehensive income	3,500

For each annual statement of income presented, these amounts should be recognized in accumulated other comprehensive income, showing *separately* the amounts ascribed to net gain or loss and net prior service cost or credit. Those amounts are separated into amounts arising during the period and reclassification adjustments of other comprehensive income as a result of being recognized as components of net periodic benefit cost for the period.

**Reporting loans to participants by defined contribution pension plans.** ASC 962-310 requires that loans to the participants in an entity's defined contribution pension plan be classified as notes receivable. These loans are to be reported separately from plan investments. The proper measurement of these loans is their unpaid principal balances, plus all accrued but unpaid interest. This requirement keeps entities from recording such loans at their fair value. The reason for making this distinction is that U.S. GAAP requires most investments by a pension plan to be recorded at their fair values, which would normally include loans to plan participants. By recording these loans as notes receivable, rather than investments, the fair value recordation requirement no longer applies.

**Measurement date for year-end financial statements.** ASC 715 requires that valuations be as of the date of the statement of financial position.

An exception is allowed in the instance of plans sponsored by consolidated subsidiaries or equity-method investees. This is a practical concession, but given that under U.S. GAAP subsidiaries and investees are permitted to report financial results using year-ends different than the parent's or investor's, the exception is a reasonable and logical one. In those situations, the determinations of the fair values of plan assets and obligations must be as of the subsidiaries' or investees' respective dates of the statements of financial position.

For an employer whose fiscal year-end does not coincide with a calendar month end, the employer has a practical expedient to measure defined benefit retirement obligations and related plan assets as of the month-end closest to its fiscal year-end.

**Measurement date for interim financial statements.** Publicly held entities must report quarterly, and private companies may choose to issue interim financial statements that are represented as being in accordance with GAAP. ASC 715 does not impose a requirement to evaluate plan assets and obligations more frequently than on an annual basis. Therefore, unless there has been an interim revaluation conducted—for example, because a plan amendment was adopted, or there had been a settlement or curtailment of a plan—the funded status as of the most recent year-end should be used in interim period reporting, with certain adjustments. The adjustments to be made are for subsequent accruals of service cost, interest, and return on plan assets included in current earnings (excluding, however, any amortization of amounts first recognized in other comprehensive income), subsequent contributions to the plan, and subsequent benefit payments from the plan. However, if there had been a revaluation subsequent to the prior year-end, the most recent valuation data would be used, again updated as just described, for any postvaluation accruals, contributions, and benefit payments.

## Disclosure Requirements

Disclosure requirements for defined benefit pension and other postretirement plans have, of necessity, always been rather voluminous and complex. In part, this has been caused by the fact that “smoothing” (what FASB calls the “delayed recognition” of pension expense) takes place, and this results in “off the statement of financial position” plan assets and obligations. What would have otherwise been distortions of the sponsor’s (reporting entity’s) financial position are arguably moderated via the footnote disclosures required under ASC 715-20. Detailed disclosure requirements can be found in the Appendix.

The simplified disclosures permitted for nonpublic entities are illustrated by the following tabulation of comparative data:

	<u>20X2</u>	<u>20X3</u>
<b>Funded status</b>		
Projected benefit obligation at December 31	\$ 1,900	\$ 2,006
Fair value of plan assets at December 31	<u>1,376</u>	<u>1,519</u>
Funded status	<u>\$ (524)</u>	<u>\$ (487)</u>
<b>Amounts recognized on the statement of financial position</b>		
Prepaid (accrued) benefit cost	\$ —	\$ (23)
<b>Amounts recognized on the income statement</b>		
Net benefit cost for the period	\$ 1,020	\$ 890
<b>Weighted-average assumptions</b>		
Discount rate	7.5%	7.5%
Expected return on plan assets	9.0%	9.0%
Rate of compensation increase	4.0%	4.0%
<b>Additional pension data</b>		
Net periodic pension cost	\$ 163	\$ 168
Employer contribution	140	145
Benefits paid	155	160

Plans’ under- or overfunded status and the “deferred recognition” gains and losses must be formally recorded in the financial statements (the statement of financial position, specifically). Essentially all defined benefit cost elements should be included in the reporting entity’s statement of financial position.

FASB has provided two prototype forms for disclosures of fair value information about plan investments, which it emphasized are not the only modes available for communicating such data to financial statement users. The following are adapted from those examples.

### Example—Method One

Asset Category	Total	Fair Value Measurements at December 31, 20X3 (in millions)		
		Quoted prices		
		in active markets for identical assets	Significant observable inputs	Significant unobservable inputs
Equity securities:				
U.S. large-cap (a)	1,100	1,100		

Asset Category	Fair Value Measurements at December 31, 20X3 (in millions)			
	Total	Quoted prices in active markets for identical assets	Significant observable inputs	Significant unobservable inputs
		(Level 1)	(Level 2)	(Level 3)
U.S. mid-cap growth	200	200		
International large-cap value	650	650		
Emerging markets growth	150	50	100	
Domestic real estate	200	40	160	
Fixed income securities:				
U.S. Treasuries	400	400		
Corporate bonds (b)	400		400	
Mortgage-backed securities	100		100	
Other types of investments:				
Equity long/short hedge funds (c)	110			110
Event-driven hedge funds (d)	90			90
Global opportunities hedge funds (e)	70			70
Multistrategy hedge funds (f)	80			80
Private equity funds (g)	94			94
Real estate	150	0	0	150
Total	\$4,094	\$2,740	\$760	\$594

- a. This category comprises low-cost equity index funds not actively managed that track the Standard & Poor's (S&P) 500.
- b. This category represents investment grade bonds of U.S. issuers from diverse industries.
- c. This category includes hedge funds that invest both long and short in primarily U.S. common stocks. Management of the hedge funds has the ability to shift investments from value to growth strategies, from small to large capitalization stocks, and from a net long position to a net short position.
- d. This category includes investments in approximately 60% equities and 40% bonds to profit from economically, politically, and government-driven events. A majority of the investments are targeted at economic policy decisions.
- e. This category includes approximately 80% investments in non-U.S. common stocks in the health care, energy, information technology, utilities, and telecommunications sectors and approximately 20% investments in diversified currencies.
- f. This category invests in multiple strategies to diversify risks and reduce volatility. It includes investments in approximately 50% U.S. common stocks, 30% global real estate projects, and 20% arbitrage investments.
- g. This category includes several private equity funds that invest primarily in U.S. commercial real estate.

**Example—Method Two**

Asset Category	Fair Value Measurements at December 31, 20X3 (in millions)			
	Total	Quoted prices in active markets for identical assets <i>(Level 1)</i>	Significant observable inputs <i>(Level 2)</i>	Significant unobservable inputs <i>(Level 3)</i>
Cash	300	300		
Equity securities:				
U.S. companies	800	800		
International companies	600	600		
Mutual funds (a)	900	640	260	
U.S. Treasury securities	400	400		
AA corporate bonds	200		200	
A corporate bonds	200		200	
Mortgage-backed securities	100		100	
Equity long/short hedge funds (b)	110			110
Event-driven hedge funds (c)	90			90
Global opportunities hedge funds (d)	70			70
Multistrategy hedge funds (e)	160			160
Private equity funds (f)	94			94
Real estate	150	0	0	150
Total	<u>\$4,094</u>	<u>\$2,740</u>	<u>\$760</u>	<u>\$594</u>

- a. 70% of mutual funds invest in common stock of large-cap U.S. companies. 30% of the company's mutual fund investments focus on emerging markets and domestic real estate common stocks.
- b. This category includes hedge funds that invest both long and short in primarily U.S. common stocks. Management of the hedge funds has the ability to shift investments from value to growth strategies, from small to large capitalization stocks, and from a net long position to a net short position.
- c. This category includes investments in approximately 60% equities and 40% bonds to profit from economically, politically, and government-driven events. A majority of the investments are targeted at economic policy decisions.
- d. This category includes approximately 80% investments in non-U.S. common stocks in the health care, energy, information technology, utilities, and telecommunications sectors and approximately 20% investments in diversified currencies.
- e. This category invests in multiple strategies to diversify risks and reduce volatility. It includes investments in approximately 50% U.S. common stocks, 30% global real estate projects, and 20% arbitrage investments.
- f. This category includes several private equity funds that invest primarily in U.S. commercial real estate.

The reporting entity is required to disclose the following information, whichever method it uses to disclose major categories of plan assets.

	<i>Fair Value Measurements Using Significant Unobservable Inputs (Level 3)</i>						
	<i>Equity long/ short hedge funds</i>	<i>Event-driven hedge funds</i>	<i>Global oppor- tunities hedge funds</i>	<i>Multi- strategy hedge funds</i>	<i>Private equity funds</i>	<i>Real estate</i>	<i>Total</i>
Beginning balance at December 31, 20X2	\$80	\$70	\$78	\$70	\$80	\$20	\$398
Actual return on plan assets:							
Relating to assets still held at the reporting date	(4)	10	(14)	10	4	6	12
Relating to assets sold during the period		6			4		10
Purchases, sales, and settlements	30	4			6	124	164
Transfers in and/or out of Level 3	4	–	6	0	0	0	10
Ending balance at December 31, 20X3	<u>\$110</u>	<u>\$90</u>	<u>\$70</u>	<u>\$80</u>	<u>\$94</u>	<u>\$150</u>	<u>\$594</u>

## Interim Financial Reporting Requirements

ASC 715-20 imposes requirements affecting both public and nonpublic company interim financial reporting. Publicly traded entities must disclose, in interim financial statements that include a statement of income, details regarding both benefit cost and contributions paid. The amount of net periodic benefit cost recognized must be set forth, showing separately the service cost component, the interest cost component, the expected return on plan assets for the period, the amount of recognized gains or losses, the amount of prior service cost recognized, and the amount of gain or loss recognized due to a settlement or curtailment. Additionally, the total amount of the employer's contributions paid, and expected to be paid, during the current fiscal year, must be presented, if significantly different from amounts previously disclosed pursuant to the annual reporting requirements of the standard. It is permissible to present estimated contributions in the aggregate, combining contributions required by funding regulations or laws, discretionary contributions, and noncash contributions. ASC 715 has conformed these requirements to the regime whereby the statement of financial position fully discloses (in accumulated other comprehensive income) deferred recognition items.

For nonpublic entities, disclosure is required—in interim periods when a complete set of GAAP-basis financial statements is being presented—of the total amount of the employer's contributions paid, and expected to be paid, during the current fiscal year, if significantly different from amounts previously disclosed pursuant to the annual reporting requirements of the standard. Estimated contributions may be presented in the aggregate combining contributions required by funding regulations or laws, discretionary contributions, and noncash contributions. (See previous section on “Measurement date for interim financial statements”.)

Remeasurement on an interim basis is neither required nor permitted under ASC 715.

## Reporting and Disclosure by Not-for-Profit Entities

Not-for-profit entities sponsoring single-employer defined benefit plans are in the scope of ASC 715, but special rules are necessary to accommodate the fact that such entities do not report other comprehensive income as prescribed under ASC 220 for all other private sector entities. It is therefore necessary to analogize from the requirements of ASC 715. Rather than include the realized but as-yet-unrecognized net gains and losses and the unrecognized prior service cost or credit in accumulated other comprehensive income, these are to be reflected in changes in unrestricted net assets arising from a defined benefit plan. These changes will flow through the current period's statement of activities, since GAAP for not-for-profit organizations does not provide for an analog to other comprehensive income, where nonstockholder changes in net worth are reported outside the income statement (statement of activities).

## Other Pension Considerations

**Annuity and insurance contracts.** Benefits of annuity contracts and other insurance contracts that are equivalent in substance are excluded from plan assets and from the accumulated and projected benefit obligations if:

- They are valid and irrevocable,
- They transfer significant risks to an unrelated insurance company (not a captive insurer), and
- There is no reasonable doubt as to their payment.

Most other contracts are not considered annuities for ASC 715-30 purposes. If a plan's benefit formula specifies coverage by nonparticipating annuity contracts, the service component of net pension costs is the cost of those contracts. In the case of a participating annuity contract, the cost of the participation right is recognized as an asset and measured annually at its fair value. If fair value is inestimable, the cost is systematically amortized and carried at amortized cost (not to exceed net realizable value). Benefits provided by the formula beyond those provided by annuities are accounted for in the usual ASC 715-30 manner. All other insurance contracts are considered investments and are usually measured at cash surrender value, conversion value, contract value, or some equivalent.

In certain circumstances, annuity benefits are paid by employers after the insurer fails to make required payments. According to ASC 715-30-35, a loss is recognized by an employer at the time the employer assumes the benefit obligation payments to retirees for an insolvent insurance company that held these pension obligations. The loss recognized is the lesser of any gain recognized in the original contract with the insurance company or the amount of benefit obligation payments assumed by the company. Any additional loss not recognized is accounted for as a plan amendment in accordance with ASC 715-30.

**Non-U.S. pension arrangements.** The terms and conditions that define the amount of benefits and the nature of the obligation determine the substance of a non-U.S. pension arrangement. If they are, in substance, similar to pension plans, ASC 715-30 applies.

**Business combinations.** When an entity that sponsors a single-employer defined benefit pension plan is purchased, the purchaser must assign part of the purchase price to an asset if plan assets exceed the projected benefit obligation, or to a liability if the projected benefit obligation exceeds plan assets. The projected benefit obligation includes the effect of any expected plan curtailment or termination as a result of the change in ownership of the sponsor. This assignment eliminates any existing unrecognized components, and any future differences between

contributions and net pension cost will affect the asset or liability recognized when the purchase was initially recorded.

### **Settlements and Curtailments of Plans**

ASC 715-30-35 contains a subsection on the accounting to be followed by obligors when all or part of defined benefit pension plans have been settled or curtailed. It establishes employer accounting procedures for benefits offered when employment is terminated.

Settlements include both the purchase of nonparticipating annuity contracts and lump-sum cash payments. The following three criteria must all be met in order to constitute a pension obligation settlement:

1. It must be irrevocable
2. It must relieve the obligor of primary responsibility for the obligation
3. It must eliminate significant risks associated with the obligation and the assets used to effect it.

(ASC 715-30-20)

Transactions that do not meet these three criteria do not qualify for treatment as a settlement under ASC 715-30. For example, an obligor could invest in a portfolio of high-quality fixed-income securities that would provide cash flows of interest and return-of-principal payments on dates that approximate the dates on which settlement payments are expected to become due. This would not meet the above criteria, however, because the employer is still primarily liable for the pension obligation and the investment is not irrevocable. Such a defeasance strategy does not constitute a settlement.

Under an annuity contract settlement, an unrelated insurance company unconditionally accepts an obligation to provide the required benefits. The following criteria must be met for this type of settlement:

1. It must be irrevocable
2. It must involve a transfer of material risk to the insurance company.

There can be no reasonable doubt as to the ability of the insurance company to meet its contractual obligation. (ASC 715-30-35-86 and 35-87) The substance of any participating annuity contract must relieve the employer of most of the risks and rewards or it does not meet the criteria.

Curtailments include early discontinuance of employee services or cessation or suspension of a plan. Additional benefits may not be earned, although future service time may be counted towards vesting. A curtailment must meet the following criteria:

1. It must materially diminish present employees' future service, or
2. It must stop or materially diminish the accumulation of benefits by a significant number of employees.

(ASC 715-30-20)

A curtailment and a settlement can occur separately or together.

**Settlements.** If the entire projected benefit obligation is settled, any ASC 715-30 unrecognized net gain (loss) is immediately recognized. A pro rata portion is recognized in the case of partial settlement. If the obligation is settled by purchasing participating annuities, the cost of the right of participation is deducted from the gain (but not from the loss) before recognition.

If the total of the interest cost and service cost components of the ASC 715-30 periodic pension cost is greater than or equal to the settlement costs during a given year, the recognition of the above gain (loss) is not required, but is permitted. However, a consistent policy must be followed in this regard. The settlement cost is generally the cash paid, or the cost of non-participating annuities purchased, or the cost of participating annuities reduced by the cost of the right of participation.

### Example of a settlement

To use information from the previous baseline example, the company's pension plan settles the \$1,150 vested benefit portion of its projected benefit obligation by using plan assets to purchase a nonparticipating annuity contract for \$1,150. As a result of this settlement, nonvested benefits and the effects of projected future compensation levels remain in the plan. Also, a pro rata amount of the unrecognized net actuarial loss on assets, unrecognized prior service cost, and unamortized net asset at ASC 715-30 adoption are recognized due to settlement. Because the projected benefit obligation is reduced from \$1,550 to \$400, a drop of 74%, the pro rata amount used for recognition purposes is 74%. These changes are noted in the following table:

	<u>Before settlement</u>	<u>Effect of settlement</u>	<u>After settlement</u>
<b>Assets and obligations:</b>			
Vested benefit obligation	\$ (1,150)	\$ 1,150	\$ 0
Nonvested benefits	(400)	—	(400)
Accumulated benefit obligation	(1,550)	1,150	(400)
Effects of projected future compensation levels	(456)	—	(456)
Projected benefit obligation	(2,006)	1,150	(856)
Plan assets at fair value	<u>1,519</u>	<u>(1,150)</u>	<u>369</u>
<b>Items not yet recognized in earnings:</b>			
Funded status	(487)	0	(487)
Unrecognized net actuarial loss on assets	174	(129)	45
Unrecognized prior service cost	293	(217)	76
Unamortized net asset at ASC 715-30 adoption	<u>(3)</u>	<u>2</u>	<u>(1)</u>
Prepaid (accrued) benefit cost	\$ (23)	\$ (344)	\$ (367)

The entry used by the company to record this transaction does not include the purchase of the annuity contract since the pension plan acquires the contract with existing funds. The recognition of the pro rata amount of the unrecognized net actuarial loss on assets, unrecognized prior service cost, and unamortized net asset at ASC 715-30 adoption is recorded with the following entry:

Loss from settlement of pension obligation	344
Accrued/prepaid pension cost	344

The maximum gain or loss subject to recognition in earnings when an obligation is settled is the net gain or loss that is remaining in accumulated other comprehensive income. The maximum gain or loss, first determined at the date of settlement, is fully reported in earnings only if the entire projected benefit obligation is settled; if it is only partially settled, only a pro rata portion of the maximum gain or loss can be recognized.

**Curtailments.** A curtailment results in the elimination of future years of service. The pro rata portions of any unrecognized cost of retroactive plan amendments are immediately recognized as a loss.

If curtailment results in a decrease in the projected benefit obligation, a gain is indicated. An increase in the projected benefit obligation (excluding termination benefits) indicates a loss. This indicated gain (loss) is then netted against the loss from unrecognized prior service cost recognized in accordance with the preceding paragraph. The net result is the curtailment gain or curtailment loss. This gain (loss) is accounted for as provided in ASC 450. A gain is recognized upon actual employee termination or plan suspension. A loss is recognized when both the curtailment is probable and the effects are reasonably estimable.

#### Example of a curtailment

To use information from the previous baseline example, the company shuts down one of its factories, which terminated the employment of a number of its staff. The terminated employees have nonvested benefits of \$120 and projected benefit obligation of \$261. As a result of this curtailment, 19% of the projected benefit obligation has been eliminated (\$381 PBO reduction resulting from the curtailment, divided by the beginning \$2,006 PBO). Accordingly, 19% of the unrecognized prior service cost and unamortized net asset at ASC 715-30 adoption are recognized due to the curtailment. In addition, the total projected benefit reduction of \$381 is first netted against the unrecognized net actuarial loss on assets of \$174, leaving \$207 to be recognized as a gain. These changes are noted in the following table:

	<i>Before curtailment</i>	<i>Effect of curtailment</i>	<i>After curtailment</i>
Assets and obligations:			
Vested benefit obligation	\$ (1,150)		\$ (1,150)
Nonvested benefits	(400)	\$120	(280)
Accumulated benefit obligation	(1,550)	120	(1,430)
Effects of projected future compensation levels	(456)	261	(195)
Projected benefit obligation	(2,006)	381	(1,625)
Plan assets at fair value	<u>1,519</u>	<u>0</u>	<u>1,519</u>
Items not yet recognized in earnings:			
Funded status	(487)	381	(106)
Unrecognized net actuarial loss on assets	174	(174)	0
Unrecognized prior service cost	293	(56)	237
Prepaid (accrued) benefit cost	\$ (20)	\$151	\$ 131

The company records the recognition of the pro rata amount of the unrecognized prior service cost and unamortized net asset at ASC 715-30 adoption with the following entry, which is offset against the net gain of \$207 resulting from the reduction in the planned benefit obligation:

Accrued/prepaid pension cost	151
Gain from curtailment of pension obligation	151

ASC 715 contains guidance on accounting for curtailments of defined benefit plans. To the extent that prior service costs are included in accumulated other comprehensive income under

the new mandates, and this is associated with service years no longer expected to be rendered, this must be recognized currently as a loss. This would occur if prior service cost is being amortized over a term that no longer accurately reflects expected future service by the post-curtailment workforce. Prior service cost, in this context, includes that resulting from plan amendments.

Curtailment gain or loss alters the projected benefit obligation. If such a gain exceeds any net loss included in accumulated other comprehensive income, or the entire gain if a net gain exists, it is reported as a curtailment gain. On the other hand, to the extent that such a loss exceeds any net gain included in accumulated other comprehensive income, or the entire loss if a net loss exists, this will be reported as a curtailment loss.

**Termination benefits.** Termination benefits are accounted for in accordance with ASC 450. Special short time period benefits require that a loss and a liability be recognized when the offer is accepted and the amount can be reasonably estimated. Contractual termination benefits require that a loss and a liability be recognized when it is probable that employees will receive the benefits and the amount can be reasonably estimated. The cost of these benefits is the cash paid at termination and the present value of future payments. Termination benefits and curtailments can occur together.

#### Example of termination benefits

Again using the information from the previous baseline example, the company offers a onetime early retirement bonus payment, which is in addition to existing pension benefits. As a result of the offer, the company directly pays \$200 in termination benefits. As a result of the employee retirements, the liability associated with projected future compensation levels drops by \$60, while the pro rata portion of the unrecognized prior service cost associated with the retiring employees is \$39. These changes are noted in the following table:

	<i>Before termination benefit</i>	<i>Effect of termination benefit</i>	<i>After termination benefit</i>
Assets and obligations:			
Vested benefit obligation	\$ (1,150)		\$ (1,150)
Nonvested benefits	(400)		(400)
Accumulated benefit obligation	(1,550)		(1,550)
Effects of projected future compensation levels	(456)	\$ 60	(396)
Projected benefit obligation	(2,006)	60	(1,946)
Plan assets at fair value	1,519	0	1,519
Items not yet recognized in earnings:			
Funded status	(487)		(427)
Unrecognized net actuarial loss on assets	174	(60)	114
Unrecognized prior service cost	293	(39)	254
Unamortized net asset at ASC 715-30 adoption	(3)	—	(3)
Prepaid (accrued) benefit cost	\$ (23)	(39)	\$ (62)
Cost of termination benefits		(200)	
Total loss on terminations		\$ (239)	

The company nets the \$60 gain on reduction of projected future compensation levels against the existing unrecognized net actuarial loss on assets. It then records the \$39 loss caused by the increased amortization of the unrecognized prior service cost and the \$200 cost of the termination benefits with the following entry:

Loss on employee terminations	239
Accrued/prepaid pension cost	39
Cash	200

**Component disposal.** Gains (losses), as calculated above, that result because of a disposal of a component of the entity are recognized according to the provisions of ASC 360.

#### **ASC 715-60, *Defined Benefit Plans—Other Postretirement***

ASC 715-60 contains the guidance for employers' accounting for other (than pension) postretirement employee benefits (commonly called OPEB). This guidance prescribes a single method for measuring and recognizing an employer's (APBO). It applies to all forms of postretirement benefits, although the most material such benefit is usually postretirement health care coverage. It uses the fundamental framework established by ASC 715-30. To the extent that the promised benefits are similar, the accounting provisions are similar. Only when there is a compelling reason is the accounting different.

ASC 715-60 requires accrual accounting and adopts the three primary characteristics of pension accounting as follows:

1. Delayed recognition (changes are not recognized immediately but are subsequently recognized in a gradual and systematic way)
2. Reporting net cost (aggregates of various items are reported as one net amount)
3. Offsetting assets and liabilities (assets and liabilities are sometimes shown net).

ASC 715-60 distinguishes between the substantive plan and the written plan. Although generally the same, the substantive plan (the one understood as evidenced by past practice or by communication of intended changes) is the basis for the accounting if it differs from the written plan.

ASC 715-60 focuses on accounting for a single-employer plan that defines the postretirement benefits to be provided. A defined benefit postretirement plan defines benefits in terms of the provision for:

- (1) monetary amounts, or
- (2) benefit coverage.

Postretirement benefits can include tuition assistance, legal services, day care, housing subsidies, health insurance coverage (probably the most significant), and other benefits. The amount of benefits usually depends on a benefit formula. OPEB may be provided to current employees, former employees, beneficiaries, and covered dependents. The guidance applies to:

- Settlement of the APBO, and
- Curtailment of a plan as part of a special termination benefit offer.

The guidance also applies to deferred compensation contracts with individuals. Taken together, these contracts are equivalent to an OPEB plan. ASC 715-60 does not apply to benefits

provided through a pension plan. If part of a larger plan with active employees, the OPEB is segregated and accounted for in accordance with this standard. If not materially different, estimates, averages, and computational shortcuts may be used.

The basic tenet of ASC 715-60 is that accrual accounting is better than cash basis accounting. Recognition and measurement of the obligation to provide OPEB is required in order to provide relevant information to financial statement users. Although funding and cash flow information is incorporated into the statement, the overall liability is the primary focus.

The guidance attempts, in accordance with the terms of the substantive plan, to account for the exchange transaction that takes place between the employer, who is ultimately responsible for providing OPEB, and the employee who provides services, in part at least, to obtain the OPEB. ASC 715-60 accounting requires that the liability for OPEB be fully accrued when the employee is fully eligible for all of the expected benefits. The fact that the employee may continue to work beyond this date is not relevant, since the employee has already provided the services required to earn the OPEB.

OPEB are considered to be deferred compensation earned in an exchange transaction during the time periods that the employee provides services. The expected cost generally is attributed in equal amounts (unless the plan attributes a disproportionate share of benefits to early years) over the periods from the employee's hiring date (unless credit for the service is only granted from a later plan eligibility or entry date) to the date that the employee attains full eligibility for all benefits expected to be received. This accrual is followed even if the employee provides service beyond the date of full eligibility.

**Accounting for postretirement benefits.** The expected postretirement benefit obligation (EPBO) is the actuarial present value (APV) as of a specific date of the benefits expected to be paid to the employee, beneficiaries, and covered dependents. Measurement of the EPBO is based on the following:

1. Expected amount and timing of future benefits
2. Expected future costs
3. Extent of cost sharing (contributions, deductibles, coinsurance provisions, etc.) between employer, employee, and others (i.e., the government). The APV of employee contributions reduces the APV of the EPBO. Obligations to return employee contributions, plus interest if applicable, are recognized as a component of EPBO.

The EPBO includes an assumed salary progression for a pay-related plan. Future compensation levels represent the best estimate after considering the individual employees involved, general price levels, seniority, productivity, promotions, indirect effects, and the like.

The APBO is the APV as of a specific date of all future benefits attributable to service by an employee to that date. It represents the portion of the EPBO earned to date. After full eligibility is attained, the APBO equals the EPBO.

The APBO also includes an assumed salary progression for a pay-related plan. Thus, this term is more comparable to the projected benefit obligation (PBO) under ASC 715-30. The accumulated benefit obligation in ASC 715-30 has no counterpart in ASC 715-60.

Net periodic postretirement benefit costs include the following components:

1. Service cost—APV of benefits attributable to the current period (i.e., the portion of the EPBO earned this period)
2. Interest cost—Interest on the APBO
3. Actual return on plan assets

4. Gain or loss
  5. Amortization of unrecognized prior service cost.
- (ASC 715-60-35-9)

Note that return on plan assets is included in the periodic expense determination, consistent with accounting for defined benefit pension plans. However, in virtually all cases, OPEB plans are unfunded, and thus there will be no asset return. If a trust has been established to fund these benefits, it does not necessarily have to be “bankruptcy proof,” or insulated completely from the claims of general creditors, to qualify as plan assets in accordance with ASC 715-60-55. On the other hand, assets held in a trust that explicitly makes them available to the general creditors in bankruptcy do not qualify as plan assets under ASC 715-60. The funded status of other postretirement defined benefit plans must be formally reported in the statement of financial position, as described above.

Service costs and interest costs are defined and measured in the same manner by both ASC 715-60 and ASC 715-30. However, under ASC 715-60, interest increases the APBO while under ASC 715-30, interest increases the PBO.

Under ASC 715-60, a single method is required to be followed in measuring and recognizing the net periodic cost and the liability involved. That method attributes the EPBO to employee service rendered to the full eligibility date.

**Assumptions.** ASC 715-60 requires the use of explicit assumptions using the best estimates available of the plan’s future experience, solely with regard to the individual assumption under consideration. Plan continuity is to be presumed, unless there is evidence to the contrary. Principal actuarial assumptions include:

- discount rates,
- present value factors,
- retirement age,
- participation rates (contributory plans),
- salary progression (pay-related plans), and
- probability of payment (turnover, dependency status, mortality).

Present value factors for health care OPEB include:

- cost trend rates,
- Medicare reimbursement rates, and
- per capita claims cost by age.

Current interest rates, as of the measurement date, are used for discount rates in present value calculations. Examples include high-quality, fixed-income investments with similar amounts and timing and interest rates at which the postretirement benefit obligations could be settled. The EPBO, APBO, service cost, and interest cost components use assumed discount rates.

The expected long-term rate of return on plan assets is an assumption about the average rate of return expected on contributions during the period and on existing plan assets. Current returns on plan assets and reinvestment returns are considered in arriving at the rate to be used. Related income taxes, if applicable, reduce the rate. Expected return on plan assets and the fair value of plan assets use this rate in their calculation. Since the Employee Retirement Security Act of 1974 (ERISA) does not require OPEB plans to be funded via the separate trust vehicles used for pension plans, OPEB plans are often unfunded. Thus, there are no “plan assets.” Instead, the sponsor pays benefits directly, as they become due, from general corporate assets.

**Example**

A sample illustration of the basic accounting for OPEB as established by ASC 715-60 follows. Kinetic Corporation established a new OPEB plan as of January 1, 20X5. Although the plan was new, it retroactively credited employees for their years of service to Kinetic prior to the establishment of the plan.

All employees had been hired at age 30 and become fully eligible for benefits at age 60. The plan is unfunded and, thus, there are no plan assets. The first calculation is the determination of the unrecognized transition obligation (UTO).

**Kinetic Corporation**  
**December 31, 20X4**

<u>Employee</u>	<u>Age</u>	<u>Years of service</u>	<u>Total years when fully eligible</u>	<u>Expected retirement age</u>	<u>Remaining service to retirement</u>	<u>EPBO</u>	<u>APBO</u>
A	35	5	30	60	25	\$ 14,000	\$ 2,333
B	40	10	30	60	20	22,000	7,333
C	45	15	30	60	15	30,000	15,000
D	50	20	30	60	10	38,000	25,333
E	55	25	30	65	10	46,000	38,333
F	60	30	30	65	5	54,000	54,000
G	65	RET	—	—	—	46,000	46,000
H	70	RET	—	—	—	38,000	38,000
					<u>85</u>	<u>\$288,000</u>	<u>\$226,332</u>

**Explanations**

1. EPBO is usually determined by an actuary, although it can be calculated if complete data are available.
2. APBO is calculated using the EPBO. Specifically, it is EPBO × (Years of service/Total years when fully eligible).
3. The UTO is the APBO at 12/31/X1, since there are no plan assets to be deducted. The \$226,332 can be amortized over the average remaining service to retirement of 14.17 (85/6) years or an optional period of 20 years, if longer. Kinetic selected the 20-year period of amortization.
4. Note that Employee F has attained full eligibility for benefits and yet plans to continue working.
5. Note that the above 20X4 table is used in the calculation of the 20X5 components of OPEB cost that follows.

After the establishment of the UTO, the next step is to determine the benefit cost for the year ended December 31, 20X5. This calculation follows the framework established by ASC 715-30. The discount rate is assumed to be 10%.

**Kinetic Corporation**  
**OPEB Cost**  
**December 31, 20X5**

1. Service cost	\$ 5,500
2. Interest cost	22,633
3. Actual return on plan assets	—
4. Gain or loss	—
5. Amortization of unrecognized prior service cost	—
6. Amortization of UTO	11,317
Total OPEB cost	<u>\$ 39,450</u>

### *Explanations*

1. Service cost calculation uses only employees not yet fully eligible for benefits.

<i>Employee</i>	[a] <u>12/31/X1 EPBO</u>	[b] <u>Total years when fully eligible</u>	[a ÷ b] <u>Service cost</u>
A	\$14,000	30	\$467
B	22,000	30	733
C	30,000	30	1,000
D	38,000	30	1,267
E	46,000	30	<u>1,533</u>
			\$5,000
	Interest for 20X0 ( $\$5,000 \times 10\%$ )		<u>500</u>
	Total service cost		<u><u>\$5,500</u></u>

2. Interest cost is the 12/31/X4 APBO of  $\$226,332 \times 10\% = \$22,633$ .
3. There are no plan assets so there is no return.
4. There is no gain (loss) since there are no changes yet.
5. There is no unrecognized prior service cost initially.
6. Amortization of UTO is the 12/31/X4 UTO of  $\$226,332/20$ -year optional election = \$11,317.

After calculation of the 20X5 benefit cost, the next step is to project the EPBO and APBO for December 31, 20X5. Assuming no changes, it is based on the December 31, 20X4 actuarial measurement and it is calculated as shown earlier in the determination of the UTO.

### Kinetic Corporation

December 31, 20X5

<i>Employee</i>	<i>Age</i>	<i>Years of service</i>	<i>Total years when fully eligible</i>	<i>EPBO</i>	<i>APBO</i>
A	36	6	30	\$15,400	\$3,080
B	41	11	30	24,200	8,873
C	46	16	30	33,000	17,600
D	51	21	30	41,800	29,260
E	56	26	30	50,600	43,853
F	61	31	—	59,400	59,400
G	66	RET	—	44,620	44,620
H	71	RET	—	<u>36,860</u>	<u>36,860</u>
				<u><u>\$305,880</u></u>	<u><u>\$243,546</u></u>

Changes in experience or assumptions will result in gains (losses). The gain (loss) is measured by the difference resulting in the APBO or the plan assets from that projected. However, except for the effects of a decision to temporarily deviate from the substantive plan, these gains or losses have no impact in the year of occurrence. They are deferred and amortized as in ASC 715-30. Amortization of unrecognized net gain (loss) is included as a component of net postretirement cost for a year if, as of the beginning of the year, it exceeds 10% of the greater of the APBO or the market-related value of plan assets. The minimum amortization is the excess divided by the remaining average service period of active plan participants. A systematic method of amortization that amortizes a greater amount, is applied consistently to both gains and losses, and is disclosed may also be used. If gains (losses) are recognized immediately, special rules of offsetting may be required.

**Effect of the prescription drug benefit on OPEB computations.** The Medicare Prescription Drug, Improvement, and Modernization Act of 2003 (the Act) introduced a prescription drug benefit under Medicare (Medicare Part D), as well as a federal subsidy to sponsors of retiree health care benefit plans that provide a benefit that is at least actuarially equivalent to Medicare Part D. Under ASC 715-60, the effects of the Act on current period measurements of postretirement benefit costs and the APBO must be accounted for, if defined criteria are met.

The guidance regarding accounting for the subsidiary set forth in ASC 715-60 applies only to sponsors of a single-employer defined benefit postretirement health care plan for which (1) the employers have concluded that prescription drug benefits available under the plan to some or all participants for some or all future years are “actuarially equivalent” to Medicare Part D and thus qualify for the subsidy under the Act, and (2) the expected subsidiaries will offset or reduce the employers’ shares of the cost of the underlying postretirement prescription drug coverage on which the subsidies are based. ASC 715-60 also provides guidance for disclosures about the effects of the subsidy for employers that sponsor postretirement health care benefit plans that provide prescription drug coverage but for which the employers have not yet been able to determine actuarial equivalency.

The central question raised has been whether a subsidy is substantively similar to other Medicare benefits that existed when ASC 715-60 was issued—and therefore to be accounted for as a reduction of the APBO and net periodic postretirement benefit cost—or whether the subsidy represents a payment to the employer that is determined by reference to its plan’s benefit payments but is not, in and of itself, a direct reduction of postretirement benefit costs. A secondary issue pertains to the timing of accounting recognition of the subsidy.

FASB concluded that the former interpretation is the correct one. That is, measures of the APBO and net periodic postretirement benefit cost on or after the date of enactment are to reflect the effects of the Act. When an employer initially accounts for the subsidy, its effect on the APBO is to be accounted for as an actuarial experience gain. Additionally, the subsidy reduces service cost when it is recognized as a component of net periodic postretirement benefit cost. If the estimated expected subsidy changes, the effect is to be treated as an actuarial experience gain or loss.

Plan amendments will also affect the reporting of OPEB cost and the APBO. If prescription drug benefits currently available under an existing plan are deemed not actuarially equivalent as of the date of enactment of the Act, but the plan is later amended to provide actuarially equivalent benefits, the direct effect of the amendment on the APBO and the effect on the APBO from any resulting subsidy to which the employer is expected to be entitled as a result of the amendment are to be combined, and deemed to be an actuarial experience gain if it reduces APBO. On the other hand, if the combined effect increases the APBO, it is deemed to be prior service cost that is to be accounted for consistent with ASC 715-60.

Additionally, according to ASC 715-60, if a plan that provides prescription drug benefits that previously were deemed actuarially equivalent under the Act is subsequently amended to reduce its prescription drug coverage such that the coverage is not considered actuarially equivalent, any actuarial experience gain related to the subsidy previously recognized is unaffected. The combined net effect on the APBO of (1) the subsequent plan amendment that reduces benefits under the plan and thus disqualifies the benefits as actuarially equivalent, and (2) the elimination of the subsidy is to be accounted for as prior service cost (credit) as of the date the amendment is adopted.

In the periods in which the subsidy affects the employer’s accounting for the plan, this will have no effect on any plan-related temporary difference accounted for under ASC 740, because the subsidy is exempt from federal taxation.

There may be a time lag before the employer is able to determine whether the benefits provided by its plan are actuarially equivalent. During the interim period, it is required to disclose: the existence of the Act and the fact that measures of the APBO or net periodic postretirement benefit cost do not reflect any amount associated with the subsidy because the employer is unable to conclude whether the benefits provided by the plan are actuarially equivalent to Medicare Part D under the Act.

In interim and annual financial statements for the first period in which an employer includes the effects of the subsidy in measuring the APBO and the first period in which an employer includes the effects of the subsidy in measuring net periodic postretirement benefit cost, it is required to disclose the following:

- a. The reduction in the APBO for the subsidy related to benefits attributed to past service.
- b. The effect of the subsidy on the measurement of net periodic postretirement benefit cost for the current period. That effect includes (1) any amortization of the actuarial experience gain in (a) as a component of the net amortization called for by ASC 715-60, (2) the reduction in current period service cost due to the subsidy, and (3) the resulting reduction in interest cost on the APBO as a result of the subsidy.
- c. Any other disclosures required by ASC 715-20, specifically disclosure of an explanation of any significant change in the benefit obligation or plan assets not otherwise apparent in the other disclosures required by that standard.

When ASC 715-60 is initially adopted, a remeasurement of the plan's assets and APBO, including the effects of the subsidy, if applicable, as well as the other effects of the Act, is to be made as of the earlier of (1) the plan's measurement date that normally would have followed enactment of the Act, or (2) the end of the employer's interim or annual period that includes the date of the Act's enactment. Alternatively, employers are permitted, but not required, to perform that remeasurement as of the date of enactment. The measurement of the APBO is to be based on the plan provisions in place on the measurement date (i.e., later amendments are not to be anticipated in the computation).

### **Deferred Compensation Contracts**

If the aggregate deferred compensation contracts with individual employees are equivalent to a pension plan, the contracts are accounted for according to ASC 715-30 and ASC 715-60. All other deferred compensation contracts are accounted for according to ASC 710.

ASC 715-60 states that the terms of the individual contract will govern the accrual of the employee's obligation for deferred compensation and the cost is to be attributed over the employee service period until full eligibility is attained.

### **ASC 715-70, *Defined Contribution Plans***

In the typical defined contribution plan, the contribution is either discretionary or derived from a formula, and that amount is the expense to be reported in the sponsor's financial statements for the year. Benefits are generally paid from the pool of accumulated contributions and are limited to the plan assets available to pay them. If, however, the defined contribution plan has defined benefits, the provision is calculated as required under ASC 715-30.

### **ASC 715-80, *Multiemployer Pension Plans***

A multiemployer plan is one to which two or more unrelated employers contribute, often pursuant to collectively bargained, union-sponsored agreements. For essentially practical reasons,

the Codification requires that the contribution for the period be recognized as net pension cost and that any contributions due and unpaid be recognized as a liability. Thus, most of the complexities arising from smoothing are avoided in accounting for sponsors participating in multiemployer plans. Assets of all the employers sponsoring this type of plan are usually commingled and not segregated or restricted. A Board of Trustees usually administers these plans. If there is a withdrawal of an employer from this type of plan and if an obligation to make up any funding deficiency is either probable or reasonably possible, ASC 450 applies.

Some plans are, in substance, a pooling or aggregation of single-employer plans and are ordinarily without collective-bargaining agreements. Contributions are usually based on a specified benefit formula. These plans are not considered multiemployer, and the accounting is based on each employer's respective interest in the plan.

Per ASC 715-80-55-2, the existence of an executed agreement does not require recognition by an employer of a liability beyond currently due and unpaid contributions.

## PERSPECTIVE AND ISSUES

---

### Subtopics

ASC 718, *Compensation—Stock Compensation*, provides guidance on share-based payments to employees and contains six subtopics:

- ASC 718-10, *Overall*, contains the high-level objectives and general guidance for the Topic
- ASC 718-20, *Awards Classified as Equity*, deals with share-based awards to employees classified as equity
- ASC 718-30, *Awards Classified as Liabilities*, deals with share-based awards to employees classified as liabilities
- ASC 718-40, *Employee Stock Ownership Plans*, contains the following subsections:
  - General
  - Leveraged employee stock ownership plans
  - Nonleveraged employee stock ownership plans
- ASC 718-50, *Employee Share Purchase Plans*, contains guidance for compensatory and noncompensatory plans
- ASC 718-60, *Income Taxes*, addresses accounting for income taxes related to share-based payment arrangements.

### Scope and Scope Exceptions

ASC 718 applies to all entities and to all share-based payment transactions where the entity acquires employee services by issuing or offering to issue equity instruments or incurring liabilities to an employee that meet these conditions:

1. The amounts are based in whole or in part on the price of the entity's equity instruments
2. The awards require or may require settlement by issuing the entity's equity instruments.

If the purpose of awarding the shares is other than compensation, ASC 718 does not apply. ASC 718 does not apply to share-based payments for other than employee services.

### Technical Alert

**ASU 2016-09.** In March 2016, the FASB issued ASU 2016-09, *Compensation—Stock Compensation (Topic 718): Improvements to Employee Share-Based Payment Accounting*. The Update is part of the FASB's Simplification Initiative.

**Scope.** The ASU affects all entities that issue share-based payment awards to employees.

**Guidance.** The FASB selected several areas of ASC 718 for simplification. The new guidance will change how entities treat certain aspects of share-based payments to employees. The guidance provides two practical expedients for nonpublic entities. Below is a summary of the areas targeted and a comparison with existing requirements and the new ASU 2016-09 requirements.

Area for Simplification	Existing Guidance	ASU 2016-09 Changes
Minimum statutory tax withholdings	Classify as a liability if the fair value of the shares withheld or could be withheld is greater than the employer's minimum statutory withholding requirement.	Classify as equity if fair value of shares withheld or could be withheld is less than or equal to amount calculated using maximum statutory tax rate in the employees' applicable jurisdictions.
Forfeitures	Estimate and adjust when actual forfeitures are likely to be different.	Choose accounting policy election to: <ul style="list-style-type: none"> <li>• recognize as the forfeitures occur, or</li> <li>• estimate and adjust, as currently required.</li> </ul>
Accounting for income taxes—additional paid-in capital (APIC) pool	Record excess tax benefits in APIC and record tax deficiencies in: <ul style="list-style-type: none"> <li>• APIC if a pool is available, or</li> <li>• Income statement if pool is not available.</li> </ul>	Record all excess tax benefits and tax deficiencies as income tax expense or benefit in income statement (i.e., eliminate APIC pool).
Recognition of excess tax benefits	Not recognized until realized, that is, reduce taxes payable.	Recognized upon option exercise or share vesting.
Cash flow classification of excess tax benefits	Cash inflows from financing activity; cash outflows from operating activity.	Operating activity.
Cash flow presentation of income taxes paid to a tax authority when shares are withheld to satisfy the entity's statutory income tax withholding obligation	No current guidance.	Classify as a financing activity.
Intrinsic value—practical expedient for nonpublic entities	Fair value for liability-classified awards unless the entity originally elected intrinsic value upon adoption of FAS 123R or first time issuing liability awards.	Entity may make one-time election to change to intrinsic value, even if it is already accounting for liability awards at fair value under ASC 718.
Expected term—practical expedient for nonpublic entities	The entity should consider historical exercise behavior, if available, and other pertinent factors.	The entity may make a simplified estimate of expected term for certain awards.

**Effective dates.** The ASU is effective as follows:

- For public entities, annual periods beginning after December 15, 2016, and interim periods within those annual periods.
- For all other entities, annual periods beginning after December 15, 2017, and interim periods within annual periods beginning after December 15, 2018.
- Early adoption is permitted. Entities that elect early adoption must adopt all amendments in the same period.

**Implementation.** The table below summarizes the implementation approach available for the various amendments.

Amendment	Implementation approach
The timing of when excess tax benefits are recognized	Modified retrospective method with a cumulative-effect adjustment to equity at the beginning of the adoption period
Minimum statutory withholding requirements	Modified retrospective method with a cumulative-effect adjustment to equity at the beginning of the adoption period
Forfeitures	Modified retrospective method with a cumulative-effect adjustment to equity at the beginning of the adoption period
Intrinsic value	Modified retrospective method with a cumulative-effect adjustment to equity at the beginning of the adoption period
Presentation of employee taxes paid on the statement of cash flows when an employer withholds shares to meet the minimum statutory withholding requirement	Retrospective method
Recognition of excess tax benefits and tax deficiencies in the income statement	Prospective method
Practical expedient for estimating expected term	Prospective method
Presentation of excess tax benefits on the statement of cash flows	Prospective or retrospective method

## Overview

The economic substance of stock-based compensation is to provide compensation, resulting in an expense that should be reported by the entity using the fair value method of accounting. ASC 718 requires fair value accounting for almost all share-based payment plans.

ASC 718-10 provides guidance applicable to all share-based payment arrangements with employees. ASC 718-10, 718-20, and 718-30 are interrelated. Preparers should look to the general guidance in ASC 718-10 and then ASC 718-20 for additional guidance on awards classified as equity and ASC 718-30 for additional guidance on awards classified as liabilities. ASC 718-40 contains the accounting for employers' contributions to employee stock ownership plans (ESOP). This includes the measurement of compensation cost and the accounting for dividends paid on unallocated shares.

## DEFINITIONS OF TERMS

---

Source: ASC 718-20. See Appendix, *Definition of Terms*, for other terms relevant to this Topic: Call Option, Employee Stock Ownership Plan (ESOP), Fair Value, Nonpublic Entity, Option, Probable, Public Entity, Purchased Call Option, Related Party, and Securities and Exchange Commission.

**Allocated Shares.** Allocated shares are shares in an employee stock ownership plan trust that have been assigned to individual participant accounts based on a known formula. Internal Revenue Service (IRS) rules require allocations to be nondiscriminatory generally based on

compensation, length of service, or a combination of both. For any particular participant such shares may be vested, unvested, or partially vested.

**Award.** The collective noun for multiple instruments with the same terms and conditions granted at the same time either to a single employee or to a group of employees. An award may specify multiple vesting dates, referred to as graded vesting, and different parts of an award may have different expected terms. References to an award also apply to a portion of an award.

**Blackout Period.** A period of time during which exercise of an equity share option is contractually or legally prohibited.

**Calculated Value.** A measure of the value of a share option or similar instrument determined by substituting the historical volatility of an appropriate industry sector index for the expected volatility of a nonpublic entity's share price in an option-pricing model.

**Closed-form Model.** A valuation model that uses an equation to produce an estimated fair value. The Black-Scholes-Merton formula is a closed-form model. In the context of option valuation, both closed-form models and lattice models are based on risk-neutral valuation and a contingent claims framework. The payoff of a contingent claim, and thus its value, depends on the value(s) of one or more other assets. The contingent claims framework is a valuation methodology that explicitly recognizes that dependency and values the contingent claim as a function of the value of the underlying asset(s). One application of that methodology is risk-neutral valuation in which the contingent claim can be replicated by a combination of the underlying asset and a risk-free bond. If that replication is possible, the value of the contingent claim can be determined without estimating the expected returns on the underlying asset. The Black-Scholes-Merton formula is a special case of that replication.

**Combination Award.** An award with two or more separate components, each of which can be separately exercised. Each component of the award is actually a separate award, and compensation cost is measured and recognized for each component.

**Committed-to-be-Released Shares.** Committed-to-be-released shares are shares that, although not legally released, will be released by a future scheduled and committed debt service payment and will be allocated to employees for service rendered in the current accounting period. The period of employee service to which shares relate is generally defined in the employee stock ownership plan documents. Shares are legally released from suspense and from serving as collateral for employee stock ownership plan debt as a result of payment of debt service. Those shares are required to be allocated to participant accounts as of the end of the employee stock ownership plan's fiscal year. Formulas used to determine the number of shares released can be based on either of the following:

- a. The ratio of the current principal amount to the total original principal amount (in which case unearned employee stock ownership plan shares and debt balance will move in tandem)
- b. The ratio of the current principal plus interest amount to the total original principal plus interest to be paid.

Shares are released more rapidly under the second method than under the first. Tax law permits the first method only if the employee stock ownership plan debt meets certain criteria.

**Derived Service Period.** A service period for an award with a market condition that is inferred from the application of certain valuation techniques used to estimate fair value. For example, the derived service period for an award of share options that the employee can exercise only if the share price increases by 25% at any time during a five-year period can be

inferred from certain valuation techniques. In a lattice model, that derived service period represents the duration of the median of the distribution of share price paths on which the market condition is satisfied. That median is the middle share price path (the midpoint of the distribution of paths) on which the market condition is satisfied. The duration is the period of time from the service inception date to the expected date of satisfaction (as inferred from the valuation technique). If the derived service period is three years, the estimated requisite service period is three years, and all compensation cost would be recognized over that period, unless the market condition was satisfied at an earlier date. Compensation cost would not be recognized beyond three years even if after the grant date the entity determines that it is not probable that the market condition will be satisfied within that period. Further, an award of fully vested, deep out-of-the-money share options has a derived service period that must be determined from the valuation techniques used to estimate fair value. (See Explicit Service Period, Implicit Service Period, and Requisite Service Period.)

**Direct Loan.** A direct loan is a loan made by a lender other than the employer to the employee stock ownership plan. Such loans often include some formal guarantee or commitment by the employer.

**Economic Interest in an Entity.** Any type or form of pecuniary interest or arrangement that an entity could issue or be a party to, including equity securities; financial instruments with characteristics of equity, liabilities, or both; long-term debt and other debt-financing arrangements; leases; and contractual arrangements such as management contracts, service contracts, or intellectual property licenses.

**Equity Restructuring.** A nonreciprocal transaction between an entity and its shareholders that causes the per-share fair value of the shares underlying an option or similar award to change, such as a stock dividend, stock split, spinoff, rights offering, or recapitalization through a large, nonrecurring cash dividend.

**Excess Tax Benefit.** The realized tax benefit related to the amount (caused by changes in the fair value of the entity's shares after the measurement date for financial reporting) of deductible compensation cost reported on an employer's tax return for equity instruments in excess of the compensation cost for those instruments recognized for financial reporting purposes.

**Explicit Service Period.** A service period that is explicitly stated in the terms of a share-based payment award. For example, an award that vests after three years of continuous employee service from a given date (usually the grant date) has an explicit service period of three years. See Derived Service Period, Implicit Service Period, and Requisite Service Period.

**Freestanding Financial Instrument.** A financial instrument that meets either of the following conditions:

1. It is entered into separately and apart from any of the entity's other financial instruments or equity transactions.
2. It is entered into in conjunction with some other transaction and is legally detachable and separately exercisable.

**Grant Date.** The date at which employer and employee reach a mutual understanding of the key terms and conditions of a share-based payment award. The employer becomes contingently obligated on the grant date to issue equity instruments or transfer assets to an employee who renders the requisite service. Awards made under an arrangement that is subject to shareholder approval are not deemed to be granted until that approval is obtained, unless approval is essentially

a formality (or perfunctory)—for example, if management and the members of the board of directors control enough votes to approve the arrangement. Similarly, individual awards that are subject to approval by the board of directors, management, or both are not deemed to be granted until all such approvals are obtained. The grant date for an award of equity instruments is the date that an employee begins to benefit from, or be adversely affected by, subsequent changes in the price of the employer's equity shares. ASC 718-10-25-5 provides guidance on determining the grant date. See Service Inception Date.

**Implicit Service Period.** A service period that is not explicitly stated in the terms of a share-based payment award but that may be inferred from an analysis of those terms and other facts and circumstances. For instance, if an award of share options vests upon the completion of a new product design, which is deemed probable in 18 months, the implicit service period is 18 months. See Derived Service Period, Explicit Service Period, and Requisite Service Period.

**Indirect Loan.** An indirect loan is a loan made by the employer to the employee stock ownership plan, with a related outside loan to the employer.

**Intrinsic Value.** The amount by which the fair value of the underlying stock exceeds the exercise price of an option. For example, an option with an exercise price of \$20 on a stock whose current market price is \$25 has an intrinsic value of \$5. (A nonvested share may be described as an option on that share with an exercise price of zero. Thus, the fair value of a share is the same as the intrinsic value of such an option on that share.)

**Lattice Model.** A model that produces an estimated fair value based on the assumed changes in prices of a financial instrument over successive periods of time. The binomial model is an example of a lattice model. In each time period, the model assumes that at least two price movements are possible. The lattice represents the evolution of the value of either a financial instrument or a market variable for the purpose of valuing a financial instrument. In this context, a lattice model is based on a risk-neutral valuation and a contingent claims framework. See Closed-form Model for an explanation of the terms *risk-neutral valuation* and *contingent claims framework*.

**Market Condition.** A condition affecting the exercise price, exercisability, or other pertinent factors used in determining the fair value of an award under a share-based payment arrangement that relates to the achievement of either of the following:

1. A specified price of the issuer's shares or a specified amount of intrinsic value indexed solely to the issuer's shares
2. A specified price of the issuer's shares in terms of a similar (or index of similar) equity security (securities). The term "similar," as used in this definition, refers to an equity security of another entity that has the same type of residual rights. For example, common stock of one entity generally would be similar to the common stock of another entity for this purpose.

**Measurement Date.** The date at which the equity share price and other pertinent factors, such as expected volatility, that enter into measurement of the total recognized amount of compensation cost for an award of share-based payment fixed.

**Modification.** A change in any of the terms or conditions of a share-based payment award.

**Nonvested Shares.** Shares that an entity has not yet issued because the agreed upon consideration, such as employee services, has not yet been received. Nonvested shares cannot be sold. The restriction on sale of nonvested shares is due to the forfeitability of the shares if specified events occur (or do not occur).

**Performance Condition.** A condition affecting the vesting, exercisability, exercise price, or other pertinent factors used in determining the fair value of an award that relates to both of the following:

1. An employee's rendering service for a specified (either explicitly or implicitly) period of time
2. Achieving a specified performance target that is defined solely by reference to the employer's own operations (or activities).

Attaining a specified growth rate in return on assets, obtaining regulatory approval to market a specified product, selling shares in an initial public offering or other financing event, and a change in control are examples of performance conditions. A performance target also may be defined by reference to the same performance measure of another entity or group of entities. For example, attaining a growth rate in (EPS) that exceeds the average growth rate in EPS of other entities in the same industry is a performance condition. A performance target might pertain either to the performance of the entity as a whole or to some part of the entity, such as a division or an individual employee.

**Reload Feature and Reload Option.** A reload feature provides for automatic grants of additional options whenever an employee exercises previously granted options using the entity's shares, rather than cash, to satisfy the exercise price. At the time of exercise using shares, the employee is automatically granted a new option, called a reload option, for the shares used to exercise the previous option.

**Replacement Award.** An award of share-based compensation that is granted (or offered to grant) concurrently with the cancellation of another award.

**Requisite Service Period.** The period or periods during which an employee is required to provide service in exchange for an award under a share-based payment arrangement. The service that an employee is required to render during that period is referred to as the requisite service. The requisite service period for an award that has only a service condition is presumed to be the vesting period, unless there is clear evidence to the contrary. If an award requires future service for vesting, the entity cannot define a prior period as the requisite service period. Requisite service periods may be explicit, implicit, or derived, depending on the terms of the share-based payment award.

**Restriction.** A contractual or governmental provision that prohibits sale (or substantive sale by using derivatives or other means to effectively terminate the risk of future changes in the share price) of an equity instrument for a specified period of time.

**Service Condition.** A condition affecting the vesting, exercisability, exercise price, or other pertinent factors used in determining the fair value of an award that depends solely on an employee rendering service to the employer for the requisite service period. A condition that results in the acceleration of vesting in the event of an employee's death, disability, or termination without cause is a service condition.

**Service Inception Date.** The date at which the requisite service period begins. The service inception date usually is the grant date, but the service inception date may differ from the grant date (see Example 6 [see ASC 718-10-55-107]).

**Settlement of an Award.** An action or event that irrevocably extinguishes the issuing entity's obligation under a share-based payment award. Transactions and events that constitute settlements include the following:

1. Exercise of a share option or lapse of an option at the end of its contractual term
2. Vesting of shares

3. Forfeiture of shares or share options due to failure to satisfy a vesting condition
4. An entity's repurchase of instruments in exchange for assets or for fully vested and transferable equity instruments.

The vesting of a share option is not a settlement because the entity remains obligated to issue shares upon exercise of the option.

**Share-based Payment Arrangement.** An arrangement under which either of the following conditions is met:

1. One or more suppliers of goods or services (including employees) receive awards of equity shares, equity share options, or other equity instruments
2. The entity incurs liabilities to suppliers that meet either of the following conditions:
  - a. The amounts based, at least in part, on the price of the entity's shares or other equity instruments. (The phrase at least in part is used because an award may be indexed to both the price of the entity's shares and something other than either the price of the entity's shares or a market, performance, or service condition.)
  - b. The awards require or may require settlement by issuance of the entity's shares.

The term shares includes various forms of ownership interest that may not take the legal form of securities (for example, partnership interests), as well as other interests, including those that are liabilities in substance but not in form. Equity shares refers only to shares that are accounted for as equity. Also called *share-based compensation arrangements*.

**Share-based Payment Transaction.** A transaction under a share-based payment arrangement, including a transaction in which an entity acquires goods or services because related parties or other holders of economic interest in that entity awards a share-based payment to an employee or other supplier of goods or services for the entity's benefit. Also called *share-based compensation transactions*.

**Share Option.** A contract that gives the holder the right, but not the obligation, either to purchase (to call) or to sell (to put) a certain number of shares at a predetermined price for a specified period of time. Most share options granted to employees under share-based compensation arrangements are call options, but some may be put options.

**Share Unit.** A contract under which the holder has the right to convert each unit into a specified number of shares of the issuing entity.

**Short-term Inducement.** An offer by the entity that would result in modification of an award to which an award holder may subscribe for a limited period of time.

**Suspense Shares.** The shares initially held by the employee stock ownership plan in a suspense account are called suspense shares. Suspense shares are shares that have not been released, committed to be released, or allocated to participant accounts. Suspense shares generally collateralize employee stock ownership plan debt.

**Tandem Award.** An award with two or more components in which exercise of one part cancels the other(s).

**Terms of a Share-based Payment Award.** The contractual provisions that determine the nature and scope of a share-based payment award. For example, the exercise price of share options is one of the terms of an award of share options. As indicated in ASC 718-10-25-5, the written terms of a share-based payment award and its related arrangement, if any, usually provide the best evidence of its terms. However, an entity's past practice or other factors may indicate that some aspects of the substantive terms differ from the written terms. The substantive terms of a share-based payment award as those terms are mutually understood by the entity and a party (either an

employee or a nonemployee) who receives the award, provide the basis for determining the rights conveyed to a party and the obligations imposed on the issuer, regardless of how the award and related arrangement, if any, are structured. See ASC 718-10-30-5.

**Time Value.** The portion of the fair value of an option that exceeds its intrinsic value. For example, a call option with an exercise price of \$20 on a stock whose current market price is \$25 has intrinsic value of \$5. If the fair value of that option is \$7, the time value of the option is \$2 (\$7 – \$5).

**Vest.** To earn the rights to. A share-based payment award becomes vested at the date that the employee's right to receive or retain shares, other instruments, or cash under the award is no longer contingent on satisfaction of either a service condition or a performance condition. Market conditions are not vesting conditions.

The stated vesting provisions of an award often establish the requisite service period, and an award that has reached the end of the requisite service period is vested. However, as indicated in the definition of requisite service period, the stated vesting period may differ from the requisite service period in certain circumstances. Thus, the more precise (but cumbersome) terms would be options, shares, or awards for which the requisite service has been rendered and end of the requisite service period.

**Volatility.** A measure of the amount by which a financial variable such as a share price has fluctuated (historical volatility) or is expected to fluctuate (expected volatility) during a period. Volatility also may be defined as a probability-weighted measure of the dispersion of returns about the mean. The volatility of a share price is the standard deviation of the continuously compounded rates of return on the share over a specified period. That is the same as the standard deviation of the differences in the natural logarithms of the stock prices plus dividends, if any, over the period. The higher the volatility, the more the returns on the shares can be expected to vary—up or down. Volatility is typically expressed in annualized terms.

## **CONCEPTS, RULES, AND EXAMPLES**

---

### **Accounting for Share-Based Payments**

ASC 718 addresses share-based payments issued to employees. It covers plans for employees that convey shares of:

- the employer's stock,
- derivatives (such as options) related to the employer's shares, or
- cash in amounts tied to the value of the employer's shares.

All share-based plans are considered compensatory unless the benefit to employees is no greater than that which is available to shareholders generally. The benefit to recipients is assessed based both on the discount from market price and the number of shares they are eligible to buy. Virtually all plans will be considered compensatory for accounting purposes, including employee stock purchase plans that are noncompensatory under the federal tax laws.

Additionally, ASC 718 describes:

1. the prescribed pattern of compensation cost recognition,
2. the accounting for employee stock purchase plans, and
3. accounting for the income tax effects of share-based transactions.

It also requires that excess tax benefits be reported in the cash flow statement as a financing activity, rather than as an operating activity (these are currently reported as a reduction of income taxes paid).

With stock compensation plans, measurement of compensation expense is the primary issue for reporters in stock compensation. The objective of measurement of the plans is to estimate, as of the grant date, the fair value of the award that an employee earns as a result of requisite service and satisfying vesting requirements. The estimate of fair value reflects transferability and other restrictions if they are in effect when the award vests. Compensation cost is recognized only for those awards that vest (which obviously demands that estimates be made).

**Classifying awards as liabilities or equity.** ASC 718 requires that the classification criteria of ASC 480 be applied in determining whether an instrument granted to an employee is a liability or equity. In particular, some stock-based compensation awards that call for settlement by issuing an entity's own equity instruments may be classified as liabilities if they meet the criteria of ASC 480.

**Measurement of equity-classified awards.** Equity-classified awards that are publicly traded and have observable market prices should be valued using the market price. Few, if any, employee stock compensation awards (i.e., employee stock options) would have this characteristic, however. If not publicly traded, equity-classified awards are valued using a model such as the binomial or the Black-Scholes-Merton.

*Grant date.* The grant date is used to fix the value of equity-based awards. This is because recognizing subsequent changes in compensation based on post-grant-date changes to the value of the underlying equity would be equivalent to recognizing changes in the value of the entity's own equity shares in earnings, which is prohibited under GAAP. Also, grant date is when the parties (the entity and its employees) have fixed the terms of their arrangement, which provides a meaningful measure of the cost to be incurred by the entity. This differs importantly from the situation with equity-based compensation that is classified as a liability because it is to be settled for cash (e.g., cash stock appreciation rights, or SARs). In that scenario, the entity is obligated to distribute assets, and the relevant measure of compensation cost, ultimately, is the amount of assets disbursed.

ASC 718 sets forth criteria for determining that a share-based payment award has been granted. One of the criteria is a mutual understanding by the employer and employee of the key terms and conditions of a share-based payment award. However, the "mutual" aspect may not occur until some time after the formal grant, when actual communications between employer and employee are held, sometimes not until, for example, a regularly scheduled performance review that might not occur for weeks or months thereafter. To address these practical concerns, guidance provides that, assuming all other criteria in the grant date definition have been met, a mutual understanding of the key terms and conditions of an award to an individual employee is presumed to exist at the date the award is approved in accordance with the relevant corporate governance requirements (that is, by the board or management with the relevant authority), if both the following conditions are met:

1. The award is a unilateral grant and, therefore, the recipient does not have the ability to negotiate the key terms and conditions of the award with the employer, and
  2. It is expected that the key terms and conditions of the award will be communicated to an individual recipient within a relatively short time period from the date of approval.
- (ASC 718-10-25-5)

**Valuation models.** In the absence of an observable market price for an award—often the reality for employee share options—reporting entities are required to use a valuation method that takes into account the factors set forth in the standard.

While ASC 718 does not dictate a valuation model, FASB believes and prefers that most companies will use the binomial or other so-called *lattice* models of value, rather than a *closed-form* model such as the Black-Scholes-Merton. The binomial model is favored, however, because it accommodates more potential postvesting behaviors than the closed-form models.

Binomial or other lattice models value options by constructing lattices or trees that represent different possible stock prices at different future points in time. The value of the option is determined at each node or branch of the tree. To determine these values, companies need to develop information about expected volatility, dividends, and risk-free rates that will apply at each of the possible branches or nodes of the model. In addition, information about employee postvesting behavior is needed to determine likely exercise dates. Note that under ASC 718 it is necessary to use *expected volatility* of share prices.

**Valuation for graded-vesting awards.** Companies that grant awards with graded, that is with multiple, vesting dates elect whether to measure the awards as if it were:

- One award, or
- Several separate awards.

If the former is chosen, the amount expensed each year on a straight-line basis would be the pro rata portion of compensation cost determined with reference to the requisite service period of the last vesting portion of the award. If the latter approach is selected, each separately vesting portion will be valued and the associated compensation cost will be expensed on a straight-line basis over the term until that portion vests. (ASC 718-30-35-8)

### Measurement Alternatives for Awards Classified as Equity—Nonpublic Companies

Stocks or options issued as part of an employee stock compensation plan must be measured at fair value. Because nonpublic companies do not trade shares on an exchange, it may be difficult for those companies to estimate the value of the underlying stock, and, thus, its volatility. ASC 718 provides a measurement alternative for nonpublic companies where it may not be possible for a nonpublic company to estimate its fair value. Nonpublic companies may choose to use either fair values or continually updated calculated values to measure equity- or liability-classified awards. If the entity chooses to update based on a calculated value, it calculates the value using the historical volatility of the appropriate industry sector index. (ASC 718-10-30-20)

Note that no such choice is available for nonvested or vested stock awards, which are to be measured using grant-date fair values.

If a nonpublic reporting entity chooses to use the calculated value alternative, the calculated value of an equity-classified award will have to be reestimated each reporting period. However, if a company uses the fair value alternative no reestimation is required, which could reduce fluctuations in reported earnings. If nonpublic companies choose the fair value approach, they will not later be able to return to the use of calculated value, because fair value is deemed preferable for purposes of applying ASC 250 (accounting changes).

### Recognizing Compensation

**Vesting.** Vesting can be based on a service condition, performance condition, or a combination of both:

- Service conditions are requirements to achieve a specified duration of employment (e.g., number of years' continuous full-time service).

- Performance conditions are requirements to achieve company-specific operating or financial goals (e.g., net income over \$3 million).

Compensation cost is recognized based on the actual number of awards that eventually vest. Estimates are used to make accruals each period, and adjustments are made based on current estimates of expected future vesting until the actual number of awards that vest are known.

Compensation cost for equity-based awards is measured at the grant date and not subsequently revised (apart from recognizing changed likelihood of forfeitures). (ASC 718-10-35-3)

**Market conditions.** Market conditions affect the exercisability of an award, but not its vesting. A market condition is an exercisability requirement based on achieving a specified share price (e.g., reaching a market price of \$22 per share before exercise is allowed). Market conditions can affect the grant-date fair value, and hence the compensation expense to be recognized by the reporting entity. If an employee forfeits an award because a market condition is not satisfied, compensation previously accrued is not reversed. This differs from what is done in the event of ordinary forfeitures, which necessitate reversal of previously accrued compensation cost (or, equivalently, adjustment of compensation cost prospectively until the vesting date).

**Performance conditions.** Entities estimate compensation costs for awards with a performance condition based on whether or not it is probable the performance obligation will be achieved. If it is probable, it is recognized in the period it becomes probable. If it is not probable, no accrual is made. (ASC 718-10-25-30)

**Awards classified as liabilities.** Compensation cost measurement date for liability-based awards is the settlement date, but compensation is estimated at each reporting date from grant date to settlement date. (ASC 718-30-30-01) The terms of an award may allow for an employee to achieve the performance target after the requisite service period. The award is accounted for as a performance condition. (ASC 718-10-30-28)

### Modification of Awards

ASC 718 holds that freestanding financial instruments issued to employees in exchange for past or future employee services are subject to the recognition and measurement provisions of ASC 718 throughout the life of the instruments, unless their terms are modified when the holder is no longer an employee. ASC 718 also holds that, for instruments originally issued as employee compensation and then modified, and where that modification to the terms of the instrument is made *solely* to reflect an equity restructuring that occurs when the holders are no longer employees, no change in the recognition or the measurement (due to a change in classification) of those instruments will result if *both* of the following conditions are met:

1. There is no increase in the fair value of the award (or the ratio of intrinsic value to the exercise price of the award is preserved—i.e., the holder is made whole), or the antidilution provision is not added to the terms of the award in contemplation of an equity restructuring; *and*
2. All holders of the same class of equity instruments (for example, stock options) are treated in the same manner.

Other modifications of the instrument (that is, any modification that fails to meet the dual tests above) that take place when the holder is no longer an employee, are subject to the modification accounting guidance set forth by ASC 718, as addressed above. Following modification, the accounting for such instruments, no longer held by employees, must follow GAAP, including ASC 480 if applicable.

The definition of short-term inducement in the glossary of terms included the phrase *or settlement of an award*. This reference raised a question about possible interaction between different provisions of the standard. FASB did not intend for a short-term inducement deemed to be a settlement to affect the classification of the award for the period it remains outstanding (for example, change the award from an equity instrument to a liability instrument). Therefore, an offer (for a limited time period) to repurchase an award should be excluded from the definition of a short-term inducement, and not be accounted for as a modification. However, if an entity has a history of settling its awards for cash, the entity should consider whether at the inception of the awards it has a substantive liability.

The incremental compensation cost resulting from a modification of an award is measured as the excess of the fair value of the modified award over the fair value of the original award measured immediately prior to the modification. Modifications can occur because of repricing, extending the life, or changing the vesting condition of the award. Cancellations of existing awards and concurrent replacement with new ones have to be accounted for as modifications. In practice, modifications will rarely result in recognized compensation costs less than the fair value of the award at the grant date, but this could conceivably result if the original service or performance vesting conditions were not expected to be satisfied at the modification date.

#### **ASC 718-30, Awards Classified as Liabilities**

**Measurement of liability-classified awards.** The provisions dealing with share-based payments that involve liabilities, rather than equity, are affected by ASC 480. Certain share-based payments create liabilities under ASC 480 (e.g., awards that result in the issuance of mandatorily redeemable shares, or those that require cash settlements or give the holders the right to demand cash, as do some stock appreciation rights). Liability-classified awards are remeasured at fair value each reporting period. Prior to vesting, the cumulative compensation costs would equal the proportionate amount of the award earned to date, and thus the periodic compensation cost would reflect both the passage of time (service period) and change in the fair value of the ultimate award. Subsequent to vesting, any further change in fair value would be recorded as a charge against earnings.

#### **Accounting for Employee Stock Options**

Under ASC 718, fair value accounting must be applied in measuring compensation expense. Ideally, fair value would be market-observed. An observable market price, if available for an option with similar features, should be used as the estimate of fair value of the employee option. However, in most cases, due to the nature of employee stock options (which lack exchangeability, etc.), observable market prices will not be available. Therefore, the reporting entity will have to estimate the fair value of the employee share option using a valuation model that meets the requirements of ASC 718. The valuation model takes into account the following factors, at a minimum:

1. Exercise price of the option.
2. Expected term of the option, taking into account several things including the contractual term of the option, vesting requirements, and postvesting employee termination behaviors. (The SEC states in 718-10-S99 that a registrant cannot use an expected term that is shorter than the vesting period.)
3. Current price of the underlying share.
4. Expected volatility of the price of the underlying share. (According to the SEC in 718-10-S99, a registrant may consider historical volatility in determining expected volatility,

which in turn should take into consideration historical volatility over a period generally commensurate with the expected or contractual option term, as well as regular intervals for price observations. A registrant can also ignore a period of historical volatility if it can support a conclusion that the period is not relevant to estimating expected volatility due to nonrecurring historical events. The SEC would also not object to the use of an industry sector index to determine the expected volatility of its share price.)

5. Expected dividends on the underlying share.
6. Risk-free interest rate(s) for the expected term of the option.

In practice, there are likely to be ranges of reasonable estimates for expected volatility, dividends, and option term. The closed-form models, of which Black-Scholes (now Black-Scholes-Merton) is the most widely regarded, are predicated on a set of deterministic assumptions that remain invariate over the full term of the option. In the real world, this condition is almost always not met. For this reason, current thinking is that a lattice model, of which the binomial model is an example, would be preferred. Lattice models explicitly identify nodes, such as the anniversaries of the grant date, at each of which new parameter values can be specified (e.g., expected dividends can be independently defined each period).

If a reporting entity changes from the BSM model to a binomial model, the change will be deemed a change in accounting estimate, not a change in accounting principle. A change from a binomial model back to a less desirable BSM model is to be discouraged, but apparently not prohibited if use of BSM or a similar closed-form model is supportable. The presumption is that moving from a binomial model to the BSM model would not be well received.

Other features that may affect the value of the option include changes in the issuer's credit risk, if the value of the awards contains cash settlement features (i.e., if they are liability instruments). Also, contingent features that could cause either a loss of equity shares earned or a reduction of realized gains from sale of equity instruments earned, such as a *clawback feature* (for example, where an employee who terminates the employment relationship and begins to work for a competitor is required to transfer to the issuing enterprise shares granted and earned under a share-based payment arrangement—see the illustrations in ASC 718) would be factors affecting the valuation model.

Market, performance, or service conditions may affect vesting. An award becomes vested at the date the employee's right to receive or retain shares no longer has any of these conditions. Vesting may be conditional on satisfying two or more conditions. Regardless of the conditions that must be satisfied, the existence of a market condition requires recognition of compensation cost if service has been rendered, even if the market condition is never satisfied.

The definition of an employee used in ASC 718 is that given by IRS Ruling 87-41. In addition, ASC 718 requires that nonemployee directors, acting in their role as members of the company's board of directors, be treated as employees if they were elected by the shareholders or appointed to the board and will be subject to election at the next shareholder election. Any awards granted to these individuals for their service as directors would be considered to be employee compensation.

The grant date is defined as the date when the employer and employee have a mutual understanding of the key terms and conditions of the share-based compensation arrangement and all necessary authorizations of those conditions have occurred. The service inception date is the first day of the requisite service period. Compensation cost is attributed over the service period.

If a given option plan involves the payment of compensation to the employees, such compensation cost should be recognized in the period(s) in which the services being compensated

are performed. If the grant is *unconditional*, which means it effectively is in recognition of past services rendered by the employees and does not depend on the rendering of further service, then compensation is reported in full in the period of the grant. If the stock options are granted before the service inception date, compensation cost should be recognized over the periods in which the performance is scheduled to occur. Whether compensation cost is recognized ratably over the periods or not is a function of the vesting provisions of the plan. If the plan provides for cliff vesting, compensation will be accrued on an essentially straight-line basis, while if it provides for graded vesting, the pattern of recognition is subject to election and may be more complex. The accounting for graded vesting plans under ASC 718 represents a change from current practice.

**Option fair value calculations.** Before presenting specific examples of accounting for stock options, simple examples of calculating the fair value of options using both the Black-Scholes-Merton and the binomial/lattice methods are provided. First, an example of the Black-Scholes-Merton closed-form model is provided.

Black-Scholes-Merton actually computes the theoretical value of a so-called *European* call option, where exercise can occur only on the expiration date. *American* options, which include most employee stock options, can be exercised at any time until expiration. The value of an American-style option on dividend paying stocks is generally greater than a European-style option, since preexercise the holder does not have a right to receive dividends that are paid on the stock. (For nondividend-paying stocks, the value of American and European options will tend to converge.) Black-Scholes-Merton ignores dividends, but this is readily dealt with, as shown below, by deducting from the computed option value the present value of expected dividend stream over the option holding period.

Black-Scholes-Merton also is predicated on constant volatility over the option term, which available evidence suggests may not be a wholly accurate description of stock price behavior. On the other hand, the reporting entity would find it very difficult, if not impossible, to compute differing volatilities for each node in the lattice model described later in this section, lacking a factual basis for presuming that volatility would increase or decrease in specific future periods.

The Black-Scholes-Merton model:

C =	$SN(d_1) - Ke^{(-rt)}N(d_2)$
C =	theoretical call premium
S =	current stock price
t =	time until option expiration
K =	option striking price
r =	risk-free interest rate
N =	cumulative standard normal distribution
e =	exponential term (2.7183)
$d_1 =$	$\frac{\ln(S/K) + (r + s^2/2)t}{s\sqrt{t}}$
$d_2 =$	$d_1 - s$
s =	standard deviation of stock returns
ln =	natural logarithm

The Black-Scholes-Merton valuation is illustrated with the following assumed facts; note that dividends are ignored in the initial calculation, but will be addressed once the theoretical value is computed. Also note that volatility is defined in terms of the variability of the entity's stock price, measured by the standard deviation of prices over, say, the past three years, which is used as a surrogate for expected volatility over the next twelve months.

**Example—Determining the fair value of options using the Black-Scholes-Merton model**

Black-Scholes-Merton is a closed-form model, meaning that it solves for an option price from an equation. It computes a theoretical call price based on five parameters—the current stock price, the option exercise price, the expected volatility of the stock price, the time until option expiration, and the short-term risk-free interest rate. Of these, expected volatility is the most difficult to ascertain. Volatility is generally computed as the standard deviation of recent historical returns on the stock. In the following example, the stock is currently selling at \$40 and the standard deviation of prices (daily closing prices can be used, among other possible choices) over the past several years was \$6.50, yielding an estimated volatility of  $\$6.50/\$40 = 16.25\%$ .

Assume the following facts:

$S$	=	\$40
$t$	=	2 years
$K$	=	\$45
$r$	=	3% annual rate
$s$	=	standard deviation of percentage returns = 16.25% (based on \$6.50 standard deviation of stock price compared to current \$40 price)

From the foregoing data, all of which is known information (the volatility,  $s$ , is computed or assumed, as discussed above), the factors  $d_1$  and  $d_2$  can be computed. The cumulative standard normal variates ( $N$ ) of these values must then be determined (using a table or formula), following which the Black-Scholes-Merton option value is calculated, *before the effect of dividends*. In this example, the computed amounts are:

$$\begin{aligned}N(d_1) &= 0.2758 \\N(d_2) &= 0.2048\end{aligned}$$

With these assumptions the value of the stock options is approximately \$2.35. This is derived from the Black-Scholes-Merton as follows:

$$\begin{aligned}C &= SN(d_1) - Ke^{(-rt)}N(d_2) \\&= 40(.2758) - 45(.942)(.2048) \\&= 11.032 - 8.679 \\&= 2.35\end{aligned}$$

The foregone two-year stream of dividends, which in this example are projected to be \$0.50 annually, have a present value of \$0.96. Therefore, the net value of this option is \$1.39 (\$2.35 – .96).

**Example—Determining the fair value of options using the binomial/lattice model**

In contrast to the Black-Scholes-Merton, the binomial/lattice model is an open form, inductive model. It allows for multiple (theoretically, unlimited) branches of possible outcomes on a “tree” of possible price movements and induces the option’s price. As compared to the Black-Scholes-Merton approach, this relaxes the constraint on exercise timing. It can be assumed that exercise occurs at any point in the option period, and past experience may guide the reporting entity to make certain such assumptions (e.g., that one-half the options will be exercised when the market price of the stock reaches 150% of the strike price, etc.). It also allows for varying dividends from period to period.

It is assumed that the common (Cox, Ross, and Rubinstein) binomial model will be used in practice. To keep this preliminary example relatively simple in order to focus on the concepts involved, a single-step binomial model is provided here for illustrative purposes. Assume an option is granted on a \$20 stock that will expire in one year. The option exercise price equals the stock price of \$20. Also,

assume there is a 50% chance that the price will jump 20% over the year and a 50% chance the stock will drop 20%, and that no other outcomes are possible. The risk-free interest rate is 4%. With these assumptions there are three basic calculations:

1. Plot the two possible future stock prices.
2. Translate these stock prices into future options values.
3. Discount these future values into a single present value.

In this case, the option will only have value if the stock price increases, and otherwise the option would expire worthless and unexercised. In this simplistic example, there is only a 50% chance of the option having a value of \$3.84, and therefore the option is worth \$1.92 at grant date.

The foregoing was a simplistic single-period, two-outcome model. A more complicated and realistic binomial model extends this single-period model into a randomized walk of many steps or intervals. In theory, the time to expiration can be broken into a large number of ever-smaller time intervals, such as months, weeks, or days. The advantage is that the parameter values (volatility, etc.) can then be varied with greater precision from one period to the next (assuming, of course, that there is a factual basis upon which to base these estimates). Calculating the binomial model, then, involves the same three calculation steps. First, the possible future stock prices are determined for each branch, using the volatility input and time to expiration (which grows shorter with each successive node in the model). This permits computation of terminal values for each branch of the tree. Second, future stock prices are translated into option values at each node of the tree. Third, these future option values are discounted and added to produce a single present value of the option, taking into account the probabilities of each series of price moves in the model.

#### Example—Multiperiod option valuation using binomial model

Consider the following example of a two-period binomial model. Again, certain simplifying assumptions will be made so that a manual calculation can be illustrated (in general, computer programs will be necessary to compute option values). Eager Corp. grants 10,000 options to its employees at a time when the market price of shares is \$40. The options expire in two years; expected dividends on the stock will be \$0.50 per year; and the risk-free rate is currently 3%, which is not expected to change over the two-year horizon. The option exercise price is \$43.

The entity's past experience suggests that, after one year (of the two-year term) elapses, if the market price of the stock exceeds the option exercise price, one-half of the options will be exercised by the holders. The other holders will wait another year to decide. If at the end of the second year—without regard to what the stock value was at the end of the first year—the market value exceeds the exercise price, all the remaining options will be exercised. The workforce has been unusually stable and it is not anticipated that option holders will cease employment before the end the option period.

The stock price moves randomly from period to period. Based on recent experience, it is anticipated that in each period the stock may increase by \$5, stay the same, or decrease by \$5, with equal probability, versus the price at the period year-end. Thus, since the price is \$40 at grant date, one year hence it might be \$45, \$40, or \$35. The price at the end of the second year will follow the same pattern, based on the price when the first year ends.

Logically, holders will exercise their options rather than see them expire, as long as there is gain to be realized. Since dividends are not paid on options, holders have a motive to exercise earlier than the expiration date, which explains why historically one-half the options are exercised after one year elapses, as long as the market price exceeds the exercise price at that date, even though the exercising holders risk future market declines.

The binomial model formulation requires that each sequence of events and actions be explicated. This gives rise to the commonly seen decision tree representation. In this simple example, following the grant of the options, one of three possible events occurs: (1) the stock price rises \$5 over the next year, (2) it remains constant, or (3) it falls by \$5. Since these outcomes have equal *a priori* probabilities,  $p = 1/3$  is assigned to each outcome of this first year event. If the price does rise, one half the option holders will exercise at the end of the first year, to reap the economic gain and capture the second year's dividend. The other holders will forego this immediate gain and wait to see what the stock price does in the second year before making an exercise decision.

If the stock price in the first year either remains flat or falls by \$5, no option holders are expected to exercise. However, there remains the opportunity to exercise after the second year elapses, if the stock price recovers. Of course, holding the options for the second year means that no dividends will be received.

The cost of the options granted by Eager Corp., measured by fair value using the binomial model approach, is computed by the sum of the probability-weighted outcomes, discounted to present value using the risk-free rate. In this example, the rate is expected to remain at 3% per year throughout the option period, but it could be independently specified for each period—another advantage the binomial model has over the more rigid Black-Scholes-Merton. The sum of these present value computations measures the cost of compensation incorporated in the option grant, regardless of what pattern of exercise ultimately is revealed, since at the grant date, using the available information about stock price volatility, expected dividends, exercise behavior, and the risk-free rate, this best measures the value of what was promised to the employees.

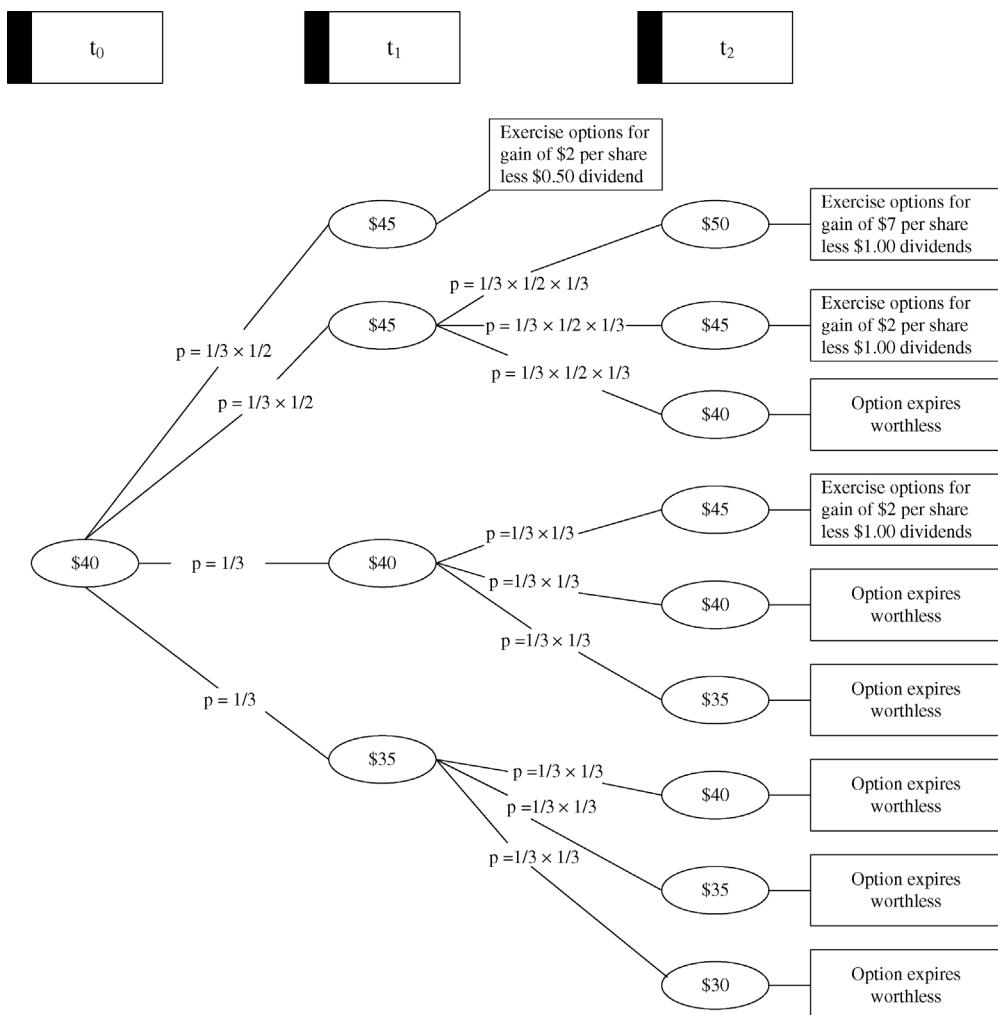

The following graphic offers a visual representation of the model, although in practice it is not necessary to prepare such a document. The actual calculations can be made by computer program, but to illustrate the application of the binomial model, the computation will be presented explicitly here. There are four possible scenarios under which, in this example, holders will exercise the options, and thus the options will have value. All other scenarios (combinations of stock price movements over the two-year horizon) will cause the holders to allow the options to expire unexercised.

First, if the stock price goes to \$45 in the first year, one-half of the holders will exercise at that point, paying the exercise price of \$43 per share. This results in a gain of \$2 ( $\$45 - \$43$ ) per share. However, having waited until the first year-end, they lost the opportunity to receive the \$0.50 per share dividend, so the net economic gain is only \$1.50 ( $\$2.00 - \$0.50$ ) per share. As this occurs after one year, the present value is only  $\$1.50 \times 1.03^{-1} = \$1.46$  per share. When this is weighted by the probability of this outcome obtaining (given that the stock price rise to \$45 in the first year has only a 1/3 probability of happening, and given further that only one-half the option holders would elect to exercise under such conditions), the actual expected value of this outcome is  $[(1/3)(1/2)(\$1.46)] = \$0.24$ . More formally:

$$[(1/3)(1/2)(\$2.00 - \$0.50)] \times 1.03^{-1} = \$0.2427$$

The second potentially favorable outcome to holders would be if the stock price rises to \$45 the first year and then either rises another \$5 the second year or holds steady at \$45 during the second year. In either event, the option holders who did not exercise after the first year's stock price rise will all exercise at the end of the second year, before the options expire. If the price goes to \$50 the second year, the holders will reap a gross gain of \$7 ( $\$50 - \$43$ ) per share; if it remains constant at \$45, the gross gain is only \$2 per share. In either case, dividends in both the first and second years will have been foregone. To calculate the compensation cost associated with these branches of the model, the first-year dividend lost must be discounted for one year, and the gross gain and second-year dividend must be discounted for two years. Also, the probabilities of the entire sequence of events must be used, taking into account the likelihood of the first year's stock price rise, the proclivity of holders to

wait for a second year to elapse, and the likelihood of a second-year price rise or price stability. These computations are shown below.

For the outcome if the stock price rises again:

$$\begin{aligned} & [(1/3)(1/2)(1/3)]\{[(\$7.00) \times 1.03^{-2}] - [(\$0.50) \times 1.03^{-1}] - [(\$0.50) \times 1.03^{-2}]\} \\ & = [0.05544]\{6.59 - \$0.48 - \$0.47\} = \$0.31276 \end{aligned}$$

For the outcome if the stock price remains stable:

$$\begin{aligned} & [(1/3)(1/2)(1/3)]\{[(\$2.00) \times 1.03^{-2}] - [(\$0.50) \times 1.03^{-1}] - [(\$0.50) \times 1.03^{-2}]\} \\ & = [0.05544]\{1.88 - \$0.48 - \$0.47\} = \$0.05147 \end{aligned}$$

The final, favorable outcome for holders would occur if the stock price holds constant at \$40 the first year but rises to \$45 the second year, making exercise the right decision. Note that none of the holders would exercise after the first year given that the price, \$40, was below exercise price. The calculation for this sequence of events is as follows:

$$\begin{aligned} & [(1/3)(1/3)]\{[($2.00) \times 1.03^{-2}] - [($0.50) \times 1.03^{-1}] - [($0.50) \times 1.03^0]\} \\ & = [0.1111]\{1.88 - \$0.48 - \$0.47\} = \$0.10295 \end{aligned}$$

Summing these values yields \$0.709879 (\$0.2427 + \$0.31276 + \$0.05147 + \$0.10295), which is the expected value per option granted. When this per-unit value is then multiplied by the number of options granted (10,000), the total compensation cost to be recognized, \$7,098.79, is derived. This would be attributed over the required service period, which is illustrated later in this section. (In the facts of this example, no vesting requirements were specified; in such cases, the employees would not have to provide future service in order to earn the right to the options, and the entire cost would be recognized upon grant.)

A big advantage of the binomial model is that it can value an option that is exercisable before the end of its term (an American-style option). This is the style that employee share-based compensation arrangements normally take. FASB prefers the binomial model, because it can incorporate the unique features of employee stock options. Two key features that FASB recommends that companies incorporate into the binomial model are vesting restrictions and early exercise. Doing so, however, requires that the reporting entity had previous experience with employee behaviors (e.g., gained with past employee option programs) that would provide it with a basis for making estimates of future behavior. In some instances, there will be no obvious bases upon which such assumptions can be developed.

The binomial model permits the specification of more assumptions than does the Black-Scholes-Merton, which has generated the perception that the binomial will more readily be manipulated so as to result in lower option values, and hence lower compensation costs, than the Black-Scholes-Merton. But this is not necessarily the case: switching from Black-Scholes-Merton to the binomial model can increase, maintain, or decrease the option's value. Having the ability to specify additional parameters, however, probably does give management greater flexibility and, accordingly, will present additional challenges for the auditors who must attest to the financial statement effects of management's specification of these variables.

To calculate option values using either the Black-Scholes-Merton or binomial models without the aid of computer software would be very difficult, but hardly impossible. Fortunately, reasonably priced software is widely available to perform these calculations. What managers must do is determine the assumptions that should be used to create an unbiased, representative value of the options. Following are specific examples of accounting for share-based compensation as required under ASC 718.

---

*NOTE: All examples ignore deferred tax effects for simplicity.*

---

**Example—Accounting for stock options for a publicly held entity**

Options are granted to corporate officers to purchase 10,000 shares of \$1 par stock at a price of \$50 per share, which is equal to the current market price. The options may not be exercised until three years from the grant date (that is, they vest in three years). ASC 718 provides that public companies must use the fair value method to measure compensation cost associated with share-based equity programs. This means that it will be necessary to determine the expected volatility of the share price over the service period. Assume that either a lattice model or Black-Scholes-Merton has been used and that the fair value per option has been determined to be \$7. Past experience suggests that forfeitures will be 4% per year, so that compensation cost under ASC 718 will be based on the net number of shares expected to vest, given as  $(.96 \times .96 \times .96 =) .885$ . Total share-based compensation will be  $(\$7 \times .885 \times 10,000 =) \$61,932$ . The annual entries would be:

Compensation cost	20,644
Additional paid-in capital	20,644

If all the options are subsequently exercised, the derived proceeds of the stock issuance will be \$566,000. The entry would be:

Cash	500,000 (option price)
Additional paid-in capital	61,932
Common stock	10,000 (par)
Additional paid-in capital	551,932 (excess)

**Example—Accounting for stock options for a nonpublic entity that is not an SEC registrant and elects the calculated value method**

Options are granted to corporate officers to purchase 10,000 shares of \$1 par stock at a price of \$50 per share, which is the current market price. The options may not be exercised until three years from the grant date (that is, they vest in three years). ASC 718 provides that nonpublic companies may use a surrogate measure of fair value, called calculated fair value, when it is not possible to determine the expected volatility of the share price over the service period. Essentially, this requires that a relevant industry sector-specific index be identified for use in place of the volatility factor in the normal Black-Scholes-Merton or lattice models.

In this case, the reporting entity identifies such an index and proceeds to compute a value of \$6.60 per option. The total compensation cost thereby calculated, \$66,000, is accrued over the three-year period ratably. The annual entries would be:

Compensation cost	22,000
Additional paid-in capital	22,000

If all the options are subsequently exercised, the derived proceeds of the stock issuance will be \$566,000. The entry would be:

Cash	500,000 (option price)
Additional paid-in capital	66,000
Common stock	10,000 (par)
Additional paid-in capital	556,000 (excess)

**Example—Accounting for stock options for a nonpublic entity that is not an SEC registrant and elects the intrinsic value method**

As discussed above, nonpublic companies are permitted to elect the intrinsic value method of accounting for the cost of share-based compensation plans. Using this method, the intrinsic value must be measured at each reporting date, and used to accrue compensation cost for the period.

Assume again that options are granted to corporate officers to purchase 10,000 shares of \$1 par stock at a price of \$50 per share, which is the current market price. The options may not be exercised until three years from the grant date. These options have no intrinsic value ( $\$50 - \$50 = 0$ ) at the grant date. The intrinsic value method and fair value method require the same measurement date (grant date) for shares and similar instruments whose fair value does not differ from their intrinsic value (and instruments with no time value). This example assumes there is no forfeiture before vesting occurs. Because of the company's decision to use the intrinsic value method, its share options are recognized at intrinsic value at each reporting date through the date of settlement, and the periodic adjustment in intrinsic value, prorated over the service period, is included in compensation cost for that period. Consequently, the compensation cost recognized each year of the three-year requisite service period will vary based on changes in the share option's intrinsic value. For example, assume that at the end of the first year, stock is valued at \$55 per share, resulting in a ( $\$55 - \$50 = \$5$ ) \$5 intrinsic value per share—thus, a total value of \$50,000 for the award. In the first year, the compensation cost would be 1/3 of \$50,000. This entry would be:

Compensation cost	16,667
Additional paid-in capital	16,667

Assume now that at the end of the second year the stock is valued at \$53 per share, and thus the intrinsic value is ( $\$53 - \$50 = \$3$ ) \$3 per share option, for an intrinsic value of the award of \$30,000 at that date. The intrinsic value of the award has declined by ( $\$50,000 - \$30,000 = \$20,000$ ). Because services for two of the three years of service have now been rendered, the company must recognize *cumulative* compensation cost for two-thirds of the intrinsic value of the award, or ( $\$30,000 \times 2/3 = \$20,000$ ). Because the company already recognized \$16,667 in the first year, only \$3,333 in further compensation cost is to be recognized in the second:

Compensation cost	3,333
Additional paid-in capital	3,333

Note that, depending on the change in intrinsic value from the prior reporting date, the current period could be credited with *negative* compensation expense. To illustrate, assume instead that at the end of the second year, the stock is valued at \$52 per share, for an intrinsic value of \$20,000. Since two years of the three-year service period have elapsed, the cumulative compensation cost to be recognized is ( $\$20,000 \times 2/3 = \$13,333$ ). Because the company already recognized \$16,667 in the first year, *negative* \$3,333 compensation cost is to be recognized in the second year:

Additional paid-in capital	3,333
Compensation cost	3,333

**Example of fair value accounting for stock options with cliff vesting—measurement and grant date the same**

Options are granted to corporate officers to purchase 10,000 shares of \$1 par stock at a price of \$50 per share, which is also the market price on the grant date. The options may not be exercised until three years from the grant date, and only if the employees remain employed through that date. The company

has no reason to expect that any of the options will be forfeited by the employees to whom they are granted (i.e., after the completion of the service period). The company uses the following assumptions to apply the binomial model:

Share options granted	10,000
Employees granted options	100
Expected forfeitures per year	3.0%
Share price at the grant date	\$50
Exercise price	\$50
Par value per share	\$1
Number of years to vest	3 years
Contractual term (CT) of options	10 years
Risk-free interest rate over CT	2 to 5%
Expected volatility over CT	40 to 700%
Expected dividend yield	1.0%
Suboptimal exercise factor	2

Given these assumptions needed to construct a binomial model to value the options, a fair value estimate of approximately \$6 per option is determined (details not presented). It is estimated that 3% of employees will turn over each year during the service period. The number of share options expected to vest is estimated at the grant date of  $(10,000 \times .97 \times .97 \times .97 =) \$9,127$ . The estimated fair value of the award on the grant date would be  $(9,127 \times \$6 =) \$54,762$ . The entry to record the compensation cost  $[(\$54,762 \div 3) = \$18,254]$  in each of the three years is:

Compensation cost	18,254
Additional paid-in capital	18,254

If in the first year the actual forfeiture rate is 6% instead of the 3% expected rate, and management determines that the forfeiture rate should change to 6%, then in the second year an adjustment would be needed. The revised estimate of the number of options expected to vest is  $(10,000 \times .94 \times .94 \times .94 =) 8,306$ . The revised cumulative compensation cost would be  $(8,306 \times \$6 =) \$49,836$ . The cumulative adjustment to reflect adjustment of the forfeiture rate is the difference between two-thirds of the revised cost of the award and the cost already recognized in the first year. The related entries and computations are:

Revised total compensation cost	\$49,836
Revised cumulative cost as of the end of year 1	\$16,112
Cost already recognized in year 1	\$18,254
Adjustment to cost at the end of year 1	\$(2,142)

The related journal entries are:

Compensation cost	2,142
Additional paid-in capital	2,142

Entries in years 2 and 3

Compensation cost	16,112
Additional paid-in capital	16,112

At the end of the third year, the company would examine actual forfeitures and make any necessary adjustments to reflect compensation cost for the number of shares actually vested. Assuming vesting equals expected, the journal entry at exercise of the options would be:

Cash	500,000 (option price)
Additional paid-in capital	49,836
Common stock	10,000 (par)
Additional paid-in capital	539,836 (excess)

The difference between the market price of the shares and the exercise price at the date of exercise is deductible for tax purposes because the share options do not qualify as incentive stock options. The realized tax benefits result in a credit to additional paid-in capital and a reduction in the deferred tax asset.

The statement of cash flows, as amended by ASC 718, requires that the cash flow benefit that results from the tax benefit be classified as a cash inflow from financing activities and a cash outflow from operating activities.

**Example of accounting for stock options with graded vesting—measurement and grant date the same**

In a shift from the position espoused in the exposure draft, ASC 718 requires each reporting entity to make a policy decision about whether to recognize compensation cost for an award with only service conditions that has a graded vesting schedule either (1) on a straight-line basis over the requisite service period for each separately vesting portion of the award as if the award was, in-substance, multiple awards, or (2) on a straight-line basis over the requisite service period for the entire award (that is, over the requisite service period of the last separately vesting portion of the award). However, ASC 718 requires that the amount of compensation cost recognized at any date must at least equal the portion of the grant-date value of the award that is vested at that date.

For this example, assume the basic facts from the prior example, but now the 10,000 options vest according to a graded schedule of 25% for the first and second years of service and 50% for the third year. Using the 3% annual employee turnover forfeiture rate, 300 options are expected to never vest, leaving 9,700 options expected to vest at 25% of the award—or 2,425 options vested. In the second year, it is anticipated that another 3% will be forfeited, leaving 9,409 to vest at 25% of the award—or 2,352 options vested. In the final year another 3% are forfeited and vesting occurs at 50% of the remaining—or 4,563 vested options. (Data upon which value per option amounts are derived are not presented in this example.)

Year	Vested option	Value per option	Compensation cost
1	2,425	\$5.00	\$12,125
2	2,352	\$5.50	12,936
3	4,563	\$6.00	<u>27,378</u>
	<u>9,340</u>		<u>\$52,439</u>

The value of the option is determined separately for different vesting periods after which exercise might occur. Thus, the compensation cost associated with the options is less in the earlier years, as reflected in the table above. Compensation cost is recognized over the periods of requisite service during which each group of share options is earned. In the first year, therefore, compensation cost is  $[\$12,125 + (\$12,936 \div 2) + (\$27,378 \div 3)] = \$27,719$ . The journal entry for the first year would be:

Compensation cost	27,719
Additional paid-in capital	27,719

## Accounting for Stock Appreciation Rights and Tandem Plans

**Background.** The accounting for variable stock plans is addressed by ASC 718. Under this standard, share-based compensation arrangements that provide for cash payments or that give to grantees the choice of receiving stock or cash in settlement are accounted for as liabilities, not equity, as compensation is accrued over the requisite service period. Publicly held entities are required to measure liabilities incurred to employees in share-based payment transactions at fair value. Nonpublic entities, on the other hand, may elect to measure their liabilities to employees incurred in share-based payment transactions at their intrinsic value.

Whether measured at fair value (using an option-pricing model such as Black-Scholes-Merton or binomial) or at intrinsic value (measured simply as the excess of market or other defined value over reference value as of the date of the statement of financial position), these amounts are updated as of each financial reporting date. Thus, when share-based compensation plans give rise to liabilities, these are continually updated as to value, whereas under the fair value measurement approach to equity instruments arising from such compensation plans, value is assessed as of the grant date in most instances, never later to be revised.

Determining whether a share-based payment should be categorized as a liability requires close attention to the guidance of ASC 718, which invokes the requirements of ASC 480. It states that, for example, a puttable share (giving the grantee the right to demand the issuer to redeem it) awarded to an employee as compensation is to be classified as a liability if either:

1. the repurchase feature permits the employee to avoid bearing the risks and rewards normally associated with equity share ownership for a reasonable period of time from the date the requisite service is rendered and the share is issued, or
2. it is probable that the employer would prevent the employee from bearing those risks and rewards for a reasonable period of time from the date the share is issued. For this purpose, a period of six months or more is defined as a reasonable period of time.

(ASC 781-10-25-9)

Note that a share that is mandatorily or optionally redeemable upon the occurrence of a defined contingency, such as an initial public offering by the grantor entity, would not make this share-based payment a liability, unless the contingency were deemed probable of occurrence within a reasonable period of time. For example, if the entity had begun the regulatory approval and registration process, this might trigger liability classification.

ASC 718 stipulates logically that options or similar instruments on shares are to be categorized as liabilities if the underlying shares are classified as liabilities or if the reporting entity is subject to a requirement to transfer cash or other assets under any circumstances in order to settle the option. However, ASC 718-10-35-15 holds that a cash settlement feature that can be exercised only upon the occurrence of a contingent event that is outside the employee's control does not meet the condition set forth by ASC 718.

Furthermore, an option or similar instrument that is first classified as equity, but subsequently becomes a liability because the contingent cash settlement event becomes probable of occurring, is to be accounted for similar to a modification from an equity to liability award. Accordingly, on the date the contingent event becomes *probable* of occurring (thus triggering reclassification of the award as a liability) the entity recognizes a share-based liability equal to the portion of the award attributed to past service (reflecting any provision for acceleration of vesting) multiplied by the award's fair value on that date. To the extent the liability equals or is less than the amount

previously recognized in equity, that is the amount transferred from equity to the liability. To the extent that the liability exceeds the amount previously recognized in equity, the excess is recognized as additional compensation cost in that period. The total recognized compensation cost for an award with a contingent cash settlement feature must at least equal the fair value of the award at the grant date.

A puttable share that does not meet either of the foregoing conditions is to be classified as equity. Options or similar instruments on shares are to be classified as liabilities if (1) the underlying shares are classified as liabilities, or (2) the reporting entity can be required under any circumstances to settle the option or similar instrument by transferring cash or other assets. If the entity grants an option to an employee that, upon exercise, would be settled by issuing a mandatorily redeemable share, the option must be classified as a liability.

According to ASC 718, a freestanding financial instrument ceases to be subject to this standard and becomes subject to the recognition and measurement requirements of ASC 480 or other applicable GAAP when the rights conveyed by the instrument to the holder are no longer dependent on the holder being an employee of the entity. Thus, once the requisite service has been provided and the grantee has, say, elected to receive stock or another instrument, guidance on the appropriate accounting would be given by ASC 480. For example, a mandatorily redeemable share becomes subject to ASC 480 or other applicable GAAP when an employee (1) has rendered the requisite service in exchange for the instrument, and (2) could terminate the employment relationship and receive that share. Similarly, a share option or similar instrument that is not transferable and whose contractual term is shortened upon employment termination continues to be subject to ASC 718 until the rights conveyed by the instrument to the holder are no longer dependent on the holder being an employee of the entity (generally, when the instrument is exercised).

An award may be indexed to a factor beyond the entity's share price. ASC 718 holds that, if that additional factor is not a market, performance, or service condition, the award is classified as a liability. In such a case, the additional factor is reflected in estimating the fair value of the award. An example of such a circumstance is an award of options whose exercise price is indexed to the market price of the commodity (e.g., wheat or gold). Another example is a share award that will vest based on the appreciation in the price of that commodity; such an award is indexed to both the value of that commodity and the issuing entity's shares. If an award is so indexed, the relevant factors (expected commodity price change) should be included in the fair value estimate of the award. ASC 718 states that the award would be classified as a liability even if the entity granting the share-based payment instrument were a producer of the commodity whose price changes are part or all of the conditions that affect an award's vesting conditions or fair value.

**Stock Appreciation Rights and similar instruments.** Stock Appreciation Rights (SARs) are a popular means of providing share-based compensation awards to employees. Essentially, the bonus arrangement is to pay employees the amount by which the share price at a defined date (say, three years hence) exceeds what it was at the measurement date. Depending on the plan, the award may be payable in the entity's shares, in cash, or in either at the option of the grantee. If the optionee has the right to demand cash or the SAR is payable in cash only, the grantor entity recognizes a liability for the accrued compensation.

If the entity is publicly held, measurement at fair value is required, with revaluation at each reporting date through final settlement. For nonpublicly held entities, an election must be made to use fair value or intrinsic value—but again, in either case, remeasurement at each reporting date until final settlement is required.

### Example of accounting for SARs—share-based liabilities

The company grants SARs with the same terms and conditions used in the examples above. Each SAR entitles the holder to receive an amount in cash equal to the increase in value of one share of company stock over \$50. Using the same assumptions and option-pricing model, the fair value of the share options is computed to be \$6 per SAR (details not presented). The awards cliff-vest at the end of three years. The forfeitures are expected to be 3% a year; thus, SARs expected to vest are  $(10,000 \times .97 \times .97 \times .97 =) 9,127$ , and the fair value of the award at the beginning of the first year is  $(9,127 \times \$6 =) \$54,762$ . It is assumed that expected and actual forfeitures are the same. The share-based compensation liability at the end of the first year is  $(\$54,762 \div 3 =) \$18,254$ . The journal entry for the first year is:

Compensation cost	18,254
Share-based compensation SAR liability	18,254

Under ASC 718, compensation arising in connection with share-based liabilities must be valued at fair value at each reporting date. At the end of the second year, the estimated fair value is assumed to be \$10 per SAR. Therefore, the award's fair value is  $(9,270 \times \$10 =) \$91,270$ , and the corresponding liability at that date is  $(\$91,270 \times 2/3 =) \$60,847$  because service has now been provided for two of the three years required. Compensation cost recognized for the award in the second year is  $(\$60,847 - \$18,254 =) \$42,593$ . The journal entry for the second year is:

Compensation cost	42,593
Share-based compensation SAR liability	42,593

At the end of the third year, the estimated fair value is assumed to be \$9 per SAR. Therefore, the award's fair value is  $(9,270 \times \$9 =) \$83,430$  and the corresponding liability at that date is the same because the award is fully vested. Compensation cost for the third year is  $(\$83,430 - \$42,593 - \$18,254 =) \$22,583$ . The journal entry for the third year is:

Compensation cost	22,583
Share-based compensation SAR liability	22,583

**Stock SARs.** If the SARs were to be redeemed (only) in common stock of the entity, “Stock rights outstanding” (a paid-in capital account) would replace the liability account in the above entries. Fair value would be assessed at the grant date (measurement date), and then not altered over the time to final settlement, consistent with how other equity compensation awards are measured under ASC 718.

**Tandem plans.** Often stock option plans and SARs are joined in tandem plans, under the terms of which the exercise of one automatically cancels the other. In the absence of evidence to the contrary, however, the presumption is that the SAR, not the options, will be exercised. If the SAR portion of the tandem plan is such that classification as a liability is required, as described above, then remeasurement through the settlement date is required.

### Modifications of Awards of Equity Instruments

In some instances awards previously issued but not yet settled are later modified in ways that may or may not change the classification (e.g., liability to equity). ASC 718 requires that modification of the terms or conditions of an equity award is to be treated as an exchange of the

original award for a new award. In substance, the event is accounted for as if the entity repurchases the original instrument by issuing a new instrument of equal or greater value, incurring additional compensation cost for any incremental value.

Incremental compensation cost in such circumstances is to be measured as the excess, if any, of the fair value of the modified award—determined in accordance with the provisions of ASC 718—over the fair value of the original award immediately before its terms are modified. These measures are to be based on the share price and other pertinent factors at the modification date. Any effect of the modification on the number of instruments expected to vest is also to be reflected in determining incremental compensation cost. The estimate at the modification date of the portion of the award expected to vest may also be subsequently adjusted, if necessary, as estimates or experience may dictate prior to final settlement.

The total recognized compensation cost for an equity award will at least equal the fair value of the award at the grant date, except for those instances when, at the date of the modification, the performance or service conditions of the original award are not expected to be satisfied. Accordingly, the total compensation cost measured at the date of a modification will be (1) the portion of the grant-date fair value of the original award for which the requisite service is expected to be rendered (or has already been rendered) at that date, plus (2) the incremental cost resulting from the modification.

The change in compensation cost for an equity award measured at intrinsic value (if elected for nonpublicly held companies) is to be measured by comparing the intrinsic value of the modified award, if any, with the intrinsic value of the original award, if any, immediately before the modification.

If a modification results in what had been a liability award becoming an equity award, the amount of the fair value (or implicit value, if such were elected as a measurement strategy by a nonpublic company), the amount becomes “fixed” as of the modification date, and this will differ from the amount that would have been recognized had the award been classified as equity at inception. On the other hand, if an award was originally equity and after modification becomes a liability, to the extent that the liability equals or is less than the amount recognized in equity for the original award, the offsetting debit is a charge to equity. To the extent that the liability exceeds the amount recognized in equity for the original award, the excess is recognized as compensation cost.

#### Example of a liability-to-equity modification

Assume that a cash payment SAR plan is created, with features similar to earlier examples (10,000 SARs granted, with three-year term, 3% forfeiture per year expectation). The share-based compensation liability is  $(9,127 \times \$10 \div 3 =) \$30,423$ , based on reporting date fair value measurement. On January 1 of the second year, the company modifies the SAR by replacing the cash-settlement feature with a net-share settlement feature, which converts the award from a liability award to an equity award, because there is no longer an obligation to settle for cash, or an obligation classified as a liability per ASC 480. For the equity award, fair value is to be measured at grant date only. Per ASC 718, when no other terms are altered by the modification, the fair value at the modification date is used to measure the amount of the total compensation to be awarded in equity instruments.

The journal entry to reclassify the liability to equity would be:

Share-based compensation SAR liability	30,423
Additional paid-in capital—SAR	30,423

Since no further remeasurement would be permitted, additional compensation cost of \$30,423 per year will be recorded at the end of the second and third years, with credits to the additional paid-in capital

account. In this example, total compensation cost was greater because the effective measurement date was the end of the first year, but it could also have happened that compensation cost was reduced for the same reason.

### Example of an equity-to-liability modification

Assume that a SAR plan, payable in shares, is created, with features similar to earlier examples (10,000 SARs granted, with three-year term, 3% forfeiture per year expectation). Using a valuation model, the amount of compensation is determined to be \$40,000 in total, computed at grant date. At the end of the first year, compensation expense and additional paid-in capital of \$13,333 is recorded, based on completion of one of the three years' required service. At that date the fair value of the SARs amounts to \$45,000. If the plan is amended at the start of the second year to offer grantees the right to a cash payout, the equity must be reclassified to liability and the value must be remeasured at each reporting date. At the time of modification, since the fair value exceeds what had been accrued, additional compensation cost must be recognized. The entry would be:

Additional paid-in capital—SAR	13,333
Compensation cost	1,667
Share-based compensation—SAR liability	15,000

On the other hand, if the fair value of the liability for the SAR at the modification date had been only \$30,000, the difference between the amount accrued in the first year and the modified value would have been left in the additional paid-in capital account. The entry follows:

Additional paid-in capital—SAR	10,000
Share-based compensation—SAR liability	10,000

A share-based payment award may also be modified as a result of an acquisition. ASC 805 describes the accounting for several instances where an acquirer exchanges its share-based payment awards for rewards held by the employees of an acquiree. If the acquiring entity replaces an acquiree's share-based awards when it is not obligated to do so, then all of the fair-value replacement cost is to be recognized as postcombination compensation expense. If the acquirer's replacement award requires some additional employee service, a portion of the replacement award's fair-value cost should be attributed to postcombination compensation expense.

### ASC 718, 740, Income Taxes

Under U.S. income tax laws, the amount that is deductible in connection with a share-based compensation arrangement is limited to intrinsic value. This is generally defined by the amount by which the fair (market) value of the compensation exceeds the amount paid, if any, by the recipient, at the exercise date (not the grant date). For example, if an option grant is made when the underlying stock is trading at \$34, and the option is exercisable at that price, and it is later exercised when the stock is trading at \$55, the deductible amount will be \$21 per share, based on the *intrinsic value* of the option as of the exercise date, which becomes observable only upon actual exercise. However, under ASC 718, compensation expense will have been recognized for the fair value of the option when granted, computed using either the Black-Scholes-Merton or lattice model as illustrated earlier in this section. Depending on other facts, that option value may have been \$5, \$10, or some other amount per share; it would not, however, be the same as the intrinsic amount other than by sheer coincidence.

Additionally, the timing of the compensation expense recognition will differ between tax and financial reporting. For financial reporting, expense is recognized over the expected service

period, as explained above. For tax, the expense is deductible at the actual exercise date. Options not exercised (i.e., forfeited) thus never give rise to taxable deductions, whereas under GAAP the compensation cost would have been expensed.

It is thus inevitable that both the timing and the amounts of compensation expense related to share-based compensation will differ. To the extent that these are timing differences, interperiod tax allocation (deferred tax accounting) will be appropriate. The cumulative amount of compensation cost that will result in a tax deduction is to be considered a deductible temporary difference. This applies both for instruments classified as equity and for those categorized as liabilities. Any compensation cost recognized in the financial statements for instruments that will not result in a tax deduction should not be considered to result in a deductible temporary difference under ASC 740.

In general, the fair value of stock-based compensation, which is computed at grant date and recognized over the vesting period as compensation cost in the financial statements, will not be tax deductible currently, giving rise to deferred tax benefits measured with reference to the book compensation expense recognized. Ultimately, when the employee's options vest and are exercised, the company is able to deduct the intrinsic value, measured by the spread between fair value on exercise date and exercise price. To the extent this exceeds the fair value of the stock-based compensation recognized as GAAP-basis expense, the tax effect of that excess tax deduction is treated as a contribution to paid-in capital. If (less likely, but quite possible) the tax deduction is lower than the compensation already recognized for financial reporting purposes, this shortfall in tax benefits is additional compensation cost—in effect, the employer entity incurred higher compensation cost in connection with the share option program since it received less than the anticipated tax benefits related thereto.

If the exercise results in a tax deduction prior to the actual realization of the related tax benefit—because the entity, for example, has a net operating loss carryforward—then the tax benefit and the credit to additional paid-in capital for the excess deduction would not be recognized until that deduction reduces taxes payable.

However, to the extent that the excess stems from a reason *other* than changes in fair value of the entity's shares between the measurement date for accounting purposes (grant date, generally) and the later measurement date for income tax purposes (exercise date), that portion of the tax effect is to be reported in income (i.e., in the tax provision). For example, a change in the tax rate could result in such a difference.

Differences between the deductible temporary difference that arises and the tax deduction that would have resulted based on the current fair value of the entity's shares should not be considered either in measuring the gross deferred tax asset or in determining the need for a valuation allowance created by the application of ASC 718.

If there should be an excess of cumulative compensation cost recognized for financial reporting purposes over the tax deductible amount (e.g., due to options lapsing unexercised), the write-off of the deferred tax asset (net of valuation allowance, if any) is first to be offset against any remaining additional paid-in capital from previous awards accounted for under the fair value method; any remaining excess should be recognized in income (the tax provision). The additional paid-in capital available to absorb tax effects is referred to as the *APIC pool*.

Consistent with the treatment of excess tax deductions for share-based compensation as being essentially similar to capital contributions, ASC 718 requires that the realized tax benefit applicable to the excess of the deductible amount over the compensation cost recognized under GAAP be reported in the cash flow statement as both a cash inflow from financing activities and a cash outflow from operating activities. This is required whether the cash flow statement is being presented under the direct method or the indirect method.

It is possible that an entity has issued dividends to employees holding nonvested shares, nonvested share units, or outstanding options. If so, it should recognize the income tax benefit as an increase to additional paid-in-capital, but only if the deduction reduces income taxes payable.

### Other ASC 718 Matters

The most common share-based compensation arrangements have been presented. Other more complicated awards have been developed. Some of these are presented below. For a further discussion with examples refer to ASC 718.

**Share options with performance conditions and/or market conditions.** Some option arrangements provide grants of share options with a performance condition. These types of plans permit employees to vest in differing numbers of options depending on the increase in market value of one of the company's products (or other condition) over a vesting period. These performance conditions can include factors such as market share increases, passing clinical trials, and other performance goals.

In addition to performance conditions, market conditions may also affect the option arrangements. These would include such things as indexing share prices to an industry group and the exercise price of options tied to this index. Therefore, the exercise price could go up or down depending on how the index performs. Arrangements exist for share units to have both performance and market conditions. These are accounted for in the same way as other options. The difficulty is in determining the fair values, as there are more factors contributing to uncertainty. These factors can, however, be modeled in a binomial valuation model.

**Performance Target Could Be Achieved After the Requisite Service Period.** For awards where the terms provide that a performance target could be achieved after the requisite service period, guidance provides that:

- A performance target that affects vesting and that could be achieved after the requisite service period should be treated as a performance condition.
- A reporting entity should apply existing guidance in Topic 718 as it relates to awards with performance conditions that affect vesting to account or such awards.
- Compensation cost should be recognized in the period in which it becomes probable that the performance target will be achieved.
- The amount recognized should represent compensation costs attributable to the periods for which the requisite service has already been rendered.

(ASC 718-10-30-28)

**Other modifications of share option awards.** A company may modify the vesting conditions of an award. The accounting treatment for these modifications depends on the probability of vesting under the original conditions or the modified conditions. Other modifications are whether SARs will be settled in cash or equity or some combination, different from the original plan assumptions. A modification of vesting conditions is accounted for based on the principles set forth in ASC 718. Illustrations of different potential modifications can be found in ASC 718-10-55.

**Other types of share-based compensation awards covered in ASC 718.** Other share awards that ASC 718 addresses are outlined below:

- *Share award with a clawback feature.* These are restrictions on the employee's subsequent employment with a direct competitor, that if violated, cause the ex-employee to return the value of the share award to the company.

- *Tandem plan—share options or cash SARs.* Employees are granted awards with two separate components, in which exercise of one component cancels the other.
- *Tandem plan—phantom shares or share options.* Similar to the plan above, but the employee's choice of which component to exercise depends on the relative value of the components when the award is exercised.
- *Look-back share options.* Share options awarded under Section 423 of the Internal Revenue Code, which provides that employees will not be immediately taxed on the difference between the market price of the stock and a discounted purchase price if certain requirements are met.
- *Escrowed share arrangements.* The SEC has stated in ASC 718-10-S99 that it considers the release of shares from an escrowed share arrangement based on performance-related criteria to be compensation.
- *Book value share purchase plans (nonpublic companies only).* Companies with two classes of stock—one of which is available to all employees and the price is based on book value.
- *Voluntary (or involuntary) change to fair-value-based method (nonpublic companies only).* A nonpublic company elects as accounting policy the intrinsic value method and grants share awards to employees. Subsequently, the accounting for the value of these awards is changed to fair value because it is preferable under GAAP. Estimating grant date values is very difficult in hindsight. Therefore, these companies do not have to retrospectively apply fair value methods to unvested awards at the date of change.
- *Certain instruments become subject to ASC 480.* Certain instruments will become subject to ASC 480 when an employee could terminate service and receive or retain the fair value of the instrument for the remaining contractual term of that instrument.

**Reload feature and reload option.** A reload feature provides for automatic grants of additional options whenever an employee exercises previously granted options using the entity's shares, rather than cash, to satisfy the exercise price. At the time of exercise using shares, the employee is automatically granted a new option, called a reload option, for the shares used to exercise the previous option.

#### Example of reload options

Mr. Jones has 6,000 shares of ABC Company's \$1 par value common stock, as well as options to purchase an additional 8,000 shares at an exercise price of \$12. It will cost Jones \$96,000 to exercise the options. The current market price of ABC stock is \$16, so he trades in his existing 6,000 shares, which have a market value of \$96,000, to purchase 8,000 shares with his options. The option plan has a reload feature, so ABC issues 6,000 replacement options (matching the number of shares traded in), for which the exercise price is set at the current market value of \$16. ABC records the stock sale with the following entry:

Treasury stock	96,000
Common stock	8,000
Additional paid-in capital	88,000

Jones elects to exercise his options when the market value of ABC Company's stock reaches \$24. At an exercise price of \$16, it will again cost Jones \$96,000 to purchase shares. At the current market price of \$24, Jones can trade in 4,000 of his existing shares to acquire new shares. However, he chooses

to trade in only 3,000 shares and pay for the remaining options with cash. ABC records the stock sale with the following entry:

Cash	24,000
Treasury stock	72,000
Common stock	6,000
Additional paid-in capital	90,000

The reload feature still applies, but now ABC only issues 3,000 replacement options, which matches the number of shares Jones traded in to acquire new shares. The new options are assigned at an exercise price of \$24, to match the market value on the grant date.

**Effect of employer payroll taxes.** ASC 718-10-25-22 discusses (1) when a liability for employer payroll taxes on employee stock compensation should be recognized in the employer's financial statements, and (2) how that liability should be measured. A liability for employee payroll taxes on stock compensation should be recognized and measured on the date of the event triggering the measurement and payment of the tax to the taxing authority (which would generally be the exercise date).

**Payments in lieu of dividends on options.** Normally dividends are not paid on shares that have not been issued; thus, unexercised options do not gain the benefit of any dividends declared on the underlying stock. However, an entity can choose to pay dividend equivalents on options.

Since the codification requires, effectively, that forfeitures be estimated and accounted for over the service period, in the author's view it would be consistent to likewise charge retained earnings only for the estimated number of options to be exercised (changing from period to period, if a lattice model is used), with the remainder of any payments in lieu of dividends charged currently to compensation expense.

#### Example of payments in lieu of dividends on options

Gary Ironworks declares dividends of \$2 per share of common stock. Its president, Mr. Jones, has 5,000 unvested options. Gary's board of directors chooses to pay Mr. Jones dividends on the 5,000 shares represented by the unvested options, on the assumption that all the options will vest. The resulting entry follows:

Retained earnings	10,000
Dividends payable	10,000

There are several other employees who have 20,000 unvested options. The board also declares dividends for these options, with the provision that dividends paid can be retained even if the associated options do not vest. The controller expects that only 70% of the options will vest, so she creates the following entry to charge the other 30% of the dividends to compensation expense:

Retained earnings	28,000
Compensation expense	12,000
Dividends payable	40,000

**Disclosure requirements under ASC 718.** For a company to achieve the objectives of ASC 718, the minimum information needed to achieve disclosure objectives is set forth below:

- A description of the share-based payment arrangements, including the terms of the awards. A nonpublic company should disclose its policy for measuring compensation cost.

- The most recent income statement should provide the number and weighted-average exercise prices of the share options and equity instruments.
- Each year for which an income statement is provided, a company should provide the weighted-average grant-date fair value of equity options and the intrinsic value of options exercised during the year.
- For fully vested share options and those expected to vest at the date of the latest statement of financial position, the company should provide the number, weighted-average exercise price, aggregate intrinsic value, and contractual terms of options outstanding and currently exercisable.
- If more than one share-based plan is in effect, the information should be provided separately for different types of awards.
- For each year for which an income statement is provided, companies should provide the following:
  - Companies that do not use the intrinsic value method should provide a description of the method of determining fair value and a description of the assumptions used.
  - Total compensation cost for share-based payment arrangements, including tax benefits and capitalization of compensation costs, should be stated.
  - Descriptions of significant modifications and numbers of employees affected should also be provided.
- On the date of the latest statement of financial position, the total compensation cost related to nonvested awards not yet recognized and the period over which they are expected to be recognized.
- The amount of cash received from exercise of share-based compensation and the amount of cash used to settle equity instruments should be disclosed.
- Description of the company's policy for issuing shares upon share options exercise, including the source of the shares.

#### **ASC 718-40, Employee Stock Ownership Plans**

There has been a steady increase in the number of corporations that are entirely or partially employee-owned under terms of ESOPs. The accounting for ESOP is governed by ASC 718-40.

Depending on what motivated the creation of the ESOP (e.g., estate planning by the controlling shareholder, expanding the capital base of the entity, rewarding and motivating the work force), the sponsor's shares may be contributed to the plan in annual installments in a block of shares from the sponsor, or shares from an existing shareholder may be purchased by the plan.

ESOPs are defined contribution plans in which shares of the sponsoring entity are awarded to employees as additional compensation. Briefly, ESOPs are created by a sponsoring corporation which either funds the plan directly (unleveraged ESOP) or, more commonly, facilitates the borrowing of money either directly from an outside lender (directly leveraged ESOP) or from the employer, which in turn will borrow from an outside lender (indirectly leveraged ESOP).

Borrowings from outside lenders may or may not be guaranteed by the sponsor. However, since effectively the only source of funds for debt repayment is future contributions by the sponsor, GAAP requires that the ESOP's debt be considered debt of the sponsor even absent a guarantee.

When recording the direct or indirect borrowings by the ESOP as debt in the sponsor's statement of financial position, a debit to a contra equity account, not to an asset, is also reported.

This is necessary since the borrowings represent a commitment (morally if not always legally) to make future contributions to the plan and this is certainly not a claim to resources. Significantly, this results in a “double hit” to the sponsor’s statement of financial position (i.e., the recording of a liability and the reduction of net stockholders’ equity), which is often an unanticipated and unpleasant surprise to plan sponsors. This contra equity account is referred to as “unearned ESOP shares” in accordance with provisions of ASC 718-40. If the sponsor itself lends funds to the ESOP without a “mirror loan” from an outside lender, this loan should not be reported in the employer’s statement of financial position as debt, although the debit should still be reported as a contra equity account.

As the ESOP services the debt, using contributions made by the sponsor and/or dividends received on sponsor shares held by the plan, it reflects the reduction of the obligation by reducing both the debt and the contra equity account on its statement of financial position. Simultaneously, income and thus retained earnings will be impacted as the contributions to the plan are reported in the sponsor’s current statement of earnings. Thus, the “double hit” is eliminated, but net worth continues to reflect the economic fact that compensation costs have been incurred.

The interest cost component of debt service must be separated from the remaining compensation expense. That is, the sponsor’s income statement should reflect the true character of the expenses being incurred, rather than aggregating the entire amount into a category which might have been denoted as “ESOP contribution.”

In a leveraged ESOP, shares held serve as collateral for the debt and are not allocated to employees until the debt is retired. In general, shares must be allocated by the end of the year in which the debt is repaid. However, to satisfy the tax laws, the allocation of shares may take place at a faster pace than the retirement of the principal portion of the debt.

Under ASC 718-40, the cost of ESOP shares allocated is measured based upon the fair value on the release date for purposes of reporting compensation expense in the sponsor’s income statements. This is in contradistinction to the actual historical cost of the shares to the plan.

Furthermore, dividends paid on unallocated shares (i.e., shares held by the ESOP) are not treated as dividends, but rather must be reported in the sponsor’s income statement as compensation cost and/or as interest expense. Of less significance to nonpublic companies is the fact that under the new rules only common shares released and committed to be released are treated as being outstanding, with the resultant need to be considered in calculating both basic and diluted EPS.

#### **Example of accounting for ESOP transactions**

Assume that Intrepid Corp. establishes an ESOP, which then borrows \$500,000 from Second Interstate Bank. The ESOP then purchases 50,000 shares of Intrepid no-par shares from the company; none of these shares are allocated to individual participants. The entries would be:

Cash	500,000
Bank loan payable	500,000
Unearned ESOP shares (contra equity)	500,000
Common stock	500,000

The ESOP then borrows an additional \$250,000 from the sponsor, Intrepid, and uses the cash to purchase a further 25,000 shares, all of which are allocated to participants:

Compensation	250,000
Common stock	250,000

Intrepid Corp. contributes \$50,000 to the plan, which the plan uses to service its bank debt, consisting of \$40,000 principal reduction and \$10,000 interest cost. The debt reduction causes 4,000 shares to be allocated to participants at a time when the average market value had been \$12 per share:

Interest expense	10,000
Bank loan payable	40,000
Cash	50,000
Compensation	48,000
Additional paid-in capital	8,000
Unearned ESOP shares	40,000

Dividends of \$.10 per share are declared (only the ESOP shares are represented in the following entry, but dividends are paid equally on all outstanding shares):

Retained earnings (on 29,000 shares)	2,900
Compensation (on 46,000 shares)	4,600
Dividends payable	7,500

Note that in all the foregoing illustrations the effect of income taxes is ignored. Since the difference between the cost and fair values of shares committed to be released is analogous to differences in the expense recognized for tax and accounting purposes with regard to stock options, the same treatment should be applied. That is, the tax effect should be reported directly in stockholders' equity, rather than in earnings.

#### **ASC 718-50, Employee Share Purchase Plans**

Employee share purchase plans are not compensatory if their terms are no more favorable than those available to all holders of the same class of shares and if all employees that meet limited employment qualifications may participate in the plan on an equitable basis.

## PERSPECTIVE AND ISSUES

---

### Subtopics

ASC 720, *Other Expenses*, contains nine subtopics:

- ASC 720-10, *Overall*, which merely lists the other subtopics
- ASC 720-15, *Start-Up Costs*
- ASC 720-20, *Insurance Costs*
- ASC 720-25, *Contributions Made*
- ASC 720-30, *Real and Personal Property Taxes*
- ASC 720-35, *Advertising Costs*
- ASC 720-40, *Electronic Equipment Waste Obligations*
- ASC 720-45, *Business and Technology Reengineering*
- ASC 720-50, *Fees Paid to the Federal Government by Pharmaceutical Manufacturers and Health Insurers*.

### Scope and Scope Exceptions

**ASC 720-15.** ASC 720-15 applies to all nongovernmental entities. Routine ongoing efforts to improve existing quality of products, services, or facilities are not start-up costs. The subtopic lists specific activities that are *not* considered start-up costs and should be accounted for in accordance with other existing authoritative literature:

1. Ongoing customer acquisition costs, such as policy acquisition costs (see Subtopic 944-30)
2. Loan origination costs (see Subtopic 310-20)
3. Activities related to routine, ongoing efforts to refine, enrich, or otherwise improve upon the qualities of an existing product, service, process, or facility
4. Activities related to mergers or acquisitions

5. Business process reengineering and information technology transformation costs addressed in Subtopic 720-45
6. Costs of acquiring or constructing long-lived assets and getting them ready for their intended uses (however, the costs of using long-lived assets that are allocated to start-up activities [for example, depreciation of computers] are within the scope of this Subtopic)
7. Costs of acquiring or producing inventory
8. Costs of acquiring intangible assets (however, the costs of using intangible assets that are allocated to start-up activities [for example, amortization of a purchased patent] are within the scope of this Subtopic)
9. Costs related to internally developed assets (for example, internal-use computer software costs) (however, the costs of using those assets that are allocated to start-up activities are within the scope of this Subtopic)
10. Research and development costs that are within the scope of Section 730-10-15
11. Regulatory costs that are within the scope of Section 980-10-15
12. Costs of fundraising incurred by NFPs
13. Costs of raising capital
14. Costs of advertising
15. Costs incurred in connection with existing contracts as stated in paragraph 605-35-25-41(d). (ASC 720-15-15-4)
16. Learning or start-up costs incurred in connection with existing contracts or in anticipation of future contracts for the same goods or services.
17. Costs incurred in connection with acquiring a contract.<sup>1</sup>

**ASC 720-25.** ASC 720-25 applies to contributions and other assets, including promises to give, but it does *not* apply to:

- Transfers of assets that are in substance purchases of goods or services for equal value. If the donor exchanges assets or services for assets of substantially lower value, the contribution is within the scope of ASC 720-25.
  - Transfers where the reporting entity acts as an agent, trustee, or intermediary, and not as a donor.
  - Tax exemptions, tax incentives, or tax abatements.
  - Transfers of assets from governments to business entities.
- (ASC 720-25-15-2 and 15-3)

**ASC 720-35.** ASC 720-35 applies to all entities and to all advertising transactions and activities, except it does *not* apply to the following transactions:

- a. Direct-response advertising costs of insurance entity (for guidance, see ASC 944-30).
- b. Advertising costs in interim periods (for guidance, see ASC 270-10-45-7).
- c. Costs of advertising conducted for others under contractual arrangements.
- d. Indirect costs that are specifically reimbursable under the terms of a contract.
- e. Fundraising by NFPs (however, ASC 720-35 does apply to advertising activities of NFPs).
- f. Customer acquisition activities, other than advertising.

---

<sup>1</sup> Note: When ASU 2014-09 is implemented, number 15 will be replaced by numbers 16 and 17.

- g. The costs of premiums, contest prizes, gifts, and similar promotions, as well as discounts or rebates, including those resulting from the redemption of coupons. (Other costs of coupons and similar items, such as costs of newspaper advertising space, are considered advertising costs.)

(ASC 720-35-15-3)

ASC 720-35 may or may not apply to activities, such as product endorsements and sponsorships of events, which may be performed pursuant to executory contracts. (ASC 720-35-15-4)

## DEFINITIONS OF TERMS

---

Source: ASC 720, *Glossaries*. See Appendix, *Definition of Terms*, for other terms relevant to this Topic: Contract, Customer, and Revenue.

**Contribution.** An unconditional transfer of cash or other assets to an entity or a settlement or cancellation of its liabilities in a voluntary nonreciprocal transfer by another entity acting other than as an owner. Those characteristics distinguish contributions from exchange transactions, which are reciprocal transfers in which each party receives and sacrifices approximately equal value; from investments by owners and distributions to owners, which are nonreciprocal transfers between an entity and its owners; and from other nonreciprocal transfers, such as impositions of taxes or legal judgments, fines, and thefts, which are not voluntary transfers. In a contribution transaction, the value, if any, returned to the resource provider is incidental to potential public benefits. In an exchange transaction, the potential public benefits are secondary to the potential proprietary benefits to the resource provider. The term *contribution revenue* is used to apply to transactions that are part of the entity's ongoing major or central activities (revenues), or are peripheral or incidental to the entity (gains). See also Inherent Contribution.

**Incurred but not Reported.** Losses incurred by the insured entity that have not yet been reported to the insurance entity.

**Inherent Contribution.** A contribution that results if an entity voluntarily transfers assets (or net assets) or performs services for another entity in exchange for either no assets or for assets of substantially lower value and unstated rights or privileges of a commensurate value are not involved.

**Promise to Give.** A written or oral agreement to contribute cash or other assets to another entity. A promise carries rights and obligations—the recipient of a promise to give has a right to expect that the promised assets will be transferred in the future, and the maker has a social and moral obligation, and generally a legal obligation, to make the promised transfer. A promise to give may be either conditional or unconditional.

**Start-up Activities.** Defined broadly as those one-time activities related to any of the following:

- a. Opening a new facility
- b. Introducing a new product or service
- c. Conducting business in a new territory
- d. Conducting business with an entirely new class of customer (for example, a manufacturer who does all of their business with retailers attempts to sell merchandise directly to the public) or beneficiary
- e. Initiating a new process in an existing facility
- f. Commencing some new operation.

**Unconditional Promise to Give.** A promise to give that depends only on passage of time or demand by the promisee for performance.

## **CONCEPTS, RULES, AND EXAMPLES**

---

### **ASC 720-10, Overall**

ASC 720-10 provides no guidance. It merely lists all the subtopics in Topic 720.

### **ASC 720-15, Start-Up Costs**

ASC 720-15 provides guidance on financial reporting of start-up costs, including organization costs, and requires such costs to be expensed as incurred. In addition to items mentioned in the Scope section of this chapter, other costs outside the scope are: store advertising, coupon giveaways, uniforms, furniture, cash registers, obtaining licenses, deferred financing costs, costs related to construction activities, such as security, property taxes, insurance, and utilities.

### **ASC 720-20, Insurance Costs**

ASC 720-20 provides guidance on:

- Retroactive contracts
- Claims-made contracts
- Multiple-year retrospectively rated contracts.

Guidance for each of the above is in a separate subsection.

The premium paid minus the amount of the premium retained by the insurer is accounted for as a deposit by the insured. This is only to “the extent that an insurance contract or reinsurance contract does not, despite its form, provide for indemnification of the insured or the ceding entity by the insurer or reinsurer against loss or liability.” (ASC 720-20-25-1)

### **ASC 720-25, Contributions Made**

ASC 720-25 states that contributions made are expenses in the period when the contribution is made. There should also be a decrease in assets or increase in liabilities. ASC 958 contains guidance on conditional contributions.

### **ASC 720-30, Real and Personal Property Taxes**

Accrued real estate and personal property taxes represent the unpaid portion of an entity’s obligation to a state, county, or other taxing authority that arises from the ownership of real or personal property, respectively. ASC 720-30 indicates that the most acceptable method of accounting for property taxes is a monthly accrual of property tax expense during the fiscal period of the taxing authority for which the taxes are levied. The fiscal period of the taxing authority is the fiscal period that includes the assessment or lien date.

A liability for property taxes payable arises when the fiscal year of the taxing authority and the fiscal year of the entity do not coincide or when the assessment or lien date and the actual payment date do not fall within the same fiscal year.

**Example of accrued real estate taxes**

Rohlf's Corporation is a calendar-year corporation that owns real estate in a state that operates on a June 30 fiscal year. In this state, real estate taxes are assessed and become a lien against real property on July 1. These taxes, however, are payable in arrears in two installments due on April 1 and August 1 of the next calendar year. Real estate taxes assessed were \$18,000 and \$22,000 for the years ended 6/30/20X2 and 6/30/20X3, respectively. Rohlf's computes its accrued real estate taxes at December 31, 20X1, as follows:

<i>Fiscal year- end of tax jurisdiction</i>	<i>Assessment date/ lien date</i>	<i>Installment due dates</i>		<i>Annual assessment</i>	<i>20X2 Expense</i>	<i>Portion of expense paid in 20X2</i>	<i>Accrued real estate tax at 12/31/X2</i>
		<i>April 1</i>	<i>August 1</i>				
6/30/20X2	7/1/20X1	20X2	20X2	\$18,000	\$9,000	\$9,000	\$ —
6/30/20X3	7/1/20X2	20X3	20X3	22,000	11,000	—	11,000
					\$20,000	\$9,000	\$11,000

Proof of the accrual computation is as follows:

Annual assessment—year-end 6/30/X3 of \$22,000 ÷ 12 = \$1,833/month × 6 months \$11,000

### **ASC 720-35, Advertising Costs**

The costs of advertising are expensed either as costs are:

- incurred, or
- the first time the advertising takes place (e.g., when the television advertisement is aired or a printed copy is published), if later. (ASC 720-35-25-1)

Depreciation or amortization costs of a tangible asset used for advertising may be a cost of advertising. (ASC 720-35-35-1)

Materials, such as sales brochures and catalogues, are accounted for as prepaid supplies until they are used. At that time, they are accounted for as advertising costs. (ASC 720-35-25-3)

ASC 720 has a separate section on communication advertising—television, airtime, and print advertising space. Costs associated with communication advertising are reported as advertising expense when the item or service has been received. (ASC 720-35-25-5)

Advertising expenditures are sometimes made subsequent to the recognition of revenue (such as in “cooperative advertising” arrangements with customers). In order to achieve proper matching, these costs are estimated, accrued, and charged to expense when the related revenues are recognized.

### **ASC 720-40, Electronic Equipment Waste Obligations**

ASC 720-40 contains “guidance on accounting for historical electronic equipment waste held by private households for obligations associated with Directive 2002/96/EC on Waste Electrical and Electronic Equipment adopted by the European Union.” (ASC 720-40-05-01)

A commercial user of electronic equipment acquired on or prior to August 13, 2005, is required to capitalize an asset retirement cost, as outlined in ASC 410, by increasing the carrying amount of the related asset by the same amount as the liability associated with the waste disposal obligation. If the asset is subsequently replaced, the obligation is shifted to the producer of the

replacement equipment, so the user must calculate that portion of the payment to the replacement equipment producer relating to the transfer of the ARO, and eliminate the associated liability from its statement of financial position, while recognizing a gain or loss based on the difference between the liability on the sale date and that portion of the payment related to the ARO. Meanwhile, the producer of the new asset recognizes revenue for the total amount of the sale, less the fair value of the ARO.

**ASC 720-45, Business and Technology Reengineering**

ASC 720-45 states that the cost of business process reengineering activities should be expensed as incurred. This includes internal efforts or third-party activities.

**ASC 720-50, Fees Paid to the Federal Government by Pharmaceutical Manufacturers and Health Insurers**

ASC 720-50 provides guidance on certain provisions of the Patient Protection and Affordable Care Act, as amended by the Health Care and Education Reconciliation Act. Those Acts require pharmaceutical manufacturers and health insurers to pay annual fees.

The liability should be “estimated and recorded in full upon the first qualifying sale for pharmaceutical manufacturers or once the entity provides qualifying health insurance for health insurers in the applicable calendar year in which the fee is payable with a corresponding deferred cost that is amortized to expense using a straight-line method of allocation unless another method better allocates the fee over the calendar year that it is payable.” (ASC 720-50-25-1)

# 46 ASC 730 RESEARCH AND DEVELOPMENT

<b>Perspective and Issues</b>	<b>813</b>	<i>ASC 730-10, Research and Development—Overall</i>	814
Subtopics	813	Example of research and development	815

<b>Definitions of Terms</b>	<b>814</b>	Nonrefundable advance payments related to future R&D activities	817
<b>Concepts, Rules, and Examples</b>	<b>814</b>		

## PERSPECTIVE AND ISSUES

---

### Subtopics

ASC 730, *Research and Development*, contains two subtopics:

- ASC 730-10, *Overall*, which provides guidance on the activities, elements, costs, accounting, and disclosures for research and development
- ASC 730-20, *Research and Development Arrangements*, which provides guidance on arrangements used to finance research and development.

### Scope and Scope Exception

ASC 730 applies to all entities and to “activities aimed at developing or significantly improving a product or service (referred to as product) or a process or technique (referred to as process) whether the product or process is intended for sale or use.” (ASC 710-30-15-3)

ASC 730 does *not* apply to:

- the costs of research and development activities conducted for others under a contractual arrangement,
  - indirect costs,
  - activities that are unique to entities in the extractive industries,
  - a process for use in an entity’s selling or administrative activities,
  - routine alterations to existing products and processes,
  - market research,
  - research and development assets acquired in an acquisition by not-for-profit entity or business combination,
  - internally developed computer software and costs incurred to purchase or use computer software unless it is intended for use with R&D activities.
- (ASC 730-10-15-4 and 5)

Note the following is effective upon implementation of ASU 2014-09, *Revenue from Contracts with Customers*: ASC 730-20 applies to arrangements for software development fully

or partially funded by a party other than the vendor developing the software, and where technological feasibility has not been established. If the technological feasibility has been established before the arrangement is entered into, the guidance in ASC 730-20 does not apply to funded software arrangements. Neither does it apply to government research and development. (ASC 730-20-15-1A and 4)

## Overview

ASC 730 addresses the proper accounting and reporting for research and development costs. It identifies:

- those activities that are to be identified as research and development,
  - the elements of costs that shall be identified with research and development activities, the accounting for these costs, and
  - the financial statement disclosures related to them.
- (ASC 730-10-05-1)

The central issue in regard to research and development costs is that the future benefits related to these expenditures are uncertain. Given this uncertainty, it is generally difficult to justify classifying them as an asset. Generally, entities should charge them to expense as incurred. (ASC 730-10-05-2 and 3)

## DEFINITIONS OF TERMS

---

Source: ASC 710-10-20 and ASC 710-20-20. Also see Appendix, *Definition of Terms*, for other terms relevant to this Topic: Acquiree, Acquirer, Acquisition by a Not-for-Profit Entity, Business, Business Combination, Legal Entity, Not-for-Profit Entity, Probably, Related Parties, and Variable Interest Entity.

**Research and Development.** Research is planned search or critical investigation aimed at discovery of new knowledge with the hope that such knowledge will be useful in developing a new product or service (referred to as product) or a new process or technique (referred to as process) or in bringing about a significant improvement to an existing product or process.

Development is the translation of research findings or other knowledge into a plan or design for a new product or process or for a significant improvement to an existing product or process whether intended for sale or use. It includes the conceptual formulation, design, and testing of product alternatives, construction of prototypes, and operation of pilot plants.

**Sponsor.** An entity that capitalizes a research and development arrangement.

## CONCEPTS, RULES, AND EXAMPLES

---

### ASC 730-10, *Research and Development—Overall*

There are three ways in which R&D costs are incurred by a business:

1. Purchase of R&D from other entities
2. Conducting R&D for others under a contractual arrangement
3. Conducting R&D activities for the benefit of the reporting entity.

The accounting treatment relative to R&D depends upon the nature of the cost. R&D costs incurred in the ordinary course of operations consist of materials, equipment, facilities, personnel,

and indirect costs that can be attributed to research or development activities. These costs are expensed in the period in which they are incurred unless they have alternative future uses. Examples of such R&D costs with alternative future uses include:

1. Laboratory research to discover new knowledge
  2. Searching for applications of new research findings or other knowledge
  3. Formulation and design of product alternatives
  4. Testing for product alternatives
  5. Modification of products or processes
  6. Design, construction, and testing preproduction prototypes and models
  7. Design of tools, dies, etc. for new technology
  8. Pilot plants not capable of commercial production
  9. Engineering activity until the product is ready for manufacture
  10. Design and development tools used to facilitate research and development or components of a product or process that are undergoing research and development activities.
- (ASC 730-10-55-1)

Examples of costs that are *not* considered R&D include:

1. Engineering during an early phase of commercial production
2. Quality control for commercial production
3. Troubleshooting during a commercial production breakdown
4. Routine, ongoing efforts to improve products
5. Adaptation of existing capacity for a specific customer or other requirements
6. Seasonal design changes to products
7. Routine design of tools, dies, etc.
8. Design, construction, startup, etc. of equipment except that used solely for R&D
9. Legal work related to patents or litigation.

(ASC 730-10-55-2)

#### **Example of research and development**

The TravelBins Corporation is developing a hard-shell plastic ski case on wheels. It assigns two staff to the design of the case, as well as a product design consultant, and also contracts with a Portuguese firm to develop suitable molds for the main case and ancillary parts. The company works its way through 17 product development and production activities before it is satisfied that the new ski case is ready for general distribution. The following matrix shows where costs are charged as various steps are completed:

<i>Step</i> <i>No.</i>	<i>Activity</i>	<i>Charge to R &amp; D expense</i>	<i>Charge to production overhead</i>	<i>Move to inventory</i>	<i>Capitalize</i>
1	Cost of product design consultant	xxx			
2	Salaries related to design of the ski case	xx			
3	Purchase of design computers and rapid prototyping machines				xxx
4	Allocation of indirect development costs	xxx			
5	Cost of preliminary test molds	xxx			

6	Cost of building in which test facility is housed		xxx
7	Cost of resin pellets acquired for test runs		xxx
8	Scrapped cases from test runs	xxx	
9	Good-quality cases from test runs		xxx
10	Cost of independent stress test firm	xxx	
11	Patent filing cost		xxx
12	Cost to defend patent		xxx
13	Cost of final mold		xxx
14	Machine set-up time	xxx	
15	Quality control during commercial production	xxx	
16	Routine mold adjustments	xxx	
17	Production engineering to reduce scrap rate	xxx	

The costs of design computers and building are capitalized, since they can be used independently from the product development process. The cost of the final mold is capitalized and amortized over the life of the mold, while patent costs are capitalized and amortized over the life of the product (which may extend past the life of the first mold). The cost of the plastic resin and good-quality ski cases can be transferred to inventory for use in regular production and for sale to customers, respectively.

#### **ASC 730-20, Research and Development Arrangements**

In many cases, entities will pay other parties to perform R&D activities on their behalf. Substance over form must be used in evaluating these arrangements. A financial reporting result cannot be obtained indirectly if it would not have been permitted if accomplished directly. Thus, if costs are incurred to engage others to perform R&D activities that, in substance, could have been performed by the reporting entity itself, those costs must be expensed as incurred.

An alternative arrangement may consist of a business entering into a limited partnership where the limited partners provide funding and the business conducts the research under a contract with the partnership. Under such an arrangement, the partnership may retain legal ownership of the results of the research. The business may have an option to buy back the results of the research upon payment of a stipulated amount to the partnership.

On the other hand, if the payment is to acquire intangibles for use in R&D activities, and these assets have other uses, then the expenditure is capitalized and accounted for in accordance with ASC 350.

When R&D costs are incurred as a result of contractual arrangements, the nature of the agreement dictates the accounting treatment of the costs involved. The key determinant is the transfer of the risk associated with the R&D expenditures. Risk is not transferred to the other parties if there is a commitment by the business to repay the other parties. Examples of commitments to repay are:

- The entity guarantees repayment regardless of the outcome
- The other parties can require the entity to purchase their interests
- The other parties receive debt or equity securities issued by the entity upon completion of the project, irrespective of the outcome.

(ASC 730-20-25-4)

If the business receives funds from another party to perform R&D and is obligated to repay those funds regardless of the outcome, a liability must be recorded and the R&D costs expensed as incurred. To conclude that a liability does not exist, the transfer of the financial risk must be substantive and genuine.

**Nonrefundable advance payments related to future R&D activities.** Entities conducting R&D activities may make payments in advance for goods or services to be used in R&D activities. Often, these payment arrangements involve a specific R&D project and the R&D activities to be performed generally have no alternative future use at the time the arrangements are entered into. All or a portion of the advance payment may be nonrefundable to the entity conducting the R&D activities. For example, if the R&D project does not advance to a stage where the goods or services that were paid for in advance are necessary, the entity conducting the R&D activities will not recover its advance payments.

Nonrefundable advance payments are deferred and capitalized. (ASC 730-20025-13) As the related goods are delivered and services performed, the capitalized amounts are to be recognized as expense. (ASC 730-20-35-1) On a continuous basis, management should evaluate whether it expects the goods to be delivered or services rendered and to charge the capitalized advance payments to expense when there no longer is an expectation of future benefits.

This is limited to nonrefundable advance payments for goods to be used or services to be rendered in future R&D activities pursuant to an executory contractual arrangement where the goods or services have no alternative future use.

## PERSPECTIVE AND ISSUES

---

### Subtopics

ASC 740, *Income Taxes*, consists of three subtopics:

- ASC 740-10, *Overall*, which provides most of the guidance on accounting and reporting for income taxes
- ASC 740-20, *Intraperiod Tax Allocation*, which provides guidance on the process of allocating income tax benefits or expenses to different components of comprehensive income
- ASC 740-30, *Other Considerations or Special Areas*, which provides guidance for specific limited exceptions related to investments in subsidiaries and corporate joint ventures arising from undistributed earnings or other causes
- ASC 740-270, *Interim Reporting*, which provides the guidance for interim period income taxes.

Incremental guidance may also be found in other topics, for example: Investments—Equity Method and Joint Ventures, Compensation—Stock Compensation, Business Combinations, Foreign Currency Matters, Reorganizations, Entertainment—Casinos, Extractive Activities—Oil and Gas, Financial Services—Depository and Lending, Financial Services—Insurance, Health Care Entities, Real Estate—Common Interest Realty Associations, Regulated Operations, and U.S. Steamship Entities.

### Scope and Scope Exceptions

ASC 740-10 applies to income taxes accounted for in accordance with ASC 740, and thus does not apply directly or by analogy to other taxes, such as real estate, personal property, sales, excise, use taxes, or franchise taxes to the extent based on capital. The scope of ASC 740-10 includes any entity potentially subject to income taxes, including:

- Nonprofit organizations
- Flow-through entities (e.g., partnerships, limited liability companies, and S corporations)
- Entities whose income tax liabilities are subject to 100% credit for dividends paid such as real estate investment trusts (REITs) and registered investment companies.

### Technical Alert

In November 2015, as part of its simplification initiative, the FASB issued ASU 2015-17, *Balance Sheet Classification of Deferred Taxes*.

**Guidance.** Currently entities must present deferred taxes for each jurisdiction as a net current asset or liability. Therefore, entities must do a jurisdiction-by-jurisdiction analysis based on:

- The classification of the assets and liabilities to which the underlying temporary differences relate, or
- For loss or credit carryforwards, based on the period in which the attribute is expected to be realized.

The entity must then allocate on a pro rata basis, by jurisdiction, any valuation allowance between current and noncurrent deferred tax assets. The changes in the ASU simplify presentation

by requiring entities to classify all deferred tax assets and liabilities and any related valuation allowance as noncurrent on the balance sheet. Therefore, each jurisdiction will have only one net noncurrent deferred tax asset or liability. The new guidance does not change the requirement that only permits offsetting within a jurisdiction. Entities should be aware that the change may affect working capital.

**Implementation.** The ASU is effective:

- For public business entities, in fiscal years beginning after December 15, 2016, including interim periods within those years.
- For all other entities, in fiscal years beginning after December 15, 2017, and interim periods within fiscal years beginning after December 15, 2018.

## Overview

There are two main objectives to accounting for income taxes:

1. Recognize the estimated taxes payable or refundable on tax returns for the current year as a tax liability or asset.
2. Recognize a deferred tax liability or asset for the estimated future tax effects attributable to temporary differences and carryforwards.

(ASC 740-10-05-5)

The term “tax position” is used in ASC 740-10 to refer to *each* judgment that management makes on an income tax return that has been or will be filed that affects the measurement of current or deferred income tax assets and liabilities at the date of each interim or year-end statement of financial position. Tax positions include:

1. Deductions claimed
2. Deferrals of current income tax to one or more future periods
3. Income tax credits applied
4. Characterization as capital gain versus ordinary income
5. Whether or not to report income on an income tax return
6. Whether or not to file an income tax return in a particular jurisdiction.

The effects of a tax position can result in a permanent reduction of income taxes payable or deferral of the payment of income taxes to a future year. The taking of a tax position can also affect management’s estimate of the valuation allowance sufficient to reflect its estimate of the amount of deferred income tax assets that are realizable.

Reporting entities are required to file income tax returns and pay income taxes in the domestic (federal, state, and local) and foreign jurisdictions in which they do business. GAAP requires that financial statements be prepared on an accrual basis and that, consequently, the reporting entity is required to accrue a liability for income taxes owed or expected to be owed with respect to income tax returns filed or to be filed for all applicable tax years and in all applicable jurisdictions.

Uncertain income tax positions are subject to formal recognition and measurement criteria, as well as to extended disclosure requirements under GAAP.

The computation of taxable income for the purpose of filing federal, state, and local income tax returns differs from the computation of net income under GAAP for a variety of reasons. In some instances, referred to as temporary differences, the timing of income or expense

recognition varies. In other instances, referred to as permanent differences, income or expense recognized for income tax purposes is never recognized under GAAP, or vice versa. An objective under GAAP is to recognize the income tax effects of transactions in the period that those transactions occur. Consequently, deferred income tax benefits and obligations frequently arise in financial statements.

The basic principle is that the deferred income tax effects of all temporary differences (which are defined in terms of differential bases in assets and liabilities under income tax and GAAP accounting) are formally recognized. To the extent that realizability of deferred income tax assets is doubtful, a valuation allowance is provided, analogous to the allowance for uncollectible receivables.

With its statement of financial position orientation, ASC 740 requires that the amounts presented be based on the amounts expected to be realized, or obligations expected to be liquidated. Use of an average effective income tax rate convention is permitted. The effects of all changes in the deferred income tax assets and liabilities flow through the income tax provision in the income statement; consequently, income tax expense is normally not directly calculable based on pretax accounting income in other than the simplest situations.

*Interperiod* income tax allocation, which gives rise to deferred income tax assets and liabilities, is required under GAAP.

## DEFINITIONS OF TERMS

---

Source: ASC 740, *Glossaries*. See Appendix A, *Definitions of Terms*, for other definitions related to this topic: Acquisition by a Not-for-Profit Entity, Business, Business Combination, Commencement Date of the Lease, Component of an Entity, Conduit Debt Securities, Consolidation, Contract, Contract Assets, Customer, Lease, Lessee, Lessor, Leveraged Lease, Merger of Not-for-Profit Entities, Noncontrolling Interests, Nonpublic Entity, Not-for-Profit Entity, Parent, Public Business Entity, Public Entity, Revenue, Subsidiary, and Underlying Asset.

**Alternative Minimum Tax.** A tax that results from the use of an alternate determination of a corporation's federal income tax liability under provisions of the U.S. Internal Revenue Code.

**Carrybacks.** Deductions or credits that cannot be utilized on the tax return during a year that may be carried back to reduce taxable income or taxes payable in a prior year. An operating loss carryback is an excess of tax deductions over gross income in a year; a tax credit carryback is the amount by which tax credits available for utilization exceed statutory limitations. Different tax jurisdictions have different rules about whether excess deductions or credits may be carried back and the length of the carryback period.

**Carryforwards.** Deductions or credits that cannot be utilized on the tax return during a year that may be carried forward to reduce taxable income or taxes payable in a future year. An operating loss carryforward is an excess of tax deductions over gross income in a year; a tax credit carryforward is the amount by which tax credits available for utilization exceed statutory limitations. Different tax jurisdictions have different rules about whether excess deductions or credits may be carried forward and the length of the carryforward period. The terms carryforward, operating loss carryforward, and tax credit carryforward refer to the amounts of those items, if any, reported in the tax return for the current year.

**Consolidated Financial Statements.** The financial statements of a consolidated group of entities that include a parent and all its subsidiaries presented as those of a single economic entity.

**Corporate Joint Venture.** A corporation owned and operated by a small group of entities (the joint venturers) as a separate and specific business or project for the mutual benefit of the members of the group. A government may also be a member of the group. The purpose of a corporate joint venture frequently is to share risks and rewards in developing a new market, product, or technology; to combine complementary technological knowledge; or to pool resources in developing production or other facilities. A corporate joint venture also usually provides an arrangement under which each joint venturer may participate, directly or indirectly, in the overall management of the joint venture. Joint venturers thus have an interest or relationship other than as passive investors. An entity that is a subsidiary of one of the joint venturers is not a corporate joint venture. The ownership of a corporate joint venture seldom changes, and its stock is usually not traded publicly. A noncontrolling interest held by public ownership, however, does not preclude a corporation from being a corporate joint venture.

**Current Tax Expense (or Benefit).** The amount of income taxes paid or payable (or refundable) for a year as determined by applying the provisions of the enacted tax law to the taxable income or excess of deductions over revenues for that year.

**Deductible Temporary Difference.** Temporary differences that result in deductible amounts in future years when the related asset or liability is recovered or settled, respectively.

**Deferred Tax Asset.** The deferred tax consequences attributable to deductible temporary differences and carryforwards. A deferred tax asset is measured using the applicable enacted tax rate and provisions of the enacted tax law. A deferred tax asset is reduced by a valuation allowance if, based on the weight of evidence available, it is more likely than not that some portion or all of a deferred tax asset will not be realized.

**Deferred Tax Consequences.** The future effects on income taxes as measured by the applicable enacted tax rate and provisions of the enacted tax law resulting from temporary differences and carryforwards at the end of the current year.

**Deferred Tax Expense (or Benefit).** The change during the year in an entity's deferred tax liabilities and assets. For deferred tax liabilities and assets acquired in a purchase business combination during the year, it is the change since the combination date. Income tax expense (or benefit) for the year is allocated among continuing operations, discontinued operations, and items charged or credited directly to shareholders' equity.

**Deferred Tax Liability.** The deferred tax consequences attributable to taxable temporary differences. A deferred tax liability is measured using the applicable enacted tax rate and provisions of the enacted tax law.

**Gains and Losses Included in Comprehensive Income but Excluded from Net Income.** Gains and losses included in comprehensive income but excluded from net income include certain changes in fair values of investments in marketable equity securities classified as noncurrent assets, certain changes in fair values of investments in industries having specialized accounting practices for marketable securities, adjustments related to pension liabilities or assets recognized within other comprehensive income, and foreign currency translation adjustments. Future changes to generally accepted accounting principles (GAAP) may change what is included in this category.

**Income Taxes.** Domestic and foreign federal (national), state, and local (including franchise) tax based on income.

**Tax Consequences.** The effects on income taxes—current or deferred—of an event.

**Tax Position.** A position in a previously filed tax return or a position expected to be taken in a future tax return that is reflected in measuring current or deferred income tax assets and liabilities

for interim or annual periods. A tax position can result in a permanent reduction of income taxes payable, a deferral of income taxes otherwise currently payable to future years, or a change in the expected realizability of deferred tax assets. The term tax position also encompasses, but is not limited to:

- a. A decision not to file a tax return
- b. An allocation or a shift of income between jurisdictions
- c. The characterization of income or a decision to exclude reporting taxable income in a tax return
- d. A decision to classify a transaction, entity, or other position in a tax return as tax exempt
- e. An entity's status, including its status as a pass-through entity or a tax-exempt not-for-profit entity.

**Taxable Income.** The excess of taxable revenue over tax deductible expenses and exemptions for the year as defined by the governmental taxing authority.

**Taxable Temporary Differences.** Temporary differences that result in taxable amounts in future years when the related asset is recovered or the related liability is settled.

**Tax-Planning Strategy.** An action (including elections for tax purposes) that meets certain criteria (see paragraph 740-10-30-19) and that would be implemented to realize a tax benefit for an operating loss or tax credit carryforward before it expires. Tax-planning strategies are considered when assessing the need for and amount of a valuation allowance for deferred tax assets.

**Temporary Difference.** A difference between the tax basis of an asset or liability computed pursuant to the requirements in Subtopic 740-10 for tax positions, and its reported amount in the financial statements that will result in taxable or deductible amounts in future years when the reported amount of the asset or liability is recovered or settled, respectively. Paragraph 740-10-25-20 cites eight examples of temporary differences. Some temporary differences cannot be identified with a particular asset or liability for financial reporting (see paragraphs 740-10-05-10 and 740-10-25-24 through 25-25), but those temporary differences do meet both of the following conditions:

1. Will result from events that have been recognized in the financial statements
2. Will result in taxable or deductible amounts in future years based on provisions of the tax law.

Some events recognized in financial statements do not have tax consequences. Certain revenues are exempt from taxation and certain expenses are not deductible. Events that do not have tax consequences do not give rise to temporary differences.

**Tentative Minimum Tax.** An intermediate calculation used in the determination of a corporation's federal income tax liability under the alternative minimum tax system in the United States.

**Unrecognized Tax Benefits.** The difference between a tax position taken or expected to be taken in a tax return and the benefit recognized and measured pursuant to Subtopic 740-10.

**Unrelated Business Income.** Income earned from a regularly carried-on trade or business that is not substantially related to the charitable, educational, or other purpose that is the basis of an organization's exemption from income taxes. This income subjects the otherwise tax-exempt organization to an entity-level unrelated business income tax (UBIT).

**Valuation Allowance.** The contra asset that is to be reflected to the extent that, in management's judgment, it is "more likely than not" that the deferred income tax asset will not be realized.

## CONCEPTS, RULES, AND EXAMPLES

---

### Accounting Theory

When reporting income taxes, accounting theory has prioritized the statement of financial position. To compute deferred income taxes consistent with this balance sheet orientation requires use of the "liability method." This essentially ascertains, as of each date for which a statement of financial position is presented, the amount of future income tax benefits or obligations that are associated with the reporting entity's assets and liabilities existing at that time. Any adjustments necessary to increase or decrease deferred income taxes to the computed balance, plus or minus the amount of income taxes owed currently, determine the periodic income tax expense or benefit to be reported in the income statement. Put another way, income tax expense is the residual result of several other computations oriented to measurement in the statement of financial position.

ASC 740 requires that all deferred income tax assets are given full recognition, whether arising from deductible temporary differences or from net operating loss or tax credit carryforwards.

Under ASC 740 it is necessary to assess whether the deferred income tax asset is realizable. Testing for realization is accomplished by means of a "more-likely-than-not" criterion that indicates whether an allowance is needed to offset some or all of the recorded deferred income tax asset. While the determination of the amount of the allowance may make use of the scheduling of future expected reversals, other methods may also be employed.

In summary, interperiod income tax allocation under GAAP is based on the liability method, using comprehensive allocation. While this basic principle may be straightforward, there are a number of computational complexities to be addressed. These will be presented in the remainder of this chapter.

An example of application of the liability method of deferred income tax accounting follows.

#### Simplified example of interperiod income tax allocation using the liability method

Caitlyn International has no permanent differences in years 20X1 through 20X3 (these are discussed later in this chapter). The company has only two amounts on its statement of financial position with temporary differences between their income tax and financial reporting bases, property and equipment, and prepaid rent. No consideration is given to the classification of the deferred income tax amounts (i.e., current or long term) as it is not considered necessary for the purposes of this example.

Details of Caitlyn's temporary differences are as follows:

#### Caitlyn International Temporary Differences

##### Prepaid rent future deductible temporary differences

Basis at December 31	Tax	GAAP	Future (taxable) deductible amount
20X1	–	\$(100,000)	\$100,000
20X2	–	(80,000)	80,000
20X3	–	(125,000)	125,000

### Property and equipment future taxable temporary difference

On January 1, 20X1, Caitlyn International purchased \$400,000 of property and equipment with a 10-year estimated useful life which, under its normal accounting policy, it depreciates using the straight-line method. For income tax purposes, these assets qualify as 5-year personal property under the General Depreciation System (GDS), and consequently, income tax depreciation is computed using the Modified Accelerated Cost Recovery System (MACRS) which is equivalent to double-declining balance depreciation with a half-year assumed for the year placed in service and changing to straight-line depreciation when advantageous to the taxpayer. In addition, as permitted by IRC Section 179, Caitlyn elected to deduct \$100,000 of these costs in the year placed in service. By making this election, for the purpose of computing income tax cost recovery, Caitlyn is required to reduce the depreciable basis of the eligible assets by the amount of Section 179 deduction taken during the tax year.

	<i>20X1</i>	<i>Tax</i>	<i>GAAP</i>	<i>Future (taxable) deductible amount</i>
A	Purchase price of assets	\$400,000	\$400,000	
B	Section 179 expense election	<u>100,000</u>	—	
C	Adjusted depreciable basis (A – B)	<u>300,000</u>	400,000	
D	Depreciation rate	$\times \frac{20\%}{}$	$\times \frac{10\%}{}$	
E	20X2 depreciation (C × D)	<u>60,000</u>	40,000	
F	Section 179 expense election (B)	<u>100,000</u>	—	
G	20X2 depreciation and section 179 (E + F)	<u>160,000</u>	40,000	
H	Basis at 12/31/X1 (A – G)	<u><u>\$240,000</u></u>	<u><u>\$360,000</u></u>	<u><u>\$(120,000)</u></u>
	<i>20X2</i>			
I	Depreciation rate	$\times \frac{32\%}{}$	$\times \frac{10\%}{}$	
J	20X3 depreciation (C × I)	<u>96,000</u>	<u>40,000</u>	
K	Basis at 12/31/X2 (H – J)	<u><u>\$144,000</u></u>	<u><u>\$320,000</u></u>	<u><u>\$(176,000)</u></u>
	<i>20X3</i>			
L	Depreciation rate	$\times \frac{19.2\%}{}$	$\times \frac{10\%}{}$	
M	20X4 depreciation (C × L)	<u>57,600</u>	<u>40,000</u>	
N	Basis at 12/31/13 (K – M)	<u><u>\$86,400</u></u>	<u><u>\$280,000</u></u>	<u><u>\$(193,600)</u></u>

The computation of deferred income taxes is as follows:

	<i>12/31/20X1</i>	<i>12/31/20X2</i>	<i>12/31/20X3</i>
Future deductible temporary difference			
Prepaid rent	\$ 100,000	\$ 80,000	\$ 125,000
Future (taxable) temporary difference			
Property and equipment	<u>(120,000)</u>	<u>(176,000)</u>	<u>(193,600)</u>
Net (taxable) deductible temporary difference	<u>(20,000)</u>	<u>(96,000)</u>	<u>(68,600)</u>
Effective tax rate	<u>34%</u>	<u>34%</u>	<u>37%</u>
Ending deferred income tax asset (liability)	<u>(6,800)</u>	<u>(32,640)</u>	<u>(25,382)</u>
Beginning deferred income tax asset (liability)	—	<u>(6,800)</u>	<u>(32,640)</u>
Deferred income tax (expense) benefit	<u><u>\$6,800</u></u>	<u><u>\$25,840</u></u>	<u><u>\$7,258</u></u>

Note from the computations that, under the liability method, deferred income tax expense or benefit is the amount necessary to adjust the statement of financial position to the computed balance. No attempt is made to correlate the amount of deferred income tax expense or benefit to pretax accounting income or loss. Nor is it necessary to track the amount of each temporary difference that originates or reverses during the year.

## Temporary Differences

Deferred income taxes are provided for all temporary differences, but not for permanent differences. Thus, it is important to be able to distinguish between the two. While many typical business transactions are accounted for identically for income tax and financial reporting purposes, there are many others subject to different income tax and accounting treatments, often leading to their being reported in different periods in financial statements than they are reported on income tax returns. The term “timing differences,” used under prior GAAP, has been superseded by the broader term “temporary differences” under current rules. Under income statement-oriented GAAP, timing differences were said to originate in one period and to reverse in a later period. These involved such common items as alternative depreciation methods, deferred compensation plans, percentage-of-completion accounting for long-term construction contracts,<sup>1</sup> and cash basis versus accrual basis accounting.

The concept of temporary differences includes all differences between the income tax basis and the financial reporting carrying value of assets and liabilities, if the reversal of those differences will result in taxable or deductible amounts in future years. Temporary differences include all the items formerly defined as timing differences and other additional items.

Temporary differences under ASC 740 can be categorized as follows:

*Revenue recognized for financial reporting purposes before being recognized for income tax purposes.* Revenue accounted for by the installment method for income tax purposes, but fully reflected in current GAAP income; certain construction-related revenue recognized using the completed-contract method for income tax purposes, but recognized using the percentage-of-completion method for financial reporting purposes; earnings from investees recognized using the equity method for accounting purposes but taxed only when later distributed as dividends to the investor. These are future taxable temporary differences because future periods’ taxable income will exceed GAAP income as the differences reverse; thus they give rise to deferred income tax liabilities.

*Revenue recognized for income tax purposes prior to recognition in the financial statements.* Certain taxable revenue received in advance, such as prepaid rental income and service contract revenue not recognized in the financial statements until later periods. These are future deductible temporary differences, because the costs of future performance will be deductible in the future years when incurred without being reduced by the amount of revenue deferred for GAAP purposes. Consequently, the income tax benefit to be realized in future years from deducting those future costs is a deferred income tax asset.

*Expenses deductible for income tax purposes prior to recognition in the financial statements.* Accelerated depreciation methods or shorter statutory useful lives used for income tax purposes, while straight-line depreciation or longer useful economic lives are used for financial reporting; amortization of goodwill and nonamortizable intangible assets over a 15-year life for income tax purposes while not amortizing them for financial reporting purposes unless they are impaired. Upon reversal in the future, the effect would be to increase taxable income without a corresponding increase in GAAP income. Therefore, these items are future taxable temporary differences, and give rise to deferred income tax liabilities.

---

<sup>1</sup> Note: Under the new revenue recognition standard (ASU 2014-09), these contracts are included in a broad category of long-term contracts with customers recognized over time using a measure of progress that depicts performance over time.

*Expenses recognized in the financial statements prior to becoming deductible for income tax purposes.* Certain estimated expenses, such as warranty costs, as well as such contingent losses as accruals of litigation expenses, are not tax deductible until the obligation becomes fixed. In those future periods, those expenses will give rise to deductions on the reporting entity's income tax return. Thus, these are future deductible temporary differences that give rise to deferred income tax assets.

In addition to these familiar and well-understood categories, temporary differences include a number of other categories that also involve differences between the income tax and financial reporting bases of assets or liabilities. These include:

*Reductions in tax-deductible asset bases arising in connection with tax credits.* Under the provisions of the 1982 Income Tax Act, taxpayers were permitted a choice of either full ACRS depreciation coupled with a reduced investment tax credit, or a full investment tax credit coupled with reduced depreciation allowances. If the taxpayer chose the latter option, the asset basis was reduced for tax depreciation, but was still fully depreciable for financial reporting purposes. Accordingly, this type of election is accounted for as a future taxable temporary difference, which gives rise to a deferred income tax liability.

*Increases in the income tax bases of assets resulting from the indexing of asset costs for the effects of inflation.* Occasionally proposed but never enacted, enacting such a provision to income tax law would allow taxpaying entities to finance the replacement of depreciable assets through depreciation based on current costs, as computed by the application of indices to the historical costs of the assets being remeasured. This reevaluation of asset costs would give rise to future taxable temporary differences that would be associated with deferred income tax liabilities since, upon the eventual sale of the asset, the taxable gain would exceed the gain recognized for financial reporting purposes resulting in the payment of additional tax in the year of sale.

*Certain business combinations accounted for by the purchase method or the acquisition method.* Under certain circumstances, the amounts assignable to assets or liabilities acquired in business combinations will differ from their income tax bases. Such differences may be either taxable or deductible in the future and, accordingly, may give rise to deferred income tax liabilities or assets. These differences are explicitly recognized by the reporting of deferred income taxes in the consolidated financial statements of the acquiring entity. Note that these differences are no longer allocable to the financial reporting bases of the underlying assets or liabilities themselves, as was the case under the old net of tax method.

A financial reporting situation in which deferred income taxes may or may not be appropriate would include life insurance (such as key person insurance) under which the reporting entity is the beneficiary. Since proceeds of life insurance are not subject to income tax under present law, the excess of cash surrender values over the sum of premiums paid is not a temporary difference, if the intention is to hold the policy until death benefits are received. On the other hand, if the entity intends to cash in (surrender) the policy at some point prior to the death of the insured (i.e., it is holding the insurance contract as an investment), which would be a taxable event, then the excess surrender value is in fact a temporary difference, and deferred income taxes are to be provided thereon.

**Temporary differences from share-based compensation arrangements.** ASC 718-50 contains intricate rules with respect to accounting for the income tax effects of different types of share-based compensation awards. The complexity is compounded by the complex statutes and regulations that apply under the U.S. Internal Revenue Code (IRC).

Differences between the accounting rules and the income tax laws can result in situations where the cumulative amount of compensation cost recognized for financial reporting purposes will differ from the cumulative amount of compensation deductions recognized for income tax purposes. For more information, see the discussion in the chapter on ASC 718.

**Temporary differences arising from convertible debt with a beneficial conversion feature.** Issuers of debt securities sometimes structure the instruments to include a nondetachable conversion feature. If the terms of the conversion feature are “in-the-money” at the date of issuance, the feature is referred to as a “beneficial conversion feature.” Beneficial conversion features are accounted for separately from the host instrument under ASC 470-20.

The separate accounting results in an allocation to additional paid-in capital of a portion of the proceeds received from issuance of the instrument that represents the intrinsic value of the conversion feature calculated at the commitment date, as defined. The intrinsic value is the difference between the conversion price and the fair value of the instruments into which the security is convertible multiplied by the number of shares into which the security is convertible. The convertible security is recorded at its par value (assuming there is no discount or premium on issuance). A discount is recognized to offset the portion of the instrument that is allocated to additional paid-in capital. The discount is accreted from the issuance date to the stated redemption date of the convertible instrument or through the earliest conversion date if the instrument does not include a stated redemption date.

For U.S. income tax purposes, the proceeds are recorded entirely as debt and represent the income tax basis of the debt security, thus creating a temporary difference between the basis of the debt for financial reporting and income tax reporting purposes.

ASC 740-10-55 specifies that the income tax effect associated with this temporary difference is to be recorded as an adjustment to additional paid-in capital. It would not be reported, as are most other such income tax effects, as a deferred income tax asset or liability in the statement of financial position.

**Other common temporary differences.** Other common temporary differences include:

*Accounting for investments.* Use of the equity method for financial reporting while using the cost method for income tax purposes.

*Accrued contingent liabilities.* These cannot be deducted for income tax purposes until the liability becomes fixed and determinable.

*Cash basis versus accrual basis.* Use of the cash method of accounting for income tax purposes and the accrual method for financial reporting.

*Charitable contributions that exceed the statutory deductibility limitation.* These can be carried over to future years for income tax purposes.

*Deferred compensation.* Under GAAP, the present value of deferred compensation agreements must be accrued and charged to expense over the employee’s remaining employment period, but for income tax purposes these costs are not deductible until actually paid.

*Depreciation.* A temporary difference will occur unless the modified ACRS method is used for financial reporting over estimated useful lives that are the same as the IRS-prescribed recovery periods. This is only permissible for GAAP if the recovery periods are substantially identical to the estimated useful lives.

*Estimated costs* (e.g., warranty expense). Estimates or provisions of this nature are not included in the determination of taxable income until the period in which the costs are actually incurred.

*Goodwill.* For U.S. federal income tax purposes, amortization over fifteen years is mandatory. Amortization of goodwill is no longer permitted under GAAP, but periodic write-downs for impairment may occur, with any remainder of goodwill being expensed when the reporting unit to which it pertains is ultimately disposed of.

*Income received in advance* (e.g., prepaid rent). Income of this nature is includable in taxable income in the period in which it is received, while for financial reporting purposes, it is considered a liability until the revenue is earned.

*Installment sale method.* Use of the installment sale method for income tax purposes generally results in a temporary difference because that method is generally not permitted to be used in accordance with GAAP.

*Long-term construction contracts.* A temporary difference will arise if different methods (e.g., completed-contract or percentage-of-completion) are used for GAAP and income tax purposes. (See footnote 1 regarding new revenue recognition standard.)

*Mandatory change from the cash method to the accrual method.* Generally one-fourth of this adjustment is recognized for income tax purposes each year.

*Net capital loss.* C corporation capital losses are recognized currently for financial reporting purposes but are carried forward to be offset against future capital gains for income tax purposes.

*Organization costs.* GAAP requires organization costs to be treated as expenses as incurred. For income tax purposes, organization costs are recorded as assets and amortized over a 60-month period. Also see the following section, “Permanent Differences.”

*Uniform cost capitalization (UNICAP).* Income tax accounting rules require manufacturers and certain wholesalers to capitalize as inventory costs certain costs that, under GAAP, are considered administrative costs that are not allocable to inventory.

## Permanent Differences

Permanent differences are book-tax differences in asset or liability bases that will never reverse and, therefore, affect income taxes currently payable but do not give rise to deferred income taxes.

Common permanent differences include:

*Club dues.* Dues assessed by business, social, athletic, luncheon, sporting, airline, and hotel clubs are not deductible for federal income tax purposes.

*Dividends-received deduction.* Depending on the percentage interest of the payer owned by the recipient, a percentage of the dividends received by a corporation are nontaxable. Different rules apply to subsidiaries.

*Goodwill—nondeductible.* If, in a particular taxing jurisdiction, goodwill amortization is not deductible, that goodwill is considered a permanent difference and does not give rise to deferred income taxes.

*Lease inclusion amounts.* Lessees of automobiles whose fair value the IRS deems to qualify as a luxury automobile are required to limit their lease deduction by adding to taxable income an amount determined by reference to a table prescribed annually in a revenue procedure.

*Meals and entertainment.* A percentage (currently 50%) of business meals and entertainment costs is not deductible for federal income tax purposes.

*Municipal interest income.* A 100% exclusion is permitted for investment in qualified municipal securities. Note that the capital gains applicable to sales of these securities are taxable.

*Officer's life insurance premiums and proceeds.* Premiums paid for an officer's life insurance policy under which the company is the beneficiary are not deductible for income tax purposes, nor are any death proceeds taxable.

*Organization and start-up costs.* GAAP requires organization and start-up costs to be treated as expenses as incurred. Certain organization and start-up costs are not allowed amortization under the tax code. The most clearly defined are those expenditures relating to the cost of raising capital. Also see the prior section, "Temporary Differences. . . ."

*Penalties and fines.* Any penalty or fine arising as a result of violation of the law is not allowed as an income tax deduction. This includes a wide range of items including parking tickets, environmental fines, and penalties assessed by the U.S. Internal Revenue Service.

*Percentage depletion.* The excess of percentage depletion over cost depletion is allowable as a deduction for income tax purposes.

*Wages and salaries eligible for jobs credit.* The portion of wages and salaries used in computing the jobs credit is not allowed as a deduction for income tax purposes.

### Treatment of Net Operating Loss Carryforwards

All temporary differences and carryforwards have been conferred identical status, and their income tax effects are given full recognition on the statement of financial position. Specifically, the income tax effects of net operating loss carryforwards are equivalent to the income tax effects of future deductible temporary differences. The deferred income tax effects of net operating losses are computed and recorded, but as is the case for all other deferred income tax assets, the need for a valuation allowance must also be assessed (as discussed below). The income tax effects of income tax credit carryforwards (e.g., general business credits, alternative minimum tax credits) are used to increase deferred income tax assets dollar-for-dollar versus being treated in the same manner as future deductible temporary differences, as illustrated in the following example.

#### Example—Net operating loss carryforwards and income tax credit carryforwards

Casey Corporation has the following future deductible temporary differences and available carryforwards at December 31, 20X1:

Inventory costs capitalized under Internal Revenue Code §263A	\$40,000
Allowance for uncollectible accounts receivable	20,000
Net operating loss carryforward	18,000
General business credit carryforward	14,000

Casey's computation of deferred income taxes at December 31, 20X2, is as follows:

Capitalized inventory costs	\$40,000
Allowance for uncollectible accounts receivable	20,000
Net operating loss carryforward	18,000
	78,000
Assumed income tax rate	× 34%
	26,520
General business credit carryforward	14,000
Deferred income tax asset	\$40,520

Note the net operating loss is multiplied by the income tax rate to compute its effect on the deferred income tax asset since it is available to reduce future years' *taxable income*. In contrast, the general business credit carryforward is not multiplied by the *income tax rate* since it is available to be used to offset future years' income tax.

ASC 740 provides that the income tax benefits of net operating loss carrybacks and carryforwards, with limited exceptions (discussed below), are to be reported in the same manner as the source of either income or loss in the current year. As used in the standard, the phrase “in the same manner” refers to the classification of the income tax benefit in the income statement (i.e., as income taxes on income from continuing operations, discontinued operations, etc.) or as the income tax effect of gains included in other comprehensive income but excluded from net income on the income statement. The income tax benefits are not reported in the same manner as the source of the net operating loss carryforward or income taxes paid in a prior year, or as the source of the expected future taxable income that will permit the realization of the carryforward.

For example, if the income tax benefit of a loss that arose in a prior year in connection with a discontinued operation is first given recognition in the current year, the benefit would be allocated to income taxes on income from continuing operations if the benefit offsets income taxes on income from continuing operations in the current year. The expression “first given recognition” means that the net deferred income tax asset, after deducting the valuation allowance, reflects the income tax effect of the loss carryforward for the first time. (ASC 740-10-55-38)

The gross deferred income tax asset will always reflect all future deductible temporary differences and net operating loss carryforwards in the periods they arise. Thus, first given recognition means that the valuation allowance is eliminated for the first time. If it offsets income taxes on income from discontinued operations in the current year, then the benefits would be reported in discontinued operations. As another example, the tax benefit arising from the entity’s loss from continuing operations in the current year would be allocated to continuing operations, regardless of whether it might be realized as a carryback against income taxes paid on discontinued operations in prior years. The income tax benefit would also be allocated to continuing operations in cases where it is anticipated that the benefit will be realized through the reduction of income taxes to be due on gains from discontinued operations in future years. (See the “Intraperiod Income Tax Allocation” section later in this chapter.)

Thus, the general rule is that the reporting of income tax effects of net operating losses is driven by the source of the tax benefits in the current period. There are only two exceptions to the foregoing rule. The first exception relates to existing future deductible temporary differences and net operating loss carryforwards that arise in connection with business combinations and for which income tax benefits are first recognized. This exception will be discussed below (see income tax effects of business combinations). As in the preceding paragraph, first recognized means that a valuation allowance (as discussed more fully later in this chapter) provided previously is being eliminated for the first time.

The second exception to the aforementioned general rule is that certain income tax benefits allocable to stockholders’ equity are not to be reflected in the income statement. Specifically, income tax benefits arising in connection with contributed capital, employee stock options, dividends paid on unallocated ESOP shares, or temporary differences existing at the date of a quasi reorganization are reported as accumulated other comprehensive income in the stockholders’ equity section of the statement of financial position and are not included in the income statement.

Certain transactions among stockholders that occur outside the company can affect the status of deferred income taxes. The most commonly encountered of these is the change in ownership of more than 50% of the company’s stock, which limits or eliminates the company’s ability to utilize net operating loss carryforwards, and accordingly requires the reversal of deferred income tax assets previously recognized under ASC 740. Changes in deferred income taxes caused by

transactions among stockholders are to be included in current period income tax expense in the income statement, since these are analogous to changes in expectations resulting from other external events (e.g., changes in enacted income tax rates). However, the income tax effects of changes in the income tax bases of assets or liabilities caused by transactions among stockholders would be included in equity, not in the income statement, although subsequent period changes in the valuation account, if any, would be reflected in income. (ASC 740-20-45)

### Measurement of Deferred Income Tax Assets and Liabilities

**Scheduling of the reversal years of temporary differences.** There is no need to forecast (or “schedule”) the future years in which temporary differences are expected to reverse except in the most exceptional circumstances. To eliminate the burden, it was necessary to endorse the use of the expected average (i.e., effective) income tax rate to measure the deferred income tax assets and liabilities and to forego a more precise measure of marginal tax effects. Scheduling is now encountered primarily:

1. when income tax rate changes are to be phased in over multiple years, and
2. in order to determine the classification (current or noncurrent) of a deferred income tax asset arising from a net operating loss carryforward or income tax credit carryforward or to determine whether such a carryforward might expire unused for the purpose of determining the amount of valuation allowance needed (as discussed in the following section of this chapter).

**Determining the appropriate income tax rate.** Assume C corporations with taxable income between \$335,000 and \$10,000,000 are taxed at an expected income tax rate equal to the 34% marginal rate and the effect of the surtax exemption has fully phased out at that level, effectively resulting in a flat tax. Thus, the computation of deferred federal income taxes for these entities is accomplished simply by applying the 34% top marginal rate to all temporary differences and net operating loss carryforwards outstanding at the date of the statement of financial position. This technique is applied to future taxable temporary differences (producing deferred income tax liabilities), and to future deductible temporary differences and net operating loss carryforwards (giving rise to deferred income tax assets). The deferred income tax assets computed must still be evaluated for realizability. Some, or all, of the projected income tax benefits may fail the “more-likely-than-not” test and consequently may need to be offset by a valuation allowance.

On the other hand, reporting entities that have historically been taxed at an effective federal income tax rate lower than the top marginal rate compute their federal deferred income tax assets and liabilities by using their expected future effective income tax rates. Consistent with the goal of simplifying the process of calculating deferred income taxes, reporting entities are permitted to apply a single, long-term expected income tax rate, without attempting to differentiate among the years when temporary difference reversals are expected to occur. In any event, the inherent imprecision of forecasting future income levels and the patterns of temporary difference reversals make it unlikely that a more sophisticated computational effort would produce better financial statements. Therefore, absent such factors as the phasing in of new income tax rates, it is not necessary to consider whether the reporting entity’s effective income tax rate will vary from year to year.

The effective income tax rate convention obviates the need to predict the impact of the alternative minimum tax (AMT) on future years. In determining an entity’s deferred income taxes, the number of computations may be as few as one.

**Computing deferred income taxes.**<sup>2</sup> To compute the gross deferred income tax provision (i.e., before addressing the possible need for a valuation allowance):

1. Identify all temporary differences existing as of the reporting date. This process is simplified if the reporting entity maintains both GAAP and income tax statements of financial position for comparison purposes.
2. Segregate the temporary differences into future taxable differences and future deductible differences. This step is necessary because a valuation allowance may be required to be provided to offset the income tax effects of the future deductible temporary differences and carryforwards, but not the income tax effects of the future taxable temporary differences.
3. Accumulate information about available net operating loss and tax credit carryforwards as well as their expiration dates or other types of limitations, if any.
4. Measure the income tax effect of aggregate future taxable temporary differences by separately applying the appropriate expected income tax rates (federal plus any state, local, and foreign rates that are applicable under the circumstances). Ensure that consideration is given in making these computations to the federal income tax deductibility of income taxes payable to other jurisdictions.
5. Similarly, measure the income tax effects of future deductible temporary differences, including net operating loss carryforwards.

Separate computations must be made for each taxing jurisdiction. In many cases, this level of complexity is not needed and a single, combined effective income tax rate can be used. However, in assessing the need for valuation allowances, it is necessary to consider the entity's ability to absorb deferred income tax benefits against income tax liabilities. Inasmuch as benefits from one tax jurisdiction will not reduce income taxes payable to another tax jurisdiction, separate calculations will be needed in these situations. Also, for purposes of presentation in the statement of financial position (discussed below), offsetting of deferred income tax assets and liabilities is only permissible within the same jurisdiction.

Separate computations are made for each taxpaying component of the primary reporting entity. If a parent company and its subsidiaries are consolidated for financial reporting purposes but file separate income tax returns, the reporting entity comprises a number of components, and the income tax benefits of any one will be unavailable to reduce the income tax obligations of the others.

The principles set forth above are illustrated by the following example.

#### Computation of deferred income tax liability and asset—basic example

Assume that Humfeld Company has a total of \$28,000 of future taxable temporary differences and a total of \$8,000 of future deductible temporary differences. There are no available operating loss or tax credit carryforwards. Taxable income is \$230,000 and the income tax rate is a flat (i.e., not graduated) 34% for the current year and not anticipated to change in the future. Also assume that there were no deferred income tax liabilities or assets in prior years.

Current income tax expense and income taxes currently payable are computed as taxable income times the current rate ( $\$230,000 \times 34\% = \$78,200$ ). The deferred income tax asset is computed as \$2,720, representing 34% of future deductible temporary differences of \$8,000. The deferred income tax liability of \$9,520 is calculated as 34% of future taxable temporary differences of \$28,000. The deferred income tax expense of \$6,800 is the net of the deferred income tax liability of \$9,520 and the deferred income tax asset of \$2,720.

<sup>2</sup> For an important update regarding balance sheet classification of deferred taxes, see the Technical Alert at the beginning of this chapter.

The journal entry to record the required amounts is:

Current income tax expense	78,200
Deferred income tax asset	2,720
Income tax expense—deferred	6,800
Deferred income tax liability	9,520
Income taxes currently payable	78,200

In 20X1, Humfeld Company has taxable income of \$411,000, aggregate future taxable and future deductible temporary differences are \$75,000 and \$36,000, respectively, and the income tax rate remains a flat 34%.

Current income tax expense and income taxes currently payable are each \$139,740 ( $\$411,000 \times 34\%$ ).

Deferred amounts are calculated as follows:

	<i>Deferred tax liability</i>	<i>Deferred tax asset</i>	<i>Income tax expense—deferred</i>
Required balance at 12/31/X2			
\$75,000 $\times 34\%$	\$25,500		—
\$36,000 $\times 34\%$		\$12,240	—
Balances at 12/31/X1	9,520	2,720	—
Adjustment required	<u>\$15,980</u>	<u>\$9,520</u>	<u>\$6,460</u>

The journal entry to record the deferred amounts is:

Deferred income tax asset	9,520
Income tax expense—deferred	6,460
Deferred income tax liability	15,980

Because the increase in the liability in 20X2 is larger (by \$6,460) than the increase in the asset for that year, the result is a deferred income tax expense for 20X2.

### The Valuation Allowance for Deferred Income Tax Assets Expected to Be Unrealizable

All deferred income tax assets must be given full recognition, subject to the possible provision of an allowance when it is determined that this asset is unlikely to be realized. This approach conveys the greatest amount of useful information to the users of the financial statements.

A valuation allowance is to be provided for that fraction of the computed year-end balances of the deferred income tax assets for which it has been determined that it is more likely than not that the reported asset amount will not be realized. As used in this context, “more likely than not” represents a probability of just over 50%. Since it is widely agreed that the term probable, as used in ASC 450, denotes a much higher probability (perhaps 85% to 90%), the threshold for reflecting an impairment of deferred income tax assets is much lower than the threshold for other assets (i.e., in most cases, the likelihood of a valuation allowance being required is greater than, say, the likelihood that a long-lived asset is impaired).

#### Establishment of a valuation allowance

Assume that Couch Corporation has a future deductible temporary difference of \$60,000 at December 31, 20X2. The tax rate is a flat 34%. Based on available evidence, management of Couch Corporation concludes that it is more likely than not that all sources will not result in future taxable income sufficient to realize an income tax benefit of more than \$15,000 (25% of the future deductible

temporary difference). Also assume that there were no deferred income tax assets in previous years and that prior years' taxable income was inconsequential.

At 12/31/X2 Couch Corporation records a deferred income tax asset in the amount of \$20,400 ( $\$60,000 \times 34\%$ ) and a valuation allowance of \$15,300 (34% of the \$45,000 difference between the \$60,000 of future deductible temporary differences and the \$15,000 of future taxable income expected to absorb the future tax deduction arising from the reversal of the temporary difference).

The journal entry at 12/31/X2 is:

Deferred income tax asset	20,400
Valuation allowance	15,300
Income tax benefit—deferred	5,100

The deferred income tax benefit of \$5,100 represents that portion of the deferred income tax asset (25%) that, more likely than not, is realizable.

Assume that at the end of 20X3, Couch Corporation's future deductible temporary difference has decreased to \$50,000 and that Couch now has a net operating loss carryforward of \$42,000. The total of the net operating loss carryforward (\$42,000) plus the amount of the future deductible temporary difference (\$50,000) is \$92,000. A deferred income tax asset of \$31,280 ( $\$92,000 \times 34\%$ ) is recognized at the end of 20X3. Also assume that management of Couch Corporation concludes that it is more likely than not that \$25,000 of the tax asset will not be realized. Thus, a valuation allowance in that amount is required, and the balance in the allowance account of \$15,300 must be increased by \$9,700 ( $\$25,000 - \$15,300$ ).

The journal entry at 12/31/X3 is:

Deferred income tax asset	10,880
Valuation allowance	9,700
Income tax benefit—deferred	1,180

The deferred income tax asset is debited \$10,880 to increase it from \$20,400 at the end of 20X2 to its required balance of \$31,280 at the end of 20X3. The deferred income tax benefit of \$1,180 represents the net of the \$10,880 increase in the deferred income tax asset and the \$9,700 increase in the valuation allowance.

While the meaning of the “more-likely-than-not” criterion is clear (more than 50%), the practical difficulty of assessing whether or not this subjective threshold test is met in a given situation remains. A number of positive and negative factors need to be evaluated in reaching a conclusion as to the necessity of a valuation allowance. Positive factors (those suggesting that an allowance is not necessary) include:

1. Evidence of sufficient future taxable income to realize the benefit of the deferred income tax asset
2. Evidence of sufficient future taxable income arising from the reversals of existing future taxable temporary differences (deferred income tax liabilities) to realize the benefit of the deferred income tax asset
3. Evidence of sufficient taxable income in prior year(s) available for realization of a net operating loss carryback under existing statutory limitations
4. Evidence of the existence of prudent, feasible tax planning strategies under management control that, if implemented, would permit the realization of the deferred income tax asset
5. An excess of appreciated asset values over their tax bases, in an amount sufficient to realize the deferred income tax asset
6. A strong earnings history exclusive of the loss creating the deferred tax asset, along with evidence that the loss is an aberration.

(ASC 740-10-30-22 and 740-10-55-37 through 55-39)

While the foregoing may suggest that the reporting entity will be able to realize the benefits of the future deductible temporary differences outstanding as of the date of the statement of financial position, certain negative factors must also be considered in determining whether a valuation allowance needs to be established against deferred income tax assets. These factors include:

1. If unfavorably resolved, circumstances that would negatively affect future profits on a continuing basis.
2. A history of operating losses, or of net operating loss or tax credit carryforwards that have expired unused.
3. Losses that are anticipated in the near future years, despite a history of profitable operations.
4. Carryback or carryforward period so brief that tax benefit realization would limit realization of a tax benefit if a single deductible temporary difference is expected to reverse in a single profit on a continuing basis in future years or the entity operates in a cyclical business.

(ASC 740-10-30-21)

Thus, the process of evaluating whether a valuation allowance is needed involves the weighing of both positive and negative factors to determine whether, based on the preponderance of available evidence, it is more likely than not that the deferred income tax assets will be realized.

**Example of applying the more-likely-than-not criterion to a deferred income tax asset**

Assume the following facts:

1. Foy Corporation reports on a calendar year, and it commenced operations and began applying ASC 740 in 20W6.
2. As of December 31, 20X2, it has future taxable temporary differences of \$85,000 relating to income earned on equity-method investments; future deductible temporary differences of \$12,000 relating to deferred compensation arrangements; a net operating loss carryforward (which arose in 20W9) of \$40,000; and a capital loss carryforward of \$10,000 (which arose in 20X2).
3. Foy's expected effective income tax rate for future years is 34% for both ordinary income and net long-term capital gains. Capital losses cannot be offset against ordinary income.

The first steps are to compute the deferred income tax asset and/or liability without consideration of the possible need for a valuation allowance.

*Deferred income tax liability:*

Future taxable temporary difference (equity-method investment)	\$85,000
Effective tax rate	× 34%
Required balance	<u><u>\$28,900</u></u>

*Deferred income tax asset:*

Future deductible temporary differences and carryforwards:

Deferred compensation	\$12,000
Net operating loss carryforward	<u>40,000</u>
	52,000
Effective tax rate	× 34%
Required balance (a)	<u><u>\$17,680</u></u>
Capital loss	\$10,000
Effective tax rate	× 34%
Required balance (b)	<u><u>\$3,400</u></u>

<i>Total deferred income tax asset: (a) + (b)</i>	
Ordinary	\$17,680
Capital	3,400
Total required balance	<u>\$21,080</u>

The next step is to consider the need for a valuation allowance to partially or completely offset the deferred income tax asset, based on a “more-likely-than-not” assessment of the asset’s realizability. Foy management must evaluate both positive and negative evidence to determine the need for a valuation allowance, if any. Assume that management identifies the following factors that may affect this need:

1. Before the net operating loss deduction, Foy reported taxable income of \$5,000 in 20X2. Management believes that taxable income in future years, apart from net operating loss deductions, should continue at approximately the same level experienced in 20X2.
2. The future taxable temporary differences are not expected to reverse in the foreseeable future as the equity method investee is not expected to incur losses or pay dividends to Foy.
3. The capital loss arose in connection with a securities transaction of a type that is unlikely to recur. The company does not generally engage in activities that have the potential to result in capital gains or losses.
4. Management estimates that certain productive assets have a fair value exceeding their respective income tax bases by about \$30,000. The entire gain, if realized for income tax purposes, would result in recapture of depreciation previously taken. Since the current plans call for a substantial upgrading of the company’s plant assets, management feels it could easily accelerate those actions in order to realize taxable gains, should it be desirable to do so for income tax planning purposes.

Based on the foregoing information, Foy Corporation management concludes that a \$3,400 valuation allowance is required. The reasoning is as follows:

1. There will be some taxable operating income generated in future years (\$5,000 annually, based on the earnings experienced in 20X2), which will absorb a modest portion of the reversal of the deductible temporary difference (\$12,000) and net operating loss carryforward (\$40,000) existing at year-end 20X2.
2. More importantly, the feasible tax planning strategy of accelerating the taxable gain relating to appreciated assets (\$30,000) would certainly be sufficient, in conjunction with operating income over several years, to permit Foy to fully realize the income tax benefits of the future deductible temporary difference and net operating loss carryover.
3. However, since capital losses can only be carried forward for five years, are only usable to offset future capital gains, and Foy management is unable to project future realization of capital gains, it is more likely than not that the associated tax benefit accrued (\$3,400) will not be realized, and thus a valuation allowance must be recorded.

Based on this analysis, an allowance for unrealizable deferred income tax benefits in the amount of \$3,400 is established by a charge against the current (20X2) income tax provision.

Among the foregoing positive and negative factors to be considered, perhaps the most difficult to fully grasp is that of available income tax planning strategies. Since ASC 740 requires that all available evidence be assessed to determine the need for a valuation allowance, the matter of the cost of implementing those strategies is irrelevant. In fact, there is no limitation regarding strategies that may involve significant costs of implementation, although in computing the amount of valuation allowance needed, any costs of implementation must be netted against the benefits to be derived.

For example, if a gross deferred income tax asset of \$50,000 is recorded, and certain strategies have been identified by management that would protect realization of the future deductible item

associated with the computed income tax benefit at an implementation cost of \$10,000, then the net amount of income tax benefit, which is more likely than not to be realizable, would not be \$50,000. Rather, it may be only \$43,400, which is the gross benefit less the after-tax cost of implementation, assuming a 34% tax rate  $\{ \$50,000 - [\$10,000 \times (1 - .34)] \}$ . Accordingly, a valuation allowance of \$6,600 is established in this example.

### Impact of a qualifying tax strategy

Assume that Kruse Company has a \$180,000 net operating loss carryforward as of 12/31/X2, scheduled to expire at the end of the following year. Future taxable temporary differences of \$240,000 exist that are expected to reverse in approximately equal amounts of \$80,000 in 20X3, 20X4, and 20X5. Kruse Company estimates that taxable income for 20X3 (exclusive of the reversal of existing temporary differences and the operating loss carryforward) will be \$20,000. Kruse Company expects to implement a qualifying income tax planning strategy that will accelerate the total of \$240,000 of taxable temporary differences to 20X3. Expenses to implement the strategy are estimated to approximate \$30,000. The tax rate is 34%.

In the absence of the income tax planning strategy, \$100,000 of the net operating loss carryforward could be realized in 20X3 based on estimated taxable income of \$20,000 plus \$80,000 of the reversal of future taxable temporary differences. Thus, \$80,000 would expire unused at the end of 20X3 and the net amount of the deferred income tax asset at 12/31/X2 would be recognized as \$34,000, computed as \$61,200 ( $\$180,000 \times 34\%$ ) minus the valuation allowance of \$27,200 ( $\$80,000 \times 34\%$ ).

However, by implementing the income tax planning strategy, the deferred income tax asset is calculated as follows:

Taxable income for 20X3:

Expected amount without reversal of taxable temporary differences	\$ 20,000
Reversal of taxable temporary differences due to tax-planning strategy,	<u>210,000</u>
net of costs	230,000
Net operating loss to be carried forward	(180,000)
Net operating loss expiring unused at 12/31/X3	<u>\$     -</u>

The gross deferred income tax asset thus can be recorded at the full benefit amount of \$61,200 ( $\$180,000 \times 34\%$ ). However, a valuation allowance is required for \$19,800, representing the net-of-tax effect of the \$30,000 in anticipated expenses related to implementation of the strategy. The net deferred income tax asset at 12/31/X1 is \$41,400 ( $\$61,200 - \$19,800$ ). Kruse Company will also recognize a deferred income tax liability of \$81,600 at the end of 20X2 (34% of the taxable temporary differences of \$240,000).

The adequacy of the valuation allowance must be assessed at the date of each statement of financial position. Adjustments to the amount of the valuation allowance are recorded by a charge against, or a credit to, current earnings, via the current period income tax expense or benefit. Thus, even if the gross amount of future deductible temporary differences has remained constant during a year, income tax expense for that year might be increased or decreased as a consequence of reassessing the adequacy of the valuation allowance at year-end. It is important that these two computational steps be separately addressed: First, the computation of the gross deferred income tax assets (the product of the expected effective income tax rate and the total amount of future deductible temporary differences) must be made; then the amount of the valuation allowance to be provided to offset the deferred income tax asset must be assessed (using the criteria set forth above). Although changes in both the deferred income tax asset and valuation allowance affect current period income

tax expense, the processes of measuring these two amounts are distinct. Furthermore, ASC 740 requires disclosure of both the gross deferred income tax asset (and also the gross deferred income tax liability) and the change in the valuation allowance for the year. These disclosure requirements underline the need to separately measure these items without offsetting.

## Accounting for Uncertainty in Income Taxes

**Background.** The process of filing income tax returns requires management, in consultation with its tax advisors, to make judgments regarding how it will apply intricate and often ambiguous laws, regulations, administrative rulings, and court precedents. If and when the income tax returns are audited by the taxing authority, sometimes years after they are filed, these judgments may be questioned or disallowed in their entirety or in part. As a result, management must make assumptions regarding the likelihood of success in defending its judgments in the event of audit in determining the accounting entries necessary to accurately reflect income taxes currently payable and/or refundable.

The primary driver behind the perceived need for guidance on uncertainty in income taxes is the notion that, in general, irrespective of the method being used to recognize and measure these assets and/or liabilities, management of reporting entities historically has not used a high degree of rigor in their determination. Consequently, especially in the case of public companies, where earnings per share are viewed as an important measure of performance, the estimation of the allowance for income taxes payable was sometimes viewed as a management tool to either improve reported earnings by reducing the allowance or to build up excess liabilities (sometimes referred to as “cookie-jar reserves”) that, when needed in future periods, could be reduced in order to achieve the desired result of greater earnings.

**Initial recognition and measurement.** ASC 740-10 uses a two-step approach to recognition and measurement.

*Initial recognition*—Management is to evaluate each tax position as to whether, based on the position’s technical merits, it is “more likely than not” that the position would be sustained upon examination by the taxing authority. In making this evaluation, management is required to assume that the tax position will be examined by the taxing authority and that the taxing authority will be provided with all relevant facts and will have full knowledge of all relevant information. Thus, management is prohibited from asserting that a position will be sustained because of a low likelihood that the reporting entity’s income tax returns will be examined.

The term “more likely than not,” consistent with its use in ASC 740-10, means that there is a probability of more than 50% that the tax position would be sustained upon examination. A judgment of more likely than not represents a positive assertion by management that the reporting entity is entitled to the economic benefits provided by the tax position it is taking. The term “upon examination” includes resolution of appeals or litigation processes, if any, necessary to settle the matter.

This is a new threshold condition for recognition. Unlike the “more-likely-than-not” criterion in ASC 740-10-45, which governs the recognition of a valuation allowance to offset all or a portion of deferred income tax assets that have already been fully recognized, this establishes a requirement for whether to give any accounting recognition to the income tax effects of questionable tax positions being taken. Failing to meet this threshold test means that, for example, an income tax deduction being claimed would not be accompanied by recognition of a reduction of income tax expense in a GAAP-basis financial statement, and thus that an income tax liability would be required to be reported for the entire tax benefit claimed on the income tax return, notwithstanding management’s assertion that a deduction claimed on its income tax return was valid.

Positions must be evaluated independently of each other without offset or aggregation. A “unit of account” approach can be taken in this evaluation if it is based on the manner in which management prepares and supports its income tax return and is consistent with the approach that the taxing authority would reasonably be expected to use in conducting an examination.

In considering the technical merits of its tax positions, management must consider the applicability of the various sources of tax authority (enacted legislation, legislative intent, regulations, rulings, and case law) to the facts and circumstances. Management may also take into account, if applicable, any administrative practices and precedents that are widely understood with respect to the manner that the taxing authority deals specifically with the reporting entity or other similar taxpayers.

*Initial measurement*—If a tax position meets the initial recognition threshold, it is then measured to determine the amount to recognize in the financial statements. The following considerations apply to the measurement process:

1. Consider if the position is based on clear and unambiguous tax law. If so, and management has a high level of confidence in the technical merits of the position, the position qualifies as a “highly certain tax position” and, consequently, the full benefit would be recognized in the financial statements. The measurement of the maximum amount of income tax benefit that is more than 50% likely to be realized is 100% of the benefit claimed.

---

*NOTE: Management may deem the **amount** of a tax position to be highly certain of being sustained but may not be highly certain as to the **timing** of the benefit. For example, in deciding whether to record a cost as an expense of the period in which it is incurred or to capitalize it, management may be highly certain that the cost will be deductible in some period but not be highly certain as to whether the proper period to deduct it is in the current period or ratably over multiple future periods. Under these circumstances, management would be required to measure the maximum amount that it believed was more than 50% likely to be sustained in the period that the cost is incurred.*

---

2. If it is not highly certain that the full benefit of a position would be sustained in the year claimed, then the amount to be recognized for the tax position is measured as management’s *best estimate* of the *maximum* benefit that is more than 50% likely to be realized upon effective settlement with a taxing authority possessing full knowledge of all relevant information. Management is to consider the amounts and probabilities of various settlement outcomes based on the facts, circumstances, and information available at the date of the statement of financial position. As stated above, management must assume that the taxing authority will conduct an examination and may not consider the likelihood of this not occurring in this measurement process.

As explained above, measurement under ASC 740-10 can be a fairly complex process. It requires that management consider the amounts and probabilities of various effective settlement outcomes. The amount of the income tax benefit to be given financial statement recognition is the largest (i.e., most favorable) estimated outcome that is more than 50% probable, as illustrated in the following example.

**Example of the two-step initial recognition and measurement process**

Menkin Manufacturing planned to claim a \$10,000 credit for increasing research activities (R&D credit) on its 20X2 corporate income tax return. In consultation with its tax advisor, management believes that a portion of the credit is at risk because of ambiguity regarding the technical merits of the decision to classify certain costs as qualifying to be included in the computation of the credit. Management does believe, however, that it is "more likely than not" that the reporting entity will qualify for all or a portion of the R&D credit, and thus recognition will have to be limited to only a portion of the amount it will be claiming on its income tax return.

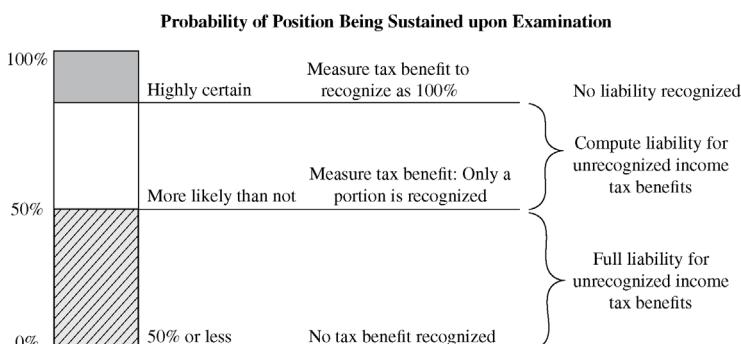

Since the credit meets the more-likely-than-not threshold for initial recognition, management must measure the amount to be recognized. It has estimated the range of possible outcomes (i.e., of credit allowed) and related likelihoods as follows:

<i>Estimated outcome</i>	<i>Probability of occurrence</i>	<i>Cumulative probability of occurrence</i>
\$10,000	5%	5%
8,500	35%	40%
7,500	25%	65%
7,000	20%	85%
6,500	10%	95%
6,000	5%	100%

The largest outcome above that has a more than 50% cumulative probability of being realized is \$7,500, which management has estimated as having a cumulative probability of 65%. Therefore, management would recognize only \$7,500 of this tax position in the reporting entity's financial statements. This would result in Menkin Manufacturing reflecting a liability for unrecognized income tax benefits in the amount of \$2,500 on its statement of financial position as of December 31, 20X2.

Note, in the foregoing example, that while the income tax return will claim an R&D credit for the full \$10,000, GAAP-basis financial statements will only reflect a credit of \$7,500, and thus will report an accrued tax liability of \$2,500 pertaining to the credit taken but not likely to be allowed upon examination. ASC 740 complies with the GAAP imperative of reporting the entity's assets and liabilities on an appropriate measurement basis. GAAP financial reporting, in other words, is not a tool to be used by management to avoid recording the accounting consequences of the tactical decisions it makes regarding the tax positions it takes.

The following diagram illustrates the application of the recognition and measurement criteria:

**Interest.** If the relevant taxing jurisdiction requires interest to be paid on income tax underpayments, the reporting entity is to recognize interest expense in the first period that interest would begin to accrue under that jurisdiction's relevant tax law. Interest is to be computed using the following formula:

$$\begin{aligned} & \text{Amount of tax position claimed (expected to be claimed) on income tax return} \\ & - \text{Amount of tax position recognized in the financial statements} \\ \hline & \text{Portion of tax position claimed not recognized in the financial statements} \\ & \times \text{Jurisdiction's applicable statutory interest rate} \\ \hline & \text{Period of time from date that interest first became accruable to reporting date} \\ \hline & \text{Accrued interest on tax positions taken but not recognized in the financial statements} \end{aligned}$$

Thus, if a tax position taken by the reporting entity fails the "more-likely-than-not" recognition test, the presumption is that the position would not be sustained and that the entire tax benefit and associated interest (and penalties, if applicable) are to be recognized as a liability on the statement of financial position. Since interest is a period cost for the use of borrowed funds, it must be accrued until the taxing authorities reject the tax position and formally impose the demand for back taxes and interest, or the statute of limitations for the position lapses.

**Penalties.** If upon disallowance on examination, a position would subject the taxpayer to penalty, the reporting entity is to recognize an expense for that penalty in the period it claims or expects to claim the position in its income tax return. That is, the penalty must be accrued as the tax position becomes formalized in a tax filing. An exception is permitted if the positions taken that would be subject to penalty are under the minimum threshold that the jurisdiction uses to assess the penalty. If management later changes its assessment of whether the minimum threshold has been exceeded in a subsequent period, the penalty is to be recognized as an expense in that period.

**Subsequent recognition, derecognition, and measurement.** Judgments regarding initial recognition and measurement are not to be changed based on a reevaluation or reinterpretation of information that was available or should have been available in previous reporting periods. Only if new information becomes available can a new judgment be made. Management's new judgment is to consider the facts, circumstances, and information available at that time. Final certainty is not necessary for this purpose; that is, the position does not have to be subject to final settlement, court ruling, or full resolution to be remeasured.

For tax positions taken by management that do not meet the initial recognition criterion, the benefit becomes recognizable in the first interim period that the position meets any one of the following three conditions:

1. The more-likely-than-not threshold is met by the reporting date.
2. The tax position is effectively settled through examination, negotiation, or litigation.
3. The statute of limitations for the relevant taxing authority to examine and challenge the tax position has expired.

(ASC 740-10-25-8)

In determining whether the condition of "effective settlement" has occurred, ASC 740 provides that management is to evaluate whether all of the following conditions have been met:

1. The taxing authority has completed its examination procedures, including all levels of appeal and administrative reviews that are required by that authority for the specific tax position.
2. Management does not intend to appeal or litigate any aspect of the position included in the completed examination.

3. The possibility of the taxing authority examining or reexamining any aspect of the tax position is remote, considering:
    - a. The authority's policy on reopening closed examinations,
    - b. The specific facts and circumstances of the tax position, and
    - c. The authority has full knowledge of all relevant information that might cause it to reopen an examination that had been previously closed.
- (ASC 740-10-25-10)

When a taxing authority conducts an examination of a tax year, it may not choose to examine a particular tax position taken by management. Nevertheless, upon completion of the examination and all levels of appeal and review, management is permitted to consider that position effectively settled for that tax year. Management is not permitted, however, to consider that tax position or a tax position similar to it to be settled for any other open periods that were not subject to examination, nor is management permitted to use the "effectively settled" criteria for a tax position as a basis for changing its assessment of the technical merits of any tax position taken in other periods.

Tax positions recognized in previous periods that no longer meet the more-likely-than-not criterion are to be reversed ("derecognized," in FASB terminology) in the first period in which that criterion is no longer met. Importantly, it is not permitted that this objective be accomplished through the use of a valuation account or allowance to offset the recorded benefit; rather, it must be recorded as a direct reversal of the previously recorded benefit.

The accounting to record a change in judgment depends on whether the amount subject to change had been previously recognized in a prior annual period or in a prior interim period of the same fiscal year.

The effects of changes in tax positions taken in prior annual periods (including related interest and penalties, if any) are to be recognized as a "discrete item" in earnings in the period of change. Although the term "discrete item" is not defined or explained, the intent is for the change to be reported and disclosed in the same manner as the effects of a change in the enacted tax rate. This entails charging or crediting income from continuing operations for the period of change. Presumably, this would not require a separate line item on the face of the income statement (which would give disproportionate attention to the item), but would require separate disclosure in the notes to the financial statements as a significant component of income tax expense attributable to continuing operations, as specified in ASC 740.

Changes occurring in interim periods are accounted for differently. A change in judgment that applies to a tax position taken in a previous interim period of the current fiscal year is considered an integral part of the annual reporting period. Consequently, the effects of the change are recognized prospectively, through an adjustment to the estimated annual effective tax rate, in accordance with ASC 270 and ASC 740-270.

**Classification.** Tax liabilities resulting from applying ASC 740-10 are current tax obligations. They are *not* to be classified as deferred income tax liabilities unless they are recognized as the result of a future taxable temporary difference created by a tax position that meets the more-likely-than-not criterion.

For reporting entities that present a classified statement of financial position, the customary classification rules apply; the portion of income tax obligations recognized that are not deferred income tax liabilities under ASC 740 are classified based on management's judgment regarding whether it anticipates the payment of cash within one year or within the reporting entity's next operating cycle, if it exceeds one year. (Deferred income tax assets and liabilities are classified using the same classification as the assets or liabilities to which they relate or, if they do not relate

to specific assets or liabilities, based on the year in which the temporary difference is expected to reverse.) The liability for unrecognized income tax benefits (or reduction in amounts refundable) is not permitted to be combined or netted with deferred income tax assets or liabilities.

ASC 740 provides management policy elections with respect to how it accounts for interest and penalties that are required to be accrued on the liability for unrecognized income tax positions:

Interest	Present as additional income taxes or as interest expense
Penalties	Present as additional income taxes or in another expense classification

Management is to elect which of these alternative accounting policies the reporting entity will follow, and then to disclose and consistently apply that policy.

**Applicability to business combinations.** ASC 805 clarifies that an acquirer is to apply its provisions to income tax positions taken by the acquiree prior to the date of the business combination. Thus, the provisions of ASC 740-10 apply to the determination of the income tax bases used to compute deferred income tax assets and liabilities as well as amounts of income taxes currently payable to or refundable from taxing authorities.

If a change occurs that affects a preexisting income tax position that was assumed as a part of the acquisition or an income tax position that arose as a result of the acquisition, the change is to be recognized as follows:

1. Changes occurring during the measurement period (as defined in ASC 805) that result from new information regarding facts and circumstances that existed on the acquisition date are recognized as an adjustment to goodwill. Should goodwill be reduced to zero, however, the remaining portion of the adjustment is to be recognized as a gain arising from a bargain purchase, in accordance with ASC 805. That standard requires recognition of such gains as part of net income.
2. All other changes relating to acquired income tax positions are to be accounted for in the same manner as prescribed for other income tax positions.

### The Effect of Tax Law Changes on Previously Recorded Deferred Income Tax Assets and Liabilities

**General rules.** The balance-sheet-oriented measurement approach of ASC 740 makes it necessary to reevaluate the deferred income tax asset and liability balances at each year-end. If changes to income tax rates or other provisions of the income tax law (e.g., deductibility of items) are enacted, the effect of these changes must be recognized so that the deferred income tax assets and liabilities are fairly presented on the statement of financial position. Any offsetting adjustments are made through the current period's income tax expense or benefit on the income statement; that is, current income tax expense or benefit reflects the income tax effect of current transactions and the revision of previously provided income tax effects for transactions which have yet to reverse.

When income tax rates are revised, this may impact not only the unreversed effects of items that were originally reported in the continuing operations section of the income statement, but also the unreversed effects of items first presented as discontinued operations or in other income statement captions. Furthermore, the impact of changes in income tax rates on the accumulated balance of deferred income tax assets or liabilities that arose through charges or credits to other comprehensive income (under ASC 220) is included in income tax expense associated with continuing operations.

For example, if an entity has unrealized gains on holding available-for-sale securities at a time when relevant income tax rates (presumably, the capital gains rates) are lowered, the

reduction in the deferred income tax liability associated with these unrealized gains will reduce current period income tax expense associated with continuing operations, despite the fact that the income tax provision was originally reported in other comprehensive income (not net income) and in the equity section of the statement of financial position as accumulated other comprehensive income.

**Enactment occurring during an interim period.** When income tax law changes occur during an interim reporting period, the effects are reported in the interim period in which enactment occurs. The effects of the changes are included in continuing operations, whatever the source of the temporary differences being impacted. For example, if in the first fiscal quarter of a year an entity accrued a loss relating to discontinued operations, which is not tax deductible until realized, the income tax effect would be shown in the discontinued operations section of the income statement for that quarter. If income tax rates are changed in the third quarter of the same year, the deferred income tax asset recognized in connection with the loss from discontinued operations would then need to be adjusted upward or downward, based on the difference between the newly enacted income tax rates and the previously effective income tax rates. The income statement effect of this adjustment is included with income tax expense pertaining to income from continuing operations in the third quarter.

**Changes in a valuation allowance for an acquired entity's deferred income tax asset.** ASC 805 has specific requirements for the acquirer to recognize changes in a valuation allowance for an acquiree's deferred income tax asset. (See the chapter on ASC 805 for more detail.)

**Leveraged leases.** When a change in the income tax law is enacted, all components of a leveraged lease must be recalculated from the inception of the lease based upon the revised after-tax cash flows resulting from the change. For more guidance on the income tax aspects of leases, see the chapter on ASC 840.

### Reporting the Effect of Tax Status Changes

The reporting of changes in an entity's income tax status is entirely analogous to the reporting of newly enacted income tax rate changes. Such adjustments typically arise from a change from (or to) taxable status to (or from) "flow through" or nontaxable status. When a previously taxable C corporation elects to become a flow-through entity (an S corporation), the stockholders become personally liable for income taxes on the company's earnings. This liability occurs whether the earnings are distributed to them or not, similar to the taxation of partnerships and limited liability companies.

When the income tax status change becomes effective, the effect of any consequent adjustments to deferred income tax assets and liabilities is reported in current income tax expense. This is always included in the income tax provision relating to continuing operations.

Under ASC 740, deferred income taxes are eliminated by reversal through current period income tax expense. Thus, if an entity with a net deferred income tax liability elects S corporation status, it will report an income tax benefit in the continuing operations section of its current income statement.

Similarly, if an S corporation elects to convert to a C corporation, the effect is to assume a net income tax benefit or obligation for unreversed temporary differences existing at the date the change becomes effective. Accordingly, the financial statements for the period in which the change becomes effective will include the effects of the event in current income tax expense. For example, if the entity has unreversed future taxable temporary differences at the date its income tax status change became effective, it reports income tax expense for that period. Conversely, if it had unreversed future deductible temporary differences, a deferred income tax asset (subject to the

effects of any valuation allowance necessitated by applying the more-likely-than-not criterion) would be recorded, with a corresponding credit to the current period's income tax expense or benefit in the income statement.

Any entity eliminating an existing deferred income tax asset or liability, or recording an initial deferred income tax asset or liability, must fully explain the nature of the events that transpired to cause this adjustment. This is disclosed in the notes to the financial statements for the reporting period.

S corporation elections may be made prospectively at any time during the year preceding the tax year in which the election is intended to be effective and retroactively up to the 16th day of the 3rd month of the tax year in which the election is intended to be effective. The IRS normally informs the electing corporation of whether or not its election has been accepted within 60 days of filing. In practice, however, the IRS seldom denies a timely filed election, and such elections are considered essentially automatic. Consequently, if a reporting entity files an election before the end of its current fiscal year to be effective at the start of the following year, it is logical that the income tax effects would be reported in current year income. For example, an election by a C corporation to become an S corporation that is filed in December 20X1, to be effective at the beginning of the company's next fiscal year, January 1, 20X1, would give rise to the elimination of the deferred income tax assets and liabilities at the date of filing, the effect of which would be reported in the 20X2 financial statements. No deferred income tax assets or liabilities would appear on the December 31, 20X1 statement of financial position, and income tax expense or benefit for 20X2 would include the effects of the reversals of deferred income tax assets and liabilities that had been previously recognized.

There are two situations that could result in an S corporation continuing to recognize deferred income taxes. The first situation arises when the S corporation operates in one or more states that impose state income taxes on the S corporation in an amount that is material to the financial statements. In this situation, the S corporation should compute and recognize deferred state income tax assets and liabilities in the same manner that a C corporation recognizes them for federal income taxes.

The second situation is referred to as "built-in gains tax." Under current income tax law, a C corporation electing to become an S corporation may have built-in gains, which could result in a future corporate income tax liability, under defined circumstances. In such cases the reporting entity, even though it has become an S corporation, will continue to report a deferred income tax liability related to this built-in gain.

### **Reporting the Effect of Accounting Changes for Income Tax Purposes**

Occasionally an entity will initiate or be required to adopt changes in accounting that affect income tax reporting, but which will not impact financial statement reporting. Past examples have included the change to the direct write-off method of bad debt recognition (mandated by a change in the income tax law, while the GAAP requirement to recognize an allowance for uncollectible accounts receivable continued in effect for financial reporting); and the adoption of uniform capitalization for valuing inventory for income tax purposes, while continuing to currently expense certain administrative costs not inventoriable under GAAP for financial reporting.

Generally, these mandated changes involve two distinct types of temporary differences. The first of these changes is the onetime, catch-up adjustment which either immediately or over a prescribed time period impacts the income tax basis of the asset or liability in question (net receivables or inventory, in the examples above), and which then reverses as these assets or

liabilities are later realized or settled and are eliminated from the statement of financial position. The second change is the ongoing differential in the amount of newly acquired assets or incurred liabilities recognized for income tax and financial reporting purposes; these differences also eventually reverse, when the inventory is ultimately sold or the receivables are ultimately collected. This second type of change is the normal temporary difference that has already been discussed. It is the first type of change that differs from those previously discussed in this chapter, and that will now be illustrated.

#### Example of adjustment for prospective catch-up adjustment due to change in tax accounting

Blakey Corporation has, at December 31, 20X1, accrued interest of \$80,000 on its long-term debt. Also assume that expected future taxes will be at a 34% rate and that, effective January 1, 20X2, the income tax law is revised to eliminate deductions for accrued but unpaid interest with existing accruals to be taken into income ratably over four years (referred to in tax vernacular as “a four-year spread”). A statement of financial position of Blakey Corporation prepared on January 1, 20X2, would report:

1. A deferred income tax *asset* in the amount of \$27,200 (i.e.,  $\$80,000 \times 34\%$ , which is the income tax effect of future deductions that Blakey will be entitled to take over the succeeding four years for the amount of interest that had been accrued and unpaid at the effective date of the tax law change, taken when specific receivables are written off and bad debts are incurred for income tax purposes);
2. A current income tax liability of \$6,800 (one-fourth of the income tax obligation); and a noncurrent income tax liability of \$20,400 (three-fourths of the tax income obligation).

The deferred income tax asset is *not* deemed to be identified with the liability, accrued interest (if it were, it would all be reported as a current asset), but rather with the future specific tax benefits expected to be realized from recognizing 25% of the accrual as a deduction in each of the next four years. Accordingly, the deferred income tax asset is categorized as current and noncurrent according to Blakey Corporation’s best estimate of the timing of those future income tax benefits.

#### Income Tax Effects of Dividends Paid on Shares Held by Employee Stock Ownership Plans

ASC 740 affects the accounting for certain employee stock ownership plan (ESOP) transactions. Under ASC 718-40, dividends paid on unallocated shares are not considered to be dividends for financial reporting purposes. If used to pay down ESOP debt, these dividends are reported as reductions of debt or of accrued interest; if paid to plan participants, such dividends are reported as compensation cost. GAAP requires that the income tax benefits arising from dividends paid on unallocated shares be consistent with the reporting of those dividends. Thus, if the dividends were included in compensation cost, the tax benefit would be included in the income tax provision associated with continuing operations.

Dividends paid on allocated shares are treated as normal dividends for financial reporting purposes. However, per ASC 718-40, any income tax benefits resulting from these dividend payments are also to be credited to income tax expense reported in continuing operations. In FASB’s view, income tax deductible dividends for other than unallocated ESOP-held shares represent an exemption from income tax of an equivalent amount of the payor’s earnings. For that reason, it concluded that the income tax effects be reported in continuing operations.

FASB’s decision regarding the presentation of the income tax effects of ESOP and other stock compensation plans are fully analogous. Given that both types of plans sometimes result in income tax deductions for amounts not recognized as compensation expense under GAAP, it was determined that the resulting income tax benefits be accounted for consistently.

## Deferred Income Tax Effects of Changes in the Fair Value of Debt and Marketable Equity Securities

Unrealized gains or losses on holdings of marketable securities are not recognized for income tax purposes until realized through a sale. Thus, the gains or losses that are included in the financial statements (either in the income statement or in other comprehensive income) are temporary differences under ASC 740-10-25-18, et seq. The income tax effects of all temporary differences are recognized in the financial statements as deferred income tax assets or deferred income tax liabilities, with an additional requirement that an allowance be provided for deferred income tax assets that more likely than not will not be realized. Accordingly, adjustments to the carrying value of debt or equity investments included in either the trading or available-for-sale portfolios for changes in fair value will give rise to deferred income taxes, as will any recognition of “other-than-temporary” declines in the value of debt securities being held to maturity.

For gains or losses recognized in connection with holdings of investments classified as trading, since the fair value changes are recognized in net income currently, the deferred income tax effects of those changes will also be presented in the income statement.

### Example of deferred income taxes on investments in debt and marketable equity securities

Odessa Corp. purchased Zeta Company bonds for the purpose of short-term speculation, at a cost of \$100,000. At year-end, the bonds had a fair value of \$75,000. Odessa has a 40% effective income tax rate. The entries to record the fair value adjustment and the related income tax effect are:

Loss on holding of trading securities	25,000
Investment in debt securities—trading portfolios	25,000
Deferred income tax benefit	10,000
Provision for income taxes	10,000

On the other hand, if the investment in Zeta Company bonds had been classified (at the date of acquisition, or subsequently if the intentions had been revised) as available-for-sale, the adjustment to fair value would have been reported in other comprehensive income, and not included in net income. Accordingly, the income tax effect of the adjustment would also have been included in other comprehensive income. The entries would have been as follows:

Unrealized loss on securities—available-for-sale	25,000
Investment in debt securities—available-for-sale (OCI)	25,000
Deferred income tax benefit	10,000
Unrealized loss on securities—available-for-sale (OCI)	10,000

Finally, if the investment in Zeta Company bonds had been made with the intention and ability to hold to maturity, recognition of the decline in value would have depended upon whether it was judged to be temporary or other than temporary in nature. If the former, no recognition would be given to the decline, and hence there would be no deferred income tax effect either. If deemed to be other than temporary, the investment would need to be written down, with the loss included in net income. Accordingly, the income tax effect would also be reported in the income statement. The entries would be as follows:

Loss on decline of securities—held-to-maturity	25,000
Investment in debt securities—held-to-maturity	25,000
Deferred income tax benefit	10,000
Provision for income taxes	10,000

An other-than-temporary decline in value in securities available for sale would also have been recognized in net income (not merely in other comprehensive income), and accordingly the income tax effect of that loss would have been reported in net income.

As with all other transactions or events giving rise to deferred income tax assets, an evaluation must be made as to whether the entity would be MLTN to ultimately realize the income tax benefit so recorded. To the extent that it was concluded that some or all of the deferred income tax asset would not be realized, an allowance would be recorded, with the offset being either to the current income tax provision (if the income tax effect of the timing difference was reported in net income) or to OCI (if the income tax effect had been reported there).

Deferred income taxes will also be recorded in connection with unrealized gains recognized due to changes in the fair value of debt or equity investments. Deferred income tax liabilities will be reported in the statement of financial position, and the corresponding income tax provision will be reported in the income statement (for fair value gains arising from holdings of securities in the trading portfolio) or in other comprehensive income (for fair value changes relative to available-for-sale investments).

**Other guidance on accounting for investments.** A number of specialized issues arising in connection with short-term (or other) investments are addressed in the following paragraphs.

### Tax Allocation for Business Investments

There are two basic methods for accounting for investments in the common stock of other corporations:

1. the fair value method as set forth in ASC 320, and
2. the equity method, as prescribed by ASC 323.

The cost method is not appropriate, except for the exceedingly rare situation when fair value information is absolutely unavailable. If the cost method is used, however, there will be no deferred income tax consequence, since this conforms to the method prescribed for income tax reporting.

Under both the cost and fair value methods, ordinary income is recognized as dividends received by the investor, and capital gains (losses) are recognized upon the disposal of the investment. For income tax purposes, no provision is made during the holding period for the allocable undistributed earnings of the investee. There is no deferred income tax computation necessary when using the cost method, because there is no temporary difference.

Under the equity method, the investment is recorded at cost and subsequently increased by the allocable portion of the investee's net income. The investor's share of the investee's net income is then included in the investor's pretax accounting income. Dividend payments are not included in pretax accounting income but instead are considered to be a reduction in the carrying amount of the investment. For income tax purposes, however, dividends received are the only revenue realized by the investor. As a result, the investor must recognize deferred income tax expense on the undistributed net income of the investee that will be taxed in the future. The current effective GAAP in this area consists of ASC 740-30 and ASC 740-10.

**Undistributed earnings of a subsidiary.** These accounting requirements are set forth in ASC 740-30. While the timing of distribution of a subsidiary's net income to its parent may be uncertain, it will eventually occur, whether by means of dividends, or via the disposal of the entity and realization of capital gains. Accordingly, deferred income taxes must be provided, but the amount will be dependent upon the anticipated means of realization, which of course may change over time.

The magnitude of the income tax effects to be provided depends upon specific application of the income tax laws and management intent. If the law provides a mechanism under which the parent can recover its investment tax-free, deferred income taxes are not provided. For example, under §332 of the IRC, a parent corporation can liquidate an 80%-or-more-owned subsidiary without recognizing gain or loss for income tax purposes. Also, under IRC §368, a parent can

effect a statutory merger or consolidation with its 80%-or-more-owned subsidiary, under which no taxable gain or loss would be recognized.

In other cases, the minimization or avoidance of income taxes can be achieved only if the parent company owns a stipulated share of the subsidiary's stock. A parent owning less than this threshold level of its subsidiary may express its intent to utilize a tax planning strategy to acquire the necessary additional shares to realize this benefit. In evaluating this strategy, the cost of acquiring the additional shares must be considered, and the benefits to be recognized (i.e., a reduced deferred income tax liability) must be offset by the cost of implementing the strategy as discussed earlier in this chapter.

A distinction exists in the application of ASC 740-30 between differences in income tax and financial reporting basis that are considered "inside basis differences" versus "outside basis differences," and this is clarified by ASC 830-740-25. Certain countries' income tax laws allow periodic revaluation of long-lived assets to reflect the effects of inflation with the offsetting credit recorded as equity for income tax purposes. Because this is an internal adjustment that does not result from a transaction with third parties, the additional basis is referred to as "inside basis." ASC 830-740-25 indicates that the ASC 740-30 indefinite reversal criteria only apply to "outside basis differences," and not to "inside basis differences" arising in connection with ownership of foreign subsidiaries. Therefore, a deferred income tax liability is to be provided on the amount of the increased inside basis.

Certain foreign countries tax corporate income at rates that differ depending on whether the income is distributed as dividends or retained by the corporation. Upon subsequent distribution of the accumulated earnings, the taxpayer receives a tax credit or refund for the difference between the two rates. In the consolidated financial statements of a parent company, the future income tax credit and the deferred income tax effects related to dividends that will be paid in the future are recognized based on the distributed rate if the parent provided for deferred income taxes because it did not invoke the indefinite reversal criteria of ASC 740-30. If the parent did not provide for deferred income taxes as a result of applying the ASC 740-30 criterion, the undistributed rate is to be used. (ASC 740-10-25) The treatment of the tax credit in the separate financial statements of the foreign company is discussed later in this chapter in the section titled "Separate Financial Statements of Subsidiaries or Investees."

**Undistributed earnings of an investee.** When an entity has an equity method investee, it is presumed to be able to exercise significant influence, but lack control. Because the ability to indefinitely postpone income taxes on the investee's net income would be absent in such a case, in contrast to the parent-subsidiary situation above, GAAP requires full interperiod income tax allocation for the effects of undistributed investee net income. The facts and circumstances involved in each situation, however, will be the final determinant of whether this temporary difference is assumed to be a future dividend or a capital gain for purposes of computing the deferred income tax effect.

#### Example of income tax effects from investee company

To illustrate the application of these concepts, assume Investor Company owns 30% of the outstanding common stock of Investee Company and 70% of the outstanding common stock of Subsidiary Company. Additional data for Subsidiary and Investee companies for the year 20X1 are as follows:

	<u>Investee Company</u>	<u>Subsidiary Company</u>
Net income	\$50,000	\$100,000
Dividends paid	20,000	60,000

The following sections illustrate how the foregoing data are used to recognize the income tax effects of the stated events.

The pretax accounting income of Investor Company will include its equity in Investee Company net income equal to \$15,000 ( $\$50,000 \times 30\%$ ). Investor's taxable income, on the other hand, will include dividend income of \$6,000 ( $\$20,000 \times 30\%$ ), reduced by a deduction of 80% of the \$6,000, or \$4,800. This 80% dividends-received deduction is a permanent difference between pretax accounting income and taxable income and is allowed for dividends received from domestic corporations in which the taxpaying corporation's ownership is less than 80% but at least 20%. A lower dividends-received deduction of 70% is permitted when the ownership is less than 20%, and a 100% deduction is provided for dividends received from domestic corporations in which the ownership is 80% to 100%.

In this example, a temporary difference results from Investor's equity (\$9,000) in Investee's undistributed income of \$30,000 (= \$50,000 net income less \$20,000 dividends). The amount of the deferred income tax credit in 20X1 depends upon the expectations of Investor Company regarding the manner in which the \$9,000 of undistributed income will be realized. If the expectation of receipt is via dividends, then the temporary difference is 20% (the net taxable portion, after the dividends-received deduction) of \$9,000, or \$1,800, and the deferred income tax liability associated with this temporary difference in 20X2 is the expected effective income tax rate times \$1,800. However, if the expectation is that receipt will be through future sale of the investment, then the temporary difference is the full \$9,000 and the deferred income tax liability is the current corporate capital gains rate times the \$9,000.

The entries below illustrate these alternatives. An assumed tax rate of 34% is used for ordinary income, while a rate of 20% is used for capital gains. It is also assumed that there are no pre-20X2 temporary differences to consider. Note that the amounts in the entries below relate only to Investee Company's incremental impact upon Investor Company's income tax assets and liabilities.

	<i>Expectations for undistributed income</i>	
	<i>Dividends</i>	<i>Capital gains</i>
Income tax expense	1,020	2,208
Deferred income tax liability	612 <sup>b</sup>	1,800 <sup>c</sup>
Income taxes payable	408 <sup>a</sup>	408 <sup>a</sup>
<i><sup>a</sup>Computation of income taxes payable:</i>		
<i>Dividend income—30% × (\$20,000)</i>		\$ 6,000
<i>Less 80% dividends-received deduction</i>		(4,800)
<i>Amount included in Investor's taxable income</i>		<u><u>\$ 1,200</u></u>
<i>Tax liability—34% × (\$1,200)</i>		<u><u>\$ 408</u></u>
<i><sup>b</sup>Computation of deferred income tax liability (dividend assumption):</i>		
<i>Temporary difference:</i>		
<i>Investor's share of undistributed income—30% ×</i>		\$ 9,000
<i>    (\$50,000 – \$20,000 = \$30,000)</i>		
<i>Less 80% dividends-received deduction</i>		(7,200)
<i>Temporary difference</i>		<u><u>\$ 1,800</u></u>
<i>Deferred income tax liability—34% × (\$1,800)</i>		<u><u>\$ 612</u></u>
<i><sup>c</sup>Computation of deferred income tax liability (capital gain assumption):</i>		
<i>Temporary difference:</i>		
<i>Investor's share of undistributed income—</i>		<u><u>\$ 9,000</u></u>
<i>    same as above</i>		
<i>Deferred income tax liability—20% × (\$9,000)</i>		<u><u>\$ 1,800</u></u>

**Example of income tax effects from subsidiary**

The pretax accounting income of Investor Company will also include equity in Subsidiary income of \$70,000 ( $70\% \times \$100,000$ ). This \$70,000 will be included in consolidated pretax income in Investor's consolidated financial statements. For income tax purposes, Investor and Subsidiary cannot file a consolidated income tax return because the minimum level of control (i.e., 80%) is not present. Consequently, the taxable income of Investor will include dividend income of \$42,000 ( $70\% \times \$60,000$ ), and there will be an 80% dividends-received deduction of \$33,600. The temporary difference discussed in ASC 740-30 results from Investor's 70% equity (\$28,000) in Subsidiary's undistributed earnings of \$40,000. The amount of the deferred income tax liability in 20X1 depends upon the expectations of Investor Company as to the manner in which this \$28,000 of undistributed income will be received. The same expectations can exist as previously discussed for Investor's equity in Investee's undistributed earnings (i.e., through future dividend distributions or capital gains).

The entries below illustrate these alternatives. A marginal tax rate of 34% is assumed for dividend income, and a rate of 20% applies to capital gains. It is also assumed that there are no pre-20X2 temporary differences to consider. The amounts in the entries below relate only to Subsidiary Company's incremental impact upon Investor Company's income tax assets and liabilities.

	<i>Expectations for undistributed income</i>	
	<u>Dividends</u>	<u>Capital gains</u>
Income tax expense	4,760	8,456
Deferred income tax liability	1,904 <sup>b</sup>	5,600 <sup>c</sup>
Income taxes payable	2,856 <sup>a</sup>	2,856 <sup>a</sup>
<i><sup>a</sup>Computation of income taxes payable:</i>		
<i>Dividend income—</i> $70\% \times (\$60,000)$		\$ 42,000
<i>Less 80% dividends-received deduction</i>		(33,600)
<i>Amount included in Investor's taxable income</i>		\$ 8,400
<i>Tax liability—</i> $34\% \times (\$8,400)$		<u>\$2,856</u>
<i><sup>b</sup>Computation of deferred income tax liability (dividend assumption):</i>		
<i>Temporary difference:</i>		
<i>Investor's share of undistributed income—</i>		\$ 28,000
<i>70% × (\$40,000)</i>		
<i>Less 80% dividends-received deduction</i>		(22,400)
<i>Deferred income tax liability—</i> $34\% \times (\$5,600)$		<u>\$ 5,600</u>
<i><sup>c</sup>Computation of deferred income tax liability (capital gain assumption):</i>		
<i>Temporary difference:</i>		
<i>Investor's share of undistributed income—</i>		\$28,000
<i>70% × (\$40,000)</i>		
<i>Deferred income tax liability—</i> $20\% \times (\$28,000)$		<u>\$ 5,600</u>

If a company owns 80% or more of the voting stock of a subsidiary and consolidates the subsidiary for both financial reporting and income tax purposes, then no temporary differences exist between consolidated pretax income and taxable income. If, in the circumstances noted above, consolidated financial statements are prepared but a consolidated income tax return is not, IRC §243 allows the Investor to take a 100% dividends-received deduction. Accordingly, the temporary difference between consolidated pretax income and taxable income is zero if the Investor assumes the undistributed income will be realized in dividends.

### Summary of Temporary Differences of Investees and Subsidiaries

*Level of Ownership Interest*

	0%	<20%	50%	>80%	100%
<i>Accounting</i>					
Income recognition		Fair value method	Equity method		
Deferred income tax on undistributed earnings		No temporary difference	Temporary difference	No temporary difference	
<i>Income tax</i>					
Dividends recognized		30% of dividends received (70% deduction)	20% of dividends received (80% deduction)	None (100% deduction)	

### Separate Financial Statements of Subsidiaries or Investees

**Push-down accounting.** ASC 805-50 addressed a number of issues concerning whether the use of a step-up in the income tax basis of an acquired entity, as permitted by the 1982 tax law, mandated the use of push-down accounting, and the necessary allocation of the income tax provision between parent and subsidiaries if a step-up was not elected. Push-down accounting is not required for non-SEC registrants. In addition, if the acquiree continues to report its net assets on their historical basis, three alternative methods of allocating consolidated income tax expense or benefit are acceptable: (1) allocation to the acquiree on the preacquisition basis, (2) crediting the income tax benefit of basis step-up to the acquiree's stockholders' equity upon realization, and (3) crediting the income tax benefit to the income of the acquirer when realized as a permanent difference.

**Tax credits related to dividend payments.** Some taxing jurisdictions have differing income tax rates that are applied to taxable income based on whether that income is distributed to investors or retained in the business. For example, Germany taxes undistributed profits at a 45% rate and distributed profits at a 30% rate. When previously undistributed profits are distributed, the taxpayer earns an income tax credit for the differential between the two rates. ASC 740-10-30 specifies that the accounting for the income tax credit in the separate financial statements of the reporting entity paying the dividend is a reduction of income tax expense in the period that the credit is included in its income tax return. During the period of time that the earnings remain undistributed, the rate applied to the temporary difference in computing deferred income taxes is the rate applicable to the undistributed profits (45% in this example).

### Asset Acquisitions

ASC 740-10-25 provides that in situations where an acquiring entity makes an asset acquisition:

- When management recognizes a reduction in the reporting entity's valuation allowance that directly results from the asset acquisition, the reduction is not to enter into the accounting for the asset acquisition. The acquiring entity is to reduce the valuation allowance and either recognize the reduction:

- a. As an income tax benefit, or
  - b. As a credit to contributed capital if related to items such as employee stock options, dividends on unallocated ESOP shares, or certain quasi reorganizations.
2. Any income tax uncertainties existing at the date of acquisition are to be accounted for in accordance with ASC 740-10-45-23.  
(Also see 805-740-30-3)

These specific amendments are to be applied to all asset acquisitions irrespective of when they occurred.

### Intraperiod Income Tax Allocation

ASC 740 predominantly deals with the requirements of interperiod income tax allocation (i.e., deferred income tax accounting), but its scope also includes intraperiod income tax allocation. This relates to the matching of various categories of comprehensive income or expense (continuing operations, corrections of errors, prior period adjustments, etc.) with the income tax effects of those items, as presented in the income (or other financial) statement. The general principle is that the income statement presentation of the effects of income taxes should be the same as items to which the income taxes relate. A “with and without” approach is prescribed as the mechanism by which the marginal, or incremental income tax effects of items other than those arising from continuing operations are to be measured. However, under ASC 740 there are some significant departures from past practice, as described in the following paragraphs.

ASC 740 prescribes an incremental calculation of income tax expense to be allocated to classifications other than continuing operations. However, rather than applying successive allocations on the “with and without” basis to determine income tax expense or benefit applicable to each succeeding income statement caption, the income tax effects of all items other than continuing operations are allocated pro rata. That is, once income tax expense or benefit allocable to continuing operations is determined, the residual income tax expense or benefit is apportioned to all the other classifications (discontinued operations, et al.) in the ratios that those other items bear, on a pretax basis, to the total of all such items. Furthermore, income tax expense or benefit on income from continuing operations includes not only income taxes on the income earned from continuing operations, as expected, but also the following items:

1. The impact of changes in income tax laws and rates, which includes the effects of such changes on items that were previously reflected directly in stockholders' equity (accumulated other comprehensive income), as described more fully below.
2. The impact of changes in the entity's taxable status.
3. Changes in estimates about whether the income tax benefits of future deductible temporary differences or net operating loss or tax credit carryforwards are more likely than not to be realizable (i.e., an adjustment to the valuation allowance for such items).
4. The income tax effects of tax-deductible dividends paid to stockholders, as discussed elsewhere in this chapter.

Under ASC 740, stockholders' equity is charged or credited directly with the initial income tax effects of items that are reported in stockholders' equity without being presented on the income statement. These items include the following:

1. Corrections of the effects of accounting errors of previous periods.
2. Gains and losses that are defined under GAAP as being part of comprehensive income but are not reported in the income statement, such as foreign currency translation adjustments

under ASC 830, and the fair value adjustments applicable to available-for-sale portfolios of debt and marketable equity securities held as investments. As per ASC 220, the income tax effects of these types of items will be reported in the same financial statement where other comprehensive income items are reported. These items may be reported either in a stand-alone statement of comprehensive income, or a combined statement of income and other comprehensive income, or in an expanded version of the statement of changes in stockholders' equity.

3. Taxable or deductible increases or decreases in contributed capital, such as offering costs reported under GAAP as reductions of the proceeds of a capital stock offering, but which are either immediately deductible or amortizable for income tax purposes.
4. Increases in the income tax bases of assets acquired in a taxable business combination accounted for as a pooling of interests under GAAP, if an income tax benefit is recognized at the date of the business combination (i.e., if the income tax effects of existing future deductible temporary differences are not fully offset by a valuation allowance at that date).
5. Expenses incurred in connection with stock issued under provisions of compensatory stock option plans, which are recognized for income tax purposes but are reported for accounting purposes in stockholders' equity.
6. Dividends that are paid on unallocated shares held in an ESOP, and that are charged against retained earnings.
7. Deductible temporary differences and net operating loss and tax credit carryforwards that existed at the date of a quasi reorganization.

The effects of income tax rate or other income tax law changes on items for which the income tax effects were originally reported directly in stockholders' equity are reported in continuing operations, if they occur in any period after the original event. For example, assume the reporting entity recognized a deferred income tax asset related to an employee stock option program amounting to \$34,000 in 20X2, based on the estimated future income tax deduction it would receive at the-then current and anticipated future income tax rate of 34%. If the statutory income tax rate is reduced to 25% in 20X3 before the temporary difference reverses, the adjustment to the deferred income tax asset ( $\$34,000 - \$25,000 = \$9,000$ ) is reported in income tax expense or benefit applicable to income from continuing operations in 20X3.

#### Comprehensive example of the intraperiod income tax allocation process

Assume \$50,000 in future deductible temporary differences at 12/31/X2; these differences remain unchanged during the current year, 20X3, at 12/31/X2; these differences remain unchanged during the current year, 20X3.

	<u>20X3</u>
Income from continuing operations	\$ 400,000
Loss from discontinued operations	(120,000)
Correction of error: understatement of depreciation in 20X2	(20,000)
Income tax credits	5,000

Income tax rates are: 15% on the first \$100,000 of taxable income; 20% on the next \$100,000; 25% on the next \$100,000; 30% thereafter.

Expected future effective income tax rates were 20% at December 31, 20X2, but are judged to be 28% at December 31, 20X3.

Retained earnings at December 31, 20X2, were \$650,000.

Intraperiod tax allocation proceeds as follows:

Step 1—Income tax on total taxable income of \$320,000 ( $\$460,000 - \$120,000 - \$20,000$ ) is \$61,000 computed as follows:

<i>Taxable income</i>	<i>Income tax rate</i>	<i>Income tax</i>	
\$100,000	15%	\$15,000	
100,000	20%	20,000	
100,000	25%	25,000	
20,000	30%	6,000	
<u>\$320,000</u>		<u>\$66,000</u>	Income tax before credits
		(5,000)	Tax credit
		<u>\$61,000</u>	Income tax payable

Step 2—Income tax on income from continuing operations of \$400,000 is \$85,000, net of tax credit computed as follows.

<i>Taxable income</i>	<i>Income tax rate</i>	<i>Income tax</i>	
\$100,000	15%	\$15,000	
100,000	20%	20,000	
100,000	25%	25,000	
160,000	30%	30,000	
<u>\$460,000</u>		<u>\$108,000</u>	Income tax before credits
		(5,000)	Tax credit
		<u>\$103,000</u>	Income tax payable

Step 3—The \$42,000 difference is allocated pro rata to discontinued operations, unusual gain, and correction of the error in prior year depreciation as follows:

	<i>Gross amount before tax</i>	<i>Relative %</i>	<i>Allocation of difference</i>
Discontinued operations	<u><math>-\\$120,000</math></u>	150%	\$ 36,000
Error correction	<u><math>-(20,000)</math></u>	25%	6,000
	<u><math>-\\$80,000</math></u>	100%	<u>\$ 42,000</u>

Step 4—The adjustment of the deferred income tax asset, amounting to a \$4,000 increase due to an effective tax rate estimate change [ $\$50,000 \times (.28 - .20)$ ], is allocated to continuing operations, regardless of the source of the temporary difference.

A summary combined statement of income and retained earnings for 20X3 is presented below:

Income from continuing operations, before income taxes		\$460,000
Income taxes on income from continuing operations:		
Current	\$108,000	
Deferred	(4,000)	
Tax credits	<u>(5,000)</u>	<u>99,000</u>
Income from continuing operations, net		361,000
Loss from discontinued operations, net of income tax benefit of \$36,000		(84,000)
Net income		<u>277,000</u>

Retained earnings, January 1, 20X3 as originally reported	650,000
Correction of accounting error, net of income tax effects of \$6,000	<u>(14,000)</u>
Retained earnings, January 1, 20X3, as restated	636,000
Retained earnings, December 31, 20X3	<u>\$913,000</u>

This example does not include items that will, under the provisions of ASC 220, be reported in other comprehensive income.

The income tax effect of a retroactive change in tax rates on current and deferred income tax assets and liabilities is to be determined at the enactment date, using temporary differences and currently taxable income computed as of the date of enactment. The cumulative income tax effect is included in income from continuing operations. Furthermore, the income tax effect of items not included in income from continuing operations (e.g., from discontinued operations) that arose during the current fiscal year and prior to enactment is measured based on the enacted income tax rate at the time the transaction was recognized for financial reporting purposes; the income tax effect of a retroactive change in rates on current or deferred income tax assets or liabilities related to those items is nevertheless included in income from continuing operations. (ASC 740-10-45)

### Classification in the Statement of Financial Position

**Deferred income taxes.** A reporting entity that presents a classified statement of financial position will classify its deferred income tax liabilities and assets as either current or noncurrent consistent with the classification of the related asset or liability. A deferred income tax asset or liability that is not related to an asset or liability for financial reporting purposes, such as the deferred income tax consequences related to a net operating loss carryforward or income tax credit carryforward, is classified based on the expected reversal or utilization date. These classifications must be made for each separate tax-paying component within each taxing jurisdiction.

Within each of the separate components, the current asset and liability are offset and presented as a single amount, with similar treatment for the noncurrent items. Understandably, offsetting is not permitted for different tax-paying components or for different tax jurisdictions. Thus, a statement of financial position may present current and noncurrent deferred income tax assets, along with current and noncurrent deferred income tax liabilities, under certain circumstances.

If the enterprise has recorded a valuation allowance, it must prorate the allowance between current and noncurrent according to the relative size of the gross deferred income tax asset in each classification.

**Payment to retain fiscal year.** S corporations and partnerships are permitted to elect tax fiscal years other than a calendar year. (IRC §444) If the election is made, however, the electing entity is required to make a payment to the Internal Revenue Service in an amount that approximates the income tax that the stockholders (or partners) would have paid on the income for the period between the fiscal year-end elected and the end of the calendar year. This payment, which is not a tax, is recomputed and adjusted annually and is fully refundable to the electing entity in the future upon liquidation, conversion to a calendar tax year-end, or a decline in its taxable income to zero. This “required payment” should be accounted for as an asset, analogous to a deposit. (ASC 740-10-55)

### Disclosures

ASC 740 is one of the standards that differentiates between public and nonpublic enterprises with respect to the nature and extent of required disclosures. The Appendix, “Disclosure Checklist for Commercial Businesses,” has a list of the interim and year-end disclosures related to income taxes.

## Accounting for Income Taxes in Interim Periods

**Basic rules.** The appropriate perspective for interim period reporting is to view the interim period as an integral part of the year, rather than as a discrete period. This objective is usually achieved by projecting income for the full annual period, computing the income tax thereon, and applying the “effective rate” to the interim period income or loss, with quarterly (or monthly) revisions to the expected annual results and the income tax effects thereof, as necessary.

While the Board chose to not comprehensively address interim reporting when it deliberated ASC 740, there were certain clear contradictions between ASC 270 and the principles of ASC 740, which the Board did address. As discussed in more detail below, these issues were (1) recognizing the income tax benefits of interim losses based on expected net income of later interim or annual periods, (2) reporting the benefits of net operating loss carryforwards in interim periods, and (3) reporting the effects of income tax law changes in interim periods. Other matters requiring interpretation, which were left to the user to address without official guidance, included the classification of deferred income tax assets and liabilities on interim statements of financial position and allocation of interim period income tax provisions between current and deferred income tax expense.

The annual computation of income tax expense is based upon the current income taxes payable or refundable as indicated on the income tax return, plus or minus the adjustment necessary to adjust the deferred income tax asset and liability to the proper balances as of the date of the statement of financial position (including consideration of the need for a valuation allowance, as previously discussed). The computation of interim period income tax expense should be consistent with this asset and liability method.

ASC 740-270 introduced some unfortunate terminology that, although confusing, nevertheless must be understood in the context of interim tax computations. The term “ordinary income” as used in ASC 740-270 is not used in the same way as in the income tax law to distinguish capital gains, for example, from operating income and deductions. The ASC 740-270 definition of “ordinary income” is, formulaically:

$$\begin{aligned} &\text{Pretax income or loss from continuing operations} \\ &+/- \\ &+/- \text{ Discontinued operations} \\ &+/- \text{ Cumulative effects of changes in accounting principle} \\ &+/- \text{ Significant unusual or infrequently occurring items} \end{aligned}$$

This “ordinary income” is used as the denominator in calculating an effective income tax rate to be used to compute income tax expense currently payable for the interim period. Note that pretax income is *not* adjusted for the effects of permanent or temporary differences.

Below is a relatively simple example that illustrates these basic principles.

### Basic example of interim period accounting for income taxes

Boffa, Inc. estimates that pretax accounting income for the full fiscal year ending June 30, 20X2, will be \$400,000. Boffa does not expect to have any of the items that would adjust its “ordinary income” as defined above either at year-end or during any of its interim quarters. The company expects that it will incur \$60,000 of meals and entertainment expenses, of which 50% are nondeductible under the current tax law; the annual premium on an officer’s life insurance policy is \$12,000; and dividend income (from a less than 20% ownership interest) is expected to be \$100,000. The company recognized income of \$75,000 in the first quarter of the year. The deferred income tax liability arises solely in connection with property and equipment temporary differences; these differences totaled \$150,000 at the beginning of

the year and are projected to equal \$280,000 at year-end after taking into account expected acquisitions and disposals for the remainder of the fiscal year. The graduated statutory income tax rate schedule is provided below. Boffa management used a future expected effective income tax rate of 34% to compute the beginning deferred income tax liability and does not anticipate changing that percentage at the end of the fiscal year. The change in the future taxable temporary difference during the first quarter is \$30,000.

Boffa must first calculate its estimated effective income tax rate for the year. This rate is computed using all of the tax planning alternatives available to the company (e.g., tax credits, foreign rates, capital gains rates, etc.).

Estimated annual pretax accounting income (and “ordinary income” as defined in ASC 740-270)		\$ 400,000
<b>Permanent differences:</b>		
Add: Nondeductible officers’ life insurance premium	\$ 12,000	
Nondeductible meals and entertainment	<u>30,000</u>	42,000
		442,000
Less: Dividends-received deduction ( $\$100,000 \times 70\%$ )	(70,000)	372,000
Less: Change in future taxable temporary difference	(130,000)	
Estimated taxable income for the year		\$ 242,000
Annual current tax on estimated taxable income (see below)		\$ 70,530
Effective income tax rate for <i>current</i> income tax expense (computed as a percentage of “ordinary income”) \$70,530/400,000		<u>17.6%</u>
<b>Tax rate schedule</b>		
<u>At least</u>	<u>Not more than</u>	<u>Taxable</u>
\$ –	\$ 50,000	<u>Rate</u>
50,000	75,000	15%
75,000	–	25%
		34%
		\$ 50,000
		25,000
		167,000
		<u>56,780</u>
		<u>\$70,530</u>

Computation of the first quarter current income tax expense:

“Ordinary income” for first quarter	\$ 75,000
Estimated annual effective income tax rate per above	$\times$ 17.6%
	<u>\$13,200</u>

This amount can be “proven” as follows:

Annualized current tax computed above	\$ 70,530
Portion of annual tax attributable to first quarter	
First quarter pretax income as a % of forecast	
\$75,000/\$400,000	$\times$ 18.75%
Result, materially the same as above	<u>\$13,224</u>

Computation of the first quarter deferred income tax expense (same method as year-end).

	<i>Future taxable temporary difference</i>	<i>Effective tax rate estimated for reversal year(s)</i>	<i>Computed deferred tax liability</i>
Property and equipment			
End of first quarter	\$180,000	34%	\$61,200
Beginning of fiscal year	150,000	34%	<u>51,000</u>
First quarter deferred income tax expense			<u>\$10,200</u>

Recap of first quarter income tax expense.

Current	\$13,200
Deferred	<u>10,200</u>
Total	<u><u>\$23,400</u></u>

Finally, the entry necessary to record the income tax expense at the end of the first quarter is as follows:

Income tax expense	23,400
Income taxes payable—current	13,200
Deferred income tax liability	10,200

In the second quarter, Boffa, Inc. revises its estimate of income for the full fiscal year. It now anticipates only \$210,000 of pretax accounting income (“ordinary income”), including only \$75,000 of dividend income, because of dramatic changes in the national economy. Other permanent differences are still expected to total \$42,000.

Estimated annual pretax accounting income (and “ordinary income” as defined in ASC 740-270)	\$210,000
<b>Permanent differences:</b>	
Add: Nondeductible officers’ life insurance premium	\$12,000
Nondeductible meals and entertainment	<u>30,000</u>
	<u><u>252,000</u></u>
Less: Dividends-received deduction ( $\$75,000 \times 70\%$ )	( <u>52,500</u> )
	<u><u>199,500</u></u>
Less: Change in future taxable temporary difference	( <u>130,000</u> )
Estimated taxable income for the year	<u><u>\$ 69,500</u></u>
Annual current tax on estimated taxable income (see below)	<u><u>\$ 12,375</u></u>
Effective income tax rate for <i>current</i> income tax expense (computed as a percentage of “ordinary income”)	<u><u>5.2%</u></u>
\$12,375/\$210,000)	

<i>Tax rate schedule</i>			<i>Taxable</i>	
<i>At least</i>	<i>Not more than</i>	<i>Rate</i>	<i>income</i>	<i>Tax</i>
\$ –	\$ 50,000	15%	\$ 50,000	\$ 7,500
50,000	75,000	25%	<u>19,500</u>	<u>4,875</u>
			<u><u>\$69,500</u></u>	<u><u>\$12,375</u></u>

The actual “ordinary income” for the second quarter was \$22,000, and the change in the temporary difference was only an additional \$10,000. Income tax expense for the second quarter is computed as follows:

<i>Computation of year-to-date and second quarter current income tax expense (benefit)</i>	
“Ordinary income” for the half year (\$75,000 + \$22,000)	\$ 97,000
Estimated annual effective income tax rate per above	$\times$ 5.2%
Year-to-date current income tax expense	\$ 5,044
Less: Expense recognized in first quarter	<u>13,200</u>
Current income tax (benefit) for second quarter	<u><u>\$ (8,156)</u></u>

*Computation of year-to-date and second quarter deferred income tax expense (benefit)*

	<i>Future taxable temporary difference</i>	<i>Effective tax rate estimated for reversal year(s)</i>	<i>Computed deferred tax liability</i>
Property and equipment			
End of second quarter	\$190,000	34%	\$64,600
Beginning of fiscal year	150,000	34%	<u>51,000</u>
Year-to-date deferred income tax expense			13,600
Less: Expense recognized in first quarter			10,200
Deferred income tax expense for second quarter			<u>\$ 3,400</u>

*Recap of second quarter income expense (benefit)*

Current	\$ (8,156)
Deferred	<u>3,400</u>
Total	<u>\$ 4,756</u>

Under ASC 270, and also under the general principle that changes in estimate are reported prospectively (as stipulated by ASC 250), the results of prior quarters are not restated for changes in the estimated effective annual tax rate. Given the current and deferred income tax expense that was recognized in the first quarter, shown above, the following entry is required to record the income taxes as of the end of the second quarter:

Income taxes payable—current	8,156
Income tax expense (benefit)	4,756
Deferred income tax liability	3,400

The foregoing illustrates the basic problems encountered in applying GAAP to interim reporting. In the following paragraphs, we discuss some of the items requiring modifications to the approach described in the previous example.

**Net operating losses in interim periods.** ASC 740-270 sets forth the appropriate accounting when losses are incurred in interim periods or when net operating loss carryforward benefits are realized during an interim reporting period.

**Carryforward from prior years.** The interim accounting for the utilization of a net operating loss carryforward is reflected in one of two ways.

1. If the income tax benefit of the net operating loss is expected to be realized as a result of current year “ordinary income,” that income tax benefit is included as an adjustment to the effective annual tax rate computation illustrated above.
2. If the income tax benefit of the net operating loss is not expected to be realized as described in item 1, the benefit is allocated first to reduce year-to-date income tax expense from continuing operations to zero with any excess allocated to other sources of income that would provide the means to utilize the net operating loss (e.g., discontinued operations, etc.).

When a valuation allowance is reduced or eliminated because of a revised judgment, the previously unrecognized income tax benefit is included in the income tax expense or benefit of the interim period in which the judgment is revised. An increase in the valuation allowance resulting

from a revised judgment would cause a catch-up adjustment to be included in the current interim period's income tax expense from continuing operations. In either situation, the effect of the change in judgment is *not* prorated to future interim periods by means of the effective tax rate estimate.

#### Example of interim-period valuation allowance adjustments due to revised judgment

Camino Corporation has a previously unrecognized \$50,000 net operating loss carryforward—that is, Camino had previously established a full valuation allowance for the deferred income tax asset arising from the net operating loss and thus had not previously recognized any deferred income tax benefit associated with the net operating loss; a flat 40% tax rate for current and future periods is assumed. Income for the full year (before net operating loss) is projected to be \$80,000. Consequently, the management of Camino has revised its judgment as to the future realizability of the net operating loss. In the first quarter Camino will report a pretax loss of \$10,000:

Projected annual income	\$80,000
× Tax rate	<u>40%</u>
Projected tax liability	<u><u>\$32,000</u></u>

Accordingly, in the income statement for the first fiscal quarter, the pretax operating loss of \$10,000 will give rise to an income tax benefit of  $\$10,000 \times 40\% = \$4,000$ .

In addition, an income tax benefit of \$20,000 (\$50,000 net operating loss  $\times$  40%) is recognized, and is included in the current quarter's income tax benefit relating to continuing operations. Thus, the total income tax benefit for the first fiscal quarter will be \$24,000 (\$4,000 + \$20,000).

If Camino's second quarter results in pretax operating income of \$30,000, and the expectation for the full year remains unchanged (i.e., operating income of \$80,000), the second quarter income tax expense is \$12,000 ( $\$30,000 \times 40\%$ ).

The income tax provision for the fiscal first half-year will be a benefit of \$12,000, as follows:

Cumulative pretax income through second quarter ( $\$30,000 - \$10,000$ )	\$ 20,000
× Effective rate	<u>40%</u>
Income tax provision before recognition of net operating loss carryforward benefit	<u>8,000</u>
Benefit of net operating loss carryforward first recognized in first quarter	<u>(20,000)</u>
Total year-to-date tax provision (benefit)	<u><u><u>\$12,000</u></u></u>
Consisting of:	
First quarter (benefit)	\$(24,000)
Second quarter expense	<u>12,000</u>
Year-to-date benefit, per above	<u><u><u>\$12,000</u></u></u>

The foregoing example assumes that during the first quarter Camino's judgment changed as to the full realizability of the previously unrecognized benefit of the \$50,000 loss carryforward. Were this not the case, however, the benefit would have been recognized only as actual tax liabilities were incurred (through current period income) in amounts sufficient to offset the net operating loss benefit.

#### Example of recognizing net operating loss carryforward benefit as actual liabilities are incurred

To illustrate this latter situation, assume the same facts about net income for the first two quarters, and assume now that Camino's judgment about the realizability of the prior period net operating loss does not change. Tax provisions for the first quarter and first half are as follows:

	<i>First quarter</i>	<i>First half-year</i>
Pretax income (loss)	\$ (10,000)	\$20,000
× Effective rate	<u>40%</u>	<u>40%</u>
Tax provision before recognition of net operating loss carryforward benefit	\$ (4,000)	\$ 8,000
Benefit of net operating loss carryforward recognized	—	(8,000)
Tax provision (benefit)	<u>\$ (4,000)</u>	<u>—</u>

Notice that recognition of an income tax benefit of \$4,000 in the first quarter is based on the expectation of at least a breakeven full year's results. That is, the benefit of the first quarter's loss was deemed more likely than not. Otherwise, no income tax benefit would have been reported in the first quarter.

***Estimated loss for the year.*** When the full year is expected to be profitable, it is irrelevant that one or more interim periods result in a loss, and the expected effective rate for the full year is used to record interim period income tax expense and benefits, as illustrated above. However, when the full year is expected to produce a loss, the computation of the effective annual income tax benefit rate must logically take into account the extent to which a net deferred income tax asset (i.e., the asset less any related valuation allowance) will be recognized at year-end. For the first set of examples, below, assume that the realization of income tax benefits related to net operating loss carryforwards is not entirely more likely than not. That is, the full benefits will be recognized as deferred income tax assets, but those assets will be offset partially or completely by the valuation allowance.

For each of the following examples we will assume that the Gibby Corporation is anticipating a loss of \$150,000 for the fiscal year. The company's general ledger currently reflects a deferred income tax liability of \$30,000; all of the liability will reverse during the fifteen-year carryforward period. Assume future income taxes will be at a 40% rate.

#### Example 1—NOL carryback

Assume that the company can carry back the entire \$150,000 net operating loss to the preceding three years. The income tax potentially refundable by the carryback would (remember this is only an estimate until year-end) amount to \$48,000 (an assumed amount). The effective rate is then 32% (\$48,000/150,000).

<i>Reporting period</i>	<i>Reporting period</i>	<i>Ordinary income (loss)</i>		<i>Tax (benefit) expense</i>	
		<i>Year-to-date</i>	<i>Year-to-date</i>	<i>Less previously provided</i>	<i>Reporting period</i>
1st qtr.	\$ (50,000)	\$ (50,000)	\$ (16,000)	\$ —	\$ (16,000)
2nd qtr.	20,000	(30,000)	(9,600)	(16,000)	6,400
3rd qtr.	(70,000)	(100,000)	(32,000)	(9,600)	(22,400)
4th qtr.	(50,000)	(150,000)	(48,000)	(32,000)	(16,400)
Fiscal year	<u>\$ (150,000)</u>				<u>\$ (48,000)</u>

Note that both the income tax expense (2nd quarter) and benefit are computed using the estimated annual effective rate. This rate is applied to the year-to-date numbers just as in the previous examples, with any adjustment being made and realized in the current reporting period. This treatment is appropriate because the accrual of income tax benefits in the first, third, and fourth quarters is consistent

with the effective rate estimated at the beginning of the year, in contrast to those circumstances in which a change in estimate is made in a quarter relating to the realizability of income tax benefits not previously provided (or benefits for which full or partial valuation allowances were required).

### Example 2—NOL carryback

In this case assume that Gibby Corporation can carry back only \$50,000 of the loss and that the remainder must be carried forward. Realization of future taxable income to fully utilize the net operating loss is not deemed to be more likely than not. The estimated carryback of \$50,000 would generate an income tax refund of \$12,000 (again assumed). The company is assumed to be in the 40% tax bracket (a flat rate is used to simplify the example). Although the benefit of the net operating loss carryforward is recognized, a valuation allowance must be provided to the extent that it is more likely than not that the benefit will not be realized. In this example, management has concluded that only 25% of the gross benefit will be realized in future years. Accordingly, a valuation allowance of \$30,000 must be established, leaving a net of \$10,000 as an estimated realizable income tax benefit related to the carryforward of the projected loss.

$$\begin{aligned} \$150,000 \text{ loss} - \$50,000 \text{ carried back} &= \$100,000 \text{ net operating loss} \times 40\% \text{ tax rate} = \\ \$40,000 \text{ benefit} \times 75\% \text{ portion deemed unrealizable} &= \$30,000 \text{ valuation allowance} \end{aligned}$$

Considered in conjunction with the carryback refund of \$12,000, the company will obtain a \$22,000 income tax benefit relating to the projected current year loss, for an effective income tax benefit rate of 14.7%. The calculation of the estimated annual effective rate is as follows:

Expected annual net loss		\$150,000
Tax benefit from net operating loss carryback		\$12,000
Tax benefit of net operating loss carryforward		
(\$100,000 × 40%)		\$40,000
Valuation allowance		(30,000)    10,000
Total recognized benefit		\$22,000
Estimated annual effective rate (\$22,000 ÷ \$150,000)		<u>14.7%</u>

Reporting period	Reporting period	Year-to-date	Ordinary income (loss)		Tax (benefit) expense		
			Computed	Limited to	Less previously provided	Reporting period	
1st qtr.	\$ 10,000	\$ 10,000	\$ 1,470	\$ —	\$ —	\$ 1,470	
2nd qtr.	(80,000)	(70,000)	(10,290)	—	1,470	(11,760)	
3rd qtr.	(100,000)	(170,000)	(24,990)	(22,000)	(10,290)	(11,710)	
4th qtr.	20,000	(150,000)	(22,000)	—	(22,000)	—	
Fiscal year	<u>\$(150,000)</u>					<u>\$(22,000)</u>	

In the foregoing, the income tax expense (benefit) is computed by multiplying the year-to-date income or loss by the estimated annual effective rate, and then subtracting the amount of tax expense or benefit already provided in prior interim periods. It makes no difference if the current period indicates an income or a loss, assuming of course that the full-year estimated results are not being revised. However, if the cumulative loss for the interim periods to date exceeds the projected loss for the full year upon which the effective income tax benefit rate had been based, then no further tax benefits can be recorded, as is illustrated above in the benefit for the third quarter.

The foregoing examples cover most of the situations encountered in practice. The reader is referred to ASC 740-270-55 for additional examples.

**Operating loss occurring during an interim period.** An instance may occur in which the company expects net income for the year and incurs a net loss during one of the reporting periods. In this situation, the estimated annual effective rate, which was calculated based upon the expected net income figure, is applied to the year-to-date income or loss to arrive at year-to-date income tax expense. The amount previously provided is subtracted from the year-to-date expense to arrive at the expense for the current reporting period. If the current period operations resulted in a loss, then the period will reflect an income tax benefit.

#### Income tax provision applicable to interim period nonoperating items

**Unusual or infrequent items.** The financial statement presentation of these items and their related income tax effects are prescribed by ASC 740. Discontinued operations are to be shown net of their related income tax effects. Unusual or infrequently occurring items are separately disclosed as a component of pretax income, and the income tax expense or benefit is included in the income tax expense from continuing operations. Presenting these items net of tax is strictly prohibited.

The interim treatment accorded these items does not differ from the fiscal year-end reporting required by GAAP. However, according to ASC 270, these items are not to be included in the computation of the estimated effective annual income tax rate. The opinion also requires that these items be recognized in the interim period in which they occur rather than being prorated equally throughout the year. Examples of the treatment prescribed by the opinion follow later in this section.

Recognition of the income tax effects of a loss due to any of the aforementioned situations is permitted if the benefits are expected to be realized during the year, or if they will be recognizable as a deferred income tax asset at year-end under the provisions of ASC 740.

If a situation arises where realization is not more likely than not in the period of occurrence but becomes assured in a subsequent period in the same fiscal year, the previously unrecognized income tax benefit is reported in income from continuing operations until it reduces the income tax expense to zero, with any excess reported in those other categories of income (e.g., discontinued operations) which provided a means of realization of the tax benefit.

The following examples illustrate the treatment required for reporting unusual or infrequently occurring items. Again, these items are not to be used in calculating the estimated annual tax rate. For income statement presentation, the income tax expense or benefit relating to unusual or infrequently occurring items is to be included with ordinary income from continuing operations.

The following data apply to the next two examples:

1. Irwin Industries expects fiscal year ending June 30, 20X2 income to be \$96,000 and net permanent differences to reduce taxable income by \$25,500.
2. Irwin Industries also incurred a \$30,000 unusual or infrequent loss in the second quarter of the year.

#### Example 1—Unusual or infrequent items

In this case, assume that the loss can be carried back to prior periods and, therefore, the realization of any income tax benefit is assured. Based on the information given earlier, the estimated annual effective income tax rate can be calculated as follows:

Expected pretax accounting income	\$ 96,000
Anticipated permanent differences	<u>(25,000)</u>
Expected taxable income	<u>\$ 70,000</u>

### Income Tax Calculation “Excluding” Unusual or Infrequent Item

$$\begin{array}{r}
 \$ 50,000 \quad \times \quad .15 = \quad \$ 7,500 \\
 \underline{20,500} \quad \times \quad .25 = \quad \underline{\underline{5,125}} \\
 \$ \underline{\underline{70,500}} \qquad \qquad \qquad \$ \underline{\underline{12,625}}
 \end{array}$$

**Effective annual rate** = 13.15% ( $\$12,625 \div 96,000$ )

No adjustment in the estimated annual effective rate is required when the unusual or infrequent item occurs. The income tax (benefit) applicable to the item is computed using the estimated fiscal year ordinary income and an analysis of the incremental impact of the unusual or infrequent item. The method illustrated below is applicable when the company anticipates operating income for the year. When a loss is anticipated but realization of benefits of net operating loss carryforwards is not more likely than not, the company computes its estimated annual effective rate based on the amount of tax to be refunded from prior years. The income tax (benefit) applicable to the unusual or infrequent item is then the decrease (increase) in the refund to be received.

Computation of the income tax applicable to the unusual or infrequent item is as follows:

Estimated pretax accounting income	\$ 96,000
Permanent differences	(25,500)
Unusual or infrequent item	<u>(30,000)</u>
Expected taxable income	<u><u>\$ 40,500</u></u>

### Income Tax Calculation “Including” Unusual or Infrequent Item

$$\underline{\underline{\$40,500}} \times .15 = \underline{\underline{\$6,075}}$$

Income tax “excluding” unusual or infrequent item	\$12,625
Income tax “including” unusual or infrequent item	<u>6,075</u>
Income tax benefit applicable to unusual or infrequent item	<u><u>\$ 6,550</u></u>

<u>Reporting period</u>	<u>Ordinary income (loss)</u>	<u>Unusual or infrequent item</u>	<u>Income tax (benefit) applicable to</u>				
			<u>Reporting period</u>	<u>Year-to-date</u>	<u>Year-to-date</u>	<u>Previously provided</u>	<u>Reporting period</u>
1st qtr.	\$10,000	\$ —	\$ 1,315	\$ 1,315	\$ —	\$ —	\$ —
2nd qtr.	(20,000)	(30,000)	(2,630)	(1,315)	(6,550)	—	(6,550)
3rd qtr.	40,000	—	5,260	3,945	(6,550)	(6,550)	—
4th qtr.	66,000	—	8,680	12,625	(6,550)	(6,550)	—
Fiscal year	<u><u>\$96,000</u></u>	<u><u>\$(30,000)</u></u>	<u><u>\$12,625</u></u>				<u><u>\$(6,550)</u></u>

**Example 2—Unusual or infrequent items**

Again, assume that Irwin Industries estimates net income of \$96,000 for the year with permanent differences of \$25,500 which reduce taxable income. The unusual loss of \$30,000 cannot be carried back and the ability to carry it forward is not more likely than not. Because no net deferred income tax assets exist, the only way that the loss can be deemed to be realizable is to the extent that current year ordinary income offsets the effect of the loss. As a result, realization of the loss is assured only as, and to the extent that, there is ordinary income for the year.

<u>Reporting period</u>	<u>Income tax (benefit) applicable to</u>						<u>Reporting period</u>	
	<u>Ordinary income (loss)</u>	<u>Unusual or infrequent item</u>	<u>Ordinary income (loss)</u>		<u>Unusual or infrequent item</u>			
			<u>Reporting period</u>	<u>Year-to-date</u>	<u>Year-to-date</u>	<u>Previously provided</u>		
1st qtr.	\$ 5,000	\$ —	\$ 658	\$ 658	\$ —	\$ —	\$ —	
2nd qtr.	20,000	(30,000)	2,630	3,288	(3,288) <sup>a</sup>	—	(3,288)	
3rd qtr.	(10,000)	—	(1,315)	1,973	(1,973) <sup>a</sup>	(3,288)	1,315	
4th qtr.	<u>81,000</u>	<u>—</u>	<u>10,652</u>	<u>12,625</u>	<u>(6,550)<sup>a</sup></u>	<u>(1,973)</u>	<u>(4,577)</u>	
Fiscal year	<u><u>\$96,000</u></u>	<u><u>\$(30,000)</u></u>	<u><u>\$12,625</u></u>				<u><u>\$(6,550)</u></u>	

<sup>a</sup> The recognition of the income tax benefit to be realized relative to the unusual or infrequent item is limited to the lesser of the total income tax benefit applicable to the item or the amount available to be realized. Because realization is based upon the amount of income tax applicable to ordinary income during the period, the year-to-date figures for the income tax benefit fluctuate as the year-to-date income tax expense relative to ordinary income fluctuates. Note that at no point does the amount of the income tax benefit exceed what was calculated above as being applicable to the unusual or infrequent item.

**Discontinued operations in interim periods.** Discontinued operations, according to ASC 270, are included as significant, unusual items. Therefore, the computations described for unusual or infrequent items will also apply to the income (loss) from the discontinued operation of the entity, including any provisions for operating gains (losses) subsequent to the measurement date.

If the decision to dispose of operations occurs in any interim period other than the first interim period, the operating income (loss) applicable to the discontinued operation has already been used in computing the estimated annual effective tax rate. Therefore, a recomputation of the total tax is not required. However, the total tax is to be divided into two components:

1. That tax applicable to ordinary income (loss)
2. That tax applicable to the income (loss) from the discontinued operation.

This division is accomplished as follows: a revised estimated annual effective rate is calculated for the income (loss) from ordinary operations. This recomputation is then applied to the ordinary income (loss) from the preceding periods. The total income tax applicable to the discontinued operation is then composed of two items:

1. The difference between the total income tax originally computed and the income tax recomputed on remaining ordinary income
2. The income tax computed on unusual, infrequent items as described above.

**Example—Discontinued operations**

Rochelle Corporation anticipates net income of \$150,000 during the fiscal year. The net permanent differences for the year will be \$10,000. The company also anticipates income tax credits of \$10,000 during the fiscal year. For purposes of this example, we will assume a flat statutory rate of 50%. The estimated annual effective rate is then calculated as follows:

Estimated pretax income	\$150,000
Net permanent differences	<u>(10,000)</u>
Taxable income	140,000
Statutory rate	<u>50%</u>
Income tax	70,000
Anticipated credits	<u>(10,000)</u>
Total estimated income tax	\$ <u>60,000</u>
Estimated effective rate (\$60,000 ÷ 150,000)	<u><u>40%</u></u>

The first two quarters of operations were as follows:

<i>Ordinary income (loss)</i>				<i>Tax expense</i>	
<i>Reporting period</i>	<i>Reporting period</i>	<i>Year-to-date</i>	<i>Year-to-date</i>	<i>Less previously provided</i>	<i>Reporting period</i>
1st qtr.	\$30,000	\$30,000	\$12,000	\$ —	\$12,000
2nd qtr.	25,000	55,000	22,000	12,000	10,000

In the third quarter, Rochelle made the decision to dispose of Division X. During the third quarter, the company earned a total of \$60,000. Upon reclassification of Division X's property and equipment to "held-for-sale" on its statement of financial position, the company expects to incur a one-time charge to income of \$75,000 and estimates that current year divisional operating losses subsequent to the disposal decision will be \$20,000, all of which will be incurred in the third quarter. The company estimates revised ordinary income in the fourth quarter to be \$35,000. The two components of pretax accounting income (discontinued operations and revised ordinary income) are shown below.

<i>Reporting period</i>	<i>Revised ordinary income</i>	<i>Loss from operations</i>	<i>Division X Asset reclassification</i>
1st qtr.	\$ 40,000	\$(10,000)	\$ —
2nd qtr.	40,000	(15,000)	—
3rd qtr.	80,000	(20,000)	(75,000)
4th qtr.	<u>35,000</u>	<u>—</u>	<u>—</u>
Fiscal year	<u><u>\$195,000</u></u>	<u><u>\$(45,000)</u></u>	<u><u>\$(75,000)</u></u>

Rochelle must now recompute the estimated annual income tax rate. Assume that all the permanent differences are related to the revised continuing operations. However, \$3,300 of the tax credits were applicable to machinery used in Division X. Because of the discontinuance of operations, the credit on this machinery would not be allowed. Any recapture of prior period credits must be used as a reduction in the income tax benefit from either operations or the loss on disposal. Assume that the company must recapture \$2,000 of the \$3,300 investment tax credit that is related to Division X.

The recomputed estimated annual rate for continuing operations is as follows:

Estimated (revised) ordinary income	\$ 195,000
Less net permanent differences	(10,000)
	\$ 185,000
Tax at statutory rate of 50%	\$ 92,500
Less anticipated credits from continuing operations	(6,700)
Tax provision	\$ 85,800
Estimated annual effective tax rate (\$85,800 ÷ 195,000)	<u>44%</u>

The next step is to then apply the revised rate to the quarterly income from continuing operations as illustrated below.

<i>Reporting period</i>	<i>Reporting period</i>	<i>Year-to-date</i>	<i>Estimated annual effective rate</i>	<i>Year-to-date</i>	<i>Tax provision</i> <i>Less previously provided</i>	<i>Reporting period</i>
1st qtr.	\$ 40,000	\$ 40,000	44%	\$17,600	\$ —	\$17,600
2nd qtr.	40,000	80,000	44%	35,200	17,600	17,600
3rd qtr.	80,000	160,000	44%	70,400	35,200	35,200
4th qtr.	<u>35,000</u>	195,000	44%	85,800	70,400	<u>15,400</u>
Fiscal year	<u>\$195,000</u>					<u>\$85,800</u>

The tax benefit applicable to the operating loss from discontinued operations and the loss from the asset reclassification and remeasurement must now be calculated. The first two quarters are calculated on a differential basis as shown below.

<i>Reporting period</i>	<i>Tax applicable to ordinary income</i> <i>Previously reported</i>	<i>Recomputed</i> <i>(above)</i>	<i>Tax (benefit) expense applicable to Division X</i>
1st qtr.	\$12,000	\$17,600	\$ (5,600)
2nd qtr.	10,000	17,600	(7,600)
			<u>\$ (13,200)</u>

The only calculation remaining applies to the third quarter tax benefit pertaining to the operating loss and the loss on reclassification of the assets of the discontinued operation. The calculation of this amount is made based on the revised estimate of annual ordinary income both including and excluding the effects of the Division X losses. This is shown below:

	<i>Loss from operations of Division X</i>	<i>Asset reclassification</i>
Estimated annual income from continuing operations	\$195,000	\$195,000
Net permanent differences	(10,000)	(10,000)
Loss from Division X operations	(45,000)	—
Provision for loss on reclassification of Division X assets	—	<u>(75,000)</u>
Total	\$140,000	\$110,000

	<i>Loss from operations of Division X</i>	<i>Asset reclassification</i>
Tax at the statutory rate of 50%	\$ 70,000	\$ 55,000
Anticipated credits (from continuing operations)	(6,700)	(6,700)
Recapture of previously recognized tax credits as a result of disposal	<u>—</u>	<u>2,000</u>
Taxes after effect of Division X losses	63,300	50,300
Taxes computed on estimated income before the effect of Division X losses	<u>85,000</u>	<u>85,800</u>
Tax benefit applicable to Division X	(22,500)	(35,500)
Amounts allocable to quarters one and two	(13,200)	<u>—</u>
(\$5,600 + \$7,600)		
Tax benefit to be recognized in the third quarter	\$ <u>(9,300)</u>	\$ <u>(35,500)</u>

The quarterly tax provisions can be summarized as follows:

<i>Reporting period</i>	<i>Pretax income (loss)</i>			<i>Tax (benefit) applicable to Operations</i>		
	<i>Continuing operations</i>	<i>of Division X</i>	<i>Loss on asset reclassification</i>	<i>Continuing operations</i>	<i>of Division X</i>	<i>Loss on asset reclassification</i>
1st qtr.	\$ 40,000	\$ (10,000)	\$ —	\$ 17,600	\$ (5,600)	\$ —
2nd qtr.	40,000	(15,000)	—	17,600	(7,600)	—
3rd qtr.	80,000	(20,000)	(75,000)	35,200	(9,300)	(35,500)
4th qtr.	35,000	—	—	15,400	—	—
Fiscal year	<u>\$195,000</u>	<u>\$(45,000)</u>	<u>\$(75,000)</u>	<u>\$85,800</u>	<u>\$(22,500)</u>	<u>\$(35,500)</u>

The following income statement shows the proper financial statement presentation of these discontinued operations. The notes to the statement indicate which items are to be included in the calculation of the annual estimated rate.

<b>Income Statement (ASC 740-270-55)</b>		
Net sales*		\$xxxx
Other income*		xxx
		xxxx
Costs and expenses		
Cost of sales*		\$xxxx

## PERSPECTIVE AND ISSUES

---

### Subtopics

ASC 805, *Business Combinations*, consists of six subtopics:

- ASC 805-10, *Overall*, which provides guidance on transactions accounted for under the acquisition method
- ASC 852-20, *Identifiable Assets and Liabilities, and Any Noncontrolling Interest*, which deals with specific aspects of the acquisition method
- ASC 805-30, *Goodwill or Gain from Bargain Purchase, Including Consideration Transferred*, which, like ASC 805-20, deals with specific aspects of the acquisition method
- ASC 805-40, *Reverse Acquisitions*, which provides guidance on business combinations that are reverse acquisitions
- ASC 805-50, *Related Issues*, which offers guidance on two items that are similar, but not the same, as a business combination: acquisition of assets and transactions between entities under common control
- ASC 805-740, *Income Taxes*, which provides “incremental guidance” on business combinations and on acquisitions by a not-for-profit entity.

### Technical Alerts

**ASU 2015-16.** In September 2015, as part of its simplification initiative, the FASB issued ASU 2015-16, *Business Combinations (Topic 805): Simplifying the Accounting for Measurement-Period Adjustments*.<sup>1</sup>

**Guidance.** The FASB came to the conclusion that the requirement to retrospectively apply adjustments made to provisional amounts recognized in a business combination adds cost and complexity to financial reporting without significantly improving the usefulness of the information provided to users. Therefore, ASU 2015-16 eliminates the requirement for an acquirer in a business combination to account for measurement-period adjustments retrospectively. The new guidance requires acquirers to recognize the cumulative impact of measurement-period adjustments in the measurement period in which the adjustments are identified, including the cumulative effect on earnings of any amounts they would have recorded in previous periods if the accounting had been completed at the acquisition date.

**Implementation.** ASU 2015-16 is effective:

- For public business entities for fiscal years beginning after December 15, 2015, and interim periods within those fiscal years.
- For all other entities for fiscal years beginning after December 15, 2016, and interim periods within fiscal years beginning after December 15, 2017.
- Early adoption is permitted for any interim and annual financial statements that have not yet been made available for issuance.

The ASU should be applied prospectively to adjustments to provisional amounts that occur after the effective date. So, entities can apply the ASU to open measurement periods, regardless of the acquisition date.

---

<sup>1</sup> See the section in this chapter on Measurement Period for background information on measurement-period adjustments. The guidance in ASU 2015-16 is reflected in that section.

**ASU 2016-03.** In March 2016, the FASB issued a consensus of its Private Company Council, ASU 2016-03, *Intangibles—Goodwill and Other (Topic 350), Business Combinations (Topic 805), Consolidation (Topic 810), Derivatives and Hedging (Topic 815); Effective Date and Transition Guidance (a consensus of the Private Company Council)*. The ASU relates to several private company alternative updates issued previously through the private company initiative:

- Update 2014-02, *Intangibles—Goodwill and Other (Topic 350): Accounting for Goodwill*
- Update 2014-03, *Derivatives and Hedging (Topic 815): Accounting for Certain Receivable-Variable, Pay-Fixed Interest Rate Swaps—Simplified Hedging Accounting Approach*
- Update 2014-07, *Consolidation (Topic 810): Applying Variable Interest Entities Guidance to Common Control Leasing Arrangements; or*
- Update 2014-18, *Business Combinations (Topic 805): Accounting for Identifiable Intangible Assets in a Business Combination.*

**Guidance.** The amendments in ASU 2016-03 make the guidance in ASUs listed above effective immediately by removing their effective dates. The amendments also include transition provisions that provide that private companies are able to forgo a preferability assessment the first time they elect the accounting alternatives in the ASUs listed. However, any subsequent change to an accounting policy election requires justification that the change is preferable under ASC 250, *Accounting Changes and Error Corrections*. The ASU also extends the transition guidance in the ASUs listed above indefinitely. However, there is no intention to change how transition is applied for those two ASUs.

### Scope and Scope Exceptions

Transactions or other events that meet the definition of a business combination are subject to ASC 805. Excluded from the scope of ASC 805, however, are:

1. Formation of a joint venture.
2. Acquisition of an asset or group of assets that does not represent a business or a nonprofit activity.
3. Combinations between entities, businesses, or nonprofit activities under common control.
4. An acquisition by a not-for-profit entity for which the acquisition date is before December 15, 2009, or a merger of not-for-profit entities (NFPs).
5. An event in which an NFP obtains control of a not-for-profit entity but does not consolidate that entity, as permitted or required by ASC 958-810-25.
6. If an NFP that obtained control in an event in which consolidation was permitted but not required decides in a subsequent annual reporting period to begin consolidating a controlled entity that it initially chose not to consolidate.
7. Financial assets and liabilities of a consolidated VIE that is a collateralized financing entity.

### Overview

Historically, one of the most daunting problems facing accountants has been how to account for the acquisition of one enterprise by another, or other combination of two or more formerly unrelated entities, into one new enterprise.

U.S. GAAP requires the acquisition method of accounting for business combinations. The acquisition method requires that the actual cost of the acquisition be recognized, including any excess over the amounts allocable to the fair value of identifiable net assets, commonly known as goodwill.

The major accounting issues in business combinations and in the preparation and presentation of consolidated or combined financial statements are:

- The proper accounting basis for the assets and liabilities of the combining entities
- The accounting for goodwill or negative goodwill (the gain from a bargain purchase).

The accounting for the assets and liabilities of entities acquired in a business combination is largely dependent on the fair values assigned to them at the transaction date. ASC 820, *Fair Value Measurements*, provides a framework for measuring fair value and important guidance when assigning values as part of a business combination. In essence, it favors valuations determined on the open market, but allows other methodologies if open market valuation is not practicable.

## DEFINITIONS OF TERMS

---

Source: ASC 805. For more definitions related to this topic, see Appendix, *Definition of Terms*: Acquiree, Acquirer, Acquisition by a Not-for-Profit Entity, Beneficial Interests, Business, Business Combination, Conduit Debt Security, Contract Asset, Defensive Intangible Asset, Direct Financing Lease, Dropdown, Fair Value, Financial Statements are Available to be Issued, Financial Statements are Issued, Goodwill, Intangible Asset, Lease, Lease Liability, Lease Payments, Lease Receivable, Lease Term, Lessee, Lessor, Market Participants, Net Investment in the Lease, Noncontrolling Interest, Nonprofit Activity, Not-for-Profit Entity, Operating Lease, Private Company, Public Business Entity, Public Entity, Pushdown Accounting, Right-of-Use Asset, Sales-Type Lease, Securities and Exchange Commission (SEC) Filer, Sublease, Underlying Asset, Unguaranteed Residual Asset, and Variable Interest Entity.

**Acquisition Date.** The date on which control of the acquiree is obtained by the acquirer.

**Collateralized Financing Entity.** A variable interest entity that holds financial assets, issues beneficial interests in those financial assets, and has no more than nominal equity. The beneficial interests have contractual recourse only to the related assets of the collateralized financing entity and are classified as financial liabilities. A collateralized financing entity may hold nonfinancial assets temporarily as a result of default by the debtor on the underlying debt instruments held as assets by the collateralized financing entity or in an effort to restructure the debt instruments held as assets by the collateralized financing entity. A collateralized financing entity also may hold other financial assets and financial liabilities that are incidental to the operations of the collateralized financing entity and have carrying values that approximate fair value (for example, cash, broker receivables, or broker payables).

**Contingency.** An existing condition, situation, or set of circumstances involving uncertainty as to possible gain (gain contingency) or loss (loss contingency) to an entity that will ultimately be resolved when one or more future events occur or fail to occur.

**Contingent Consideration.** Usually an obligation of the acquirer to transfer additional assets or equity interests to the former owners of an acquiree as part of the exchange for control of the acquiree if specified future events occur or conditions are met. However, contingent consideration also may give the acquirer the right to the return of previously transferred consideration if specified conditions are met.

Contingent consideration might also arise when the terms of the business combination provide a requirement that the acquiree's former owners return previously transferred assets or equity interests to the acquirer under certain specified conditions.

**Control.** The same as the meaning of controlling financial interest in paragraph 810-10-15-8: For legal entities other than limited partnerships, the usual condition for a controlling financial interest is ownership of a majority voting interest, and, therefore, as a general rule ownership by one reporting entity, directly or indirectly, of more than 50 percent of the outstanding voting shares of another entity is a condition pointing toward consolidation. The power to control may also exist with a lesser percentage of ownership, for example, by contract, lease, agreement with other stockholders, or by court decree.

**Control of a Not-for-Profit Entity.** See Control.

**Equity Interests.** Used broadly to mean ownership interests of investor-owned entities; owner, member, or participant interests of mutual entities; and owner or member interest in the net assets of not-for-profit entities.

**Identifiable Asset.** Assets (not including financial assets) that lack physical substance. (The term intangible assets is used to refer to intangible assets other than goodwill.)

**Merger of Not-for-Profit Entities.** A transaction or other event in which the governing bodies of two or more not-for-profit entities cede control of those entities to create a new not-for-profit entity.

**Nonfinancial Asset.** An asset that is not a financial asset. Nonfinancial assets include land, buildings, use of facilities or utilities, materials and supplies, intangible assets, or services.

**Owners.** Used broadly to include holders of ownership interests (equity interests) in investor-owned mutual entities, or not-for-profit entities. Owners include shareholders, partners, proprietors, or members, or participants of mutual entities. Owners also include owner and member interests in the net assets of not-for-profit entities.

**Reverse Acquisition.** An acquisition in which the entity that issues securities (the legal acquirer) is identified as the acquiree for financial accounting purposes, based on application of the guidance in ASC 805-10-55-11 through 55-15. The entity whose equity interests are acquired (the legal acquiree) must be the acquirer for accounting purposes in order for the transaction to be considered a reverse acquisition.

**Reverse Spin-off.** A spin-off transaction in which the nominal or legal spinnor is to be accounted for as the spinnee, in order to reflect the economic reality of the spin-off transaction.

## CONCEPTS, RULES, AND EXAMPLES

---

### Transactions and Events Accounted for as Business Combinations

A business combination results from the occurrence of a transaction or other event that results in an acquirer obtaining control of one or more businesses. This can occur in many different ways that include the following examples individually or, in some cases, in combination:

1. Transfer of cash, cash equivalents, or other assets, including the transfer of assets of another business of the acquirer
2. Incurring liabilities
3. Issuance of equity instruments
4. By providing more than one type of consideration
5. By contract alone without the transfer of consideration, such as when:
  - a. An acquiree business repurchases enough of its own shares to cause one of its existing investors (the acquirer) to obtain control over it

- b. There is a lapse of minority veto rights that had previously prevented the acquirer from controlling an acquiree in which it held a majority voting interest
  - c. An acquirer and acquiree contractually agree to combine their businesses without a transfer of consideration between them.
- (ASC 805-10-55-2)

### Qualifying as a Business

ASC 805 provides a definition of a business. Further, it clarifies that the initial consolidation of a VIE that is a business is considered to be a business combination. This effectively provides parity between the accounting for business combinations and any related noncontrolling interests involving voting interest entities and those involving variable interest entities.

A business consists of inputs and processes applied to those inputs that have the ability to create outputs. While outputs are usually present in a business, they are not required to qualify as a business. There simply must be the *ability* to create them.

- An *input* is an economic resource that creates or has the ability to create outputs when one or more processes are applied to it. Examples of inputs include fixed assets, intangible rights to use fixed assets, intellectual property or other intangible assets, and access to markets in which to hire employees or purchase materials.
  - A *process* is a system, protocol, convention, or rule with the ability to create outputs when applied to one or more inputs. Processes are usually documented; however, an organized workforce with the requisite skills and experience may apply processes necessary to create outputs by following established rules and conventions. In evaluating whether an activity is a process, ASC 805 indicates that functions such as accounting, billing, payroll, and other administrative systems do not meet the definition. Thus, processes are the types of activities that an entity engages in to produce the products and/or services that it provides to the marketplace, rather than the internal activities it follows in operating its business.
  - An *output* is simply the by-product resulting from applying processes to inputs. An output provides, or has the ability to provide, the desired return to investors, members, participants, or other owners.
- (ASC 805-10-55-4)

In analyzing a transaction or event to determine whether it is a business combination, it is not necessary that the acquirer retain, postcombination, all of the inputs or processes used by the seller in operating the business. Using the “market participant” approach to analyzing the facts, as defined in ASC 820, if market participants could, for example, acquire the business in an arm’s-length transaction and continue to produce outputs by integrating the business with their own inputs and processes, then that subset of remaining inputs and processes still meets the definition of a business from the standpoint of the acquirer. (ASC 805-10-55-5)

The guidance in ASC 805 provides additional flexibility by providing that it is not necessary that a business have liabilities, although that situation is expected to be rare.

If a business is not producing outputs, the acquirer must determine whether the enterprise constitutes a business by considering whether it:

1. Has started its planned principal activities,
2. Has hired employees,
3. Has obtained intellectual property,
4. Has obtained other inputs,

5. Has implemented processes that could be applied to its inputs,
  6. Is pursuing a plan to produce outputs,
  7. Will have the ability to obtain access to customers that will purchase the outputs.
- (ASC 805-10-55-7)

It is important to note, however, that it is not required that all of these factors be present for a given set of activities and assets to qualify as a business. Again, the relevant question to ask is whether a market participant would be capable of conducting or managing the set of activities and assets as a business irrespective of whether the seller did so or the acquirer intends to do so. (ASC 805-10-55-8)

Finally, ASC 805 provided what it acknowledged was circular logic in asserting that, absent evidence to the contrary, if goodwill is included in a set of assets and activities, it can be presumed to be a business. The circularity arises from the fact that, in order to apply GAAP to determine whether to initially recognize goodwill, the accountant would be required to first determine whether there had, in fact, been an acquisition of a business. Otherwise, it would not be permitted to recognize goodwill. It is not necessary, however, that goodwill be present in order to consider a set of assets and activities to be a business. (ASC 805-10-55-9)

### Techniques for Structuring Business Combinations

A business combination can be structured in a number of different ways that satisfy the acquirer's strategic, operational, legal, tax, and risk management objectives. Some of the more frequently used structures are:

1. One or more businesses become subsidiaries of the acquirer. As subsidiaries, they continue to operate as legal entities.
2. The net assets of one or more businesses are legally merged into the acquirer. In this case, the acquiree entity ceases to exist (in legal vernacular, this is referred to as a *statutory merger* and normally the transaction is subject to approval by a majority of the outstanding voting shares of the acquiree).
3. The owners of the acquiree transfer their equity interests to the acquirer entity or to the owners of the acquirer entity in exchange for equity interests in the acquirer.
4. All of the combining entities transfer their net assets (or their owners transfer their equity interests) into a new entity formed for the purpose of the transaction). This is sometimes referred to as a *roll-up* or put-together transaction.
5. A former owner or group of former owners of one of the combining entities obtains control of the combined entities collectively.
6. An acquirer might hold a noncontrolling equity interest in an entity and subsequently purchase additional equity interests sufficient to give it control over the investee. These transactions are referred to as *step acquisitions* or business combinations achieved in stages.
7. A business owner organizes a partnership, S corporation, or LLC to hold real estate. The real estate is the principal location of the commonly owned business and that business entity leases the real estate from the separate entity.

### Accounting for Business Combinations Under the Acquisition Method

The acquirer accounts for a business combination using the *acquisition method*. This term represents an expansion of the now-outdated term, "purchase method." The change in terminology was made to emphasize that a business combination can occur even when a purchase transaction is not involved.

The following steps are required to apply the acquisition method:

1. Identify the acquirer.
2. Determine the acquisition date.
3. Identify the assets and liabilities, if any, requiring separate accounting because they result from transactions that are not part of the business combination, and account for them in accordance with their nature and the applicable GAAP.
4. Identify assets and liabilities that require acquisition date classification or designation decisions to facilitate application of GAAP in postcombination financial statements and make those classifications or designations based on (a) contractual terms, (b) economic conditions, (c) acquirer operating or accounting policies, and (d) other pertinent conditions existing at the acquisition date.
5. Recognize and measure the identifiable tangible and intangible assets acquired and liabilities assumed.
6. Recognize and measure any noncontrolling interest in the acquiree.
7. Measure the consideration transferred.
8. Recognize and measure goodwill or, if the business combination results in a bargain purchase, recognize a gain.

(ASC 805-10-05-4)

**Step 1—Identify the acquirer.** ASC 805 strongly emphasizes the concept that every business combination has an acquirer. In the “basis for conclusions” that accompanies FASB 141 (R) (the original source of ASC 805), FASB asserted that:

. . . “true mergers” or “mergers of equals” in which none of the combining entities obtain control of the others are so rare as to be virtually nonexistent . . .

The determination of the acquirer is based on application of the provisions of ASC 810 regarding the party that possesses a controlling financial interest in another entity. In general, ASC 810 provides that direct or indirect ownership of a majority of the outstanding voting interests in another entity “. . . is a condition pointing toward consolidation.” However, this is not an absolute rule to be applied in all cases. In fact, ASC 810 explicitly provides that majority owned entities are not to be consolidated if the majority owner does not hold a controlling financial interest in the entity. Exceptions to the general majority ownership rule include, but are not limited to, the following situations:

1. An entity that is in legal reorganization or bankruptcy
2. An entity subject to uncertainties due to government-imposed restrictions, such as foreign exchange restrictions or controls, whose severity casts doubt on the majority interest owner’s ability to control the entity
3. Is a broker dealer within the scope of ASC 940 and control is likely to be temporary.
4. If the power of the majority voting interest shareholder is restricted by rights given to the noncontrolling shareholder (noncontrolling rights) and are so restrictive that it is questionable whether control exists with majority owners. (ASC 810-10-15-10)
5. If the acquiree is a variable interest entity (VIE), the primary beneficiary of the VIE is always considered to be the acquirer.

If applying the guidance in ASC 810 does not clearly indicate the party that is the acquirer, ASC 805-10-55-10 through 15 provides factors to consider in making that determination under different facts and circumstances:

1. *Relative size*—Generally, the acquirer is the entity whose relative size is significantly larger than that of the other entity or entities. Size can be compared by using measures such as assets, revenues, or net income. (ASC 805-10-55-13)
  2. *Initiator of the transaction*—When more than two entities are involved, another factor to consider (beside relative size) is which of the entities initiated the transaction. (ASC 805-10-55-14)
  3. *Roll-ups or put-together transactions*—When a new entity is formed to issue equity interests to effect a business combination, one of the preexisting entities is to be identified as the acquirer. If, instead, a newly formed entity transfers cash or other assets, or incurs liabilities as consideration to effect a business combination, that new entity may be considered to be the acquirer. (ASC 805-10-55-15)
  4. *Nonequity consideration*—In business combinations accomplished primarily by the transfer of cash or other assets, or by incurring liabilities, the entity that transfers the cash or other assets, or incurs the liabilities is usually the acquirer. (ASC 805-10-55-11)
  5. *Exchange of equity interests*—In business combinations accomplished primarily by the exchange of equity interests, the entity that issues its equity interests is generally considered to be the acquirer. One notable exception that occurs frequently in practice is sometimes referred to as a reverse acquisition, discussed in detail later in this chapter. In a reverse acquisition, the entity issuing equity interests is legally the acquirer, but for accounting purposes is considered the acquiree. There are, however, other factors that should be considered in identifying the acquirer when equity interests are exchanged. These include:
    - a. *Relative voting rights in the combined entity after the business combination*—Generally, the acquirer is the entity whose owners, as a group, retain or obtain the largest portion of the voting rights in the consolidated entity. This determination must take into consideration the existence of any unusual or special voting arrangements as well as any options, warrants, or convertible securities.
    - b. *The existence of a large minority voting interest in the combined entity in the event no other owner or organized group of owners possesses a significant voting interest*—Generally, the acquirer is the entity whose owner or organized group of owners holds the largest minority voting interest in the combined entity.
    - c. *The composition of the governing body of the combined entity*—Generally, the acquirer is the entity whose owners have the ability to elect, appoint, or remove a majority of members of the governing body of the combined entity.
    - d. *The composition of the senior management of the combined entity*—Generally the acquirer is the entity whose former management dominates the management of the combined entity.
    - e. *Terms of the equity exchange*—Generally, the acquirer is the entity that pays a premium over the precombination fair value of the equity interests of the other entity or entities.
- (ASC 805-10-55-12)

**Step 2—Determine the acquisition date.** By definition, the acquisition date is that on which the acquirer obtains control of the acquiree. As discussed in the chapter on ASC 810, this concept of control (or, more precisely, controlling financial interest) is not always evidenced by voting ownership. Thus, control can be obtained contractually by an acquirer absent that party holding any voting ownership interests.

The general rule is that the acquisition date is the date on which the acquirer legally transfers consideration, acquires the assets, and assumes the liabilities of the acquiree. This date, in a relatively straightforward transaction, is referred to as the *closing date*. Not all transactions are that straightforward, however. All pertinent facts and circumstances are to be considered in determining the acquisition date. The parties to a business combination might, for example, execute a contract that entitles the acquirer to the rights and obligates the acquirer with respect to the obligations of the acquiree prior to the actual date of the closing. Thus, in evaluating economic substance over legal form, the acquirer will have contractually acquired the target on the date it executed the contract. (ASC 805-10-25-7)

Guidance on the measurement period, which is relevant to the steps that follow, is described and illustrated below.

**Measurement period.** More frequently than not, management of the acquirer does not obtain all of the relevant information needed to complete the acquisition-date measurements in time for the issuance of the first set of interim or annual financial statements subsequent to the business combination. If the initial accounting for the business combination has not been completed by that time, the acquirer should report provisional amounts in the consolidated financial statements for any items for which the accounting is incomplete. ASC 805 provides for a “measurement period” of a reasonable time not to exceed one year. During the measurement period, any adjustments to the provisional amounts recognized at the acquisition date are to be adjusted to reflect new information that management obtains regarding facts and circumstances existing as of the acquisition date that, if known, would have affected the measurement of the asset recognized. (ASC 805-10-25-13 and 25-14) Any adjustments to provisional amounts should have a corresponding adjustment to goodwill. (ASC 805-10-25-17) Information that has a bearing on this determination must not relate to postacquisition events or circumstances. The information is to be analyzed to determine whether, if it had been known at the acquisition date, it would have affected the measurement of the amounts recognized as of that date.

In evaluating whether new information obtained meets the criteria for adjusting provisional amounts, management of the acquirer must consider all relevant factors. Relevant factors include:

1. The timing of the receipt of the additional information, *and*
2. Whether management of the acquirer can identify a reason that a change is warranted to the provisional amounts.

(ASC 805-10-30-8)

Obviously, information received shortly after the acquisition date has a higher likelihood of relevance to acquisition-date circumstances than information received months later. (ASC 805-10-30-3)

#### Example of consideration of new information obtained during the measurement period

Krupp Industries, Inc. (KI) acquired Miller Motor Works Corp. (MMW) on January 2, 2012. In the first quarter 2012 consolidated financial statements of Krupp Industries and Subsidiary, it assigned a provisional fair value of \$40 million to an asset group consisting of a factory and related machinery that manufactures engines used in large trucks and sport utility vehicles (SUVs).

As of the acquisition date, the average cost of gasoline in the markets served by the customers of MMW was \$4.30 per gallon. For the first four months subsequent to the acquisition, the per-gallon price of gasoline was relatively stable and only fluctuated slightly up or down on any given day. Upon further analysis, management was able to determine that during that four-month period, the production levels of the asset group and related order backlog did not vary substantially from the acquisition date.

In May 2012, however, due to an accident on May 3, 2012, at a large U.S. refinery, the average cost per gallon skyrocketed to more than \$6.00 a gallon. As a result of this huge spike in the price of fuel, MMW's largest customers either canceled orders or sharply curtailed the number of engines they had previously ordered.

**Scenario 1:** On April 15, 2012, management of KI signed a sales agreement with Joshua International (JI) to sell the asset group for \$30 million. Given the fact that management was unable to identify any changes that occurred during the measurement period that would have accounted for a change in the acquisition-date fair value of the asset group, management determines that it will retrospectively reduce the provisional fair value assigned to the asset group to \$30 million.

**Scenario 2:** On May 15, 2012, management of KI signed a sales agreement with Joshua International (JI) to sell the asset group for \$30 million. Given the intervening events that affected the price of fuel and the demand for MMW's products, management determines that the \$10 million decline in the fair value of the asset group from the provisional fair value it was originally assigned resulted from those intervening changes and, consequently, does not adjust the provisional fair value assigned to the asset group at the acquisition date.

In addition to adjustments to provisional amounts recognized, the acquirer may determine during the measurement period that it omitted recognition of additional assets or liabilities that existed at the acquisition date. During the measurement period, any such assets or liabilities identified are also to be recognized and measured as if the accounting had been complete at the acquisition date. (ASC 805-10-25-17)

In determining adjustments to the provisional amounts assigned to assets and liabilities, management should be alert for interrelationships between recognized assets and liabilities. For example, new information that management obtains that results in an adjustment to the provisional amount assigned to a liability for which the acquiree carries insurance could also result in an adjustment, in whole or in part, to a provisional amount recognized as an asset representing the claim receivable from the insurance carrier. (ASC 805-10-25-16) In addition, changes in provisional amounts assigned to assets and liabilities frequently will also affect temporary differences between the items' income tax basis and GAAP carrying amount, which in turn will affect the computation of deferred income assets and liabilities.

Adjustments to the provisional amounts that are made during the measurement period are recognized as if the accounting for the business combination had actually been completed as of the acquisition date. This will result in the revision of comparative information included in the financial statements for prior periods including any necessary adjustments to depreciation, amortization, or other effects on net income or other comprehensive income related to the adjustments.

The measurement period ends on the *earlier* of:

1. The date management of the acquirer receives the information it seeks regarding facts and circumstances as they existed at the acquisition date or learns that it will be unable to obtain any additional information, *or*
2. One year after the acquisition date.

After the end of the measurement period, the only revisions that are permitted to be made to the initial acquisition date accounting for the business combination are restatements for corrections of prior period errors in accordance with ASC 250, *Accounting Changes and Error Corrections*.

**Step 3—Identify assets and liabilities requiring separate accounting.** ASC 805 provides a basic recognition principle that, as of the acquisition date, the acquirer is to recognize, separately from goodwill, the identifiable assets acquired (whether tangible or intangible), the liabilities assumed, and, if applicable, any noncontrolling interest (previously referred to as "minority interest") in the acquiree.

In applying the recognition principle to a business combination, the acquirer may recognize assets and liabilities that had not been recognized by the acquiree in its precombination financial statements. ASC 805 continues to permit recognition of acquired intangibles (e.g., patents, customer lists) that would not be granted recognition if they were internally developed.

ASC 805 elaborates on the basic principle by providing that recognition is subject to the following conditions:

1. At the acquisition date, the identifiable assets acquired and liabilities assumed must meet the definitions of assets and liabilities as set forth in CON 6.<sup>2</sup> (ASC 805-20-25-2)
2. The assets and liabilities recognized must be part of the exchange transaction between the acquirer and the acquiree (or the acquiree's former owners) and not part of a separate transaction or transactions. (ASC 805-20-25-3)

**Restructuring or exit activities.** Frequently, in a business combination, the acquirer's plans include the future exit of one or more of the activities of the acquiree or the termination or relocation of employees of the acquiree. Since these exit activities are discretionary on the part of the acquirer and the acquirer is not obligated to incur the associated costs, the costs do not meet the definition of a liability and are not recognized at the acquisition date. Rather, the costs will be recognized in postcombination financial statements in accordance with ASC 420.

**Boundaries of the exchange transaction.** Preexisting relationships and arrangements often exist between the acquirer and acquiree prior to beginning negotiations to enter into a business combination. Furthermore, while conducting the negotiations, the parties may enter into separate business arrangements. In either case, the acquirer is responsible for identifying amounts that are not part of the exchange for the acquiree. Recognition under the acquisition method is only given to the consideration transferred for the acquiree and the assets acquired and liabilities assumed in exchange for that consideration. Other transactions outside the scope of the business combination are to be recognized by applying other relevant GAAP.

The acquirer is to analyze the business combination transaction and other transactions with the acquiree and its former owners to identify the components that comprise the transaction in which the acquirer obtained control over the acquiree. This distinction is important to ensure that each component is accounted for according to its economic substance, irrespective of its legal form.

The imposition of this condition was based on an observation that, upon becoming involved in negotiations for a business combination, the parties may exhibit characteristics of related parties. In so doing, they may be willing to execute agreements designed *primarily* for the benefit of the acquirer or the combined entity that might be designed to achieve a desired financial reporting outcome after the business combination has been consummated. Thus, the imposition of this condition is expected to curb such abuses.

In analyzing a transaction to determine inclusion or exclusion from a business combination, consideration should be given to which of the parties will reap its benefits. If a precombination transaction is entered into by the acquirer, or on behalf of the acquirer, or *primarily* to benefit the acquirer (or to benefit the to-be-combined entity as a whole) rather than for the benefit of the acquiree or its former owners, the transaction most likely would be considered to be a "separate

---

<sup>2</sup> Assets are defined as "probable future economic benefits obtained or controlled by a particular entity as a result of past transactions or events." (CON 6, para. 25) Liabilities are defined as "probable future sacrifices of economic benefits arising from present obligations of a particular entity to transfer assets or provide services to other entities in the future as a result of past transactions or events." (CON 6, para. 35)

transaction” outside the boundaries of the business combination and for which the acquisition method would not apply.

The acquirer should consider the following factors, which FASB indicates “are neither mutually exclusive nor individually conclusive,” in determining whether a transaction is a part of the exchange transaction or recognized separately:

1. *Purpose of the transaction*—Typically, there are many parties involved in the management, ownership, operation, and financing of the various entities involved in a business combination transaction. Of course, there are the acquirer and acquiree entities, but there are also owners, directors, management, and various parties acting as agents representing their respective interests. Understanding the motivations of the parties in entering into a particular transaction potentially provides insight into whether or not the transaction is a part of the business combination or a separate transaction.
2. *Initiator of the transaction*—Identifying the party that initiated the transaction may provide insight into whether or not it should be recognized separately from the business combination. FASB believes that if the transaction was initiated by the acquirer, it would be less likely to be part of the business combination and, conversely, if it were initiated by the acquiree or its former owners, it would be more likely to be part of the business combination.
3. *Timing of the transaction*—Examining the timing of the transaction may provide insight into whether, for example, the transaction was executed in contemplation of the future business combination in order to provide benefits to the acquirer or the postcombination entity. FASB believes that transactions that take place during the negotiation of the terms of a business combination may be entered into in contemplation of the eventual combination for the purpose of providing future economic benefits *primarily* to the acquirer of the to-be-combined entity and, therefore, should be accounted for separately.

(ASC 805-10-55-18)

ASC 805 provides the following presumption after analyzing the economic benefits of a precombination transaction:

<u>Primarily for the benefit of</u>	<u>Transaction is likely to be</u>
Acquirer or combined entity	Separate transaction
Acquiree or its former owners	Part of the business combination

ASC 805 provides three examples of separate transactions that *are not* to be included in applying the acquisition method, each of which will be discussed in further detail:

1. Reimbursement to the acquiree or its former owners for paying the acquirer’s acquisition-related costs,
2. A settlement of a preexisting relationship between acquirer and acquiree, and
3. Compensation to employees or former owners of the acquiree for future services.

*Acquisition-related costs.* Acquisition-related costs are charged to expense of the period in which the costs are incurred and the related services received. Examples of these costs include:

Accounting fees	Internal acquisitions department
Advisory fees	Legal fees
Consulting fees	Other professional fees
Finder’s fees	Valuation fees

ASC 805 makes an exception to the general rule with respect to costs to register and issue equity or debt securities. These costs are to be recognized in accordance with other applicable GAAP. Stock issuance costs are normally charged against the gross proceeds of the issuance. Debt issuance costs are, under CON 6, either to be treated as a reduction of the amount borrowed or treated as an expense of the period in which they are incurred; however, some reporting entities have treated these costs as deferred charges and amortized them to income during the term of the debt.

*Settlements of preexisting relationships between acquirer and acquiree.* Prior to pursuing a business combination, business may have been transacted between the parties. The nature of the transactions may have been contractual, such as the purchase of goods and/or services, or the licensing of intellectual property. On the other hand, the parties may have had an adversarial relationship whereby they were plaintiff and defendant in pending litigation. If, in effect, a business combination settles such a preexisting relationship, the acquirer recognizes a gain or loss measured in the following manner:

1. If the relationship is noncontractual (e.g., litigation), measure at fair value
2. If the relationship is contractual, measure at the lesser of:
  - a. The amount by which, from the acquirer's perspective, the contract is favorable or unfavorable, or
  - b. The amount of any settlement provisions stated in the contract that are available to the counterparty for which the contract is unfavorable.

If 2b is less than 2a, the difference is included as part of the accounting for the business combination.

In determining whether a contract is favorable or unfavorable to a party, the terms of the contract are compared to current market terms. It is important to note that a contract can be unfavorable to the acquirer and yet not result in a loss.

The amount of the gain or loss measured as a result of settling a preexisting relationship will, of course, depend on whether the acquirer had previously recognized related assets or liabilities with respect to that relationship.

**Example of settlement of preexisting contractual supplier relationship; contract unfavorable to acquirer**

Meyer Corporation (MC) and Henning, Inc. (HI) are parties to a 3-year supply contract that contains the following provisions:

1. MC is required to annually purchase 3,000 flat-panel displays from HI at a fixed price of \$400 per unit for an aggregate purchase price of \$1,200,000 for each of the three years.
2. MC is required to pay HI the annual \$1,200,000 irrespective of whether it takes delivery of all 3,000 units and the required payment is nonrefundable.
3. The contract contains a penalty provision that would permit MC to cancel it at the end of the second year for a lump sum payment of \$500,000.
4. In each of the first two years of the contract, MC took delivery of the full 3,000 units.

At December 31, 20X1, the supply contract was unfavorable to MC because MC would be able to purchase flat-panel displays with similar specifications and of similar quality from another supplier for \$350 per unit. Therefore, in accordance with ARB 43, MC accrued a loss of \$150,000 (3,000 units remaining under the firm purchase commitment × \$50 loss per unit).

On January 1, 20X2, MC acquires HI for \$30 million, which reflects the fair value of HI based on what other marketplace participants would be willing to pay. On the acquisition date, the \$30 million fair value of HI includes \$750,000 related to the contract with MC that consists of:

Identifiable intangibles <sup>3</sup>	<u>\$600,000</u>	Representing the remaining year of the contract, at prevailing market prices
Favorable pricing	<u>\$150,000</u>	Representing the portion of the contract price that is favorable to HI and unfavorable to MC
	<u><u>\$750,000</u></u>	

HI has no other identifiable assets or liabilities related to the supply contract with MC. MC would compute its gain or loss on settlement of this preexisting relationship as follows:

1. Amount of unfavorability to acquirer (MC) at acquisition date	\$150,000
2. Lump-sum settlement amount available to MC	500,000
3. Lesser of 1 or 2	150,000
4. Amount by which 1 exceeds 2	N/A

Since MC had already recognized an unrealized loss on the firm purchase commitment as of December 31, 20X1, upon its acquisition of HI, its loss of \$150,000 from recognizing the lesser of items 1 and 2 in the preceding list would be offset by the elimination of the liability for the unrealized loss on the firm purchase commitment in the same amount of \$150,000. Thus, under these circumstances, MC would have neither a gain nor a loss on the settlement of its preexisting relationship with HI. The entries to record these events are not considered part of the business combination accounting. It is important to note that, from the perspective of MC, when it applies the acquisition method to record the business combination, it will characterize the \$600,000 “at-market” component of the contract as part of goodwill and not as identifiable intangibles. This is the case because of the obvious fallacy of MC recognizing customer-relationship intangible assets that represent a relationship with itself.

**Example of settlement of preexisting contractual supplier relationship; contract favorable to acquirer**

Using the same facts as the MC/HI example above, assume that, instead of the contract being unfavorable to the acquirer MC, it was unfavorable to HI in the amount of \$150,000 and that there was a cancellation provision in the contract that would permit HI to pay a penalty after year two of \$100,000 to cancel the remainder of the contract.

On the acquisition date, the \$30 million fair value of HI under this scenario would include \$450,000 related to the contract with MC that consists of:

Identifiable intangibles	\$600,000	Representing the remaining year of the contract, at prevailing market prices
Unfavorable pricing	(150,000)	Representing the portion of the contract price that is unfavorable to HI and favorable to MC
	<u><u>\$45,000</u></u>	

Under these changed assumptions, MC would not have incurred or recorded an unrealized loss on the firm purchase commitment with HI since the contract terms were favorable to MC. The determination of MC’s gain or loss would be as follows:

<sup>3</sup> In computing the valuation of HI, these amounts would represent such identifiable customer-related intangible assets as customer contract, related customer relationship, production backlog, and the like.

1. Amount of favorability to acquirer (MC) at acquisition date	\$150,000
2. Lump-sum settlement amount available to HI	100,000
3. Lesser of 1 or 2	100,000
4. Amount by which 1 exceeds 2	50,000

Under this scenario, unless HI believed that the market would change in the near term, it would be economically advantageous, absent a business combination, for HI to settle the remaining contract at the acquisition date by paying the \$100,000 penalty because HI would be able to sell the remaining 3,000 units covered by the contract for an aggregate price of \$150,000 more than it was committed to sell those units to MC.

At the acquisition date, MC would record a gain of \$100,000 to settle its preexisting relationship with HI. The entry to record the gain is not considered part of the business combination accounting.

In addition, however, since item 2 is less than item 1, the \$50,000 difference is included in the accounting for the business combination, since economically, postcombination, the combined entity will not benefit from that portion of the acquisition date favorability of the contract.

As was the case in the first example, the portion of the purchase price allocated to the contract in the business combination accounting would be accounted for as goodwill for the same reason.

*Contingent payments to employees or former owners of the acquiree.* The acquirer assesses whether arrangements to make contingent payments to employees or selling owners of the acquiree represent contingent consideration that is part of the business combination transaction or represent separate transactions to be excluded from the application of the acquisition method to the business combination. In general, the acquirer considers:

- The reasons why the terms of the acquisition include the payment provision,
- The party that initiated the arrangement, and
- When (at what stage of the negotiations) the arrangement was entered into by the parties.

When those considerations do not provide clarity regarding whether the transaction is separate from the business combination, the acquirer considers the following indicators:

1. *Postcombination employment*—Consideration is to be given to the terms under which the selling owners will be providing services as key employees of the combined entity. The terms may be evidenced by a formal employment contract, by provisions included in the acquisition documents, or by other documents. If the arrangement provides that the contingent payments are automatically forfeited upon termination of employment, the consideration is to be characterized as compensation for postcombination services. If, instead, the contingent payments are not affected by termination of employment, this would be an indicator that the contingent payments represent additional consideration that is part of the business combination transaction and not compensation for services.
2. *Duration of postcombination employment*—If the employee is contractually bound to remain employed for a period that equals or exceeds the period during which the contingent payments are due, this may be an indicator that the contingent payments represent compensation for services.
3. *Amount of compensation*—If the amount of the employee's compensation that is not contingent is considered to be reasonable in relation to other key employees of the combined entity, this may indicate that the contingent amounts represent additional consideration and not compensation for services.
4. *Differential between amounts paid to employees and selling owners who do not become employees of the combined entity*—If, on a per-share basis, the contingent payments due to

former owners of the acquiree that did not become employees are lower than the contingent payments due to the former owners that did become employees of the combined entity, this may indicate that the incremental amounts paid to the employees are compensation.

5. *Extent of ownership*—The relative ownership percentages (e.g., number of shares, units, percentage of membership interest) owned by the selling owners who remain employees of the combined entity serve as an indicator of how to characterize the substance of the contingent consideration. If, for example, the former owners of substantially all of the ownership interests in the acquiree are continuing to serve as key employees of the combined entity, this may be an indicator that the contingent payment arrangement is substantively a profit-sharing vehicle designed with the intent of providing compensation for services to be performed postcombination. Conversely, if the former owners that remained employed by the combined entity collectively owned only a nominal ownership interest in the acquiree and all of the former owners received the same amount of contingent basis on a per-share basis, this may be an indicator that the contingent payments represent additional consideration. In considering the applicability of this indicator, care must be exercised to closely examine the effects, if any, of transactions, ownership interests, and employment relationships, precombination and postcombination, with respect to parties related to the selling owners of the acquiree.
6. *Relationship of contingent arrangements to the valuation approach used*—The payment terms negotiated in many business combinations provide that the amount of the acquisition date transfer of consideration from acquirer to acquiree (or the acquiree's former owners) is computed near the lower end of a range of valuation estimates the acquirer used in valuing the acquiree. Furthermore, the formula for determining future contingent payments is derived from or related to that valuation approach. When this is the case, it may be an indicator that the contingent payments represent additional consideration. Conversely, if the formula for determining future contingent payments more closely resembles prior profit-sharing arrangements, this may be an indicator that the substance of the contingent payment arrangement is to provide compensation for services.
7. *Formula prescribed for determining contingent consideration*—Analyzing the formula to be used to determine the contingent consideration may provide insight into the substance of the arrangement. Contingent payments that are determined on the basis of a multiple of earnings may be indicative of being, in substance, contingent consideration that is part of the business combination transaction. Alternatively, contingent consideration that is determined as a prespecified percentage of earnings would be more suggestive of a routine profit-sharing arrangement for the purposes of providing additional compensation to employees for postcombination services rendered.
8. *Other considerations*—Given the complexity of a business combination transaction and the sheer volume of legal documents necessary to affect it, the financial statement preparer is charged with the daunting, but unavoidable task of performing a comprehensive review of the terms of all of the associated agreements. These can take the form of noncompete agreements, consulting agreements, leases, guarantees, indemnifications, and, of course, the formal agreement to combine the businesses. Particular attention should be paid to the applicable income tax treatment afforded to the contingent payments. The income tax treatment of these payments may be an indicator that tax avoidance was a primary motivator in characterizing them in the manner that they are structured. An acquirer might,

for example, simultaneous to a business combination, execute a property lease with one of the key owners of the acquiree. If the lease payments were below market, some or all of the contingent payments to that key owner/lessor under the provisions of the other legal agreements might, in substance, be making up the shortfall in the lease and thus should be recharacterized as lease payments and accounted for separately from the business combination in the combined entity's postcombination financial statements. If this were not the case, and the lease payments were reflective of the market, this would be an indicator pointing to a greater likelihood that the contingent payment arrangements actually did represent contingent consideration associated with the business combination transaction.

**Step 4—Classify or designate identifiable assets acquired and liabilities assumed.** To facilitate the combined entity's future application of GAAP in its postcombination financial statements, management is required to make decisions on the acquisition date relative to the classification or designation of certain items. These decisions are based on contractual terms, economic and other conditions, and the acquirer's operating and accounting policies as they exist *on the acquisition date*. Examples include, but are not limited to, the following:

1. Classification of investments in certain debt and equity securities as trading, available for sale, or held to maturity under ASC 320, *Investments—Debt and Equity Securities*
2. Designation of a derivative instrument as a hedging instrument under the provisions of ASC 815, *Derivatives and Hedging*
3. Assessment of whether an embedded derivative is to be separated from the host contract under ASC 815.

In applying Step 4, specific exceptions are provided for lease contracts and insurance contracts. Generally, these contracts are classified by reference to the contractual terms and other factors that were applicable *at their inception* rather than at the acquisition date. If, however, the contracts were modified subsequent to inception and those modifications would change their classification at that date, then the accounting for the contracts is determined by the modification date facts and circumstances. Under these circumstances, the modification date could be the same as the acquisition date.

**Step 5—Recognize and measure the identifiable tangible and intangible assets acquired and liabilities assumed.** In general, the acquirer measures the identifiable tangible and intangible assets acquired, liabilities assumed, and, if applicable, noncontrolling interest at fair value on the acquisition date. The following guidance is followed in applying the recognition and measurement principles (subject to certain specified exceptions).

**Private Company Alternative for Accounting for Identifiable Intangible Assets in a Business Combination<sup>4</sup>**

Entities must decide whether or not to apply the accounting alternative upon the occurrence of the first transaction within the scope of this accounting alternative in fiscal years beginning after December 15, 2015. The elective adoption is effective for the fiscal year's first in-scope adoption annual financial reporting and all interim and annual periods thereafter. If the first in-scope transaction occurs in fiscal years beginning after December 15, 2016, the elective adoption is effective in the interim period that includes the date of that first in-scope transaction and subsequent interim and annual periods thereafter.

---

<sup>4</sup> See the Technical Alert section at the beginning of this chapter for an important update ASU 2014-08.

*Guidance.* If an entity adopts this alternative, it should no longer recognize and measure (and instead subsume into goodwill):

1. customer-related intangible assets unless they are capable of being sold or licensed independently from the other assets of the business, and
2. noncompetition agreements.

The alternative use is designed to reduce the costs and complexity of measuring these assets by decreasing the number of intangible assets that need to be recognized separately without diminishing decision-useful information for users of private company financials.

Adopting this alternative will result in a higher goodwill balance at acquisition. An entity that elects the accounting alternative must adopt the private company alternative to amortize goodwill as described in FASB Accounting Standards Update No. 2014-02, *Intangibles—Goodwill and Other (Topic 350): Accounting for Goodwill*. However, an entity that elects the accounting alternative in Update 2014-02 is not required to adopt the amendments in this Update.

**Operating leases.** Regardless of whether the acquiree is the lessee or lessor, the acquirer evaluates, as of the acquisition date, each of the acquiree's operating leases to determine whether its terms are favorable or unfavorable compared to the market terms of leases of identical or similar items. Under extant guidance:<sup>5</sup>

- If the lease terms are favorable, the acquirer recognizes an intangible asset;
- If the lease terms are unfavorable, the acquirer recognizes a liability.

(ASC 805-20-25-12)

Even when the lease is considered to be at market terms, there nevertheless may be an identifiable intangible associated with it. This would be the case if market participants would be willing to pay to obtain it (i.e., to obtain the rights and privileges associated with it). Examples of this situation are leases for favorably positioned airport gates, and prime retail space in an economically favorable location. If, from the perspective of marketplace participants, acquiring the lease would entitle them to future economic benefits that qualify as identifiable intangible assets (discussed later in this chapter), the acquirer would recognize, separately from goodwill, the associated identifiable intangible asset.

**Operating lease assets owned by an acquiree/lessor.** The fair value of assets owned by the acquiree that are subject to operating leases with the acquiree being the lessor are measured separately from the underlying lease to which they are subject. (ASC 805-20-25-13)<sup>6</sup>

**Assets with uncertain cash flows.** Since fair value measurements take into account the effects of uncertainty regarding the amounts and timing of future cash flows, the acquirer does not recognize a separate valuation allowance for assets subject to such uncertainties.

---

<sup>5</sup> Upon implementation of ASU 2016-02 on leases, this guidance makes a distinction as to whether the acquiree is a lessor or a lessee. If the acquiree is a lessor, the acquirer recognizes:

- an intangible asset if the terms of an operating lease are favorable relative to market terms, and
- a liability if the terms are unfavorable relative to market terms.

If the acquiree is a lessee, the acquirer adjusts the measurement of the acquired right-of-use asset for any favorable or unfavorable terms. (ASC 805-20-25-12) In those circumstances, the acquirer measures:

- the lease liability at the present value of the remaining lease payments, as if the acquired lease were a new lease of the acquirer at the acquisition date
- the right-of-use asset at the same amount as the lease liability as adjusted to reflect favorable or unfavorable terms of the lease when compared with market terms.

(ASC 802-20-30-24)

<sup>6</sup> Paragraph superseded by ASU 2016-02 upon implementation.

***Assets the acquirer plans to idle or to use in a manner that is not their highest and best use.***

The measurement of the identifiable assets acquired at fair value is to be made in accordance with the requirements of ASC 820. One of those requirements is that the measurement is to assume the highest and best use of the asset by market participants. In applying this requirement to assets that are acquired in a business combination, this assumption is to be used even if it differs from the manner in which the acquiree was using the assets or the manner in which the acquirer intends to use the assets. Thus, even if the acquirer intends to protect its competitive position or for other business reasons to idle an acquired asset or use it in a manner that is not its highest and best use, the acquirer is still required to initially measure the fair value of that asset using the assumption of its highest and best use and to continue to use that assumption for the purposes of subsequently testing the asset for impairment. (ASC 805-20-30-6)

***Identifiable intangibles are recognized separately from goodwill.*** ASC 350 addresses the accounting for all intangibles and how to distinguish between separately identifiable intangibles having finite lives, those having indefinite lives, and goodwill, which is unique in being “unidentifiable” and having an indeterminate life (which makes periodic amortization impossible, in the FASB’s view). CON 5, *Recognition and Measurement in Financial Statements of Business Enterprises*, states that an asset is recognized if it meets the definition of an asset (found in CON 6, *Elements of Financial Statements*), has a relevant attribute measurable with sufficient reliability, and the information about it is representationally faithful, verifiable, neutral (i.e., it is reliable), and capable of making a difference in user decisions (i.e., it is relevant). In a business acquisition, any acquired identifiable intangible asset (e.g., patents, customer lists, etc.) must be recognized separately from goodwill when it meets these CON 5 asset recognition criteria, and additionally meets either of the following two criteria:

1. *Separability criterion*—The intangible asset is capable of being separated or divided from the entity that holds it, and sold, transferred, licensed, rented, or exchanged, regardless of the acquirer’s intent to do so. An intangible asset meets this criterion even if its transfer would not be alone, but instead would be accompanied or bundled with a related contract, other identifiable asset, or a liability.
2. *Legal/contractual criterion*—The intangible asset results from contractual or other legal rights. An intangible asset meets this criterion even if the rights are not transferable or separable from the acquiree or from other rights and obligations of the acquiree.

(ASC 805-20-55-2)

ASC 805-20-55 contains a listing of intangible assets that FASB believes have characteristics that meet one of these two criteria (legal/contractual or separability). A logical approach in practice would be for the acquirer to first consider whether the intangibles specifically included on the FASB list are applicable to the particular acquiree and then to consider whether there may be other unlisted intangibles included in the acquisition that meet one or both of the criteria for separate recognition.

ASC 805-20-55-13 organizes groups of identifiable intangibles into categories related to or based on:

1. Marketing
2. Customers or clients
3. Artistic works
4. Contractual
5. Technological.

These categorizations are somewhat arbitrary. Consequently, some of the items listed could fall into more than one of the categories. All intangible assets acquired—whether singly, in groups, or as part of a business combination—are initially recognized and measured based on their respective fair values. Under the provisions of ASC 350, serious effort must be directed to identifying the various intangibles acquired, thus minimizing the amount of goodwill to be recognized.

Examples of identifiable intangibles included in each of the categories are as follows:

*Marketing-related intangible assets.*

1. *Newspaper mastheads.* The unique appearance of the title page of a newspaper or other periodical.
2. *Trademarks, service marks, trade names, collective marks, certification marks.* A *trademark* represents the right to use a name, word, logo, or symbol that differentiates a product from products of other entities. A *service mark* is the equivalent of a trademark for a service offering instead of a product. A *collective mark* is used to identify products or services offered by members affiliated with each other. A *certification mark* is used to designate a particular attribute of a product or service such as its geographic source (e.g., Colombian coffee or Florida orange juice) or the standards under which it was produced (e.g., ISO 9000 Certified).
3. *Trade dress.* The overall appearance and image (unique color, shape, or package design) of a product.
4. *Internet domain names.* The unique name that identifies an address on the Internet. Domain names must be registered with an Internet registry and are renewable.
5. *Noncompetition agreements.* Rights to assurances that companies or individuals will refrain from conducting similar businesses or selling to specific customers for an agreed-upon period of time.

(ASC 820-20-55-14 through 55-19)

*Customer-related intangible assets.*

1. *Customer lists.* Names, contact information, order histories, and other information about a company's customers that a third party, such as a competitor or a telemarketing firm, would want to use in its own business.
2. *Customer contracts and related customer relationships.* When a company's relationships with its customers arise primarily through contracts and are of value to buyers who can "step into the shoes" of the sellers and assume their remaining rights and duties under the contracts, and which hold the promise that the customers will place future orders with the entity or relationships between entities and their customers for which:
  - a. The entities have information about the customers and have regular contacts with the customers, and
  - b. The customers have the ability to make direct contact with the entity.
3. *Noncontractual customer relationships.* Customer relationships that arise through means such as regular contacts by sales or service representatives, the value of which are derived from the prospect of the customers placing future orders with the entity.
4. *Order or production backlogs.* Unfilled sales orders for goods and services in amounts that exceed the quantity of finished goods and work-in-process on hand for filling the orders.

(ASC 820-20-55-20 through 55-28)

*Artistic-related intangible assets.*

1. *Plays, operas, ballets.*
2. *Books, magazines, newspapers, and other literary works.*
3. *Musical works such as compositions, song lyrics, and advertising jingles.*
4. *Photographs, drawings, and clip art.*
5. *Audiovisual material including motion pictures, music videos, television programs.*

(ASC 820-20-55-29)

*Contract-based intangible assets.*

1. *License, royalty, standstill agreements.* License agreements represent the right, on the part of the licensee, to access or use property that is owned by the licensor for a specified period of time at an agreed-upon price. A royalty agreement entitles its holder to a contractually agreed-upon portion of the income earned from the sale or license of a work covered by patent or copyright. A standstill agreement conveys assurances that a company or individual will refrain from engaging in certain activities for specified periods of time.
2. *Advertising contracts.* A contract with a newspaper, broadcaster, or Internet site to provide specified advertising services to the acquiree.
3. *Lease agreements.* (Irrespective of whether the acquiree is the lessee or lessor.)<sup>7</sup>
4. *Construction permits.* Rights to build a specified structure at a specified location.
5. *Construction contracts.* Rights to become the contractor responsible for completing a construction project and benefit from the profits it produces, subject to the remaining obligations associated with performance (including any past-due payments to suppliers and/or subcontractors).
6. *Management, service, or supply contracts.* Rights to manage a construction project for a fee, procure specified services at a specified fee, or purchase specified products at contractually agreed-upon prices.
7. *Broadcast rights.* Legal permission to transmit electronic signals using specified bandwidth in the radio frequency spectrum, granted by the operation of communication laws.
8. *Franchise rights.* Legal rights to engage in a trade-named business, to sell a trademarked good, or to sell a service-marked service in a particular geographic area.
9. *Operating rights.* Permits to operate in a certain manner, such as those granted to a carrier to transport specified commodities.
10. *Use rights.* Permits to use specified land, property, or air space in a particular manner, such as the right to cut timber, expel emissions, or to land airplanes at specified gates at an airport.
11. *Servicing contracts.* The contractual right to service a loan. Servicing entails activities such as collecting principal and interest payments from the borrower, maintaining escrow accounts, paying taxes and insurance premiums when due, and pursuing collection of delinquent payments.
12. *Employment contract.* The right to succeed the acquiree as the employer under a formal contract to obtain an employee's services in exchange for fulfilling the employer's remaining duties, such as payment of salaries and benefits, as specified by the contract.

(ASC 820-20-55-38 through 55-45)

---

<sup>7</sup> Upon implementation of ASU 2016-02 on leases, this becomes "Operating lease agreements of a lessor."

*Technology-based intangible assets.*

1. *Patented technology.* Computer software source code, program specifications, procedures, and associated documentation that are legally protected by patent.
2. *Mask works.* Software permanently stored on a read-only memory chip as a series of stencils or integrated circuitry. Mask works may be provided statutory protection in some countries.
3. *Unpatented technology.* Access to knowledge about the proprietary processes and workflows followed by the acquiree to accomplish desired business results.
4. *Databases.* Databases are collections of information generally stored digitally in an organized manner. A database can be protected by copyright (e.g., the database contained on the CD-ROM version of this publication). Many databases, however, represent information accumulated as a natural by-product of a company conducting its normal operating activities. Examples of these databases are plentiful and include title plants, scientific data, and credit histories. Title plants represent historical records with respect to real estate parcels in a specified geographic location.
5. *Trade secrets.* Trade secrets are proprietary, confidential information, such as a formula, process, or recipe.

One commonly cited intangible asset deliberately omitted by the FASB from its list of identifiable intangibles is an *assembled workforce*. FASB decided that the replacement cost technique that is often used to measure the fair value of an assembled workforce is not a representationally faithful measure of the fair value of the intellectual capital acquired. It was thus decided that an exception to the recognition criteria would be made, and that the fair value of an acquired assembled workforce would remain part of goodwill.

*Useful economic life.* Reliably measurable identifiable intangible assets, with the exception of those meeting the criteria for nonamortization (explained below), must be amortized over their respective useful economic lives. Useful economic life is the period over which the asset is expected to contribute (whether directly or indirectly) to cash flows into the entity. Factors to be considered in estimating the useful economic life of an intangible asset to an enterprise include:

1. Legal, regulatory, or contractual provisions that may limit the maximum useful life;
2. Legal, regulatory, or contractual provisions that may enable renewal or extension of the asset's legal or contractual life (provided there is evidence to support renewal or extension without substantial cost and without materially modifying the original terms);
3. The effects of obsolescence, demand, competition, and other economic factors (such as the stability of the industry, the rate of technological change, expected changes in distribution channels, and the existence of uncertainty over future legal and/or regulatory changes);
4. The expected useful life of assets or groups of assets of the enterprise that the useful life of the asset may parallel (such as mineral rights to depleting assets);
5. The expected use of the intangible asset by the enterprise; and
6. The level of maintenance expenditures required to be made in order to obtain the expected future economic benefits from the asset.

In those instances where an intangible asset is determined to have an indefinite useful economic life, it will not be amortized until its life is determined to be finite at a later date. An example of such an asset would be a broadcast license, expiring in five years, but which may be renewed indefinitely at little cost. If the acquirer intends to renew the license indefinitely, and there is evidence to support its ability to do so, and the cash flows related to that license are expected to

continue indefinitely, then no amortization would be recognized until such time as these criteria are no longer met.

*Residual value.* Typically, the entire fair value assigned to an intangible asset will be subject to amortization, although in some instances a residual value may be determined, which reduces the asset's amortizable basis. The residual value of an amortizable intangible is assumed to be zero unless the useful life to the acquiring enterprise is shorter than the intangible asset's useful economic life, and either (1) the acquiring enterprise has a commitment from a third party to purchase the asset at the end of its useful life, or (2) the residual value can be determined by reference to an observable market for that asset and that market is expected to exist at the end of the asset's useful life. The method of amortization is to reflect the pattern in which the economic benefits of the intangible asset are to be consumed; absent the ability to ascertain this, straight-line amortization is applied. However, if impairment (determined by application of the ASC 360 criteria) is later determined to have occurred, the carrying amount will be written down to the impaired amount.

*Research and development assets.* ASC 805 requires the acquirer to recognize and measure all tangible and intangible assets used in research and development (R&D) activities acquired individually or in a group of assets as part of the business combination. This prescribed treatment is to be followed even if the assets are judged to have no alternative future use. These assets are measured at their acquisition-date fair values. Fair value measurements, consistent with ASC 820, must be made based on the assumptions that would be made by market participants in pricing the asset. Assets that the acquirer does not intend to use or intends to use in a manner that is not their highest and best use are, nevertheless, required to be measured at fair value.

*Intangible R&D assets.* Upon initial recognition, the *intangible* R&D assets are classified as indefinite-lived assets until the related R&D efforts are either completed or abandoned. In the reporting periods during which the R&D intangible assets are classified as indefinite-lived, they are not amortized. Instead, they are tested for impairment in the same manner as other indefinite-lived intangibles. Upon completion or abandonment of the related R&D efforts, management determines the remaining useful life of the intangibles and amortizes them accordingly. In applying these requirements, assets that are temporarily idled are not to be considered abandoned.

*Tangible R&D assets.* Tangible R&D assets acquired in a business combination are accounted for according to their nature (e.g., supplies, inventory, depreciable assets).

*Exceptions to the recognition and/or measurement principles.* ASC 805 provides certain exceptions to its general principles for recognizing assets acquired and liabilities assumed at their acquisition date fair values. These can be summarized as follows:

<u>Nature of exception</u>	<u>Recognition</u>	<u>Measurement</u>
1. Assets held for sale		x
2. Contingent assets and liabilities of the acquiree	x	x
3. Indemnification assets	x	x
4. Reacquired rights		x
5. Employee benefits	x	x
6. Share-based payment awards		x
7. Income taxes	x	x

1. *Assets held for sale.* Assets classified as held for sale individually or as part of a disposal group are to be measured at acquisition date fair value less cost to sell consistent with ASC 360.

In postacquisition periods, long-lived assets classified as held for sale are not to be depreciated or amortized. If the assets are part of a disposal group, interest and other expenses related to the liabilities included in the disposal group are to continue to be accrued.

In determining fair value less cost to sell, it is important to differentiate costs to sell from expected future losses associated with the operation of the long-lived asset or disposal group to which it belongs.

Costs to sell are defined as the incremental direct costs necessary to transact a sale. To qualify as costs to sell, the costs must result directly from the sale transaction, incurring them needs to be considered essential to the transaction, and the costs would not have been incurred by the entity absent the decision to sell the assets. Examples of costs to sell include brokerage commissions, legal fees, title transfer fees, and closing costs necessary to effect the transfer of legal title. Costs to sell are expressly not permitted to include any future losses expected to result from operating the assets (or disposal group) while it is classified as held for sale. If the expected timing of the sale exceeds one year from the date of the statement of financial position, which is permitted in limited situations by ASC 360-10-45, the costs to sell are to be discounted to their present value.

If a loss is recognized in subsequent periods because of declines in the fair value less cost to sell, such *losses* are permitted to be restored by future periods' gains only to the extent to which the losses have been recognized cumulatively from the date the asset (or disposal group) was classified as held for sale.

2. *Contingent assets and liabilities of the acquiree.* A gain or loss contingency is defined as an existing, unresolved condition, situation, or set of circumstances that will eventually be resolved by the occurrence or nonoccurrence of one or more future events. A potential gain or loss to the reporting entity can result from the contingency's resolution.

*Acquisition-date considerations.* To determine whether to recognize a contingent asset or liability of the acquiree, the acquirer is to evaluate information available during the measurement period about the facts and circumstances as they existed at the measurement date. As a result of that evaluation, the acquirer is to conclude as to whether or not the *acquisition-date fair value* (ADFV) of a contingent asset acquired or contingent liability assumed can be determined during the measurement period.

- a. If ADFV is considered determinable during the measurement period, the acquirer recognizes the asset or liability at its ADFV.
- b. If ADFV is not considered determinable during the measurement period, an asset or liability is recognized at the acquisition date if both of the following criteria are met, following the application guidance in ASC 450 and ASC 450-20:
  - Information available prior to the end of the measurement period indicates that it is *probable* that an asset existed or that a liability had been incurred at the measurement date, and
  - The amount of the asset or liability can be reasonably estimated.
- c. If neither criterion a. nor b. is met, no asset or liability is recognized at the measurement date and the contingencies are subject to the same ASC 450 considerations as any other contingencies of the ongoing consolidated reporting entity.

The acquirer is required, however, to initially recognize the ADFV of any preexisting contingent consideration arrangements of the acquiree that the acquirer assumes in the business combination.

*Postacquisition considerations.* Management of the acquirer is to develop a “systematic and rational” basis for subsequently measuring and accounting for assets and liabilities arising from contingencies based on the nature of the contingency.

With respect to contingent consideration arrangements of the acquiree that are assumed by the acquirer in the business combination, these are subsequently accounted for in the same manner as contingent consideration arrangements entered into between the acquirer and acquiree as a part of the business combination:

- If additional information is obtained during the measurement period that pertains to facts and circumstances that existed at the acquisition date and affects the ADFV of the contingency, the acquirer is to reflect the effects of the new information on ADFV as a measurement period adjustment.
- Changes in the fair value of the contingency resulting from postacquisition events, such as meeting a targeted level of earnings, reaching a specified stock price, or successfully meeting a milestone of a research and development project, are not to be reflected as measurement period adjustments. These are accounted for as follows:
  - (1) the contingent consideration was classified as equity, it is not remeasured and, when subsequently settled, it is accounted for in equity.
  - (2) If the contingent consideration was classified as an asset or liability, it is remeasured at fair value in each reporting period until the contingency is resolved. Changes in fair value are charged or credited to net income unless the contingent arrangement is a hedging instrument for which ASC 15, *Derivatives and Hedging*, requires changes to be recognized initially in other comprehensive income.

3. *Indemnification assets.* Indemnification provisions are usually included in the voluminous closing documents necessary to effect a business combination. Indemnifications are contractual terms designed to fully or partially protect the acquirer from the potential adverse effects of an unfavorable future resolution of a contingency or uncertainty that exists at the acquisition date. Frequently the indemnification is structured to protect the acquirer by limiting the maximum amount of postcombination loss that the acquirer would bear in the event of an adverse outcome. A contractual indemnification provision results in the acquirer obtaining, as a part of the acquisition, an indemnification asset and simultaneously assuming a contingent liability of the acquiree.

*Acquisition-date considerations.* ASC 805 requires the acquirer to recognize and measure the indemnification asset using the same measurement basis it uses to measure the indemnified obligation.

In measuring an indemnification asset, management is to take into account any uncertainty in the amounts or timing of expected future cash flows. If the asset is measured at acquisition-date fair value, those effects are included in the measure of fair value and, therefore, a separate valuation allowance is not recognized.

Some indemnifications relate to assets or liabilities that are exceptions to the recognition or measurement principles. Indemnifications may, for example, be related to contingencies that do not meet the previously discussed criteria for recognition in the acquisition-date financial statements. Other indemnifications may be related to uncertain income tax positions that are measured, under ASC 740, as the maximum amount that is

estimated to be more likely than not of being sustained upon examination by the relevant taxing jurisdiction. In cases such as these, the indemnification asset is to be recognized and measured using assumptions consistent with those used to measure the item being indemnified. Since uncertainty with respect to the collectibility of the indemnification asset is not directly included in its measurement, collectibility is considered separately and, to the extent necessary, reflected in a valuation allowance to reduce the carrying amount of the indemnification asset.

*Postacquisition considerations.* At each reporting date subsequent to the acquisition date, the acquirer is to measure an indemnification asset recognized as part of the business combination using the same basis as the indemnified item, subject to any limitations imposed contractually on the amount of the indemnification. If an indemnification asset is not subsequently measured at fair value (because to do so would be inconsistent with the basis used to measure the indemnified item), management is to assess the collectibility of the asset and, to the extent necessary, a valuation allowance should be established or adjusted. An indemnification asset is derecognized only when the asset is collected, the rights to receive the asset are sold, or the acquirer otherwise loses its right to receive it.

4. *Reacquired rights.* An acquirer and acquiree may have engaged in preacquisition business transactions such as leases, licenses, or franchises that resulted in the acquiree paying consideration to the acquirer to use tangible and/or intangible assets of the acquirer in the acquiree's business.

*Acquisition-date considerations.* Upon consummation of the business combination, the acquirer may reacquire a previously granted right. Upon reacquisition, the acquirer is to account for the right as an identifiable, amortizable intangible asset separate from goodwill.

If the terms of the contract that give rise to the reacquired right are either favorable or unfavorable to the acquirer compared to current market transactions for identical or similar rights, the acquirer is to recognize a gain or loss computed as the lesser of:

- a. The amount by which, from the acquirer's perspective, the contract is favorable or unfavorable, or
- b. The amount of any settlement provisions stated in the contract that are available to the counterparty for which the contract is unfavorable.

If item b is less than item a, the difference is to be included as part of the accounting for the business combination.

*Postacquisition considerations.* Reacquired rights recognized at the acquisition date are amortized, postcombination, on the basis of the remaining, unexpired term of the related contract. The remaining contractual term is to be used for this purpose even if market participants would consider potential future contract renewals in determining the fair value of the contract.

Should the acquirer subsequently sell the reacquired right to a third party, the carrying amount of the intangible asset is to be included in the determination of gain or loss on the sale.

5. *Employee benefits.* Liabilities (and assets, if applicable), associated with acquiree employee benefit arrangements are recognized and measured under other GAAP, as applicable.

<i>Types of benefits</i>	<i>Applicable GAAP</i>
Deferred compensation contracts including postretirement benefit aspects of split-dollar life insurance arrangements	ASC 710-10-25ASC 715-60
Compensated absences and sabbatical leaves	ASC 710-10-15ASC 710-10-25
Pensions, plan curtailments, and termination benefits	ASC 715-30ASC 715-20
Postretirement benefits other than pensions, including postretirement benefit aspects of split-dollar life insurance arrangements	ASC 715-60ASC 715-20
Postemployment benefits (benefits provided to inactive or former employees, their beneficiaries, and covered dependents after employment but before retirement) including, but not limited to: <ul style="list-style-type: none"> <li>• Salary continuation</li> <li>• Supplemental unemployment benefits</li> <li>• Severance benefits</li> <li>• Disability-related benefits including workers' compensation</li> <li>• Job training and counseling (e.g., outplacement)</li> <li>• Continuation of benefits such as health care and life insurance</li> </ul>	ASC 712
Onetime termination benefits	ASC 420

In researching the application of these pronouncements, it is important to consider the changes to them made by ASC 805. For example:

- a. ASC 715-30 and ASC 715-60 clarify that:
  - (1) The acquirer is to recognize, as part of the business combination, an asset or liability that represents the funded status of a single-employer defined benefit pension plan and/or a single-employer defined benefit postretirement plan. In determining the funded status, the acquirer is to disregard the effects of expected plan amendments, terminations, or curtailments that it has no obligation to make at the acquisition date.
  - (2) The projected benefit obligation assumed for a single-employer defined benefit pension plan or the accumulated postretirement benefit obligation assumed for a single-employer defined benefit postretirement plan are to reflect any other necessary changes in assumptions based on an assessment by the acquirer of relevant future events.
  - (3) If the acquiree participates in a multiemployer-defined benefit pension or post-retirement plan, and at the acquisition date it is probable that the acquirer will withdraw from that plan, the acquirer is to recognize a withdrawal liability as of the acquisition date under ASC 450.
- b. ASC 420 is amended to expand its scope to cover exit activities associated with entities that are acquired in a business combination.
- 6a. *Acquirer share-based payment awards exchanged for acquiree awards held by its employees.* In connection with a business combination, the acquirer often awards share-based payments to the employees of the acquiree in exchange for the employees' acquiree awards. Obviously, there are many valid business reasons for the exchange, not the

least of which is ensuring smooth transition and integration as well as retention of valued employees.

The discussion that follows uses concepts and terminology from ASC 718, *Compensation—Stock Compensation*.

- 6b. *Acquirer not obligated to exchange.* Accounting for the replacement awards under ASC 805 is dependent on whether the acquirer is obligated to replace the acquiree awards. The acquirer is obligated to replace the acquiree awards if the acquiree or its employees can enforce replacement through rights obtained from the terms of the acquisition agreement, the acquiree awards, or applicable laws or regulations.

If the acquirer is not obligated to replace the acquiree awards, all of the fair-value-based measure (FVBM)<sup>8</sup> of the replacement awards is recognized as compensation cost in the postcombination financial statements.

#### **Example of acquirer replacing acquiree awards without the obligation to do so**

New Parent, Inc. (NP) acquired New Subsidiary, Inc. (NS) on January 1, 20X1. Because of the business combination, the share-based payment awards that had been previously granted by NS to its employees expired on the acquisition date.

Although NP was not obligated, legally or contractually, to replace the expired awards, its Board of Directors approved a grant of NP awards designed so that the employees of NS would not be financially disadvantaged by the acquisition transaction.

Since the replacement awards were voluntary on the part of NP, the FVBM of the replacement award is attributed wholly to the postcombination consolidated financial statements of NP and Subsidiary.

*Acquirer obligated to replace acquiree awards.* If the acquirer is obligated to replace the awards of the acquiree, either all or a portion of the FVBM of the replacement awards is included in measuring the consideration transferred by the acquirer in the business combination. To the extent a portion of the replacement awards is not allocated to consideration transferred, it is accounted for as compensation for postcombination services in the acquirer's consolidated financial statements.

For the purposes of illustrating the allocation computations, the following conventions and abbreviations are used:

FVBM <sub>RA</sub>	Acquisition date fair-value-based measure of acquirer replacement award
FVBM <sub>AA</sub>	Acquisition date fair-value-based measure of acquiree award that is being replaced by the acquirer
RSP <sub>AA</sub>	Original requisite service period <sup>9</sup> of acquiree awards at their grant date
RSP <sub>RA</sub>	Requisite service period of the acquirer replacement awards at acquisition date
CRSP <sub>AA</sub>	Portion of requisite service period completed at the acquisition date by employees under the acquiree awards
TSP	Total service period—the service period already satisfied by the employees at the acquisition date under the acquiree awards plus the requisite service period, if any, required by the acquirer replacement awards
PRE	Portion of FVBM <sub>RA</sub> attributable to precombination services performed by the employees of the acquiree

<sup>8</sup> Although the accompanying guidance uses the term "fair-value-based measure" to refer to the measurement of share-based awards, the guidance also applies to awards of both the acquirer and acquiree that are measured using either the calculated value method or intrinsic value method.

<sup>9</sup> The term "requisite service period" includes explicit, implicit, and derived service periods during which employees are required to provide services in exchange for the award. These terms are explained in ASC 718.

PCC      Postcombination compensation cost

$$TSP = CRSP_{AA} + RSP_{RA}$$

The following steps are followed to determine the portion of the FVBM of the replacement award to be included as part of the consideration transferred by the acquirer:

1. Compute both  $FVBM_{RA}$  and  $FVBM_{AA}$  by following the provisions of ASC 718.
2. Compute the portion of the replacement award that is attributable to precombination services rendered by the acquiree's employees as follows:
  - a. If  $RSP_{AA} > TSP$ , then:

$$PRE = FVBM_{AA} \left( \frac{CRSP_{AA}}{RSP_{AA}} \right)$$

- b. If  $RSP_{AA} \leq TSP$ , then:

$$PRE = FVBM_{AA} \left( \frac{CRSP_{AA}}{TSP} \right)$$

3. Compute the portion of the nonvested replacement award attributable to postcombination service as follows:

$$PCC = FVBM_{RA} - PRE$$

This amount is to be recognized as compensation cost in the postcombination financial statements since, at the acquisition date, the requisite service conditions had not been met.

The following examples are adapted from the implementation guidance for ASC 805.

**Example of acquirer replacement awards requiring no postcombination services exchanges for fully vested acquiree awards where the employees have rendered all required services by the acquisition date**

New Parent, Inc. (NP) acquired New Subsidiary, Inc. (NS) on January 1, 20X1. In accordance with the acquisition agreement, NP agreed to replace share-based awards that had previously been issued by NS. Details are as follows:

	<i>a. Acquiree Awards</i>	<i>b. Acquirer Awards</i>
1. Acquisition date FVBM of awards	$FVBM_{AA} = \$100$	$FVBM_{RA} = \$110$
2. Original requisite service period of acquiree awards at their grant date	$RSP_{AA} = 4$ years	–
3. Portion of 2a completed by the acquisition date by employees of the acquiree	$CRSP_{AA} = 4$ years	–
4. Requisite service period of acquirer replacement awards at the acquisition date	–	$RSP_{RA} = 0$
5. Total service period (3a + 4b)	–	$TSP = 4$ years
6. The greater of the total service period (5b) or the original requisite service period of the acquiree awards (2a)	–	4 years

Since the acquiree's employees had completed all of the services required under the prior awards, applying the formula yields a result that attributes 100% of the fair value of the acquiree award that is

being replaced to precombination services rendered:

$$\begin{aligned} PRE &= \left( \frac{3a}{6b} \right) \\ PRE &= \$100 \left( \frac{4 \text{ years}}{4 \text{ years}} \right) \\ PRE &= \$100 \end{aligned}$$

The \$100 result, attributed to precombination services, is included by the acquirer in its computation of the consideration transferred in exchange for control of the acquiree.

The final step in the computation is to account for the difference between the acquisition date fair values of the replacement awards and the acquiree awards as follows:

Fair value of replacement awards—FVBM <sub>RA</sub>	\$110
– Allocated to consideration per above	<u>100</u>
Additional compensation cost recognized immediately in postcombination financial statements	\$10

This result illustrates the basic principle in ASC 805 that any excess of FVBM<sub>RA</sub> over the FVBM<sub>AA</sub> is to be attributed to postcombination services and recognized as compensation cost in the postcombination financial statements.

**Example of acquirer replacement awards requiring performance of postcombination services exchanged for acquiree awards for which all requisite services had been rendered by the acquiree's employees as of the acquisition date**

The acquisition agreement referred to in the previous example governing the NP acquisition of NS that occurred on January 1, 20X1, contained the following provisions regarding exchange of outstanding NS awards at acquisition date for NP replacement awards:

	<i>a. Acquiree Awards</i>	<i>b. Acquirer Awards</i>
1. Acquisition date FVBM of awards	FVBM <sub>AA</sub> = \$100	FVBM <sub>RA</sub> = \$100
2. Original requisite service period of acquiree awards at their grant date	RSP <sub>AA</sub> = 4 years	–
3. Portion of 2a completed by the acquisition date by employees of the acquiree (the acquiree employees in this example had actually completed a total of 7 years of services by the acquisition date)	CRSP <sub>AA</sub> = 4 years	–
4. Requisite service period of acquirer replacement awards at the acquisition date	–	RSP <sub>RA</sub> = 1 year
5. Total service period (3a + 4b)	–	TSP = 5 years
6. The greater of the total service period (5b) or the original requisite service period of the acquiree awards (2a)	–	5 years

Even though the acquiree's employees had completed all of the requisite service required by the acquiree's awards three years prior to the acquisition, the imposition of an additional year of required service by the acquirer's replacement awards results in an allocation between precombination compensation cost and postcombination compensation cost as follows:

$$\begin{aligned} PRE &= 1a \quad \left( \frac{3a}{6b} \right) \\ PRE &= \$100 \left( \frac{4 \text{ years}}{4 \text{ years}} \right) \\ PRE &= \$80 \end{aligned}$$

The \$80 result, attributed to precombination services, is included by the acquirer in its computation of the consideration transferred in exchange for control of the acquirer.

The \$20 difference between the \$100 fair value of the replacement awards and the \$80 allocated to precombination services (and included in consideration transferred) is accounted for as compensation cost in the postcombination consolidated financial statements of NP and Subsidiary under the provisions of ASC 718.

**Example of acquirer replacement awards requiring performance of postcombination services exchanged for acquiree awards with remaining unsatisfied requisite service period as of the acquisition date**

The acquisition agreement referred to in the previous examples governing the NP acquisition of NS that occurred on January 1, 20X1, contained the following provisions regarding exchange of outstanding NS awards at acquisition date for NP replacement awards:

	<i>a. Acquiree Awards</i>	<i>b. Acquirer Awards</i>
1. Acquisition date FVBM of awards	FVBM <sub>AA</sub> = \$100	FVBM <sub>RA</sub> = \$100
2. Original requisite service period of acquiree awards at their grant date	RSP <sub>AA</sub> = 4 years	—
3. Portion of 2a completed by the acquisition date by employees of the acquiree	CRSP <sub>AA</sub> = 2 years	—
4. Requisite service period of acquirer replacement awards at the acquisition date	—	RSP <sub>RA</sub> = 1 year
5. Total service period (3a + 4b)	—	TSP = 3 years
6. The greater of the total service period (5b) or the original requisite service period of the acquiree awards (2a)	—	4 years

The portion of the FVBM of the replacement awards attributable to precombination services already rendered by the acquiree employees is computed as follows:

$$\begin{aligned} PRE &= 1a \left( \frac{3a}{6b} \right) \\ PRE &= \$100 \left( \frac{2 \text{ year}}{4 \text{ year}} \right) \\ PRE &= \$50 \end{aligned}$$

Based on the computation above, at the acquisition date, NP, the acquirer, includes \$50 as consideration transferred to obtain control of NS, the acquiree. The remaining \$50 is attributed to postcombination services and, accordingly, recognized as compensation cost in the consolidated postcombination financial statements of NP and Subsidiary.

**Example of acquirer replacement awards that do not require postcombination services exchanged for acquiree awards for which the acquiree's employees had not yet completed all of the requisite services by the acquisition date**

The acquisition agreement referred to in the previous examples governing the NP acquisition of NS that occurred on January 1, 20X1, contained the following provisions regarding exchange of outstanding NS awards at acquisition date for NP replacement awards:

	<i>a. Acquiree Awards</i>	<i>b. Acquirer Awards</i>
1. Acquisition date fair-value-based measure of awards	$FVBM_{AA} = \$100$	$FVBM_{RA} = \$100$
2. Original requisite service period of acquiree awards at their grant date	$RSP_{AA} = 4 \text{ years}$	—
3. Portion of 2a completed by the acquisition date by employees of the acquiree	$CRSP_{AA} = 2 \text{ years}$	—
4. Requisite service period of acquirer replacement awards at the acquisition date	—	$RSP_{RA} = 0$
5. Total service period (3a + 4b)	—	$TSP = 2 \text{ years}$
6. The greater of the total service period (5b) or the original requisite service period of the acquiree awards (2a)	—	4 years

Under this scenario, the terms of the awards previously granted by NS, the acquiree, did not contain a change-in-control provision that would have fully vested them upon the acquisition by NP. If this had been the case, the outcome would be the same as the example above where neither the acquiree awards nor the replacement rewards required the completion of any service on the part of the acquiree's employees.

Since, at the acquisition date, the acquiree employees had completed only two out of the four years of required services and the replacement awards do not extend the duration of services required postcombination, the total service period (TSP) in 5b is the two years already completed by the acquiree's employees under their original awards in 3a ( $CRSP_{AA}$ ).

The portion of the FVBM of the replacement awards attributable to precombination services already rendered by the acquiree employees is computed as follows:

$$\begin{aligned} PRE &= 1a \left( \frac{3a}{6b} \right) \\ PRE &= \$100 \left( \frac{2 \text{ year}}{4 \text{ year}} \right) \\ PRE &= \$50 \end{aligned}$$

Consequently, \$50 of the FVBM of the replacement awards is attributable to precombination services already performed by the acquiree employees and is, therefore, included in computing the consideration transferred in exchange for obtaining control of the acquiree.

The remaining \$50 of the FVBM of the replacement awards is attributable to postcombination service. However, since the acquiree's employees are not required to provide any postcombination services under the terms of the replacement awards, the entire \$50 is immediately recognized by NP, the acquirer, in its postcombination consolidated financial statements.

Although not illustrated in the preceding examples, ASC 805 requires the acquirer to estimate the number of its replacement awards for which the requisite service is expected to occur. To the extent that service is not expected to occur due to employees terminating prior to meeting the replacement award's requisite service requirements, the portion of the FVBM of the replacement awards included in consideration transferred in the business combination is reduced accordingly.

If the replacement award is subject to a graded vesting schedule, the acquirer is to recognize the related compensation cost in accordance with its policy election for other awards in accordance with ASC 718-10-35. Compensation cost is either:

1. recognized using the *graded vesting attribution method* that separates the award into tranches according to the year in which they vest and treats each tranche as if it had been a separate award, or
2. recognized using a straight-line attribution method over the graded vesting period.

If option (2) is elected, compensation cost at any date must equal at least the amount attributable to options that actually vested on or before that date.

Finally, it is important to note that the same requirements for apportioning the replacement award between precombination and postcombination service apply to replacement awards that are classified as equity or as liabilities. All post-acquisition-date changes in the FVBM of liability awards (and their related income tax effects) are recognized in the acquirer's postcombination financial statements in the periods in which the changes occur.

7. The seventh and final of the exceptions noted on p. 911 to the fair-value-based recognition and measurement provisions of ASC 805 is the accounting for income taxes. Since recognition and measurement of income tax assets and liabilities under U.S. GAAP has not historically used fair value measurement or discounted present value techniques, FASB was loath to make fundamental changes to this complex area of accounting.

The remainder of this section is devoted to describing the provisions of those standards and other related interpretive guidance related to accounting for income taxes in connection with business combinations.

*Basic principle.* The basic principle that applies to income tax accounting in a business combination (carried forward without change by ASC 805) is that the acquirer is to recognize, as of the acquisition date, deferred income tax assets or liabilities for the future effects of temporary differences and carryforwards of the acquiree that either:

- a. Exist on the acquisition date, *or*
- b. Are generated by the acquisition itself.

ASC 805 also clarifies ASC 740's applicability to business combinations as follows:

- a. In computing the acquisition date amount of currently payable or refundable income taxes from a particular taxing jurisdiction, management is to apply the recognition and measurement provisions of ASC 740 to evaluate the amounts to record relative to prior income tax positions taken by the acquiree.
- b. As a result of management's evaluation of prior tax positions and the amounts recognized in item 1, management is to adjust the income tax bases used in computing the deferred income tax assets and liabilities associated with the business combination at the acquisition date.
- c. New information regarding the facts and circumstances that existed at the acquisition date that comes to the attention of management regarding those income tax positions is treated as follows:
  - (1) If the information results in a change during the measurement period, the adjustment is made to goodwill. If goodwill is reduced to zero, any remaining portion of the adjustment is recorded as a bargain purchase gain.
  - (2) If the information results in a post-measurement-period change, the change is accounted for in the same manner as any other ASC 740 changes.

*Valuation allowances.* To the extent applicable, deferred income tax assets are to be reduced by a valuation allowance for the portion of the asset not deemed MLTN to be realized.

On the acquisition date, any benefits of future deductible temporary differences or *net operating loss carryforwards* (NOLs) of an acquired entity are to be recognized if the acquirer is permitted to utilize those benefits on a consolidated income tax return

under the existing income tax law. The income tax benefits will be recorded gross with an offsetting valuation allowance if it is more likely than not that the deferred income tax asset will not be realized by the reporting entity (for example, if it is estimated that there will not be sufficient future taxable income to utilize the NOL prior to its expiration).

Some jurisdictions restrict the future use of income tax benefits of the acquiree and only permit those benefits to be applied to subsequent taxable income generated by the acquiree even though the entities are permitted to file a consolidated income tax return. When this is the case, or when the acquiree is expected to file a separate income tax return, management of the consolidated reporting entity is to assess the need for a valuation allowance for those benefits based only on the acquiree's separate past and expected future taxable income.

As a result of the acquisition and the permissibility of filing a consolidated income tax return in a particular jurisdiction, the acquirer may be able to use future taxable income generated by the acquiree to obtain the tax benefits of its own NOLs for which the acquirer had previously recognized a valuation allowance. If, based on the weight of available evidence, management of the acquirer concludes that its previously recognized valuation allowance can be reduced or eliminated, the adjustment is not considered part of the accounting for the business combination. Instead, the benefit is recognized as a component of income tax expense in the period of the acquisition.

Post-acquisition-date changes in a valuation allowance with respect to an acquiree's deferred income tax asset are to be recognized as follows:

- a. If the change in judgment occurs during the measurement period (as defined in ASC 805) that is not to exceed one year from the acquisition date, and results from new information bearing on facts and circumstances that existed at the acquisition date, the change is to be recognized as an adjustment to goodwill. Should the adjustment reduce goodwill to zero, the acquirer is to recognize any further reduction in the valuation allowance as a gain from a bargain purchase.
- b. If the change in judgment occurs subsequent to the measurement period, it is reported as an increase or decrease in income tax expense or benefit of the period in which the judgment changed. Exceptions to this treatment are provided for changes attributable to dividends on unallocated shares of an employee stock ownership plan (ESOP), employee stock options, and certain quasi reorganizations. Accounting for these exceptions results in adjustments directly to contributed capital rather than to income tax expense.

*Goodwill.* Historically, amortization of goodwill was not an allowable deduction for U.S. federal income tax purposes. To the extent that goodwill amortization is nondeductible in any applicable taxing jurisdiction, the nondeductible goodwill does not represent a temporary difference between GAAP and tax and consequently does not give rise to deferred income taxes.

The 1993 Tax Reconciliation Act amended U.S. federal income tax law to permit the amortization of goodwill and other specified acquired intangibles over a statutory 15-year period (IRC § 197). The method of determining the amount of goodwill to recognize for income tax purposes, however, differs from the method prescribed by ASC 805 for financial reporting purposes. Further complicating matters, other taxing jurisdictions to which the reporting entity is subject may not recognize goodwill

amortization as deductible. This can result in onerous recordkeeping of book/tax differences in the carrying amounts of goodwill in each of the major jurisdictions in which the reporting entity is taxed.

When goodwill amortization is tax deductible in a particular jurisdiction, it does result in a temporary difference between the income tax basis and GAAP carrying amount of the goodwill. GAAP goodwill is only written off if it becomes partially or fully impaired whereas tax goodwill is subject to periodic amortization until its income tax basis is reduced to zero.

Since goodwill represents a residual amount after considering all identifiable assets acquired and liabilities assumed in the business combination, any deferred income tax asset associated with goodwill would necessarily have to be computed in order to determine the residual. Thus, FASB prescribed the use of a simultaneous equation method to compute goodwill net of the deferred income tax asset associated with it. To operationalize this requirement, ASC 805-74-55 describes and illustrates it.

**Step 6—Recognize and measure any noncontrolling interest in the acquiree.** The term *noncontrolling interest* replaces the term *minority interest* to refer to the portion of the acquiree, if any, that is not controlled by the parent. The term “minority interest” had become, in some cases, an inaccurate descriptor, because under ASC 805 and ASC 810, an entity can possess a controlling financial interest in another entity without possessing a majority of the voting interests of that entity. Thus, it would be inaccurate, in many cases, to refer to the party that does not possess a controlling financial interest as a “minority,” since that party could, in fact, hold a majority of the voting equity of the acquiree.

ASC 805 requires the noncontrolling interest in the acquiree to be measured at fair value on the basis of a quoted price in an active market at the acquisition date. If the acquirer is not acquiring all of the shares in the acquiree and there is an active market for the remaining outstanding shares in the acquiree, the acquirer may be able to use the market price to measure the fair value of the noncontrolling interest. Otherwise, the acquirer would measure fair value using other valuation techniques.

In applying the appropriate valuation technique to determine the fair value of the noncontrolling interest, it is likely that there will be a difference in the fair value per share of that interest and the fair value per share of the controlling interest. This difference arises from what has been referred to as a “minority interest discount” applicable to the noncontrolling shares. Obviously, an investor would be unwilling to pay the same amount per share for equity shares in an entity that did not convey control of that entity than it would pay for shares that did convey control. (ASC 805-20-6 through 8)

#### Example of fair value of noncontrolling interest adjusted for noncontrolling interest discount

Shirley Corporation (SC) is considering acquiring an 80% interest in Jake Industries Inc. (JI), a privately held corporation. SC engages a valuation specialist to determine the fair value of JI whose shares do not trade in an active market.

The specialist’s findings with respect to JI as a whole were as follows:

Aggregate fair value of JI	\$ 15 million
Number of outstanding shares	375,000
Aggregate fair value per share	\$ 40

In valuing the noncontrolling interest, however, the specialist made the following additional assumptions:

Aggregate fair value per share	\$ 40
Estimated noncontrolling interest discount per share	10
Estimated fair value per share of noncontrolling interest	<u>\$ 30</u>
Fair value of noncontrolling interest	
Fair value per noncontrolling share	\$ 30
× # of noncontrolling shares outstanding	× 75,000
	<u>\$2,250,000</u>

It is important to note from this analysis that, from the perspective of the acquirer, the computation of the acquisition-date fair value of the noncontrolling interest in the acquiree is not computed by simply multiplying the same fair value per share that the acquirer used to value the entity by the percentage voting interest retained collectively by the noncontrolling stockholders. Such a simplistic calculation would have yielded a different result:

$$\$15 \text{ million aggregate fair value} \times 20\% \text{ noncontrolling shares} = \$3 \text{ million}$$

If this method had been used, the noncontrolling interest would be overvalued by \$750,000 (the difference between \$3 million and \$2,250,000).

**Step 7—Measure the consideration transferred.** In general, consideration transferred by the acquiree is measured at its acquisition-date fair value. Examples of consideration that could be transferred include cash, other assets, a business, a subsidiary of the acquirer, contingent consideration, common or preferred equity instruments, options, and warrants. The aggregate consideration transferred is the sum of the following elements measured at the acquisition date:

1. The fair value of the assets transferred by the acquirer,
2. The fair value of the liabilities incurred by the acquirer to the former owners of the acquiree, and
3. The fair value of the equity interests issued by the acquirer subject to the measurement exception discussed earlier in this chapter for the portion, if applicable, of acquirer share-based awards exchanged for awards held by employees of the acquiree that is included in consideration transferred.

To the extent the acquirer transfers consideration in the form of assets or liabilities with carrying amounts that differ from their fair values at the acquisition date, the acquirer is to remeasure them at fair value and recognize a gain or loss on the acquisition date. If, however, the transferred assets or liabilities remain within the consolidated entity postcombination with the acquirer retaining control of them, no gain or loss is recognized, and the assets or liabilities are measured at their carrying amounts to the acquirer immediately prior to the acquisition date. This situation can occur, for example, when the acquirer transfers assets or liabilities to the entity being acquired rather than to its former owners.

The structure of the transaction may involve the exchange of equity interests between the acquirer and either the acquiree or the acquiree's former owners. If the acquisition-date fair value of the acquiree's equity interests is more reliably measurable than the equity interests of the acquirer, the fair value of the acquiree's equity interests is used to measure the consideration transferred.

**Contingent consideration.** Contingent consideration arrangements in connection with business combinations can be structured in many different ways and can result in the recognition of either assets or liabilities under ASC 805. In either case, the acquirer is to include contingent assets and liabilities as part of the consideration transferred, measured at acquisition-date fair value.

If the contingent consideration includes a future payment obligation, that obligation is to be classified as either a liability or equity under the provisions of:

- ASC 480,
- ASC 815-40, or
- Other applicable GAAP.

The acquirer is to carefully consider information obtained subsequent to the acquisition-date measurement of contingent consideration. Additional information obtained during the measurement period that relates to the facts and circumstances that existed at the acquisition date result in measurement period adjustments to the recognized amount of contingent consideration and a corresponding adjustment to goodwill or gain from bargain purchase. Changes that result from events occurring after the acquisition date, such as meeting a specified earnings target, reaching a specified share price, or reaching an agreed-upon milestone on a research and development project, do not constitute measurement period adjustments. Changes in the fair value of contingent consideration that do not result from measurement period adjustments are to be accounted for as follows:

1. If the contingent consideration is classified as equity, it is not to be remeasured and subsequent settlement of the contingency is to be reflected within equity.
2. If the contingent consideration is classified as an asset or liability, it is to be remeasured at fair value at each reporting date until resolution of the contingency. Changes in the fair value between reporting dates are to be recognized in net income unless the arrangement is a hedging instrument for which ASC 815, as amended by ASC 805, requires the changes to be initially recognized in other comprehensive income.

**Step 8—Recognize and measure goodwill or gain on a bargain purchase.** The last step in applying the acquisition method is the measurement of goodwill or a gain from a bargain purchase. Goodwill represents an intangible that is not specifically identifiable. It results from situations when the amount the acquirer is willing to pay to obtain its controlling interest exceeds the aggregate recognized values of the net assets acquired, measured following the principles of ASC 805. Goodwill's elusive nature as an unidentifiable, residual asset means that it cannot be measured directly but rather can only be measured by reference to the other amounts measured as a part of the business combination:

GW	=	Goodwill
NG	=	Negative goodwill
NI	=	Noncontrolling interest in the acquiree, if any, measured at fair value
CT	=	Consideration transferred, generally measured at acquisition-date fair value
PE	=	Fair value of the acquirer's previously held interest in the acquiree if the acquisition was achieved in stages
NA	=	Net assets acquired at the acquisition date—consisting of the identifiable assets acquired and liabilities assumed, measured as described in this chapter
$(CT + NI + PE) - NA = GW \text{ or } (NG)$		

Thus, when application of the formula yields an excess of the consideration transferred, noncontrolling interest, and fair value of previously held interests over the net assets acquired, the acquirer has paid a premium for the acquisition and that premium is characterized as goodwill.

When the opposite is true, that is, when the formula yields a negative result, sometimes referred to as *negative goodwill*, the acquirer has, in fact, obtained a bargain purchase, as the value the acquirer obtained in the exchange exceeded the fair value of what it surrendered.

In a business combination in which no consideration is transferred, the acquirer is to use one or more valuation techniques to measure the acquisition-date fair value of its interest in the acquiree and substitute that measurement in the formula for CT, the consideration transferred. The techniques selected require the availability of sufficient data to properly apply them and are to be appropriate for the circumstances. If more than one technique is used, management of the acquirer is to evaluate the results of applying the techniques including the extent of data available and how relevant and reliable the inputs (assumptions) used are. Guidance on the use of valuation techniques is provided in ASC 820.

**Bargain purchases.** If the computation above results in negative goodwill, this constitutes a *bargain purchase*. Under ASC 805, a bargain purchase is recognized in net income as an acquisition-date gain. The gain is not characterized as an extraordinary gain. Rather, it is considered part of income from continuing operations.

Given the complexity of the computations involved, FASB prescribes a verification protocol for management to follow if the computation preliminarily results in a bargain purchase. If the computation initially yields a bargain purchase, management of the acquirer is to perform the following procedures before recognizing a gain on the bargain purchase:

1. Perform a completeness review of the identifiable tangible and intangible assets acquired and liabilities assumed to reassess whether all such items have been correctly identified. If any omissions are found, recognize the assets and liabilities that had been omitted.
2. Perform a review of the procedures used to measure all of the following items. The objective of the review is to ensure that the acquisition-date measurements appropriately considered all available information available at the acquisition date:
  - a. Identifiable assets acquired
  - b. Liabilities assumed
  - c. Consideration transferred
  - d. Noncontrolling interest in the acquiree, if applicable
  - e. Acquirer's previously held equity interest in the acquiree for a business combination achieved in stages.

## Application Guidance

Due to the complexity of many business combinations and the varying structures used to effect them, ASC 805 provides supplemental guidance to aid practitioners in their application.

**Business combinations achieved in stages (step acquisitions).** A step acquisition is a business combination in which the acquirer held an equity interest in the acquiree prior to the acquisition date on which it obtained control.

ASC 805 requires the acquirer to remeasure its previous holdings of the acquiree's equity at acquisition date fair value. Any gain or loss on remeasurement is recognized in earnings on that date.

If the acquirer had previously recognized changes in the carrying amount of the acquiree's equity in other comprehensive income (e.g., because the investment was classified as available for sale), that amount is to be reclassified and included in the computation of the acquisition date gain or loss from remeasurement.

### Example of a step acquisition

On 12/31/20X1, Finestone Corporation (FC) owned 5% of the 30,000 outstanding voting common shares of Kitzes Industries (KI). On FC's 12/31/20X statement of financial position, it classified its investment in KI as available-for-sale. On 3/31/20X2, FC acquired additional equity shares in KI sufficient to provide FC with a controlling interest in KI and, thus, became KI's parent company.

The following table summarizes FC's initial holdings in KI, the subsequent increase in those holdings, and the computation of the gain on remeasurement at the acquisition date of 3/31/20X2:

	<u>Dart</u>	<u># of shares</u>	<u>Percent interest</u>	<u>Per share</u>		<u>Aggregate investment Cost</u>	<u>Fair value</u>	<i>Unrealized appreciation included in accumulated other comprehensive income</i>
12/31/20X1		1,500	5%	\$10	\$16	\$ 15,000	\$ 24,000	\$9,000
3/31/20X2		<u>21,000</u>	<u>70%</u>	20	20	420,000	420,000	
		<u>22,500</u>	<u>75%</u>					

Computation of gain (loss) on remeasurement at acquisition date:

Fair value per share on 4/1/20X2	\$ 20
Number of preacquisition shares	$\times 1,500$
Aggregate fair value of preacquisition shares on 4/1/20X2	30,000
Carrying amount of preacquisition shares on 4/1/20X2	24,000
Appreciation attributable to the 1st quarter of 20X2	6,000
Pre-2012 appreciation reclassified from accumulated OCI	9,000
Gain on remeasurement of KI stock on 3/31/20X2	<u>\$15,000</u>

**Changes in the parent's ownership interest in a subsidiary.** Subsequent to a business combination, the parent may increase or decrease its ownership percentage in the acquiree/subsidiary, which may or may not affect whether the parent continues to control the subsidiary.

**Changes not affecting control.** The parent company may purchase or sell shares of the subsidiary after the acquisition date without affecting the determination that it controls the subsidiary. In addition, the subsidiary may issue new shares or repurchase some of its own shares as treasury stock or for retirement.

Changes in the parent's ownership interest that do not affect the determination that the parent retains a controlling financial interest in the subsidiary are accounted for as equity transactions with no gain or loss recognized in consolidated net income or in other comprehensive income. The carrying amount of the noncontrolling interest in the subsidiary is to be adjusted to reflect the change in ownership interest. Any difference between the fair value of the consideration received or paid in the transaction and the amount by which the noncontrolling interest is adjusted is to be recognized in equity attributable to the parent.

In the case of a subsidiary that has *accumulated other comprehensive income* (AOCI), if there is a change in the parent's ownership interest, the carrying amount of AOCI is to be adjusted through a corresponding charge or credit to equity attributable to the parent.

**Changes resulting in loss of control.** If a parent company ceases to have a controlling financial interest in a subsidiary, the parent is required to deconsolidate the subsidiary as of the date on which its control ceased. Examples of situations that can result in a parent being required to deconsolidate a subsidiary include:

1. Sale by the parent of all or a portion of its ownership interest in the subsidiary resulting in the parent no longer holding a controlling financial interest,
2. Expiration of a contract that granted control of the subsidiary to the parent,
3. Issuance by the subsidiary of stock that reduces the ownership interest of the parent to a level not representing a controlling financial interest,
4. Loss of control of the subsidiary by the parent because the subsidiary becomes subject to control by a governmental body, court, administrator, or regulator.

If a parent effects a deconsolidation of a subsidiary through a nonreciprocal transfer to owners, such as through a spin-off transaction, the transaction is accounted for under ASC 845. Otherwise, the parent is to account for the deconsolidation by recognizing, in net income, a gain or loss attributable to the parent. The gain or loss is measured as follows:

FVCR	=	Fair value of consideration received, if any
FVNIR	=	Fair value of any noncontrolling investment retained by the former parent at the deconsolidation date
CVNI	=	Carrying value of the noncontrolling interest in the former subsidiary on the deconsolidation date, including any accumulated other comprehensive income attributable to the noncontrolling interest
CVAL	=	Carrying value of the former subsidiaries' assets and liabilities at the deconsolidation date.

$$(+ \text{FVNIR} + \text{CVNI}) - \text{CVAL} = \text{Deconsolidation Gain (Loss)}$$

Should the parent's loss of controlling financial interest occur through two or more transactions, management of the former parent is to consider whether the transactions should be accounted for as a single transaction. In evaluating whether to combine the transactions, management of the former parent is to consider all of the terms and conditions of the transactions as well as their economic impact. The presence of one or more of the following indicators may lead to management concluding that it should account for multiple transactions as a single transaction:

1. The transactions are entered into simultaneously or in contemplation of one another,
2. The transactions, when considered in tandem, are in substance a single transaction designed to achieve an overall commercial objective,
3. The occurrence of one transaction depends on the occurrence of at least one other transaction,
4. One transaction, when considered on its own merits, does not make economic sense, but when considered together with the other transaction or transactions would be considered economically justifiable.

Obviously, this determination requires the exercise of sound judgment and attention to economic substance over legal form.

This guidance does not apply to sales of real estate or the conveyance of oil and gas mineral rights. Refer to ASC 360-20 and 976-605 for the appropriate guidance for real estate, and to ASC 932-360 for oil and gas mineral rights.

**Allocation of net income and other comprehensive income to the parent and non-controlling interest.** In preparing consolidated financial statements, the parent eliminates 100% of the intercompany income or loss. This elimination is not affected by the existence of a noncontrolling interest since the consolidated financial statements purport to present the financial position and economic performance of a single economic entity. The elimination of the intercompany income or loss may be allocated between the parent and noncontrolling interests.

Revenues, expenses, gains, losses, net income or loss, and other comprehensive income are reported in the consolidated financial statements at the consolidated amounts that include amounts attributable to the owners of the parent company and the noncontrolling interest. Net income or loss, and other comprehensive income or loss, are allocated to the parent and the noncontrolling interest.

Losses allocated to the parent and to the noncontrolling interest may exceed their respective interests in the equity of the subsidiary. When this occurs, and if it continues to occur in subsequent periods, the excess as well as any further losses continue to be allocated to the parent and noncontrolling interest, even if this allocation results in a deficit balance in noncontrolling interest.

#### **ASC 805-40, Reverse Acquisitions**

**Introduction.** A reverse acquisition is a stock transaction that occurs when one entity (the legal acquirer) issues so many of its shares to the former owners of another entity (the legal acquiree) that those former owners become the majority owners of the resultant consolidated enterprise. As a result of the transaction, the legal and accounting treatments will differ, with the legal acquiree being treated as the acquirer for financial reporting purposes. While often the legal acquirer will adopt the acquiree's name, thus alerting users of the financial statements to the nature of the organizational change, this does not necessarily occur, and, in any event, it is critical that the financial statements contain sufficient disclosure so that users are not misled. This is particularly important in the periods immediately following the transaction, and especially when comparative financial statements are presented that include periods prior to the acquisition, since comparability will be affected.

**Structure of the transaction.** A typical reverse acquisition (see diagram on page 916) involves a public company and a nonpublic operating company. The objective is for the nonpublic entity to "go public" without the usual time-consuming and expensive registration process involved in a formal initial public offering (IPO). However, reverse acquisitions are not limited to such situations, and such transactions have occurred involving two public or two nonpublic companies.

It had become popular for private companies to use this technique by locating a *public shell* (a publicly held company that is dormant or inactive) to serve as the legal acquirer/accounting acquiree. The staff of the SEC Division of Corporate Finance provided the following interpretive guidance in March 2001 that effectively ended the use of reverse acquisition accounting when a public shell is involved:

*The merger of a private operating company into a nonoperating public shell corporation with nominal net assets typically results in the owners and management of the private company having actual or effective operating control of the combined company after the transaction, with shareholders of the former public shell continuing only as passive investors. These transactions*

*are considered by the staff to be capital transactions in substance, rather than business combinations. That is, the transaction is equivalent to the issuance of stock by the private company for the net monetary assets of the shell corporation, accompanied by a recapitalization. The accounting is identical to that resulting from a reverse acquisition, except that no goodwill or other intangible should be recorded.<sup>10</sup>*

In addition to the foregoing SEC guidance, ASC 805-40-25-1 imposed a requirement that, in transactions occurring after its effective date, the legal acquirer meet the definition of a business. Thus, the use of a public shell entity would not give rise to goodwill and should be accounted for as described in the SEC guidance.

The reverse acquisition is effected when the shareholders of the legal acquiree obtain control of the postacquisition consolidated enterprise, and most commonly this results from a stock-for-stock exchange. The public entity issues shares of newly registered common stock (the legal acquirer) to the shareholders of the nonpublic company in exchange for their ownership interests.

Based on the application of ASC 805-10-55-11 through 55-15, and as a result of the change in control effected by the exchange of stock, the legal acquiree entity is identified as the accounting acquirer of the legal acquirer/accounting acquiree.

**Continuation of the business of the legal acquiree.** Following a reverse acquisition, just as in any business combination, consolidated financial statements are to be presented. Although the financial statements will be identified as being those of the legal acquirer (which will be the legal owner of the legal acquiree), in substance these will be a continuation of the financial statements of the legal subsidiary/GAAP acquirer, with the assets, liabilities, revenues, and expenses of the legal acquirer being consolidated effective with the acquisition date. Put another way, the consolidated entity will be presented as a continuation of the business of the legal subsidiary, notwithstanding the formal structure of the transaction or the name of the successor enterprise.

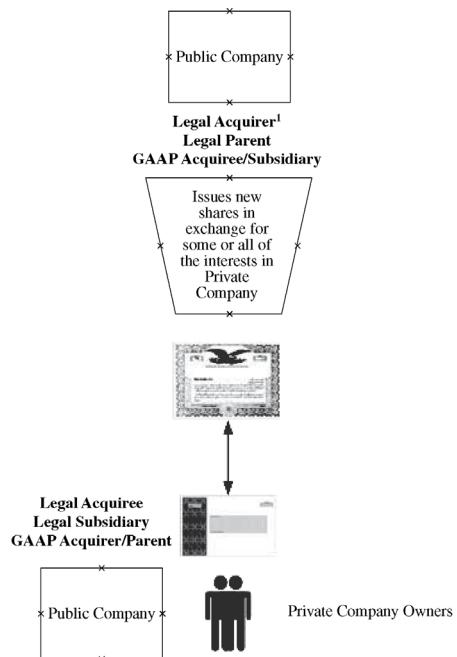

Comparative financial statements for earlier periods, if presented, are to be consistent, meaning that in order for them to be comparable to the postacquisition financial statements, these would also need to represent the financial statements of the legal acquiree. Since in some instances the acquiree's name is different than that shown in the heading, care must be taken to fully communicate with the readers. The fact that the prior period's financial information, identified as being that of the legal parent, is really that of the legal acquiree is obviously extremely pertinent to a reader's understanding of the financial statements.

If the legal parent/accounting subsidiary does not change its name to that of the accounting parent, it is essential that the financial statement titles be captioned in a way that clearly communicates the substance of the transaction to the readers. For example, the statements may be headed "ABC Company, Inc.—successor to XYZ Corporation."

<sup>10</sup> "Frequently Requested Accounting and Financial Reporting Interpretations and Guidance"; Accounting staff members of the Division of Corporation Finance, U.S. SEC; Washington, D.C.; March 31, 2001; [www.sec.gov/divisions/corpfin/guidance/cfactfaq.htm](http://www.sec.gov/divisions/corpfin/guidance/cfactfaq.htm).

### Structure of Typical Reverse Acquisition

<sup>1</sup> The legal name of the public company/legal acquirer is used in the consolidated financial statements; however disclosure is included that the entity is a continuation of the business of the legal acquiree/subsidiary.

**Equity structure adjustments.** One adjustment to the financial statements is unique to a reverse acquisition. Management is to retroactively adjust the capital of the legal acquiree/GAAP acquirer to reflect the legal capital of the legal acquirer/GAAP acquiree. The adjustment is necessary in order for the consolidated statement of financial position to reflect the capital of the legal parent/GAAP subsidiary. Information presented for comparative purposes in the consolidated financial statements is also to be retroactively adjusted to reflect the legal parent's legal capital.

**Consolidation procedures.** The consolidated financial statements present the continuation of the financial statements of the legal subsidiary with the exception of its capital structure. Thus, those postcombination consolidated financial statements will reflect, per ASC 805-40-45-2:

1. The assets and liabilities of the legal subsidiary/accounting parent recognized and measured at their precombination carrying amounts.
2. The assets and liabilities of the legal parent/accounting subsidiary recognized and measured as a business combination under ASC 805.
3. The retained earnings and other equity balances of the legal subsidiary/accounting parent *prior to* the business combination.
4. The consolidated equity structure (i.e., the number and type of equity interests issued) is to be adjusted to reflect the equity structure of the legal parent/accounting subsidiary, including the equity interests issued by the legal parent in order to effect the combination. To operationalize this adjustment, the legal subsidiary's equity structure is to be restated to reflect the number of shares of the legal parent issued in the reverse acquisition using the exchange ratio prescribed by the acquisition agreement.

5. The noncontrolling interest's proportionate share of the legal subsidiary's precombination carrying amounts of retained earnings and other equity interests as discussed in ASC 805-40-25-2 and ASC 805-40-30-3.

### **ASC 805-50, Related Issues**

#### **Pushdown Accounting<sup>11</sup>**

Under new basis (or *pushdown*) accounting, the amounts allocated to various assets and liabilities can be adjusted to reflect the arm's-length valuation reflected in a significant transaction, such as the sale of a majority interest in the entity. For example, the sale of 90% of the shares of a company by one shareholder to a new investor—which under the entity concept would not alter the accounting by the company itself—would, under new basis accounting, be “pushed down” to the entity. The logic is that, as under accounting for business combinations, the most objective gauge of “cost” is that arising from a recent arm's-length transaction.

Traditionally, GAAP has not permitted new basis accounting, in part because of the practical difficulty of demonstrating that the reference transaction was indeed arm's-length in nature. (Obviously, the risk is that a series of sham transactions could be used to grossly distort the “cost” and hence carrying values of the entity's assets, resulting in fraudulent financial reporting.) Also heavily debated has been where the threshold should be set (a 50% change in ownership, an 80% change, etc.) to denote when a significant event had occurred that would provide valid information on the valuation of the entity's assets and liabilities for financial reporting purposes.

Many of the more general issues of pushdown accounting (those applicable to traditional business acquisitions) have yet to be dealt with. For example, proponents of pushdown accounting point out that in a business combination a new basis of accounting is established, and that this new basis should be pushed down to the acquired entity and should be used when presenting that entity's own, separate financial statements. However, practical problems remain: For example, while pushdown makes some sense in the case where a major block of the investee's shares is acquired in a single free-market transaction, if new basis accounting were to be used in the context of a series of step transactions, continual adjustment of the investee's carrying values for assets and liabilities would be necessary. Furthermore, the price paid for a portion of the ownership of an investee may not always be meaningfully extrapolated to a value for the investee company as a whole.

#### **Applying Pushdown Accounting**

Pushdown accounting can be applied retrospectively as a change in accounting policy. Once applied, pushdown accounting cannot be undone. In addition, the SEC rescinded SAS Topic 5.J. Topic 5.J included the staff views on applying pushdown accounting. All entities, including public, will not apply. (ASU 2014-17)

Pushdown accounting is optional for an entity each time an acquirer obtains control of the entity, i.e., a change in control event. The acquirer must still apply business combination accounting.

Entities should weigh the costs/benefits and the needs of the financial statement users when deciding whether or not to apply pushdown accounting. Some private entities may opt to apply pushdown accounting in order to eliminate separate bases of accounting between parent and subsidiary or to report the fair value, rather than the historical basis, of assets and liabilities. Other

---

<sup>11</sup> See Technical Alerts section at the beginning of this chapter for important information on ASU 2014-17 and 2015-08.

private entities may choose not to use pushdown accounting to avoid dragging down earnings as a result of the stepped-up value associated with acquisition accounting.

### Example of pushdown accounting

Assume that Pullup Corp. acquires, in an open market arm's-length transaction, 90% of the common stock of Pushdown Co. for \$464.61 million. At that time, Pushdown Co.'s net book value was \$274.78 million (for the entire company). Book and fair values of selected assets and liabilities of Pushdown Co. as of the transaction date are summarized as follows (\$000,000 omitted):

	<i>Book value</i> <u>100% of entity</u>	<i>Fair value of</i> <u>90% interest</u>	<i>Excess of</i> <u>FV over book</u>
<b>Assets</b>			
Receivables	\$ 24.6	\$ 22.14	\$ 7.61
Inventory	21.9	19.71	5.09
Property, plant, and equipment, net	434.2	390.78	97.42
All others	<u>223.4</u>	<u>201.06</u>	0.00
Additional goodwill			<u>120.00</u>
Total assets	<u>\$704.1</u>	<u>\$633.69</u>	<u>\$230.12</u>
<b>Liabilities</b>			
Bonds payable	104.9	94.41	5.76
All other liabilities	<u>325.0</u>	<u>292.50</u>	<u>18.05</u>
Total liabilities	<u>429.9</u>	<u>386.91</u>	<u>12.29</u>
<b>Equity</b>			
Preferred stock	40.0	36.00	0.00
Common stock	87.4	78.66	0.00
Revaluation surplus*			217.83
Retained earnings	<u>146.8</u>	<u>132.12</u>	<u>0.00</u>
Total equity	<u>274.2</u>	<u>246.88</u>	<u>217.83</u>
Liabilities + equity	<u>\$704.1</u>	<u>\$633.69</u>	<u>\$230.12</u>

\* Net premium paid over book value by arm's-length of "almost all" common stock.

Assuming that "new basis" accounting is deemed to be acceptable and meaningful, since Pushdown Co. must continue to issue separate financial statements to its creditors and holders of its preferred stock, and also assuming that a revaluation of the share of ownership that did not change hands (i.e., the 10% noncontrolling interest in this example) should not be revalued based on the majority transaction, the entries by the subsidiary (Pushdown Co.) for purposes only of preparing stand-alone financial statements would be as follows:

Accounts receivable	7,610,000
Inventory	5,090,000
Plant, property, and equipment (net)	97,420,000
Goodwill	120,000,000
Discount on bonds payable	5,760,000
Other liabilities	18,050,000
Paid-in capital from revaluation	217,830,000

The foregoing entry would only be made for purposes of preparing separate financial statements of Pushdown Co. If consolidated financial statements of Pullup Corp. are also presented, essentially the same result will be obtained. The additional paid-in capital account would be eliminated against the parent's investment account, however, since in the context of the

consolidated financial statements this would be a cash transaction rather than a mere accounting revaluation.

There is also a body of opinion holding that the separate financial statements of Pushdown Co. in this example should be “grossed up” for the imputed premium that would have been achieved on the transfer of the remaining 10% ownership interest. This is less appealing, however, given the absence of a “real” transaction involving that last 10% ownership stake, making the price at which it would have traded somewhat speculative.

The foregoing example obviously also ignored the tax effects of the transaction. Since the step-ups in carrying value would not, in all likelihood, alter the corresponding tax bases of the assets and liabilities, deferred income tax effects would also require recognition. This would be done following the procedures set forth at ASC 740. See the chapter on ASC 740 for additional information.

### Accounting for Leveraged Buyouts

Another complex issue that arises in practice is the determination of the appropriate accounting treatment for a leveraged buyout (sometimes referred to as a bootstrap transaction or simply abbreviated as an LBO).

An LBO results from a highly leveraged single transaction or series of transactions in which all of the previously outstanding common stock in a target entity, “OLDCO,” is acquired from the target’s shareholders by “NEWCO,” a financial sponsor entity often organized as a private equity limited partnership.

The source of the financing for the LBO transaction is nonrecourse debt collateralized by the underlying assets of OLDCO, the acquiree. Thus, the acquiree’s own assets provide the underlying collateral to enable the acquirer to execute the transaction. The postacquisition operating cash flows expected to be generated by the acquiree are intended to provide the funding necessary to meet the debt service requirements.

When an LBO meets its initial expectations, it can provide an attractive return on the relatively minimal initial investment required by the sponsor/acquirer’s investors. However, when the acquiree’s postacquisition financial performance falls short of expectations, the potential for a default on the acquisition indebtedness is substantial and the previously successful business that made the target company an attractive acquisition candidate can end up in bankruptcy reorganization or in outright liquidation.

At the center of the accounting issue is the question of whether a new basis of accounting has been created by the execution of the LBO transaction notwithstanding the fact that the change in ownership occurred outside of the target entity through the purchase of shares from the target’s existing owners. Generally, under GAAP, such a transaction does not affect the reporting entity since that entity was not a party to the transaction.

However, it could be argued conceptually that the change in control of the target/acquiree is economically similar to the results that would be achieved if the sponsor/acquirer were to obtain control through a business combination transaction. Proponents of this economic substance over form argument hold that the execution of the LBO transaction would warrant a step-up in the reported amounts of the target/acquiree’s assets and/or liabilities. If a step-up is not recognized, the carryforward bases of the predecessor entity assets and liabilities continue to be reported in its financial statements.

The Emerging Issues Task Force (EITF) had addressed leveraged buyouts in several pre-Codification Consensuses (EITF 88-16, *Basis in Leveraged Buyout Transactions*, and EITF 90-12, *Allocating Basis to Individual Assets and Liabilities for Transactions within the Scope of Issue*

No. 88-16). However, both of these Consensuses were nullified in December 2007 by the issuance of FAS 141(R), *Business Combinations*, subsequently codified as Topic ASC 805.

Since FAS 141(R) was not required to be applied to transactions that preceded its effective date, the nullified EITF consensuses represent grandfathered guidance applicable to those transactions that were within their scope.

The EITF concluded that full or partial new basis accounting is appropriate only when the transaction results in a change in control of voting interests. EITF 88-16 established a series of mechanical tests by which this change in interest was to be measured. Three groups of interests were identified: (1) shareholders in the newly created company; (2) management; and (3) shareholders in the old company (who may or may not also have an interest in the new company). Depending upon the relative interests of these groups in the old entity (OLDCO) and in the new enterprise (NEWCO), there will be either (1) a finding that the transaction was a business combination (new basis accounting applies), or (2) a finding that it was a recapitalization or a restructuring (carryforward basis accounting applies).

Among the tests that the EITF decreed to determine proper accounting for any given LBO transaction is the *monetary test*. This test required that at least 80% of the net consideration paid to acquire OLDCO interests must have been monetary. In this context, monetary means cash, debt, and the fair value of any equity by securities given by NEWCO to selling shareholders of OLDCO. Loan proceeds provided OLDCO to assist in the acquisition of NEWCO shares by NEWCO shareholders were excluded from this definition. If the portion of the purchase effected through monetary consideration was less than 80%, but other criteria of EITF 88-16 were satisfied, there would be a step-up. This step-up was limited to the percentage of the transaction represented by monetary consideration.

EITF 88-16 presented an extensive series of examples illustrating the circumstances that would and would not meet the former purchase accounting criteria to be employed in an LBO.

### **Non-Sub Subsidiaries**

An issue that has concerned accountants and the SEC is the popularity of what have been called *non-sub subsidiaries*. This situation arises when an entity plays a major role in the creation and financing of what is often a start-up or experimental operation, but does not take an equity position at the outset. For example, the sponsor might finance the entity by means of convertible debt or debt with warrants entitling it to the later purchase of common shares. The original equity in such arrangements is often provided by the creative or managerial talent engaged in the new entity's operations, who generally exchange their talents for an equity interest. If the operation prospers, the sponsor will exercise its rights and obtain a majority voting stock position; if the operation fails, the sponsor presumably avoids reflecting the losses in its financial statements.

While this strategy may seem to avoid the requirements of equity method accounting or consolidation based on majority voting ownership, the economic substance of the arrangement clearly suggests that the operating results of the sponsored entity be reflected as a subsidiary in the consolidated financial statements of the sponsor who, in substance, is fulfilling the customary role of a parent, even absent ownership of voting stock.

The entities described above are often similar in structure and purpose to what were formerly called "special-purpose entities" or "special-purpose vehicles" and which have now been identified as "variable interest entities."

Joint operating activities	922	third parties	923
Overview	923	Example of a collaborative arrangement	924
<b>Definitions of Terms</b>	<b>923</b>		

## PERSPECTIVE AND ISSUES

---

### Subtopic

ASC 808-10, *Collaborative Arrangements*, contains one subtopic:

- ASC 808-10, *Overall*, which defines collaborative arrangements and gives reporting requirements.

### Scope

ASC 808-10 applies to all collaborative arrangements, except for those addressed in other topics. Specifically excluded from ASC 808 are:

1. Arrangements for which the accounting treatment is addressed by other authoritative literature, (ASC 808-10-15-3)
2. Guidance regarding matters such as:
  - a. Determining the appropriate units of accounting,
  - b. Determining the appropriate recognition requirements for a given unit of accounting,
  - c. The timing of when recognition criteria are considered to have been met. (ASC 808-10-15-5)

A collaborative arrangement is not *primarily* conducted through a separate legal entity created for it. If a part of the arrangement is conducted through a legal entity, that part is accounted for under ASC 810. (ASC 808-10-15-4)

**Endeavor.** An activity (referred to as an “endeavor”) that is the subject of a joint operating arrangement is characterized as a collaborative arrangement within the scope of the pronouncement if:

1. The endeavor involves two or more parties.
2. Both (all) of the parties are:
  - a. Active participants in the endeavor, and
  - b. Exposed to significant risks and rewards that depend on the endeavor’s commercial success.

**Timing of determination or redetermination.** A participant may become involved in a collaborative arrangement at any time during the life cycle of the endeavor. From the perspective of a participant, determination of whether an endeavor is a collaborative arrangement is to be made at the inception of the arrangement or when the participant initially becomes involved in the arrangement based on the facts and circumstances existing at that time. A participant is to reevaluate whether the arrangement continues to qualify as a collaborative arrangement any time there is a change in a participant's role in the arrangement or a change in a participant's exposure to risks or entitlement to rewards from the arrangement. (ASC 808-10-15-6)

**Joint operating activities.** (ASC 808-10-15-7) Collaborative arrangements are used to conduct many different types of business activities. For example:

- Two or more parties may agree to collaborate on joint operation of a facility, such as a hospital or long-term care nursing facility.
- Two professional services firms (e.g., architects, engineers, consultants) may choose to jointly submit a proposal to obtain a new engagement that neither would have the capacity and/or capability to perform on its own.
- A movie studio may collaborate with another studio because it wants to produce a film starring an actor who is under contract with another studio, or two studios may wish to spread the cost (and, of course, the risk) of producing a film.
- Frequently, in the pharmaceutical industry, two companies engage in a joint operating activity to research, develop, market, manufacture, and/or distribute a drug candidate, including the process of obtaining all necessary regulatory approvals in one or more geographic markets.

A collaborative arrangement may involve various types of activities conducted or supervised by the participants, including but not limited to research, development, branding, promotion, sales, marketing, order processing, package design, manufacturing, and distribution. In some collaborative arrangements, a legal entity may be used for certain specified activities or in certain geographic jurisdictions due, for example, to legal restrictions imposed by the jurisdiction.

The participants' roles and responsibilities vary between arrangements but can be structured where certain responsibilities are shared between the participants and other responsibilities are solely the responsibility of one of the participants.

**Active involvement.** (ASC 808-10-15-8) In evaluating whether a participant is active with respect to an endeavor, management is to consider the arrangement's specific facts and circumstances. Examples of involvement that could constitute active participation include, but are not limited to:

1. Directing and executing the activities of the endeavor,
2. Participating on a steering committee or other oversight or governance body,
3. Possessing a legal or contractual right to the intellectual property that underlies the endeavor.

Solely providing financial resources to an endeavor would not constitute an active level of involvement for the purposes of ASC 808. (ASC 808-10-15-9)

**Significant risks and rewards.** (ASC 808-10-15-10 through 13) Management of a participant is to exercise its best judgment in evaluating whether the participant is exposed to significant risks and entitled to significant rewards. Consideration is to be given to the terms and conditions of the arrangement and the facts and circumstances surrounding it, including:

- The stage of the endeavor's life cycle at which the participant is commencing its involvement

- Management's expectations regarding the duration and extent of its financial participation in relation to the total expected duration and total expected value of the endeavor.

Examples of terms and conditions of an arrangement that may indicate that a participant is not exposed to significant risks or entitled to significant rewards include the following:

- Market rates are paid for services provided by the participant
- Ability of a participant to exit the arrangement without cause and recover all or most of its cumulative economic participation through the exit date
- Limits on the rewards that a participant is entitled to receive
- Allocation of initial profits from the endeavor to only one participant.

Frequently, a collaborative arrangement will involve the license of intellectual property with the participants to the arrangement exchanging consideration with respect to the license at the arrangement's inception. The existence of terms of this nature is not necessarily indicative of the participants not being exposed to significant risks or entitled to significant rewards.

## Overview

A collaborative arrangement (sometimes referred to in practice as "line-item" joint ventures or "virtual" joint ventures) is a contractual agreement between two or more parties (participants) to jointly conduct business activities for their mutual benefit without the formation of a separate entity in which to conduct the activities. These types of arrangements are commonly used for such purposes as:

- producing motion pictures;
- designing and developing hardware and/or software; or
- developing new pharmaceutical drugs.

Determining the proper accounting treatment for the various activities included in these endeavors is the subject of ASC 808, *Collaborative Arrangements*.

## DEFINITIONS OF TERMS

---

Source: ASC 808-10-20. Also see Appendix A, *Definition of Terms*, for additional terms related to this topic: Customer, Contract, and Revenue.

**Collaborative Arrangement.** A contractual agreement that involves a joint operating activity. These arrangements involve two (or more) parties that meet both of the following requirements:

1. They are active participants in the activity.
2. They are exposed to significant risks and rewards dependent on the commercial success of the activity.

**Endeavor.** The activity upon which participants in a collaborative arrangement collaborate. For example, in a biotechnology or pharmaceutical environment the endeavor may be the development and commercialization of a drug candidate. In the entertainment industry, it may be production and distribution of a motion picture.

## CONCEPTS, RULES, AND EXAMPLES

---

### Collaborative Arrangements—Presentation

**Accounting for transactions with unrelated third parties.** (ASC 808-10-45-1 and 45-2) A participant in a collaborative arrangement recognizes revenue earned and costs incurred in

transactions with third parties (parties that are not participants to the collaborative arrangement) in its income statement based on whether the participant is serving as a principal or an agent in the transaction as determined under ASC 605-45.<sup>1</sup> The principal should record the amounts on a gross basis. See the chapter on ASC 605 for more guidance. The equity method should not be applied to collaborative arrangements. (ASC 808-10-45-1 and 45-2)

### Example of a collaborative arrangement

Leonard Sporting Goods Company (LSG) and Maureen Metals LLC (MML) contractually agree to co-develop a new set of golf clubs using a special alloy and what they believe to be a revolutionary design. The terms of their Joint Development Agreement (JDA) are as follows:

#### *LSG responsibilities*

- Conducting all necessary research and development activities associated with the design of the club faces and shafts
- Developing the branding strategy, and designing the logo and product packaging
- Engaging a contract manufacturer and performing or supervising all manufacturing, warehousing, logistics, and order processing functions
- Carrying necessary inventories and insuring them against casualty loss
- Establishing prices, and performing all invoicing, credit checks, and collection activities.

#### *MML responsibilities*

- Conducting all necessary research and development on the development of the experimental alloy
- Handling all press relations and conducting the advertising campaign
- Filing of all patents associated with the product, its design, and materials
- Marketing the product in its home state and six surrounding states; sales orders originating in those states are to be forwarded to LSG for processing, and shipment, with LSG responsible for performing all of the activities specified above. In the specified states, MML has limited discretion regarding the pricing of the product.

Other provisions of the JDA include:

- All costs and operating profits are to be split by the participants 50%/50%.
- The participants will co-own the intellectual property arising out of the project.
- Due to legal considerations in the Grand Duchy of Leslie, all sales in that jurisdiction are required to be made by a legal entity duly established within its borders. Consequently, when orders are placed for shipment to the Duchy, LSG sells the golf clubs to Duchy Golf Sales Co. (DGS), a corporation chartered in the Duchy to enable DGS to then transact with the sporting goods retailer located in the Duchy. DGS is owned 50% each by LSG and MML, who each invested \$10,000 upon its incorporation on January 2, 20X1.
- On a quarterly basis each participant is to provide the other participant a full accounting for its activities with respect to the endeavor, and whichever participant has advanced a net amount in excess of its proportionate share of the operating results is entitled to receive an “equalization payment” from the other participant.

<sup>1</sup> When the new revenue guidance in ASU 2014-09 is implemented, this reference will change to 606-10-55-36 through 55-40.

The following summarizes the transactions associated with the endeavor for calendar year 20X1, including the final activities necessary to commence production of the product and deliver it to sporting good stores in time for the 20X1 holiday selling season.

	<i>Total endeavor results (000s omitted)</i>	<i>50% of endeavor results (excluding JV)</i>	<i>Joint venture results DGS</i>
Sales	\$9,200	\$4,600	\$500
Cost of sales	5,000	2,500	300
Gross profit	4,200	2,100	200
Operating expenses			
Advertising and promotion	500	250	
Bad debts	200	100	
Branding, package, and logo design	300	150	
Legal and patent filing fees	600	300	50
Research and development			
Alloy and metallurgy	200	100	
Club faces and shafts	300	150	
Shipping and delivery	600	300	20
Total operating expenses	2,700	1,350	70
Income from operations	\$1,500		\$130
× share of operating results allocable to each participant		× 50%	
	\$ 750		\$ 750

The annual “equalization” payment was computed as follows, based on the transactions reported by the participants:

	<i>(000s omitted)</i>	<i>Initially recorded in the accounting records of LSG</i>	<i>MML</i>
Sales	\$9,200	\$ –	–
Cost of sales	5,000	–	–
Gross profit	4,200	–	–
Operating expenses			
Advertising and promotion	–	500	
Bad debts	200	–	–
Branding, package, and logo design	300	–	–
Legal and patent filing fees	–	600	
Research and development			
Alloy and metallurgy	–	200	
Club faces and shafts	300	–	–
Shipping and delivery	600	–	–
Total operating expenses	1,400	1,300	
Income (loss) from operations prior to equalization	2,800	(1,300)	
Share of operating results per agreement	750	750	
Equalization payment (receivable) payable	\$2,050		\$ (2,050)

#### *Analysis*

1. *Determine applicability of ASC 808.* The endeavor involves two parties that are both actively involved and that share equally in both risks and rewards. The existence of the separate entity (DGS) does not disqualify the arrangement, since the joint operating activities are not *primarily*

conducted through the separate entity. Thus, from the perspective of the participants, the arrangement is considered a collaborative arrangement within the scope of ASC 808 for the year ended December 31, 20X1.

2. *Determine the accounting for the transactions in the separate legal entity.* DGS has no parent company that controls it via ownership as a voting interest entity or via other financial control as a variable interest entity (VIE). Thus, under ASC 323, each participant is to record its investment in DGS and apply the equity method to account for its investment in the joint venture as follows:

**I/2/20X1**

Investment in DGS	10,000
Cash	10,000

*To record initial investment in Duchy Golf Sales Co. joint venture*

**12/31/20X1**

Investment in DGS	65
Equity in earnings of investee (income statement)	65

*To record 50% interest in the earnings of the joint venture for the year*

3. Apply ASC 605-45<sup>2</sup> to determine which of the participants is principal and which is agent. Analysis under the provisions of ASC 605-45 yields the following results:

<u>Indicator (G = Gross; N = Net)</u>	<u>LSG</u>	<u>MML</u>
a. Is primary obligor	G	N
b. Has authority, within reasonable limits, to establish price	G	N*
c. Involved in determining specifications of product or service	G	N
d. Changes the product or performs part of the service	G	N
e. Has discretion in selection of suppliers	G	N
<u>Indicator (G = Gross; N = Net)</u>	<u>LSG</u>	<u>MML</u>
f. Exposed to inventory risks:		
1. General risk before order placed; upon customer return	G	N
2. Specific risk after order placed or during shipping	G	N
g. Exposure to credit risk	G	G
h. Earnings fixed vs. variable	G	G

\* In six states, MML has limited discretion with respect to sales price.

Under ASC 605-45, the party that is the primary obligor is a strong indicator of the party that serves as principal to the transactions. In addition, all of the other indicators point towards LSG being the principal. This is irrespective of the fact that MML does have limited authority in certain markets to negotiate price. Even in those limited states, LSG serves as the principal to the transaction. Both participants bear credit risk equally and are not limited to a percentage commission since they share equally in the commercial success of the endeavor, thus the applicability of indicators g and h is neutral between the parties. Based on the analysis of the above factors, management of both participants concluded that LSG is the principal to the transactions associated with the collaborative arrangement and MML functions as an agent.

Note that, in this fact situation, LSG is the principal for all sales other than those made through the joint venture. In some collaborative arrangements, this will not be the case and

---

<sup>2</sup> Upon implementation of ASU 2014-09 on revenue recognition, entities will look to the guidance in ASC 606-10-32-25 through 27.

management will be required to analyze differing sales arrangements to determine separately for each type of arrangement, the party that is the principal. As can be discerned from the analysis above, this involves the exercise of judgment in light of the specific facts and circumstances.

4. Determine the applicable GAAP for the transactions and elect an appropriate accounting policy to be disclosed and followed consistently. Management of LSG and MML summarized the various activities, revenues, and expenses associated with the arrangement as follows:

Natural classification	Participation with primary responsibility under JDA	Functional classification			Ongoing, major central operations?		
		Directly earned or incurred as principal in transactions with third-party customers	Design and development of product, co-owned intellectual property	Development of co-owned marketing-related intangibles	Marketing	LSG	MML
Sales to sporting goods stores	LSG	x				x	
R&D laboratory services; licensing	N/A						x
Advertising and promotion of product	MML				x	x	
Branding, logo, package design	LSG			x		x	
Credit, collections, bad debts	LSG	x				x	
Filing for patents	MML		x			x	x
Manufacturing, delivery, fulfillment	LSG	x				x	
R&D—Clubs	LSG		x			x	
R&D—Metals	MML		x			x	x

Based on the foregoing analysis, LSG's management determines that since it is the principal under ASC 605-45, LSG is required to present in its income statement, 100% of the sales, and cost of sales, and other related operating expenses that it incurred in connection with the endeavor. It is unable to find any authoritative GAAP that directly or by analogy would address how to account for the equalization payments it is required to make or entitled to receive. It analyzes the components of the payment and reflects them in LSG's income statement as follows:

#### Components of Equalization Payment to MML

*Presented as additional cost of sales; in effect the sharing of its gross profit with MML results in LSG realizing a reduced margin on its sales of these codeveloped products*

a.	MML share of gross profit	\$2,100
Reimbursements to MML for LSG share of expenses:		
<i>These functions were performed under the JDA by MML; LSG elects to present these as operating expenses; none of the advertising expenses were capitalizable as direct response advertising or required to be deferred prior to the first time the advertising takes place under LSG's accounting policies it adopted under ASC 720-35, Advertising Costs.</i>		
b.	Advertising and promotion	250
c.	Legal and patent filing fees	300
<i>LSG records the reimbursement to MML for the metallurgical research and development as additional research and development expense analogous with outsourced contract R&amp;D, since its laboratory did not have the experience or capability to perform such research.</i>		
d.	Research and development alloy and metallurgy	100
Reimbursement from MML for MML share expenses		
<i>LSG elects to present these reimbursements as reductions of its recorded expenses retaining their character; it believes its arrangement with MML to share half of the endeavor's results provides it the benefit of reduced costs and that the benefits it receives from the equalization payment should be characterized in its income statement as reductions of the expenses it would otherwise have borne on its own without MML's participation.</i>		
e.	Bad debts	(100)
f.	Branding, package, and logo design	(150)
g.	Research and development—club faces and shafts	(150)
h.	Shipping and delivery	(300)
Net equalization payment		<u>\$2,050</u>

**Leonard Sporting Goods Company**  
**Statement of Income**  
**Ignoring income taxes and other transactions (000s omitted)**  
**Year ended 12/31/20X1**

	Prior to application of ASC 808	Effects of equalization payment	Adjusted income statement
Sales	<u>\$9,200</u>		<u>\$9,200</u>
Cost of sales			
Sales to third parties	5,000		5,000
Reimbursement to MML as agent		a	<u>2,100</u>
Total cost of sales	<u>5,000</u>	<u>2,100</u>	<u>7,100</u>
Gross profit	<u>4,200</u>	(2,100)	<u>2,100</u>
Operating expenses			
Advertising and promotion	—	b	250
Bad debts	200	e	(100)
Branding, package, and logo design	300	f	(150)
Legal and patent filing fees	—	c	300

Research and development				
Alloy and metallurgy	—	d	100	100
Club faces and shafts	300	g	(150)	150
Shipping and delivery	600	h	(300)	300
Total operating expenses	1,400		(50)	1,350
Income (Loss) from operations	2,800		(2,050)	750
Equity interest in income of investee	65			65
Pretax income	\$2,865		\$(2,050)	\$ 815

MML's management analyzed the facts and circumstances associated with the collaborative arrangement. As a research laboratory, performing research and development activities for other entities under contractual arrangements is part of MML's ongoing major and central operations.<sup>3</sup> MML management reached the conclusion that, since LSG is the principal in the transactions with third parties, MML, as an agent, should not recognize revenue or the related cost of that revenue at their gross amounts, nor should it present expenses in the operating expense category in its income statement that are related to these transactions that it considers peripheral. Following this line of reasoning management classifies the activity related to the arrangement as follows:

**Maureen Metals LLC**  
**Statement of Income**  
**Ignoring income taxes and other transactions (000s omitted)**  
**Year ended December 31, 20X1**

<i>Revenues from collaborative arrangement</i>				
MML share of gross profit				\$2,100
Related expenses net of reimbursements				
Advertising and promotion	\$500		\$(250)	250
Bad debts				100
Branding, package, and logo design				150
Shipping and delivery				300
				800
Net revenues from collaborative arrangement				1,300
<i>Intellectual property design and development</i>				
Legal and patent filing fees	\$600		\$(300)	300
Research and development				
Metallurgical	200		(100)	100
Club faces and shafts				150
				550
Income from operations				750
Equity interest in income of investee				65
Pretax income				\$ 815

<sup>3</sup> The phrase "ongoing, major, or central operations" is used in CON 5 to differentiate activities from those that are incidental or peripheral to the reporting entity. Frequently, financial results from incidental or peripheral activities are presented in "other income and expense" if they are unusual or infrequent in nature, whereas the results from ongoing, major, or central operations are shown as components of operating income and expense.

Note MML management's position that the costs of developing the intellectual property and protecting it by filing for patents are part of its "ongoing, major, or central operations." Thus, those expenses are not considered directly related to its earnings as agent from the transactions occurring after the product was fully developed and shipments commenced. Although the details are presented for illustrative purposes, the net revenues from the collaborative arrangement could be shown as the first line in the income statement, and MML management could elect to voluntarily disclose the details in the notes to the financial statements to better inform the reader regarding the nature and results of the activities associated with the collaborative arrangement.

## PERSPECTIVE AND ISSUES

---

### Technical Alerts

**ASU 2015-02.** In February 2015, the FASB issued ASU 2015-02, *Consolidation—Amendments to the Consolidation Analysis*. The ASU is a result of a project to remove the deferral of variable interest entity (VIE) guidance in ASU 2009-17 and eliminate the risk and rewards approach. In the process of addressing the issue, the FASB also made other changes to the VIE consolidation model.

**Effective dates.** The ASU is effective for:

- Public business entities for annual periods and interim periods within those annual periods beginning after December 15, 2015.
- Nonpublic business entities for annual periods beginning after December 15, 2016 and interim periods beginning after December 15, 2017.

Early adoption is permitted.

Because early adoption is permitted and the changes are pervasive, the details of the changes are highlighted within this chapter where relevant. In brief, the ASU affects critical areas of consolidation guidance, including: scope, variable interest determination, determining whether an entity is a VIE, the VIE model, the voting interest model, and disclosures.

The ASU streamlines consolidation guidance by:

- Eliminating the presumption that general partners should consolidate a limited partnership
- Eliminating Subtopic 810-20, the consolidation model specific to limited partnerships
- Clarifying when fees paid to a decision maker should be factored into VIE consolidation
- Changing the guidance for assessing how related parties affect the VIE consolidation analysis
- Eliminating the indefinite deferral for certain investment funds, but creating a permanent scope exception or certain money market funds.

**ASU 2016-03.** In March 2016, the FASB issued a consensus of its Private Company Council, ASU 2016-03, *Intangibles—Goodwill and Other (Topic 350), Business Combinations (Topic 805), Consolidation (Topic 810), Derivatives and Hedging (Topic 815), Effective Date and Transition Guidance (a consensus of the Private Company Council)*. The ASU relates to several private company alternative updates issued previously through the private company initiative:

- Update 2014-02, *Intangibles—Goodwill and Other (Topic 350): Accounting for Goodwill*;
- Update 2014-03, *Derivatives and Hedging (Topic 815): Accounting for Certain Receive-Variable, Pay-Fixed Interest Rate Swaps—Simplified Hedging Accounting Approach*;
- Update 2014-07, *Consolidation (Topic 810): Applying Variable Interest Entities Guidance to Common Control Leasing Arrangements*; or
- Update 2014-18, *Business Combinations (Topic 805): Accounting for Identifiable Intangible Assets in a Business Combination*.

**Guidance.** The amendments in ASU 2016-03 make the guidance in ASUs listed above effective immediately by removing their effective dates. The amendments also include transition provisions that provide that private companies are able to forgo a preferability assessment the first

time they elect the accounting alternatives in the ASUs listed. However, any subsequent change to an accounting policy election requires justification that the change is preferable under ASC 250, *Accounting Changes and Error Corrections*. The ASU also extends the transition guidance in the ASUs listed above indefinitely. However, there is no intention to change how transition is applied for those two ASUs.

## Subtopics

ASC 810, *Consolidations*, consists of three subtopics:

- ASC 810-10, *Overall*, which has three subsections:
  - General
  - Variable Interest Entities, which explains how to identify VIEs and when the reporting entity should consolidate the entity
  - Consolidation of Entities Controlled by Contract, which provides guidance for entities that are not VIEs but are controlled by contract, including physician practices and physician practice management entities.
- ASC 810-20, *Control of Partnerships and Similar Entities*, which addresses the potential consolidation of those entities.
- ASC 810-30, *Research and Development Arrangements*, which provides direction on whether and how those arrangements should be consolidated. Upon implementation of ASU 2015-02, this section is superseded. See Technical Alert on ASU 2015-02 and detailed information on limited partnerships and similar entities later in this chapter.

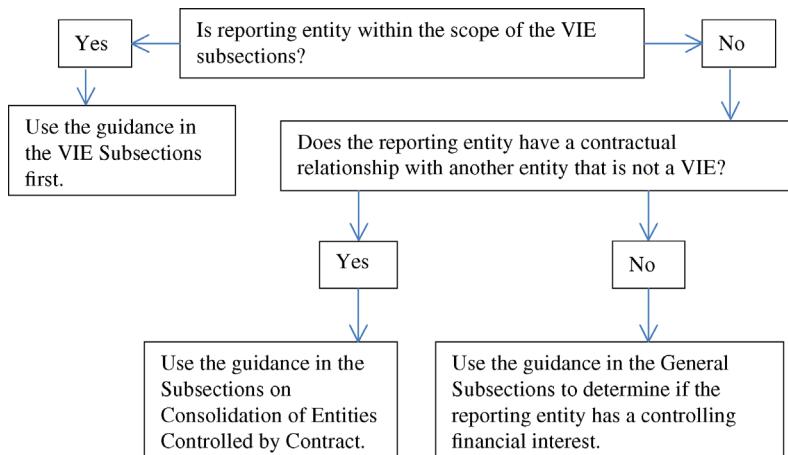

## Scope and Scope Exceptions

All *legal* entities are included in the scope of ASC 810. The application to not-for-profit entities is subject to additional guidance in ASC 958-810. Scope exceptions for ASC 810-10 are:

- general, applying to all subtopics under ASC 810-10, and
- specific, applying to VIEs.

**Applying the scope guidance.** If a reporting entity is within the scope of the VIE Subsections, that entity should apply that guidance first. If not, then the reporting entity should determine whether it has a direct or indirect controlling financial interest. This is defined as more than 50%. There are circumstances where an entity may hold a majority voting interest, but may not have a controlling interest, that is, the power to control the operations or assets of the investee. This is called a noncontrolling majority interest and may happen through a contract, lease, agreement with other stockholders or court decrees. (ASC 810-10-15-8) Also see information on VIEs within scope according to ASC 810-10-15-14, in ASC 2015-02 changes in a subsequent section.

If the reporting entity has a contractual management relationship that is not a VIE, the reporting entity should use the guidance in the 810-10 Subsections, *Consolidations of Entities Controlled by Contract*, to determine if the arrangement is a controlling financial interest.

**Exhibit—Determining Scope and Scope Exceptions (ASC 810-10-15-3)**

**General scope exceptions.** For entities that are not in the scope of the VIE subsection, a reporting entity should consolidate all entities in which the parent has a controlling financial interest, except:

- If the subsidiary:
  - Is in a legal reorganization
  - Is in bankruptcy
  - Operates under “foreign exchange restrictions, controls, or other governmentally imposed uncertainties, so severe that they cast significant doubt on the parent’s ability to control the subsidiary”
  - Is a broker dealer within the scope of ASC 940 and control is likely to be temporary.
- If the power of the majority voting interest shareholder is restricted by rights given to the noncontrolling shareholder (noncontrolling rights) and are so restrictive that it is questionable whether control exists with majority owners. (ASC 810-10-15-10)
- If control exists other than through ownership of a majority voting interest. Upon implementation of ASU 2015-02, this exception reads: “If control exists other than through ownership of a majority voting interest or a majority of kick-out rights through voting interests.”

The logic in these situations is that the reporting entity does not have control.

The guidance in ASC 810 does not apply to:

- An employee benefit plan subject to ASC 712, *Nonretirement Postemployment Benefits*, or to ASC 715, *Retirement Benefits*.
- The VIE model is deferred for investments accounted for at fair value, as per ASC 946. Upon implementation of ASU 2015-02, this exception will be: “An investment company within the scope of Topic 946 shall not consolidate an investee that is not an investment company.”
- A governmental organization.

- A financing entity established by a governmental organization, unless the financing entity meets both of the following conditions:
    - It is not a governmental organization, and
    - It is used by a business entity in a manner similar to a VIE to attempt to circumvent VIE accounting rules.
- (ASC 810-10-15-12)

**ASU 2015-02 Changes.** ASU 2015-02 adds a scope exception for certain money market funds. Once the ASU is implemented, the consolidation guidance will not apply to money market funds registered with the SEC pursuant to Rule 2a-7 of the Investment Company Act of 1940, that is, registered money market funds. The exception also includes similar unregistered money market funds. Although reporting entities that qualify for the scope exception do not have to apply the consolidation model, they will have to provide new disclosures. (ASC 810-10-15-12f)

**Variable interest entities within scope.** The VIE model applies when the reporting entity has a variable interest in a legal entity. Any legal entity that, by design, possesses one of the following characteristics is subject to consolidation under the VIE guidance:

1. The entity is thinly capitalized. The total equity investment at risk is not sufficient to permit the entity to finance its activities without additional subordinated financial support from either the existing equity holders or other parties. Normally, the equity provided by shareholders is sufficient to support operations. For this purpose, the total equity investment at risk:
  - a. Includes only equity investments in the entity that participate significantly in profits and losses even if those investments do not carry voting rights.
  - b. Does not include equity interests that the entity issued in exchange for subordinated interests in other variable interest entities.
  - c. Does not include amounts provided to the equity investor directly or indirectly by the entity or by other parties involved with the entity (for example, by fees, charitable contributions, or other payments), unless the provider is a parent, subsidiary, or affiliate of the investor that is required to be included in the same set of consolidated financial statements as the investor.
  - d. Does not include amounts financed for the equity investor (for example, by loans or guarantees of loans) directly by the entity or by other parties involved with the entity, unless that party is a parent, subsidiary, or affiliate of the investor that is required to be included in the same set of consolidated financial statements as the investor.
2. Equity lacks decision-making rights. Residual equity holders do not have the power, directly or indirectly, to make decisions about an entity's activities that significantly affect the entity's economic performance. The investors do not have that ability through voting rights or similar rights if no owners hold voting rights or similar rights (such as those of a common stockholder in a corporation or a general partner in a partnership).
3. Reporting entity lacks the obligation to absorb the expected losses of the entity. Conventionally, resident equity holders are exposed to the risks of ownership. The investor or investors do not have that obligation if they are directly or indirectly protected from absorbing the expected losses or are guaranteed a return by the entity itself or by other parties with whom the entity is involved.

4. Reporting entity lacks the right to receive expected residual returns of the entity. Conventionally, the resident shareholders enjoy the benefit of ownership. The investors do not have that right if their benefits are limited to a specified maximum amount by the entity's governing documents or arrangements with other variable interest holders or with the entity.
  5. The entity was established with nonsubstantive voting interest. The guidance contains what can be thought of as an anti-abuse clause. This is designed to prevent an entity from structuring in a way that allows the sponsor to avoid consolidation under the VIE mode. This provision includes a two-step test, both steps of which must be met:
    - First, the reporting entity must determine if the distribution of economic benefits generated by the entity is proportional to equity ownership and voting rights.
    - Second, if they are not proportional, the reporting entity determines whether substantially all of the entity's activities either involve of consolidated on behalf of a party that has disproportionately low voting rights relative to economic interest.
- (ASC 810-10-15-14)

**ASU 2015-02 Changes.** The section will incorporate guidance related to limited partners. This new guidance states that for number 2 above, limited partners lack power if a simple majority is not able to exercise substantive kick-out rights or participating rights over the general partner. For more detail, see the section later in this chapter on ASC 810-20.

**Variable interest entities scope exceptions.** As is clear from the above, a VIE differs from a voting interest entity because the VIE is structured in a way that voting rights are ineffective in determining which party has a controlling interest. In a VIE, control of an entity is achieved through arrangements that do not involve voting equity. The following are excluded from the scope of the subtopics and sections of ASC 810-10 governing variable interest entities (VIEs):

- Not-for-profit entities unless the entity was organized to avoid VIE status. It is important to note, however, that a not-for-profit organization can be a related party for the purpose of determining the primary beneficiary (parent) of a VIE by applying ASC paragraphs 810-10-25-42 through 44.
- Separate accounts of life insurance entities (ASC 944-80).
- An entity created prior to December 31, 2003, for which, after expending "exhaustive efforts," management of the variable interest holder is unable to obtain information needed to determine whether the entity is a VIE, determine whether the holder is the primary beneficiary, or make the required accounting entries required to consolidate the VIE.
- Entities that meet the definition of a business do not have to be evaluated by a variable interest holder to determine whether they are VIEs unless one or more of the following conditions exists:
  - The variable interest holder and/or its related parties/de facto agents<sup>1</sup> (de facto agents are discussed later in this chapter) participated significantly in the design or redesign of the entity. This factor is not considered when the entity is an operating joint venture

---

<sup>1</sup> For this purpose, the term "de facto agent" would exclude a party with an agreement that it cannot sell, transfer, or encumber its interests in the entity without the prior approval of the variable interest holder when that right could constrain the other party's ability to manage the economic risks or realize the economic rewards from its interests in a VIE through the sale, transfer, or encumbrance of those interests.

jointly controlled by the variable interest holder, and either one or more independent parties, or a franchisee.

- The design of the entity results in substantially all of its activities either involving or being conducted on behalf of the reporting entity and its related parties.
  - Based on the relative fair values of interests in the entity, the variable interest holder and its related parties provide more than half of its total equity, subordinated debt, and other forms of subordinated financial support.
  - The entity's activities relate primarily to one or both of the following:
    - Single-lessee leases
    - Securitizations or other forms of asset-backed financings.
- (ASC 810-10-15-17)

The above requirements for scope exceptions for businesses can be difficult to meet.

**Private company alternative for common control leasing arrangements.<sup>2</sup>** A private company may elect not to apply VIE guidance to a lessor under common control when:

- a. The private company lessee (the reporting entity) and the lessor legal entity are under common control,
  - b. The private company lessee has a leasing arrangement with the lessor legal entity,
  - c. Substantially all of the activity between the private company lessee and the lessor legal entity is related to the leasing activities (including supporting leasing activities) between those two entities, and
  - d. If the private company lessee explicitly guarantees or provides collateral for any obligation of the lessor legal entity related to the asset leased by the private company, then the principal amount of the obligation at inception of such guarantee or collateral arrangement does not exceed the value of the asset leased by the private company from the lessor legal entity.
- (ASC 810-10-15-17A)

Instead of consolidating, the private company would make certain disclosures about the lessor and the leasing arrangement. If elected, the accounting alternative should be applied to all leasing arrangements meeting the above conditions. The alternative should be applied retrospectively to all periods presented. (ASC 810-10-15-17B through 17C) The guidance applies to all entities *other than* a public business entity, a not-for-profit entity, or an employee benefit plan within the scope of Topics 960–965.

**Alternative approach for measuring the financial assets and the financial liabilities of a consolidated collateralized financing entity.** An entity may measure the financial assets and financial liabilities of a qualifying collateralized financial entity (CFE) using either the fair value of the financial assets or the financial liabilities, whichever is more observable.

Entities that elect this option are relieved from independently measuring the fair value of the financial assets and financial liabilities. Entities that do not elect the alternative must attribute any differences in the fair value to the controlling interest holder in the consolidated income statement.

An entity may use the alternative if it meets both of the following conditions:

- a. All of the financial assets and the financial liabilities of the collateralized financing entity are measured at fair value in the consolidated financial statements under other applicable

---

<sup>2</sup> See the Technical Alert section at the beginning of this chapter for an important update related to this topic.

Topics, other than financial assets and financial liabilities that are incidental to the operations of the collateralized financing entity and have carrying values that approximate fair value (for example, cash, broker receivables, or broker payables).

- b. The changes in the fair values of those financial assets and financial liabilities are reflected in earnings.

(ASC 810-10-15-17D)

This guidance is applied using:

- A modified retrospective approach by recording a cumulative-effect adjustment to equity as of the beginning of the annual period of adoption.
- A retrospective approach by applying the changes retrospectively to all relevant prior periods beginning with the annual period in which the amendments in ASU 2009-17, *Consolidations (Topic 810): Improvements to Financial Reporting by Enterprises Involved with Variable Interest Entities*, were initially adopted.

**Limited partnerships and similar entities.** An entity is within the scope of ASC 810-20 if the entity is required to apply the consolidation guidance in ASC 810-10 to its investment in a limited partnership. ASC 810-20 does not apply to:

- Limited partnerships or similar entities that are entities within the scope of the Variable Interest Entities Subsections of ASC 810-10.
- A general partner that carries its investment in the limited partnership at fair value with changes in fair value reported in a statement of operations or financial performance.
- Entities in industries in which it is appropriate for a general partner to use the pro rata method of consolidation for its investment in a limited partnership.
- Circumstances in which no single general partner in a group of general partners controls the limited partnership.

(ASC 810-20-15-2)

**ASU 2015-02 Changes.** Upon implementation of ASU 2015-05, ASC 810-20 is superseded. See section on ASC 810-20 later in this chapter for information on other changes regarding limited partnerships or similar entities and VIEs.

**ASC 810-30, Research and Development Arrangements.** ASC 810-30 is limited to those research and development arrangements in which all of the funds for the research and development activities are provided by the sponsor of the research and development arrangement. It does not apply to either:

- Transactions in which the funds are provided by third parties, which would generally be within the scope of Subtopic 730-20.
- Legal entities required to be consolidated under the guidance on variable interest entities.

(ASC 810-30-15-3)

## Overview

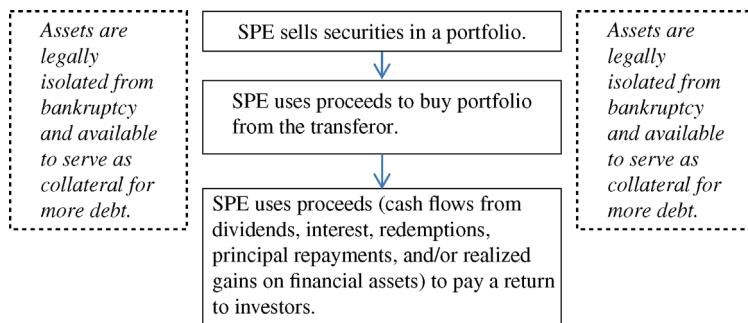

The requirement to consolidate financial statements over which a reporting entity has control is a long-standing tenet of GAAP. There is a presumption that consolidated financial statements are more meaningful and are necessary for a fair presentation. Historically, the assessment of whether or not to consolidate was based on the voting interest the reporting entity held in the investee—the voting interest model.

Over the years, managers and their advisors devised many new and creative types of ownership structures, financing arrangements, financial instruments, and business relationships. Perhaps no such type of financial arrangement or structure has received the same level of negative publicity as the special purpose entity (SPE). An SPE is narrowly defined as a trust or other legal vehicle to which a transferor transfers a portfolio of financial assets, such as mortgage loans, commercial loans, credit card debt, automobile loans, and other groups of homogeneous borrowings.

Commonly, SPEs have been organized as trusts or partnerships (flow-through entities, to avoid double corporate income taxation), and the outside equity participant was ultimately defined as having as little as 3% of the total assets of the SPE at risk. No authoritative GAAP ever established this 3% threshold, but nevertheless it evolved somewhat by default and had been subject to varying interpretations under different sets of conditions.

In a process called a *securitization*, the SPE typically issues and sells securities that represent beneficial interests in the cash flows from the portfolio. The proceeds the SPE receives from the sale of these securities are used to purchase the portfolio from the transferor. The cash flows received by the SPE from the dividends, interest, redemptions, principal repayments, and/or realized gains on the financial assets are used to pay a return to the investors in the SPE's securities. By transferring packages of such loans to an SPE, these assets can be legally isolated and made "bankruptcy proof" (and thus made more valuable as collateral for other borrowings); various types of debt instruments can thus be used, providing the sponsor with fresh resources to fund future lending activities.

#### **Exhibit—Special Purpose Entity—Securitization Process**

Enron created SPEs to hide debt, avoid taxes, reward management, and otherwise conceal its true financial condition. These entities appeared to be separate legal entities which posed little risk or reward. This was not true, and the risk and rewards of ownership rested with Enron. Enron and other entities exploited GAAP's bright-line, 50% criterion for control.

The increasing use of special purpose entities structured in certain ways created accounting challenges and led to abuses, culminating in the Enron scandal. The FASB recognized the need to expand the existing consolidations model to take into account financial arrangements where parties other than the holders of a majority of the voting interests exercise financial control over another entity. In 2003, the FASB added to consolidation guidance the variable interest model.

FASB decided not to refer to entities within the scope of the eventual guidance as SPEs. This decision underscores the fact that the type of entity to which the guidance applies is more broadly defined than entities that qualify as SPEs involved in securitization transactions or even SPEs that hold nonfinancial assets. FASB coined the term *variable interest entity* (VIE) to designate an entity that is financially controlled by one or more parties that do not hold a majority voting interest. A party that possesses the majority of this financial control, if there is one, is referred to as the VIE's *primary*

*beneficiary.* The codification definition of “parent” includes a VIE’s primary beneficiary, and the definition of “subsidiary” includes a VIE that is consolidated by its primary beneficiary.

Over the years, the FASB continued to refine the VIE model, including ASUs issued in 2009, 2010, 2014, and 2015. The 2003 guidance instituted a risk and reward VIE model to determine the primary beneficiary. With changes made in ASU 2009-17, the model shifted from the quantitative risk and reward model to a more qualitative “power and economics” model. However, in ASU 2009-17 there were unintended consequences related to money market funds required to comply with Rule 2a-7 of the Investment Company Act of 1940. In ASU 2010-10, the FASB responded to constituent concerns and created a deferral for many investment funds managed by asset managers. Entities meeting the deferral criteria continued to apply the risks and rewards approach. In ASU 2015-02, the FASB creates a scope exception for those entities.

## DEFINITIONS OF TERMS

---

Source: ASC 810. See Appendix A, *Definition of Terms*, for other terms relevant to this chapter: Acquiree, Acquirer, Acquisition by a Not-for-Profit Entity, Beneficial Interest, Business, Business Combination, Cash Equivalents, Combined Financial Statements, Component of an Entity, Contract, Customer, Debt Security, Direct Financing Lease, Equity Security, Fair Value, Lease, Lease Payments, Lessee, Lessor, Nonfinancial Asset, Nonprofit Activity, Nonreciprocal Transfer, Operating Lease, Operating Segment, Ordinary Course of Business, Public Business Entity, Readily Determinable Fair Value, Related Parties, Sales-Type Lease, Security, Underlying Asset, With Cause, Without Cause.

**Acquisition, Development, and Construction Arrangements.** Acquisition, development, or construction arrangements, in which a lender, usually a financial institution, participates in expected residual profit from the sale or refinancing of property.

**Collateralized Financing Entity.** A variable interest entity that holds financial assets, issues beneficial interests in those financial assets, and has no more than nominal equity. The beneficial interests have contractual recourse only to the related assets of the collateralized financing entity and are classified as financial liabilities. A collateralized financing entity may hold nonfinancial assets temporarily as a result of default by the debtor on the underlying debt instruments held as assets by the collateralized financing entity or in an effort to restructure the debt instruments held as assets by the collateralized financing entity. A collateralized financing entity also may hold other financial assets and financial liabilities that are incidental to the operations of the collateralized financing entity and have carrying values that approximate fair value (for example, cash, broker receivables, or broker payables).

**Consolidated Financial Statements.** The financial statements of a consolidated group of entities that include a parent and all its subsidiaries presented as those of a single economic entity.

**Consolidated Group.** A parent and all its subsidiaries.

**Decision Maker.** An entity or entities with the power to direct the activities of another legal entity that most significantly impact the legal entity’s economic performance.

**Decision-making Authority.** The power to direct the activities of a legal entity that most significantly impact the entity’s economic performance.

**Equity Interests.** Used broadly to mean ownership interests of investor-owned entities; owner, member, or participant interests of mutual entities; and owner or member interests in the net assets of not-for-profit entities.

**Expected Losses.** A legal entity that has no history of net losses and expects to continue to be profitable in the foreseeable future can be a variable interest entity (VIE). A legal entity that expects to be profitable will have expected losses. A VIE’s expected losses are the expected

negative variability in the fair value of its net assets exclusive of variable interests and not the anticipated amount or variability of the net income or loss.

**Expected Losses and Expected Residual Returns.** Expected losses and expected residual returns refer to amounts derived from expected cash flows as described in FASB Concepts Statement No. 7, *Using Cash Flow Information and Present Value in Accounting Measurements*. However, expected losses and expected residual returns refer to amounts discounted and otherwise adjusted for market factors and assumptions rather than to undiscounted cash flow estimates. The definitions of expected losses and expected residual returns specify which amounts are to be considered in determining expected losses and expected residual returns of a variable interest entity (VIE).

**Expected Residual Returns.** A variable interest entity's (VIE's) expected residual returns are the expected positive variability in the fair value of its net assets exclusive of variable interests.

**Expected Variability.** Expected variability is the sum of the absolute values of the expected residual return and the expected loss. Expected variability in the fair value of net assets includes expected variability resulting from the operating results of the legal entity.

**Kick-Out Rights.** The ability to remove the reporting entity with the power to direct the activities of a VIE that most significantly impact the VIE's economic performance.

**Noncontrolling Interest.** The portion of equity (net assets) in a subsidiary not attributable, directly or indirectly, to a parent. A noncontrolling interest is sometimes called a minority interest.

**Participating Rights (VIE Definition).** The ability to block or participate in the actions through which an entity exercises the power to direct the activities of a VIE that most significantly impact the VIE's economic performance. Participating rights do not require the holders of such rights to have the ability to initiate actions.

**Primary Beneficiary.** An entity that consolidates a variable interest entity (VIE). See paragraphs 810-10-25-38 through 25-38G for guidance on determining the primary beneficiary.

**Protective Rights.** Rights designed to protect the interests of the party holding those rights without giving that party a controlling financial interest in the entity to which they relate. For example, they include any of the following:

- a. Approval or veto rights granted to other parties that do not affect the activities that most significantly impact the entity's economic performance. Protective rights often apply to fundamental changes in the activities of an entity or apply only in exceptional circumstances. Examples include both of the following:
  1. A lender might have rights that protect the lender from the risk that the entity will change its activities to the detriment of the lender, such as selling important assets or undertaking activities that change the credit risk of the entity.
  2. Other interests might have the right to approve a capital expenditure greater than a particular amount or the right to approve the issuance of equity or debt instruments.
- b. The ability to remove the reporting entity that has a controlling financial interest in the entity in circumstances such as bankruptcy or on breach of contract by that reporting entity.
- c. Limitations on the operating activities of an entity. For example, a franchise agreement for which the entity is the franchisee might restrict certain activities of the entity but may not give the franchisor a controlling financial interest in the franchisee. Such rights may only protect the brand of the franchisor.

**Protective Rights (VIE Definition).** Rights that are only protective in nature and that do not allow the limited partners or noncontrolling shareholders to participate in significant financial and operating decisions of the limited partnership or corporation that are made in the ordinary course of business.

**Sponsor.** An entity that capitalizes a research and development arrangement.

**Subordinated Financial Support.** Variable interests that will absorb some or all of a variable interest entity's (VIE's) expected losses.

**Variable Interests.** The investments or other interests that will absorb portions of a variable interest entity's (VIE's) expected losses or receive portions of the entity's expected residual returns are called variable interests. Variable interests in a VIE are contractual, ownership, or other pecuniary interests in a VIE that change with changes in the fair value of the VIE's net assets exclusive of variable interests. Equity interests with or without voting rights are considered variable interests if the legal entity is a VIE and to the extent that the investment is at risk as described in paragraph 810-10-15-14. Paragraph 810-10-25-55 explains how to determine whether a variable interest in specified assets of a legal entity is a variable interest in the entity. Paragraphs 810-10-55-16 through 55-41 describe various types of variable interests and explain in general how they may affect the determination of the primary beneficiary of a VIE. (ASC 810-10-20)

## CONSOLIDATION MODELS—INTRODUCTION AND BACKGROUND

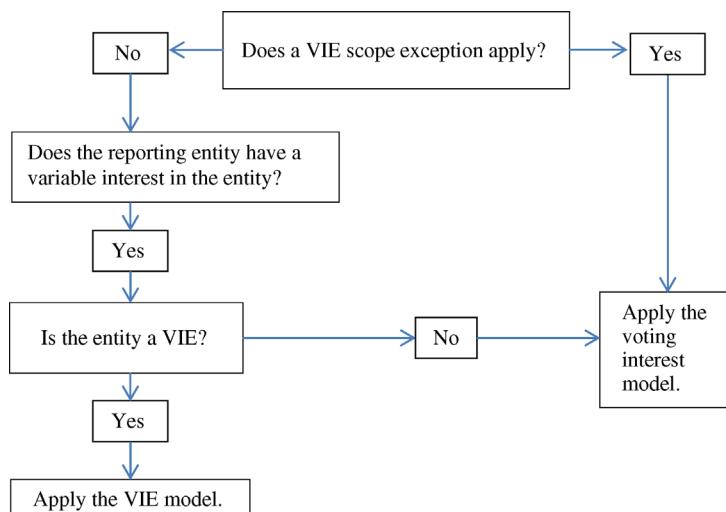

---

ASC 810 provides the primary authority for determining when presentation of consolidated financial statements is required. Consolidation is only required for legal entities within the scope of ASC 810. The rationale underlying ASC 810 is that when one enterprise directly or indirectly holds a controlling financial interest in one or more other enterprises, consolidated financial statements are more informative to users. There are two models for assessing whether a reporting entity has a controlling interest in the entity being evaluated for consolidation:

1. The voting interest model
2. The variable interest entity model.

The first step in determining which accounting model applies and which, if any, reporting entity must consolidate an entity is to determine if a VIE scope exception applies. Then the reporting entity must determine whether the entity under consideration for consolidation is a variable interest entity or a voting interest entity.

### Exhibit—Steps to Determine Which Consolidation Model Applies to a Legal Entity

## THE VIE MODEL

The VIE model identifies the party that has a controlling financial interest, and, therefore, whether or not the entity should be consolidated and by which reporting entity.

### Does a VIE Scope Exception Apply?

The reporting entity first determines if any of the VIE scope exceptions apply. See the “Scope and Scope Exceptions” section at the beginning of this chapter for additional guidance.

### Does the Reporting Entity Have a Variable Interest in the Entity?

A variable interest is an investment or other interest that will absorb portions of a VIE’s expected losses or receive portions of the entity’s expected residual returns. Variable interests in a VIE change with changes in the fair value of the VIE’s net assets, exclusive of variable interest.

### Is the Reporting Entity a VIE?

The definition of variable interest dictates that the financial statement preparer must determine whether a particular item either absorbs expected losses or receives expected residual returns (collectively referred to as expected variability) or both. Only those interests that absorb changes in the fair value of an entity’s net assets are considered variable interests. Changes in cash flows drive the success or failure of the entity. Thus, the cash flows create the variability in the entity. For example, ABC Equity Investment absorbs some or all of the fair value changes of VIE’s assets—its variability. ABC will receive a lower return on investment if VIE generates poor cash flows. The cash flows absorb some of the entity’s negative variability.

A variable interest is commonly found in:

- Equity or debt investments in a VIE,
- Financing provided to a VIE through such vehicles as guarantees or derivatives,
- A monetary arrangement with a VIE, perhaps through management or service contracts or leases, or
- Implicit relationships, particularly if a related party is involved.

ASC 810-10-55-16 through 55-41, *Identifying Variable Interests*, provides examples of potential variable interests. Each of the items below is potentially an explicit or implicit variable interest in an entity or in specified assets of an entity.

#### Exhibit—Examples of Potential Variable Interests

1. At-risk equity investments in a VIE
2. Investments in subordinated debt instruments issued by a VIE
3. Investments in subordinated beneficial interests issued by a VIE
4. Guarantees of the value of VIE assets or liabilities
5. Written put options on the assets of a VIE or similar obligations that protect senior interests from suffering losses
6. Forward contracts to sell assets owned by the entity at a fixed price
7. Stand-alone or embedded derivative instruments, including total return swaps and similar arrangements
8. Contracts or agreements for fees to be paid to a decision maker. (These are generally deemed to absorb variability unless the relationship between the entity and the decision maker meets

- specified criteria to be considered an employee/employer relationship or a “hired service provider” relationship, in which case the arrangement would not be deemed to create a variable interest. In this case, the fees would be included in computations of expected variability.)
9. Other service contracts with nondecision makers
  10. Operating leases that include residual value guarantees and/or lessee option to purchase the leased property at a specified price
  11. Variable interests of one VIE in another VIE
  12. Interests retained by a transferor of financial assets to a VIE.

All of these examples potentially qualify as variable interests. However, they may vary widely in the extent of their variability, and that has a direct effect on the determination of the primary beneficiary. (Note that an interest can qualify as a variable interest but the entity in which the interest is held may not qualify as a VIE.) The identification of a variable interest can be challenging. The financial statement preparer identifies variable interests by thoroughly analyzing the assets, liabilities, and contractual arrangements of an entity.

**Analyzing an entity’s design.** To address diversity in practice and provide consistency, in 2006 the FASB added a requirement to analyze an entity’s design to determine the variability the entity was designed to create and distribute to the holders of the interest. This determination affects:

- Which interests are variable interests
- Whether the entity is a VIE
- Which party, if any, is the primary beneficiary.

(ASC 810-10-25-21)

This “by design” assessment is applied in two steps:

1. Analyze the nature of the risks in the legal entity, including credit, interest rate, foreign currency exchange, commodity price, equity price, and operations risk. (ASC 810-10-25-24)
2. Determine the purpose for which the legal entity was created and the variabilities the legal entity is designed to create and pass along to interest holders. The role—to absorb or receive the legal entity’s variability—of the contract or arrangement in the design of the legal entity determines whether the interest creates variability or absorbs variability. Generally, the assets and operations of the entity create variability and, therefore, are not variable interests. On the other hand, liabilities and equities absorb the variability and, therefore, are variable interests. (ASC 810-10-25-26)

The analyst should review:

- the activities of the legal entity,
- contract terms,
- the nature of the legal entity’s interests issued,
- how those interests were negotiated or marketed to investors, and
- which parties had significant participation in the design or redesign of the legal entity.

Using the guidance, a qualitative analysis of the legal entity’s design will often be sufficient to determine the variability to consider. (ASC 810-10-25-29)

*Quantitative analysis of expected losses, expected residual returns, and expected variability.* The current VIE model can be seen as a “power and “economics” model. However, there are some provisions in the current guidance that reference the earlier expected

losses and expected residual returns model, and so it is useful to understand those concepts. Expected losses and expected returns are derived from expected cash flows as explained in CON 7, *Using Cash Flow Information and Present Value in Accounting Measurement*. It is important to note that expected losses and expected residual returns are not GAAP losses and income. They are statistical measures of the variability (or risk) inherent in the fair value of the entity.

This quantitative approach to analyzing the expected losses, expected residual returns, and expected variability is not required and should not be the only factor considered when determining whether the entity has the obligation to absorb significant losses or the right to receive significant benefits:

$$\text{Expected losses} + \text{Expected residual returns} = \text{Expected variability}$$

**Estimating expected future cash flows.** The absorbing/receiving of variability of the entity's cash flows is the sole determinant of whether an interest is a variable interest. In analyzing specific situations, the degree of variability can differ widely for each item. It is the role of the item to absorb or receive variability that distinguishes it as a variable interest. The role, in turn, often depends on the design of the legal entity. Therefore, it is critical for the financial statement preparer to understand the purpose and design of the entity being evaluated.

When estimating an entity's expected future cash flows in accordance with CON 7 a range of probability-weighted expected outcomes is used. Mathematically, this is simply a weighted-average calculation. The following example illustrates the mathematical concept of expected variability:

#### Example of expected variability of cash flows

Mided Mining Company is computing the probability-weighted expected future cash flows from operating and disposing of a tunnel boring machine that has a remaining estimated useful life of three years. This estimate was necessitated by ASC 360, which requires an evaluation, when certain events or circumstances occur, of whether the future cash flows associated with the use and disposal of long-lived assets are sufficient to recover their carrying value over their estimated remaining depreciable lives. Because of uncertainty regarding the amounts and timing of the cash flows, Mided's management used the CON 7 probability-weighted expected cash flow model with the following results:

	20X1	20X2	20X3	3-year outcome	Probability of occurrence	Probability-weighted expected outcome
Expected outcome 1	\$3,500	\$3,200	\$2,700	\$ 9,400	20%	\$1,880
Expected outcome 2	4,000	3,900	3,700	11,600	45%	5,220
Expected outcome 3	4,300	4,100	4,000	12,400	30%	3,720
Expected outcome 4	4,400	4,700	–	9,100	5%	455
					100%	
Probability-weighted expected cash flows (weighted-average)						\$11,275

The \$11,275 weighted-average, undiscounted, is compared to the carrying value of the tunnel boring machine to determine whether or not the carrying value is fully recoverable. The weighted-average consists of four different outcomes, each with its own estimated probability of occurrence. Since these amounts represent management's best estimates, management deems it possible that, at the end of the three-year period, any one of these outcomes could actually occur. When management considers the individual probability of occurrence for each of the four outcomes estimated above, the analysis yields the following results:

	[1] Probability- weighted 3-year outcome	[2] expected outcome	[3] [1] – [2] Variation	[4] Probability of occurrence	[5] [3] × [4] Probability- weighted variation	Positive variation	Negative variation
Expected outcome 1	\$ 9,400	\$11,275	\$(1,875)	20%	\$(375)	\$ –	\$(375)
Expected outcome 2	11,600	11,275	325	45%	146	146	–
Expected outcome 3	12,400	11,275	1,125	30%	338	338	–
Expected outcome 4	9,100	11,275	(2,175)	5%	(109)	–	(109)
				<u>100%</u>		<u>\$484</u>	<u>\$(484)</u>

Careful examination of the above analysis yields the following conclusions:

1. Variations naturally occur between expected outcomes and actual outcomes.
2. Because the expected outcome is calculated as an average, some of the amounts used to compute it will be higher than the average and some will be lower than the average.
3. When the individual variations are computed and each is multiplied by its probability of occurrence, the absolute value of the sum of the positive variations will exactly equal the absolute value of the sum of the negative variations.
4. When these two absolute values are summed ( $\$484 + \$484 = \$968$  in the example above), the result, the total variability in both directions, is called the expected variability of the cash flows.
5. The higher the expected variability of a set of cash flow estimates, the higher the level of risk and uncertainty associated with the estimate.

**Initial determination of VIE status.** Whether or not an entity qualifies as a VIE is initially determined on the date the reporting entity becomes involved with the legal entity. Involvement includes:

- Ownership,
- Contractual interest, or
- Other pecuniary interests.

This determination is based on the circumstances existing at that date, taking into account future changes that are required in existing governing documents and contractual arrangements.

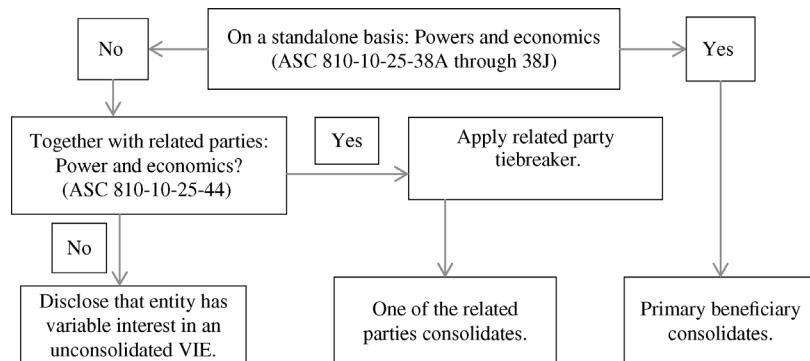

### Is the Reporting Entity the Primary Beneficiary?

Once the reporting entity has determined that:

1. A VIE scope exception does not apply, and
2. The reporting entity has a variable interest in the legal entity (ASC 810-10-55-16),

then the reporting entity applies the VIE model to determine if it is the primary beneficiary and, therefore, must consolidate the variable entity.

### Exhibit—Overview of the VIE Model

**How to determine if an interest holder is the primary beneficiary.** Once it is determined that the reporting entity has a variable interest in a VIE, the reporting entity must determine whether it has a *controlling* financial interest. This assessment includes:

- The characteristics of the reporting entity's variable interests
- Other involvement, including related parties or de facto agents
- The involvement of other interest holders
- The VIE's purpose and design.

The reporting entity is a primary beneficiary and must consolidate when it has:

- The *power* to direct the activities that most significantly affect the economic performance of the entity, *and*
- The *obligation* to absorb losses or the right to receive benefits of the entity that could be potentially significant to the entity.

(ASC 810-10-25-38A)

The primary beneficiary must consolidate the VIE regardless of the extent of ownership (or lack of it) by that entity. More than one entity may have the obligation to absorb losses or the right to receive benefits, but only one reporting entity will have the *power* to direct those activities of the VIE that most significantly affect the VIE's performance and, therefore, be the primary beneficiary. (ASC 810-10-25-38A) Only one enterprise should be identified as the primary beneficiary, with the determining factor being the power to direct those activities of the VIE most significantly impacting its economic performance. It is possible that no primary beneficiary can be identified.

**Shared power.** ASC 810 includes the concept of shared power when evaluating a primary beneficiary: Power is shared:

- if two or more unrelated parties together have the power to direct the activities of a VIE that most significantly impact the VIE's economic performance, and
- if decisions about those activities require the consent of each of the parties.

If power is shared with other unrelated parties and no one party has the power to direct activities that most significantly impact the VIE's economic performance, then the reporting entity is *not* the primary beneficiary. (ASC 810-10-25-38D)

**Fees paid to decision maker.** In some arrangements, a legal entity may outsource all or some decision making over the entity's activities through a contractual arrangement. The fees received by those decision makers or service providers may represent variable interests. Decision makers or service providers may include oil and gas operators, real estate property managers, asset managers, and so forth. The decision maker or service provider must assess the fee arrangement to determine if it qualifies as a variable interest.

**ASU 2015-02 Changes.** Currently, if a decision maker meets all six of the criteria below, it is not a variable interest. ASU 2015-02 eliminates three of the criteria as illustrated in the Exhibit below.

**Exhibit—Criteria to Determine Whether a Fee Paid to a Decision Maker or Service Provider Is a Variable Interest**

<b>Reference to ASC 810-10-25-55-37</b>	The fees paid to a decision maker or service provider is a variable interest if:
	<b>Criteria Retained by ASU 2015-02</b>
A	The fees are compensation for services provided and are commensurate with level of effort required to provide those services.

C	The decision maker or service provider does not hold other economic interests in the VIE that individually, or in the aggregate, would absorb more than an insignificant amount of the VIE's expected losses or receive more than an insignificant amount of the VIE's expected residual returns.
D	The service arrangement includes only terms, conditions, or amounts that are customarily present in arrangements for similar services negotiated at arm's length.
<b>Criterion Removed by ASU 2015-02</b>	
B	Substantially all of the fees are at or above the same level of seniority as other operating liabilities of the VIE that arise in the normal course of the VIE's activities, such as trade payables.
E	The total amount of anticipated fees is insignificant relative to the total amount of VIE's anticipated economic performance.
F	The anticipated fees are expected to absorb an insignificant amount of the variability associated with the VIE's anticipated economic performance.

**ASU 2015-02 Changes.** As can be seen in the Exhibit above, ASU 2015-02 retains the criterion to consider the level of other economic interests held by the decision maker. (ASC 810-10-25-37C above) Certain related-party interests need to be considered in assessing that criterion. A decision maker or service provider limits the extent to which related-party interests are included in Criterion C above and should consider only its direct interest plus its proportional share of the related party's or de facto agent's interests, unless the decision maker and related party are under common control. In that case, the decision maker should consider the related party's entire interest.

**Related-party considerations in determining the primary beneficiary.** For the purpose of a variable interest holder determining whether it is the primary beneficiary of a VIE, the definition of related parties is expanded from the definition set forth in ASC 850, *Related-Party Disclosures*, to include additional parties that act as "de facto agents" or "de facto principals" of the variable interest holder. Under the VIE model, the identification of related parties and de facto agents is an important step in evaluating which party should consolidate the entity. The following table sets forth the related parties as prescribed by ASC 850 as well as additional related parties designated for this purpose in ASC 810-10-25-42 and 43:

- | <u>Related parties</u>   | <u>De facto principals/agents</u>   |
|--|---|
| <ul style="list-style-type: none"> <li>Affiliates of the entity</li> <li>Entities for which investments in their equity securities would be required, absent the election of the fair value option under the Fair Value Option Subsection of Section 825-10-15, to be accounted for by the equity method by the investing entity</li> <li>Trusts for the benefit of employees, such as pension and profit-sharing trusts that are managed by or under the trusteeship of management</li> </ul> | <ul style="list-style-type: none"> <li>Parties that cannot finance their operations without subordinated financial support from the variable interest holder (e.g., another VIE of which the variable interest holder is the primary beneficiary)</li> <li>Parties that received their interest in the VIE as a contribution or loan from the variable interest holder</li> <li>Officers and employees of the variable interest holder</li> <li>Members of the governing board of the variable interest holder</li> </ul> |

- Principal owners of the entity and members of their immediate families
- Management of the entity and members of their immediate families
- Other parties with which the entity may deal if one party controls or can significantly influence the management or operating policies of the other to an extent that one of the transacting parties might be prevented from fully pursuing its own separate interests
- Other parties that can significantly influence the management or operating policies of the transacting parties or that have an ownership interest in one of the transacting parties and can significantly influence the other to an extent that one or more of the transacting parties might be prevented from fully pursuing its own separate interests.
- Parties that have agreements not to sell, transfer, or pledge their interests in the VIE as collateral without the prior approval of the variable interest holder where that prior approval right constrains that party's ability to manage the economic risks or realize the economic rewards from its interests
- Parties with a close business relationship to the variable interest holder such as the relationship of a professional service provider to one of its significant clients. (ASC 810-10-25-43)

The related-party attribution rules require consolidation of many of the currently popular SPE structures, unless the VIE is well capitalized and such subordinated support vehicles as loan guarantees are dispensed with.

**Related-party tie breaker.** The related-party tiebreaker test helps identify which related party in a group is the primary beneficiary. If two or more related parties (including the de facto principals/agents specified above) hold variable interests in the same VIE, and the aggregate variable interests held by those parties would, if held by a single party, identify that party as the primary beneficiary, then the member of the related-party group that is most closely associated with the VIE is the primary beneficiary and is required to consolidate the VIE as a subsidiary in its financial statements. In determining which party is most closely associated with the VIE, all relevant facts and circumstances are considered, including:

1. Whether there is a principal/agent relationship between parties within the related-party group
2. The relationship of the activities of the VIE to each of the parties in the related-party group
3. The significance of the VIE's activities to each of the parties in the related-party group
4. The extent of a party's exposure to the expected losses of the VIE
5. The structure of the VIE.

**Variable interests in “silos.”** A party may hold a variable interest in specific assets of a VIE (e.g., a guarantee or a subordinated residual interest). In computing expected losses and expected residual returns, a holder of a variable interest in specified assets of a VIE must determine if the interest it holds qualifies as an interest in the VIE itself. The variable interest is considered an interest in the VIE itself if either (1) the fair value of the specific assets is more than half of the total fair value of the VIE's assets, or (2) the interest holder has another significant variable interest in the entity as a whole.

If the interests are deemed to be interests in the VIE itself, the expected losses and expected residual returns associated with the variable interest in the specified assets are treated as being associated with the VIE. (ASC 810-10-25-55)

## Measurement

**Initial measurement with common control.** If the primary beneficiary of a VIE and the VIE itself are under common control, the primary beneficiary (parent) initially measures the assets, liabilities, and noncontrolling interests of the newly consolidated reporting entity at their carrying amounts in the accounting records of the entity that controls the VIE. (ASC 810-10-30-1)

**Initial measurement absent common control.** The rules governing the initial measurement of the assets and liabilities of a newly consolidated VIE conform closely to the rules governing other business combinations. The following table summarizes the rules.

**Accounting by a Primary Beneficiary (Parent)  
for Initial Consolidation of a Variable Interest Entity**

<i>Recognition or measurement issue</i>	<i>Accounting</i>
1. Measurement date	Acquisition date, which is the date the acquirer/primary beneficiary obtains control of the acquiree/VIE. (ASC 805-10-25-6)
2. Measurement amount for assets, liabilities, and noncontrolling interests	The initial consolidation of a VIE that is a business is a business combination and should be accounted for as discussed previously in this chapter.
3. Measurement exception for enterprises under common control	Carrying value (net book value or NBV) in the accounting records of the enterprise that controls the VIE with no “step-up.”
4. Assets and liabilities transferred to the VIE by the PB at, after, or shortly before the date of initial consolidation where the VIE <i>is not a business</i>	The assets and liabilities are measured at the same amounts in which the assets and liabilities would have been measured if they had not been transferred. No gain or loss is recognized on account of the transfer.
5. Assets and liabilities transferred to the VIE by the PB at, after, or shortly before the date of initial consolidation where the VIE <i>is a business</i>	If the VIE <i>is a business</i> , it should follow ASC 805-10-25-20 et seq., <i>Determining What Is Part of the Business Combination Transaction</i> , to assess the substance of such transfers and whether they are to be considered part of the business combination.
6. Recognition and measurement of goodwill	If the VIE is a business, goodwill is recognized and measured identical to the manner described for other business combinations. If the VIE is not a business, goodwill is not to be recognized and, instead, is recognized as a loss in the period of initial consolidation. That loss, however, is not to be characterized as extraordinary.
7. Recognition of negative goodwill	Irrespective of whether the VIE is a business, negative goodwill is not used to reduce the carrying values of any of the acquired assets or liabilities; rather it is recognized and measured identically with the manner described for business combinations as a gain on bargain purchase with a prohibition against characterizing the gain as extraordinary.

After initial measurement, the assets, liabilities, and noncontrolling interests of a consolidated variable interest entity are accounted for as if the entity were consolidated based on majority voting interests.

**Noncontrolling interests.** If there are other (noncontrolling) interests, these are shown in the consolidated balance sheet as minority interests, and likewise a share of the operating results of the VIE are allocated to the noncontrolling interests in the consolidated statements of income (operations). A noncontrolling interest represents the portion of equity (or net assets) in a subsidiary (VIE) that is not directly or indirectly attributable to a parent (primary beneficiary). Thus, parent companies of subsidiaries that are VIEs are required to fully record the non-controlling interest's share of VIE losses even if recording these losses results in a deficit in noncontrolling interest. ASC 810-10-45 requires that the noncontrolling interest be reported within the equity section of the consolidated statement of financial position, separately from the equity of the parent company, and clearly identified with a caption such as "noncontrolling interest in subsidiaries." Should there be noncontrolling interests attributable to more than one consolidated subsidiary, the amounts may be aggregated in the consolidated statement of financial position.

Only equity-classified instruments issued by the subsidiary may be classified as equity in this manner. If, for example, the subsidiary had issued a financial instrument that, under applicable GAAP, was classified as a liability in the subsidiary's financial statements, that instrument would not be classified as a noncontrolling interest since it does not represent an ownership interest.

**Sufficiency of equity investment at risk.** ASC 810-10-25-45 et seq. provides a 10% equity threshold test, which in practice is confusing and unworkable. The guidance indicates that an at-risk equity investment of less than 10% of the entity's total assets is presumptively not considered sufficient to permit the entity to finance its activities without obtaining additional subordinated financial support but then goes on to provide that the presumption of insufficiency can be overcome by either quantitative analysis, qualitative analysis, or both. Consequently, financial statement preparers could mistakenly rely on the 10% presumption to conclude that an entity with less than 10% at-risk equity is a VIE, when in fact, further analysis would contradict that conclusion. Conversely, the interpretation indicates that it is also possible that an entity can require at-risk equity of more than 10% in order to sufficiently finance its activities. Consequently, the financial statement preparer also cannot rely on meeting or exceeding the 10% threshold as conclusive proof that the entity is sufficiently capitalized to avoid being characterized as a VIE.

ASC 810-10-25 requires existing unconsolidated variable interest entities to be consolidated by their primary beneficiaries if the entities do not effectively disperse risks among the parties involved. Variable interest entities that effectively disperse risks will not be consolidated unless a single party holds an interest or combination of interests that effectively recombines risks that were previously dispersed.

**Implicit variable interests.** One of the most misunderstood aspects of this area of the literature is referred to as an implicit variable interest. The FASB staff attempts to clarify this matter in ASC 810-10-25-49 through 54 and ASC 810-10-55-88 through 89.

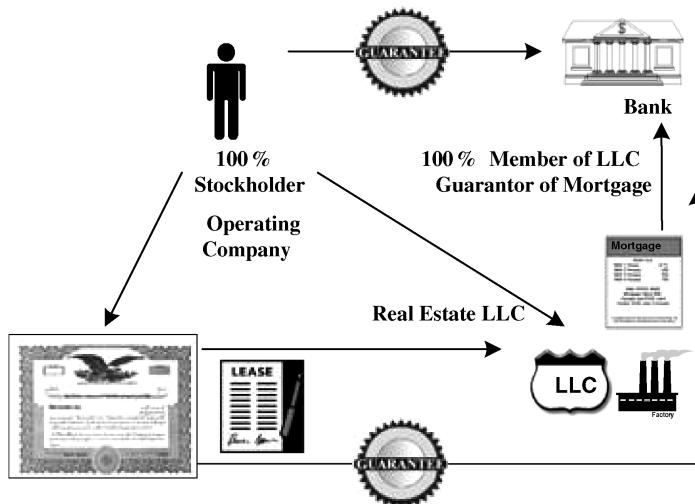

A party that did not explicitly issue a direct guarantee of another party's obligation may, nevertheless, be held to be an implicit guarantor of that obligation and thus hold a variable interest in the party whose debt is implicitly guaranteed.

**Example of application of ASC 810 to related-party leases**

The most commonly encountered potential VIE situations that occur in practice involve related-party leases. Business owners often organize a partnership or LLC (for this discussion we will assume an LLC) to own property that is leased to a business with the same or similar ownership. The transaction is structured in this manner for a number of reasons that include avoidance of double taxation of the gain on the eventual sale of the property and legal protection of the building from creditors of the operating business in the event of business bankruptcy.

In attempting to avoid lessee capitalization, the lease is often structured with a short initial term (e.g., three years), with the lessee having successive options to renew the lease at similar terms. The building is pledged as collateral under a mortgage with a third-party lender. The lessor entity is thinly capitalized (i.e., it has very little owner-invested equity). Consequently, the lender, besides holding a mortgage on the building as collateral, has further protected its interests by obtaining a loan guarantee from the lessee, an assignment of rents, and a personal guarantee of the owner.

These relationships are illustrated in the following diagram:

### Analysis under ASC 810

Following the decision diagrams and using the related-party/de facto principal and agent rules included in ASC 810:

1. The lessee holds a variable interest in the lessor in the form of the guarantee of the lessor's mortgage debt.
2. The lessor entity is not “scoped out” of ASC 810.
3. The lessor entity is a business. It has inputs (owned fixed assets), processes for managing its investment, and outputs relative to access to the lessee.
4. The following “further evaluation factors” apply:
  - a. The lessee/variable interest holder and its related parties participated significantly in the design of the lessor.
  - b. The design of the lessor LLC results in all of its activities involving and being conducted on behalf of the lessee/variable interest holder.

- c. The lessee/variable interest holder and its related parties provided 100% of the subordinated financial support for the lessor entity.
- d. The lessor entity's activities relate to a single-lessee lease.
5. The lessee/evaluator and its related-party owner were involved in the design of the lessor entity.
6. The lessee's variable interest is assumed to be *significant* for the purpose of this analysis. ASC 810 does not provide guidance on making this determination.
7. The lessee's variable interest is in the leased asset.
8. The fair value of the leased asset represents 100% of the total fair value of the lessor's assets and thus is deemed to be an interest in the lessor as a whole versus an interest in just the specified assets of the lessor.
9. The at-risk equity holder of the lessor does not meet the second criterion for being considered to hold a controlling financial interest (i.e., the variable interest holder/lessee could potentially absorb expected losses of the lessor should the lessee be called upon by the lender to perform under the guarantee of the lessor's indebtedness). Note that, in this case, the other two criteria for controlling financial interest are met.
10. As a result of the analysis up to this point, it can be concluded that the lessor is a variable interest entity.
11. No silos exist, since 100% of the fair value of the assets is leased to the single lessee.
12. Application of the related-party/de facto principal and agent rules to the variable interests in the lessor indicates that 100% of the expected losses and expected residual returns from the lessor are allocable to the members of the related-party group (the lessee and the related-party owner of both). Thus, collectively, the lessee and its 100% stockholder are the primary beneficiary of the VIE/lessor. The party most closely associated with the leased property is the lessee who, consequently, is considered the primary beneficiary that is required to consolidate the lessor in its financial statements.

**Other lease terms and provisions.** The following discussion examines the effect that certain changes to the above facts would have on the foregoing conclusions.

**Existence or absence of guarantees.** Even if the stockholder/member's guarantee of the mortgage is not required by the lender and only the lessee guaranteed the debt, the analysis above would be identical. Due to the fact that the lessee/variable interest holder is exposed to the expected losses of the lessor under the terms of the guarantee, the lessor/LLC's sole member (and at-risk equity holder) is not the only party that potentially would absorb expected losses of the lessor.

Conversely, when ASC 810 was originally issued, many observers initially believed if the lessee was not required by the lender to guarantee the mortgage, and the only guarantee was that of the stockholder/member, that the absence of an explicit variable interest held by the lessee would preclude the conclusion that the lessor was a VIE.

This situation illustrates one of the most misunderstood provisions of ASC 810—referred to as an *implicit variable interest*—which the FASB staff attempts to clarify in ASC 810-10-25-49 et seq.

Even though the lessee did not directly guarantee the debt of the lessor, consideration must be given to the likely scenarios if the lessor/LLC should be close to a default on the mortgage payments. Realistically, what is the likelihood that the sole stockholder/sole member would perform under his or her personal guarantee obligation rather than directing the lessee to pay additional rent sufficient to enable the LLC to keep its mortgage payments current?

Clearly, it would not make economic sense for the sole stockholder/member to perform personally under the guarantee, as this would, in substance, result in the stockholder/member making a loan or capital contribution to an otherwise insolvent LLC. Instead, it would logically follow that the best course of action would be for the lessee to pay rent in amounts adequate to fund the LLC's mortgage payments so that the lessee would continue to have use of the leased premises without concern over whether the bank will foreclose on and sell the property to a third party. If the lessee were having difficulty funding the rent payments, its owner would probably authorize it to borrow money or sell assets in order to enable it to do so before its owner used personal funds to perform under the guarantee.

After analyzing this situation, with appropriate attention to the substance rather than simply its form, it can be seen that the lessee is the holder of an implicit variable interest in the lessor in the form of an implicit guarantee of the lessor's mortgage debt.

The remainder of the analysis would be identical to what was presented earlier. Due to the fact that the lessee/variable interest holder is exposed to the expected losses of the lessor under the terms of the implicit guarantee, the lessor/LLC's sole member (and at-risk equity holder) is not the only party that potentially would absorb expected losses of the lessor.

Finally, consider the situation where neither the lessee nor the owner is required to guarantee the debt. A prudent lender would probably not waive both guarantees unless the lessor was sufficiently capitalized by the owner's at-risk equity. That is, there is a presumption that the lessor in such an instance is not a VIE. Under this scenario, the lessee would perform the quantitative analysis required to estimate expected losses and estimated residual returns to determine whether the lessor is a VIE and, if it is, whether it is the primary beneficiary.

**Above- or below-market rentals.** Rentals due under related-party leases sometimes exceed arm's-length market rentals because the owner is using the lessor as a conduit for the lessee to indirectly provide additional salary or dividends to the owner (characterized as the excess rent).

Under ASC 810, an operating lease is generally not considered to be a variable interest unless:

1. The lease terms include a lessee residual guarantee of the fair value of the leased asset, since this results in the lessee potentially absorbing estimated negative variability that would otherwise be absorbed by the equity holder of the lessor.
2. The lease terms include an option for the lessee to purchase the property at the end of the lease term at a specified price, since this means that the lessee potentially may receive estimated positive variability that would otherwise be received by the equity holder of the lessor.
3. The lease terms are not indicative of market terms for a similar property in the same geographic location, since this would result in the lessee either receiving estimated positive variability of the lessor (if the lease terms were below market) or absorbing negative variability of the lessor (if the lease terms were above market).

Under each of the foregoing scenarios, the lease is considered a variable interest in determining the primary beneficiary, because the expected losses of the lessor that would be borne by the lessee (the excess of the rentals required over the fair value of the right to use the leased property) exceed the amounts that would have been expected had the rentals been at fair value. Thus, the stockholder/member would not be considered to have a controlling financial interest, since s/he was not the only party exposed to the lessor's expected losses.

If the situation reversed, and the rentals were below market amounts, it could be logically concluded that the lessor was absorbing negative variability of the lessee and that, therefore, the

lease was a variable interest in the lessee held by the lessor that could potentially result in the lessor being considered the primary beneficiary of the lessee that would necessitate the lessor consolidating the lessee in its financial statements.

**Other contractual arrangements.** Leases are often accompanied by other contractual arrangements between the lessee and lessor. Such contractual arrangements can include management, marketing, brokerage, and other types of service agreements. These agreements must be carefully analyzed, as ASC 810 provides restrictive rules that often result in such agreements being characterized as variable interests.

All parties affected by these transactions should seek expert professional advice prior to either structuring a new transaction or modifying an existing transaction. For example, adverse income tax consequences could result from the transfer of property from one form of ownership to another.

#### Example of consolidation of a VIE—consolidation worksheet and journal entries

This example uses a structured related-party lease to illustrate application of the consolidation provisions of ASC 810-10-30.

Arielle Aromatics Ltd. (AAL) is a manufacturer of aromatherapy products that is 100% owned by Arielle Stone. AAL's headquarters and manufacturing plant are leased pursuant to an operating lease with an S Corporation, Myles' Management, Inc. (MMI), owned by Arielle's brother, Myles.

AAL's headquarters building and the land on which it is built are the only assets owned by MMI. They have been pledged as collateral for a mortgage loan that is guaranteed by a corporate guarantee of AAL and a personal guarantee of Arielle.

MMI has been determined to be a variable interest entity (VIE) and AAL its primary beneficiary.

The following is the consolidating worksheet at December 31, 20X1:

**Arielle Aromatics Ltd. and Subsidiary  
Consolidating Worksheet  
Year Ending December 31, 20X1**

(000 omitted)	Adjustments and Eliminations					
	<u>AAL</u>	<u>MMI</u>	<u>Debit</u>	<u>Credit</u>	<u>Noncont. interest</u>	<u>Consolidated</u>
<b>Statement of income:</b>						
Revenues						
Sales	\$ 6,400					\$ 6,400
Rental income		\$1,200 <sup>a</sup>	\$1,200			—
Cost of sales	3,800					3,800
Gross profit	2,600	1,200	1,200			2,600
Depreciation	100	230				330
Rent expense	1,200			\$1,200 <sup>a</sup>		—
Interest expense	200	400				600
Other expenses	300	—				300
Total operating expenses and interest	1,800	630		1,200		1,230
Income before noncontrolling interest share		570	1,200	1,200		1,370
Noncontrolling interest share of income					\$ 570	(570)
Net income	<u>\$ 800</u>	<u>\$ 570</u>	<u>\$1,200</u>	<u>\$1,200</u>	<u>\$ 570</u>	<u>\$ 800</u>

## Statement of retained earnings:

Retained earnings, beginning						
AAL	\$ 1,200					\$ 1,200
MMI		\$ -				-
Add net income (from above)	800	570	\$1,200	\$1,200	\$ 570	800
Deduct dividends paid	(100)	(500)			(500)	(100)
Retained earnings, ending	<u>\$ 1,900</u>	<u>\$ 70</u>	<u>\$1,200</u>	<u>\$1,200</u>	<u>\$ 70</u>	<u>\$ 1,900</u>
Statement of financial position:						
Cash	\$ 2,100					\$ 2,100
Accounts receivable, trade (net)	7,500					7,500
Rentals receivable		\$ 100	b	\$ 100		-
Inventories	1,100					1,100
Land		1,000				1,000
Depreciable property and equipment	1,200	7,000				8,200
Accumulated depreciation	(300)	(230)				(530)
Total assets	<u>\$11,600</u>	<u>\$ 7,870</u>		100		<u>\$19,370</u>
Notes and mortgages payable	\$ 5,000	\$ 6,900				\$11,900
Accounts payable, trade	4,400					4,400
Rent payable	100	b	\$100			
Total liabilities	<u>9,500</u>	<u>6,900</u>	100			<u>900</u>
Common stock	200	900				200
Retained earnings (from above)	1,900	70	1,200	1,200	\$970	1,900
Noncontrolling interest					970	970
Total stockholders' equity	<u>2,100</u>	<u>970</u>	1,200	1,200		<u>3,070</u>
Total liabilities and stockholders' equity	<u>\$11,600</u>	<u>\$7,870</u>	<u>\$1,300</u>	<u>\$1,200</u>		<u>\$19,370</u>

The consolidating entries posted to the December 31, 2011 worksheet are as follows:

- a. Rental income 1,200  
     Rental expense 1,200  
*To eliminate intercompany rental income and rental expense at December 31, 2011*
- b. Rental payable 100  
     Rentals receivable 100  
*To eliminate intercompany rent receivable and rent payable at December 31, 2011*

The consolidation process is relatively straightforward. The effects of the related-party lease, the rental income and expense, and intercompany receivable and payable are eliminated so that, on a consolidated basis, the financial statements reflect the building, mortgage debt, depreciation, and interest expense.

The only difference between this consolidation of a VIE and a conventional consolidation of a voting interest entity in accordance with ASC 810-10-45 is the noncontrolling interest allocation. ASC 810-10-45-18 specifies that the elimination of intraentity profit or loss is not affected by the existence of a noncontrolling interest and that the elimination may be allocated between the parent (the controlling interest) and the noncontrolling interests.

In this example, however, the controlling interest holder, AAL, has no legal claim on the profit of MMI, since MMI's profit or loss is legally allocable to its equity owner. If this example had been a conventional consolidation of a voting interest entity, the effect of eliminating the rental income from MMI would be a remaining MMI loss of \$630, computed as follows:

MMI net income	\$ 570
Effect of elimination of rental income	<u>(1,200)</u>
MMI net loss after elimination of intercompany rental income	<u><u>\$ (630)</u></u>

ASC 810-10-35-3 provides a special rule that the effect of eliminating fees or other sources of income or expense between the primary beneficiary and the consolidated VIE is to be attributed solely to the primary beneficiary and not to the noncontrolling interest computed as follows and illustrated above:

Net loss of VIE	\$ (630)
FIN 46(R) adjustment to allocate rental expense to primary beneficiary	<u>1,200</u>
Adjusted VIE net income allocable to noncontrolling interest	<u><u>\$ 570</u></u>

The net income allocation to the noncontrolling interest shown above is reduced by the dividends paid to the noncontrolling interest as follows:

Adjusted VIE net income allocable to noncontrolling interest	\$ 570
Dividend paid to noncontrolling interest	<u>(500)</u>
Noncontrolling interest retained earnings	<u>70</u>
Noncontrolling interest common stock	<u>900</u>
Total noncontrolling interest	<u><u>\$ 970</u></u>

The results of the consolidation can be summarized as:

Primary beneficiary rent expense	<u><u>\$ 1,200</u></u>
VIE	
Depreciation	230
Interest	<u>400</u>
	<u>630</u>
Net effect, allocable to noncontrolling interest	<u><u>\$ 570</u></u>

Consolidated net income of \$800 is the same as the primary beneficiary's net income since the entire \$570 of VIE net income is allocated to the noncontrolling interest. The results, however, can have a profound effect on the way that the financial statements portray the leverage of the primary beneficiary to users, which might be the difference between AAL meeting or violating its loan covenants.

Debt to equity ratio	
Primary beneficiary	4.5:1
Consolidated	5.3:1

Certain practical matters require consideration in the case of consolidating VIEs.

1. *VIE without GAAP financial statements.* Many VIEs structured as shown in this example had not previously prepared financial statements. Prior to consolidating the VIE with the primary beneficiary, the VIE's accounting records must be adjusted to eliminate any differences between GAAP and the basis on which the VIE reports for income tax purposes.
2. *Lack of prior independent CPA involvement with VIE.* VIEs that had not been subject to financial reporting in the past obviously had not needed to engage an independent CPA to perform a compilation, review, or audit engagement. Upon consolidation, the consolidated financial statements, including the VIE's (subsidiary's) financial position and results of operations, will be subject to the same level of service as the financial statements of the primary beneficiary (parent).

3. *Interaction with ASC 460-10.* ASC 460-10, *Guarantor's Accounting and Disclosure Requirements for Guarantees, Including Indirect Guarantees of Indebtedness of Others*, requires guarantors to recognize a liability at inception for the obligations embodied in the guarantee. In the example above, the guarantee of the VIE's mortgage by the primary beneficiary would be exempt from the initial recognition and measurement provision of ASC 460-10 because the guarantee is analogous to a parent guarantee of its subsidiary's debt to a third party, which is specifically exempted from the recognition and measurement provisions of ASC 460-10. However, the guarantee is not exempt from the disclosure requirements of ASC 460-10 and ASC 450-10.
4. *General-purpose financial statements.* In the example, AAL is the "parent" company. It would be precluded by ASC 810-10-45-11 from issuing separate, general-purpose financial statements that exclude MMI, since this would be a GAAP departure; however, nothing precludes MMI from issuing separate subsidiary-only financial statements.

#### **Example of an implicit variable interest**

Consider the situation where the principal shareholder of a company personally guarantees a mortgage on the premises that the company occupies and leases from a related LLC whose sole member is the lessee's principal shareholder. Normally, the rent payments due under the related-party lease are structured to provide sufficient cash flow to the lessor to enable it to meet its debt service obligations under the mortgage. If the lessee were to become delinquent under its rent obligations to the lessor, the lessor would not have sufficient cash flow to enable it to make the payments due under its mortgage, which would cause a loan delinquency or default.

Should this occur, the following scenarios could occur:

1. The lender could repossess the property and sell it to pay off the loan,
2. The lender could enforce the guarantee and compel the shareholder to pay off the loan on behalf of the lessor or, at least to make the delinquent payments on behalf of the lessor to cure the default, or
3. The lessee could sell off assets or borrow money from its stockholder or a third party to enable it to pay its delinquent rent, thereby enabling the lessor to make its delinquent mortgage payments.

Scenario 1 would not be a desirable outcome, as the lessor would lose title to its property and the lessee, in default on its rent, could end up without the premises in which it operates its business since, upon sale of the property, the successor owner would potentially terminate the lease for nonpayment.

Under scenario 2 if the shareholder were to pay the delinquent mortgage payment on behalf of the lessor, the transactions would be recorded as follows:

#### **Lessor Accounting Records**

Rent receivable	xxx
Rental income	xxx
<i>To record delinquent rent due from lessee</i>	
Mortgage payable	xxx
Loan payable—member	xxx
<i>To record mortgage payment made on behalf of LLC by its member as a loan payable to the member</i>	

#### **Lessee Accounting Records**

Rent expense	xxx
Rent payable	xxx
<i>To record delinquent rent due to lessor</i>	

Scenario 3 would be recorded as follows (assuming that the lessee obtains additional funds from its principal shareholder):

#### **Lessee Accounting Records**

Cash	xxx	
Loan payable—shareholder		xxx
<i>To record loan from shareholder</i>		
Rent payable	xxx	
Cash		xxx
<i>To record rent payment</i>		

#### **Lessor Accounting Records**

Cash	xxx	
Rental income		xxx
<i>To record rent received from lessee</i>		
Mortgage interest	xxx	
Mortgage payable	xxx	
Cash		xxx
<i>To record mortgage payment</i>		

The outcomes of scenarios 2 and 3 are very similar. Under scenario 2, the shareholder/member will have a loan receivable from the thinly capitalized LLC that depends solely on the delinquent corporation for its cash flow. In scenario 2, the lessee will have to raise cash in an amount sufficient to fund the LLC's repayment of its loan to the shareholder/member and keep the mortgage current. Since the LLC is dependent upon the lessee for its cash flow, the lessee has implicitly incurred an obligation to fund the LLC's loan repayment to the shareholder/member. It is, of course, in the best interest of the lessee to fund this, since it entitles the lessee to continue to benefit from the use of the leased property and, contractually, the lessee is already obligated to pay the delinquent rent.

Under scenario 3, the shareholder/member will have a loan receivable from a lessee that is experiencing difficulty in meeting its rent obligations. The lessee will have substituted a presumably interest-bearing loan payable to its shareholder for a noninterest-bearing rent payable obligation to the LLC and will, as in scenario 2, be obligated to raise cash sufficient to repay its shareholder and fund its rent obligations under the lease. In effect, the lessee will have used its available credit that it could have used for other operating purposes to help provide financial support to the LLC that would otherwise have insufficient capital to be self-sustaining. Again, implicitly, the lessee is functioning as a guarantor of the LLC's mortgage indebtedness by its willingness to provide the cash flow necessary for the LLC to meet its obligations.

Based on the foregoing analysis, in substance the lessee is the holder of an implicit variable interest in the lessor in the form of an implicit guarantee of the lessor's mortgage debt. Due to the fact that the implicit guarantee exposes the lessee/variable interest holder to the expected losses of the lessor, the lessor/LLC's sole member (and at-risk equity holder) is not the only party that potentially would absorb expected losses of the lessor.

#### **Example: Arm's-length leases—computing expected losses and expected residual returns**

The application of ASC 810 is, of course, not limited to related-party arrangements. The following is an example of the quantitative analysis (versus the qualitative analysis illustrated in the related-party example above) that might be necessary in an arm's-length leasing arrangement.

Lawrence Lessor, LLC (referred to herein as "the Entity" since it is the entity that the variable interest holders will be evaluating as to whether it is a VIE) is a limited liability company organized

specifically for the purpose of building, owning, and operating a single-lessee retail discount warehouse club store on land that it has recently acquired. The store is the only asset owned by the Entity. The 148,000 square foot store will be occupied by Clubco, a nationally known chain that is unrelated to Lawrence Lessor.

The Entity's voting owners (the LLC members) wish only to invest a minimal amount of equity in the Entity and, consequently, the mortgage lender insisted on obtaining a third-party guarantee of the mortgage which Lawrence obtained from an unrelated third party and for which Lawrence paid a premium.

The terms of the lease with the retailer are as follows (assumed to be an operating lease):

Description of space	148,000 square foot retail discount warehouse club store
Lessee	Clubco Stores, Inc.
Initial lease term	Three years
Lease commencement date	1/1/20X1
Annual base rent	\$600,000
Contingent rent	1% of annual sales over \$30 million
Purchase options	\$9 million—not a bargain purchase option in accordance with ASC 840
Residual guarantee	Lessee guarantees to lessor that residual value of the building at the end of the lease term will be at least equal to the \$7,500,000 fair value of the store land and building at inception or it will pay the lessor the difference
Executive costs	All real estate taxes, maintenance, insurance, and common area expenses are to be borne by the lessee

The construction has been completed, the occupancy permits issued, and the construction financing settled with the proceeds of a 25-year, 6% mortgage loan on December 1, 20X1. The mortgage loan is guaranteed by an unrelated third-party guarantor. The store is opening and commencing business on January 1, 20X2.

Mortgage details are as follows:

#### Summary Amortization Schedule for Mortgage

25-year, 6% mortgage, original principal amount of \$7,275,750

<u>Year</u>	<u>Payments</u>	<u>Interest</u>	<u>Principal</u>	<u>Balance</u>
Original loan				\$7,275,750
20X2	\$ 562,533	\$ 433,022	\$129,511	7,146,239
20X3	562,533	425,034	137,499	7,008,740
20X4	562,533	416,553	145,980	6,862,760
	<u>\$1,687,599</u>	<u>\$1,274,609</u>	<u>\$412,990</u>	

The Entity's recorded aggregate carrying amount of \$7,500,000 for the land and building represents the fair value at lease inception with the land's fair value representing 10%, or \$750,000.

The rental terms for the store are considered to be at market rates. If the terms were not at market rates, additional expected variability would be assigned to the lease (in addition to the expected variability resulting from the purchase option and residual value guarantee).

Expected cash flows are discounted to their present value using an assumed 3% interest rate representing the interest rate available on risk-free investments. To simplify the example, cash flows are assumed to occur at the end of each annual period for the purpose of discounting them to present value. A copy of the statement of financial position from the Entity's annual partnership return at lease inception is as follows:

Schedule L**Statement of Financial Position per Books**

<u>Assets</u>	<i>Beginning of tax year</i>		<i>End of tax year</i>	
	(a)	(b)	(c)	(d)
1. Cash				1,000
2. a. Trade notes and accounts receivable				
b. Less allowance for bad debts				
3. Inventories				
4. U.S. government obligations				
5. Tax-exempt securities				
6. Other current assets ( <i>attach schedule</i> )				
7. Mortgage and real estate loans				
8. Other investments ( <i>attach schedule</i> )				
9. a. Buildings and other depreciable assets			6,750,000	
b. Less accumulated depreciation				6,750,000
10. a. Depletable assets				
b. Less accumulated depletion				
11. Land (net of any amortization)				750,000
12. a. Intangible assets (amortizable only)				
b. Less accumulated amortization				
13. Other assets ( <i>attach schedule</i> )				
14. Total assets				7,501,000
<b><u>Liabilities and Capital</u></b>				
15. Accounts payable				
16. Mortgages, notes, bonds payable in less than 1 year				
17. Other current liabilities ( <i>attach schedule</i> )				
18. All nonrecourse loans				7,275,750
19. Mortgages, notes, bonds payable in 1 year or more				
20. Other liabilities ( <i>attach schedule</i> )				
21. Partners' capital accounts				225,250
22. Total liabilities and capital				7,501,000

**Analysis by Clubco**

- Clubco holds a variable interest in Lawrence Lessor (“the Entity”) in the form of the lease. Expected variability results from the purchase option and the residual value guarantee.

2. The Entity is not scoped out of ASC 810.
3. The Entity is a business.
4. Further evaluation factor applies for a single-lessee lease.
5. Clubco was not involved in the design of the Entity.
6. For illustrative purposes, assume that the purchase option is significant to Clubco.
7. Clubco holds a variable interest in the leased store (the specified assets) in the form of the lease containing a purchase option and residual value guarantee.
8. The fair value of the building leased by Clubco is 100% of the fair value of the Entity's assets. Therefore, Clubco is deemed to hold a variable interest in the Entity as a whole.
9. In applying the test to determine if the members of the LLC/Entity have a controlling financial interest (distinguished from a controlling voting interest, which they clearly have), the following results are determined:
  - a. The LLC members are the sole voting interest holders and, therefore, meet the voting test.
  - b. The LLC members are *not* the only parties that absorb expected losses of the lessor due to the existence of the residual value guarantee provision in the lease that potentially could result in Clubco bearing a portion of the expected losses.
  - c. The LLC members are also *not* the only parties entitled to receive the expected residual returns from the property due to the existence of the purchase option provision in the lease that potentially could result in Clubco receiving a portion of the expected residual returns.
10. As a consequence of the analysis up to this point, Clubco can conclude that its variable interest is in a lessor that is a VIE.
11. Since Clubco leases 100% of the fair value of the assets held by the Entity, there are no silos included therein.
12. To determine whether or not it is the primary beneficiary of the VIE/lessor, Clubco must determine whether it either will bear the majority of the expected losses, or receive the majority of the expected residual returns. One form this calculation might take is illustrated below.

#### Computation of expected cash flow possibilities for the lease term

<u>Probability</u>	20X2					
	5%	15%	30%	35%	10%	5%
<u>Assumptions</u>						
Annual store sales	\$25,000,000	\$30,000,000	\$ 40,000,000	\$ 50,000,000	\$ 55,000,000	\$60,000,000

Rent—Percentage	—	—	118,200	230,438	287,744	355,200	
Total rental income	600,000	600,000	718,200	830,438	887,744	955,200	
Mortgage payments	562,533	562,533	562,533	562,533	562,533	562,533	
Possible net cash flow, operations	\$ 37,467	\$ 37,467	\$ 155,667	\$ 267,905	\$ 325,211	\$ 392,667	
Estimated residual amount	7,000,000	8,000,000	9,000,000	10,000,000	12,000,000	13,000,000	
Mortgage repayment	6,862,760	6,862,760	6,862,760	6,862,760	6,862,760	6,862,760	
Possible net sales proceeds	137,240	1,137,240	2,137,240	3,137,240	5,137,240	6,137,240	
Possible net cash flow	\$ 174,707	\$ 1,174,707	\$ 2,292,907	\$ 3,405,144	\$ 5,462,451	\$ 6,529,907	
Present value, discounted at 3%	\$ 159,881	\$ 1,075,023	\$ 2,098,334	\$ 3,116,189	\$ 4,998,916	\$ 5,975,790	
3-year totals of present value of possible cash flows discounted at 3%	<u>\$ 231,573</u>	<u>\$ 1,146,715</u>	<u>\$ 2,368,914</u>	<u>\$ 3,582,357</u>	<u>\$ 5,564,528</u>	<u>\$ 6,644,145</u>	

Note that, in the forecast for 20X4, the effects of the purchase option and residual value guarantee are ignored. They are considered later in the analysis of which variable interest holders participate in expected losses and expected residual returns.

13. Calculation of probability-weighted discounted expected cash flows.

Scenario	Present value of possible cash flows	Estimated probability	Discounted probability-weighted expected cash flows	
			\$	
1	\$ 231,573	5%	\$ 11,579	
2	1,146,715	15%	172,007	
3	2,368,914	30%	710,674	
4	3,582,357	35%	1,253,825	
5	5,564,528	10%	556,453	
6	6,644,145	5%	332,207	
		100%	\$3,036,745	

This computation uses the expected cash flow methodology prescribed by CON 7, which is also used in estimation of fair value for the purposes of impairment testing of goodwill and tangible long-lived assets, and in computing asset retirement obligations.

14. Calculations of expected losses and expected residual returns (and the related expected variability).

<i>Scenario</i>	<i>Present value of possible cash flows</i>	<i>Discounted/ probability-weighted expected cash flows</i>	<i>Variance from expected outcome</i>	<i>Estimated probability</i>	<i>Expected losses</i>	<i>Expected residual returns</i>
1	\$ 231,573	\$3,036,745	\$(2,805,172)	5%	\$(140,259)	
2	1,146,715	3,036,745	(1,890,030)	15%	(283,505)	
3	2,368,914	3,036,745	(667,831)	30%	(200,349)	
4	3,582,357	3,036,745	545,612	35%		\$190,965
5	5,564,528	3,036,745	2,527,783	10%		252,778
6	6,644,145	3,036,745	3,607,400	5%		180,370
				<u>100%</u>	<u>\$624,113</u>	<u>\$624,113</u>

ASC 810 requires consideration of the “expected variability” inherent in the estimate of probability-weighted expected cash flows; in this case \$3,036,745. This amount represents a weighted-average of the various expected outcomes multiplied by their respective probabilities. As is always the case when averaging numbers, the sums of the positive and negative differences between each value included in the average and the average itself are always equal. This explains why the expected losses and expected residual returns each equal \$624,113. Therefore, the expected variability in both directions is the sum of the two absolute values (i.e., \$624,113 + \$624,113 = \$1,248,226).

Another important point to note is that the terms “expected losses” and “expected residual returns” are not associated with traditional GAAP income or cash flow measures. The entity illustrated above has positive expected cash flows under all six scenarios for all three years. Notwithstanding that fact, the computation shows that it will experience expected losses and expected residual returns—variations from expectation, positive or negative, that could occur as a result of operations or of changes in the fair value of the property. This will always be the case, irrespective of how profitable an entity is or how much cash flow it generates.

15. For each scenario, the facts are analyzed to determine which of the variable interest holders will bear the expected losses. There were no silos included in the VIE; therefore, only a single primary beneficiary determination is required. The results of the analysis are aggregated as follows:

<i>Scenario</i>	<i>Expected losses</i>					
	<i>Estimated residual value of store</i>	<i>Expected losses</i>	<i>Clubco</i>	<i>3rd-party guarantor</i>	<i>holders of entity</i>	<i>Mortgage lender</i>
1	7,000,000	\$(140,259)	\$(140,259)			\$7.5 MM guarantee \$7 MM residual
2	8,000,000	(283,505)				
3	9,000,000	(200,349)				
Excess of share of losses over equity				(258,604)	(258,604)	
	<u><u>\$624,113</u></u>	<u><u>\$(140,259)</u></u>	<u><u>\$(258,604)</u></u>	<u><u>\$225,250</u></u>	<u><u>\$ -</u></u>	
	<u><u>100%</u></u>	<u><u>22%</u></u>	<u><u>42%</u></u>	<u><u>36%</u></u>	<u><u>0%</u></u>	

Total equity at risk is \$225,250, which would not be sufficient for the entity to absorb the expected losses of \$624,113 without receiving additional subordinated financial support. Consequently, the Entity (Lawrence Lessor, LLC) by definition is a VIE.

Note that, based on the analysis of the expected losses, no variable interest holder will absorb a majority (>50%) of the Entity's losses. Consequently, the expected residual returns need to be analyzed.

<u>Scenario</u>	<u>Estimated residual value of store</u>	<u>Expected residual returns</u>	<u>Clubco</u>	<u>entity</u>	<u>At-risk equity holders of entity</u>	<u>Guarantor</u>	<u>Notes</u>
4	\$10,000,000	\$190,965	\$190,965				Exercise of \$9MM option
5	12,000,000	252,778	252,778				Exercise of \$9MM option
6	13,000,000	180,370	180,370				Exercise of \$9MM option
		\$624,113	\$624,113				
		<u>100%</u>	<u>100%</u>				

16. Since 100% of the expected residual returns will be received by Clubco, it is the primary beneficiary, the party that is required to consolidate Lawrence Lessor, LLC in its financial statements.

If the interests are not deemed to be interests in the VIE itself, the interests in the specified assets are treated as a separate VIE (referred to as a *silo*) if the expected cash flows from the specified assets (and any associated credit enhancements, if applicable) are essentially the sole source of payment for specified liabilities or specified other interests. Under this scenario, expected losses and expected residual returns associated with the silo assets are accounted for separately to the extent that the interest holder either absorbs the VIE's expected losses or is entitled to receive its expected residual returns. Any excess of expected losses or expected residual returns not borne by (received by) the variable interest holder is considered attributable to the entity as a whole.

If one interest holder is required to consolidate a silo of a VIE, other VIE interest holders are to exclude the silo from the remaining VIE.

#### Reconsideration of VIE status

Once an initial determination is made as to whether an entity is a variable interest entity (as opposed to a voting interest entity), that initial determination need not be reconsidered unless one or more of the following circumstances occurs:

1. A change is made to the VIE's governing documents or contractual arrangements that results in changes in either the characteristics or sufficiency of the at-risk equity investment in the VIE.
2. As a result of a return of some or all of the equity investment to the equity investors, other interests become exposed to the VIE's expected losses.
3. There is an increase in the VIE's expected losses that results from the entity engaging in activities or acquiring assets that were not anticipated at either the inception of the entity or a later reconsideration date.
4. There is a decrease in the VIE's expected losses due to the entity modifying or curtailing its activities.
5. Additional at-risk equity is invested in the VIE.
6. The equity investors, as a group, lose the power to direct the activities of the VIE that most significantly impact its economic performance.

(ASC 810-10-35-4)

## VOTING INTEREST MODEL

---

Voting interest entity is not defined in ASC 810. By default it means an entity that is not a variable interest entity. ASC 810 stipulates that the usual condition that best evidences which party holds a controlling financial interest is the party that holds a majority voting interest. Voting rights are the key driver in determining which party should consolidate the entity. The voting interest model generally assumes the percentage of ownership determines the level of influence that the reporting entity has over an investee. The Exhibit below outlines the presumptive control based on voting interest. (Also, see the Scope and Scope Exceptions section at the beginning of this chapter for exceptions to the majority control presumption.)

### Exhibit—Voting Interest Model

<b>Percentage of Ownership:</b>	0 → 50	↔50	↔100
<b>Presumptive Level of Influence:</b>	Little or none	Significant	Control
<b>Valuation/Reporting Method:</b>	Fair value method	Equity method	Consolidation

Under the equity method, investments are shown as a single line in the statement of financial position and a single line item in the income statement. This is sometimes referred to as a one-line consolidation. In consolidated financial statements, details of all entities are reported in full.

### Preparing Consolidated Workpapers

Preparing consolidated workpapers facilitates making the adjustments and eliminations necessary to creating consolidated financial statements. The goal is to present the financial information as though the intercompany transaction had never occurred. Following are examples of intercompany transactions and how they are handled in the consolidation process.

**Receivables and payables.** The gross amounts of intercompany receivables and payables are eliminated in the consolidation process. The amounts are fully eliminated without regard to ownership percentage.

For example, assume Parent Company makes a \$10,000 advance to Subsidiary Company. The elimination entity would be:

Advance from Parent Company	10,000
Advance to Subsidiary Company	10,000

Care should be taken to find timing differences related to year-end transactions where an event is recorded on one party's books, but not the other.

**Sales, cost of sales, and inventory.** Consolidated sales should reflect only sales to outside entities. Likewise, cost of sales should reflect the cost to the consolidated group of goods sold to outside entities. The inventory on the statement of financial position at the reporting date is recorded at the cost to the consolidated group.

Parent Company sells all its inventory to Subsidiary Company at a 20% markup. During the year, Parent Company sells \$500,000 of goods to Subsidiary. In the same year, Subsidiary Company sells all the goods to an external entity at a 25% markup.

Income Statement	Parent	Subsidiary	Dr./Cr.	Consolidated Amount
Sales	600,000	750,000	Dr. 600,000	750,000
Cost of Sales	500,000	600,000	Cr. 600,000	500,000
Gross Profit	100,000	150,000		250,000

**Parent-only financial information.** Parent company-only financial statements are unacceptable. However, there are circumstances where parent-only financial information is needed. An acceptable way to present the parent information is with columns or parent and subsidiaries with a consolidated column. Where individual investors or unconsolidated subsidiaries have control, the financial statements may be combined. Combined financial statements are the same as consolidated financial statements, except no one entity has control.

**Differences in fiscal year-end.** If the difference between parent and subsidiary fiscal year-ends is less than three months, it is feasible to consolidate. If the difference is greater than three months, it is usually acceptable to use the subsidiary's financial statements and disclose in notes interim events that materially affect the results of operations or financial position. (ASC 810-10-45-12)

ASC 810-10-45 and ASC 810-10-50 state that the following scenarios constitute voluntary changes in accounting principle that are subject to the accounting and disclosure rules in ASC 250:

1. A consolidated entity changes its fiscal year-end to alter or eliminate a difference between its year-end and the fiscal year-end of the entity that consolidates it in its financial statements (the parent or ASC 810 primary beneficiary).
2. An investee that is accounted for by an investor using the equity method changes its fiscal year-end to alter or eliminate a difference between its year-end and the fiscal year-end of the equity method investor.

Retrospective application is not required if it is impracticable to do so. (See chapter in this volume on ASC 250.)

**Combined financial statements.** While the presentation of consolidated financial statements is required under GAAP, there is no parallel requirement to present combined financial statements for entities under common control (brother/sister entities). However, in certain cases, it is desirable that combined financial statements be prepared for such entities. This process is very similar to an accounting consolidation using pooling accounting, except that the equity accounts for the combining entities are carried forward intact.

The financial statements of a combined group of commonly controlled entities or commonly managed entities are presented as those of a single economic entity. The combined group does not include the parent. (ASC 810-10-20)

### **ASC 810-20, Control of Partnerships and Similar Entities**

**General partnerships.** Partners holding lesser interests may possess *substantive participating rights* (as that term is used in ASC 810-20-25-5) granted by a contract, lease, agreement with other partners, or court decree. When the other partners have such rights, the presumption of control by the general partner with the majority voting interest or majority financial interest is overcome. Under those circumstances, the controlling general partner would consolidate the partnership and the noncontrolling general partner would consolidate the partnership using the equity method. (ASC 970-323; ASC 810-20-25-19)

**Limited partnerships.** The structure of many limited partnerships consists of one investor serving as general partner and having only a small equity interest and the other investors holding limited partnership (or equivalent) interests. The proper accounting for such structures is ASC 970-323, *Real Estate Investments—Equity Method and Joint Ventures*, which formally deals only with certain real estate investments but has been applied by analogy to other investments. ASC 810-10-25 provides expanded guidance to the appropriate accounting in those circumstances where the majority owner lacks control due to the existence of “substantial participating rights” by minority owners.

If the investor/holder is an entity that is required under GAAP to measure its investment in the limited partnership (LP) at fair value with changes in fair value reported in the income statement, then it follows that applicable specialized guidance with respect to accounting for its investment.

**Limited partnership is a VIE.** If the investee entity is a variable interest entity (VIE) under the provisions of ASC 810, the holders of interests in the entity must use the guidance applicable to those interests. If the investor has a controlling financial interest in the VIE, the investor is deemed to be the entity’s primary beneficiary (analogous to a parent company) and is required to consolidate the investee in its financial statements.

Noncontrolling interest holders in an LP that is a VIE are to account for their interests using the equity method or the cost method. Limited partner interests that are so minor that the limited partner has virtually no influence over operating and financial policies of the partnership are accounted for using the cost method. (ASC 970-323) To be considered to be this minor, the SEC staff has indicated that an interest would not be permitted to exceed 3–5%. (ASC 323-30-S99) In practice, this benchmark is also generally accepted for non-SEC registrants, since it represents the most authoritative guidance currently available with respect to making this determination.

**Limited partnership is not a VIE.** If the LP is not a VIE and the partners are not subject to specialized industry fair value accounting rules, a determination is made as to whether a single general partner or multiple general partners control the LP. If a single general partner controls the LP, that partner is consolidates the LP. All other general partners apply the equity method of accounting to their investments, and the limited partners use either the cost method (for minor investments) or the equity method, as previously discussed.

If more than one general partner controls the partnership, ASC 810-20 provides the framework for analyzing the respective legal and contractual rights and privileges associated with each owner/investor’s interests to determine control. For the purpose of applying ASC 810-20, entities under common control are considered to be a single general partner. No guidance is offered, however, in ASC 810-20 as to how to determine which of several general partners should consolidate the partnership.

**Kick-out rights.** ASC 810 includes the concept of “kick-out rights” which, when held by limited partners, gives them the right to eject the general partner(s) of the partnership, thereby (often) preventing the general partner(s) from exercising control. ASC 810-20 holds that there is a rebuttable presumption that general partners in a partnership have control, regardless of their actual ownership percentage. This presumption can be overcome if the limited partners have certain defined abilities.

If the limited partners have the *substantive ability* to dissolve (liquidate) the limited partnership or otherwise remove the general partners without cause—which is referred to as “kick-out rights”—then the general partners are deemed to lack control over the partnership. In such cases, consolidated financial reporting would not be appropriate, but equity method accounting would almost inevitably be warranted. To qualify, the kick-out rights must be exercisable by a single limited partner or a simple majority (or fewer) of limited partners.

Thus, if a super-majority of limited partner votes is required to remove the general partner(s), this would not constitute a substantive ability to dissolve the partnership and would not thwart control by the general partner(s).

There is a range of possible qualifying requirements to exercise kick-out rights that could lead to the conclusion that nominal kick-out rights are ineffective in precluding the general partner(s) from exercising control. ASC 810-20 offers a series of illustrative examples to help the preparer interpret this guidance and should be consulted to benchmark any real-world set of circumstances. Examples of barriers to the exercise of kick-out rights include:

1. Conditions that make it unlikely the rights will be exercisable (e.g., conditions that narrowly limit the timing of the exercise)
2. Financial penalties or operational barriers associated with dissolving (liquidating) the limited partnership or replacing the general partners that would act as a significant disincentive for dissolution (liquidation) or removal
3. The absence of an adequate number of qualified replacements for the general partners or the lack of adequate compensation to attract a qualified replacement
4. The absence of an explicit, reasonable mechanism in the limited partnership agreement or in the applicable laws or regulations, by which the limited partners holding the rights can call for and conduct a vote to exercise those rights
5. The inability of the limited partners holding the rights to obtain the information necessary to exercise them.

A limited partner's unilateral right to withdraw is pointedly not equivalent to a kick-out right. However, if the partnership is contractually or statutorily bound to dissolve upon the withdrawal of one partner, that would equate to a kick-out right.

ASC 810-20 also addresses "participating rights" held by the limited partners, which it contrasts to "protective rights" as these are first defined in ASC 810. Limited partners' rights (whether granted by contract or by law) that would allow the limited partners to block selected limited partnership actions would be considered protective rights and would not overcome the presumption of control by the general partner(s).

Among the actions cited by ASC 810-20 as illustrating protective (not participating) rights are:

1. Amendments to the limited partnership agreement
2. Pricing on transactions between the general partners and the limited partnership and related self-dealing transactions
3. Liquidation of the limited partnership initiated by the general partners or a decision to cause the limited partnership to enter bankruptcy or other receivership
4. Acquisitions and dispositions of assets that are not expected to be undertaken in the ordinary course of business (note that limited partners' rights relating to acquisitions and dispositions expected to be made in the ordinary course of the limited partnership's business are participating rights)
5. Issuance or repurchase of limited partnership interests.

The presence of protective rights does not serve to overcome the presumption of control by the general partner(s). Substantive participating rights, on the other hand, do overcome the presumption of general partner control. Such rights could include:

1. Selecting, terminating, and setting the compensation of management responsible for implementing the limited partnership's policies and procedures
2. Establishing operating and capital decisions of the limited partnership, including budgets, in the ordinary course of business.

ASC 810-20 states that determination of whether the presumption of general partner control is overcome is a "facts and circumstances" assessment to be made in each unique situation. For example, depending on which decisions are required to be put to a full vote of the partnership (as opposed to being reserved for the general partner), the limited partners may be found to have substantive participating rights. Another important factor weighing on this determination is the relationships among limited and general partners (using ASC 850 related-party criteria).

The assessment of the extent of limited partners' rights and the impact those have on the presumption of general partner(s)' control over the partnership (for consolidated financial reporting purposes) is to be made upon initial acquisition of the general partner's interest or formation of the partnership, and again at each financial reporting (i.e., statement of financial position) date.

**Limited partnerships controlled by the general partners.** As previously stated, the general partners are collectively presumed to be in control of the limited partnership and, if this is substantively the case, the accounting for the general partners depends on whether control of the entity rests with a single general partner. If a single general partner controls the limited partnership, that general partner consolidates the limited partnership in its financial statements. If no single general partner controls the limited partnership, each general partner applies the equity method to account for its interest. (ASC 810-20)

Noncontrolling limited partners account for their interests using the equity method or by the cost method. As previously discussed, limited partner interests that are so minor (not to exceed 3–5%) that the limited partner has virtually no influence over operating and financial policies of the partnership would be accounted for using the cost method. (ASC 970-323)

**Limited partnerships controlled by the limited partners.** If the presumption of control by the general partners is overcome by applying ASC 810-20 and the limited partners control the partnership, the general partners would use the equity method to account for their interests in the partnership.

If there is a controlling limited partner, that partner would consolidate the limited partnership in its financial statements. Noncontrolling limited partners would follow the same guidance provided above that applies when the general partners control the partnership (i.e., use the equity method unless the interest is minor—in which case the cost method would be used).

### **Limited Liability Companies that Maintain a Specific Ownership Account for Each Investor**

When an LLC maintains individual equity accounts for each member, similar to the structure of a limited partnership, the investor/member is to analogize to the guidance above that applies to accounting for investments in limited partnerships using either the cost method or equity method. (ASC 272 and, by reference, ASC 970-323 and ASC 323-30-S99) In the discussion of ASC 272, it was indicated that it might be appropriate to apply this guidance by analogy to other entities that have similar specifically identifiable ownership account structures.

ASC 272 provides an exception to this general rule. Its scope does not include investments in LLCs used as securitization vehicles under ASC 860 that continue to be held by a transferor in a securitization transaction accounted for as a sale. These interests are accounted for as debt securities and categorized as either available-for-sale or trading securities under ASC 320 and are

subject to specialized requirements regarding recognition of interest income and impairment. (ASC 325-40)

### **Limited Liability Companies that are Functionally Equivalent to Corporations (“Analogous Entities”)**

Some LLCs have governance structures that have characteristics that closely resemble those of corporations. These LLCs are not included in the scope of ASC 272 summarized earlier. Instead, membership interests in these LLCs are subject to different criteria to determine the proper accounting treatment to be used in the investor/member’s financial statements.

The applicable GAAP relative to LLCs that are analogous entities is ASC 810-10-25. Under ASC 810-10-25, there is a similar rebuttable presumption that the majority voting interest holder(s) are in control of the investee. Management is to exercise judgment based on the relevant facts and circumstances as to whether one or more minority shareholders or members possess rights that individually or in the aggregate provide them with effective participation in the significant decisions expected to be made in the “ordinary course of business.” If the minority owner or owners possess substantive participating rights, the presumption of control by the majority owners is overcome and the minority owner or owners are considered to be in control.

Again, the controlling interest holder would be required to consolidate, and the noncontrolling interest holders would apply either the equity method or cost method, depending on the extent of their respective holdings.

### **Display in the Reporting Entity’s Financial Statements when the Investee is not a Corporation**

Under some circumstances, investor-venturers account for undivided interests in assets by means of pro rata consolidation, including a fraction of each asset category of the investee in the investor’s statement of financial position, typically commingled with the investor’s own assets. This has most commonly occurred in the case of construction joint ventures, and is not a procedure formally defined under GAAP. In ASC 810-10-45, the issue addressed is whether proportional consolidation can be used to account for an investment in a partnership or a joint venture, as an alternative to full consolidation, equity method accounting, or historical cost.

The standard states that the pro rata method of consolidation is not appropriate for an investment in an unincorporated legal entity, except when the investee is in either the construction industry or an extractive industry, where there is a longstanding practice of its use. An entity is considered to be in an extractive industry only if its activities are limited to the extraction of mineral resources (such as oil and gas exploration and production) and not if its activities involve such related pursuits as refining, marketing, or transporting the extracted mineral resources.

**ASC 2015-02 changes to ASC 810-20.** ASU 2015-02 eliminates Subtopic 810-20, changes some guidance, and merges the guidance with Subtopic 810-10.

Because of their unique design and purpose, ASU 2015-02 adds a requirement for limited partnerships and similar entities, like limited liability companies governed by a managing member. The evaluation of whether an entity should be treated as a limited partnership or as a corporation requires judgment.

To demonstrate that a limited partnership is a voting entity, the partners or members must have:

- Kick-out rights
- Participating rights.

These rights give the partners or members rights that are comparable to the voting rights of corporate shareholders. However, even if these rights are present, the limited partnership might still be a VIE under one of the other VIE characteristics.

If a limited partnership is determined to be a VIE and the general partner meets the power and economics tests to avoid consolidation, the general partner would need a single party kick-out or participating right over all the entity's most significant activities. The right must be unilaterally exercisable.

ASU 2015-02 removes the presumption that the general partner should consolidate a limited partnership. It also amends the definition of kick-out rights to include removal rights and liquidation rights. The liquidation rights are the ability to dissolve the entity.

In order to demonstrate that the limited partnership is not a VIE, those rights must be substantive. They are substantive only if exercisable by a simple majority vote of the entity's limited partners or as low as a single limited partner.

The substance of the kick-out rights might be questionable if there are economic or operational barriers to exercising them, such as:

- Conditions making it unlikely they will be exercised
- The rights are subject to financial penalties
- The rights are subject to operational barriers
- There is an inadequate number of qualified replacements
- The level of compensation paid to the decision maker is not enough to attract a replacement
- No explicit mechanism exists to allow the holder to exercise the right or obtain the information necessary to exercise the rights.

Substantive participating rights held by at least one limited partner demonstrate that the partnership is a voting entity. For this purpose, ASU 2015-02 defines participating rights as rights to block or participate in significant financial and operating decisions made in the ordinary course of business. This is consistent with the voting entity model. Current standards contain guidance for assessing whether the participating rights are substantive. Note that redemption rights held by the limited partners are not considered.

#### **ASC 810-30, Research and Development Arrangements**

**Sponsored research and development activities.** ASC 810-30-55 discusses the accounting for a transaction in which a sponsor creates a wholly owned subsidiary with cash and rights to certain technology originally developed by the sponsor, and receives from the newly created subsidiary two classes of stock. The sponsor then distributes one of the classes of stock (e.g., Class A) to its stockholders. This class of stock has voting rights. Under a purchase option, the sponsor has the right, for a specified period of time, to repurchase all the Class A stock distributed to the stockholders for an exercise price approximating the fair value of the Class A shares. The class retained by the sponsor (e.g., Class B) conveys essentially no financial interest to the sponsor and has no voting rights other than certain blocking rights. The certificate of incorporation prohibits the subsidiary from changing its capital structure, from selling any significant portion of its assets, and from liquidating or merging during the term when the purchase option is outstanding.

The sponsor and the subsidiary enter into a development contract that requires the subsidiary to spend all the cash contributed by the sponsor for research and development activities mutually agreed upon with the sponsor. The subsidiary has no employees other than its CEO. The

subsidiary contracts with the sponsor to perform, on behalf of the sponsor, all of the research and development activities under the development contract.

The sponsor accounts for the research and development contract as follows:

- The sponsor reclassifies the cash contributed to the subsidiary as restricted cash when the Class A shares are distributed to its stockholders.
- The distribution of the Class A shares by the sponsor to its stockholders is accounted for as a dividend based on the fair value of the shares distributed.
- In the financial statements of the sponsor, the Class A shares are presented similar to a minority interest.
- The sponsor recognizes research and development expense as the research and development activities are conducted.
- The research and development expense recognized by the sponsor is not allocated to the Class A shares in determining net income or in calculating earnings per share.
- If the Class A purchase option is exercised, the sponsor accounts for the purchase as the acquisition of a minority interest.
- If the Class A purchase option is not exercised by its expiration date, the sponsor reclassifies the Class A stock to additional paid-in capital as an adjustment of the original dividend.

The effect of the above guidance is quite similar to what would be achieved by consolidating the subsidiary.

## PERSPECTIVE AND ISSUES

---

### Subtopics

ASC 815, *Derivatives*, contains eight subtopics:

- ASC 815-10, *Overall*, which contains two Subsections:
  - General
  - Certain Contracts on Debt and Equity Securities
- ASC 815-15, *Embedded Derivatives*
- ASC 815-20, *Hedging—General*
- ASC 815-25, *Fair Value Hedges*
- ASC 815-30, *Cash Flow Hedges*
- ASC 815-35, *Net Investment Hedges*
- ASC 815-40, *Contracts in Entity's Own Equity*
- ASC 815-45, *Weather Derivatives*.

ASC 815-40 and ASC 815-45 address guidance on accounting for contracts that have characteristics of derivative instruments but that are not accounted for as derivative instruments under ASC 815. The other Subtopics provide guidance on accounting for derivative instruments and hedging activities. ASC 815-10 focuses on whether a contract meets the definition of a derivative instrument. (ASC 815-10-05-2)

### Scope

ASC 815 applies to all *entities*. ASC 815 contains extensive scope exceptions. Some of those exceptions relate to items that fall under other guidance; other exceptions are aimed at simplifying the guidance. However, the following instruments are *not* included in the ASC 815 guidance, provided they meet the specific exception criterion in ASC 815-10-15-14 through 15-42.

1. Regular-way security trades
2. Normal purchases and normal sales
3. Certain insurance contracts
4. Certain financial guarantee contracts
5. Certain contracts that are not traded on an exchange
6. Derivative instruments that impede sales accounting
7. Investments in life insurance
8. Certain investment contracts
9. Certain loan commitments
10. Certain interest-only strips and principal-only strips
11. Certain contracts involving an entity's own equity
12. Leases
13. Residual value guarantees
14. Registration payment arrangements.  
(ASC 815-10-15-13)

The following section expands on the information above and references the scope exceptions:

1. *Regular-way security trades*—Delivery of a security readily convertible to cash within the time period generally established by marketplace regulations or conventions where the trade takes place rather than by the usual procedure of an individual enterprise. Contracts for the delivery of securities that are not readily convertible to cash are not subject to ASC 815's provisions because net settlement would not be possible.

For example, most trades of equity securities in the United States require settlement in three business days. If an individual contract requires settlement in more than three business days (even if this is normal for a particular entity), this exception would not apply, unless (per ASC 815-10-15) the reporting entity is required, or has a continuing policy, to account for such transactions on a trade-date basis. (ASC 815-10-15-15) This exception also applies to when-issued and to-be-announced securities (except for those contracts accounted for on a trade-date basis), if there is no other way to purchase or sell them and if the trade will settle within the shortest period permitted.

Based on the foregoing, the following may be excluded: forward purchases or sales of to-be-announced securities, and when-issued, as-issued, or if-issued securities. (ASC 815-10-15-17)

Note: Counterparties may reach different conclusions as to whether the contracts are a derivative instrument. Asymmetrical results are acceptable (i.e., the exception may apply to one party but not the other). (ASC 815-10-15-24)

2. *Normal purchases and normal sales*—Contracts for purchase or sale of something, other than derivative instruments or financial instruments, that will be delivered in quantities expected to be used or sold over a reasonable time period in the normal course of business. (ASC 815-10-15-22) Terms must be consistent with normal transactions and quantities must be reasonable in relation to needs. (ASC 815-10-15-27) All relevant factors are to be considered. An example would include contracts similar to binding purchase orders. However, take or pay contracts that require little or no initial net investment, and that have products readily convertible to cash that do not qualify as normal purchases, would be a derivative instrument, and not an exception.

The purpose of the “normal purchases and normal sales” definition is to exclude certain routine types of transactions from the required accounting as derivative instruments. This exemption includes certain contracts which do contain net settlement or market mechanisms if it is judged probable, at the inception and throughout the duration of such contracts, that they will not in fact settle net and will instead result in physical delivery. Notwithstanding, this more broadly based exemption from the accounting requirements of ASC 815, certain contracts will not qualify for exemption in any case; these include contracts the price of which are based on an underlying that is not clearly and closely related to the assets being sold or purchased (ASC 815-10-15-30), and those requiring cash settlement for any gains or losses or otherwise settled net on a periodic basis. (ASC 815-10-15-35) Documentary evidence is required to support the use of the expanded exemption from the ASC 815 provisions. (ASC 815-10-15-37)

Power purchase or sales agreements (whether forwards, options, or some combination thereof) pertaining to delivery of electricity qualify for this exception only if a series of conditions are all met. The contracts cannot permit net settlement, but must require physical delivery, and must be capacity contracts, as differentiated from ordinary option

contracts. For the seller, the quantities deliverable under the contracts must be quantities normally to be sold; for the buyer, quantities must be those to be used or sold in the normal course of business, and the buyer must be an entity which is contractually obligated to maintain sufficient capacity to meet the needs of its customers. Certain additional requirements, and further exceptions, are set forth by ASC 815-10-15-45. (Also, see the Technical Alerts section at the beginning of this chapter for an update related to this guidance.)

3. *Certain insurance contracts*—Contracts where the holder is only compensated when an insurable event (other than price or rate change) takes place and:

- a. The value of the holder's asset or liability is adversely changed, or
- b. The holder incurs a liability.

For example, contracts generally not considered to be derivative instruments include traditional life insurance and traditional property and casualty insurance policies. (ASC 815-10-15-53)

Most traditional insurance contracts will not be derivative instruments. Some, however, can include embedded derivatives that must be accounted for separately. For example, embedded derivatives may be found in indexed annuity contracts, variable life and annuity contracts, and property and casualty contracts involving changes in currency rates. (ASC 815-10-15-54)

4. *Certain financial guarantee contracts*—Contracts that call for payments only to reimburse for a loss from debtor failure to pay when due. However, a credit-indexed contract requiring payment for changes in credit ratings (an underlying) would not be an exception. (ASC 815-10-15-58)
5. *Certain contracts that are not exchange traded*—Contracts with underlyings based on one of the following:

- a. Climatic, geological, or other physical variable: for example, inches of rain or heating-degree days;
- b. Value or price involving a nonfinancial asset not readily converted to cash;
- c. Fair value of a nonfinancial liability that does not require delivery of an asset that is readily converted to cash; or
- d. Specified volumes of revenue of one of the parties: examples are royalty agreements or contingent rentals based on related sales.

(ASC 815-10-15-59)

In the case of a mixture of underlyings, some of which are exceptions, the predominant characteristic of the combined variable of the contract is the determinant. If there is a high correlation with the behavior of the excepted variables above, it is an exception and if there is a high correlation with the nonexcepted variables, it is a derivative instrument. (ASC 815-10-15-60)

6. *Derivatives that serve as impediments to sales accounting*—A derivative instrument that affects the accounting for the transfer of an asset. For example, a call option on transferred assets under ASC 860 would prevent accounting for the transfer as a sale. This is necessary, since recognizing the call as a derivative instrument would result in double counting. For instance, a lessor guarantee of the residual value may prevent the accounting for a sales-type lease. (ASC 815-10-15-63)

In addition to the preceding, the following are not considered derivative instruments:

1. Certain contracts involving an entity's own equity issued or held that are both:

- a. Indexed to the enterprise's own stock, and
- b. Classified in shareholders' equity.

Derivative instruments are assets or liabilities. Items properly accounted for in shareholders' equity are thus excluded from the definition of derivatives. Contracts that can or must be settled through issuance of an equity instrument but that are indexed in part or in full to something other than the enterprise's own stock are considered derivative instruments if they qualify and they are to be classified as assets or liabilities.

2. Contracts issued in connection with stock-based compensation arrangements as addressed in ASC 718.
3. Contracts issued as contingent consideration in a business combination under ASC 805.

Contracts in a business combination that are similar to, but are not accounted for as, contingent consideration under ASC 805, are subject to this standard as derivative instruments or embedded derivative instruments including contracts to acquire not-for-profits or merge not-for-profits.

(ASC 815-10-15-74)

The exceptions for the above three issued contracts are not applicable to the counterparties.  
(ASC 815-10-15-75)

ASC 815-15 does not apply to:

- Normal purchases and normal sales contracts
- Unsettled foreign currency transactions
- Plain-vanilla servicing rights
- Features involving certain aspects of credit risk
- Features involving certain currencies

(ASC 815-15-15-3)

### Technical Alert

**ASU 2015-13.** In September 2015, the FASB issued ASU 2015-15, *Derivatives and Hedging (Topic 815): Application of the Normal Purchases and Normal Sales Scope Exception to Certain Electricity Contracts within Nodal Energy Markets (a consensus of the FASB Emerging Issues Task Force)*.

**Guidance.** The ASU relates to a scope exception for electricity contracts. The ASU specifies that the use of locational marginal pricing for certain contracts for the purchase or sale of electricity on a forward basis utilizing a nodal energy market does not, by itself, cause the contract to fail the physical delivery criterion of the normal purchases and normal sales elective scope exception in ASC 815.

**Effective date.** The ASU is effective upon issuance. It should be applied prospectively.

**ASU 2016-03.** In March 2016, the FASB issued a consensus of its Private Company Council, ASU 2016-03, *Intangibles—Goodwill and Other (Topic 350), Business Combinations (Topic 805), Consolidation (Topic 810), Derivatives and Hedging (Topic 815); Effective Date and*

*Transition Guidance (a consensus of the Private Company Council).* The ASU relates to several private company alternative updates issued previously through the private company initiative:

- Update 2014-02, *Intangibles—Goodwill and Other (Topic 350): Accounting for Goodwill*;
- Update 2014-03, *Derivatives and Hedging (Topic 815): Accounting for Certain Receivable, Pay-Fixed Interest Rate Swaps—Simplified Hedging Accounting Approach*;
- Update 2014-07, *Consolidation (Topic 810): Applying Variable Interest Entities Guidance to Common Control Leasing Arrangements*; or
- Update 2014-18, *Business Combinations (Topic 805): Accounting for Identifiable Intangible Assets in a Business Combination*.

**Guidance.** The amendments in ASU 2016-03 make the guidance in ASUs listed above effective immediately by removing their effective dates. The amendments also include transition provisions that provide that private companies are able to forgo a preferability assessment the first time they elect the accounting alternatives in the ASUs listed. However, any subsequent change to an accounting policy election requires justification that the change is preferable under ASC 250, *Accounting Changes and Error Corrections*. The ASU also extends the transition guidance in the ASUs listed above indefinitely. However, there is no intention to change how transition is applied for those two ASUs.

**ASU 2016-05.** In March 2016, the FASB issued *Effect of Derivative Contract Novations on Existing Hedge Accounting Relationships*. The ASU is a consensus of the EITF and clarifies the hedge accounting when there is a change in one of the counterparties to the derivative contract, that is, a novation.

**Guidance.** A novation may occur for many reasons, including:

- Regulatory or legal rule changes,
- Financial institution mergers,
- Intercompany transactions,
- Desire to reduce credit risk,
- Financial institutions voluntarily exiting a particular derivative business, or
- Financial institution voluntarily exiting a customer relationship.

ASU 2016-05 makes clear that the fact of a change in counterparty to a derivative contract does not in and of itself require the de-designation of a hedging relationship. The entity does have to evaluate whether it is probable that the counterparty will perform under the contract as part of its ongoing effectiveness assessment for hedge accounting and should consider counterparty credit risk, which is consistent with existing GAAP. Therefore, a novation may result in the de-designation of the hedging relationship. The ASU codifies a previous SEC staff view.

**Effective date.** The new guidance is effective as follows:

- For public business entities for fiscal years beginning after December 15, 2016 and interim periods within those years.
- For other entities, the guidance is effective for fiscal years beginning after December 15, 2017 and interim periods within fiscal years beginning after December 15, 2018.
- Early adoption is permitted.

**Transition.** Entities have the option to adopt the guidance on:

- a prospective basis to new derivative contract novations, or
- a modified retrospective basis.

**ASU 2016-06.** In March 2016, the FASB issued *Derivatives and Hedging (Topic 815): Contingent Put and Call Options in Debt Instruments*.

**Guidance.** The Codification requires embedded derivatives to be separated from the host contract and accounted for separately as derivatives if certain criteria are met, known as the “clearly and closely related” criterion. The purpose of the guidance is to clarify that an assessment of whether an embedded contingent put or call option is clearly and closely related to the debt host requires *only* an analysis of the four-step decision sequence in ASC 815-15-25-42:

- Step 1: Is the amount paid upon settlement (the payoff) adjusted based on changes in an index? If yes, continue to Step 2. If no, continue to Step 3.
- Step 2: Is the payoff indexed to an underlying other than interest rates or credit risk? If yes, then that embedded feature is not clearly and closely related to the debt host contract and further analysis under Steps 3 and 4 is not required. If no, then that embedded feature should be analyzed further under Steps 3 and 4.
- Step 3: Does the debt involve a substantial premium or discount? If yes, continue to Step 4. If no, further analysis of the contract under paragraph 815-15-25-26 is required, if applicable.
- Step 4: Does a contingently exercisable option accelerate the repayment of the contractual principal amount? If yes, the option is not clearly and closely related to the debt instrument. If not contingently exercisable, further analysis of the contract under paragraph 815-15-25-26 is required, if applicable.

The guidance clarifies that when a call or put option is contingently exercisable, an entity does not have to assess whether the event that triggers the ability to exercise a call or put option is related to interest rates or credit risks.

For entities that are no longer required to bifurcate an embedded derivative, the aggregate of the carrying amount of the debt host contract and the fair value of the previously bifurcated embedded derivative becomes the carrying amount of the debt instrument at the date of adoption. The entities do not have to record a cumulative-effect adjustment to retained earnings at the beginning of the period of adoption.

There is a one-time option for a debt instrument that is within the scope of ASC 825-10-15-4 and 15-5 and is no longer required to be accounted for as separate units. For those instruments, the entity may irrevocably elect to measure the debt instrument at fair value with changes in fair value recognized in earnings.

**Transition.** Entities must apply the new guidance to existing debt instruments or hybrid financial instruments that are determined to have a debt host using a modified retrospective method as of the beginning of the adoption period.

**Effective dates.** The guidance is effective as follows:

- For public business entities for fiscal years beginning after December 15, 2016 and interim periods within those years.
- For other entities, the guidance is effective for fiscal years beginning after December 15, 2017 and interim periods within fiscal years beginning after December 15, 2018.
- Early adoption is permitted.

**ASU 2016-11.** In May 2016, the FASB issued *Revenue Recognition (Topic 605) and Derivatives and Hedging (Topic 815): Rescission of SEC Guidance Because of Accounting Standards Updates 2014-09 and 2014-16 Pursuant to Staff Announcements at the March 3, 2016 EITF Meeting*. The guidance related to ASC 815 rescinds the SEC guidance in “Determining the

Nature of a Host Contract Related to a Hybrid Instrument Issued in the Form of a Share Under Topic 815,” codified in ASC 815-10-S99-3.

## Overview

The financial engineering efforts common in recent decades resulted in the creation of a wide range of derivatives, from easily understood interest rate swaps (exchanging variable- or floating-rate debt for fixed-rate debt) and interest rate caps (limiting exposure to rising interest rates) to such complicated “exotics” as structured notes, inverse floaters, and interest-only strips. At one time, most of these were not given formal statement of financial position recognition, resulting in great accounting risk (i.e., risk of loss in excess of amounts reported in the financial statements). Now, the FASB Codification includes extensive guidance on accounting for and reporting on derivatives and hedges.

Derivatives literature is exceedingly complex, which is largely a consequence of the rules establishing “special accounting” for hedging. Limited accounting relief (i.e., simplified accounting) for certain types of hedging activities may be provided by applying ASC 825-10-25, *Financial Instruments: Fair Value Option*, and the “private company alternative” discussed later in this chapter.

## DEFINITIONS OF TERMS

---

Source: ASC 815 and FASB Codification Master Glossary. Also see Appendix, *Definition of Terms*, for additional terms relevant to this Topic: Acquiree, Acquirer, Acquisition by a Not-for-Profit Entity, Business, Business Combination, Call Option, Combination, Comprehensive Income, Credit Derivative, Derivative Instruments, Fair Value, Financial Instrument, Financial Statements are Available to be Issued, Firm Commitment, Market Participants, Net Income, Noncontrolling Interest, Not-for-Profit Entity, Orderly Transaction, Other Comprehensive Income, Probable (2nd definition), Public Business Entity, Put Option, Time Value, Trading, Transaction, and Underlying, Underlying Asset, Variable Lease Payments.

**Asymmetrical Default Provision.** A nonperformance penalty provision that requires the defaulting party to compensate the nondefaulting party for any loss incurred but does not allow the defaulting party to receive the effect of favorable price changes.

**Benchmark Interest Rate.** A widely recognized and quoted rate in an active financial market that is broadly indicative of the overall level of interest rates attributable to high-credit-quality obligors in that market. It is a rate that is widely used in a given financial market as an underlying basis for determining the interest rates of individual financial instruments and commonly referenced in interest-rate-related transactions.

In theory, the benchmark interest rate should be a risk-free rate (that is, has no risk of default). In some markets, government borrowing rates may serve as a benchmark. In other markets, the benchmark interest rate may be an interbank offered rate.

**Bid-Ask Spread.** A bid-ask spread is the difference between the highest price a buyer will pay to acquire an instrument and the lowest price at which any investor will sell an instrument.

**Capacity Contract.** An agreement by an owner of capacity to sell the right to that capacity to another party so that it can satisfy its obligations. For example, in the electric industry, capacity (sometimes referred to as installed capacity) is the capability to deliver electric power to the electric transmission system of an operating control area.

**Cash Flow Hedge.** A hedge of the exposure to variability in the cash flows of a recognized asset or liability, or of a forecasted transaction, that is attributable to a particular risk.

**Control Area.** A control area requires entities that serve load within the control area to demonstrate ownership or contractual rights to capacity sufficient to serve that load at time of peak demand and to provide a reserve margin to protect the integrity of the system against potential generating unit outages in the control area. A control area is a portion of the electric grid that schedules, dispatches, and controls generating resources to serve area load (ultimate users of electricity) and coordinates scheduling of the flow of electric power over the transmission system to neighboring control areas.

**Credit Risk.** For purposes of a hedged item in a fair value hedge, credit risk is the risk of changes in the hedge item's fair value attributable to both of the following:

1. Changes in the obligor's creditworthiness
2. Changes in the spread over the benchmark interest rate with respect to the hedge item's credit sector at inception of the hedge.

For purposes of a hedge transaction in a cash flow hedge, credit risk is the risk of changes in the hedge transaction's cash flows attributable to all of the following:

1. Default
2. Changes in the obligor's creditworthiness
3. Changes in the spread over the benchmark interest rate with respect to the related financial asset's or liability's credit sector at inception of the hedge.

**Derivative Instruments.** In ASC 815, derivative instruments are defined by their three distinguishing characteristics, which are:

1. One or more underlyings and one or more notional amounts (or payment provisions or both);
2. No initial net investment or a smaller net investment than required for contracts expected to have a similar response to market changes; and
3. Terms that require or permit
  - a. Net settlement
  - b. Net settlement by means outside the contract
  - c. Delivery of an asset that results in a position substantially the same as net settlement

ASC 815 defines derivative instruments by reference to specific characteristics, rather than in terms of classes or categories of financial instruments. These distinctive features are believed to distinguish the fundamental nature of derivative instruments such as options and futures.

**Embedded Credit Derivative.** An embedded derivative that is also a credit derivative.

**Embedded Derivative.** Implicit or explicit terms that affect some or all of the cash flows or the value of other exchanges required by a contract in a manner similar to a derivative instrument.

**Exercise Contingency.** A provision that entitles the entity (or the counterparty) to exercise an equity-linked financial instrument (or embedded feature) based on changes in an underlying, including the occurrence (or nonoccurrence) of a specified event. Provisions that accelerate the timing of the entity's (or the counterparty's) ability to exercise an instrument and provisions that extend the length of time that an instrument is exercisable are examples of exercise contingencies.

**Expected Cash Flow.** The probability-weighted average (that is, mean of the distribution) of possible future cash flows.

**Face Amount.** See Notional Amount.

**Fair Value Hedge.** A hedge of the exposure to changes in the fair value of a recognized asset or liability, or of an unrecognized firm commitment, that are attributable to a particular risk.

**Fed Funds Effective Swap Rate.** The fixed rate on a U.S. dollar, constant-notional interest rate swap that has its variable-rate leg referenced to the Fed Funds effective rate with no additional spread over the Fed Funds effective rate on that variable-rate leg. That fixed rate is the derived rate that would result in the swap having a zero fair value at inception because the present value of fixed cash flows, based on that rate, equates to the present value of the variable cash flows.

**Forecasted Transaction.** A transaction that is expected to occur for which there is no firm commitment. Because no transaction or event has yet occurred and the transaction or event when it occurs will be at the prevailing market price, a forecasted transaction does not give an entity any present rights to future benefits or a present obligation for future sacrifices.

**Foreign Exchange Risk.** The risk of changes in a hedged item's fair value of functional-currency-equivalent cash flows attributable to changes in the related foreign currency exchange rates.

**Hybrid Instrument.** A contract that embodies both an embedded derivative and a host contract.

**Interest Rate Risk.** The risk of changes in a hedged item's fair value or cash flows attributable to changes in the designated benchmark interest rate.

**Internal Derivative.** A foreign currency derivative instrument that has been entered into with another member of a consolidated group (such as a treasury center).

**Intrinsic Value.** The amount by which the fair value of the underlying stock exceeds the exercise price of an option. For example, an option with an exercise price of \$20 on a stock whose current market price is \$25 has an intrinsic value of \$5. (A nonvested share may be described as an option on that share with an exercise price of zero. Thus, the fair value of a share is the same as the intrinsic value of such an option on that share.)

**Loan Commitment.** Loan commitments are legally binding commitments to extend credit to a counterparty under certain prespecified terms and conditions. They have fixed expiration dates and may either be fixed rate or variable rate. Loan commitments can be either of the following:

1. Revolving (in which the amount of the overall line of credit is reestablished upon repayment of previously drawn amounts)
2. Nonrevolving (in which the amount of the overall line of credit is not reestablished upon repayment of previously drawn amounts).

Loan commitments can be distributed through syndication arrangements, in which one entity acts as a lead and an agent on behalf of other entities that will each extend credit to a single borrower. Loan commitments generally permit the lender to terminate the arrangement under the terms of covenants negotiated under the agreement. This is not an authoritative or all-encompassing definition.

**London Interbank Offered Rate Swap Rate.** The fixed rate on a single-currency, constant-notional interest rate swap that has its variable-rate leg referenced to the London Interbank Offered Rate (LIBOR) with no additional spread over LIBOR on that variable-rate leg. That fixed rate is the derived rate that would result in the swap having a zero fair value at inception because the present value of fixed cash flows, based on that rate, equate to the present value of the variable cash flows.

**Make Whole Provision.** A contractual option that gives a debtor (that is, an issuer) the right to pay off debt before maturity at a significant premium over the fair value of the debt at the date of settlement.

**Mandatorily Redeemable Financial Instrument.** Any of various financial instruments issued in the form of shares that embody an unconditional obligation requiring the issuer to redeem the instrument by transferring its assets at a specified or determinable date (or dates) or upon an event that is certain to occur.

**Market Value Annuity.** An annuity that provides for a return of principal plus a fixed rate of return (that is, book value) if held to maturity or, alternatively, a market-adjusted annuity purchases.

**Net Cash Settlement.** The party with a loss delivers to the party with a gain a cash payment equal to the gain, and no shares are exchanged.

**Net Share Settlements.** The party with a loss delivers to the party with a gain shares with a current fair value equal to the gain. The portion of equity (net assets) in a subsidiary not attributable, directly or indirectly, to a parent. A noncontrolling interest is sometimes called a minority interest.

**New Basis Event.** See Remeasurement.

**Nonperformance Risk.** The risk that an entity will not fulfill an obligation. Nonperformance risk includes, but may not be limited to, the reporting entity's own credit risk.

**Notional Amount.** A number of currency units, shares, bushels, pounds, or other units specified in a derivative instrument. Sometimes other names are used. For example, the notional amount is called a face amount in some contracts.

**Payment Provision.** A payment provision specifies a fixed or determinable settlement to be made if the underlying behaves in a specified manner.

**Payout Phase.** The period during which the contract holder is receiving periodic payments from an annuity, also referred to as the annuitization phase.

**Periodic Ratchet Design.** The period during which the contract holder is receiving periodic payments from an annuity, also referred to as the annuitization phase.

**Physical Settlement.** The party designated in the contract as the buyer delivers the full stated amount of cash to the seller, and the seller delivers the full stated number of shares to the buyer.

**Prepayable.** Able to be settled by either party before its scheduled maturity.

**Private Company.** An entity other than a public business entity, a not-for-profit entity, or an employee benefit plan within the scope of Topics 960 through 965 on plan accounting.

**Readily Convertible to Cash.** Assets that are readily convertible to cash have both of the following:

1. Interchangeable (fungible) units
2. Quoted prices available in an active market that can rapidly absorb the quantity held by the entity without significantly affecting the price.

(Based on paragraph 83(a) of FASB Concepts Statement No. 5, *Recognition and Measurement in Financial Statements of Business Enterprises*.)

**Recorded Investment.** The amount of the investment in a loan, which is not net of a valuation allowance, but which does reflect any direct write-down of the investment.

**Regular-way Security Trades.** Regular-way security trades are contracts that provide for delivery of a security within the period of time (after the trade date) generally established by regulations or conventions in the marketplace or exchange in which the transaction is being executed.

**Remeasurement Event.** A remeasurement (new basis) event is an event identified in other authoritative accounting literature, other than the recognition of an other-than-temporary impairment, that requires a financial instrument to be remeasured to its fair value at the time of the event

but does not require that financial instrument to be reported at fair value continually with the change in fair value recognized in earnings. Examples of remeasurement events are business combinations and significant modifications of debt as discussed in paragraph 470-50-40-6.

**Spot Rate.** The exchange rate for immediate delivery of currencies exchanged.

**Take-or-Pay Contract.** Under a take-or-pay contract, an entity agrees to pay a specified price for a specified quantity of a product whether or not it takes delivery.

**Trading.** An activity involving securities sold in the near term and held for only a short period of time. The term trading contemplates a holding period generally measured in hours and days rather than months or years. See ASC 948-310-40-1 for clarification of the term trading for a mortgage banking entity.

**Trading Purposes.** The determination of what constitutes trading purposes is based on the intent of the issuer or holder and shall be consistent with the definition of trading in ASC 320-10-25-1(A).

**Unconditional purchase obligation.** An obligation to transfer funds in the future for fixed or minimum amounts or quantities of goods or services at fixed or minimum prices (for example, as in take-or-pay contracts or throughput contracts).

**Zero-Coupon Method.** A swap valuation method that involves computing and summing the present value of each future net settlement that would be required by the contract terms if future spot interest rates match the forward rates implied by the current yield curve. The discount rates used are the spot interest rates implied by the current yield curve for hypothetical zero coupon bonds due on the date of each future net settlement on the swap.

## CONCEPTS, RULES, AND EXAMPLES

---

### ASC 815-10, *Derivatives and Hedging, Overall*

#### Financial Instruments<sup>1</sup>

**Types of financial assets.** The term “financial assets” encompasses a wide range of instruments including, but not limited to:

Accounts receivable	General partnership interests
Beneficial interests in trusts	Limited partnership interests
Cash	LLC member interests
Certificates of deposit	Municipal bonds
Commercial paper	Mutual fund shares or units
Common and preferred stock	Notes and loans receivable
Corporate bonds	U.S. Government securities.

An unconditional contractual obligation whose economic benefit or sacrifice is to be the receipt or delivery of a financial instrument other than cash is considered a financial instrument. For example, a note that is payable in U.S. Treasury bonds gives an issuer the contractual obligation to deliver and gives a holder the contractual right to receive bonds, not cash. But because the bonds represent obligations of the U.S. Treasury to pay cash, they are considered financial instruments. Therefore, the note is also a financial instrument to both the holder of the note and the issuer of the note.

---

<sup>1</sup> Some of the items subject to the guidance in ASC 815-10 are financial instruments. For additional guidance on financial instruments, including the fair value option, see the chapter on ASC 825.

Another type of financial instrument is one that gives an entity the *contractual right* or obligation to exchange other financial instruments on *potentially* favorable or unfavorable terms. An example of this type of financial instrument would be a call option to purchase a specific U.S. Treasury note for \$100,000 in six months. The option *holder* has a contractual right, but not obligation, to exchange the financial instrument on potentially favorable terms. Six months later, if the fair value of the note exceeds \$100,000, the holder will exercise the option because the terms are favorable (the option is now “in the money”). The *writer* of the call option has a contractual obligation to exchange financial instruments on potentially unfavorable terms if the holder exercises the option. The writer is normally compensated for accepting this obligation by being paid a premium, which it keeps whether or not the option is exercised.

A put option to sell a Treasury note has similar effects, although the change in fair values making it worthwhile to exercise the option will be a decline, rather than an increase. The holder of the put option, as with the call option, effectively has an unlimited profit potential and no risk of loss (the only sunk cost is the premium paid), whereas the writer of the option has unlimited risk of loss and only a fixed amount of income.

Options are derivative financial instruments because their value is derived from the value of the underlying. A bank’s commitment to lend \$100,000 to a customer at a fixed rate of 10% any time during the next six months at the customer’s option is also a derivative financial instrument, since its value would vary as market interest rates change. It is an option, with the potential borrower being the holder and the bank being the writer (the parties are collectively referred to as the “counterparties”).

An interest rate swap is a series of forward contracts to exchange, for example, fixed cash payments for variable cash receipts. The cash receipts are computed by multiplying a specified floating-rate market index by a notional amount of principal. An interest rate swap is both a contractual right and a contractual obligation of both counterparties.

**Exclusions.** Excluded from financial instrument classification are options and contracts that contain the right or obligation to exchange a financial instrument for a physical asset, such as bushels of wheat. For example, two entities enter a sale-purchase contract in which the purchaser agrees to take delivery of wheat or gold six months later and pay the seller \$100,000 at the time of delivery. The contract is not a financial instrument because it requires the delivery of wheat or gold, which are not financial instruments.

Also excluded from financial instrument classification are contingent items that may ultimately require the payment of cash but that are not contractual. An example would be a contingent liability for tort judgments payable. However, when such an obligation becomes enforceable and is reduced to a fixed payment schedule, it then would be considered to be a financial instrument.

## Derivative Financial Instruments

Derivative financial instruments are financial instruments whose fair value correlates to a specified benchmark, such as stock prices, interest rates, mortgage rates, currency rates, commodity prices, or some other agreed-upon reference (these are called “underlyings”). Option contracts and forward contracts are the two basic forms of derivatives, and they can be either publicly or privately traded. Forward contracts have symmetrical gain and loss characteristics—that is, they provide exposure to both losses and gains from market movements, although generally there is no initial premium to be paid. Forward contracts are usually settled on or near the delivery date by paying or receiving cash, rather than by physical delivery. On the other hand, option contracts have asymmetrical loss functions: They provide little or no exposure to losses

(beyond the premium paid) from unfavorable market movements, but can provide large benefits from favorable market movements. Both forwards and options have legitimate roles to play in hedging programs, if properly understood and carefully managed.

Typical derivative financial instruments *include*:

- |                                |   |
|--------------------------------|---|
| 1. Option contracts            | 7. Forward contracts                          |
| 2. Interest rate caps          | 8. Forward interest rate agreements           |
| 3. Interest rate floors        | 9. Interest rate collars                      |
| 4. Fixed-rate loan commitments | 10. Futures                                   |
| 5. Note issuance facilities    | 11. Swaps                                     |
| 6. Letters of credit           | 12. Instruments with similar characteristics. |

Derivative financial instruments *exclude* all on-statement of financial position payables including:

1. Mortgage-backed securities
2. Interest-only obligations
3. Principal-only obligations
4. Indexed debt
5. Other optional characteristics incorporated within those receivables and payables (such as convertible bond conversion or call terms).

In addition, derivative financial instruments *exclude* contracts that either:

1. Require exchange for a nonfinancial commodity, or
2. Permit settlement by delivering a nonfinancial commodity.

Thus, most product (petroleum, grain, etc.) futures contracts would be excluded from the definition of derivative financial instrument, while swaps (if settled in cash) would be included.

As with other financial instruments, derivatives can be acquired either for investment purposes or for speculation. For enterprises which are not in the business of speculation, however, the typical purpose of derivative financial instrument is to manage risk, such as that associated with stock price movements, interest rate variations, currency fluctuations, and commodity price volatility. The parties involved tend to be brokerage firms, financial institutions, insurance companies, and large corporations, although any two or more entities of any size can hold or issue derivatives. Even small companies often engage in hedging, most commonly for risk arising from importing and exporting denominated in foreign currencies.

Derivative financial instruments are contracts which are intended to protect or hedge one or more of the parties from adverse movement in the underlying base, which can be a financial instrument position held by the entity or a commitment to acquire the same at some future date, among others. These protections or hedges are rarely perfect and sometimes the hedge, once established, is later modified, even indirectly—such as by disposing of the underlying position while retaining the former hedge—so that the derivative financial instrument becomes in effect a speculative position. The derivative financial instruments themselves can become risky and, if leveraged, small adverse price or interest rate variations can produce significant losses.

Determining whether realized gains or losses on physically settled derivative contracts that are *not* held for trading purposes should be presented gross or net in the income statement irrespective of whether the derivative is a matter of judgment. In evaluating the facts and circumstances, entities should consider:

- The economic substance of the transaction
- ASC 845 on nonmonetary exchanges
- Principal versus agent guidance in ASC 606.  
(ASC 815-10-55-62)

It states that determining whether realized gains and losses on physically settled derivative contracts *not* held for trading purposes should be reported in the income statement on a gross or net basis is a matter of judgment that depends on the relevant facts and circumstances. Consideration of the facts and circumstances should be made in the context of the various activities of the entity, and not based solely on the terms of the individual contracts. For making an evaluation of the facts and circumstances in order to determine whether an arrangement should be reported on a gross or net basis, the economic substance of the transaction as well as the guidance set forth in ASC 845 relative to nonmonetary exchanges and the gross versus net reporting indicators provided in ASC 605-45<sup>2</sup> may be considered. The economic substance of the transaction should be given precedence over its legal form.

**Basic principles.** ASC 815 lists four principles or cornerstones that underlie its guidance:

1. Derivative instruments represent rights or obligations that meet the definitions of assets or liabilities and should be reported in financial statements as assets or liabilities.
  2. Fair value is the most relevant measure for financial instruments and the only relevant measure for derivative instruments. Derivative instruments should be measured at fair value, and adjustments to the carrying amount of hedged items should reflect changes in their fair value (that is, gains or losses) that are attributable to the risk being hedged and that arise while the hedge is in effect.
  3. Only items that are assets or liabilities should be reported as such in financial statements.
  4. Special accounting for items designated as being hedged should be provided only for qualifying items. One aspect of qualification should be an assessment of the expectation of effective offsetting changes in fair values or cash flows during the term of the hedge for the risk being hedged. Gains and losses from hedges should be reported differently based on the type of hedge.
- (ASC 815-10-10-1)

Gains and losses on derivative instruments not designated as hedges are recognized in earnings (or as a change in net assets, in the case of not-for-profit enterprises).

**Not-for-profit entities.** Not-for-profit (NFP) entities are not permitted to use hedge accounting for forecasted transactions. This is because NFP entities do not report *other comprehensive income*—all such items are included in the statement of activity, which provides an all-inclusive measure of changes in net assets for the period. In other regards, however, ASC 815 requirements are fully applicable to NFP entities.

**Private company alternative<sup>3</sup>.** ASC 815 allows for a simplified hedging accounting approach for private companies. This alternative does not apply to public business entities, not-for-profit entities, employee benefit plans within the scope of Topics 960-965 on plan accounting, and financial institutions. It allows private companies to apply a simplified hedge

---

<sup>2</sup> Upon implementation of ASU 2014-09, the principal versus agent considerations may be found in ASC 606-10-55-36 through 55-40.

<sup>3</sup> See the Technical Alert section at the beginning of this chapter for an important update on the private company alternative.

accounting method to hedging relationships. Certain criteria must be met and the relationships must involve variable-rate debt and a pay-fixed, receive-floating interest rate swap. This approach assumes no hedge ineffectiveness in the hedging relationship. This results in an income statement impact similar to what could have occurred had the company simply entered into a fixed-rate borrowing. The approach also allows private companies to measure the hedging interest rate swap at its settlement value, rather than at fair value, and gives private companies more time to put hedge documentation in place. Also included in the guidance are provisions that allow certain private companies with relief from fair value measurement disclosure requirements.

### **ASC 815-15, Embedded Derivatives**

According to ASC 815, the holder of an interest in securitized financial assets (other than holders of strips or related claims to cash flows) must determine whether the interest is a freestanding derivative or contains an embedded derivative that would be required to be separated from the host contract and accounted for separately. That determination is based on an analysis of the contractual terms of the interest in securitized financial assets. This, in turn, requires understanding the nature and amount of assets, liabilities, and other financial instruments that constitute the complete securitization transaction. It is expected that the holder of an interest in securitized financial assets will obtain sufficient information about the payoff structure and the payment priority of the interest to make a determination about whether an embedded derivative exists.

A reporting entity is not allowed to circumvent the requirements of ASC 815 recognition and measurement by embedding a derivative instrument in another contract. If these embedded derivative instruments would otherwise be subject to ASC 815, they are included in its scope.

*Embedded derivative instruments* are defined as explicit or implicit terms affecting:

1. the cash flows, or
2. the value of other exchanges required by contract in a way similar to a derivative instrument (one or more underlying can modify the cash flows or exchanges).

**Recognition.** An embedded derivative instrument must be separated from the host contract and accounted for separately as a derivative instrument by both parties if, and only if, *all* three following criteria are met:

1. Risks and economic characteristics are not clearly and closely related to those of the host contract;
2. The hybrid instrument is not required to be measured at fair value under GAAP with changes reported in earnings; and
3. A separate instrument with the same terms as the embedded derivative instrument would be accounted for as a derivative instrument. For this condition, the initial net investment of the hybrid instrument is not the same as that for the embedded derivative instrument.

These three conditions for the separate accounting for embedded derivatives are explained in the following paragraphs. (ASC 815-15-25-1)

*Risks and economic characteristics are not clearly and closely related to those of the host contract.* If the underlying is an interest rate or interest rate index that changes the net interest payments of an interest-bearing contract, it is considered clearly and closely related unless one of the following conditions exist:

1. The hybrid instrument can be settled contractually in a manner that permits any possibility whatsoever that the investor would not recover substantially all of the initial recorded investment.
2. The embedded derivative instrument could under any possibility whatsoever:
  - a. At least double the investor's initial rate of return (ROR) on the host contract, and
  - b. Also result in an ROR at least twice the market return for a similar contract (same host contract terms and same debtor credit quality).

The date acquired (or incurred) is the assessment date for the existence of the above conditions. Thus, the issuer and an acquirer in a secondary market could account for the instrument differently because of different points in time.

**Example of embedded instruments which are separately accounted for.** Assuming that the host contract is a debt instrument, the following are considered not to be clearly and closely related and would normally have to be separated out as embedded derivatives:

1. Interest rate indexes, floors, caps, and collars not meeting the criteria for exclusion (see number 2 in the next set of examples) (ASC 815-15-25-26);
2. Leveraged inflation-indexed interest payments or rentals (ASC 815-15-25-21 and 25-49);
3. Under certain conditions, certain securitized interests in prepayable financial assets (ASC 815-15-25-33);
4. Calls and puts that do not accelerate repayment of the principal but require a cash settlement equal to the option price at date of exercise. Subsequently added options that cause one party to be exposed to performance or default risk by different parties for the embedded option than for the host contract (ASC 815-15-25-37);
5. Term extending options where there is no reset of interest rates (ASC 815-15-25-44);
6. Equity-indexed interest payments (ASC 815-15-25-49);
7. Commodity-indexed interest or principal payments (ASC 815-15-25-48);
8. A convertible debt conversion option for the investor if it qualifies as a derivative instrument (readily convertible to cash, etc.) (ASC 815-15-25-41); and
9. A convertible preferred stock conversion option if the terms of the preferred stock (not the conversion option) are more similar to debt (a cumulative fixed rate with a mandatory redemption feature) than to equity (cumulative, participating, perpetual).

**Example of embedded instruments which are not separately accounted for.** Assuming that the host contract is a debt instrument, the following are considered to be clearly and closely related and would not normally have to be separated out as embedded derivative instruments:

1. Interest rate indexes (see below)
2. Interest rate floors, caps and collars, if at issuance:
  - a. The cap is at or above the current market price (or rate), and/or
  - b. The floor is at or below the current market price (or rate)  
(ASC 815-15-25-26)
3. Nonleveraged inflation-indexed interest payments or rentals (ASC 815-15-25-50)
4. Credit-sensitive payments (interest rate resets for debtor creditworthiness) (ASC 815-15-25-46)
5. "Plain-vanilla" servicing rights not containing a separate embedded derivative instrument

6. Calls and puts that can accelerate repayment of principal unless:
  - a. The debt involves substantial premium or discount (zero coupon), and
  - b. The call or put is only contingently exercisable (not exercisable unless default occurs) and is indexed only to credit risk or interest rates  
(ASC 815-15-25-40)
7. Term-extending options if the interest rate is concurrently reset to approximately the current market rate for the extended term and the host contract had no initial significant discount (ASC 815-15-25-44)
8. Contingent rentals based on a variable interest rate. (ASC 815-15-25-22)

Based on the foregoing, calls and puts embedded in equity instruments are normally accounted for as follows:

1. Investor—Both the call and the put are embedded derivative instruments.
2. Issuer—Only the put could be an embedded derivative instrument. The put and the call would not be embedded derivative instruments if they are both:
  - a. Indexed to the issuing entity's own stock, and
  - b. Classified in shareholders' equity.

*The hybrid instrument is not required to be measured at fair value under GAAP with changes reported in earnings.* For example, most unsettled foreign currency transactions are subject to ASC 830. Gains or losses are recognized in earnings and thus instruments of this nature are not considered embedded derivative instruments. Trading and available-for-sale securities that have cash flows denominated in a foreign currency also are not considered embedded derivative instruments.

*A separate instrument with the same terms as the embedded derivative instrument would be accounted for as a derivative instrument.* For this condition, the initial net investment of the hybrid instrument is not the same as that for the embedded derivative instrument.

To illustrate, a convertible debt conversion option for the issuer would not be an embedded derivative instrument since a separate option with the same terms would not be a derivative instrument because it is indexed to the issuer's own stock and would be classified in shareholders' equity.

*Instruments indexed to the issuing entity's own stock.* To determine whether an instrument is indexed to an entity's own stock, the reporting entity is to use a two-step approach: Step 1 is to evaluate the instrument's contingent exercise provisions, if any; Step 2 is to evaluate the instrument's settlement provisions. An exercise contingency would not preclude an instrument (or embedded feature) from being considered indexed to an entity's own stock provided that it is not based on (1) an observable market, other than the market for the issuer's stock (if applicable), or (2) an observable index, other than an index calculated or measured solely by reference to the issuer's own operations (e.g., sales revenue of the issuer, EBITDA of the issuer, net income of the issuer, or total equity of the issuer). An instrument (or embedded feature) would be considered indexed to an entity's own stock if its settlement amount will equal the difference between the fair value of a fixed number of the entity's equity shares and a fixed monetary amount or a fixed amount of a debt instrument issued by the entity. An equity-linked financial instrument (or embedded feature) would not be considered indexed to the entity's own stock if the strike price is denominated in a currency other than the issuer's functional currency (including a conversion

option embedded in a convertible debt instrument that is denominated in a currency other than the issuer's functional currency).

Freestanding financial instruments (and embedded features) for which the payoff to the counterparty is based, in whole or in part, on the stock of a consolidated subsidiary are not precluded from being considered indexed to the entity's own stock in the consolidated financial statements of the parent if the subsidiary is a substantive entity.

Another example of an embedded derivative determination situation would involve convertible preferred stock. A convertible preferred stock conversion option would not be an embedded derivative instrument if the terms of the preferred stock (not the conversion option) bear greater similarity to equity (e.g., cumulative, participating, perpetual) than to debt (i.e., a cumulative fixed rate with a mandatory redemption feature).

Interest-only strips and principal-only strips are specifically not subject to this standard assuming (1) the original financial instrument did not contain an embedded derivative instrument and (2) they don't incorporate any new terms from the original. In addition, foreign currency derivative instruments are specifically not separated from the host contract if (1) the currency of the primary economic environment is the functional currency of one of the parties, or (2) the good or service price is routinely denominated in that currency in international commerce.

*Embedded derivative instrument separated from host.* If an embedded derivative instrument is separated from the host, the accounting is as follows:

1. The embedded derivative instrument is accounted for based on ASC 815, and
2. The host contract is accounted for based on GAAP for that instrument, without the embedded derivative instrument.

If the embedded derivative instrument cannot be reliably identified and measured separately, the contract cannot be designated as a hedging instrument, and the entire contract must be measured at fair value with the gain or loss recognized in income.

The SEC's position, as articulated in ASC 815-10-S99-3, is that in performing an evaluation of an embedded derivative feature, the consideration of the economic characteristics and risks of the host contract should be based on all of the stated or implied substantive terms and features of the hybrid financial instrument. In evaluating the stated and implied substantive terms and features, the existence or omission of any single term or feature is not necessarily determinative of the economic characteristics and risks of the host contract (i.e., whether the nature of the host contract is more akin to a debt instrument or more akin to an equity instrument). Although the consideration of an individual term or feature may be weighted more heavily in the evaluation, judgment is required based upon an evaluation of all the relevant terms and features.

**Measurement.** ASC 815-15-25 simplifies the accounting for hybrid financial instruments by permitting fair value remeasurement for any hybrid financial instrument that contains an embedded derivative that otherwise would require bifurcation under ASC 815.

If an embedded instrument requires separation (because the close correlation criterion noted above is not met) from its host, but it cannot be reliably identified and measured, the entire contract must be measured at fair value. Upon recognition of a hybrid instrument that would otherwise require separation into a derivative and a host, the reporting entity may elect irrevocably to measure, on an instrument-by-instrument basis, the entire hybrid instrument at fair value. The changes in fair value are reported currently in earnings. (ASC 815-15-30-1) Such an election must be supported either by concurrent documentation or by a preexisting documented policy supporting automatic election.

This fair value election is also available for remeasurement with respect to:

- previously recognized financial instruments upon the occurrence of a business combination,
- a significant modification of debt, or
- other qualifying remeasurement event, where a new basis of accounting may be created.

Fair value measurements will often differ because they exclude transaction costs, which are included in many historical cost-based accounting entries. (For example, the fair value of stock just purchased on an exchange is lower than cost.) ASC 815 holds that any difference at inception of a recognized hybrid financial instrument for which the fair value election is applied and the transaction price is *not* to be included in current earnings (and thus is retained in the asset carrying amount) unless estimated fair value has been determined (1) from a quoted price in an active market, (2) from comparison to other observable current market transactions, or (3) using a valuation technique that incorporates observable market data.

**Presentation.** ASC 815 requires statement of financial position segregation of those hybrid financial instruments that are being measured at fair value. This can be accomplished either by:

- the display of separate line items for fair value and nonfair value carrying amounts, or
- parenthetical disclosure of fair value carrying amounts included in the aggregate of all carrying amounts.

(ASC 815-15-45-1)

Also, disclosure must be made of the effect on earnings of changes in the fair value of recognized hybrid financial instruments.

#### **ASC 815-20, Hedging—General**

**Overview.** While the standard requires that all derivatives be reported at fair value in the statement of financial position, the changes in fair value are reported in different ways depending on the nature and effectiveness of the hedging activities to which they are related, if held for hedging purposes. (ASC 815-20-35-1) ASC 815 identifies changes in the fair values of derivatives as being the result of:

1. effective hedging,
2. ineffective hedging, or
3. unrelated to hedging.

Furthermore, the hedging itself can be related to the fair value of an existing asset or liability or of a firm commitment, the cash flow associated with forecasted transactions, or foreign currency exposures.

- **Fair value hedges.** Hedges of the changes in fair value can be associated with a recognized asset or liability or of an unrecognized firm commitment. In a fair value hedge, gains and losses of both the derivative instrument (DI) and the hedged item are recognized currently in earnings. In the case of a perfectly effective hedge, these gains and losses will fully offset each period, but more typically this result will not be achieved. There will thus be a residual charge or credit to earnings each period that the hedge position is in place.
- **Cash flow hedges.** Cash flow hedges, on the other hand, pertain to forecasted transactions. The effective portions of these hedges are initially reported in other comprehensive income and are reclassified into earnings only later, when the forecasted transactions affect earnings. Any ineffective portions of the hedges are reported currently in earnings.

- **Foreign currency hedges.** Hedges of the foreign currency exposure of a net investment in a foreign operation also qualify for special accounting treatment. In a foreign currency net investment hedge, the gain or loss is reported in other comprehensive income as part of the cumulative translation adjustment. In the case of foreign currency hedges of unrecognized firm commitments, the gain or loss is reported the same way as a fair value hedge. A gain or loss on a foreign currency hedge that is associated with an available-for-sale security will also be reported the same way as a fair value hedge. Finally, a gain or loss arising from a hedge relating to a foreign currency-denominated forecasted transaction is reported in the same way as a cash flow hedge.

Hedge portions that are not effective are reported in earnings immediately.

A nonderivative financial instrument cannot generally be designated as a hedge. One exception, however, occurs under certain circumstances when that instrument is denominated in a foreign currency. (See the section of Foreign Currency Hedges later in this chapter.) Not-for-profit enterprises cannot use hedge accounting for forecasted transactions.

### Summary of Accounting for Hedges

<i>Type of hedge—ASC 815</i>			
<i>Attribute</i>	<i>Fair value</i>	<i>Cash flow</i>	<i>Foreign currency (FC)</i>
Types of hedging instruments permitted	Derivatives	Derivatives	Derivatives or nonderivatives depending on the type of hedge
Statement of financial position valuation of hedging instrument	Fair value	Fair value	Fair value
Recognition of gain or loss on changes in value of hedging instrument	Currently in earnings	Effective portion currently as a component of other comprehensive income (OCI) and reclassified to earnings in future period(s) that forecasted transaction affects earnings	<b>FC-denominated firm commitment</b> Currently in earnings, same as a fair value hedge <b>Available-for-sale (AFS) security</b> Currently in earnings <b>Forecasted FC transaction</b> Same as cash flow hedge <b>Net investment in a foreign operation</b> OCI as part of the cumulative translation adjustment to the extent it is effective as a hedge
Ineffective portion	Currently in earnings	Currently in earnings	
Recognition of gain or loss on changes in the fair value of the hedged item	Currently in earnings	Not applicable; these hedges are not associated with recognized assets or liabilities	<b>FC-denominated firm commitment</b> Currently in earnings <b>Available-for-sale security (AFS)</b> Currently in earnings <b>Forecasted FC transaction</b> Not applicable; same as cash flow hedge

**Hedge effectiveness—general observations.** Designation and documentation of a hedge at inception is required. (ASC 815-20-25-3) The method used for assessing the effective and ineffective portions of a hedge must be:

- defined at the time of designation,
- used throughout the hedge period, and
- consistent with the approach used by the entity for managing risk.

Similar hedges should usually be assessed for effectiveness in a similar manner unless a different method can be justified. If an improved method is identified and is to be applied prospectively to an existing hedge, that hedge must be discontinued. The new method can then be designated and a new hedge relationship can be established.

The effect of all excluded factors and ineffective amounts are included in earnings. For example, if an option contract hedge is assessed for effectiveness based on changes in the option's intrinsic value, the change due to the time value of the contract would be excluded from the effectiveness assessment, and that amount would be included in earnings. As another example, differences in key terms between the hedged item and the hedging instrument such as notional amounts, maturities, quantities, location, or delivery dates would cause ineffectiveness and that amount would be included in earnings.

Hedge effectiveness does not require perfect effectiveness (which is almost never attainable in practice), but the guidance is not explicit regarding the degree of effectiveness that must be attained to justify the use of special hedge accounting. Should a hedge fail to meet a minimum threshold of effectiveness, it is to be redesignated, and hedge accounting ceases.

Strategic risk hedges do not meet qualifying criteria. Thus, hedge accounting is limited to relationships involving derivative instruments and certain foreign currency-denominated instruments that are designated as hedges and meet the qualifying criteria.

### **ASC 815-25, Fair Value Hedges**

The change in the fair value of an entire financial asset or liability for a period is computed as the fair value at the end of the period, adjusted to exclude changes in fair value (1) from payments received or made (partial recoveries or settlements), and (2) from the passage of time, minus the fair value at the beginning of the period.

**Qualifications.** To qualify as a fair value hedge, both the hedged items and the designated hedging instruments must meet all of the following criteria:

1. At the hedge's inception, formal documentation exists of the:
  - a. Hedging relationship;
  - b. Risk management objectives;
  - c. Strategy for undertaking the hedge;
  - d. Identification of the hedged item, the hedging instrument, the nature of the risk being hedged, the method of assessing effectiveness and the components (if any) that are excluded (such as time value) from the effectiveness assessment; and the
  - e. Reasonable method to be used in recognizing in earnings the asset or liability representing the gain or loss in the case of a hedged firm commitment.
2. The hedging relationship is expected to be highly effective in producing offsetting fair value changes throughout the hedge period. This relationship must be assessed at least every three months and each time financial statements or earnings are reported.

3. If hedging with a written option, the combination must provide as much potential for gains from positive fair value changes as potential for losses from negative fair value changes. If a net premium is received, a combination of options is considered a written option. The combination of a written option and some other nonoption derivative is also considered a written option.

According to ASC 815, an asset or liability will be eligible for designation as a hedged item in a fair value hedge if the hedged item:

1. is specifically identified as all or a specific portion of a recognized asset or liability, or an unrecognized firm commitment;
2. is exposed to fair value changes that are attributable to the hedged risk such that earnings would be affected; and
3. is not either remeasured at fair value for financial reporting purposes, or an equity-method investment, or an equity method or minority interest in a consolidated subsidiary, a firm commitment related to the foregoing, or an equity instrument issued by the entity.

Other limitations also apply, affecting held-to-maturity debt securities and nonfinancial assets.

More specifically, to be eligible for designation as a hedged item, an asset or liability must meet all of the following criteria:

1. The single item (or portfolio of similar items) must be specifically identified as hedging all or a specific portion.
  - a. If similar items are aggregated and hedged, each item has to share the risk exposure that is being hedged (i.e., each individual item must respond in a generally proportionate manner to the change in fair value).
    - (1) A specific portion must be one of the following:
      - (2) A percentage of the total asset, liability, or portfolio;
      - (3) One or more selected contractual cash flows: for instance, the present value of the interest payments due in the first two years of a four-year debt instrument;
      - (4) An embedded put, call, cap, or floor that does not qualify as an embedded derivative in an existing asset or liability; or
      - (5) Residual value in a lessor's net investment in a sales-type or direct financing lease.
2. The item has an exposure to fair value changes that could affect earnings (this does not apply to not-for-profit enterprises).
3. The item is not:
  - a. Remeasured with changes reported currently in earnings; for example, a foreign currency-denominated item;
  - b. An ASC 323 equity-method investment or an equity investment in a consolidated subsidiary;
  - c. A minority interest;
  - d. A firm commitment to enter into a business combination or to acquire or dispose of:
    - (1) A subsidiary;
    - (2) A minority interest; or
    - (3) An equity method investee; or
  - e. An entity-issued equity interest classified in stockholders' equity.

4. The item is not a held-to-maturity debt security (or similar portfolio) unless the hedged risk is for something other than fair value changes in market interest rates or foreign exchange rates; examples include hedges of fair value due to changes in the obligor's creditworthiness, and hedges of fair value due to changes in a prepayment option component.
5. If the item is a nonfinancial asset or liability (other than a recognized loan servicing right or a nonfinancial firm commitment with financial components), the designated hedged risk is the fair value change of the total hedged item (at its actual location, if applicable); ASC 815 stipulates that the price of a major ingredient cannot be used, and the price of a similar item at a different location cannot be used without adjustment.
6. If the item is a financial asset or liability, a recognized loan servicing right or a nonfinancial firm commitment with financial components, the designated hedge risk is the risk of changes in fair value from fair value changes in:
  - a. The total hedged item;
  - b. Market interest rates;
  - c. Related foreign currency rates;
  - d. The obligor's creditworthiness; or
  - e. Two or more of the above, other than a.

Prepayment risk for a financial asset cannot be hedged, but an option component of a prepayable instrument can be designated as the hedged item in a fair value hedge. Embedded derivatives have to be considered also in designating hedges. For instance, in a hedge of interest rates, the effect of an embedded prepayment option must be considered in the designation of the hedge.

**Reporting gains and losses from fair value hedges.** The accounting for qualifying fair value hedges' gains and losses is as follows:

- On the hedging instrument, gains and losses are recognized in earnings.
- On the hedged item, gains and losses are recognized in earnings, even if they would normally be included in other comprehensive income if not hedged. For example, gains and losses on an available-for-sale security would be taken into income, if this is being hedged. The carrying amount of the hedged item is adjusted by the gains and losses resulting from the hedged risk.

(ASC 815-25-35-1)

Differences between the gains and losses on the hedged item and the hedging instrument are either due to amounts excluded from the assessment of hedging effectiveness, or are due to ineffectiveness. These gains and losses are to be recognized currently in earnings.

#### Example—Gains and losses on fair value hedges

An available-for-sale security carrying amount is adjusted by the amount resulting from the hedged risk, a fair value hedge.

Hedged item:	Available-for-sale security
Hedging instrument:	Put option
Underlying:	Price of the security
Notional amount:	100 shares of the security

On July 1, 20X1, Company XYZ purchased 100 shares of Widgetworks at a cost of \$15 per share and classified it as an available-for-sale security. On October 1, 20X1, Company XYZ purchased for \$350 an at-the-money put on Widgetworks with an exercise price of \$25 and an expiration date of April 20X2. This put purchase locks in a profit of \$650 (\$1,000 spread in market price less \$350 cost of the put), if the price stays at \$25 or goes lower, but allows continued profitability if the price of the Widgetworks stock continues to go up. Company XYZ specifies that only the intrinsic value of the option is to be used to measure effectiveness. Thus, the time value decreases in the fair value of the put will be charged against the income of the period. Company XYZ then documents the hedge's strategy, objectives, hedging relationships, and method of measuring effectiveness. The following table shows the fair value of the hedged item and the hedging instrument.

	<b>Case 1</b>			
<b>Hedged Item</b>	<i>10/1/X1</i>	<i>12/31/X1</i>	<i>3/31/X2</i>	<i>4/17/X3</i>
Widgetworks share price	\$ 25	\$ 22	\$ 20	\$ 20
Number of shares	100	100	100	100
Total	\$ 2,500	\$ 2,200	\$ 2,000	\$ 2,000
<b>Hedging Instrument</b>				
Put option (100 shares)

		Hedge loss	300
		Valuation allowance—available-for-sale security (fair value loss)	300

#### **Partial Statement of Financial Position**

##### **Effect of Hedging Relationships**

**December 31, 20X1**

**Dr (Cr)**

Cash	\$(1,850)
Available-for-sale securities	1,200
Plus: Valuation allowance	1,000
Put option	515
Other comprehensive income	(1,000)
Retained earnings	135

		<b>Entries</b>		
3/31/X2	End of Quarter:	Put option	200	
		Hedge gain (intrinsic value changes)	200	
		Hedge loss	162	
		Put option (time value loss)	162	
		Hedge loss	200	
		Available-for-sale security (fair value loss)	200	
4/17/X2	Put Expires:	Put option	0	
		Hedge gain (intrinsic value changes)	0	
		Hedge loss	53	
		Put option (time value changes)	53	
		Hedge loss	0	
		Available-for-sale security (fair value changes)	0	

**Partial Statement of Financial Position****Effect of Hedging Relationships****April 17, 20X2 (Expiration of put)****Dr (Cr)**

Cash	\$(1,850)
Available-for-sale securities	1,500
Plus: Valuation allowance	500
Put option	500
Other comprehensive income	(1,000)
Retained earnings	350

At or before expiration, an in-the-money put must be sold or exercised. Assuming that it is sold, the entry would be:

Cash	500
Put option	500

On the other hand, if the put is exercised, the entry would be

Cash (exercise price)	2,500
Other comprehensive income	1,000
Available-for-sale security	1,500
Valuation allowance	500
Put option	500
Gain on sale	1,000

The net effect on retained earnings of the hedge and sale is a net gain of \$650 (\$1,000 – \$350).

<b>Hedged Item</b>	<b>Case 2</b>			
	<u><b>10/1/X1</b></u>	<u><b>12/31/X1</b></u>	<u><b>3/31/X2</b></u>	<u><b>4/17/X2</b></u>

		Cash	350
12/31/X1	End of Year:	Put option	0
		Hedge gain (intrinsic value gain)	0
		Hedge loss	250
		Put option (time value loss)	250
		Valuation allowance—available-for-sale security	300
		Hedge gain (fair value gain)	300

**Partial Statement of Financial Position****Effect of Hedging Relationships****December 31, 20X1****Dr (Cr)**

Cash	\$ (1,850)
Available-for-sale securities	1,500
Plus: Valuation allowance	1,300
Put option	100
Other comprehensive income	(1,000)
Retained earnings	(50)

**Entries**

3/31/X2	End of Quarter:	Put option	0
		Hedge gain (intrinsic value change)	0
		Hedge loss	75
		Put option (time value loss)	75
		Valuation allowance—available-for-sale security	200
		Hedge gain (fair value gain)	200
4/17/X2	Put Expires:	Put option	0
		Hedge gain (intrinsic value change)	0
		Hedge loss	25
		Put option (time value change)	25
		Valuation allowance—available-for-sale security	100
		Hedge gain (fair value change)	100

**Effect of Hedging Relationships****April 17, 20X2 (Expiration of put)****Dr (Cr)**

Cash	\$ (1,850)
Available-for-sale securities	1,500
Plus: Valuation allowance	1,600
Put option	0
Other comprehensive income	(1,000)
Retained earnings	(250)

The put expired unexercised and Company XYZ must decide whether to sell the security. If it continues to hold, normal ASC 320 accounting would apply. If it continues to hold and a new put is purchased, the above example would be applicable again with the present position as a starting point. If the security is sold, the entry would be:

Cash (fair value)	3,100
Other comprehensive income	1,000
Available-for-sale security	1,500
Valuation allowance	1,600
Gain on sale	1,000

**Measuring the effectiveness of fair value hedges.** Although there are specific conditions applicable to the hedge type (fair value or cash flow), in general, the assumption of no ineffectiveness in a hedging relationship between an interest-bearing financial instrument and an interest rate swap (or a compound hedging instrument composed of an interest rate swap and a mirror-image call or put option) can be made if all of the following conditions are met:

1. The principal amount of the interest-bearing asset or liability being hedged and the notional amount of the swap match.
2. The fair value of the swap is zero at inception, if the hedging instrument is solely an interest rate swap. If the hedging instrument is a compound derivative containing the swap and a mirror-image call or put, the premium for the option must be paid or received in the same manner as the premium on the option embedded in the hedged item, and further conditions must be met depending on whether the premium on the option element of the hedged item was paid upon inception or over the life of the instrument.
3. The net settlements under the swap are computed the same way on each settlement date.
4. The financial instrument is not prepayable, but this criterion does not apply to an interest-bearing asset or liability that is prepayable only due to an embedded call option when the hedging instrument is a compound derivative composed of a swap and a mirror-image call option.
5. The terms are typical for those instruments and do not invalidate the assumption of effectiveness.
6. The maturity date of the instrument and the expiration date of the swap match.
7. No floor or ceiling on the variable interest rate of the swap exists.
8. The interval (three to six months or less) between repricings is frequent enough to assume the variable rate is a market rate.

The fixed rate on the hedged item is not required to exactly match the fixed rate on the swap. The fixed and variable rates on the swap can be changed by the same amount. As an example, a swap payment based on LIBOR and a swap receipt based on a fixed rate of 5% can be changed to a payment based on LIBOR plus 1% and a receipt based on 6%.

ASC 815 permits a “shortcut method” to compute fair value adjustments, which produces the same reporting results as when the method illustrated above has been applied. This shortcut is only appropriate for a fair value hedge of a fixed-rate asset or liability using an interest rate swap and only with the assumption of no ineffectiveness is appropriate (i.e., if the criteria above have been met). The FASB’s decision to redefine interest rate risk (by permitting “benchmark rate” hedging

in ASC 815-20-25) necessitated that it also address the effect on the shortcut method for fair value hedges and cash flow hedges. The steps in the shortcut method are as follows:

1. Determine the difference between the fixed rate to be received on the swap and the fixed rate to be paid on the bonds.
2. Combine that difference with the variable rate to be paid on the swap.
3. Compute and recognize interest expense using that combined rate and the fixed-rate liability's principal amount. (Amortization of any purchase premium or discount on the liability also must be considered, although that complication is not incorporated in this example.)
4. Determine the fair value of the interest rate swap.
5. Adjust the carrying amount of the swap to its fair value and adjust the carrying amount of the liability by an offsetting amount.

For fair value hedges, an assumption of no ineffectiveness is invalidated when the interest rate index embodied in the variable leg of the interest rate swap is different from the benchmark interest rate being hedged. In situations in which the interest rate index embodied in the variable leg of the swap has greater credit risk than that embodied in the benchmark interest rate, the effect of the change in the swap's credit sector spread over that in the benchmark interest rate would represent hedge ineffectiveness because it relates to an unhedged risk (credit risk) rather than to the hedged risk (interest rate risk).

In situations in which the interest rate index embodied in the variable leg of the swap has less credit risk than that embodied in the benchmark interest rate, the effect of the change in a certain portion of the hedged item's spread over the swap interest rate would also represent hedge ineffectiveness. For an entity to comply with an assumption of no ineffectiveness, the index on which the variable leg of the swap is based must match the benchmark interest rate designated as the interest rate risk being hedged for the hedging relationship.

**Discontinuance of a fair value hedge.** The accounting for a fair value hedge should not continue if any of the events below occur:

1. The criteria are no longer met;
2. The derivative instruments expire or are sold, terminated, or exercised; or
3. The designation is removed.

If the fair value hedge is discontinued, a new hedging relationship may be designated with a different hedging instrument and/or a different hedged item, as long as the criteria established in ASC 815 are met.

**Ineffectiveness of a fair value hedge.** Unless the shortcut method is applicable, the reporting entity must assess the hedge's effectiveness at the inception of the hedge and at least every three months thereafter. In addition, ASC 815 requires that at the inception of the hedge the method to be used to assess hedge effectiveness must be identified. To comply, the reporting entity should decide which changes in the derivative's fair value will be considered in assessing the effectiveness of the hedge, and the method to be used to assess hedge effectiveness. Regarding the former, some derivative instruments (options) have two components: intrinsic value and time value. The intrinsic value of a call option is the excess, if any, of the market price over the strike or exercise price; the intrinsic value of an option recognizes that the price of the underlying item may move above the strike price (for a call) or below the strike price (for a put) during the exercise period. The enterprise elects to measure effectiveness either including or excluding time value; it must do so consistently once the designation is made.

Hedge effectiveness must be assessed in two different ways—in *prospective* considerations and in *retrospective* evaluations. ASC 815 provides flexibility in selecting the method the entity will use in assessing hedge effectiveness, but an entity should assess effectiveness for similar hedges in a similar manner and that the use of different methods for similar hedges should be justified.

Prospectively, the entity must, at both inception and on an ongoing basis, be able to justify an expectation that the relationship will be highly effective in achieving offsetting changes in fair value over future periods. That expectation can be based upon regression or other statistical analysis of past changes in fair values or on other relevant information. Retrospectively, the entity must, at least quarterly, determine whether the hedging relationship has been highly effective in having achieved offsetting changes in fair value through the date of periodic assessment. That assessment can also be based upon regression or other statistical analysis of past changes in fair values, as well as on other relevant information. If at inception the entity elects to use the same regression analysis approach for both prospective and retrospective effectiveness evaluations, then during the term of that hedging relationship those regression analysis calculations should generally incorporate the same number of data points. As an alternative to using regression or other statistical analysis, an entity could use the dollar-offset method to perform the retrospective evaluations of assessing hedge effectiveness.

ASC 815-20-25 addresses documentation of the method that is used to measure hedge ineffectiveness under ASC 815. ASC 815 implies that an entity must document, at inception of a hedge, the method that will be used to measure hedge ineffectiveness (in addition to the method to be used to assess effectiveness) in order to meet the documentation requirements of the standard. The FASB has stated that formal documentation is required, at the inception of a hedge, of the hedging relationship and the entity's risk management objective and strategy for undertaking the hedge, including identification of:

1. The hedging instrument,
2. The hedged item or transaction,
3. The nature of the risk being hedged,
4. The method that will be used to retrospectively and prospectively assess the hedging instrument's effectiveness, and
5. The method that will be used to measure hedge ineffectiveness.

**Impairment considerations for hedging and hedged items.** All assets or liabilities designated as fair value hedges are subject to the normal GAAP requirements for impairment assessment and, as needed, accounting adjustment. Those requirements are to be applied, however, only after the carrying amounts have been adjusted for the period's hedge accounting. Since the hedging instrument is a separate asset or liability, its fair value is not considered in applying the impairment criteria to the hedged item.

The hedged item is also, of course, subject to the requirement for impairment assessment. A fair value measurement represents the price at which a transaction would occur between market participants in an orderly transaction at the measurement date. The fair value is determined, as set forth by ASC 820-10, by using one of the following methods:

- Utilizing *quoted* prices in an active market (Level 1)
- Utilizing relevant *observable* inputs (Level 2)
- Utilizing significant *unobservable* inputs (Level 3).

ASC 820 stipulates that fair value represents the price at which an orderly transaction would take place between market participants. An orderly transaction is one that would not be characterized as a forced liquidation or distress sale. Thus, notwithstanding that there may be little or no market activity for an asset at the measurement date, the objective of determining fair value remains the identification of an exit price for the asset in question. Under reduced market activity conditions it would *neither* be appropriate to conclude that all market activity represents forced liquidations or distress sales, *nor* that any given transaction price is determinative of fair value.

Put another way, this admonition suggests that, in such circumstances, there may be a need to apply Level 3 measurements as described in ASC 820, if Level 1 (quoted prices) are absent or unreliable and Level 2 measures are similarly sparse or absent or no longer relevant. There would thus be a greater need to employ management's internal assumptions concerning future cash flows discounted at an appropriate risk-adjusted interest rate. When some Level 2 (observable) data is available but requires significant adjustment based on unobservable data, these should be considered to be Level 3 fair value measurements.

#### Example of applying fair value measurements in times of market inactivity or stress

Magna Financial holds as an investment a tranche of AA-rated mortgage-backed securities (MBS) that are collateralized by unguaranteed nonconforming residential mortgage loans. The fair value of this financial asset had heretofore been determined based on either (1) quoted prices in active markets for similar MBS (which constituted Level 2 inputs), or (2) quoted prices in inactive markets representing current transactions for the same or similar MBS not requiring significant adjustments (which were also Level 2 inputs).

As of year-end 20X1, the MBS market has grown inactive (as evidenced at first by a widening of the bid-ask spread, and subsequently by a decline in transaction volume). At the date of the statement of financial position, Magna Financial concludes that the markets for identical and similar MBS tranches are inactive. This determination was made by considering that (1) few transactions for the same MBS or similar tranches were presently observable, and (2) the few observable prices for such transactions exhibited substantial variations. Accordingly, valuation information available for Magna Financial's AA-rated MBS tranche was classified within Level 3 of the fair value hierarchy.

Magna Financial determined that use of a present value technique that would maximize the use of observable inputs (and would thus minimize the use of unobservable inputs) would be at least as representative of fair value as the market approach applied at earlier measurement dates. Specifically, Magna Financial decides to employ the "discount rate adjustment technique," under which the adjustment for risk inherent in the asset's contractual cash flows will be incorporated into the discount rate itself.

In determining the interest rate to be applied to the contractually obligated future cash flows as of year-end 20X1, Magna Financial takes into account (1) a 16% implied rate of return on the last date on which the market for an identical MBS was deemed active, and (2) the subsequent 1.5% (150 basis point) widening of credit spreads and the subsequent 4% (400 basis point) increase in liquidity risk premiums. Furthermore, Magna Financial will consider all available market information that could be obtained without due cost and effort, which in the present fact situation will include (1) previous quoted prices in markets for identical or similar MBS, (2) reports issued by analysts and rating agencies, (3) movements in relevant indexes, such as those gauging interest rates and credit risks, (4) data pertaining to the performance of the underlying mortgage loans (including delinquency and foreclosure rates, loss experience, and prepayment speeds), and (5) two indicative (but nonbinding) broker quotes based on proprietary pricing models using Level 3 inputs, which implied rates of return of 20% and 24%, respectively.

Based on the foregoing facts, Magna Financial will be required to select an appropriate interest rate to apply in discounting the contractual cash flows of the MBS for the purpose of estimating fair value for this portfolio at year-end 20X1. Under the circumstances, Magna Financial determined that a 23% rate was to be used, as that was the result of evaluating and weighing the respective indications of the appropriate rate of the MBS tranche's return within a range of 21.5%–25.5%. The low end of the range is computed as follows:

16.0%	=	Implied rate of return as of the last date on which the market for identical MBS was active
1.5%	=	Subsequent widening of credit spreads (150 basis points)
4.0%	=	Subsequent increase in risk premiums (400 basis points)
21.5%	=	Low end of the range

The high end of the range is based on two nonbinding broker quotes that imply an average 25.5% rate of return (i.e., the average of the implied rates of 23% and 28%). Magna Financial believes that the range is reasonable and the 23% rate reflects the best estimate of the assumptions that would be made by market participants of the fair value at the measurement date and takes into account:

1. nonperformance risk (consisting of both default and collateral value risks), and
2. liquidity risk (determined by the compensation a market participant would expect to receive for acquiring an asset that is difficult to sell under current market conditions).

In this instance, Magna Financial assigned slightly greater weight to its own estimate of fair value (the low end of the range, 21.5%) because:

1. broker quotes were nonbinding and based on models using significant unobservable inputs, and
2. the entity was able to use market inputs relating to the performance of the underlying mortgage loans.

### **ASC 815-30, Cash Flow Hedges**

The second major subset of hedging arrangements relates to uncertain future cash flows, as contrasted with hedged items engendering uncertain fair values. A derivative instrument may be designated as a hedge to the exposure of fluctuating expected future cash flows produced by a particular risk. The exposure may be connected with an existing asset or liability or with a forecasted transaction.

**Qualifications.** To qualify as a cash flow hedge, both the hedged items and the designated hedging instruments must meet all of the following criteria:

1. At the hedge's origin, formal documentation exists of the:
  - a. Hedging relationship;
  - b. Risk management objectives;
  - c. Strategy for undertaking the hedge; and
  - d. Identification of the hedged transaction, the hedging instrument, the nature of the hedged risk, the method of assessing effectiveness, and the components (if any) that are excluded (such as time value) from the effectiveness assessment.
2. Documentation must include:
  - a. All relevant details;
  - b. The specific nature of any asset or liability involved;
  - c. When (date on or period within) a forecasted transaction is expected to occur; and

- d. The expected currency amount (exact amount of foreign currency being hedged) or expected quantity (specific physical quantities such as number of items, weight, etc.) of a forecasted transaction. If a price risk is being hedged in a forecasted sale or purchase, the hedged transaction cannot:
- (1) Be specified solely in terms of expected currency amounts, or
  - (2) Be specified as a percentage of sales or purchases.

The current price of the transaction should be identified and the transaction should be described so that it is evident that a given transaction is or is not the hedged transaction. For instance, a forecasted sale of the first 2,000 units in January is proper, but the forecasted sale of the last 2,000 units is not because they cannot be identified when they occur—the month has to end before the last units sold can be identified.

3. The hedging relationship is expected to be highly effective in producing offsetting cash flows throughout the hedge period. This relationship must be assessed at least every three months and each time financial statements or earnings are reported.
4. If hedging with a written option, the combination must provide at least as much potential for positive cash flow changes as exposure to negative cash flow changes. A derivative that results from the combination of a written option and another nonoption derivative is also considered a written option.
5. A link must be used to modify interest receipts or payments of a recognized financial asset or liability from one variable rate to another variable rate. It has to be between a designated asset (or group of similar assets) and a designated liability (or group of similar liabilities) and it has to be highly effective. A link occurs when the basis of one leg of an interest rate swap is the same as the basis of the interest rate receipt of a designated asset and the basis of the other leg of the swap is the same as the basis of the interest payments for a designated liability.

A nonderivative instrument cannot be designated as a hedging instrument for a cash flow hedge.

In addition to the above, to be eligible for designation as a cash flow hedge, a forecasted transaction must meet all of the following criteria:

1. The single transaction (or group of individual transactions) must be specifically identified. If individual transactions are grouped and hedged, each has to share the same risk exposure that is being hedged (i.e., each individual transaction must respond in a proportionate manner to the change in cash flow). Thus, a forecasted sale and a forecasted purchase cannot both be included in the same group of transactions.
2. The occurrence is probable.
3. It is a transaction with an external party (unless a foreign currency cash flow hedge) and it has an exposure to cash flow changes that could affect earnings.
4. The transaction is not to be remeasured under GAAP with changes reported in earnings; for example, foreign currency-denominated items would be excluded for this reason. Forecasted sales on credit and forecasted accrual of royalties on probable future sales are not considered the forecasted acquisition of a receivable. Also, if related to a recognized asset or liability, the asset or liability is not remeasured under GAAP with changes in fair value resulting from the hedged risk reported in earnings.

5. The item is not a held-to-maturity debt security (or similar portfolio) unless the hedged risk is for something other than for cash flow changes in market interest rates, as, for example, in a hedge of cash flow changes due to an obligor's creditworthiness or default.
6. It does not involve:
  - a. A business combination;
  - b. A parent company's interest in consolidated subsidiaries;
  - c. A minority interest;
  - d. An equity-method investment; or
  - e. An entity-issued equity interest classified in stockholders' equity.
7. If it involves a purchase or sale of a nonfinancial asset, the hedged risk is:
  - a. The change in the functional-currency-equivalent cash flows resulting from changes in the related foreign currency rates; or
  - b. The change in cash flows relating to the total hedged purchase or sales price (at its actual location, if applicable); for example, the price of a similar item at a different location cannot be used.
8. If it involves a purchase or sale of a financial asset or liability or the variable cash flow of an existing financial asset or liability, the hedged risk is the risk of changes in cash flow of:
  - a. The total hedged item;
  - b. Market interest rates;
  - c. Related foreign currency rates;
  - d. Obligor's creditworthiness or default; or
  - e. Two or more of the above, other than "a."

Prepayment risk for a financial asset cannot be hedged.

**Effectiveness of cash flow hedges.** The assumption of no ineffectiveness in a cash flow hedge between an interest-bearing financial instrument and an interest rate swap can be assumed if all of the following conditions are met:

1. The principal amount and the notional amount of the swap match;
2. The fair value of the swap is zero at origin;
3. The net settlements under the swap are computed the same way on each settlement date;
4. The financial instrument is not prepayable;
5. The terms are typical for those instruments and do not invalidate the assumption of effectiveness;
6. All variable rate interest payments or receipts on the instrument during the swap term are designated as hedged and none beyond that term;
7. No floor or cap on the variable rate of the swap exists unless the variable rate instrument has one. If the instrument does, the swap must have a comparable (not necessarily equal) one;
8. Repricing dates match; and
9. The index base for the variable rates matches.

The variable rate on the instrument is not required to exactly match the variable rate on the swap. The fixed and variable rates on the swap can be changed by the same amount.

**Example of using options to hedge future purchase of inventory**

Friendly Chemicals Corp. uses petroleum as a feedstock from which it produces a range of chemicals for sale to producers of synthetic fabrics and other consumer goods. It is concerned about the rising price of oil and decides to hedge a major purchase it plans to make in mid-20X1. Oil futures and options are traded on the New York Mercantile exchange and other markets; Friendly decides to use options rather than futures because it is only interested in protecting itself from a price increase; if prices decline, it wishes to reap that benefit rather than suffer the loss which would result from holding a futures contract in a declining market environment.

At December 31, 20X1, Friendly projects a need for 10 million barrels of crude oil of a defined grade to be purchased by mid-20X2; this will suffice for production through mid-20X3. The current world price for this grade of crude is \$164.50 per barrel, but prices have been rising recently. Management desires to limit its crude oil costs to no higher than \$165.75 per barrel, and accordingly purchases, at a cost of \$2 million, an option to purchase up to 10 million barrels at a cost of \$165.55 per barrel (which, when added to the option premium, would make the total cost \$165.75 per barrel if the full 10 million barrels are acquired), at any time through December 20X2.

Management has studied the behavior of option prices and has concluded that changes in option prices which relate to time value are not correlated to price changes and hence are ineffective in hedging price changes. On the other hand, changes in option prices which pertain to pricing changes (intrinsic value changes) are highly effective as hedging vehicles. The table below reports the value of these options, analyzed in terms of time value and intrinsic value, over the period from December 2012 through December 20X2.

<i>Date</i>	<i>Price of oil/barrel</i>	<i>Fair value of option relating to Time value*</i>	<i>Intrinsic value</i>
December 31, 20X1	\$ 164.50	\$2,000,000	\$ 0
January 31, 20X2	164.90	1,900,000	0
February 28, 20X2	165.30	1,800,000	0
March 31, 20X2	165.80	1,700,000	2,500,000
April 30, 20X2	166.00	1,600,000	4,500,000
May 31, 20X2	165.85	1,500,000	3,000,000
June 30, 20X2**	166.00	700,000	2,250,000
July 31, 20X2	165.60	650,000	250,000
August 31, 20X2	165.50	600,000	0
September 30, 20X2	165.75	550,000	1,000,000
October 31, 20X2	165.80	500,000	1,250,000
November 30, 20X2	165.85	450,000	1,500,000
December 31, 20X2***	165.90	400,000	1,750,000

\* This example does not address how the time value of options would be computed in practice.

\*\* Options for 5 million barrels exercised; remainder held until end of December, then sold.

\*\*\* Values cited are immediately prior to sale of remaining options.

At the end of June 20X2, Friendly Chemicals exercises options for 5 million barrels, paying \$165.55 per barrel for oil selling on the world markets for \$166.00 each. It holds the remaining options until December, when it sells these for an aggregate price of \$2.1 million, a slight discount to the nominal fair value at that date.

The inventory acquired in mid-20X2 is processed and included in goods available for sale. Sales of these goods, in terms of the 5 million barrels of crude oil that were consumed in their production, are as follows:

<u>Date</u>	<i>Equivalent barrels sold in month</i>	<i>Equivalent barrels on hand at month end</i>
June 30, 20X2	300,000	4,700,000
July 31, 20X2	250,000	4,450,000
August 31, 20X2	400,000	4,050,000
September 30, 20X2	350,000	3,700,000
October 31, 20X2	550,000	3,150,000
November 30, 20X2	500,000	2,650,000
December 31, 20X2	650,000	2,000,000

Based on the foregoing facts, the journal entries prepared on a monthly basis (for illustrative purposes) for the period December 20X1 through December 20X2 are as follows:

#### **December 31, 20X1**

Option contract	2,000,000
Cash	2,000,000
<i>To record purchase premium on option contract for up to 10 million barrels of oil at price of \$165.55 per barrel</i>	

#### **January 31, 20X2**

Loss on hedging transaction	100,000
Option contract	100,000
<i>To record change in time value of option contract—charge premium to income since this represents payment for time value of money, which expires ratably over two-year term and does not qualify for hedge accounting treatment</i>	
Option contract	0
Other comprehensive income	0
<i>To reflect change in intrinsic value of option contracts (no value at this date)</i>	

#### **February 28, 20X2**

Loss on hedging transaction	100,000
Option contract	100,000
<i>To record change in time value of option contract—charge premium to income since this represents payment for time value of money, which expires ratably over two-year term and does not qualify for hedge accounting treatment</i>	
Option contract	0
Other comprehensive income	0
<i>To reflect change in intrinsic value of option contracts (no value at this date)</i>	

#### **March 31, 20X2**

Loss on hedging transaction	100,000
Option contract	100,000
<i>To record change in time value of option contract—charge premium to income since this represents payment for time value of money, which expires ratably over two-year term and does not qualify for hedge accounting treatment</i>	

Option contract	2,500,000
Other comprehensive income	2,500,000

*To reflect change in intrinsic value of option contracts*

#### April 30, 20X2

Loss on hedging transaction	100,000
Option contract	100,000

*To record change in time value of option contract—charge premium to income since this represents payment for time value of money, which expires ratably over two-year term and does not qualify for hedge accounting treatment*

Option contract	2,000,000
Other comprehensive income	2,000,000

*To reflect change in intrinsic value of option contracts (further increase in value)*

#### May 31, 20X2

Loss on hedging transaction	100,000
Option contract	100,000

*To record change in time value of option contract—charge premium to income since this represents payment for time value of money, which expires ratably over two-year term and does not qualify for hedge accounting treatment*

Other comprehensive income	1,500,000
Option contract	1,500,000

*To reflect change in intrinsic value of option contracts (decline in value)*

#### June 30, 20X2

Loss on hedging transaction	800,000
Option contract	800,000

*To record change in time value of option contract—charge premium to income since this represents payment for time value of money, which expires ratably over two-year term and does not qualify for hedge accounting treatment; since one-half the options were exercised in June, the remaining unexpensed time value of that portion is also entirely written off at this time*

Option contract	1,500,000
Other comprehensive income	1,500,000

*To reflect change in intrinsic value of option contracts (further increase in value) before accounting for exercise of options on 5 million barrels*

June 30 intrinsic value of options before exercise	4,500,000
Allocation to oil purchased at \$165.55	2,250,000
Remaining intrinsic value of option	<u>2,250,000</u>

The allocation to exercised options will be maintained in other comprehensive income until transferred to cost of goods sold as a contra cost, as the 5 million barrels are sold, at the rate of 45¢ per equivalent barrel (\$166.00 – \$165.55).

Inventory	827,750,000	
Cash (or accounts payable)		827,750,000
<i>To record purchase of 5 million barrels of oil at option price of \$165.55/barrel</i>		
Inventory	2,250,000	
Option contract		2,250,000
<i>To increase the recorded value of the inventory to include the fair value of options given up (exercised) in acquiring the oil (taken together, the cash purchase price and the fair value of options surrendered add to \$166 per barrel, the world market price at date of purchase)</i>		
Cost of goods sold	49,800,000	
Inventory		49,800,000
<i>To record cost of goods sold (300,000 barrels at \$166) before amortizing deferred hedging gain in other comprehensive income</i>		
Other comprehensive income	135,000	
Cost of goods sold		135,000
<i>To amortize deferred hedging gain at rate of 45¢ per barrel sold</i>		

**July 31, 20X2**

Loss on hedging transaction	50,000	
Option contract		50,000
<i>To record change in time value of option contract—charge premium to income since this represents payment for time value of money, which expires ratably over two-year term, and does not qualify for hedge accounting treatment</i>		
Other comprehensive income	2,000,000	
Option contract		2,000,000
<i>To reflect change in intrinsic value of remaining option contracts (decline in value)</i>		
Cost of goods sold	41,500,000	
Inventory		41,500,000
<i>To record cost of goods sold (250,000 barrels at \$166) before amortizing deferred hedging gain in other comprehensive income</i>		
Other comprehensive income	112,500	
Cost of goods sold		112,500
<i>To amortize deferred hedging gain at rate of 45¢ per barrel sold</i>		

**August 31, 20X2**

Loss on hedging transaction	50,000	
Option contract		50,000
<i>To record change in time value of option contract—charge premium to income since this represents payment for time value of money, which expires ratably over two-year term, and does not qualify for hedge accounting treatment</i>		

Other comprehensive income	250,000
Option contract	250,000
<i>To reflect change in intrinsic value of remaining option contracts (decline in value to zero)</i>	
Cost of goods sold	66,400,000
Inventory	66,400,000
<i>To record cost of goods sold (400,000 barrels at \$166) before amortizing deferred hedging gain in other comprehensive income</i>	
Other comprehensive income	180,000
Cost of goods sold	180,000
<i>To amortize deferred hedging gain at rate of 45¢ per barrel sold</i>	

**September 30, 20X2**

Loss on hedging transaction	50,000
Option contract	50,000
<i>To record change in time value of option contract—charge premium to income since this represents payment for time value of money, which expires ratably over two-year term, and does not qualify for hedge accounting treatment</i>	
Option contract	1,000,000
Other comprehensive income	1,000,000
<i>To reflect change in intrinsic value of remaining option contracts (increase in value)</i>	
Cost of goods sold	58,100,000
Inventory	58,100,000
<i>To record cost of goods sold (350,000 barrels at \$166) before amortizing deferred hedging gain in other comprehensive income</i>	
Other comprehensive income	157,500
Cost of goods sold	157,500
<i>To amortize deferred hedging gain at rate of 45¢ per barrel sold</i>	

**October 31, 20X2**

Loss on hedging transaction	50,000
Option contract	50,000
<i>To record change in time value of option contract—charge premium to income since this represents payment for time value of money, which expires ratably over two-year term, and does not qualify for hedge accounting treatment</i>

Inventory	83,000,000
<i>To record cost of goods sold (500,000 barrels at \$166) before amortizing deferred hedging gain in other comprehensive income</i>	
Other comprehensive income	225,000
Cost of goods sold	225,000
<i>To amortize deferred hedging gain at rate of 45¢ per barrel sold</i>	

**December 31, 20X2**

Loss on hedging transaction	50,000
Option contract	50,000
<i>To record change in time value of option contract—charge premium to income since this represents payment for time value of money, which expires ratably over two-year term, and does not qualify for hedge accounting treatment</i>	
Option contract	250,000
Other comprehensive income	250,000
<i>To reflect change in intrinsic value of remaining option contracts (further increase in value) before sale of options</i>	
Cost of goods sold	107,900,000
Inventory	107,900,000
<i>To record cost of goods sold (650,000 barrels at \$166) before amortizing deferred hedging gain in other comprehensive income</i>	
Other comprehensive income	292,500
Cost of goods sold	292,500
<i>To amortize deferred hedging gain at rate of 45¢ per barrel sold</i>	
Cash	2,100,000
Loss on sale of options	50,000
Option contract	2,150,000
Other comprehensive income	1,750,000
Gain on sale of options	1,750,000
<i>To record sale of remaining option contracts; the cash price was \$50,000 lower than carrying value of asset sold (options having unexpired time value of \$400,000 plus intrinsic value of \$1,750,000), but transfer of other comprehensive income to income recognizes formerly deferred gain; since no further inventory purchases are planned in connection with this hedging activity, the unrealized gain is taken into income</i>	

Note that at December 31, 20X2, other comprehensive income has a remaining credit balance of \$900,000, which represents the deferred gain pertaining to the 2 million equivalent barrels of oil in inventory. As this is sold, the other comprehensive income will be transferred to cost of goods sold as a reduction of cost of sales.

**Discontinuance of a cash flow hedge.** The accounting for a cash flow hedge should not continue if any of the events below occur:

1. The criteria are no longer met;
2. The derivative instrument expires or is sold, terminated, or exercised, or
3. The designation is removed by management.

The net gain or loss in accumulated other comprehensive income should remain there until it is properly reclassified when the hedged transaction affects earnings. If it is probable that the original forecasted transactions will not occur, the net gain or loss in accumulated other comprehensive income should immediately be reclassified into earnings.

If the cash flow hedge is discontinued, a new hedging relationship may be designated with a different hedging instrument and/or a different hedged item, as long as the criteria established in ASC 815 are met.

**Ineffectiveness of a cash flow hedge.** In assessing the effectiveness of a cash flow hedge, the time value of money generally will need to be considered, if significant in the circumstances. Doing so becomes especially important if the hedging instrument involves periodic cash settlements. For example, a *tailing strategy* with futures contracts is a situation in which an entity likely would reflect the time value of money. When employing such a strategy, the entity adjusts the size or contract amount of futures contracts used in a hedge so that earnings (or expense) from reinvestment (or funding) of daily settlement gains (or losses) on the futures do not distort the results of the hedge. To assess offset of expected cash flows when a tailing strategy has been used, an entity could reflect the time value of money, possibly comparing the present value of the hedged forecasted cash flow with the results of the hedging instrument.

**Impairment of a cash flow hedge.** All assets or liabilities designated as cash flow hedges are subject to normal GAAP requirements for impairment. Those requirements are to be applied, however, after hedge accounting has been applied for the period. Since the hedging instrument is a separate asset or liability, its expected cash flow or fair value is not considered in applying the impairment criteria to the hedged item. If an impairment loss or recovery on a hedged forecasting asset or liability is recognized, any offsetting amount should be immediately reclassified from accumulated other comprehensive income into earnings.

**Expanded application of interest rate hedging.** ASC 815 also permits the use of hedge accounting where the interest rate being hedged is the “benchmark interest rate.” As used in the standard, this rate will be either the risk-free rate (i.e., that applicable to direct Treasury borrowings—UST), the LIBOR swap rate, or the OIS (Overnight Indexed Swap). LIBOR-based swaps are the most commonly employed interest rate hedging vehicles.

The FASB has concluded that, with respect to the separation of interest rate risk and credit risk, the risk of changes in credit sector spread and any credit spread attributable to a specific borrower should be encompassed in credit risk rather than interest rate risk. Under such an approach, an entity would be permitted to designate the risk of changes in the risk-free rate as the hedged risk, and any spread above that rate would be deemed to reflect credit risk.

ASC 815 requires that all contractual cash flows be used in determining the changes in fair value of the hedged item when benchmark interest rates are being employed. In other words, cash

flows pertaining to the portion of interest payments which is related to the entity's credit risk (the risk premium over the benchmark rate) cannot be excluded from the computation.

The accounting for an interest rate hedge using a benchmark rate is very similar to that illustrated previously in this chapter. However, the variable rate used, rather than reflecting the credit riskiness of the party doing the hedging (which was prime + 1/2% in that illustration), would instead be the benchmark rate (e.g., the rate on Treasury five-year notes). Since changes in the benchmark rate might not exactly track the changes in the underlying instrument (due to changes in the "credit spread" which are a reflection of changes in the underlying party's perceived credit risk), the hedge will likely be imperfect, such that a net gain or loss will be reflected in periodic earnings.

**Gains and losses from cash flow hedges.** The accounting for qualifying cash flow hedges' gains and losses is as follows:

1. The effective portion of the gain or loss on the derivative instrument is reported in other comprehensive income.
2. The ineffective portion of the gain or loss on the derivative instrument is reported in earnings.
3. Any component excluded from the computation of the effectiveness of the derivative instrument is reported in earnings. (ASC 815-30-35-2 through 35-6)
4. Accumulated other comprehensive income from the hedged transaction should be adjusted to the lesser (in absolute amounts) of the following:
  - a. The cumulative gain or loss on the derivative from the creation of the hedge minus any component excluded from the determination of hedge effectiveness and minus any amounts reclassified from accumulated other comprehensive income into earnings;
  - b. The portion of the cumulative gain or loss on the derivative needed to offset the cumulative change in expected future cash flow on the transaction from the creation of the hedge minus any amounts reclassified from accumulated other comprehensive income into earnings.
5. Any remaining gain or loss is reported in earnings.

**Reclassifications to earnings.** In the period that the hedged forecasted transaction affects earnings, amounts in accumulated other comprehensive income should be reclassified into earnings. If the transaction results in an asset or liability, amounts in accumulated other comprehensive income should be reclassified into earnings when the asset or liability affects earnings through cost of sales, depreciation, interest expense, and the like. Any time that a net loss on the combined derivative instrument and the hedged transaction is expected, the amount that is not expected to be recovered should immediately be reclassified into earnings.

#### Example of a "plain vanilla" interest rate swap

On July 1, 20X1, Abbott Corp. borrows \$5 million with a fixed maturity (no prepayment option) of June 30, 20X5, carrying interest at prime + 1/2%. Interest only is due semiannually. At the same date, it enters into a "plain vanilla"-type swap arrangement, calling for fixed payments at 8% and receipt of

prime + 1/2%, on a notional amount of \$5 million. At that date prime is 7.5%, and there is no premium due on the swap arrangement.

This swap qualifies as a cash flow hedge under ASC 815, and it is appropriate to assume no ineffectiveness, since the criteria set forth in that standard are all met.

---

*NOTE: These criteria are that: the notional amount of the swap and the principal amount of the debt are equal; the fair value of the swap at inception is zero; the formula for computing net settlements under the swap is constant during its term; the debt may not be prepaid; all interest payments on the debt are designated as being hedged and no payments beyond the term of the swap are so designated; there is no floor or cap on the variable rate of the debt that is not likewise designated for the swap; the repricing dates of the swap match those of the variable rate debt; and the same index is designated for the hedging instrument and the underlying obligation.*

---

Accordingly, as rates change over the term of the debt and of the swap arrangement, changes in the value of the swap are reflected in other comprehensive income, and the swap will appear on the statement of financial position as an asset or liability at fair value. As the maturity of the debt approaches, the value of the swap will converge on zero. Periodic interest expense in the income statement will be at the effective rate of 8%.

Assume that the prime rate over the four-year term of the loan, as of each interest payment date, is as follows, along with the fair value of the remaining term of the interest rate swap at those dates:

<u>Date</u>	<u>Prime rate (%)</u>	<u>Fair value of swap*</u>
December 31, 20X1	6.5	\$-150,051
June 30, 20X2	6.0	-196,580
December 31, 20X2	6.5	-111,296
June 30, 20X3	7.0	-45,374
December 31, 20X3	7.5	0
<u>Date</u>	<u>Prime rate (%)</u>	<u>Fair value of swap*</u>
June 30, 20X4	8.0	23,576
December 31, 20X4	8.5	24,038
June 30, 20X5	8.0	0

\* Fair values are determined as the present values of future cash flows resulting from expected interest rate differentials, based on the current prime rate, discounted at 8%.

Regarding the fair values presented in the foregoing table, it should be assumed that the fair values are precisely equal to the present value, at each valuation date (assumed to be the interest payment dates), of the differential future cash flows resulting from utilization of the swap. Future variable interest rates (prime + 1/2%) are assumed to be the same as the existing rates at each valuation date (i.e., there is no basis for any expectation of rate changes, and therefore the best estimate is that the current rate will persist over time). The discount rate, 8%, is assumed to be constant over time.

Thus, for example, the fair value of the swap at December 31, 20X1, would be the present value of an annuity of seven payments (the number of remaining semiannual interest payments due) of \$25,000 each (pay 8%, receive 7%, based on then-existing prime rate of 6.5%) to be made to the swap counterparty, discounted at an annual rate of 8% (using 4% for the semiannual discounting, which is a slight simplification). This computation yields a present value of a stream of seven \$25,000 payments to the swap counterparty amounting to \$150,051 at December 31, 20X1, which is a liability to be reported by the entity at that date. The offset is a debit to other comprehensive income, since the hedge is (presumably) judged to be 100% effective in this case. Semiannual accounting entries will be as follows:

**December 31, 20X1**

Interest expense	175,000
Accrued interest (or cash)	175,000
<i>To accrue or pay semiannual interest on the debt at the variable rate of prime + 1/2% (7.0%)</i>	
Interest expense	25,000
Accrued interest (or cash)	25,000
<i>To record net settlement on swap arrangement (8.0 – 7.0%)</i>	
Other comprehensive income	150,051
Swap contract	150,051
<i>To record the fair value of the swap contract as of this date (a net liability because fixed rate payable to counterparty of 8% exceeds floating rate receivable from counterparty of 7%)</i>	

**June 30, 20X2**

Interest expense	162,500
Accrued interest (or cash)	162,500
<i>To accrue or pay semiannual interest on the debt at the variable rate of prime + 1/2% (6.5%)</i>	
Interest expense	37,500
Accrued interest (or cash)	37,500
<i>To record net settlement on swap arrangement (8.0 – 6.5%)</i>	
Other comprehensive income	46,529
Swap contract	46,529
<i>To record the fair value of the swap contract as of this date (increase in obligation because of further decline in prime rate)</i>	

**December 31, 20X2**

Interest expense	175,000
Accrued interest (or cash)	175,000
<i>To accrue or pay semiannual interest on the debt at the variable rate of prime + 1/2% (7.0%)</i>	
Interest expense	25,000
Accrued interest (or cash)	25,000
<i>To record net settlement on swap arrangement (8.0 – 7.0%)</i>	
Other comprehensive income	150,051
Swap contract	150,051
<i>To record the fair value of the swap contract as of this date (decrease in obligation due to increase in prime rate)</i>	

**June 30, 20X3**

Interest expense	187,500
Accrued interest (or cash)	187,500
<i>To accrue or pay semiannual interest on the debt at the variable rate of prime + 1/2% (7.5%)</i>	
Interest expense	12,500
Accrued interest (or cash)	12,500
<i>To record net settlement on swap arrangement (8.0 – 7.5%)</i>	

Swap contract	65,922
Other comprehensive income	65,922
<i>To record the fair value of the swap contract as of this date (decrease in obligation due to further increase in prime rate)</i>	

**December 31, 20X3**

Interest expense	200,000
Accrued interest (or cash)	200,000
<i>To accrue or pay semiannual interest on the debt at the variable rate of prime + 1/2% (8.0%)</i>	
Interest expense	0
Accrued interest (or cash)	0
<i>To record net settlement on swap arrangement (8.0 – 8.0%)</i>	
Swap contract	45,374
Other comprehensive income	45,374
<i>To record the fair value of the swap contract as of this date (further increase in prime rate to the original rate of inception of the hedge eliminates fair value of the derivative)</i>	

**June 30, 20X4**

Interest expense	212,500
Accrued interest (or cash)	212,500
<i>To accrue or pay semiannual interest on the debt at the variable rate of prime + 1/2% (8.5%)</i>	
Receivable from counterparty (or cash)	12,500
Interest expense	12,500
<i>To record net settlement on swap arrangement (8.0 – 8.5%), counterparty remits settlement</i>	
Swap contract	23,576
Other comprehensive income	23,576
<i>To record the fair value of the swap contract as of this date (increase in prime rate creates net asset position for derivative)</i>	

**December 31, 20X4**

Interest expense	225,000
Accrued interest (or cash)	225,000
<i>To accrue or pay semiannual interest on the debt at the variable rate of prime + 1/2% (9.0%)</i>	
Receivable from counterparty (or cash)	25,000
Interest expense	25,000
<i>To record net settlement on swap arrangement (8.0 – 9.0%), counterparty remits settlement</i>	
Swap contract	462
Other comprehensive income	462
<i>To record the fair value of the swap contract as of this date (increase in asset value due to further rise in prime rate)</i>	

**June 30, 20X5 (Maturity)**

Interest expense	212,500
Accrued interest (or cash)	212,500
<i>To accrue or pay semiannual interest on the debt at the variable rate of prime + 1/2% (8.5%)</i>	
<i>+ 1/2% (8.5%)</i>	
Receivable from counterparty (or cash)	12,500
Interest expense	12,500
Other comprehensive income	24,038
Swap contract	24,038
<i>To record the fair value of the swap contract as of this date (value declines to zero as expiration date approaches)</i>	

**Example of an option on an interest rate swap**

The facts of this example are a variation on the previous example. Abbott Corp. anticipates as of June 30, 20X1, that as of June 30, 20X3, it will become a borrower of \$5 million with a fixed maturity four years hence (June 30, 20X7). Based on its current credit rating, it expects to be able to borrow at prime + 1/2%. As of June 30, 20X1, it is able to purchase, for a single payment of \$25,000, a “swaption” (an option on an interest rate swap), calling for fixed pay at 8% and variable receipt at prime + 1/2%, on a notional amount of \$5 million, for a term of four years. The option will expire in two years. At June 30, 20X1, prime is 7.5%.

---

*NOTE: The interest rate behavior in this example differs somewhat from the prior example, to better illustrate the “one-sidedness” of options, versus the obligation under a swap arrangement or other futures and forwards.*

---

It will be assumed that the time value of the swaption expires ratably over the two years.

This swaption qualifies as a cash flow hedge under ASC 815. However, while the change in fair value of the contract is an effective hedge of the cash flow variability of the prospective debt issuance, the premium paid is a reflection of the time value of money and is thus to be expensed ratably over the period that the swaption is outstanding.

The table below gives the prime rate at semiannual intervals including the two-year period prior to the debt issuance, plus the four years during which the forecasted debt (and the swap, if the option is exercised) will be outstanding, as well as the fair value of the swaption (and later, the swap itself) at these points in time.

<u>Date</u>	<u>Prime rate (%)</u>	<u>Fair value of swaption/swap*</u>
December 31, 20X1	7.5	\$ 0
June 30, 20X2	8.0	77,925
December 31, 20X2	6.5	0
June 30, 20X3	7.0	-84,159
December 31, 20X3	7.5	0
June 30, 20X4	8.0	65,527
December 31, 20X4	8.5	111,296
June 30, 20X5	8.0	45,374
December 31, 20X5	8.0	34,689
June 30, 20X6	7.5	0
December 31, 20X6	7.5	0
June 30, 20X7	7.0	0

\* Fair value is determined as the present value of future expected interest rate differentials, based on the current prime rate, discounted at 8%. An “out of the money” swaption is valued at zero, since the option does not have to be exercised. Since the option is exercised on June 30, 2014, the value at that date is recorded, although negative.

The value of the swaption contract is only recorded (unless and until exercised, of course, at which point it becomes a contractually binding swap) if it is positive, since if “out of the money” the holder would forego exercise in most instances and thus there is no liability by the holder to be reported. (This example is an illustration of the opposite, however, as despite having a negative value, the option holder determines that exercise is advisable.) At June 30, 20X2, for example, the swaption is an asset, since the reference variable rate (prime + 1/2% or 8.5%) is greater than the fixed swap rate of 8%, and thus the expectation is that the option will be exercised at expiration. This would, if present rates hold steady, which is the naïve assumption, result in a series of eight semiannual payments from the swap counterparty in the amount of \$12,500. Discounting this at a nominal 8%, the present value as of the debt origination date (to be June 30, 20X3) would be \$84,159, which, when further discounted to June 30, 20X2, yields a fair value of \$77,925.

Note that the following period (December 31, 20X2) prime drops to such an extent that the value of the swaption evaporates entirely (actually goes negative, which will not be reported since the holder is under no obligation to exercise it), and the carrying value is therefore eliminated. At expiration, the holder does (for this example) exercise, notwithstanding a negative fair value, and from that point forward the fair value of the swap will be reported, whether positive (an asset) or negative (a liability).

As noted above, assume that, at the option expiration date, despite the fact that prime + 1/2% is below the fixed pay rate on the swap, the management of Abbott Corp. is convinced that rates will climb over the four-year term of the loan, and thus exercises the swaption at that date. Accounting journal entries over the six years are as follows:

#### **June 30, 20X1**

Swaption contract	25,000
Cash	25,000

*To record purchase premium on swaption contract*

#### **December 31, 20X1**

Loss on hedging transaction	6,250
Swaption contract	6,250

*To record change in time value of swaption contract—charge premium to income since this represents payment for time value of money, which expires ratably over two-year term*

#### **June 30, 20X2**

Swaption contract	77,925
Other comprehensive income	77,925

*To record the fair value of the swaption contract as of this date*

Loss on hedging transaction	6,250
Swaption contract	6,250

<i>No change to the zero fair value of the swap contract as of this date</i>	

**June 30, 20X7 (Maturity)**

Interest expense	187,500
Accrued interest (or cash)	187,500
<i>To accrue or pay interest on the debt at the variable rate of prime + 1/2% (7.5%)</i>	
Interest expense	12,500
Accrued interest (or cash)	12,500
<i>To record net settlement on swap arrangement (8.0 – 7.5%)</i>	
Other comprehensive income	0
Swap contract	0
<i>No change to the zero fair value of the swap contract, which expires as of this date</i>	

**Foreign Currency Hedges**

The FASB's basic objectives in hedge accounting for foreign currency exposure are:

1. To continue to permit the hedge accounting required under ASC 830, and
2. To increase the consistency of accounting guidance by broadening the scope of hedges eligible for this treatment.

Unlike ASC 830, this standard allows hedges of forecasted foreign currency transactions, including some intercompany transactions. Hedging foreign currency intercompany cash flows with foreign currency options is a common practice and was permitted under prior GAAP. ASC 815 modified that accounting rule to permit using other derivative instruments (forward contracts, etc.), on the grounds that the accounting for all derivative instruments should be the same.

Designated hedging instruments and hedged items qualify for fair value hedge accounting and cash flow hedge accounting only if all of the criteria in ASC 815 for fair value hedge accounting and cash flow hedge accounting are met. The FASB concluded that fair value hedges could be used for all recognized foreign currency-denominated asset or liability hedging situations and that cash flow hedges could be used for recognized foreign currency-denominated asset or liability hedging situations in which all of the variability in the functional currency-equivalent cash flows are eliminated by the effect of the hedge. Remeasurement of the foreign currency-denominated assets and liabilities will continue to be based on the guidance in ASC 830, which requires remeasurement based on spot exchange rates, regardless of whether a fair value hedging relationship or a cash flow hedging relationship exists.

**Foreign currency net investment hedge.** Either a derivative instrument or a nonderivative financial instrument (which can result in a foreign currency transaction gain or loss under ASC 830)

can be designated as a hedge of a foreign currency exposure of a net investment in a foreign operation. The gain or loss from the designated instrument to the extent that it is effective is reported as a translation adjustment. The hedged net investment is accounted for under ASC 830.

### Example of a foreign currency net investment hedge

Auburn Corporation has invested \$15 million in a subsidiary in Germany, for which the euro is the functional currency. The initial exchange rate is €1.2:\$1, so the initial investment is worth €18,000,000. Auburn issues a debt instrument for €12 million and designates it as a hedge of the German investment. Auburn's strategy is that any change in the fair value of the loan attributable to foreign exchange risk should offset any translation gain or loss on 2/3 of Auburn's German investment.

At the end of the year, the exchange rate changes to €0.8:\$1. Auburn uses the following calculation to determine the translation gain on its net investment:

$$\text{€18,000,000}/\$0.8 = \$22,500,000 \text{ less } \text{€18,000,000}/\$1.2 = \$15,000,000 = \$7,500,000$$

Auburn uses the following calculation to determine the translation loss on its euro-denominated debt:

$$\text{€12,000,000}/\$0.8 = \$15,000,000 \text{ less } \text{€12,000,000}/\$1.2 = \$10,000,000 = \$5,000,000$$

Auburn creates the following entries to record changes in the value of the translation gain on its investment and translation loss in its debt, respectively:

Investment in subsidiary	7,500,000
Cumulative translation adjustment (equity)	7,500,000
Cumulative translation adjustment (equity)	5,000,000
Euro-denominated debt	5,000,000

The net effect of these translation adjustments is a net increase in Auburn's investment of \$2,500,000. In the following year, the exchange rates do not change, and Auburn sells its subsidiary for \$17.5 million. Auburn's tax rate is 30%. Its reported annual gains and losses follow:

	<u>Year 1</u>	<u>Year 2</u>
Net income:		
Gain on sale of investment in ABC Company	\$ 2,500,000	
Income tax expense	(750,000)	
Net gain realized in net income	1,750,000	
Other comprehensive income:		
Foreign currency translation adjustment, net of tax	\$1,750,000	
Reclassification adjustment, net of tax	(1,750,000)	
Other comprehensive income net gain/(loss)	\$1,750,000	\$(1,750,000)

**Foreign currency unrecognized firm commitment hedge.** Either a derivative instrument or a nonderivative financial instrument (which can result in a foreign currency transaction gain or loss under ASC 830) can be designated as a fair value hedge of an unrecognized firm commitment (or a specific portion) attributable to foreign currency. If the criteria are met, this hedging relationship is accounted for as a fair value hedge.

**Foreign currency available-for-sale security hedge.** Only a derivative instrument can be designated as a fair value hedge of an available-for-sale debt security (or a specific portion) attributable to foreign currency. If the criteria are met, this hedging relationship is accounted for as a fair value hedge. For an available-for-sale equity security to be accounted for as a fair value hedge, it must meet all of the fair value hedge criteria and the following two requirements:

1. The security cannot be traded on an exchange (or similar marketplace) denominated in the investor's functional currency, and
2. Dividends (or other cash flows) to the holders must be denominated in the same foreign currency as that expected to be received upon the sale of the security.

If the available-for-sale equity security qualifies as a foreign currency hedge, the change in fair value from foreign exchange risk is reported in earnings and not in other comprehensive income.

Any gain or loss on a designated nonderivative hedging instrument from foreign currency risk is determined under ASC 830 (as the increase or decrease in functional currency cash flows produced by the change in spot exchange rates) and is reported in earnings along with the change in the carrying amount of the hedged firm commitment.

**Foreign currency-denominated forecasted transaction.** Only a derivative instrument can be designated as a cash flow hedge of a foreign currency-denominated forecasted transaction. The parties to this transaction can either be external or intercompany. To qualify for hedge accounting, all of the following criteria must be met:

1. An operating unit with foreign currency exposure is a party to the derivative instrument;
2. The transaction is denominated in a currency that is not the functional currency;
3. All of the criteria for a cash flow hedge are met (with the possible exception of allowing a qualifying intercompany transaction); and
4. If a group of individual transactions is involved, both an inflow and an outflow of foreign currency cannot be included in the same group.

If the foregoing criteria are met, this hedging relationship is accounted for as a cash flow hedge.

**Using certain intercompany derivatives as hedging instruments in cash flow hedges of foreign currency risk in the consolidated financial statements.** ASC 815 permits the use of intercompany derivatives as the hedging instruments in cash flow hedges of foreign currency risk in the consolidated financial statements, if those intercompany derivatives are offset by unrelated third-party contracts on a net basis. The new standard defines an "internal derivative" as a foreign currency derivative contract that has been entered into with another member of a consolidated group and that can be a hedging instrument in a foreign currency cash flow hedge of a forecasted borrowing, purchase, or sale or an unrecognized firm commitment in the consolidated financial statements only if the following two conditions are satisfied. First, from the perspective of the member of the consolidated group using the derivative as a hedging instrument, specific criteria for foreign currency cash flow hedge accounting are satisfied. Second, the members of the consolidated group who are not using the derivative as a hedging instrument must either (1) enter into a derivative contract with an unrelated third party to offset the exposure that results from that internal derivative, or (2) if certain defined conditions are met, enter into derivative contracts with unrelated third parties that would offset, on a net basis for each foreign currency, the foreign exchange risk arising from multiple internal derivative contracts.

**Other guidance on accounting for financial instruments.** ASC 932-330-55 is directed at the accounting for derivative contracts held for trading purposes and contracts involved in energy trading and risk management activities. It concluded that energy contracts should not be marked to fair value. It determined, as well, that the common practice of carrying energy physical inventories at fair value had no basis under GAAP. Furthermore, net presentation of gains and losses derived from derivatives is required under ASC 815, even if physical settlement occurs, if the derivatives

are held for trading purposes (as that term is defined in ASC 320). It was also decided that a derivative held for trading purposes may be designated as a hedging instrument, if the ASC 815 criteria are all met, on a prospective basis (i.e., from date of the consensus), notwithstanding the ASC 815 prohibition on designation of derivative instruments held for trading as “hedges.”

### Organizations That Do Not Report Earnings

Not-for-profits or other organizations not reporting earnings recognize gains or losses on nonhedging derivative instruments and hedging instruments as a change in net assets. Changes in the carrying amount of the hedged items are also recognized as a change in net assets.

Organizations that do not report earnings cannot use cash flow hedges. If the hedging instrument is a foreign currency net investment hedge, it is accounted for in the same manner as described above.

### ASC 815-40, Contracts in Entity’s Own Equity

**Accounting for contracts held or issued by the reporting entity that are indexed to its own stock.** ASC 815-10-15 provides that the reporting entity is not to consider contracts issued or held by that reporting entity that are both (1) indexed to its own stock, and (2) classified in stockholders’ equity in its statement of financial position to be derivative instruments for purposes of that topic. ASC 718-10-60-1B offers extensive examples to clarify the circumstances where the first part of this particular exemption (i.e., indexed to the entity’s own stock) would apply. It applies to any freestanding financial instrument or embedded feature that has all the characteristics of a derivative in ASC 815-10-15, for purposes of determining whether that instrument or embedded feature qualifies for the first part of the scope exception in ASC 815-10-15-74. It also applies to any freestanding financial instrument that is potentially settled in an entity’s own stock, regardless of whether the instrument has all the characteristics of a derivative in ASC 815-10-15, for purposes of determining whether the instrument is within the scope of ASC 815-40.

It is required that an evaluation be made of whether an equity-linked financial instrument (or embedded feature), using the following two-step approach:

- Step 1 is to evaluate the instrument’s contingent exercise provisions, if any;
- Step 2 is to evaluate the instrument’s settlement provisions.

An exercise contingency would not preclude an instrument (or embedded feature) from being considered indexed to an entity’s own stock provided that it is not based on (1) an observable market, other than the market for the issuer’s stock (if applicable), or (2) an observable index, other than an index calculated or measured solely by reference to the issuer’s own operations. If the evaluation of Step 1 does not preclude an instrument from being considered indexed to the entity’s own stock, the analysis would proceed to Step 2. An *exercise contingency* is a provision that entitles the entity, or counterparty, to exercise an equity-linked financial instrument (or embedded feature) based on changes in an underlying, including the occurrence (or nonoccurrence) of a specified event. Provisions that accelerate the timing of the entity’s, or counterparty’s, ability to exercise an instrument, and provisions that extend the length of time that an instrument is exercisable, are examples of exercise contingencies.

An instrument (or embedded feature) would be considered indexed to an entity’s own stock if its settlement amount will equal the difference between the fair value of a fixed number of the entity’s shares and a fixed monetary amount or a fixed amount of a debt instrument issued by the entity.

A number of examples of the application of this guidance are provided in the topic. For example, warrants that become exercisable upon an initial public offering (IPO), at a fixed price, would meet the criteria for being deemed indexed to the entity's stock, measured by the difference between fair value and the fixed exercise price. On the other hand, if conditioned on the change in some external index (such as the Dow Industrials) over some defined period, the warrants would not be deemed linked to the entity's stock.

ASC 815-40 reached a number of conclusions. These are summarized as follows:

1. *Basis of settlement.* Initial statement of financial position classification is to be guided by the principle that contracts that require net cash settlements are assets or liabilities, and those that require settlement in shares are equity instruments. If the reporting entity has the choice of settlement modes, settlement in shares is to be assumed; if the counterparty has the option, net cash settlement is presumed. An exception occurs if the two settlement alternatives are not of equal value, in which case the economic substance should govern.
2. *Measurement.* Initial measurement should be at fair value. Contracts classed as equity are accounted for in permanent equity, with value changes being ignored, unless settlement expectations change. For publicly held companies, under defined circumstances, guidance is provided by analogy from Accounting Series Release (ASR) 268. All other contracts would be classified as assets or liabilities, to be measured continuously at fair value. If settlement in shares ultimately occurs, already recognized gains or losses are left in earnings, not reclassified or reversed.
3. *Contract reclassification.* Events may necessitate reclassification of contracts from assets/liabilities to equity. If a contract first classed as equity is later reclassified to assets/liabilities, any value change to the date of reclassification will be included in equity, not earnings. Thereafter, value changes will be reported in earnings. If partial net share settlement is permitted, the portion that can be so settled remains in equity. Appropriate disclosure under ASC 235 may be required, if more than one contract exists and different methods are applied to them.
4. *Equity classification criteria.* All the following conditions must be satisfied in order to classify a contract in equity:
  - a. The contract permits settlement in unregistered shares (the assumption being that the issuer cannot effectively control the conditions for registration, making cash settlement likely unless unregistered shares can be delivered);
  - b. There are sufficient authorized, unissued shares to settle the contact, after considering all other outstanding commitments;
  - c. The contract contains an explicit limit on the number of shares to be issued;
  - d. There are no required cash payments to the counterparty based on the issuer's failure to make timely SEC filings;
  - e. There are no "make whole" provisions to compensate the holder after he sells the shares issued in the market at a price below some defined threshold value;
  - f. Requirements for net cash settlement are accompanied by similar requirements for existing shareholders;
  - g. There are no provisions that indicate that the counterparties have rights greater than those of the actual shareholders; and
  - h. There is no requirement for any collateral posting for any reason.

5. *Hedge accounting applicability.* Contracts that are subject to this consensus cannot qualify for hedge accounting.
6. *Multiple settlement alternatives.* Contracts offering multiple settlement alternatives that require the company to receive cash when the contract is in a gain position but pay either stock or cash at the company's option when in a loss position are to be accounted for as equity. Also, such contracts requiring payment of cash when in a loss position but receipt of either cash or stock at the company's option when in a gain position must be accounted for as assets/liabilities.
7. *EPS calculations.* For EPS computation purposes, for those contracts that provide the company with a choice of settlement methods, settlement in shares is to be assumed, although this can be overcome based on past experience or stated policy. If the counterparty controls the choice, however, the more dilutive assumption must be made, irrespective of past experience or policy.

**Freestanding derivatives indexed to, and potentially settled in, stock of a consolidated subsidiary.** ASC 815-40 cited above establishes a framework for accounting for freestanding derivative instruments that are indexed to, and potentially settled in, a company's own stock. The ASC does not, however, provide guidance on how to account for freestanding derivative instruments that are indexed to, and potentially settled in, a subsidiary's stock. ASC 810-10 deals with how such contracts should be classified and measured in the consolidated financial statements.

Stock of a subsidiary is not equity of the parent; therefore, derivatives indexed to and to be settled in stock of a subsidiary do not meet ASC 815-10-15's exclusion criteria. If derivatives meet the criteria (e.g., for net settlement, etc.), they must be accounted for under the provisions of ASC 815-25 through 815-35, and not of ASC 815-40. The ASC also discusses a number of exceptions based on the criteria set forth in ASC 815.

Option or forward strike prices and premiums could be indicative of impairments of the parent's investment in subsidiaries. A parent's contract to purchase a subsidiary's (minority held) common stock should not be recorded until settled; during the period of the contract, income should continue to be allocated to the minority interest. A contract to sell shares in a subsidiary, likewise, should be recorded when settled; until that time, income would not be allocated to outside interests (counterparties to the derivative).

ASC 815-40 applies to freestanding derivatives only—similar embedded derivatives are not covered. Also not covered are derivatives which are issued to compensate employees or to acquire goods and services from nonemployees, when performance has yet to occur. It does apply, however, to derivatives issued to acquire goods and services from nonemployees, when performance has occurred.

FASB clarified whether a financial instrument for which the payoff to the counterparty is based, in whole or in part, on the stock of an entity's consolidated subsidiary is indexed to the reporting entity's own stock. It holds that freestanding financial instruments (and embedded features) for which the payoff to the counterparty is based, in whole or in part, on the stock of a consolidated subsidiary are not precluded from being considered indexed to the entity's own stock in the consolidated financial statements of the parent if the subsidiary is a substantive entity. If the subsidiary is not a substantive entity, however, the instrument or embedded feature would not be considered indexed to the entity's own stock. The fair value of an outstanding instrument that was previously classified as an asset or liability is to be its net carrying amount at that date (that is, the current fair value). The net carrying amount is then to be reclassified to noncontrolling interest.

Gains or losses recorded during the periods that the instrument was classified as an asset or liability are not to be reversed.

### **ASC 815-45, Weather Derivatives**

“Weather derivatives” are addressed by ASC 815-45. At issue was whether such contracts should be reported under accrual accounting, under settlement accounting, under insurance accounting, marked to fair value through earnings at each reporting date, or under some other method. Also at issue was whether the accounting for these derivatives should vary based on the type of contract.

ASC 815 provides that contracts that are not exchange-traded are not subject to the requirements of that statement if settlement is based on a climatic or geological variable or on some other physical variable. Any derivative based on a physical variable that eventually becomes exchange-traded automatically becomes subject to the requirements of ASC 815.

ASC 815-45 states that an entity that enters into a nonexchange-traded forward-based weather derivative in connection with nontrading activities is to account for the contract by applying an “intrinsic value method.” The intrinsic value method computes an amount based on the difference between the expected results from an upfront allocation of the cumulative strike and the actual results during a period, multiplied by the contract price (for example, dollars per heating degree day). The use of external statistical sources, such as the National Weather Service, is necessary in applying this technique.

Furthermore, an entity that purchases a nonexchange-traded option-based weather derivative in connection with nontrading activities is to amortize to expense the premium paid (or due) and apply the intrinsic value method to measure the contract at the date of each interim statement of financial position. The premium asset is to be amortized in a rational and systematic manner.

Also, all entities that sell or write a nonexchange-traded option-based weather derivative are to initially recognize the premium as a liability and recognize any subsequent changes in fair value currently in earnings (the premium would not be amortized).

In addition, a purchased or written weather derivative may contain an “embedded” premium or discount when the contract terms are not consistent with current market terms. In those circumstances, the premium or discount is to be quantified, removed from the calculated benchmark strike, and accounted for as noted above.

Finally, all weather derivative contracts entered into under trading or speculative activities are to be accounted for at their fair value, with subsequent changes in fair value reported currently in earnings.

### **Other Guidance**

**Structured notes.** Structured notes are debt obligations that are coupled with derivatives, most often related to interest rates or foreign currency exchange rates, such that a prescribed increase or decrease in the reference rate will have a large impact on some defined attribute of the debt obligation, such as its interest rate, maturity value, or maturity date. The accounting for structured notes can be found in the chapter on ASC 320.

## PERSPECTIVE AND ISSUES

---

### Subtopic

ASC 820 contains one subtopic:

- ASC 820-10, *Overall*, which defines fair value, describes a framework for measuring fair value, and details required disclosures.

### Scope and Scope Exceptions

ASC 820 does not require fair value measurements in addition to those required by other Topics in the Codification.

**Scope.** In pursuing an incremental approach, ASC 820 contains scope exceptions for certain, highly complex specialized applications. It does *not* apply to:

1. Share-based payments transactions, except for transaction covered in ASC 718-40 which are within the scope of ASC 820
2. Measurements that are similar to fair value but that are not intended to measure fair value, including:

- a. Measurements models that are based on vendor-specific objective evidence<sup>1</sup> of fair value, such as multiple-deliverable arrangements and software revenue recognition
  - b. Inventory
3. Accounting principles that address fair value measurements for purposes of lease classification or measurement. The exception does *not* apply to assets acquired and liabilities assumed in a business combination or an acquisition by a not-for-profit entity that are required to be measured at fair value regardless of whether those assets and liabilities are related to leases.<sup>2</sup>
- (ASC 820-10-15-2)

In addition to the scope exceptions listed above, ASC 820 retains the practicability exceptions included in GAAP that applies when, in management's judgment, it is not practical to estimate fair value. In such instances, management is required to inform the reader in an explanatory note to the financial statements that it is unable to estimate fair value and the reasons that such an estimate cannot be made.

The practicability exception applies to certain measurements made in connection with the following matters:

<i>GAAP measurement category</i> <sup>3</sup>	<i>Primary GAAP</i>
Asset retirement obligations	ASC 410-20 and 440-10-50 and 440-10-55
Business combinations, for specific items where other measures are allowed	ASC 805-20-30-10
Financial assets or financial liabilities of a consolidated VIE when these items are measured using the measurement alternative	ASC 810-10-30-10 through 30-30 and 810-10-35-6 through 35-8.
Contributions made and received, if the value cannot be measured reliably	ASC 958 and 720-25
Financial instrument disclosures <sup>4</sup>	ASC 825-10-50
Guarantees, the use of an entry price at initial recognition	ASC 460
Nonmonetary transactions	ASC 845, 605-20-25, and 605-20-50
Participation rights	ASC 715-30 and 715-60
Restructuring obligations	ASC 420

(ASC 820-10-15-3)

<sup>1</sup> Upon implementation of ASU 2014-09, *Revenue from Contracts with Customers*, "vendor-specific objective evidence" will be replaced by "standalone selling price." ASU 2014-09 also adds two scope exceptions for revenue from contracts with customers in ASC 606 and recognition and measurement of gains and losses from the derecognition of nonfinancial assets in ASC 610.

<sup>2</sup> Upon implementation of ASU 2016-02 on leases, this item is superseded.

<sup>3</sup> Upon implementation of ASU 2014-09, *Revenue from Contracts with Customers*, noncash consideration—ASC 606—will be added to the GAAP measurement category. Also added will be collateralized financing entity—ASC 810-10-30 and ASC 810-10-35—upon implementation of ASU 2014-13.

<sup>4</sup> Upon implementation of ASU 2016-01, this item is superseded.

## Overview

**ASC 820, Fair Value Measurement.** Accounting Standards Codification (ASC) 820 provides:

- a unified definition of fair value,
- related guidance on measurement, and
- enhanced disclosure requirements to inform financial statement users about:
  - the fair value measurements included in the financial statements,
  - the methods and assumptions used to estimate them, and
  - the degree of observability of the inputs used in management's estimation process.

## Technical Alert

**ASU 2015-07.** In May 2015, FASB issued ASU 2015-07, *Fair Value Measurement (Topic 820): Disclosure for Investments in Certain Entities That Calculate Net Asset Value per Share (or Its Equivalent) a consensus of the EITF.*

ASU 2015-07 affects reporting entities that measure an investment's fair value using the net asset value per share (or an equivalent) practical expedient. ASC 820 provides reporting entities with an option to measure the fair value of certain investments using net asset value instead of fair value. The changes in ASU No. 2015-07 eliminate the requirement to classify the investment measured using the practical expedient within the fair value hierarchy based on whether the investment is:

- Redeemable with the investee at net asset value on the measurement date,
- Never redeemable with the investee at net asset value, or
- Redeemable with the investee at net asset value at a future date.

In addition, the ASU removed the requirement to make specific disclosures for all investments eligible to be assessed at fair value with the net asset value per share practical expedient. Instead, such disclosures are restricted only to investments measured using the practical expedient.

**Implementation.** The ASU is effective for:

- Public entities for fiscal years starting after December 15, 2015, and the interim periods within.
- All other entities for fiscal years starting after December 15, 2016, and the interim periods within.

Early application is permitted.

The changes should be applied retrospectively to all periods presented. The changes should be applied retrospectively. Therefore, investments in which fair value is assessed through the net asset value per share practical expedient should be removed from the fair value hierarchy in all periods presented.

## DEFINITIONS OF TERMS

---

Source: ASC 820-10-20. Also see Appendix A, *Definition of Terms*, for additional terms relevant to this chapter: Conduit Debt Security, Contract, Customer, Expected Cash Flow, Fair Value, Financial Asset, Financial Instrument, Financial Liability, Legal Entity, Market Participants, Nonpublic Entity, Not-for-Profit Entity, Readily Determinable Fair Value, Related Parties, Standalone Selling Price, Unit of Account, and Variable Interest Entity.

**Active Market.** A market in which transactions for the asset or liability occur with sufficient frequency and volume to provide pricing information on an ongoing basis.

**Brokered Market.** A market in which brokers attempt to match buyers with sellers, but do not stand ready to trade for their own account.

**Cost Approach.** A valuation technique that reflects the amount that currently would be required to replace the service capacity of an asset, often called current replacement cost.

**Credit Risk.** For purposes of a hedged item in a fair value hedge, credit risk is the risk of changes in the hedged item's fair value attributable to both of the following:

1. Changes in the obligor's creditworthiness
2. Changes in the spread over the benchmark interest rate with respect to the hedged item's credit sector at inception of the hedge.

For purposes of a hedged transaction in a cash flow hedge, credit risk is the risk of changes in the hedged transaction's cash flows attributable to all of the following:

1. Default
2. Changes in the obligor's creditworthiness
3. Changes in the spread over the benchmark interest rate with respect to the related financial asset's or liability's credit sector at inception of the hedge.

**Currency Risk.** The risk that the fair value or future cash flows of a financial instrument will fluctuate because of changes in foreign exchange rates.

**Dealer Market.** A market in which dealers stand ready to trade (either buy or sell for their own account), thereby providing liquidity by using their capital to hold an inventory of the items for which they make a market. Typically, bid and ask prices (representing the price at which the dealer is willing to buy and the price at which the dealer is willing to sell, respectively) are more readily available than closing prices. Over-the-counter markets (for which prices are publicly reported by the National Association of Securities Dealers Automated Quotations systems or by OTC Markets Group Inc.) are dealer markets. For example, the market for U.S. Treasury securities is a dealer market. Dealer markets also exist for some other assets and liabilities, including other financial instruments, commodities, and physical assets (for example, used equipment).

**Discount Rate Adjustment Technique.** A present value technique that uses a risk-adjusted discount rate and contractual, promised, or most likely cash flows.

**Entry Price.** The price paid to acquire an asset, or received to assume a liability in an exchange transaction.

**Exchange Market.** A market in which closing prices are both readily available and generally representative of fair value (such as the New York Stock Exchange).

**Exit Price.** The price that would be received to sell an asset or paid to transfer a liability.

**Highest and Best Use.** The use of a nonfinancial asset by market participants that would maximize the value of the asset or the group of assets and liabilities (for example, a business) within which the asset would be used.

**Income Approach.** Valuation techniques that convert future amounts (for example, cash flows or income and expenses) to a single current (that is, discounted) amount. The fair value measurement is determined on the basis of the value indicated by current market expectations about those future amounts.

**Inputs.** The assumptions that market participants would use when pricing the asset or liability, including assumptions about risk, such as the following:

1. The risk inherent in a particular valuation technique used to measure fair value (such as a pricing model)
2. The risk inherent in the inputs to the valuation technique.

Inputs may be observable or unobservable.

**Interest Rate Risk.** The risk of changes in a hedged item's fair value or cash flows attributable to changes in the designated benchmark interest rate.

**Level 1 Inputs.** Quoted prices (unadjusted) in active markets for identical assets or liabilities that the reporting entity can access at the measurement date.

**Level 2 Inputs.** Inputs other than quoted prices included within Level 1 that are observable for the asset or liability, either directly or indirectly.

**Level 3 Inputs.** Unobservable inputs for the asset or liability.

**Liability Issued with an Inseparable Third-party Credit Enhancement.** A liability that is issued with a credit enhancement obtained from a third party, such as debt that is issued with a financial guarantee from a third party that guarantees the issuer's payment obligation.

**Management.** Persons who are responsible for achieving the objectives of the entity and who have the authority to establish policies and make decisions by which those objectives are to be pursued. Management normally includes members of the board of directors, the chief executive officer, chief operating officer, vice presidents in charge of principal business functions (such as sales, administration, or finance), and other persons who perform similar policy-making functions. Persons without formal titles also may be members of management.

**Market Approach.** A valuation technique that uses prices and other relevant information generated by market transactions involving identical or comparable (that is, similar) assets, liabilities, or a group of assets and liabilities, such as a business.

**Market Risk.** The risk that the fair value or future cash flows of a financial instrument will fluctuate because of changes in market prices. Market risk comprises the following:

1. Interest rate risk
2. Currency risk
3. Other price risk.

**Market-Corroborated Inputs.** Inputs that are derived principally from or corroborated by observable market data by correlation or other means.

**Most Advantageous Market.** The market that maximizes the amount that would be received to sell the asset or minimizes the amount that would be paid to transfer the liability, after taking into account transaction costs and transportation costs.

**Net Asset Value per Share.** Net asset value per share is the amount of net assets attributable to each share of capital stock (other than senior equity securities; that is, preferred stock) outstanding at the close of the period. It excludes the effects of assuming conversion of outstanding convertible securities, whether or not their conversion would have a diluting effect.

**Nonperformance Risk.** The risk that an entity will not fulfill an obligation. Nonperformance risk includes, but may not be limited to, the reporting entity's own credit risk.

**Observable Inputs.** Inputs that are developed using market data, such as publicly available information about actual events or transactions, and that reflect the assumptions that market participants would use when pricing the asset or liability.

**Orderly Transaction.** A transaction that assumes exposure to the market for a period before the measurement date to allow for marketing activities that are usual and customary for transactions involving such assets or liabilities; it is not a forced transaction (for example, a forced liquidation or distress sale).

**Other Price Risk.** The risk that the fair value of future cash flows of a financial instrument will fluctuate because of changes in market prices (other than those arising from interest rate risk or currency risk), whether those changes are caused by factors specific to the individual financial instrument or its issuer or by factors affecting all similar financial instruments traded in the market.

**Present Value.** A tool used to link future amounts (cash flows or values) to a present amount using a discount rate (an application of the income approach). Present value techniques differ in how they adjust for risk and in the type of cash flows they use.

**Principal Market.** The market with the greatest volume and level of activity for the asset or liability.

**Principal-to-Principal Market.** A market in which transactions, both originations and resales, are negotiated independently with no intermediary. Little information about those transactions may be made available publicly.

**Risk Premium.** Compensation sought by risk-averse market participants for bearing the uncertainty inherent in the cash flows of an asset or a liability. Also referred to as a *risk adjustment*.

**Systematic Risk.** The common risk shared by an asset or a liability with the other items in a diversified portfolio. Portfolio theory holds that in a market in equilibrium, market participants will be compensated only for bearing the systematic risk inherent in the cash flows. (In markets that are inefficient or out of equilibrium, other forms of return or compensation might be available.) Also referred to as *nondiversifiable risk*.

**Transaction Costs.** The costs to sell an asset or transfer a liability in the principal (or most advantageous) market for the asset or liability that are directly attributable to the disposal of the asset or transfer of the liability and meet both of the following criteria:

1. They result directly from and are essential to that transaction.
2. They would not have been incurred by the entity had the decision to sell the asset or transfer the liability not been made (similar to costs to sell, as defined in ASC 360-10-35-38).

**Transportation Costs.** The costs that would be incurred to transport an asset from its current location to its principal (or most advantageous) market.

**Unobservable Inputs.** Inputs for which market data are not available and that are developed using the best information available about the assumptions that market participants would use when pricing the asset or liability.

**Unsystematic Risk.** The risk specific to a particular asset or liability. Also referred to as *diversifiable risk*.

## CONCEPTS, RULES, AND EXAMPLES

---

### The Mixed Attribute Model

Under longstanding U.S. GAAP, assets, liabilities, and equity are measured and presented on a reporting entity's statement of financial position by applying a disjointed, inconsistent assortment of accounting methods. This current state of affairs is sometimes referred to as the "mixed attribute model." The following table summarizes the current state of the mixed attribute model and the effects of ASC 820 and ASC 825-10-25 (if any) on specified assets and liabilities of reporting entities that are not financial institutions, investment companies, or insurance companies.

		Assets		Liabilities and Equity

\* ABBREVIATION KEY:

E—Generally eligible for fair value election under ASC 825-10-25

A—Already stated at fair value or an amount that approximates fair value

N—Not eligible for fair value election or to be measured at fair value on a recurring basis

## Definition

The term “fair value” was coined by the FASB to replace the previously used term “market value” (for which the term “fair market value” was sometimes used interchangeably) in authoritative accounting literature. This change was made to emphasize the fact that, even in the absence of active primary markets for an asset or liability, the asset or liability can be valued by reference to prices and rates from secondary markets as well. Over time, this concept has been expanded further to include the application of various fair value estimation models, such as the discounted probability-weighted expected cash flow model first introduced in CON 7.

As these broader fair value concepts were evolving in the literature and in practice, the preexisting “market-based” literature had not been revised. Further, the concepts and definitions of fair value were not consistently understood or applied in similar situations by similar reporting entities.

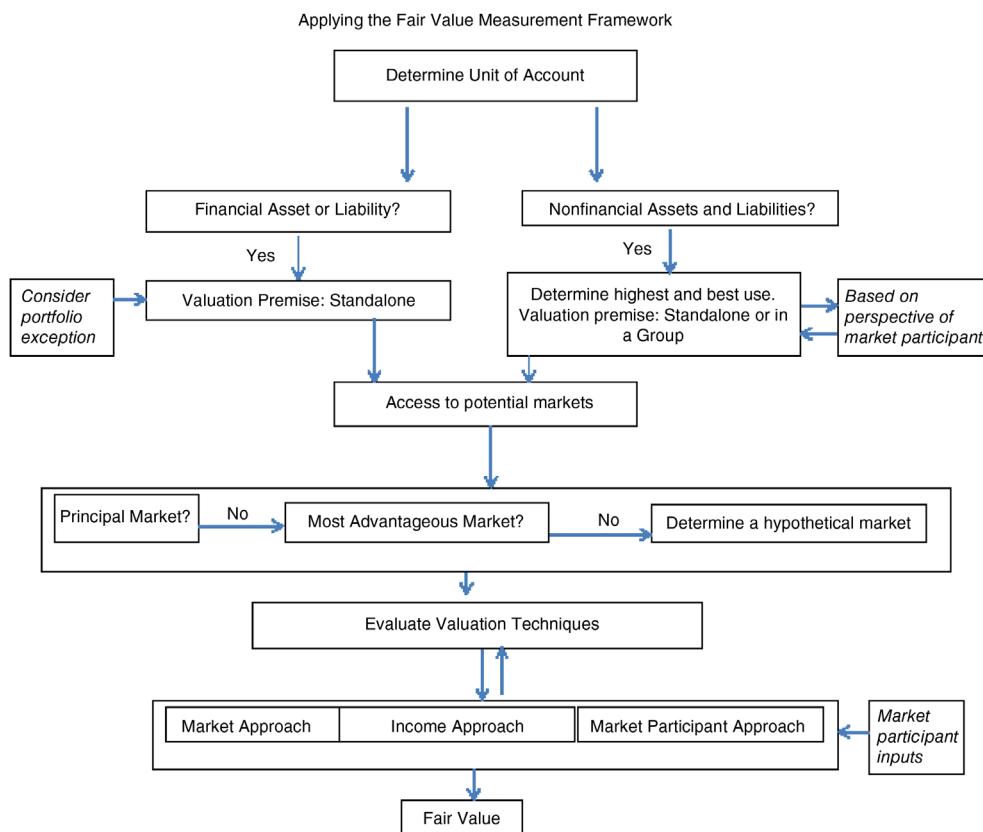

## Measurement Principles and Methodologies

ASC 820 contains a fair value measurement framework which is used at both initial and subsequent measurement. It is helpful to break down the measurement process under ASC 820 into a series of steps. Although not necessarily performed in a linear manner, the following procedures and decisions need to be applied and made, in order to value an asset or liability at fair value under ASC 820. The process will be discussed in greater detail:

1. *Identify the item to be valued and the unit of account.* Specifically identify the asset or liability, including the unit of account to be used for the measurement. (ASC 820-10-35-2B through 2E)
2. *Determine the principal or most advantageous market and the relevant market participants.* From the reporting entity’s perspective, determine the principal market in which it would sell the asset or transfer the liability. In the absence of a principal market, consider the most advantageous market for the asset or the liability. Once the principal or most advantageous market is identified, determine the characteristics of the market participants. It is not necessary that specifically named individuals or enterprises be identified for this purpose. (ASC 820-10-35-5A through 35-6C)
3. *Select the valuation premise to be used for asset measurements.* If the item being measured is an asset, determine the valuation premise to be used by evaluating whether marketplace participants would judge the highest and best use of the nonfinancial asset on a stand-alone basis or in combination with other assets as a group or with other assets and liabilities. Note that the highest and best use and valuation premise concepts only apply to measuring of nonfinancial assets. (ASC 820-10-35-10A through 10D)

4. Consider the risk assumptions applicable to liability measurements. If the item being measured is a liability, identify the key assumptions that market participants would make regarding nonperformance risk including, but not limited to, the reporting entity's own credit risk (credit standing).
5. Identify available inputs. Identify the key assumptions that market participants would use in pricing the asset or liability, including assumptions about risk. In identifying these assumptions, referred to as "inputs" by ASC 820, maximize the inputs that are relevant and observable (i.e., that are based on market data available from sources independent of the reporting entity). In so doing, assess the availability of relevant, reliable market data for each input that significantly affects the valuation, and identify the level of the fair value input hierarchy in which it is to be categorized. (ASC 820-10-35-16B through 16BB)
6. Select the appropriate valuation technique(s). Based on the nature of the asset or liability being valued, and the types and reliability of inputs available, determine the appropriate valuation technique or combination of techniques to use in valuing the asset or liability. The three broad categories of techniques are the market approach, the income approach, and the cost approach. (ASC 820-10-35-24A)
7. Make the measurement. Measure the asset or liability.
8. Determine amounts to be recognized and information to be disclosed. Determine the amounts and information to be recorded, classified, and disclosed in interim and annual financial statements.

The flowchart that follows outlines the steps in the process.

**Item identification and unit of account.** In general, the same unit of account at which the asset or liability is aggregated or disaggregated by applying other applicable GAAP pronouncements is used for fair value measurement purposes. ASC 820-10-35-44 prohibits adjustment to the valuation for a “blockage factor” if the fair value is measured using a quoted price on an active market. A blockage factor is an adjustment made to a valuation that takes into account the fact that the investor holds a large quantity (block) of shares relative to the market trading volume in those shares. The prohibition applies even if the quantity held by the reporting entity exceeds the market’s normal trading volume—and that, if the reporting entity were, hypothetically, to place an order to sell its entire position in a single transaction, that transaction could affect the quoted price.

There is an exception for financial assets and financial liabilities with offsetting positions in market risks or counterparty credit risk that are managed on the basis of the entity’s net exposure to the risks. If certain criteria are met, the entity can measure the fair value of net position in a manner that is consistent with how market participants would price the net position. (ASU 820-10-35-18D) To use the exception, all the following conditions must be met. The company:

1. Manages the group of financial assets and financial liabilities on the basis of the reporting entity’s net exposure to a particular market risk (or risks) or to the credit risk of a particular counterparty in accordance with the reporting entity’s documented risk management or investment strategy.
2. Provides information on that basis about the group of financial assets and financial liabilities to the reporting entity’s management.
3. Is required or has elected to measure those financial assets and financial liabilities at fair value in the statement of financial position at the end of each reporting period.

(ASU 820-10-35-18E)

**Principal or most advantageous market and market participants.** ASC 820 requires the person performing the valuation to maximize the use of relevant assumptions (inputs) that are observable from market data obtained from sources independent of the reporting entity. In making a fair value measurement, management is to assume that the asset or liability is exchanged in an orderly transaction between market participants at the measurement date.

To characterize the exchange as orderly, it is assumed that the asset or liability will have been exposed to the market for a sufficient period of time prior to the measurement date to enable marketing activities to occur that are usual and customary with respect to transactions involving such assets or liabilities. It is also to be assumed that the transaction is not a forced transaction (e.g., a forced liquidation or distress sale).

ASC 820 also specifies that if there is a principal market for an asset, the measure of fair value is the price in that market (whether directly observable or determined indirectly using a valuation technique), even if the price in a different market is potentially more advantageous at the measurement date. (ASU 820-10-35-6)

Management identifies the *principal market* for the asset or liability, if such a market exists. If the entity has access to more than one market, the principal market is the market in which the reporting entity would sell the asset or transfer the liability that has the greatest volume and activity level for the asset or liability. The greater volume of activity ensures that the measurement is based on multiple transactions potentially between multiple counterparties, and is thus more representative of fair value than if the measurement were based on less extensive data.

Note that the determination of the principal market is made from the perspective of the reporting entity. Thus, different reporting entities engaging in different specialized industries, or with access to different markets, might not have the same principal market for an identical asset or

liability. Inputs from the principal market are to be used irrespective of whether the price is directly observable or determined through the use of a valuation technique.

If there is no principal market for an asset or liability from the perspective of the reporting entity, then management uses the most advantageous market for the measurement. In determining the most advantageous market, management considers transaction costs. However, once the most advantageous market had been identified, transaction costs are not used to adjust the market price used for the purposes of the fair value measurement.

ASC 820 provides a typology of markets that potentially exist for assets or liabilities. (See the Definitions of Terms section at the beginning of this chapter for descriptions of each of these markets.)

1. Active market.
2. Dealer market.
3. Brokered market.
4. Principal-to-principal market.

Market participants in the principal or most advantageous market are buyers and sellers that:

1. Are unrelated third parties
2. Have the ability to enter into a transaction for the asset or liability
3. Have the motivation to voluntarily enter into a transaction for the asset or liability without being forced to do so under duress
4. Are knowledgeable about the asset or liability since they would possess a reasonable understanding of the asset or liability and the terms of the transaction based on all available information including information obtainable through the performance of usual and customary due diligence procedures.

The person determining the measurement is not required to identify specific individuals or enterprises that would potentially be market participants. Instead, it is important to identify the distinguishing characteristics of participants in the particular market by considering factors specific to the asset or liability being measured, the market identified, and the participants in that market with whom the reporting entity would enter into a transaction for the asset or liability.

**Measurement considerations when markets become illiquid or less liquid.** Questions have arisen regarding whether transactions occurring in less liquid markets with less frequent trades might cause those market transactions to be considered forced or distress sales, thus rendering valuations made using those prices not indicative of the actual fair value of the securities.

Under ASC 820, orderly transactions are occurring in the marketplace for an asset or liability when knowledgeable buyers and sellers independent of the reporting entity are willing and able to transact and are motivated to transact without being forced to do so. If orderly transactions are occurring in a manner that is usual and customary for the asset or liability, then the transactions are not to be characterized as forced or distress sales. Just because transaction volume in a market drops significantly from prior periods does not necessarily mean that the market is no longer active.

**Determining whether there has been a significant decrease in level of activity.** Management is to consider the volume and level of activity in the market compared with normal market activity for the asset or liability (or similar assets or liabilities) being measured. In making that comparison, the following indicators of declining activity may point to a decrease that is considered significant. The indicators include, but are not limited to, the following (which are not to be considered of equal significance or relevance when evaluating the weight of evidence):

1. Few recent transactions
  2. Price quotations based on information that is not current
  3. Price quotations vary substantially over time or among market makers (e.g., in some brokered markets)
  4. Indexes that were previously highly correlated with the fair values of the asset or liability have become demonstrably uncorrelated with recent indications of fair value for that asset or liability
  5. There has been a significant increase in implied liquidity risk premiums, yields, or performance indicators (such as delinquency rates or loss severities) for observed transactions or quoted prices when compared with management's estimate of expected cash flows, taking into consideration all available market data about credit and other nonperformance risk for the asset or liability being measured
  6. There is a wide bid-ask spread or a significant increase in that spread
  7. There is a significant decline or absence of a market for new issuances (that is, a primary market) for the asset or liability (or similar assets or liabilities)
  8. Little information is publicly released (e.g., in a principal-to-principal market).
- (ASC 820-10-35-54C)

Management evaluates the relevance and significance of these indicators as well as whether other indicators might be present to determine whether, based on the weight of the evidence, there has been a significant decrease in the volume and level of activity for the asset or liability.

If management concludes that a significant decrease has occurred, it must perform further analysis of the transactions or quoted prices in that market in order to determine whether it is necessary to significantly adjust the quoted prices to estimate fair value in accordance with ASC 820. It is important to note that, for the purpose of estimating fair value, management's own intention to hold an asset or liability is not relevant. Fair value is a market-based measurement, not an entity-specific measurement.

Other unrelated circumstances might also necessitate significant adjustments to quoted prices, such as when a price for a similar asset requires a significant adjustment in order to compensate for characteristics or attributes of the comparable asset that are different from those of the asset whose fair value is being measured, or when a quoted price may not be sufficiently close to the measurement date.

FASB stresses that, even if there has been a significant decrease in the market volume and level of activity for the item being measured, it is inappropriate, based solely on that judgment, to conclude that all transactions occurring in that market are not orderly transactions. Factors to consider in judging whether a transaction might not be orderly include, but are not limited to:

1. Insufficient time period of exposure to the market prior to the measurement date to allow for usual or customary marketing activities for transactions involving assets or liabilities *under the current market conditions*
2. The marketing exposure period was sufficient, but the seller only marketed the item being measured to a single market participant
3. The seller is in or near bankruptcy or receivership (in other words, the seller is "distressed"), or the seller is being compelled to sell in order to meet legal or regulatory requirements (in other words, the sale is "forced")
4. The transaction price is an outlier when compared with recently occurring transactions for the same or similar item.

(ASC 820-10-35-54I)

Management considers the weight of the evidence in determining whether a particular market transaction is orderly. In making that determination, management is to consider the following guidance:

1. *Transactions considered orderly.* If the weight of the evidence indicates a transaction is *orderly*, management considers that transaction price when estimating fair value or market risk premiums. The weight to be placed on that transaction price versus other indications of fair value is dependent on the specific facts and circumstances such as:
  - a. The volume of shares (or units) included in the transaction,
  - b. The extent of comparability between the items included in the transaction and the asset or liability being measured, and
  - c. How close the transaction was to the measurement date.
2. *Transactions considered not orderly.* If the weight of the evidence indicates a transaction is *not orderly*, management is to place little, if any, weight on that transaction price as compared to other indications of fair value when estimating fair value or market risk premiums.
3. *Insufficient information to determine whether or not transactions are orderly.* If management lacks sufficient information to conclude whether or not a transaction is orderly, the transaction price is to be considered when estimating fair value or market risk premiums. However, that transaction may not be the sole or even the primary basis for estimating fair value or market risk premiums. Management is to place less weight on transactions of this nature, where sufficient information is not available to conclude whether the transaction is orderly when compared with other transactions that are known to be orderly.

(ASC 820-10-35-54J)

In making the determinations above, management is not required to make all possible efforts to obtain relevant information; however, management is not to ignore information available without undue cost and effort. Obviously, management would be prevented from asserting that it lacks sufficient information with respect to whether a transaction is orderly when the reporting entity was a party to that transaction. (ASC 820-10-35-54J)

Irrespective of what valuation technique or combination of techniques is used to measure fair value, the measurement is to include appropriate risk adjustments. According to ASC 820-10-55-8, risk-averse market participants seek compensation for bearing the uncertainties inherent in the estimated future cash flows associated with an asset or liability. This compensation is referred to as a risk premium or market risk premium and it reflects the amount that the market participant would demand in order to obtain adequate compensation for that market participant's perception of the risks associated with either the amounts or timing of the estimated future cash flows. Absent such an adjustment, a measurement would not faithfully represent fair value. While determination of the appropriate risk premium may be difficult, the degree of difficulty alone is an insufficient rationale for management excluding a risk adjustment from its fair value measurement. The risk premium adjustment, however, is to reflect an orderly transaction between market participants at the measurement date *under current market conditions*.

Quoted prices obtained from third-party pricing services or brokers may be used as inputs in the fair value measurement if management had determined that those quoted prices were determined by the third party in accordance with the principles of ASC 820 which in practical terms means that management will need to inquire of the information provider as to, among other

things, the origin of the quote, the methodology followed to compute it, the types of inputs used and their sources, the level of activity in the market for market-based quotes, the age of the data used (its proximity to the measurement date), and other information relevant in the circumstances.

When there has been a significant decrease in the volume and level of activity for the asset or liability, management is to evaluate whether those quoted prices are based on current information that reflects orderly transactions (mark-to-market) or are based on application of a valuation technique reflecting market participant assumptions, including assumptions about risk premiums (mark-to-model). Management is to place less weight on quotes that are not based on the results of actual market transactions than on other indications of fair value. The type of quote is also to be considered, for example, whether the quote represents a binding offer or an indicative price, with a binding offer to be given greater weight than an indicative price.

**Selection of the valuation premise for asset measurements.** The measurement of the fair value of a nonfinancial asset is to assume the highest and best use of that asset from the perspective of market participants. Generally, the highest and best use is the way that market participants would be expected to deploy the asset (or a group of assets within which they would use the asset) that would maximize the value of the asset (or group). This highest and best use assumption might differ from the way that the reporting entity is currently using the asset or group of assets or its future plans for using it (them).

At the measurement date, the highest and best use must be physically possible (given the physical characteristics of the asset), legally permissible (taking into account any legal restrictions), and financially feasible (based on income or cash flows). Determination of the highest and best use of the nonfinancial asset will establish which of the two valuation premises to use in measuring the asset's fair value, the in-use valuation premise, or the in-exchange valuation premise.

**Strategic buyers and financial buyers.** ASC 820 differentiates between two broad categories of market participants that would potentially buy an asset or group of assets.

1. *Strategic buyers* are market participants whose acquisition objectives are to use the asset or group of assets (the “target”) to enhance the performance of their existing business by achieving benefits such as additional capacity, improved technology, managerial, marketing, or technical expertise, access to new markets, improved market share, or enhanced market positioning. Thus, a strategic buyer views the purchase as a component of a broader business plan and, as a result, a strategic buyer may be willing to pay a premium to consummate the acquisition and may, in fact, be the only type of buyer available with an interest in acquiring the target. Ideally, from the standpoint of the seller, more than one strategic buyer would be interested in the acquisition which would create a bidding situation that further increases the selling price.
2. *Financial buyers* are market participants who seek to acquire the target based on its merits as a stand-alone investment. A financial buyer is interested in a return on its investment over a shorter time horizon, often three to five years, after which time their objective would typically be to sell the target. An attractive target is one that offers high growth potential in a short period of time resulting in a selling price substantially higher than the original acquisition price. Therefore, even at acquisition, a financial buyer is concerned with a viable exit strategy. A financial buyer, unlike a strategic buyer, typically does not possess a high level of industry or managerial expertise in the target’s industry.

**The combination valuation premise.** This premise assumes that the maximum fair value to market participants is the price that would be received by the reporting entity (seller) assuming the

asset would be used by the buyer with other assets as a group and further that the other assets in the group would be available to potential buyers. The target might continue to be used as presently installed or may be configured in a different manner by the buyer. The assumptions regarding the level of aggregation (or disaggregation) of the asset and other associated assets may be different than the level used in applying other accounting pronouncements. Thus, in considering highest and best use and the resulting level of aggregation, the evaluator is not constrained by how the asset may be assigned by the reporting entity to a reportable or operating segment under ASC 820, a business, reporting unit, asset group, or disposal group. (ASC 820-10-35) The assumptions regarding the highest and best use of the target should normally be consistent for all of the assets included in the group within which it would be used. Generally, the market participants whose highest and best use of an asset or group of assets would be in combination are characterized as strategic buyers, as previously described.

**The stand-alone valuation premise.** This premise assumes that the maximum fair value to market participants is the price that would be received by the reporting entity (seller) assuming the asset would be sold principally on a stand-alone basis.

**Risk assumptions when valuing a liability.** Many accountants, analysts, and others find the concept of computing fair value of liabilities and recognizing changes in fair value as they occur to be counterintuitive. Consider the case when a reporting entity's own credit standing declines (universally acknowledged as a "bad thing"). A fair value measurement that incorporates the effect of this decline in credit rating would result in a decline in the fair value of the liability and a resultant increase in stockholders' equity (a "good thing"). The justification provided in ASC 820 (and by referencing CON 7) is that:

*A change in credit standing represents a change in the relative positions of the two classes of claimants (shareholders and creditors) to an entity's assets. If the credit standing diminishes, the fair value of creditors' claims diminishes. The amount of shareholders' residual claims to the entity's assets may appear to increase but that increase is probably offset by losses that may have occasioned the decline in credit standing. Because shareholders usually cannot be called on to pay a corporation's liabilities, the amount of their residual claims approaches, and is limited by zero. Thus a change in the position of borrowers necessarily alters the position of shareholders, and vice versa. (CON 7, Paragraph 82)*

**The hypothetical transaction and operational difficulties experienced in practice.** Under ASC 820, fair value measurements of liabilities assume that a hypothetical transfer to a market participant occurs on the measurement date. In measuring the fair value of a liability, the evaluator assumes that the reporting entity's obligation to its creditor (i.e., the counterparty to the obligation) will continue at and after the measurement date (i.e., the obligation will not be repaid or settled prior to its contractual maturity). This being the case, this hypothetical transfer price would most likely represent the price that the current creditor (holder of the debt instrument) could obtain from a marketplace participant willing to purchase the debt instrument in a transaction involving the original creditor assigning its rights to the purchaser. In effect, the hypothetical market participant that purchased the instrument would be in the same position as the current creditor with respect to expected future cash flows (or expected future performance, if the liability is not settleable in cash) from the reporting entity.

The evaluator further assumes that the nonperformance risk related to the obligation would remain outstanding and the transferee would fulfill the obligation. Nonperformance risk is the risk that an entity will not fulfill its obligation. It is an all-encompassing concept that includes the reporting entity's own credit standing but also includes other risks associated with the

nonfulfillment of the obligation. For example, a liability to deliver goods and/or perform services may bear nonperformance risk associated with the ability of the debtor to fulfill the obligation in accordance with the timing and specifications of the contract. Further, nonperformance risk increases or decreases as a result of changes in the fair value of credit enhancements associated with the liability (e.g., collateral, credit insurance, and/or guarantees).

**Liabilities with inseparable third-party credit enhancements.** Creditors often impose a requirement that, in connection with granting credit to a debtor, the debtor obtain a guarantee of the indebtedness from a creditworthy third party. Under such an arrangement, should the debtor default on its obligation, the third-party guarantor would become obligated to repay the obligation on behalf of the defaulting debtor and, of course, the debtor would be obligated to repay the guarantor for having satisfied the debt on its behalf.

In connection with a bond issuance, for example, the guarantee is generally purchased by the issuer (debtor) and the issuer then combines (bundles) the guarantee (also referred to as a “credit enhancement”) with the bonds and issues the combined securities to investors. By packaging a bond with a related credit enhancement, the issuer increases the likelihood that the bond will be successfully marketed as well as reduces the effective interest rate paid on the bond by obtaining higher issuance proceeds than it would otherwise receive absent the bundled credit enhancement.

*Scope exceptions.* The following guidance does *not* apply to:

1. Credit enhancements provided:
  - a. By a government or government agency (such as deposit insurance provided by the U.S. Federal Deposit Insurance Corporation [FDIC])
  - b. Between reporting entities within a consolidated or combined group
  - c. Between entities under common control
2. The holder of the issuer’s credit-enhanced liability.

**Measurement.** In accordance with ASC 820-10-35-18a, the issuer is not to include the effect of the credit enhancement in its fair value measurement of the liability. Thus, in determining the fair value of the liability, the issuer would consider its own credit standing and would not consider the credit standing of the third-party guarantor that provided the credit enhancement. Consequently, the unit of accounting to be used in the fair value measurement of a liability with an inseparable credit enhancement is the liability itself, absent the credit enhancement.

In the event that the guarantor is required to make payments to the creditor under the guarantee, it would result in a transfer of the issuer’s obligation to repay the original creditor to the guarantor with the issuer then obligated to repay the guarantor. Should this occur, the obligation of the issuer to the guarantor would be an unguaranteed liability. Thus, the fair value of that transferred, unguaranteed obligation only considers the credit standing of the issuer.

Upon issuance of the credit-enhanced debt, the issuer is to allocate the proceeds it receives between the liability issued and the premium for the credit enhancement.

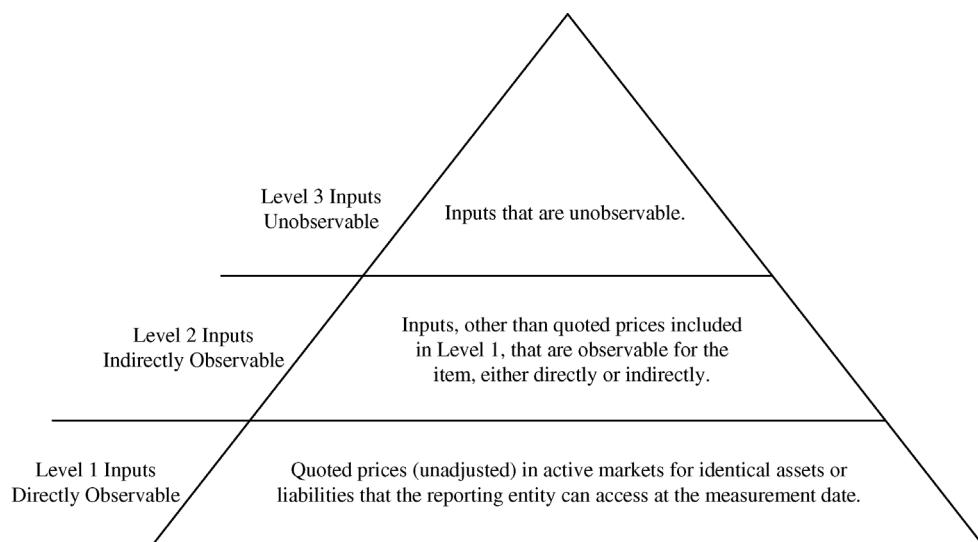

*Disclosure.* An issuer of debt with an inseparable credit enhancement that is covered by the scope of this guidance is required to disclose the existence of the third-party credit enhancement.

**Inputs.** For the purpose of fair value measurements, inputs are the assumptions that market participants would use in pricing an asset or liability, including assumptions regarding risk. An input is either observable or unobservable. Observable inputs are either directly observable or indirectly observable. ASC 820 requires the evaluator to maximize the use of relevant observable inputs and minimize the use of unobservable inputs.

An observable input is based on market data obtainable from sources independent of the reporting entity. For an input to be considered relevant, it must be considered determinative of fair value. Even if there has been a significant decrease in the volume and level of market activity for an asset or liability, it is not to be automatically assumed that the market is inactive or that individual transactions in that market are disorderly (that is, are forced or liquidation sales made under duress).

An unobservable input reflects assumptions made by management of the reporting entity with respect to assumptions it believes market participants would use to price an asset or liability based on the best information available under the circumstances.

ASC 820 provides a fair value input hierarchy (see diagram below) to serve as a framework for classifying inputs based on the extent to which they are based on observable data.

**Level 1 inputs.** Level 1 inputs are considered the most reliable evidence of fair value and are to be used whenever they are available. These inputs consist of quoted prices in active markets for identical assets or liabilities. The active market must be one in which the reporting entity has the ability to access the quoted price at the measurement date. To be considered an active market, transactions for the asset or liability being measured must occur frequently enough and in sufficient volume to provide pricing information on an ongoing basis.

A Level 1 input should be used without adjustment to measure fair value whenever possible. One should not adjust a Level 1 input except in these cases:

- When the entity has a large number of similar assets or liabilities, and it would be difficult to obtain pricing information for each individual item on the measurement date.
- When a quoted price in an active market does not represent the fair value of an asset or liability on the measurement date.
- When the quoted price needs to be adjusted for factors specific to the item.

The use of Level 2 or Level 3 inputs is generally prohibited when Level 1 inputs are available.

**Level 2 inputs.** Level 2 inputs are quoted prices for the asset or liability (other than those included in Level 1) that are either directly or indirectly observable. Level 2 inputs are to be

considered when quoted prices for the identical asset or liability are not available. If the asset or liability being measured has a contractual term, a Level 2 input must be observable for substantially the entire term. These inputs include:

1. Quoted prices for *similar* assets or liabilities in active markets
2. Quoted prices for identical or similar assets or liabilities in markets that are *not active*
3. Inputs other than quoted prices that are observable for the asset or liability (e.g., interest rates and yield curves observable at commonly quoted intervals; implied volatilities; credit spreads; and market-corroborated inputs).

Adjustments made to Level 2 inputs necessary to reflect fair value, if any, will vary depending on an analysis of specific factors associated with the asset or liability being measured. These factors include:

1. Condition or location
2. Extent to which the inputs relate to items comparable to the asset
3. Volume or level of activity in the markets in which the inputs are observed.

Depending on the level of the fair value input hierarchy in which the inputs used to measure the adjustment are classified, an adjustment that is significant to the fair value measurement in its entirety could render the measurement a Level 3 measurement.

**Level 3 inputs.** Level 3 inputs are unobservable inputs. These are necessary when little, if any, market activity occurs for the asset or liability. Level 3 inputs assumptions that a market participant would use when pricing the asset or liability including assumptions about risk. The best information available in the circumstances is to be used to develop the Level 3 inputs. This information might begin with internal data of the reporting entity. Cost/benefit considerations apply in that management is not required to “undertake all possible efforts” to obtain information about the assumptions that would be made by market participants. Attention is to be paid, however, to information available to management without undue cost and effort and, consequently, management’s internal assumptions used to develop unobservable inputs are to be adjusted if such information contradicts those assumptions.

**Inputs based on bid and ask prices.** Quoted bid prices represent the maximum price at which market participants are willing to buy an asset; quoted ask prices represent the minimum price at which market participants are willing to sell an asset. If available market prices are expressed in terms of bid and ask prices, management is to use the price within the bid-ask spread (the range of values between bid and ask prices) that is most representative of fair value irrespective of where in the fair value hierarchy the input would be classified. ASC 820 permits the use of pricing conventions such as midmarket pricing as a practical alternative for determining fair value measurements within a bid-ask spread. The use of bid prices for asset valuations and ask prices for liability valuations is permitted but not required. (ASC 820-10-35-36C and 35-36D)

**Categorizing inputs.** Categorization of inputs as to the level of the hierarchy in which they fall serves two purposes. First, it provides the evaluator with a means of prioritizing assumptions used as to their level of objectivity and verifiability in the marketplace. Second, as discussed later in this chapter, the hierarchy provides a framework to provide informative disclosures that enable readers to assess the reliability and market observability of the fair value estimates embedded in the financial statements.

In making a particular measurement of fair value, the inputs used may be classifiable in more than one of the levels of the hierarchy. When this is the case, the inputs used in the fair value

measurement in its entirety are to be classified in the level of the hierarchy in which the lowest level input that is significant to the measurement is classified.

It is important to assess available inputs and their relative classification in the hierarchy prior to selecting the valuation technique or techniques to be applied to measure fair value for a particular asset or liability. The objective, in selecting from among alternative calculation techniques, would be to select the technique or combination of techniques that maximizes the use of observable inputs.

**Valuation techniques.** In measuring fair value, management employs one or more valuation techniques consistent with the market approach, the income approach, and/or the cost approach. As previously discussed, the selection of a particular technique (or techniques) to measure fair value is to be based on its appropriateness to the asset or liability being measured, maximizing the use of observable inputs and minimizing the use of unobservable inputs.

In certain situations, such as when using Level 1 inputs, use of a single valuation technique will be sufficient. In other situations, such as when valuing a reporting unit, management may need to use multiple valuation techniques. When doing so, the results yielded by applying the various techniques are evaluated considering the reasonableness of the range of values. The fair value is the point within the range that is most representative of fair value in the circumstances.

Management is required to consistently apply the valuation techniques it elects to use to measure fair value. It would be appropriate to change valuation techniques or how they are applied if the change results in fair value measurements that are equally or more representative of fair value. Situations that might give rise to such a change would be when new markets develop, new information becomes available, previously available information ceases to be available, valuation techniques improve, or market conditions change. Revisions that result from either a change in valuation technique or a change in the application of a valuation technique are to be accounted for as changes in accounting estimate under ASC 250.

**Market approach.** The market approach to valuation uses information generated by actual market transactions for identical or comparable assets or liabilities (including a business in its entirety). Market approach techniques often will use market multiples derived from a set of comparable transactions for the asset or liability or similar items. The evaluator needs to consider both qualitative and quantitative factors in determining the point within the range that is most representative of fair value. An example of a market approach is matrix pricing. This is a mathematical technique used primarily for the purpose of valuing debt securities without relying solely on quoted prices for the specific securities. Matrix pricing uses factors such as the stated interest rate, maturity, credit rating, and quoted prices of similar issues to develop the issue's current market yield.

**Cost approach.** The cost approaches are based on quantifying the amount required to replace an asset's remaining service capacity (i.e., the asset's current replacement cost). A valuation technique classified as a cost approach would measure the cost to a market participant (buyer) to acquire or construct a substitute asset of comparable utility, adjusted for obsolescence. Obsolescence adjustments include factors for physical wear and tear, improvements to technology, and economic (external) obsolescence. Thus, obsolescence is a broader concept than financial statement depreciation which simply represents a cost allocation convention and is not intended to be used as a valuation technique.

**Income approach.** Techniques classified as income approaches measure fair value based on current market expectations about future amounts (such as cash flows or net income) and discount them to an amount in measurement date dollars. Valuation techniques that follow an income approach include the Black-Scholes-Merton model (a closed-form model) and binomial or lattice

models (open-form models), which use present value techniques, as well as the multiperiod excess earnings method that is used in fair value measurements of certain intangible assets such as in-process research and development.

### ***Measurement considerations***

***Initial recognition.*** When the reporting entity first acquires an asset or incurs (or assumes) a liability in an exchange transaction, the transaction price is an entry price, the price paid to acquire the asset and the price received to assume the liability. Fair value measurements are based not on entry prices, but rather on exit prices—the price that would be received to sell the asset or paid to transfer the liability. While entry and exit prices differ conceptually, in many cases they may be identical and can be considered to represent fair value of the asset or liability at initial recognition. This is not always the case, however, and in assessing fair value at initial recognition, management is to consider transaction-specific factors and factors specific to the assets and/or liabilities that are being initially recognized. Examples of situations where transaction price might not represent fair value at initial recognition include:

1. Related-party transactions, unless the entity has evidence that the transaction was entered into at market terms.
2. Transactions taking place under duress or the seller is forced to accept the price, such as when the seller is experiencing financial difficulties.
3. Different units of account that apply to the transaction price and the assets/liabilities being measured. This can occur, for example, where the transaction price includes other elements besides the assets/liabilities that are being measured such as unstated rights and privileges that are subject to separate measurement or when the transaction price includes transaction costs (see discussion below).
4. The exchange transaction takes place in a market different from the principal or most advantageous market in which the reporting entity would sell the asset or transfer the liability. An example of this situation is when the reporting entity is a securities dealer that enters into transactions with customers in the retail market, but the principal market for the exit transaction is with other dealers in the dealer market.

(ASC 820-10-30-3A)

If another ASC Topic requires or permits fair value measurement initially and the transaction price differs from fair value, the resulting gain or loss is recognized in earnings, unless otherwise specified.

***Transaction costs.*** Transaction costs are the incremental direct costs that would be incurred to sell an asset or transfer a liability. While, as previously discussed, transaction costs are considered in determining the market that is most advantageous, they are not used to adjust the fair value measurement of the asset or liability being measured. FASB excluded them from the measurement because they are not characteristic of an asset or liability being measured. (ASC 820-10-35-9B)

***Transportation costs.*** If an attribute of the asset or liability being measured is its location, the price determined in the principal or most advantageous market is to be adjusted for the costs that would be incurred by the reporting entity to transport it to or from that market. (ASC 820-10-35-9C)

### **Fair Value Disclosures**

Substantial disclosures regarding fair value are required by various ASC Topics. In the preparation of the financial statements, these disclosures are often placed in different informative

notes including descriptions of the entity's accounting policies, financial instruments, impairment, derivatives, pensions, revenue recognition, share-based compensation, risks and uncertainties, certain significant estimates, etc. ASC 820 encourages preparers to combine disclosure requirements under ASC 820 with those of other subtopics. Plan assets of a defined benefit pension plan or other postretirement plans accounted for under ASC 715 are not subject to the ASC 820 requirements and should apply the disclosure requirements in the relevant paragraphs of ASC 715. A list of the required disclosures can be found in Appendix B.

## PERSPECTIVE AND ISSUES

---

### Subtopics

ASC 825, *Financial Instruments*, contains two Subtopics:

- ASC 825-10, *Overall*, which has two Subsections:
  - General, which provides guidance on credit losses on financial instruments with off-balance-sheet credit risk and some disclosures about financial instruments
  - Fair Value Option, which provides guidance on the circumstances under which entities may choose the fair value option and the related presentation and disclosure requirements
- ASC 825-20, *Registration Payment Arrangements*.

### Scope and Scope Exceptions

The following items are eligible for the fair value option (also see the chapter on ASC 820—the summary table in the section entitled “The Mixed Attribute Model”):

1. All recognized financial assets and financial liabilities *except*:
  - a. Investments in subsidiaries required to be consolidated by the reporting entity
  - b. Interests in variable interest entities required to be consolidated by the reporting entity<sup>1</sup>
  - c. Employers’ and plans’ obligations (unfunded or underfunded liabilities) or assets (representing net overfunded positions) for:

---

<sup>1</sup> Under ASC 805, consolidated variable interest entities are referred to as subsidiaries in the same manner as consolidated voting interest entities.

1. Pension benefits
  2. Other postretirement benefits (including health care and life insurance benefits)
  3. Postemployment benefits
  4. Other deferred compensation, termination, and share-based payment arrangements such as employee stock option plans; employee stock purchase plans; compensated absences; and exit and disposal activities
  - d. Financial assets and financial liabilities under leases (this exception does not, however, apply to a guarantee of a third-party lease obligation or a contingent obligation associated with cancellation of a lease)
  - e. Deposit liabilities, withdrawable on demand, of banks; saving and loan associations; credit unions; and other similar depository institutions
  - f. Financial instruments that are, in whole or in part, classified by the issuer as a component of stockholders' equity (including "temporary equity," also sometimes referred to as "mezzanine") such as a convertible debt security with a noncontingent beneficial conversion feature.
- (ASC 825-10-15-5)
2. Firm commitments that would otherwise not be recognized at inception and that involve only financial instruments. An example is a forward purchase contract for a loan that is not readily convertible to cash. The commitment involves only financial instruments (the loan and cash) and would not be recognized at inception since it does not qualify as a derivative.
  3. A written loan commitment.
  4. Rights and obligations under insurance contracts or warranties that are not financial instruments<sup>2</sup> but whose terms permit the insurer (warrantor) to settle claims by paying a third party to provide goods and services to the counterparty (insured party or warranty claimant).
  5. A host financial instrument resulting from bifurcating an embedded nonfinancial derivative instrument from a nonfinancial hybrid instrument under ASC 815-15-25. An example would be an instrument in which the value of the bifurcated embedded derivative is payable in cash, services, or merchandise but the host debt contract is only payable in cash.
- (ASC 825-10-15-4)

## Overview

A credit loss on a financial instrument with off-statement-of-financial-position risk is recorded as a liability rather than being included in a valuation allowance netted against a recognized financial instrument. When settled, the credit loss is deducted from the liability. (ASC 825-10-5-3)

ASC 825-10-25, *The Fair Value Option*, encourages reporting entities to elect to use fair value to measure eligible assets and liabilities in their financial statements. The objective is to improve financial reporting by mitigating the volatility in reported earnings that is caused by measuring related assets and liabilities differently. Electing entities obtain relief from the onerous and complex documentation requirements that apply to certain hedging transactions under ASC

---

<sup>2</sup> Insurance contracts that require or permit the insurer to settle claims by providing goods or services instead of by paying cash are not, by definition, financial instruments. Similarly, warranties that require or permit the warrantor to settle claims by providing goods and services in lieu of cash do not constitute financial instruments.

815. ASC 825-10-25 applies to businesses and not-for-profit organizations and provides management of these entities substantial discretion in electing to measure eligible assets and liabilities at fair value.

Management is given an extraordinary amount of discretion in selecting the assets and/or liabilities for which it chooses to make this election, the fair value option. In general, the election is made on an individual contract or item-by-item basis.

### Technical Alert

In January 2016, the FASB issued ASU 2016-01, *Financial Instruments—Overall (Subtopic 825-10): Recognition and Measurement of Financial Assets and Financial Liabilities*. The ASU is the result of the FASB's project on accounting for financial instruments. The goal of the project is to improve the usefulness of financial instruments reporting for decision makers. Simplification is expected to be an outcome of the project. This ASU is the first one issued as part of the financial instruments project. New impairment guidance is expected in 2016 as is an exposure draft on hedging.

The last exposure draft, issued in 2013, on recognition and measurement proposed significant changes in the current accounting model. The extant model is a mixed attribute model. The FASB looked at several measurement attributes:

- Fair value—the exit price.
- Current value—based on discounted cash flows to calculate the present value of expected future cash flows for a financial instrument, approximating an entry price.
- Amortized cost—currently used for loans held for sale, other receivables, debt securities held to maturity, an entity's own issued debt, and other liabilities.

After studying the feedback from constituents and redeliberating the issue, the FASB found few stakeholders supported fair value for all instruments, commenting that fair value is subjective, difficult to measure, and resultant volatility would not reflect the way an entity manages its financial instruments. The FASB discarded many of its proposals, retained a mixed attribute model and most of the provisions from extant GAAP, and instead made targeted improvements.

The ASU affects guidance on:

- Equity investments that are not consolidated or accounted for under the equity method,
- Financial liabilities under the fair value option, and
- Presentation and disclosure requirements for financial instruments.

For equity investments without readily determinable fair value, the ASU generally eliminates the cost method: cost less impairment, adjusted for subsequent observable price changes. However, some investments are eligible to use the cost method as a practical expedient and entities may choose to use it.

In the ASU, the FASB clarifies that entities need a valuation allowance for deferred tax assets that result from unrealized losses or available-for-sale debt securities. It left largely unchanged the guidance on accounting for other financial instruments, such as:

- Loans,
- Investments in debt securities, and
- Financial liabilities not under the fair value option.

Notice that there is now a split in the accounting for debt and equity securities. This resulted in the addition of ASC 321 and changes in terminology in the other investment topics.

**Scope.** The scope of the ASU is broad and includes all types of equity investments that are not consolidated or accounted for under the equity method, including those that would not be found in the definition of a security. For example, limited partnerships that hold only debt securities fall under ASC 321. This is because the new guidance does not allow a “look through” to the holdings in order to determine recognition and measurement. ASC 321 also applies to forwards and options designed to acquire and dispose of ownership interests not accounted for as derivative instruments under ASC 815.

**Effective date.** ASC 2016-01 is effective:

- For public business entities—fiscal years beginning after December 15, 2017, including interim periods within those fiscal years.
- For all other entities—fiscal years beginning after December 15, 2017, including interim periods within those fiscal years. Early adoption is permitted for provisions that eliminate previously required disclosures.

## DEFINITIONS OF TERMS

---

Source: ASC 825-20. See Appendix, *Definition of Terms*, for terms relevant to this chapter: Cash Equivalents, Conduit Debt Securities, Fair Value, Financial Asset, Financial Instrument, Financial Liability, Firm Commitment, Nonpublic Entity, and Public Traded Entity

**Liability Issued with an Inseparable Third-Party Credit Enhancement.** A liability that is issued with a credit enhancement obtained from a third party, such as debt that is issued with a financial guarantee from a third party that guarantees the issuer’s payment obligation.

## CONCEPTS, RULES, AND EXAMPLES

---

### ASC 825-10-25, *Financial Instruments: The Fair Value Option*

**Flexibility of application.** ASC 825-10-25 provides management with substantial flexibility in electing the fair value option (FVO). Once elected, however, the election is irrevocable unless, as discussed later in this section, a new election date occurs. The election can be made for a single eligible item without electing it for other identical items subject to the following limitations:

1. If the FVO is elected with respect to an investment otherwise required to be accounted for under the equity method of accounting, the FVO election is to be applied to all of the investor’s financial interests in the same entity (equity and debt, including guarantees) that are eligible items.
2. If a single contract with a borrower (such as a line of credit or construction loan) involves multiple advances to that borrower and those advances lose their individual identity and are aggregated with the overall loan balance, the FVO is only permitted to be elected to apply to the larger overall loan balance and not individually with respect to each individual advance.
3. If the FVO is applied to an eligible insurance or reinsurance contract, it is also required to be applied to all claims and obligations under the contract.
4. If the FVO is elected for an eligible insurance contract (base contract) for which integrated or nonintegrated contract features or coverages (some of which are referred to as “riders”) are issued either concurrently or subsequently, the FVO is required to be applied to those features and coverages. The FVO is not permitted to be elected for only the nonintegrated

contract features and coverages, even though they are accounted for separately under ASC 944-30.<sup>3</sup>

Other than as provided in (1) and (2) above, management is not required to apply the FVO to all instruments issued or acquired in a single transaction. The lowest level of election, however, is at the single legal contract level. A financial instrument that is, in legal form, a single contract is not permitted to be separated into component parts for the purpose of electing the FVO. For example, an individual bond is the minimum denomination of that type of debt security.

An investor in an equity security of a particular issuer may elect the FVO for its entire investment in that equity security including any fractional shares issued by the investee in connection, for example, with a dividend reinvestment plan.

Management of an acquirer, parent company, or primary beneficiary<sup>4</sup> decides whether to elect the FVO with respect to the eligible items of an acquiree, subsidiary, or consolidated variable interest entity. That decision, however, only applies in the consolidated financial statements. FVO choices made by management of an acquiree, subsidiary, or variable interest entity continue to apply in their separate financial statements should they choose to issue them.

**Timing of the election.** Management may elect the FVO for an eligible item in one of two ways:

1. Based on an established policy for specified types of eligible items that it follows consistently, or
2. On the date of occurrence of one of the following events:
  - a. The entity initially recognizes the item.
  - b. The entity enters into an eligible firm commitment.
  - c. Financial assets previously required to be reported at fair value with unrealized gains and losses included in income due to the application of specialized accounting principles cease to qualify for that accounting treatment (e.g., a subsidiary subject to ASC 946 transfers a security to another subsidiary of the same parent that is not subject to the ASC).
  - d. The accounting treatment for an investment in another entity changes because:
    1. The investment becomes subject to the equity method of accounting (and, for example, had previously been accounted for under ASC 320 or under the FVO)
    2. The investor ceases to consolidate a subsidiary or variable interest entity but retains an interest in the entity.
  - e. An event requires an eligible item to be remeasured at fair value at the time that the event occurs but does not require fair value measurements to be made at each subsequent reporting date. Specifically excluded from being considered an eligible event are:
    1. Recognition of impairment under lower-of-cost-or-market accounting, or
    2. Other-than-temporary impairment.

(ASC 825-10-25-4)

---

<sup>3</sup> ASC 944-30-20 defines a nonintegrated contract feature in an insurance contract as a feature in which the benefits provided are not related to or dependent on the provisions of the base contract. For the purposes of applying the FVO election, neither an integrated nor a nonintegrated contract feature or coverage qualifies as a separate instrument.

<sup>4</sup> Under ASC 805 a primary beneficiary is referred to as a parent in the same manner as a company that consolidates a voting interest entity.

Among the events that require initial fair value measurement or subsequent fair value remeasurements of this kind are:

1. Business combinations,
  2. Consolidation or deconsolidation of a subsidiary or variable interest entity, and
  3. Significant modifications of debt, as defined in ASC 470-50, *Debt—Modifications and Extinguishments*.
- (ASC 825-10-25-5)

### **Financial Statement Presentation and Disclosure**

**Statement of financial position.** ASC 825-10-25 requires the reporting entity to report assets and liabilities for which the FVO was elected in a manner that separates those amounts from carrying amounts of similar assets and liabilities measured using another measurement method. Two alternatives are provided:

1. Present the aggregate fair value and nonfair value amounts on the same line of the statement of financial position and parenthetically provide the amount measured at fair value that is included in the aggregate amount.
2. Present two separate line items to display the fair value and nonfair value carrying amounts.

The manner in which the first alternative is illustrated in ASC 825-10-25 could potentially confuse or mislead readers.

Private equity investments (\$75 at fair value)	\$125
---	-------

This caption could easily be misunderstood by the reader to mean that the reporting entity holds private equity investments with an aggregate carrying value of \$125 whose fair value has declined to \$75 thus implying a \$50 unrealized loss. In fact, this caption is intended to convey the fact that the reporting entity holds private equity investments with an aggregate carrying value of \$125 and that the \$125 is comprised of \$75 valued at fair value in accordance with an election of the FVO and \$50 using another measurement attribute such as the cost method or equity method.

If using parenthetical disclosure, it would be less misleading if the amount were presented as follows:

Private equity investments (\$75 measured at fair value; \$50 measured using the equity method)	\$125
--	-------

This can get cumbersome and is still confusing. It becomes even more unwieldy when considering the fact that reporting entities customarily present two or three years' comparative statements of financial position and that not-for-profit organizations often use tabular formats for their statements of financial position that present separate columns for unrestricted net assets, temporarily restricted net assets, and permanently restricted net assets.

Another source of confusion is the fact that existing GAAP requires certain items (such as derivatives, trading securities, and available-for-sale securities) to be stated at fair value without consideration of the FVO. Therefore, it is conceivable that a single statement of financial position will contain financial instruments that are stated at fair value due to a requirement in GAAP, financial instruments that are stated at fair value due to management's election of the FVO, and financial instruments that are stated using some other attribute such as cost method or equity method, or, as is permitted for investments in certain debt securities, using amortized cost. When this is the case, the reporting entity may wish to use a format such as the one shown in the sample "Consolidated Statement of Financial Position" for Young Aviation Chopper and Helicopter Works, Inc.

Many variations can be derived from this method of presentation. For example, subtotals are only necessary to be presented for the total column since the notes to the financial statements provide fair value totals by major class. The financial statement preparer may wish to augment this presentation by including a column that subtotals all amounts stated at fair value irrespective of whether they are subject to the FVO election.

Separate sections of assets and liabilities could contain separate line items enumerating the eligible items within each for which the FVO was elected by management.

Accounts payable		\$ 110		110
Accrued liabilities	130			130
Other liabilities	555			555
<b>Total liabilities</b>	<b><u>953</u></b>	<b><u>110</u></b>	<b><u>60</u></b>	<b><u>1,123</u></b>
<b>Stockholders' equity</b>				
Common stock	4			4
Additional paid-in capital	88			88
Retained earnings	42			42
Accumulated other comprehensive income	(1)			(1)
<b>Total stockholders' equity</b>	<b><u>133</u></b>	<b><u>—</u></b>	<b><u>—</u></b>	<b><u>133</u></b>
<b>Total liabilities and stockholders' equity</b>	<b><u>\$ 1,086</u></b>	<b><u>\$ 110</u></b>	<b><u>\$ 60</u></b>	<b><u>\$ 1,256</u></b>

**Other comprehensive income.** If an entity elects the fair value option for financial liabilities, the guidance requires that an entity must recognize a change in fair value attributable to instrument-specific credit risk in other comprehensive income instead of net income. Entities can measure the fair value attributable to instrument-specific credit risk:

- As the excess of the total change in fair value over the change in fair value attributable to changes in a base market rate, such as a risk-free rate, or
- Using another method if it produces a faithful measure and is applied consistently.

The guidance acknowledges that recognizing changes in fair value attributable to instrument-specific credit risk in net income may result in higher net income that may be misleading.

If the financial liability is settled before its maturity date, the accumulated gains and losses from changes in instrument-specific credit risk are removed from other comprehensive income and recognized in net income.

Changes in value of financial liabilities required to be measured at fair value are recognized in net income.

**Policy election.** The ASU offers entities the option to measure the change in instrument-specific credit risk as the portion of the periodic change in fair value that is not a result of changes in a base market rate. An entity can make this policy election if it believes it will be a more faithful representation of the change in credit risk for the entity. The election must be applied consistently to each financial liability and disclosed.

**Statement of cash flows.** ASC 825-10-25 requires cash receipts and cash payments related to items measured at fair value to be classified in the statement of cash flows according to their nature and purpose. Inexplicably, however, ASC 825-10-25 leaves the provision of ASC 230 unchanged that requires returns on investments (interest and dividends) to be accounted for as operating activities.

**Disclosure objectives.** Consistent with the approach in ASC 820, ASC 825-10-25 provides financial statement preparers with the principal objectives associated with fair value option disclosures and then sets forth in detail the disclosures FASB deems necessary to meet the objective. The principal objectives are to facilitate comparisons (1) between entities that choose different measurement attributes for similar assets and liabilities, and (2) between assets and liabilities in the financial statements of an entity that elects to use different measurement attributes for similar assets and liabilities. FASB indicates that it expects the disclosures to result in:

1. Information sufficient to enable financial statement users to understand:
  - a. The reasons why management elected or partially elected the FVO
  - b. How changes in fair values affected net income for the period
  - c. The differences between fair values and contractual cash flows for certain items.
2. The information that would have been required to be disclosed about certain items (e.g., equity-method investments, nonperforming loans) absent the FVO election.

Although not required by ASC 825-10-25, FASB encourages management to present the disclosures it requires in combination with related fair value disclosures required to be disclosed by parts of the codification (such as ASC 825-10-50 and ASC 820).

#### Example of disclosure under ASC 820 and ASC 825-10-25 combined with ASC 825-10-50 disclosures

The following example does not purport to illustrate all of the disclosure requirements specified within GAAP. Instead, it is presented to illustrate how the financial statement preparer might organize the required tabular disclosures by integrating the ASC 825-10-50 disclosures regarding the fair value of financial instruments with the ASC 820 and ASC 825-10-25 disclosures discussed in this chapter.

## PERSPECTIVE AND ISSUES

### Subtopics

ASC 830 contains five subtopics:

- ASC 830-10, *Overall*
- ASC 830-20, *Foreign Currency Transactions*
- ASC 830-30, *Translation of Financial Statements*
- ASC 830-250, *Statement of Cash Flows*
- ASC 830-740, *Income Taxes*.

ASC 830 provides guidance about:

- Foreign transaction, and
- Translation of financial statements.

### Scope and Scope Exceptions

ASC 830 applies to all entities. ASC 830-20 does not apply to derivative instruments. Preparers should look to ASC 815 for guidance on derivatives.

## Overview

To facilitate the proper analysis of foreign operations by financial statement users, transactions and financial statements denominated in foreign currencies must be expressed in a common currency (i.e., U.S. dollars). The GAAP governing the translation of foreign currency financial statements and the accounting for foreign currency transactions are found primarily in Accounting Standards Codification (ASC) 830, *Foreign Currency Matters*. These principles apply to the translation of:

1. Foreign currency transactions (e.g., exports, imports, and loans) that are denominated in other than a company's functional currency
2. Foreign currency financial statements of branches, divisions, subsidiaries, and other investees that are incorporated into the financial statements of a company reporting under U.S. GAAP by combination, consolidation, or application of the equity method.

The objectives of translation are to provide:

1. Information relative to the expected economic effects of rate changes on an enterprise's cash flows and equity
2. Information in consolidated statements relative to the financial results and relationships of each individual foreign consolidated entity as reflected by the functional currency of each reporting entity.

Companies sometimes use hedging strategies to attempt to manage their risk and minimize their exposure to fluctuations in the exchange rates of foreign currencies. Hedge accounting under ASC 815, *Derivatives and Hedging*, is addressed at the end of this chapter.

## DEFINITIONS OF TERMS

---

Source: ASC 830, *Glossaries*. See Appendix A, *Definition of Terms*, for additional terms relevant to this Topic: Net realizable value and Not-for-profit entity.

**Attribute.** The quantifiable characteristic of an item that is measured for accounting purposes. For example, historical cost and current cost are attributes of an asset.

**Exchange Rate.** The ratio between a unit of one currency and the amount of another currency for which that unit can be exchanged at a particular time.

**Foreign Currency.** A currency other than the functional currency of the reporting entity being referred to (for example, the U.S. dollar could be a foreign currency for a foreign entity). Composites of currencies, such as the Special Drawing Rights on the International Monetary Fund (SDR), used to set prices, denominate amounts of loans, and the like have the characteristics of foreign currency for purposes of applying ASC 830.

**Foreign Currency Statements.** Financial statements that employ as the unit of measure a functional currency that is not the reporting currency of the enterprise.

**Foreign Currency Transactions.** Transactions whose terms are denominated in a currency other than the reporting entity's functional currency. Foreign currency transactions arise when an enterprise (1) buys or sells goods or services on credit whose prices are denominated in foreign currency, (2) borrows or lends funds and the amounts payable or receivable are denominated in foreign currency, (3) is a party to an unperformed forward exchange contract, or (4) for other reasons, acquires or disposes of assets or incurs or settles liabilities denominated in foreign currency.

**Foreign Currency Translation.** The process of expressing in the enterprise's reporting currency amounts that are denominated or measured in a different currency.

**Foreign Entity.** An operation (for example, subsidiary, division, branch, joint venture, and so forth) whose financial statements are both:

1. Prepared in a currency other than the reporting currency of the reporting entity
2. Combined or consolidated with or accounted for on the equity basis in the financial statements of the reporting entity.

**Functional Currency.** The currency of the primary economic environment in which the entity operates; normally, the currency of the environment in which the entity primarily generates and expends cash.

**Local Currency.** The currency of a particular country being referred to.

**Noncontrolling Interest.** The portion of equity (net assets) in a subsidiary not attributable, directly or indirectly, to a parent. A noncontrolling interest is sometimes called a minority interest.

**Reporting Currency.** The currency used by the entity to prepare its financial statements.

**Reporting Entity.** An entity or group of entities whose financial statements are being referred to. Those financial statements reflect (1) the financial statements of one or more foreign operations by combination, consolidation, or equity method accounting; (2) foreign currency transactions; or (3) both.

**Transaction Gain or Loss.** Transaction gains or losses result from a change in exchange rates between the functional currency and the currency in which a foreign currency transaction is denominated. They represent an increase or decrease in (1) the actual functional currency cash flows realized upon settlement of foreign currency transactions and (2) the expected functional currency cash flows on unsettled foreign currency transactions.

**Translation Adjustments.** Translation adjustments result from the process of translating financial statements from the entity's functional currency into the reporting currency.

## **CONCEPTS, RULES, AND EXAMPLES**

---

### **Translation of Foreign Currency Financial Statements**

**Selection of the functional currency.** Before the financial statements of a foreign branch, division, or subsidiary are translated into U.S. dollars, the management of the U.S. entity must make a decision as to which currency is the functional currency of the foreign entity. Once chosen, the functional currency cannot be changed unless economic facts and circumstances have clearly changed. Additionally, previously issued financial statements are not restated for any changes in the functional currency. The functional currency decision is crucial, because different translation methods are applied which may have a material effect on the U.S. entity's financial statements.

FASB defines functional currency but does not list definitive criteria that, if satisfied, would with certainty result in the identification of an entity's functional currency. Rather, realizing that such criteria would be difficult to develop, FASB listed various factors that were intended to give management guidance in making the functional currency decision. These factors include:

1. Cash flows. (Do the foreign entity's cash flows directly affect the parent's cash flows and are they immediately available for remittance to the parent?)
2. Sales prices. (Are the foreign entity's sales prices responsive to exchange rate changes and to international competition?)
3. Sales markets. (Is the foreign entity's sales market the parent's country or are sales denominated in the parent's currency?)

4. Expenses. (Are the foreign entity's expenses incurred primarily in the parent's country?)
5. Financing. (Is the foreign entity's financing primarily from the parent or is it denominated in the parent's currency?)
6. Intercompany transactions. (Is there a high volume of intercompany transactions between the parent and the foreign entity?)

If the answers to the questions above are predominantly yes, the functional currency is the reporting currency of the parent entity (i.e., the U.S. dollar). If the answers are predominantly no, the functional currency would most likely be the local currency of the foreign entity, although it is possible for a foreign currency other than the local currency to be the functional currency.

**Translation methods.** To deal with discrete circumstances, FASB chose two different methods to translate an entity's foreign financial statements into U.S. dollars:

- The *current rate* method, and
- The *remeasurement* method.

These are not alternatives, but rather are employed as circumstances dictate. The primary distinction between the methods is the classification of assets and liabilities (and their corresponding income statement amounts) that are translated at either the current or historical exchange rates.

**Current rate method.** The current rate method is the approach mandated by ASC 830 when the functional currency is the foreign currency (e.g., the domestic currency of the foreign subsidiary or operation). All assets and liabilities are translated at the current rates, while stockholders' equity accounts are translated at the appropriate historical rate or rates. Revenues and expenses are translated at rates in effect when the transactions occur, but those that occur evenly over the year may be translated at the weighted-average rate for the year.

Note that weighted-average, if used, must take into account the actual pace and pattern of changes in exchange rates over the course of the year, which will often not be varying at a constant rate throughout the period nor, in many instances, monotonically increasing or decreasing over the period. When these conditions do not hold, it is incumbent upon the reporting entity to develop a weighted-average exchange rate that is meaningful under the circumstances. When coupled with transactions (sales, purchases, etc.) that also have not occurred evenly throughout the year, this determination can become a fairly complex undertaking, requiring careful attention.

The theoretical basis for the current rate method is the "net investment concept," wherein the foreign entity is viewed as a separate entity in which the parent invested, rather than being considered part of the parent's operations. FASB's reasoning was that financial statement users can benefit most when the information provided about the foreign entity retains the relationships and results created in the environment (economic, legal, and political) in which the entity operates. Converting all assets and liabilities at the same current rate accomplishes this objective.

The rationale for this approach is that foreign-denominated debt is often used to purchase assets that create foreign-denominated revenues. These revenue-producing assets act as a natural hedge against changes in the settlement amount of the debt due to changes in the exchange rate. The excess (net) assets—which are the U.S. parent entity's net equity investment in the foreign operation—will, however, be affected by this foreign exchange risk, and this effect is recognized by the parent.

**Remeasurement method.** The remeasurement method has also been referred to as the monetary/nonmonetary method. This approach is required by ASC 830 when the foreign entity's accounting records are *not* maintained in the functional currency (e.g., when the U.S. dollar is designated as the functional currency for a Brazilian subsidiary). This method translates monetary

assets (cash and other assets and liabilities that will be settled in cash) at the current rate. Nonmonetary assets, liabilities, and stockholders' equity are translated at the appropriate historical rates. The appropriate historical rate would be the exchange rate at the date the transaction involving the nonmonetary account originated. Also, the income statement amounts related to nonmonetary assets and liabilities, such as cost of goods sold (inventory), depreciation (property, plant, and equipment), and intangibles amortization (patents, copyrights), are translated at the same rate as used for the related statement of financial position translation. Other revenues and expenses occurring evenly over the year may be translated at the weighted-average exchange rate in effect during the period, subject to the considerations discussed above.

*Recap.* Thus, to summarize, if the foreign entity's local currency is the functional currency, ASC 830 requires use of the current rate method when translating the foreign entity's financial statements. If, on the other hand, the U.S. dollar (or other nonlocal currency) is the functional currency, ASC 830 requires the remeasurement method when translating the foreign entity's financial statements. Both of these methods are illustrated below. All amounts in the following two illustrations, other than exchange rates, are in thousands.

**Example of the current rate method**

Assume that a U.S. entity has a 100% owned subsidiary in Italy that commenced operations in 20X2. The subsidiary's operations consist of leasing space in an office building. This building, which cost one million euros, was financed primarily by Italian banks. All revenues and cash expenses are received and paid in euros. The subsidiary also maintains its accounting records in euros. As a result, management of the U.S. entity has decided that the euro is the functional currency of the subsidiary.

The subsidiary's statement of financial position at December 31, 20X2, and its combined statement of income and retained earnings for the year ended December 31, 20X2, are presented below in euros.

<b>Italian Company</b>			
<b>Statement of Financial Position</b>			
<b>At December 31, 20X2</b>			
(€000 omitted)			
<b>Assets</b>	<b>Liabilities and Stockholders' Equity</b>		
Cash	€ 100	Accounts payable	€ 60
Accounts receivable	40	Unearned rent	20
Land	200	Mortgage payable	800
Building	1,000	Common stock	80
Accumulated depreciation	(20)	Additional paid-in capital	320
		Retained earnings	40
		Total liabilities and stockholders' equity	
Total assets	€1,320		€1,320

<b>Italian Company</b>	
<b>Statement of Income and Retained Earnings</b>	
<b>For the Year Ended December 31, 20X2</b>	
(€000 omitted)	
Revenues	€400
Expenses (including depreciation of €20)	340
Net income	60
Retained earnings, January 1, 20X2	—
Less dividends declared	(20)
Retained earnings, December 31, 20X2	€ 40

Various exchange rates for 20X2 are as follows:

- €1 = \$1.50 at the beginning of 20X2 (when the common stock was issued and the land and building were financed through the mortgage)
- €1 = \$1.55 weighted-average for 20X2
- €1 = \$1.58 at the date the dividends were declared and paid and the unearned rent was received
- €1 = \$1.62 at the end of 20X2

Since the euro is the functional currency, the Italian Company's financial statements must be translated into U.S. dollars by the current rate method. This translation process is illustrated below.

**Italian Company**

**(The euro is the functional currency)**  
**For the Year Ended December 31, 20X2**  
**(€/\$000 omitted)**

	<u>Euros</u>	<u>Exchange rate</u>	<u>U.S. dollars</u>
<i>Operating activities</i>			
Net income	€60	1.55	\$93.00
Adjustments to reconcile net income to net cash provided by operating activities			
Depreciation	20	1.55	31.00
Increase in accounts receivable	(40)	1.55	(62.00)
Increase in accounts payable	60	1.55	93.00
Increase in unearned rent	20	1.58	31.60
Net cash provided by operating activities	<u>120</u>		<u>186.60</u>
<i>Investing activities</i>			
Purchase of land	(200)	1.50	(300.00)
Purchase of building	(1,000)	1.50	\$ (1,500.00)
Net cash used by investing activities	(1,200)		<u>(1,800.00)</u>
<i>Financing activities</i>			
Proceeds from issuance of common	400	1.50	600.00
Proceeds from mortgage payable	800	1.50	1,200.00
Dividends paid	(20)	1.58	(31.60)
Net cash provided by financing activities	<u>1,180</u>		<u>1,768.40</u>
Effect of exchange rate changes on cash	N/A		7.00
Increase in cash and equivalents	100		162.00
Cash at beginning of year	0		0
Cash at end of year	€ <u>100</u>	1.62	\$ <u>62.00</u>

Note the following points concerning the current rate method:

1. All assets and liabilities are translated using the current exchange rate at the date of the statement of financial position (€1 = \$1.62). All revenues and expenses are translated at the rates in effect when these items are recognized during the period. Due to practical considerations, however, weighted-average rates can be used to translate revenues and expenses (€1 = \$1.55).
2. Stockholders' equity accounts are translated by using historical exchange rates. Common stock was issued at the beginning of 20X2 when the exchange rate was €1 = \$1.50. The translated balance of retained earnings is the result of the weighted-average rate applied to revenues and expenses and the specific rate in effect when the dividends were declared (€1 = \$1.58).
3. Translation adjustments result from translating all assets and liabilities at the current rate, while stockholders' equity is translated by using historical and weighted-average rates. The adjustments have no direct effect on cash flows. Also, the translation adjustment is due to the net investment rather than the subsidiary's operations. For these reasons, the cumulative translation adjustments balance is reported as a component of accumulated other comprehensive income (AOCI) in the stockholders' equity section of the U.S. parent entity's consolidated statement of financial position. This balance essentially equates the total debits of the subsidiary (now expressed in U.S. dollars) with the total credits (also in dollars). It also may be determined directly, as shown next, to verify the translation process.

4. The translation adjustments credit of \$30.70 is calculated as follows for the differences between the exchange rate of \$1.62 at the end of the year and the applicable exchange rates used to translate changes in net assets:

Net assets at inception (Land and buildings of \$1,200,000 – Portion financed by mortgage of \$800,000)	$400 \times (\$1.62 - \$1.50)$	=	\$48.00 credit
Net income	$60 \times (\$1.62 - \$1.55)$	=	4.20 credit
Dividends declared	$20 \times (\$1.62 - \$1.58)$	=	0.80 debit
Translation adjustment			<u>\$51.40</u> credit

5. The translation adjustments balance that appears as a component of AOCI in the stockholders' equity section is cumulative in nature. Consequently, the change in this balance during the year is disclosed as a component of other comprehensive income (OCI) for the period. In the illustration, this balance went from zero to \$51.40 at the end of 20X2. In addition, assume the following occurred during the following year, 20X3:

<b>Italian Company</b> <b>Statement of Financial Position</b> <b>At December 31, 20X3</b> <b>(€000 omitted)</b>			
	<u>20X3</u>	<u>20X2</u>	<u>Increase/(Decrease)</u>
<b>Assets</b>			
Cash	€ 200	€ 100	€100
Accounts receivable, net	–	40	(40)
Land	300	200	100
Building, net	960	980	(20)
Total assets	<u>€1,460</u>	<u>€1,320</u>	<u>€140</u>
<b>Liabilities and Stockholders' Equity</b>			
Accounts payable	€ 100	€ 60	€ 40

**Statement of Cash Flows**  
**Statement Translation**  
**(The euro is the functional currency)**  
**For the Year Ended December 31, 20X3**  
**(€/\$000 omitted)**

	<u>Euros</u>	<u>Exchange rate</u>	<u>U.S. dollars</u>
<i>Operating activities</i>			
Net income	€ 100	1.65	\$ 165.00
Adjustments to reconcile net income to net cash provided by operating activities			
Depreciation	20	1.65	33.00
Decrease in accounts receivable	40	1.65	66.00
Increase in accounts payable	40	1.65	66.00
Decrease in unearned rent	<u>(20)</u>	1.65	<u>(33.00)</u>
Net cash provided by operating activities	<u>180</u>		<u>297.00</u>
<i>Investing activities</i>			
Purchase of land	(100)	1.68	(168.00)
Net cash used by investing activities	<u>(100)</u>		<u>(168.00)</u>
<i>Financing activities</i>			
Mortgage payable	100	1.68	168.00
Dividends	<u>(80)</u>	1.68	<u>(134.40)</u>
Net cash provided by financing activities	<u>20</u>		<u>33.60</u>
Effect of exchange rate changes on cash	N/A		17.40
Increase in cash and equivalents	<u>100</u>		<u>180.00</u>
Cash at beginning of year	<u>100</u>		<u>162.00</u>
Cash at end of year	<u>€ 200</u>	1.71	<u>\$ 342.00</u>

Using the analysis presented before, the *change* in the translation adjustment attributable to 2013 is computed as follows:

Net assets at January 1, 20X3	€440	(\$1.71 – \$1.62)	=	\$39.60	credit
Net income for 20X3	€100	(\$1.71 – \$1.65)	=	6.00	credit
Dividends for 20X3	€ 80	(\$1.71 – \$1.68)	=	2.40	debit
Total				<u>\$43.20</u>	credit

The balance in the cumulative translation adjustment component of AOCI at the end of 2013 is \$94.60. (\$51.40 from 20X2 and \$43.20 from 20X3.)

6. The use of the equity method by the U.S. parent entity in accounting for the subsidiary would result in the following journal entries (in \$000s), based upon the information presented above:

	<u>20X2</u>	<u>20X3</u>
<i>Original investment</i>		
Investment in Italian subsidiary	600*	–
Cash	600	–
<i>Earnings pickup</i>		
Investment in Italian subsidiary	93.00	165.00
Equity in subsidiary income	93.00	165.00

\* €80 of common stock + €320 of additional paid-in capital = €400 translated at €1.50 = \$600.

<b>Dividends received</b>			
Cash	31.60	134.40	
Investment in Italian subsidiary	31.60		134.40
<b>Translation adjustments</b>			
Investment in Italian subsidiary	51.40	43.20	
OCI—Translation adjustments	51.40		43.20

Note that in applying the equity method to record this activity in the U.S. parent entity's accounting records, the parent's stockholders' equity should be the same whether or not the Italian subsidiary is consolidated. Since the subsidiary does not report the translation adjustments on its financial statements, care should be exercised so that it is not forgotten in the application of the equity method.

7. If the U.S. entity disposes of its investment in the Italian subsidiary, the cumulative translation adjustments balance becomes part of the gain or loss that results from the transaction and is eliminated. Guidance requires that when a parent ceases to hold a controlling interest *within a foreign entity*, the parent should apply ASC 830-30 and release any cumulative foreign translation adjustment into net income. For an equity method investment in a foreign entity, the partial sale guidance in ASC 830-40 applies.

For example, assume that on January 2, 20X4, the U.S. entity sells its entire investment for €465,000. The exchange rate at this date is €1 = \$1.71. The balance in the investment account at December 31, 20X3, is \$786,600 as a result of the entries made previously.

Investment in Italian Subsidiary		
1/1/X2	600.00	
	93.00	31.60
	51.40	
1/1/X3 balance	712.80	
	165.00	
	43.20	134.40
12/31/X3 balance	786.60	

The following entries would be made by the U.S. parent entity to reflect the sale of the investment:

Cash (€465 × \$1.71 conversion rate)	795.15
Investment in Italian subsidiary	786.60
Gain from sale of subsidiary	8.55
AOCI—Translation adjustments	94.60
Gain from sale of subsidiary	94.60

If the U.S. entity had sold only a portion of its investment in the Italian subsidiary, only a pro rata portion of the accumulated translation adjustments balance would have become part of the gain or loss from the transaction. To illustrate, if 80% of the Italian subsidiary was sold for €372 on January 2, 20X4, the following journal entries would be made:

Cash (€372 × \$1.71 exchange rate)	636.12
Investment in Italian subsidiary (80% × \$786.60)	629.28
Gain from sale of subsidiary	6.84
AOCI—Translation adjustments (80% × \$94.60)	75.68
Gain from sale of subsidiary	75.68

An exchange rate might not be available if there is a temporary suspension of foreign exchange trading. ASC 830-30-55 provides that, if exchangeability between two currencies

is temporarily lacking at a transaction date or the date of the statement of financial position, the first subsequent rate at which exchanges could be made is to be used to implement ASC 830.

### Example of the remeasurement method

In the previous situation, the euro was the functional currency because the Italian subsidiary's cash flows were primarily in euros. Assume, however, that the financing of the land and building was denominated in U.S. dollars instead of euros and that the mortgage payable is denominated in U.S. dollars (i.e., it must be repaid in U.S. dollars). Although the rents collected and the majority of the cash flows for expenses are in euros, management has decided that, due to the manner of financing, the U.S. dollar is the functional currency. The accounting records, however, are maintained in euros.

The remeasurement of the Italian financial statements is accomplished by use of the remeasurement method (also known as the monetary/nonmonetary method). This method is illustrated below using the same information that was presented before for the Italian subsidiary.

**Italian Company**

<i>Investing activities</i>			
Purchase of land	(200)	1.50	(300.00)
Purchase of building	(1,000)	1.50	(1,500.00)
Net cash used by investing activities	<u>(1,200)</u>		<u>(1,800.00)</u>
<i>Financing activities</i>			
Proceeds from issuance of common	400	1.50	600.00
Proceeds from mortgage payable	800	1.50	1,200.00

Dividends paid	(20)	1.58	(31.60)
Net cash provided by financing activities	<u>1,180</u>		<u>1,768.40</u>
Effect of exchange rate changes on cash	N/A	7.00	
Increase in cash and equivalents	100		162.00
Cash at beginning of year	0		0
Cash at end of year	€ <u>100</u>	1.62	\$ <u>162.00</u>

Note the following points concerning the remeasurement method:

1. Assets and liabilities that have historical cost balances (nonmonetary assets and liabilities) are remeasured by using historical exchange rates (i.e., the rates in effect when the transactions giving rise to the balance first occurred). Monetary assets and monetary liabilities, cash, and those items that will be settled in cash are remeasured by using the current exchange rate at the date of the statement of financial position. In 20X2, the unearned rent from year-end 20X2 of €10 would be remeasured at the rate of €1 = \$1.58. The unearned rent at the end of 20X2 is not considered a monetary liability. Therefore, the \$1.58 historical exchange rate is used for all applicable future years. See the final Section of this chapter, titled “Accounts to Be Remeasured Using Historical Exchange Rates” for a listing of accounts that are remeasured using historical exchange rates.
2. Revenues and expenses that occur frequently during a period are remeasured, for practical purposes, by using the weighted-average exchange rate for the period. Revenues and expenses that represent allocations of historical balances (e.g., depreciation, cost of goods sold, and amortization of intangibles) are remeasured using historical exchange rates. Note that this is a different treatment as compared to the current rate method.
3. If the functional currency is the U.S. dollar rather than the local foreign currency, the amounts of specific line items presented in the reconciliation of net income to net cash flow from operating activities will be different for nonmonetary items (e.g., depreciation).
4. The calculation of the remeasurement gain (loss), in a purely mechanical sense, is the amount needed to make the dollar debits equal the dollar credits in the Italian entity’s trial balance.
5. The remeasurement loss of \$90.40 is reported on the U.S. parent entity’s consolidated income statement because the U.S. dollar is the functional currency. When the reporting currency is the functional currency, as it is in this example, it is assumed that all of the foreign entity’s transactions occurred in U.S. dollars (even if this was not the case). Accordingly, remeasurement gains and losses are taken immediately to the income statement in the year in which they occur as they can be expected to have direct cash flow effects on the parent entity. They are not deferred as a translation adjustments component of AOCI, as they were when the functional currency was the euro (applying the current rate method).
6. The use of the equity method of accounting for the subsidiary would result in the following entries by the U.S. parent entity during 20X2:

#### Original investment

Investment in Italian subsidiary	600.00
Cash	600.00

#### Earnings (loss) pickup

Investment in Italian subsidiary	3.60
Equity in subsidiary income	3.60

#### Dividends received

Cash	31.60
Investment in Italian subsidiary	31.60

Note that remeasurement gains and losses are included in the subsidiary’s net income (net loss) as determined in U.S. dollars before the earnings (loss) pickup is made by the U.S. entity.

7. In economies in which—per ASC 830-10-45—cumulative inflation is greater than 100% over a three-year period, FASB requires that the functional currency be the reporting currency, that is, the U.S. dollar. Projections of future inflation cannot be used to satisfy this threshold condition. The remeasurement method must be used in this situation even though the factors indicate the local currency is the functional currency. FASB made this decision to prevent the evaporation of the foreign entity's fixed assets, a result that would occur if the local currency was the functional currency.

**Cessation of highly inflationary condition.** When a foreign subsidiary's economy is no longer considered highly inflationary, the entity converts the reporting currency values into the local currency at the exchange rates on the date of change on which these values become the new functional currency accounting bases for nonmonetary assets and liabilities.

Furthermore, ASC 830-740 states that when a change in functional currency designation occurs because an economy ceases to be highly inflationary, the deferred taxes on the temporary differences that arise as a result of a change in the functional currency are treated as an adjustment to the cumulative translation adjustments portion of stockholders' equity (accumulated other comprehensive income).

**Applying ASC 740 to foreign entity financials restated for general price levels.** Price level-adjusted financial statements are preferred for foreign currency financial statements of entities operating in highly inflationary economies when those financial statements are intended for readers in the United States. If this recommendation is heeded, the result is that the income tax bases of the assets and liabilities are often restated for inflation. ASC 830-740 provides guidance on applying the asset-and-liability approach of ASC 740 as it relates to such financial statements. It discusses (1) how temporary differences are to be computed under ASC 740, and (2) how deferred income tax expense or benefit for the year is to be determined.

With regard to the first issue, temporary differences are computed as the difference between the indexed income tax basis amount and the related price-level restated amount of the asset or liability. The consensus reached on the second issue is that the deferred income tax expense or benefit is the difference between the deferred income tax assets and liabilities reported at the end of the current year and those reported at the end of the prior year. The deferred income tax assets and liabilities of the prior year are recalculated in units of the current year-end purchasing power.

On a related matter, ASC 830-10-45 states that, when the functional currency changes to the reporting currency because the foreign economy has become highly inflationary, ASC 740 prohibits recognition of deferred income tax benefits associated with indexing assets and liabilities that are remeasured in the reporting currency using historical exchange rates. Any related income tax benefits would be recognized only upon their being realized for income tax purposes. Any deferred income tax benefits that had been recognized for indexing before the change in reporting currency is effected are eliminated when the related indexed amounts are realized as income tax deductions.

### **Summary of Current Rate and Remeasurement Methods**

1. Before foreign currency financial statements can be translated into U.S. dollars, management of the U.S. parent entity must select the functional currency for the foreign entity whose financial statements will be incorporated into theirs by consolidation, combination, or the equity method. As the examples illustrated, this decision is important because it may have a material effect upon the financial statements of the U.S. entity.
2. If the functional currency is the local currency of the foreign entity, the current rate method is used to translate foreign currency financial statements into U.S. dollars. All assets and liabilities are translated by using the current exchange rate at the date of the statement of financial position. This method insures that all financial relationships remain the same in both local currency and U.S. dollars. Owners' equity is translated using historical rates,

while revenues (gains) and expenses (losses) are translated at the rates in existence during the period when the transactions occurred. A weighted-average rate can be used for items occurring frequently throughout the period. The translation adjustments (debit or credit) that result from the application of these rules are reported in other comprehensive income and then accumulated and reported as a separate component of stockholders' equity of the U.S. entity's consolidated statement of financial position (or parent-only statement of financial position if consolidation is deemed not to be appropriate).

3. If the functional currency is the parent entity's reporting currency (the U.S. dollar), the foreign currency financial statements are remeasured in U.S. dollars. All foreign currency balances are restated in U.S. dollars using both historical and current exchange rates. Foreign currency balances that reflect prices from past transactions are remeasured using historical rates, while foreign currency balances which reflect prices from current transactions are remeasured using the current exchange rate. Remeasurement gains/losses that result from the remeasurement process applied to foreign subsidiaries that are consolidated are reported on the U.S. parent entity's consolidated income statement.

The above summary is arranged in tabular form as shown below.

<i>Functional currency</i>	<i>Functional currency determinants</i>	<i>Translation method</i>	<i>Reporting and display</i>
Local currency of foreign entity	a. Operations not integrated with parent's operations b. Buying and selling activities primarily in local currency c. Cash flows not immediately available for remittance to parent d. Financing denominated in local currency	Current rate (all assets/liabilities translated using current exchange rate; revenues/expenses use weighted-average rate; equity accounts use historical rates)	Accumulated translation adjustments are reported in the equity section of the U.S. parent entity's consolidated statement of financial position as part of AOCI. Changes in accumulated translation adjustments reported as a component of OCI. Effect of exchange rates on cash included in reconciliation of beginning and ending cash balances on statement of cash flows.
U.S. dollar	a. Operations integrated with parent's operations b. Buying and selling activities primarily in the United States and/or in U.S. dollars c. Cash flows immediately available for remittance to parent d. Financing denominated in U.S. dollars	Remeasurement (monetary assets/liabilities use current exchange rate; historical cost balances use historical rates; revenues/expenses use weighted-average rates and historical rates, the latter for allocations like depreciation expenses)	Remeasurement gain/loss is reported on the U.S. entity's consolidated income statement. Remeasurement gain/loss shown as a reconciliation item between net income and cash flows from operations in the statement of cash flows. Effect of exchange rates on cash included in reconciliation of beginning and ending cash balances on statement of cash flows.

**Application of ASC 830 to an investment to be disposed of that is evaluated for impairment.** Under ASC 830, accumulated foreign currency translation adjustments are reclassified to net income only when realized upon sale or upon complete or substantially complete liquidation of the investment in the foreign entity. ASC 830-30-45 addresses whether a reporting entity is to include the translation adjustments in the carrying amount of the investment in assessing impairment of an investment in a foreign entity that is held for disposal if the planned disposal will cause some or all of the translation adjustments to be reclassified to net income. The standard points out that an entity that has committed to a plan that will cause the translation adjustments for an equity-method investment or consolidated investment in a foreign entity to be reclassified to earnings is to include the translation adjustments as part of the carrying amount of the investment when evaluating that investment for impairment. An entity would also include the portion of the translation adjustments that represents a gain or loss from an effective hedge of the net investment in a foreign operation as part of the carrying amount of the investment when making this evaluation.

### Foreign Operations in the United States

With the world economy as interconnected as it is, entities in the United States are sometimes the subsidiaries of parent companies domiciled elsewhere in the world. The financial statements of the U.S. entity may be presented separately in the United States or may be combined as part of the financial statements in the foreign country.

In general, financial statements of U.S. companies are prepared in accordance with U.S. GAAP. However, adjustments may be necessary to conform these financial statements to the accounting principles of the foreign country of the parent entity where they will be consolidated.

### Translation of Foreign Currency Transactions

According to ASC 830, a foreign currency transaction is a transaction “. . . denominated in a currency other than the entity’s functional currency.” Denominated means that the amount to be received or paid is fixed in terms of the number of units of a particular foreign currency regardless of changes in the exchange rate. From the viewpoint of a U.S. entity, a foreign currency transaction results when it imports or exports goods or services to or from a foreign entity or makes a loan involving a foreign entity and agrees to settle the transaction in currency other than the U.S. dollar (the functional currency of the U.S. entity). In these situations, the U.S. entity has “crossed currencies” and directly assumes the risk of fluctuating exchange rates of the foreign currency in which the transaction is denominated. This risk may lead to recognition of foreign exchange transaction gains or losses in the income statement of the U.S. entity. Note that transaction gains or losses can result only when the foreign transactions are denominated in a foreign currency. When a U.S. entity imports or exports goods or services and the transaction is to be settled in U.S. dollars, the U.S. entity is not exposed to a foreign exchange gain or loss because it bears no risk due to exchange rate fluctuations.

#### Example of foreign currency transaction translation

The following example illustrates the terminology and procedures applicable to the translation of foreign currency transactions. Assume that U.S. Company, an exporter, sells merchandise to a customer in Italy on December 1, 20X2, for €10,000. Receipt is due on January 31, 20X3 and U.S. Company prepares financial statements on December 31, 20X2. At the transaction date (December 1, 20X2), the spot rate for immediate exchange of foreign currencies indicates that €1 is equivalent to \$1.30. To find

the U.S. dollar equivalent of this transaction, the foreign currency amount, €10,000, is multiplied by \$1.30 to get \$13,000. At December 1, 20X2, the foreign currency transaction is recorded by U.S. Company in the following manner:

Accounts receivable—Italy (€ denominated)	13,000
Sales	13,000

The accounts receivable and sales are measured in U.S. dollars at the transaction date using the spot rate at the time of the transaction. While the accounts receivable is measured and reported in U.S. dollars, the receivable is denominated or fixed in euros. This characteristic may result in foreign exchange transaction gains or losses if the spot rate for the euro changes between the transaction date and the date the transaction is settled (January 31, 20X3).

If financial statements are prepared between the transaction date and the settlement date, all receivables and liabilities denominated in a currency other than the functional currency (the U.S. dollar) must be restated to reflect the spot rates in effect at the statement of financial position date. Assume that on December 31, 20X2, the spot rate for euros is €1 = \$1.32. This means that the €10,000 are now worth \$13,200 and that the accounts receivable denominated in euros has increased by \$200. The following adjustment is recorded on December 31, 20X2:

Accounts receivable—Italy (€ denominated)	200
Foreign currency transaction gain	200

Note that the \$13,000 credit to sales recorded on the transaction date is not affected by subsequent changes in the spot rate. This treatment exemplifies the two-transaction viewpoint adopted by FASB. In other words, making the sale is the result of an operating decision, while bearing the risk of fluctuating spot rates is the result of a financing decision. Therefore, the amount determined as sales revenue at the transaction date is not altered because of the financing decisions to wait until January 31, 20X3, for payment of the account and to accept payment denominated in euros. The risk of a foreign exchange transaction loss can be avoided by (1) demanding immediate payment on December 1, 20X2, (2) fixing the price of the transaction in U.S. dollars instead of in the foreign currency, or (3) by entering into a forward exchange contract to hedge the exposed asset (accounts receivable). The fact that, in the example, U.S. Company did not take any of these actions is reflected by recognizing foreign currency transaction gains or losses in its income statement (reported as financial or nonoperating items) in the period during which the exchange rates changed. This treatment has been criticized, however, because earnings will fluctuate because of changes in exchange rates and not because of changes in the economic activities of the enterprise. The counterargument, however, is that economic reality is that earnings *are* fluctuating because the management chose to commit the reporting entity to a transaction that exposes it to economic risks and, therefore, the case can be made that the volatility in earnings faithfully represents the results of management's business decision.

On the settlement date (January 31, 20X3), assume the spot rate is €1 = \$1.31. The receipt of €10,000 and their conversion into U.S. dollars is recorded as follows:

Foreign currency (€)	13,100
Foreign currency transaction loss	100
Accounts receivable—Italy (€ denominated)	13,200
Cash	13,100
Foreign currency (€)	13,100

The net effect of this foreign currency transaction was to receive \$13,100 in settlement from a sale that was originally measured (and recognized) at \$13,000. This realized net foreign currency transaction gain of \$100 is reported on two income statements—a \$200 gain in 20X2 and a \$100 loss in 20X3. The reporting of the gain or loss in two income statements causes a temporary difference in the basis of the receivable for income tax and financial reporting purposes. This results because the 20X2 unrealized

transaction gain of \$200 is not taxable until 20X3, the year the transaction was ultimately completed or settled. Accordingly, deferred income tax accounting is required to account for the effects of this temporary difference.

It is important to note that all monetary assets and liabilities of U.S. Company that are denominated in a currency other than U.S. Company's functional currency (the U.S. dollar) are required to be remeasured at the date of each statement of financial position to the extent that they are affected by increases or decreases in the exchange rate. For example, a U.S. Company whose functional currency is the U.S. dollar holds a bank account in France that is denominated in euros. At the date of each statement of financial position, by reference to the spot rate for the euro, U.S. Company would remeasure the carrying amount of its French bank account and record any resulting transaction gains and losses in the same manner as above.

### Intercompany Transactions and Elimination of Intercompany Profits

Gains or losses from intercompany transactions are reported on the U.S. company's consolidated income statement unless settlement of the transaction is not planned or anticipated in the foreseeable future. In that case, which is atypical, gains and losses arising from intercompany transactions are reflected in the accumulated translations adjustments component of accumulated other comprehensive income in stockholders' equity of the U.S. entity. In the typical situation (i.e., gains and losses reported on the U.S. entity's income statement) gains and losses result whether the functional currency is the U.S. dollar or the foreign entity's local currency. When the U.S. dollar is the functional currency, foreign currency transaction gains and losses result because of one of the two situations below:

1. The intercompany foreign currency transaction is denominated in U.S. dollars. In this case, the foreign subsidiary has a payable or receivable denominated in U.S. dollars. This may result in a foreign currency transaction gain or loss that would appear on the foreign subsidiary's income statement. This gain or loss would be translated into U.S. dollars and would appear on the U.S. entity's consolidated income statement.
2. The intercompany foreign currency transaction is denominated in the foreign subsidiary's local currency. In this situation, the U.S. entity has a payable or receivable denominated in a foreign currency. Such a situation may result in a foreign currency transaction gain or loss that is reported on the U.S. parent entity's income statement.

The above two cases can be easily altered to reflect what happens when the foreign entity's local currency is the functional currency. The gain or loss from each of these scenarios would be reflected on the other entity's financial statements first (i.e., the subsidiary's rather than the parent's and vice versa).

The elimination of intercompany profits due to sales and other transfers between related entities is based upon exchange rates in effect when the sale or transfer occurred. Reasonable approximations and averages are allowed to be used if intercompany transactions occur frequently during the year.

#### Example of intercompany transactions involving foreign exchange

Cassiopeia Corporation buys an observatory-grade telescope from its Spanish subsidiary for €850,000, resulting in a profit for the subsidiary of €50,000 on the sale date at an exchange rate of \$1:€0.6 (euros). The profit is eliminated at \$1:€0.6. The payable to the subsidiary is due in 90 days, and is denominated in euros. On the payment date, the exchange rate has changed to \$1:€0.65. Thus, rather

than paying \$1,416,667 to settle the payable, as would have been the case on the sale date, Cassiopeia must now pay \$1,307,692 on the payable date. Cassiopeia presents the \$108,975 exchange gain in its income statement in the following manner:

Sales	\$ 20,000,000
Cost of sales	(\$14,000,000)
Gross profit	6,000,000
Operating expenses	(5,500,000)
Other revenues/gains (expenses/losses)	
Gain on translation of foreign currencies	<u>(108,975)</u>
Net income	<u>\$ 608,975</u>

In a separate series of transactions, the subsidiary sends a weekly shipment of telescope repair parts to Cassiopeia, totaling €48,000 of profits for the entire year. For these transactions, the exchange rate varies from \$1:€0.6 to \$1:€0.75. A reasonable estimate of the average exchange rate for all the transactions is \$1:€1.67. Consequently, the €48,000 profit is eliminated at the \$1:€1.67 = \$71,642 average exchange rate.

## Foreign Currency Hedging

ASC 815 provides complex hedging rules that permit the reporting entity to elect to obtain special accounting treatment relative to foreign currency risks with respect to the following items:

1. Recognized assets or liabilities
2. Available-for-sale debt and equity securities
3. Unrecognized firm commitments
4. Foreign currency-denominated forecasted cash flows
5. Net investment in a foreign operation.

The chapter on ASC 815 provides a detailed discussion of derivatives and hedging. The table on the next page provides a high-level summary of the complex provisions that apply to hedges related to foreign currency exposures.

**Measuring hedge effectiveness.** While any entity may use hedging strategies, under the provisions of ASC 815 the transaction must meet a number of important conditions to qualify for hedge accounting. Among these conditions are the establishment, at inception, of criteria for measuring hedge effectiveness and ineffectiveness. Periodically, each hedge must be evaluated for effectiveness, using the preestablished criteria, and the gains or losses associated with hedge ineffectiveness must be reported currently in earnings and not deferred to future periods. In the instance of foreign currency hedges, ASC 815 states that reporting entities must exclude from their assessments of hedge effectiveness the portions of the fair value of forward contracts attributable to spot-forward differences (i.e., differences between the spot exchange rate and the forward exchange rate).

In practice, this means that reporting entities engaging in foreign currency hedging will recognize changes in the above-described portion of the derivative's fair value in earnings, in the same manner that changes representing hedge ineffectiveness are reported, but these are not considered to represent ineffectiveness. These entities must estimate the cash flows on forecasted transactions based on the current spot exchange rate, appropriately discounted for time value. Effectiveness is then assessed by comparing the changes in fair values of the forward contracts attributable to changes in the dollar spot price of the pertinent foreign currency to the changes in the present values of the forecasted cash flows based on the current spot exchange rate(s).

### **Hedging Foreign Currency Exposures**

*Hedges of foreign currency (FC) exposures (where FC is not the reporting entity's functional currency)*

	<i>A</i>	<i>B</i>	<i>C</i>
Types of items that may qualify to be hedged	<b>Fair value hedges</b> <ul style="list-style-type: none"> <li>A1. Recognized assets or liabilities</li> <li>A2. Available-for-sale debt securities</li> <li>A3. Available-for-sale equity securities</li> <li>A4. UFC</li> </ul>	<b>Cash flow hedges</b> <ul style="list-style-type: none"> <li>B1. Forecasted cash flow from recognized assets or liabilities</li> <li>B2. Forecasted external transactions</li> <li>B3. Forecasted intercompany transactions</li> <li>B4. UFC</li> </ul>	C. Hedges of a net investment in a foreign operation
Risk being hedged	Changes in fair value of the hedged item that result from changes in the exchange rate (ER) of the FC in which it is denominated (which, by definition, is not the functional currency of the reporting entity)	The FC exposure to variability in the "equivalent functional currency cash flows" associated with the hedged item	Exposure of the net investment to changes in the exchange rate applicable to the functional currency of the investee
Type of instruments that qualify for use as hedging instruments	A1, A2, A3—Required to be derivatives A\$ can be a derivative instrument or nonderivative financial instrument	Required to be derivatives	Can be a derivative instrument or a nonderivative financial instrument; nonderivative financial instruments, to be designated, cannot be subject to GAAP that requires that they be presented at FV since that accounting treatment would not result in foreign currency transaction gains or losses under ASC 830
Summary of accounting treatment	<p>General Rule: When the ER changes, recognize in current earnings: (1) changes in fair value of hedged item caused by the hedged risk, (2) gain or loss on changes in fair value of the designated hedging instrument, and (3) hedge ineffectiveness, if any</p> <p>AFS securities: Change in fair value of the security attributable to FC risk is reported in earnings; other changes in fair value of the security, not attributable to the hedged risk, continue to be reported in other comprehensive income</p>	<p>General Rule: The effective portion of the gain or loss on a derivative designated as a cash flow hedge is reported in OCI and the ineffective portion is reported currently in earnings. In the period or periods during which a hedged forecasted transaction affects earnings, amounts in AOCI are reclassified to earnings</p> <p>Additional complex accounting provisions are provided by ASC 815-30</p>	<p>To the extent of hedge effectiveness, gains or losses on the hedging derivative instrument (or FC transaction gains or losses on the hedging nonderivative instrument) are accounted for in the same manner as an FC translation adjustment (i.e., reported as other comprehensive income and as a change in accumulated other comprehensive income). The hedged net investment is accounted for consistent with ASC 830 as described in this chapter; any hedge ineffectiveness is reflected as a transaction gain or loss in earnings of the period in which it arises</p>

Applicable conditions,  
criteria limitations, or  
exceptions

**Fair value hedges**

- a. Fair value hedges are required to meet the requirements of ASC 815-20 with respect to such matters as timely hedge designation, tests of hedge effectiveness at inception, and on an ongoing basis.
- b. A3—(i) The AFS equity security cannot be traded on an exchange or market where transactions are denominated in the investor's functional currency, and (ii) dividends and all other cash flows associated with holding or selling the security must be denominated in the same foreign currency.
- c. A2, A4—The hedged transaction must be denominated in an FC other than the hedging unit's functional currency, and if consolidated financial statements, the party to the hedging instrument must be either (i) the operating unit with the FC exposure or (ii) another member of the consolidated group (subject to certain specified restrictions and meeting certain conditions) with the same functional currency as that operating unit.
- d. FC derivatives entered into with another member of the consolidated group can be designated as hedging instruments in all fair value hedge transaction types (A1–A4) only if that member has entered into an offsetting contract with an unrelated third party to hedge the exposure it acquired from issuing the derivative instrument to the affiliate that initiated the hedge.

**Cash flow hedges and hedges of net investments in foreign operations**

- e. Cash flow hedges must meet the requirements of ASC 815-20
- f. Cash flow hedges of forecasted transactions must additionally meet the requirements of ASC 815-20-25
- g. Cash flow hedges of forecasted transactions (B1) and hedges of net investments in foreign operations (C) must also meet the criteria in item d of this list.

A4—Limited eligibility when the UFC involves only financial instruments      Not eligible      Not eligible

Eligibility for ASC 825-10-25  
Fair Value Option (FVO)

**Example of hedge effectiveness measurement**

On October 1, 20X2, Braveheart Co. (a U.S. entity) orders from its European supplier, Gemutlichkeit GmbH, a machine that is to be delivered and paid for on March 31, 20X3. The price, denominated in euros, is €4,000,000. Although Braveheart will not make the payment until the planned delivery date, it has immediately entered into a firm commitment to make this purchase and to pay €4,000,000 upon delivery. This creates a euro liability exposure to foreign exchange risk; thus, if the euro appreciates over the intervening six months, the dollar cost of the equipment will increase.

To reduce or eliminate this uncertainty, Braveheart desires to lock in the purchase cost in euros by entering into a six-month forward contract to purchase euros on the date when the purchase order is issued to and accepted by Gemutlichkeit. The spot rate on October 1, 20X2, is \$1.40 per euro and the forward rate for March 31, 20X3, settlement is \$1.44 per euro. Braveheart enters into a forward contract on October 1, 20X2, with the First Intergalactic Bank to pay U.S. \$5,760,000 in exchange for the receipt of €4,000,000 on March 31, 20X3, which can then be used to pay Gemutlichkeit. No premium is received or paid at the inception of this forward contract.

The transaction is a firm commitment consistent with the requirements of ASC 815, and fair value hedge accounting is used in accounting for the forward contract.

Assume the relevant time value of money is measured at 1/2% per month (a nominal 6% annual rate). The spot rate for euros at December 31, 20X2, is \$1.45, and at March 31, 20X3, it is \$1.48. The forward rate as of December 31 for March 31 settlement is \$1.46.

Entries to reflect the foregoing scenario are as follows:

10/1/X2	<i>No entries, since neither the forward contract nor the firm commitment have value on this date</i>	
12/31/X2	Forward currency contract Gain on forward contract <i>To record present value (at 1/2% monthly rate) of change in value of forward contract [= change in forward rate (1.46 – 1.44) × €4,000,000 = \$80,000 to be received in three months, discounted at 6% per annum]</i>	78,818 78,818
	Loss on firm purchase commitment Firm commitment obligation <i>To record present value (at 1/2% monthly rate) of change in amount of firm commitment [= change in spot rate (1.45 – 1.40) × €4,000,000 = \$200,000 to be paid in three months, discounted at 6% per annum]</i>	197,044 197,044
	Gain on forward contract Loss on firm purchase commitment P&L summary (then to retained earnings) <i>To close the gain and loss accounts to net income and thus to retained earnings</i>	78,818 197,044 118,226
3/31/X3	Forward currency contract Gain on forward contract <i>To record change in value of forward contract {[= (1.48 – 1.44) × €4,000,000 = \$160,000] – gain previously recognized (\$78,818)}</i>	81,182 81,182
	Loss on firm commitment Firm commitment obligation <i>To record change in amount of firm commitment {[= (1.48 – 1.40) × €4,000,000] less loss previously recognized (\$197,044)}</i>	122,956 122,956

3/31/X3	Firm commitment obligation	320,000
	Machinery and equipment	5,600,000
	Cash	5,920,000
<i>To record purchase of machinery based on spot exchange rate as of date of contractual commitment (1.40) and close out the firm commitment obligation (representing effect of change in spot rate during commitment period)</i>		
	Cash	160,000
	Forward contract	160,000
<i>To record collection of cash on net settlement of forward contract [= (1.48 – 1.44) × €4,000,000]</i>		
	Gain on forward contract	81,182
	P&L summary (then to retained earnings)	41,774
	Loss on firm purchase commitment	122,956
<i>To close the gain and loss accounts to net income and thus to retained earnings</i>		

Observe that in the foregoing example the gain on the forward contract did not precisely offset the loss incurred from the firm commitment. Since a hedge of an unrecognized foreign currency denominated firm commitment is accounted for as a fair value hedge, with gains and losses on hedging positions and on the hedged item both being recorded in current earnings, it may appear that the matter of hedge effectiveness is of academic interest only. However, according to ASC 815, even if both components (that is, the net gain or loss representing hedge ineffectiveness, and the amount charged to earnings that was excluded from the measurement of ineffectiveness) are reported in current period earnings, the distinction between them is still of importance.

With respect to fair value hedges of firm purchase commitments denominated in a foreign currency, ASC 815 directs that “the change in value of the contract related to the changes in the differences between the spot price and the forward or futures price would be excluded from the assessment of hedge effectiveness.” As applied to the foregoing example, therefore, the net credit to income in 20X2 (\$118,226) can be further analyzed into two constituent elements: the amount arising from the change in the difference between the spot price and the forward price, and the amount resulting from hedge ineffectiveness.

The former item, not attributed to ineffectiveness, arose because the spread between spot and forward price at hedge inception,  $(1.44 - 1.40 =) .04$ , fell to  $(1.46 - 1.45 =) .01$  by December 31, for an impact amounting to  $(.04 - .01 =) .03 \times €4,000,000 = $120,000$ , which, reduced to present value terms, equaled \$118,227. The net credit to earnings in December 2012,  $(\$78,818 + 118,226 =) \$197,044$ , relates to the spread between the spot and forward rates on December 31 and is identifiable with hedge ineffectiveness.

### Forward Exchange Contracts

Foreign currency transaction gains and losses on assets and liabilities that are denominated in a currency other than the functional currency can be hedged if a U.S. entity enters into a forward exchange contract. The following example shows how a forward exchange contract can be used as a hedge, first against a firm commitment and then, following delivery date, as a hedge against a recognized liability.

A general rule for estimating the fair value of forward exchange rates under ASC 815 is to use the changes in the forward exchange rates, and discount those estimated future cash flows to a

present-value basis. An entity will need to consider the time value of money if significant in the circumstances for these contracts. The following example does not apply discounting of the future cash flows from the forward contracts in order to focus on the relationships between the forward contract and the foreign currency denominated payable.

#### **Example of a forward exchange contract**

Durango, Inc. enters into a firm commitment with Dempsey Ing., Inc. of Germany, on October 1, 20X2, to purchase a computerized robotic system for €6,000,000. The system will be delivered on March 1, 20X3, with payment due sixty days after delivery (April 30, 20X3). Durango, Inc. decides to hedge this foreign currency firm commitment and enters into a forward exchange contract on the firm commitment date to receive €6,000,000 on the payment date. The applicable exchange rates are shown in the table below.

<u>Date</u>	<u>Spot rates</u>	<u>Forward rates for April 30, 20X3</u>
October 1, 20X2	€1 = \$1.55	€1 = \$1.57
December 31, 20X2	€1 = \$1.58	€1 = \$1.589
March 1, 20X3	€1 = \$1.58	€1 = \$1.585
April 30, 20X3	€1 = \$1.60	

The example on the following pages separately presents both the forward contract receivable and the dollars payable liability in order to show all aspects of the forward contract. For financial reporting purposes, most companies present just the net fair value of the forward contract that would be the difference between the current value of the forward contract receivable and the dollars payable liability. Note that the foreign currency hedges in the illustration are not perfectly effective. However, for this example, the degree of ineffectiveness is not deemed to be sufficient to trigger income statement recognition per ASC 815.

The transactions that reflect the forward exchange contract, the firm commitment and the acquisition of the asset, and retirement of the related liability appear at the end of this section. The net fair value of the forward contract is shown below each set of entries for the forward exchange contract.

In the case of using a forward exchange contract to speculate in a specific foreign currency, the general rule to estimate the fair value of the forward contract is to use the forward exchange rate for the remainder of the term of the forward contract.

#### **The Fair Value Option**

ASC 825-10-25 encourages reporting entities to voluntarily elect to use fair value to measure eligible financial assets and financial liabilities in their financial statements. This election is referred to as the Fair Value Option (FVO). Changes in the fair values of these assets and liabilities would be reflected in earnings as they occur.

In issuing ASC 825-10-25, FASB indicated that among the reasons it decided to permit this election was that the election would “enable entities to achieve consistent accounting and, potentially, an offsetting effect for the changes in the fair values of related assets and liabilities without having to apply complex hedge accounting provisions, thereby providing greater simplicity in the application of accounting guidance.”<sup>1</sup>

<sup>1</sup> ASC 825-10-25, *Financial Instruments—Fair Value Option*. Norwalk, CT: Financial Accounting Standards Board, 2007.

	<i><b>Forward contract entries</b></i>		<i><b>Hedge against firm commitment entries</b></i>
(1) 10/1/11 (forward rate for 4/30/11 €1 = \$1.57)			
Forward contract receivable	9,420,000		
Dollars payable		9,420,000	
This entry recognizes the existence of the forward exchange contract using the gross method. Under the net method, this entry would not appear at all, since the fair value of the forward contract is zero when the contract is initiated. The amount is calculated using the 10/1/10 forward rate for 4/30/12 ( $\text{€}6,000,000 \times \$1.57 = \$9,420,000$ ).			
Net fair value of the forward contract = \$0			
Note that the net fair value of the forward exchange contact on 10/1/X0 is zero because there is an exact amount offset of the forward contract receivable of \$9,420,000 with the dollars payable liability of \$9,420,000. Many companies present only the net fair value of the forward contract on their balance sheets, and, therefore, they would have no net amount reported for the forward contract at its inception.			
(2) 12/31/X1 (forward rate for 4/30/11 €1 = \$1.589)			
Forward contract receivable	114,000		114,000
Gain on hedge activity		114,000	
The dollar values for this entry reflect, among other things, the change in the forward rate from 10/1/X1 to 12/31/X1. However, the actual amount recorded as gain or loss (gain in this case) is determined by all market factors.			
Net increase in fair value of the forward contract = $(1.589 - 1.57) = .019 \times \text{€}6,000,000 = \$114,000$			
The increase in the net fair value of the forward exchange contract on 12/31/X0 is \$114,000 for the difference between the \$7,134,000 (\$7,020,000 plus \$114,000) in the forward contract receivable and the \$7,020,000 for the dollars payable liability. Many companies present only the net fair value on their balance sheet, in this case as an asset. And this \$114,000 is the amount that would be discounted to present value, if interest is significant, to recognize the time value of the future cash flow from the forward contract.			
(4) 3/1/X2 (forward rate for 4/30/10 €1 = \$1.585)			
Loss on hedge activity	24,000		24,000
Forward contract receivable		24,000	
(5) 3/1/X2			
		Firm commitment	24,000
		Gain on hedge activity	24,000

These entries again will be driven by market factors, and they are calculated the same way as entries (2) and (3) above. Note that the decline in the forward rate from 12/31/X1 to 3/1/X2 resulted in a loss against the forward contract receivable and a gain against the firm commitment [ $1.585 - 1.589 = (.004) \times \text{€}6,000,000 = (\$24,000)$ ].

**Forward contract entries**

Net fair value of the forward contract = \$90,000

The net fair value of the forward exchange contract on 3/1/X1 is \$90,000 for the difference between the \$9,510,000 (\$9,420,000 plus \$114,000 minus \$24,000) in the forward contract receivable and the \$9,420,000 for the dollars payable liability. Another way of computing the net fair value is to determine the change in the forward contract rate from the initial date of the contract, 10/1/X1, which is  $\$1.58 - \$1.57 = \$0.01 \times \$6,000,000 = \$90,000$ . Also note that the amount in the firm commitment temporary liability account is equal to the net fair value of the forward contract on the date the equipment is received.

(7) 4/30/12 (spot rate €1 = \$1.60)		
Forward contract receivable	90,000	
Gain on forward contract		90,000

The gain or loss (gain in this case) on the forward contract is calculated using the change in the forward to the spot rate from 3/1/X2 to 4/30/X2 [ $\$6,000,000 \times (\$1.60 - \$1.58) = \$90,000$ ].

Net fair value of the forward contract = \$180,000

The net fair value of the forward exchange contract on 4/30/X2 is \$180,000 for the difference between the \$9,600,000 (\$9,510,000 plus \$90,000) in the forward contract receivable and the \$9,420,000 for the dollars payable liability. The net fair value of the forward contract at its terminal date of 4/30/X2 is based on the difference between the contract forward rate of €1 = \$1.57 and the spot rate on 4/30/X2 of €1 = \$1.60. The forward contract receivable has reached its maturity and the contract is completed on this date at the forward rate of €1 = \$1.57 as contracted on 10/1/X1. If the entity recognizes an interest factor in the forward contract over the life of the contract, then interest is recognized at this time on the forward contract, but no separate accrual of interest is required for the accounts payable in euros.

(9) 4/30/X2		
Dollars payable	9,420,000	
Cash		9,420,000
Foreign currency units (€)	9,600,000	
Forward contract receivable		9,600,000

This entry reflects the settlement of the forward contract at the 10/1/X1 contracted forward rate ( $\$6,000,000 \times \$1.17 = \$7,020,000$ ) and the receipt of foreign currency units valued at the spot rate ( $\$6,000,000 \times \$1.20 = \$7,200,000$ ).

***Hedge against recognized liability entries***

(6) 3/1/X2 (spot rate €1 = \$1.58)		
Equipment	9,390,000	
Firm commitment	90,000	
Accounts payable (€)		9,480,000

This entry records the receipt of the equipment, the elimination of the temporary liability account (firm commitment), and the recognition of the payable, calculated using the spot rate on the date of receipt ( $\$6,000,000 \times \$1.58 = \$9,480,000$ ).

(8) 4/30/X2		
Transaction loss	120,000	
Accounts payable (€)		120,000

The transaction loss related to the accounts payable reflects only the change in the spot rates and ignores the accrual of interest ( $\$6,000,000 \times (\$1.60 - \$1.58) = \$120,000$ ).

(10) 4/30/X2		
Accounts payable (€)	9,600,000	
Foreign currency units (€)		9,600,000

This entry reflects the use of the foreign currency units to retire the account payable.

As noted in the table “Hedging Foreign Currency Exposures” presented earlier in this chapter, the provisions of ASC 825-10-25 have limited applicability with respect to foreign currency risks. The election does not affect cash flow hedges or hedges of a net investment in a foreign operation. With respect to fair value hedges, the reporting entity may elect the FVO for eligible nonderivative financial assets or liabilities. An unrecognized firm commitment (UFC) may qualify as a financial instrument if it only involves financial assets and liabilities. ASC 825-10-25 provides, as an example, a forward purchase contract for a loan that is not readily convertible to cash. This instrument would qualify for the FVO. In order to achieve the desired economic offsetting that would resemble hedge accounting, the reporting entity would also have to hold assets denominated in the same foreign currency (which is not the entity’s functional currency) that give rise to foreign currency transaction gains or losses that would partially or fully offset changes in the fair value of the forward purchase contract during its term and at settlement.

Elections made under the FVO are irrevocable and, if made by early adopting ASC 825-10-25, also require the reporting entity to early adopt the disclosure provisions of ASC 820 that otherwise would not be effective until the same date as ASC 825-10-25.

## **ACCOUNTS TO BE REMEASURED USING HISTORICAL EXCHANGE RATES**

---

1. Marketable securities carried at cost (equity securities and debt securities not intended to be held until maturity)
2. Inventories carried at cost
3. Prepaid expenses such as insurance, advertising, and rent
4. Property, plant, and equipment
5. Accumulated depreciation on property, plant, and equipment
6. Patents, trademarks, licenses, and formulas
7. Goodwill
8. Other intangible assets
9. Deferred charges and credits, except policy acquisition costs for life insurance companies
10. Deferred income
11. Common stock
12. Preferred stock carried at issuance price
13. Revenues and expenses related to nonmonetary items
  - a. Cost of goods sold
  - b. Depreciation of property, plant, and equipment
  - c. Amortization of intangible items such as goodwill, patents, licenses, and the like
  - d. Amortization of deferred charges or credits, except policy acquisition costs for life insurance companies.

## PERSPECTIVE AND ISSUES

### Subtopics

ASC 835, *Interest*, contains three Subtopics:

- ASC 835-10, *Overall*, which merely points to other Topics with guidance on interest
- ASC 835-20, *Capitalization of Interest*, which provides guidance on capitalization of interest in connection with an asset investment
- ASC 835-30, *Imputation of Interest*, which provides guidance where imputation of interest is required.

### Scope and Scope Exceptions

All assets that require a time period to get ready for their intended use should include a capitalized amount of interest. However, accomplishing this level of capitalization would usually violate a reasonable cost/benefit test because of the added accounting and administrative costs that would be incurred. In many such situations, the effect of interest capitalization would be immaterial. Accordingly, interest cost is only capitalized as a part of the historical cost of the

following types of assets (qualifying assets) when such interest is considered to be material. (ASC 835-20-15-2) Common examples include:

1. Assets constructed for an entity's own use or for which deposit or progress payments are made
  2. Assets produced as discrete projects that are intended for lease or sale
  3. Equity-method investments when the investee is using funds to acquire qualifying assets for principal operations that have not yet begun.
- (ASC 835-20-15-5)

Many entities use threshold levels to determine whether or not interest costs related to inventory or property, plant, and equipment should be capitalized. (ASC 835-20-15-4)

The capitalization of interest costs does not apply to the following situations:

1. When the effects of capitalization would not be material, compared to the effect of expensing interest
2. When qualifying assets are already in use or ready for use
3. When qualifying assets are not being used and are not awaiting activities to get them ready for use
4. When qualifying assets are not included in a statement of financial position of the parent company and its consolidated subsidiaries
5. When principal operations of an investee accounted for under the equity method have already begun
6. When regulated investees capitalize both the cost of debt and equity capital
7. When assets are acquired with grants and gifts that are restricted by the donor (or grantor) to the acquisition of those assets, to the extent that funds are available from those grants and gifts. For this purpose, interest earned on the temporary investment of those funds that is subject to similar restriction is to be considered an addition to the gift or grant.

(ASC 835-10-15-6)

Accretion costs related to exit costs and asset retirement obligations are covered by the guidance in ASC 420 or ASC 410-20. So, too, the interest cost component of net periodic pension cost falls under the ASC 715-30 guidance.

## Overview

ASC 835 provides guidance in two instances—where interest capitalization is in connection with an investment in an asset and where imputation of interest is required.

Per ASC 835-20, the recorded amount of an asset includes all of the costs necessary to get the asset set up and functioning properly for its intended use, including interest. The principal purposes accomplished by the capitalization of interest costs are:

1. To obtain a more accurate measurement of the costs associated with the investment in the asset
2. To achieve a better matching of costs related to the acquisition, construction, and development of productive assets to the future periods that will benefit from the revenues that the assets generate.

ASC 835-30 specifies when and how interest is to be imputed when the receivable is noninterest-bearing or the stated rate on the receivable is not reasonable. It applies to transactions

conducted at arm's length between unrelated parties, as well as to transactions in which captive finance companies offer favorable financing to increase sales of related companies.

## DEFINITIONS OF TERMS

---

Source: ASC 835. Also see Appendix, *Definitions of Terms*, for the definitions of Contract, Contract Asset, Contract Liability, Customer, Fair Value, and Public Business Entity (3rd definition).

**Activities.** The term activities is to be construed broadly. It encompasses physical construction of the asset. In addition, it includes all the steps required to prepare the asset for its intended use. For example, it includes administrative and technical activities during the preconstruction stage, such as the development of plans or the process of obtaining permits from governmental authorities. It also includes activities undertaken after construction has begun in order to overcome unforeseen obstacles, such as technical problems, labor disputes, or litigation.

**Capitalization Rate.** Rate used to determine amount of interest to be capitalized in an accounting period.

**Discount.** The difference between the net proceeds, after expense, received upon issuance of debt and the amount repayable at its maturity. See Premium.

**Expenditures.** Expenditures to which capitalization rates are to be applied are capitalized expenditures (net of progress payment collections) for the qualifying asset that have required the payment of cash, the transfer of other assets, or the incurring of a liability on which interest is recognized (in contrast to liabilities, such as trade payables, accruals, and retainages on which interest is not recognized).

**Imputed Interest Rate.** The interest rate that results from a process of approximation (or imputation) required when the present value of a note must be estimated because an established exchange price is not determinable and the note has no ready market.

**Intended Use.** Intended use of an asset embraces both readiness for use and readiness for sale, depending on the purpose of acquisition.

**Interest Cost.** Interest cost includes interest recognized on obligations having explicit interest rates, interest imputed on certain types of payables in accordance with Subtopic 835-30, and interest related to a capital lease determined in accordance with Subtopic 840-30. With respect to obligations having explicit interest rates, interest cost includes amounts resulting from periodic amortization of discount or premium and issue costs on debt.

**Interest Method.** The method used to arrive at a periodic interest cost (including amortization) that will represent a level effective rate on the sum of the face amount of the debt and (plus or minus) the unamortized premium or discount and expense at the beginning of each period.

**Premium.** The excess of the net proceeds, after expense, received upon issuance of debt over the amount repayable at its maturity. See Discount.

## CONCEPTS, RULES, AND EXAMPLES

---

### ASC 835-20, *Capitalization of Interest*

**Interest cost.** Generally, inventories and land that are not undergoing preparation for intended use are not qualifying assets. When land is being developed, it is a qualifying asset. If land is developed for lots, the capitalized interest cost is added to the cost of the land. The capitalized interest will then be properly matched against revenues when the lots are sold. If, however, the land is developed for a building, then the capitalized interest cost is added to the cost

of the building, in which case the capitalized interest will be matched against related revenues as the building is depreciated.

*The amount of interest to be capitalized.* Interest cost includes the following:

1. Interest on debt having explicit interest rates (fixed or floating)
2. Interest related to capital leases
3. Interest required to be imputed on payables (i.e., those due in over one year, per ASC 835-30).

**Capitalization interest rate.** The most appropriate rate to use as the capitalization rate is the rate applicable to specific new debt resulting from the need to finance the acquired assets. If there is no specific new debt, the capitalization rate is a weighted-average of the rates of the other borrowings of the entity. This reflects the fact that the previously incurred debt of the entity could be repaid if not for the acquisition of the qualifying asset. Thus, indirectly, the previous debt is financing the acquisition of the new asset and its interest is part of the cost of the new asset. The selection of borrowings to be used in the calculation of the weighted-average of rates requires judgment. The amount of interest to be capitalized is that portion which could have been avoided if the qualifying asset had not been acquired. Thus, the capitalized amount is the incremental amount of interest cost incurred by the entity to finance the acquired asset. (ASC 835-20-30-2)

If the reporting entity uses derivative financial instruments as fair value hedges to affect its borrowing costs, ASC 815-25-35-14 specifies that the interest rate to use in capitalizing interest is the effective yield that takes into account gains and losses on the effective portion of a derivative instrument that qualifies as a fair value hedge of fixed interest rate debt. The amount of interest subject to capitalization could include amortization of the adjustments of the carrying amount of the hedged liability under ASC 815, if the entity elects to begin amortization of those adjustments during the period in which interest is eligible for capitalization. Any ineffective portion of the fair value hedge is not reflected in the capitalization rate.

**Capitalizable base.** Once the appropriate rate has been established, the base to which that rate is to be applied is the average amount of accumulated net capital *expenditures* incurred for qualifying assets during the relevant time frame. (ASC 835-20-30-3) Capitalized costs and expenditures are not the same terms. Theoretically, a capitalized cost financed by a trade payable for which no interest is recognized is not a capital expenditure to which the capitalization rate is applied. Reasonable approximations of net capital expenditures are acceptable, however, and capitalized costs are generally used in place of capital expenditures unless there is expected to be a material difference.

If the average capitalized expenditures exceed the specific new borrowings for the time frame involved, then the *excess* expenditures are multiplied by the weighted-average of rates and not by the rate associated with the specific debt. This requirement more accurately reflects the interest cost incurred by the entity to acquire the fixed asset.

The interest being paid on the debt may be simple or compound. Simple interest is computed on the principal alone, whereas compound interest is computed on the principal *and* on any interest that has not been paid. Most fixed assets will be acquired with debt subject to compound interest.

The total amount of interest actually incurred by the entity is the ceiling for the amount of interest cost capitalized. The amount capitalized cannot exceed the amount actually incurred during the period involved. On a consolidated basis, the ceiling is defined as the total of the parent's interest cost plus that of the consolidated subsidiaries. If financial statements are issued separately, the interest cost capitalized is limited to the amount that the separate entity has incurred, and that amount includes interest on intercompany borrowings. (ASC 835-20-30-6). The

interest incurred is a gross amount and is not netted against interest earned except in cases involving externally restricted tax-exempt borrowings. (ASC 835-20-30-10)

### Example of accounting for capitalized interest costs

1. On January 1, 20X1, Daniel Corp. contracted with Rukin Company to construct a building for \$2,000,000 on land that Daniel had purchased years earlier.
2. Daniel Corp. was to make five payments in 20X1, with the last payment scheduled for the date of completion, December 31, 20X1.
3. Daniel Corp. made the following payments during 20X7:

January 1, 20X1	\$ 200,000
March 31, 20X1	400,000
June 30, 20X1	610,000
September 30, 20X1	440,000
December 31, 20X1	350,000
	\$2,000,000

4. Daniel Corp. had the following debt outstanding at December 31, 20X7:

a. A 12%, four-year note dated 1/31/20X7 with interest compounded quarterly. Both principal and interest due 12/31/Y0 (relates specifically to building project).	\$850,000
b. A 10%, ten-year note dated 12/31/X1 with simple interest payable annually on December 31.	\$600,000
c. A 12%, five-year note dated 12/31/20X3 with simple interest payable annually on December 31.	\$700,000

The amount of interest to be capitalized during 20X7 is computed as follows:

Step 1—Compute average accumulated expenditures

<i>Average Accumulated Expenditures</i>			<i>Average accumulated expenditures</i>
<i>Date</i>	<i>Expenditure</i>	<i>Capitalization period*</i>	
1/1/X7	\$ 200,000	12/X7	\$200,000
3/31/X7	400,000	9/X7	300,000
6/30/X7	610,000	6/X7	305,000
9/30/X7	440,000	3/X7	110,000
12/31/X7	350,000	0/X7	—
	\$2,000,000		\$915,000

\* The number of months between the date expenditures were made and the date interest capitalization stops (December 31, 20X7).

Because the average accumulated expenditures of \$915,000 exceed the \$850,000 borrowed specifically for the project, interest will be capitalized on the excess expenditures of \$65,000 by using the weighted-average interest rate on the other two notes.

Step 2—Compute the weighted-average interest rate on the company's other borrowings

	<i>Principal</i>	<i>Interest</i>
10%, ten-year note	\$ 600,000	\$ 60,000
12%, five-year note	700,000	84,000
	\$1,300,000	\$144,000

$$\frac{\text{Total interest}}{\text{Total principal}} = \frac{\$144,000}{\$1,300,000} = 11.08\% \text{ weighted-average interest rate}$$

Step 3—Compute the potential interest cost to be capitalized

The \$850,000 loan is considered first because it relates specifically to the project. Interest accretes on this loan quarterly. Since interest is not due until the loan's maturity, the interest for each quarter increases the unpaid principal amount on which further quarters' interest will be accreted.

Date	Description	Interest	Principal	Balance
1/1/20X7	Loan proceeds			\$ 850,000
4/1/20X7	Quarterly compound interest	\$ 25,500	\$ (25,500)	875,500
7/1/20X7	Quarterly compound interest	26,265	(26,265)	901,765
10/1/20X7	Quarterly compound interest	27,053	(27,053)	928,818
12/31/20X7	Quarterly compound interest	27,866	(27,866)	956,684
	<i>Totals</i>	\$106,684	\$(106,684)	

The above computations can be made using specialized present value software or standard spreadsheet software. They can also be made/proved using the following formula to compute the future value of \$1 for four periods at 3% per period (12% annual rate  $\div$  4 periods per year quarterly compounding) where:

FV = Future value of the present sum of \$1,

i = The interest rate at which the amount will be compounded each period, and

n = The number of periods.

$$\begin{aligned}
 FV &= (1 + i)^n \\
 &= (1 + .03)^4 \\
 &= 1.03^4 \\
 &= 1.12551 \\
 \$850,000 \times 1.12551 &= \$956,684 \\
 &\quad (850,000) \text{ principal} \\
 &\quad \$106,684 \text{ interest}
 \end{aligned}$$

#### Potential Interest Cost to Be Capitalized

Interest on the project-related loan	$(\$850,000 \times 1.12551) - \$850,000$	=	\$106,684
Interest on remaining average accumulated expenditures	$65,000 \times .1108$	=	7,202
			\$915,000
			\$113,886

Step 4—Compute the actual interest cost for the period

12%, three-year note $[(\$850,000 \times 1.12551) - \$850,000]$	=	\$106,684
10%, ten-year note $(\$600,000 \times 10\%)$	=	60,000
12%, five-year note $(\$700,000 \times 12\%)$	=	84,000
Total interest		\$250,684

Step 5—Compute the amount of interest cost to be capitalized

The interest cost to be capitalized is the lesser of \$113,886 (avoidable interest cost) or \$250,684 (actual interest cost), which is \$113,886. The remaining \$136,798 (\$250,684 – \$113,886) is expensed during 20X7.

**Determining the time period for interest capitalization.** Three conditions must be met before capitalization commences:

1. Necessary activities are in progress to get the asset ready to function as intended
2. Qualifying asset expenditures have been made
3. Interest costs are being incurred.

As long as these conditions continue, interest costs are capitalized.

Necessary activities are interpreted in a very broad manner. They start with the planning process and continue until the qualifying asset is substantially complete and ready to function. Brief, normal interruptions do not stop the capitalization of interest costs. However, if the entity intentionally suspends or delays the activities for some reason, interest costs are not capitalized from the point of suspension or delay until substantial activities regarding the asset resume.

If the asset is completed in parts, the capitalization of interest costs stops for each part as it becomes ready. An asset that must be entirely complete before the parts can be used capitalizes interest costs until the total asset becomes ready.

Interest costs continue to be capitalized until the asset is ready to function as intended, even in cases where lower of cost or market rules are applicable and market is lower than cost. The required write-down is increased accordingly.

**Capitalization of interest costs incurred on tax-exempt borrowings.** If qualifying assets have been financed with the proceeds from tax-exempt, externally restricted borrowings, and if temporary investments have been purchased with those proceeds, a modification is required. The interest costs incurred from the date of borrowing must be reduced by the interest earned on the temporary investment in order to calculate the ceiling for the capitalization of interest costs. This procedure is followed until the assets financed in this manner are ready. When the specified assets are functioning as intended, the interest cost of the tax-exempt borrowing becomes available to be capitalized by other qualifying assets of the entity. Portions of the tax-exempt borrowings that are not restricted are eligible for capitalization in the normal manner.

**Assets acquired with gifts or grants.** Qualifying assets that are acquired with externally restricted gifts or grants are not subject to capitalization of interest. The principal reason for this treatment is the concept that there is no economic cost of financing when a gift or grant is used in the acquisition.

**Summary of interest capitalization requirements.** The process chart that follows summarizes the accounting for interest capitalization.

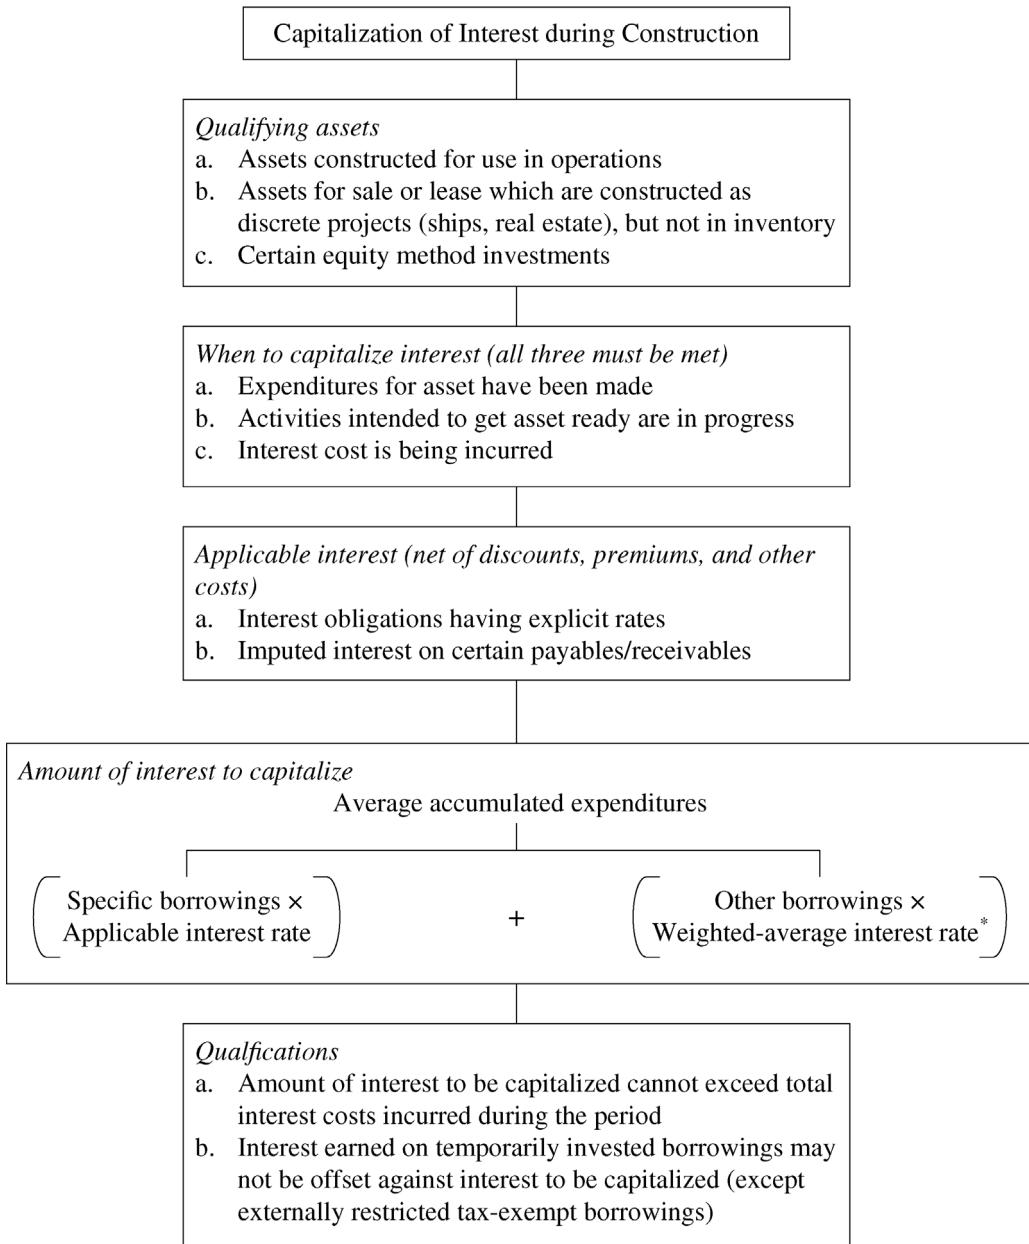

#### ASC 835-30, *Imputation of Interest*

**Receivables.** If a receivable is due on terms exceeding one year, the proper valuation is the present value of future payments to be received, determined by using an interest rate commensurate with the risks involved at the date of the receivable's creation. In many situations the interest rate commensurate with the risks involved is the rate stated in the agreement between the payee and the debtor. However, if the receivable is noninterest-bearing or if the rate stated in the agreement is not indicative of the market rate for a debtor of similar creditworthiness under similar terms, interest is imputed at the market rate. A valuation allowance is used to adjust the face amount of the receivable to the present value at the market rate. The balance in the valuation allowance is amortized as additional interest income so that interest income is recognized using a constant rate of interest over the life of the agreement. Initial recording of such a valuation allowance also results in the recognition of an expense, typically (for customer receivables) reported as selling expense or as a contra revenue item (sales discounts).

ASC 835-30-25 divides receivables into three categories for discussion:

- notes issued solely for cash,
- notes issued for cash and rights or privileges, and
- notes issued in exchange for property, goods, or services.

### **Summary of Accounting for Interest Capitalization**

\*Weighted-average interest rate =  $\frac{\text{Total interest on other borrowings}}{\text{Average outstanding principal during period}}$

**Note issued solely for cash.** When a note is issued solely for cash, its present value is necessarily assumed to be equal to the cash proceeds. The interest rate is that rate which equates the cash proceeds received by the borrower to the amounts to be paid in the future. For example, if a borrower agrees to pay \$1,060 in one year in exchange for cash today of \$1,000, the interest rate implicit in that agreement is 6%. A valuation allowance of \$60 is applied to the face amount (\$1,060) so that the receivable is included in the statement of financial position at its present value (\$1,000).

**Note issued for cash and rights or privileges.** When a note receivable that bears an unrealistic rate of interest is issued in exchange for cash, an additional right or privilege is usually granted, unless the transaction was not conducted at arm's length. If there was an added right or privilege involved, the difference between the present value of the receivable and the cash advanced is the value assigned to the right or privilege. It will be accounted for as an addition to the cost of the products purchased for the purchaser/lender, and as additional revenue to the debtor.

#### Example of accounting for a note issued for both cash and a contractual right

1. Schwartz borrows \$10,000 from Weiss via an unsecured five-year note. Simple interest at 2% is due at maturity.
2. Schwartz agrees to sell Weiss a car for \$15,000, which is less than its market price.
3. The market rate of interest on a note with similar terms and a borrower of similar creditworthiness is 10%.

The present value factor for an amount due in five years at 10% is .62092. Therefore, the present value of the note is \$6,830 [= (\$10,000 principal + \$1,000 interest at the stated rate)  $\times$  .62092]. According to ASC 835, the \$3,170 (= \$10,000 – \$6,830) difference between the present value of the note and the face value of the note is regarded as part of the cost/purchase price of the car. The following entry would be made by Weiss to record the transaction:

Note receivable	10,000
Car	18,170
Cash	25,000
Discount on note receivable	3,170

The discount on note receivable is amortized using the effective interest method, as follows:

	Effective interest (10%)	Stated interest (2%)	Amortization	Note and interest receivable
01/01/X1				6,830
01/01/X2	683	200	(483)	7,513
01/01/X3	751	200	(551)	8,264
01/01/X4	826	200	(626)	9,091
01/01/X5	909	200	(709)	10,000
01/01/X6	1,000	200	(800)	11,000

The entry for the first year would be:

Discount on note receivable	483
Interest receivable	200
Interest revenue	683

**Note issued in exchange for property, goods, or services.** When a note is issued in exchange for property, goods, or services and the transaction is entered into at arm's length, the stated interest rate is presumed to be fair unless:

1. no interest rate is stated,
2. the stated rate is unreasonable,
3. the face value of the note receivable is materially different from fair value of the property, goods, or services received, or
4. the face value of the note receivable is materially different from the current market value of the note at the date of the transaction.

According to ASC 835, when the rate on the note is not fair, the note is to be recorded at the fair market value of the property, goods, or services sold or the market value of the note, whichever is the more clearly determinable. The difference is recorded as a discount or premium and amortized to interest income.

#### Example of accounting for a note exchanged for goods

1. Green sells Brown inventory that has a fair market value of \$8,573.
2. Green receives a two-year noninterest-bearing note having a face value of \$10,000.

In this situation, the fair market value of the consideration is readily determinable and, thus, represents the amount at which the note is to be recorded. The following entry would be made by Green:

Notes receivable	10,000
Discount on notes receivable	1,427
Sales revenue	8,573

The discount will be amortized to interest expense over the two-year period using the interest rate implied in the transaction, which is 8%. The present value factor is .8573 (\$8,573/\$10,000). Using a present value table for amount due in two years, .8573 is located under the 8% rate.

If neither the fair value of the property, goods, or services sold nor the fair value of the note receivable is determinable, then the present value of the note must be determined using an imputed market interest rate. This rate will then be used to establish the present value of the note by discounting all future payments on the note at that rate. General guidelines for determining the appropriate interest rate, which are provided by ASC 835, include the prevailing rates of similar instruments with debtors having similar credit ratings and the rate the debtor could obtain for similar financing from other sources. Other factors to be considered include any collateral or restrictive covenants involved, the current and expected prime rate, and other terms pertaining to the instrument. The objective is to approximate the rate of interest that would have resulted if an independent borrower and lender had negotiated a similar transaction under comparable terms and conditions. This determination is as of the issuance date, and any subsequent changes in market interest rates are irrelevant.

#### Example of accounting for a note exchanged for property

1. Alexis sells Brett a machine that has a fair market value of \$7,510.
2. Alexis receives a three-year noninterest-bearing note having a face value of \$10,000.

In this situation, the fair market value of the consideration is readily determinable and, thus, represents the amount at which the note is to be recorded. The following entry by Brett is necessary:

Machine	7,510
Discount on notes payable	2,490
Notes payable	10,000

The discount will be amortized to interest expense over the three-year period using the interest rate implied in the transaction. The interest rate implied is 10%, because the factor for an amount due in three years is .75132, which when applied to the \$10,000 face value results in an amount equal to the fair value of the machine.

#### Example of accounting for a note exchanged to property

1. Alexis sells Brett a used machine. The fair market value is not readily determinable.
2. Alexis receives a three-year noninterest-bearing note having a face value of \$20,000. The market value of the note is not known.
3. Brett could have borrowed the money for the machine's purchase from a bank at a rate of 10%.

In this situation, the fair market value of the consideration is not readily determinable, so the present value of the note is determined using an imputed interest rate. The rate used is the rate at which Brett could have borrowed the money—10%. The factor for an amount due in three years at 10% is .75132, so the present value of the note is \$15,026. The following entry by Brett is necessary:

Machine	15,026
Discount on notes payable	4,974
Notes payable	20,000

**Notes and bonds.** The appropriate valuation of long-term debt at the date of issuance is the present value of the future payments, using an interest rate commensurate with the risks involved. In many situations this is the rate stated in the agreement between the borrower and the creditor. However, in other situations the debt may be noninterest-bearing, or the rate stated in the agreement may not be indicative of the rate applicable to a borrower having similar creditworthiness and debt having similar terms. In other words, the rate stated in the agreement is not commensurate with the risks involved. To reflect the liability at the appropriate value, interest must be imputed at the market rate, and the resulting premium or discount is amortized as interest over the life of the agreement.

Notes are a common form of exchange in business transactions for cash, property, goods, and services. Notes represent debt issued to a single investor without intending for the debt to be broken up among many investors. A note's maturity, usually lasting one to seven years, tends to be shorter than that of a bond.

Bonds are primarily used to borrow funds from the general public or institutional investors when a contract for a single amount (a note) is too large for any one lender to supply. Dividing up the amount needed into \$1,000 or \$10,000 units makes it easier to sell the bonds. Bonds also result from a single agreement.

Notes and bonds share common characteristics. They both are promises to pay sums of money at designated maturity dates, plus periodic interest payments at stated rates. They each feature written agreements stating the amounts of principal, the interest rates, when the interest and principal are to be paid, and the restrictive covenants, if any, that must be met.

The interest rate is affected by many factors, including the cost of money, the business risk factors, and general and industry-specific inflationary expectations. The stated rate on a note or bond often differs from the market rate at the time of issuance. When this occurs, the present value of the interest and principal payments will differ from the maturity, or face value. (For a complete discussion of present value techniques see Chapter 1.) If the market rate exceeds the stated rate, the cash proceeds will be less than the face value of the debt because the present value of the total interest and principal payments discounted back to the present yields an amount that is less than the face value. Because an investor is rarely willing to pay more than the present value, the bonds must be issued at a discount. The discount is the difference between the issuance price (present value) and the face, or stated, value of the bonds. This discount is then amortized over the life of the bonds to increase the recognized interest expense so that the total amount of the expense represents the actual bond yield. When the stated rate exceeds the market rate, the bond will sell for more than its face value (at a premium) to bring the effective rate to the market rate. Amortization of the premium over the life of the bonds will decrease the total interest expense.

When the market and stated rates are equivalent at the time of issuance, no discount or premium exists and the instrument will sell at its face value. Changes in the market rate subsequent to issuance are irrelevant in determining the discount or premium or its amortization.

All commitments to pay (and receive) money at a determinable future date are subject to present value techniques and, if necessary, interest imputation with the exception of the following:

1. Normal accounts payable due within one year
2. Amounts to be applied to purchase price of goods or services or that provide security to an agreement (e.g., advances, progress payments, security deposits, and retentions)
3. Transactions between parent and subsidiary
4. Obligations payable at some indeterminable future date (e.g., warranties)
5. Lending and depositor savings activities of financial institutions whose primary business is lending money
6. Transactions where interest rates are affected by prescriptions of a governmental agency (e.g., revenue bonds, tax exempt obligations, etc.).

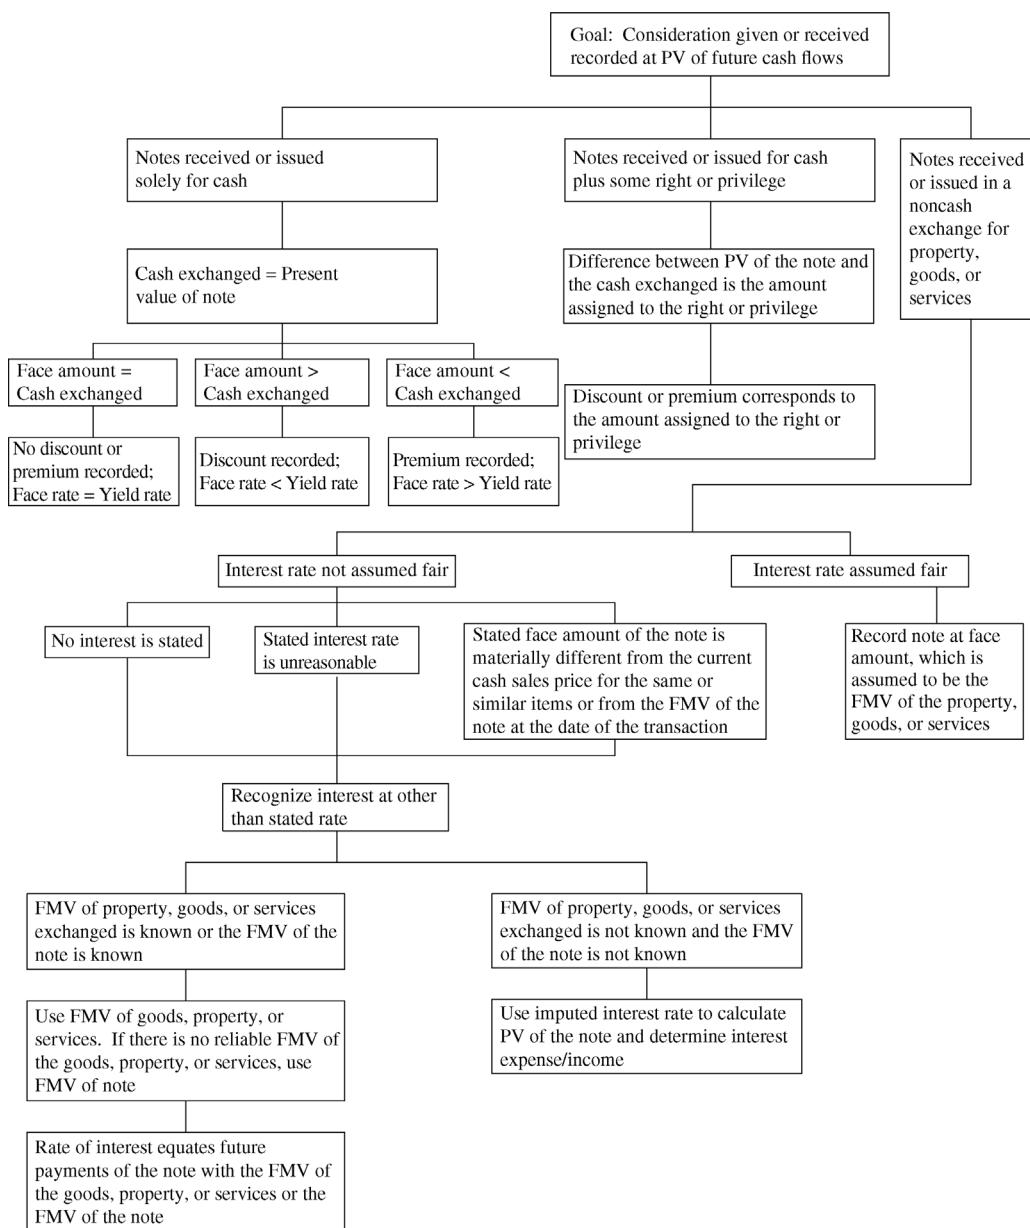

**Summary—ASC 835-30.** ASC 835-30 specifies when and how interest is to be imputed when a debt is either noninterest-bearing or the stated rate is not reasonable. ASC 835-30 divides debt into three categories for discussion. The following diagram illustrates the accounting treatment for the three types of debt.

**Notes issued solely for cash.** When a note is issued solely for cash, its present value is assumed to be equal to the cash proceeds. The interest rate is that rate equating the cash proceeds to the amounts to be paid in the future. For example, a \$1,000 note due in three years that sells for \$889 has an implicit rate of 4% ( $= \$1,000 \times .889$ , where .889 is the present value factor at 4% for a lump sum due three years hence). This implicit rate, 4%, is to be used when amortizing the discount.

In most situations, a bond will be issued at a price other than its face value. The amount of the cash exchanged is equal to the total of the present values of all the future interest and principal payments. The difference between the cash proceeds and the face value is recorded as a premium if the cash proceeds are greater than the face value or a discount if they are less. The journal entry to record a bond issued at a premium follows:

Cash	(proceeds)	
Bonds payable		(face value)
Premium on bonds payable		(difference)

## Accounting for Monetary Assets and Liabilities

### Example of bonds issued for cash

Enterprise Autos issues \$100,000 of 10-year bonds bearing interest at 10%, paid semiannually, at a time when the market demands a 12% return from issuers with similar credit standings. The proceeds of the bond issuance would be \$88,500, which is computed as follows:

Present value of 20 semiannual interest payments of \$5,000 discounted at 12% (6% semiannually: factor = 11.4699)	\$57,300
Present value of \$100,000 due in 10 years, discounted at 12% compounded semiannually (factor = .31180)	31,200
Present value of bond issuance	\$88,500

The journal entry would be:

Cash	88,500
Discount on bonds payable	11,500
Bonds payable	100,000

**Notes issued for cash and a right or privilege.** Often when a note bearing an unrealistic rate of interest is issued in exchange for cash, an additional right or privilege is granted, such as the issuer agreeing to sell merchandise to the purchaser at a reduced rate. The difference between the present value of the receivable and the cash loaned is regarded as an addition to the cost of the products purchased for the purchaser/lender and as unearned revenue to the seller/issuer. This treatment stems from an attempt to match revenue and expense in the proper periods and to differentiate between those factors that affect income from operations and income or expense from nonoperating sources. In the situation above, the purchaser/lender will amortize the discount (difference between the cash loaned and the present value of the note) to interest income over the life of the note, and the contractual right to purchase inventory at a reduced rate will be allocated to inventory (or cost of sales) as the right expires. The seller/issuer of the note will amortize the discount to interest expense over the life of the note, and the unearned revenue will be recognized in sales as the products are sold to the purchaser/lender at the reduced price. Because the discount is amortized on a different basis than the contractual right, net income for the period is also affected.

### Example of accounting for a note issued for both cash and a contractual right

1. Miller borrows \$10,000 via a noninterest-bearing three-year note from Krueger.
2. Miller agrees to sell \$50,000 of merchandise to Krueger at less than the ordinary retail price for the duration of the note.
3. The market rate of interest on a note with similar payment terms and a borrower of similar creditworthiness is 10%.

According to ASC 835-30, the difference between the present value of the note and the face value of the loan is to be regarded as part of the cost of the products purchased under the agreement. The present value factor for an amount due in three years at 10% is .75132. Therefore, the present value of the note is \$7,513 ( $= \$10,000 \times .75132$ ). The \$2,487 ( $= \$10,000 - \$7,513$ ) difference between the face value and the present value is to be recorded as a discount on the note payable and as unearned revenue on the future purchases by the debtor. The following entries would be made by the debtor (Miller) and the creditor (Krueger) to record the transaction:

<i>Miller</i>		<i>Krueger</i>	
Cash	10,000	Note receivable	10,000
Discount on note payable	2,487	Contract right with supplier	2,487
Note payable	10,000	Cash	10,000
Unearned revenue	2,487	Discount on note receivable	2,487

The discount on note payable (and note receivable) is to be amortized using the effective interest method, while the unearned revenue account and contract right with supplier account are amortized on a pro rata basis as the right to purchase merchandise is used up. Thus, if Krueger purchased \$20,000 of merchandise from Miller in the first year, the following entries would be necessary:

<i>Miller</i>		<i>Krueger</i>	
Unearned revenue	995	Inventory (or cost of sales)	995
[\$2,487 × (20,000/50,000)]			
Sales	995	Contract right with supplier	995
Interest expense	751	Discount on note receivable	751
Discount on note payable	751	Interest revenue	751
(\$7,513 × 10%)			

The amortization of unearned revenue and contract right with supplier accounts will fluctuate with the amount of purchases made. If there is a balance remaining in the account at the end of the loan term, it is amortized to the appropriate account in that final year.

**Redeemable instruments.** ASC 470-10-55 addresses the classification of certain long-term debt that is subject to a demand from the holder for redemption, subject to a best efforts attempt by the issuer to remarket that date. Thus, there is a possibility that the demand for redemption would not be honored, although a bank letter of credit is also provided as additional security for the lender. Notwithstanding that possibility, this debt must be reported as a current obligation.

**Sales of future revenue.** ASC 470-10-25 deals with the situation in which a reporting entity receives an initial payment from another party in exchange for a promised stream of royalties or other revenue-based receipts from a defined business, which could be a segment or product line of the reporting entity. Arguably, the up-front payment could be seen as an advance against the future payments, or as a borrowing by the reporting entity. The payment is not revenue to the reporting entity.

The Codification states that the initial receipt would be accounted for as either debt or deferred revenue, depending on the facts and circumstances of the transaction. It identifies six factors that would cause the amounts to be recorded as debt, rather than as deferred income. These factors are:

1. The transaction does not purport to be a sale.
2. The reporting entity has significant continuing involvement in the generation of the cash flows due the other party (referred to as the investor in this consensus).
3. The transaction is cancelable by either party through payment of a lump sum or other transfer of assets by the entity.
4. The investor's rate of return is implicitly or explicitly limited by the terms of the transaction.
5. Variations in the reporting entity's revenue or income underlying the transaction have only a trifling impact on the investor's rate of return.
6. The investor has any recourse to the reporting entity relating to the payments due to the investor.

(ASC 470-10-25-2)

Amounts recorded as debt should be amortized under the interest method and amounts recorded as deferred income should be amortized under the units-of-revenue method. The proceeds classified as foreign-currency-denominated debt would be subject to recognition of foreign currency transaction (exchange) gains and losses under ASC 830-20.

ASC 815 established cash flow hedge accounting for hedges of the variability of the functional currency equivalent of future foreign-currency-denominated cash flows. If the proceeds are classified as deferred income, this would be a nonmonetary liability. Thus, no foreign exchange gains or losses would arise under ASC 830-20.

### Effective Interest Method

The effective interest method is the preferred method of accounting for a discount or premium arising from a note or bond. Under the effective interest method, the discount or premium is amortized over the life of the debt in such a way as to result in a constant rate of interest when applied to the amount outstanding at the beginning of any given period. Therefore, interest expense is equal to the market rate of interest at the time of issuance multiplied by this beginning figure. The difference between the interest expense and the cash paid represents the amortization of the discount or premium.

Amortization tables are often created at the time of the bond's issuance to provide amounts necessary when recording the entries relating to the debt issue. They also provide a check of accuracy since the final values in the unamortized discount or premium and carrying value columns should be equal to zero and the bond's face value, respectively.

#### Example of applying the effective interest method

1. A 3-year, 12%, \$10,000 bond is issued at 1/1/20X1, with interest payments semiannually.
2. The market rate is 10%.

The amortization table would appear as follows:

<i>Date</i>	<i>Credit cash</i>	<i>Debit int. exp.</i>	<i>Debit  prem.</i>	<i>Unamort.  prem. bal.</i>	<i>Carrying  value</i>
1/1/X1				\$507.61	\$10,507.61 <sup>(a)</sup>
7/1/X1	\$ 600.00 <sup>(b)</sup>	\$ 525.38 <sup>(c)</sup>	\$ 74.62 <sup>(d)</sup>	432.99 <sup>(e)</sup>	10,432.99 <sup>(f)</sup>
1/1/X2	600.00	521.65	78.35	354.64	10,354.64
7/1/X2	600.00	517.73	82.27	272.37	10,272.37
1/1/X3	600.00	513.62	86.38	185.99	10,185.99
7/1/X3	600.00	509.30	90.70	95.29	10,095.29
1/1/X4	600.00	504.71 <sup>(g)</sup>	95.29	—	10,000.00
	\$3,600.00	\$3,092.39	\$507.61		

<sup>(a)</sup> PV of principal and interest payments at 5% for 6 periods

<sup>(b)</sup>  $\$10,000 \times .12 \times \text{one-half year}$

<sup>(c)</sup>  $\$10,507.61 \times .10 \times \text{one-half year}$

<sup>(d)</sup>  $\$600.00 - \$525.38$

<sup>(e)</sup>  $\$507.61 - \$74.62$

<sup>(f)</sup>  $\$10,507.61 - \$74.62$

<sup>(g)</sup>  $(\$10,000 + \$432.99)$

<sup>(b)</sup>  $\$10,000.00 \times .12 \times \text{one-half year}$

<sup>(g)</sup> Rounding error = \$.05

Although the effective interest method is the preferred method of amortizing a discount or premium, the straight-line method may be used if the results are not materially different. The amortized portion is equal to the total amount of the discount or premium divided by the life of the debt from issuance in months multiplied by the number of months the debt has been outstanding that year. Interest expense under the straight-line method is equal to the cash interest paid plus the amortized portion of the discount or minus the amortized portion of the premium.

When the interest date does not coincide with the year-end, an adjusting entry must be made to recognize the proportional share of interest payable and the amortization of the discount or premium. Within the amortization period, the discount or premium can be amortized using the straight-line method.

If bonds or notes are issued between interest payment dates, the interest and the amortization must be computed for the period between the sale date and the next interest date. The purchaser usually pays the issuer for the amount of interest that has accrued since the last payment date. That payment is recorded as a payable by the issuer. At the next interest date, the issuer pays the purchaser as though the bond had been outstanding for the entire interest period. The discount or premium is also amortized for the short period.

#### **Example of note issued between payment dates**

On June 1, 20X1, Acme Manufacturing issues a \$100,000 7% bond with a three-year life at 104 (i.e., at 104% of face value). Interest is payable on July 1 and January 1. The computation of the premium would be:

Proceeds	\$104,000
Face value	100,000
Premium	\$ 4,000

The entry to record the bond issuance and the receipt of interest from the purchaser would be:

Cash	106,967
Bonds payable	100,000
Premium on bonds	4,000
Interest payable	2,967

The bonds will be outstanding for two years and seven months. An effective interest rate must be computed that will equate the present value of the future principal and interest payments to the cash received. Using a spreadsheet facilitates the trial and error process. Many calculators with financial functions also do this calculation. Alternatively, present value tables can be used to compute the value, as shown below.

First, compute the present value of the interest and principal payments as of 7/1/X1 using a guess of 5% annually.

$$\begin{aligned} \text{Present value of an annuity due of } \$3,500 \text{ for six periods @ } 2.5\% &= 3,500 \times 5.6458 = & 19,760 \\ \text{Present value of a single payment of } \$100,000 \text{ in five periods @ } 2.5\% &= 100,000 \times .88385 = & 88,385 \\ && 108,145 \end{aligned}$$

Then, compute the present value of that result one month earlier (at June 1, 2012) using the same interest rate.

$$\text{Present value of a single payment of } \$108,145 \text{ in one month} = 108,145/[1 + (.05/12)] = 107,696$$

The result is more than the cash received (\$106,967), so we know that the interest rate must be higher than 5%. Repeat the calculation at a 6% annual rate.

Present value of an annuity due of \$3,500 for six periods @ 3% =  $3,500 \times 5.5797 = 19,529$

Present value of a single payment of \$100,000 in five periods @ 3% =  $100,000 \times .86261 = 86,261$

105,790

Present value of a single payment of \$105,790 in one month =  $105,790/[1 + (.06/12)] = 105,263$

The result is less than the cash received (\$106,967), so we know the rate is between 5 and 6%. By interpolation, we determine that the rate is 5.3%.

$$\frac{107,696 - 106,967}{107,696 - 105,263} \times (6\% - 5\%) = .2996\%, \text{ which is added to } 5\% \text{ to get the effective rate.}$$

The amortization of the \$4,000 premium would be as follows:

	<i>Cash paid (received)</i>	<i>Interest at 5.3% annually</i>	<i>Amortization</i>	<i>Interest payable</i>	<i>Bond payable</i>
					104,000
06/01/X1	(2,967)			2,967	104,000
07/01/X1	3,500	459	74	(2,967)	103,926
01/01/X2	3,500	2,754	746		103,180
07/01/X2	3,500	2,734	765		102,415

	<i>Cash paid (received)</i>	<i>Interest at 5.3% annually</i>	<i>Amortization</i>	<i>Interest payable</i>	<i>Bond payable</i>
					101,629
01/01/X3	3,500	2,714	786		101,629
07/01/X3	3,500	2,693	807		100,822
01/01/X4	103,500	2,672	822		100,000

The entry to record the first interest payment would be:

Interest payable	2,967		
Interest expense	459		
Premium on bonds	74		
Cash		3,500	

## Debt Issuance Costs

Costs may be incurred in connection with issuing bonds. Examples include legal, accounting, and underwriting fees; commissions; and engraving, printing, and registration costs. Debt issuance costs must be presented on the statement of financial position as a direct reduction of proceeds from debt and the costs must be amortized and reported as interest expense. (ASC 835-30-45-1 through 45-3) For a \$200,000 loan with \$10,000 in debt issuance costs, the transaction is recorded as:

Debit	Credit
Cash	190,000
	Long-term debt

**Consistency.** The presentation of debt issuance costs as a direct reduction of the liability is consistent with current guidance on debt discounts. The guidance is also consistent with FASB CON 6, paragraph 237 which states:

Debt issuance cost is not an asset for the same reason that debt discount is not: it provides no future economic benefit. Debt issue cost in effect reduces the proceeds of borrowing and increases the effective interest rate and thus may be accounted for the same as debt discount.

## PERSPECTIVE AND ISSUES

---

### Subtopics

ASC 840, *Leases*, and its subtopics establish standards of accounting and reporting by lessees and lessors for leases overall, and for specific classifications of leases. ASC 840 contains four subtopics:

- ASC 840-10, *Overall*
- ASC 840-20, *Operating Leases*
- ASC 840-30, *Capital Leases*
- ASC 840-40, *Sale-Leaseback Transactions*.

Each of the subtopics contains the following Subsections:

- General
- Lessees
- Lessors.

### Scope and Scope Exceptions

ASC 840 applies to all entities. However, to be considered a lease the right to use property, plant, or equipment must be transferred from one contracting party to the other. The definition of lease does not include contracts for services.

### Overview

Lease transactions became enormously popular over the years as businesses sought new ways to finance long-lived assets. Leasing offered two attractive advantages: typically 100% financing, coupled very often with off-the-books obligations.

There are several economic reasons why the lease transaction is considered a viable alternative to outright purchase:

1. The lessee (borrower) is frequently able to obtain 100% financing.
2. Income tax benefits may be available to one or both of the parties.
3. The lessor receives the equivalent of interest as well as an asset with some remaining residual value at the end of the lease term.
4. In some cases, equipment or other assets are not available for outright purchase.

A lease agreement involves at least two parties, a lessor and a lessee, and an asset that is to be leased. The lessor, the party that either owns or commits to purchase the asset, agrees to grant the lessee the right to use it for a specified period of time in return for periodic rent payments.

The lease transaction derives its accounting complexity from the number of alternatives available to the parties involved. Leases can be structured to allow differing assignments of income tax benefits associated with the leased asset to meet the objectives of the transacting parties. Leases can be used to transfer ownership of the leased asset, and they can be used to transfer the risks and rewards of ownership. In any event, the substance of the transaction dictates, with certain exceptions, the accounting treatment, irrespective of its legal form. The lease transaction is probably the best example of the accounting profession's substance-over-form argument. If the transaction effectively transfers the risks and rewards of ownership to the lessee,

then the substance of the transaction is that of a sale and, accordingly, it is recognized as such for accounting purposes even though the transaction is legally structured as a lease.

**Variable interest entities.** There later developed the practice of using nonsubstantive lessors (which often were related entities) to assist in keeping leases off the statement of financial position of lessees. These entities were frequently used to exclude liabilities from the lessee's consolidated statement of financial position in order to more favorably portray the lessee's financial condition. However, under the provisions of ASC 810, many more lessor entities are now required to be consolidated with the financial statements of the lessee, especially in situations where the lessor and lessee have common or related-party ownership.

It is necessary for the lessee to first apply ASC 810 to evaluate its relationship with the lessor and, in that respect, ASC 810 takes precedence over ASC 840, *Leases*. This is because if ASC 810 requires the lessee to consolidate the lessor, the effects of the lease transaction between the parties will be removed from the consolidated financial statements via an eliminating entry and, consequently, the consolidated reporting entity will depreciate the leased asset and reflect all of the costs of acquiring, holding, maintaining, and disposing of the asset. This makes the issue of distinguishing between operating and financial leases moot for any leases between a Variable Interest Entity (VIE) and its primary beneficiary.

The lessor will, of course, in any separately issued financial statements, account for the lease in accordance with the appropriate lease accounting requirements that would apply absent ASC 810. Certain concepts and definitions discussed in this chapter are also explained in the chapter on ASC 810 but are repeated and expanded upon here for completeness and further clarification in the context of lease transactions.

## DEFINITIONS OF TERMS

---

Source: 840 Glossary Sections. Other terms relevant to this topic can be found in the Appendix, *Definitions of Terms*: Acquiree, Acquirer, Acquisition by a Not-for-Profit Entity, Contract, Customer, Financing Receivable, Nonprofit Entity, Revenue, Standalone Selling Price, Variable Interest, and Variable Interest Entity.

**Bargain Purchase Option.** A provision allowing the lessee, at his option, to renew the lease for a rental sufficiently lower than the fair rental of the property at the date the option becomes exercisable that exercise of the option appears, at lease inception, to be reasonably assured. Fair rental of a property in this context shall mean the expected rental for equivalent property under similar terms and conditions.

**Bargain Renewal Option.** A provision allowing the lessee, at his option, to renew the lease for a rental sufficiently lower than the fair rental of the property at the date the option becomes exercisable that exercise of the option appears, at lease inception, to be reasonably assured. Fair rental of a property in this context shall mean the expected rental for equivalent property under similar terms and conditions.

**Capital Lease.** From the perspective of a lessee, a lease that meets any of the four lease classification criteria in ASC 840-10-25-1:

1. *Transfer of ownership.* The lease transfers ownership of the property to the lessee by the end of the lease term. This criterion is met in situations in which the lease agreement provides for the transfer of title at or shortly after the end of the lease term in exchange for the payment of a nominal fee, for example, the minimum required by statutory regulation to transfer title.

2. *Bargain purchase option.* This option is included in the lease.
3. *Lease term.* The lease term is equal to 75% or more of the estimated economic life of the leased property. However, if the beginning of the lease term falls within the last 25% of the total estimated economic life of the lease property, including earlier years of use, this criterion shall not be used for purposes of classifying the lease.
4. *Minimum lease payment.* The present value at the beginning of the lease term of the minimum lease payments, excluding that portion of the payments representing executor costs such as insurance, maintenance, and taxes to be paid by the lessor, including any profit thereon, equals or exceeds 90% of the excess of the fair value of the leased property to the lessor at lease inception over any related investment tax credit retained by the lessor and expected to be realized by the lessor. If the beginning of the lease term falls within the last 25% of the total estimated economic life of the leased property, including earlier years of use, this criterion shall not be used for purposes of classifying the lease.

**Contingent Rentals.** The increases or decreases in lease payments that result from changes occurring after lease inception in the factors (other than the passage of time) on which lease payments are based, excluding any escalation of minimum lease payments relating to increases in construction or acquisition cost of the leased property or for increases in some measure of cost or value during the construction or pre-construction period. The term *contingent rentals* contemplates an uncertainty about future changes in the factors on which lease payments are based.

**Estimated Economic Life.** The estimated remaining period during which the property is expected to be economically usable by one or more users, with normal repairs and maintenance, for the purpose for which it was intended at lease inception, without limitation by the lease term.

**Estimated Residual Value of Leased Property.** The estimated fair value of the leased property at the end of the lease term.

**Fair Value of Leased Property.** The price that would be received to sell the property in an orderly transaction on the measurement date between market participants that are not related parties.

When the lessor is a manufacturer or dealer, the fair value of the property at the inception of the lease will ordinarily be its normal selling price net of volume or trade discounts. In some cases, due to market conditions, fair value may be less than the normal selling price or even the cost of the property.

When the lessor is not a manufacturer or dealer, the fair value of the property at the inception of the lease will ordinarily be its cost net of volume or trade discounts. However, if a significant amount of time elapses between the acquisition of the property by the lessor and the inception of the lease, fair value is determined in light of market conditions prevailing at the inception of the lease. Thus, fair value may be greater or less than the cost or carrying amount of the property.

Fair value determinations made for lease classification or measurement purposes are to be performed as defined by ASC 840, not as later set forth by ASC 820, other than as pertains to business combinations accounted for under ASC 805. For acquisition accounting applications, ASC 820 is the relevant guidance to be followed.

**Incremental Borrowing Rate.** The rate that, at lease inception, the lessee would have incurred to borrow over a similar term the funds necessary to purchase the leased asset. This definition does not proscribe the lessee's use of a secured borrowing rate as its incremental borrowing rate if that rate is determinable, reasonable, and consistent with the financing that would have been used in the particular circumstances.

**Initial Direct Costs.** Only those costs incurred by the lessor that are (1) costs to originate a lease incurred in transactions with independent third parties that (a) result directly from and are essential to acquire that lease and (b) would not have been incurred had that leasing transaction not occurred, and (2) certain costs directly related to specified activities performed by the lessor for that lease. Those activities are: evaluating the prospective lessee's financial condition; evaluating and recording guarantees, collateral, and other security arrangements; negotiating lease terms; preparing and processing lease documents; and closing the transaction. The costs directly related to those activities include only that portion of the employees' total compensation and payroll-related fringe benefits directly related to time spent performing those activities for that lease and other costs related to those activities that would not have been incurred but for that lease. Initial direct costs do not include costs related to activities performed by the lessor for advertising, soliciting potential lessees, servicing existing leases, and other ancillary activities related to establishing and monitoring credit policies, supervision, and administration. Initial direct costs do not include administrative costs, rent, depreciation, any other occupancy and equipment costs and employees' compensation and fringe benefits related to activities described in the previous sentence, unsuccessful origination efforts, and idle time.

**Interest Method.** The method used to arrive at a periodic interest cost (including amortization) that will represent a level effective rate on the sum of the face amount of the debt and (plus or minus) the unamortized premium or discount and expense at the beginning of each period.

**Interest Rate Implicit in the Lease.** The discount rate that causes the aggregate present value at the beginning of the lease term of the minimum lease payments (as described in paragraph 840-10-25-4), excluding that portion of the payments representing executory costs to be paid by the lessor, together with any profit thereon and the unguaranteed residual value, accruing to the benefit of the lessor to be equal to the fair value of the leased property to the lessor at lease inception, minus any investment tax credit retained by the lessor and expected to be realized by him. If the lessor is not entitled to any excess of the amount realized on disposition of the property over a guaranteed amount, no unguaranteed residual value would accrue to its benefit.

**Lease.** An agreement conveying the right to use property, plant, or equipment (land or depreciable assets or both), usually for a stated period of time.

**Lease Incentive.** An incentive for the lessee to sign the lease, such as an up-front cash payment to the lessee, payment of costs for the lessee (such as moving expenses), or the assumption by the lessor of the lessee's preexisting lease with a third party.

**Lease Inception.** The date of the lease agreement or commitment, if earlier. For purposes of this definition, a commitment shall be in writing, signed by the parties in interest to the transaction, and shall specifically set forth the principal provisions of the transaction. If any of the principal provisions are yet to be negotiated, such a preliminary agreement or commitment does not qualify for purposes of this definition.

**Lease Term.** The fixed noncancelable term of the lease plus the following:

1. Periods covered by bargain renewal options
2. Periods for which failure to renew the lease imposes a penalty on the lessee in an amount such that renewal appears, at the inception of the lease, to be reasonably assured
3. Periods covered by ordinary renewal options during which a guarantee by the lessee of the lessor's debt directly or indirectly related to the leased property is expected to be in effect, or a loan from the lessee to the lessor directly or indirectly related to the leased property is expected to be outstanding

4. Periods covered by ordinary renewal options preceding the date that a bargain purchase option is exercisable
5. Periods representing renewals or extensions of the lease at the lessor's option.

However, the lease term does not extend beyond the date a bargain purchase option becomes exercisable or beyond the useful life of the leased asset.

**Minimum Lease Payments.** For the lessee: The payments that the lessee is or can be required to make in connection with the leased property. Contingent rental guarantees by the lessee of the lessor's debt, and the lessee's obligation to pay executory costs, are excluded from minimum lease payments (MLPs). Additionally, if a portion of the MLPs representing executory costs is not determinable from the provisions of the lease, an estimate of executory costs is excluded from the calculation of the minimum lease payments. If the lease contains a bargain purchase option, only the minimum rental payments over the lease term and the payment called for in the bargain purchase option are included in minimum lease payments. Otherwise, MLPs include the following:

1. The minimum rental payments called for by the lease over the lease term.
2. Any guarantee of residual value at the expiration of the lease term made by the lessee (or any party related to the lessee), whether or not the guarantee payment constitutes a purchase of the leased property. When the lessor has the right to require the lessee to purchase the property at termination of the lease for a certain or determinable amount, that amount is considered a lessee guarantee. When the lessee agrees to make up any deficiency below a stated amount in the lessor's realization of the residual value, the guarantee to be included in the MLP is the stated amount rather than an estimate of the deficiency to be made up. ASC 840 provides additional guidance regarding residual guarantees, as follows:
  - a. Lease provisions requiring the lessee to reimburse the lessor for residual value deficiencies due to damage, extraordinary wear and tear, or excessive usage are analogous to contingent rentals, since at the inception of the lease, the amount of the deficiency is not determinable. Therefore, these payments are not included in the MLP as residual value guarantees
  - b. Some leases contain provisions limiting the lessee's obligation to reimburse the lessor for residual value deficiencies to an amount less than the stipulated residual value of the leased property at the end of the lease term. In computing the MLP associated with these leases, the amount of the lessee's guarantee is limited to the specified maximum deficiency the lessee can be required to reimburse to the lessor
  - c. A lessee may contract with an unrelated third party to guarantee the residual for the benefit of the lessor. The MLP can only be reduced by the third-party guarantee to the extent that the lessor explicitly releases the lessee from the obligation to make up the deficiency, even if the guarantor defaults. Amounts paid by the lessee to the guarantor are executory costs and are not included in the MLP.
3. Any payment that the lessee must or can be required to make upon failure to renew or extend the lease at the expiration of the lease term, whether or not the payment would constitute a purchase of the leased property.

For the lessor: The payments described above, plus any guarantee of the residual value or of the rental payments beyond the lease term by a third party unrelated to either the lessee or lessor (provided the third party is financially capable of discharging the guaranteed obligation).

Noncancelable in this context means that a lease is cancelable only if one of the following conditions is satisfied:

1. A remote contingency occurs
2. The lessor grants permission
3. The lessee enters into a new lease with the same lessor
4. The lessee pays a penalty in an amount such that continuation of the lease appears, at inception, reasonably assured.

**Nonrecourse Financing.** Lending or borrowing activities in which, in the event of default, the collateral available to the creditor is limited to certain assets that are specifically agreed to in the loan agreement, and that collateral does not include the general assets of the debtor.

**Penalty.** Any requirement that is imposed or can be imposed on the lessee by the lease agreement or by factors outside the lease agreement to pay cash, incur or assume a liability, perform services, surrender or transfer an asset or rights to an asset or otherwise forego an economic benefit, or suffer an economic detriment.

**Primary Beneficiary.** A variable interest holder that is required to consolidate a VIE. Consolidation is required when the holder of one or more variable interests would absorb a majority of the VIE's expected losses, receive a majority of the VIE's expected residual returns, or both. If one holder would absorb a majority of the VIE's expected losses and another holder would receive a majority of the VIE's expected residual returns, the holder absorbing the majority of the expected losses is the primary beneficiary and is thus required to consolidate the VIE.

**Profit or Loss on Sale.** The profit or loss that would be recognized on the sale if there were no leaseback. For example, on a sale of real estate subject to Topic 360, the profit on the sale to be deferred and amortized in proportion to the leaseback would be the profit that could otherwise be recognized in accordance with Topic 360.

**Profit Recognition.** Any method to record a transaction involving real estate, other than the deposit method, or the methods to record transactions accounted for as financing, leasing, or profit-sharing arrangements. Profit recognition methods commonly used to record transactions involving real estate include, but are not limited to, the full accrual method, the installment method, the cost recovery method, and the reduced profit method.

**Sale-Leaseback Accounting.** A method of accounting for a sale-leaseback transaction in which the seller-lessee records the sale, removes all property and related liabilities from its statement of financial position, recognizes gain or loss from the sale, and classifies the leaseback in accordance with this section.

**Unguaranteed Residual Value.** The estimated residual value of the leased property, exclusive of any portion guaranteed by the lessee, by any party related to the lessee, or by any party unrelated to the lessee. If the guarantor is related to the lessor, the residual value is considered unguaranteed.

**Unrelated Parties.** All parties that are not related parties as defined above.

## CONCEPTS, RULES, AND EXAMPLES

---

### Variable Interest Entities

From the standpoint of the lessee, it is critical for the accountant to first determine whether the relationship between the entities requires consolidation as a VIE under ASC 810. This is discussed in detail in the chapter on ASC 810. If consolidation is required, the effects of the lease recorded by

the parties will be eliminated in the consolidated financial statements and the lease accounting will, in effect, be moot from the standpoint of the lessee.

In essence, a VIE is an entity that, by design, is not funded with an amount of at-risk equity sufficient to enable it to sustain itself in the face of reasonably possible losses without obtaining additional support (“subordinated financial support”) from existing or additional sources. In practical terms, in the context of leasing, the lessee is at risk for an amount greater than the contractual rental payments—such as for the lessor’s debt arising from financing the leased property.

Determining whether an entity is a VIE involves analysis of the individual facts, circumstances, relationships, structures, risks, and rewards associated with the entity and the parties with whom it is involved. Often, especially when related parties are involved, this analysis can be performed qualitatively without laborious numeric estimates of expected variability. That is because even a superficial review of the relationships and transaction details will reveal that the entity in question is indeed a VIE, or that it clearly is not one.

In more complex situations, however, or when qualitative analysis does not yield a conclusive answer, the holder of one or more variable interests may be required to estimate the present value of the probability-weighted expected cash flows associated with the entity in order to determine the expected variability of the entity’s future cash flows as well as the portion of that expected variability that is allocable to the various holders of variable interests.

For more information and examples regarding leases and consolidation, see the chapter on ASC 810.

### **Lease or Sale—The Interplay of Lease and Revenue Recognition Accounting**

**ASC 840-10-35: Determining whether an arrangement contains a lease.** ASC 840 defines a lease as “an agreement conveying the right to use property, plant, or equipment (land and/or depreciable assets) usually for a stated period of time.” ASC 840-10-35 provides guidance on determining when all or part of an arrangement constitutes a lease.

**Scope of ASC 840-10-35.** Property, plant, or equipment, as the term is used in ASC 840, includes only land and/or depreciable assets. Therefore, inventory (including equipment parts inventory) cannot be the subject of a lease because inventory is not depreciable. Although specific property, plant, or equipment may be explicitly identified in an arrangement, it is not the subject of a lease if the arrangement can be fulfilled without using the specified property, plant, or equipment. For example, if the owner/seller is obligated to deliver a specified quantity of goods or services but can provide those goods or services using property, plant, or equipment other than that specified in the arrangement, then the arrangement does not contain a lease.

In addition, ASC 840 contains specific scope exceptions with respect to agreements concerning:

1. Exploration or exploitation of natural resources (e.g., oil, gas, minerals, and timber)
2. Intangible licensing rights (e.g., motion pictures, plays, manuscripts, patents, and copyrights).

Lease treatment is not precluded in situations where the owner or manufacturer of the property has extended a product warranty that includes a provision for replacement of the property if it is not operating adequately. Similarly, if the arrangement includes a provision permitting the equipment owner the right to substitute other equipment on or after a specified date, irrespective of the reason, the arrangement can still qualify as a lease.

**Right to use property, plant, or equipment.** The right to use the specified property, plant, or equipment is conveyed if any one of the following conditions is met:

- A party (for the purpose of this discussion, we will refer to this party, the potential lessee, as “the recipient” of the rights) has the ability or right to operate the property, plant, or equipment or direct others to do so as the recipient specifies, while attaining or controlling more than a minor portion of the output (or service utility),
- The recipient has the ability or right to control physical access to the specified property, plant, or equipment while attaining or controlling more than a minor portion of the output (or other service utility), or
- Analysis of the relevant facts and circumstances indicates that it is remote (as that term is used in ASC 450-20) that a party (or parties) other than the recipient will attain more than a minor amount of the output (or other service utility) that will be produced or generated by the specified property, plant, or equipment during the term of the arrangement, *and* the price that the recipient will pay for the output is neither contractually fixed per unit of output nor equal to the market price per unit of output at the time delivery of the output is received.

**Timing of initial assessment and subsequent reassessments.** The assessment of whether an arrangement contains a lease is to be made at the inception of the arrangement. A reassessment of whether the arrangement contains a lease is to be made only if (a) the contractual terms are modified, (b) a renewal option is exercised or the parties to the arrangement agree on an extension of its term, (c) there is a change in the determination as to whether or not fulfillment of the arrangement is dependent on the property, plant, or equipment that was originally specified, or (d) the originally specified property and equipment undergoes a substantial physical change. Remeasurement/redetermination is not permitted merely because of a change in an estimate made at inception (e.g., the number of expected units of output or the useful life of the equipment).

**Aggregation of separate contracts.** There is a rebuttable presumption that separate contracts between the same parties (or related parties) that are executed on or near the same date were negotiated together as a package.

This issue also provides accounting guidance for any recognized assets and liabilities existing at the time that an arrangement (or a portion of an arrangement) either ceases to qualify as a lease or commences to qualify as a lease due to a reassessment in the circumstances as described above.

**Sales with a guaranteed minimum resale value.** To provide sales incentives, manufacturers sometimes include in a sales contract a guarantee that the purchaser will, upon disposition of the property, receive a minimum resale amount. Upon disposition, the manufacturer either reacquires the property at the agreed-upon minimum price or reimburses the purchaser for any shortfall between the actual sales proceeds and the guaranteed amount.

ASC 605-50-60<sup>2</sup> states that transactions containing guarantees of resale value of equipment by a manufacturer are to be accounted for as leases and not as sales. The minimum lease payments used to determine if the criteria have been met for lessor sales-type lease accounting, described later in this chapter, are computed as the difference between the proceeds received from the transferee/lessee upon initial transfer of the equipment and the amount of the residual value guarantee on its first contractual exercise date.

---

<sup>2</sup> Upon implementation of ASU 2014-09, this reference will change and the guidance can be found in ASC 606-10-25-30 and ASC 60-10-55-66 through 78.

If the lease is accounted for as an operating lease because it does not qualify for sales-type lease accounting (as discussed and illustrated later in this chapter), the manufacturer/lessor is to record the proceeds received at inception as a liability, which is subsequently reduced by crediting revenue pro rata from the inception of the lease until the first guarantee exercise date so that, on that exercise date, the remaining liability is the guaranteed residual amount. If the lessee elects, under the terms of the arrangement, to continue to use the leased asset after the first exercise date, the manufacturer/lessor will continue to amortize the liability for the remaining residual amount to revenue to reduce it further to any remaining guarantee, if applicable.

The foregoing prescribed accounting is followed by manufacturers even when there is dealer involvement in the transaction when it is the manufacturer who is responsible for the guarantee to the purchaser.

ASC 460-10-55-17 states that ASC 460-10-55 does not apply to these transactions irrespective of whether they are accounted for as operating leases or sales-type leases because, in either case, the underlying of such a guarantee is an asset owned by the guarantor.

**Equipment sold and subsequently repurchased subject to an operating lease.** ASC 605-15-25-5 specifies that if four conditions are satisfied, a manufacturer can recognize a sale at the time its product is transferred to a dealer for subsequent sale to a third-party customer, even if this ultimate customer (the dealer's customer) enters into an operating lease agreement with the same manufacturer or the manufacturer's finance affiliate:

1. The dealer must be an independent entity that conducts business separately with manufacturers and customers,
2. The passage of the product from the manufacturer to the dealer fully transfers ownership,
3. The manufacturer (or finance affiliate) has no obligation to provide a lease arrangement for the dealer's customer, and
4. The dealer's customer is in control of selecting which of the many financing options available will be used.

### Lessee Classification

For accounting and reporting purposes the lessee has two possible classifications for a lease:

1. Operating
2. Capital.

The proper classification of a lease is determined by the circumstances surrounding the transaction. According to ASC 840, if substantially all of the benefits and risks of ownership have been transferred to the lessee, the lessee records the lease as a capital lease at its inception. Substantially all of the risks or benefits of ownership are deemed to have been transferred if any one of the following criteria is met:

1. The lease transfers ownership to the lessee by the end of the lease term.
2. The lease contains a bargain purchase option.
3. The lease term is equal to 75% or more of the estimated economic life of the leased property, and the beginning of the lease term does not fall within the last 25% of the total economic life of the leased property.
4. The present value of the minimum lease payments at the beginning of the lease term is 90% or more of the fair value to the lessor less any investment tax credit retained by the lessor. This requirement cannot be used if the lease's inception is in the last 25% of the useful economic life of the leased asset. The interest rate, used to compute the

present value, is the incremental borrowing rate of the lessee unless the implicit rate is available and lower. For the purpose of this test, lease structuring fees or lease administration fees paid by the lessee to the lessor are included as part of the minimum lease payments. (ASC 840-10-25)

If a lease agreement meets none of the four criteria set forth above, it is classified as an operating lease by the lessee.

### Lessor Classification

There are four possible classifications that apply to a lease from the standpoint of the lessor.

1. Operating
2. Sales-type
3. Direct financing
4. Leveraged.

The conditions surrounding the origination of the lease determine its classification by the lessor. If the lease meets any one of the four criteria specified above for lessees and both of the qualifications set forth below, the lease is classified as either a sales-type lease, direct financing lease, or leveraged lease depending upon the conditions present at the inception of the lease.

1. Collectibility of the minimum lease payments is reasonably predictable
2. No important uncertainties surround the amount of unreimbursable costs yet to be incurred by the lessor under the lease.

If a lease transaction does not meet the criteria for classification as a sales-type lease, a direct financing lease, or a leveraged lease as specified above, it is classified by the lessor as an operating lease. The classification testing is performed prior to considering the proper accounting treatment.

It is a common practice in equipment leasing transactions for the lessor to obtain, from an unrelated third party, a full or partial guarantee of the residual value of a portfolio of leased assets. These transactions are structured in such a manner that the third-party guarantor provides a guarantee of the aggregate residual value of the portfolio but does not individually guarantee the residual value of any of the individually leased assets included in that portfolio. To the extent that a specific leased asset's residual value exceeds the guaranteed minimum amount, that excess is used to offset shortfalls relating to other specific leased assets whose residual values are below the guaranteed minimum amount.

In ASC 840-30-S99, the SEC staff observer announced the SEC staff's position that the expected proceeds from these types of portfolio residual guarantees are to be *excluded* from minimum lease payments in computing the present value of the minimum lease payments for the purpose of determining the lessor's classification of the lease transaction. The SEC believes this treatment to be appropriate because, under the terms of this portfolio guarantee, the lessor is unable to determine, at lease inception, the guaranteed residual amount of any individually leased asset.

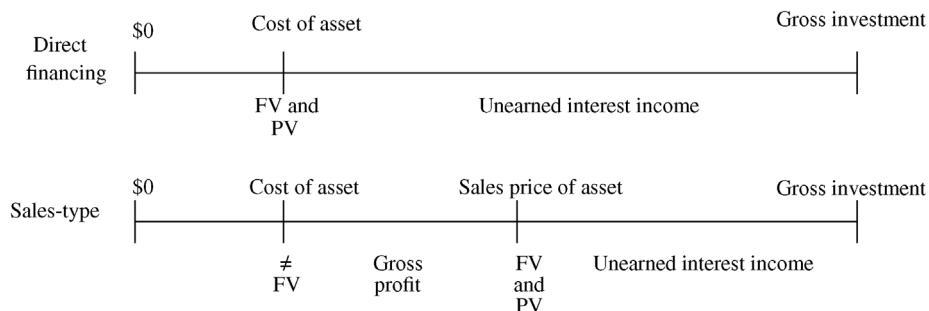

**Distinctions among sales-type, direct financing, and leveraged leases.** A lease is classified as a sales-type lease when the criteria set forth above have been met and the lease transaction is structured in such a way that the lessor (generally a manufacturer or dealer) recognizes a profit or loss on the transaction in addition to interest income. In order for this to occur, the fair value of the property must be different from the cost (carrying value). The essential substance of this transaction is that of a sale, and thus its name. Common examples of sales-type leases:

(1) when a customer of an automobile dealership opts to lease a car in lieu of an outright purchase, and (2) the re-lease of equipment coming off an expiring lease. Note, however, that a lease involving real estate must transfer title (i.e., criterion 1 in the preceding list) by the end of the lease term for the lessor to classify the lease as a sales-type lease.

A direct financing lease differs from a sales-type lease in that the lessor does not realize a profit or loss on the transaction other than interest income. In a direct financing lease, the fair value of the property at the inception of the lease is equal to the cost (carrying value). This type of lease transaction most often involves lessor entities engaged in financing operations. The lessor (a bank, or other financial institution) purchases the asset and then leases the asset to the lessee. This transaction merely replaces the conventional lending transaction in which the borrower uses the borrowed funds to purchase the asset. There are many economic reasons why the lease transaction is considered. They are as follows:

1. The lessee (borrower) is able to obtain 100% financing
2. Flexibility of use for the tax benefits
3. The lessor receives the equivalent of interest as well as an asset with some remaining value at the end of the lease term.

In summary, it may help to visualize the following chart when considering the classification of a lease from the lessor's standpoint:

One form of a direct financing lease is a leveraged lease which is discussed later in this chapter. This type is mentioned separately because it receives a different accounting treatment by the lessor. A leveraged lease meets all the definitional criteria of a direct financing lease, but differs because it involves at least three parties: a lessee, a long-term creditor, and a lessor (commonly referred to as the equity participant). Other characteristics of a leveraged lease are as follows:

1. The financing provided by the long-term creditor must be without recourse to the general credit of the lessor, although the creditor may hold recourse with respect to the leased property. The amount of the financing must provide the lessor with substantial "leverage" in the transaction.
2. The lessor's net investment declines during the early years and rises during the later years of the lease term before its elimination.

### **Lessee Accounting**

As discussed in the preceding section, there are two classifications that apply to a lease transaction from the standpoint of the lessee, operating or capital.

**Operating leases.** The accounting treatment accorded an operating lease is relatively simple; the rental payments are charged to expense as the payments are made or become payable. This assumes that the lease payments are being made on a straight-line basis (i.e., an equal payment per period over the lease term).

If the lease agreement calls for either an alternative payment schedule or a scheduled rent increase over the lease term, per ASC 840-20-25, the lease expense is recognized on a straight-line basis over the lease term unless another systematic and rational basis is a better representation of the actual physical usage of the leased property. In addition, the lessor may grant various incentives to the lessee during the lease term, such as a rent holiday, or allowances to fund leasehold improvements. Incentives paid to or incurred on behalf of the lessee by the lessor are an inseparable part of the lease agreement. These amounts are recognized as reductions to rental expense on a straight-line basis over the term of a lease, as described in the preceding paragraph.

In these instances, it is necessary to record either a prepaid asset or a liability depending upon the structure of the payment schedule. If the scheduled increase(s) is due to additional leased property, recognition is to be based on the portion of the leased property that is being utilized with the increased rents recognized over the years that the lessee has control over the use of the additional leased property.

Notice that in the case of an operating lease there is no recognition of the leased asset on the statement of financial position, because the substance of the lease is merely that of a rental. There is no reason to expect that the lessee will derive any future economic benefit from the leased asset beyond the lease term.

**Capital leases.** Recall that the classification of a lease is determined prior to the consideration of the accounting treatment. Therefore, it is necessary to first examine the lease transaction against the four criteria (transfer of title, bargain purchase option, 75% of useful life, or 90% of net fair value). Should the lease agreement satisfy one of these, it is accounted for as a capital (also referred to as financing) lease.

The lessee records a capital lease as an asset and an obligation (liability) at an amount equal to the present value of the minimum lease payments at the beginning of the lease term. For the purposes of the 90% test, the present value is computed using the incremental borrowing rate of the lessee unless it is practicable for the lessee to determine the implicit rate used by the lessor, and the implicit rate is less than the incremental borrowing rate. The incremental borrowing rate is defined as the rate at lease inception at which the lessee would have been able to borrow over a loan term equivalent to the lease term had it chosen to purchase the leased asset. If the lessee determines a secured borrowing rate that is reasonable and consistent with the financing that would have been used, then it is acceptable to use a secured borrowing rate.

The asset is recorded at the lower of the present value of the minimum lease payments or the fair value of the asset. When the fair value of the leased asset is less than the present value of the minimum lease payments, the interest rate used to amortize the lease obligation will differ from the interest rate used in the 90% test.

The interest rate used in the amortization will be the same as that used in the 90% test when the fair value is greater than or equal to the present value of the minimum lease payments. For purposes of this computation, the minimum lease payments are considered to be the payments that the lessee is obligated to make or can be required to make excluding executory costs such as insurance, maintenance, and taxes.

The minimum lease payments generally include the minimum rental payments, any guarantee of the residual value made by the lessee, and the penalty for failure to renew the lease, if

applicable. If the lease includes a bargain purchase option (BPO), the amount required to be paid under the BPO is also included in the minimum lease payments.

The lease term used in this present value computation is the fixed, noncancelable term of the lease plus the following:

1. All periods covered by bargain renewal options
2. All periods for which failure to renew the lease imposes a penalty on the lessee
3. All periods covered by ordinary renewal options during which the lessee guarantees the lessor's debt on the leased property
4. All periods covered by ordinary renewals or extensions up to the date a BPO is exercisable
5. All periods representing renewals or extensions of the lease at the lessor's option.

Remember, if the amount computed as the present value of the minimum lease payments exceeds the fair value of the leased property at the inception of the lease, the amount recorded is limited to the fair value.

The amortization of the leased asset will depend upon how the lease qualifies as a capital lease. If the lease transaction meets the criteria of either transferring ownership, or containing a bargain purchase option, then the asset arising from the transaction is amortized over the estimated useful life of the leased property. If the transaction qualifies as a capital lease because it meets either the 75% of useful life or 90% of fair value criteria, the asset is amortized over the lease term. The conceptual rationale for this differentiated treatment arises because of the substance of the transaction. Under the first two criteria, the asset actually becomes the property of the lessee at the end of the lease term (or upon exercise of the BPO). In the latter situations, the title to the property remains with the lessor, and, thus, the lessee ceases to have the right to use the property at the conclusion of the lease term.

The leased asset is amortized (depreciated) over the lease term if title does not transfer to the lessee, while the asset is depreciated in a manner consistent with the lessee's normal depreciation policy if the title is to eventually transfer to the lessee. This latter situation can be interpreted to mean that the asset is depreciated over the useful economic life of the leased asset. The treatment and method used to amortize (depreciate) the leased asset is very similar to that used for any other long-lived asset. The amortization entry requires a debit to amortization expense and a credit to accumulated amortization. The leased asset is not amortized below the estimated residual value.

In some instances when the property is to revert to the lessor, there may be a guaranteed residual value. This is an amount that the lessee guarantees to the lessor. If the fair value of the asset at the end of the lease term is greater than or equal to the guaranteed residual amount, the lessee incurs no additional obligation. On the other hand, if the fair value of the leased asset is less than the guaranteed residual value, then the lessee must make up the difference, usually with a cash payment. The guaranteed residual value is often used as a tool to reduce the periodic payments by substituting the lump-sum amount at the end of the term that results from the guarantee. In any event the amortization must still take place based on the estimated residual value. This results in a rational and systematic allocation of the expense to the periods of usage and avoids a large loss (or expense) in the last period as a result of the guarantee.

The annual (periodic) rent payments made during the lease term are allocated between a reduction in the obligation and interest expense in a manner such that the interest expense represents the application of a constant periodic rate of interest to the remaining balance of the lease obligation. This is commonly referred to as the effective interest method.

The following examples illustrate the treatment described in the foregoing paragraphs.

**Example of accounting for a capital lease—Asset returned to lessor**

1. The lease is initiated on 1/1/X1 for equipment with an expected useful life of three years. The equipment reverts to the lessor upon expiration of the lease agreement.
2. The fair value of the equipment at lease inception is \$135,000.
3. Three payments are due to the lessor in the amount of \$50,000 per year beginning 12/31/X1. An additional sum of \$1,000 is to be paid annually by the lessee for insurance.
4. The lessee guarantees a \$10,000 residual value on 12/31/X3 to the lessor.
5. Irrespective of the \$10,000 residual value guarantee, the leased asset is expected to have only a \$1,000 salvage value on 12/31/X3.
6. The lessee's incremental borrowing rate is 10%. (The lessor's implicit rate is unknown.)
7. The present value of the lease obligation is as follows:

$$\begin{array}{rcl}
 \text{PV of guaranteed residual value} & = \$10,000 \times .7513^* & = \$ 7,513 \\
 \text{PV of annual payments} & = \$50,000 \times 2.4869^{**} & = \underline{\$124,345} \\
 & & \underline{\$131,858}
 \end{array}$$

\* The present value of an amount of \$1 due in three periods at 10% is .7513.

\*\* The present value of an ordinary annuity of \$1 for three periods at 10% is 2.4869.

The first step in dealing with any lease transaction is to classify the lease. In this case, the lease term is for three years, which is equal to 100% of the expected useful life of the asset. Note that the 90% test is also fulfilled as the present value of the minimum lease payments (\$131,858) is greater than 90% of the fair value ( $90\% \times \$135,000 = \$121,500$ ). Thus, the lessee accounts for the lease as a capital lease.

In item 7, the present value of the lease obligation is computed. Note that the executory costs (insurance) are not included in the minimum lease payments and that the incremental borrowing rate of the lessee was used to determine the present value. This rate was used because the lessor's implicit rate was not determinable.

---

*NOTE: To have used the implicit rate it would have to have been less than the incremental borrowing rate.*

---

The entry necessary to record the lease on 1/1/X1 is:

Leased equipment	131,858
Lease obligation	131,858

Note that the lease is recorded at the present value of the minimum lease payments that, in this case, is less than the fair value. If the present value of the minimum lease payments had exceeded the fair value, the lease would have been recorded at the fair value.

The next step is to determine the proper allocation between interest and reduction of the lease obligation for each lease payment. This is done using the effective interest method as illustrated below.

Year	Cash payment	Interest expense	Reduction in lease obligation	Balance of lease obligation
Inception of lease				\$131,858
20X1	\$50,000	\$13,186	\$36,814	95,044
20X2	50,000	9,504	40,496	54,548
20X3	50,000	5,452	44,548	10,000

The interest is calculated at 10% (the incremental borrowing rate) of the balance of the lease obligation for each period, and the remainder of each \$50,000 payment is allocated as a reduction in the lease obligation. The lessee is also required to pay \$1,000 for insurance on an annual basis. The entries necessary to record all payments relative to the lease for each of the three years are shown below.

	<u>12/31/X1</u>	<u>12/31/X2</u>	<u>12/31/X3</u>
Insurance expense	1,000	1,000	1,000
Interest expense	13,186	9,504	5,452
Lease obligation	36,814	40,496	44,548
Cash	51,000	51,000	51,000

The leased equipment recorded as an asset must also be amortized (depreciated). The initial unamortized balance is \$131,858; however, as with any other long-lived asset, it cannot be amortized below the estimated residual value of \$1,000 (note that it is amortized down to the actual estimated residual value, not the guaranteed residual value). In this case, the straight-line amortization method is applied over a period of three years. This three-year period represents the lease term, not the life of the asset, because the asset reverts to the lessor at the end of the lease term. Therefore, the following entry will be made at the end of each year:

Amortization expense	43,619	
Accumulated amortization		43,619 $[(\$131,858 - 1,000) \div 3]$

Finally, on 12/31/X3 we must recognize the fact that ownership of the property has reverted back to the owner (lessor). The lessee made a guarantee that the residual value would be \$10,000 on 12/31/14; as a result, the lessee must make up the difference between the guaranteed residual value and the actual residual value with a cash payment to the lessor. The following entry illustrates the removal of the leased asset and obligation from the lessee's accounting records:

Lease obligation	10,000	
Accumulated amortization		130,858
Cash		9,000
Leased equipment		131,858

The foregoing example illustrated a situation where the asset was to be returned to the lessor. Another situation exists (under BPO or transfer of title) where ownership of the asset is expected to transfer to the lessee at the end of the lease term. Remember that leased assets are amortized over their useful life when title transfers or a bargain purchase option exists. At the end of the lease, the balance of the lease obligation should equal the guaranteed residual value, the bargain purchase option price, or termination penalty for failure to renew the lease.

#### Example of accounting for a capital lease—Asset ownership transferred to lessee

1. A three-year lease is initiated on 1/1/X1 for equipment with an expected useful life of five years.
2. Three annual lease payments of \$52,000 are required beginning on 1/1/X1 (note that the payment at the beginning of the year changes the present value computation from the previous example). The lessee pays \$2,000 per year for insurance on the equipment and this amount is included in the annual payments.
3. The lessee can exercise a bargain purchase option on 12/31/X3 for \$10,000. The expected residual value at 12/31/X3 is \$18,000.
4. The lessee's incremental borrowing rate is 10% (the lessor's implicit rate is unknown).
5. The fair value of the leased property at the inception of the lease is \$140,000.

Once again, the classification of the lease must be determined prior to computing the accounting entries to record it. This lease is classified as a capital lease because it contains a BPO. In this case, the 90% test is also fulfilled.

The present value of the lease obligation is computed as follows:

$$\begin{array}{rcl} \text{PV of bargain purchase option} & = & \$10,000 \times .7513^* = \$7,513 \\ \text{PV of annual payments} & = & (\$52,000 - \$2,000) \times 2.4869^{**} = \underline{\underline{\$136,755}} \\ & & \underline{\underline{\$144,268}} \end{array}$$

\* .7513 is the present value of an amount due in three periods at 10%.

\*\* 2.7355 is the present value of an annuity due for three periods at 10%.

Since the lessee pays \$2,000 a year for insurance, this payment is treated as executory costs and excluded from the calculation of the present value of the annual payments. Note that the present value of the lease obligation is greater than the fair value of the asset. Because of this, the lease obligation must be recorded at the fair value of the leased asset:

1/1/X1 Leased equipment	140,000
Obligation under capital lease	140,000

According to ASC 840, the allocation between interest and principal is determined so that interest expense is computed using a constant periodic rate of interest applied to the remaining balance of the obligation. If the fair value of the leased asset is greater than or equal to the present value of the lease obligation, the interest rate used is the same as that used to compute the present value (i.e., the incremental borrowing rate or the implicit rate). In cases such as this, when the present value exceeds the fair value of the leased asset, a new rate must be computed through a series of manual trial and error calculations. Alternatively, spreadsheet or loan amortization software can be used to solve for the unknown effective interest rate. In this situation the interest rate used was 13.267%. The amortization of the lease takes place as follows:

Date	Cash payment	Interest expense	Reduction in lease obligation	Balance of lease obligation
Inception of lease				\$140,000
1/1/X1	\$50,000	\$ –	\$50,000	90,000
1/1/X2	50,000	11,940	38,060	51,940
1/1/X3	50,000	6,891	43,109	8,831
12/31/X3	10,000	1,169	8,831	–

The following entries are required in years 20X1 through 20X3 to recognize the payment and amortization:

		<u>20X1</u>	<u>20X2</u>	<u>20X3</u>
1/1	Insurance expense	2,000	2,000	2,000
	Obligation under capital lease	50,000	38,060	43,109
	Accrued interest payable		11,940	6,891
	Cash	52,000	52,000	52,000
12/31	Interest expense	11,940	6,891	1,169
	Accrued interest payable	11,940	6,891	1,169
12/31	Amortization expense	24,400	24,400	24,400
	Accumulated amortization [(\$140,000 – \$18,000) ÷ 5 years)]	24,400	24,400	24,400
12/31	Obligation under capital lease			8,831
	Accrued interest payable			1,169
	Cash			10,000

## Lessor Accounting

As previously noted, there are four classifications of leases with which a lessor must be concerned. They are operating, sales-type, direct financing, and leveraged.

**Operating leases.** As in the case of the lessee, the operating lease requires a less complex accounting treatment. The payments received by the lessor are recorded as rent revenues in the period in which the payment is received or becomes receivable. As with the lessee, if the rentals vary from a straight-line basis, the lease agreement contains a scheduled rent increase over the lease term, or the lessor grants incentives to the lessee such as a rent holiday or leasehold improvement allowance, the revenue is recorded on a straight-line basis unless an alternative basis of systematic and rational allocation is more representative of the time pattern of physical usage of the leased property. If the scheduled increase(s) is due to the lessee leasing additional property under a master lease agreement, the increase is allocated proportionally to the additional leased property and recognized on a straight-line basis over the years that the lessee has control over the additional leased property. ASC 840-20-25 prescribes that, in this case, the total revised rent be allocated between the previously leased property and the additional leased property based on their relative fair values.

The lessor presents the leased property on the statement of financial position under the caption "Investment in leased property." This caption is shown with or near the fixed assets of the lessor, and depreciated in the same manner as the lessor's other fixed assets.

Any initial direct costs are amortized over the lease term as the related lease revenue is recognized (i.e., on a straight-line basis unless another method is more representative). However, these costs may be charged to expense as incurred if the effect is not materially different from straight-line amortization.

Any incentives made by the lessor to the lessee are treated as reductions of rent and recognized on a straight-line basis over the term of the lease.

In most operating leases, the lessor recognizes rental income over the lease term and does not measure or recognize any gain or loss on any differential between the fair value of the property and its carrying value. One exception to this rule is set forth in ASC 840-40. The exception applies when an operating lease involving real estate is not classified as a sales-type lease because ownership to the property does not transfer to the lessee at the end of the lease term. In this case, if at the inception of the lease the fair value of the property is less than its carrying amount, the lessor must recognize a loss equal to that difference at the inception of the lease.

**Sales-type leases.** In accounting for a sales-type lease, it is necessary for the lessor to determine the following amounts:

1. Gross investment
2. Fair value of the leased asset
3. Cost.

Note that, following the promulgation of ASC 820, there was some confusion over the definition of fair value to be employed for purposes of lease determination and measurement. ASC 820 does not apply to ASC 840 determinations of lease classifications or measurements. However, ASC 820 is applicable to the determinations to be made in business combinations accounted for under ASC 805.

From these amounts, the remainder of the computations necessary to record and account for the lease transaction can be made. The first objective is to determine the numbers necessary to complete the following entry:

Lease receivable	xx
Cost of goods sold	xx
Sales	xx
Inventory	xx
Unearned interest	xx

The gross investment (lease receivable) of the lessor is equal to the sum of the minimum lease payments (excluding executory costs) plus the unguaranteed residual value. The difference between the gross investment and the present value of the two components of gross investment (minimum lease payments and unguaranteed residual value) is recorded as the unearned interest revenue. The present value is computed using the lease term and implicit interest rate (both of which were discussed earlier). The lease term used in this computation includes any renewal options exercisable at the discretion of the lessor. The resulting unearned interest revenue is to be amortized into income using the effective interest method. This will result in a constant periodic rate of return on the net investment (the net investment is the gross investment less the unearned income).

Recall from our earlier discussion that the fair value of the leased property is, by definition, equal to the normal selling price of the asset adjusted by any residual amount retained (this amount retained can be exemplified by an unguaranteed residual value, investment credit, etc.). The adjusted selling price used for a sales-type lease is equal to the present value of the minimum lease payments. Thus, we can say that the normal selling price less the residual amount retained is equal to the PV of the minimum lease payments.

The cost of goods sold to be charged against income in the period of the sale is computed as the historic cost or carrying value of the asset (most likely inventory) plus any initial direct costs, less the present value of the unguaranteed residual value. (ASC 840-30-25-6) The difference between the adjusted selling price and the amount computed as the cost of goods sold is the gross profit recognized by the lessor at the inception of the lease (sale). Thus, a sales-type lease generates two types of revenue for the lessor:

1. The gross profit on the sale
2. The interest earned on the lease receivable.

Note that if the sales-type lease involves real estate, the lessor must account for the transaction under the provisions of ASC 360 in the same manner as a seller of the same property (see chapter on ASC 360).<sup>3</sup>

The application of these points is illustrated in the example below.

#### Example of accounting for a sales-type lease

Price Inc. is a manufacturer of specialized equipment. Many of its customers do not have the necessary funds or financing available for outright purchase. Because of this, Price offers a leasing alternative. The data relative to a typical lease are as follows:

1. The noncancelable fixed portion of the lease term is five years. The lessor has the option to renew the lease for an additional three years at the same rental. The estimated useful life of the asset is ten years.
2. The lessor is to receive equal annual payments over the term of the lease. The leased property reverts to the lessor upon termination of the lease.

<sup>3</sup> Upon implementation of ASU 2014-09, this paragraph will be superseded,

3. The lease is initiated on 1/1/12. Payments are due annually on 12/31 for the duration of the lease term.
4. The cost of the equipment to Price Inc. is \$100,000. The lessor incurs costs associated with the inception of the lease in the amount of \$2,500.
5. The selling price of the equipment for an outright purchase is \$150,000.
6. The equipment is expected to have a residual value of \$15,000 at the end of five years and \$10,000 at the end of eight years.
7. The lessor desires a return of 12% (the implicit rate).

The first step is to calculate the annual payment due to the lessor. To yield the lessor's desired return, the present value of the minimum lease payments must equal the selling price adjusted for the present value of the residual amount. The present value is computed using the implicit interest rate and the lease term. In this case, the implicit rate is given as 12% and the lease term is eight years (the fixed noncancelable portion plus the renewal period). Thus, the computation would be as follows:

$$\text{Normal selling price} - \text{PV of residual value} = \text{PV of minimum lease payments}$$

Or, in this case,

$$\begin{array}{rcl}
 \$150,000 - (.40388^* \times \$10,000) = \$4,038.80 & & 4.96764^{**} \times \text{Annual minimum lease payment} \\
 \underline{\$145,961.20} & & = \text{Annual minimum lease payment} \\
 \underline{4.96764} & & \\
 \$29,382.40 & & = \text{Annual minimum lease payment}
 \end{array}$$

\* .40388 is the present value of an amount of \$1 due in eight periods at a 12% interest rate.

\*\* 4.96764 is the present value of an annuity of \$1 for eight periods at a 12% interest rate.

Prior to examining the accounting implications of the lease, we must first determine the lease classification. Assume that there are no uncertainties regarding the lessor's costs, and the collectibility of the lease payments is reasonably assured. In this example, the lease term is eight years (discussed above) while the estimated useful life of the asset is ten years; thus, this lease is not an operating lease because the lease term covers 80% of the asset's estimated useful life. This exceeds the previously discussed 75% criterion. (Note that it also meets the 90% of fair value criterion because the present value of the minimum lease payments of \$145,961.20 is greater than 90% of the fair value [ $90\% \times \$150,000 = \$135,000$ ].) Next it must be determined if this is a sales-type, direct financing, or leveraged lease. To do this, examine the fair value or selling price of the asset and compare it to the cost. Because the two are not equal, this is a sales-type lease.

Next, obtain the figures necessary for the lessor to record the entry. The gross investment is the total minimum lease payments plus the unguaranteed residual value, or:

$$(\$29,382.40 \times 8 = \$235,059.20) + \$10,000 = \$245,059.20$$

The cost of goods sold is the historical cost of the inventory (\$100,000) plus any initial direct costs (\$2,500) less the present value of the unguaranteed residual value ( $\$10,000 \times .40388 = \$4,038.80$ ). Thus, the cost of goods sold amount is \$98,461.20 ( $= \$100,000 + \$2,500 - \$4,038.80$ ). Note that the initial direct costs will require a credit entry to record their accrual (accounts payable) or payment (cash). The inventory account is credited for the carrying value of the asset, in this case \$100,000.

The adjusted selling price is equal to the present value of the minimum payments, or \$145,961.20. Finally, the unearned interest revenue is equal to the gross investment (i.e., lease receivable) less the present value of the components making up the gross investment (the present values of the minimum annual lease payments of \$29,382.40 and the unguaranteed residual of \$10,000). The computation is  $[\$245,059.20 -$

$(\$29,382.40 \times 4.96764 = \$145,961.20) - (\$10,000 \times .40388 = 4,038.80) = \$95,059.20$ . Therefore, the entry necessary for the lessor to record the lease is:

Lease receivable	245,059.20
Cost of goods sold	98,461.20
Inventory	100,000.00
Sales	145,961.20
Unearned interest	95,059.20
Accounts payable (initial direct costs)	2,500.00

The next step in accounting for a sales-type lease is to determine the proper handling of each payment. Both principal and interest are included in each payment. Interest is recognized using the effective interest rate method so that an equal rate of return is earned each period over the term of the lease. This will require setting up an amortization schedule, as illustrated below:

<u>Year</u>	<u>Cash payment</u>	<u>Interest</u>	<u>Reduction in principal</u>	<u>Balance of net investment</u>
Inception of lease				\$150,000.00
20X1	\$ 29,382.40	\$18,000.00	\$ 11,382.40	138,617.00
20X2	29,382.40	16,634.11	12,748.29	125,869.31
20X3	29,382.40	15,104.32	14,278.08	111,591.23
20X4	29,382.40	13,390.95	15,991.45	95,599.78
20X5	29,382.40	11,471.97	17,910.43	77,689.35
20X6	29,382.40	9,322.72	20,059.68	57,629.67
20X7	29,382.40	6,915.56	22,466.84	35,162.83
20X8	<u>29,382.40</u>	<u>4,219.57</u>	<u>25,162.83</u>	<u>10,000.00</u>
	<u><u>\$235,059.20</u></u>	<u><u>\$95,059.20</u></u>	<u><u>\$140,000.00</u></u>	

A few of the columns need to be elaborated upon. First, the net investment is the gross investment (lease receivable) less the unearned interest. Note that at the end of the lease term, the net investment is equal to the estimated residual value. Also note that the total interest earned over the lease term is equal to the unearned interest at the beginning of the lease term.

The entries below illustrate the proper accounting for the receipt of the lease payment and the amortization of the unearned interest in the first year:

Cash	29,382.40
Lease receivable	29,382.40
Unearned interest	18,000.00
Interest revenue	18,000.00

Note that there is no entry to recognize the principal reduction. This is done automatically when the net investment is reduced by decreasing the lease receivable (gross investment) by \$29,382.40 and the unearned interest account by only \$18,000. The \$18,000 is 12% (implicit rate) of the net investment. These entries are to be made over the life of the lease.

At the end of the lease term the asset is returned to the lessor and the following entry is required:

Asset	10,000
Lease receivable	10,000

**Direct financing leases.** The accounting for a direct financing lease holds many similarities to that for a sales-type lease. Of particular importance is that the terminology used is much the same; however, the treatment accorded these items varies greatly. Again, it is best to preface our discussion by determining our objectives in the accounting for a direct financing lease.

Once the lease has been classified, it must be recorded. To do this, the following numbers must be obtained:

1. Gross investment
2. Cost
3. Residual value.

As noted, a direct financing lease generally involves a leasing company or other financial institution and results in only interest income being earned by the lessor. This is because the fair value (selling price) and the cost are equal and, therefore, no profit is recognized on the actual lease transaction. Note how this is different from a sales-type lease that involves both a profit on the transaction and interest income over the lease term. The reason for this difference is derived from the conceptual nature underlying the purpose of the lease transaction. In a sales-type lease, the manufacturer (distributor, dealer) is seeking an alternative means to finance the sale of the product, whereas a direct financing lease is a result of the consumer's need to finance an equipment purchase through a third party. Because the consumer is unable to obtain conventional financing, he or she turns to a leasing company that will purchase the desired asset and then lease it to the consumer. Here the profit on the transaction remains with the manufacturer, while the interest income is earned by the leasing company.

Like a sales-type lease, the first objective is to determine the amounts necessary to complete the following entry:

Lease receivable	xxx
Asset	xxx
Unearned interest	xx

The gross investment is still defined as the minimum amount of lease payments exclusive of any executory costs plus the unguaranteed residual value. The difference between the gross investment as determined above and the cost (carrying value) of the asset is to be recorded as the unearned interest income because there is no manufacturer's/dealer's profit earned on the transaction. The following entry would be made to record the initial direct costs:

Initial direct costs	xx
Cash (or accounts payable)	xx

The net investment in the lease is defined as the gross investment less the unearned interest income plus the unamortized initial direct costs related to the lease. Initial direct costs are defined in the same way that they were for purposes of the sales-type lease; however, the accounting treatment is different. For a direct financing lease, the unearned lease (interest) income and the initial direct costs are amortized to income over the lease term to yield a constant effective rate of interest on the net investment. Thus, the effect of the initial direct costs is to reduce the implicit interest rate, or yield, to the lessor over the life of the lease.

An example follows that illustrates the preceding principles.

#### Example of accounting for a direct financing lease

Edwards, Inc. needs new equipment to expand its manufacturing operation; however, it does not have sufficient capital to purchase the asset at this time. Because of this, Edwards has employed Samuels Leasing to purchase the asset. In turn, Edwards (the lessee) will lease the asset from Samuels (the lessor). The following information applies to the terms of the lease:

***Lease information***

1. A three-year lease is initiated on 1/1/X1 for equipment costing \$131,858 with an expected useful life of five years. Fair value at 1/1/X2 of the equipment is \$131,858.
2. Three annual payments are due to the lessor beginning 12/31/X1. The property reverts to the lessor upon termination of the lease.
3. The unguaranteed residual value at the end of year three is estimated to be \$10,000.
4. The annual payments are calculated to give the lessor a 10% return (implicit rate).
5. The lease payments and unguaranteed residual value have a present value equal to \$131,858 (FMV of asset) at the stipulated discount rate.
6. The annual payment to the lessor is computed as follows:

$$\begin{aligned}
 \text{PV of residual value} &= \$10,000 \times .7513^* = \$7,513 \\
 \text{PV of lease payments} &= \text{Selling price} - \text{PV of residual value} \\
 &= \$131,858 - 7,513 = \$124,345 \\
 \text{Annual payment} &= \frac{\$124,345}{\text{PV}_3, 10\%} = \frac{\$124,345}{2.4869^{**}} = \$50,000
 \end{aligned}$$

\* .7513 is the present value of an amount due in three periods at 10%.

\*\* 2.4869 is the present value of an annuity of \$1 for three periods at a 10% interest rate.

7. Initial direct costs of \$7,500 are incurred by Samuels in the lease transaction.

As with any lease transaction, the first step must be to determine the proper classification of the lease. In this case, the present value of the lease payments (\$124,345) exceeds 90% of the fair value ( $90\% \times \$131,858 = \$118,672$ ). Assume that the lease payments are reasonably assured and that there are no uncertainties surrounding the costs yet to be incurred by the lessor.

Next, determine the unearned interest and the net investment in the lease.

Gross investment in lease $[(3 \times \$50,000) + \$10,000]$	\$160,000
Cost of leased property	<u>131,858</u>
Unearned interest	<u><u>\$28,142</u></u>

The unamortized initial direct costs are to be added to the gross investment in the lease and the unearned interest income is to be deducted to arrive at the net investment in the lease. The net investment in the lease for this example is determined as follows:

Gross investment in lease	\$160,000
Add: Unamortized initial direct costs	<u>7,500</u>
	<u>\$167,500</u>
Less: Unearned interest income	<u>28,142</u>
Net investment in lease	<u><u>\$139,358</u></u>

The net investment in the lease (Gross investment – Unearned revenue) has been increased by the amount of initial direct costs. Therefore, the implicit rate is no longer 10%. We must recompute the implicit rate. The implicit rate is really the result of an internal rate of return calculation. We know that the lease payments are to be \$50,000 per annum and that a residual value of \$10,000 is expected at the end of the lease term. In return for these payments (inflows) we are giving up equipment (outflow) and incurring initial direct costs (outflows) with a net investment of \$139,358 (\$131,858 +

\$7,500). The only way to manually obtain the new implicit rate is through a trial and error calculation, as set up below.

$$\frac{50,000}{(1+i)} + \frac{50,000}{(1+i)^2} + \frac{50,000}{(1+i)^3} + \frac{10,000}{(1+i)^3} = \$139,358$$

Where  $i$  = implicit rate of interest.

This computation is most efficiently performed using either spreadsheet or present value software. In doing so, the \$139,358 is entered as the present value, the contractual payment stream and residual value are entered, and the software iteratively solves for the unknown implicit interest rate.

In this case, the implicit rate is equal to 7.008%. Thus, the amortization table would be set up as follows:

	(a) Lease payments	(b) Reduction in unearned interest	(c) $PV \times \text{implicitrate (7.008\%)}$	(d) Reduction in initial direct costs ( $b - c$ )	(e) Reduction in $PVI \text{ net invest.}$ $(a - b + d)$	(f) $PVI \text{ net invest.}$ $\text{in lease}$ $(f)_{(n+1)} = (f)_n - (e)$ \$139,358
1	\$ 50,000	\$13,186 (1)	\$ 9,766	\$3,420	\$ 40,234	99,124
2	50,000	9,504 (2)	6,947	2,557	43,053	56,071
3	<u>50,000</u>	<u>5,455</u> (3)	<u>3,929</u>	<u>1,526</u>	<u>46,271</u>	10,000
	<u>\$150,000</u>	<u>\$28,145*</u>	<u>\$20,642</u>	<u>\$7,503</u>	<u>\$129,358</u>	

\* Rounded.

$$(b.1) \$131,858 \times 10\% = \$13,186$$

$$(b.2) [\$131,858 - (\$50,000 - 13,186)] \times 10\% = \$9,504$$

$$(b.3) [\$131,858 - (\$50,000 - 9,504) + (\$50,000 - 13,186)] \times 10\% = \$5,455$$

Here the interest is computed as 7.008% of the net investment. Note again that the net investment at the end of the lease term is equal to the estimated residual value.

The entry made to initially record the lease is as follows:

Lease receivable* [(\$50,000 $\times$ 3) + 10,000]	160,000
Asset acquired for leasing	131,858
Unearned interest	28,142

\* Also the "gross investment in lease."

When the payment of (or obligation to pay) the initial direct costs occurs, the following entry must be made:

Initial direct costs	7,500
Cash (or accounts payable)	7,500

Using the schedule above, the following entries would be made during each of the indicated years:

	20X1	20X2	20X3
Cash	50,000	50,000	50,000
Lease receivable*		50,000	50,000
Unearned interest	13,186	9,504	5,455
Initial direct costs		3,420	2,557
Interest revenue		9,766	6,947

\* Also the "gross investment in lease."

Finally, when the asset is returned to the lessor at the end of the lease term, it must be recorded by the following entry:

Used asset	10,000
Lease receivable*	10,000

\* Also the "gross investment in lease."

**Leveraged leases.** One of the more complex accounting subjects regarding leases is the accounting for a leveraged lease. Just as is the case with sales-type and direct financing leases, the classification of the lease by the lessor has no impact on the classification of the lease by the lessee. The lessee simply considers whether the lease qualifies as an operating lease or a capital lease. The lessor's accounting issues, however, are substantially more complex.

To qualify as a leveraged lease, a lease agreement must meet the following requirements, and the lessor must account for the investment tax credit (when in effect) in the manner described below.

---

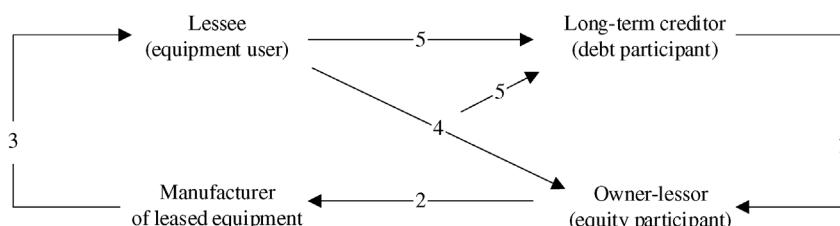

*NOTE: Failure to do so will result in the lease being classified as a direct financing lease.*

---

1. The lease must meet the definition of a direct financing lease (the 90% of fair value criterion does not apply).<sup>4</sup>
2. The lease must involve at least three parties:
  - a. An owner-lessor (equity participant)
  - b. A lessee
  - c. A long-term creditor (debt participant).
3. The financing provided by the creditor is nonrecourse as to the general credit of the lessor and is sufficient to provide the lessor with substantial leverage.
4. The lessor's net investment (defined below) decreases in the early years and increases in the later years until it is eliminated.

This last characteristic poses the accounting issue.

The leveraged lease arose as a result of an effort to maximize the income tax benefits associated with a lease transaction. To accomplish this, it was necessary to involve a third party to the lease transaction (in addition to the lessor and lessee): a long-term creditor. The following diagram<sup>5</sup> illustrates the relationships in a leveraged lease agreement:

<sup>4</sup> A direct financing lease must have its cost or carrying value equal to the fair value of the asset at the lease's inception. So even if the amounts are not significantly different, leveraged lease accounting may not be used.

<sup>5</sup> Adapted from "A Straightforward Approach to Leveraged Leasing" by Pierce R. Smith, *The Journal of Commercial Bank Lending*, July 1973, pp. 40–47.

1. The owner-lessor obtains long-term financing from the creditor, generally in excess of 50% of the purchase price. ASC 840 indicates that the lessor must be provided with sufficient leverage in the transaction, therefore the 50%.
2. The owner then uses this financing along with his/her own funds to purchase the asset from the manufacturer.
3. The manufacturer delivers the asset to the lessee.
4. The lessee remits the periodic rent to the lessor.
5. The debt is guaranteed by using either the equipment as collateral, the assignment of the lease payments, or both, depending on the demands established by the creditor.

The FASB concluded that the entire lease agreement be accounted for as a single transaction and not a direct financing lease plus a debt transaction. The feeling was that the latter did not readily convey the lessor's net investment in the lease to the user of the financial statements. Thus, the lessor records the investment as a net amount. The gross investment is calculated as a combination of the following amounts:

1. The rentals receivable from the lessee, net of the principal and interest payments due to the long-term creditor
2. A receivable for the amount of the investment tax credit (ITC) to be realized on the transaction<sup>3</sup>
3. The estimated residual value of the leased asset
4. The unearned and deferred income, consisting of:
  - a. The estimated pretax lease income (or loss), after deducting initial direct costs, remaining to be allocated to income
  - b. The ITC remaining to be allocated to income over the remaining term of the lease.<sup>6</sup>

The first three amounts described above are readily obtainable; however, the last amount, the unearned and deferred income, requires additional computations. In order to compute this amount, it is necessary to create a cash flow (income) analysis by year for the entire lease term. As described in item 4 of the preceding list, the unearned and deferred income consists of the pretax lease income (Gross lease rentals – Depreciation – Loan interest) and the unamortized investment tax credit. The total of these two amounts for all of the periods in the lease term represents the unearned and deferred income at the inception of the lease.

The amount computed as the gross investment in the lease (foregoing paragraphs) less the deferred taxes relative to the difference between pretax lease income and taxable lease income is the net investment for purposes of computing the net income for the period. To compute the periodic net income, another schedule must be completed that uses the cash flows derived in the first schedule and allocates them between income and a reduction in the net investment.

The amount of income is first determined by applying a rate to the net investment. The rate to be used is the rate that will allocate the entire amount of cash flow (income) when applied in the years in which the net investment is positive. In other words, the rate is derived in much the same way as the implicit rate (trial and error), except that only the years in which there is a positive net investment are considered. Thus, income is recognized only in the years in which there is a positive net investment.

---

<sup>6</sup> The ITC was repealed, effective January 1, 1986. ITC was relevant only for property placed in service prior to this date. We continue to discuss these concepts because Congress has historically reinstated this credit during economic downturns.

The income recognized is divided among the following three elements:

1. Pretax accounting income
2. Amortization of investment tax credit
3. The tax effect of the pretax accounting income.

The first two are allocated in proportionate amounts from the unearned and deferred income included in the calculation of the net investment. In other words, the unearned and deferred income consists of pretax lease accounting income and ITC. Each of these is recognized during the period in the proportion that the current period's allocated income is to the total income (cash flow). The last item, the income tax effect, is recognized in income tax expense for the year. The income tax effect of any difference between pretax lease accounting income and taxable lease income is charged (or credited) to deferred income taxes.

When income tax rates change, all components of a leveraged lease must be recalculated from the inception of the lease using the revised after-tax cash flows arising from the revised income tax rates.

If, in any case, the projected cash receipts (income) are less than the initial investment, the deficiency is to be recognized as a loss at the inception of the lease. Similarly, if at any time during the lease period the aforementioned method of recognizing income would result in a future period loss, the loss is to be recognized immediately.

This situation may arise as a result of the circumstances surrounding the lease changing. Therefore, any estimated residual value and other important assumptions must be reviewed on a periodic basis (at least annually). Any change is to be incorporated into the income computations; however, there is to be no upward revision of the estimated residual value.

The following example illustrates the application of these principles to a leveraged lease.

#### Example of simplified leveraged lease

1. A lessor acquires an asset for \$100,000 with an estimated useful life of three years in exchange for a \$25,000 down payment and a \$75,000 three-year note with equal payments due on 12/31 each year. The interest rate is 18%.
2. The asset has no residual value.
3. The present value of an ordinary annuity of \$1 for three years at 18% is 2.17427.
4. The asset is leased for three years with annual payments due to the lessor on 12/31 in the amount of \$45,000.
5. The lessor uses the Accelerated Cost Recovery System (ACRS) method of depreciation (150% declining balance with a half-year convention in the year placed in service) for income tax purposes and elects to reduce the ITC rate to 4% as opposed to reducing the depreciable basis.
6. Assume a constant income tax rate throughout the life of the lease of 40%.

Chart 1 analyzes the cash flows generated by the leveraged leasing activities. Chart 2 allocates the cash flows between the investment in leveraged leased assets and income from leveraged leasing activities. The allocation requires finding that rate of return, which when applied to the investment balance at the beginning of each year that the investment amount is positive, will allocate the net cash flow fully to net income over the term of the lease. This rate can be found only by a computer program or by an iterative trial and error process. The example that follows has a positive investment value in each of the three years, and thus the allocation takes place in each time period. Leveraged leases usually have periods where the investment account turns negative and is below zero.

Allocating principal and interest on the loan payments is as follows:

$$(\$75,000 \div 2.17427 = \$34,494)$$

<u>Year</u>	<u>Payment</u>	<u>Interest 18%</u>	<u>Principal</u>	<u>Balance</u>
Inception of lease	\$ —	\$ —	\$ —	\$75,000
1	34,494	13,500	20,994	54,006
2	34,494	9,721	24,773	29,233
3	34,494	5,261	29,233	—

**Chart 1**

	<i>A</i>	<i>B</i>	<i>C</i>	<i>D</i>	<i>E</i> <i>Income</i>	<i>F</i>	<i>G</i>	<i>H</i>	<i>I</i>
					<i>Taxable income</i>	<i>tax payable</i>	<i>Loan principal</i>	<i>Cash flow</i> <i>(A + G - C)</i>	<i>Cumulative cash flow</i>
	<i>Rent</i>	<i>Depr.</i>	<i>Interest on loan</i>	<i>(A-B-C)</i>	<i>Dx40%</i>	<i>payments</i>	<i>ITC</i>	<i>E - F</i>	
Initial	\$ —	\$ —	\$ —	\$ —	\$ —	\$ —	\$ —	\$ (25,000)	\$ (25,000)
Year 1	45,000	25,000	13,500	6,500	2,600	20,994	4,000	11,906	(13,094)
Year 2	45,000	38,000	9,721	(2,721)	(1,088)	24,773	—	11,594	(1,500)
Year 3	45,000	37,000	5,261	2,739	1,096	29,233	—	9,410	7,910
Total	<u>\$135,000</u>	<u>\$100,000</u>	<u>\$28,482</u>	<u>\$6,518</u>	<u>\$2,608</u>	<u>\$75,000</u>	<u>\$4,000</u>	<u>\$ 7,910</u>	

The chart below allocates the cash flows determined above between the net investment in the lease and income. Recall that the income is then allocated between pretax accounting income and the amortization of the investment credit. The income tax expense for the period is a result of applying the income tax rate to the current periodic pretax accounting income.

The amount to be allocated in total in each period is the net cash flow determined in column H above. The investment at the beginning of year one is the initial down payment of \$25,000. This investment is then reduced on an annual basis by the amount of the cash flow not allocated to income.

**Chart 2**

	<i>1</i>	<i>2</i>	<i>3</i>	<i>4</i>	<i>5</i>	<i>6</i> <i>Income analysis</i>	<i>7</i>
	<i>Cash flow assumption</i>						
	<i>Investment beginning of year</i>	<i>Cash flow</i>	<i>Allocated to investment</i>	<i>Allocated to income</i>	<i>Pretax income</i>	<i>Income tax expense</i>	<i>Investment tax credit</i>
Year 1	\$25,000	\$11,906	\$ 7,964	\$3,942	\$3,248	\$1,300	\$1,994

		<u>\$32,910</u>	<u>\$25,000</u>	<u>\$7,910</u>	<u>\$6,518</u>	<u>\$2,608</u>	<u>\$4,000</u>

$$\text{Rate of return} = 15.77\%$$

- Column 2 is the net cash flow after the initial investment, and columns 3 and 4 are the allocation based upon the 15.77% rate of return. The total of column 4 is the same as the total of column H in Chart 1.
- Column 5 allocates column D in Chart 1 based upon the allocations in column 4. Column 6 allocates column E in Chart 1 (and, of course, is computed as 40% of column 5), and column 7 allocates column G in Chart 1 on the same basis.

The journal entries below illustrate the proper recording and accounting for the leveraged lease transaction. The initial entry represents the cash down payment, investment tax credit receivable, the unearned and deferred revenue, and the net cash to be received over the term of the lease.

The remaining journal entries recognize the annual transactions which include the net receipt of cash and the amortization of income.

	<u>Year 1</u>	<u>Year 2</u>	<u>Year 3</u>
Rents receivable [Chart 1 (A – C – F)]	31,518		
Investment tax credit receivable	4,000		
Cash	25,000		
Unearned and deferred income	10,518		
<i>Initial investment, Chart 2 (5 + 7) totals</i>			
	<u>Year 1</u>	<u>Year 2</u>	<u>Year 3</u>
Cash	10,506	10,506	10,506
Rent receivable	10,506	10,506	10,506
<i>Net for all cash transactions, Chart 1 (A – C – F) line by line for each year</i>			
Income tax receivable (cash)	4,000		
Investment tax credit receivable	4,000		
Unearned and deferred income	5,242	3,571	1,705
Income from leveraged leases	5,242	3,571	1,705
<i>Amortization of unearned income, Chart 2 (5 + 7) line by line for each year</i>			

The following schedules illustrate the computation of deferred income tax amount. The annual amount is a result of the temporary difference created due to the difference in the timing of the recognition of income for GAAP and income tax purposes. The income for income tax purposes can be found in column D in Chart 1, while the income for GAAP purposes is found in column 5 of Chart 2. The actual amount of deferred income tax is the difference between the income tax computed with the temporary difference and the income tax computed without the temporary difference. These amounts are represented by the income tax payable or receivable as shown in column E of Chart 1 and the income tax expense as shown in column 6 of Chart 2. A check of this figure is provided by multiplying the difference between GAAP income and tax income by the annual rate.

	<u>Year 1</u>	
Income tax payable	\$ 2,600	
Income tax expense	(1,300)	
Deferred income tax (Dr)		<u>\$1,300</u>
Taxable income	\$6,500	
Pretax accounting income	(3,248)	
Difference	<u>\$3,252</u>	
$\$3,252 \times 40\% = \$1,300$		
	<u>Year 2</u>	
Income tax receivable	\$1,088	
Income tax expense	885	
Deferred income tax (Dr)		<u>\$1,973</u>
Taxable loss	\$2,721	
Pretax accounting income	2,213	
Difference	<u>\$4,934</u>	
$\$4,934 \times 40\% = \$1,973$		

	<u>Year 3</u>
Income tax payable	\$ 1,096
Income tax expense	<u>(423)</u>
Deferred income tax (Dr)	<u>\$673</u>
Taxable income	\$ 2,739
Pretax accounting income	<u>(1,057)</u>
Difference	<u>\$1,682</u>
$\$1,682 \times 40\% = \$673$	

***Interpretive guidance.***

*Changes in income tax rates.* ASC 840 requires that the rate of return and allocation of income to be recalculated from the date of inception of a lease and a gain or loss recognized when an important assumption is changed. Per ASC 840-30-35, the effect on a leveraged lease of a change in the income tax rate is recognized as a gain or loss in the accounting period in which the rate changes. Deferred income taxes relating to the change are recognized in accordance with ASC 740.

*Change or projected changes in the timing of cash flows relative to income taxes applicable to a leveraged lease transaction.* ASC 840 also provides that the projected timing of income tax cash flows attributable to a leveraged lease is to be reviewed annually during the lease term (or between annual reviews if events or changes in circumstances indicate that a change in timing either has occurred or is projected to occur in the future). Upon review, if the projected timing of the lease's income tax cash flows changes, the lessor will be required to recalculate, from the inception of the lease, the rate of return and the allocation of income to positive investment years in accordance with ASC 840-30-35. The net investment amount is adjusted to the recalculated amount with the change recognized as a gain or loss in the year that the assumptions changed. The pretax gain or loss is to be included in income from continuing operations before income taxes in the same financial statement caption in which leverage lease income is recognized with the income tax effect of the gain or loss reflected in the income tax provision or benefit.

The standard further provides that the recalculated cash flows are to exclude interest and penalties, advance payments, and deposits to the IRS (and presumably any other relevant state, local, or foreign taxing jurisdiction). The deposits or advance payments are to be included in the projected amount of the settlement with the taxing authority.

This accounting treatment is applicable only to changes or projected changes in the timing of income taxes that are directly attributable to the leveraged lease transaction. ASC 840-30-35 provides that reporting entities whose tax positions frequently vary between the alternative minimum tax (AMT) and regular tax are not required to annually recalculate the net investment in the lease unless there is an indication that the original assumptions about the leveraged lease's anticipated total after-tax net income were no longer valid.

Another factor to consider in the determination of the after-tax cash flows attributable to a leveraged lease transaction is the application of ASC 740-40-25, *Income Taxes—Recognition*. As discussed in detail in the chapter on ASC 740, the lessor is required to assess whether it is more likely than not (i.e., there is a greater than 50% chance probability) that the tax positions it takes or plans to take relative to the transaction would be sustained upon examination by the applicable taxing authorities. If the tax positions do not meet that recognition threshold, the tax benefits associated with taking those positions would be excluded from the leveraged lease calculations and, in fact, would give rise to a liability for unrecognized income tax benefits as well as an accrual for any applicable interest and penalties for all open tax years that are within the statute of

limitations. This could obviously have a significant impact on the computed rate of return on the investment attributable to the years in which the net investment is positive.

If, however, the tax positions meet the recognition threshold, then they are subject to measurement to determine the maximum amount that is more than 50% probable of being sustained upon examination. The difference between the income tax position taken or planned to be taken on the income tax return (the “as-filed” benefit), and the amount of the benefit measured using the more than 50% computation, along with any associated penalties and interest, is recorded as the liability for unrecognized income tax benefits as previously described.

The only situation in which this liability, penalties, and interest would not be applicable would be if the tax positions were assessed to be highly certain tax positions, as defined in ASC 740-10-55. Under those circumstances, the entire tax benefit associated with the lease would be recognized and, of course, no interest or penalties would be recognized.

*Applicability to real estate leases.* The foregoing discussion involved the lease of a manufactured asset. ASC 840-40 clarifies that leases that involve land and buildings or leases in a sale-leaseback transaction potentially qualify as leveraged leases if the criteria to qualify as a leveraged lease are met.

*Applicability to existing assets of the lessor.* At the inception of a lease, the cost or carrying value and the fair value of an asset must be the same for the lease to be classified as a direct financing lease which is a necessary condition for leveraged lease treatment. The carrying amount of an existing asset before any write-down must equal its fair value in order for the lease to be classified as a leveraged lease. (ASC 840-10-55)

## Real Estate Leases

Real estate leases can be divided into the following four categories:

1. Leases involving land only
2. Leases involving land and building(s)
3. Leases involving real estate and equipment
4. Leases involving only part of a building.

### Leases involving only land

**Lessee accounting.** If the lease agreement transfers ownership or contains a bargain purchase option, the lessee accounts for the lease as a capital lease, and records an asset and related liability equal to the present value of the minimum lease payments. If the lease agreement does not transfer ownership or contain a bargain purchase option, the lessee accounts for the lease as an operating lease.

**Lessor accounting.** If the lease gives rise to dealer’s profit (or loss) and transfers ownership (i.e., title), the lease is classified as a sales-type lease and accounted for under the provisions of ASC 360-20<sup>7</sup> in the same manner as a seller of the same property. (ASC 840-10-25-55) If the lease transfers ownership and the criteria for both collectibility and no material uncertainties are met, but the lease does not give rise to dealer’s profit (or loss), the lease is accounted for as a direct financing or leveraged lease as appropriate. If the lease does not transfer ownership, but it contains a bargain purchase option and both the collectibility and no material uncertainties criteria are met, the lease is accounted for as a direct financing, leveraged, or operating lease using the same lessor classification criteria as any other lease. If the lease does not meet the collectibility and/or no material uncertainties criteria, the lease is accounted for as an operating lease.

<sup>7</sup> Upon implementation of ASC 2014-09, this reference will change to ASC 610-20.

## Leases involving land and building

**Lessee accounting.** If the agreement transfers title or contains a bargain purchase option, the lessee accounts for the agreement by separating the land and building components and capitalizing each separately. The land and building elements are allocated on the basis of their relative fair values measured at the inception of the lease. The land and building components are separately accounted for because the lessee is expected to own the real estate by the end of the lease term. The building is amortized over its estimated useful life without regard to the lease term.

When the lease agreement neither transfers title nor contains a bargain purchase option, the fair value of the land must be determined in relation to the fair value of the aggregate property included in the lease agreement. If the fair value of the land is less than 25% of the aggregate fair value of the leased property, then the land is considered immaterial. Conversely, if the fair value of the land is 25% or greater of the fair value of the aggregate leased property, then the land is considered material and the land and building must be treated separately for accounting purposes.

When the land component of the lease agreement is considered immaterial (fair value land < 25% of the total fair value), the lease is accounted for as a single unit. The lessee capitalizes the lease if one of the following applies:

1. The term of the lease is 75% or more of the economic useful life of the building.
2. The present value of the minimum lease payments equals 90% or more of the fair value of the leased real estate less any lessor investment tax credit.

If neither of the above two criteria is met, the lessee accounts for the lease agreement as a single operating lease.

When the land component of the lease agreement is considered material (fair value land  $\geq$  25% of the total fair value), the land and building components are separated. By applying the lessee's incremental borrowing rate to the fair value of the land, the annual minimum lease payment attributed to land is computed. The remaining payments are attributed to the building. The division of minimum lease payments between land and building is essential for both the lessee and lessor. The portion of the lease involving the land is always accounted for as an operating lease. The lease involving the building(s) must meet either the 75% or 90% test to be treated as a capital lease. If neither of the two criteria is met, the building(s) are also accounted for as an operating lease.

### *Computing the minimum lease payments.*

**Construction period lease payments.** Payments made by a lessee during construction of the leased asset and prior to the beginning of the lease term (sometimes called "construction period lease payments") are considered part of the minimum lease payments for the purpose of the 90% of fair value test. These advance payments are to be included in minimum lease payments at their future value, at the beginning of the lease term, with interest accreted using the same interest rate used to discount payments made during the lease term. (ASC 840-10-25)

If the lease is an operating lease, these payments are accounted for as prepaid rent and amortized to expense along with other rental costs over the term of the lease, normally using the straight-line method.

**Residual value guarantees.** If the terms of the lease include a guarantee of the residual value of the leased property by the lessee, that guarantee is to be included in the minimum lease payments and, in accordance with ASC 840-10-25, is to be allocated entirely to the building. This treatment is consistently followed by both the lessee and the lessor.

*Environmental indemnifications.* An indemnification by the lessee to the lessor that any environmental contamination that the lessee causes during the lease term does not affect the lessee's classification of the lease as capital or operating.

If the lessee's indemnification covers contamination that occurred prior to the lease term, the lessee is to consider, under the ASC 450 criteria for evaluating contingencies, whether the likelihood of loss is considered remote, reasonably possible, or probable before considering any available reimbursements available from insurance companies or other third parties. If the probability of loss is considered remote, then the indemnification does not affect the lessee's classification of the lease. If, however, the probability of loss is either reasonably possible or probable, the transaction is subject to the sale-leaseback provisions of ASC 840-40 and the lessee will be considered to have purchased, sold, and then leased back the property. A lessee providing an indemnification that meets certain criteria under ASC 460 is required to record the indemnification as a guarantee and, in addition, is subject to that pronouncement's disclosure provisions.

*Lessee obligation to maintain financial covenants.* Leases sometimes contain financial covenants similar to those included in loan agreements that obligate the lessee to maintain certain financial ratios. Should the lessee violate these covenants, it is considered an event of default under the lease and the lessor may have a right to put the property to the lessee or require the lessee to make a payment to the lessor. In this case, for the purpose of the 90% of fair value test, the lessee includes in the minimum lease payments the maximum amount it would be required to pay in the event of default unless all of the following conditions exist:

1. The default covenant provision is customary in financing arrangements,
2. The occurrence of the event of default is objectively determinable and is not at the subjective whim of the lessor,
3. The event of default is based on predefined criteria that relate solely to the lessee and its operations, and
4. It is reasonable to assume at the inception of the lease and in considering recent lessee operating trends that the event of default will not occur.

*Lessor accounting.* The lessor's accounting depends on whether the lease transfers ownership, contains a bargain purchase option, or does neither of the two.

If the lease transfers ownership and gives rise to dealer's profit (or loss), the lessor classifies the lease as a sales-type lease and accounts for the lease as a single unit under the provisions of ASC 360-20 in the same manner as a seller of the same property. If the lease transfers ownership, meets both the collectibility and no important uncertainties criteria, but does not give rise to dealer's profit (or loss), the lease is accounted for as a direct financing or leveraged lease as appropriate.

If the lease contains a bargain purchase option and gives rise to dealer's profit (or loss), the lease is classified as an operating lease. If the lease contains a bargain purchase option, meets both the collectibility and no material uncertainties criteria, but does not give rise to dealer's profit (or loss), the lease is accounted for as a direct financing lease or a leveraged lease as appropriate.

If the lease agreement neither transfers ownership nor contains a bargain purchase option, the lessor should follow the same rules as the lessee in accounting for real estate leases involving land and building(s).

However, the collectibility and the no material uncertainties criteria must be met before the lessor can account for the agreement as a direct financing lease, and in no such case may the lease be classified as a sales-type lease (i.e., ownership must be transferred).

The treatment of a lease involving both land and building can be illustrated in the following examples.

**Example of lessee accounting for land and building lease containing transfer of title**

1. The lessee enters into a ten-year noncancelable lease for a parcel of land and a building for use in its operations. The building has an estimated remaining useful life of twelve years.
2. The fair value of the land is \$75,000, while the fair value of the building is \$310,000.
3. A payment of \$50,000 is due to the lessor at the beginning of each of the ten years of the lease.
4. The lessee's incremental borrowing rate is 10%. (The lessor's implicit rate is unknown.)
5. Ownership will transfer to the lessee at the end of the lease.

The present value of the minimum lease payments is \$337,951 ( $\$50,000 \times 6.75902$ ).<sup>8</sup> The portion of the present value of the minimum lease payments to be capitalized for each of the two components of the lease is computed as follows:

FV of land		\$ 75,000
FV of building		<u>310,000</u>
Total FV of leased property		<u>\$385,000</u>
Portion of PV allocated to land	$\$337,951 \times \frac{75,000}{385,000}$	= \$65,835
Portion of PV allocated to building	$\$337,951 \times \frac{310,000}{385,000}$	= <u>272,116</u>
Total PV to be capitalized		<u>\$337,951</u>

The entry made to initially record the lease is as follows:

Leased land	65,835
Leased building	272,116
Lease obligation	337,951

Subsequently, the obligation will be decreased using the effective interest method. The leased building will be amortized over its expected useful life.

**Example of lessee accounting for land and building lease without transfer of title or bargain purchase option**

Assume the same facts as the previous example except that title does not transfer at the end of the lease.

The lease is still a capital lease because the lease term is more than 75% of the remaining useful life of the building. Since the fair value of the land is less than 25% of the aggregate fair value of the leased property, ( $75,000/385,000 = 19\%$ ), the land component is considered immaterial and the lease is accounted for as a single unit. The entry to record the lease is as follows:

Leased property	337,951
Lease obligation	337,951

Assume the same facts as the previous example except that the fair value of the land is \$110,000 and the fair value of the building is \$275,000. Once again title does not transfer.

Because the fair value of the land exceeds 25% of the aggregate fair value of the leased property ( $110,000/385,000 = 29\%$ ), the land component is considered material and the lease is

<sup>8</sup> 6.75902 is the present value of an annuity due for ten periods at 10%.

separated into two components. The annual minimum lease payment attributed to the land is computed as follows:

$$\begin{array}{ll} \text{FV of land} & \$110,000 = \$16,275 \\ \text{PV factor} & 6.75902^* \end{array}$$

\* 6.75902 is the present value of an annuity due for ten periods at 10%.

The remaining portion of the annual payment is attributed to the building.

Annual payment	\$50,000
Less amount attributed to land	<u>(16,275)</u>
Annual payment attributed to building	<u>\$33,725</u>

The present value of the minimum annual lease payments attributed to the building is then computed as follows:

$$\begin{array}{ll} \text{Minimum annual lease payment attributed to building} & \$33,725 \\ \text{PV factor} & \times 6.75902^* \\ \text{PV of minimum annual lease payments attributed to} & \underline{\$227,948} \\ \text{building} & \end{array}$$

\* 6.75902 is the present value of an annuity due for ten periods at 10%.

The entry to record the capital portion of the lease is as follows:

Leased building	227,948
Lease obligation	227,948

There is no computation of the present value of the minimum annual lease payment attributed to the land since the land component of the lease is treated as an operating lease. For this reason, each year \$16,275 of the \$50,000 lease payment will be recorded as land rental expense. The remainder of the annual payment (\$33,725) will be applied against the lease obligation using the effective interest method.

**Leases involving real estate and equipment.** ASC 360-20-15 states that sales of integral equipment are within the scope of ASC 360-20. Consequently, the determination of whether equipment is considered to be integral equipment has increased in importance. A determination of whether equipment to be leased is integral is also necessary for proper accounting for sales-type leases by lessors.

According to ASC 360-20-15,<sup>9</sup> the determination of whether equipment is integral is based on two factors:

1. The significance of the cost to remove the equipment from its existing location (which would include the costs of repairing the damage done to that location by the removal).
2. The decrease in value of the equipment that would result from its removal (which is, at minimum, the cost to ship the equipment to the new site and reinstall it). The nature of the

---

<sup>9</sup> Upon implementation of ASU 2014-09, this reference will change to 978-10-15-7/.

equipment and whether others can use it are considered in determining whether there is further diminution in fair value. When the combined total of the cost to remove and any further diminution of value exceeds 10% of the fair value of the equipment (installed), the equipment is considered integral equipment.

ASC 360-20-15 clarifies that ASC 360-20 applies to all sales of real estate, including real estate with accompanying property improvements or integral equipment. Consistent with ASC 360-20-15, ASC 840-10-25 specifies that when evaluating a lease that includes integral equipment to determine the classification of the lease under ASC 840, the equipment is to be evaluated as real estate. ASC 840-10-25 also provides guidance on evaluating how to determine transfer of ownership of integral equipment when no statutory title registration system exists in the jurisdiction.

When real estate leases also involve equipment or machinery, the equipment component is separated and accounted for as a separate lease agreement by both lessees and lessors. “The portion of the minimum lease payments applicable to the equipment element of the lease shall be estimated by whatever means are appropriate in the circumstances.” The lessee and lessor apply the capitalization requirements to the equipment lease independently of accounting for the real estate lease(s). The real estate leases are handled as discussed in the preceding two sections. In a sale-leaseback transaction involving real estate with equipment, the equipment and land are not separated.

**Leases involving only part of a building.** It is common to find lease agreements that involve only part of a building as, for example, when leasing a floor of an office building or a store in a shopping mall. A difficulty that arises in this situation is that the cost and/or fair value of the leased portion of the whole may not be objectively determinable.

**Lessee accounting.** If the fair value of the leased property is objectively determinable, then the lessee follows the rules and accounts for the lease as described in “Leases involving land and building.” If the fair value of the leased property cannot be objectively determined, consider whether the agreement satisfies the 75% test. This calculation is made using the estimated remaining economic life of the building in which the leased premises are located. If the test is met (i.e., the term of the lease is 75% or more of the estimated remaining economic life of the building), the lease is accounted for as a capital lease. If the test is not met, the lease is accounted for as an operating lease.

**Lessor accounting.** From the lessor’s position, both the cost and fair value of the leased property must be objectively determinable before the procedures described under “Leases involving land and building” will apply. If either the cost or the fair value cannot be determined objectively, the lessor accounts for the agreement as an operating lease.

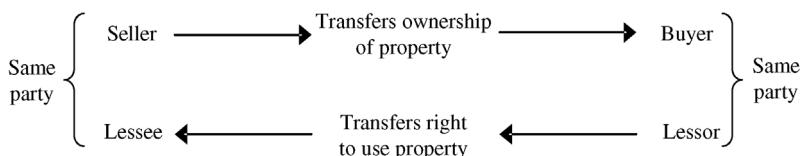

**Operating leases with guarantees.** It is important to note that, for any operating lease where the terms include a guarantee of the residual value of the leased asset, two issues require consideration:

1. Since a guarantee constitutes a variable interest in the lessor or in the leased assets, does the guarantee cause the lessee to be the primary beneficiary of the lessor that would be required to consolidate the lessor? (See discussion of ASC 810 earlier in this chapter.)
2. Is the guarantee required to be recognized as a liability at inception on the statement of financial position of the lessee under ASC 460?

**Lessee-incurred real estate development or construction costs.** Lessees sometimes incur real estate development or construction costs prior to executing a lease with the developer/lessor. The lessee records these costs as construction in progress on its statement of financial position and any subsequent lease arrangement is accounted for as a sale-leaseback transaction under ASC 840-40, as discussed in the following section.

### Sale-Leaseback Transactions

Sale-leaseback describes a transaction where the owner of property (seller-lessee) sells the property, and then immediately leases all or part of it back from the new owner (buyer-lessor). These transactions may occur when the seller-lessee is experiencing cash flow or financing problems or because of available income tax advantages. The important consideration in this type of transaction is the recognition of two separate and distinct economic events. It is important to note, however, that in a typical sale-leaseback there is not a change in the party that has the right to use the property. First, there is a sale of property, and second, there is a lease agreement for the same property in which the original seller is the lessee and the original buyer is the lessor. This is illustrated below.

A sale-leaseback transaction is usually structured with the sales price of the asset at or above its current fair value. The result of this higher sales price is higher periodic rental payments over the lease term. The transaction is usually attractive because of the income tax benefits associated with it. The seller-lessee benefits from the higher price because of the increased gain on the sale of the property and the deductibility of the lease payments that are usually larger than the depreciation that was previously being deducted. The buyer-lessor benefits from both the higher rental payments and the larger depreciable income tax basis.

**Retention of rights to use the property.** The accounting treatment from the seller-lessee's point of view will depend upon the extent to which it retains the rights to use the property which can be characterized as one of the following:

1. Substantially all
2. Minor
3. More than minor but less than substantially all.

#### Retention of Rights to Use Property

Minor	More than minor but less than substantially all	Substantially all
0%	10%	90% 100%

Present value of reasonable leaseback rentals as a percent of the fair value of the asset sold

As depicted in the diagram “Retention of Rights to Use Property,” the guideline for the determination of substantially all is based upon the classification criteria presented for the lease transaction. That is, if the present value of fair rental payments is equal to 90% or more of the fair value of the asset sold, the seller-lessee is presumed to have retained substantially all of the rights to use the sold property. The test for retention of minor rights would be to substitute 10% or less for 90% or more in the preceding sentence.

If substantially all the rights to use the property are retained by the seller-lessee, and the agreement meets at least one of the criteria for capital lease treatment, the seller-lessee accounts for the leaseback as a capital lease and any profit on the sale is deferred and amortized in proportion to amortization of the leased asset. If the leaseback is classified as an operating lease, it is accounted for as such, and any profit on the sale is deferred and amortized over the lease term in proportion to gross rental charges. Any loss on the sale would also be deferred unless the loss were perceived to be a real economic loss, in which case the loss would be immediately recognized and not deferred.

If only a minor portion of the rights to use are retained by the seller-lessee, the sale and the leaseback are accounted for separately. However, if the rental payments appear unreasonable based upon the existing market conditions at the inception of the lease, the profit or loss is adjusted so the rentals are at a reasonable amount. The amount created by the adjustment is deferred and amortized over the life of the property if a capital lease is involved or over the lease term if an operating lease is involved.

If the seller-lessee retains more than a minor portion but less than substantially all the rights to use the property, any excess profit on the sale is recognized on the date of the sale. For purposes of this paragraph, excess profit is derived as follows:

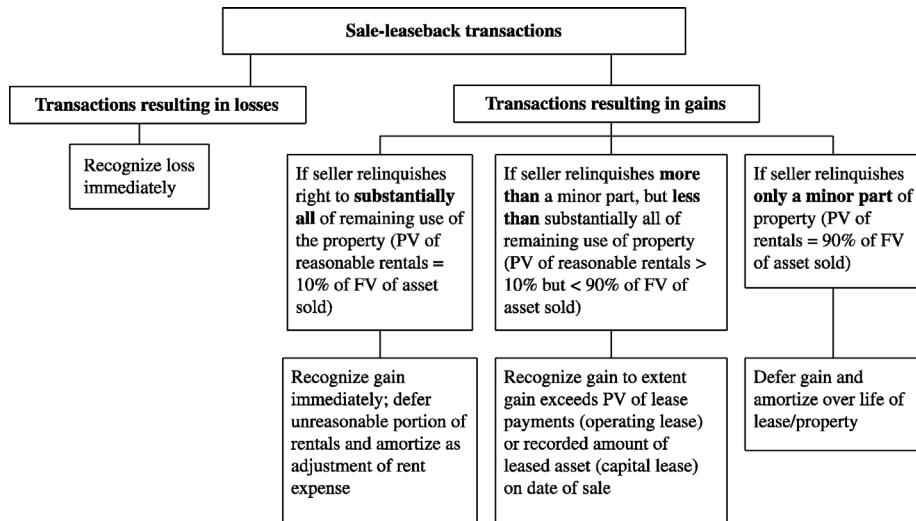

1. If the leaseback is classified as an operating lease, the excess profit is the portion of the profit that exceeds the present value of the minimum lease payments over the lease term including the gross amount of the guaranteed residual value. The seller-lessee uses its incremental borrowing rate to compute the present value of the minimum lease payments. If the implicit rate of interest in the lease is known and lower, it is substituted for the incremental borrowing rate in computing the present value of the minimum lease payments. The present value is amortized over the lease term while that guaranteed residual is deferred until resolution at the end of the lease term.
2. If the leaseback is classified as a capital lease, the excess profit is the portion of the profit that exceeds the recorded amount of the leased asset.

Executory costs are not to be included in the calculation of profit to be deferred in a sale-leaseback transaction. (ASC 840-40-30) When the fair value of the property at the time of the leaseback is less than its undepreciated cost, the seller-lessee immediately recognizes a loss for the difference. In the example below, the sales price is less than the book value of the property. However, there is no economic loss because the fair value is greater than the book value.

Sales price	Book value	FV and PV
\$85,000	\$90,000	\$100,000
	(-\$5,000)	
	Artificial loss	

The artificial loss is deferred and amortized as an addition to depreciation.

The diagram below summarizes the accounting for sale-leaseback transactions.

In the above circumstances, when the leased asset is land only, any amortization is recognized on a straight-line basis over the lease term, regardless of whether the lease is classified as a capital or operating lease.

The buyer-lessor accounts for the transaction as a purchase and a direct financing lease if the agreement meets the criteria of either a direct financing lease or a sales-type lease. Otherwise, the agreement is accounted for as a purchase and an operating lease.

**Sale-leaseback involving real estate.** Three requirements are necessary for a sale-leaseback involving real estate (including real estate with equipment) to qualify for sale-leaseback accounting treatment. Those sale-leaseback transactions not meeting the three requirements are accounted for using the deposit method or as a financing. The three requirements are:

1. The lease must be a normal leaseback (i.e., it involves active use of the leased property in the seller-lessee's trade or business during the lease term).
2. Payment terms and provisions must adequately demonstrate the buyer-lessor's initial and continuing investment in the property as prescribed by ASC 360-20.
3. Payment terms and provisions must transfer all the risks and rewards of ownership as demonstrated by a lack of continuing involvement by the seller-lessee.

**Adequacy of initial and continuing investment.** The buyer-lessor's initial investment is adequate if it demonstrates the buyer-lessor's commitment to pay for the property and indicates a reasonable likelihood that the seller-lessee will collect any receivable related to the leased property. The buyer-lessor's continuing investment is adequate if the buyer is contractually obligated to pay an annual amount at least equal to the amount of the annual payment sufficient to repay the principal and interest over no more than twenty years for land or the customary term of a first mortgage for other real estate.

**Lack of continuing involvement by the seller-lessee.** Any continuing involvement by the seller-lessee other than normal leaseback disqualifies the lease from sale-leaseback

accounting treatment. Some examples of continuing involvement other than normal leaseback include:

1. The seller-lessee has an obligation or option (excluding the right of first refusal) to repurchase the property
2. The seller-lessee (or party related to the seller-lessee) guarantees the buyer-lessor's investment or debt related to that investment or a specified return on that investment
3. The seller-lessee is required to reimburse the buyer-lessor for a decline in the fair value of the property below estimated residual value at the end of the lease term based on other than excess wear and tear
4. The seller-lessee remains liable for an existing debt related to the property
5. The seller-lessee's rental payments are contingent on some predetermined level of future operations of the buyer-lessor
6. The seller-lessee provides collateral on behalf of the buyer-lessor other than the property directly involved in the sale-leaseback
7. The seller-lessee provides nonrecourse financing to the buyer-lessor for any portion of the sales proceeds or provides recourse financing in which the only recourse is the leased asset
8. The seller-lessee enters into a sale-leaseback involving property improvements or integral equipment without leasing the underlying land to the buyer-lessor
9. The buyer-lessor is obligated to share any portion of the appreciation of the property with the seller-lessee
10. Any other provision or circumstance that allows the seller-lessee to participate in any future profits of the buyer-lessor or the appreciation of the leased property.

The inclusion of a put provision in the lease as a remedy for the occurrence of an event of default under the lease including for lessee noncompliance with financial covenants violates the continuing involvement criteria in ASC 840-40 when the transaction is part of a sale-leaseback. This would necessitate accounting for the transaction using the deposit method or as a financing depending on the application of ASC 360-20 to the circumstances.

When one member of a consolidated group provides an uncensured guarantee of lease payments for another member of the same consolidated group, this is not held to be continuing involvement on the part of the consolidated group. Therefore, sale-leaseback accounting is appropriate in the consolidated financial statements. In the separate financial statements of the subsidiary/seller-lessee, however, the guarantee is a form of continuing involvement that precludes sale-leaseback accounting because the guarantee provides the buyer-lessor with additional collateral that reduces the buyer-lessor's risk of loss. (ASC 840-40-25)

An uncollateralized irrevocable letter of credit is not a form of continuing involvement that precludes sale-leaseback accounting unless a contract exists between the seller-lessee and third-party guarantor that would create collateral (e.g., right of offset of amounts on deposit). All written contracts between the seller-lessee and the issuer of the letter of credit must be evaluated to determine if other forms of collateral exist. (ASC 840-40-25)

#### Example of accounting for a sale-leaseback transaction

To illustrate the accounting treatment in a sale-leaseback transaction, suppose that Seller/Lessee Corporation sells equipment that has a book value of \$80,000 and a fair value of \$100,000 to Buyer/Lessor Corporation for \$100,000 in cash, and then immediately leases it back under the following conditions:

1. The sale date is January 1, 20X1, and the equipment has a fair value of \$100,000 on that date and an estimated remaining useful life of fifteen years.
2. The lease term is fifteen years, noncancelable, and requires equal rental payments of \$13,109 at the beginning of each year.
3. Seller/Lessee Corp. has the option to annually renew the lease at the same rental payments upon expiration of the original lease.
4. Seller/Lessee Corp. has the obligation to pay all executory costs.
5. The annual rental payments provide the Buyer/Lessor Corp. with a 12% return on investment.
6. The incremental borrowing rate of Seller/Lessee Corp. is 12%.
7. Seller/Lessee Corp. depreciates similar equipment on a straight-line basis.

Seller/Lessee Corp. will classify the agreement as a capital lease since the lease term exceeds 75% of the estimated remaining economic life of the equipment, and because the present value of the lease payments ( $\$13,109 \times 7.62817 = \$100,000$ )<sup>10</sup> is greater than 90% of the fair value of the equipment. Assuming that collectibility of the lease payments is reasonably predictable and that no important uncertainties exist concerning the amount of unreimbursable costs yet to be incurred by Buyer/Lessor Corp., Buyer/Lessor Corp. will classify the transaction as a direct financing lease because the present value of the minimum lease payments is equal to the fair value of \$100,000.

Seller/Lessee Corp. and Buyer/Lessor Corp. would make the following journal entries during the first year:

#### Upon Sale of Equipment on January 1, 20X1

	<i><u>Seller/Lessee Corp.</u></i>		<i><u>Buyer/Lessor Corp.</u></i>	
Cash	100,000		Equipment	100,000
Equipment*	80,000		Cash	100,000
Unearned profit on sale-leaseback	20,000			
Leased equipment	100,000		Lease receivable	
Lease obligations	100,000	(\$13,109 × 15)		196,635
			Equipment	100,000
			Unearned interest	96,635

\* Assumes new equipment; for used equipment the accumulated depreciation would also be debited to remove it.

#### To Record First Payment on January 1, 20X1\*\*

	<i><u>Seller/Lessee Corp.</u></i>		<i><u>Buyer/Lessor Corp.</u></i>	
Lease obligations	13,109		Cash	13,109
Cash	13,109		Lease receivable	13,109

\*\* No interest is recorded in connection with the first payment since it is made at the inception of the lease.

#### To Record Incurrence and Payment of Executory Costs

	<i><u>Seller/Lessee Corp.</u></i>		<i><u>Buyer/Lessor Corp.</u></i>	
Insurance, taxes, etc.	xxx		(No entry)	
Cash (or accounts payable)	xxx			

<sup>10</sup> 7.62817 is the present value of an annuity due for fifteen periods at a 12% interest rate.

**To Record Amortization Expense on the Equipment, December 31, 20X1**

<u>Seller/Lessee Corp.</u>		<u>Buyer/Lessor Corp.</u>
Amortization expense	6,667	(No entry)
Accum. amort.— capital leases (\$100,000 ÷ 15)		6,667

**To Amortize Profit on Sale-Leaseback by Seller/Lessee Corp., December 31, 20X1**

<u>Seller/Lessee Corp.</u>		<u>Buyer/Lessor Corp.</u>
Unearned profit on sale-leaseback	1,333	(No entry)
Amortization expense (\$20,000 ÷ 15)		1,333

**To Record Interest for 20X1, December 31, 20X1**

<u>Seller/Lessee Corp.</u>		<u>Buyer/Lessor Corp.</u>	
Interest expense	10,427	Unearned interest	10,427
Accrued interest payable	10,427	Interest income	10,427

**Partial Lease Amortization Schedule\*\***

<u>Date</u>	<u>Cash payment</u>	<u>Interest expense</u>	<u>Reduction of obligation</u>	<u>Lease obligation</u>
Inception of lease		\$100,000		
1/1/X1	\$13,109	\$ –	\$13,109	86,891
1/1/X2	13,109	10,427	2,682	84,209

\*\* No interest is recorded in connection with the first payment since it is made at the inception of the lease.

**Supplemental guidance.** The following paragraphs provide supplemental guidance regarding the application of sale-leaseback accounting.

**Property sold subject to seller's preexisting operating lease.** ASC 840-40-55 considers the situation in which the reporting entity is an investor in a partnership that owns property with respect to which the reporting entity is also a lessee under an operating lease that covers all or a portion of the property. The reporting entity sells its interest in the partnership or the partnership sells the property to an independent party with the preexisting operating lease continuing in effect.

If the leased property is within the scope of ASC 840-40 (real estate or real estate with integral equipment), ASC 840-40-55 requires recognition of the transaction as a sale-leaseback if the preexisting lease is significantly modified in connection with the sale. If no changes are made to the lease, or if changes are insignificant, then profit is deferred and recognized in accordance with ASC 360-20 and ASC 840-40 for real estate, property improvements, and integral equipment.

The computation of any deferred profit is not affected by the seller-lessee's prior ownership percentage in the property. In addition, exercise of renewal options or sublease provisions contained in the preexisting lease that were included in the original minimum lease term do not affect the accounting for the transaction. ASC 840-40 would apply, however, to renewal options not contained in the original minimum lease term. These renewal options would be treated as a new lease. Finally, leases between parties under common control are not considered preexisting leases for this purpose and ASC 840-40 applies unless one of the parties is a regulated enterprise such as a public utility under the provisions of ASC 980. (ASC 840-40-55)

**Sale-leaseback of an asset leased to another party.** A variation of the previous issue arises when a leaseback involves an asset that is personal property falling outside coverage of ASC 840-40 and either (1) subject to an operating lease, or (2) subleased or intended to be subleased to another entity under an operating lease. The standard specified that the seller-lessee-sublessor is to account for the transaction by recording the sale, removing the asset from its statement of financial position, classifying the leaseback based on the normal criteria for determining lease classification, and recognizing or deferring any gain on the transaction as previously discussed. (ASC 840-40-55)

### Other Lease Issues

**Accounting for a sublease.** A sublease is an arrangement where the original lessee re-leases the leased property to a third party (the sublessee), and the original lessee acts as a sublessor. Normally, the nature of a sublease agreement does not affect the original lease agreement, and the original lessee/sublessor retains primary liability to the lessor.

The original lease remains in effect, and the original lessor continues to account for the lease as before. The original lessee/sublessor accounts for the lease as follows:

1. If the original lease agreement transfers ownership or contains a BPO and if the new lease meets any one of the four specified criteria (i.e., transfers ownership, BPO, 75% test, or 90% test) and both the collectibility and uncertainties criteria, then the sublessor classifies the new lease as a sales-type or direct financing lease; otherwise it is classified as an operating lease. In either situation, the original lessee/sublessor continues accounting for the original lease obligation as before.
2. If the original lease agreement does not transfer ownership or contain a BPO, but it still qualifies as a capital lease, then the original lessee/sublessor (with one exception) applies the usual criteria in classifying the new agreement. If the new lease qualifies, the original lessee/sublessor accounts for it as a direct financing lease, with the unamortized balance of the asset under the original lease being treated as the cost of the leased property. However, the original lessee/sublessor should recognize a loss on the sublease if its carrying amount exceeds the total sublease rentals and the estimated residual value. (ASC 840-20-25) The one exception arises when the circumstances surrounding the sublease suggest that the sublease agreement was an important part of a predetermined plan in which the original lessee played only an intermediate role between the original lessor and the sublessee. In this situation, the sublease is classified by the 75% and 90% criteria as well as collectibility and uncertainties criteria. In applying the 90% criterion, the fair value for the leased property is the fair value to the original lessor at the inception of the original lease. Under all circumstances, the original lessee continues accounting for the original lease obligation as before. If the new lease agreement (sublease) does not meet the capitalization requirements imposed for subleases, then the new lease is accounted for as an operating lease.
3. If the original lease is an operating lease, the original lessee/sublessor accounts for the new lease as an operating lease and accounts for the original operating lease as before.

#### Example of a direct-financing sublease

The Silver Pick Mine obtains a \$300,000 ore carrier truck under a five-year capital lease at 8% interest. Annual lease payments are \$75,137. Silver Pick reduces its lease liability in accordance with the following amortization table:

<u>Year</u>	<u>Cash payment</u>	<u>Interest</u>	<u>Reduction in principal</u>	<u>Balance of net investment</u>
Inception				\$300,000
1	\$75,137	\$24,000	\$51,137	248,863
2	75,137	19,909	55,228	193,635
3	75,137	15,419	59,646	133,989
4	75,137	10,719	64,418	69,571
5	75,137			0
	<u>\$375,685</u>	<u>\$75,685</u>	<u>\$300,000</u>	

At the end of Year 2, silver prices drop too low for ongoing mining operations to be profitable, so Silver Pick subleases the ore carrier via a direct financing lease to the Lead Bottom Mine for the remaining three years of the lease at the same interest rate. Silver Pick should use the unamortized balance of \$193,635 at the end of Year 2 as the cost basis of the sublease, but Lead Bottom negotiates a lower inception value of \$160,000, resulting in the following amortization table:

<u>Year</u>	<u>Cash payment</u>	<u>Interest</u>	<u>Reduction in principal</u>	<u>Balance of net investment</u>
Inception				\$160,000
3	\$62,085	\$12,800	\$49,285	110,715
4	62,085	8,857	53,228	57,487
5	62,085	4,598	57,487	0
	<u>\$186,255</u>	<u>\$26,255</u>	<u>\$160,000</u>	

At the inception of the sublease, Silver Pick records a loss of \$39,156 to reflect the negotiated \$33,635 drop in the cost basis of the sublease, from \$193,635 to \$160,000, as well as a reduction of sublease interest income of \$5,521, also due to the reduced cost basis. The summary entry for the final three years of Silver Pick's payments under the original lease agreement and its receipts under the sublease follows:

	<u>Years 3–5 of original lease transaction</u>	<u>Total of sublease transactions</u>	<u>Variance</u>
Lease liability	193,635	160,000	33,635
Interest expense	31,776	26,255	5,521
Cash	225,411	186,255	39,156

**Lease escalations.** Virtually all commercial leases contain provisions obligating the lessee to pay the lessor various additional sums, often referred to as lease escalations, that supplement the specified fixed rentals. It is important that the parties to the lease properly classify these payments because the way they are characterized can affect whether the lease is accounted for in the correct manner.

**Escalating base rents.** These are periodic increases in the fixed monthly rentals scheduled to occur at one or more points during the lease term. Escalating base rents are included in minimum lease payments.

Variations of this type of escalation occur when the fixed (or base) rent is structured at inception to include a future escalation based on the expected growth of the lessee requiring it to

physically use additional portions of the premises that it was not using at inception or an actual addition or based on the lessee actually adding space or capacity.

ASC 840-20-25 prescribes the following two rules:

1. If, at the inception of the lease, the lessee takes possession of or controls the physical use of the leased property, all rentals including the escalated rents are to be recognized by the lessee and lessor as rental expense and rental revenue, respectively, on a straight-line basis commencing with the beginning of the lease term.
2. If rents escalate under a master lease agreement because the lessee obtains access to or control of additional leased property at the time of the escalation, the escalated rents are considered by the lessee and lessor as rental expense and rental revenue respectively that is attributable to the newly leased property. This additional rental expense or rental revenue is to be computed based on the relative fair values of the original leased property and the additional leased property as determined at the inception of the lease and allocated to the time periods during which the lessee controls the use of the additional leased property.

**Executory costs.** These represent reimbursements to the lessor of costs associated with owning and maintaining the leased property. The most common executory costs are real estate taxes, insurance, and maintenance. Amounts paid by a lessee as consideration for a guarantee from an unrelated third party of the residual value are also considered executory costs. If executory costs are paid by the lessor, any lessor's profit on those costs is considered in the same manner as the actual executory costs. Executory costs are excluded from minimum lease payments.

**Contingent rentals.** These are additional rentals due that are computed based on changes that occur subsequent to the inception of the lease in factors, other than the passage of time, on which the lease payments were based. Examples of contingent rentals include real estate rentals based on a percentage of the lessee's retail sales over a certain dollar amount (often referred to as percentage rent or overage rent) and equipment rentals based on machine hours of use. One type of escalation that many commercial leases contain is a required rent increase based on increases in an index such as the prime interest rate or the Consumer Price Index (CPI). Depending on how the terms are structured, these payments might actually consist of two elements that must be separately considered. The portion attributable to the index or rate that was in effect at the inception of the lease (considered part of the minimum lease payments) and the portion representing subsequent increases in that index or rate (considered to be contingent rentals) are illustrated in the following examples.

#### Example 1

A three-year lease requires fixed rentals of \$1,000 per month plus \$10 for every full percentage point of the prime interest rate or fraction thereof determined as of the beginning of the month. The prime interest rate at the inception of the lease is 6% and on the first day of the fourth month of the lease term the prime interest rate increased to 7%.

At lease inception, the minimum rentals are computed as follows:

$$\$1,000 + (10 \times 6 \text{ percentage points} = \$60) = \$1,060 \text{ per month} \times 36 \text{ months} = \$38,160$$

The increase in rent due at the beginning of the fourth month would be allocated as follows:

Minimum rentals:	$\$10 \times 6 \text{ percentage points} = \$60$
Contingent rentals:	$\begin{array}{r} \$10 \\ \hline \$70 \end{array}$

**Example 2**

Same facts as Example 1, except that the lease requires the lessee to pay fixed rentals of \$1,000 per month plus \$10 for every full percentage point or fraction thereof that the prime interest rate determined as of the beginning of the month exceeds 6%.

At lease inception, the minimum rentals are computed as follows:

$$\$1,000 \text{ per month} \times 36 \text{ months} = \$36,000$$

The increase in rent due at the beginning of the fourth month would be allocated as follows:

Minimum rentals:	\$ –
Contingent rentals:	$\begin{array}{r} \$10 \times 1 \text{ percentage point} \\ = \end{array}$ $\underline{\underline{\$10}}$

As illustrated in the examples, amounts determined to be contingent rentals are excluded from minimum lease payments.

As discussed previously, leases for retail space often contain percentage rent provisions that obligate the lessee to pay the lessor a percentage of retail sales over a certain dollar amount. These dollar thresholds are often expressed in terms of annual targets such as one-half of one percent of annual sales over \$10 million. This type of lease provision raises the accounting issue of how the lessor and lessee are to account for the lease during the interim periods prior to the attainment of the contractual target.

ASC 840-10-25 and ASC 840-10-40 prescribes the accounting as follows:

Lessor: No revenue recognition until the actual target is achieved and surpassed.

Lessee: Recognize contingent rental expense during interim periods if it is probable that the target will be reached by the end of the fiscal year. If, subsequently, the specified target is not met, previously recorded expense is reversed at the time it becomes probable that the target will not be met.

**Lessee involvement in asset construction.** A lessee often has substantial involvement in construction activities with respect to an asset to be leased under a long-term lease agreement. This involvement can take many forms that can include:

1. Providing the construction financing directly or indirectly
2. Guaranteeing the construction debt
3. Serving as primary or secondary obligor under construction contracts
4. Acting as the real estate developer or general contractor
5. Agreeing to purchase the asset if the construction is not completed by a specified date
6. Agreeing to fund construction cost overruns
7. Serving as an agent of the lessor for the construction, financing, or ultimate sale of the asset
8. Agreeing to a date-certain lease that obligates the lessee to commence rental payments on a certain date irrespective of whether the construction is complete by that date.

**Construction period rent associated with land and building leases.** In certain instances, the lessee will delay occupancy or usage of leased property until, for example, leasehold improvements have been completed. ASC 840-20-25 states that a lease conveys to the lessee the right to control the use of property, such as leased land and building, both during and after any construction period necessary to construct leasehold improvements to the property. Consequently, rental expense is required to be allocated to periods during which construction activities are occurring even though the lessee has not yet commenced operations on the premises. It further provides that the rentals allocated to the construction period are not to be capitalized as part of the

cost of the leasehold improvements but rather are to be recorded as a period expense as a charge against income from continuing operations in the lessee's financial statements.

**Transfer of construction period risks.** A lessee is considered the owner of a real estate project during its construction period if the lessee bears substantially all of the construction period risks. (ASC 840-40)

Under ASC 840-40, if the lessee is determined to bear substantially all of the construction risks, it is considered to be the owner of the asset during the construction period. If that is the case, then a sale-leaseback of the asset occurs upon the completion of construction and the commencement of the lease term.

The primary test to be used in determining if a lessee has substantially all of the construction period risks is virtually the same as the 90% of fair value test for determining if a lease is to be classified as a capital lease by a lessee. Beginning with the earlier of the date of the inception of the lease or the date that the construction terms are agreed to, if at any time during the construction period the documents governing the construction project could require, under any circumstance, that the lessee pay 90% or more of the total project costs, excluding land acquisition costs, then the lessee is considered to be the owner of the real estate project during its construction period.

Even if the present value of the lessee's maximum guarantee is less than 90% of total project costs, ASC 840-40 provides six examples of when the lessee would still be considered the owner of a real estate project.

For the purposes of this 90% test, the lessee's maximum guarantee includes any payments the lessee could be required to make in connection with the construction project. The lessee's maximum guarantee includes, but is not limited to:

1. Lease payments that must be made regardless of when or whether the project is complete
2. Guarantees of the construction financing
3. Equity investments made in the owner-lessor or any party related to the owner-lessor
4. Loans or advances made to the owner-lessor or any party related to the owner-lessor
5. Payments made by the lessee in the capacity of a developer, a general contractor, or a construction manager/agent that are reimbursed less frequently than is normal or customary
6. Primary or secondary obligations to pay project costs under construction contracts
7. Obligations that could arise from being the developer or general contractor
8. An obligation to purchase the real estate project under any circumstances
9. An obligation to fund construction cost overruns
10. Rent or fees of any kind, such as transaction costs, to be paid to or on behalf of the lessor by the lessee during the construction period
11. Payments that might be made with respect to providing indemnities or guarantees to the owner-lessor.

The scope of ASC 840-40 includes government-owned property under construction and subject to a future lease of the completed improvements. (ASC 840-40-15)

Any direct or indirect financial interests of the lessee in the leased asset or in the lessor must be analyzed by the lessee to determine if:

1. They require accounting recognition as a guarantee obligation under ASC 460.
2. They result in the lessee holding a variable interest in the lessor or in the lessor's specified assets (the project) that potentially could require the lessee to consolidate the lessor as the

primary beneficiary of a VIE or consolidate the specified assets and related liabilities (referred to as “silo” or a “virtual VIE”).

If the lessee consolidates the lessor or the project, intercompany transactions and balances will be eliminated in consolidation.

**Change in residual value.** For any of the foregoing types of leases, the lessor is to review the estimated residual value at least annually. If there is a decline in the estimated residual value, the lessor must make a determination as to whether this decline is temporary or permanent. If temporary, no adjustment is required; however, if the decline is other than temporary, then the estimated residual value must be revised to conform to the revised estimate. The loss that arises in the net investment is recognized in the period of decline. Under no circumstance is the estimated residual value to be adjusted to reflect an increase in the estimate. ASC 840-30-35 clarifies that this prohibition against reflecting an increase in the estimated residual value also extends to increases in the guaranteed portions of the residual value that result from renegotiations between the parties.

#### Example of a permanent decline in residual value

Hathaway Corporation enters into a sales-type leasing transaction as the lessor of a fire truck. The following table shows key information about the lease:

Lease term	10 years
Implicit interest rate	8%
Lease payments	One payment per year
Normal selling price	\$300,000
Asset cost	\$200,000
Residual value	\$50,000

After one year, immediately after the first lease payment has been received, Hathaway determines that an indicated decline in residual value from \$50,000 to \$30,000 is other than temporary. The calculation it originally used to determine the annual minimum lease payment follows:

$$\frac{\text{Selling price} - (\text{Present value of residual value due in 10 years at } 8\% \text{ interest} \times \text{residual value})}{\text{Present value of an annuity of } \$1 \text{ for 10 years at } 8\% \text{ interest}}$$

$$= \frac{\$300,000 - (0.46319 \times \$50,000)}{6.71008}$$

$$= \$41,257.33 \text{ Annual minimum lease payment}$$

Hathaway calculates the following reduction in the residual present value of the fire truck, using a multiplier of 0.5002 to obtain the present value of the residual value due in nine years at an interest rate of 8%:

$$\begin{aligned} \text{Accreted original residual asset present value} &= (\$50,000) \times (\text{Present value of } 0.5002) = \$25,010 \\ \text{Less: Revised residual asset present value} &= (\$30,000) \times (\text{Present value of } 0.5002) = \$15,006 \\ \text{Equals net change in residual asset present value} &= (\$10,004) \end{aligned}$$

The following table shows the original and revised elements of Hathaway’s lease transaction entry:

	<u>Initial entry*</u>	<u>Revised residual value</u>	<u>Entry net of Residual value change</u>
Less receivable	462,572	20,000	442,572
Cost of goods sold	176,840		176,840
Loss on residual reduction	10,004		10,004
Inventory		200,000	200,000
Sales		276,840	276,840
Unearned interest		162,572	9,996
			152,576

\*  $\text{Lease receivable} = (\text{Total minimum lease payments}) + (\text{Residual asset value})$

$\text{Cost of goods sold} = (\text{Inventory cost}) - (\text{Present value of residual asset value})$

$\text{Sales} = (\text{Present value of minimum lease payments})$

$\text{Unearned interest} = (\text{Lease receivable}) - (\text{Present value of minimum lease payments}) - (\text{Present value of residual asset value})$

The following amortization table tracks the net impact of these changes, resulting in a \$30,000 residual value at the end of Year 10:

<u>Year</u>	<u>Cash payment</u>	<u>Interest</u>	<u>Reduction in principal</u>	<u>Balance of net investment</u>
Inception				\$300,000
1	\$41,257	\$24,000	\$17,257	282,743
Adjustment			10,004	272,739
2	41,257	21,819	19,438	253,301
3	41,257	20,264	20,993	232,308
4	41,257	18,584	22,673	209,635
5	41,257	16,770	24,487	185,148
6	41,257	14,811	26,446	158,702
7	41,257	12,696	28,561	130,141
8	41,257	10,411	30,846	99,295
9	41,257	7,943	33,314	65,981
10	41,257	5,276	35,981	30,000
	<u>\$412,570</u>	<u>\$152,574</u>	<u>\$270,000</u>	

Thus, net of rounding errors, the total of all payments on the amortization table and the \$30,000 revised residual value equals the revised lease receivable of \$442,572. Similarly, the total of all interest payments on the amortization table matches the adjusted unearned interest entry.

**Change in the provisions of a lease.** Accounting issues arise when the lessee and lessor agree, subsequent to its inception, to change the provisions of the lease (other than by renewals or term extensions that are discussed later). If, from the standpoint of the lessee, the revised lease terms would have, at the inception of the original lease, resulted in a different lease classification (e.g., operating lease versus capital lease or vice versa), the revised agreement is considered to be a new agreement.

If the original lease was accounted for as a capital lease and the revised lease qualifies for treatment as an operating lease, they are to be accounted for as sale-leaseback transactions (discussed later in this chapter).

If the original lease was accounted for as an operating lease and the revised lease is a capital lease, then on the date of the revision, the lessee records an asset and an obligation based on the present value of the remaining lease payments (or the fair value of the leased property, if less).

Finally, if the original and revised leases are both capital leases, then the lessee adjusts the recorded asset and obligation by an amount equal to the difference between the present value of the future minimum lease payments under the revised agreement and the recorded balance of the obligation. For the purposes of this calculation, the rate of interest to be used is the rate that was used to record the lease initially. The adjustment is recognized as a gain or loss of the period in which the revision is made.

In the case of either a sales-type or direct financing lease where there is a change in the provisions of a lease, the lease is accounted for by the lessor as discussed below.

Changes in the provisions that affect the amount of the remaining minimum lease payments can result in one of the following three outcomes:

1. The change does not give rise to a new agreement. A new agreement is defined as a change that, if in effect at the inception of the lease, would have resulted in a different classification.
2. The change does give rise to a new agreement that would be classified as a direct financing lease.
3. The change gives rise to a new agreement that would be classified as an operating lease.

If either item 1 or item 2 occurs, the balance of the minimum lease payments receivable and the estimated residual value (if affected) are adjusted to reflect the effect of the change. The net adjustment is charged (or credited) to unearned income, and the accounting for the lease over its remaining term is adjusted to reflect the change.

If the new agreement is an operating lease, then the remaining net investment (lease receivable less unearned income) is written off and the leased asset is recorded by the lessor at the lower of its cost, present fair value, or carrying value. The net adjustment resulting from these entries is charged (or credited) to income of the period in which the revision is made. Thereafter, the new lease is accounted for as any other operating lease.

The lessee and the lessor may negotiate a shortened lease term and an increase in the lease payments over the revised lease term. ASC 840-20-55 observes that the nature of the modification is a matter of judgment that depends on the relevant facts and circumstances. If the modification is deemed only a change in future lease payments, the increase is amortized over the remaining term of the modified lease. On the other hand, a modification deemed a termination penalty is to be recognized in the period of modification. Termination penalties are calculated as the excess of the modified lease payments over the original lease payments that would have been required during the shortened lease term.

ASC 840-20-55 provides that consideration is to be given to (1) the length of the modified lease period compared to the remaining term of the original lease, and (2) the difference between the modified lease payments and comparable market rents in determining whether the modification is a termination penalty.

**Early termination of a lease.** Accounting for premature lease termination from the standpoints of the lessee and lessor follows.

**Lessee accounting.** Discontinuation of business activities in a particular location is considered an exit activity, the accounting for which is specified in ASC 420.

**Operating leases.** In connection with lease termination, the lessee may incur (1) costs to terminate the lease prior to the end of its noncancelable term and/or (2) continuing lease costs incurred during the remainder of the lease term for which the lessee receives no economic benefit because the premises are no longer in use. On the date the lessee terminates the lease, the lessee recognizes a liability for the fair value of the termination costs. The termination date is

the date that the lessee provides written notice to the lessor in accordance with the notification requirements contained in the lease or the date the lessee and lessor agree to a negotiated early termination.

The fair value of rentals that continue to be incurred under the lease during its remaining term without benefit to the lessee is recognized as a liability on the date that the lessee ceases to use the property (referred to as the cease-use date). Fair value is computed based on the remaining rentals due under the lease, adjusted for any prepaid or deferred rent under the lease, and reduced by estimated sublease rentals that are reasonable to expect for the property. The fair value measurement requires that reasonable sublease rentals be included in the computation even if the lessee does not intend to sublease the property.

In periods subsequent to the recognition of these liabilities but prior to their settlement, changes in fair value are measured using the credit-adjusted risk-free rate of interest (in essence, the lessee's incremental borrowing rate) used to initially measure the liability.

Upon initial recognition of these liabilities, the related costs are recognized in the lessee's income statement as operating expense (or income from continuing operations if no measure of operations is presented) unless required to be presented as part of discontinued operations. The cumulative effects of any subsequent period changes in liabilities that result from changes in the estimates of either the amounts or timing of cash flows are reported in the same income statement caption used to initially recognize the costs. Changes to the liabilities as a result of the passage of time increase their carrying amount and are recorded as accretion expense, which is also considered an operating expense.

*Capital leases.* If the lease is a capital lease, it is subject to the provisions of ASC 360 with respect to long-lived assets to be disposed of other than by sale (see chapter on ASC 360) either individually (in which case the gain or loss is recorded as a component of operating expense) or as part of a disposal group (in which case the gain or loss is presented as a part of discontinued operations). During the time period between the termination date and the cease-use date, the capital lease asset continues to be classified as "held and used," is subject to impairment evaluation, and its remaining carrying value is amortized over that shortened time period.

*Lessor accounting.* Lessor accounting for an early lease termination is as follows.

*Sales-type and direct financing leases.* The lessor records the leased equipment as an asset at the lower of its original cost, present fair value, or current carrying value. The difference between the remaining net investment in the lease and the amount of the adjustment to recognize the leased equipment is reflected in income of the period in which the lease is terminated.

#### Example of lessor accounting for the early termination of a sales-type lease

La Crosse Corporation enters into a sales-type leasing transaction as the lessor of a digital color copier. The following table shows key information about the lease:

Lease term	5 years
Implicit interest rate	8%
Lease payments	One payment per year
Normal selling price	\$80,000
Asset cost	\$50,000
Residual value	\$10,000
Present value of ordinary annuity of 1 for 5 years at 8%	3.9927
Present value of 1 due in 5 years at 8%	0.6806

Based on the information in the table, La Crosse calculates an annual minimum lease payment of \$18,332, which is reflected in the following amortization table:

<u>Year</u>	<u>Cash payment</u>	<u>Interest</u>	<u>Reduction in principal</u>	<u>Balance of net investment</u>
Inception		\$80,000		
1	\$18,332	\$6,400	\$11,932	68,068
2	18,332	5,445	12,887	55,181
3	18,332	4,414	13,918	41,263
4	18,332	3,301	15,031	26,232
5	18,332	2,100	16,232	10,000
	<u>\$91,660</u>	<u>\$21,660</u>	<u>\$70,000</u>	

At the end of Year 3, the lessee cancels the lease. At that time, the fair value of the color copier is \$35,000, which is \$6,263 less than the \$41,263 current carrying value indicated at the end of Year 3 in the amortization table. This change is reflected in the following table, which notes the original and revised elements of La Crosse's lease transaction:

	<u>Initial entry*</u>	<u>Total of transactions for first 3 years</u>	<u>Lease cancellation entry</u>
Cash		54,996	
Lease receivable	101,660	54,996	46,664
Cost of goods sold	43,194		
Inventory		50,000	35,000
Sales		73,194	
Interest income			16,259
Loss on early lease termination			6,263

\* *Lease receivable = (Total minimum lease payments) + (Residual asset value)*

*Cost of goods sold = (Inventory cost) – (Present value of residual asset value)*

*Sales = (Present value of minimum lease payments)*

*Unearned interest = (Lease receivable) – (Present value of minimum lease payments) – (Present value of residual asset value)*

*Operating leases.* Accounting for the leased asset is subject to the provisions of ASC 360. Between the termination date and the cease-use date, the leased asset continues to be presented as held-and-used and depreciated subject to an impairment evaluation that considers the likelihood and timing of replacing the tenant and market rents that would be realized. On the cease-use date, the leased asset is reclassified from held-and-used to the category of idle property and equipment with the associated temporary suspension of depreciation.

Upon receiving notice of termination, the lessor recognizes a receivable for the fair value of any termination fees to be received from the lessee as a result of early cancellation and a corresponding deferred rent liability that is recorded as an adjustment to any previously recorded deferred rent liability or prepaid rent. The remaining rental stream to be received thereafter is recognized on a straight-line basis over the remainder of the time period during which such payments were agreed to continue by adjusting any remaining prepaid rent, deferred rent, and/or unamortized initial direct costs so that they will be fully amortized by the date on which the lessee's payment obligation is fully satisfied.

**Renewal or extension of an existing lease.** The renewal or extension of an existing lease agreement affects the accounting of both the lessee and the lessor. There are two basic situations: (1) the renewal occurs and makes a residual guarantee or penalty provision inoperative, or (2) the renewal agreement does not do the foregoing and the renewal is treated as a new agreement. The accounting treatment prescribed under the latter situation for a lessee is as follows:

1. If the renewal or extension is classified as a capital lease, then the (present) current balances of the asset and related obligation are adjusted by the difference between the

present value of the future minimum lease payments under the revised agreement and the (present) current balance of the obligation. The present value of the minimum lease payments under the revised agreement is computed using the interest rate in effect at the inception of the original lease.

2. If the renewal or extension is classified as an operating lease, then the current balances of the asset and liability are written off and a gain (loss) recognized for the difference. The new lease agreement resulting from a renewal or extension is accounted for in the same manner as other operating leases.

Under the same circumstances, the following treatment is followed by the lessor:

1. If the renewal or extension is classified as a direct financing lease, then the existing balances of the lease receivable and the estimated residual value are adjusted for the changes resulting from the revised agreement.

---

*NOTE: Remember that an upward adjustment to the estimated residual value is not allowed.*

---

The net adjustment is charged or credited to unearned income.

2. If the renewal or extension is classified as an operating lease, then the remaining net investment under the existing sales-type lease or direct financing lease is written off and the leased asset is recorded as an asset at the lower of its original cost, present fair value, or current carrying amount. The difference between the net investment and the amount recorded for the leased asset is charged to income of the period that includes the renewal or extension date. The renewal or extension is then accounted for prospectively as any other operating lease.
3. If the renewal or extension is classified as a sales-type lease and it occurs at or near the end of the existing lease term, then the renewal or extension is accounted for as a sales-type lease.

---

*NOTE: A renewal or extension that occurs in the last few months of an existing lease is considered to have occurred at or near the end of the existing lease term.*

---

If the renewal or extension causes the guarantee or penalty provision to be inoperative, the lessee adjusts the current balance of the leased asset and the lease obligation to the present value of the future minimum lease payments (according to ASC 840 “by an amount equal to the difference between the present value of the future minimum lease payments under the revised agreement and the present balance of the obligation”). The present value of the future minimum lease payments is computed using the rate used in the original lease agreement.

Given the same circumstances, the lessor adjusts the existing balance of the lease receivable and estimated residual value to reflect the changes of the revised agreement (remember, no upward adjustments to the residual value). The net adjustment is charged (or credited) to unearned income.

#### **Example of lessor accounting for extension of a sales-type lease**

Entré Computers enters into a sales-type leasing transaction as the lessor of a corporate computer system. The following table shows key information about the lease:

Lease term	6 years
Implicit interest rate	10%
Lease payments	One payment per year
Normal selling price	\$240,000

Asset cost	\$180,000
Residual value	\$450,000
Present value of ordinary annuity of 1 for 6 years at 10%	4.3553
Present value of 1 due in 6 years at 10%	0.5645

Based on the information in the table, Entré calculates an annual minimum lease payment of \$49,273, which is reflected in the following amortization table:

<u>Year</u>	<u>Cash payment</u>	<u>Interest</u>	<u>Reduction in principal</u>	<u>Balance of net investment</u>
Inception				\$240,000
1	\$49,273	\$24,000	\$25,273	214,727
2	49,273	21,472	27,801	186,926
3	49,273	18,692	30,581	156,345
4	49,273	15,634	33,639	122,706
5	49,273	12,270	37,003	85,703
6	49,273	8,570	40,703	45,000
	<u>\$295,638</u>	<u>\$100,638</u>	<u>\$195,000</u>	

After making the Year 3 payment, the lessee requests a lease extension in order to reduce the annual payment amount. To do so, Entré extends the lease duration by two years and assumes the same residual value. Entré calculates the revised annual minimum lease payment under the assumption that the selling price is the balance of the net investment at the end of Year 3, as noted in the preceding amortization table.

$$\frac{\text{Selling price} - (\text{Present value of residual value due in 5 years at 10\% interest} \times \text{Residual value})}{\text{Present value of an annuity of } \$1 \text{ for 5 years at 10\% interest}}$$

$$= \frac{\$156,345 - (0.6209 \times \$45,000)}{3.7908}$$

$$= \$33,873 \text{ Annual minimum lease payment}$$

The revised lease payment and residual value is shown in the following amortization table, which includes both the first three years of the original lease agreement and the full five years of the lease extension agreement:

<u>Year</u>	<u>Cash payment</u>	<u>Interest</u>	<u>Reduction in principal</u>	<u>Balance of net investment</u>
Inception				\$240,000
1	\$49,273	\$ 24,000	\$25,273	214,727
2	49,273	21,472	27,801	186,926
3	49,273	18,692	30,581	156,345
4	33,873	15,635	18,238	138,107
5	33,873	13,811	20,062	118,045
6	33,873	11,805	22,068	95,977
7	33,873	9,598	24,275	71,702
8	33,873	7,171	26,702	45,000
	<u>\$317,184</u>	<u>\$122,184</u>	<u>\$195,000</u>	

This change is reflected in the following table, which notes the original and revised elements of Entré's lease transaction:

	<u>Initial entry*</u>	<u>Revised entry</u>	<u>Net entry required</u>
Lease receivable	340,638	362,184	21,546
Cost of goods sold	154,597	154,597	
Inventory	180,000	180,000	
Sales	214,597	214,597	
Unearned interest	100,638	122,184	21,546

\*  $\text{Lease receivable} = (\text{Total minimum lease payments}) + (\text{Residual asset value})$

$\text{Cost of goods sold} = (\text{Inventory cost}) - (\text{Present value of residual asset value})$

$\text{Sales} = (\text{Present value of minimum lease payments})$

$\text{Unearned interest} = (\text{Lease receivable}) - (\text{Present value of minimum lease payments}) - (\text{Present value of residual asset value})$

**Leases between related parties.** Leases between related parties are classified and accounted for as though the parties are unrelated, except in cases where it is certain that the terms and conditions of the agreement have been influenced significantly by the fact that the lessor and lessee are related. When this is the case, the classification and/or accounting is modified to reflect the true economic substance of the transaction rather than the legal form. Under ASC 810, discussed earlier in this chapter, many related-party lessors will qualify as VIEs. When this is the case, the lessee will present consolidated financial statements that include the lessor's assets, liabilities, and results of operations. The elimination of inter-company transactions and balances will result in the rental expense and rental income being removed from the consolidated financial statements, which will instead reflect the depreciation of the leased asset and the interest expense on any related debt.

ASC 850 requires that the nature and extent of leasing activities between related parties be disclosed. ASC 810 requires the following disclosures by the primary beneficiary of a VIE:

1. The nature, purpose, size, and activities of the VIE
2. The carrying amount and classification of consolidated assets that collateralize the VIE's obligations
3. Any lack of recourse that VIE creditors or holders of VIE beneficial interests have to the general credit of the primary beneficiary.

**Indemnification provisions in lease agreements.** Some lease agreements contain a provision whereby the lessee indemnifies the lessor on an after-tax basis for certain income tax benefits that the lessor might lose if a change in the income tax law should occur.

An indemnification agreement of this kind is considered a guarantee that is subject to the recognition and disclosure requirements of ASC 460. Any payments that might be required under the indemnification clause are, therefore, not considered contingent rentals.

**Accounting for leases in a business combination.** A business combination, in and of itself, has no effect upon the classification of a lease. However, if, in connection with a business combination, a lease agreement is modified to change the original classification of the lease, it is considered a new agreement and accounted for as previously discussed.

In most cases, a business combination will not affect the previous classification of a lease unless the provisions have been modified as indicated in the preceding paragraph.

The acquiring company applies the following procedures to account for a leveraged lease in a business combination:

1. The classification as a leveraged lease is retained.
2. The net investment in the leveraged lease is assigned a fair value (present value, net of income taxes) based upon the remaining future cash flows. Also, the estimated income tax effects of the cash flows are recognized.
3. The net investment is broken down into three components: net rentals receivable, estimated residual value, and unearned income.
4. Thereafter, the leveraged lease is accounted for as described in the discussion earlier in this chapter.

ASC 805 significantly alters the accounting for business combinations. It requires the use of the acquisition method, which requires that assets acquired and liabilities assumed in such a transaction be accounted for at fair values. This means, among other things, that capital leases under which the acquiree entity was obligated at the acquisition date are to be revalued at fair value at the date of the acquisition. The amounts of depreciation and interest to be recognized in subsequent periods by the acquirer will accordingly, in most instances, vary from the amounts that would have been recognized by the acquiree absent the business combination.

For example, if the fair value of the leased property under a capital lease is greater than its carrying value (the depreciated capitalized value as of that date), future amortization will be greater than would otherwise have been the case. Given that rental payments will not be altered by the acquisition transaction, this means that the effective interest cost will be reduced. A new effective interest rate will need to be computed in order to properly record the accounting implications of future rental payments, in such a circumstance. Contrariwise, if the fair value of the leased property is lower than its precombination carrying (book) value, the effective interest rate will be greater than had previously been determined.

ASC 805 states that the determination of the classification of an existing lease is generally not reassessed at the date of a business combination, and that the determination made at the lease inception is not to be reconsidered. However, if the terms of an operating lease are favorable or unfavorable compared with the market terms of leases of the same or similar items at the acquisition date, accounting ramifications must be addressed. The acquirer in such a circumstance is to recognize an intangible asset if the terms of an operating lease are favorable relative market terms, and is to recognize a liability if the terms are unfavorable relative to market terms.

An identifiable intangible asset may be associated with an operating lease, which may be objectively revealed by market participants' willingness to pay a price for the lease even if its terms are already at market. For example, a lease of gates at an airport or of retail space in a prime shopping area might provide entry into a market or other future economic benefits that qualify as identifiable intangible assets—for example, as a customer relationship. In that situation, the acquirer is to recognize the associated identifiable intangible asset(s). Under ASC 805, the identifiable intangible assets acquired in a business combination are to be recognized distinct from goodwill. An intangible asset is *identifiable* if it meets either the separability criterion or the contractual-legal criterion described by ASC 805.

If the acquiree in a business combination has assets (e.g., building or equipment) that are subject to operating leases (that is, the acquiree is a lessor), ASC 805 directs that such assets are to

be recorded at fair value determined without regard to the terms of the associated leases. The extent to which the lease terms are favorable or unfavorable relative to the market at the acquisition date, however, will be reflected in the additional intangible asset or liability to be recognized by the acquirer.

**Accounting for changes in lease agreements resulting from refunding of tax-exempt debt.** Tax-exempt debt is often “refunded” by the issuer of the debt instruments. Refunding is a refinancing that enables the issuer (i.e., a municipality that issued bonds) to take advantage of favorable interest rates. A current refunding is effected when the debt becomes callable and the issuer issues new debt in order to use the proceeds to retire the original debt. An advance refunding is a more complex variation that occurs prior to the call date of the original instruments. It entails issuance of new tax-exempt debt at the lower interest rate with a similar maturity to the original issuance. The proceeds of the new debt are invested in a portfolio of market-traded U.S. Treasury securities and other obligations that effectively “defeas” the original bonds. If, during the lease term, a change in the lease results from a refunding by the lessor of tax-exempt debt (including an advance refunding) and (1) the lessee receives the economic advantages of the refunding, and (2) the revised agreement can be classified as a capital lease by the lessee and a direct financing lease by the lessor, the change is accounted for as follows:

1. If the change is accounted for as an extinguishment of debt:
  - a. Lessee accounting. The lessee adjusts the lease obligation to the present value of the future minimum lease payments under the revised agreement. The present value of the minimum lease payments is computed using the interest rate applicable to the revised agreement. Any gain or loss is recognized currently as a gain or loss on the extinguishment of debt in accordance with the provisions of ASC 470-50-45 (discussed in detail in the chapter on ASC 470).  
b. Lessor accounting. The lessor adjusts the balance of the lease receivable and the estimated residual value, if affected, for the difference in present values between the old and revised agreements. Any resulting gain or loss is recognized currently.
2. If the change is not accounted for as an extinguishment of debt:
  - a. Lessee accounting. The lessee accrues any costs in connection with the debt refunding that are obligated to be reimbursed to the lessor. These costs are amortized by the interest method over the period from the date of refunding to the call date of the debt to be refunded.  
b. Lessor accounting. The lessor recognizes as revenue any reimbursements to be received from the lessee, for costs paid in relation to the debt refunding. This revenue is recognized in a systematic manner over the period from the date of refunding to the call date of the debt to be refunded.

**Sale or assignment to third parties; nonrecourse financing.** The sale or assignment of a lease or of property subject to a lease that was originally accounted for as a sales-type lease or a direct financing lease will not affect the original accounting treatment of the lease. Any profit or loss on the sale or assignment is recognized at the time of the transaction, except under the following two circumstances:

1. When the sale or assignment is between related parties, apply substance versus form provisions presented above under “leases between related parties.”

2. When the sale or assignment is with recourse, it is accounted for using the provisions of ASC 860.

The sale of property subject to an operating lease is not treated as a sale if the seller (or any related party to the seller) retains “substantial risks of ownership” in the leased property. A seller may retain “substantial risks of ownership” by various arrangements. For example, if the lessee defaults upon the lease agreement or if the lease terminates, the seller may arrange to do one of the following:

1. Acquire the property or the lease
2. Substitute an existing lease
3. Secure a replacement lessee or a buyer for the property under a remarketing agreement.  
(ASC 840-20-40-3)<sup>11</sup>

A seller does not retain substantial risks of ownership by arrangements where one of the following occurs:<sup>12</sup>

1. A remarketing agreement includes a reasonable fee to be paid to the seller.
2. The seller is not required to give priority to the releasing or disposition of the property owned by the third party over similar property owned by the seller.  
(ASC 840-20-40-4)

When the sale of property subject to an operating lease is not accounted for as a sale because the substantial risk factor is present, it is accounted for as a borrowing. (ASC 840-20-40-5)<sup>13</sup> The proceeds are recorded by the seller as an obligation. Rental payments made by the lessee under the operating lease are recorded as revenue by the seller even if the payments are paid to the third-party purchaser. The seller accounts for each rental payment by allocating a portion to interest expense (to be imputed in accordance with the provisions of ASC 835-30), and the remainder to reduce the existing obligation. Other normal accounting procedures for operating leases are applied except that the depreciation term for the leased asset is limited to the amortization period of the obligation.

The sale or assignment of lease payments under an operating lease by the lessor is accounted for as a borrowing as described above.

Nonrecourse financing is a common occurrence in the leasing industry, whereby the stream of lease payments on a lease is discounted on a nonrecourse basis at a financial institution with the lease payments collateralizing the debt. The proceeds are then used to finance future leasing transactions. Even though the discounting is on a nonrecourse basis, the offsetting of the debt against the related lease receivable is prohibited unless a legal right of offset exists or the lease qualified as a leveraged lease at its inception.

**Money-over-money lease transactions.** A money-over-money lease transaction occurs when an enterprise manufactures or purchases an asset, leases the asset to a lessee and obtains nonrecourse financing in excess of the asset’s cost using the leased asset and the future lease

<sup>11</sup> Upon implementation of ASU 2014-09, this paragraph will be superseded by guidance in ASC 606.

<sup>12</sup> Ibid.

<sup>13</sup> Ibid.

rentals as collateral. ASC 840-30-55 prescribes that this series of transactions should be accounted for as follows:

1. Record the purchase or manufacture of the asset,
2. Record the lease as an operating, direct financing, or sales-type lease as appropriate,
3. Record nonrecourse debt.

The only income that is recognizable by the reporting entity in this transaction would be any manufacturer's or dealer's profit that arises if the lease is classified as a sales-type lease. With respect to the presentation in the statement of financial position, offsetting of any assets recorded as a result of the transaction with the nonrecourse debt is not permitted unless a right of setoff exists.

**Wrap-lease transactions.** A wrap-lease transaction (see diagram) occurs when a reporting enterprise:

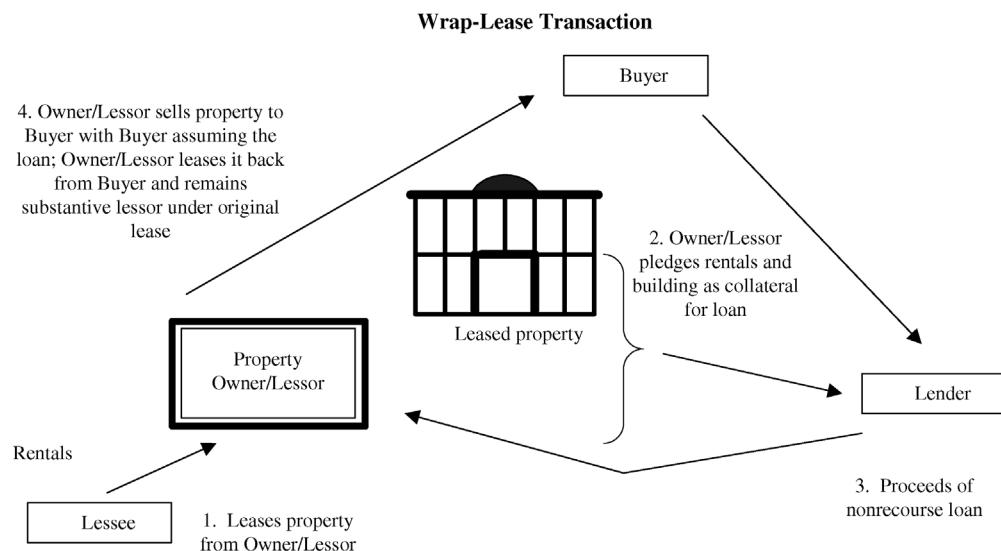

1. Purchases an asset,
2. Leases the asset to a lessee,
3. Obtains nonrecourse financing using the lease rentals and/or the asset as collateral,
4. Sells the asset to an investor, subject to the lease and the nonrecourse debt, and
5. Leases the asset back while remaining the substantive principal lessor under the original lease.

If the asset is real estate, the specialized rules with respect to sale-leaseback of real estate set forth in ASC 840-40 apply (see example of accounting for a sale-leaseback transaction in this chapter).

If the asset is personal property, the accounting would be as follows:

1. The asset is removed from the accounting records of the original reporting entity
2. The leaseback is classified in accordance with the normal criteria for the classification of leases
3. Gain on the transaction is recognized or deferred/amortized following the criteria in ASC 840-40-25
4. The reporting entity reflects the following items on its statement of financial position:
  - a. Any retained interest in the residual value of the leased asset
  - b. Gross sublease receivable
  - c. Note receivable from the investor
  - d. Nonrecourse third-party debt
  - e. Leaseback obligation
  - f. Deferred revenue related to any future remarketing rights for which the remarketing services had not yet been performed.

The sublease asset and related nonrecourse debt are not permitted to be offset on the statement of financial position unless a right of setoff exists.

#### Cash Flows

Lessee pays rentals to Lessor.  
 Lessor pays rentals to Buyer.  
 Buyer pays loan principal and interest to Lender.

**Transfers of residual value (ASC 860).** Acquisitions of interests in residual values of leased assets may be effected by companies whose primary business is other than leasing or financing. This generally occurs through the outright purchase of the right to own the leased asset or the right to receive the proceeds from the sale of a leased asset at the end of its lease term.

In instances such as these, the rights are recorded by the purchaser at the fair value of the assets surrendered net of the present value of any liabilities assumed, unless the fair value of the residual is more objectively determinable. Increases in the estimated value of the interest in the residual (i.e., residual value accretion) to the end of the lease term are permitted to be recognized only for *guaranteed* residual values because they are financial assets. However, recognition of such increases is prohibited for *unguaranteed* residual values. A nontemporary write-down of a residual value interest (guaranteed/unguaranteed) is recognized as a loss and is not permitted to be subsequently restored. This guidance also applies to lessors who sell the related minimum lease payments but retain the interest in the residual value irrespective of whether the residual is guaranteed.

#### Example of the transfer of residual value

Longbottom Lease Brokers obtains an interest in the residual value of a cable placer truck as a fee for its assistance in leasing the truck to a third party. The fair value of Longbottom's interest in the residual value of the truck is estimated by an appraiser to be \$47,000. Since the fair value of Longbottom's interest in the residual value is the most clearly evident valuation, Longbottom uses it as the basis for the following entry:

Interest in asset residual value	47,000
Revenue—leasing services rendered	47,000

In another transaction, Longbottom pays \$32,000 for the residual value of an aerial truck. Longbottom records the transaction as follows:

Interest in asset residual value	32,000
Cash	32,000

After six months, Longbottom appraises its interest in the residual value of both trucks, and finds that the value of the cable placer has declined from \$47,000 to \$41,000, while the residual value of the aerial truck has increased from \$32,000 to \$35,000. Longbottom uses the following entry to record the reduction of value in its cable placer truck:

Loss on interest in asset residual value	6,000
Interest in asset residual value	6,000

Longbottom records no entry for the \$3,000 increase in value of its aerial truck.

**Leases involving government units.** Leases that involve government units (i.e., airport facilities, bus terminal space, etc.) usually contain special provisions that prevent the agreements from being classified as anything but operating leases. These special provisions, referred to as fiscal funding clauses, include the governmental body's authority to abandon a facility at any time during the lease term, thus making its economic life indeterminable. These leases also do not contain a BPO or transfer ownership. The fair value is generally indeterminable because neither the leased property nor similar property is available for sale.

However, leases involving government units are subject to the same classification criteria as nongovernment units, except when all of the following six criteria are met:

---

*NOTE: If all six conditions are met, the agreement is classified as an operating lease by both lessee and lessor.*

---

1. A government unit or authority owns the leased property.
2. The leased property is part of a larger facility operated by or on behalf of the lessor.
3. The leased property is a permanent structure or part of a permanent structure that normally cannot be moved to another location.
4. The lessor, or a higher governmental authority, has the right to terminate the lease at any time under the lease agreement or existing statutes or regulations.
5. The lease neither transfers ownership nor allows the lessee to purchase or acquire the leased property.
6. The leased property or similar property in the same area cannot be purchased or leased from anyone else.

If any one of the six conditions that qualify the lease for automatic operating lease treatment is not met, then the lease is evaluated to determine the likelihood of future cancellation. Using the loss contingency criteria from ASC 450, if it is remote (i.e., the chances are slight) that the lease will be canceled, then the lease agreement qualifies as a noncancelable lease and is classified the same as any other such lease with a nongovernmental lessee. Otherwise, the lease is considered to be cancelable and accounted for as an operating lease. (ASC 840-10-25)

**Maintenance deposits by lessees.** In some lease arrangements, the lessee may be required to make a deposit associated with the lessee's responsibility for the maintenance of the leased asset. Under a typical arrangement of this sort, the deposit is calculated based on a performance measure,

such as hours of use of the leased asset, and is contractually required under the lease to be used to reimburse the lessee for required maintenance of the leased asset upon the completion of that maintenance. The lessor is thus contractually required to reimburse the lessee for the maintenance costs paid by the lessee, to the extent of the amounts on deposit. If the cumulative maintenance costs are less than the amount deposited, the excess may or may not be required to be returned to the lessee.

ASC 840-10-25 and ASC 840-10-35 address this issue. Maintenance deposits paid by a lessee under an arrangement accounted for as a lease that are refunded only if the lessee performs specified maintenance activities are to be accounted for as a deposit asset. Lessees must continue to evaluate whether it is *probable* that an amount on deposit will be returned to reimburse the costs of the maintenance activities incurred by the lessee. When an amount on deposit is less than probable of being returned, it is to be recognized as additional expense. When the underlying maintenance is performed, the maintenance cost is to be expensed or capitalized in accordance with the lessee's existing maintenance accounting policy.

Entities are to recognize the effect of the change as a change in accounting principle as of the beginning of the fiscal year in which this requirement is initially applied for all arrangements existing at the effective date. The cumulative effect of the change in accounting principle is to be recognized as an adjustment to the opening balance of retained earnings (or other appropriate components of equity or net assets in the statement of financial position) for that fiscal year, presented separately. The cumulative effect adjustment is the difference between the amounts recognized in the statement of financial position before initial application of this requirement and the amounts recognized in the statement of financial position at its initial application.

**Leasehold improvements.** Leasehold improvements result when tangible physical enhancements are made to property by or on behalf of the lessee of real estate. By law, when improvements are made to real property and those improvements are permanently affixed to the property, the title to those improvements automatically transfers to the owner of the property. The rationale behind this is that the improvements, when permanently affixed, are inseparable from the rest of the real estate.

As a result of this automatic title transfer, the lessee's interest in the improvements is not a direct ownership interest but rather it is an intangible right to use and benefit from the improvements during the term of the lease. Consequently, the capitalized costs incurred by a lessee in constructing improvements to property that it leases represent an intangible asset analogous to a license to use them. Thus, when allocating the costs of leasehold improvements to the periods benefited, the expense is referred to as amortization (as used in the context of amortization of intangibles) and not depreciation.

A frequently encountered issue with respect to leasehold improvements relates to determination of the period over which they are to be amortized. Normally, the cost of long-lived assets is charged to expense over the estimated useful lives of the assets. However, the right to use a leasehold improvement expires when the related lease expires, irrespective of whether the improvement has any remaining useful life. Thus, the appropriate useful life for a leasehold improvement is the lesser of the useful life of the improvement or the term of the underlying lease. ASC 840-10-35-9 reinforces this concept by requiring that leasehold improvements acquired in a business combination or leasehold improvements completed well after commencement of a lease agreement be amortized over the lesser of the useful life of the leasehold improvement or a time period that includes required lease periods as well as reasonably assured lease renewal periods.

Some leases contain a fixed, noncancelable term and additional renewal options. When considering the term of the lease for the purposes of amortizing leasehold improvements, normally only the initial fixed noncancelable term is included. There are exceptions to this general rule that arise out of the application of GAAP to the lessee's accounting for the lease. If a renewal option is a bargain renewal option, then it is probable at the inception of the lease that it will be exercised and, therefore, the option period is included in the lease term for purposes of determining the amortizable life of the leasehold improvements. Additionally, under the definition of the lease term there are other situations where it is probable that an option to renew for an additional period would be exercised. These situations include periods for which failure to renew the lease imposes a penalty on the lessee in such amount that a renewal appears, at the inception of the lease, to be reasonably assured. Other situations of this kind arise when an otherwise excludable renewal period precedes a provision for a bargain purchase of the leased asset or when, during periods covered by ordinary renewal options, the lessee has guaranteed the lessor's debt on the leased property.

In deciding whether to include the period covered by a renewal option in the calculation of the amortizable life of the leasehold improvements, management of the lessee must be consistent with its own interpretation of renewal options that it included in the minimum lease payment calculations made to determine whether the lease is a capital or operating lease.

**Example**

Marcie Corporation occupies a warehouse under a five-year operating lease commencing January 1, 20X1, and expiring December 31, 20X5. The lease contains three successive options to renew the lease for additional five-year periods. The options are not bargain renewals, as they call for fixed rentals at the prevailing fair market rents that will be in effect at the time of exercise. When the initial calculation was made to determine whether the lease is an operating lease or a capital lease, only the initial noncancelable term of five years was included in the calculation. Consequently, for the purpose of determining the amortizable life of any leasehold improvements made by Marcie Corporation, only the initial five-year term is used. If Marcie Corporation decides, at the beginning of year 4 of the lease, to make a substantial amount of leasehold improvements to the leased property, it could be argued that it would now be probable that Marcie would exercise one or more of the renewal periods, since not doing so would impose the substantial financial penalty of abandoning expensive leasehold improvements. This would trigger accounting for the lease as if it were a new agreement and would require testing to determine whether the lease, prospectively, qualifies as a capital or operating lease.

The SEC has provided the following guidance on the proper accounting treatment by a lessee for incentives or allowances provided by a lessor to a lessee under an operating lease.<sup>14</sup>

1. The incentives are not permitted to be netted against the leasehold improvements they were intended to subsidize. Instead, they are to be recorded as deferred rent and amortized as reductions to lease expense over the lease term.
2. The leasehold improvements are to be recorded gross, at their cost, and amortized as discussed above.
3. The lessee's cash flow statement is to reflect the cash received from the lessor as an incentive or allowance as cash provided by operating activities and the acquisition of the leasehold improvements as cash used for investing activities.

<sup>14</sup> Letter from SEC Chief Accountant to the chairman of the American Institute of Certified Public Accountants (AICPA) Center for Public Company Audit Firms (CPCAF) dated February 7, 2005; [www.sec.gov/info/accountants/staffletters/cpcaf020705.htm](http://www.sec.gov/info/accountants/staffletters/cpcaf020705.htm).

Note that this guidance is a reasonable interpretation of GAAP as it applies to all entities, not just those subject to the jurisdiction of the SEC.

**Statement of financial position classification.** The balance of the lease payments receivable (lessor) and the lease obligation (lessee) must be allocated between their current and noncurrent portions. First, the current portion is computed at the date of the financial statements as the present value of the lease payments (or receipts) to be paid (received) within twelve months of the date of the statement of financial position. The noncurrent portion is computed as the difference between the current portion and the balance of the lease obligation at the end of the period. The conceptual justification for this treatment is the fact that the total lease obligation is equal to the present value of the future minimum lease payments. Therefore, it follows that the current portion is the present value of the lease payments due within one year while the noncurrent portion is the present value of all other remaining lease payments.

**Summary of Accounting for Selected Items** (see following page)

## TREATMENT OF SELECTED ITEMS IN ACCOUNTING FOR LEASES

	<i>Operating</i>	<i>Lessor</i>	<i>Lessee</i>
	<i>Capitalizing and sales-type</i>	<i>Direct financing</i>	<i>Capital</i>
Initial direct costs	Capitalize and amortize over lease term recognized proportion to rent revenue in (normally SL basis)	Record in separate account Add to net investment in lease Compute new effective rate that equates gross amt. of min. lease payments and unguar. residual value with net invest.	N/A
	Amortize so as to produce constant rate of return over lease term		
		<i>Sales-type:</i> Expense in period incurred as part of cost of sales	
Investment tax credit retained by lessor	N/A	Reduces FV of leased asset for 90% test	N/A
Bargain purchase option	N/A	Include in: Minimum lease payments 90% test	N/A
Guaranteed residual value	N/A	Include in: Minimum lease payments 90% test	N/A
Unguaranteed residual value	N/A	Sales-type: Include PV in sales revenues Include in: “Gross investment in lease” Not included in: 90% test	N/A
Contingent rentals	Revenue in period earned	Sales-type: Exclude from sales revenue Deduct PV from cost of sales Not part of minimum lease payments; revenue in period earned	Expense in period incurred Not part of minimum lease payments; expense in period incurred

	<i>Lessor</i>	<i>Lessee</i>
	<u>Operating</u>	<u>Capital</u>
Amortization period	Amortize down to estimated residual value over estimated economic life of asset (normally SL basis)	N/A
Revenue (expense) <sup>a</sup>	<p>Direct financing:</p> <p>Rent revenue (normally SL basis)</p> <p>Sales-type:</p> <p>Amortization (depreciation expense)</p>	<p>Interest expense and amortization (depreciation) expense</p> <p>Rent expense (normally SL basis)<sup>b</sup></p> <p>Dealer profit in period of sale (sales revenue less cost of leased asset)</p> <p>Interest revenue on net investment in lease</p>
		<p>Direct financing and sales-type</p> <p>Interest revenue on net investment in lease (gross investment less unearned interest income)</p>

<sup>a</sup> Elements of revenue (expense) listed for the above items are not repeated here (e.g., treatment of initial direct costs).

<sup>b</sup> If lease has automatic passage of title or bargain purchase option, use estimated economic life; otherwise, use the lease term.

<sup>c</sup> If payments are not on an SL basis, recognize rent expense on an SL basis unless another systematic and rational method is more representative of use or benefit obtained from the property, in which case the other method should be used.

<b>FASB Issues New Standard for Lease Accounting</b>	<b>1179</b>	Key Terms in the Standard	1180
Overview	1179	Transition	1180
Lessors	1179	Practical Expedients	1181
Lessees	1179	Significant Changes from Current U.S.	
Effective Date	1180	GAAP	1181
		Implementation Considerations	1183

## FASB ISSUES NEW STANDARD FOR LEASE ACCOUNTING

### Overview

In February 2016, the FASB issued Accounting Standards Update (ASU) 2016 – 02, *Leases (Topic 842)*. The existing standard has been criticized because its bright-line classification criteria enabled entities to structure leases in such a way as to avoid putting them on the balance sheet. The standard aims to improve and simplify the financial reporting for leases and create a model that provides for faithful representation of leasing transactions for both lessees and lessors.

The objective of the standard is to improve information for financial statement users by increasing transparency and comparability among organizations. To accomplish this, the standard requires:

- Lessees to recognize lease assets and lease liabilities on the balance sheet
- Lessees and lessors to disclose significant information about lease transactions.

**Lessors.** The lessor accounting model is substantially unchanged. However, lessors will have to review their systems and processes to ensure that data will be available to management for the new required disclosures. The main focus of the FASB was specifically to improve the guidance for operating leases in the financial statements of lessees. Therefore, the Board decided not to make fundamental changes to lessor accounting. However, some changes were made to lessor guidance in order to conform and align it to the new guidance for lessees and the new revenue recognition guidance, Topic 606, *Revenue from Contracts with Customers*. The new lease standard is aligned with the revenue recognition standard, and those familiar with that standard will see some similarities in terminology and approach.

Lessor accounting remains substantially unchanged. Lessors will retain the current classifications:

- Sales-type
- Direct financing
- Operating leases.

However, leveraged lease classification is eliminated.

**Lessees.** Lessees will recognize all leases, other than short-term leases, on the balance sheet. Lessees will recognize a right-of-use (ROU) asset and a lease liability for those leases. This may significantly increase reported assets and liabilities for some lessees for some leases. For the first

time, long-term operating leases will appear on the balance sheet as nondebt liabilities. The new guidance offers some relief by exempting leases with terms of less than 12 months. As a consequence, some lessees may request new or renewal renewed leases of terms less than 12 months.

The critical determination is whether a contract contains a lease. Lessees will classify leases as either operating or financing leases. Under current GAAP, the classification of a lease determines whether or not it is on the balance sheet. Under the new standard, because all leases will generally be on the balance sheet, the classification determines how entities measure and present lease income and expenses and cash flows. A lease is present in the contract if the contract includes:

- An identified asset, that is:
  - The asset is explicitly or implicitly specified
  - The supplier has no practical ability to substitute or would not economically benefit from substituting
- The right to control the use of the asset during the term of the lease, that is:
  - The lessee has decision-making authority over the use of the asset
  - The lessee has the ability to obtain substantially all economic benefit from the use of the asset.

Those familiar with the revenue recognition standard will recognize these concepts.

### **Effective Date**

The new standard is effective as follows:

	<b>Public Business Entities</b>	<b>All Other Entities</b>
<b>Effective Date</b>	Annual and interim periods in fiscal years beginning after December 15, 2018	Annual periods beginning after December 15, 2019. Interim periods in financial statements beginning after December 15, 2019
<b>Early Adoption</b>	Yes	Yes

Note that in order to capture comparative data, some companies will have to keep two sets of records for fiscal years beginning in 2017. Some entities may want to take advantage of the synergies between the new revenue recognition standard and the lease standard by early adopting and aligning processes.

### **Key Terms in the Standard**

A lease is a contract, or part of a contract, that conveys the right to control the use of identified property, plant, or equipment (an identified asset) for a period of time in exchange for consideration.

Right-of-use asset is an asset that represents a lessee's right to use an underlying asset for the least term. (ASC 842-10-20)

### **Transition**

Like the revenue standard the leases standard provides for a transition approach using the modified retrospective transition approach. The approach must be applied to all comparative periods presented.

**Practical Expedients.** Again, as with the revenue recognition standard, the standard setters provide practical expedients to ease the transition. The expedients must be applied consistently to all leases. The expedients include:

- An entity may elect not to reassess:
  - Whether expired or existing contracts contain leases under the new definition of a lease
  - Lease classification for expired or existing leases
  - Whether previously capitalized initial direct costs would qualify for capitalization under the new standard
- (The above expedients must be elected as a package at the date of adoption.)
- Use of hindsight when determining the lease term and in assessing impairment of right-to-use assets
- Making an accounting policy election by class of underlying asset not to separate lease components from nonlease components. Entities making this election account for the nonlease components and the lease components as a single lease component

### Significant Changes from Current U.S. GAAP

**Collectibility Uncertainties.** Under current GAAP, a lease with uncertainties related to collectibility cannot be classified as a sales-type lease. This changes with the new standard. Where collectibility of the lease payments plus any amount necessary to satisfy a lessee residual value guarantee is not probable for a sales-type, the entity accounts for the lease as follows:

- Lease payments received are recognized as a deposit liability rather than income.
- Generally, the underlying asset is not derecognized until collectibility of the remaining amounts becomes probable.

For a lease that otherwise would be a direct financing lease, collectibility uncertainties require that the lease be classified as an operating lease.

**Significant Variable Lease Payments.** The new standard permits leases with predominantly variable payments to be classified as sale-type or direct financing leases.

**Definition of Initial Direct Costs.** The new standard's definition is narrower than under current GAAP. The new definition excludes:

- Legal fees
- Costs of evaluating the prospective lessee's financial condition
- Costs of negotiating lease terms and conditions
- General overhead expenses.

Those expenses must be expensed as incurred. This change may have the effect of some lessors recognizing more expenses before the lease begins, and it may create higher margins on lease income earned over the lease term.

**Allocation of Consideration to Lease and Nonlease Components.** The new standard only applies to accounting for leases. So, if an entity has a lease that has a nonlease component, like a service component, that component is accounted for under the new revenue recognition standard. (Also see Practical Expedients section above.)

The lessor may have executory costs to cover ownership of the underlying asset, like property taxes or insurance. Those costs do not represent payment for a good or service and under current

GAAP are excluded from lease accounting. Under the new lease standard, such costs are allocated to the lease and nonlease components in the same manner as all other payments in the contract.

**New Disclosures.** The standard significantly expands qualitative and quantitative disclosures. The lessor's disclosures include:

- Qualitative information:
  - Information about the nature of variable payment arrangements and termination, renewal or purchase options,
  - Information about how the lessor manages residual asset risk, including about residual value guarantees and other means of limiting that risk
  - Significant accounting judgments and estimates
- Quantitative information:
  - Maturity analysis of lease receivables for sales-type and direct financing leases and of lease payments for operating leases
  - Table of lease income, showing:
    - Selling profit or loss recognized at lease commencement and interest income for sales-type and direct financing leases
    - Operating lease income
    - Variable lease income.

The lessee's disclosures include:

- Qualitative:
  - Nature of lease, such as terms and conditions of variable lease payments, extension and termination options, purchase options, and residual value guarantees
- Quantitative:
  - Operating lease costs
  - Amortization of finance lease right-of-use assets, and interest on finance lease liabilities
  - Variable lease cost
  - Weighted-average discount rate
  - Maturity analysis of lease liabilities
- Significant judgments
  - Such as whether a contract contains a lease, standalone price for leases and nonlease components, and the discount rate for the entities' leases.
  - Information about the nature of leases.

**Sale-Lease Back Accounting.** Under current GAAP, a failed sale for the seller-lessee is not accounted for as a failed purchase by the buyer-lessor. The new standard requires buyer-lessors to evaluate whether they have purchased the underlying asset based on the transfer of control guidance in the new revenue recognition standard. The buyer-lessor must also account for a failed purchase as a financing arrangement.

The new standard brings sale-leaseback transactions onto the balance sheet by requiring seller-lessees to recognize a right-of-use asset and a lease liability for the leaseback.

If the transaction does not meet the qualifications for sale under the revenue recognition guidance, the seller-lessee accounts for it as a financing transaction. Purchase options preclude sale accounting unless:

- The strike price of the repurchase option is the fair value of the asset at the option exercise date, *and*

- Assets that are substantially the same as the underlying asset are readily available in the marketplace.

If the sale-leaseback transaction qualifies as a sale of the underlying asset, the seller-lessee recognizes the entire gain from the sale at the time of sale as opposed to recognition over the leaseback terms. The gain is the difference between the selling price and the carrying value of the amount of the underlying asset. The sale-leaseback guidance is the same for all assets, including real estate.

**Build-to-Suit Lease Guidance Eliminated.** Build-to-suit lease guidance is eliminated by the new standard. The standard states that a lessee is the owner for accounting purposes of an asset under construction if it controls the asset before the lease commencement date. The rules for determining control of an asset will likely result in fewer instances where the lessee is deemed the accounting owner of an asset during the construction period. Under current GAAP, build-to-suit assets and liabilities may have remained in the balance sheet after the end of the construction period. When those entities transition to the new guidance, many will be able to do you derecognize those assets.

### Implementation Considerations

As part of its change management approach to the new standard management, will want to have a robust implementation plan. When implementing its project plan, management should consider the following steps:

- Review existing leases.
- Evaluate the ability of current systems to collect and maintain all the data necessary for compliance. IT systems must capture data for proper period or date related to disclosures.
- Identify where more judgment is required. Implement processes and controls to make sure adequate processes and controls are in place. Also make sure adequate documentation is in place to respond to auditors or regulators.
- Determine whether the Standard affects other areas, such as:
  - Taxation
  - Debt covenant compliance. Debt covenants are often based on a measure of net income. Entities must be careful not to unintentionally violate an agreement. Debt covenants may have to be modified in preparation for change, while keeping their original intent.
- Review standard leases and determine if language should be changed. The standard introduces some new terms and those should be considered.
- Review lease terms. Entities may want to make changes to better align with the standard.
- Analyze how implementation affects net income and communicate it internally, but also to stakeholders.
- Evaluate the need for training at all levels: audit committees, management, operational units.

1192	Summary	1197

## PERSPECTIVE AND ISSUES

---

### Subtopics

ASC 845, *Nonmonetary Transactions*, has only one subtopic:

- ASC 845-10, *Overall*, which includes five subsections:
  - General
  - Purchases and sales of inventory with the same counterparty
  - Barter transactions
  - Exchanges involving monetary consideration
  - Exchanges of a nonfinancial asset for a noncontrolling ownership interest.

### Scope and Scope Exceptions

Several variants of noncash transactions are governed by ASC 845. ASC 845-10-15-4 lists scope exceptions. The following types of transactions are *not* treated as nonmonetary transactions:

1. A business combination accounted for by an entity according to the provisions of ASC 805 or a combination accounted for by a not-for-profit entity according to the provisions of ASC 958-805

2. A transfer of nonmonetary assets solely between entities or persons under common control, such as between a parent and its subsidiaries or between two subsidiaries of the same parent, or between a corporate joint venture and its owners
3. Acquisition of nonmonetary assets or services on issuance of the capital stock of an entity under ASC 718-10 and ASC 505-50
4. Stock issued or received in stock dividends and stock splits
5. A transfer of assets to an entity in exchange for equity interest in that entity (except for certain exchanges of a nonfinancial asset for a noncontrolling ownership interest)
6. A pooling of assets in a joint undertaking intended to find, develop, or produce oil or gas from a particular property or group of properties
7. The exchange of a part of an operating interest owned for a part of an operating interest owned by another party that is subject to ASC 932-360-55-6
8. The transfer of a financial asset within the scope of ASC 860-10-15
9. Involuntary conversions specified in ASC 605-40-15-2<sup>1</sup>
10. The transfer of goods or services in a contract with a customer within the scope of ASC 606
11. The transfer of a nonfinancial asset within the scope of ASC 610-20 in exchange for noncash consideration. Noncash consideration promised in exchange for a nonfinancial asset that is a noncontrolling ownership interest is within the scope of ASC 845.<sup>2</sup>  
(ASC 845-10-15-4)

The guidance in the Purchases and Sales of Inventory with the Same Counterparty subsections does not apply to inventory purchase and sales arrangements that:

- Are accounted for as derivatives under Topic 815, or
- Involve exchanges of software or exchanges of real estate.<sup>3</sup>  
(ASC 845-10-15-8)

The guidance in the Exchanges Involving Monetary Consideration subsections does not apply to:

- Transfers between a joint venture and its owners
- Transfers of real estate (if the transfer involves monetary consideration, see ASC 360-20 and the Exchanges Involving Monetary Considerations Subsection of Section 845-10-30).<sup>4</sup>  
(ASC 845-10-15-14)

The guidance in the Exchanges of a Nonfinancial Asset for a Noncontrolling Ownership Interest subsections does not apply to the following types of transfers:

- Transfers between a joint venture and its owners
- Capital contributions of real estate in return for an unconsolidated real estate investment (for guidance, see Subtopic 970-323)

---

<sup>1</sup> Upon implementation of ASU 2014-09 on revenue, this citation changes to ASC 610-30-15-2).

<sup>2</sup> Items 10 and 11 are effective upon implementation of ASU 2014-09.

<sup>3</sup> Upon implementation of ASU 2014-09, this bullet is superseded.

<sup>4</sup> Upon implementation of ASU 2014-09, this bullet is superseded.

- Transfers of real estate in exchange for nonmonetary assets other than real estate (for guidance on the recognition of profit from the exchange, see Subtopic 976-605 and Section 360-20-40)<sup>5</sup>
- A deconsolidation of a subsidiary that is a business or nonprofit activity that is within the scope of Subtopic 810-10 (see paragraph 810-10-40-3A)
- A derecognition of a group of assets that constitutes a business or nonprofit activity that is within the scope of Subtopic 810-10 (see paragraph 810-10-40-3A).  
(ASC 845-10-15-21)

## Overview

ASC 845, *Nonmonetary Transactions*, addresses those transactions in which no money changes hands. These transactions are most commonly associated with exchanges of fixed assets, but can also involve other items, such as inventory, liabilities, and ownership interests. They can also involve one-way, or nonreciprocal, transfers.

This chapter sets forth the basic structure and concepts of nonmonetary transactions, including the concept of commercial substance, rules regarding similar and dissimilar exchanges, involuntary conversions, and how to handle exchanges that include a certain amount of monetary consideration.

## DEFINITIONS OF TERMS

---

Source: ASC 845-10-20. Also see Appendix, *Definitions of Terms*, for other terms related to this Topic: Contract, Customer, Nonprofit Activity, Owners, and Revenue.

**Exchange.** A reciprocal transfer between two entities, resulting in one entity acquiring assets or services or satisfying liabilities by surrendering other assets or services or incurring other obligations.

**Monetary Assets and Liabilities.** Monetary assets and liabilities are assets and liabilities whose amounts are fixed in terms of units of currency by contract or otherwise. Examples are cash, short- or long-term accounts and notes receivable in cash, and short- or long-term accounts and notes payable in cash.

**Nonmonetary Assets and Liabilities.** Assets and liabilities other than monetary ones. Examples are inventories; investments in common stocks; property, plant, and equipment; and liabilities for rent collected in advance.

**Nonreciprocal Transfer.** A transfer of assets or services in one direction from an entity to its owners (whether or not in exchange for their ownership interests) or another entity, or from its owners or another entity to the entity. An entity's reacquisition of its outstanding stock is an example of a nonreciprocal transfer.

**Owners.** Used broadly to include holders of ownership (equity interests) of investor-owned entities, mutual entities, or not-for-profit entities. Owners include shareholders, partners, proprietors, or members or participants of mutual entities. Owners also include owner and member interests in the net assets of not-for-profit entities.

**Productive Assets.** Productive assets are assets held for or used in the production of goods or services by the entity. Productive assets include an investment in another entity if the investment is accounted for by the equity method but exclude an investment not accounted for by that method.

---

<sup>5</sup> Ibid.

Similar productive assets are productive assets that are of the same general type, that perform the same function, or that are employed in the same line of business.

## CONCEPTS, RULES, AND EXAMPLES

---

### Types of Nonmonetary Transactions

There are three types of nonmonetary transactions identified in ASC 845:

1. Nonreciprocal transfers with owners—Examples include dividends-in-kind, nonmonetary assets exchanged for common stock, split-ups, and spin-offs.
2. Nonreciprocal transfers with nonowners—Examples include charitable donations of property either made or received by the reporting entity, and contributions of land by a state or local government to a private enterprise for the purpose of construction of a specified structure.
3. Nonmonetary exchanges—Examples include exchanges of inventory for productive assets, exchanges of inventory for similar products, and exchanges of productive assets.  
(ASC 845-10-05-3)

### General Rule

The primary accounting issue in nonmonetary transactions is the determination of the amount to assign to the nonmonetary assets or services transferred to or from the reporting entity.

The general rule is to value the transaction at the fair value of the asset *given up*, unless the fair value of the asset *received* is more clearly evident, and to recognize gain or loss on the difference between the fair value and carrying value of the asset. ASC 820 provides the guidance for fair value and provides that when one of the parties to a nonmonetary transaction could have elected to receive cash in lieu of the nonmonetary asset, the amount of cash that would have been received may be the best evidence of the fair value of the nonmonetary assets exchanged. The fair value of the asset surrendered should be used to value the exchange unless the fair value of the asset received is more clearly evident of the fair value. (ASC 845-10-30-1)

### Modification of the Basic Principle

ASC 845-10-30-3 states that under certain circumstances a nonmonetary exchange should be measured based on the recorded amount (after reduction, if appropriate, for an indicated impairment of value) of the nonmonetary asset relinquished, and not on the fair values of the exchanged asset, if any of the following conditions apply:

1. The fair value of neither the asset received nor the asset relinquished is determinable within reasonable limits.
2. The transaction is an exchange of a product or property held for sale in the ordinary course of business for a product of property to be sold in the same line of business to facilitate sales to customers other than the parties to the exchange.
3. The transaction lacks commercial substance.

---

*NOTE: ASC 845 states that a transfer of a nonmonetary asset will not qualify as an exchange if the transferor has substantial continuing involvement in the transferred assets that result in the transferee not obtaining the usual risks and rewards associated with ownership of the transferred assets.*

---

## Commercial Substance

As explained in ASC 845-10-30-4, a nonmonetary exchange is subjected to a test to determine whether or not it has “commercial substance.” An exchange has commercial substance if cash flows change as a result of the exchange. If determined to have commercial substance, the exchange is recorded at the fair value of the transferred asset. If the transaction is determined not to have commercial substance, the exchange is recognized using the recorded amount of the exchanged asset or assets, reduced for any applicable impairment of value.

To determine commercial substance, management estimates whether, after the exchange, the reporting entity will experience changes in its expected cash flows:

1. Because of changes in amounts, timing, and/or risks (these factors are collectively referred to as the “configuration” of the expected future cash flows), *or*
2. Because the entity-specific value of the assets received differs from the entity-specific value of the assets transferred.

If the changes in either of these criteria are significant relative to the fair values of the assets exchanged, the transaction is considered to have commercial substance. *Entity-specific value* is a concept defined in CON 7 that substitutes assumptions that an entity makes with respect to its own future cash flows for the corresponding assumptions that marketplace participants would make with respect to cash flows. The commercial substance criterion is *not* met if a transaction is structured to achieve income tax benefits or in order to achieve a specific outcome for financial reporting purposes.

**Recognition of gains or losses.** Entities should recognize losses incurred on all exchanges whether or not they have commercial substance. This is so that assets are not overstated. If an exchange has commercial substance, any gain should be recognized immediately. If an exchange has no commercial substance, the entity recognizes the gain through lower depreciation expense or when it sells the asset. However, if cash or “boot” is received, the entity may recognize a portion of the gain even if there is no commercial substance.

## Nonreciprocal Transfers

The valuation of most nonreciprocal transfers is based upon the fair value of the nonmonetary asset (or service) given up, unless the fair value of the nonmonetary asset received is more clearly evident. This will result in recognition of gain or loss on the difference between the fair value assigned to the transaction and the carrying value of the asset surrendered.

The valuation of nonmonetary assets distributed to owners of the reporting entity in a spin-off or other form of reorganization or liquidation is based on the recorded amounts, again after first recognizing any warranted reduction for impairment. Other nonreciprocal transfers to owners are accounted for at fair value if (1) the fair value of the assets distributed is objectively measurable, and (2) that fair value would be clearly realized by the distributing reporting entity in an outright sale at or near the time of distribution to the owners. (ASC 845-10-30-10)

### Example of accounting for a nonreciprocal transfer with a nonowner

1. Jacobs Corporation donated depreciable property with a book value of \$10,000 (cost of \$25,000 less accumulated depreciation of \$15,000) to a charity during the current year.
2. The property had a fair value of \$17,000 at the date of the transfer.

The transaction is valued at the fair value of the property transferred, and any gain or loss on the transaction is recognized on the date of the transfer. Thus, Jacobs recognizes a gain of \$7,000 (\$17,000 – \$10,000) in the determination of the current period's net income. The entry to record the transaction would be as follows:

Charitable donations	17,000
Accumulated depreciation	15,000
Property	25,000
Gain on donation of property	7,000

Note that the gain on disposition of the donated property is reported as operating income in accordance with ASC 420 and is not to be presented in the "other income" section of the income statement.

#### Example of an exchange involving no boot

Company presidents Able and Baker agree to swap copiers, since each needs certain printing features only available on the other company's copier. Able's copier has a book value of \$18,000 (cost of \$24,000 less depreciation of \$6,000). Both copiers have a fair value of \$24,000. In testing for the commercial substance of the transaction, there is no difference in the fair values of the assets exchanged, nor are Able's future cash flows expected to significantly change as a result of the transfer. Under ASC 845, exchanges of assets that do not alter expected future cash flows are deemed to lack commercial substance, and are accounted for at book value. As a result of the trade, Able has the following *unrecognized* gain:

Fair value of Able copier given to Baker	\$24,000
Book value of Able copier given to Baker	<u>18,000</u>
Total gain (unrecognized)	<u><u>\$ 6,000</u></u>

The entry by Able to record this transaction is as follows:

Fixed assets—Office equipment; Copier received from Baker	18,000
Accumulated depreciation—Office equipment; Copier given	6,000
Fixed assets—Office equipment; Copier given	24,000

Able elects to depreciate its newly acquired copier over four years with an assumed salvage value of zero, which computes to monthly depreciation of \$375. If Able had recorded the fair value of the incoming copier at \$24,000, this would have required a higher monthly depreciation rate of \$500. Thus, the unrecognized gain on the transaction is actually being recognized each month through reduced depreciation charges.

Able immediately exchanges its newly acquired copier for one owned by Charlie. However, the fair value of the copier owned by Charlie is \$30,000, as compared to the \$24,000 fair value of Able's copier (which is being carried at \$18,000, the carryforward basis of its predecessor). In testing for the commercial substance of the transaction, there is determined to be a significant difference in the entity-specific values of the assets exchanged, so in accordance with the provisions of ASC 845 Able must record a gain on the transaction based on the difference in the fair values of the exchanged assets. This is done with the following entry:

Fixed assets—Office equipment; Copier received from Charlie	30,000
Fixed assets—Office equipment; Copier received from Baker	18,000
Gain on disposal of office equipment	12,000

Note that the full gain from both exchanges is now being recognized, since the carryforward book value of the original copier was used as the book value of the first-acquired trade, and that carryforward amount is now being compared to the fair value of the latest trade.

Able elects to depreciate the newly acquired copier over four years with no salvage value, resulting in monthly depreciation of \$625.

After ten months, Able trades his newly acquired copier to Echo. The book value has now dropped to \$23,750 (cost of \$30,000 less depreciation of \$6,250); however, due to technology advances, its fair value has declined to \$20,000. This final trade has no commercial substance, in the ASC 845-defined sense, since cash flows will not materially vary between the use of these two machines. Thus, in general, under ASC 845, fair value accounting would not be employed in an exchange of similar assets lacking commercial substance; Able is required to recognize an impairment loss under ASC 360-10-40-4 if the fair value of the asset being disposed of is less than its carrying amount. Were this not done, the new asset would be recognized at an amount in excess of its realizable amount (fair value). Able has incurred the following impairment loss resulting from the transaction, which must be fully recognized in the current period:

Fair value of Able copier given to Echo	\$ 20,000
Book value of Able copier given to Echo	<u>(23,750)</u>
Total impairment loss (recognized)	<u>\$ (3,750)</u>

The entry by Able to record this transaction is as follows:

Fixed assets—Office equipment; Copier received from Echo	20,000
Accumulated depreciation—Office equipment; Copier received from Charlie	6,250
Impairment loss on asset disposed of	3,750
Fixed assets—Office equipment; Copier received from Charlie	30,000

### Nonmonetary Exchanges That Include Monetary Consideration (Boot)

A single exception to the nonrecognition rule for an exchange without commercial substance occurs when the exchange involves both a monetary and nonmonetary asset being exchanged for a nonmonetary asset. The monetary portion of the exchange is termed *boot*. When boot is at least 25% of the fair value of the exchange, the exchange is considered a monetary transaction. In that case, both parties record the exchange at fair value. When boot received is less than 25%, only the boot portion of the earnings process is considered to have culminated. The portion of the gain applicable to the boot is considered realized and is recognized in the determination of net income in the period of the exchange by the receiver of the boot. The payor does not record a gain. (ASC 845-10-25-6) The payor records the asset received at the monetary consideration received plus the recorded amount of the nonmonetary asset surrendered. Any loss in the exchange is recorded. (ASC 845-10-30-6)

The formula for the recognition of the gain in an exchange involving boot of less than 25% of fair value is expressed as follows:

$$\frac{\text{Boot}}{\text{Boot} + \text{Fair value of nonmonetary asset received}} \times \text{Total gain indicated} = \text{Gain recognized}$$

**Example of an exchange involving no commercial substance and boot**

Amanda Excavating exchanges one of its underutilized front loaders with Dorothy Diggers, another excavator, for a bulldozer.

These assets are carried on the respective companies' statements of financial position as follows:

	<i>Amanda</i> <i>(front loader)</i>	<i>Dorothy</i> <i>(bulldozer)</i>
Cost	\$75,000	\$90,000
Accumulated depreciation	7,500	15,000
Net book value	<u>\$67,500</u>	<u>\$75,000</u>
Fair (appraised) value	<u>\$60,000</u>	<u>\$78,000</u>

The terms of the exchange require Amanda to pay Dorothy \$18,000 cash (boot). Boot represents approximately 23% of the fair value of the exchange computed as follows:

	<i>Amount</i>	<i>Percent of total</i>
Fair value of front loader	\$60,000	77%
Cash consideration (boot)	18,000	23%
Total consideration	<u>\$78,000</u>	<u>100%</u>

Note that as the payer of boot, Amanda does not recognize a gain. As a receiver of boot that is less than 25% of the fair value of the consideration received, Dorothy recognizes a pro rata gain that is computed as follows:

$$\text{Total gain} = \$78,000 \text{ consideration} - \$75,000 \text{ net book value of bulldozer} = \$3,000$$

Portion of gain to be recognized by Dorothy

$$\frac{\$18,000 \text{ boot}}{\$18,000 \text{ boot} + \$60,000 \text{ fair value of nonmonetary asset received}} = 23\% \times \$3,000 \text{ gain} = \$690 \text{ gain recognized}$$

nonmonetary asset received = \$78,000

The accounting entries to record this transaction by Amanda and Dorothy are as follows:

	<i>Amanda</i>	<i>Dorothy</i>		
	<i>Debit</i>	<i>Credit</i>	<i>Debit</i>	<i>Credit</i>
Excavating equipment	10,500			32,310
Accum. depreciation—excavating equipment	7,500		15,000	
Cash		\$18,000	18,000	
Recognized gain	<u>—</u>	<u>—</u>	<u>—</u>	<u>690</u>
	<u>18,000</u>	<u>\$18,000</u>	<u>33,000</u>	<u>33,000</u>

Amanda records the increase in the carrying value of its excavating equipment to account for the difference between the \$78,000 fair value of the bulldozer received and the \$67,500 carrying value of the front loader exchanged. The accumulated depreciation on the front loader is reversed since, from the standpoint of Amanda, it has no accumulated depreciation on the bulldozer at the date of the exchange.

Dorothy records the cash received, removes the previously recorded accumulated depreciation on the bulldozer, records the \$690 gain attributable to the boot as computed above, and records the difference as an adjustment to the carrying value of its excavating equipment.

After recording the entries above, the carrying values of the exchanged equipment would be as follows:

	<i>Amanda</i> (bulldozer)	<i>Dorothy</i> (front loader)
Net book value exchanged	\$67,500	\$ 75,000
Cash paid (received)	18,000	(18,000)
Gain recognized		\$ 690
Carrying value of asset received	<u>\$85,500</u>	<u>\$ 57,690</u>

To summarize, if boot is 25% or more of the fair value of an exchange, the transaction is considered a monetary transaction. In that case, both parties record the transaction at fair value. If the boot is less than 25%, the payer of the boot does not recognize a gain and the receiver of the boot must follow the pro rata recognition guidance in ASC 845-10-30-6. See the following section for rules regarding exchanges with boot involving real estate.

Gain on a *monetary* exchange that involves transfer by one entity of its ownership of a controlled asset, group of assets, or business to another entity in exchange for a noncontrolling ownership interest in the other entity is accounted for consistent with the guidance above for similar *nonmonetary* exchanges.

### Exchanges of Real Estate Involving Monetary Consideration (Boot)<sup>6</sup>

A transaction that involves the exchange of similar real estate and boot of 25% or more of the fair value of the exchange is recorded with two separate components, a monetary component and a nonmonetary component. The allocation is made based on the relative fair values of the monetary and nonmonetary portions at the time of the transaction. (ASC 845-10-25-7) The party that receives the boot accounts for the monetary component of the transaction under ASC 360-20 as the equivalent of a sale of an interest in the underlying real estate and the nonmonetary component of the transaction based on the recorded amount (reduced, if applicable, for any impairment in value) of the nonmonetary asset relinquished. For the party that pays the boot, the monetary component is accounted for as an acquisition of real estate, and the nonmonetary component is accounted for based on the recorded amount (reduced, if applicable, for any impairment in value).

### Inventory Purchases and Sales with the Same Counterparty

Some enterprises sell inventory to another party from whom they also acquire inventory in the same line of business. These transactions may be part of single or separate arrangements and the inventory purchased or sold may be raw materials, work-in-process, or finished goods. These arrangements require careful analysis to determine if they are to be accounted for as a single exchange transaction under ASC 845, *Nonmonetary Transactions*, and whether they are to be recognized at fair value or at the carrying value of the inventory transferred.<sup>7</sup>

**Determining whether transactions constitute a single exchange.** ASC 845-10-15-6 states that inventory purchases and sales with the same counterparty are to be treated as a single transaction when:

1. An inventory transaction is legally contingent upon the occurrence of another inventory transaction with the same counterparty, or

<sup>6</sup> This guidance is superseded when ASU 2014-09 is implemented.

<sup>7</sup> This guidance does not apply to arrangements accounted for as derivatives under ASC 815, or to exchanges of software or real estate.

2. Two or more inventory purchase and sale transactions involving the same counterparties are entered into in contemplation of one another and are combined.

In determining whether transactions were entered into in contemplation of one another, FASB provides the following indicators, which are neither all-inclusive nor determinative (ASC 845-10-25-4):

1. The counterparties have a specific legal right of offset of their respective obligations.
2. The transactions are entered into simultaneously.
3. The terms of the transactions were “off-market” when the arrangement was agreed to by the parties.
4. The relative certainty that reciprocal inventory transactions will occur between the counterparties.

**Measurement of the exchange.** When management has determined that multiple transactions between the same counterparties within the same line of business are to be treated as a single exchange transaction, the measurement of the transaction depends on the type of inventory items exchanged. The rules are summarized in the following table:

Type of inventory transferred to counterparty	Type of inventory received from counterparty	Accounting treatment
Finished goods	Raw materials or work-in-process	Recognize the transaction at fair value if fair value is determinable within reasonable limits, and transaction has commercial substance per ASC 845-10-30-4; otherwise, recognize at the carrying value of the inventory transferred
	Finished goods*	Recognize the transaction at the carrying value of the inventory transferred
Raw materials	Raw materials, work-in-process, or finished goods	
Work-in-process		

- \* NOTE: A transfer of finished goods in exchange for other finished goods is subject to ASC 845-10-30-3 (b), which prescribes that when an exchange transaction involving products or property to be sold in the same line of business is made to facilitate sales to customers that are not parties to the exchange, the transaction is measured at the recorded amount of the assets relinquished, reduced for any indicated impairment of value.

#### Example of counterparty inventory transfers

Shapiro Optics Corporation (SOC) manufactures lenses for cameras, binoculars, and telescopes.

Farber Products, Inc. (FPI) is a manufacturer of digital cameras. FPI internally manufactures many of the individual parts used in its cameras including all of the electronic circuitry and the viewfinders. FPI does not have the expertise or capacity to design and manufacture lenses or camera housings, which it accordingly purchases from external suppliers.

SOC has been a long-time supplier of lenses to FPI and due to their strong business relationship, SOC wishes to purchase electronic components from FPI similar to those that FPI uses in its camera circuit boards. SOC plans to use those components as raw materials in a popular line of telescopes it manufactures. The parties negotiate and execute an agreement with the following terms:

1. FPI agrees to purchase a specified number of lenses from SOC over a two-year period.
2. At least weekly, at its discretion, FPI can settle its payable to SOC by either paying the obligation in cash, or by shipping electronic components to SOC of equivalent value.
3. SOC is obligated to accept the components in lieu of cash, should FPI choose to settle the outstanding balance in that manner.

Historically, based on its manufacturing capacity and its cash management policies, FPI has settled these transactions by shipping components and SOC has accepted those components and used them in manufacturing its telescopes. Upon delivery of its lenses to FPI, SOC reasonably expects that it will receive electronic components from FPI in return.

These transfers are to be treated as a single, nonmonetary transaction, since:

1. The agreement that governs both the purchase transactions and their settlement is evidence that they were entered into simultaneously.
2. There is a strong likelihood that each time FPI purchases lenses it will also ship components in a reciprocal inventory transaction.
3. By accepting settlement of its receivable from FPI in components rather than in cash, SOC is, in effect, allowing the offset of its receivable from FPI with its payable to FPI for its purchase of components.

From the perspective of SOC, it is relinquishing its lenses, which are accounted for in its financial statements as finished goods inventory, and exchanging the lenses for electronic components, which are accounted for as raw materials used in the production of its telescopes. Assuming the transaction passes the commercial substance test (ASC 840-10-30-4), SOC will account for the nonmonetary exchange at fair value.

### **Exchange of Product or Property Held for Sale for Productive Assets**

An exchange of goods held for sale in the ordinary course of business for property and equipment to be used in the production process, even if they pertain to the same line of business, is recorded at fair value.

### **Exchanges Involving Assets That Constitute a Business**

The GAAP rules for recognizing exchanges or purchases of productive assets differ materially from those that apply to acquisitions of businesses (e.g., goodwill would only be recognized in connection with the latter class of transaction, and under ASC 845 certain nonmonetary exchanges are recorded at book value).

The ASC Master Glossary defines a business as an integrated set of activities and assets conducted and managed for the purpose of providing a return to investors. (ASC 845-10-30-10) A business consists of:

1. inputs,
  2. processes applied to those inputs, and
  3. resulting outputs that are used to generate revenues.
- (ASC 805-10-55-4)

For a transferred set of activities and assets to be deemed a business, it must contain essentially all of the inputs and processes necessary for it to continue to conduct normal operations after the transferred assets are separated from the transferor, which includes the ability to sustain a revenue stream by providing its outputs to customers. If these criteria are not satisfied, the assets do not comprise a business and ASC 805, *Business Combinations*, does not apply to accounting for the acquisition.

## Barter Transactions

Through third-party barter exchanges, many commercial enterprises exchange their goods and services to obtain barter credits that can be used in lieu of cash to obtain goods and services provided by other members of the barter exchange.

ASC 845-10-30-17<sup>8</sup> specifies two rebuttable presumptions that apply to accounting for exchanges of nonmonetary assets for barter credits:

1. The fair value of the nonmonetary asset is presumed to be more clearly evident than the fair value of the barter credits received; and
2. The fair value of the nonmonetary asset is presumed not to exceed its carrying amount.

The general rule is that when a nonmonetary asset is exchanged for barter credits, the transaction is valued at the fair value of the nonmonetary asset surrendered, since it is presumed to be the more readily determinable of the two fair values.

The first presumption can be overcome if (1) the entity is able to convert the barter credits into cash within the near term, as evidenced by past practice of doing so shortly after receipt; or (2) independent quoted market prices are available for items to be received in exchange for the barter credits. The second presumption can be overcome if persuasive evidence exists that supports a higher value. (ASC 845-10-30-18)<sup>9</sup>

If it subsequently becomes apparent that either of the following conditions exist, the reporting entity is to recognize an impairment loss on the barter credits:

1. The carrying value of any remaining barter credits exceeds their fair value, or
2. It is probable that the entity will not use all of the remaining barter credits.

If an exchange involves transfer or assumption of an operating lease for barter credits, impairment of the lease is to be measured as the amount of remaining lease costs (the discounted future rental payments plus the carrying amount of unamortized leasehold improvements) in excess of the fair value of the discounted amount of the probable future sublease rentals for the remaining lease term. (ASC 845-10-30-20)<sup>10</sup>

## Involuntary Conversions

An involuntary conversion results from the forced disposition of property due to casualty, theft, condemnation, or threat of condemnation. Upon involuntary conversion, the owner of the asset forfeits it and potentially receives proceeds from filing a property/casualty insurance claim or from condemnation awards.

Certain conditions may occur that necessitate the involuntary conversion of a nonmonetary asset into a monetary asset. ASC 605-40, *Revenue Recognition—Gains and Losses*, specifies that involuntary conversions of nonmonetary assets to monetary assets are monetary transactions, and the resulting gain or loss is recognized in the period of conversion. It makes no difference that the monetary assets received are immediately reinvested in nonmonetary assets.

This rule does not apply to an interim period involuntary conversion of LIFO inventories that are intended to be replaced but have not yet been replaced by year end.

<sup>8</sup> ASC 845-10-30-17 is superseded when ASU 2014-09 is implemented.

<sup>9</sup> ASC 845-10-30-18 is superseded when ASU 2014-09 is implemented.

<sup>10</sup> ASC 845-10-30-20 is superseded when ASU 2016-02 on leases is implemented.

### Exchanges of a Nonfinancial Asset for a Noncontrolling Ownership Interest

An entity may transfer a nonfinancial asset to a newly created entity in exchange for a noncontrolling ownership interest in that new entity. The transaction is accounted for using the guidance for the equity method and a monetary consideration. In that case, gain is recognized at fair value. If the entity that transfers the nonfinancial asset has no actual or implied financial or other commitment to support the operations of the new entity, any gain recognized may exceed the amount calculated.

A commitment for the purposes of the preceding paragraph exists if the parties to the transaction have signed a binding, written agreement that specifies the principal provisions of the transaction. A preliminary agreement does not qualify as a commitment if any of the principal provisions are yet to be negotiated, or are subsequently changed.

#### Exchange of a nonfinancial asset for a noncontrolling ownership interest<sup>11</sup>

Acme owns equipment with a recorded value of \$1,000 and a fair value of \$4,000. BetaCorp creates a new subsidiary, NewCo, and transfers cash of \$600 to NewCo. Acme transfers the equipment to NewCo in exchange for NewCo stock that represents a 40% ownership interest in NewCo. At the same time, NewCo borrows \$3,000 with recourse to only the equipment and pays Acme \$3,600 cash.

If Acme has no actual or implied commitment, financial or otherwise, to support the operations of BetaCorp in any manner, a gain of \$2,600 is recognized. The investor's basis in the new entity should be no less than zero. The gain calculation is illustrated below:

Fair value of interest in equipment sold ( $\$4,000 \times .60$ )	\$2,400
Less: Cost of interest in equipment sold ( $\$1,000 \times .60$ )	(600)
Plus: Additional gain	800
Total gain recognized	<u>\$2,600</u>
<i>Calculation of additional gain of \$800 above:</i>	
Cost of equipment	\$1,000
Less: Cost of interest in equipment sold	(600)
Remaining cost	400
Less: Cash received in excess of 50% of the equipment's fair value ( $\$3,600 - \$2,400$ )	(1,200)
Negative investment	<u><u>\$ (800)</u></u>

### Deferred Income Taxes

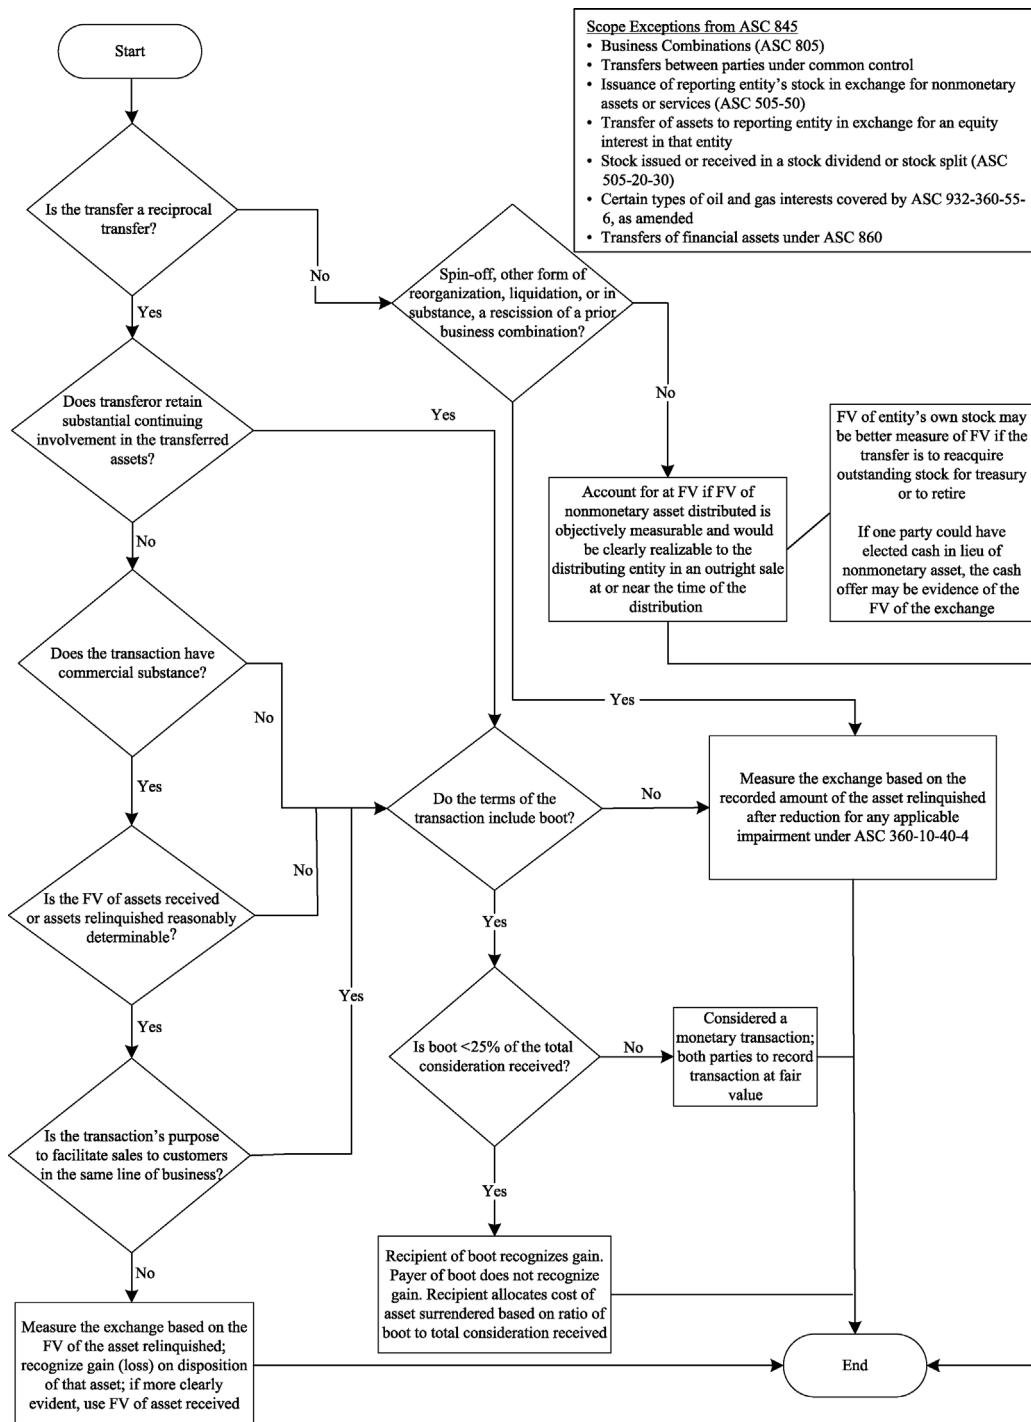

A difference between the amount of gain or loss recognized for financial reporting purposes and that recognized for income tax purposes constitutes a temporary difference. The difference in the gain or loss recognized results in a difference between the income tax basis and the financial reporting basis of the asset received. The difference in the gain or loss reverses as a result of the annual charge to depreciation. The proper treatment of temporary differences is discussed in the chapter on ASC 740.

### Summary

The situations involving the exchange of nonmonetary assets are summarized in the diagram on the following page.

<sup>11</sup> This example is based on ASC 845-10-55-27 and 55-28.

## Nonmonetary Transactions

# 59 ASC 850 RELATED-PARTY DISCLOSURES

<b>Perspective and Issues</b>	<b>1199</b>	<b>Concepts, Rules, and Examples</b>	<b>1200</b>
Subtopic	1199	Disclosures	1200
Scope	1199		
<b>Definitions of Terms</b>	<b>1199</b>		

## PERSPECTIVE AND ISSUES

---

### Subtopic

ASC 850 contains one subtopic:

- ASC 850-10, *Overall*, which sets forth the disclosure requirements, certain significant related party transactions, and control relationships.

### Scope

ASC 850 applies to all entities.

## DEFINITIONS OF TERMS

---

Source: ASC 850-20. Also see Appendix A, *Definition of Terms*, for another term related to this topic: Related Parties.

**Affiliate.** A party that, directly or indirectly through one or more intermediaries, controls, is controlled by, or is under common control with an entity.

**Control.** The possession, direct or indirect, of the power to direct or cause the direction of the management and policies of an entity through ownership, by contract, or otherwise.

**Immediate Family.** Family members who might control or influence a principal owner or a member of management, or who might be controlled or influenced by a principal owner or a member of management, because of the family relationship.

**Management.** Persons who are responsible for achieving the objectives of the entity and who have the authority to establish policies and make decisions by which those objectives are to be pursued. Management normally includes members of the board of directors, the chief executive officer, chief operating officer, vice presidents in charge of principal business functions (such as sales, administration, or finance), and other persons who perform similar policy-making functions. Persons without formal titles also may be members of management.

**Principal Owners.** Owners of record or known beneficial owners of more than 10% of the voting interests of the entity.

## CONCEPTS, RULES, AND EXAMPLES

---

### Disclosures

According to ASC 850, *Related-Party Disclosures*, financial statements are required to disclose material related-party transactions other than compensation arrangements, expense allowances, or other similar items that occur in the ordinary course of business.

A related party is essentially any party that controls or can significantly influence the management or operating policies of the company to the extent that the company may be prevented from fully pursuing its own interests. Related parties include affiliates, investees accounted for by the equity method, trusts for the benefit of employees, principal owners, management, and immediate family members of owners or management.

Transactions with related parties must be disclosed even if there is no accounting recognition made for such transactions (e.g., a service is performed without payment). Disclosures are not permitted to assert that the terms of related-party transactions were essentially equivalent to arm's-length dealings unless those claims can be substantiated. If the financial position or results of operations of the reporting entity could change significantly because of common control or common management, disclosure of the nature of the ownership or management control is required, even if there were no transactions between the entities.

The disclosures include:

1. The nature of the relationship
2. A description of transactions and the effects of those transactions reflected in the financial statements for each period for which an income statement is presented
3. The dollar amount of transactions for each period for which an income statement is presented and the effects of any change in the terms of such transactions as compared to the terms used in prior periods
4. Amounts due to and from related parties as of the date of each statement of financial position presented, together with the terms and manner of settlement.

# 60 ASC 852 REORGANIZATIONS

<b>Perspective and Issues</b>	<b>1201</b>	<b>Concepts, Rules, and Examples</b>	<b>1203</b>
Subtopics	1201	Corporate Bankruptcy and Reorganizations	1203
Scope and Scope Exceptions	1201	Entities operating under and emerging from protection of the bankruptcy laws	1203
Overview	1201		
<b>Definitions of Terms</b>	<b>1202</b>	Quasi-Reorganizations	1204

## PERSPECTIVE AND ISSUES

---

### Subtopics

ASC 852, *Reorganizations*, contains two subtopics:

- ASC 852-10, *Overall*, which provides guidance for entities that have filed petitions in the Bankruptcy Court and expect to reorganize under Chapter 11
- ASC 852-20, *Quasi-Reorganizations*.

### Scope and Scope Exceptions

ASC 852-10 applies to all entities except governmental organizations but does *not* apply to debt restructurings outside of Chapter 11 and reorganizations consisting of liquidation or adoption of plans of liquidation under the Bankruptcy Code.

ASC 852-20 applies only to “readjustments in which the current income, or retained earnings or accumulated deficit account, or the income account of future years is relieved of charges that would otherwise be made against it. . . .” Further, it does not apply to:

- a. “Quasi-reorganizations involving only deficit reclassifications
  - b. Charges against additional paid-in capital in other types of readjustments such as readjustments for the purpose of correcting erroneous credits made to additional paid-in capital in the past
  - c. Financial reporting for entities that enter and intend to emerge from Chapter 11 reorganization, at the time of such reorganization.”
- (ASC 852-20-15-3)

### Overview

Entities expected to reorganize as going concerns under Chapter 11 of the Bankruptcy Code employ so-called “fresh start” accounting if:

1. The “reorganization value of the assets of the emerging entity immediately before the date of confirmation is less than the total of all postpetition liabilities and allowed claims, and
  2. Holders of existing voting shares immediately before confirmation receive less than 50 percent of the voting shares of the emerging entity.”
- (ASC 852-10-45-19)

## DEFINITIONS OF TERMS

---

Source: 851-10-20

**Allowed Claim.** The amount allowed by the Bankruptcy Court as a claim against the estate. This amount may differ from the actual settlement amount.

**Bankruptcy Code.** A federal statute, enacted October 1, 1979, as title 11 of the United States Code by the Bankruptcy Reform Act of 1978, that applies to all cases filed on or after its enactment and that provides the basis for the current federal bankruptcy system.

**Bankruptcy Court.** The United States Bankruptcy Court is an adjunct of the United States District Courts. Under the jurisdiction of the District Court, the Bankruptcy Court is generally responsible for cases filed under Chapters 7, 11, 12, and 13 of the Bankruptcy Code.

**Chapter 7.** A liquidation, voluntarily or involuntarily initiated under the provisions of the Bankruptcy Code, that provides for liquidation of the business or the debtor's estate.

**Chapter 11.** A reorganization action, either voluntarily or involuntarily initiated under the provisions of the Bankruptcy Code, that provides for a reorganization of the debt and equity structure of the business and allows the business to continue operations. A debtor may also file a plan of liquidation under Chapter 11.

**Claim.** As defined by Section 101(4) of the Bankruptcy Code, a right to payment, regardless of whether the right is reduced to judgment, liquidated, unliquidated, fixed, contingent, matured, unmatured, disputed, undisputed, legal, secured, or unsecured, or a right to an equitable remedy for breach of performance if such breach results in a right to payment, regardless of whether the right is reduced to a fixed, contingent, matured, unmatured, disputed, undisputed, secured, or unsecured right.

**Emerging Entity.** An entity (sometimes referred to as the reorganized entity), that has had its plan confirmed and begins to operate as a new entity.

**Obligations Subject to Compromise.** Includes all prepetition liabilities (claims) except those that will not be impaired under the plan, such as claims in which the value of the security interest is greater than the claim.

**Petition.** A document filed in a court of bankruptcy, initiating proceedings under the Bankruptcy Code.

**Plan of Reorganization** An agreement formulated in Chapter 11 proceedings under the supervision of the Bankruptcy Court that enables the debtor to continue in business. The plan, once confirmed, may affect the rights of undersecured creditors, secured creditors, and stockholders as well as those of unsecured creditors. Before a plan is confirmed by the Bankruptcy Court, it must comply with general provisions of the Bankruptcy Code. Those provisions mandate, for example, that the plan is feasible, the plan is in the best interest of the creditors, and, if an impaired class does not accept the plan, the plan must be determined to be fair and equitable before it can be confirmed.

**Postpetition Liabilities.** Liabilities incurred after the filing of a petition that are not associated with prebankruptcy events. Thus, these liabilities are not considered prepetition liabilities.

**Prepetition Liabilities.** Liabilities that were incurred by an entity before its filing of a petition for protection under the Bankruptcy Code, including those considered by the Bankruptcy Court to be prepetition claims, such as a rejection of a lease for real property.

**Reorganization Items.** Items of income, expense, gain, or loss that are realized or incurred by an entity because it is in reorganization.

**Reorganization Proceeding.** A Chapter 11 case from the time at which the petition is filed until the plan is confirmed.

**Reorganization Value.** The value attributed to the reconstituted entity, as well as the expected net realizable value of those assets that will be disposed of before reconstitution occurs. Therefore, this value is viewed as the value of the entity before considering liabilities and approximates the amount a willing buyer would pay for the assets of the entity immediately after the restructuring.

**Secured Claim.** A liability that is secured by collateral. A fully secured claim is one in which the value of the collateral is greater than the amount of the claim.

**Terminal Value.** A component of reorganization value. Reorganization value calculated based on the discounting of cash flows normally consists of three parts: the discounted cash flows determined for the forecast period, the residual value or terminal value, and the current value of any excess working capital or other assets that are not needed in reorganization. Terminal or residual value represents the present value of the business attributable to the period beyond the forecast period.

**Trustee.** A person appointed by the Bankruptcy Court in certain situations based on the facts of the case, not related to the size of the entity or the amount of unsecured debt outstanding, at the request of a party in interest after a notice and hearing.

**Undersecured Claim.** A secured claim whose collateral is worth less than the amount of the claim. Sometimes referred to as an undersecured claim liability.

**Unsecured Claim.** A liability that is not secured by collateral. In the case of an undersecured creditor, the excess of the secured claim over the value of the collateral is an unsecured claim, unless the debtor elects in a Chapter 11 proceeding to have the entire claim considered secured. The term is generally used in bankruptcy to refer to unsecured claims that do not receive priority under the Bankruptcy Code. Sometimes referred to as an unsecured claim liability.

## CONCEPTS, RULES, AND EXAMPLES

---

### Corporate Bankruptcy and Reorganizations

**Entities operating under and emerging from protection of the bankruptcy laws.** The going concern assumption is one of the basic postulates underlying generally accepted accounting principles and is responsible for, among other things, the historical cost convention in financial reporting. For entities that have entered bankruptcy proceedings, however, the going concern assumption is no longer of central importance.

ASC 852 provides financial reporting standards for entities undergoing and emerging from reorganization under the bankruptcy laws. Under its provisions, assets are presented at estimated realizable values. Liabilities are set forth at the estimated amounts to be allowed in the statement of financial position, and liabilities subject to compromise are distinguished from those that are not. Furthermore, the Codification requires that in both the statements of income and cash flows, normal transactions be differentiated from those that have occurred as a consequence of the entity's being in reorganization. While certain allocations to the latter category are rather obvious, such as legal and accounting fees incurred, others are less clear. For example, the Codification suggests that if the entity in reorganization earns interest income on funds that would normally have been used to settle obligations owed to creditors, such income will be deemed to be income arising as a consequence of the bankruptcy action.

Another interesting aspect of ASC 852 is the accounting for the emergence from reorganization (known as confirmation of the plan of reorganization). The ASC provides for "fresh start" financial reporting in such instances. This accounting is similar to that applied in

acquisitions, with the total confirmed value of the entity upon its emergence from reorganization being analogous to the purchase price in an acquisition. In both cases, this total value is allocated to the identifiable assets and liabilities of the entity, with any excess being allocated to goodwill. In the case of entities emerging from bankruptcy, goodwill (called reorganization value in excess of amounts allocable to identifiable assets) is measured as the excess of liabilities existing at the plan confirmation date, computed at present value of future amounts to be paid, over the reorganization value of assets. Reorganization value is calculated with reference to a number of factors, including forecasted operating results and cash flows of the new entity.

ASC 852 applies *only* to entities undergoing formal reorganization under the Bankruptcy Code. Less formal procedures may still be accounted for under quasi-reorganization accounting procedures.

### Quasi-Reorganizations

Generally, this procedure is applicable during a period of declining price levels. It is termed “quasi” since the accumulated deficit is eliminated at a lower cost and with less difficulty than a legal reorganization.

Per ASC 852-20, the procedures in a quasi-reorganization involve the:

1. Proper authorization from stockholders and creditors where required
2. Revaluation of assets to their current values: all losses are charged to retained earnings, thus increasing any deficit
3. Elimination of any deficit by charging paid-in capital:
  - a. First, additional paid-in capital to the extent it exists
  - b. Second, capital stock when additional paid-in capital is insufficient: the par value of the stock is reduced, creating the extra additional paid-in capital to which the remaining deficit is charged.

No retained earnings may be created by a reorganization. Any excess created by the reduction of par value is credited to “Paid-in capital from quasi-reorganization.”

ASC 852-20-10-2 requires that retained earnings be titled for ten years (less than ten years may be justified under exceptional circumstances) after a quasi-reorganization takes place. Disclosure similar to “since quasi-reorganization of June 30, 20XX” is appropriate.

# 61 ASC 853 SERVICE CONCESSION ARRANGEMENTS

<b>Perspective and Issues</b>	<b>1205</b>	<b>Concepts, Rules, and Examples</b>	<b>1206</b>
Subtopic	1205	Accounting for Service Concession Arrangements	1206
Scope	1205	Service concession arrangements	1206
Scope exception	1205	Economic substance	1206
Overview	1206		
<b>Definitions of Terms</b>	<b>1206</b>		

## PERSPECTIVE AND ISSUES

---

### Subtopic

ASC 853, *Service Concession Arrangements*, contains one Subtopic:

- ASC 853-10, *Overall*, which addresses the accounting for service concession arrangements between a public sector entity grantor and an operating entity where the operating entity operates the grantor's infrastructure.

### Scope

ASC 853 applies to the accounting:

- *by operating entities*
- *of a service concession arrangement*
- *under which a public-sector entity grantor enters into a contract with an operating entity to operate the grantor's infrastructure.*

The operating entity also may provide the construction, upgrading, or maintenance services of the grantor's infrastructure.

(ASC 853-10-15-2)

It is important to note that a service concession arrangement within the scope of ASC 853 must meet *both* of the following conditions:

- a. The grantor controls or has the ability to modify or approve the services that the operating entity must provide with the infrastructure, to whom it must provide them, and at what price.
- b. The grantor controls, through ownership, beneficial entitlement, or otherwise, any residual interest in the infrastructure at the end of the term of the arrangement.

(ASC 853-10-15-3)

**Scope exception.** A service concession arrangement meeting the scope criteria in Topic 980 on regulated operations should apply the guidance in Topic 980.

## Overview

ASC 853 is the result of a consensus of the Emerging Issues Task Force (EITF) and addresses a narrow issue. However, the existing guidance was confusing, and practice was diverse. Depending on the terms, some preparers may have concluded that a service arrangement is a lease. To bring consistency in practice, the EITF decided that the arrangements described in the ASU should not be accounted for as leases. The EITF limited the scope of the guidance to arrangements in which the grantor is a public-sector entity.

## DEFINITIONS OF TERMS

---

See Appendix A, *Definitions of Terms*, for terms relevant to this topic: Not-for-Profit Entity, Public Business Entity

## CONCEPTS, RULES, AND EXAMPLES

---

### Accounting for Service Concession Arrangements

The topic has two main provisions:

- Service concession arrangements that meet the guidelines are not to be accounted for as leases. For guidance, preparers should look to other topics, for example, ASC 605 to recognize revenue on construction, upgrade, or operation services.
- The infrastructure involved in the arrangements should not be recognized as the operating entity's property, plant, and equipment.

**Service concession arrangements.** The infrastructure that the entity operates may be airports, roads, bridges, hospitals, prisons, etc. The operating entity may also provide construction or maintenance services to the grantor's infrastructure. A key feature of a service concession arrangement is that it is generally for the public good. The operator usually receives payment for the services performed over a specified time. The operator may have the right to charge users of the infrastructure. The arrangement may include unconditional guarantees for guaranteed minimum payments.

**Economic substance.** The grantor controls or has the ability to modify or approve the services provided and the price charged for the service. The grantor controls any residual interest in the infrastructure at the end of the term. This control is important in deciding the economic substance of the transaction and the reason why it is not appropriate for the operating entity to recognize a lease or property, plant, and equipment. (ASC 853-10-05-01 and 05-02)

# 62 ASC 855 SUBSEQUENT EVENTS

<b>Perspective and Issues</b>	<b>1207</b>	<b>Definitions of Terms</b>	<b>1207</b>
Subtopic	1207	<b>Concepts, Rules, and Examples</b>	<b>1208</b>
Scope and Scope Exceptions	1207	Types of Subsequent Events	1208
Overview	1207	Examples of subsequent events	1209

## PERSPECTIVE AND ISSUES

---

### Subtopic

ASC 855, *Subsequent Events*, consists of one subtopic:

- ASC 855-10, *Overall*, which provides guidance for events or transactions occurring after the balance sheet date.

### Scope and Scope Exceptions

ASC 855 applies to all entities and all transactions except for those covered in other Codification Topics.

### Overview

ASC 855 describes the circumstances under which an entity should recognize events or transactions in its financial statements that occur subsequent to the balance sheet date, but before the financial statements are available to be issued. This can have a potentially significant impact on loss contingencies.

## DEFINITIONS OF TERMS

---

Source: ASC 855-20. See Appendix A, *Definitions of Terms*, for other terms related to this topic: Conduit Debt Securities, Financial Statements Are Available to Be Issued, Financial Statements Are Issued, and (SEC) Filers.

**Revised Financial Statements.** Financial statements revised only for either of the following conditions:

- a. Correction of an error
- b. Retrospective application of U.S. GAAP.

**Subsequent Events.** Events or transactions that occur after the balance sheet date but before financial statements are issued or are available to be issued. There are two types of subsequent events:

- a. The first type consists of events or transactions that provide additional evidence about conditions that existed at the date of the balance sheet, including the estimates inherent in the process of preparing financial statements (that is, recognized subsequent events).

- b. The second type consists of events that provide evidence about conditions that did not exist at the date of the balance sheet but arose subsequent to that date (that is, nonrecognized subsequent events).

## CONCEPTS, RULES, AND EXAMPLES

---

### Types of Subsequent Events

The statement of financial position is dated as of the last day of the fiscal period, but a period of time usually elapses before the financial statements are issued. During this period, significant events or transactions may have occurred that materially affect the company's financial position. These events and transactions are called subsequent events. The omission of disclosure of significant events occurring between the date of the statement of financial position and issuance date of the financial statements could mislead the reader who is otherwise unaware of those events.

SEC filers and conduit bond obligors for conduit debt securities traded in a public market are required to evaluate subsequent events through the date the financial statements are issued. All other entities must evaluate subsequent events through the date the financial statements are *available* to be issued. (ASC 855-10-25-1A)

There are two types of subsequent events, which relate to when the event or transaction occurred and determine the accounting treatment:

1. *Existing conditions.* Additional evidence may arise about a condition that existed as of the balance sheet date. If so, recognize these changes within the financial statements.
2. *Subsequent events.* Evidence may arise about conditions that did not exist as of the balance sheet date, but which occurred later. Do not recognize these changes within the financial statements.

The following table presents a variety of sample situations occurring after the balance sheet date but before the financial statements are available to be issued, and that apply to these two types of subsequent events:

<i>Event</i>	<i>Accounting Treatment</i>
Litigation is settled for an amount different from the recorded liability	(1)
Loss on a customer receivable caused by customer bankruptcy	(1)
Loss of assets due to a natural disaster	(2)
Loss on receivables from conditions arising after the balance sheet date	(2)
Changes in the fair value of assets or liabilities	(2)
Issuing significant guarantees	(2)

(1) *Recognize within the financial statements if they are not yet available to be issued.*

(2) *Do not recognize until the next reporting period.*

An entity should disclose the date through which it has evaluated subsequent events, and whether that date is the date when the financial statements were issued or available to be issued. For revised financial statements, disclose both the dates through which subsequent events have been evaluated through the issued or available-to-be-issued financial statements, and for the revised financial statements.

If a nonrecognized event is so significant that the financial statements would be misleading without disclosure of it, note the nature of the event and an estimate of its financial effect, or a statement that the entity cannot create such an estimate.

**Examples of subsequent events**

1. A loss on an uncollectible trade account receivable that results from a customer's deteriorating financial condition, which led to bankruptcy subsequent to the date of the statement of financial position, would be indicative of conditions existing at the date of the statement of financial position, thereby calling for adjustment of the financial statements before their issuance. On the other hand, a loss on an uncollectible trade account receivable resulting from a customer's major casualty, such as a fire or flood subsequent to the date of the statement of financial position, would not be indicative of conditions existing at the date of the statement of financial position, and the adjustment of the financial statements would not be appropriate. However, if the amount is material, disclosure would be required.
2. A settlement of a lawsuit would require adjustment of the financial statements if the event that gave rise to the claim occurred prior to the date of the statement of financial position. However, only disclosure is required if the event that gave rise to the claim occurred after the date of the statement of financial position, and then only if the amount involved were expected to be material.
3. The second type of subsequent events (those not existing at the date of the statement of financial position) that require disclosure, but not adjustment, include the following:
  - a. Sale of a bond or capital stock issue
  - b. Purchase of a business
  - c. Loss of plant or inventories as a result of fire or flood
  - d. Gains or losses on certain marketable securities.

## PERSPECTIVE AND ISSUES

### Subtopics

ASC 860 contains five subtopics:

- ASC 860-10, *Overall*
- ASC 860-20, *Sales of Financial Assets*
- ASC 860-30, *Secured Borrowings and Collateral*
- ASC 860-40, *Transfers to Qualifying Special-Purpose Entities*
- ASC 860-50, *Servicing Assets and Liabilities*.

### Scope and Scope Exceptions

ASC 860 applies to transfers and servicing of noncash financial assets. A transfer includes:

- Selling a receivable,
- Transferring a receivable to a trust, or
- Using a receivable as security for a loan.

A transfer does *not* include:

- The origination of a receivable,
- The settlement of a receivable, or
- The restructuring of a receivable in a troubled debt restructuring.

Those transactions are transfers involving the issuer of the receivable.

Among the types of transfers of financial assets for which ASC 860 establishes standards are:

- Financial instruments
- Financial assets
- Collateral
- Transfers of receivables with recourse (factoring with recourse)
- Transfers of undivided partial interests in receivables (retained interests)
- Transfers of receivables with servicing retained
- Transfers of lease receivables under sales-type and direct financing leases and any related guaranteed residual
- Putting a receivable into a securitization trust
- Repurchase agreements
- Dollar rolls
- Securities lending transactions
- Posting a receivable as collateral
- Banker's acceptances.

ASC 860-10-15-4 excludes the following items from the scope of ASC 860:

1. Except for transfers of servicing assets (see ASC 860-50-40) and for the transfers noted in the following paragraph, transfers of nonfinancial assets
2. Transfers of unrecognized financial assets, for example, lease receivables to be received under operating leases
3. Transfers of custody of financial assets for safekeeping
4. Contributions
5. Transfers of ownership interests that are in substance sales of nonfinancial assets
6. Investments by owners or distributions to owners of a business entity
7. Employee benefits subject to the provisions of ASC 712
8. Leveraged leases subject to ASC 840
9. Money-over-money and wrap-lease transactions involving nonrecourse debt subject to ASC 840.

## Overview

Transfers of financial assets may take many forms. ASC 860 covers:

- Securitizations
- Factoring
- Transfers of receivables with recourse
- Securities lending transactions

- Repurchase agreements
  - Loan participations
  - Banker's acceptances.
- (ASC 860-10-05-6)

ASC 860 describes the proper accounting for sales of financial assets to third parties and the use of financial assets as collateral in secured borrowings. This chapter also includes ASC 860's standards for repurchase agreements and securities lending. Although those two types of transfers usually involve investments, they are covered in ASC 860 because the same underlying theory—the financial components approach—is used for those transactions as is used for transfers involving receivables.

## DEFINITIONS OF TERMS

---

Source: ASC 860 and Master Glossary. Also see Appendix A, *Definitions of Terms*, for additional terms relevant to this topic: Affiliate, Financial Asset, Financial Instrument, Financial Liability, Not-for-Profit Entity, Public Business Entity, Remote, Repurchase Agreement.

**Agent.** A party that acts for and on behalf of another party. For example, a third-party intermediary is an agent of the transferor if it acts on behalf of the transferor.

**Bankruptcy-remote Entity.** An entity that is designed to make remote the possibility that it would enter bankruptcy or other receivership.

**Beneficial Interests.** Rights to receive all or portions of specified cash inflows received by a trust or other entity, including, but not limited to, all of the following:

1. Senior and subordinated shares of interest, principal, or other cash inflows to be passed-through or paid-through
2. Premiums due to guarantors
3. Commercial paper obligations
4. Residual interests, whether in the form of debt or equity.

**Cleanup Call Option.** An option held by the servicer or its affiliate, which may be the transferor, to purchase the remaining transferred financial assets, or the remaining beneficial interest not held by the transferor, its affiliates, or its agents in an entity (or in a series of beneficial interests in transferred financial assets within an entity) if the amount of outstanding financial assets or beneficial interests falls to a level at which the cost of servicing those assets or beneficial interests becomes burdensome in relation to the benefits of servicing.

**Collateral.** Personal or real property in which a security interest has been given.

**Consolidated Affiliate.** An entity whose assets and liabilities are included in the consolidated, combined, or other financial statements being presented.

**Continuing Involvement.** Any involvement with the transferred financial asset that permits the transferor to receive cash flows or other benefits that arise from the transferred financial assets or that obligates the transferor to provide additional cash flows or other assets to any party related to the transfer.

**Controlled Amortization Method.** Liquidation method used to allocate principal payments on the receivables in a trust to the investors, under which a predetermined monthly payment schedule is established so that payout to the investors will occur over a specified liquidation period. Principal payments are allocated to the investors based on their participation interests in the receivables in the trust, using one of the liquidation methods (fixed, preset, or

floating). Principal payments in excess of the predetermined monthly payment, if any, are allocated to the transferor and increase the investors' ownership interests. If the principal payments allocated to the investors are insufficient to cover the predetermined monthly payment, that payment is reduced by the amount of the deficiency. If the principal payments allocated to the investors in subsequent months exceed the predetermined monthly payment, the deficiency is recovered.

**Derecognize.** Remove previously recognized assets or liabilities from the statement of financial position.

**Derivative Financial Instrument.** A derivative instrument that is a financial instrument.

**Dollar-roll Repurchase Agreement.** An agreement to sell and repurchase similar but not identical securities. The securities sold and repurchased are usually of the same issuer. Dollar rolls differ from regular repurchase agreements in that the securities sold and repurchased have all of the following characteristics:

1. They are represented by different certificates.
2. They are collateralized by different but similar mortgage pools (for example, conforming single-family residential mortgages).
3. They generally have different principal amounts.

Fixed coupon and yield maintenance dollar agreements comprise the most common agreement variations. In a fixed coupon agreement, the seller and buyer agree that delivery will be made with securities having the same stated interest rate as the interest rate stated on the securities sold. In a yield maintenance agreement, the parties agree that delivery will be made with securities that will provide the seller a yield that is specified in the agreement.

**Embedded Call Option.** A call option held by the issuer of a financial instrument that is part of and trades with the underlying instrument. For example, a bond may allow the issuer to call it by posting a public notice well before its stated maturity that asks the current holder to submit it for early redemption and provides that interest ceases to accrue on the bond after the early redemption date. Rather than being an obligation of the initial purchaser of the bond, an embedded call option trades with and diminishes the value of the underlying bond.

**Equitable Right of Redemption.** The right of a property owner who has defaulted on a secured obligation to recover the securing property before its sale by paying the amounts due and any appropriate fees and charges. Other creditors of or a receiver for the property owner also may be able to exercise that right. After a transfer of a financial asset, a right of redemption may allow the transferor to buy back the transferred asset.

**Fixed Participation Method.** Liquidation method used to allocate principal payments on the receivables in a trust to the investors, under which all principal payments on the receivables in the trust are allocated to the investors based on their respective participation interests in the credit card receivables in the trust at the end of the reinvestment period.

**Floating Participation Method.** Liquidation method used to allocate principal payments on the receivables in a trust to the investors, under which principal payments allocated to the investors are based on the investors' actual participation interests in the receivables in the trust each month. Each month, investors' participation interests in the credit card receivables in the trust are redetermined for that month's allocation of principal payments.

**Freestanding Call Option.** A call option that is neither embedded in nor attached to an asset subject to that call option.

**Government National Mortgage Association Rolls.** The term Government National Mortgage Association (GNMA) rolls has been used broadly to refer to a variety of transactions

involving mortgage-backed securities, frequently those issued by the GNMA. There are four basic types of transactions:

- Type 1. Reverse repurchase agreements for which the exact same security is received at the end of the repurchase period (vanilla repo)
- Type 2. Fixed coupon dollar reverse repurchase agreements (dollar repo)
- Type 3. Fixed coupon dollar reverse repurchase agreements that are rolled at their maturities, that is, renewed in lieu of taking delivery of an underlying security (GNMA roll)
- Type 4. Forward commitment dollar rolls (also referred to as to-be-announced GNMA forward contracts or to-be-announced GNMA rolls), for which the underlying security does not yet exist.

**Liquidation Method.** The method used to allocate the principal payments on the receivables in a trust to the investors.

**Loan Origination Fees.** Origination fees consist of all of the following:

1. Fees that are being charged to the borrower as prepaid interest or to reduce the loan's nominal interest rate, such as interest buy-downs (explicit yield adjustments)
2. Fees to reimburse the lender for origination activities
3. Other fees charged to the borrower that relate directly to making the loan (for example, fees that are paid to the lender as compensation for granting a complex loan or agreeing to lend quickly)
4. Fees that are not conditional on a loan being granted by the lender that receives the fee but that are, in substance, implicit yield adjustments because a loan is granted at rates or terms that would not have otherwise been considered absent the fee (for example, certain syndication fees addressed in ASC 310-20-25-19)
5. Fees charged to the borrower in connection with the process of originating, refinancing, or restructuring a loan. This term includes, but is not limited to, points, management, arrangement, placement, application, underwriting, and other fees pursuant to a lending or leasing transaction and also includes syndication and participation fees to the extent they are associated with the portion of the loan retained by the lender.

**Loan Participation.** A transaction in which a single lender makes a large loan to a borrower and subsequently transfers undivided interest in the loan to groups of banks or other entities.

**Loan Syndication.** A transaction in which several lenders share in lending to a single borrower. Each lender loans a specific amount to the borrower and has the right to repayment from the borrower. It is common for groups of lenders to jointly fund those loans when the amount borrowed is greater than any one lender is willing to lend.

**Money-over-Money Lease.** A transaction in which an entity manufactures or purchases an asset, leases the asset to a lessee, and obtains nonrecourse financing in excess of the asset's cost using the leased asset and the future lease rental as collateral.

**Participating Interest.** From the date of the transfer, it represents a proportionate (pro rata) ownership interest in an entire financial asset. The percentage of ownership interests held by the transferor in the entire financial asset may vary over time, while the entire financial asset remains outstanding as long as the resulting portions held by the transferor (including any participating interest retained by the transferor, its consolidated affiliates included in the financial statements being presented, or its agents) and the transferee(s) meet the other characteristics of a participating interest. For example, if the transferor's interest in an entire

financial asset changes because it subsequently sells another interest in the entire financial asset, the interest held initially and subsequently by the transferor must meet the definition of the participating interest.

**Preset Participation Method.** Liquidation method used to allocate the principal payments on the receivables in a trust to the investors. The preset participation method is similar to the fixed participation method, except that the percentage used to determine the principal payments allocated to the investors is preset higher than the investors' expected participation interests in the receivables in the trust at the end of the reinvestment period. This method results in a faster payout to the investors than the fixed participation method, because a higher percentage of the principal payment is allocated to the investors.

**Recourse.** The right of the transferee of receivables to receive payment from the transferor of those receivables for any of the following:

1. Failure of debtors to pay when due
2. The effects of prepayments
3. Adjustments resulting from defects in the eligibility of the transferred receivables.

**Repurchase Financing.** A repurchase agreement that relates to a previously transferred financial asset between the same counterparties (or consolidated affiliates of either counterparty) that is entered into contemporaneously with, or in contemplation of, the initial transfer.

**Repurchase-to-Maturity Transaction.** A repurchase agreement in which the settlement date of the agreement to repurchase a transferred financial asset is at the maturity date of that financial asset and the agreement would not require the transferor to reacquire the financial asset.

**Revolving-Period Securitizations.** Securitizations in which receivables are transferred at the inception and also periodically (daily or monthly) thereafter for a defined period (commonly three to eight years), referred to as the revolving period. During the revolving period, the special-purpose entity uses most of the cash collections to purchase additional receivables from the transferor on prearranged terms.

**Securitization.** The process by which financial assets are transformed into securities.

**Seller.** A transferor that relinquishes control over financial assets by transferring them to a transferee in exchange for consideration.

**Setoff Right.** A common law right of a party that is both a debtor and a creditor to the same counterparty to reduce its obligation to that counterparty if that counterparty fails to pay its obligation.

**Standard Representations and Warranties.** Representations and warranties that assert the financial asset being transferred is what it is purported to be at the transfer date.

**Transfer.** The conveyance of a noncash financial asset by and to someone other than the issuer of that financial asset.

A transfer includes the following:

1. Selling a receivable
2. Putting a receivable into a securitization
3. Posting a receivable as collateral.

A transfer excludes the following:

1. The origination of a receivable
2. Settlement of a receivable
3. The restructuring of a receivable into a security in a troubled debt restructuring.

**Transferee.** An entity that receives a financial asset, and interest in a financial asset, or a group of financial assets from a transferor.

**Transferor.** An entity that transfers a financial asset, and interest in a financial asset, or a group of financial assets that it controls to another entity.

**Transferred Financial Assets.** Transfers of any of the following:

1. An entire financial asset
2. A group of entire financial assets
3. Participating interest in an entire financial asset.

**Unilateral Ability.** A capacity for action not dependent on the actions (or failure to act) of any other party.

## **CONCEPTS, RULES, AND EXAMPLES**

---

Factoring results in a transfer of title of the factored receivables. Where there is a no-recourse provision or other continuing involvement with the receivables, the removal of the receivables from the borrower's statement of financial position is clearly warranted.

Another variation is known as *factoring with recourse*. Accounting for factoring with recourse requires a determination of whether the transfer is a sale or a secured borrowing. That determination is made by applying ASC 860, *Transfers and Servicing*.

### **Transfers of Financial Assets under ASC 860—Introduction**

If receivables or other financial assets are transferred to another entity and the transferor has no continuing involvement with the transferred assets or with the transferee, it is clear that:

- A sale has taken place,
- The asset should be derecognized, and
- A gain or loss on the sale is to be measured and recognized.

However, the transferor may have some form of continuing involvement with the transferred assets. It may sell the receivables with recourse for uncollectible amounts, retain an interest in the receivables, or agree to service the receivables after the sale. The more control that the transferor retains over the receivables, the more the transfer appears to be in substance a secured borrowing rather than a sale.

ASC 860 establishes the criteria and procedures used to determine whether a transfer of financial assets is a sale or a secured borrowing. ASC 860 uses a financial components approach in which a single financial asset is viewed as a mix of component assets (controlled economic benefits) and component liabilities (obligations for probable future sacrifices of economic benefits). The focus is on who controls the components and whether that control has changed as a result of a given transfer. If the transferor has surrendered control of the transferred assets, the transfer is a sale. If the transferor retains control of the transferred assets, the transfer is a secured borrowing.

Derecognition of financial liabilities by a debtor can be properly reflected only if the obligation is extinguished, which requires that either the debt is retired (paid off) or the debtor is legally released from being the primary obligor by either the counterparty or by judicial action (e.g., in bankruptcy proceedings). These conditions are discussed in the following sections.

**Surrender of control.** A transfer of financial assets (or a component of a financial asset) is recognized as a sale if the transferor surrenders control over those assets in exchange for

consideration. However, control is not surrendered to the extent that the consideration received is a beneficial interest in these very same transferred assets. For example, a transferor's exchange of one form of beneficial interests in a trust for an equivalent, but different, form in the same transferred financial assets cannot be accounted for as a sale. If the trust initially issued the beneficial interests, the exchange is not even considered to be a transfer under ASC 860.

The criteria for identifying surrender of control are described in ASC 860-10-40-5:

1. *Isolation of transferred financial assets.* The financial assets transferred are beyond the reach of the transferor and its affiliates, its creditors, potential bankruptcy trustees, or other receivers. This is achieved only if the transferred financial assets would be beyond the reach of the powers of a bankruptcy trustee or other receiver for the transferor or any of its consolidated affiliates included in the financial statements being presented. For multiple-step transfers, an entity that is designed to make remote the possibility that it would enter bankruptcy or other receivership (the "bankruptcy-remote entity") is not considered a consolidated affiliate for purposes of performing the isolation analysis. Notwithstanding the isolation analysis, each entity involved in the transfer is subject to the applicable GAAP guidance on whether it must be consolidated.

---

*NOTE: The former distinction made between qualifying special purpose entities (QSPEs) and variable interest entities (VIEs) has been eliminated and former QSPEs are now subject to consolidation, as are all VIEs, if defined criteria are met.*

---

2. *Pledge or exchange rights.* Each transferee (or—if the transferee is an entity whose sole purpose is to engage in securitization or asset-backed financing activities, and if it is constrained from pledging or exchanging the assets it receives—each third-party holder of its beneficial interests) has the right to pledge or exchange the assets (or beneficial interests) it received, and no condition both (1) constrains the transferee (or third-party holder of its beneficial interests) from taking advantage of its right to pledge or exchange, and (2) provides more than a trivial benefit to the transferor.
3. *Effective control.* The transferor or its consolidated affiliates included in the financial statements being presented, or its agents, does not maintain effective control over the transferred financial assets or the third-party beneficial interests related to those transferred assets. A transferor maintains effective control if (1) an agreement both entitles and obligates the transferor to repurchase or redeem the financial assets before their maturity, (2) the transferor has the ability to unilaterally cause the holder to return specific financial assets and that ability conveys more than trivial benefit, or (3) an agreement permits the transferee to require the transferor to repurchase the transferred financial assets at a price that is so favorable to the transferee that it is probable that the transferee will require this to occur. If the transferor can cause the holder to return assets only through a cleanup call, that ability does not indicate effective control.

A repurchase to maturity transaction is accounted for as a secured borrowing. (ASC 860-10-40-5A)

All available evidence is assessed to determine if transferred assets would be beyond the reach of the powers of a bankruptcy trustee (or equivalent). It is irrelevant to this determination that the possibility of bankruptcy is remote at the date of the transfer. Instead, the transferor must endeavor to isolate the assets in the event of bankruptcy, however unlikely that eventuality may be. In many

cases, transferors use two transfers to isolate the transferred assets. First, it transfers the assets to a wholly owned corporation that is designed in a way that prevents the transferor or its creditors from reclaiming the assets (or makes the possibility that they can reclaim them remote). Next, the wholly owned corporation transfers the assets to a trust. The trust is prevented from undertaking any business other than management of the assets and from incurring any liabilities. (Thus, there are no creditors to force bankruptcy of the trust.)

A determination that the transferred assets are beyond the reach of a bankruptcy trustee may require a legal opinion regarding the application of the laws of the relevant jurisdiction. Such legal opinions commonly address whether a “true sale” has occurred, and in practice different attorneys may reach different conclusions regarding a given transaction.

Prior to 2010, a common practice was to transfer financial assets to a related entity (a securitization trust, typically) that would qualify as a QSPE, which under then-extant GAAP would always be excluded from consolidation by the sponsoring entity. The concept of QSPE has been entirely eliminated; such transferee entities must be evaluated for possible consolidation by the sponsoring entity under other existing GAAP requirements.

The existence of setoff rights does not impede the finding of a “true sale.” In practice, while setoff rights may exist for the transferor and transferee, if either the obligor under the transferred financial asset (e.g., debtor under transferred receivable) or the transferor entity enters bankruptcy, the transferee might have only an unsecured claim, notwithstanding the nominal right of setoff.

Assets transferred by a bank or other financial institution that is subject to possible receivership by the FDIC can be considered isolated from the transferor even if the FDIC or another creditor can require their return, provided that the return can only occur in receivership, after a default, and in exchange for a payment of, at a minimum, principal and interest earned at the contractual yield to the date the investors are paid. (That rule does not apply to situations in which the transferor can require return of the assets in exchange for payment of principal and interest earned at the contractual yield to the date the investors are paid. In those cases the assets are not isolated from the transferor.)

A transferee has control of transferred assets if there is the unconstrained right to both pledge and exchange the assets. In actual practice it may be more difficult to discern whether the transferee has control if it can pledge the transferred assets but cannot sell them. The key to a determination of control by a transferee with the right to pledge *or* exchange the assets rests on whether the transferee obtains all or most of the cash inflows that are the primary economic benefits of the pledged or exchanged assets. Generally, the right of first refusal, prohibition of a sale to competitors, and the requirement to obtain transferor permission that will not be unreasonably withheld (judgment is necessary in this case) to sell or pledge will not preclude accounting as a sale. Agreements that constrain the transferee from pledge or exchange are to be accounted for as secured borrowings.

**Maintaining effective control.** If the transferor maintains effective control, the transfer is accounted for as a secured borrowing and not as a sale.

FASB substantially limits sale accounting, by stipulating that sale accounting can be applied only if transfers are of entire financial assets, a group of financial assets—or of a portion of those assets only if the transferor and transferee proportionately share in all the rights, risks, and benefits of the entire asset. Thus, it is difficult to employ sale accounting (and thus to recognize gains on such sales) when transferring less than an entire financial asset (or group of assets).

The concept of a *participating interest* is used to denote a portion of a financial asset that is transferred meeting criteria for sale accounting. If a given financial asset is divided into

components prior to transfer, the transfer can be accounted for as a sale only if the components meet the criteria for being participating interests (see criteria, below). It is not appropriate to apply surrender of control criteria unless the component (or entire asset or group of assets) being transferred meets the definition of participating interests. If the definition of participating interest is satisfied, *and* if control is surrendered, only then will sale accounting be validly applied.

The transferor must not be able to unilaterally take back the transferred assets. Therefore, a call option, a forward purchase contract, or a removal of accounts provision will in most cases defeat the determination that a sale has taken place. The transferor cannot take back the transferred assets even through the liquidation of the VIE or other transferee.

A transferor maintains effective control over the transferred assets, and thus cannot account for the transfer as a sale, if a repurchase or redemption agreement meets all of the following conditions:

1. The financial assets covered by the agreement are the same or substantially the same as the transferred assets. In order to meet this condition, the assets transferred and those to be repurchased or redeemed must meet all of the following conditions:
  - a. The same primary obligor or, in the case of government-guaranteed instruments, the same guarantor and terms of the guarantee. (If the asset is debt guaranteed by a sovereign government, central bank, government-sponsored enterprise, or agency thereof, the guarantor and the terms of the guarantee must be the same.)
  - b. Identical form and type providing the same risks and rights
  - c. The same maturity, or, in the case of mortgage-backed pass-through or pay-through securities, have similar remaining weighted-average maturities that provide approximately the same market yield
  - d. Similar assets as collateral
  - e. The same aggregate unpaid principal amount or principal amounts that are within accepted “good delivery” standards for the type of security being transferred.
2. The redemption or repurchase agreement is executed concurrently with the transfer of the assets and requires repurchase or redemption prior to maturity at a fixed or determinable price.
3. The agreement is entered into simultaneously with, or in contemplation of, the transfer.

ASC 860-20-55 addresses situations where the original transferee subsequently transfers the financial assets back to the original transferor as collateral for a borrowing arrangement under a repurchase arrangement. The issue is whether this violates the surrender of control criterion of ASC 860, obviating the ability of the original transferor to record the transfer as a sale. It establishes criteria under which the secured borrowing could be evaluated separately from the initial transfer for purposes of determining proper accounting.

Under the provisions of ASC 860, the transferor and transferee are to separately account for a transfer of a financial asset and a related repurchase financing arrangement only if the two transactions have a valid and distinct business or economic purpose for being entered into separately, *and* the repurchase financing does not result in the transferor regaining control over the financial asset. The valid business purpose criterion excludes obtaining favorable accounting treatment. To qualify for separate accounting treatment, the initial transfer of a financial asset and the repurchase financing entered into, either contemporaneously with or in

contemplation of each other, must meet *all* of the following conditions at inception of the transaction:

1. The initial transfer and the repurchase financing are not contractually contingent on each other, so that the pricing and performance of either the transfer or the repurchase financing will not be dependent on the terms and execution of the other.
2. The repurchase financing provides the initial transferor with recourse to the transferee upon default, which must leave the transferor exposed to the credit risk of the transferee or its affiliates, and not only exposed to the market risk of the transferred financial asset.
3. The transferee's agreement to repurchase the previously transferred financial asset is at a fixed price (generally related to the agreed interest rate on the amount financed) and not at fair value.
4. The financial asset is readily obtainable in the marketplace, and the transfer and repurchase financing are executed at market rates, and not circumvented by embedding off-market terms in a separate transaction contemplated at the time of the initial transfer or the repurchase financing.
5. The maturity date of the repurchase financing is earlier than that of the financial asset.

If the transaction satisfies each of the above-noted conditions, the initial transfer should be evaluated to determine whether, without consideration of the repurchase financing, it meets the requirements for sale accounting under ASC 860. Also, the transferor and transferee should analyze the repurchase financing as a repurchase agreement, with both parties using the same criteria.

**Components of financial assets.** As securitization activity increased over recent years, it became clear that more guidance was needed, particularly since a number of such arrangements appeared to feature implicit transferor guarantees or other arrangements that raised doubts about the extent to which control had really been relinquished, even as sales (and gains) were being reported by the sponsoring entity. Transferors often kept custody of the securitized assets, further adding to the difficulty in objectively assessing the transfer of control necessary to justify applying "gain on sale" accounting.

Partially in response to this specific concern, ASC 860-10-05 establishes the definition of a *participating interest* to describe when it would be appropriate to evaluate a transferred portion of a financial asset for sale accounting treatment. FASB decided that, for sales of partial interests in financial assets, it was only appropriate to apply the sale accounting conditions if the transferor and transferee proportionately share in all of the rights, risks, and benefits of the entire financial asset.

A transfer can only be treated as a sale if the transferor has surrendered control over the financial asset. If a portion, rather than the entire asset, is transferred, the transferor retains a participating interest, the character of which will determine whether sale treatment is warranted. If an entity transfers part of a financial asset and retains another portion of that asset, gain can be recognized on the portion sold only, and then only if all components qualify as participating interests; gain can be recognized, in such situations, only on the components transferred, assuming control is relinquished. However, if the entire asset (or group) is transferred in circumstances where sale accounting is warranted, and then, after first relinquishing control, the transferor obtains a beneficial interest in the transferred asset, the gain recognized on the transfer will be based on the entire transfer.

FASB has provided specific guidance on the definition of a portion of a financial asset that would be eligible for sale accounting. According to ASC 860-10-40-60, participating interest must have *all* of the following characteristics:

1. *From the date of the transfer, the participating interest represents a proportionate (pro rata) ownership interest in an entire financial asset.* The percentage of ownership interests held by the transferor in the entire financial asset may vary over time, while the entire financial asset remains outstanding, as long as the resulting portions held by the transferor (including any participating interest retained by the transferor, its consolidated affiliates, or its agents) and the transferee(s) meet the other characteristics of a participating interest.

For example, if the transferor's interest in an entire financial asset changes because it subsequently sells another interest in the entire financial asset (a piecemeal transfer of its interests to others), the interests held initially and subsequently by the transferor will meet the definition of a participating interest.

2. *From the date of the transfer, all cash flows received from the entire financial asset are divided proportionately among the participating interest holders according to their respective shares of ownership.* Cash flows that are allocated as compensation for services performed (e.g., for loan servicing), if any, may not be included in that determination provided those cash flows are not subordinate to the proportionate cash flows of the participating interest and are not significantly above an amount that would fairly compensate a substitute service provider, should one be required, which includes any profit that would be demanded by a market participant.

Also, any cash flows received by the transferor as proceeds of the transfer of the participating interest are to be excluded from the determination of proportionate cash flows, provided that the transfer does not result in the transferor receiving an ownership interest in the financial asset that permits it to receive disproportionate cash flows.

3. *The rights of each participating interest holder (including the transferor, in its role as a participating interest holder) have the same priority of cash flow, and no participating interest holder's interest is subordinated to the interest of another participating interest holder.* Priority is not subject to change in the event of bankruptcy or other receivership of the transferor, the original debtor, or any other participating interest holder. Participating interest holders can have no recourse to the transferor (or its consolidated affiliates or its agents) or to each other, other than for the standard representations and warranties, ongoing contractual obligations to service the entire financial asset and administer the transfer contract, and contractual obligations to share in any setoff benefits received by any participating interest holder. Thus, no participating interest holder can be entitled to receive cash before any other participating interest holder under its contractual rights as a participating interest holder.

Note, however, that if a participating interest holder also is the servicer of the entire financial asset, and receives cash in its role as servicer, that arrangement would not violate the requirement that all participating interest holders share the same priority.

4. *No party has the right to pledge or exchange the entire financial asset unless all participating interest holders agree to pledge or exchange the entire financial asset.*

If all the foregoing conditions are satisfied, the transfer of a portion of the entire financial asset would be accounted for as a sale, if control is relinquished. If one or more of the foregoing conditions are not met, however, the transfer would be accounted for as a lending transaction.

Specifically, regarding surrender of control, the transfer is to be accounted for as a sale to the extent that consideration *other than beneficial interests* in the transferred assets is received in exchange, and if *all of the following conditions* are met:

1. *The transferred financial assets have been isolated from the transferor*—put presumptively beyond the reach of the transferor and its creditors, even in the event of bankruptcy or other receivership. The assets are effectively isolated only if the transferred financial assets would be beyond the reach of the powers of a bankruptcy trustee or other receiver for the transferor or any of its consolidated affiliates. For multiple-step transfer structures, if an entity is designed to make remote the possibility that it would enter bankruptcy or other receivership (thus being a “bankruptcy-remote entity”), it is not considered a consolidated affiliate for the isolation analysis. (However, each entity involved in the transfer is subject to the applicable guidance on whether it must be consolidated, which is a separate determination to be made.)
2. *Each transferee has the right to pledge or exchange the assets (or beneficial interests) it received*, and there is no condition that both (1) constrains the transferee from taking advantage of its right to pledge or exchange, and (2) provides more than a trivial benefit to the transferor. If the transferee is an entity whose sole purpose is to engage in securitization or asset-backed financing activities and it is constrained from pledging or exchanging the assets it receives, each third-party holder of its beneficial interests must have the right to pledge or exchange those interests.
3. *The transferor, its consolidated affiliates, and its agents, if any, do not maintain effective control over the transferred financial assets or third-party beneficial interests related to those transferred assets*. A transferor’s effective control over transferred assets is exemplified by (1) an agreement that both entitles and obligates the transferor to repurchase or redeem them before their maturity, (2) an agreement that provides the transferor with both the unilateral ability to cause the holder to return specific financial assets and a more-than-trivial benefit attributable to that ability, other than through a “cleanup call” (to eliminate a small outstanding balance that would be more administratively costly to maintain than it would be worthwhile to do), and (3) an agreement that permits the transferee to require the transferor to repurchase the transferred financial assets at a price that is so favorable to the transferee that it is probable that the transferee will require the transferor to repurchase them.

**Accounting for transfers.** When a transfer of a participating interest that satisfies the conditions above (i.e., surrender of control over a participating interest in a financial asset) has been completed, the transferor (*seller*) is to:

1. Allocate the previous carrying amount of the entire financial asset between the participating interests sold and the participating interest that continues to be held by the transferor, on the basis of relative fair values as of the date of the transfer;
2. Derecognize the participating interest(s) sold;
3. Recognize and initially measure at *fair value* servicing assets, servicing liabilities, and any other assets obtained and liabilities incurred in the sale;
4. Recognize in earnings any gain or loss on the sale; and
5. Report any participating interest or interests that continue to be held by the transferor as the difference between the previous carrying amount of the entire financial asset and the amount derecognized (i.e., the initial amount is allocated book value).

Any participating interest(s) obtained, other assets obtained, and any liabilities incurred are to be recognized and initially measured at fair value.

If, instead of a participating interest, the entire financial asset or group of financial assets is transferred, in a manner that complies with the requirements (as set forth above) for sale accounting, then the transferor (seller) is required to:

1. Derecognize all transferred financial assets;
2. Recognize and initially measure at fair value servicing assets, servicing liabilities, and any other assets obtained (including a transferor's beneficial interest in the transferred financial assets) and liabilities incurred in the sale; and
3. Recognize in earnings any gain or loss on the sale.

The transferee furthermore is to recognize all assets obtained and any liabilities incurred and initially measure them at fair value (which, in the aggregate, presumptively equals the price paid).

If the transfer is accounted for as a secured borrowing, there is no adjustment to carrying value and no gain recognition.

**Measuring assets and liabilities after completion of a transfer.** ASC 860 addresses initial recognition and measurement. For example:

1. Interest-only strips, other beneficial interests, loans, other receivables, or other financial assets that can contractually be prepaid or otherwise settled in such a way that the holder would not recover substantially all of its recorded investment (except for derivative instruments that are within the scope of ASC 815) are to be subsequently measured like investments in debt securities classified as available-for-sale or trading under ASC 320, and thus at fair value. They cannot be reported at amortized cost, since they cannot be classified as held-to-maturity.
2. Equity securities that have readily determinable fair values are subsequently measured in accordance with ASC 320, at fair value (either available-for-sale or trading).
3. Debt securities are subsequently measured in accordance with ASC 320, ASC 948 (mortgage-backed securities), or ASC 325-40 (purchased and retained beneficial interests in securitized financial assets).
4. Derivative financial instruments are subsequently measured in accordance with ASC 815.

ASC 860-30-35-2 provides subsequent measurement guidance for pledged assets required to be reclassified that are accounted for as secured borrowings. For those assets, the transferor should follow the same measurement principles as before the transfer.

If it was initially impracticable to measure the fair value of an asset or liability but it later becomes practicable, the transferor does not remeasure the asset or liability (or the gain or loss) under ASC 860 unless it is a servicing asset or liability. (ASC 860-50-35, *Transfers and Servicing—Servicing Assets and Liabilities*, has revised accounting for servicing assets and liabilities; this is discussed in detail later in this chapter.) However, adjustment of the carrying value may be required by other standards, such as ASC 320.

The provisions of ASC 860 apply to a wide range of transfers of financial instruments. Some of those are discussed in the following paragraphs.

**Transfers of receivables with recourse.** Classic factoring involves the outright sale of receivables and, notwithstanding the existence of a "holdback" intended to deal with returns and allowances, are accounted for as sales. However, some entities have such a poor history of uncollectible accounts that factors are only willing to purchase their accounts if a substantial fee is collected to compensate for the risk. If the company believes that the receivables are of a better

quality than the factor has assessed them, a way to avoid excessive factoring fees is to sell these receivables with recourse. This variation of factoring is, in substance, an assignment of receivables with notification to the affected customers (whereas traditional assignment does not include notification of debtors).

**Structure of transfer.** In a transfer of receivables with recourse, the transferor is obligated to make payments to the transferee or to repurchase receivables sold upon the occurrence of an uncertain future event. Typically, recourse provisions compensate the transferee for uncollectible accounts (sometimes amounts over a defined threshold), but they can also be written to compensate the transferee for such uncertain future events as prepayments of receivables subject to discounts or that are interest bearing, merchandise returns, or other events that change the anticipated cash flows from the receivables.

The effect of a recourse provision on the application of ASC 860's surrender of control provisions may vary by jurisdiction and by the level of recourse provided. For example, in some jurisdictions, full recourse will not place the receivables beyond the reach of the transferor and its creditors, while a limited recourse provision may have this result. Thus, some transfers of receivables with recourse will meet the criteria of ASC 860 and be accounted for as sales; other transfers will fail the criteria and be accounted for as secured borrowings. The remaining discussion in this section relates to scenarios where the arrangement qualifies for sales treatment.

**Applicability of ASC 815 or ASC 460.** For the recourse provision to be exempt from derivatives accounting, it must meet *all three* of the following criteria:

1. *Restricted payment.* The contract provides for payments to be made solely to reimburse the guaranteed party (the factor) for failure of the debtor to satisfy its obligations to make required payments, when due at prespecified payment dates or at dates that are earlier due to acceleration caused by a default. For the purposes of meeting this criterion, the debtor's obligation cannot be due under a contract that is accounted for as a derivative.
2. *Past due limitation.* Payment under the recourse provision is made only if the debtor's obligation under item 1 is past due.
3. *Risk of nonpayment.* At the date of inception of the factoring arrangement and subsequently throughout the term of the arrangement, the factor will be exposed to the risk of nonpayment through direct or indirect ownership of the guaranteed receivable.

If the recourse provision fails any of the three above criteria, it is considered a derivative and is accounted for by the transferor under the provisions of ASC 815.

Another accounting issue to consider is whether the recourse provision is considered a guarantee under ASC 460. ASC 460 provides that a contract that contingently requires the guarantor to make payments to the guaranteed party (in this case the factor) based on the nonoccurrence of a scheduled payment under a contract is considered a guarantee. The determination that the recourse obligation is a guarantee does not affect the measurement of that obligation because the measurement rules of ASC 460 are identical with the measurement rules for a recourse obligation that is not considered a guarantee. However, it is important to determine the applicability of that interpretation because ASC 460 requires additional disclosures not demanded by ASC 860.

**Computing gain or loss.** In computing the gain or loss to be recognized at the date of a transfer of receivables that meets the criteria of ASC 860, the borrower (transferor) must take into account the anticipated chargebacks from the transferee. This action requires an estimate by the transferor, based on its past experience. Adjustments are to be made at the time of sale to record the recourse obligation for the estimated effects of any bad debts, prepayments by customers (where

the receivables are interest-bearing or where cash discounts are available), and any defects in the eligibility of the transferred receivables. In computing this recourse obligation, the transferor is to consider all probable credit losses over the life of the transferred receivables. The recourse obligation is to be measured at its fair value on the date of sale.

A present value method is acceptable for estimating fair value if the timings of the future cash flows are reasonably estimable. In applying a present value method, the estimated future cash flows are to be discounted using a discount rate at which the liability could be settled in an arm's-length transaction (i.e., a risk-adjusted rate versus a risk-free rate). Subsequent accruals to adjust the discounted amount are to be discounted at the interest rate inherent in determining the initial recourse obligation. ASC 860 expresses a preference for the use of the CON 7 probability-weighted expected cash flow model over the more traditional discounting of the single point estimate of the most probable or most likely cash flows. This model is discussed and illustrated in Chapter 1.

#### Example of accounting for the transfer of receivables with recourse

1. Thirsty Corp. enters into an agreement with Rich Company to sell a group of its receivables with a face value of \$200,000 on which a 5% allowance for uncollectible accounts has been recorded. Rich Company (the factor) will charge 20% interest computed on the weighted-average time to maturity of the receivables of thirty-six days and a 3% fee. A 5% holdback will also be retained.
2. Generally, 40% of Thirsty's customers take advantage of a 2% cash discount.
3. The factor accepts the receivables subject to recourse for nonpayment.
4. In this jurisdiction, the transfer qualifies as a sale.

Under ASC 860, Thirsty must record the recourse liability. It has accepted the obligation for all credit losses and has, in effect, guaranteed the receivables. The recourse obligation is measured as the estimate of uncollectibles (5% of face value).

The entry required to record the sale is:

Cash	180,055
Allowance for bad debts	10,000
Interest expense ( $200,000 \times .20 \times 36/365$ )	3,945
Factoring fee ( $200,000 \times .03$ )	6,000
Factor's holdback receivable	9,500
$[\$10,000/(\$10,000 + \$190,000) \times \$190,000]$	
Loss on sale of receivables	2,100
Due to factor for discounts ( $200,000 \times .40 \times .02$ )	1,600
Accounts receivable	200,000
Recourse obligation	10,000

Simplified, the entry is:

Cash	180,055
Allowance for bad debts	10,000
Factor's holdback receivable ( $9,500 - 1,600$ )	7,900
Loss on sale of receivables ( $3,945 + 6,000 + 2,100$ )	12,045
Accounts receivable	200,000
Recourse obligation	10,000

The accounts receivable net of the allowance for uncollectible accounts (a valuation allowance) is removed from the transferor's accounting records, as it has been sold. Previously

accrued bad debts expense is not reversed, however, as the transferor still expects to incur that expense through the recourse provision of the factoring agreement. (Alternatively, the bad debts expense could have been reversed and the new charge to loss on sale will have to be increased by \$10,000.) The loss on sale of receivables is the sum of the interest charged by the factor (\$3,945), the factor's fee (\$6,000), the expected chargeback for cash discounts to be taken (\$1,600), and the difference between the holdback receivable at face value and at carrying value (\$500). The factor's holdback receivable is a retained interest in the receivables transferred, and it is measured by allocating the original carrying amount (\$190,000) between the assets sold (\$190,000) and the assets retained (\$10,000).

If, subsequent to the sale of the receivables, the actual experience relative to the recourse terms differs from the provision made at the time of the sale, a change in an accounting estimate results. It is accounted for prospectively, as are all changes in accounting estimates, and therefore will be reflected as an additional gain or loss in the subsequent period. These changes are not to be deemed corrections of errors or other retroactive adjustments.

If the above facts apply, but the transfer does not qualify as a sale, the borrower's entry will be:

Cash	180,055
Interest expense (or prepaid)	3,945
Factoring fee	6,000
Factor borrowing payable	190,000

In a secured borrowing, the accounts receivable continue to be recognized by the borrower. Both the accounts receivable and the factor borrowings payable must be cross-referenced on the face of the statement of financial position or in the notes to the financial statements. The accounting for the collateral under ASC 860 depends upon the terms of the collateral agreement. Accounting for collateral is discussed later in this chapter.

**Retained interests.** Interests in transferred assets that are not a part of the proceeds of a sale are considered retained interests that are still under the control of the transferor. Retained interests include participating interests for which control has not been given up by the transferor, servicing assets and liabilities, and beneficial interests in assets transferred in a securitization in a transaction that can be accounted for as a sale. In general, the more extensive an interest that the transferor of assets retains, the less likely the transaction will be classified as a sale and the more likely the transaction will be classified as a secured borrowing. The primary reason for this result is that in a true sale, the transferor no longer bears the risks or reaps the rewards associated with the transferred assets. If a determination cannot be made between classification as proceeds of a sale or as retained interests, the asset is classified as proceeds and measured at fair value.

In practice, retained interests are usually comprised of one or both of two items: the spread between the average yield on the assets securitized and the cost of the debt issued by the securitization trust, and any overcollateralization provided. Regarding the spread in yields, it is often the case that trusts can issue debt securities at a lower cost than could the transferring entity, for reasons that may include the lower risk attaching to trust instruments, which are isolated from the transferor's overall credit risk. Indeed, this is one of the major attractions of employing a securitization structure. Typically the excess of the yields on the assets placed into securitization over the costs of servicing the debt issued by the securitization trust, less credit losses and other costs incurred, revert to the transferor at the termination of the securitization. Since this event may be many years in the future, the current value of this residual interest, to the transferor, must be measured on a present value (i.e., discounted) basis, which then accretes over the term to final maturity.

Overcollateralization is the other principal residual interest held by transferors. To enhance the creditworthiness of the securities issued by the trust, it is commonly found that placing a surfeit of collateral (i.e., the underlying mortgage or other loans) into the trust (say, \$100 of loans receivable for each \$90 of debt to be issued by the trust) will result in a significantly reduced net interest cost incurred by the trust, and hence a greater yield spread that will ultimately revert to the transferor. Additionally, an overcollateralization structure will garner a better rating for the trust securities, making them more readily marketable (in addition to having lower coupon rates), thus insuring the ability to fully fund the trust. Alternatives to the use of an overcollateralization structure include the purchase of credit insurance and arranging for a standby letter of credit. Only overcollateralization results in a residual interest being retained by the transferor, however.

Retained interests are measured by allocating the carrying value of the transferred assets before the transfer between the assets sold (if any) and the assets retained based on their relative fair values on the date of transfer. ASC 860-50-35 specifies that the carrying value allocated is to be exclusive of any amounts included in an allowance for loan losses. Any gain recognized upon a partial sale of a loan is not to exceed the gain that would be recognized if the entire loan were sold. If the transferor retains a servicing contract, a portion of the carrying value is allocable to either a servicing asset retained or a servicing liability undertaken since ASC 860 requires all entities servicing financial assets for others to recognize either a servicing asset or servicing liability for each servicing contract.

Relative fair value determinations are to incorporate assumptions regarding interest rates, defaults, and prepayments that marketplace participants would make, as well as the expected timing of cash flows. This allocation must be applied to all transfers that have retained interests, regardless of whether or not they qualify as sales. It should be noted that this fair value allocation may result in a relative change in financial reporting basis unless the fair values are proportionate to their carrying values. Thus, the gain or loss from any sale component could also be affected.

The retained interests continue to be the transferor's assets, since control of these assets has not been transferred. Thus, the retained interest is considered continuing control over a previously owned asset (although the form may have changed). It is not to be remeasured at fair value, nor is a gain or loss recognized on it.

#### **Example: Sale of partial interest in receivables**

##### **Facts Given**

Receivables' fair value	\$16,500
Receivables' book value	15,000

Seller sells 80% of receivables and agrees to service them. The benefits of servicing are just adequate to compensate for the servicing, thus there is no servicing asset or liability to be recognized.

	<i>FV</i>	<i>80% FV</i>	<i>20% FV</i>	<i>Allocated 80% BV*</i>	<i>Allocated 20% BV*</i>
Receivables sold	\$16,500	\$13,200		\$12,000	
Retained amount (20%)			\$3,300		\$3,000

\* Allocated based on the relative fair values.

***Seller's Journal Entry***

Cash	13,200
Receivables	12,000
Gain	1,200

Seller reports retained amount at \$3,000, which is defined by book value, not fair value.

**Examples: Sale of loans with various types of retained interests*****Facts Given Applicable to All Examples Below (Each Example Is Independent)***

Loans' fair value and amount of cash proceeds	\$16,500
Loans' book value	15,000
Fair value of recourse obligation	(900)
Fair value of call option* on portfolio of \$16,500	800
Fair value of interest rate swap on portfolio of \$16,500	700

\* An option that permits the seller/transferor to repurchase the same or similar loans.

***Seller's Journal Entries***

## 1. Sale only

Cash	16,500
Loans	15,000
Gain	1,500

## 2. Sale with recourse obligation

Cash	16,500
Loans	15,000
Recourse obligation	900
Gain	600

## 3. Sale with recourse obligation and call option to purchase the loans sold or similar loans

Cash	16,500
Call option	800
Loans	15,000
Recourse obligation	900
Gain	1,400

## 4. Sale with recourse obligation, call, and swap (seller provides floating interest rate return although the underlying loans are at fixed interest rate terms)

Cash	16,500
Call option	800
Interest rate swap	700
Loans	15,000
Recourse obligation	900
Gain	2,100

5. Partial sale with recourse obligation, call, and swap. Seller sells 80% of loans.

	<i>FV</i>	<i>80% FV</i>	<i>20% FV</i>	<i>Allocated 80% BV*</i>	<i>Allocated 20% BV*</i>
Loans	\$16,500	\$13,200		\$11,579	
Call	800	640		561	
Swap	700	560		491	
Recourse obligation	(900)	(720)		(631)	
Retained amount (20%)			\$3,420		\$3,000
	<u>\$17,000</u>	<u>\$13,680</u>	<u>\$3,420</u>	<u>\$12,000</u>	<u>\$3,000</u>
Cash		13,200			
Call		640			
Swap		560			
Loans				12,000	
Recourse obligation				720	
Gain				1,680	

Seller reports retained amount of receivables at \$3,000, at book value.

\* Allocated based on the relative fair values.

In some transfers of receivables, the transferor provides credit enhancement (similar to a recourse provision) by retaining a beneficial interest that absorbs the credit risk. If there is no liability beyond the transferor's retained subordinated interests, the retained interest is initially measured at allocated carrying value based on relative fair value, and no recourse liability is necessary. The retained interest would be subsequently measured like other retained interests held in the same form.

Cash reserve accounts and subordinated beneficial interests created as credit enhancements are retained interests and are accounted for as such even if the seller collects the proceeds and deposits a portion in the cash reserve account. (New asset credit enhancements such as financial guarantees and credit derivatives are measured at the fair value of the amount to benefit the transferor.) ASC 860-10-35 provides guidance on estimating fair values and should be used in the case of credit enhancements.

One possible method of estimating fair value of a credit enhancement is the *cash-out method*. Using that method, cash flows are discounted from the date the credit enhancement asset becomes available to the transferor (i.e., when the cash in the credit enhancement account is expected to be paid out to the transferor). The present value can be computed using an expected present value technique with a risk-free rate or a "best estimate" technique with an appropriate discount rate. Among other transferor assumptions, time period of restrictions, reinvestment income, and potential losses due to uncertainties must be included. ASC 860 does not provide guidance concerning subsequent measurement of credit enhancements.

ASC 860-20-55-18 states that:

*The right to receive the accrued interest receivable, if and when collected, is transferred to the securitization trust. Generally, if a securitization transaction meets the criteria for sale treatment and the accrued interest receivable is subordinated either because the asset has been isolated from the transferor (see paragraph 860-10-50-5) or because of the operation of the cash flow distribution (or waterfall) through the securitization trust, the total accrued interest receivable should be considered to be one of the components of the sale transaction. Therefore, under the circumstances described, the accrued interest receivable asset*

should be accounted for as a transferor's interest. It is inappropriate to report the accrued interest receivable related to securitized and sold receivables as loans receivable or other terminology implying that it has not been subordinated to the senior interest in the securitization.

**Servicing.** When loans (mortgages and other) are sold to securitization trusts, the debtors are not informed that ownership has been transferred, and they will continue to make monthly (or other) payments to the original creditor. Often the transferor retains servicing, which involves collections of loan principal and interest, payment of expenses, and forwarding of net proceeds to the trustee or other transferee, to be further distributed, depending on the terms of the so-called "waterfall" provisions, to the various classes of investors in trust-issued securities. For example, if the cash flows have been assigned to different *tranches* of securities (having claims to early period cash flows, later period cash flows, principal payments only, interest payments only, etc.), the cash flows will be first used to satisfy certain securities holders, then others, in accordance with the prescribed cash-flow sequence set forth in the trust indenture.

Transferors will most commonly retain the right and obligation to perform this servicing, and will be paid a certain fee to do so, often a small percentage (say, one-quarter of 1%) of the principal amount of loans being serviced. In some cases third parties will buy the right to service loans, or, in other situations, the transferor will retain servicing and purchase rights to service yet other loans. If the fee for providing servicing exceeds the expected cost of doing so, the right to service will be a valuable asset, which will trade for a positive price. In other circumstances, a party (generally the transferor) will have to perform servicing for a fee that will not cover expected costs, in which case a servicing liability exists.

**The nature of servicing.** Servicing of financial assets can include such activities as:

1. Collecting payments (principal, interest, and escrows)
2. Paying taxes and insurance from escrows
3. Monitoring delinquencies
4. Foreclosing
5. Investing funds temporarily prior to their distribution
6. Remitting fees to guarantors, trustees, and service providers
7. Accounting for and remitting distributions to holders of beneficial interests.

Although inherent in holding most financial assets, servicing is a distinct asset or liability only when separated contractually from the underlying financial asset. Servicers' obligations are contractually specified. Servicing is subject to significant risks due to the effects of change in interest rates and debtors' propensity for prepayment of the related obligations. As the likelihood of prepayment (known as *prepayment speed*) increases, the value of the servicing asset decreases, and vice versa.

Adequate compensation for servicing is determined by the marketplace. The concept of adequate compensation is judged by requirements that would be imposed by a new or outside servicer. It includes profit demanded by the marketplace and does not vary with the specific servicing costs of the servicer. Thus, it would not be acceptable to use a given servicer's cost plus a profit margin to estimate the fair value of a servicing asset or liability to be recognized by that particular servicer.

Other changes in economic conditions may also impact the value of servicing arrangements. Some entities having servicing contracts will attempt to hedge these risks by holding financial assets, the value of which will move in the opposite direction of the servicing contracts.

Typically, the benefits are more than adequate compensation for the servicing and the servicing contract results in an asset. The benefits to be reaped by the servicer include:

1. Fees
2. Late charges
3. Float
4. Other income.

If the above benefits are not expected to provide adequate compensation, the contract results in a liability. With regard to the sale of assets, a servicing liability would reduce the net proceeds and would affect the gain or loss calculation.

**Accounting for servicing.** Servicing assets are recognized at fair value if arising out of the transfer of the entire financial asset or group of financial assets, or a participating interest in financial assets, or if associated with purchased servicing rights unrelated to the assets transferred. If financial assets are transferred to an unconsolidated affiliate in a sale transaction, and the transferor retains servicing and obtains debt securities (from the securitization process) that are properly classified as held-to-maturity, the servicing rights may be reported either as a separate asset or combined with the debt instruments held.

Once a servicing asset is recognized, the asset must be expensed over the expected period over which serving income will be realized. Similarly, if a loss on servicing is anticipated, the liability must be taken into income over the appropriate time horizon. One of two acceptable methods can be employed:

1. *Amortization method:* Amortize servicing assets or servicing liabilities in proportion to and over the period of estimated net servicing income (if servicing revenues exceed servicing costs) or net servicing loss (if servicing costs exceed servicing revenues), and assess servicing assets or servicing liabilities for impairment or increased obligation based on fair value at each reporting date; or
2. *Fair value measurement method:* Measure servicing assets or servicing liabilities at fair value at each reporting date and report changes in fair value of servicing assets and servicing liabilities in earnings in the period in which the changes occur.

The method chosen can vary by class of servicing, so a given entity may be using both amortization and fair value methods simultaneously. However, all servicing in a given class must be accounted for consistently, and cannot be changed after being elected. For purposes of this requirement, a class of servicing assets and servicing liabilities is identified based on (1) the availability of market inputs used in determining the fair value of servicing assets or servicing liabilities, (2) an entity's method for managing the risks of its servicing assets or servicing liabilities, or (3) both.

A reporting entity that elects to subsequently measure a class of separately recognized servicing assets and servicing liabilities at fair value should apply that election prospectively to all new and existing separately recognized servicing assets and servicing liabilities within those classes that a servicer elects to subsequently measure at fair value. This election cannot be applied on a contract-by-contract basis.

ASC 860-50-35 requires that servicing assets or liabilities must be given recognition whenever the entity undertakes a commitment to provide servicing of financial assets, such as loans. This may arise when the entity transfers assets in a "true sale" situation (i.e., when gain or loss on the transfer is recognized, in contrast to transfers that are only secured

borrowings). Additionally, it can arise from independent acquisitions or assumptions of servicing rights or obligations unrelated to financial assets of the reporting entity or its consolidated affiliates.

ASC 860-50-35 provides reporting entities with recognized servicing rights with an *optional* onetime reclassification of available-for-sale securities to trading securities, without calling into question the treatment of other available-for-sale securities under ASC 320, provided that the available-for-sale securities are identified as offsetting the entity's exposure to changes in fair value of servicing assets or servicing liabilities that a servicer elects to subsequently measure at fair value. Note that this election is not available relative to servicing assets or liabilities that will be accounted for by the amortization method. Any gains and losses associated with the reclassified securities that are included in accumulated other comprehensive income at the time of the reclassification should be reported as a cumulative-effect adjustment to retained earnings as of the beginning of the fiscal year that an entity adopts ASC 860-50-35. The carrying amount of reclassified securities and the effect of that reclassification on the cumulative-effect adjustment should be separately disclosed.

The purpose of reclassifying financial assets to trading is to have the changes in fair values reported in current earnings, rather than in other comprehensive income. Including fair value changes in current income will tend to offset, albeit not perfectly, the income effects of changes in the servicing assets and liabilities being accounted for at fair value. There is no need to test for hedging effectiveness, in contrast to hedge accounting under ASC 815, although ASC 860-50-35 does require that these assets be identified as being useful in this regard.

Finally, ASC 860-50-35 requires that servicing assets and liabilities that are being accounted for at fair value must be segregated from those being accounted for by the amortization method. This can be accomplished by using separate financial statement captions, or by footnote disclosures.

#### Example: Sale of receivables with servicing asset retained by transferor

##### Facts

Receivables' fair value, without servicing	\$16,500
Receivables' book value	15,000
Servicing asset of \$16,500 portfolio	800

Partial sale of receivables with servicing asset (i.e., excess of servicing fees anticipated over cost to provide services) retained. Seller sells 80% of receivables.

	<u>FV</u>	<u>80% FV</u>	<u>20% FV</u>	<i>Receivables allocated</i>	<i>Receivables allocated</i>
				<u>80% BV*</u>	<u>20% BV*</u>
Receivables sold	\$16,500	\$13,200		\$12,000	
Servicing asset**	800	640			
Retained amount (20%)	<u>\$17,300</u>	<u>\$13,840</u>	<u>\$3,460</u>	<u>\$12,000</u>	<u>\$3,000</u>

\* Allocated based on the relative fair values.

\*\* Initially measured at fair value, per ASC 860-50-35.

***Journal Entry***

Cash	13,200
Servicing asset	640
Receivables	12,000
Gain	1,840

Seller reports retained receivables at \$3,000 (book value) and the servicing asset at its fair value of \$640.

**Example: Sale of receivables with servicing liability retained by transferor*****Facts Given***

Receivables' fair value, without servicing	\$16,500
Receivables' book value	15,000
Servicing (liability) for \$16,500 portfolio	(500)

Partial sale of receivables with servicing liability (i.e., excess cost to provide servicing over fees anticipated) retained. Seller sells 80% of receivables.

	<i>FV</i>	<i>80% FV</i>	<i>20% FV</i>	<i>Receivables allocated</i> <i>80% BV*</i>	<i>Receivables allocated</i> <i>20% BV*</i>

Servicing liability**	(500)	(400)			
Retained amount (20%)	<u>      </u>	<u>      </u>	\$3,300	<u>      </u>	\$3,000
	<u>\$16,000</u>	<u>\$12,800</u>	<u>\$3,300</u>	<u>\$12,000</u>	<u>\$3,000</u>

\* Allocated based on the relative fair values.

\*\* Initially measured at fair value, if practicable, per ASC 860-50-35.

***Journal Entry***

Cash	13,200
Servicing liability	400
Receivables	12,000
Gain	800

Seller reports retained receivables at \$3,000 (book value) and the servicing obligation at its fair value of \$400.

ASC 860 imposes standards for both initial measurement and subsequent measurement of servicing assets and liabilities. Specifically, servicing assets or servicing liabilities from each contract are to be accounted for separately as follows:

1. Assets are to be reported separately from liabilities. They are not to be netted, since there is no right of offset.
2. Initially measure retained servicing assets and liabilities at fair values at date of sale or securitization.
3. Initially measure at fair value all purchased servicing assets, assumed servicing liabilities, and servicing liabilities undertaken in a sale or securitization.
4. Account separately for interest-only strips (future interest income from serviced assets that exceeds servicing fees).

5. Either amortize servicing assets and liabilities in proportion to and over the period of estimated net servicing income (the excess of servicing revenues over servicing costs), or adjust to fair value at each reporting date. However, if amortization is employed, impairment of servicing assets and increased obligation of servicing obligations must be accounted for, as described in the following point.
6. Evaluate and measure impairment of servicing assets as follows:
  - a. Stratify recognized servicing assets based on predominant risk (asset size, type, interest rate, term, location, date of organization, etc.).
  - b. Recognize impairment through a valuation allowance for individual stratum in the amount of the excess of carrying value over fair value.
  - c. Adjust the valuation allowances to reflect subsequently needed changes. Excess fair value for a stratum is not recognized.
7. If amortization of servicing liabilities is employed, it is done in proportion to and over the period of net servicing loss (excess of servicing costs over servicing revenues). In cases where subsequent changes have increased the fair value of the servicing liability above the carrying value, an increased liability and a loss are recognized.
8. If servicing assets and liabilities are reported at fair value, changes in value are to be included in periodic earnings as they occur.

The fair value of a servicing asset or liability at date of transfer is best measured by quoted market prices for similar servicing responsibilities. There is the potential for significantly different estimates of fair value when a quoted market price is not available. The transferor is to analyze all available information to obtain the best estimate of the fair value of the servicing contract. These include:

1. The amount that would result in a current transaction between willing parties other than in a forced or liquidation sale
2. The legitimacy of the offer
3. The third party's specific knowledge about relevant factors
4. The experience of the broker with similar contracts
5. The price of other parties that have demonstrated an interest
6. The right to benefit from cash flows of potential future transactions (late charges, ancillary revenue, etc.)
7. The nature of the assets being serviced.

In cases where there are few servicing contracts purchased or sold, present value methods may be used for estimating the fair value of servicing. Disclosure is required of the methods and significant assumptions followed to determine the estimate of fair value (unless not practicable) of recognized servicing assets and liabilities.

#### **Examples: Sale of receivables with servicing asset retained**

##### ***Facts Given Applicable to Both Examples Below (Each Example Is Independent)***

Receivables' fair value	\$16,500
Receivables' book value	15,000
Servicing asset fair value on portfolio of \$16,500	700
Recourse obligation on portfolio of \$16,500	(900)

1. Receivables sold, with servicing asset retained, no recourse obligation on receivables.

**Journal Entry**

Cash	16,500
Servicing asset	700
Receivables	15,000
Gain on transfer	2,200

2. Partial sale of receivables with servicing asset retained and recourse obligation. Seller sells 80% of receivables.

	<u>FV</u>	<u>80% FV</u>	<u>20% FV</u>	<u>Allocated 80% BV*</u>	<u>Allocated 20% BV*</u>
Receivables sold	\$16,500	\$13,200		\$12,000	
Servicing asset	700	560			
Recourse obligation	(900)	(720)			
Retained amount (20%)	<u>\$16,300</u>	<u>\$16,040</u>	<u>\$3,300</u>	<u>\$12,000</u>	<u>\$3,000</u>

\* Allocated based on the relative fair values of the receivables sold and retained.

**Journal Entry**

Cash	13,200
Servicing asset	560
Receivables	12,000
Recourse obligation	720
Gain on transfer	1,040

Seller reports retained receivables at \$3,000 (book value) and servicing asset at \$560, the fair value of servicing the 80% of the portfolio that has been transferred.

The foregoing example presumes that the recourse obligation does not obviate the ability to apply sale accounting for the asset transferred. While this is possible under specific circumstances, it is less likely to be acceptable under the revised ASC 860 provisions than it would have been under preamendment GAAP.

**Impairment testing.** In remeasuring servicing assets for impairment, this is to be based on the fair value of the contracts and not on the gain or loss from carrying out the terms of the contracts. ASC 860-50-35 requires that entities separately evaluate and measure impairment of designated strata of servicing assets. Stratification requires that judgment be used when selecting the most important characteristic. ASC 860 does not require that either the most predominant risk characteristic or more than one predominant risk characteristic be used to stratify the servicing assets for purposes of evaluating and measuring impairment. Different stratification criteria may be used for ASC 860 impairment testing and for ASC 815 grouping of similar assets to be designated as a hedged portfolio in a fair value hedge. The stratum selected is to be used consistently; a change is to be accounted for as a change in estimate under ASC 250. The change and reasons for the change are to be included in the disclosures made in accordance with ASC 860-50-50.

A servicing liability accounted for by the amortization method, on the other hand, is to be remeasured for increases in fair value, which would be recognized as a loss. Similar to the accounting for changes in a valuation allowance for an impaired asset, increases in the servicing obligation may be recovered, but the obligation cannot be adjusted to less than the amortized measurement of its initially recognized amounts.

**Subcontracted servicing.** Subcontracting the servicing to another entity is not accounted for under ASC 860 because it does not involve a transfer. It is to be accounted for under other existing guidance (noting that executory contracts generally do not receive financial statement recognition under GAAP).

In the unusual case that servicing assets are assumed without a cash payment, the facts and circumstances will determine how the transaction is recorded. For example, the servicing asset may represent consideration for goods or services provided by the transferee to the transferor of the servicing. The servicing assets also might be received in full or partial satisfaction of a receivable from the transferor of the servicing. Another possibility is that the transferor (the party providing servicing) is in substance making a capital contribution to the transferee (the party receiving the servicing) in exchange for an increased ownership interest. Additionally, the possibility that there is an overstatement of the value of the servicing by the transferee must be carefully considered.

The amount to be paid to a replacement servicer under the terms of the servicing contract is not relevant to the determination of adequate compensation. This amount could, however, be relevant for determining the contractually specified servicing fees.

**Rights to serviced asset income.** Rights to future income from serviced assets that exceed contractually specified servicing fees are accounted for as a servicing asset, an interest-only strip, or both, depending on whether the servicer would continue to receive the value of the right to future income if a replacement servicer started servicing the assets. Generally, the value of the right to receive future cash flows from ancillary sources such as late fees is included with the servicing asset if retention of the right depends on servicing being performed satisfactorily.

An interest-only strip does not depend on satisfactory performance of servicing, and any portion that would continue to be received if servicing were shifted to a replacement servicer would be accounted for separately as a financial asset. ASC 860-50-35 specifies that interest-only strips or other interests that continue to be held by the transferor in securitizations, loans, other receivables, or other financial assets that can be prepaid or otherwise settled in such a way that the entity might not recover its investment are to be subsequently remeasured as an investment in debt securities classified as available-for-sale or trading under ASC 320.

#### Example of rights to future income from serviced assets

The NorthStar Bank sells a portion of its loan portfolio, but retains the obligation to service the loans and the rights to a portion of any future interest income. Accounting for the servicing asset will be on the amortization method permitted by ASC 860-50-35. NorthStar records a servicing asset of \$148,000 and an interest-only strip receivable of \$68,000 (based on the fair value of its retention of a portion of interest proceeds) as part of the sale transaction. The total book value of loans sold is \$3,000,000, for which it receives total payment of \$2,900,000. The entry to record these assets as part of the sale is:

Servicing asset	148,000
Interest-only strip receivable	68,000
Cash	2,900,000
Loans	3,000,000
Gain on transfer of receivables	116,000

The \$3,000,000 of loans to be serviced will be contractually terminated at different times, so the estimated net servicing income and related amortization of the servicing asset will decline in accordance with the following schedule:

	<u>Year 1</u>	<u>Year 2</u>	<u>Year 3</u>	<u>Year 4</u>	<u>Year 5</u>
Estimated net servicing income	\$120,000	\$109,000	\$82,000	\$53,000	\$19,000
Percent of total estimated servicing income	31%	28%	21%	14%	6%
Annual amortization of servicing asset	\$45,880	\$41,440	\$31,080	\$20,720	\$8,880

Thus, the entry to record amortization of the servicing asset in Year 1 follows:

Amortization—servicing asset	45,880
Servicing asset	45,880

NorthStar retains a portion of the interest income to which it is due under the original loan sale agreement. The initial interest income retention is for \$23,000, and is recorded as follows:

Cash	23,000
Interest-only strip receivable	23,000

At the beginning of Year 4, NorthStar sells its servicing business to a third party, but retains the interest-only strip receivable, whose balance has now declined to \$17,500. The entry to eliminate the remaining unamortized balance of the servicing asset, covering Years 4 and 5, follows:

Amortization—servicing asset	29,600
Servicing asset	29,600

Since the interest-only strip receivable is no longer dependent on NorthStar's satisfactory servicing activities, it shifts the remaining balance of this receivable into an available-for-sale investment account, as shown in the following entry:

Investment in debt securities—	17,500
available-for-sale	
Interest-only strip receivable	17,500

**Transferred servicing rights.** Some organizations transfer servicing rights on loans to third parties. ASC 942 provides criteria to be considered when evaluating whether the transfer qualifies as a sale, the first three of which are cited by reference to ASC 860-50-40.

1. Has title passed?
2. Have substantially all risks and rewards of ownership been irrevocably passed to the buyer?
3. Are any protection provisions retained by the seller considered minor and are they reasonably estimable?
4. Has the seller received written approval from the investor (if required)?
5. Is the buyer a currently approved seller/servicer and not at risk of losing approved status?
6. If the sale is seller-financed:
  - a. Has the buyer made a nonrefundable deposit large enough to demonstrate a commitment to pay the remaining sales price?
  - b. Does the note receivable from the buyer provide full recourse to the buyer?
7. Is the seller adequately compensated in accordance with a subservicing agreement for any short-duration, temporary servicing provided?

If the servicing rights sold are on loans that are retained, the carrying amount is allocated between servicing rights and loans retained using the relative fair value method prescribed by ASC 860.

**Changes resulting in transferor regaining control of financial assets sold.** If a transferor is required to re-recognize financial assets in which it holds a beneficial interest because the

transferor's contingent right (for example, a removal of accounts provision, known as ROAP, or other contingent call option on the transferred financial assets) becomes exercisable, no gain or loss is recognized. The transferor continues to account for its beneficial interest in those assets apart from the re-recognized assets. That is, the beneficial interest is not combined with and accounted for with the re-recognized assets. A gain or loss may be recognized upon the exercise of a ROAP or similar contingent right with respect to the "repurchased" portion of the transferred assets that were sold if the ROAP or similar contingent right held by the transferor is not accounted for as a derivative under ASC 815 and is not at-the-money. The exercise would result in a recombination of the beneficial interest with the repurchased assets.

If a transferor is required to re-recognize financial assets because the SPE becomes non-qualifying, no gain or loss is recognized with respect to the "repurchase" by the transferor of the financial assets originally sold that remain outstanding in the SPE (or the portion thereof, if the transferor retained a partial interest in those assets). The fair value of the re-recognized assets will equal the fair value of the liability assumed by the transferor, because the transferor is contractually required to pass on all of the cash flows from the re-recognized assets to the SPE for distribution in accordance with the contractual documents governing the SPE. The transferor continues to account for its beneficial interest in those assets, if any, apart from the re-recognized assets.

Under no circumstances is a valuation allowance initially recorded for assets (loans) that are re-recognized at their fair value.

The accounting for the servicing asset related to the previously sold financial assets does not change because the transferor, as servicer, is still contractually required to collect the asset's cash flows for the benefit of the SPE and otherwise service the assets. The transferor continues to recognize the servicing asset and assess it for impairment as required by ASC 860-20-55.

**Sales-type and direct financing lease receivables.** Lessors' lease receivables are composed of two components: lease receivables and residual values. Lease receivables are requirements for lessees to pay cash, and thus are financial assets subject to ASC 860 if transferred. Residual values are the rights to the leased equipment at the end of the lease. If the residual value is guaranteed at the inception of the lease, the right is a financial asset subject to ASC 860 if transferred. If the residual value is not guaranteed (or if it is guaranteed after the inception of the lease), transfers of that residual value are not subject to ASC 860. When entities sell lease receivables, the gross investment of the lease is allocated between lease payments, residual values guaranteed at inception, and residual values not guaranteed at inception. (ASC 860-20-55-26) If the reporting entity retains servicing rights, it also records a servicing asset or liability if appropriate. ASC 860 does not apply to sales of operating lease payments.

#### Example of sale of interest in lease payments

Lucky Leasing sells a senior interest in the guaranteed cash flows of a financing lease for \$12,200. It retains a subordinated interest in the guaranteed cash flows and the residual value that is not guaranteed. The lease has the following components:

	<i>Face value</i>	<i>Present value</i>
Lease receivable	\$ 8,350	\$ 7,000
Guaranteed residual value	7,000	5,875
Residual value not guaranteed	1,400	1,175
Total investment in lease	<u>\$16,750</u>	<u>\$14,050</u>

The present values are computed using the implicit lease rate. The fair value of the subordinated interest retained is \$1,200. Lucky Leasing receives no explicit compensation for servicing the lease, but it estimates that the benefits of servicing are just adequate to compensate it for its servicing responsibilities (that is, there is no servicing asset or liability). The allocation of the carrying amount for the interest sold is as follows:

	<u>Fair value</u>	<u>Allocated cost</u>
Senior interest sold	\$12,200	\$11,722
Subordinated interest retained	<u>1,200</u>	<u>1,153</u>
Totals	<u>\$13,400</u>	<u>\$12,875</u>

The entry to record the sale would be as follows:

Cash	12,200
Subordinated interest	1,153
Residual value	1,175
Net investment in lease	14,050
Gain on sale	478

**Securitizations.** Entities that generate a large number of similar receivables, such as mortgages, credit card receivables, or car loans, sometimes securitize those receivables. Securitization is the transformation of the receivables into securities that are sold to other investors. For example, mortgages can be converted into mortgage-backed securities, which entitle the investors to receive specific cash flows generated by the mortgages. With an established market, issuance of the securities can cost less than using the receivables as collateral for a borrowing. Transfers in securitization transactions must be evaluated for sale accounting treatment by the criteria in ASC 860, and must be evaluated for consolidation by the usual GAAP criteria applicable to variable interest entities, set forth at ASC 810. If consolidation of the securitization entity is necessitated by the circumstances, gain cannot be recognized on the transfer.

Note that securitizations may still be treated as transfers warranting sale treatment, and thus gain recognition if justified by the facts, but the new, stricter, criteria will make this more difficult to achieve.

Securitizations may involve a single transfer to a special-purpose entity, or multiple transfers, which are designed to provide greater assurance that the transferred assets have been isolated, thus providing not only greater bankruptcy protection, but also stronger support for sale accounting treatment of the transfer. ASC 860 provides a detailed description of the conditions that would warrant this treatment.

In a typical securitization, the transferor (also called issuer or sponsor) forms a securitization mechanism (a separate corporation or a trust) to buy the assets and to issue the securities. The securitization mechanism then generates beneficial interests in the assets or resulting cash flows that are sold to investors with the sales proceeds used to pay the transferor/sponsor for the transferred assets. The form of the securities chosen depends on such things as the nature of the assets, income tax considerations, and returns to be received. The securities issued by the securitization entity may consist of a single class of interests with the characteristics of equity or multiple classes of interests, some having debt characteristics and others equity characteristics.

For example, a transferor originates long-term loans and accumulates them on its statement of financial position (referred to as warehousing). When the group of loans reaches a sufficient size,

the loans are sold to a securitization entity. During the accumulation phase, the transferor finances the cost of holding the loans with prearranged lines of credit, known as warehouse lines. Often the transferor hedges the price risk of the loans as they await sale. This is referred to as an *on-statement-of-financial-position warehousing*.

Alternatively, a transferor may use a properly structured *off-statement-of-financial-position warehousing* to securitize assets. In an off-statement-of-financial-position warehouse, the transferor creates a temporary securitization vehicle. A bank typically extends credit to the securitization vehicle in the form of a variable-funding note. Using the proceeds of the note, the vehicle acquires loans from the transferor as they are originated. The principal of the note increases, up to a ceiling, as the transferor transfers additional loans to the securitization vehicle. When the loans have reached the ceiling amount of the note, the bank puts the note back to the securitization vehicle, forcing the vehicle to sell the loans to a permanent securitization entity to raise the cash to pay the note.

Payments by the securitization mechanism are usually classified as pay-through, pass-through, or revolving-period. In a *pay-through*, cash flows from the assets pay off the debt securities. The assets are essentially collateral. In a *pass-through*, undivided interests are issued and the investors share in the net cash flows. In a *revolving-period*, undivided interests are issued, but until liquidation, the net cash flows are split between buying additional assets and paying off investors. During the reinvestment period, principal repayments are reinvested in additional receivables generated by the debtors whose receivables were securitized. Under ASC 860-10-05, any gain recognized by the transferor/sponsor on the sale of credit card or other receivables to a securitization entity is limited to amounts relating to receivables existing at the date of sale. This prevents the transferor/sponsor from recognizing additional gains on transfers that are anticipated to occur during the specified reinvestment period.

In computing gain or loss on the initial transfer, the transferor/sponsor recognizes costs estimated to be incurred for all future servicing activities, including the costs of servicing the receivables that the sponsor expects to sell to the vehicle during the reinvestment period. If the initial sale results in a gain, the costs associated with the receivables to be sold during the reinvestment period may be recorded as an asset and allocated to expense using a systematic and rational method over the initial and reinvestment periods.

Various financial components arise from securitizations. Examples include servicing contracts, interest-only strips, retained interests, recourse obligations, options, swaps, and forward contracts. All controlled assets and liabilities must be recognized under ASC 860. The following examples presume that sale criteria under amended ASC 860 are met, but it is important to bear in mind that this is a facts and circumstances determination that must be made in each situation.

#### Example of a securitization deal involving four classes of securities

Principal of loans held by the securitizer/transferor	\$10,000,000
Accrued interest on loans held by the securitizer/transferor	230,000
Deferred origination costs of loans held by the securitizer/transferor	100,000
Deferred origination fees of loans held by the securitizer/transferor	(200,000)
Loss allowance on loans held by the securitizer/transferor	(250,000)
Net carrying amount of loans	<u>\$ 9,880,000</u>

Classes of securities issued and prices:

	<u>Principal</u>	<u>Price</u>	<u>Fair value</u>
Class A	\$9,000,000	100	\$ 9,000,000
Class B	1,000,000	90	900,000
Interest-only strip (retained)			150,000
Residual class (retained)			100,000
Total fair value			<u>\$10,150,000</u>

Servicing is retained by the transferor and has a fair value of \$75,000

Transaction costs are \$100,000

Proceeds are \$9,800,000 (\$9,000,000 Class A + \$900,000 Class B – \$100,000 costs)

Allocation of carrying value:

	<u>Fair value</u>	<u>Percent</u>	<u>Allocation</u>	<u>Sold</u>	<u>Retained</u>
Class A	\$ 9,000,000	88.0	\$8,696,332	\$8,696,332	
Class B	900,000	8.8	869,633	869,633	
Interest-only strip	150,000	1.5	144,939		\$144,939
Residual class	100,000	1.0	96,626		96,626
Servicing	75,000	.7	72,470		72,470
Total	<u>\$10,225,000</u>	<u>100.0</u>	<u>\$9,880,000</u>	<u>\$9,565,965</u>	<u>\$314,035</u>

The entry to record the sale would be as follows:

Cash	9,800,000
Interest-only strip	144,939
Residual class	96,626
Servicing asset	72,470
Loan loss allowance	250,000
Deferred origination fees	200,000
Loans receivable	\$10,000,000
Interest receivable	230,000
Deferred origination costs	100,000
Gain on sale of loans	234,035

The entry to mark the securities retained to fair value under ASC 320 would be:

Interest-only strip	5,061
Residual class	3,374
Comprehensive income (unless trading)	8,435

Just as it is necessary to distinguish new assets, which are recorded at fair value, from retained interests, which are recorded at allocated carrying value, when accounting for a transfer to another enterprise, it is necessary to do so when accounting for a transfer to a securitization entity. In certain securitization transactions, more than one transferor contributes assets to a single securitization entity. A transferor treats the beneficial interests it receives in a securitization that commingles assets from more than one transferor as:

1. New assets, to the extent that the sources of the cash flows to be received by the transferor are assets transferred by another entity
2. Retained interests, to the extent that the sources of the cash flows are assets transferred by the transferor
3. New assets, to the extent that any derivatives, guarantees, or other contracts were entered into by the securitization entity to “transform” the transferred assets.

After a securitization, the beneficial interests held by the transferor either are in the form of securities that are accounted for under ASC 320 or are required to be accounted for as available-for-sale securities in accordance with ASC 860. Thus, the transferor must classify the beneficial interests into one of the ASC 320 categories. If beneficial interests held by the transferor after the transfer convey rights to the same cash flows as the transferor was entitled to receive from securities that it transferred to the securitization entity, the ASC 320 classification of the beneficial interests is the same as the securities held before the transfer. For example, if prior to the transfer the debt securities were accounted for as available-for-sale securities in accordance with ASC 320, the beneficial interests are to be classified as available-for-sale securities if the transferor receives the cash flows from those securities via its beneficial interest. In contrast, if the transferred assets were not ASC 320 securities prior to the transfer but the beneficial interests were issued in the form of debt securities that have readily determinable fair values, then the transferor has the opportunity to decide the appropriate ASC 320 classification at the date of the transfer. (ASC 860-10-55-77)

Revolving-period securitizations present some unique issues because they contain an implicit forward contract to sell new receivables during the revolving period. The forward contract may become valuable to the transferor or burdensome depending upon how interest rates and market conditions change. The value of the implicit forward contract arises from the difference between the rate promised to the holders of the beneficial interests and the market rate of return on similar investments. For example, if the agreed-upon rate to holders is 5% and the market rate is 7%, the forward contract's value to the transferor is 2% of the amount of the investment for each year remaining in the revolving period, after the initially transferred receivables are collected. When receivables are sold to a revolving-period securitization trust, gain or loss recognition is limited to receivables that exist and have been sold. Similarly, servicing assets or liabilities are limited to servicing receivables that exist and have already been transferred. As proceeds from collection of the receivables are used to purchase new receivables for the trusts, each additional transfer is treated as a separate sale, with its own gain or loss calculation. Those additional transfers also can result in recognition of additional servicing assets and liabilities.

ASC 860 does not address the accounting for desecuritization of securities into loans or other financial assets. ASC 320-10-25 addresses that issue. It states that the guidance in ASC 860 is to be extended by analogy to desecuritizations. Thus, the transfer of securities or beneficial interests in a securitized pool of financial assets in which the transferor receives in exchange only the financial assets underlying those securities or beneficial interests would not be accounted for as a sale.

#### Example of revolving period securitizations

The Mason-Dixon Auto Sales Company enters into a revolving-period securitization agreement to sell \$100,000 of its car loan receivables each month to the Meridian Securitization Trust for a four-year period. Meridian guarantees a 5% rate of return to its investors for the entire four-year period. Mason-Dixon will continue to service all receivables sold to Meridian. If Mason-Dixon can create new car loans at interest rates greater than 5%, then it can recognize the difference between the actual interest rate and the rate issued to Meridian's investors as an interest-only strip.

At the end of the first month, Mason-Dixon sells \$100,000 of principal on car loan receivables to Meridian, as well as \$600 of accrued interest on the loans. Thus, the net carrying amount of the loans sold is \$100,600. Mason-Dixon retains receivables servicing, which has a fair value of \$6,000, as well as an interest-only strip receivable that recognizes the difference between the 5% guaranteed interest rate paid to Meridian's investors and the average 7% actual interest rate on the loan receivables, which has a fair value of \$8,000 at the sale date.

The initial sale includes transaction costs of \$5,000, which are deducted from the cash paid by Meridian to Mason-Dixon. The following entry by Mason-Dixon records the sale transaction:

Cash	95,600
Interest-only strip receivable	8,000
Servicing asset	6,000
Loans receivable	100,000
Interest receivable	600
Gain on sale of loans	9,000

At the end of the next month, Mason-Dixon sells another \$100,000 of receivables to Meridian, as well as \$350 of accrued interest on the loans. Thus, the net carrying amount of the second group of loans is \$100,350. The lower accrued interest is due to a drop in the actual interest rate on this second block of loans, which averages 4% and is below the 5% guaranteed Meridian's investors. The fair value of the servicing asset associated with these loans is \$6,000. The following calculation allocates the fair value of the various elements of the transaction to the net carrying amount of the loans:

	<i>Fair value</i>	<i>Percent</i>	<i>Allocation</i>
Loans	\$100,000	98.0	\$ 98,343
Interest-only strip	(4,000)	(3.9)	(3,914)
Servicing asset	6,000	5.9	5,921
Totals	\$102,000	100.0	\$100,350

This second sale also includes transaction costs of \$5,000, which are deducted from the cash paid to Mason-Dixon. The following entry records the sale transaction:

Cash	95,350
Servicing asset	6,000
Loss on sale of loans	3,000
Interest-only strip receivable	4,000
Loans receivable	100,000
Interest receivable	350

**Repurchase agreements.** Repurchase agreements are used to obtain short-term use of funds. Under the terms of a repurchase agreement the transferor transfers financial assets to a transferee in exchange for cash. Concurrently, the transferor agrees to reacquire the financial assets at a future date for an amount equal to the cash exchanged and an interest factor. Many repurchase agreements are for short terms, often overnight.

It is necessary to determine whether the repurchase agreement meets the requirements described in the section earlier in this chapter, "Surrender of control." Usually the critical determination is whether the repurchase agreement gives the transferor effective control over the transferred assets. That determination is made by applying the criteria described in the section entitled, "Maintaining effective control." In most cases, if the repurchase is required prior to the maturity of the security transferred and the cash transferred is sufficient to repurchase the assets if the transferee defaults, the transferor retains effective control and the agreement is accounted for as a collateralized borrowing. For example, fixed-coupon and dollar-roll repurchase agreements, and other contracts under which the securities to be repurchased need not be the same as the securities sold, qualify as borrowings if the return of substantially the same securities as those transferred is assured. However, if a transferor does not maintain control over the transferred assets and other criteria in ASC 860 are met, the transfer is accounted for as a sale and a forward commitment. ASC 860-20-55, discussed earlier in this chapter, addresses situations where a transferee transfers

the assets back to the transferor in a repurchase financing arrangement, which (depending on meeting criteria specified) may or may not interfere with derecognition of the assets by the original transferor.

### **Example of a repurchase agreement**

Mighty Manufacturing has \$1,995,000 excess cash that it desires to invest for a 7-day period. It transfers the cash to Lion Bank in exchange for \$2,000,000 of commercial paper. At the end of the 7-day period, Lion Bank agrees to repurchase the commercial paper for \$1,996,500. Mighty Manufacturing does not have the right to sell or pledge the commercial paper during the 7-day period.

The entries to record the origination of the agreement are as follows:

<u>Mighty Manufacturing</u>		<u>Lion Bank</u>	
Investment	1,995,000	Cash	1,995,000
Cash	1,995,000	Short-term payable	1,995,000

The entries to record the termination of the agreement seven days later are as follows:

<u>Mighty Manufacturing</u>		<u>Lion Bank</u>	
Cash	1,996,500	Short-term payable	1,995,000
Investment	1,995,000	Interest expense	1,500
Interest income	1,500	Cash	1,996,500

**Securities lending transactions.** Broker-dealers and other financial services companies initiate securities lending transactions when they need to obtain specific securities to cover a short sale or a customer’s failure to deliver securities sold. The transferor/lender provides the securities to the transferee/borrower in exchange for “collateral,” usually in an amount greater than the fair value of the borrowed securities. This collateral is commonly cash but could alternatively be other securities or standby letters of credit.

When the collateral is cash, the transferor/lender invests the cash during the period that the security is loaned. The investment return on the cash collateral is larger than the fees paid by the lender under the agreement (the rebate). Because the cash collateral is usually valued daily and adjusted frequently for changes in the market value of the underlying securities, the transaction has very low credit risk.

In determining whether to account for a securities lending transaction as a sale or a secured borrowing, the same criteria used for other asset transfers are applied. Many securities lending transactions are accompanied by an agreement that entitles and obligates the transferor/lender to repurchase or redeem the transferred assets before their maturity. Thus, the transferor maintains effective control over the securities lent. If that is the case, the transaction is accounted for as a secured borrowing. The following is an example of a securities lending transaction accounted for as a secured borrowing:

#### **Example: Securities lending transaction (30 days)**

Fair value of loaned security	\$16,500
Book value of loaned security	16,500
Collateral (cash)	16,995
Transferor/lender's return from investing cash	5%
Transferor/lender's rebate to transferee/borrower	4%

***Transferor/lender's journal entries******At date of loan:***

Securities pledged	16,500
Securities	16,500

***To record transfer of securities as a loan***

Cash	16,995
Loan agreement payable	16,995

***To record receipt of cash collateral***

Money market instrument	16,995
Cash	16,995

***To invest cash collateral******At end of 30 days:***

Cash	17,065
Interest income	70
Money market instrument	16,995

***To transfer cash from money market and record interest earned***

Securities	16,500
Securities pledged	16,500

***To record securities returned by transferee/borrower***

Loan agreement payable	16,995
Interest rebate	56
Cash	17,051

***To return cash collateral and pay rebate***

**Accounting for collateral.** Accounting for collateral depends both on whether the secured party has the right to sell or repledge the collateral and on whether the debtor has defaulted. Ordinarily, the transferor should carry the collateral as an asset and the transferee does not record the pledged asset.

The collateral provisions of ASC 860 apply to all transfers (repurchase agreements, dollar-roll, securities lending, etc.) of financial assets pledged as collateral and accounted for as a secured borrowing. The provisions do not apply to the accounting for cash in secured borrowing transactions.

If the secured party (transferee) has the right to sell or repledge the collateral, then the debtor (transferor) reclassifies the asset used as collateral and reports it in the statement of financial position separately from other assets not similarly encumbered. That is, the debtor (transferor) continues to hold the collateral assets as its own, and the secured party (transferee) does not recognize the collateral asset. If the secured party (transferee) sells the collateral, it recognizes the proceeds from the sale and the obligation to return the collateral to the debtor (transferor).

Although collateral is required to be reclassified and reported separately by the transferor if the transferee has the right to sell or repledge the collateral, that requirement does not change the transferor's measurement of the collateral. The same measurement principles are to be used as before the transfer and the collateral is not derecognized. The subsequent measurement of the transferee's obligation to return the collateral in securities borrowing and resale agreement transactions is not addressed by ASC 860.

If the transferor defaults and is not entitled to the return of the collateral, it is to be derecognized by the transferor. If not already recognized, the transferee records its asset at fair value.

#### Example of accounting for collateral

Deep Water Marine enters into a loan arrangement with Key West Bank for \$4,700,000, using one of its submersibles as collateral. The loan terms are monthly interest payments at an annual rate of 9%, followed by a balloon payment in five years for the entire amount of the principal. The submersible has a book value of \$4,250,000, net of accumulated depreciation of \$500,000, and a fair value of \$4,650,000. Deep Water misses its first loan payment, so the parties renegotiate the loan agreement, allowing Key West the right to resell the submersible. Deep Water records this change by separately listing the submersible in the property, plant, and equipment section of its statement of financial position in the following manner:

Equipment used as collateral with right of sale	\$4,250,000
(net of accumulated depreciation of \$500,000)	

Two months after the loan initiation date, Deep Water defaults on the note and enters bankruptcy proceedings, so Key West takes possession of the submersible. Deep Water records the default with the following entry:

Loan payable	4,700,000
Accrued interest payable	70,500
Accumulated depreciation	500,000
Fixed assets—equipment	4,750,000
Gain on loan defaults	520,500

Foreclosure of the Deep Water loan is certain. The estimated cost to sell the submersible is a 2% commission, or \$93,000, which Key West includes in the following entry to record its ownership of the submersible (\$4,650,000 fair value net of \$93,000 commission):

Repossessed assets	4,557,000
Bad debt expense	213,500
Interest receivable	70,500
Loans receivable	4,700,000

Key West sells the submersible for \$4,500,000, net of all sales costs. It records the transaction with the following entry:

Cash	4,500,000
Loss on asset sale	57,000
Repossessed assets	4,557,000

**Financial assets subject to prepayment.** ASC 860 requires interest-only strips, loans, other receivables, or retained interests in securitizations to be measured like investments in debt securities. If they can be contractually prepaid or settled in a way that potentially precludes recovery of substantially all of the recorded investment, they are classified as available-for-sale or trading under ASC 320 (i.e., they generally cannot be treated as held-to-maturity debt instruments). Only assets meeting all of the ASC 320 requirements and acquired late enough in life that,

even if prepaid, the holder would recover substantially all of its recorded investment may be initially classified as held-to-maturity. The probability of prepayment or settlement is not relevant to the classification under ASC 320.

Although financial assets that do not meet the securities definition of ASC 320 must be measured in the same manner as investments under ASC 320, other provisions of that Statement (disclosures, etc.) are not required to be applied.

## CONTRACTORS—FEDERAL GOVERNMENT (ASC 912)<sup>1</sup>

### PERSPECTIVE AND ISSUES

ASC 912 governs the accounting and income recognition issues concerning cost-plus-fixed-fee and fixed-price supply contracts. The fees under government cost-plus-fixed-fee contracts are recognized as income on the basis of partial performance if there is reasonable assurance of realization. Fees are also accrued as they become billable unless this accrual is not reasonably related to the proportionate performance of total work to be performed.

This pronouncement also covers:

- Renegotiation (refunds of excessive profits)<sup>2</sup>, and
- Contracts terminated for the convenience of the government.

### DEFINITIONS OF TERMS

Terms are from ASC 912, *Glossary*.

<sup>1</sup> Upon implementation of ASU 2014-09, *Revenue from Contracts with Customers*, ASC 912-605 and ASC 912-705 and other paragraphs will be superseded will be superseded by guidance in ASC 606.

<sup>2</sup> Upon implementation of ASU 2014-09, *Revenue from Contracts with Customers*, this bullet will be superseded by guidance in ASC 606.

**Contract.** A legal agreement obligating a contractor (referred to as the “general contractor” or “prime contractor”) to provide products or services to the U.S. government. The term also refers to subcontracts obligating subcontractors to indirectly perform in a similar manner under the supervision and control of the prime contractor.

**Contractors.** In the context of this discussion, contractors are enterprises that sell products or services to the U.S. government pursuant to a formal contract. The relationship to the government can be direct (a prime contract between the enterprise and the government) or indirect (a subcontract between the enterprise and a prime contractor).

**Cost-plus-fixed-fee Contracts.** A contract under which the contractor is reimbursed for costs plus the provision for a fixed fee. (ASC 912-10-20)

**Disposal Credits.** Amounts deducted from the contractor’s termination claim receivable by reason of the contractor’s retention, or sale to outsiders, of some or all of the termination inventory for which the claim was made. In the circumstance of items retained, either as scrap or for use by the contractor, the amount of the credit is determined by agreement between the contractor and a representative of the government. (ASC 912-310-25-4)

**No-cost Settlements.** A contractor whose contract is terminated may prefer to retain the termination inventory for use in other production or for disposal at the contractor’s risk. For these or other reasons the contractor may prefer to make no claim against the government or a higher-tier contractor. In such no-cost settlements there is no sale of inventory or other items to the government and no occasion to accrue any profit arising from the termination. The costs otherwise applicable to the contract shall be given their usual treatment in the accounts. Items of inventory or other property retained, having been previously recorded, require no charge to purchases but shall be treated in accordance with the usual procedures applicable to such assets. (ASC 912-310-25-5)

**Service Contracts.** Contracts in which the contractor acts only as an agent.

**Subcontractor’s Claims.** Those obligations of a contractor to a subcontractor that arise from the subcontractor’s costs incurred through transactions that were related to a contract terminated but did not result in the transfer of billable materials or services to the contractor before termination. (FASB ASC Master Glossary)

**Supply Contracts.** Contract in which the contractor’s services extend beyond that of an agent. Contracts include services such as the use of the contractor’s own facilities and the contractor assumes responsibility to creditors for material and services, and to employees for salaries.

## **CONCEPTS, RULES, AND EXAMPLES**

---

Cost-plus-fixed-fee contracts (CPFFC) are used for the manufacture and delivery of products, the construction of plants and other facilities, and for management and other services. The amount of the flat-fee payment is usually determined by the ratio of the actual expenditures to the total estimated expenditures. CPFFC may be cancelled and terminated by the government. If this occurs, the contractor is entitled to reimbursement for expenditures and an appropriate portion of the fixed fee.

Normally, profits are recognized when the right to full payment is unconditional. However, revenues can be accrued and profits recognized for partial performance when total profit can be reasonably estimated and realization is reasonably assured. The fees are usually accrued as they become billable. Because risk is minimal and there is no credit problem, billable amounts are indicative of realization. The contractor’s fee is considered earned when it is billable and when the related costs are incurred or paid. Accrual based on billable amounts is an application of the percentage-of-completion method, rather than a deviation from the accrual method. The fee is considered billable when approved by the government. An alternative date is used when a determination is made that

estimated and final costs are significantly different. Accrual of the fee upon delivery or based on percentage of completion is more appropriate when excess costs are substantial.

For supply contracts, reimbursable costs and fees are included in sales. For service contracts, only fees are included in sales. Unbilled amounts are included in the statement of financial position as a receivable but are to be captioned and presented separately from billed receivables. Advances in CPFFC are generally intended to assist the contractor in financing its costs. Thus, in general, advances are treated as liabilities and are not offset against contract receivables. Advances are permitted to be offset against contract receivables only when there is an expectation that the advances will be applied against those specific charges. Any such offsets require disclosure in the financial statements.

### **Renegotiation**

Renegotiation typically addresses a refund to the government of “excessive” profits. In reality, it is more of an adjustment of the selling price. The financial statements are to disclose situations when a substantial portion of a contractor’s business consists of contracts that are subject to renegotiation. When a reasonable estimate of renegotiation refunds can be made, a provision is shown as a deduction from revenue in the income statement and as a current liability on the statement of financial position. Deferred income taxes are adjusted accordingly. When a reasonable estimate cannot be made, disclosure is required along with the reasons for the inability to make an estimate. Footnote disclosure is also required regarding material uncertainties and their significance, and regarding the basis for determining the renegotiation provision. (See footnote at the beginning of this chapter.)

### **Terminated Defense Contracts**

These contracts are contracts terminated for the convenience of the government. Profits accrue as of the effective date of termination and are included in financial statements after the termination. Disclosure is made of all material facts and circumstances. Termination claims are recorded as a single amount even if they consist of several different types of cost reimbursements. Material termination claims are to be captioned separately from other receivables and such claims receivable directly from the government are to be presented separately from related claims against other contractors. Claims receivable are classified as current assets unless there is an indication of extended delay, such as a serious disagreement indicative of probable litigation. Pretermination contract advances are shown as a deduction from claims receivable and adequately explained. Termination loans are classified as current liabilities and cross-referenced to the related claims receivable.

Material termination claims are separately captioned in the revenues section of the contractor’s statement of income. When inventory is reacquired by the contractor after including it in a termination claim, it is recorded as a purchase. The credit is applied against the termination claim receivable.

## **DEVELOPMENT STAGE ENTERPRISES (ASC 915)**

---

### **Technical Alert**

**ASU 2014-10.** In June 2014, the FASB issued ASU 2014-10, *Development Stage Entities (Topic 915) Elimination of Certain Financial Reporting Requirements, including an Amendment to Variable Interest Entities Guidance in ASC 810, Consolidation*. The objective of the amendments in ASU 2014-10 is to improve financial reporting by reducing the cost and complexity associated with the incremental reporting requirements for development stage entities. Users of financial statements of development stage entities told the Board that the development stage entity distinction, the inception-to-date information, and certain other disclosures currently required under U.S. generally accepted accounting principles (GAAP) in the financial statements of development

stage entities provide information that has limited relevance and is generally not decision useful. As a result, this ASU eliminates the concept of development stage entities from U.S. GAAP. In so doing, it removes ASC 915 from the FASB's Accounting Standards Codification.

## ENTERTAINMENT—BROADCASTERS (ASC 920)<sup>3</sup>

### PERSPECTIVE AND ISSUES

---

ASC 920 sets forth accounting and reporting standards for the broadcasting industry. A broadcaster is an enterprise or an affiliated group of enterprises that transmits radio or television program material. Broadcasters acquire program exhibition rights through license agreements. A typical license agreement for program material (e.g., features, specials, series, or cartoons) covers several programs (a package) and grants a television station, group of stations, network, pay television, or cable television system (licensee) the right to broadcast either a specified number or an unlimited number of showings over a maximum period of time (license period) for a specified fee. Ordinarily, the fee is paid in installments over a period generally shorter than the license period. The agreement usually contains a separate license for each program in the package. The licensee expires at the earlier of the last telecast allowed or the end of the license period. The licensee pays the required fee whether or not the rights are exercised. If the licensee does not exercise the contractual rights, the rights revert to the licensor with no refund to the licensee.

### DEFINITIONS OF TERMS

---

Source: ASC 920, *Glossaries*

**Broadcaster.** An enterprise or an affiliated group of enterprises that transmits radio or television program material.

**Daypart.** An aggregation of programs broadcast during a particular time of day (e.g., daytime, evening, late night) or programs of a similar type (e.g., sports, news, children's shows).

**License Agreement for Program Material.** A typical license agreement for program material (e.g., features, specials, series, or cartoons) covers several programs (a package) and grants a television station, group of stations, network, pay television, or cable television system (licensee) the right to broadcast either a specified number or an unlimited number of showings over a maximum period of time (license period) for a specified fee.

**Network Affiliation Agreement.** A broadcaster may be affiliated with a network under a network affiliation agreement. Under the agreement the station receives compensation for the network programming that it carries based on a formula designed to compensate the station for advertising sold on a network basis and included in the network programming.

### CONCEPTS, RULES, AND EXAMPLES

---

#### Accounting for License Agreements

A broadcaster accounts for a license agreement for program material as a purchase of rights. Thus, an asset and a liability are recorded for the program rights purchased and the liability incurred when the license period begins and the broadcaster has met the following requirements:

---

<sup>3</sup> Upon implementation of ASU 201-09, guidance in ASC 920 on revenue, nonmonetary transactions, and barter transactions will be superseded by guidance in ASC 606.

1. Knows or can reasonably determine the cost of each program
  2. Has accepted the program material according to the license agreement
  3. Has access to the program for the first telecast (unless an agreement with another licensee prevents the telecast).
- (ASC 920-350-25-2)

The asset is capitalized and the liability reported at either the gross amount of the liability for program rights or, alternatively, at the fair value of the liability. If a present value technique is used to measure fair value, the difference between the gross and net liability must be accounted for as interest. (ASC 920-405-30-1) Under either method, the capitalized costs are allocated to each program within a package based on the relative value of each program to the broadcaster. (ASC 920-405-45-1)

The asset is separated into current and noncurrent portions based on expected time of program usage. The liability is likewise segregated according to the payment maturities.

### **Amortizing Capitalized Costs**

The capitalized costs are amortized to expense as the program rights are used; generally based on the estimated number of program telecasts. However, licenses granting the right to unlimited broadcasts of programs such as cartoons are amortized over the license period, since the number of telecasts may be indeterminable. (ASC 920-350-35-1)

Feature programs and program series require specific treatment. Feature programs are amortized program-by-program, unless amortization as a package produces approximately the same result. Syndicated programs are amortized as a series. If the broadcaster considers the first showing to be more valuable than reruns, the series is amortized using an accelerated method. If each showing is equally valuable, straight-line amortization is used. (ASC 920-350-35-2)

#### **Example of accounting for program license agreements**

On July 31, 20X1, Lakie Media Company executed a license agreement for three movies, which it plans to televise on its local television station. The agreement allows the broadcast of each movie twice during the license period. Lakie is a calendar year-end company. The appropriate rate for imputing interest is 12%. Additional facts and assumptions are as follows:

<u>Film</u>	<u>License Period</u>		<u>Film availability date</u>	<u>First telecast</u>		<u>Second telecast</u>	
	<u>From</u>	<u>To</u>		<u>Date</u>	<u>% of Total revenue</u>	<u>Date</u>	<u>% of Total revenue</u>
A	10/1/X1	9/30/X3	9/1/X1	3/1/X2	60%	6/1/X3	40%
B	10/1/X1	9/30/X3	9/1/X1	5/1/X2	70%	7/1/X3	30%
C	11/1/X1	8/31/X3	10/1/X1	6/1/X2	75%	8/1/X3	25%

Payment terms and discounted present value data are as follows (Films A and B were acquired as a package):

<u>Film(s)</u>	<u>Payment</u>		<u>Discount period *</u>	
	<u>Date</u>	<u>Amount</u>	<u>From</u>	<u>To</u>
A & B	7/31/X1	\$ 1,000		
	12/31/X1	6,000	10/1/X1	12/31/X1
	12/31/X2	6,000	10/1/X1	12/31/X2
		13,000		
C	12/31/X2	3,750	11/1/X1	12/31/X2
		<u>\$16,750</u>		

\* Discounted from the first day of the license period to the date of payment.

Based on management's estimates of expected advertising revenues, Film A represents 70% and Film B 30% of the total package A and B.

**Present value approach.** When each film's license period begins, an asset and a liability are recorded at the present value of the liability. Since the first three payments apply to the package of films A and B, the \$12,027 combined present value (see the amortization schedule below) must be allocated to these films according to the 70%/30% assumption stated above.

<u>Film</u>	<u>Asset and liability recognized</u>	
A	\$ 8,419	$(\$12,027 \times 70\%)$
B	<u>3,608</u>	$(\$12,027 \times 30\%)$
	12,027	
C	<u>3,283</u>	
	<u>\$15,310</u>	

In this case, all costs are capitalized in 20X1 because all of the films' licensing periods begin in that year (assuming the three conditions are met).

The amount capitalized as an asset is amortized according to the percentage of revenues to be earned each year from each film. Interest is accrued on the unpaid balance of the liability for each film. Note that for films A and B, the unpaid balance at December 31, 20X1 is \$11,027 (\$12,027 – the \$1,000 down payment).

#### Amortization Schedules—Annual Compounding

<u>Description</u>	<u>Date</u>	<u>Payment</u>	<u>Interest at 12%</u>	<u>Principal</u>	<u>Balance</u>
<u>Films A and B</u>					
Down payment	7/31/X1	\$ 1,000.00	–	\$1,000.00	–
Discounted obligation	10/1/X1				\$11,027.23
Payment	12/31/X1	6,000.00	\$ 329.91	5,670.09	5,357.14
Payment	12/31/X2	6,000.00	642.86	5,357.14	–
		13,000.00	972.77	12,027.23	
<u>Film C</u>					
Original obligation	11/1/X1				3,283.44
Accrued interest	12/31/X2	–	64.77	(64.77)	3,348.21
Payment	12/31/X2	3,750.00	401.79	3,348.21	–
		3,750.00	466.56	3,283.44	
		<u>\$16,750.00</u>	<u>\$1,439.33</u>	<u>\$15,310.67</u>	
			<u>20X1</u>	<u>20X2</u>	<u>20X3</u>
<u>Amortization of film rights</u>					
<u>Film A</u>					
(\$12,027 × 70% =) \$8,419 × 60%			\$ 5,051		
(\$12,027 × 70% =) \$8,419 × 40%				\$3,368	\$8,419
<u>Film B</u>					
(\$12,027 × 30% =) \$3,608 × 70%			2,526		
(\$12,027 × 30% =) \$3,608 × 30%				1,082	3,608
					12,027
<u>Film C</u>					
\$3,283 × 75%			2,462		
\$3,283 × 25%				821	3,283
Total amortization of film rights			<u>\$10,039</u>	<u>\$5,271</u>	15,310

	<u>20X1</u>	<u>20X2</u>	<u>20X3</u>	<u>Total</u>
<i>Interest expense per amortization schedule</i>				
Films A and B	\$330	\$ 643		973
Film C	65	402		467
	<u>\$395</u>	<u>\$1,045</u>		<u>1,440</u>
				<u>\$16,750</u>

**Gross method.** Costs are capitalized at the gross amount of the liability.

<u>Film</u>	<u>Asset and liability recognized</u>
A	\$ 9,100
B	3,900
C	3,750
	<u>\$16,750</u>

Again, since the license period for all the films begins in 2012, the assets and liabilities are recognized in that year.

Under the gross approach, no interest is accrued on the unpaid liability. Thus, the only expense recognized is the amortization of the program cost.

<u>Film</u>	<u>Year of expense recognition</u>		<u>Total</u>	
	<u>20X2</u>	<u>20X3</u>		
A	\$ 5,460	(1)	\$3,640	(4) \$ 9,100
B	2,730	(2)	1,170	(5) 3,900
C	2,813	(3)	937	(6) 3,750
	<u>\$11,003</u>		<u>\$5,747</u>	<u>\$16,750</u>

- (1)  $\$9,100 \times 60\%$
- (2)  $\$3,900 \times 70\%$
- (3)  $\$3,750 \times 75\%$
- (4)  $\$9,100 \times 40\%$
- (5)  $\$3,900 \times 30\%$
- (6)  $\$3,750 \times 25\%$

## Accounting for Network Affiliation Agreements

A broadcaster may be affiliated with a network under a network affiliation agreement. Under the agreement, the station receives compensation for the network programming that it carries based on a formula designed to compensate the station for advertising sold on a network-wide basis and included in the network programming. Program costs, a major expense of television stations, are generally lower for a network affiliate than for an independent station because an affiliate does not incur program costs for network programs. (ASC 920-10-20)

Upon termination of a network affiliation agreement, immediate replacement, or an agreement to replace the affiliation, the broadcaster will recognize a loss measured by the unamortized cost of the previous affiliation less the fair value of the new affiliation. No gain is recognized if the fair value exceeds the unamortized cost. If the terminated affiliation is not replaced, its unamortized cost is charged to expense. (ASC 920-350-40-1)

## Accounting for Barter Transactions<sup>4</sup>

Broadcasters may exchange unsold advertising time for products or services. The broadcaster benefits (providing the exchange does not interfere with its cash sales) by exchanging otherwise

<sup>4</sup> Upon implementation of ASU 2014-09, *Revenue from Contracts with Customers*, guidance for this subject can be found in ASC 606.

unsold time for such things as programs, fixed assets, merchandise, other media advertising privileges, travel and hotel arrangements, entertainment, and other services or products. Such transactions are reported at the fair value of the services or products (except when advertising time is exchanged for programs).

Barter revenue is recognized when all of the following conditions are met:

1. Persuasive evidence exists of the advertising arrangement in the form of a noncancelable contract signed by both the broadcaster and the advertiser.
2. The production of the advertising is complete and has been delivered or is available for immediate and unconditional delivery in accordance with the terms of the arrangement.
3. The period of the arrangement has begun and the advertiser is entitled to use the advertising time.
4. The terms of the agreement and any fees involved are fixed and determinable.
5. Collectibility of any cash portion of the arrangement is reasonably assured.

If all of these conditions are satisfied except for the existence of a noncancelable contract, then the advertising revenue is not recognized until the advertising is aired.

The products or services received in exchange for the advertising time are reported when received or used. A liability results if products or services are received in advance of advertising revenue recognition and a receivable results if the advertising revenue is recognized prior to receipt of the products and services.

### **Reporting and Disclosure**

The capitalized cost of program rights is reported in the statement of financial position at the lower of unamortized cost or net realizable value. Net realizable value is estimated on a package, series, program-by-program, or daypart basis. (ASC 920-350-30-3) Daypart is an aggregation of programs broadcast during a particular time of day (e.g., daytime, evening, late night) or programs of a similar type (e.g., sports, news, children's shows). Broadcasters generally sell access to viewing audiences to advertisers on a daypart basis. If the broadcaster expects the usefulness of a program to diminish, the program may have to be written down from unamortized cost to estimated net realizable value. This establishes a new cost basis for the program. The write-down is not permitted to be restored in future periods.

Network affiliation agreements are reported in the statement of financial position as intangible assets. (ASC 920-350-45-2)

## **ENTERTAINMENT—CABLE TELEVISION (ASC 922)<sup>5</sup>**

### **PERSPECTIVE AND ISSUES**

---

ASC 922 provides accounting and reporting guidance for the cable television industry. These standards apply to cable television systems in the prematurity period. During the prematurity period, the cable television system is partially under construction and partially in service. The prematurity period begins with the first earned subscriber revenue. Its end will vary with the

---

<sup>5</sup> Upon implementation of ASU 2014-09, *Revenue from Contracts with Customers*, guidance for revenue and deferred revenue for this industry can be found in ASC 606.

system's circumstances but will be determined based on plans for completion of the first major construction period or achievement of a specified predetermined subscriber level at which no additional investment will be required for other than cable television plant. The length of the prematurity period varies with the franchise development and construction plans. Except in the smallest systems, programming is usually delivered to portions of the system, and some revenues are obtained before construction of the entire system is complete. Thus, virtually every cable television system experiences a prematurity period during which it is receiving some revenue while continuing to incur substantial costs related to the establishment of the total system. (ASC 950-350-20)

## DEFINITIONS OF TERMS

---

Terms are from ASC 922, *Glossary*.

**Cable Television Plant.** The cable television plant refers to the equipment required to render service to subscribers including:

*Head-end.* This includes the equipment used to receive signals of distant television or radio stations, whether directly from the transmitter or from a microwave relay system. It also includes the studio facilities required for operator-originated programming, if any.

*Cable.* This consists of cable and amplifiers (which maintain the quality of the signal) covering the subscriber area, either on utility poles or underground.

*Drops.* These consist of the hardware that provides access to the main cable, the short length of cable that brings the signal from the main cable to the subscriber's television set, and other associated hardware, which may include a trap to block particular channels.

*Converters and descramblers.* These devices are attached to the subscriber's television sets when more than twelve channels are provided or when special services are provided, such as "pay cable" or two-way communication.

**Direct Selling Costs.** Direct selling costs include commissions, the portion of a salesperson's compensation other than commissions for obtaining new subscribers, local advertising targeted for acquisition of new subscribers, and costs of processing documents related to new subscribers acquired. Direct selling costs do not include supervisory and administrative expenses or indirect expenses, such as rent and other facilities costs.

**Subscriber-related Costs.** Costs incurred to obtain and retain subscribers including costs of billing and collection, bad debts, and mailings; repairs and maintenance of taps and connections; franchise fees related to revenues or number of subscribers; general and administrative system costs, such as salary of the system manager and office rent; programming costs for additional channels used in the marketing effort or costs related to revenues from, or number of subscribers to, per channel or per program service; and direct selling costs.

## CONCEPTS, RULES, AND EXAMPLES

---

### Accounting during the Prematurity Period

Before the first subscriber revenue is earned by the cable company, the beginning and end of the prematurity period must be established by management. This period generally will not exceed two years. Once the prematurity period has been established, it may not be changed except in highly unusual circumstances. (ASC 920-360-25-1)

Separate accounting is required for any portion<sup>6</sup> of a cable television system that is in the prematurity period and that is distinct from the rest of the system. This distinction is made if the portion is characterized by a majority of the following differences:

- Accounting (e.g., separate forecasts, budgets, etc.)
  - Investment decisions (e.g., separate ROI, breakeven, etc.)
  - Geographical (e.g., separate franchise area)
  - Mechanical (e.g., separate equipment)
  - Timing (e.g., separate inception of construction or marketing).
- (ASC 922-360-25-3)

If the portion meets these requirements, it will be charged costs of the entire system only if these costs are directly traceable to that portion. Separate projections are also developed for that portion.

During the prematurity period, costs incurred for the plant are capitalized as usual. General and administrative expenses and subscriber-related costs are considered period costs. Subscriber-related costs are costs incurred to obtain and retain subscribers to the cable television system. (ASC 922-360-25-4 and 25-5)

System costs that will benefit the cable system upon completion (e.g., programming costs), and that will remain fairly constant despite changes in the number of subscribers, are separated into amounts benefiting current operations (which are expensed currently) and amounts allocable to future operations (which are capitalized). The amount to be currently expensed is determined by multiplying the total monthly system costs by a fraction calculated each month during the prematurity period as follows:

$$\text{Current portion of system costs} = \frac{\begin{matrix} \text{Greatest of} \\ \text{a) Average \# of subscribers expected at beginning of prematurity period,} \\ \text{b) Average \# of subscribers assuming straight-line progress towards estimated \# of subscribers at end of prematurity period, or} \\ \text{c) Average \# of actual subscribers} \end{matrix}}{\text{Total \# of subscribers expected at end of prematurity period}}$$

During the prematurity period, interest cost is capitalized using an interest capitalization rate as described in ASC 835-20. The amount of interest cost to be capitalized is determined as follows:

$$\text{Interest cost} = \text{Interest capitalization rate} \times \text{Average amount of qualifying assets during the period capitalized}$$

FAS 34 defines qualifying assets. The amount of capitalized interest cost may not exceed actual interest cost for the period.

Depreciation and amortization during the prematurity period are determined as follows:

---

<sup>6</sup> The word “segment” has been used by some television enterprises. However, since ASC 280 uses segment in a different context, the FASB uses the word “portion” instead of “segment” to refer to the part of a cable television system that is still in the prematurity period.

Depreciation and amortization expense	=	Monthly depreciation and amortization of total capitalized costs expected on completion of the prematurity period (using depreciation method to be used at completion of prematurity period)	$\times$	Fraction used to determine monthly system costs to be expensed currently
---------------------------------------	---	--	----------	--

## Amortization

**Amortizable life for portions built at different times.** Costs that have been capitalized for a portion of a cable television system that is in the prematurity period, and that are clearly distinguishable on the basis of differences in timing between construction of that portion and the rest of the system are amortized over the same depreciation period used by the main cable plant.

**Installation revenues and costs.** A cable television system recognizes initial hookup revenue to the extent of the direct selling costs associated with that revenue. Any excess over the direct selling costs is deferred and amortized to income over the average period that subscribers are expected to be connected to the system.

Initial installation costs are capitalized and depreciated over a period that does not exceed the period used to depreciate the cable plant. After the initial installation, any costs incurred to disconnect or reconnect subscribers are charged to expense as incurred.

**Franchise application costs.** A cable television franchise is a right granted by a municipality to provide service to its residents. The treatment of franchise application costs depends upon whether or not the application is successful. If successful, the application costs are capitalized and amortized as intangible assets over the life of the franchise agreement. If unsuccessful or abandoned, all application costs are charged to expense.

**Impairment.** Capitalized plant and amortizable intangible assets are subject to the impairment provisions outlined in ASC 360 (discussed in detail in the chapter on ASC 360). Any of the system's intangible assets deemed to have an indefinite life are tested for impairment at least annually under the provisions of ASC 350. A separate evaluation is made for portions of the cable television system that are in their prematurity period. If total capitalized costs reach the maximum recoverable amount, capitalization continues. However, the provision to record an impairment loss to reduce capitalized costs to recoverable value is increased.

## ENTERTAINMENT—CASINOS (ASC 924)<sup>7</sup>

### PERSPECTIVE AND ISSUES

---

There is some form of legalized gambling in most states, as well as on Native American land and on riverboats. Legalized gambling includes betting for horse racing, dog racing, lotteries, and jai alai. Gambling has become a considerable revenue stream for resort operators who also provide other services to attract gamblers.

There is a limited amount of guidance available for gambling entities, which is centered on ASC 924, *Entertainment—Casinos*.

---

<sup>7</sup> Upon implementation of ASU 2014-09, *Revenue from Contracts with Customers*, guidance for revenue and deferred revenue for this industry can be found in ASC 606.

---

## DEFINITIONS OF TERMS

---

Source: ASC 924-10-20

**Base Jackpot.** The fixed, minimum amount of the payout from a slot machine for a specific combination.

**Chips.** Money substitutes issued by a gaming entity and used by its patrons for wagering.  
**Slot Machine.** A type of mechanical or electrical apparatus used in connection with gaming.

---

## CONCEPTS, RULES, AND EXAMPLES

---

A casino typically exchanges cash from patrons for its gaming chips. When a casino exchanges gaming chips for cash, it records a liability. The casino calculates the amount of this liability by determining the difference between the total chips placed in service and the actual amount of chips in custody.

A casino should recognize revenue as the difference between gaming wins and losses, not the total amount wagered.

If a casino has immaterial base jackpots, it can charge them to revenue when established. If base jackpots are material, then it should charge them to revenue ratably over the period of time before payout is expected. If a base jackpot has not yet been charged to revenue when a jackpot is actually paid, the casino should charge it to revenue in the period when it pays the jackpot. A casino should not accrue a base jackpot before it is won if the casino can avoid paying it (such as by removing the machine from play). If the casino has an obligation to pay the jackpot, then it should accrue the jackpot in advance.

If a casino leases slot machines, a leasing condition may be to pay a percentage of wins to the machine lessor. If so, the casino records the win as revenue, and the participating fee as an expense. Upon implementation of ASU 2014-09, a casino will be required to record a liability to pay a jackpot. (ASC 924-405-25-2) For base jackpots from slot machines or other games, an entity may be able to avoid a payout. If so, the entity does not have to record a liability until the entity is subject to pay. (ASC 924-405-55-1)

## ENTERTAINMENT—FILM (ASC 926)<sup>8</sup>

---

### PERSPECTIVE AND ISSUES

---

#### Overview

The production, sale, licensing, and distribution of motion pictures (and television series) are fraught with uncertainties. The industry is speculative in nature with studios routinely investing multimillion dollar sums in the hope that the production will achieve critical acclaim and that moviegoers will flock to the box office, purchase licensed merchandise tied to the film and its characters, and purchase or rent copies of the film. Due to the uncertainties involved in estimating the revenues that will be earned and costs that will be incurred over a film's life, an acceptable estimation methodology is required to achieve proper matching of costs and revenues and

---

<sup>8</sup> Upon implementation of ASU 2014-09, *Revenue from Contracts with Customers*, guidance for revenue and deferred revenue for this industry can be found in ASC 606.

accurately reflect the results of the film's financial performance. This methodology is provided in ASC 926, *Entertainment—Films*.

## DEFINITIONS OF TERMS

---

Source: ASC 926, *Glossary*. Also see Appendix A, *Definition of Terms*, for other terms relevant to this topic: Contract and Revenue.

**Cross-collateralized.** A contractual arrangement granting distribution rights to multiple films, territories, and/or markets to a licensee. In this type of arrangement, the exploitation results of the entire package are aggregated by the licensee in determining amounts payable to the licensor.

**Distributor.** The owner or holder of the rights to distribute films. Excluded from this definition, for the purposes of applying ASC 926, are entities that function solely as broadcasters, retailers (such as video stores), or movie theaters.

**Exploitation Costs.** All direct costs incurred in connection with the film's distribution. Examples include marketing, advertising, publicity, promotion, and other distribution expenses.

**Film Costs.** Film costs include all direct negative costs incurred in the physical production of a film, including allocations of production overhead and interest capitalized in accordance with ASC 835-20. Examples of direct negative costs include costs of story and scenario; compensation of cast members, extras, directors, producers, and miscellaneous staff; costs of set construction and operations, wardrobe and accessories; costs of sound synchronization; rental facilities on location; and postproduction costs such as music, special effects, and editing.

**Film Prints.** The materials containing the completed audio and video elements of a film which are distributed to a theater to exhibit the film to its customers.

**Firm Commitment.** An agreement with a third party that is binding on both parties. The agreement specifies all significant terms, including items to be exchanged, consideration, and timing of the transaction. The agreement includes a disincentive for nonperformance that is sufficiently large to ensure the expected performance. With respect to an episodic television series, a firm commitment for future production includes only episodes to be delivered within one year from the date of the estimate of ultimate revenue.

**Market.** A distribution channel located within a certain geographic territory for a certain type of media, exhibition, or related product. Examples include theatrical exhibition, home video (laser disc, videotape, DVD), pay television, free television, and the licensing of film-related merchandise.

**Nonrefundable Minimum Guarantee.** Amount to be paid by a customer in a variable fee arrangement that guarantees an entity a minimum fee on that arrangement. This amount applies to payments paid at inception, as well as to legally binding commitments to pay amounts over the license period.

**Overall Deal.** An arrangement whereby an entity compensates a creative individual (e.g., producer, actor, or director) for the exclusive or preferential use of that party's creative services.

**Participation Costs.** Frequently, persons involved in the production of a film are compensated, in part or in full, with an interest (referred to as a *participation*) in the financial results of the film. Determination of the amount of compensation payable to the participant is usually based on formulas (participations) and by contingent amounts due under provisions of collective bargaining agreements (residuals). The recipients of this compensation are referred to as participants and the costs are referred to as participation costs. Participations may be paid to creative talent (e.g., actors or writers), or to entities from whom distribution rights are licensed.

**Producer.** An individual or enterprise that is responsible for all aspects of a film and has a financial interest in a film. Although the producer's role may vary, his or her responsibilities include administration of such aspects of the project as initial concept, script, budgeting, shooting, postproduction, and release.

**Revenue.** Amounts earned by an entity from its direct distribution, exploitation, or licensing of a film, before deduction for any of the entity's direct costs of distribution. In markets and territories where the entity's fully or jointly owned films are distributed by third-party distributors, revenue is the net amount payable to the entity by the distributor. Revenue is reduced by appropriate allowances, estimated returns, price concessions, or similar adjustments, as applicable.

**Sale.** The transfer of control of the master copy of a film and all of the associated rights that accompany it.

**Set for Production.** A film qualifies as being set for production when all of the following conditions have been met: (1) management with relevant authority authorizes (implicitly or explicitly) and commits to funding the film's production; (2) active preproduction has begun; and (3) the start of principal photography is expected to begin within six months.

**Spot Rate.** The exchange rate for immediate delivery of currencies exchanged.

**Territory.** A geographic area in which a film is exploited, usually a country. In some cases, however, a territory may be contractually defined as countries with a common language.

## CONCEPTS, RULES, AND EXAMPLES

---

ASC 926, *Entertainment—Films*, provides the authoritative guidance with respect to accounting for arrangements to sell, license, or exhibit films. The term “film” is generic and includes intellectual property produced on traditional celluloid film as well as videotape, digital, or other video-recording formats. The content or format of films includes (1) feature films, (2) television series, (3) television specials, and (4) similar products (including animated films and television programming). The guidance in the standard applies to producers and distributors who own or hold rights to distribute or exploit films. The standard does not apply to the following specialized industries or applications that have their own specialized GAAP:

1. The recording industry (ASC 928)
2. Cable television (ASC 922)
3. Broadcasters (ASC 920)
4. Computer software to be sold, leased, or otherwise marketed (ASC 985-20)
5. Software revenue recognition (ASC 985-605) (See footnote at the beginning of this chapter regarding revenue recognition for this topic.)
6. Entertainment and educational software products (ASC 985-705).

There are many varieties of contractual sales or licensing arrangements governing the rights or group of rights to a single or multiple films. The film's producer (referred to in the standard and in this discussion as *the entity*) may license it to distributors, theaters, exhibitors, or other licensees (referred to in the standard and in this discussion as *customers*) on an exclusive or nonexclusive basis in a particular market or territory. The terms of the license may be for a fixed (or flat) fee or the fee may be variable based on a percentage of the customer's revenue. If the arrangement is variable, it may include a nonrefundable minimum guarantee payable either in advance or over the licensing period.

## Revenue Recognition

(See footnote at the beginning of this chapter regarding revenue recognition for this topic.) An entity recognizes revenue from a sale or licensing arrangement only when all of the following conditions are met:

1. Persuasive evidence exists of a sale or licensing arrangement with a customer.
2. The film is complete and, in accordance with the terms of the arrangement, has been delivered or is available for immediate and unconditional delivery.
3. The license period for the arrangement has started and the customer can begin exploitation, exhibition, or sale.
4. The arrangement fee is fixed or determinable.
5. Collection of the arrangement fee is reasonably assured.

If any of the above conditions have not been met, the entity defers recognizing revenue until all of the conditions are met. If the entity recognizes a receivable on its statement of financial position for advances under an arrangement for which all of the above conditions have not been met, a liability for deferred revenue of the same amount is to be recognized until such time as all of the conditions have been met.

**Persuasive evidence of an arrangement.** This condition is met solely by documentary evidence that sets forth, at a minimum, the following terms: (1) the license period, (2) the film or films covered by the agreement, (3) a description of the rights transferred, and (4) the consideration to be exchanged. If the agreement is ambiguous regarding the parties' rights and obligations, or if there is significant doubt as to the ability of either party to perform under the agreement, revenue is not recognized. Acceptable documentary evidence must be verifiable (e.g., a contract, a purchase order, or an online authorization). (ASC 926-605-25-4 and 25-5)

**Delivery.** The delivery condition may be satisfied by an arrangement providing the customer with immediate and unconditional access to a film print held by the entity. The customer may also receive a lab access letter that authorizes it to order a film laboratory to make the film immediately and unconditionally available for its use. Under these conditions, the delivery condition is satisfied if the film is complete and available for immediate delivery. (ASC 926-605-25-7)

Some licensing arrangements require the entity to make significant changes to the film after it becomes initially available. Significant changes are changes that are additive to the film and that result from the entity creating additional content after the film becomes initially available. The changes can consist of the reshooting of selected scenes or adding additional special effects. When such changes are required to be made to the film, the arrangement does not meet the delivery condition. The costs incurred for these significant changes are added to film costs and subsequently recorded as expense when the related revenue is recognized.

Changes that are not considered to be significant changes include insertion or addition of preexisting film footage, addition of dubbing or subtitles to existing footage, removal of offensive language, reformatting to fit a broadcaster's screen dimensions, or adjustments to allow for the insertion of television commercials. Such insignificant changes do not alter the film's qualification to meet the delivery condition. The expected costs of these insignificant changes are accrued and charged directly to expense by the entity at the time that revenue recognition commences even if they have not yet been incurred. (ASC 926-605-25-8 and 25-9)

**Commencement of exploitation.** Some arrangements impose on the customer a release date or *street date* before which the film may not be exhibited or sold. Such a date defines the

commencement date of the exploitation rights. The entity does not begin to recognize revenue on the arrangement until this restriction has expired.

**Fixed or determinable arrangement fee.** When there is a flat fee that covers a single film, the amount of the fee is, of course, considered fixed and determinable and the entity recognizes the entire license fee as revenue when all of the conditions set forth above have been satisfied. (ASC 926-605-25-11)

If the flat fee applies to multiple films, some of which have not been produced or completed, the entity allocates the fee to each individual film by market or territory based on relative fair values of the rights to exploit each film under the licensing arrangement. The entity bases the allocations to a film or films not yet produced or completed on the amounts that would be refundable if the entity did not ultimately complete and deliver the films to the customer. The entity allocates the remaining flat fee to completed films based on the relative fair values of the exploitation rights to those films under the arrangement. These allocations may not be adjusted subsequently even if better information becomes available. (ASC 926-605-25-12 and 25-13) After making the allocations described above, the entity recognizes revenue for each film when all of the above conditions are met with respect to that film by market and territory. If the entity is not able to determine relative fair values for the exploitation rights, then the fee is not fixed or determinable and the entity may not recognize revenue until such a determination can be made and it meets all five of the conditions.

An entity's arrangement fees may be variable based on a percentage of the customer's revenue from exploitation of the film. When all five conditions have been met, the entity commences revenue recognition as the customer exploits or exhibits the film. (ASC 926-605-25-18)

Certain variable fee arrangements include a nonrefundable minimum guarantee whereby the customer guarantees to pay the entity a nonrefundable minimum amount that is applied against the variable fees on a film or group of films that are not cross-collateralized. In applying the revenue recognition conditions, the amount of the nonrefundable minimum guarantee is considered to be fixed and determinable and is recognized as revenue when all of the other conditions have been met. If the nonrefundable minimum guarantee is applied against variable fees from a group of films on a cross-collateralized basis, the amount of the minimum guarantee attributable to each individual film cannot be objectively determined. In this situation, the entity recognizes revenue as described in the preceding paragraph (i.e., when all five of the conditions have been met as the customer exhibits or exploits each film). Under this scenario, if there is a remaining portion of the nonrefundable minimum guarantee that is unearned at the end of the license period, the entity recognizes the remaining guarantee as revenue by allocating it to the individual films based on their relative performance under the arrangement. (ASC 926-605-25-19 through 25-21)

**Returns and price concessions.** These can affect whether the arrangement fee meets the condition of being fixed and determinable. The factors to consider include the provisions of the arrangement between the entity and its customer and the entity's policies and past actions related to granting concessions or accepting product returns. If the arrangement includes a right-of-return provision or if its past practices allow for such rights, the entity must meet all of the conditions in ASC 605 in order for it to recognize revenue. Among those conditions is a requirement that the entity be able to reasonably estimate the amount of future returns. ASC 605 is discussed in detail in the chapter on ASC 605.

**Barter revenue.** If an entity licenses programming to television stations in exchange for a specified amount of advertising time on those stations, the exchange is accounted for as a nonmonetary exchange in accordance with ASC 845. See the discussion of nonmonetary transactions in the chapter on ASC 845.

**Modifications of arrangements.** If, during the term of a licensing arrangement, the entity and its customer agree to extend an existing arrangement for which all of the revenue recognition conditions have been met, the accounting follows the same rules cited above for flat-fee arrangements, variable fee arrangements, and variable fee arrangements with minimum guarantees.

For modifications that are not extensions of an existing arrangement, the modification is accounted for as a new arrangement and a termination of the former arrangement. At the time the former arrangement is terminated, the entity accrues and expenses all costs associated with the arrangement or reverses previously reported revenue to reflect refunds and concessions that result from the new arrangement. In addition, the entity adjusts accumulated film cost amortization and accrued participation costs attributable to the excess revenue. The new arrangement fee is accounted for by applying the provisions of the standard.

### Example

Eva Enterprises produced a film that did not meet revenue expectations. The film was originally projected to gross \$9,500,000 and to date has only earned \$2,300,000.

The original arrangement called for a fixed fee of \$150,000. Eva had previously met all five criteria for recognizing the \$150,000 fixed fee as revenue. To placate its customers, Eva negotiated a new arrangement that reduced the original fixed fee from \$150,000 to \$80,000 and substituted a variable component based on 1% of the customers' revenues from exploiting the film. The effects of the new arrangement on Eva's revenue are computed as follows:

<b>Revenue recognizable under new arrangement</b>	
Fixed fee	\$80,000
Variable fee earned to date (1% of \$2,300,000)	<u>23,000</u>
	103,000
<b>Original fixed fee recognized as revenue</b>	<u>150,000</u>
<b>Reduction in revenue due to new arrangement</b>	<u><u>\$(47,000)</u></u>

In addition to the adjustment above, Eva also must adjust its previously recorded accumulated amortization of film costs and accrued participation costs attributable to the excess revenue previously recorded. Prospectively, the new arrangement is accounted for in accordance with the provisions of the standard.

**Product licensing.** Any revenue from licensing arrangements to market film-related products is deferred until the release date of the film.

**Present value.** Revenue that an entity recognizes in connection with licensing arrangements is recorded at the present value of the license fee computed in accordance with ASC 835 as of the date that the entity first recognizes the revenue. A discounted cash flow model is often used to estimate fair value. FASB Concepts Statement No. 7, *Using Cash Flow Information and Present Value in Accounting Measurements*, provides guidance on the traditional and expected cash flow approaches to present value measurements.

### Costs and Expenses—Components

Costs associated with the production and bringing to market of a film can be categorized as one of the following:

1. Film costs
2. Participation costs
3. Exploitation costs
4. Manufacturing costs.

**Film costs.** Film costs are presented separately on the entity's statement of financial position. They consist of direct negative costs, production overhead, and production period interest capitalized in accordance with ASC 835-20. Direct negative costs include costs to acquire the rights to intellectual property (e.g., film rights to books or stage plays, or original screenplays); the cost of adaptation or development of the property; compensation of the cast, directors, producers, extras, and other staff members; costs of set construction and operations, wardrobe and accessories; costs of sound synchronization; on-location rental facilities; and postproduction costs such as music, special effects, and editing. Production overhead includes allocation of costs of individuals or departments with exclusive or significant responsibility for the production of films. However, production overhead does not include general and administrative expenses, the costs of certain overall deals, or charges for losses on properties sold or abandoned. If the entity presents a classified statement of financial position, unamortized film costs are presented as a noncurrent asset. The amortization of film costs is explained later in this section.

**Participation costs.** Participation costs are contingent compensation paid to creative talent such as actors or writers, or to entities from whom the distribution rights are licensed, such as the publisher of a novel on which a screenplay is based (these recipients are referred to as participants). The costs are computed (accrued) based on contractual formulas (participations) and by contingent amounts due under provisions of collectively bargained union agreements (residuals). The accrual of these costs is discussed later in this section.

**Exploitation costs.** Exploitation costs are the direct costs associated with the film's distribution. The advertising cost component of exploitation costs is accounted for in accordance with ASC 340-20. All other exploitation costs, including marketing costs, publicity, promotion, and other distribution expenses, are expensed as incurred.

**Manufacturing costs.** The cost of making theatrical film prints is charged to expense over the period benefited. The cost of manufacturing and/or duplication of products to be held for sale such as videocassettes and digital video discs is charged to expense on a unit-specific basis when the related product revenue is recognized. Unsold inventories are to be evaluated at the date of each statement of financial position, for net realizable value and obsolescence.

### Costs and Expenses—Amortization of Film Costs and Accrual of Participation Costs

Amortization of capitalized film costs and accrual (expensing) of participation costs commences when the film is released and the entity begins to recognize revenue from the film. The method used to compute the amortization of film costs and the accrual of participation costs is called the individual-film-forecast-computation method. This method amortizes film costs using the following formula:

$$\frac{\text{Current period actual revenue}}{\text{Estimated remaining unrecognized ultimate revenue as of the beginning of the fiscal year}} \times \frac{\text{Unamortized film costs at the beginning of the fiscal year}}{\text{for the fiscal year}} = \text{Film cost amortization}$$

Similarly, participation costs are accrued and expensed using the following formula:

$$\frac{\text{Current period actual revenue}}{\text{Estimated remaining unrecognized ultimate revenue as of the beginning of the fiscal year}} \times \frac{\text{Unaccrued ultimate participation costs at the beginning of the fiscal year}}{\text{for the fiscal year}} = \frac{\text{Amount of participation costs to be accrued (expensed) for the fiscal year}}{\text{for the fiscal year}}$$

Irrespective of the above calculation, participation costs are subject to special rules. The liability is only accrued if it is probable that there will be a sacrifice of assets to settle the entity's obligation under the participation agreement. In addition, at the date of each statement of financial position, accrued participation costs must at least equal the amounts that the entity is obligated to pay at that date.

Using this formulaic approach, if the actual results from the exploitation of the film are realized as originally estimated, the entity would earn a constant rate of profit over the ultimate period for each film before considering exploitation costs, manufacturing costs, and other period costs.

It is, of course, likely that the actual results will vary from the estimates and that the estimates will require review and refinement. At each reporting date, the entity reviews and revises estimates of ultimate revenue and ultimate participation costs to reflect the most current information available to it. As a result of this review, the denominator is revised to include only the remaining ultimate revenue at the beginning of the fiscal year of change. In this way, these changes in estimate are accounted for prospectively as of the beginning of the fiscal year of the change. The numerator is unaffected by the change since it is based on actual results. The entity uses this revised denominator in the fraction applied to the net unamortized film costs and to the film's unaccrued ultimate participation costs. The difference between expenses determined using the new estimates and any amounts previously recorded as expense during that fiscal year are charged (or credited) to the income statement in the period (e.g., quarter) during which the estimates are revised.

**Ultimate revenue.** In general, ultimate revenue to be included in the denominator of the fraction includes estimates of revenue to be recognized by the entity from the exploitation, exhibition, and sale of a film in all markets and territories. There are, however, certain limitations that apply to the determination of ultimate revenue:

1. The period over which ultimate revenue for a film may be estimated is limited to ten years following the date of the film's initial release.
2. For previously released films acquired as part of a film library, the period over which ultimate revenue may be estimated is limited to twenty years from the date of acquisition of the library. A film must have been initially released at least three years prior to the acquisition date of the film library in order to be categorized as part of the library for the purposes of applying this limitation.
3. Ultimate revenue includes estimates of revenue for a market or territory only if persuasive evidence exists that the revenue will be earned, or if an entity can demonstrate a history of earning revenue in that market or territory. Ultimate revenue includes estimates of revenue from newly developing territories only if an existing arrangement provides persuasive evidence that the entity will realize the revenue.
4. Ultimate revenue includes estimates of revenue from licensing arrangements with third parties to market film-related products only if there is persuasive evidence that the revenue from that arrangement will be earned for that particular film (e.g., a signed contract to receive a nonrefundable minimum guarantee or nonrefundable advance) or if the entity can demonstrate a history of earning revenue from that form of arrangement.
5. Ultimate revenue includes estimates of the portion of the wholesale or retail revenue from an entity's sale of peripheral items (such as toys and apparel) attributable to the

exploitation of themes, characters, or other contents related to a particular film only if the entity can demonstrate a history of earning revenues from that form of exploitation in similar kinds of films. Under this limitation, the amount of revenue to be included in ultimate revenue is an estimate of the amount that would be earned by the entity if rights for such a form of exploitation had been granted under licensing arrangements with third parties. Thus, the entity's estimate of ultimate revenue does not include the entire gross wholesale or retail revenue from the sale of peripheral items, but rather, the amount that it would realize in net license fees from the sales.

6. Ultimate revenue excludes estimates of revenue from unproven or undeveloped technologies.
7. Ultimate revenue excludes estimates of wholesale promotion or advertising reimbursements to be received from third parties. These reimbursements are accounted for as an offset against exploitation costs.
8. Ultimate revenue excludes estimates of amounts related to the sale of film rights for periods after those identified in 1 and 2 above.

With respect to episodic television series, the following rules apply:

1. The period over which ultimate revenue for an episodic television series may be estimated is limited to ten years from the date of delivery of the first episode or, if the series is still in production, five years from the date of delivery of the most recent episode, if later.
2. Ultimate revenue includes estimates of secondary market revenue (revenue from syndication of the series to markets other than the initial market) for produced episodes only if the entity can demonstrate through its experience or industry norms that the number of episodes already produced, plus those for which a firm commitment exists and the entity expects to deliver, can be licensed successfully in the secondary market.
3. Ultimate revenue excludes estimates of amounts related to the sale of rights for periods after those identified in 1 above.

Ultimate revenue is a gross undiscounted amount and does not include amounts representing projections of future inflation. The portion of ultimate revenue that is expected to be received in a foreign currency is valued at current spot rates.

**Ultimate participation costs.** The estimate of unaccrued ultimate participation costs to be used in the individual-film-forecast-computation method is made using assumptions consistent with the entity's estimates of film costs, exploitation costs, and ultimate revenue subject to the limitations set forth above. If, at the date of any statement of financial position, the recognized participation costs liability exceeds the estimated unpaid ultimate participation costs for an individual film, the excess liability is first applied to reduce unamortized film costs with any remaining excess credited to income. If the entity continues to incur participation costs after the film costs have been fully amortized, the participation costs are accrued and expensed as the related revenues are recognized.

**Example of individual film forecast computation method**

Paula Pictures incurred film costs and earned revenues from its motion picture, Arachno-Man, as follows:

	<i>Year 1</i>	<i>Year 2</i>
1. Film cost, including capitalized interest (FC)	\$15,000	
2. End-of-year estimate of ultimate revenue (UR)	36,000	\$30,000
3. Remaining ultimate revenue at beginning of year* (RUR)	—	11,000
4. Actual earned revenues for the year (ER)	19,000	5,000
5. End-of-year estimate of ultimate participation costs (UPC)	3,600	3,000
6. Actual participation costs for the year (APC)	1,600	500

\* *Revised estimate of ultimate revenue less actual revenue earned from date of release through the beginning of the year.*

The individual film forecast computation method is applied as follows:

**Year 1**

Film cost amortization:

$$\frac{\$19,000 \text{ ER}}{\$36,000 \text{ UR}} \times \$15,000 \text{ FC} = \$7,917 \text{ Film cost amortization}$$

Accrual of participation costs:

$$\frac{\$19,000 \text{ ER}}{\$36,000 \text{ UR}} \times \$3,600 \text{ UPC} = \$1,900 \text{ Accrued participation costs}$$

**Year 2**

Film cost amortization:

$$\frac{\$5,000 \text{ ER}}{\$11,000 \text{ RUR}^*} \times \$7,083^{**} \text{ Unamortized film costs} = \$3,220 \text{ Film cost amortization}$$

\* *Computed as Year 2 revised estimate of ultimate revenue of \$30,000 less actual revenue recognized in prior year of \$19,000.*

\*\* *Computed as film cost of \$15,000 less prior amortization expense recognized of \$7,917.*

Accrual of participation costs:

$$\frac{\$5,000 \text{ ER}}{\$11,000 \text{ RUR}} \times \$1,100 \text{ Remaining ultimate participation costs}^{***} = \$500$$

\*\*\* *Computed as Year 2 revised estimate for ultimate participation costs of \$3,000 less the prior year accrued amount of \$1,900.*

## Valuation of Unamortized Film Costs

Unamortized film costs must be tested for impairment when there is an indication that the fair value of the film may be less than unamortized costs. Consistent with the rules for recognizing impairment of long-lived assets in ASC 360, the standard sets forth examples of events or changes in circumstances that indicate that the entity must assess whether the fair value of the film (whether it has been completed or is still in production) is less than the carrying amount of its unamortized film costs:

1. An adverse change in the expected performance of the film prior to its release
  2. Actual costs substantially in excess of budgeted costs
  3. Substantial delays in completion or release schedules
  4. Changes in release plans, such as a reduction in the initial release pattern
  5. Insufficient funding or resources to complete the film and to market it effectively
  6. Actual performance subsequent to release fails to meet prerelease expectations.
- (ASC 926-20-35-12)

Upon making the comparison between the film's fair value and its unamortized costs, any excess of the unamortized costs over the fair value is to be written off as an operating expense on the income statement. Amounts written off may not be subsequently restored.

The fair value of a film is often estimated using a traditional discounted cash flow model. The limits regarding the number of years of revenue to include in the determination of ultimate revenue do not apply to the estimation of future cash flows associated with the film for the purpose of determining the film's fair value. Factors to be considered by management in estimating future cash inflows for a film include:

1. The film's performance in prior markets, if previously released
2. The public's perception (the popularity and market appeal) of the film's story, cast, director, or producer
3. Historical results of similar films
4. Historical results of the cast, director, or producer on prior films
5. The running time of the film.

In addition to estimating the film's cash inflows, management must estimate future costs to complete the film (if any), future exploitation and participation costs, and other necessary cash outflows necessary to achieve the estimated cash inflows.

When using the traditional discounted cash flow method to estimate fair value, the estimates of future cash inflows and outflows represent management's best estimates of the most likely cash flows. The discount rate used is adjusted to consider the level of risk inherent in investing in a project of this nature.

When using the expected cash flow approach to estimate fair value (which is preferred and encouraged by ASC 360), all possible relevant future cash inflows and outflows are probability-weighted by period and the estimated average for each period used. In employing this method, the discount rate is risk-adjusted as described above only if the probable expected cash flows have not already been risk-adjusted. Guidance for applying these two estimation techniques is contained in CON 7, discussed in detail in Chapter 1.

**Subsequent events.** When evidence of the possible need for a write-down of unamortized film costs arises after the date of the statement of financial position but before the entity issues its financial statements, a rebuttable presumption had existed that the conditions leading to the write-off existed at the statement of financial position date. When this situation arose, whether the film was released before or after the date of the statement of financial position, the entity used this subsequent evidence to compute the adjustment necessary to record a change in estimate in its financial statements. ASU 2012-07 removed this rebuttable presumption. The relevant guidance is now ASC 820, *Fair Value*, and ASC 855, *Subsequent Events*. This aligns the guidance for film with the guidance on fair value measurements in other instances, including the impairment testing of other assets.

## ENTERTAINMENT—MUSIC (ASC 928)<sup>9</sup>

### PERSPECTIVE AND ISSUES

---

ASC 928 sets forth accounting and reporting standards for the recording and music industry. In this industry, business is transacted through license agreements, contractual arrangements entered into by an owner (licensor) of a music master or copyright. License agreements are modifications of the compulsory provisions of the copyright law. The licensor grants the licensee the right to sell or distribute recordings or sheet music for a fixed fee paid to the licensor or for a fee based on sales. This section presents the proper accounting by both the licensor and the licensee for license agreements in the recording and music industry.

### DEFINITIONS OF TERMS

---

Source: ASC 928, *Glossary*

**Advance Royalty.** An amount paid to music publishers, producers, songwriters, or other artists in advance of their earning royalties from recording or sheet music sales. These amounts are based on contractual terms and are generally nonrefundable.

**License Agreements.** Contractual arrangements entered into by an owner (licensor) of a master or music copyright and a licensee that grant the licensee the right to sell or distribute recordings or sheet music for a fixed fee paid to the licensor or for a fee based on sales.

**Minimum Guarantee.** An amount paid in advance by a licensee to a licensor for the right to sell or distribute recordings or sheet music.

**Recording (or Record) Master.** The master tape resulting from the performance of the artist. It is used to produce tapes for use in making cartridges, cassettes, and compact discs.

**Royalties.** Amounts paid to producers, songwriters, or other artists for their participation in making recordings and to sheet music publishers for their copyright interest in music.

### CONCEPTS, RULES, AND EXAMPLES

---

#### Accounting by Licensors

**Revenues.** A license agreement is considered an outright sale when the licensor has:

1. Signed a noncancelable contract
2. Agreed to accept a specified fee
3. Transferred the music rights to the licensee, who is able to use them
4. Fulfilled all significant duties owed the licensee.

When all of these conditions are met, the earnings process is complete and revenue is recognized if there is reasonable assurance that the license fee is fully collectible.

In some cases the licensee pays a minimum guarantee, which is an amount paid in advance to a licensor for the right to sell or distribute recordings or sheet music. A minimum guarantee is first recorded by the licensor as a liability and then amortized to income as the license fee is earned. If

---

<sup>9</sup> Upon implementation of ASU 2014-09, *Revenue from Contracts with Customers*, guidance for revenue and deferred revenue for this industry can be found in ASC 606.

the amount of the fee that is earned is indeterminable, then straight-line recognition of revenue from the guaranteee is required over the license period.

**Example**

A licensor receives a \$10,000 minimum guarantee under a five-year license agreement. The entry to record the receipt of cash is:

Cash	10,000
Liability under license agreement	10,000

The licensor recognizes revenue from the guaranteee on a straight-line basis. At the end of each year of the license period, the licensor records the following entry:

Liability under license agreement	2,000
License fees earned (revenue)	2,000

A licensor may charge fees for such items as free recordings beyond a certain number given away by a recording club. The amount of such fees is not determinable when the license agreement is made. Therefore, the licensor can recognize revenue only when the amount can be reasonably estimated or when the license agreement expires.

**Cost of artist compensation.** Royalties are paid to producers, songwriters, or other artists for their participation in making recordings and to music publishers for their copyright interest in music. Amounts for artists are determined by the terms of personal service contracts negotiated between the artists and media companies and usually are determined based upon a percentage of sales activity and license fee income, adjusted for estimated sales returns. Publishing royalties are generally based on copyright or other applicable laws. Royalties are recorded as a period expense of the licensor.

Advance royalties are recorded as assets if the licensor expects that the artist's recording will be successful enough to provide for full recovery of the advance from future royalties due the artist. As royalties are subsequently earned by the artist, the capitalized advance is charged to expense. (ASC 928-340-35-1) The advance must be apportioned between current and noncurrent assets according to how soon each portion is expected to be charged to expense. If it later appears that the advance will not be fully recovered from subsequent royalties earned by the artist, then the unrecoverable portion is charged to expense in the period in which the loss becomes apparent.

**Cost to produce masters.** A master is the media that contains the recording of the artist's performance. The costs of producing a master include (1) the cost of the musical talent (musicians, vocal background, and arrangements); (2) the cost of the technical talent for engineering, directing, and mixing; (3) costs for the use of the equipment to record and produce the master; and (4) studio facility charges. Under the standard type of artist contract, the media company bears a portion of the costs and recovers a portion of the cost from the artist out of designated royalties earned. However, either party may contractually agree to bear all or most of the cost.

The portion of the cost that is paid by the media company is recorded as an asset if the company expects that sales of the artist's recording will be successful enough to provide for full recovery of the accumulated costs. If this is not the case, then these costs are expensed. Any amount capitalized is amortized over the useful life of the recording in a manner that relates the costs to estimated net revenue to be realized. Costs to produce masters that are recoverable from the artist's royalties are treated as advanced royalties by the media company. (ASC 928-340-25-2 and 25-3)

## Accounting by Licensees

When a licensee pays a minimum guarantee in advance, the guarantee is recorded as an asset and then amortized to expense according to the terms specified in the license agreement. If it later appears that the minimum guarantee is not fully recoverable through use of the rights received under the agreement, then the unrecoverable portion is charged to expense. (ASC 928-340-35-3)

Fees for which the amount is indeterminable before the agreement expires are sometimes stipulated in the license agreement. An example is a fee charged to a recording club for free recordings beyond a certain number given away. The licensee must estimate the amount of such fees and accrue them on a license-by-license basis.

## EXTRACTIVE ACTIVITIES—OIL AND GAS (ASC 932)<sup>10</sup>

### PERSPECTIVE AND ISSUES

---

Oil and gas producing activities are those activities that involve the acquisition of mineral interests in properties, exploration, development, and production of crude oil, including condensate and natural gas liquids, and natural gas. Specialized GAAP does not address refining, marketing, or transportation issues. The successful efforts method of accounting adheres to a traditional historical cost basis. Property acquisition costs, whether the property is proved or unproved, are capitalized as incurred. For other costs incurred under this method, a direct relationship between the costs incurred and specific reserves discovered is required before costs are permitted to be capitalized. Under the successful efforts method, costs that cannot be directly related to the discovery of specific oil and gas reserves are expensed immediately as incurred, analogous to research and development. Oil and gas producing companies are also subject to the requirements of ASC 410 regarding the recognition of asset retirement obligations.

The use of the successful efforts method is preferred, but not required by GAAP. An oil and gas producing company is permitted to use, as an alternative to the successful efforts method, a prescribed form of the full cost method permitted by the SEC. All enterprises are required to disclose the method used for accounting for costs incurred and the method of disposition used for capitalized costs. The SEC requires additional disclosures for publicly traded companies and also provides guidance (SAB 106) on ensuring that the expected cash flows associated with asset retirement obligations are not double-counted in making computations under the full cost method.

For an enterprise that uses the full cost method of accounting, assets being depreciated, depleted, or amortized are considered to be in use in the earning activities of the enterprise and, consequently, do not qualify for interest capitalization. However, assets employed in ongoing exploration or development activities but that are not yet engaged in earning activities and not presently being depreciated, depleted or amortized, are subject to interest capitalization.

Exploratory wells or tests that are in progress at the end of the period present unique accounting issues. If, subsequent to the end of the period, but before the financial statements are issued, a well or test is found to be unsuccessful, the incurred costs, less salvage value, are expensed. Retroactively restated financial statements are not permitted.

---

<sup>10</sup> Upon implementation of ASU 2014-09, *Revenue from Contracts with Customers*, guidance for revenue and deferred revenue for this industry can be found in ASC 606.

## CONCEPTS, RULES, AND EXAMPLES

---

The following is a discussion of the recommended treatment of oil and gas activities as per ASC 932. (Note that this treatment is recommended, but not required.)

The costs of the special types of assets used in oil and gas producing activities are capitalized when incurred. Some examples include:

1. Mineral interests in properties:
  - a. Unproved—Properties with no proved reserves
  - b. Proved—Properties with proved reserves
2. Wells and related equipment and facilities
3. Support equipment and facilities
4. Uncompleted wells, equipment, and facilities.

Costs associated with drilling exploratory wells or exploratory-type stratigraphic wells are capitalized until it is determined that the well has proved reserves at which time the capitalized costs are reclassified to wells and related equipment and facilities. If, however, proved reserves are not found, the capitalized drilling costs of the well are charged to expense. When drilling is completed if it is determined that the well has reserves but those reserves cannot be classified as proved, the reporting enterprise will continue to capitalize drilling costs if (1) the reserves found are sufficient to justify completion of the well as a producing well, and (2) the reporting enterprise is making sufficient progress assessing the reserves and the economic and operating viability of the project.

These costs are amortized as reserves are produced and, along with lifting (production) costs, are classified as costs of production. Periodically, unproved properties are evaluated for impairment. The impairment model used for drilling and mineral rights is not the same model set forth in ASC 350 for intangible assets, but rather is based on the level of established reserves. (ASC 932-350-50) If impaired, a loss is recognized.

Acquisition costs incurred to obtain oil and gas properties through purchase, lease, etc. are capitalized.

Geological and geophysical costs, unproved properties' carrying costs, and the costs of dry hole and bottom hole contributions are expensed. Drilling costs are capitalized until a determination has been made as to the success of the well. If successful, these costs are transferred to uncompleted wells, related equipment, and facilities. The cost of drilling, less residual value, is charged to expense if proved reserves are not found.

Development costs are incurred in order to:

1. Get access to and prepare well locations
2. Drill and equip development wells
3. Set up production facilities
4. Provide better recovery systems.

These costs are capitalized as uncompleted equipment and facilities until drilling or construction is completed.

The cost of support equipment is capitalized and depreciated. This depreciation, along with other operating costs, is allocated to exploration, development, or production costs, as appropriate.

Production involves different costs ranging from lifting to field storage. These costs, together with depreciation, depletion, and amortization of capitalized acquisition, exploration, and development costs, are part of the cost of the oil and gas produced.

Unproved properties are reclassified to proved properties upon discovery of proved reserves. When proved reserves are found, the costs capitalized as uncompleted wells, equipment, and facilities are reclassified as completed wells, equipment, and facilities. Capitalized costs are amortized or depleted by the unit of production method. Estimated residual values must be considered when determining amortization and depreciation rates.

Any information that becomes available between the end of the period and the date when the financial statements are issued is to be considered in the evaluation of conditions existing at the date of the statement of financial position. With respect to the costs of a company's wells, related equipment, facilities, and the costs of related proved properties, the provisions for impairment as outlined in ASC 360 are applicable.

## **FINANCIAL SERVICES—DEPOSITORY AND LENDING (ASC 942)<sup>11</sup>**

### **PERSPECTIVE AND ISSUES**

---

ASC 942, *Financial Services—Depository and Lending*, addresses industry-specific guidance for depository and lending institutions.

In general, certain characteristics unique to financial services entities do demand that certain accounting and financial reporting matters be given more elaboration and interpretation than do these same principles when applied to less specialized entities. These more complex areas are summarized in this section.

The thrift and (to a lesser degree) banking industries endured difficult times in the 1980s and early 1990s, largely due to very difficult interest rate environments, and a record number of banks and thrifths failed. Extraordinary steps were taken by government regulators to avert such events. Mergers were encouraged, and in some cases effectively insolvent institutions (i.e., those having liabilities in excess of assets, when both were adjusted to fair values) were acquired by healthier banks or thrifths. In some instances, acquisitions were encouraged by an unorthodox accounting treatment, whereby the net deficit was accounted for as *supervisory goodwill*, to be amortized over an agreed-upon period (typically, fifteen to twenty-five years), with the net unamortized goodwill being considered a “valid asset” for purposes of computing regulatory capital (rather than being deducted from net assets, as would otherwise have been the case).

The accounting profession objected to this treatment, since this supervisory goodwill failed to meet the usual definition of goodwill as being related to excess future earnings potential. However, the profession was ultimately forced to acquiesce. Supervisory goodwill was eliminated as an acceptable asset for banks and thrifths by controversial government legislation, spawning a wave of litigation against the federal government which continues to the present time.

Under current GAAP (ASC 350), any goodwill remaining is no longer subject to amortization, but is to be tested for impairment at least annually, more often under defined circumstances.

Banks and savings institutions are exempted from the need to present certain cash flow information. Specifically, gross amounts for such high-volume transaction categories as deposits and withdrawals need not be disclosed. Banks and thrifths are not exempt from presenting cash flow statements, however.

---

<sup>11</sup> Upon implementation of ASU 2014-09, *Revenue from Contracts with Customers*, guidance for revenue and deferred revenue for this industry can be found in ASC 606.

Lenders often incur significant costs directly related to the origination or purchase of loans and normally receive different nonrefundable fees at the inception of the loans. Historically, disparate accounting procedures had been applied in the reporting of these costs and fees. ASC 320 enumerated various categories of costs and fees and set forth the required accounting for each of them. Most fees are deferred and amortized, via the effective yield method, over the term of the arrangement.

ASC 310 requires loss recognition whenever loans are restructured, unless these involve only an extended payment schedule with full contractual rates of interest being applied to the new due dates. The banking regulators and the SEC have indicated that heightened scrutiny is to be applied to loan loss provisions, and interpretative guidance has been offered.

ASC 942 addresses the accounting and financial reporting requirements applicable to banks and saving institutions, credit unions, and finance companies. It provides revised accounting guidance for sales of loan servicing rights and makes other recommendations. It addresses GAAP for finance companies and conforms the accounting by various institutions such as banks, thrifts, credit unions, finance companies, corporate credit unions, and mortgage companies. It also is applicable to the financing activities of manufacturers, retailers, wholesalers, and other business enterprises. It eliminates differences in accounting and disclosure established by the respective financial institution AAGs, but carries forward accounting guidance for transactions determined to be unique to certain financial institutions.

The Codification has the following features:

- Mortgage companies and corporate credit unions are explicitly included in its scope.
- Regulatory capital disclosures are required for mortgage companies, credit unions, banks, and thrifts.
- Credit unions report amounts placed in their deposit insurance fund as an asset if such amounts are fully refundable, due to unique legal and operational aspects of the credit union share insurance fund. Banks and thrifts expense payments to their deposit insurance fund as incurred. Both practices have been preserved because of differences in how the funds operate.
- Finance companies record purchases and sales of securities on the settlement date, whereas banks, thrifts, and credit unions follow trade date accounting. Finance companies follow trade date accounting.

ASC 310-30, *Loans and Debt Securities Acquired with Deteriorated Credit Quality*, addresses the accounting for the differences between contractual and expected future cash flows of acquired loans when these differences are attributable, at least in part, to credit quality. Under this standard, when loans are acquired with evidence of deterioration in credit quality since origination, the acquirer must estimate the cash flows expected to be collected on each loan; this is to be done both at the purchase date and periodically over the lives of the loans. Cash flows expected to be collected in excess of the purchase price will be recognized as yield, while contractual cash flows in excess of expected cash flows will not be so recognized, since to do so would probably cause later recognition of bad debts.

## DEFINITIONS OF TERMS

---

Source: ASC 942, *Glossary*

**Accrutable Yield.** In the context of loans acquired in transfers, the cash flows expected to be collected in excess of the initial investment.

**Carrying Amount.** The face amount of the interest-bearing asset plus (or minus) the unamortized premium (or discount).

**Cash.** Consistent with common usage, cash includes not only currency on hand but demand deposits with banks or other financial institutions. Cash also includes other kinds of accounts that have the general characteristics of demand deposits in that the customer may deposit additional funds at any time and also effectively may withdraw funds at any time without prior notice or penalty. All charges and credits to those accounts are cash receipts or payments to both the entity owning the account and the bank holding it. For example, a bank's granting of a loan by crediting the proceeds to a customer's demand deposit account is a cash payment by the bank and a cash receipt of the customer when the entry is made. (ASC 942-230-20)

**Commitment Fees.** Fees charged for entering into an agreement that obligates the enterprise to make or acquire a loan or to satisfy an obligation of the other party under a specified condition. For purposes of this Statement, the term commitment fees includes fees for letters of credit and obligations to purchase a loan or group of loans and pass-through certificates.

**General Reserve.** Used in the context of the special meaning this term has in regulatory pronouncements and in the U.S. Internal Revenue Code.

**Incremental Direct Costs.** Costs to originate a loan that (1) result directly from and are essential to the lending transaction, and (2) would not have been incurred by the lender had that lending transaction not occurred.

**Long-term Interest-bearing Assets.** For purposes of this section, these are interest-bearing assets with a remaining term to maturity of more than one year.

**Net-Spread Method.** Under this method, the acquisition of a savings and loan association is viewed as the acquisition of a leveraged whole rather than the acquisition of the separate assets and liabilities of the association.

**Nonaccretable Difference.** In the context of loans acquired in a transfer, the excess of contractual cash flows over the amount of expected cash flows.

**Origination Fees.** Fees charged to the borrower in connection with the process of originating, refinancing, or restructuring a loan. This term includes, but is not limited to, points, management, arrangement, placement, application, underwriting, and other fees pursuant to a lending or leasing transaction and also includes syndication and participation fees to the extent they are associated with the portion of the loan retained by the lender.

**Pretax Accounting Income.** Represents income or loss for a period, exclusive of related income tax expense, determined in conformity with generally accepted accounting principles.

**Taxable Income.** Represents pretax accounting income (1) adjusted for reversal of provisions of estimated losses on loans and property acquired in settlement of loans, gains or losses on the sales of such property, and adjusted for permanent differences, and (2) after giving effect to the bad debt deduction allowable by the U.S. Internal Revenue Code assuming the applicable tax return were to be prepared based on such adjusted pretax accounting income.

## **CONCEPTS, RULES, AND EXAMPLES**

---

### **Justifying a Change in Accounting Principle**

The following sources are preferred for depository and lending institutions that must justify a change in accounting principle:

1. ASC 942, *Financial Services—Depository and Lending*
2. ASC 310-30, *Loans and Debt Securities Acquired with Deteriorated Credit Quality*.

## Acquisition of a Depository or Lending Institution

The following discussion applies not only to the acquisition of a savings and loan association, but also to acquisition of savings and loan holding companies, commercial banks, mutual savings banks, credit unions, and other depository institutions with assets and liabilities of the same type.

**Acquisition method.** In accounting for the acquisition of a depository or lending institution, the fair value of the assets and liabilities acquired must be determined using the separate-valuation method. Under this method, each of the identifiable assets and liabilities acquired are accounted for individually, or by type, at its fair value at the date of acquisition. The total amount is reported in the consolidated financial statements.

Note that use of the net-spread method is not considered appropriate for this type of business combination. The net-spread method, which views acquisition of the institution as a leveraged whole, does not appropriately recognize the fair value of individual, or types of, assets and liabilities.

Liabilities acquired are accounted for at their present value at the date of acquisition. The present value of savings deposits due on demand equals the face amount plus interest accrued or accruable at the acquisition date. The present value of other liabilities assumed is calculated by using interest rates for similar liabilities in effect at the date of acquisition.

**Identified intangible assets.** The purchase price of a depository or lending institution may include intangible benefits from the purchase, such as the capacity of acquired assets to generate new business. Intangible assets that can be separately identified at a determinable fair value are to be assigned a portion of the total purchase price and are to be amortized over their estimated lives. Any portion of the purchase price that cannot be identified with specific tangible and intangible assets (less liabilities assumed) is assigned to goodwill.

**Unidentifiable intangible asset.** An unidentifiable intangible asset arises when the fair value of liabilities assumed exceeds the fair value of tangible and identified intangible assets acquired. This asset is amortized over a period no greater than the estimated remaining life of any long-term interest-bearing assets acquired. Amortization is applied to the carrying amount of the interest-bearing assets expected to be outstanding at the beginning of each subsequent period. If, however, the assets acquired do not include a significant portion of long-term interest-bearing assets, the unidentifiable intangible asset is amortized over a period not exceeding the estimated average remaining life of the existing customer base acquired. The amortization period may not exceed forty years.

In the sale or liquidation of a large segment, or separable group, of the operating assets of an acquired depository or lending institution, the portion of the unidentifiable intangible asset identified with that segment, or separable group, shall be included in the cost of the assets sold. If the sale or liquidation of a large portion of the interest-bearing assets significantly reduces the benefits of the unidentifiable intangible asset, any reduction shall be recognized as a charge to income.

**Regulatory-assisted combinations.** Bank regulatory authorities may grant financial assistance to encourage a bank acquisition. Generally, this is done when a failing bank is sold to a solvent one and the amount of any such direct assistance is less than the cost that would have been incurred honoring the deposit insurance commitment, net of recoveries on assets held by the failing bank. Under GAAP, the assistance should be accounted for as part of the combination if receipt of the assistance is probable and the amount to be received is reasonably estimable. Otherwise, assistance should be reported as a reduction of the unidentifiable asset (goodwill), with any excess over that amount being reported in income. If the grantee is required to repay all or a portion of the assistance, a liability would be recognized, together with a charge against income. Assistance received must be disclosed in the financial statements.

**Elimination of special accounting for goodwill associated with bank and thrift mergers.** The thrift, and later, banking crises of the 1980s gave rise to a number of unusual and often unwise practices. One of these was the invention of *supervisory goodwill*, which sometimes was used as an inducement to relatively stronger institutions to acquire those that were, on a mark-to-market (i.e., fair value) basis, already insolvent. The net liabilities assumed, in such instances, were recognized as the intangible asset goodwill, although this would not have generally qualified as such under existing GAAP, since it often did not imply excess future earnings potential, the usual working definition for goodwill. However, thrift and banking regulators permitted the combined institutions to present this asset on their statements of financial position, subject to amortization over agreed-upon periods, and to treat the unamortized balance as a qualified asset for capital computation purposes (whereas goodwill was otherwise to be deducted from equity for the purpose of making this calculation).

The accounting profession objected to the recognition of supervisory goodwill for GAAP-basis reporting purposes, but ultimately had to acquiesce. Certain parameters were established for the amortization periods to be applied to such supervisory goodwill (referred to as an “unidentifiable intangible asset” in that standard). Thus, the intangible was to be amortized over a period no longer than the estimated remaining life of interest-bearing assets (loans and investments) acquired, which would typically be shorter than the agreed-to terms under the various acquisition agreements then being encouraged by the regulators.

Beginning in 1989, supervisory goodwill was eliminated from regulatory filings, and although this did not require that such goodwill be deleted from GAAP-basis financial statements, this was largely the consequential effect. More recently, accounting for purchase business combinations has been revised in ASC 805, and the accounting for goodwill has been materially altered by ASC 350.

The requirements of ASC 850 deal with the assignment of purchase price to the various acquired assets and assumed obligations. ASC 805 also specifies that acquisitions of branches are to be accounted for as business combinations, if a branch meets the definition of a business, with the possibility of recognizing goodwill in such a transaction. If the branch does not meet the definition of a business, the transaction is to be accounted for as merely the acquisition of assets, and goodwill cannot be recognized. (The definition of a business is set forth in the Master Glossary.)

The impairment testing of servicing assets, another commonly encountered bank or thrift intangible, is set forth by ASC 860-50.

For those intangibles that arose in business combinations, the remaining unamortized balances are to be transferred to goodwill unless they can be identified as other specific intangibles (e.g., customer relationships). Amounts reclassified to goodwill are no longer subject to amortization, but tested at least annually for impairment.

## **Bad-Debt Reserves**

Both stock and mutual savings and loan associations are required by regulatory authorities to place a portion of their earnings into a general reserve as protection for depositors. Savings and loan associations are allowed by the IRS to maintain a bad-debt reserve and to deduct any additions to their reserve in determining taxable income. Since this method differs from the method for determining bad debt expense, pretax accounting income and taxable income will differ.

## **Accounting by Creditors for Impairment of a Loan**

A persistent practice problem has been in the proper determination of loan loss provisions. Since such reserves are necessarily matters of judgment, the possibility of manipulation (by either

understatement or overstatement) in order to manage reported earnings or otherwise bias perceptions about the thrift's or bank's performance has always existed. In more recent years, this has received greater attention, first by the issuance of a detailed standard on accounting for impaired loans (ASC 310-10-35), and later by several FASB, SEC, and banking regulatory authority policy announcements.

The SEC has noted in 310-10-S99-4 that a registrant engaged in lending activities should create a formal loan loss allowance methodology that incorporates the use of internal and external factors impacting loan collectibility, lending risks, and current collateral values. An entity's management should also periodically review and update this methodology in order to yield the best possible estimate of the allowance for loan losses. An entity should also maintain supporting documentation of related internal controls, policies and procedures, loan grading systems, and changes to the loan loss allowance process.

For additional information on impairment of loans and nonrefundable loan fees and costs, see the chapter on ASC 310.

### **Accounting for Loans Acquired by Transfer**

Banks commonly acquire loans originated by other financial intermediaries. In some cases, these are impaired when first acquired. That is, due to changes in the borrowers' credit risks since loan inception, the expected cash flows from the purchased loans may not equal the contractual cash flows. (Note that the differences in expected cash flows versus contractual cash flows arising from changes in interest rates during the interval from loan inception to loan acquisition are a separate issue; the resulting discount or premium would be amortized by the effective yield method over the expected term of the loan.)

ASC 310-30 addresses the accounting for the differences between contractual and expected future cash flows of acquired loans when these differences are attributable, at least in part, to credit quality.

Under the provisions of ASC 310-30, purchased loans are to be displayed at the initial investment amount on the statement of financial position. The amount of any discount is not to be displayed in the statement of financial position nor should the acquirer carry over an allowance for loan losses established by the seller. This prohibition applies equally to standalone purchases of loans and to those which occur as part of purchase business combinations.

For additional information on accounting for loans acquired by transfer, see the chapter on ASC 310.

### **Conforming Practice by All Financial Institutions**

ASC 942, *Financial Services—Depository and Lending*, reconciled and conformed the accounting and financial reporting provisions of the former AICPA AAG applicable to banks and saving institutions, credit unions, and finance companies. It furthermore added mortgage companies and corporate credit unions to the scope of coverage. The standard applies, additionally, to all entities which finance other entities, even via normal trade credit arrangements, and thus directs the accounting to be employed by manufacturers, retailers, wholesalers, and other business enterprises.

ASC 942 provides revised accounting guidance for sales of loan servicing rights, in order to comply with the revenue recognition model set forth in ASC 860-50-40. It also adopts the basis allocation approach set forth in ASC 860.

ASC 942 requires that, to the extent management has the intent and the ability to hold them for the foreseeable future or until maturity or payoff, loans should be reported on the statement of

financial position at the amount of outstanding principal adjusted for any charge-offs, the allowance for loan losses, any deferred fees or costs on originated loans, and any unamortized premiums or discounts on purchased loans. Nonmortgage loans held for sale should be reported at the lower of cost or fair value. When a decision is made to sell loans not previously held for sale, those loans should be reclassified as held-for-sale and carried at the lower of cost or fair value.

With regard to credit losses, these are to be deducted from the allowance. Loan balances should be charged off in the periods in which the loans are deemed uncollectible. Recoveries of amounts previously charged off should be recorded when received. Credit losses on off-balance-sheet instruments should be reported separately from valuation accounts for recognized instruments.

Under ASC 942, standby commitments to purchase loans are reported in one of two ways, depending on whether the settlement date is within a reasonable time and whether the entity has the intent and ability to accept delivery without selling assets. If both conditions are met, the entity should record the loans purchased at cost, net of the standby commitment fee received, on the settlement date. If one or both conditions are not met, or if the entity does not have the intent and ability to take delivery without selling assets, the standby commitment fee (which is essentially a written put option premium) should be reported as a liability. Thereafter, the liability should be reported at the greater of the initial standby commitment fee or the fair value of the written put option, with the unrealized gains or losses included in current operations.

A transfer of servicing rights should only be accounted for as a sale if the transfer qualifies as a sale under ASC 860-50-40, and if (1) the seller has written approval from the investor (if required), (2) the buyer is a currently approved seller/servicer, (3) in a seller-financed sale, the nonrefundable down payment is large enough to demonstrate the buyer's commitment to complete the transaction, and (4) the transferor receives adequate compensation for any temporary servicing it performs. Sales of servicing rights previously sold should be recognized in income consistent with this provision and the requirements under ASC 860.

ASC 942 also addresses a number of other issues. Thus, Federal Home Loan Bank and Federal Reserve Bank stock is to be classified as a restricted investment security, carried at cost, and evaluated for impairment. Also, any delinquency fees are to be recognized in income when chargeable, assuming collectibility is reasonably assured. Prepayment fees are not recognized in income until the loans or trade receivables are prepaid, except as set forth by ASC 310-20. Finally, accrual of interest income should not be affected by the possibility that rebates may be calculated using a method different than the interest method, except as set forth in ASC 310-20.

With regard to financial statement disclosures, ASC 942 requires that the summary of significant accounting policies state the basis of accounting for loans, trade receivables, and lease financings; the method used to determine the lower of cost or market of nonmortgage loans held for sale, the classification and method of accounting for interest-only strips, loans, and other receivables or retained interests in securitizations; and the method for recognizing interest income on loan and trade receivables, including the method of amortizing net deferred fees or costs. The accounting policies note should also describe the criteria for placing loans on nonaccrual status, for charging off uncollectible loans and trade receivables, and for determining past due or delinquency status.

The financial statement notes should include a description of the accounting policies and methodology used to estimate the allowance for loan losses, and any liability for off-balance-sheet credit losses, as well as the related charges for loan, trade receivable, or other credit losses. Aggregate gains or losses on sales of loans or trade receivables should be presented separately in the financial statements or disclosed in the notes thereto. Major categories of loans or trade

receivables should be presented separately either in the statement of financial position or in the notes, as should the allowance for credit losses, the allowance for doubtful accounts, and any unearned income. Receivables held for sale should be separately reported.

ASC 942 also requires that foreclosed and repossessed assets be reported separately on the statement of financial position or disclosed in the notes. The recorded investment in loans and trade receivables on nonaccrual status should be disclosed, as should the amount of loans and trade receivables past due ninety days or more and still accruing.

The amount of securities deposited with state regulatory authorities (if required) should be disclosed. The carrying amount of loans, trade receivables, securities, and financial instruments that serve as collateral for borrowings should also be disclosed.

ASC 815 requires disclosure of the extent, nature, terms, and credit risk of financial instruments, not limited to derivatives with off-balance-sheet credit risk.

Previously, GAAP for banks and savings institutions did not require disclosure of capital requirements for branches of foreign banks, because those branches do not have capital. However, branches are subject to requirements to maintain certain levels of capital-equivalent deposits and may be required to maintain other specified reserves. Since failure to comply with those requirements potentially has an adverse impact on the reporting entity, disclosures about the balance requirements and a branch's compliance are required under ASC 942. Similarly, capital requirements for trust operations are unpublished, are subject to variations of interpretation as between regulatory agencies, and may not be uniformly applied to the trust operations of all institutions. Nonetheless, to the extent that an institution has been advised of an expectation that certain trust-related capital levels be maintained, its compliance with those expectations should be disclosed.

## Servicing Assets and Liabilities

Financial institutions often acquire, or retain, servicing rights to financial assets, such as for loans originated and subsequently sold to other institutions or to qualified special-purpose entities. ASC 860-50-35 contains guidance on the accounting for retained or acquired servicing rights, which are to be recorded, at acquisition, at fair value. If the contractually expected fees and other revenues are expected to exceed the cost of providing the servicing, a servicing asset is recorded; if a shortfall of revenue is expected, a liability is recognized. Subsequent accounting for servicing assets and liabilities can be either by the amortization or the fair value method, with the option to elect one or the other for a given class of financial asset being serviced.

## Cash Flow Statement

Banks, savings institutions, and credit unions are not required to report gross cash receipts and payments for the following:

1. Deposits placed with other financial institutions
2. Withdrawals of deposits
3. Time deposits accepted
4. Repayments of deposits
5. Loans made to customers
6. Principal collections of loans.

If an enterprise is part of a consolidated enterprise, net cash receipts and payments of the enterprise should be reported separate from the gross cash receipts and payments of the consolidated enterprise.

## Other Accounting Guidance

ASC 310-20-35-13 concluded that, for situations where a lender allows a borrower to make larger payments for some number of periods (at least twelve payments), after which the borrower is then relieved of any remaining obligation, the loss related to the forgiven portion should be accrued over the period of the larger payments.

ASC 860-10-55-60 stated that forward commitment GNMA *dollar rolls* should be marked to market.

In some instances, a reporting entity may sell a loan but retain a share in the interest income, as well as the servicing rights for that loan. ASC 860-50-40-10 mandated that a gain should be recognized upon the sale of mortgage service rights that include participation in the future interest stream of the loans. On another related topic, ASC 860-50-35-18, states that servicing fee rates set by secondary market makers (GNMA, FHLMC, FNMA) should be considered normal for transactions with those agencies.

ASC 860-50-40-7 addresses events in which a mortgage loan servicer (transferor) transfers the servicing rights and related risks to an unaffiliated enterprise (transferee), which then makes a subservicing agreement whereby the transferor services the loans for a fixed fee. Income recognition should be deferred, and treatment as a sale or a financing depends on the circumstances surrounding the transaction. However, this consensus does not apply to temporary subservicing agreements. In addition, a loss should be recognized currently if loan prepayments may result in future servicing losses. When there is such a sale of mortgage servicing rights with a subservicing agreement, ASC 860-50-40 through 860-50-40-10 states that this should be accounted for as a sale if substantially all the risks and rewards of ownership have been transferred to the buyer. If substantially all the risks and rewards have not been transferred, then the transaction must be accounted for as a financing.

Normal servicing fee rates for mortgage loans are those set by federally sponsored secondary market makers (GNMA, FHLMC, FNMA). For transactions with those agencies or for mortgage loans sold to private sector investors where the seller retains servicing rights, normal servicing rates should be considered. In the latter case, a stated servicing fee rate that differs from the normal rate requires adjustment to the sales price to yield the normal rate. In either case, according to ASC 860-50-35-17 through 860-50-35-18, a loss should be accrued if expected servicing costs exceed anticipated fees based on the stated servicing fee rate. If the servicer refinances a mortgage loan and actual prepayments differ from any anticipated payments, then the servicing asset must be adjusted.

ASC 805 states that when a mutual savings and loan association converts to stock ownership and pools with another S&L, its EPS should be excluded from the restated combined EPS for years before the date of conversion. The method of presentation must be disclosed.

ASC 815 addressed equity certificates of deposit, stating that contingent interest expense resulting from equity certificates of deposit be recognized concurrently with gains relating to the assets upon which the equity is given.

Any goodwill resulting from the acquisition of a bank or thrift institution is to be amortized according to ASC 350, prohibiting amortization of goodwill but requiring annual impairment testing.

ASC 260 mandates that neither equity commitment notes nor equity contract notes should be included in earnings per share computations.

ASC 605-20-25-9 holds that a guarantor should recognize loan guarantee fees as revenue over the term of the guarantee. Any direct costs related to the guarantee must be recognized in the same manner. If material, footnote disclosure is required, and the probability of loss should be continually assessed. ASC 460 requires that a liability be recognized, at the inception of a guarantee, for the fair value of the obligation undertaken by the guarantor.

Regarding distribution fees paid by mutual funds not having front-end charges (loads), the cost deferral method should be employed. Under this method, fees expected to be received over some future period should be recognized upon receipt. Deferred incremental direct costs are amortized while indirect costs are expensed as incurred.

RAP basis accounting is no longer used in general-purpose financial statements. ASC 942-740-45-1 states that the Comptroller's Banking Circular 202, which limits the net deferred tax debits allowable on a bank's statement of condition, applies only for regulatory purposes and does not affect GAAP financial statements.

ASC 310-10-25-7 addressed purchased credit card portfolios involving premiums paid to the seller. It held that the excess of the purchase price of a credit card portfolio including cardholder relationships over the amounts due should be allocated between the credit card loans acquired and the cardholder relationships acquired. The premium related to cardholder relationships is an identifiable intangible asset and is amortized over the period of benefit. The premium related to the loans is amortized over the life of the loans.

ASC 942-405-55-1 holds that the savings accounts deposited in a credit union must be unequivocally listed as a liability if the financial statements of the credit union are to comply with the (now superseded) AICPA Credit Union Guide. The statement of financial condition must present savings accounts either as the first item in the liabilities and equity section or as a separate subtotal before total liabilities.

Lending institutions often utilize what traditionally were referred to as special-purpose entities (SPEs), and which now may or may not qualify as qualified SPEs (QSPEs) or might be simply variable interest entities (VIEs). A fairly common transaction involves securitizations of credit card receivables, which sometimes have a feature called a *removal of accounts provision* (ROAP) that allows certain accounts to be withdrawn and replaced by other receivables. ASC 860 concluded that credit card securitizations with such a provision should be recognized as sales transactions as long as the removal meets any specified terms, does not reduce the interests of the investor in the pool, and does not reduce the seller's percentage interest below a contractually specified level. The accounting implications of a ROAP depend on whether it results in the transferor maintaining effective control over the transferred assets. Unconditional ROAPs and those conditioned on a transferor's decision would preclude sale accounting when the receivables are transferred.

On a related topic, ASC 310-20-25-18 stipulated that credit card origination costs that qualify for deferral should be netted against the credit card fee charged, if any, and the net amount should be amortized on a straight-line basis over the term of the credit card or one year, depending on the significance of the fee.

Additionally, for both purchased and originated credit cards, the accounting policies, the net amount capitalized, and the amortization period should be disclosed.

Additional disclosure requirements relative to securitizations, which will impact financial reporting by banks and many other financial institutions that sponsor such arrangements, are detailed in the chapter on ASC 310.

## **FINANCIAL SERVICES—INSURANCE (ASC 944)**

### **PERSPECTIVE AND ISSUES**

---

The two major types of insurance companies are life and property and casualty. Each category is further subdivided into stock companies and mutual associations. Due to the regulated nature of

the insurance industry, financial reporting may be in conformity to statutory accounting principles (SAP) or GAAP. Furthermore, publicly held companies subject to SEC accounting rules will account for certain transactions and events in other manners dictated by those requirements. While accounting principles under GAAP are broadly applicable to all types of insurance companies (including those dealing in such specialized products as mortgage insurance, title insurance, and reinsurance), the nature of the estimation process (such as for claims liabilities) differs substantially depending upon the character of the risks assumed.

The main contrasts between SAP and GAAP arise from the more conservative nature of SAP, which is a reflection of the insurance regulatory agencies' concern with protection of the policyholders' interests, and hence with the liquidity and solvency of the insurance companies. Accordingly, under SAP certain costs, such as policy acquisition expenses, are written off as incurred; certain nonliquid assets, such as property and furniture, are not recognized; and claims liabilities are very conservatively estimated. In contrast to this essentially short-term perspective, financial statements prepared on the GAAP basis are more concerned with the value of the companies' investments and net worth on a going concern basis.

The primary source of insurance industry GAAP is ASC 944, *Financial Services—Insurance*. Insurance contracts are categorized as short duration (which includes most property and liability insurance) or long duration (which includes most life, mortgage, and title insurance). Nominal insurance contracts that are effectively investment contracts, however, are not accounted for as insurance.

ASC 944 discusses those aspects of accounting and auditing unique to life and health insurance entities, and contains significant discussions of statutory accounting practices (SAP), which comprise laws, regulations, and administrative rulings adopted by various states that govern the operations and reporting requirements of life insurance entities. It does not reflect SAP under the National Association of Insurance Commissioners (NAIC) codification project.

The ASC also addresses the classification and valuation of liabilities, as well as disclosures for nontraditional annuity and life insurance contracts issued by insurance enterprises. Several of the conclusions reached on these topics are discussed later in this section.

## **CONCEPTS, RULES, AND EXAMPLES**

---

### **Premium Income**

Premium income is recognized differently for short- and long-duration contracts. For short-duration contracts, premium income is recognized over the contract term in proportion to the amount of insurance provided. In the case of long-duration contracts, revenue is accrued as the premiums become due from policyholders, except for contracts that provide benefits over a term longer than the premium payment term (such as twenty-year life policies), in which case income is recognized over the longer period during which benefits may be provided.

### **Claim Cost Recognition**

Costs of benefits are recognized when insured events such as property damage occur. Estimated costs are accrued for as claims incurred but not yet reported. For long-duration contracts, the present values of estimated future benefits are accrued, net of the present values of future net premiums to be collected. Accrual of these benefit obligations generally involves actuarial determinations. Accountants may be dependent on the services of specialists in such cases, as they are in computing costs related to defined benefit pension plans. Recognition of other expenses is governed by the matching concept. For example, costs that vary with acquisition

activity are capitalized and amortized over the period during which premium income is earned. Catastrophic losses (as from natural disasters such as hurricanes) are accrued under the guidelines of ASC 450: when impairment of the asset or incurring of a liability is probable and the amount is reasonably estimable.

### Deferred Income Taxes

GAAP requires that deferred income taxes be provided for temporary differences. An exception was previously provided under the *indefinite reversal criterion*, for stock life insurance companies only, for differences designated as policyholders' surplus. However, ASC 740 holds that deferred taxes must be provided, consistent with the accounting prescribed for all other temporary differences.

### Other Matters

**Financial guarantee insurance.** Financial guarantee insurance (and reinsurance) contracts are contracts issued by insurers that provide protection to the holder of a financial obligation, such as a municipal bond or an asset-backed security, from a financial loss in the event of a default. A financial guarantee insurance contract obligates the insurer to pay a claim upon the occurrence of an event of default. Insurers are to recognize a liability for unearned premium revenue at the inception of a financial guarantee insurance contract in an amount equal to the present value of the premiums due or, if certain criteria are met and used, expected to be collected over the period of the financial guarantee insurance contract. The insurance enterprise is to determine the present value of the premiums due or expected to be collected using a discount rate that reflects the risk-free rate at the inception of the contract, based on the insurance contract period unless the insurer is permitted to consider prepayments. The discount is to be accreted on the premium receivable through earnings over that same period. The discount rate used is to be updated to a current risk-free rate only when prepayment assumptions change.

When an *expected period* is used to measure the unearned premium revenue, the insurer is to adjust the prepayment assumptions when those assumptions change. The adjustment to the unearned premium revenue will equal the adjustment to the premium receivable, and thus there will be no effect on earnings at the time of the adjustment. If the premium receivable is found to be uncollectible, it must be adjusted via a charge against earnings. Revenue is recognized over the period of insurance in proportion to the amount of coverage outstanding from period to period, which typically declines over time as the insured principal (e.g., bonds outstanding) are retired.

The insurer will recognize a claim liability on a financial guarantee insurance contract when it expects that a claim loss will exceed the unearned premium revenue for that contract based on the present value of expected net cash outflows to be paid under the insurance contract. Since the unearned premium revenue represents the stand-ready obligation under a financial guarantee insurance contract at initial recognition, if the likelihood of a default (i.e., the insured event) later increases so that the present value of the expected net cash outflows expected to be paid under the insurance contract exceeds the declining amount of unearned premium revenue, the entity must recognize a claim liability, in addition to the unearned premium revenue. The amount of recognized claim liability must be updated for new information and discounted at an updated risk-free rate for each statement of financial position presented.

**Reinsurance.** Another specialized topic area pertinent to insurance companies is that of reinsurance, which is addressed by ASC 944. It requires that reinsurance receivables, including amounts related to claims incurred but not reported, be reported as assets, consistent with the manner in which liabilities relating to the underlying reinsured contracts are accounted for. The

standard also establishes criteria for recognition as reinsurance, and sets forth detailed accounting for long- and short-duration contracts, as well as disclosure requirements.

**Loss reserves.** ASC 944-605 concerns accounting for foreign property and liability reinsurance, and concludes that except for special circumstances, only the periodic method is acceptable in accounting for foreign reinsurance premiums. ASC 944-505-50 requires disclosures where permission was received from the National Association of Insurance Commissioners to use different accounting practices. ASC 944 also covers capitalization and amortization costs and several other matters for mutual life insurance companies, assessment enterprises, fraternal benefit societies, and stock life insurance companies.

**Guaranty funds.** ASC 405-30 addresses matters pertaining to guaranty funds and certain other insurance-related assessments. The key elements of this standard are discussed in the following paragraphs.

Under the standard, guaranty fund and similar assessments would be recognized when (1) it has been imposed or is deemed probable of being imposed, (2) the event obligating an entity to pay the assessment has occurred, and (3) the amount of the assessment can be reasonably estimated. All three conditions would have to be fulfilled before a liability could be accrued. Discounting to present value will be permitted. The codification offers specific guidance regarding the ability to reasonably estimate the liability for assessments.

Guaranty funds are essentially state-mandated insurance funds used to settle claims against insolvent insurers and, typically, all licensed insurers are assessed premiums based on the volume of defined lines of business they conduct in the given state. A variety of methods have been applied in determining the amounts of guaranty fund assessments (e.g., retrospectively, based on premiums written over the past two years; or prospectively, based on business written over the next several years following an insolvency of a failed insurer), with the result that entities upon which assessments are being levied have been inclined to use different methods of recognizing the cost and related obligation. In general, to warrant accrual under the codification, an insolvency of another insurer would have to have occurred, since the presumption would be that the assessments would become probable (the threshold criterion) when there has been a formal determination of another entity's insolvency. An example of an exception would be when the state uses prospective premium-based guaranty fund assessments; if the reporting entity cannot avoid the obligation by ceasing to write policies, the obligating event would be the determination of insolvency, but if it could avoid the assessment, the obligating event is the writing of premiums after the insolvency.

**Surplus notes.** ASC 944-470 affects accounting by certain insurance companies that issue a security known as surplus notes. It requires that these instruments be accounted for as debt and included in the liabilities caption of the statement of financial position. Furthermore, interest must be accrued over the term of the notes, whether or not payment of interest and/or principal has been approved by an insurance company. However, disclosure is required as to the status of the request for approval.

**Deposit accounting.** ASC 340-30 applies to entities entering into short-duration insurance and reinsurance contracts that do not transfer insurance risk, or multiple-year contracts that either do not transfer insurance risk or for which insurance risk transfer is not determinable. See the chapter on ASC 340 for more detail.

**Demutualizations.** ASC 944-805 addressed the increasingly common phenomenon of demutualizations (whereby formerly mutually owned insurers issue stock), as well as the formation of insurance holding companies (MIHC). A key concern is the accounting for the *closed block* of assets and liabilities, and of earnings allocable to the closed block. This pertains to mechanisms designed to protect the adjustable policy features and dividend expectations of

participating life insurance policyholders from the competing interests of stockholders. Typically, the plan of demutualization describes how the closed block will operate. The closed block assets and cash returns on those assets will not inure to the stockholders of the demutualized company; instead, all cash flows from these assets will be used to benefit the closed block policyholders. The insurance enterprise remains obligated to provide for minimum guarantees under the participating policy, and it is consequently possible under certain circumstances that additional “stockholder” funds will have to be used to meet the contractual benefits of the closed block policyholders. The assets designated to the closed block are subject to the same liabilities, with the same priority in the case of insolvency or in liquidation, as assets outside the closed block. In many situations, commissions and other expenses (including management expenses) of operating and administering the closed block will not be charged to the closed block. Unless the state insurance department consents to an earlier termination, the closed block will continue in effect until the date on which none of the policies in the closed block remains in force.

Alternatives to the closed block have arisen in practice encompassing, for a number of types of contracts, various mechanisms believed by the insurance enterprise and state insurance regulators to be appropriate in the specific circumstances. Closed block alternative mechanisms have been used in lieu of closed blocks for certain participating life contracts to commit to the insurance regulator that the insurance company will continue to follow its established dividend practices. Closed block alternative mechanisms also have been used to protect nonguaranteed elements of participating and nonparticipating insurance contracts such as interest credits on deferred annuities and adjustable premiums on adjustable premium term business. In some instances, the methodology and limitations defined in the agreements with the state insurance regulators have considered only specific profit components, such as mortality experience on a block of term insurance or investment spreads on a block of annuities, and in other instances have considered virtually all components of product profitability. Where there is a limitation on the profits that may inure to the stockholders, there generally is a formal agreement between the insurance company and the insurance regulators that defines (1) the contracts covered by the limitation, (2) the profit limitation calculation, and (3) the timing and manner (for example, as policy dividends, reduced premiums, or additional benefits) in which amounts that may not be distributed to stockholders are to be distributed to policyholders.

Some of the more important conclusions reached were as follows:

1. The classification of expenses related to a demutualization and the formation of an MIHC should be considered other than highly unusual expense.
2. Closed block assets and liabilities from the closed block should be included with the corresponding financial statement items of the insurance enterprise.
3. ASC 944 should continue to be applied after conversion to a stock company.
4. The maximum future contribution of the closed block to the earnings of the company is typically the excess of the GAAP liabilities over the GAAP assets at the date of demutualization. Under ASC 944, a dividend liability should be established for current earnings that will be paid to policyholders through future benefits. From a shareholder perspective, excess earnings of the closed block that will never inure to the shareholders should be set up as a liability. There should be a dividend liability for excess earnings due to policyholders that cannot inure to shareholders.
5. For a *distribution-form* demutualization, an insurance enterprise should reclassify all of its retained earnings as of the date of demutualization to capital stock and additional paid-in capital accounts. A *subscription-form* demutualization should not, in and of itself, result in

reclassification of retained earnings. The equity accounts of the MIHC at the date of formation should be determined using the principles for transactions of companies under common control with the amount of retained earnings of the demutualized insurance enterprise, before reclassification to the capital accounts, being reported as retained earnings of the MIHC.

### Nontraditional Long-Duration Contracts

ASC 944 also addresses the classification and valuation of liabilities as well as disclosures for nontraditional annuity and life insurance contracts issued by insurance enterprises. The requirements under this standard are set forth in the following paragraphs.

The portion of separate account assets representing contract holder funds are to be measured at fair value and reported in the insurance enterprise's financial statements as a summary total, with an equivalent summary total for related liabilities, if the separate account arrangement meets all the specified criteria. If the arrangement does not meet the criteria, assets representing contract holder funds should be accounted for as general account assets, and any related liability should be accounted for as a general account liability.

Assets underlying an insurance enterprise's proportionate interest in a separate account do not represent contract holder funds, and thus are not to be separately reported and valued. If a separate account arrangement meets the criteria in ASC 944 and (1) the terms of the contract allow the contract holder to invest in additional units in the separate account, or (2) the insurance enterprise is marketing contracts that permit funds to be invested in the separate account, the assets underlying the insurance enterprise's proportionate interest in the separate account should be accounted for in a manner consistent with similar assets held by the general account that the insurance enterprise may be required to sell.

If the enterprise's proportionate interest in the separate account is less than 20% of the separate account, and all of the underlying investments of the separate account meet the definition of securities under the Master Glossary, or the definition of cash and cash equivalents, the enterprise may report its portion of the separate account value as an investment in equity securities classified as trading under ASC 320.

Assets transferred from the general account to a separate account should be recognized at fair value to the extent of third-party contract holders' proportionate interest in the separate account if the separate account arrangement meets the criteria set forth in the codification. Any gain related to the third-party contract holder's proportionate interest should be recognized immediately in earnings of the general account of the insurance enterprise, if the risks and rewards of ownership have been transferred to contract holders using the fair value of the asset at the date of the contract holder's assumption of risks and rewards. A guarantee of the asset's value or minimum rate of return or a commitment to repurchase the asset would indicate that the risks of ownership have not been transferred, and no gain can be recognized. If the separate account arrangement does not meet the criteria in the codification, the transfer generally should have no financial reporting effect (that is, general account classification and carrying amounts should be retained). In certain situations loss recognition may be appropriate.

The basis for determining the balance that accrues to the contract holder for a long-duration insurance or investment contract that is subject to ASC 944 is the accrued account balance. The accrued account balance equals:

1. Deposit(s) net of withdrawals;
2. Plus amounts credited pursuant to the contract;

3. Less fees and charges assessed;
4. Plus additional interest (for example, persistency bonus); and
5. Other adjustments, such as appreciation or depreciation recognized under the codification, to the extent not already credited.

For contracts that have features that may result in more than one potential account balance, the accrued account balance should be the highest contractually determinable balance that will be available in cash or its equivalent at contractual maturity or the reset date, without reduction for future fees and charges. The accrued account balance should not reflect any surrender adjustments (for example, fair value annuity adjustments, surrender charges, or credits). For contracts in which amounts credited as interest to the contract holder are reset periodically, the accrued balance should be based on the highest crediting rate guaranteed or declared through the reset date.

For a contract not accounted for under ASC 815 that provides a return based on the total return of a contractually referenced pool of assets either through crediting rates or termination adjustments, the accrued account balance should be based on the fair value of the referenced pool of assets (or applicable index value) at the date of the statement of financial position, even if the related assets are not recognized at fair value.

To determine the accounting under ASC 944 for a contract that contains death or other insurance benefit features, the enterprise should first determine whether the contract is an investment or universal-life-type contract. If the mortality or morbidity risks are other than nominal and the fees assessed or insurance benefits are not fixed and guaranteed, the contract should be classified as an ASC 944 universal-life-type contract. A rebuttable presumption is that a contract has significant mortality risk where the additional insurance benefit would vary significantly in response to capital markets volatility. The determination of significance should be made at contract inception, other than at transition, and should be based on a comparison of the present value of expected excess payments (that is, insurance benefit amounts and related incremental claim adjustment expenses in excess of the account balance) to be made under insurance benefit features to the present value of all amounts expected to be assessed against the contract holder (revenue).

For contracts classified as insurance contracts that have amounts assessed against contract holders each period for the insurance benefit feature that are assessed in a manner that is expected to result in profits in earlier years and subsequent losses from that insurance benefit function, a liability should be established in addition to the account balance to recognize the portion of such assessments that compensates the insurance enterprise for benefits to be provided in future periods in accordance with the guidance in the codification.

If a reinsurer assumes the insurance benefit feature, it should assess the significance of mortality and morbidity risk within the reinsurance contract according to the guidance in ASC 944, regardless of whether there is an account balance. The reinsurer should determine the classification of the reinsurance contract as an investment contract or as an insurance contract at the inception of the reinsurance contract. For reinsurance contracts, the mortality or morbidity risk could be deemed other than nominal even if the original issuer did not determine mortality or morbidity to be other than nominal. Similarly, the issuer of a contract that provides only an insurance benefit feature that wraps a noninsurance contract, for example, a guaranteed minimum death benefit related to a mutual fund balance, should evaluate its contract in the same manner. A reinsurer or issuer of the insurance benefit features of a contract should calculate a liability for the portion of premiums collected each period that represents compensation to the insurance enterprise for benefits that are assessed in a manner that is expected to result in current profits and future

losses from the insurance benefit function. That liability should be calculated using the methodology described in ASC 944.

Contracts may provide for potential benefits in addition to the account balance that are payable only upon annuitization, such as annuity purchase guarantees, guaranteed minimum income benefit (GMIB), and two-tier annuities. Insurance enterprises should determine whether such contract features should be accounted for under the provisions of ASC 815. If the contract feature is not accounted for under the provisions of ASC 815, an additional liability for the contract feature should be established if the present value of expected annuitization payments at the expected annuitization date exceeds the expected account balance at the expected annuitization date in accordance with the guidance in ASC 944.

Sales inducements provided to the contract holder, whether for investment or universal-life-type contracts, should be recognized as part of the liability for policy benefits over the period for which the contract must remain in force for the contract holder to qualify for the inducement or at the crediting date, if earlier, in accordance with the codification. No adjustments should be made to reduce the liability related to the sales inducements for anticipated surrender charges, persistency, or early withdrawal contractual features.

Sales inducements that are recognized as part of the liability under ASC 944, that are explicitly identified in the contract at inception, and that meet the criteria specified in the codification should be deferred and amortized using the same methodology and assumptions used to amortize capitalized acquisition costs.

The financial statements of an insurance enterprise should disclose information about the following:

1. Separate account assets and liabilities; the nature, extent, and timing of minimum guarantees related to variable contracts; and the amount of gains and losses recognized on assets transferred to separate accounts.
2. An insurance enterprise's accounting policy for sales inducements, including the nature of the costs capitalized and the method of amortizing those costs; the amount of costs capitalized and amortized for each of the periods presented; and the unamortized balance as of the date of each statement of financial position presented.
3. The nature of the liabilities and methods and assumptions used in estimating any contract benefits recognized in excess of the account balance pursuant to the codification.

### **Costs Associated with Acquiring or Renewing Insurance Contracts<sup>12</sup>**

ASC 944-30-25-1A specifies that only the following costs incurred in the acquisition of insurance contracts can be capitalized and subsequently amortized:

- Incremental direct costs of successfully acquiring or renewing insurance contracts; these are costs that result directly from the contract transactions and are essential to the contract and would not have been incurred if the contract acquisition had not occurred.
- Costs directly related to underwriting, policy issuance, medical and inspection, and sales force contract selling for successfully acquired or renewed insurance contracts.

All other costs, such as market research, training, administration, and product development, should be treated as period costs. Entities should treat all administrative expenses as period costs.

---

<sup>12</sup> Upon implementation of ASU 2014-09 on revenue, entities will need to evaluate whether or not direct-response advertising costs should be capitalized.

Capitalized acquisition costs should be charged to expense in proportion to premium revenue recognized under ASC 944-605. (ASC 944-30-35-3A)

### Deferred Acquisition Costs for Insurance Contract Modifications or Exchanges

ASC 944-30 addresses the accounting for deferred acquisition costs related to the internal replacement of selected insurance and investment contracts. An internal replacement is a modification of an insurance product's benefits, features, rights, or coverages (described hereafter as *benefits*) by a variety of means, including the extinguishment and replacement of a contract.

If an internal replacement occurs and the rights and obligations of the parties are essentially unchanged, then the replacement contract is considered a continuation of the replaced contract. In this case, the replaced contract's unamortized deferred acquisition costs, unearned revenue liabilities, and deferred sales inducement assets should continue to be recognized as part of the replacement contract. Also, costs incurred in connection with such a replacement are charged to expense as incurred.

A contract change must meet all of the following criteria in order to be considered a continuation of the replaced contract—if any condition is not met, the change is treated as a substantially changed contract:

1. The insured event, risk, or period of coverage has not changed.
2. The contract holder's investment return rights have not changed.
3. Either there is no change in the insurance premium, or a premium reduction is matched by a corresponding reduction in benefits.
4. Net of distributions, there is no net reduction in contract value.
5. There is no change in contractual participation or dividend features.
6. There is no change in the contract's amortization method or revenue classification.

If benefits replacement results in a substantially changed contract, then the replaced contract is considered extinguished, in which case unamortized deferred acquisition costs, unearned revenue liabilities, and deferred sales inducement assets from the replaced contract should not be deferred as part of the replacement contract.

If a contract is accounted for as a long-duration participating contract, the estimated gross profit of the replacement contract is treated as a revision of the replaced contract's gross profit when determining the amortization of deferred acquisition costs, deferred sales inducement assets, and the recognition of unearned revenues. If a contract is accounted for as nonrefundable fees, the cash flows of the replacement contract revise the cash flows of the replaced contract for purposes of calculating the interest rate amortization of unamortized deferred acquisition costs and deferred sales inducement assets.

This standard does not apply to contract modifications resulting from an election by the contract holder that was within the original contract, as long as (1) the election followed the terms of the original contract, (2) the election is not subject to any underwriting, (3) the insurance provider cannot decline the coverage or adjust contract pricing, and (4) the benefit had been accounted for since the contract inception. The standard also does not apply if a contract feature is nonintegrated (it provides coverage that is priced solely for the incremental benefits coverage, and does not alter other components of the contract), in which case it should be accounted for as a separately issued contract.

### Other Accounting Guidance

ASC 944-20-S99 notes that industry practice is to amortize the present value of future profits (PVP) using an interest method with accrual of interest added to the unamortized balance. In the

past, there has been some diversity in the application of this method in practice, and so the codification mandates that the interest rate used to amortize PVP should be the liability or contract rate. It also states that changes in estimates of future gross profits on contracts should be accounted for as a catch-up adjustment. And finally, PVP and any related liability should be subject to the premium deficiency test required in ASC 944-60.

ASC 944-20 includes criteria for the recognition and amounts of assets and liabilities by the assuming and ceding enterprises, respectively, and accounting for changes in coverage during the reinsurance period. A number of conditions are identified, satisfaction of which is necessary for a contract to be treated as reinsurance, and in their absence such contracts are to be accounted for by the deposit method.

ASC 944-20-25 addresses how enterprises other than insurance companies should account for contracts with insurance companies covering various types of risks such as product and environmental liability risks. ASC 944-20 also addresses *pooled risk* contracts and reinsurance contracts entered into by a captive insurer. In order for a contract to be considered insurance it must indemnify the insured party as this would result in a transfer of risk. If no transfer of risk exists, then the contract is not considered insurance, and the balance of the premium less any amount to be retained by the insurer should be accounted for as a deposit.

ASC 325-20 provided guidance on the accounting for those formerly mutual insurance companies that have undergone demutualization transactions and converted to stock enterprises. In order to effect a demutualization, a company may be required to issue consideration, often in the form of stock, to existing participating policyholders in exchange for their current membership interests. The receipt of such stock has no direct effect on the policyholders' contractual interests of their insurance policies (for example, it does not alter the cash surrender value of their life insurance policies). However, the governance of the mutual insurance company and, in particular, the participating policyholders' interest in that governance are modified. Thus, stock received from a demutualization should be accounted for at fair value with a gain recognized in income from continuing operations.

ASC 944-605 addressed the lack of uniformity of practices among foreign reinsurers, and in particular how U.S. insurers were to account for property and liability reinsurance assumed from foreign companies.

ASC 944-505-55 illustrates disclosures for insurance enterprises that have received permission by the insurance department in their domiciliary states to use accounting practices other than those prescribed by state laws, regulations, and rules and by the National Association of Insurance Commissioners (NAIC).

ASC 944 provides guidance in accounting for mutual life insurance contracts. Capitalization and amortization of acquisition costs are discussed. Premiums are to be reported as revenue when due from policyholders. Death and surrender benefits are reported as expenses, and annual dividends are reported separately as expenses. The calculation of estimated gross margin and liability for future policy benefits is described.

ASC 405-30 addresses the diversity in practice of accounting for assessments made by government agencies against insurance activities such as workers' compensation second injury funds, this standard imposed accrual accounting requirements and set forth the conditions that must be met before a liability may be recognized.

ASC 340-30 provides guidance on how to account for insurance and reinsurance contracts that do not have the effect of transferring insurance risk. It applies to all entities and all types of insurance or reinsurance contracts, other than long duration life and health insurance contracts. The method prescribed by this standard is *deposit accounting*.

ASC 944-805 provides necessary guidance to the proper accounting for demutualization transactions and also for the formation of mutual insurance holding companies.

ASC 944-605-25 states that recognition of an unearned revenue liability representing amounts that have been assessed to compensate insurers for services to be performed over future periods is a requirement under ASC 944. Importantly, this liability is not to be used to inappropriately level or smooth out gross profit over the term of the contract or produce a level gross profit from the mortality benefit over the life of the contract.

The staff of the SEC's Division of Corporate Finance has issued guidance in its "Current Accounting and Disclosure Issues" publication regarding the proper disclosures required of publicly held property-casualty insurance companies. The disclosure about the policies and methodologies for estimating the liability for unpaid claims and claim adjustment expenses should (1) separately address each material line of business, (2) identify and describe the actuarial method used, (3) describe any policy for adjusting the liability for unpaid claims and claim adjustment expenses to an amount differing from the amount calculated by its actuaries, and (4) describe any difference in the annual and interim procedures for determining the liability for unpaid claims and claim adjustment expenses. Further, the disclosure of the reasons for incurred claims and claim adjustment expenses in the current income statement that are attributed to insured events in prior years should (1) quantify the amount by line of business and by accident year within each line, (2) describe the new events or information obtained since the last reporting period that led to any changes in estimate, and (3) explain why recognition occurred in the current period, rather than in earlier periods.

The SEC staff also requires disclosure about reserving assumptions. For each material line of business, disclosure should include (1) the key assumptions affecting the estimate of liability for unpaid claims and claim adjustment expenses, and (2) a quantification of any material assumption changes from the preceding period. Finally, registrants should disclose whether the liability for claims and claim adjustment expenses is likely to change in the future. This disclosure should include, for each material line of business, (1) the identification of key assumptions that are reasonably likely to change, (2) an explanation of why management believes each change is likely, and (3) quantification of the effect that these changes may have on future financial position, liquidity, and results of operations.

## **FINANCIAL SERVICES—INVESTMENT COMPANIES (ASC 946)<sup>13</sup>**

### **PERSPECTIVE AND ISSUES**

---

An investment company pools shareholders' funds to provide shareholders with professional investment management. Investment companies' activities include selling capital shares to the public, investing the proceeds in securities, and distributing net income and net realized gains to its shareholders.

ASC 946 discusses those aspects of accounting and auditing unique to investment companies, and provides guidance on accounting for offering costs, amortization of premium or discount on bonds, liabilities for excess expense plans, reporting complex capital structures, payments by

---

<sup>13</sup> Upon implementation of ASU 2014-09, *Revenue from Contracts with Customers*, guidance for revenue and deferred revenue for this industry can be found in ASC 606.

affiliates, and financial statement presentation and disclosures for investment companies and nonpublic investment partnerships.

ASC 946 provides incremental guidance to those entities that meet the assessment guidelines to be deemed investment companies. All entities regulated under the Investment Company Act of 1940 are in the scope of ASC 946. Other entities must assess the characteristics of an investment company outlined below, taking into account the entities' purpose and design. The fundamental characteristics of an investment company are that it:

- Obtains funds from one or more investors.
- Provides the investors with investment management services.
- Commits to its investors that its business purpose and only substantive activities are investing the funds solely for returns from capital appreciation, investment income, or both.
- Does not obtain or have the objective of obtaining returns or benefits from an investee or its affiliates that are not normally attributable to ownership interests or that are other than capital appreciation or investment income.

Typical characteristics of an investment company are:

1. It has more than one investment and investor.
2. Investors are not related parties of the parent, if any, or the investment manager.
3. Ownership interests are in the form of equity or partnership interests.
4. It manages substantially all of its investments on a fair value basis.

(ASC 946-10-15-6 and 15-7)

Entities that do not possess one or more of the characteristics may still be investment companies.

If an entity makes the assessment and judges that it is an investment company, it should account for the effect of the change from the date of the change, recognizing the effect as a cumulative effect adjustment. Entities that make the assessment and come to the conclusion that they are no longer an investment company discontinue applying the guidance and account for the effect of the change prospectively in accordance with other Topics. (ASC 946-10-15-5)

## **DEFINITIONS OF TERMS**

---

Terms are from ASC 946, *Glossary*. Other terms relevant to this topic can be found in Appendix A, *Definitions of Terms*, including Affiliate, Fair Value, Parent, and Related Parties.

**Front-End Load.** A sales commission or charge payable at the time of purchase of mutual fund shares.

**Net Asset Value per Share.** Net asset value per share is the amount of net assets attributable to each share of capital stock (other than senior equity securities, that is, preferred stock) outstanding at the close of the period. It excludes the effects of assuming conversion of outstanding convertible securities, whether or not their conversion would have a diluting effect.

## **CONCEPTS, RULES, AND EXAMPLES**

---

Several types of investment companies exist: management investment companies, unit investment trusts, collectible trust funds, investment partnerships, certain separate accounts of life insurance companies, and offshore funds. Management investment companies include

open-end funds (mutual funds), closed-end funds, special-purpose funds, venture capital investment companies, small business investment companies, and business development companies.

### Accounting Policies

The accounting policies for an investment company result from the company's role as a vehicle through which investors can invest as a group. These policies are largely governed by the SEC, Small Business Administration, and specific provisions of the Internal Revenue Code relating to investment companies.

Investment companies report investment securities at fair value in accordance with the guidance in ASC 825. (ASC 946-10-15-2)

Security purchases and sales are generally recorded at the trade date; therefore, the effects of all securities trades entered into by the investment company to the date of the financial statements are included in the financial report. (ASC 946-320-25-1)

Investment companies record dividend income on the ex-dividend date, not on the later record or payable date. The rationale for this treatment is that the market price of market securities may be affected by the exclusion of the declared dividend. Additionally, investment companies record a liability for dividends payable on the ex-dividend date because mutual fund shares are purchased and redeemed at prices equal to or based on net asset value. If investors purchase shares between the declaration and ex-dividend dates they are entitled to receive dividends; however, investors purchasing shares after the ex-dividend date are not entitled to receive dividends. (ASC 946-320-25-4)

Open-end investment companies often employ the practice of equalization. This theory states that the net asset value of each share of capital stock sold comprises the par value of the stock, undistributed income, and paid-in capital and other surplus. When shares are sold or repurchased, the investment company calculates the amount of undistributed income available for distribution to its shareholders. Based on the number of shares outstanding, the investment company determines the per share amount; this amount is credited to an equalization account when shares are sold. Conversely, the equalization account is charged when shares are repurchased.<sup>14</sup>

### Accounting for High-Yield Debt Securities

The accounting by creditors for investments in *step interest* and *payment in kind (PIK)* debt securities, if these qualify as *high-yield* securities, is addressed by the ASC 946. Step interest bonds are generally unsecured debentures that pay no interest for a specified period after issuance, then pay a stipulated rate for a period, then a higher rate for another period, etc., until maturity. Thus, they combine some of the characteristics of zero-coupon bonds with some features of current interest bonds. PIK bonds pay some or all interest in the form of other debt instruments (*baby* or *bunny* bonds), which in turn may also pay interest in the form of baby bonds. All babies mature at the due date of the parent bond.

The interest method should be used for step interest bonds; to the extent that interest income is not expected to be realized, a reserve against the income should be established. For PIK bonds, the interest method is also required.

---

<sup>14</sup> See *Investment Companies—Audit and Accounting Guide*, Copyright 2014, American Institute of Certified Public Accountants.

## Exemptions from the Requirement to Provide a Statement of Cash Flows

The following conditions must be met for an investment company to be exempted from providing a statement of cash flows:

1. The entity's investments are carried at fair value and classified as Level 1 or Level 2 measurements per ASC 820.
2. The entity had little or no debt, based on average debt outstanding during the period, in relation to average total assets.
3. The entity provides a statement of changes in net assets.

(ASC 230-10-15-4)

## Taxes

Investment companies that distribute all taxable income and taxable realized gains qualifying under Subchapter M of the Internal Revenue Code are not required to record a provision for federal income taxes. If the investment company does not distribute all taxable income and taxable realized gains, a liability should be recorded at the end of the last day of the taxable year. The rationale for recording on the last day of the year is that only shareholders of record at that date are entitled to credit for taxes paid.<sup>15</sup>

## Commodity Pools

ASC 946-210 stipulates that investment partnerships which are commodity pools subject to regulation by the Commodity Exchange Act of 1934 are subject to its guidance. Thus, notwithstanding the rapid turnover common among such pools, the financial statements must include a schedule of investments. (ASC 946-210-50-4)

## Other Accounting Guidance

ASC 946-320 concludes that for PIK and step bonds:

1. the interest method should be used to determine interest income;
2. a reserve against income should be established for interest income not expected to be realized;
3. the cost plus any discount should not exceed undiscounted future cash collections.

(ASC 946-320-35-10 and 35-11)

For defaulted debt securities, any interest receivable written off that had been recognized as income constitutes a reduction of income. Write-offs of purchased interest increase the cost basis and represent an unrealized loss until the security is sold. (ASC 946-320-35-17 and 35-18) *Capital infusions* are accounted for as an addition to the cost basis, while related "workout expenditures" are recorded as unrealized losses. Any ongoing expenditures to protect the value of the investment are recorded as operating expenses. (ASC 946-320-35-14 through 16)

In ASC 946-830, it was concluded that transactions denominated in a foreign currency must originally be measured in that currency. Reporting exchange rate gains and losses separately from any gain/loss on the investment due to changes in market price is allowable but not required.

ASC 946-210-50 pertains to investment partnerships that are exempt from SEC registration under the Investment Company Act of 1940. Specifically, the statement requires that the financial statements include a condensed schedule of securities that categorizes investments by type,

---

<sup>15</sup> Ibid.

country or geographic region, and industry; discloses pertinent information concerning investments comprising greater than 5% of net assets; and aggregates any securities holdings less than the 5% of net assets threshold. The statement of operations for nonpublic investment companies shall be presented in conformity with requirements for public investment companies per the AAG so as to reflect their comparable operations. The financial statements shall also present management fees and disclose their computation.

ASC 946-20 requires investment companies with enhanced 12b-1 plans or board-contingent plans for which the board has committed to pay costs to recognize a liability and the related expense, for the amount of excess costs. This liability should be discounted at an appropriate current rate if the amount and timing of cash flows are reliably determinable and if distribution costs are not subject to a reasonable interest charge. Excess costs are recorded as a liability as the fund has assumed an obligation to pay the 12b-1 fee after the termination of the plan to the extent that the distributor has excess costs.

In a related matter, ASC 946-605 specifies the accounting for cash received from a third party for a distributor's right to future cash flows relating to distribution fees for previously sold shares. Revenue recognition is deemed proper when cash is received from a third party if the distributor has no continuing involvement or recourse; any deferred costs related to the sale of shares is to be expensed concurrently. It further defines absence of continuing involvement and recourse.

ASC 946-210 affects the required display of certain contracts held by investment companies if these are fully benefit-responsive. Both the fair values of the contracts, segregated between guaranteed investment contracts and so-called wrapper contracts, and the contract (guaranteed) values, must be displayed in the investment company's statement of financial position.

A contract is deemed fully benefit-responsive if *all* five conditions set forth by the ASC are met. These conditions are defined as:

1. The contract is negotiated directly between the fund and the issuer, and it prohibits the fund from assigning or selling the contract or its proceeds to another party without the consent of the issuer.
2. Either (a) the repayment of principal and interest credited to participants in the fund is guaranteed by the issuer of the investment contract, or (b) the fund provides for prospective interest crediting rate adjustments to participants in the fund on a designated pool of investments held by the fund, provided that the terms of the agreement with participants in the fund specify that the crediting interest rate cannot be less than zero. The risk of decline in the interest crediting rate below zero must be transferred to a financially responsible third party through a *wrapper* contract. If an event (e.g., decline in creditworthiness of the contract issuer or wrapper provider) has occurred that may affect the realization of full contract value for a particular investment contract, the contract no longer is to be considered fully benefit-responsive.
3. The terms of the contract require all permitted participant-initiated transactions with the fund to occur at contract value with no conditions, limits, or restrictions. Permitted participant-initiated transactions are those transactions allowed by the underlying defined-contribution plan, such as withdrawals for benefits, loans, or transfers to other funds within the plan.
4. Events that limit the ability for the fund to transact at contract value with the issuer (e.g., premature termination of the contracts by the plan, plant closings, layoffs, plan termination, bankruptcy, mergers, and early retirement incentives) must be *probable* of *not* occurring.
5. The fund itself must allow participants reasonable access to their funds.

(ASC 946-210-20)

This standard requires that statements of financial position of investment companies report separately investments, including guaranteed investment contracts, at fair value, and wrapper contracts, also at fair value. The statement of financial position must also display an additional account to bring the total assets being reported to contract amounts—that is, the amounts at which participants can transact with the fund. (ASC 946-210-45-15)

Additionally, the following information must be disclosed in footnotes to the financial statements for each investment contract, and be reconciled to corresponding line items on the statement of financial position:

1. The fair value of the wrapper contract and the fair value of each of the corresponding underlying investments;
2. Adjustment from fair value to contract value (if the investment contract is fully benefit-responsive); and
3. Major credit ratings of the issuer or wrapper provider.

(ASC 946-210-45-18)

Other expanded disclosures are mandated for investment companies having fully benefit-responsive contracts, as follows:

1. A description of the nature of the investment contracts, how they operate, and the methodology for calculating the crediting interest rate, including the key factors that could influence future average crediting interest rates, the basis for and frequency of determining credit interest-rate resets, and any minimum crediting interest rate under the terms of the contracts. This disclosure should explain the relationship between future crediting rates and the amount reported on the statement of financial position representing the adjustment of the portion of net assets attributable to fully benefit-responsive investments from fair value to contract value.
2. A reconciliation between the beginning and ending balance of the amount presented on the statement of financial position that represents the difference between net assets at fair value and net assets for each period in which a statement of changes in net assets is presented. This reconciliation should include:
  - a. The change in the difference between the fair value and contract value of all fully benefit-responsive investment contracts, and
  - b. The increase or decrease due to changes in the fully benefit-responsive status of the fund's investment contracts.
3. The average yield earned by the entire fund (without regard to the interest rate credited to participants in the fund) for each period for which a statement of financial position is presented.
4. The average yield earned by the entire fund with an adjustment to reflect the actual interest rate credited to participants in the fund covering each period for which a statement of financial position is presented.
5. Two different sensitivity analyses:
  - a. The effect on the weighted-average crediting interest rates calculated at the latest date of a statement of financial position and the next four reset dates, under two or more scenarios where there is an immediate hypothetical increase or decrease in interest rates, with no change to the duration of the underlying investment portfolio and no contributions or withdrawals. These scenarios should include, at a minimum,

- immediate hypothetical changes in market yields equal to one-quarter and one-half of the current yield.
- b. The effect on the weighted-average crediting interest rates calculated at the latest date of a statement of financial position and the next four reset dates, under two or more scenarios where there are the same immediate hypothetical changes in market yields in the first analysis, combined with an immediate hypothetical 10% decrease in the net assets of the fund due to participant transfers, with no change to the duration of the portfolio.
  - 6. A description of the events which limit the ability of the fund to transact at contract value with the issuer (for example, premature termination of the contracts by the plan, plant closings, layoffs, plan termination, bankruptcy, mergers, and early retirement incentives), including a statement that the occurrence of such events is probable or not probable.
  - 7. A description of the events and circumstances that would allow issuers to terminate fully benefit-responsive investment contracts with the fund and settle at an amount different from contract value.
- (ASC 946-210-50-14)

In order to be considered within the scope of the guidance in ASC 946-210-45-15 through 45-18, any portion of the net assets of the investment company that is not held by participants in qualified employer-sponsored defined-contribution plans as of the effective date are not permitted to increase due to gross contributions, loan repayments, or transfers into the fund. (ASC 946-210-45-18A)

## **FINANCIAL SERVICES—MORTGAGE BANKING (ASC 948)<sup>16</sup>**

### **PERSPECTIVE AND ISSUES**

---

Mortgage banking comprises two activities:

- 1. The origination or purchase of mortgage loans and subsequent sale to permanent investors, and
- 2. Long-term servicing of the mortgage loan.

To the extent that mortgage banking activities discussed in this section may be undertaken by subsidiaries or divisions of commercial banks or savings institutions, the same accounting and reporting standards apply. Normal, nonmortgage lending of those enterprises, however, is accounted for in accordance with the lender's normal accounting policies for such activities.

Mortgage loans held for sale are valued at the lower of cost or market. Mortgage-backed securities are reported under ASC 320 as held-to-maturity, trading, or available-for-sale, depending on the entity's intent and ability to hold the securities.

Loan origination fees and related direct costs for loans held for sale are capitalized as part of the related loan and amortized, using the effective yield method. However, fees and costs associated with commitments to originate, sell, or purchase loans are treated as part of the commitment, which is a derivative accounted for under ASC 815.

Loan origination fees and costs for loans held for investment are deferred and recognized as an adjustment to the yield.

---

<sup>16</sup> Upon implementation of ASU 2014-09, *Revenue from Contracts with Customers*, guidance for revenue and deferred revenue for this industry can be found in ASC 606.

ASC 942, *Financial Services—Depository and Lending*, provides uniform and consistent guidance for the accounting and reporting practices for similar transactions by various types of depository and lending institutions, and has now been incorporated in a unified AAG. The standard includes in its scope corporate credit unions and mortgage companies and, in fact, affects disclosure practices for any entity that extends credit to customers. (See the summary under the “Financial Services—Banking and Lending” section of this chapter for a discussion of the general disclosure requirements for all enterprises. These general requirements also apply, when applicable, to mortgage banking enterprises and are not repeated in this section.) In addition, the standard prescribes required disclosures for mortgage banking enterprises regarding their regulatory capital and net worth requirements.

## DEFINITIONS OF TERMS

---

Source: ASC 948, *Glossary*

**Affiliated Entity.** An entity that directly or indirectly controls, is controlled by, or is under common control with another entity; also, a party with which the entity may deal if one party has the ability to exercise significant influence over the other’s operating and financial policies.

**Current (Normal) Servicing Fee Rate.** A servicing fee rate that is representative of servicing fee rates most commonly used in comparable servicing agreements covering similar types of mortgage loans.

**Federal Home Loan Mortgage Corporation (FHLMC).** Often referred to as *Freddie Mac*, FHLMC is a private corporation authorized by Congress to assist in the development and maintenance of a secondary market in conventional residential mortgages. FHLMC purchases and sells mortgages principally through mortgage participation certificates (PC) representing an undivided interest in a group of conventional mortgages. FHLMC guarantees the timely payment of interest and the collection of principal on the PC.

**Federal National Mortgage Association (FNMA).** Often referred to as *Fannie Mae*, FNMA is an investor-owned corporation established by Congress to support the secondary mortgage loan market by purchasing mortgage loans when other investor funds are limited and selling mortgage loans when other investor funds are available.

**Gap Commitment.** A commitment to provide interim financing while the borrower is in the process of satisfying provisions of a permanent loan agreement, such as obtaining a designated occupancy level on an apartment project. The interim loan ordinarily finances the difference between the floor loan (the portion of a mortgage loan commitment that is less than the full amount of the commitment) and the maximum permanent loan.

**Government National Mortgage Association (GNMA).** Often referred to as *Ginnie Mae*, GNMA is a U.S. governmental agency that guarantees certain types of securities (mortgage-backed securities) and provides funds for and administers certain types of low-income housing assistance programs.

**Internal Reserve Method.** A method for making payments to investors for collections of principal and interest on mortgage loans by issuers of GNMA securities. An issuer electing the internal reserve method is required to deposit in a custodial account an amount equal to one month’s interest on the mortgage loans that collateralize the GNMA security issued.

**Mortgage-backed Securities.** Securities issued by a governmental agency or corporation (e.g., GNMA or FHLMC) or by private issuers (e.g., FNMA, banks, and mortgage banking entities). Mortgage-backed securities generally are referred to as mortgage participation certificates or pass-through certificates (PC). A PC represents an undivided interest in a pool of specific

mortgage loans. Periodic payments on GNMA PC are backed by the U.S. government. Periodic payments on FHLMC and FNMA PC are guaranteed by those corporations and are not backed by the U.S. government.

**Mortgage Banking Entity.** An entity that is engaged primarily in originating, marketing, and servicing real estate mortgage loans for other than its own account. Mortgage banking entities, as local representatives of institutional lenders, act as correspondents between lenders and borrowers.

**Permanent Investor.** An entity that invests in mortgage loans for its own account, for example, an insurance entity, commercial or mutual savings bank, savings and loan association, pension plan, real estate investment trust, or FNMA.

**Repurchase Financing.** A repurchase agreement that relates to a previously transferred financial asset between the same counterparties, and which is entered into contemporaneously with, or in contemplation of, the initial transfer.

## CONCEPTS, RULES, AND EXAMPLES

---

### Mortgage Banking Activities

A mortgage banking entity (MBE) acts as an intermediary between borrowers (mortgagors) and lenders (mortgagees). MBE activities include purchasing and originating mortgage loans for sale to permanent investors and performing servicing activities during the period that the loans are outstanding. The mortgage loans offered for sale to permanent investors may be originated by the MBE (in-house originations); purchased from realtors, brokers, or investors; or converted from short-term, interim credit facilities to permanent financing. The common technique used by the MBE to market and sell the loans is referred to as securitization because the mortgage loans receivable are pooled and converted to mortgage-backed securities and sold in that form.

MBEs customarily retain the rights to service the loans that they sell to permanent investors in exchange for a servicing fee. The servicing fee, normally a percentage of the mortgage's outstanding principal balance, compensates the MBE for processing of mortgagor payments of principal, interest and escrow deposits, disbursing funds from the escrow accounts to pay property taxes and insurance on behalf of the mortgagor, and remitting net proceeds to the permanent investor along with relevant accounting reports.

**Mortgage loans.** The MBE is required to classify mortgage loans that it holds as either (1) held-for-sale, or (2) held for long-term investment.

**Loans held-for-sale.** Mortgage loans held for sale are reported at the lower of cost or market as of the date of the statement of financial position. Any excess of cost over market is accounted for as a valuation allowance, changes in which are to be included in income in the period of change. (ASC 948-310-35-1)

**Determination of cost basis.** The following matters must be considered with respect to the cost basis used for the purposes of the lower of cost or market value determination:

1. If a mortgage loan has been identified as a hedged item in a fair value hedge under ASC 815, the cost basis used reflects adjustments to the loan's carrying amount for changes in the loan's fair value attributable to the risk being hedged.
2. Purchase discounts on mortgage loans reduce the cost basis and are not amortized as interest revenue during the period that the loans are held for sale.
3. Capitalized costs attributable to the acquisition of mortgage servicing rights associated with the purchase or origination of mortgage loans are excluded from the cost basis of the mortgage loans.

**Determination of fair value.** The fair value of mortgage loans held for sale is determined by type of loan; at a minimum, separate determinations are made for residential and commercial loans. Either an aggregate or individual loan basis may be used in determining the lower of cost or fair value for each type of loan. Fair values for loans subject to investor purchase commitments (committed loans) and loans held for speculative purposes (uncommitted loans) must be determined separately as follows:

1. For committed loans, market value is defined as fair value.
2. For uncommitted loans, fair value is based on quotations from the market in which the MBE normally operates, considering:
  - a. Market prices and yields sought by the MBE's normal market outlets,
  - b. Quoted Government National Mortgage Association (GNMA) security prices or other public market quotations of rates for long-term mortgage loans, and
  - c. Federal Home Loan Mortgage Corporation (FHLMC) and Federal National Mortgage Association (FNMA) current delivery prices.

(ASC 948-310-35-3)

**Loans held for long-term investment.** Mortgage loans may be transferred from the held-for-sale classification to the held-for-long-term investment classification only if the MBE has both the intent and ability to hold the loan for the foreseeable future or until maturity. The transfer to the long-term investment classification is recorded at the lower of cost or market value on the date of transfer. Any difference between the loan's adjusted carrying amount and its outstanding principal balance (e.g., purchase discounts as discussed above) is recognized as a yield adjustment using the interest method. (ASC 948-310-35-4)

If recoverability of the carrying amount of a mortgage loan held for long-term investment is doubtful and the impairment is judged to be other than temporary, the loan's carrying amount is reduced by the amount of the impairment to the amount expected to be collected with the related charge recognized as a loss. The adjusted carrying value becomes the loan's new cost basis and any eventual gain on recovery may only be recognized upon the loan's sale, maturity, or other disposition. (ASC 948-310-35-5)

**Mortgage-backed securities.** The securitization of mortgage loans held-for-sale is accounted for as a sale of the mortgage loans and purchase of mortgage-backed securities.

**Classification and valuation.** After the securitization of a held-for-sale mortgage loan, any mortgage-backed securities retained by the MBE are classified as (1) trading, (2) available-for-sale, or (3) held-to-maturity under the provisions of ASC 320. As is the case with the MBE's mortgage loans held for investment, the MBE must have both the intent and ability to hold the mortgage-backed securities for the foreseeable future or until maturity in order to classify them as held-to-maturity. If the MBE had committed to sell the securities before or during the securitization process, the securities are required to be classified under the trading category. (ASC 948-310-35-3A) Mortgage-backed securities held by a not-for-profit entity are stated at fair value under ASC 958-320.

The fair value of uncommitted mortgage-backed securities collateralized by the MBE's own loans is ordinarily based on the market value of the securities. If the trust holding the loans may be readily terminated and the loans sold directly, fair value of the securities is based on the market value of either the loans or the securities, depending on the entity's intentions. Fair value for other uncommitted mortgage-backed securities is based on published yield data.

**Repurchase agreements.** Mortgage loans or mortgage-backed securities held for sale may be temporarily transferred by an MBE to another financial institution under a formal or informal

agreement which serves as a means of financing these assets. Such agreements are accounted for as collateralized financing arrangements; the loans and securities transferred under the agreements are still reported by the MBE as held for sale.

A formal repurchase agreement specifies that the MBE retains control over future economic benefits and also the risk of loss relating to the loans or securities transferred. These assets are subsequently reacquired from the financial institution upon the sale of the assets by the mortgage banking entity to permanent investors.

An informal repurchase agreement exists when no formal agreement has been executed but loans or securities are transferred by an MBE that does all of the following:

1. Is the sole marketer of the assets
2. Retains any interest spread on the assets
3. Retains risk of loss in market value
4. Reacquires uncollectible loans
5. Regularly reacquires most or all of the assets and sells them to permanent investors.

When mortgage loans held for sale are transferred under a repurchase arrangement, they continue to be reported by the transferor as loans held for sale. Mortgage-backed securities sold under agreements to repurchase are reported as trading securities as defined in ASC 320.

### Servicing Mortgage Loans

Rights to service mortgage loans for others are recognized as separate assets by an MBE. If the entity acquires such rights through purchase or origination of mortgage loans and retains them upon sale or securitization, the total cost of the mortgage loans must be allocated between the rights and the loans (without the rights) based on their relative fair values. If it is impossible to determine the fair value of the mortgage servicing rights apart from the mortgage, the MBE/transferor records the mortgage servicing rights at zero value. (ASC 860) Otherwise, mortgage servicing rights are capitalized at their fair value and recognized as a net asset if the benefits of servicing the mortgage are expected to be more than adequate compensation to the servicer for performing the duties. If the benefits of servicing the mortgage are not expected to adequately compensate the servicer, the servicer recognizes a liability. The asset, mortgage servicing contract rights, is initially measured at its fair value. Subsequent impairment is recognized as follows:

1. The mortgage servicing assets are stratified based on predominant risk characteristics.
2. Impairment is recognized through a valuation allowance for an individual stratum. The amount of impairment equals the carrying amount for a particular stratum minus its fair value.
3. The valuation allowance is adjusted to reflect changes in the measurement of impairment after the initial measurement of impairment.

**Servicing fees.** Servicing fees are usually based on a percentage of the outstanding principal balance of the mortgage loan. When a mortgage loan is sold with servicing rights retained, the sales price must be adjusted if the stated rate is materially different from the current (normal) servicing fee rate so that the gain or loss on the sale can be determined. (ASC 948-10-05-7) The adjustment is:

$$\text{Adjustment} = \frac{\text{Actual sales price}}{\text{Estimated sales price obtainable if normal servicing fee rate had been used}}$$

This adjustment allows for recognition of normal servicing fees in subsequent years.

The adjustment and any recognized gain or loss is determined as of the sale date. If estimated normal servicing fees are less than total expected servicing costs, then this loss is accrued on the sale date as well.

### Repurchase Financing

A repurchase financing involves the transfer of a previously transferred financial asset back to the lender as collateral for a financing between the borrower and the lender. The lender usually returns the financial asset to the borrower when the financing is repaid. The borrower and lender cannot separately account for an asset transfer and related repurchase financing unless the two transactions have a valid business purpose for being entered into separately, and the repurchase financing does not result in the lender retaining control over the financial asset. If a transaction meets these criteria, then evaluate the initial transfer without the repurchase financing to see if it meets the requirements for sale accounting. (ASC 860) If the transaction does not meet these criteria, then the arrangement is probably a forward contract.

### Sales to Affiliated Entities

When mortgage loans or mortgage-backed securities are sold to an affiliated entity, the carrying amount of the assets must be adjusted to lower of cost or market as of the date that management decides that the sale will occur. This date is evidenced by formal approval by a representative of the affiliated entity (purchaser), issuance of a purchase commitment, and acceptance of the purchase commitment by the seller. Any adjustment is charged to income.

If a group of (or all) mortgage loans are originated specifically for an affiliate, then the originator is an agent of the affiliated entity. In this case, the loans are transferred at the originator's cost of acquisition. This treatment does not apply to *right of first refusal* or similar contracts in which the originator retains all risks of ownership. (ASC 948-310-30-1 and 30-2)

### Issuance of GNMA Securities

An issuer of GNMA securities who elects the internal reserve method must pay one month's interest cost to a trustee. This cost is capitalized (at no greater than the present value of net future servicing income) and amortized. (ASC 948-310-25-1)

### Loan and Commitment Fees and Costs

Mortgage bankers may pay or receive loan and commitment fees as compensation for various loan administration services. These fees and costs are accounted for as described in the following paragraphs.

**Loan origination fees received.** Loan origination fees and related direct costs are deferred and amortized, using the effective yield method. Fees and costs associated with commitments to originate, sell, or purchase loans, however, must be considered part of the commitments, which are deemed to be derivatives under ASC 815. If the loan is held for investment, loan origination fees and costs are recognized as an adjustment of yield using the effective interest method.

**Services rendered.** Fees for specific services rendered by third parties as part of a loan origination (e.g., appraisal fees) are recognized when the services are performed. (ASC 948-720-25-1)

**Commitment fees paid to investors on loans held for sale.** Residential or commercial loan commitment fees paid to permanent investors are recognized as expense when the loans are sold or when it is determined that the commitment will not be used. (ASC 948-605-25-1)

Since residential loan commitment fees typically cover groups of loans, the amount of fees recognized as revenue or expense relating to an individual transaction is calculated as:

$$\text{Revenue or expense} = \frac{\text{Total residential loan commitment fee}}{\text{Total commitment amount}} \times \frac{\text{Amount of individual loan}}{\text{individual transaction}}$$

Loan placement fees (fees for arranging a commitment directly between investor and borrower) are recognized as revenue once all significant services have been performed by the MBE. In some cases, an MBE secures a commitment from a permanent investor before or at the same time a commitment is made to a borrower and the latter commitment requires (ASC 948-605-25-1):

1. Simultaneous assignment to the investor, and
  2. Simultaneous transfer to the borrower of amounts paid by the investor.
- (ASC 948-605-25-3)

The fees related to such transactions are also accounted for as loan placement fees.

**Expired commitments or early repayment of loans.** At the time that a loan commitment expires unused or is repaid before repayment is due, any related fees that had been deferred are recognized as revenue or expense.

## Reporting

An MBE must, on its statement of financial position, distinguish between mortgage loans and mortgage-backed securities that are held for sale and those that are held for long-term investment. The notes to the financial statements are to disclose whether the MBE used the aggregate method or the individual-loan method to determine the lower of cost or market.

ASC 942, *Financial Services—Depository and Lending*, contains specific capital disclosure requirements including, at a minimum:

1. A description of the minimum net worth requirements related to:
  - a. Secondary market investors, and
  - b. State-imposed regulatory mandates.
2. The actual or possible material effects of noncompliance with those requirements.
3. Whether the entity is in compliance with the regulatory capital requirements including, as of the date of each statement of financial position presented, the following measures:
  - a. The amount of the entity's required and actual net worth
  - b. Factors that may significantly affect adequacy of net worth such as potentially volatile components of capital, qualitative factors, or regulatory mandates.
4. If the entity is not in compliance with capital adequacy requirements as of the date of the most recent statement of financial position, the possible material effects of that condition on amounts and disclosures in the financial statements.
5. Loan servicers with net worth requirements imposed by more than one source are to disclose the new worth requirements of:
  - a. Significant servicing covenants with secondary market investors with commonly defined servicing requirements,
  - b. Any other secondary market investor where violation of the net worth requirement would have an adverse effect on the business, and

- c. The most restrictive third-party agreement if not already included in the above disclosures.

The standard points out that noncompliance with minimum net worth requirements may trigger substantial doubt about the entity's ability to continue as a going concern.

## FINANCIAL SERVICES—TITLE PLANT (ASC 950)

### PERSPECTIVE AND ISSUES

---

ASC 950-350, *Financial Services—Title Plant*, presents accounting and reporting standards for costs relating to the construction and operation of title plants. A title plant comprises a record of all transactions or conditions that affect titles to land located in a specified area. The length of time spanned by a title plant depends upon regulatory requirements and the time frame required to gather sufficient information to efficiently issue title insurance. Updating occurs frequently as documentation of the current status of a title is added to the title plant.

This pronouncement applies to entities such as title insurance companies, title abstract companies, and title agents that use a title plant in their operations. (ASC 950-350-15-1)

The standard provides that costs directly incurred to construct a title plant are to be capitalized when the entity can use the title plant to do title searches and that such capitalized costs are not normally depreciated. The statement also requires that the costs of maintaining a title plant and of doing title searches be expensed as incurred. (ASC 950-350-25-1 and 25-2)

### DEFINITIONS OF TERMS

---

Source: ASC 950, *Glossary*

**Backplant.** A title plant that antedates the period covered by its existing title plant.

**Title Plant.** A historical record of all matters affecting title to parcels of land in a particular geographic area. The number of years covered by a title plant varies, depending on regulatory requirements and the minimum information period considered necessary to issue title insurance policies efficiently.

### CONCEPTS, RULES, AND EXAMPLES

---

#### Acquisition Costs

The cost of constructing a title plant includes the cost of obtaining, organizing, and summarizing historical information pertaining to a particular tract of land. Costs incurred to assemble a title plant are to be capitalized until the record is usable for conducting title searches. Costs incurred to construct a backplant (a title plant that predates the time span of an existing title plant) must also be capitalized. However, an entity may capitalize only those costs that are directly related to and traceable to the activities performed in constructing the title plant or backplant. (ASC 950-350-30-1)

The purchase of a title plant or backplant, or an undivided interest therein (the right to its joint use) is recorded at cost as of the date acquired. If the title plant is acquired separately, it is recorded at the fair value of consideration given. (ASC 950-350-30-2)

Capitalized title plant costs are not amortized or depreciated unless an impairment in the carrying amount of the title plant occurs. The following events or changes in circumstances can indicate that the carrying amount may not be recoverable. An impairment may be indicated by the following circumstances (not intended to be an exhaustive list):

1. Changing legal or statutory requirements
  2. Economic factors, such as changing demand
  3. Loss of competitive advantage
  4. Failure to maintain an up-to-date title plant
  5. Circumstances that indicate obsolescence, such as abandonment of title plant.
- (ASC 950-350-35-1 through 35-3)

The provisions of ASC 360 apply to any such impairment. See chapter on ASC 360 for a complete discussion of this topic.

### **Operating Costs**

Costs of title plant maintenance and of conducting title searches are required to be expensed currently. A title plant is maintained through frequent, often daily, updating which involves adding reports on the current status of specific real estate titles and documentation of security or other ownership interests in such land. A title search entails a search for all information or documentation pertaining to a particular parcel of land. This information is found in the most recently issued title report.

Once a title plant is operational, costs may be incurred to convert the record from one storage and retrieval system to another or to modify the current storage and retrieval system. These costs may not be capitalized as title plant. However, they may be separately capitalized and amortized using a systematic and rational method.

### **Reporting Title Plant Sales<sup>17</sup>**

The sale of a title plant is to be reported separately. The amount to be reported is determined by the circumstances surrounding the sale as follows:

<u>Terms of sale</u>	<u>Amount reported</u>
a. Sale of title plant and waiver of all rights to future use	Amount received less adjusted cost of title plant
b. Sale of undivided ownership interest (rights to future joint use)	Amount received less pro rata portion of adjusted cost of title plant
c. Sales of copies of title plant or the right to use it	Amount received

Note that in the last instance the amount reported is simply the amount received. In this case, no cost is allocated to the item sold unless the title plant's value drops below its adjusted cost as a result of the sale. (ASC 950-350-40-1)

### **FRANCHISORS (ASC 952)<sup>18</sup>**

#### **PERSPECTIVE AND ISSUES**

---

##### **Overview**

Franchising has become a popular growth industry with many businesses seeking to sell franchises as their primary income source and individuals seeking to buy franchises and become

<sup>17</sup> Upon implementation of ASU 2014-09, *Revenue from Contracts with Customers*, guidance for revenue, deferred revenue, and costs associated with "a" and "b" can be found in ASC 606 and ASC 610.

<sup>18</sup> Upon implementation of ASU 2014-09, guidance for revenue from franchise sales can be found in ASC 606.

entrepreneurs. How to recognize revenue on the individual sale of franchise territories and on the transactions that arise in connection with the continuing relationship between the franchisor and franchisee are prime accounting issues.

Franchise fees are governed by ASC 952, *Franchisors*.

## DEFINITIONS OF TERMS

---

Source: ASC 952, *Glossary*

**Area Franchise.** An agreement that transfers franchise rights within a geographical area permitting the opening of a number of franchised outlets. Under those circumstances, decisions regarding the number of outlets, their location, and so forth are more likely made unilaterally by the franchisee than in collaboration with the franchisor. A franchisor may sell an area franchise to a franchisee who operates the franchised outlets or the franchisor may sell an area franchise to an intermediary franchisee who then sells individual franchises to other franchisees who operate the outlets.

**Continuing Franchise Fee.** Consideration for the continuing rights granted by the franchise agreement and for general or specific services during its term.

**Franchise Agreement.** A written business agreement that meets the following principal criteria:

1. The relation between the franchisor and franchisee is contractual, and an agreement confirming the rights and responsibilities of each party is in force for a specified period.
2. The continuing relation has as its purpose the distribution of a product or service, or an entire business concept, within a particular market area.
3. Both the franchisor and the franchisee contribute resources for establishing and maintaining the franchise. The franchisor's contribution may be a trademark, a company reputation, products, procedures, labor, equipment, or a process. The franchisee usually contributes operating capital as well as the managerial and operational resources required for opening and continuing the franchised outlet.
4. The franchise agreement outlines and describes the specific marketing practices to be followed, specifies the contribution of each party to the operation of the business, and sets forth certain operating procedures with which both parties agree to comply.
5. The establishment of the franchised outlet creates a business entity that will, in most cases, require and support the full-time business activity of the franchisee.
6. Both the franchisee and the franchisor have a common public identity. This identity is achieved most often through the use of common trade names or trademarks and is frequently reinforced through advertising programs designed to promote the recognition and acceptance of the common identity within the franchisee's market area.

The payment of an initial franchise fee or a continuing royalty fee is not a necessary criterion for an agreement to be considered a franchise agreement.

**Franchisee.** The party who has been granted business rights (the franchise) to operate the franchised business.

**Franchisor.** The party who grants business rights (the franchise) to the party (the franchisee) who will operate the franchised business.

## CONCEPTS AND RULES

---

### Franchise Sales

Franchise operations are generally subject to the same accounting principles as other commercial entities. Special issues arise out of franchise agreements, however, which require the application of special accounting rules.

Revenue is recognized, with an appropriate provision for bad debts, when the franchisor has substantially performed all material services or conditions. Only when revenue is collected over an extended period of time and collectibility cannot be predicted in advance would the use of the cost recovery or installment methods of revenue recognition be appropriate. Substantial performance means:

1. The franchisor has no remaining obligation to either refund cash or forgive any unpaid balance due.
2. Substantially all initial services required by the agreement have been performed.
3. No material obligations or conditions remain.

Even if the contract does not require initial services, the pattern of performance by the franchisor in other franchise sales will impact the time period of revenue recognition. This can delay such recognition until services are either performed or it can reasonably be assured they will not be performed. The franchisee operations will be considered as started when such substantial performance has occurred.

If initial franchise fees are large compared to services rendered and continuing franchise fees are small compared to services to be rendered, then a portion of the initial fee is deferred in an amount sufficient to cover the costs of future services plus a reasonable profit, after considering the impact of the continuing franchise fee.

#### Example of initial franchise fee revenue recognition

Shanghai Asian Cuisine sells a Quack's Roast Duck franchise to Toledo Restaurants. The franchise is renewable after two years. The initial franchise fee is \$50,000, plus a fixed fee of \$500 per month. In exchange, Shanghai provides staff training, vendor relations support, and site selection consulting. Each month thereafter, Shanghai provides \$1,000 of free local advertising. Shanghai's typical gross margin on franchise startup sales is 25%.

Because the monthly fee does not cover the cost of monthly services provided, Shanghai defers a portion of the initial franchise fee and amortizes it over the two-year life of the franchise agreement, using the following calculation:

Cost of monthly services provided	$\$1,000 \times 24 \text{ months}$	=	\$24,000
÷ Markup to equal standard 25% gross margin		÷	.75
= Estimated revenue required to offset monthly services provided		=	\$32,000
Less: Monthly billing to franchise	$\$500 \times 24 \text{ months}$	-	\$12,000
= Amount of initial franchise fee to be deferred		=	\$20,000

Shanghai's entry to record the franchise fee deferral follows:

Franchise fee revenue	20,000
Unearned franchise fees (liability)	20,000

Shanghai recognizes 1/24 of the unearned franchise fee liability during each month of the franchise period on a straight-line basis, which amounts to \$833.33 per month.

### **Area Franchise Sales**

Sometimes franchisors sell territories rather than individual locations. In this event, the franchisor may render services to the area independent of the number of individual franchises to be established. Under this circumstance, revenue recognition for the franchisor is the same as stated above. If, however, substantial services are performed by the franchisor for each individual franchise established, then revenue is recognized in proportion to mandatory service. The general rule is that when the franchisee has no right to receive a refund, all revenue is recognized. It may be necessary for revenue recognition purposes to treat a franchise agreement as a divisible contract and allocate revenue among existing and estimated locations. Future revisions to these estimates will require that remaining unrecognized revenue be recorded in proportion to remaining services expected to be performed.

#### **Example of revenue recognition for area franchise sales**

Shanghai Asian Cuisine sells an area Quack's Roast Duck franchise to Canton Investments for \$40,000. Under the terms of this area franchise, Shanghai is solely obligated to provide site selection consulting services to every franchise that Canton opens during the next twelve months, after which Canton is not entitled to a refund. Canton estimates that it will open 12 outlets sporadically throughout the year. Shanghai estimates that it will cost \$2,500 for each site selection, or \$30,000 in total. Based on the initial \$40,000 franchise fee, Shanghai's estimated gross margin is 25%. Canton's initial payment of \$40,000 is recorded by Shanghai with the following entry:

Cash	40,000
Unearned franchise fees (liability)	40,000

After six months of preparation, Canton requests that four site selection surveys be completed. Shanghai completes the work at a cost of \$10,000 and uses the following entry to record both the expenditure and related revenue:

Unearned franchise fees (liability)	13,333
Franchise fee revenue	13,333
Site survey expense	10,000
Accounts payable	10,000

By the end of the year, Shanghai has performed ten site selection surveys at a cost of \$25,000 and recognized revenue of \$33,333, leaving \$6,667 of unrecognized revenue. Since Canton is no longer entitled to a refund, Shanghai uses the following entry to recognize all remaining revenue, with no related expense:

Unearned franchise fees (liability)	6,667
Franchise fee revenue	6,667

### **Other Relationships**

Franchisors may guarantee debt of the franchisee, continue to own a portion of the franchise, or control the franchisee's operations. Revenue is not recognized until all services, conditions, and obligations have been performed.

In addition, the franchisor may have an option to reacquire the location. Accounting for initial revenue is to consider the probability of exercise of the option. If the expectation at the time of the

agreement is that the option is likely to be exercised, the entire franchise fee is deferred and not recognized as income. Upon exercise, the deferral reduces the recorded investment of the franchisor.

An initial fee may cover both franchise rights and property rights, including equipment, signs, and inventory. A portion of the fee applicable to property rights is recognized to the extent of the fair value of these assets. However, fees relating to different services rendered by franchisors are generally not allocated to these different services because segregating the amounts applicable to each service could not be performed objectively. The rule of revenue recognition when all services are substantially performed is generally upheld. If objectively determinable separate fees are charged for separate services, then recognition of revenue can be determined and recorded for each service performed.

Franchisors may act as agents for the franchisee by issuing purchase orders to suppliers for inventory and equipment. These are not recorded as sales and purchases by the franchisor; instead, consistent with the agency relationship, receivables from the franchisee and payables to the supplier are reported on the statement of financial position of the franchisor. There is, of course, no right of offset associated with these amounts, which are to be presented gross.

### **Continuing Franchise and Other Fees**

Continuing franchise fees are recognized as revenue as the fees are earned. Related costs are expensed as incurred. Regardless of the purpose of the fees, revenue is recognized when the fee is earned and receivable. The exception is when a portion of the fee is required to be segregated and used for a specific purpose, such as advertising. The franchisor defers this amount and records it as a liability. This liability is reduced by the cost of the services received.

Sometimes, the franchisee has a period of time where bargain purchases of equipment or supplies are granted by the contract. If the bargain price is lower than other customers pay or denies a reasonable profit to the franchisor, a portion of the initial franchise fee is deferred and accounted for as an adjustment of the selling price when the franchisee makes the purchase. The deferred amount is either the difference in the selling price among customers and the bargain price, or an amount sufficient to provide a reasonable profit to the franchisor.

### **Costs**

Direct and incremental costs related to franchise sales are deferred and recognized when revenue is recorded. However, deferred costs cannot exceed anticipated future revenue, net of additional expected costs.

Indirect costs are expensed as incurred. These usually are regular and recurring costs that bear no relationship to sales.

### **Repossessed Franchises**

If, for any reason, the franchisor refunds the franchise fee and obtains the location, previously recognized revenue is reversed in the period of repossession. If a repossession is made without a refund, there is no adjustment of revenue previously recognized. However, any estimated uncollectible amounts are to be provided for and any remaining collected funds are recorded as revenue.

### **Business Combinations**

Business combinations where the franchisor acquires the business of a franchisee are accounted for in accordance with the requirements of ASC 805.

No adjustment of prior revenue is made since the financial statements are not retroactively consolidated in recording a business combination. Care must be taken to ensure that the purchase is not a repossession. If the transaction is deemed to be a repossession, it is accounted for as described in the above section.

## NOT-FOR-PROFIT ENTITIES (ASC 958)<sup>19</sup>

### PERSPECTIVE AND ISSUES

---

#### Overview

Not-for-profit entities have several characteristics that distinguish them from business entities. First, and perhaps foremost, not-for-profit entities exist to provide goods and services without the objective of generating a profit. Rather than obtaining resources by conducting exchange transactions at a profit or from capital infusions from owners, a not-for-profit organization obtains most resources from others that share its desire to serve a chosen mission—an educational, scientific, charitable, or religious goal. Although not-for-profit organizations can be “owned” or controlled by another, the ownership interest is unlike that of business entities because the “owner” cannot remove resources from the entity for personal use or gain; the resources must be used for a mission-related purpose. Examples of not-for-profit entities are: churches and religious entities, colleges and universities, health care entities, libraries, museums, performing arts entities, civic or fraternal entities, federated fund-raising entities, professional and trade associations, social clubs, research entities, cemeteries, arborets, and zoos.

Specifically excluded from the list of not-for-profit entities are entities that exist to provide dividends, lower costs, or other economic benefits directly and proportionately to their members, participants, or owners, such as mutual insurance companies, credit unions, farm or utility cooperatives, and employee benefit plans. Further, some not-for-profit entities are governmental and are required to follow the standards of the Governmental Accounting Standards Board (GASB). Governmental entities are outside of the scope of this publication. Readers instead should refer to *Wiley GAAP for Governments 2012*.

All authoritative pronouncements in the FASB codification apply to not-for-profit entities unless the pronouncement specifically excludes not-for-profit entities from its scope. Certain standards apply specifically to not-for-profit entities. Because those standards are particularly relevant to the transactions of not-for-profit entities they are discussed in this chapter.

ASC 958, *Not-for-Profit Entities*, applies specifically to not-for-profit entities that are nongovernmental entities. (ASC 958-10-05-01) It requires not-for-profit entities to depreciate their long-lived assets and to disclose balances for the major classes of assets, depreciation for the period, accumulated depreciation, and the organization’s policy for computing depreciation.

ASC 958-605 establishes standards for recognition and display of contributions received and contributions made. It requires all contributions received and made to be measured at fair value and recognized in the period the gift is made. It applies to any contribution of assets, including contributions of cash, securities, supplies, long-lived assets, use of facilities or utilities, services, intangible assets, or unconditional promises to give those items in the future.

---

<sup>19</sup> Upon implementation of ASU 2014-09, *Revenue from Contracts with Customers*, guidance for revenue and deferred revenue for this industry can also be found in ASC 606.

ASC 958-205 establishes standards for the general-purpose financial statements issued by not-for-profit entities. It defines a complete set of financial statements for most entities as a statement of financial position, a statement of activities, a statement of cash flows, and accompanying notes. It requires an organization's net assets and its revenues, expenses, gains, and losses to be classified based on the existence or absence of restrictions imposed by donors.

ASC 958-320 establishes standards for investments held by not-for-profit entities. It requires equity securities with readily determinable fair values and debt securities to be reported at fair value with the resulting holding gains and losses reported in the statement of activities. It also establishes standards for reporting investment return, including losses on donor-restricted endowment funds.

ASC 958-20 establishes standards for transfers of assets to a not-for-profit organization or a charitable trust that raises or holds contributions for others. Although it primarily affects federated fund-raising entities, community foundations, and institutionally related foundations, all entities are subject to its standards because they can be the beneficiaries of the contributions raised by those entities.

Combinations in which the acquiring entity is a not-for-profit organization, unlike combinations in which the acquiring entity is a business entity, cannot be assumed to be an exchange of commensurate value. Acquired not-for-profit entities lack owners who are focused on receiving a return on and return of their investment. Moreover, the parent or governing body of an acquired organization may place its mission effectiveness ahead of achieving maximum price when negotiating a combination agreement. Thus, when two not-for-profit entities combine, it will be necessary to determine if there was an exchange of commensurate value (in which case, standards similar to ASC 850 would be applied) or if there is a contribution inherent in the transaction that would be reported in accordance with ASC 958-605.

If there is a contribution inherent in the transaction, it would be measured as the excess of the net fair values of the identifiable assets acquired and the liabilities assumed over the fair value of the consideration exchanged. If the acquired entity is a business enterprise, the contribution inherent in a combination would be measured as the excess of the fair value of the acquired business enterprise over the cost of that business enterprise. The primary difference is that no goodwill would be recognized in most contributions of not-for-profit entities, although it would be in the contributions of business entities.

In the rare cases in which the sum of the fair values of the liabilities assumed exceeds the sum of the fair values of the identifiable assets acquired, the acquiring organization would initially recognize that excess as an unidentifiable intangible asset (goodwill).

ASC 954 applies to providers of health care services, including hospitals, nursing homes, medical clinics, continuing care retirement communities, health maintenance entities, home health agencies, and rehabilitation facilities. It discusses the aspects of financial statement preparation and audit particularly relevant to the entities within its scope.

ASC 958-805, *Not-for-Profit Entity—Business Combinations*, establishes standards for determining whether a combination of not-for-profit entities is a merger or an acquisition, describes the carryover method of accounting (for a merger) and the acquisition method of accounting (for an acquisition), and notes related disclosures.

ASC 958-810 establishes standards for consolidation by not-for-profit entities of investments in for-profit entities and other not-for-profit entities. It also describes the disclosures required when related entities are not consolidated because the relationship does not meet the criteria of control and economic benefit.

ASC 958-720 establishes standards for the functional classification of expenses incurred in activities that combine program or management and general components with fund-raising. It

requires that all costs of the combined activity be classified as fund-raising expenses unless three criteria—purpose, audience, and content—are met.

ASC 954-815 clarifies that the performance indicator required to be reported in the financial statements of a not-for-profit health care organization is analogous to income from continuing operations of a business (for-profit) enterprise.

This chapter contains a highly summarized discussion of accounting and reporting standards for not-for-profit entities. Readers who desire a more in-depth discussion should refer to *Wiley Not-for-Profit GAAP*.

## DEFINITIONS OF TERMS

---

**Agent.** An entity that acts for and on behalf of another. For example, a not-for-profit organization acts as an agent for and on behalf of a donor if it receives resources from the donor and agrees to transfer the resources or the return generated by investing those resources to another entity named by the donor. Similarly, a not-for-profit organization acts for and on behalf of a beneficiary if it agrees to solicit contributions in the name of the beneficiary and distribute any contributions thereby received to the beneficiary.

**Collections.** Works of art, historical treasures, or similar assets that meet the following three criteria: (1) they are held for public exhibition, education, or research in service to the public rather than for financial gain; (2) they are protected, kept unencumbered, cared for, and preserved; and (3) they are subject to a policy requiring that the organization use the proceeds from the sale of an item to acquire another item for the collection.

**Contribution.** A voluntary and unconditional transfer of assets to an entity (the donee) from another entity that does not expect to receive equivalent value in exchange and does not act as an owner (the donor). A contribution can also take the form of a settlement or cancellation of the donee's liabilities.

**Designated Net Assets.** Unrestricted net assets subject to self-imposed limits by action of the governing board. Designated net assets may be earmarked for future programs, investment, contingencies, purchase or construction of fixed assets, or other uses.

**Donor-imposed Condition.** A donor stipulation that specifies a future and uncertain event whose occurrence (or failure to occur) gives the donor the right of return of resources it has transferred or releases the donor from the obligation to transfer assets in the future. For example, "I will contribute one dollar for each dollar raised during the month of July in excess of \$10,000," includes a donor-imposed condition. If only \$9,000 is raised, the donor has no obligation to transfer assets.

**Donor-imposed Restriction.** A donor stipulation that specifies a use for contributed resources that is narrower than the limitations that result from the nature of the organization, the environment in which it operates, and the purposes specified in its articles of incorporation, bylaws, or similar documents. A restriction may be temporary or permanent. A temporary restriction is a restriction that will expire (be satisfied) either by an action of the organization (such as spending the resources for the purpose described by the donor) or by the passage of time. A permanent restriction never expires. Instead, it requires that the contributed resources be maintained permanently, although it allows the organization to spend the income or to use the other economic benefits generated by those resources.

**Endowment Fund.** A fund of cash, securities, or other assets held to provide income for the support of a not-for-profit organization. A donor-restricted endowment fund is a fund established by a donor, specifying that the gift must be invested permanently to generate support (a permanent

endowment fund) or invested for a specified period of time (a term endowment fund). A quasi-endowment fund is a fund established by an organization's governing board to provide income for a long, but usually unspecified, period of time. A quasi-endowment fund may be created from unrestricted resources or from resources that are for a restricted purpose but not required by the donor to be invested.

**Intermediary.** An organization that acts as a facilitator for the transfer of resources between two or more other parties. An intermediary generally does not take possession of the assets transferred.

**Natural Expense Classification.** A method of grouping expenses according to the kinds of economic benefits received in incurring those expenses. Examples of natural expense classifications include salaries and wages, employee benefits, supplies, rent, and utilities.

**Net Assets.** The residual interest in the assets of a not-for-profit organization that remains after deducting its liabilities. Net assets are divided into three categories—permanently restricted, temporarily restricted, and unrestricted—based on the nature and existence (or absence) of donor-imposed restrictions. Permanently restricted net assets are the portion of net assets that result from contributions and other inflows of resources that are subject to permanent donor-imposed restrictions. Permanently restricted net assets are not permitted to be expended or used up. Temporarily restricted net assets are the portion of net assets that result from contributions and other inflows of resources that are subject to temporary donor-imposed restrictions. They are permitted to be expended or used up as long as their use is consistent with the limitations imposed by the donor. Unrestricted net assets are the portion of net assets that are neither permanently nor temporarily restricted by donors. The use of unrestricted net assets is subject only to the limitations imposed by the nature of the organization, its articles of incorporation or bylaws, and the environment in which it operates.

**Not-for-Profit Entity.** An entity that possesses the following characteristics, in varying degrees, that distinguish it from a business entity:

1. Contributions of significant amounts of resources from resource providers who do not expect commensurate or proportionate pecuniary return
2. Operating purposes other than to provide goods or services at a profit
3. Absence of ownership interests like those of business entities.

Entities that clearly fall outside this definition include the following:

1. All investor-owned entities
2. Entities that provide dividends, lower costs, or other economic benefits directly and proportionately to their owners, members, or participants, such as mutual insurance entities, credit unions, farm and rural electric cooperatives, and employee benefit plans.

**Promise to Give.** A written or oral agreement to contribute resources to another entity at a future date. A promise to give can be either conditional or unconditional. The obligation of the donor who makes a conditional promise to give is dependent on the occurrence (or failure to occur) of a donor-imposed condition. An unconditional promise to give depends only on the passage of time or demand by the donee for payment of the promised assets.

**Spending Rate.** The portion of total return on investments used for fiscal needs of the current period, usually used as a budgetary method of reporting returns of investments. It is usually measured in terms of an amount or a specified percentage of a moving average market value. Typically, the selection of a spending rate emphasizes the use of prudence and a systematic formula to determine the portion of cumulative investment return that can be used to support fiscal

needs of the current period and the protection of endowment gifts from a loss of purchasing power as a consideration in determining the formula to be used.

**Trustee.** An entity that holds and manages assets for the benefit of a specified beneficiary in accordance with a charitable trust agreement.

**Voluntary Health and Welfare Organization.** An organization formed for the purpose of attempting to prevent or solve health and welfare problems of society, and in many cases, of particular individuals.

## CONCEPTS, RULES, AND EXAMPLES

---

### The Reporting Entity

Not-for-profit entities are exempted from the provisions of ASC 850 and ASC 350. Consequently the financial statement preparer must consider the applicability of ASC 958-810 in determining the reporting entity. It provides guidance on reporting investments in majority-owned for-profit subsidiaries, investments in common stock in which the not-for-profit organization owns a 50% or less voting interest, and certain relationships with other not-for-profit entities.

If a not-for-profit organization has a controlling financial interest in a for-profit organization (generally a majority voting interest), it follows the standards in ASC 810. Control of a related, but separate, not-for-profit entity in which the reporting entity has an economic interest may take forms other than a majority ownership interest, sole corporate membership, or majority voting interest in the board of the other entity. For example, control may be through contract or affiliation agreement. In circumstances such as these, consolidation is permitted but not required. Consolidation is, however, encouraged if *both* the following criteria are met:

1. The reporting entity controls a separate not-for-profit entity that it has an economic interest in, and that control is not control through either of the following means:
  - a. A controlling financial interest in the other not-for-profit through direct or indirect ownership of a majority voting interest
  - b. A majority voting interest in the board of the other not-for-profit.
2. Consolidation would be meaningful.

ASC 810 does, however, include an antiabuse provision that provides that the scope exemption does not apply if the not-for-profit organization is being used by a business enterprise in a manner similar to a variable interest entity in order to circumvent ASC 810. Variable interest entities are discussed at length in the chapter on ASC 810.

If a not-for-profit organization has significant influence over the operating and financial policies of the investee (generally owns 20% or more but less than 50% of the voting stock), it either follows the standards in ASC 323 or reports the investment at fair value.

Different combinations of control and economic interest determine the appropriate accounting for relationships with other not-for-profit entities, as shown in the following table. Control is defined for this purpose as the direct or indirect ability to determine the direction of management and policies through ownership, contract, or otherwise. Economic interest is defined as an interest in another entity that exists if (1) the other entity holds or utilizes significant resources that must be used for the purposes of the reporting organization, either directly or indirectly by producing income or providing services, or (2) the reporting organization is responsible for the liabilities of the other entity.

<u>Control?</u>	<u>Economic interest?</u>	<u>Standards</u>
Yes, via ownership of a majority voting interest	Yes	Consolidate.
Yes, via ownership of a majority voting interest	No	Consolidate.
Yes, via majority voting interest in the board of the other entity, as a majority owner	Yes	Consolidate.
Yes, via majority voting interest in the board of the other entity, as a majority owner	No	Consolidation is prohibited, and disclosure required.
Yes, via a contract or an affiliation agreement	Yes	Consolidation is permitted, but not required.
Yes, via a contract or an affiliation agreement	No	Consolidation is prohibited, and disclosure required.
No	Yes	Consolidation is prohibited, and disclosure required.
No	No	Consolidation is prohibited. No disclosure required.

Certain disclosures are necessary if consolidated statements are not presented. If consolidated statements are not presented when consolidation is permitted, but not required, the not-for-profit organization must disclose the identity of the other organization, the nature of the relationship, and summarized financial data in addition to the information required by ASC 850. If consolidation is prohibited, the not-for-profit organization must disclose the information required by ASC 850.

### Complete Set of Financial Statements

Financial statements are intended to help donors, creditors, and others who provide resources to a not-for-profit organization assess the services provided by the not-for-profit organization and its ability to continue to provide those services. The statements should also help them assess whether management has properly discharged its stewardship responsibilities and whether it has performed satisfactorily in its other management duties.

ASC 958, *Not-for-Profit Entities*, requires all not-for-profit entities to present a statement of financial position, a statement of activities, a statement of cash flows, and notes to the financial statements any time it purports to present a complete set of financial statements. In addition, voluntary health and welfare entities are required to present a statement of functional expenses as an additional basic financial statement. In most ways, the content and format of those financial statements are similar to the financial statements prepared by business enterprises.

However, three major differences between not-for-profit entities and business enterprises cause differences in the content and format of financial statements of not-for-profit entities. First, there is no profit motive in the nonprofit sector, and thus no single indicator of performance comparable to a business enterprise's net income or bottom line. In fact, the best indicators of the performance of a not-for-profit organization are generally not measurable in dollar amounts but rather in the reader's qualitative judgment about the effectiveness of the organization in achieving its mission. Nevertheless, dollars are the language of financial reporting. Information to help assess performance is provided in financial statements (1) by reporting revenues and expenses gross rather than net, and (2) by classifying expenses based on the mission-related programs and supporting activities they sustain, rather than by their natural classifications (salaries, utilities, depreciation, etc.).

Second, because the bottom line of a not-for-profit organization's statement of activities is not a performance measure, but simply a change in net assets for the reporting period, there is no need

for not-for-profit entities to distinguish between components of comprehensive income as business enterprises do. All revenues, expenses, gains, and losses are reported in a single statement rather than being divided between an income statement and a statement of other comprehensive income.

Third, not-for-profit entities receive contributions, a type of transaction that is without counterpart in business enterprises. Those contributions often are subject to donor-imposed restrictions which can affect the types and levels of service that a not-for-profit organization can offer. Because donor-imposed restrictions are prevalent, recurring, and, in some cases, permanent, financial reporting by not-for-profit entities needs to reflect the nature and extent of donor-imposed restrictions and changes in them that occur during the reporting period.

If the reporting entity is a not-for-profit health care organization, the standard requires it to include within its statement of activities an intermediate subtotal called a performance indicator. ASC 954-815 clarifies that the performance indicator is analogous to income from continuing operations of a business (for-profit) enterprise, and thus would exclude items that are required to be reported in or reclassified from other comprehensive income, the effect of discontinued operations, the cumulative effect of accounting changes, transactions with owners acting in that capacity, and equity transfers from entities that control the reporting entity, are controlled by the reporting entity, or are under common control with the reporting entity. The performance indicator also excludes restricted contributions, contributions of and reclassifications related to gifts of long-lived assets, unrealized gains and losses on investments not restricted by donors or law (except for investments classified as trading), and investment returns restricted by donors.

### **Net Assets and Changes in Net Assets**

The nature and extent of donor-imposed restrictions are reported in the statement of financial position by distinguishing between the portions of net assets that are permanently restricted, temporarily restricted, and unrestricted. Separate line items on the face of that statement or details in the notes to the financial statements are used to meet the requirement to disclose the amounts for different types of permanent and temporary restrictions.

Changes in donor-imposed restrictions are reported in the statement of activities. The organization's revenues, expenses, gains, and losses for the period are classified into the three classes of net assets so that the statement of activities reports amounts for the change in permanently restricted net assets, the change in temporarily restricted net assets, and the change in unrestricted net assets, as well as the change in net assets in total. Transactions and events that do not change the net assets of the organization as a whole, but only their classification, are reported separately as reclassifications. Reclassifications are events that simultaneously increase one class of net assets and decrease another. For example, unrestricted net assets increase and temporarily restricted net assets decrease when the purchase of a long-lived asset fulfills a donor-imposed restriction to acquire long-lived assets with the gift (sometimes referred to as a release of restrictions).

Not-for-profit entities often use fund accounting as a tool for tracking compliance with donor-imposed restrictions and internal designations. Fund accounting is a system of recording resources whose use is limited either by donors, granting agencies, governing boards, law, or legal covenants. A separate fund (a self-balancing group of accounts composed of assets, liabilities, and net assets) is maintained for each purpose limitation. For external reporting, a fund may be classified entirely in one net asset class or it may need to be allocated among two or three classes. (For an example of the allocations necessary to restate a fund balance to net asset classes, see the discussion of endowment funds in "Investments" in this section.)

## Reporting Revenues

Revenues are reported in the statement of activities as increases in unrestricted net assets unless the use of the resources received is subject to a donor-imposed restriction. Thus, contribution revenues increase unrestricted net assets, temporarily restricted net assets, or permanently restricted net assets, depending on the existence and nature of donors' restrictions. Revenues from most exchange transactions (such as sales of goods or services) are classified as unrestricted.

Revenues from exchange transactions only increase restricted net asset classes if a preexisting donor-imposed restriction limits the use of the resources received. For example, if a donor contributes a car to the local library and requires that the proceeds from the sale of the car be used to purchase children's books, the proceeds from the sale of the car (an exchange transaction) increase temporarily restricted net assets. Investment income and gains (which are also exchange transactions) increase unrestricted net assets unless a donor required that the gift be invested and the investment return used for a restricted purpose. For example, assume a donor contributes securities worth \$85,000 to a zoo, requires that all dividends and gains be retained and reinvested until the accumulated value is \$100,000, and states that the \$100,000 must be maintained as a permanent endowment fund, the income of which is to be used for the purchase of animals. In the early years of the endowment, before the accumulated value reaches \$100,000, investment income and gains increase permanently restricted net assets. Investment income and gains earned after the accumulated value of the fund reaches \$100,000 increase temporarily restricted net assets with the restriction expiring upon use of those funds to purchase animals.

ASC 958-605, *Not-For-Profit Entities—Revenue Recognition*, requires contributions to be recognized as revenue at the time of the gift and measured at the fair value of the contributed assets regardless of the form of the assets contributed. Donor-imposed restrictions do not change the timing of recognition of a contribution. Donor-imposed restrictions, or the absence of them, affect only a contribution's classification as an increase in permanently restricted net assets, temporarily restricted net assets, or unrestricted net assets. Donor-imposed conditions, however, affect the timing of recognition. Because a contribution is an unconditional transfer, a transfer of assets subject to donor-imposed conditions is not a contribution yet, although it may become one at a future date. Conditional transfers are not recognized as contribution revenues until the conditions are substantially met. Thus, the distinction between donor-imposed restrictions and donor-imposed conditions is very important to the timing of recognition. If a donor's stipulations do not clearly state whether a gift depends on meeting a stated stipulation and the ambiguity cannot be resolved by communicating with the donor or by examining the circumstances surrounding the gift, a transfer is presumed to be conditional.

Unconditional promises to give cash or other assets are recognized in financial statements when the promise is made and received, provided that there is sufficient evidence in the form of verifiable documentation (written, audio, or video). If payments of the promises are due in future periods, the promise has an implied time restriction that expires on the date the payment is due. Thus, unless circumstances surrounding the receipt of the promise indicate that the donor intended the gift to support the current period's activities, unconditional promises increase temporarily restricted net assets. A present value technique is used to measure unconditional promises to give, although short-term promises (due in less than one year) may be reported at net realizable value. Conditional promises are not recognized as revenue until the conditions are substantially met; however, they are required to be disclosed in notes to the financial statements.

In a manner similar to recognizing promises to give, a beneficiary recognizes contributions held on its behalf by an agent, trustee, or intermediary. For example, if the assets held by the agent

were transferred subject to a condition that is not yet met, the beneficiary does not recognize its potential rights to the assets held by the agent. If a beneficiary has an unconditional right to receive cash flows from a charitable trust or other pool of assets, the beneficiary recognizes its rights when the beneficial interest is created and measures the rights using the present value of the estimated expected cash flows. However, if the beneficiary and the agent, trustee, or intermediary are financially interrelated entities, the beneficiary reports its rights to the assets held using a method similar to the equity method of accounting for investments. (For further discussion, see “Transfers Received as an Agent, Trustee, or Intermediary” in this section.)

The value of volunteer services received by the organization is recognized in certain circumstances. Contributed services that create or improve a nonfinancial asset (such as building a shed or replacing a roof) are recognized as revenue as contributions either by valuing the hours of service received or by measuring the change in the fair value of the nonfinancial asset created or improved. Other contributed services are recognized only if they meet all three of the following criteria: (1) they require specialized skills, (2) they are provided by persons possessing those skills, and (3) they would typically need to be purchased if not provided by donation. If volunteer services neither meet those three criteria nor create or improve nonfinancial assets, they cannot be recognized in the organization’s financial statements. However, entities are required to describe the programs or activities for which contributed services are used, the nature and extent of services received for the period (regardless of whether those services are recognized), and disclose the amount recognized as revenues.

An organization that maintains works of art, historical treasures, and similar assets in collections, as defined, does not recognize gifts of items that are added to its collections unless it also capitalizes its collections. However, gifts that are not added to collections or items given to entities that do not maintain collections in accordance with the definition are recognized as revenues and measured at the fair value of the assets received.

### **Reporting Expenses**

Expenses are recognized in the statement of activities as decreases in unrestricted net assets. Financing an expense with donor-restricted resources does not make the expense restricted; instead, it releases the restriction on the restricted resources, causing a reclassification to be reported in the statement of activities.

Expenses must be reported by functional classifications either on the face of the statement of activities or in the notes to the financial statements. The functional classifications describe the major classes of program services and supporting activities of an organization. Program services are the mission-related activities of the organization that result in goods and services being distributed to clients, customers, or members. They are the activities that are the major purpose of and the major output of the organization. For example, a not-for-profit organization with the mission of enhancing the lives of the community’s senior citizens might have senior center, home visits, transportation services, and home maintenance as its program expense classifications. Supporting activities are all activities of a not-for-profit organization other than program services. Fund raising expenses and management and general are two common supporting activity classifications.

ASC 958-205 encourages, but does not require, most not-for-profit entities to provide an analysis of expenses by natural classification. Information about expenses by natural expense classifications (salaries, benefits, rent, depreciation, and so forth) can help readers of the financial statements understand the mix of fixed and discretionary costs incurred by the organization. Only voluntary health and welfare entities are required to report information about expenses by both

functional and natural classification. Those entities must provide that information in a matrix format in a statement of functional expenses. (ASC 958-205-45-6)

ASC 958-360, *Not-for-Profit Entities—Property, Plant, and Equipment*, requires the depreciation of land, buildings, and equipment used by not-for-profit entities. An exception to that requirement is provided for certain works of art, historical treasures, and similar assets. If a not-for-profit organization can demonstrate both (1) that an asset individually has cultural, historical, or aesthetic value worth maintaining in perpetuity, and (2) that the organization has the ability to protect and preserve that value essentially undiminished and is doing so, depreciation need not be recognized. Depreciation expense is a natural expense classification that must be allocated to programs and supporting activities in reporting expenses by functional classification.

Many not-for-profit entities solicit contributions as part of conducting activities that also serve their program or management and general functions. For example, an organization that has a mission of reducing the incidence of cancer might conduct a direct mail campaign and include in an envelope a listing of lifestyle changes that will lessen the risks of cancer and a request for contributions. When a fund-raising activity is conducted in conjunction with an activity that serves a program or other support purpose, the activity is referred to as a joint activity. Users of the financial statements of not-for-profit entities are particularly interested in the extent to which the organization is able to minimize its fund-raising and management and general costs. Because neither of these types of costs directly benefit the beneficiaries of the organization's programs, successful entities attempt to minimize them as a percent of the organization's support and revenue. Since the effectiveness of the management of a not-for-profit organization is often judged on operating metrics of this nature, there is a natural incentive for management to maximize the portion of the costs of these joint activities that is characterized as program expenses.

ASC 958-720 established standards for reporting the costs of joint activities. It begins with the presumption that the costs of a joint activity are reportable as fund-raising expenses. To overcome that presumption, three criteria must be met: purpose, audience, and content. If all three of the criteria are met, the costs of a joint activity are to be charged as follows:

- Costs identifiable with a particular function are charged to that function.
- Joint costs are allocated between fund-raising and the appropriate program or management and general function.

Joint costs are the costs of conducting joint activities that are not directly identifiable with a particular component of the activity. Joint costs might include the costs of salaries, professional fees, paper, printing, postage, event advertising, telephones, broadcast airtime, and facility rentals.

Determining whether all three criteria are met is complicated because the purpose and audience criteria have additional tests within them. The purpose test includes a call to action test, a compensation or fees test, a similar scale and same medium test, and another evidence test. The audience criterion includes a prior donor test, an ability and likelihood to contribute test, and a need to use or reasonable potential for use test. Failure of one of the additional tests often causes the activity to fail the criterion.

If any of the three criteria is not met, all costs of the joint activity must be reported as fund-raising expense. "All costs" includes the costs that would have been considered program or management and general if they had been incurred in a different activity. There is an exception to the rule that all costs are charged to fund-raising expense if one or more of the criteria is not met. The costs of goods or services provided in an exchange transaction (sometimes referred to as a quid pro quo contribution) that is part of the joint activity are charged to cost of goods sold rather than fund-raising expense. For example, the costs of direct donor benefits, such as the value of

items sold at a fund-raising auction or meals served at a fund-raising dinner, are not charged to fund-raising expenses.

ASC 958-720 requires that the method used to allocate the joint costs be rational and systematic and that it result in a reasonable allocation of costs. The method selected is to be applied consistently given similar facts and circumstances. No particular method of allocation is required by the standard, but three allocation methods are illustrated: the physical units method, the relative direct cost method, and the standalone joint-cost-allocation method.

Entities that allocate joint costs are required to disclose the types of activities in which joint costs have been incurred, a statement that the costs have been allocated, and the total amount of joint costs allocated, and the portion of joint costs allocated to each functional expense category. The standard also encourages disclosure of the amount of joint costs for each type of joint activity.

### Transfers Received as an Agent, Trustee, or Intermediary

ASC 958-20 and ASC 958-605 establish standards for transactions in which a donor makes a contribution by using an agent, trustee, or intermediary. (Agents, trustees, and intermediaries are referred to as recipient entities.) The donor transfers assets to the recipient organization. The recipient organization accepts the assets from the donor and agrees to use the assets on behalf of or transfer the assets, their investment return, or both to another entity—the beneficiary—named by the donor. It also establishes standards for transactions that take place in a similar manner but are not contributions because the transactions are revocable, repayable, or reciprocal. It does not set standards for recipient entities that are trustees.

In general, a recipient organization reports a liability if it accepts assets from a donor and agrees to use those assets on behalf of or transfer those assets to another organization or individual specified by the donor. When it subsequently spends the assets on behalf of the beneficiary or transfers the assets, their return, or both to the beneficiary, the nonprofit organization reduces the liability it recorded earlier. If the assets received from the donor are donated materials, supplies, or other nonfinancial assets, the recipient organization may choose either to (1) report the receipt of the assets as liability to the beneficiary concurrent with recognition of the assets received, or (2) not to report the transaction at all. The choice is an accounting policy that must be applied consistently from period to period and disclosed in the notes to the financial statements.

If the donor explicitly grants the recipient organization variance power, the recipient organization, rather than the beneficiary, recognizes contribution revenue. Variance power is the unilateral power to direct the transferred assets to an entity other than the specified beneficiary. Unilateral power means that the recipient organization does not have to contact the donor, the beneficiary, or any other interested party in order to substitute a different beneficiary. Variance power must be granted by the instrument transferring the assets.

If the recipient organization and the specified beneficiary are financially interrelated entities, the recipient organization reports contribution revenue and the specified beneficiary recognizes its interest in the net assets of the recipient organization using a method similar to the equity method of accounting for investments in common stock. Entities are financially interrelated if the relationship between them has both of the following characteristics: (1) one organization has the ability to influence the operating and financial decisions of the other, and (2) one organization has an ongoing economic interest in the net assets of the other. The ability to influence the operating and financial decisions of the other can be demonstrated in several ways: (1) the entities are affiliates as defined in ASC 850, *Related-Party Disclosures*, (2) one organization has considerable representation on the governing board of the other, (3) the charter or bylaws of one organization limit its activities to those that are beneficial to the other, or (4) an agreement

between the entities allows one organization to actively participate in the policymaking processes of the other. An ongoing economic interest in the net assets of another is a residual right to the other organization's net assets that results from an ongoing relationship. A common example of financially interrelated entities is a foundation that exists to raise, hold, and invest assets for a specific beneficiary that it supports.

In addition to establishing standards for contributions transferred to beneficiaries via agents, trustees, and intermediaries, ASC 958-20 sets standards for transfers that take place in a similar manner but are not contributions because the terms of the transfer or the relationships between the parties make the transfer revocable, repayable, or reciprocal. Transfers are recognized by the recipient organization as liabilities if one or more of the following situations are present: (1) the transfer is subject to the transferor's right to redirect the transferred assets to another beneficiary, (2) the transfer is accompanied by the transferor's conditional promise to give, (3) the transferor controls the recipient organization and specifies an unaffiliated beneficiary, or (4) the transferor specifies itself or its affiliate as the beneficiary of a transfer that is not an equity transaction. An equity transaction is a transfer that has all of the following terms: (1) the transferor specifies itself or its affiliate as beneficiary, (2) the transferor and the recipient organization are financially interrelated entities, and (3) neither the transferor nor its affiliate expects payment of the transferred assets (although payment of investment return is allowable). Equity transactions are reported by the recipient organization as a separate line item in the statement of activities.

### **Investments and Endowment Funds**

ASC 958-320 requires investments in equity securities with readily determinable fair values and all debt securities to be reported at fair value. Although the standard applies to the same securities that ASC 320 covers for business enterprises, accounting for the resulting gains and losses is different than specified by that standard. Gains and losses (both realized and unrealized) are reported in a not-for-profit organization's statement of activities.

ASC 958 establishes standards for reporting other investments. The appropriate standards to apply depend on whether the not-for-profit organization is a college or university, a voluntary health and welfare organization, a health care organization, or another type of not-for-profit organization. Most entities have the option of reporting their other investments at either cost or at the lower of cost or market.

Not-for-profit health care entities are required to apply the provisions of ASC 815 in the same manner as business enterprises, including the provisions pertaining to cash flow hedge accounting. The gain or loss items that affect a business enterprise's income from continuing operations similarly affect the not-for-profit health care organization's performance indicator, and the gain or loss items that are excluded from a business enterprise's income from continuing operations (such as items reported in other comprehensive income) are to be excluded from the performance indicator.

Many of the investments held by not-for-profit entities are held as the investments of endowment funds. Endowment funds generally are established by gifts from donors who desire to provide support for the organization permanently (a permanently restricted endowment fund) or for a specified period of time (a term endowment fund). In addition, a governing board may determine that certain resources be invested and that only the return generated be spent by the organization. These board-designated amounts are referred to as quasi-endowment funds or funds functioning as endowment. The net assets of an endowment fund are classified in accordance with the restrictions placed on the resources by donors, if any. Because a donor can place different restrictions on each source of the net assets (original gift, investment gains and losses, and investment income), each source must be examined separately to achieve the proper classification.

Each source is unrestricted unless its use is temporarily or permanently restricted by the donor or by a law that extends the donor's restriction to the source. Thus, the net assets of an endowment fund created by the governing board from a large unrestricted bequest (or from unrestricted net assets) are classified as unrestricted because no donor was involved in the transaction of creating the endowment fund and all amounts transferred to that fund are free of donor-imposed restrictions.

In contrast, assume that a donor contributes \$50,000 to a museum and stipulates that the gift be invested in perpetuity and the investment income be used to purchase works of art. The donor further stipulates that any gains on the investment be added to the original gift and invested in perpetuity. The donor's original gift (\$50,000) increases permanently restricted net assets because of the stipulation that the gift be invested in perpetuity. The income earned by the investment of the gift increases temporarily restricted net assets. When works of art are purchased, the restriction on net assets resulting from the income is fulfilled and the net assets are reclassified to unrestricted net assets. The realized and unrealized gains from investment of the gift increase permanently restricted net assets because the donor required that those gains also be reinvested in perpetuity.

In most cases, the classification of the original gift and the investment income is straightforward because donors explicitly state the time and purpose restrictions on them. Classification of gains and losses on the investments is not as clearly determinable unless the donor explicitly states how gains are to be used and whether losses must be restored immediately from other sources, from future gains on the investments, or not at all. However, donors are often silent in their agreements about those matters.

In the absence of explicit donor restrictions, the law in most states provides some direction about the restrictions on investment gains of donor-restricted endowment funds. The Uniform Management of Institutional Funds Act (UMIFA) extends certain donor restrictions to the net appreciation (accumulated net gains) of donor-restricted endowment funds. In states that have adopted UMIFA, net appreciation is expendable unless the donor states otherwise. UMIFA provides that the net appreciation can be spent for the uses and purposes for which the endowment fund was established. Thus, unless the donor specifies otherwise, gains increase unrestricted net assets if the endowment's income is not restricted by the donor, and gains increase temporarily restricted net assets if the endowment's income is temporarily restricted by the donor. Assume in the earlier example of the \$50,000 gift to the museum that the donor was silent about the use of gains earned by investing the original gift. In a state that has adopted UMIFA, the accumulated gains on the endowment fund would be restricted to the purchase of artwork because the law requires that the donor's restriction be extended to those gains. The restrictions on those temporarily restricted net assets expire when the museum purchases works of art even if the money to purchase the work of art is not withdrawn from the fund. Thus, this single endowment fund can be composed of permanently restricted net assets (the original \$50,000 gift), temporarily restricted net assets (the gains on which restrictions have not yet been met), and unrestricted net assets (the gains on which restrictions have been met).

ASC 958-205 has expanded certain disclosure requirements applicable to endowment funds. It stipulates that not-for-profit entities that are subject to an enacted version of the Uniform Prudent Management of Institutional Funds Act of 2006 (UPMIFA, a modernized version of the Uniform Management of Institutional Funds Act of 1972 [UMIFA], the model act on which 46 states and the District of Columbia had based their primary laws governing the investment and management of donor-restricted endowment funds by not-for-profit entities) are required to classify a portion of a donor-restricted endowment fund that are of a perpetual duration as being permanently restricted net assets. The amount that is to be classified as permanently restricted should be the amount of the

fund (1) that is required to be permanently retained due to an explicit stipulation by the donor, or (2) that in the absence of such donor stipulations, the organization's governing board determines must be permanently restricted to comply with applicable laws.

Losses incurred on the investments of the funds should not reduce the portion of the donor-restricted endowment fund that is to be classified as permanently restricted net assets, unless this is a requirement of the donor. Furthermore, the amount of permanently restricted net assets is not to be reduced by an organization's appropriations from the fund.

A not-for-profit organization should classify the portion of the funds that are not classified as permanently restricted net assets as temporarily restricted net assets until they are appropriated for expenditure by the organization, unless the gift instrument states otherwise. This is in accordance with the stipulation in subsection 4(a) of UPMIFA that requires, "unless stated otherwise in the gift instrument, the assets in an endowment fund are donor-restricted assets until appropriated for expenditure by the institution."

According to ASC 958-205, a not-for-profit organization, whether or not subject to UPMIFA, is to disclose information that will enable users of its financial statements to understand the net asset classification, net asset composition, changes in net asset composition, spending policies, and related investment policies of its endowment funds. Therefore, at a minimum, the following disclosures should be made:

1. A description of the governing board's interpretation of the law that supports the organization's net asset classification of donor-restricted endowment funds.
2. A description of the organization's endowment spending policies.
3. A description of the organization's endowment investment policies.
4. The make-up of the organization's endowment by net asset class at the end of the period. These amounts should be presented in total, as well as by endowment fund and should separately show donor-restricted endowment funds from board-designated endowment funds.
5. A reconciliation of the beginning and ending balance of the organization's endowment, in total and by net asset class.
6. Information about the net assets of its endowment funds such as:
  - a. The nature and types of any permanent restrictions or temporary restrictions.
  - b. The aggregate amount of the deficiencies for all donor-restricted endowment funds where the fair value of the assets at the reporting date is less than the level required in the donor stipulations or law.

ASC 958-320 requires that losses on the investments of an endowment fund reduce temporarily restricted net assets to the extent that temporary restrictions on net appreciation have not yet been met before the loss occurs. The remainder of the loss, if any, reduces unrestricted net assets. If the losses reduce the value of the fund below the level required by the donor or by law, future gains that restore the value to the required level are classified as unrestricted net assets.

Expanding on the earlier example, assume that several years after the fund was established, the assets of the fund have increased in value to \$65,000. Assume also that the classification of the net assets in the fund is: \$50,000 permanently restricted (the original gift), \$10,000 temporarily restricted (accumulated gains on which the restrictions have not been met), and \$5,000 unrestricted (gains on which the restriction was met by purchasing a work of art with unrestricted funds in years after the inception of the fund). A market correction causes the value of the investments to fall to \$58,000. The \$7,000 loss decreases temporarily restricted net assets from

\$10,000 to \$3,000. Assume that a further market correction reduces the value of the investments another \$9,000 from \$58,000 to \$49,000. The \$9,000 loss reduces temporarily restricted net assets by \$3,000 (the amount remaining after the \$7,000 loss decreased the original \$10,000) and reduces unrestricted net assets by \$6,000. After recording the loss, the classification of the \$49,000 value of the endowment fund would be: \$50,000 permanently restricted (the original gift) and (\$1,000) deficit in unrestricted net assets. A not-for-profit organization is required to disclose the amount by which the value of the endowment fund is less than the level required by the donor.

Continuing the example, assume that the next year the value of the investments increases from \$49,000 to \$53,000. The \$4,000 gain increases unrestricted net assets by \$1,000 (the restoration of the deficit) and increases temporarily restricted net assets by \$3,000. After the gain, the net assets of the endowment fund are \$50,000 permanently restricted (the original gift) and \$3,000 temporarily restricted for the purchase of works of art.

### Collections

Not-for-profit entities are allowed an exception to the normal requirement to capitalize purchases of property, plant, and equipment. If a not-for-profit organization maintains collections of works of art, historical treasures, or similar assets in the manner defined in the Master Glossary, it can choose whether it will capitalize and report those collections in its statement of financial position. To qualify for the exception, an organization must (1) hold the items for public exhibition, education, or research in service to the public rather than for financial gain, (2) protect the items, keep them unencumbered, care for them, and preserve them, and (3) use the proceeds from the sale of any items to acquire other items for the collection. If an organization meets those criteria, it can choose one of the following policies: (1) capitalize its collections, (2) capitalize only collection items acquired after the adoption of ASC 958-605, or (3) not capitalize any collections. An organization cannot selectively choose to capitalize only certain collections.

If an organization does not capitalize its collections, transactions involving collection items must be reported separately on the face of its statement of activities. Similarly, if an organization chose to capitalize its collections prospectively when it adopted ASC 958-605, it would separately report transactions involving collection items not previously capitalized. Descriptions of the collections, including information about stewardship policies and items *deaccessed* (removed from the collection), must be included in notes to the financial statements by entities that do not capitalize their collections or that capitalize them prospectively.

Capitalization is required of works of art, historical treasures, and similar assets that are not collection items, even if those items are held by entities that regularly maintain collections. Thus, if a museum does not capitalize its collections and it is given a work of art that it does not add to its collection (perhaps because it duplicates other collection items), the museum would recognize that contribution and report the asset in its statement of financial position as a work of art held for sale.

### Split-Interest Agreements

A split-interest agreement is an arrangement in which a donor transfers assets to a not-for-profit organization or to a charitable trust and requires that the benefits of ownership of those assets be split among two or more beneficiaries. Charitable gift annuities, annuity trusts, charitable remainder unitrusts, charitable lead trusts, and pooled (or life) income funds are examples of split-interest agreements. ASC 958 provides guidance for reporting the initial gifts that create these funds and the annual adjustments necessary to report them properly. Accounting for split-interest gifts is a complex area; the following discussion is highly summarized and overly simplified.

Not-for-profit entities are required to report their interests in irrevocable split-interest agreements. If another party, such as a bank, holds the assets, a not-for-profit organization recognizes its interest as an asset and contribution revenue and measures its interest at fair value, usually based on the present value of the cash flows to be received. If the not-for-profit organization holds the assets and is also a beneficiary of the agreement, it reports the fair value of the assets received from the donor as its assets and reports the actuarially computed present value of the payments to be made to other beneficiaries as its liability. The difference between the two amounts is the contribution received by the not-for-profit organization. Each year thereafter, the liability to the beneficiaries is recomputed based on revaluations of the amounts to be paid, the expected lives of the beneficiaries, and other relevant actuarial assumptions.

The net assets resulting from most split-interest agreements are classified as temporarily restricted because they are subject to time restrictions and purpose restrictions. The net assets are time-restricted either because the distributions are not yet due (when amounts are held by a third party) or because the contribution amount cannot be used by the not-for-profit organization until the death of the beneficiary or some other future specified date. However, the net assets are classified as permanently restricted if the donor has permanently restricted the organization's use of the assets. (For example, the donor requires that the not-for-profit organization use the remaining assets to create a permanent endowment fund at the end of the agreement.) Similarly, if upon the establishment of the agreement the organization can immediately spend the contribution portion without restriction, as is the case for some gift annuities, the net assets would be classified as unrestricted. (ASC 958-30-45-2)

Revocable split-interest agreements are not recorded unless the not-for-profit organization holds the assets. Assets received by a not-for-profit organization that acts as trustee under a revocable agreement are recognized as refundable advances at their fair value.

### Mergers and Acquisitions

ASC 958-805 establishes standards for determining whether a combination of not-for-profit entities is a merger or an acquisition, describes the carryover method of accounting (for a merger) and the acquisition method of accounting (for an acquisition), and notes related disclosures.

In many not-for-profit mergers and acquisitions, there is no transfer of consideration, so there is no fair value exchange to record. Because of this issue, different accounting methods are applied to a merger of not-for-profit entities and an acquisition by a not-for-profit entity.

In a merger, where two or more not-for-profit entities cede control to a new entity, the *carryover method* is used. (ASC 958-05-25-3) Under this method, the initial financial statements of the combined entities carry forward the assets and liabilities of the combining entities, measured at their carrying amounts, less the effects of any intra-entity transactions. There is no recognition of changes in fair value. The financial history of the new entity created by the merger begins on the merger date—it does not report the prior financial results of the preceding merged entities. Key merger disclosures include the reasons for the merger, the amounts of any significant adjustments made to conform the individual accounting policies of the merged entities, and the amounts of any intra-entity balance eliminations.

An acquisition by a not-for-profit entity is accounted for using the *acquisition method*, which was described in detail earlier in this chapter. If this method is used, there are a few exceptions to the recognition principle in ASC 805. The acquirer cannot recognize an acquired donor relationship as an intangible asset. So, too, if the not-for-profit acquirer has a policy of not capitalizing collections (works of art, historical treasures, or similar assets), then the acquirer does not recognize those items as assets at acquisitions added to the collection. Instead, the acquirer

recognizes the cost of the collection items purchased as a decrease in the appropriate class of net assets in the statement of activities and as a cash outflow for investing activities and does not recognize the fair value of collection items contributed. For conditional promises to give, the not-for-profit acquirer recognizes either:

- The conditional promise only if the conditions on which it depends are substantially met as of the acquisition date, or
- A transfer of assets with a conditional promise to contribute them as a refundable advance unless the conditions have been substantially met as of the acquisition date.

Key acquisition disclosures include the reasons for the acquisition, the factors that make up either goodwill recognized or the equivalent amount charged to expense, and the fair value of consideration transferred.

If an acquirer expects the operations of the acquiree to be supported primarily by contributions and returns on investments, then it should recognize as an expense on the acquisition date the amount that would otherwise be recognized as a goodwill asset. This situation arises when an acquiree's contributions and returns on investments are expected to significantly exceed all other sources of revenue.

In an acquisition, there is an *inherent contribution received*, because the acquirer receives net assets from the acquiree without any corresponding transfer of consideration.

## PLAN ACCOUNTING (ASC 960, ASC 962, ASC 965)

### PERSPECTIVE AND ISSUES

---

Employee benefit plans have become increasingly important and diverse. Using assets that are segregated from the plan sponsor, they provide benefits to employees and former employees in accordance with a plan agreement. The provisions of the plan agreement deal with such matters as eligibility, entitlement to benefits, funding, plan amendments, operation and administration, allocation of responsibilities among the fiduciaries, and fiduciaries' ability to delegate duties. A few examples of employee benefit plans are pension plans, profit-sharing plans, stock bonus plans, 401(k) plans, 403(b) plans, disability plans, health care plans, life insurance plans, unemployment benefit plans, tuition assistance plans, dependent care plans, and cafeteria/flexible benefit plans. For accounting and reporting purposes, the plans are divided into three major types: defined benefit pension plans, defined contribution pension plans, and health and welfare benefit plans.

Employee benefit plans that are sponsored by and provide benefits to the employees of state and local governmental entities are outside of the scope of this publication. Readers should instead refer to *Wiley GAAP for Governments 2012*.

All authoritative pronouncements apply to employee benefit plans unless the pronouncement specifically excludes them from its scope. Certain authoritative pronouncements apply specifically to employee benefit plans. Because those pronouncements are particularly relevant to the transactions of employee benefit plans, they are discussed in this chapter.

ASC 960, *Plan Accounting—Defined Benefit Pension Plans*, is the principal standard involving the accounting and reporting of employee benefit plans. ASC 960 applies only to ongoing plans, not to plans that are terminated or expected to be terminated. The codification describes the objectives of plan financial statements and the necessary components of a complete set of plan financial statements.

ASC 230-10-15 exempts defined benefit pension plans and certain other employee benefit plans from ASC 230's requirement to present a statement of cash flows.

ASC 960-325-35 requires defined benefit pension plans to report all investment contracts, including guaranteed investment contracts issued by insurance companies, at fair value. Only contracts that incorporate mortality or morbidity risk (insurance contracts) may be reported at contract value.

ASC 960, ASC 962, and ASC 965 set standards for defined benefit pension plans, defined contribution pension plans, and health and welfare benefit plans, respectively. In addition to providing accounting and reporting guidance for the plans, they provide summaries of statutory rules and regulations applicable to employee benefit plans and illustrative financial statements.

ASC 965, *Plan Accounting—Health and Welfare Benefit Plans*, provides the standards for health and welfare benefit plans. It divides the diverse universe of plans into two major types: defined benefit health and welfare plans and defined contribution health and welfare plans. It requires defined benefit health and welfare plans to use certain provisions of ASC 715, to measure benefit obligations. In addition, it applies many of the measurement and disclosure provisions of ASC 960 to health and welfare plans.

ASC 965-205-05 specifies the accounting for and disclosure of 401(h) features of defined benefit pension plans that offer medical benefits to retirees in addition to the normal retirement benefits.

This section presents a highly summarized discussion of accounting and reporting standards by employee benefit plans. This chapter does not describe an employer's requirements for reporting information about employee benefit plans. That information is described in the chapters on ASC 710-718.

### Technical Alert

In July, 2015, as part of its effort to reduce complexity in employee benefit plan accounting, the FASB issued ASU 2015-12, *Plan Accounting: Defined Benefit Pension Plans (Topic 960), Defined Contribution Pension Plans (Topic 962), Health and Welfare Benefit Plans (Topic 965): (Part I) Fully Benefit-Responsive Investment Contracts, (Part II) Plan Investment Disclosures, (Part III) Measurement Date Practical Expedient (consensuses of the FASB Emerging Issues Task Force)*.

**Guidance.** Part I of the ASU designates contract value as the *only* required measure for fully benefit-responsive investment contracts, which maintains the relevant information while reducing the cost and complexity of reporting for fully benefit-responsive investment contracts. Part II of the ASU simplifies and makes more effective the investment disclosure requirements under Topic 820 and under Topics 960, 962, and 965 for employee benefit plans. Part III of the ASU provides a measurement date practical expedient for employee benefit plans that is similar to that provided in ASU No. 2015-04, *Compensation—Retirement Benefits (Topic 715): Practical Expedient for the Measurement Date of an Employer's Defined Benefit Obligation and Plan Assets*. That expedient allows employers to measure defined benefit plan assets on a month-end date that is nearest to the employer's fiscal year-end ("alternative measurement date"). This is allowed when the fiscal period does not coincide with a month-end. Employers who elect the expedient in ASU 2015-12 are required to:

- apply it consistently from year to year,
- disclose contributions, distributions, or significant events occurring between the alternative measurement date and the plan's fiscal year-end, and
- disclose the use of the practical expedient, the alternative measurement date, and the date used to measure investment-related accounts.

## DEFINITIONS OF TERMS

---

Source: ASC 960, *Glossary*

**Accumulated Plan Benefits.** Future benefit payments that are attributable under the provisions of a pension plan to employees' service rendered to the benefit information date. Accumulated plan benefits comprise benefits expected to be paid to any of the following:

1. Retired or terminated employees or their beneficiaries
2. Beneficiaries of deceased employees
3. Present employees or their beneficiaries.

**Benefits.** The monetary or in-kind benefits or benefit coverage to which participants may be entitled under a pension plan or other postretirement benefit plan, including health care benefits, life insurance, legal, educational, and advisory services, pension benefits, disability benefits, death benefits, and benefits due to termination of employment.

**Defined Benefit Plan.** A defined benefit plan provides participants with a determinable benefit based on a formula provided for in the plan.

1. Defined benefit health and welfare plans—Defined benefit health and welfare plans specify a determinable benefit, which may be in the form of a reimbursement to the covered plan participant or a direct payment to providers or third-party insurers for the cost of specified services. Such plans may also include benefits that are payable as a lump sum, such as death benefits. The level of benefits may be defined or limited based on factors such as age, years of service, and salary. Contributions may be determined by the plan's actuary or be based on premiums, actual claims paid, hours worked, or other factors determined by the plan sponsor. Even when a plan is funded pursuant to agreements that specify a fixed rate of employer contributions (for example, a collectively bargained multiemployer plan), such a plan may nevertheless be a defined benefit health and welfare plan if its substance is to provide a defined benefit.
2. Defined benefit pension plan—A pension plan that defines an amount of pension benefit to be provided, usually as a function of one or more factors such as age, years of service, or compensation. Any pension plan that is not a defined contribution pension plan is, for purposes of Subtopic 715-30, a defined benefit pension plan.
3. Defined benefit postretirement plan—A plan that defines postretirement benefits in terms of monetary amounts (for example, \$100,000 of life insurance) or benefit coverage to be provided (for example, up to \$200 per day for hospitalization, or 80% of the cost of specified surgical procedures). Any postretirement benefit plan that is not a defined contribution postretirement plan is, for purposes of Subtopic 715-60, a defined benefit postretirement plan. (Specified monetary amounts and benefit coverage are collectively referred to as benefits.)

**Defined Contribution Plan.** A plan that provides an individual account for each participant and provides benefits that are based on all of the following: amounts contributed to the participant's account by the employer or employee; investment experience; and any forfeitures allocated to the account, less any administrative expenses charged to the plan:

1. Defined contribution health and welfare plans—Defined contribution health and welfare plans maintain an individual account for each plan participant. They have terms that specify the means of determining the contributions to participants' accounts, rather than

the amount of benefits the participants are to receive. The benefits a plan participant will receive are limited to the amount contributed to the participant's account, investment experience, expenses, and any forfeitures allocated to the participant's account. These plans also include flexible spending arrangements.

2. Defined contribution postretirement plan—A plan that provides postretirement benefits in return for services rendered, provides an individual account for each plan participant, and specifies how contributions to the individual's account are to be determined rather than specifying the amount of benefits the individual is to receive. Under a defined contribution postretirement plan, the benefits a plan participant will receive depend solely on the amount contributed to the plan participant's account, the returns earned on investments of those contributions, and the forfeitures of other plan participants' benefits that may be allocated to that plan participant's account.

**Health and Welfare Benefit Plan.** Plans that provide benefits such as medical, dental, visual, or other health care, insurance, disability, vacation, education, or dependent care.

**Liquidation.** The process by which an entity converts its assets to cash or other assets and settles its obligations with creditors in anticipation of the entity ceasing all activities. Upon cessation of the entity's activities, any remaining cash or other assets are distributed to the entity's investors or other claimants (albeit sometimes indirectly). Liquidation may be compulsory or voluntary. Dissolution of an entity as a result of that entity being acquired by another entity or merged into another entity in its entirety and with the expectation of continuing its business does not qualify as liquidation.

**Net Assets.** The residual interest in the assets of an employee benefit plan that remains after deducting its liabilities. The liabilities of a plan do not include its accumulated plan benefits (defined benefit pension plans) or its benefit obligation (defined benefit health and welfare plans).

**Noncontributory Plan.** A pension or other postretirement benefit plan under which participants do not make contributions.

**Participant.** Any employee or former employee, or any member or former member of a trade or other employee association, or the beneficiaries of those individuals, for whom there are pension plan benefits or other accumulated plan benefits.

**Pension Benefits.** Periodic (usually monthly) payments made pursuant to the terms of the pension plan to a person who has retired from employment or to that person's beneficiary.

**Plan Assets.** Assets—usually stocks, bonds, and other investments—that have been segregated and restricted, usually in a trust, to provide for pension benefits. The amount of plan assets includes amounts contributed by the employer, and by employees for a contributory plan, and amounts earned from investing the contributions, less benefits paid. Plan assets ordinarily cannot be withdrawn by the employer except under certain circumstances when a plan has assets in excess of obligations and the employer has taken certain steps to satisfy existing obligations. Assets not segregated in a trust or otherwise effectively restricted so that they cannot be used by the employer for other purposes are not plan assets even though it may be intended that such assets be used to provide pensions. If a plan has liabilities other than for benefits, those nonbenefit obligations may be considered as reductions of plan assets. Amounts accrued by the employer but not yet paid to the plan are not plan assets. Securities of the employer held by the plan are includable in plan assets provided they are transferable.

**Service.** Employment taken into consideration under a pension plan. Years of employment before the inception of a plan constitute an employee's past service; years thereafter are classified in relation to the particular actuarial valuation being made or discussed. Years of employment

(including past service) before the date of a particular valuation constitute prior service; years of employment following the date of the valuation constitute future service; a year of employment adjacent to the date of valuation, or in which such date falls, constitutes current service.

**Sponsor.** In the case of a pension plan established or maintained by a single employer, the employer; in the case of a plan established or maintained by an employee entity, the employee entity; in the case of a plan established or maintained jointly by two or more employers or by one or more employers and one or more employee entities, the association, committee, joint board of trustees, or other group of representatives of the parties that have established or that maintain the pension plan.

## CONCEPTS, RULES, AND EXAMPLES

---

In addition to varying by basic type (defined benefit plan, defined contribution plan, and health and welfare benefit plan), employee benefit plans vary by operating and administrative characteristics. Plans established by one employer or a group of controlled corporations are referred to as single employer plans. Alternatively, they can include the employees of many employers who are related in some way, often by all being parties to a collective-bargaining agreement. Those plans are referred to as multiemployer plans. A plan can be either contributory or noncontributory. A contributory plan requires both the employer and the participants to fund (contribute to) the cost of the future benefits. In a noncontributory plan, the participants do not fund any part of the cost of the future benefits. Insured plans are funded through insurance contracts. Self-funded plans are funded through contributions and investment return. Split-funded plans are funded by a combination of insurance contracts, contributions, and investment return.

### Complete Set of Financial Statements

The primary objective of a plan's financial statements is to provide the information necessary to assess the plan's ability to pay benefits when due. Thus, financial statements are to include information about the plan's resources, the results of transactions and events that changed the plan's resources, the stewardship of management over the plan's resources, and any other facts necessary to understand the information provided.

A complete set of financial statements includes a statement of net assets available for benefits as of the end of the plan year (statement of financial position equivalent), a statement of changes in net assets available for benefits for the plan year ended (income statement equivalent), and notes to the financial statements. In addition, defined benefit plans must include information about the actuarial present value of accumulated benefits and changes in the accumulated benefits. That information can appear either as additional financial statements or in the notes to financial statements.

ASC 230-10-15 exempts defined benefit pension plans from the requirement that a statement of cash flows be provided. Other employee benefit plans are also exempted if they report similar to defined benefit pension plans, including ASC 960's requirement to report plan investments at fair value. Although not required, presentation of a statement of cash flows is encouraged if it would provide useful information about the plan's ability to pay future liabilities, as would be the case if the plan either holds illiquid investments or purchases investments using borrowed funds.

ASC 220-10-15 requires that changes in equity other than transactions with owners be reported in financial statements in the period in which they are recognized. The statement of changes in net assets available for benefits is a comprehensive income statement because all changes in net assets available for benefits are reflected in that statement. Thus, although it did not

specifically exempt employee benefit plans from its provisions, the codification did not change the reporting for employee benefit plans.

### **Statement of Net Assets Available for Benefits**

Most investments of the plan are reported at fair value. If there is an active market, quoted market prices are used. If market quotations are not available, investments are valued “in good faith” by the plan’s trustees and administrator. The selling price of similar investments or discounted cash flows can be useful in estimating fair value. The use of an independent expert may be necessary for the valuation of certain investments. Investment contracts with an insurance company, bank, or other financial institution are reported at fair value. Only insurance contracts—contracts that incorporate mortality or morbidity risk (defined benefit pension plans) or that are fully benefit-responsive (defined contribution plans and health and welfare plans)—may be reported at contract value, and then only if the plan reports at contract value in its annual report filed with government agencies. The financial statements are to identify plan investments by type of investment and indicate how fair value was determined. It is not necessary to disclose the original cost of investments in the basic financial statements. Plans are to disclose in the notes to the financial statements any investments representing 5% or more of the net assets available for benefits as of the end of the year.

Contributions receivable include those due as of the reporting date from participants, employers, withdrawing employers of a multiemployer plan, and other sources (such as a state or federal government in the case of a grant or subsidy). Receivables arise from formal commitments of an employer, legal requirements, or contractual requirements. The receivables are to be reduced by an allowance for uncollectible amounts if warranted.

Long-lived assets (such as buildings, equipment, furniture and fixtures, and leasehold improvements) that are used in the plan’s operations are presented at cost less accumulated depreciation or amortization.

### **Statement of Changes in Net Assets Available for Benefits**

The statement of changes in net assets available for benefits is a comprehensive income statement that includes all recognized transactions and events that change the net assets available for benefits. At a minimum, the statement is to include separate amounts for:

1. Contributions from:
  - a. Employer(s)—separating cash from noncash contributions
  - b. Participants, including those transmitted by the plan sponsor
  - c. Other identified sources.
2. Net appreciation or depreciation (realized and unrealized amounts may be combined) in fair value for each significant class of investment, presented by:
  - a. Investments measured by quoted market prices
  - b. Investments measured by some other means.
3. Investment income (not including appreciation or depreciation in fair value).
4. Payments to plan participants for benefits, excluding amounts paid by insurance contracts that are not included in plan assets.
5. Payments to insurance companies to purchase contracts that are excluded from plan assets.
6. Administrative expenses.
7. Other changes, if necessary, with appropriate description(s).

## Transactions with Related Parties (ASC 850)

Transactions between a plan sponsor and its employee benefit plans are subject to the disclosure requirements of ASC 850, *Related-Party Disclosures*.

## Risks and Uncertainties

Employee benefit plans must disclose the information required by ASC 275, *Risks and Uncertainties*. Risks that are unique to employee benefit plans include:

1. A significant industry downturn that could cause employees to retire early in order to avoid being laid off, especially if the plan's participants are concentrated within a particular industry or with a single employer.
2. Likelihood that an employer will significantly increase pension or health and welfare benefits in order to avoid a union walkout.
3. A planned downsizing that is expected to offer early retirement to employees.
4. Investments in the stock of the employer.

## Defined Benefit Plans

In addition to the statement of net assets available for benefits and the statement of changes in net assets available for benefits, defined benefit pension plans must provide information about the actuarial present value of accumulated plan benefits and changes in the actuarial present value of accumulated plan benefits. The information can be included as separate financial statements or as schedules in the notes to the financial statements.

Accumulated plan benefits include the present value of future benefits to retired or terminated employees or their beneficiaries, to beneficiaries of deceased employees, and to present employees or their beneficiaries. Whenever possible, plan provisions are to govern the measurement of accumulated plan benefits. If the benefits earned in each year are not determinable from the plan's provisions, a formula for measurement is provided in ASC 960. When calculating accumulated plan benefits, an ongoing plan is to be assumed, analogous to the going concern assumption used in preparing GAAP financial statements of other types of entities. Thus, interest rates used for discounting expected future payments are based on rates of return on investments for the benefit deferral period, and employee turnover and employee mortality are considered.

At a minimum, the information provided in the financial statements for accumulated plan benefits is to include:

1. Vested benefits of participants currently collecting benefits
2. Other vested benefits
3. Nonvested benefits.

Either a reconciliation or a narrative description is to identify significant factors affecting the accumulated plan benefits from the beginning of the year to the end. The information is to include:

1. Effects of plan amendments
2. Changes in the nature of the plan, such as a merger or a spin-off
3. Changes in actuarial assumptions
4. Benefits accumulated during the year
5. Benefits paid during the year
6. Interest component (from amortizing the discount)
7. Other changes.

The last four items can be combined into a single “other changes” category.

If the provisions of the defined benefit plan include a postretirement medical benefit component that is funded in accordance with IRC §401(h), ASC 965-205-05 specifies the accounting and disclosure rules with respect to the §401(h) component. These specialized rules are necessary due to legal requirements regarding the separate accounting for and funding of these arrangements.

### Defined Contribution Plans

The three general types of defined contribution plans are profit-sharing plans, money purchase pension plans, and stock bonus plans. A profit-sharing plan is a plan that is neither a pension plan, as defined in the Internal Revenue Code, nor a stock bonus plan. Employer contributions to a profit-sharing plan are to be either discretionary or based on a fixed formula. Although the plan is called a profit-sharing plan, the contributions need not be made from the profits of the plan sponsor. A money purchase plan is a benefit plan that bases employer contributions on a fixed formula that is unrelated to profits. A stock bonus plan is a plan that makes its distributions to participants in the stock of the employer unless the participant chooses otherwise. Within these three categories of plans are more specialized plans, such as 401(k) plans, 403(b) plans, savings plans, employee stock ownership plans, target benefit plans, and Keogh plans.

The three primary attributes that distinguish a defined contribution plan from a defined benefit plan are:

1. Employer contributions are determined at the discretion of the employer or according to a contractual formula, rather than being actuarially determined.
2. Individual accounts are maintained for each plan participant, rather than a single account in which all participants partake.
3. Benefits are determined based on the amount accumulated in a participant’s account at the time he or she retires or withdraws from the plan, rather than being defined in the plan agreement. If vested, the account’s value is either paid to the participant or used to purchase an annuity for the participant.

The liabilities of a defined contribution plan include accounts payable, amounts owed for securities purchases, and borrowings. The liabilities are not to include amounts that have not been paid to withdrawing participants. Those amounts are included in net assets available for benefits (representing the participants’ equity in the plan net assets) and disclosed in the notes to the financial statements. Because those amounts are liabilities for regulatory purposes, a note to reconcile the financial statements to the Form 5500 may be necessary to comply with the Employee Retirement Income Security Act of 1974 (ERISA), as amended.

ASC 946-210-45 specifies that, if the net assets of an investment company contain fully benefit-responsive investment contracts, those assets shall be reported at their contract values, because that is the amount participants in the fund would receive if they were to initiate withdrawals under the terms of the plan. An asset is considered fully benefit-responsive if (1) the investment contract is between the fund and the issuer and prohibits the fund from assigning or selling the contract without issuer permission, (2) the issuer is obligated to repay principal and interest, or a financially responsible third party assures that the interest rate will not drop below zero, (3) all permitted participant-initiated transactions occur at contract value, and (4) an event that would limit the fund’s ability to transact at contract value with the issuer is not probable. The codification also specifies disclosure requirements for this scenario.

## Employee Health and Welfare Benefit Plans

Defined benefit health and welfare plans stipulate a determinable benefit amount, which may take the form of a payment directly to the participant or a payment to a third party (such as a service provider or an insurance company) on the participant's behalf. These benefits may be provided upon retirement of the participant or during the postemployment period between termination of employment and retirement. Factors such as length of employment, age, and salary level determine the level of benefits to be provided. The contributions from the employer may be determined actuarially, by actual claims paid, or by a formula established by the plan sponsor. Regardless of the manner in which the plan is funded, the plan is a defined benefit health and welfare plan if its purpose is to provide a defined benefit.

Like defined benefit pension plans, defined benefit health and welfare plans must include information in their financial statements about the actuarial present value of benefit obligations earned by having performed past service. A benefit obligation exists if all of the following conditions are met:

1. The participants' rights to receive benefits are attributable to services already rendered.
2. The participants' benefits vest or accumulate.
3. Payment of benefits is probable.
4. The amount can be reasonably estimated.

If conditions 1 and 2 are not met, the obligation exists if the event that gives rise to the liability has already occurred and the amount can be reasonably estimated. The benefit obligations are measured as of the end of the plan year and include the actuarial present value of:

1. Claims payable
2. Claims incurred but not reported (IBNR)
3. Insurance premiums due
4. Accumulated eligibility credits and postemployment benefits, net of amounts currently payable
5. Postretirement benefits for retired participants and their beneficiaries, other plan participants who are eligible to receive benefits, and participants who are not yet eligible to receive benefits.

Benefit obligations of defined benefit health and welfare plans, similar to accumulated plan benefits of defined benefit pension plans, do not appear as liabilities on the statement of net assets available for benefits. Instead, they are presented either as a separate financial statement, on the face of another financial statement, such as the statement of net assets available for benefits, or in the notes to the financial statements. Regardless of the location selected, the information about benefit obligations is required to be presented in its entirety in the same location.

A reconciliation, presented as a separate statement, on the face of another financial statement, or in the notes to the financial statements, is to identify significant factors comprising the change in the benefit obligation from the beginning of the year to the end. The changes are classified into at least three categories: (1) amounts currently payable, which includes claims payable, claims IBNR, and premiums due insurance companies, (2) accumulated eligibility credits and post-employment benefits, net of amounts currently payable, and (3) postretirement benefit obligations, net of amounts currently payable and claims IBNR. The information for each category is to include, at a minimum, the effects of:

1. Plan amendments
2. Changes in the nature of the plan, such as a merger or a spin-off

3. Changes in actuarial assumptions
4. Benefits accumulated during the year
5. Benefits paid during the year
6. Interest component (from amortizing the discount)
7. Other changes.

The last four items can be combined into a single “other changes” line.

ASC 965-205-50 requires the following additional disclosures:

1. The weighted-average assumed discount rate used to measure the obligation for post-employment benefits,
2. Investments representing 5% or more of the net assets available for benefits as of the end of the plan year, and
3. The portion of the plan’s estimated cost of providing postretirement benefits that is funded by contributions from retirees.

Defined contribution health and welfare plans, like other defined contribution plans, maintain an account for each participant that determines the amount of benefits that the participant will eventually receive. The terms of a defined contribution health and welfare plan agreement determine the contribution that will be made by the employer or participant into each account. Defined contribution health and welfare plans do not report information about benefit obligations because a plan’s obligation is limited to the amounts accumulated in the participants’ accounts.

### **Government Regulations**

Pursuant to the requirements of ERISA, the federal government oversees the operating and reporting practices of employee benefit plans. ERISA establishes minimum standards for participation, vesting, and funding. It defines the responsibilities of plan fiduciaries and standards for their conduct. It requires plans to annually report summarized plan information to plan participants.

The Department of Labor (DOL) and the Internal Revenue Service (IRS) are authorized to issue regulations establishing reporting and disclosure requirements for employee benefit plans that are subject to ERISA. Each year, plans are required to report certain information to the DOL, the IRS, and the Pension Benefit Guaranty Corporation (if applicable). For many plans, the information is reported using Form 5500, which includes financial statements prepared in conformity with GAAP and additional supplementary financial schedules.

Various provisions of the Internal Revenue Code apply to employee benefit plans. If an employee benefit plan qualifies under Section §401(a) of the Code, certain favorable tax treatments apply. For example, if a plan is qualified, the plan sponsor receives current deductions for contributions to the plan, and the plan participants do not pay income taxes on those contributions or the accumulated earnings on them until benefits are distributed to them. In addition, plan participants may receive favorable tax treatment on the distributions. Qualified plans are exempt from income taxes, except for taxes on unrelated business income. Nonqualified plans, which generally provide benefits selectively only to a few key employees, are not entitled to those favorable treatments.

### **Terminating Plans**

If the liquidation of a plan is imminent before the end of the plan year, the plan is a terminating plan, even if another plan will replace the terminated plan. A terminating plan may continue to operate for as long as necessary to pay accrued benefits. Prominent disclosure of the relevant circumstances is necessary in all financial statements issued by the plan after the decision to

terminate is made. Financial statements of a terminating plan are prepared on the liquidation basis of accounting for plan years ending after the determination that the termination is imminent. The liquidation basis for accumulated plan benefits (defined benefit pension plans) and benefit obligations (defined benefit health and welfare plans) may differ from the actuarial present value of benefits for an ongoing plan. For example, certain or all benefits may become vested upon plan termination.

## REAL ESTATE—GENERAL (ASC 970)<sup>20</sup>

### PERSPECTIVE AND ISSUES

---

ASC 970, *Real Estate—General*, specifies the accounting for various costs in acquiring and developing real estate projects. It does not apply to:

1. Real estate developed by an entity for its own use rather than for sale or rental
2. Initial direct costs of leases (discussed in the chapter on ASC 840)
3. Costs directly related to manufacturing, merchandising, or service activities rather than real estate activities
4. Rental operations in which the predominant rental period is less than a month.

ASC 970 does address the accounting for costs of real estate whether rented or sold.

### DEFINITIONS OF TERMS

---

**Amenities.** Features of or enhancements made to real estate projects that enhance the attractiveness of the property to potential tenants or purchasers. Amenities include golf courses, utility plants, clubhouses, swimming pools, tennis courts, indoor recreational facilities, and parking facilities.

**Common Costs.** Costs that relate to two or more units within a real estate project.

**Costs Incurred to Rent Real Estate Projects.** Includes costs of model units and their furnishings, rental facilities, semipermanent signs, rental brochures, advertising, “grand openings,” and rental overhead including rental salaries.

**Costs Incurred to Sell Real Estate Projects.** Includes costs of model units and their furnishings, sales facilities, sales brochures, legal fees for preparation of prospectuses, semi-permanent signs, advertising, “grand openings,” and sales overhead including sales salaries.

**Fair Value.** The amount in cash or cash equivalent value of other consideration that a real estate parcel would yield in a current sale between a willing buyer and a willing seller (other than in a forced or liquidation sale). The fair value of a parcel is affected by its physical characteristics, ultimate use, and the time required to make such use of the property considering access, development plans, zoning restrictions, and market absorption factors.

---

<sup>20</sup> Once ASU 2014-09 is implemented, to apply the guidance, entities will need to determine whether a contract is with a customer or a noncustomer and whether the contract is for the sale of a real estate asset or a real estate business. If the sale is of a real estate business or a real estate asset to a customer in the ordinary course of business, ASC 606 applies. If the sale is of a real estate asset to a non-customer or is a sale of in-substance real estate, ASC 610-20, *Gains and Losses from the Derecognition of Nonfinancial Assets*, applies. If the sale of real estate involves a group of assets or a subsidiary that is a nonprofit activity or business that is not a transfer of in-substance nonfinancial assets or a transfer of a good or service with a customer, ASC 810-10-40 applies.

**Incidental Operations.** Revenue-producing activities engaged in during the holding or development period to reduce the cost of developing the property for its intended use, as distinguished from activities designed to generate a profit or a return from the use of the property.

**Incremental Costs of Incidental Operations.** Costs that would not be incurred except in relation to the conduct of incidental operations. Interest, taxes, insurance, security, and similar costs that would be incurred during the development of a real estate project regardless of whether incidental operations were conducted are not incremental costs.

**Incremental Revenue from Incidental Operations.** Revenues that would not be earned except in relation to the conduct of incidental operations.

**Indirect Project Costs.** Costs incurred after the acquisition of the property, such as construction administration, legal fees, and various office costs, that clearly relate to projects under development or construction.

**Net Realizable Value.** The estimated selling price in the ordinary course of business less estimated costs of completion, holding, and disposal.

**Phase.** A contractually or physically distinguishable portion of a real estate project (including time-sharing projects). That portion is distinguishable from other portions based on shared characteristics such as:

1. Units a developer has declared or legally registered to be for sale
2. Units linked to an owners' association
3. Units to be constructed during a particular time period
4. How a developer plans to build the real estate project.

**Preacquisition Costs.** Costs related to a property that are incurred for the express purpose of, but prior to, obtaining that property. Examples may be costs of surveying, zoning or traffic studies, or payments to obtain an option on the property.

**Project Costs.** Costs clearly associated with the acquisition, development, and construction of a real estate project.

**Relative Fair Value before Construction.** The fair value of each land parcel in a real estate project in relation to the fair value of the other parcels in the project, exclusive of value added by on-site development and construction activities.

## CONCEPTS, RULES, AND EXAMPLES

---

### Preacquisition Costs

Payments are generally capitalized if they relate to an option to obtain the real property or if all of the following conditions are met:

1. Costs are directly identified with the property.
2. Costs would be capitalized if the property already were acquired.
3. Acquisition of the option or property is probable. The purchaser wants the property and believes it to be available for sale and has the ability to finance its acquisition.

Once capitalized, these costs are project costs that, if not receivable in the future, or if the property is not acquired, are to be recognized as expense.

### Taxes and Insurance

Real estate taxes and insurance are capitalized as property costs only when the property is undergoing activities necessary to get the property ready for its intended use. After the property is substantially complete and ready for its intended use such items are expensed.

## Project Costs

Costs that are identifiable and clearly associated with acquisition, development, and construction of a real estate project are capitalized as a cost of the project.

Indirect costs that relate to several projects are capitalized and allocated to these projects. Overhead costs that do not clearly relate to any project (i.e., general and administrative expenses) are expensed as incurred.

## Amenities

The costs in excess of anticipated proceeds of amenities that are to be sold or transferred in connection with the sale of individual units are treated as common costs of the project.

The costs of amenities that are to be sold separately or retained by the developer are capitalized with those costs in excess of estimated fair value treated as common costs. Fair value is determined as of the expected date of substantial physical completion and the amounts allocated to the amenity are not to be revised later. The sale of the amenity results in a gain or loss when the selling price differs from the fair value less accumulated depreciation.

Costs of amenities are allocated among land parcels benefited for which development is probable. The fair value of a parcel is affected by its physical characteristics, its highest and best use, and the time and cost required to make such use of the property. Before completion and availability for use, operating income or loss is an adjustment to common costs. After such date, operating income or loss is included in the income statement.

## Incidental Operations

Revenue from incidental operations is netted with the costs of such operations and any excess of incremental revenue over incremental costs reduces capitalized project costs. If such costs exceed revenues, the excess is recognized as expense as incurred.

## Allocation of Costs

Capitalized costs are allocated by specific identification. If this is not feasible, then costs prior to construction are allocated by the relative fair value of each parcel before construction and construction costs are allocated by the relative sales value of each unit.

If estimation of relative values is impractical, allocation may be based on square footage or another area method, or by using other appropriate methods.

## Revisions of Estimates

Estimates made and cost allocations are to be reviewed at least annually until the project is substantially complete and available for sale. Costs are revised and reallocated as required for changes in current estimates.

## Abandonment and Change in Use

Abandonment of a project requires all capitalized costs to be expensed and not reallocated to other components of the project or other projects. Real estate dedicated to governmental units is not deemed abandoned and its costs are treated as project common costs.

Changes in use require that costs incurred and expected to be incurred that exceed the estimated value of the required project (when substantially complete and ready for intended use) be charged to expense. If no formal plan for the project exists, then project costs in excess of current net realizable value are expensed.

## Selling Costs

Costs incurred to sell are capitalized if they are:

1. Reasonably expected to be recovered from sale of the project or from incidental operations, and
2. Incurred for tangible assets used directly throughout the selling period to assist the selling process or incurred for services required to obtain regulatory approval of sales.

Other costs may be capitalized as prepaid expenses if directly associated with sales, cost recovery is reasonably expected from sales, and the full accrual method cannot be used.

All other costs are expensed in the period incurred. Capitalized costs are expensed in the period in which the related revenue is earned.

## Rental Costs

Costs related to and reasonably expected to be recoverable from future rental operations are capitalized. This excludes initial direct costs as defined and described in accounting for leases. Costs that do not qualify for capitalization are expensed as incurred.

Capitalized costs are amortized over the term of the lease, if directly related to a specific operating lease, or over the period of expected benefit. Amortization begins when the project is substantially completed and available for occupancy. Estimated unrecoverable amounts are expensed when it is probable that the lease will be terminated.

A project is substantially completed and available for occupancy when tenant improvements are completed or after one year from the end of major construction activity. Then normal operations take place with all revenues and costs (including depreciation and other amortized costs) recognized in the income statement. If part of a project is occupied but other parts are not yet complete, completed portions are considered separate projects.

## Impairment and Recoverability

As discussed in the chapter on ASC 360, real estate projects must be evaluated, when warranted by events and circumstances, to determine whether their carrying value is recoverable from estimated future cash flows. ASC 360 provides guidance on grouping assets that are being held and used into “asset groups” and assets being held for sale into “disposal groups” for the purpose of the evaluation of recoverability and impairment computations. ASC 360 applies to real estate held for development and sale, property to be developed in the future, and property currently undergoing development.

Generally, under ASC 360, recoverability is evaluated at the “lowest level for which identifiable cash flows are largely independent of the cash flows of other assets and liabilities.” If a project has identifiable elements with separate cash flows such as residential and commercial, or houses and condominiums, then each element is evaluated separately and not combined for the whole project. Projects are not combined in order to avoid recognizing impairment of one of the components.

Once impairment losses are recognized on property, similar to inventory, a new cost basis is adopted and future recoveries in value are not recognized.

**Real estate special assessments.** The laws of various states permit the formation of Tax Increment Financing Entities (TIFEs). Although their structure and characteristics differ between jurisdictions, TIFEs are generally special taxing districts established to finance and operate infrastructure owned by the municipality, such as roads, water mains, electric lines, sewers, and

the like. These infrastructure improvements are used to revitalize a discrete geographic area by facilitating the private development of adjoining residential and commercial real estate. The TIFE or, absent a TIFE, the municipality typically issues bonds to finance the construction of the infrastructure improvements. The bonds may offer investors favorable after-tax yields by qualifying for tax-exempt status under IRC §141. Generally, the bonds are repaid from special assessments specifically designated for this purpose by the TIFE (or the municipality) such as user fees, tolls, sales taxes, real estate taxes, hotel bed taxes, and the like.

Besides paying for the debt service, these special assessments also fund ongoing operating costs, such as routine infrastructure repairs and maintenance. The infrastructure improvements made with the bond proceeds directly benefit the adjoining property owners and, in fact, the terms of these arrangements are often jointly negotiated between residential and commercial real estate developers and the municipality as an inducement to the developers to invest in a local development project.

Depending on an analysis of the specific facts and circumstances, including the relevant statute, ordinance, bond indenture, and other legal documents, the property owner or developer may potentially be required to record:

1. A liability for a special assessment by the TIFE or municipality if that assessment is levied on each individual property owner at an amount that is fixed or determinable and that covers a determinable period of time. (ASC 970-470)
2. A guarantee liability under ASC 460 if, for example, it has:
  - a. Contractually agreed to cover all or a portion of any shortfalls in the required annual debt service of the bond obligations of the issuing TIFE or municipality.
  - b. Pledged company assets as collateral for the bond obligations.
  - c. Provided a letter of credit or other credit enhancements to support all or a portion of the bond obligations.

### Other Guidance to Accounting for Real Estate Operations

ASC 970-360 holds that when a seller of real estate agrees to make up any rental shortfalls for a period of time, payments to and receipts from the seller are adjustments to the cost of the property and will affect future depreciation charges.

ASC 974-323-25 addresses the accounting by a REIT in a service corporation (SC). In determining a REIT's accounting for its investment in an SC, the SC must be evaluated as a potential VIE under ASC 810. If the SC is subject to ASC 810, this codification section does not apply to the determination of the REIT's accounting. If, however, the SC is not subject to ASC 810, this section continues to apply to the determination of the method of accounting that the REIT should use to record its investment (consolidation, equity method, or cost method). The codification includes a list of factors that indicate that the equity method of accounting is to be used. Regardless of the method of accounting used by a REIT for its investment in an SC, the SC is not considered an independent third party for the purpose of capitalizing lessor initial direct costs under ASC 310-20. Consequently, leasing costs capitalized by a REIT as initial direct costs may not exceed the amounts allowable if the REIT had incurred the costs directly.

As noted in the preceding section of this chapter, ASC 978 addresses the accounting for time-share operations. ASC 978 also establishes accounting requirements for incidental operations. In particular, rental and other operations during holding periods, including sampler programs and minivacations, are to be accounted for as incidental operations. The excess, if any, of revenue over costs of such operations is to be recorded as a reduction of inventory costs.

## REAL ESTATE—RETAIL LAND (ASC 976)<sup>21</sup>

### PERSPECTIVE AND ISSUES

---

The substance of a sale of any asset is that the transaction unconditionally transfers the risks and rewards of ownership to the buyer. However, the economic substance of many real estate sales is that the risks and rewards of ownership have not been clearly transferred. The turbulent and cyclical environments in the real estate and debt markets have led to the evolution of many complex methods of financing real estate transactions. For example, in some transactions the seller, rather than an independent third party, finances the buyer, while in others, the seller may be required to guarantee a minimum return to the buyer or continue to operate the property for a specified period of time. In many of these complex transactions, the seller still has some association with the property even after the property has been sold. The question that must be answered in these transactions is: At what point does the seller become disassociated enough from the property that profit may be recognized on the transaction?

Accounting for sales of real estate is governed by ASC 976. The purpose of this section is to present the guidelines that need to be considered when analyzing nonretail real estate transactions. ASC 840-40 dealing with sales-type real estate leases and sales-leaseback real estate transactions is covered in the chapter on ASC 840.

A specialized situation involving the sale of real estate pertains to time-share projects, which are addressed by ASC 978, as discussed in this chapter.

### DEFINITIONS OF TERMS

---

**Buy-Sell Agreement.** A contractual arrangement that gives both investors in a jointly owned entity the ability to offer to buy the other's interest.

**Continuing Investment.** Payments that the buyer is contractually required to pay on its total debt for the purchase price of the property.

**Cost Recovery Method.** A method which defers the recognition of gross profit on a real estate sale until the seller recovers the cost of the property sold.

**Deposit Method.** A method which records payments by the buyer as deposits rather than a sale. The seller continues to report the asset and related debt on the statement of financial position until the contract is canceled or until the sale has been achieved.

**First Mortgage (Primary Debt).** The senior debt the seller has on the property at the time the buyer purchases the property. A first mortgage lender (mortgagee) has foreclosure rights superior to those of second (or junior) mortgage lenders (i.e., proceeds from sale of the foreclosed property are used first to repay the first mortgage lender in full with only the remainder available to satisfy the junior lenders' balances).

**Full Accrual Method.** A method that recognizes all profit from a real estate sale at the time of sale.

**Initial Investment.** The sales value received by the seller at the time of sale. It includes a cash down payment, buyer's notes supported by an irrevocable letter of credit, and payments by the buyer to third parties to reduce or eliminate the seller's indebtedness on the property.

---

<sup>21</sup> See footnote 20.

**Installment Method.** A method that recognizes revenue on the basis of payments made by the buyer on debt owed to the seller and payments by the buyer to the holder of primary debt. Each payment is apportioned between profit and cost recovery.

**Lien.** A claim or charge a creditor has on property which serves as security for payment of debt by the debtor.

**Minimum Initial Investment.** The minimum amount that an initial investment must equal or exceed so that the criterion for using the full accrual method is met.

**Partial Sale.** A sale in which the seller retains an equity interest in the property or has an equity interest in the buyer.

**Property Improvements.** An addition made to real estate, usually consisting of buildings but that may also include any permanent structure such as streets, sidewalks, sewers, utilities, and the like.

**Reduced Profit Method.** A method which recognizes profit at the point of sale, but only a reduced amount. The remaining profit is deferred to future periods.

**Release Provision.** An agreement that provides for the release of property to the buyer. This agreement releases the property to the buyer free of any previous liens.

**Sales Value.** The sales price of the property increased or decreased for other consideration in the sales transaction that are, in substance, additional sales proceeds to the seller.

**Subordination.** The process by which a party's rights are ranked below the rights of others.

## CONCEPTS, RULES, AND EXAMPLES

---

### Real Estate Sales Other than Retail Land Sales

**ASC 976 scope.** ASC 976, *Real Estate—Retail Land*, contains standards applicable to all real estate sales for all types of businesses.

ASC 360-20-15 explicitly states that real estate sales transactions under ASC 976 include real estate with property enhancements or integral equipment. This defines property improvements and integral equipment as “any physical structure or equipment attached to real estate or other parts thereof, that cannot be removed and used separately without incurring significant cost.” Examples include an office building or manufacturing plant.

Transactions excluded from the provisions of ASC 976 are as follows:

1. A sale of improvements or integral equipment with no sale or plans for a sale of the land.
2. A sale of stock, net assets of a business, or a segment of a business which contain real estate except in cases in which an “in-substance” real estate sale occurs.
3. Securities accounted for under ASC 320.

**Profit recognition methods.** Profit from real estate sales is recognized in full, provided the following:

1. The profit is determinable (i.e., the collectibility of the sales price is reasonably assured or the amount that will not be collectible can be estimated).
2. The earnings process is virtually complete, that is, the seller is not obliged to perform significant activities after the sale to earn the profit.

When both of these conditions are satisfied, the method used to recognize profits on real estate sales is referred to as the full accrual method. If both of these conditions are not satisfied, recognition of all or part of the profit is postponed.

For real estate sales, the collectibility of the sales price is reasonably assured when the buyer has demonstrated a commitment to pay. This commitment is supported by a substantial initial investment, along with continuing investments that give the buyer a sufficient stake in the property such that the risk of loss through default motivates the buyer to honor its obligations to the seller. Collectibility of the sales price is also assessed by examining the conditions surrounding the sale (e.g., credit history of the buyer; age, condition, and location of the property; and history of cash flows generated by the property).

The full accrual method is appropriate and profit is recognized in full at the point of sale for real estate transactions when all of the following criteria are met:

1. A sale is consummated.
2. The buyer's initial and continuing investments are adequate to demonstrate a commitment to pay for the property.
3. The seller's receivable is not subject to future subordination.
4. The seller has transferred to the buyer the usual risks and rewards of ownership in a transaction that is in substance a sale, and the seller does not have a substantial continuing involvement in the property.

On sales in which an independent third party provides all of the financing for the buyer, the seller is most concerned that criterion 1 is met. For such sales, the sale is usually consummated on the closing date. When the seller finances the buyer, the seller must analyze the economic substance of the agreement to ascertain that criteria 2, 3, and 4 are also met (i.e., whether the transaction clearly transfers the risks and rewards of ownership to the buyer).

ASC 360-20 provides the following guidelines for a seller of real estate to follow when considering the various forms of financing that may be applicable to the transaction:

1. The ASC 976 conditions for obtaining sufficient initial and continuing investment from the buyer before full accrual profit recognition is allowed must be applied unless the seller receives as the full sales value of the property:
  - a. Cash without any seller contingent liability on any debt on the property incurred or assumed by the buyer,
  - b. The buyer's assumption of the seller's existing nonrecourse debt on the property,
  - c. The buyer's assumption of all recourse debt on the property with the complete release of the seller from those obligations, or
  - d. Any combination of such cash and debt assumption.
2. In computing the buyer's initial investment, debt incurred by the buyer that is secured by the property is not considered part of the buyer's initial investment. This is true whether the debt was incurred directly from the seller or other parties or indirectly through assumption. Payments to the seller from the proceeds of such indebtedness are not included as part of the buyer's initial investment.
3. If the transaction does not qualify for full accrual accounting and, consequently, is being accounted for using installment, cost recovery or reduced profit methods, payments made on debt described in 2 above are not considered to be buyer's cash payments. However, if the profit deferred under the applicable method exceeds the outstanding amount of seller financing and the outstanding amount of buyer's debt secured by the property for which the seller is contingently liable, the seller recognizes the excess in income.

**Consummation of a sale.** A sale is considered consummated when the following conditions are met:

1. The parties are bound by the terms of a contract.
2. All consideration has been exchanged.
3. Any permanent financing for which the seller is responsible has been arranged.
4. All conditions precedent to closing have been performed.

When a seller is constructing office buildings, condominiums, shopping centers, or similar structures, item 4 may be applied to individual units rather than the entire project. These four conditions are usually met on or after closing, not at the point the agreement to sell is signed or at a preclosing meeting. Closing refers to the final steps of the transaction (i.e., when consideration is paid, the mortgage is secured, and the deed is delivered or placed in escrow). If the consummation criteria have not been satisfied, the seller uses the deposit method of accounting until all of the criteria are met (i.e., the sale has been consummated).

**Adequacy of the buyer's initial investment.** Once the sale is consummated, the next step is to determine whether the buyer's initial investment adequately demonstrates a commitment to pay for the property and the reasonable likelihood that the seller will collect it. This determination is made by comparing the buyer's initial investment to the sales value of the property. ASC 976 specifically details items that are includable as the initial investment and the minimum percentages that the initial investment must bear to the sales value of the property. To make the determination of whether the initial investment is adequate, the sales value of the property must also be computed.

**Computation of sales value.** The sales value of property in a real estate transaction is computed as follows:

- Stated sales price
- + Proceeds from the issuance of an exercised purchase option
  - + Other payments that are, in substance, additional sales proceeds (e.g., management fees, points, prepaid interest, or fees required to be maintained in advance of the sale that will be applied against amounts due to the seller at a later point)
  - A discount that reduces the buyer's note to its present value
  - Net present value of services seller agrees to perform without compensation
  - Excess of net present value of services seller performs over compensation that seller will receive
  - = Sales value of the property

**Composition of the initial investment.** Sales transactions are characterized by many different types of payments and commitments made between the seller, buyer, and third parties; however, the buyer's initial investment only includes the following:

1. Cash paid to the seller as a down payment
2. Buyer's notes given to the seller that are supported by irrevocable letters of credit from independent lending institutions
3. Payments by the buyer to third parties that reduce existing indebtedness the seller has on the property
4. Other amounts paid by the buyer that are part of the sales value
5. Other consideration received by the seller that can be converted to cash without recourse to the seller; for example, other notes of the buyer.

ASC 976 specifically states that the following items are not included as initial investment:

1. Payments by the buyer to third parties for improvements to the property

2. A permanent loan commitment by an independent third party to replace a loan made by the seller
3. Funds that have been or will be loaned, refunded, or directly or indirectly provided to the buyer by the seller or loans guaranteed or collateralized by the seller for the buyer.

**Size of initial investment.** Once the initial investment is computed, its size must be compared to the sales value of the property. To qualify as an adequate initial investment, the initial investment must be equal to at least a major part of the difference between usual loan limits established by independent lending institutions and the sales value of the property. The minimum initial investment requirements for real estate sales (other than retail land sales) vary depending upon the type of property being sold. The following table from ASC 976 provides the limits for the various properties:

<u>Type of property</u>	<u>Minimum initial investment expressed as a percentage of sales value</u>
<b>Land</b>	
Held for commercial, industrial, or residential development to commence within two years after sale	20
Held for commercial, industrial, or residential development to commence more than two years after sale	25
<b>Commercial and Industrial Property</b>	
Office and industrial buildings, shopping centers, and so forth:	
Properties subject to lease on a long-term lease basis to parties with satisfactory credit rating; cash flow currently sufficient to service all indebtedness	10
Single-tenancy properties sold to a buyer with a satisfactory credit rating	15
All other	20
Other income-producing properties (hotels, motels, marinas, mobile home parks, and so forth):	
Cash flow currently sufficient to service all indebtedness	15

<b>Single-Family Residential Property (including condominium or cooperative housing)</b>	
Primary residence of the buyer	5 <sup>a</sup>
Secondary or recreational residence	10 <sup>a</sup>

<sup>a</sup> If collectibility of the remaining portion of the sales price cannot be supported by reliable evidence of collection experience, the minimum initial investment [is to] be at least 60% of the difference between the sales value and the financing available from loans guaranteed by regulatory bodies such as the Federal Housing Authority (FHA) or the Veterans Administration (VA), or from independent, established lending institutions. This 60% test applies when independent first-mortgage financing is not utilized and the seller takes a receivable from the buyer for the difference between the sales value and the initial investment. If independent first mortgage financing is utilized, the adequacy of the initial investment on sales of single-family residential property [is] determined [as described in the next paragraph].

Lenders' appraisals of specific properties often differ. Therefore, if the buyer has obtained a permanent loan or firm permanent loan commitment for maximum financing of the property from an independent lending institution, the minimum initial investment must be the greater of the following:

1. The minimum percentage of the sales value of the property specified in the above table, or
2. The lesser of:
  - a. The amount of the sales value of the property in excess of 115% of the amount of a newly placed permanent loan or firm loan commitment from a primary lender that is an independent established lending institution
  - b. 25% of the sales value.

To illustrate the determination of whether an initial investment adequately demonstrates a commitment to pay for property, consider the following example.

#### **Example of determining adequacy of initial investment**

Marcus, Inc. exercised a \$2,000 option for the purchase of an apartment building from Rubin, Inc. The terms of the sales contract required Marcus to pay \$3,000 of delinquent property taxes, pay a \$300,000 cash down payment, assume Rubin's recently issued first mortgage of \$1,200,000, and give Rubin a second mortgage of \$500,000 at a prevailing interest rate.

Step 1—Compute the sales value of the property.

Payment of back taxes to reduce Rubin's liability to local municipality	\$ 3,000
Proceeds from exercised option	2,000
Cash down payment	300,000
First mortgage assumed by Marcus	1,200,000
Second mortgage given to Rubin	\$ 500,000
Sales value of the apartment complex	<u>\$2,005,000</u>

Step 2—Compute the initial investment.

Cash down payment	\$ 300,000
Payment of back taxes to reduce Rubin's liability to local municipality	3,000
Proceeds from exercised option	2,000
	<u>\$ 305,000</u>

Step 3—Compute the minimum initial investment required.

- a. The minimum percentage of the sales value of the property as specified in the table is 200,500 ( $= \$2,005,000 \times 10\%$ ).
- b. 1. The amount of the sales value of the property in excess of 115% of the recently placed permanent mortgage is \$625,000 (sales value of  $\$2,005,000 - \$1,380,000 [= 115\% \text{ of } \$1,200,000]$ ).
2. 25% of the sales value (\$2,005,000) is \$501,250.

The lesser of b.1 and b.2 is b.2, \$501,250. The greater of a and b is b, \$501,250. Therefore, to record this transaction under the full accrual method (assuming all other criteria are met), the minimum initial investment must be equal to or greater than \$501,250. Since the actual initial investment is only \$305,000, all or part of the recognition of profit from the transaction must be postponed.

If the sale has been consummated but the buyer's initial investment does not adequately demonstrate a commitment to pay, the transaction is accounted for using the installment method when the seller is reasonably assured of recovering the cost of the property if the buyer defaults. However, if the recovery of the cost of the property is not reasonably assured should the buyer

default or if the cost has been recovered and the collection of additional amounts is uncertain, the cost recovery or deposit method is used.

**Adequacy of the buyer's continuing investments.** The collectibility of the buyer's receivable must be reasonably assured; therefore, for full profit recognition under the full accrual method, the buyer must be contractually required to pay each year on its total debt for the purchase price of the property an amount at least equal to the level annual payment that would be needed to pay that debt (both principal and interest) over a specified period. This period is no more than twenty years for land, and no more than the customary amortization term of a first mortgage loan by an independent lender for other types of real estate. For continuing investment purposes, the contractually required payments must be in a form that is acceptable for an initial investment. If the seller provides funds to the buyer, either directly or indirectly, these funds must be subtracted from the buyer's payments in determining whether the continuing investments are adequate.

The indebtedness on the property does not have to be reduced proportionately. A lump-sum (balloon) payment will not affect the amortization of the receivable as long as the level annual payments still meet the minimum annual amortization requirement. For example, a land real estate sale may require the buyer to make level annual payments at the end of each of the first five years and then a balloon payment at the end of the sixth year. The continuing investment criterion is met provided the level annual payment required in each of the first five years is greater than or equal to the level annual payment that would be made if the receivable were amortized over the maximum twenty-year (land's specified term) period.

**Continuing investment not qualifying.** If the sale has been consummated and the minimum initial investment criteria have been satisfied but the continuing investment by the buyer does not meet the stated criterion, the seller recognizes profit by the reduced profit method at the time of sale if payments by the buyer each year will at least cover both of the following:

1. The interest and principal amortization on the maximum first mortgage loan that could be obtained on the property
2. Interest, at an appropriate rate, on the excess of the aggregate actual debt on the property over such a maximum first mortgage loan.

If the payments by the buyer do not cover both of the above, the seller recognizes profit by either the installment or cost recovery method.

**Release provisions.** An agreement to sell real estate may provide that part or all of the property sold will be released from liens by payment of an amount sufficient to release the debt or by an assignment of the buyer's payments until release. To meet the criteria of an adequate initial investment, the investment must be sufficient both to pay the release on property released and to meet the initial investment requirements on property not released. If not, profit is recognized on each released portion as if it were a separate sale when a sale has been deemed to have taken place.

**Seller's receivable subject to future subordination.** The seller's receivable should not be subject to future subordination. Future subordination by a primary lender would permit the lender to obtain a lien on the property, giving the seller only a secondary residual claim. This subordination criterion does not apply if either of the following occur:

1. A receivable is subordinate to a first mortgage on the property existing at the time of sale.
2. A future loan, including an existing permanent loan commitment, is provided for by the terms of the sale and the proceeds of the loan will be applied first to the payment of the seller's receivable.

If the seller's receivable is subject to future subordination, profit is recognized using the cost recovery method. The cost recovery method is justified because the collectibility of the sales price is not reasonably assured in circumstances when the receivable may be subordinated to amounts due to other creditors.

**Seller's continuing involvement.** Sometimes sellers continue to be involved with property for periods of time even though the property has been legally sold. The seller's involvement often takes the form of profit participation, management services, financing, guarantees of return, construction, etc. The seller does not have a substantial continuing involvement with property unless the risks and rewards of ownership have been clearly transferred to the buyer.

If the seller has some continuing involvement with the property and does not clearly transfer substantially all of the risks and rewards of ownership, profit is recognized by a method other than the full accrual method. The method chosen is determined by the nature and extent of the seller's continuing involvement. As a general rule, profit is only recognized at the time of sale if the amount of the seller's loss due to the continued involvement with the property is limited by the terms of the sales contract. In this event, the profit recognized at this time is reduced by the maximum possible loss from the continued involvement.

**Leases involving real estate.** ASC 840-40 dealing with sales-type real estate leases and sale-leaseback real estate transactions is covered in the chapter on ASC 840.

**Profit-sharing, financing, and leasing arrangements.** In real estate sales, it is often the case that economic substance takes precedence over legal form. Certain transactions, though possibly called sales, are in substance profit-sharing, financing, or leasing arrangements and are accounted for as such. These include situations in which:

1. The seller has an obligation to repurchase the property, or the terms of the transaction allow the buyer to compel the seller to repurchase the property or give the seller an option to do so.
2. The seller is a general partner in a limited partnership that acquires an interest in the property sold and holds a receivable from the buyer for a significant part (15% of the maximum first-lien financing) of the sales price.
3. The seller guarantees the return of the buyer's investment or a return on that investment for an extended period of time.
4. The seller is required to initiate or support operations, or continue to operate the property at its own risk for an extended period of time.

**Options to purchase real estate property.** Often a buyer will buy an option to purchase land from a seller with the hopeful intention of obtaining a zoning change, building permit, or some other contingency specified in the option agreement. Proceeds from the issue of an option by a property owner (seller) are accounted for by the deposit method. If the option is exercised, the seller includes the option proceeds in the computation of the sales value of the property. If the option is not exercised, the seller recognizes the option proceeds as income at the time the option expires.

**Partial sales of property.** Per ASC 976, "a sale is a partial sale if the seller retains an equity interest in the property or has an equity interest in the buyer." Profit on a partial sale may be recognized on the date of sale if the following occur:

1. The buyer is independent of the seller.
2. Collection of the sales price is reasonably assured.
3. The seller will not be required to support the operations of the property on its related obligations to an extent greater than its proportionate interest.

If the buyer is not independent of the seller, the seller may not be able to recognize any profit that is measured at the date of sale (see the following “Buy-sell agreements” section).

If the seller is not reasonably assured of collecting the sales price, the cost recovery or installment method is used to recognize profit on the partial sale.

A seller who separately sells individual units in condominium projects or time-sharing interests recognizes profit by the percentage-of-completion method on the sale of individual units or interests if all of the following criteria are met:

1. Construction is beyond a preliminary stage (i.e., engineering and design work, execution of construction contracts, site clearance and preparation, excavation, and completion of the building foundation have all been completed).
2. The buyer is unable to obtain a refund except for nondelivery of the units or interest.
3. Sufficient units have been sold to assure that the entire property will not revert to being rental property.
4. Sales prices are collectible.
5. Aggregate sales proceeds and costs can be reasonably estimated.

The deposit method is used to account for these sales up to the point all the criteria are met for recognition of a sale.

**Buy-sell agreements.** A buy-sell clause is not a prohibited form of continuing involvement precluding partial sales treatment, but only if (1) the buyer can act independently from the seller, or if (2) the seller is not compelled to reacquire the other investor’s interest in the jointly owned entity. The decision is judgmental, requiring consideration of numerous factors.

Factors to consider in determining whether the buyer cannot act independently from the seller are (1) the presence of a predetermined buy-sell price, (2) the seller has a strategic necessity barring it from relinquishing its ownership rights to the buyer, (3) the seller has business arrangements with the jointly owned entity that economically require it to reacquire the real estate to avoid losing economic benefits or escaping negative consequences of the arrangements, or (4) tax implications compelling the seller to acquire the buyer’s interest in the entity.

Factors to consider in determining if the buyer can compel the seller to repurchase the property include (1) the buyer is financially unable to acquire the seller’s interest, (2) the buy-sell clause contains a specified rate of return for either party, (3) the buyer has a strategic necessity requiring it to sell its interest to the seller, (4) the buyer is legally restricted from acquiring the seller’s interest, (5) the buyer cannot realize its economic interest by sale to a third party, due to the integration of the real estate into the seller’s business, or (6) tax implications compelling the buyer to sell its interest to the seller.

**Selection of method.** If a loss is apparent (e.g., the carrying value of the property exceeds the sum of the deposit, fair value of unrecorded note receivable, and the debt assumed by the buyer), then immediate recognition of the loss is required.

The installment method is used if the full accrual method cannot be used due to an inadequate initial investment by the buyer, provided that recovery of cost is reasonably assured if the buyer defaults. The cost recovery method or the deposit methods are used if such cost recovery is not assured.

The reduced profit method is used when the buyer’s initial investment is adequate but the continuing investment is not adequate, and payments by the buyer at least cover the sum of (1) the amortization (principal and interest) on the maximum first mortgage that could be obtained on the property, and (2) the interest, at an appropriate rate, on the excess of aggregate debt over the maximum first mortgage.

## Methods of Accounting for Real Estate Sales other than Retail Land Sales

**Full accrual method.** This method of accounting for nonretail sales of real estate is appropriate when all four of the recognition criteria have been satisfied. The full accrual method is simply the application of the revenue recognition principle. A real estate sale is recognized in full when the profit is determinable and the earnings process is virtually complete. The profit is determinable when the first three criteria have been met (the sale is consummated, the buyer has demonstrated a commitment to pay, and the seller's receivable is not subject to future subordination). The earnings process is virtually complete when the fourth criterion has been met (the seller has transferred the risks and rewards of ownership and does not have a substantial continuing involvement with the property). If all of the criteria have not been met, the seller records the transaction by one of the following methods as indicated by ASC 976:

1. Deposit
2. Cost recovery
3. Installment
4. Reduced profit
5. Percentage-of-completion (see the section on “Long-Term Construction Contracts” in this chapter).

Profit under the full accrual method is computed by subtracting the cost basis of the property surrendered from the sales value given by the buyer. Also, the computation of profit on the sale includes all costs incurred that are directly related to the sale, such as accounting and legal fees.

**Installment method.** Under the installment method, each cash receipt and principal payment by the buyer on debt assumed with recourse to the seller consists of part recovery of cost and part recovery of profit. The apportionment between cost recovery and profit is in the same ratio as total cost and total profit bear to the sales value of the property sold. Therefore, under the installment method, the seller recognizes profit on each payment that the buyer makes to the seller and on each payment the buyer makes to the holder of the primary debt. When a buyer assumes debt that is without recourse to the seller, the seller recognizes profit on each payment made to the seller and on the entire debt assumed by the buyer. The accounting treatment differs because the seller is subject to substantially different levels of risk under the alternative conditions. For debt that is without recourse, the seller recovers a portion, if not all, of the cost of the asset surrendered at the time the buyer assumes the debt.

### Example of the installment method

Assume Tucker sells to Price a plot of undeveloped land for \$2,000,000. Price will assume, with recourse, Tucker's existing first mortgage of \$1,000,000 and also pay Tucker a \$300,000 cash down payment. Price will pay the balance of \$700,000 by giving Tucker a second mortgage payable in equal installments of principal and interest over a ten-year period. The cost of the land to Tucker was \$1,200,000 and Price will commence development of the land immediately.

1. *Computation of sales value:*

Cash down payment	\$ 300,000
First mortgage	1,000,000
Second mortgage	<u>700,000</u>
Sales value	<u>\$2,000,000</u>

2. *Computation of the initial investment:*

Cash down payment	\$ <u>300,000</u>
-------------------	-------------------

3. *Computation of the minimum required initial investment:*

- a. \$400,000 ( $\$2,000,000 \times 20\%$ )
- b. 1. \$850,000 [ $\$2,000,000 - (115\% \times \$1,000,000)$ ]  
2. \$500,000 ( $\$2,000,000 \times 25\%$ )

The minimum initial investment is \$500,000 since b.2 is less than b.1 and b.2 is greater than a.

The initial investment criterion has not been satisfied because the actual initial investment is less than the minimum initial investment. Therefore, assuming the sale has been consummated and Tucker is reasonably assured of recovering the cost of the land from Price, the installment method is to be used. The gross profit to be recognized over the installment payment period by Tucker is computed as follows:

Sales value	\$ 2,000,000
Cost of land	( <u>1,200,000</u> )
Gross profit	<u>\$ 800,000</u>

The gross profit percentage to apply to each payment by Price to Tucker and the primary debt holder is 40% ( $\$800,000/\$2,000,000$ ).

If Price also pays \$50,000 of principal on the first mortgage and \$70,000 of principal on the second mortgage in the year of sale, Tucker would recognize the following profit in the year of sale:

Profit recognized on the down payment ( $\$300,000 \times 40\%$ )	\$120,000
Profit recognized on the principal payments:	
First mortgage ( $\$50,000 \times 40\%$ )	20,000
Second mortgage ( $\$70,000 \times 40\%$ )	<u>28,000</u>
Total profit recognized in year of sale	<u>\$168,000</u>

Note that Tucker recognizes profit only on the payment applicable to the first mortgage. This is because Tucker may be called upon to satisfy the liability on the first mortgage if Price defaults.

If Tucker's first mortgage was assumed without recourse, Tucker would recognize the following profit in the year of sale:

Profit recognized on the down payment ( $\$300,000 \times 40\%$ )	\$120,000
Profit recognized on Price's assumption of Tucker's first mortgage without recourse ( $\$1,000,000 \times 40\%$ )	400,000
Profit recognized on the principal payment of the second mortgage ( $\$70,000 \times 40\%$ )	<u>28,000</u>
Total profit recognized in year of sale	<u>\$548,000</u>

The income statement (or related footnotes) for the period of sale includes the sales value received, the gross profit recognized, the gross profit deferred, and the costs of sale. In future periods when further payments are made to the buyer, the seller realizes gross profit on these payments. This amount is presented as a single line item in the revenue section of the income statement.

If, in the future, the transaction meets the requirements for the full accrual method of recognizing profit, the seller may change to that method and recognize the remaining deferred profit as income at that time.

**Cost recovery method.** When the cost recovery method is used (e.g., when the seller's receivable is subject to subordination or the seller is not reasonably assured of recovering the cost of the property if the buyer defaults), no profit is recognized on the sales transaction until the seller has recovered the cost of the property sold. If the buyer assumes debt that is with recourse to the seller, profit is not recognized by the seller until the cash payments by the buyer, including both

principal and interest on debt due the seller and on debt assumed by the buyer, exceed the seller's cost of the property sold. If the buyer assumes debt that is without recourse to the seller, profit may be recognized by the seller when the cash payments by the buyer, including both principal and interest on debt due the seller, exceed the difference between the seller's cost of the property and the nonrecourse debt assumed by the buyer.

For the cost recovery method, principal collections reduce the seller's related receivable, and interest collections on such receivable increase the deferred gross profit on the statement of financial position.

#### Example of the cost recovery method

Assume that on January 1, 2012, Simon, Inc. purchased undeveloped land with a sales value of \$365,000 from Davis Co. The sales value is represented by a \$15,000 cash down payment, Simon assuming Davis's \$200,000 first mortgage (10%, payable in equal annual installments over the next twenty years), and Simon giving Davis a second mortgage of \$150,000 (12%, payable in equal annual installments over the next ten years). The sale has been consummated, but the initial investment is below the minimum required amount and Davis is not reasonably assured of recovering the cost of the property if Simon defaults. The cost of the land to Davis was \$300,000. The circumstances indicate the cost recovery method is appropriate. The transaction is recorded by Davis as follows:

1/1/X1			
	Notes receivable	150,000	
	First mortgage payable	200,000	
	Cash	15,000	
	Revenue from sale of land		365,000
	Revenue from sale of land	365,000	
	Land	300,000	
	Deferred gross profit	65,000	

Case 1—The first mortgage was assumed with recourse to Davis. Immediately after the sale, the unrecovered cost of the land is computed as follows:

Land	\$300,000
Less: Cash down payment	(15,000)
Unrecovered cost	<u>\$285,000</u>

The note (second mortgage) is reported as follows:

Note receivable	\$150,000	
Less: Deferred gross profit	(65,000)	\$85,000

At the end of the year Simon pays \$26,547.64 (\$8,547.64 principal and \$18,000.00 interest) on the second mortgage note and \$23,491.94 (\$3,491.94 principal and \$20,000.00 interest) on the first mortgage. At 12/31/12 the unrecovered cost of the land is computed as follows:

Previous unrecovered cost		\$285,000.00
Less: Note receivable payment	\$26,547.64	
First mortgage payment	<u>23,491.94</u>	(50,039.58)
Unrecovered cost	\$	<u>\$234,960.42</u>

The receivable is reported on the 12/31/X1 statement of financial position as follows:

Note receivable (\$150,000 – 8,547.64)	\$141,452.36	
Less: Deferred gross profit (\$65,000 + 18,000)	<u>83,000.00</u>	\$58,452.36

Case 2—The first mortgage is assumed without recourse to Davis. The reporting of the note is the same as Case 1; however, the unrecovered cost of the property is different. Immediately after the sale, the unrecovered cost of the property is computed as follows:

Land	\$300,000
Less: Cash down payment	(15,000)
Nonrecourse debt assumed by Simon	(200,000)
Unrecovered cost	<u><u>\$ 85,000</u></u>

After Simon makes the payments at the end of the year, the unrecovered cost is computed as follows:

Previous unrecovered cost	\$85,000.00
Less: Notes receivable payment	<u>26,547.64</u>
Unrecovered cost	<u><u>\$58,452.36</u></u>

For the cost recovery method, the income statement for the year the real estate sale occurs includes the sales value received, the cost of the property given up, and the gross profit deferred. In future periods, after the cost of the property has been recovered, the income statement includes the gross profit earned as a separate revenue item.

If, after accounting for the sale by the cost recovery method, circumstances indicate that the criteria for the full accrual method are satisfied, the seller may change to the full accrual method and recognize any remaining deferred gross profit in full.

**Deposit method.** When the deposit method is used (e.g., when the sale is, in substance, the sale of an option and not real estate), the seller does not recognize any profit, does not record a receivable, continues to report in its financial statements the property and the related existing debt even if the debt has been assumed by the buyer, and discloses that those items are subject to a sales contract. The seller also continues to recognize depreciation expense on the property for which the deposits have been received, unless the property has been classified as held for sale (per ASC 360-10). Cash received from the buyer (initial and continuing investments) is reported as a deposit on the contract. However, some amounts of cash may be received that are not subject to refund, such as interest on the unrecorded principal. These amounts are used to offset any carrying charges on the property (e.g., property taxes and interest on the existing debt). If the interest collected on the unrecorded receivable is refundable, the seller records this interest as a deposit before the sale is consummated and then includes it as a part of the initial investment once the sale is consummated. If deposits on retail land sales are eventually recognized as sales, the interest portion of the deposit is separately recognized as interest income. For contracts that are canceled, the nonrefundable amounts are recognized as income and the refundable amounts returned to the depositor at the time of cancellation.

As stated, the seller's statement of financial position continues to present the debt assumed by the buyer (this includes nonrecourse debt) among its other liabilities. However, the seller reports any principal payments on the mortgage debt assumed as additional deposits, while correspondingly reducing the carrying amount of the mortgage debt.

#### Example of a deposit transaction

Elbrus Investments enters into two separate property acquisition transactions with the Buena Vista Land Company.

1. Elbrus pays a \$50,000 deposit and promises to pay an additional \$800,000 to buy land and a building in an area not yet properly zoned for the facility Elbrus intends to construct. Final

acquisition of the property is contingent upon these zoning changes. Buena Vista does not record the receivable, and records the deposit with the following entry:

Cash	50,000
Customer deposits	50,000

Part of the purchase agreement stipulates that Buena Vista will retain all interest earned on the deposit, and that 10% of the deposit is nonrefundable. Buena Vista earns 5% interest on Elbrus' deposit over a period of four months, resulting in \$208 of interest income that is offset against the property tax expenses of the property with the following entry:

Cash	208
Property tax expense	208

Immediately thereafter, the required zoning changes are turned down, and Elbrus cancels the sales contract. Buena Vista returns the refundable portion of the deposit to Elbrus and records the nonrefundable portion as income with the following entry:

Customer deposits	50,000
Income from contract cancellation	10,000
Cash	40,000

- Elbrus pays a \$40,000 deposit on land owned and being improved by Buena Vista. Elbrus immediately begins paying \$5,000/month under a four-year, 7% loan agreement totaling \$212,000 of principal payments, and agrees to pay an additional \$350,000 at closing, subject to the land being approved for residential construction. After two months, Buena Vista has earned \$167 of refundable interest income on Elbrus' deposit and has been paid \$7,689 of refundable principal and \$2,311 of refundable interest on the debt. Buena Vista records these events with the following entry:

Cash	10,167
Customer deposits	10,167

The land is approved for residential construction, triggering sale of the property. Buena Vista's basis in the property is \$520,000. Buena Vista uses the following entry to describe completion of the sale:

Cash	350,000
Note receivable	204,311
Customer deposits	50,167
Gain on asset sale	84,478
Land	520,000

**Reduced profit method.** The reduced profit method is appropriate when the sale has been consummated and the initial investment is adequate but the continuing investment does not clearly demonstrate the buyer's willing commitment to pay the remaining balance of the receivable. For example, a buyer may purchase land under an agreement in which the seller will finance the sale over a thirty-year period. ASC 976 specifically states twenty years as the maximum amortization period for the purchase of land; therefore, the agreement fails to meet the continuing investment criteria.

Under the reduced profit method, the seller recognizes a portion of the profit at the time of sale with the remaining portion recognized in future periods. The amount of reduced profit recognized

at the time of sale is determined by discounting the receivable from the buyer to the present value of the lowest level of annual payments required by the sales contract over the maximum period of time specified for that type of real estate property (twenty years for land and the customary term of a first mortgage loan set by an independent lending institution for other types of real estate). The remaining profit is recognized in the periods that lump-sum or other payments are made.

#### Example of the reduced profit method

Assume Levinson, Inc. sells a parcel of land to Raemer Co. Levinson receives sales value of \$2,000,000. The land cost \$1,600,000. Raemer gave Levinson the following consideration:

Cash down payment	\$ 500,000
First mortgage note payable to an independent lending institution (payable in equal installments of principal and 12% interest, \$133,887 payable at the end of each of the next twenty years)	1,000,000
Second mortgage note payable to Levinson (payable in equal installments of principal and 10% interest, \$53,039 payable at the end of each of the next thirty years)	<u>500,000</u>
Total sales value	<u>\$2,000,000</u>

The amortization term of the second mortgage (seller's receivable) exceeds the twenty-year maximum permitted by ASC 976. It is assumed that the payments by the buyer will cover the interest and principal on the maximum first mortgage loan that could be obtained on the property and interest on the excess aggregate debt on the property over such a maximum first mortgage loan; consequently, the reduced profit method is appropriate. It is also assumed that the market interest rate on similar agreements is 14%.

The present value of \$53,039 per year for twenty years at the market rate of 14% is \$351,278 ( $\$53,039 \times 6.623$ ).

The gross profit on the sale (\$400,000) is reduced by the difference between the face amount of the seller's receivable (\$500,000) and the reduced amount (\$351,278) or \$148,722. The profit recognized at the time of sale is the sales value less the cost of the land less the difference between the face amount of the receivable and the reduced amount. Therefore, the reduced profit recognized on the date of sale is computed as follows:

Sales value	\$2,000,000
Less: Cost of land	(1,600,000)
Excess	(148,722)
Reduced profit	<u>\$ 251,278</u>

Under the reduced profit method, the seller amortizes its receivable at the market rate, not the rate given on the second mortgage. The receivable's carrying balance is zero after the specified term expires (in this case, twenty years). The remaining profit of \$148,722 is recognized in the years after the specified term expires as the buyer makes payments on the second mortgage (years twenty-one through thirty).

#### Profit Recognition on Retail Land Sales

A single method of recognizing profit is applied to all consummated sales transactions within a project.

**Full accrual method.** The full accrual method of accounting is applied if all of the following conditions are met and a sale can be recorded:

1. **Expiration of refund period.** The buyer has made the down payment and each required subsequent payment until the period of cancellation with refund has expired. That period

is the longest period of those required by local law, established by the seller's policy, or specified in the contract.

2. **Sufficient cumulative payments.** The cumulative payments of principal and interest equal or exceed 10% of the contract sales price.
3. **Collectibility of receivables.** Collection experience for the project in which the sale is made or for the seller's prior projects indicates that at least 90% of the contracts in the project in which the sale is made that are in force six months after sale will be collected in full. The collection experience with the seller's prior projects may be applied to a new project if the prior projects have:
  - a. The same characteristics (type of land, environment, clientele, contract terms, sales methods) as the new project
  - b. A sufficiently long collection period to indicate the percentage of current sales of the new project that will be collected at maturity.A down payment of at least 20% is an acceptable indication of collectibility.
4. **Nonsubordination of receivables.** The receivable from the sale is not subject to subordination to new loans on the property except that subordination by an individual lot buyer for home construction purposes is permissible if the collection experience on those contracts is the same as on contracts not subordinated.
5. **Completion of development.** The seller is not obligated to complete improvements of lots sold or to construct amenities or other facilities applicable to lots sold.

**Percentage-of-completion method.** The percentage-of-completion method is used if criteria 1, 2, 3, and 4 above are met, and full accrual criteria are not met (criterion 5 is not satisfied). However, additional criteria (6 and 7) must be satisfied.

1. **There has been progress on improvements.** The project's improvements progressed beyond preliminary stages and the work apparently will be completed according to plan. Some indications of progress are:
  - a. The expenditure of funds
  - b. Initiation of work
  - c. Existence of engineering plans and work commitments
  - d. Completion of access roads and amenities such as golf courses, clubs, and swimming pools.Additionally, there should be no indication of significant delaying factors, such as the inability to obtain permits, contractors, personnel, or equipment. Finally, estimates of costs to complete and extent of progress toward completion should be reasonably dependable.

2. **Development is practical.** There is an expectation that the land can be developed for the purposes represented and the properties will be useful for those purposes; restrictions, including environmental restrictions, will not seriously hamper development; and that improvements such as access roads, water supply, and sewage treatment or removal are feasible within a reasonable time period.

**Installment method.** The installment method is appropriate if criteria a and b are met, full accrual criteria are not met, and the seller is financially capable, as shown by capital structure, cash flow, or borrowing capacity. If the transaction subsequently meets the requirements for the full

accrual method, the seller is permitted to change to that method. This would be a change in accounting estimate. This method may be changed to the percentage-of-completion method when all of the criteria are met.

**Deposit method.** If a retail land sale transaction does not meet any of the above criteria, the deposit method is appropriate.

## REAL ESTATE TIME-SHARING ACTIVITIES (ASC 978)<sup>22</sup>

### PERSPECTIVE AND ISSUES

---

#### Overview

A major segment of the real estate industry has evolved in recent decades to market and sell time-shares, whereby parties acquire the right to use property (typically, resort condominiums or other vacation-oriented property) for a fixed number of weeks per year (known as intervals). While a vast variety of property types and transaction structures exist, there are certain common features and complexities that have challenged the accounting profession. Time-sharing transactions are characterized by the following:

1. Volume-based, homogeneous sales
2. Seller financing
3. Relatively high selling and marketing costs
4. Upon default, recovery of the time-sharing interval by the seller and some forfeiture of principal by the buyer.

Time-share transactions are to be accounted for as nonretail land sales, while time-share transactions are excluded from certain provisions otherwise applicable to incidental rental operations.

### DEFINITIONS OF TERMS

---

Source: ASC 978, *Glossary*

**Fixed Time.** A time-sharing arrangement in which ownership is passed through a deed and the buyer purchases a specific period (generally, a specific week) during the year.

**Floating Time.** A time-sharing arrangement in which ownership is passed through a deed but the buyer is not limited to a specific period (generally, a specific week) during the year.

**Fractional Interest.** A partial ownership interest in real estate that typically includes larger blocks of time on an annual basis (for example, three weeks or more).

**Interval.** The specific period (generally, a specific week) during the year that a time-sharing unit is specified by agreement to be available for occupancy by a particular customer. Also denoted Time-Sharing Interest or Time-Share.

---

<sup>22</sup> Upon implementation of ASU 2014-09, *Revenue from Contracts with Customers*, guidance for revenue and deferred revenue for this industry can be found in ASC 606.

**Phase.** A contractually or physically distinguishable portion of a real estate project (including time-sharing projects). That portion is distinguishable from other portions based on shared characteristics such as:

1. Units a developer has declared or legally registered to be for sale
2. Units linked to an owners' association
3. Units to be constructed during a particular time period
4. How a developer plans to build the real estate project.

**Points.** Purchased vacation credits that a buyer may redeem for occupancy at various sites. The number of points redeemed depends on such factors as unit type and size, site location, and season.

**Project.** A time-sharing development; some projects may be completed in a single phase, such as a single, one-story building containing several time-sharing units. Other projects may be completed in several phases, for example:

- a. A hotel that is being converted to time-sharing units one floor at a time while the unconverted units continue to be rented
- b. A number of buildings, each containing several time-sharing units, being built on a piece of property over an extended period of time.

**Tenancy-for-Years.** A time-sharing arrangement in which a customer has a qualified right to possession and use of a time-sharing interval for a certain number of years, after which it reverts to the seller or a third party. Also known as estate-for-years or term-for-years.

**Time-Share.** See Interval.

**Time-Sharing.** An arrangement in which a seller sells or conveys the right to occupy a dwelling unit for specified periods in the future. Forms of time-sharing arrangements include but are not limited to fixed and floating time, interval ownership, undivided interests, points programs, vacation clubs, right-to-use arrangements such as tenancy-for-years arrangements, and arrangements involving special-purpose entities. In this context, an undivided interest is a time-sharing arrangement that involves a tenant-in-common interest in a condominium unit or entire improved property, and in which the interest holder is assigned a specific period (generally, a specific week). The interest holder is also assigned a specific unit if the undivided interest is in the entire improved property.

**Time-Sharing Interest.** See Interval.

**Time-Sharing Special-Purpose Entity.** An entity, typically a corporation or a trust, to which a seller transfers time-sharing real estate in exchange for the entity's stock, membership interests, or beneficial interests.

## **CONCEPTS, RULES, AND EXAMPLES**

---

**Accounting for time-share transactions.** ASC 978 provides guidance for a seller's accounting for real estate time-sharing transactions, including:

1. Fee simple transactions in which nonreversionary title and ownership of the real estate pass to the buyer or an SPE
2. Transactions in which title and ownership of all or a portion of the real estate remain with the seller
3. Transactions in which title and ownership of all or a portion of the real estate pass to the buyer and subsequently revert to the seller or transfer to a third party
4. Transactions by a time-share reseller.

The major conclusions of this very detailed, specialized section of the ASC are as follows:

**Profit recognition.** A time-share seller should recognize profit on time-sharing transactions as set forth by the provisions of ASC 978 that specify the accounting for other than retail land sales. In order to justify recognizing profit, nonreversionary title must be transferred. If title transfer is reversionary, on the other hand, the seller must account for the transaction as if it were an operating lease.

For a time-sharing transaction to be accounted for as a sale, it must meet the following criteria:

1. The seller transfers nonreversionary title to the time-share;
2. The transaction is *consummated*;
3. The buyer makes cumulative payments (excluding interest) of at least 10% of the sales value of the time-share; and
4. Sufficient time-shares would have been sold to reasonably assure that the units will not become rental property.

**Effect of sales incentives.** The codification requires that certain sales incentives provided by a seller to a buyer to consummate a transaction are to be recorded separately, by reducing the stated sales price of the time-share by the excess of the fair value of the incentive over the amount paid by the buyer. For purposes of testing for buyer's financial commitment as set forth under ASC 978, the seller must reduce its measurement of the buyer's initial and continuing investments by the excess of the fair value of the incentive over the stated amount the buyer pays, except in certain situations in which the buyer is required to make specific payments on its note in order to receive the incentive.

**Reload transactions.** A reload transaction is considered to be a separate sale of a second interval, and the second interval is accounted for in accordance with the profit recognition guidance of ASC 978. For an upgrade transaction, that guidance is applied to the sales value of the new (upgrade) interval, and the buyer's initial and continuing investments from the original interval are included in the profit recognition tests related to the new interval.

**Uncollectibles.** The term uncollectibles is used in ASC 978 to include all situations in which, as a result of credit issues, a time-share seller collects less than 100% of the contractual cash payments of a note receivable, except for certain transfers of receivables to independent third parties by the seller. An estimate of uncollectability that is expected to occur should be recorded as a reduction of revenue at the time that profit is recognized on a time-sharing sale recorded under the full accrual or percentage-of-completion method. Historical and statistical perspectives are used in making such a determination of anticipated uncollectible amounts. Subsequent changes in estimated uncollectibles should be recorded as an adjustment to estimated uncollectibles and thereby as an adjustment to revenue. Under the relative sales value method, the seller effectively does not record revenue, cost of sales, or inventory relief for amounts not expected to be collected. There generally is no accounting effect on inventory when, as expected, a time-share is reposessed or otherwise reacquired.

**Cost of sales.** The seller should account for cost of sales and time-sharing inventory in accordance with the relative sales value method.

**Costs charged to current period expense.** All costs incurred to sell time-shares would be charged to expense as incurred except for certain costs that are:

- Incurred for tangible assets used directly in selling the time-shares;
- Incurred for services performed to obtain regulatory approval of sales; or
- Direct and incremental costs of successful sales efforts under the percentage-of-completion, installment, reduced profit, or deposit methods of accounting.

**Incidental operations.** Rental and other operations during holding periods, including sampler programs and minivacations, should be accounted for as incidental operations. This requires that any excess of revenue over costs be recorded as a reduction of inventory costs.

**VIEs and other complex structures.** The accounting treatment for more complex time-sharing structures such as time-sharing special-purpose entities (variable interest entities [VIEs], which were formerly known as *special-purpose entities*, or SPEs), points systems, and vacation clubs should be determined using the same profit recognition guidance as for simpler structures, provided that the time-sharing interest has been sold to the end user. For statement of financial position presentation purposes, a VIE should be viewed as an entity lacking economic substance and established for the purpose of facilitating sales if the VIE structure is legally required for purposes of selling intervals to a class of nonresident customers, and the VIE has no assets other than the time-sharing intervals and has no debt. In those circumstances, the seller should present on its statement of financial position as time-sharing inventory the interests in the VIE not yet sold to end users.

**Continuing involvement by seller or related entities.** If the seller, seller's affiliate, or related party operates an exchange, points, affinity, or similar program, the program's operations constitute continuing involvement by the seller, and the seller should determine its accounting based on an evaluation of whether it will receive compensation at prevailing market rates for its program services.

## REGULATED OPERATIONS (ASC 980)<sup>23</sup>

### PERSPECTIVE AND ISSUES

---

Although various businesses are subject to regulatory oversight to greater or lesser degrees, as used in GAAP the term regulated operations refers primarily to public utilities, whose ability to set selling prices for the goods or services they offer is constrained by government actions. Generally, the regulatory process has been designed to permit such enterprises to recover the costs they incur, plus a reasonable rate of return to stockholders. However, given the political process of rate-setting by regulatory authorities, and the fact that costs such as those for plant construction have escalated, the ability to recover all costs through rate increases has become less certain. For this and other reasons, specialized GAAP has been promulgated.

### CONCEPTS, RULES, AND EXAMPLES

---

These accounting principles apply to regulated enterprises only if they continue to meet certain criteria, which relate to the intended ability to recover all costs through the rate-setting process. When and if these conditions are no longer met, due to deregulation or a shift to rate-setting which is not based on cost recovery, then application of the specialized GAAP is to terminate.

#### Asset Recognition

If certain costs are not recognized for current rate-setting purposes, but it is probable that the costs will be recovered through future revenue, then these costs can be capitalized even though a

---

<sup>23</sup> Upon implementation of ASU 2014-09, entities should look to the guidance in ASC 606 for information on revenue recognition.

nonregulated enterprise would be required to expense these costs currently. Deferred costs can include an imputed cost of equity capital, if so accounted for rate-setting purposes, even though this would not normally be permitted under GAAP. Thus, the regulatory process can result in the accounting recognition of an asset that would not otherwise be recognized by a commercial enterprise. If at any time it becomes apparent that the incurred cost will not be recovered through generation of future revenue, that cost is to be charged to expense. If a regulator subsequently excludes specific costs from allowable costs, the carrying value of the asset recognized is to be reduced to the extent of the excluded costs. Should the regulator allow recovery of these previously excluded costs or any additional costs, a new asset is to be recognized and classified as if these costs had been initially included in allowable costs.

### **Imposition of Liabilities**

In other situations, the regulatory process can result in the accounting recognition of a liability. This usually occurs when regulators mandate that refunds be paid to customers, which must be accrued when probable and reasonably estimable, per ASC 450, *Contingencies*. Furthermore, regulatory rates may be set at a higher level, in order to recover costs expected to be incurred in the future, subject to the caveat that such amounts will be refunded to customers if it later becomes apparent that actual costs incurred were less than expected. In such cases, the incremental rate increase related to recovery of future costs must be accounted for as a liability (unearned revenue), until the condition specified is satisfied. Finally, regulators may stipulate that a gain realized by the utility will be returned to customers over a specified future period; this will be accounted for by accrual of a liability rather than by recognition of the gain for accounting purposes.

### **Abandonment**

Accounting for abandonments is also stipulated for regulated enterprises. If an abandonment occurs or becomes probable, any costs which are probable of not being recovered are required to be written off as a loss. Furthermore, if the return on the investment that will be recoverable will not be equal to the normal rate of return, then an additional loss accrual must be recognized currently. This loss is measured by the difference between the projected future revenues, discounted at the enterprise's incremental borrowing rate, and the remaining costs to be recovered. The amount of loss to be recognized obviously depends on the enterprise's estimate of time to elapse until rate increases are effective, and the length of time over which the increases will remain in effect. These estimates may change over time, and the effect of revisions in the estimate will be reflected in earnings in the periods the new estimates are made.

The carrying value of the costs of an abandoned plant is increased during the period from the abandonment until recovery occurs through rate increases as promised by the regulatory authorities. If full return of investment is anticipated, the cost of abandoned assets is accreted at the rate (the enterprise's overall cost of capital) permitted for rate-setting purposes. If partial or no return on investment is expected, the asset value is accreted at the same rate that was used to compute the loss accrual, which is the enterprise's incremental borrowing rate. During the recovery period, the costs of the abandoned plant are amortized. If full return on investment is expected, this amortization is to be computed on the same basis as is permitted for rate-setting purposes. If partial or no return is expected, amortization is recognized in amounts that provide a constant rate of return on the unamortized balance of the investment in the costs of the abandoned plant.

## Accounting for Liabilities Related to Asset Retirement Obligations

Historically, and particularly since the advent of nuclear energy generation, public utilities have faced the problem of accounting for costs which are expected to be incurred attendant upon the retirement from service of the generating facilities. Environmental and other laws and regulations typically mean that very substantial costs have to be borne, in order to dispose of waste, restore the land (not merely the power generating facility site, but, in the case of coal-fired plants, restoration of the strip mining locations), and ameliorate other problems. These issues are addressed by ASC 410-20, *Asset Retirement Obligations*.

The chapter on ASC 410 presents a detailed examination of ASC 410-20, and that discussion is not duplicated here. In brief, this pronouncement establishes standards for measuring the future cost to retire an asset and recognizing it in the financial statements as a liability and correspondingly, as part of the depreciable cost of the asset. ASC 410-20 applies to legal obligations associated with the retirement of tangible long-lived assets that result from their acquisition, construction, development, and/or normal operation. It does not apply to situations where moral suasion is to be applied to encourage cleanup efforts, even if the reporting entity has a history of making such voluntary gestures. However, the principle of “promissory estoppel” does create legal obligations even absent contractual or statutory requirements, in some cases.

If costs, such as those related to nuclear decommissioning, are legal obligations, the present value of the future expenditures is recognized as an added cost of the asset, and as a liability, at acquisition. Further cost accretion is required due to the passage of time. Depreciation charges are based on the recorded cost of the asset, including the estimated future retirement costs. Changes in estimates, which are inevitable, are handled differently if they are increases versus decreases, as described in the chapter on ASC 360.

## Accounting for Asset Impairments

While not unique to regulated industries (public utilities, in particular), the issue of asset impairment will often be dealt with in these operations, due to the large investment in very long-lived fixed assets and the potential impact of changes in technology over time. ASC 360 addresses this issue. Briefly, under defined conditions, assets must be reviewed to determine whether their carrying value will be fully recovered from future cash flows from using and disposing of them. If the future estimate of cash flows over the asset’s (or group of assets’) remaining estimated useful life, undiscounted, is less than the carrying value, the asset is considered impaired, and the carrying value is reduced to the fair value of the asset with the impairment loss being charged to expense in the current period. Typically, a projected cash flows approach is used in estimating value, although in some instances a more direct approach, relying on market prices, might be usable.

## Accounting for Deregulation and “Stranded Costs”

The utilities industries have undergone varying degrees of deregulation. This has significant effects on the financial reporting of many of the entities operating in these industries, since under GAAP many had recognized regulatory assets and regulatory liabilities which will no longer be recognizable once full deregulation occurs. Also, certain costs may no longer be recoverable in a deregulated environment, transforming certain assets into *stranded costs*.

ASC 980-20-35 addresses the matter of deregulation. When deregulation legislation has been enacted affecting all or a portion of the entity’s operations, it is to cease applying ASC 980 to the affected operations. In cases in which the effects of deregulation are imposed by means of a rate

order, such an order would have to be sufficiently detailed so that the entity would be able to determine how it will be affected. Regulatory assets would not, however, be immediately written off; instead, an evaluation of regulatory cash flows would be conducted to determine whether an impairment had occurred and to determine whether the portion of the business from which the regulatory cash flows are derived is still subject to ASC 980. Only if the asset is impaired (applying ASC 360 criteria) or if ASC 980 is no longer applicable would the asset be written off before being recovered. Similarly, regulatory liabilities would not be reclassified into income until the obligation is eliminated by the regulatory authority.

A related concern is whether the new regulatory assets or liabilities must be given recognition to reflect expenses and obligations that will arise from the portion of the business being deregulated. The same “source of cash flow” type of analysis noted above is to be applied to make these determinations. Thus, a cost or obligation is recognized as a regulatory asset or liability, respectively, once it is expensed or incurred after ASC 980 is applied to that portion of the operations, if it has been designated for recovery or settlement, respectively, via regulated cash flows.

### Other Accounting Guidance

ASC 980-605-25<sup>24</sup> states that nonutility generators (NUG) are to recognize the lesser of (1) the amount billable under the contract, or (2) a formula-based pricing arrangement, as revenue. The formula-based pricing arrangement is determined by the kilowatt-hours (kwhs) made available during the period multiplied by the estimated average revenue per kwh over the term of the contract for the fixed or scheduled price period of the contract. Revenue is not to be recognized utilizing the formula-based pricing arrangement if its only purpose is to establish liquidating damages. Additionally, a receivable arises when the amounts billed are less than the amount computed pursuant to the formula-based pricing arrangement and if the contract requires a payment, probable of recovery, to the NUG at the end of the contract term.

ASC 980-605-25 also addresses the treatment of additional revenues of rate-regulated utility companies that are to be billed in the future under alternative revenue programs. It identifies two types of alternative revenue programs, defined as Type A and Type B. The revenues from alternative revenue programs are to be recognized when the events permitting billing of the revenues have occurred and three specific criteria that are discussed in the abstract are met.

Also, rate-regulated utilities recognizing revenues from an alternative revenue program that do not meet the conditions of this consensus must amend the plan or change the program to meet the conditions.

ASC 980-715-25 holds that, if the regulator includes other postemployment benefits (OPEB), costs in rates on a pay-as-you-go basis, the regulatory asset relating to the cost under ASC 715 is not to be recognized. Further, the regulatory asset for a rate-regulated enterprise is to recognize the difference between ASC 715 costs and the OPEB costs if future revenue will at least offset the deferred cost and meet four specific criteria, which are discussed in the standard.

Regarding the accounting for regulatory assets, ASC 980-715-25-8 states that a rate-regulated enterprise that fails to initially meet the asset recognition criteria can recognize a regulatory asset for other postemployment benefits costs in a future period when applicable criteria are met. This consensus applies also to all regulatory assets recognized pursuant to ASC 980-10-05 criteria.

Additionally, it was noted that the carrying amount of the regulatory asset to be recognized is to be reduced by any impairment that may have occurred.

<sup>24</sup> ASC 980-605-25 is superseded upon implementation of ASU 2014-09 on revenue.

Fixed price arrangements are to be handled in accordance with ASC 980-605-25. Variable price arrangements in which the rate is at least equal to expected costs are to recognize revenue as billed, in accordance with the provisions of the contract for that variable price period. A long-term power sales contract is to be reviewed periodically to determine whether it is a loss contract, in which case the loss is to be recognized immediately. Finally, any premium related to a contractual rate in excess of the current market rate is to be amortized over the remaining portion of the contract for long-term power sales contracts acquired in a purchase business combination.

## SOFTWARE (ASC 985)<sup>25</sup>

### PERSPECTIVE AND ISSUES

---

#### Overview

As technology has come to play a more important role in businesses, increasing levels of activity have been devoted to the development of computer software. This involves a number of undertakings:

- Software licensed, purchased, or leased from others for internal use
- Software obtained from others for resale in the normal course of business (either on a standalone basis or as part of a larger product)
- Software developed internally for sale to others
- Software developed internally for the developer's own use.

Software can be licensed, purchased, or leased and can reside on the user's hardware or be "hosted" by an application service provider (ASP) and leased to the user for remote use over the Internet. A growing set of accounting standards deal with some, but not all, of these issues.

The accounting for the cost of software developed internally for sale (or lease, etc.) to others is addressed by ASC 985-605; it provides that costs incurred prior to the point at which technological feasibility has been demonstrated are to be expensed as research and development costs, but specified costs incurred subsequently are capitalized, and later amortized or expensed (e.g., as cost of sales) as appropriate.

The cost of software acquired from others for resale in the normal course of business is not separately addressed by GAAP, but would be handled as are any other inventory costs. The usual inventory costing methods (LIFO, FIFO, etc.) and financial reporting concerns (lower of cost or market, etc.) are applicable to such situations.

ASC 350-40 addresses accounting for the costs of software acquired from others, or developed internally, for internal use. Internal-use software and the related rules regarding costs of developing Web sites are discussed in connection with the discussion of intangible assets in the chapter on ASC 350. This standard establishes the conditions that must be met before internal use software costs are capitalized. To qualify for capitalization, costs must have been incurred subsequent to the completion of the conceptual formulation, design and testing of possible project

---

<sup>25</sup> Upon implementation of ASU 2014-09, *Revenue from Contracts with Customers*, guidance for revenue and deferred revenue for this industry will be significantly affected by the guidance in ASC 606. Revenue recognition for software arrangements will no longer be deferred if vendor specific objective evidence of fair value for undelivered goods or services is not available. Entities that license software will also be affected and will need to analyze the guidance in ASC 606.

alternatives (including the process of vendor selection for purchased software). In addition, management at the appropriate level of authority must have authorized funding for the development project and conclude that it is probable that the project will be completed and the software will be used to perform the intended functions. This prerequisite is roughly analogous to the “technological feasibility” threshold prescribed by ASC 985 for software to be sold or leased to customers. Costs that are eventually capitalized under ASC 350-40 will be amortized over the period of expected economic benefit, as is the case with all other long-lived assets used in the business.

The increasingly central role of technology has received the attention of accounting standard setters in another arena as well. For enterprises that sell computer software and associated goods and services (program upgrades, maintenance agreements, etc.), complicated issues of revenue recognition arise.

## DEFINITIONS OF TERMS

---

Terms are from ASC 985, *Glossary*.

**Coding.** Generating detailed instructions in a computer language to carry out the requirements described in the detail program design. The coding of a computer software product may begin prior to, concurrent with, or subsequent to the completion of the detail program design.

**Customer Support.** Services performed by an enterprise to assist customers in their use of software products. Those services include any installation assistance, training classes, telephone question and answer services, newsletters, on-site visits, and software or data modifications.

**Detail Program Design.** The specifications of a computer software product that take product functions, features, and technical requirements to their most detailed, logical form and enable coding of the product.

**Maintenance.** Activities undertaken after the product is available for general release to customers to correct errors (commonly referred to as “bugs”) or keep the product updated with current information. Those activities include routine changes and additions.

**Product Design.** A logical representation of all product functions in sufficient detail to serve as product specifications.

**Product Enhancement.** Improvements to an existing product that are intended to extend the life or improve significantly the marketability of the original product. Enhancements normally require their own product design and may require a redesign of all or part of the existing product.

**Product Masters.** A completed version, ready for copying, of the computer software product, the documentation, and the training materials that are to be sold, leased, or otherwise marketed.

**Testing.** Performing the steps necessary to determine whether the coded computer software product meets function, feature, and technical performance requirements set forth in the product design.

**Working Model.** An operative version of the computer software product that is completed in the same software language as the product to be ultimately marketed, performs all the major functions planned for the product, and is ready for initial customer testing (usually referred to as **beta testing**).

## CONCEPTS, RULES, AND EXAMPLES

---

### Costs of Software Developed Internally for Sale or Lease

A separate set of accounting issues arise in connection with the costs of computer software developed internally for lease or sale to others. The principal issue relates to the point in the development process at which development efforts are no longer characterized as research and

development (R&D). The costs of R&D activities are required to be expensed currently as discussed in the chapter on ASC 730. The determination of this milestone has important accounting significance because specified costs incurred subsequent to the completion of R&D may be deferred (i.e., inventoried) and later reclassified as cost of sales as the finished products are sold or leased.

ASC 985 established the concept of technological feasibility to demarcate the point at which it is proper to begin to defer costs. According to this standard, all costs of development are considered research and development costs until technological feasibility has been established. This point is reached when all the necessary planning, designing, coding, and testing activities have been completed, to the extent these activities are necessary to establish that the product in question can meet its design specifications. Design specifications, in turn, may include such product aspects as functions, features, and technical performance requirements.

If the process of creating the software involves a detail program design, evidence of having achieved technological feasibility includes having performed these steps:

1. The product design (the logical representation of the product) and detailed program design have been completed. This step includes having demonstrated that the necessary skills, hardware, and software technologies are accessible to the entity for completion of product development.
2. The detailed program design has been documented and traced to product specifications, thus demonstrating completeness and consistency.
3. The detailed program design has been reviewed for any high-risk elements, such as unproven functions or product innovations, and any such high-risk elements have been resolved through coding and testing.

If the software development effort does not involve creation of a detailed program design, then the following steps would require completion to demonstrate technological feasibility:

1. A product design and working model of the software have been completed.
2. The completeness of the working model and its consistency with the product design have been confirmed by testing.

If all the foregoing steps in either of the above listings have been completed as applicable, then technological feasibility has been demonstrated, and qualifying costs of producing product masters incurred thereafter are capitalized as production costs. Such costs include additional coding and testing activities that occur after the establishment of technological feasibility. The costs of producing product masters include not only the master copy of the software itself but also related user documentation and training materials. Capitalized production costs may include allocated indirect costs (e.g., occupancy costs related to programmers). (ASC 985-20-25-5)

Capitalization of software costs ceases once the product is available for general release to customers of the entity. Period costs, such as maintenance and ongoing customer support efforts, are expensed as incurred.

The capitalized production costs must be amortized, beginning when the product is first available for general release to customers. Amortization is computed on a product-by-product basis, which means that costs related to development of earlier products cannot be “rolled forward” into the costs of newer products, thereby delaying expense recognition. Periodic amortization must be the greater of (1) an amount determined with reference to total estimated revenues to be generated by the product, or (2) an amount computed on a straight-line basis with reference to the product’s expected life cycle.

**Example of amortization of capitalized computer software development costs**

Assume total costs of \$30,000 have been capitalized at the point product sales begin. Management estimates that the product will eventually generate revenues of \$5,100,000 over a period of four years. For the current period (1/2 of a year), revenues of \$600,000 have been earned. Capitalized costs of \$3,750 must be amortized, which is the greater of the pro rata amount based on estimated total revenues to be derived from product sales  $[($600,000 \div \$5,100,000) \times \$30,000 = \$3,529]$  or the amount determined on a straight-line basis  $(\$30,000 \div 4 \times 1/2 = \$3,750)$ .

Other costs, such as product duplication, training material publication, and packaging, are capitalized as inventory on a unit-specific basis and expensed as cost of sales when product sales revenues are recognized.

Capitalized production costs are subject to annual evaluation for net realizable value; if impairment adjustments are recognized, the written-down amount becomes the new cost basis for further amortization purposes, as well as for comparison to net realizable value in the following period.

Capitalized inventory costs are subject to the same lower of cost or market evaluation as is required for inventories of tangible goods.

### Software Revenue Recognition

The basic principles underlying ASC 985-605 are set forth in the following paragraphs.

**Licensing vs. sales.** Standards setters were concerned that transfers of rights to software by licenses rather than by outright sales (a technique widely employed to provide vendors with legal recourse when others engage in unauthorized duplication of their products) were being accounted for differently. The standard setters concluded that any legal distinction between a license and a sale should not cause revenue recognition to differ.

**Product may not equate with delivery of software.** Arrangements to deliver software, whether alone or in conjunction with other products, often include services. Services to be provided in such contexts commonly involve significant production, modification, or customization of the software. Thus, physical delivery of the software might not constitute the delivery of the final product contracted for, absent those alterations, resulting in the requirement that such arrangements be accounted for as construction-type or production-type contracts in conformity with ASC 605-35. However, if the services do not entail significant production, modification, or customization of the software, the services are accounted for as a separate element.

**Delivery is the key threshold issue for revenue recognition.** This is consistent with the principles set forth in CON 5, *Recognition and Measurement in Financial Statements of Business Enterprises*, which states that:

*An entity's revenue-earning activities involve delivering or producing goods, rendering services, or other activities that constitute its ongoing major or central operations, and revenues are considered to have been earned when the entity has substantially accomplished what it must do to be entitled to the benefits represented by the revenues . . . [t]he two conditions (being realized or realizable and being earned) are usually met by the time the product or merchandise is delivered . . . to customers, and revenues . . . are commonly recognized at time of sale (usually meaning delivery).*

**Revenue must be allocated to all elements of the sales arrangement, with recognition dependent upon meeting the criteria on an element-by-element basis.** Under prior GAAP, the accounting for vendor obligations remaining after delivery of software was dependent upon

whether or not the obligation was deemed to be significant. Under ASC 985-605-25, however, all obligations are accounted for and revenue is allocated to each element of the arrangement, based on vendor-specific objective evidence (VSOE) of the fair values of the elements. Revenue associated with a particular element is not recognized until the revenue-recognition conditions established by the ASC are met, as the earnings process related to that element will not be considered complete until that time.

**Fair values for revenue allocation purposes must be vendor-specific.** When there are multiple elements of an arrangement, revenue is generally recognized on an element-by-element basis as individual elements are delivered. Revenue is allocated to the various elements in proportion to their relative fair values. Under ASC 985-605-25, this allocation process requires that VSOE of fair value be employed, regardless of any separate prices stated in the contract for each element, since prices stated in a contract may not represent fair value and, accordingly, might result in an unreasonable allocation of revenue. If an element is not yet being sold separately, then the price established by management is acceptable as a substitute. Separate transaction prices for the individual elements comprising the arrangement, if they are also being sold on that basis, would be the best such evidence, although under some circumstances (such as when prices in the arrangement are based on multiple users rather than the single user pricing of the element on a standalone basis) even that information could conceivably be invalid for revenue allocation purposes. Relative sales prices of the elements included in the arrangement are to be used whenever possible.

**The earnings process is not complete if fees are subject to forfeiture.** Even when elements have been delivered, if fees allocated to those elements are subject to forfeiture, refund, or other concession if the vendor does not fulfill its delivery responsibilities relative to other elements of the arrangement, those fees are not treated as having been earned. The potential concessions are an indication that the customer would not have licensed the delivered elements without also licensing the undelivered elements. For that reason, there must be persuasive evidence that fees allocated to delivered elements are not subject to forfeiture, refund, or other concessions before revenue recognition can be justified. Thus, for example, in determining the persuasiveness of the evidence, the vendor's history of making concessions that were not required by the provisions of an arrangement is more persuasive than are terms included in the arrangement that indicate that no concessions are required.

**Exclusions.** The ASC provides that software revenue recognition guidance does *not* apply when a tangible product contains software and non-software components that function together to deliver its essential functionality. Further, an entity should always exclude hardware components of a tangible product from software revenue guidance. The exclusion also applies to any software contained within a tangible product, and which is essential to its functionality (including essential software sold with the product). An example of a tangible product that would be excluded from software revenue recognition guidance is a computer sold with an included operating system. Conversely, an example of a tangible product that would *not* be excluded from software revenue recognition guidance is a computer sold with a bundle of software productivity software; this software is not essential to the operation of the computer, and so is not excluded from the software revenue recognition guidance.

Consider the following factors when deciding if a specific scenario is governed by these exclusions:

- Infrequent sales of the tangible product without the software elements indicate that the software elements are essential to the product's functionality.

- If an entity sells multiple similar products that primarily differ only in the presence or absence of a software component, then consider them the same for the purposes of reviewing the exclusion applicability.
- The separate sale of software that is also contained within a tangible product does not necessarily mean that the software is not essential to the tangible product.
- A software element may be considered essential to a tangible product even it is not embedded within the product.
- The non-software elements of a tangible product must substantially contribute to its functionality.
- If there is an undelivered element of a deliverable that can be subdivided into elements that are excluded from and applicable to software revenue guidance, then bifurcate them into software and non-software deliverable.

### **Operational Rules Established by ASC 985-605**

1. If an arrangement to deliver software or a software system, either alone or together with other products or services, requires significant production, modification, or customization of software, the entire arrangement is accounted for in conformity with ASC 605-35.
2. If the arrangement does not require significant production, modification, or customization of software, revenue is recognized when all of the following criteria are met:
  - a. Persuasive evidence of an arrangement exists;
  - b. Delivery has occurred;
  - c. The vendor's fee is fixed or determinable; and
  - d. Collectibility is probable.
3. For software arrangements that provide licenses for multiple software deliverables (multiple elements), some of which may be deliverable only on a when-and-if-available basis, these deliverables are considered in determining whether an arrangement includes multiple elements. The requirements with respect to arrangements that consist of multiple elements are applied to all additional products and services specified in the arrangement, including those described as being deliverable only on a when-and-if-available basis.
4. For arrangements having multiple elements, the fee is allocated to the various elements based on VSOE of fair value, regardless of any separate prices stated for each element within the contract. VSOE of fair value is limited to the following:
  - a. The price charged when the same element is sold separately; or
  - b. For an element not yet being sold separately, the price established by management, if it is probable that the price, once established, will not change before the separate introduction of the element into the marketplace.

The revenue allocated to undelivered elements cannot later be adjusted. However, if it becomes probable that the amount allocated to an undelivered element of the arrangement will result in a loss on that element, the loss must be immediately recognized. When a vendor's pricing is based on multiple factors such as the number of products and the number of users, the amount allocated to the same elements when sold separately must consider all the relevant factors of the vendor's pricing structure.

In ASC 985-605, multiple-element arrangements are not accounted for as long-term construction contracts when (1) there is VSOE of the fair values of all undelivered elements, (2) VSOE does not exist for one or more of the delivered elements, and (3) all

other revenue recognition criteria have been satisfied. In such cases, the “residual” method of allocation of selling price is to be utilized. This results in deferral of the aggregate fair value of the undelivered elements of the arrangement (to be recognized later as delivery occurs), with the excess of the total arrangement fee over the deferred portion being recognized in connection with the delivered components. This change was made to accommodate the situation whereby software is commonly sold with one “free” year of support, where additional years of support are also marketed at fixed prices; in this case, the fair value of the “free” support is deferred (and amortized over the year), while the software itself is assigned a revenue amount which is the difference between the package price and the known price of one year’s support.

5. If a discount is offered in a multiple-element arrangement, a proportionate amount of the discount is applied to each element included in the arrangement, based on each element’s fair value without regard to the discount. However, no portion of the discount is allocated to any upgrade rights.
6. If sufficient VSOE does not exist for the allocation of revenue to the various elements of the arrangement, all revenue from the arrangement is deferred until the earlier of the point at which (1) such sufficient VSOE does exist, or (2) all elements of the arrangement have been delivered. The exceptions to this guidance, provided in ASC 985-605, are as follows:
  - a. If the only undelivered element is postcontract customer support (PCS), the entire fee is recognized ratably over the contractual PCS period, or when the PCS rights are implicit in the arrangement, over the period that PCS is expected to be provided to the customer.
  - b. If the only undelivered element is services that do not involve significant production, modification, or customization of the software (e.g., training or installation), the entire fee is recognized over the period during which the services are expected to be performed.
  - c. If the arrangement is in substance a subscription, the entire fee is recognized ratably over the term of the arrangement, if stated, otherwise over the estimated economic life of the products included in the arrangement.
  - d. If the fee is based on the number of copies delivered, how the arrangement is accounted for depends on whether the total fee is fixed, and on whether the buyer can alter the composition of the copies to be received, as follows:
    - (1) If the arrangement provides customers with the right to reproduce or obtain copies of two or more software products at a specified price per copy (not per product) up to the total amount of the fixed fee, an allocation of the fee to the individual products generally cannot be made, because the total revenue allocable to each software product is unknown at inception and depends on subsequent choices to be made by the customer and, sometimes, on future vendor development activity. Nevertheless, certain arrangements that include products that are not deliverable at inception impose a maximum number of copies of the undeliverable product(s) to which the customer is entitled. In such arrangements, a portion of the arrangement fee is allocated to the undeliverable product(s). This allocation is made assuming that the customer will elect to receive the maximum number of copies of the undeliverable product(s).
    - (2) In arrangements in which no allocation can be made until the first copy or product master of each product covered by the arrangement has been delivered to the customer, and assuming the four conditions set forth above are met, revenue is

recognized as copies of delivered products are either (a) reproduced by the customer, or (b) furnished to the customer if the vendor is duplicating the software. Once the vendor has delivered the product master or the first copy of all products covered by the arrangement, any previously unrecognized licensing fees are recognized, since only duplication of the software is required to satisfy the vendor's delivery requirement and such duplication is incidental to the arrangement. Consequently, the delivery criterion is deemed to have been met upon delivery to the customer of the product master or first copy. When the arrangement terminates, the vendor recognizes any licensing fees not previously recognized. Revenue is not recognized fully until at least one of the following conditions is met: either (a) delivery is complete for all products covered by the arrangement, or (b) the aggregate revenue attributable to all copies of the software products delivered is equal to the fixed fee, provided that the vendor is not obligated to deliver additional software products under the arrangement.

- (3) The revenue allocated to the delivered products is recognized when the product master or first copy is delivered. If, during the term of the arrangement, the customer reproduces or receives enough copies of these delivered products so that revenue allocable to the delivered products exceeds the revenue previously recognized, the additional revenue is recognized as the copies are reproduced or delivered. The revenue allocated to the undeliverable product(s) is reduced by a corresponding amount.
7. The portion of the fee allocated to a contract element is recognized when the four revenue recognition criteria are met with respect to the element. In applying those criteria, the delivery of an element is considered not to have occurred if there are undelivered elements that are essential to the functionality of the delivered element, because functionality of the delivered element is considered to be impaired.
8. No portion of the fee can be deemed to be collectible if the portion of the fee allocable to delivered elements is subject to forfeiture, refund, or other concession if any of the undelivered elements are not delivered. If management represents that it will not provide refunds or concessions that are not required under the provisions of the arrangement, this assertion must be supported by reference to all available evidence. This evidence may include the following:
  - a. Acknowledgment in the arrangement regarding products not currently available or not to be delivered currently;
  - b. Separate prices stipulated in the arrangement for each deliverable element;
  - c. Default and damage provisions as defined in the arrangement;
  - d. Enforceable payment obligations and due dates for the delivered elements that are not dependent on the delivery of future deliverable elements, coupled with the intent of the vendor to enforce rights of payment;
  - e. Installation and use of the delivered software; and
  - f. Support services, such as telephone support, related to the delivered software being provided currently by the vendor.

### **Other Accounting Guidance**

As a complex and still evolving area, the use of technology in general, and computer software in particular, has created many accounting concerns.

Both software developers and motion picture companies engage in development of software products that combine entertainment (e.g., including well-known cartoon characters and film storylines in the software) and education. The term *edutainment* has been coined to refer to these hybrid products. Diversity in accounting practice had arisen whereby different companies engaged in edutainment development were using different combinations of GAAP to account for the same activities.

In ASC 985-705-S99 the SEC staff announced that:

1. Entertainment and educational products developed for sale or lease, or that are otherwise marketed are to be accounted for under ASC 985-20.
2. Costs subject to ASC 985-20 accounting include film costs incurred in the development of the product that would otherwise be accounted for under ASC 926 (discussed earlier in this chapter).
3. Exploitation costs (marketing, advertising, publicity, promotion, and other distribution expenses) are to be expensed as incurred unless they qualify for capitalization as direct response advertising under ASC 340-20.

The SEC announcement should be deemed the most meaningful guidance on this topic.

In ASC 720-45-25, all expenditures incurred for business process reengineering activities (either by insiders or outsiders) are to be expensed as incurred. This guidance also applies when business process reengineering activities are part of development or implementation of internal-use software. Finally, the accounting for internal-use software development and acquisition of property, plant, and equipment are not affected by this consensus.

ASC 720-45-30-1 also states that, in cases where a third party is engaged for a business process reengineering project, the entire consulting contract price is to be allocated to each activity on the basis of the relative fair values of the separate components.

Some software users do not actually receive and load applications software on their computers, but instead merely access and use it via the Internet, on the vendor's or a third party's server, on an as-needed basis. (Commonly, the applications are "hosted" by companies known as application service providers, or ASPs.) In such arrangements, the customer is paying for two elements—the right to use the software and the storage of the software (and sometimes, the customer's proprietary data) on the provider's hardware. ASC 985-605 has addressed certain concerns arising in such circumstances.

When a vendor provides hosting, several revenue recognition issues may arise. First, the relationship between the customer and the ASP may be structured in the form of a service agreement providing Internet access to the specified site, without a corresponding software license. In such instances, the application of ASC 985-605 to the arrangement was unclear. Second, when the transaction is structured as a software license with a service element, evaluation of how the arrangement meets the delivery requirement of ASC 985-605 was unclear.

ASC 985-605 only applies if the customer has the right to take possession of the software at any time during the hosting period, without significant penalty, and install the software on its own hardware or contract with another service provider to host it. Most, if not all, ASP arrangements would not provide this option to the customer and therefore ASC 985-605 would not apply.

For those few hosting arrangements meeting the foregoing criteria, and thus subject to ASC 985-605, software delivery is deemed to have occurred when the customer first has the option to take possession. The criteria of ASC 985-605 must be met in order for the ASP to recognize revenue allocable to the software element; revenue relating to the hosting element is recognized as that service is provided.

Finally, ASC 985-605 provides authoritative guidance regarding the amounts and timing of revenue recognition in transactions involving the sale or license of computer software. Such transactions are often structured to bundle other software-related “elements” with the software such as future upgrades, postcontract customer support (PCS), training, customization, or other services. Those bundled arrangements are referred to as multiple-element arrangements (MEA).

ASC 985-605-15-3 states that in an MEA that includes software that is “more than incidental” to the arrangement, ASC 985-605 applies to the software-related elements enumerated above as well as any nonsoftware element for which the software element is essential to its functionality.

---

NOTES:

1. *ASC 460-10-30 provides that, at the inception of the guarantee, the guarantor may be required under ASC 450 to recognize a liability for a contingent loss. In the circumstances described here, this would result in the developer or property owner recording the TIFE or municipality debt as their own obligation. In fact, ASC 970-470 specifies that if the property owner is constructing facilities for its own use or operation, the presence of any of the above factors a. through c. would create a presumption that the TIFE debt be recognized as a company obligation.*
  2. *Consolidation of the TIFE by the property owner or developer will most likely be prohibited under ASC 810, since governmental organizations and financing entities established by governmental organizations are exempt from consolidation unless the property owner or developer is using the arrangement in an attempt to circumvent ASC 810.*
- 

Real estate developers follow the guidance in ASC 970. Under ASC 970, the developer capitalizes any portion allocable to the production period as part of the cost of the property being developed. The remaining portion is charged to expense because it is attributable to the period after the project is substantially complete and ready for intended use.

Reporting entities developing the property for their own use are not included in the scope of ASC 970 and, therefore need to consider the best of the available alternatives. The author favors analogizing from ASC 970 and the literature on interest capitalization on self-constructed assets, and accordingly following the same accounting as described in the previous paragraph.

## **APPENDIX A DEFINITIONS OF TERMS**

---

**Acquiree.** The business or businesses that the acquirer obtains control of in a business combination. This term also includes a nonprofit activity or business that a not-for-profit acquirer obtains control of in an acquisition by a not-for-profit entity.

**Acquirer.** The entity that obtains control of the acquiree. However, in a business combination in which a variable interest entity (VIE) is acquired, the primary beneficiary of that entity always is the acquirer.

**Acquisition Date.** The date on which the acquirer obtains control of the acquiree.

**Acquisition by a Not-for-Profit Entity.** A transaction or other event in which a not-for-profit acquirer obtains control of one or more nonprofit activities or businesses and initially recognizes their assets and liabilities in the acquirer's financial statements. When applicable guidance in Topic 805 is applied by a not-for-profit entity, the term "business combination" has the same meaning as this term has for a not-for-profit entity. Likewise, a reference to business combinations in guidance that links to Topic 805 has the same meaning as a reference to acquisitions by not-for-profit entities.

**Acquisition, Development, and Construction Arrangements.** Acquisition, development, or construction arrangements, in which a lender, usually a financial institution, participates in expected residual profit from the sale or refinancing of property.

**Affiliate.** A party that, directly or indirectly through one or more intermediaries, controls, is controlled by, or is under common control with an entity.

**Available-for-Sale Securities.** Investments not classified as either trading securities or as held-to-maturity securities.

**Bargain Purchase Option.** A provision allowing the lessee, at his option, to purchase the leased property for a price that is sufficiently lower than the expected fair value of the property at the date the option becomes exercisable that exercise of the option appears, at lease inception, to be reasonably assured.

**Bargain Renewal Option.** A provision allowing the lessee, at his option, to renew the lease for a rental sufficiently lower than the fair rental of the property at the date the option becomes exercisable that exercise of the option appears, at lease inception, to be reasonably assured. Fair rental of a property in this context shall mean the expected rental for equivalent property under similar terms and conditions.

**Beneficial Interests.** Rights to receive all or portions of specified cash inflows received by a trust or other entity, including, but not limited to, all of the following:

- a. Senior and subordinated shares of interest, principal, or other cash inflows to be passed-through or paid-through
- b. Premiums due to guarantors
- c. Commercial paper obligations
- d. Residual interests, whether in the form of debt or equity.

**Benefit Formula.** The basis for determining benefits to which participants may be entitled under a postretirement benefit plan. A plan's benefit formula specifies the years of service to be rendered, age to be attained while in service, or a combination of both that must be met for an employee to be eligible to receive benefits under the plan. A plan's benefit formula may also define the beginning of the credited service period and the benefits earned for specific periods of service.

**Benefits.** The monetary or in-kind benefits or benefit coverage to which participants may be entitled under a pension plan or other postretirement benefit plan, including health care benefits, life insurance, legal, educational, and advisory services, pension benefits, disability benefits, death benefits, and benefits due to termination of employment.

**Business.** An integrated set of activities and assets that is capable of being conducted and managed for the purpose of providing a return in the form of dividends, lower costs, or other economic benefits directly to investors or other owners, members, or participants. Additional guidance on what a business consists of is presented in paragraphs 805-10-55-4 through 55-9.

**Business Combination.** A transaction or other event in which an acquirer obtains control of one or more businesses. Transactions sometimes referred to as true mergers or mergers of equals also are business combinations. See also Acquisition by a Not-for-Profit Entity.

**Call Option.** A contract that allows the holder to buy a specified quantity of stock from the writer of the contract at a fixed price for a given period. See Option and Purchased Call Option.

**Cash.** Consistent with common usage, cash includes not only currency on hand but demand deposits with banks or other financial institutions. Cash also includes other kinds of accounts that have the general characteristics of demand deposits in that the customer may deposit additional funds at any time and also effectively may withdraw funds at any time without prior notice or penalty. All charges and credits to those accounts are cash receipts or payments to both the entity owning the account and the bank holding it. For example, a bank's granting of a loan by crediting the proceeds to a customer's demand deposit account is a cash payment by the bank and a cash receipt of the customer when the entry is made.

**Cash Consideration.** Cash payments and credits that the customer can apply against trade amounts owed to the vendor. In addition, as indicated in Section 505-50-25, consideration in the form of equity instruments is recognized in the same period or periods and in the same manner (that is, capitalize versus expense) as if the entity had paid cash for the goods or services or used cash rebates as a sales discount instead of paying with or using the equity instruments. Accordingly, guidance with respect to cash consideration is applicable to consideration that consists of equity instruments (regardless of whether a measurement date has been reached).

**Cash Equivalents.** Cash equivalents are short-term, highly liquid investments that have both of the following characteristics:

1. Readily convertible to known amounts of cash
2. So near their maturity that they present insignificant risk of changes in value because of changes in interest rates.

Generally, only investments with original maturities of three months or less qualify under that definition. Original maturity means original maturity to the entity holding the investment. For example, both a three-month U.S. Treasury bill and a three-year U.S. Treasury note purchased three months from maturity qualify as cash equivalents. However, a Treasury note purchased three years ago does not become a cash equivalent when its remaining maturity is three months.

Examples of items commonly considered to be cash equivalents are Treasury bills, commercial paper, money market funds, and federal funds sold (for an entity with banking operations).

**Change in Accounting Principle.** A change from one generally accepted accounting principle to another generally accepted accounting principle when there are two or more generally accepted accounting principles that apply or when the accounting principle formerly used is no longer generally accepted. A change in the method of applying an accounting principle also is considered a change in accounting principle.

**Combined Financial Statements.** The financial statements of a combined group of commonly controlled entities or commonly managed entities presented as that of a single economic entity. The combined group does not include the parent.

**Commencement Date of the Lease.** The date on which a lessor makes an underlying asset available for use by a lessee. See paragraphs 842-10-55-19 through 55-21 for implementation guidance on the commencement date.

**Commitment Fees.** Fees charged for entering into an agreement that obligates the entity to make or acquire a loan or to satisfy an obligation of the other party under a specified condition. Commitment fees include fees for letters of credit and obligations to purchase a loan or group of loans and pass-through certificates.

**Common Stock.** A stock that is subordinate to all other stock of the issuer. Also called common shares.

**Component of an Entity.** A component of an entity comprises operations and cash flows that can be clearly distinguished, operationally and for financial reporting purposes, from the rest of the entity. A component of an entity may be a reportable segment or an operating segment, a reporting unit, a subsidiary, or an asset group.

**Comprehensive Income.** The change in equity (net assets) of a business entity during a period from transactions and other events and circumstances from nonowner sources. It includes all changes in equity during a period except those resulting from investments by owners and distributions to owners. Comprehensive income comprises both of the following:

1. All components of net income
2. All components of other comprehensive income.

**Conduit Debt Securities.** Certain limited-obligation revenue bonds, certificates of participation, or similar debt instruments issued by a state or local governmental entity for the express purpose of providing financing for a specific third party (the conduit bond obligor) that is not a part of the state or local government's financial reporting entity. Although conduit debt securities bear the name of the governmental entity that issues them, the governmental entity often has no obligation for such debt beyond the resources provided by a lease or loan agreement with the third party on whose behalf the securities are issued. Further, the conduit bond obligor is responsible for any future financial reporting requirements.

**Consolidation.** The presentation of a single set of amounts for an entire reporting entity. Consolidation requires elimination of intra-entity transactions and balances.

**Contingency.** An existing condition, situation, or set of circumstances involving uncertainty as to possible gain (gain contingency) or loss (loss contingency) to an entity that will ultimately be resolved when one or more future events occur or fail to occur.

**Contract.** An agreement between two or more parties that creates enforceable rights and obligations.

**Contract Asset.** An entity's right to consideration in exchange for goods or services that the entity has transferred to a customer when that right is conditioned on something other than the passage of time (for example, the entity's future performance).

**Contract Liability.** An entity's obligation to transfer goods or services to a customer for which the entity has received consideration (or the amount is due) from the customer.

**Control.** (Topics 310, 850) The possession, direct or indirect, of the power to direct or cause the direction of the management and policies of an entity through ownership, by contract, or otherwise.

**Credit Derivative.** A derivative instrument that has both of the following characteristics:

1. One or more of its underlyings are related to any of the following:
  - a. The credit risk of a specified entity (or a group of entities)
  - b. An index based on the credit risk of a group of entities.
2. It exposes the seller to potential loss from credit-risk-related events specified in the contract.

Examples of credit derivatives include, but are not limited to, credit default swaps, credit spread options, and credit index products.

**Current Assets.** Current assets is used to designate cash and other assets or resources commonly identified as those that are reasonably expected to be realized in cash or sold or consumed during the normal operating cycle of the business.

**Current Tax Expense (or Benefit).** The amount of income taxes paid or payable (or refundable) for a year as determined by applying the provisions of the enacted tax law to the taxable income or excess of deductions over revenues for that year.

**Customer.** A party that has contracted with an entity to obtain goods or services that are an output of the entity's ordinary activities in exchange for consideration.

**Debt.** A receivable or payable (collectively referred to as debt) represents a contractual right to receive money or a contractual obligation to pay money on demand or on fixed or determinable dates that is already included as an asset or liability in the creditor's or debtor's balance sheet at the time of the restructuring.

**Debt Security.** Any security representing a creditor relationship with an entity. The term debt security also includes all of the following:

- a. Preferred stock that by its terms either must be redeemed by the issuing entity or is redeemable at the option of the investor
- b. A collateralized mortgage obligation (or other instrument) that is issued in equity form but is required to be accounted for as a nonequity instrument regardless of how that instrument is classified (that is, whether equity or debt) in the issuer's statement of financial position
- c. U.S. Treasury securities
- d. U.S. government agency securities
- e. Municipal securities
- f. Corporate bonds

- g. Convertible debt
- h. Commercial paper
- i. All securitized debt instruments, such as collateralized mortgage obligations and real estate mortgage investment conduits
- j. Interest-only and principal-only strips.

The term debt security *excludes* all of the following:

- a. Option contracts
- b. Financial futures contracts
- c. Forward contracts
- d. Lease contracts
- e. Receivables that do not meet the definition of security and, so, are not debt securities (unless they have been securitized, in which case they would meet the definition of a security), for example:
  - 1. Trade accounts receivable arising from sales on credit by industrial or commercial entities
  - 2. Loans receivable arising from consumer, commercial, and real estate lending activities of financial institutions.

**Defensive Intangible Asset.** An acquired intangible asset in a situation in which an entity does not intend to actively use the asset but intends to hold (lock up) the asset to prevent others from obtaining access to the asset.

**Derivative Financial Instrument.** (Topics 210, 815, and 860. Paragraphs 815-10-15-83 through 15-139) A derivative instrument that is a financial instrument.

**Direct Financing Lease.** From the perspective of a lessor, a lease that meets none of the criteria in paragraph 842-10-25-2 but meets the criteria in paragraph 842-10-25-3(b).

**Direct Guarantee of Indebtedness.** An agreement in which a guarantor states that if the debtor fails to make payment to the creditor when due, the guarantor will pay the creditor. If the debtor defaults, the creditor has a direct claim on the guarantor.

**Direct Loan Origination Costs.** Direct loan origination costs represent costs associated with originating a loan. Direct loan origination costs of a completed loan shall include only the following:

- a. Incremental direct costs of loan origination incurred in transactions with independent third parties for that loan
- b. Certain costs directly related to specified activities performed by the lender for that loan. Those activities include all of the following:
  - 1. Evaluating the prospective borrower's financial condition
  - 2. Evaluating and recording guarantees, collateral, and other security arrangements
  - 3. Negotiating loan terms
  - 4. Preparing and processing loan documents
  - 5. Closing the transaction.

The costs directly related to those activities shall include only that portion of the employees' total compensation and payroll-related fringe benefits directly related to time spent performing those activities for that loan and other costs related to those activities that would not have been incurred but for that loan. See Section 310-20-55 for examples of items.

**Disposal Group.** A disposal group for a long-lived asset or assets to be disposed of by sale or otherwise represents assets to be disposed of together as a group in a single transaction and liabilities directly associated with those assets that will be transferred in the transaction. A disposal group may include a discontinued operation along with other assets and liabilities that are not part of the discontinued operation.

**Dividends.** Dividends paid or payable in cash, other assets, or another class of stock and does not include stock dividends or stock splits.

**Dropdown.** A transfer of certain net assets from a sponsor or general partner to a master limited partnership in exchange for consideration.

**Effective Interest Rate.** The rate of return implicit in the loan, that is, the contractual interest rate adjusted for any net deferred loan fees or costs, premium, or discount existing at the origination or acquisition of the loan.

**Employee.** An individual over whom the grantor of a share-based compensation award exercises or has the right to exercise sufficient control to establish an employer–employee relationship based on common law as illustrated in case law and currently under U.S. Internal Revenue Service (IRS) Revenue Ruling 87-41. A reporting entity based in a foreign jurisdiction would determine whether an employee–employer relationship exists based on the pertinent laws of the jurisdiction. Accordingly, a grantee meets the definition of an employee if the grantor consistently represents that individual to be an employee under common law. The definition of an employee for payroll tax purposes under the U.S. Internal Revenue Code includes common law employees. Accordingly, a grantor that classifies a grantee potentially subject to U.S. payroll taxes as an employee also must represent that individual as an employee for payroll tax purposes (unless the grantee is a leased employee as described below). A grantee does not meet the definition of an employee solely because the grantor represents that individual as an employee for some, but not all, purposes. For example, a requirement or decision to classify a grantee as an employee for U.S. payroll tax purposes does not, by itself, indicate that the grantee is an employee, because the grantee also must be an employee of the grantor under common law.

A leased individual is deemed to be an employee of the lessee if all of the following requirements are met:

1. The leased individual qualifies as a common law employee of the lessee, and the lessor is contractually required to remit payroll taxes on the compensation paid to the leased individual for the services provided to the lessee.
2. The lessor and lessee agree in writing to all of the following conditions related to the leased individual:
  - a. The lessee has the exclusive right to grant stock compensation to the individual for the employee service to the lessee.
  - b. The lessee has a right to hire, fire, and control the activities of the individual. (The lessor also may have that right.)
  - c. The lessee has the exclusive right to determine the economic value of the services performed by the individual (including wages and the number of units and value of stock compensation granted).
  - d. The individual has the ability to participate in the lessee's employee benefit plans, if any, on the same basis as other comparable employees of the lessee.

- e. The lessee agrees to and remits to the lessor funds sufficient to cover the complete compensation, including all payroll taxes, of the individual on or before a contractually agreed-upon date or dates.

A nonemployee director does not satisfy this definition of employee. Nevertheless, nonemployee directors acting in their role as members of a board of directors are treated as employees if those directors were elected by the employer's shareholders or appointed to a board position that will be filled by shareholder election when the existing term expires. However, that requirement applies only to awards granted to nonemployee directors for their services as directors. Awards granted to those individuals for other services shall be accounted for as awards to nonemployees.

**Employee Stock Ownership Plan.** An employee stock ownership plan is an employee benefit plan that is described by the Employee Retirement Income Security Act of 1974 and the Internal Revenue Code of 1986 as a stock bonus plan, or combination stock bonus and money purchase pension plan, designed to invest primarily in employer stock. Also called an employee share ownership plan.

**Equity Security.** (Definition 1: ASC 230; 321; 958-320) Any security representing an ownership interest in an entity (for example, common, preferred, or other capital stock) or the right to acquire (for example, warrants, rights, forward purchase contracts, and call options) or dispose of (for example, put options and forward sale contracts) an ownership interest in an entity at fixed or determinable prices. The term equity security does not include any of the following:

1. Written equity options (because they represent obligations of the writer, not investments)
2. Cash-settled options on equity securities or options on equity-based indexes (because those instruments do not represent ownership interests in an entity)
3. Convertible debt or preferred stock that by its terms either must be redeemed by the issuing entity or is redeemable at the option of the investor.

**Note:** The following definition is Pending Content; see Transition Guidance in 825-10-65-2.

Any security representing an ownership interest in an entity (for example, common, preferred, or other capital stock) or the right to acquire (for example, warrants, rights, forward purchase contracts, and call options) or dispose of (for example, put options and forward sale contracts) an ownership interest in an entity at fixed or determinable prices. The term equity security does not include any of the following:

- a. Written equity options (because they represent obligations of the writer, not investments)
- b. Cash-settled options on equity securities or options on equity-based indexes (because those instruments do not represent ownership interests in an entity)
- c. Convertible debt or preferred stock that by its terms either must be redeemed by the issuing entity or is redeemable at the option of the investor.

**Equity Security.** (Definition 2) Any security representing an ownership interest in an entity (for example, common, preferred, or other capital stock) or the right to acquire (for example, warrants, rights, forward purchase contracts, and call options) or dispose of (for example, put options and forward sale contracts) an ownership interest in an entity at fixed or determinable prices. However, the term does not include convertible debt or preferred stock that by its terms either must be redeemed by the issuing entity or is redeemable at the option of the investor.

**Equity Shares.** Equity shares refers only to shares that are accounted for as equity.

**Event.** A happening of consequence to an entity. The term encompasses both transactions and other events affecting an entity. [FAS 109, paragraph 289, sequence 1058.]

**Expected Cash Flow.** The probability-weighted average (that is, mean of the distribution) of possible future cash flows.

**Expected Return on Plan Assets.** An amount calculated as a basis for determining the extent of delayed recognition of the effects of changes in the fair value of plan assets. The expected return on plan assets is determined based on the expected long-term rate of return on plan assets and the market-related value of plan assets.

**Fair Value.** (Definition 1) The amount at which an asset (or liability) could be bought (or incurred) or sold (or settled) in a current transaction between willing parties, that is, other than in a forced or liquidation sale.

**Fair Value.** (Definition 2: Topics 505, 718) The price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date.

**Financial Asset.** Cash, evidence of an ownership interest in an entity, or a contract that conveys to one entity a right to do either of the following:

- a. Receive cash or another financial instrument from a second entity
- b. Exchange other financial instruments on potentially favorable terms with the second entity.

**Financial Instrument.** Cash, evidence of an ownership interest in an entity, or a contract that both:

- a. Imposes on one entity a contractual obligation either:
  1. To deliver cash or another financial instrument to a second entity
  2. To exchange other financial instruments on potentially unfavorable terms with the second entity.
- b. Conveys to that second entity a contractual right either:
  1. To receive cash or another financial instrument from the first entity
  2. To exchange other financial instruments on potentially favorable terms with the first entity.

The use of the term “financial instrument” in this definition is recursive (because the term financial instrument is included in it), though it is not circular. The definition requires a chain of contractual obligations that ends with the delivery of cash or an ownership interest in an entity. Any number of obligations to deliver financial instruments can be links in a chain that qualifies a particular contract as a financial instrument.

Contractual rights and contractual obligations encompass both those that are conditioned on the occurrence of a specified event and those that are not. All contractual rights (contractual obligations) that are financial instruments meet the definition of asset (liability) set forth in FASB Concepts Statement No. 6, *Elements of Financial Statements*, although some may not be recognized as assets (liabilities) in financial statements—that is, they may be off-balance-sheet—because they fail to meet some other criterion for recognition.

For some financial instruments, the right is held by or the obligation is due from (or the obligation is owed to or by) a group of entities rather than a single entity.

**Financial Liability.** A contract that imposes on one entity an obligation to do either of the following:

- a. Deliver cash or another financial instrument to a second entity
- b. Exchange other financial instruments on potentially unfavorable terms with the second entity.

**Financial Statements Are Available to Be Issued.** Financial statements are considered available to be issued when they are complete in a form and format that complies with GAAP and all approvals necessary for issuance have been obtained, for example, from management, the board of directors, and/or significant shareholders. The process involved in creating and distributing the financial statements will vary depending on an entity's management and corporate governance structure as well as statutory and regulatory requirements.

**Financial Statements Are Issued.** Financial statements are considered issued when they are widely distributed to shareholders and other financial statement users for general use and reliance in a form and format that complies with GAAP. (U.S. Securities and Exchange Commission [SEC] registrants also are required to consider the guidance in paragraph 855-10-S99-2.)

**Financing Receivable.** A financing arrangement that has both of the following characteristics:

- a. It represents a contractual right to receive money in either of the following ways:
  1. On demand
  2. On fixed or determinable dates.
- b. It is recognized as an asset in the entity's statement of financial position.

See paragraphs 310-10-55-13 through 55-15 for more information on the definition of financing receivable, including a list of items that are excluded from the definition (for example, debt securities).

**Firm Commitment.** An agreement with an unrelated party, binding on both parties and usually legally enforceable, with the following characteristics:

- a. The agreement specifies all significant terms, including the quantity to be exchanged, the fixed price, and the timing of the transaction. The fixed price may be expressed as a specified amount of an entity's functional currency or of a foreign currency. It may also be expressed as a specified interest rate or specified effective yield. The binding provisions of an agreement are regarded to include those legal rights and obligations codified in the laws to which such an agreement is subject. A price that varies with the fair value of the item that is the subject of the firm commitment cannot qualify as a fixed price. For example, a price that is specified in terms of ounces of gold would not be a fixed price if the fair value of the item to be purchased or sold under the firm commitment varied with the price of gold.
- b. The agreement includes a disincentive for nonperformance that is sufficiently large to make performance probable. In the legal jurisdiction that governs the agreement, the existence of statutory rights to pursue remedies for default equivalent to the damages suffered by the nondefaulting party, in and of itself, represents a sufficiently large

disincentive for nonperformance to make performance probable for purposes of applying the definition of a firm commitment.

**Firm Purchase Commitment.** A firm purchase commitment is an agreement with an unrelated party, binding on both parties and usually legally enforceable, that meets both of the following conditions:

- a. It specifies all significant terms, including the price and timing of the transaction.
- b. It includes a disincentive for nonperformance that is sufficiently large to make performance probable.

**Gain Contingency.** An existing condition, situation, or set of circumstances involving uncertainty as to possible gain to an entity that will ultimately be resolved when one or more future events occur or fail to occur.

**Goodwill.** An asset representing the future economic benefits arising from other assets acquired in a business combination or an acquisition by a not-for-profit entity that are not individually identified and separately recognized. For ease of reference, this term also includes the immediate charge recognized by not-for-profit entities in accordance with ASC 958-805-25-29.

**Holding Gain or Loss.** The net change in fair value of a security. The holding gain or loss does not include dividend or interest income recognized but not yet received or write-downs for other-than-temporary impairment.

**Hosting Arrangement.** In connection with the licensing of software products, an arrangement in which an end user of the software does not take possession of the software; rather, the software application resides on the vendor's or a third party's hardware, and the customer accesses and uses the software on an as-needed basis over the Internet or via a dedicated line.

**Income from Continuing Operations.** Income after applicable income taxes but excluding the results of discontinued operations, the cumulative effect of accounting changes, translation adjustments, purchasing power gains and losses on monetary items, and increases and decreases in the current cost or lower recoverable amount of nonmonetary assets and liabilities.

**Income Tax Expense (or Benefit).** The sum of current tax expense (or benefit) and deferred tax expense (or benefit).

**Income Taxes.** Domestic and foreign federal (national), state, and local (including franchise) taxes based on income.

**Initial Investment.** The amount paid to the seller plus any fees paid or less any fees received.

**Initial Market.** The first market of a film's exploitation in each territory, whether that market is a broadcast or cable television network, first-run syndication, or other.

**Indirectly Related to the Leased Property.** The provisions or conditions that in substance are guarantees of the lessor's debt or loans to the lessor by the lessee that are related to the leased property but are structured in such a manner that they do not represent a direct guarantee or loan. Examples include a party related to the lessee guaranteeing the lessor's debt on behalf of the lessee, or the lessee financing the lessor's purchase of the leased asset using collateral other than the leased property.

**Intangible Asset Class.** A group of intangible assets that are similar, either by their nature or by their use in the operations of an entity.

**Intangible Assets.** Assets (not including financial assets) that lack physical substance. (The term intangible assets is used to refer to intangible assets other than goodwill.)

**Integral Equipment.** Integral equipment is any physical structure or equipment attached to the real estate that cannot be removed and used separately without incurring significant cost.

**Investee.** An entity that issued an equity instrument that is held by an investor.

**Investor.** A business entity that holds an investment in voting stock of another entity.

**Lease.** An agreement conveying the right to use property, plant, or equipment (land and/or depreciable assets) usually for a stated period of time.

ASC 842 Definition: A contract, or part of a contract, that conveys the right to control the use of identified property, plant, or equipment (an identified asset) for a period of time in exchange for consideration.

**Lease Liability.** A lessee's obligation to make the lease payments arising from a lease, measured on a discounted basis.

**Lease Modification.** A change to the terms and conditions of a contract that results in a change in the scope of or the consideration for a lease (for example, a change to the terms and conditions of the contract that adds or terminates the right to use one or more underlying assets or extends or shortens the contractual lease term).

**Lease Payments.** See paragraph 842-10-30-5 for what constitutes lease payments from the perspective of a lessee and a lessor.

**Lease Receivable.** A lessor's right to receive lease payments arising from a sales-type lease or a direct financing lease plus any amount that a lessor expects to derive from the underlying asset following the end of the lease term to the extent that it is guaranteed by the lessee or any other third party unrelated to the lessor, measured on a discounted basis.

**Lease Term.** The fixed noncancelable lease term plus all of the following, except as noted in the following paragraph:

1. All periods, if any, covered by bargain renewal options.
2. All periods, if any, for which failure to renew the lease imposes a penalty on the lessee in such amount that a renewal appears, at lease inception, to be reasonably assured.
3. All periods, if any, covered by ordinary renewal options during which any of the following conditions exist:
  - a. A guarantee by the lessee of the lessor's debt directly or indirectly related to the leased property is expected to be in effect.
  - b. A loan from the lessee to the lessor directly or indirectly related to the leased property is expected to be outstanding.
  - c. All periods, if any, covered by ordinary renewal options preceding the date as of which a bargain purchase option is exercisable.
  - d. All periods, if any, representing renewals or extensions of the lease at the lessor's option.

The lease term shall not be assumed to extend beyond the date a bargain purchase option becomes exercisable.

**Legal Entity.** Any legal structure used to conduct activities or to hold assets. Some examples of such structures are corporations, partnerships, limited liability companies, grantor trusts, and other trusts.

**Lending Activities.** Lending, committing to lend, refinancing or restructuring loans, arranging standby letters of credit, syndicating loans, and leasing activities are lending activities.

**Lessee.** An entity that enters into a contract to obtain the right to use an underlying asset for a period of time in exchange for consideration.

**Lessor.** An entity that enters into a contract to provide the right to use an underlying asset for a period of time in exchange for consideration.

**Leveraged Lease.** From the perspective of a lessor, a lease that was classified as a leveraged lease in accordance with the leases guidance in effect before the effective date and for which the commencement date is before the effective date.

**Loan Origination Fees.** Origination fees consist of all of the following:

- a. Fees that are being charged to the borrower as prepaid interest or to reduce the loan's nominal interest rate, such as interest buy-downs (explicit yield adjustments)
- b. Fees to reimburse the lender for origination activities
- c. Other fees charged to the borrower that relate directly to making the loan (for example, fees that are paid to the lender as compensation for granting a complex loan or agreeing to lend quickly)
- d. Fees that are not conditional on a loan being granted by the lender that receives the fee but are, in substance, implicit yield adjustments because a loan is granted at rates or terms that would not otherwise have been considered absent the fee (for example, certain syndication fees addressed in paragraph 310-20-25-19)
- e. Fees charged to the borrower in connection with the process of originating, refinancing, or restructuring a loan. This term includes, but is not limited to, points, management, arrangement, placement, application, underwriting, and other fees pursuant to a lending or leasing transaction and also includes syndication and participation fees to the extent they are associated with the portion of the loan retained by the lender.

**Long-Term Obligations.** Long-term obligations are those scheduled to mature beyond one year (or the operating cycle, if applicable) from the date of an entity's balance sheet.

**Loss Contingency.** An existing condition, situation, or set of circumstances involving uncertainty as to possible loss to an entity that will ultimately be resolved when one or more future events occur or fail to occur. The term loss is used for convenience to include many charges against income that are commonly referred to as expenses and others that are commonly referred to as losses.

**Market Participants.** Buyers and sellers in the principal (or most advantageous) market for the asset or liability that have all of the following characteristics:

1. They are independent of each other, that is, they are not related parties, although the price in a related-party transaction may be used as an input to a fair value measurement if the reporting entity has evidence that the transaction was entered into at market terms

2. They are knowledgeable, having a reasonable understanding about the asset or liability and the transaction using all available information, including information that might be obtained through due diligence efforts that are usual and customary
3. They are able to enter into a transaction for the asset or liability
4. They are willing to enter into a transaction for the asset or liability, that is, they are motivated but not forced or otherwise compelled to do so.

**Merger of Not-for-Profit Entity.** A transaction or other event in which the governing bodies of two or more not-for-profit entities cede control of those entities to create a new not-for-profit entity.

**Multiemployer Plan.** (Subtopic 715-80) A pension or postretirement benefit plan to which two or more unrelated employers contribute, usually pursuant to one or more collective-bargaining agreements. A characteristic of multiemployer plans is that assets contributed by one participating employer may be used to provide benefits to employees of other participating employers since assets contributed by an employer are not segregated in a separate account or restricted to provide benefits only to employees of that employer. A multiemployer plan is usually administered by a board of trustees composed of management and labor representatives and may also be referred to as a joint trust or union plan. Generally, many employers participate in a multiemployer plan, and an employer may participate in more than one plan. The employers participating in multiemployer plans usually have a common industry bond, but for some plans the employers are in different industries and the labor union may be their only common bond. Some multiemployer plans do not involve a union. For example, local chapters of a not-for-profit entity (NFP) may participate in a plan established by the related national.

**Multiple-Employer Plan.** (Subtopics 715-30 and 715-60) A pension plan or other postretirement benefit plan maintained by more than one employer but not treated as a multiemployer plan. Multiple-employer plans are generally not collectively bargained and are intended to allow participating employers, commonly in the same industry, to pool their plan assets for investment purposes and to reduce the cost of plan administration. A multiple-employer plan maintains separate accounts for each employer so that contributions provide benefits only for employees of the contributing employer. Multiple-employer plans may have features that allow participating employers to have different benefit formulas, with the employer's contributions to the plan based on the benefit formula selected by the employer.

**Mutual Entity.** An entity other than an investor-owned entity that provides dividends, lower costs, or other economic benefits directly and proportionately to its owners, members, or participants. Mutual insurance entities, credit unions, and farm and rural electric cooperatives are examples of mutual entities.

**Net Income.** A measure of financial performance resulting from the aggregation of revenues, expenses, gains, and losses that are not items of other comprehensive income. A variety of other terms such as net earnings or earnings may be used to describe net income.

**Net Investment in the Lease.** For a sales-type lease, the sum of the lease receivable and the unguaranteed residual asset. For a direct financing lease, the sum of the lease receivable and the unguaranteed residual asset, net of any deferred selling profit.

**Net Periodic Pension Cost.** The amount recognized in an employer's financial statements as the cost of a pension plan for a period. Components of net periodic pension cost are service cost,

interest cost, actual return on plan assets, gain or loss, amortization of prior service cost or credit, and amortization of the transition asset or obligation existing at the date of initial application of Subtopic 715-30. The term net periodic pension cost is used instead of net pension expense because part of the cost recognized in a period may be capitalized along with other costs as part of an asset such as inventory.

**Net Periodic Postretirement Benefit Cost.** The amount recognized in an employer's financial statements as the cost of a postretirement benefit plan for a period. Components of net periodic postretirement benefit cost include service cost, interest cost, actual return on plan assets, gain or loss, amortization of prior service cost or credit, and amortization of the transition obligation or asset.

**Net Realizable Value.** Estimated selling prices in the ordinary course of business, less reasonably predictable costs of completion, disposal, and transportation.

**Noncancellable Lease Term.** That portion of the lease term that is cancelable only under any of the following conditions:

- a. Upon the occurrence of some remote contingency
- b. With the permission of the lessor
- c. If the lessee enters into a new lease with the same lessor
- d. If the lessee incurs a penalty in such amount that continuation of the lease appears, at inception, reasonably assured.

**Noncontrolling Interest.** The portion of equity (net assets) in a subsidiary not attributable, directly or indirectly, to a parent. A noncontrolling interest is sometimes called a minority interest.

**Nonfinancial Asset.** An asset that is not a financial asset. Nonfinancial assets include land, buildings, use of facilities or utilities, materials and supplies, intangible assets, or services.

**Nongovernmental Entity.** An entity that is not required to issue financial reports in accordance with guidance promulgated by the Governmental Accounting Standards Board or the Federal Accounting Standards Advisory Board.

**Nonprofit Activity.** An integrated set of activities and assets that is capable of being conducted and managed for the purpose of providing benefits, other than goods or services at a profit or profit equivalent, as a fulfillment of an entity's purpose or mission (for example, goods or services to beneficiaries, customers, or members). As with a not-for-profit entity, a nonprofit activity possesses characteristics that distinguish it from a business or a for-profit business entity.

**Nonpublic Entity.** (Definition 1: Topics 105, 220, 350, 360, 405, 820, 830) Any entity that does not meet any of the following conditions:

- a. Its debt or equity securities trade in a public market either on a stock exchange (domestic or foreign) or in an over-the-counter market, including securities quoted only locally or regionally.
- b. It is a conduit bond obligor for *conduit debt securities* that are traded in a public market (a domestic or foreign stock exchange or an over-the-counter market, including local or regional markets).
- c. It files with a regulatory agency in preparation for the sale of any class of debt or equity securities in a public market.

- d. It is required to file or furnish financial statements with the Securities and Exchange Commission.
- e. It is controlled by an entity covered by criteria (a) through (d).

**Nonpublic Entity.** (Definition 2: Topic 718) Any entity other than one that meets any of the following criteria:

- a. Has equity securities that trade in a public market either on a stock exchange (domestic or foreign) or in an over-the-counter market, including securities quoted only locally or regionally
- b. Makes a filing with a regulatory agency in preparation for the sale of any class of equity securities in a public market
- c. Is controlled by an entity covered by the preceding criteria.

An entity that has only debt securities trading in a public market (or that has made a filing with a regulatory agency in preparation to trade only debt securities) is a nonpublic entity.

**Nonpublic Entity.** (Definition 3: Topic 715-20) Any entity other than one with any of the following characteristics:

- a. Whose debt or equity securities trade in a public market either on a stock exchange (domestic or foreign) or in the over-the-counter market, including securities quoted only locally or regionally
- b. That is a conduit bond obligor for conduit debt securities that are traded in a public market (a domestic or foreign stock exchange or an over-the-counter market, including local or regional markets)
- c. That makes a filing with a regulatory agency in preparation for the sale of any class of debt or equity securities in a public market
- d. That is controlled by an entity covered by a., b., or c.

Conduit debt securities refers to certain limited-obligation revenue bonds, certificates of participation, or similar debt instruments issued by a state or local governmental entity for the express purpose of providing financing for a specific third party (the conduit bond obligor) that is not a part of the state or local government's financial reporting entity. Although conduit debt securities bear the name of the governmental entity that issues them, the governmental entity often has no obligation for such debt beyond the resources provided by a lease or loan agreement with the third party on whose behalf the securities are issued. Further, the conduit bond obligor is responsible for any future financial reporting requirements.

**Not-for-Profit Entity.** An entity that possesses the following characteristics, in varying degrees, that distinguish it from a business entity:

- 1. Contributions of significant amounts of resources from resource providers who do not expect commensurate or proportionate pecuniary return
- 2. Operating purposes other than to provide goods or services at a profit
- 3. Absence of ownership interests like those of business entities.

Entities that clearly fall outside this definition include the following:

- 1. All investor-owned entities
- 2. Entities that provide dividends, lower costs, or other economic benefits directly and proportionately to their owners, members, or participants, such as mutual insurance entities, credit unions, farm and rural electric cooperatives, and employee benefit plans.

Not-for-profit entity performance obligation.

**Nonreciprocal Transfer.** Nonreciprocal transfer is a transfer of assets or services in one direction, either from an entity to its owners (whether or not in exchange for their ownership interests) or to another entity, or from owners or another entity to the entity. An entity's reacquisition of its outstanding stock is an example of a nonreciprocal transfer.

**Operating Cycle.** The average time intervening between the acquisition of materials or services and the final cash realization constitutes an operating cycle.

**Operating Lease.** From the perspective of a lessee, any lease other than a finance lease. From the perspective of a lessor, any lease other than a sales-type lease or a direct financing lease.

**Operating Segment.** A component of a public entity. See Section 280-10-50 for additional guidance on the definition of an operating segment.

**Option.** Unless otherwise stated, a call option that gives the holder the right to purchase shares of common stock from the reporting entity in accordance with an agreement upon payment of a specified amount. Options include, but are not limited to, options granted to employees and stock purchase agreements entered into with employees. Options are considered securities. See Call Option.

**Orderly Transaction.** A transaction that assumes exposure to the market for a period before the measurement date to allow for marketing activities that are usual and customary for transactions involving such assets or liabilities; it is not a forced transaction (for example, a forced liquidation or distress sale).

**Ordinary Course of Business.** Decisions about matters of a type consistent with those normally expected to be events or transactions that would necessitate such decisions will occur. The ordinary course of business does not include self-dealing transactions.

**Other Comprehensive Income.** Revenues, expenses, gains, and losses that under generally accepted accounting principles (GAAP) are included in comprehensive income but excluded from net income.

**Owners.** Used broadly to include holders of ownership interests (equity interests) of investor-owned entities, mutual entities, or not-for-profit entities. Owners include shareholders, partners, proprietors, or members or participants of mutual entities. Owners also include owner and member interests in the net assets of not-for-profit entities.

**Parent.** An entity that has a controlling financial interest in one or more subsidiaries. (Also, an entity that is the primary beneficiary of a variable interest entity.)

**Participating Rights.** The ability to block the actions through which a reporting entity exercises the power to direct the activities of a VIE that most significantly impact the VIE's economic performance.

**Penalty.** Any requirement that is imposed or can be imposed on the lessee by the lease agreement or by factors outside the lease agreement to do any of the following:

- a. Disburse cash
- b. Incur or assume a liability
- c. Perform services
- d. Surrender or transfer an asset or rights to an asset or otherwise forego an economic benefit, or suffer an economic detriment. Factors to consider in determining whether an

economic detriment may be incurred include, but are not limited to, all of the following:

1. The uniqueness of purpose or location of the underlying asset
2. The availability of a comparable replacement asset
3. The relative importance or significance of the underlying asset to the continuation of the lessee's line of business or service to its customers
4. The existence of leasehold improvements or other assets whose value would be impaired by the lessee vacating or discontinuing use of the underlying asset
5. Adverse tax consequences
6. The ability or willingness of the lessee to bear the cost associated with relocation or replacement of the underlying asset at market rental rates or to tolerate other parties using the underlying asset.

**Performance Obligation.** A promise in a contract with a customer to transfer to the customer either:

1. A good or service (or a bundle of goods or services) that is distinct
2. A series of distinct goods or services that are substantially the same and that have the same pattern of transfer to the customer.

**Preliminary Project State.** When a computer software project is in the preliminary project stage, entities will likely do the following:

- a. Make strategic decisions to allocate resources between alternative projects at a given point in time. For example, should programmers develop a new payroll system or direct their efforts toward correcting existing problems in an operating payroll system?
- b. Determine the performance requirements (that is, what it is that they need the software to do) and systems requirements for the computer software project it has proposed to undertake.
- c. Invite vendors to perform demonstrations of how their software will fulfill an entity's needs.
- d. Explore alternative means of achieving specified performance requirements. For example, should an entity make or buy the software? Should the software run on a mainframe or a client server system?
- e. Determine that the technology needed to achieve performance requirements exists.
- f. Select a vendor if an entity chooses to obtain software.
- g. Select a consultant to assist in the development or installation of the software.

**Private Company.** An entity other than a public business entity, a not-for-profit entity, or an employee benefit plan within the scope of Topics 960 through 965 on plan accounting.

**Probable.** (Definition 1: Topic 840) As used in paragraph 25 of FASB Concepts Statement No. 6, Elements of Financial Statements, that which can reasonably be expected or believed on the basis of available evidence or logic but is neither certain nor proved (Webster's New World Dictionary of the American Language, 2d college ed. [New York Simon and Schuster 1982], p. 1132).

**Probable.** (Definition 2: Topics 205, 310, 323, 325, 360, 450, 460, 470, 606, 705, 715, 718, 730, 815, 842, 944, 985) The future event or events are likely to occur.

**Public Business Entity.** A public business entity is a business entity meeting any one of the criteria below. Neither a not-for-profit entity nor an employee benefit plan is a business entity.

1. It is required by the U.S. Securities and Exchange Commission (SEC) to file or furnish financial statements, or does file or furnish financial statements (including voluntary filers), with the SEC (including other entities whose financial statements or financial information are required to be or are included in a filing).
2. It is required by the Securities Exchange Act of 1934 (the Act), as amended, or rules or regulations promulgated under the Act, to file or furnish financial statements with a regulatory agency other than the SEC.
3. It is required to file or furnish financial statements with a foreign or domestic regulatory agency in preparation for the sale of or for purposes of issuing securities that are not subject to contractual restrictions on transfer.
4. It has issued, or is a conduit bond obligor for, securities that are traded, listed, or quoted on an exchange or an over-the-counter market.
5. It has one or more securities that are not subject to contractual restrictions on transfer, and it is required by law, contract, or regulation to prepare U.S. GAAP financial statements (including footnotes) and make them publicly available on a periodic basis (for example, interim or annual periods). An entity must meet both of these conditions to meet this criterion.

An entity may meet the definition of a public business entity solely because its financial statements or financial information is included in another entity's filing with the SEC. In that case, the entity is only a public business entity for purposes of financial statements that are filed or furnished with the SEC.

**Public Entity.** (Topics 280, 805, 954, 958) A business entity or a not-for-profit entity that meets any of the following conditions:

- a. It has issued debt or equity securities or is a conduit bond obligor for conduit debt securities that are traded in a public market (a domestic or foreign stock exchange or an over-the-counter market, including local or regional markets).
- b. It is required to file financial statements with the Securities and Exchange Commission (SEC).
- c. It provides financial statements for the purpose of issuing any class of securities in a public market.

**Public Entity.** (Definition 1: Topic 740) An entity that meets any of the following conditions:

1. Its debt or equity securities are traded in a public market (a domestic or foreign stock exchange) or an over-the counter market, including securities quoted only locally or regionally.
2. It is a conduit bond obligor for conduit debt securities that are traded in a public market (a domestic or foreign stock exchange) or an over-the-counter market, including local or regional markets.
3. Its financial statements are filed with a regulatory agency in preparation for the sale of any class of securities.

**Public Entity.** (Definition 2: Topics 470, 718) An entity that meets any of the following criteria:

- a. Has equity securities that trade in a public market, either on a stock exchange (domestic or foreign) or in an over-the-counter market, including securities quoted only locally or regionally

- b. Makes a filing with a regulatory agency in preparation for the sale of any class of equity securities in a public market
- c. Is controlled by an entity covered by the preceding criteria. That is, a subsidiary of a public entity is itself a public entity.

An entity that has only debt securities trading in a public market (or that has made a filing with a regulatory agency in preparation to trade only debt securities) is not a public entity.

**Publicly Traded Company.** A publicly traded company includes any company whose securities trade in a public market on either of the following:

- a. A stock exchange (domestic or foreign)
- b. In the over-the-counter market (including securities quoted only locally or regionally), or any company that is a conduit bond obligor for conduit debt securities that are traded in a public market (a domestic or foreign stock exchange or an over-the-counter market, including local or regional markets).

Additionally, when a company is required to file or furnish financial statements with the SEC or makes a filing with a regulatory agency in preparation for sale of its securities in a public market it is considered a publicly traded company for this purpose.

Conduit debt securities refer to certain limited-obligation revenue bonds, certificates of participation, or similar debt instruments issued by a state or local governmental entity for the express purpose of providing financing for a specific third party (the conduit bond obligor) that is not a part of the state or local government's financial reporting entity. Although conduit debt securities bear the name of the governmental entity that issues them, the governmental entity often has no obligation for such debt beyond the resources provided by a lease or loan agreement with the third party on whose behalf the securities are issued. Further, the conduit bond obligor is responsible for any future financial reporting requirements.

**Publicly Traded Entity (or Public Entity).** Any entity that does not meet the definition of a nonpublic entity.

**Purchased Call Option.** A contract that allows the reporting entity to buy a specified quantity of its own stock from the writer of the contract at a fixed price for a given period. See Call Option.

**Pushdown Accounting.** Use of the acquirer's basis in the preparation of the acquiree's separate financial statements.

**Put Option.** A contract that allows the holder to sell a specified quantity of stock to the writer of the contract at a fixed price during a given period.

**Reacquisition Price of Debt.** The amount paid on extinguishment, including a call premium and miscellaneous costs of reacquisition. If extinguishment is achieved by a direct exchange of new securities, the reacquisition price is the total present value of the new securities.

**Readily Determinable Fair Value.** An equity security has a readily determinable fair value if it meets any of the following conditions:

- a. The fair value of an equity security is readily determinable if sales prices or bid-and-asked quotations are currently available on a securities exchange registered with the U.S. Securities and Exchange Commission (SEC) or in the over-the-counter market, provided that those prices or quotations for the over-the-counter market are publicly reported by the

National Association of Securities Dealers Automated Quotations systems or by OTC Markets Group Inc. Restricted stock meets that definition if the restriction terminates within one year.

- b. The fair value of an equity security traded only in a foreign market is readily determinable if that foreign market is of a breadth and scope comparable to one of the U.S. markets referred to above.
- c. The fair value of an equity security that is an investment in a mutual fund or in a structure similar to a mutual fund (that is, a limited partnership or a venture capital entity) is readily determinable if the fair value per share (unit) is determined and published and is the basis for current transactions.

**Reasonably Possible.** The chance of the future event or events occurring is more than remote but less than likely.

**Recorded Investment.** The amount of the investment in a loan, which is not net of a valuation allowance, but which does reflect any direct write-down of the investment. However, if a loan is a hedged item in a fair value hedge, the amount of that loan's recorded investment should include the unamortized amount of the cumulative fair value hedge adjustments.

**Recourse.** The right of a transferee of receivables to receive payment from the transferor of those receivables for any of the following:

- a. Failure of debtors to pay when due
- b. The effects of prepayments
- c. Adjustments resulting from defects in the eligibility of the transferred receivables.

**Related Parties.** Related parties include:

- a. Affiliates of the entity
- b. Entities for which investments in their equity securities would be required, absent the election of the fair value option under the Fair Value Option Subsection of Section 825-10-15, to be accounted for by the equity method by the investing entity
- c. Trusts for the benefit of employees, such as pension and profit-sharing trusts, that are managed by or under the trusteeship of management
- d. Principal owners of the entity and members of their immediate families
- e. Management of the entity and members of their immediate families
- f. Other parties with which the entity may deal if one party controls or can significantly influence the management or operating policies of the other to an extent that one of the transacting parties might be prevented from fully pursuing its own separate interests
- g. Other parties that can significantly influence the management or operating policies of the transacting parties or that have an ownership interest in one of the transacting parties and can significantly influence the other to an extent that one or more of the transacting parties might be prevented from fully pursuing its own separate interests.

**Remote.** The chance of the future event or events occurring is slight.

**Reporting Unit.** The level of reporting at which goodwill is tested for impairment. A reporting unit is an operating segment or one level below an operating segment (also known as a component).

**Repurchase Agreement.** An agreement under which the transferor (repo party) transfers a financial asset to a transferee (repo counterparty or reverse party) in exchange for cash and

concurrently agrees to reacquire that financial asset at a future date for an amount equal to the cash exchanged plus or minus a stipulated interest factor. Instead of cash, other financial assets sometimes are exchanged. Some repurchase agreements call for repurchase of financial assets that need not be identical to the financial assets transferred.

**Reseller.** Any entity that purchases another vendor's products for resale, regardless of whether that entity is a distributor or wholesale, a retailer, or other type of reseller.

**Residual Value.** The estimated fair value of an intangible asset at the end of its useful life to an entity, less any disposal costs.

**Retirement.** The other-than-temporary removal of a long-lived asset from service. This term encompasses sale, abandonment, recycling, or disposal in some other manner. However, it does not encompass the temporary idling of a long-lived asset. After an entity retires an asset, that asset is no longer under the control of that entity, no longer in existence, or no longer capable of being used in the manner for which the asset was originally acquired, constructed, or developed.

**Retrospective Application.** The application of a different accounting principle to one or more previously issued financial statements, or to the statement of financial position at the beginning of the current period, as if that principle had always been used, or a change to financial statements of prior accounting periods to present the financial statements of a new reporting entity as if it had existed in those prior years.

**Revenue.** Inflows or other enhancements of assets of an entity or settlements of its liabilities (or a combination of both) from delivering or producing goods, rendering services, or other activities that constitute the entity's ongoing major or central operations. (New ASC 606 Definition)

**Reverse Repurchase Agreement Accounted for as a Collateralized Borrowing.** A reverse repurchase agreement accounted for as a collateralized borrowing (also known as a reverse repo) refers to a transaction that is accounted for as a collateralized lending in which a buyer-lender buys securities with an agreement to resell them to the seller-borrower at a stated price plus interest at a specified date or in specified circumstances. The receivable under a reverse repurchase agreement accounted for as a collateralized borrowing refers to the amount due from the seller-borrower for the repurchase of the securities from the buyer-lender. In certain industries, the terminology is reversed; that is, entities in those industries refer to this type of agreement as a repo.

**Right-of-Use Asset.** An asset that represents a lessee's right to use an underlying asset for the lease term.

**Sale-Leaseback Accounting.** A method of accounting for a sale-leaseback transaction in which the seller-lessee records the sale, removes all property and related liabilities from its balance sheet, recognizes gain or loss from the sale, and classifies the leaseback in accordance with the Lessees Subsections of Subtopic 840-40.

**Sales-Type Lease.** From the perspective of a lessor, a lease that meets either of the conditions in paragraph 840-10-25-43(a). From the perspective of a lessor, a lease that meets one or more of the criteria in paragraph 842-10-25-2.

**Securities and Exchange Commission (SEC) Filers.** An entity that is required to file or furnish its financial statements with either of the following:

1. The Securities and Exchange Commission (SEC)
2. With respect to an entity subject to Section 12(i) of the Securities Exchange Act of 1934, as amended, the appropriate agency under that Section.

Financial statements for other entities that are not otherwise SEC filers whose financial statements are included in a submission by another SEC filer are not included within this definition.

**Securities and Exchange Commission (SEC) Registrant.** An entity (or an entity that is controlled by an entity) that meets any of the following criteria:

1. It has issued or will issue debt or equity securities that are traded in a public market (a domestic or foreign stock exchange or an over-the counter market, including local or regional markets).
2. It is required to file financial statements with the SEC.
3. It provides financial statements for the purpose of issuing any class of securities in a public market.

**Security.** (Definition 1: Topics 260, 505) The evidence of debt or ownership or a related right. It includes options and warrants as well as debt and stock.

**Security.** (Definition 2: Topics 320, 321, 860, 958) A share, participation, or other interest in property or an entity of the issuer or an obligation of the issuer that has all of the following characteristics:

1. It is either represented by an instrument issued in bearer or registered form or, if not represented by an instrument, is registered in books maintained to record transfers by or on behalf of the issuer.
2. It is of a type commonly dealt in on securities exchanges or markets or, when represented by an instrument, is commonly recognized in any area in which it is issued or dealt in as a medium for investment.
3. It is either one of a class or series or, by its terms, is divisible into a class or series of shares, participations, interests, or obligations.

**Settlement of a Pension or Postretirement Benefit Obligation.** A transaction that is an irrevocable action, relieves the employer (or the plan) of primary responsibility for a pension or postretirement benefit obligation, and eliminates significant risks related to the obligation and the assets used to effect the settlement.

**Standalone Selling Price.** The price at which an entity would sell a promised good or service separately to a customer.

**Standby Letter of Credit.** A letter of credit (or similar arrangement however named or designated) that represents an obligation to the beneficiary on the part of the issuer for any of the following:

- a. To repay money borrowed by or advanced to or for the account of the account party
- b. To make payment on account of any evidence of indebtedness undertaken by the account party
- c. To make payment on account of any default by the account party in the performance of an obligation.

A standby letter of credit would not include the following:

- a. Commercial letters of credit and similar instruments where the issuing bank expects the beneficiary to draw upon the issuer and which do not guarantee payment of a money obligation
- b. A guarantee or similar obligation issued by a foreign branch in accordance with and subject to the limitations of Regulation M of the Federal Reserve Board.

**Sublease.** A transaction in which an underlying asset is re-leased by the lessee (or intermediate lessor) to a third party (the sublessee) and the original (or head) lease between the lessor and the lessee remains in effect.

**Subsidiary.** An entity, including an unincorporated entity such as a partnership or trust, in which another entity, known as its parent, holds a controlling financial interest. (Also, a variable interest entity that is consolidated by a primary beneficiary.)

**Time of Restructuring.** Troubled debt restructurings may occur before, at, or after the stated maturity of debt, and time may elapse between the agreement, court order, and so forth, and the transfer of assets or equity interest, the effective date of new terms, or the occurrence of another event that constitutes consummation of the restructuring. The date of consummation is the time of the restructuring.

**Time Value.** The portion of the fair value of an option that exceeds its intrinsic value. For example, a call option with an exercise price of \$20 on a stock whose current market price is \$25 has intrinsic value of \$5. If the fair value of that option is \$7, the time value of the option is \$2 ( $\$7 - \$5$ ).

**Trading.** An activity involving securities sold in the near term and held for only a short period of time. The term trading contemplates a holding period generally measured in hours and days rather than months or years. See paragraph 948-310-40-1 for clarification of the term trading for a mortgage banking entity.

**Transaction.** An external event involving transfer of something of value (future economic benefit) between two (or more) entities.

**Transaction Price.** The amount of consideration to which an entity expects to be entitled in exchange for transferring promised goods or services to a customer, excluding amounts collected on behalf of third parties.

**Troubled Debt Restructuring.** A restructuring of a debt constitutes a troubled debt restructuring if the creditor for economic or legal reasons related to the debtor's financial difficulties grants a concession to the debtor that it would not otherwise consider.

**Unconditional Purchase Obligation.** An obligation to transfer funds in the future for fixed or minimum amounts or quantities of goods or services at fixed or minimum prices (for example, as in take-or-pay contracts or throughput contracts).

**Underlying.** A specified interest rate, security price, commodity price, foreign exchange rate, index of prices or rates, or other variable (including the occurrence or nonoccurrence of a specified event such as a scheduled payment under a contract). An underlying may be a price or rate of an asset or liability but is not the asset or liability itself. An underlying is a variable that, along with either a notional amount or a payment provision, determines the settlement of a derivative instrument.

**Underlying Asset.** An asset that is the subject of a lease for which a right to use that asset has been conveyed to a lessee. The underlying asset could be a physically distinct portion of a single asset.

**Unguaranteed Residual Asset.** The amount that a lessor expects to derive from the underlying asset following the end of the lease term that is not guaranteed by the lessee or any other third party unrelated to the lessor, measured on a discounted basis.

**Unit of Account.** The level at which an asset or a liability is aggregated or disaggregated in a Topic for recognition purposes.

**Useful Life.** The period over which an asset is expected to contribute directly or indirectly to future cash flows.

**Variable Interest Entity.** A legal entity subject to consolidation according to the provisions of the Variable Interest Entities subsections of Subtopic 810-10.

**Variable Interests.** The investments or other interests that will absorb portions of a variable interest entity's (VIE's) expected losses or receive portions of the entity's expected residual returns are called variable interests. Variable interests in a VIE are contractual, ownership, or other pecuniary interests in a VIE that change with changes in the fair value of the VIE's net assets exclusive of variable interests. Equity interests with or without voting rights are considered variable interests if the legal entity is a VIE and to the extent that the investment is at risk as described in paragraph 810-10-15-14. Paragraph 810-10-25-55 explains how to determine whether a variable interest in specified assets of a legal entity is a variable interest in the entity. Paragraphs 810-10-55-16 through 55-41 describe various types of variable interests and explain in general how they may affect the determination of the primary beneficiary of a VIE.

**Variable Lease Payments.** Payments made by a lessee to a lessor for the right to use an underlying asset that vary because of changes in facts or circumstances occurring after the commencement date, other than the passage of time.

**Vendor.** A service provider or product seller, such as a manufacturer, distributor, or reseller.

**Warrant.** A security that gives the holder the right to purchase shares of common stock in accordance with the terms of the instrument, usually upon payment of a specified amount.

**Weather Derivative.** A forward-based or option-based contract for which settlement is based on a climatic or geological variable. One example of such a variable is the occurrence or nonoccurrence of a specified amount of snow at a specified location within a specified period of time.

**With Cause.** With cause generally restricts the limited partners' ability to dissolve (liquidate) the limited partnership or remove the general partners in situations that include, but that are not limited to, fraud, illegal acts, gross negligence, and bankruptcy of the general partners.

**Without Cause.** Without cause means that no reason need be given for the dissolution (liquidation) of the limited partnership or removal of the general partners.

**Working Capital.** Working capital (also called net working capital) is represented by the excess of current assets over current liabilities and identifies the relatively liquid portion of total entity capital that constitutes a margin or buffer for meeting obligations within the ordinary operating cycle of the entity.

## **APPENDIX B DISCLOSURE CHECKLIST FOR COMMERCIAL BUSINESSES**

---

The disclosure checklist presented below provides a quick reference to those disclosures that are common to the financial statements of most commercial business enterprises. This checklist does not purport to be suitable for use as a comprehensive SEC disclosure checklist, nor is it designed to be used for reporting entities that are not-for-profit organizations, state or local governments, or that are engaged in other industries that are subject to specialized accounting and reporting rules. Readers are advised to access the FASB Codification for additional details on requirements.

Numbers preceding the topics refer to the relevant FASB ASC Topic. For each Topic, the related chapter in *Wiley GAAP 2017* offers more information about implementing the requirements and gives examples.

### **CONTENTS**

<b>Presentation</b>		
205-10	Presentation of Financial Statements	1407
205-20	Discontinued Operations	1408
205-30	Liquidation Basis of Accounting	1410
205-40	Going Concern	1410
210-10	Balance Sheet	1411
210-20	Offsetting	1411
220	Comprehensive Income	1412
225-20	Income Statement	1413
225-30	Business Interruption Insurance	1413
230	Statement of Cash Flows	1413
235	Notes to Financial Statements	1413
250	Accounting Changes and Error Corrections	1414
260	Earnings Per Share	1416
270	Interim Financial Information	1416
272	Limited Liability Entities	1419
275	Risks and Uncertainties	1419
280	Segment Reporting	1421
<b>Assets</b>		
310-10	Receivables	1423
310-20	Nonrefundable Fees and Other Costs	1426
310-30	Loans and Debt Securities Acquired with Deteriorated Credit Quality	1427
310-40	Troubled Debt Restructurings by Creditors	1427
320	Investments—Debt and Equity	1428
321	Investments—Equity Securities	1431
323-10	Investments—Equity Method and Joint Ventures	1431
323-740	Investments—Equity Method and Joint Ventures—Income Taxes	1431
325	Investments—Other	1432
325-20	Cost Method Investments	1432
325-30	Investments in Insurance Contracts	1432
330	Inventory	1433
340	Other Assets and Deferred Costs	1433
340-20	Capitalized Advertising Costs	1433
340-30	Insurance Contracts That Do Not Transfer Insurance Risk	1434
340-40	Contracts with Customers	1434

350	Intangibles—Goodwill and Other	1434
350-20	Goodwill	1434
350-30	General Intangibles Other than Goodwill	1436
360	Property, Plant, and Equipment	1437
<b>Liabilities</b>		
452-20	Extinguishment of Liabilities	1439
452-30	Insurance-Related Assessments	1439
405-40	Obligations Resulting from Joint and Several Liability Arrangements	1439
410	Asset Retirement and Environmental Obligations	1439
410-20	Asset Retirement Obligations	1439
410-30	Environmental Remediation Obligations	1440
420	Exit or Disposal Cost Obligations	1440
440	Commitments	1441
450	Contingencies	1442
450-20	Loss Contingencies	1442
450-30	Gain Contingencies	1442
460	Guarantees	1442
470	Debt-10	1443
470-20	Debt with Conversion and Other Options	1444
470-30	Participating Mortgage Loans	1445
470-60	Troubled Debt Restructurings by Debtors	1445
480	Distinguishing Liabilities from Equity	1445
<b>Equity</b>		
505-10	Equity	1446
505-20	Stock Dividends and Stock Splits	1447
505-30	Treasury Stock	1448
505-50	Equity-Based Payments to Non-Employees	1448
<b>Revenue</b>		
605-20	Services	1448
605-25	Multiple Element Arrangements	1448
605-28	Milestone Method	1449
605-35	Construction-Type and Production-Type Contracts	1449
605-45	Principal Agent Considerations	1450
605-50	Customer Payments and Incentives	1450
606	Revenue from Contracts with Customers	1450
<b>Expenses</b>		
710	Compensation—General	1452
712	Compensation—Nonretirement Postemployment Benefits	1452
715-20	Defined Benefit Plans—General	1453
715-60	Defined Benefit Plans—Other Postretirement	1458
715-70	Defined Contribution Plans	1459
715-80	Multiemployer Plans	1459
718	Compensation—Stock Compensation	1462
718-40	Employee Stock Ownership Plans (ESOP)	1465
720-20	Other Expenses—Insurance Costs	1465
720-35	Other Expenses—Advertising Costs	1465
730-10	Research and Development—Overall	1465
730-20	Research and Development Arrangements	1465
740-10	Income Taxes—Overall	1466
740-30	Income Taxes—Other Considerations or Special Areas	1468
740-270	Income Taxes—Interim Reporting	1468
<b>Broad Transactions</b>		
805-10	Business Combinations—Overall	1468

805-20	Identifiable Assets and Liabilities and Any Noncontrolling Interest	1470
805-30	Goodwill or Gain from Bargain Purchase	1471
805-50	Business Combinations—Related Issues	1472
808	Collaborative Arrangements	1473
810	Consolidations	1473
815	Derivatives and Hedging	1478
815-15	Embedded Derivatives	1483
815-25	Fair Value Hedges	1483
815-30	Cash Flow Hedges	1484
815-35	Net Investment Hedges	1484
815-40	Contracts in Entity's Own Entity	1484
815-45	Weather Derivatives	1485
820	Fair Value	1485
825	Financial Instruments—Overall	1490
825-20	Registration Payment Arrangements	1494
830	Foreign Currency	1495
830-20	Foreign Currency Transactions	1495
830-30	Translation of Financial Statements	1495
835-20	Interest—Capitalization of Interest	1496
840	Leases	1496
840-20	Operating Leases	1496
840-30	Capital Leases	1497
840-40	Sale-Leaseback Transactions	1498
842	Leases	1498
842-20	Lessee	1498
842-30	Lessor	1500
842-40	Sale and Leaseback Transaction	1502
842-50	Leveraged Lease Arrangements	1503
845	Nonmonetary Transactions	1503
850	Related-Party Disclosures	1503
852-10	Reorganizations—overall	1504
852-20	Reorganizations—Quasi-Reorganizations	1505
855	Subsequent Events	1505
860	Transfers and Servicing of Financial Assets	1506
860-20	Sales of Financial Assets	1506
860-30	Secured Borrowing and Collateral	1508
860-50	Servicing Assets and Liabilities	1509

## PRESENTATION

In the far right column, indicate:

Yes—if the disclosure has been made.

No—if the disclosure is required, but has not been made.

N/A—if the disclosure is not applicable to the entity.

### 205-10 Presentation of Financial Statements

1. A full set of financial statements includes:

- a. Financial position \_\_\_\_\_
- b. Earnings for the period as a separate statement or within a continuous statement of comprehensive income \_\_\_\_\_
- c. Comprehensive income in one statement or two separate but consecutive statements \_\_\_\_\_
- d. Cash flows \_\_\_\_\_
- e. Investments by and distributions to owners during this period. \_\_\_\_\_

2. Comparative statements of financial position, income, and changes in equity are preferable. \_\_\_\_\_
- (FASB ASC 205-10-45-2)
3. Include name of entity for which statements are being presented (if d/b/a different name than legal name, indicate both). \_\_\_\_\_
  4. Titles of statements should be appropriate (certain titles denote and should be reserved for GAAP financial statements; other titles denote other comprehensive basis of accounting [OCBOA] financial statements). \_\_\_\_\_
  5. Dates and periods covered should be clearly stated. \_\_\_\_\_
  6. If one or more consolidated subsidiaries have different fiscal periods than the parent (not to exceed 3 months), disclose any intervening events that materially affect financial position or results of operations. \_\_\_\_\_
  7. If comparative statements are presented, repeat notes from prior years to extent they continue to be significant. \_\_\_\_\_

(FASB ASC 205-10-45-4)

8. Differences between “economic” entity and legal entity being presented should be noted (e.g., consolidated or not, subsidiaries included and excluded, combined statements, etc.). Disclose summarized financial information for previously unconsolidated subsidiaries. \_\_\_\_\_
9. Identify new accounting principles not yet adopted and expected impact of adoption. (*SEC SAB Topic 11*) \_\_\_\_\_
10. For reclassifications or other reasons, if changes have occurred in the manner or basis of presenting corresponding items in two or more periods, disclose the explanation of the change. \_\_\_\_\_

(FASB ASC 205-10-50-1)

## 205-20 Discontinued Operations

*The following requirements for ASC 205-20-50 are based on new guidance in ASU 2014-08. See the chapter on ASC 205 for information on implementation and effective dates.*

1. For periods in which a discontinued operation has been disposed of or is classified as held-for-sale:
  - a. The facts and circumstances leading to the disposal or expected disposal, \_\_\_\_\_
  - b. The expected manner and timing of the disposal, \_\_\_\_\_
  - c. If not separately presented on the face of the income statement as part of discontinued operations, gain or loss recognized on the disposal or loss recognized on classification as held for sale in accordance with the relevant guidance in other subtopics, \_\_\_\_\_
  - d. If applicable, the segment in which the discontinued operation is reported under Topic 280. \_\_\_\_\_

(FASB ASC 205-20-50-1)

## Change to a Plan of Sale

3. If an entity changes its plan of sale, in the period in which that decision is made, in the notes:
  - a. The facts and circumstances leading to the decision, \_\_\_\_\_
  - b. The effect of the change on the results of operations for all periods presented. \_\_\_\_\_

(FASB ASC 205-20-50-3)

***Adjustments to Previously Recorded Amounts***

4. The nature and amount of adjustments to amounts previously reported in discontinued operations.
- 

(FASB ASC 205-20-50-3A)

5. For as long as the discontinued operation is presented separately, information about the entity's significant continuing involvement with a discontinued operation after the disposal date.
- 

(FASB ASC 205-20-50-4A)

6. For each discontinued operation in which the entity retains significant continuing involvement after the disposal date:
- a. Description of the nature of the activities that give rise to the continuing involvement
  - b. Period of time the involvement is expected to continue
  - c. The amount of any cash flows
  - d. Revenues or expenses in continuing operations after the disposal transaction that were eliminated in consolidated financial statements as intra-entity transactions
  - e. Where an entity retains an equity method investment after disposal:
    - i. The pretax income of the investee
    - ii. The ownership interest in the discontinued operation before and after disposal
    - iii. Share of the income or loss of the investee in the period after the disposal and where on the income statement that is reported.
- 
- 
- 
- 
- 

(FASB ASC 205-20-50-4B)

***Disclosures Required for a Discontinued Operation Comprising a Component or Group of Components of an Entity***

7. For discontinued operations, to the extent not presented on the face of the financial statements as part of discontinued operations:
- a. Pretax profit or loss.
  - b. Major classes of line items making up the pretax profit or loss.
  - c. For the periods in which the results of discontinued operations are presented in the income statement either the total operating and investing cash flows of the discontinued operation or the depreciation, amortization, capital expenditures, and significant operating and investing noncash items.
  - d. The pretax profit or loss attributable to the parent if the discontinued operation includes a noncontrolling interest.
  - e. Carrying amounts of major classes of assets and liabilities included in discontinued operations for the period in which it is classified as held for sale and all prior periods presented.
- 
- 
- 
- 
- 

(FASB ASC 205-20-50-5B)

8. If the above disclosures are provided in a note, the following amounts, if not considered major, may be aggregated in one line:
- a. For the initial period in which a disposal group is classified as held for sale and all prior periods, reconciliation of the amounts disclosed in 7e above and total assets and liabilities classified as held for sale that are presented separately on the face of the statement of financial position.
  - b. For the periods in which the results of operations of the discontinued operations are recorded in the income statement, the amounts disclosed in 7a and b above and the after-tax profit or loss from discontinued operations.
- 
- 
- 

(FASB ASC 205-20-50-5C and 5D)

***Disclosures Required for a Discontinued Operation Comprising an Equity Method Investment***

9. Summarized information about the assets, liabilities, and results of operations of the investee if that information was disclosed in periods before the disposal.

(FASB ASC 205-20-50-7)

**205-30 Liquidation Basis of Accounting**

1. Disclose information required by other Topics relevant to understanding the statement of net assets in liquidation and statement of changes in net assets in liquidation, informing readers about the amount of cash or other consideration that the entity expects to collect and the amount that the entity is obligated or expects to be obligated to pay during the course of liquidation.

(FASB ASC 205-30-50-1)

2. Disclose all of the following when for financial statements using the liquidation basis of accounting:
  - a. The financial statements are prepared using the liquidation basis of accounting.
  - b. The facts and circumstances surrounding the adoption of the liquidation basis of accounting and the entity's determination that liquidation is imminent.
  - c. The entity's plan for liquidation, including a description of each of the following:
    1. The manner by which it plans to dispose of its assets
    2. Other items it expects to sell that it had not previously recognized as assets (for example, trademarks)
    3. The manner by which it plans to settle its liabilities
    4. The expected date by which the entity expects to complete its liquidation.
  - d. Methods and significant assumptions used to measure assets and liabilities.
  - e. Any subsequent changes to those methods and assumptions.
  - f. The type and amount of costs and income accrued in the statement of net assets in liquidation.
  - g. The period over which those costs are expected to be paid or income earned.

(FASB ASC 205-30-50-2)

**205-40 Going Concern**

1. If substantial doubt is raised but attenuated by management's plans, information that enables users to understand:
  - a. Conditions or events that raised the going concern issue.
  - b. Management's evaluation of the conditions as related to the entity's ability to meet its obligation.
  - c. Management's plans to mitigate the conditions.

(FASB ASC 205-40-50-12)

2. If substantial doubt is not alleviated:
  - a. A statement that substantial doubt exists about the entity's ability to continue as a going concern within one year after the date that the financial statements are issued.
  - b. Include the items in 1 a, b, and c above.

(FASB ASC 205-40-50-13)

3. In subsequent years:
  - a. If the condition or events that raised substantial doubt continues, continue to provide disclosures in 1 and 2 above and add any new information or changes.
  - b. If substantial doubt no longer exists, explain that it was resolved.

(FASB ASC 205-40-50-14)

**210-10 Balance Sheet**

1. Total of current liabilities in classified balance sheets.

(FASB ASC 210-10-45-5)

2. Amount of current assets:

- a. Supplementary information that reveals the basis upon which the various classifications of inventory items amounts are stated, and where practicable, the method of determining the cost—for example, average cost, first-in first-out (FIFO), last-in first-out (LIFO), and so forth.

(FASB ASC 210-10-50-1)

**210-20 Offsetting**

1. The disclosures below apply to both of the following:

- a. Recognized derivative instruments that are offset in accordance with either Section 210-20-45 or Section 815-10-45.  
b. Recognized derivative instruments that are subject to an enforceable master netting arrangement or similar agreement, irrespective of whether they are offset in accordance with either Section 210-20-45 or Section 815-10-45.

(FASB ASC 210-20-50-1)

2. Information to enable financial statements users to evaluate the effect or potential effect of netting arrangements on its financial position for assets and liabilities within the scope of 1 above, including the effect or potential effect of rights of setoff associated with an entity's recognized assets and recognized liabilities that are in the scope of 1 above.

(FASB ASC 210-20-50-2)

3. In tabular format, separately for assets and liabilities, at the end of the reporting period the following quantitative information that are recognized derivative instruments that are in the scope of 1 above and meet the objective in 2 above.

(FASB ASC 210-20-50-1)

- a. The gross amounts of those recognized assets and those recognized liabilities.  
b. The amounts offset in accordance with the guidance in Sections 210-20-45 and 815-10-45 to determine the net amounts presented in the statement of financial position.  
c. The net amounts presented in the statement of financial position.  
d. The amounts subject to an enforceable master netting arrangement or similar agreement not otherwise included in (b):

- (1) The amounts related to recognized financial instruments and other derivative instruments that either:  
(a) Management makes an accounting policy election not to offset.  
(b) Do not meet some or all of the guidance in either Section 210-20-45 or Section 815-10-45.  
(2) The amounts related to financial collateral (including cash collateral).

- e. The net amount after deducting the amounts in (d) from the amounts in (c).

(FASB ASC 210-20-50-3)

4. The total amount disclosed in accordance with 3(d) above for an instrument should not exceed the amount disclosed in accordance with 3(c) above for that instrument.

(FASB ASC 210-20-50-4)

5. A description of the rights of setoff associated with an entity's recognized assets and recognized liabilities subject to an enforceable master netting arrangement or similar agreement disclosed in accordance with paragraph 210-20-50-3(d), including the nature of those rights.
- 

(FASB ASC 210-20-50-5)

## **220 Comprehensive Income**

1. Present comprehensive income in a single continuous financial statement or two separate but consecutive financial statements.
- 

(FASB ASC 220-10-45-1)

2. If single financial statement; present information in 2 sections:
- Net income, and
  - Other comprehensive income.
- 

Include:

- Total of net income and its components
  - Total of other comprehensive income and its components
  - Total comprehensive income.
- 
- 
- 

(FASB ASC 220-10-45-1A)

3. If two consecutive financial statements:
- Components of net income
  - Total net income
  - Begin second statement with net income
  - Components of other comprehensive income
  - Total of other comprehensive income.
- 
- 
- 
- 

(FASB ASC 220-10-45-1a through 45-1e)

4. For noncontrolling interest amounts:
- Net income and other comprehensive income attributable to the parent and non-controlling interests.
- 

(FASB ASC 220-10-45-5)

5. Other comprehensive income components shown net of tax or before tax with one amount for income taxes and for total other comprehensive income.
- 

(FASB ASC 220-10-45-11)

6. On face of financial statements or in the notes:
- Changes in accumulated balances for each component of other comprehensive income.
  - Current period reclassifications out of accumulated other comprehensive income and other amounts of other comprehensive income.
- 
- 

(FASB ASC 220-10-45-14A)

7. Information on the effects of net income of significant amounts classified out of each component of accumulated other comprehensive income:
- For amounts required by other topics to be reclassified in their entirety to net income in the same reporting periods, present on face of the financial statements parenthetically including the aggregate tax effect or as a separate disclosure in the notes.
- 

(FASB ASC 220-10-45-17 and 45-17A)

**225-20 Income Statement*****Unusual or Infrequent Items***

1. Disclose the nature and financial effects of each event or transaction on the face of the income statement as a separate component of continuing operations, or alternatively, in notes to financial statements.

(FASB ASC 225-20-50-3)

**225-30 Business Interruption Insurance**

1. Disclose in notes:
  - a. Nature of the event causing business interruption losses.
  - b. Interruption insurance recoveries and the line item where classified.

**230 Statement of Cash Flows**

2. Policy for determining which items are treated as cash equivalents.

(FASB ASC 230-10-50-1)

3. Disclose both interest and income taxes paid in a schedule following the statement or in the notes, if the indirect method of reporting net cash flows from operating activities is used.

(FASB ASC 230-10-50-2)

4. Information about all investing and financing activities of an entity during a period that affect recognized assets or liabilities but that do not result in cash receipts or cash payments in the period, presented either in a narrative or summarized in a schedule and clearly relating the cash and noncash aspects of transactions involving similar items.

(FASB ASC 230-10-50-3)

5. Some transactions are part cash and part noncash; only the cash portion should be reported in the statement of cash flows.

(FASB ASC 230-10-50-5)

6. If there are only a few such noncash transactions, it may be convenient to include them on the same page as the statement of cash flows. Otherwise, the transactions may be reported elsewhere in the financial statements, clearly referenced to the statement of cash flows.

(FASB ASC 230-10-50-6)

**235 Notes to Financial Statements**

1. Identify and describe significant accounting principles followed and methods of applying them that materially affect statements; disclosures should include principles and methods that involve:
  - a. Selection from acceptable alternatives.
  - b. Principles and methods peculiar to the entity's industry.
  - c. Unusual or innovative applications of generally accepted accounting principles.

(FASB ASC 235-10-50-1 and 3)

2. Among others, common accounting policies are:
  - a. Basis of consolidation
  - b. Depreciation methods
  - c. Amortization of intangibles
  - d. Inventory pricing

- e. Accounting for recognition of profit on long-term construction-type contracts
- f. Recognition of revenue from franchising and leasing operation<sup>1</sup>
- g. Use of estimates
- h. Cash equivalents
- i. Impairment
- j. Property
- k. Interperiod tax allocation.

(FASB ASC 235-10-50-4)

- 3. Accounting policies disclosures do not duplicate details presented elsewhere. It may be appropriate to refer to related details presented elsewhere in the financial statements.

(FASB ASC 235-10-50-5)

- 4. It is preferable to disclose significant accounting policies in a separate summary preceding the notes to financial statements, or as the initial note, under the same or a similar title.

(FASB ASC 235-10-50-6)

## 250 Accounting Changes and Error Corrections

### *Change in Accounting Principle*

For the period in which the change in accounting principle is made:

- a. The nature of and reasons for making the change, addressing preferability of the newly adopted principle.
- b. Descriptions of prior period items that have been restated.
- c. The effects of the change for both current period and prior period(s) being presented; specific quantification of the effects on income from continuing operations, net income, any other financial statement caption materially affected, and corresponding per-share amounts for each.
- d. The cumulative effect on retained earnings at the beginning of the earliest period's financial statements presented.
- e. As of the beginning of the earliest statement presented, the cumulative effect of the change in retained earnings or other components of equity or net assets in the statement of financial position.
- f. If the requirement to restate prior periods is not adhered to based on impracticability criterion, explanation and details regarding method of accounting applied.
- g. When indirect effects of change in accounting principle are included, description of these effects and the amounts recognized in the current reporting period, together with per-share amounts. If possible, also state indirect effects of the change in each of the prior periods being presented.

(FASB ASC 250-10-50-1)

- 2. For interim reports after the date of adoption of a new accounting principle:
  - a. The effect of the change on income from continuing operations,
  - b. Net income (or other appropriate captions of changes in the applicable net assets or performance indicator), and
  - c. Related per-share amounts for those post-change interim periods.

(FASB ASC 250-10-50-3)

---

<sup>1</sup> Upon implementation of ASU 2014-09, this item will change to "Recognition of revenue from contracts with customers and leasing operations."

***Change in Accounting Estimate***

3. If the change affects several future periods (e.g., for change in useful lives of fixed assets), the effect on income from continuing operations and net income of current period and related per-share amounts. For a change in estimate not having material effect in the current period, but which is deemed likely to have material effects on later periods, a description of the change.

(FASB ASC 250-10-50-4)

***Change in Reporting Entity***

4. Nature of change and reason for it; also, effect of change on income from continuing operations, net income, and other comprehensive income for all periods presented (also per-share amounts). For a change in entity not having material effect currently but anticipated to have such effect in later periods, the nature of the change and reason the change was made.

(FASB ASC 250-10-50-6)

***Correction of an Error in Previously Issued Financial Statements***

5. That the previously issued statements have been reissued and:
  - a. The nature of the error in previously issued statements.
  - b. The effect of its correction on each financial statement line item (only in period of discovery and correction), with per-share equivalents.
  - c. The cumulative effect on retained earnings or other appropriate components of equity or net assets.

(FASB ASC 250-10-50-7)

6. The effects (both gross and net of applicable income tax) of prior period adjustments on the net income of prior periods in the annual report for the year in which the adjustments are made and in interim reports issued during that year after the date of recording the adjustments.

(FASB ASC 250-10-50-8)

7. For single period only financial statements, the effects of such restatement on the balance of retained earnings at the beginning of the period and on the net income of the immediately preceding period.
8. For financial statements with more than one period presented:
  - a. The effects for each of the periods included in the statements.
  - b. Include the amounts of income tax applicable to the prior period adjustments.

(FASB ASC 250-10-50-9)

***Error Corrections Related to Prior Interim Periods of the Current Fiscal Year***

9. The effect on income from continuing operations, net income, and related per-share amounts for each prior interim period of the current fiscal year.
10. Income from continuing operations, net income, and related per-share amounts for each prior interim period restated in accordance with paragraph 250-10-45-26.

(FASB ASC 250-10-50-11)

**260 Earnings per Share**

1. Earnings per-share amounts for income from continuing operations and net income, shown on the face of income statement for all periods presented.
- 

(FASB ASC 260-10-45-2)

2. If applicable, per-share amounts for discontinued operations, basic and diluted EPS, presented either on face of income statement or in notes to financial statements.
- 

(FASB ASC 260-10-45-3)

3. For each income statement presented:
    - a. Reconciliation of the numerators and the denominators of the basic and diluted per-share computations for income from continuing operations.
    - b. Reconciliation includes effects of individual income and share amounts for all securities that affect EPS.
    - c. Effect that has been given to preferred dividends in arriving at income available to common stockholders in computing basic EPS.
    - d. Securities (including those issuable pursuant to contingent stock agreements) that could potentially dilute basic EPS in the future that were not included in the computation of diluted EPS because to do so would have been antidilutive for the period(s) presented.
- 

(FASB ASC 260-10-50-1)

4. Description of any transaction where amounts have been restated because of stock dividends, splits, or reverses occurring after close of period but before statements are available to be issued, with appropriate disclosure that the transactions would have had a material effect on the number of common shares or potential common shares outstanding at the end of the period.
- 

(FASB ASC 260-10-50-2)

***Master Limited Partnerships***

5. In the period in which a dropdown transaction accounted for under ASC 805-50 occurs, how the rights to the earnings of the transferred net assets differ before and after the dropdown transaction occurs.
- 

(FASB ASC 260-10-50-3)

**270 Interim Financial Information**

1. Public business entities provide, at a minimum, the captions and disclosures required when publicly traded entities report summarized interim financial information. These required disclosures are:

- a. Sales or gross revenues, provision for income taxes, net income, and comprehensive income.
  - b. Basic and diluted earnings per share for each period presented.
  - c. Seasonal revenues, costs, and expenses.
  - d. Significant changes in income tax estimates or provisions.
  - e. Disposal of a component of an entity and unusual or infrequently occurring items.
  - f. Contingencies.
  - g. Changes in accounting principles or estimates.
  - h. Significant changes in financial position.
  - i. Information regarding reportable operating segments including provisions related to restatement of segment information in previously issued financial statements:
    - (1) Revenues from external customers.
-

- (2) Intersegment revenues. \_\_\_\_\_  
(3) A measure of segment profit or loss. \_\_\_\_\_  
(4) Total assets for which there has been a material change from the amount disclosed in the last annual report. \_\_\_\_\_  
(5) A description of differences from the last annual report in the basis of segmentation or in the measurement of segment profit or loss. \_\_\_\_\_  
(6) A reconciliation of the total of the reportable segments' measures of profit or loss to the enterprise's consolidated pretax income, discontinued operations. If, for example, an entity allocates items such as income taxes to segments, the entity may choose to reconcile the total of the segments' measures of profit or loss to consolidated income after those items. Identify separately significant reconciling items and describe in that reconciliation. \_\_\_\_\_
- j. The following information regarding defined benefit pension plans and other defined benefit postretirement benefit plans, disclosed for interim statements that include an income statement:
- (1) The amount of the net periodic benefit cost recognized, for each period for which a statement of income is presented, separately showing the service cost component, interest cost component, expected return on plan assets for the period, gain or loss component, prior service cost or credit component, transition asset or obligation component, and gain or loss recognized due to a settlement or curtailment. \_\_\_\_\_  
(2) The total amount of the employer's contributions paid, and expected to be paid during the current fiscal year, if significantly different from amounts previously disclosed. Estimated contributions may be presented in the aggregate, combining contributions required by funding laws or regulations, discretionary contributions, and noncash contributions. \_\_\_\_\_
- k. Information about the use of fair value to measure assets and liabilities recognized in the statement of financial position as required by ASC 820-10-50. \_\_\_\_\_
- l. Information about derivative instruments required by ASC 815-10-50, 815-20-50, 815-30-50, and 815-35-50. \_\_\_\_\_
- m. Information about fair value of financial instruments as required by Section 825-10-50. \_\_\_\_\_
- n. The information about certain investments in debt and equity securities as required by Sections 320-10-50 and 942-320-50. \_\_\_\_\_
- o. The information about other-than-temporary impairments as required by Sections 320-10-50, 325-20-50, and 958-320-50 and impairments as required by ASC 321-10-50.<sup>2</sup> \_\_\_\_\_
- p. All of the following information about the credit quality of financing receivables and the allowance for credit losses determined in accordance with the provisions of Topic 310:
- (1) Nonaccrual and past-due financing receivables (see paragraphs 310-10-50-5A through 50-7B) \_\_\_\_\_  
(2) Allowance for credit losses related to financing receivables (see paragraphs 310-10-50-11A through 50-11C) \_\_\_\_\_  
(3) Impaired loans (see paragraphs 310-10-50-14A through 50-15) \_\_\_\_\_  
(4) Credit quality information related to financing receivables (see paragraphs 310-10-50-27 through 50-30) \_\_\_\_\_

<sup>2</sup> The ASC 321 requirement is added upon implementation of ASU 2016-01.

- (5) Modifications of financing receivables (see paragraphs 310-10-50-31 through 50-34).
- q. The gross information and net information required by paragraphs 210-20-50-1 through 50-6.
  - r. The information about changes in accumulated other comprehensive income required by ASC 220-10-45-14A and ASC 220-10-45-17 through 45-17B.
  - s. The carrying amount of foreclosed residential real estate (see 310-10-50-1) and the amount of loans in the process of foreclosure (see 310-10-50-35).

If summarized financial data are regularly reported on a quarterly basis, the foregoing information with respect to the current quarter and the current year to date or the last 12 months to date furnished together with comparable data for the preceding year.

*(FASB ASC 270-10-50-1)*

2. In the absence of a separate fourth quarter report or disclosure of the results (as outlined in the preceding paragraph) for that quarter in the annual report, disclose disposals of components of an entity and unusual or infrequently occurring items recognized in the fourth quarter, as well as the aggregate effect of year-end adjustments that are material to the results of that quarter (see paragraphs 270-10-05-2 and 270-10-45-10) in the annual report in a note to the annual financial statements. If a publicly traded company that regularly reports interim information makes an accounting change during the fourth quarter of its fiscal year and does not report the data specified by the preceding paragraph in a separate fourth quarter report or in its annual report, the disclosures about the effect of the accounting change on interim periods that are required by paragraphs 270-10-45-12 through 45-14 or by paragraph 250-10-45-15, as appropriate, in a note to the annual financial statements for the fiscal year in which the change is made.

*(FASB ASC 270-10-50-2)*

3. Disclosure of the impact of the financial results for interim periods of the matters discussed in paragraphs 270-10-45-12 through 45-16 and 270-10-50-5 through 50-6 is desirable for as many subsequent periods as necessary to keep the reader fully informed. There is a presumption that users of summarized interim financial data will have read the latest published annual report, including the financial disclosures required by generally accepted accounting principles (GAAP) and management's commentary concerning the annual financial results, and that the summarized interim data will be viewed in that context. In this connection, management is encouraged to provide commentary relating to the effects of significant events upon the interim financial results.

*(FASB ASC 270-10-50-3)*

4. Publicly traded companies are encouraged to publish balance sheet and cash flow data at interim dates since these data often assist users of the interim financial information in their understanding and interpretation of the income data reported. If condensed interim balance sheet information or cash flow data are not presented at interim reporting dates, significant changes since the last reporting period with respect to liquid assets, net working capital, long-term liabilities, or stockholders' equity shall be disclosed.

*(FASB ASC 270-10-50-4)*

5. Contingencies and other uncertainties expected to affect the fairness of presentation of financial data at an interim date shall be disclosed in interim reports in the same manner required for annual reports. Repeat those in interim and annual reports until the contingencies have been removed, resolved, or have become immaterial. Include those matters that form the basis of a qualification of an independent auditor's report.

*(FASB ASC 270-10-50-6)*

6. Lessors must disclose in a table all of the lease-related income items in the interim financial statements.<sup>3</sup>

(ASC 270-10-50-6A)

7. The following may not represent all references to interim disclosure:
  - a. For business combinations and combinations accounted for by not-for-profit entities, see Sections 805-10-50, 805-20-50, 805-30-50, 805-740-50, and 958-805-50.
  - b. For compensation-related costs, see paragraphs 715-60-50-3 and 715-60-50-6.
  - c. For disclosures required for entities with oil- and gas-producing activities, see paragraph 932-270-50-1.
  - d. For disclosures related to prior interim periods of the current fiscal year, see paragraph 250-10-50-11.
  - e. For fair value requirements, see Section 820-10-50.
  - f. For guarantors, see Section 460-10-50.
  - g. For pensions and other postretirement benefits, see paragraphs 715-20-50-6 through 50-7.
  - h. For reportable segments, see paragraphs 280-10-50-39 and 280-10-55-16.
  - i. For suspended well costs and interim reporting, see Section 932-235-50.
  - j. For applicability of disclosure requirements related to risks and uncertainties, see paragraph 275-10-15-3.
  - k. For discontinued operations, see paragraphs 205-20-50-1 through 50-7.
  - l. For disposals of individually significant components of an entity, see paragraphs 360-10-50-3A.
  - m. For insurance entities that account for short-duration contracts, see paragraphs 944-40-50-3 and 944-40-50-4E.

(FASB ASC 270-10-50-7)

## 272 Limited Liability Entities

1. For LLCs not reporting the equity of each class of its members separately within the equity section, disclose amounts in notes.
2. For LLCs maintaining separate accounts for components of members' equity, disclose those amounts on face of statement of financial position or in the notes.

(FASB ASC 272-10-50-1)

3. Disclose any inconsistencies in periods presented in the notes.

(FASB ASC 272-10-50-2)

4. A description of any limitation of its members' liability.
5. The different classes of members' interests and the respective rights, preferences, and privileges of each class.
6. The date the LLC will cease to exist if the LLC has a finite life.

(FASB ASC 272-10-50-3)

## 275 Risks and Uncertainties

### *Nature of Operations*

1. For entities that have commenced planned principal operations, nature of operations including description of major products, services, principal markets, served locations, and relative importance of operations in various businesses and basis for determination of relative importance (e.g., sales volume, profits, etc.). Convey relative importance, but disclosures need not be quantified.

(FASB ASC 275-10-50-2)

---

<sup>3</sup> This item should be disclosed upon implementation of ASU 2016-02 on leases.

2. For entities that have not commenced principal operations, disclosures about the risks and uncertainties related to the activities of the entity.

(FASB ASC 275-10-50-2A)

#### ***Use of Estimates***

3. Explanation that the preparation of financial statements requires the use of management's estimates.

(FASB ASC 275-10-50-4)

#### ***Certain Significant Estimates***

4. Information regarding estimates used in valuing assets, liabilities, or gain or loss contingencies if both of the following conditions are met:
  - a. It is at least reasonably possible that the estimate of the effect on the financial statements of a condition, situation, or set of circumstances that existed at the date of the financial statements will change in the near term due to one or more future confirming events.
  - b. The effect of the change would be material to the financial statements.

(FASB ASC 275-10-50-6)

5. Significant estimates used in the determination of the carrying amounts of assets or liabilities or in the disclosure of gain or loss contingencies when, based on information known to management prior to issuance of the financial statements, it is at least reasonably possible that the effect on the financial statements of a condition or situation existing at the statement of financial position date for which an estimate has been made will change in the near term due to one or more future confirming events.

(FASB ASC 275-10-50-8 ASC)

6. If the estimate involves a loss contingency covered by ASC 450, include an estimate of the possible loss or range of loss, or state such estimate cannot be made. Indicate the nature of the uncertainty and that it is at least reasonably possible that a change in estimate may occur in the near term.

(FASB ASC 275-10-50-9)

#### ***Current Vulnerability Due to Certain Concentrations***

7. Current vulnerability due to certain concentrations if management knows prior to issuance of the financial statements that all of the following conditions exist:
  - a. The concentrations exist at the date of the financial statements.
  - b. The concentrations make the entity vulnerable to the risk of a near-term severe impact.
  - c. It is at least reasonably possible that the events that could cause the severe impact will occur in the near term.

(ASC 275-10-50-16)

8. Vulnerability because of concentrations in:
  - a. The volume of business with a particular customer, supplier, or lender;
  - b. Revenue from particular products or services;
  - c. Available sources of supply of materials, labor, or other inputs; and
  - d. Market or geographic area.

(ASC 275-10-50-18)

9. For concentrations of labor subject to collective bargaining agreements, both:
  - a. The percentage of the labor force covered by a collective bargaining agreement, and
  - b. The percentage of the labor force covered by a collective bargaining agreement that will expire within one year.
10. For concentrations of operations located outside of the entity's home country, disclose the carrying amounts of net assets and the geographic areas in which they are located.

(FASB ASC 275-10-50-20)

## 280 Segment Reporting

1. General information on segments including:
  - a. Factors used to identify the enterprise's reportable segments, including the basis of organization (e.g., whether management has chosen to organize the enterprise around differences in products and services, geographic areas, regulatory environments, or a combination of factors and whether operating segments have been aggregated).
  - b. Types of products and services from which each reportable segment derives its revenues.

(FASB ASC 280-10-50-21)

2. The following about each reportable segment if the specified amounts are included in the measure of segment profit or loss reviewed by the chief operating decision maker:
  - a. Revenues from external customers.
  - b. Revenues from transactions with other operating segments of the same public entity.
  - c. Interest revenue.
  - d. Interest expense.
  - e. Depreciation, depletion, and amortization expense.
  - f. Unusual items.
  - g. Equity in the net income of investees accounted for by the equity method.
  - h. Income tax expense or benefit.
  - i. Significant noncash items other than depreciation, depletion, and amortization expense.

(FASB ASC 280-10-50-22)

3. Disclose the following about each reportable segment if the specific amounts are included in the determination of segment assets reviewed by the chief operating decision maker:
  - a. The amount of investment in equity method investees.
  - b. Total expenditures for additions to long-lived assets other than financial instruments, long-term customer relationships of a financial institution, mortgage and other servicing rights, deferred policy acquisition costs, and deferred tax assets.

(FASB ASC 280-10-50-25)

4. If no asset information is provided for a reportable segment, that fact and the reason.

(FASB ASC 280-10-50-26)

5. An explanation should be provided by a public entity of the measurements of segment profit or loss and segment assets for each reportable segment; at a minimum, these shall include the following:
  - a. The basis of accounting for any transactions between reportable segments.
  - b. The nature of any differences between the measurements of the reportable segments' profits or losses and the company's consolidated income before income taxes and discontinued operations.

- c. The nature of any differences between the measurements of the reportable segments' assets and the company's consolidated assets (if not apparent from the reconciliations); for example, accounting policies and policies for allocation of jointly used assets that are necessary for an understanding of the reported segment information.
- d. The nature of any changes from prior periods in the measurement methods used to determine reported segment profit or loss and the effect, if any, of those changes on the measure of segment profit or loss.
- e. The nature and effect of any asymmetrical allocations to segments.

(FASB ASC 280-10-50-29)

- 6. Reconciliations of a public entity's:
  - a. Total of the reportable segments' revenues to the enterprise's consolidated revenues.
  - b. Total of the reportable segments' measures of profit or loss to the company's consolidated income before income taxes and discontinued operations.
  - c. Total of the reportable segments' assets to the company's consolidated assets.
  - d. Total of the reportable segments' amounts for every other significant item of information disclosed to the corresponding consolidated amount.

(FASB ASC 280-10-50-30)

- 7. Identify and describe separately all significant reconciling items.

(FASB ASC 280-10-50-31)

- 8. For a public entity disclose all of the following about each reportable segment in condensed financial statements of interim periods:
  - a. Revenues from external customers.
  - b. Intersegment revenues.
  - c. A measure of segment profit or loss.
  - d. Total assets for which there has been a material change from the amount disclosed in the last annual report.
  - e. A description of differences from the last annual report in the basis of segmentation or in the basis of measurement of segment profit or loss.
  - f. A reconciliation of the total of the reportable segments' measures of profit or loss to the public entity's consolidated income before income taxes and discontinued operations. However, if a public entity allocates items such as income taxes to segments, the public entity may choose to reconcile the total of the segments' measures of profit or loss to consolidated income after those items. Significant reconciling items shall be separately identified and described in that reconciliation.

(FASB ASC 280-10-50-32)

- 9. Interim disclosures are required for the current quarter and year-to-date amounts. Paragraph 270-10-50-1 states that when summarized financial data are regularly reported on a quarterly basis, the information in the previous paragraph with respect to the current quarter and the current year to date or the last 12 months to date should be furnished together with comparable data for the preceding year.

(FASB ASC 280-10-50-33)

- 10. For a public entity, with a change in the composition of its reportable segments, whether the entity has restated the corresponding items of segment information for earlier periods.

(FASB ASC 280-10-50-34)

11. For a public entity that has a change in the structure of its internal organization that causes the reportable segments to change and if segment information is not restated, disclose the segment information for the current period under both old and new bases.

(FASB ASC 280-10-50-35)

12. For public entities, the revenue from external customers for each product and service or group of similar products and services.

(FASB ASC 280-10-50-40)

13. For a public entity, the following geographic information:
- Revenues from external customers from the country of domicile and foreign countries in total.
  - Material revenue from one country individually.
  - Long-lived assets other than financial instruments.
  - Long-term customer relationships of a financial institution.
  - Mortgage and other servicing rights.
  - Deferred policy acquisition costs.
  - Deferred tax assets from the country of domicile and all foreign countries.

(FASB ASC 280-10-50-41)

14. If revenues from transaction with a single external customer amount to ten percent or more of an enterprise's revenues, that fact, the total amount of revenues from each such customer, and the identity of the segment or segments reporting the revenues.

(FASB ASC 280-10-50-42)

15. Depreciation and amortization expense for each reportable segment, when the chief operating decision maker evaluates the performance of its segments based on earnings before interest, taxes, depreciation, and amortization.

(FASB ASC 280-10-55-13)

## ASSETS

### 310-10 Receivables

For loans and trade receivables:

- Basis of accounting for loans and trade receivables.
- Method used in determining the lower of cost or fair value of nonmortgage bonds held for sale.
- Classification and method of accounting for interest-only strips, loans, other receivables or retained interests in securitizations that can contractually be prepaid or otherwise settled in a way that the holder would not recover substantially all of its recorded investment.
- Methods for recognizing interest income on load and trade receivables.

(FASB ASC 310-10-50-2)

- Each major category of loans and trade receivables separately reported either on the face of the statement of financial position or in the notes.

(FASB ASC 310-10-50-3)

- The allowance for doubtful accounts or credit losses and any unearned income, unamortized premiums or discounts, and any net unamortized deferred fees and costs.

(FASB ASC 310-10-50-4)

7. The policy for charging off uncollectible trade accounts receivable except for credit card receivables that have a contractual maturity of one year or less **and** that arose from the sale of goods or services.

(FASB ASC 310-10-50-4A)

#### ***Assets Serving as Collateral***

8. The carrying amount of financial instruments that serve as collateral for borrowings.  
(See also 860-30-50-1A)

(FASB ASC 310-10-50-5)

#### ***Nonaccrual and Past Due Financing Receivables***

9. By class of financing receivable, with some exceptions (FASB ASC 310-10-50-5b) accounting policies for financing receivables, including policies related to nonaccrual status, for recording payments received on nonaccrual financing receivables, for resuming accrual of interest, and for determining past due or delinquent status.

(FASB ASC 310-10-50-6)

10. For nonaccrual and past due financing receivables as of each balance sheet date:
  - a. The recorded investment in loans (and trade receivables, if applicable on nonaccrual status).
  - b. The recorded investment in financing receivables past due 90 days or more and still accruing.

(FASB ASC 310-10-50-7)

11. An analysis of the age of the recorded investment in past due financing receivables except for receivables measured at fair value with changes reported in earnings as lower cost or fair value and trade account receivables, except for credit card receivables that have contractual maturity of one year or less and arose from the sale of goods or receivables, and defined contribution pension plan participant loans.

(FASB ASC 310-10-50-7a and 7b)

#### ***Accounting Policies for Off-Balance Sheet Credit Exposure***

12. Policies and methodology used to estimate liability for off-balance-sheet credit exposures and related charges for those credit exposures, including the factors that influenced management's judgement and risk elements.

(FASB ASC 310-10-50-9)

#### ***Foreclosed and Repossessed Assets***

13. Disclose separately the amount of foreclosed or repossessed assets, included in other assets and the carrying amount of foreclosed residential real estate properties held at the reporting date as a result of obtaining physical possession as per 310-40-40-6 and 310-40-55-10A.

(FASB ASC 310-10-50-11)

#### ***Allowance for Credit Losses Related to Financing Receivables***

14. All of the following by portfolio segment:
  - a. The entity's accounting policies and methodology used to estimate the allowance for credit losses, including:
    - (1) The factors that influenced management's judgment, including historical losses and existing economic conditions.

- (2) Risk characteristics relevant to each portfolio segment. \_\_\_\_\_
- (3) Any changes to accounting policies or methodology from the prior period and the rationale for the change. \_\_\_\_\_
- b. The policy for charging off uncollectible financing receivables. \_\_\_\_\_
- c. Activity in the allowance for credit losses for each period, including:
  - (1) The balance in the allowance at the beginning and end of each period \_\_\_\_\_
  - (2) Current period provision \_\_\_\_\_
  - (3) Direct write-downs charged against the allowance \_\_\_\_\_
  - (4) Recoveries of amounts previously charged off. \_\_\_\_\_
- d. The quantitative effect of changes identified in item (a)(3) on item (c)(2). \_\_\_\_\_
- e. The amount of any significant purchases of financing receivables during each reporting period. \_\_\_\_\_
- f. The amount of any significant sales of financing receivables or reclassifications of financing receivables to held for sale during each reporting period. \_\_\_\_\_
- g. The balance in the allowance for credit losses at the end of each period disaggregated on the basis of the entity's impairment method. \_\_\_\_\_
- h. The recorded investment in financing receivables at the end of each period related to each balance in the allowance for credit losses, disaggregated on the basis of the entity's impairment methodology in the same manner as the disclosure in item (g). \_\_\_\_\_

(FASB ASC 310-50-11B)

15. Separately:
- a. Amounts collectively evaluated for impairment. \_\_\_\_\_
  - b. Amounts individually evaluated for impairment. \_\_\_\_\_
  - c. Amounts related to loans acquired with deteriorated credit quality. \_\_\_\_\_

(FASB ASC 310-10-50-11C)

***Impaired Loans***

16. For each class of financing receivable, the accounting for and the amount of impaired loans. \_\_\_\_\_

(FASB ASC 310-10-50-14A)

17. For loans that meet the definition of an impaired loan by class of financing receivable:
- a. The recorded investment in the impaired loans and the amount for which there is a related allowance for credit losses, the amount of that allowance, and the amount of the investment for which there is no allowance for credit losses. \_\_\_\_\_
  - b. The total unpaid principal balance. \_\_\_\_\_
  - c. The policy for recognizing interest income on impaired loans, including how cash receipts are recorded. \_\_\_\_\_
  - d. The average recorded investment in the impaired loans. \_\_\_\_\_
  - e. The related amount of interest income recognized during the time within that period that the loans were impaired. \_\_\_\_\_
  - f. The amount of interest income recognized using a cash-basis method of accounting during the time within that period that the loans were impaired, if practicable. \_\_\_\_\_
  - g. The entity's policy for determining which loans the entity assesses for impairment. \_\_\_\_\_
  - h. The factors considered in determining that the loan is impaired. \_\_\_\_\_

(FASB ASC 310-10-50-15)

18. Items in 17 above for impaired loans that have been charged off partially. \_\_\_\_\_

(FASB ASC 310-10-50-16)

19. Information that enables financial statement users to understand how and to what extent management monitors the credit quality of its financing receivables in an ongoing manner assess the quantitative and qualitative risks arising from the credit quality of its financing receivables.
- 

(FASB ASC 310-10-50-28)

20. Provide quantitative and qualitative information by class about credit quality of financing receivables, including a description of the credit quality indicator, the recorded investment in financing receivables by credit quality indicator, and the date or range of dates in which the information was updated for each indicator.
- 

(FASB ASC 310-10-50-29)

21. Qualitative information on how any internal risk ratings relate to the likelihood of loss.
- 

(FASB ASC 310-10-50-30)

#### ***Modifications***

22. For troubled debt restructurings of financing receivables that occurred during the period:
- By class of financing receivable, qualitative and quantitative information, including how the financing receivables were modified and the financial effects of the modifications.
  - By portfolio segment, qualitative information about how such modifications are factored into the determination of the allowance for credit losses.
- 

(FASB ASC 310-10-50-33)

23. For financing receivables modified as troubled debt restructurings within the previous 12 months and for which there was a payment default during the period:

- By class of financing receivable, qualitative and quantitative information about those defaulted financing receivables, including types of financing receivables that defaulted and the amount that defaulted.
  - By portfolio segment, qualitative information about how such defaults are factored into the determination of the allowance for credit losses.
- 

(FASB ASC 310-10-50-34)

#### ***Loans in Process of Foreclosure***

24. The recorded investment in consumer mortgage loans secured by residential real estate properties where formal disclosure procedures are in process.<sup>4</sup>
- 

(FASB ASC 310-10-50-35)

#### **310-20 Nonrefundable Fees and Other Costs**

- The method for recognizing interest income on trade and loan receivables, including a statement about the policy for treatment of related fees and costs, including the method of amortizing net deferred fees or costs.
- 

(FASB ASC 310-20-50-1)

- If prepayments are anticipated in applying the interest method, the policy, and the significant assumptions underlying the prepayment estimates.
- 

(FASB ASC 310-20-50-2)

---

<sup>4</sup> This requirement is based on guidance on ASU 2014-04. For more information and effective dates, see the chapter on ASC 310.

3. The unamortized net fees and costs reported as a part of each loan category and additional disclosures such as unamortized net fees and costs if the lender believes that such information is useful to the users of financial statements.
- 

(FASB ASC 310-20-50-3)

4. For credit card fees, except for those related to private label credit cards, the accounting policy for credit card fees, net amount capitalized at the balance sheet date, and the amortization period(s).
- 

(FASB ASC 310-20-50-4)

### **310-30 Loans and Debt Securities Acquired with Deteriorated Credit Quality**

1. For certain loans or debt securities acquired with deteriorated credit quality, the following disclosures are required:
    - a. How prepayments on loans receivable are considered in the determination of contractual cash flows and cash flows expected to be collected.
- 

(FASB ASC 310-30-50-1)

- b. For loans acquired through purchase, including in a business combination, separately for loans accounted for as debt securities and for those not accounted for as debt securities:
    - (1) The outstanding balance (undiscounted cash flows owed and the carrying amount at the beginning and end of the period).
    - (2) The amount of accretable yield at the beginning of the period to the amount of accretable yield at the end of the period, reconciled for additions, accretion, disposals of loans, and reclassifications to or from nonaccretable difference during the period.
    - (3) For loans acquired in the current period:
      - (a) The contractually required payments receivable.
      - (b) The cash flows expected to be collected.
      - (c) The fair value at acquisition.
      - (d) The carrying amount of any acquired loans in nonaccrual status.
    - (4) The carrying amount of all loans in a nonaccrual status.
    - (5) For loans not accounted for as debt securities:
      - (a) The amount of any expense recognized for impairment.
      - (b) The amount of any reduction in a valuation allowance for losses that results from an increase in cash flows previously expected to be collected.
      - (c) The amount of the allowance for uncollectible loans at the beginning and the end of the period.
- 

(FASB ASC 310-30-50-2)

### **310-40 Troubled Debt Restructurings by Creditors**

#### ***Creditor Disclosure of Troubled Debt Restructurings***

1. In the body of the financial statements or in the accompanying notes, the amount of commitments to lend additional funds to debtors owing receivables whose terms have been modified in a troubled debt restructuring.
- 

(FASB ASC 310-40-50-1)

2. If both of the following conditions exist, it is not necessary to disclose information about an impaired loan that has been restructured in a troubled debt restructuring

involving a modification of terms need not be included in the disclosures required by paragraphs 310-10-50-15(a) and 310-10-50-15(c) in years after the restructuring:

- a. The restructuring agreement specifies an interest rate equal to or greater than the rate that the creditor was willing to accept at the time of the restructuring for a new loan with comparable risk.
- b. The loan is not impaired based on the terms specified by the restructuring agreement.

(FASB ASC 310-40-50-2)

- 3. For a loan whose terms are modified in a troubled debt restructuring and is already written and the measure of the restructured loan is equal to or greater than the recorded investment, no impairment would be recognized under ASC 310-40. Disclose the amount of the write-down and the recorded investment in the year of the write-down, but not in later years if the two criteria of paragraph 310-40-50-2 are met.

(FASB ASC 310-40-50-4)

#### ***Loan Restructured into Two (or More) Loan Agreements***

- 4. For a loan restructured in a troubled debt restructuring into two (or more) loan agreements, consider the restructured loans separately when assessing the applicability of the disclosures in paragraph 310-10-50-15 in years after the restructuring.

(FASB ASC 310-40-50-5)

#### **320 Investments—Debt and Equity**

- 1. The disclosures for investments in debt and equity<sup>5</sup> securities are required for all interim and annual periods. In determining whether disclosure for a particular security type is necessary and whether it is necessary to further separate a particular security type into greater detail, consider (shared) activity or business sector, vintage, geographic concentration, credit quality, and economic characteristics.

(FASB ASC 320-10-50-1A and B)

- 2. For securities classified as available-for-sale, disclose by major security type as of each date for which a statement of financial position is presented:
  - a. The amortized cost basis.
  - b. Aggregate fair value.
  - c. Total other-than-temporary impairment recognized in accumulated other comprehensive income.
  - d. Total gains for securities with net gains in accumulated other comprehensive income.
  - e. Total losses for securities with net losses in accumulated other comprehensive income.
  - f. The contractual maturities of the securities. These may be combined in appropriate groupings.

(FASB ASC 320-10-50-2 and 50-3)

- 3. Combined maturity information in appropriate groupings.

(FASB ASC 320-10-50-3)

- 4. For securities classified as held-to-maturity, by major security type as of each date for which a statement of financial position is presented:
  - a. Amortized cost basis.
  - b. Aggregate fair value.
  - c. Gross unrecognized holding gains.

---

<sup>5</sup> Upon implementation of ASU 2016-01, this requirement will pertain only to debt securities.

- d. Gross unrecognized holding losses.
- e. Net carrying amount.
- f. Total other-than-temporary impairment (OTTI) recognized in accumulated other comprehensive income (AOCI).
- g. Gross gains and losses in AOCI for any derivatives that hedged the forecasted acquisition of the held-to-maturity securities.
- h. Information about the contractual maturities of those securities as of the date of the statement of financial position presented. (Maturity information may be combined in appropriate groupings.)

(FASB ASC 320-10-50-5)

#### ***Impairment of Securities***

5. For all investments for which there is an unrealized loss:
  - a. Quantitative information in tabular form and aggregated by category of investment under ASC 320, and cost-method investments<sup>6</sup>, as of the date of each statement of financial position presented.

**NOTE:** *The disclosures in (1) and (2) below should be segregated by those investments that have been in a continuous unrealized loss position for less than 12 months and those that have been in a continuous unrealized loss position for 12 months or longer.*

- (1) The aggregate related fair value of investments with unrealized losses.
- (2) The aggregate amount of unrealized losses.
- b. A narrative as of the date of the most recent statement of financial position that provides information that enables the reader of the financial statements to understand the disclosures in a. above, as well as both the positive and negative information that the investor considered in reaching the conclusion that the impairment is not other than temporary.

**NOTE:** *These disclosures may be aggregated by investment category; however, individually significant unrealized losses should not be aggregated.*

- c. Other evidence considered by the investor in concluding that the impairment is not other than temporary (e.g., reports from industry analysts, sector credit ratings, volatility data regarding the fair value of the security, and/or any other relevant information that the investor considered).

(FASB ASC 320-10-50-6 and 7)

6. For interim and annual periods in which an other-than-temporary impairment of a debt security is recognized and only the amount related to a credit loss was recognized in earnings, by major security type, the methodology and significant inputs used to measure the amount related to credit loss. Examples of significant inputs include, but are not limited to, all of the following:
  - a. Performance indicators of the underlying assets in the security, including all of the following:
    - (1) Default rates
    - (2) Delinquency rates
    - (3) Percentage of nonperforming assets

<sup>6</sup> Upon implementation of ASU 2016-01, the phrase “and cost method investments” is deleted from this requirement.

- b. Loan-to-collateral-value ratios
- c. Third-party guarantees
- d. Current levels of subordination
- e. Vintage
- f. Geographic concentration
- g. Credit ratings.

 \_\_\_\_\_  
 \_\_\_\_\_  
 \_\_\_\_\_

(FASB ASC 320-10-5-8A)

7. For each period presented, a tabular roll forward of the amount related to credit losses recognized in earnings in accordance with paragraph 320-10-35-34D, which include at a minimum:
  - a. The beginning balance of the amount related to credit losses on debt securities held by the entity at the beginning of the period for which a portion of an other-than-temporary impairment was recognized in other comprehensive income.
  - b. Additions for the amount related to the credit loss for which an other-than-temporary impairment was not previously recognized.
  - c. Reductions for securities sold during the period.
  - d. Reductions for securities for which the amount previously recognized in other comprehensive income was recognized in earnings because the entity intends to sell the security or more likely than not will be required to sell the security before recovery of its amortized cost basis.
  - e. If the entity does not intend to sell the security and it is not more likely than not that the entity will be required to sell the security before recovery of its amortized cost basis, additional increases to the amount related to the credit loss for which an other-than-temporary impairment was previously recognized.
  - f. Reductions for increases in cash flows expected to be collected that are recognized over the remaining life of the security (see paragraph 320-10-35-35).
  - g. The ending balance of the amount related to credit losses on debt securities held by the entity at the end of the period for which a portion of an other-than-temporary impairment was recognized in other comprehensive income.

(FASB ASC 320-10-50-8B)

#### *Sales, Transfers, and Related Matters that Occurred During the Period*

8. For each period presented:
  - a. Proceeds from sales of available-for-sale securities and the gross realized gains.
  - b. Gross realized losses that have been included in earnings as a result of those sales.
  - c. Basis on which the cost of a security sold or the amount reclassified out of AOCI into earnings was determined.
  - d. Gross gains and gross losses included in earnings from transfers of securities from the available-for-sale category into the trading category.
  - e. Amount of the net unrealized holding gains or losses on available-for-sale securities for the period that are included in AOCI.
  - f. Amount of gains and losses reclassified out of AOCI into earnings for the period.
  - g. Portion of trading gains and losses for the period that relates to trading securities still held at the reporting date.

(FASB ASC 320-10-50-9)

9. For any sales/transfers from held-to-maturity classification, disclose:
  - a. Net carrying amount.
  - b. Net gain or loss in AOCI for any derivative that hedged the forecasted acquisition of the held-to-maturity security.

\_\_\_\_\_  
 \_\_\_\_\_

- c. Realized or unrealized gain or loss.
- d. Circumstances leading to decision to sell or transfer the security.

(FASB ASC 320-10-50-10)

### **321 Investments—Equity Securities**

1. For all interim and annual financial periods:
  - a. Entitles that apply the guidance in ASC 310 for equity securities without readily determinable fair values:
    - (1) The carrying amount of investments without readily determinable fair values \_\_\_\_\_
    - (2) The amount of annual and cumulative impairments and downward adjustments \_\_\_\_\_
    - (3) The amount of annual and cumulative upward adjustments \_\_\_\_\_
    - (4) In narrative form, as of the date of the most recent statement of financial position, additional information that is sufficient to permit financial statement users to understand the quantitative disclosures and the information that the entity considered in reaching the carrying amounts and upward or downward adjustments resulting from observable price changes. \_\_\_\_\_

(ASC 321-10-50-3)

- b. For each period for which the results of operations are presented, the portion of unrealized gains and losses for the period that relates to equity securities still held at the reporting date.

(ASC 321-10-50-4)

### **323-10 Investments—Equity Method and Joint Ventures**

1. If the investor has more than one investment in common stock, disclosures wholly or partly on a combined basis may be appropriate. \_\_\_\_\_

(FASB ASC 323-10-50-2)

2. Name of each investee and the percentage of ownership of common stock. \_\_\_\_\_
3. Accounting policies with respect to each of the investments. \_\_\_\_\_
4. Difference between the carrying amount for each investment and its underlying equity in the investee's net assets and the accounting treatment of the difference between these amounts. \_\_\_\_\_
5. For those investments which have a quoted market price, the aggregate value of each investment. \_\_\_\_\_
6. For material investments in corporate joint ventures or other investments accounted for under the equity method, summarized data for the investor's assets, liabilities, and results of operations. \_\_\_\_\_
7. If potential conversion of convertible securities and exercise of options and warrants would have material effects on the investor's percentage of the investee. \_\_\_\_\_

(FASB ASC 323-10-50-3)

### **323-740 Investments—Equity Method and Joint Ventures—Income Taxes**

1. A reporting entity with an investment in a Qualified Affordable Housing Project should disclose information that helps investors understand the nature of the investment and effect of the measurement of its investment and related tax credits on financial position and results of operations. These disclosures may include:
  - a. The amount of tax benefits recognized during the year. \_\_\_\_\_
  - b. The balance of the investment. \_\_\_\_\_
  - c. For those investments accounted for using the proportional amortization method, the amount recorded as a component of income tax expense or benefit. \_\_\_\_\_
  - d. For those investments accounted for using the equity method, the investment income or loss included in pretax income. \_\_\_\_\_

- e. Any commitments or contingent commitments.
- f. Amount and nature of impairment losses from the forfeiture or ineligibility of tax credits.

(ASC 323-740-50-1 and 50-2)

### **325 Investments—Other**

#### **325-20 Cost Method Investments**

1. For investments valued using the cost method, as of the date of each statement of financial position presented in the annual financial statements:
  - a. The aggregate carrying amount of all investments valued using the cost method.
  - b. The aggregate carrying amount of cost-method investments not evaluated for impairment by the investor.
  - c. The fact that the fair value of a cost-method investment is not estimated by management if no events or changes in circumstances have been identified that potentially would have a significant adverse effect on the investment's fair value, and any of the following:
    - (1) The investor determined that it is not practicable to estimate the fair value of the investment,
    - (2) The investor is exempt from estimating fair value, or
    - (3) The entity is exempt from estimating interim fair value because it does not meet the FASB ASC definition of a publicly traded company.

(FASB ASC 325-20-50-1<sup>7</sup>)

#### **325-30 Investments in Insurance Contracts**

1. For policyholders, contractual restrictions on the ability to surrender a policy.

(FASB ASC 325-30-50-1)

2. For investors:

- a. Accounting policy for life settlement contracts including the classification of cash receipts and cash disbursements in statement of cash flows.

(FASB ASC 325-30-50-2)

- b. All of the following for life settlement contracts accounted for under the investment method based on the remaining life expectancy for each of the first five succeeding years from the date of the statement of financial position and thereafter, as well as in the aggregate: the number of life settlement contracts and their carrying value and the face value of underlying life insurance policies.

(FASB ASC 325-30-50-4)

- c. As of the date of the most recent statement of financial position, the life insurance premiums anticipated to be paid for each of the five succeeding fiscal years in order to keep the life settlement contracts in force.

(FASB ASC 325-30-50-5)

- d. The nature of new or updated information that causes the investor to change its expectations on the timing of the realization of proceeds from the investments in life settlement contracts. Include the information and the related effect on the timing of the realization of proceeds from the life settlement contracts.

---

<sup>7</sup> Upon implementation of ASU 2016-01, this disclosure is superseded.

**Fair Value Method**

(FASB ASC 325-30-50-6)

- e. The method and significant assumptions used to estimate the fair value of investments in life settlement contracts, including any mortality assumptions.
- 

(FASB ASC 325-30-50-7)

- f. For life settlement contracts accounted for under the fair value method based on remaining life expectancy for each of the first five succeeding years from the date of the statement of financial position and thereafter, as well as in the aggregate: the number and carrying value of life settlement contracts and the face value (death benefits) of the life insurance policies underlying the contracts.
- 

(FASB ASC 325-30-50-8)

- g. The reasons for changes in its expectation of the timing of the realization of the investments in life settlement contracts.
- 

(FASB ASC 325-30-50-9)

- h. For each reporting period presented in the income statement:
    - i. the gains or losses recognized during the period on investments sold during the period, and
    - ii. the unrealized gains or losses recognized during the period on investments held at the date of the statement of financial position.
- 

(FASB ASC 325-30-50-10)

**330 Inventory**

- 1. Basis of stating inventories.
  - 2. Change in basis of stating inventories and its effect.
- 

(FASB ASC 330-10-50-1)

- 3. Substantial and unusual losses that result from the subsequent measurement of inventory.
- 

(FASB ASC 330-10-50-2)

- 4. Goods stated above cost.
- 

(FASB ASC 330-10-50-3)

- 5. Inventories stated at sales price.
- 

(FASB ASC 330-10-50-4)

- 6. Amount of net losses on firm purchase commitments accrued under 330-10-35-1.
- 

(FASB ASC 330-10-50-5)

- 7. Significant estimates applicable to inventories.
- 

(FASB ASC 330-10-50-6)

**340 Other Assets and Deferred Costs****340-20 Capitalized Advertising Costs**

- 1. a. The accounting policy selected from the two alternatives in paragraph 720-35-25-1 for reporting advertising, indicating whether such costs are expensed as incurred or the first time the advertising takes place.
  - b. A description of the direct-response advertising reported as assets (if any), the accounting policy for it, and the amortization method and period.
-

- c. The total amount charged to advertising expense for each income statement presented, with separate disclosure of amounts, if any, representing a write-down to net realizable value.
- d. The total amount of advertising reported as assets in each balance sheet presented.

*(FASB ASC 340-20-50-1) This paragraph will be superseded upon implementation of ASU 2014-09, Revenue from Contracts with Customers.*

### 340-30 Insurance Contracts That Do Not Transfer Insurance Risk

- 1. A description of the contracts accounted for as deposits and the separate amounts of total deposit assets and total deposit liabilities reported in the statement of financial position.

*(FASB ASC 340-30-50-1)*

- 2. Insurance entities—the changes in the recorded amount of the deposit arising from an insurance or reinsurance contract that transfers only significant underwriting risk.

*(FASB ASC 340-30-50-2)*

### 340-40 Contracts with Customers

---

*NOTE: The disclosures in ASC 340 are required upon implementation of ASU 2014-09, Revenue from Contracts with Customers.*

---

#### *Assets Recognized from the Costs to Obtain or Fulfill a Contract with a Customer*

---

*NOTE: Entities other than public entities as defined by ASC 606 may elect not to disclose the items in ASC 340-40-50-2 and 50-3.*

---

*(FASB ASC 340-40-50-4)*

- 1. Description of judgments made in determining the amount of the costs incurred to obtain or fulfill a contract with a customer
- 2. The method used to determine amortization of fulfillment costs.

*(FASB ASC 340-40-50-2)*

- 3. By main category of asset, the closing balances of assets recognized from the costs incurred to obtain or fulfill a contract with a customer
- 4. Amortization amount and
- 5. Impairment losses recognized in the reporting period.

*(FASB ASC 340-40-50-3)*

#### *Practical Expedients*

- 1. The fact that the entity is using the practical expedient in ASC 340-40-25-4 on the incremental costs of obtaining a contract. Entities other than public entities as defined by ASC 606 may elect not to disclose the use of the practical expedient.

*(FASB ASC 340-40-50-5 and 50-6)*

### 350 Intangibles—Goodwill and Other<sup>8</sup>

#### 350-20 Goodwill

- 1. For goodwill, a reconciliation of changes in the carrying amount during the period, showing separately:

---

<sup>8</sup> See below for private company accounting alternatives.

- a. The gross amount and accumulated impairment losses at the beginning of the period.
- b. Additional goodwill recognized during the period, except goodwill that is included in a disposal group that, upon acquisition, meets the criteria in ASC 360 to be classified as held for sale.
- c. Adjustments resulting from the subsequent recognition of deferred tax assets during the period in accordance with ASC 805-740.
- d. Goodwill included in a disposal group classified as held for sale in accordance with 360-10-45-9 and goodwill derecognized during the period without having previously been reported in a disposal group classified as held for sale.
- e. Impairment losses recognized during the period.
- f. Net foreign exchange differences arising during the period.
- g. Any other changes in carrying amounts during the period.
- h. The gross amount and accumulated impairment losses at the end of the period.

For entities that report segment information in accordance with Topic 280, provide the above information about goodwill in total and for each reportable segment and disclose any significant changes in the allocation of goodwill by reportable segment. If any portion of goodwill has not yet been allocated to a reporting unit at the date the financial statements are issued, disclose that unallocated amount and the reasons for not allocating that amount.

(FASB ASC 350-20-50-1)

2. Goodwill impairment losses recognized during the period:
  - a. The facts and circumstances causing the impairment.
  - b. The amount of the impairment loss and the method of determining fair value of the associated reporting unit (whether based on quoted market prices; prices of comparable businesses; or present value or other valuation techniques; or a combination of these methods).
  - c. If the amount recognized is an estimate that has not yet been finalized, that fact and the reasons why the estimate is not yet complete.

(FASB ASC 350-20-50-2)

3. The quantitative disclosures about significant unobservable inputs used in fair value measurements categorized within Level 3 of the fair value hierarchy required by paragraph 820-10-50-2(bbb) are not required for fair value measurements related to the financial accounting and reporting for goodwill after its initial recognition in a business combination.

(FASB ASC 350-20-50-3)

#### *Accounting Alternative for Private Companies<sup>9</sup>*

4. For those entities who choose the accounting alternative:
  - a. For any addition to goodwill for each period for which a statement of financial position is presented:
    - i. Amount assigned to goodwill and the weighted average amortization period in total and by major business combination or by reorganization event that results in fresh-start reporting.

(FASB ASC 350-20-50-4)

- b. For each period for which a statement of financial position is presented:
  - i. The gross carrying amount of:
    - (a) Goodwill

<sup>9</sup> See the chapter on ASC 350 for more information on applying alternatives in ASC 350-20-50-4 through 50-7.

- (b) Accumulated amortization \_\_\_\_\_
- (c) Accumulated impairment loss \_\_\_\_\_
- ii. Aggregate amortization expense \_\_\_\_\_
- iii. Goodwill in a disposal group classified as held for sale \_\_\_\_\_
- iv. Goodwill recognized during the period without having previously been reported in a disposal group classified as held for sale. \_\_\_\_\_

(FASB ASC 350-20-50-5)

- c. For each goodwill impairment loss:
  - i. Description of the facts and circumstances leading to the impairment \_\_\_\_\_
  - ii. Amount of the loss and how the fair value of the entity or reporting unit was determined \_\_\_\_\_
  - iii. Where the impairment loss is included in the income statement amount \_\_\_\_\_
  - iv. Method used to allocate the loss to the individual amortizable units of goodwill. \_\_\_\_\_

(FASB ASC 350-20-50-6)

- d. Quantitative disclosures about significant unobservable inputs used in fair value measurements categorized in Level 3 required by 820-10-50-2(bbb) are not required for fair value measurements related to the financial accounting and reporting for goodwill after its initial recognition in a business combination. \_\_\_\_\_

(FASB ASC 350-20-50-7)

### **350-30 General Intangibles Other Than Goodwill**

- 1. For each major class of intangible asset, for each period-end for which a statement of financial position is presented:
  - a. For intangible assets subject to amortization, all of the following:
    - (1) The total amount assigned and the amount assigned to any major intangible asset class. \_\_\_\_\_
    - (2) The amount of any significant residual value, in total and by major intangible asset class. \_\_\_\_\_
    - (3) The weighted-average amortization period, in total and by major intangible asset class. \_\_\_\_\_

(FASB ASC 350-30-50-1a)

- b. For intangible assets not subject to amortization, the total carrying amount and the carrying amount for each major intangible asset class. \_\_\_\_\_

(FASB ASC 350-30-50-1b)

- c. The amount of research and development assets acquired in a transaction other than a business combination or an acquisition by a not-for-profit entity and written off in the period and the line item in the income statement in which the amounts written off are aggregated. \_\_\_\_\_

(FASB ASC 350-30-50-1c)

- d. For intangible assets with renewal or extension terms, the weighted-average period before the next renewal or extension (both explicit and implicit), by major intangible asset class. \_\_\_\_\_

(FASB ASC 350-30-50-1d)

---

*NOTE: Also disclose the information in FASB ASC 350-30-50-1 separately for each material business combination or in the aggregate for individually immaterial business combinations that are material collectively if the aggregate fair values of intangible assets acquired, other than goodwill, are significant.*

---

2. a. Gross carrying amount and accumulated amortization, in total and by major class of intangible asset.  
b. Amortization expense for the period.  
c. Estimated aggregate amortization expenses for each of the five succeeding fiscal years as of the date of the latest statement of financial position presented.

(FASB ASC 350-30-50-2a)

3. For intangible asset not subject to amortization, the total carrying amount and the carrying amount for each major intangible asset class.

(FASB ASC 350-30-50-2b)

4. The entity's accounting policy on the treatment of costs incurred to renew or extend the term of a recognized intangible asset.

(FASB ASC 350-30-50-2c)

5. If intangible assets have been renewed or extended in the period for which the statement of financial position is presented:
  - (1) Total amount of costs incurred to renew or extend the term of a recognized intangible asset, by major intangible asset class.
  - (2) Weighted-average period before the next renewal or extension, by major intangible asset class.

(FASB ASC 350-30-50-2d)

6. For each impairment loss recognized related to an intangible asset, the following disclosures are to be made in financial statements that include the period the loss is recognized:
  - a. A description of the impaired intangible asset and the facts and circumstances that caused the impairment.
  - b. The amount of the impairment loss and the method used to determine fair value.
  - c. The caption of the income statement in which it is included.
  - d. If applicable, the segment in which the impaired intangible asset is reported under Topic 280.

(FASB ASC 350-30-50-3)

7. A nonpublic entity is not required to disclose the quantitative information about significant unobservable inputs used in fair value measurements categorized within Level 3 of the fair value hierarchy required by paragraph 820-10-50-2(bbb) that relate to the financial accounting and reporting for an indefinite-lived intangible asset after its initial recognition.

(FASB ASC 350-30-50-3A)

8. For a recognized intangible asset, information that enables users of financial statements to assess the extent to which the expected future cash flows associated with the asset are affected by the entity's intent and/or ability to renew or extend the arrangement.

(FASB ASC 350-30-50-4)

### 360 Property, Plant, and Equipment

1. Depreciation expense for the period.
2. Balances of major classes of depreciable assets, by nature or function, at the balance sheet date.
3. Accumulated depreciation, either by major classes of depreciable assets or in total, at the balance sheet date.

4. A general description of the method or methods used in computing depreciation with respect to major classes of depreciable assets.
- 

(FASB ASC 360-10-50-1)

5. In the period in which an impairment loss is incurred:
    - a. A description of the impaired long-lived asset (asset group) and the facts and circumstances leading to the impairment.
    - b. If not separately presented on the face of the statement, the amount of the impairment loss and the caption in the income statement or the statement of activities that includes that loss.
    - c. The method or methods for determining fair value (whether based on a quoted market price, prices for similar assets, or another valuation technique).
    - d. If applicable, the segment in which the impaired long-lived asset (asset group) is reported under Topic 280.
- 
- 
- 
- 
- 

(FASB ASC 360-10-50-2)

6. For the period in which a long-lived asset has been disposed of or classified as held for sale:
    - a. The facts and circumstances leading to the disposal or expected disposal
    - b. Manner and timing of disposal
    - c. Gain or loss recognized
    - d. If not separately presented, the caption that includes the gain or loss
    - e. If not separately presented, carrying amounts of the major classes of assets and liabilities included as part of a disposal group classified as held for sale
    - f. The segment in which the long-lived asset is reported.
- 
- 
- 
- 
- 

(FASB ASC 360-10-50-3)

---

*NOTE: A nonpublic entity is not required to disclose the quantitative information about significant unobservable inputs used in fair value measurements categorized within Level 3 of the fair value hierarchy that relate to indefinite-lived intangible asset after initial recognition. (FASB ASC 360-10-50-3A)*

---

## LIABILITIES

### **405-20 Extinguishment of Liabilities**

1. Methodology used to recognize breakage.
2. Judgment used in applying methodology.

(ASC 405-20-50-2)

### **405-30 Insurance-Related Assessments**

1. For discounted loss contingencies:
  - a. The undiscounted amounts,
  - b. Related asset for premium tax offsets or policy surcharges, and
  - c. The discount rate used.
2. For undiscounted loss contingencies:
  - a. Amount of the liability,
  - b. Related asset for premium tax offsets or policy surcharges,
  - c. Periods during which the assessments are expected to be paid, and
  - d. Period during which the recorded premium tax offsets or policy surcharges are expected to be realized.

(FASB ASC 405-30-50-1)

### **405-40 Obligations Resulting from Joint and Several Liability Arrangements**

1. About each obligation, or each group of similar obligations, resulting from joint and several liability arrangements for which the total amount under the arrangement is fixed at the reporting date:
  - a. The nature of the arrangement
  - b. How the liability arose
  - c. The relationship with other co-obligors
  - d. Terms and conditions of the arrangement
  - e. The total outstanding amount under the arrangement (not reduced by the effect of any amounts that may be recoverable from other entities)
  - f. The carrying amount of the liability and the carrying amount of any receivable recognized
  - g. The nature of any recourse provisions that would enable recovery from other entities of the amounts paid, including any limitations on the amounts that might be recovered
  - h. In the period the liability is initially recognized and measured or in a period the measurement changes significantly, the corresponding entry and where the entry was recorded in the financial statements.

(FASB ASC 405-40-50-1)

### **410 Asset Retirement and Environmental Obligations**

#### **410-20 Asset Retirement Obligations**

1. General description of asset retirement obligations and the related long-lived assets.
2. Fair value of assets legally restricted to satisfy the liability.
3. Reconciliation of the beginning and ending aggregate carrying amount of the liability separately, whenever there is a significant change in any of these components during the reporting period, showing the changes resulting from:
  - a. Liabilities incurred during the current period
  - b. Settlements of liabilities during the current period

- c. Accretion expense
- d. Revisions in estimated cash flows.

(FASB ASC 410-20-50-1)

- 4. If the fair value of an asset retirement obligation cannot be reasonably estimated, that fact and the reasons therefor.

(FASB ASC 410-20-50-2)

#### **410-30 Environmental Remediation Obligations**

- 1. Whether the accrual for environmental remediation liabilities is measured on a discounted basis.

(FASB ASC 410-30-50-4)

- 2. For recorded accruals for environmental remediation loss contingencies and assets for third-party recoveries related to environmental remediation obligations:
  - a. If any portion of the accrued obligation is discounted,
  - b. The undiscounted amount of the obligation, and
  - c. The discount rate used in the present-value determinations.

(FASB ASC 410-30-50-7)

- 3. May include a contingency conclusion that addresses the estimated total unrecognized exposure to environmental remediation and other loss contingencies

(FASB ASC 410-30-50-14)

- 4. Optionally, a description of the general applicability and impact of environmental laws and regulations upon the business and how the laws and regulations may give rise to loss contingencies for future environmental remediation.

(FASB ASC 410-30-50-17)

#### **420 Exit or Disposal Cost Obligations**

- 1. In notes to financial statements that include the period in which an exit or disposal activity is initiated and any subsequent period until the activity is completed:
  - a. A description of the exit or disposal activity, including the facts and circumstances leading to the expected activity and the expected completion date.
  - b. For each major type of cost associated with the activity, both of the following:
    - (1) The total amount expected to be incurred in connection with the activity, the amount incurred in the period, and the cumulative amount incurred to date.
    - (2) A reconciliation of the beginning and ending liability balances showing separately the changes during the period attributable to costs incurred and charged to expense, costs paid or otherwise settled, and any adjustments to the liability with an explanation of the reason(s) why.
  - c. Line item(s) in the income statement or the statement of activities in which the costs in b. are aggregated.
  - d. For each reportable segment:
    - (1) The total amount of costs expected to be incurred in connection with the activity,
    - (2) The amount incurred in the period, and
    - (3) The cumulative amount incurred to date, net of any adjustments to the liability with an explanation of the reason(s) why.
  - e. If a liability for a cost associated with the activity is not recognized because fair value cannot be reasonably estimated, that fact and the reasons why.

(FASB ASC 420-10-50-1)

**440 Commitments**

1. All of the following:
  - a. Unused letters of credit \_\_\_\_\_
  - b. Leases \_\_\_\_\_
  - c. Assets pledged as security for loans \_\_\_\_\_
  - d. Pension plans \_\_\_\_\_
  - e. The existence of cumulative preferred stock dividends in arrears \_\_\_\_\_
  - f. Commitments, including a commitment for plant acquisition and obligations to reduce debts, maintain working capital, and restrict dividends. \_\_\_\_\_

(FASB ASC 440-10-50-1)

***Unconditional Purchase Obligations***

2. Unconditional purchase obligations in accordance with FASB ASC 440-10-50-4 (if not recorded on the statement of financial position) or FASB ASC 440-10-50-6 (if recorded on the statement of financial position), if all the following criteria are met:
  - a. It is noncancelable, or cancelable only:
    - (1) Upon the occurrence of some remote contingency \_\_\_\_\_
    - (2) With the permission of the other party \_\_\_\_\_
    - (3) If a replacement agreement is signed between the same parties \_\_\_\_\_
    - (4) Upon payment of a penalty in an amount such that continuation of the agreement appears reasonably assured; \_\_\_\_\_
  - b. It is negotiated as part of a supplier's product financing arrangement for the facilities that will provide the contracted goods or services or for costs related to those goods or services (e.g., carrying costs for contracted goods); and \_\_\_\_\_
  - c. It has a remaining term in excess of one year. \_\_\_\_\_

(FASB ASC 440-10-50-2)

***Unrecognized Commitments***

*Entities are not required to disclose future minimum lease payments that meet the conditions in ASC 440-10-50-2 above if those future minimum lease payments are disclosed under ASC 840 or under ASC 842 upon implementation of ASU 2016-02, Leases. (ASC 440-10-50-3)*

3. If the obligation meets the criteria of FASB ASC 440-10-50-2 and is not recorded on the statement of financial position, then the following disclosures are required:
  - a. The nature and term of the obligation(s). \_\_\_\_\_
  - b. The amount of the fixed and determinable portion of the obligation(s) at the statement of financial position date in the aggregate and for each of the next five years, if determinable. \_\_\_\_\_
  - c. The nature of any variable components of the obligation(s). \_\_\_\_\_
  - d. The amounts purchased under the obligation for each period for which an income statement is presented. \_\_\_\_\_

(FASB ASC 440-10-50-4)

***Recognized Commitments***

4. If the obligation fulfills the criteria in FASB ASC 440-10-50-2 and is recorded on the statement of financial position, the aggregate amount of payments to be made for each of the five years following the date of the balance sheet. \_\_\_\_\_

(FASB ASC 440-10-50-6)

**450 Contingencies****450-20 Loss Contingencies**

1. If necessary to avoid misleading statements, the nature of the loss accrual and the amount accrued, using terminology such as estimated liability, but not reserve.

(FASB ASC 450-20-50-1)

2. If prior to issuance of financial statements, management has an indication that it is at least reasonably possible that a change in an entity's estimate of its probable liability could occur in the near term, disclose that information. (See FASB ASC 275-10-50-8 and 9.)

(FASB ASC 450-20-50-2)

***Unrecognized Contingencies***

3. Disclose the contingency if there is at least a reasonable possibility that a loss or an additional loss may have been incurred and the contingency does not meet the criteria for accrual or an exposure to loss exists in excess of the amount accrued.

(FASB ASC 450-20-50-3)

4. When accruals are not made because probable loss could not be estimated:
  - a. The nature of the contingency.
  - b. An estimate of the possible loss or range of loss or a statement that such an estimate cannot be made.

(FASB ASC 450-20-50-4)

5. Disclosure is preferable to accrual when a reasonable estimate of loss cannot be made or it is reasonably possible that a loss has occurred.

(FASB ASC 450-20-50-5)

6. The nature of the loss and an estimate of the range of loss for unasserted claims for which it is both probable that a claim will be asserted, and reasonably possible that an unfavorable outcome will result.

(FASB ASC 450-20-50-6)

***Losses Arising After the Date of the Financial Statements***

7. Events occurring after the date of the statement of financial position but before those financial statements are issued that may give rise to a loss contingency, including the nature of the loss or loss contingency and an estimate of the possible loss or range of loss or a statement that an estimate cannot be made.

(FASB ASC 450-20-50-9)

**450-30 Gain Contingencies**

1. Gain contingencies, if described such that the likelihood of realization is not overstated.

(FASB ASC 450-30-50-10)

**460 Guarantees*****Loss Contingencies***

1. Loss contingencies, even if the possibility of loss is remote, where a guarantee provides a right to proceed against an outside party in the event that the guarantor is called on to satisfy the guarantee.

(FASB ASC 460-10-50-2)

2. The nature and amount of the guarantee.
3. For guarantees, including guarantees of the indebtedness of others:
  - a. The nature of the guarantee, including the approximate term, how the guarantee arose, the events or circumstances that would require the guarantor to perform under the guarantee, and the current status (that is, as of the date of the statement of financial position) of the payment/performance risk of the guarantee. For example, the current status of the payment/performance risk of a credit-risk-related guarantee could be based on either recently issued external credit rating or current internal groupings used by the guarantor to manage its risks. An entity that uses internal groupings shall disclose how those groupings are determined and used for managing risk.
  - b. The maximum potential amount of the future payments (undiscounted) that the entity would be required to make, or if the guarantee provides no limitation on future payments, that fact.
  - c. The reasons why the maximum future payments cannot be estimated, if the entity is unable to estimate that amount.
  - d. The current carrying amount of the liability.
  - e. The nature of any recourse provisions that would enable the entity to recover from third parties any amounts paid under the guarantee, and the extent to which the proceeds are expected to cover the amount in b. above.
  - f. The nature of any assets (collateral) that can be liquidated to recover amounts paid under the guarantee, and the extent to which the proceeds from liquidation are expected to cover the amount in b. above.

(FASB ASC 460-10-50-4)

#### **Product Warranties**

2. For product warranties:
  - a. Information required by FASB ASC 460-10-50-4 except for b. above.
  - b. Accounting policy and method used in determining liability for product warranties.
  - c. Tabular reconciliation of the changes in aggregate product warranty liability for the period, including the beginning and ending balances, the aggregate reductions for payments made, and aggregate changes in the liability related to product warranties issued during the reporting period.

(FASB ASC 460-10-50-8)

#### **470 Debt-10**

##### **Long-Term Obligations**

1. The combined aggregate amount of maturities and sinking fund requirements for all long-term borrowings for each of the five years following the date of the latest balance sheet presented.

(FASB ASC 470-10-50-1)

2. The circumstances where a long-term liability callable because of a violation but it is probable the violation will be cured within the grace period.

(FASB ASC 470-10-50-2)

##### **Subjective Acceleration Clause**

3. Existence of Subjective Acceleration Clauses.
4. Classify long-term debt as current if the debtor is in violation of a debt covenant at the statement of financial position date which:
  - a. Makes the obligation callable within one year, or

- b. Will make the obligation callable within one year if the violation is not cured within a specified grace period.

Unless:

- a. The creditor has waived or has subsequently lost the right to demand repayment for one year (or, if longer, the operating cycle) from the statement of financial position date, or
- b. It is probable (likely) that the violation will be cured by the debtor within the grace period stated in the terms of the debt agreement, thus preventing the obligation from being called.

(FASB ASC 470-10-50-3 and FASB ASC 470-10-45-11)

#### ***Short-term Obligations Expected to Be Refinanced***

- a. If a short-term obligation is expected to be refinanced, a general description of the financing agreement and the terms of any new obligations incurred or expected to be incurred or equity securities issued or expected to be issued as a result of a refinancing.

(FASB ASC 470-10-50-4)

#### **470-20 Debt with Conversion and Other Options**

##### ***Own-Share Lending Arrangements Issued in Contemplation of Convertible Debt Issuance***

1. If there is a share-lending arrangement of an entity's own shares in contemplation of a convertible debt offering or other financing:
  - a. Outstanding share-lending arrangements on the entity's own stock.
  - b. All significant terms of the arrangement, including the number of shares, the term, circumstances under which cash settlement would be required, and any collateral requirements for the counterparty.
  - c. The reasons for entering into the arrangement.
  - d. The fair value of the loaned shares.
  - e. The treatment of the share-lending arrangement for calculating EPS.
  - f. The unamortized amount of issuance costs associated with the arrangement.
  - g. The classification of issuance costs associated with the arrangement.
  - h. Interest cost associated with the share-lending arrangement.
  - i. Dividends paid related to the loaned shares that will not be reimbursed.

(FASB ASC 470-20-50-2A)

- j. If it is probable in the current period that the counterparty will default, the amount of expense related to the default. In subsequent periods, material changes in the fair value of the shares or probable recoveries.
- k. If default is probable but has not yet occurred, the number of shares related to the arrangement that will be included in basic and diluted earnings per share when there is a default.

(FASB ASC 470-20-50-2C)

##### ***Cash Conversion***

2. With respect to convertible debt instruments that were outstanding during any of the periods presented and that are within the scope of ASC 470-20 disclose:
  - a. As of each date for which a statement of financial position is presented:
    - (1) The carrying amount of the equity component.
    - (2) The principal amount, unamortized discount, and net carrying amount of the liability component.

(FASB ASC 470-20-50-4)

3. As of the date of the *most recent* statement of financial position presented:
  - a. The remaining period over which any discount on the liability component will be amortized.
  - b. The conversion price and the number of shares on which the aggregate consideration to be delivered on conversion is determined.
  - c. For public entities, the amount by which the if-converted value of the instrument exceeds its principal amount, irrespective of whether the instrument is currently convertible.
  - d. Whether or not the related derivative transactions are accounted for as assets, liabilities, or equity instruments, information about derivative transactions entered into in connection with the issuance of the instruments, including the terms of those derivative transactions, how those transactions relate to the instruments, the number of shares underlying the derivative transactions, and the reasons for entering into those derivatives transactions.

(FASB ASC 470-20-50-5)

4. For each period for which a statement of financial performance is presented:
  - a. Effective interest rate on the liability component.
  - b. Amount of interest cost recognized relating to both the contractual interest coupon and amortization of the discount on the liability component.

(FASB ASC 470-20-50-6)

#### 470-30 Participating Mortgage Loans

1. Aggregate amount of participating mortgage obligations at the balance sheet date.
2. Separate disclosure of the aggregate participation liabilities and related debt discounts.
3. Terms of the participations by the lender in either the appreciation in the fair value of the mortgaged real estate project or results of operations of the mortgaged real estate project.

(FASB ASC 470-30-50-1)

#### 470-60 Troubled Debt Restructurings by Debtors

1. Disclosures by the debtor:
  - a. A description of the changes in terms and/or major features of the settlement.
  - b. The aggregate gain on restructuring and the related tax effect.
  - c. The aggregate net gain or loss on the transfer of assets recognized during the period.
  - d. The per share amount of the aggregate gain or loss.

(ASC 470-60-50-1)

2. In financial statements for periods after a troubled debt restructuring, the extent to which amounts contingently payable are included in the carrying amount of restructured payables per paragraph 470-60-35-7.
3. If required by paragraphs 450-20-50-1 through 50-6 and 450-20-50-9 through 50-10, in financial statements for periods after a troubled debt restructuring, total amounts that are contingently payable on restructured payables and the conditions under which those amounts would become payable or would be forgiven.

(FASB ASC 470-60-50-2)

#### 480 Distinguishing Liabilities from Equity

1. For issuers of financial instruments within the scope of 480-10-25:
  - a. The nature and terms of the financial instruments.
  - b. The rights and obligations embodied therein, including:
    1. Settlement alternatives in the contract.

2. The entity that controls the settlement alternatives.

(FASB ASC 480-10-50-1)

2. For issuers of all outstanding financial instruments and for each settlement alternative:
  - a. The amount that would be paid, or the number and fair value of shares that would be issued, determined under the conditions specified in the contract, if the settlement were to occur at the reporting date.
  - b. How changes in the fair value of the issuer's equity shares would affect those settlement amounts.
  - c. The maximum amount that the issuer could be required to pay to redeem the instrument by physical settlement.
  - d. The maximum number of shares that could be required to be issued, if applicable.
  - e. That a contract does not limit the amount that the issuer could be required to pay or the number of shares that the issuer could be required to issue, if applicable.
  - f. For a forward contract or an option indexed to the issuer's equity shares, the forward price or option strike price, the number of issuer's shares to which the contract is indexed, and the settlement date or dates of the contract, as applicable.

(FASB ASC 480-10-50-2)

3. For entities having no equity instruments outstanding but having financial instruments in the form of shares, all of which are mandatorily redeemable financial instruments required to be classified as liabilities:
  - a. The components of the liability that would otherwise be related to shareholders' interest, and
  - b. Other comprehensive income subject to the redemption feature.

(FASB ASC 480-10-50-4)

## **EQUITY**

### **505-10 Equity**

1. In separate statements or in the basic financial statements or a note, if both financial position and results of operations are presented:
  - a. Changes in the separate accounts comprising shareholders' equity (in addition to retained earnings);
  - b. Changes in the number of shares of equity securities during at least the most recent annual fiscal period and any subsequent interim period presented.

(FASB ASC 505-10-50-2)

2. Summary explanation within the financial statements of the pertinent rights and privileges of outstanding securities.
3. The number of shares issued upon conversion, exercise, or satisfaction of required conditions during at least the most recent annual fiscal period and any subsequent interim period presented.

(FASB ASC 505-10-50-3)

### **Securities with Preference**

4. For preferred stock (or other senior stock) that has a preference in involuntary liquidation considerably in excess of the par or stated value of the shares the liquidation preference of the stock in the equity section of the statement of financial position in the aggregate, either parenthetically or in short.

(FASB ASC 505-10-5-4)

5. Both of the following within the financial statements (either on the face of the statement of financial position or in the notes thereto):
- Aggregate or per-share amounts at which preferred stock may be called or is subject to redemption through sinking-fund operations or otherwise.
  - Aggregate and per-share amounts of arrearages in cumulative preferred dividends.

(FASB ASC 505-10-50-5)

#### *Contingently Convertible Securities*

6. To comply with the general disclosure requirements of 2 and 3 above, the significant terms of the conversion features of the contingently convertible security that will enable users to understand the circumstances of the contingency and the potential impact of conversion. The following may be helpful in understanding both the nature of the contingency and the potential impact of conversion:
- Events or changes in circumstances that would cause the contingency to be met and any significant features necessary to understand the conversion rights and the timing of those rights.
  - The conversion price and the number of shares into which a security is potentially convertible.
  - Events or changes in circumstances, if any, that could adjust or change the contingency, conversion price, or number of shares, including significant terms of those changes.
  - The manner of settlement upon conversion and any alternative settlement methods.

(FASB ASC 505-10-50-6)

6. In order to meet the disclosure requirements of the preceding paragraph, disclose the possible conversion prices and dates as well as other significant terms for each convertible instrument.

(FASB ASC 505-10-50-7)

7. In the notes to its financial statements the terms of the transaction, including the excess of the aggregate fair value of the instruments that the holder would receive at conversion over the proceeds received and the period over which the discount is amortized.

(FASB ASC 505-10-50-8)

8. Whether the shares that would be issued if the contingently convertible securities were converted are included in the calculation of diluted EPS and the reasons why or why not.

(FASB ASC 505-10-50-9)

9. For an entity that issues redeemable stock, the amount of redemption requirements, separately by issue or combined, for all issues of capital stock redeemable at fixed or determinable prices on fixed or determinable dates in each of the five years following the date of the latest statement of financial position presented.

(FASB ASC 505-10-50-11)

#### **505-20 Stock Dividends and Stock Splits**

1. Paragraph 505-20-25-2 identifies a situation in which a stock dividend in form is a stock split in substance. In such instances make every effort to avoid the use of the word dividend in related corporate resolutions, notices, and announcements and that, in those cases in which because of legal requirements this cannot be done, the transaction be described, for example, as a stock split effected in the form of a dividend.

(FASB ASC 505-20-50-1)

**505-30 Treasury Stock**

1. State laws relating to an entity's repurchase of its own outstanding common stock that restrict the availability of retained earnings for payment of dividends or have other effects of a significant nature.
- 

(FASB ASC 505-30-50-2)

2. Allocation of amounts paid in excess of current market price for repurchase of treasury shares and other elements of the transaction and the accounting treatment of such amounts.
- 

(FASB ASC 505-30-50-4)

**505-50 Equity-Based Payments to Non-Employees**

1. For an entity that acquires goods or services other than employee services in share-based payment transactions, disclosures similar to those required by paragraphs 718-10-50-1 through 50-2 to the extent that those disclosures are important to an understanding of the effects of those transactions on the financial statements.
- 

(FASB ASC 505-50-50-1)

**REVENUE**

Upon implementation of ASU 2014-09, Revenue from Contracts with Customers, ASC 605 will be superseded. See the section following for ASC 606 disclosures and the chapter on ASC 606 for more information.

**605-20 Services*****Advertising Barter Transactions***

1. Disclose the amount of revenue and expense recognized from advertising barter transactions for each income statement period presented. In addition, if an entity engages in advertising barter transactions for which the fair value is not determinable within the limits of paragraphs 605-20-25-15 through 25-18, information regarding the volume and type of advertising surrendered and received (such as the number of equivalent pages, the number of minutes, or the overall percentage of advertising volume) shall be disclosed for each income statement period presented.
- 

(FASB ASC 605-20-50-1)

**605-25 Multiple Element Arrangements**

1. In addition to specifically required disclosures, any other qualitative and quantitative information that will provide both qualitative and quantitative information about revenue arrangements and about the significant judgments made about the application of the requirements in the 605-25 guidance and changes in those judgments or in the application that may significantly affect the timing or amount of revenue recognition.
- 

(FASB ASC 605-25-50-1)

2. If the company is a party to multiple-deliverable arrangements:

- a. The nature of the entity's multiple-deliverable arrangements.
    - b. Significant deliverables within the arrangements.
    - c. General timing of the delivery of goods or performance of services.
    - d. Performance, cancellation, termination, and refund provisions.
    - e. Significant factors, inputs, assumptions, and methods used to determine selling price for significant deliverables.
    - f. Whether significant deliverables are separable into units of accounting and the reasons they do not qualify as separate units of accounting if applicable.
- 
- 
- 
- 
- 
- 
-

- g. General timing of revenue recognition for significant units of accounting.
- h. The effect of changes in selling price or the methods used to determine the selling price for a unit of accounting if the change has a significant effect on the allocation of consideration in an arrangement.

(FASB ASC 605-25-50-1 and 2)

#### **605-28 Milestone Method**

1. If an entity uses the milestone method of revenue recognition, disclose the following:
  - a. The accounting policy for using the milestone method.
  - b. Describe each such arrangement.
  - c. Describe each milestone and related contingent consideration.
  - d. Note whether each milestone is substantive.
  - e. The factors considered in determining whether the milestones are substantive.
  - f. The amount of consideration recognized during the period for the milestones.

(FASB ASC 605-28-50-2)

#### **605-35 Construction-Type and Production-Type Contracts**

##### *Percentage of Completion Method*

1. If the percentage-of-completion method is used, the method of measuring extent of progress toward completion (e.g., cost-to-cost, efforts-expended).

(FASB ASC 605-35-50-2)

2. An entity that departs from use of the percentage-of-completion method as its basic accounting policy in the circumstances described in paragraph 605-35-25-61 shall disclose such a departure from the basic policy.

(FASB ASC 605-35-50-3)

##### *Completed-Contract Method*

3. If the completed-contract method is used, disclose the specific criterion used to determine when a contact is substantially completed.

(FASB ASC 605-35-50-4)

4. An entity that departs from use of the completed-contract method as its basic accounting policy in the circumstances described in paragraph 605-35-25-95 shall disclose such a departure.

(FASB ASC 605-35-50-5)

##### *Contract Claims*

5. In the notes, revenue amounts recorded to the extent that contract costs relating to a claim have been incurred, per ASC 605-35-25-31.

(FASB ASC 605-35-50-6)

6. In the notes, revenues from claims recorded only when the amounts have been received or awarded per ASC 605-35-25-3 in the notes to financial statements.

(FASB ASC 605-35-50-7)

7. If the requirements in paragraph 605-35-25-31 are not met or if those requirements are met but the claim exceeds the recorded contract costs, a contingent asset per paragraph 450-30-50-1.

(FASB ASC 605-35-50-8)

### ***Revision of Estimates***

8. Although estimating is a continuous and normal process for contractors, paragraph 250-10-50-4 requires disclosure of the effect of revisions if the effect is material.

(FASB ASC 605-35-50-9)

9. Events occurring after the date of the financial statements that are outside the normal exposure and risk aspects of the contract shall not be considered refinements of the estimating process of the prior year but should be disclosed as subsequent events.

(FASB ASC 605-35-50-10)

### **605-45 Principal Agent Considerations**

1. For significant shipping or handling costs, both the amount of such costs and the line item or items on the income statement that include them.

(FASB ASC 605-45-50-2)

2. Accounting policy regarding the presentation of taxes within the scope of this Subtopic on either a gross or a net basis (excluded from revenues).

(FASB ASC 605-45-50-2)

3. For any such taxes, significant in amount, that are reported on a gross basis, the amounts of those taxes in interim and annual financial statements for each period for which an income statement is presented. The disclosure of those taxes can be done on an aggregate basis.

(FASB ASC 605-45-50-2)

### **605-50 Customer Payments and Incentives**

1. If significant, the nature of incentive programs and the amounts recognized in the statement of operations for those incentive programs and their related classification for each period presented.

(FASB ASC 605-50-50-1)

### **606 Revenue from Contracts with Customers<sup>10</sup>**

1. Revenue recognized from contracts with customers, disclosed separately from other sources of revenue.

(FASB ASC 606-10-50-4a)

2. Impairment losses recognized on receivables or contract assets, disclosed separately from other impairment losses.

(FASB ASC 606-10-50-4b)

3. Revenue from contracts with customers disaggregated into categories that show:
  - a. How economic factors affect the amount, timing, and uncertainty of revenue and cash flows. (See ASC 606-10-50-7 below for related nonpublic entity requirement.)

(FASB ASC 606-10-50-5)

4. Information that enables users to understand the relationship between the disclosures of disaggregated information and segment information. (See ASC 606-10-50-7 below for related other than public entity requirement.)

(FASB ASC 606-10-50-6)

---

<sup>10</sup> ASC 606 contains a number of paragraphs that provide relief to other than public entities. In this section, those paragraphs are marked with an asterisk. See the Appendix A, *Definitions of Terms*, for a description of public business entities.

5. For ASC 606-10-50-5 and 50-6, other than public entities may elect not to provide the quantitative disaggregation disclosure. If election is chosen:
- Revenue disaggregated by timing of transfer of goods or services, and
  - Qualitative information about how economic factors affect the nature, amount, timing, and uncertainty of revenue and cash flows.

(FASB ASC 606-10-50-7)

6. Opening and closing balances of receivables, contract assets, and contract liabilities.

(FASB ASC 606-10-50-8a)

7. \*Amount of revenue recognized in the current period that was included in the opening contract liability balance.

(FASB ASC 606-10-50-8b)

8. \*Amount of revenue recognized in the current period from performance obligations satisfied or partially satisfied in the previous periods.

(FASB ASC 606-10-50-8c)

9. \*Explanation (may use qualitative information) of how the timing of performance obligations and the entity's contracts' payment terms will affect its contract asset and contract liability balances.

(FASB ASC 606-10-50-9)

10. Qualitative and quantitative information about the significant changes in contract asset and liability balances.

(FASB ASC 606-10-50-10)

11. \*Descriptive information about an entity's performance of obligations, including:
- When the entity typically satisfies its performance obligations,
  - Significant payment terms,
  - Nature of the goods or services promised to transfer (highlighting any performance obligations for another entity to transfer goods or services),
  - Obligations for returns, refunds, and other similar obligations,
  - Types of warrantees and related obligations.

(FASB ASC 606-10-50-12)

12. Aggregate amount of the transaction price allocated to remaining performance obligations unsatisfied or partially satisfied.

(FASB ASC 606-10-50-13a)

13. \*Either a quantitative (using time bands) or a qualitative explanation of when the entity expects the aggregated amount of the transaction price allocated to remaining performance obligations to be recognized as revenue.

(FASB ASC 606-10-50-13b)

14. \*Entities may elect not to disclose the information required by ASC 606-10-50-13 if the related contract has an original expected duration of one year or less or the entity uses the practical expedient in ASC 606-10-55-18, recognizing revenue in the amount for which the entity has a right to invoice for performance obligations based

on a right to consideration from a customer in an amount that corresponds directly with the value of the entity's performance completed to date.

(FASB ASC 606-10-50-14)

15. \*For entities choosing the election in ASC 606-10-50-14, include qualitative explanation of whether any consideration is not included in the transaction price.

(FASB ASC 606-10-50-15)

16. Judgments and changes in judgment that affect the determination of the amount and timing of recognition of revenue from contracts with customers, particularly:
  - a. Timing of satisfaction of performance obligations, and
  - b. Transaction price and the allocation to performance obligations.

(FASB ASC 606-10-50-17)

17. Methods used to recognize revenue for performance obligations satisfied over time.

(FASB ASC 606-10-50-18a)

18. \*Why the method used to recognize revenue over time provides a faithful depiction of the transfer goods or services.

(FASB ASC 606-10-50-18b)

19. \*Significant judgments related to transfer of control for performance obligations satisfied at a point in time.

(FASB ASC 606-10-50-19)

20. \*Information about the methods, inputs, and assumptions used to determine and allocate transaction price.

(FASB ASC 606-10-50-20a and c)

21. Assessing whether an estimate of variable consideration is constrained.

(FASB ASC 606-10-50-20b)

22. \*Measuring obligations for returns, refunds, and other similar obligations.

(FASB ASC 606-10-50-20d)

23. \*Use of the practical expedient regarding the existence of a significant financing component.

(FASB ASC 606-10-50-22)

## EXPENSES

### **710 Compensation—General**

#### *Compensated Absences*

1. If the employer's obligation is from service already rendered, the obligation vests or accumulates, and payment is probable, but the amount cannot be estimated, that fact.

(FASB ASC 710-10-50-1)

### **712 Compensation—Nonretirement Postemployment Benefits**

1. If an obligation for other postemployment benefits is not accrued only because the amount cannot be reasonably estimated, that fact.

(FASB ASC 712-10-50-2)

**715-20 Defined Benefit Plans—General*****Disclosures by Public Entities***

1. An employer that sponsors one or more defined benefit pension plans or one or more other defined benefit postretirement plans, the following information, separately for pension plans and postretirement plans:
  - a. Amounts related to the employer's results of operations for each period for which an income statement is presented.
  - b. Amounts related to the employer's financial position as of the date of each statement of financial position presented.

(FASB ASC 715-20-50-1)

2. Defined benefit plans and other postretirement plans:
  - a. Schedule reconciling beginning and ending balances of the benefit obligation (for defined benefit pension plans, the benefit obligation is the projected benefit obligation; for defined benefit postretirement plans, the benefit obligation is the accumulated postretirement benefit obligation) separately showing if applicable, the effects during the period attributable to each of the following (not required for nonpublic entities):
    - (1) Service cost.
    - (2) Interest cost.
    - (3) Contributions by plan participants.
    - (4) Actuarial gains and losses.
    - (5) Changes in foreign currency exchange rates.<sup>11</sup>
    - (6) Benefits paid.
    - (7) Plan amendments.
    - (8) Business combinations.
    - (9) Divestitures.
    - (10) Curtailments.
    - (11) Settlements.
    - (12) Special and contractual termination benefits.
  - b. Schedule reconciling beginning and ending balances of the fair value of plan assets, separately showing if applicable the effects of (not required for nonpublic entities):
    - (1) Actual return on plan assets.
    - (2) Changes in foreign currency exchange rates. (see footnote 8)
    - (3) Employer contributions.
    - (4) Contributions by plan participants.
    - (5) Benefits paid.
    - (6) Business combinations.
    - (7) Divestitures.
    - (8) Settlements.
  - c. Information on the funded status of the plan(s), and amounts recognized in the statement of financial position, separately presenting the assets and current and noncurrent liabilities recognized (not required for nonpublic entities).
  - d. The following information regarding assets of the plan:
    - (1) A narrative description of investment policies and strategies, including target allocation percentages or ranges of percentages considering the major

<sup>11</sup> Note that the term "changes in foreign currency exchange rates" as used herein is applicable to plans of a foreign operation whose functional currency is not the reporting currency, as those terms are defined in FASB ASC 830-10-45.

categories of plan assets disclosed pursuant to (2) below, as of the latest statement of financial position presented (on a weighted-average basis for employers with more than one plan), and other factors pertinent to an understanding of those policies and strategies such as investment goals, risk management practices, permitted and prohibited investments including the use of derivatives, diversification, and the relationship between plan assets and benefit obligations. For investment funds disclosed as major categories as described in (2) below, a description of the significant investment strategies of those funds shall be provided.

- (2) The fair value of each major category of plan assets, based on the nature and risks of assets in employer's plan, as of each date for which a statement of financial position is presented.
- (3) A narrative description of the basis used to determine the overall expected long-term rate-of-return-on-assets assumption. The description should consider the major categories of assets described in (2) above, as appropriate.
- (4) By an employer, information that enables users of financial statements to assess the inputs and valuation techniques used to develop fair value measurements of plan assets at the reporting date and for fair value measurements using significant unobservable inputs, the effect of the measurements on changes in plan assets for the period, including the following information for each major category of plan assets disclosed pursuant to (3) above:
  - (a) The level of the fair value hierarchy in which the fair value measurements in their entirety fall, segregating fair value measurements using quoted prices in active markets for identical assets and liabilities (Level 1), significant other observable inputs (Level 2), and significant unobservable inputs (Level 3).
  - (b) For fair value measurements of plan assets using significant unobservable inputs (Level 3), a reconciliation of the beginning and ending balances, separately presenting changes during the period attributable to the following: actual return on plan assets, separately identifying the amount related to assets still held at the reporting date and the amount related to assets sold during the period; purchases, sales, and settlements net; and transfers in and/or out of Level 3.
  - (c) Information about the valuation technique(s) and inputs used to measure fair value and a discussion of changes in valuation techniques and inputs, if any, during the period.
- e. Defined benefit pension plans: The accumulated benefit obligation.
- f. The benefits, as of the date of the latest statement of financial position presented, that are expected to be paid in each of the next five fiscal years, and in the aggregate for the five fiscal years thereafter.
- g. The best estimate of the employer, as soon as reasonably determinable, of contributions expected to be paid to the plan during the next fiscal year that begins after the date of the latest statement of financial position presented. Estimated contributions are permitted to be presented in the aggregate combining:
  - (1) Contributions required by funding laws and regulations
  - (2) Discretionary contributions
  - (3) Noncash contributions.
- h. The amount of net benefit cost recognized, separately showing (not required for nonpublic entities):
  - (1) Service cost component
  - (2) Interest cost component

- |  |       |
|--|-------|
| (3) Expected return on plan assets for the period  | _____ |
| (4) The gain or loss   | _____ |
| (5) The prior service cost or credit component   | _____ |
| (6) The transition asset or obligation component   | _____ |
| (7) The gain or loss recognized due to settlements or curtailments.  | _____ |
| i. Separate disclosure of the net gain or loss and net prior service cost or credit recognized in other comprehensive income (OCI) for the period and reclassification adjustments of OCI for the period, as those amounts, including amortization of the net transition asset or obligation, are recognized as components of net periodic benefit cost. | _____ |
| j. The amounts in accumulated other comprehensive income (AOCI) not yet recognized as components of net periodic benefit cost, separately presenting the net gain or loss, net prior service cost or credit, and net transition asset or obligation.   | _____ |
| k. The following assumptions used in the accounting for the plans, on a weighted-average basis, specifying in a tabular format:  |       |
| (1) Assumed discount rates.  | _____ |
| (2) For pay-related plans, rates of compensation increase.   | _____ |
| (3) Expected long-term rates of return on plan assets.   | _____ |
| l. Assumed health-care cost trend rate(s) for the next year used to measure the expected cost of benefits covered by the plan (gross eligible charges), and a general description of the direction and pattern of change in the assumed trend rates thereafter, along with the ultimate trend rate(s) and when that rate is expected to be achieved.     | _____ |
| m. The effect of both a 1% increase and a 1% decrease in the assumed health-care cost trend rates on each of the following (not required for nonpublic entities):  |       |
| (1) Service and interest cost components (aggregated) of the net periodic post-retirement health-care benefit costs.   | _____ |
| (2) Health-care accumulated postretirement benefit obligation for health-care benefits (APBO) (based on the substantive plan and while holding all other assumptions constant).  | _____ |
| n. If applicable:  |       |
| (1) Amounts and types of employer and related-party securities included in plan assets.  | _____ |
| (2) Approximate amount of future annual benefits covered by insurance contracts by the employer and related parties.   | _____ |
| (3) Any significant transactions between the employer and related parties with the plan during the period.   | _____ |
| o. Any alternative method used to amortize prior service amounts or net gains and losses, if applicable (not required for nonpublic entities).   | _____ |
| p. Any substantive commitments, such as past practice or a history of regular benefit increases, used as the basis for accounting for the benefit obligation, if applicable (not required for nonpublic entities).   | _____ |
| q. Cost of providing special or contractual termination benefits recognized during the period (not required for nonpublic entities) including a description of the:  |       |
| (1) Nature of the event.   | _____ |
| (2) Cost.  | _____ |
| r. An explanation (not required for nonpublic entities) of matters of significance in regard to changes in:  |       |
| (1) Benefit obligation   | _____ |
| (2) Plan assets.   | _____ |

- s. The amounts in AOCI expected to be recognized as components of net periodic benefit cost during the fiscal year following the most recent annual statement of financial position presented, separately presenting:
  - (1) Net gain or loss \_\_\_\_\_
  - (2) Net prior service cost or credit \_\_\_\_\_
  - (3) Net transition asset or obligation. \_\_\_\_\_
- t. The amount and timing of any plan assets expected to be returned to the business entity during the 12-month period, or operating cycle if longer, that follows the most recent annual statement of financial position presented. \_\_\_\_\_
- u. Accounting policy election to measure plan assets and benefit obligations using the month end closest to the employer's fiscal year-end. \_\_\_\_\_

(FASB ASC 715-20-50-1)

#### ***Entities (Public and Nonpublic) with Two or More Plans***

- 3. Separately aggregate all of the employer's defined benefit pension plans and all of the employer's defined benefit postretirement plans:

- a. Disaggregate into groups if otherwise required or if it would provide useful information. \_\_\_\_\_

(FASB ASC 715-20-50-2)

- b. May aggregate disclosures regarding pension plans with assets in excess of the ABO with disclosures regarding pension plans with ABO in excess of assets. The same aggregation is permitted for other postretirement benefit plans. If disclosures are aggregated:

- (1) For plans where the ABO is in excess of plan assets as of the measurement date of each statement of financial position presented:
  - (a) Aggregate benefit obligation. \_\_\_\_\_
  - (b) Aggregate fair value of plan assets. \_\_\_\_\_

- (2) For pension plans where the ABO is in excess of plan assets:
  - (a) Aggregate pension accumulated benefit obligation. \_\_\_\_\_
  - (b) Aggregate fair value of plan assets. \_\_\_\_\_

(FASB ASC 715-20-50-3)

- c. U.S. pension and OPEB plans and plans outside the U.S. may be combined unless benefit obligations outside the U.S. are significant relative to the total benefit obligation and those plans use significantly different assumptions. A foreign reporting entity that prepares financial statements in conformity with U.S. GAAP applies this guidance to its domestic and foreign plans. \_\_\_\_\_

(FASB ASC 715-20-50-4)

#### ***Disclosures by Nonpublic Entities***

- 4. A nonpublic entity sponsoring one or more defined benefit pension plans or one or more other defined benefit postretirement plans is to provide the following information, separately for pension plans and other postretirement benefit plans. Amounts related to the employer's results of operations are to be disclosed for each period for which an income statement is presented. Amounts related to the employer's financial position are to be disclosed at the date of each statement of financial position presented.
  - a. Benefit obligation, fair value of plan assets, funded status of plan. \_\_\_\_\_
  - b. Employer contributions, participant contributions, benefits paid. \_\_\_\_\_
  - c. Information about plan assets: \_\_\_\_\_

- (1) A narrative description of the plan's investment policies and strategies, including target allocation percentages or range of percentages considering the major categories of plan assets disclosed pursuant to (2) below, as of the latest statement of financial position presented (on a weighted-average basis for employers with more than one plan), and other factors pertinent to understanding those policies or strategies, such as investment goals, risk management practices, permitted and prohibited investments including the use of derivatives, diversification, and the relationship between plan assets and benefit obligations. For investment funds disclosed as major categories as described in (2) below, a description of the significant investment strategies of those funds shall be provided.
- (2) The fair value of each major category of plan assets as of each date for which a statement of financial position is presented. Asset categories shall be based on the nature and risks of assets in an employer's plan(s).
- (3) A narrative description of the basis used to determine the overall expected long-term rate-of-return-on-assets assumption considering the major categories of assets described in (2) above, as appropriate.
- (4) Information that enables users of financial statements to assess the inputs and valuation techniques used to develop fair value measurements of plan assets at the reporting date and for fair value measurements using significant unobservable inputs, the effect of the measurements on changes in plan assets for the period. To meet those objectives, the following information for each major category of plan assets disclosed pursuant to (3) above:
- (a) The level within the fair value hierarchy in which the fair value measurements in their entirety fall, segregating fair value measurements using quoted prices in active markets for identical assets and liabilities (Level 1), significant other observable inputs (Level 2), and significant unobservable inputs (Level 3).
- (b) For fair value measurements of plan assets using significant unobservable inputs (Level 3), a reconciliation of the beginning and ending balances, separately presenting changes during the period attributable to the following: actual return on plan assets, separately identifying the amount related to assets still held at the reporting date and the amount related to assets sold during the period; purchases, sales, and settlements net; and transfers in and/or out of Level 3.
- (c) Information about the valuation technique(s) and inputs used to measure fair value and a discussion of changes in valuation techniques and inputs, if any, during the period.
- d. For defined benefit plans, the accumulated benefit obligation (ABO).
- e. As of the date of the latest statement of financial position presented, the benefits expected to be paid in each of the next five fiscal years, and in the aggregate for the five fiscal years thereafter.
- f. The employer's best estimate, as soon as it can be determined reasonably, of contributions expected to be paid to the plan during the next fiscal year beginning after the date of the latest statement of financial position presented. Estimated contributions may be presented in the aggregate, combining:
- (1) Contributions required by funding laws or regulations.
- (2) Discretionary contributions.
- (3) Noncash contributions.

- g. The amounts recognized in the statements of financial position, showing separately the postretirement benefit assets and current and noncurrent postretirement benefit liabilities.
- h. Separate disclosure of the net gain or loss and the net prior service cost or credit recognized in OCI for the period, and reclassification adjustments of OCI for the period as those amounts, including amortization of the net transition asset or obligation, are recognized as components of net periodic benefit cost.
- i. The amounts in AOCI that have not yet been recognized as components of net periodic benefit cost, separately presenting the net gain/loss, net prior service cost/credit, and net transition asset/obligation.
- j. On a weighted-average basis, all of the following assumptions used in the accounting for the plans, specifying in a tabular format, the assumptions used to determine the benefit obligation and the assumptions used to determine net benefit cost:
  - (1) Assumed discount rates for a discussion of representationally faithful disclosure.
  - (2) Rates of compensation increase (for pay-related plans).
  - (3) Expected long-term rates of return on plan assets.
- k. The assumed health-care cost trend rate(s) for the next year used to measure the expected cost of benefits covered by the plan (gross eligible charges), and a general description of the direction and pattern of change in the assumed trend rates thereafter, together with the ultimate trend rate(s) and when the rate is expected to be achieved.
- l. The amounts and types of securities of the employer and related parties included in plan assets, the approximate amount of future annual benefits of plan participants covered by insurance contracts, including annuity contracts, issued by the employer or related parties, and any significant transactions between the employer or related parties and the plan during the period.
- m. The nature and effect of significant nonroutine events.
- n. The amounts in AOCI expected to be recognized as components of net periodic benefit cost over the fiscal year following the date of the most recent annual statement of financial position presented, with separate presentation of the net gain/loss, net prior service cost/credit, and net transition asset/obligation.
- o. The amount and timing of any plan assets expected to be returned to the employer during the 12-month period (or operating cycle, if longer) following the most recent annual statement of financial position presented.
- p. Accounting policy election to measure plan assets and benefit obligations using the month end closest to the employer's fiscal year end.
- q. The amount of net periodic benefit recognized.

(FASB ASC 715-20-50-5)

#### ***Disclosures Related to Expected Rate of Return on Plan Assets***

- 4. If the weighted-average expected rate of return on plan assets changes because of interim measurement, disclose the beginning and most recently assumed rate or a weighted combination of the two.

(FASB ASC 715-20-50-8)

#### **715-60 Defined Benefit Plans—Other Postretirement**

**Scope.** This subsection provides guidance on disclosures regarding the effect of the Medicare subsidy. This subsection also provides guidance on the disclosures about the effects of the subsidy for an employer that sponsors a postretirement health care benefit plan that provides prescription drug coverage but for which the employer has not yet been able to determine actuarial equivalency.

(FASB ASC 715-60-50-2)

1. In interim and annual financial statements for the first period in which an employer includes the effects of the subsidy in measuring the accumulated postretirement benefit obligation and the first period in which an employer includes the effects of the subsidy in measuring net periodic postretirement benefit cost, all of the following:
  - a. The reduction in the accumulated postretirement benefit obligation for the subsidy related to benefits attributed to past service.
  - b. The effect of the subsidy on the measurement of net periodic postretirement benefit cost for the current period including any amortization of the actuarial gain in a. of this paragraph as a component of the net amortization called for by paragraphs 715-60-35-29 through 35-30, the reduction in current period service cost due to the subsidy, and the resulting reduction in interest cost on the accumulated postretirement benefit obligation as a result of the subsidy.
  - c. Any other disclosures required by paragraph 715-20-50-1(r).

(FASB ASC 715-60-50-3)

2. For purposes of the disclosures required by paragraph 715-20-50-1(a) and 715-20-50-1(f), disclose gross benefit payments (paid and expected, respectively), including prescription drug benefits, and separately the gross amount of the subsidy receipts (received and expected, respectively).

(FASB ASC 715-60-50-4)

3. Until an employer is able to determine whether benefits provided by its plan are actuarially equivalent disclose both of the following in financial statements for interim or annual periods:
  - a. The existence of the Medicare Prescription Drug, Improvement, and Modernization Act.
  - b. That measures of the accumulated postretirement benefit obligation or net periodic postretirement benefit cost do not reflect any amount associated with the subsidy because the employer is unable to conclude whether the benefits provided by the plan are actuarially equivalent to Medicare Part D under the Act.

(FASB ASC 715-60-50-6)

### **715-70 Defined Contribution Plans**

1. Separately from disclosures regarding defined benefit plans, the following information for all periods presented:
  - a. Cost recognized for defined contribution pension plans.
  - b. Cost recognized for other defined contribution postretirement benefit plans.
  - c. Description of the nature and effect of any significant changes during the period affecting comparability, such as a change in the employer contribution rate, a business combination, or a divestiture.

(FASB ASC 715-70-50-1)

### **715-80 Multiemployer Plans**

1. Apply the accounting and disclosure provisions of ASC 450, *Contingencies*, in situations where it is either reasonably possible or probable that:
  - a. The employer would withdraw from the plan under circumstances resulting in an obligation to the plan for a portion of the unfunded pension plan benefit obligation,  
*or*

- b. The employer's contributions to the fund would be increased during the remainder of the contract period to make up for a shortfall in the funds needed to maintain the negotiated level of benefit coverage (referred to as a "maintenance of benefits" clause).

(FASB ASC 715-80-50-2)

2. Apply the provisions of Topic 450 to participation in a multiemployer plan if it is either probable or reasonably possible that either of the following would occur:
- An employer would withdraw from the plan under circumstances that would give rise to an obligation.
  - An employer's contribution to the fund would be increased during the remainder of the contract period to make up a shortfall in the funds necessary to maintain the negotiated level of benefit coverage (a maintenance of benefits clause).

(FASB ASC 715-80-50-2)

#### ***Multiemployer Plans That Provide Pension Benefits***

3. Provide the disclosures required by paragraphs 715-80-50-4 through 50-10 in annual financial statements, including all items recognized as net pension costs. The disclosures based on *the most recently available* information are the most recently available through the date at which the employer has evaluated subsequent events.

(FASB ASC 715-80-50-3)

4. For an employer that participates in a multiemployer plan that provides pension benefits, a narrative description both of the general nature of the multiemployer plans that provide pension benefits and of the employer's participation in the plans that would indicate how the risks of participating in these plans are different from single-employer plans.

(FASB ASC 715-80-50-4)

5. When feasible, the information required by this paragraph in a tabular format. Information that requires greater narrative description may be provided outside the table. For each individually significant multiemployer plan that provides pension benefits, the following:

- Legal name of the plan.
- The plan's Employer Identification Number and, if available, its plan number.
- For each statement of financial position presented, the most recently available certified zone status provided by the plan, as currently defined by the Pension Protection Act of 2006 or a subsequent amendment of that Act. The disclosure shall specify the date of the plan's year-end to which the zone status relates and whether the plan has utilized any extended amortization provisions that affect the calculation of the zone status. If the zone status is not available, an employer shall disclose, as of the most recent date available, on the basis of the financial statements provided by the plan, the total plan assets and accumulated benefit obligations, whether the plan was:
  - Less than 65 percent funded
  - Between 65 percent and 80 percent funded
  - At least 80 percent funded.
- The expiration date(s) of the collective-bargaining agreement(s) requiring contributions to the plan, if any. If more than one collective-bargaining agreement applies to the plan, a range of the expiration dates of those agreements, supplemented with a qualitative description that identifies the significant collective-bargaining agree-

ments within that range as well as other information to help investors understand the significance of the collective-bargaining agreements and when they expire.

- e. For each period that a statement of income is presented:
  - (1) The employer's contributions made to the plan.
  - (2) Whether the employer's contributions represent more than 5 percent of total contributions to the plan as indicated in the plan's most recently available annual report (Form 5500 for U.S. plans). The disclosure shall specify the year-end date of the plan to which the annual report relates.
- f. As of the end of the most recent annual period presented:
  - (1) Whether a funding improvement plan or rehabilitation plan (for example, as those terms are defined by the Employment Retirement Security Act of 1974) had been implemented or was pending.
  - (2) Whether the employer paid a surcharge to the plan.
  - (3) A description of any minimum contribution(s), required for future periods by the collective-bargaining agreement(s), statutory obligations, or other contractual obligations, if applicable.

Factors other than the amount of the employer's contribution to a plan may need to be considered when determining whether a plan is significant.

(FASB ASC 715-80-50-5)

- 6. A description of the nature and effect of any significant changes that affect comparability of total employer contributions from period to period, such as:
  - a. A business combination or a divestiture.
  - b. A change in the contractual employer contribution rate.
  - c. A change in the number of employees covered by the plan during each year.

(FASB ASC 715-80-50-6)

- 7. In circumstances in which plan level information is not available in the public domain, in addition to the requirements of paragraphs 715-80-50-5 through 50-6, the following information about each significant plan:
  - a. A description of the nature of the plan benefits.
  - b. A qualitative description of the extent to which the employer could be responsible for the obligations of the plan, including benefits earned by employees during employment with another employer.
  - c. Other quantitative information, to the extent available, as of the most recent date available, to help users understand the financial information about the plan, such as total plan assets, actuarial present value of accumulated plan benefits, and total contributions received by the plan.
  - d. If the quantitative information in paragraph 715-80-50-5(c), 715-80-50-5(e)(2), or 715-80-50-7(c) cannot be obtained without undue cost and effort, that quantitative information may be omitted and the employer shall describe what information has been omitted and why. In that circumstance, the employer also shall provide any qualitative information as of the most recent date available that would help users understand the financial information that otherwise is required to be disclosed about the plan.

(FASB ASC 715-80-50-7)

- 8. Disclosures about multiemployer plans that are subject to the guidance in the preceding paragraph shall be included in a separate section of the tabular disclosure required by paragraph 715-80-50-5.

(FASB ASC 715-80-50-8)

9. In addition to the information about the significant multiemployer plans that provide pension benefits required by paragraphs 715-80-50-5 and 715-80-50-7, disclose in a tabular format for each annual period for which a statement of income or statement of activities is presented, both of the following:
  - a. Its total contributions made to all plans that are not individually significant.
  - b. Its total contributions made to all plans.

(FASB ASC 715-80-50-9)

#### ***Multiemployer Plans That Provide Postretirement Benefits Other Than Pensions***

10. The amount of contributions to multiemployer plans that provide postretirement benefits other than pensions for each annual period for which a statement of income or statement of activities is presented. The disclosures shall include a description of the nature and effect of any changes that affect comparability of total employer contributions from period to period, such as:

- a. A business combination or a divestiture.
- b. A change in the contractual employer contribution rate.
- c. A change in the number of employees covered by the plan during each year.

Also include a description of the nature of the benefits and the types of employees covered by these benefits, such as medical benefits provided to active employees and retirees.

(FASB ASC 715-80-50-11)

#### **718 Compensation—Stock Compensation**

1. For an entity with one or more share-based payment arrangements, information that enables users of the financial statements to understand all of the following:
  - a. The nature and terms of such arrangements that existed during the period and the potential effects of those arrangements on shareholders.
  - b. The effect of compensation cost arising from share-based payment arrangements on the income statement.
  - c. The method of estimating the fair value of the goods or services received, or the fair value of the equity instruments granted (or offered to grant), during the period.
  - d. The cash flow effects resulting from share-based payment arrangements.

This disclosure is not required for interim reporting.

(FASB ASC 718-10-50-1)

---

**NOTE:** If the reporting entity grants equity or liability instruments under multiple share-based payment arrangements with employees, the information specified in a. through e. is to be provided separately for each different type of award to the extent that differences in the awards' characteristics make separate disclosure important to understanding the way the reporting entity uses share-based compensation.

---

1. Plan description, including general terms of awards such as requisite service period(s) and other substantive conditions including vesting requirements, maximum contractual term of equity (or liability) share options or similar instruments, the number of shares authorized for awards of equity share options or other equity instruments, and the method used to measure compensation cost under share-based payment arrangements with employees.

(FASB ASC 718-10-50-2a through 2b)

2. For the most recent year for which an income statement is provided:
- The number and weighted-average exercise prices (or conversion ratios) for each of the groups of share options or share units:
    - Outstanding at the beginning of the year.
    - Granted during the year.
    - Exercised or converted during the year.
    - Forfeited during the year.
    - Expired during the year.
    - Exercisable or convertible at the end of the year.
    - Outstanding at the end of the year.

(FASB ASC 718-10-50-2c1)

- The number and weighted-average grant-date fair value (or calculated value or intrinsic value when permitted to be used) of equity instruments not specified in (1) above (such as shares of nonvested stock) for each of the following groups of equity instruments:
  - Nonvested at the beginning of the year.
  - Granted during the year.
  - Vested during the year.
  - Forfeited during the year.
  - Nonvested at the end of the year.

(FASB ASC 718-10-50-2c2)

- For each year for which an income statement is provided:
  - Weighted-average grant-date fair value (calculated value or intrinsic value for those reporting entities permitted to use those methods) of equity options or other equity instruments granted during the year.
  - The total intrinsic value of options exercised (or share units converted), share-based liabilities paid, and the total fair value of shares vested during the year.

(FASB ASC 718-10-50-2d)

- For fully vested share options (or share units) and share options expected to vest at the date of the latest statement of financial position:
  - The number, weighted-average exercise price (or conversion ratio), the aggregate intrinsic value (except for nonpublic entities), and the weighted-average remaining contractual term of options (or share units) outstanding.
  - The number, weighted-average exercise price (or conversion ratio), the aggregate intrinsic value (except for nonpublic entities), and the weighted-average remaining contractual term of options (or share units) currently exercisable (or convertible).

(FASB ASC 718-10-50-2e)

- For awards *not* accounted for using the intrinsic value method, for each year for which an income statement is presented:
  - A description of the method used during the year to estimate the fair value (or calculated value) of awards under share-based payment arrangements.
  - A description of the significant assumptions used during the year to estimate the fair value (or calculated value) of share-based compensation awards including, where applicable:

- (a) Expected term of share options and similar instruments, including a discussion of the method used to incorporate the contractual term of the instrument and the employees' expected exercise and postvesting employment termination behavior into the fair value (or calculated value) of the instrument.
- (b) Expected volatility of the entity's shares and the method used to estimate it.
- (c) If the entity uses a valuation method that employs different volatilities during the contractual term:
  - [1] The range of expected volatilities used.
  - [2] The weighted-average expected volatility.
- (d) If the entity is a nonpublic entity that uses the calculated value method:
  - [1] The reasons why it is not practicable for it to estimate the expected volatility of its share price.
  - [2] The appropriate industry sector index it has selected and the reasons for selecting that particular index.
  - [3] How it has calculated historical volatility using that index.
- (e) Expected dividends and, if the entity uses a method employing different dividend rates during the contractual term, the range of expected dividends used and the weighted-average expected dividends.
- (f) Risk-free rate(s) and, if the entity uses a method employing different risk-free rates, the range of risk-free rates used.
- (g) The discount for postvesting restrictions and the method used to estimate it.

*(FASB ASC 718-10-50-2f)*

- f. If an entity that grants equity or liability instruments under multiple share-based payment arrangements with employees, the information specified in paragraphs ASC 718-10-50 (a) through (f) separately for different types of awards to the extent that the differences in the characteristics of the awards make separate disclosure important to an understanding of the entity's use of share-based compensation. An entity that has multiple share-based payment arrangements with employees must disclose information separately for different types of awards under those arrangements to the extent that differences in the characteristics of the awards make separate disclosure important to an understanding of the entity's use of share-based compensation.

*(FASB ASC 718-10-50-2g)*

- g. For each year for which an income statement is presented:
  - (1) Total compensation cost for share-based payment arrangements recognized in income, the associated income tax benefit recognized, and the total compensation cost capitalized as part of the cost of an asset.
  - (2) A description of significant modifications, including the terms of the modifications, number of affected employees, and the total incremental compensation cost resulting from the modifications.

*(FASB ASC 718-10-50-2h)*

- h. As of the latest statement of financial position date presented, the total compensation cost related to nonvested awards not yet recognized and the weighted-average period over which it is expected to be recognized.

*(FASB ASC 718-10-50-2i)*

- i. The amount of cash used to settle equity instruments granted under share-based payment arrangements.

*(FASB ASC 718-10-50-2i)*

- j. A description of the reporting entity's policy (if any) for issuing shares upon share option exercise (or share unit conversion), including the source of the shares (i.e., newly issued shares or treasury shares). If, as a result of this policy, the entity expects to repurchase shares in the following annual period, an estimate of the amount (or range, if more appropriate) of shares to be repurchased during that period.
- 

(FASB ASC 718-10-50-2j)

- k. The amount of cash received from exercise of share options and similar instruments granted under share-based payment arrangements and the tax benefit from stock options exercised during the annual period.
- 

(FASB ASC 718-10-50-2k)

#### **718-40 Employee Stock Ownership Plans (ESOP)**

1. Description of the plan, including basis for determining contributions, groups covered, nature and effect of matters affecting comparability of information across periods.
  2. For leveraged ESOPs, the basis for releasing shares by leveraged and pension reversion ESOP.
  3. Accounting policies pertinent to ESOP transactions.
  4. Compensation cost recognized during the period.
  5. Numbers of shares allocated, committed to be released, and held in suspense by the ESOP.
  6. Fair value amount of unearned compensation at year-end.
  7. Existence and nature of any repurchase obligations and aggregate fair value thereof.
  8. Amount and treatment in the EPS computation of the tax benefit related to dividends paid to any employee stock ownership plan.
- 

(FASB ASC 718-40-50-1)

#### **720-20 Other Expenses—Insurance Costs**

1. For an entity that has changed from occurrence-based insurance to claims-made insurance or elects to significantly reduce or eliminate its insurance coverage, if it is at least reasonably possible that a loss has been incurred and consider possible disclosures with respect to unasserted claims.
- 

(FASB ASC 720-20-50-1)

#### **720-35 Other Expenses—Advertising Costs**

1. The accounting policy for reporting advertising, indicating whether such costs are expensed as incurred or the first time the advertising takes place.
- 

(FASB ASC 720-35-50-1a)

2. The total amount charged to advertising expense for each income statement presented.
- 

(FASB ASC 720-35-50-1b)

#### **730-10 Research and Development—Overall**

1. In each income statement presented, total research and development costs charged to expense, including research and development costs incurred for a computer software product to be sold, leased, or otherwise marketed.
- 

(FASB ASC 730-10-50-1)

#### **730-20 Research and Development Arrangements**

1. Research and development (as defined by 730-20) arrangements:

- a. Terms including royalties, purchase provisions, license agreements, and funding commitments.
- b. Amounts earned and costs incurred each period for which an income statement is presented.

(FASB ASC 730-20-50-1)

- 2. If a party to more than one research and development arrangement, aggregation of similar arrangements by type may be appropriate. Separately disclose each arrangement if necessary to understand the effects on the financial statements.

(FASB ASC 730-20-50-3)

#### **740-10 Income Taxes—Overall**

- 1. The components of the net deferred tax liability or asset recognized in an entity's statement of financial position:
  - a. The total of all deferred tax liabilities.
  - b. The total of all deferred tax assets.
  - c. The total valuation allowance recognized for deferred tax assets.
  - d. The net change during the year in the total valuation allowance.

(FASB ASC 740-10-50-2)

- 2. Both of the following:
  - a. The amounts and expiration dates of operating loss and tax credit carryforwards for tax purposes.
  - b. Any portion of the valuation allowance for deferred tax assets for which subsequently recognized tax benefits will be credited directly to contributed capital.

(FASB ASC 740-10-50-3)

- 3. If a change in an entity's tax status becomes effective after year-end in Year 2 but before the financial statements for Year 1 are issued or are available to be issued, disclose in the entity's financial statements for Year 1 the change in the entity's tax status for Year 2 and the effects of that change, if material.

(FASB ASC 740-10-50-4)

- 4. For a public entity, the approximate tax effect of each type of temporary difference and carryforward that gives rise to a significant portion of deferred tax liabilities and deferred tax assets (before allocation of valuation allowances).

(FASB ASC 740-10-50-6)

- 5. For a nonpublic entity, the types of significant temporary differences and carryforwards but may omit disclosure of the tax effects of each type.

(FASB ASC 740-10-50-8)

- 6. Amounts allocated to:
  - a. Current tax expense or benefit.
  - b. Deferred tax expense or benefit (exclusive of the effects of the other components listed below).
  - c. Investment tax or other credits.
  - d. Government grants (to the extent recognized as a reduction of income tax expense).
  - e. The benefits of operating loss carryforwards.
  - f. Tax expense that results from allocating certain tax benefits directly to contributed capital.
  - g. Adjustments of a deferred tax liability or asset for enacted changes in tax laws or rates or a change in the tax status of the enterprise.

- h. Adjustments of the beginning-of-the-year balance of a valuation allowance because of a change in circumstances that causes a change in judgment about the realizability of the related deferred tax asset in future years.

(FASB ASC 740-10-50-9)

7. Amounts allocated to:
- a. Continuing operations.
  - b. Discontinued operations.
  - c. Cumulative effect of accounting changes.
  - d. Prior period adjustments.
  - e. Other comprehensive income.
  - f. Items charged or credited directly to shareholders' equity.

(FASB ASC 740-10-50-10)

8. Reconcile statutory tax rates to actual rates for significant items (nonpublic enterprises need only disclose the nature of significant reconciling items).

(FASB ASC 740-10-50-12 and 13)

9. The nature and effect of any other significant matters affecting comparability of information for all periods presented.

(FASB ASC 740-10-50-14)

10. All of the following at the end of each annual reporting period presented:
- a. The total amounts of interest and penalties recognized in the statement of operations and in the statement of financial position.
  - b. For positions for which it is reasonably possible that the total amounts of unrecognized tax benefits will significantly increase or decrease within 12 months of the reporting date:
    - (1) The nature of the uncertainty
    - (2) The nature of the event that could occur in the next 12 months that would cause the change
    - (3) An estimate of the range of the reasonably possible change or a statement that an estimate of the range cannot be made.
  - c. A description of tax years that remain subject to examination by major tax jurisdictions.

(FASB ASC 740-10-50-15)

11. For public entities, both of the following at the end of each annual reporting period presented:
- a. A tabular reconciliation of the total amounts of unrecognized tax benefits at the beginning and end of the period, including at a minimum:
    - (1) The gross amounts of the increases and decreases in unrecognized tax benefits as a result of tax positions taken during a prior period
    - (2) The gross amounts of increases and decreases in unrecognized tax benefits as a result of tax positions taken during the current period
    - (3) The amounts of decreases in the unrecognized tax benefits relating to settlements with taxing authorities
    - (4) Reductions to unrecognized tax benefits as a result of a lapse of the applicable statute of limitations.
  - b. The total amount of unrecognized tax benefits that, if recognized, would affect the effective tax rate.

(FASB ASC 740-10-50-15A)

12. For public entities, state if entity is not subject to income taxes because income is taxed directly to owners. State the net difference between tax and book bases of assets and liabilities.
- 

(FASB ASC 740-10-50-16)

13. If consolidated return filed, separately issued financial statements should state:
- Amount of current and deferred tax expense for each income statement and the tax-related balances due to or from affiliates for each statement of financial position.
  - The method of allocating consolidated amounts of current and deferred tax expense and effects of any change in that methodology.
- 

(FASB ASC 740-10-50-17)

14. Policy on classification of interest and penalties in accordance with the alternatives permitted in paragraph 740-10-45-25 in the notes to the financial statements.
- 

(FASB ASC 740-10-50-19)

15. Method of accounting for the investment credit (deferral or flow-through method) and amounts involved, when material.
- 

(FASB ASC 740-10-50-20)

#### **740-30 Income Taxes—Other Considerations or Special Areas**

- When a deferred tax liability is not recognized because of the exceptions to comprehensive recognition of deferred taxes:
    - A description of the types of temporary differences for which a deferred tax liability has not been recognized and the types of events that would cause those temporary differences to become taxable.
    - The cumulative amount of each type of temporary difference.
    - The amount of the unrecognized deferred tax liability for temporary differences related to investments in foreign subsidiaries and foreign corporate joint ventures that are essentially permanent in duration if determination of that liability is practicable or a statement that determination is not practicable.
    - The amount of the deferred tax liability for temporary differences other than those in c. above (i.e., undistributed domestic earnings, the bad-debt reserve for tax purposes of a U.S. savings and loan association or other qualified thrift lender, the policyholders' surplus of a life insurance enterprise, and the statutory reserve funds of a U.S. steamship enterprise) that is not recognized.
- 

(FASB ASC 740-30-50-2)

#### **740-270 Income Taxes—Interim Reporting**

- In the interim period financial statements, the reasons for significant variations in the customary relationship between income tax expense and pretax accounting income, if they are not otherwise apparent from the financial statements or from the nature of the entity's business.
- 

(FASB ASC 740-270-50-1)

### **BROAD TRANSACTIONS**

#### **805-10 Business Combinations—Overall**

- Information that enables the users to evaluate business combinations *occurring during the reporting period* or after the reporting date but before the financial statements are available to be issued.
- 

(FASB ASC 805-10-50-1)

2. For each business combination that occurs during the reporting period:
- a. The name and a description of the acquiree. \_\_\_\_\_
  - b. The acquisition date. \_\_\_\_\_
  - c. The percentage of voting equity interest acquired. \_\_\_\_\_
  - d. The primary reasons for the business combination. \_\_\_\_\_
  - e. A description of how the acquirer obtained control over the acquiree. \_\_\_\_\_
  - f. For transactions that are recognized separately from the acquisition of assets and assumptions of liabilities in the business combination:
    - (1) A description of each transaction, \_\_\_\_\_
    - (2) How the acquirer accounted for each transaction, \_\_\_\_\_
    - (3) The amounts recognized for each transaction and the line item in the financial statements in which each amount is recognized, and \_\_\_\_\_
    - (4) If the transaction is the effective settlement of a preexisting relationship, the method used to determine the settlement amount. \_\_\_\_\_
  - g. For disclosures required in f:
    - (1) Amount of acquisition-related costs, \_\_\_\_\_
    - (2) Amount recognized as an expense, \_\_\_\_\_
    - (3) Line item or items in the income statement in which those expenses are recognized, and \_\_\_\_\_
    - (4) Amount of any issuance costs not recognized as an expense and how they were recognized. \_\_\_\_\_
  - h. In a business combination achieved in stages, all of the following:
    - (1) The acquisition-date fair value of the equity interest in the acquiree held by the acquirer immediately before the acquisition date. \_\_\_\_\_
    - (2) The amount of any gain or loss recognized as a result of remeasuring to fair value the equity interest in the acquiree held by the acquirer immediately before the business combination (see paragraph 805-10-25-10) and the line item in the income statement in which that gain or loss is recognized. \_\_\_\_\_
    - (3) The valuation techniques used to measure the acquisition-date fair value of the equity interest in the acquiree held by the acquirer immediately before the business combination. \_\_\_\_\_
    - (4) Information that enables users of the acquirer's financial statements to assess the inputs used to develop the fair value measurement of the equity interest in the acquiree held by the acquirer immediately before the business combination. \_\_\_\_\_
  - i. If the acquirer is a public entity, all of the following:
    - (1) The amounts of revenue and earnings of the acquiree since the acquisition date included in the consolidated income statement for the reporting period. \_\_\_\_\_
    - (2) If comparative financial statements are not presented, the revenue and earnings of the combined entity for the current reporting period as though the acquisition date for all business combinations that occurred during the year had been as of the beginning of the annual reporting period (supplemental pro forma information). \_\_\_\_\_
    - (3) If comparative financial statements are presented, the revenue and earnings of the combined entity as though the business combination(s) that occurred during the current year had occurred as of the beginning of the comparable prior annual reporting period (supplemental pro forma information). \_\_\_\_\_

- (4) The nature and amount of any material, nonrecurring pro forma adjustments directly attributable to the business combination included in the reported pro forma revenue and earnings.
- j. If disclosure of any of the information required by (h) is impracticable, the acquirer discloses that fact and explains why the disclosure is impracticable.

(FASB ASC 805-10-50-2)

3. For individually immaterial business combinations occurring during the reporting period that are material collectively, the information required by (f) through (i) in the preceding paragraph in the aggregate.

(FASB ASC 805-10-50-3)

4. If the acquisition date is after the reporting date but before the financial statements are issued or available to be issued, the information required by FASB ASC 805-20-50-2. If the accounting is incomplete at that time, describe which disclosures could not be made and why.

(FASB ASC 805-10-50-4)

5. Disclose financial effects of adjustments during the current period that relate to business combinations that occurred in the current or previous reporting periods.

(FASB ASC 805-10-50-5)

6. Any other information needed for the users to evaluate business combination per ASC 805-10-50-1.

(FASB ASC 805-10-50-7)

#### **805-20 Identifiable Assets and Liabilities and Any Noncontrolling Interest**

1. Make the following disclosures for identifiable assets and liabilities and any non-controlling interest:
  - a. For indemnification assets:
    - (1) The amount recognized as of the acquisition date.
    - (2) A description of the arrangement and the basis for determining the amount of the payment.
    - (3) An estimate of the range of outcomes (undiscounted) or, if a range cannot be estimated, that fact and the reasons why. Disclose if the maximum amount of the payment is unlimited.
  - b. For acquired receivables such as loans, direct finance leases<sup>12</sup> under ASC 840, and any other class of receivables:
    - (1) The fair value of the receivables.
    - (2) The gross contractual amount of the receivables.
    - (3) The best estimate at the acquisition date of the contractual cash flows not expected to be collected.
  - c. The amounts recognized as of the acquisition date for each major class of assets acquired and liabilities assumed.

---

<sup>12</sup> Upon implementation of ASU 2016-02, *Leases*, “capital leases” will be deleted and “sales-type leases or direct financing leases” will be inserted.

- d. For contingencies, the following:
- (1) For assets and liabilities arising from contingencies recognized at the acquisition date:
    - (a) The amounts recognized at the acquisition date and the measurement basis applied (that is, at fair value or at an amount recognized in accordance with Topic 450 and Section 450-20-25).
    - (b) The nature of the contingencies.
  - (2) For contingencies that are not recognized at the acquisition date, the disclosures required by Topic 450 if the criteria for disclosures in that Topic are met.

---

*NOTE: An acquirer may aggregate disclosures for assets and liabilities arising from contingencies that are similar in nature.*

---

- e. For each business combination in which the acquirer holds less than 100 percent of the equity interest in the acquiree, the fair value of the noncontrolling interest in the acquiree and the valuation technique and significant inputs used to measure the fair value.

(FASB ASC 805-20-50-1)

2. If individually immaterial business combinations occurring during the reporting period are material collectively, the information above in the aggregate.

(FASB ASC 805-20-50-2)

3. If the acquisition date of a business combination is after the reporting date but before the financial statements are issued or are available to be issued, the information required in 1. above. If the initial accounting for the business combination is incomplete at the time the financial statements are issued or are available to be issued, describe which disclosures could not be made and the reason why.

(FASB ASC 805-20-50-3)

4. If the initial accounting is incomplete and, therefore, the amounts recognized related to the business combination are only provisional:
  - a. Reasons why the accounting is incomplete.
  - b. Items for which the accounting is incomplete.
  - c. Nature and amount of any adjustments recognized during the reporting period, including separately or on the face of the income statement the amount of adjustment to current period line items relating to the income effects that would have been recognized in previous periods if the adjustment to provisional amounts were recognized as of the acquisition date.

(FASB ASC 805-20-50-4A)

#### **805-30 Goodwill or Gain from Bargain Purchase**

1. For each business combination that occurs during the reporting period:
  - a. A qualitative description of the factors that make up goodwill recognized.
  - b. The acquisition-date fair value of the total consideration transferred and the acquisition-date fair value of each major class of consideration, such as cash, other tangible or intangible assets, liabilities incurred, equity interests of the acquirer.
  - c. For contingent consideration arrangements:
    - (1) The amount recognized as of the acquisition date,

- (2) A description of the arrangement and the basis for determining the payment,
  - (3) An estimate of the range of outcomes or the reason why a range cannot be estimated, and
  - (4) If the maximum amount of the payment is unlimited.
- d. The total amount of goodwill that is expected to be deductible for tax purposes.
- e. If the acquirer is required to disclose segment information, the goodwill by segment.
- f. If the assignment of goodwill to reporting units has not been completed on the financial statements' issuance date, the acquirer is to disclose that fact.
- g. Bargain purchases:
- (1) The amount of gain recognized.
  - (2) The line item in the income statement in which the gain is recognized.
  - (3) A description of the reasons why the transaction resulted in a gain.

*(FASB ASC 805-30-50-1)*

2. If business combinations occurring during the reporting period are individually immaterial, but material collectively, information required by the preceding paragraph in the aggregate.

*(FASB ASC 805-30-50-2)*

3. If the acquisition date of a business combination is after the reporting date but before the financial statements are issued or are available to be issued, the information required by the paragraph above.
4. If the accounting for the business combination is incomplete at the time the financial statements are issued or are available to be issued, describe which disclosures could not be made and the reason why they could not be made.

*(FASB ASC 805-30-50-3)*

5. For each material business combination or in the aggregate for individually immaterial business combinations that are material collectively:
  - a. For each reporting period after the acquisition date until the entity collects, sells, or otherwise loses the right to a contingent consideration asset, or until the entity settles a contingent consideration liability or the liability is cancelled or expires, all of the following:
    - (1) Any changes in the recognized amounts, including any differences arising upon settlement.
    - (2) Any changes in the range of outcomes (undiscounted) and the reasons for those changes.
    - (3) The fair value disclosures required by Section 820-10-50.
  - b. A reconciliation of the carrying amount of goodwill at the beginning and end of the reporting period as required by paragraph 350-20-50-1.

*(FASB ASC 805-30-50-4)*

## **805-50 Business Combinations—Related Issues**

### *Transactions Between Entities Under Common Control*

1. The nature of and effects on EPS of nonrecurring intra-entity transactions involving long-term assets and liabilities.

*(FASB ASC 805-50-50-2)*

2. In the notes to financial statements of the receiving entity, the following for the period in which the transfer of assets and liabilities or exchange of equity interests occurred:
  - a. The name and brief description of the entity included in the reporting entity as a result of the net asset transfer or exchange of equity interests. \_\_\_\_\_
  - b. The method of accounting for the transfer of net assets or exchange of equity interests. \_\_\_\_\_

(FASB ASC 805-50-50-3)

#### ***Pushdown Accounting***

3. For an entity electing pushdown accounting, information that enables users to evaluate the effect, which may include:
  - a. Name and description of the acquirer. \_\_\_\_\_
  - b. How the acquirer obtained control. \_\_\_\_\_
  - c. Acquisition date. \_\_\_\_\_
  - d. Fair value at the acquisition date of consideration transferred. \_\_\_\_\_
  - e. As a result of applying push down accounting, amounts recognized by the acquiree for each major class of assets and liabilities. \_\_\_\_\_
  - f. Reasons why initial accounting is incomplete. \_\_\_\_\_
  - g. Qualitative description of the factors that make up recognized goodwill. \_\_\_\_\_
  - h. Information to evaluate the effects of current reporting period adjustments related to pushdown accounting that occurred in the current or previous periods. \_\_\_\_\_
  - i. Other information necessary for users to evaluate the effect of applying pushdown accounting. \_\_\_\_\_

(FASB ASC 805-50-50-5 and 50-6)

#### **808 Collaborative Arrangements**

1. In the initial interim or annual period and all annual periods thereafter, a participant to a collaborative arrangement, the following information, separately for each individually significant collaborative arrangement:
  - a. The nature and purpose of its collaborative arrangements. \_\_\_\_\_
  - b. The entity's rights and obligations under the arrangements. \_\_\_\_\_
  - c. The accounting policy for collaborative arrangements. \_\_\_\_\_
  - d. The amounts attributable to transactions arising from the collaborative arrangement between participants for each period an income statement is presented. \_\_\_\_\_
  - e. Where those amounts are classified in the income statement. \_\_\_\_\_

(FASB ASC 808-10-50-1)

#### **810 Consolidations**

##### ***Consolidation Policy***

1. The entity's consolidation policy. In most cases this can be made apparent by the headings or other information in the financial statements, but in other cases a note is required. \_\_\_\_\_

(FASB ASC 810-10-50-1)

##### ***Parent with a Less-Than-Wholly-Owned Subsidiary***

2. For each reporting period, a parent with one or more less-than-wholly-owned subsidiaries:
  - a. Separately on the face of the consolidated financial statements, the amounts of consolidated net income and consolidated comprehensive income and the related amounts of each attributable to the parent and the noncontrolling interest. \_\_\_\_\_

- b. Either on the face of the consolidated income statement or in the notes, amounts attributable to the parent for:
  - (1) Income from continuing operations.
  - (2) Discontinued operations.
- c. Either in the consolidated statement of changes in equity if presented, or in the notes, a reconciliation of beginning of period and end of period carrying amounts of total equity, equity attributable to the parent, and equity attributable to the non-controlling interest, separately disclosing:
  - (1) Net income.
  - (2) Transactions with owners acting in their capacity as owners, separately showing contributions and distributions.
  - (3) Each component of other comprehensive income.
- d. A separate schedule showing the effects of any changes in the parent's ownership interest in a subsidiary on the equity attributable to the parent.

(FASB ASC 810-10-50-1A)

#### ***Deconsolidation of a Subsidiary***

- 3. If a subsidiary is deconsolidated during the reporting period, the parent is to disclose:
  - a. The amount of gain or loss recognized.
  - b. The portion of any gain or loss that relates to the remeasurement to fair value of any investment retained by the former parent in its former subsidiary.
  - c. The caption in the income statement in which the gain or loss is recognized unless presented separately on the face of the income statement.
  - d. Description of the valuation techniques used to measure the fair value of the former investment.
  - e. Enough information for users to assess the inputs used in the development of fair value of the former investment.
  - f. The nature of any continuing involvement with the entity acquiring the assets.
  - g. Whether the transaction was with a related party.
  - h. Whether the former subsidiary or entity acquiring the assets will be a related party after the deconsolidation.

(FASB ASC 810-10-50-1B)

#### ***A Change in the Difference Between Parent and Subsidiary Fiscal Year-Ends***

- 4. For all entities that change (or eliminate) a previously existing difference between the reporting periods of a parent and a consolidated entity or an investor and an equity method investee, the disclosures required by Topic 250. This paragraph does not apply in situations in which a parent entity or an investor changes its fiscal year-end.

(FASB ASC 810-10-50-2)

#### ***Variable Interest Entities<sup>13</sup>***

- 5. Disclosures to be made by the primary beneficiary of a variable interest entity (unless that party also holds a majority voting interest). The principal objectives of these

---

<sup>13</sup> ASU 2015-02, *Consolidation (Topic 810): Amendments to the Consolidation Analysis*, has a significant effect on treatment of consolidations, particularly variable interest entities. See the chapter on ASC 810 for more information, including effective dates.

disclosures are to provide the users of the financial statements with information to enable an understanding of:

- a. The significant judgments and assumptions made by management in determining whether it must consolidate a VIE and/or disclose information about its involvement in a VIE;
- b. The nature of restrictions on a consolidated VIE's assets and on the settlement of its liabilities reported by a reporting entity in its statement of financial position, including the carrying amounts of such assets and liabilities;
- c. The nature of, and changes in, the risks associated with the reporting entity's involvement with the VIE; and
- d. How a reporting entity's involvement with the VIE affects its financial position, financial performance, and cash flows.

(FASB ASC 810-10-50-2AA)

**Accounting Alternative<sup>14</sup>**

6. For a private company that elects the accounting alternative (see 810-10-15-17A):
  - a. Amount and key terms of liabilities that are recognized by the lessor and expose the lessee to providing financial support to the lessor legal entity.
  - b. Qualitative description of circumstances not recognized by the lessor and that expose the lessee to providing financial support to the legal entity.

(FASB ASC 810-10-50-2AD)

7. In applying the disclosures above, the lessee should consider exposures through implicit guarantees, including:
  - a. The existence of an economic incentive for the lessee to act as guarantor or to make funds available.
  - b. Those actions have occurred in similar past situations.
  - c. The lessor acting as guarantor or making funds available.

(FASB ASC 810-10-50-2AE)

8. When disclosing lessor legal entity information, the private company lessee should combine the disclosures with disclosures requested by other guidance, such as guarantees, related party disclosures, and leases. These can be combined in a single note or through cross references.

(FASB ASC 810-10-50-2AF)

**Primary Beneficiary**

9. The primary beneficiary of a VIE that is a business is to provide the disclosures required by other guidance. The primary beneficiary of a VIE that is not a business is to disclose the amount of any gain or loss recognized on the initial consolidation of the VIE. In addition to other disclosures required by this topic, the primary beneficiary (PB) of a VIE is to disclose the following:
  - a. The carrying amounts and classification of the VIE's assets and liabilities in the statement of financial position that are consolidated, including qualitative information about the relationships between those assets and liabilities.

---

<sup>14</sup> The disclosures related to the Accounting Alternative are based on guidance in ASU 2014-07. Information about that guidance and entity eligibility can be found in the chapter on ASC 810.

- b. Lack of recourse if creditors (or holders of beneficial interests) of a consolidated VIE have no recourse to the general credit of the PB.
- c. Terms or arrangements, giving consideration to both explicit arrangements and implicit variable interests that could require the reporting entity to provide financial support to the VIE, including events or circumstances that could expose the reporting entity to a loss.
- d. A business entity that issues voting equity interest and the entity holding the majority voting interest is the primary beneficiary, does not have to make disclosures a through c. above.

(FASB ASC 810-10-50-3)

10. In addition to disclosure required by other guidance, a reporting entity that holds a variable interest in a VIE but is not the VIE's primary beneficiary is to disclose:
  - a. The carrying amounts and classification of the assets and liabilities in the statement of financial position of the reporting entity that relate to the reporting entity's variable interest in the VIE.
  - b. The entity's maximum exposure to loss as a result of its involvement with the VIE, including how the maximum exposure is determined and the significant sources of the reporting entity's exposure to the VIE. If management is unable to quantify the maximum exposure to loss, that fact is to be disclosed.
  - c. A tabular comparison of the carrying amounts of the assets and liabilities, as required in a. above, and the enterprise's maximum exposure to loss as required in b. above. A reporting entity is to provide qualitative and quantitative information to enable financial statement users to understand the differences between the two amounts. The discussion is to include, but not be limited to, the terms of arrangements, giving consideration to both explicit arrangements and implicit variable interests, that could require the reporting entity to provide financial support to the VIE, including events or circumstances that could expose the reporting entity to loss.
  - d. Information regarding any liquidity arrangements, guarantees, and/or other commitments by third parties that may affect the fair value or risk of the reporting entity's VIE is encouraged to be provided.
  - e. If applicable, significant factors and judgments made in determining the power to direct the activities of a VIE that most significantly impact the VIE's economic performance is shared.

(FASB ASC 810-10-50-4)

11. For a reporting entity that is a primary beneficiary of a VIE or a reporting entity that holds a variable interest in a VIE but is not the entity's primary beneficiary:
  - a. The methodology used to determine whether the reporting entity is the PB of a VIE, including significant judgments and assumptions made.
  - b. If facts and circumstances change, resulting in a change to the conclusion to consolidate a VIE in the most recent financial statements, the primary factors that caused the change and the effect on the financial statements of the reporting entity.
  - c. Whether the reporting entity has provided financial or other support (explicitly or implicitly) during the periods presented to the VIE that it was not previously contractually required to provide or whether the reporting entity intends to provide that support, including both of the following:
    - (1) The type and amount of support, including situations in which the reporting entity assisted the VIE in obtaining another type of support.
    - (2) The primary reasons for providing the support.

- d. Qualitative and quantitative information about the reporting entity's involvement with the VIE (considering both explicit arrangements and implicit variable interest) including, but not limited to, the nature, purpose, size, and activities of the VIE, and how the VIE is financed.
- 

(FASB ASC 810-10-50-5A)

12. A VIE may issue voting equity interests, and the entity that holds a majority voting interest also may be the primary beneficiary of the VIE. If so, and if the VIE meets the definition of a business and the VIE's assets can be used for purposes other than the settlement of the VIE's obligations, the disclosures in the preceding paragraph are not required.
- 

(FASB ASC 810-10-50-5B)

**Scope—Related Disclosures**

13. For an enterprise that does not apply ASC 810 to one or more VIEs or potential VIEs because after exhaustive efforts it is unable to obtain the necessary information:
- The number of legal entities to which ASC 810 is not being applied and the reason why the information required to apply ASC 810 is not available.
  - The nature, purpose, size (if the information is available), and activities of the VIE or potential VIE and the nature of the enterprise's involvement with those entities.
  - The enterprise's maximum exposure to loss as a result of its involvement with the entity or entities.
  - The amount of income, expense, purchases, sales, or other measure of activity between the reporting enterprise and the entity (entities) for all periods presented. (If not practicable to present the prior period information in the first set of financial statements to which this requirement applies, that prior period information may be omitted.)
- 
- 
- 

(FASB ASC 810-10-50-6)

14. Disclosures about VIEs may be reported in the aggregate for similar entities if separate reporting would not provide more useful information to financial statement users. A reporting entity should disclose how similar entities are aggregated and shall distinguish between:
- VIEs that are not consolidated because the reporting entity is not the primary beneficiary but has a variable interest.
  - VIEs that are consolidated.
- 
- 

The disclosures shall be presented in a manner that clearly explains to financial statement users the nature and extent of an entity's involvement with VIEs.

(FASB ASC 810-10-50-9)

**Collateralized Financing Entities**

15. If a reporting entity consolidates a collateralized financing entity and measures the financing assets and liabilities using the measurement alternative in ASC 810-30-10 and ASC 810-10-35-6 through 35-8:
- Information fair value measurement required by ASC 820 and ASC 825.
-

- b. For the less observable fair value of the financial assets and liabilities measured in accordance with the measurement alternative, the amount was measured on the basis of the more observable of the fair value of the financial assets and liabilities.
- 

(FASB ASC 810-10-50-21 and 50-22)

### **815 Derivatives and Hedging**

1. Entities with derivative instruments, information that will enable users of the financial statements to understand:
    - a. How and why the entity uses derivatives.
    - b. How derivatives and related hedged items are accounted for.
    - c. How derivatives and related hedged items affect the entity's financial position, financial performance, and cash flows.
- 

(FASB ASC 815-10-50-1)

2. Entities that hold or issue derivative instruments (or nonderivative instruments that are designated and qualify as hedging instruments), the following information for every interim and annual reporting period for which a statement of financial position and income statement are presented:
    - a. The objectives for holding or issuing those instruments.
    - b. The context needed to understand those objectives.
    - c. The strategies for achieving those objectives.
    - d. Information to enable financial statements users to understand the volume of the entity's derivative activity.
- 

(FASB ASC 815-10-50-1A)

3. Select the format and specifics of these volume-related disclosures that are most relevant and practical for their individual facts and circumstances. Information regarding these instruments is to be disclosed in the context of each instrument's underlying risk exposure (e.g., interest rate, credit, foreign exchange rate, or overall price). These instruments are also to be distinguished between those used for risk management purposes and those used for other purposes. Derivatives used for risk management purposes include those designated as hedging instruments as well as those used as economic hedges for other purposes with respect to the risk exposures of the entity.
- 

(FASB ASC 815-10-50-1B)

4. Distinguish in the description between hedging instruments designated as fair value hedges, cash flow hedges, and hedges of foreign currency exposure in a net investment in a foreign operation, and derivative instruments used as economic hedges and for other purposes related to the entity's risk exposures, and for other purposes.
- 

(FASB ASC 815-10-50-2)

5. If an entity opts to apply the simplified hedge approach<sup>15</sup> (815-20-25-131A through 131E) in accounting for a qualifying receivable-variable, pay-fixed interest rate swap, the entity may use the settlement value of the swap in place of fair value in the disclosures required by ASC 815 or in other fair value disclosures. The entity must clearly state the amounts are the settlement value. Those amounts must be disclosed separately from amounts disclosed as fair value.
- 

(FASB ASC 815-10-50-3)

---

<sup>15</sup> ASC 815-10-50-3 was added by ASU 2014-03, a consensus of the Private Company Council. See the Technical Alert in the chapter on ASC 815 for information on the entities eligible for the "accounting alternative" and the effective date.

6. For derivatives not designated as hedging instruments, the description is to indicate the purpose of the derivative activity for which the derivatives are held or issued.

(FASB ASC 815-10-50-4)

7. For an entity that holds or issues derivative instruments (and nonderivative instruments that are designated and qualify as hedging instruments) all of the following for every annual and interim reporting period for which a statement of financial position and statement of financial performance are presented:
- The location and fair value of derivative instruments (and such nonderivative instruments) reported in the statement of financial position.
  - The location and amount of the gains and losses on derivative instruments (and such nonderivative instruments) and related hedged items reported in any of the following:
    - The statement of financial performance.
    - The statement of financial position (for example, gains and losses initially recognized in other comprehensive income).

(FASB ASC 815-10-50-4A)

8. For the disclosures required by paragraph a. above:
- Present the fair value of derivative instruments on a gross basis even when the instruments are subject to master netting arrangements and qualify for net presentation in the statement of financial position per ASC 210-20.
  - Cash collateral payables and receivables associated with derivative instruments are not to be added to or netted against the fair value amounts.
  - Present fair value amounts as separate asset and liability values segregated between derivatives designated and qualifying as hedging instruments and those that are not. Within each of these two broad categories, fair value amounts are to be presented separately by type of derivative contract (e.g., interest rate contracts, foreign exchange contracts, equity contracts, commodity contracts, credit contracts, etc.).
  - The disclosure is to identify the line item or items in the statement of financial position in which the fair value amounts for these categories are included.

Present amounts required to be reported for nonderivative instruments at the carrying value of the nonderivative hedging instrument, which includes the adjustment for the foreign currency transaction gain or loss on that instrument.

(FASB ASC 815-10-50-4B)

9. For the gains and losses disclosed pursuant to paragraph 815-10-50-4A(b) present separately for all of the following by type of contract (as discussed in the following paragraph):
- Derivative instruments designated and qualifying as fair value hedges and the related hedged items.
  - The effective portion of gains and losses on derivative instruments designated and qualifying in cash flow hedges and net investment hedges that was recognized in OCI during the current period.
  - The effective portion of gains and losses on derivative instruments designated and qualifying as cash flow hedges and net investment hedges recorded in accumulated other comprehensive income (AOCI) during the term of the hedging relationship and reclassified to earnings during the current period.

- d. The portion of gains and losses on derivative instruments designated and qualifying in cash flow hedges and net investment hedges representing:
  - (1) The amount of the hedges' ineffectiveness, and
  - (2) The amount, if any, excluded from the assessment of hedge effectiveness.
- e. Derivative instruments not designated or qualifying as hedging instruments.

(FASB ASC 815-10-50-4C)

- 10. For disclosures required by FASB ASC 815-10-50-4C:
  - a. Present separately by type of contract, and
  - b. Identify the line item in the statement of financial position in which the gains and losses for these categories are included.

(FASB ASC 815-10-50-4D)

- 11. Present, in a tabular format, the disclosures required by 815-10-40-4A(a) and 50-4A(b), except for the information required for hedged items by 815-10-50-4C(a). For a derivative instrument where a portion is a hedging instrument and a portion is not a hedging instrument, allocate the related amounts to the appropriate categories with the disclosure table.

(FASB ASC 815-10-50-4E)

- 12. For derivative instruments that are not designated or qualifying as hedging instruments, if the entity's policy is to include these derivative instruments in its trading activities (such as part of a trading portfolio that includes derivative and nonderivative or cash instruments), management can elect not to separately disclose gains and losses as required by FASB ASC 815-10-50-4C(e), provided all of the following information is disclosed:
  - a. The gains and losses on its trading activities (including both derivative and non-derivative instruments) recognized in the income statement, separately by major types of items (e.g., fixed income/interest rates, foreign exchange, equity, commodity, and credit).
  - b. The line items in the income statement that include gains and losses from trading activities.
  - c. A description of the nature of the entity's trading activities and related risks and how the entity manages those risks.

If the disclosure is elected, include a note in the required tables referencing the use of the alternative disclosures for trading activities.

(FASB ASC 815-10-50-4F)

#### **Credit-Risk-Related Contingent Features**

- 13. For derivative instruments and nonderivative hedging instruments, all of the following:
  - a. The existence and nature of credit-risk-related contingent features.
  - b. The circumstances that could trigger the features in derivative instruments that are in a net liability position at the end of the reporting period.
  - c. The aggregate fair value amounts of derivative instruments that contain credit-risk-related contingent features that are in a net liability position at the end of the reporting period.
  - d. The aggregate fair value of assets that are already posted as collateral at the end of the reporting period, and

- e. The aggregate fair value of additional assets that would be required to be posted as collateral, and/or
- f. The aggregate fair value of assets needed to settle the instrument immediately, if the credit-risk-related contingent features were triggered at the end of the reporting period.
- g. The amounts required to be reported for nonderivative instruments designated and qualifying as hedging instruments are the carrying value of the nonderivative hedging instrument, including the adjustment for the foreign currency transaction gain or loss on that instrument.

(FASB ASC 815-10-50-4H)

#### Credit Derivatives

- 14. Credit derivatives disclosures are to be made by the seller (the party that assumes credit risk), which could be a guarantor in a guarantee-type contract, and any party that provides the credit protection in an option-type contract, a credit default swap, or any other credit derivative contract.

(FASB ASC 815-10-50-4J)

- 15. The seller of credit derivatives is to disclose information about its credit derivatives and hybrid instruments that have embedded credit derivatives to enable users of the financial statements to assess their potential effect on the seller's financial position, financial performance, and cash flows for each statement of financial position presented. The seller of a credit derivative should disclose the following information even if the likelihood of the seller's having to make any payments under the credit derivative is remote:
  - a. The nature of the credit derivative, including:
    - (1) The approximate terms.
    - (2) The reason(s) for entering into the credit derivative.
    - (3) The events or circumstances that would require the seller to perform under the credit derivative.
    - (4) The current status of the payment/performance risk of the credit derivative.
    - (5) If the entity uses internal groupings for purposes of item (a)(4), how those groupings are determined and used for managing risk.
  - b. All of the following information about the maximum potential amount of future payments under the credit derivative:
    - (1) The maximum potential amount of future payments (undiscounted) the seller could be required to make under the credit derivative.
    - (2) The fact that the terms of the credit derivative provide for no limitation to the maximum potential future payments under the contract, if applicable.
    - (3) If the seller is unable to develop an estimate of the maximum potential amount of future payments under the credit derivative, the reasons why it cannot estimate the maximum potential amount.
  - c. The fair value of the credit derivative as of the date of the statement of financial position.
  - d. The nature of any recourse provisions that would enable the seller to recover from third parties any of the amounts paid under the credit derivative.

- e. The nature of any assets held either as collateral or by third parties that, upon the occurrence of any specified triggering event or condition under the credit derivative, the seller can obtain and liquidate to recover all or a portion of the amounts paid under the credit derivative.
- f. If estimable, the approximate extent to which the proceeds from liquidation of assets held either as collateral or by third parties would be expected to cover the maximum potential amount of future payments under the credit derivative. In its estimate of potential recoveries, the seller of credit protection shall consider the effect of any purchased credit protection with identical underlying(s).
- g. These disclosures do not apply to an embedded derivative feature related to the transfer of credit risk that is only in the form of subordination of one financial instrument to another.

(FASB ASC 815-10-50-4K)

#### ***Qualitative Disclosures***

- 16. Qualitative disclosures about an entity's objectives and strategies for using derivative instruments (and nonderivative instruments that are designated and qualify as hedging instruments pursuant to paragraphs 815-20-25-58 and 815-20-25-66) may be more meaningful if such objectives and strategies are described in the context of an entity's overall risk exposures relating to all of the following:
  - a. Interest rate risk
  - b. Foreign exchange risk
  - c. Commodity price risk
  - d. Credit risk
  - e. Equity price risk.

Include a discussion of those exposures even though the entity does not manage some of those exposures by using derivative instruments. An entity is encouraged, but not required, to provide such additional qualitative disclosures about those risks and how they are managed.

(FASB ASC 815-10-50-5)

#### ***Unconditional Purchase Obligations***

- 17. If an unconditional purchase obligation is subject to the requirements of both Topic 440 and Subtopic 815-10-50, comply with both sets of disclosure requirements.

(FASB ASC 815-10-50-6)

#### ***Balance Sheet Offsetting***

- 18. The policy to offset or not offset in accordance with paragraph 815-10-45-6.

(FASB ASC 815-10-50-7)

- 19. The information required by paragraphs 210-20-50-1 through 50-6 for all recognized derivative instruments accounted for in accordance with Topic 815, including bifurcated embedded derivatives, which are either:
  - a. Offset in accordance with either Section 210-20-45 or Section 815-10-45.
  - b. Subject to an enforceable master netting arrangement or similar agreement.

(FASB ASC 815-10-50-7A)

20. The amounts recognized at the end of each reporting period for the right to reclaim cash collateral or the obligation to return cash collateral as follows:
- If a reporting entity has made an accounting policy decision to offset fair value amounts separately, amounts recognized for the right to reclaim cash collateral or the obligation to return cash collateral that have been offset against net derivative positions in accordance with paragraph 815-10-45-5.
  - Separately amounts recognized for the right to reclaim cash collateral or the obligation to return cash collateral under master netting arrangements that have not been offset against net derivative instrument positions.
  - For a reporting entity that has made an accounting policy decision to not offset fair value amounts separately, the amounts recognized for the right to reclaim cash collateral or the obligation to return cash collateral under master netting arrangements.

(FASB ASC 815-10-50-8)

#### **Certain Contracts on Debt and Equity Securities**

21. The accounting policy for the premium paid to acquire an option that is classified as held to maturity or available for use.

(FASB ASC 815-10-50-9)

#### **815-15 Embedded Derivatives**

##### **Hybrid Instruments That Are Not Separated**

1. For hybrid instruments that have embedded credit derivatives, the seller of the embedded credit derivative, the required information for the entire hybrid instrument, not just the embedded credit derivatives.

(FASB ASC 815-15-50-1)

2. Information that will allow users to understand the effect of changes in fair value of hybrid financial instruments measured at fair value under the election and under the practicability exception in paragraph 815-15-30-1 on earnings.

(FASB ASC 815-15-50-2)

##### **Embedded Conversion Option That Is No Longer Bifurcated**

3. Both of the following for the period in which an embedded conversion option previously accounted for as a derivative instrument no longer meets the separation criteria under this subtopic:
- A description of the principal changes causing the embedded conversion option to no longer require bifurcation.
  - The amount of the liability for the conversion option reclassified to stockholders' equity.

(FASB ASC 815-15-50-3)

#### **815-25 Fair Value Hedges**

1. Include the following for derivative instruments as well as nonderivative instruments that may give rise to foreign currency transaction gains or losses under ASC 830-20, that have been designated and have qualified as fair value hedging instruments and for the related hedged items:
- The net gain or loss recognized in earnings during the reporting period representing:
    - The amount of the hedges' ineffectiveness, and

- (2) The component of the derivative instrument's gain or loss, if any, excluded from the assessment of hedge effectiveness.
- b. The amount of net gain or loss recognized in net income when a hedged firm commitment no longer qualifies as a fair value hedge.

(FASB ASC 815-25-50-1)

### 815-30 Cash Flow Hedges

1. For derivative instruments that have been designated and have qualified as cash flow hedging instruments and for the related hedging transactions:
  - a. A description of the transactions or other events that will result in the reclassification into earnings of gains and losses that are reported in accumulated other comprehensive income.
  - b. The estimated net amount of the existing gains or losses at the reporting date that is expected to be reclassified into earnings within the next 12 months.
  - c. The maximum length of time over which the entity is hedging its exposure to the variability in future cash flows for forecasted transactions excluding those forecasted transactions related to the payment of variable interest on existing financial instruments.
  - d. The amount of gains or losses reclassified into earnings as a result of the discontinuance of cash flow hedges because it is probable that the original forecasted transactions will not occur by the end of the originally specified time period or within the additional period of time as specified by ASC 815-30-40.

(FASB ASC 815-30-50-1)

2. As part of the disclosures of accumulated other comprehensive income, separately all of the following:
  - a. The beginning and ending accumulated derivative instrument gain or loss.
  - b. The related net change associated with current period hedging transactions.
  - c. The net amount of any reclassification into earnings.

(FASB ASC 815-30-50-2)

### 815-35 Net Investment Hedges

1. Quantitative disclosures about derivative instruments may be more useful and less likely to be considered out of context or otherwise misunderstood, if similar information is disclosed about other financial instruments or nonfinancial assets and liabilities to which the derivative instruments are related by activity. In those situations, management is encouraged, but not required, to present a more complete picture of its activities by disclosing that information.

(FASB ASC 815-35-50-2)

### 815-40 Contracts in Entity's Own Entity

1. Changes in the fair value of all contracts classified as assets or liabilities.

(FASB ASC 815-40-50-1)

2. If the contracts meet the definition for a derivative instrument, disclosures required for derivatives.

(FASB ASC 815-40-50-2)

***Reclassifications and Related Accounting Policy Disclosures***

3. Contract reclassifications, the reason for the reclassification, and the effect on the financial statements.
- 

(FASB ASC 815-40-50-3)

4. Accounting policy decision regarding the determination of how to partially reclassify contracts subject to this Subtopic.
- 

(FASB ASC 815-40-50-4)

***Interaction with Disclosures About Capital Structure***

5. The disclosures required by ASC Topic 505-10, *Equity—Overall*, apply to all contracts within the scope of ASC Topic 815-40 as follows:

- a. For an option or forward contract indexed to the issuer's equity:
- (1) The forward rate
  - (2) The option strike price
  - (3) The number of issuer's shares to which the contract is indexed
  - (4) The settlement date or dates of the contract
  - (5) The issuer's accounting for the contract (that is, as an asset, liability, or equity).
- 
- b. If the terms of the contract provide settlement alternatives, those settlement alternatives, including both of the following:
- (1) Who controls the settlement alternatives
  - (2) The maximum number of shares that could be required to be issued to net share settle a contract, if applicable. Paragraph 505-10-50-3 requires additional disclosures for actual issuances and settlements that occurred during the accounting period.
- 
- c. For a contract that does not have a fixed or determinable maximum number of shares that may be required to be issued, the fact that a potentially infinite number of shares could be required to be issued to settle the contract
- 
- d. A contract's current fair value for each settlement alternative (denominated, as relevant, in monetary amounts or quantities of shares) and how changes in the price of the issuer's equity instruments affect those settlement amounts (For some issuers, a tabular format may provide the most concise and informative presentation of these data.)
- 
- e. The disclosures required by paragraph 505-10-50-11 for any equity instrument within the scope of this Subtopic that is (or would be if the issuer were a public entity) classified as temporary equity. (That paragraph applies to redeemable stock issued by nonpublic entities, regardless of whether the private entity chooses to classify those securities as temporary equity.)
- 

(FASB ASC 815-40-50-5)

**815-45 Weather Derivatives**

1. Entities that enter into weather derivatives contracts follow the disclosure requirements under ASC 825-10.
- 

(FASB ASC 815-45-50-1)

**820 Fair Value**

Notes to the preparer

- Unless otherwise indicated, the disclosures included in this section are required to be presented in interim and annual financial statements.
- 
-

- Disclosures required to be made separately for each major category of assets and liabilities measured at fair value on a recurring basis in periods subsequent to initial recognition.
  - Quantitative disclosures required by FASB ASC 820-10-50 should be presented in tabular format.
- 
- 

(FASB ASC 820-10-50-8)

1. Information that allows users to assess:
    - a. For assets and liabilities that are measured at fair value on a recurring or non-recurring basis in the periods subsequent to initial recognition, the valuation techniques and inputs used to develop those measurements.
    - b. For recurring fair value measurements using significant unobservable inputs (Level 3), the effect of the measurements on earnings (or changes in net assets) or other comprehensive income for the period.
- 
- 
- 

(FASB ASC 820-10-50-1)

2. To meet the reporting objectives, consider all of the following:
    - a. The level of detail necessary to satisfy the disclosure requirements.
    - b. How much emphasis to place on each of the various requirements.
    - c. How much aggregation or disaggregation to undertake.
    - d. Whether users of financial statements need additional information to evaluate the quantitative information disclosed.
- 
- 
- 

(FASB ASC 820-10-50-1A)

3. For each class of assets and liabilities measured at fair value in the statement of financial position after initial recognition:
    - a. For recurring fair value measurements, the fair value measurement at the end of the reporting period, and for nonrecurring fair value measurements, the fair value measurement at the relevant measurement date and the reasons for the measurement. Recurring fair value measurements of assets or liabilities are those that other Topics require or permit in the statement of financial position at the end of each reporting period. Nonrecurring fair value measurements of assets or liabilities are those that other Topics require or permit in the statement of financial position in particular circumstances (for example, when a reporting entity measures a long-lived asset or disposal group classified as held for sale at fair value less costs to sell in accordance with Topic 360 because the asset's fair value less costs to sell is lower than its carrying amount). If nonrecurring measurements are estimated at a date during the reporting period other than the end of the period, indicate that the fair value information presented is not as of the period's end as well as the date or period that the measurement was taken.
    - b. For recurring and nonrecurring fair value measurements, the level of the fair value hierarchy within which the fair value measurements are categorized in their entirety (Level 1, 2, or 3):
      - (1) For assets and liabilities held at the end of the reporting period that are measured at fair value on a recurring basis, the amounts of any transfers between Level 1 and Level 2 of the fair value hierarchy, the reasons for those transfers, and the reporting entity's policy for determining when transfers between levels are deemed to have occurred. Transfers into each level shall be disclosed and discussed separately from transfers out of each level.
- 
-

- (2) For recurring and nonrecurring fair value measurements categorized within Level 2 and Level 3 of the fair value hierarchy, a description of the valuation technique(s) and the inputs used in the fair value measurement. If there has been a change in valuation technique (for example, changing from a market approach to an income approach or the use of an additional valuation technique), the reporting entity shall disclose that change and the reason(s) for making it. For fair value measurements categorized within Level 3 of the fair value hierarchy, a reporting entity shall provide quantitative information about the significant unobservable inputs used in the fair value measurement. A reporting entity is not required to create quantitative information to comply with this disclosure requirement if quantitative unobservable inputs are not developed by the reporting entity when measuring fair value (for example, when a reporting entity uses prices from prior transactions or third-party pricing information without adjustment). However, when providing this disclosure, a reporting entity cannot ignore quantitative unobservable inputs that are significant to the fair value measurement and are reasonably available to the reporting entity.<sup>16</sup>
- 
- c. For recurring fair value measurements categorized within Level 3 of the fair value hierarchy, a reconciliation from the opening balances to the closing balances, disclosing separately changes during the period attributable to the following:
- (1) Total gains or losses for the period recognized in earnings (or changes in net assets), and the line item(s) in the statement of income (or activities) in which those gains or losses are recognized:
- (a) Total gains or losses for the period recognized in other comprehensive income, and the line item(s) in other comprehensive income in which those gains or losses are recognized.
- 
- (2) Purchases, sales, issues, and settlements (each of those types of changes disclosed separately).
- 
- (3) The amounts of any transfers into or out of Level 3 of the fair value hierarchy, the reasons for those transfers, and the reporting entity's policy for determining when transfers between levels are deemed to have occurred. Transfers into Level 3 shall be disclosed and discussed separately from transfers out of Level 3.
- 
- d. For recurring fair value measurements categorized within Level 3 of the fair value hierarchy, the amount of the total gains or losses for the period in (c)(1) included in earnings (or changes in net assets) that is attributable to the change in unrealized gains or losses relating to those assets and liabilities held at the end of the reporting period, and the line item(s) in the statement of income (or activities) in which those unrealized gains or losses are recognized.
- 
- e. For recurring and nonrecurring fair value measurements categorized within Level 3 of the fair value hierarchy, a description of the valuation processes used by the reporting entity (including, for example, how an entity decides its valuation policies and procedures and analyzes changes in fair value measurements from period to period).
- 

<sup>16</sup> ASU 2013-09 indefinitely defers the requirement for all employee benefit plans other than those subject to the SEC's filing requirements to disclose fair value measurements of investments in nonpublic entity equity securities issued by the plan sponsor and nonpublic entity equity securities of the plan sponsor's affiliated entities.

- f. For recurring fair value measurements categorized within Level 3 of the fair value hierarchy, a narrative description of the sensitivity of the fair value measurement to changes in unobservable inputs if a change in those inputs to a different amount might result in a significantly higher or lower fair value measurement. If there are interrelationships between those inputs and other unobservable inputs used in the fair value measurement, a reporting entity shall also provide a description of those interrelationships and of how they might magnify or mitigate the effect of changes in the unobservable inputs on the fair value measurement. To comply with that disclosure requirement, the narrative description of the sensitivity to changes in unobservable inputs shall include, at a minimum, the unobservable inputs disclosed when complying with paragraph 820-10-50-2(bbb).
- g. For recurring and nonrecurring fair value measurements, if that of a nonfinancial asset differs from its current use, a reporting entity shall disclose that fact and why the nonfinancial asset is being used in a manner that differs from its highest and best use.

(FASB ASC 820-10-50-2)

4. Determine the appropriate classes of assets and liabilities on the basis of the nature, characteristics, and risks of the asset or liability and the level of the fair value hierarchy within which the fair value measurement is categorized.

The number of classes may need to be greater for fair value measurements categorized within Level 3 of the fair value hierarchy because those measurements have a greater degree of uncertainty and subjectivity. Determining appropriate classes of assets and liabilities for which disclosures about fair value measurements should be provided requires judgment. A class of assets and liabilities will often require greater disaggregation than the line items presented in the statement of financial position. However, a reporting entity shall provide information sufficient to permit reconciliation to the line items presented in the statement of financial position. If another Topic specifies the class for an asset or a liability, a reporting entity may use that class in providing the disclosures required in this Topic if that class meets the requirements in this paragraph.

(FASB ASC 820-10-50-2B)

5. The policy for determining when transfers between levels of the fair value hierarchy are deemed to have occurred in accordance with paragraph 820-10-50-2(bb) and (c)(3). The policy about the timing of recognizing transfers shall be the same for transfers into the levels as for transfers out of the levels.

(FASB ASC 820-10-50-2C)

6. An accounting policy decision to use the exception in paragraph 820-10-35-18D regarding net positions for groups of assets.

(FASB ASC 820-10-50-2D)

7. If a class of assets and liabilities is not measured at fair value in the statement of financial position, but the fair value is disclosed, the level of the fair value hierarchy used to measure the items; for level 2 and 3 items, disclose the valuation techniques and inputs used; and if the highest and best use of a nonfinancial asset is not its current use, disclose that and explain why. Quantitative disclosures about significant unobservable inputs for Level 3 assets and liabilities are not required.

(FASB ASC 820-10-50-2E)

8. A nonpublic entity is not required to disclose the information required by paragraph 820-10-50-2(bb) and (g) and paragraph 820-10-50-2E unless required by another topic.

(FASB ASC 820-10-50-2F)

9. For derivative assets and liabilities, both of the following:
- The fair value disclosures required by paragraph 820-10-50-2(a) through (bb) on a gross basis.
  - The reconciliation required by paragraph 820-10-50-2(c) through (d) on either a gross or a net basis.

(FASB ASC 820-10-50-3)

10. For a liability measured at fair value and issued with an inseparable third-party credit enhancement, the existence of that credit enhancement.

(FASB ASC 820-10-50-4A)

11. For investments that are within the scope of paragraphs 820-10-15-4 through 15-5 (and that are measured using the practical expedient in paragraph 820-10-35-59) on a recurring or nonrecurring basis during the period, information that helps users of the financial statements to understand the nature and risks of the investments and whether the investments, if sold, are probable of being sold at amounts different from net asset value per share (or its equivalent, such as member units or an ownership interest in partners' capital to which a proportionate share of net assets is attributed).<sup>17</sup> To meet that objective, to the extent applicable, at a minimum, the following information for each class of investment:

- The fair value measurement (as determined by applying paragraphs 820-10-35-59 through 35-62) of the investments in the class at the reporting date and a description of the significant investment strategies of the investee(s) in the class.
- For each class of investment that includes investments that can never be redeemed with the investees, but the reporting entity receives distributions through the liquidation of the underlying assets of the investees, the reporting entity's estimate of the period of time over which the underlying assets are expected to be liquidated by the investees.
- Unfunded commitments amount related to investments in the class.
- A general description of the terms and conditions upon which the investor may redeem investments in the class.
- The circumstances in which an otherwise redeemable investment in the class (or a portion thereof) might not be redeemable. Also, for those otherwise redeemable investments that are restricted from redemption as of the reporting entity's measurement date, estimate of when the restriction from redemption might lapse. If an estimate cannot be made, that fact and how long the restriction has been in effect.
- Any other significant restriction on the ability to sell investments in the class at the measurement date.
- If a group of investments would otherwise meet the criteria in paragraph 820-10-35-62 but the individual investments to be sold have not been identified, so the investments continue to qualify for the practical expedient in paragraph 820-10-35-59, the reporting entity shall disclose its plans to sell and any remaining actions required to complete the sale(s).

(FASB ASC 820-10-50-6A)

<sup>17</sup> Upon implementation of ASU 2015-07, this sentence will change to "For investments within the scope of ASC 820-10-15-4 through 15-5 and that are measured using the practical expedient in paragraph 820-10-35-39 on a recurring or nonrecurring basis during the period . . ."

## 825-10 Financial Instruments—Overall

### *Entities*

1. For interim reporting periods, this disclosure guidance applies to all entities but is optional for those entities that do not meet the definition of a public business entity.

(FASB ASC 825-10-50-2A)

### *Transactions*

2. The disclosures about fair value prescribed in paragraphs 825-10-50-10 through 50-16 are not required for:

- a. Employers' and plans' obligations for pension benefits, other postretirement benefits including health care and life insurance benefits, postemployment benefits, employee stock option and stock purchase plans, and other forms of deferred compensation arrangements (see Topics 710, 712, 715, 718, and 960).
- b. Substantively extinguished debt subject to the disclosure requirements of Subtopic 405-20.
- c. Insurance contracts, other than financial guarantees (including financial guarantee insurance contracts within the scope of Topic 944) and investment contracts, as discussed in Subtopic 944-20.
- d. Lease contracts as defined in Topic 840 (a contingent obligation arising out of a cancelled lease and a guarantee of a third-party lease obligation are not lease contracts and are subject to the disclosure requirements in this subsection).
- e. Warranty obligations (see Topic 450 and the Product Warranties Subsections of Topic 460).
- f. Unconditional purchase obligations as defined in paragraph 440-10-50-2.
- g. Investments accounted for under the equity method in accordance with the requirements of Topic 323.
- h. Noncontrolling interests and equity investments in consolidated subsidiaries (see Topic 810).
- i. Equity instruments issued by the entity and classified in stockholders' equity in the statement of financial position (see Topic 505).
- j. Receivable-variable, pay-fixed interest rate swaps for which the simplified hedge accounting approach is applied.<sup>18</sup>
- k. Fully benefit-responsive investment contracts held by an employee benefit plan.
- l. Investments in equity securities accounted for under the measurement guidance for equity securities without readily determinable fair values (see Topic 321).
- m. Trade receivables and payables due in one year or less.
- n. Deposit liabilities with no defined or contractual maturities.

(FASB ASC 825-10-50-8)

### *Fair Value of Financial Instruments*

3. Either in the financial statements or the notes, as of each interim and annual statement of financial position date:
  - a. The fair value of financial instruments.
  - b. The level of the fair value hierarchy within which the fair value measurements are categorized in their entirety (Level 1, 2, or 3).

(FASB ASC 825-10-50-10)

---

<sup>18</sup> See footnote 7 for important information on the simplified hedge accounting approach.

- c. Present fair value with the related carrying amount in a form that clarifies whether the fair value and carrying amount represent assets or liabilities and how the carrying amounts relate to what is reported in the statement of financial position.

(FASB ASC 825-10-50-11)

- 4. If the fair value of financial instruments is disclosed in more than a single note, one of the notes shall include a summary table. The summary table shall contain the fair value and related carrying amounts and cross-references to the location(s) of the remaining disclosures required by this Section.

(FASB ASC 825-10-50-12)

- 5. In disclosing the fair value of a financial instrument, an entity shall not net that fair value with the fair value of other financial instruments—even if those financial instruments are of the same class or are otherwise considered to be related (for example, by a risk management strategy)—except to the extent that the offsetting of carrying amounts in the statement of financial position is permitted under either of the following:
  - a. The general principle in paragraph 210-20-45-1.
  - b. The exceptions for master netting arrangements in paragraph 815-10-45-5 and for amounts related to certain repurchase and reverse repurchase agreements in paragraphs 210-20-45-11 through 45-17.

(FASB ASC 825-10-50-15)

#### ***Concentrations of Credit Risk of All Financial Instruments***

- 6. All significant concentrations of credit risk arising from all financial instruments, whether from an individual counterparty or groups of counterparties.

(FASB ASC 825-10-50-20)

- 7. Except as indicated in the following paragraph, all of the following about each significant concentration:
  - a. Information about the (shared) activity, region, or economic characteristic that identifies the concentration.
  - b. The maximum amount of loss due to credit risk that, based on the gross fair value of the financial instrument, the entity would incur if parties to the financial instruments that make up the concentration failed completely to perform according to the terms of the contracts and the collateral or other security, if any, for the amount due proved to be of no value to the entity.
  - c. With respect to collateral, all of the following:
    - (1) The entity's policy of requiring collateral or other security to support financial instruments subject to credit risk.
    - (2) Information about the entity's access to that collateral or other security.
    - (3) The nature and a brief description of the collateral or other security supporting those financial instruments.
  - d. With respect to master netting arrangements, all of the following:
    - (1) The entity's policy of entering into master netting arrangements to mitigate the credit risk of financial instruments.
    - (2) Information about the arrangements for which the entity is a party.
    - (3) A brief description of the terms of those arrangements, including the extent to which they would reduce the entity's maximum amount of loss due to credit risk.

(FASB ASC 825-10-50-21)

8. The requirements of the preceding paragraph do not apply to the following financial instruments, whether written or held:
  - a. The financial instruments described in paragraph 825-10-50-8(a); (c); (e); and (f), except for reinsurance receivables and prepaid reinsurance premiums.
  - b. Financial instruments of a pension plan, including plan assets, if subject to the accounting and reporting requirements of Topic 715.

Financial instruments of a pension plan, other than the obligations for pension benefits, if subject to the accounting and reporting requirements of Topic 960, are subject to the requirements of paragraphs 825-10-50-20 through 50-21.

(FASB ASC 825-10-50-22)

#### ***Market Risk of All Financial Instruments***

9. An entity is encouraged, but not required, to disclose quantitative information about the market risks of financial instruments that is consistent with the way it manages or adjusts those risks. Appropriate ways of reporting that quantitative information will differ for different entities and will likely evolve over time as management approaches and measurement techniques evolve. Possibilities include disclosing any of the following:
  - a. More details about current positions and perhaps activity during the period.
  - b. The hypothetical effects on comprehensive income (or net assets), or annual income, of several possible changes in market prices.
  - c. A gap analysis of interest rate repricing or maturity dates.
  - d. The duration of the financial instruments.
  - e. The entity's value at risk from derivatives and from other positions at the end of the reporting period and the average value at risk during the year.

This list is not exhaustive, and an entity is encouraged to develop other ways of reporting quantitative information.

(FASB ASC 825-10-50-23)

#### ***Fair Value Option***

10. When management elects the fair value option:
  - a. The reasons that management elected the fair value option for each eligible item or group of similar eligible items.
  - b. If management elected the fair value option for some but not all of the eligible items within a group of similar items:
    - (1) A description of the items in the group and the reasons for the partial election.
    - (2) Information sufficient to enable users to understand how the group of similar items relates to the individual line items presented on the statement of financial position.

(FASB ASC 825-10-50-28)

11. For each statement of financial position line item that includes one or more items for which the fair value option was elected:
  - a. Information sufficient to enable users to understand how each statement of financial position line item relates to major categories of assets and liabilities presented in accordance with the fair value disclosure requirements of ASC 820 (see above) that provide the reader with information with respect to the level or levels within the fair value hierarchy in which the assumptions used to measure fair value (referred to as "inputs") are derived.

- b. The aggregate carrying amount of items included in each statement of financial position line item, if any, that are not eligible for the fair value option. \_\_\_\_\_
- c. The difference between the aggregate fair value and the aggregate unpaid principal balance of:
  - (1) Loans and long-term receivables (other than securities subject to ASC 820) with contractual principal amounts and for which the fair value option has been elected. \_\_\_\_\_
  - (2) Long-term debt instruments that have contractual principal amounts and for which the fair value option has been elected. \_\_\_\_\_
- d. For loans held as assets for which the fair value option has been elected:
  - (1) The aggregate fair value of loans that are 90 or more days past due. \_\_\_\_\_
  - (2) The aggregate fair value of loans on nonaccrual status if the entity's policy is to recognize interest income separately from other changes in fair value. \_\_\_\_\_
- (3) The difference between the aggregate fair value and the aggregate unpaid principal balance for loans that are 90 or more days past due, in nonaccrual status, or both. \_\_\_\_\_
- e. For investments that, absent election of the fair value option, would have been accounted for under the equity method, the following disclosures from ASC 323 are to be made. The extent of disclosures necessary to inform the reader of the financial position and results of operations of an investee is based on management's evaluation of the significance of an investment to the financial position and results of operations of the reporting entity:
  - (1) Parenthetical disclosure, or disclosure in the notes to the financial statements or in separate statements or schedules of:
    - a. The name of each investee and the percentage of ownership of its common stock held by the reporting entity. \_\_\_\_\_
    - b. The accounting policies of the investor with respect to investments in common stock. \_\_\_\_\_
  - (2) When investments in common stock of corporate joint ventures or other investments accounted for under the equity method are, in the aggregate, material to the investor's financial position and results of operations, it may be necessary to present in the notes, or in separate statements, either individually or in groups, summarized information as to assets, liabilities, and results of operations of the investees. \_\_\_\_\_

(FASB ASC 825-10-50-28)

- 12. Required in each interim and annual period for which an income statement is presented about items for which the fair value option has been elected:
  - a. For each line item in the statement of financial position, the amounts of gains and losses from changes in fair value included in net income during the period and the specific line in the income statement on which those gains and losses are reported. ASC 825-10-25 permits management to meet this requirement by aggregating these disclosures with respect to items for which the fair value option was elected with the amounts of gains and losses from changes in fair value with respect to other items measured at fair value as required by other authoritative literature. \_\_\_\_\_
  - b. A description of how interest and dividends are measured and where they are reported in the statement of income. \_\_\_\_\_

- c. With respect to gains and losses included in net income during the period attributable to changes in instrument-specific credit risk associated with loans and other receivables held as assets:
  - (1) The estimated amount of such gains or losses.
  - (2) How the gains or losses were determined.
- d. For liabilities with fair values, effects of the instrument-specific credit risk and changes in it:
  - (1) The amount of change, during the period and cumulatively in fair value of the liability attributable to changes in the instrument-specific credit risk.
  - (2) How the gains and losses were determined.
  - (3) If a liability is settled during the period, the amount, if any, recognized in other comprehensive income that was recognized in net income at settlement.

(FASB ASC 825-10-50-30)

#### ***Other Required Disclosures***

- 13. In annual financial statements only, the methods and significant assumptions used to estimate the fair value of items for which the fair value option was elected, except that the quantitative disclosures about significant unobservable inputs used in fair value measurements categorized within Level 3 of the fair value hierarchy are not required.

(FASB ASC 825-10-50-31)

- 14. If management elects the fair value option upon the occurrence of an event where (1) an investment newly becomes subject to the equity method, (2) a subsidiary or a variable interest entity that the investor previously consolidated ceases to qualify for consolidation but the investor continues to hold common stock in the entity, or (3) an eligible item is required to be measured or remeasured at fair value at the time of the event but is not required to be subsequently remeasured at each succeeding reporting date, the following disclosures are required in the financial statements covering the period of the election:
  - a. Qualitative information about the nature of the event.
  - b. Quantitative information by statement of financial position line item indicating which line items in the income statement include the effect on net income of initially electing the fair value option for the item.

(FASB ASC 825-10-50-32)

#### **825-20 Registration Payment Arrangements**

- 1. The issuer of a registration payment arrangement shall disclose the following information about each registration payment arrangement or each group of similar arrangements:
  - a. The nature of the registration payment arrangement, including the approximate term of the arrangement, the financial instrument(s) subject to the arrangement, and the events or circumstances that would require the issuer to transfer consideration under the arrangement.
  - b. Any settlement alternatives contained in the terms of the registration payment arrangement, including the party that controls the settlement alternatives.
  - c. The maximum potential amount of consideration, undiscounted, that the issuer could be required to transfer under the registration payment arrangement (including the maximum number of shares that may be required to be issued). If the terms of the arrangement provide for no limitation to the maximum potential consideration (including shares) to be transferred, that fact shall be disclosed.

- d. The fact, if so, that the terms of the arrangement provide for no limitation to the maximum potential consideration to be transferred.
- e. The current carrying amount of the liability representing the issuer's obligations under the registration payment arrangement and the income statement classification of any gains or losses resulting from changes in the carrying amount of that liability.
- f. The income statement classification of any gains or losses resulting from changes in the carrying amount of the liability representing the issuer's obligations under the registration payment arrangement.

(FASB ASC 825-20-50-1)

### 830 Foreign Currency

#### 830-20 Foreign Currency Transactions

- 1. Aggregate transaction gain or loss that is included in the entity's net income.

(FASB ASC 830-20-50-1)

#### Subsequent Rate Changes

- 2. If significant, a rate change that occurs after the date of the reporting entity's financial statements and its effects on unsettled balances pertaining to foreign currency transactions. Include consideration of changes in unsettled transactions from the date of the financial statements to the date the rate changed. If it is not practicable to determine these changes, state that fact.

(FASB ASC 830-20-50-2)

#### Effects of Rate Changes on Results of Operations

- 3. To assist financial report users in understanding the implications of rate changes and to compare recent results with those of prior periods, entities are encouraged but not required, to supplement required disclosures an analysis and discussion of the effects of rate changes on the reported results of operations.

(FASB ASC 830-20-50-3)

#### 830-30 Translation of Financial Statements

- 1. Analysis of changes in accumulated translation adjustments which are reported as other comprehensive income. At a minimum, the disclosures should include:
  - a. Beginning and ending amounts of the translation adjustments account.
  - b. Aggregate adjustment for the period resulting from translation adjustments, and gains and losses from certain hedges and intercompany balances.
  - c. Amount of income taxes for the period allocated to translation adjustments.
  - d. Amounts transferred from the translation adjustments account and included in determining net income as a result of the (partial) sale or liquidation of the foreign operation.

(FASB ASC 830-30-50-1)

- 2. Rate changes subsequent to the date of the financial statements including effects on unsettled foreign currency transactions.

(FASB ASC 830-30-50-2)

**835-20 Interest—Capitalization of Interest**

1. The following information with respect to interest costs in the financial statements or related notes:
  - a. For an accounting period in which no interest cost is capitalized, the amount of interest cost incurred and charged to expense during the period.
  - b. For an accounting period in which some interest cost is capitalized, the total amount of interest cost incurred during the period and the amount thereof that has been capitalized.

(FASB ASC 835-20-50-1)

**840 Leases**

1. The nature and extent of leasing transactions with related parties.

(FASB ASC 840-10-50-1)

***Lessees***

2. The lessee, in its financial statements or notes, a general description of its leasing arrangements, including all of the following:
  - a. The basis on which contingent rentals are determined.
  - b. The existence and terms of renewal or purchase options and escalation clauses.
  - c. Restrictions imposed by lease agreements, such as those concerning dividends, additional debt, and further leasing.

(FASB ASC 840-10-50-2)

***Lessors***

3. If leasing, exclusive of leveraged leasing, is a significant part of the lessor's business activities in terms of revenue, net income, or assets, in the financial statements or notes thereto a general description of the lessor's leasing arrangements.

(FASB ASC 840-10-50-4)

4. Lessor's accounting policy for contingent rental income. If a lessor accrues contingent rental income before the lessee's achievement of the specified target (provided achievement of that target is considered probable), disclosure of the impact on rental income shall be made as if the lessor's accounting policy was to defer contingent rental income until the specified target is met.

(FASB ASC 840-10-50-5)

**840-20 Operating Leases*****Lessees***

1. For all operating leases:
  - a. Present rental expense, disclosing separately the amount for minimum rentals, contingent rentals, and sublease rentals.
  - b. Rental payments for leases with terms of a month or less that were not renewed may be excluded.

(FASB ASC 840-20-50-1)

2. For operating leases having initial or remaining noncancelable term in excess of one year:
  - a. Future minimum lease payments in the aggregate and for each of the next five fiscal years.
  - b. Total of minimum rentals that will be received under noncancelable subleases.

(FASB ASC 840-20-50-2)

#### **Lessors**

3. For operating leases, if leasing exclusive of leveraged leasing, is a significant part of the lessor's business activities:
  - a. The cost and carrying amount of property leased or held for leasing, segregated by major classes of property according to function or nature, and the total amount of accumulated depreciation.
  - b. Minimum rentals on noncancelable leases in the aggregate and for each of the succeeding five fiscal years.
  - c. Total contingent rentals included in income.

(FASB ASC 840-20-50-4)

### **840-30 Capital Leases**

#### **Lessees**

1. For capital leases:
  - a. The gross amount of assets recorded under capital leases presented by major classes according to function or nature.
  - b. Future minimum lease payments in the aggregate and for each of the next five fiscal years with separate deductions made for executory costs (including any profit thereon) included in the minimum lease payments, and the amount of imputed interest needed to reduce the net minimum lease payments to present value.
  - c. Total of minimum sublease rentals to be received in the future under noncancelable subleases.
  - d. Total contingent rentals actually incurred for each period for which an income statement is presented.

(FASB ASC 840-30-50-1)

#### **Lessors**

2. For sales-type and direct financing leases, if leasing, exclusive of leveraged leasing, is a significant part of the business activities:
  - a. Components of the net investment in leases including:
    - (1) Future minimum lease payments to be received with separate deductions for amount representing executory costs (including any profit thereon), and the accumulated allowance for uncollectible lease payments.
    - (2) Unguaranteed residual values accruing to benefit of lessor.
    - (3) For direct financing leases only, initial direct costs.
    - (4) Unearned income.
  - b. Future minimum lease payments to be received for each of the next five fiscal years.
  - c. Total contingent rentals included in income for each period for which an income statement is presented.

(FASB ASC 840-30-50-4)

### **Leveraged Leases**

3. For a significant investment in leveraged leases recorded net of the nonrecourse debt, the net of the balances of following accounts shall represent the initial and continuing investment in leveraged leases:
  - a. Rentals receivable.
  - b. Investment tax credit receivable.
  - c. Estimated residual value of leased asset.
  - d. Unearned and deferred income.

(FASB ASC 840-30-50-5)

4. If accounting for the effect on leveraged leases of the change in tax rates results in a significant variation from the customary relationship between income tax expense and pretax accounting income and the reason for that variation is not otherwise apparent, the reason for that variation.

(FASB ASC 840-30-50-6)

### **840-40 Sale-Leaseback Transactions**

#### *Lessees*

1. For sale-leaseback transactions:
  - a. In addition to requirements of ASC 840 and ASC 360, financials of seller-lessee shall describe terms of sale-leaseback transaction, including future commitments, obligations, provisions, or circumstances requiring or resulting in seller-lessee's involvement.

(FASB ASC 840-40-50-1)

#### *Real Estate*

##### ***Transactions that Do Not Qualify for Sale-Leaseback Accounting***

2. The financial statements of a seller-lessee that has accounted for a sale-leaseback transaction by the deposit method or as a financing according to the guidance in this subtopic also shall disclose both of the following:
  - a. The obligation for future minimum lease payments as of the date of the latest statement of financial position presented in the aggregate and for each of the five succeeding fiscal years.
  - b. The total of minimum sublease rentals, if any, to be received in the future under noncancelable subleases in the aggregate and for each of the five succeeding fiscal years.

(FASB ASC 840-40-50-2)

### **842 Leases<sup>19</sup>**

#### **842-20 Lessee**

---

*NOTE: All the disclosures in Subtopic 842-20 are made by the lessee.*

---

1. Qualitative and quantitative information about all of the following:
  - a. Leases.

---

<sup>19</sup> Disclosures in ASC 842 and its Subtopics are required upon implementation of ASC 2016-02, *Leases*.

- b. The significant judgments made in applying the requirements in this Topic to those leases.
- c. The amounts recognized in the financial statements relating to those leases.

(FASB ASC 842-20-50-1)

- 2. Aggregate or disaggregate disclosures so that useful information is not obscured by including a large amount of insignificant detail or by aggregating items that have different characteristics.

(FASB ASC 842-20-50-2)

- 3. Information about the nature of the leases, including:
  - a. A general description of those leases.
  - b. The basis and terms and conditions on which variable lease payments are determined.
  - c. The existence and terms and conditions of options to extend or terminate the lease.
  - d. A narrative disclosure about the options that are recognized as part of its right-of-use assets and lease liabilities and those that are not.
  - e. The existence and terms and conditions of residual value guarantees provided by the lessee.
  - f. The restrictions or covenants imposed by leases, for example, those relating to dividends or incurring additional financial obligations.
  - g. The information relating to subleases included in the disclosures provided in (a) through (e), as applicable.
- 4. Information about leases that have not yet commenced but that create significant rights and obligations for the lessee, including the nature of any involvement with the construction or design of the underlying asset.
- 5. Information about significant assumptions and judgments made in applying the requirements of ASC 842-20, including:
  - a. The determination of whether a contract contains a lease
  - b. The allocation of the consideration in a contract between lease and nonlease components
  - c. The determination of the discount rate for the lease (as described).

(FASB ASC 842-20-50-3)

- 6. For each period presented in the financial statements, the following amounts relating to a lessee's total lease cost, which includes both amounts recognized in profit or loss during the period and any amounts capitalized as part of the cost of another asset in accordance with other Topics, and the cash flows arising from lease transactions:
  - a. Finance lease cost, segregated between the amortization of the right-of-use assets and interest on the lease liabilities.
  - b. Operating lease cost.
  - c. Short-term lease cost, excluding expenses relating to leases with a lease term of one month or less.
  - d. Variable lease cost.
  - e. Sublease income, disclosed on a gross basis, separate from the finance or operating lease expense.
  - f. Net gain or loss recognized from sale and leaseback transactions.

- g. Amounts segregated between finance and operating leases:
- (1) Cash paid for amounts included in the measurement of lease liabilities, segregated between operating and financing cash flows \_\_\_\_\_
  - (2) Supplemental noncash information on lease liabilities arising from obtaining right-of-use assets \_\_\_\_\_
  - (3) Weighted-average remaining lease term \_\_\_\_\_
  - (4) Weighted-average discount rate. \_\_\_\_\_

(FASB ASC 842-20-50-4)

7. A maturity analysis of its finance lease liabilities and its operating lease liabilities separately:

- a. Showing the undiscounted cash flows:
  - On an annual basis for a minimum of each of the first five years, and \_\_\_\_\_
  - A total of the amounts for the remaining years. \_\_\_\_\_
- b. A reconciliation of the undiscounted cash flows to the finance lease liabilities and operating lease liabilities recognized in the statement of financial position. \_\_\_\_\_

(FASB ASC 842-20-50-6)

8. Lease transactions between related parties. \_\_\_\_\_

(FASB ASC 842-20-50-7)

9. The fact that, if applicable, short-term leases are accounted for in accordance with paragraph 842-20-25-2. \_\_\_\_\_
10. If the short-term lease expense for the period does not reasonably reflect the lessee's short-term lease commitments, that fact and the amount of the short-term lease commitments. \_\_\_\_\_

(FASB ASC 842-20-50-8)

11. Accounting policy election to use the practical expedient on not separating lease components from nonlease components and which class or classes of underlying assets it has elected to apply the practical expedient. \_\_\_\_\_

(FASB ASC 842-20-50-9)

### **842-30 Lessor**

---

*NOTE: All the disclosures in Subtopic 842-30 are made by the lessor.*

---

1. Qualitative and quantitative information about all of the following:
  - a. Leases \_\_\_\_\_
  - b. The significant judgments made in applying the requirements in ASC 842 to those leases \_\_\_\_\_
  - c. The amounts recognized in the financial statements relating to those leases. \_\_\_\_\_

(FASB ASC 842-30-50-1)

2. Aggregate or disaggregate disclosures so that useful information is not obscured by including a large amount of insignificant detail or by aggregating items that have different characteristics. \_\_\_\_\_

(FASB ASC 842-30-50-2)

3. Information about the nature of its leases, including:
  - a. A general description of those leases \_\_\_\_\_
  - b. The basis and terms and conditions on which variable lease payments are determined \_\_\_\_\_
  - c. The existence and terms and conditions of options to extend or terminate the lease \_\_\_\_\_
  - d. The existence and terms and conditions of options for a lessee to purchase the underlying asset \_\_\_\_\_
4. Information about significant assumptions and judgments made in applying the requirements of this Topic, including:
  - a. The determination of whether a contract contains a lease \_\_\_\_\_
  - b. The allocation of the consideration in a contract between lease and nonlease components \_\_\_\_\_
  - c. The determination of the amount the lessor expects to derive from the underlying asset following the end of the lease term \_\_\_\_\_

(FASB ASC 842-30-50-3)

5. Any lease transactions between related parties (see Topic 850 on related party disclosures) \_\_\_\_\_

(FASB ASC 842-30-50-4)

6. In tabular format, lease income recognized in each annual and interim reporting period, to include the following:
  - a. For sales-type leases and direct financing leases:
    - (1) Profit or loss recognized at the commencement date (disclosed on a gross basis or a net basis consistent with paragraph 842-30-45-4) \_\_\_\_\_
    - (2) Interest income either in aggregate or separated by components of the net investment in the lease \_\_\_\_\_
  - b. For operating leases, lease income relating to lease payments \_\_\_\_\_
  - c. Lease income relating to variable lease payments not included in the measurement of the lease receivable \_\_\_\_\_

(FASB ASC 842-30-50-5)

7. In the notes the components of its aggregate net investment in sales-type and direct financing leases, that is:
  - a. The carrying amount of the lease receivables, \_\_\_\_\_
  - b. The unguaranteed residual assets, and \_\_\_\_\_
  - c. Any deferred selling profit on direct financing leases) \_\_\_\_\_

(FASB ASC 842-30-50-6)

8. Information about how the entity manages risk associated with the residual value of its leased assets, including:
  - a. Its risk management strategy for residual assets \_\_\_\_\_

- b. The carrying amount of residual assets covered by residual value guarantees (excluding guarantees considered to be lease payments for the lessor,
- c. Any other means by which the lessor reduces its residual asset risk.

(FASB ASC 842-30-50-7)

#### ***Sales-Type and Direct Financing Leases***

- 1. The disclosures required by paragraphs 842-30-50-3 through 50-7.

(FASB ASC 842-30-50-8)

- 2. An explanation of significant changes in the balance of its unguaranteed residual assets and deferred selling profit on direct financing leases.

(FASB ASC 842-30-50-9)

- 3. A maturity analysis of its lease receivables:

- a. Showing the undiscounted cash flows to be received:

(1) On an annual basis for a minimum of each of the first five years.

(2) A total of the amounts for the remaining years.

(3) A reconciliation of the undiscounted cash flows to the lease receivables recognized in the statement of financial position (or disclosed separately in the notes).

(FASB ASC 842-30-50-10)

#### ***Operating Leases***

- 1. The disclosures required by paragraphs 842-30-50-3 through 50-7.

(FASB ASC 842-30-50-11)

- 2. Presented separately from the maturity analysis required by ASC 842-30-50-10, a maturity analysis of lease payments:

- a. Showing the undiscounted cash flows to be received:

(1) On an annual basis for a minimum of each of the first five years, and

(2) A total of the amounts for the remaining years.

(FASB ASC 842-30-50-12)

- 3. Disclosures required by Topic 360 on property, plant, and equipment separately for underlying assets under operating leases from owned assets.

(FASB ASC 842-30-50-13)

#### **842-40 Sale and Leaseback Transactions**

- 1. Disclosures required in paragraphs 842-20-50-1 through 50-9 for a seller-lessee or paragraphs 842-30-50-1 through 50-13 for a buyer-lessor.

(FASB ASC 842-40-50-1)

2. In addition to the disclosures required by paragraphs 842-20-50-1 through 50-9, a seller-lessee that enters into a sale and leaseback transaction, the following:
  - a. The main terms and conditions of that transaction
  - b. Any gains or losses arising from the transaction separately from gains or losses on disposal of other assets.

(FASB ASC 842-40-50-2)

#### **842-50 Leveraged Lease Arrangements**

1. In the notes, where leveraged leasing is a significant part of the lessor's business activities in terms of revenue, net income, or assets:
  - a. The components of the net investment balance in leveraged leases.

(FASB ASC 842-50-50-1)

2. See the guidance in ASC 310 for guidance on disclosures on receivables relating to a lessor's rights to payments from leveraged leases.

(FASB ASC 842-50-50-1)

3. Disclose any significant variation in the customary relationship between income tax expense and pretax accounting income related to accounting for the effect on leveraged leases of the change in tax rates and the reason for that variation unless it is otherwise apparent.

(FASB ASC 842-50-50-3)

#### **845 Nonmonetary Transactions**

1. Nature of transaction.
2. Basis of accounting for the assets transferred.
3. Gain or loss and basis of accounting for assets transferred.

(FASB ASC 845-10-50-1)

4. Amount of gross operating revenue recognized as a result of nonmonetary transactions.

(FASB ASC 845-10-50-2)<sup>20</sup>

5. The amount of revenue and costs (or gains and losses) associated with inventory exchanges recognized at fair value.

(FASB ASC 845-10-50-3)

#### **850 Related-Party Disclosures**

1. Nature of relationship and amounts due to or from related parties with significant terms and manner of settlement.
2. A description of the transactions, including transactions to which no amounts or nominal amounts were ascribed, for each of the periods for which income statements are presented, and such other information deemed necessary to an understanding of the effects of the transactions on the financial statements.
3. Dollar amounts of transaction, including the effects of any change in the method of establishing the terms.

---

<sup>20</sup> Upon implementation of ASU 2014-09, this paragraph will be superseded.

4. Amount due from or to related parties and manner of settlement as of the date of each balance sheet.
5. For additional requirements, see requirements for FASB ASC 740-10-50-17 previously in this checklist.

(FASB ASC 850-10-50-1)

6. Show separately, and not included under a general heading such as notes receivable or accounts receivable, notes or accounts receivable from officers, employees, or affiliated entities.

(FASB ASC 850-10-50-2)

7. In some cases, aggregation of similar transactions by type of related party may be appropriate. Sometimes, the effect of the relationship between the parties may be so pervasive that disclosure of the relationship alone will be sufficient. If necessary to the understanding of the relationship, the name of the related party shall be disclosed.

(FASB ASC 850-10-50-3)

8. It is not necessary to duplicate disclosures in a set of separate financial statements that is presented in the financial report of another entity (the primary reporting entity) if those separate financial statements also are consolidated or combined in a complete set of financial statements and both sets of financial statements are presented in the same financial report.

(FASB ASC 850-10-50-4)

#### ***Disclosures About Arm's Length Bases of Transactions***

9. Transactions involving related parties cannot be presumed to be carried out on an arm's-length basis. Representations about transactions with related parties must not imply that the related party transactions were consummated on terms equivalent to those that prevail in arm's-length transactions unless such representations can be substantiated.

(FASB ASC 850-10-50-5)

#### ***Control Relationships***

10. The nature of control relationship, even absent any transactions, of companies under common ownership or management control, if such could lead to operating results or financial position significantly different than what would have resulted if entities were autonomous.

(FASB ASC 850-10-50-6)

#### ***852-10 Reorganizations—Overall***

1. In the notes to financial statements of an entity in chapter:
  - a. Claims not subject to reasonable estimation based on the provisions of Subtopic 450-20.
  - b. The principal categories of the claims subject to compromise.
2. The extent to which reported interest expense differs from stated contractual interest. It may be appropriate to disclose this parenthetically on the face of the statement of operations.

(FASB ASC 852-10-50-2)

(FASB ASC 852-10-50-3)

3. Intra-entity receivables and payables of entities in reorganization proceedings in the condensed combined financial statements referred to in paragraph 852-10-45-14.

(FASB ASC 852-10-50-4)

**Financial Reporting When Entities Emerge from Chapter Reorganization and Adopt Fresh-Start Reporting**

4. In the notes to the initial fresh-start financial statements when fresh-start reporting is adopted. That additional information consists of all of the following:
- a. Adjustments to the historical amounts of individual assets and liabilities.
  - b. The amount of debt forgiveness.
  - c. Significant matters relating to the determination of reorganization value, including all of the following:
    - (1) The method or methods used to determine reorganization value and factors such as discount rates, tax rates, the number of years for which cash flows are projected, and the method of determining terminal value.
    - (2) Sensitive assumptions—that is, assumptions about which there is a reasonable possibility of the occurrence of a variation that would have significantly affected measurement of reorganization value.
    - (3) Assumptions about anticipated conditions that are expected to be different from current conditions, unless otherwise apparent.

(FASB ASC 852-10-50-7)

**852-20 Reorganizations—Quasi Reorganizations**

1. After readjustment under Topic 852-20, a new retained earnings account must be established, dated to show that it runs from the effective date of the readjustment. Disclose this dating until such time as the effective date is no longer deemed to possess any special significance.

(FASB ASC 852-20-50-2)

**855 Subsequent Events**

**Date Through Which Subsequent Events Have Been Evaluated**

1. For non-SEC filers, the following:
  - a. The date through which subsequent events have been evaluated.
  - b. Whether that date is either of the following:
    - (1) The date the financial statements were issued.
    - (2) The date the financial statements were available to be issued.

(FASB ASC 855-10-50-1)

**Nonrecognized Subsequent Events**

2. For nonrecognized subsequent events that, by their nature, their disclosure is necessary in order to prevent the financial statements from being misleading, disclose the following:
  - a. The nature of the event.
  - b. An estimate of the financial effect of the event, or a statement that an estimate cannot be made.

(FASB ASC 855-10-50-2)

3. If the nonrecognized subsequent event is so significant that disclosure is best made by presenting pro forma financial data, management should consider supplementing the historical financial statements with that data that would give effect to the event as if it had occurred on the date of the statement of financial position. In some situations, management is also to consider presenting pro forma statements, usually a statement of financial position only, in columnar form on the face of the historical financial statements.
- 

(FASB ASC 855-10-50-3)

#### ***Revised Financial Statements***

4. The date through which management has evaluated subsequent events and specify whether that date represents the date the financial statements were issued, or the date the financial statements were available to be issued.
- 

(FASB ASC 855-10-50-4)

5. If the financial statements are reissued, the date through which subsequent events were evaluated with respect to both the originally issued financial statements and the revised financial statements.
- 

(FASB ASC 855-10-50-5)

### **860 Transfers and Servicing of Financial Assets**

#### **860-20 Sales of Financial Assets**

1. For securitizations, asset-backed financing arrangements, and similar transfers accounted for as sales when the transferor has continuing involvement with the transferred financial assets:

- a. For each income statement presented:

- (1) The characteristics of the transfer (including a description of the transferor's continuing involvement with the transferred financial assets), the nature and initial fair value of the assets obtained as proceeds and the liabilities incurred in the transfer, and the gain or loss from sale of transferred financial assets. For initial fair value measurements of assets obtained and liabilities incurred in the transfer, the following information:

- (a) The level within the fair value hierarchy in which the fair value measurements fall in their entirety; segregating Level 1, Level 2, and Level 3 measurements.
      - (b) The key inputs and assumptions used in measuring the fair value of assets obtained and liabilities incurred as a result of the sale that relate to the transferor's continuing involvement (including at a minimum, but not limited to, and if applicable, quantitative information about discount rates, expected prepayments including the expected weighted-average life of prepayable financial assets, and anticipated credit losses, including expected static pool losses).
      - (c) The valuation technique(s) used to measure fair value.

- (2) Cash flows between a transferor and transferee, including proceeds from new transfers, proceeds from collections reinvested in revolving-period transfers, purchases of previously transferred financial assets, servicing fees, and cash flows received from a transferor's beneficial interests.

(FASB ASC 860-20-50-3)

- b. For each statement of financial position presented, irrespective of when the transfer occurred:
- (1) Qualitative and quantitative information about the transferor's continuing involvement with transferred financial assets sufficient to provide users of the financial statements with needed information to assess the reasons for the continuing involvement and the risks related to the transferred financial assets to which the transferor continues to be exposed after the transfer and the extent that the transferor's risk profile has changed as a result of the transfer (including, but not limited to, credit risk, interest rate risk, and other risks) including:
    - (a) The total principal amount outstanding, the amount that has been derecognized, and the amount that continues to be recognized in the statement of financial position.
    - (b) The terms of any arrangements that could require the transferor to provide financial support to the transferee or its beneficial interest holders, including a description of any events or circumstances that could expose the transferor to loss and the amount of the maximum exposure to loss.
    - (c) Whether the transferor has provided financial or other support during the periods presented that it was not previously contractually required to provide to the transferee or its beneficial interest holders, including when the transferor assisted the transferee or its beneficial interest holders in obtaining support, including:
      - [1] The type and amount of support.
      - [2] The primary reasons for providing the support.
    - (d) Information is encouraged to be provided regarding any liquidity arrangements, guarantees, and/or other commitments provided by third parties related to the transferred financial assets that may affect that transferor's exposure to loss or risk of the related transferor's interest.
  - (2) Accounting policies for subsequently measuring assets or liabilities that relate to the continuing involvement with the transferred financial assets.
  - (3) The key inputs and assumptions used in measuring the fair value of assets or liabilities that relate to the transferor's continuing involvement (including quantitative information about discount rates, expected prepayments including the expected weighted-average life of prepayable financial assets, and anticipated credit losses, including expected static pool losses).
  - (4) For the transferor's interests in the transferred financial assets, a sensitivity analysis or stress test showing the hypothetical effect on the fair value of those interests (including any servicing assets or servicing liabilities) or two or more unfavorable variations from the expected levels for each key assumption reported, independently from any change in another key assumption, and a description of the objectives, methodology, and limitation of the sensitivity analysis or stress test.
  - (5) Information about the asset quality of transferred financial assets and any other assets that it manages together with them. This information should be separated between assets that have been derecognized and assets that continue to be recognized in the statement of financial position. This information is intended to provide financial statement users with an understanding of the risks inherent in the transferred financial assets as well as in other assets and liabilities that it manages together with transferred financial assets.

2. By type of transaction:<sup>21</sup>

- a. The carrying amounts of assets derecognized as of the date of derecognition:
  - (1) For amounts that have changed significantly or are not representative of the activity during the period, the reasons for the change.
- b. Amount of gross cash proceeds received by the transferor of the assets derecognized as of the derecognition date.
- c. Information about the transferor's ongoing exposure to the economic return on the transferred financial assets, including:
  - (1) The fair value of assets derecognized by the transferor.
  - (2) Statement of financial position amounts arising from the transaction.
  - (3) Description of the arrangements resulting in the transferor retaining substantially all of the exposure to the economic return in the transferred financial assets and the risks related to these arrangements.

(FASB ASC 860-20-50-4D)

3. The aggregate amount of gains or losses on sales of loans or trade receivables (including adjustments to record loans held for sale at the lower of cost or fair value) shall be presented separately in the financial statements or disclosed in the notes to financial statements.

(FASB ASC 860-20-50-5)

### **860-30 Secured Borrowing and Collateral**

1. All of the following for collateral:

- a. If the entity has entered into repurchase agreements or securities lending transactions, it shall disclose its policy for requiring collateral or other security.
- b. As of the date of the latest statement of financial position presented, both of the following:
  - (1) The carrying amount and classifications of both of the following:
    - (a) Any assets pledged as collateral that are not reclassified and separately reported in the statement of financial position in accordance with paragraph 860-30-25-5(a).
    - (b) Associated liabilities.
  - (2) Qualitative information about the relationship(s) between those assets and associated liabilities; for example, if assets are restricted solely to satisfy a specific obligation, a description of the nature of restrictions placed on those assets.
- c. If the entity has accepted collateral that it is permitted by contract or custom to sell or repledge, it shall disclose all the following:
  - (1) The fair value as of the date of each statement of financial position presented of that collateral.
  - (2) The fair value as of the date of each statement of financial position presented of the portion of that collateral that it has sold or repledged.
  - (3) Information about the sources and uses of that collateral.

(FASB ASC 860-30-50-1A)

---

<sup>21</sup> See ASC 860-20-50-4a through 4c for scope restrictions related to this paragraph.

***Disclosures for Repurchase Arrangements, Securities Lending Transactions, and Repurchase-to-Maturity Transactions***

2. Information about the collateral pledged and the associated risks to which the transferor continues to be exposed after the transfer:
  - a. A disaggregation of the gross obligation by class of collateral pledged.  
\_\_\_\_\_
  - (1) Total borrowings must be reconciled to the amount of the gross liability for repurchase agreements and securities lending transactions before any adjustments for offsetting.  
\_\_\_\_\_
  - b. Removing contractual maturity.  
\_\_\_\_\_
  - c. Discussion of the potential risks associated with the agreements and related collateral pledged.  
\_\_\_\_\_

(FASB ASC 860-30-50-7)

3. The information on offsetting required by ASC 210 for the following that are either offset in accordance with ASC 210-20-45 or are subject to an enforceable master netting arrangement or similar agreement:
  - a. Recognized repurchase agreements accounted for as a collateralized borrowing and reverse repurchase agreements accounted for as a collateralized borrowing.  
\_\_\_\_\_
  - b. Recognized securities borrowing and securities lending transactions.  
\_\_\_\_\_

**860-50 Servicing Assets and Liabilities**

1. For all servicing assets and liabilities:
  - a. Management's basis for determining its classes of servicing assets and liabilities.  
\_\_\_\_\_
  - b. A description of the risks inherent in servicing assets and servicing liabilities and, if applicable, the instruments used to mitigate the effect on the income statement of changes in fair value of the servicing assets and servicing liabilities. Note that it is encouraged, but not required, that management provide disclosure of quantitative information about the instruments used to manage the risks inherent in servicing assets and servicing liabilities, including the fair value of those instruments at the beginning and end of the period.  
\_\_\_\_\_
  - c. The amount of contractually specified servicing fees, late fees, and ancillary fees recognized for each period for which results of operations are presented, including a description of where each amount is reported in the income statement.  
\_\_\_\_\_
  - d. Encouraged but not required, quantitative and qualitative information about the assumptions used to estimate the fair value. (An entity that voluntarily provides the encouraged quantitative information about the instruments used to manage risks inherent in the servicing assets and servicing liabilities is also encouraged to disclose quantitative and qualitative information about the assumptions used to estimate the fair value of those instruments.)  
\_\_\_\_\_

(FASB ASC 860-50-50-2)

2. For servicing assets and servicing liabilities subsequently measured at fair value:
  - a. For each class of servicing assets and servicing liabilities, the activity in the balance of servicing assets and the activity in the balance of servicing liabilities (including a description of where changes in fair value are reported in the income statement for each period for which results of operations are presented), including but not limited to the following:
    - (1) The beginning and ending balances.  
\_\_\_\_\_

- (2) Additions through purchases of servicing assets, assumptions of servicing obligations, and recognition of servicing obligations resulting from transfers of financial assets.
- (3) Disposals.
- (4) Changes in fair value during the period resulting from changes in valuation inputs or assumptions used in the valuation model or other changes in fair value and a description of those changes.
- (5) Other changes that affect the balance and a description of those changes.

*(FASB ASC 860-50-50-3)*

- 3. For servicing assets and servicing liabilities subsequently amortized in proportion to and over the period of estimated net servicing income or loss and assessed for impairment or increased obligation:
  - a. For each class of servicing assets and servicing liabilities, the activity in the balance of servicing assets and the activity in the balance of servicing liabilities (including a description of where changes in the carrying amount are reported in the income statement for each period for which results of operations are presented), including, but not limited to, the following:
    - (1) The beginning and ending balances.
    - (2) Additions (through purchases of servicing assets, assumptions of servicing obligations, and recognition of servicing obligations resulting from transfers of financial assets).
    - (3) Disposals.
    - (4) Amortization.
    - (5) Application of valuation allowance to adjust carrying value of servicing assets.
    - (6) Other-than-temporary impairments.
    - (7) Other changes affecting the balance and a description of those changes.
  - b. For each class of servicing assets and servicing liabilities, the fair value of recognized servicing assets and servicing liabilities at the beginning and end of the period.
  - c. The risk characteristics of the underlying financial assets used to stratify recognized servicing assets for purposes of measuring impairment.
  - d. The activity by class in any valuation allowance for impairment of recognized servicing assets—including beginning and ending balances, aggregate additions charged and recoveries credited to operations, and aggregate write-downs charged against the allowance—for each period for which results of operations are presented.

*(FASB ASC 860-50-50-4)*

- 4. If an entity elects to subsequently measure a class of servicing assets and servicing liabilities at fair value at the beginning of the fiscal year, disclose separately the amount of the cumulative-effect adjustment to retained earnings.

*(FASB ASC 860-50-50-5)*
