## PREFACE

---

*Wiley GAAP 2017: Interpretation and Application* provides analytical explanations, copious illustrations, and nearly 300 examples of all current generally accepted accounting principles. The book integrates principles promulgated by the FASB in its *Accounting Standards Codification*.<sup>TM</sup> This edition of *Wiley GAAP* is organized to align fully with the structure of the FASB Codification. Each chapter begins with a list of the Subtopics included within the Topic, major scope and scope exceptions, technical alerts of any FASB Updates, and an overview of the Topic. The remainder of each chapter contains a detailed discussion of the concepts and practical examples and illustrations. This organization facilitates the primary objective of the book—to assist financial statement preparers and practitioners in resolving the myriad practical problems faced in applying GAAP.

Hundreds of meaningful, realistic examples guide users in the application of GAAP to the complex fact situations that must be dealt with in the real world practice of accounting. In addition to this emphasis, a major strength of the book is that it explains the theory of GAAP in sufficient detail to serve as a valuable adjunct to accounting textbooks. Much more than merely a reiteration of currently promulgated GAAP, it provides the user with the underlying conceptual bases for the rules. It facilitates the process of reasoning by analogy that is so necessary in dealing with the complicated, fast-changing world of commercial arrangements and transaction structures. It is based on the author's belief that proper application of GAAP demands an understanding of the logical underpinnings of all its technical requirements.

As a bonus, a comprehensive disclosure checklist, following the main text, offers practical guidance to preparing financial statements for commercial entities in accordance with GAAP. For easy reference and research, the checklist follows the order of the codification.

The following FASB Accounting Standards Updates were issued since *Wiley GAAP 2016* and through May 2016. Their requirements are incorporated in this edition of *Wiley GAAP*, as and where appropriate and at a minimum in the Technical Alert section at the beginning of the Topic referenced in the ASU title.

- ASU 2015-10, *Technical Corrections and Improvements*
- ASU 2015-11, *Inventory (Topic 330): Simplifying the Measurement of Inventory*
- ASU 2015-12, *Plan Accounting: Defined Benefit Pension Plans (Topic 960), Defined Contribution Pension Plans (Topic 962), Health and Welfare Benefit Plans (Topic 965): (Part I) Fully Benefit-Responsive Investment Contracts, (Part II) Plan Investment Disclosures, (Part III) Measurement Date Practical Expedient (consensuses of the FASB Emerging Issues Task Force)*
- ASU 2015-13, *Derivatives and Hedging (Topic 815): Application of the Normal Purchases and Normal Sales Scope Exception to Certain Electricity Contracts within Nodal Energy Markets (a consensus of the FASB Emerging Issues Task Force)*
- ASU 2015-14, *Revenue from Contracts with Customers: (Topic 606): Deferral of the Effective date*
- ASU 2015-15, *Interest—Imputation of Interest (Topic 835): Presentation and Subsequent Measurement of Debt Issuance Costs Associated with Line-of-Credit Arrangements—*

*Amendments to SEC Paragraphs Pursuant to Staff Announcement at June 18, 2015 EITF Meeting (SEC Update)<sup>1</sup>*

- ASU 2015-16, *Business Combinations (Topic 805): Simplifying the Accounting for Measurement-Period Adjustments*
- ASU 2015-17, *Income Taxes (Topic 740): Balance Sheet Classification of Deferred Taxes 40)*
- ASU 2016-01, *Financial Instruments—Overall (Subtopic 825-10): Recognition and Measurement of Financial Assets and Financial Liabilities*
- ASU 2016-02, *Leases (Topic 842)*
- ASU 2016-03, *Intangibles—Goodwill and Other (Topic 350), Business Combinations (Topic 805), Consolidation (Topic 810), Derivatives and Hedging (Topic 815); Effective Date and Transition Guidance (a consensus of the Private Company Council)*
- ASU 2016-04, *Liabilities—Extinguishments of Liabilities (Subtopic 405-20): Recognition of Breakage for Certain Prepaid Stored-Value Products (a consensus of the Emerging Issues Task Force)*
- ASU 2016-05, *Derivatives and Hedging (Topic 815): Effect of Derivative Contract Novations on Existing Hedge Accounting Relationships (a consensus of the Emerging Issues Task Force)*
- ASU 2016-06, *Derivatives and Hedging (Topics 815): Contingent Put and Call Options in Debt Instruments (a consensus of the Emerging Issues Task Force)*
- ASU 2016-07, *Investments—Equity Method and Joint Ventures (Topic 323): Simplifying the Transition to the Equity Method of Accounting*
- ASU 2016-08, *Revenue from Contracts with Customers (Topic 606): Principal versus Agent Considerations (Reporting Revenue Gross versus Net)*
- ASU 2016-09, *Compensation—Stock Compensation (Topic 718): Improvements to Employee Share-Based Payment Accounting*
- ASU 2016-10, *Revenue from Contracts with Customers (Topic 606): Identifying Performance Obligations and Licensing*
- ASU 2016-11, *Revenue Recognition (Topic 605) and Derivatives and Hedging (Topic 815): Rescission of SEC Guidance Because of Accounting Standards Updates 2014-09 and 2014-16 Pursuant to Staff Announcements at the March 3, 2016 EITF Meeting.*

Significant accounting changes are on the horizon. In the next year, the FASB is expected to make strides on the following major projects and others:

- Revenue Recognition—technical improvements and corrections
- Financial Instruments—Impairment
- Financial Instruments—Hedging
- Disclosure Framework

Readers are encouraged to check the FASB website for status updates to the above and other FASB projects.

In response to the 2011 report of the Blue Ribbon Panel on Standard Setting for Private Companies, the FASB began important initiatives. The FASB created the Private Company Council to address the Blue Ribbon Panel's report. The FASB issued a framework for the FASB

---

<sup>1</sup> This book does not cover ASU 2015-15. The ASU is an EITF consensus, narrow in scope and only affects two paragraphs in the SEC guidance section of ASC 835, which are not otherwise covered in this book.

and the PCC to use in determining whether alternatives to existing and proposed U.S. GAAP are warranted for private companies. Since 2013, FASB has issued three ASUs that are consensuses of the PCC and in 2016 issued another. That is listed on the table above.

The author's wish is that this book will serve preparers, practitioners, faculty, and students, as a reliable reference tool to facilitate their understanding of, and ability to apply, the complexities of the authoritative literature.

Joanne M. Flood  
June 2016

## **ABOUT THE AUTHOR**

---

**Joanne M. Flood, CPA**, is an author and independent consultant on accounting and auditing technical topics and e-learning. She has experience as an auditor in both an international firm and a local firm and worked as a senior manager in the AICPA's Professional Development group. She received her MBA Summa Cum Laude in Accounting from Adelphi University and her Bachelor's degree in English from Molloy College.

While in public accounting, Joanne worked on major clients in retail, manufacturing, and finance and on small business clients in construction, manufacturing, and professional services. At the AICPA, Joanne developed and wrote e-learning, text, and instructor-led training courses on U.S. and International Standards. She also produced training materials in a wide variety of media, including print, video, and audio, and pioneered the AICPA's e-learning product line. Joanne resides on Long Island, New York, with her daughter, Elizabeth. Joanne is the author of several articles for and contributor to Wiley Insight IFRS and the following Wiley publications:

*Financial Disclosure Checklist*

*Wiley GAAP 2017: Interpretation and Application of Generally Accepted Accounting Principles*

*Wiley Practitioner's Guide to GAAS 2017: Covering all SASs, SSAEs, SSARs, and Interpretations*

*Wiley GAAP: Financial Statement Disclosures Manual (Wiley Regulatory Reporting)*

*Wiley Revenue Recognition*

And the following AICPA online and live CPE programs:

*Audit Staff Essentials, Level 1—New Hire*

*Audit Staff Essentials, Level 2—Experienced Staff*

*Audit Staff Essentials, Level 3—Audit Senior/In-Charge*

## PERSPECTIVES AND ISSUES

### What Is GAAP?

The FASB Accounting Standards Codification™ (ASC) is the:

*. . . source of authoritative generally accepted accounting principles (GAAP) recognized by the FASB to be applied by nongovernmental entities. Rules and interpretive releases of the Securities and Exchange Commission (SEC) under authority of federal securities laws are also sources of authoritative GAAP for SEC registrants. In addition*

*to the SEC's rules and interpretive releases, the SEC staff issues Staff Accounting Bulletins that represent practices followed by the staff in administering SEC disclosure requirements, and it utilizes SEC Staff Announcements and Observer comments made at Emerging Issues Task Force meetings to publicly announce its views on certain accounting issues for SEC registrants.* ASC 105-10-05-1

In the absence of authoritative guidance, the FASB Codification (the Codification) offers the following approach:

*If the guidance for a transaction or event is not specified within a source of authoritative GAAP for that entity, an entity shall first consider accounting principles for similar transactions or events within a source of authoritative GAAP for that entity and then consider nonauthoritative guidance from other sources. An entity shall not follow the accounting treatment specified in accounting guidance for similar transactions or events in cases in which those accounting principles either prohibit the application of the accounting treatment to the particular transaction or event or indicate that the accounting treatment should not be applied by analogy.* ASC 105-10-05-2

**Nonauthoritative Sources.** The Codification lists some possible nonauthoritative sources:

- Practices that are widely recognized and prevalent either generally or in the industry,
  - FASB Concepts Statements,
  - American Institute of Certified Public Accountants (AICPA) Issues Papers,
  - International Financial Reporting Standards of the International Accounting Standards Board,
  - Pronouncements of professional associations or regulatory agencies,
  - Technical Information Service Inquiries and Replies included in AICPA Technical Practice Aids,
  - Accounting textbooks, handbooks, and articles.
- (ASC 105-10-05-3)

GAAP establishes:

- The measurement of economic activity,
- The time when such measurements are to be made and recorded,
- The disclosures surrounding this activity, and
- The preparation and presentation of summarized economic information in the form of financial statements.

GAAP develops when questions arise about how best to accomplish those items. In response to those questions, GAAP is either prescribed in official pronouncements of authoritative bodies empowered to create it, or it originates over time through the development of customary practices that evolve when authoritative bodies fail to respond. Thus, GAAP is a reaction to and a product of the economic environment in which it develops. As such, the development of accounting and financial reporting standards has lagged the development and creation of increasingly intricate economic structures and transactions.

There are two broad categories of accounting principles—recognition and disclosure.

**Recognition Principles.** Recognition principles determine the timing and measurement of items that enter the accounting cycle and impact the financial statements. These are reflected in quantitative standards that require economic information to be reflected numerically.

**Disclosure Principles.** Disclosure principles deal with factors that are not always quantifiable. Disclosures involve qualitative information that is an essential ingredient of a full set of

financial statements. Their absence would make the financial statements misleading by omitting information relevant to the decision-making needs of the reader. Disclosure principles also complement recognition principles by dictating that disclosures expand on some quantitative data, explain assumptions underlying the numerical information and provide additional information on accounting policies, contingencies, uncertainties, etc., which are essential to fully understand the performance and financial condition of the reporting enterprise.

## DEFINITIONS OF TERMS

---

See Appendix A, ***Definitions of Terms***, for terms related to this topic: Conduit Debt Securities, Financial Statements are Available to be Issued, Nongovernmental Entity, Nonpublic Entity, Not-for-Profit Entity, and Public Business Entity.

## CONCEPTS, RULES, AND EXAMPLES

---

### History of GAAP

From time to time, the bodies given responsibility for the promulgation of GAAP have changed, and indeed more than a single such body has often shared this responsibility. In response to the stock market crash of 1929, the AICPA appointed the Committee on Accounting Procedure. This was superseded in 1959 by the Accounting Principles Board (APB) created by the AICPA. Because of operational problems, in 1972 the profession replaced the APB with a three-part organization consisting of the Financial Accounting Foundation (FAF), Financial Accounting Standards Board (FASB), and the Financial Accounting Standards Advisory Council (FASAC). Since 1973 the FASB has been the organization designated to establish standards of financial reporting.

**Other sources.** Not all GAAP has resulted from the issuance of pronouncements by authoritative bodies. For example, depreciation methods such as straight-line and declining balance have long been accepted. There are, however, no definitive pronouncements that can be found to state this. Furthermore, there are many disclosure principles that evolved into general accounting practice because they were originally required by the SEC in documents submitted to them. Much of the content of statements of financial position and income statements has evolved over the years in the absence of adopted standards.

### GAAP Codification

In 2009, FASB's Codification became the single official source of authoritative, non-governmental US generally accepted accounting principles. It superseded all nongrandfathered (see ASC 105-10-70-2 for a list of grandfathered guidance), non-SEC accounting guidance. Only one level of authoritative GAAP exists, excluding the guidance issued by the Securities and Exchange Commission (SEC). All other literature is nonauthoritative.

**SEC Guidance in the Codification.** To increase the utility of the Codification for public companies, relevant portions of authoritative content issued by the SEC and selected SEC staff interpretations and administrative guidance are included for reference in the Codification. The sources include:

- Regulation S-X,
- Financial Reporting Releases (FRR)/Accounting Series Releases (ASR),
- Interpretive Releases (IR), and
- SEC staff guidance in:
  - Staff Accounting Bulletins (SAB),
  - EITF Topic D and SEC Staff Observer comments.

The Codification does not, however, incorporate the entire population of SEC rules, regulations, interpretive releases, and staff guidance. SEC guidance not incorporated in the codification includes content related to auditing or independence matters or matters outside of the basic financial statements, including Management's Discussion and Analysis (MD&A).

## Standards-setting Process

The FASB has long adhered to rigorous “due process” when creating new guidance. The goal is to involve constituents who would be affected by the newly issued guidance so that the standards created will result in information that reports economic activity as objectively as possible without attempting to influence behavior in any particular direction. Ultimately, however, the guidance is the judgment of the FASB, based on research, public input, and deliberation.

The Board issues guidance through Accounting Standards Updates (ASU) which describe amendments to the Accounting Standards Codification. Once issued, the provisions become GAAP after the stated effective date.

**Emerging Issues Task Force.** The Emerging Issues Task Force (EITF) was formed in 1984 by the FASB to assist the Board in identifying current or emerging issues and implementation problems before divergent practices become entrenched. The guidance provided has often been restricted to narrow issues that were of immediate interest and importance.

If an EITF consensus is approved by the FASB, it amends the FASB Codification through an ASU.

**Accounting Standards Updates.** Accounting Standards Updates (ASUs) are composed of:

- A summary of the key provisions of the project that led to the changes,
- The specific changes to the Codification, and
- The Basis for Conclusions.

The title of the combined set of new guidance and instructions is *Accounting Standards Update YY-XX*, where YY is the last two digits of the year and XX is the sequential number for each update. All authoritative GAAP issued by the FASB is issued in this format.

The FASB organizes the content of ASUs using the same Section headings as those used in the Codification. ASUs are not deemed authoritative in their own right; instead, they serve only to update the Codification and provide the historical basis for conclusions.

The content from updates that is not yet fully effective for all reporting entities appears in the Codification as boxed text and is labeled “pending content.” The pending content text box includes the earliest transition date and a link to the related transition guidance, also found in the Codification.

**Maintenance Updates.** As with any publishing practice, irregularities occur. To make necessary corrections, the FASB staff issues Maintenance Updates. These are not addressed by the Board and contain nonsubstantive editorial changes and link-related changes.

**American Institute of Certified Public Accountants.** Although it currently plays a greatly reduced standard-setting role, the American Institute of Certified Public Accountants (AICPA) has authorized the Financial Reporting Executive Committee (FinREC) to determine the AICPA’s policies on financial reporting standards and to speak for the AICPA on accounting matters. FinREC, formerly the Accounting Standards Executive Committee

(AcSEC), is the senior technical committee at the AICPA. It is composed of seventeen volunteer members, representative of industry, analysts, and both national and regional public accounting firms.

## Researching GAAP Problems

These procedures should be refined and adapted to each individual fact situation.

**Codification Structure.** The FASB Codification is located on [fasb.org](https://fasb.org). The site is intended to be easily searchable for research purposes. This section provides an overview of the site's contents and search functionality.

*Areas.* On all pages of the site, all categories of the Codification are listed down the vertical menu bar on the left side of the page, revealing the following Areas, and the numbering series for each one:

- General Principles (100). (Establishes the Codification as the source of GAAP.)
- Presentation (200). (Topics in this area relate only to presentation matters; they do not address recognition, measurement, and derecognition matters. Examples of these topics are income statement, balance sheet, and earnings per share.)
- Assets (300).
- Liabilities (400).
- Equity (500).
- Revenue (600).
- Expenses (700). (Clusters all types of expense-related GAAP into five broad categories, which are cost of goods sold, research and development, compensation, income taxes, and other expenses.)
- Broad Transactions (800). (Contains the major transactional topics, such as business combinations, derivatives, and foreign currency matters.)
- Industry (900). (Itemizes GAAP for specific industries, such as entertainment, real estate, and software.)
- Master Glossary.

*Topics.* The Codification content is arranged by Area and then further divided by Topics, Subtopics, Sections, and Subsections. FASB has developed a classification system specifically for the Codification. The following is the structure of the classifications system: XXX-YY-ZZ-PP, where:

- XXX = topic,
- YY = subtopic,
- ZZ = section, and
- PP = paragraph.

An “S” preceding the section number denotes SEC guidance. At the most granular level of detail, the Codification has a two-digit numerical code for a standard set of categories.

The Codification Taxonomy can be found in the section that precedes Chapter 1.

*Subtopics.* Subtopics represent subsets of a topic and are typically identified by type or by scope. For example, lessees and lessors are two separate subtopics of leases Topic 842. Each topic contains an “overall subtopic” (designated “-10”) that generally represents the pervasive guidance for the topic, which includes guidance that applies to all other subtopics. Each

additional subtopic represents incremental or unique guidance not contained in the overall subtopic.

Sections (See explanation on the next page)		
Title	Number	Description
Status	00	Includes references to the Accounting Standards Updates that affect the subtopic.
Overview and background	05	Provides overview and background material.
Objectives	10	States the high-level objectives of the topic.
Scope and scope exceptions	15	Outlines the transactions, events, and other occurrences to which the subtopic guidance does or does not apply.
Glossary	20	Contains definitions for terms found within the subtopic guidance.
Recognition	25	Defines the criteria, timing, and location for recording an item in the financial statements.
Initial measurement	30	Provides guidance on the criteria and amounts used to measure a transaction at the initial date of recognition.
Subsequent measurement	35	Provides guidance on the measurement of an item after the recognition date.
Derecognition	40	Relates almost exclusively to assets, liabilities, and equity. Provides criteria, the method to determine the amount of basis, and the timing to be used when derecognizing a particular item for purposes of determining gain or loss.
Other presentation matters	45	Provides guidance on presenting items in the financial statements.
Disclosure	50	Provides guidance regarding disclosure in the notes to or on the face of the financial statements.
Implementation guidance and illustrations	55	Contains illustrations of the guidance provided in the preceding sections.
Relationships	60	Contains links to guidance that may be helpful to the reader of the subtopic.
Transition and Open Effective Date Information	65	Contains references to paragraphs within the subtopic that have open transition guidance.
Grandfathered Guidance	70	Contains descriptions, references, and transition periods for content grandfathered after July 1, 2009, by an Accounting Standards Update. <sup>1</sup>
XBRL Elements	75	Contains the related XBRL elements for the subtopic.
SEC Materials	S99	Contains selected SEC content for use by public companies.

<sup>1</sup> Certain accounting standards allowed for the continued application of superseded accounting standards for transactions that have an ongoing effect in an entity's financial statements. That superseded guidance has not been included in the Codification is considered grandfathered and continues to remain authoritative for those transactions after the effective date of the Codification. (ASC 105-10-70-2)

*Sections.* Sections represent the nature of the content in a subtopic—for example, recognition, measurement, and disclosure. The sectional organization for all subtopics is the same. In a manner similar to that used for topics, sections correlate closely with sections of individual International Accounting Standards. Sections are further broken down into *subsections*, *paragraphs*, and *subparagraphs*, depending on the specific content of each section.

*Finding Information.* By drilling down through the various topics and subtopics in the sidebar of the online Codification, a researcher can eventually locate the relevant GAAP information. However, there are other ways to access GAAP information through the Codification site that may prove to be easier:

- *Cross-referencing.* If the researchers know the reference number of an original GAAP source document, such as an EITF consensus or a FASB Staff Position, then they can enter this information through the Cross-Reference tab, which is located at the top center of the Codification home page.
- *Codification search.* If the researchers are searching for specific words or phrases, then the best search tool is the Codification search bar, which is located in the upper right corner of any page on the site. To use it for a precision search, enter quotes around the search text; for a less precise search that returns individual words within the search text, do not use quotes.

*Codification Terminology.* The FASB standardized on the term “entity” to replace terms such as company, organization, enterprise, firm, preparer, etc. So, too, the Codification uses “shall” throughout to replace “should,” “shall,” “is required to,” “must,” etc. The FASB believes these terms all represent the same concept—the requirement to apply a standard. “Would” and “should” are used to indicate hypothetical situations. To reduce ambiguity, the Codification also eliminated qualifying terminology, such as *usually*, *ordinarily*, *generally*, and similar terms.

## Research Procedures

**Step 1: Identify the problem.** Most often it is found that incorrect answers (e.g., regarding the proper way to report revenue-producing activities) flow from improper definition of the actual question to be resolved. Consider the following:

- Gain an understanding of the problem or question.
- Challenge the tentative definition of the problem and revise, as necessary.
- Problems and research questions can arise from new authoritative pronouncements, changes in a firm’s economic operating environment, or new transactions, as well as from the realization that the problem had not been properly defined in the past.
- If proposed transactions and potential economic circumstances are anticipated, more deliberate attention can be directed at finding the correct solution, and certain proposed transactions having deleterious reporting consequences might be avoided altogether or structured more favorably.
- If little is known about the subject area, it may be useful to consult general reference sources to become more familiar with the topic, that is, the basic what, why, how, when, who, and where. Web-based research vastly expands the ability to gather useful information.
- Ensure that the issue you are researching is a GAAP issue or is an auditing issue so that your search is directed to the appropriate literature.

**Step 2: Analyze the problem.**

- Identify critical factors, issues, and questions that relate to the research problem.
- What are the options? Brainstorm possible alternative accounting treatments.
- What are the goals of the transaction? Are these goals compatible with full and transparent disclosure and recognition?
- What is the economic substance of the transaction, irrespective of the manner in which it appears to be structured?
- What limitations or factors can affect the accounting treatment?

**Step 3: Refine the problem statement.**

- Clearly articulate the critical issues in a way that will facilitate research and analysis.

**Step 4: Identify plausible alternatives.**

- Plausible alternative solutions are based upon prior knowledge or theory.
- Additional alternatives may be identified as Steps 5–7 are completed.
- The purpose of identifying and discussing different alternatives is to be able to respond to key accounting issues that arise out of a specific situation.
- The alternatives are the potential methods of accounting for the situation from which only one will ultimately be chosen.
- Exploring alternatives is important because many times there is no single cut-and-dried financial reporting solution to the situation.
- Ambiguity often surrounds many transactions and related accounting issues and, accordingly, the accountant and business advisor must explore the alternatives and use professional judgment in deciding on the proper course of action.

**Step 5: Develop a research strategy.**

- Determine which literature to search.
- Generate keywords or phrases that will form the basis of an electronic search.
- Consider trying a broad search to:
  - Assist in developing an understanding of the area,
  - Identify appropriate search terms, and
  - Identify related issues and terminology.
- Consider trying very precise searches to identify whether there is authoritative literature directly on point.

**Step 6: Search authoritative literature (described in additional detail below).** This step involves implementation of the research strategy through searching, identifying, and locating applicable information:

- Research published GAAP.
- Research using *Wiley GAAP*.
- Research other literature.
- Research practice.
- Use theory.
- Find analogous events and/or concepts that are reasonably similar.

**Step 7: Evaluation of the Information Obtained.**

- Analyze and evaluate all of the information obtained.
- This evaluation should lead to the development of a solution or recommendation. Again, it is important to remember that Steps 3–7 describe activities that will interact with each other and lead to a more refined process in total, and a more complete solution. These steps may involve several iterations.

**Search Authoritative Literature (Step 6)—Further Explanation**

The following sections discuss in more detail how to search authoritative literature as outlined in Step 6.

**Researching Wiley GAAP.** This publication can assist in researching GAAP for the purpose of identifying technical answers to specific inquiries. You can begin your search in one of two ways: by using the contents page at the front of this book to determine the chapter in which the answer to your question is likely to be discussed, or by using the index at the back of this publication to identify specific pages of the publication that discuss the subject matter relating to your question. The path chosen depends in part on how specific the question is. An initial reading of the chapter or relevant section will provide a broader perspective on the subject. However, if one's interest is more specific, it might be better to search the index.

Each chapter in this publication is organized in the following manner:

- A chapter table of contents on the first page of the chapter.
- Perspective and Issues, providing an overview of the chapter contents (noting any current controversy or proposed GAAP changes affecting the chapter's topics), scope of the Topic, and a list of major Topics and Subtopics in the FASB Accounting Standards Codification relevant to the chapter's topics.
- Concepts, Rules, and Examples, setting forth the detailed guidance and examples.

The appendices in this publication are Definitions of Terms and Disclosure Checklist for Commercial Businesses. After reading the relevant portions of this publication, the list of major topics and subtopics in the Codification can be used to find the sections in the Codification that are related to the topic, so that these can be appropriately understood and cited in documenting your research findings and conclusions. Readers familiar with the professional literature can use the Codification Taxonomy that precedes this chapter to quickly locate the pages in this publication relevant to each specific pronouncement.

**Researching nonpromulgated GAAP.** Researching nonpromulgated GAAP consists of reviewing pronouncements in areas similar to those being researched, reading accounting literature mentioned in ASC 105-10-05-3 and earlier in this chapter as “other sources,” and carefully reading the relevant portions of the FASB Conceptual Framework (summarized later in this chapter). Concepts and intentions espoused by accounting experts offer essential clues to a logical formulation of alternatives and conclusions regarding problems that have not yet been addressed by the standard-setting bodies.

Both the AICPA and FASB publish a myriad of nonauthoritative literature. FASB publishes the documents it uses in its due process: Discussion Papers, Invitations to Comment, Exposure Drafts, and Preliminary Views as well as minutes from its meetings. It also publishes research reports, newsletters, and implementation guidance. The AICPA publishes Technical Practice Aids, Issues Papers, Technical Questions and Answers, Audit and Accounting Guides, as well as comment letters on proposals of other standard-setting bodies, and the monthly periodical, *Journal of Accountancy*. Technical Practice Aids are answers published by the AICPA to questions about accounting and auditing standards. AICPA Issues Papers are research documents

about accounting and reporting problems that the AICPA believes should be resolved by FASB. They provide information about alternative accounting treatments used in practice.

The Securities and Exchange Commission issues Staff Accounting Bulletins and makes rulings on individual cases that come before it. These rulings create and impose accounting standards on those whose financial statements are to be submitted to the Commission.

Governmental agencies such as the Government Accountability Office, the Federal Accounting Standards Advisory Board, and the Cost Accounting Standards Board have certain publications that may assist in researching written standards. Also, industry organizations and associations may be other helpful sources.

Certain publications are helpful in identifying practices used by entities that may not be promulgated as standards. The AICPA publishes an annual survey of the accounting and disclosure policies of many public companies in *U.S. GAAP Financial Statements—Best Practices in Presentation and Disclosure* and offers an online version which contains a library of financial statements that can be accessed through a computerized search. EDGAR (Electronic Data Gathering, Analysis, and Retrieval) publishes the SEC filings of public companies, which includes the companies' financial statements. Through selection of keywords and/or topics, these services can provide information on how other entities resolved similar problems.

**Internet-based research sources.** There has been and continues to be an information revolution affecting the exponential growth in the volume of materials, authoritative and nonauthoritative, that are available on the Internet. A listing of just a small cross-section of these sources follows:

#### Accounting Websites

<b>AICPA Online</b>	<a href="http://www.aicpa.org">www.aicpa.org</a>	Includes the Financial Reporting Center for accounting and assurance information and resources; CPE information; Professional Ethics and Peer Review releases and information; information on relevant congressional/executive actions; online publications, such as the <i>Journal of Accountancy</i> ; also has links to other organizations; includes links to standard-setting bodies and their authoritative standards for nonissuers including auditing standards, attestation standards, and quality control standards
<b>FASB</b>	<a href="http://www.fasb.org">www.fasb.org</a>	Information on FASB; Access to the Codification and ASUs, Project Status reports with EDs, research papers, and meeting notes; webcasts
<b>FASB Codification</b>	<a href="http://asc.fasb.org/home">asc.fasb.org/home</a>	Database using the accounting Codification; includes cross-referencing and tutorials
<b>GASB</b>	<a href="http://www.gasb.org">www.gasb.org</a>	Information on GASB; new GASB documents; summaries/status of all GASB statements; proposed Statements; Technical Bulletins; Interpretations
<b>International Accounting Standards Board (IASB)</b>	<a href="http://www.ifrs.org">www.ifrs.org</a>	Information on the IASB; lists of Pronouncements, Exposure Drafts, project summaries, and conceptual framework
<b>PCAOB</b>	<a href="http://www.pcaobus.org">www.pcaobus.org</a>	Sections on rulemaking, standards (including the auditing, attestation, quality control, ethics, and independence standards), enforcement, inspections and oversight activities
<b>SEC</b>	<a href="http://www.sec.gov">www.sec.gov</a>	SEC digest and statements; EDGAR searchable database; information on current SEC rulemaking

## The Concept of Materiality

**Technical Alert.** The FASB currently has two companion projects deliberating the concept of materiality. As part of its Framework project, the FASB issued an Exposure Draft in September 2015, *Proposed Amendments to Statement of Financial Accounting Concepts*, to amend CON 8. The Board is aware that the CON 8 description of the legal concept of materiality can be inconsistent with the U.S. Supreme Court's definition (see below). That was not the intent, and so the Board has tentatively decided to remove the CON 8 description and replace it with:

Materiality is a legal concept. In the United States a legal concept may be established or changed through legislative, executive, or judicial action. The Board observes but does not promulgate definitions of materiality. Currently, the Board observes that the U.S. Supreme Court's definition of materiality, in the context of the antifraud provisions of the U.S. securities laws, generally states that information is material if there is a substantial likelihood that the omitted or misstated item would have been viewed by a reasonable resource provider as having significantly altered the total mix of information. Consequently, the Board cannot specify or advise specifying a uniform quantitative threshold for materiality or predetermine what could be material in a particular situation.

As part of its Disclosure Framework project, the FASB issued an Exposure Draft in September 2015, *Proposed Accounting Standards Update: Notes to Financial Statements: Assessing Whether Disclosures Are Material (Topic 235)*, and has tentatively decided to add this guidance to Topic 235:

Materiality is applied to quantitative and qualitative disclosure individually and in the aggregate in the context of the financial statements taken as a whole; therefore, some, all, or none of the requirements in a disclosure Section may be material.

The proposal goes on to include language indicating that materiality is a legal concept. It also makes clear that omission of immaterial disclosures is not an accounting error. The proposal is designed to align the guidance with materiality with the legal definition.

As this volume goes to press, the FASB is redeliberating. See the FASB website for more information on these projects.

## Descriptions of Materiality

Materiality has great significance in understanding, researching, and implementing GAAP and affects the entire scope of financial reporting. Disputes over financial statement presentations often turn on the materiality of items that were, or were not, recognized, measured, and presented in certain ways.

Materiality is described by the FASB in Statement of Financial Concepts 8 (CON 8), *Qualitative Characteristics of Accounting Information*:

*Information is material if omitting it or misstating it could influence decisions that users make on the basis of the financial information of a specific reporting entity. In other words, materiality is an entity-specific aspect of relevance based on the nature or magnitude or both of the items to which the information relates in the context of an individual entity's financial report.*

The Supreme Court has held that a fact is material if there is:

*a substantial likelihood that the disclosure of the omitted fact would have been viewed by the reasonable investor as having significantly altered the "total mix" of information made available.*

Due to its inherent subjectivity, the FASB definition does not provide specific or quantitative guidance in distinguishing material information from immaterial information. The individual accountant must exercise professional judgment in evaluating information and concluding on its materiality. Materiality as a criterion has both quantitative and qualitative aspects, and items should not be deemed *immaterial* unless all potentially applicable quantitative and qualitative aspects are given full consideration and found not relevant.

SAB Topics 1.M (SAB 99) and 1.N (SAB 108) contain guidance from the SEC staff on assessing materiality during the preparation of financial statements. That guidance references the Supreme Court opinion and the definition in CON 2, which has been superseded by CON 8. The SEC in Staff Accounting Bulletin (SAB) Topics 1.M (SAB 99) and 1.N (SAB 108) provides useful discussions of this issue. SAB Topic 1.M indicates that:

*a matter is material if there is a substantial likelihood that a reasonable person would consider it important.*

Although not strictly applicable to nonpublic preparers of financial statements, the SEC guidance is worthy of consideration by all accountants and auditors. Among other things, Topic 1.M notes that deliberate application of nonacceptable accounting methods cannot be justified merely because the impact on the financial statements is deemed to be immaterial. Topic 1.N also usefully reminds preparers and others that materiality has both quantitative and qualitative dimensions, and both must be given full consideration. Topic 1.N has added to the literature of materiality with its discussion of considerations applicable to prior period restatements.

**Quantitative factors.** Quantitatively, materiality has been defined in relatively few pronouncements, which speaks to the great difficulty of setting precise measures for materiality. For example, in ASC 280-10-50, which addresses segment disclosures, a material segment or customer is defined in ASC 280-10-50-12 as representing 10% or more of the reporting entity's revenues (although, even given this rule, qualitative considerations may cause smaller segments to be deemed reportable). The Securities and Exchange Commission has, in several of its pronouncements, defined materiality as 1% of total assets for receivables from officers and stockholders, 5% of total assets for separate balance sheet disclosure of items, and 10% of total revenue for disclosure of oil and gas producing activities.

**Qualitative factors.** In addition to quantitative assessments, preparers should consider qualitative factors, such as company-specific trends and performance metrics. Information from analysts' reports and investor calls may provide an indication of what is important to reasonable investors and should be considered.

Although materiality judgments have traditionally been primarily based on quantitative assessments, the nature of a transaction or event can affect a determination of whether that transaction or event is material. For example, a transaction that, if recorded, changes a profit to a loss or changes compliance with ratios in a debt covenant to noncompliance would be material even if it involved an otherwise immaterial amount. Also, a transaction that might be judged immaterial if it occurred as part of routine operations may be material if its occurrence helps meet certain objectives. For example, a transaction that allows management to achieve a target or obtain a bonus that otherwise would not become due would be considered material, regardless of the actual amount involved. So, too, offers to buy or sell assets for more or less than book value, litigation proceedings against the company pursuant to price-fixing or antitrust allegations, and active negotiations regarding their settlement can have a material impact on the enterprise's future profitability and, thus, are all examples of items that would not be capable of being evaluated for materiality based solely upon numerical calculations.

**Degree of precision.** Another factor in judging materiality is the degree of precision that may be attained when making an estimate. For example, accounts payable can usually be estimated more accurately than a possible loss from the incurrence of an asset retirement obligation. An error amount that would be material in estimating accounts payable might be acceptable in estimating the retirement obligation.

## The Conceptual Framework

FASB has issued eight pronouncements (five of which remain extant) called Statements of Financial Accounting Concepts (CON). The conceptual framework is designed to prescribe the nature, function, and limits of financial accounting and reporting and is to be used as a guideline that will lead to consistent standards. These conceptual statements do **not** establish accounting standards or disclosure practices for particular items and are not enforceable under the AICPA Code of Professional Conduct. Since GAAP may be inconsistent with the principles set forth in the conceptual framework, the FASB expects to reexamine existing accounting standards. Until that time, a CON does not require a change in existing GAAP. CON do not amend, modify, or interpret existing GAAP, nor do they justify departing from GAAP based upon interpretations derived from them.

FASB's conceptual framework is intended to serve as the foundation upon which the Board can construct standards that are both sound and internally consistent. The fact that the framework was intended to guide FASB in establishing standards is embodied in the preface to CON 8, which states:

*The Board itself is likely to be the most direct beneficiary of the guidance provided by Concepts Statements. They will guide the Board in developing accounting and reporting standards by providing the Board with a common foundation and basic reasoning on which to consider merits of alternatives.*

The conceptual framework is also intended for use by the business community to help understand and apply standards and to assist in their development. This goal is also mentioned in the preface to CON 8:

*However, knowledge of the objectives and concepts the Board will use in developing new guidance also should enable those who are affected by or interested in generally accepted accounting standards (GAAP) to understand better the purposes, content, and characteristics of information provided by financial accounting and reporting. That knowledge is expected to enhance the usefulness of, and confidence in, financial accounting and reporting. The objectives and fundamental concepts also may provide some guidance in analyzing new or emerging problems of financial accounting and reporting in the absence of applicable authoritative pronouncements.*

The FASB Special Report, *The Framework of Financial Accounting Concepts and Standards* (1998), states that the conceptual framework should help solve complex financial accounting or reporting problems by:

- Providing a set of common premises as a basis for discussion;
- Providing precise terminology;
- Helping to ask the right questions;
- Limiting areas of judgment and discretion and excluding from consideration potential solutions that are in conflict with it; and
- Imposing intellectual discipline on what traditionally has been a subjective and ad hoc reasoning process.

**Components of the conceptual framework.** The components of the conceptual framework for financial accounting and reporting include objectives, qualitative characteristics, elements, recognition, measurement, and disclosure concepts.

Elements of financial statements are the components from which financial statements are created. They include assets, liabilities, equity, investments by owners, distributions to owners, comprehensive income, revenues, expenses, gains, and losses. In order to be included in financial statements, an element must meet criteria for recognition and possess a characteristic that can be reliably measured.

Reporting or display considerations are concerned with what information should be provided, who should provide it, and where it should be displayed. How the financial statements (financial position, earnings, and cash flow) are presented is the focal point of this part of the conceptual framework project.

Of the five extant Concepts Statements, the fourth, *Objectives of Financial Reporting by Nonbusiness Organizations*, is not covered here due to its specialized nature. Because the topics in CON 8 are foundational, this discussion begins with CON 8.

CON 8 is a result of a joint FASB/IASB project to improve and converge their frameworks. Chapters 1 and 3 of CON 8 replaced CON 1 and CON 2, and Chapter 2 of CON 8 is reserved for a chapter on the Reporting Entity. The current status of the project can be found on [FASB.org](http://FASB.org). For information on a proposal to amend CON 8, see the Technical Alert section in this chapter.

### **CON 8—Chapter 1: The Objective of General Purpose Financial Reporting**

Chapter 1 identifies the objective of financial reporting and indicates that this objective applies to all financial reporting. It is not limited to financial statements. The objective is to provide information that is useful in making decisions about providing resources to the entity. Users of financial information are identified as existing and potential investors, lenders, and other creditors. Chapter 1 is directed at general-purpose external financial reporting by a business enterprise as it relates to the ability of that enterprise to generate favorable cash flows.

Investors and creditors need financial reports that provide understandable information that will aid in predicting the future cash flows of an entity. The expectation of cash flows affects an entity's ability to meet the obligations of loans and other forms of credit and to pay interest and dividends, which in turn affects the market price of that entity's stocks and bonds.

To assess cash flows, financial reporting should provide information relative to an enterprise's economic resources, the claims against the entity, and the effects of transactions, events, and circumstances that change resources and claims to resources. A description of these informational needs follows:

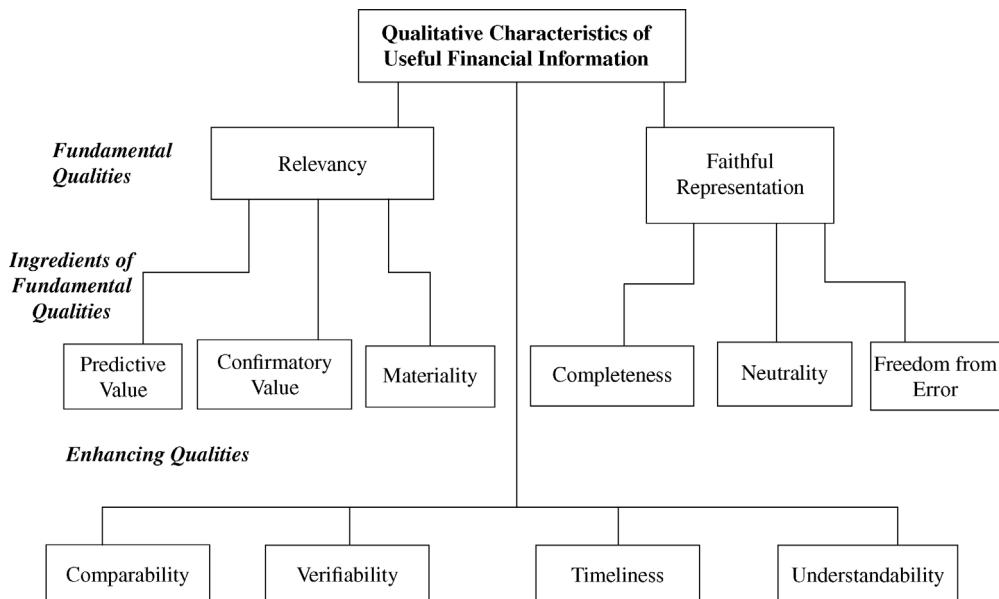

- *Economic resources, claims against the entity, and owners' equity.* This information provides the users of financial reporting with a measure of future cash flows and an indication of the entity's strengths, weaknesses, liquidity, and solvency.
- *Economic performance and earnings.* Past performance provides an indication of an entity's future performance. Furthermore, earnings based upon accrual accounting provide a better indicator of economic performance and future cash flows than do current cash receipts and disbursements. Accrual basis earnings are a better indicator because a charge for recovery of capital (depreciation/amortization) is made in determining these earnings. The relationship between earnings and economic performance results from matching the costs and benefits (revenues) of economic activity during a given period by means of accrual accounting. Over the life of an enterprise, economic performance can be determined by net cash flows or by total earnings since the two measures would be equal.

- *Liquidity, solvency, and funds flows.* Information about cash and other funds flows from borrowings, repayments of borrowings, expenditures, capital transactions, economic resources, obligations, owners' equity, and earnings may aid the user of financial reporting information in assessing a firm's liquidity or solvency.
- *Management stewardship and performance.* The assessment of a firm's management with respect to the efficient and profitable use of the firm's resources is usually made on the basis of economic performance as reported by periodic earnings. Because earnings are affected by factors other than current management performance, earnings may not be a reliable indicator of management performance.
- *Management explanations and interpretations.* Management is responsible for the efficient use of a firm's resources. Thus, it acquires knowledge about the enterprise and its performance that is unknown to the external user. Explanations by management concerning the financial impact of transactions, events, circumstances, uncertainties, estimates, judgments, and any effects of the separation of the results of operations into periodic measures of performance enhance the usefulness of financial information.

### CON 8—Chapter 3: Qualitative Characteristics of Useful Financial Information

The purpose of financial reporting is to provide decision makers with useful information. Individuals or standard-setting bodies should make accounting choices based upon the usefulness of that information to the decision-making process. CON 8—Chapter 3 identifies the qualities or characteristics that make information useful in the decision-making process. It also establishes a terminology to provide a greater understanding of the characteristics.

**Usefulness for decision.** This is the most important characteristic of information. Information must be useful to be beneficial to the user. To be useful, accounting information must both be *relevant* and *faithfully represent* what it claims to represent. Both of these fundamental qualitative characteristics are affected by the completeness of the information.

**Relevance.** Information is relevant to a decision if it makes a difference to the decision maker in his/her ability to predict events or to confirm or correct expectations. Relevant information will reduce the decision maker's assessment of the uncertainty of the outcome of a decision even though it may not change the decision itself. Information is relevant if it provides knowledge concerning:

- Past events (confirmatory value). Disclosure information is relevant because it provides information about past events.
- Future events (predictive value) and if it is timely. The predictive value of accounting information does not imply that such information is a prediction. The predictive value refers to the utility that a piece of information has as an input into a predictive model.

An item of information is material and should be reported if it is significant enough to have an effect on the decision maker. Materiality is entity specific. It is dependent upon the relative size of an item and nature of the item. Because materiality is evaluated in the context of an individual entity's financial report, the FASB could not offer quantitative standards of materiality.

**Faithful representation.** Financial statements are an abstraction of the activities of a business enterprise. They simplify the activities of the actual entity. To be faithfully representative, financial statements must portray the important financial relationships of the entity itself. Information is faithfully representative if it is:

- Complete,
- Neutral, and
- Free from errors.

A complete representation contains all the information that would enable users to understand the information. In addition to quantitative information, a particular item may need to include a description and explanation.

**Neutrality.** Neutrality means that accounting information should serve to communicate without attempting to influence behavior in a particular direction. This does not mean that accounting should not influence behavior or that it should affect everyone in the same way. It means that information should not favor certain interest groups.

Free from error does not mean perfectly accurate. However, it does mean that a description is:

- Accurately described,
- The explanation of the phenomenon is explained, and
- No errors have been made in selecting and reporting the process.

Information that is relevant and faithfully represented can be enhanced by:

- Comparability,
- Verifiability,
- Timeliness, and
- Understandability.

**Comparability.** To be useful, accounting information should be comparable. The characteristic of comparability allows the users of accounting information to assess the similarities and differences either among different entities for the same time period or for the same entity over different time periods. Comparisons are usually made on the basis of quantifiable measurements of a common characteristic. Therefore, to be comparable, the measurements used must be reliable with respect to the common characteristic. Noncomparability can result from the use of different inputs, procedures, or systems of classification.

Related to comparability, consistency is an interperiod comparison that requires the use of the same accounting principles from one period to another. Although a change of an accounting principle to a more preferred method results in inconsistency, the change is acceptable if the effect of the change is disclosed. Consistency, however, does not ensure comparability. If the measurements used are not representationally faithful, comparability will not be achieved.

**Verifiability** means that several independent measures will obtain the same accounting measure. An accounting measure that can be repeated with the same result (consensus) is desirable because it serves to detect and reduce measurer bias. Cash is highly verifiable. Inventories and depreciable assets tend to be less verifiable because alternative valuation methods exist. The direct verification of an accounting measure would serve to minimize measurer bias and measurement bias. The verification of the procedures used to obtain the measure would minimize measurer bias only. Finally, verifiability does not guarantee representational faithfulness or relevance.

**Timeliness.** Although timeliness alone will not make information useful, information must be timely to be useful.

**Understandability.** Financial reports must be understandable for users who have a “reasonable knowledge of business and economic activities and who review and analyze the information diligently” (CON 8, QC 32).

**Trade-offs.** Although it is desirable that accounting information contains the characteristics that have been identified above, not all of these characteristics are compatible. Often, one characteristic may be obtained only by sacrificing another. The trade-offs that must be made are determined on the basis of the relative importance of the characteristics. This relative importance, in turn, is dependent upon the nature of the users and their particular needs.

**Cost constraint.** The qualitative characteristics of useful accounting information are subject to a constraint: the relative cost-benefit of that information. Associated with the benefits to the user of accounting information is the cost of using that information and of providing it to the user. Information should be provided only if its benefits exceed its cost. Unfortunately, it is difficult to value the benefit of accounting information. It is also difficult to determine whether the burden of the cost of disclosure and the benefits of such disclosure are distributed fairly.

## CON 5: Recognition and Measurement in Financial Statements of Business Enterprises

CON 5 indicates that financial statements are the principal means of communicating useful financial information. A full set of such statements contains:

- Financial position at end of the period
- Earnings for the period
- Comprehensive income for the period
- Cash flows during the period
- Investments by and distributions to owners during the period.

Financial statements result from simplifying, condensing, and aggregating transactions. Therefore, no one financial statement provides sufficient information by itself and no one item or part of each statement can summarize the information.

A statement of financial position provides information about an entity’s assets, liabilities, and equity. Earnings are a measure of entity performance during a period. Earnings are similar to net income but exclude accounting adjustments from earlier periods such as cumulative effect changes in accounting principles. Comprehensive income comprises all recognized changes in equity other than those arising from investments by and distributions to owners. A statement of

cash flows reflects receipts and payments of cash by major sources and uses including operating, financing, and investing activities. The investments by and distributions to owners reflect the capital transactions of an entity during a period.

Income is determined by the concept of financial capital maintenance, which means that only if the money amount of net assets increases during a period (excluding capital transactions) is there a profit. For recognition in financial statements, subject to both cost-benefit and materiality constraints, an item must meet the following criteria:

1. Definition—Meet the definition of an element in financial statements
2. Measurability—Have a relevant attribute measurable with sufficient reliability
3. Relevance
4. Reliability.

Items reported in the financial statements are based on historical cost, replacement cost, market value, net realizable value, and present value of cash flows. Price level changes are not recognized in these statements and conservatism guides the application of recognition criteria.

## CON 6: Elements of Financial Statements

CON 3 was replaced by CON 6. CON 6 carried forward essentially all of the concepts in CON 3 and added the elements unique to the financial statements of not-for-profit organizations. CON 6 defines ten interrelated elements that are used in the financial statements of business enterprises:

1. *Assets*—Probable future economic benefits obtained or controlled by a particular entity as a result of past transactions or events.
2. *Liabilities*—Probable future sacrifices of economic benefits arising from present obligations of a particular entity to transfer assets or provide services to other entities in the future as a result of past transactions or events.
3. *Equity (Net Assets)*—The residual interest in the assets that remains after deducting its liabilities. In a business enterprise, equity is the ownership interest.
4. *Revenues*—Inflows or other enhancements of assets of an entity or settlement of its liabilities (or a combination of both) from delivering or producing goods, rendering services, or other activities that constitute the entity's ongoing major and central operations.
5. *Expenses*—Outflows or other using up of assets or incurrences of liabilities (or a combination of both) from delivering or producing goods, rendering services, or carrying out other activities that constitute the entity's ongoing major and central operations.
6. *Gains*—Increases in equity (net assets) from peripheral or incidental transactions of an entity and from all other transactions and other events and circumstances affecting the entity except those that result from revenues or investments by owners.
7. *Losses*—Decreases in equity (net assets) from peripheral or incidental transactions of an entity and from all other transactions and other events and circumstances affecting the entity except those that result from expenses or distributions to owners.
8. *Comprehensive Income*—The change in equity of a business enterprise during a period from transactions and other events and circumstances from sources other than investments by owners or distributions to owners.
9. *Investments by Owners*—Increases in equity of a particular business enterprise resulting from transfers to it for the purpose of increasing ownership interests.
10. *Distributions to Owners*—Decreases in the equity of a particular business enterprise resulting from transferring assets, rendering services, or incurring liabilities to owners.

Revenues are commonly distinguished from gains for three reasons. See the table below:

<i>Revenues</i>	<i>Gains</i>
Result from an entity's central operations	Result from incidental or peripheral activities of the entity
Are usually earned	Result from nonreciprocal transactions (such as winning a lawsuit or receiving a gift) or other economic events for which there is no earnings process
Are reported gross	Are reported net

Expenses are commonly distinguished from losses for three reasons:

<i>Expenses</i>	<i>Losses</i>
Result from an entity's central operations	Result from incidental or peripheral activities of the entity
Often incurred during the earnings process	Often result from nonreciprocal transactions (such as thefts or fines) or other economic events unrelated to an earnings process
Reported gross	Reported net

**Definitions of terms.** CON 6 also defines several significant financial accounting and reporting terms that are used in the Concepts Statements (and FASB pronouncements issued after the Concepts Statements).

An *event* is a happening of consequence to an entity. It can be an internal event (the use of raw materials) or an external event with another entity (the purchase of labor) or with the environment in which the business operates (a technological advance by a competitor).

A *transaction* is a particular kind of event. It is an external event that involves transferring something of value to another entity.

*Circumstances* are a condition, or set of conditions, that create situations that might otherwise not have occurred and might not have been anticipated.

*Accrual* is the accounting process of recognizing the effects of future cash receipts and payments in the current period. Accrual accounting attempts to record the financial effects on an entity of transactions and of other events and circumstances that have consequences for the entity in the periods in which those transactions, events, and circumstances occur rather than in the periods in which cash is received or paid by the entity.

*Deferral* is the accounting process of recognizing a liability resulting from a current cash receipt or an asset resulting from a current cash payment.

*Realization* is the process of converting noncash assets into cash.

*Recognition* is the process of formally incorporating a transaction or other event into the financial statements.

*Matching* is the simultaneous recognition of the revenues and expenses that result directly and jointly from the same transaction or other event.

*Allocation* is the process of assigning expenses to periods when the transactions or events that cause the using up of the benefits cannot be identified or when the cause can be identified but the actual amount of benefit used up cannot be reliably measured.

**Elements of not-for-profit financial statements.** CON 6 also discusses the elements used in the financial statements of not-for-profit organizations. Of the ten elements, seven are used by not-for-profit organizations. The three elements omitted are investments by owners, distributions

to owners, and comprehensive income. The net assets (equity) of not-for-profit organizations is divided into three classes—unrestricted, temporarily restricted, and permanently restricted—based on the existence or absence of donor-imposed restrictions.

### **CON 7: Using Cash Flow Information and Present Value in Accounting Measurements**

CON 7 provides a framework for using estimates of future cash flows as the basis for accounting measurements either at initial recognition or when assets are subsequently remeasured at fair value and for using the interest method of amortization. It provides the principles that govern measurement using present value, especially when the amount of future cash flows, their timing, or both are uncertain. However, it does not address recognition questions, such as which transactions and events should be valued using present value measures.

Fair value is the objective for most measurements at initial recognition and for fresh-start measurements in subsequent periods. At initial recognition, the cash paid or received (historical cost or proceeds) is usually assumed to be fair value, absent evidence to the contrary. For fresh-start measurements, a price that is observed in the marketplace for an essentially similar asset or liability is fair value. If purchase prices and market prices are available, there is no need to use alternative measurement techniques to approximate fair value. However, if alternative measurement techniques must be used for initial recognition and for fresh-start measurements, those techniques should attempt to capture the elements that when taken together would comprise a market price if one existed. The objective is to estimate the price likely to exist in the marketplace if there were a marketplace fair value.

CON 7 states that the only objective of using present value in accounting measurements is fair value. It is necessary to capture, to the extent possible, the economic differences in the marketplace between sets of estimated future cash flows. A present value measurement that fully captures those differences must include the following elements:

1. An estimate of the future cash flow, or in more complex cases, series of future cash flows at different times;
2. Expectations about possible variations in the amount or timing of those cash flows;
3. The time value of money, represented by the risk-free rate of interest;
4. The risk premium—the price for bearing the uncertainty inherent in the asset or liability;
5. Other factors, including illiquidity and market imperfections.

#### **How CON 7 measures differ from previously utilized present value techniques.**

Previously employed present value techniques typically used a single set of estimated cash flows and a single discount (interest) rate. In applying those techniques, adjustments for factors 2 through 5 described in the previous section are incorporated in the selection of the discount rate. In the CON 7 approach, only the third factor listed (the time value of money) is included in the discount rate; the other factors cause adjustments in arriving at risk-adjusted expected cash flows. CON 7 introduces the probability-weighted, expected cash flow approach, which focuses on the range of possible estimated cash flows and estimates of their respective probabilities of occurrence.

Previous techniques used to compute present value used estimates of the cash flows most likely to occur. CON 7 refines and enhances the precision of this model by weighting different cash flow scenarios (regarding the amounts and timing of cash flows) by their estimated probabilities of occurrence and factoring these scenarios into the ultimate determination of fair value. The difference is that values are assigned to the cash flows other than the most likely one. To illustrate, a cash flow might be \$100, \$200, or \$300, with probabilities of 10%, 50%, and 40%, respectively. The most likely cash flow is the one with 50% probability, or \$200. The expected cash flow is \$230 [ $= (\$100 \times .1) + (\$200 \times .5) + (\$300 \times .4)$ ].

The CON 7 method, unlike previous present value techniques, can also accommodate uncertainty in the timing of cash flows. For example, a cash flow of \$10,000 may be received in one year, two years, or three years, with probabilities of 15%, 60%, and 25%, respectively. Traditional present value techniques would compute the present value using the most likely timing of the payment—two years. The example below shows the computation of present value using the CON 7 method. Again, the expected present value of \$9,030 differs from the traditional notion of a best estimate of \$9,070 (the 60% probability) in this example:

Present value of \$10,000 in 1 year discounted at 5%	\$9,523
Multiplied by 15% probability	\$1,428
Present value of \$10,000 in 2 years discounted at 5%	\$9,070
Multiplied by 60% probability	5,442
Present value of \$10,000 in 3 years discounted at 5%	\$8,638
Multiplied by 25% probability	2,160
Probability weighted expected present value	<u><u>\$9,030</u></u>

**Measuring liabilities.** The measurement of liabilities involves different problems from the measurement of assets; however, the underlying objective is the same. When using present value techniques to estimate the fair value of a liability, the objective is to estimate the value of the assets required currently to (1) settle the liability with the holder or (2) transfer the liability to an entity of comparable credit standing. To estimate the fair value of an entity's notes or bonds payable, accountants look to the price at which other entities are willing to hold the entity's liabilities as assets. For example, the proceeds of a loan are the price that a lender paid to hold the borrower's promise of future cash flows as an asset.

The most relevant measurement of an entity's liabilities should always reflect the credit standing of the entity. An entity with a good credit standing will receive more cash for its promise to pay than an entity with a poor credit standing. For example, if two entities both promise to pay \$750 in three years with no stated interest payable in the interim, Entity A, with a good credit standing, might receive about \$630 (a 6% interest rate). Entity B, with a poor credit standing, might receive about \$533 (a 12% interest rate). Each entity initially records its respective liability at fair value, which is the amount of proceeds received—an amount that incorporates that entity's credit standing.

Present value techniques can also be used to value a guarantee of a liability. Assume that Entity B in the above example owes Entity C. If Entity A were to assume the debt, it would want to be compensated \$630—the amount that it could get in the marketplace for its promise to pay \$750 in three years. The difference between what Entity A would want to take the place of Entity B (\$630) and the amount that Entity B receives (\$533) is the value of the guarantee (\$97).

**Interest method of allocation.** CON 7 describes the factors that suggest that an interest method of allocation should be used. It states that the interest method of allocation is more relevant than other methods of cost allocation when it is applied to assets and liabilities that exhibit one or more of the following characteristics:

1. The transaction is, in substance, a borrowing and lending transaction.
2. Period-to-period allocation of similar assets or liabilities employs an interest method.
3. A particular set of estimated future cash flows is closely associated with the asset or liability.
4. The measurement at initial recognition was based on present value.

**Accounting for changes in expected cash flows.** If the timing or amount of estimated cash flows changes and the asset or liability is not remeasured at a fresh-start measure, the interest method of allocation should be altered by a catch-up approach. That approach adjusts the carrying

amount to the present value of the revised estimated future cash flows, discounted at the original effective interest rate.

**Application of present value tables and formulas.** *Present value of a single future amount.* To take the present value of a single amount that will be paid in the future, apply the following formula, in which  $PV$  is the present value of \$1 paid in the future,  $r$  is the interest rate per period, and  $n$  is the number of periods between the current date and the future date when the amount will be realized:

$$PV = \frac{1}{(1 + r)^n}$$

In many cases the results of this formula are summarized in a present value factor table:

(n) Periods	2%	3%	4%	5%	6%	7%	8%	9%	10%
1	0.9804	0.9709	0.9615	0.9524	0.9434	0.9346	0.9259	0.9174	0.9091
2	0.9612	0.9426	0.9246	0.9070	0.8900	0.8734	0.8573	0.8417	0.8265
3	0.9423	0.9151	0.8890	0.8638	0.8396	0.8163	0.7938	0.7722	0.7513
4	0.9239	0.8885	0.8548	0.8227	0.7921	0.7629	0.7350	0.7084	0.6830
5	0.9057	0.8626	0.8219	0.7835	0.7473	0.7130	0.6806	0.6499	0.6209

#### Example of a present value calculation

Suppose one wishes to determine how much would need to be invested today to have \$10,000 in 5 years if the sum invested would earn 8%. Looking across the row with  $n = 5$  and finding the present value factor for the  $r = 8\%$  column, the factor of 0.6806 would be identified. Multiplying \$10,000 by 0.6806 results in \$6,806, the amount that would need to be invested today to have \$10,000 at the end of 5 years. Alternatively, using a calculator and applying the present value of a single sum formula, one could multiply \$10,000 by  $1/(1 + .08)^5$ , which would also give the same answer—\$6,806.

*Present value of a series of equal payments (an annuity).* Many times in business situations a series of equal payments paid at equal time intervals is required. Examples of these include payments of semiannual bond interest and principal or lease payments. The present value of each of these payments could be added up to find the present value of this annuity, or alternatively a much simpler approach is available. The formula for calculating the present value of an annuity of \$1 payments over  $n$  periodic payments at a periodic interest rate of  $r$  is:

$$\text{PV Annuity} = \frac{\left(1 - \frac{1}{(1 + r)^n}\right)}{r}$$

The results of this formula are summarized in an annuity present value factor table:

(n) Periods	2%	3%	4%	5%	6%	7%	8%	9%	10%
1	0.9804	0.9709	0.9615	0.9524	0.9434	0.9346	0.9259	0.9174	0.9091
2	1.9416	1.9135	1.8861	1.8594	1.8334	1.8080	1.7833	1.7591	1.7355
3	2.8839	2.8286	2.7751	2.7233	2.6730	2.6243	2.5771	2.5313	2.4869
4	3.8077	3.7171	3.6299	3.5460	3.4651	3.3872	3.3121	3.2397	3.1699
5	4.7135	4.5797	4.4518	4.3295	4.2124	4.1002	3.9927	3.8897	3.7908

**Example of an annuity present value calculation**

Suppose four annual payments of \$1,000 will be needed to satisfy an agreement with a supplier. What would be the amount of the liability today if the interest rate the supplier is charging is 6% per year? Using the table to get the present value factor, the  $n = 4$  periods row, and the 6% column, gives you a factor of 3.4651. Multiply this by \$1,000 and you get a liability of \$3,465.10 that should be recorded. Using the formula would also give you the same answer with  $r = 6\%$  and  $n = 4$ .

Caution must be exercised when payments are not to be made on an annual basis. If payments are on a semiannual basis,  $n = 8$ , but  $r$  is now 3%. This is because  $r$  is the periodic interest rate, and the semiannual rate would not be 6%, but half of the 6% annual rate. Note that this is somewhat simplified, since due to the effect of compound interest 3% semianually is slightly more than a 6% annual rate.

**Example of the relevance of present values.** A measurement based on the present value of estimated future cash flows provides more relevant information than a measurement based on the undiscounted sum of those cash flows. For example, consider the following four future cash flows, all of which have an undiscounted value of \$100,000:

1. Asset A has a fixed contractual cash flow of \$100,000 due tomorrow. The cash flow is certain of receipt.
2. Asset B has a fixed contractual cash flow of \$100,000 due in 20 years. The cash flow is certain of receipt.
3. Asset C has a fixed contractual cash flow of \$100,000 due in 20 years. The amount that ultimately will be received is uncertain. There is an 80% probability that the entire \$100,000 will be received. There is a 20% probability that \$80,000 will be received.
4. Asset D has an *expected* cash flow of \$100,000 due in 20 years. The amount that ultimately will be received is uncertain. There is a 25% probability that \$120,000 will be received. There is a 50% probability that \$100,000 will be received. There is a 25% probability that \$80,000 will be received.

Assuming a 5% risk-free rate of return, the present values of the assets are:

1. Asset A has a present value of \$99,986. The time value of money assigned to the one-day period is \$14 [ $\$100,000 \times .05/365$  days].
2. Asset B has a present value of \$37,689 [ $\$100,000/(1 + .05)^{20}$ ].
3. Asset C has a present value of \$36,181 [ $(\$100,000 \times .8 + \$80,000 \times .2)/(1 + .05)^{20}$ ].
4. Asset D has a present value of \$37,689 [ $(\$120,000 \times .25 + \$100,000 \times .5 + \$80,000 \times .25)/(1 + .05)^{20}$ ].

Although each of these assets has the same undiscounted cash flows, few would argue that they are economically the same or that a rational investor would pay the same price for each. Investors require compensation for the time value of money. They also require a risk premium. That is, given a choice between Asset B with expected cash flows that are certain and Asset D with cash flows of the same expected amount that are uncertain, investors will place a higher value on Asset B, even though they have the same expected present value. CON 7 says that the risk premium should be subtracted from the expected cash flows before applying the discount rate. Thus, if the risk premium for Asset D was \$500, the risk-adjusted present values would be \$37,500  $\{[\($120,000 \times .25 + \$100,000 \times .5 + \$80,000 \times .25) - 500]/(1 + .05)^{20}\}$ .

**Practical matters.** Like any accounting measurement, the application of an expected cash flow approach is subject to a cost-benefit constraint. The cost of obtaining additional information

must be weighed against the additional reliability that information will bring to the measurement. As a practical matter, an entity that uses present value measurements often has little or no information about some or all of the assumptions that investors would use in assessing the fair value of an asset or a liability. Instead, the entity must use the information that is available to it without undue cost and effort when it develops cash flow estimates. The entity's own assumptions about future cash flows can be used to estimate fair value using present value techniques, as long as there are no contrary data indicating that investors would use different assumptions. However, if contrary data exist, the entity must adjust its assumptions to incorporate that market information.

## PERSPECTIVE AND ISSUES

---

### Subtopics

ASC 205, *Presentation of Financial Statements*, is divided into four subtopics:

- ASC 205-10, *Overall*, which emphasizes the value of comparative financial statements.
- ASC 205-20, *Discontinued Operations*, which provides guidance on reporting the results of operations when:
  - A component of an entity has been disposed of or is classified as held for sale, and
  - A business or nonprofit activity that, on acquisition, is classified as held for sale.
- ASC 205-30, *Liquidation Basis of Accounting*, provides guidance on when and how to prepare liquidation basis of accounting financial statements and the related disclosures.
- ASC 204-40, *Going Concern*, which provides guidance for evaluating whether there is substantial doubt about an entity's ability to continue as a going concern.

### Scope and Scope Exceptions

**ASC 205-20.** The guidance in 205-20 applies to either:

- A component of an entity or a group of components that is disposed of or is classified as held for sale, *or*
- A business or nonprofit entity that, on acquisition, is classified as held for sale.  
(ASC 205-20-15-2)

The guidance does *not* apply to oil and gas properties that use the full-cost method of accounting prescribed by the SEC. (ASC 205-20-15-23)

**ASC 205-30.** ASC 205-30 does not apply to companies registered under the Investment Company Act of 1945.

## DEFINITIONS OF TERMS

---

Source: ASC 205, *Glossaries*. Also see Appendix A, *Definitions of Terms*, for other terms related to this topic: Business, Component of an Entity, Comprehensive Income, Fair Value, Financial Statements are Available to be Issued, Financial Statements are Issued, Firm Purchase Commitment, Market Participants, Net Income, Nonprofit Activity, Not-for-Profit Entity, Operating Segment, Other Comprehensive Income, Probable, Public Business Entity, Related Parties, Reporting Unit.

**Asset Group.** An asset group is the unit of accounting for a long-lived asset or assets to be held and used, which represents the lowest level for which identifiable cash flows are largely independent of the cash flows of other groups of assets and liabilities.

**Disposal Group.** A disposal group for a long-lived asset or assets to be disposed of by sale or otherwise represents assets to be disposed of together as a group in a single transaction and liabilities directly associated with those assets that will be transferred in the transaction. A disposal group may include a discontinued operation along with other assets and liabilities that were not part of the discontinued operation.

**Liquidation.** The process by which an entity converts its assets to cash or other assets and settles its obligations with creditors in anticipation of the entity ceasing all activities. Upon cessation of the entity's activities, any remaining cash or other assets are distributed to the entity's investors or other claimants (albeit sometimes indirectly). Liquidation may be compulsory or voluntary. Dissolution of an entity as a result of that entity being acquired by another entity or merged into another entity in its entirety and with the expectation of continuing its business does not qualify as liquidation.

**Orderly Transactions.** A transaction that assumes exposure to the market for a period before the measurement date to allow for marketing activities that are usual and customary for transactions involving such assets or liabilities; it is not a forced transaction (for example, a forced liquidation or distress sale).

**Settlement of a Pension or Postretirement Benefit Obligation.** A transaction that is an irrevocable action, relieves the employer (or the plan) of primary responsibility for a pension or postretirement benefit obligation, and eliminates significant risks related to the obligation and the assets used to effect the settlement.

**Statement of Changes in Net Assets in Liquidation.** A statement that presents the changes during the period in net assets available for distribution to investors and other claimants during liquidation.

**Statement of Net Assets in Liquidation.** A statement that presents a liquidating entity's net assets available for distribution to investors and other claimants as of the end of the reporting period.

**Substantial Doubt About an Entity's Ability to Continue as a Going Concern.** Substantial doubt about an entity's ability to continue as a going concern exists when conditions and events, considered in the aggregate, indicate that it is probable that the entity will be unable to meet its obligations as they become due within one year after the date that the financial statements are issued (or within one year after the date that the financial statements are available to be issued when applicable). The term *probable* is used consistently with its use in Topic 450 on contingencies.

## CONCEPTS, RULES, AND EXAMPLES

---

### ASC 205-10, Overall

**Comparative Statements.** To increase the usefulness of financial statements, many entities include financial statements for one or more prior years in their annual reports. Some also include five- or ten-year summaries of condensed financial information. Comparative financial statements allow investment analysts and other interested readers to perform comparative analysis of pertinent information. ASC 205-10-45-1 explains that the presentation of comparative financial statements in annual reports enhances the usefulness of such reports and brings out more clearly the nature and trends of current changes affecting the enterprise. Comparative presentation emphasizes the fact that the statements for a series of periods are far more significant than those for a single period and that the accounts for one period are but an installment of what is essentially a continuous history. A full set of financial statements consists of:

1. Financial position at the end of the period
2. Earnings (net income), which may be shown in a separate statement or within one continuous statement of comprehensive income
3. Comprehensive income for the period in one statement or two consecutive statements
4. Cash flows during the period
5. Investments by and distributions to the owners during the period.

(ASC 205-10-45-1A)

**Changes affecting comparability.** ASC 205 emphasizes the principle of comparability and the importance of consistency to comparability. To the extent they remain significant, notes to financial statements should be repeated in comparative statements or at least referred to. Any exceptions to comparability must be disclosed as described in ASC 250. If because of reclassification or other reasons the manner of or basis for presenting corresponding items has changed, that change must be explained. (ASC 205-10-50-1)

### ASC 205-20, Discontinued Operations

The Codification requires entities to report discontinued operations separately on the balance sheet. The objective is to provide comparability for an entity's continuing operations. ASC 205-20 provides guidance on which disposals can be presented as discontinued operations.

**Determining When a Disposal Should Be Presented as a Discontinued Operation.** The unit of account for a discontinued operation is:

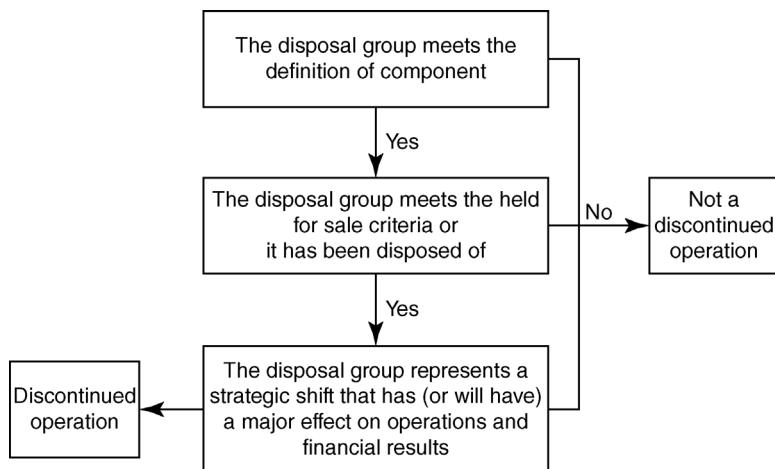

- A component of an entity,
- A group of components of an entity, or
- A business or nonprofit entity.

The guidance describes a discontinued operation as a disposal of a component or group of components that:

1. Is disposed of by sale, classified as held for sale, or disposed by other than sale (for example, by abandonment, exchange, or distribution to owner), *and*
2. Represents a strategic shift that has (or will have) a major effect on an entity's operations and financial results.

(ASC 205-20-45-1B)

### Exhibit—Classification as a Discontinued Operation

**The Concept of a Strategic Shift.** The guidance states that a strategic shift could include:

- A major geographical area of operations,
  - A major line of business,
  - A major equity method investment, or
  - Other major parts of an entity.
- (ASC 205-20-45-1C)

Strategic shift is an entity-specific concept, based on the qualitative and quantitative conditions of a particular entity. An entity will need to use considerable judgment to determine whether a strategic shift has occurred. The guidance does not define “major” in major strategic shift, but does provide several detailed examples. However, even with reference to the examples, there is a degree of judgment involved in making the determination of whether a major shift has occurred.

FASB avoided using a bright line quantitative threshold measurement when determining whether a strategic shift exists. However, the Codification does provide case studies with the following sales measures:

- Product line that represents 15% of a reporting entity’s total revenues
- Geographical area that represents 20% of a reporting entity’s total assets
- All stores in one of its two types of formats that represents 30% of historic net income and 15% of current period net income
- Component that is an equity method investment representing 20% of the entity’s total assets
- 80% of a product line that accounts for 40% of total revenue.

**Classification as Held for Sale.** A component or group of components is classified as held for sale in the period in which *all* of the following occur:

- a. Management commits to a plan to sell the entity.
- b. The entity to be sold is available for immediate sale.
- c. The entity has taken action to complete the plan, including a program to find a buyer or other actions.

- d. The sale or transfer of the entity to be sold is probable and is expected to be recognized as a completed sale within one year, unless events beyond the entity's control occur.
  - e. The entity to be sold is being actively marketed at a price that is reasonable in relation to its current fair value, indicating the entity's intent and ability to sell the entity, and the entity to be sold is available for immediate sale.
  - f. Actions required to complete the plan to sell make it unlikely that the plan will be withdrawn or changed in any significant way.
- (ASC 205-20-45-1E)

These criteria mirror those in ASC 360-10-45-9. For those components that have been disposed of or classified as held for sale, but that do not meet the requirements for reporting as discontinued operations, the entity should look to ASC 360-10-45 on long-lived assets classified as held for sale or to be disposed of for guidance. (ASC 205-10-05-3A)

If at any time the criteria for held for sale are no longer met, the entity to be sold is reclassified as held and used.

Any business or nonprofit activity that on the date of acquisition meets the held for sale criteria must be presented as a discontinued operation whether or not it meets the strategic shift criteria. (ASC 205-20-45-1D) This avoids including in operations an activity that will never be part of continuing operations.

#### Example—Determination of Whether to Report Discontinued Operations

Software Solutions Plus offers four major product lines. It has a children's educational line, a children's game line, a business office line, and a desktop publishing line. The product line is the lowest level at which the operations and cash flows can be clearly distinguished by management. Each line is branded and has distinguishable operations and cash flow. Therefore, each product line includes a group of components of the entity.

**Case 1**—Software Solutions Plus decides to shift its strategy and exit the game business and commits to a plan to sell the children's game line. The assets and liabilities of the product line are classified as held for sale at that date. Software Solutions Plus has decided that it will not develop any new computer games for the children's market. In this case, the conditions are met to report the children's game line as a discontinued operation.

**Case 2**—Instead of exiting the children's game business entirely as in Case 1, Software Solutions Plus decides to keep its game programmers on its staff and have them develop new children's games. However, instead of selling the games to the home market via distributors as it had been doing, each existing and newly developed game will be marketed and sold to other software game companies. Software Solutions Plus will not provide technical support for any particular game software after it is sold. It will continue to have revenues and expenses related to the children's game product line. Thus, management concludes there is not a major strategic shift. The change in the manner of marketing the line cannot be reported in discontinued operations.

**Case 3—Discontinued Product Not a Component of the Entity.** Software Solutions Plus decides to discontinue developing and selling its graphics drawing program product, which is part of the desktop publishing product line. In this case, because the graphics drawing program product is not a component of the entity on its own, but instead is part of the component desktop publishing product line, the sale of the graphics drawing program cannot be reported in discontinued operations.

**Presentation—Balance Sheet.** In the period that a discontinued operation is classified as held for sale or is disposed of and for all prior reporting periods, entities must separately present assets and liabilities of the discontinued operation on the face of the balance sheet. Those assets and liabilities should not be offset and presented as a single line item. Disposal groups may meet

the held-for-sale criteria of a discontinued operation but not meet the definition of a discontinued operation. In those cases, the entity must separately present assets and liabilities on the face of the balance sheet in the period in which the disposal group is classified as held for sale and the entity does not have to reclassify previously reported amounts. (ASC 205-20-45-10)

The entity must also disclose the major classes of assets and liabilities of a discontinued operation on the face of the balance sheet or in the notes. (ASC 205-20-50-5B(e)) Guidance does not specify the major classes, but one of the examples includes cash, trade receivables, inventories, property, plant and equipment, trade payables, and short-term borrowings.

**Presentation—Income Statement.** In the period in which a component of an entity is reported as a discontinued operation, the results of operations of that component are reported as a separate component of income, before the cumulative effect of accounting changes. Any gain or loss recognized on disposal is reported separately on the face of the income statement or disclosed in the notes. The income statements of any prior periods being presented should be restated to also reflect the results of operations of the component as discontinued operations. All amounts should be reported less applicable income taxes (benefits), as shown in the example below. If a disposal does not qualify as a discontinued operation, it should be included in income from continuing operations. (ASC 205-20-45-3 and 3B)

The gain or loss is calculated based on guidance in other topics. For example, if the discontinued operation is within the scope of ASC 360, *Property, Plant and Equipment*, guidance can be found in that topic and in the related chapter in this book. (ASC 205-20-45-3C)

#### Example of Income Statement Presentation for Discontinued Operations

	<u>20X2</u>	<u>20X1</u>
Income from continuing operations before income taxes	\$ 598	\$ 583
Income taxes	<u>239</u>	<u>233</u>
Income from continuing operations	<u>359</u>	<u>350</u>
Discontinued operations (Note _____)		
Loss from operations of discontinued component	1,165	1,045
Loss on disposal of discontinued component	167	
Income tax benefit	<u>532</u>	<u>418</u>
Loss on discontinued operations	<u>800</u>	<u>277</u>
Net income	<u><u>\$ (441)</u></u>	<u><u>\$ (282)</u></u>

#### Treatment of Other Items

Allocation of overhead	General corporate overhead may not be allocated to discontinued operations. (ASC 205-20-45-9)
Interest—buyer assumes debt of the entity or the entity is required to repay debt	Allocated to discontinued operations. (ASC 205-20-45-6)
Interest—other consolidated interest	Allocation to discontinued operations is permitted but not required. (ASC 205-20-45-7) If allocated, look to guidance in ASC 205-20-55.

**Adjustments to Amounts Previously Reported.** Circumstances may be such that amounts previously reported in discontinued operations may need to be adjusted in a subsequent period.

If so, those adjustments should be presented separately in the discontinued operations section of the income statement. (ASC 205-20-45-4) Adjustments may result from such events as resolution of contingencies or settlement of employee benefit plan obligations.

### **ASC 205-30, Liquidation Basis of Accounting**

Guidance requires financial statements to be prepared using the liquidation basis of accounting (see Definitions of Terms section in this chapter) when liquidation is imminent. Liquidation is considered imminent when either of the following occurs:

- A plan for liquidation is approved by the person or persons with the authority to make such a plan effective, and the likelihood is remote that either of the following will occur:
    - The execution of the plan will be blocked by other parties
    - The entity will return from liquidation.
  - A plan for liquidation is being imposed by other forces, such as involuntary bankruptcy, and the likelihood is remote that the entity will return from liquidation.
- (ASC 205-30-25-2)

**Measurement.** An entity using the liquidation basis of accounting may have items that it now intends to sell or use to settle liabilities, but that were previously recognized, e.g., trademarks. Those items may be recognized in the aggregate and should be recognized for the amount expected to be realized. (ASC 205-30-30-1) Liabilities should be recognized in accordance with relevant guidance in other Topics. However, the entity should not anticipate being legally released from its debt. (ASC 205-30-30-2) Estimated costs to dispose of assets or other items to be sold in liquidation should be accrued, but discount provisions should not be applied. (ASC 205-30-30-3) Those costs should be presented in the aggregate, but separate from the related assets or items. If and when it has a reasonable basis for estimation, the entity should accrue costs and income expected to be incurred or earned through the end of the liquidation. (ASC 205-25-4 through 7)

The entity must remeasure its assets, liabilities, and disposal cost and income accruals at each measurement date.

**Financial statements.** The entity must at least prepare:

- A statement of net assets in liquidation, and
  - A statement of changes in net assets in liquidation.
- (ASC 205-30-45-1)

The liquidation basis of accounting should be applied prospectively from the day the liquidation becomes imminent. The initial statement of changes in net assets in liquidation should present changes that occurred only during the period since liquidation became imminent. (ASC 205-30-45-2)

### **ASC 205-40, Going Concern**

In August 2014, the FASB issued ASU 2014-15, *Presentation of Financial Statements—Going Concern (Subtopic 205-40): Disclosure of Uncertainties about an Entity’s Ability to Continue as a Going Concern*. This ASU essentially, with some changes, mirrors going concern requirements for auditors currently found in PCAOB and AICPA standards. Management must perform at least annually an evaluation of the entity’s ability to continue as a going concern within one year after the financial statements issuance date. The assessment should be performed for each

annual and interim period. ASU 2014-15 is effective for annual periods ending after December 15, 2016 and for annual periods and interim periods thereafter. Early adoption is permitted.

**Evaluating Conditions and Events That May Raise Substantial Doubts.** Management must evaluate, in the aggregate, conditions and events that are known or reasonably knowable at the evaluation date. The initial assessment should not take into account the mitigating effect of management's potential actions. Substantial doubt exists if it is probable that the entity will not be able to meet its obligations within one year after the issuance date of the financial statements. When making this evaluation, management should consider quantitative and qualitative information about:

- The entity's current financial condition, including its liquidity sources
- The entity's conditional and unconditional obligation due within the year
- The fund's required to maintain operations
- Other conditions that in the light of the above may adversely affect the entity's ability to meet its obligations.

(ASC 205-40-50-5)

Indicators of adverse conditions or events include:

- Negative financial trends
- Default on obligations
- Work stoppages
- Labor difficulties
- Substantial dependence on success of a particular project
- Unprofitable long-term commitments
- Legal proceedings
- Legislation that might jeopardize the entity's ability to operate
- Loss of a key patent or franchise
- Loss of a major customer or supplier
- Underinsured natural catastrophe.

**Consideration of Management's Plans When Substantial Doubt Is Raised.** If the above conditions raise substantial doubt about a going concern, that it is probable that the entity will be unable to meet its obligations, management must assess its plans to mitigate the issues and whether they will alleviate the substantial doubt. Management's plans may include:

- Disposing of an asset or business
- Borrowing money
- Restructuring debt
- Reducing expenditures
- Delaying expenditures
- Increasing ownership equity.

(ASC 205-40-3)

These plans can be considered only if both of the following conditions are met:

- It is probable that the plans will be effectively implemented within the year.
- It is probable that the plans when implemented will mitigate the conditions or events that raise substantial doubt about a going concern.

(ASC 205-40-50-7)

The probability threshold is the same as used for accounting for contingencies—more likely than not. In order for these plans to be considered, generally, management or those with authority must approve the plans before the issuance date of the financial statements. (ASC 205-40-50-8)

### Disclosure Requirements

Management Conclusion	Disclosures
Conditions do not give rise to substantial doubt	No specific disclosures are required.
Substantial doubt that is alleviated by management's plans	<ul style="list-style-type: none"> <li>• Principal conditions or events that raised substantial doubt,</li> <li>• Management's evaluation of the significance of those conditions or events in relation to the entity's ability to meet its obligations, and</li> <li>• Management's plans that alleviated those concerns.</li> </ul> <p>(ASC 205-40-50-12)</p>
After considering all the facts and management's plans, management concludes that substantial doubt remains	<ul style="list-style-type: none"> <li>• A statement that there is substantial doubt about the entity's ability to continue as a going concern within one year after the date that the financial statements are issued or available to be issued.</li> <li>• Disclosures that allow users to understand:           <ul style="list-style-type: none"> <li>• Principal conditions or events that raised substantial doubt,</li> <li>• Management's evaluation of the significance of those conditions or events in relation to the entity's ability to meet its obligations, and</li> <li>• Management's plans to mitigate the conditions or events.</li> </ul> </li> </ul> <p>(ASC 205-40-50-13)</p>

The above disclosures must be presented in subsequent financial statements as long as substantial doubt exists. If any changes in conditions or events occur, they should be explained. It is expected that as more is known, the disclosure will become more extensive. If the substantial doubt is resolved in a subsequent period, the entity must disclose how it was resolved. (ASC 205-40-50-14)

## PERSPECTIVE AND ISSUES

---

### Subtopics

ASC 210, *Balance Sheets*, is divided into two subtopics:

- ASC 210-10, *Overall*, which focuses on the presentation of the balance sheet, particularly the operating cycle and current assets and liabilities, and
- ASC 210-20, *Offsetting*, which offers guidance on offsetting amounts for certain contracts and repurchase agreements accounted for as collateralized borrowings and reverse repurchase agreements accounted for as collateralized borrowings.

### Scope and Scope Exceptions

The guidance in ASC 210-20 does not apply to:

The derecognition or nonrecognition of assets and liabilities. Derecognition by sale of an asset or extinguishment of a liability results in removal of a recognized asset or liability and generally results in the recognition of gain or loss. Although conceptually different, offsetting that results in a net amount of zero and derecognition with no gain or loss are indistinguishable in their effects on the statement of financial position. Likewise, not recognizing assets and liabilities of the same amount in financial statements achieves similar reported results. (ASC 205-10-15-2)

Generally, right of setoff involves only two parties. Exceptions are limited to the guidance in these subtopics and paragraphs:

1. ASC 840-30, paragraphs 32 through 52 (leveraged leases)
2. ASC 842-50 (leveraged leases)
3. ASC 715-30 (accounting for pension plan assets and liabilities)

4. ASC 715-60 (accounting for plan assets and liabilities)
5. ASC 740-10 (net tax asset or liability amounts reported)
6. ASC 815, paragraphs 815-10-45-1 through 45-7 (derivative instruments with the right to reclaim cash collateral or the obligation to return cash collateral)
7. ASC 940-320 (trade date accounting for trading portfolio positions) and 910-405 (advances received on construction contracts)
8. ASC 942-305, paragraph 45-1 (reciprocal balances with other banks).

## Overview

Statements of financial positions (also commonly known as balance sheets and also referred to as statements of financial condition) present information about assets, liabilities, and owners' equity and their relationships to each other. They reflect an entity's resources (assets) and its financing structure (liabilities and equity) in conformity with generally accepted accounting principles. The statement of financial position reports the aggregate effect of transactions at a point in time, whereas the statements of income, retained earnings, comprehensive income, and cash flows all report the effect of transactions occurring during a specified period of time such as a month, quarter, or year.

It is common for the statement of financial position to be divided into classifications based on the length of the entity's operating cycle. Assets are classified as current if they are reasonably expected to be converted into cash, sold, or consumed either within one year or within one operating cycle, whichever is longer. Liabilities are classified as current if they are expected to be liquidated through the use of current assets or incurring other current liabilities. The excess or deficiency of current assets over or under current liabilities, which is referred to as net working capital, identifies, if positive, the relatively liquid portion of the entity's capital that is potentially available to serve as a buffer for meeting unexpected obligations arising within the ordinary operating cycle of the business.

## Practice Alerts

Financial statement classification is a frequent topic of SEC comment letters. While SEC rules only apply to public entities, preparers of financial statements can benefit from the findings of SEC reviewers. The classification of current and noncurrent assets and liabilities, including debt, have been a source of SEC staff comments. Preparers should look to the guidance in ASC 210-10-45 and the discussion in this chapter when preparing classified balance sheets to determine whether an item should be classified as current or noncurrent.

## DEFINITIONS OF TERMS

---

Source: ASC 210, *Glossaries*. Also see Appendix A, *Definitions of Terms*, for additional terms relevant to this section: Cash, Cash Equivalents, Contract, Derivative Instrument, Lease, Lessee, Lessor, Leveraged Lease, Underlying Asset, Working Capital.

**Current Assets.** Current assets is used to designate cash and other assets or resources commonly identified as those that are reasonably expected to be realized in cash or sold or consumed during the normal operating cycle of the business.

**Current Liabilities.** Current liabilities is used principally to designate obligations whose liquidation is reasonably expected to require the use of existing resources properly classifiable as current assets, or the creation of other current liabilities.

**Daylight Overdraft.** Daylight overdraft or other intraday credit refers to the accommodation in the banking arrangements that allows transactions to be completed even if there is insufficient cash on deposit during the day provided there is sufficient cash to cover the net cash requirement at the end of the day. That accommodation may be through a credit facility, including a credit facility for which a fee is charged, or from a deposit of collateral.

**Operating Cycle.** The average time intervening between the acquisition of materials or services and the final cash realization constitutes an operating cycle.

**Repurchase Agreement Accounted for as a Collateralized Borrowing.** A repurchase agreement (repo) refers to a transaction in which a seller-borrower of securities sells those securities to a buyer-lender with an agreement to repurchase them at a stated price plus interest at a specified date or in specified circumstances. A repurchase agreement accounted for as a collateralized borrowing is a repo that does not qualify for sale accounting under Topic 860. The payable under a repurchase agreement accounted for as a collateralized borrowing refers to the amount of the seller-borrower's obligation recognized for the future repurchase of the securities from the buyer-lender. In certain industries, the terminology is reversed; that is, entities in those industries refer to this type of agreement as a reverse repo.

**Reverse Repurchase Agreement Accounted for as a Collateralized Borrowing.** A reverse repurchase agreement accounted for as a collateralized borrowing (also known as a reverse repo) refers to a transaction that is accounted for as a collateralized lending in which a buyer-lender buys securities with an agreement to resell them to the seller-borrower at a stated price plus interest at a specified date or in specified circumstances. The receivable under a reverse repurchase agreement accounted for as a collateralized borrowing refers to the amount due from the seller-borrower for the repurchase of the securities from the buyer-lender. In certain industries, the terminology is reversed; that is, entities in those industries refer to this type of agreement as a repo.

**Right of Setoff.** A right of setoff is a debtor's legal right, by contract or otherwise, to discharge all or a portion of the debt owed to another party by applying against the debt an amount that the other party owes to the debtor.

**Securities Custodian.** The securities custodian for a securities transfer system may be the bank or financial institution that executes securities transfers over the securities transfer system, and book entry securities exist only in electronic form on the records of the transfer system operator for each entity that has a security account with the transfer system operator.

**Short-Term Obligations.** Short-term obligations are those that are scheduled to mature within one year after the date of an entity's balance sheet or, for those entities that use the operating cycle concept of working capital, within an entity's operating cycle that is longer than one year.

## CONCEPTS, RULES, AND EXAMPLES

---

### Form of the Statement of Financial Position

The format of a statement of financial position is not specified by any authoritative pronouncement. Instead, formats and titles have developed as a matter of tradition and, in some cases, through industry practice.

Two basic formats are used:

1. The balanced format, in which the sum of the amounts for liabilities and equity are added together on the face of the statement to illustrate that assets equal liabilities plus equity.
2. The less frequently presented equity format, which shows totals for assets, liabilities, and equity, but no sums illustrating that assets less liabilities equal equity.

Those two formats can take one of two forms:

1. The account form, presenting assets on the left-hand side of the page and liabilities and equity on the right-hand side.
2. The report form, which is a top-to-bottom or running presentation.

The three elements customarily displayed in the heading of a statement of financial position are:

1. The legal name of the entity whose financial position is being presented
2. The title of the statement (e.g., statement of financial position or balance sheet)
3. The date of the statement (or statements, if multiple dates are presented for comparative purposes).

**Entity's name.** The entity's legal name appears in the heading exactly as specified in the document that created it (e.g., the certificate of incorporation, partnership agreement, LLC operating agreement, etc.). The legal form of the entity is often evident from its name when the name includes such designations as "incorporated," "LLP," or "LLC." Otherwise, the legal form is either captioned as part of the heading or disclosed in the notes to the financial statements. A few examples are as follows:

**ABC Company**  
(a general partnership)  
**ABC Company**  
(a sole proprietorship)  
**ABC Company**  
(a division of DEF, Inc.)

The use of the titles "statement of financial position," "balance sheet," or "statement of financial condition" infers that the statement is presented using generally accepted accounting principles. If, instead, some financial reporting framework such as income tax basis or cash basis is used, the financial statement title must be revised to reflect this variation. The use of a title such as "Statements of Assets and Liabilities—Income Tax Basis" is necessary to differentiate the financial statement being presented from a GAAP statement of financial position.

**Date.** The last day of the fiscal period is used as the statement date. Usually, this is a month-end date unless the entity uses a fiscal reporting period always ending on a particular day of the week such as Friday or Sunday. In these cases, the statement of financial position would be dated accordingly (i.e., December 26, October 1, etc.).

**Consistency of format.** Statements of financial position generally are uniform in appearance from one period to the next with consistently followed form, terminology, captions, and patterns of combining insignificant items. If changes in the manner of presentation are made when comparative statements are presented, the prior year's information must be restated to conform to the current year's presentation.

#### **ASC 205-10, Overall**

Assets, liabilities, and shareholders' equity are separated in the statement of financial position so that important relationships can be shown and attention can be focused on significant subtotals.

**Current assets.** Current assets are cash and other assets that are reasonably expected to be realized in cash or sold or consumed during the normal operating cycle of the business. (ASC 210-10-05-4) When the normal operating cycle is less than one year, a one-year period is used to

distinguish current assets from noncurrent assets. When the operating cycle exceeds one year, the operating cycle will serve as the proper period for purposes of current asset classification. (ASC 210-10-45-3) When the operating cycle is very long, the usefulness of the concept of current assets diminishes. The following items are classified as current assets:

1. *Cash and cash equivalents* include cash on hand consisting of coins, currency, undeposited checks; money orders and drafts; demand deposits in banks; and certain short-term, highly liquid investments. Any type of instrument accepted by a bank for deposit would be considered to be cash. Cash must be available for withdrawal on demand. Cash that is restricted as to withdrawal, such as certificates of deposit, would not be included with cash because of the time restrictions. Cash must be available for current use in order to be classified as a current asset. Cash that is restricted in use would not be included in cash unless its restrictions will expire within the operating cycle. Cash restricted for a noncurrent use, such as cash designated for the purchase of property or equipment, would not be included in current assets. (ASC 210-10-45-4) Cash equivalents include short-term, highly liquid investments that:
  - a. are readily convertible to known amounts of cash, and
  - b. are so near their maturity (maturities of three months or less from the date of purchase by the entity) that they present negligible risk of changes in value because of changes in interest rates.

U.S. Treasury bills, commercial paper, and money market funds are all examples of cash equivalents. Only instruments with original maturity dates of three months or less qualify as cash equivalents. (ASC 205-10-45-1)

2. *Short-term investments* are readily marketable securities representing the investment of cash available for current operations. To be classified as current assets, management must be willing and able to sell the security to meet current cash needs, or the investment must mature within one year (or the operating cycle, if longer). These securities are accounted for under ASC 320. Securities classified as trading securities must be reported as current assets. Securities classified as held-to-maturity or available-for-sale are reported as either current or noncurrent depending upon management's intended holding period, the security's maturity date (if any), or both. It is not necessary to show the ASC 320 classification on the face of the statement of financial position. Short-term investments can be combined into a single line if the classification details appear in the notes to the financial statements. The statement of financial position presentation might look as follows:

Marketable securities	\$xxx
-----------------------	-------

3. *Receivables* include accounts and notes receivable, receivables from affiliated entities, and officer and employee receivables. The term "accounts receivable" is generally understood to represent amounts due from customers arising from transactions in the ordinary course of business (sometimes referred to as "trade receivables"). Valuation allowances, if any, must be clearly stated. Estimates of needed allowances for uncollectibility may be based on historical correlations of bad debt experience as a percentage of sales or based on a direct credit quality analysis of the receivables. Valuation allowances to reflect the time value of money (discounts) are reported with the related receivable. If material, the

different components that comprise receivables should be separately stated. Receivables pledged as collateral are disclosed in the notes to the financial statements. The receivables section of a statement of financial position might be presented as follows:

Receivables:	
Accounts	\$xxx
Notes	<u>xxx</u>
	xxx
Less allowance for uncollectible accounts	(xxx)
	xxx
Affiliated companies	xxx
Officers and employees	<u>xxx</u>
	\$xxx

4. *Inventories* are goods on hand and available-for-sale. The basis of valuation and the method of pricing are to be disclosed. One form of presentation is as follows:

Inventories—at the lower of cost or market (specific identification)	\$xxx
---	-------

In the case of a manufacturing concern, raw materials, work in process, and finished goods must be stated separately on the statement of financial position or disclosed in the notes to the financial statements. Customarily, the components of manufacturing inventories are stated in order of their readiness for sale and ultimate conversion to cash—that is, finished goods are ready for sale, work in process is closer to being finished than raw materials, and, of course, raw materials have not yet been placed into production. The disclosures must also include the basis upon which the amounts are stated and where practical the method of determining cost. A sample form of presentation is as follows:

Inventories:	
Finished goods	\$xxx
Work in process	xxx
Raw materials	<u>xxx</u>
	\$xxx

5. *Prepaid expenses* are amounts paid in advance to secure the use of assets or the receipt of services at a future date. Prepaid expenses will not be converted to cash, but they are classified as current assets because, if not prepaid, they would have required the use of current assets during the coming year or operating cycle, if longer. (ASC 205-10-45-2) Prepaid rent and prepaid insurance are the most common examples of prepaid expenses.

**Noncurrent assets.** ASC 205-10-45-4 excludes the following from current assets:

- Cash and claims to cash that are:
  - restricted as to withdrawal or use for other than current operations,
  - designated for expenditure in the acquisition or construction of noncurrent assets, or
  - segregated for the liquidation of long-term debts.

Even though not actually set aside in special accounts, funds that are clearly to be used in the near future for the liquidation of long-term debts, payments to sinking funds, or for similar purposes shall also, under this concept, be excluded from current assets. However, if such

funds are considered to offset maturing debt that has properly been set up as a current liability, they may be included within the current asset classification.

- b. Receivables arising from unusual transactions (such as the sale of capital assets, or loans or advances to affiliates, officers, or employees) that are not expected to be collected within 12 months.
- c. Investments that are intended to be held for an extended period of time (longer than one operating cycle). The following are the three major types of long-term investments:
  - 1. *Debt and equity securities*—stocks, bonds, and long-term notes receivable. Securities that are classified as available-for-sale or held-to-maturity investments under ASC 320 would be classified as long term if management intended to hold them for more than one year. Under ASC 320, the categories of these securities (held-to-maturity versus available-for-sale) need not be reported on the face of the statement of financial position if they are reported in the notes to the financial statements. The securities section of the statement of financial position could be presented as follows:

Long-term investments:		
Investments in A company common stock		\$xxx
Notes receivable	\$ xxx	
Less discount on notes receivable	(xxx)	xxx
Investment in B company bonds		<u>xxx</u>
		\$xxx

- 2. *Tangible assets* not currently used in operations (e.g., land purchased as an investment and held for sale).
- 3. *Investments held in special funds* (e.g., sinking funds, pension funds, amounts held for plant expansion, and cash surrender values of life insurance policies).
- d. Property, plant, and equipment. These are disclosed with related accumulated depreciation/depletion as follows:

Property, plant, and equipment	\$xxx
Less accumulated depreciation	(xxx)
Or	\$xxx
Property, plant, and equipment (net of \$xxx accumulated depreciation)	\$xxx

Accumulated depreciation may be shown in total or by major classes of depreciable assets. In addition to showing this amount on the statement of financial position, the notes to the financial statements must disclose the amounts of major classes of depreciable assets, by nature or function, at the date of the statement of financial position. Assets under capital leases are separately disclosed. A general description of the method or methods used in computing depreciation with respect to major classes of depreciable assets (ASC 360-10-50) must be included in the notes to financial statements.

- e. Intangible assets include legal and/or contractual rights that are expected to provide future economic benefits and purchased goodwill. Patents, copyrights, logos, and trademarks are examples of rights that are recognized as intangible assets. Intangible assets with finite useful lives are amortized to expense over those lives. Generally, the amortization of an intangible asset is credited directly to the recorded amount of the asset although it is

acceptable to use an accumulated amortization valuation allowance. Intangible assets with indefinite economic useful lives are tested for impairment at least annually.

- f. Other assets. An all-inclusive heading that incorporates assets that do not fit neatly into any of the other asset categories (e.g., long-term prepaid expenses, deposits made to purchase equipment, deferred income tax assets (net of any required valuation allowance), bond issue costs, noncurrent receivables, and restricted cash).

## Liabilities

Liabilities are displayed on the statement of financial position in the order of expected payment.

**Current liabilities.** Obligations are classified as current if their liquidation is reasonably expected to require the use of existing resources properly classifiable as current assets or to create other current obligations. (ASC 210-10-45-6) Current liabilities also includes obligations that are due on demand or that are callable at any time by the lender and are classified as current regardless of the intent of the entity or lender. ASC 470-10-45 includes more guidance on those and on short-term debt expected to be refinanced. (ASC 205-10-45-7) The following items are classified as current liabilities:

1. *Accounts payable.* Accounts payable is normally comprised of amounts due to suppliers (vendors) for the purchase of goods and services used in the ordinary course of running a business.
2. *Trade notes payable* are also obligations that arise from the purchase of goods and services. They differ from accounts payable because the supplier or vendor finances the purchase on terms longer than the customary period for trade payables. The supplier or vendor generally charges interest for this privilege. If interest is not charged, it is imputed in accordance with ASC 835.

A valuation allowance is used to reduce the carrying amount of the note for the resulting discount as follows:

Notes payable, net of imputed interest of \$xx		\$xxx
Or		
Notes payable	\$ xxx	
Less discounts	(xxx)	\$xxx

3. *Accrued expenses* represent estimates of expenses incurred on or before the date of the statement of financial position that have not yet been paid and that are not payable until a succeeding period within the next year. Examples of accrued expenses include salaries, vacation pay, interest, and retirement plan contributions.
4. *Dividends payable* are obligations to distribute cash or other assets to shareholders that arise from the declaration of dividends by the entity's board of directors.
5. *Advances and deposits* are collections of cash or other assets received in advance to ensure the future delivery of goods or services. Advances and deposits are classified as current liabilities if the goods and services are to be delivered within the next year (or the operating cycle, if longer). Advances and deposits include such items as advance rentals and customer deposits. Certain advances and deposits are sometimes captioned as deferred or unearned revenues.
6. *Agency collections and withholdings* are liabilities that arise because the entity acts as an agent for another party. Employee tax withholdings, sales taxes, and wage garnishments are examples of agency collections. (ASC 210-10-45-9d)

7. *Current portion of long-term debt* is the portion of a long-term obligation that will be settled during the next year (or operating cycle, if longer) by using current assets. (ASC 210-10-45-9b) Generally, this amount includes only the payments due within the next year under the terms of the underlying agreement. However, if the entity has violated a covenant in a long-term debt agreement and, as a result, the investor is legally entitled to demand payment, the entire debt amount is classified as current unless the lender formally (in writing) waives the right to demand repayment of the debt for a period in excess of one year (or one operating cycle, if longer). In two cases, obligations to be paid in the next year are not classified as current liabilities because the liquidation does not require the use of current assets or the creation of other current liabilities:
- Debt expected to be refinanced through another long-term issue, and
  - Debt that will be retired through the use of noncurrent assets, such as a bond sinking fund, are treated as noncurrent liabilities.

**Noncurrent liabilities.** Obligations that are not expected to be liquidated within one year (or the current operating cycle, if longer) are classified as noncurrent. The following items would be classified as noncurrent:

1. *Notes and bonds payable* are obligations that will be paid in more than one year (or one operating cycle, if longer).
2. *Capital lease obligations* are contractual obligations that arise from obtaining the use of property or equipment via a capital lease contract.
3. *Written put options on the option writer's (issuer's) equity shares and forward contracts to purchase an issuer's equity shares that require physical or net cash settlement* are classified as liabilities on the issuer's statement of financial position. The obligation is classified as noncurrent unless the date at which the contract will be settled is within the next year (or operating cycle, if longer).
4. *Certain financial instruments that embody an unconditional obligation to issue a variable number of equity shares and financial instruments other than outstanding shares that embody a conditional obligation to issue a variable number of equity shares* are classified as a liability in the issuer's statement of financial position. The obligation is classified as noncurrent unless the date at which the financial instrument will be settled is within the next year (or operating cycle, if longer).
5. *Contingent obligations* are recorded when it is probable that an obligation will occur as the result of a past event. In most cases, a future event will eventually confirm the amount payable, the payee, or the date payable. The classification of a contingent liability as current or noncurrent depends on when the confirming event will occur and how soon afterwards payment must be made.
6. *Mandatorily redeemable shares* are recorded as liabilities per ASC 480. A mandatory redemption clause requires common or preferred stock to be redeemed (retired) at a specific date(s) or upon occurrence of an event which is uncertain as to timing although ultimately certain to occur. The obligation is classified as noncurrent unless the date at which the shares must be redeemed is within the next year (or operating cycle, if longer).
7. *Other noncurrent liabilities* include defined benefit pension obligations, postemployment obligations, and postretirement obligations. Deferred income taxes are liabilities to pay income taxes in the future that result from differences between the carrying amounts of assets and liabilities for income tax and financial reporting purposes.

## Presentation

The classification and presentation of information in a statement of financial position may be highly aggregated, highly detailed, or anywhere in between. In general, highly aggregated statements of financial position are used in annual reports and other presentations provided to the public. Highly detailed statements of financial position are used internally by management. The following highly aggregated statement of financial position includes only a few line items. The additional details required by GAAP are found in the notes to the financial statements.

### Example: Statement of financial position—highly aggregated

**ABC Corporation**  
**Statement of Financial Position**  
**December 31, 20X1**

***Assets***

Current assets	xxx
Long-term investments	xxx
Property, plant, and equipment, net	xxx
Deferred income tax assets	xxx
Goodwill	xxx
Intangible and other assets	xxx
Total assets	<u>xxx</u>

***Liabilities and Shareholders' Equity***

Current liabilities	xxx
Deferred income tax liabilities	xxx
Long-term debt	<u>xxx</u>
Total liabilities	<u>xxx</u>
Capital stock	xxx
Additional paid-in capital	xxx
Retained earnings	xxx
Accumulated other comprehensive income	<u>xxx</u>
Total shareholders' equity	<u>xxx</u>
Total liabilities and shareholders' equity	<u>xxx</u>

The following more comprehensive statement of financial position includes more line items (for details about specific assets and liabilities) than are found in most statements of financial position.

### Example: Statement of financial position—highly detailed

**ABC Corporation**  
**Statement of Financial Position**  
**December 31, 20X1**

***Assets***

*Current assets:*

Cash and bank deposits:

Restricted to current bond maturity	\$xxx
Unrestricted	<u>xxx</u>

Short-term investments:

Marketable equity securities (trading)	xxx
Marketable debt securities (available-for-sale)	xxx

Refundable income taxes	xxx
Receivables from affiliates	xxx
Accounts receivable	xxx
Less allowance for uncollectible accounts	(xxx)      xxx
Notes receivable due in 20X2	xxx
Less discounts on notes receivable	(xxx)      xxx
Installment notes receivable due in 20X2	xxx
Interest receivable	xxx
Creditors' accounts with debit balances	xxx
Advances to employees	xxx
Inventories (carried at the lower of cost or market using FIFO):	
Finished goods	xxx
Work in process	xxx
Raw materials	xxx      xxx
Deferred income taxes (net of valuation allowance of \$xxx)	
Prepaid expenses:	
Prepaid rent	xxx
Prepaid insurance	xxx      xxx
Total current assets	\$xxx
<i>Long-term investments:</i>	
Investments in equity securities (available-for-sale)	xxx
Investments in bonds (held-to-maturity)	xxx
Investments in equity securities (at cost, plus equity in undistributed net earnings since acquisition)	xxx
Investments in unused land and facilities	xxx
Cash surrender value of officers' life insurance policies	xxx
Sinking fund for bond retirement	xxx
Plant expansion fund	xxx
Total long-term investments	\$xxx
<i>Property, plant, and equipment:</i>	
Land	\$xxx
Buildings (including capitalized interest of \$xxx)	xxx
Machinery and equipment	xxx
Furniture and fixtures	xxx
Assets under capital leases	xxx
Leasehold improvements	xxx
Less accumulated depreciation and amortization	(xxx)
Total property, plant, and equipment	xxx

From 12% cumulative preferred	xxx
From common stock	xxx
From treasury stock transactions	xxx
From stock dividends	xxx
From expiration of share options	xxx
Warrants outstanding	<u>xxx</u>

<i>Retained earnings</i>	xxx
<i>Accumulated other comprehensive income</i>	(xxx)
Less: Treasury stock at cost	(xxx)
Total shareholders' equity	<u>\$xxx</u>
Total liabilities and shareholders' equity	<u>\$xxx</u>

### ASC 210-20, *Offsetting*

In general, assets and liabilities are not permitted to be offset against each other unless certain specified criteria are met. ASC 210-20-45-1 permits offsetting only when *all* of the following conditions are met that constitute a right of setoff:

1. Each of the two parties owes the other determinable amounts (although they may be in different currencies and bear different rates of interest).
2. The reporting party has the right to set off the amount it owes against the amount owed to it by the other party.
3. The reporting party intends to set off the two amounts.
4. The right of setoff is legally enforceable.

(ASC 210-20-45-1)

Furthermore, when maturities differ, only the party with the nearest maturity can offset, because the party with the later maturity must settle in the manner determined by the party with the earlier maturity. (ASC 210-20-45-3)

Entities must apply their choices to offset consistently. Net receivables arising from application of ASC 210-20 cannot be offset against net payables. (ASC 210-20-45-12)

**Bankruptcy.** In particular cases, state laws or bankruptcy laws may impose restrictions or prohibitions against the right of setoff. (ASC 210-20-45-8)

**Taxes payable.** Cash or the offsetting of other assets against a tax liability or other amounts due to governmental bodies is acceptable only under the following, limited circumstances:

- When it is clear that a purchase of securities is in substance an advance payment of taxes payable in the near future, and
- The securities are acceptable for the payment of taxes.

Primarily this occurs as an accommodation to governmental bodies that issue tax anticipation notes in order to accelerate the receipt of cash from future taxes. (ASC 210-20-45-6 and 45-7)

**Repurchase agreements.** ASC 210-20-45-11 permits the offset of amounts recognized as payables in repurchase agreements accounted for as collateralized borrowings against amounts recognized as receivables in reverse repurchase agreements accounted for as collateralized borrowings with the same counterparty. If certain conditions are met, an entity may, but is not required to, offset the amounts recognized. The additional conditions are:

1. The repurchase agreements and the reverse repurchase agreements must have the same explicit settlement date.
2. The repurchase agreements and the reverse repurchase agreements must be executed in accordance with a master netting agreement.
3. The securities underlying the repurchase agreements and the reverse repurchase agreements exist in "book entry" form and can be transferred only by means of entries in the records of the transfer system operator or the security custodian.

4. The repurchase agreements and the reverse repurchase agreements will be settled on a securities transfer system that transfers ownership of “book entry” securities, and banking arrangements are in place so that the entity must only keep cash on deposit sufficient to cover the net payable.
5. Cash settlements for securities transferred are made under established bank arrangements that provide that an entity to have cash on deposit for net amounts due at close of business. The entity uses the same account for cash inflows and outflows related to the settlement. (Also see ASC 210-20-45-14 through 17 for additional details.)
6. The same account at the clearing bank is used for the cash inflows of the settlement of the reverse repurchase agreements and the cash outflows in the settlement of the repurchase agreements.

These conditions do not apply to amounts recognized for other types of repurchase and reverse repurchase agreements executed under a master netting arrangement. This does not mean that those amounts could not otherwise meet the conditions for a right of setoff. (ASC 210-20-45-3)

**Disclosures.** For information on disclosures, please see Appendix B to this volume.

## PERSPECTIVE AND ISSUES

---

### Subtopic

ASC 220, *Comprehensive Income*, consists of one topic:

- ASC 220-10, *Overall*, which provides guidance on the reporting, presentation, and disclosure of comprehensive income.

### Scope Exceptions

ASC 220 does *not* apply to the following entities:

1. Those that do not have any items of comprehensive income.
2. Those not-for-profit entities that are required to follow the guidance in ASC 958-205. (ASC 220-10-15-4)

### Overview

In financial reporting, performance is primarily measured by net income and its components, which are presented in the income statement. A second performance measure—comprehensive income—is a more inclusive notion of performance than net income. It includes all recognized changes in equity that occur during a period except those resulting from investments by owners and distributions to owners.

Because comprehensive income includes the effects on an entity of economic events largely outside of management’s control, some have said that net income is a measure of management’s performance and comprehensive income is a measure of entity performance.

## DEFINITIONS OF TERMS

---

Source: ASC 220-10-20. Also see Appendix A, *Definitions of Terms*, for definitions relevant to this chapter: Available-for-Sale Securities, Comprehensive Income, Conduit Debt Securities, Net Income, Non Controlling Interest, Nonpublic Entity, Other Comprehensive Income, Parent, Publicly Traded Company, and Subsidiary.

**Reclassification Adjustments.** Adjustments made to avoid double counting in comprehensive income items that are displayed as part of net income for a period that also had been displayed as part of other comprehensive income in that period or earlier periods. (ASC 220-10-20)

## CONCEPTS, RULES, AND EXAMPLES

---

### Limitations of the Income Statement

Economists have generally adopted a wealth maintenance concept of income. Under this concept, income is the maximum amount that can be consumed during a period and still leave the enterprise with the same amount of wealth at the end of the period as existed at the beginning. Wealth is determined with reference to the current market values (fair values) of the net productive assets at the beginning and end of the period. Therefore, the economists' definition of income would fully incorporate market value changes (both increases and decreases in wealth) in the determination of periodic income.

Accountants, on the other hand, have generally defined income by reference to specific events that give rise to recognizable elements of revenue and expense during a reporting period. The events that produce reportable items of revenue and expense are a subset of economic events that determine economic income. Many changes in the market values of wealth components are deliberately excluded from the measurement of accounting income, but are included in the measurement of economic income.

Accountants have moved closer to an economic measure of income by introducing the measure comprehensive income into the financial statements. Because of the realization and recognition accounting principles discussed in the chapter on ASC 105, comprehensive income still remains a subset of economic income.

### Other Comprehensive Income

Comprehensive income is the change in equity that results from revenue, expenses, gains, and losses during a period, as well as any other recognized changes in equity that occur for reasons other than investments by owners and distributions to owners. (ASC 220-10-45-1)

### Format of Statement of Income and Comprehensive Income

In a statement of the same prominence as other financial statements, entities must present:

- The components of other comprehensive income,
- The total for net income,
- The total of other comprehensive income, and
- The total of comprehensive income.

The required amounts may be presented:

- In a combined statement of income and comprehensive income, or
- In two separate, but consecutive statements.

(ASC 220-10-45-1)

**Exhibit—Items Required to be Displayed Either Acceptable Format of the Statement of Comprehensive Income**

<b>One Continuous Statement of Net Income and Comprehensive Income</b>	<b>Two Separate But Consecutive Statements</b>
Two sections: Net income and other comprehensive income	In the statement of net income show: <ul style="list-style-type: none"><li>• Components of net income</li><li>• Total of net income</li></ul>
Show: <ul style="list-style-type: none"><li>• Components of net income</li><li>• Total net income</li><li>• Components of other comprehensive income</li><li>• Total of other comprehensive income</li><li>• Total comprehensive income</li></ul>	In the statement of comprehensive income presented immediately after the statement of net income show: <ul style="list-style-type: none"><li>• Components of other comprehensive income</li><li>• Total of comprehensive income</li></ul>
(ASC 220-10-45-1A)	(ASC 220-10-45-1B)

**Entities with an Outstanding Noncontrolling Interest.** In addition to presenting consolidated net income and comprehensive income, entities with an outstanding noncontrolling interest are required to report the following items in the financial statement in which net income and comprehensive income are presented:

- Amount of net income and comprehensive income attributable to the parent
  - Amount of net income and comprehensive income attributable to the noncontrolling interest in a less-than-wholly-owned subsidiary.
- (ASC 220-10-45-5)

**Items of Other Comprehensive Income.** ASC 220-10-45-10A lists the following as items currently within other comprehensive income:

- Foreign currency translation adjustments (see paragraph 830-30-45-12).
- Gains and losses on foreign currency transactions that are designated as, and are effective as, economic hedges of a net investment in a foreign entity, commencing as of the designation date (see paragraph 830-20-35-3(a)).
- Gains and losses on intra-entity foreign currency transactions that are of a long-term investment nature (that is, settlement is not planned or anticipated in the foreseeable future), when the entities to the transaction are consolidated, combined, or accounted for by the equity method in the reporting entity's financial statements (see paragraph 830-20-35-3(b)).
- Gains and losses (effective portion) on derivative instruments that are designated as, and qualify as, cash flow hedges (see paragraph 815-20-35-1(c)).
- Unrealized holding gains and losses on available-for-sale securities (see paragraph 320-10-45-1).
- Unrealized holding gains and losses that result from a debt security being transferred into the available-for-sale category from the held-to-maturity category (see paragraph 320-10-35-10(c)).
- Amounts recognized in other comprehensive income for debt securities classified as available-for-sale and held-to-maturity related to an other-than-temporary impairment

recognized in accordance with Section 320-10-35 if a portion of the impairment was not recognized in earnings.

- Subsequent decreases (if not an other-than-temporary impairment) or increases in the fair value of available-for-sale securities previously written down as impaired (see paragraph 320-10-35-18).
- Gains or losses associated with pension or other postretirement benefits (that are not recognized immediately as a component of net periodic benefit cost) (see paragraph 715-20-50-1(j)).
- Prior service costs or credits associated with pension or other postretirement benefits (see paragraph 715-20-50-1(j)).
- Transition assets or obligations associated with pension or other postretirement benefits (that are not recognized immediately as a component of net periodic benefit cost) (see paragraph 715-20-50-1(j)).

The following do not qualify as comprehensive income:

- Changes in equity resulting from investment by and distributions to owners
  - Items that are direct adjustments to paid-in-capital, retained earnings, or other nonincome equity accounts.
- (ASC 220-10-45-10B)

Other comprehensive income is recognized and measured in accordance with the accounting pronouncement that deems it part of other comprehensive income. The Codification notes that additional classifications or additional items within current classifications may result from future accounting standards.

**Accumulated Other Comprehensive Income.** At the end of the reporting period, that reporting period's total of other comprehensive income is transferred to a component of equity. It is presented separately from retained earnings and additional paid-in capital on the balance sheet. (ASC 220-10-45-14) The changes in the accumulated balances of each component of other comprehensive income are presented either:

- On the face of the financial statements, or
- As a note.

**Reclassification adjustments.** Some items impact other comprehensive income in one period and then affect net income in the same or a later period. For example, an unrealized holding gain on an available-for-sale security is included in other comprehensive income in the period in which the market fluctuation occurs. Later, perhaps years later, the security is sold, and the realized gains are included in net income. An adjustment to the unrealized holding gain component of other comprehensive income is necessary to avoid double counting the gain—once in net income in the current year and once in other comprehensive income in the earlier period. Adjustments of that type are called reclassification adjustments. The process of including in net income an item previously reported in other comprehensive income is often referred to as “recycling.”

Usually, a sale triggers the need for a reclassification adjustment. The sale of an available-for-sale security in the current period triggers the need for an adjustment for the gains (losses) that had been included in other comprehensive income in a prior period. Likewise, the sale of an

investment in a foreign entity triggers an adjustment for foreign currency items that had been included in other comprehensive income previously (i.e., accumulated translation gains or losses). Amounts accumulated in other comprehensive income from cash flow hedges are reclassified into earnings in the same period(s) in which the hedged forecasted transactions (such as a forecasted sale) affect earnings. If it becomes probable that the forecasted transaction will not occur, the net gain or loss in accumulated other comprehensive income must be immediately reclassified. An adjustment is also necessary upon the complete (or substantially complete) liquidation of an investment in a foreign entity. Only minimum pension liabilities will not require reclassification adjustments (because they will not be reported in net income in any future period).

Reclassification adjustments can be presented by component of other comprehensive income, either:

- In a single note, or
- Parenthetically on the face of their annual financial statement.  
(ASC 220-10-45-17)

Public companies also have to include this information in their interim reports. All required information must be in a single location. New disclosures for items reclassified out of AOCI include:

- The effect of significant amounts reclassified from each component of AOCI based on its source
- The income statement line items affected by the reclassification.

If a component is only partially reclassified to net income, entities must cross-reference to the related footnote for additional information.

**Income Tax Effects.** The tax effects of each component of other comprehensive income must be presented in the statement in which those components are presented or in the notes of the financial statements. The items of other comprehensive income can be reported either:

- Net of related tax effects in the statement, or
- Gross with the tax effects related to all components reported on a single, separate line.

If gross reporting is used, the notes to the financial statements must disclose the tax effects related to each component (if there is more than one component). The following examples illustrate the two presentations.

**Interim Reporting.** For interim reporting, entities must present a total for comprehensive income but are *not* required to present the individual components of OCI. Entities that present two statements in their annual financial reports have the option of using a single-statement approach in their condensed interim financial statements. Using one statement avoids the presentation of a separate statement of comprehensive income that contains only one line item for total comprehensive income. (ASC 220-10-45-18) Nonpublic entities are not required to meet the requirements for reclassifications in interim reporting.

**Example of single statement of income and comprehensive income with “net of tax” presentation**

<b>Hypothetical Corporation</b>		
<b>Statement of Comprehensive Income</b>		
<b>For the Year Ended December 31, 20X1</b>		
(\$000 omitted)		
Revenues		\$395,400
Expenses		(251,220)
Other gains and losses		1,500
Income from operations before tax		<u>145,680</u>
Income tax expense		(62,430)
Net income		<u>83,250</u>
Earnings per share		
Basic and diluted 0.73		
Other comprehensive income		
Foreign currency translation adjustment, net of \$5,100 tax		11,900
Unrealized gain on securities:		
Unrealized holding gains arising during period, net of \$7,500 tax	17,500	
Less: Reclassification adjustment, net of \$1,500 tax, for gain included currently in net income	<u>(3,500)</u>	14,000
Cash flow hedges		
Net derivative losses arising during the period, net of \$4,800 tax	(11,200)	
Less: Reclassification adjustment for losses included currently in net income, net of \$7,762 tax	<u>18,113</u>	6,913
Defined benefit pension plans:		
Prior service cost arising during period	<u>(3,900)</u>	
Net loss arising during period	<u>(2,900)</u>	
Less: Amortization of prior service cost included with net period pension cost	<u>300</u>	
Less: Tax effects	<u>1,950</u>	(4,550)
Other comprehensive income		<u>28,263</u>
Comprehensive income		<u>\$111,513</u>

**Example of single statement of income and comprehensive income with “gross of tax” presentation**

<b>Hypothetical Corporation</b>		
<b>Statement of Comprehensive Income</b>		
<b>For the Year Ended December 31, 20X1</b>		
(\$000 omitted)		
Sales		\$395,400
Expenses		(251,220)
Other gains and losses		1,500
Income from operations before tax		<u>145,680</u>
Income tax expense		<u>(62,430)</u>
Net earnings		<u>83,250</u>
Earnings per share		
Basic and diluted 0.73		

Other comprehensive income			
Foreign currency translation adjustment			17,000
Unrealized gains on securities:			
Unrealized holding gains arising during period	25,000		
Less: Reclassification adjustment for gain included currently in net income	(5,000)		20,000
Cash flow hedges			
Net derivative losses arising during the period	(16,000)		
Less: Reclassification adjustment for losses included currently in net income	<u>25,875</u>		9,875
Defined benefit plans adjustment			
Prior service cost arising during period	(3,900)		
Net loss arising during period	(2,900)		
Less: Amortization of prior service cost included with net period pension cost	<u>300</u>		(6,500)
Other comprehensive income, before tax			40,375
Income tax expense related to items of other comprehensive income			(12,112)
Other comprehensive income, net of tax			28,263
Comprehensive income			<u>\$111,513</u>

If the “gross” approach illustrated above is utilized, it is also necessary to present in the notes to the financial statements details regarding the allocation of the tax effects to the several items included in other comprehensive income. An example of that note disclosure follows.

#### Example Note X: Income Taxes

The tax effects of items included in other comprehensive income for the year ended December 31, 20X1, are as follows:

	<i>Before-tax amount</i>	<i>Tax expense (benefit)</i>	<i>Net-of-tax amount</i>
Foreign currency translation adjustments	\$17,000	\$ 5,100	\$11,900
Unrealized gains on securities:			
Unrealized holding gains arising during period	25,000	7,500	17,500
Less: Reclassification adjustment for gains realized in net income	(5,000)	(1,500)	(3,500)
Net unrealized holding gains	<u>20,000</u>	<u>6,000</u>	<u>14,000</u>
Cash flow hedges:			
Net derivative losses arising during the period	(16,000)	4,800	(11,200)
Plus: Reclassification adjustment for losses realized in net income	<u>25,875</u>	<u>(6,913)</u>	<u>18,113</u>
Net effects of cash flow hedges	9,875	(2,113)	6,913
Defined benefit plans	(6,500)	(1,950)	(4,550)
Other comprehensive income	<u>\$40,375</u>	<u>\$12,112</u>	<u>\$28,263</u>

#### Reporting Comprehensive Income in Two Separate but Consecutive Statements of Income and Comprehensive Income

Entities are not required to present information about comprehensive income in a continuous statement of income and comprehensive income. Instead, they can present the components of other comprehensive income, the totals of other comprehensive income, and a total for comprehensive income in a statement which must immediately follow a statement of net income.

**Example of two separate but consecutive statements of income and comprehensive income—net of tax presentation**

**Hypothetical Corporation**  
**Statement of Income**  
**For the Year Ended December 31, 20X1**  
**( $\$000$  omitted)**

Revenues (includes \$12,000 accumulated other comprehensive income reclassifications for net gains in cash flow hedges)	<u>\$395,400</u>
Expenses (includes (\$10,000) accumulated other comprehensive income reclassifications for net loss in cash flow hedges)	<u>(251,220)</u>
Other gains and losses	1,500
Income from operations before tax	<u>145,680</u>
Income tax expense	<u>(62,430)</u>
Net income	<u>83,250</u>
Earnings per share	
Basic and diluted 0.73	

**Hypothetical Corporation**  
**Statement of Comprehensive Income**  
**For the Year Ended December 31, 20X1**  
**( $\$000$  omitted)**

Net income	<u>83,250</u>
Other comprehensive income	
Foreign currency translation adjustment, net of \$5,100 tax	<u>11,900</u>
Unrealized gain on securities:	
Unrealized holding gains arising during period, net of \$7,500 tax	<u>17,500</u>
Less: Reclassification adjustment, net of \$1,500 tax, for gain included currently in net income	<u>(3,500)</u> <u>14,000</u>
Cash flow hedges

## PERSPECTIVE AND ISSUES

---

### Technical Alert

In January 2015, the FASB issued ASU 2015-01, *Income Statement—Extraordinary and Unusual Items (Subtopic 225-20): Simplifying Income Statement Presentation by Eliminating the Concept of Extraordinary Items*. This ASU is part of the FASB's Simplification Initiative. The ASU eliminates from GAAP the concept of extraordinary items. The Board eliminated extraordinary items because of feedback that the criteria (unusual in nature and infrequent in occurrence) for classifying an item as extraordinary were unclear and the usefulness of the classification was questionable. The use of the classification was also extremely rare.

By moving unusual and infrequent events to the presentation and disclosure guidance for items that are unusual or infrequent, the FASB is of the opinion that the information most useful to investors and other financial statement users will be retained.

### Implementation

The update is effective for all entities for fiscal years, and interim periods within those fiscal years, beginning after December 15, 2015. Early adoption is permitted if the guidance is applied from the beginning of the fiscal year of adoption.

The ASU gives the following options for adoption:

- Prospectively, disclosing the nature and amount of an item included in income from continuing operations after adoption that adjusts an extraordinary item previously classified and presented before the adoption date.
- Retrospectively to all prior periods presented including the disclosures currently required.

## Subtopics

ASC, *Income Statement*, contains three subtopics:

- ASC 220-10, *Overall*, which provides general income statement guidance and guidance on the structure of the Topic.
- ASC 220-20, *Extraordinary Items and Unusual Items*, which addresses the classification, presentation, and disclosure of extraordinary events and transactions and the presentation and disclosure of unusual and infrequently occurring items that do not meet the extraordinary criteria. (See Technical Alert above.)
- ASC 220-30, *Business Interruption Insurance*, which provides presentation and disclosure requirements for business interruption insurance.

The three subtopics provide discrete information and are not interrelated.

## Scope and Scope Exceptions

The guidance in ASC 225 applies to all entities. ASC 225-20-15-2 specifically mandates that “The net effect of discontinuing the application of regulatory operations accounting addressed in Section 980-20-40 shall be recognized as an extraordinary item and thus shall be subject to the scope of this Subtopic regardless of whether the criteria discussed in paragraph 225-20-45-2 are met.” This requirement is superseded upon adoption of ASU 2015-01. (See Technical Alert at the beginning of this chapter.)

## Overview

The primary focus of financial reporting is to provide information about an entity’s performance that is useful to present and potential investors, creditors, and others when they are making financial decisions. In financial reporting, performance is primarily measured by net income and its components, which are provided in the income statement.

In contrast to the statement of financial position, which provides information about an entity at a point in time, an income statement provides information about a period of time. It reflects information about the transactions and other events occurring within the period. Most of the weaknesses of an income statement are a result of its periodic nature. Entities are continually creating and selling goods and services, and at any single point in time some of those processes will be incomplete.

## DEFINITIONS OF TERMS

---

Source: ASC 220-20-20, *Glossaries*.

**Business Interruption Insurance.** Insurance that provides coverage if business operations are suspended due to the loss of use of property and equipment resulting from a covered cause of loss. Business interruption insurance coverage generally provides for reimbursement of certain costs and losses incurred during the reasonable period required to rebuild, repair, or replace the damaged property.

**Extraordinary Items.** This definition is superseded upon adoption of ASU 2015-01. Extraordinary items are events and transactions that are distinguished by their unusual nature and by the infrequency of their occurrence. Thus, both of the following criteria should be met to classify an event or transaction as an extraordinary item:

- a. Unusual nature. The underlying event or transaction should possess a high degree of abnormality and be of a type clearly unrelated to, or only incidentally related to, the ordinary and typical activities of the entity, taking into account the environment in which the entity operates (see paragraph 225-20-60-3).
- b. Infrequency of occurrence. The underlying event or transaction should be of a type that would not reasonably be expected to recur in the foreseeable future, taking into account the environment in which the entity operates (see paragraph 225-20-60-3).

**Gross Margin.** The excess of sales over cost of goods sold. Gross margin does not consider all operating expenses.

**Infrequency of Occurrence.** The underlying event or transaction should be of a type that would not reasonably be expected to recur in the foreseeable future, taking into account the environment in which the entity operates (see paragraph 225-20-60-3).

**Unusual Nature.** The underlying event or transaction should possess a high degree of abnormality and be of a type clearly unrelated to, or only incidentally related to, the ordinary and typical activities of the entity, taking into account the environment in which the entity operates (see paragraph 225-20-60-3).

## CONCEPTS, RULES, AND EXAMPLES

---

### Format of Statements of Income and Comprehensive Income

The basic order of presentation of information in an income statement (or statement of income and comprehensive income) is defined by accounting standards, as shown by the diagram below. Other than in the section “income from continuing operations,” the display of revenues, expenses, gains, losses, and other comprehensive income is predetermined by the Codification guidance. Only within income from continuing operations do tradition and industry practice determine the presentation.

### Exhibit—Basic Order of Income Statement and Comprehensive Income Statement

<i>Statement of Income</i>	<i>Report net of tax?</i>	<i>Reference</i>
<b>Income from continuing operations</b>	No	ASC 225
Sales or service revenues		ASC 605, 606
Costs of goods sold		ASC 705
Operating expenses		Various
Remaining excess of fair value over cost of acquired net assets in a business combination		ASC 805
Gains and losses		Various
Other revenues and expenses		Various
Items that are unusual or infrequent, but not both		ASC 225
Income tax expense related to continuing operations		ASC 740

<i>Statement of Income</i>	<i>Report net of tax?</i>	<i>Reference</i>
<b>Results from discontinued operations</b> Income (loss) from operations of a discontinued component Gain (loss) from disposal of a discontinued component	Yes	ASC 360, ASC 250
Items that are both unusual and infrequent	Yes	ASC 225
<b>Net income</b>		
<b>Earnings per share information</b>		ASC 260
<b>Other comprehensive income</b> Foreign currency translation adjustments Unrealized gains (losses) on securities Adjustments related to pension liabilities or assets Gains/losses on cash-flow hedging items Gains/losses on hedges of forecasted foreign-currency-denominated transactions Reclassification adjustment (may be shown gross or net of tax, details may be disclosed in note) Income tax related to other comprehensive income (if components are not shown net of tax)	Optional	ASC 220, 320, 715, 815, 830
<b>Comprehensive income</b>		
<b>Earnings per share information</b>		ASC 260

The three items that are shown in the heading of an income statement are:

1. The name of the entity whose results of operations is being presented
2. The title of the statement
3. The period of time covered by the statement.

**Entity name.** The entity's legal name should be used and supplemental information could be added to disclose the entity's legal form as a corporation, partnership, sole proprietorship, or other form if that information is not apparent from the entity's name.

**Statement titles.** The use of the titles "Income Statement," "Statement of Income and Comprehensive Income," "Statement of Operations," or "Statement of Earnings" denotes preparation in accordance with GAAP. If another comprehensive basis of accounting were used, such as the cash or income tax basis, the title of the statement would be modified accordingly. "Statement of Revenue and Expenses—Income Tax Basis" or "Statement of Revenue and Expenses—Modified Cash Basis" are examples of such titles.

**Statement date.** The date of an income statement must clearly identify the time period involved, such as "Year Ending March 31, 20X1." That dating informs the reader of the length of the period covered by the statement and both the starting and ending dates. Dating such as "The Period Ending March 31, 20X1" or "Through March 31, 20X1" is not useful because of the lack of precision in those titles. Income statements are rarely presented for periods in excess of one year but are frequently seen for shorter periods such as a month or a quarter. Entities whose operations form a natural cycle may have a reporting period end on a specific day (e.g., the last Friday of the month). These entities should head the income statement "For the 52 Weeks Ended March 29, 20X1" (each week containing seven days, beginning on a Saturday and ending on a Friday). Although that fiscal period includes only 364 days (except for leap years), it is still considered an annual reporting period.

**Consistency of form.** Income statements generally should be uniform in appearance from one period to the next. The form, terminology, captions, and pattern of combining insignificant items should be consistent. If comparative statements are presented, the prior year's information should be restated to conform to the current year's presentation if changes in presentation are made.

**Aggregation.** Aggregation of items should not serve to conceal significant information, such as netting revenues against expenses or combining dissimilar types of resources, expenses, gains, or losses. The category "other or miscellaneous expense" should contain, at maximum, an immaterial total amount of aggregated insignificant items. Once this total approaches a material amount of total expenses, some other aggregations with explanatory titles should be selected.

### Income from Continuing Operations

The section "income from continuing operations" includes all revenues, expenses, gains, and losses that are not required to be reported in other sections of an income statement.

There are two generally accepted formats for the presentation of income from continuing operations: the single-step and the multiple-step formats.

In the single-step format, items are classified into two groups: revenues and expenses. The operating revenues and other revenues are itemized and summed to determine total revenues. The cost of goods sold, operating expenses, and other expenses are itemized and summed to determine total expenses. The total expenses (including income taxes) are deducted from the total revenues to arrive at income from continuing operations.

#### Example of a single-step format for income from continuing operations

Revenues:		
Sales (net of discounts and returns and allowances)	\$xxx	
Gain on sale of equipment	xxx	
Interest income	xxx	
Dividend income	<u>xxx</u>	\$xxx
Expenses:		
Cost of goods sold	\$xxx	
Selling expenses	xxx	
General and administrative expenses	xxx	
Interest expense	<u>xxx</u>	<u>xxx</u>
Income from continuing operations		<u>xxx</u>

**Multiple-step format.** Some believe that a multiple-step format enhances the usefulness of information about an entity's performance by reporting the interrelationships of revenues and expenses, using subtotals to report significant amounts. In a multiple-step format, operating revenues and expenses are separated from nonoperating revenues and expenses to provide more information concerning the firm's primary activities. This format breaks the revenue and expense items into various intermediate income components so that important relationships can be shown and attention can be focused on significant subtotals. Some examples of common intermediate income components are as follows:

1. Gross profit (margin)—The difference between net sales and cost of goods sold.
2. Operating income—Gross profit less operating expenses.

3. Income before income taxes—Operating income plus any other revenue items and less any other expense items.

**Example of a multiple-step format for income from continuing operations**

Sales:		
Sales		\$xxx
Less: Sales discounts	\$xxx	
Sales returns and allowances	<u>xxx</u>	(xxx)
Net sales		\$xxx
Cost of goods sold		<u>xxx</u>
Gross profit		\$xxx
Operating expenses:		
Selling expenses		
Sales salaries	\$xxx	
Commissions	xxx	
Advertising expense	xxx	
Delivery expense	xxx	
Selling supplies expense	xxx	
Depreciation of store furniture and equipment	<u>xxx</u>	\$xxx
General and administrative expenses		
Officers' salaries	\$xxx	
Office salaries	xxx	
Bad debts expense	xxx	
Office supplies expense	xxx	
Depreciation of office furniture and fixtures	xxx	
Depreciation of building	xxx	
Insurance expense	xxx	
Utilities expense	<u>xxx</u>	<u>xxx</u>
Total operating expense		(xxx)
Operating income		\$xxx
Other revenues:		
Dividend income	\$xxx	
Gain on business acquisition ("bargain purchase")	xxx	
Interest income	<u>xxx</u>	xxx
Other expenses:		
Interest expense		(xxx)
Income from continuing operations		\$ <u>xxx</u>

**Income from Continuing Operations.** The following items of revenue, expense, gains, and losses are included within income from continuing operations:

1. *Sales or service revenues* are charges to customers for the goods and/or services provided during the period. This section should include information about discounts, allowances, and returns in order to determine net sales or net revenues.
2. *Cost of goods sold* is the cost of the inventory items sold during the period. In the case of a merchandising firm, net purchases (purchases less discounts, returns, and allowances plus freight-in) are added to the beginning inventory to obtain the cost of goods available-for-sale. From the cost of goods available-for-sale amount, the ending inventory is deducted to obtain the cost of goods sold.

3. *Operating expenses* are primary recurring costs associated with central operations (other than cost of goods sold) that are incurred in order to generate sales. Operating expenses are normally reported in the following two categories:

- a. Selling expenses
- b. General and administrative expenses.

Selling expenses are those expenses directly related to the company's efforts to generate sales (e.g., sales salaries, commissions, advertising, delivery expenses, depreciation of store furniture and equipment, and store supplies). General and administrative expenses are expenses related to the general administration of the company's operations (e.g., officers and office salaries, office supplies, depreciation of office furniture and fixtures, telephone, postage, accounting and legal services, and business licenses and fees).

4. *Gains and losses* result from the peripheral transactions of the entity. If immaterial, they are usually combined and shown with the normal, recurring revenues and expenses. If they are individually material, they should be disclosed on a separate line. Examples are write-downs of inventories and receivables, effects of a strike, gains and losses on the disposal of equipment, and gains and losses from exchange or translation of foreign currencies. Holding gains on available-for-sale securities are included in other comprehensive income rather than income from continuing operations.
5. *Other revenues and expenses* are revenues and expenses not related to the central operations of the company (e.g., interest revenues and expenses, and dividend revenues).
6. *Unusual or infrequent* items should be reported as a separate component of income from continuing operations.
7. *Goodwill impairment losses* are presented as a separate line item in the income from continuing operations section of the income statement.
8. *Exit or disposal activity costs* are included in income from continuing operations before income taxes.
9. *Income tax expense* related to continuing operations is that portion of the total income tax expense applicable to continuing operations.

**Net income.** The section ends in a subtotal that varies depending upon the existence of discontinued operations.<sup>1</sup> Net income reflects all items of profit and loss recognized during the period, except for error corrections. The effects of changes in accounting principles (under ASC 250) are dealt with by *retrospective application* to all prior periods being presented. For example, the subtotal is usually titled "income from continuing operations" only when there is a section for discontinued operations in one of the years presented. If there is only a section for extraordinary items, the subtotal is usually titled "income before extraordinary items." The titles are adjusted accordingly if more than one of these additional sections are necessary. If there are no discontinued operations or extraordinary items, the subtotal is titled "net income."

The requirement that net income be presented as one amount does not apply to those entities that have statements different in format from commercial enterprises:

- Investment companies
  - Insurance entities
  - Certain not-for-profit entities (NFPs).
- (ASC 225-10-45-1)

---

<sup>1</sup> Also see the chapter on ASC 205 for information on ASU 2014-08, an update related to discontinued operations.

**ASC 225-20, Extraordinary and Unusual Items**

**Extraordinary items.** (See Technical Alert section of this chapter for a significant update to this topic.)

**Unusual or Infrequent Items.** Items that are unusual or infrequent, but not both, should be reported as a separate component of income from continuing operations. The EPS effect of these items should not be separated on the face of the income statement. (ASC 225-20-45-16)

**Unusual nature.** To meet this criterion, the underlying event or transaction should:

- Possess a high degree of abnormality, and
- Be clearly unrelated to, or only incidentally related to, the ordinary and typical activities of the reporting entity, taking into account the environment in which it operates.

In determining whether an event or transaction is of an unusual nature, the following special characteristics of the reporting entity are considered:

- Type and scope of operations
- Lines of business
- Operating policies
- Industry (or industries) in which the reporting entity operates
- Geographic locations of its operations
- Nature and extent of government regulation.

An event that is of an unusual nature for one reporting entity can be an ordinary and usual activity of another because of the above characteristics. Whether an event or transaction is beyond the control of management is irrelevant in the determination of whether it is of an unusual nature.

**Infrequency of occurrence.** To satisfy this requirement, the underlying event or transaction should be of a type that would not reasonably be expected to recur in the foreseeable future, again taking into account the environment in which the reporting entity operates.

**Pro Forma Earnings**

Companies have made reference in press releases and published materials to an alternative measure of performance, referred to as “pro forma earnings.” This practice has generated confusion because there is no standard definition for “pro forma earnings.” Different reporting entities can, and have, defined pro forma earnings on a wide range of ad hoc bases, and sometimes a given entity fails even to consistently define this amount from period to period.

Often, even when GAAP-basis earnings are stated in the same announcement as the pro forma measure, it is the latter that receives most of the attention. In a number of instances, pro forma earnings have been based on very aggressive exclusions of operating costs and, sometimes, the inclusion of onetime gains. Such practices ultimately came to be widely recognized as being misleading and inappropriate, and popular sentiment turned against employment of such devices.

The SEC adopted Regulation G to curtail the use of pro forma earnings statements. Regulation G states that a public company, or a person acting on its behalf, is not to make public a non-GAAP financial measure that, taken together with the information accompanying that measure, either contains an untrue statement of a material fact or omits a material fact that would be necessary to make the presentation of the non-GAAP financial measure not misleading. Further, Regulation G requires a public company that discloses or releases a non-GAAP financial measure to include in that disclosure or release a presentation of the most directly comparable

GAAP financial measure and a reconciliation of the disclosed non-GAAP measure to that directly comparable GAAP financial measure. (Regulation G, Section II A, paragraph 3a)

The regulations also prohibit certain non-GAAP measures from inclusion in SEC filings. Public companies must not:

1. Exclude from non-GAAP liquidity measures charges or liabilities that required, or will require, cash settlement, or would have required cash settlement absent an ability to settle in another manner. However, earnings before interest and taxes (EBIT) and earnings before interest, taxes, depreciation, and amortization (EBITDA) are permissible.
2. Create a non-GAAP performance measure that eliminates items identified as non-recurring, infrequent, or unusual if the nature of the excluded item is such that it is (a) reasonably likely to recur within two years or (b) similar to a charge or gain that occurred within the prior two years.
3. Present non-GAAP financial measures on the face of the registrant's financial statements prepared in accordance with GAAP or in the accompanying notes.
4. Present non-GAAP financial measures on the face of any pro forma financial information required to be disclosed by Article 11 of Regulation S-X (e.g., business combinations or disposals).
5. Use titles or descriptions of non-GAAP financial measures that are the same as, or confusingly similar to, titles or descriptions used for GAAP measures.

(Regulation G, Section II B, paragraph 2)

#### **ASC 225-30, Business Interruption Insurance**

ASC 225-30 provides guidance on presentation and disclosure of business interruption insurance. This type of insurance may cover:

- Gross margin lost because of the suspension of normal operations,
- Fixed charges,
- Expenses related to gross margin, and
- Expenses incurred to reduce the loss from business interruption, etc.

Entities may choose how to record proceeds from business interruption insurance as long as it does not conflict with other standards. Disclosure requirements can be found in the Appendix.

## PERSPECTIVE AND ISSUES

---

### Subtopic

ASC 230, *Statement of Cash Flows*, contains one subtopic:

- ASC 230-10, *Overall*, that establishes standards for cash flow reporting in general purpose financial statements.

### Scope and Scope Exceptions

A statement of cash flows is a required part of a complete set of financial statements for business enterprises and not-for-profit organizations. The following are *not* required to present a statement of cash flows:

- Defined pension plans that present financial information under Topic 960,
- Other employee plans that present information similar to ASC 960 (ASC 962-205-45-9),
- A common trust fund, variable annuity account, or similar fund maintained by a bank, insurance entity, or other entity in its capacity as a trustee, administrator, or guardian for the collective investment and reinvestment of moneys.
- Investment companies within the scope of ASC 946 if the following conditions are met:
  - Substantially all of the entity's investments are highly liquid,
  - The entity's investments are carried at fair value and classified in accordance with ASC 820 as Level 1 or Level 2 or were measured using the practical expedient to determine fair value and are redeemable in the near term,

- The entity has little or no debt, based on average debt outstanding during the period, in relation to average total assets, and
- The entity provides a statement of changes in net assets.  
(ASC 230-10-15-4)

## Overview

The primary purpose of the statement of cash flows is to provide information about cash receipts and cash payments of an entity during a period. A secondary purpose is to provide information about the entity's investing and financing activities during the period.

Specifically, the statement of cash flows helps investors and creditors assess:

1. The entity's ability to generate future positive cash flows
2. The entity's ability to meet obligations and pay dividends
3. The reasons for differences between net income and net cash receipts and payments
4. The cash and noncash aspects of investing and financing transactions on an entity's financial position.

The ultimate objective of investment and credit decisions is the maximization of net cash inflows, so information for assessing the amounts, timing, and uncertainty of prospective cash flows is needed.

## DEFINITIONS OF TERMS

---

**Source:** ASC 230-10-20, *Glossary*, except for "direct method" and "indirect method." See also Appendix A, *Definitions of Terms*, for additional terms relevant to this topic: Bargain Purchase Option, Bargain Renewal Option, Cash, Cash Equivalents, Contract, Fair Value (3rd definition), Financial Asset (1st definition), Indirectly Related to the Leased Party, Lease, Lease Liability, Lease Payments, Lease Term, Lessee, Lessor, Market Participants, Noncancellable Lease Term, Orderly Transaction, Penalty, Right-of-Use Asset, Underlying Asset.

**Direct Method.** A method that derives the net cash provided by operating activities from the components of operating cash receipts and payments as opposed to adjusting net income for items not affecting cash.

**Financing Activities.** Financing activities include obtaining resources from owners and providing them with a return on, and a return of, their investment; receiving restricted resources that by donor stipulation must be used for long-term purposes; borrowing money and repaying amounts borrowed, or otherwise settling the obligation; and obtaining and paying for other resources obtained from creditors on long-term credit.

**Indirect (Reconciliation) Method.** A method that derives the net cash provided by operating activities by adjusting net income for revenue and expense items not resulting from cash transactions.

**Investing Activities.** Investing activities include making and collecting loans and acquiring and disposing of debt or equity instruments and property, plant, and equipment and other productive assets, that is, assets held for or used in the production of goods or

services by the entity (other than materials that are part of the entity's inventory). Investing activities exclude acquiring and disposing of certain loans or other debt or equity instruments that are acquired specifically for resale, as discussed in paragraphs ASC 230-10-45-12 and 230-10-45-21.

**Operating Activities.** Operating activities include all transactions and other events that are not defined as investing or financing activities (see paragraphs 230-10-45-12 through 45-15). Operating activities generally involve producing and delivering goods and providing services. Cash flows from operating activities are generally the cash effects of transactions and other events that enter into the determination of net income.

## CONCEPTS, RULES, AND EXAMPLES

---

### Cash Focus

The statement of cash flows includes only inflows and outflows of cash and cash equivalents. Cash equivalents include any short-term highly liquid investments (see definition in Appendix A for criteria) used as a temporary investment of idle cash. The effects of investing and financing activities that do not result in receipts or payments of cash should be reported in a separate schedule immediately following the statement of cash flows or in the notes to the financial statements. This is to preserve the statement's primary focus on cash flows from operating, investing, and financing activities. If a transaction is part cash and part noncash, only the cash portion is reported in the body of the statement of cash flows.

### Classification of Cash Receipts and Disbursements

ASC 230-10-45-10 through 17 discuss classification of cash receipts and disbursements. The statement of cash flows requires classification of cash receipts and cash disbursements into three categories:

- Investing activities
- Financing activities
- Operating activities.

See the Definitions of Terms section above for more information on these categories.

The following exhibit contains examples of the classification of cash inflows and outflows within the statement of cash flows.

### Exhibit—Classification of Inflows and Outflows

- |   |
|---|
| • Topics 255 and 940 offer guidance on securities and other assets held in trading accounts carried by banks, brokers, and dealers in securities.   |
| • Cash receipts and payments from purchases and sales of securities classified as trading debt securities in accordance with Topic 320 and equity securities accounted for in accordance with Topic 321 are classified as cash flows based on the nature and purpose for which the securities were acquired. (ASC 230-10-45-19) |
| • When a cash receipt or payment has aspects of more than one cash flow category, it should be in the category that is likely to be the predominant source of cash flows. (ASC 230-10-45-22)  |

	<i>Operating</i>	<i>Investing</i>	<i>Financing</i>
Cash Inflows	<ul style="list-style-type: none"> <li>• Receipts from sale of goods or services</li> <li>• Returns on loans, other debt instruments of other entities, and equity securities (interest and dividends) (ASC 230-10-45-16)</li> <li>• Sales of other securities and other assets if acquired for resale and carried at fair value in a trading account (ASC 230-10-45-20)</li> <li>• Acquisitions and sales of loans acquired specifically for resale and carried at fair value at the lower of cost or fair value (ASC 230-10-45-21)</li> </ul>	<ul style="list-style-type: none"> <li>• Cash flows from purchases, sales, and maturities of available-for-sale debt securities (ASC 230-10-45-11)</li> <li>• Collections or sales of loans and sales of other entities' debt instruments, except, per ASC 230-10-45-21A, for cash equivalents and certain debt instruments acquired specifically for resale, and donated debt instruments received by not-for-profit entities</li> <li>• Sales of equity instruments, held in available-for-sale or held-to-maturity portfolios, of other enterprises and from returns of investment in those instruments</li> <li>• Sales of property, plant, and equipment and other productive assets</li> <li>• Sales of loans not specifically acquired for resale (ASC 230-10-45-12)</li> </ul>	<ul style="list-style-type: none"> <li>• Proceeds from issuing equity instruments</li> <li>• Proceeds from issuing debt (short-term or long-term), including bonds, mortgages, and notes</li> <li>• Not-for-profits' cash receipts from nearly immediate sale of donor-restricted for long-term purposes financial assets</li> <li>• Proceeds from derivative instruments that include, at inception, financing elements. The proceeds may be received at inception or over the term of the instrument. Not included are a financing element inherently included in an at-the-market derivative instrument with no prepayments</li> <li>• Cash retained as a result of the tax deductibility of increase in the value of equity instruments issued under share-based payment arrangements not included in the cost of goods or services that is recognizable for financial reporting purposes. Excess tax benefits are determined on an individual award basis (ASC 230-10-45-14)</li> </ul>
	<ul style="list-style-type: none"> <li>• Not-for-profits' sale of donated financial assets that on receipt had no donor-imposed limitations on sale and were converted immediately into cash (ASC 230-10-45-21A)</li> </ul>	<ul style="list-style-type: none"> <li>• Not-for-profits' cash proceeds from sales of donated financial assets that are not classified as operating or financing activities (ASC 230-10-45-21A)</li> </ul>	<ul style="list-style-type: none"> <li>• Not-for-profits' donor-restricted cash gifts that are limited to long-term purposes</li> </ul>

	<i>Operating</i>	<i>Investing</i>	<i>Financing</i>
	<ul style="list-style-type: none"> <li>For lessors—cash receipts from lease payments (ASC 842-30-45-5)</li> </ul>		
	<ul style="list-style-type: none"> <li>All other cash receipts not from inventory or financing activities (ASC 230-10-45-16a)</li> </ul>		
Cash Outflows	<ul style="list-style-type: none"> <li>Payments for inventory</li> <li>Payments to employees and other suppliers for goods and services</li> <li>Payments to government for taxes, duties, fines, and other fees or penalties</li> <li>Payments of interest</li> <li>Payments of asset retirement obligations (ASC 230-10-45-17)</li> <li>Purchase of other securities and assets acquired specifically for resale carried at fair value in a trading account (ASC 230-10-45-20)</li> <li>Loans acquired specifically for resale and carried at fair value at the lower of cost or fair value (ASC 230-10-45-21)</li> </ul>	<ul style="list-style-type: none"> <li>Loans made and acquisitions of other entities' debt instruments other than cash equivalents and certain debt instruments acquired for resale</li> <li>Purchase of equity instruments carried in a trading account of other enterprises</li> <li>Purchase of property, plant, and equipment and other productive assets, including interest capitalized as part of the cost of those assets (ASC 230-10-45-13)</li> </ul>	<ul style="list-style-type: none"> <li>Payment of dividends or other distributions to owners, including repurchase of entity's stock. Cash paid to a tax authority when the employer is withholding shares from an employee's award for tax-withholding purposes is an outlay to reacquire the entity's equity instruments</li> <li>Repayment of debt principal</li> <li>Other payments to creditors for long-term credit</li> <li>Distributions, to counterparties of derivative instruments that include financing elements at inception. These may be received at inception or over the term of the instrument. Not included are a financing element inherently included in an at-the-market derivative instrument with no prepayments</li> <li>Payments for debt issue costs (ASC 230-10-45-15)</li> </ul>

	<i>Operating</i>	<i>Investing</i>	<i>Financing</i>
	<ul style="list-style-type: none"> <li>Payments for the interest portion of the lease liability from a finance lease</li> <li>Payments from operating leases, except to the extent that those payments represent costs to bring another asset for its intended use</li> <li>Variable lease payments and short-term payments not included in the lease liability (ASC 842-20-45-5b-c)</li> </ul>	<ul style="list-style-type: none"> <li>Loan payments associated with the costs to bring another asset for its intended use that are capitalized as part of a lease sale (ASC 842-20-45-5b)</li> </ul>	<ul style="list-style-type: none"> <li>Repayments for the principal portion of the lease liability from a financing lease (ASC 842-20-45-5a)</li> </ul>
	<ul style="list-style-type: none"> <li>All other cash payments that are not from investing or financing activities (ASC 230-10-45-17f)</li> </ul>		

**Exhibit—Statement of Cash Flows (Without Details of Operating Activities).** The following exhibit demonstrates the classification of cash receipts and disbursements in the investing and financing activities of a statement of cash flows (though without detail of the required operating activities section):

**Liquid Corporation**  
**Statement of Cash Flows**  
**For the Year Ended December 31, 20X1**

Net cash flows from operating activities	\$ xxx
Cash flows from investing activities:	
Purchase of property, plant, and equipment	\$(xxx)
Sale of equipment	xx
Collection of notes receivable	<u>xx</u>
Net cash used in investing activities	(xx)
Cash flows from financing activities:	
Sale of common stock	xxx
Repayment of long-term debt	(xx)
Reduction of notes payable	<u>(xx)</u>
Net cash provided by financing activities	xx
Effect of exchange rate changes on cash	<u>xx</u>
Net increase (decrease) in cash	xxx
Cash and cash equivalents at beginning of year	<u>xxx</u>
Cash and cash equivalents at end of year	<u>\$ xxx</u>
Schedule of noncash financing and investing activities:	
Conversion of bonds into common stock	\$ xxx
Property acquired under finance leases	<u>xxx</u>
	<u>\$ xxx</u>

## Operating Activities Presentation

The operating activities section of the statement of cash flows can be presented under the direct method or the indirect method. The FASB has long expressed a preference for the direct method of presenting net cash from operating activities, that is, presenting major classes of gross cash receipts and payments and their sum. Conversely, the indirect method has always been vastly preferred by preparers.

### ***The Direct Method***

The direct method shows the items that affected cash flow during the reporting period. Cash received and cash paid are presented, as opposed to converting accrual-basis income to cash flow information. At a minimum, entities using the direct method are required to report the following classes of operating cash receipts and payments:

1. Cash collected from customers
2. Interest and dividends received
3. Other operating cash receipts
4. Cash paid to employees and other suppliers
5. Interest paid
6. Income taxes paid including separate identification of the cash that would have been paid if the reporting entity had not received an income tax benefit resulting from increases in the fair value of its shares associated with share-based compensation arrangements
7. Other operating cash payments.

(ASC 230-10-45-25)

Entities are encouraged to make further breakdowns that would be useful to financial statement users. For example, disaggregating number 4 above, “cash paid to employees and suppliers,” might reveal useful information.

The direct method allows the user to clarify the relationship between the company’s net income and its cash flows. For example, payments of expenses are shown as cash disbursements and are deducted from cash receipts. In this way, the user is able to understand the cash receipts and cash payments for the period. The information needed to prepare the operating activities section using the direct method can often be obtained by converting information already appearing in the statement of financial position and income statement. Formulas for conversion of various income statement amounts for the direct method of presentation from the accrual basis to the cash basis are summarized below.

### **Exhibit—Converting Income Statement Amounts From the Accrual Basis to the Cash Basis—Direct Method**

<u>Accrual basis</u>		<u>Additions</u>		<u>Deductions</u>		<u>Cash basis</u>
Net sales	+	Beginning A/R	-	Ending A/R A/R written off	=	Cash received from customers
Cost of goods sold	+	Ending inventory Beginning A/P	-	Manufacturing depreciation and amortization Beginning inventory Ending A/P	=	Cash paid to suppliers

<u>Accrual basis</u>		<u>Additions</u>		<u>Deductions</u>		<u>Cash basis</u>
Operating expenses	+	Ending prepaid expenses Beginning accrued expenses	-	Sales and administrative depreciation and amortization Beginning prepaid expenses Ending accrued expenses payable Bad debts expense	=	Cash paid for operating expenses

### ***The Indirect Method***

The indirect method is the most widely used presentation of cash from operating activities, because it is easier to prepare. It focuses on the differences between net income and cash flows. The indirect format begins with net income, which is obtained directly from the income statement. Revenue and expense items not affecting cash are added or deducted to arrive at net cash provided by operating activities. For example, depreciation and amortization would be added back because they reduce net income without affecting cash.

The statement of cash flows prepared using the indirect method emphasizes changes in the components of most current asset and current liability accounts. Changes in inventory, accounts receivable, and other current accounts are used to determine the cash flow from operating activities. Preparers calculate the change in accounts receivable using the balances net of the allowance account in order to ensure that write-offs of uncollectible accounts are treated properly. Other adjustments under the indirect method include changes in the account balances of deferred income taxes and the income (loss) from investments reported using the equity method. However, short-term borrowing used to purchase equipment is classified as a financing activity.

The following diagram shows the adjustments to net income necessary for converting accrual-based net income to cash-basis net income when using the indirect method. The diagram is simply an expanded statement of financial position equation.

### **Exhibit—Converting Accrual-based Net Income to Cash-basis Net Income—Indirect Method**

	<u>Current assets*</u>	+	<u>Noncurrent assets</u>	=	<u>Current liabilities</u>	+	<u>Long-term liabilities</u>	+	<u>Income</u>	<u>Accrual income adjustment to convert to cash flow</u>
1.	Increase			=					Increase	Decrease
2.	Decrease			=					Decrease	Increase
3.				=	Increase				Decrease	Increase
4.				=	Decrease				Increase	Decrease

\* Other than cash and cash equivalents.

For example, using Row 1, a credit sale would increase accounts receivable and accrual-basis income but would not affect cash. Therefore, its effect must be removed from the accrual income in order to convert to cash income. The last column indicates that the increase in a current asset balance must be deducted from income to obtain cash flow. Using Row 2, a decrease in a current asset, such as prepaid rent, indicates that net income was decreased by rent expense, without a cash outflow in the current period. Thus, the decrease in prepaid rent would be added back to convert to cash income.

Similarly, using Row 3, an increase in a current liability must be added to income to obtain cash flows (e.g., accrued wages are on the income statement as an expense, but they do not require cash; the increase in wages payable must be added back to remove this noncash expense from accrual-basis income). Using Row 4, a decrease in a current liability, such as accounts payable, indicates that cash was used but the expense was incurred in an earlier period. Thus, the decrease in accounts payable would be subtracted to include this disbursement in cash income.

If the indirect method is chosen, then the amount of interest and income tax paid must be included in the related disclosures.

### ***Reconciliation of Net Income and Net Cash Flow from Operating Activities***

If an entity uses the indirect method to provide information about major classes of operating cash receipts and payments, it must report the same amount of net cash flow from operating activities indirectly. This is done with an adjustment to net income to reconcile it to net cash from operating activities by removing:

- The effects of all deferrals of past operating activities, and
- All items included in net income that do not affect cash provided for or used for operating activities.

(ASC 230-10-45-28)

When the direct method is used, a schedule reconciling net income to net cash flows from operating activities must also be provided. That reconciliation must be presented in a separate schedule. (ASC 230-10-45-30) That schedule reports the same information as the operating activities section prepared using the indirect method. Therefore, a firm must prepare and present both the direct and indirect methods when using the direct method for reporting cash from operating activities.

If the indirect method is used, the reconciliation may be presented with the statement of cash flow or in a separate schedule. If presented separately, the statement of cash flow reports only the net cash flow from operating activities. If the reconciliation is presented in the statement of cash flows, adjustments to net income to determine net cash flow from operating activities must be identified as reconciling items. (ASC 230-10-45-31 and 45-32)

### ***Comparison of Methods***

The major drawback to the indirect method involves the user's difficulty in comprehending the information presented. This method does not show the sources or uses of cash. Only adjustments to accrual-basis net income are shown. In some cases, the adjustments can be confusing. For instance, the sale of equipment resulting in an accrual-basis loss would require that the loss be added to net income to arrive at net cash from operating activities. (The loss was deducted in the computation of net income, but because the sale will be shown as an investing activity, the loss must be added back to net income.)

The direct method portrays the amounts of cash both provided by and used in the reporting entity's operations, instead of presenting net income and reconciling items. The direct method reports only the items that affect cash flow (inflows/outflows of cash) and ignores items that do not affect cash flow (depreciation, gains, etc.). The general formats of both the direct method and the indirect method are shown below.

### **Exhibit—Formats for Direct and Indirect Methods**

#### **Direct method**

Cash flows from operating activities:	
Cash received from sale of goods	\$xxx
Cash interest received	xxx
Cash dividends received	<u>xxx</u>
Cash provided by operating activities	\$xxx
Cash paid to suppliers	(xxx)
Cash paid for operating expenses	(xxx)
Cash interest paid	(xxx)
Cash paid for taxes	<u>(xxx)</u>
Cash disbursed for operating activities	(xxx)
Net cash flows from operating activities	<u>\$xxx</u>

#### **Indirect method**

Cash flows from operating activities:	
Net income	\$ xx
Add/deduct items not affecting cash:	
Decrease (increase) in accounts receivable	(xx)
Depreciation and amortization expense	xx
Increase (decrease) in accounts payable	xx
Decrease (increase) in inventories	<u>xx</u>
Loss on sale of equipment	
Net cash flows from operating activities	<u>\$ xx</u>

### **Other Requirements**

**Gross vs. net basis.** The emphasis in the statement of cash flows is on gross cash receipts and payments. For instance, reporting the net change in bonds payable would obscure the financing activities of the entity by not disclosing separately cash inflows from issuing bonds and cash outflows from retiring bonds. In a few circumstances, netting of cash flows is allowed. The items must have these characteristics:

- Quick turnovers,
  - Large amounts, and
  - Short maturities (maturities of three months or less).
- (ASC 230-10-45-8)

Net reporting for the following assets and liabilities is allowed provided the original maturity is three months or less:

1. Investments (other than cash equivalents),
  2. Loans receivable, and
  3. Debts.
- (ASC 230-10-45-9)

**Discontinued operations.** See the chapter on ASC 205 for an important Technical Alert on discontinued operations. The disclosure requirements relevant to discontinued operations and related cash flows can be found in the disclosure checklist in Appendix B of this volume—reference ASC 205-20-50-5B(c).

**Cash flow per share.** This information may *not* be displayed in the financial statements of a reporting entity.

### Net Reporting by Financial Institutions

Banks, savings institutions, and credit unions are allowed to report net cash receipts and payments for the following:

1. Deposits placed with other financial institutions
2. Withdrawals of those deposits
3. Time deposits accepted
4. Repayments of time deposits
5. Loans made to customers
6. Principal collections of loans made to customers.

(ASC 942-230-45-1)

### Reporting Hedging Transactions

Per ASC 230-10-45-27, the cash flows resulting from derivative instruments that are accounted for as fair value hedges or cash flow hedges may be classified as the same type of cash flows as the hedged items provided that the accounting policy is disclosed. There is an exception for hedges considered to have a financing element at inception. If the derivative instrument used to hedge includes at inception an other-than-insignificant financing element, all cash inflows and outflows associated with the derivative instrument are reported by the borrower as cash flows from financing activities. (ASC 230-10-45-27) A derivative that at inception includes off-market terms, or requires up-front cash payment, or both, often contains a financing element. A derivative instrument is viewed as including a financing element if its contractual terms have been structured to ensure that net payments will be made by one party in the earlier periods of the derivative's term and subsequently returned by the counterparty in the later periods (other than elements that are inherent in at-the-money derivative instruments with no prepayments). If for any reason hedge accounting for an instrument is discontinued, then any cash flows subsequent to the date of discontinuance are classified consistent with the nature of the instrument.

### Reporting Foreign Currency Cash Flows

If an entity has foreign currency transactions or foreign operations, it should look to ASC 830 for guidance.

### Preparation of the Statement

Under a cash and cash equivalents basis, the changes in the cash account and any cash equivalent account is the “bottom line” figure of the statement of cash flows. Using the 20X1 and 20X2 statements of financial position shown below, an increase of \$25,000 can be computed. This is the difference between the totals for cash and treasury bills between 20X1 and 20X2 ( $\$41,000 - \$16,000$ ).

When preparing the statement of cash flows using the direct method, gross cash inflows from revenues and gross cash outflows to suppliers and for expenses are presented in the operating activities section.

In preparing the reconciliation of net income to net cash flow from operating activities (indirect method), changes in all accounts (other than cash and cash equivalents) that are related to operations are additions to or deductions from net income to arrive at net cash provided by operating activities.

A T-account analysis may be helpful when preparing the statement of cash flows. A T-account is set up for each account, and beginning (20X1) and ending (20X2) balances are taken from the appropriate statement of financial position. Additionally, a T-account for cash and cash equivalents from operating activities and a master or summary T-account of cash and cash equivalents should be used.

### Example of preparing a statement of cash flows

The financial statements below will be used to prepare the statement of cash flows.

**Johnson Company**  
**Statements of Financial Position**  
**December 31, 20X2 and 20X1**

	<u>20X2</u>	<u>20X1</u>
<b>Assets</b>		
<i>Current assets:</i>		
Cash	\$ 37,000	\$ 10,000
Treasury bills	4,000	6,000
Accounts receivable—net	9,000	11,000
Inventory	14,000	9,000
Prepaid expenses	<u>10,000</u>	<u>13,000</u>
Total current assets	<u>\$ 74,000</u>	<u>\$ 49,000</u>
<i>Noncurrent assets:</i>		
Investment in available-for-sale securities	7,500	15,000
Add (less) adjustment for changes in fair value	1,000	(3,000)
Investment in XYZ (35%)	16,000	14,000
Patent	5,000	6,000
Leased asset	5,000	—
Property, plant, and equipment	39,000	37,000
Less accumulated depreciation	<u>(7,000)</u>	<u>(3,000)</u>
Total assets	<u>\$140,500</u>	<u>\$115,000</u>
<b>Liabilities</b>		
<i>Current liabilities:</i>		
Accounts payable	\$ 2,000	\$ 12,000
Notes payable—current	9,000	—
Interest payable	3,000	2,000
Dividends payable	5,000	2,000
Income taxes payable	2,180	1,000
Lease obligation	<u>700</u>	<u>—</u>
Total current liabilities	<u>21,880</u>	<u>17,000</u>

*Noncurrent liabilities:*

Deferred tax liability	9,360*	4,920*
Bonds payable	10,000	25,000
Lease obligation	4,300	—
Total liabilities	\$ 45,540	\$ 46,920

*Stockholders' equity*

Common stock, \$10 par value	\$ 33,000	\$ 26,000
Additional paid-in capital	16,000	3,000
Retained earnings	45,320	41,000
Accumulated other comprehensive income		
Net unrealized loss on available-for-sale securities	640	(1,920)
Total stockholders' equity	\$ 94,960	\$ 68,080
Total liabilities and stockholders' equity	\$140,500	\$115,300

\* Net of deferred tax asset (\$540) and (\$1,080) respectively.

**Johnson Company**  
**Statement of Earnings and Comprehensive Income**  
**For the Year Ended December 31, 20X2**

Sales	\$100,000	
Other income	8,500	
	<u>\$108,500</u>	
Cost of goods sold, excluding depreciation	60,000	
Selling, general, and administrative expenses	12,000	
Depreciation	8,000	
Amortization of patents	1,000	
Interest expense	<u>2,000</u>	
	<u>\$ 83,000</u>	
Income before taxes		\$ 25,500
Income taxes:		
Current	\$6,180	
Deferred	<u>3,000</u>	<u>9,180</u>
Net income		\$ 16,320
Other comprehensive income, net of tax		
Unrealized gains on securities:		
Unrealized holding gains (less applicable income taxes of \$900)	1,600	
Add reclassification adjustment (less applicable income taxes of \$540)	<u>960</u>	
Total other comprehensive income	\$ 2,560	
Comprehensive income	<u>\$ 18,880</u>	

*Additional information (all relating to 20X2)*

1. Equipment costing \$6,000 with a book value of \$2,000 was sold for \$5,000.
2. The company received a \$3,000 dividend from its investment in XYZ, accounted for under the equity method and recorded income from the investment of \$5,000 that is included in other income.

3. The company issued 200 shares of common stock for \$5,000.
4. The company signed a note payable for \$9,000.
5. Equipment was purchased for \$8,000.
6. The company converted \$15,000 bonds payable into 500 shares of common stock. The book value method was used to record the transaction.
7. A dividend of \$12,000 was declared.
8. Equipment was leased on December 31, 20X2. The principal portion of the first payment due December 31, 20X3 is \$700.
9. The company sold half of their available-for-sale investments during the year for \$8,000. The fair value of the remaining available-for-sale investments was \$8,500 on December 31, 20X2.
10. The income tax rate is 36%.

Summary of Cash and Cash Equivalents		Cash and Cash Equivalents—Operating	
Inflows	Outflows

### Explanation of entries to compile the statement of cash flows

- Cash and Cash Equivalents—Operating Activities is debited for \$16,320 (net income) and the credit is to Retained Earnings.
- Depreciation is not a cash flow; however, depreciation expense was deducted to arrive at net income. Therefore, Accumulated Depreciation is credited and Cash and Cash Equivalents—Operating Activities is debited.
- Amortization of patents is another expense not requiring cash; therefore, Cash and Cash Equivalents—Operating Activities is debited and Patent is credited.
- The sale of equipment (additional information, item 1) resulted in a \$3,000 gain. The gain is computed by comparing the book value of \$2,000 with the sales price of \$5,000. Cash proceeds of \$5,000 are an inflow of cash. Since the gain was included in net income, it must be deducted from net income to determine cash provided by operating activities. This is necessary to avoid counting the \$3,000 gain both in cash provided by operating activities and in investing activities. The following entry would have been made on the date of sale:

Cash	5,000
Accumulated depreciation (\$6,000 – \$2,000)	4,000
Property, plant, and equipment	6,000
Gain on sale of equipment (\$5,000 – \$2,000)	3,000

Adjust the T-accounts as follows: debit Summary of Cash and Cash Equivalents for \$5,000, debit Accumulated Depreciation for \$4,000, credit Property, Plant, and Equipment for \$6,000, and credit Cash and Cash Equivalents—Operating Activities for \$3,000.

- e. The deferred income tax liability account shows an increase of \$4,440. The \$3,000 increase that pertains to amounts reported in the income statement must be added to income from operations. Although the \$3,000 was deducted as part of income tax expense in determining net income, it did not require an outflow of cash. Therefore, debit Cash and Cash Equivalents—Operating Activities and credit Deferred Taxes. The other two amounts in the deferred tax liability account are covered below, under paragraph “p.”
- f. Item 2 under additional information indicates that the investment in XYZ is accounted for under the equity method. The investment in XYZ had a net increase of \$2,000, which is the result of the equity in the earnings of XYZ of \$5,000 and the receipt of a \$3,000 dividend. Dividends received (an inflow of cash) would reduce the investment in XYZ, while the equity in the income of XYZ would increase the investment without affecting cash. The journal entries would have been:

Cash (dividend received)	3,000
Investment in XYZ	3,000
Investment in XYZ	5,000
Equity in earnings of XYZ	5,000

The dividend received (\$3,000) is an inflow of cash, and the equity earnings are not. Debit Investment in XYZ for \$5,000, credit Cash and Cash Equivalents—Operating Activities for \$5,000, debit Cash and Cash Equivalents—Operating Activities for \$3,000, and credit Investment in XYZ for \$3,000.

- g. The Property, Plant, and Equipment account increased because of the purchase of \$8,000 (additional information, item 5). The purchase of assets is an outflow of cash. Debit Property, Plant, and Equipment for \$8,000 and credit Summary of Cash and Cash Equivalents.
- h. The company sold 200 shares of common stock during the year (additional information, item 3). The entry for the sale of stock was:

Cash	5,000
Common stock (200 shares × \$10)	2,000
Additional paid-in capital	3,000

This transaction resulted in an inflow of cash. Debit Summary of Cash and Cash Equivalents \$5,000, credit Common Stock \$2,000, and credit Additional Paid-in Capital \$3,000.

- i. Dividends of \$12,000 were declared (additional information, item 7). Only \$9,000 was actually paid in cash, resulting in an ending balance of \$5,000 in the Dividends Payable account. Therefore, the following entries were made during the year:

Retained earnings	12,000
Dividends payable	12,000

Dividends payable	9,000
Cash	9,000

These transactions result in an outflow of cash. Debit Retained Earnings \$12,000 and credit Dividends Payable \$12,000. Additionally, debit Dividends Payable \$9,000 and credit Summary of Cash and Cash Equivalents \$9,000 to indicate the cash dividends paid during the year.

- j. Accounts Receivable (net) decreased by \$2,000. This is added as an adjustment to net income in the computation of cash provided by operating activities. The decrease of \$2,000 means that an additional \$2,000 cash was collected on account above and beyond the sales reported in the income statement. Debit Cash and Cash Equivalents—Operating Activities and credit Accounts Receivable for \$2,000.
- k. Inventories increased by \$5,000. This is subtracted as an adjustment to net income in the computation of cash provided by operating activities. Although \$5,000 additional cash was spent to increase inventories, this expenditure is not reflected in accrual-basis cost of goods sold. Debit Inventory and credit Cash and Cash Equivalents—Operating Activities for \$5,000.
- l. Prepaid Expenses decreased by \$3,000. This is added back to net income in the computation of cash provided by operating activities. The decrease means that no cash was spent when incurring the related expense. The cash was spent when the prepaid assets were purchased, not when they were expensed on the income statement. Debit Cash and Cash Equivalents—Operating Activities and credit Prepaid Expenses for \$3,000.
- m. Accounts Payable decreased by \$10,000. This is subtracted as an adjustment to net income. The decrease of \$10,000 means that an additional \$10,000 of purchases were paid for in cash; therefore, income was not affected but cash was decreased. Debit Accounts Payable and credit Cash and Cash Equivalents—Operating Activities for \$10,000.
- n. Notes Payable increased by \$9,000 (as listed under additional information, item 4). This is an inflow of cash and would be included in the financing activities. Debit Summary of Cash and Cash Equivalents and credit Notes Payable for \$9,000.
- o. Interest Payable increased by \$1,000, but interest expense reported on the income statement was \$2,000. Therefore, although \$2,000 was expensed, only \$1,000 cash was paid (\$2,000 expense – \$1,000 increase in interest payable). Debit Cash and Cash Equivalents—Operating Activities for \$1,000 for the noncash portion, debit Interest Payable for \$1,000 for the cash portion, and credit Interest Payable for \$2,000 for the expense.
- p. The following entry was made to record the incurrence of the tax liability:

Income tax expense	9,180
Income taxes payable	6,180
Deferred tax liability	3,000

Therefore, \$9,180 was deducted in arriving at net income. The \$3,000 credit to Deferred Income Taxes was accounted for in entry e. above. The \$6,180 credit to Taxes Payable does not, however, indicate that \$6,180 cash was paid for taxes. Since Taxes Payable increased \$1,180, only \$5,000 must have been paid and \$1,180 remains unpaid. Debit Cash and Cash Equivalents—Operating Activities for \$1,180, debit Income Taxes Payable for \$5,000, and credit Income Taxes Payable for \$6,180.

- q. Item 6 under the additional information indicates that \$15,000 of bonds payable were converted to common stock. This is a *noncash* financing activity and should be reported in a separate schedule. The following entry was made to record the transaction:

Bonds payable	15,000
Common stock (500 shares × \$10 par)	5,000
Additional paid-in capital	10,000

Adjust the T-accounts with a debit to Bonds Payable, \$15,000; a credit to Common Stock, \$5,000; and a credit to Additional Paid-in Capital, \$10,000.

- r. Item 8 under additional information indicates that leased equipment was acquired on the last day of 20X2. The entity classified that lease as a finance lease. This is also a noncash financing activity and should be reported in a separate schedule. The following entry was made to record the lease transaction:

Leased asset	5,000
Lease obligation	5,000

- s. The company sold half of its available-for-sale investments during the year for \$8,000 (additional information, item 9). The entry for the sale of the investments was:

Cash	8,000
Investment in available-for-sale securities	7,500
Gain on sale of investments	500

This transaction resulted in an inflow of cash. Debit Summary of Cash and Cash Equivalents \$8,000, credit Investment in Available-for-Sale Securities \$7,500, and credit Cash and Cash Equivalents—Operating Activities \$500. The following additional journal entries were made:

Adjustment for changes in FV	1,500
Other comprehensive income (\$1,500 × 64%)	960
Deferred tax liability (\$1,500 × 36%)	540

To adjust the allowance account for the sale, one-half of the amounts provided at the end of 2012 must be taken off the books when the related securities are sold.

Adjustment for changes in FV	2,500
Unrealized gain on available-for-sale securities (\$2,500 × 64%)	1,600
Deferred tax liability (\$2,500 × 36%)	900

The change in fair value of the remaining securities at year-end (as listed under additional information, item 9) must be adjusted. The book value of the securities before the adjustment above is \$6,000 (\$7,500 – \$1,500). The fair value of the securities is \$8,500. An adjustment of \$2,500 is necessary.

- t. The cash and cash equivalents from operations (\$15,000) is transferred to the Summary of Cash and Cash Equivalents.

All of the changes in the noncash accounts have been accounted for and the balance in the Summary of Cash and Cash Equivalents account of \$25,000 is the amount of the year-to-year increase in cash and cash equivalents. The formal statement may now be prepared using the T-account, Summary of Cash and Cash Equivalents. The alphabetic characters in the

statement below refer to the entries in that T-account. The following statement of cash flows is prepared under the direct method. The calculations for gross receipts and gross payments needed for the direct method are shown below the statement.

**Johnson Company**  
**Statement of Cash Flows**  
**For the Year Ended December 31, 20X2**

**Cash flow from operating activities**

Cash received from customers	\$102,000	
Dividends received	<u>3,000</u>	
Cash provided by operating activities	<u>\$105,000</u>	
Cash paid to suppliers	\$ 75,000	
Cash paid for expenses	9,000	
Interest paid	1,000	
Income taxes paid	<u>5,000</u>	
Cash paid for operating activities	<u>(90,000)</u>	
Net cash flow provided by operating activities	(t) \$ 15,000	

**Cash flow from investing activities**

Sale of equipment	5,000	(d)
Sale of investments	8,000	(s)
Purchase of property, plant, and equipment	<u>(8,000)</u>	(g)
Net cash provided by investing activities	5,000	

**Cash flow from financing activities**

Sale of common stock	\$ 5,000	(h)
Increase in notes payable	9,000	(n)
Dividends paid	<u>(9,000)</u>	(i)
Net cash provided by financing activities	<u>5,000</u>	
Net increase in cash and cash equivalents	<u>\$ 25,000</u>	
Cash and cash equivalents at beginning of year	<u>16,000</u>	
Cash and cash equivalents at end of year	<u>\$ 41,000</u>	

**Calculation of amounts for operating activities section**

$$\text{Cash received from customers} = \text{Net sales} + \text{Beginning A/R} - \text{Ending A/R}$$

$$\$100,000 + \$11,000 - \$9,000 = \$102,000$$

$$\text{Cash paid to suppliers} = \text{Cost of goods sold} + \text{Beginning A/P} - \text{Ending A/P} + \text{Ending inventory} - \text{Beginning inventory}$$

$$\$60,000 + \$12,000 - \$2,000 + \$14,000 - \$9,000 = \$75,000$$

$$\text{Cash paid for operating expenses} = \text{Operating expenses} + \text{Ending prepaid expenses} - \text{Beginning prepaid expenses} - \text{Depreciation expense (and other noncash operating expenses)}$$

$$\$12,000 + \$8,000 + \$1,000 + \$10,000 - \$13,000 - \$8,000 - \$1,000 = \$9,000$$

$$\text{Interest paid} = \text{Interest expense} + \text{Beginning interest payable} - \text{Ending interest payable}$$

$$\$2,000 + \$2,000 - \$3,000 = \$1,000$$

$$\text{Taxes paid} = \text{Income taxes} + \text{Beginning income taxes payable} - \text{Ending income taxes payable} - \text{Change in deferred income taxes—operating portion}$$

$$\$9,180 + \$1,000 - \$2,180 - \$3,000 = \$5,000$$

When a statement of cash flows is prepared using the direct method of reporting operating cash flows, the reconciliation of net income to operating cash flows must also be provided. The T-account, Cash and Cash Equivalents—Operating Activities is used to prepare the reconciliation. The alphabetic characters in the reconciliation below refer to the entries in the T-account.

***Reconciliation of net income to net cash provided by operating activities***

Net income	(a)	\$16,320
Add (deduct) items not using (providing) cash:		
Depreciation	8,000	(b)
Amortization	1,000	(c)
Gain on sale of equipment	(3,000)	(d)
Increase in deferred taxes	3,000	(e)
Equity in XYZ	(2,000)	(f)
Decrease in accounts receivable	2,000	(j)
Increase in inventory	(5,000)	(k)
Decrease in prepaid expenses	3,000	(l)
Decrease in accounts payable	(10,000)	(m)
Increase in interest payable	1,000	(o)
Increase in income taxes payable	1,180	(p)
Gain on sale of AFS securities	(500)	(s) <u>(1,320)</u>
Net cash flow provided by operating activities	(t)	<u>\$15,000</u>

***Schedule of noncash investing and financing activities transactions***

Conversion of bonds into common stock	(q)	\$15,000
Acquisition of leased equipment	(r)	\$ 5,000

### Statement of Cash Flows for Consolidated Entities

A consolidated statement of cash flows must be presented when a complete set of consolidated financial statements is issued. The consolidated statement of cash flows would be the last statement to be prepared, as the information to prepare it will come from the other consolidated statements (consolidated statement of financial position, income statement, and statement of retained earnings). The preparation of a consolidated statement of cash flows involves the same analysis and procedures as the statement for an individual entity with a few additional items. When the indirect method is used, the additional noncash transactions relating to the business combination, such as the differential amortization, must also be reversed, and all transfers to affiliates must be eliminated, as they do not represent cash inflows or outflows of the consolidated entity.

All unrealized intercompany profits should have been eliminated in preparation of the other statements. Any income or loss allocated to noncontrolling parties would need to be added back, as it would have been eliminated in computing consolidated net income but does not represent a true cash outflow or inflow. Finally, only dividend payments that are not intercompany should be recorded as cash outflows in the financing activities section.

In preparing the operating activities section of the statement by the indirect method following a purchase business combination, the changes in assets and liabilities related to operations since acquisition should be derived by comparing the consolidated statement of financial position as of the date of acquisition with the year-end consolidated statement of financial position. These changes will be combined with those for the acquiring company up to the date of acquisition as

adjustments to net income. The effects due to the acquisition of these assets and liabilities are reported under investing activities.

## PERSPECTIVE AND ISSUES

---

### Subtopic

ASC 235, *Notes to Financial Statements*, contains one Subtopic:

- ASC 235-10, *Overall*, which addresses “the content and usefulness of the accounting policies judged by management to be most appropriate to fairly present the entity’s financial statement.”

The topic does not address specific disclosures. Those are addressed in the related topics. The topic does, however, list accounting policy disclosures commonly required:

- Basis of consolidation
  - Depreciation methods
  - Amortization of intangibles
  - Inventory pricing
  - Recognition of revenue from contracts with customers
  - Recognition of revenue from leasing operations.
- (ASC 235-10-50-4)

### Scope

ASC 235 applies to all entities and has no scope exceptions.

### Technical Alert

Disclosures have drawn the attention of both the FASB and the SEC. As the disclosure requirements have accumulated over the years, there has been a growing concern about information overload and whether more is necessarily better.

**FASB Initiatives.** The FASB currently has two companion projects deliberating the concept of materiality. The FASB has a project to develop a framework to increase the effectiveness of disclosures. The framework will address the process for establishing disclosure and for determining which disclosures to make. As part of its Framework project, the FASB issued an Exposure Draft in September 2015, *Proposed Amendments to Statement of Financial Accounting Concepts*, to amend CON 8. As part of its second project, the Disclosure Framework project, the FASB issued an Exposure Draft in September 2015, *Proposed Accounting Standards Update: Notes to Financial Statements: Assessing Whether Disclosures Are Material (Topic 235)*. As this volume goes to press, the FASB is redeliberating. More information can be found in the Technical Alert section of the chapter on ASC 105 and on the FASB's website.

**SEC Initiative.** The SEC is reviewing specific sections of regulations S-K and S-X, with a goal of updating requirements and eliminating duplicate disclosures. The Commission also wants to continue to provide material information and reduce cost burdens on companies. There are several suggestions for decreasing disclosure overload. In September 2015, the SEC issued a request for comment on the effectiveness of certain Regulation S-X requirements. The SEC in April 2016 issued a request for comment on a concept release related to financial disclosures required by Regulation S-K. SEC Commissioner Mary Jo White expects 2016 to bring more on Regulation S-K and various technical changes related to financial statement disclosures and improvements to presentation of information.

**Congressional Mandate.** In addition to the SEC's Disclosure Framework project, a transportation bill enacted in 2015 included a provision on disclosure modernization and simplification. The bill requires the SEC to study the requirements in Regulation S-K, report the findings to Congress, and issue a proposed rule to implement the recommendations of the study.

**Suggestions for Improving Disclosure Effectiveness.** In an April 2014 speech by Keith Higgins, SEC Division of Corporation Finance Director, Mr. Higgins suggested ways that entities can improve disclosure effectiveness now. The full speech is available on [sec.gov](http://sec.gov).

- **Reduce Repetition**—Think twice before repeating something. There are plenty of examples of companies including—verbatim—disclosure from their significant accounting policies footnote in their MD&A discussions of critical accounting estimates. Setting aside the fundamental question of whether our MD&A guidance on critical accounting estimates requires a recitation of the accounting principle itself, if there were ever a place in a report that cried out for a cross reference—and there are likely plenty of them—this is near the top of the list. The purpose of the discussion of critical accounting estimates is to educate the reader about the aspects of the particular accounting policy that are the most uncertain and subject to possible revision, not to repeat how the accounting policy works, which is described elsewhere. Before you repeat anything in a filing, please step back and ask yourself—do I need to say it again?
- **Focus Your Disclosure**—I wonder if Abe Lincoln—who wrote the Gettysburg Address in 272 words—ever dreamed we would have annual reports with risk factor disclosure exceeding 30 or 40 pages. Some have suggested, only partly in jest, that we implement a page limit for risk factors or require companies to list their top ten risk factors. We can all probably agree that risk factors could be written better—less generic and more tailored—and they should explain how the risks would affect the company if they came to pass. There is no question that many companies have come to view these discussions as an insurance policy. After taking into account the safe harbor in the Private Securities Litigation Reform Act of 1995, and courts' lack of uniformity about the interpretation of

“meaningful cautionary statements,” the result is that companies have little incentive to limit the number of risk factors. I recognize this is a problem. But, are there effective ways to incentivize companies—and their lawyers—to write better risk factors that would allow investors to zero in on the material risks?

Turning to a different example, the transparency of our review and comment process has had a generally salutary effect, which has been far reaching. One effect that may not be as salutary is the tendency for companies to simply follow what others have done when making disclosure decisions or to include disclosures because a client alert says that it is a “hot button” issue for the staff. However, the first question should be “does this issue apply to the company?” And when the answer is no, it should be the last question as well.

- **Eliminate Outdated Information**—Disclosure should evolve over time. In a survey of 122 public companies, 74% said that once they include disclosure in a public filing in response to an SEC comment, it is rarely, if ever, removed.<sup>1</sup> Companies and their representatives should regularly evaluate their disclosures to determine whether they are material to investors. If they are not material, and they are not required, you can take them out. Yes, as unsettling as I am sure this can be for some, it is perfectly all right to remove disclosure when it is immaterial or outdated even if it was included in a prior filing in response to a staff comment. A response to a staff comment is not carved in stone and enshrined for time immemorial in each filing going forward—unless, of course, it remains material. And if it does, keep it in.

For those interested in the SEC’s disclosure project, a staff report to Congress was issued in December 2013 and is also available on the SEC site at <http://www.sec.gov/news/studies/2013/reg-sk-disclosure-requirements-review.pdf>. This report was mandated by the Jumpstart Our Business Startups (JOBS) Act. It provides the staff’s preliminary conclusions and recommendations about disclosure reform.

## DEFINITIONS OF TERMS

---

See Appendix A, *Definitions of Terms*, for definitions of terms related to this Topic: Contract, Customer, and Revenue.

## CONCEPTS, RULES, AND EXAMPLES

---

### Accounting Policies

The reporting entity’s management is responsible for adopting and adhering to the highest quality accounting policies possible. ASC 235 requires management, in discharging this responsibility, to adopt accounting principles and methods of applying them that are “the most appropriate in the circumstances to present fairly financial position, results of operations, and cash flows in accordance with generally accepted accounting principles.”

There are many different methods of valuing assets, recognizing revenues, and assigning costs. Financial statement users must be aware of the accounting policies used by an entity so that

---

<sup>1</sup> See KPMG LLP and Financial Executives Research Foundation, Inc., Disclosure overload and complexity: hidden in plain sight. Available at: <http://www.kpmg.com/US/en/IssuesAndInsights/ArticlesPublications/Documents/disclosure-overload-complexity.pdf>.

sound economic decisions can be made. Per ASC 235, financial statement disclosures should identify and describe:

- All significant accounting policies followed by the entity, and
- Methods of applying those principles that materially affect the determination of financial position, changes in cash flows, or results of operations.

This requirement applies even in reporting situations where one or more of the basic financial statements have been omitted. However, it does not apply to unaudited interim statements where the accounting policies have not changed since the issuance of the last annual statements. (ASC 275-10-50-2)

The accounting policies disclosure should encompass those accounting principles and methods that involve the following:

1. Selection from acceptable alternatives
2. Principles and methods peculiar to the industry
3. Unique applications of GAAP.

In theory, if only one method of accounting for a type of transaction is acceptable under GAAP, it is not necessary to explicitly cite it in the accounting policies note, although many entities do routinely identify all accounting policies affecting the major financial statement captions.

In the accounting policy disclosure, it is not necessary to repeat details that are provided in other disclosures. Many preparers simply cross-reference accounting policy disclosures to relevant details provided in other notes to the financial statements.

The “summary of significant accounting policies” is customarily, but not necessarily, the first note disclosure included in the financial statements. A more all-encompassing title such as “Nature of business and summary of significant accounting policies” is frequently used.

**Commonly disclosed accounting policies.** A listing of accounting policies commonly disclosed by reporting entities follows (the listing is not intended to be all-inclusive):

- Advertising costs
- Advertising, direct response arrangements
- Cash equivalents
- Changes in accounting policies
- Combined financial statements, principles of combination
- Concentrations of credit risk, major customers and/or suppliers
- Consolidated financial statements, principles of consolidation
- Consolidated financial statements, variable interest entities
- Deferred income taxes
- Deferred income taxes, undistributed earnings of subsidiaries and/or joint ventures
- Derivatives and hedging activities
- Fair value elections, methods, assumptions, inputs used
- Financial instruments
- Fiscal year, 52–53 week year
- Fiscal year, difference between fiscal year used for financial reporting and for income tax purposes
- Foreign currency translation
- Foreign sales corporations

- Goodwill
- Guarantees
- Impairment of long-lived assets, goodwill, other intangibles, investments, etc.
- Income taxes, deposit to retain fiscal year
- Income taxes, liability for unrecognized income tax positions
- Income taxes, nonaccrual by flow-through entity
- Intangibles, amortizable and/or nonamortizable
- Interest capitalization
- Internal-use software
- Inventories
- Investments, cost method
- Investments, debt and marketable equity securities including reclassifications between portfolios
- Investments, equity method
- Nature of operations
- Not-for-profits; restrictions that are satisfied in the year they originate
- Operating cycle
- Out-of-pocket costs (typically for service businesses)
- Pension and other postretirement or postemployment plans
- Property and equipment, changes from held-and-used to held-for-sale
- Property and equipment, depreciation and amortization
- Rebates
- Receivables, past due, interest and late charges, determination of allowance for bad debts
- Reclassifications
- Revenue from contracts with customers
- Revenue recognition, lessor leasing activities
- Revenue recognition, methods for each significant product or service
- Revenue recognition, product returns
- Revenue recognition, real estate (time-sharing) sales (e.g., installment cost recovery, full accrual)
- Share-based payment arrangements
- Shipping and handling costs
- Start-up costs
- Syndication costs
- Use of estimates
- Warranties.

**Timing of adoption decisions.** Upon formation of a business or nonprofit organization, management makes decisions regarding the adoption of accounting policies, based on the types of activities in which the entity engages and the industry and environment in which it operates. Certain ASC Topics permit choices to be made from among alternative, acceptable accounting treatments. The principles selected from among the available alternatives and the methods of applying those principles constitute the reporting entity's accounting policies.

Management initially adopts accounting principles at two distinct times:

1. Upon formation of the reporting entity
2. Upon the occurrence of a new type of event or transaction that had either not happened in the past or had previously been judged to be immaterial.

Once the initial adoption decisions are made, the users of the financial statements expect a reporting entity's financial statements to be prepared consistently over time. This facilitates comparisons across periods and among different reporting entities.

### Disclosure Techniques

The following five disclosure techniques are used in varying degrees in contemporary financial statements:

1. Parenthetical explanations
2. Notes to the financial statements
3. Cross-references
4. Valuation allowances (sometimes referred to as “contra” amounts)
5. Supporting schedules.

**Parenthetical explanations.** Information is sometimes disclosed by means of parenthetical explanations appended to the appropriate statement of financial position caption. For example:

Common stock (\$10 par value, 200,000 shares authorized, 150,000 issued)	\$1,500,000
--	-------------

Parenthetical explanations have an advantage over both notes to the financial statements and supporting schedules. Parenthetical explanations place the disclosure prominently in the body of the statement instead of in a note or schedule where it is more likely to be overlooked.

**Notes to financial statements.** If the information cannot be disclosed in a relatively short and concise parenthetical explanation, a note disclosure is used. For example:

Inventories (see note 1)	\$2,550,000
--------------------------	-------------

The notes to the financial statements would contain the following:

**Note 1:** Inventories are stated at the lower of cost or market. Cost is determined using the first-in, first-out (FIFO) method.

**Cross-references.** Cross-referencing is used when there is a direct relationship between two accounts on the statement of financial position. For example, among the current assets, the following might be shown if \$1,500,000 of accounts receivable were pledged as collateral for a \$1,200,000 bank loan:

Accounts receivable pledged as collateral on bank loan payable	\$1,500,000
--	-------------

Included in the current liabilities would be the following:

Bank loan payable—collateralized by accounts receivable	\$1,200,000
---	-------------

**Valuation allowances.** Valuation allowances are used to reduce or increase the carrying amounts of certain assets and liabilities. Accumulated depreciation reduces the carrying value of property, plant, and equipment, and a bond premium (discount) increases (decreases) the face value of a bond payable as shown in the following illustration:

Equipment	\$18,000,000	
Less accumulated depreciation	<u>(1,625,000)</u>	\$16,375,000
Bonds payable	\$20,000,000	
Less discount on bonds payable	<u>(1,300,000)</u>	\$18,700,000
Bonds payable	\$20,000,000	
Add premium on bonds payable	<u>1,300,000</u>	\$21,300,000

## PERSPECTIVE AND ISSUES

---

### Subtopics

ASC 250, *Accounting Changes and Error Corrections*, contains one subtopic:  
ASC 250-10, *Overall*, which:

- Provides guidance on accounting for and reporting on accounting changes and error corrections
- Requires, unless impractical, retrospective application of a change in accounting principle
- Provides guidance on when retrospective application is impractical and how to report on the impracticality.

(ASC 250-10-05-2 and 05-3)

ASC 250-10 also:

- Specifies the method of treating error correction in comparative statements
- Specifies the disclosures required upon restatement of previously issued statements of income
- Recommends methods of presentation of historical, statistical-type financial summaries affected by error corrections.

(ASC 250-10-05-5)

## Scope

ASC 250 applies to all entities' financial statements and summaries of information that reflect an accounting period affected by accounting change or error. (ASC 250-10-15-2)

## Overview

Under U.S. GAAP, management is granted the flexibility of choosing between or among certain alternative methods of accounting for the same economic transactions. Examples of the availability of such choices are provided throughout this publication, in such diverse areas as alternative cost-flow assumptions used to account for inventory and cost of sales, different methods of depreciating long-lived assets, and varying methods of identifying operating segments. The professional literature (in the areas of accounting principles, auditing standards, quality control standards, and professional ethics) is emphatic that, in choosing among the various alternatives, management is to select principles and apply them in a manner that results in financial statements that faithfully represent economic substance over form and that are fully transparent to the user.

Changes in accounting can be necessitated over time due to changes in the assumptions and estimates underlying the application of accounting principles and methods of applying them, changes in the principles defined as acceptable by a standards-setting authority, or other types of changes.

Changes in accounting for given transactions can have a profound influence on investing and operational decisions. Financial statement analysts and management decision makers both generally presume the consistency and comparability of financial statements across periods and among entities within industry groupings. Any type of accounting change potentially can create inconsistency. The challenge is to present the effects of the change in a manner that is most readily comprehended by users of financial statements, who may impose various adjustments of their own in their efforts to make the information comparable for analysis purposes.

When contemplating a potential change in accounting principle, a primary focus of management should be to consider its effect on financial statement comparability. This should not, however, dissuade preparers from adopting preferable accounting standards, where otherwise warranted.

ASC 250 contains the underlying presumption that in preparing financial statements, an accounting principle, once adopted, should not be changed in accounting for events and transactions of a similar type. This consistent use of accounting principles is intended to enhance the utility of financial statements. The presumption that a reporting entity should not change an accounting principle may be overcome only if management justifies the use of an alternative acceptable accounting principle on the basis that it is actually preferable.

ASC 250 does not provide a definition of preferability or criteria by which to make such assessments, so this remains a matter of professional judgment. What is preferable for one industry or company is not necessarily considered preferable for another.

## DEFINITIONS OF TERMS

---

Source: ASC 250-10-20

**Accounting Change.** A change in an accounting principle, an accounting estimate, or the reporting entity. The correction of an error in previously issued financial statements is not an accounting change.

**Change in Accounting Estimate.** A change that has the effect of adjusting the carrying amount of an existing asset or liability or altering the subsequent accounting for existing or future assets or liabilities. A change in accounting estimate is a necessary consequence of the assessment, in conjunction with the periodic presentation of financial statements, of the present status and expected future benefits and obligations associated with assets and liabilities. Changes in accounting estimates result from new information. Examples of items for which estimates are necessary are uncollectible receivables, inventory obsolescence, service lives and salvage values of depreciable assets, and warranty obligations.

**Change in Accounting Estimate Effected by a Change in Accounting Principle.** A change in accounting estimate that is inseparable from the effect of a related change in accounting principle. An example of a change in estimate effected by a change in principle is a change in the method of depreciation, amortization, or depletion for long-lived, nonfinancial assets.

**Change in Accounting Principle.** A change from one generally accepted accounting principle to another generally accepted accounting principle when there are two or more generally accepted accounting principles that apply or when the accounting principle formerly used is no longer generally accepted. A change in the method of applying an accounting principle is also considered a change in accounting principle.

**Change in the Reporting Entity.** A change that results in financial statements that, in effect, are those of a different reporting entity. A change in the reporting entity is limited mainly to the following:

- a. Presenting consolidated or combined financial statements in place of financial statements of individual entities
- b. Changing specific subsidiaries that make up the group of entities for which consolidated financial statements are presented
- c. Changing the entities included in combined financial statements.

Neither a business combination accounted for by the acquisition method nor the consolidation of a variable interest entity (VIE) pursuant to Topic 810 is a change in reporting entity.

**Direct Effects of a Change in Accounting Principle.** Those recognized changes in assets or liabilities necessary to effect a change in accounting principle. An example of a direct effect is an adjustment to an inventory balance to effect a change in inventory valuation method. Related changes, such as an effect on deferred income tax assets or liabilities or an impairment adjustment resulting from applying the subsequent measurement guidance in Subtopic 330-10 to the adjusted inventory balance, are also examples of direct effects of a change in accounting principle.

**Error in Previously Issued Financial Statements.** An error in recognition, measurement, presentation, or disclosure in financial statements resulting from mathematical mistakes, mistakes in the application of generally accepted accounting principles (GAAP), or oversight or misuse of facts that existed at the time the financial statements were prepared. A change from an accounting principle that is not generally accepted to one that is generally accepted is a correction of an error.

**Indirect Effects of a Change in Accounting Principle.** Any changes to current or future cash flows of an entity that result from making a change in accounting principle that is applied retrospectively. An example of an indirect effect is a change in a nondiscretionary profit sharing or royalty payment that is based on a reported amount such as revenue or net income.

**Restatement.** The process of revising previously issued financial statements to reflect the correction of an error in those financial statements.

**Retrospective Application.** The application of a different accounting principle to one or more previously issued financial statements, or to the statement of financial position at the beginning of the current period, as if that principle had always been used, or a change to financial statements of prior accounting periods to present the financial statements of a new reporting entity as if it had existed in those prior years.

## **CONCEPTS, RULES, AND EXAMPLES**

---

### **Accounting Changes**

There are legitimate reasons why a reporting entity would change its accounting:

1. Changing to an existing alternative accounting principle that management deems to be preferable to the one it is currently following
2. Adopting a newly issued accounting principle
3. Refining an estimate made in the past as a result of further experience and better information
4. Correcting an error made in previously issued financial statements. Although technically not an “accounting change” as defined in GAAP literature, this involves restating previously issued financial statements and is also governed by ASC 250.

To facilitate accurate analysis, it is important for management of the reporting entity to adequately inform the financial statement users when one or more of these changes are made, and to provide sufficient information to enable the reader to distinguish the effects of the change from other factors affecting results of operations.

Each of the types of accounting changes and the proper treatment prescribed for them is summarized in the following chart and discussed in detail in the following sections.

## Summary of Accounting Changes and Error Corrections

	<i>Treatment in financial statements, historical summaries, financial highlights, and other similar presentations of businesses and not-for-profit organizations</i>		
<i>Type and description of change or correction</i>	<i>Retrospective application to all periods presented<sup>1</sup></i>	<i>Affects period of change and, if applicable, future periods</i>	<i>Restatement of all prior period financial statements presented</i>
<b>Accounting Changes</b>	✓		
Change in accounting principle <i>New principle required to be preferable</i>		✓	
Change in accounting estimate <i>New principle required to be preferable</i>		✓	
Change in reporting entity <sup>2</sup>	✓		
<b>Restatements<sup>3</sup></b> Correction of errors in previously issued financial statements			✓

### Change in Accounting Principle

Management is permitted to change from one generally accepted accounting principle to another only when:

1. It voluntarily decides to do so and can justify the use of the alternative accounting principle as being preferable to the principle currently being followed, or
2. It is required to make the change as a result of a newly issued accounting pronouncement. (ASC 250-10-45-2)

Per ASC 250-45-1, the following are not considered a change in accounting principle:

- Initial adoption of an accounting principle
  - Adoption or modification of an accounting principle for transactions or events substantially different from previous transactions.
- (ASC 250-45-1)

<sup>1</sup> ASC 250 provides an exception to the requirement for retroactive restatement when it is impracticable to make the restatement. This exception is only permitted to be used under specified conditions.

<sup>2</sup> This is generally limited to (a) presentation of consolidated or combined financial statements instead of financial statements of individual entities, (b) a change in the specific subsidiaries making up a group of entities for which consolidated financial statements are presented, and (c) changing the entities included in combined financial statements. Neither a business combination under ASC 805 nor consolidation of a variable interest entity under ASC 810 is considered a change in reporting entity.

<sup>3</sup> The word “restatement” is only to be used to describe and/or present corrections of prior period errors.

If a change in accounting principle is being made voluntarily, the financial statements of the period of change must include disclosure of the nature of and reason for the change and an explanation of why management believes the newly adopted accounting principle is preferable. This preferability assessment is required to be made from the perspective of financial reporting, and not solely from an income tax perspective. Thus, favorable income tax consequences alone do not justify making a change in financial reporting practices.

According to ASC 250, the term *accounting principle* includes not only the accounting principles and practices used by the reporting entity, but also its methods of applying them. A change in the components used to cost a firm's inventory is considered a change in accounting principle and, therefore, is only permitted when the new inventory costing method is preferable to the former method.

**Preferability.** As stated, management is only permitted to voluntarily change the reporting entity's accounting principles when the newly employed principle is preferable to the principle it is replacing. The independent auditors are then charged with concurring with management's assessment. If the auditors do not believe management has provided reasonable justification for the change, AU-C §708.07 requires the auditors to express either a qualified or adverse opinion, depending on the materiality of the effects of the unacceptable accounting principle on the financial statements.

When management of a public company voluntarily changes the registrant's accounting principles, a letter from the registrant's independent public accountants is required to be filed with the Securities and Exchange Commission (SEC). This "preferability letter" is to be included as an exhibit in 10-Q and 10-K filings (Regulation S-K Item 601, Exhibit 18) and must indicate whether the change in principle or practice (or method of applying that principle or practice) is to an acceptable alternative that, in the auditors' judgment, is preferable under the circumstances. (ASC 250-10-S99-4)

**Retrospective application.** ASC 250-10-45-5 provides that changes in accounting principle be reflected in financial statements by retrospective application to all prior periods presented unless it is impracticable to do so. ASC 250-45-3 points out that Accounting Standards Updates include specific provisions regarding transitioning to the new principles that are to be followed by adopting entities. The default method is retrospective restatement. Updates may provide for adoption using cumulative effect adjustments, if FASB believes that is the most beneficial method of transition.

Retrospective application is accomplished by the following steps:

At the beginning of the first period presented in the financial statements,

- Step 1    Adjust the carrying amounts of assets and liabilities for the cumulative effect of changing to the new accounting principle on periods prior to those presented in the financial statements.
- Step 2    Offset the effect of the adjustment in Step 1 (if any) by adjusting the opening balance of retained earnings (or other components of equity or net assets, as applicable to the reporting entity).

For each individual prior period that is presented in the financial statements,

- Step 3    Adjust the financial statements for the effects of applying the new accounting principle to that specific period.

(ASC 250-10-45-5)

**Example of retrospective application of a new accounting principle**

In 20X1, upon the incorporation of Newburger Company, its management elected to recognize advertising costs as incurred. Newburger has been consistently following that policy in its financial statements. In 20Y3, Newburger's management reviewed its accounting policies and concluded that application of its current policy was resulting in substantial costs associated with the production of television advertising being recognized in financial reporting periods that preceded the periods in which the related revenues were earned. Consequently, management decided to change Newburger's policy to elect to expense advertising costs the first time the advertising takes place as permitted by ASC 720-35, *Advertising Costs*. Additional assumptions follow:

- As has been its policy in the past, Newburger plans to issue comparative financial statements presenting two years, 20Y3 and 20Y2.
- Newburger does not engage in direct-response advertising activities.
- A combined federal and state income tax rate of 40% was in effect for all relevant periods.
- Prior to the change in accounting principle, there were no temporary differences or loss carryforwards and, thus, there were no deferred income tax assets or liabilities.
- Advertising costs are deductible for income tax purposes when incurred and, therefore, upon adoption of the new accounting policy, Newburger will have a temporary difference between the book and income tax bases of its asset, deferred advertising costs. These advertising costs that are being recognized in the financial statements in the year after they are deducted on Newburger's income tax return represent a future taxable temporary difference that will give rise to a deferred income tax liability.
- The financial statements originally issued as of and for the years ended December 31, 20Y2 and 20Y1, prior to the adoption of the new accounting principle, are presented below with advertising-related captions shown separately for illustrative purposes.

**Newburger Company**  
**Statements of Income and Retained Earnings**  
**Prior to Change in Accounting Principle**  
**Years Ended December 31, 20Y2 and 20Y1**

	<u><b>20Y2</b></u>	<u><b>20Y1</b></u>
Sales	\$ 2,300,000	\$ 2,000,000
Cost of sales	<u>(850,000)</u>	<u>(750,000)</u>
Gross profit	<u>1,450,000</u>	<u>1,250,000</u>
Advertising expense	65,000	55,000

Proceeds from sale	—	—
Net cash used for investing activities	<u>(133,000)</u>	<u>(120,000)</u>

***Financing activities***

Dividends paid to stockholders	(1,400,000)	(1,200,000)
Long-term debt		
Borrowed	—	—
Repaid	(5,000)	(5,000)
Net cash used for financing activities	(1,405,000)	(1,205,000)
Decrease in cash and cash equivalents	(200,000)	(150,600)
Cash and cash equivalents, beginning of year	2,400,000	2,550,600
Cash and cash equivalents, end of year	\$ 2,200,000	\$ 2,400,000

Step 1     Adjust the carrying amounts of assets and liabilities at the beginning of the first period presented in the financial statements (January 1, 20Y2, in this example). For the cumulative effect of changing to the new accounting principle on periods prior to those presented in the financial statements.

In this example, the preparer refers to the previously issued 2011 financial statements presented above. Assume the following data regarding advertising costs at December 31, 20Y1/January 1, 20Y2:

Costs incurred during 20Y1 for advertising that will not take place for the first time until 20Y2	\$25,000
Deferred income tax liability that would have been recognized at December 31, 20Y1, computed at 40% of the temporary difference	(10,000)
Net adjustment to beginning assets and liabilities	\$15,000

Step 2     Offset the effect of the adjustment in Step 1 by adjusting the opening balance of retained earnings (or other components of equity or net assets, as applicable to the reporting entity).

The \$15,000 net effect of the adjustment in Step 1 is presented in the statement of income and retained earnings as an adjustment to the January 1, 20Y2 retained earnings as previously reported at December 31, 20Y1.

Step 3     Adjust the financial statements of each individual prior period presented for the effects of applying the new accounting principle to that specific period.

In this case, the following adjustments are necessary to adjust the 20Y2 financial statements for the period-specific effects of the change in accounting principle:

<i>Cost incurred in</i>	<i>Year the advertising was first run</i>	
20Y1	20Y2	\$ 25,000
20Y2	20Y3	<u>(45,000)</u>
Pretax, period-specific adjustment to advertising costs at 12/31/Y1		(20,000)
× 40% income tax effect		8,000
Effect on 20Y2 net income		<u>\$(12,000)</u>

Adjustments to the 20Y2 financial statements for the period-specific effects of retrospective application of the new accounting principle are:

*Adjustments to 20Y2 financial statements*

	<i>Deferred advertising costs</i>	<i>Deferred income tax liability</i>	<i>Advertising expense</i>	<i>Income tax expense</i>
Balance at 12/31/Y2 prior to adjustment	\$ —	\$ —	\$ <u>65,000</u>	\$ 404,000
Adjustment to opening balances from retrospective application to 20Y2	25,000	10,000	—	—
Advertising costs incurred in 2010, first run in 20Y2	(25,000)	—	25,000	—
Advertising costs incurred in 2011, first run in 20Y3	45,000	—	(45,000)	—
			(20,000)	
Income tax effect of net adjustment to 20Y2 advertising expense (40%)	—	8,000	—	8,000
Adjusted amounts for 20Y2 financial statements	<u>\$45,000</u>	<u>\$18,000</u>	<u>\$45,000</u>	<u>\$412,000</u>

The adjusted comparative financial statements, reflecting the retrospective application of the new accounting principle, follow.

Cash and cash equivalents, end of year	<u>\$ 2,382,000</u>	<u>\$ 2,200,000</u>

It is important to note that, in presenting the previously issued financial statements for 20Y2, the caption “as adjusted” is included in the column heading. ASC 250 explicitly defines a restatement as a revision to previously issued financial statements to correct an error. Therefore, to avoid misleading the financial statement reader, use of the terms restatement or restated are to be limited to prior period adjustments to correct errors, as discussed later in this chapter.

***Indirect effects.*** The example above only reflects the direct effects of the change in accounting principle, net of the effect of income taxes. Changing accounting principles sometimes results in indirect effects from legal or contractual obligations of the reporting entity, such as profit sharing or royalty arrangements that contain monetary formulas based on amounts in the financial statements. In the preceding example, if Newburger Company had an incentive compensation plan that required it to contribute 15% of its pretax income to a pool to be distributed to its employees, the adoption of the new accounting policy would potentially require Newburger to provide additional contributions to the pool computed as:

	<i><u>Pretax effect of retroactive application</u></i>	<i><u>Contractual rate</u></i>	<i><u>Indirect effect</u></i>
Prior to 20Y2	\$25,000	15%	\$3,750
20Y2	(20,000)	15%	<u>(3,000)</u>

Contracts and agreements are often silent regarding how such a change might affect amounts that were computed (and distributed) in prior years. Management of Newburger Company might have discretion over whether to make the additional contributions. Further, it would probably consider it undesirable to reduce the 20Y2 incentive compensation pool because of an accounting change of this nature, and it might thus decide for valid business reasons not to reduce the pool under these circumstances.

ASC 250 specifies that irrespective of whether the indirect effects arise from an explicit requirement in the agreement or are discretionary, if incurred they are to be recognized in the period in which the reporting entity makes the accounting change, which is 20Y3 in the example above.

***Impracticability exception.*** All prior periods presented in the financial statements are required to be adjusted for the retroactive application of the newly adopted accounting principle, unless it is impracticable to do so. (ASC 250-10-45-9) FASB recognizes that there are certain circumstances when there is a change in accounting principle when it will not be feasible to compute (1) the retroactive adjustment to the prior periods affected or (2) the period-specific adjustments relative to periods presented in the financial statements.

For management to assert that it is impracticable to retrospectively apply the new accounting principle, one or more of the following conditions must be present:

1. Management has made a reasonable effort to determine the retrospective adjustment and is unable to do so.
2. If it were to apply the new accounting principle retrospectively, management would be required to make assumptions regarding its intent in a prior period that would not be able to be independently substantiated.
3. If it were to apply the new accounting principle retrospectively, management would be required to make significant estimates of amounts for which it is impossible to develop objective information that would have been available at the time the original financial statements for the prior period (or periods) were issued to provide evidence of circumstances that existed at that time regarding the amounts to be measured, recognized, and/or disclosed by retrospective application.

**Inability to determine period-specific effects.** If management is able to determine the adjustment to beginning retained earnings for the cumulative effect of applying the new accounting principle to periods prior to those presented in the financial statements, but is unable to determine the period-specific effects of the change on all of the prior periods presented in the financial statements, ASC 250-10-45-6 requires the following steps to adopt the new accounting principle:

1. Adjust the carrying amounts of the assets and liabilities for the cumulative effect of applying the new accounting principle at the beginning of the earliest period presented for which it is practicable to make the computation.
2. Any offsetting adjustment required by applying Step 1 is made to beginning retained earnings (or other applicable components of equity or net assets) of that period.

**Inability to determine effects on any prior periods.** If it is impracticable to determine the cumulative effect of adoption of the new accounting principle on any prior periods, ASC 250-10-45-7 requires that the new principle be applied prospectively as of the earliest date that it is practicable to do so. The most common example of this occurs when management of a reporting entity decides to change its inventory costing assumption from first-in, first-out (FIFO) to last-in, first-out (LIFO), as illustrated in the following example:

#### Example of change from FIFO to LIFO

During 20X3 Warady Inc. decided to change the method used for pricing its inventories from FIFO to LIFO. The inventory values are as listed below using both FIFO and LIFO methods. Sales for the year were \$15,000,000 and the company's total purchases were \$11,000,000. Other expenses were \$1,200,000 for the year. The company had 1,000,000 shares of common stock outstanding throughout the year.

#### Inventory values

	<u>FIFO</u>	<u>LIFO</u>	<u>Difference</u>
12/31/X2 Base year	\$ 2,000,000	\$2,000,000	\$ —
12/31X3	4,000,000	1,800,000	2,200,000
Variation	<u>\$ 2,000,000</u>	<u>\$ 2,000,000</u>	<u>\$ 2,200,000</u>

The computations for 20X3 would be as follows:

	<u><b>FIFO</b></u>	<u><b>LIFO</b></u>	<u><b>Difference</b></u>
Sales	\$15,000,000	\$15,000,000	\$ —
Cost of goods sold			
Beginning inventory	2,000,000	2,000,000	—
Purchases	<u>11,000,000</u>	<u>11,000,000</u>	—
Goods available for sale	13,000,000	13,000,000	—
Ending inventory	<u>4,000,000</u>	<u>1,800,000</u>	<u>2,200,000</u>
	<u>9,000,000</u>	<u>11,200,000</u>	<u>(2,200,000)</u>
Gross profit	6,000,000	3,800,000	2,200,000
Other expenses	<u>1,200,000</u>	<u>1,200,000</u>	—
Net income	<u>\$ 4,800,000</u>	<u>\$ 2,600,000</u>	<u>\$ 2,200,000</u>

The following is an example of the required disclosure in this circumstance:

#### **Example Note A: Change in method of accounting for inventories**

During 20X3, management changed the company's method of accounting for all of its inventories from first-in, first-out (FIFO) to last-in, first-out (LIFO). The change was made because management believes that the LIFO method provides a better matching of costs and revenues. In addition, with the adoption of LIFO, the company's inventory pricing method is consistent with the method predominant in the industry. The change and its effect on net income (\$000 omitted except for per-share amounts) and earnings per share for 20X3 are as follows:

	<u><b>Net income</b></u>	<u><b>Earnings per share</b></u>
Net income before the change	<u>\$4,800</u>	<u>\$4.80</u>
Reduction of net income due to the change	<u>2,200</u>	<u>2.20</u>
Net income as adjusted	<u>\$2,600</u>	<u>\$2.60</u>

Management has not retrospectively applied this change to prior years' financial statements because beginning inventory on January 1, 20X3, using LIFO is the same as the amount reported on a FIFO basis at December 31, 20X2. As a result of this change, the current period's financial statements are not comparable with those of any prior periods. The FIFO cost of inventories exceeds the carrying amount valued using LIFO by \$2,200,000 at December 31, 20X3.

#### **Disclosure of Prospective Changes in GAAP**

**Disclosing the impact of newly established GAAP that has not yet become effective.** The accounting principles used in the reporting entity's financial statements may comply with GAAP as of the reporting date, but those principles may become unacceptable at a specified future date due to the issuance of a new accounting standard that is not yet effective. If the new GAAP, when adopted, is expected to materially affect the future financial statements, the users of the current financial statements may find it helpful to be informed about the future change. The objective of such a disclosure is to ensure that the financial statements are not misleading and that the users are provided with adequate information to assess the significance of adopting the new GAAP on the reporting entity's future financial statements.

In some cases, the effect of the future change will be so pervasive that the presentation of pro forma financial data to supplement the historical financial statements would be useful. The pro forma data would present the effects of the future adoption as if it had occurred at the date of the statement of financial position. The pro forma data may be presented in a column next to the historical data, in the notes to the financial statements, or separately accompanying the basic

historical financial statements. Disclosure may also be useful regarding other future effects that may be triggered by the adoption of the new GAAP, such as adverse effects on the reporting entity's compliance with its debt covenants.

The best source of guidance in determining the form and content of these disclosures is ASC 250-10-S99. While this guidance is applicable to public companies, other entities may want to consider applying it. Under the SEC requirement management is to disclose:

1. A brief description of the new standard.
2. The date the reporting entity is required to adopt the new standard.
3. If the new standard permits early adoption and the reporting entity plans to do so, the date that the planned adoption will occur.
4. The method of adoption that management expects to use. If this determination has not yet been made, then a description of the alternative methods of adoption that are permitted by the new standard.
5. The impact that the new standard will have on reported financial position and results of operations. If management has quantified the impact, then it is to disclose the estimated amount. If management has not yet determined the impact or if the impact is not expected to be material, this is to be disclosed.

The SEC staff also encourages the following additional disclosures:

1. The potential impact of adoption on such matters as loan covenant compliance, planned or intended changes in business practices, changes in availability of or cost of capital, and the like.
2. Newly issued standards that are not expected to materially affect the reporting entity should nevertheless be disclosed with an accompanying statement that adoption is not expected to have a material effect on the reporting entity.
3. When the newly issued standard only affects disclosure and the future disclosures are expected to be significantly different from the current disclosures, it is desirable to provide the reader with details.

**Proposed GAAP.** There is no requirement under GAAP or under SEC rules to disclose the potential effects of standards that have been proposed but not yet issued. If management wishes to voluntarily disclose information that it believes will provide the financial statement users with useful, meaningful information, the SEC provides guidance (§501.11 of the Codification of Financial Reporting Policies) on how to present this information, either in narrative form or as pro forma information, in a manner that "is reasonable, balanced and not misleading." In its guidance, the SEC notes that it may be reasonable to cover only those proposals where, based on the standard setter's published agenda, adoption appears imminent. When management chooses to make these disclosures, the disclosures should:

1. Provide a brief description of the proposed standard.
2. Explain the purpose of the disclosures, the basis of presentation, and any significant assumptions made in preparing them.
3. Discuss, in a balanced manner:
  - a. The positive and negative effects of applying the proposed standard,
  - b. The effects the proposed standard would have had on prior results of operations,
  - c. The potential effects of the proposed standard on future periods,

- d. The effects that can be quantified, and
  - e. The effects, if any, that cannot be quantified.
4. Address the entire proposed standard, not just certain aspects of it.
  5. Limit any disclosures that quantify the effects of the proposed standard to covering only the most recent fiscal year.
  6. Warn the readers that the final standard, when and if issued, could differ from the proposal that was used as a basis for these disclosures and that, as a result, the actual application of any final standard could result in effects different than those disclosed.
  7. If necessary for a fair and balanced presentation, provide information regarding more than one proposed standard. There is a risk to the reporting entity that the disclosure may appear to be incomplete or misleading if it discusses the effects of one significant proposed standard but not another.

### Reclassifications

Occasionally, a company will choose to change the way it applies an accounting principle, resulting in a change in the way that a particular financial statement caption is displayed or in the individual general ledger accounts that comprise a caption. These reclassifications may occur for a variety of reasons, including:

1. In management's judgment, the revised methodology more accurately reflects the economics of a type or class of transaction.
2. An amount that was immaterial in previous periods and combined with another number has become material and warrants presentation as a separately captioned line item.
3. Due to changes in the business or the manner in which the financial statements are used to make decisions, management deems a different form of presentation to be more useful or informative.

To maintain comparability of financial statements when such changes are made, the financial statements of all periods presented must be reclassified to conform to the new presentation.

Such reclassifications, which usually affect only the statement of income, do not affect reported net income or retained earnings for any period since they result in simply recasting amounts that were previously reported. Normally a reclassification will result in an increase in one or more reported numbers with a corresponding decrease in one or more other numbers. In addition, these changes reflect changes in the application of accounting principles either for which there are multiple alternative treatments, or for which GAAP is silent and thus management has discretion in presentation.

Reclassifications are not explicitly dealt with in GAAP but nevertheless do commonly occur in practice. The following examples are adapted from actual notes that appeared in the summary of significant accounting policies of publicly held companies:

#### Example 1

Effective January 1, 20X3, the company removed the impact of intellectual property income, gains and losses on sales and other-than-temporary declines in market value of certain investments, realized gains and losses on certain real estate activity, and foreign currency transaction gains and losses from the caption "Selling, General, and Administrative Expenses" in the Consolidated Statement of Income. Custom development income was also removed from the "Research, Development, and Engineering" caption on the Consolidated Statement of Income. Intellectual property and custom development

income are now presented in a separate caption in the Consolidated Statement of Income. The other items listed above are now included as part of “Other Income and Expense.” Results of prior periods have been reclassified to conform to the current year presentation.

### Example 2

Effective January 1, 20X3, management has elected to reclassify certain expenses in its consolidated statements of income. Costs of the order entry function and certain accounting and information technology services have been reclassified from cost of sales to selling, general, and administrative expense. Costs related to order fulfillment have been reclassified from selling, general, and administrative expense to cost of sales. These reclassifications resulted in a decrease to cost of sales and an increase to selling, general, and administrative expense of \$31.8 million and \$36.2 million for the years ended December 31, 20X2 and 20X1, respectively.

### Change in Accounting Estimate

The preparation of financial statements requires frequent use of estimates for such items as asset service lives, salvage values, lease residuals, asset impairments, collectability of accounts receivable, warranty costs, pension costs, and the like. Future conditions and events that affect these estimates cannot be estimated with certainty. Therefore, changes in estimates will be inevitable as new information and more experience is obtained. ASC 250-10-45-17 requires that changes in estimates be recognized currently and prospectively. The effect of the change in accounting estimate is accounted for in “(a) the period of change if the change affects that period only or (b) the period of change and future periods if the change affects both.” The reporting entity is precluded from retrospective application, restatement of prior periods, or presentation of pro forma amounts as a result of a change in accounting estimate.

### Example of a change in accounting estimate

On January 1, 20X1, a machine purchased for \$10,000 was originally estimated to have a ten-year useful life and a salvage value of \$1,000. On January 1, 20X5 (five years later), the asset is expected to last another ten years and have a salvage value of \$800. As a result, both the current period (the year ending December 31, 20X1) and subsequent periods are affected by the change. Annual depreciation expense over the estimated remaining useful life is computed as follows:

Original cost	\$10,000
Less estimated salvage (residual) value	(1,000)
Depreciable amount	<u>9,000</u>
Accumulated depreciation, based on original assumptions (10-year life)	
20X1	900
20X2	900
20X3	900
20X4	900
20X5	<u>900</u>
	4,500
Carrying value at 1/1/20X6	5,500
Revised estimate of salvage value	(800)
Depreciable amount	<u>4,700</u>
Remaining useful life at 1/1/20X6	10 years
	\$ <u>470</u> depreciation per year
Effect on 20X6 net income	\$470 – \$900 = \$430 increase

### Example Note A: Change in accounting estimate

During 20X6, management assessed its estimates of the useful lives and residual values of the company's machinery and equipment. Management revised its original estimates and currently estimates that its production equipment acquired in 20X1 and originally estimated to have a 10-year useful life and a residual value of \$1,000 will have a 15-year useful life and a residual value of \$800. The effects of reflecting this change in accounting estimate on the 2018 financial statements are as follows:

Increase in	
Income from continuing operations and net income	<u>\$430.00</u>
Earnings per share (for public companies)*	<u>\$ 0.02</u>

\*Assuming 25,000 shares were outstanding for all of 2018.

### Example of a change in accounting estimate

The industry in which ABC Company operates suffers a significant downturn, resulting in a decline in the financial condition of its customers and a noticeable worsening of the days required to collect its accounts receivable. ABC had formerly provided an amount equal to 2% of its credit sales as an increment to the bad debt allowance, resulting in a current balance in the allowance of \$105,000. However, the new economic conditions mandate an immediate change to a 4% allowance. Accordingly, ABC provides an additional \$105,000 in the current period to increase the previously recorded allowance to meet the new 4% estimate, and also begins providing 4% in the bad debt allowance on all new credit sales. Both of these adjustments are reflected in current period expense, even though the increased allowance on existing receivables pertains to sales made (in part) in a prior reporting period, because the change in estimate was made in the current period based on new circumstances that arose in that period—specifically, the declining credit standing of its customers.

Accounting for long-term construction contracts under the percentage-of-completion method necessarily involves ongoing revisions to estimates of total contract revenue, total contract cost, and extent of progress toward project completion. These revisions represent changes in accounting estimate and, in accordance with ASC 605-35, the change in estimate is accounted for using the cumulative catch-up method. This is applied by:

1. Computing the percentage of completion, earned revenues, cost of earned revenues, and gross profit on a contract-to-date basis at the date of the statement of financial position using the reporting entity's consistently applied accounting policy for the contract and reflecting the revised estimates.
2. Reflecting in the current period's earned revenue and cost of earned revenue the difference between the newly computed contract-to-date results computed in item 1 and those amounts recognized in previous periods.

This approach results in the effect of the change in accounting estimate being reflected in the current period statement of income, and prospectively accounting for the contract using the revised assumptions.

Note that an impairment of a long-lived asset, as described by ASC 360-10-35, is not a change in accounting estimate. Rather, it is an event that is to be treated as an operating expense of the period in which it is recognized, in effect as additional depreciation. (See further discussion in the chapter in this volume on ASC 360.)

### Change in Accounting Estimate Effected by a Change in Accounting Principle

To change certain accounting estimates, management must adopt a new accounting principle or change the method it uses to apply an accounting principle. In contemplating such a change, management would not be able to separately determine the effects of changing the accounting principle from the effects of changing its estimate. The change in estimate is accomplished by changing the method.

Under ASC 250-10-45-18, a change in accounting estimate that is effected by a change in accounting principle is accounted for in the same manner as a change in accounting estimate, that is, prospectively in the current and future periods affected. However, because management is changing the company's accounting principle or method of applying it, the new accounting principle, as previously discussed, must be preferable to the accounting principle being superseded.

Management may decide, for example, to change its depreciation method for certain types of assets from straight-line to an accelerated method, such as double-declining balance to recognize the fact that those assets are more productive in their earlier years of service because they require less downtime and do not require repairs as frequently. Such a change is permitted by ASC 250-10-45-19 only if management justifies it based on the fact that using the new method is preferable to the old one, in this case because it more accurately matches the costs of production to periods in which the units are produced.

A distinction is made in ASC 250-10-45-20, however, for entities that elect to apply a depreciation method that results in accelerated depreciation until the point during the useful life of the depreciable asset when it is useful to change to straight-line depreciation in order to fully depreciate the asset over the remaining term. At this point, the remaining carrying value (net book value) is depreciated using the straight-line method over its remaining useful life. ASC 250 provides that, if this method is consistently followed by the reporting entity, the changeover to straight-line depreciation is not considered to be an accounting change.

### Change in Reporting Entity

An accounting change resulting in financial statements that are, in effect, of a different reporting entity than previously reported on is retrospectively applied to the financial statements of all prior periods presented in order to show financial information for the new reporting entity for all periods (ASC 250-10-45-21). The change is also retrospectively applied to previously issued interim financial information.

The following qualify as changes in reporting entity:

1. Consolidated or combined financial statements in place of individual entities' statements
2. A change in the members of the group of subsidiaries that comprise the consolidated financial statements
3. A change in the companies included in combined financial statements.

Specifically *excluded* from qualifying as a change in reporting entity are:

1. A business combination accounted for by the purchase method, and
2. Consolidation of a variable interest entity under ASC 810.

## Error Corrections

Errors are sometimes discovered after financial statements have been issued. Errors result from mathematical mistakes, mistakes in the application of GAAP, or the oversight or misuse of facts known or available to the accountant at the time the financial statements were prepared. Errors can occur in recognition, measurement, presentation, or disclosure. A change from an unacceptable (or incorrect) accounting principle to a correct principle is also considered a correction of an error and not a change in accounting principle. Such a change should not be confused with the preferability determination discussed earlier that involves two or more acceptable principles. An error correction pertains to the recognition that a previously used method was not an acceptable method at the time it was employed.

The essential distinction between a change in estimate and the correction of an error depends upon the availability of information. An estimate requires revision because by its nature it is based upon incomplete information. Later data will either confirm or contradict the estimate and any contradiction will require revision of the estimate. An error results from the misuse of existing information available at the time which is discovered at a later date. However, this discovery is not as a result of additional information or subsequent developments.

ASC 250 specifies that, when correcting an error in prior period financial statements, the term “restatement” should be used. That term is exclusively reserved for this purpose so as to effectively communicate to users of the financial statements the reason for a particular change in previously issued financial statements.

Restatement consists of the following steps:

- Step 1     Adjust the carrying amounts of assets and liabilities at the beginning of the first period presented in the financial statements for the cumulative effect of correcting the error on periods prior to those presented in the financial statements.
- Step 2     Offset the effect of the adjustment in Step 1 (if any) by adjusting the opening balance of retained earnings (or other components of equity or net assets, as applicable to the reporting entity) for that period.
- Step 3     Adjust the financial statements of each individual prior period presented for the effects of correcting the error on that specific period (referred to as the period-specific effects of the error).

### Example of a prior period adjustment

Assume that Truesdell Company had overstated its depreciation expense by \$50,000 in 20X0 and \$40,000 in 20X2, both due to mathematical mistakes. The errors affected both the financial statements and the income tax returns in 20X1 and 20X2 and are discovered in 20X3.

Truesdell’s statements of financial position and statements of income and retained earnings as of and for the year ended December 31, 20X2, prior to the restatement were as follows:

**Truesdell Company**  
**Statement of Income and Retained Earnings**  
**Prior to Restatement**  
**Year Ended December 31, 20X2**

	<u>20X2</u>
Sales	\$ 2,000,000
Cost of sales	
Depreciation	750,000
Other	<u>390,000</u>
	1,140,000
Gross profit	860,000
Selling, general, and administrative expenses	<u>450,000</u>
Income from operations	410,000
Other income (expense)	<u>10,000</u>
Income before income taxes	420,000
Income taxes	<u>168,000</u>
Net income	252,000
Retained earnings, beginning of year	6,463,000
Dividends	<u>(1,200,000)</u>
Retained earnings, end of year	<u>\$ 5,515,000</u>

**Truesdell Company**  
**Statement of Financial Position**  
**Prior to Restatement**  
**December 31, 20X2**

	<u>20X2</u>
<b>Assets</b>	
Current assets	<u>\$2,540,000</u>
Property and equipment	
Cost	3,500,000
Accumulated depreciation and amortization	<u>(4,30,000)</u>
	3,070,000
Total assets	<u>\$5,610,000</u>
<b>Liabilities and stockholders' equity</b>	
Income taxes payable	\$ —
Other current liabilities	<u>12,000</u>
Total current liabilities	12,000
Noncurrent liabilities	<u>70,000</u>
Total liabilities	<u>82,000</u>
Stockholders' equity	
Common stock	13,000
Retained earnings	<u>5,515,000</u>
Total stockholders' equity	<u>5,528,000</u>
Total liabilities and stockholders' equity	<u>\$5,610,000</u>

The following steps are followed to restate Truesdell's prior period financial statements:

- Step 1     Adjust the carrying amounts of assets and liabilities at the beginning of the first period presented in the financial statements for the cumulative effect of correcting the error on periods prior to those presented in the financial statements.

The first period presented in the financial statements is 20X2. At the beginning of that year, \$50,000 of the mistakes had been made and reflected on both the income tax return and financial statements. Assuming a flat 40% income tax rate and ignoring the effects of penalties and interest that would be assessed on the amended income tax returns, the following adjustment would be made to assets and liabilities at January 1, 20X2:

Decrease in accumulated depreciation	\$50,000
Increase in income taxes payable	(20,000)
	<u>\$30,000</u>

- Step 2 Offset the effect of the adjustment in Step 1 by adjusting the opening balance of retained earnings (or other components of equity or net assets, as applicable to the reporting entity) for that period.

Retained earnings at the beginning of 20X2 will increase by \$30,000 as the offsetting entry resulting from Step 1.

- Step 3 Adjust the financial statements of each individual prior period presented for the effects of correcting the error on that specific period (referred to as the period-specific effects of the error).

The 20X2 prior period financial statements will be corrected for the period-specific effects of the restatement as follows:

Decrease in depreciation expense and accumulated depreciation	\$40,000
Increase in income tax expense and income taxes payable	(16,000)
Increase 20X2 net income	<u>\$24,000</u>

The restated financial statements are presented below.

**Truesdell Company**  
**Statements of Income and Retained Earnings**  
**As Restated**  
**Years Ended December 31, 20X3 and 20X2**

	<i>20X3</i>	<i>20X2</i>
	<i>restated</i>	
Sales	\$ 2,100,000	\$ 2,000,000
Cost of sales		
Depreciation	740,000	710,000
Other	410,000	390,000
	<u>1,150,000</u>	<u>1,100,000</u>
Gross profit	950,000	900,000
Selling, general, and administrative expenses	460,000	450,000
Income from operations	490,000	450,000
Other income (expense)	(5,000)	10,000
Income before income taxes	485,000	460,000
Income taxes	2,00,000	184,000
Net income	285,000	276,000
Retained earnings, beginning of year, as originally reported	5,569,000	6,463,000
Restatement to reflect correction of depreciation (Note X)		30,000
Retained earnings, beginning of year, as restated	5,569,000	6,493,000
Dividends	(800,000)	(1,200,000)
Retained earnings, end of year	<u>\$ 5,054,000</u>	<u>\$ 5,569,000</u>

**Truesdell Company**  
**Statements of Financial Position**  
**As Restated**  
**December 31, 20X3 and 20X2**

	<u>20X3</u>	<u>20X2 restated</u>
<b>Assets</b>		
Current assets	\$ 2,840,000	\$ 2,540,000
Property and equipment		
Cost	3,750,000	3,500,000
Accumulated depreciation and amortization	<u>(1,050,000)</u>	<u>(340,000)</u>
	<u>2,700,000</u>	<u>3,160,000</u>
Total assets	<u>\$ 5,540,000</u>	<u>\$5,700,000</u>
<b>Liabilities and stockholders' equity</b>		
Income taxes payable	\$50,000	\$ 36,000
Other current liabilities	<u>110,000</u>	<u>12,000</u>
Total current liabilities	<u>160,000</u>	<u>48,000</u>
Noncurrent liabilities	<u>313,000</u>	<u>70,000</u>
Total liabilities	<u>473,000</u>	<u>118,000</u>
Stockholders' equity		
Common stock	13,000	13,000
Retained earnings	<u>5,054,000</u>	<u>5,569,000</u>
Total stockholders' equity	<u>5,067,000</u>	<u>5,582,000</u>
Total liabilities and stockholders' equity	<u>\$5,540,000</u>	<u>\$5,700,000</u>

When restating previously issued financial statements, management is to disclose:

1. The fact that the financial statements have been restated
2. The nature of the error
3. The effect of the restatement on each line item in the financial statements
4. The cumulative effect of the restatement on retained earnings (or other applicable components of equity or net assets):
  - a. At the beginning of the earliest period presented in comparative financial statements, or
  - b. At the beginning of the period in single-period financial statements
5. The effect on net income, both gross and net of income taxes:
  - a. For each prior period presented in comparative financial statements, or
  - b. For the period immediately preceding the period presented in single-period financial statements
6. For public companies (or others electing to report earnings per share data), the effect of the restatement on affected per-share amounts for each prior period presented.

These disclosures need not be repeated in subsequent periods.

The correction of an error in the financial statements of a prior period discovered subsequent to their issuance is reported as a prior period adjustment in the financial statements of the subsequent period.

## Evaluating Uncorrected Misstatements

Misstatements, particularly if detected after the financial statements have been produced and distributed, may under certain circumstances be left uncorrected. This decision is directly impacted by judgments about materiality, an important concept discussed in Chapter 1. The financial statement preparer is expected to exercise professional judgment in determining the level of materiality to apply in order to cost-effectively prepare full, complete, and accurate financial statements in a timely manner. However, there have been instances where the materiality concept has been used to rationalize the noncorrection of errors that should have been dealt with, and even to excuse errors known when first committed. The fact that the concept of materiality has sometimes been abused led to the promulgation of further guidance relative to error corrections.

Although independent auditors are charged with obtaining sufficient evidence to enable them to provide the financial statement user with reasonable assurance that management's financial statements are free of material misstatement, the financial statements are primarily the responsibility of the preparers. Certain auditing literature is therefore germane to the preparers' consideration of matters such as error corrections and application of materiality guidelines. These matters are further explored in the following paragraphs.

**Types of misstatements.** Preparers of financial statements need to have control procedures to reduce the risk of accounting errors being committed and not detected. From the auditors' perspective, it is required that the examination be conducted in a manner that will provide reasonable assurance of detecting material misstatements, including those resulting from errors. Known misstatements arise from:

1. Incorrect selection or application of accounting principles
2. Errors in gathering, processing, summarizing, interpreting, or overlooking relevant data
3. An intent to mislead the financial statement user to influence their decisions
4. To conceal theft.

Likely misstatements arise from:

1. Differences in judgment between management and the auditor regarding accounting estimates where the amount presented in the financial statements is outside the range of what the auditor believes is reasonable
2. Amounts that the auditor has projected based on the results of performing statistical or nonstatistical sampling procedures on a population.

Management, in assessing the impact of uncorrected misstatements, is required to assess materiality both quantitatively and qualitatively from the standpoint of whether a financial statement user would be misled if a misstatement were not corrected or if, in the case of informative disclosure errors, full disclosure was not made. Qualitative considerations include (but are not limited to) whether the misstatement:

1. Arose from estimates or from items capable of precise measurement and, if the misstatement arose from an estimate, the degree of precision inherent in the estimation process
2. Masks a change in earnings or other trends
3. Hides a failure to meet analysts' consensus expectations for the reporting entity
4. Changes a loss to income or vice versa
5. Concerns a segment or other portion of the reporting entity's business that has been identified as playing a significant role in operations or profitability

6. Affects compliance with loan covenants or other contractual commitments
7. Increases management's compensation by affecting a performance measure used as a basis for computing it
8. Involves concealment of an unlawful transaction.

**Misstatements from prior years.** Management may have decided to not correct misstatements that occurred in one or more prior years because, in their judgment at the time, the financial statements were not materially misstated. Two methods of making that materiality assessment—sometimes referred to as the “rollover” and the “iron curtain” methods—have been widely used in practice. These are described and illustrated in the following paragraphs.

The *rollover method* quantifies a misstatement as its originating or reversing effect on the *current period's* statement of income, irrespective of the potential effect on the statement of financial position of one or more prior periods' accumulated uncorrected misstatements.

The *iron curtain method*, on the other hand, quantifies a misstatement based on the *accumulated uncorrected amount* included in the current, end-of-period statement of financial position, irrespective of the year (or years) in which the misstatement originated.

Each of these methods, when considered separately, has strengths and weaknesses, as follows:

<b><u>Method</u></b>	<b><u>Focuses on</u></b>	<b><u>Strength</u></b>	<b><u>Weakness</u></b>
Rollover	Current period income statement	Focuses on whether the income statement of the current period is materially misstated, assuming that the statement of financial position is not materially misstated	Material misstatement of the statement of financial position can accumulate over multiple periods
Iron curtain	End of period statement of financial position	Focuses on ensuring that the statement of financial position is not materially misstated, irrespective of the year or years in which a misstatement originated	Does not consider whether the effect of correcting a statement of financial position misstatement that arose in one or more periods is material to the current period income statement

**Guidance for SEC registrants.** The SEC staff issued Staff Accounting Bulletin (SAB) 108, *Considering the Effects of Prior Year Misstatements in Current Year Financial Statements*, to address how registrants (i.e., publicly held corporation) are to evaluate misstatements. SAB 108 prescribes that if a misstatement is material to *either* the income statement or the statement of financial position, it is to be corrected in a manner set forth in the bulletin and illustrated in the example and diagram below.

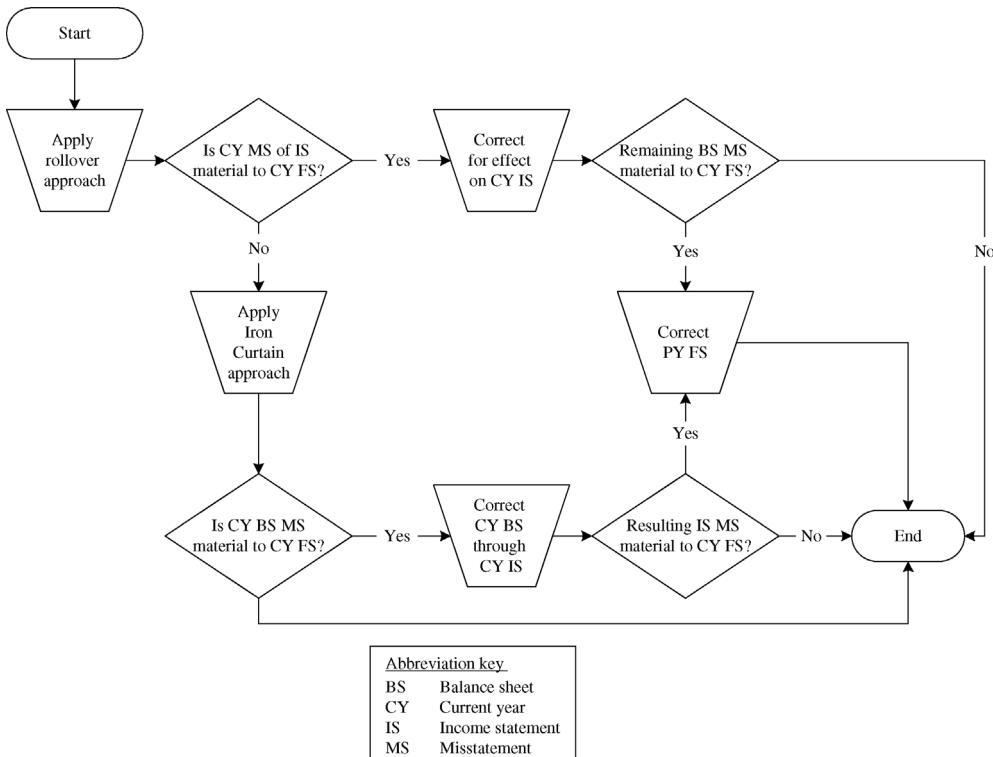

### Example

Lenny Payne, the CFO of Flamingo Industries, is preparing the company's 20X3 financial statements. The company has consistently overstated its accrued liabilities by following a policy of accruing the entire audit fee it will pay its independent auditors for auditing the financial statements for the reporting year, even though approximately 80% of the work is performed in, and is thus an expense of, the following year.

Due to regular increases in audit fees, the overstatement of liabilities at 12/31/20X5 has accumulated as follows:

<u>Year ended 12/31</u>	<u>Amount of misstatement originating during year</u>	<u>End-of-year accumulated misstatement</u>
20X1	\$15	\$15
20X2	5	20
20X3	5	25
20X4	5	30
20X5	10	40

Lenny has consistently used the rollover approach to assess materiality and, in all previous years, had judged the amount of the misstatement that originated during that year to be immaterial. The guidance in SAB 108 is illustrated in the following decision diagram:

Following the decision tree, Lenny analyzes the misstatement as follows:

1. Applying the *rollover* approach, as he had done consistently in the past, Lenny computes the misstatement as the \$10 that originated in 20X5. In his judgment, this amount is immaterial to the 20X5 income statement.
  2. Applying the *iron curtain* approach, Lenny evaluates whether the accumulated misstatement of \$40 materially misstates the statement of financial position at 12/31/20X5. Lenny believes that, considering both quantitative and qualitative factors, the misstatement has grown to the point where it does result in a materially misstated statement of financial position.

According to SAB 108 and as shown on the diagram, Lenny would record an adjustment to correct the statement of financial position as follows:

	<u>Debit</u>	<u>Credit</u>
Accrued professional fees	40,000	
Professional fees (general and administrative expenses)		40,000
<i>To correct the statement of financial position by reversing misstated accrual for audit fees not yet incurred.</i>		

Upon review of the effect of the correcting entry, Lenny believes that recording the entry will result in a material misstatement to the 20X5 income statement. Consequently, to avoid this result, the prior years' financial statements of Flamingo Industries would, under normal circumstances, be required to be restated as previously discussed in the section of this chapter titled "Error Corrections." This would be the case even if the adjustment to the prior year financial statements was, and continues to be, immaterial to those financial statements. The SEC would not, however, require Flamingo Industries to amend previously filed reports; instead, registrants are permitted to make the correction in the next filing submitted to the SEC that includes the prior year financial statements.

If the cumulative effect adjustment occurs in an interim period other than the first interim period, the SEC waived the requirement that previously filed interim reports for that fiscal year be amended. Instead, comparative information presented for interim periods of the first year subsequent to initial application is to be adjusted to reflect the cumulative effect adjustment as of the beginning of the fiscal year of initial application. The adjusted results are also required to be included in the disclosures of selected quarterly information that are required by Regulation S-K, Item 302.

Entities that do not meet the criteria to use the cumulative effect adjustment are required to follow the provisions of ASC 250 that require restatement of all prior periods presented in the filing.

## Interim Reporting Considerations

If a change in accounting principle is made in an interim period, the change is made using the same methodology for retrospective application discussed and illustrated earlier in this chapter. Management is precluded from using the impracticability exception to avoid retrospective application to prechange interim periods of the same fiscal year in which the change is made. Thus, if it is impracticable to apply the change to those prechange interim periods, the change can only be made as of the beginning of the following fiscal year. FASB believes this situation will rarely occur in practice.

ASC 270 requires that interim financial reports disclose any changes in accounting principles or the methods of applying them from those that were employed in:

1. The prior fiscal year;
2. The comparable interim period of the prior fiscal year; and
3. The preceding interim periods of the current fiscal year.

The disclosures required by ASC 250 for changes in accounting principle are to be made, in full, in the financial statements of the interim period in which the change is made.

**Public companies.** When a public company adopts a new standard in an interim period, the ASC 270 disclosures cited above are to be supplemented, as applicable, with all disclosures required by the newly adopted standard to be included in annual financial statements. If the change is made in a period other than the first quarter, prior filings are not required to be amended; however, adjustment of each prior quarter's results is to be included in the filing for the quarter in which the new principle is being adopted. If the newly adopted standard requires retrospective

application to all prior periods, the prior interim quarters are also to be presented on an adjusted basis.

In addition, a special disclosure rule applies to a public company that:

1. Changes accounting principles in the fourth quarter of a fiscal year;
2. Regularly reports interim financial information; and
3. Does not separately disclose in its annual report (or in a separate report) the minimum summarized information required by ASC 270 for the fourth quarter of the fiscal year.

When all three of these conditions are present, management is required to disclose in a note to the annual financial statements the effects of the change on interim period results.

# 10 ASC 255 CHANGING PRICES

<b>Perspective and Issues</b>	<b>125</b>	<b>Concepts, Rules, and Examples</b>	<b>127</b>
Subtopic	125	Elective Disclosures	127
Scope	125	Other Sources	128
<b>Definitions of Terms</b>	<b>125</b>		

## PERSPECTIVE AND ISSUES

---

### Subtopic

ASC 255, *Changing Prices*, contains one subtopic:

- ASC 255-10, *Overall*, that provides guidance on reporting the effects of changing prices or inflation

### Scope

The topic applies to business entities that prepare U.S. GAAP financial statements and “foreign entities that prepare financial statements in the currency for which the operations and that operate in countries with hyperinflationary economies.”

The ASC disclosures are **encouraged**, but not required.

## DEFINITIONS OF TERMS

---

Source: ASC 255-10-20. Also see Appendix A, *Definitions of Terms*, for terms Fair Value and Income from Continuing Operations.

**Consumer Price Index for All Urban Consumers.** An index of price level changes affecting consumers generally often used to measure changes in the general purchasing power of the monetary unit itself.

**Current Cost-Constant Purchasing Power Accounting.** A method of accounting based on measures of current cost or lower recoverable amount in units of currency, each of which has the same general purchasing power. For operations in which the dollar is the functional currency, the general purchasing power of the dollar is used and the Consumer Price Index for All Urban Consumers is the required measure of purchasing power. For operations in which the functional currency is other than the dollar, the general purchasing power of either the dollar or the functional currency is used (see paragraphs 255-10-50-45 through 50-47).

**Historical Cost.** The generally accepted method of accounting used in the primary financial statements that is based on measures of historical prices without restatement into units, each of which has the same general purchasing power.

**Historical Cost-Constant Purchasing Power Accounting.** A method of accounting based on measures of historical prices in units of a currency, each of which has the same general purchasing power.

**Income-Producing Real Estate.** Properties that meet all of the following criteria:

- a. Cash flows can be directly associated with a long-term leasing agreement with unaffiliated parties.
- b. The property is being operated. (It is not in a construction phase.)
- c. Future cash flows from the property are reasonably estimable.
- d. Ancillary services are not a significant part of the lease agreement.

Hotels, which have occupancy rates and related cash flows that may fluctuate to a relatively large extent, do not meet the criteria for income-producing real estate.

**Mineral Resource Assets.** Assets that are directly associated with and derive value from all minerals that are extracted from the earth. Such minerals include oil and gas, ores containing ferrous and nonferrous metals, coal, shale, geothermal steam, sulphur, salt, stone, phosphate, sand, and gravel. Mineral resource assets include mineral interests in properties, completed and uncompleted wells, and related equipment and facilities and other facilities required for purposes of extraction. This definition does not cover support equipment because that equipment is included in the property, plant, and equipment for which current cost measurements are required.

**Monetary Assets.** Money or a claim to receive a sum of money the amount of which is fixed or determinable without reference to future prices of specific goods or services.

**Monetary Liability.** An obligation to pay a sum of money the amount of which is fixed or determinable without reference to future prices of specific goods and services.

**Motion Picture Films.** All types of film, including feature films, television specials, television series, or similar products (including animated films and television programming) that are sold, licensed, or exhibited, whether produced on film, video tape, digital, or other video recording format.

**Parity Adjustment.** The effect of the difference between local and U.S. inflation for the year on net assets (that is, shareholders' equity) measured in nominal dollars. If only the differential rates of U.S. and local inflation are reflected in the exchange rates (parity), the parity adjustment and the translation adjustment net to zero. Therefore, the sum of the parity adjustment and the translation adjustment represents the effect of exchange rate changes in excess of (or less than) that needed to maintain purchasing power parity between the functional currency and the dollar.

**Probable Reserves.** Probable reserves are reserves for which quantity and grade and/or quality are computed from information similar to that used for proven reserves, but the sites for inspection, sampling, and measurement are farther apart or are otherwise less adequately spaced. The degree of assurance, although lower than that for proven (measured) reserves, is high enough to assume continuity between points of observation.

**Proven Reserves.** Proven reserves are reserves for which both of the following conditions are met:

- a. Quantity is computed from dimensions revealed in outcrops, trenches, workings, or drill holes; grade and/or quality are computed from the results of detailed sampling.
- b. The sites for inspection, sampling, and measurement are spaced so closely and the geologic character is so well defined that size, shape, depth, and mineral content of reserves are well established.

**Purchasing Power Gain or Loss.** The net gain or loss determined by restating in units of constant purchasing power the opening and closing balances of, and transactions in, monetary assets and liabilities.

**Recoverable Amount.** Current worth of the net amount of cash expected to be recoverable from the use or sale of an asset.

**Restate-Translate.** An approach to converting current cost-nominal functional currency data of a foreign operation into units of constant purchasing power expressed in dollars. Using this approach, the current cost-nominal functional currency data are restated into units of constant purchasing power using a general price index for the foreign currency. After restatement into units of constant functional currency purchasing power, the current cost data are translated into dollars. This approach often necessitates a parity adjustment.

**Translate-Restate.** An approach to converting current cost-nominal functional currency data of a foreign operation into units of constant purchasing power expressed in dollars. Using this approach, the current cost-nominal functional currency data are first translated into dollars and then restated into units of constant purchasing power using the Consumer Price Index for All Urban Consumers.

**Translation Adjustments.** Translation adjustments result from the process of translating financial statements from the entity's functional currency into the reporting currency.

**Value in Use.** The amount determined by discounting the future cash flows (including the ultimate proceeds of disposal) expected to be derived from the use of an asset at an appropriate rate that allows for the risk of the activities concerned.

## CONCEPTS, RULES, AND EXAMPLES

---

### Elective Disclosures

Business entities are encouraged, but not required, to present supplementary information on the effects of changing prices. ASC 255-10-50-3 contains a list of items that should be disclosed in a five-year summary of financial data:

- Net sales and other operating revenues
- Income from continuing operations on a current cost basis
- Purchasing power gain or loss on net monetary items
- Increase or decrease in the current cost or lower recoverable amount of inventory and property, plant, and equipment, net of inflation
- The aggregate foreign currency translation adjustment on a current cost basis, if applicable
- Net assets at year-end on a current cost basis
- Income per common share from continuing operations on a current cost basis
- Cash dividends declared per common share
- Market price per common share at year-end.

In addition to the disclosures above, if income from continuing operations on a current cost-constant purchasing power basis would differ significantly from income from continuing operations in the primary financial statements, an entity should provide the following information (ASC 255-10-50-11 through 16):

- Components of income from continuing operations for the current year on a current cost basis, applying the same constant purchasing power option used for presentation of the five-year summary.
- Separate amounts for the current cost or lower recoverable amount at the end of the current year of inventory and property, plant, and equipment.

- Increase or decrease in current cost or lower recoverable amount before and after adjusting for the effects of inflation of inventory and property, plant, and equipment for the current year.
- Any differences between (1) the depreciation methods, estimates of useful lives, and salvage values of assets used for calculations of current cost-constant purchasing power and (2) the methods and estimates used for calculations of depreciation in the primary financial statements.

ASC 255 includes other elective disclosures related to entities with mineral resource assets. Entities that have elected to make ASC 255 disclosures should refer to the Codification for additional guidance.

## PERSPECTIVE AND ISSUES

---

### Subtopic

ASC 260, *Earnings per Share*, consists of one subtopic:

- ASC 260-10, *Overall*, that provides the guidance for computation, presentation, and disclosure for earnings per share (EPS) for entities with publicly held common stock or potential common stock.

The subtopic also includes master limited partnership subsections that clarify the application to master limited partnership of the Other Presentation Matters subsection.

### Scope and Scope Exceptions

ASC 260 applies to all entities:

- Whose common stock or potential common stock is traded in a public market, or
- Who have made a filing or are in the process of making a filing to trade their stock publicly.

If an entity that is not required to report under ASC 260 chooses to provide EPS information, the entity must comply with the ASC 260 guidance.

The guidance does not apply to investment companies who comply with ASC 946 or in statements of wholly owned subsidiaries.

### Overview

Earnings per share (EPS) is an indicator widely used by investors to gauge the profitability of a corporation. Its purpose is to indicate how effective an enterprise has been in using the resources provided by its common stockholders. In its simplest form, EPS is net income (loss) divided by the weighted-average number of shares of outstanding common stock. The EPS computation becomes more complex with the existence of securities that are not common stock but have the potential of causing additional shares of common stock to be issued to dilute EPS upon conversion or exercise (e.g., convertible preferred stock, convertible debt, options, and warrants). Diluted EPS considers the potential dilution that could occur from other financial instruments that would increase the total number of outstanding shares of common stock. Omission of an EPS number that takes into account the potential dilutive effects of such securities would be misleading. In addition, a lack of standardization in the way in which these securities are included in such an EPS computation would make comparisons among corporations extremely difficult.

Publicly traded corporations with a complex capital structure are obligated to report basic EPS and diluted EPS. The dual presentation is required on the face of the corporation's income statement even if both of these computations result in the same EPS amount. In addition, a reconciliation of the numerator and the denominator of the basic EPS computation to the numerator and denominator of the diluted EPS computation is required.

## DEFINITIONS OF TERMS

---

Source: ASC 260-10-20, *Glossary*. See also Appendix A for definitions of Call Option, Employee Stock Ownership Plan, Fair Value, Noncontrolling Interest, Option, Put Option, Security, Subsidiaries, and Warrants.

**Antidilution.** An increase in earnings per share amounts or a decrease in loss per share amounts.

**Basic Earnings Per Share.** The amount of earnings for the period available to each share of common stock outstanding during the reporting period.

**Consolidated Financial Statements.** The financial statements of a consolidated group of entities that include a parent and all its subsidiaries presented as those of a single economic entity.

**Consolidated Group.** A parent and all its subsidiaries.

**Contingent Issuance.** A possible issuance of shares of common stock that is dependent on the satisfaction of certain conditions.

**Contingent Stock Agreement.** An agreement to issue common stock (usually in connection with a business combination) that is dependent on the satisfaction of certain conditions. See Contingently Issuable Shares.

**Contingently Convertible Instruments.** Contingently convertible instruments are instruments that have embedded conversion features that are contingently convertible or exercisable based on either of the following:

- a. A market price trigger
- b. Multiple contingencies if one of the contingencies is a market price trigger and the instrument can be converted or share settled based on meeting the specified market condition.

A market price trigger is a market condition that is based at least in part on the issuer's own share price. Examples of contingently convertible instruments include contingently convertible debt, contingently convertible preferred stock, and the instrument described by paragraph 260-10-45-43, all with embedded market price triggers.

**Contingently Issuable Shares.** Shares issuable for little or no cash consideration upon the satisfaction of certain conditions pursuant to a contingent stock agreement. Also called contingently issuable stock. See Contingent Stock Agreement.

**Conversion Rate.** The ratio of the number of common shares issuable upon conversion to a unit of a convertible security. For example, \$100 face value of debt convertible into 5 shares of common stock would have a conversion ratio of 5:1. Also called conversion ratio.

**Convertible Security.** A security that is convertible into another security based on a conversion rate. For example, convertible preferred stock that is convertible into common stock on a two-for-one basis (two shares of common for each share of preferred).

**Diluted Earnings Per Share.** The amount of earnings for the period available to each share of common stock outstanding during the reporting period and to each share that would have been outstanding assuming the issuance of common shares for all dilutive potential common shares outstanding during the reporting period.

**Dilution.** A reduction in EPS resulting from the assumption that convertible securities were converted, that options or warrants were exercised, or that other shares were issued upon the satisfaction of certain conditions.

**Dropdown.** A transfer of certain net assets from a sponsor or general partner in exchange for consideration. (Effective upon implementation of ASU 2015-06.)

**Earnings Per Share.** The amount of earnings attributable to each share of common stock. For convenience, the term is used to refer to either earnings or loss per share.

**Exercise Price.** The amount that must be paid for a share of common stock upon exercise of an option or warrant.

**If-Converted Method.** A method of computing EPS data that assumes conversion of convertible securities at the beginning of the reporting period (or at time of issuance, if later).

**Income Available to Common Stockholders.** Income (or loss) from continuing operations or net income (or net loss) adjusted for preferred stock dividends.

**Participating Security.** A security that may participate in undistributed earnings with common stock, whether that participation is conditioned upon the occurrence of a specified event or not. The form of such participation does not have to be a dividend—that is, any form of participation in undistributed earnings would constitute participation by that security, regardless of whether the payment to the security holder was referred to as a dividend.

**Potential Common Stock.** A security or other contract that may entitle its holder to obtain common stock during the reporting period or after the end of the reporting period.

**Preferred Stock.** A security that has preferential rights compared to common stock.

**Purchased Call Option.** A contract that allows the reporting entity to buy a specified quantity of its own stock from the writer of the contract at a fixed price for a given period. See Call Option.

**Reverse Treasury Stock Method.** A method of recognizing the dilutive effect on EPS of satisfying a put obligation. It assumes that the proceeds used to buy back common stock (pursuant to the terms of a put option) will be raised from issuing shares at the average market price during the period. See Put Option.

**Rights Issue.** An offer to existing shareholders to purchase additional shares of common stock in accordance with an agreement for a specified amount (which is generally substantially less than the fair value of the shares) for a given period.

**Stock Dividend.** An issuance by a corporation of its own common shares to its common shareholders without consideration and under conditions indicating that such action is prompted mainly by a desire to give the recipient shareholders some ostensibly separate evidence of a part of their respective interests in accumulated corporate earnings without distribution of cash or other property that the board of directors deems necessary or desirable to retain in the business. A stock dividend takes nothing from the property of the corporation and adds nothing to the interests of the stockholders; that is, the corporation's property is not diminished and the interests of the stockholders are not increased. The proportional interest of each shareholder remains the same.

**Treasury Stock Method.** A method of recognizing the use of proceeds that could be obtained upon exercise of options and warrants in computing diluted EPS. It assumes that any proceeds would be used to purchase common stock at the average market price during the period.

**Weighted-Average Number of Common Shares Outstanding.** The number of shares determined by relating the portion of time within a reporting period that common shares have been outstanding to the total time in that period. In computing diluted EPS, equivalent common shares are considered for all dilutive potential common shares.

## CONCEPTS, RULES, AND EXAMPLES

---

### Simple Capital Structure

Simple capital structures are those with only common stock outstanding, having no potential common shares that upon conversion or exercise could dilute EPS. Simple capital structures only have basic EPS.

All other entities are considered to have a complex capital structure. Entities with a complex capital structure have potential common stock in the form of potentially dilutive securities,

options, warrants, or other rights that upon conversion or exercise have the potential to dilute earnings per common share.

### Basic EPS Calculation

$$\text{EPS} = \frac{\text{Net income} - \text{preferred dividends (income available to common stockholders)}}{\text{Weighted-average number of shares outstanding}}$$

**Computational guidelines.** The basic EPS calculation is income available to common stockholders (the numerator) divided by the weighted-average number of common shares outstanding (the denominator) during the period. (ASC 260-10-45-10) The objective of the basic EPS calculation is to measure the performance of the entity over the reporting period. This calculation becomes complex when net income does not necessarily represent the earnings available to the common stockholder, and a simple weighted-average of common shares outstanding does not necessarily reflect the true nature of the situation.

**Numerator.** The net income available to common stockholders used as the numerator in any of the EPS computations must be reduced by any preferential claims against it by other securities. (ASC 260-10-45-11) The justification for this reduction is that the preferential claims of the other securities must be satisfied before any income is available to the common stockholder. These other securities are usually in the form of preferred stock, and the deduction from income is the amount of the dividend declared (whether or not paid) during the year on the preferred stock. If the preferred stock is cumulative,<sup>1</sup> the dividend is deducted from income (added to the loss) whether or not declared. Dividends in arrears do not affect the calculation of EPS in the current period; those dividends have been included in prior periods' EPS computations. However, the entity must disclose the amount in arrears and the effects on the EPS calculation of the rights given to holders of preferential securities.

If an entity is presenting consolidated financial statements with less than wholly owned subsidiaries, then it should exclude from net income the income attributable to the noncontrolling interest in subsidiaries. (ASC 45-11A)

**Denominator.** The computation of the weighted-average of common stock shares outstanding is complicated by the effect that various transactions have on the computation of common shares outstanding. While it is impossible to analyze all the possibilities, ASC 260 provides discussion of some of the more common transactions affecting the number of common shares outstanding. By analogy, the theoretical model set forth in these relatively simple examples can be applied to situations that are not explicitly discussed.

**Treasury stock.** If a company reacquires its stock (treasury stock), the number of shares reacquired is excluded from EPS calculations as of the date of reacquisition. The same theory holds for the issuance of common stock during the period. The number of shares newly issued is included in the computation only for the period after their issuance date. The logic for this treatment is that the proceeds from issuance of the shares were not available to the company to generate earnings until the shares were issued. This same logic applies to the reacquired shares, because the cash paid to reacquire those shares was no longer available to generate earnings after the reacquisition date.

**Stock dividend or stock split.** When an entity issues a dividend in the form of its own stock or splits its stock, it does not receive any consideration, but it does increase the number of

---

<sup>1</sup> Cumulative preferred stock requires that if the entity fails to pay a dividend in any year, it must make it up in a later year before paying any dividends to holders of common stock.

shares outstanding. ASC 260 states that the increase in shares as a result of a stock split or dividend, or decrease in shares as a result of a reverse split, should be given retroactive recognition as an appropriate equivalent charge for all periods presented. Thus, even if a stock dividend or split occurs at the end of the period, it is considered outstanding for the entirety of each period presented. The reasoning is that a stock dividend or split has no effect on the ownership percentage of the common stockholder. To show a dilution in the EPS reported would erroneously give the impression of a decline in profitability when in fact it was merely an increase in the shares outstanding due to the stock dividend or split. ASC 260 carries this principle one step further by requiring the retroactive adjustment of outstanding shares for stock dividends or splits occurring after the end of the period, but before the release of the financial statements. The rationale for this adjustment is that the primary interest of the financial statement user is considered to be the company's current capitalization. If this situation occurs, disclosure of both the end-of-year outstanding shares and those used to compute EPS is required.

When shares are issued in connection with a business combination that occurs during the period, they are treated as issued and outstanding as of the date of the acquisition.

#### **Exhibit—Effect of Certain Transactions or Amounts on the Weighted-Average Computation**

<b>Weighted-Average Computations</b>	
<i>Transaction/Amount</i>	<i>Effect on weighted-average computation</i>
• Common stock outstanding at the beginning of the period	• Included in number of shares outstanding
• Issuance of common stock	• Increase number of shares outstanding by the number of shares issued times the portion of the year outstanding
• Conversion into common stock	• Increase number of shares outstanding by the number of shares converted times the portion of the year outstanding
• Reacquisition of common stock	• Decrease number of shares outstanding by number of shares reacquired times portion of the year since reacquisition
• Stock dividend or split	• Increase number of shares outstanding by number of shares issued for the dividend or resulting from the split retroactively as of the beginning of the earliest period presented
• Reverse split	• Decrease number of shares outstanding by decrease in shares retroactively as of the beginning of the earliest period presented
• Business combination	• Increase number of shares outstanding by number of shares issued times portion of year since acquisition

The Exhibit above does not provide for all of the possible complexities arising in the EPS computation; however, most of the others occur under a complex capital structure. The complications arising under a complex capital structure are discussed and illustrated in detail later in this chapter and in the final Section, "Comprehensive Example." The illustration below applies some of the foregoing concepts to a simple capital structure.

**Example of EPS computation—simple capital structure**

Assume the following information:

<i>Numerator information</i>	<i>Denominator information</i>
a. Income from continuing operations before extraordinary items	\$130,000
b. Loss from discontinued operations (net of income tax)	(30,000)
c. Net income	100,000
d. 6% cumulative preferred stock, \$100 par, 1,000 shares issued and outstanding	100,000
a. Common shares outstanding 1/1/X1	100,000
b. Shares issued for cash 4/1/X1	20,000
c. Shares issued in 10% stock dividend declared in July 20 X1	12,000
d. Shares of treasury stock reacquired 10/1/X1	10,000

When calculating the numerator, the claims related to the preferred stock are deducted to arrive at the income available to the common stockholders. In this example, the preferred stock is cumulative. Thus, regardless of whether or not the board of directors declares a preferred dividend, holders of the preferred stock have a claim of \$6,000 ( $= 1,000 \text{ shares} \times \$100 \text{ par} \times 6\%$ ) against 20X1 earnings. Therefore, \$6,000 must be deducted from the numerator to arrive at the income available to common stockholders. Note that any cumulative preferred dividends in arrears are ignored in computing this period's EPS since they would have been incorporated into previous periods' EPS calculations. Also note that this \$6,000 would have been deducted for *noncumulative* preferred stock only if a dividend of this amount had been declared during the period.

The EPS calculations follow:

*Earnings per common share*

On income from continuing operations before loss from discontinued operation	$\frac{\$130,000 - \$6,000}{\text{Common shares outstanding}}$
On net income	$\frac{\$100,000 - \$6,000}{\text{Common shares outstanding}}$

The computation of the denominator is based upon the weighted-average number of common shares outstanding. A simple weighted-average is not considered appropriate because of the various complexities. Table 11.1 illustrates one way of computing the weighted-average number of shares outstanding.

**Table 1**

<i>Item</i>	<i>Actual number of shares</i>	<i>Retroactive effects of July stock dividend</i>	<i>Subtotal number of shares deemed outstanding</i>	<i>Fraction of the year deemed outstanding</i>	<i>Shares times fraction of the year deemed outstanding</i>
Number of shares as of beginning of the year 1/1/X1	100,000	10,000 [10%(100,000)]	110,000	12/12	110,000
Shares issued 4/1/X1	20,000	2,000 [10%(20,000)]	22,000	9/12	16,500
Treasury shares reacquired 10/1/X1	(10,000)	–	(10,000)	3/12	(2,500)
Weighted-average number of common shares outstanding					<u>124,000</u>

The stock dividend declared in July is treated as being retroactive to the beginning of the year. Thus, for the period 1/1 through 4/1, 110,000 shares are considered to be outstanding. When shares are issued, they are included in the weighted-average beginning with the date of issuance. The shares issued as a result of the stock dividend applicable to the 20,000 newly issued shares are also assumed to have been outstanding for the same period as the 20,000 shares. Thus, we can see that of the 12,000-share stock dividend, 10,000 shares relate to the beginning balance and 2,000 shares to the new issuance (10% of 100,000 and 20,000, respectively). The reacquisition of the treasury stock requires that these shares be excluded from the calculation for the remainder of the period after their reacquisition date. This amount is subtracted from the calculation because the shares were reacquired from shares outstanding prior to their reacquisition.

To complete the example, we divide the previously computed numerator by the weighted-average number of common shares outstanding to arrive at EPS.

*Earnings per common share:*

$$\text{On income from continuing operations before loss from discontinued operation} \quad \frac{\$130,000 - \$6,000}{124,000 \text{ common shares}} = \$1.00$$

$$\text{On net income} \quad \frac{\$100,000 - \$6,000}{124,000 \text{ common shares}} = \$0.76$$

The numbers computed above are required to be presented on the face of the income statement. Reporting a \$.24 loss from discontinued operation per share (\$30,000 loss on discontinued operation ÷ 124,000 common shares) is required either on the face of the income statement or in the notes to the financial statements.

**Preferred stock dividends payable in common shares.** All dividends represent distributions of accumulated earnings, and accordingly are not reported as expenses on the income statement under GAAP. However, as illustrated above, for purposes of computing EPS, preferred dividends must be deducted in order to ascertain how much income is available for common stockholders. In some cases, preferred dividends are not payable in cash, but rather in common shares (based on market value as of the date of declaration, typically). In certain cases, the dividends may be payable in common shares or cash at the issuer's option.

ASC 260 defines income available to common stockholders as "income (or loss) from continuing operations or net income (or net loss) adjusted for preferred stock dividends." This adjustment in computing income available to common stockholders is consistent with the treatment of common stock issued for goods or services. (ASC 260-10-45-12)

**Example of preferred stock dividends payable in common shares**

Delta Corporation has three classes of preferred stock outstanding, as noted in the following table:

<u>Stock type</u>	<u>Preferred stock description</u>	<u>Total \$ issued</u>
Series A	7% preferred stock, \$100 par value, 3,000 shares outstanding, payable in common stock priced at market value on declaration date	\$300,000
Series B	5% preferred stock, \$100 par value, 2,000 shares outstanding, payable in common stock at fixed price of \$2.00/share	200,000
Series C	8% preferred stock, \$100 par value, 1,000 shares outstanding, payable in cash or in common stock at market price on declaration date, at Delta's option	100,000

On the dividend declaration date, the price of a share of common stock is \$2.50. Delta's Board of Directors approves the payment of the Series C dividend as 50% cash, 50% common stock. The following table shows the types and amounts of dividends due for all types of preferred stock:

<u>Stock type</u>	<u>Total dividend due</u>	<u>Applicable common stock price</u>	<u>Number of common shares issued</u>	<u>Cash issued</u>
Series A	\$21,000	\$2.50	8,400	
Series B	10,000	2.00	5,000	
Series C	<u>8,000</u>	2.50	<u>1,600</u>	<u>\$4,000</u>
	<u><u>\$39,000</u></u>		<u><u>15,000</u></u>	<u><u>\$4,000</u></u>

Delta has net income of \$110,000, from which the total dividend due, regardless of the form of payment, must be subtracted. The calculation follows:

$$\frac{\$110,000 \text{ net income} - \$39,000 \text{ dividend}}{\text{Common shares outstanding}}$$

Delta's fiscal year is the calendar year. Delta had 200,000 shares of common stock outstanding on January 1, issued an additional 30,000 common shares on May 1, and declared the previously described preferred stock dividends on 12/31. Based on this information, the weighted-average number of shares outstanding follows:

<u>Description</u>	<u>Number of shares</u>	<u>Fraction of the year deemed outstanding</u>	<u>Weighted-average shares outstanding</u>
Number of shares as of 1/1	200,000	12/12	200,000
Common stock issuance on 5/1	30,000	8/12	20,000
Common stock issued on 12/31 as part of preferred stock dividend	15,000	12/12	<u>15,000</u>
Weighted-average number of common shares outstanding			235,000

Delta divides the 235,000 common shares outstanding into the adjusted net income to arrive at the following EPS calculation:

$$\frac{\$110,000 - \$39,000}{235,000 \text{ common shares}} = \$0.30$$

**Effect of preferred stock dividends payable in common shares on computation of EPS.** At the option of the issuer, preferred stock dividends are sometimes payable in either cash or common stock. According to ASC 260-10-45, the form of payment is not a determinant in accounting for the effect of the preferred dividend on net income available to common stockholders. Therefore, for the purposes of the numerator in EPS computations, net income or loss is adjusted to compute the portion available to common stockholders.

**Material limited partnerships—dropdown transactions.** General partners, limited partners, and incentive distribution rights holders have different rights to participate in distributable cash flow under the guidance in ASC 260. This results in a two-class method of calculating earnings per unit.

A general partner may transfer or “drops down” net assets to a master limited partnership. If that transaction is accounted for as a transaction between entities under common control, the statements of operations of the master limited partnership are adjusted retrospectively to reflect the dropdown transaction as if it occurred on the earliest date during which the entities

were under common control. If a dropdown transaction occurs after the formation of a master limited partnership, ASC 260 requires that all earnings or losses of a transferred business related to periods prior to the date of the dropdown transaction be allocated entirely to the general partner.

### Complex Capital Structure

The computation of EPS under a complex capital structure involves all of the complexities discussed under the simple structure and many more. A complex capital structure is one that includes securities that grant rights with the potential to be exercised and reduce EPS (dilutive securities). The denominator is increased to include the number of additional shares that would have been outstanding had the dilutive shares been issued. The numerator is also adjusted for any change in income or loss that would have resulted from the conversion. Any antidilutive securities (those that increase EPS) are not included in the computation of EPS.

### Exhibit—Diluted EPS Computation

$$\text{EPS} = \frac{\text{Net income} - \text{preferred dividends} - \text{Impact of convertibles}}{\text{Weighted-average number of shares outstanding}} - \text{Impact of options, warrants, and other dilutive securities}$$

Note that a complex capital structure requires dual presentation of basic EPS and diluted earnings per share (DEPS). The common stock outstanding and all other dilutive securities are used to compute DEPS.

**Diluted earnings per share.** DEPS represents the earnings attributable to each share of common stock after giving effect to all potentially dilutive securities which were outstanding during the period. The computation of DEPS requires that the following steps be performed:

1. Identify all potentially dilutive securities.
2. Compute dilution, the effects that the other dilutive securities have on net income and common shares outstanding.

**Identification of potentially dilutive securities.** Dilutive securities are those that have the potential of being exercised and reducing the EPS figure. Some examples of dilutive securities identified by ASC 260 are convertible debt, convertible preferred stock, options, warrants, participating securities, two-class common stocks, and contingent shares.

**Convertible securities.** A convertible security is one type of potentially dilutive security. A security of this type has an inherent dual nature. Convertibles are comprised of two distinct elements:

- The right to receive dividends or interest, and
- The right to potentially participate in earnings by becoming a common stockholder.

This security is included in the DEPS computation due to the latter right.

**Options and warrants.** Options, warrants, and their equivalents generally derive their value from the right to obtain common stock at specified prices over an extended period of time.

**Participating securities and two-class common stocks.** The capital structure of some entities includes securities that may participate in dividends with common stocks according to a predetermined formula, or a class of common stock with different dividend rates from those of

another class of common stock but without prior or senior rights. If the effect is dilutive, entities do not have the option of using the if-converted method for those securities that are convertible into common stock. For these securities, participating securities, and two-class common stocks, the two-class method of computing EPS, as described below, is used.

**Financial instruments with characteristics of both liabilities and equity.** ASC 480 specifies that certain freestanding financial instruments (as distinguished from compound financial instruments) that may resemble equity are nevertheless required to be classified as liabilities on the issuer's statement of financial position. Such instruments include mandatorily redeemable financial instruments (including mandatorily redeemable common or preferred stock) and certain forward contracts that require physical settlement by repurchase of a fixed number of the issuer's equity shares. Issuers of these instruments are required to:

1. Exclude any shares of common stock that are required to be redeemed or repurchased from the denominator of the EPS and DEPS computations, and
2. Apply the two-class method described below to deduct from income available to common stockholders (the numerator of EPS and DEPS computations) any amounts that are attributable to shares that are to be redeemed or repurchased, including contractual dividends and participation rights in undistributed earnings.

The deduction described in (2) is limited to amounts not recognized in the issuer's financial statements as interest expense. More information can be found in the chapter on ASC 480.

**Contingent issuances of common stock.** Another consideration is contingent issuances of common stock (e.g., stock subscriptions). If shares are to be issued in the future with no restrictions on issuance other than the passage of time, they are considered issued and treated as outstanding in the computation of DEPS.

Other issuances that are dependent upon certain conditions being met should be evaluated in a different manner. ASC 260 uses as examples the maintenance of current earnings levels and the attainment of specified earnings increases. The following table lists examples and the accounting treatment for each.

#### Exhibit—Issuances Contingent on Certain Conditions

Shares Issued Contingent Upon:	Treatment
Merely maintaining the earnings levels currently being attained	The shares are considered outstanding for the entire period and considered in the computation of DEPS if the effect is dilutive.
Increasing earnings over a period of time	The DEPS computation should include those shares that would be issued based on the assumption that the current amount of earnings will remain unchanged if the effect is dilutive.
An earnings level attainment	Previously reported DEPS are not restated.
The lapsing of time <i>and</i> the market price of the stock (which generally affects the number of shares issued)	Both conditions must be met to include the contingently issuable shares in the DEPS computation.
Fluctuations in the market price occurring in future periods	Restatement of DEPS data is prohibited.
(ASC 260-10-45-48 through 45-55)	

### Example of the impact of contingent stock issuances on EPS

Arturo Corporation offers its management team the following set of stock-based incentives that apply to the current year of operations:

- A stock grant of 25,000 common shares if the company attains full-year net income of at least \$1 million.
- An additional stock grant of 1,000 common shares for every additional \$100,000 of net income recorded above \$1 million.
- A stock grant of 50,000 common shares if the company is granted ISO 9001 certification, to be issued immediately upon completion of the certification.

Arturo has 500,000 shares of common stock outstanding throughout the calendar year, which is its fiscal year. It obtains the ISO 9001 certification on April 1. Arturo's full-year net income is \$1,300,000. It records the following basic EPS:

$$\frac{\$1,300,000 \text{ net income}}{537,500 \text{ common shares}} = \$2.42$$

The denominator incurs 3/4 of the 50,000 stock grant (e.g., 37,500 shares) associated with completion of the ISO 9001 certification, since the grant occurs after 1/4 of the fiscal year had been completed. The stock grant that is contingent on full-year earnings is not included in the basic EPS calculation, since the grant cannot occur until the last day of the year, and therefore has a negligible impact on the calculation.

For the DEPS calculation, the contingent stock grant of 25,000 shares associated with the \$1 million net income goal is included in the full-year weighted-average, as well as the 3,000 shares associated with the incremental increase in net profits above \$1 million and the 50,000 shares associated with the ISO 9001 project completion. The calculation of shares to include in the DEPS denominator follows:

Common stock outstanding	\$500,000
Stock grant associated with ISO 9001 project completion	50,000
Stock grant associated with attainment of \$1 million net income goal	25,000
Stock grant associated with attainment of incremental \$300,000 net income goal	3,000
Total DEPS shares	<u>\$578,000</u>

By including these shares in the denominator of the DEPS calculation, Arturo arrives at the following diluted EPS:

$$\frac{\$1,300,000 \text{ net income}}{578,000 \text{ common shares}} = \$2.25$$

**Computation of DEPS.** The second step in the process is the actual computation of DEPS. There are basically two methods used to incorporate the effects of other dilutive securities on EPS (excluding participating and two-class common securities for which the two-class method described above is used):

1. The treasury stock method, and
2. The if-converted method.

**The treasury stock method.** The treasury stock method, used for the exercise of most warrants or options, requires that DEPS be computed as if:

- The options or warrants were exercised at the beginning of the period (or actual date of issuance, if later), and
- That the funds obtained from the exercise were used to purchase (reacquire) the company's common stock at the average market price for the period.

The incremental shares (the difference between the number of shares assumed issued and the number of shares assumed purchased) is included in the denominator of the diluted EPS computation. (ASC 260-10-45-23)

#### Example—Treasury Stock Method

An example of the requirements under ASC 260 follows. If a corporation has warrants outstanding for 1,000 shares of common stock exercisable at \$10 per share, and the average market price of the common stock is \$16 per share, the following occurs: The company receives \$10,000 ( $1,000 \times \$10$ ) and issues 1,000 shares from the exercise of the warrants which would enable it to repurchase 625 shares ( $\$10,000 \div \$16$ ) in the open market. The net increase in the denominator (which effects a dilution in EPS) is 375 shares (1,000 issued less 625 repurchased). If the exercise price is greater than the average market price, the exercise is not assumed since the result would be antidilutive. In that case, DEPS of prior periods presented in comparative form are not restated to reflect the change in market price.

#### Treasury Stock Method

Denominator must be increased by net dilution, as follows:

Net dilution	= Shares issued – Shares assumed to be repurchased
<i>where</i>	
Shares issued	= Proceeds received ÷ Exercise price per share
Shares assumed to be repurchased	= Proceeds received ÷ Average market price per share

**The if-converted method.** The if-converted method is used for those convertible securities that are currently sharing in the earnings of the company through the receipt of interest or dividends as preferential securities, but that have the potential for sharing in the earnings as common stock (e.g., convertible bonds or convertible preferred stock). The if-converted method logically recognizes that the convertible security can only share in the earnings of the company as one or the other, not both. Thus, the dividends or interest less income tax effects applicable to the convertible security as a preferential security are not recognized in income available to common stockholders used to compute DEPS, and the weighted-average number of shares is adjusted to reflect the assumed conversion as of the beginning of the year (or actual date of issuance, if later). (ASC 260-10-45-40)

#### Example—If-Converted Method Computation

##### Numerator

Income available to common stockholders recomputed to reflect assumed and/or actual conversion

- Add back interest expense less income tax effects
- Convertible preferred dividends are no longer subtracted
- Add back other expenses attributable to convertible issues

##### Denominator

Weighted-average number of shares of common stock outstanding adjusted to reflect the assumed and/or actual conversion of convertible securities at the beginning of the period or actual date of issuance, if later

**Exceptions.** Generally, the if-converted method is used for convertible securities, while the treasury stock method is used for options and warrants. There are some situations specified by ASC 260 for which this does not hold true:

1. If options or warrants permit or require that debt or other securities of the issuer be tendered for all or a portion of the exercise price, the if-converted method is used.
2. If options or warrants require that the proceeds from the exercise are to be used to retire existing debt, the if-converted method is used.
3. If convertible securities require cash payment upon conversion, and are, therefore, considered equivalent to warrants, the treasury stock method is used.

(ASC 260-10-55-9 through 55-11)

**Dual presentation of EPS.** DEPS is a pro forma presentation which reflects the dilution of EPS that would have occurred if all contingent issuances of common stock that would individually reduce EPS had taken place at the beginning of the period (or the date actually issued, if later). The presentation of the concept of dual EPS provides the reader with factually supportable EPS that range from no dilution to the maximum potential dilution. DEPS assumes that all issuances that have the legal right to become common stock exercise that right (unless the exercise would be antidilutive), and therefore anticipates and measures all potential dilution. The underlying basis for the computation is that of conservatism. The DEPS considers all other potentially dilutive securities, but only uses those securities that are dilutive. Thus, in most cases, the DEPS is less than the basic EPS. DEPS can never be greater than the basic EPS, but it could potentially be the same if all of the convertible securities were antidilutive.

### Examples of EPS Computation—Complex Capital Structure

Each of the following independent examples is presented to illustrate the foregoing principles. The procedural guidelines are detailed to enable the reader to understand the computation without referring back to the preceding explanatory text.

#### Example of the treasury stock method

Assume that net income is \$50,000 and the weighted-average number of common shares outstanding has been computed as 10,000. Additional information regarding the capital structure is:

1. 4% nonconvertible, cumulative preferred stock, par value of \$100 per share, 1,000 shares issued and outstanding the entire year.
2. Options and warrants to purchase 1,000 shares of common stock at \$8 per share were outstanding all year.
3. The average market price of common stock during the year was \$10.

The first step in applying this method is the determination of basic EPS. This calculation appears as follows:

$$\frac{\text{Net income} - \text{Preferred dividends}}{\text{Weighted-average number of common shares outstanding}} = \frac{\$50,000 - \$4,000}{10,000 \text{ shares}} = \$4.60$$

The second step is the calculation of DEPS, which is based upon outstanding common stock and other dilutive securities. The options and warrants are the only potentially dilutive securities in the example. However, remember that only dilutive options (Market price > Exercise price) are included in the computation. The treasury stock method is used to compute the number of shares to be added to the denominator as illustrated below.

Proceeds from assumed exercise of options and warrants (1,000 shares × \$8 per share)	<u>\$8,000</u>
Number of shares issued	1,000
Number of shares assumed to be reacquired (\$8,000 ÷ \$10 average market price per share)	800
Number of shares assumed issued and not reacquired	<u>200*</u>

\* An alternative approach that can be used to calculate this number for DEPS is demonstrated below.

$$\frac{\text{Average market price} - \text{Exercise price}}{\text{Average market price}} \times \text{Number of shares under options/warrants} = \text{Shares not reacquired}$$

$$\frac{\$10 - \$8}{\$10} \times 1,000 \text{ shares} = 200 \text{ shares}$$

DEPS can now be calculated as follows, including the effects of applying the treasury stock method:

$$\frac{\text{Net income} - \text{Preferred dividends}}{\text{Weighted-average number of common shares}} = \frac{\$50,000 - \$4,000}{10,200 \text{ shares}} = \$4.51$$

outstanding + Number of shares assumed issued and not  
reacquired with proceeds from options and warrants

Note the dilutive effect of the options and warrants shown in Table 11.2, as EPS of \$4.60 is reduced to DEPS of \$4.51.

**Table 2**  
**Computations of Basic EPS and Diluted EPS**

<i>Item</i>	<i>EPS on outstanding common stock</i> (Basic EPS)		<i>DEPS</i>	
	<i>Numerator</i>	<i>Denominator</i>	<i>Numerator</i>	<i>Denominator</i>
Net income	\$50,000		\$50,000	
Preferred dividends	(4,000)		(4,000)	
Common shares outstanding		10,000 shs		10,000 shs
Options and warrants	—	—	—	200
Totals	\$46,000	÷	10,000 shs	\$46,000
EPS				\$4.51

**Example of the if-converted method**

Assume net income of \$50,000 and weighted-average common shares outstanding of 10,000. Additional information regarding capital structure is:

1. 7% convertible debt, 200 bonds each convertible into forty common shares. The bonds were outstanding the entire year. The income tax rate is 40%. The bonds were issued at par (\$1,000 per bond). No bonds were converted during the year.
2. 4% convertible, cumulative preferred stock, par value of \$100 per share, 1,000 shares issued and outstanding. Each preferred share is convertible into two common shares. The preferred stock was issued at par value and was outstanding the entire year. No shares were converted during the year.

The first step is to compute basic EPS. As in the previous example, this is \$4.60. The next step is the computation of DEPS, assuming conversion of the convertible debt in order to determine whether their conversion would be dilutive. The convertible bonds are assumed to have been converted to common stock at the beginning of the year, since no bonds were actually converted during the year. The effects of this assumption are twofold. One, if the bonds are converted, interest expense would be reduced by \$14,000 ( $= 7\% \times 200 \text{ bonds} \times \$1,000 \text{ par value per bond}$ ); and two, there will be an additional 8,000 shares of common stock outstanding during the year ( $= 200 \text{ bonds} \times 40 \text{ common shares per bond}$ ). The effect of avoiding \$14,000 of interest expense will increase net income, but it will also increase income tax expense due to the lost income tax deduction. Consequently, the net after-tax effect of avoiding interest expense of \$14,000 is \$8,400 [ $= (1 - .40) \times \$14,000$ ]. DEPS is computed as follows:

$$\frac{\text{Net income} - \text{Preferred dividends} + \text{Interest expense (net of tax)}}{\text{Weighted-average number of common shares outstanding} + \text{Shares issued upon conversion of bonds}} = \frac{\$50,000 - \$4,000 + \$8,400}{10,000 + 8,000 \text{ shares}} = \$3.02$$

The convertible debt is dilutive because EPS of \$4.60 is reduced to DEPS of \$3.02.

To determine the dilutive effect of the preferred stock, the preferred stock is assumed to have been converted to common stock at the beginning of the year, since no shares of preferred stock were actually converted during the year. The effects of this assumption are twofold. One, if the preferred stock is converted, there will be no preferred dividends of \$4,000 for the year; and two, there will be an additional 2,000 shares of common stock outstanding during the year (the conversion rate is 2 for 1 on 1,000 shares of outstanding preferred stock). DEPS considering the preferred stock is computed, as follows, reflecting these two assumptions:

$$\frac{\text{Net income} + \text{Interest expense (net of tax)}}{\text{Weighted-average number of common shares outstanding} + \text{Shares issued upon conversion of bonds and conversion of preferred stock}} = \frac{\$50,000 + \$8,400}{10,000 + 8,000 + 2,000 \text{ shares}} = \$2.92$$

The convertible preferred stock is also dilutive because DEPS of \$3.02 is reduced to DEPS of \$2.92.

Together, the effect of the convertible bonds and preferred stock reduces EPS of \$4.60 to DEPS of \$2.92. In this example, the convertible bonds must be considered first, prior to the inclusion of the convertible preferred stock in the computation. For a complete explanation of the sequencing process of including multiple dilutive securities in the computations of DEPS, see the comprehensive example at the end of the chapter. Table 11.3 summarizes the computations made for this example.

**Table 3**  
**Computations of Basic EPS and Diluted EPS**

<i>Item</i>	<i>EPS on outstanding common stock (Basic EPS)</i>		<i>DEPS</i>	
	<i>Numerator</i>	<i>Denominator</i>	<i>Numerator</i>	<i>Denominator</i>
Net income	\$50,000		\$50,000	
Preferred dividend	(4,000)			
Common shares outstanding		10,000 shs		10,000 shs
Conversion of preferred				2,000
Conversion of bonds				
Totals	\$46,000	÷	10,000 shs	8,000
EPS			\$58,400	÷
				20,000 shs
			\$2.92	

In the preceding example, all of the potentially dilutive securities were outstanding the entire year and no conversions or exercises were made during the year. If a potentially dilutive security was not outstanding the entire year, then the numerator and denominator effects would have to be *time-weighted*. For instance, suppose the convertible bonds in the above example were issued during the current year on July 1. If all other facts remain unchanged, DEPS would be computed as follows:

$$\frac{\text{Net income} + \text{Interest expense (net of tax)}}{\text{Weighted-average number of common shares}} = \frac{\$50,000 + \frac{1}{2}(8,400)}{10,000 + 2,000 + \frac{1}{2}(8,000)} = \$3.39$$

outstanding + Shares issued upon conversion  
of preferred stock and conversion bonds

Since the DEPS of \$3.39 is still less than the EPS of \$4.60, the convertible debt is dilutive whether or not it is outstanding the entire year.

If actual conversions or exercises take place during a period, the common shares issued upon conversion will be outstanding from their date of issuance and therefore will be included in the computation of the weighted-average number of common shares outstanding. These shares are then weighted from their respective dates of issuance. Assume that all the bonds in the above example are converted on July 1 into 8,000 common shares; the following effects should be noted:

1. For basic EPS, the weighted-average of common shares outstanding will be increased by (8,000 shares) (6 months outstanding/12 months in the period) or 4,000. Income will increase \$4,200 net of income tax, because the bonds were only outstanding for the first half of the year.
2. For DEPS, the if-converted method is applied to the period January 1 to June 30 because it was during this period that the bonds were potentially dilutive. The interest expense, net of income tax, of \$4,200 is added to the net income in the numerator, and 4,000 shares are added to the denominator.
3. Interestingly, the net effect of items 1 and 2 is the same for the period, whether these dilutive bonds were outstanding the entire period or converted during the period.

### **Participating Securities and the Two-Class Method**

Reporting entities that issue securities that are entitled to participate in dividends with common shares will report lower EPS under the guidance in ASC 260-10-55. This issue addresses the computation of EPS by entities that have issued securities, other than common stock, that entitle the holder to participate in dividends when, and if, dividends are declared on common stock. In addition, ASC 260-10-55 provides further guidance on calculating EPS using a two-class method and requires companies to retroactively restate EPS amounts presented. (ASC 260-10-45-59)

Participation rights are defined based solely on whether the holder is entitled to receive any dividends if the entity declares them during the period. The codification also requires the use of the two-class method for computing basic EPS when participating convertible securities exist. The use of the two-class method encompasses other forms of participating securities, including options, warrants, forwards, and other contracts to issue an entity's common shares (including unvested share-based compensation awards).

**Presentation and disclosure.** Presentation of participating securities' basic and diluted EPS is not required, but is permitted for other than common stock. What is required by ASC 260-10-55 is adjustment to the earnings that are used to compute EPS for the common stock.

**Participating security defined.** ASC 260-10-55 formally defines participating securities as any “security that may participate in undistributed earnings with common stock, whether that participation is conditioned upon the occurrence of a specified event or not . . . regardless of the whether the payment to the security holder was referred to as a dividend.”

Additional guidance clarifies that instruments granted in share-based payment transactions can be participating securities prior to the requisite service having been rendered. However, the right to receive dividends or dividend equivalents that the holder will forfeit if the award does not vest does not qualify as a participation right, as the award does not meet the definition of a participation security. Also not considered to be participation rights are dividends, or their equivalents, that can be transferred to the holder of a share-based payment award as a reduction in the exercise price of the award.

**Allocating earnings and losses.** In addition to the amount of dividends declared in the current period, net dividends must be reduced by the contractual amount of dividends or other participation payments that are paid or accumulated for the current period. The allocation of undistributed earnings for a period should be done for a participating security based on the contractual participation rights of the security to share in the current earnings assuming all earnings for the period are distributed. The allocation process is not based on a fair-value analysis, but is based on the term of the securities. For losses, an entity would allocate to the participating securities a portion of the net losses of the entity in accordance with the contractual provisions that may require the security to have an obligation to share in the issuing entity’s losses. This occurs when the participating security holder has an obligation to share in the losses of the issuing entity if the holder is obligated to fund the issuing authority’s losses or if losses incurred by the issuing entity reduce the security’s principal or mandatory redemption amount.

**Two-class method.** This is an earnings allocation formula for computing EPS. It determines EPS for each class of common stock and participating securities according to dividends declared/accumulated and participation rights in undistributed earnings. The codification requires that the two-class method be applied for participating convertible securities when computing basic EPS. This changes earlier guidance, which permitted reporting entities to make an accounting policy election to use the if-converted method, rather than the two-class method, in the basic EPS calculation, as long as the if-converted method was not less dilutive.

Use of the two-class method is dependent upon having no unsatisfied *contingencies* or objectively determinable contingent events. Thus, if preferred shares are entitled to participate in dividends with common shareholders only if management declares the distribution to be “extraordinary,” this would not invoke the use of the two-class computation of EPS. However, if classification of dividends as extraordinary is predetermined by a formula, then undistributed earnings would be allocated to common stock and the participating security based on the assumption that all of the earnings for the period are distributed, with application of the defined sharing formula used for the determination of the allocation to the participating security.

If the participating security participates with common stock in earnings for a period in which a specified event occurs, regardless of whether a dividend is actually paid during the period (e.g., achievement of a target market price or achievement of threshold earnings), then undistributed earnings would be allocated to common stock and the participating security based on the assumption that all of the earnings for the period are distributed. Undistributed earnings would be allocated to the participating security if the contingent condition would have been satisfied at the reporting date, even if no actual distribution were made.

**Example—Participating convertible preferred stock**

Assume that Struthers Corp. had 20,000 shares of common stock and 5,000 shares of preferred stock outstanding during 20X1, and reported net income of \$65,000 for 20X1. Each share of preferred stock is convertible into two shares of common stock. The preferred stock is entitled to a noncumulative annual dividend of \$5 per share. After the common has been paid a dividend of \$1 per share, the preferred stock then participates in any additional dividends on a 2:3 per share ratio with the common. For 20X1, the common shareholders have been paid \$26,000 (or \$1.30 per share), and the preferred shareholders have been paid \$26,000 (or \$5.20 per share). Basic EPS under the two-class method for 20X1 would be computed as follows:

Net income		65,000
Less dividends paid:		
Common	\$26,000	
Preferred stock	<u>26,000</u>	<u>52,000</u>
Undistributed 20X1 earnings		<u>\$13,000</u>

**Allocation of undistributed earnings**
*To preferred*

$$0.2(5,000) \div [0.2(5,000) + 0.3(20,000)] \times \$13,000 = \$1,857$$

$$\$1,857 \div 5,000 \text{ shares} = \$0.37 \text{ per share}$$

*To common*

$$0.3(20,000) \div [0.2(5,000) + 0.3(20,000)] \times \$13,000 = \$11,143$$

$$\$11,143 \div 20,000 \text{ shares} = \$0.56 \text{ per share}$$

**Basic EPS amounts for 20X1**

	<u>Preferred</u>	<u>Common</u>
Distributed earnings	\$5.20	\$1.30
Undistributed earnings	<u>0.37</u>	<u>0.56</u>
Total	<u><u>\$5.57</u></u>	<u><u>\$1.86</u></u>

**Example—Participating convertible debt instrument**

Assume that Wincomp, Inc. had 20,000 shares of common stock outstanding during 20X1 and reported net income of \$85,000 for the year. On January 1, 20X1, Wincomp issues 1,000 30-year, 3% convertible bonds with an aggregate par value of \$1,000,000. Each bond is convertible into eight shares of common stock. After the common has been paid a dividend of \$1 per share, the bondholders then participate in any additional dividends on a 2:3 per share ratio with common shareholders. The bondholders receive common stock dividends based on the number of shares of common stock into which the bonds are convertible. The bondholders do not have any voting rights prior to conversion into common stock. For 20X1, the Wincomp common shareholders have been paid

\$20,000 (or \$1.00 per share). Basic EPS under the two-class method for 20X1 would be computed as follows:

Net income		\$85,000
Less dividends paid:		
Common	<u>\$20,000</u>	<u>20,000</u>
Undistributed 20X1 earnings		<u>\$65,000</u>

#### Allocation of undistributed earnings

*To convertible bonds*

$$0.2(8,000) \div [0.2(8,000) + 0.3(20,000)] \times \$65,000 = \$13,684$$

$$\$13,684 \div 8,000 \text{ shares} = \$1.71 \text{ per share}$$

*To common*

$$0.3(20,000) \div [0.2(8,000) + 0.3(20,000)] \times \$65,000 = \$51,316$$

$$\$51,316 \div 20,000 \text{ shares} = \$2.57 \text{ per share}$$

#### Basic EPS amounts for 20X1

	<i>Convertible bonds</i>	<i>Common</i>
Distributed earnings	\$ –	\$1.00
Undistributed earnings	<u>1.71</u>	<u>2.57</u>
Total	<u>\$1.71</u>	<u>\$3.57</u>

#### Example—Participating warrants

Assume that SmithCo. had 15,000 shares of common stock and 1,000 warrants to purchase shares of common stock outstanding during 20X1. SmithCo. reported net income of \$75,000 for the year. Each warrant entitles the holder to purchase one share of common stock at \$10 per share. In addition, the warrant holders receive dividends on the underlying common stock to the extent they are declared. For 20X1, common shareholders have been paid \$30,000 (\$2.00 per share), and the warrant holders have been paid \$2,000 (also \$2.00 per share). Basic EPS under the two-class method for 20X1 would be computed as follows:

Net income		\$75,000
Less dividends paid:		
Common stock	<u>\$30,000</u>	
Warrants	<u>2,000</u>	<u>32,000</u>
Undistributed 20X1 earnings		<u>\$43,000</u>

#### Allocation of undistributed earnings

*To warrants*

$$0.5(1,000) \div [0.5(1,000) + 0.5(15,000)] \times \$43,000 = \$2,687.50$$

$$\$2,687.50 \div 1,000 \text{ shares} = \$2.69 \text{ per share}$$

*To common*

$$0.5(15,000) \div [0.5(1,000) + 0.5(15,000)] \times \$43,000 = \$40,312.50$$

$$\$40,312.50 \div 15,000 \text{ shares} = \$2.69 \text{ per share}$$

**Basic EPS amounts for 20X1**

	<u>Common</u>	<u>Warrants</u>
Distributed earnings	\$2.00	\$2.00
Undistributed earnings	2.69	2.69
Total	<u>\$4.69</u>	<u>\$4.69</u>

**Effect of Contracts That May Be Settled in Stock or Cash on the Computation of DEPS**

There is an issue regarding how the option to settle contracts (e.g., written puts on the reporting entity's shares) in stock or cash influences the computation of EPS. FASB staff concluded that in calculating EPS, adjustments should be made to the numerator for contracts that are classified, in accordance with ASC 815-40-15, as equity instruments, but for which the company has a stated policy or for which past experience provides a reasonable basis to believe that such contracts will be paid partially or wholly in cash (in which case there will be no potential common shares included in the denominator). Thus, a contract that is reported as an equity instrument for accounting purposes may require an adjustment to the numerator for any changes in income or loss that would result if the contract had been reported as an asset or liability for accounting purposes during the period.

For purposes of computing diluted EPS, the adjustments to the numerator described above are only permitted for instruments for which the effect on net income (the numerator) is different depending on whether the instrument is accounted for as an equity instrument or as an asset or liability (e.g., those that are within the scope of ASC 480 or ASC 815-40-15). The provisions of ASC 260 require that for contracts that provide the company with a choice of settlement methods, the company will assume that the contract will be settled in shares. That presumption may be overcome if past experience or a stated policy provides a reasonable basis to believe that it is probable that the contract will be paid partially or wholly in cash.

ASC 260-10-55-36 also states that, for contracts in which the holder controls the means of settlement, past experience or a stated policy is not determinative. In those situations, the more dilutive of cash or share settlement should be used.

Adjustment to the numerator in year-to-date diluted EPS calculations may be required in certain circumstances. ASC 260-10-55-34 cites the example of contracts in which the holder controls the method of settlement and that would have a more dilutive effect if settled in shares, where the numerator adjustment is equal to the earnings effect of the change in the fair value of the asset/liability recorded during the year-to-date period. In that situation, the number of incremental shares included in the denominator is to be determined by calculating the number of shares that would be required to settle the contract using the average share price during the year-to-date period.

ASC 260-10-55 also notes that antidilutive contracts, such as purchased put options and purchased call options, should be excluded from diluted EPS.

ASC 480 requires entities that issue mandatorily redeemable financial instruments or that enter into forward purchase contracts that require physical settlement by repurchase of a fixed number of shares in exchange for cash to exclude the common shares that are to be redeemed or repurchased in calculating EPS and DEPS. Amounts attributable to shares that are to be redeemed or repurchased that have not been recognized as interest costs (e.g., amounts associated with participation rights) are deducted in computing the income available to common shareholders (the numerator of the EPS calculations) consistently under the "two-class" method. Therefore, ASC 480's requirements for calculating EPS partially nullify ASC 260-10-55 for those financial

instruments. For other financial instruments, including those that are liabilities under ASC 480, the guidance in ASC 260-10-55 remains applicable.

### **Inclusions/Exclusions from Computation of DEPS**

Certain types of instruments and contracts having characteristics of both liabilities and equity require special treatment using the two-class method described previously; if under ASC 480, they are required to be classified as liabilities on the statement of financial position of the issuer. Examples of these instruments include mandatorily redeemable common or preferred stock, and forward purchase contracts or written put options on the issuer's equity shares that require physical settlement or net cash settlement.

The computations of DEPS also does not include contracts such as purchased put options and purchased call options (options held by the entity on its own stock). The inclusion of such contracts would be antidilutive.

Sometimes entities issue contracts that may be settled in common stock or in cash at the election of either the issuing entity or the holder. The determination of whether the contract is reflected in the computation of DEPS is based on the facts available each period. It is presumed that the contract will be settled in common stock and the resulting common shares will be included in DEPS if the effect is dilutive. This presumption may be overcome if past experience or a stated policy provides a reasonable basis to believe that the contract will be paid partially or wholly in cash. If during the reporting period the exercise price exceeds the average market price for that period, the potential dilutive effect of the contract on EPS is computed using the reverse treasury stock method. Under this method:

1. Issuance of sufficient common shares is assumed to have occurred at the beginning of the period (at the average market price during the period) to raise enough proceeds to satisfy the contract.
2. The proceeds from issuance of the shares are assumed to have been used to satisfy the contract (i.e., to buy back shares).
3. The denominator of the DEPS calculation includes the incremental number of shares (the difference between the number of shares assumed issued and the number of shares assumed received from satisfying the contract).

### **The Effect of Contingently Convertible Instruments on DEPS**

In recent years contingently convertible securities have become more common. ASC 260-10-45 addresses the impact of the existence of such instruments on the computation of EPS. Contingently convertible instruments are those that have embedded conversion features that are contingently convertible or exercisable based either on a market price trigger or on multiple contingencies, if one of the contingencies is a market price trigger and the instrument can be converted or share settled based on meeting the specified market condition. A market price trigger is a condition that is based at least in part on the reporting entity's share price. Examples include contingently convertible debt and contingently convertible preferred stock. A typical trigger occurs when the market price exceeds a defined conversion price by a specified percentage (e.g., when the market price first equals or exceeds 20% more than the conversion price of \$33 per share). Others have floating market price triggers for which conversion is dependent upon the market price of the reporting entity's stock exceeding the conversion price by a specified percentage(s) at specified times during the term of the debt. Yet other contingently convertible instruments require that the market price of the issuer's stock exceed a specified level for a specified period (for example, 20% above the conversion price for

a 30-day period). In addition, these instruments may have additional features such as parity features, issuer call options, and investor put options.

ASC 260-10-45-44 requires that contingently convertible instruments are to be included in diluted EPS, if dilutive, regardless of whether the market price trigger has been met. The reasoning is that there is no substantive economic difference between contingently convertible instruments and conventional convertible instruments with a market price conversion premium. ASC 260-10-45-44 is to be applied to instruments that have multiple contingencies, if one of these is a market price trigger and the instrument is convertible or settleable in shares based on a market condition being met—that is, the conversion is not dependent on a substantive non-market-based contingency.

#### Example—Contingently convertible debt with a market price trigger

The holder of the Frye Corp. 4% interest-bearing bonds, amounting to \$100,000 face value, may convert the debt into shares of Frye common stock when the share price exceeds the market price trigger; otherwise, the holder is only entitled to the par value of the debt. The conversion ratio is 20 shares per bond, or a total of 2,000 shares of stock. The implicit conversion price, therefore, is \$50 per share.

At the time of issuance of the bonds, Frye common stock has a market price of \$40. Frye's effective tax rate is 35%. Frye has 20,000 shares of its common shares outstanding. The bonds become convertible when the average share price for the year exceeds \$65 (130% of conversion price).

The contingently convertible bonds are issued on January 1, 20X1. Income available to common shareholders for the year ended December 31, 20X1, is \$80,000, and the average share price for the year is \$55. The issuer of the contingently convertible debt would apply ASC 260-10-45, which requires the reporting entity to include the dilutive effect of the convertible debt in diluted EPS even though the market price trigger of \$65 has not been met.

Basic EPS is  $(\$80,000 \div 20,000 \text{ shares}) = \$4.00$  per share. Applying the if-converted method to the debt instrument dilutes EPS to \$3.77. (To compute DEPS, net income is increased by the after-tax effect of interest, and this is then divided by the total of outstanding plus potential common shares.)

#### Consolidated DEPS

When computing consolidated DEPS entities with subsidiaries that have issued common stock or potential common shares to parties other than the parent company (minority interests) follow these general guidelines:

1. Securities issued by a subsidiary that enable their holders to obtain the subsidiary's common stock are included in computing the subsidiary's EPS. Per-share earnings of the subsidiary are included in the consolidated EPS calculations based on the consolidated group's holding of the subsidiary's securities.
2. For the purpose of computing consolidated DEPS, securities of a subsidiary that are convertible into its parent company's common stock, along with subsidiary's options or warrants to purchase common stock of the parent company, are all considered among the potential common shares of the parent company.

#### Partially Paid Shares

If an entity has common shares issued in a partially paid form and the shares are entitled to dividends in proportion to the amount paid, the common-share equivalent of those partially paid shares is included in the computation of basic EPS to the extent that they were entitled to participate in dividends. Partially paid stock subscriptions that do not share in dividends until paid

in full are considered the equivalent of warrants and are included in the calculation of DEPS using the treasury stock method.

### Example of impact of partially paid shares on EPS

Orion Corporation has 200,000 shares of common stock outstanding. In addition, under a stock subscription plan, investors have paid \$30,000 towards the purchase of 4,000 common shares at the fixed price of \$15 per share. Investors purchasing shares under the plan are entitled to dividends in proportion to the amount paid. Thus, there are 2,000 shares in the stock subscription plan for the purpose of calculating basic EPS, calculated as follows:

$$\frac{4,000 \text{ common shares}}{(4,000 \text{ common shares} \times \$15/\text{share})/\$30,000 \text{ paid}} = 2,000 \text{ shares}$$

Orion records net income of \$50,000 for the fiscal year. Its calculation of basic EPS follows:

$$\frac{\$50,000 \text{ net income}}{2,000 \text{ existing common shares} + 2,000 \text{ stock subscription shares}} = \$0.25$$

Once the stock subscription plan is completed, with all shares paid for and issued under that earlier plan, Orion creates another plan, which is one that does not allow participants to share in dividends until all payments are completed. Again, participants have thus far paid \$30,000 to acquire 4,000 common shares at a fixed price of \$15 each. Orion has 204,000 shares of common stock outstanding, and its net income for the current fiscal year is \$80,000. The average market price of Orion's stock during the period is \$20. Orion calculates the number of additional common shares with the following calculation, which is the same approach used to calculate the number of shares associated with warrants:

Proceeds from assumed purchase of shares in subscription plan (4,000 shares × \$15/share)	<u>\$60,000</u>
Number of shares to be issued	4,000
Number of shares assumed to be reacquired (\$60,000/\$20 average market price)	3,000
Number of shares assumed issued and not reacquired	<u>1,000</u>

Orion's DEPS calculation follows:

$$\frac{80,000 \text{ net income}}{204,000 \text{ existing common shares} + 1,000 \text{ shares from stock purchase plan}} = \$0.39$$

Note that Orion's basic EPS is not affected by the shares to be issued under this plan, since no right to dividends exists until the subscription has been fully paid.

### Effect of Certain Derivatives on EPS Computations

ASC 260 did not contemplate certain complex situations having EPS computation implications. In ASC 815-40-15, the accounting for derivative financial instruments that are indexed to, and potentially to be settled in, the reporting entity's own shares has been addressed. It establishes a model for categorization of a range of such instruments and deals with the EPS effects of each of these. This approach assumes that when the entity can elect to settle these instruments by payment of cash or issuance of shares, the latter will be chosen; if the holder (counterparty) has that choice, payment of cash must be presumed. (Certain exceptions exist when the settlement alternatives are not economically equivalent; in those instances, accounting is to be based on the economic substance of the transactions.) Statement of financial position classification of such instruments is based on consideration of a number of factors, and classification may change from period to period if there are certain changes in circumstances.

For EPS computation purposes, for those contracts that provide the company with a choice of either cash settlement or settlement in shares, ASC 815-40-15 states that settlement in shares should be assumed, although this can be overcome based on past experience or stated policy. If the counterparty controls the choice, however, the more dilutive assumption must be made, irrespective of past experience or policy.

ASC 260 requires the use of the “reverse treasury stock method” to account for the dilutive impact of written put options and similar derivative contracts, if they are “in the money” during the reporting period. Using this method, an incremental number of shares is determined to be the excess of the number of shares that would have to be sold for cash, at the average market price during the period, to satisfy the put obligation over the number of shares obtained via the put exercise. ASC 815-40-15 states that, for contracts giving the reporting entity a choice of settlement methods (stock or cash), it should assume share settlement, although this can be overcome if past behavior makes it reasonable to presume cash settlement. If the holder controls the settlement method, however, the more dilutive method of settlement must be presumed.

### **Effect on EPS of Redemption or Induced Conversion of Preferred Stock**

Companies may redeem shares of their outstanding preferred stock for noncash consideration such as by exchanges for other securities. Sometimes the company induces conversion by offering additional securities or other consideration to the holders. Such offers are sometimes referred to as “sweeteners.” The accounting for “sweeteners” offered to convertible debt holders was addressed by ASC 470-20-05, and is explained in the chapter on ASC 470. ASC 260-10-S99 deals with the anomalous situation of “sweeteners” offered to induce conversion of convertible preferred shares.

The position of the SEC staff is that any excess of the fair value of consideration given over the book value of the preferred stock represents a return to the preferred stockholder and, consequently, is to be accounted for similar to dividends paid to the preferred stockholders for purposes of computing EPS. This means that the excess should be deducted from earnings to compute earnings available for common stockholders in the calculation of EPS.

If the converse is true, with consideration given being less than carrying value, including when there is an excess of the carrying amount of the preferred stock over the fair value of the consideration transferred, this should be added to net income to derive earnings available for common stockholders in the calculation of EPS.

This SEC staff position applies to redemptions of convertible preferred stock, whether or not the embedded conversion feature is “in the money” or not at the time of redemption.

If the redemption or induced conversion is effected by offering other securities, rather than cash, fair values would be the referent to determine whether an excess was involved. If the conversion includes the reacquisition of a previously recognized beneficial conversion feature, then reduce the fair value of the consideration by the intrinsic value of the conversion option on the commitment date.

Furthermore, per ASC 260-10-S99, in computing the carrying amount of preferred stock that has been redeemed or been subject to an induced conversion, the carrying amount of the preferred stock is to be reduced by the related issuance costs irrespective of how those costs were classified in the stockholders’ equity section of the statement of financial position upon initial issuance.

Since ASC 480-10-25-4 defines mandatorily redeemable preferred stock as a liability, not as equity, the guidance in ASC 260-10-S99 would not apply. Rather, any excess or shortfall offered

in an induced conversion situation involving mandatorily redeemable preferred stock would be reported as gain or loss on debt extinguishment, not as a dividend.

In a related matter, ASC 260-10-S99 discusses the accounting required when a reporting entity effects a redemption or induced conversion of only a portion of the outstanding securities of a class of preferred stock. Reflecting an SEC staff position, any excess consideration should be attributed to those shares that are redeemed or converted. Thus, for the purpose of determining whether the “if-converted” method is dilutive for the period, the shares redeemed or converted should be considered separately from those shares that are not redeemed or converted. It would be inappropriate to aggregate securities with differing effective dividend yields when determining whether the “if-converted” method is dilutive, which would be the result if a single, aggregate computation was made for the entire series of preferred stock.

#### Example of partial conversion

Hephaestus Construction has 1,000 shares of convertible preferred stock outstanding at the beginning of the reporting period. Hephaestus issued the preferred stock at its fair value, which matched its \$15/share par value. The shares have a stated dividend of 7% (\$1.05), and each convertible preferred share converts into one share of Hephaestus common stock. During the reporting period, Hephaestus redeemed 250 shares for \$18/share.

Hephaestus should determine whether the conversion is dilutive for the remaining 750 shares by applying the “if-converted” method for the entire period, comparing the \$1.05 stated dividend to the effect of assuming their conversion into 750 shares of Hephaestus common stock.

Hephaestus should use the same calculation for the converted 250 shares, weighted from the beginning of the period to their redemption date. In this case, Hephaestus should apply the “if-converted” method using the \$1.05 stated dividend and redemption premium of \$3/share, in comparison to the effect of assuming their conversion into 250 shares of Hephaestus common stock.

#### EPS Impact of Tax Effect of Dividends Paid on Unallocated ESOP Shares

Under the provisions of ASC 718-40, dividends paid on unallocated shares are not charged to retained earnings. Since the employer controls the use of dividends on unallocated shares, these dividends are not considered dividends for financial reporting purposes. Consequently, the dividends do not affect the DEPS computation.

#### Earnings Per Share Implications of ASC 718

ASC 718 mandates that share-based employee compensation arrangements must, with very few exceptions, be recognized as expenses over the relevant employee service period. ASC 260-10-45-28A requires that employee equity share options, nonvested shares, and similar equity instruments granted to employees be treated as potential common shares in computing diluted EPS. DEPS is to be based on the actual number of options or shares granted and not yet forfeited, unless doing so would be antidilutive. If vesting in or the ability to exercise (or retain) an award is contingent on a performance or market condition (e.g., as the level of future earnings), the shares or share options shall be treated as contingently issuable shares. If equity share options or other equity instruments are outstanding for only part of a reporting period, the shares issuable are to be weighted to reflect the portion of the period during which the equity instruments are outstanding.

ASC 260 provides guidance on applying the treasury stock method for equity instruments granted in share-based payment transactions in determining DEPS.

## Presentation

The reason for the differentiation between simple and complex capital structures is that ASC 260 requires different financial statement presentation for each. ASC 260 mandates that EPS be shown on the face of the income statement for each of the following items (when applicable):

1. Income from continuing operations
2. Net income.

An entity that reports a discontinued operation or the cumulative effect of a change in accounting principle presents basic and diluted EPS amounts for these line items either on the face of the income statement or in the notes to the financial statements. These requirements must be fulfilled regardless of whether the capital structure is simple or complex. The difference in the two structures is that a simple capital structure requires presentation of only a single EPS number for each item, while a complex structure requires the dual presentation of basic EPS and DEPS for each item.

EPS data is to be presented for all periods for which an income statement or summary of earnings is presented. If DEPS is reported for at least one period, it is to be reported for all periods presented, regardless of whether or not DEPS differs from basic EPS. (ASC 260-10-45-7) However, if basic and diluted EPS are the same amounts for all periods presented, dual presentation may be accomplished in one line on the face of the income statement.

**Rights issue.** A rights issue whose exercise price at issuance is below the fair value of the stock contains a bonus element. If a rights issue contains a bonus element (somewhat similar to a stock dividend) and is offered to all existing stockholders, basic and diluted EPS are adjusted retroactively for the bonus element for all periods presented. However, if the ability to exercise the rights issue is contingent on some event other than the passage of time, this retroactive adjustment does not apply until the contingency is resolved.

**Restated EPS.** When a restatement of the results of operations of a prior period is required to be included in the income statement, EPS for the prior period(s) is also restated. The effect of the restatement, expressed in per-share terms, is disclosed in the period of restatement. Restated EPS data is computed as if the restated income (loss) had been reported in the prior period(s).

**Year-to-date diluted EPS.** ASC 260-10-45 addresses the matter of how to compute year-to-date diluted EPS (1) when a company has a year-to-date loss from continuing operations including one or more quarters with income from continuing operations, and (2) when in-the-money options or warrants were not included in one or more quarterly diluted EPS computations because there was a loss from continuing operations in those quarters.

ASC 260 directs that in applying the treasury stock method in year-to-date computations, the number of incremental shares to be included in the denominator is to be determined by computing a year-to-date weighted-average of the number of incremental shares included in each quarterly diluted EPS computation.

However, ASC 260 includes a prohibition against antidilution, which states that the computation of diluted EPS is not to assume conversion, exercise, or contingent issuance of securities that would have an antidilutive effect on EPS. There may be a conflict between these provisions when a period longer than three months has an overall loss but includes quarters with income. For periods with year-to-date income (as in quarterly filings on Form 10-Q), in computing year-to-date diluted EPS, SEC staff believes that year-to-date income (or loss) from continuing

operations should be the basis for determining whether or not dilutive potential common shares not included in one or more quarterly computations of diluted EPS should be included in the year-to-date computation.

According to ASC 260-10-45, (1) when there is a year-to-date loss, potential common shares should never be included in the computation of diluted EPS, because to do so would be antidilutive, and (2) when there is year-to-date income, if in-the-money options or warrants were excluded from one or more quarterly diluted EPS computations because the effect was antidilutive (there was a loss from continuing operations in those periods), then those options or warrants should be included in the diluted EPS denominator (on a weighted-average basis) in the year-to-date computation as long as the effect is not antidilutive. Similarly, contingent shares that were excluded from a quarterly computation solely because there was a loss from continuing operations should be included in the year-to-date computation unless the effect is antidilutive.

### Other Disclosure Requirements

The additional items required to be disclosed for all periods for which an income statement is presented can be found in the disclosure checklist in the Appendix to this volume.

## COMPREHENSIVE EXAMPLE

---

The previous examples used a simplified approach for determining whether or not options, warrants, convertible preferred stock, or convertible bonds have a dilutive effect on DEPS. If the DEPS number computed was lower than basic EPS, the security was considered dilutive. This approach is adequate when the company has only *one* potentially dilutive security. If the firm has *more than one* potentially dilutive security, a more complex ranking procedure must be employed. (ASC 260)

For example, assume the following facts concerning the capital structure of a company:

1. Income from continuing operations and net income are both \$50,000. Income from continuing operations is not displayed on the firm's income statement.
2. The weighted-average number of common shares outstanding is 10,000 shares.
3. The income tax rate is a flat 40%.
4. Options to purchase 1,000 shares of common stock at \$8 per share were outstanding all year.
5. Options to purchase 2,000 shares of common stock at \$13 per share were outstanding all year.
6. The average market price of common stock during the year was \$10.
7. 200 7% convertible bonds, each convertible into 40 common shares, were outstanding the entire year. The bonds were issued at par value (\$1,000 per bond) and no bonds were converted during the year.
8. 4% convertible, cumulative preferred stock, par value of \$100 per share, 1,000 shares issued and outstanding the entire year. Each preferred share is convertible into one common share. The preferred stock was issued at par value and no shares were converted during the year.

Note that reference is made below to some of the tables included in the body of the chapter because the facts above represent a combination of the facts used for the examples in the chapter.

To determine both basic EPS and DEPS, the following procedures must be performed:

1. Calculate basic EPS as if the capital structure were simple.
2. Identify other potentially dilutive securities.
3. Calculate the per-share effects of assuming issuance or conversion of each potentially dilutive security on an individual basis.
4. Rank the per-share effects from smallest to largest.
5. Recalculate EPS (Step 1 above) adding the potentially dilutive securities one at a time in order, beginning with the security with the *smallest* per-share effect.
6. Continue adding potentially dilutive securities to each successive calculation until all have been added or until the addition of a security increases EPS (antidilution) from its previous level.

Applying these procedures to the facts above:

1. Basic EPS

$$\frac{\text{Net income} - \text{Preferred dividends}}{\text{Weighted-average number of common shares outstanding}} = \frac{\$50,000 - \$4,000}{10,000 \text{ shares}} = \$4.60$$

2. Identification of other potentially dilutive securities:

- a. Options (two types)
- b. 7% convertible bonds
- c. 4% convertible cumulative preferred stock.

### Diluted EPS (DEPS)

3. Per-share effects of conversion or issuance of other potentially dilutive securities calculated individually:

- a. Options—Only the options to purchase 1,000 shares at \$8.00 per share are potentially dilutive. The options to purchase 2,000 shares of common stock are antidilutive because the exercise price is greater than the average market price. Thus, they are not included in the computation.

Proceeds if options exercised:

$$1,000 \text{ shares} \times \$8 \text{ per share} = \underline{\underline{8,000}}$$

Shares that could be acquired:

$$\$8,000 \div \$10 = \underline{\underline{800}}$$

$$\text{Dilutive shares: } 1,000 - 800 = \underline{\underline{200}}$$

$$\frac{\text{Increase/decrease in net income}}{\text{Increase in weighted-average number of common shares outstanding}} = \frac{\$0}{200 \text{ shares}} = \$0$$

- b. 7% convertible bonds (see Table 11.3).

$$\frac{\text{Increase/decrease in net income}}{\text{Increase in weighted-average number of common shares outstanding}} = \frac{\$8,400}{8,000 \text{ shares}} = \$1.05$$

- c. 4% convertible cumulative preferred stock—The outstanding common shares increase by 1,000 when all shares are converted. This results in total dividends of \$4,000 not being paid.

$$\frac{\text{Increase/decrease in net income}}{\text{Increase in weighted-average number of common shares outstanding}} = \frac{\$4,000}{1,000 \text{ shares}} = \$4.00$$

4. Rank the per-share effects from smallest to largest:

a. Options	\$ 0
b. 7% convertible bonds	1.05
c. 4% convertible cumulative preferred stock	4.00

5. Recalculate the EPS in rank order starting from the security with the smallest per-share dilution and adding one potentially dilutive security at a time:

- a. DEPS—options added:

$$\frac{\text{Net income} - \text{Preferred dividends}}{\text{Weighted-average number of common shares outstanding} + \text{Shares not acquired with proceeds of options}} = \frac{\$50,000 - \$4,000}{10,000 + 200 \text{ shares}} = \$4.51$$

- b. DEPS—options and 7% convertible bonds added:

$$\frac{\text{Net income} - \text{Preferred dividends} + \text{Interest expense (net of tax)}}{\text{Weighted-average number of common shares outstanding} + \text{Shares not acquired with proceeds of options} + \text{Shares issued upon conversion of bonds}} = \frac{\$50,000 - \$4,000 + \$8,400}{10,000 + 200 + 8,000 \text{ shares}} = \$2.99$$

- c. DEPS—options, 7% convertible bonds, and 4% convertible cumulative preferred stock added:

$$\frac{\text{Net income} + \text{Interest expense (net of tax)}}{\text{Weighted-average number of common shares outstanding} + \text{Shares not acquired with proceeds of options} + \text{Shares issued upon conversion of bonds and preferred stock}} = \frac{\$50,000 + \$8,400}{10,000 + 200 + 8,000 + 1,000 \text{ shares}} = \$3.04$$

### DEPS = \$2.99

Since the addition of the 4% convertible cumulative preferred stock raises DEPS from \$2.99 to \$3.04, the preferred stock is antidilutive and is therefore excluded from the computation of DEPS.

A dual presentation of basic EPS and DEPS is required. The dual presentation on the face of the income statement would appear as follows:

Net income	<u><u>\$50,000</u></u>
Earnings per common share* (Note X)	<u><u>\$ 4.60</u></u>
Earnings per common share, assuming dilution* (Note X)	<u><u>\$ 2.99</u></u>

\* The captions “Basic EPS” and “Diluted EPS” may be substituted, respectively.

**Note X: Earnings per Share (Illustrative Disclosure Based on Facts from the Example)**

The following adjustments were made to the numerators and denominators of the basic and diluted EPS computations:

	<i>Year Ended December 31, 20X1</i>		
	<i>Income (numerator)</i>	<i>Weighted-average number of outstanding shares (denominator)</i>	<i>Amount per share</i>
Net income	\$50,000		
Less: Preferred stock dividends	(4,000)		
<b>Basic EPS</b>			
Income available to common stockholders	46,000	10,000	\$4.60
<b>Effects of Dilutive Securities</b>			
Options to purchase common stock		200	
7% convertible bonds	8,400	8,000	
<b>Diluted EPS</b>			
Income available to common stockholders adjusted for the effects of assumed exercise of options and conversion of bonds	\$54,400	18,200	\$2.99

There were 1,000 shares of \$100 par value, 4% convertible, cumulative preferred stock issued and outstanding during the year ended December 31, 20X1, that were not included in the above computation because their conversion would not have resulted in a dilution of EPS.

**Example of the presentation and computation of earnings per share<sup>2</sup>**

Assume that 100,000 shares were outstanding throughout the year.

**ABC Company**  
**Income Statement**  
**For the Year Ended December 31, 20X1**

Sales		\$2,000,000
Cost of goods sold		750,000
Gross profit		\$1,250,000
Selling and administrative expenses		500,000
Income from operations		\$ 750,000
Other revenues and expense		
Interest income	\$40,000	
Interest expense	(30,000)	10,000
Income before unusual or infrequent items and income taxes		\$ 760,000
Unusual or infrequent items:		
Loss from permanent impairment of value of manufacturing facilities		(10,000)
Income from continuing operations before income taxes		\$ 750,000
Income taxes		300,000
Income from continuing operations		\$ 450,000

<sup>2</sup> See the chapters on ASC 205 and ASC 225 for important updates on discontinued operation and extraordinary items.

## Discontinued operations:

Loss from operations of Division X, including loss on disposal of \$100,000 and income tax benefit of \$58,000	\$ 102,000
Net income	\$ <u>348,000</u>
Basic EPS computation	
Income from continuing operations (\$450,000/100,000)	\$ 4.50
Extraordinary items* (\$72,000/100,000)	(0.72)
Discontinued operations* (\$30,000/100,000)	(0.30)
Net income available for common stockholders	\$ <u>3.48</u>

\* May instead be shown in the notes to the financial statements.

## PERSPECTIVE AND ISSUES

### Subtopic

ASC 270, *Interim Reporting*, contains one subtopic:

- ASC 270-10, *Overall*, that provides guidance on:
  - Accounting and disclosure issues for reporting on periods less than one year, and
  - Minimum disclosure requirements for interim reporting for publicly traded companies.

### Overview

The term “interim reporting” refers to financial reporting for periods of less than a year. The Codification does not mandate interim reporting. However, in the United States the Securities and Exchange Commission (SEC) requires public companies to file quarterly summarized interim financial data on its Form 10-Q. The level of detail of the information required in those interim reports is substantially less than is specified under the Codification for annual financial statements.

**Objective.** The objective of interim reporting is to provide current information regarding enterprise performance to existing and prospective investors, lenders, and other financial statement users. This enables users to act upon relevant information in making informed decisions in a timely manner. SEC filings on Form 10-Q are due in no more than 45 days after period end.

The demand for timely information means that interim data will often be more heavily impacted by estimates and assumptions.

**Integral Approach.** Historically, there have been two competing views of interim reporting. Under the *integral* view, the interim period is considered an integral part of the annual accounting period. It thus follows that annual operating expenses are to be estimated and allocated to the interim periods based on forecasted annual activity levels such as sales volume. The results of subsequent interim periods are adjusted to reflect the effect of estimation errors in earlier interim periods of the same fiscal year. ASC 270-10-45-1 prefers the integral view.

**Discrete Approach.** Under the *discrete* view, each interim period is considered a discrete accounting period. Thus, estimations and allocations are made using the same methods used for annual reporting. It follows that the same expense recognition rules apply as under annual reporting, and no special interim accruals or deferrals would be necessary or permissible. Annual operating expenses are recognized in the interim period incurred, irrespective of the number of interim periods benefited (i.e., no special deferral rules would apply to interim periods).

**Integral/Discrete Pros and Cons.** Proponents of the integral view argue that unique interim expense recognition procedures are necessary to avoid fluctuations in period-to-period results that might be misleading to financial statement users. Applying the integral view results in interim earnings which are indicative of annual earnings and, thus, arguably more useful for predictive purposes. Proponents of the discrete view argue that the smoothing of interim results for purposes of forecasting annual earnings has undesirable effects. For example, a turning point during the year in an earnings trend could be obscured if smoothing techniques implied by the integral view were to be employed.

The debate between integral and discrete views of interim reporting can result in very different interim measures of results of operations. This can occur, for example, because certain annual expenses may be concentrated in one interim period, yet benefit the entire year's operations. Examples include advertising expenses and major repairs and maintenance of equipment. Also, in the United States (and many other jurisdictions) progressive (graduated) income tax rates are applied to total annual income and various income tax credits may arise, all of which are computed on annual pretax earnings, often adding complexity to the determination of quarterly income tax expense.

**Other Issues.** Interim reporting is problematic for reasons other than the choice of an underlying measurement philosophy. As reporting periods are shortened, the effects of errors in estimation and allocation are magnified, and randomly occurring events which might not be material in the context of a full fiscal year could create major distortions in short interim period summaries of reporting entity performance. The effects of seasonal fluctuations and temporary market conditions further limit the reliability, comparability, and predictive value of interim reports.

## **DEFINITIONS OF TERMS**

---

See Appendix A for definitions of Acquiree, Acquirer, Acquisition by a Not-for-Profit Entity, Business, Business Combination, Contract, Contract Asset, Contract Liability, Financing Receivable, Lease, Legal Entity, Lessee, Lessor, Net Realizable Value, Not-for-Profit Entity, Performance Obligation, Public Business Entity, Transaction Price, Underlying Asset, and Variable Interest Entity.

## **CONCEPTS, RULES, AND EXAMPLES**

---

### **Differentiation between Public and Nonpublic Entities**

The explanations and interpretations in this chapter have been divided into two sections. Part I discusses issues applicable to *both* public and nonpublic reporting entities (including, where

applicable, not-for-profit organizations). Part II discusses issues applicable *only* to publicly traded companies.

The usefulness of interim reports rests on the relationship to annual reports. Therefore, ASC 270-10-45-1 states that “each interim period should be viewed primarily as an integral part of an annual period,” and the accounting should be based on the principles and practices used in the entity’s annual reporting. The exception to this is if the entity has adopted a change in accounting in the interim period. Certain principles and practices may also have to be modified so that the interim reporting better relates to the annual results. The modifications are detailed in ASC 270-10-45-4 through 45-11 and are discussed in the sections below.

## PART I—REQUIREMENTS APPLICABLE TO ALL REPORTING ENTITIES

---

### Revenues

Revenues are recognized as earned during an interim period using the same principles followed in annual reports. (ASC 270-10-45-3) This rule applies to both product sales and service revenues. For example, product sales cutoff procedures are applied at the end of each interim period in the same manner that they are applied at year-end, and revenue from long-term construction contracts is recognized at interim dates using the same method used at year-end.

### Product Costs and Direct Costs

Product costs and costs directly associated with service revenues are treated in interim reports in the same manner as in annual reports. ASC 270-10-45 provides for four integral view exceptions:

1. The gross profit method may be used to estimate cost of goods sold and ending inventory for interim periods.
2. When inventory consists of LIFO layers, and a portion of the base period layer is liquidated at an interim date, and it is expected that this inventory will be replaced by year-end, the anticipated cost of replacing the liquidated inventory is included in cost of sales of the interim period.
3. Inventory losses from the application of subsequent measurement guidance in ASC 330-10 should not be deferred beyond the interim period. Recoveries from such losses are recognized as a gain in the subsequent interim period. Recognition of this gain in the later interim period is limited to the extent of loss previously recognized. This is in marked contrast to the lower of cost or market write-downs in annual financial statements, which are not permitted to be restored in a later period.
4. Entities using standard cost accounting systems ordinarily report purchase price, wage rate, and usage or efficiency variances in the same manner as year-end. Planned purchase price and volume variances are deferred if expected to be absorbed by year-end.

The first exception above eliminates the need for a physical inventory count at the interim date. The other three exceptions attempt to synchronize the quarterly financial statements with the annual report. For example, consider the LIFO liquidation exception. Without this exception, interim cost of goods sold could include low earlier year or base-period costs, while annual cost of goods sold would include only current year costs.

(ASC 270-10-45-6)

**Example of interim reporting of product costs**

Dakota Corporation encounters the following product cost situations as part of its quarterly reporting:

- It takes physical inventory counts at the end of the second quarter and end of the fiscal year. Its typical gross profit is 30% of sales. The actual gross profit applicable to the first six months of the year is 32%. The actual full-year gross profit is 29%.
- It carries one type of its inventory at LIFO and the remaining inventory at first-in, first-out (FIFO).
- It suffers a clearly temporary decline of \$10,000 in the market value of a specific part of its FIFO inventory in the first quarter, which it recovers in the second quarter.
- It liquidates earlier-period, lower-cost LIFO inventories during the second quarter. The liquidation results in second quarter cost of goods sold being \$90,000 less (and, of course, second quarter gross profit being \$90,000 more) than it would have been absent the LIFO liquidation. Dakota expects to, and does, restore these inventory levels by year-end.
- It suffers a decline of \$65,000 in the market value of its FIFO inventory during the third quarter. The inventory value increases by \$75,000 in the fourth quarter.

Dakota computes interim cost of goods sold to reflect the effect of these situations as follows:

	<u>Quarter 1</u>	<u>Quarter 2</u>	<u>First 6 months</u>	<u>Quarter 3</u>	<u>Quarter 4</u>	<u>Full year</u>
Sales	\$10,000,000	\$ 8,500,000	\$ 18,500,000	\$7,200,000	\$11,800,000	\$37,500,000
Complement of normal gross profit percentage		<u>70%</u>			<u>70%</u>	
Cost of goods sold using gross profit method		7,000,000			5,040,000	
Complement of year- to-date gross profit percentage based on actual count				<u>68%</u>		<u>70%</u>
Cost of goods sold based on actual count			12,580,000			26,625,000
Sales	\$10,000,000	<u>\$ 8,500,000</u>	\$ 18,500,000	\$7,200,000	<u>\$11,800,000</u>	\$37,500,000
Adjustment for effect of temporary LIFO liquidation <sup>3</sup>			90,000			
Decline in inventory value <sup>4</sup>				<u>65,000</u>		
Adjusted cost of goods sold	<u>\$ 7,000,000</u>	<u>\$ 5,670,000<sup>1</sup></u>	<u>\$ 12,670,000</u>	<u>\$ 5,105,000</u>	<u>\$ 8,850,000<sup>2</sup></u>	<u>\$ 26,625,000</u>

<sup>1</sup> Calculated as: *Adjusted cost of goods sold for first six months based on actual inventory count – Cost of goods sold recognized during the first quarter using the gross profit method.*

<sup>2</sup> Calculated as: *Full year cost of goods sold of \$26,625,000 – \$12,670,000 Cost of goods sold for first half of year – \$5,105,000 Cost of goods sold recognized during the third quarter.*

<sup>3</sup> *Full recognition of replacement of earlier period LIFO layer in the period that the temporary liquidation was incurred.*

<sup>4</sup> *No recognition is given to the first quarter temporary decline in value or the subsequent increase because, at the time it occurred, it was expected to be temporary. Full recognition is given to the third quarter market value decline assuming that it was not expected to be temporary. This is followed by recognition of the market value increase, but only to offset the amount of the initial decline.*

To illustrate that the fourth quarter is appropriately adjusted for the effects of applying the interim costing rules to the other quarters, the fourth quarter cost of goods sold is proved as follows:

	<i>Fourth quarter</i>
Fourth quarter sales × actual annual gross profit complement ( $100\% - 29\% = 71\%$ )	\$8,378,000
Adjustment for the difference between the 68% complement based on the second quarter physical inventory count and the 71% annual complement multiplied by sales for the first six months	555,000
Adjustment for the difference between the 70% complement used under the gross profit method in the third quarter and the actual 71% annual complement multiplied by sales for the third quarter	72,000
Fourth quarter recovery of the third quarter FIFO market decline	(65,000)
Effect of replacing the second quarter temporary decline in LIFO inventory levels	(90,000)
	<b>\$8,850,000</b>

### Other Costs and Expenses

The integral view is evident in how the Codification treats costs incurred in interim periods. Most costs and expenses are recognized in interim periods as incurred. However, a cost that clearly benefits more than one interim period (e.g., annual repairs or property taxes) is allocated among the periods benefited. (ASC 270-10-45-8) The allocation is based on:

- Estimates of time expired,
- Benefit received, or
- Activity related to the specific periods.

Allocation procedures are to be consistent with those used at year-end reporting dates. However, if a cost incurred during an interim period cannot be readily associated with other interim periods, it is not arbitrarily assigned to those periods. The following parameters (ASC 270-45-10-9) are used in interim periods to account for certain types of expenses incurred in those periods:

1. Costs that benefit two or more interim periods (e.g., annual major repairs) are assigned to interim periods through the use of deferrals or accruals.
2. Quantity discounts given to customers based on annual sales volume are allocated to interim periods on the basis of sales to customers during the interim period relative to estimated annual sales.
3. Property taxes (and like costs) are deferred or accrued at a year-end date to reflect a full year's charge to operations. Charges to interim periods follow similar procedures.
4. Advertising costs are permitted to be deferred to subsequent interim periods within the same fiscal year if the costs clearly benefit those later periods. Prior to actually receiving advertising services, advertising costs may be accrued and allocated to interim periods on the basis of sales if the sales arrangement implicitly includes the advertising program. See Chapter 3 for a discussion of the specialized accounting for direct-response advertising prescribed by ASC 340-20. Those rules apply to both interim and annual reporting periods.

Costs and expenses subject to year-end determination, such as discretionary bonuses and profit-sharing contributions, are assigned to interim periods in a reasonable and consistent manner to the extent they can be reasonably estimated. (ASC 270-10-45-10)

Application of interim expense reporting principles is illustrated in the following examples.

#### Example of interim reporting of other expenses

Dakota Corporation encounters the following expense scenarios as part of its quarterly reporting (for illustrative purposes, all amounts are considered to be material):

- Its largest customer, Floor-Mart, placed firm orders for the year that will result in sales of \$1,500,000 in the first quarter, \$2,000,000 in the second quarter, \$750,000 in the third quarter, and \$1,650,000 in the fourth quarter. Dakota gives Floor-Mart a 5% rebate if Floor-Mart buys at least \$5 million of goods each year. Floor-Mart exceeded the \$5 million goal in the preceding year and is expected to do so again in the current year.
- It incurs \$24,000 of trade show fees in the first quarter for a trade show that will occur in the third quarter.
- It pays \$64,000 in advance in the second quarter for a series of advertisements that will run during the third and fourth quarters.
- It receives a \$32,000 property tax bill in the second quarter that applies to the following twelve-month period (July 1 to June 30).
- It incurs annual air filter replacement costs of \$6,000 in the first quarter.
- Its management team is entitled to a year-end cash bonus of \$120,000 if it meets an annual sales target of \$40 million, prior to any sales rebates, with the bonus dropping by \$10,000 for every million dollars of sales not achieved.

Dakota used the following calculations to record these scenarios:

	<u>Quarter 1</u>	<u>Quarter 2</u>	<u>Quarter 3</u>	<u>Quarter 4</u>	<u>Full year</u>
Sales	\$10,000,000	\$8,500,000	\$7,200,000	\$11,800,000	\$37,500,000
Deduction from sales	(75,000) <sup>1</sup>	(100,000)	(37,500)	(82,500)	(295,000)
Marketing expense			24,000 <sup>2</sup>		24,000
Advertising expense			32,000 <sup>3</sup>	32,000	64,000
Property tax expense			8,000 <sup>4</sup>	8,000	16,000
Maintenance expense	1,500 <sup>5</sup>	1,500	1,500	1,500	6,000
Bonus expense	30,000 <sup>6</sup>	25,500	21,600	17,900	95,000

<sup>1</sup> The sales rebate is based on 5% of actual sales to the customer in the quarter when the sale is made. The actual payment back to the customer does not occur until the end of the year when the \$5 million goal is definitively reached.

<sup>2</sup> The \$24,000 trade show payment is initially recorded as a prepaid expense and then charged to marketing expense when the trade show occurs in the third quarter.

<sup>3</sup> The \$64,000 advertising payment is initially recorded as a prepaid expense and then charged to advertising expense when the advertisements run.

<sup>4</sup> The \$32,000 property tax payment is initially recorded as a prepaid expense and then charged to property tax expense on a straight-line basis over the next four quarters.

<sup>5</sup> The \$6,000 airfilter replacement payment is initially recorded as a prepaid expense and then charged to maintenance expense over the one-year life of the air filters.

<sup>6</sup> The management bonus is recognized in proportion to the amount of revenue recognized in each quarter. Once it becomes apparent that the full sales target will not be reached, the bonus accrual is adjusted downward. In this case, the downward adjustment is assumed to be in the fourth quarter, since past history and seasonality factors made achievement of the full goal unlikely until fourth quarter results were known.

## Income Taxes

At each interim date, the reporting entity is required to make its best estimate of the effective income tax rate expected to apply to the full fiscal year. This estimate reflects expected federal, state, local, and foreign income tax rates, income tax credits, and the effects of applying income tax planning techniques. However, changes in income tax legislation are reflected in interim periods only after the enactment date of the legislation. This process is necessary to avoid distortions that would result if early interim periods reflected the entire effect of lower income tax brackets, while later periods suffered from having all income taxed at higher bracket rates. Since income taxes apply to annual income, not to interim periods on stand-alone bases, an integral approach is clearly warranted.

## Fair Value of Financial Instruments

ASC 825-10-50 requires disclosures about the fair value of financial instruments in interim reporting periods, as well as in annual financial statements. Those requirements can be found in the disclosure checklist in Appendix B of this volume.

## Unusual or Infrequent Items and Disposals of Components

The effects of the disposal of a component of the entity and unusual or infrequently occurring transactions or events that are material to operating results of the interim period are reported separately in the interim period in which they occur. (ASC 270-10-45-11A) The same treatment is given to other unusual or infrequently occurring events. No attempt is made to allocate the effects of these items over the entire fiscal year in which they occur.

### Example of disposal of a component and unusual or infrequently occurring items

Dakota Corporation's Helena, Montana, facility suffers a direct hit from a tornado during the second quarter. Dakota's management believes the loss warrants treatment as an unusual and infrequently occurring item since the state of Montana does not typically experience tornadoes. Dakota's insurance does not cover tornadoes, and the loss resulting from cleanup costs and写ting down the net book value of the damaged portion of the building is \$620,000, or \$403,000 net of applicable income taxes computed at a flat 35% rate. As required by ASC 360-10-35, Dakota's management estimates the expected future cash flows from the use and ultimate disposition of the property and determines that the building does not require any further write-down for impairment.

In the third quarter, before the tornado repairs are completed, this unfortunate facility is subjected to a flood; however, the unreimbursed damage is only \$68,000, or \$44,200 net of applicable income taxes. The flood damage is considered material in the third quarter, but subsequently, during the fourth quarter, is determined to be immaterial for annual reporting purposes.

Finally, in the fourth quarter, management declares the facility too damaged to repair, and reclassifies it as held-for-sale. The facility meets the criteria of ASC 360-10-35 to be classified as a component of the entity since its operations and cash flows are clearly distinguishable from the rest of Dakota Corporation. Activities conducted at the facility generated income from operations of \$82,000 in the first quarter, followed by losses of \$102,000, \$129,000, and \$104,000 in the succeeding quarters, prior to 35% income taxes. Upon classification of the facility as held for sale, the carrying value is written down to its fair value less cost to sell resulting in a further loss of \$117,000, which is net of \$63,000 in applicable income taxes.

Dakota includes these circumstances in its quarterly and annual financial statement in the following manner:

	<u>Quarter 1</u>	<u>Quarter 2</u>	<u>Quarter 3</u>	<u>Quarter 4</u>	<u>Full year</u>
Income from continuing operations	\$814,000	\$629,000	\$483,000		\$2,483,650 <sup>1</sup>
Discontinued operations:					
Loss from operations of discontinued component, net of applicable income taxes of \$36,400				(67,600) <sup>2</sup>	
Loss from operations of discontinued component, net of applicable income taxes of \$88,550					(164,450) <sup>3</sup>
Income from continuing operations	\$814,000	\$629,000	\$483,000	\$505,000	\$2,483,650 <sup>1</sup>
	<u>Quarter 1</u>	<u>Quarter 2</u>	<u>Quarter 3</u>	<u>Quarter 4</u>	<u>Full year</u>
Loss from reclassification of Montana facility as held for sale and adjusting the carrying value to fair value less costs to sell, net of applicable income taxes of \$63,000				(117,000)	(117,000)
Loss from discontinued operations				(184,600)	(281,450)
Unusual and infrequently occurring items:					
Tornado loss (less applicable income taxes of \$217,000)			(403,000)		(403,000)
Flood loss (less applicable income taxes of \$23,800)			(44,200)		0 <sup>1</sup>
Net income	<u>\$814,000</u>	<u>\$226,000</u>	<u>\$438,800</u>	<u>\$320,400</u>	<u>\$1,799,200</u>

<sup>1</sup> The full-year income from continuing operations does not match the total of quarterly income from continuing operations, because the third-quarter classification of flood damage is not considered unusual or infrequent for annual reporting purposes, and so is added back into annual income from continuing operations. Annual income is also reduced by operating losses in the discontinued facility for the full year, which were retained in income from continuing operations for the first three quarters. Full-year income from continuing operations is computed as follows:

Sum of operating income for four quarters	\$2,431,000
– Unusual or infrequent loss shifted back to operating income	(44,200)
+ After-tax effect of first three quarters of losses on discontinued operations	96,850
= Full-year income from continuing operations	<u>\$2,483,650</u>

<sup>2</sup> The facility is classified as discontinued in the fourth quarter; there is no requirement to restate prior interim statements to show the loss from operations of the facility in earlier quarters.

<sup>3</sup> The full-year financial statement reflects the full-year loss from discontinued operations.

Note that classification as an unusual or infrequently occurring item is based on facts and circumstances, given the requirement under the Codification that the event be infrequent in occurrence or unusual in nature. If the plant were located in Kansas, for example, and tornado damage did not

qualify under both criteria given its location, then this would not have been presented as an unusual or infrequently occurring item.

## Contingencies

In general, contingencies and uncertainties that exist at an interim date are accrued or disclosed in the same manner required for annual financial statements. For example, contingent liabilities that are probable and subject to reasonable estimation are to be accrued. The materiality of the contingency is evaluated in relation to the expected annual results. Disclosures regarding material contingencies and uncertainties are to be repeated in all interim and annual financial statements until they have been settled, adjudicated, transferred, or judged to be immaterial.

The following adjustments or settlements are accorded special treatment in interim reports if they relate to prior interim periods of the current fiscal year:

1. Litigation or similar claims
2. Income taxes (except for the effects of retroactive tax legislation enacted during an interim period)
3. Renegotiation proceedings associated with government contracts
4. Utility revenue under rate-making processes.

If the item is material, directly related to prior interim periods of the current fiscal year in full or in part, and becomes reasonably estimable in the current interim period, it is reported as follows:

1. The portion directly related to the current interim period is included in that period.
2. Prior interim periods are restated to reflect the portions directly related to those periods.
3. The portion directly related to prior years is recognized in the restated first interim period of the current year.

### Example of interim reporting of contingencies

Dakota Corporation is sued over its alleged violation of a patent in one of its products. Dakota settles the litigation in the fourth quarter. Under the settlement terms, Dakota must retroactively pay a 3% royalty on all sales of the product to which the patent applies. Sales of the product are \$150,000 in the first quarter, \$82,000 in the second quarter, \$109,000 in the third quarter, and \$57,000 in the fourth quarter. In addition, the cumulative total of all sales of the product in prior years is \$1,280,000. Dakota restates its quarterly financial results to include the following royalty expense:

	<u>Quarter 1</u>	<u>Quarter 2</u>	<u>Quarter 3</u>	<u>Quarter 4</u>	<u>Full year</u>
Sales related to lawsuit	\$150,000	\$82,000	\$109,000	\$57,000	\$398,000
Royalty expense	4,500	2,460	3,270	1,710	11,940
Royalty expense related to prior years' sales		38,400			38,400

## Seasonality

The operations of many businesses are subject to recurring material seasonal variations. Such businesses are required to disclose the seasonality of their activities to avoid the possibility of misleading interim reports. ASC 270-10-45-11 also recommends that such businesses present results of operations for twelve-month periods ending at the interim date of the current and preceding year.

## Accounting Changes

**Change in accounting principle.** The discussion commencing at ASC 270-10-45-12 requires disclosure in interim financial statements of any changes in accounting principles or the methods of applying them from those that were followed in:

1. The prior fiscal year,
2. The comparable interim period of the prior fiscal year, and
3. The preceding interim periods of the current fiscal year.

The information to be included in these disclosures is the same as is required to be included in annual financial statements and is to be provided in the interim period in which the change occurs, subsequent interim periods of that same fiscal year, and the annual financial statements that include the interim period of change.

ASC 250 requires changes in accounting principle to be adopted through retrospective application to all prior periods presented. This accounting treatment is the same in both interim and annual financial statements. The impracticability exception provided by ASC 250 is only applicable to annual financial statements and may not be invoked for pre-change interim periods occurring in the same fiscal year as the change is made.

ASC 270-10-45-15 recommends making a change in accounting principle in the first interim report of a fiscal year wherever possible.

**Change in accounting estimate.** ASC 250 requires that changes in accounting estimate be accounted for currently and prospectively. Retroactive restatement and presentation of pro forma amounts are not permitted. This accounting is the same whether the change occurs at the end of a year or during an interim reporting period.

**Change in reporting entity.** When an accounting change results in the financial statements presenting a different reporting entity than was presented in the past, all prior periods presented in the new financial statements, including all previously issued interim financial information, are to be retroactively restated to present the financial statements of the new reporting entity. In restating the previously issued information, however, interest previously capitalized under ASC 835, with respect to equity-method investees that have not yet commenced their planned principal operations, is not to be changed.

**Restatements.** The term “restatement” may only be used to describe a correction of an error from a prior period. Under ASC 250, when a restatement is made, the financial statements of each individual prior period presented (whether interim or annual) are to be adjusted to reflect correction of the effects of the error that relate to that period. Full disclosure of the restatement is to be provided in the financial statements of the:

1. Interim period in which the restatement is first made,
2. Subsequent interim periods during the same fiscal year that includes the interim period in which the restatement is first made, and
3. Annual period that includes the interim period in which the restatement is first made.

## PART II—REQUIREMENTS APPLICABLE TO PUBLIC REPORTING ENTITIES

---

### Quarterly Reporting to the SEC

**Summarized interim financial data.** The SEC does not require registrants to file complete sets of quarterly financial statements. Rather, on a quarterly basis, condensed (summarized)

unaudited interim financial statements are required to be filed with the SEC on its Form 10-Q (Regulation S-X, Rule 10-01—ASC 270-10-S99-1). The minimum captions and disclosures required to be included in these financial statements are summarized in the Disclosure Checklist in the appendix. Although such financial statements are informational tools used by investors, creditors, and analysts, they are not presented in sufficient detail to constitute a fair presentation of the reporting entity's financial position and results of operations in accordance with U.S. GAAP.

**Changes in accounting principle.** In the interim period in which a new accounting principle is adopted, the SEC expects registrants to include in the quarterly condensed financial statements a complete set of the disclosures required to be included in annual financial statements. In addition, these complete disclosures are to be repeated in the interim condensed financial statements of each of the quarters immediately succeeding the quarter of adoption until an annual Form 10-K is filed that reflects the registrant's adoption of the new accounting principle.

**Fourth quarter adjustments.** When, as is typical, the fourth quarter results are not reported separately, the annual financial statements of publicly traded companies are required to disclose the effects on the fourth quarter of accounting changes made during the quarter; disposals of components of the reporting entity; extraordinary, unusual, or infrequently occurring items; and the aggregate effect of year-end adjustments having a material effect on the quarter's results.

**Earnings per share.** The same procedures used at year-end are used for earnings per share computations and disclosures in interim reports. Note that annual earnings per share generally will not equal the sum of the interim earnings per share amounts, due to such factors as stock issuances during the year and market price changes. No reconciliation requirements exist for such disparities.

**Accelerated reporting requirements.** To provide stakeholders with relevant, actionable information on a more timely basis, the SEC requires certain events that occur between regular quarterly reporting deadlines to be reported on its Form 8-K in accordance with an accelerated timetable. Events subject to accelerated reporting requirements are set forth below.

<i>Form 8-K</i>	<i>item number</i>	<i>Event requiring disclosure</i>
<b>Section 1—Registrant's Business and Operations</b>		
1.01		Entry into or amendment of a “material definitive agreement” not made in the ordinary course of business that provides for rights or obligations material to and enforceable by or against the registrant
1.02		Termination of material definitive agreement
1.03		Bankruptcy or receivership
1.04		Mine safety—reporting of shutdowns and patterns of violations
<b>Section 2—Financial Information</b>		
2.01		Completion of acquisition or disposition of significant amounts of assets by registrant or any of its majority-owned subsidiaries (other than in the ordinary course of business)
2.02		Results of operations and financial condition—disclosure of material nonpublic information regarding a completed fiscal year or quarter included in a public announcement or release including an update of an earlier announcement or release
2.03		Creation of a direct financial obligation or an obligation under an off-balance-sheet arrangement
2.04		Triggering events that accelerate or increase a direct financial obligation or an obligation under an off-balance-sheet arrangement
2.05		Costs associated with exit or disposal activities
2.06		Material impairments

**Section 3—Securities and Trading Markets**

- 3.01 Notice of delisting or failure to satisfy a continued listing rule or standard; transfer of listing
- 3.02 Unregistered sales of equity securities
- 3.03 Material modification to rights of security holders, including working capital restrictions and other limitations on the payment of dividends

**Section 4—Matters Related to Accountants and Financial Statements**

- 4.01 Changes in registrant's certifying accountant
- 4.02 Nonreliance on previously issued financial statements or a related audit report or completed interim review

**Section 5—Corporate Governance and Management**

- 5.01 Changes in control of the registrant
- 5.02 Departure of directors or principal officers; election of directors; appointment of certain officers; compensatory arrangements of certain officers
- 5.03 Amendments to articles of incorporation or bylaws; change in fiscal year
- 5.04 Temporary suspension of trading under registrant's employee benefit plans
- 5.05 Amendments to the registrant's code of ethics, or waivers of a provision of the code of ethics
- 5.06 Change in shell company status
- 5.07 Submission of matters to a vote of security holders
- 5.08 Shareholder director nominations

**Section 6—Asset-Backed Securities**

- 6.01 Asset-backed securities' informational and computational material
- 6.02 Change of servicer or trustee
- 6.03 Change in credit enhancement or other external support for asset-backed securities
- 6.04 Failure to make a required distribution
- 6.05 Securities Act updating disclosure
- 6.06 Static pool

**Section 7—Regulation FD**

- 7.01 Regulation FD disclosure

**Section 8—Other Events**

- 8.01 Other events that the registrant deems important to security holders that are not otherwise called for by Form 8-K

**Section 9—Financial Statements and Exhibits**

- 9.01 Financial statements, pro forma information, and exhibits relative to business combinations described in item number 2.01 including certain shell company transactions; or acquisitions of one or more real estate properties

# 13 ASC 272 LIMITED LIABILITY ENTITIES

<b>Perspective and Issues</b>	<b>173</b>		
Subtopic	173	Presentation	174
		Members' equity	174
<b>Definitions of Terms</b>	<b>173</b>	Comparative statements	174
<b>Concepts, Rules, and Examples</b>	<b>173</b>	Disclosures	174
Reporting by Limited Liability Companies and Partnerships	173	Other Sources	175

## PERSPECTIVE AND ISSUES

---

### Subtopic

ASC 272, *Limited Liability Entities*, contains one subtopic:

- ASC 272-10, *Overall*, that contains guidance for limited liability entities organized in the United States that prepare financial statements under U.S. GAAP.

## DEFINITIONS OF TERMS

---

ASC 272 does not contain a glossary. However, it does define a limited liability company as having the following characteristics:

- It is an unincorporated association of two or more persons
- Its members have limited personal liability for the obligations or debts of the entity
- It is classified as a partnership for federal income tax purposes.

Further, ASC 272 states that for a limited liability company to be classified as a partnership for federal tax purposes, it must lack at least two of the following characteristics:

- Limited liability
  - Free transferability of interests
  - Centralized management
  - Continuity of life.
- (ASC 272-10-5-6)

## CONCEPTS, RULES, AND EXAMPLES

---

### Reporting by Limited Liability Companies and Partnerships

Accounting theory and practice have overwhelmingly developed within the context of businesses organized as traditional corporations. Accordingly, there is little official guidance to entities organized as partnerships or other forms of business, which is generally not a serious

concern given that most transactions entered into by such entities do not differ generically from those conducted by corporations. The primary differences relate to equity transactions and to the display of the equity section of the statement of financial position.

ASC 272 addresses certain issues pertaining to accounting and reporting by limited liability companies and partnerships. This Topic establishes that, when an entity restructures itself as a limited liability company or a limited liability partnership, the basis of all assets and liabilities from its predecessor entity are carried forward. Also, as suggested by ASC 740, *Income Taxes*, if the new entity is not a taxable one, any deferred tax assets or liabilities existing previously are to be written off at the time the change in tax status becomes effective; with the elimination of any debit or credit balance being effected by a charge or credit to current period tax expense.

**Presentation.** With regard to financial statement display issues, the Codification establishes that the headings of each statement identify the entity as being a limited liability company or a limited liability partnership, similar to the common practice of identifying partnership entities. The apparent logic is that this alerts the user to certain anomalies, such as (most commonly) an absence of income tax expense and a related liability, and the use of somewhat distinctive captions in the equity section of the statement of financial position. In the case of limited liability companies and partnerships, the term “members’ equity” has been prescribed, and the changes in members’ equity are to be communicated either in a separate financial statement, in a combined statement of operations and changes in members’ equity, or in the notes to the financial statements.

**Members’ equity.** A limited liability company (LLC) presents its equity using the caption “members’ equity.” In accordance with ASC 272-10-45-3, the equity attributable to each class of member is to be separately stated on the face of the statement of financial position or disclosed in the notes to the financial statements.

A deficit, if one exists, should be reported in the members’ equity account(s), even if there is limited liability for the members. This is consistent with the “going concern” assumption that underlies GAAP. It is not required to disaggregate members’ equity into separate components (undistributed earnings, unallocated capital, etc.) on the face of the statement of financial position or in the notes, although this is of course permissible. (ASC 272-10-45-4)

Amounts due from members for capital contributions, if any remain unpaid at the date of the statement of financial position, should be shown as deductions from members’ equity. This is entirely consistent with practice for unpaid stock subscriptions receivable. (ASC 272-10-45-5)

**Comparative statements.** GAAP presumes that comparative financial statements are more useful than those for a single period, and accordingly that comparative statements should normally be presented. However, for such financial statements to be meaningful, the information for the earlier period must be truly comparable to that of the more recent period. (ASC 272-10-45-6) If the formation of the limited liability company or the limited liability partnership results in a new reporting entity being created, the guidance of ASC 250 dealing with changes in accounting entities should be consulted. (ASC 272-10-45-7)

**Disclosures.** ASC 272 sets forth certain disclosures to be made in the financial statements of limited liability companies. There should be a description of any limitations on members’ equity and of the different *classes* of members’ interests and the respective rights, preferences, and privileges of each class and amounts thereof. If the entity will cease to exist at a stipulated date, this must be disclosed. As suggested above, any change in tax status, and the impact of eliminating any tax liability or benefit from the entity’s statement of financial position, must be adequately explained in the notes to the financial statements in the period the change in status occurs.

Basis of presentation	178		

## PERSPECTIVE AND ISSUES

---

### Subtopic

ASC 274, *Personal Financial Statements*, consists of one subtopic:

- ASC 274-10, *Overall*, that addresses the preparation and presentation of financial statements of individuals or groups of related individuals (i.e., families).

### Overview

Personal financial statements are generally prepared to organize and plan an individual's financial affairs on a more formal basis. Specific purposes that might require the preparation of personal financial statements include the obtaining of credit, income tax planning, retirement planning, gift and estate planning, or the public disclosure of financial affairs. Third-party recipients of personal financial statements use them in deciding whether to grant credit, in evaluating the financial condition of individuals, in assessing the financial affairs of public officials and candidates for public office, and for other purposes. Estimated current values of assets and liabilities are almost always specified for use in the preparation of personal financial statements as this information is more relevant to users than historical cost.

## DEFINITIONS OF TERMS

---

Source: ASC 274-10-20

**Estimated Current Value of an Asset.** The amount for which an item could be exchanged between a buyer and a seller, each of whom is well informed and willing, and neither of whom is compelled to buy or sell.

**Net Worth.** The difference between total assets and total liabilities, after deducting estimated income taxes on the differences between the estimated current values of assets and the estimated current amounts of liabilities and their income tax bases.

## CONCEPTS, RULES, AND EXAMPLES

---

Personal financial statements can be prepared for an individual, jointly for a husband and wife, or collectively for a family.

Personal financial statements consist of:

1. *Statement of financial condition*—The only required financial statement, the statement of financial condition, presents the estimated current values of assets and the estimated current amounts of liabilities. A liability is recognized for estimated income taxes on the difference between the asset and liability amounts set forth in the statement of financial condition and their respective income tax bases. Naturally, the residual amount after deducting the liabilities (including the estimated income tax liability) from the assets is presented as net worth at that date.
2. *Statement of changes in net worth*—An optional statement that presents the primary sources of increases and decreases in net worth over a period of time.
3. *Comparative financial statements*—The inclusion of a comparison of the current period's financial statements with one or more previous period's financial statements is optional.

(Source: 274-10-45-4)

**Basis of presentation.** The accrual basis, rather than the cash basis, of accounting is used in preparing personal financial statements. The presentation of personal financial statements does not require the classification of assets and liabilities as current and noncurrent. Instead, assets and liabilities are presented in order of liquidity and maturity.

**Measurement.** In personal financial statements, assets are presented at their estimated current values. This is defined by ASC 274 as the amount at which the item could be exchanged between a buyer and a seller, assuming both parties are well informed, and neither party is compelled to buy or sell. Disposal costs, if material, are deducted to arrive at current values. It is important to note that this definition has not been amended to conform to the definition of fair value as set forth in ASC 820. The definition of estimated current value in ASC 274 more closely resembles the definition of fair value less cost to sell that is used in FAS ASC 360, *Property, Plant, and Equipment*. Furthermore, ASC 274 specifically provides for adjustment of the current value of securities for the effects of transferability restrictions or the effects of the investor holding a large block of securities (blockage factor). Adjustments for blockage factors are specifically prohibited by ASC 820.

A specialist may need to be consulted in the determination of the current value of certain types of assets (e.g., works of art, jewelry, restricted securities, investments in closely held businesses, and real estate). If property is held in joint tenancy, as community property, or through a similar joint ownership arrangement, the financial statement preparer may require the advice of an attorney to determine, under applicable state law, the portion of the property interest that should be included in the individual's assets.

Liabilities are presented at the lesser of the discounted amount of cash to be paid or the current cash settlement amount. The discount rate should be the rate implicit in the transaction that gave rise to the liability. As a practical matter, the preparer may decide to use the individual's incremental borrowing rate at the inception of the transaction to discount the remaining cash flows.

The use of information about recent transactions involving similar types of assets and liabilities, in similar circumstances, constitutes a satisfactory means of determining the estimated current value of an asset and the estimated current amount of a liability. If recent transactional information cannot be obtained, it is permissible to use other methods (e.g., capitalization of past or prospective earnings, the use of liquidation values, the adjustment of historical cost based on

changes in a specific price index, the use of appraisals, and the use of the discounted amounts of projected cash receipts and payments). The methods used should be followed consistently from period to period unless the facts and circumstances dictate a change to different methods.

Income taxes payable are to include unpaid income taxes for completed tax years and the estimated amount for the elapsed portion of the current tax year. Additionally, personal financial statements are required to include estimated income tax on the difference between the current value (amount) of assets (liabilities) and their respective income tax bases as if they had been realized or liquidated.

The table below summarizes the methods of determining “estimated current values” for assets and “estimated current amounts” for liabilities.

	<i>Discounted cash flow</i>	<i>Quoted market price</i>	<i>Appraised value</i>	<i>Other</i>
• Receivables	x			
• Marketable debt and equity securities		x		If traded on valuation day: closing price. If not traded: valuation must fall in range (between bid and ask price); adjustments may be required for factors such as the holding of a large block of equity securities in an enterprise (blockage factor) or for restrictions on transfer of the securities
• Options—securities		x		If a quoted market price for the option is not available, compute based on the value of the asset subject to option considering factors such as the exercise price and length of option period
• Options—other assets*				Difference between the exercise price and the current value of the contracted asset, discounted at the interest rate that would be available to the individual to borrow with the asset under option as collateral
• Investment in life insurance				Cash surrender value less outstanding loans
• Investment in closely held business	x		x	Liquidation value, multiple of earnings, reproduction value, adjustment of book value or cost
• Real estate (including leaseholds)	x		x	By reference to sales of comparable property, appraisals used for the purpose of borrowing, by reference to assessed values used for property tax purposes, and to the relationship of assessed value to current value of properties in the geographic area

	<u>Discounted cash flow</u>	<u>Quoted market price</u>	<u>Appraised value</u>	<u>Other</u>
• Intangible assets	x			Net proceeds from current sale or discounted cash flows from asset; otherwise, may use cost of purchasing a similar asset, if available
• Future interests (nonforfeitable rights)**	x			
• Payables and other liabilities	x			Discharge amount if lower than discounted amount
• Noncancelable commitments***	x			
• Income taxes payable				Unpaid income tax for completed tax years and estimated income tax for elapsed portion of current tax year to date of financial statements
• Estimated income tax on difference between current values of assets and current amounts of liabilities and their respective tax bases				Computed as if current value of assets and liabilities had been respectively realized or liquidated considering applicable tax laws and regulations, recapture provisions, and carryovers
• Uncertain obligations*				Not covered by SOP 82-1; follow recognition, measurement, and disclosure guidance in ASC 450

\* Adapted from: "Personal Financial Statements: Valuation Challenges and Solutions," Michael D. Kinsman, CPA, PhD, and Bruce Samuelson, CPA, DBA, *Journal of Accountancy*, September 1987, pp. 138–148.

\*\* Rights have all of the following attributes: (1) are for fixed or determinable amounts; (2) are not contingent on holder's life expectancy or occurrence of a particular event (e.g., disability/death), and (3) do not require future performance of service by holder.

\*\*\* Commitments have all of the following attributes: (1) are for fixed or determinable amounts; (2) are not contingent on others' life expectancies or occurrence of a particular event (e.g., disability/death); and (3) do not require future performance of service by others.

**Business interests.** Business interests that comprise a large portion of a person's total assets should be presented separately from other investments. An investment in a separate entity that is marketable as a going concern (e.g., a closely held corporation) should be presented as one amount. If the investment is a limited business activity, not conducted in a separate legal entity, separate asset and liability amounts should be shown (e.g., investment in real estate and related mortgage; only the person's beneficial interest in the investment is included in his/her personal financial statements).

The preparer must decide whether to value the net investment him/herself or to engage a qualified specialist. The possible valuation methods available are discounted cash flow, appraised value, liquidation value, multiple of earnings, reproduction value, adjustment of book value (e.g., equity method), or cost. In some cases, it is appropriate to use a combination of approaches to reasonably estimate the current value.

**Disclosures.** The following disclosures are typically made in either the body of the financial statements or in the accompanying notes. (This list is not all-inclusive.)

1. A clear identification of the individuals covered by the financial statements
2. That assets are presented at their estimated current values and liabilities are presented at their estimated current amounts
3. The methods used in determining the estimated current values of major assets and the estimated current amounts of major liabilities or major categories of assets and liabilities, and
4. Changes in methods used in (3) from one period to the next
5. If assets held jointly by the person and by others included in the statements, the nature of the joint ownership
6. If the person's investment portfolio is material in relation to his or her other assets and is concentrated in one or a few companies or industries, the names of the companies or industries and the estimated current values of the securities
7. If the person has a material investment in a closely held business:
  - a. The name of the company
  - b. The person's percentage of ownership
  - c. The nature of the business
  - d. Summarized financial information about assets, liabilities, and results of operations for the most recent year based on the businesses' own financial statements as well as the basis of presentation (e.g., GAAP, cash basis, income tax basis, etc.), and any significant loss contingencies
8. Description of intangible assets and their estimated useful lives
9. The face amount of life insurance the individual owns
10. Certain nonforfeitable rights, such as pensions based on life expectancy
11. The methods and assumptions used to calculate estimated income taxes on the differences between the estimated current values of assets and the estimated current amounts of liabilities and their tax bases as well as a statement that the provision will probably differ from the amounts eventually paid as the timing and method of disposal as well as changes in the tax laws and regulations will affect the actual taxes to be paid
12. Unused operating loss and capital loss carryforwards and any other unused deductions or credits and, if applicable, the tax year in which they expire (under the current income tax code, there will frequently be unused alternative minimum tax credit carryforwards)
13. The differences between the estimated current values of major assets and the estimated current amounts of major liabilities or categories of assets and liabilities and their tax bases
14. Maturities, interest rates, collateral, and other pertinent details relating to receivables and debt
15. Certain noncancelable commitments.

**Marcus and Kelly Imrich**  
**Notes to Financial Statements**

**Note 1:** The accompanying financial statements include the assets and liabilities of Marcus and Kelly Imrich. Assets are stated at their estimated current values, and liabilities at their estimated current amounts.

**Note 2:** The estimated current values of marketable securities are either (1) their quoted closing prices or (2) for securities not traded on the financial statement date, amounts that fall within the range of quoted bid and asked prices.

Marketable securities consist of the following:

<u>Stocks</u>	<u>Number of shares</u>	<u>Estimated current values</u>	<u>Number of shares</u>	<u>Estimated current values</u>
Susan Schultz, Inc.			1,000	\$122,000
Ripley Robotics Corp.	500	\$ 51,927	1,000	120,485
L.A.W. Corporation	300	20,700	100	5,000
Jay & Kelly Corp.	300	20,700	200	5,000
J.A.Z. Corporation	200	<u>35,460</u>	200	<u>8,000</u>
		<u>\$ 128,787</u>		<u>\$260,485</u>

**Note 3:** The interest income from state and municipal bonds is generally not subject to federal income taxes but is, except in certain cases, subject to state income tax and federal alternative minimum tax.

**Note 4:** The loan receivable from Carol Parker, Inc. matures January 2020 and bears interest at the prime rate.

**Note 5:** Partnership and joint venture interests consist of the following:

	<u>Percent owned</u>	<u>Cost</u>	<u>Estimated current value 12/31/20X2</u>	<u>Estimated current value 12/31/20X1</u>
East Third Partnership	50.0%	\$50,000	100,000	100,000
631 Lucinda Joint Venture	20.0	10,000	35,000	38,000
27 Wright Partnership	22.5	10,000	40,000	50,000
Eannarino Partnership	10.0	40,000	60,000	50,000
Sweeney Joint Venture	30.0	100,000	600,000	600,000
Kelly Parker Group	20.0	20,000	100,000	100,000
707 Lucinda Joint Venture	50.0	(11,000)	—	—
			<u>\$935,000</u>	<u>\$938,000</u>

**Note 6:** Mr. and Mrs. Imrich own a one-half interest in an apartment building in DeKalb, Illinois. The estimated current value was determined by Mr. and Mrs. Imrich. Their income tax basis in the apartment building was \$1,000,000 for both 20X2 and 20X1.

**Note 7:** Kelly Imrich owns 75% of the common stock of the David Corporation. A condensed statement of assets, liabilities, and stockholders' equity (income tax basis) of David Corporation as of December 31, 20X2 and 20X1 is summarized below.

	<u>20X2</u>	<u>20X1</u>
Current assets	\$2,975,000	\$3,147,000
Investments	200,000	200,000
Property and equipment (net)	145,000	165,000
Loans receivable	<u>110,000</u>	<u>120,000</u>
Total assets	<u>\$3,430,000</u>	<u>\$3,632,000</u>
Current liabilities	<u>\$2,030,000</u>	<u>\$2,157,000</u>
Other liabilities	<u>450,000</u>	<u>400,000</u>
Total liabilities	<u>2,480,000</u>	<u>2,557,000</u>
Stockholders' equity	950,000	1,075,000
Total liabilities and stockholders' equity	<u>\$3,430,000</u>	<u>\$3,632,000</u>

**Note 8:** At December 31, 20X2 and 20X1, Marcus Imrich owned a \$1,000,000 whole life insurance policy. Mrs. Imrich is the sole beneficiary under the policy.

**Note 9:** The estimated current values of the personal residences are their appraisal value based on an estimate of selling price, net of estimated selling costs obtained from an independent real estate agent familiar with similar properties in similar locations. Both residences were purchased in 20X0.

**Note 10:** The estimated current values of personal effects and jewelry are the appraised values of those assets, determined by an independent appraiser for insurance purposes.

**Note 11:** The mortgage (collateralized by the residence) is payable in monthly installments of \$2,479, including interest at an annual rate of 6% through 20X5.

**Note 12:** The estimated current amounts of liabilities at December 31, 2013, and December 31, 2012, equaled their income tax bases. Estimated income taxes have been provided on the excess of the estimated current values of assets over their tax bases as if the estimated current values of the assets had been realized on the dates of the statements of financial condition, using applicable income tax laws and regulations. The provision will probably differ from the amounts of income taxes that eventually will be paid because those amounts are determined by the timing and the method of disposal or realization and the income tax laws and regulations in effect at the time of disposal or realization.

The excess of estimated current values of major assets over their income tax bases are:

	<u>December 31</u>	
	<u>20X2</u>	<u>20X1</u>
Investment in David Corporation	\$1,400,000	\$1,350,000
Vested interest in benefit plan	350,000	300,000
Investment in marketable securities	<u>100,000</u>	<u>120,300</u>
	<u>\$1,850,000</u>	<u>\$1,770,300</u>

## PERSPECTIVE AND ISSUES

---

### Subtopic

ASU 275, *Risks and Uncertainties*, contains one subtopic:

- ASU 275-10, *Overall*, that provides guidance on disclosures of risks and uncertainties inherent in entity's operations and activities in cases where principal operations have not begun.

This topic recognizes that all entities face risk and uncertainty. The objective of ASC 275 is to provide guidelines that will enable the preparer to screen the many risks and uncertainties faced by entities and focus on those most useful to the readers of the particular entity's report—those that will enable the readers to assess the future cash flows and result of operations. Thus, the topic focuses on screening criteria for risks and uncertainties and the resulting required disclosures.

### Scope and Scope Exceptions

The guidance applies to all GAAP financial statements, interim and annual, but not to condensed or summarized financial statements. The guidance does not apply to risks and uncertainties associated with:

- Management or key personnel
  - Proposed changes in accounting principles
  - Deficiencies in the internal control structure
  - The possible effects of acts of God, war, or sudden catastrophes.
- (ASC 275-10-15-4)

The Codification points out that there is overlap between this topic and the requirements of the SEC and other Codification topics. The guidance in ASC 275 does not alter any of those requirements.

### Practice Alert

While SEC comments do not pertain to nonpublic entities, their comments can often provide valuable guidance. In the area of risks and uncertainties, the SEC has commented that:

- Entities need to provide sufficient information—both qualitative and quantitative—to allow a financial statement user to evaluate the effect those risks may have on results of operations.
- The risk disclosures should not be vague, but identify which aspect of the business is exposed to those risks.
- The entity must identify the actual risks.
- The disclosures should avoid generic risks factors that could apply to any entity and avoid boilerplate language.
- The disclosures should include material risks that currently affect the entity, including cybersecurity risks.
- Entities should be mindful of disclosing risks associated with business activities in areas identified by the U.S. State Department as state sponsors of terrorism.

### DEFINITIONS OF TERMS

---

Source: ASC 275-10-20. Also see Appendix A for the definitions of Contract, Customer, Fair Value, Performance Obligation, Revenue, and Transaction Price.

**Near Term.** A period of time not to exceed one year from the date of the financial statements.

**Net Realizable Value.** Estimated selling prices in the ordinary course of business, less reasonably predictable costs of completion, disposal, and transportation.

**Severe Impact.** (Used in reference to current vulnerability due to certain concentrations.) A significant financially disruptive effect on the normal functioning of an entity. Severe impact is a higher threshold than material. Matters that are important enough to influence a user's decisions are deemed to be material, yet they may not be so significant as to disrupt the normal functioning of the entity. Some events are material to an investor because they might affect the price of an entity's capital stock or its debt securities, but they would not necessarily have a severe impact on (disrupt) the entity itself. The concept of severe impact, however, includes matters that are less than catastrophic. Matters that are catastrophic include, for example, those that would result in bankruptcy.

### CONCEPTS, RULES, AND EXAMPLES

---

ASC 275-10-50, *Risks and Uncertainties*, requires disclosure in financial statements about risks and uncertainties existing as of the date of those statements that could significantly affect the amounts reported in the near term. The four areas of disclosure required by ASC 275-10-50 are risks and uncertainties relating to:

- The nature of the entity's operations, including the activities in which the entity is currently engaged even if principal operations have not commenced,
- Use of estimates in the preparation of financial statements,
- Certain significant estimates, and
- Vulnerability due to certain concentrations.

These areas are not mutually exclusive and may overlap with other requirements. The disclosures may be:

- Grouped together,
- Placed in other parts of the financial statements, or
- Made as part of the disclosures required by other ASC Topics.

### Nature of Operations or Activities

ASC 275-10-50 requires that entities that have commenced planned principal operations disclose:

- The major products or services that they sell or provide,
- The principal markets that they serve, and
- The location of those markets.

If an entity has not commenced principal operations, it should also disclose what activities are being planned. Quantification is not required in disclosures about the nature of operations.

An entity operating in more than one industry must disclose:

- All industries it is operating within.
- The relative importance of each industry. (This can be conveyed by the use of words such as “predominantly,” “about equally,” or “major.”)
- The basis for determining the relative importance of each industry (assets, revenue, or earnings).

Not-for-profit entities should disclose the nature of their principal services and the revenue sources for those services.

For details of the required disclosures, see Appendix B, *Disclosure Checklist for Commercial Businesses*. (Note these disclosures apply to all entities.)

### Use of Estimates in the Preparation of Financial Statements

Financial statements must include an explanation that the preparation of financial statements in accordance with GAAP requires the use of estimates by management. The purpose of this disclosure is to clearly alert users to the pervasiveness of estimates. (ASC 275-10-50-4)

### Certain Significant Estimates

Under certain circumstances, ASC 275-10-50 requires disclosures regarding estimates used. See Appendix B, *Disclosure Checklist for Commercial Businesses*, for details.

**Examples of items that may be based on estimates that are particularly sensitive to change in the near term (ASC 275-10-50-15)**

1. Inventory subject to rapid technological obsolescence
2. Specialized equipment subject to technological obsolescence
3. Valuation allowances for deferred income tax assets based on future taxable income
4. Capitalized motion picture film production costs
5. Capitalized computer software costs
6. Deferred policy acquisition costs of insurance entities
7. Valuation allowances for commercial and real estate loans
8. Environmental remediation-related obligations

9. Litigation-related obligations
10. Contingent liabilities for guarantees of other entities' obligations
11. Amounts reported for long-term obligations, such as amounts reported for pensions and postemployment benefits
12. Net proceeds recoverable, the provisions for expected loss to be incurred, or both, on disposition of a business or assets
13. Amounts reported for long-term contracts.

## Current Vulnerability Due to Concentrations

Vulnerability from concentrations occurs when entities fail to diversify in order to mitigate risk. See Appendix B, *Disclosure Checklist for Commercial Businesses*, for details of disclosures required from concentration vulnerability.

### Examples of concentrations that require disclosure (ASC 275-10-50)

1. Concentrations in the volume of business transacted with a particular customer, supplier, lender, grantor, or contributor
2. Concentrations in revenue from particular products, services, or fundraising events
3. Concentrations in the available sources of supply of materials, labor, services, or of licenses or other rights used in the entity's operations
4. Concentrations in the market or geographic area in which an entity conducts its operations.

The potential for severe impact can occur as the result of the total or partial loss of a business relationship, price or demand changes, loss of patent protection, changes in the availability of a resource or right, or the disruption of operations in a market or geographic area. For purposes of ASC 275-10-50, it is always considered reasonably possible in the near term that any customer, grantor, or contributor will be lost and that operations located outside an entity's home country will be disrupted.

For concentrations of labor subject to collective bargaining agreements and concentrations of operations outside an entity's home country, the following additional disclosures are required (ASC 275-10-50-20):

1. For labor subject to collective bargaining agreements, disclosure is to include both the percentage of the labor force covered by collective bargaining agreements and the percentage of the labor force covered by collective bargaining agreements that will expire within one year.
2. For operations located outside the entity's home country, disclosure is to include the carrying amounts of net assets and the geographic areas in which they are located.

## PERSPECTIVE AND ISSUES

---

### Subtopic

ASC 280, *Segment Reporting*, has one subtopic:

- ASC 280-10, *Overall*, that provides guidance to public business entities on how to report certain information about:
  - Operating segments in complete sets of financial statements, and in
  - Condensed financial statements of interim periods issued to shareholders.

ASC 280 also requires public entities to disclose certain information about:

- Their products and services,
- The geographic areas in which they operate, and
- Their major customers.

### Scope and Scope Exceptions

ASC 280 applies to public entities. The statement does not mandate application to not-for-profit organizations or to nonpublic entities—which are, nevertheless, encouraged to voluntarily provide the segment disclosures prescribed by ASC 280. It also does not apply to “parent entities, subsidiaries, joint ventures, or investees accounted for by the equity method if those entities’ separate company statements also are consolidated or combined in a complete set of financial statements and both the separate company statements and the consolidated or combined statements are included in the same financial report.” However, ASC 280 does apply to those

entities if they are public entities, whose financial statements are issued separately. (ASC 280-15-2 and 3)

## Overview

**Objective.** With many companies organized as conglomerates, the presentation of basic consolidated financial statements on an aggregated basis does not provide users with sufficient information for decision-making purposes. The objective of segment reporting, as set forth in ASC 280-10-1, is to

*. . . Provide information about the different types of business activities in which an enterprise engages and the different economic environments in which it operates to help users of financial statements:*

- a. *Better understand the enterprise's performance*
- b. *Better assess its prospects for future net cash flows*
- c. *Make more informed judgments about the enterprise as a whole.*

**Benefits.** The primary benefit of segment reporting is the release of “hidden data” from consolidated financial information. Different segments may possess different levels of profitability, risk, and growth. Assessing future cash flows and their associated risks can be aided by segment data. For example, knowledge of the level of reporting entity operations in growing or declining product lines can help in the prediction of cash flow, while knowledge of the scope of reporting entity operations in an unstable geographic area can help in the assessment of risk. In general, information about the nature and relative size of an enterprise’s various business operations is considered useful by decision makers.

ASC 280 governs the way publicly held businesses are required to report disaggregated information in interim and annual financial reports to stockholders. The statement defines operating segments as distinct revenue-producing components of the reporting entity about which separate financial information is produced internally, and whose operating results are regularly reviewed by the reporting entity.

**Management approach.** The disclosure approach adopted by ASC 280-10-05-03 and 04 is the “management approach,” meaning it is based on the way management organizes segments internally to make operating decisions and assess performance. The management approach, in general, provides that external financial reporting will closely conform to internal reporting, thus giving financial statement users the ability to view the reporting entity’s segments in the same manner as internal decision makers.

Financial information can be segmented in several ways: by types of products or services, by geography, by legal entity, or by type of customer. ASC 280 provides a methodology to identify the operating segments that are separately reportable (referred to as “reportable segments”) and requires that each reportable segment disclose, among other items, its profit or loss, certain specific revenues and expenses, and its assets. Management is required to reconcile segment information with its consolidated general-purpose financial statements.

In addition, ASC 280 requires that all public companies report information on a company-wide basis about revenues for each product and service, about countries in which revenues are recognized and assets are held, and about its major customers, even if this information is not used by management in making operating decisions.

The Codification does not limit segment reporting to purely financial information. It also requires a description of the company’s rationale or methods employed in determining the composition of the segments. This description includes the products or services produced by each

segment, differences in measurement practices between segments and the consolidated entity, and differences in the segments' measurement practices between periods.

### Practice Alert

Segment reporting is a frequent topic of SEC comment letters. While SEC rules only apply to public entities, preparers of financial statements can benefit from the findings of SEC reviewers. For segment reporting, these are some of the areas commented on by the SEC:

- How operating segments were identified
- The basis of aggregation of operating segments
- Confirmation that prior periods were revised so that information is consistent
- Lack of quantitative disclosure about products and services
- Lack of disclosure about geographic information.

## DEFINITIONS OF TERMS

---

Source: ASC 280, *Glossaries*. Also see Appendix A, *Definitions of Terms*, for definitions of Conduit Debt Securities and Public Entity.

**Chief Operating Decision Maker (CODM).** The person(s) at the reporting entity level whose general function (not specific title) is to allocate resources to, and assess the performance of, the segments. Within a reporting entity, this authority does not necessarily need to be vested in a single individual; rather, the responsibilities can be fulfilled by a group of individuals.

**Operating Segment.** A component of a public entity that has all of the following characteristics:

- a. It engages in business activities from which it may recognize revenues and incur expenses (including revenue and expenses relating to transactions with other components of the same public entity).
- b. Its operating results are regularly reviewed by the public entity's chief operating decision maker to make disclosures about resources to be allocated to the segment and assess its performance.
- c. Its discrete financial information is available.

**Segment Manager.** The person(s) accountable to the reporting entity's CODM (defined earlier) for one or more operating segment's activities, financial results, budgets, forecasts, and operating plans. The reporting entity's CODM can also serve as segment manager for one or more operating segments. (ASC 280-10-50-7 and 8)

## CONCEPTS, RULES, AND EXAMPLES

---

### Operating Segments

Operating segments frequently have a segment manager function that communicates on an ongoing basis with the reporting entity's CODM. The segment manager is not necessarily a single individual but rather the segment management responsibility can vest functionally in a committee or group of designated individuals. Additionally, an operating segment may not be revenue generating from its inception, because it may be in a start-up phase. (ASC 280-10-50-3)

Not all activities that occur within the reporting entity are allocable to its operating segments. Activities that are non-revenue-producing or that are incidental to the reporting entity, such as corporate headquarters or certain service or support departments, should not be attributed to operating segments. ASC 280 specifies that the reporting entity's pension and other postretirement benefit plans are not considered to be operating segments. (ASC 280-10-50-4)

## Reportable Segments

An operating segment is considered to be a reportable segment if it is significant to the enterprise as a whole because it satisfies one of the three quantitative 10% tests described below. (ASC 280-10-50-12)

**Revenue test.** Segment revenue (unaffiliated and intersegment) is at least 10% of the combined revenue (unaffiliated and intersegment) of all operating segments.

**Profit and loss test.** The absolute amount of segment profit or loss is at least 10% of the greater, in absolute amount, of:

1. Combined profits of all operating segments reporting a profit
2. Combined losses of all operating segments reporting a loss.

ASC 280-10-55 clarifies that, if the CODM uses different measures of profit or loss to evaluate the performance of different segments (e.g., net income versus operating income), the reporting entity must use a single, consistent measure for the purposes of this profit and loss test. This does not, however, affect the requirement that the reporting entity disclose the measure of profit or loss used by the CODM for the purposes of decision making regarding the segment's performance and resources to be allocated to the segment.

**Assets test.** Segment assets are at least 10% of the combined assets of all operating segments. Segment assets include those assets used exclusively by the segment and the allocated portion of assets shared by two or more segments. Assets held for general corporate purposes are not assigned to segments.

**Comparability.** Interperiod comparability must be considered in conjunction with the results of the 10% tests. If a segment fails to meet the tests in the current reporting period but has satisfied the tests in the past and is expected to in the future, it is considered as being reportable in the current year for the sake of comparability. Similarly, if a segment which rarely passes the tests does so in the current year as the result of an unusual event, that segment may be excluded to preserve comparability.

**75% test.** After the 10% tests are completed, a 75% test must be performed. (ASC 280-10-50-14) The combined external revenue of all reportable segments must be at least 75% of the combined unaffiliated revenue of all operating segments. If the 75% test is not satisfied, additional segments must be designated as reportable until the test is satisfied. The purpose of this test is to ensure that reportable segments account for a substantial portion of the entity's operations.

**Example of segment testing**

The following example illustrates the three 10% tests and the 75% test.

<u>Operating segment</u>	<u>External revenue</u>	<u>Intersegment revenue</u>	<u>Total revenue</u>	<u>Segment profit</u>	<u>Segment (loss)</u>	<u>Assets</u>
A	\$ 90	\$ 12	\$ 102	\$11	\$ –	\$ 70
B	120	–	120	10	–	50
C	110	20	130	–	(40)	90
D	200	–	200	–	–	140
E	140	300	440	–	(100)	230
F	380	–	380	60	–	260
G	144	–	144	8	–	30
Total	<u>\$1,184</u>	<u>\$332</u>	<u>\$1,516</u>	<u>\$89</u>	<u>\$(140)</u>	<u>\$870</u>

*NOTE: Because the \$140 total segment losses exceed the \$89 total segment profits, the \$140 is used for the 10% test.*

**Summary of Test Results**

*x = Passed test – Reportable segment*

<u>Operating segment</u>	<u>Total revenues (10% of \$1,516 = \$152)</u>	<u>Segment profit/loss (10% of \$140 = \$14)</u>	<u>Assets (10% of \$870 = \$87)</u>	<u>75% of unaffiliated revenues test</u>
A				
B				
C		x	x	\$ 110
D	x		x	200
E	x	x	x	140
F	x	x	x	380
G				
				830
			75% of \$1,184	888
			Revenue shortfall	\$ (58)

Note that the aggregate revenues of the reportable segments that passed the 10% tests are \$58 short of providing the required coverage of 75% of external revenues. Consequently, an additional operating segment (A, B, or G) will need to be added to the reportable segments in order to obtain sufficient coverage.

**Aggregating segments.** Certain other factors must be considered when identifying reportable segments. Management may consider aggregating two or more operating segments if:

1. They have similar economic characteristics,
2. Aggregation is consistent with the objective and basic principles of ASC 280, and
3. The segments are similar in all of the following areas:
  - a. The nature of the products and services
  - b. The nature of the production processes
  - c. The type of customer for their products and services
  - d. The methods used to distribute their products or provide their services
  - e. The nature of the regulatory environment.

(ASC 280-10-50-11)

At the discretion of management, this aggregation can occur prior to performing the 10% tests.

Management may *optionally* combine information on operating segments that do not meet any of the 10% tests to produce a reportable segment, but only if the segments being combined have similar economic characteristics and also share a majority of the five aggregation criteria listed above. (ASC 280-10-50-13)

Note that information about operating segments that do not meet any of the 10% thresholds may still be disclosed separately. (ASC 280-10-50-15) By utilizing the aggregation criteria and quantitative thresholds (10% tests) for determining reportable segments, ASC 280 uses what should be considered a modified management approach.

The number of reportable segments should not be so great as to decrease the usefulness of segment reporting. As a rule of thumb, FASB suggests that if the number of reportable segments exceeds ten, segment information may become too detailed. In this situation, the most closely related operating segments should be combined into broader reportable segments, again, however, subject to the objectives inherent in ASC 280's requirements. (ASC 280-10-50-18)

Refer to the "Alternative Statement of Financial Position Segmentation" section and the accompanying diagram that follows. It provides an example of the different components of a reporting entity used for various accounting and reporting purposes.

## Measurement Issues

**Transfer pricing.** Since segment revenue as defined by ASC 280 includes intersegment sales, transfer pricing becomes an issue. Rather than establishing a basis for setting transfer prices, FASB requires companies to use the same transfer prices for segment reporting purposes as are used internally. Since most segments are organizational profit centers, internal transfer prices would generally reflect market prices, but even if this is not the case, these same transfer prices must be used for segment disclosures.

**Common costs.** Another issue in determining profit or loss is the allocation of common costs. Common costs are expenses incurred by the reporting entity for the benefit of more than one operating segment. Again, segment reporting is required to conform to internal management reporting. Accordingly, these costs are only allocated to a segment for external reporting purposes if they are included in the measure of the segment's profit or loss that is used internally by the CODM.

**General corporate expense.** Difficulties can arise in distinguishing common costs from general corporate expenses. General corporate expenses are not direct expenses from the point of view of any operating segment; they are incurred for the benefit of the corporation as a whole and cannot be reasonably attributed to any operating segment. Common costs, on the other hand, benefit two or more segments and can be allocated to those segments in a manner determined by management to support internal decision making by the reporting entity.

**Corporate assets.** Similarly, only those assets that are included internally in the measure of the segment's assets used to make operating decisions are reported as assets of the segment in external financial reports. If management allocates amounts to segment profit or assets internally and those amounts are used by the CODM, then those amounts are to be allocated on a reasonable basis and disclosed.

## Segment Disclosures

ASC 280 requires disclosures regarding the reporting entity's reportable segments. Those disclosures can be found in Appendix A, *Disclosure Checklist for Commercial Businesses*.

## Entity-Wide Disclosures

In addition to segment data, ASC 280-10-50-38 through 42 mandates that certain entity-wide disclosures be made. Those disclosures are listed in Appendix A, *Disclosure Checklist for Commercial Businesses*, and are explained in detail below.

The entity-wide disclosures are required for all reporting entities subject to ASC 280, even those that have only a single reportable segment.

**Products and services.** Revenue from external customers for each product and service or each group of similar products and services is to be reported by the reporting entity unless impracticable. If deemed to be impracticable, disclose that fact. If the company's reportable segments have been organized around products and services, then this disclosure will generally not be required.

**Geographic areas.** A reporting entity separately discloses revenues from external customers and long-lived assets attributable to its domestic operations and foreign operations. If the reportable segments have been organized around geographic areas, then these disclosures will generally not be required because they would be duplicative.

Domestic operations are those operations located in the reporting entity's home country that generate either unaffiliated or intersegment revenues. Foreign operations are similar operations located outside of the home country of the reporting entity. For the purposes of these disclosures, U.S. reporting entities' operations in Puerto Rico are not considered to be foreign operations, although management is not precluded from voluntary disclosure regarding Puerto Rican operations. (ASC 280-10-55)

If the reporting entity functions in two or more foreign geographic areas, to the extent revenues or assets of an individual foreign geographic area are material, then separately disclose these amounts. In addition, disclosure is required of the basis for attributing revenue to different geographic areas. A geographic area is defined as an individual country. If providing this information is impracticable, disclose that fact.

**Major customers.** If the reporting entity earns 10% or more of its revenue on sales to a single external customer, disclose that fact and the amount of revenue from each such customer. Also, disclose the segment making these sales. This disclosure provides information on concentrations of risk.

For the purpose of this disclosure, a group of customers under common control, such as subsidiaries of a common parent, is regarded as a single customer. Similarly the various agencies of a government are considered to be a single customer. An insuring entity (such as Blue Cross) is not considered to be the customer unless that entity (rather than the patient) controls the decision as to the doctor, type of service, etc.

## Restatement of Previously Reported Segment Information

ASC 280-10-50-34 requires segment reporting on a comparative basis when the associated financial statements are comparative. Therefore, restate the information to preserve comparability whenever the reporting entity has changed the structure of its internal organization in a manner that causes a change to its reportable segments. Management must explicitly disclose that it has restated the segment information of earlier periods.

### Example—Comprehensive illustration of the application of segment reporting

The following illustration is provided for a hypothetical company, Resources Unlimited. The illustration provides segment disclosures by legal entity.

---

*NOTE: ASC 280 provides illustrative segment disclosures by product line.*

---

**Description of the types of products and services from which each reportable segment derives its revenues.** Resources Unlimited has four reportable segments: Wholesale Corporation, Retail Corporation, Library Corporation, and Software Corporation. Wholesale Corporation buys and resells used elementary and college textbooks. Retail Corporation operates 200 college book stores and a related e-commerce website selling both new and used college textbooks, trade books, sports apparel, and other sundries. Library Corporation sells library books primarily to elementary school libraries. Software Corporation develops and sells library systems application software.

**Measurement of segment profit or loss and segment assets.** The accounting policies of the segments are the same as those described in the summary of significant accounting policies except the first-in, first-out (FIFO) method of inventory valuation is used for segment reporting. In addition, Resources Unlimited allocates interest expense to each segment based on the segment's average borrowings from the corporate office. However, the related debt is not allocated to the segments and remains on the corporate statement of financial position. Resources Unlimited evaluates performance based on profit or loss before income taxes not including nonrecurring gains and losses.

Resources Unlimited accounts for intersegment sales and transfers as if the sales or transfers were transacted with third parties (i.e., at current market prices).

**Factors management used to identify reportable segments.** Resources Unlimited's business is conducted through four separate legal entities that are wholly owned subsidiaries. At the company's inception, each entity was founded and managed by a different Resources Unlimited stockholder/family member. Each corporation is still managed separately, as each business has a distinct customer base and requires different strategic and marketing efforts.

**Information about profit and loss and assets.** The amounts in the illustration are assumed to be the amounts in reports used by the CODM. Resources Unlimited allocates interest expense to the segments; however, it does not allocate income taxes and unusual items to them.

	(\$000 omitted)				
	<i>Wholesale</i> <i>Corporation</i>	<i>Retail</i> <i>Corporation</i>	<i>Library</i> <i>Corporation</i>	<i>Software</i> <i>Corporation</i>	<i>Totals</i>
Revenues from external customers	\$197,500	\$263,000	\$182,300	\$102,200	\$745,000
Intersegment revenues	23,000	—	—	—	23,000
Interest revenue	250	150	—	—	400
Interest expense	1,570	2,150	1,390	2,700	7,810
Depreciation and amortization*	8,600	13,100	7,180	6,070	34,950
Segment profit	12,100	13,500	9,900	5,100	40,600
Segment assets	121,200	153,350	100,600	85,000	460,150
Expenditures for segment assets	7,200	12,700	5,600	6,700	32,200

\* Depreciation and amortization are required to be disclosed for each operating segment even if the CODM evaluates segment performance using predepreciation measures such as earnings before income taxes, depreciation, and amortization (EBITDA). (ASC 280-10-55)

**Reconciliations.** An illustration of reconciliations for revenues, profit and loss, assets, and other significant items is shown below. In general, this illustration assumes that there are no unreported operating segments, but there is a corporate headquarters, thus most reconciling items relate to corporate revenues and expenses.

As discussed previously, the company recognizes and measures inventory based on FIFO valuation for segment reporting. The consolidated financial statements are assumed not to include discontinued operations or the cumulative effect of a change in accounting principle.

	(\$000 omitted)		
<b>Revenue</b>			
Total revenues for reportable segments	\$768,000		
Elimination of intersegment revenue	<u>(23,000)</u>		
Total consolidated revenue	<u>\$745,000</u>		
<b>Profit and loss</b>			
Total profit for reportable segments	\$40,600		
Elimination of intersegment profits	<u>(6,100)</u>		
Unallocated amounts relating to corporate operations:			
Interest revenue	500		
Interest expense	<u>(800)</u>		
Depreciation and amortization	<u>(1,900)</u>		
Unrealized gain on trading securities	<u>1,865</u>		
Income before income taxes and extraordinary items	<u>\$34,165</u>		
<b>Assets</b>			
Total assets for reportable segments	\$460,150		
Corporate short-term investments, land and building	25,100		
Adjustment for LIFO reserve in consolidation	<u>(9,200)</u>		
	<u>\$476,050</u>		
<b>Other significant items</b>			
	<i>Segment totals</i>	<i>Adjustments</i>	<i>Consolidated totals</i>
Expenditures for segment assets	\$32,200	800	\$33,000

The reconciling adjustment is the amount of expenditures incurred for additions to the corporate headquarters building, which is not included in the segment information.

#### Products and services

Used textbooks	\$296,125
New textbooks	72,150
Trade books	45,700
Sports apparel	41,325
Sundries	5,200
Library books	182,300
Library software	<u>102,200</u>
Total consolidated revenue	<u>\$745,000</u>

**Geographic information**

	<i>Revenues*</i>	<i>Long-lived assets</i>
United States	\$687,400	\$253,200
Foreign countries	<u>57,600</u>	<u>18,800</u>
Total	<u><u>\$745,000</u></u>	<u><u>\$272,000</u></u>

\* Revenues are attributed to countries as follows: For Wholesale Corporation and Library Corporation, the country in which the customer takes delivery. For Retail Corporation, the country in which the retail store is located or, for internet sales, the country to which the merchandise is delivered. For Software Corporation, the country where the host server on which the software is installed is located.

**Major customers.** No single customer represents 10% or more of the consolidated revenues. Consequently, management believes that the companies' sales are appropriately diversified.

# 17 ASC 305 CASH AND CASH EQUIVALENTS

<b>Perspective and Issues</b>	<b>201</b>	<b>Concepts, Rules, and Examples</b>	<b>202</b>
Subtopic	201	Cash	202
Scope	201	Compensating balances	202
Overview	201	Cash not immediately available	202
Practice Alert	201	Overdrafts	202
<b>Definitions of Terms</b>	<b>201</b>	Petty cash	202

## PERSPECTIVE AND ISSUES

---

### Subtopic

ASC 305, *Cash and Cash Equivalents*, contains one subtopic:

- ASC 305-10, *Overall*, that provides implementation guidance on cash on deposit at a financial institution.

### Scope

ASC 305 applies to all entities and has no scope exceptions.

### Overview

To provide information about liquidity, assets on the statement of financial position are often divided into current and noncurrent assets. Current assets consist of cash and other assets that are reasonably expected to be realized in cash or sold or consumed during the normal operating cycle of the business. Cash is the most liquid of assets, and cash items are generally classified as current assets.

### Practice Alert

The classification of investments as cash equivalents is a frequent topic of SEC comment letters. While SEC rules only apply to public entities, preparers of financial statements can benefit from the findings of SEC reviewers. Preparers should bear in mind that an investment does not meet the ASC 230-10-20 definition of a cash equivalent unless the security is purchased very near its stated maturity date. Unless the investments are purchased three months or less before their maturity date, investments with stated maturities greater than three months cannot be classified as cash equivalents. For further information, see the Definitions of Terms section below and discussion of cash classification later in this chapter.

## DEFINITIONS OF TERMS

---

See Appendix A, *Definitions of Terms*, for definitions of Cash and Cash Equivalents.

## CONCEPTS, RULES, AND EXAMPLES

---

### Cash

To be included as cash in the statement of financial position, funds must be represented by coins, currency, undeposited checks, money orders, drafts, and demand deposits that are immediately available without restriction. Recognition and measurement of cash is generally straightforward. However, it is necessary to inform readers of the financial statements about any limitations on the ability to use cash in current operations.

Cash whose use is restricted would not be included with cash unless the restrictions on it expire within the year (or the operating cycle, if longer). Thus, cash contractually required to be held in a sinking fund is classified as a current asset if it will be used to retire the current portion of long-term debt. However, if material, it would be reported on a separate line rather than within cash. Cash in a demand deposit account that is being held for the retirement of long-term debts that do not mature currently is excluded from current assets and shown as a noncurrent investment. Cash in transit to the reporting entity (e.g., checks already mailed by the customer) cannot be included in cash because it is not under the control of the reporting entity.

**Compensating balances.** An entity will often be required to maintain a minimum amount of cash on deposit, generally in connection with having a borrowing arrangement with a financial institution (compensating balance). The purpose of this balance may be to substitute for service fees foregone by the bank (or fees at a rate less than market) or simply to increase the yield on a loan to the lender. Since most organizations must maintain a certain working balance in their cash accounts simply to handle routine transactions and to cushion against unforeseen variations in the demand for cash, borrowers often will not find compensating balance arrangements objectionable. Nevertheless, the compensating balance is not available for unrestricted use and penalties will result if it is used. If material, the portion of the reporting entity's cash account that is a compensating balance must be segregated and shown as a separate caption on the statement of financial position, and this should be included in noncurrent assets if related borrowings are noncurrent liabilities. If the borrowings are current liabilities or if the compensating balance reduces fees that would have been incurred in the next year, it is acceptable to show the compensating balance as a separately captioned current asset.

**Cash not immediately available.** Cash in savings accounts subject to a statutory notification requirement and cash in certificates of deposit maturing during the current operating cycle or within one year may be included as current assets but, if material, should be separately captioned in the statement of financial position to avoid the misleading implication that these funds are available immediately upon demand. Typically, such items will be included in the short-term investments caption, but these could be labeled as time deposits or restricted cash deposits.

**Overdrafts.** A reporting entity may issue checks with a dollar value exceeding the balance in its checking account. If the excess amount of these checks over the checking account balance has not yet cleared the bank, the overage is called a *book overdraft*, since the overdraft only exists in the reporting entity's accounting records. For reporting purposes, although the bank is yet unaware of this situation, the overdraft is reported as a liability, since the checks have already been released and are thus no longer under the control of the reporting entity. If the checks have cleared the bank, and the bank has advanced the reporting entity the funds (sometimes marketed as "automatic overdraft protection"), then this borrowing is also reported as a liability.

**Petty cash.** Petty cash and other imprest cash accounts are usually combined in financial statements with other cash accounts.

## PERSPECTIVE AND ISSUES

---

### Subtopics

ASC 310, *Receivables*, consists of four subtopics:

- ASC 310-10, *Overall*, which provides general guidance for receivables and has two subsections:
  - *General*, which provides guidance on receivables in general and standby commitments to purchase loans, factoring arrangements, and rebates,
  - *Acquisition, Development, and Construction Arrangements*, which provides guidance on whether a lender should account for the arrangement as a loan or as an investment in real estate or in a joint venture.
- ASC 310-20, *Nonrefundable Fees and Other Costs*, which provides guidance on non-refundable fees, origination costs, and acquisition costs associated with lending activities and loan purchases.
- ASC 310-30, *Loans and Debt Securities Acquired with Deteriorated Credit Quality*, which provides guidance regarding loans acquired with evidence of deterioration of credit quality since origination acquired by completion of a transfer for which it is probable, at acquisition, that the investor will be unable to collect all contractually required payments receivable.
- ASC 310-40, *Troubled Debt Restructurings by Creditors*, which provides guidance focused on the creditor's records. Guidance for the debtor's accounting in a troubled debt restructuring (TDR) is found in ASC 470-60.

### Scope and Scope Exceptions

The scope and scope exceptions for this topic are presented at the beginning of the section on each subtopic.

## DEFINITIONS OF TERMS

---

Source: ASC 310, *Glossary Sections*. Also see Appendix A, *Definitions of Terms*, for definitions of Acquisition, Development, and Construction Arrangement, Bargain Purchase Option, Bargain Renewal Option, Commencement Date of the Lease (Commencement Date), Commitment Fees, Contract, Control, Current Assets, Debt, Debt Security, Direct Financing Lease, Loan Origination Costs, Effective Interest Rates, Fair Value, Financing Receivable, Indirectly Related to the Leased Property, Initial Investment, Lease, Lease Modification, Lease Payments, Lease Receivable, Lease Term, Lending Activities, Lessee, Lessor, Leveraged Lease, Loan Origination Fees, Market Participants, Not-for-Profit Entity, Noncancelable Lease Term, Orderly Transaction, Penalty, Probable, Public Business Entity, Recorded Investment, Recourse, Related Parties, Sales-type Lease, Standby Letter of Credit, Time of Restructuring, Troubled Debt Restructuring, and Underlying Asset.

**Accrutable Yield.** The excess of a loan's cash flows expected to be collected over the investor's initial investment in the loan.

**Blended-rate Loans.** Blended-rate loans involve lending new funds at market interest rates combined with existing loans at rates currently lower than market rates. (Those funds are not advanced under a line of credit.)

**Carrying Amount.** For a receivable, the face amount increased or decreased by applicable accrued interest and applicable unamortized premium, discount, finance charges, or issue costs and also an allowance for uncollectible amounts and other valuation accounts. For a payable, the face amount increased or decreased by applicable accrued interest and applicable unamortized premium, discount, finance charges, or issue costs.

**Cash Flows Expected at Acquisition.** The investor's estimate, at acquisition, of the amount and timing of undiscounted principal, interest, and other cash flows expected to be collected. This would be the investor's best estimate of cash flows, including the effect of prepayments if considered, that is used in determining the acquisition price, and, in a business combination, the investor's estimate of fair value for purposes of acquisition price assignment in accordance with Subtopic 805-20. One acceptable method of making this estimate is described in paragraphs 820-10-55-3F through 55-3G and 820-10-55-4 through 55-20, which provide guidance on present value techniques.

**Class of Financing Receivable.** A group of financing receivables determined on the basis of all of the following:

- a. Initial measurement attribute (for example, amortized cost or purchased credit impaired)
- b. Risk characteristics of the financing receivable
- c. An entity's method for monitoring and assessing credit risk.

See paragraphs 310-10-55-16 through 55-18 and 310-10-55-22.

**Collateral-dependent Loan.** A loan for which the repayment is expected to be provided solely by the underlying collateral.

**Common Risk Characteristics.** Loans with similar credit risk (for example, evidenced by similar Fair Isaac Company [FICO] scores, an automated rating process for credit reports) or risk ratings, and one or more predominant risk characteristics, such as financial asset type, collateral type, size, interest rate, date of origination, term, and geographic location.

**Completion of a Transfer.** A completion of a transfer occurs for a transaction with any of the following characteristics:

- a. It satisfies the conditions in paragraph 860-10-40-5 to be accounted for as a sale.
- b. It is in a business combination.
- c. It is to a newly created subsidiary if the transferee has written the loan down to its fair value with the intent of transferring the stock of the subsidiary as a dividend to the shareholders of the parent entity.
- d. It is a contribution receivable or a transfer that satisfies a prior promise to give.
- e. Contractually Required Payments Receivable. The total undiscounted amount of all uncollected contractual principal and contractual interest payments both past due and scheduled for the future, adjusted for the timing of prepayments, if considered, less any reduction by the investor. For an acquired asset-backed security with required contractual payments of principal and interest, the contractually required payments receivable is represented by the contractual terms of the security. However, when contractual payments of principal and interest are not specified by the security, it is necessary to consider the contractual terms of the underlying loans or assets.

**Contractually Required Payments Receivable.** The total undiscounted amount of all uncollected contractual principal and contractual interest payments both past due and scheduled for the future, adjusted for the timing of prepayments, if considered, less any reduction by the investor. For an acquired asset-backed security with required contractual payments of principal and interest, the contractually required payments receivable is represented by the contractual terms of the security. However, when contractual payments of principal and interest are not specified by the security, it is necessary to consider the contractual terms of the underlying loans or assets.

**Credit Card Fees.** The periodic uniform fees that entitle cardholders to use credit cards. The amount of such fees generally is not dependent upon the level of credit available or frequency of usage. Typically the use of credit cards facilitates the cardholder's payment for the purchase of goods and services on a periodic, as-billed basis (usually monthly), involves the extension of credit, and, if payment is not made when billed, involves imposition of interest or finance charges. Credit card fees include fees received in similar arrangements, such as charge card and cash card fees.

**Credit Quality Indicator.** A statistic about the credit quality of financing receivables.

**Expected Residual Profit.** The amount of profit, whether called interest or another name, such as equity kicker, above a reasonable amount of interest and fees expected to be earned by a lender.

**Idle Time.** Idle time represents the time that a lender's employees are not actively involved in performing origination activities for specific loans. Idle time can be caused by many factors, including lack of work, delays in work flow, and equipment failure. Idle time can be measured through the establishment of standard costs, time studies, ratios of productive and nonproductive time, and other methods.

**Incremental Direct Costs.** Costs to originate a loan that have both of the following characteristics:

- a. Result directly from and are essential to the lending transaction
- b. Would not have been incurred by the lender had that lending transaction not occurred.

**Initial Investment.** The amount paid to the seller plus any fees paid or less any fees received.

**Lending Activities.** Lending, committing to lend, refinancing or restructuring loans, arranging standby letters of credit, syndicating loans, and leasing activities are lending activities.

**Loan.** A contractual right to receive money on demand or on fixed or determinable dates that is recognized as an asset in the creditor's statement of financial position. Examples include but are not limited to accounts receivable (with terms exceeding one year) and notes receivable.

**Loan Participation.** A transaction in which a single lender makes a large loan to a borrower and subsequently transfers undivided interests in the loan to groups of banks or other entities.

**Loan Syndication.** A transaction in which several lenders share in lending to a single borrower. Each lender loans a specific amount to the borrower and has the right to repayment from the borrower. It is common for groups of lenders to jointly fund those loans when the amount borrowed is greater than any one lender is willing to lend.

**Net Investment in an Original Loan.** The net investment in an original loan includes the unpaid loan principal, any remaining unamortized net fees or costs, any remaining unamortized purchase premium or discount, and any accrued interest receivable.

**Nonaccrable Difference.** A loan's contractually required payments receivable in excess of the amount of its cash flows expected to be collected.

**Portfolio Segment.** The level at which an entity develops and documents a systematic methodology to determine its allowance for credit losses. See paragraphs 310-10-55-21 through 55-22.

**Private Label Credit Cards.** Private label credit cards are those credit cards that are issued by, or on behalf of, a merchandising entity for the purchase of goods or services that are sold at that entity's place(s) of business.

**Recorded Investment.** The amount of the investment in a loan, which is not net of a valuation allowance, but which does reflect any direct write-down of the investment.

**Recorded Investment in the Receivable.** The recorded investment in the receivable is the face amount increased or decreased by applicable accrued interest and unamortized premium, discount, finance charges, or acquisition costs and may also reflect a previous direct write-down of the investment.

**Recourse.** The right of a transferee of receivables to receive payment from the transferor of those receivables for any of the following:

- a. Failure of debtors to pay when due
- b. The effects of prepayments
- c. Adjustments resulting from defects in the eligibility of the transferred receivables.

**Revolving Privileges.** A feature in a loan that provides the borrower with the option to make multiple borrowings up to a specified maximum amount, to repay portions of previous borrowings, and to then reborrow under the same loan.

**Standby Letter of Credit.** A letter of credit (or similar arrangement however named or designated) that represents an obligation to the beneficiary on the part of the issuer for any of the following:

- a. To repay money borrowed by or advanced to or for the account of the account party
- b. To make payment on account of any evidence of indebtedness undertaken by the account party
- c. To make payment on account of any default by the account party in the performance of an obligation.

A standby letter of credit would *not* include the following:

- a. Commercial letters of credit and similar instruments where the issuing bank expects the beneficiary to draw upon the issuer and which do not guarantee payment of a money obligation
- b. A guarantee or similar obligation issued by a foreign branch in accordance with and subject to the limitations of Regulation M of the Federal Reserve Board.

## **CONCEPTS, RULES, AND EXAMPLES**

---

### **Scope**

**ASC 310-10, Overall.** ASC 310-10-15-3 lists two exceptions to the guidance in the General Subsections of ASC 310-10:

- Mortgage banking activities, and
- Contracts accounted for as derivative instruments under ASC 815-10.

ASC 310-10-15-5 states that the Acquisition, Development, and Construction Subsections' guidance applies to all entities, but not all arrangements. It applies only to those acquisition, development, and construction arrangements in which the lender participates in expected residual profit.

## Overview

Receivables come from credit sales, loans, or other transactions and may be in the form of loans, notes, or other type of financial instruments. Trade receivables and other customary trade term receivables that are due in no longer than one year, provided that management has the intent and ability to hold those receivables for the foreseeable future or until maturity, payoff is measured at:

- outstanding face value (principal),
- adjusted for any write-offs and the allowance for doubtful accounts.

Loans receivable that management will hold until maturity or payoff are valued at outstanding principal adjusted for:

- any write-offs,
- the allowance for loan losses,
- any deferred fees or costs on originated loans, and
- any unamortized premiums or discounts on purchased loans.

If a receivable is due on terms exceeding one year, the proper valuation is the present value of future payments to be received. These future payments are computed by using an interest (discount) rate commensurate with the risks involved, as of the date of the receivable's creation. In many situations where an explicit interest rate is provided, the rate commensurate with the risks involved is the rate stated in the agreement between the payee and the obligor. However, if the receivable is noninterest-bearing or if the rate stated in the agreement is not indicative of the market rate for a debtor of similar creditworthiness under similar terms, interest must be imputed at the market rate. The resulting discount is amortized as additional interest income over the life of the agreement, per ASC 835.

Receivables that are pledged or assigned to a lender as collateral for a lending agreement remain under the control of the reporting entity and, therefore, remain on its statement of financial position to inform readers of the financial statements about the pledge or assignment.

As an alternative to borrowing against the value of the receivables, customer obligations are sometimes sold to generate cash before their due dates. If the transferor has no continuing involvement with the transferred assets or with the transferee, it is clear that a sale has taken place, and a gain or loss on sale is measured and recognized. However, in many cases, the transferor of the receivables has continuing involvement with the transferred assets because it sells the receivables with recourse for uncollectible amounts, retains an interest in the receivables, or agrees to service the receivables after the sale. The greater the control that the transferor retains over the receivables, the more likely that the transfer will be accounted for as a secured borrowing rather than a sale.

**Types of receivables.** Financing receivables include:

- trade accounts receivable,
- loans,
- lease receivables arising from sales-type leases or direct financing leases. (This bullet is added by ASU 2016-02 on *Leases*.)
- credit cards,
- notes receivable,
- receivables relating to a lessor's right to payments from a lease other than an operating lease that should be recognized as assets.

(ASC 310-10-55-14)

Accounts receivable, open accounts, or trade accounts are agreements by customers to pay for services received or merchandise obtained.

Notes receivable are formalized obligations evidenced by written promissory notes. Notes receivable generally arise from cash advances but could result from sales of merchandise or the provision of services.

Entities may enter into forward standby commitments to purchase loans at a stated price in return for a standby commitment fee. Settlement is in the hands of the seller. The seller would deliver the loans only when and if the contract price is equal to or executes the market price on the settlement date. This arrangement is, in effect, a written put option. (ASC 310-10-05-05)

Factored receivables are sold to a third party, usually a factor. The factor assumes the risk of collection, without recourse to the transferor. Debtors pay the factor directly. (ASC 310-10-05-06)

Rebates are refunds of portions of precomputed finance charges on installment loans or trade receivables. Rebate calculations are often governed by law. (ASC 310-10-05-7)

**Presentation.** The nature of receivables varies. For example, the nature of amounts due from trade customers is often different from that of balances receivable from related parties, such as employees or shareholders. The different classes of receivables should be separately identified either on the face of the statement of financial position itself or in the notes thereto. (ASC 310-10-45-02)

The Codification gives entities the option of using fair value as the measurement basis in the financial statements. Entities can record most financial instruments, including receivables, at fair value.

Receivables due within one year (or one operating cycle, if longer) generally are presented at outstanding face value (principal amount), adjusted for any write-offs already taken and valuation allowances, provided that management has the intent and ability to hold those receivables for the foreseeable future or until maturity or payoff.

**Valuation allowances.** Valuation allowances adjust the carrying amount of receivables downward because not all of those receivables will ultimately be realized as cash. For example, valuation allowances are reported for:

- Amounts estimated to be uncollectible,
- The estimated returns, allowances, other discounts to be taken by customers prior to or at the time of payment,
- Merchandise that is shipped “on approval” if it is known that sales are recorded and available data suggest that a sizable proportion of such sales are returned by the customers.

Material amounts of anticipated discounts and allowances should be recorded in the period of sale.

If an entity measures bad debt expense based on the present value of cash flows, the entity may report:

- the entire change in present value as bad debt expense, or
  - a change attributable to the passage of time as interest income.
- (ASC 310-10-45-5)

If the observable market price of an impaired loan or the fair value of the collateral of an impaired collateral-dependent loan changes from one reporting period to the next, the changes should be reported as bad debt expense of a reduction in bad debt expense. (ASC 310-10-45-6)

#### Example of presentation of different classes of receivables

Snowy Winters & Sons is a purveyor of fine books about the Alaskan heartland. Its total ending receivable balance is \$420,000. The receivable balance is affected by the following items:

- The allowance for uncollectible accounts receivable is \$17,000, reflecting a historical rate of bad debts equal to 4% of receivables.
- It ships books on a subscription basis, resulting in a 15% return rate. Winters has recorded an allowance for returns of \$63,000.
- It offers an early payment discount of 1%, which is generally taken. Winters maintains a 1% early payments allowance of \$4,200 to reflect this arrangement.
- One large customer, Anchorage Book Company (ABC), is delinquent in its payments, so the collections department has converted ABC's outstanding balance of \$58,000 into a short-term note receivable, payable over ten months at a 12% interest rate.
- The Winters legal staff has won a lawsuit from which the company can expect to receive a total of \$12,000, payable over two years.
- Early Winters, the family patriarch, borrowed \$15,000 from the company to purchase an antique dog sled.

Snowy Winters' controller reports this information on the Winters statement of financial position in the following manner:

Accounts receivable, trade	335,000
Less: Allowances for doubtful accounts	(17,000)
Returns allowance	(63,000)
Early payment for discount allowance	<u>(4,200)</u>
Receivables due from officers	250,800
Notes receivable due in current year	15,000
Noncurrent receivables	58,000
Claims receivable (litigation settlement to be collected over two years)	12,000

### Valuation Allowance for Uncollectible Amounts

The recording of a valuation allowance for anticipated uncollectible amounts is almost always necessary. The *direct write-off method*, in which a receivable is charged off only when it is clear that it cannot be collected, is unsatisfactory since it overstates assets and also results in a mismatching of revenues and expenses. (Note that the direct write-off method may be required for tax purposes, but if so, this results in temporary differences for which interperiod tax allocation will generally be required.) Proper matching, which remains a valid financial reporting objective, can only be achieved if bad debts are recorded in the same fiscal period as the revenues to which they are related. Since the amount of uncollectible accounts is not known with certainty, an estimate must generally be made.

There are two popular estimation techniques, both acceptable under GAAP:

- The *percentage-of-sales method* is principally oriented towards achieving the best possible matching of revenues and expenses.
- The *aging the accounts* method is more inclined toward the presentation of the correct net realizable value of the trade receivables in the statement of financial position.

**Percentage-of-sales method.** For the percentage-of-sales method, historical data are analyzed to ascertain the relationship between bad debts and credit sales. The derived percentage is then applied to the current period's sales revenues to arrive at the appropriate debit to bad debts expense for the year. The offsetting credit is made to allowance for uncollectible accounts. When specific customer accounts are subsequently identified as uncollectible, they are written off against this allowance.

### Example of percentage-of-sales method

Total credit sales for year:	\$7,500,000	
Bad debt ratio from prior years or other data source:	1.75%	of credit sales
Computed year-end adjustment for bad debts expense:	\$ <u>131,250</u>	$(\$7,500,000 \times .0175)$
The entry required is		
Bad debts expense	131,250	
Allowance for uncollectible receivables		131,250

Care must be taken to ensure that the bad debt ratio computed will be representative of uncollectibility of the current period's credit sales. A ratio based on historical experience may require an adjustment to reflect the current economic climate. For example, if a large percentage of customers are concentrated in a geographic area that is experiencing an economic downturn, the rate of default may increase over that previously suffered. Changes in credit terms and in customer mix may also affect the relationship between sales and bad debts, and should be given consideration in determining the bad debt percentage to be applied to current period credit sales. In practice, these relationships evolve slowly over time and may not always be observed over the short term.

**Aging the accounts method.** When aging the accounts, an analysis is prepared of the customer receivables at the date of the statement of financial position. Each customer's balance is categorized by the number of days or months the underlying invoices have remained outstanding. Based on the reporting entity's past experience or on other available statistics, such as industry trends, historical bad debts percentages are applied to each of these aggregate amounts, with larger percentages being applied to the older accounts. The end result of this process is a computed total dollar amount that implies the proper ending balance in the allowance for uncollectible receivables at the date of the statement of financial position. The computed amount is compared to the balance in the valuation account, and an adjustment is made for the differences.

### Example of the aging method

	<i>Age of accounts</i>			
	<u>Under 30 days</u>	<u>30–90 days</u>	<u>Over 90 days</u>	<u>Total</u>
Gross receivables	\$ 1,100,000	\$425,000	\$360,000	
Bad debt percentage	0.5%	2.5%	15%	
Provision required	\$ <u>5,500</u>	\$ <u>10,625</u>	\$ <u>54,000</u>	\$ <u>70,125</u>

The credit balance required in the allowance account is \$70,125. Assuming that a debit balance of \$58,250 already exists in the allowance account (from charge-offs during the year that exceeded the credit balance in the allowance account at the previous year-end), the necessary entry is:

Bad debts expense	128,375	
Allowance for uncollectible receivables		128,375

**Change in estimate.** Both of the estimation techniques should produce approximately the same result over the course of a number of years. Nonetheless, these adjustments are based upon estimates and will never precisely predict ultimate results. There are two possible accounting treatments for adjustments, depending on the circumstances.

- When facts subsequently become available to indicate that the amount provided as an allowance for uncollectible accounts was incorrect, an adjustment classified as a change in estimate is made.
- If the amount is incorrect because of a failure to consider facts available at the time the estimate was made, a correction of an accounting error is recognized.

**Imputed interest.** If a receivable is due on terms exceeding one year, the proper valuation is the present value of future payments to be received, determined by using an interest rate commensurate with the risks involved at the date of the receivable's creation. In many situations the interest rate commensurate with the risks involved is the rate stated in the agreement between the payee and the debtor. However, if the receivable is noninterest-bearing or if the rate stated in the agreement is not indicative of the market rate for a debtor of similar creditworthiness under similar terms, interest is imputed at the market rate. A valuation allowance is used to adjust the face amount of the receivable to the present value at the market rate. The balance in the valuation allowance is amortized as additional interest income so that interest income is recognized using a constant rate of interest over the life of the agreement. Initial recording of such a valuation allowance also results in the recognition of an expense, typically (for customer receivables) reported as selling expense or as a contra revenue item (sales discounts). ASC 835-30 specifies when and how interest is to be imputed when the receivable is noninterest-bearing or the stated rate on the receivable is not reasonable. It applies to transactions conducted at arm's length between unrelated parties, as well as to transactions in which captive finance companies offer favorable financing to increase sales of related companies. Detailed information and examples can be found in the chapter on ASC 835.

**Lending and financing activities, including trade receivables.** Receivables generally arise from extending credit to others.

If the reporting entity has the intent and ability to hold trade receivables or loans for the foreseeable future or until maturity or payoff, those receivables are reported in the statement of financial position at their outstanding principal (face) amounts less any write-offs and allowance for uncollectible receivables or at fair value. Loans originated by the reporting entity are reported net of deferred fees or costs of originating them, and purchased loans are reported net of any unamortized premium or discount. If a decision has been made to sell loans, those loans are transferred to a held-for-sale category on the statement of financial position and reported at the lower of cost or fair value. Any amount by which cost exceeds fair value is accounted for as a valuation allowance.

When a trade receivable or loan is deemed uncollectible, the balance is written off against the allowance for uncollectible receivables. Recoveries of loans and trade receivables that were previously written off are recorded when received—either by a credit directly to earnings or by a credit to the allowance for uncollectible receivables. A credit loss on a financial instrument with off-statement-of-financial-position risk is recorded as a liability rather than being included in a valuation allowance netted against a recognized financial instrument. When settled, the credit loss is deducted from the liability. (ASC 835-10-35-3)

ASC 310-10-25 also includes standards for recognizing fees related to receivables. Delinquency fees are recognized when chargeable, provided that collectibility is reasonably assured. Prepayment fees are not recognized until prepayments have occurred. Rebates of finance charges due because payments are made earlier than required are recognized when the receivables are prepaid and are accounted for as adjustments to interest income. (ASC 310-10-25-11 through 25-13)

**Example of delinquency fees, prepayment fees, and rebates**

The DitchWay Company sells a ditch-digging machine called the DitchMade that contractors use to lay utility lines and pipes. DitchWay invoices customers a standard monthly fee for two years, after which they receive title to their DitchMade machines. The DitchMade machine is patent-protected and unique, so contractors must purchase from DitchWay. If a contractor makes a late payment, DitchWay bills them a \$150 late fee. Since DitchWay can withhold title to the equipment if all fees are not received, the collection of these fees is reasonably assured. DitchWay's entry to record a late fee follows:

Accounts receivable	150
Income—delinquency fees	150

One contractor enters bankruptcy proceedings. It has accumulated \$450 of unpaid delinquency fees by the time it enters bankruptcy. DitchWay uses the following entry to eliminate the fees from its accounts receivable:

Bad debt allowance	450
Accounts receivable	450

DitchWay's sale agreement recognizes that its billing schedule is essentially a series of loan payments with an implied interest rate of 12%. About 20% of all contractors obtain better financing elsewhere and prepay their invoices in order to reduce the interest payment. DitchWay charges a flat \$500 prepayment fee when a prepayment occurs. Though the proportion of early payments is predictable, DitchWay cannot recognize prepayment fees until each prepayment actually occurs. One contractor makes a prepayment, so DitchWay records the receivable for the prepayment fee with the following entry:

Accounts receivable	500
Income—prepayment fees	500

The DitchWay sales agreement also states that, when a contractor prepays an invoice, it should pay the full amount of the invoice, even if paid early, and DitchWay will rebate the unearned portion of the interest expense associated with the early payment. In one case, a contractor prepays a single \$2,500 invoice for which the original sales entry was as follows:

Accounts receivable	2,500
Interest income	450
Revenue	2,050

The amount of interest to be rebated back to the contractor is \$225, which DitchWay records with the following entry:

Interest income—rebated	225
Cash	225

In this case, the use of the contra account, interest income—rebated, provides the reporting entity with greater control and information for management purposes. However, the debit could be made directly to interest income if these enhancements are not useful.

### Pledging, Assigning, and Factoring Receivables

An organization can alter the timing of cash flows resulting from sales to its customers by using its accounts receivable as collateral for borrowings or by selling the receivables outright. A wide variety of arrangements can be structured by the borrower and lender, but the most common are pledging, assignment, and factoring.

**Pledging.** Accounts receivable pledging is an agreement in which accounts receivable are used as collateral for loans. The customers whose accounts have been pledged are not aware of this event, and their payments are still remitted to the original entity to which the debt was owed. The pledged accounts merely serve as security to the lender, giving comfort that sufficient assets exist to generate cash flows adequate in amount and timing to repay the debt. However, the debt is paid by the borrower whether or not the pledged receivables are collected and whether or not the pattern of their collection matches the payments due on the debt.

**Disclosures.** The only accounting issue relating to pledging is that of adequate disclosure. See Appendix B—Disclosure Checklist for Commercial Businesses.

**Assignment.** Accounts receivable assignment is a more formalized transfer of the receivables to the lending institution. The lender investigates the specific receivables that are being proposed for assignment and will approve those that it deems worthy as collateral. Usually customers are not aware that their accounts have been assigned and they continue to forward their payments to the original obligee (the borrowing entity). In some cases, the assignment agreement requires that collection proceeds be immediately delivered to the lender. The borrower is, however, the primary obligor of the debt and is required to make timely payment on the debt whether or not the receivables are collected as anticipated. The borrowing is with recourse, and the general credit of the borrower is pledged to the payment of the debt.

Since the lender knows that not all the receivables will be collected on a timely basis by the borrower, only a fraction of the face value of the receivables will be advanced as a loan to the borrower. Typically, this amount ranges from 70 to 90%, depending upon the credit history and collection experience of the borrower.

Assigned accounts receivable remain the assets of the borrower and continue to be presented in its financial statements, with appropriate disclosure of the assignment similar to that illustrated for pledging. Prepaid finance charges would be recorded as a prepaid expense and amortized to expense over the period to which the charges apply.

In the typical case involving the assignment of receivables, the borrower retains control of the receivables, and it is clear that the transaction is a secured borrowing rather than a sale. If it is unclear whether the borrower has retained control of the receivables, a determination must be made as to whether to account for the transfer as a sale or as a secured borrowing. Making that determination is discussed in the chapter on ASC 860, *Transfers of Financial Assets under ASC 860*.

**Factoring.** Accounts receivable factoring traditionally involves the outright sale of receivables to a finance company known as a factor. These arrangements involve (1) notification to the customer to remit future payments to the factor and (2) the transfer of receivables to the factor without recourse to the transferor. The factor assumes the risk of an inability to collect. Thus, once a factoring arrangement is completed, the transferor has no further involvement with the accounts, except for a return of merchandise.

In its simplest form, the receivables are sold and the difference between the cash received and the carrying value is recognized as a gain or loss.

The classic factoring arrangement provides two financial services to the business:

- It permits the reporting entity to obtain cash earlier than waiting for customers to pay, and
- It transfers the risk of bad debts to the factor.

The factor is compensated for each of these services. Interest is charged based on the anticipated length of time between the date the factoring arrangement is consummated and the

expected collection date of the receivables sold. A fee is charged based upon the factor's anticipated bad debt losses.

Some companies factor receivables as a means of transferring bad debt risk, but leave the cash on deposit with the factor until the weighted-average due date of the receivables, thereby avoiding interest charges. This arrangement is still referred to as factoring, since the customer receivables have been sold. However, the borrowing entity does not receive cash but instead records a new receivable, usually captioned "Due from Factor." This receivable, in contrast to the original customer receivables, is essentially without risk and is presented in the statement of financial position without a deduction for estimated uncollectible receivables.

Merchandise returns are normally the responsibility of the transferor, who must then make the appropriate settlement with the factor. To protect against the possibility that merchandise returns will diminish the total of receivables to be collected, a factor will frequently advance only a portion of the face amount of the factored receivables (less any interest and factoring fee deductions). The factor will retain a certain fraction of the total proceeds relating to the portion of sales that are anticipated to be returned by customers. This sum is known as the factor's *holdback*. When merchandise is returned to the transferor, an entry is made offsetting the receivable from the factor. At the end of the return privilege period, any remaining holdback will become due and payable to the transferor.

#### Example of accounting for the factoring of receivables without recourse

1. Thirsty Corp. enters into an agreement with Rich Company to sell a group of its receivables without recourse. The receivables have a total face value of \$200,000 (against which a 5% allowance had been recorded). The factor will charge 20% interest computed on the weighted-average time to maturity of the receivables of 36 days plus a 3% fee. A 5% holdback will also be retained.
2. Thirsty's customers return for credit \$4,800 of merchandise.
3. The customer return privilege period expires and the remaining holdback is paid to the transferor.

The entries required are as follows:

1. Cash	180,055
Allowance for bad debts ( $200,000 \times .05$ )	10,000
Interest expense (or prepaid) ( $200,000 \times .20 \times 36/365$ )	3,945
Factoring fee ( $200,000 \times .03$ )	6,000
Factor's holdback receivable	9,500
$[\$10,000/(\$10,000 + \$190,000) \times \$190,000]$	
Loss on sale of receivables	500
Bad debts expense	10,000
Accounts receivable	200,000

The interest expense, factor's fee, and loss can be combined into a \$10,445 charge to loss on the sale of receivables.

2. Sales returns and allowances	4,800
Factor's holdback receivable	4,800
3. Cash	5,200
Factor's holdback receivable	4,700
Loss on sale of receivables	500

The factor's holdback receivable recorded by the seller is required by ASC 860 to be an allocation of the carrying value of the receivables (\$190,000) between the assets sold (the receivables) and the assets retained (the holdback) based on their relative fair values at the date of the factoring agreement. The factor holds back 5% of the face value (\$200,000) for a total of \$10,000. Upon settlement the loss or gain recorded at the origination of the factoring arrangement needs to be adjusted because the factor pays the remaining holdback of \$5,200 (\$10,000 holdback – \$4,800 returns) in settlement of an asset with a carrying value of \$4,700 (\$9,500 – \$4,800).

Factoring results in a transfer of title to the factored receivables. Where there is a no recourse provision or other continuing involvement with the receivables, the removal of the receivables from the borrower's statement of financial position is clearly warranted.

Another variation is known as factoring with recourse. Accounting for factoring with recourse requires a determination of whether the transfer is a sale or a secured borrowing. That determination is made by applying ASC 860. See the chapter on ASC 860 for more information.

### **Impairment of Loans and Receivables**

ASC 310-10-35 applies to all creditors and to all loans except:

- Large groups of similar small balance loans that are collectively evaluated for impairment.
  - Loans measured at fair value or lower of cost or fair value.
  - Leases ASC 840, *Leases*. (This bullet is superseded upon adoption of ASU 2016-02 on *Leases*.)
  - ASC 320 debt securities.
- (ASC 310-10-35-13)

If it is probable that a creditor will not collect all amounts (principal and interest) owed to the degree specified in the loan agreement, a loan is considered impaired. (ASC 310-10-35-16) A delay does not impair the loan if the creditor collects all amounts due, including interest accrued during the delay, at the contractual rate.

**Measurement.** An impaired loan can be measured on a loan-by-loan basis or aggregated with other loans with common risk factors. The impaired loan can be measured in any of the following ways:

1. Present value of expected future cash flows using the loan's original effective interest rate (the contractual interest rate adjusted for premium or discount and net deferred loan costs or fees at acquisition or origination)
  2. Loan's observable market price
  3. Fair value of the collateral if the loan is collateral dependent, that is, repayment is expected to be provided by the collateral. (If this method is used, ASC 820 on fair value applies.)
- (ASC 310-10-35-22)

When foreclosure becomes probable, the creditor must measure impairment based on the fair value of the collateral. This must be done so that the impairment is not delayed until actual impairment occurs. (ASC 310-10-35-32)

Other measurement considerations include:

1. Costs to sell, on a discounted basis, if they will reduce cash flows to satisfy the loan, (ASC 310-10-35-24)
2. Creation of or adjustment to a valuation allowance account with the offset to bad-debt expense if the recorded investment is greater than:

- the impaired loan measurement,
  - the observable market price of the loan, or
  - the fair value of the collateral.
3. If the contractual interest rate varies based on changes in an independent factor, the creditor can choose between:
    - a. Calculating the effective interest on the factor as it changes over the loan's life, or
    - b. Calculating the effective interest as fixed at the rate in effect at the date of impairment.  
(ASC 310-10-35-25)
  4. Cash flow estimates should be the creditors' best estimate based on reasonable and supportable assumptions. (ASC 310-10-35-26)
  5. Significant changes occurring in measurement values require recalculation and adjustment of the valuation allowance. Net carrying amount of the loan should not exceed the recorded investment. (ASC 310-10-35-38)

The choice must be consistently applied. Projections of factor changes should not be made. (ASC 310-10-35-28)

After impairment, creditors should use the methods described above to record, measure, and present impairment. If the existing policy results in a recorded investment less than fair value, no additional impairment is recognized. (ASC 310-10-35-37)

#### **ASC 310-20, Nonrefundable Fees and Other Costs**

**Scope and Scope Exceptions.** ASC 310-20-15-3 specifically excludes from ASC 310-20 guidance:

- a. Loan origination or commitment fees that are refundable; however, the guidance does apply when such fees subsequently become nonrefundable.
- b. Costs that are incurred by the lender in transactions with independent third parties if the lender bills those costs directly to the borrower.
- c. Nonrefundable fees and costs associated with originating or acquiring loans that are carried at fair value if the changes in fair value are included in earnings of a business entity or change in net assets of a not-for-profit entity (NFP). The exclusion provided in this paragraph and the preceding paragraph applies to nonrefundable fees and costs associated with originating loans that are reported at fair value and premiums or discounts associated with acquiring loans that are reported at fair value. Loans that are reported at cost or the lower of cost or fair value, loans or debt securities reported at fair value with changes in fair value reported in other comprehensive income (includes financial assets subject to prepayment as defined in paragraph 860-20-35-2, and debt securities classified as available-for-sale under Topic 320), and loans that have a market interest rate, or adjust to a market interest rate, are not considered to be loans carried at fair value.
- d. Fees and costs related to a commitment to originate, sell, or purchase loans that is accounted for as a derivative instrument under Subtopic 815-10.
- e. Fees and costs related to a standby commitment to purchase loans if the settlement date of that commitment is not within a reasonable period or the entity does not have the intent and ability to accept delivery without selling assets. For guidance on fees and costs related to such a commitment, see paragraph 310-10-30-7.

**Loan origination fees.** These fees should be deferred and recognized over the life of the loan as an adjustment of interest income. If there are any related direct loan origination costs, the origination fees and origination costs should be netted, and only the net amount should be deferred and amortized via the interest method. Origination costs include those incremental costs such as credit checks and security arrangements, among others, pertaining to a specific loan.

The only exception to the foregoing rule would be in the instance of certain loans that also qualify as debt instruments under ASC 320. For those carried in the “trading securities” portfolio, related loan origination fees should be charged to expense when incurred; the requirement that these be carried at fair value would make adding these costs to the asset carrying amounts a useless exercise.

#### Example of a loan origination fee

Debtor Corp. wishes to take out a loan with Klein Bank for the purchase of new machinery. The fair value of the machinery is \$614,457. The loan is for ten years, designed to give Klein an implicit return of 10% on the loan. The annual payment is calculated as follows:

$$\text{Annual payment} = \frac{\$614,457}{\text{PV}_{10, 10\%}} = \frac{614,457}{6.14457} = \$100,000$$

Unearned interest on the loan would be \$385,543  $[(10 \times \$100,000) - \$614,457]$ .

Klein also is to receive a “nonrefundable origination fee” of \$50,000. Klein incurred \$20,000 of direct origination costs (for credit checks, etc.). Thus, Klein has *net* nonrefundable origination fees of \$30,000. The new net investment in the loan is calculated below.

Gross investment in loan $(10 \times \$100,000)$	\$1,000,000
Less: Unamortized net nonrefundable origination fees	<u>(30,000)</u>
	970,000
Less: Unearned interest income (from above)	<u>385,543</u>
Net investment in loan	<u><u>\$ 584,457</u></u>

The new net investment in the loan can be used to find the new implicit interest rate.

$$\frac{100,000}{(1+i)^1} + \frac{100,000}{(1+i)^2} + \dots + \frac{100,000}{(1+i)^{10}} = \$584,457$$

where  $i$  = implicit rate

Thus, the implicit interest rate is 11.002%. The amortization table for the first three years is set up as follows:

(a) <u>Loan payments</u>	(b) <u>Reduction in unearned interest</u>	(c) <u>Interest revenue (PV × implicit rate of 11.002%)</u>	(d) <u>Reduction in net orig. fees (c-b)</u>	(e) <u>Reduction in PV of net invest (a-c)</u>	(f) <u>PV of net loan investment</u>
\$100,000	\$61,446*	\$64,302	\$2,856	\$35,689	\$584,457
100,000	57,590**	60,374	2,784	39,626	548,759
100,000	53,349***	56,015	2,666	43,985	509,133
					465,148

\*  $(\$614,457 \times 10\%) = \$61,446$

\*\*  $[\$614,457 - (\$100,000 - \$61,446)] \times 10\% = \$57,590$

\*\*\*  $[\$575,900 - (\$100,000 - \$57,590)] \times 10\% = \$53,349$

**Commitment fees and costs.** Often fees are received in advance in exchange for a commitment to originate or purchase a loan. These fees should be deferred (ASC 310-20-25-4) and recognized upon exercise of the commitment as an adjustment of interest income over the life of the loan (ASC 310-20-35-2), as in Example 1 for origination costs and fees. (ASC 310-20-25-11) If a commitment expires unexercised, the fees should be recognized as income upon expiration.

As with loan origination fees and costs, if both commitment fees are received and commitment costs are incurred relating to a commitment to originate or purchase a loan, the net amount of fees or costs should be deferred and recognized over the life of the loan. (ASC 310-20-25-12)

If there is a remote possibility of exercise, the commitment fees may be recognized on a straight-line basis over the commitment period as “service fee income.” If there is a subsequent exercise, the unamortized fees at the date of exercise should be recognized over the life of the loan as an adjustment of interest income, as in the previous example.

In certain cases, commitment fees are determined retroactively as a percentage of available lines of credit. If the commitment fee percentage is nominal in relation to the stated rate on the related borrowing, with the borrowing earning the market rate of interest, the fees shall be recognized in income as of the determination date. (ASC 310-20-35-3)

#### Example of a commitment fee

Glass Corp. has a \$2 million, 10% line of credit outstanding with Ritter Bank. Ritter charges its annual commitment fee as 0.1% of any available balance as of the end of the prior period. Ritter will report \$2,000 ( $\$2\text{ million} \times 0.1\%$ ) as service fee income in its current income statement.

**Fees and costs in refinancing or restructurings.** (Assume this is not a troubled debt restructuring.) When the terms of a refinanced/restructured loan are as favorable to the lender as the terms for loans to customers with similar risks who are not in a restructuring, the refinanced loan is treated as a new loan, and all prior fees of the old loan are recognized in interest income when the new loan is made. This condition is met if:

1. The new loan’s effective yield at least equals the effective yield for similar loans, and
2. Modifications of the original debt are more than minor.

(ASC 310-20-35-9)

When the above situation is not satisfied, the fees or costs from the old loan become part of the net investment in the new loan.

#### Example of a refinanced loan—favorable terms—origination fees

Jeffrey Bank refinanced a loan receivable to \$1,000,000, at 10% interest, with annual interest receipts for ten years. Jeffrey’s “normal” loan in its portfolio to debtors with similar risks is for \$500,000 at 9% interest for five years. Jeffrey had loan origination fees from the original loan of \$20,000. These fees are recognized in income *immediately* because the terms of the restructuring are as favorable to Jeffrey as a loan to another debtor with similar risks.

#### Example of a refinanced loan—unfavorable terms—origination fees

Assume the same facts as in Example 3 except that the refinanced terms are \$500,000 principal, 7% interest for three years. Since the terms of the restructuring are not as favorable to Jeffrey as a loan to another debtor with similar risks, the \$20,000 origination fees become part of the new investment in the loan and recognized in interest income over the life of the new loan, as in Example 1.

**Purchase of a loan or group of loans.** Fees paid or fees received when purchasing a loan or group of loans should normally be considered part of the initial investment, to be recognized in income over the lives of the loans. However, if the loans qualify as debt securities under ASC 320 and are held in the lender's "trading securities" portfolio, these fees should be reported in income when paid or received, and not added to the cost of the loans.

**Special arrangements.** Often lenders provide demand loans (loans with no scheduled payment terms). In this case, any net fees or costs should be recognized on a straight-line basis over a period determined by mutual agreement of the parties, usually over the estimated length of the loan.

Under a revolving line of credit, any net fees or costs are recognized in income on a straight-line basis over the period that the line of credit is active. If the line of credit is terminated due to the borrower's full payment, any unamortized net fees or costs are recognized in income.

#### Example of a line of credit—origination fee

Green Bank received \$50,000 as a nonrefundable origination fee on a \$2 million demand loan. Green's loan dictates that any fees are to be amortized over a period of ten years. Therefore, \$5,000 ( $= \$50,000 \times 1/10$ ) of origination fees will be recognized as an addition to interest income each year for the next ten years.

**Other lending-related costs.** Some ancillary costs do not qualify for deferral and should be expensed. The Exhibit below lists some of those costs and others that do qualify for deferral.

#### Exhibit—Other Lending-Related Costs Incurred by Lender

Cost	Treatment
Advertising	Expense as incurred
Soliciting potential borrowers	Expense as incurred
Servicing existing loans	Expense as incurred
Establishing and monitoring credit policies, supervision, and administration (ASC 320-20-25-3)	Expense as incurred
Software for loan processing and origination (ASC 320-20-25-4)	Expense as incurred
Fees paid to service loans for loan processing and origination (ASC 320-20-25-5)	Expense as incurred
Employee bonuses related to loan origination activities (ASC 320-20-25-6)	Portion directly related are deferrable
Commission-based compensation directly related to time spent	Deferrable
Allocation of total compensation between origination and other activities so that costs associated with lending activities deferred for completed loans (ASC 320-20-25-7)	Deferrable

**ASC 310-30, Certain Loans and Debt Securities Acquired with Deteriorated Credit Quality**

**Scope and Scope Exceptions.** This subtopic applies to loans acquired by completion of a transfer for which it is probable at the time of acquisition that the new investor will not be able to collect all the contractually required payments. The loans have evidence of deterioration of credit quality since their origination. ASC 310-30-15-2 excludes the following transactions from ASC 310-30 guidance:

- a. Loans that are measured at fair value if all changes in fair value are included in earnings or, for an NFP, loans that are measured at fair value if all changes in fair value are included in the statement of activities and included in the performance indicator if a performance indicator is presented. Examples include those loans classified as trading securities under Topic 320 and Subtopic 948-310.
- b. Mortgage loans classified as held for sale under paragraph 948-310-35-1.
- c. Leases as defined in Topic 840. Only contracts that are classified by the purchaser as leases under that topic meet this exclusion. The distinction between purchasing a lease and purchasing a stream of cash flows must be drawn to determine applicability of this Section. (This bullet is superseded by ASU 2016-02.)
- d. Loans acquired in a business combination accounted for at historical cost, including business combinations of two or more NFPs, the acquisition of a for-profit business entity by an NFP, and combinations of two or more mutual entities.
- e. Loans held by liquidating banks (financial reporting by liquidating banks is discussed in Topic 942).
- f. Revolving credit agreements, such as credit cards and home equity loans, if at the acquisition date the borrower has revolving privileges.
- g. Loans that are a transferor's interests (see Subtopic 325-40).

ASC 310-30-15-4 further excludes the following transactions and activities:

- a. Loans that are derivative instruments subject to the requirements of Topic 815. If a loan would otherwise be in the scope of this paragraph of this Section and has within it an embedded derivative that is subject to that topic, the host instrument (as described in that topic) remains within the scope of this paragraph of this Section if it satisfies the conditions in this paragraph.
- b. Loans for which it is possible, but not probable, that the investor will be unable to collect all amounts due according to the contractual terms of the loan.
- c. Situations in which credit is still being offered, and the entire relationship is excluded if, at the acquisition date, the borrower has revolving privileges. This scope exclusion is appropriate because lenders generally will not continue to make credit available to borrowers from whom it is probable that the lender will not collect all contractually required payments receivable.

**Overview.** ASC 310-30 requires the preparer to differentiate between securities investments acquired directly from the issuer and those obtained on the secondary market. It imposes accounting requirements for debt instruments acquired in transfers when the purchase price reflects a change in the debtor's credit standing since the original issuance of the instrument. This guidance is applicable to all acquirers of loans or debt securities (bonds, securitized loans, etc.), not merely financial institutions, although fewer commercial or industrial entities would tend to be making such purchases.

**Market conditions.** Debt instruments (whole loans or loan participations, as well as securities) will generally trade in the secondary market at prices that vary from the amount at which they were issued originally. The prices may be higher or lower than the face amount, depending on the confluence of several factors. Because interest rates change almost continually, it is rare that market rates will correspond to the nominal rate on any given loan or debt security, even if the loan or instrument originally carried a market yield. Furthermore, many instruments are issued at premiums or discounts at inception, for various reasons. In the secondary market, prices will be adjusted continually to reflect current market conditions related to the loan's (or security's) coupon rate and the credit standing of the issuer/borrower, within the context of market rates of interest and other factors. If current rates are higher than the instrument's coupon (i.e., contractual) rate, it will trade at a discount from par value, while if the current rates are below the coupon rate, it will sell for a premium, if other variables are held constant.

**Changes in creditworthiness.** Furthermore, the borrower's creditworthiness may have changed since the loan was originated or the debt instrument was issued. This also impacts the price at which the loan or security will trade. A decline in credit standing results in a drop in value, while an improvement in credit standing causes a rise in the value of the entity's debt. Creditworthiness pertains to the risk of default, and a number of well-regarded private sector companies closely monitor the outstanding debt of publicly held and private corporations and various governmental agencies and political subdivisions. Examples of rating agencies or measures are Moody's, Standard & Poor's, and Fitch's for publicly held companies and the Fair Isaac credit score (FICO) for private companies.

Loans or debt securities may trade in the secondary market at their original issuance prices as the coincidental result of offsetting changes in the variables noted above. Thus, market yields may have declined—which would cause a rise in the price of fixed coupon debt instruments, but concurrently the issuer's creditworthiness may have been downgraded by rating agencies, which would cause the price of the debt to decline. In tandem, the credit downgrade may have essentially negated the price increase from lower market interest rates. In applying ASC 310-30, entities must:

- Refer to the price at which the loan or security has been transferred, in relation to its "par" or original issuance price, and
- Examine whether there is information to suggest that there has been a change in the issuer's credit quality since inception of the obligation.

ASC 310-30 only applies if there has been a change in the issuer's credit quality since the inception of the debt.

**ASC 310-30 in greater detail.** The purpose of ASC 310-30 is to prescribe the accounting for debt instruments (comprising most loans and debt securities, with certain exceptions) which are acquired via a transfer (i.e., in the secondary market) and which have been affected by changes in credit quality. The guidance requires that the accretable yield be determined. The accretable yield is derived from:

- The relationship between the future cash flows expected to be collected, and
- The price paid by the investor for the acquired instrument.

The accretable yield is distinguished from the nonaccretable difference, which is generally the excess of the total of contractual future cash flows over the expected cash flows.

Neither the accretable yield nor the nonaccretable difference can be displayed in the financial statements. For example, consider a loan that contractually is obligated to pay a total of \$85,000 in future interest and principal, but which can be purchased for \$50,000 and is expected to provide

future cash flows of only \$73,500. The \$23,500 ( $\$73,500 - \$50,000$ ) spread between the purchase price and the undiscounted expected future cash flows is the accretable yield. The further \$11,500 ( $\$85,000 - \$73,500$ ) spread between expected and contractual cash flows, however, is the nonaccretable difference, which cannot be given accounting recognition under ASC 310-30. That is, the loan (which is an investment in the hands of the transferee) cannot be recorded or displayed at the higher \$85,000 amount, with a contra account or valuation allowance pertaining to the pretransfer estimated uncollectible amount being reported. Instead, the purchase cost, \$50,000, must be the initial representation of this acquired asset, which is later increased by virtue of the accretion of yield (and reduced by collections).

Upon acquisition, the effective yield is computed based on the expected pattern (i.e., timings and amounts) of future cash flows, so that interest can be accrued on the level-yield basis (a constant rate on a changing base). Over the holding term of the investment, expected cash flows may change. They may:

- Decline due to perceived impairment, or
- Increase due to upgrading of creditworthiness.

The accounting for such changes varies, with decreases in expectations triggering immediate impairment loss recognition, while increases will generally be reported prospectively over the holding period of the instrument. The precise accounting for changes in expected future cash flows also depends, per ASC 310-30, on whether the instrument is accounted for as a:

- loan (under ASC 310-30), or
- debt security (under ASC 320).

Under ASC 310-30, reductions in expected future cash flows trigger the recognition of a loss in the current reporting period.

#### **Accounting for investments in loans with deteriorated credit quality acquired by transfer.**

*Initial measurement.* Loans acquired by transfer (i.e., in the secondary market) are recorded initially at acquisition cost. If the acquisition price differs from the par or face amount (i.e., there is a premium or a discount), the effective yield has to be computed and used to accrete the discount (or, if a premium, amortize it) over the expected term of the instrument. The estimation of the amounts of expected future cash flows, and the timing of those cash flows, is obviously a matter of some complexity and inevitable subjectivity. For example, if payments from a credit-impaired obligor are expected to be made, say, fifteen days late on average, this will impact the computed effective yield on the loan and is to be given explicit consideration in ascertaining the effective yield, subject to the usual materiality threshold concerns. The calculation of accretable yield is made at the acquisition date, but it may later have to be adjusted as expectations regarding future cash flow amounts change. Subsequent reduced expectations of cash flows will result in the recognition of impairment, while expectations of enhanced or improved cash flows may result in reversal of previously recognized impairment (if any), or increased effective yield over the instrument's remaining holding period.

*Subsequent measurement—loans not accounted for as a debt security.* At the date of transfer, if there is evidence of a decline in creditworthiness since the instrument's inception, such that the full amount of contractual cash flows will not be received, the provisions of ASC 310-30 must be applied. In this context, the loan is considered impaired for purposes of applying ASC 450 or, if applicable, ASC 310-10. To apply the guidance in ASC 310-10-35-10 through 35-11, the investor must meet certain criteria. It must be unable to collect all cash flows expected to be collected by the investor plus any additional cash flows expected to be collected arising from a change in estimate after acquisition.

In such cases, the investor must estimate cash flows to be received, and accrete the initial carrying amount to that amount, rather than to the gross amount of future contractual cash flows. An uncertainty regarding future cash flows that suggests only a possible shortfall versus contractual amounts owed would not qualify for the accounting in Subtopic ASC 310-30. In such a situation, there would be disclosure of reasonably possible contingent losses, and if at a later date the loss is deemed to have become probable, a loss accrual would be recognized per ASC 450 as a change in estimate. (ASC 310-30-35-10)

**Example—Loan acquired with deteriorated credit quality at transfer**

Assume that Investor Co. acquires a loan with a remaining principal balance of \$650,000 on January 1, 20X1. The contractual terms of the loan call for interest-only payments, at 9%, annually through December 31, 20X5, at which time the full principal balance is due. The debtor's credit rating has been reduced subsequent to the initiation of the borrowing, and the 20X0 interest payment was not made when due. Investor Co. pays \$500,000 (flat) for the loan and any unpaid interest. The expectation is that the debtor will pay \$40,000 at the end of 20X1, \$60,000 at the end of years 20X2 and 20X1 (each year), \$70,000 at the end of 20X4, and \$600,000 at the end of 20X5. These total projected cash inflows of \$830,000 are lower than the contractually due amount, \$1,001,000 (including the amount in arrears for 20X0). The effective yield will be about 12.6%. At transfer, the investment is recorded at cost, as follows:

Investment in loan receivable	500,000
Cash	500,000
(500,000 × 12.6%)	

At the end of 20X1, immediately prior to receipt of the payment, the entry to record the accretion for the year, at the effective yield, is:

Investment in loan receivable	62,974
Accretion (interest income)	62,974

The collection of the anticipated amount at December 31, 20X1, is recorded as follows:

Cash	40,000
Investment in loan receivable	40,000

Entries for subsequent years' accretion and collections would follow in the same manner. This presumes, of course, that amounts expected to be received indeed are received, and that expectations about the future receipts do not depart from what had been anticipated when the loan was purchased.

The changes in carrying amount and recognition of income over the full five-year period are illustrated in the following chart.

Year ending December 31	A <i>Beginning carrying amount</i>	B <i>Cash flows expected to be collected</i>	C <i>Interest income</i>	D <i>Reduction (increase) in carrying amount (B-C)</i>	E <i>Ending carrying amount of loan (A-D)</i>
20X1	\$500,000	\$ 40,000	\$ 62,974	\$ (22,974)	\$522,974
20X2	522,974	60,000	65,867	(5,867)	528,841
20X3	528,841	60,000	66,606	(6,606)	535,447
20X4	535,447	70,000	67,438	2,56	532,885
20X5	532,885	600,000	67,115	532,885	—
		<u>\$830,000</u>	<u>\$330,000</u>		<u>\$ 500,000</u>

In the foregoing chart, the \$830,000 total cash collected consists of \$330,000 in interest, accreted at the 12.6% computed yield, and \$500,000 return of investment in the loan receivable.

Contrast this result with the examples that follow.

### Example—Subsequent decrease in expected cash flows

If, subsequent to acquisition and computation of effective yield, the expected cash flows associated with a loan are revised downward, ASC 310-30 directs that this be accounted for as an impairment. The adjustment results in the previously determined yield percentage being maintained in future periods by applying the constant return to the reduced carrying value of the loan. While some might argue that a diminished expectation of cash flows would imply a new lower rate of return, ASC 310-30 instead opts for recognizing an immediate impairment, measured as the then-present value of the stream of cash flow shortfalls being projected. This results in a continuing rate of return equal to the original estimate, but with a step-down in the carrying value of the loan.

To illustrate, using the same basic facts above, assume now that immediately after the 20X3 payment is made, Investor Co. revises its expectation of cash flows to be received in 20X4 and 20X5. It now anticipates zero cash collection in 20X3, and only \$500,000 at year-end 20X5. The present value of these shortfalls—a \$70,000 shortage one year hence, followed by a \$100,000 shortfall two years later—discounted at the 12.6% yield on the investment computed at the date of transfer, reveals an impairment of \$141,039 as of the start of 20X4. The entry to record this, given that the investment is treated as a loan rather than as a debt security, is as follows:

Bad debt expense		141,039
Allowance for uncollectible loan receivable		141,039

The reduced net carrying value of the loan receivable, which is \$394,408 immediately following this adjustment, will continue to accrete at 12.6%, as the following table illustrates:

Year ending December 31	A Beginning carrying amount of loan	B Cash flows expected to be collected	C Interest income	D Reduction (increase) in carrying amount (B-C)	E Ending carrying amount of loan (A-D)
20X1	\$500,000	\$ 40,000	\$ 62,974	\$ (22,974)	\$522,974
20X2	522,974	60,000	65,867	(5,867)	528,841
20X3	528,841	60,000	66,606	(6,606)	
20X4*		141,039	394,408		
20X5	394,408	—	49,675	(49,675)	444,083
20X6	444,083	<u>500,000</u>	<u>55,917</u>	<u>444,083</u>	—
		<u>\$660,000</u>	<u>\$301,039</u>	<u>\$500,000</u>	

\* Provision of allowance for estimated uncollectible future cash flows, computed at present value using the effective yield of the loan.

Observe in the foregoing chart that total cash collected, \$660,000, consists of \$301,039 in interest, accreted at the 12.6% computed yield, and the recovery of only \$358,961 of the \$500,000 investment in the loan receivable. In other words, the guidance treats the decrease in expected cash flows as a loss of principal, accounted for as a bad debt and a provision of a valuation allowance against the \$500,000 loan receivable. Note that the decreased cash flow expectation was *not* accounted for as a lowered future return on the investment (which would have resulted in lower interest income recognition in years 20X4 and 20X5 coupled with a full recovery of the principal invested).

**Example with decrease in expected cash flows followed by increase in expected cash flows  
(recovery of uncollectible loan receivable)**

If Investor Co., above, first lowers its expectation regarding future cash flows and then partially reverses its estimate, so that some or all (but not more than all) of the allowance of the uncollectible loan receivable proves unneeded, this is accounted for under ASC 310-30 as a reversal of the valuation allowance account (i.e., as a change in an accounting estimate).

To illustrate, consider again the facts in the basic example, and now assume that in 20X3 Investor Co. has the expectation that no interest will be collected in 20X4 and that only \$500,000 will be collected in 20X5. In 20X4, however, \$20,000 is in fact collected, and Investor Co. then expects a full collection of the \$600,000 in 20X5 (but no recovery of the \$50,000 missed payment in 20X4).

The entry to record the reduced expectation of future cash flows at the end of 20X2 or beginning of 20X3 is as shown previously.

Bad debt expense	141,039
Allowance for uncollectible loan receivable	141,039

In 20X4, the collection of the \$20,000 (when no collection at all was anticipated) coupled with the renewed expectation of collecting \$600,000 in 20X5 required that some of the previously provided valuation allowance be reversed. The amount of valuation allowance to be restored, per ASC 310-30, is that amount which will result in interest accretion thereafter at the previously determined 12.6% yield through the final collection of the loan. Assuming that the \$20,000 collection in December 20X4 came as a surprise, the adjustment will be computed with reference to the final remaining collection, \$600,000, expected in December 20X5, and to the \$20,000 unexpected 20X6 collection.

The entry to partially restore the carrying value of the loan, net of the valuation allowance, is as follows:

Allowance for uncollectible loan receivable	108,802
Bad debt expense	108,802

The computation of the foregoing amount may be somewhat confusing, unless one keeps in mind that the objective of ASC 310-30 is to provide for the reporting of interest income over the full carrying term of the loan receivable, at a constant rate on a changing balance, with that rate being the rate computed at the date of transfer. The only exception, which will be illustrated later in this section, is for situations where the total cash to be collected exceeds the estimate made at the date of transfer; in that case, a higher rate of return is reported in periods after the change in estimate, to avoid the alternative of reporting a gain at the date the new estimate is made. In this example, the anticipated “extra” 20X5 collection of \$100,000 (\$600,000 – \$500,000) has a present value at the end of 20X4 of \$88,802, so this previously provided valuation allowance is no longer needed. Furthermore, the \$20,000 collection in 20X4 was unexpected, and had previously been fully included in the valuation allowance as being uncollectible, so this too must be reversed. Therefore, the total reversal of valuation allowance is the sum of these two amounts, or \$108,802. Alternatively, this can be computed as the adjustment necessary to bring the net carrying value of the loan receivable to the amount of “principal” to be collected in December 20X5 (i.e., the present value, discounting at 12.6%, of the expected \$600,000 collection).

The net carrying value of the loan receivable will continue to accrete at 12.6%, both after the recognition of the valuation allowance at the end of 20X3 and after the partial elimination of the valuation allowance in 20X4, as the following table illustrates:

<i>Year ending December 31</i>	<i>A Beginning carrying amount of loan</i>	<i>B Cash flows expected to be collected</i>	<i>C Interest income</i>	<i>D Reduction (increase) in carrying amount (B-C)</i>	<i>E Ending carrying amount of loan (A-D)</i>
20X1	\$500,000	\$ 40,000	\$ 62,974	\$ (22,974)	\$522,974
20X2	522,974	60,000	65,867	(5,867)	528,841
20X3	528,841	60,000	66,606	(6,606)	
20X3*		141,039	394,408		
20X4	394,408	20,000	49,675	(29,675)	
20X4**				(108,802)	532,885
20X5	532,885	<u>6,00,000</u>	<u>67,115</u>	<u>532,885</u>	—
		<u>\$780,000</u>	<u>\$312,237</u>	<u>\$ 500,000</u>	

\* Provision of allowance for estimated uncollectible future cash flows, computed at present value using the effective yield on the loan.

\*\* Restoration of a portion of the previously provided allowance, computed at present value using the effective yield on the loan, relative to expected 20X5 collection, plus the \$20,000 unanticipated collection in 20X4 at full accreted amount.

Observe in the foregoing chart that total cash collected, \$780,000, consisted of \$312,237 in interest, accreted at the 12.6% computed yield, and the recovery of only \$467,763 of the \$500,000 investment in the loan receivable. As in the immediately preceding example, ASC 310-30 treats the decrease in expected cash flows as a loss of principal, accounted for as a bad debt and a provision of a valuation allowance against the \$500,000 loan receivable. In this case, \$32,237 of “principal” (i.e., of the amount recognized at the time of transfer) was lost, which is the net of the \$141,039 valuation allowance provision in 20X3 and the \$108,802 recovery recognized in 20X4.

Note that in all of the preceding examples the carrying value of the loan receivable continues to earn the computed 12.6% yield throughout the holding period. This was true if the initially estimated future cash flows were all collected as planned, or if changes to the estimated amounts or timings later were made—as long as the total cash to be collected did not exceed the amount originally (i.e., upon transfer to Invest Co.) estimated. In the next example, the collections exceed what was anticipated when the loan was acquired, and this necessitates a different approach to accounting for the interest yield on the investment.

In all cases where an allowance for uncollectible loan amounts has been provided, if the loan is subsequently foreclosed, the lender must measure the long-lived asset received in full satisfaction of a receivable at fair value less cost to sell as prescribed by ASC 310-40. That subtopic prescribes that after a troubled debt restructuring, the creditor must account for assets received in satisfaction of a receivable the same as if the assets had been acquired for cash. Accordingly there will be a new cost basis for the long-lived asset received in full satisfaction of a receivable; the valuation allowance would not be carried over as a separate element of the cost basis for purposes of accounting for the long-lived asset under ASC 360 subsequent to foreclosure.

#### Example—Increase in expected cash flows

Assume again the basic facts of the investment in the loan receivable made by Investor Co. However, after fully collecting the anticipated amounts in 20X1 and 20X2, Investor revises its estimates of the amounts to be collected in 20X3, 20X4, and 20X5. Specifically, it now expects to receive \$75,000 at the end of 20X3 and again at the end of 20X4, and to collect the full remaining balance, \$650,000, at the end of 20X5. ASC 310-30 does not permit recognition of a gain or other income upon making this new estimate, but does instead require that the effective yield be recomputed and that future receipts be allocated between interest income and principal reduction consistent with the new accretable yield.

Note that no entry is required at the time of the new estimate of future cash flows because no gain or loss (or reversal of previously recognized loss) is being affected. As with changes in accounting estimates under ASC 250, this is handled strictly on a prospective basis.

<i>Year ending December 31</i>	<i>A Beginning carrying amount of loan</i>	<i>B Cash flows expected to be collected</i>	<i>C Interest income</i>	<i>D Reduction (increase) in carrying amount (B-C)</i>	<i>E Ending carrying amount of loan (A-D)</i>
20X1	\$500,000	\$ 40,000	\$ 62,974	\$ (22,974)	\$522,974
20X2	522,974	60,000	65,867	(5,867)	528,841
20X3*					
20X4	528,841	75,000	88,086	(13,086)	541,927
20X5	541,927	75,000	90,265	(15,265)	557,192
20X6	557,192	650,000	92,808	557,192	—
		<u>\$9,00,000</u>	<u>\$4,00,000</u>	<u>\$5,00,000</u>	

\* Based on new expectations regarding future cash flows, a new yield is computed in an amount that equates the present value of expected receipts in 20X3–X5 to the carrying value at the end of 20X2, \$528,841. This yield is about 16.7%.

In the foregoing example, \$900,000 in cash is ultimately collected, allocated \$400,000 to interest income and \$500,000 to recovery of the amount recorded at the date of transfer, which was the sum paid for the loan receivable.

**Accounting for investments in pools of loans acquired by transfer.** Loans that are acquired as a pool present special accounting considerations. Each individual loan must meet the criteria of ASC 310-30 in order to apply the accounting set forth in this standard. Thus, if a group of loans are acquired together and in the aggregate have expected future cash flows in an amount lower than the aggregate contractual cash flows, this does not qualify each of the loans to be accounted for under ASC 310-30. Rather, each loan must be reviewed for impairment due to credit quality, and only those individual loans exhibiting the defined characteristic would be subject to the specified accounting.

After making a determination that each loan in a proposed pool has met the threshold conditions set forth under ASC 310-30 (i.e., that there has been evidence of credit quality deterioration subsequent to the origination, and that it is probable that, as of the transfer date, the transferee will not collect all the contractually required payments), a further determination must be made that the loans share common risk characteristics. Under provisions of ASC 310-30, loans with similar credit risk or risk ratings, and one or more predominant risk characteristics, such as financial asset type, collateral type, size, interest rate, date of origination, term, and geographic location, will be considered to have common risk characteristics. Credit risk can be assessed by reference to publicly available ratings of publicly held companies or by automated ratings such as that produced by FICO.

The aggregate cost of the loans to be aggregated is apportioned to the loans in the pool in proportion to their respective fair values at date of acquisition. The aggregate accretable yield of the pool is allocated among the loans in this same manner.

Only loans acquired in a given fiscal *quarter* (not year!) are subject to aggregation for financial reporting purposes. Once a pool is established, its integrity must be maintained, and thus loans can only be removed from the pool upon sale, foreclosure, write-off, or settlement. (ASC 330-30-40-1) New loans cannot be added to an existing pool. The excess of contractually required cash flows over the acquisition cost of the pool may not be used to offset or absorb changes to

anticipated cash flows associated with other loans or pools of loans having other common risk characteristics.

Removal of a loan from a portfolio is effected at the loan's then-carrying value (ASC 330-30-40-2), and accordingly a gain or loss would be reflected in income of the period, measured as the difference between the carrying value and the fair value of the amount received in settlement (e.g., cash or collateral). Any difference between the carrying amount of the loan being removed from the pool and the fair value of the amount received will not impact the percentage yield being used to accrete value on the remainder of the pool. (ASC 330-30-35-15)

**Example of an investment in a pool of loans acquired by transfer**

Garfield Corporation acquires the following seven loans for \$600,000 during the same fiscal quarter:

<u>Loan no.</u>	<u>Fair value</u>	<u>Remaining term</u>	<u>Interest rate</u>	<u>FICO score</u>
1	\$ 53,000	4 years	9%	450
2	260,000	4 years	6%	800
3	125,000	4 years	10%	600
4	78,000	4 years	8%	480
5	50,000	4 years	7%	730
6	92,000	4 years	10%	390
7	<u>67,000</u>	4 years	9%	340
	<u>\$725,000</u>			

Garfield elects to split these loans into two groups—those having FICO scores below the minimum Fannie Mae acceptance score of 620, and those above it. Accordingly, loan numbers 2 and 5 are shifted into a separate Pool A, with the remaining loans in Pool B. The \$600,000 acquisition cost is allocated to the two pools based on the relative fair values of the loans within the pools, as shown below.

<u>Pool no.</u>	<u>Aggregate fair value</u>	<u>Proportion of total fair value</u>	<u>Cost allocation</u>
A	\$310,000	43%	\$258,000
B	<u>415,000</u>	<u>57%</u>	<u>342,000</u>
	<u>\$725,000</u>	<u>100%</u>	<u>\$600,000</u>

Garfield expects \$117,376 annual payments from the Pool B loans. It determines that the discount rate equating all cash flows expected to be collected with the \$342,000 allocated purchase price is 14%. Using the 14% rate, Garfield constructs the following amortization table for Pool B:

<u>Year</u>	<u>Expected cash receipts</u>	<u>Interest income (14%)</u>	<u>Reduction of carrying amount</u>	<u>Carrying amount</u>
Inception				\$342,000
1	\$117,376	\$ 47,880	\$ 69,496	272,504
2	117,376	38,151	79,225	193,279
3	117,376	27,059	90,317	102,962
4	<u>117,376</u>	<u>14,414</u>	<u>102,962</u>	0
	<u>\$469,504</u>	<u>\$127,504</u>		<u>\$342,000</u>

At the beginning of Year 3, Garfield writes off the remaining balance of Loan 7. Prior to the final payment, Loan 7 has a carrying value of \$31,204, as determined by apportioning the carrying amount of Pool B at the end of Year 2 amongst the five loans in the pool based on their relative fair values at the date of acquisition. This apportionment calculation is shown in the following table:

<u>Loan no.</u>	<u>Fair value at inception</u>	<u>Relative values</u>	<u>Apportionment of Year 2 carrying amount</u>
1	\$ 53,000	12.77%	\$ 24,684
3	125,000	30.12%	58,217
4	78,000	18.80%	36,327
6	92,000	22.17%	42,847
7	<u>67,000</u>	<u>16.14%</u>	<u>1,204</u>
	<u>\$415,000</u>	<u>100.00%</u>	<u>\$193,279</u>

Garfield records the loan write-off with the following entry:

Loss on loan write-off	31,204
Investment in loan receivable	31,204

The following amortization table reflects the removal of Loan 7 from Pool B, along with its proportionate share of the expected cash receipts in Years 3 and 4.

<u>Year</u>	<u>Expected cash receipts</u>	<u>Interest income (14%)</u>	<u>Reduction of carrying amount</u>	<u>Carrying amount</u>
Inception		\$ 342,000		
1	\$117,376	\$ 47,880	\$ 69,496	272,504
2	117,376	38,151	79,225	193,279
Write-off	31,204	162,075		
3	98,426	22,690	75,736	86,339
4	<u>98,426</u>	<u>12,087</u>	<u>86,339</u>	0
	<u>\$431,604</u>	<u>\$120,808</u>	<u>\$342,000</u>	

If loans are accounted for in a pool and you subsequently modify one or more of these loans, do not remove the loans from the pool even if the modification would otherwise be considered a troubled debt restructuring. The entity must continue to evaluate whether the pool is impaired if the expected cash flows associated with the pool change.

**Subsequent measurement—loans accounted for as debt securities.** If the debt instrument acquired in a transfer to be accounted for under ASC 310-30 meets the definition of a security, as set forth in ASC 320 (namely, that it constitutes a share, participation, or other interest that is represented by a registered or bearer instrument or by book entry, and is one of a class or series of participations, interests, or obligations), then ASC 310-30 prescribes a slightly different mode of accounting for changes in expected cash flows.

If the fair value of the debt security is less than its amortized cost, the entity should apply the impairment guidance in ASC 320-10-35. To conform to ASC 320's requirements, an anticipated downward change in expected future cash flows must be examined to determine whether the change is merely a temporary change or whether an other than temporary decline has occurred. While temporary impairment is not impossible, if in fact the transferee of debt securities now anticipates further reduced cash flows from the security, there is a substantial likelihood that the impairment in value is other than temporary. Under ASC 320, other-than-temporary impairment must be recognized by writing down the carrying value of the investment and reflecting the change in current earnings, whether the security is being held in the available-for-sale portfolio or is being held to maturity.

If, on the other hand, the entity expects the debt security's cash flows to increase from the amounts anticipated at transfer, then similar to what was illustrated above, the accretable yield

must be recomputed and periodic interest income thereafter appropriately adjusted. This is considered a change in accounting estimate under ASC 250. (ASC 330-30-35-8 and 35-9)

To illustrate, consider the same facts as set forth above, except now assume that the loan is a debt security meeting the definition set forth in ASC 320. When acquired, it was treated as being available-for-sale, but for this example no changes in value are addressed other than that associated with the changed expectation of cash flows.

#### Example of reduction in cash flow expectations

The anticipated cash flows occurred in 20X1, 20X2, and 20X3, but at the beginning of 20X4 Investor Co. revises its expectations, and now believes that there will be a zero cash collection in 20X4, and only \$500,000 at year-end 20X5. The present value of these shortfalls—a \$70,000 shortage at year-end 20X4, followed by a \$100,000 gap at year-end 20X5—discounted at the same 12.6% rate computed as the yield on the investment at transfer, reveals an impairment of \$141,039 as of the start of 20X4. The entry to record this, given that the investment is treated as a debt security, rather than as a loan, is as follows:

Loss on impairment of investment	141,039
Investment in available-for-sale debt securities	141,039

Apart from the bookkeeping (writing down the investment directly rather than crediting a contra asset account), the treatment is very similar to that previously presented. Most importantly, the reduced net carrying value of the debt security held as an available-for-sale security will continue to accrete at 12.6%, as the following table illustrates:

Year ending December 31	Beginning carrying amount of investment	Cash flows expected to be collected	Interest income	Reduction (increase) in carrying amount <u>(B-C)</u>	E Ending carrying amount of investment <u>(A-D)</u>	
					C	D
20X1	\$500,000	\$ 40,000	\$ 62,974	\$ (22,974)	\$522,974	
20X2	522,974	60,000	65,867	(5,867)	528,841	
20X3	528,841	60,000	66,606	(6,606)		
20X3*		141,039	394,408			
20X4	394,408	—	49,675	(49,675)	444,083	
20X5	444,083	<u>5,00,000</u>	<u>55,917</u>	<u>444,083</u>		—
		<u>\$660,000</u>	<u>\$301,039</u>	<u>\$ 500,000</u>		

\* Write-down of carrying value of investment in debt security, due to reduced expectation of future cash flows, which is judged to be an OTTI, computed at present value using the effective yield on the loan.

The total cash collected, \$660,000, is accounted for as interest income, in the total amount \$301,039, and recovery of the “principal” of the investment, net of the impairment recorded in 20X3, amounting to \$358,961.

#### Example with decrease in expected cash flows followed by increase in expected cash flows

Unlike in the earlier examples, where the investment was accounted for as a loan receivable, here the investment is in a debt security accounted for under ASC 320, which prohibits restoring an other-than-temporary decline in value. For this reason, the write-down was not reflected through a contra asset

(allowance) account, and a later improvement in the outlook for future cash flows must instead be accounted for prospectively as a yield adjustment.

Assume, therefore, that Investor Co. first lowers its expectation regarding future cash flows and then partially reverses its estimate, so that some or all of the amount of future cash flow thought not to be forthcoming now again is expected to be received. Specifically, assume that in 20X3 Investor Co. has the expectation that no interest will be collected in 20X4 and that only \$500,000 will be collected in 20X5. In 20X4, however, \$20,000 is in fact collected, and Investor Co. then expects a full collection of the \$600,000 in 20X5 (but no recovery of the \$50,000 missed payment in 20X4).

The entry to record the reduced expectation of future cash flows at the end of 20X2 or beginning of 20X3 is as shown below.

Loss on impairment of investment	141,039
Investment in available-for-sale debt securities	141,039

In 20X4, the collection of the \$20,000 (when no collection at all was anticipated), coupled with the renewed expectation of collecting \$600,000 in 20X5, requires that the yield through the end of the expected holding period (final payoff, in this case) be recomputed. Assuming that the \$20,000 payment for 20X4 is received before the financial statements for 20X4 have been prepared, it would be appropriate to recompute accretable yield as of the beginning of that year, so that both 20X4 and 20X5 will report interest income consistent with the pattern of cash flows over that two-year period. The calculated yield on an investment equal to the carrying value at the beginning of 20X4 (\$394,408), which is expected to generate cash inflows of \$20,000 at the end of that year and \$600,000 at the end of the next year, is 25.9%, and this is used to accrete yield over the remaining term.

Since this will be reported prospectively, no entry is made as of the beginning of the year (nor would the necessary information have been available), but the entry to record interest income and the accretion for uncollected interest would be as follows:

Cash	20,000
Investment in available-for-sale debt securities	82,156
Interest income	102,156

The accretion of value is akin to an amortization of discount, and represents interest earned but not received, based on the most recent estimates of future cash flows. It does not represent a recovery of the previously written down carrying value of the investment because of permanent impairment. The complete analysis can be seen in the chart that follows:

Year ending December 31	Beginning carrying amount of investment	Cash flows expected to be collected	Interest income	Reduction (increase) in carrying amount (B-C)	E	
					C	Ending carrying amount of investment (A-D)
20X1	\$500,000	\$ 40,000	\$ 62,974	\$ (22,974)		\$522,974
20X2	522,974	60,000	65,867	(5,867)		528,841
20X3	528,841	60,000	66,606	(6,606)		
20X3*		141,039	394,408			
20X4**	394,408	20,000	102,156	(82,156)		476,564
20X5	476,564	600,000	123,436	476,564		—
		<u>\$780,000</u>	<u>\$421,039</u>	<u>\$ 500,000</u>		

\* Write-down of carrying value of investment in debt security, due to reduced expectation of future cash flows, which is judged to be an OTTI computed at present value using the effective yield on the loan.

\*\* Interest is accreted at the new rate of 25.9% hereafter.

It will be observed in the foregoing chart that total cash collected, \$780,000, consisted of \$421,039 in interest, accreted first at the 12.6% computed yield through the end of 20X3, and then at the 25.9% computed yield in light of higher expected cash flows for 20X4 and 20X5. The remainder of the cash flows, totaling \$358,961, was attributable to the recovery of the investment, net of the write-down for impairment in 20X3.

In contrast to the example where the investment was accounted for as a loan receivable, here the yield is adjusted prospectively when a recovery in value is observed, and this causes relatively more of the future cash flows to be treated as interest income, and relatively less as recovery of the investment principal.

Note that if no reduction in future cash flows had been anticipated, but if an increase in cash flows was expected at some point during the holding period of the investment, the result, from an accounting standpoint, would be as shown immediately above. The accretable yield would have been computed and recognized prospectively over the remaining holding period of the security.

#### **ASC 310-40, Troubled Debt Restructurings by Creditors**

A TDR occurs under specific circumstances: when a creditor “for economic or legal reasons related to the debtor’s financial difficulties grants a concession to the debtor that it would not otherwise consider.” Therefore, a TDR does not apply to restructurings that merely reflect general economic conditions that may lead to a reduction in interest rates. It also does not apply if a debt is refunded with new debt having an effective interest rate that approximates that of similar debt issued by nontroubled debtors.

ASC 310-40 focuses on the substance of debt modifications—their effect on future cash receipts or payments. Timing, interest, or principal may be modified under a TDR. These all affect cash flows and a creditor’s total return on the receivable. Evaluating whether a modification of debt terms is in substance a TDR is critical to determining whether ASC 310-40 applies. Therefore, the scope and scope exceptions of this subtopic take on added significance.

#### **Scope**

**Scope and Scope Exceptions.** ASC 310-40 applies to all troubled debt restructurings by creditors. Accounting by debtors is found in ASC 470-60. Interestingly the two subtopics use different applicability tests and so creditors and debtors applying the same facts and circumstances may not reach the same conclusion as to whether a troubled debt restructuring (TDR) has occurred.

TDRs may include, but are not limited to, one or a combination of two basic transaction types:

1. Settling the debt for less than its recorded investment in the receivable through:
  - Transfer from the debtor to the creditor of receivables from third parties, real estate, or other assets to satisfy fully or partially a debt
  - Granting of an equity interest to the creditor by the debtor to satisfy fully or partially a debt. This does not apply if the equity interest is granted pursuant to existing terms for converting the debt into an equity interest.
2. Continuing to carry the debt, but modifying the terms through, for instance,
  - Reduction of the stated interest rate, accrued interest, face amount of the debt, or maturity amount of the debt
  - Extension of the maturity date at a stated interest rate lower than the current market rate.

(ASC 310-40-15-9)

The following are *excluded* for consideration under the TDR guidance:

- Lease modifications
  - Changes in employment-related agreements
  - Unless they involve an agreement between debtor and creditor to restructure:
    - Debtors' failures to pay trade accounts according to their terms, or
    - Creditors' delays in taking legal action to collect overdue amounts of interest and principal
  - Modifications of loans within a pool accounted for as impaired loans
  - Changes in expected cash flows of a pool of loans accounted for as impaired loans resulting from the modification of one or more loans within the pool.
- (ASC 310-40-15-11)

Even if a debtor is experiencing some financial difficulties, a debt restructuring may not be a troubled debt restructuring for the purposes of ASC 310-40. None of the following situations are considered TDRs:

- The fair value of assets or equity accepted by a creditor from a debtor in full satisfaction of its receivable at least equals the creditor's recorded investment in the receivable.
  - The fair value of assets or equity transferred by a debtor to a creditor in full settlement of its payable at least equals the debtor's carrying amount of the payable.
  - The creditor reduces the effective interest rate on the debt primarily to reflect a decrease in market interest rates in general or a decrease in the risk so as to maintain a relationship with a debtor that can readily obtain funds from other sources at the current market interest rate.
  - The debtor issues, in exchange for its debt, new marketable debt having an effective interest rate based on its market price that is at or near the current market interest rates of debt with similar maturity dates and stated interest rates issued by nontroubled debtors.
- (ASC 310-40-15-12)

**Determining Whether a Troubled Debt Restructuring Has Occurred.** The first thing the creditor should consider in determining whether a TDR has occurred is whether it expects to collect all amounts due. A TDR receivable is one that is restructured or modified for economic or legal reasons where these conditions are present:

1. The creditor grants a concession that it otherwise would not consider, and
  2. The borrower is having financial difficulties.
- (ASC 310-40-15-5)

The creditor's motivation is to recoup as much of the debt as possible. A TDR may be a result of negotiation between the parties or may be imposed by a court, for example, in an arrangement under the Federal Bankruptcy Protection Act. "Concession" and "financial difficulties" have specific meanings under the guidance.

**Determining Whether a Concession Has Been Granted.** The Codification offers specific instances describing when concessions have occurred.

**Amounts due.** A concession has been granted as a result of a restructuring when the creditor does not expect to collect all amounts due, including interest accrued at the original contract rate. The creditor should also consider changes to underlying collateral if the principal payment is dependent on the value of the collateral. (ASC 310-40-15-13)

The Codification does not specify how a creditor should determine that it will be unable to collect all amounts due according to the contractual terms of a loan. (ASC 310-40-35-9) A creditor should apply its normal loan review procedures in making that judgment. However, the Codification does specifically prohibit creditors from using the borrower's effective rate test in ASC 470-60-55-10 in evaluating whether a concession has been granted to a borrower. (ASC 310-40-15-8A)

*Additional collateral and guarantees.* A creditor may restructure a debt in exchange for additional collateral or guarantees from the debtor. If the nature and amount of that additional collateral or guarantees received as part of a restructuring do not serve as adequate compensation for other terms of the restructuring, the creditor needs to consider whether a concession has occurred. (ASC 310-40-15-14)

*Access to market-rate funds.* In a declining-rate environment, the loan may be restructured with a lower interest rate. The creditor needs to evaluate whether the debtor would be able to get the same terms and market rate from another lender. If so, a concession has not occurred. If not, the restructuring would be considered to be at a below-market rate and this may indicate that the creditor has granted a concession. (ASC 310-40-15-15)

*Temporary/permanent increases in interest rate.* The borrower cannot assume that a temporary or permanent increase in the contractual interest rate as a result of a restructuring is not a concession. The new contractual interest rate could still be below market interest rates for new debt with similar risk characteristics. Borrowers have to perform the TDR evaluation based on consideration of any other changes as a result of the restructuring. (ASC 310-40-15-16)

*Evaluating an insignificant delay.* A delay in payments is not considered a concession if the delay is insignificant. This is aligned with the impairment guidance in ASC 310-10. A delay may be insignificant depending on the following factors:

1. The amount of payment subject to delay is insignificant relative to the unpaid principal or collateral value of the debt
  2. The restructuring results in an insignificant shortfall in the contractual amount due
  3. The delay in the timing is insignificant with respect to:
    - a. The frequency of payments due
    - b. The original contractual maturity
    - c. The original expected duration.
- (ASC 310-40-15-17)

The preparer should use judgment in evaluating the factors listed. Other factors may also be considered in evaluating whether an insignificant delay has occurred, including the cumulative effect of past restructurings.

**Determining Whether a Debtor Is Experiencing Financial Difficulty.** Lenders should consider the following factors when evaluating the first condition for a TDR—borrower's financial difficulty:

- Borrower is in payment default on any of its debt; or it is probable the debtor will be in payment default on any of its debt in the foreseeable future without the modification.
- The borrower has declared or is in the process of declaring bankruptcy.
- There is substantial doubt about the borrower's business continuing as a going concern.
- Borrower has securities that have been delisted or are in the process or threat of being delisted from an exchange.

- Based on estimates and projections that encompass only the current business capabilities, the creditor forecasts that the debtor's entity-specific cash flows will be insufficient to service any of its debt in accordance with contractual terms for the foreseeable future.
- Without the modification, the borrower cannot obtain funds from sources other than the existing creditors at an effective interest rate equal to the current market interest rate for similar debt for a nontroubled debtor.

(ASC 310-40-15-20)

### **Measurement and Derecognition<sup>1</sup>**

Accounting treatment of a TDR depends on the facts and circumstances, that is, the type of restructuring.

**Substituted debtors in a troubled debt restructuring.** ASC 310-40-40-1 addresses the situation of a sale of real estate collateral by a debtor in a troubled debt situation, with the acquirer assuming the obligation to the creditor (the reporting entity) such that the fair value of the obligation (the present value of payments, less than the net investment) was less than the creditor's carrying value of the loan receivable. In such circumstances, the creditor would be required to recognize a loss on the original loan in the amount by which the net investment in the loan exceeds the fair value of the assets received. The fair value of the payments should be recorded as an asset by the creditor.

**Receipt of assets in full satisfaction of a receivable.** A creditor may receive from the debtor receivables from third parties, real estate, or other assets or equity interest in the debtor.

- If the assets received represent full satisfaction of a receivable, the creditor should record those items at their fair value at the time of the restructuring.
- If the creditor intends to sell long-lived assets received, it should deduct costs to sell from fair value. The creditor may also use the fair value of the receivable satisfied, if this is more clearly evident.
- The difference between the recorded investment in the receivable and the fair value of the amounts received in settlement of the debt less costs to sell is recorded as a loss for the period.

(ASC 310-40-40-2 through 40-4)

**Partial satisfaction of a receivable.** The creditor may receive assets in partial satisfaction of a receivable and agree to modify the terms of the remaining receivable. The recorded investment in the receivable is reduced by the fair value less cost to sell the assets received. If the creditor receives cash, it reduces the investment in the receivable by the amount of cash received. This treatment is used even if the terms of the remaining receivable are not modified. (ASC 310-40-35-7)

**Impairment of a loan.** Often a loan whose terms are modified in a TDR has already been treated as an impaired loan under ASC 310-10. However, if it has not, the creditor should use the effective interest rate based on the original contract rate to discount cash flows. (ASC 310-40-35-12) The creditor should recognize a loss on the original loan and an asset at fair value for the payment to be received. The creditor measures the loss in the same way as in receipt of asset in full satisfaction of a receivable (see above). (ASC 310-40-40-1)

---

<sup>1</sup> Recorded investment in the receivable is used in this section instead of carrying amount of the receivable because the carrying amount is net of an allowance for estimated uncollectible amounts or other valuation account, if any, while the recorded investment in the receivable is not.

**Foreclosure.**<sup>2</sup> A TDR may be an in-substance repossession or foreclosure whether or not a formal foreclosure has taken place. The creditor may have received the debtor's assets in full or partial satisfaction of the receivable. In that case, the creditor treats the transaction in the same way as receipts of asset in full satisfaction of a receivable (see above). (ASC 320-40-40-6) The creditor is considered to have physical possession of the property and the receivable should be derecognized and the real property recognized only when either:

1. The creditor obtains legal title to the property upon completion of foreclosure, or
2. The borrower conveys all interest in the property to the creditor to satisfy the loan through completion of a deed in lieu of foreclosure or a similar legal agreement.

(ASC 310-40-55-10A)

If the transaction has certain characteristics, the foreclosed property is recorded at the lower of the net amount of the receivable or the fair value of the property. (ASC 310-40-40-7) Those characteristics are:

- A sale of real estate was financed by the seller.
- The buyer's initial investment was not sufficient for recognition of profit under the full accrual method.
- The seller met the conditions of Subtopic 970-605 to record a sale and recognized profit on the installment or cost recovery methods.
- Subsequently, the buyer defaulted on the mortgage to the seller.
- The seller forecloses on the property.
- At the time of foreclosure, fair value of the property is less than the seller's gross receivable but greater than the seller's net receivable, that is, the principal and interest receivable less the deferred profit on the sale and related allowances.

(ASC 310-40-40-6A)

***Classification of Certain Government-Guaranteed Mortgage Loans upon Foreclosure.***

This is a narrow-scope topic designed to eliminate inconsistencies in financial reporting.

Certain government-sponsored loan guarantee programs, such as those offered by the FHA, HUD, and the VA, allow qualifying creditors to extend mortgage loans to borrowers with a guarantee that entitles the creditor to recover all or a portion of the unpaid principal balance from the government if the borrower defaults. The Codification offers specific guidance on how to classify or measure foreclosed mortgage loans that are government-guaranteed.

ASC 310-40 requires that the entity derecognize a mortgage loan and recognize a separate other receivable upon foreclosure if *all* the following conditions are met:

1. The loan has a government guarantee that is not separable from the loan before foreclosure.
2. At the time of foreclosure, the creditor has the intent to convey the real estate property to the guarantor and make a claim on the guarantee, and the creditor has the ability to recover under that claim.
3. At the time of foreclosure, any amount of the claim that is determined on the basis of the fair value of the real estate is fixed.

(ASC 310-40-40-7B)

---

<sup>2</sup> Some guidance in this section is superseded upon adoption of ASU 2014-09 on revenue recognition. See the chapter on ASC 610.

Upon foreclosure, the entity should measure the separate other receivable based on the amount of the loan balance (principal and interest) expected to be recovered from the guarantor. (ASC 310-40-40-7A)

**Example 1—Settlement of a troubled debt by transfer of assets**

Assume the debtor company transfers land having a book value of \$70,000 and a fair market value of \$80,000 in full settlement of its note payable. The note has a remaining life of five years, a principal balance of \$90,000, and related accrued interest of \$10,000 is recorded. The creditor makes the following entries to record the settlement:

Land	80,000
Bad debt expense	20,000
Note receivable	90,000
Interest receivable	10,000

**Example 2—Modification of terms: restructuring with gain/loss recognized (payments are less than the recorded investment in the receivable)**

Assume that a note has a principal balance of \$90,000, accrued interest of \$10,000, an interest rate of 5%, and a remaining life of five years. The interest rate is reduced to 4%, the principal is reduced to \$72,500, and the accrued interest at date of restructure is forgiven.

Future cash flows (after restructuring) at the agreement's original effective interest rate:

	5% 5 yrs PV Factor
Principal	\$ 56,806 (\$72,500 × .78353)
Interest	<u>12,555</u> (\$2,900 × 4.32948)
Total present value	\$ 69,361
Amount prior to restructure (\$90,000 principal + \$10,000 accrued interest)	<u>(100,000)</u>
Creditor's loss	<u>\$ (30,639)</u>

***Beginning of Year 1***

Bad debt expense	30,639
Interest receivable	10,000
Valuation allowance	20,639

***End of Year 1***

Cash	2,900
Valuation allowance	568
Bad debt expense (or interest income)	3,468 ( $69,361 \times .05$ )

***End of Year 2***

Cash	2,900
Valuation allowance	596
Bad debt expense (or interest income)	$3,496 [ (69,361 + 568) = 69,929 \times .05 ]$

*End of Year 3*

Cash	2,900	
Valuation allowance	626	
Bad debt expense (or interest income)		3,526 [(69,929 + 596) = 70,525 × .05]

*End of Year 4*

Cash	2,900	
Valuation allowance	658	
Bad debt expense (or interest income)		3,558 [(70,525 + 626) = 71,151 × .05]

*End of Year 5*

Cash	2,900	
Valuation allowance	691	
Bad debt expense (or interest income)		3,591 [(71,151 + 658) = 71,809 × .05]
Cash	72,500	
Valuation allowance	17,500	
Note receivable		90,000

**Example 3—Restructuring with no gain/loss recognized (payments exceed the recorded investment in the receivable)**

Modify Example 2 as follows:

Assume the \$100,000 owed is reduced to a principal balance of \$95,000. The interest rate of 5% is reduced to 4%.

Future cash flows (after restructuring) at the agreement's original effective interest rate:

		5% 5 yrs <i>PV Factor</i>
Principal	\$ 74,435	(\$95,000 × .78353)
Interest	<u>16,452</u>	(\$ 3,800 × 4.32948)
<b>Total</b> present value	<b>\$ 90,887</b>	
Amount prior to restructure (\$90,000 principal + \$10,000 accrued interest)	<u>(1,00,000)</u>	
Creditor's loss	<u><b>\$ (9,113)</b></u>	

*Beginning of Year 1*

Bad debt expense	9,113	
Note receivable—new	95,000	
Note receivable—old	90,000	
Interest receivable	10,000	
Valuation allowance	4,113	

***End of Year 1***

Cash	3,800
Valuation allowance	744
Bad debt expense (or interest income)	4,544 ( $90,887 \times .05$ )

***End of Year 2***

Cash	3,800
Valuation allowance	781
Bad debt expense (or interest income)	$4,581 [(90,887 + 744) = 91,631 \times .05]$

***End of Year 3***

Cash	3,800
Valuation allowance	821
Bad debt expense (or interest income)	$4,621 [(91,631 + 781) = 92,412 \times .05]$

***End of Year 4***

Cash	3,800
Valuation allowance	862
Bad debt expense (or interest income)	$4,662 [(92,412 + 821) = 93,233 \times .05]$

***End of Year 5***

Cash	3,800
Valuation allowance	905
Bad debt expense (or interest income)	$4,705 [(93,233 + 862) = 94,095 \times .05]$
Cash	95,000
Note receivable	95,000

## PERSPECTIVE AND ISSUES

### Investment Topics

The Codification contains several topics dealing with investments, including:

- ASC 320, *Investments—Debt and Equity Securities*
- ASC 323, *Investments—Equity Method and Joint Ventures*
- ASC 325, *Investments—Other*

ASU 2016-01 adds a new topic related to investments: ASC 321, *Investments—Equity Securities*. It also changes the name of ASC 320 to *Investments—Debt Securities*. See the chapter on ASC 321 for more information.

## Subtopics

ASC 320, *Investments—Debt and Equity Securities*, contains one subtopic:

- ASC 320-10, *Overall*, that contains guidance for passive investments in:
  - All debt securities, and
  - Those equity securities that have a readily determinable fair value.

## Scope and Scope Exceptions

ASC 320 applies to all entities that do not belong to specialized industries for purposes of ASC 320. The entities deemed by ASC 320 not to be specialized industries include:

1. Cooperatives,
2. Mutual entities, and
3. Trusts that do not report substantially all their securities at fair value.

ASC 320 does *not* apply to “entities whose specialized accounting practices include accounting for substantially all investments in debt securities and equity securities at fair value, with changes in value recognized in earnings (income) or in the change in net assets,” such as brokers and dealers in securities, defined benefit and other postretirement plans, and investment companies. (ASC 320-15-3)

ASC 320 does not apply to:

- Derivative instruments
- Cost method investments accounted for under ASC 325-20, except with respect to the impairment guidance in ASC 320-10-35
- Equity method investments absent the election of the fair value option under ASC 825-10-25-1
- Investments in consolidated subsidiaries.

(ASC 320-10-15-7)

In the case of an investment subject to ASC 320 with an embedded derivative, the host instrument is accounted for under ASC 320, and the embedded derivative is accounted for under ASC 815. If an option to buy an equity security does not meet the definition of a derivative and has a readily determinable fair value, it is in the scope of ASC 320. (ASC 320-10-55-5)

## Overview

ASC 320 classifies debt and equity securities into one of three categories:

1. Held-to-maturity,
2. Trading, or
3. Available-for-sale.

These categories are explored in depth in this chapter and summarized in the Exhibit, “Classification of Debt Securities and Equity Securities with Readily Determinable Fair Value.”

## Practice Alert

While SEC rules only apply to public entities, preparers of financial statements can benefit from the findings of SEC reviewers. Investments are a frequent topic of SEC comment letters. Determining when an investment is other-than-temporarily-impaired requires significant

judgment. Neither the SEC nor the FASB offer definitive guidelines. The SEC commonly requests:

- Support for the preparer's conclusion that unrealized losses are temporary
- Information on how the preparer determined which period to report the impairment
- More transparent disclosures
- Basis for determining that unrealized losses are recoverable
- How entities separate their OTTI losses on debt securities between credit and noncredit components.

Preparers would be prudent to document how conclusions were reached.

With the worldwide economy continuing to experience volatility, the SEC recently has focused on disclosures related to holdings of sovereign debt issued by Eurozone member countries experiencing financial difficulty. Entities need to determine whether those debt securities will recover their entire amortized cost basis. Equity and privately debt securities issued in those areas also need a careful evaluation.

## DEFINITIONS OF TERMS

---

Source: ASC 320-10-20, *Glossary*. Also see Appendix A, *Definitions of Terms*, for additional terms related to this topic: Cash Equivalents, Debt Security, Equity Security, Fair Value, Operating Segment, and Readily Determinable Fair Value

**Amortized Cost Basis.** The amount at which an investment is acquired, adjusted for accretion, amortization, collection of cash, previous other-than-temporary impairments recognized in earnings (less any cumulative-effect adjustments), foreign exchange, and fair value hedge accounting adjustments.

**Asset Group.** An asset group is the unit of accounting for a long-lived asset or assets to be held and used that represents the lowest level for which identifiable cash flows are largely independent of the cash flows of other groups of assets and liabilities.

**Available-for-Sale Securities.** Investments not classified as either trading securities or as held-to-maturity securities.

**Holding Gain or Loss.** The net change in fair value of a security. The holding gain or loss does not include dividend or interest income recognized but not yet received or write-downs for other-than-temporary impairment.

**Retrospective Interest Method.** A method of interest income recognition under which income for the current period is measured as the difference between the amortized cost at the end of the period and the amortized cost at the beginning of the period, plus any cash received during the period.

**Structured Note.** A debt instrument whose cash flows are linked to the movement in one or more indexes, interest rates, foreign exchange rates, commodities prices, prepayment rates, or other market variables. Structured notes are issued by U.S. government-sponsored enterprises, multilateral development banks, municipalities, and private entities. The notes typically contain embedded (but not separable or detachable) forward components or option components such as caps, calls, and floors. Contractual cash flows for principal, interest, or both can vary in amount and timing throughout the life of the note based on nontraditional indexes or nontraditional uses of traditional interest rates or indexes.

**Trading.** An activity involving securities sold in the near term and held for only a short period of time. The term trading contemplates a holding period generally measured in hours and days

rather than months or years. See paragraph 948-310-40-1 for clarification of the term trading for a mortgage banking entity.

**Trading Securities.** Securities that are bought and held principally for the purpose of selling them in the near term and therefore held for only a short period of time. Trading generally reflects active and frequent buying and selling, and trading securities are generally used with the objective of generating profits on short-term differences in price.

## CONCEPTS, RULES, AND EXAMPLES

---

### Debt Securities, and Equity Securities with Readily Determinable Fair Values

ASC 320, *Investments—Debt and Equity Securities*, governs the accounting:

- for passive investments in all debt securities, and
- for equity securities with readily determinable fair values.

The fair value of an equity security is considered readily determinable if it meets the definition in ASC 320-10-20. See the Definition of Terms section in this chapter for the criteria.

**Classification of investment securities.** Classification is made and documented at the time of the initial acquisition of each investment. (ASC 320-10-25-1 and 2) The appropriateness of classification is reassessed at each reporting date. ASC 320 requires all debt securities and equity securities with readily determinable fair values to be placed into one of three categories. These are summarized in the Exhibit below and the discussion that follows.

<b>Classification of debt securities and equity securities with readily determinable fair values</b>				
<u>Category</u>	<u>Type</u>	<u>Characteristics</u>	<u>Reported on statement of financial position</u>	<u>Reported in income</u>
Held-to-maturity	Debt	Positive intent and ability to hold until maturity	Amortized cost	Interest Realized gains and losses <sup>1</sup>
Trading	Debt or equity	Bought and held principally to sell short-term	Fair value	Interest and dividends Realized gains and losses Unrealized gains and losses Changes in fair value
Available-for-sale	Debt or equity	Neither held-to-maturity nor trading securities Have readily determinable fair value	Fair value as current assets Unrealized gains and losses in accumulated other comprehensive income (component of equity) <sup>2</sup>	Interest and dividends Realized gains and losses

<sup>1</sup> A transaction gain or loss on a foreign-currency-denominated held-to-maturity security is accounted for according to ASC 830-20.

<sup>2</sup> There is an exception to this treatment. “If an available for sale security is designated as being held in a fair value hedge, all or a portion of the unrealized gain or loss should be recognized in earnings.” (ASC 815-25-35-1)

**Presentation.** If a classified statement of financial position is presented, the debt and equity securities owned by an entity are grouped into current and noncurrent portfolios. By definition, all trading securities are classified as current assets. The determination of current or noncurrent status for individual held-to-maturity and individual available-for-sale securities is made on the basis of whether or not the securities are considered working capital available for current operations. (ASC 210-10-45) Investments that are held for purposes of control of another entity or pursuant to an ongoing business relationship, for example, stock held in a supplier, would be excluded from current assets and would instead be listed as other assets or long-term investments.

If they are disclosed in the notes, individual amounts for the three categories of investments do *not* have to be presented on the face of the income statement. (ASC 320-10-45-13)

### Held-to-Maturity Debt Securities

Only debt securities can be classified as held-to-maturity because equity securities do not have a maturity date. Certain conditions may indicate that an entity does not have either or both the intent and ability to hold the security to maturity. If an entity has both the *positive intent* and the *ability* to hold debt securities to maturity, those maturities are measured and presented at amortized cost. For these securities, fair value is not relevant to measuring the cash flow and there is no benefit to financial statement users of introducing the potential volatility associated with fair value. Each investment in a debt security is evaluated separately.

**Changes consistent with the held-to-maturity category.** Held-to-maturity securities are accounted for at amortized cost. To justify that accounting treatment, the held-to-maturity category does not include securities available for sale in response to a need for liquidity or changes in:

1. Market interest rates
2. Foreign currency risk
3. Funding sources and terms
4. Yield and availability of alternative investments
5. Prepayment risk.

(ASC 320-10-25-4)

For asset-liability management purposes, similar or identical securities may be classified differently depending upon intent and ability to hold. (ASC 320-10-25-4)

Under ASC 860-20-35, securities such as interest-only strips, which can be settled in a manner that could cause the recorded amounts to not be substantially recovered, cannot be classified as held-to-maturity. Depending upon the circumstances, those securities are categorized as either trading or available-for-sale.

There are also specific scenarios where a debt security should *not* be classified as held-to-maturity or where stated intent will be called into question in the future:

- Contractually, the security can be prepaid or settled in a way that the holder would not recover all or substantially all of its investment.
- The debt security is available to be used in response to:
  - Changes in market interest rates or the security's prepayment risk or foreign exchange risk
  - Need for liquidity.

- The security may need to be sold to implement tax strategies.
  - Security sold based on speculative analysis before any actual deterioration of the issuer's creditworthiness.
  - Security sold to meet regulatory capital requirements.
  - Exercise of a put option.
  - Convertible debt securities classified as held-to-maturity.
  - The entity has a policy to initially classify all debt securities as held-to-maturity and then transfer all securities to available-for-sale at a trigger point.
  - An insurance or other regulatory entity clarifies a security as held-to-maturity while at the same time telling regulators that the security could be sold to meet liquidity needs.
- (ASC 320-10-25-5)

**Transfers.** In general, transfers to or from this category are not permitted. In those rare circumstances when there are transfers or sales of securities in this category, disclosure must be made of the following in the notes to the financial statements for each period for which the results of operations are presented:

1. Amortized cost
2. Realized or unrealized gain or loss
3. Circumstances leading to the decision to sell or transfer.

ASC 320-10-25-6 lists changes in circumstances that are not considered inconsistent with the transfer, including:

1. Significant deterioration in creditworthiness of the issuer
2. Elimination or reduction of tax-exempt status of interest through a change in tax law
3. Major business disposition or combination
4. Statutory or regulatory changes that significantly modify what a permissible investment is or the maximum level of the security to be held
5. Downsizing in response to a regulatory increase in the industry's capital requirements
6. A significant increase in risk weights for regulatory risk-based capital purposes.

Other events may prompt a sale or transfer of a held-to-maturity security before maturity (ASC 320-10-25-9). These events should be:

1. Isolated
2. Nonrecurring
3. Unusual for the reporting entity
4. Not able to be reasonably anticipated.

If a sale meets *all* four of the conditions above, it may be considered not "tainted" and not call into question the entity's intent to hold other debt to maturity in the future. (See section later in this chapter on Transfers between Categories for more information on "tainted" transfers.)

**Sales within three months of maturity date.** The sale of a security within three months of its maturity meets the requirement to hold to maturity, since the interest rate risk is substantially diminished. Likewise, if a call is considered probable, a sale within three months of that date meets the requirement. The sale of a security after collection of at least 85% of the principal outstanding at acquisition (due to prepayments or to scheduled payments of principal and interest in equal installments) also qualifies, since the "tail" portion no longer represents an efficient investment

due to the economic costs of accounting for the remnants. Scheduled payments are not required to be equal for variable-rate debt. (ASC 320-10-25-14)

### Example of held-to-maturity debt securities

The 12/31/X1 debt security portfolio categorized as held-to-maturity is as follows:

<u>Security</u>	<u>Maturity value</u>	<u>Amortized cost</u>	<u>Assumed fair value</u>
DEF 12% bond, due 12/31/X2	\$ 10,000	\$10,320	\$10,200
PQR mortgage-backed debt, due 12/31/X4	\$100,000	\$92,000	\$90,000
JKL 8% bond, due 12/31/X8	\$ 10,000	8,929	\$ 9,100

The statement of financial position would report all the securities in this category at amortized cost and would classify them as follows:

<u>Security</u>	<u>Maturity date</u>	<u>Statement of financial position</u>	<u>Classification</u>
DEF	12/31/X2	\$10,320	Current
PQR	12/31/X4	92,000	Noncurrent
JKL	12/31/X8	8,929	Noncurrent

Interest income, including premium and discount amortization, is included in income. Any realized gains or losses are also included in income. Unless another basis yields a similar result, entities must amortize the premium or discount on debt securities using the effective-interest method. Interest income is calculated using the effective-interest rate applied to the beginning carrying amount for each period.

### Trading Securities

If an entity has debt and/or equity securities (with readily determinable fair value) that it intends to actively and frequently buy and sell for short-term profits, those securities are classified as trading securities. Unless classified as held-to-maturity securities under ASC 948, mortgage-backed securities held for sale require classification as trading securities. The securities in this category are required to be carried at fair value on the statement of financial position as current assets. All applicable interest and dividends, realized gains and losses, and unrealized gains and losses on changes in fair value are included in income from continuing operations.

### Example of accounting for trading securities

The Year 1 current trading securities portfolio is as follows:

<u>Security</u>	<u>Cost</u>	<u>Fair value</u>	<u>Difference (fair value minus cost)</u>
ABC	\$1,000	\$ 900	\$(100)
MNO calls	1,500	1,700	200
STU	2,000	1,400	(600)
XYZ 7% bond	2,500	2,600	100
	<u>\$7,000</u>	<u>\$6,600</u>	<u>\$(400)</u>

A \$400 adjustment is required in order to recognize the decline in fair value. The entry required is:

Unrealized loss on trading securities	400
Trading securities—MNO calls	200
Trading securities—XYZ 7% bond	100
Trading securities—ABC	100
Trading securities—STU	600

The unrealized loss would appear on the income statement as part of other expenses and losses. (ASC 320-10-35-1) Dividend income and interest income (including premium and discount amortization) is included in income. Any realized gains or losses from the sale of securities are also included in income.

An alternative to direct write-up and write-down of securities is the use of an asset valuation allowance account to adjust the portfolio totals. In the above example, the entry would be:

Unrealized loss on trading securities	400
Valuation allowance (contra asset)	400

The valuation allowance of \$400 would be deducted from historical cost to obtain a fair value of \$6,600 for the trading securities on the statement of financial position.

All trading securities are classified as current assets and the statement of financial position would appear as follows:

*Current assets:*

Trading securities at fair value (cost = \$7,000)	<u>\$6,600</u>
---	----------------

The Year 2 current trading portfolio is as follows:

<u>Security</u>	<u>New securities cost</u>	<u>Old securities</u>	<u>Year 1 fair value</u>	<u>Year 2 fair value</u>	<u>Difference*</u>
ABC			\$ 900	\$1,000	\$100
DEF Puts	\$1,500			1,500	0
STU			1,400	1,800	400
VWX	2,700			2,800	100
	<u>\$4,200</u>		<u>\$2,300</u>	<u>\$7,100</u>	<u>\$600</u>

\* Difference = Year 2 fair value – (Cost or Year 1 fair value)

A \$600 adjustment is required in order to recognize the increase in fair value. The entry required is:

Trading securities—ABC	100
Trading securities—STU	400
Trading securities—VWX	100
Unrealized gain on trading securities	600

The unrealized gain would appear on the income statement as part of other income.

**Example of accounting for a realized gain on trading securities**

1. The same information as given in the above example for Year 1
2. In Year 2, the MNO calls are sold for \$1,600 and the XYZ 7% bonds are sold for \$2,700.

The entry required to record the sale is:

Cash	4,300
Realized loss on sale of trading securities	100
Realized gain on sale of trading securities	100
Trading securities—MNO calls (Year 1 fair value)	1,700
Trading securities—XYZ 7% bonds (Year 1 fair value)	2,600

Under the valuation allowance method, the current trading portfolio would appear as follows:

<u>Security</u>	<u>Cost</u>	<u>X2 fair value</u>
ABC	\$1,000	\$1,000
DEF Puts	1,500	1,500
STU	2,000	1,800
VWX	2,700	2,800
	<u>\$7,200</u>	<u>\$7,100</u>

The required entries to recognize the increase in fair value and the realized gain are:

Valuation allowance	300
Unrealized gain on trading securities	300

*To adjust the valuation allowance to reflect the unrealized loss of \$100 at the end of year 2 on the remaining trading portfolio*

Cash	4,300
Trading securities—MNO calls (Cost)	1,500
Trading securities—XYZ 7% bonds (Cost)	2,500
Realized gain on sale of trading securities	300

The statement of financial position under both methods would appear as follows:

*Current assets:*

Trading securities at fair value (cost = \$7,200)	<u>\$7,100</u>
---	----------------

### Available-for-Sale Securities

Investments in debt securities and in equity securities with a readily determinable fair value that are *not* classified as either trading securities or held-to-maturity are classified as available-for-sale. The securities in this category are required to be carried at fair value on the statement of financial position. (ASC 320-10-35-1) The determination of current or noncurrent status for individual securities depends on whether the securities are considered working capital. (ASC 210-10-45)

Other than the possibility of having some noncurrent securities on the statement of financial position, the major difference between trading securities and available-for-sale securities is the handling of unrealized gains and losses. Unlike trading securities, the *unrealized* gains and losses of available-for-sale securities are excluded from net income. Instead, they are reported in other comprehensive income. An exception to this is if all or part of the gain or loss is designated as a fair value hedge. In that case, the unrealized gain or loss is recognized in earnings. (ASC 320-10-35-1)

All applicable interest (including premium and discount amortization) and any realized gains or losses from the sale of securities are included in income from continuing operations.

#### Example of available-for-sale equity securities

Bonito Corporation purchases 2,500 shares of equity securities at \$6 each, which it classifies as available-for-sale. At the end of one year, the quoted market price of the securities is \$4, which rises to \$9 at the end of the second year, when Bonito sells the securities. The company has an incremental tax rate of 25%. The calculation of annual gains and losses follows:

	<u>Gain/(loss) before tax</u>	<u>Tax on gain/(loss)</u>	<u>Gain/(loss) net of tax</u>
End of Year 1	(5,000)	(1,250)	(3,750)
End of Year 2	12,500	3,125	9,375
Net gain	7,500	1,875	5,625

Bonito reports these gains and losses in net income and other comprehensive income in the indicated years as follows:

	<u>Year 1</u>	<u>Year 2</u>
Net income:		
Gain on sale of securities	\$7,500	
Income tax expense	<u>(1,875)</u>	
Net gain realized in net income	5,625	
Other comprehensive income:		
Gain/(loss) on available-for-sale securities arising during period, net of tax	\$(3,750)	9,375
Reclassification adjustment, net of tax		<u>(5,625)</u>
Other comprehensive income net gain/(loss)	(3,750)	<u><u>3,750</u></u>

#### Example of available-for-sale debt securities

Bonito Corporation purchases 10,000 bonds of Easter Corporation maturing in six years, at a price of \$95.38, and classifies them as available-for-sale. The bonds have a par value of \$100 and pay interest of 7% annually. At the price Bonito paid, the effective interest rate is 8%. The calculation of the bond discount follows:

Maturity value of bonds receivable	\$1,000,000
Present value of \$1,000,000 due in 6 years at 8% (multiplier = 0.6302)	630,200
Present value of \$70,000 interest payable annually for 6 years at 8% annually (multiplier = 4.6229)	323,600
Purchase price of bonds	<u>953,800</u>
Discount on bonds payable	<u><u>46,200</u></u>

The complete table of interest income and discount amortization calculations for the remaining life of the bonds follows:

<u>Year</u>	<u>Beginning value</u>	<u>Interest received</u>	<u>Recognized interest income*</u>	<u>Discount amortization</u>	<u>Ending value</u>
1	\$953,800	\$70,000	\$76,304	6,304	960,104
2	960,104	70,000	76,808	6,808	966,912
3	966,912	70,000	77,353	7,353	974,265
4	974,265	70,000	77,941	7,941	982,206
5	982,206	70,000	78,576	8,576	990,782
6	990,782	70,000	79,218	9,218	1,000,000
				<u>46,200</u>	

\*  $(\text{Beginning value}) \times (\text{Effective interest rate of } 8\%)$

At the end of Year 1, the quoted market price of the bonds is \$98, and it is \$94 at the end of Year 2. The company has an incremental tax rate of 25%. The following table calculates the before-tax and after-tax holding gains and losses on the investment.

<u>Year</u>	<u>Ending carrying value</u>	<u>Ending fair value</u>	<u>Holding gain/(loss)</u>	<u>Income tax</u>	<u>Net of tax</u>
1	\$960,104	\$980,000	\$19,896	4,974	14,922
2	966,912	940,000	(26,912)	(6,728)	(20,184)
Net			(7,016)	(1,754)	(5,262)

Bonito sells the bonds at the end of Year 2, and reports these gains and losses in net income and other comprehensive income in the indicated years as follows:

	<u>Year 1</u>	<u>Year 2</u>
Net income:		
Interest income	76,304	76,808
Loss on sale of bonds		(7,016)
Income tax expense	(19,076)	(17,448)
Net gain/(loss) realized in net income	57,228	52,344
Other comprehensive income:		
Gain/(loss) on available-for-sale securities arising during period, net of tax	14,922	(20,184)
Reclassification adjustment, net of tax		5,262
Other comprehensive income net gain/(loss)	14,922	(14,922)

Notice that the changes in fair value are reflected in net income *after* the sale of available-for-sale securities, thus reducing volatility in net income.

## Transfers Between Categories

ASC 320 includes provisions intended to curtail management manipulation of income through careful selection of portfolio securities to be sold, a practice commonly known as “gains trading” and primarily used by financial institutions. Transfers from one of the three portfolio classifications to any other are expected to be rare. ASC 320 imposes limitations on situations in which it would be permissible to transfer investments between portfolios. With respect to debt securities, ASC 320 prohibits an entity the use of the “held-to-maturity” classification once it has been “tainted” by sales of securities that had been classified in that portfolio. (ASC 320-10-35-8 and 9) (See the discussion earlier in this chapter in the section “Held-to-Maturity Securities—Transfer” for more information.)

Securities purchased for the trading portfolio are so classified because it is management’s intent to seek advantage in short-term price movements. The fact that management does not dispose of those investments quickly does not necessarily mean that the original categorization was improper or that an expressed changed intent calls for an accounting entry. While transfers out of the trading category are not completely prohibited, they would have to be supported by facts and circumstances making the assertion of changed intent highly credible.

**Measurement.** Transfers among portfolios are accounted for at fair value as of the date of the transfer. Generally, investments in the trading category transferred to the available-for-sale category warrant no further recognition of gain or loss, as the carrying value of the investments already reflects any unrealized gains or losses experienced since their original acquisition. The only caveat is that, if the reporting entity’s accounting records of its investments, as a practical matter, have not been updated for fair values since the date of the most recently issued statement of financial position, any changes occurring since that time need to be recognized at the date the transfer occurs. The fair value at the date of transfer becomes the new “cost” of the equity security in the available-for-sale portfolio.

In brief, fair value is used for transfers between categories. When the security is transferred, any unrealized holding gains and losses are accounted for in the following manner:

1. From trading—Fair value already recognized and must not be reversed
2. Into trading—Recognize immediately in income

3. Available-for-sale debt security into held-to-maturity—Continue to report the unrealized holding gain or loss at the transfer date as other comprehensive income and amortize the gain or loss over the investment's remaining life as an adjustment of yield in the same manner as a premium or discount. The transferred-in security will probably record a premium or discount since fair value is used. Thus, the two amortizations will tend to cancel each other on the income statement.
4. Held-to-maturity debt security into available-for-sale—Recognize in other comprehensive income per ASC 220. Few transfers are expected from the held-to-maturity category. (ASC 320-10-35-10)

#### **Example of a transfer between trading and available-for-sale portfolios**

Neihaus Corporation's investment in Rabin Restaurants' common stock was assigned to the trading portfolio and at December 31, 20X1, was reflected at its fair value of \$88,750. Assume that in April 20X2 management determines that this investment will not be traded, but rather will continue to be held indefinitely. Under the criterion established by ASC 320, this investment now belongs in the available-for-sale portfolio. Assume also that the fair value at the date this decision is made is \$92,000, and that no adjustments have been made to the accounting records since the one that recognized the fair value increase to \$88,750. The entry to record the transfer from the trading portfolio to the available-for-sale portfolio is:

Investment in equity securities—available-for-sale	92,000
Investment in equity securities—held-for-trading	88,750
Unrealized gain on holding equity securities	3,250

Unrealized gains and losses on trading securities are always recognized in income, and in this example the additional increase in fair value since the last fair value adjustment, \$3,250, is recognized at the time of the transfer to the available-for-sale portfolio. Further gains after this date, however, will not be recognized in net income, but rather will be included in other comprehensive income.

For securities being transferred into the trading category, any unrealized gain or loss (that had previously been recorded in accumulated other comprehensive income, as illustrated above) is deemed to have been realized at the date of the transfer. Also, any fair value changes since the date of the most recent statement of financial position may need to be recognized at that time.

#### **Example of a transfer between available-for-sale and trading portfolios**

---

*NOTE: Items affecting other comprehensive income or loss are required to be recorded net of income tax. For illustrative purposes, the income tax effects of such transactions have been ignored.*

---

The investment in Mitzen preferred stock was held in the available-for-sale portfolio and had been adjusted at December 31, 20X1, from its original acquisition cost of \$125,000 to an end-of-year fair value of \$109,500 by reflecting in other comprehensive loss the \$15,500 unrealized decline in fair value that management judged to be temporary.

At March 31, 20X2, the fair value of Mitzen remained at \$109,500 and management now believed the unrealized loss to be an other-than-temporary impairment. As discussed in detail later in this chapter, this loss was recognized as a charge to net income at March 31, 2013, and reclassified ("recycled") from accumulated other comprehensive income into net income to prevent duplication in the financial statements (see summary table below).

At June 30, 20X2, the fair value of Mitzen had increased slightly from \$109,500 to \$112,000. Because Mitzen shares were classified as “available-for-sale,” this increase is reflected in other comprehensive income and is computed as:

$$\text{Fair value of } \$112,000 - \text{Cost adjusted for OTTI } \$109,500 = \$2,500.$$

On July 15, 20X2, management reverses course and decides to try to sell the investment in the short term. Thus, the shares no longer qualify to be classified as available-for-sale and are now considered securities held for trading purposes. The fair value of the shares held at the date of decision is \$114,700.

The activity described above with respect to Mitzen is summarized as follows:

<u>Date</u>	<u>Description</u>	<i>Memo: Cost (adjusted cost)</i>	<i>Fair value (carrying amount)</i>	<i>Net income (loss)</i>	<i>Reflected in OCI</i>
3/5/20X1	Original acquisition	\$125,000	\$125,000		
12/31/20X1	Unrealized loss		(15,500)		\$ (15,500)
			\$109,500		(15,500)
3/31/20X2	OTTI	(15,500)	0	(15,500)	15,500
		109,500	109,500	(15,500)	0
6/30/20X2	Partial recovery		2,500		2,500
			112,000		2,500
7/15/20X2	Reclassification and further recovery		2,700	5,200	(2,500)
		\$109,500	\$114,700	\$ (10,300)	\$ 0

#### *Abbreviations*

OCI	Other comprehensive income (loss)
OTTI	Other-than-temporary impairment
AOCI	Accumulated other comprehensive income (loss)
FV	Fair value
AFS	Available-for-sale

On July 15, 20X2, immediately preceding the reclassification of the investment from available-for-sale to trading, the accounting records reflect the following componentized balances (assuming these were the only transactions occurring during the period):

#### *Statement of financial position*

Cost adjusted for OTTI of AFS equity securities (asset)	109,500
Change in FV of AFS equity securities (valuation account)	2,500
	\$ 112,000
Accumulated other comprehensive loss (equity)	\$ (15,500)

#### *Statement of comprehensive income*

Loss on impairment of AFS equity securities (net income)	\$ (15,500)
Reclassification of AOCI to net income (OCI)	15,500
Unrealized appreciation of AFS equity securities (OCI)	2,500

\$ 2,500

The entry to record the transfer from available-for-sale to trading and the “realization” of the increase in fair value from \$112,000 to \$114,700 at that date is as follows:

	<u>Debit</u>	<u>Credit</u>
<i>July 15, 20X2</i>		
Change in FV of AFS equity securities (valuation account)	2,700	
Unrealized appreciation of AFS equity securities (OCI)		2,700
<i>To record appreciation in AFS portfolio at 7/15/20X2</i>		
Equity securities held for trading purposes	114,700	
Cost adjusted for OTTI of AFS equity securities		109,500
Change in FV of AFS equity securities (valuation account)		5,200
Unrealized appreciation of AFS equity securities (OCI)	5,200	
Unrealized gain on equity securities held for trading (net income)		5,200
<i>To reclassify equity securities from the AFS portfolio to the trading portfolio, to recognize the appreciation in fair value of those securities in current net income, and to reclassify the previously unrecognized appreciation on those securities from OCI</i>		

The recognized gain at the time of transfer, in this case, is the sum of the previously unrecognized gain that had been recorded in accumulated other comprehensive income (AOCI), the additional equity account (\$2,500) plus the further gain not yet recognized in the investor's financial statements (\$2,700). Note that the elimination of the additional equity representing the previously reported unrealized gain will be included in comprehensive income in the current period as a debit, since the additional equity account is being reversed at this time.

### Other-than-Temporary Impairment (OTTI)

ASC 320-10-35-17 through 34E addresses the impairment of individual available-for-sale and held-to-maturity securities. Impairment of trading securities is generally not relevant because trading securities are measured at fair value in income.

**Scope.** The guidance on impairment of individual available-for-sale and held-to-maturity securities applies to:

1. Debt and equity securities within the scope of ASC 320 with the following clarifications:
  - All equity securities held by insurance entities are included in the scope of the guidance.
  - Entities are not to “look through” the form of their investment to the nature of the securities held by the investee entity. So, for example, if the reporting entity holds an investment in shares of a mutual fund whose investment strategy is to invest primarily in debt securities, management is to assess the mutual fund investment as an equity security, since the shares held by the reporting entity represent equity in the mutual fund, irrespective of the fact that the mutual fund’s holdings are comprised primarily of debt.
  - If the application of ASC 815-15-25 (recognition of embedded derivatives) results in bifurcating an investment into a host instrument and an embedded derivative, the host instrument would be evaluated for impairment under this guidance if it falls within its scope.
2. The standard applies to debt and equity securities that are (a) within the scope of ASC 958-320 (not-for-profit entities’ investments in debt and equity securities) and (b) held by an investor that reports a performance indicator.
3. Cost-method investments in equity securities.  
(ASC 320-10-35-17)

ASC 320-10-35 establishes a multistep decision process to determine if an investment has been impaired:

- Evaluate whether the impairment is other than temporary, and
- If OTTI is determined to have occurred, measure the impairment loss.

It also establishes a discrete model for assessing impairment of cost-method investments that present unique challenges since reasonable estimation of their fair value is often not practical or cost effective.

**Unit of accounting.** The unit of accounting for the purpose of performing these steps is the individual security level. This is defined as the level and method of aggregation used by the reporting entity to measure realized and unrealized gains and losses on its debt and equity securities. An example of an acceptable method of aggregation would be for the reporting entity to consider equity securities of an issuer that carry the same Committee on Uniform Security Information Procedures (CUSIP) number that were purchased in separate trade lots to be considered together on an average cost basis.

In considering whether the issuer (i.e., borrower or debtor) of a debt security can prepay or settle the security in a manner that would result in the investor not recovering substantially all of its cost, the investor is not permitted to combine separate contracts such as a debt security and a guarantee or other credit enhancement.

The impairment model for investments, other than those accounted for using the cost method, follows.

**Step 1—Determine whether the investment is impaired.** An investment is impaired if its fair value is less than its cost. Cost as defined for this purpose includes adjustments made to the cost basis of an investment for accretion, amortization, previous OTTIs, and hedging.<sup>3</sup>

In assessing impairment of debt securities, the investor is not permitted to combine separate contracts such as guarantees or other credit enhancements.

The assessment of whether an investment is impaired must be made for each interim and annual reporting period, subject to special provisions that apply to cost-method investments discussed separately below.

After comparing fair value to cost, if cost exceeds fair value, the investment is considered impaired, and the evaluator then proceeds to Step 2 to evaluate whether the impairment is considered to be “other than temporary.”

**Step 2—Evaluate whether the impairment is other than temporary.** If the fair value of the investment is less than its cost at the ending date of a reporting period (the date of the latest statement of financial position), management is tasked with evaluating whether the impairment is temporary, or whether it is “other-than-temporary.” While the term “other-than-temporary” is not defined, FASB affirmatively states that it *does not mean permanent*. Thus, a future recovery of all or a portion of the decline in fair value is not necessarily indicative that an assessment of OTTI made in prior periods was incorrect.

**OTTI of available-for-sale (AFS) equity securities.** (ASC 320-10-35-32A) When the fair value of an equity security declines, management starts with a working premise that the decline may necessitate a write-down of the security. With that mindset, management investigates the reasons for the decline by considering all available evidence to evaluate the AFS equity

---

<sup>3</sup> ASC 815-25-35 indicates that, with respect to a qualifying fair value hedge, the change in fair value of the hedged item that is attributable to the hedged risk is recorded as an adjustment to the carrying amount of the hedged item and is recognized currently in net income.

investment's realizable value. Many factors should be considered by management in performing the evaluation and, of course, the evaluation will depend on the individual facts and circumstances. The SEC's Staff Accounting Bulletin Series, Topic 5.M provides a few examples of factors that, when considered individually or in the aggregate, indicate that a decline in fair value of an AFS equity security is other-than-temporary, and that an impairment write-down of the carrying value is required:

1. The period of time and the extent to which the fair value has been less than cost;
2. The financial condition and near-term prospects of the issuer, including any specific events that might influence the operations of the issuer such as changes in technology that may impair the earnings potential of the investment or the discontinuance of a segment of the business that may affect the future earnings potential; *or*
3. The intent or ability of the holder to retain its investment in the issuer for a period of time sufficient to allow for any anticipated recovery in fair value.

Unless there is existing evidence supporting a realizable value greater than or equal to the carrying value of the investment, a write-down to fair value accounted for as a realized loss is recorded. The loss is recognized as a charge to net income in the period in which it occurs and the written-down value of the investment in investee becomes the new cost basis of the investment.

It is important to note that, if an investor has decided to sell an impaired AFS equity security, and the investor does not expect the fair value of the security to fully recover prior to the expected time of sale, the security is considered OTTI in the period in which the investor decides to sell the security. However, even if a decision to sell the security has not been made, the investor recognizes OTTI when that impairment has been determined to have been incurred.

*OTTI of debt securities.* (ASC 320-10-35-33A through 33I) If the fair value of a debt security is less than its amortized cost basis at the date of the statement of financial position, management must assess whether the impairment is an OTTI.

If management intends to sell the security, then an OTTI is considered to have occurred.

If management does not intend to sell the security, management should consider all available evidence to assess whether it is more likely than not that it will be required to sell the security prior to recovery of its amortized cost basis (e.g., whether the entity's cash or working capital requirements, or contractual or regulatory obligations, will require sale of the security prior to the occurrence of a forecasted recovery). If it is more likely than not that a sale will be required prior to recovery of the security's amortized cost basis, OTTI is considered to have been incurred.

If, at the measurement date, management does not expect to recover the *entire* amortized cost basis, this precludes an assertion that it will recover the amortized cost basis irrespective of whether management's intent is to continue holding the security or to sell the security. Therefore, when this is the case, OTTI is considered to have been incurred.

Expected recovery is computed by comparing the present value of cash flows expected to be collected (PVCF) from the security to the security's amortized cost basis.

If PVCF is less than amortized cost basis, the entire amortized cost basis of the security will not be recovered; a credit loss has occurred, and an OTTI has been incurred.

Amortized cost basis (ACB) includes adjustments made to the original cost of the investment for such items as:

1. Accretion
2. Amortization
3. Cash collections

4. Previous OTTI recognized as charges to net income (less any cumulative-effect adjustments recognized in transitioning to the provisions of FSP 115-2)
5. Fair value hedge accounting adjustments.

In determining whether a credit loss has been incurred, management must use its best estimate of the present value of cash flows expected to be collected from the debt security. The computation, in simple terms, is made by discounting the expected cash flows at the effective interest rate implicit in the security at the date of its acquisition. A methodology for estimation of that amount is described in ASC 310, which is codified in the ASC as follows:

- ASC 310-10-35-21 through 35-37
- ASC 310-30-30-2
- ASC 310-40-35-12.

Many factors influence the estimate of whether a credit loss has occurred and the period over which the debt security is expected to recover. (ASC 320-10-35-33F) Examples of these factors include, but are not limited to:

1. The length of time and the extent to which the fair value of the security has been less than its amortized cost basis
2. Adverse conditions that relate specifically to the security, an industry, or a geographic locale such as:
  - a. Changes in the financial condition of the issuer of the security or, in the case of asset-backed securities, changes in the financial condition of the underlying loan obligors
  - b. Changes in technology
  - c. Discontinuance of a segment of the business that may affect the future earnings potential of the issuer or underlying loan obligors of the security
  - d. Changes in the quality of a credit enhancement
3. The historical and implied volatility of the fair value of the security
4. The payment structure of the debt security and the likelihood of the issuer being able to make payments that are scheduled to increase in the future; examples of nontraditional loan terms are described in ASC 310-10-50-25, ASC 825-10-55-1, and ASC 825-10-55-2
5. Failure of the security's issuer to make scheduled interest or principal payments
6. Changes in the rating of the security by a ratings agency
7. Recoveries or additional declines in fair value that occur subsequent to the date of the statement of financial position.

In developing the estimate of PVCF for the purpose of assessing whether OTTI has occurred (or recurred), management should consider all available information relevant to the collectibility of sums due under the terms of the security, including information about past events, current conditions, and reasonable and supportable forecasts. That information generally should include:

1. The remaining payment terms of the security,
2. Prepayment speeds,
3. The financial condition of the issuer(s),
4. Expected defaults, and
5. The value of the collateral.

(ASC 320-10-35-33G)

To accomplish this objective, management should consider, for example:

1. Industry analyst reports and forecasts,
2. Sector credit ratings, and
3. Other market data relevant to the collectibility of the security.

(ASC 320-10-35-33H)

Management must also consider how other credit enhancements affect the expected performance of the security, including:

1. The current financial condition of the guarantor of the security (unless the guarantee is a separate contract under ASC 320-10-35-23), and/or
2. Whether any subordinated interests are capable of absorbing estimated losses on the loans underlying the security.

(ASC 320-10-35-33I)

The remaining payment terms of the security could differ significantly from the payment terms in prior periods, such as when securities are backed by nontraditional loans (e.g., reverse mortgages, interest-only debt, adjustable-rate products). As a result, management must consider whether currently performing loans that back a security will continue to perform when required payments increase in the future, including any required “balloon” payments. Management should also consider how the value of any collateral would affect the security’s expected performance. If there has been a decline in the fair value of the collateral, management is to assess the effect of that decline on the ability of the entity to collect the balloon payment.

**Recognition of an other-than-temporary impairment.** If, as a result of Step 2, management judges the impairment to be other than temporary, the reporting entity recognizes an impairment loss as a charge to net income for the entire difference between the investment’s cost and its fair value at the date of the statement of financial position. The impairment measurement must not include any partial recoveries that might have occurred subsequent to the date of the statement of financial position but prior to issuance of the financial statements.

The reduced carrying amount of the investment becomes that investment’s new cost basis. This new cost basis is not changed for any subsequent recoveries in fair value. Subsequent recoveries in the fair value of available-for-sale securities are included in other comprehensive income; subsequent decreases in fair value are evaluated as to whether they are other than temporary in nature. If considered temporary, the decrease is recorded in other comprehensive income. If considered other than temporary, the decrease is recognized as a component of net income for the period as previously described.

**Determining OTTI of debt securities to be recognized in net income and in other comprehensive income (OCI).** ASC 320 permits reporting entities to split OTTI of debt securities into two components and thus recognize only a portion of the OTTI as a charge to net income when incurred. The remaining portion is to be accounted for through other comprehensive income as described in the following paragraphs.

When an OTTI has been incurred with respect to a debt security, the amount of the OTTI recognized in net income is dependent upon whether management intends to sell the security or more likely than not will be required to sell the security prior to recovery of its ACB, less any recognized current period credit loss, as explained below.

As discussed previously, if management intends to sell the security or more likely than not will be required to sell the security prior to recovery of its amortized cost basis, less any

current period credit loss, the OTTI to be recognized in net income equals the entire difference between the investment's amortized cost basis and its fair value at the date of the statement of financial position. Stated differently, in this situation, the entire amount of the OTTI is deemed to be a credit loss and is recognized as an immediate charge to net income in its entirety.

If, however:

1. Management does not intend to sell the security, *and*
2. It is more likely than not the entity will not be required to sell the security prior to recovery of its amortized cost basis less any current period credit lost, the OTTI is to be separated into two components as follows:

**Component 1:** The amount representing the credit loss, *and*

**Component 2:** The remaining amount, which is presumed to be related to all other factors (but that economically is inseparable from the factors that would cause a loss to be characterized as being from deteriorated credit quality).

Component 1 should be recognized in its entirety in net income and Component 2 should be recognized in OCI, net of applicable income taxes.

The previous ACB less Component 1 of the current year's OTTI that represents the current period credit loss becomes the new amortized cost basis of the investment prospectively. That new ACB is not adjusted for subsequent recoveries in fair value. The amortized cost basis is adjusted, however, for accretion and amortization, as described in the next section.

#### Example of other-than-temporary impairment of an available-for-sale security

In January 20X2 new information comes to the attention of Neihaus Corporation management regarding the viability of Mitzen Corp. Based on this information, it is determined that the decline in Mitzen preferred stock is probably not a temporary one, but rather is other-than-temporary (i.e., the asset impairment requires financial statement recognition). ASC 320 prescribes that such a decline be reflected in net income and the written-down value be treated as the new cost basis. The fair value has remained at the amount last reported, \$109,500. Accordingly, the entry to recognize the fact of the investment's permanent impairment is as follows:

Loss on holding equity securities	15,500
Unrealized loss on securities—available-for-sale (other comprehensive income)	15,500

Any subsequent recovery in this value would not be recognized in net income unless realized through a sale of the investment to an unrelated entity in an arm's-length transaction, as long as the investment continues to be categorized as "available-for-sale," as distinct from "held-for-trading." However, if there is an increase in value (not limited to just a recovery of the amount of the loss recognized above, of course) the increase will be added to the investment account and shown in a separate account in stockholders' equity, since the asset is to be marked to fair value on the statement of financial position.

It should be noted that the issue of other-than-temporary impairment does not arise in the context of investments held for trading purposes, since unrealized holding gains and losses are immediately recognized without limitation. In effect, the distinction between realized and unrealized gains or losses does not exist for trading securities.

**Example of temporary impairment of an available-for-sale security**

In March 20X2 further information comes to management's attention, which now suggests that the decline in Mitzen preferred was indeed only a temporary decline; in fact, the value of Mitzen now rises to \$112,000. Since the carrying value after the recognition of the impairment was \$109,500, which is treated as the new cost basis for purposes of measuring further declines or recoveries, the increase to \$112,000 is accounted for as an increase to be reflected in the additional stockholders' equity account (AOCI), as follows:

Investment in equity securities—available-for-sale	2,500
Unrealized gain on securities—available-for-sale (other comprehensive income)	2,500

Note that this increase in fair value is not recognized in current net income, since the investment is still considered to be available-for-sale, rather than a part of the trading portfolio. Even though the previous decline in Mitzen stock was realized in current net income, because it was judged at the time to be an OTTI, the recovery is not permitted to be recognized in net income. Rather, the change in fair value will be included in other comprehensive income and then displayed in AOCI.

**Subsequent measurement after recognition of an OTTI.** After recognition of an OTTI, the impaired security is accounted for as follows. Management accounts for a debt security subject to OTTI as if that security had been purchased on the measurement date of the OTTI at an amortized cost basis equal to the previous amortized cost basis less Component 1 of the OTTI (the portion recognized as a charge to net income as a current period credit loss).

**Debt securities classified as available-for-sale (AFS).** Subsequent increases and decreases in the fair value of AFS securities, if not caused by an additional OTTI, are included in OCI.

**Debt securities classified as held-to-maturity.** The OTTI recognized in OCI for held-to-maturity securities is prospectively accreted (sometimes referred to as "recycling") from other comprehensive income (OCI) to the amortized cost of the debt security over its remaining life based on the amount and timing of future estimated cash flows. That accretion is to increase the security's carrying value and continues until the security is sold, matures, or there is an additional OTTI charged to net income. If the security is sold, guidance on the effect of changes in circumstances that would not call into question management's intent to hold other debt securities to maturity in the future is discussed in a previous section of this chapter and is provided in the following authoritative literature:

- ASC 320-10-25-6 and 25-9
- ASC 320-10-25-14
- ASC 320-10-50-11.

**Additional guidance with respect to subsequent period accounting.** For debt securities for which OTTI has been recognized as a charge to net income, the difference between the new amortized cost basis and the cash flows expected to be collected is to be accreted following existing guidance on interest income. The entity should continue to estimate the PVCF expected to be collected over the remaining life of the debt security.

For specified beneficial interests in securitized financial assets, entities should apply the provisions of ASC 325-40 to account for changes in the PVCF.

For all other debt securities, if subsequent evaluation indicates a significant increase in the PVCF or if actual cash flows are significantly greater than cash flows previously expected, those

changes are accounted for as a prospective adjustment to the accretable yield of the security under ASC 310-30, even if the debt security would not otherwise be subject to the scope of that standard.

**Income statement presentation.** In periods in which management determines that a decline in the fair value of a security below its amortized cost basis is other than temporary, management presents the total OTTI in the income statement with an offset for the amount of the total OTTI that is recognized in OCI, if any (Component 2).

#### Example of income statement presentation of OTTI

Total losses from other-than-temporary impairment	\$(30,000)
Portion of loss recognized in other comprehensive income (before income taxes)	<u>22,000</u>
Net impairment losses recognized in net income	<u><u>\$ (8,000)</u></u>

When reporting the components of accumulated other comprehensive income (AOCI), management must present separately the amounts recognized in AOCI related to held-to-maturity and available-for-sale debt securities for which a portion of an OTTI has been recognized as a charge to net income.

**Subsequent accounting for debt securities after recognition of OTTI.** After recognizing a loss from other-than-temporary impairment with respect to a debt security, the investor treats the security as if it had been purchased on the measurement date on which the impairment was recognized. If the security had been originally purchased at a premium, the impairment charge will either reduce or eliminate the premium or if the impairment is large enough cause the reporting entity to record a discount. If the security had been purchased at its face amount or a discount, the impairment charge will result in recording or increasing the discount.

After recording the adjustment for the impairment, the adjusted premium or discount is amortized prospectively over the remaining term of the debt security based on the amount and timing of future estimated cash flows.

#### Cost-Method Investments

By their nature, cost-method investments normally do not have readily determinable fair values. Consequently, ASC 320-10-35-25 provides a different model for determining whether a cost-method investment is other-than-temporarily impaired. The determination is made as follows:

1. If the investor has estimated the investment's fair value (e.g., for the purposes of the disclosures of the fair value of financial assets required by ASC 825-10-50), that estimate is to be used to determine if the investment is impaired for those reporting periods in which the investor estimates fair value. If the fair value is less than cost, the investor would proceed to Step 2 of the impairment protocol described previously.
2. For reporting periods in which the investor has not estimated the fair value of the investment, the investor is required to evaluate whether an event or change in circumstances has occurred during the period that may have a significant adverse effect on the fair value of the investment. Such events and circumstances are referred to as impairment indicators and include, but are not limited to:
  - a. A significant deterioration in the earnings performance, credit rating, asset quality, or business prospects of the investee

- b. A significant adverse change in the economic, regulatory, or technological environment of the investee
- c. A significant adverse change in the general market condition of either the geographic area or the industry in which the investee operates
- d. A solicited or unsolicited bona fide offer to purchase, an offer by the investee to sell, or a completed auction process for the same or similar security for an amount less than the cost of the investment
- e. Existing factors that raise significant concerns regarding the ability of the investee to continue as a going concern, such as negative cash flows from operations, working capital deficiencies, or noncompliance with debt covenants or statutory capital requirements.

(ASC 320-10-35-27)

If an impairment indicator is present, the investor is required to estimate the investment's fair value and compare the estimated fair value to the cost of the investment. If the fair value is less than cost, the investor is to proceed to Step 2, as previously described, to evaluate whether the impairment is other than temporary.

Additionally, if a cost-method investment had previously been evaluated under Step 2 as to whether impairment was other than temporary, and the investor had previously concluded that the investment was not other-than-temporarily impaired, the investor is required to continue to make this evaluation by estimating the investment's fair value in each subsequent interim and annual reporting period until either:

1. the investment's fair value recovers to an amount that equals or exceeds the cost of the investment, or
2. the investor recognizes an other-than-temporary impairment loss.

(ASC 320-10-35-28)

For more information on cost-method investments, see the chapter on ASC 325.

### **Changes in Fair Value Measurements After Year-end—Reporting and Disclosures**

Under GAAP, events occurring after the date of the statement of financial position are generally not recognized as adjustments to the financial statements. However, disclosure may be necessary if, absent that information, the user of the financial statements would be misled. While not addressed explicitly by ASC 320, presumably material changes in fair value occurring subsequent to the date of the statement of financial position but prior to issuance of the financial statements should be disclosed by management.

Sometimes changes in fair value can be indicative of the underlying cause of the price fluctuations. Of most interest here would be declines in value of available-for-sale securities held at the date of the statement of financial position, which suggest that an “other-than-temporary” impairment has occurred. If the decline actually occurred after year-end as evidenced by a bankruptcy filing, then the event would be disclosed but not reflected in the year-end statement of financial position. However, in some instances, the subsequent decline would be seen as a “confirming event” which provided evidence that the classification or other treatment of an item on the date of the statement of financial position was incorrect. Thus, if a decline in the fair value of available-for-sale securities at the date of the statement of financial position had been accounted for as temporary (and hence reported in other comprehensive income) a further decline after the statement of financial position date might suggest that the decline as of the statement of financial

position date had, in fact, been a permanent impairment. Note that any further value decline after year-end would not be recorded in the financial statements; the only question to be addressed is whether the decline that occurred prior to year-end should have been treated as a permanent impairment rather than as a temporary market fluctuation.

If it is clear that the impairment at year-end had, in fact, been other than temporary in nature, then the financial statements are adjusted to reflect this loss in net income. Absent sufficient basis to reach this conclusion, the appropriate course of action is to not adjust the statements, but merely to disclose the (material) change in fair value that occurred subsequent to year-end including, if appropriate, a statement to the effect that the later decline was deemed to be an OTTI and will be reflected in the net income of the next year's financial statements. It should also be made clear that the decline occurring prior to year-end was not considered to be an other-than-temporary impairment at that time.

The FASB staff noted that when an entity has decided to sell a security classified as available-for-sale having a fair value less than cost at year-end, and it does not reasonably expect a recovery in value before the sale is to occur, then a write-down for an other-than-temporary decline is prescribed. This would most obviously be necessary if the actual sales transaction, anticipated at year-end, occurs prior to the issuance of the financial statements.

## Other Issues

*Mutual funds invested in U.S. government contracts.* ASC 320-10-50 holds that investments in open-end mutual funds that invest in U.S. government securities should be reported at fair value per ASC 320. Investments in mutual funds that invest solely in U.S. government debt securities are deemed to be equity investments (since it is the shares of the fund, and not the ultimate debt securities, that are owned), and therefore cannot be classified as held-to-maturity investments.

*Forward contracts and options.* ASC 815-10-35 addresses the accounting for certain forward contracts and purchased options to acquire securities covered by ASC 320. It applies only when the terms require physical settlement. It stipulates that forward contracts and purchased options (which are not classified as derivatives, having no intrinsic value at acquisition) should be designated and accounted for as prescribed by ASC 320. These forwards and options would not be eligible for designation as hedging instruments.

*Structured notes.* ASC 320-10-35 deals with the complex area of "structured notes," in particular with the matters of the recognition of interest income and of the statement of financial position classification of such instruments. When recognizing interest income on structured note securities in an available-for-sale or held-to-maturity portfolio, the retrospective interest method is used if three conditions are satisfied. These conditions are:

1. Either the original investment amount or the maturity amount of the contractual principal is at risk
2. Return of investment on note is subject to volatility arising from either:
  - a. No stated rate or stated rate that is not a constant percentage or in the same direction as changes in market-based interest rates or interest rate index, or
  - b. Fixed or variable coupon rate lower than that for interest for traditional notes with similar maturity, and a portion of potential yield based on occurrence of future circumstances or events
3. Contractual maturity of bond is based on a specific index or on occurrence of specific events or situations outside the control of contractual parties.

This does not apply to structured note securities that, by their nature, subject the holder to reasonably possible loss of all, or substantially all, of the original invested amount (other than due to debtor failure to pay amount owed). In those instances, the investment is to be carried at fair value with changes in value recognized in current earnings.

The retrospective interest method requires that periodic income be measured by reference to the change in amortized cost from period beginning to period end, plus any cash received during the period. Amortized cost is determined with reference to the conditions applicable as of the respective date of the statement of financial position. Other-than-temporary declines in fair value would also have to be recognized in earnings, consistent with ASC 320 requirements for held-to-maturity investments.

## PERSPECTIVE AND ISSUES

### Technical Alert

In January 2016, the FASB issued ASU 2016-01, *Financial Instruments—Overall (Subtopic 825-10): Recognition and Measurement of Financial Assets and Financial Liabilities*. The ASU is the result of the FASB’s project on accounting for financial instruments. The goal of the project is to improve the usefulness of financial instruments reporting for decision makers. Simplification is expected to be an outcome of the project. This ASU is the first one issued as part of the financial instruments project. New impairment guidance is expected in 2016 as is an exposure draft on hedging.

The ASU affects guidance on:

- Equity investments that are not consolidated or accounted for under the equity method,
- Financial liabilities under the fair value option, and
- Presentation and disclosure requirements for financial instruments.

For equity investments without readily determinable fair value, the ASU generally eliminates the cost method—cost less impairment, adjusted for subsequent observable price changes. However, some investments are eligible to use the cost method as a practical expedient and entities may choose to use it. There is now a split in the accounting for debt and equity securities. This resulted in the addition of ASC 321 and changes in terminology in the other investment topics.

**Scope.** The scope of the ASU is broad and includes all types of equity investments that are not consolidated or accounted for under the equity method, including those that would not be found in the definition of a security. For example, limited partnerships that hold only debt securities fall under ASC 321. This is because the new guidance does not allow a “look through” to the holdings in order to determine recognition and measurement. ASC 321 also applies to

forwards and options designed to acquire and dispose of ownership interests not accounted for as derivative instruments under ASC 815.

**Effective date.** ASC 2016-01 is effective:

- For public business entities—fiscal years beginning after December 15, 2017, including interim periods within those fiscal years.
- For all other entities—fiscal years beginning after December 15, 2017, including interim periods within those fiscal years. Early adoption is permitted for provisions that eliminate previously required disclosures.

For more information on the ASU, see the chapter on ASC 825.

## Investment Topics

The Codification contains several topics dealing with investments, including:

- ASC 320, *Investments—Debt and Equity Securities*
- ASC 323, *Investments—Equity Method and Joint Ventures*
- ASC 325, *Investments—Other*

ASU 2016-01 adds a new topic related to investments: ASC 321, *Investments—Equity Securities*. It also changes the name of ASC 320 to *Investments—Debt Securities*.

### Subtopics

ASC 321, *Investments—Equity Securities*, contains one subtopic:

- ASC 321-10, *Overall*, which provides accounting and reporting guidance for investments in equity securities and other ownership interests in an entity.

### Scope and Scope Exceptions

**In scope.** The guidance in ASC 321 applies to all entities, including entities that are not deemed specialized industries for purposes of this Topic:

- Cooperatives and mutual entities, such as credit unions and mutual insurance entities
- Trusts that do not report substantially all of their securities at fair value.  
(ASC 321-10-15-2)

Included in the scope, as if the ownership interests are equity securities, are ownership interests in an entity, including:

- Investments in partnerships,
- Unincorporated joint ventures, and
- Limited liability corporations.  
(ASC 321-10-15-4)

It also applies to forwards and options to acquire and dispose of ownership interests that are not treated as derivatives in ASC 815. (ASC 321-10-15-6)

**Scope exceptions.** The guidance does *not* apply to entities in certain specialized industries whose specialized accounting practices include accounting for substantially all investments at fair value, with changes in value recognized in earnings (income) or in the change in net assets. Examples of those entities are:

- Brokers and dealers in securities (Topic 940)

- Defined benefit pension and other postretirement plans (Topics 960, 962, and 965)
  - Investment companies (Topic 946).
- (ASC 321-10-15-3)

ASC 321 does *not* apply to any of the following items:

- Derivative instruments subject to the requirements of ASC 815, including those that have been separated from a host contract as required by ASC 815-15-25. If an investment otherwise would be in the scope of this topic and it has within it an embedded derivative that is required by ASC 815 to be separated, the host instrument remains within the scope of ASC 815. (Note that guidance in the subsection on certain contracts on debt and equity securities does apply to forward contracts and purchased options that are not ASC 815 derivative instruments.)
  - Investments accounted for under the equity method (Topic 323).
  - Investments in consolidated subsidiaries.
  - An exchange membership that has the characteristics specified in paragraph 940-340-25-1(b) for an ownership interest in the exchange.
  - Federal Home Loan Bank Stock.
  - Federal Reserve Bank Stock.
- (ASC 321-10-15-5)

## DEFINITIONS OF TERMS

---

Source: ASC 321-20. See Appendix A for terms related to this topic: Equity Security, Fair Value, Holding Gain or Loss, Market Participants, Orderly Transaction, Readily Determinable Fair Values, Related Parties, and Security.

## CONCEPTS, RULES, AND EXAMPLES

---

### Investments That No Longer Qualifies for Equity Method

In a case where the investor's share of the investment decreases to a level that the investment no longer qualifies for the equity method, the security's initial basis becomes the carrying value. Any losses accrued remain as part of the carrying value. (ASC 323-10-30-1)

### Measurement

**Equities with readily determinable fair value.** Except for securities accounted for under the equity method of accounting, all equity investments in the scope of ASC 321 are measured at fair value, using the guidance in ASC 820, with changes in fair value reflected in income. For securities with readily determinable fair value, the available-for-sale category has been eliminated. Because, unlike debt securities, equity securities do not have a maturity date, the entity primarily realizes the value of an equity investment through a sale. So, fair value is the most appropriate measure. ASC 321 offers an alternative measurement for equity investments without readily determinable fair values.

**Equity investments without readily determinable fair values.** Unless the investment qualifies for the measurement alternative described below, entities should report equities without readily determinable fair values at fair value in accordance with ASC 820 and report all subsequent changes in fair value in net income. This approach requires a quantitative valuation

each year. A quantitative valuation may sometimes necessitate that the entity engage an outside expert. Recognizing the time and cost involved in valuing each equity investment for each reporting period, the FASB provides a practical alternative—a measurement alternative.

**Measurement alternatives.** Entities have two measurement alternatives available to them for equity investments without readily determinable fair value:

1. The ASC 820 alternative
2. The ASC 321 practical alternative.

*The ASC 820 alternative.* Some investments that do not have readily determinable fair value as defined in ASC 820-20 may qualify for a measurement alternative under ASC 820-10-35-59. This alternative is available to:

- Investment companies within the scope of ASC 946, or
- Real estate funds that use measurement principles consistent with those in ASC 946.

If the investment meets those qualifications, the entity may value them at net asset value per share, that is, the amount of net assets attributable to each share of common stock.

*The ASC 321 practical measurement alternative.* For equity investments without readily determinable fair value, ASC 321 allows some entities to elect the cost method. Entities following specialized accounting models, such as investment companies and broker-dealers, do not have that option. All others may elect to record these investments at cost, less impairment, adjusted for subsequent price changes. Entities that elect the cost-method option must make changes in the carrying value of the equity investment whenever there are observable price changes:

- in orderly transactions
- for the identical or similar investment
- of the same issuer.

Entities are required to make a reasonable effort to identify reasonably knowable price changes. (ASC 321-10-55-8) This approach eliminates the need for entities to get a valuation every reporting period for equity investments without readily determinable fair values. However, in making its measurement election, the entity should also consider the effort required to identify known or reasonably knowable observable transactions, determine whether those transactions were orderly, and determine if those transactions were for similar investments.

Determining whether an equity security is similar requires significant judgment. When making the determination, entities should consider differences in rights and obligations of the securities. Differences may indicate either that:

- The observable price should not be used to adjust the value of the security, or
- The observable price should be adjusted to reflect the differences.

(ASC 321-10-55-9)

An entity elects the cost-method alternative on an investment by investment basis. Once elected, it should be applied to an investment consistently as long as the investment meets the qualifying criteria. Each reporting period the entity must reassess whether an equity investment qualifies for the alternative measurement. (ASC 321-10-35-2) For example, if an investee goes public and there is a readily determinable fair value, the investment must be measured prospectively at fair value using the guidance in ASC 820.

The application of the measurement alternative requires professional judgment. Entities would be prudent to document their assessments.

## Impairment

**Impairment model for equity investments without readily determinable fair values.** An entity must follow the impairment guidance in ASC 321 for an investment without readily determinable fair value if:

- The investment does not qualify for the measurement alternative in ASC 820-10-35-59, and
- The entity uses the ASC 321 practical measurement alternative to measure the investment. (ASC 321-10-35-3)

ASC 321 introduces a new, single-step, impairment model for equity investments without readily determinable fair values. The single-step model requires the entity to perform a qualitative assessment of impairment each reporting period. If the entity determines impairment exists, it then turns to a quantitative assessment and estimates the fair value of the investment the loss is the difference between the carrying value and the fair value of the investment (ASC 321-10-35-4) and is recognized in net income. Using the single-step model, the entity does not have to predict whether the investment will recover its value.

**Impairment indicators.** ASC 321 includes the following impairment indicators:

- A significant deterioration in the investee's:
    - earnings performance,
    - credit rating,
    - asset quality, or
    - business prospects.
  - A significant adverse change in the investee's:
    - regulatory,
    - economic, or
    - technological environment
  - A significant adverse change in the general market condition of either the geographical area or the industry in which the investee operates
  - For an amount less than the carrying amount of that investment:
    - a bona fide offer to purchase,
    - an offer by the investee to sell, or
    - a completed auction process for the same or similar investment
  - Factors that raise significant concerns about the investee's ability to continue as a going concern, such as negative cash flows from operations, working capital deficiencies, or noncompliance with statutory capital requirements or debt covenants.
- (ASC 323-10-35-3)

The guidance does not assign a probability threshold to the indicators. The presence of any one of these or other indicators does not mean impairment exists. It does mean that the entity needs a quantitative valuation of the investment.

**Dividend income.** Dividend income from investments in equity securities is included in income of the investor. (ASC 321-10-35-6)

**Presentation.** ASC 321-45 requires:

- Separate presentation of financial assets and financial liabilities by measurement categories and form of financial asset in the statement of financial position and in the notes.
- Separate recognition of changes in fair value from instrument-specific credit risk if the fair value option is elected for financial liabilities.
- Classification of cash flows from purchases and sales of an equity security based on the nature and purpose for which it was acquired.

## PERSPECTIVE AND ISSUES

---

### Investment Topics

The Codification contains several topics dealing with investments, including:

- ASC 320, *Investments—Debt and Equity Securities*
- ASC 323, *Investments—Equity Method and Joint Ventures*
- ASC 325, *Investments—Other*
- ASU 2016-01 adds a new topic related to investments: ASC 321, *Investments—Equity Securities*. It also changes the name of ASC 320 to *Investments—Equity Securities*. See the chapter on ASC 321 for more information.

**Technical Alert.** In March 2016, as part of its simplification initiative, the FASB issued ASU 2016-07, *Investments—Equity Method and Joint Ventures (Topic 323): Simplifying the Transition to the Equity Method of Accounting*.

**Guidance.** The ASU eliminates the requirement for an investor to retrospectively apply equity method accounting when an investment that it had accounted for by another method initially qualifies for the equity method. Entities will:

- Apply the equity method prospectively from the date investments qualify for the equity method.
- Add the carrying values of existing investments to the costs of the additional investments in order to determine the initial cost basis of the equity method investment.
- If they have available-for-sale securities that subsequently qualify for the equity method, recognize in net income the unrealized holding gains or losses in accumulated other comprehensive income related to those securities when the entities begin applying the equity method.

This requirement will be eliminated when the new guidance in ASU 2016-01 on classifying and measuring financial instruments becomes effective because entities will no longer be able to classify equity investments as available-for-sale and accumulate unrealized holding gains or losses in other comprehensive income. (See the chapter on ASU 321 for more information on ASU 2016-01.)

**Implementation.** The guidance is effective:

- For all entities for fiscal years beginning after December 15, 2016, and interim periods within those years.
- Early adoption is permitted in any interim or annual period.
- The guidance will be adopted on a prospective basis.

### Subtopics

ASC 323, *Investments—Equity Method and Joint Ventures*, contains three subtopics:

- ASC 323-10, *Overall*
- ASC 323-30, *Partnerships, Joint Ventures, and Limited Liability Entities*, which provides guidance on applying the equity method to partnerships, joint ventures, and limited liability entities

- ASC 323-740, *Income Taxes*, provides stand-alone guidance on a specific type of real estate investment, Qualified Affordable Housing Project Subsections.

Investments in the stock of joint ventures and other noncontrolled entities are usually accounted for by one of three methods:

1. The cost method (ASC 325),
2. The fair value method (ASC 320), or
3. The equity method (this topic—ASC 323).

## Scope and Scope Exceptions

### ASC 323-10, Overall

ASC 323 applies to all entities and their investments in common stock or in-substance common stock, including common stock of joint ventures. The guidance in ASC 323 guidance does not apply to an investment:

- Accounted for in accordance with ASC 815-10, *Derivatives and Hedging—Overall*
- In common stock held by a nonbusiness entity, such as an estate, trust, or individual
- In common stock within the scope of ASC 810, *Consolidation*
- Held by an investment company within the scope of ASC 946, except as discussed in paragraph 946-323-45-2.  
(ASC 323-10-15-2 through 5)

ASC 323-10 does not apply to an investment in a partnership or unincorporated joint venture (covered in ASC 323-30) or an investment in a limited liability company that maintains specific ownership accounts for each investor (discussed in ASC 272-10).

### ASC 323-30, Partnerships, Joint Ventures, and Limited Liability Entities

ASC 323-30 follows the same scope and scope exceptions as ASC 323-10, providing guidance specifically on:

- Partnerships
- Unincorporated joint ventures
- Limited liability companies.

**ASC 323-740, Income Taxes.** ASC 323-740 follows the same scope and scope exceptions as ASC 323-10 and the guidance applies to investments in limited partnerships that operate qualified affordable housing projects.

## Overview

**ASC 323-10, Overall.** When an investor has significant influence over an investee, the investor is no longer considered to be a passive investor, and the equity method is an appropriate way to reflect that fact and to account for the investment. If an investor has the ability to influence significantly the operations and financial policies of an investee, it is appropriate for the investor to reflect that responsibility in the investor's financial statements. The advantages of the equity method are that it:

- Recognizes changes to the underlying economic resources
- More closely meets the objectives of accrual accounting than the cost method
- Best enables investors in corporate joint ventures to reflect their investment in those ventures.  
(ASC 323-10-15-4)

### ASC 323-740, Income Taxes

**Overview.** ASC 323-740 provides guidance on a specific tax issue—investments in a Qualified Affordable Housing Project. Created under the Tax Reform Act of 1986, this federal program gives incentives for the utilization of private equity in the development of affordable housing for low-income Americans. The Revenue Reconciliation Act of 1993 retroactively extended and made permanent the affordable housing credit. Corporations eligible for the credits generally purchase an interest in a limited partnership that operates the qualified affordable housing projects. So, the guidance in ASC 323-740 applies to investments in limited partnerships that operate qualified affordable housing projects.

## DEFINITIONS OF TERMS

---

Source: ASC 323, *Glossaries*. Also see Appendix A, *Definitions of Terms*, for other terms relevant to this topic: Common Stock, Current Tax Expense, Dividends, Event, Income Tax Expense (or Benefits), Income Taxes, Investor, Noncontrolling Interest, Not-for-Profit Entity, Parent, Public Business Entity, and Subsidiary.

**Corporate Joint Venture.** A corporation owned and operated by a small group of entities (the joint venturers) as a separate and specific business or project for the mutual benefit of the members of the group. A government may also be a member of the group. The purpose of a corporate joint venture frequently is to share risks and rewards in developing a new market, product, or technology; to combine complementary technological knowledge; or to pool resources in developing production or other facilities. A corporate joint venture also usually provides an arrangement under which each joint venturer may participate, directly or indirectly, in the overall management of the joint venture. Joint venturers thus have an interest or relationship other than as passive investors. An entity that is a subsidiary of one of the joint venturers is not a corporate joint venture. The ownership of a corporate joint venture seldom changes, and its stock is usually not traded publicly. A noncontrolling interest held by public ownership, however, does not preclude a corporation from being a corporate joint venture.

**Earnings or Losses of an Investee.** Net income (or net loss) of an investee determined in accordance with U.S. GAAP.

**In-substance Common Stock.** An investment in an entity that has risk and reward characteristics that are substantially similar to that entity's common stock.

**Significant Influence.** See ASC 323-10-15-6 through 15-11 and information in the Perspectives and Issues section at the beginning of this chapter.

**Standstill Agreement.** An agreement signed by the investee and investor under which the investor agrees to limit its shareholding in the investee.

## CONCEPTS, RULES, AND EXAMPLES

---

### The Equity Method of Accounting for Investments

**Introduction and background.** The equity method of accounting has been referred to as “one-line consolidation,” because the net result of applying ASC 323 on reported net income and on net worth should be identical to what would have occurred had full consolidation been applied. However, rather than include its share of each component (e.g., sales, cost of sales, operating expenses, etc.) in its financial statements, the investor only includes its share of the investee’s net income as a separate line item in its income. (Note that there is an exception to this one-line rule for prior period adjustments.) It should be noted that the final bottom-line impact on the investor’s

financial statements is identical whether the equity method or full consolidation is employed; only the amount of detail presented within the financial statements differs.

**Significant influence.** The equity method recognizes a substantive economic relationship between the investor and investee. The equity method is not, however, a substitute for consolidation. It is employed where the investor has significant influence over the operations of the investee but lacks control. In general, significant influence is inferred when the investor owns between 20% and 50% of the investee's voting common stock. Any ownership percentage over 50% presumably gives the investor actual voting control, making full consolidation of financial statements necessary. Indications of significant influence are:

- Representation on the board of directors
  - Participation in policy-making processes
  - Material intra-entity transactions
  - Interchange of managerial personnel
  - Technological dependency
  - Extent of ownership in relation to other investors.
- (ASC 323-10-15-6)

The 20% threshold stipulated in ASC 323 is presumptive, but not absolute. Circumstances may suggest that significant influence exists even though the investor's level of ownership is less than 20% or, conversely, that it is absent despite a level of ownership above 20%.

Whether sufficient contrary evidence exists to negate the presumption of significant influence is a matter of judgment. Judgment requires a careful evaluation of all pertinent facts and circumstances, over an extended period of time in some cases. In considering whether significant influence may not exist, ASC 323-10-15-10 identifies the following factors:

1. Opposition by the investee
2. Agreements under which the investor surrenders shareholder rights
3. Majority ownership by a small group of shareholders
4. Inability to obtain desired information from the investee
5. Inability to obtain representation on investee board of directors, etc.

As a practical matter, absence of control by the parent is the only remaining reason to not consolidate a majority-owned investee.

**Recognition and initial measurement.** Investment in the stock of an investee is recognized as an asset. The investor measures its initial equity method investment at cost.

**Determination of cost.** When the consideration is in the form of cash, the cost of the acquisition is measured as the amount of cash paid to acquire the investment, including transaction costs associated with the acquisition.<sup>1</sup>

In some transactions, noncash consideration is surrendered by the investor. This can take the form of:

- Noncash assets,
- Liabilities incurred or assumed, or
- Equity interests issued.

The measurement of consideration in these transactions is based on either the cost to the acquirer or the fair value of the assets (or net assets) acquired, whichever is considered more

---

<sup>1</sup> This treatment of transaction costs is unique to an asset acquisition or acquisition of an equity method investment. In a business combination accounted for under the acquisition method, transaction costs are expensed as incurred.

reliably measurable. No gain or loss is recognized by the investor, unless the value of noncash assets surrendered as consideration differs from their carrying amounts in the investor's accounting records.

**Contingent consideration arrangements.** All business combinations are required to be accounted for using the acquisition method as prescribed in ASC 805. Contingent consideration should, in general, only be included in the initial measurement of an equity method investment if required to be so included by guidance contained in other than ASC 805.

If an equity method investment agreement involves a contingent consideration arrangement in which the fair value of the investor's share of the investee's net assets exceeds the investor's initial cost (referred to as the "differential"), a liability is recognized for the *lesser* of the:

1. Excess of the investor's share of the investee's net assets over the measurement of initial cost (including contingent consideration otherwise recognized), *or*
2. Maximum amount of contingent consideration not otherwise recognized.  
(ASC 323-10-25-2 and 30-2B)

Subsequently, upon the resolution of a contingent liability recorded under this provision (ASC 323-10-30-2B), when the consideration is issued or becomes issuable:

1. An excess of the fair value of the contingent consideration issued or issuable over the amount previously recognized as a liability is to be recognized as an additional cost of the investment.
2. An excess of the amount previously recognized as a liability over the contingent consideration issued or issuable is to be applied to reduce the cost of the investment.  
(ASC 323-10-35-14A)

**Basis differences.** ASC 323 requires that the investor account for any differential between its cost and its proportionate share of the fair value of the investee's net identifiable assets consistent with the accounting for a business combination under the acquisition method prescribed by ASC 805.

In almost all instances, the price paid by an investor to acquire shares of an investee will differ from the corresponding underlying book value (i.e., the investee's net assets per its GAAP-basis financial statements). The differential can be broken down into the following components from the authoritative literature on business combinations:

1. Tangible and intangible assets recognized in the accounting records of the investee at carrying values that are below their fair values.
2. Intangible assets not recognized in the accounting records of the investee because of the longstanding prohibition in GAAP against recognizing internally developed intangibles (with the notable exception of internal-use software). These might include in-process research and development assets, customer lists, and other amortizable or nonamortizable intangibles as discussed in detail in the chapters on ASC 730, *Research and Development* and ASC 350, *Intangibles—Goodwill and Other*.
3. Contingent consideration.
4. Goodwill.

This means that premiums or discounts versus underlying book values must be identified, analyzed, and dealt with. It also means that assets or liabilities *not* recognized by the investee must be identified and assigned, on a memo basis, the appropriate shares of the investor's purchase cost.

In the simplest example of applying this principle, if the investor identifies fixed assets with appreciated fair values, part of the price paid by the investor must be allocated (in a notional sense

only—since the entire investment is presented as a single caption in the investor's financial statements, consistent with the “one-line consolidation” characteristic of equity method accounting) to the “step-up” in the values of those assets. Since those assets (other than land) are subject to depreciation, the investor must amortize a part of the investment cost to reduce the proportionate share of investee earnings that it would otherwise recognize in its entirety. This can require a costly and time-consuming effort on the part of the investor, particularly when a range of assets having varying depreciable lives is involved, as is almost always the case. The carrying amount of the investment is adjusted for:

- Intra-entity profits and losses
  - Basis differences, that is, adjustments to amortize differences between cost and equity in net assets
  - Investee capital transactions
  - Other comprehensive income.
- (ASC 310-10-35-5)

Under ASC 323, any premium paid by the investor that cannot be identified as being attributable to appreciated recognized tangible and intangible assets or unrecognized internally developed intangible assets of the investee (1 and 2 above) is analogous to goodwill. Goodwill is not amortized unless a private company elects the accounting alternative that allows amortization on a straight-line basis for a period not to exceed ten years. (See the chapter on ASC 350 for more details on this election.)

Since the ultimate income statement effects of applying the equity method of accounting must generally be the same as full consolidation, an adjustment must be made to account for these differentials.

**Subsequent accounting<sup>2</sup>.** In periods subsequent to the initial acquisition of the investment, the investor recognizes:

- Increases to the carrying value of the investment for the investor's proportionate share of the investee's net income, and
  - Decreases in the carrying value of the investment for the investor's proportionate share of the investee's net losses and for cash dividends received.
- (ASC 323-10-35-4 and 35-5)

The basic procedure is illustrated below.

**Example of the equity method—a simple case that ignores deferred income taxes**

On January 2, 20X1, R Corporation (the investor) acquired 40% of E Company's (the investee) voting common stock from the former owner for \$100,000. Unless demonstrated otherwise, it is assumed that R Corporation can exercise significant influence over E Company's operating and financing policies. On January 2, E's stockholders' equity consists of the following:

Common stock, \$1.00 par value per share; 100,000 shares authorized,	\$ 50,000
50,000 shares issued and outstanding	
Additional paid-in capital	150,000
Retained earnings	<u>50,000</u>
Total stockholders' equity	<u>\$ 250,000</u>

<sup>2</sup> See the section later in this chapter on Qualified Affordable Housing Project Investments for an exception to this accounting treatment.

Note that, although improbable in practice, for this simple example, the cost of E Company common stock was exactly equal to 40% of the book value of E's net assets. Assume also that there is no difference between the book value and the fair value of E Company's assets and liabilities. Accordingly, the balance in the investment account in R's records represents exactly 40% of E's stockholders' equity (net assets). Assume further that E Company reported net income for 20X1 of \$30,000 and paid cash dividends of \$10,000. Its stockholders' equity at year-end would be as follows:

Common stock, \$1.00 par value per share; 100,000 shares authorized,	\$ 50,000
50,000 shares issued and outstanding	
Additional paid-in capital	150,000
Retained earnings	<u>70,000</u>
Total stockholders' equity	<u><u>\$ 270,000</u></u>

R Corporation would record its share of the increase in E Company's net assets during 20X1 as follows:

Investment in E Company	12,000
Equity in E income	12,000
<i>(<math>\\$30,000 \times 40\%</math>)</i>	
<i>To record net income of E Company</i>	
Cash	4,000
Investment in E Company	4,000
<i>(<math>\\$10,000 \times 40\%</math>)</i>	
<i>To record the cash dividend</i>	

When R's statement of financial position is prepared at December 31, 20X1, the balance reported as the carrying value of the equity method investment in E Company would be \$108,000 (= \$100,000 + \$12,000 – \$4,000). This amount continues to represent 40% of the book value of E's net assets at the end of the year ( $40\% \times \$270,000$ ). The equity in E income is reported as a separate caption in R's income statement, typically as a component of income from continuing operations before income taxes.

**Deferred income tax accounting.** The equity method is not a recognized accounting method for federal income tax purposes under the U.S. Internal Revenue Code (IRC). For income tax purposes, the investor's share of the investee's net income is not recognized until it is realized through either the investor's receipt of dividends from the investee or the investor's sale of the investment. Thus, when the investor, under the equity method, recognizes its proportionate share of the net income of the investee as an increase to the carrying value of the investment, a future taxable temporary difference between the carrying value of the equity method investment for financial reporting purposes and the income tax basis of the investment will arise. The temporary difference will give rise to recognition of a deferred income tax liability.

In computing the deferred income tax effects of income recognized by applying the equity method, the investor must make an assumption regarding the means by which the undistributed earnings of the investee will be realized. The earnings can be realized either through later dividend receipts or by disposition of the investment at a gain. The former assumption would result in income taxes at the investor's marginal income tax rate on ordinary income (net of the 80% dividends received deduction permitted by the Internal Revenue Code for intercorporate investments of less than 80% but at least 20%; a lower deduction of 70% applies if ownership is below 20%). The latter option would be treated as a capital gain.

**Example of the equity method—a simple case that includes deferred income taxes**

Assume the same information as in the example above. In addition, assume that R Corporation has a combined (federal, state, and local) marginal income tax rate of 34% on ordinary income and that it anticipates realization of E Company earnings through future dividend receipts.

R Corporation's current income tax expense associated with its investment is computed based on its current dividends received less the dividends received deduction under IRC §243. Since R owns a 40% interest in E, the applicable percentage for the dividends received deduction is 80%. Note that the dividends received deduction constitutes a permanent difference under ASC 740 that never reverses. The provision for income taxes currently payable is computed as follows:

Dividends received	\$4,000
Less—dividends received deduction (80%)	3,200
Taxable income from investment in E	<u>800</u>
× current combined federal and state tax rate	× 34%
Income taxes currently payable	<u><u>\$ 272</u></u>

To compute deferred income taxes under the liability method used in ASC 740, at each reporting date we must determine the temporary difference between the carrying amount of the investment for financial reporting purposes and its income tax basis. In this case, this is done as follows:

Carrying value of equity method investment for financial reporting purposes	
Original cost	\$100,000
Equity method earnings	12,000
Dividends	(4,000)
Income tax basis	
Original cost	100,000
Temporary difference	\$ 8,000

Since R expects to realize this difference in the future through the receipt of dividends, it adjusts the difference for the permanent difference that arises from benefit of the dividends received deduction of 80% of \$8,000 or \$6,400 thus leaving \$1,600 that would be subject to the effective rate that R expects to apply to reversal of the temporary difference, which, as provided in the assumptions above, is 34%. Applying the 34% expected future effective tax rate to the \$1,600 taxable portion of the temporary difference would yield a deferred income tax expense (and related liability) of \$544. The entry to record these items at December 31, 20X1, is as follows:

Income tax expense—Current	272
Income tax expense—Deferred	544
Income taxes currently payable	272
Deferred income tax liability	544

*To record provision for income taxes for the year ended 12/31/20X1 attributable to equity method investment in E*

The deferred income tax liability is originally computed with reference to the projected income tax effect of the "temporary difference reversal." It may be subsequently adjusted for a variety of reasons, including changed income tax rates and altered management expectations (see the chapter on ASC 740 for a complete discussion).

Notwithstanding ASC 740's requirement that deferred income taxes be adjusted for changed expectations at the date of each subsequent statement of financial position, the actual income tax effect of the temporary difference reversal may still differ from the deferred income tax liability provided. This difference may occur because the actual income tax effect is a function of the

entity's other current items of income and expense in the year of reversal (while ASC 740 requires the use of a projected effective income tax rate, actual rates may differ). It may also result from a realization of the investee's earnings in a manner other than anticipated (assuming that income tax rates on "ordinary" income differ from those on capital gains).

**Example of income tax effects resulting from the sale of an equity method investment**

Assume that in 20X2, before any further earnings or dividends are reported by the investee, the investor sells the entire investment for \$115,000. The income tax impact is:

Selling price	\$ 115,000
Less income tax basis (original cost)	<u>100,000</u>
Gain	\$ 15,000
Capital gain rate (marginal corporate rate)	<u>× 34%</u>
Income tax liability	<u><u>\$ 5,100</u></u>

The entries to record the sale, the income tax thereon, and the reversal of the previously provided deferred income taxes on the undistributed 20X3 earnings of the investee are as follows:

1. Cash	115,000	
Investment in E Company		108,000
Gain on sale of investment		7,000
2. Income tax expense—Current	5,100	
Deferred income tax liability	544	
Income taxes payable—Current		5,100
Income tax benefit—Deferred		544

Note that if the realization through a sale of the investment had been anticipated at the time the 20X1 statement of financial position was prepared, the deferred income tax liability would have been adjusted (possibly to reflect the entire \$5,100 amount of the ultimate obligation), with the offset included in 20X1's ordinary income tax expense. The above example explicitly assumes that the sale of the investment was not anticipated prior to 20X2.

**Differences in fiscal year.** If the investor and investee have different fiscal years, ASC 323-10-35-6 permits the investor to use the most recent financial statements available as long as the lag in reporting is consistent from period to period. Analogizing from ASC 810, the lag period is not to exceed three months.

If the investee changes its fiscal year-end to reduce or eliminate the lag period, ASC 810-10-45 stipulates that the change be treated as a voluntary change in accounting principle under ASC 250 (discussed in detail in the chapter on ASC 250). Although ASC 250 requires such changes to be made by retrospective application to all periods presented, it provides an exception if it is not practical to do so.

**Goodwill impairment testing.** Under ASC 350-20-35-58 and 35-59 the goodwill component is not subject to amortization, but rather to impairment testing. There is an exception to this provision for private companies who may elect to amortize goodwill. (Also see the chapter on ASC 350 for more information on the guidance for private companies.)

The impairment testing regime to be applied is not, however, that specified in ASC 350, which only pertains to testing by entities which actually record an asset explicitly as goodwill (i.e., the acquirer in a business combination accounted for under ASC 805). Equity method investors assess impairment of investments in investees by considering whether declines in the fair values of those investments, versus the carrying values of the underlying assets, may be other than temporary in nature as discussed previously in this chapter.

There is a requirement, applicable to the accounting for business combinations and equity method investments, to identify intangible assets that require recognition separately from goodwill. Accordingly, in analyzing the purchase cost of an equity method investment, an investor needs to identify the portions of the premium paid that relate to identifiable intangibles per ASC 350, as well as to goodwill, with appropriate treatments regarding varying amortizable lives or, in some instances, amortization not being recognized due to the identifiable intangible assets having indefinite lives.

Although infrequently encountered in practice, the amount paid by the investor for its interest in the investee may imply that there had been a discount, analogous to a bargain purchase in the Codification guidance that relates to business combinations. In the rare instances where this occurs, this would be treated in the same manner as negative goodwill or gain from a bargain purchase. These are discussed in greater detail in the chapter on ASC 805.

In the following examples, the accounting for equity method investments involving both positive goodwill and negative goodwill are presented.

#### Example of a complex case that ignores deferred income taxes—equity method goodwill

Foxen Corporation (FC) acquired 40% of Besser, Inc.'s (BI) shares on January 2, 20X1, for \$140,000. BI's assets and liabilities at that date had the following book values and fair values:

	<i><u>Book values</u></i>	<i><u>Fair values</u></i>
Cash	\$ 10,000	\$ 10,000
Accounts receivable (net)	40,000	40,000
Inventories (FIFO cost)	80,000	90,000
Land	50,000	40,000
Plant and equipment (net of accumulated depreciation)	<u>140,000</u>	<u>220,000</u>
Total assets	<u>\$ 320,000</u>	<u>\$ 400,000</u>
Liabilities	\$ (70,000)	\$ (70,000)
Net assets (stockholders' equity)	<u>\$ 250,000</u>	<u>\$ 330,000</u>

The first order of business is the calculation of the differential, as follows:

FC's cost for 40% of BI's common	\$ 140,000
Book value of 40% of BI's net assets ( $\$250,000 \times 40\%$ )	<u>(100,000)</u>
Total differential	\$ 40,000

Next, the \$40,000 differential is allocated to those individual assets and liabilities for which fair value differs from book value. In the example, the differential is allocated to inventories, land, and plant and equipment, as follows:

<i><u>Item</u></i>	<i><u>Book value</u></i>	<i><u>Fair value</u></i>	<i><u>Difference</u></i>	<i><u>40% of difference</u></i>
			<i><u>debit (credit)</u></i>	<i><u>debit (credit)</u></i>
Inventories	\$80,000	\$90,000	\$10,000	\$ 4,000
Land	50,000	40,000	(10,000)	(4,000)
Plant and equipment	140,000	220,000	80,000	32,000
Differential allocated				<u>\$32,000</u>

Assuming that there are no unrecognized identifiable intangibles included in the allocation, the difference between the allocated differential of \$32,000 and the total differential of \$40,000 is goodwill of \$8,000. Goodwill, as shown by the following computation, represents the excess of the cost of the investment over the fair value of the net assets acquired.

FC's cost for 40% of BI's common	\$ 140,000
40% of the fair value of BI's net assets ( $\$330,000 \times 40\%$ )	$\$(132,000)$
Excess of cost over fair value (goodwill)	\$ 8,000

It is important to note that the allocation of this differential is not recorded formally by either FC or BI. Because the equity method (one-line consolidation) does not involve the recording of individual assets and liabilities of the investee in the financial statements of the investor, FC, the investor, does not remove the differential from the investment account and recategorize it in its own respective asset categories. FC leaves the differential of \$40,000 in the investment account, as a part of the balance of \$140,000 at January 2, 20X1. Accordingly, information pertaining to the allocation of the differential is maintained by the investor, but this information is outside the formal accounting system, presumably on a spreadsheet maintained for this purpose.

After the differential has been allocated, the amortization pattern is developed. To develop the pattern in this example, assume that BI's plant and equipment have ten years of useful life remaining and that BI depreciates its fixed assets on a straight-line basis. FC would prepare the following amortization schedule covering the years 20X1 through 20X3:

<u>Item</u>	<u>Differential debit (credit)</u>	<u>Remaining useful life</u>	<u>20X1</u>	<u>20X2</u>	<u>Amortization 20X3</u>
Inventories (FIFO)	\$ 4,000	Sold in 20X1	\$4,000	\$ —	\$ —
Land	(4,000)	Indefinite	—	—	—
Plant and equipment (net)	32,000	10 years	3,200	3,200	3,200
Goodwill	8,000	Not relevant	—	—	—
Totals	<u><u>\$40,000</u></u>		<u><u>\$7,200</u></u>	<u><u>\$3,200</u></u>	<u><u>\$3,200</u></u>

Note that the entire differential allocated to inventories is amortized in 20X3 because the cost flow assumption used by BI is FIFO. If BI had been using LIFO instead of FIFO, no amortization would take place until BI sold some of the inventory included in the LIFO layer that existed at January 2, 20X1. Since this sale could be delayed for many years under LIFO, the differential allocated to LIFO inventories would not be amortized until BI sold more inventory than it manufactured/purchased. Note, also, that the differential (in this example, a negative valuation amount) allocated to BI's land is not amortized, because land is not a depreciable asset. The goodwill component of the differential is not amortized, but instead is evaluated along with the investment as a whole as to whether it is other-than-temporarily impaired.

The amortization of the differential is recorded formally in the accounting system of FC. Recording the amortization adjusts the equity in BI's income that FC records based upon BI's income statement. BI's income must be adjusted because it is based upon BI's book values, not upon the cost that FC incurred to acquire its interest in BI. FC makes the following entries in 20X1, assuming that BI reported net income of \$30,000 and paid cash dividends of \$10,000:

1. Investment in BI	12,000	
Equity in BI income		12,000
<i>To record net income of the investee (<math>\\$30,000 \text{ net income} \times 40\% \text{ proportionate share}</math>)</i>		
2. Equity in BI income	7,200	
Investment in BI		7,200
<i>To record the amortization of the differential</i>		
3. Cash	4,000	
Investment in BI		4,000
<i>To record dividends received by investor (<math>\\$10,000 \times 40\%</math>)</i>		

The balance in the investment account on FC's records at the end of 20X1, after giving effect to these entries, is \$140,800 ( $\$140,000 + \$12,000 - \$7,200 - \$4,000$ ), and BI's stockholders' equity is  $\$250,000 + \text{net income of } \$30,000 - \text{dividends of } \$10,000 = \$270,000$ . FC's investment account

balance of \$140,800, is not equal to \$108,000 (40% of \$270,000 BI's equity). However, this difference can easily be reconciled, as follows:

FC's balance in investment account at December 31, 20X1	\$140,800
40% of BI's net assets at December 31, 20X1	108,000
Difference at December 31, 20X1	<u>\$32,800</u>
Differential at January 2, 20X1	\$40,000
Differential amortized during 20X1	<u>(7,200)</u>
Unamortized differential at December 31, 20X1	<u><u>\$32,800</u></u>

FC's share of BI's net income and dividend payments are reflected in BI's net earnings. With the passing years, the balance in FC's investment account approaches the amount representing 40% of the book value of BI's net assets, as the differential is amortized as a component of equity method income or loss. However, since a part of the differential was allocated to land, which is not depreciating, and to goodwill, which is not subject to amortization, the carrying value will most likely never exactly equal the equity in the investee's net assets. If the investee disposes of the land, the investor must also eliminate the associated portion of the differential. If the carrying value of the investment becomes impaired and the impairment is considered other than temporary, the goodwill portion of the differential may also be reduced or eliminated. Thus, under certain conditions the investor's carrying value may subsequently be adjusted to equal the underlying net asset value.

To illustrate how the sale of land would affect equity method procedures, assume that BI sold the land in the year 20X6 for \$80,000. Since BI's cost for the land was \$50,000, it would report a gain of \$30,000, of which \$12,000 ( $= \$30,000 \times 40\%$ ) would be recorded by FC, when it records its 40% share of BI's reported net income, ignoring income taxes. However, from FC's viewpoint, the gain on sale of land should have been \$40,000 ( $\$80,000 - \$40,000$ ) because the cost of the land from FC's perspective was \$40,000 at January 2, 20X3 (since the allocated fair value of the land was below its book value). Therefore, in addition to the \$12,000 share of the gain recorded above, FC should record an additional \$4,000 gain [ $(\$40,000 - \$30,000) \times 40\%$ ] by debiting the investment account and crediting the equity in BI's income account. This \$4,000 debit to the investment account will eliminate the \$4,000 differential allocated to land on January 2, 20X2, since the original differential was a credit (the fair value of the land was \$10,000 less than its book value).

Adjustments to the goodwill portion of the differential are somewhat more complex. ASC 323 requires that the difference between cost and underlying book value be accounted for as if the investee were a consolidated subsidiary. An investor is therefore required to determine the individual components that comprise the differential as illustrated above, and this may result in the identification of part of the differential as goodwill (referred to as "equity method goodwill"). Under GAAP, goodwill associated with a business combination is required to be evaluated annually for impairment. FASB decided, however, that equity method investments would continue to be tested for impairment in accordance with ASC 323 (i.e., the equity method investment as a whole, not the underlying net assets, are evaluated for impairment) and that equity method goodwill will not be treated as being separable from the related investment. Accordingly, goodwill should not be tested for impairment in accordance with the current goodwill and intangible assets standard, ASC 350.

**Example of adjustment of goodwill for other-than-temporary impairment of an equity method investment—that ignores income taxes**

Building on the facts from the previous example, BI's reported net income in 20X2 and loss in 20X3 are \$15,000 and (\$12,000), respectively. No dividends are paid by BI after 20X1. FC's carrying value, before considering possible impairment in value, as of year-end 20X2 is computed as follows:

Carrying value of investment, December 31, 20X1	\$ 140,800
FC's interest in BI's 20X2 net income ( $\$15,000 \times 40\%$ )	6,000
Amortization of differential between fair value and carrying value	<u>(3,200)</u>
Carrying value, December 31, 20X2	143,600
FC's interest in BI's 20X3 net loss ( $\$12,000 \times 40\%$ )	(4,800)
Amortization of differential between fair value and carrying value	<u>(3,200)</u>
Carrying value, December 31, 20X3, before considering additional charge for impairment	<u><u>\$ 135,600</u></u>

If, at December 31, 20X3, FC determines that the fair value of its investment in BI has declined to \$130,000, and this decline in value is judged to be other than temporary in nature, then FC must, per ASC 323, recognize a further loss amounting to \$5,600 for the year. Notice that this fair value decline is assessed with reference to the fair (presumably, but not necessarily, market) value of the investment in BI. It would not be determined with specific reference to the value of BI's business operations, in the manner that the implied fair value of goodwill is assessed in connection with business combinations accounted for by the presentation of consolidated financial statements, although such a decline in value of the investment would likely be related to the value of BI's operations.

While the ASC is silent on this issue, it is reasonable that any recognized decline in value be assigned first to the implicit goodwill component of the investment account. In this example, since the decline, \$5,600, is less than the \$8,000 goodwill component of the differential, it will be fully absorbed, and future periods' amortization of the differential assigned to other assets will not be affected. On the other hand, if the value decline had exceeded \$8,000, the excess would logically have been allocated to the underlying nonmonetary assets of the investee, such that the remaining differential previously identified with plant and equipment might have been reduced or eliminated, thereby altering future amortization on a prospective basis.

The impact of interperiod income tax allocation in the foregoing example is similar to that demonstrated earlier in the simplified example. Under GAAP goodwill rules, unless goodwill has been reduced for financial reporting purposes due to other-than-temporary impairment of the investment, there will be no book-tax difference and hence no deferred income tax issue to be addressed. The other components of the differential in the foregoing example are all temporary differences, with normal deferred income tax implications.

**Example of a complex case that ignores deferred income taxes—computation of negative goodwill**

The facts in this example are similar to those in the immediately preceding examples, but in this instance the price paid by the investor, Lucky Corp., is less than its proportionate share of the investee's net assets, at fair value. This is analogous to negative goodwill in a business combination, and the accounting for the negative differential between cost and fair value follows that mandated for bargain purchases either under the business combinations and goodwill standards, ASC 805 and ASC 350, or, if the stock is acquired after its effective date, under the bargain purchase provisions of ASC 805.

Assume that Lucky Corp. acquired 40% of Compliant Company's shares on January 2, 20X1, for a cash payment of \$120,000. Compliant Company's assets and liabilities at that date had the following book and fair values:

	<i>Book values</i>	<i>Fair values</i>
Cash	\$ 10,000	\$ 10,000
Accounts receivable (net)	40,000	40,000
Inventories (FIFO cost)	80,000	90,000
Land	50,000	40,000

Plant and equipment (net of accumulated depreciation)	140,000	<u>220,000</u>
Total assets	<u>\$320,000</u>	<u>\$ 400,000</u>
Liabilities	<u>\$ (70,000)</u>	<u>\$ (70,000)</u>
Net assets (stockholders' equity)	<u><u>\$250,000</u></u>	<u><u>\$ 330,000</u></u>

The first step is to compute the differential, which is as follows:

Lucky's cost for 40% of Compliant's common stock	\$120,000
Book value of 40% of Compliant's net assets ( $\$250,000 \times 40\%$ )	<u>(100,000)</u>
Total differential	<u><u>\$ 20,000</u></u>

Next, the \$20,000 is allocated, on a preliminary basis, to those individual assets and liabilities for which fair value differs from book value. In the example, the differential is initially allocated to inventories, land, and plant and equipment, as follows:

<u>Item</u>	<u>Book value</u>	<u>Fair value</u>	<u>Difference debit (credit)</u>	<u>40% of difference debit (credit)</u>
Inventories	\$ 80,000	\$ 90,000	\$ 10,000	\$4,000
Land	50,000	40,000	(10,000)	(4,000)
Plant and equipment	140,000	220,000	80,000	32,000
Differential allocated				<u><u>\$32,000</u></u>

The difference between the allocated differential of \$32,000 and the actual differential of \$20,000 is negative goodwill of \$12,000. Negative goodwill, as shown by the following computation, represents the excess of the fair value of the net assets acquired over the cost of the investment.

Lucky's cost for 40% of Compliant's common stock	\$120,000
40% of the fair value of Compliant's net assets ( $\$330,000 \times 40\%$ )	<u>(132,000)</u>
Excess of fair value over cost (negative goodwill)	<u><u>\$ 12,000</u></u>

Although the topic is not addressed explicitly by ASC 350, the investor's handling of negative goodwill should track how this would be dealt with by a parent company preparing consolidated financial statements following a "bargain purchase" business combination. It is important to note that the treatment of negative goodwill in this regard will depend on the date on which the investor obtained its interest.

**Investor share of investee losses in excess of the carrying value of the investment.** As demonstrated in the foregoing paragraphs, the carrying value of an investment which is accounted for by the equity method is increased by the investor's share of investee earnings and reduced by its share of investee losses and by dividends received from the investee. Sometimes the losses are so large that the carrying value is reduced to zero, and this raises the question of whether the investment account should be allowed to "go negative," or whether losses in excess of the investment account should be recognized in some other manner.

In general, an equity method investment would not be permitted to have a negative (i.e., credit) balance, since this would imply that it represented a liability. In the case of normal corporate investments, the investor would enjoy limited liability and would not be held liable to the investee's creditors should, for instance, the investee become insolvent. For this reason, excess losses of the investee would not be reflected in the financial statements of the investor. The practice is to discontinue application of the equity method when the investment account reaches a zero balance, with adequate disclosure being made of the fact that further investee losses are not being reflected in the investor's earnings. If the investee later returns to profitability, the investor ignores its share of earnings until the previously ignored losses have been fully offset; thereafter, normal application of the equity method is resumed.

There are, however, limited circumstances in which further investee losses would be reflected. Often the investor has guaranteed or otherwise committed to indemnify creditors or other investors in the investee entity for losses incurred, or to fund continuing operations of the investee. Having placed itself at risk in the case of the investee's insolvency, continued application of the equity method is deemed to be appropriate, since the net credit balance in the investment account (reportable as a liability entitled "losses in excess of investment made in investee") would indeed represent an obligation of the investor.

The other situation in which investee losses in excess of the investor's actual investment in common stock of the investee are to be reflected is somewhat more complicated. When the investor has investments consisting of both common stock holdings accounted for under ASC 323, and other investments in or loans to the investee, such as in its preference shares (including mandatorily redeemable preferred stock) or debt obligations of the investee, there will not only be further application of ASC 323, but also possible interaction between the provisions of ASC 323 and those of ASC 310 and/or ASC 320. In addition, there will be the question of the appropriate proportion of the investee's loss to be recognized by the investor—that is, should the investor's share of further investee losses be computed based only on its common stock ownership interest, or would some other measure of economic interest be more relevant?

ASC 323-10-35 addresses the accounting to be applied under the circumstances described in the preceding paragraph. A principal concern was that an anomaly could develop if, for example, the common shareholdings were being accounted for by application of the equity method (including a suspension of the method when the carrying value declined to zero due to investee losses) while investments in the same investee's debt or preferred shares were being carried at fair value per ASC 320 (assuming that the debt was not being carried at amortized cost due to classification as a held-to-maturity investment). A parallel concern invokes the accounting for loans under ASC 310-10-35 when investee debt is being held by the investor.

According to ASC 323-10-35, the adjusted basis of the other investments (preferred stock, debt, etc.) are to be adjusted for the equity method losses, after which the investor is to apply ASC 310-10-35 and ASC 320 to the other investments, as applicable. Those equity method losses are applied to the other investments in reverse order of seniority (that is, the respective priority in liquidation). This sequence is logical because it tracks the risk of investor loss: Common shareholders' interests are the first to be eliminated, followed by those of the preferred shareholders, and so on—with debt having the highest claim to investee assets in the event of liquidation. If the investee later becomes profitable, equity method income subsequently recorded (if, as described earlier, any unrecognized losses have first been exceeded) is applied to the adjusted basis of the other investments in reverse order of the application of the equity method losses (i.e., equity method income is applied to the more senior securities first).

In applying ASC 323, the cost basis of the other investments is taken to mean the original cost of those investments adjusted for the effects of:

- Other than temporary write-downs,
- Unrealized holding gains and losses on ASC 320 securities classified as trading, and
- Amortization of any discount or premium on debt securities or loans.

The adjusted basis is defined as the cost basis, as adjusted for the ASC 310-10-35 valuation allowance account for an investee loan and for the cumulative equity method losses applied to the other investments.

The interaction of ASC 323 and ASC 310-10-35 and ASC 320 could mean, for example, that investee losses are recognized via a reduction in carrying value of preferred shares, which might

then be immediately upwardly adjusted to recognize fair value as of the date of the statement of financial position in accordance with ASC 320. In a situation such as this, the equity method downward adjustment would be a loss recognized currently in net income, while the upward revaluation to fair value would typically be credited to other comprehensive income, and thus excluded from current period net income (unless defined as being held for trading purposes, which would be unusual).

ASC 323-10-35 addresses only the situation where the investor had the same percentage interests in common stock and all the other equity or debt securities of the investee. However, a further complication can arise when the investor's share in the common stock of the investee is not mirrored in its investment in the other debt or equity securities of the investee that it also holds. While this possibility is discussed in ASC 323, GAAP is not definitive regarding the mechanism by which the investor's share of further losses should be recognized in such situations. What is clear, however, is that merely applying the investor's percentage interest in the investee's common stock to the period's loss would not be appropriate in these cases.

In the absence of definitive guidance, two approaches are justifiable. The first is to eliminate the carrying value of the first, the common stock, and then the other securities of the investee (including loans made to the investee), in reverse order of seniority, as set forth under ASC 323-10-35. The percentage of the investee's loss to be absorbed against each class of investment other than common stock would be governed by the proportion of that investment held by the investor—and emphatically not by its common stock ownership percentage. The logic is that, if the investor entity were to be harmed by the investee's further losses (once the common stock investment were reduced to zero carrying value), the harm would derive from being forced to take a reduced settlement in a liquidation of the investee, at which point the percentage ownership in separate classes of stock or in holdings of classes of debt would determine the amount of the investor's losses.

The second acceptable approach also takes into account the investor's varying percentage interests in the different equity and debt holdings. However, rather than being driven by the investee's reported loss for the period, the investor's loss recognition is determined by the period-to-period change in its claim on the net assets of the investee, as measured by book value. This approach implicitly assumes that fair values upon a hypothetical liquidation of the investee would equal book values—an assumption which is obviously unlikely to be borne out in any actual liquidation scenario. Nonetheless, given the enormous difficulty of applying this measurement technique to the continuously varying fair values of the investee's assets and liabilities, this was deemed to be a necessary compromise.

Thus, both methods of computing the excess investee losses to be recognized by an investor having more than just a common stock interest in the investee depend on the varying levels of those other investment vehicles. These two alternative, acceptable approaches are described and illustrated below.

**Example of accounting for excess loss of investee when other investments are also held in same entity, when proportions of all investments are identical**

Assume the following facts: Dardanelles Corporation owns 25% of the common stock of Bosporus Company. Dardanelles also owns 25% of Bosporus' preferred shares, and 25% of its commercial debt. Bosporus has \$50,000 of debt and \$100,000 of preferred stock outstanding.

As of 1/1/20X1 the carrying (i.e., book) value of Dardanelles' investment in Bosporus common stock was \$12,000, after having applied the equity method of accounting in prior periods, per ASC 323. In 20X1, 20X2, and 20X3, Bosporus incurs net losses of \$140,000, \$50,000, and \$30,000, respectively.

As of 1/1/20X1, the carrying (book) values of Dardanelles' investment in Bosporus' preferred stock and commercial debt were \$25,000 and \$12,500, respectively. Due to its continuing losses, the market or fair value of Dardanelles' outstanding preferred shares and its commercial debt decline over the years 20X1–20X3; Bosporus' portion of these values are as follows:

	<i>Fair value of preferred shares, consistent with ASC 320</i>	<i>Fair value of commercial debt, consistent with ASC 310-10-35</i>
1/1/20X1	N/A	N/A
12/31/20X1	\$20,000	\$12,000
12/31/20X2	9,500	8,000
12/31/20X3	2,000	7,000

The following table indicates the adjustments that would be made on the books of Dardanelles to record its share of Bosporus' losses in 20X1–20X3:

	<i>Common stock</i>	<i>Preferred stock</i>		<i>Commercial debt</i>	
	<i>Book value</i>	<i>Book value</i>	<i>Fair value</i>	<i>Book value</i>	<i>Fair value</i>
1/1/20X1	\$ 12,000	\$ 25,000	N/A	\$ 12,500	N/A
20X1 loss ( $25\% \times 140,000 = 35,000$ )	(12,000)	(23,000)	2,000	\$20,000	12,500
Adjust pfd. stk. to FMV and debt to FV		18,000		(500)	
<b>12/31/20X1 values</b>	0	20,000		12,000	
20X1 loss ( $25\% \times 50,000 = 12,500$ )		(2,000)		(10,500)	
Adjust pfd. stk. to FMV and debt to FV		18,000	9,500	1,500	8,000
<b>12/31/20X2 values</b>	0	9,500		1,500	
20X2 loss ( $25\% \times 30,000 = 7,500$ )		—		(1,500)	
Adjust pfd. stk. to FMV and debt to FV		9,500	2,000	0	7,000
<b>12/31/20X3 values</b>	<u>\$ 0</u>	<u>\$ 2,000</u>		<u>\$ 0</u>	

Actual journal entries and explanations for the foregoing are given as follows:

12/31/X1	Investee losses	35,000	
	Investment in Bosporus common stock		12,000
	Investment in Bosporus preferred stock		23,000
<i>To record Dardanelles' share of Bosporus' loss for the year; the excess over the carrying value of the common stock is used to reduce the carrying value of the preferred shares</i>			
12/31/X1	Investment in Bosporus preferred stock	18,000	
	Unrealized gain on securities available for sale		18,000
	(other comprehensive income)		
<i>Since the fair value of the preferred shares is \$20,000, per ASC 320 the carrying value must be upwardly revalued, and the adjustment is included in other comprehensive income for the year</i>			
12/31/X1	Loss from impairment of loan	500	12,000
	Investment in Bosporus commercial debt		23,000
<i>As required by ASC 310-10-35, the impairment of the loan to Bosporus must be recognized by a charge against current period net income</i>			
12/31/X2	Investee losses	12,500	
	Investment in Bosporus preferred stock		2,000
	Investment in Bosporus commercial debt		10,500

It should be noted in the foregoing example that in year 20X3 there will be \$6,000 of unrecognized investee losses, since as of the end of that year the carrying value of all the investor's investments in the investee will have been reduced to zero, except for the fair value of the preferred stock which is presented pursuant to ASC 320. Also note that the carrying value of the commercial debt is reduced for an impairment in 20X1 because the fair value is lower than the cost basis; in later years the fair value exceeds the cost basis, but under ASC 310-10-35 net upward adjustments would not be permitted.

**Example of accounting for excess loss of investee when other investments are also held in same entity, when proportions of investments vary—first method: investee's reported loss used as basis for recognition**

When the percentage interest in common stock of the investee is not mirrored by the level of ownership in its other securities, the process of recognizing the investor's share of investee losses becomes much more complex. Per ASC 323, there are two acceptable approaches, both of which are illustrated here. The first approach is to recognize the investor's share of investee losses by reducing the various investments held in the investee (common and preferred stock and commercial debt, in this example) by the relevant percentages applicable to each class of investment.

In the following, the same facts as in the preceding example are continued, except that the percentage of ownership in the equity and debt instruments is as follows:

	<i>Percentage ownership by Dardanelles Corporation</i>
Common stock	25%
Preferred stock	50%
Commercial debt	100%

Note that the fair values of the securities held (using the new assumed percentages of ownership of each class) are as follows:

	<i>Fair value of preferred shares, consistent with ASC 320</i>	<i>Fair value of commercial debt, consistent with ASC 310-10-35</i>
1/1/20X1	N/A	N/A
12/31/20X1	\$40,000	\$48,000
12/31/20X2	19,000	32,000
12/31/20X3	4,000	28,000

Given the foregoing, the period-by-period adjustments are summarized in the following table:

	<i>Common stock</i>	<i>Preferred stock</i>	<i>Commercial debt</i>		
	<i>Book value</i>	<i>Book value</i>	<i>Fair value</i>	<i>Book value</i>	<i>Fair value</i>
1/1/20X1	\$ 12,000	\$ 50,000	N/A	\$50,000	N/A
20X1 loss = \$140,000 Eliminate @ 25% ratio	(12,000)				
Reduce preferred @ 50% ratio		(46,000)			
		4,000	\$40,000		\$48,000
Adjust pfd. stk. to FMV and debt to FV		36,000		(2,000)	
<b>12/31/20X1 values</b>	0	40,000		48,000	
20X2 loss = \$50,000 Eliminate preferred @ 50% ratio		(4,000)			
Reduce commercial debt @ 100% ratio				(42,000)	
		36,000	19,000	6,000	32,000
Adjust pfd. stk. to FMV and debt to FV		17,000		—	
<b>12/31/20X2 values</b>	0	19,000		6,000	
20X3 loss = \$30,000				(6,000)	
Reduce commercial debt @ 100% ratio			4,000	0	7,000
Adjust pfd. stk. to FMV and debt to FV		(15,000)		—	
<b>12/31/20X3 values</b>	\$ <u>  </u> 0	\$ 4,000		\$ <u>  </u> 0	

Journal entries and explanations for the adjustments that would be made consistent with the foregoing fact pattern are as follows:

12/31/X1	Investee losses	58,000
	Investment in Bosphorus common stock	12,000
	Investment in Bosphorus preferred stock	46,000
	<i>To record Dardanelles' share of Bosphorus' loss for the year; the excess over the carrying value of the common stock is used to reduce the carrying value of the preferred shares based on Dardanelles' 50% ownership interest in the preferred stock outstanding</i>	
	Investment in Bosphorus preferred stock	36,000
	Unrealized gain on securities available for sale (other comprehensive income)	36,000
	<i>Since the fair value of the preferred shares is \$40,000, per ASC 320 the carrying value must be upwardly revalued and the adjustment is included in other comprehensive income for the year</i>	

	Loss from impairment of loan	2,000
	Investment in Bosphorus commercial debt	2,000
	<i>As required by ASC 310-10-35, the impairment of the loan to Bosphorus must be recognized by a charge against current period net income</i>	
12/31/X2	Investee losses	46,000
	Investment in Bosphorus preferred stock	4,000
	Investment in Bosphorus commercial debt	42,000
	<i>To record Dardanelles' share of Bosphorus' loss for the year; the excess over the remaining carrying value of the preferred stock (without consideration of the ASC 320 adjustment) is used to reduce the carrying value of the commercial debt held</i>	
12/31/X2	Unrealized gain on securities available for sale (other comprehensive income)	17,000
	Investment in Bosphorus preferred stock	17,000
	<i>Since the fair value of the preferred shares is not \$19,000, the adjustment booked in the prior period must be partially reversed; this adjustment is included in other comprehensive income for the year</i>	
12/31/X3	Investee losses	6,000
	Investment in Bosphorus commercial debt	6,000
	<i>To record Dardanelles' share of Bosphorus' loss for the year; the maximum to be recognized is the carrying value of the commercial debt since the carrying value of common and preferred stock investments has already been reduced to zero</i>	
	Unrealized gain on securities available for sale (other comprehensive income)	15,000
	Investment in Bosphorus preferred stock	15,000
	<i>Since the fair value of the preferred shares is now \$4,000, the carrying value must be further reduced, with the adjustment included in other comprehensive income</i>	

It should be noted in the foregoing example that the limitation on loss recognition each year is given by reference to the investor's percentage interests in the various classes of equity or debt held. The 20X1 loss is allocated between the common and preferred interests. A \$12,000, 25% interest in the common stock equates to a total of \$48,000 of common stock ( $\$12,000 \div 25\%$ ). Therefore, if the full \$140,000 loss were first allocated to reduce the book value of the common stock, \$48,000 would have been applied to reduce that book value to zero. That would leave \$92,000 of loss ( $\$140,000 - \$48,000$ ) that remains to be allocated to the preferred interests.  $\$92,000 \times$  the 50% preferred interest of the investor is \$46,000. Since the carrying value of the preferred stock investment is greater than this amount, the full loss is recognized by the investor proportional to its interest.

Similarly, the investee loss of \$50,000 in 20X2 is first used to eliminate the remaining carrying value (before the ASC 320 adjustment) of the preferred stock investment, at a 50% ratio. The total of the preferred interests is computed by dividing the remaining carrying value of the preferred stock, \$4,000, by the 50% interest that it represents. Therefore, the \$8,000 of the \$50,000 loss would be allocated to the preferred interests, thus leaving \$42,000 to allocate to the commercial debt. Since Dardanelles owns all of this debt issue, the limitation on loss recognition would be the lesser of the remaining loss (\$42,000) or the carrying value of the debt (before the ASC 310-10-35 adjustment) of \$48,000.

Finally, note that in year 20X3 there will be \$24,000 of unrecognized investee losses, since as of the end of that year the carrying value of all the investor's investments in the investee will have been reduced to zero (except for the fair value of the preferred stock which is presented pursuant to ASC 320).

**Example of accounting for excess loss of investee when other investments are also held in same entity, when proportions of investments vary—second method: investee's reported change in net assets used as basis for recognition**

The alternative, equally acceptable approach to investee loss recognition when various equity and debt interests are held in the investee, at varying percentage ownership levels, ignores the investee's reported loss for the period in favor of an indirect approach, making reference to the change in the investor's interest in the investee's reported net assets (net book value). In theory, the results will often be very similar if not identical, but investee capital transactions with other owners (e.g., issuing another series of preferred shares) could impact the loss recognition by the investor under some circumstances. Furthermore, since the investor's cost of its investments in the investee will normally vary from the investee's book value of those investments (e.g., if the investments were acquired in the secondary market), the losses computed by this method may differ from those computed by the first of the two alternative approaches.

To illustrate, again assume all the facts above, including the percentage interests in the immediately preceding example. Also, the condensed statements of financial position of Bosporus Corporation as of the relevant dates are given as follows:

	<u>1/1/X1</u>	<u>12/31/X1</u>	<u>12/31/X2</u>	<u>12/31/X3</u>
Total assets	\$ <u>270,000</u>	\$ <u>135,000</u>	\$ <u>90,000</u>	\$ <u>50,000</u>
Commercial debt	50,000	50,000	50,000	50,000
Other liabilities	20,000	25,000	30,000	20,000
Preferred stock	100,000	100,000	100,000	100,000
Common stock + retained earnings	<u>100,000</u>	(40,000)	(90,000)	(120,000)
Total liabilities and equity	\$ <u>270,000</u>	\$ <u>135,000</u>	\$ <u>90,000</u>	\$ <u>50,000</u>

The investor's share of the investee's net assets at these respective dates and the changes to be recognized therein as the investor's share of investee losses for the years 20X1–20X3 are given below.

	<u>1/1/X1</u>	<u>12/31/X1</u>	<u>12/31/X2</u>	<u>12/31/X3</u>
<i>(At investee's book values)</i>				
Investor's shares of:				
Commercial debt (100%)	\$50,000	\$50,000	\$50,000	\$30,000
Preferred stock (50%)	50,000	30,000	5,000	0
Common stock + retained earnings (25%)	<u>25,000</u>	0	0	0
Total share of investee's net assets	<u>\$125,000</u>	<u>\$ 80,000</u>	<u>\$ 55,000</u>	<u>\$ 30,000</u>
Change in share from prior year (investor's share of investee loss for year)		<u>\$(45,000)</u>	<u>\$(25,000)</u>	<u>\$(25,000)</u>

In terms of how the actual investee losses should be recorded by the investor, the standard is not explicit, but there is no reason to depart from the approach illustrated above. Thus, the investment in Bosporus common stock would be eliminated first, then the investment in the preferred stock, and finally the investment in the debt securities. The provisions of ASC 310-10-35 and ASC 320 would have to be adhered to as well, again similar to the illustration above.

One part of the foregoing analysis that may need elaboration is the decision, in 20X3, to absorb all the excess investee losses against the investor's interest in the commercial debt. In many cases the commercial debt will be secured or for other reasons have preference over the other liabilities (which would tend to include accruals, trade payables, etc.). Therefore, in an actual liquidation situation the unsecured creditors would be eliminated before the commercial

debtholders. However, the purpose of this computation—determining how much of the investee's losses should be reported by the investor—is not predicated on an actual liquidation but, rather, is based on a going concern assumption and conservatism. Since the investor in this example owns a major position in the common stock, half of the preferred stock, and all of the debt, presumably if the ongoing losses were indicative of imminent demise the investor would have already put the investee into liquidation or taken other dramatic steps. Since this has not occurred, the appropriate computational strategy, it is believed, is to allocate further losses against the investor's remaining interest, which is in the commercial debt. (If actual liquidation were being contemplated, it would be necessary to consider an even greater write-down of the carrying value of this investment.)

Note that the loss recognized each period differs from that under the previous approach, since the allocation is based on the book values of the various interests on the investee's statement of financial position, not the cost basis from the investor's perspective, as detailed below.

	<i>Common stock</i>	<i>Preferred stock</i>	<i>Commercial debt</i>	
	<i>Book value</i>	<i>Book value</i>	<i>Fair value</i>	<i>Book value</i>
1/1/20X1	\$12,000	\$50,000	N/A	\$ 50,000
20X1 change in investor's share of investee's net book value = -45,000	(12,000)			
Eliminate carrying value of common		(33,000)		
Reduce carrying value of preferred				
Adjust pfd. stk. to FMV and debt to FV	17,000	\$40,000		\$48,000
<b>12/31/20X1 values</b>	<b>0</b>	<b>40,000</b>		<b>48,000</b>
20X2 change in investor's share of investee's net book value = -25,000				
Reduce carrying value of commercial debt	17,000		(8,000)	
Adjust pfd. stk. to FMV and debt to FV	23,000	19,000	40,000	32,000
<b>12/31/20X2 values</b>	<b>0</b>	<b>19,000</b>		<b>32,000</b>
20X3 change in investor's share of investee's net book value = -25,000				
Reduce carrying value of commercial debt			(25,000)	
Adjust pfd. stk. to FMV and debt to FV	(15,000)	4,000	7,000	7,000
<b>12/31/20X3 values</b>	<b>\$ 0</b>	<b>\$ 4,000</b>		<b>\$ 7,000</b>

Journal entries and explanations for the adjustments that would be made consistent with the foregoing fact pattern would be similar to those shown earlier in this section and therefore will not be repeated here.

**Accounting for subsequent investments in an investee after suspension of equity method loss recognition.** Recognition of investee losses by the investor is suspended when the investment account is reduced to zero, subject to the further reduction in the carrying value of any other investments (preferred stock, debt, etc.) in that investee, as circumstances warrant. In some cases,

after the recognition of investee losses is suspended, the investor will make a further investment in the investee, and the question arises whether recognition of some or all of the previously unrecognized investee losses should immediately be given recognition, up to the amount of the additional investment.

ASC 323-10-S99 addresses the situation where the increased investment in the equity method investee triggered a need to consolidate (i.e., the 50% ownership threshold was exceeded), and cites the Securities and Exchange Commission (SEC)'s position against further loss recognition. ASC 323-10-35-29 deals with the situation where the increased investment did not cause control to be assumed, but rather where equity method accounting was specified both before and after the further investment is made (e.g., the investor owned 30% of the investee's common stock previously, and then increased the interest to 35%) has been dealt with.

ASC 323-10-35-29 holds that recognition of some or all of the previously unrecognized ("suspended") losses is conditioned on whether the new investment represents funding of prior investee losses. To the extent that it does, the previously unrecognized share of prior losses will be given recognition (i.e., reported in the investor's current period net income). Making this determination requires the use of judgment and is fact-specific, but some of the considerations would be as follows:

- Whether the additional investment is acquired from a third party or directly from the investee, since it is unlikely that funding of prior losses occurs unless funds are infused into the investee;
- The fair value of the consideration received in relation to the value of the consideration paid for the additional investment, with an indicated excess of consideration paid over that received being suggestive of a funding of prior losses;
- Whether the additional investment results in an increase in ownership percentage of the investee, with investments being made without a corresponding increase in ownership or other interests (or, alternatively, a pro rata equity investment made by all existing investors) being indicative of the funding of prior losses; and
- The seniority of the additional investment relative to existing equity of the investee, with investment in subordinate instruments being suggestive of the funding of prior losses.

When additional investments are made in an investee that has experienced losses, the corollary issue of whether the investor has committed to further investments may arise. If such is the case, then yet-unrecognized (suspended) investee losses may also need to be recognized in investor net income currently—in effect, as a loss contingency that is deemed probable of occurrence.

#### **Example of subsequent investments in investee with losses in excess of original investment**

R Corp. invested \$500,000 in an investee, E Company, representing a 40% ownership interest. Investee losses caused R Corp. to completely eliminate the carrying value of this investment, and the recognition of R Corp.'s share of a further \$200,000 of E Company losses ( $\$200,000 \times 40\% = \$80,000$ ) was suspended. Later, R Corp. invested another \$100,000 in E Company. Application of the criteria above led to the conclusion that one-half of its investment was in excess of the value of the consideration received, and thus the entry to record the further investment would be:

Investment in E Company stock	50,000
Loss on equity method investment in E Company	50,000
Cash	100,000

If it is determined, however, that R Corp. has “otherwise committed” to further investment in E Company, the investor might have to recognize losses up to the full amount of the suspended losses. The entry might therefore be:

Investment in E Company stock	20,000
Loss on equity method investment in E Company	80,000
Cash	100,000

**Intercompany transactions between investor and investee.** Transactions between the investor and the investee may require that the investor make certain adjustments when it records its share of the investee earnings. According to the realization concept, profits can be recognized by an entity only when realized through a sale to outside (unrelated) parties in arm's-length transactions (sales and purchases) between the investor and investee. Similar problems, however, can arise when sales of fixed assets between the parties occur. In all cases, there is no need for any adjustment when the transfers are made at book value (i.e., without either party recognizing a profit or loss in its separate accounting records).

In preparing consolidated financial statements, all intercompany (parent-subsidiary) transactions are eliminated. However, when the equity method is used to account for investments, only the profit component of intercompany (investor-investee) transactions is eliminated. This is because the equity method does not result in the combining of all income statement accounts (such as sales and cost of sales), and therefore will not cause the financial statements to contain redundancies. In contrast, consolidated statements would include redundancies if the gross amounts of all intercompany transactions were not eliminated.

Another distinction between the consolidation and equity method situations pertains to the percentage of intercompany profit to be eliminated. In the case of consolidated statements, the entire intercompany profit is eliminated, regardless of the percentage ownership of the subsidiary. However, only the investor's pro rata share of intercompany profit is to be eliminated in equity accounting, whether the transaction giving rise to the profit is “downstream” (a sale to the investee) or “upstream” (a sale to the investor). An exception is made when the transaction is not “arm's-length” or if the investee company was created by or for the benefit of the investor. In these cases, 100% profit elimination would be required, unless realized through a sale to a third party before year-end.

#### Example of accounting for intercompany transactions

Continue with the basic facts set forth in an earlier example and also assume that E Company sold inventory to R Corporation in 20X1 for \$2,000 above E's cost. Of this inventory, 30% remains unsold by R at the end of 20X1. E's net income for 20X1, including the gross profit on the inventory sold to R, is \$15,000; E's income tax rate is 34%. R should make the following journal entries for 20X1 (ignoring deferred income taxes):

1. Investment in E Company	6,000
Equity in E income	6,000
\$15,000 × 40%	
2. Equity in E income (amortization of differential)	3,200
Investment in E Company	3,200
3. Equity in E income	158
Investment in E Company	158
\$2,000 × 30% × 66% × 40%	

The amount in the last entry needs further elaboration. Since 30% of the inventory remains unsold, only \$600 of the intercompany profit remains unrealized at year-end. This profit, net of income taxes, is \$396. R's share of this profit (\$158) is included in the first (\$6,000) entry recorded. Accordingly, the third entry is needed to adjust or correct the equity in the reported net income of the investee.

Eliminating entries for intercompany profits in fixed assets are similar to those in the examples above. However, intercompany profit is realized only as the assets are depreciated by the purchasing entity. In other words, if an investor buys or sells fixed assets from or to an investee at a price above book value, the gain would only be realized piecemeal over the asset's remaining depreciable life. Accordingly, in the year of sale the pro rata share (based on the investor's percentage ownership interest in the investee, regardless of whether the sale is upstream or downstream) of the unrealized portion of the intercompany profit would have to be eliminated. In each subsequent year during the asset's life, the pro rata share of the gain realized in the period would be added to income from the investee.

#### **Example of eliminating intercompany profit on fixed assets**

Assume that Investor Co., which owns 25% of Investee Co., sold to Investee a fixed asset, having a five-year remaining life, at a gain of \$100,000. Investor Co. is in the 34% marginal income tax bracket. The sale occurred at the end of 20X1; Investee Co. will use straight-line depreciation to amortize the asset over the years 20X3 through 20X5.

The entries related to the foregoing are:

#### **20X1**

1. Gain on sale of fixed asset	25,000	
Deferred gain		25,000
<i>To defer the unrealized portion of the gain</i>		
2. Deferred income tax benefit	8,500	
Income tax expense		8,500

#### *Income tax effect of gain deferral*

Alternatively, the 20X1 events could have been reported by this single entry.

Equity in <i>investee</i> income	16,500	
Investment in Investee Co.		16,500

#### **20X2 through 20X6 (each year)**

1. Deferred gain	5,000	
Gain on sale of fixed assets		5,000
<i>To amortize deferred gain</i>		
2. Income tax expense	1,700	
Deferred income tax benefit		1,700

#### *Income tax effect of gain realization*

The alternative treatment would be:

Investment in Investee Co.	3,300	
Equity in <i>investee</i> income		3,300

In the above example, the income tax currently paid by Investor Co. ( $34\% \times \$25,000$  taxable gain on the transaction) is recorded as a deferred income tax benefit in 20X1 since current income taxes will not be due on the book gain recognized in the years 20X2 through 20X6. Under

provisions of ASC 740, deferred income tax assets are recorded to reflect the income tax effects of all future deductible temporary differences. Unless Investor Co. could demonstrate that future taxable amounts arising from existing future taxable temporary differences exist (or, alternatively, that a net operating loss carryback could have been elected), this deferred income tax asset will be offset by an equivalent valuation allowance in Investor Co.'s statement of financial position at year-end 20X1. Thus, the deferred income tax asset might not be recognizable, net of the valuation allowance, for financial reporting purposes unless other future taxable temporary differences not specified in the example generate future taxable income to offset the net deductible effect of the deferred gain.

---

*NOTE: The deferred income tax impact of an item of income for book purposes in excess of tax is the same as a deduction for income tax purposes in excess of book.*

---

**Investee income items separately reportable by the investor.** In the examples thus far, the investor has reported its share of investee income, and the adjustments to this income, as a single item described as equity in investee income. However, when the investee has prior period adjustments that are material, the investor is to report its share of these separately on its financial statements.

#### Example of accounting for separately reportable items

Assume that a prior period adjustment reported in an investee's retained earnings statements is individually considered material from the investor's viewpoint.

**Statement of changes in retained earnings**

Retained earnings at January 1, 20X1, as originally reported	250,000
Add restatement for prior period adjustment—correction of an error made in 20X0 (net of income taxes of \$10,000)	<u>20,000</u>
Retained earnings at January 1, 20X1, restated	<u>\$ 270,000</u>

If an investor owned 30% of the voting common stock of this investee, the investor would make the following journal entries in 20X1:

1. Investment in investee company	24,000
Equity in investee income	24,000
\$80,000 × 30%	
2. Investment in investee company	6,000
Equity in investee prior period adjustment	6,000
\$20,000 × 30%	

The equity in the investee's prior period adjustment should be reported on the investor's statement of changes in retained earnings which is often presented in a more all-encompassing format with the statement of changes in stockholders' equity.

**Obtaining significant influence subsequent to initial investment or partial sale of an equity method investment.** An investor that holds an investment accounted for using the cost method may subsequently qualify to use the equity method of accounting. This can occur, for example, if the investor acquires additional voting shares or if the investor's voting percentage increases as a result of repurchase of voting stock by the investee. ASC 323 stipulates that this change in accounting principle (i.e., to the equity method) requires that the investment account, results of operations (all periods presented, current and prior), and retained earnings of the investor

company be retroactively adjusted. In such a case, the investor should apply the equity method. The investor should adjust the investment, results of operations, and retained earnings as if the equity method had been used for all periods that the investment was held. (ASC 323-10-35-33) The entity may increase its ownerships through a series of purchases. The equity method is applied on a step-by-step basis. At each step of the acquisition of equity, the investor compares the carrying value of the investment with the investee's net assets and determines the differential. The differential is then amortized. This is a step-by-step restatement.

The example and discussion below covers the accounting issues that arise when the investor sells some or all of its equity in the investee or acquires additional equity in the investee.

#### Example of accounting for a discontinuance of the equity method

Assume that an investor owns 10,000 shares (30%) of XYZ Company common stock, for which it paid \$250,000 ten years ago. On July 1, 20X1, the investor sells 5,000 XYZ shares for \$375,000. The balance in the investment in XYZ Company account at January 1, 20X1, was \$600,000. Assume that the original differential between cost and book value has been fully amortized. To calculate the gain (loss) upon this sale of 5,000 shares, it is first necessary to adjust the investment account so that it is current as of the date of sale. Assuming that the investee had net income of \$100,000 for the six months ended June 30, 20X1, the investor would record the following entries:

1. Investment in XYZ Company	30,000	
Equity in XYZ income		30,000
\$100,000 × 30%		
2. Income tax expense	2,040	
Deferred income tax liability		2,040
\$30,000 × 20% × 34%		

The gain upon sale can now be computed, as follows:

Proceeds upon sale of 5,000 shares	\$375,000
Book value of the 5,000 shares (\$630,000 × 50%)	<u>315,000</u>
Gain from sale of XYZ common	<u>\$ 60,000</u>

Two entries will be needed to reflect the sale: one to record the proceeds, the reduction in the investment account, and the gain (or loss); and the other to record the related income tax effects. Remember that the investor must have computed the deferred tax effects of the undistributed earnings of the investee that it had recorded each year, on the basis that those earnings either would eventually be paid as dividends or would be realized as capital gains. When those dividends are ultimately received or when the investment is disposed of, the previously recorded deferred income tax liability must be reversed.

To illustrate, assume that the investor in this example provided deferred income taxes at an effective rate for dividends (considering the 80% exclusion) of 6.8%. The realized capital gain will be taxed at an assumed 34%. For income tax purposes, this gain is computed as \$375,000 – \$125,000 = \$250,000, yielding an income tax effect of \$85,000. For accounting purposes, the deferred income taxes already provided are  $6.8\% \times (\$315,000 - \$125,000)$ , or \$12,920. Accordingly, an additional income tax expense of \$72,080 is incurred upon the sale, due to the fact that an additional gain was realized for book purposes ( $\$375,000 - \$315,000 = \$60,000$ ; income tax at 34% = \$20,400) and that the deferred income tax previously provided for at

dividend income rates was lower than the real capital gains rate  $[\$190,000 \times (34\% - 6.8\%)] = \$51,680$  extra income tax due]. The entries are as follows:

1. Cash	375,000	
Investment in XYZ Company	315,000	
Gain on sale of XYZ Company stock	60,000	
2. Deferred income tax liability	12,920	
Income tax expense	72,080	
Income taxes payable—current	85,000	

The gains (losses) from sales of investee stock are reported on the investor's income statement in the "Other income and expense" section, assuming that a multistep income statement is presented.

In this example, the sale of investee stock reduced the percentage owned by the investor to 15%. In such a situation, the investor would discontinue use of the equity method. The balance in the investment account on the date the equity method is suspended (\$315,000 in the example) will be accounted for on the basis of fair value, under ASC 320, presumably being reported in the available-for-sale investment portfolio. This accounting principle change does not require the computation of a cumulative effect or any retroactive disclosures in the investor's financial statements. In periods subsequent to this principles change, the investor records cash dividends received from the investment as dividend income and subjects the investment to the appropriate GAAP used to assess "other-than-temporary" impairment. Any dividends received in excess of the investor's share of postdisposal net income of the investee are credited to the investment, rather than to income.

The process of discontinuing the use of the equity method and adopting ASC 320, as necessitated by a reduction in ownership below the significant influence threshold level, does not require retroactive application. (ASC 323-10-35-35 and 35-36)

**Investor accounting for investee capital transactions.** According to ASC 323, investee transactions of a capital nature that affect the investor's share of the investee's stockholders' equity are accounted for on a step-by-basis. (ASC 323-10-35-15) These transactions principally include situations where the investee purchases treasury stock from, or sells unissued shares or reissues treasury shares it holds to outside shareholders. (If the investor participates in these transactions on a pro rata basis, its percentage ownership will not change and no special accounting will be necessary.) Similar results are obtained when holders of outstanding options or convertible securities acquire investee common shares.

When the investee engages in one of the above capital transactions and the investor's ownership percentage is changed, a gain or loss arises, depending on whether the price paid (for treasury shares acquired) or received (for shares issued) is greater or lesser than the per share carrying value of the investor's interest in the investee. Any gain or loss is recognized in earnings. (ASC 323-10-40-1)

#### Example of accounting for an investee capital transaction

Assume R Corp. purchases, on 1/2/X1, 25% (2,000 shares) of E Corp.'s outstanding shares for \$80,000. The cost is equal to both the book and fair values of R's interest in E's underlying net assets (i.e., there is no differential to be accounted for). One week later, E Corp. buys 1,000 shares of its stock from other shareholders for \$50,000. Since the price paid (\$50/share) exceeded R Corp.'s per share carrying value of its interest, \$40, R Corp. has in fact suffered an economic loss by the transaction. Also,

its percentage ownership of E Corp. has increased as the number of shares held by third parties has been reduced.

R Corp.'s new interest in E's net assets is:

$$\frac{2,000 \text{ shares held by R}}{7,000 \text{ shares outstanding}} \times \text{E Corp. net assets}$$

$$.2857 \times (\$320,000 - \$50,000) = \$77,143$$

The interest held by R Corp. has thus been diminished by  $\$80,000 - \$77,143 = \$2,857$ . Therefore, R Corp. should make the following entry:

Loss on E Corp purchase of its stock	2,857	
Investment in E Corp.		2,857

R Corp. charges the loss against additional paid-in capital if such amounts have accumulated from past transactions of a similar nature; otherwise the debit is to retained earnings. Had the transaction given rise to a gain it would have been credited to additional paid-in capital only (never to retained earnings) following the rule that transactions in one's own shares cannot produce net income.

Note that the amount of the charge to additional paid-in capital (or retained earnings) in the entry above can be verified as follows: R Corp.'s share of the posttransaction net equity (2/7) times the "excess" price paid ( $\$50 - \$40 = \$10$ ) times the number of shares purchased =  $2/7 \times \$10 \times 1,000 = \$2,857$ .

**Investor's proportionate share of other comprehensive income items.** ASC 323-10-35-37 holds that an investor's proportionate share of an investee's equity adjustments for other comprehensive income items (e.g., fair value adjustments to available-for-sale investments) should be offset against the carrying value of the investment in the investee entity at the time significant influence is lost. To the extent that the offset results in a carrying value of the investment that is less than zero, an investor will (1) reduce the carrying value of the investment to zero; and (2) record the remaining balance in income.

**Exchanges of equity method investments.** According to ASC 845, an exchange of an equity method investment for another such investment is to be accounted for at book value, without gain or loss recognition (other than what may be necessary to record impairment, of course).

**Change in level of ownership or degree of influence.** An equity method investor accounts for an issuance of shares by the investee as if the investor had sold a proportionate share of its investment. Any gain or loss to the investor that results from the investee's share issuance is to be recognized in net income.

**Significant influence in the absence of ownership of voting common stock.** ASC 323 was written to apply the accounting for investments to investments in voting common stock of an investee. ASC 323-10-15-13 addresses the accounting for investments in other investment vehicles, such as options and warrants, and complex licensing and/or management agreements, where significant influence might also be present.

ASC 323-10-15-13 states that a reporting entity that has the ability to exercise significant influence over the operating and financial policies of an investee should apply the equity method only when it has an investment(s) in common stock and/or an investment that is in-substance common stock. In-substance common stock is an investment in an entity that has risk and reward characteristics that are substantially similar to the investee's common stock. Whether or not significant influence is wielded is a fact question, and suggested criteria are not provided in the ASC.

Management must consider certain characteristics when determining whether an investment in an entity is substantially similar to an investment in that entity's common stock. These are conjunctive constraints. If the entity determines that *any* one of the following characteristics indicates that an investment in an entity is not substantially similar to an investment in that entity's common stock, the investment is not in-substance common stock.

1. *Subordination.* It must be determined whether the investment has subordination characteristics substantially similar to the investee's common stock. If there are substantive liquidation preferences, the instrument would not be deemed substantially similar to common stock. On the other hand, certain liquidation preferences are not substantive (e.g., when the stated liquidation preference that is not significant in relation to the purchase price of the investment), and would be discounted in this analysis.
2. *Risks and rewards of ownership.* A reporting entity must determine whether the investment has risks and rewards of ownership that are substantially similar to an investment in the investee's common stock. If an investment is not expected to participate in the earnings (and losses) and capital appreciation (and depreciation) in a manner that is substantially similar to common stock, this condition would not be met. Participating and convertible preferred stocks would likely meet this criterion, however.
3. *Obligation to transfer value.* An investment is not substantially similar to common stock if the investee is expected to transfer substantive value to the investor and the common shareholders do not participate in a similar manner. For example, if the investment has a substantive redemption provision (for example, a mandatory redemption provision or a non-fair-value put option) that is not available to common shareholders, the investment is not substantially similar to common stock.

In some instances it may be difficult to assess whether the foregoing characteristics are present or absent. ASC 323-10-15-13 suggests that, in such circumstances, management of the reporting entity (the investor) should also analyze whether the future changes in the fair value of the investment are expected to be highly correlated with the changes in the fair value of the investee's common stock. If the changes in the fair value of the investment are not expected to be highly correlated with the changes in the fair value of the common stock, then the investment is not in-substance common stock. (ASC 323-10-15-15)

According to ASC 323-10-15-13, the determination of whether an investment vehicle is in-substance common stock must be made upon acquisition, if the entity has the ability to exercise significant influence. The assessment should be revisited if one or more of these occur:

1. The contractual terms of the investment are changed resulting in a change to any of its characteristics described above.
2. There is a significant change in the capital structure of the investee, including the investee's receipt of additional subordinated financing.
3. The reporting entity obtains an additional interest in an investment in which the investor has an existing interest. As a result, the method of accounting for the cumulative interest is based on the characteristics of the investment at the date at which the entity obtains the additional interest (that is, the characteristics that the entity evaluated in order to make its investment decision), and will result in the reporting entity applying one method of accounting to the cumulative interest in an investment of the same issuance.

(ASC 323-10-15-16)

The mere fact that the investee is suffering losses is not a basis for reconsideration of whether the investment is in-substance common stock.

Upon implementation of ASC 323-10-15-13, for investments in which the entity has the ability to exercise significant influence over the operating and financial policies of the investee, the reporting entity makes an initial determination about whether existing investments are in-substance common stock. The initial determination is to be based on circumstances that existed on the date of adoption, rather than on the date that the investment was made.

### **ASC 323-30, *Equity Investments in Corporate Joint Ventures and Noncorporate Entities***

A wide variety of noncorporate entities and structures are used to:

- Operate businesses,
- Hold investments in real estate or in other entities, or
- Undertake discrete projects as joint ventures.

These include:

- Partnerships, for example, limited partnerships, general partnerships, limited liability partnerships, and
- Limited liability companies (LLC).

Practice questions persistently arise regarding whether directly or by analogy, authoritative GAAP literature that applies to corporate structures is also applicable to investors in noncorporate entities.

By analogy, investors with controlling interests in unincorporated entities, such as partnerships and other unincorporated joint ventures, generally should account for their investments using the equity method. (ASC 323-30-25-1)

**General partnerships.** There is a rebuttable presumption that a general partner that has a majority voting interest is in control of the partnership. If voting rights are indeterminate under the provisions of the partnership agreement or applicable law, the general partner with a majority of the financial interests in the partnership's profits or losses would be presumed to have control. If this presumption is not overcome, the general partner with voting control or the majority financial interest would consolidate the partnership in its financial statements and the other noncontrolling general partners would use the equity method. (ASC 323, ASC 970-323)

**Limited liability companies.** A limited liability company may maintain a specific ownership account for each investor—similar to a partnership capital account structure. In that case, the investment in the limited liability company is viewed as similar to an investment in a limited partnership for purposes of determining whether a noncontrolling investment in a limited liability company is accounted for using the cost method or the equity method.

### **ASC 323-740, *Qualified Affordable Housing Project Investments***

(The Perspectives and Issues section at the beginning of this chapter gives a brief summary of this federal tax provision.)

These investments are accounted for using:

- Effective yield method, or
- The guidance in ASC 970-323, *Real Estate General—Investments—Equity Method and Joint Ventures*.

**The proportional amortization method.** The Codification includes an election available to qualified affordable housing projects. The election allows a “proportional amortization method” that can be used to amortize the investment basis of investments that meet certain conditions. If elected, the method is required for all eligible investments in qualified affordable housing projects and must be applied consistently. It replaces the effective yield method. Under the proportional method, an investor amortizes the costs of its investment, in proportion to the tax credits and other tax benefits it receives, to income tax expense.

To elect the proportional method, all of the following conditions must be met:

1. It is probable that the tax credits allocable to the investor will be available.
2. The investor does not have the ability to exercise significant influence over the operating and financial policies of the limited liability entity.
3. Substantially all of the projected benefits are from tax credits and other tax benefits (for example, tax benefits generated from the operating losses of the investment).
4. The investor’s projected yield based solely on the cash flows from the tax credits and other tax benefits is positive.
5. The investor is a limited liability investor in the limited liability entity for both legal and tax purposes, and the investor’s liability is limited to its capital investment.

(ASC 323-740-25-1)

The decision to use the proportional amortization method is an accounting policy decision that must be applied consistently to individual qualifying investments. (ASC 323-740-25-4)

**Effective yield method.** Investors that do not qualify for the proportional amortization presentation must continue to account for their investments under the equity method or cost method, which results in losses recognized in pretax income and tax benefits recognized in income taxes (“gross” presentation of investment results).

The effective yield is the internal rate of return on the investment, based on the cost of the investment and the guaranteed tax credits allocated to the investor, excluding any expected residual value of the investment. (ASC 323-740-35-2)

**Recognition.** The investor should recognize a liability for:

- Delayed equity contributions that are unconditional and legally binding.
- Equity contributions that are contingent upon a future event.

An investor should not recognize credits before their inclusion in the investor’s tax return. (ASC 323-740-25-5)

**Subsequent measurement.** Under the proportional allocation method, investors amortize the initial cost of the investment to recognize an effective yield in proportion to the tax credit and other tax benefits allocated to the investor. (ASC 323-740-35-2) Investors include in earnings any cash received from operations of the limited partnership. (ASC 323-740-35-5)

**Presentation.** Under the proportional amortization method, the investor recognizes the amortization of the investment in the income statement as a component of income tax expense or benefit. The current portion of the expense or benefit is accounted for under the requirements of ASC 740. (ASC 323-740-45-2)

## PERSPECTIVE AND ISSUES

### Topics

The Codification contains several topics on the various forms of investments:

- ASC 320, *Investments—Debt and Equity Securities*
- ASC 323, *Investments—Equity Method and Joint Ventures*
- ASC 325, *Investments—Other*.
  - ASU 2016-01 adds a new topic related to investments: ASC 321, *Investments—Equity Securities*. It also changes the name of ASC 320 to *Investments—Debt Securities*. See the chapter on ASC 321 for more information.

### Subtopics

ASC 325 contains four subtopics:

- ASC 325-10, *Overall*, which merely identifies the other three topics
- ASC 325-20<sup>1</sup>, *Cost Method Investments*, which offers guidance on stocks of entities not accounted for under the fair value method (ASC 320) or the equity method (ASC 323)
- ASC 325-30, *Investments in Insurance Contracts*, which provides guidance on investments, life insurance contracts in general, and life settlement contracts

<sup>1</sup> This entire subtopic is superseded upon implementation of ASU 2016-01. See the chapter on ASC 321 for more information on ASU 2016-01.

- ASC 325-40, *Beneficial Interests in Securitized Financial Assets*, which provides guidance on accounting for a transferor's interest in securitized transaction accounted for as sales and purchased beneficial interests.

## Scope

ASC 325-40 "applies to a transferor's interests in securitization transactions that are accounted for as sales under Topic 860 and purchased beneficial interests in securitized financial assets." (ASC 325-40-15-2)

According to ASC 325-15-40-3, the guidance applies to beneficial interests that have *all* of the following characteristics:

1. "Are either debt securities under Subtopic 320-10 or required to be accounted for like debt securities under that subtopic pursuant to paragraph 860-20-35-2."
2. Involve securitized financial assets that have contractual cash flows. The guidance does not apply to securitized financial assets that do not involve contractual cash flows.
3. Do not result in consolidation of the entity issuing the beneficial interest by the holder of the beneficial interests.
4. Are not within the scope of ASC 310-30.
5. Are not beneficial interests in securitized financial assets that have both of the following characteristics:
  - a. Are of high credit quality (for example, guaranteed by the U.S. government, its agencies, or other creditworthy guarantors, and loans or securities sufficiently collateralized to ensure that the possibility of credit loss is remote)
  - b. Cannot contractually be prepaid or otherwise settled in such a way that the holder would not recover substantially all of its recorded investment.

(ASC 325-40-15-3)

Note that a beneficial interest in securitized financial assets that is in equity form may meet the definition of a debt security. These beneficial interests would be with in the scope of this topic and ASC 320 because ASC 320 requires them to be accounted for as debt securities:

- If the beneficial interests issued in the form of equity:
  - Represent solely a right to receive a stream of future cash flows to be collected under preset terms and conditions, or
  - According to the terms of the special-purpose entity, must be redeemed by the issuing entity or must be redeemable at the option of the investor.

(ASC 325-40-15-5)

ASC 325-40 does not apply to hybrid beneficial interests measured at fair value pursuant to paragraphs 815-15-25-4 through 25-6 for which the transferor does not report interest income as a separate item in its income statements. (ASC 325-40-15-9)

## DEFINITIONS OF TERMS

---

Source: ASC 325, *Glossaries*.

See Appendix A, *Definitions of Terms*, for other terms related to this topic: Debt Security, Probable, and Publicly Traded Company.

**Beneficial Interests.** Rights to receive all or portions of specified cash inflows received by a trust or other entity, including, but not limited to, all of the following:

1. Senior and subordinated shares of interest, principal, or other cash inflows to be passed through
2. Premiums due to guarantors
3. Commercial paper obligations
4. Residual interests, whether in the form of debt or equity.

**Cash Surrender Value.** The amount of cash that may be realized by the owner of a life insurance contract or annuity contract upon discontinuance and surrender of the contract before its maturity. The cash surrender value may be different from the policy account balance due to outstanding loans (including accrued interest) and surrender charges. (Note: The use of this glossary term is not consistent among legal contracts. When determining the applicability of this term, the economic substance of the item shall be taken into consideration.)

**Certificates.** An insurance entity issues to each individual in a group contract a certificate of insurance for each person insured under the group contract. The certificate is merely a summary of the rights, duties, and benefits available under a group policy. If there is any conflict between the certificate and a group policy, the group policy is the controlling document. (Note: The use of this glossary term is not consistent among legal contracts. When determining the applicability of this term, the economic substance of the item shall be taken into consideration.)

**Claims Stabilization Reserve.** The claims stabilization reserve is established through deductions from the policy account balance through the cost of insurance charge and is sometimes held in a general account (that is, an account that is intermingled with the insurance entity's assets) as opposed to a legally segregated account (sometimes referred to as a separate account). The amounts are accumulated in this account until a death benefit is paid. The death benefit represents a combination of the policy account balance and the claims stabilization reserve based on the contractual terms. The cost of insurance is recalculated periodically based on actual experience of the insured class. Annually, the claims stabilization reserve is reviewed and an experience credit may be issued back to the policyholder if the experience has been favorable. The balance in the claims stabilization reserve will be reviewed annually and to the extent the balance is greater than the forecasted or expected amount, an experience refund would get credited to the entity's policy account balance. An entity's claims stabilization reserve will generally be realized through the collection of death benefits or an experience refund that gets credited to the policyholder's policy account balance or upon surrender of the group policy. A claims stabilization reserve is included in a policy as a mechanism for the policyholder and the insurance entity to share in the mortality risk, which in this case is the risk that the deaths will occur sooner than originally expected. Absent a claims stabilization reserve, the policyholder's net cost of insurance would typically be higher than in a policy without a claims stabilization reserve. The claims stabilization reserve is sometimes referred to as a mortality reserve or a mortality retention reserve. (Note: The use of this glossary term is not consistent among legal contracts. When determining the applicability of this term, the economic substance of the item shall be taken into consideration.)

**Deferred Acquisition Costs Tax.** Section 848 of the Internal Revenue Code requires insurance entities to capitalize certain policy acquisition costs and defer deducting them in determining the insurer's tax liability. These costs are known as the deferred acquisition costs tax and are based on a percentage of the premium received as specified by the Internal Revenue Code. The initial deferred acquisition costs tax is deducted from a policyholder's policy account balance when the premium is paid. The deferred acquisition costs tax is credited back to the policyholder's

policy account balance as the tax deduction is recognized in the insurer's tax return. (Note: The use of this glossary term is not consistent among legal contracts. When determining the applicability of this term, the economic substance of the item shall be taken into consideration.)

**Insurance Policy.** The legal agreement between the policyholder and the insurance entity that states the terms of the arrangement. The term insurance policy includes all riders, attachments, side agreements, and other related documents that are either directly or indirectly part of the contractual arrangement. (Note: The use of this glossary term is not consistent among legal contracts. When determining the applicability of this term, the economic substance of the item shall be taken into consideration.)

**Life Settlement Contract.** A life settlement contract is a contract between the owner of a life insurance policy (the policy owner) and a third-party investor (investor), and has all of the following characteristics:

1. The investor does not have an insurable interest (an interest in the survival of the insured, which is required to support the issuance of an insurance policy).
2. The investor provides consideration to the policy owner of an amount in excess of the current cash surrender value of this life insurance policy.
3. The contract pays the face value of the life insurance policy to an investor when the insured dies.

**Policy Account Balance.** At any point in time, this is the amount held by the insurance entity on behalf of the policyholder. This balance may be held in a general account, a separate account (a legally segregated account), or a combination of both on the insurance entity's balance sheet. This account includes premiums received from the policyholder, plus any credited income, less any relevant charges (acquisition costs, cost of insurance, and so forth). (Note: The use of this glossary term is not consistent among legal contracts. When determining the applicability of this term, the economic substance of the item shall be taken into consideration.)

**Surrender Charge.** A contractual fee imposed by the insurance entity when a policyholder surrenders the insurance policy that typically decreases over the life of the policy. The surrender charge represents a recovery of costs incurred by the insurance entity in originating the policy. It may or may not be explicitly called a surrender charge and can be embedded in other agreements besides the insurance contract. (Note: The use of this glossary term is not consistent among legal contracts. When determining the applicability of this term, the economic substance of the item shall be taken into consideration.)

## CONCEPTS, RULES, AND EXAMPLES

---

### ASC 325-20, *Cost Method Investments*<sup>2</sup>

An entity may hold stock in entities other than subsidiaries. The entity should account for these investments by one of three methods:

- The cost method (addressed in this subtopic),
- The fair value method (Topic 320), or
- The equity method (Topic 323).

---

<sup>2</sup> This entire subtopic is superseded upon implementation of ASU 2016-01. See the chapter on ASC 321 for more information on ASU 2016-01.

The cost method is generally followed:

- For most investments in noncontrolled corporations,
- For investments in some corporate joint ventures, and
- To a lesser extent in investments in unconsolidated subsidiaries, particularly foreign.

For investments using the cost method, the investor recognizes, initially at cost, investments in stock of investees as assets on the statement of financial position.

**Dividends.** Dividends are the vehicle for an investor to recognize earnings from an investment under the cost method. From the date of the investment entities recognize dividends received from an investee in one of two ways:

- If the dividends are distributed from net accumulated earnings, the investor recognizes them as income.
- If the dividends are in excess of earnings, they are considered a return on investment and the investor records them as reductions in the cost of the investment.

**Impairment.** The value of the investment in stock accounted for under the cost method may lose its value because of a series of operating losses or other factors. If the impairment is considered other than temporary, investors should look to ASC 320-10-35-17 through 35-35, as discussed in the chapter on ASC 320. Those paragraphs discuss the methodology for determining impairment and evaluating whether the impairment is other than temporary and, therefore, must be recognized.

**Changes in accounting method.** The level of ownership in stock of an investee may change. An investor may lose the ability to influence policy or gain the ability to influence policy. These circumstances call for a change to or from the equity method of accounting. In those cases, preparers should look to ASC 323-10-35 for guidance.

**Other accounting issues.** ASC 325-20 provides guidance on Accounting for a Cost Method Investment in Affordable Housing Projects with Allocated Tax Credits. Disclosures required by ASC 325 may be found in the disclosure checklist included with this volume.

**Other sources.** For guidance on the use of the cost method by real estate investment trusts with related service corporations, see Topic 974. (ASC 325-20-60)

### **ASC 325-30, Investments in Insurance Contracts**

**Overview.** ASC 325-30 provides guidance on investments in insurance contracts. A life settlement contract is an agreement executed between a third-party investor and the owner of a life insurance policy where (1) the investor does not have an insurable interest in the life of the insured, (2) the investor pays an amount in excess of this policy's cash surrender value to the policy owner, and (3) upon the death of the insured, the face value of the policy is paid to the investor. These investments may be facilitated by a broker or transacted directly between the investor and the policy owner.

**Investments in life settlement contracts.** For a life settlement contract, ASC 325-30 requires the investor to elect to account for these investments using either the "investment method" or the "fair value method." This irrevocable election is made in one of two ways:

1. On an instrument-by-instrument basis supported by documentation prepared concurrently with acquisition of the investment, or
2. Based on a pre-established, documented policy that automatically applies to all such investments.

**The investment method.** The investor recognizes the initial investment at the transaction price plus all initial direct external costs. Continuing costs (payments of policy premiums and direct external costs, if any) necessary to keep the policy in force are capitalized. Gain recognition is deferred until the death of the insured. At that time the investor recognizes in net income (or other applicable performance indicator) the difference between the carrying amount of the investment and the policy proceeds.

The investor is required to test the investment for impairment upon the availability of new or updated information that indicates that, upon the death of the insured, the expected proceeds from the insurance policy may not be sufficient for the investor to recover the carrying amount of the investment plus anticipated gross future premiums (undiscounted for the time value of money) and capitalizable external direct costs, if any. Indicators to be considered include, but are not limited to:

1. A change in the life expectancy of the insured
2. A change in the credit standing of the insurer.

As a result of performing an impairment test, if the undiscounted expected cash inflows (the expected proceeds from the policy) are less than the carrying amount of the investment plus the undiscounted anticipated gross future premiums and capitalizable external direct costs, an impairment loss is recognized. The loss is recorded by reducing the carrying value of the investment to its fair value. The fair value computation is to employ current interest rates. Note that a change in interest rates would not by itself require an impairment test.

**The fair value method.** The initial investment is recorded at the transaction price. Each subsequent reporting period, the investor remeasures the investment at fair value and recognizes changes in fair value in current period net income (or other relevant performance indicators for reporting entities that do not report net income). Cash outflows for policy premiums and inflows for policy proceeds are to be included in the same financial statement line item as the changes in fair value are reported.

**Presentation in the statement of financial position.** On the face of its statement of financial position, the investor is required to differentiate between investments remeasured at fair value and those accounted for using the investment method. This may be accomplished by either:

1. Presenting separate line items for each type of investment, or
2. Parenthetical disclosure.

#### Examples of presentation alternatives in the statement of financial position

1. Separate line items

Investments in life settlement contracts measured at	
Fair value	\$xxx,xxx
Initial investment and accumulated costs	\$xxx,xxx

2. Parenthetical disclosure

Investments in life settlement contracts	\$xxx,xxx
(Portion stated at fair value \$xxx,xxx)	

**Income statement presentation.** Investment income attributable to fair value remeasurements is presented on the face of the income statement separately from investment income

attributable to contracts accounted for using the investment method. This may be accomplished by either:

1. Presenting separate line items for investment income attributable to each type of investment, or
2. Parenthetical disclosure.

#### Examples of income statement presentation alternatives

1. Separate line items

Investment income from life settlement contracts measured at	
Fair value	\$xxx,xxx
Initial investment and accumulated costs	\$xxx,xxx

2. Parenthetical disclosure

Investment income from life settlement contracts	\$xxx,xxx
(Portion from contracts carried at fair value \$xxx,xxx)	

**Cash flow statement presentation.** Cash inflows and outflows attributable to investments in life settlement contracts are to be classified based on the nature and purpose for which the contracts were acquired.

**Disclosure of accounting policy.** In addition to other applicable GAAP disclosures, the investor is to disclose the policy it follows to account for life settlement contracts, including the classification in the cash flow statement of cash inflows and outflows associated with these contracts.

**Disclosures when using the investment method.** For life settlement contracts accounted for under the investment method, the investor is required to disclose the following information based on the remaining life expectancy of the insured individuals:

1. By year, for each of the first five fiscal years ending after the date of the statement of financial position, in total for the years succeeding those first five years, and in the aggregate:
  - a. The number of life settlement contracts in which it has invested
  - b. The carrying value of those contracts
  - c. The face value (death benefits) of the life insurance policies covered by those contracts.
2. By year, for each of the first five fiscal years ending after the date of the most recent statement of financial position presented, the life insurance premiums expected to be paid in order to keep the life insurance policies related to the life settlement contracts in force.
3. If management becomes aware of new or updated information that causes it to change its estimates of the expected timing of its receipt of the proceeds from the investments, it is to disclose the nature of the information and its related effect on the timing of the expected receipt of the policy proceeds. This disclosure is to include significant effects of the change in estimate on the disclosure described in item<sup>3</sup>.

---

<sup>3</sup> This disclosure requirement does not impose an obligation on management to actively seek out new or updated information in order to update the assumptions used in determining the remaining life expectancy of the life settlement contracts.

**Disclosures when using the fair value method.** For life settlement contracts accounted for under the fair value method, the investor is required to disclose the following information based on the remaining life expectancy of the insured individuals:

1. The method(s) and significant assumptions used to estimate the fair value of the contracts, including any mortality assumptions.
2. By year, for each of the first five fiscal years ending after the date of the statement of financial position, in total for the years succeeding those first five years, and in the aggregate:
  - a. The number of life settlement contracts in which it has invested
  - b. The carrying value of those contracts
  - c. The face value (death benefits) of the life insurance policies covered by those contracts.
3. The reasons for changes in its estimates of the expected timing of its receipt of the proceeds from the investments including significant effects of the change in estimates on the information disclosed in item 2.

#### **ASC 325-40, *Beneficial Interests in Securitized Financial Assets***

**Overview.** ASC 325-40 provides guidance on another type of investment. When a reporting entity sells a portion of an asset that it owns, the portion retained becomes an asset separate from the portion sold and separate from the assets obtained in exchange. This is the situation when financial assets such as loans are securitized with certain interests being retained (e.g., a defined portion of the contractual cash flows). Management of the reporting entity must allocate the previous carrying amount of the assets sold based on the relative fair values of each component at the date of sale. In most cases, the initial carrying amount (i.e., the allocated cost) of the retained interest will be different from the fair value of the instrument. Furthermore, cash flows from those instruments may be delayed depending on the contractual provisions of the entire structure (for example, cash may be retained in a trust to fund a cash collateral account). The issue is addressed by ASC 325-40.

This subtopic provides that the holder of the beneficial interest must recognize the excess of all cash flows anticipated at the acquisition transaction date over the initial investment (ASC 325-40-30-2) as interest income using the effective yield method. (ASC 325-40-35-1) The holder is required to update the estimate of cash flows over the life of the beneficial interest. If the estimated cash flows change (but there was still an excess over the carrying amount), the adjustment is accounted for prospectively as a change in estimate with the amount of the periodic accretion adjusted over the remaining life of the beneficial interest. If the fair value of the beneficial interest declines below its carrying amount, the reporting entity should determine if the decline is other than temporary and apply the impairment guidance in ASC 320-10-35-18. If it is not practicable for a holder/transferor to estimate the fair value of the beneficial interest at the securitization date, interest income is recognized using the cash basis rather than the effective yield method.

**Impairment and interest income on purchased and retained beneficial interests in securitized financial assets.** If, based on current information and events that the reporting entity anticipates a market participant would use in determining the current fair value of the beneficial interest, there is a change in estimated cash flows, the amount of accretable yield is recalculated. If the change in estimated cash flows is adverse, an other-than-temporary impairment would be considered to have occurred.

*OTTI evaluations.* The objective of the analysis as to whether an impairment is other-than-temporary is to determine whether it is probable that the holder will realize some portion of the unrealized loss on an impaired security. Under U.S. GAAP, a holder may ultimately realize an unrealized loss on the impaired security because, for example:

1. It is probable that the holder will not collect all of the contractual or estimated cash flows, considering both their amount and timing, or
2. The holder of the security lacks the intent and ability to hold it until recovery of the loss.

It is inappropriate for management to automatically conclude that, because all of the scheduled payments to date have been received, a security has not incurred an OTTI. Conversely, it is also inappropriate for management to automatically conclude that every decline in fair value of a security represents OTTI. The longer and/or the more severe the decline in fair value, the more persuasive the evidence that would be needed to overcome the premise that it is probable that the holder will not collect all of the contractual or estimated cash flows from the security. (ASC 325-40-35-10A)

Further analysis and the exercise of judgment are required to assess whether a decline in fair value indicates that it is probable that the holder will not collect all of the contractual or estimated cash flows from the security.

In performing the assessment of OTTI and developing estimates of future cash flows, the holder should look to the guidance in ASC 320-10-35-33G through 35-33I and consider all information available that is relevant to collectibility, including information about past events, current conditions, and forecasts that are reasonable and supportable. ASC 320-10-35 provides that this information should generally include:

1. The remaining payment terms of the security
2. Prepayment speeds
3. The issuer's financial condition
4. Expected defaults
5. The value of the underlying collateral
6. Industry analyst reports and forecasts, sector credit ratings, and other relevant market data,
7. The effect, if applicable, of any credit enhancements on the expected performance of the security, including consideration of the current financial condition of a guarantor of the security.

(ASC 320-10-35-33G through 35-33I)

---

*NOTE: This applies only if the guarantee is not a separate contract. Per ASC 320-10-35-23, the holder is not to combine separate contracts (such as a debt security and a guarantee or other credit enhancement) for the purpose of the determination of impairment or the determination of whether the debt security can be contractually prepaid or otherwise settled in a manner that would preclude the holder from recovering substantially all of its cost.*

---

Some or all of the securitized loans that comprise many beneficial interests may be structured with payment streams that are not level over the life of the loan. Thus, the remaining payments expected to be received from the security could differ significantly from those received in prior periods. These so-called “nontraditional” loans may have features such as:

1. Terms permitting principal payment deferral (interest-only)
2. Interest accruals exceeding the required payments (negative amortization or reverse mortgages)

3. A high loan-to-value ratio
4. Collateral applying to multiple loans that, when considered together, result in a high loan-to-value ratio
5. Option adjustable rate mortgages (option ARMs) or similar products that may expose the borrower to future increases in required payments
6. An initial interest rate (“teaser rate”) below the market rate of interest for the initial period of the term of the loan that will increase significantly at the end of that initial period
7. Interest-only loans
8. Loans requiring a “balloon” payment at maturity.

In achieving this objective, the holder considers information such as:

1. Reports and forecasts from industry analysts
2. Sector credit ratings
3. Other market data relevant to the collectibility of the security.

The existence of these or other features necessitates consideration by the holder of whether a security backed by loans that are currently performing will continue to perform when the contractual provisions of those loans require increasing payments on the part of the borrowers. In addition, the holder is to consider how the value of any collateral would affect the expected performance of the security. Naturally, if the fair value of the collateral has declined, the holder must assess the effect of the decline on the ability of the borrower to make the balloon payment since the decline in value may preclude the borrower from obtaining sufficient funds from a potential refinancing of the debt.

*Timing of recognition of an OTTI.* If management of the entity *both* holds an available-for-sale beneficial interest whose fair value is less than its amortized cost basis *and* does not expect the fair value to recover prior to an expected sale shortly after the date of the statement of financial position, a write-down for other-than-temporary impairment is recognized as a charge to net income in the period in which the decision to sell the beneficial interest is made. (ASC 325-40-35-13)

## PERSPECTIVE AND ISSUES

### Technical Alert

In July 2015, the FASB, as part of its simplification initiative, issued ASU 2015-11, *Inventory (Topic 330) Simplifying the Measurement of Inventory*.

**Scope.** The change does not apply to inventory that is measured using LIFO or the retail inventory method. The change applies to all other inventory.

**Guidance.** Inventory within the scope of the ASU is measured at the lower of cost and net realizable value (NRV). NRV is defined as:

*The estimated selling price in the ordinary course of business*

*Less: Reasonably predictable costs of completion, disposal, and transportation.*

The ASU does not change the subsequent measurement of inventory in GAAP using LIFO or the retail inventory method.

**Effective dates.** It is expected that because it may reduce costs, entities may well take advantage of early adoption. The changes are effective as follows:

- Public business entities: The changes are effective for fiscal years beginning after December 15, 2016, including interim periods within those fiscal years.
- All other entities: Effective for fiscal years beginning after December 15, 2016 and interim periods within fiscal years beginning after December 15, 2017.

The changes should be applied prospectively. Earlier application is permitted.

### **Subtopic**

ASC 330, *Inventory*, consists of one subtopic:

- ASC 330-10, *Overall*, that provides guidance on the accounting and reporting practices on inventory.

ASC 330, *Inventory*, discusses the definition, valuation, and classification of inventory.

### **Scope**

ASC 330 applies to all entities but is not necessarily applicable to:

- Not-for-profit entities
  - Regulated utilities.
- (ASC 330-10-15-2 and 15-3)

### **Practice Alert**

While SEC comments do not pertain to nonpublic entities, their comments can often provide valuable guidance. In the area of inventory, the SEC has commented on:

- the selection and disclosure of valuation methods,
- how spoilage is estimated,
- cost capitalized in inventory, and
- disclosure of adjustments.

Preparers should pay close attention to the accounting and disclosures in those areas.

### **Overview**

The accounting for inventories is a major consideration for many entities because of its significance to both the income statement (cost of goods sold) and the statement of financial position (current assets).

The complexity of accounting for inventories arises from factors that include:

1. The high volume of activity (or turnover) and the associated challenges of keeping accurate, up-to-date records.
2. Choosing from among various cost flow alternatives that are permitted by GAAP.

3. Ensuring compliance with complex U.S. income tax laws and regulations when electing to use the last-in, first-out (LIFO) method.
4. Monitoring and properly accounting for adjustments necessitated by applying the lower of cost or market method to the inventory.

There are two types of entities for which the accounting for inventories is relevant. The merchandising entity purchases inventory for resale to its customers. The manufacturer buys raw materials, and processes those raw materials using labor and equipment into finished goods that are then sold to its customers. While the production process is progressing, the costs of the raw materials, salaries, and wages paid to the labor force (and related benefits), depreciation of the machinery, and an allocated portion of the manufacturer's overhead are accumulated by the accounting system as work-in-process (WIP). Finished goods inventory is the completed product which is on hand awaiting shipment or sale.

In the case of either type of entity, we are concerned with answering the same basic questions:

1. At what point in time should the items be included in inventory (ownership)?
2. What costs incurred should be included in the valuation of inventories?
3. What cost flow assumption should be used?
4. At what value should inventories be reported (determination of the lower of cost or market, or LCM)?

## DEFINITIONS OF TERMS

---

Source: ASC 330-10-20. Also see Appendix A, *Definitions of Terms*, for other definitions relevant to this chapter: Customer, Reseller (2nd definition), and Vendor.

**Direct Effects of a Change in Accounting Principle.** Those recognized changes in assets or liabilities necessary to effect a change in accounting principle. An example of a direct effect is an adjustment to an inventory balance to effect a change in inventory valuation method. Related changes, such as an effect on deferred income tax assets or liabilities or an impairment adjustment resulting from applying the subsequent measurement guidance in Subtopic 330-10 to the adjusted inventory balance, also are examples of direct effects of a change in accounting principle.

**Inventory.** The aggregate of those items of tangible personal property that have any of the following characteristics:

- a. Held for sale in the ordinary course of business
- b. In the process of production for such sale
- c. To be currently consumed in the production of goods or services to be available for sale.

The term inventory embraces goods awaiting sale (the merchandise of a trading concern and the finished goods of a manufacturer), goods in the course of production (work-in-process), and goods to be consumed directly or indirectly in production (raw materials and supplies). This definition of inventories excludes long-term assets subject to depreciation accounting, or goods which, when put into use, will be so classified. The fact that a depreciable asset is retired from regular use and held for sale does not indicate that the item should be classified as part of the inventory. Raw materials and supplies purchased for production may be used or consumed for the construction of long-term assets or other purposes not related to production, but the fact that inventory items representing a small portion of the total may not be absorbed ultimately in the production process does not require separate classification. By trade practice, operating materials and supplies of certain types of entities such as oil producers are usually treated as inventory.

**Market (2nd Definition).** As used in the phrase lower of cost or market, the term market means current replacement cost (by purchase or by reproduction, as the case may be) provided that it meets both of the following conditions:

- a. Market shall not exceed the net realizable value.
- b. Market shall not be less than net realizable value reduced by an allowance for an approximately normal profit margin.

**Net Realizable Value (2nd Definition).** Estimated selling price in the ordinary course of business less reasonably predictable costs of completion, disposal, and transportation.

## CONCEPTS, RULES, AND EXAMPLES

---

### Ownership of Goods

Generally, in order to obtain an accurate measurement of inventory quantity, it is necessary to determine when title legally passes between buyer and seller. The exception to this general rule arises from situations when the buyer assumes the significant risks of ownership of the goods prior to taking title and/or physical possession of the goods. Substance over form in this case would dictate that the inventory is an asset of the buyer and not the seller, and that a purchase and sale of the goods be recognized by the parties irrespective of the party that holds legal title.

The most common error made in this area is to assume that an entity has title only to the goods it physically holds. This may be incorrect because:

- Goods held may not be owned, and
- Goods that are not held may be owned.

Four issues may affect the determination of ownership:

1. Goods in transit,
2. Consignment arrangements,
3. Product financing arrangements, and
4. Sales made with the buyer having the right of return.

**Goods in transit.** At year-end, any goods in transit from seller to buyer must be included in one of those parties' inventories based on the conditions of the sale. Such goods are included in the inventory of the firm financially responsible for transportation costs. This responsibility may be indicated by a variety of peculiar shipping acronyms such as FOB, which is used in overland shipping contracts, or FAS, CIF, C&F, and ex-ship, which are used in maritime contracts.

The term FOB is an abbreviation of "free on board." If goods are shipped FOB destination, transportation costs are paid by the seller and title does not pass until the carrier delivers the goods to the buyer. These goods are part of the seller's inventory while in transit. If goods are shipped FOB shipping point, transportation costs are paid by the buyer and title passes when the carrier takes possession of the goods. These goods are part of the buyer's inventory while in transit. The terms FOB destination and FOB shipping point often indicate a specific location at which title to the goods is transferred, such as FOB Cleveland. This means that the seller retains title and risk of loss until the goods are delivered to a common carrier in Cleveland who will act as an agent for the buyer. The rationale for these determinations originates in agency law, since transfer of title is conditioned upon whether the carrier with physical possession of the goods is acting as an agent of the seller or the buyer.

A seller who ships FAS (free alongside) must bear all expense and risk involved in delivering the goods to the dock next to (alongside) the vessel on which they are to be shipped. The buyer bears the costs of loading and shipment. Title passes when the carrier, as agent for the buyer, takes possession of the goods.

In a CIF (cost, insurance, and freight) contract, the buyer agrees to pay in a lump sum the cost of the goods, insurance costs, and freight charges. In a C&F (cost and freight) contract, the buyer promises to pay a lump sum that includes the cost of the goods and all freight charges. In either case, the seller must deliver the goods to the buyer's agent/carrier and pay the costs of loading. Both title and risk of loss pass to the buyer upon delivery of the goods to the carrier.

A seller who delivers goods ex-ship bears all expense and risk until the goods are unloaded, at which time both title and risk of loss pass to the buyer.

#### Examples of goods in transit

The Meridian Vacuum Company is located in Santa Fe, New Mexico, and obtains compressors from a supplier in Hong Kong. The standard delivery terms are free alongside (FAS) a container ship in Hong Kong harbor, so that Meridian takes legal title to the delivery once possession of the goods is taken by the carrier's dockside employees for the purpose of loading the goods on board the ship. When the supplier delivers goods with an invoiced value of \$120,000 to the wharf, it e-mails an advance shipping notice (ASN) and invoice to Meridian via an electronic data interchange (EDI) transaction, itemizing the contents of the delivery. Meridian's computer system receives the EDI transmission, notes the FAS terms in the supplier file, and therefore automatically logs it into the company computer system with the following entry:

Inventory	120,000
Accounts payable	120,000

The goods are assigned an "In Transit" location code in Meridian's perpetual inventory system. When the compressor eventually arrives at Meridian's receiving dock, the receiving staff records a change in inventory location code from "In Transit" to a code designating a physical location within the warehouse.

Meridian's secondary compressor supplier is located in Vancouver, British Columbia, and ships overland using free on board (FOB) Santa Fe terms, so the supplier retains title until the shipment arrives at Meridian's location. This supplier also issues an advance shipping notice by EDI to inform Meridian of the estimated arrival date, but in this case Meridian's computer system notes the FOB Santa Fe terms, and makes no entry to record the transaction until the goods arrive at Meridian's receiving dock.

**Consignment arrangements.** In consignment arrangements, the consignor ships goods to the consignee, who acts as the agent of the consignor in trying to sell the goods. In some consignments, the consignee receives a commission upon sale of the goods to its customer. In other arrangements, the consignee "purchases" the goods simultaneously with the sale of the goods to the customer. Goods on consignment are included in the inventory of the consignor and excluded from the inventory of the consignee.

#### Example of a consignment arrangement

The Portable Handset Company (PHC) ships a consignment of its cordless phones to a retail outlet of the Consignee Corporation. PHC's cost of the consigned goods is \$3,700. PHC shifts the inventory cost into a separate inventory account to track the physical location of the goods. The entry follows:

Consignment out inventory	3,700
Finished goods inventory	3,700

A third-party shipping company ships the cordless phone inventory from PHC to Consignee. Upon receipt of an invoice for this \$550 shipping expense, PHC charges the cost to consignment inventory with the following entry:

Consignment out inventory	550
Accounts payable	550

*To record the cost of shipping goods from the factory to Consignee*

Consignee sells half the consigned inventory during the month for \$2,750 in credit card payments, and earns a 22% commission on these sales, totaling \$605. According to the consignment arrangement, PHC must also reimburse Consignee for the 2% credit card processing fee, which is \$55(\$2,750 × 2%).

The results of this sale are summarized as follows:

Sales price to Consignee's customer earned on behalf of PHC	\$2,750
Less: Amounts due to Consignee in accordance with arrangement	
22% sales commission	(605)
Reimbursement for credit card processing fee	<u>(55)</u>
	<u>(660)</u>
Due to PHC	<u>\$2,090</u>

Upon receipt of the monthly sales report from Consignee, PHC records the following entries:

Accounts receivable	2,090
Cost of goods sold	55
Commission expense	605
Sales	2,750
<i>To record the sale made by Consignee acting as agent of PHC, the commission earned by Consignee and the credit card fee reimbursement earned by Consignee in connection with the sale</i>	
Costs of goods sold	2,125
Consignment out inventory	2,125

*To transfer the related inventory cost to cost of goods sold, including half the original inventory cost and half the cost of the shipment to consignee [(\$3,700 + \$550 = \$4,250) × ½ = \$2,125]*

**Product financing arrangements.** ASC 470-40 addresses the issues involved with product financing arrangements. A product financing arrangement is a transaction in which an entity (referred to as the “sponsor”) simultaneously sells and agrees to repurchase inventory to and from a financing entity. The repurchase price is contractually fixed at an amount equal to the original sales price plus the financing entity’s carrying and financing costs. The purpose of the transaction is to enable the sponsor enterprise to arrange financing of its original purchase of the inventory.

The substance of this transaction is that of a borrowing transaction, not a sale. That is, the transaction is, in substance, no different from the sponsor directly obtaining third-party financing to purchase inventory. ASC 470-40 specifies that the proper accounting by the sponsor is to record a liability in the amount of the selling price when the funds are received from the financing entity in exchange for the initial transfer of the inventory. The sponsor proceeds to accrue carrying and financing costs in accordance with its normal accounting policies. These accruals are eliminated and the liability satisfied when the sponsor repurchases the inventory. The inventory is not removed from the statement of financial position of the sponsor and a sale is not recorded. Thus, although legal title has passed to the financing entity, for purposes of measuring and valuing inventory, the inventory is considered to be owned by the sponsor.

For more information, see the chapter on ASC 470.

**Sales made with the buyer having the right of return.** Another issue requiring special consideration exists when a buyer is granted a right of return, as defined by ASC 605-15.<sup>1</sup> The seller must consider the propriety of recognizing revenue at the point of sale under such a situation. The sale is recorded only when six specified conditions are met including the condition that the future amount of returns can be reasonably estimated by the seller. If a reasonable estimate cannot be made, then the sale is not recorded until the earlier of the expiration date of the return privilege or the date when all six conditions are met. Similar to product financing costs, this situation results in the seller continuing to include the goods in its measurement and valuation of inventory even though legal title has passed to the buyer. For more information, see the chapter on ASC 605.

### Accounting for Inventories

A major objective of accounting for inventories is the matching of appropriate costs to the period in which the related revenues are earned in order to properly compute gross profit, also referred to as gross margin. Inventories are recorded in the accounting records using either a periodic or perpetual system.

**Periodic inventory system.** In a periodic inventory system, inventory quantities are determined by physical count. The quantity of each item counted is then priced using the cost flow assumption that the enterprise had adopted as its accounting policy for that type of inventory. Cost of goods sold is computed by adding beginning inventory and net purchases (or cost of goods manufactured) and subtracting ending inventory.

Using a periodic inventory system necessitates the taking of physical inventory counts to determine the quantity of inventory on hand at the end of a reporting period. To facilitate accurate annual financial statements, in practice physical counts are performed at least annually on the last day of the fiscal year.

**Perpetual inventory system.** A perpetual inventory system keeps a running total of the quantity (and possibly the cost) of inventory on hand by maintaining subsidiary inventory records that reflect all sales and purchases as they occur. When inventory is purchased, inventory (rather than purchases) is debited. When inventory is sold, the cost of goods sold and corresponding reduction of inventory are recorded.

If the enterprise maintains a perpetual inventory system, it must regularly and systematically verify the accuracy of its perpetual records by physically counting inventories and comparing the quantities on hand with the perpetual records. GAAP does not provide explicit requirements regarding the timing and frequency of physical counts necessary to verify the perpetual records; however, there is a U.S. income tax requirement (IRC§471[b][1]) that a taxpayer perform “. . . a physical count of inventories at each location on a regular and consistent basis . . .” The purpose of this requirement is to enable the taxpayer to support any tax deductions taken for inventory shrinkage if it elects not to take a complete physical inventory at all locations on the last day of the fiscal year. The IRS, in its Rev. Proc. 98-29, provided a “retail safe harbor method” that permits retailers to deduct estimated shrinkage where the retailer takes physical inventories at each location at least annually. (ASC 330-10-30-1)

### Initial Measurement—Valuation of Inventories

The primary basis of accounting for inventories is cost. Cost is defined as the sum of the applicable expenditures and charges directly or indirectly incurred in bringing an article to its

---

<sup>1</sup> See the chapter on ASC 606 for guidance on right of return as set forth in ASU 2014-09, *Revenue from Contracts with Customers*. The new guidance is codified in ASC 606-10-55-22 through 29.

existing condition and location. (ASC 330-10-30-1) This definition allows for a wide interpretation of the costs to be included in inventory.

**Raw materials and merchandise inventory.** For raw materials and merchandise inventory which are purchased outright, the identification of cost is relatively straightforward. The cost of these purchased inventories will include all expenditures incurred in bringing the goods to the point of sale and converting them to a salable condition. These costs include the purchase price, transportation costs (freight-in), insurance while in transit, and handling costs charged by the supplier.

#### Example of recording raw material costs

Aruba Bungee Cords, Inc. (ABC) purchases rubber bands, a raw material that it uses in manufacturing its signature product. The company typically receives delivery of all its raw materials and uses them in manufacturing its finished products during the winter, and then sells its stock of finished goods in the spring. The supplier invoice for a January delivery of rubber bands includes the following line items:

Rubber band (1,681 pounds at \$3 per pound)	\$5,043
Shipping and handling	125
Shipping insurance	48
Subtotal	<u>5,216</u>
Sales tax	193
Total	<u><u>\$5,409</u></u>

Since ABC is using the rubber bands as raw materials in a product that it resells, it will not pay the sales tax. However, both the shipping and handling charge and the shipping insurance are required for ongoing product acquisition, and so are included in the following entry to record receipt of the goods:

Inventory raw materials	5,216
Accounts payable	5,216

*To record purchase of rubber bands and related costs*

On February 1, ABC purchases a \$5,000, two-month shipping insurance policy (a type of policy sometimes referred to as “inland marine” coverage) that applies to all incoming supplier deliveries for the remainder of the winter production season. This allows ABC to refuse shipping insurance charges on individual deliveries. Since the policy insures all inbound raw materials deliveries (not just rubber bands), it is too time-consuming to charge the cost of this policy to individual raw material deliveries using specific identification, and accordingly, the controller can estimate a flat charge per delivery based on the number of expected deliveries during the two-month term of the insurance policy as follows:

\$5,000 insurance premium ÷ 200 expected deliveries during the policy term = \$25 per delivery and then charge each delivery with \$25 as follows:

Inventory—raw materials	25
Prepaid insurance	25

*To allocate cost of inland marine coverage to inbound insured raw materials shipments*

In this case, however, the controller determined that shipments are expected to occur evenly during the two-month policy period and therefore will simply make a monthly standard journal entry as follows:

Inventory—raw materials	2,500
Prepaid insurance	2,500

*To amortize premium on inland marine policy using the straight-line method*

Note that the controller must be careful, under either scenario, to ensure that perpetual inventory records appropriately track unit costs of raw materials to include the cost of shipping insurance. Failure to do so would result in an understatement of the cost of raw materials inventory on hand at the end of any accounting period.

Purchases can be recorded at their gross amount or net of any allowable discount. If recorded gross, the discounts taken represent a reduction in the purchase cost for purposes of determining cost of goods sold. On the other hand, if they are recorded net, any lost discounts are treated as a financial expense, not as cost of goods sold. The net method is considered to be theoretically preferable, but the gross method is simpler and, thus, more commonly used. Either method is acceptable under GAAP, provided that it is consistently applied.

**Inventory purchases and sales with the same counterparty.** Some enterprises sell inventory to another party from whom they also acquire inventory in the same line of business. These transactions may be part of a single arrangement or separate arrangements and the inventory purchased or sold may be raw materials, work-in-process, or finished goods. These arrangements require careful analysis to determine if they are to be accounted for as a single exchange transaction under ASC 845, *Nonmonetary Transactions*, and whether they are to be recognized at fair value or at the carrying value of the inventory transferred. This guidance does not apply to arrangements accounted for as derivatives under ASC 815, or to exchanges of software or real estate. More detailed information can be found in the chapter on ASC 845.

**Inventory hedges.** One notable exception to recording inventories at cost is provided by the hedge accounting requirements of ASC 815. If inventory has been designated as the hedged item in a fair value hedge, changes in the fair value of the hedged inventory are recognized on the statement of financial position as they occur, with the offsetting charge or credit recognized currently in net income. Hedging is discussed in detail in the chapter on ASC 815.

**Manufacturing inventories.** Inventory cost in a manufacturing enterprise includes both acquisition and production costs. This concept is commonly referred to as *full absorption* or *full costing*. As a result, the WIP and finished goods inventories include direct materials, direct labor, and an appropriately allocated portion of indirect production costs referred to as indirect overhead.

Under full absorption costing, indirect overhead costs—costs that are incidental to and necessary for production—are allocated to goods produced and, to the extent those goods are uncompleted or unsold at the end of a period, are included in ending WIP or finished goods inventory, respectively. Indirect overhead costs include such costs as:

- Depreciation and cost depletion
- Repairs
- Maintenance
- Factory rent and utilities
- Indirect labor
- Normal rework labor, scrap, and spoilage
- Production supervisory wages
- Indirect materials and supplies
- Quality control and inspection
- Small tools not capitalized.

Indirect overhead is comprised of two elements, variable and fixed overhead. ASC 330-10-30-3 clarifies that variable overhead is allocated to work-in-process and finished goods based on the actual usage of the production facilities. Fixed overhead, however, is allocated to work-in-process and finished goods based on the normal expected capacity of the enterprise's production facilities, with the overhead rate recomputed in instances when actual production exceeds the normal capacity. (ASC 330-10-30-3) Initially, this may appear to be an inconsistent accounting method; however, the use of this convention ensures that the inventory is not recorded at an amount in excess of its actual cost, as illustrated in the following example.

**Example of allocating fixed overhead to units produced**

Brewed Refreshment Plant, Inc. (BRP), located in Washington, D.C., has historically produced between 3,200 and 3,800 barrels of beer annually with its average production approximating 3,500 barrels. This average takes into account its normal number of work shifts and the normal operation of its machinery adjusted for downtime for normal maintenance and recalibration. BRP's average capacity and overhead costs (partial list) are presented below.

(a) Normal expected annual productive capacity	<u>3,500</u> barrels
Fixed overhead costs (partial list):	
Depreciation of machinery	\$600
Factory rent	800
Plant superintendent	<u>80</u>
(b) Total fixed overhead to allocate	<u>\$ 1,480</u>
(c) Fixed overhead rate per barrel produced (b ÷ a)	<u>\$ 0.4229</u> per barrel

*Scenario 1:* The Washington Nationals major-league baseball team outperforms expectations; since BRP's beer is sold at the Nationals' stadium, BRP substantially increases production beyond the normal level expected.

Actual production level	<u>4,500</u> barrels
-------------------------	----------------------

If BRP were to apply fixed overhead using the rate based on its normal productive capacity, the calculation would be as follows:

$$4,500 \text{ barrels produced} \times \$0.4229 \text{ per barrel} = \$1,903 \text{ of overhead applied}$$

This would result in an over-allocation of \$423, the difference between the \$1,903 of overhead applied and the \$1,480 of overhead actually incurred. This violates the lower of cost or market principle, since the inventory would be valued at an amount that exceeded its actual cost. Therefore, BRP applied ASC 330 and recomputed its fixed overhead rate as follows:

$$1,480 \text{ fixed overhead incurred} \div \text{Revised production level of } 4,500 \text{ barrels} = \$0.3289 \text{ per barrel}$$

*Scenario 2:* The Washington Nationals experience a cold, rainy summer and worse-than-expected attendance. If production lags expectations and BRP only produces 2,500 barrels of beer, the original overhead rate is not revised. The fixed overhead is allocated as follows:

$$2,500 \text{ barrels produced} \times \$0.4229 \text{ per barrel} = \$1,057 \text{ of overhead applied}$$

Per ASC 330, when production levels decline below the original expectation, the fixed overhead rate is not recomputed. The \$423 difference between the \$1,480 of actual fixed overhead incurred and the \$1,057 of overhead applied is accounted for as an expense in the period incurred.

For the purpose of determining normal productive capacity, it is expected that capacity will vary from period to period based on enterprise-specific or industry-specific experience. Management must formulate a judgment regarding a reasonable range of normal production levels expected to be achieved under normal operating conditions.

The enterprise may incur unusually large expenses resulting from idle facilities, excessive waste, spoilage, freight, or handling costs. ASC 330-10-30-7 clarifies that when this situation occurs, the abnormal portion of these expenses should be treated as a period cost and should not be allocated to inventory. Most general and administrative and selling expenses are also expensed as incurred, although ASC 606 has modified the guidance on selling expenses.

Generally, interest costs incurred during the production of inventory are not capitalized under ASC 835-20. A complete discussion regarding the capitalization of interest costs is provided in the chapter on ASC 835.

### Example of variable and fixed overhead allocation

The InCase Manufacturing Company (IMC) uses injection molding to create two types of plastic CD cases—regular size and mini—on a seven-day, three-shift production schedule. During the current month, it records the following overhead expenses:

Depreciation of machinery	\$232,000	Rent	\$36,000
Indirect labor	208,000	Repairs	12,000
Indirect materials	58,000	Small tools	28,000
Maintenance	117,000	Scrap and spoilage	49,000
Production supervisory wages	229,000	Utilities	37,000
Quality control	82,000		

IMC's controller analyzed scrap and spoilage statistics and determined that abnormal losses of \$32,000 were incurred due to a bad batch of plastic resin pellets. She adjusted scrap and spoilage expense by charging the cost of those pellets to cost of goods sold during the current period, resulting in a reduced scrap and spoilage expense of \$17,000. Also, the rent cost includes a \$6,000 lease termination penalty payable to the lessor of a vacant factory. Since this cost is considered an exit or disposal activity under ASC 420, it does not benefit production and is therefore charged directly to expense in the current period.

For allocation purposes, IMC's controller elects to group the adjusted overhead expenses into two cost pools.

- Pool #1 contains all expenses related to machinery operation, which includes depreciation, indirect labor, indirect materials, maintenance, rent, repairs, small tools, and utilities.
- Pool #2 contains all expenses related to production runs, which includes production supervisory wages, quality control, scrap, and spoilage.

The controller makes the following three journal entries.

Cost of goods sold expense	38,000
Scrap and spoilage expense	32,000
Rent expense	6,000

*To record excess scrap and unused facilities in the current period*

Overhead pool #1—Machinery operation	722,000
Depreciation	232,000
Indirect labor	208,000
Indirect materials	58,000
Maintenance	117,000
Rent	30,000
Repairs	12,000
Small tools	28,000
Utilities	37,000

*To record the allocation of costs to the machinery cost pool*

Overhead pool #2—Production runs	328,000
Production supervisory wages	229,000
Quality control	82,000
Scrap and spoilage	17,000

*To record the allocation of costs to the production runs cost pool*

**Allocation of costs to production.** Because the costs in overhead pool #1 are centered on machine usage, the controller elects to use the total operating hours used for the production of each product as the allocation basis for that pool. The accumulated production hours by machine for the past month are as follows:

Machinery type	Regular CD production hours	Mini CD production hours
50-ton press	0	710
55-ton press	310	290
70-ton press	480	230
85-ton press	690	0
Total hours	<u>1,480</u>	<u>1,230</u>
Percentage of total hours	<u>55%</u>	<u>45%</u>

Since the costs in overhead pool #2 are centered on production volume, the controller decides to use the total pounds of plastic resin pellets used for production during the month as the allocation basis for that cost pool. The total plastic resin usage, adjusted for spoilage, was 114,000 pounds of resin for the regular CD cases and 76,000 pounds for the mini CD cases, which is a percentage split of 60% for regular CD cases and 40% for mini CD cases.

With the calculation of allocation bases completed, the split of overhead costs between the two products is:

Overhead pool #1	Total costs in pool	55% regular CD allocation	45% mini CD allocation
	722,000	397,100	324,900
Overhead pool #2	Total costs in pool	60% regular CD allocation	40% mini CD allocation
	328,000	196,800	131,200

Totals		<u>593,900</u>	<u>456,100</u>

**Allocating overhead to products in costs of goods sold and finished goods inventory.** Of the case quantities produced, 85% of the regular CD cases and 70% of the mini CD cases were sold during the month, with the remainder being transferred into finished goods inventory. IMC's controller uses these percentages to apportion the cost of allocated overhead between the cost of goods sold and finished goods inventory, as shown in the following entry:

Cost of goods sold—regular CD cases	504,815
Cost of goods sold—mini CD cases	319,270
Finished goods inventory—regular CD cases	89,085
Finished goods inventory—mini CD cases	136,830
Overhead pool #1—Machinery operation	722,000
Overhead pool #2—Production runs	328,000

**Determining inventory cost.** The theoretical basis for valuing inventories and cost of goods sold requires assigning production and/or acquisition costs to the specific goods to which they relate. This method of inventory valuation is usually referred to as specific identification. Specific identification is generally not practical inasmuch as the product will generally lose its separate identity as it passes through the production and sales process. Exceptions to this would arise in situations involving small inventory quantities with high unit value and low turnover rate, such as automobiles or heavy machinery. Where it is not practical to use specific identification, it is necessary to make certain assumptions regarding the cost flows associated with inventory. Although these cost flow assumptions are used for accounting purposes, they may or may not reflect the actual physical flow of the inventory.

**Cost flow assumptions.** The most common cost flow assumptions used are specified in ASC 330-10-30-9:

1. first-in, first-out (FIFO),
2. last-in, first-out (LIFO), and
3. weighted-average.

Additionally, there are variations in the application of each of these assumptions which are commonly used in practice. ASC 330-10-30-9 points out that:

“The major objective in selecting a method should be to choose the one which, under the circumstances, most clearly reflects periodic income.”

In selecting which cost flow assumption to adopt as its accounting policy for a particular type of industry, management should consider a variety of factors:

- The industry norm, as this will facilitate intercompany comparison by financial statement users,
- The nature of the industry, and
- The expected economic climate.

The appropriate method in a period of rising prices differs from the method that is appropriate for a period of declining prices. Each of the foregoing assumptions and their relative advantages or disadvantages are discussed below. Examples are provided to enhance understanding of the application.

**First-in, first-out (FIFO).** The FIFO method of inventory valuation assumes that the first goods purchased are the first goods used (manufacturing) or sold (merchandising), regardless of the actual physical flow. This method is thought to most closely parallel the physical flow of the units in most industries. The strength of this cost flow assumption lies in the inventory amount reported on the statement of financial position. Because the earliest goods purchased are the first ones removed from the inventory account, the remaining balance is composed of items priced at more recent cost. This yields results similar to those obtained under current cost accounting on the statement of financial position. However, the FIFO method does not necessarily reflect the most accurate income figure as older, historical costs are being charged to cost of goods sold and matched against current revenues.

#### Example of the basic principles involved in the application of FIFO

	<i>Units</i>			
	<i>available</i>	<i>Units sold</i>	<i>Actual unit cost</i>	<i>Actual total cost</i>
Beginning inventory	100	–	\$2.10	\$210
Sale	–	75	–	–
Purchase	150	–	2.80	420
Sale	–	100	–	–
Purchase	50	–	3.00	150
Total	<u>300</u>	<u>175</u>		<u>\$780</u>

Given this data, the cost of goods sold and ending inventory balance are determined as follows:

	<u>Units</u>	<u>Unit cost</u>	<u>Total cost</u>
Cost of goods sold	100	\$2.10	\$210
	<u>75</u>	2.80	<u>210</u>
	<u>175</u>		420
Ending inventory	50	3.00	150
	<u>75</u>	2.80	<u>210</u>
	<u>125</u>		360
Totals	<u><u>300</u></u>		<u><u>\$780</u></u>

Notice that the total of the units in cost of goods sold and ending inventory, as well as the sum of their total costs, is equal to the goods available for sale and their respective total costs.

The FIFO method provides the same results under either the periodic or perpetual inventory tracking system.

**Last-in, first-out (LIFO).** The LIFO method of inventory valuation assumes that the last goods purchased are the first goods used or sold. This allows the matching of current costs with current revenues and provides the best measure of gross profit. However, unless costs remain relatively unchanged over time, the LIFO method will usually misstate the ending inventory amount on the statement of financial position amount, because LIFO inventory usually includes costs of acquiring or manufacturing inventory that were incurred in earlier periods. LIFO does not usually follow the physical flow of merchandise or materials. However, the matching of physical flow with cost flow is not an objective of accounting for inventories.

LIFO accounting is actually an income tax concept. The rules regarding the application of the LIFO method are found in the U.S. Internal Revenue Code (IRC) §472. U.S. Treasury Regulations provide that any taxpayer that maintains inventories may select LIFO application for any or all inventoriable items. This election is made with the taxpayer's income tax return on Form 970 after the close of the first tax year that the taxpayer intends to use (or expand the use of) the LIFO method.

The quantity of ending inventory on hand at the beginning of the year of election is termed the "base layer." This inventory is valued at actual (full absorption) cost, and unit cost for each inventory item is determined by dividing total cost by the quantity on hand. At the end of the initial and subsequent years, increases in the quantity of inventory on hand are referred to as increments, or LIFO layers. These increments are valued individually by applying one of the following costing methods to the quantity of inventory representing a layer:

1. The actual cost of the goods most recently purchased or produced
2. The actual cost of the goods purchased or produced in order of acquisition
3. An average unit cost of all goods purchased or produced during the current year
4. A hybrid method that more clearly reflects income (for income tax purposes, this method must meet with the approval of the IRS Commissioner).

Thus, after using the LIFO method for five years, it is possible that an enterprise could have ending inventory consisting of the base layer and five additional layers (or increments) provided that the quantity of ending inventory increased every year.

**Example of the single goods (unit) LIFO approach**

Rose Co. is in its first year of operation and elects to use the periodic LIFO method of inventory valuation. The company sells only one product. Rose applies the LIFO method using the order of current year acquisition cost. The following data are given for years 1 through 3:

	<u>Year 1</u>	<u>Units</u>		<u>Purchase cost</u>	
		<u>Beginning inventory</u>	<u>Purchased</u>	<u>Sold</u>	<u>Ending inventory</u>
Purchase			200		\$2.00
Sale				100	—
Purchase			200		3.00
Sale		—		150	—
	—	400	250	150	

	<u>Year 2</u>	<u>Units</u>		<u>Purchase cost</u>	
		<u>Beginning inventory</u>	<u>Purchased</u>	<u>Sold</u>	<u>Ending inventory</u>
Purchase			300		\$3.20
Sale				200	—
Purchase		—	100	—	3.30
	—	150	400	200	350
<u>Year 3</u>					
Purchase			100		\$3.50
Sale				200	—
Sale		—		100	—
	—	350	100	300	150

In year 1 the following occurred:

1. The total goods available for sale were 400 units.
2. The total sales were 250 units.
3. Therefore, the ending inventory was 150 units.

The ending inventory is valued at the earliest current year acquisition cost of \$2.00 per unit. Thus, ending inventory is valued at \$300 ( $150 \times \$2.00$ ).

Another way to look at this is to analyze both cost of goods sold and ending inventory.

<u>Year 1</u>	<u>Units</u>	<u>Unit cost</u>	<u>Unit cost</u>
Cost of goods sold	200	\$3.00	\$600
	50	2.00	100
	250		\$700
Ending inventory	150	2.00	\$300

Note that the base-year cost is \$2.00 and that the base-year level is 150 units. Therefore, if ending inventory in the subsequent period exceeds 150 units, a new layer (or increment) will be created.

<u>Year 2</u>	<u>Units</u>	<u>Unit cost</u>	<u>Total cost</u>	
Cost of goods sold	100	\$3.30	\$330	
	<u>100</u>	3.20	<u>320</u>	
	<u>200</u>		<u>\$650</u>	
Ending inventory	150	2.00	\$300	Base-year layer
	<u>200</u>	3.20	<u>640</u>	Year 2 increment
	<u>350</u>		<u>\$940</u>	

If ending inventory exceeds 350 units in the next period, a third layer (increment) will be created.

<u>Year 3</u>	<u>Units</u>	<u>Unit cost</u>	<u>Total cost</u>	
Cost of goods sold	100	\$3.50	\$350	
	<u>200</u>	3.20	<u>640</u>	
	<u>300</u>		<u>\$990</u>	
Ending inventory	<u>150</u>	2.00	<u>\$300</u>	Base-year layer

Notice how the decrease (decrement) of 200 units in year 3 eliminated the entire year 2 increment. Thus, any year 4 increase in the quantity of inventory would result in a *new* increment, which would be valued at year 4 prices.

In situations where the ending inventory decreases from the level established at the close of the preceding year, the enterprise experiences a decrement or LIFO liquidation. Decrements reduce or eliminate previously established LIFO layers. Once any part of a LIFO layer has been eliminated, it cannot be reinstated after year-end. For example, if in its first year after the election of LIFO an enterprise establishes a LIFO layer (increment) of ten units, then in the next year inventory decreases by four units, leaving the first layer at six units, the enterprise is not permitted in any succeeding year to increase the number of units in the first year layer back up to the original ten units. The quantity in the first layer remains at a maximum of six units subject to further reduction if decrements occur in future years. Any unit increases in future years will create one or more new layers. The effect of LIFO liquidations in periods of rising prices is to transfer, from ending inventory into cost of goods sold, costs that are below the current cost being paid. Thus, the resultant effect of a LIFO liquidation is to increase income for both accounting and income tax purposes. Because of this, LIFO is most commonly used by companies in industries in which levels of inventories are consistently maintained or increased over time.

LIFO liquidations can be either voluntary or involuntary. A voluntary liquidation occurs when an enterprise deliberately lets its inventory levels drop. Voluntary liquidations may be desirable for a number of reasons. Management might consider the current price of purchasing the goods to be too high, a smaller quantity of inventory might be needed for efficient production due to conversion to a “just-in-time” production model, or inventory items may have become obsolete due to new technology or transitions in the enterprise’s product lines.

Involuntary LIFO liquidations stem from reasons beyond the control of management, such as a strike, material shortages, shipping delays, etc. Whether voluntary or involuntary, all LIFO liquidations result in a corresponding increase in income in periods of rising prices.

To determine the effect of the liquidation, management must compute the difference between actual cost of sales and what cost of sales would have been had the inventory been reinstated. The Internal Revenue Service has ruled that this hypothetical reinstatement must be computed under the company’s normal pricing procedures for valuing its LIFO increments. In the preceding example the effect of the year 3 LIFO liquidation would be computed as follows:

Hypothetical inventory reinstatement

$$200 \text{ units} @ \$3.50 - \$3.20 = \$60$$

Hypothetically, if there had been an increment instead of a decrement in year 3 and the year 2 inventory layer had remained intact, 200 more units (out of the 300 total units sold in year 3) would have been charged to cost of goods sold at the year 3 price of \$3.50 instead of the year 2 price of \$3.20. Therefore, the difference between \$3.50 and the actual amount charged to cost of sales for these 200 units liquidated (\$3.20) measures the effect of the liquidation.

The following is considered acceptable GAAP disclosure in the event of a LIFO liquidation:

During 20X3, inventory quantities were reduced below their levels at December 31, 20X2. As a result of this reduction, LIFO inventory costs computed based on lower prior years' acquisition costs were charged to cost of goods sold. If this LIFO liquidation had not occurred and cost of sales had been computed based on the cost of 2013 purchases, cost of goods sold would have increased by approximately \$xxx and net income decreased by approximately \$xx or \$x per share.

Applying the unit LIFO method requires a substantial amount of recordkeeping. The recordkeeping becomes more burdensome as the number of products increases. For this reason a "pooling" approach is often used to compute LIFO inventories.

Pooling is the process of grouping items that are naturally related and then treating this group as a single unit in determining LIFO cost. Because the ending inventory normally includes many items, decreases in one item can be offset by increases in others, whereas under the unit LIFO approach a decrease in any one item results in a liquidation of all or a portion of a LIFO layer.

Complexity in applying the pooling method arises from the income tax regulations. These regulations require that the opening and closing inventories of each type of good be compared. In order to be considered comparable for this purpose, inventory items must be similar as to character, quality, and price. This qualification has generally been interpreted to mean identical. The effect of this interpretation is to require a separate pool for each item under the unit LIFO method. To provide a simpler, more practical approach to applying LIFO and allow for increased use of LIFO pools, election of the dollar-value LIFO method is permitted.

**Dollar-value LIFO.** Under the dollar-value LIFO method of inventory valuation, the cost of inventories is computed by expressing base-year costs in terms of total dollars rather than specific prices of specific units. The dollar-value method also provides an expanded interpretation of the use of LIFO pools. Increments and decrements are treated the same as under the unit LIFO approach but are reflected only in terms of a *net* increment or liquidation for the entire pool.

**Identifying pools.** Three alternatives exist for determining pools under dollar-value LIFO: (1) the natural business unit method, (2) the multiple pooling method, and (3) pools for wholesalers, retailers, jobbers, and the like.

The natural business unit is defined by the existence of separate and distinct processing facilities and operations and the maintenance of separate income (loss) records. The concept of the natural business unit is generally dependent upon the type of product being produced, not the various stages of production for that product. Thus, the pool of a manufacturer can (and will) contain raw materials, WIP, and finished goods. The three examples below, adapted from the U.S. Treasury Regulations, illustrate the application of the natural business unit concept.

#### Example 1—Identifying pools

A corporation manufactures, in one division, automatic clothes washers and dryers of both commercial and domestic grade as well as electric ranges and dishwashers. The corporation manufactures, in another division, radios and television sets. The manufacturing facilities and processes used in manufacturing the radios and television sets are distinct from those used in manufacturing the automatic clothes washers, etc. Under these circumstances, an enterprise consisting of two business units and two

pools would be appropriate: one consisting of all of the LIFO inventories involved with the manufacture of clothes washers and dryers, electric ranges and dishwashers and the other consisting of all the LIFO inventories involved with the production of radios and television sets.

#### Example 2—Identifying pools

A taxpayer produces plastics in one of its plants. Substantial amounts of the production are sold as plastics. The remainder of the production is shipped to a second plant of the taxpayer for the production of plastic toys which are sold to customers. The taxpayer operates its plastics plant and toy plant as separate divisions. Because of the different product lines and the separate divisions, the taxpayer has two natural business units.

#### Example 3—Identifying pools

A taxpayer is engaged in the manufacture of paper. At one stage of processing, uncoated paper is produced. Substantial amounts of uncoated paper are sold at this stage of processing. The remainder of the uncoated paper is transferred to the taxpayer's finishing mill where coated paper is produced and sold. This taxpayer has only one natural business unit, since coated and uncoated paper are within the same product line.

A pool consists of all items entering into the entire inventory investment of a natural business unit, unless the taxpayer elects to use the multiple-pooling method.

The multiple-pooling method is the grouping of "substantially similar" items. In determining substantially similar items, consideration is given to the processing applied, the interchangeability, the similarity of use, and the customary practice of the industry. While the election of multiple pools will necessitate additional recordkeeping, it may result in a better estimation of gross profit and periodic net income.

According to Reg. §1.472-8(c), inventory items of wholesalers, retailers, jobbers, and distributors are to be assigned to pools by major lines, types, or classes of goods. The natural business unit method may be used with permission of the Commissioner.

All three methods of pooling allow for a change in the components of inventory over time. New items which properly fall within the pool may be added, and old items may disappear from the pool, but neither will necessarily cause a change in the total dollar value of the pool.

**Computing dollar-value LIFO.** The purpose of the dollar-value LIFO method of valuing inventory is to convert inventory priced at end-of-year prices to that same quantity of inventory priced at base-year (or applicable LIFO layer) prices. The dollar-value method achieves this result through the use of a conversion price index. The inventory computed at current year cost is divided by the appropriate index to arrive at its base-year cost. The main computational focus is on the determination of the conversion price index. There are four types of methods that can be used in the computation of the ending inventory amount of a dollar-value LIFO pool:

1. double-extension,
2. link-chain,
3. indexing, and
4. alternative LIFO for automobile dealers.

**Double-extension method.** This method was originally developed to compute the conversion price index. It involves extending the entire quantity of ending inventory for the current year at both base-year prices and end-of-year prices to arrive at a total dollar value for each, hence the title "double-extension." The dollar total computed at end-of-year prices is then divided by the dollar

total computed at base-year prices to arrive at the index, usually referred to as the conversion price index. This index indicates the relationship between the base-year and current prices in terms of a percentage. Each layer (or increment) is valued at its own percentage. Although a representative sample is allowed (meaning that not all of the items need to be double-extended; this is discussed in more detail under indexing), the recordkeeping under this method is very burdensome. The base-year price must be maintained for each inventory item. Depending upon the number of different items included in the inventory of the enterprise, the necessary records may be too detailed to keep past the first year or two.

The following example illustrates the double-extension method of computing the LIFO value of inventory. The example presented is relatively simple and does not attempt to incorporate all of the complexities of LIFO inventory accounting.

#### Example of the dollar-value LIFO method

Isaacson, Inc. uses the dollar-value method of LIFO inventory valuation and computes its price index using the double-extension method. Isaacson has a single pool that contains two inventory items, A and B. Year 1 is the company's initial year of operations. The following information is given for years 1 through 4:

<i>Year</i>	<i>Ending inventory current prices</i>	<i>Ending quantity (units) and current unit price</i>		
		<i>A</i>	<i>B</i>	
1	\$100,000	5,000	\$6.00	7,000 \$10.00
2	120,300	6,000	6.30	7,500 11.00
3	122,220	5,800	6.40	7,400 11.50
4	133,900	6,200	6.50	7,800 12.00

In year 1 there is no computation of an index; the index is 100%. The LIFO cost is the same as the actual current year cost. This is the base year.

In year 2 the first step is to double-extend the quantity of ending inventory at base-year and current year costs.

<i>Item</i>	<i>Quantity</i>	<i>Base-year cost/unit</i>	<i>Extended</i>	<i>Current year cost/unit</i>	<i>Extended</i>
A	6,000	\$ 6.00	\$ 36,000	\$ 6.30	\$ 37,800
B	7,500	10.00	75,000	11.00	82,500

\* When using the double-extension method and extending **all** of the inventory items to arrive at the index, this number must equal the ending inventory at current prices. If a sampling method is used (as discussed under indexing), this number **divided by** your ending inventory at current prices is the percentage sampled.

Now we can compute the conversion price index which is:

$$\frac{\text{Ending inventory at current year prices}}{\text{Ending inventory at base-year prices}}$$

In this case  $\frac{120,300}{111,000} = 108.4\% \text{ (rounded)}$

Next, compute the year 2 layer at base-year cost by taking the current year-ending inventory at base-year prices (if you only extend a sample of the inventory, this number is arrived at by dividing the

ending inventory at current year prices by the conversion price index) of \$111,000 and subtracting the base-year cost of \$100,000. In year 2 we have an increment (layer) of \$11,000 valued at base-year costs.

The year 2 layer of \$11,000 at base-year cost must be converted so that the layer is valued at the prices in effect when it came into existence (i.e., at year 2 prices). This is done by multiplying the increment at base-year cost (\$11,000) by the rounded conversion price index (1.084). The result is the year 2 layer at LIFO prices.

Base-year layer	\$100,000
Year 2 layer ( $\$11,000 \times 1.084$ )	<u>11,924</u>
	<u><u>\$111,924</u></u>

In year 3 the same basic procedure is followed.

<i>Item</i>	<i>Quantity</i>	<i>Base-year</i>		<i>Current year</i>	
		<i>cost/unit</i>	<i>Extended</i>	<i>cost/unit</i>	<i>Extended</i>
A	5,800	\$ 6.00	\$ 34,800	\$ 6.40	\$ 37,120
B	7,400	10.00	<u>74,000</u>	11.50	<u>85,100</u>
			<u><u>\$108,800</u></u>		<u><u>\$122,220</u></u>

There has been a decrease in the base-year cost of the ending inventory ( $\$111,000 - \$108,800 = \$2,200$ ) which is referred to as a decrement. A decrement results in the decrease (or elimination) of previously provided layers. In this situation, the computation of the index is not necessary as there is no LIFO layer that requires a valuation. If a sampling approach has been used, the index is needed to arrive at the ending inventory at base-year cost and thus determine if there has been an increment or decrement.

Now the ending inventory at base-year cost is \$108,800. The base-year cost layer is still intact at \$100,000, so the cumulative increment is \$8,800. Since this is less than the \$11,000 increment of year 2, no additional increment is established in year 3. The LIFO cost of the inventory is shown below.

Base-year layer	\$100,000
Year 2 layer ( $\$8,800 \times 1.084$ )	<u>9,539</u>
	<u><u>\$109,539</u></u>

The fourth year then follows the same steps.

<i>Items</i>	<i>Quantity</i>	<i>Base-year</i>		<i>Current year</i>	
		<i>cost/unit</i>	<i>Extended</i>	<i>cost/unit</i>	<i>Extended</i>
A	6,200	\$ 6.00	\$ 37,200	\$ 6.50	\$ 40,300
B	7,800	10.00	<u>78,000</u>	12.00	<u>93,600</u>
			<u><u>\$115,200</u></u>		<u><u>\$133,900</u></u>

The conversion price index is 116.2% ( $133,900/115,200$ ).

A current year increment exists because the ending inventory at base-year prices in year 4 of \$115,200 exceeds the year 3 number of \$108,800. The current year increment of \$6,400 must be valued at year 4 prices. Thus, the LIFO cost of the year 4 inventory is:

Base-year layer	\$100,000
Year 2 layer ( $\$8,800 \times 1.084$ )	<u>9,539</u>
Year 4 layer ( $\$6,400 \times 1.162$ )	<u>7,437</u>
	<u><u>\$116,976</u></u>

It is important to point out that once a layer is reduced or eliminated it is never reinstated (as with the year 2 increment) after year-end.

**Link-chain method.** Since the double-extension method computations are arduous even if only a few items exist in the inventory, consider the complexity that arises when there is a constant change in the inventory mix or when there is a large number of inventory items. The link-chain method of applying dollar-value LIFO was developed to mitigate the effects of this complexity.

Consider the situation where the components of inventory are constantly changing. The regulations require that any new products added to the inventory be recorded at base-year prices. If these are not available, then the earliest cost available after the base year is used. If the item was not in existence in the base year, the taxpayer may reconstruct the base cost, using a reasonable method to determine what the cost would have been if the item had been in existence in the base year. Finally, as a last resort, the current year purchase price can be used. While this does not appear to be a problem on the surface, imagine a base period that is twenty-five to fifty years in the past. The difficulty involved with finding the base-year cost may require using a more current cost, thus eliminating some of the LIFO benefit. Imagine a situation faced by a company in a “high-tech” industry where inventory is continually being replaced by newer, more advanced products. The effect of this rapid change under the double-extension method (because the new products did not exist in the base period) is to use current prices as base-year costs. When inventory has such a rapid turnover, the overall LIFO advantage becomes diluted as current and base-year costs are often identical. This situation necessitated the development of the link-chain method.

The link-chain method was originally developed for (and limited to) those companies that wanted to use LIFO but, because of a substantial change in product lines over time, were unable to reconstruct or maintain the historical records necessary to make accurate use of the double-extension method. It is important to note that the double-extension and link-chain methods are not elective alternatives for the same situation. For income tax purposes, the link-chain election requires that substantial changes in product lines be evident over the years, and may not be elected solely because of its ease of application. The double-extension and index methods must be demonstrably impractical in order to elect the link-chain method. However, an enterprise may use different computational techniques for financial reporting and income tax purposes. Therefore, the link-chain method could be used for financial reporting purposes even if a different application is used for income tax purposes. Obviously, the recordkeeping burdens imposed by using different LIFO methods for GAAP and income tax purposes (including the deferred income tax accounting that would be required for the temporary difference between the GAAP and income tax bases of the LIFO inventories) would make this a highly unlikely scenario.

The link-chain method is the process of developing a single cumulative index which is applied to the ending inventory amount priced using beginning-of-the-year costs. Thus, the index computed at the end of each year is “linked” to the index from all previous years. A separate cumulative index is used for each pool regardless of the variations in the components of these pools over the years. Technological change is accommodated by the method used to calculate each current year’s index. The index is calculated by double-extending a representative sample of items in the pool at both beginning-of-year prices and end-of-year prices. This annual index is then applied to (multiplied by) the previous period’s cumulative index to arrive at the new current year cumulative index.

An example of the link-chain method is shown below. The end-of-year costs and inventory quantities used are the same as those used in the double-extension example.

**Example—Link-chain method**

Assume the following inventory data for years 1–4 for Dickler Distributors, Inc. Year 1 is assumed to be the initial year of operation for the company. The LIFO method is elected on the first income tax return. Assume that A and B constitute a single pool.

<i>Product</i>	<i>Ending inventory quantity</i>	<i>Cost per unit</i>		<i>Extension</i>	
		<i>Beg. of yr.</i>	<i>End of yr.</i>	<i>Beginning</i>	<i>End</i>
<b>Year 1</b>					
A	5,000	N/A	\$ 6.00	N/A	\$ 30,000
B	7,000	N/A	10.00	N/A	<u>70,000</u>
					<u><u>\$100,000</u></u>
<b>Year 2</b>					
A	6,000	\$ 6.00	6.30	\$ 36,000	\$ 37,800
B	7,500	10.00	11.00	<u>75,000</u>	<u>82,500</u>
				<u><u>\$111,000</u></u>	<u><u>\$120,300</u></u>
<b>Year 3</b>					
A	5,800	6.30	6.40	\$ 36,540	\$ 37,120
B	7,400	11.00	11.50	<u>81,400</u>	<u>85,100</u>
				<u><u>\$117,940</u></u>	<u><u>\$122,220</u></u>
<b>Year 4</b>					
A	6,200	6.40	6.50	\$ 39,680	\$ 40,300
B	7,800	11.50	12.00	<u>89,700</u>	<u>93,600</u>
				<u><u>\$129,380</u></u>	<u><u>\$133,900</u></u>

The initial year (base year) does not require the computation of an index under any LIFO method. The base-year index will always be 1.00.

Thus, the base-year inventory layer is \$100,000 (the end-of-year inventory stated at base-year cost). The second year requires the first index computation. Notice that in year 2 our extended totals are:

<i>Product</i>	<i>Beginning-of-year prices</i>		<i>End-of-year prices</i>
A	\$ 36,000		\$ 37,800
B	<u>75,000</u>		<u>82,500</u>
	<u><u>\$111,000</u></u>		<u><u>\$120,300</u></u>

The year 2 index is 1.084 ( $120,300/111,000$ ). This is the same as computed under the double-extension method because the beginning-of-the-year prices reflect the base-year price. This will not always be the case, as sometimes new items may be added to the pool, causing a change in the index. Thus, the cumulative index is the 1.084 current year index multiplied by the preceding year index of 1.00 to arrive at a link-chain index of 1.084.

This index is then used to restate the inventory to base-year cost by dividing the inventory at end-of-year prices by the cumulative index:  $\$120,300/1.084 = \$111,000$ . The determination of the LIFO increment or decrement is then basically the same as the double-extension method. In year 2 the increment (layer) at base-year cost is  $\$11,000(\$111,000 - 100,000)$ . This layer must be valued at the

prices effective when the layer was created, or extended at the cumulative index for that year. This results in an ending inventory at LIFO cost of:

	<u>Base-year cost</u>	<u>Index</u>	<u>LIFO cost</u>
Base-year layer	\$100,000	1.000	\$100,000
Year 2 layer	<u>11,000</u>	1.084	<u>11,924</u>
	<u><u>\$111,000</u></u>		<u><u>\$111,924</u></u>

The index for year 3 is computed as follows:

	<u>Beginning-of-year prices</u>	<u>End-of-year prices</u>
A	\$ 36,540	\$ 37,120
B	<u>81,400</u>	<u>85,100</u>
	<u><u>\$117,940</u></u>	<u><u>\$122,220</u></u>
122,220/117,940 = 1.036		

The next step is to determine the cumulative index which is the product of the preceding year's cumulative index and the current year index, or  $1.123(1.084 \times 1.036)$ . The new cumulative index is used to restate the inventory at end-of-year dollars to base-year cost. This is accomplished by dividing the end-of-year inventory by the new cumulative index. Thus, current inventory at base-year cost is  $\$108,833(\$122,220 \div 1.123)$ . In this instance we have experienced a decrement (a decrease from the prior year's \$111,000). The determination of ending inventory is:

	<u>Base-year cost</u>	<u>Index</u>	<u>LIFO cost</u>
Base-year layer	\$100,000	1.000	\$100,000
Year 2 layer	8,833	1.084	9,575
Year 3 layer	—	1.123	—
	<u><u>\$108,833</u></u>		<u><u>\$109,575</u></u>

Finally, the same steps are performed for the year 4 computation. The current year index is  $1.035(133,900/129,380)$ . The new cumulative index is  $1.162(1.035 \times 1.123)$ . The base-year cost of the current inventory is  $\$115,232(133,900/1.162)$ . Thus, LIFO inventory at the end of year 4 is:

	<u>Base-year cost</u>	<u>Index</u>	<u>LIFO cost</u>
Base-year layer	\$100,000	1.000	\$100,000
Year 2 layer	8,833	1.084	9,575
Year 3 layer	—	1.123	—
Year 4 layer	<u>6,399</u>	1.162	<u>7,435</u>
	<u><u>\$115,232</u></u>		<u><u>\$117,010</u></u>

Notice how even though the numbers used were the same as those used in the double-extension example, the results were different (year 4 inventory under double-extension was \$116,976)—however, not by a significant amount. It is much easier to keep track of beginning-of-the-year prices than base-year prices, but perhaps more importantly, it is easier to establish beginning-of-the-year prices for new items than to establish their base-year price. This latter reason is why the link-chain method is so much more desirable than the double-extension method. However, before electing or applying this method, a company must be able to establish a sufficient need as defined in the Treasury Regulations.

***Indexing methods.*** Indexing methods can basically be broken down into two types: (1) an internal index and (2) an external index.

The internal index is merely a variation of the double-extension method. The regulations allow for the use of a statistically valid representative sample of the inventory to be double-extended.

The index computed from the sample is then used to restate the inventory to base-year cost and to value the new layer.

The external index method, referred to in Treasury Regulations as the Inventory Price Index Computation (IPIC) Method, involves using indices published by the U.S. Department of Labor's Bureau of Labor Statistics (BLS).<sup>2</sup> For more information see <http://www.bls.gov>, and applying them to specified categories of inventory included in the taxpayer's LIFO pools. Taxpayers wanting to change to the IPIC Method from another LIFO method must obtain IRS consent by filing Form 3115, *Application for Change in Accounting Method*.

**Alternative LIFO method for automobile dealers.** A simplified dollar-value method is available for use by retail automobile dealers for valuing inventory of new automobiles and light-duty trucks. The use of this method and its acceptance for income tax purposes is conditioned on the application of several LIFO submethods, definitions, and special rules. The reader is referred to Rev. Proc. 92-79 for a further discussion of this method.

**LIFO accounting literature.** GAAP for the application of LIFO has been based upon income tax rules rather than on financial accounting pronouncements. LIFO is cited in GAAP as an acceptable inventory method, but specific rules regarding its implementation are not provided. The income tax regulations, as discussed below, do provide specific rules for the implementation of LIFO and require financial statement conformity. For this reason, income tax rules have essentially defined the financial accounting treatment of LIFO inventories.

In recognition of the lack of authoritative accounting guidelines in the implementation of LIFO, the American Institute of Certified Public Accountants (AICPA)'s Accounting Standards Division formed a task force on LIFO inventory problems to prepare an Issues Paper on this topic. "Identification and Discussion of Certain Financial Accounting and Reporting Issues Concerning LIFO Inventories," issued in 1984, identifies financial accounting issues resulting from the use of LIFO and includes advisory guidance on resolving them. Issues Papers do not establish authoritative standards of financial accounting, however, the SEC in SAB Topic 5.L, *LIFO Inventory Practices*, does mention the Issues Papers. The SEC's staff position on the Issues Papers is:

*"In the absence of existing authoritative literature on LIFO accounting, the staff believes the registrants and their independent accountants should look to the papers for guidance in determining what constitutes acceptable LIFO accounting practices." (ASC 330-10-S99)*

The guidance provided by the task force is described below.<sup>3</sup>

1. **Specific goods versus dollar-value.** Either the specific goods approach or dollar-value approach to LIFO is acceptable for financial reporting. Disclosure of whether the specific goods or dollar-value approach is used is not required.
2. **Pricing current year purchases.** Three approaches to pricing LIFO inventory increments are available under income tax regulations—earliest acquisition price, latest acquisition price, and average acquisition price. The earliest acquisition price approach is the most compatible with financial reporting objectives, but all three are acceptable for financial reporting.
3. **Quantity to use to determine price.** The price used to determine the inventory increment should be based on the cost of the quantity or dollars of the increment

---

<sup>2</sup> For more information see <http://www.bls.gov>.

<sup>3</sup> The Issues Paper can be found at [tinyurl.com/8j3f8t7](http://tinyurl.com/8j3f8t7).

rather than on the cost of the quantity or dollars equal to the ending inventory. Disclosure of which approach is used is not required.

4. **Disclosure of LIFO reserve or replacement cost.** The LIFO reserve or replacement cost and its basis for determination should be disclosed for financial reporting.
5. **Partial adoption of LIFO.** If a company changes to LIFO, it should do so for all of its inventories. Partial adoption should only be allowed if there exists a valid business reason for not fully adopting LIFO. A planned gradual adoption of LIFO over several time periods is considered acceptable if valid business reasons exist (lessening the income statement effect of adoption in any one year is not a valid business reason). Where partial adoption of LIFO has been justified, the extent to which LIFO has been adopted should be disclosed. This can be disclosed by indicating either the portion of the ending inventory priced on LIFO or the portion of cost of sales resulting from LIFO inventories.
6. **Methods of pooling.** An entity should have valid business reasons for establishing its LIFO pools. Additionally, the existence of a separate legal entity that has no economic substance is not reason enough to justify separate pools. Disclosure of details regarding an entity's pooling arrangements is not required.
7. **New items entering a pool.** New items should be added to a pool based on what the items would have cost had they been acquired in the base period (reconstructed cost) rather than based on their current cost. The reconstructed cost should be determined based on the most objective sources available, including published vendor price lists, vendor quotes, and general industry indexes. Where necessary, the use of a substitute base year in making the LIFO computation is acceptable. Disclosure of the way that new items are priced is not required.
8. **Dollar-value index.** The required index can be developed using two possible approaches, the unit cost method or the cost component method. The unit cost method measures changes in the index based on the weighted-average increase or decrease in the unit costs of raw materials, work-in-process, and finished goods inventory. The cost component method, on the other hand, measures changes in the index by the weighted-average increase or decrease in the component costs of material, labor, and overhead that make up ending inventory. Either of these methods is acceptable.
9. **LIFO liquidations.** The effects on income of LIFO inventory liquidations should be disclosed in the notes to the financial statements. A replacement reserve for the liquidation should not be provided. When an involuntary LIFO liquidation occurs, the effect on income of the liquidation should not be deferred.

When a LIFO liquidation occurs, there are three possible ways to measure its effect on income:

- a. The difference between actual cost of sales and what cost of sales would have been had the inventory been reinstated under the entity's normal pricing procedure
- b. The difference between actual cost of sales and what cost of sales would have been had the inventory been reinstated at year-end replacement cost
- c. The amount of the LIFO reserve at the beginning of the year which was credited to income (excluding the increase in the reserve due to current year price changes).

The first method is considered preferable. Disclosure of the effect of the liquidation should give effect only to pools with decrements (i.e., there should be no netting of pools with decrements against other pools with increments).

10. **Lower of cost or market.** The most reasonable approach to applying the lower of cost or market rules to LIFO inventory is to base the determination on groups of inventory rather than on an item-by-item approach. A pool constitutes a reasonable grouping for this purpose. An item-by-item approach is permitted by authoritative accounting literature, particularly for obsolete or discontinued items.

For companies with more than one LIFO pool, it is permissible to aggregate the pools in applying the lower of cost or market test if the pools are similar. Where the pools are significantly dissimilar, aggregating the pools is not appropriate.

Previous write-downs to market value of the cost of LIFO inventories should be reversed after a company disposes of the physical units of the inventory for which reserves were provided. The reserves at the end of the year should be based on a new computation of cost or market.

11. **LIFO conformity and supplemental disclosures.** A company may present supplemental non-LIFO disclosures within the historical cost framework. If nondiscretionary variable expenses (i.e., profit sharing based on earnings) would have been different based on the supplemental information, then the company should give effect to such changes. Additionally, the supplemental disclosure should reflect the same type of income tax effects as required by generally accepted accounting principles in the primary financial statements.

A company may use different LIFO applications for financial reporting than it uses for income tax purposes. Any such differences should be accounted for as temporary differences with the exception of differences in the allocation of cost to inventory in a business combination. Any differences between LIFO applications used for financial reporting and those used for income tax purposes need not be disclosed beyond the requirements of ASC 740.

12. **Interim reporting and LIFO.** The FASB guidance on interim reporting of LIFO inventory is discussed in the chapter on ASC 270.
13. **Different financial and income tax years.** A company with different fiscal year-ends for financial reporting and income tax reporting should make a separate LIFO calculation for financial purposes using its financial reporting year as a discrete period for that calculation.
14. **Business combinations accounted for by the purchase method.** Inventory acquired in a business combination accounted for by the purchase method will be recorded at fair value at the date of the combination. The acquired company may be able to carry over its prior basis for that inventory for income tax purposes, causing a difference between GAAP and income tax basis. An adjustment should be made to the fair value of the inventory only if it is reasonably estimated that it will be liquidated in the future. The adjustment would be for the income tax effect of the difference between income tax and GAAP basis.

Inventory acquired in such a combination should be considered the LIFO base inventory if the inventory is treated by the company as a separate business unit or a separate LIFO pool. If instead the acquired inventory is combined into an existing pool, then the acquired inventory should be considered as part of the current year's purchases.

15. **Changes in LIFO applications.** A change in a LIFO application is a change in accounting principle. LIFO applications refer to the approach (i.e., dollar value or specific goods), computational technique, or the numbers or contents of the pools.

ASC 810-10-55 provides guidance for intercompany transfers. The focus of this section is the LIFO liquidation effect caused by transferring inventories, which in turn creates intercompany profits. This liquidation can occur when (1) two components of the same taxable entity transfer inventory, for example, when a LIFO method component transfers inventory to a non-LIFO component, or (2) when two separate taxable entities that consolidate transfer inventory, even though both use the LIFO method.

This LIFO liquidation creates profit that must be eliminated along with other intercompany profits.

**LIFO income tax rules and restrictions.** As discussed previously, most of the rules and regulations governing LIFO originate in the U.S. IRC and the related regulations, revenue rules, revenue procedures, and judicial decisions. Taxpayers electing to use the LIFO inventory method are subject to myriad rules and restrictions, such as:

1. The inventory is to be valued at cost regardless of market value (i.e., application of the lower of cost or market rule is not allowed).
2. Changes in the LIFO reserve can potentially cause the taxpayer to be subject to alternative minimum tax (AMT) or increase the amount of AMT.
3. Corporations that use the LIFO method whose stockholders subsequently elect to be taxed as an “S” Corporation are required to report as income their entire LIFO reserve resulting in a special tax under IRC §1363(d) that is payable in four annual installments. The “S” Corporation is, however, permitted to retain LIFO as its inventory accounting method after the election.
4. Once elected, the LIFO method must continue to be used consistently in future periods. A taxpayer is permitted, subject to certain restrictions, to revoke its LIFO election in accordance with Rev. Proc. 99-49. After revocation, however, the taxpayer is precluded from reelecting LIFO for a period of five taxable years beginning with the year of the change. For GAAP purposes, a change to or from the LIFO method is accounted for as a change in accounting principle under ASC 250.

A unique rule regarding LIFO inventories is referred to as the LIFO Conformity Rule. (Sec. 472(c)) A taxpayer may not use a different inventory method in reporting income, profit, or loss of the entity for external financial reports. Thus, if LIFO is elected for income tax purposes, it must also be used for accounting purposes.

Treasury Regulations permit certain exceptions to this general rule. Among the exceptions allowable under the regulations are the following:

1. The use of an inventory method other than LIFO in presenting information reported as a supplement to or explanation of the taxpayer’s primary presentation of income in financial reports to outside parties. (Reg. §1.472-2[e][1][i])
2. The use of an inventory method other than LIFO to determine the value of the taxpayer’s inventory for purposes of reporting the value of such inventory as an asset on the statement of financial position. (Reg. §1.472-2[e][1][ii])
3. The use of an inventory method other than LIFO for purposes of determining information reported in internal management reports. (Reg. §1.472-2[e][1][iii])
4. The use of an inventory method other than LIFO for financial reports covering a period of less than one year. (Reg. §1.472-2[e][1][iv])
5. The use of lower of LIFO cost or market to value inventories for financial statements while using LIFO cost for income tax purposes. (Reg. §1.472-2[e][1][v])

6. For inventories acquired by a corporation in exchange for issuing stock to a stockholder that, immediately after the exchange, is considered to have control (a section 351 transaction), the use of the transferor's acquisition dates and costs for GAAP while using redetermined LIFO layers for tax purposes. (Reg. §1.472-2[e][1][vii])
7. The inclusion of certain costs (under full absorption) in inventory for income tax purposes, as required by regulations, while not including those same costs in inventory under GAAP (full absorption). (Reg. §1.472-2[e][8][i])
8. The use of different methods of establishing pools for GAAP purposes and income tax purposes. (Reg. §1.472-2[e][8][ii])
9. The use of different determinations of the time sales or purchases are accrued for GAAP purposes and tax purposes. (Reg. §1.472-2[e][8][xii])
10. In the case of a business combination, the use of different methods to allocate basis for GAAP purposes and income tax purposes. (Reg. §1.472-29[e][8][xiii])

Another important consideration in applying the LIFO conformity rule is the law concerning related corporations. In accordance with the Tax Reform Act of 1984, all members of the same group of financially related corporations are treated as a single taxpayer when applying the conformity rule. Previously, taxpayers were able to circumvent the conformity rule by having a subsidiary on LIFO, while the non-LIFO parent presented combined non-LIFO financial statements. This is a violation of the conformity requirement (see 472(g)).

**Weighted-average and moving-average.** Another method of inventory valuation involves averaging and is commonly referred to as the weighted-average method.

Under this method the cost of goods available for sale (beginning inventory plus net purchases) is divided by the number of units available for sale to obtain a weighted-average cost per unit. Ending inventory and cost of goods sold are then priced at this average cost.

#### Example of the weighted-average method

Assume the following data:

	<i>Units available</i>	<i>Units sold</i>	<i>Actual unit cost</i>	<i>Actual total cost</i>
Beginning inventory	100	—	\$2.10	\$210
Sale	—	75	—	—
Purchase	150	—	2.80	420
Sale	—	100	—	—
Purchase	50	—	3.00	150
Total	<u>300</u>	<u>175</u>		<u>\$780</u>

The weighted-average cost per unit is \$780/300, or \$2.60. Ending inventory is 125 units ( $300 - 175$ ) at \$2.60, or \$325; cost of goods sold is 175 units at \$2.60, or \$455.

When the weighted-average assumption is applied using a perpetual inventory system, the average cost is recomputed after each purchase. This process is referred to as a moving average. Cost of goods sold is recorded using the most recent average. This combination is called the moving-average method and is applied below to the same data used in the weighted-average example above.

	<i>Units on hand</i>	<i>Purchases in dollars</i>	<i>Cost of sales in dollars</i>	<i>Inventory total cost</i>	<i>Inventory moving- average unit cost</i>
Beginning inventory	100	\$ —	\$ —	\$210.00	\$2.10
Sale (75 units @ \$2.10)	25	—	157.50	52.50	2.10
Purchase (150 units, \$420)	175	420.00	—	472.50	2.70
Sale (100 units @ \$2.70)	75	—	270.00	202.50	2.70
Purchase (50 units, \$150)	125	150.00	—	352.50	2.82

Cost of goods sold is 75 units at \$2.10 and 100 units at \$2.70, or \$427.50.

This method is permitted for financial reporting purposes but had historically been prohibited for income tax purposes. (Rev. Ruling 71-234) The IRS has issued Revenue Procedure 2008-43, which grants limited use of this method for income tax reporting purposes. This relief is only available to taxpayers that were already using an average cost method for financial reporting purposes. In addition, an electing taxpayer is required to meet both of the following safe harbors:

1. The taxpayer must recompute the rolling average inventory price with every new purchase, or no less frequently than monthly.
2. The results under the rolling average method may not vary by more than 1% from the results using a FIFO or specific identification method. A shortcut method is permitted to be used to meet this safe harbor. If the taxpayer's annual turnover for its entire inventory exceeds four times, this safe harbor is considered to have been met.

**Comparison of cost flow assumptions.** Of the three cost flow assumptions, FIFO and LIFO produce the most extreme results, while results from using the weighted-average method generally fall somewhere in between. The selection of one of these methods involves a detailed analysis of the organization's objectives, industry practices, current and expected future economic conditions, and most importantly, the needs of the intended users of the financial statements.

The following table compares the relative effects of using FIFO and LIFO cost assumptions on the statement of financial position and statement of income under differing economic conditions:

<i>Changes in price levels</i>	<i>Relative effect on statement of financial position</i>		<i>Relative effect on statement of income</i>	
	<i>FIFO</i>	<i>LIFO</i>	<i>FIFO</i>	<i>LIFO</i>
Inflation (i.e., rising prices)	Higher inventory carrying value	Lower inventory carrying value	Lower cost of sales; higher gross profit and net income	Higher cost of sales; lower gross profit and net income
Deflation (i.e., falling prices)	Lower inventory carrying value	Higher inventory carrying value	Higher cost of sales; lower gross profit and net income	Lower cost of sales; higher gross profit and net income

In periods of rising prices, the LIFO method is generally thought to best fulfill the objective of providing the clearest measure of periodic net income. It does not, however, provide an accurate estimate of inventory cost in an inflationary environment. However, this shortcoming can usually be overcome by providing additional disclosures in the notes to the financial statements. In periods of rising prices, a prudent business should use the LIFO method because it will result in a decrease in the current income tax liability when compared to other alternatives. In a deflationary period, the opposite is true.

FIFO is a balance-sheet-oriented costing method. It gives the most accurate estimate of the current cost of inventory during periods of changing prices. In periods of rising prices, the FIFO method will result in higher income taxes than the other alternatives, while in a deflationary period FIFO provides for a lesser income tax burden. However, a major advantage of the FIFO method is that it is not subject to all of the complex regulations and requirements of the income tax code that govern the use of LIFO.

The average methods do not provide an estimate of current cost information on either the statement of financial position or income statement. The average methods are not permitted to be used for income tax purposes and, therefore, their use for financial reporting purposes would necessitate the use of FIFO for income tax reporting purposes since LIFO requires financial statement conformity.

Although price trends and underlying objectives are important to consider in selecting a cost flow assumption, other considerations are the risk of experiencing unintended liquidations of LIFO layers, as well as the effects of the chosen method on cash flow, capital maintenance, collateral requirements, and restrictive covenants imposed by lenders, etc.

### Lower of Cost or Market (LCM)<sup>4</sup>

As stated in ASC 330-10-20:

*. . . as used in the phrase lower of cost or market, the term market means current replacement cost, provided that it meets both the following conditions: a) market shall not exceed the net realizable value, and b) market shall not be less than net realizable value reduced by an allowance for an approximately normal profit margin.*

Inventory can lose value for a variety of reasons including damage, spoilage, obsolescence, changes in market prices, and the like. The application of LCM is a means of attempting to measure loss of value and recognize the effects in the period in which this occurs.

The term “market” means current replacement cost not to exceed a ceiling of net realizable value (selling price less reasonably estimable costs of completion and disposal) or be less than a floor of net realizable value adjusted for a normal profit margin.

LCM is not applied in conjunction with the LIFO method of inventory valuation for income tax purposes. However, it is important to note that LCM/LIFO is applied for financial reporting purposes. Such application gives rise to a temporary difference in the carrying value of inventory between financial statements and income tax returns. LCM/LIFO for financial reporting was discussed earlier in this chapter.

LCM may be applied to either the entire inventory or to each individual inventory item. The primary objective for selecting between the alternative methods of applying the LCM rule is to select the one that most clearly reflects periodic income. The rule is most commonly applied to the inventory on an item-by-item basis. The reason for this application is twofold:

1. It is required for income tax purposes unless it involves practical difficulties, and
2. It provides the most conservative valuation of inventories, because decreases in the value of one item are not offset by increases in the value of another.

---

<sup>4</sup> See the Technical Alert section at the beginning of this chapter for important information on this subject.

**Example of the lower of cost or market calculation**

The application of these principles is illustrated in this example. Assume the following information for products A, B, C, D, and E:

<u>Item</u>	<u>Cost</u>	<u>Replacement cost</u>	<u>Est. selling price</u>	<u>Cost to complete</u>	<u>Normal profit percentage</u>	<u>Normal profit amount</u>
A	\$2.00	\$1.80	\$ 2.50	\$0.50	24%	\$0.60
B	4.00	1.60	4.00	0.80	24%	0.96
C	6.00	6.60	10.00	1.00	18%	1.80
D	5.00	4.75	6.00	2.00	20%	1.20
E	1.00	1.05	1.20	0.25	12.5%	0.15

First, determine the market value and then compare this to historical cost. Market value is equal to the replacement cost, but cannot exceed the net realizable value (NRV) nor be below net realizable value less the normal profit percentage.

**Market Determination**

<u>Item</u>	<u>Cost</u>	<u>Replacement cost</u>	<u>NRV (ceiling)</u>	<u>NRV less profit (floor)</u>	<u>Market</u>	<u>LCM</u>
A	\$2.00	\$1.80	\$2.00	\$1.40	\$1.80	\$1.80
B	4.00	1.60	3.20	2.24	2.24	2.24
C	6.00	6.60	9.00	7.20	7.20	6.00
D	5.00	4.75	4.00	2.80	4.00	4.00
E	1.00	1.05	0.95	0.80	0.95	0.95

NRV (ceiling) equals selling price less costs of completion (e.g., item A: \$2.50 – .50 = \$2.00). NRV less profit (floor) is self-descriptive (e.g., item A: \$2.50 – .50 – .60 = \$1.40). Market is replacement cost unless lower than the floor or higher than the ceiling. Note that market must be designated before LCM is determined. Finally, LCM is the lower of cost or market value.

Replacement cost is a valid measure of the future utility of the inventory item, since increases or decreases in the enterprise's purchase price generally foreshadow related increases or decreases in the price at which it is able to sell the item. The ceiling and the floor provide safeguards against the recognition of either excessive profits or excessive losses in future periods in those instances where the selling price and replacement cost do not move in the same direction in a proportional manner. The ceiling avoids the recognition of additional losses in the future when the selling price is falling faster than replacement cost. Without the ceiling constraint, inventories would be carried at an amount in excess of their net realizable value. The floor avoids the recognition of abnormal profits in the future when replacement cost is falling faster than the selling price. Without the floor, inventories would be carried at a value less than their net realizable value minus a normal profit.

The loss from writing inventories down to LCM is generally reflected on the income statement in cost of goods sold. If material, the loss must be separately captioned in the income statement. While GAAP is not explicit as to presentation, it would appear that this adjustment could either be displayed as a separately identified charge within cost of goods sold, or as an administrative expense. The write-down is recorded as a debit to a loss account and a credit either to an inventory or a valuation allowance account.

**Inventory estimation methods.** There are instances in which an accountant must estimate the value of inventories without an actual physical count. Some of the estimation methods used to accomplish this are the retail method, the LIFO retail method, and the gross profit method. These methods are not cost flow assumptions like LIFO and FIFO; rather, they are computational methods that have been devised to assist in estimating inventory cost under the relevant cost flow assumption.

**Retail method.** The retail method is used by retailers to estimate the cost of their ending inventory. The retailer can either take a physical inventory at retail prices or estimate ending retail inventory and then use a computed cost-to-retail ratio to convert the ending inventory priced at retail to its estimated cost. This method eliminates the process of going back to original vendor invoices or other documents in order to determine the original cost for each inventoriable item. The retail method can be used under any of the three cost flow assumptions discussed earlier: FIFO, LIFO, or average cost. As with ordinary FIFO or average cost, the LCM rule is also applied when either one of these two cost assumptions is used in conjunction with the retail method.

The key to applying the retail method is determining the cost-to-retail ratio. The calculation of this ratio varies depending upon the cost flow assumption selected. The cost-to-retail ratio provides a measure of the relationship between the cost of goods available for sale and the retail price of these same goods. This ratio is used to convert the ending retail inventory back to cost. The computation of the cost-to-retail ratio for the FIFO and average cost methods is described below. The use of the LIFO cost flow assumption with this method is discussed in the succeeding section.

1. **FIFO cost**—The FIFO method assumes that the ending inventory is made up of the latest purchases. Therefore, beginning inventory is excluded from the computation of the cost-to-retail ratio, and the computation uses the cost of current year net purchases divided by their retail value adjusted for both net markups and net markdowns as will be further explained and illustrated.
2. **FIFO (LCM)**—The computation is basically the same as FIFO cost, except that markdowns are excluded from the computation of the cost-to-retail ratio.
3. **Average cost**—Average cost assumes that ending inventory consists of all goods available for sale. Therefore, the cost-to-retail ratio is computed by dividing the cost of goods available for sale (Beginning inventory + Net purchases) by the retail value of these goods adjusted for both net markups and net markdowns.
4. **Average cost (LCM)**—Is computed in the same manner as average cost, except that markdowns are excluded from the calculation of the cost-to-retail ratio.

#### Example of the cost-to-retail ratio

A simple example illustrates the computation of the cost-to-retail ratio under both the FIFO cost and average cost methods in a situation where no markups or markdowns exist.

	<i>FIFO cost</i>	<i>Average cost</i>		
	<i>Cost</i>	<i>Retail</i>	<i>Cost</i>	<i>Retail</i>
Beginning inventory	\$100,000	\$ 200,000	\$100,000	\$ 200,000
Net purchases	500,000 (a)	800,000 (b)	500,000	80,000
Total goods available for sale	<u>\$ 600,000</u>	1,000,000	<u>\$ 600,000</u> (c)	1,000,000 (d)
Sales at retail		(80,000)		(80,000)
Ending inventory—retail		<u>\$ 200,000</u>		<u>\$ 200,000</u>
Cost-to-retail ratio	(a) 500,000 (b) 800,000	= 62.5%	(a) 600,000 (b) 100,000	= 60%
Ending inventory—cost		<u>200,000 × 62.5%</u> <u>200,000 × 60%</u>	<u>\$125,000</u>	<u>\$120,000</u>

Note that the only difference in the two examples is the numbers used to calculate the cost-to-retail ratio.

The lower of cost or market aspect of the retail method is a result of the treatment of net markups and net markdowns. Net markups (markups less markup cancellations) are net increases above the original retail price, which are generally caused by changes in supply and demand. Net markdowns (markdowns less markdown cancellations) are net decreases below the original retail price. An approximation of “lower of cost or market” pricing is achieved by including net markups but excluding net markdowns, from the cost-to-retail ratio.

To understand this approximation, assume a toy is purchased for \$6, and the retail price is set at \$10. It is later marked down to \$8. A cost-to-retail ratio including markdowns would be \$6 divided by \$8 or 75%, and ending inventory would be valued at \$8 times 75%, or \$6 (original cost). The logic behind including markdowns in the cost-to-retail ratio is the assumption that these inventories would eventually be marked down and that markdowns are a normal part of business for this enterprise and/or these types of inventories. A cost-to-retail ratio excluding markdowns would be \$6 divided by \$10 or 60%, and ending inventory would be valued at \$8 times 60%, or \$4.80 (LCM). The logic behind excluding markdowns from the cost-to-retail ratio is that the enterprise did not expect to mark these inventory items down and that this is not a normal occurrence. The write-down to \$4.80 reflects the loss in utility which is evidenced by the reduced retail price.

The application of the lower of cost or market rule is illustrated for both the FIFO and average cost methods in the example below. Remember, if the markups and markdowns below had been included in the previous example, both would have been included in the cost-to-retail ratio.

**Example of the lower of cost or market rule—FIFO and average cost methods**

	<i>FIFO cost (LCM)</i>		<i>Average cost (LCM)</i>	
	<u>Cost</u>	<u>Retail</u>	<u>Cost</u>	<u>Retail</u>
Beginning inventory	\$100,000	\$200,000	\$100,000	\$200,000
Net purchases	500,000 (a)	800,000 (b)	500,000	800,000
Net markups	—	250,000 (b)	—	250,000
Total goods available for sale	<u>\$600,000</u>	1,250,000	<u>\$600,000</u> (c)	1,250,000 (d)
Net markdowns		(50,000)		(50,000)
Sales at retail		(800,000)		(800,000)
Ending inventory—retail		\$400,000		<u>\$400,000</u>
Cost-to-retail ratio	(a) 500,000 (b) 1,050,000	= 47.6%	(c) 600,000 (d) 1,250,000	= 48%
Ending inventory—LCM				
	400,000 × 47.6%	\$190,400		
	400,000 × 48%			\$192,400

Under the FIFO (LCM) method all of the markups are considered attributable to the current period purchases. While this is not necessarily accurate, it provides the most conservative estimate of the ending inventory.

There are a number of additional issues that affect the computation of the cost-to-retail ratio. Purchase discounts and freight-in affect only the cost column in this computation. The sales figure that is subtracted from the adjusted cost of goods available for sale in the retail column must be gross sales after adjustment for sales returns. Sales discounts are not included in the computation. If sales are recorded gross, then deduct the gross sales figure. If sales are recorded net, then both the recorded sales and sales discount must be deducted to give the same effect as deducting gross

sales. Normal spoilage is generally allowed for in the enterprise's pricing policies, and for this reason it is deducted from the retail column after the calculation of the cost-to-retail ratio. Abnormal spoilage, on the other hand, is deducted from both the cost and retail columns before the cost-to-retail calculation as it could otherwise distort the ratio. It is then generally reported as a separate loss, either within cost of goods sold or administrative expenses. Abnormal spoilage generally arises from a major theft or casualty, while normal spoilage is usually due to shrinkage or breakage. These determinations and their treatments will vary depending upon the enterprise's policies.

When applying the retail method, separate computations are made for any departments that experience significantly higher or lower gross profit margins. Distortions arise in applying the retail method when a department sells goods with gross profit margins that vary in a proportion different from the gross profit margins of goods purchased during the period. In this case, the cost-to-retail percentage would not be representative of the mix of goods in ending inventory. Also, manipulations of income are possible by planning the timing of markups and markdowns.

The retail method is an acceptable method of estimating inventories under FIFO (LCM) for income tax purposes. Income tax regulations require valuation at lower of cost or market (except for LIFO) and regular and consistent physical counts of inventory at each location.

**LIFO retail method.** As with other LIFO methods, Treasury Regulations are the governing force behind the LIFO retail method. The regulations differentiate between a "variety" store, which is required to use an internally computed index, and a "department" store, which is permitted to use a price index published by the Bureau of Labor Statistics. The computation of an internal index was previously discussed in the dollar-value LIFO section. It involves applying the double-extension method to a representative sample of the ending inventory. Selection of an externally published index is to be in accordance with the Treasury Regulations.

The steps used in computing the value of ending inventory under the LIFO retail method are listed below and then applied in an example for illustrative purposes.

1. Calculate (or select) the current year conversion price index. Recall that in the base year this index will be 1.00.
2. Calculate the value of the ending inventory at both cost and retail. Remember, as with other LIFO methods, income tax regulations do not permit the use of LCM, so both markups and markdowns are included in the computation of the cost-to-retail ratio. However, the beginning inventory is excluded from goods available for sale at cost and at retail.
3. Restate the ending inventory at retail to base-year retail. Divide the current ending inventory at retail by the current year index determined in Step 1.
4. Layers are then treated as they were for the dollar-value LIFO example presented earlier. If the ending inventory restated to base-year retail exceeds the previous year's amount at base-year retail, a new layer is established.
5. The computation of LIFO cost is the last step and requires multiplying each layer at base-year retail by the appropriate price index and multiplying this product by the cost-to-retail ratio in order to arrive at the LIFO cost for each layer.

**Example of the LIFO retail method**

The following example illustrates a two-year period to which the LIFO retail method is applied. The first period represents the first year of operations for the company and is its base year.

**Year 1**

Step 1—Because this is the base year, there is no need to compute an index, as it will always be 1.00.

Step 2—

	<u>Cost</u>	<u>Retail</u>
Beginning inventory	\$ —	\$ —
Purchases	582,400	988,600
Markups	—	164,400
Markdowns	—	(113,000)
Subtotal	582,400	1,040,000
Total goods available for sale	<u>\$582,400</u>	1,040,000
Sales—at retail		840,000
Ending year 1 inventory—at retail		<u>\$ 200,000</u>
Cost-to-retail ratio	(a) 582,400	= 56%
	(b) 1,040,000	
Ending inventory at cost \$200,000 × 56%		<u>\$112,000</u>

Step 3—Because this is the base year, the restatement to base-year cost is not necessary; however, the computation would be  $\$200,000/1.00 = \$200,000$ .

Steps 4 and 5—The determination of layers is again unnecessary in the base year; however, the computation would take the following format:

	<u>Ending inventory at base-year retail</u>	<u>Conversion price index</u>	<u>Cost-to- retail ratio</u>	<u>LIFO cost</u>
Base year	(\$200,000/1.00)	\$200,000	1.00	0.56

**Year 2**

Step 1—We make the assumption that the computation of an internal index yields a result of 1.12 (obtained by double-extending a representative sample).

Step 2—

	<u>Cost</u>	<u>Retail</u>
Beginning inventory	\$112,000	\$ 200,000
Purchases	716,300	1,168,500
Markups	—	87,500
Markdowns	—	(21,000)
Subtotal	<u>716,300</u>	1,235,000
Total goods available for sale		1,435,000
Sales—at retail		1,171,800
Ending year 2 inventory—at retail		<u>\$263,200</u>
Cost-to-retail ratio	716,300	= 58%
	1,235,000	

Step 3—The restatement of ending inventory at current year retail to base-year retail is done using the index computed in Step 1. In this case it is  $\$263,200/1.12 = \$235,000$ .

Steps 4 and 5—There is a LIFO layer in year 2 because the \$235,000 inventory at base-year retail exceeds the year 1 amount of \$200,000.

The computation of the LIFO cost for each layer is shown below.

	<i>Ending inventory at base-year retail</i>	<i>Conversion price index</i>	<i>Cost-to- retail ratio</i>	<i>LIFO cost</i>
Base year				
(\$200,000/1.00)	\$200,000	1.00	0.56	\$112,000
Year 2 layer	<u>35,000</u>	1.12	0.58	<u>22,736</u>
	<u>\$235,000</u>			
Ending year 2 inventory at LIFO cost				<u>\$134,736</u>

The treatment of subsequent increments and decrements is the same for this method as it is for the regular dollar-value method.

**Gross profit method.** The gross profit method is used to estimate ending inventory when a physical count is not taken. It can also be used to evaluate the reasonableness of a given inventory amount. Assume the following data:

Beginning inventory	\$125,000
Net purchases	450,000
Sales	600,000
Estimated gross profit percentage	32%

Ending inventory is estimated as follows:

Beginning inventory	\$125,000
Net purchases	<u>450,000</u>
Cost of goods available for sale	575,000
Cost of goods sold [ $\$600,000 - (32\% \times \$600,000)$ ]	<u>408,000</u>
Estimated ending inventory	<u>\$167,000</u>

The gross profit method is used for interim reporting estimates, for conducting analytical review procedures by independent accountants in audits and review engagements, and for estimating inventory lost in fires or other catastrophes. The method is not acceptable, however, for either income tax or annual financial reporting purposes.

**Standard costs.** Standard costs are predetermined unit costs used by manufacturing firms for planning and control purposes. Standard costs are often used to develop approximations of GAAP inventories for financial reporting purposes. The use of standard cost approximations in financial reporting is acceptable only if adjustments to the standards are made periodically to reflect current conditions and if their use approximates the results that would be obtained by directly applying one of the recognized cost flow assumptions.

### Example of standard costing

The Bavarian Clock Company (BCC) uses standard costing to value its FIFO inventory. One of its products is the Men's Chronometer wristwatch, for which the following bill of materials has been constructed:

<u>Part description</u>	<u>Quantity</u>	<u>Cost</u>
Titanium watch casing	1	\$212.25
Leather strap	1	80.60
Scratch resistant crystal bezel	1	120.15
Double timer shock-resistant movement	1	42.80
Multilingual instruction sheet	1	0.80
Ornamental box	1	2.75
Overhead charge	1	<u>28.00</u>
Total		\$487.35

The industrial engineering department designed the following labor routing for assembly of the Men's Chronometer and determined the standard process times:

<u>Labor routing description</u>	<u>Quantity/ minutes</u>	<u>Labor type</u>	<u>Cost/ minute</u>	<u>Cost</u>
Quality review of raw materials received	3.5	Quality assurance	\$0.42	\$ 1.47
Attach strap to casing	7.5	Watch maker	0.79	5.93
Insert movement in casing	10.8	Watch maker	0.79	8.53
Attach bezel	3.2	Watch maker	0.79	2.53
Final quality review and testing	11.0	Quality assurance	0.42	4.62
Insert into packing case	<u>1.5</u>	Assembler	0.13	.20
Total	<u>37.5</u>			<u>\$23.28</u>

Thus, the total standard cost of the Men's Chronometer is \$510.63 (\$487.35 material and overhead cost + \$23.28 labor cost). At the beginning of December, there are 1,087 Men's Chronometers in finished goods inventory, which are recorded at standard cost, resulting in a beginning inventory valuation of \$555,054.81 (= \$510.63 × 1,087 units).

During December, BCC records actual material costs of \$1,915,312.19, actual labor costs of \$111,844.40, and actual overhead costs of \$124,831.55 related to the Men's Chronometer, which are charged to the inventory account. During the month, BCC manufactures 4,105 Men's Chronometers and ships 4,385, leaving 807 units in finished goods inventory. At a standard cost of \$510.63 per unit, this results in a month-end finished goods inventory balance of \$412,078.41. The monthly charge to cost of goods sold is calculated as follows:

Beginning inventory at standard cost	\$ 555,054.81
+ Actual material costs incurred	1,915,312.19
+ Actual labor costs incurred	111,844.40
+ Actual overhead costs incurred	124,831.55
- Ending inventory at standard cost	(412,078.41)
= Cost of goods sold	<u>\$2,294,964.54</u>

At month-end, the purchasing manager conducts his quarterly review of the bill of materials and determines that the cost of the bezel has permanently increased by \$4.82, bringing the total standard bezel cost to \$124.97 and therefore the total standard cost of the Men's Chronometer to \$515.45. This increases the value of the ending inventory by \$3,889.74 (\$4.82 standard cost increase × 807 units in

finished goods inventory), to \$415,968.15, while reducing the cost of goods sold to \$2,291,074.80. The following entry records the month-end inventory valuation at standard cost:

Cost of goods sold	2,291,074.80
Finished goods inventory	2,291,074.80

As a cross-check, BCC's controller divides the cost of goods sold by the total number of units shipped, and arrives at an actual unit cost of \$522.48, as opposed to the standard costs of \$515.45. The variance from the standard cost is \$7.03 per unit, or a total of \$30,826.55. Upon further investigation, she finds that overnight delivery charges of \$1,825 were incurred for a shipment of watch casings, while there was a temporary increase in the cost of the leather strap of \$2.83 for a 1,000-unit purchase, resulting in an additional charge of \$2,830. She elects to separately track these excess material-related costs with the following entry:

Material price variance	4,655.00
Cost of goods sold	4,655.00

In addition, the production staff incurred overtime charges of \$16,280 during the month. Since overtime is not included in the labor routing standard costs, the controller separately tracks this information with the following entry:

Labor price variance	16,280.00
Cost of goods sold	16,280.00

Finally, the controller determines that some costs comprising the overhead cost pool exceeded the budgeted overhead cost during the month, resulting in an excess charge of \$9,891.55 to the Men's Chronometer cost of goods sold. She separates this expense from the cost of goods sold with the following entry:

Overhead price variance	9,891.55
Cost of goods sold	9,891.55

Her variance analysis has identified all causes of the \$30,826.55 cost overage, as noted in the following table:

Total cost of goods sold	\$ 2,291,074.80
– Standard cost of goods sold	(2,260,248.25)
– Material price variance	(4,655.00)
– Labor price variance	(16,280.00)
– Overhead price variance	<u>(9,891.55)</u>
= Remaining unresolved variance	<u><u><u><u></u></u></u></u>

As explained previously, variances resulting from abnormal costs incurred are considered period costs and, thus, are not allocated to inventory.

### Other inventory valuation methods.

**Base stock.** The base stock method assumes that a certain level of inventory investment is necessary for normal business activities and is, therefore, permanent. The base stock inventory is carried at historical cost. Decreases in the base stock are considered temporary and are charged to cost of goods sold at replacement cost. Increases are carried at current year costs. The base stock approach is seldom used in practice, since it is not allowed for income tax purposes, and the LIFO method yields similar results.

**Direct costing.** An alternative to full absorption costing is direct costing. Direct costing (also referred to as variable costing) requires classifying only direct materials, direct labor, and variable

production overhead as inventory costs. Under this method, all fixed costs are accounted for as period costs. The exclusion of all overhead from inventory costs is not an acceptable accounting method for GAAP or under the U.S. Treasury Regulations for income tax purposes.

**Relative sales value.** Relative sales (or net realizable) values are used to assign costs to inventory items purchased or manufactured in groups. This method is applicable to joint products, subdivided assets such as real estate lots, and basket purchases.

For example, products A and B have the same processes performed on them up to the split-off point. The total cost incurred to this point is \$80,000. This cost can be assigned to products A and B using their relative sales value at the split-off point. If A could be sold for \$60,000 and B for \$40,000, the total sales value is \$100,000. The cost would be assigned on the basis of each product's relative sales value. Thus, A would be assigned a cost of \$48,000 ( $60,000/100,000 \times 80,000$ ) and B a cost of \$32,000 ( $40,000/100,000 \times 80,000$ ).

### Differences between GAAP and Income Tax Accounting for Inventories

**Full absorption costing—income tax.** The Tax Reform Act (TRA) of 1986 included provisions referred to as Uniform Capitalization (UNICAP) requiring certain additional indirect costs that are not capitalizable under GAAP to be capitalized rather than expensed for income tax purposes:

1. Depreciation and amortization in excess of that reported in financial statements
2. Percentage depletion in excess of cost
3. Rework labor, scrap, and spoilage costs
4. Allocable general and administrative costs related to the production function.

For income tax purposes, these costs, as well as the indirect production costs listed above for inventory costing under GAAP, are allocated to the WIP and finished goods inventories. Examples of general and administrative costs that must be allocated include payroll department costs, wages of security guards, and the president's salary. The difference between the GAAP and income tax inventory carrying values is a temporary difference, which requires deferred income tax accounting (discussed in Chapter 24).

**Uniform capitalization rules—income tax versus GAAP.** TRA 1986 established the UNICAP rules for inventory costs for tax purposes. ASC 330-10-55-4 states that capitalizing a cost for income tax purposes does not, by itself, indicate that it is preferable or even appropriate to capitalize the cost for financial reporting purposes. Although a cost may be required to be capitalized for income tax purposes, management must analyze the individual facts and circumstances based on the nature of its operations and industry practice to determine whether to capitalize the cost for financial reporting purposes.

**Inventory capitalization for retailers/wholesalers—income tax versus GAAP.** TRA 1986 applied UNICAP (uniform capitalization) to certain retailers and wholesalers and introduced a requirement that additional costs be capitalized. Inventories of retailers/wholesalers whose average annual gross receipts for the preceding three years are \$10 million or less are exempt from applying UNICAP.

The costs which must be capitalized have been divided into two categories. The first category is direct costs and includes the inventory invoice price plus transportation. Also included in direct costs is the cost of labor for purchasing, storing, and handling inventory items. The second category is indirect costs and consists of any costs that directly benefit or are incurred because of

the performance of a resale activity. The following types of indirect costs must be capitalized under UNICAP:

1. Off-site storage or warehousing
2. Purchasing
3. Handling, processing, assembly, and repackaging
4. Allocable general and administrative costs related to the above three functions.

The indirect costs are allocated between inventory and cost of goods sold by using traditional methods (specific identification, standard costing methods, etc.) or one of three simplified methods. Temporary differences require deferred income tax accounting as discussed in the chapter on ASC 740, *Income Taxes*.

### Other Inventory Topics

**Inventories valued at selling price.** In exceptional cases, inventories may be reported at sales price less estimated disposal costs. Such treatment is justified when cost is difficult to determine, quoted market prices are available, marketability is assured, and units are interchangeable. Precious metals, certain agricultural products, and meat are examples of inventories valued in this manner. When inventory is valued above cost, revenue is recognized before the time of sale. Naturally, full disclosure in the financial statements is required.

**Stripping costs incurred during production in the mining industry.** ASC 930-330-25-1 states that stripping costs incurred during a mine's production phase are to be accounted for as variable production costs and therefore allocated to inventory. The ASC is limited to stripping costs incurred during the period when inventory is being produced (i.e., extracted) and did not address the accounting for these costs when incurred during the preproduction phase of the mine.

## PERSPECTIVE AND ISSUES

### Subtopics

ASC 340, *Other Assets and Deferred Costs*, contains four subtopics:

- ASC 340-10, *Overall*, which provides guidance on certain deferred costs and prepaid expenses.
- ASC 340-20, *Capitalized Advertising Costs*,<sup>1</sup> which provides guidance on the initial measurement, amortization, realizability, and disclosure of direct response advertising costs reported as assets.

<sup>1</sup> This Subtopic will be superseded when ASU 2014-09, *Revenue from Contracts with Customers (Topic 606)*, becomes effective.

- ASC 340-30, *Insurance Contracts that Do Not Transfer Insurance Risk*, which provides guidance on how to apply the deposit method of accounting when it is required for insurance and reinsurance contracts that do not transfer risk.
- ASC 340-40, *Contracts with Customers*,<sup>2</sup> provides guidance on costs incurred related to a contract with a customer.

The guidance in ASC 340-10 is limited to a discussion of the nature of prepaid expenses and guidance for preproduction costs related to long-term supply arrangements. The specific guidance for many other deferred costs is included in various other areas of the Codification.

### Scope and Scope Exceptions

**ASC 340-10.** The guidance in Topic 340 applies to all entities and to all subtopics of ASC 340 unless specifically excepted.

**ASC 340-20.** ASC 340-20 provides the following scope description:

“Direct-response advertising activities exclude advertising that, though related to the direct-response advertising, is directed to an audience that could not be shown to have responded specifically to the direct-response advertising. For example, a television commercial announcing that order forms (that are direct-response advertising) soon will be distributed directly to some people in the viewing area would not be a direct-response advertising activity because the television commercial is directed to a broad audience, not all of which could be shown to have responded specifically to the direct-response advertising.” (ASC 340-20-15-4)

**ASC 340-30.** ASC 340-30-15 provides guidance on which transactions are covered and which are not covered by subtopic ASC 340-30. The guidance in the Subtopic includes the following transactions:

- Short-duration insurance and reinsurance contracts that do not transfer insurance risk as described in paragraph 720-20-25-1 and, for reinsurance contracts, as described in Section 944-20-15
  - Multiple-year insurance and reinsurance contracts that do not transfer insurance risk or for which insurance risk transfer is not determinable.
- (ASC 340-30-15-3)

The guidance in ASC 340-30 does not apply to the following transactions and activities:

- Long-duration life and health insurance contracts that do not indemnify against mortality or morbidity risk shall be accounted for as investment contracts under Topic 944. Therefore, such contracts are not covered by this Subtopic.
- (ASC 340-30-15-4)

**ASC 340-40.** ASC 340-40 applies to the following costs of obtaining a contract with a customer within the scope of ASC 606:

- Incremental costs of obtaining a contract with a customer
- Costs of fulfilling a contract with a customer.

The guidance on costs incurred in fulfilling a contract does *not* apply to costs included in:

- a. ASC 330 on inventory
- b. ASC 340-10-25-1 through 25-4 on preproduction costs related to long-term supply arrangements (In 2016, as part of its Technical Corrections and Improvements project,

---

<sup>2</sup> This Subtopic has been added by ASU 2014-09 and will be effective when ASU 2014-09 becomes effective.

the FASB plans to issue an exposure draft of an ASU that will eliminate this scope exception by superseding the guidance on preproduction costs related to long-term supply arrangements within Subtopic 340-10. As a result, entities would apply the guidance in ASC 340-40.)

- c. ASC 350-40 on internal-use software
  - d. ASC 360 on property, plant, and equipment
  - e. ASC 985-20 on cost of software to be sold leased or otherwise marketed.
- (ASC 340-40-15-3)

At the January 2015 revenue recognition Transition Resources Group meeting, members generally agreed that ASC 340-40 does not amend the current standards on liabilities, such as ASC 405.<sup>3</sup>

## Overview

Prepaid expenses are amounts paid to secure the use of assets or the receipt of services at a future date or continuously over one or more future periods. Prepaid expenses will not be converted to cash, but they are classified as current assets because, if they were not prepaid, they would have required the use of current assets during the coming year (or operating cycle, if longer).

Manufacturers often incur preproduction costs related to products and services they will supply to their customers under long-term arrangements. The supplier may be contractually guaranteed reimbursement of design and development costs, implicitly guaranteed reimbursement of design and development costs through the pricing of the product or other means, or not guaranteed reimbursement of the design and development costs incurred under the long-term supply arrangement.

## DEFINITIONS OF TERMS

---

Source: ASC 340, *Glossaries*. Also see Appendix A, *Definition of Terms*, for other terms related to this chapter: Contract, Customers, Not-for-Profit Entity, Performance Obligations, Public Business Entity, Revenue, and Transaction Price.

**Assuming Entity.** The party that receives a reinsurance premium in a reinsurance transaction. The assuming entity (or reinsurer) accepts an obligation to reimburse a ceding entity under the terms of the reinsurance contract.

**Ceding Entity.** The party that pays a reinsurance premium in a reinsurance transaction. The ceding entity receives the right to reimbursement from the assuming entity under the terms of the reinsurance contract.

**Experience Adjustment.** A provision in an insurance or reinsurance contract that modifies the premium, coverage, commission, or a combination of the three, in whole or in part, based on experience under the contract.

**Insurance Risk.** The risk arising from uncertainties about both underwriting risk and timing risk. Actual or imputed investment returns are not an element of insurance risk. Insurance risk is fortuitous; the possibility of adverse events occurring is outside the control of the insured.

---

<sup>3</sup> TRG Agenda Paper 25, *January 2015 Meeting—Summary of Issues Discussed and Next Steps*, dated March 30, 2015.

**Timing Risk.** The risk arising from uncertainties about the timing of the receipt and payments of the net cash flows from premiums, commissions, claims, and claim settlement expenses paid under a contract.

**Underwriting Risk.** The risk arising from uncertainties about the ultimate amount of net cash flows from premiums, commissions, claims, and claim settlement expenses paid under a contract.

## CONCEPTS, RULES, AND EXAMPLES

---

### ASC 340-10, *Overall*

#### Prepaid Expenses

**Types of prepaid expenses.** Prepaid expenses are amounts paid to secure the use of assets or the receipt of services at a future date or continuously over one or more future periods. Prepaid expenses will not be converted to cash, but they are classified as current assets because, if they were not prepaid, they would have required the use of current assets during the coming year (or operating cycle, if longer). Examples of items that are often prepaid include dues, subscriptions, maintenance agreements, memberships, licenses, rents, and insurance.

The examples of prepaid expenses cited in the previous paragraph are unambiguous. This is, however, not always the case. In negotiating union labor contracts, the parties may agree that the union employees will be entitled to receive a lump-sum cash payment or series of payments in exchange for agreeing to little or no increase in the employees' base wage rate. These lump-sum arrangements ordinarily do not require the employee to refund any portion of the lump sum to the employer in the event that the employee terminates employment during the term of the labor agreement. Further, it is assumed by the parties that, upon termination of a union member, the employer will replace that individual with another union member at the same base wage rate to whom no lump sum would be due. Management believes that the lump-sum payment arrangement will reduce or eliminate raises during the contract term and that these lump-sum payments will benefit future periods. To record these lump sums as prepaid expenses, ASC 710-10-25 specifies that, based on a careful review of the facts and circumstances around the contract and negotiations, the payments must clearly benefit a future period in the form of a lower base wage rate than would otherwise have been in effect. Further, the amortization period is not permitted to extend beyond the term of the union contract. The presumption of replacing terminating union members with other union members at the same wage rate is essential to this conclusion and, thus, this accounting treatment is only applicable to union contracts and is not permitted to be applied by analogy to account for individual employment contracts or other compensation arrangements. The SEC observer noted that accounting for this transaction as a prepaid expense is only appropriate when there is no evidence of any kind that the lump-sum payment or payments are related to services rendered in the past.

**Amortization.** Prepaid expenses are amortized to expense on a ratable basis over the period during which the benefits or services are received. For example, if rent is prepaid for the quarter at the beginning of the quarter, two months of the rent will be included in the prepaid rent account. At the beginning of the second month, the equivalent of one month's rent would be charged to rent expense. At the beginning of the third month, the remaining prepayment would be charged to rent expense.

### Example of prepaid expenses

The PipeTrak Company starts using geographical information systems (GIS) software to track the locations of the country's pipeline infrastructure under a contract for the Department of Homeland Security. It pays maintenance fees on three types of GIS software, for which the following maintenance periods are covered:

<i>Software name</i>	<i>Maintenance start date</i>	<i>Maintenance duration</i>	<i>Maintenance fee</i>
Culture Data (CD)	February	Annual	\$4,800
Map Layering (ML)	April	Semianual	18,000
Land Grid (LG)	June	Quarterly	6,000

It initially records these fee payments as prepaid expenses. PipeTrak's controller then uses the following amortization table to determine the amount of prepaid expenses to charge to expense each month:

<i>Software</i>	<i>Feb</i>	<i>Mar</i>	<i>Apr</i>	<i>May</i>	<i>Jun</i>	<i>Jul</i>	<i>Aug</i>	<i>Sep</i>	<i>Oct</i>	<i>Nov</i>	<i>Dec</i>
CD	400	400	400	400	400	400	400	400	400	400	400
ML			3,000	3,000	3,000	3,000	3,000	3,000			
LG					2,000	2,000	2,000				
Totals	400	400	3,400	3,400	5,400	5,400	5,400	3,400	400	400	400

In June, PipeTrak records the following entry to charge a portion of its prepaid software maintenance to expense:

Software maintenance expense	5,400
Prepaid expenses	5,400

### Preproduction Costs Related to Long-Term Supply Arrangements

Manufacturers often incur costs referred to as preproduction costs, related to products that they will provide to their customers under long-term supply arrangements. ASC 340-10-25 states the following with respect to these costs:

1. Costs of design and development of products to be sold under long-term supply arrangements are expensed as incurred. (ASC 340-10-25-1)
2. Costs of design and development of molds, dies, and other tools that the supplier will own and that will be used in producing the products under the long-term supply arrangement are capitalized as part of the molds, dies, and other tools (subject to an ASC 360 recoverability assessment when one or more impairment indicators is present). There is an exception, however, for molds, dies, and other tools involving new technology, which are expensed as incurred as research and development costs under ASC 730. (ASC 340-10-25-1)
3. If the molds, dies, and other tools described in 2 above are *not to be owned* by the supplier, then their costs are expensed as incurred unless the supply arrangement provides the supplier the noncancelable right (as long as the supplier is performing under the terms of the supply arrangement) to use the molds, dies, and other tools during the term of the supply arrangement. (ASC 340-10-25-2)
4. If there is a legally enforceable contractual guarantee for reimbursement of design and development costs that would otherwise be expensed under these rules, the costs are recognized as an asset as incurred. Such a guarantee must contain reimbursement

provisions that are objectively measurable and verifiable. The ASC provides examples illustrating this provision. (ASC 340-20-25-3)

Under these rules, preparers are encouraged (and SEC registrants are required) to disclose the following information (ASC 340-10-S99-3):

1. The accounting policy for preproduction design and development costs.
2. The aggregate amounts of:
  - a. Assets recognized pursuant to agreements providing for contractual reimbursement of preproduction design and development costs.
  - b. Assets recognized for molds, dies, and other tools that the supplier owns.
  - c. Assets recognized for molds, dies, and other tools that the supplier does not own.

It is important to note that the above provisions do not apply to assets acquired in a business combination that are used in research and development activities. Instead, such assets are accounted for in accordance with ASC 805, which permits recognition of in-process research and development assets.

#### **ASC 340-20, Capitalized Advertising Costs<sup>4</sup>**

The costs of advertising are expensed either as costs are incurred or the first time the advertising takes place (e.g., when the television advertisement is aired or printed copy is published), if later (720-35-25). However, if both of the following conditions are met, those costs can be capitalized:

1. The primary purpose is to elicit sales to customers who could be shown to have responded specifically to the advertising, and
2. The advertising results in probable future economic benefits.

The future benefits to be received are the future revenues arising as a direct result of the advertising. The company is required to provide entity-specific persuasive evidence that there is a linkage between the direct-response advertising and these future benefits. These costs are then amortized over the period in which the future benefits are expected to be received.

Advertising expenditures are sometimes made subsequent to the recognition of revenue (such as in “cooperative advertising” arrangements with customers). In order to achieve proper matching, these costs are to be estimated, accrued, and charged to expense when the related revenues are recognized. (ASC 340-20-25-2)

#### **ASC 340-30, Insurance Contracts That Do Not Transfer Insurance Risk**

**Overview.** Insurance risk is comprised of both timing risk and underwriting risk, and one or both of these may not be transferred to the insurer (assuming entity in the case of reinsurance) under certain circumstances. For example, many workers’ compensation policies provide for *experience adjustments* which have the effect of keeping the underwriting risk with the insured, rather than transferring it to the insurer; in such instances, deposit accounting would be prescribed.

*Deposit Method—a revenue recognition method under which premiums are not recognized as revenue and claim costs are not charged to expense until the ultimate premium is reasonably estimable, and recognition of income is postponed until that time.*

(Master Glossary)

---

<sup>4</sup> When ASU 2014-09, *Revenue from Contracts with Customers*, is implemented, this Subtopic is superseded by ASC 340-40. See the section on ASC 340-40 later in this chapter.

This subtopic offers guidance for applying the deposit method of accounting when it is required for insurance and reinsurance contracts. If insurance risk is not transferred, there are four possible categories for deposit arrangements:

1. Only significant timing risk is transferred
2. Neither significant timing nor underwriting risk is transferred
3. Only significant underwriting risk is transferred
4. The insurance contract has an indeterminate risk.

(ASC 340-30-05-2)

**Transfer of significant timing risk or neither significant timing nor underwriting risk.** For contracts that transfer only significant timing risk or that transfer neither significant timing nor underwriting risk, the entity should recognize at inception a:

- Deposit asset (from the insured's or ceding entity's perspective, respectively, for insurance and reinsurance arrangements), or
- Liability (from the insurer's or assuming entity's perspective, respectively, for insurance and reinsurance arrangements).

The deposit asset or liability should be remeasured at subsequent financial reporting dates by calculating the effective yield on the deposit to reflect actual payments to date and expected future payments. Yield is determined as set forth in ASC 310-20, using the estimated amounts and timings of cash flows. The deposit is adjusted to the amount that would have existed at the statement of financial position date had the new effective yield been applied since inception of the contract. (ASC 340-30-35-1 through 35-3) Thus, expense or income for a period will be determined by first calculating the necessary amount in the related statement of financial position account.

**Transfer of only significant underwriting risk.** For contracts that transfer only significant underwriting risk, a deposit asset or liability is also established at inception. However, subsequent remeasurement of the deposit does not occur until such time as a loss is incurred that will be reimbursed under the contract. Instead, the deposit is reported at its amortized amount. Once the loss occurs, the deposit should be remeasured by the present value of expected future cash flows arising from the contract, plus the remaining unexpired portion of the coverage. (ASC 340-30-35-6) Changes in the deposit arising from the present value measure are reported:

- In the insured's income statement as an offset against the loss to be reimbursed
- In the insurer's income statement as an incurred loss.

(ASC 340-30-45-3)

The reduction due to amortization of the deposit is reported as an adjustment to incurred losses by the insurer. (ASC 340-30-45-4) The discount rate used to compute the present value is the rate on government obligations with similar cash flow characteristics, adjusted for differences in default risk. The default risk is based on the insurer's credit rating. Rates are determined at the loss date(s) and not revised later, absent further losses.

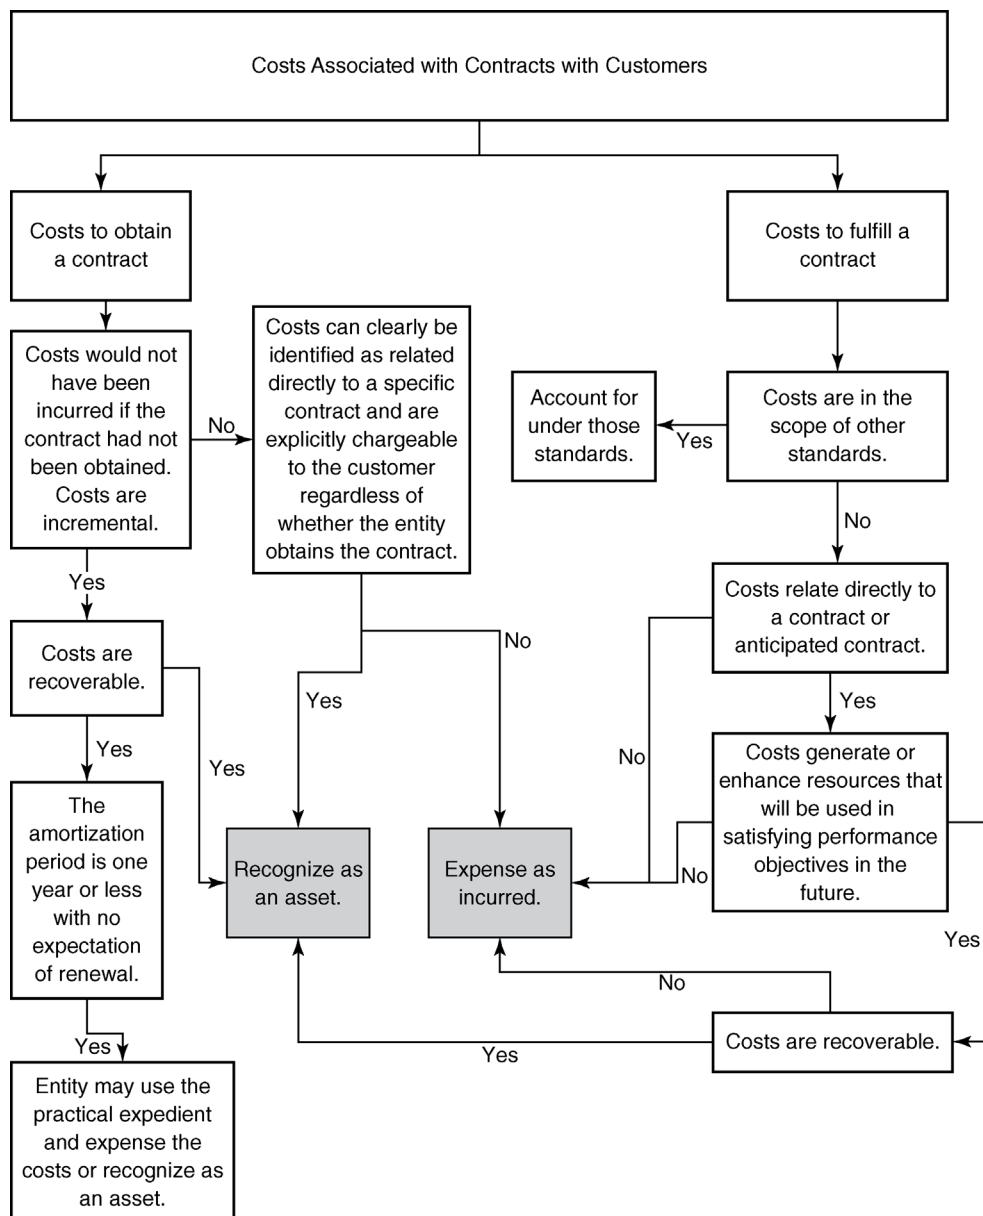

**Insurance contract that has indeterminate risk.** For insurance contracts with indeterminate risk, the procedures set forth in ASC 944-605 (the open-year method) should be applied. (ASC 340-40-05-8) This involves the segregation, in the statement of financial position, of amounts that have not been adjusted due to lack of sufficient loss or other data. When sufficient information becomes available, the deposit asset or liability is adjusted and reported as an accounting change per ASC 250.

## ASC 340-40, Contracts with Customers

### Overview

The exhibit below gives an overview of how costs associated with contracts with customers are treated in Subtopic ASC 340-40.

### Exhibit—Costs Associated with Contracts with Customers—Overview

---

**Practice Pointer:** Applying the guidance on contract costs will likely result in the recognition of more assets than currently. For example, if recoverable, entities will have to capitalize and amortize costs related to sales commissions and start-up costs. Applying the guidance may also require extra effort and changes to internal systems in order to track commissions on contracts. Likewise, entities that capitalize bid costs of trying to obtain a contract will have to analyze whether those costs are incremental to obtaining a contract and will have to exclude bid costs incurred regardless of whether the contract is obtained.

---

### Incremental Costs of Obtaining a Contract

*Incremental costs are those that an entity would not have incurred if the contract had not been obtained. (ASC 340-40-25-2)*

An example of this type of cost is a sales commission. Such incremental costs should be recognized as assets if the entity expects to recover those costs. This is in line with the definition of an asset.<sup>5</sup>

**Recoverability.** Recoverable amounts are an asset provided the entity's right to reimbursement is unconditional. Recovery may be:

- Direct, through explicit reimbursement under the contract, or
- Indirect through the margin in a contract.

Recoverability of costs is assessed on a contract-by-contract basis or for a group of contracts if the costs in question are associated with a group of contracts.

**Costs That Are Not Incremental.** Generally, costs that are not incremental, that would have been incurred trying to obtain a contract regardless of whether the contract was obtained, for example bid costs, should be expensed as incurred. However, those costs should be capitalized if they:

- Can clearly be identified as related directly to a specific contract, and
- Are explicitly chargeable to the customer regardless of whether a contract is obtained.

(ASC 340-40-25-3)

**Determining When Costs Are Incremental.** Because the capitalization requirements only apply to incremental costs that are incurred to obtain a contract, it is important to understand what is meant by "incremental costs." Entities must distinguish between incremental costs to obtain a contract and other customer-related costs, such as those related to managing a customer relationship or costs incurred to grow sales in an existing contract. Entities and their systems must track these different types of costs.

**Direct Response Advertising Costs.** Under legacy standards, direct response advertising costs are capitalized if certain criteria are met. (ASC 340-20-25) ASC 340-40 supersedes that legacy guidance and relocates some of it to industry-specific guidance or insurance contracts. Under ASC 340-40, these costs are not considered incremental and, therefore, are not subject to the capitalization rules and are expensed as incurred.

**Other Marketing Related Costs.** Bid, proposal, selling, and marketing costs, including the advertising costs mentioned above, are not incremental. The entity incurs those costs whether or not it obtains the contract.

Fixed salaries for sales personnel, unlike sales commissions mentioned above, are not considered incremental.

---

<sup>5</sup> Assets are "probable future economic benefits obtained or controlled by a particular entity as a result of past transactions or events." FASB Statement of Financial Accounting Concepts No. 6, para. 25.

**Practical Expedient.** A practical expedient offers relief to entities with short-duration contracts without expectation of renewal. If the amortization period of capitalizable incremental contract costs of obtaining a contract is one year or less, the entity may recognize it as an expense. (ASC 340-40-25-4) When determining the amortization period, the entity should take into account renewals, amendments, and follow-on contracts.

#### Example, Costs of Obtaining a Contract—Commissions, Bonuses

Mary Mays, a sales representative for InfoTech, sells to MegaCo a one-year subscription to a database information system. Mary earns a 5% commission on the sale. The contract is not expected to be renewed, and InfoTech expects to recover the costs.

The commission is considered an incremental cost to obtain the contract. The commission would not have been incurred if the contract had not been obtained. Because InfoTech expects to recover the cost, under the ASC 340-40, it is allowed to record the commission as an asset and amortize it as revenue is recognized over the year. However, because the amortization period is one year or less and the entity does not expect the contract to be renewed, InfoTech has the option to use the practical expedient and expense the commission as incurred.

Mary's manager also earns a commission on Mary's sales. InfoTech determines that the manager's commission is incremental to obtaining the specific MegaCo contract.

Mary, as a member of the sales team, is also entitled to a bonus based on the "success" of InfoTech. The bonus is expensed because it is not directly attributable to obtaining a particular contract. Bonuses based on quantitative and qualitative measures, such as profitability, EPS, or performance evaluations, are not directly related to the contract and, therefore, probably do not meet the capitalization criteria.

#### Example, Costs of Obtaining a Contract—Travel, Due Diligence Costs

Mary incurs travel fees when meeting with the customer. InfoTech does not recognize those fees as assets because they are costs associated with trying to obtain the contract and would have been incurred whether or not the contract was obtained.

Also, in preparation for offering the contract, InfoTech incurs external legal fees related to due diligence. The legal costs are associated with trying to obtain the contracts, and they also would have been incurred even if the contract is not obtained. Therefore, the legal fees are expensed as incurred.

### Costs of Fulfilling a Contract

Before transferring goods or services, an entity often incurs costs to fulfill the contract's performance obligations. An entity may also incur such costs in anticipation of obtaining a specifically identified contract. Those costs can be capitalized.

To address how to recognize fulfillment costs, the entity must first determine whether those costs are addressed by other guidance. Cost to fulfill a contract required to be expensed by other standards cannot be capitalized under ASC 340-40. That is, entities should first refer to the out-of-scope guidance listed at the beginning of this chapter and then use ASC 340-40's guidance to determine whether costs need to be capitalized. If the other standards preclude capitalization of a cost, then it cannot be capitalized under ASC 340-40.

**Three Criteria for Recognizing Assets for Costs of Fulfilling a Contract.** Entities are required to recognize assets for costs of fulfilling a contract, if not addressed by other standards, and if all of the following three criteria are met:

1. The costs relate directly to a contract or to an anticipated contract that the entity can specifically identify. An example of this would be costs relating to services to be provided

under renewal of an existing contract or costs of designing an asset to be transferred under a specific contract that has not yet been approved.

2. The costs generate or enhance resources of the entity that will be used in satisfying (or in continuing to satisfy) performance obligations in the future.
  3. The costs are expected to be recovered. (More information on recoverability can be found earlier in this chapter.)
- (ASC 340-10-25-5)

Notice that the criteria above align with the definition of an asset. If all three criteria above are met, the fulfillment costs must be capitalized. They cannot be expensed, and there is no practical expedient.

**Categories of Fulfillment Costs.** Determining which costs should be recognized requires judgment. Some costs are straightforward. Others are not as clear. There may be costs that relate to a contract, but that do not meet the definition of an asset, that is, they do not generate or enhance the resources of the entity or relate to the satisfaction or fulfillment of performance obligations. To help make these distinctions, ASC 340-40 divided contract fulfillment costs into two categories: costs to be capitalized and costs to be expensed as incurred. ASC 340-40 includes specific guidance on each type of contract-related costs. The exhibit below summarizes that guidance and lists both types of contract-related costs—those that should be capitalized and those that should be expensed.

#### Exhibit—Treatment of Costs of Fulfilling a Contract

Costs Required to Be Capitalized Related Directly to a Contract or Specific Anticipated Contract If Other Criteria Are Met (ASC 340-10-25-7)	Costs Required to Be Expensed as Incurred (ASC 340-10-25-8)
Direct labor (salaries, wages, of employees providing services directly to the customer, etc.)	General and administrative costs (unless they are explicitly chargeable to the customers under the contract, in which case an entity shall evaluate those costs in accordance with ASC 340-40-25-7)
Direct materials (for example, supplies used in fulfilling the performance obligations)	Costs of wasted materials, labor, or other resources to fulfill the contract that were not reflected in the price of the contract
Allocation of costs that relate directly to the contract or to contract activities (for example, costs of contract management and supervision, insurance, and depreciation of tools and equipment used in fulfilling the contract)	Costs that relate to satisfied or partially satisfied performance obligations in the contract (that is, costs that relate to past performance) even if the related revenue has not been recognized
Costs that are explicitly chargeable to the customer under the contract	Costs for which an entity cannot distinguish whether the costs relate to unsatisfied performance obligations or to satisfied or partially satisfied performance obligations
Other costs that are incurred only because an entity entered into the contract (for example, payments to subcontractors)	

Bear in mind that costs must be recoverable in order to be capitalized. (See discussion earlier in this section.)

If a cost cannot be capitalized under other guidance and if an entity cannot determine whether a cost relates to past or future performance, it must be expensed as incurred.

**Example, Costs That Create an Asset.** Mary May, a sales representative for InfoTech, signed a five-year contract with MegaCo to provide a learning management system (LMS) to train Mega's 100,000 employees. InfoTech expects that Mega will renew the contract for one 5-year period. Mary earns the CU 10,000 sales commission on the deal, which she receives before InfoTech begins work on the contract. Before InfoTech delivers the LMS, it works on the platform that will host the LMS and the technology that will connect the LMS to Mega's employees. InfoTech does not deliver the platform, but it will be used to deliver the training courses to Mega's employees, track results, and provide reports to Mega's human resources team. The costs occurred in setting up the technology and other costs are:

Cost Item	Amount	Recognition
Mary's sales commission	10,000	Recognize an asset under ASC 340-40 because the entity expects to recover the cost.
Consulting with Mega's LMS implementation team to create a Statement of Work (SOW)	40,000	If the costs meet the three criteria in ASC 340-40 for capitalization, record an asset.
Designing the interface	75,000	If the costs meet the three criteria in ASC 340-40 for capitalization, record an asset.
Hardware	10,000	Account for in accordance with ASC 360, <i>Property, Plant, and Equipment</i> , or IAS 16, <i>Property, Plant and Equipment</i> .
Software	15,000	Account for in accordance with ASC 350-40, <i>Internal-Use Software</i> , or IAS 38, <i>Intangible Assets</i> .
Migration and beta testing the LMS	60,000	Recognize an asset under ASC 340-40 because the costs meet the three criteria for capitalization.
Final deployment of the system	30,000	Recognize an asset under ASC 340-40 because the costs meet the three criteria for capitalization.
Two employees to provide service to MegaCo.		The entity concludes that the employees are responsible for providing customer services. However, they do not generate or enhance resources of the entity, therefore, Infotech recognizes payroll expense as incurred.

InfoTech will amortize the asset over a 10-year period, the initial five years plus one five-year renewal period.

**Set-Up Costs.** Some of the costs in the previous example might be considered set-up costs, costs incurred at the beginning of the contract that enable an entity to fulfill a contract. Such costs might include labor, travel, or overhead. If these costs do not fall into the scope of other standards, they should be assessed under ASC 340-40.

**Abnormal Costs.** An entity, like InfoTech in the previous example, may incur learning curve expenses. Such costs are usually anticipated and built into the price of the contract. Those costs should be assessed to see if they meet the criteria for capitalization.

There may be other costs that are not anticipated. These may involve waste, spoiled goods, or unproductive labor costs. These “abnormal costs” should be expensed as incurred.

### Amortization of Costs

The costs capitalized in connection with contracts with customers must be amortized. The amortization method selected must result in a systematic basis consistent with the contract’s transfer of goods or services to the customer. (ASC 340-10-35-1) For example, if the services are transferred continuously and evenly, then the straight-line method may be appropriate. On the other hand, if, for instance, renewals are anticipated and no additional costs are expected, it may be appropriate for the amortization period to be longer than the initial contract period. Similarly, certain costs, like design costs, may relate to more than one contract and the amortization period could be longer than the term of just one contract. In determining the pattern of transfer, entities should analyze the specific terms of the contract and take into account their experience with the pattern of transfer and the timing of the transfer of control to the customer.

If there is a significant change in the timing of the contract, the entity should update the amortization schedule and account for any change as a change in accounting estimate. (ASC 340-10-35-2)

**Example, Costs—Recognition and Amortization.** Alarm Systems enters into a contract and installs a security system at Condo Complex. The contract includes five years of monitoring the system for \$40 per month. Alarm determines that there is one performance obligation. Alarm incurs \$750 to install the system. Alarm recognizes an asset of \$750 for set-up costs and amortizes it over five years, consistent with the pattern of satisfaction of the performance obligation.

**Example, Costs—Amortization—Contract Extension.** Use the same set of facts as in the preceding example. In year three of the contract, Alarm Systems extends the contract for two years beyond the five-year initial term. Condo Complex will benefit from the initial set-up costs during the extension period. Alarm Systems amortizes the remaining set-up costs over the now remaining four years of the contract. The costs are adjusted in accordance with other guidance on changes in accounting estimates.

If the extension had been anticipated at the inception of the contract, Alarm Systems would have initially amortized the costs over seven years.

### Impairment Loss

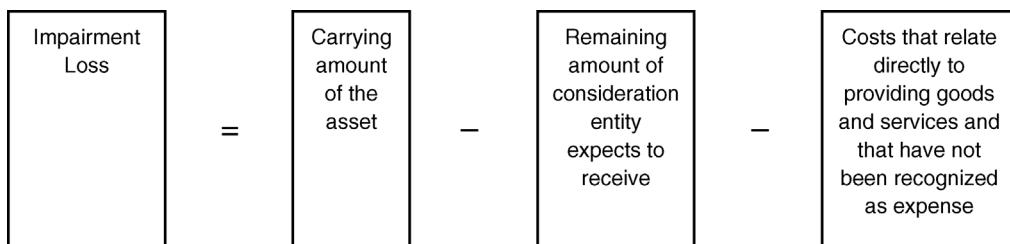

Assets must be tested for impairment at the end of each reporting period. Before recognizing an impairment loss related to contract costs, the entity should recognize impairment losses on contract assets in accordance with other guidance, for example:

- U.S. GAAP:
  - FASB ASC 310-40-35-30 on inventory,
  - FASB ASC 985-20 on costs of software to be sold, leased, or otherwise marketed,
  - FASB ASC 360 on property, plant, and equipment, and
  - FASB ASC 350 on goodwill and other intangibles.

Entities can make their recoverability assessment contract by contract or for a group of contracts if the costs are associated with a group of contracts. Entities will have to exercise considerable judgment when assessing the amortization pattern for a contract cost asset related to multiple performance obligations that are satisfied over different periods of time.

The objective of the recoverability assessment is to consider only the economic benefits in the contract. To do so, the entities must compare the carrying amount with the remaining amount of promised consideration. To calculate an impairment loss for an asset recognized in relation to contracts with customers, an entity uses the formula below.

### **Exhibit—Calculation of Impairment Loss**

(ASC 340-0-35-3)

**Practice Pointer:** The amortization costs may include those related to anticipated contracts that are specifically identifiable. To determine which contracts are specifically identifiable, entities may want to look at past history with similar customers and the market beyond the initial contract term.

The entity should use the principles in ASC 606 for determining the transaction price to determine the amount of consideration. For this purpose, though, the entity should not include the guidance on constraining estimates of variable consideration in ASC 606, but the entity should adjust the amount to reflect the customer's credit risk. When determining the transaction price, ASC 340-40 states that an entity should not anticipate that the contract will be "cancelled, renewed, or modified." This principle was raised with the TRG in relation to impairment at the July 2014 TRG meeting. The TRG generally agreed that an impairment test for capitalized costs should include cash flows for contract renewal periods.<sup>6</sup>

An entity should not reverse an impairment loss previously recognized.

## PERSPECTIVE AND ISSUES

### Subtopics

ASC 350, *Intangibles—Goodwill and Other*, consists of five subtopics:

- ASC 350-10, *Overall*, which provides an overview of the other subtopics and the overall scope of the topic.
- ASC 350-20, *Goodwill*, which provides guidance on accounting for goodwill subsequent to acquisition and for the cost of internally developed goodwill.
- ASC 350-30, *General Intangibles Other Than Goodwill*, which provides guidance on accounting and reporting for intangible assets, other than goodwill, acquired individually or with a group of other assets.
- ASC 350-40, *Internal-Use Software*, which provides guidance on accounting for software developed for internal use and determining whether that software is for internal use.
- ASC 350-50, *Website Development Costs*, which provides guidance on accounting for costs associated with the development of a website, including costs incurred:

- In the planning, application development, infrastructure development, and operating stages.
- To develop graphics and content.

## Scope

The guidance in ASC 350 applies to all entities. The accounting alternative policy election for private companies applies to:

1. Goodwill recognized in a business combination after it has been initially recognized and measured
2. Amounts recognized as goodwill in applying the equity method of accounting and to the excess reorganization value recognized by entities that adopt fresh-start reporting.

(ASC 350-20-15-4)

## Scope Exceptions

All of the subtopics above adopt the following scope limitations of ASC 350-10, the overall subtopic. The guidance does *not* apply to:

- Accounting at acquisition for goodwill acquired in a business combination (see ASC 805-30) or in an acquisition by a not-for-profit entity (see ASC 958-805).
- Accounting at acquisition for intangible assets other than goodwill acquired in a business combination or in an acquisition by a not-for-profit entity (see ASC 805-20 and ASC 958-805).

(ASC 350-10-15-3)

ASC 350-10-15-4 goes on to list locations that are *not* affected by the guidance in ASC 350:

- Research and development costs under Subtopic 730-10
- Extractive activities under Topic 932
- Entertainment and media, including records and music under Topic 928
- Financial services industry under Topic 950
- Entertainment and media, including broadcasters under Topic 920
- Regulatory operations under paragraphs 980-350-35-1 through 35-2
- Software under Topic 985
- Income taxes under Topic 740
- Transfers and servicing under Topic 860.

## Issues

For manufacturing companies, the primary assets typically are tangible, such as buildings and equipment. For financial institutions, the major assets are financial instruments. For high-technology, knowledge-based companies, however, the primary assets are intangible, such as patents and copyrights, and for professional service firms the key assets may be “soft” resources, such as knowledge bases and client relationships. Overall, enterprises for which intangible assets constitute a large and growing component of total assets are a rapidly growing part of the economy, and there is pressure to improve the relevance of financial reporting in light of changing business and economic conditions.

Intangible assets are defined as both current and noncurrent assets that lack physical substance. Specifically excluded, however, are financial instruments and deferred income tax assets. The value of intangible assets is based on the rights or privileges to which they entitle the reporting entity. Most of the accounting issues associated with intangible assets involve their

characteristics, valuation and amortization. Adequate consideration must be given to the economic substance of the transaction.

*Note: For a summary and comparison of accounting and impairment rules for property, plant and equipment and intangibles, see the Perspectives and Issues section of the chapter on ASC 360.*

### Technical Alert

**ASU 2016-03.** In March 2016, the FASB issued a consensus of its Private Company Council, ASU 2016-03, *Intangibles—Goodwill and Other (Topic 350), Business Combinations (Topic 805), Consolidation (Topic 810), Derivatives and Hedging (Topic 815); Effective Date and Transition Guidance (a consensus of the Private Company Council)*. The ASU relates to several private company alternative updates issued previously through the private company initiative:

- Update 2014-02, *Intangibles—Goodwill and Other (Topic 350): Accounting for Goodwill*
- Update 2014-03, *Derivatives and Hedging (Topic 815): Accounting for Certain Receivable-Variable, Pay-Fixed Interest Rate Swaps—Simplified Hedging Accounting Approach*
- Update 2014-07, *Consolidation (Topic 810): Applying Variable Interest Entities Guidance to Common Control Leasing Arrangements, or*
- Update 2014-18, *Business Combinations (Topic 805): Accounting for Identifiable Intangible Assets in a Business Combination.*

**Guidance.** The amendments in ASU 2016-03 make the guidance in ASUs listed above effective immediately by removing their effective dates. The amendments also include transition provisions that provide that private companies are able to forgo a preferability assessment the first time they elect the accounting alternatives in the ASUs listed. However, any subsequent change to an accounting policy election requires justification that the change is preferable under ASC 250, *Accounting Changes and Error Corrections*. The ASU also extends the transition guidance in the ASUs listed above indefinitely. However, there is no intention to change how transition is applied to ASU 2014-07 and 2014-18.

## DEFINITIONS OF TERMS

---

Source: ASC 350, *Glossary Sections*. See Appendix A, *Definition of Terms*, for other terms relevant to this topic: Acquiree, Acquirer, Acquisition by a Not-for-Profit Entity, Business, Business Combination, Conduit Debt Securities, Contract, Customer, Defensive Intangible Asset, Goodwill, Hosting Arrangement, Intangible Asset Class, Intangible Assets, Legal Entity, Mutual Entity, Noncontrolling Interest, Nonprofit Activity, Nonpublic Entity, Not-for-Profit Entity, Operating Segment, Preliminary Project Stage, Private Company, Public Business Entity, Reporting Unit, Residual Value, Useful Life, and Variable Interest Entity.

## CONCEPTS, RULES, AND EXAMPLES

---

### ASC 350-10, Overall

ASC 350-10 guidance consists of an overview of the other Subtopics and the scope of the Topic.

### ASC 350-20, Goodwill

The guidance in this section is presented in two subsections—a. General and b. Accounting Alternative.

Goodwill is not considered an identifiable intangible asset, and accordingly, under ASC 350-20, it is accounted for differently from identifiable intangibles. The lack of identifiability is the

critical element in the definition of goodwill. Accordingly, *identifiable* intangible assets that are reliably measurable are recognized and reported separately from goodwill.

Costs of internally developed goodwill are expensed as incurred. (ASC 350-20-25-3) Accounting at acquisition for goodwill acquired during the acquisition of an entire entity is accounted for under the provisions of ASC 805-30. Accounting at acquisition for goodwill acquired at acquisition by a not-for-profit entity is accounted for under the provisions of 958-805.

**Amortization and impairment testing.** Goodwill is considered to have an indefinite life and, therefore, is not amortized. (See the Goodwill—Accounting Alternative section for an alternative approach for private companies.) Goodwill is, however, subject to unique impairment testing techniques. Goodwill is impaired when its *implied* fair value is less than its carrying amount. The fair value of goodwill cannot be measured directly; it can only be “implied,” that is, measured as a residual.

**Reporting unit.** The impairment test for goodwill is performed at the level of the reporting unit. A reporting unit, as detailed in ASC 350-20-35-33 through 46, is an operating segment or one level below an operating segment. In the chapter on ASC 280, the diagram entitled “Alternative Balance Sheet Segmentation” illustrates how different groupings in a business can be characterized as reporting units. The diagram is accompanied by definitions of reporting units, operating segments, and other organizational groupings. The reporting entity may internally refer to reporting units by terms such as business units, operating units, or divisions.

Determination of reporting units is largely dependent on how the business is managed and its structure for reporting and management accountability. An entity may have only one reporting unit, which would, of course, result in the goodwill impairment test being performed at the entity level. This can occur when the entity has acquired a business that it has integrated with its existing business in such a manner that the acquired business is not separately distinguishable as a reporting unit.

On the date an asset is acquired or a liability is assumed, the asset or liability is assigned to a reporting unit if it meets both of the following conditions:

1. The asset will be used in or the liability is related to the operations of a reporting unit
  2. The asset or liability will be considered in determining the fair value of the reporting unit.
- (ASC 350-20-35-39)

---

**Practice Pointer:** To perform Step 1 of the impairment test, entities may need to allocate the assets and liabilities of existing businesses and subsidiaries among their reporting units. Corporate assets or liabilities that relate to more than one unit should be assigned to the unit using a reasonable and supportable method applied consistently each year.

---

The methodology used to determine reporting units must be reasonable and supportable and must be applied similarly to how aggregate goodwill is determined in a purchase business combination. (ASC 350-20-35-41)

Net assets include assets and liabilities that are recognized as “corporate” items if they, in fact, relate to the operations of the reporting unit. Examples of corporate items are environmental liabilities associated with land owned by a reporting unit, and pension assets and liabilities attributable to employees of a reporting unit. Executory contracts (e.g., operating leases, contracts for purchase or sale, construction contracts) are considered part of net assets only if the amount reflected in the acquirer’s financial statements is based on a fair value measurement subsequent to entering into the contract. To illustrate, if an acquiree had a

preexisting operating lease on either favorable or unfavorable terms as compared to its fair value on the date of acquisition, the acquirer would recognize, in its purchase price allocations, an asset or liability for the fair value of the favorable or unfavorable terms, respectively. ASC 350 distinguishes between accounting for this fair value of an otherwise unrecognized executory contract and prepaid rent or rent payable, which generally have carrying values that approximate their fair values.

*Implied fair value.* The implied fair value of goodwill is the excess of the fair value of the reporting unit as a whole over the fair values that would be assigned to its assets and liabilities in a purchase business combination.

*Timing of testing.* The annual goodwill impairment test may be performed at any time during the fiscal year as long as it is done consistently at the same time each year. Each reporting unit is permitted to establish its own annual testing date. (ASC 350-20-35-28)

ASC 350-20-35-30 indicates that additional impairment tests are required between annual impairment tests if:

1. They are warranted by a change in events and circumstances, *and*
2. It is more likely than not that the fair value of the reporting unit is below its carrying amount.

ASC 350-20-35-30 references ASC 350-20-35-3C to provide examples of events or circumstances that require goodwill of a reporting unit to be tested for impairment between annual tests:

- a. Macroeconomic conditions, such as a deterioration in general economic conditions, limitations on accessing capital, fluctuations in foreign exchange rates, or other developments in equity and credit markets
- b. Industry and market considerations, such as a deterioration in the environment in the city in which an entity operates, an increased competitive environment, a decline in market-dependent multiples or metrics (consider in both absolute terms and relative to peers), a change in the market for entity's products or services, or a regulatory or political development
- c. Cost factors, such as increases in raw materials, labor, or other costs that have a negative effect on earnings and cash flows
- d. Overall financial performance, such as negative or declining cash flows or a decline in actual or planned revenue or earnings compared with actual and projected results of relevant prior periods
- e. Other relevant entity-specific events, such as changes in management, key personnel, strategy, or customers; contemplation of bankruptcy; or litigation
- f. Events affecting a reporting unit, such as a change in the composition or carrying amount of its net assets, a more-likely-than-not expectation of selling or disposing all, or a portion, of a reporting unit, or recognition of a goodwill impairment loss in the financial statements of a subsidiary that is a component of a reporting unit
- g. If applicable, a sustained decrease in share price (consider in both absolute terms and relative to peers).

This list is not intended to be all-inclusive. Other indicators may come to the attention of management that would indicate that goodwill impairment testing should be performed between annual tests. Goodwill must also be tested for impairment if a portion of goodwill is allocated to a business to be disposed of.

If indicators exist requiring impairment testing of goodwill, impairment testing of non-amortizable intangibles, and/or recoverability evaluation of tangible long-lived assets or amortizable intangibles, the other assets are tested/evaluated first and any impairment loss is recognized prior to testing goodwill for impairment. (ASC 350-20-35-31)

*Performing the impairment test.* To what had been a two-step process, the FASB has, in effect, introduced “Step 0.” Step 0 gives entities the option of performing a qualitative assessment before calculating the fair value in Step 1. In the qualitative assessment, entities determine whether it is more likely than not that the fair value of the reporting unit is less than the carrying amount. The qualitative assessment is optional and entities may bypass it for any reporting unit in any period. (ASC 350-20-35-3A)

The factors listed previously that indicate impairment testing should be done between annual tests are the same as those that should be considered in the qualitative assessment. (See ASC 350-20-35-3C examples above.)

ASC 350-20-35-3F goes on to say that these examples are not all-inclusive, and offers other events and circumstances than an entity must consider:

*An entity shall consider the extent to which each of the adverse events and circumstances identified could affect the comparison of a reporting unit's fair value with its carrying amount. An entity should place more weight on the events and circumstances that most affect a reporting unit's fair value or the carrying amount of its net assets. An entity also should consider positive and mitigating events and circumstances that may affect its determination of whether it is more likely than not that the fair value of a reporting unit is less than its carrying amount. If an entity has a recent fair value calculation for reporting unit, it also should include as a factor in its consideration the difference between the fair value and the carrying amount in reaching its conclusion about whether to perform the first step of the goodwill impairment test.*

ASC 350-20-35-3G advises that the events and circumstances should be considered in context and no one event necessarily requires the entity to perform Step 1.

If it is *not* more likely than not that the fair value of the reporting unit is less than the carrying amount, further testing is not performed. If it *is* more likely than not the fair value of the reporting unit is less than the carrying amount, the entity proceeds to Step 1. (ASC 350-20-35-3D through 3E)

Step 1. Compare the fair value of the reporting unit as a whole to its carrying value, including goodwill. (ASC 350-20-35-4)

- If the reporting unit's carrying amount is greater than zero and its fair value exceeds its carrying value, goodwill is not impaired and no further computations are required. (ASC 350-20-35-6)
- If the reporting unit has a zero or negative carrying amount, then the entity must proceed to the next step if it is more likely than not that a goodwill impairment exists. In making this evaluation, the entity should consider whether there are significant differences between the carrying amount and the estimated fair value of the assets and liabilities, and the existence of significant unrecognized intangible assets. (ASC 350-20-35-6 and 35-8A)
- If the carrying value of the reporting unit exceeds its fair value, the second step of the impairment test is required. (ASC 350-20-35-8)

Step 2. Determine whether and by how much goodwill is impaired as follows:

- a. Estimate the implied fair value of goodwill.
  - b. Compare the implied fair value of goodwill to its carrying amount.
  - c. If the carrying amount of goodwill exceeds its implied fair value, it is impaired and is written down to the implied fair value.
- (ASC 350-20-35-9 through 35-11)

Consistent with long-standing practice in GAAP, upon recognition of an impairment loss, the adjusted carrying amount of goodwill becomes its new cost basis, and future restoration of the written down amount is prohibited. (ASC 350-20-35-12)

*Determining the implied fair value of goodwill.* The fair value of a reporting unit is defined in the ASC 350 Glossary as the price that would be received to sell the unit as a whole in an orderly transaction between market participants at the measurement date. The determination of the implied fair value of goodwill is based on the assumption that the fair value of a reporting unit as a whole differs from the fair value of its identifiable net assets. This is the general principle that gives rise to goodwill in the first place. The acquirer assigns additional value to the acquiree (as evidenced by a purchase price that exceeds the collective fair values of the assets and liabilities to be acquired) based on the acquirer's perceived ability to take advantage of synergies and other benefits that flow from its control over the acquiree. (ASC 350-20-35-15 through 35-17)

**Determining the fair value of a reporting unit.** Quoted market prices in active markets are considered the best evidence of fair value and are to be used if available. However, market capitalization of a publicly traded business unit is computed based on a quoted market price per share that does not consider any advantages that might inure to an acquirer in a situation where control is obtained. For this reason, ASC 350-20-35-23 cautions that the market capitalization of a reporting unit with publicly traded stock may not be representative of its fair value. Presumably, estimating the fair value of a privately held business using earnings multiples derived from publicly traded companies in the same line of business might have the same limitation.

ASC 350 also prescribes that when a significant portion of a reporting unit is comprised of an acquired entity, the same techniques and assumptions used to determine the purchase price of the acquisition are to be used to measure the fair value of the reporting unit unless such techniques and assumptions are not consistent with the objective of measuring fair value.

If quoted market prices are not available, the estimate of fair value is to be based on the best information available, including prices for similar assets and liabilities or the results of applying available valuation techniques. Such techniques include expected present value methods, option pricing models, matrix pricing, option-adjusted spread models, and fundamental analysis. The weight given to evidence gathered in the valuation process must be proportional to the ability to objectively observe it. When an estimate is in the form of a range of either the amount or timing of estimated future cash flows, the likelihood of possible outcomes should be considered (i.e., probability weightings are assigned in order to estimate the most likely outcome).

The measurement techniques and assumptions used to estimate the fair values of the reporting unit's net assets should be consistent with those used to measure the fair value of the reporting unit as a whole. For example, estimates of the amounts and timing of cash flows used to value the

significant assets of the reporting unit are to be consistent with those assumptions used to estimate such cash flows at the reporting unit level when a cash flow model is used to estimate the reporting unit's fair value as a whole.

For the purposes of determining the fair value of a reporting unit, the relevant facts and circumstances are to be carefully evaluated with respect to whether to assume that the reporting unit could be bought or sold in a taxable or nontaxable transaction. The factors to consider in making the evaluation are set forth in ASC 350-20-35:

1. The assumptions that marketplace participants would make in estimating fair value
2. The feasibility of the assumed structure considering:
  - a. The ability to sell the reporting unit in a nontaxable transaction, and
  - b. Any limits on the entity's ability to treat a sale as a nontaxable transaction imposed by income tax laws or regulations, or corporate governance requirements.
3. Whether the assumed structure would yield the best economic after-tax return to the (hypothetical) seller for the reporting unit.

(ASC 350-20-35-26 through 35-27)

If a reporting unit is not wholly owned by the reporting entity, the fair value of that reporting unit and the implied fair value of goodwill are to be determined in the same manner as prescribed by ASC 805. If the reporting unit includes goodwill that is solely attributable to the parent, any impairment loss would be attributed entirely to the parent. If, however, the reporting unit's goodwill is attributable to both the parent and the noncontrolling interest, the impairment loss would need to be allocated to both the parent and the noncontrolling interest in a rational manner. The same logic applies to gain or loss on disposal of all or a portion of a reporting unit. When that reporting unit is disposed of, the gain or loss on disposal is to be attributed to both the parent and to the noncontrolling interest. (ASC 350-20-35-57A and 57B)

For the purpose of goodwill impairment testing, the carrying value of a reporting unit includes deferred income taxes irrespective of whether fair value of the reporting unit was determined assuming taxable or nontaxable treatment.

## Measuring Fair Value

**Implied fair value computation.** For the purpose of computing the implied fair value of reporting unit goodwill, assumptions must be made as to the income tax bases of the reporting unit's assets and liabilities in order to compute any relevant deferred income taxes. If the computation of the reporting unit's fair value in Step 1 of the goodwill impairment test assumed that the reporting unit was structured as a taxable transaction, then new income tax bases are used. Otherwise the existing income tax bases are used. (ASC 350-20-35-20)

**Recognition of impairment loss.** If the carrying amount of the reporting unit's goodwill exceeds the implied fair value of that goodwill, an impairment loss in the amount equal to the excess is recognized. The recognized loss cannot exceed the carrying amount of goodwill. The new carrying amount of the goodwill is the adjusted amount after recognizing the loss. Once the loss is recognized, it cannot be reversed subsequently. (ASC 350-20-35-11 through 35-13)

If the second step of the impairment test is not completed before the financial statements are issued and a loss is probable, the entity should recognize the loss and disclose the fact that it is an estimate. Upon completion of the test, the entity may make an adjustment to that estimated loss in the subsequent period.

**Example of the goodwill impairment test**

Spectral Corporation acquires FarSite Binocular Company for \$5,300,000; of this amount, \$3,700,000 is assigned to a variety of assets, with the remaining \$1,600,000 assigned to goodwill, as noted in the following table:

Purchase price	\$ 5,300,000
– Accounts receivable	(450,000)
– Inventory	(750,000)
– Production equipment	(1,000,000)
– Acquired formulas and processes	<u>(1,500,000)</u>
= Goodwill	<u>\$1,600,000</u>

The asset allocation related to acquired formulas and processes is especially critical to the operation, since it refers to the use of a proprietary lens coating system that allows FarSite's binoculars to yield exceptional clarity in low-light conditions. This asset is being depreciated over ten years.

One year after the acquisition date, the FarSite division has recorded annual cash flow of \$1,450,000; assuming the same cash flow for the next five years, the present value of the expected cash flows, discounted at the corporate cost of capital of 8%, is roughly \$5,789,000. Also, an independent appraisal firm assigns a fair value of \$3,600,000 to FarSite's identifiable assets. With this information, the impairment test follows:

FarSite division's fair value	\$ 5,789,000
– Fair value of identifiable assets	(3,600,000)
= Implied fair value of goodwill	<u>\$2,189,000</u>

Though the implied fair value of FarSite's goodwill has increased, Spectral's controller cannot record this increase.

A few months later, Spectral's management learns that a Czech optics company has created a competing optics coating process that is superior to and less expensive than FarSite's process. Since this will likely result in a reduction in FarSite's fair value below its carrying amount, Spectral conducts another impairment test. Management assumes that the forthcoming increase in competition will reduce the expected present value of its cash flows to \$3,900,000. In addition, the appraisal firm now reduces its valuation of the acquired formulas and processes asset by \$1,200,000. The revised impairment test follows:

FarSite division's fair value	\$ 3,900,000
– Fair value of identifiable assets	(2,400,000)
= Implied fair value of goodwill	1,500,000
– Carrying amount of goodwill	<u>1,600,000</u>
= Impairment loss	<u>\$100,000</u>

Since the implied fair value of goodwill is \$100,000 less than its current carrying amount, Spectral's controller uses the following entry to record reduction in value:

Impairment loss	100,000
Goodwill	100,000

In addition, Spectral's controller writes down the value of the acquired formulas and processes by the amount recommended by the appraisal firm with the following entry:

Impairment loss	1,200,000
Accumulated depreciation	1,200,000

A year later, FarSite's research staff discovers an enhancement to its optical coating process that will restore FarSite's competitive position against the Czech firm. However, Spectral's controller cannot increase the carrying cost of the acquired formulas and processes or goodwill to match their newly increased fair value and implied fair value, respectively.

**Other goodwill considerations.** Other provisions included in ASC 350 include the following:

- Equity method goodwill continues to be recognized under ASC 323 and is not subject to amortization. This goodwill is not tested for impairment under ASC 350, but rather is tested under ASC 323. This test considers whether the fair value of the underlying investment has declined and whether that decline is "other than temporary."
- Goodwill of a reporting unit that is fully disposed of is included in the carrying amount of the net assets disposed of in computing the gain or loss on disposal. (ASC 350-20-40-1)
- If a significant portion of a reporting unit is disposed of, the goodwill of that unit is required to be tested for impairment. In performing the impairment test, only the net assets to be retained after the disposal are included in the computation. If, as a result of the test, the carrying amount of goodwill exceeds its implied fair value, the excess carrying amount is allocated to the carrying amount of the net assets disposed of in computing the gain or loss on disposal and, consequently, is not considered an impairment loss. (ASC 350-20-40-2 and 40-3)

**Presentation.** To provide financial statement users with transparent information about goodwill, ASC 350-20-45 requires separate line item treatment as follows:

- *Statement of financial position*—the aggregate amount of goodwill included in assets is captioned separately from other assets and may not be combined with other intangibles. (ASC 350-20-45-1)
- *Income statement*—the aggregate amount of goodwill impairment losses is captioned separately in the operating section unless associated with discontinued operation. If the goodwill impairment loss is associated with a discontinued operation, the loss should be presented net of tax within discontinued operations. (ASC 350-20-45-2 and 45-3)

### Goodwill—Accounting Alternative for Private Companies<sup>1</sup>

This alternative is a result of the FASB's Private Company Council initiative and amends a long-standing policy of not allowing amortization of goodwill. Public companies, not-for-profit entities, and employee benefit plans within the scope of Topics 960 through 965 on plan accounting are outside the scope of these amendments. Companies within scope are allowed to amortize goodwill on a straight-line basis over a period of no more than ten years. A period of less than ten years is allowed if a shorter life is more appropriate. (ASC 350-20-35-63)

Entities electing this alternative are subject to its related subsequent measurement, derecognition, other presentation, and disclosure requirements. Once an entity elects the alternative, it applies to existing goodwill and any goodwill recognized in the future.

Entities electing this alternative must make an accounting policy decision to test goodwill for impairment at either the reporting-unit level or the entity level. Under this alternative impairment model, goodwill should be tested when a triggering event occurs, rather than once a year as required for other entities. A triggering event is one that indicates that the fair value of the reporting unit or the company may be below its carrying value. (ASC 350-20-35-66) In addition,

---

<sup>1</sup> See the Technical Alert section at the beginning of this chapter for an important update.

for companies electing the alternative, step two of the existing impairment model is eliminated. Once impairment is indicated, no further testing is necessary. (ASC 350-20-35-71)

Disclosures under the alternative are similar to other GAAP requirements. However, entities are not required to present changes in goodwill in tabular format.

At adoption, goodwill existing at the beginning of the period of adoption should be amortized prospectively on a straight-line basis over not more than ten years. (ASC 350-20-35-64)

### **Exhibit—Comparison of General Goodwill Impairment Requirements with the Private Company Alternative**

<b>General Goodwill Impairment Requirements</b>	<b>Private Company Alternative</b>
Do not amortize goodwill	Amortize goodwill over 10 years or less on a straight-line basis
Test for impairment at least annually or more frequently	Test for impairment upon occurrence of triggering event
Reporting unit level	Entity level or reporting unit level
Two-step test	One-step test
Optional qualitative assessment	Optional qualitative assessment

### **ASC 350-30, General Intangibles Other Than Goodwill**

Intangible assets, other than goodwill, fall into two categories:

- Those with finite useful lives, which are amortized and subject to impairment testing
- Those with indefinite lives, which are not amortized, but are subject to impairment testing.

**Initial recognition of intangible assets.** Intangibles acquired individually or with a group of other assets<sup>2</sup> are initially recognized and measured based on their fair values. Fair value, consistent with ASC 820, *Fair Value*, is determined based on the assumptions that market participants would use in pricing the asset. Even if the reporting entity does not intend to use an intangible asset in a manner that is its highest and best use, the intangible is nevertheless measured at its fair value.

Per 805-20-S99-3, the SEC does not allow an entity to assign a purchase price, rather than fair value, to intangible assets, and then allocate the remainder of the acquisition price to an “indistinguishable” intangible asset.

The aggregate amount assigned to a group of assets acquired in other than a business combination is to be allocated to the individual assets acquired based on their relative fair values. Goodwill is prohibited from being recognized in such an asset acquisition. (ASC 350-30-25-2)

Although a reporting entity can purchase intangibles that were developed by others, U.S. GAAP continues to maintain a strict prohibition against capitalizing costs of internally developing, maintaining, or restoring intangibles, including goodwill. (ASC 350-30-25-3) Exceptions to this general rule are software developed for internal use and website development costs. Both are discussed later in this chapter.

**Defensive intangible assets.** In connection with a business combination or asset acquisition, management of the acquirer may acquire intangible assets that it does not intend to actively use

<sup>2</sup> See discussion in the chapter on ASC 805, Business Combinations.

but, rather, wishes to hold in order to prevent other parties from employing them or obtaining access to them. As noted in ASC 350-30-25-5, these intangibles are often referred to as defensive assets, or as “locked-up assets.”<sup>3</sup>

To qualify as a defensive intangible asset, the asset must be either:

1. Acquired with the intent to not use it, *or*
2. Used by the acquirer with the intent to discontinue its use after completion of a transition period.

(ASC 350-30-55-1)

Obviously, upon being characterized as a defensive intangible, the asset is precluded from being considered abandoned upon acquisition, regardless of the fact that it is not being used.

Subsequent to the asset being characterized as a defensive intangible, management may decide to actively employ the asset. If so, it would cease to be considered a defensive intangible. (ASC 350-30-55-1B)

At acquisition, defensive intangibles are subject to the same fair value valuation principles as any other acquired intangible asset, including that they be measured considering exit price to marketplace participants that would put them to their highest and best use. In making the measurement, defensive intangibles are accounted for as a separate unit of accounting and are not to be grouped with other intangibles.

It would be rare for defensive intangible assets to have an indefinite life, since lack of market exposure and competitive and other factors contribute to diminish the fair value of these assets over time. (ASC 350-30-35-5B)

Defensive intangible assets are, in theory, to be assigned a useful life representing how (and for how long) the entity expects to consume the expected benefits related to them in the form of direct and indirect cash flows that would result from the prevention of others from realizing any value from them. In practice, however, such estimates would be difficult to make and highly subjective; consequently, ASC 350-30-35-5A substituted what it believed to be a more workable determination of useful life based on management’s estimate of the period over which the defensive intangible asset diminishes in fair value.

**Determining the useful life of intangible assets.** An income approach is commonly used to measure the fair value of an intangible asset. The period of expected cash flows used to measure fair value of the intangible, adjusted for applicable entity-specific factors, is to be considered by management in determining the useful life of the intangible for amortization purposes.

Under ASC 350-30-35-3, in estimating the useful life of an intangible asset, the reporting entity is to consider:

1. The entity’s expected use of the asset
2. The expected useful life of another asset or asset group to which the useful life of the intangible asset may be related
3. Any provisions contained in applicable law, regulation, or contract that may limit the useful life
4. The entity’s own historical experience in renewing or extending similar arrangements if such experience is consistent with the intended use of the intangible asset by the reporting entity, irrespective of whether those similar arrangements contained explicit renewal or extension provisions. In the absence of such historical experience, management is to

---

<sup>3</sup> Defensive assets exclude intangible assets used in research and development activities, since such assets are subject to different accounting rules under ASC 730-10-25-2c.

consider the assumptions that market participants would use about the renewal or extension consistent with their highest and best use of the asset, and adjusted for relevant entity-specific factors.

5. The effects of obsolescence, demand, competition, and other economic factors such as:
  - a. Stability of the industry,
  - b. Known technological advances,
  - c. Legislative action that results in an uncertain or changing regulatory environment, and
  - d. Expected changes in distribution channels.
6. The level of maintenance expenditures that would be required to obtain the expected future cash flows from the asset.

If no legal, regulatory, contractual, competitive, economic, or other factors limit the useful life of an intangible asset to the reporting entity, the useful life of the asset is considered to be indefinite (which, of course, is not the same as unlimited or infinite). (ASC 350-30-35-4)

**Amortization of intangible assets.** Identifiable intangible assets, such as franchise rights, customer lists, trademarks, patents and copyrights, and licenses are to be amortized over their expected useful economic life with required impairment reviews of their recoverability when necessitated by changes in facts and circumstances in the same manner as set forth in ASC 360 for tangible long-lived assets.

ASC 350-30-35-8 also requires consideration of the intangible's residual value (analogous to salvage value for a tangible asset) in determining the amount of the intangible to amortize. Residual value is defined as the value of the intangible to the entity at the end of its (entity-specific) useful life reduced by any estimated disposition costs. The residual value of an amortizable intangible is assumed to be zero unless the intangible will continue to have a useful life to another party after the end of its useful life to its current holder, and one or both of the following criteria are met:

1. The current holder has received a third-party commitment to purchase the intangible at the end of its useful life, *or*
2. A market for the intangible exists and is expected to continue to exist at the end of the asset's useful life as a means of determining the residual value of the intangible by reference to marketplace transactions.

The entity should evaluate the residual value each reporting period. (ASC 350-30-35-9)

*Intangible assets subject to amortization and impairment considerations.* Many intangible assets are based on rights that are conveyed legally by contract, statute, or similar means. For example, governments grant franchises or similar rights to taxi companies, cable companies, and hydroelectric plants; and companies and other private-sector organizations grant franchises to automobile dealers, fast-food outlets, and professional sports teams. Other rights, such as airport landing rights, are granted by contract. Some of those franchises or similar rights are for finite terms, while others are perpetual. Many of those with finite terms are routinely renewed, absent violations of the terms of the agreement, and the costs incurred for renewal are minimal. Many such assets are also transferable, and the prices at which they trade reflect expectations of renewal at minimal cost. However, for others, renewal is not assured, and their renewal may entail substantial cost.

Trademarks, service marks, and trade names may be registered with the government for a period of twenty years and are renewable for additional twenty-year periods as long as the trademark, service mark, or trade name is used continuously. (Brand names, often used synonymously with trademarks, are typically not registered and thus the required attribute of

control will be absent.) The U.S. government now grants copyrights for the life of the creator plus fifty years. Patents are granted by the government for a period of seventeen years but may be effectively renewed by adding minor modifications that are patented for additional seventeen-year periods. Such assets also are commonly transferable.

A broadcast license, while nominally subject to expiration in five years, might be indefinitely renewable at little additional cost to the broadcaster. If cash flows can be projected indefinitely, and assuming a market exists for the license, no amortization is to be recorded until such time as a finite life is predicted. However, impairment is required to be tested at least annually to ensure that the asset is carried at no more than its fair value. (ASC 350-30-55-12)

The foregoing examples all addressed identifiable intangibles, which are recognized in the financial statements when purchased separately or in connection with a business combination. There are other intangibles, which are deemed to not be identifiable because they cannot be reliably measured. Technological know-how and an assembled workforce are examples of such intangible assets. Intangibles that cannot be separately identified are considered integral components of goodwill.

**Indefinite-lived intangible assets—not subject to amortization.** Identifiable intangible assets having indefinite useful economic lives supported by clearly identifiable cash flows are not subject to regular periodic amortization. (ASC 350-30-35-15) Instead, the carrying amount of the intangible is tested for impairment annually, and again between annual tests if events or circumstances warrant such a test. (ASC 350-30-35-18) An impairment loss is recognized if the carrying amount exceeds the fair value. Furthermore, amortization of the asset commences when evidence suggests that its useful economic life is no longer deemed indefinite. (ASC 350-30-35-18A)

*Testing for impairment of indefinite-lived intangible assets.* The ASC gives entities the option to first assess qualitatively whether it is more likely than not (more than 50 percent) that the asset is impaired. The qualitative assessment test can be performed on some or all of the assets, or the entity can bypass the qualitative test and perform the quantitative test.

If it is not more likely than not that the asset is impaired, the entity does not have to calculate the fair value of the intangible asset and perform the quantitative impairment test. If it is more likely than not that the asset is impaired, the entity must perform the quantitative impairment test and calculate the fair value of an indefinite-lived intangible asset.

If performing the qualitative assessment, the entity needs to identify and consider those events and circumstances that, individually or in the aggregate, most significantly affect an indefinite-lived intangible asset's fair value. Examples of events and circumstances that should be considered include those listed in ASC 350-30-35-18B:

- a. Cost factors such as increases in raw materials, labor, or other costs that have a negative effect on future expected earnings and cash flows that could affect significant inputs used to determine the fair value of the indefinite-lived intangible asset
- b. Financial performance such as negative or declining cash flows or a decline in actual or planned revenue or earnings compared with actual and projected results of relevant prior periods that could affect significant inputs used to determine the fair value of the indefinite-lived intangible asset
- c. Legal, regulatory, contractual, political, business, or other factors, including asset-specific factors that could affect significant inputs used to determine the fair value of the indefinite-lived intangible asset
- d. Other relevant entity-specific events such as changes in management, key personnel, strategy, or customers; contemplation of bankruptcy; or litigation that could affect significant inputs used to determine the fair value of the indefinite-lived intangible asset

- e. Industry and market considerations such as a deterioration in the environment in which an entity operates, an increased competitive environment, a decline in market-dependent multiples or metrics (in both absolute terms and relative to peers), or a change in the market for an entity's products or services due to the effects of obsolescence, demand, competition, or other economic factors (such as the stability of the industry, known technological advances, legislative action that results in an uncertain or changing business environment, and expected changes in distribution channels) that could affect significant inputs used to determine the fair value of the indefinite-lived intangible asset
- f. Macroeconomic conditions such as deterioration in general economic conditions, limitations on accessing capital, fluctuations in foreign exchange rates, or other developments in equity and credit markets that could affect significant inputs used to determine the fair value of the indefinite-lived intangible asset.

Any positive and mitigating events and circumstances should also be considered, as well as the difference between the fair value in a recent calculation of an indefinite-lived intangible asset and the then carrying amount, whether there have been changes to the carrying amount of the indefinite-lived intangible asset. (ASC 350-30-35-18C)

*Determining the unit of accounting.* ASC 350-30-35 provides guidance about when it is appropriate to combine into a single “unit of accounting” for impairment testing purposes, separately recorded indefinite-life intangibles, whether acquired or internally developed.

The assets may be combined into a single unit of accounting for impairment testing if they are operated as a single asset and, as such, are inseparable from one another. The following indicators are to be used in evaluating the individual facts and circumstances to enable the exercise of judgment. (ASC 350-30-35-21)

The following are indicators that indefinite-lived intangibles are to be combined as a single unit of accounting. (ASC 350-30-35-23):

1. The intangibles will be used together to construct or enhance a single asset.
2. If the intangibles had been part of the same acquisition, they would have been recorded as a single asset.
3. The intangibles, as a group, represent “the highest and best use of the assets” (e.g., they could probably realize a higher sales price if sold together than if they were sold separately). Indicators pointing to this situation are:
  - a. The unlikelihood that a substantial portion of the assets would be sold separately, or
  - b. The fact that, should a substantial portion of the intangibles be sold individually, there would be a significant reduction in the fair value of the remaining assets in the group.
4. The marketing or branding strategy of the entity treats the assets as being complementary (e.g., a trademark and its related trade name, formulas, recipes, and patented or unpatented technology can all be complementary to an entity's brand name).

The following are indicators that indefinite-lived intangibles are *not* to be combined as a single unit of accounting. (ASC 350-30-35-24):

1. Each separate intangible generates independent cash flows.
2. In a sale, it would be likely that the intangibles would be sold separately. If the entity had previously sold similar assets separately, this would constitute evidence that combining the assets would not be appropriate.
3. The entity is either considering or has already adopted a plan to dispose of one or more of the intangibles separately.

4. The intangibles are used exclusively by different asset groups (as defined in the ASC Master Glossary).
5. The intangibles have differing useful economic lives.

ASC 350-30-35-26 provides guidance regarding the “unit of accounting” determination.

1. Goodwill and finite-lived intangibles are not permitted to be combined in the “unit of accounting” since they are subject to different impairment rules.
2. If the intangibles collectively constitute a business, they may not be combined into a unit of accounting.
3. If the unit of accounting includes intangibles recorded in the separate financial statements of consolidated subsidiaries, it is possible that the sum of impairment losses recognized in the separate financial statements of the subsidiaries will not equal the consolidated impairment loss.

---

*NOTE: Although counterintuitive, this situation can occur when:*

1. At the separate subsidiary level, an intangible asset is impaired since the cash flows from the other intangibles included in the unit of accounting that reside in other subsidiaries cannot be considered in determining impairment, and
  2. At the consolidated level, when the intangibles are considered as a single unit of accounting, they are not impaired.
- 
4. Should a unit of accounting be included in a single reporting unit, that same unit of accounting and associated fair value is to be used in computing the implied fair value of goodwill for measuring any goodwill impairment loss.

**Quantitative impairment test for indefinite-lived intangible asset.** This test consists simply of comparing the fair value of the asset with its carrying amount. (ASC 350-30-35-19)

**Recognition of impairment loss for indefinite-lived intangible asset.** If the carrying amount exceeds its fair value, the entity recognizes an impairment loss equal to that excess. After recognition of the loss, the adjusted carrying amount becomes the new basis for that intangible asset.

**Presentation.** To provide financial statement users with transparent information about intangible assets, ASC 350-30-45 requires:

- *Statement of financial position:* All intangible assets must be aggregated and presented as a separate line item in the statement of financial position. The entity may also choose to present individual intangible assets or classes of intangible assets as separate line items. (ASC 350-30-45-1)
- *Income statement:* As appropriate, the entity should present amortization expense and impairment losses in line items within continuing operations. (ASC 350-30-45-2)

#### **ASC 350-40, Software Developed for Internal Use**

ASC 350-40-05-02 and 03 provide guidance on accounting for the costs of software developed for internal use. Software must meet two criteria to be accounted for as internal-use software:

1. The software’s specifications must be designed or modified to meet the reporting entity’s internal needs, including costs to customize purchased software.

2. During the period in which the software is being developed, there can be no plan or intent to market the software externally, although development of the software can be jointly funded by several entities that each plan to use the software internally.

To justify capitalization of related costs, it is necessary for management to conclude that it is probable that the project will be completed and that the software will be used as intended. Absent that level of expectation, costs must be expensed currently as research and development costs. Entities that engage in both research and development of software for internal use and for sale to others must carefully identify costs with one or the other activity, since the former is (if all conditions are met) subject to capitalization, while the latter is expensed as research and development costs until technological feasibility is demonstrated, per ASC 985-20.

**Costs subject to capitalization.** Cost capitalization commences when an entity has completed the conceptual formulation, design, and testing of possible project alternatives, including the process of vendor selection for purchased software, if any. These early-phase costs (referred to as “preliminary project stage” in ASC 350-40) are analogous to research and development costs and must be expensed as incurred. These cannot be later restored as assets if the development proves to be successful.

---

**Preliminary Project Stage.** When a computer software project is in the preliminary project stage, entities will likely do the following:

1. Make strategic decisions to allocate resources between alternative projects at a given point in time. For example, should programmers develop a new payroll system or direct their efforts toward correcting existing problems in an operating payroll system?
2. Determine the performance requirements (that is, what it is that they need the software to do) and systems requirements for the computer software project it has proposed to undertake.
3. Invite vendors to perform demonstrations of how their software will fulfill an entity’s needs.
4. Explore alternative means of achieving specified performance requirements. For example, should an entity make or buy the software? Should the software run on a mainframe or a client server system?
5. Determine that the technology needed to achieve performance requirements exists.
6. Select a vendor if an entity chooses to obtain software.
7. Select a consultant to assist in the development or installation of the software.

(ASC 350-40-20)

---

Costs incurred subsequent to the preliminary project stage that meet the criteria for long-lived assets are capitalized and amortized over the asset’s expected economic life. Capitalization of costs begins when both of two conditions in ASC 350-40-25-12 are met.

- *First*, management having the relevant authority authorizes and commits to funding the project and believes that it is probable that it will be completed and that the resulting software will be used as intended.
- *Second*, the conceptual formulation, design, and testing of possible software project alternatives (i.e., the preliminary project stage) have all been completed.

**Application development stage.** Costs capitalized include those of the application development stage of the software development process. These include coding and testing activities and various implementation costs. ASC 350-40-30-1 limits these costs to:

1. External direct costs of materials and services consumed in developing or obtaining internal-use computer software;

2. Payroll and payroll-related costs for employees who are directly associated with and who devote time to the internal-use computer software project to the extent of the time spent directly on the project; and
3. Interest cost incurred while developing internal-use computer software, consistent with the provisions of ASC 835-20.

**Costs expensed.** General and administrative costs, overhead costs, and training costs are expensed as incurred. (ASC 350-40-30-3) Even though these may be costs associated with the internal development or acquisition of software for internal use, under GAAP those costs relate to the period in which they are incurred. The issue of training costs is particularly important, since internal-use computer software purchased from third parties often includes, as part of the purchase price, training for the software (and often fees for routine maintenance as well). When the amount of training or maintenance fees is not specified in the contract, entities are required to allocate the cost among training, maintenance, and amounts representing the capitalizable cost of computer software. Training costs are recognized as expense as incurred. Maintenance fees are recognized as expense ratably over the maintenance period.

**Examples of computer software developed for internal use.** The Codification provides examples of when computer software is acquired or developed for internal use. The following is a list of examples illustrating when computer software is for internal use:

1. A manufacturing entity purchases robots and customizes the software that the robots use to function. The robots are used in a manufacturing process that results in finished goods.
2. An entity develops software that helps it improve its cash management, which may allow the entity to earn more revenue.
3. An entity purchases or develops software to process payroll, accounts payable, and accounts receivable.
4. An entity purchases software related to the installation of an online system used to keep membership data.
5. A travel agency purchases a software system to price vacation packages and obtain airfares.
6. A bank develops software that allows a customer to withdraw cash, inquire about balances, make loan payments, and execute wire transfers.
7. A mortgage loan servicing entity develops or purchases computer software to enhance the speed of services provided to customers.
8. A telecommunications entity develops software to run its switches that are necessary for various telephone services such as voice mail and call forwarding.
9. An entity is in the process of developing the accounts receivable system. The software specifications meet the entity's internal needs and the entity did not have a marketing plan before or during the development of the software. In addition, the entity has not sold any of its internal-use software in the past. Two years after completion of the project, the entity decided to market the product to recoup some or all of its costs.
10. A broker-dealer entity develops a software database and charges for financial information distributed through the database.
11. An entity develops software to be used to create components of music videos (for example, the software used to blend and change the faces of models in music videos). The entity then sells the final music videos, which do not contain the software, to another entity.

12. An entity purchases software to computerize a manual catalog and then sells the manual catalog to the public.
13. A law firm develops an intranet research tool that allows firm members to locate and search the firm's databases for information relevant to their cases. The system provides users with the ability to print cases, search for related topics, and annotate their personal copies of the database.

(ASC 350-40-55-1)

On the other hand, software that does *not* qualify as being for internal use includes:

- Software sold by a robot manufacturer to purchasers of its products;
- The cost of developing programs for microchips used in automobile electronic systems;
- Software developed for both sale to customers and internal use;
- Computer programs written for use in research and development efforts; and
- Costs of developing software under contract with another entity.

ASC 350-40-55-2 contains these and other examples.

**Impairment.** Impairment of capitalized internal-use software is recognized and measured in accordance with the provisions of ASC 360 in the same manner as tangible long-lived assets and other amortizable intangible assets. Circumstances that might suggest that an impairment has occurred and that would trigger a recoverability evaluation include:

1. A realization that the internal-use computer software is not expected to provide substantive service potential;
2. A significant change in the extent or manner in which the software is used;
3. A significant change has been made or is being anticipated to the software program; or
4. The costs of developing or modifying the internal-use computer software significantly exceed the amount originally expected. These conditions are analogous to those generally set forth by ASC 360, *Property, Plant, and Equipment*.

(ASC 350-40-35-1)

In some instances, ongoing software development projects will become troubled before being discontinued. ASC 350-40 indicates that management needs to assess the likelihood of successful completion of projects in progress. When it becomes no longer probable that the computer software being developed will be completed and placed in service, the asset is to be written down to the lower of the carrying amount or fair value, if any, less costs to sell. Importantly, it is a rebuttable presumption that any uncompleted software has a zero fair value.

Indicators that the software is no longer expected to be completed and placed in service. These include:

1. A lack of expenditures budgeted or incurred for the project;
2. Programming difficulties that cannot be resolved on a timely basis;
3. Significant cost overruns;
4. Information indicating that the costs of internally developed software will significantly exceed the cost of comparable third-party software or software products, suggesting that management intends to obtain the third-party software instead of completing the internal development effort;
5. The introduction of new technologies that increase the likelihood that management will elect to obtain third-party software instead of completing the internal project; and

6. A lack of profitability of the business segment or unit to which the software relates or actual or potential discontinuation of the segment.  
 (ASC 350-40-35-3)

**Amortization.** ASC 350-40-35-4 through 35-6 provide guidance on amortization. As for other long-lived assets, the cost of computer software developed or obtained for internal use should be amortized in a systematic and rational manner over its estimated useful life. The intangible nature of the asset contributes to the difficulty of developing a meaningful estimate, however. Among the factors to be weighed are the effects of obsolescence, new technology, and competition. Management would especially need to consider if rapid changes are occurring in the development of software products, software operating systems, or computer hardware, and whether it intends to replace any technologically obsolete software or hardware.

Amortization commences for each module or component of a software project when the software is ready for its intended use, without regard to whether the software is to be placed in service in planned stages that might extend beyond a single reporting period. Computer software is deemed ready for its intended use after substantially all testing has been completed.

**Internal-use software subsequently marketed.** In some cases internal-use software is later sold or licensed to third parties, notwithstanding the original intention of management that the software was acquired or developed solely for internal use. In such cases, any proceeds received are to be applied first as a reduction of the carrying amount of the software. No profit is recognized until the aggregate net proceeds from licenses and amortization have reduced the carrying amount of the software to zero. After the carrying value is fully recovered, any subsequent proceeds are recognized as revenue or gain, depending on whether the contract is with a customer. (ASC 350-40-35-8)

#### Example of software developed for internal use

The Da Vinci Invention Company employs researchers based in countries around the world. The far-flung nature of its operations makes it extremely difficult for the payroll staff to collect timesheets, so the management team authorizes the design of an in-house, web-based timekeeping system. The project team incurs the following costs:

<u>Cost type</u>	<u>Charged to expense</u>	<u>Capitalized</u>
Concept design	\$ 2,500	
Evaluation of design alternatives	3,700	
Determination of required technology	8,100	
Final selection of alternatives	1,400	
Software design		\$ 28,000
Software coding		42,000
Quality assurance testing		<u>30,000</u>
Data conversion costs	3,900	
Training	14,000	
Overhead allocation	6,900	
General and administrative costs	11,200	
Ongoing maintenance costs	6,000	
Totals	<u>\$57,700</u>	<u>\$100,000</u>

Thus, the total capitalized cost of this development project is \$100,000. The estimated useful life of the timekeeping system is five years. As soon as all testing is completed, Da Vinci's controller begins amortizing using a monthly charge of \$1,666.67. The calculation follows:

$$\$100,000 \text{ capitalized cost} \div 60 \text{ months} = \$1,666.67 \text{ amortization charge}$$

Once operational, management elects to construct another module for the system that issues an e-mail reminder for employees to complete their timesheets. This represents significant added functionality, so the design cost can be capitalized. The following costs are incurred:

<u>Labor type</u>	<u>Labor cost</u>	<u>Payroll taxes</u>	<u>Benefits</u>	<u>Total cost</u>
Software developers	\$11,000	\$ 842	\$1,870	\$13,712
Quality assurance testers	7,000	536	1,190	8,726
Totals	<u>\$18,000</u>	<u>\$1,378</u>	<u>\$3,060</u>	<u>\$22,438</u>

The full \$22,438 amount of these costs can be capitalized. By the time this additional work is completed, the original system has been in operation for one year, thereby reducing the amortization period for the new module to four years. The calculation of the monthly straight-line amortization follows:

$$\$22,438 \text{ capitalized cost} \div 48 \text{ months} = \$467.46 \text{ amortization charge}$$

The Da Vinci management then authorizes the development of an additional module that allows employees to enter time data into the system from their cell phones using text messaging. Despite successfully passing through the concept design stage, the development team cannot resolve interface problems on a timely basis. Management elects to shut down the development project, requiring the charge of all \$13,000 of programming and testing costs to expense in the current period.

After the system has been operating for two years, a Da Vinci customer sees the timekeeping system in action and begs management to sell it as a stand-alone product. The customer becomes a distributor, and lands three sales in the first year. From these sales Da Vinci receives revenues of \$57,000, and incurs the following related expenses:

<u>Expense type</u>	<u>Amount</u>
Distributor commission (25%)	\$14,250
Service costs	1,900
Installation costs	4,300
Total	<u>\$20,450</u>

Thus, the net proceeds from the software sale are \$36,550 (\$57,000 revenue less \$20,450 related costs). Rather than recording these transactions as revenue and expense, the \$36,550 net proceeds are offset against the remaining unamortized balance of the software asset with the following entry:

Revenue	\$57,000
Fixed assets—software	\$36,550
Commission expense	14,250
Service expense	1,900
Installation expense	4,300

At this point, the remaining unamortized balance of the timekeeping system is \$40,278, which is calculated as follows:

Original capitalized amount	\$100,000
+ Additional software module	22,438
– 24 months' amortization on original capitalized amount	(40,000)
– 12 months' amortization on additional software module	(5,610)
– Net proceeds from software sales	(36,550)
Total unamortized balance	<u>\$ 40,278</u>

Immediately thereafter, Da Vinci's management receives a sales call from an application service provider who manages an Internet-based timekeeping system. The terms offered are so good that the company abandons its in-house system at once and switches to the ASP system. As a result of this change, the company writes off the remaining unamortized balance of its timekeeping system with the following entry:

Accumulated depreciation	\$45,610
Loss on asset disposal	40,278
Fixed assets—software	\$85,888

### Customer's Accounting for Fees Paid in a Cloud Computing Arrangement

In April 2015, the FASB issued ASU 2015-05, *Intangibles—Goodwill and Other—Internal-Use Software* (Subtopic 350-40) Customer's Accounting for Fees Paid in a Cloud Computing Arrangement. The ASU is part of the FASB's simplification initiative. Lack of clear guidance for customers in cloud computing arrangements led to diversity in practice. The ASU is designed to reduce diversity and save costs by simplifying the assessment of costs and fees associated with these software arrangements. The guidance aligns the customer's and service provider's evaluation of whether the arrangement contains a software license or a service.

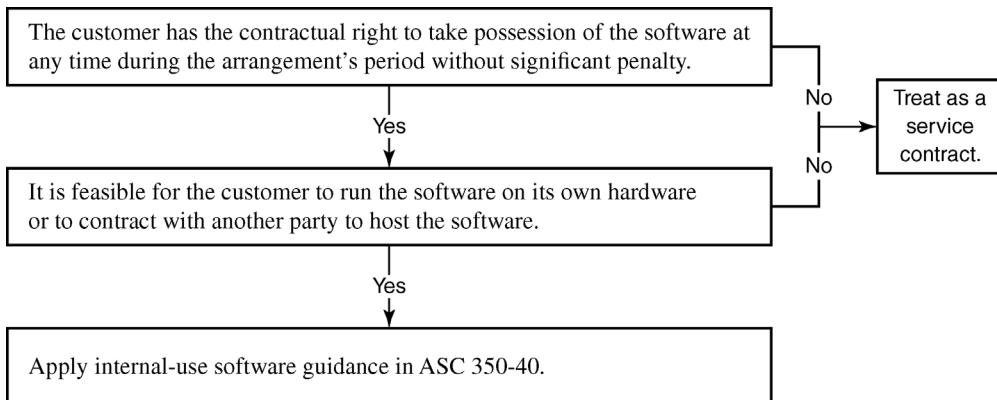

*Guidance.* In cloud computing arrangements, the customer never takes possession of a physical product. Instead, the software resides on a vendor's or third party's hosting site, which the customer accesses remotely. The ASU does not provide explicit guidance, but provides help on whether cloud computing or other hosting arrangement involves a software license and which accounting model the customer should apply. Customers will essentially use the same criteria as vendors in determining whether the arrangement contains a software license or is solely a service contract:

- The customer has the contractual right to take possession of the software at any time during the arrangement's period without significant penalty. Indicators that there is not a significant penalty would be the ability to:
  - Take delivery of the underlying software without significant cost
  - Use that software separately without a significant reduction in the value
- It is feasible for the customer to run the software on its own hardware or to contract with another party to host the software.

If both those provisions are *not* met, the arrangement is treated as service contract under existing GAAP and separate accounting for a license is not permitted. If those provisions are met, the arrangements are treated as multiple-element arrangements to purchase a software license and

a service for hosting the software. The customer applies the existing guidance on internal-use software to the license and costs are allocated between the license and hosting arrangements, based on relative fair value.

#### Exhibit—Software License in a Hosting Arrangement

#### ASC 350-50, Website Development Costs

The costs of developing a website, including the costs of developing services that are offered to visitors (e.g., chat rooms, search engines, blogs, social networking, e-mail, calendars, and so forth), are often quite significant. The SEC staff had expressed the opinion that a large portion of those costs should be accounted for in accordance with ASC 350-50, which sets forth certain conditions which must be met before costs may be capitalized.

Costs incurred in the planning stage must be expensed as incurred. (ASC 350-50-25-2) The cost of software used to operate a website must be accounted for consistent with ASC 350-40, unless a plan exists to market the software externally, in which case ASC 985-20, *Software-Costs of Software to Be Sold, Leased, or Marketed*, governs, and costs should be expensed until the entity establishes the software's technological feasibility. Costs incurred to develop graphics (broadly defined as the “look and feel” of the web page) are included in software costs, and thus accounted for under ASC 350-40 or ASC 985-20. (ASC 350-50-25-4) Costs of hosting websites are generally expensed over the benefit period. (ASC 350-50-25-5)

ASC 350-50-55 includes a detailed exhibit stipulating how a variety of specific costs are to be accounted for under its requirements.

## PERSPECTIVE AND ISSUES

### Subtopics

ASC 360, *Property, Plant, and Equipment*, consists of two subtopics:

- ASC 360-10, *Overall*, which is further divided into two subsections:
  - *General*, which provides guidance on accounting and reporting on property, plant, and equipment, including accumulated depreciation
  - *Impairment or disposal of long-lived assets*, which contains guidance for:
    - (1) Recognizing impairment of long-lived assets to be held and used,
    - (2) Long-lived assets to be disposed of by sale, and
    - (3) Disclosures for the implementation and disposals of individually significant components of an entity
- ASC 360-20, *Real Estate Sales*, which provides guidance on the sale of real estate other than retail land.<sup>1</sup>

<sup>1</sup> Upon adoption of ASU 2014-09, *Revenue from Contracts with Customers*, the title of Subtopic 360-20 will be amended to *Property, Plant, and Equipment—Real Estate Sales—Sale Leaseback Accounting*. This subtopic is superseded upon adoption of ASU 2016-02, *Leases*.

## Scope and Scope Exceptions

**ASC 360-10, General.** The guidance in the ASC 360-10, *General*, subsection applies to all entities.

**ASC 360-10, Impairment or Disposal of Long-Lived Assets.** The guidance in the ASC 360-10, *Impairment or Disposal of Long-Lived Assets*, subsection applies to:

- Capital leases of lessees or when ASU 2016-02 is implemented, right-of-use assets of lessees,
- Long-lived assets of lessors subject to operating leases,
- Proved oil and gas properties accounted for using the successful-efforts method of accounting, and
- Long-term prepaid assets.

The guidance in these Subsections does not apply to the following transactions and activities:

1. Goodwill
2. Intangible assets not being amortized that are to be held and used
3. Servicing assets
4. Financial instruments, including investments in equity securities accounted for under the cost or equity method
5. Deferred policy acquisition costs
6. Deferred tax assets
7. Unproved oil and gas properties that are being accounted for using the successful-efforts method of accounting
8. Oil and gas properties that are accounted for using the full-cost method of accounting as prescribed by the Securities and Exchange Commission (SEC) (see Regulation S-X, Rule 4-10, Financial Accounting and Reporting for Oil and Gas Producing Activities Pursuant to the Federal Securities Laws and the Energy Policy and Conservation Act of 1975)
9. Certain other long-lived assets for which the accounting is prescribed elsewhere in the standards. See:
  - a. ASC 928, *Entertainment—Music*
  - b. ASC 920, *Entertainment—Broadcasters*
  - c. ASC 985-20, *Software*
  - d. ASC 980-360, *Regulated Operations*(ASC 360-10-15-5)

**ASC 360-20.** The guidance in ASC 360-20 applies to all entities, and ASC 360-20-15-3 includes the following transactions in ASC 360-20 guidance.<sup>2</sup>

1. All sales of real estate, including real estate with property improvements or integral equipment. The terms *property improvements* and *integral equipment* as they are used in this Subtopic refer to any physical structure or equipment attached to the real estate that cannot be removed and used separately without incurring significant cost. Examples include an office building, a manufacturing facility, a power plant, and a refinery.

<sup>2</sup> The scope of ASC 360-20 is changed upon implementation of ASU 2014-09 and its guidance in ASC 610. ASU 2014-09 limits the scope of ASC 360-20 in items 1–4 to assets that are part of a sale-leaseback transaction and establishes guidance for recognition of profit on all real estate sale-leaseback transactions. Note that items 5 and 6 are superseded by ASU 2014-09. As previously noted, upon adoption of ASU 2016-02, *Leases*, the entire subtopic is superseded.

2. Sales of property improvements or integral equipment subject to an existing lease of the underlying land should be accounted for in accordance with paragraphs 360-20-40-56 through 40-59.
3. The sale or transfer of an investment in the form of a financial asset that is in substance real estate.
4. The sale of timberlands or farms (that is, land with trees or crops attached to it).
5. Real estate time-sharing transactions (see Topic 978).
6. Loss of a controlling financial interest (as described in Subtopic 810-10) in a subsidiary that is in substance real estate because of a default by the subsidiary on its nonrecourse debt.

ASC 360-20-15 excludes the following transactions and activities:

- The sale of only property improvements or integral equipment without a concurrent (or contemplated) sale of the underlying land. However, ASC 360-20 does apply to sales of property improvements or integral equipment with the concurrent lease (whether explicit or implicit in the transaction) of the underlying land to the buyer.
- The sale of the stock or net assets of a subsidiary or a segment of a business if the assets of that subsidiary or that segment contain real estate. If such a transaction is, in substance, the sale of real estate, ASC 360-20 does apply.
- Exchanges of real estate for other real estate. See the accounting for nonmonetary transactions in ASC 845.
- The sale of debt and equity securities accounted for under ASC 320.
- Retail land sales.
- Natural assets such as those that have been extracted from the land (for example, oil, gas, coal, and gold). See ASC 932.

(ASC 360-20-15-10)

## Overview

**ASC 360-10, Overall.** Property, plant, and equipment (sometimes referred to as “fixed assets,” “tangible long-lived assets,” or “plant assets”) are tangible property used in a productive capacity that will benefit the reporting entity for a period exceeding one year. They include land, buildings, machinery, furniture, and tools. Items of property, plant, and equipment are used in the ordinary course of business. They are not for resale. Property, plant, and equipment are some of the most significant items in the statement of financial position and usually represent a substantial investment by the entity.

Among the accounting issues that can arise in accounting for property, plant, and equipment are:

1. Amounts at which to initially record the assets, whether acquired through purchase or nonmonetary exchange or through construction by the reporting entity
2. Capitalization of discrete assets in groups or separately (determination of the unit of account)
3. Accounting for postacquisition costs
4. The rate and pattern of allocation of amounts capitalized to the proper future periods, including, if applicable, periods during which the assets become impaired
5. Reclassification to or from categories such as held and used, held for sale, or idle
6. Derecognition—sale, exchange, retirement, and/or disposal of the assets at or before the end of their productive lives.

**Comparison of accounting and impairment rules.** The following diagram summarizes and compares the rules affecting the accounting for tangible and intangible long-lived assets.

**Exhibit—Summary and Comparison of Accounting and Impairment Rules**

Attribute	PP&E, website dev., internal-use software	Amortizable intangibles	Indefinite-lived intangibles	Goodwill <sup>3</sup>
Useful life	Estimated useful life or, for leasehold improvements, the lesser of that life or the term of the lease		Indefinite	Indefinite for public; alternative for private companies of 10-year maximum
Consider residual or salvage value?	Yes	Yes—with either 3rd party commitment or ready market	No	
Capitalize interest if self-constructed?	Yes			
Recoverability evaluation or impairment test?	Recoverability evaluation		Optional qualitative and then quantitative impairment test	Optional Step 0 qualitative assessment and Special 2-step impairment test
Frequency	When events and circumstances warrant		At least annually; more often if events and circumstances warrant, unless entity has elected alternative, then triggering event	
Change between amortizable and nonamortizable		Test for impairment, adjust if required		
Subsequent increases recognized?	No			
Level of aggregation for impairment purposes	Asset group or disposal group		Unit of accounting as specified by ASC 350-30-35	Reporting unit

**ASC 360-20, Real Estate Sales<sup>4</sup>.** The substance of a sale of any asset is that the transaction unconditionally transfers the risks and rewards of ownership to the buyer. However, the economic substance of many real estate sales is that the risks and rewards of ownership have *not* been clearly transferred. The turbulent and cyclical environments in the real estate and debt markets have led to the evolution of many complex methods of financing real estate

<sup>3</sup> See the chapter on ASC 350 for information on the alternative related to amortization and impairment testing for other than public entities.

<sup>4</sup> See the earlier footnotes in this chapter for important information related to ASC 360-20.

transactions. For example, in some transactions the seller, rather than an independent third party, finances the buyer, while in others, the seller may be required to guarantee a minimum return to the buyer or continue to operate the property for a specified period of time. In many of these complex transactions, the seller still has some association with the property even after the property has been sold. The question that must be answered in these transactions is: At what point does the seller become disassociated enough from the property that profit may be recognized on the transaction?

Another question is under what circumstances is a transaction in substance the sale of real estate. To make that determination, ASC 360-20 suggests the preparer considers the nature of the entire component being sold, that is, not just the land, but the land plus the property improvements and integral equipment. Further, that determination should not consider whether the operations in which the assets are involved are traditional or nontraditional real estate activities. For example, if a ski resort is sold and the lodge and ski lifts are considered to be affixed to the land (that is, they cannot be removed and used separately without incurring significant cost), then it would appear that the sale is in substance the sale of real estate and that the entire sale transaction would be subject to the provisions of this Subtopic. Transactions involving the sale of underlying land (or the sale of the property improvements or integral equipment subject to a lease of the underlying land) should not be bifurcated into a real estate component (the sale of the underlying land) and a nonreal estate component (the sale of the lodge and lifts) for purposes of determining profit recognition on the transaction.

Accounting for retail land sales is governed by ASC 976. The purpose of ASC 360-20 is to present the guidelines that need to be considered when analyzing nonretail real estate transactions. ASC 840-40 dealing with sales-type real estate leases and sales-leaseback real estate transactions is covered in the chapter on ASC 840. Also see the chapter on ASC 842.

## DEFINITIONS OF TERMS

---

Source: ASC 360-10-20 and 360-20-20, *Glossaries*, unless otherwise noted. Also see Appendix A, *Definitions of Terms*, for additional terms relevant to this chapter: Business, Component of an Entity, Conduit Debt Security, Contract, Customer, Disposal Group, Fair Value, Firm Commitment, Integral Equipment, Lease, Lease Term, Lessee, Lessor, Market Participants, Net Realizable Value, Nonprofit Activity, Nonpublic Entity, Not-for-Profit Entity, Operating Segment, Orderly Transaction, Performance Obligation, Probably, Public Business Entity, Related Party, Reporting Unit, Revenue, Right-of-Use Asset, Sale-Leaseback Accounting, and Underlying Asset.

**Activities.** The term activities is to be construed broadly. It encompasses physical construction of the asset. In addition, it includes all the steps required to prepare the asset for its intended use. For example, it includes administrative and technical activities during the preconstruction stage, such as the development of plans or the process of obtaining permits from governmental authorities. It also includes activities undertaken after construction has begun in order to overcome unforeseen obstacles, such as technical problems, labor disputes, or litigation.

**Asset Group.** An asset group is the unit of accounting for a long-lived asset or assets to be held and used, which represents the lowest level for which identifiable cash flows are largely independent of the cash flows of other groups of assets and liabilities.

**Cost Recovery Method.** Under the cost recovery method, no profit is recognized until cash payments by the buyer, including principal and interest on debt due to the seller and on existing debt assumed by the buyer, exceed the seller's cost of the property sold.

**Deposit Method.** Under the deposit method, the seller does not recognize any profit, does not record notes receivable, continues to report in its financial statements the property and the related existing debt even if it has been assumed by the buyer, and discloses that those items are subject to a sales contract.

**Full Accrual Method.** A method that recognizes all profit from a real estate sale at the time of sale.

**Impairment.** Impairment is the condition that exists when the carrying amount of a long-lived asset (asset group) exceeds its fair value.

**Installment Method.** The installment method apportions each cash receipt and principal payment by the buyer on debt assumed between cost recovered and profit. The apportionment is in the same ratio as total cost and total profit bear to the sales value.

**Reduced-profit Method.** A reduced profit is determined by discounting the receivable from the buyer to the present value of the lowest level of annual payments required by the sales contract over the maximum period, specified in ASC 360-20-40-19 through 360-20-40-20 and excluding requirements to pay lump sums.

## CONCEPTS, RULES, AND EXAMPLES

---

### Property, Plant, and Equipment

**Cost considerations—initial acquisition.** Determination of costs is critical to proper accounting for property, plant, and equipment. Entities use historical cost to value property, plant, and equipment. Upon acquisition, the reporting entity should measure and capitalize all the historical costs necessary to deliver the asset to its intended location and prepare it for its productive use. This includes interest costs incurred during the period of time necessary to ready the asset for use. (ASC 835-20-05-1) Examples of delivery and asset preparation costs include:

1. Sales, use, excise, and other taxes imposed on the purchase
2. Import duties
3. Finders' fees
4. Freight costs and related shipping insurance
5. Storage and handling costs
6. Installation and setup costs
7. Testing and breaking-in costs
8. Foundations and other costs related to providing proper support for the asset
9. Costs of reconditioning assets that are purchased used in order to prepare them for use.

The purchase price, any encumbrances such as tax liens, and all costs to prepare it for use are costs of land. Costs to prepare land for use include demolition of preexisting structures occupying the land, as well as costs related to excavating, grading, or filling the land to ready it for the new structure.

When the asset consists of one or more buildings, capitalized costs include items such as:

1. Contract price paid to the general contractor and subcontractors
2. Architectural and engineering costs
3. Building permits
4. Labor and overhead
5. Costs of renovating a preexisting purchased building to convert it for use by the buyer.

**Construction of tangible assets for internal use.** All direct costs (labor, materials, payroll, and related benefit costs) of constructing an entity's own tangible fixed assets are capitalized. However, a degree of judgment is involved in allocating costs between indirect costs—a reasonable portion of which are allocable to construction costs—and general and administrative costs, which are treated as period costs.

Prudence suggests that management establish a carefully reasoned policy that is consistently followed and fully disclosed in the notes to the financial statements, to unambiguously inform the user about the methods used and amounts involved.

**Interest cost.** The recorded amount of an asset includes all of the costs necessary to get the asset set up and functioning properly for its intended use, including interest. The principal purposes of capitalizing rather than expensing interest costs are:

1. To obtain a more accurate measurement of the costs associated with the investment in the asset
2. To achieve a better matching of costs related to the acquisition, construction, and development of productive assets to the future periods that will benefit from the revenues that the assets generate.

Theoretically, all assets that require a time period to get ready for their intended use should include capitalized interest. However, accomplishing this level of capitalization would usually not meet a reasonable cost/benefit test. Accordingly, interest cost is only capitalized as a part of the historical cost of qualifying assets when such interest is considered to be material. For more detailed information on capitalization of interest costs, see the chapter on ASC 835.

**Acquisition of an interest in the residual value in leased assets.** An interest in the residual value of a leased asset is recorded as an asset at the date the right is acquired. (ASC 360-10-25-4) The asset is recorded initially at:

- The amount of cash disbursed,
- The fair value of other consideration, and
- The present value of liabilities assumed.

To measure cost, entities may use the fair value of the interest acquired if it is more evident than the fair value of assets or services surrendered or liabilities assumed. (ASC 360-10-30-4)

**Accounting for assets acquired in a group.** It is important to differentiate the acquisition of assets in a group from those acquired in a business combination. If the assets acquired and liabilities assumed constitute a “business,” the transaction is a business combination, and it is accounted for under the guidance in ASC 805. Otherwise, it is accounted for as an asset acquisition. For guidance related to assets acquired in a business combination, see the chapter on ASC 805. For the definition of a business, see Appendix A.

When a reporting entity acquires assets and assumes liabilities that do not constitute a business, the transaction is accounted for as an asset acquisition. Assets acquired in an asset acquisition are initially recognized at their cost to the acquirer, including related transaction costs. The costs of assets acquired as a group are allocated to the individual assets acquired or liabilities assumed based on their relative fair values. Goodwill is recognized in a transaction of this nature.

If assets are transferred between entities under common control, the entity receiving the net assets or equity interests initially recognizes the assets and liabilities transferred at their carrying amounts to the transferring entity at the transfer date. For reasons like not applying push-down accounting, there may be a difference between the carrying amount of the assets transferred and the historical cost to the parent company. In that case, then the financial statements of the recipient entity should reflect the transferred assets and liabilities at the historical cost of the parent of the entities under common control.

**Unit of accounting.** GAAP does not provide specific guidance regarding the unit of account to be used by management in capitalizing long-lived assets. Management might choose, with respect to assets it acquires or constructs, to aggregate individually identifiable assets and record them as if they were a single asset, and then depreciate them accordingly. Conversely, management might choose, with respect to longer-lived assets such as buildings or aircraft, to disaggregate the purchase price and separately record and depreciate the asset's major components over each component's own, individually determined estimated useful life. (Note that there may be significant tax advantages to separately accounting for components.)

Absent specific guidance regarding such practices, it is important that the financial statements provide sufficient information on the reporting entity's policies regarding capitalization of property, plant, and equipment and the criteria used by management to determine whether to record specified categories of assets in groups and/or by component. These policies should be followed consistently, once adopted. Future voluntary, postadoption changes in the policies are subject to ASC 250, *Accounting Changes and Error Corrections*.

**Other asset acquisition concerns.** For general guidance on assets acquired:

- In a business combination, see ASC 805-20-25
- In a nonmonetary transaction, see ASC 845-10-30-1 through 30-10
- Under a lease, see ASC 840-30 or ASC 842-20 upon adoption of ASU 2016-02. (ASC 360-10-30-6 through 30-8)

**Cost considerations—postacquisition.** Many different terms are used to describe costs that occur subsequent to initial acquisition including, but not limited to, the following:

Addition	Overhaul	Rehabilitation	Retrofitting
Alteration	Planned major maintenance	Renovation	Turnaround
Betterment	Rearrangement	Repair	
Improvement	Redevelopment	Replacement	
Maintenance	Refurbishment	Retooling	

Regardless of the terminology used to describe a cost, the proper accounting treatment depends on a careful analysis of whether the cost is expected to provide future benefits to the reporting entity and, if so, the nature of those expected benefits. Costs incurred that bring greater future benefit should generally be capitalized. There are two major categories of such costs:

- Costs that increase the value of the asset by increasing capacity or operating efficiency
- Costs that increase the useful life of the asset.

**Costs that increase the value of the asset.** If the cost to improve the capacity or operating efficiency of an asset adds to the value of the existing asset, in effect a new asset has been created that is subject to the same capitalization considerations applied in recognizing the original asset.

When the cost is significant, the cost is capitalized and the depreciation for future periods is revised based on the new book value of the asset. As a practical expedient, most reporting entities establish a dollar threshold under which such costs are charged to expense, irrespective of their purpose (e.g., all costs under \$1,500 are charged to expense). This is done under the assumption that the costs of capitalizing and depreciating the item exceed the benefits to users of the financial statements. In effect, these items are considered to be immaterial to the financial statements, both individually and in the aggregate.

**Costs and their affect on the future service potential of the asset.** If the cost affects the future service potential of the asset, it is accounted for in one of the following ways, depending on the individual facts and circumstances:

1. *Costs that do not extend the overall useful life of the asset.* If a portion of the original asset is being replaced, theoretically, the carrying value, if any, of the corresponding portion of the asset that is being replaced (cost less accumulated depreciation and less any impairment charges recognized in prior periods) should be removed from the accounting records and recorded as a loss in the period of the replacement. This accounting is seldom used in practice because, in general, accounting records for fixed assets are not maintained in the painstaking detail necessary to determine the carrying value of the individual components that comprise each asset. Instead, most companies will capitalize the replacement components under the rationale that the portion of the asset being replaced would have been depreciated sufficiently based on the useful life of the host asset so that at the time of replacement, little or no carrying value would remain to be removed.
2. *Costs that extend the overall useful life of the asset.* If, as a result of incurring a cost, the useful life of the asset is extended, depreciation for future periods is revised based on the new estimated remaining useful life.

**Reinstallations and rearrangements.** If, as a result of reinstallation and rearrangement activities, the reporting entity expects to obtain benefits that extend into future years arising from improved production efficiency or reduced production costs, these costs can be capitalized and depreciated. If the activities are not expected to provide those future benefits, the costs are to be recognized as expense as incurred.

**Relocation.** The costs of moving a fixed asset to a new location at which it will operate in the same manner and with the same functionality as it did at its former location does not result in any future benefits, and therefore the costs of dismantlement, packaging/crating, shipping, and reinstallation should be recognized as expenses as incurred.

**Repairs and maintenance.** If a cost does not extend an asset's useful life, increase its productivity, improve its operating efficiency, or add additional production capacity, the cost is to be recognized as an expense as incurred.

**Planned major maintenance activities.** ASC 908-360 contains guidance on accounting for the expenses related to airline maintenance activities. Line maintenance and other routine maintenance activities should be expensed as incurred. There are three acceptable methods for accounting for planned major maintenance activities:

1. Expense as incurred
2. Deferral
3. Built-in overhaul method.

Additional guidance can be found in ASC 908-360-25-2 and in the AICPA's *Airlines – Audit and Accounting Guide*.

**Depreciation and depletion.** The costs of property, plant, and equipment are allocated to the periods of their expected useful life through depreciation or depletion. The method of depreciation chosen is that which results in a systematic and rational allocation of the cost of the asset (less its residual or salvage value) over the asset's expected useful life, the periods over which the entity will benefit. (ASC 360-10-35-4) The entity must determine:

- The depreciable base
- Useful life
- The best method to apportion costs.

*The depreciable base.* The factors to consider in determining the depreciable base are discussed above.

*The useful life.* The estimation of useful life takes a number of factors into consideration, including:

- Technological change,
- Normal deterioration, and
- Actual physical usage.

The method used is selected based on either a function of time (e.g., technological change or normal deterioration) or as a function of actual physical usage. (ASC 360-10-35-8)

### **Depreciation methods**

#### **Exhibit—Types of depreciation methods**

Methods base on time:	1. Straight line
	2. Accelerated methods
	a. Declining balance
	b. Double declining balance
	c. Sum-of-the-years' digits
Methods based on actual physical usage:	3. Units of production
Other methods	4. Present value methods
	5. Group or composite methods

*Depreciation methods as a function of time.* Each of the examples below is based on the following facts.

Michele Corporation purchased a production machine and placed it in service on January 1, 20X1. The machine cost \$100,000, has an estimated salvage value of \$10,000, and an estimated useful life of five years.

1. Straight-line method—Depreciation expense is recognized evenly over the estimated useful life of the asset.

#### **Formula**

- a. Compute the straight-line depreciation rate as:

$$\frac{1}{\text{Estimated useful life}}$$

- b. Multiply the depreciation rate by the cost less estimated salvage value.

### Example of straight-line depreciation

- a. Straight-line depreciation =  $\frac{1}{5} = 20\%$  per year
- b.  $20\% \times (\$100,000 - \$10,000) = \$18,000$  annual depreciation

Accelerated methods—Depreciation expense is higher in the early years of the asset's useful life and lower in the later years. These methods are more appropriate than straight-line if the asset depreciates more quickly or has greater production capacity in the earlier years than it does as it ages. They are also sometimes used on the theory that maintenance and repair costs typically increase as assets age; therefore, in conjunction with accelerated depreciation total ownership costs (depreciation, maintenance, and repairs) will approximate straight-line. The ASC specifically prohibits use of the IRS's Accelerated Cost Recovery System (ACRS) if a reasonable range of the asset's useful life is not reflected within the years specified by the ACRS. The ASC also states that the annuity method of depreciation is not acceptable. (ASC 360-10-35-9)

2. a. Declining balance—Annual depreciation is computed by multiplying the book value at the beginning of the fiscal year by a multiple of the straight-line rate of depreciation as computed above. (ASC 360-10-35-7)
  - b. Double-declining balance (ceases when the book value = the estimated salvage value)  
 $2 \times \text{straight-line depreciation rate} \times \text{book value at the beginning of the year}$

The double-declining balance and the sum-of-the-years' digits methods reflect greater expected productivity or revenue earning power of the asset in the earlier years of the asset's life or with maintenance charges expected to be greater in the later years of the asset's life. (ASC 360-10-35-7)

The declining balance methods do not deduct the salvage value from the cost when calculating depreciation.

### Example of double-declining balance depreciation

<i>Year</i>	<i>Net book value, beginning of year</i>	<i>Double-declining balance depreciation computed as <math>2 \times SL</math> rate</i>	
		<i>(40% in this case) <math>\times</math> Net book value, beginning NBV</i>	<i>Net book value, end of year</i>
1	\$100,000	\$40,000	\$60,000
2	60,000	24,000	36,000
3	36,000	14,400	21,600
4	21,600	8,640	12,960
5	12,960	2,960	10,000 limited by salvage value
Total		\$ <u>90,000</u>	

- c. Sum-of-the-years' digits (SYD) depreciation

### Formula

$$(\text{Cost} - \text{Estimated salvage value}) \times \text{Applicable percentage}$$

$$\text{Applicable percentage} = \frac{\text{Number of years of estimated life remaining at the beginning of the year}}{\text{SYD}}$$

$$\text{SYD} = \frac{n(n + 1)}{2} \quad \text{where } n = \text{estimated useful life}$$

**Example of sum-of-the-years' digits (SYD) depreciation**

$$\text{SYD} = \frac{5(5+1)}{2} = 15$$

This formula yields the sum of each year of the estimated useful life:

$$1 + 2 + 3 + 4 + 5 = 15$$

<i>Year</i>	<i>Remaining estimated useful life at beginning of year</i>	<i>SYD</i>	<i>Applicable percentage</i>	<i>Annual depreciation</i>
1	5	5/15	33.33%	\$ 30,000
2	4	4/15	26.67	24,000
3	3	3/15	20.00	18,000
4	2	2/15	13.33	12,000
5	1	1/15	6.67	6,000
Totals	15		100.00%	\$ <u>90,000</u>

**Partial-year depreciation.** When an asset is either acquired or disposed of during the year, the full-year depreciation calculation is prorated between the accounting periods involved.

**Example of partial-year depreciation**

Ginger Corporation, a calendar-year entity, acquired a machine on June 1, 20X2 that cost \$40,000 with an estimated useful life of four years and a \$2,500 salvage value. The depreciation expense for each full year of the asset's life is calculated as:

	<i>Straight-line</i>	<i>Double-declining balance</i>	<i>Sum-of-years' digits</i>
Year 1	$37,500 \div 4 = 9,375$	$50\% \times 40,000 = 20,000$	$4/10 \times 37,500^* = 15,000$
Year 2	9,375	$50\% \times 20,000 = 10,000$	$3/10 \times 37,500 = 11,250$
Year 3	9,375	$50\% \times 10,000 = 5,000$	$2/10 \times 37,500 = 7,500$
Year 4	9,375	$50\% \times 5,000 = 2,500$	$1/10 \times 37,500 = 3,750$
	<u>37,500</u>	<u>37,500</u>	<u>37,500</u>

\*  $(40,000 - 2,500)$

Because the first full year of the asset's life does not coincide with the company's fiscal year, the amounts shown above must be prorated as follows:

	<i>Straight-line</i>	<i>Double-declining balance</i>	<i>Sum-of-years' digits</i>
20X2	$7/12 \times 9,375 = 5,469$	$7/12 \times 20,000 = 11,677$	$7/12 \times 15,000 = 8,750$
20X3	9,375	$5/12 \times 20,000 = 8,333$	$5/12 \times 15,000 = 6,250$
		$7/12 \times 10,000 = \underline{5,833}$	$7/12 \times 11,250 = \underline{6,563}$
		$\underline{14,166}$	$\underline{12,813}$
20X4	9,375	$5/12 \times 10,000 = 4,167$	$5/12 \times 11,250 = 4,687$
		$7/12 \times 5,000 = \underline{2,917}$	$7/12 \times 7,500 = \underline{4,375}$
		$\underline{7,084}$	$\underline{9,062}$
20X5	9,375	$5/12 \times 5,000 = 2,083$	$5/12 \times 7,500 = 3,125$
		$7/12 \times 2,500 = \underline{1,458}$	$7/12 \times 3,750 = 2,188$
		$\underline{3,541}$	$\underline{5,313}$
20X6	$5/12 \times 9,375 = \underline{3,096}$	$5/12 \times 2,500 = \underline{1,042}$	$5/12 \times 3,750 = \underline{1,562}$
	<u>37,500</u>	<u>37,500</u>	<u>37,500</u>

As an alternative to proration, an entity may follow any one of several simplified conventions.

1. Record a full year's depreciation in the year of acquisition and none in the year of disposal.
2. Record one-half year's depreciation in the year of acquisition and one-half year's depreciation in the year of disposal.

#### ***Depreciation method based on actual physical usage***

3. *Units of production.* Depreciation is based upon the number of units produced by the asset in a given year.

$$\text{Depreciation rate} = \frac{\text{Cost less salvage value}}{\text{Estimated number of units to be produced by the asset over its estimated useful life}}$$

$$\text{Units of production} = \frac{\text{Depreciation rate} \times \text{Number of units produced during the current year}}{\text{depreciation}}$$

#### ***Other depreciation methods***

4. *Present value methods.* Depreciation expense is lower in the early years and higher in the later years. The rate of return on the investment remains constant over the life of the asset. With these methods, time value of money formulas are used.
  - a. Sinking fund—Uses the future value of an annuity formula.
  - b. Annuity fund—Uses the present value of an annuity formula.
5. *Group (composite) method.* In addition to the foregoing, a group (composite) method is sometimes used. This method averages the service lives of a number of assets using a weighted-average of the units and depreciates the group or composite as if it were a single unit. A group consists of similar assets, while a composite is made up of dissimilar assets.

$$\text{Depreciation rate} = \frac{\text{Sum of the straight-line depreciation of individual assets}}{\text{Total asset cost}}$$

Depreciation expense: Depreciation rate  $\times$  Total group (composite) cost

Gains and losses are not recognized on the disposal of an asset but are netted into accumulated depreciation.

#### ***Depletion***

Depletion is the annual charge for the use of natural resources. In order to compute depletion, it is first necessary to establish a depletion base, the amount of the depletable asset.

The depletion base includes the following elements:

1. *Acquisition costs*—The cost to obtain the property rights through purchase or lease, royalty payments to the property owner,
2. *Exploration costs*—Typically, these costs are expenses as incurred; however, in certain circumstances in the oil and gas industry, they may be capitalized,
3. *Development costs*—Intangible development costs such as drilling costs, tunnels, shafts, and wells,
4. *Restoration costs*—The costs of restoring the property to its natural state after extraction of the natural resources has been completed.

The amount of the depletion base, less its estimated salvage value, is charged to depletion expense each period using a depletion rate per unit extracted, or *unit depletion rate* that is

computed using the following formula:

$$\frac{1}{\text{Total expected recoverable units}} \times \text{Depletion base} \times \text{Units extracted}$$

The unit depletion rate is revised frequently due to the uncertainties surrounding the recovery of natural resources. The revision is made prospectively; the remaining undepleted cost is allocated over the remaining expected recoverable units.

### Example of depletion

The Cheyenne Oil Company drills a well in the Denver Basin oil field. It expects to incur the following acquisition, development, and restoration costs associated with the well:

Land acquisition	\$ 172,000
Land preparation (road and drill pad)	38,000
Well drilling	301,000
Trunk line construction	29,000
Estimated site restoration cost	50,000
Total	\$ 590,000

A considerable amount of extraction equipment is also positioned at the well, but since it can be moved among well sites and is therefore not a fixed part of this well, it is depreciated separately.

The entire \$590,000 is capitalized. Cheyenne's geologists calculate that the well has proven reserves of 250,000 barrels of crude oil. In the first year of production, the well produces 45,000 barrels of oil. The depletion charge for the first year of operation follows:

$$\frac{1}{250,000 \text{ barrels of proven reserves}} \times \$590,000 = \$2.36 \text{ per barrel extracted unit depletion rate}$$

$$\$2.36 \text{ per barrel extracted} \times 45,000 \text{ barrels extracted} = \$106,200 \text{ first-year depletion charge}$$

During the second year of the well's operation, Cheyenne's engineers revise the estimated remaining proven reserves upward by 20,000 barrels from 250,000 barrels to 270,000 barrels, based on improved oil recovery techniques. Also, due to new environmental laws, the estimated site restoration cost increases by \$10,000, increasing the depletion base from \$590,000 to \$600,000. Total production for the second year is 62,000 barrels of oil. The depletion charge for the first year is not retroactively adjusted; instead changes in cost and estimated total production are accounted for prospectively. The depletion calculation for the second year follows:

$$\frac{1}{225,000 \text{ barrels of proven reserves remaining}} \times \$600,000 \times 62,000 \text{ barrels extracted in year 2}$$

$$= \$136,069, \text{ which is the depletion charge of } \$2.19 \text{ per barrel extracted}$$

These depletion expenses leave \$357,731 of capitalized costs yet to be amortized over remaining proven reserves of 163,000 barrels, representing a future depletion charge of \$2.19 per barrel, barring any further future changes in estimates.

**Income tax methods.** Income tax deductions for depreciation (referred to in income tax law as "cost recovery deductions"), including Section 179 and bonus depreciation deductions, are not in accordance with GAAP because, in general, they are not based on estimated useful lives and do not allocate cost to future periods benefited on a systematic and rational basis. Therefore, differences between financial statement and income tax depreciation result in temporary differences between the carrying values of the long-lived assets for income tax and financial reporting

purposes. These temporary differences are taken into account in the calculation of deferred income taxes, as discussed in the chapter on ASC 740. The Codification specifically prohibits use of the years specified by ACRS unless they fall within a reasonable range of the asset's useful life. (ASC 360-10-35-10)

Income tax depreciation will differ in amount from financial statement depreciation because of differences in treatment of salvage value, recovery methods, recovery periods, and the use of conventions for assets placed in service during the year. The difference between income tax depreciation and financial statement depreciation is reported as a reconciling item (referred to as a "Schedule M-1 or Schedule M-3 adjustment") on a corporation's U.S. federal income tax return.

**Impairment.** The impairment provisions of ASC 360-10 are generally split between:

- Long-lived assets classified as held and used, and
- Long-lived assets classified as held for sale.

The Codification rules for measuring and recording impairment of assets are not uniform for all assets or for all industries, and preparers should review the applicable industry guidance.

**Impairment of long-lived assets to be held and used.** Impairment losses are only recognized when the carrying amount of the impaired asset (or asset group) is not *recoverable* and exceeds its fair value. Recoverability is determined by comparing the carrying amount of the asset (or asset group) on the date it is being evaluated for recoverability to the sum of the *undiscounted* cash flows expected to result from its use and eventual disposition. It is important to note that, as opposed to the measure used in recoverability testing, the impairment loss to be recorded is measured by the amount by which the carrying amount exceeds its fair value. If the carrying value is recoverable from expected future cash flows from its use and disposition, as defined, no impairment loss is recognized. (ASC 360-10-35-17) This can be seen as a multi-step process:

1. Determine when to use the recoverability test—indicators of impairment
2. Test for recoverability
3. Measure of impairment
4. Allocate the loss
5. Recognize the new cost basis
6. Report and disclose.

**Step 1—Determine when to use the recoverability test—indicators of impairment.** "Events and circumstances" criteria determine when, if at all, an asset (or asset group) is evaluated for recoverability. Thus, there is no set interval or frequency for recoverability evaluation. The Codification provides a list of examples of events or changes in circumstances that indicate the carrying amount of an asset (asset group) *may* not be recoverable and thus should be evaluated for recoverability. It is important to note that the list of events and circumstances below is not intended to be all-inclusive. Rather, it is intended to provide examples of situations that warrant evaluation of an asset or group of assets for recoverability to determine whether an impairment loss must be recognized.

1. A significant decrease in the market price of a long-lived asset (asset group)
2. A significant adverse change in the extent or manner in which a long-lived asset (asset group) is being used or is in its physical condition
3. A significant adverse change in legal factors or in the business climate that could affect the value of a long-lived asset (asset group), including an adverse action or assessment by a regulator

4. An accumulation of costs significantly in excess of the amount originally expected for the acquisition or construction of a long-lived asset (asset group)
5. A current period operating or cash flow loss combined with a history of operating or cash flow losses or a projection or forecast that demonstrates continuing losses associated with the use of a long-lived asset (asset group)
6. A current expectation that, more likely than not, a long-lived asset (asset group) will be sold or otherwise disposed of significantly before the end of its previously estimated useful life. (ASC 360-10-35-21)

Financial statement preparers should routinely assess whether the indicators above or other indicators are present.

In conjunction with the recoverability evaluation, it may also be necessary to review the appropriateness of the method of depreciation (amortization) and depreciable (amortizable) life of the asset or group of assets. If as a result of that review the remaining useful life of the asset (group) is revised, the revised useful life is used to develop the cash flow estimates used to evaluate recoverability. Changes to the accounting method (e.g., from straight-line to accelerated depreciation) under ASC 250, however, would be made prospectively after the application of ASC 360. (ASC 360-10-35-22)

**Asset group impairment analysis.** ASC 360 includes the concept of the *asset group*, defined as the lowest level for which identifiable cash flows are largely independent of the cash flows of other assets and liabilities. (ASC 360-10-35-23)

An asset group could be:

- The whole company
- An operating segment as defined in the ASC Master Glossary
- A reporting unit as defined in the ASC Master Glossary
- A business
- A part of a business (such as a division or department).

The asset groups referenced below are shown in the diagram entitled “Alternative Balance Sheet Segmentation” in the chapter on ASC 280.

- Asset group (a) in the diagram is a single division of a subsidiary
- Asset groups (b) and (c) are each separate businesses that comprise another division of the same subsidiary
- Asset group (d) is an entire subsidiary consisting of a single business
- Asset group (e) is a product line that is part of a larger business and, after the disposal of disposal group (f), will constitute an entire operating segment
- Asset groups (g) and (h) are each separate businesses that comprise a subsidiary.

If a long-lived asset cannot be assigned to any asset group because it does not have identifiable cash flows largely independent of other long-lived assets individually or in asset groups (such as a corporate headquarters), then that asset is evaluated for recoverability by reference to all assets and liabilities of the entity. (ASC 360-10-35-24)

Assets and liabilities in a group may be neither long-lived assets nor goodwill. If so, they should be separately identified. Since those assets and liabilities are not subject to the provisions of ASC 360, the guidance applicable to their valuation is applied *before* applying ASC 360 to the group. For example, allowances for uncollectible accounts receivable and inventory obsolescence are recorded as necessary. (ASC 360-10-35-27)

*Effect of goodwill on grouping.* In assessing the composition of asset groups, management must be aware of the interrelationship between ASC 360, *Property, Plant, and Equipment*, and ASC 350, *Intangibles—Goodwill and Other*. Goodwill can only be assigned to an asset group that is being evaluated for recoverability if the asset group is either a reporting unit or includes a reporting unit.

*Step 2—Test for Recoverability*

*Estimates of future cash flows.* For the purposes of recoverability evaluation, future cash flows are defined as cash inflows less the associated cash outflows directly associated with, and that are expected to arise as a direct result of, the use and eventual disposition of the asset group, excluding interest that is recognized as a period expense when incurred. (ASC 360-10-35-29) The estimate of future cash flows:

- Is based on all available evidence
- Incorporates assumptions that marketplace participants would use in their estimates of fair value when that information is available without undue cost or effort; otherwise, the entity incorporates its own assumptions, including the “highest and best use” of the asset (or group)
- Should be consistent with assumptions used by the entity for comparable periods such as internal budgets and projections, accruals related to incentive compensation plans, or information communicated to others
- Is made for the remaining estimated useful life of the asset (or the primary asset of an asset group) to the entity

---

*NOTE: The primary asset is the long-lived asset being depreciated (or intangible asset being amortized) that is the most significant component asset from which the group derives its cash-flow generating capacity. The primary asset cannot be land or nonamortizing intangible assets. If the primary asset does not have the longest useful life of the long-lived assets in the group, cash flow estimates must assume that the entire group will be sold at the end of the primary asset’s useful life.* (ASC 360-10-35-31)

---

- Takes into account future expenditures necessary to complete an asset under development including interest capitalized under ASC 835-20
- Includes future outflows necessary to maintain the existing service potential of all or a component of the asset or group of assets
- Excludes cash flows for future capital expenditures that increase the service potential of a long-lived asset or group of assets
- Is required to take into account the likelihood of possible cash flow outcomes if alternative courses of action are being contemplated, or if ranges of cash flows are estimated to occur under different scenarios.  
(ASC 360-10-35-30)

---

*NOTE: ASC 360 indicates that, when uncertainties exist with respect to timing and amount of future cash flows, using an expected present value technique is the appropriate way to estimate fair value.*

---

The recoverability test screens for impairments. If the carrying amount of an asset or asset group (in use or under development) is evaluated and found not to be fully recoverable (the carrying amount exceeds the estimated gross, undiscounted cash flows from use and disposition), then an impairment loss must be recognized. (ASC 360-10-35-17)

Carrying amount > undiscounted cash flows from use and disposition → impairment loss exists

*Step 3—Measure the impairment loss.* The impairment loss is measured as the excess of the carrying amount over the asset's (or asset group's) fair value.

$$\text{Impairment loss} = \text{Carrying amount} - \text{Fair value}$$

Fair value (as defined in the ASC Master Glossary) is the price that the reporting entity would receive to sell the asset on the measurement date in an orderly transaction between market participants in the principal (or most advantageous) market for the asset. To measure fair value, management must determine the asset's (or group of assets') highest and best use, which may not coincide with the manner in which the reporting entity is currently using it. Fair value measurements are discussed and illustrated in the chapter on ASC 820.

*Step 4—Allocate impairment losses.* If an asset group is found to have sustained an impairment loss, the loss is only applied to reduce the carrying amounts of the long-lived asset or assets in the group. In general, the loss is allocated to the long-lived assets in the group based on their relative carrying values. However, the carrying value of any individual asset in the group that has a fair value that is separately identifiable without “undue cost or effort” must not be reduced below that fair value. (ASC 360-10-35-28)

*Step 5—Recognize the new cost basis.* After recognition of impairment losses, the adjusted carrying amounts of the impaired long-lived assets constitute their new cost bases. Depreciation (amortization) is recognized prospectively over their remaining estimated useful lives. The adjustment to carrying values to reflect an impairment loss may never be restored.

*Step 6—Reporting and disclosure.* See Appendix B to this book.

#### Example of impairment

(Refer to the diagram under the section entitled “Alternative Balance Sheet Segmentation” in the chapter on ASC 280.)

The Parent Holding Company (PHC) owns and operates seven subsidiaries comprising eleven businesses, primarily engaged in the manufacturing and distribution of food and beverages. All of the businesses are headquartered in the same building that is owned by PHC. Additional facts are as follows:

- Due to general economic conditions and the failure, in 20X4, of several high-tech start-ups in the city in which PHC is headquartered, the local commercial real estate market is depressed. PHC's headquarters building has eight years remaining in its expected useful life and its carrying value is \$4,500,000. PHC has substantial excess space in the building, which it does not expect to need in the foreseeable future. PHC management expects the real estate market to remain depressed for the next two years and when the market recovers, it will consider selling the building and either leasing or purchasing a smaller facility in the area.
- Subsidiary 2 operates a South American bottling plant that produces a line of carbonated beverages that is sold exclusively on that continent. A large increase in sugar prices during 20X4 has resulted in lower margins and, due to partial price increases, a 30% decrease in units sold during the year. The plant operates in a building that Subsidiary 2 leases under an operating lease with five years remaining. The primary asset owned by Subsidiary 2 is what it refers to as its “bottling line” which consists of equipment that mixes ingredients, adds carbon dioxide, and fills and caps the bottles. The bottling line has a remaining useful life of four years. The other assets in the asset group have remaining useful lives of seven years. Subsidiary 2 has been profitable for the past three years (20X1–20X3) but is showing a small operating loss for 20X4. Additional information regarding Subsidiary 2 follows:

	<i>Bottling line (primary asset)</i>	<i>Asset B</i>	<i>Asset C</i>	<i>Totals</i>
Net book value	<u>\$87,000</u>	<u>\$19,000</u>	<u>\$17,000</u>	<u>\$123,000</u>
Remaining life	4 years	7 years	7 years	
Expected cash inflows, net of outflows				
20X5				4,000
20X6				6,000
20X7				7,000
20X8				8,000
From assumed disposition—end of 20X8				75,000
Total expected net operating cash flows				<u>\$100,000</u>

- PHC is in the process of preparing its consolidated financial statements for the year ended December 31, 20X4. Thus far, normal depreciation of PHC and its subsidiaries' fixed assets has been recorded and impairment has not yet been considered.

### *Analysis*

*Identify asset groups.* This has been illustrated in the diagram in the chapter on ASC 280. Note that the headquarters building cannot be assigned to any specific asset group since it does not generate independent cash flows. Therefore, its potential impairment is assessed at the PHC level on a consolidated basis.

*Step 1—Determine when to use the recoverability test—impairment indicators.* Assess each of PHC's asset groups (and on a consolidated basis), as to whether the example events and circumstances provided by ASC 360 or any other events and circumstances indicate that PHC's long-lived assets may be impaired. Based on the decline in the local real estate market, it would be presumed that the market price of the headquarters building has declined, and thus the building should be evaluated for recoverability. Analysis of the situation of Subsidiary 2 is more complex. Two of the factors in ASC 360 warrant consideration. First, it could be argued that the increase in sugar prices constitutes a significant adverse change in the business climate. This might be mitigated if management believed the price increase to be a short-term condition and assuming this belief was supportable by past experience. Second, the current period operating loss should be considered. Since there has not been a history of such losses, the relevance of this factor depends on management's forecast of future results. If Subsidiary 2 were forecast to continue to experience operating losses, this would indicate that the asset group needs to be evaluated for recoverability. For the purposes of this example, we will assume that continuing losses are forecast.

*Step 2—Test for recoverability.* Two recoverability evaluations are required, one for the headquarters building and the other for the asset group represented by Subsidiary 2. Since the headquarters building is not allocable to an asset group, its recoverability is evaluated using consolidated cash flows that include the cash flows of Subsidiary 2. Thus, the recoverability evaluation for Subsidiary 2 is performed first.

Subsidiary 2's recoverability evaluation is performed by reference to the four-year remaining useful life of the bottling line, its primary asset. The cash flows used to evaluate recoverability are required to assume that the asset group will be sold in its entirety at the end of four years.

Comparison of the \$100,000 sum of the undiscounted expected cash flows from use and disposition to the carrying amount of \$123,000 indicates that the carrying amount

of the asset group is not expected to be fully recoverable. Therefore, the asset group is impaired.

The recoverability evaluation for the building is performed using an estimate of expected cash flows, weighted for the probabilities as to whether management will pursue the sale of the facility when the local economy recovers in two years, versus retaining it for the remaining eight years of its expected useful life. In addition, depending on different scenarios of future economic conditions and business performance by PHC's businesses, different levels of cash flows could result both from operations and from disposition. Acknowledging the inherent uncertainties associated with predicting future results and the subjectivity involved in the estimation process, management formulated its best judgment regarding the probabilities of the best, worst, and most-likely scenarios.

#### Estimate of Future Cash Flows

<u>Course of action</u>	<u>Use of the asset (consolidated basis)</u>	<u>Disposition of the asset</u>	<u>Total</u>	<u>Probability assessment</u>	<u>Probability-weighted possible cash flows</u>
Sale at the end of 2 years					
	\$100,000	\$3,500,000	\$3,600,000	20%	\$ 720,000
	130,000	4,600,000	4,730,000	60%	2,838,000
	150,000	4,600,000	4,750,000	20%	950,000
				<u>100%</u>	<u>\$4,508,000</u>
Sale at the end of 8 years					
	\$410,000	\$4,000,000	\$4,410,000	20%	\$882,000
	550,000	4,700,000	5,250,000	60%	3,150,000
	620,000	4,800,000	5,420,000	20%	1,084,000
				<u>100%</u>	<u>\$5,116,000</u>

Upon review of the analysis above, management determined that it is 70% probable that it will sell the building at the end of two years. Consequently, the expected cash flows from the use and disposition of the building are as follows:

<u>Course of action</u>	<u>Probability-weighted possible cash flows</u>	<u>Probability assessment for course of action</u>	<u>Undiscounted expected cash flows</u>
Sale at the end of 2 years	\$4,508,000	70%	\$3,155,600
Sale at the end of 8 years	5,116,000	30%	1,534,800
		<u>100%</u>	<u>\$4,690,400</u>

Comparison of the undiscounted expected cash flows or \$4,690,400 per above to the \$4,500,000 carrying value of the building at December 31, 20X4, indicates that the carrying value of the building is expected to be fully recoverable, and thus the building is not impaired.

As a result of the above analysis, management may decide upon one of the alternative courses of action. If so, the expected cash flows from that course of action would be used in the recoverability evaluation since it would no longer be necessary to probability-weight the outcomes.

**Step 3—Measure impairment, if any.** Market information regarding the asset group of Subsidiary 2 is not available "without undue cost and effort." Management elects to use the traditional present value of estimated cash flows method to estimate fair value because it believes that uncertainty regarding the timing and amounts of cash flows is

minimal (but, if this were not the case, management would use an *expected present value* technique to make this estimate). This estimation method is referred to in ASC 820 as a *discount rate adjustment* technique. Using this technique requires:

- A single set of most-likely cash flows that includes assumptions regarding the likelihood of occurrence or nonoccurrence of events that potentially influence the estimated amounts
- A discount rate approximating a market rate of return based on observable rates of return for comparable assets traded in the same market as the asset or group of assets being measured.

The 8% interest rate used for this illustration is assumed to be a rate commensurate with the risks involved (unlike the risk-free rate sometimes used in applying an expected present value technique). The computation is as follows:

<u>Year</u>	<u>Net cash flows</u>	<u>Present value at 8%<sup>5</sup></u>	<u>Carrying value of asset group</u>	<u>Impairment adjustment required</u>
20X5	\$4,000	\$ 3,704		
20X6	6,000	5,144		
20X7	7,000	5,557		
20X8—Use	8,000	5,880		
20X8—Sale	75,000	55,127		
	<u>\$100,000</u>	<u>\$75,412</u>	<u>\$123,000</u>	<u>\$47,588</u>
<u>Asset</u>	<u>Carrying value</u>	<u>Pro rata allocation factor</u>	<u>Allocation of impairment loss</u>	<u>Tentative adjusted carrying amount</u>
Bottling line	\$ 87,000	71%	\$33,660	\$53,340
Asset B	19,000	15%	7,351	11,649
Asset C	17,000	14%	6,577	10,423
Total	<u>\$123,000</u>	<u>100%</u>	<u>\$47,588</u>	<u>\$75,412</u>

*Step 4—Allocate the loss.* Note that the adjusted carrying amount is captioned “tentative.” This is because Subsidiary 2 was able to obtain a quoted market price of \$16,000 for Asset B. ASC 360 specifies that assets are not to be reduced to an amount below their fair value. To obtain the proper result, the impairment loss requires reallocation among the assets comprising the asset group.

<u>Asset</u>	<u>Tentative adjusted carrying amount</u>	<u>Pro rata reallocation factor</u>	<u>Reallocation of excess impairment loss</u>	<u>Adjusted carrying amount</u>
Bottling line	\$53,340	84%	\$(-3,640)	\$49,700
Asset C	10,423	16%	(711)	9,712
Subtotal	63,763	<u>100%</u>	(4,351)	
Asset B	11,649		4,351	16,000
Total	<u>\$75,412</u>		<u>\$ =</u>	<u>\$75,412</u>

<sup>5</sup> These present values can be calculated using standardized spreadsheet software; specialized software used to compute time value of money and amortization schedules; the table of factors in Chapter 1 for the present value of a single future amount; or the formula used to derive that table, which is also cited in Chapter 1.

**Step 5—Recognize impairment loss.** The entry to record impairment in the accounting records of Subsidiary 2 is as follows:

Impairment loss (operating section of income statement)	47,588
Accumulated depreciation—Machinery and equipment	47,588
<i>To adjust the carrying value of the bottling line and related assets to reflect an impairment loss for 20X4.</i>	

**Step 6—Report and disclose.** See Appendix B for disclosure requirements.

**Other impairment considerations.** Besides the foregoing, other issues arise as a consequence of applying the impairment rules.

*Going concern.* The example above included an estimate of cash flows at the entity level to assess whether the building was impaired. If the estimate had indicated that the building was impaired, management must consider whether the cash flows estimated for at least the ensuing year will be sufficient for the entity to continue as a going concern. Disclosure in the financial statements of management's plans may be required under ASC 205-30, *Going Concern*.

*Significant estimates.* If, in the example above, the expected cash flows used to assess the recoverability of the building were closer to the building's \$4,500,000 carrying value, consideration is given to the applicability of ASC 275, *Risks and Uncertainties*. The assumptions used in the cash flow estimates could be considered significant estimates for which it is reasonably possible changes could occur in the near term (the ensuing year) and, consequently, disclosure would be required.

*Treatment of certain site restoration/environmental exit costs.* ASC 360-10-55 discusses how, for the purpose of performing the recoverability evaluation under ASC 360, to treat the costs of future site restoration or closure (referred to as "environmental exit costs") that may be incurred if the asset is sold, abandoned, or ceases operations. To conform to ASC 360, references to an "asset" are also applicable to an "asset group."

ASC 410-20, *Asset Retirement and Environmental Obligations*, requires asset retirement obligations recognized as liabilities to be included as part of the capitalized cost of the related asset and, to avoid double-counting, the cash settlement of those liabilities to be excluded from the expected future cash flows used to evaluate recoverability under ASC 360. If the asset retirement costs have not yet been recognized under ASC 410-20 because the obligation is being incurred over more than one reporting period during the useful life of the asset, then the cash flows for those unrecognized costs are to be included in the expected future cash flows.

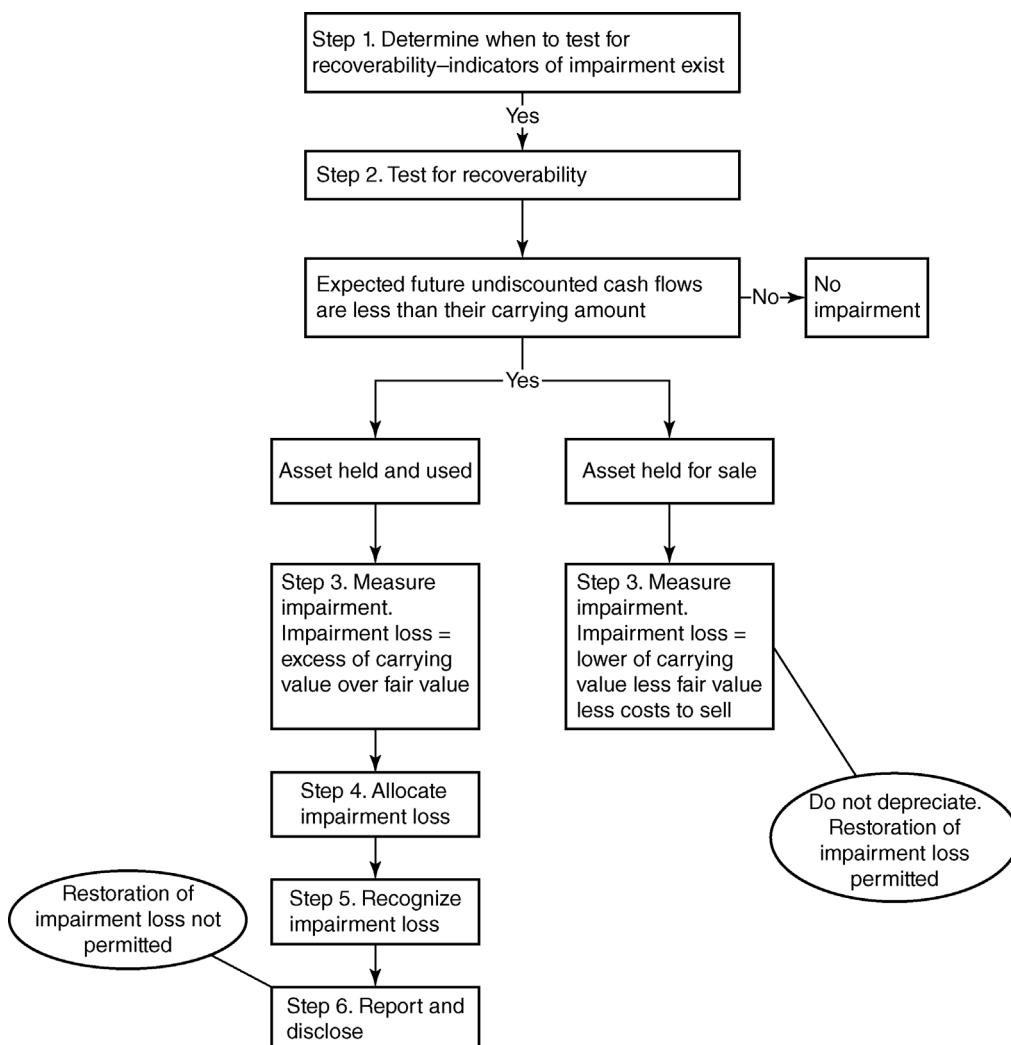

The cash flows for environmental exit costs that are not recorded as liabilities under ASC 410-30 may not occur until the end of the asset's life if the asset ceases to be used or may be delayed indefinitely as long as management retains ownership of the asset and chooses not to sell or abandon it. Consequently, management's intent regarding future actions with respect to the asset is to be taken into account in determining whether to include or exclude these cash flows from the computation of the expected future cash flows used to evaluate recoverability under ASC 360. If management is contemplating alternative courses of action to recover the carrying amount of the asset or if a range is estimated for the amount of possible future cash flows, the likelihood (probability) of these possible outcomes is to be considered in connection with the recoverability evaluation under ASC 360.

ASC 360-10-55 provides examples illustrating situations where cash flows for environmental exit costs not recognized as liabilities under ASC 410-30 are either included in or excluded from

the undiscounted expected future cash flows used to evaluate a long-lived asset or group of assets for recoverability under ASC 360.

*Deferred income taxes.* Impairment losses are not deductible for U.S. federal income tax purposes. Consequently, financial statement recognition of these losses will result in differences between the carrying amounts of the impaired assets for financial reporting purposes and income tax purposes. These differences are considered temporary differences and are accounted for under the provisions of ASC 740.

#### Exhibit—Impairment Process Disposal

**Long-lived assets classified as held for sale.** An asset may be disposed of individually or as part of a disposal group (see Definition of Terms section in this chapter).

**The six held-for-sale criteria.** Long-lived assets (or disposal groups) are classified as held-for-sale in the period in which *all* of the following six criteria are met (ASC 360-10-45-9):

1. Management possessing the necessary authority commits to a plan to sell the asset (disposal group)
  2. The asset (disposal group) is immediately available for sale on an “as is” basis (i.e., in its present condition subject only to usual and customary terms for the sale of such assets)
  3. An active program to find a buyer and other actions required to execute the plan to sell the asset (disposal group) have commenced
  4. An assessment of remaining actions required to complete the plan indicates that it is unlikely that significant changes will be made to the plan or that the plan will be withdrawn
  5. Sale of the asset (disposal group) is probable, as that term is used in the context of ASC 450-20 (i.e., likely to occur), and transfer of the asset (disposal group) is expected to qualify for recognition as a completed sale within one year
- 

*NOTE: Certain exceptions to the one-year requirement are set forth in ASC 360-10-45-11 for events and circumstances beyond the entity’s control that extend the period required to complete the sale.*

---

6. The asset (disposal group) is being actively marketed for sale at a price that is reasonable in relation to its current fair value.

For a long-lived asset (disposal group) that has been newly acquired in a business combination to be classified as held for sale at that date, it must:

- Meet criterion 5 above (subject to the same exceptions noted in 5), *and*
- Any other of the required criteria that are not met at the date of acquisition are judged to be probable of being met within a short period (approximately three months or less) of acquisition.

(ASC 360-10-45-12)

If the criteria are met after the date of the statement of financial position but prior to issuance of the entity’s financial statements, the long-lived asset continues to be classified as held-and-used at the date of the statement of financial position. (ASC 360-10-45-13) Appropriate subsequent events disclosures would be included in the financial statements in accordance with ASC 855, *Subsequent Events*.

**Measuring expected disposal gain or loss.** (ASC 360-10-35-43) Long-lived assets (disposal groups) classified as held-for-sale are measured at the lower of their carrying amount or fair value less cost to sell. A loss is recognized for any initial or subsequent write-down to fair value less cost to sell. A gain is recognized for any subsequent increase in fair value less cost to sell, but recognized gains may not exceed the cumulative losses previously recognized. Long-lived assets that are classified as held-for-sale are presented separately on the statement of financial position.

Long-lived assets (disposal groups) being held for sale are not depreciated (amortized) while being presented under the held-for-sale classification. Interest and other expenses related to the liabilities of a held-for-sale disposal group are accrued as incurred.

Cost to sell consists of costs that directly result from the sales transaction that would not have been incurred if no sale were transacted. Cost to sell includes brokerage commissions, legal fees,

title transfer fees, and other closing costs that must be incurred prior to transfer of legal title to assets. Prior to measurement of fair value less cost to sell, the entity adjusts the carrying amounts of any assets included in the disposal group not covered by ASC 360 including any goodwill (e.g., establishes appropriate valuation allowances for receivables and inventory, recognizes other-than-temporary impairment of applicable investment securities, etc.). The entity may not accrue, as part of cost to sell, expected future losses associated with operating the long-lived asset (disposal group) while it is classified as held-for-sale.

Costs associated with the disposal, including costs of consolidating or closing facilities, are only recognized when the actual costs are incurred. If the exception to the one-year requirement applies (permitted when there are certain events and circumstances beyond the entity's control), and the sale is expected to occur in more than one year, the cost to sell is discounted to its present value. (ASC 360-10-35-38)

*Reclassification—changes to a plan to sell.* If, at any time after meeting the criteria to be classified as held-for-sale, the asset (disposal group) no longer meets those criteria, the long-lived asset (disposal group) should be reclassified from held-for-sale to held-and-used, measured at the *lower of*:

- Carrying value prior to classification as held-for-sale, adjusted for any depreciation (amortization) that would have been recognized had the asset (disposal group) continued to be classified as held-and-used, or
- Fair value at the date of the subsequent decision not to sell the asset (disposal group). (ASC 360-10-35-44)

The adjustment required to the carrying amount of an asset (disposal group) being reclassified from held-for-sale to held-and-used is included in income from continuing operations in the period that the decision is made not to sell. Impairment losses from long-lived assets to be held and used, gains or losses recognized on long-lived assets to be sold, and other costs associated with exit or disposal activities (as defined in ASC 420) should be accounted for consistently. Therefore, if the entity reports income from operations, these amounts are reported in operations unless they qualify as discontinued operations. The income statement classification of these amounts must be consistent with the accounting policy for classifying the depreciation of the underlying assets per the following examples:

Underlying Asset	Income Statement Classification
Machinery and equipment used in production	Cost of goods sold
Office equipment	General and administrative
Trucks and delivery equipment	General and administrative or, if a separate category of expenses, selling expense
Combination factory/office building	Allocate between cost of goods sold, and general and administrative in the same manner as depreciation

If a component of an entity (as defined below) is reclassified as held-and-used, the results of that component that had previously been reported in discontinued operations are reclassified and included in income from continuing operations for all periods presented.

Upon removal of an individual asset or liability from a disposal group classified as held-for-sale, the remaining part of the group should be evaluated to determine if it still meets all six of the criteria to be classified as held-for-sale. If all of the criteria are still met, then the remaining assets

and liabilities will continue to be measured and accounted for as a group. If not all of the criteria are met, then the remaining long-lived assets are to be measured individually at the lower of their carrying amounts or fair value less cost to sell at that date. Any assets that will not be sold are reclassified as held-and-used as described above. (ASC 360-10-35-45)

**Example of long-lived assets to be disposed of by sale**

*Classification as held-for-sale.* The Hewitt Candy Company chooses to stop sales of its candy cane product line, and accordingly shifts the \$840,000 carrying cost (i.e., book value) of its candy cane twister equipment into a held-for-sale account. After several months of trying to close a sale of the equipment, Hewitt's controller determines that the fair value of the twister equipment is now \$855,000. However, after projected sale costs that include commissions, legal fees, and title transfer fees are included, the net fair value is only \$825,000. The controller accordingly writes down the equipment cost to \$825,000 with the following entry:

Loss on decline of fair value of equipment held-for-sale	15,000
Equipment held-for-sale	15,000

After another two months, the controller determines that the equipment's fair value, net of estimated disposition costs, has increased to \$860,000. Although this represents a gain of \$35,000 over the adjusted carrying cost of the equipment, he can only recognize a gain up to the amount of all previously recorded losses, which he does with the following entry:

Equipment held-for-sale	15,000
Recovery of fair value of equipment held-for-sale	15,000

*Reclassification from held-for-sale to held-and-used.* Six months after the twister equipment is classified as held-for-sale, Hewitt's management concludes that it will wait for better economic conditions to market and sell the equipment. Hewitt's controller reclassifies the equipment as held-and-used with the following entry:

Equipment held-and-used	840,000
Equipment held-for-sale	840,000

Prior to its classification as held-for-sale, the equipment had been depreciated on a straight-line basis over a ten-year life span using an original equipment base cost of \$1.2 million, so \$60,000 would otherwise have been incurred in the six months the equipment was classified as held-for-sale; this would have reduced the equipment's net carrying cost (i.e., book value) from \$840,000 to \$780,000. Since this is lower than the estimated fair value of \$860,000 as of the date when the decision was made to halt sale activities, the controller records the following entry:

Depreciation—equipment	60,000
Accumulated depreciation—equipment	60,000

*Sale of equipment.* After four more months, Hewitt receives an unsolicited cash offer of \$875,000 for the twister equipment, which it accepts. During these additional four months, the equipment has been depreciated by a further \$40,000. Hewitt's controller records the sale with the following entry:

Cash	875,000
Accumulated depreciation—equipment	460,000
Equipment held-and-used	1,200,000
Gain on equipment sale	135,000

**Long-lived assets to be disposed of other than by sale.** Long-lived assets may be abandoned, exchanged, or distributed to owners in a spin-off. Until the actual disposal occurs, the assets

continue to be classified on the statement of financial position as “held and used.” During the period prior to disposal, they are subject to conventional impairment rules applicable to assets held and used.

If the entity commits to a plan to abandon the asset before the end of its previously estimated useful life, the depreciable life is revised in accordance with the rules governing a change in estimate under ASC 250 and depreciation of the asset continues until the end of its shortened useful life. (ASC 360-10-35-47) Abandoned assets are considered disposed of when they cease to be used. Temporary idling of an asset, however, is not considered abandonment. (ASC 360-10-35-49)

At the time an asset is abandoned, its carrying value should be adjusted to its salvage value, if any, but not less than zero (i.e., a liability cannot be recorded upon abandonment). (ASC 360-10-35-48) If an acquired asset meets the criteria to be considered a defensive intangible asset, it is prohibited from being considered abandoned upon its acquisition.

Per ASC 360-10-40-4, if a long-lived asset is to be disposed of either by spinning it off to owners of the company or in an exchange transaction for a similar productive long-lived asset, the disposal is recognized when the actual exchange or spin-off occurs. If that asset (group) is evaluated for recoverability while held and used and before the disposal, the estimates of future cash flows are to assume that the disposal will not occur and that the asset will continue to be held and used for the remainder of its useful life. Two separate impairment losses might be recognized in this scenario.

1. An impairment loss for the asset while it is held and used
2. An additional impairment loss if, upon exchange or spin-off, which are recorded under ASC 845 at the asset’s recorded amount, the recorded amount/carrying value exceeds fair value.

***Discontinued operations.*** Discontinued operations are covered in depth in the chapter on ASC 205, *Presentation of Financial Statements*.

***Long-lived assets temporarily idled.*** The only reference in ASC 360 to the temporary idling of long-lived assets is the provision that prohibits recognizing temporary idling as abandonment. At a minimum, however, if material assets are temporarily idled, the following considerations apply:

1. Idling constitutes a “significant adverse change in the extent or manner in which . . .” the asset (or asset group) is being used, which is an indicator requiring a recoverability evaluation under ASC 360.
2. The estimates of future cash flows used in performing the recoverability evaluation are to consider, on a probability-weighted basis, the range of outcomes under consideration by management regarding when the asset will be returned to service, sold, or abandoned.
3. Idle property and equipment is to be clearly and unambiguously captioned and segregated on the statement of financial position from both the “held-and-used” and “held-for-sale” categories, since it does not qualify for either classification, with appropriate disclosure of the relevant circumstances.
4. As part of the ongoing review of the appropriateness of useful lives, the remaining useful life of the idle equipment is to be reassessed.
5. Evaluation by management of whether temporary suspension of depreciation or amortization of the asset is warranted until it is returned to service.

## Real Estate Sales Other than Retail Land Sales

**Scope<sup>6</sup>.** ASC 360-20-15 explicitly states that real estate sales transactions under ASC 360 include real estate with property enhancements or integral equipment. This defines property improvements and integral equipment as (ASC 360-20-15-3a) “any physical structure or equipment attached to real estate or other parts thereof that cannot be removed and used separately without incurring significant cost.” Examples include an office building or manufacturing plant. (For guidance on retail land sales that are sales, on a volume basis, of lots that are subdivisions of large tracts of land, see ASC 976.)

**Criteria for using full accrual method.** Profit from real estate sales is recognized in full, provided the following (ASC 360-20-40-3):

1. The profit is determinable (i.e., the collectability of the sales price is reasonably assured or the amount that will not be collectible can be estimated).
2. The earnings process is virtually complete, that is, the seller is not obliged to perform significant activities after the sale to earn the profit.

When both of these conditions are satisfied, the method used to recognize profits on real estate sales is referred to as the full accrual method. If both of these conditions are not satisfied, recognition of all or part of the profit is postponed.

The Codification goes on to say (ASC 360-20-40-4) that for real estate sales, the collectibility of the sales price is reasonably assured when the buyer has demonstrated a commitment to pay. This commitment is supported by a substantial initial investment, along with continuing investments that give the buyer a sufficient stake in the property such that the risk of loss through default motivates the buyer to honor its obligations to the seller. Collectibility of the sales price is also assessed by examining the conditions surrounding the sale (e.g., credit history of the buyer; age, condition, and location of the property; and history of cash flows generated by the property).

**Continuing investment.** Payments that the buyer is contractually required to pay on its total debt for the purchase price of the property. (ASC 360-20-40-20)

**Initial investment.** The sales value received by the seller at the time of sale. It includes a cash down payment, buyer’s notes supported by an irrevocable letter of credit, payments by the buyer to third parties to reduce or eliminate the seller’s indebtedness on the property, and any other amounts paid by the buyer that are part of the sales value. (ASC 360-20-40-10)

The full accrual method is appropriate and profit is recognized in full at the point of sale for real estate transactions when all of the following criteria are met (ASC 360-20-40-5):

1. A sale is consummated.
2. The buyer’s initial and continuing investments are adequate to demonstrate a commitment to pay for the property.
3. The seller’s receivable is not subject to future subordination.

<sup>6</sup> See the Scope section and the related footnotes at the beginning of this chapter for information on changes to this section.

4. The seller has transferred to the buyer the usual risks and rewards of ownership in a transaction that is in substance a sale, and the seller does not have a substantial continuing involvement in the property.

On sales in which an independent third party provides all of the financing for the buyer, the seller is most concerned that criterion number 1 above is met. For such sales, the sale is usually consummated on the closing date. When the seller finances the buyer, the seller must analyze the economic substance of the agreement to ascertain that criteria 2, 3, and 4 are also met (i.e., whether the transaction clearly transfers the risks and rewards of ownership to the buyer).

**Consummation of a sale.** A sale is considered consummated when the following conditions are met (ASC 360-20-40-7):

- a. The parties are bound by the terms of a contract.
- b. All consideration has been exchanged.
- c. Any permanent financing for which the seller is responsible has been arranged.
- d. All conditions precedent to closing have been performed.

When a seller is constructing office buildings, condominiums, shopping centers, or similar structures, item 4 may be applied to individual units rather than the entire project. These four conditions are usually met on or after closing, not at the point the agreement to sell is signed or at a preclosing meeting. Closing refers to the final steps of the transaction (i.e., when consideration is paid, the mortgage is secured, and the deed is delivered or placed in escrow). If the consummation criteria have not been satisfied, the seller uses the deposit method of accounting until all of the criteria are met (i.e., the sale has been consummated).

**Composition of the initial investment.** Sales transactions are characterized by many different types of payments and commitments made between the seller, buyer, and third parties; however, the buyer's initial investment only includes the following (ASC 360-20-40-10):

1. Cash paid to the seller as a down payment
2. Buyer's notes given to the seller that are supported by irrevocable letters of credit from independent lending institutions
3. Payments by the buyer to third parties that reduce existing indebtedness the seller has on the property
4. Other amounts paid by the buyer that are part of the sales value
5. Other consideration received by the seller that can be converted to cash without recourse to the seller; for example, other notes of the buyer.

ASC 360-20-40-13 specifically states that the following items are not included as initial investment:

1. Payments by the buyer to third parties for improvements to the property
2. A permanent loan commitment by an independent third party to replace a loan made by the seller
3. Funds that have been or will be loaned, refunded, or directly or indirectly provided to the buyer by the seller or loans guaranteed or collateralized by the seller for the buyer.

**Buyer's initial and continuing involvement.** The initial and continuing investment requirements for the full accrual method apply unless the seller receives any of the following as the full sales value of the property (ASC 360-20-40-15):

- a. Cash without any seller contingent liability on any debt on the property incurred or assumed by the buyer,

- b. The buyer's assumption of the seller's existing nonrecourse debt on the property,
- c. The buyer's assumption of all recourse debt on the property with the complete release of the seller from those obligations, or
- d. Any combination of such cash and debt assumption.

If the seller has received full payment for the sale and has no financing risk, the buyer's commitment to pay is not a factor in the seller's recognition of the sale. (ASC 360-20-40-16)

In computing the buyer's initial investment, debt incurred by the buyer that is secured by the property is not considered part of the buyer's initial investment. This is true whether the debt was incurred directly from the seller or other parties or indirectly through assumption. Payments to the seller from the proceeds of such indebtedness are not included as part of the buyer's initial investment. (ASC 360-20-40-17)

If the transaction does not qualify for full accrual accounting and, consequently, is being accounted for using installment, cost recovery, or reduced profit methods, payments made on debt the preceding paragraph are not considered to be buyer's cash payments. However, if the profit deferred under the applicable method exceeds the outstanding amount of seller financing and the outstanding amount of buyer's debt secured by the property for which the seller is contingently liable, the seller recognizes the excess in income.

**Adequacy of the buyer's initial investment.** Once the sale is consummated, the next step is to determine whether the buyer's initial investment adequately demonstrates a commitment to pay for the property and the reasonable likelihood that the seller will collect it. This determination is made by comparing the buyer's initial investment to the sales value of the property. ASC 360-20-55-1 and 55-2 specifically detail items that are includable as the initial investment and the minimum percentages that the initial investment must bear to the sales value of the property. To make the determination of whether the initial investment is adequate, the sales value of the property must also be computed.

**Computation of sales value.** The sales value of property in a real estate transaction is computed as follows:

- Stated sales price
- + Proceeds from the issuance of an exercised purchase option
- + Other payments that are, in substance, additional sales proceeds (e.g., management fees, points, prepaid interest, or fees required to be maintained in advance of the sale that will be applied against amounts due to the seller at a later point)
- A discount that reduces the buyer's note to its present value
- Net present value of services seller agrees to perform without compensation
- Excess of net present value of services seller performs over compensation that seller will receive
- = Sales value of the property

**Size of initial investment.** Once the initial investment is computed, its size must be compared to the sales value of the property. To qualify as an adequate initial investment, the initial investment must be equal to at least a major part of the difference between usual loan limits established by independent lending institutions and the sales value of the property. The minimum initial investment requirements for real estate sales (other than retail land sales) vary depending upon the type of property being sold. (ASC 360-20-40-18) The following table from ASC 360-20-55-2 provides the limits for the various properties:

<i>Type of property</i>	<i>Minimum initial investment expressed as a percentage of sales value</i>
<b>Land</b>	
Held for commercial, industrial, or residential development to commence within two years after sale	20
Held for commercial, industrial, or residential development to commence more than two years after sale	25
<b>Commercial and Industrial Property</b>	
Office and industrial buildings, shopping centers, and so forth:	
Properties subject to lease on a long-term lease basis to parties with satisfactory credit rating; cash flow currently sufficient to service all indebtedness	10
Single-tenancy properties sold to a buyer with a satisfactory credit rating	15
All other	20
Other income-producing properties (hotels, motels, marinas, mobile home parks, and so forth):	
Cash flow currently sufficient to service all indebtedness	15
Start-up situations or current deficiencies in cash flow	25
<b>Multifamily Residential Property</b>	
Primary residence:	
Cash flow currently sufficient to service all indebtedness	10
Start-up situations or current deficiencies in cash flow	15
Secondary or recreational residence:	
Cash flow currently sufficient to service all indebtedness	15
Start-up situations or current deficiencies in cash flow	25
<b>Single-Family Residential Property (including condominium or cooperative housing)</b>	
Primary residence of the buyer	52 <sup>a</sup>
Secondary or recreational residence	10 <sup>a</sup>

<sup>a</sup> If collectibility of the remaining portion of the sales price cannot be supported by reliable evidence of collection experience, the minimum initial investment [is to] be at least 60% of the difference between the sales value and the financing available from loans guaranteed by regulatory bodies such as the Federal Housing Authority (FHA) or the Veterans Administration (VA), or from independent, established lending institutions. This 60% test applies when independent first-mortgage financing is not utilized and the seller takes a receivable from the buyer for the difference between the sales value and the initial investment. If independent first mortgage financing is utilized, the adequacy of the initial investment on sales of single-family residential property [is] determined [as described in the next paragraph].

Lenders' appraisals of specific properties often differ. Therefore, if the buyer has obtained a permanent loan or firm permanent loan commitment for maximum financing of the property from an independent lending institution, the minimum initial investment must be the greater of the following (ASC 360-20-55-1):

1. The minimum percentage of the sales value of the property specified in the above table or

2. The lesser of:

- a. The amount of the sales value of the property in excess of 115% of the amount of a newly placed permanent loan or firm loan commitment from a primary lender that is an independent established lending institution
- b. 25% of the sales value.

To illustrate the determination of whether an initial investment adequately demonstrates a commitment to pay for property, consider the following example.

**Example determining adequacy of initial investment**

Marcus, Inc. exercised a \$2,000 option for the purchase of an apartment building from Rubin, Inc. The terms of the sales contract required Marcus to pay \$3,000 of delinquent property taxes, pay a \$300,000 cash down payment, assume Rubin's recently issued first mortgage of \$1,200,000, and give Rubin a second mortgage of \$500,000 at a prevailing interest rate.

Step 1—Compute the sales value of the property.

Payment of back taxes to reduce Rubin's liability to local municipality	\$ 3,000
Proceeds from exercised option	2,000
Cash down payment	300,000
First mortgage assumed by Marcus	1,200,000
Second mortgage given to Rubin	500,000
Sales value of the apartment complex	<u>\$2,005,000</u>

Step 2—Compute the initial investment.

Cash down payment	\$ 300,000
Payment of back taxes to reduce Rubin's liability to local municipality	3,000
Proceeds from exercised option	2,000
	<u>\$305,000</u>

Step 3—Compute the minimum initial investment required.

- a. The minimum percentage of the sales value of the property as specified in the table is 200,500 ( $= \$2,005,000 \times 10\%$ ).
- b. 1. The amount of the sales value of the property in excess of 115% of the recently placed permanent mortgage is \$625,000 (sales value of \$2,005,000 – \$1,380,000 [ $= 115\% \text{ of } \$1,200,000$ ]).  
2. 25% of the sales value (\$2,005,000) is \$501,250.

The lesser of b.1 and b.2 is b.2, \$501,250. The greater of a and b is b, \$501,250. Therefore, to record this transaction under the full accrual method (assuming all other criteria are met), the minimum initial investment must be equal to or greater than \$501,250. Since the actual initial investment is only \$305,000, all or part of the recognition of profit from the transaction must be postponed.

*Release provisions.* An agreement to sell real estate may provide that part or all of the property sold will be released from liens by payment of an amount sufficient to release the debt or by an assignment of the buyer's payments until release. To meet the criteria of an adequate initial investment, the investment must be sufficient both to pay the release on property released and to meet the initial investment requirements on property not released. If not, profit is recognized on each released portion as if it were a separate sale when a sale has been deemed to have taken place. (ASC 360-20-40-21 through 40-23)

**Recognition of profit when the requirements for the full accrual method are not met**  
*Buyer's initial or continuing investments do not qualify for full accrual method.* If the sale has been consummated but the buyer's initial investment does not adequately demonstrate a commitment to pay, the transaction is accounted for using the installment method when the seller is reasonably assured of recovering the cost of the property if the buyer defaults. However, if the recovery of the cost of the property is not reasonably assured should the buyer default or if the cost has been recovered and the collection of additional amounts is uncertain, the cost recovery or deposit method is used. (ASC 360-20-40-31)

**Exhibition—Recognition of Profit When Sale Is Not Consummated or Full Accrual Requirements Are Not Met**

Circumstances	Accounting Treatment
Sale not consummated	Deposit method
Buyer's initial investment does not meet criteria for recognition of profit by the full accrual method: <ul style="list-style-type: none"> <li>• Recovery of the property is reasonably assured if buyer defaults</li> <li>• Recovery of the property is not reasonably assured if buyer defaults</li> <li>• Cost has already been recovered and collection of additional amounts is uncertain</li> </ul> (ASC 360-40-28 through 40-31)	Installment method or cost recovery method Cost recovery or deposit method Cost recovery or deposit method

*Adequacy of the buyer's continuing investments.* The collectibility of the buyer's receivable must be reasonably assured; therefore, for full profit recognition under the full accrual method, the buyer must be contractually required to pay each year on its total debt for the purchase price of the property an amount at least equal to the level annual payment that would be needed to pay that debt (both principal and interest) over a specified period. This period is no more than twenty years for land, and no more than the customary amortization term of a first mortgage loan by an independent lender for other types of real estate. For continuing investment purposes, the contractually required payments must be in a form that is acceptable for an initial investment. If the seller provides funds to the buyer, either directly or indirectly, these funds must be subtracted from the buyer's payments in determining whether the continuing investments are adequate. (ASC 360-20-40-19 and 55-02)

The indebtedness on the property does not have to be reduced proportionately. A lump-sum (balloon) payment will not affect the amortization of the receivable as long as the level annual payments still meet the minimum annual amortization requirement. For example, a land real estate sale may require the buyer to make level annual payments at the end of each of the first five years and then a balloon payment at the end of the sixth year. The continuing investment criterion is met provided the level annual payment required in each of the first five years is greater than or equal to the level annual payment that would be made if the receivable were amortized over the maximum twenty-year (land's specified term) period.

**Seller's receivable subject to future subordination.** The seller's receivable should not be subject to future subordination. Future subordination by a primary lender would permit the lender

to obtain a lien on the property, giving the seller only a secondary residual claim. This subordination criterion does not apply if either of the following occur (ASC 360-20-40-25):

1. A receivable is subordinate to a first mortgage on the property existing at the time of sale.
2. A future loan, including an existing permanent loan commitment, is provided for by the terms of the sale and the proceeds of the loan will be applied first to the payment of the seller's receivable.

If the seller's receivable is subject to future subordination, profit is recognized using the cost recovery method. The cost recovery method is justified because the collectibility of the sales price is not reasonably assured in circumstances when the receivable may be subordinated to amounts due to other creditors.

**Seller's continuing involvement.** Sometimes sellers continue to be involved with property for periods of time even though the property has been legally sold. The seller's involvement often takes the form of profit participation, management services, financing, guarantees of return, construction, etc. The seller does not have a substantial continuing involvement with property unless the risks and rewards of ownership have been clearly transferred to the buyer.

If the seller has some continuing involvement with the property and does not clearly transfer substantially all of the risks and rewards of ownership, profit is recognized by a method other than the full accrual method. The method chosen is determined by the nature and extent of the seller's continuing involvement. As a general rule, profit is only recognized at the time of sale if the amount of the seller's loss due to the continued involvement with the property is limited by the terms of the sales contract. In this event, the profit recognized at this time is reduced by the maximum possible loss from the continued involvement. (ASC 360-20-40-37)

**Continuing investment not qualifying.** If the sale has been consummated and the minimum initial investment criteria have been satisfied but the continuing investment by the buyer does not meet the stated criterion, the seller recognizes profit by the reduced profit method at the time of sale if payments by the buyer each year will at least cover both of the following (ASC 360-20-40-33):

1. The interest and principal amortization on the maximum first mortgage loan that could be obtained on the property
2. Interest, at an appropriate rate, on the excess of the aggregate actual debt on the property over such a maximum first mortgage loan.

If the payments by the buyer do not cover both of the above, the seller recognizes profit by either the installment or cost recovery method. (ASC 360-20-40-34)

**Graduated payment mortgages.** Graduated payment mortgages for which negative principal amortization is recognized do not meet the continuing investment tests in ASC 360, and thus full profit is not recognized immediately. (ASC 360-20-40-35) Mortgage insurance is not to be considered the equivalent of an irrevocable letter of credit in determining whether profit is to be recognized, and the purchase of such insurance is not in itself a demonstration of commitment by the buyer to honor its obligation to pay for the property. The sole exception to this rule is that an irrevocable financial instrument from an established independent insuring institution, such as FHA (Federal Housing Administration) and VA (Veteran's Affairs), profits may be recognized under the full accrual method. (ASC 360-20-40-12) The seller may consider these to be the equivalent of irrevocable letters of credit.

**Profit-sharing, financing, and leasing arrangements.** In real estate sales, it is often the case that economic substance takes precedence over legal form. Certain transactions, though possibly

called sales, are in substance profit-sharing, financing, or leasing arrangements and are accounted for as such. These include situations in which:

1. The seller has an obligation to repurchase the property, or the terms of the transaction allow the buyer to compel the seller to repurchase the property or give the seller an option to do so. (ASC 360-20-40-38)
2. The seller is a general partner in a limited partnership that acquires an interest in the property sold and holds a receivable from the buyer for a significant part (15% of the maximum first-lien financing) of the sales price. (ASC 360-20-40-40)
3. The seller guarantees the return of the buyer's investment or a return on that investment for an extended period of time. (ASC 360-20-40-41)
4. The seller is required to initiate or support operations, or continue to operate the property at its own risk for an extended period of time. (ASC 360-20-40-42)

*Antispeculation clauses.* ASC 360-20-40-39 deals with antispeculation clauses sometimes found in land sale agreements, requiring the buyer to develop the land in a specific manner or within a specific period of time and giving the seller the right, but not the obligation, to reacquire the property when the condition is not met. This option does not preclude recognition of a sale if the probability of the buyer not complying is remote.

*Options to purchase real estate property.* Often a buyer will buy an option to purchase land from a seller with the hopeful intention of obtaining a zoning change, building permit, or some other contingency specified in the option agreement. Proceeds from the issue of an option by a property owner (seller) are accounted for by the deposit method. If the option is exercised, the seller includes the option proceeds in the computation of the sales value of the property. If the option is not exercised, the seller recognizes the option proceeds as income at the time the option expires. (ASC 360-20-40-45)

*Partial sales of property.* Per ASC 360-20-40-46, "a sale is a partial sale if the seller retains an equity interest in the property or has an equity interest in the buyer." Profit on a partial sale may be recognized on the date of sale if all of the following occur:

1. The buyer is independent of the seller.
2. Collection of the sales price is reasonably assured.
3. The seller will not be required to support the operations of the property on its related obligations to an extent greater than its proportionate interest.

If the buyer is not independent of the seller, the seller may not be able to recognize any profit that is measured at the date of sale (see the following Buy-sell agreements section). (ASC 360-20-40-47)

If the seller is not reasonably assured of collecting the sales price, the cost recovery or installment method is used to recognize profit on the partial sale. (ASC 360-20-40-48)

A seller who separately sells individual units in condominium projects or time-sharing interests recognizes profit by the percentage-of-completion method on the sale of individual units or interests if all of the following criteria are met (ASC 360-20-40-50):

1. Construction is beyond a preliminary stage (i.e., engineering and design work, execution of construction contracts, site clearance and preparation, excavation, and completion of the building foundation have all been completed).
2. The buyer is unable to obtain a refund except for nondelivery of the units or interest.
3. Sufficient units have been sold to ensure that the entire property will not revert to being rental property.

4. Sales prices are collectible.
5. Aggregate sales proceeds and costs can be reasonably estimated.

The deposit method is used to account for these sales up to the point all the criteria are met for recognition of a sale. (ASC 360-20-40-54)

**Leases involving real estate.** (ASC 360-20-40-60) ASC 840-40 dealing with sales-type real estate leases and sale-leaseback real estate transactions is covered in the chapter on ASC 840. Also see the chapter on ASC 842.

**Buy-sell agreements.** A buy-sell clause is not a prohibited form of continuing involvement precluding partial sales treatment, but only if:

1. The buyer can act independently from the seller, or if
2. The seller is not compelled to reacquire the other investor's interest in the jointly owned entity.

The decision is judgmental, requiring consideration of numerous factors.

Factors to consider in determining whether the buyer cannot act independently from the seller are:

1. The presence of a predetermined buy-sell price,
2. The seller has a strategic necessity barring it from relinquishing its ownership rights to the buyer,
3. The seller has business arrangements with the jointly owned entity that economically require it to reacquire the real estate to avoid losing economic benefits or escaping negative consequences of the arrangements, or
4. Tax implications compelling the seller to acquire the buyer's interest in the entity.

Factors to consider in determining if the buyer can compel the seller to repurchase the property include:

1. The buyer is financially unable to acquire the seller's interest,
2. The buy-sell clause contains a specified rate of return for either party,
3. The buyer has a strategic necessity requiring it to sell its interest to the seller,
4. The buyer is legally restricted from acquiring the seller's interest,
5. The buyer cannot realize its economic interest by sale to a third party, due to the integration of the real estate into the seller's business, or
6. Tax implications compelling the buyer to sell its interest to the seller.

### Methods of Accounting for Real Estate Sales other than Retail Land Sales

**Selection of method.** The full accrual method of accounting for nonretail sales of real estate is appropriate when all four of the recognition criteria have been satisfied:

1. The sale is consummated,
2. The buyer has demonstrated a commitment to pay,
3. The seller's receivable is not subject to future subordination,
4. The seller has transferred the risks and rewards of ownership and does not have a substantial continuing involvement with the property.

If all of the criteria have not been met, the seller records the transaction by one of the following methods as indicated by ASC 360-20:

1. Deposit
2. Cost recovery
3. Installment
4. Reduced profit
5. Percentage-of-completion.

The installment method is used if the full accrual method cannot be used due to an inadequate initial investment by the buyer, provided that recovery of cost is reasonably assured if the buyer defaults.

The cost recovery method or the deposit methods are used if such cost recovery is not assured.

The reduced profit method is used when the buyer's initial investment is adequate but the continuing investment is not adequate, and payments by the buyer at least cover the sum of:

1. The amortization (principal and interest) on the maximum first mortgage that could be obtained on the property, and
2. The interest, at an appropriate rate, on the excess of aggregate debt over the maximum first mortgage.

**Full accrual method.** The full accrual method is simply the application of the revenue recognition principle. Profit under the full accrual method is computed by subtracting the cost basis of the property surrendered from the sales value given by the buyer. Also, the computation of profit on the sale includes all costs incurred that are directly related to the sale, such as accounting and legal fees.

If a loss is apparent (e.g., the carrying value of the property exceeds the sum of the deposit, fair value of unrecorded note receivable, and the debt assumed by the buyer), then immediate recognition of the loss is required.

A real estate sale is recognized in full when the profit is determinable and the earnings process is virtually complete. The profit is determinable when the first three recognition criteria listed above have been met. The earnings process is virtually complete when the fourth criterion has been met.

**Installment method.** Under the installment method (ASC 360-20-55-7), each cash receipt and principal payment by the buyer on debt assumed with recourse to the seller consists of part recovery of cost and part recovery of profit. The apportionment between cost recovery and profit is in the same ratio as total cost and total profit bear to the sales value of the property sold. Therefore, under the installment method, the seller recognizes profit on each payment that the buyer makes to the seller and on each payment the buyer makes to the holder of the primary debt. When a buyer assumes debt that is without recourse to the seller, the seller recognizes profit on each payment made to the seller and on the entire debt assumed by the buyer. The accounting treatment differs because the seller is subject to substantially different levels of risk under the alternative conditions. For debt that is without recourse, the seller recovers a portion, if not all, of the cost of the asset surrendered at the time the buyer assumes the debt.

**Example of the installment method**

Assume Tucker sells to Price a plot of undeveloped land for \$2,000,000. Price will assume, with recourse, Tucker's existing first mortgage of \$1,000,000 and also pay Tucker a \$300,000 cash down payment. Price will pay the balance of \$700,000 by giving Tucker a second mortgage payable in equal installments of principal and interest over a ten-year period. The cost of the land to Tucker was \$1,200,000 and Price will commence development of the land immediately.

1. Computation of sales value:

Cash down payment	\$300,000
First mortgage	1,000,000
Second mortgage	<u>700,000</u>
Sales value	<u>\$2,000,000</u>

2. Computation of the initial investment:

Cash down payment	<u>\$300,000</u>
-------------------	------------------

3. Computation of the minimum required initial investment:

- a. \$400,000 (\$2,000,000 × 20%)
- b. 1. \$850,000 [\$2,000,000 – (115% × 1,000,000)]
2. \$500,000 (\$2,000,000 × 25%)

The minimum initial investment is \$500,000 since b.2 is less than b.1 and b.2 is greater than a.

The initial investment criterion has not been satisfied because the actual initial investment is less than the minimum initial investment. Therefore, assuming the sale has been consummated and Tucker is reasonably assured of recovering the cost of the land from Price, the installment method is to be used. The gross profit to be recognized over the installment payment period by Tucker is computed as follows:

Sales value	\$2,000,000
Cost of land	(1,200,000)
Gross profit	<u>\$ 800,000</u>

The gross profit percentage to apply to each payment by Price to Tucker and the primary debt holder is 40% (\$800,000/\$2,000,000).

If Price also pays \$50,000 of principal on the first mortgage and \$70,000 of principal on the second mortgage in the year of sale, Tucker would recognize the following profit in the year of sale:

Profit recognized on the down payment (\$300,000 × 40%)	\$120,000
Profit recognized on the principal payments:	
First mortgage (\$50,000 × 40%)	20,000
Second mortgage (\$70,000 × 40%)	<u>28,000</u>
Total profit recognized in year of sale	<u>\$168,000</u>

Note that Tucker recognizes profit only on the payment applicable to the first mortgage. This is because Tucker may be called upon to satisfy the liability on the first mortgage if Price defaults.

If Tucker's first mortgage was assumed without recourse, Tucker would recognize the following profit in the year of sale:

Profit recognized on the down payment (\$300,000 × 40%)	\$120,000
Profit recognized on Price's assumption of Tucker's first mortgage without recourse (\$1,000,000 × 40%)	400,000
Profit recognized on the principal payment of the second mortgage (\$70,000 × 40%)	<u>28,000</u>
Total profit recognized in year of sale	<u>\$548,000</u>

The income statement (or related footnotes) for the period of sale includes the sales value received, the gross profit recognized, the gross profit deferred, and the costs of sale. In future periods when further payments are made to the buyer, the seller realizes gross profit on these payments. This amount is presented as a single line item in the revenue section of the income statement.

If, in the future, the transaction meets the requirements for the full accrual method of recognizing profit, the seller may change to that method and recognize the remaining deferred profit as income at that time.

**Cost recovery method.** When the cost recovery method (ASC 360-20-55-13) is used (e.g., when the seller's receivable is subject to subordination or the seller is not reasonably assured of recovering the cost of the property if the buyer defaults), no profit is recognized on the sales transaction until the seller has recovered the cost of the property sold. If the buyer assumes debt that is with recourse to the seller, profit is not recognized by the seller until the cash payments by the buyer, including both principal and interest on debt due the seller and on debt assumed by the buyer, exceed the seller's cost of the property sold. If the buyer assumes debt that is without recourse to the seller, profit may be recognized by the seller when the cash payments by the buyer, including both principal and interest on debt due the seller, exceed the difference between the seller's cost of the property and the nonrecourse debt assumed by the buyer.

For the cost recovery method, principal collections reduce the seller's related receivable, and interest collections on such receivable increase the deferred gross profit on the statement of financial position. (ASC 360-20-55-14)

#### Example of the cost recovery method

Assume that on January 1, 20X1, Simon, Inc. purchased undeveloped land with a sales value of \$365,000 from Davis Co. The sales value is represented by a \$15,000 cash down payment, Simon assuming Davis's \$200,000 first mortgage (10%, payable in equal annual installments over the next twenty years), and Simon giving Davis a second mortgage of \$150,000 (12%, payable in equal annual installments over the next ten years). The sale has been consummated, but the initial investment is below the minimum required amount and Davis is not reasonably assured of recovering the cost of the property if Simon defaults. The cost of the land to Davis was \$300,000. The circumstances indicate the cost recovery method is appropriate. The transaction is recorded by Davis as follows:

1/1/X1	Notes receivable	150,000
	First mortgage payable	200,000
	Cash	15,000
	Revenue from sale of land	365,000
	Revenue from sale of land	365,000
	Land	300,000
	Deferred gross profit	65,000

Case 1—The first mortgage was assumed with recourse to Davis. Immediately after the sale, the unrecovered cost of the land is computed as follows:

Land	\$300,000
Less: Cash down payment	(15,000)
Unrecovered cost	<u>\$285,000</u>

The note (second mortgage) is reported as follows:

Note receivable	\$150,000
Less: Deferred gross profit	<u>(65,000)</u>

At the end of the year Simon pays \$26,547.64 (\$8,547.64 principal and \$18,000.00 interest) on the second mortgage note and \$23,491.94 (\$3,491.94 principal and \$20,000.00 interest) on the first mortgage. At 12/31/12 the unrecovered cost of the land is computed as follows:

Previous unrecovered cost	\$285,000.00
Less: Note receivable payment	\$26,547.64
First mortgage payment	<u>23,491.94</u>
Unrecovered cost	<u><u>\$234,960.42</u></u>

The receivable is reported on the 12/31/12 statement of financial position as follows:

Note receivable (\$150,000 – 8,547.64)	\$141,452.36
Less: Deferred gross profit (\$65,000 + 18,000)	<u>83,000.00</u>

Case 2—The first mortgage is assumed without recourse to Davis. The reporting of the note is the same as Case 1; however, the unrecovered cost of the property is different. Immediately after the sale, the unrecovered cost of the property is computed as follows:

Land	\$300,000
Less: Cash down payment	(15,000)
Nonrecourse debt assumed by Simon	<u>(200,000)</u>
Unrecovered cost	<u><u>\$85,000</u></u>

After Simon makes the payments at the end of the year, the unrecovered cost is computed as follows:

Previous unrecovered cost	\$85,000.00
Less: Notes receivable payment	<u>26,547.64</u>
Unrecovered cost	<u><u>\$58,452.36</u></u>

For the cost recovery method, the income statement for the year the real estate sale occurs includes the sales value received, the cost of the property given up, and the gross profit deferred. In future periods, after the cost of the property has been recovered, the income statement includes the gross profit earned as a separate revenue item.

If, after accounting for the sale by the cost recovery method, circumstances indicate that the criteria for the full accrual method are satisfied, the seller may change to the full accrual method and recognize any remaining deferred gross profit in full.

**Deposit method.** When the deposit method (ASC 360-20-55-17) is used (e.g., when the sale is, in substance, the sale of an option and not real estate), the seller does not recognize any profit, does not record a receivable, continues to report in its financial statements the property and the related existing debt even if the debt has been assumed by the buyer, and discloses that those items are subject to a sales contract. The seller also continues to recognize depreciation expense on the property for which the deposits have been received, unless the property has been classified as held for sale (per ASC 360-10). Cash received from the buyer (initial and continuing investments) is reported as a deposit on the contract. However, some amounts of cash may be received that are not subject to refund, such as interest on the unrecorded principal. These amounts are used to offset any carrying charges on the property (e.g., property taxes and interest on the existing debt). If the

interest collected on the unrecorded receivable is refundable, the seller records this interest as a deposit before the sale is consummated and then includes it as a part of the initial investment once the sale is consummated. If deposits on retail land sales are eventually recognized as sales, the interest portion of the deposit is separately recognized as interest income. For contracts that are cancelled, the nonrefundable amounts are recognized as income and the refundable amounts returned to the depositor at the time of cancellation.

As stated, the seller's statement of financial position continues to present the debt assumed by the buyer (this includes nonrecourse debt) among its other liabilities. However, the seller reports any principal payments on the mortgage debt assumed as additional deposits, while correspondingly reducing the carrying amount of the mortgage debt.

#### **Example of a deposit transaction**

Elbrus Investments enters into two separate property acquisition transactions with the Buena Vista Land Company.

1. Elbrus pays a \$50,000 deposit and promises to pay an additional \$800,000 to buy land and a building in an area not yet properly zoned for the facility Elbrus intends to construct. Final acquisition of the property is contingent upon these zoning changes. Buena Vista does not record the receivable, and records the deposit with the following entry:

Cash	50,000	
Customer deposits		50,000

Part of the purchase agreement stipulates that Buena Vista will retain all interest earned on the deposit, and that 10% of the deposit is nonrefundable. Buena Vista earns 5% interest on Elbrus' deposit over a period of four months, resulting in \$208 of interest income that is offset against the property tax expenses of the property with the following entry:

Cash	208	
Property tax expense		208

Immediately thereafter, the required zoning changes are turned down, and Elbrus cancels the sales contract. Buena Vista returns the refundable portion of the deposit to Elbrus and records the non-refundable portion as income with the following entry:

Customer deposits	50,000	
Income from contract cancellation		10,000
Cash		40,000

2. Elbrus pays a \$40,000 deposit on land owned and being improved by Buena Vista. Elbrus immediately begins paying \$5,000/month under a four-year, 7% loan agreement totaling \$212,000 of principal payments, and agrees to pay an additional \$350,000 at closing, subject to the land being approved for residential construction. After two months, Buena Vista has earned \$167 of refundable interest income on Elbrus' deposit and has been paid \$7,689 of refundable principal and \$2,311 of refundable interest on the debt. Buena Vista records these events with the following entry:

Cash	10,167	
Customer deposits		10,167

The land is approved for residential construction, triggering sale of the property. Buena Vista's basis in the property is \$520,000. Buena Vista uses the following entry to describe completion of the sale:

Cash	350,000
Note receivable	204,311
Customer deposits	50,167
Gain on asset sale	84,478
Land	520,000

**Reduced profit method.** The reduced profit method is appropriate when the sale has been consummated and the initial investment is adequate but the continuing investment does not clearly demonstrate the buyer's willing commitment to pay the remaining balance of the receivable. For example, a buyer may purchase land under an agreement in which the seller will finance the sale over a thirty-year period. ASC 976 specifically states twenty years as the maximum amortization period for the purchase of land; therefore, the agreement fails to meet the continuing investment criteria.

Under the reduced profit method (ASC 360-20-55-16), the seller recognizes a portion of the profit at the time of sale with the remaining portion recognized in future periods. The amount of reduced profit recognized at the time of sale is determined by discounting the receivable from the buyer to the present value of the lowest level of annual payments required by the sales contract over the maximum period of time specified for that type of real estate property (twenty years for land and the customary term of a first mortgage loan set by an independent lending institution for other types of real estate). The remaining profit is recognized in the periods that lump-sum or other payments are made.

#### Example of the reduced profit method

Assume Levinson, Inc. sells a parcel of land to Raemer Co. Levinson receives sales value of \$2,000,000. The land cost \$1,600,000. Raemer gave Levinson the following consideration:

Cash down payment	\$ 500,000
First mortgage note payable to an independent lending institution (payable in equal installments of principal and 12% interest, \$133,887 payable at the end of each of the next twenty years)	1,000,000
Second mortgage note payable to Levinson (payable in equal installments of principal and 10% interest, \$53,039 payable at the end of each of the next thirty years)	<u>500,000</u>
Total sales value	<u>\$2,000,000</u>

The amortization term of the second mortgage (seller's receivable) exceeds the twenty-year maximum permitted by ASC 976. It is assumed that the payments by the buyer will cover the interest and principal on the maximum first mortgage loan that could be obtained on the property and interest on the excess aggregate debt on the property over such a maximum first mortgage loan; consequently, the reduced profit method is appropriate. It is also assumed that the market interest rate on similar agreements is 14%.

The present value of \$53,039 per year for twenty years at the market rate of 14% is \$351,278 ( $\$53,039 \times 6.623$ ).

The gross profit on the sale (\$400,000) is reduced by the difference between the face amount of the seller's receivable (\$500,000) and the reduced amount (\$351,278) or \$148,722. The profit recognized at the time of sale is the sales value less the cost of the land less the difference between the face amount of

the receivable and the reduced amount. Therefore, the reduced profit recognized on the date of sale is computed as follows:

Sales value	\$2,000,000
Less: Cost of land	(1,600,000)
Excess	(148,722)
Reduced profit	\$ <u>251,278</u>

Under the reduced profit method, the seller amortizes its receivable at the market rate, not the rate given on the second mortgage. The receivable's carrying balance is zero after the specified term expires (in this case, twenty years). The remaining profit of \$148,722 is recognized in the years after the specified term expires as the buyer makes payments on the second mortgage (years twenty-one through thirty).

### Other Guidance to Accounting for Real Estate Sales Transactions

**Integral equipment.** Sales of integral equipment are within the scope of ASC 360, and thus the determination of whether equipment is integral is an important one. A determination of whether equipment to be leased is integral is also necessary to enable lessors to determine the proper accounting for sales-type leases. This determination is made based on two factors:

1. The first is the significance of the cost to remove the equipment from its existing location (which would include any costs of repairing the damage done to that location by the act of removal). (ASC 360-20-15-4)
2. The second is the decrease in value of the equipment that results from its removal (which is, at a minimum, the cost to ship and reinstall the equipment at a new site). (ASC 360-20-15-5)

The nature of the equipment and whether others can use it is considered in determining whether there would be any further diminution in fair value. When the combined total of the cost to remove and any further diminution of fair value exceeds 10% of the fair value of the equipment (installed), the equipment is to be deemed integral equipment, and thus accounted for under the provisions of ASC 360. (ASC 360-20-15-7)

**Collateralized loan valuation allowance.** ASC 310-40-55 deals with the question of whether a valuation allowance previously established for a loan which is collateralized by a long-lived asset should be carried forward after the asset is foreclosed due to loan default. It holds that, when such a loan is foreclosed, any valuation allowance established for the foreclosed loan should not be carried over as a separate element of the cost basis for purposes of accounting for the long-lived assets under ASC 360. Rather, upon foreclosure the lender must measure the long-lived asset received in full satisfaction of a receivable at fair value less cost to sell as prescribed by ASC 310-40. Application of ASC 310-40 results in the identification of a new cost basis for the long-lived asset received in full satisfaction of a receivable.

**Foreclosure—subsequent recovery of value.** ASC 310-40-55 also addresses the limitation on gain recognition when an impaired asset obtained by means of foreclosure later recovers some value. ASC 360-10-35-40 states that “a loss shall be recognized for any initial or subsequent write-down to fair value less cost to sell. A gain shall be recognized for any subsequent increase in fair value less cost to sell, but not in excess of the cumulative loss previously recognized (for a write-down to fair value less cost to sell).” Thus, gain recognition is limited to the cumulative extent that losses have been recognized while the assets were accounted for as long-lived assets under ASC 360. Put differently, ASC 360 does not allow the lender to “look back” to lending impairments measured and recognized under ASC 450 or ASC 310, for purposes of measuring the cumulative loss previously recognized. “Recovery” of losses not recognized is thus not permitted.

**Homebuilder builds home on own lot.** ASC 970-360-55 addresses the timing of income recognition when a homebuilder enters into a contract to build a home on its own lot, relinquishing title to both the lot and the home at closing. It states that profit recognition is not appropriate until the conditions specified in ASC 360 have been met. Deposit accounting is to be used for both the land and building activity until the conditions are met.

**Repossessed real estate.** ASC 310-40-40-7 deals with the proper valuation for repossessed real estate which is recorded at the lower of the net receivable due to the seller at foreclosure or the fair value of the property.

**Minority interests in REITs.** ASC 974-810-30 addresses the proper treatment of minority interests in certain real estate investment trusts. It holds that the net equity of the operating partnership (after the contributions of the sponsor and the Real Estate Investment Trusts, or REITs) multiplied by the sponsor's ownership percentage in the operating partnership represents the amount to be initially reported as the minority interest in the REIT's consolidated financial statements. Also, if a minority interest balance is negative, the related change in the REIT's income statement would be the greater of the minority interest holder's share of current earnings or the amount of distributions to the minority interest holder during the year. Any excess is to be credited directly to equity until elimination of the minority interest deficit that existed at the formation of the REIT. Other REIT accounting matters are also addressed in the codification; for example, subsequent acquisitions by the REIT, for cash, of a sponsor's minority interest in an operating partnership are accounted for consistent with the accounting for formation of the REIT.

**ADC loans.** The matter of appropriate accounting for transfers of investments that are in substance real estate is addressed by ASC 360-20-15-3, which holds that in such circumstances the accounting is to follow ASC 360. Thus, transfers of acquisition, development, and construction loans (ADC loans), which are deemed in substance real estate under ASC 815-15-55-10, are subject to this rule, and transfers of marketable investments in a REIT which are accounted for under ASC 320 are to be accounted for per ASC 860.

**Condominium unit sales.** ASC 360-20-40 addresses the applicability of a buyer's continuing investment to an entity's recognition of revenue when selling condominium units. An entity can assess the collectibility of the sales price as per ASC 360 by requiring the buyer to either make additional payments during the construction term at least equal to the level annual payments that would be required to fund principal and interest on a customary mortgage for the remaining purchase price of the property, or increase the minimum initial investment by an equivalent aggregate amount. If these criteria cannot be met, then the seller should record the transaction under the deposit method.

**Investments in real estate ventures.** ASC 970-323, specifying the accounting for investments in real estate ventures, has been widely applied in practice—even to the extent that its guidance has been analogized to other equity investment situations. It requires that owners of real estate ventures should generally use the equity method of accounting to account for their investments. However, limited partners may have such a minor interest and have no influence or control, in which case the cost method would instead be appropriate.

According to ASC 970-323, if losses exceed the investment, the losses are to be recognized regardless of any increase in the estimated fair value of the venture's assets. Losses in excess of the amount of the investment are a liability. Losses which cannot be borne by certain investors require the remaining investors to use ASC 450 to determine their share of any additional loss. Limited partners are not required to record losses in excess of investment. As usual, if investors do not recognize losses in excess of investment, the equity method is resumed only after the investor's share of net income exceeds the cumulative net losses not recognized previously.

The codification also notes that venture agreements may designate different allocations for profits, losses, cash distributions, and cash from liquidation. Accounting for equity in profits and losses therefore requires careful consideration of allocation formulas because the substance over form concept requires equity method accounting to follow the ultimate cash allocations.

Contributions of real estate to a venture as capital are recorded by the investor at cost, and cannot result in the recognition of a gain, since a capital contribution does not represent the culmination of the earnings process.

***Real estate syndications.*** ASC 970-323 states that interest on loans and advances that are, in substance, capital contributions and so are accounted for as distributions and not interest.

In ASC 970-605, the related topic of appropriate accounting for real estate syndication income is addressed. This applies to all income recognition from real estate syndication activities. ASC 976 applies to profit and loss recognition on sales of real estate by syndicators to partnerships. ASC 970-605 requires that the same concepts be applied to the syndicators—even though they may have never owned the property.

Under the provisions of ASC 970-605, all fees charged by syndicators are includable in the determination of sales value, as required by ASC 976, except for syndication fees and fees for which future services must be performed. Syndication fees are recognized as income when the earning process is complete and collectibility is reasonably assured. If fees are unreasonable, they are to be adjusted, and the sales price of the real estate is to be appropriately adjusted as well. If a partnership interest is received by the syndicator, the value is included in the test of fee reasonableness. If it is part of the fee, the syndicators are to account for this interest as a retained interest from the partial sale of real estate in conformity with ASC 976. Fees for future services are recognized when the service is rendered.

Fees received from blind pool transactions are recognized ratably as the syndication partnership invests in property but only to the extent that the fees are nonrefundable. If syndicators are exposed to future losses from material involvement or from uncertainties regarding collectibility, income is deferred until the losses can be reasonably estimated. For purposes of determining the ASC 976 requirement concerning the buyer's initial and continuing investment for profit recognition, before cash received by syndicators can be allocated to initial and continuing investment, it is allocated to (1) unpaid syndication fees until such fees are paid in full, and (2) amounts previously allocated to fees for future services (to the extent such services have already been performed when the cash is collected). If syndicators receive or retain partnership interests that are subordinated, these are accounted for as participations in future profits without risk of loss.

## PERSPECTIVE AND ISSUES

### Technical Alert

**ASU 2016-04.** In March 2016, the FASB issued ASU 2016-04, *Recognition of Breakage for Certain Prepaid Stored-Value Products*. The ASU is a consensus of the EITF.

**Guidance.** ASC 2016-04 was created to align the guidance in ASC 405-20 for financial liabilities with the guidance for nonfinancial liabilities in ASU 2014-09, *Revenue Recognition*, and codified in ASC 606. To do so, the guidance in ASU 2016-04 creates an exception to the requirements of ASC 405-20. It requires issuers to derecognize financial liabilities related to breakage amounts in either of the following two ways:

- If the entity expects to have a related breakage amount, derecognize the liability:
    - in amounts proportionate to the pattern of rights expected to be exercised by the holder of the product
    - to the extent that a significant reversal of the breakage amount will not subsequently occur, or
  - If the entity does not expect to be entitled to a breakage amount, the entity derecognizes the liability when the likelihood of the exercise of rights becomes remote.
- (ASC 405-20-40-4)

Entities must reassess their breakage estimates each reporting period. Changes in estimate are accounted for as a change in accounting estimate under the guidance in ASC 250-10-45-17 through 45-20.

**Implementation.** The guidance in ASU 2016-04 is effective concurrent with ASU 2014-09. For more on breakage and the effective dates of ASU 2014-09, see the chapter on ASC 606.

### Subtopics

ASC 405, *Liabilities*, consists of four subtopics:

- ASC 405-10, *Overall*, which merely points to other areas of the Codification that contain guidance on liabilities

- ASC 405-20, *Extinguishments of Liabilities*, which provides guidance on when an entity should consider a liability settled
- ASC 405-30, *Insurance-Related Assessments*, which provides guidance on items such as assessments for state guaranty funds and workers' compensation second-injury funds
- ASC 405-40, *Obligations Resulting from Joint and Several Liabilities*, which provides guidance on arrangements where the total amount of the obligation is fixed at the reporting date.

### Scope and Scope Exceptions

**ASC 405.** ASC 405 guidance applies to all entities with the covered transactions.

**ASC 405-20.** ASC 405-20 applies to extinguishments of both financial and nonfinancial liabilities unless addressed by another Topic. (ASC 405-20-15-2)

**ASC 405-30.** ASC 405-30 applies to entities:

- Subject to guaranty-forward assessments
  - Subject to other insurance-related assessments.
- (ASC 405-30-15-1)

The guidance also applies to assessments mandated by statute or regulatory authority related directly or indirectly to underwriting activities, such as self-insurance. (ASC 405-30-30-15-2)

ASC 405-30 does *not* apply to the following:

- Amounts payable or paid as a result of reinsurance contracts or arrangements that are in substance reinsurance, including assumed reinsurance activities and certain involuntary pools that are covered by Topic 944.
  - Assessments of depository institutions related to bank insurance and similar funds.
  - The annual fee imposed on health insurers by the Patient Protection and Affordable Care Act as amended by the Health Care and Education Reconciliation Act (the Acts). The accounting for the Acts' fee is addressed in Subtopic 720-50.
- (ASC 405-30-15-3)

ASC 405-30 also does not apply to assessments related to income taxes and premium taxes.

**ASC 405-40.** ASC 405-40 applies to all entities and obligations such as debt arrangements, other contractual obligations, and settled litigation and judicial rulings. The guidance does *not* apply to obligations accounted for under the following topics:

- ASC 410, *Asset Retirement and Environmental Obligations*
  - ASC 450, *Contingencies*
  - ASC 460, *Guarantees*
  - ASC 715, *Compensation—Retirement Benefits*
  - ASC 740, *Income Taxes*.
- (ASC 405-40-15-1)

### Overview

ASC 405 provides accounting and reporting guidance related to short-term liabilities and certain guidance that may apply broadly to any liability.

The FASB has declared, as a long-term goal, that all financial liabilities should be recognized in the statement of financial position at fair value, rather than at amounts based on their historical cost. The proper calculation of fair value is described in detail in the chapter on ASC 820, *Fair Value Measurements and Disclosures*. Under ASC 825, *Financial Instruments*, an entity has the

option to record certain of its current liabilities that meet the definition of “financial liabilities” at their respective fair values, with changes in fair value recognized each period in net income. Liabilities that require the entity to provide goods or services to settle the obligation, instead of cash settlement, are not financial liabilities and thus are not eligible for the fair value measurement election permitted by ASC 825. This option is addressed in detail in the chapter on ASC 825.

Although measurement of liabilities is generally straightforward, some liabilities are difficult to measure because of uncertainties. Uncertainties regarding subsequent events, whether an obligation exists, how much of an entity’s assets will be needed to settle the obligation, and when the settlement will take place can impact whether, when, and for how much an obligation will be recognized in the financial statements.

Most entities continue to measure their current liabilities at their settlement value, which is the amount of cash (or its equivalent amount of other assets) that will be paid to the creditor to liquidate the obligation during the current operating cycle. Accounts payable, dividends payable, salaries payable, and other current obligations are measured at settlement value because they require the entity to pay a determinable amount of cash within a relatively short period of time. If a current liability is near its payment date, there will be only an insignificant risk of changes in fair value because of changes in market conditions or the entity’s credit standing, and settlement value and fair value will be essentially the same.

Other current liabilities are measured at the proceeds received when the obligation arose. Liabilities that are measured in this manner generally require the entity to discharge the obligation by providing goods or services rather than by paying cash. Deposits payable, or rents paid in advance on the statement of financial position of a lessor, are examples of current liabilities measured by reference to proceeds received.

## DEFINITIONS OF TERMS

---

Source: ASC 405, *Glossaries*. Also see Appendix, *Definitions of Terms*, for Conduit Debt Security and Nonpublic Entity.

**In-force Policies.** Policies effective before a specified date that have not yet expired or been cancelled.

**Incurred Losses.** Losses paid or unpaid for which the entity has become liable during a period.

**Involuntary Pools.** A residual market mechanism for insureds who cannot obtain insurance in the voluntary market.

**Life, Annuity, and Health Insurance Entities.** An entity that may issue annuity, endowment, and accident and health insurance contracts as well as life insurance contracts. Life and health insurance entities may be either stock or mutual entities.

**Obligated to Write.** A circumstance in which an entity has no discretion to cancel a policy because of legal obligation under state statute, contract terms, or regulatory practice and is required to offer or issue insurance policies for a period in the future.

**Premium Tax Offsets.** Offsets against premium taxes levied on insurance entities by states.

**Premiums Written.** The premiums on all policies an entity has issued in a period.

**Property and Casualty Insurance Entity.** An entity that issues insurance contracts providing protection against either of the following:

- a. Damage to or loss of property caused by various perils, such as fire and theft
- b. Legal liability resulting from injuries to other persons or damage to their property.

Property and liability insurance entities may be either stock or mutual entities.

## CONCEPTS, RULES, AND EXAMPLES

---

### **ASC 405-10, Overall**

ASC 405-10 contains no guidance. Its purpose is to point to guidance in other areas of the Codification. ASC 410-10-02 points to the following Codification Topics which contain guidance on accounting and reporting on liabilities:

- *Asset Retirement and Environmental Obligations*—ASC 410
- *Exit or Disposal Cost Obligations and Contract Liabilities (added by ASU 2014-09)*—ASC 420
- *Deferred Revenue and Contract Liabilities*—ASC 430
- *Commitments*—ASC 440
- *Contingencies*—ASC 450
- *Guarantees*—ASC 460
- *Debt*—ASC 470
- *Distinguishing Liabilities from Equity*—Topic 480.

### **ASC 405-20, Extinguishments of Liabilities**

*Note: See the Technical Alert section at the beginning of this chapter for important information on an ASU that updates this Subtopic.*

Unless addressed by other guidance, the entity recognizes extinguishment of a liability when:

- The debtor pays the creditor
  - The debtor is legally given relief from the liability.
- (ASC 405-20-40-1)

If the entity becomes a guarantor on the debt, the entity applies the guidance in ASC 460. (ASC 405-20-40-1)

### **ASC 405-30, Insurance—Related Assessments**

Entities that self-insure, as well as insurance entities, are subject to assessments related to insurance activities. However, note that the annual fee imposed on health insurers by the Patient Protection and Affordable Care Act is not considered an insurance-related assessment. The accounting for that fee falls under the guidance in ASC 720-50.

### **ASC 405-40, Obligations Resulting from Joint and Several Liabilities**

ASC 405-40 requires an entity to measure obligations resulting from joint and several liability arrangements for which the total amount of the obligation within the scope of the guidance is fixed at the reporting date as the sum of:

1. The amount the reporting entity agreed to pay on the basis of its arrangement among its obligors, and
2. Any additional amount the entity expects to pay on behalf of its co-obligors.

The corresponding entry depends on the particular facts and circumstances.

Asset retirement obligations requiring	453	Environmental remediation liabilities	461

## PERSPECTIVE AND ISSUES

---

### Subtopics

ASC 410, *Asset Retirement and Environmental Obligations*, consists of three subtopics:

- ASC 410-10, *Overall*, which merely points out the differences between the other two subtopics.
- ASC 410-20, *Asset Retirement Obligations*, which provides guidance on asset retirement obligation and environmental remediation liabilities resulting from normal operations of long-lived assets.
- ASC 410-30, *Environmental Obligations*, which provides guidance on environmental remediation liabilities.

### Scope and Scope Exceptions

**ASC 410-20.** ASC 410-20 applies to all entities. It does not apply to these transactions:

1. Obligations that arise solely from a plan to sell or otherwise dispose of a long-lived asset.
2. An environmental remediation liability that results from the improper operation of a long-lived asset.
3. Activities necessary to prepare an asset for an alternative use as they are not associated with the retirement of the asset.
4. Historical waste held by private households.

5. Obligations of a lessee in connection with leased property, whether imposed by a lease agreement or by a party other than the lessor, that meet the definition of either minimum lease payments or contingent rentals in paragraphs. (Upon adoption of ASU 2016-02 on leases, this wording will change to: Obligations of a lessee in connection with an underlying asset, whether imposed by a lease or by a party other than the lessor, that meet the definition of either lease payments or variable lease payments in ASC 842-10.)
6. An obligation for asbestos removal resulting from the other-than-normal operation of an asset.
7. Costs associated with complying with funding or assurance provisions.
8. Obligations associated with maintenance, rather than retirement, of a long-lived asset.
9. The cost of a replacement part that is a component of a long-lived asset.  
(ASC 410-20-15-3)

**ASC 410-30.** ASC 410-30 applies to all entities. It applies to the following:

- a. Legal obligations associated with the retirement of a tangible long-lived asset result from the acquisition, construction or development, and or the normal operation of a long-lived asset.
- b. An environmental liability that results from the normal operation of a long-lived asset and this is associated with the retirement of that asset.
- c. A conditional obligation to perform a retirement activity.
- d. Obligations of a lessor in connection with leased property meeting the provisions in “a” above. (Upon adoption of ASU 2016-02, this language will change to: Obligations of a lessor in connection with an underlying asset that meet the provisions in “a” above.)
- e. The costs associated with the retirement of specified assets that qualifies as historical waste equipment defined by EU Directive 2002/96/EC.  
(ASC 410-20-15-2)

It does *not* apply to these transactions:

1. Environmental contamination incurred in the normal operation of a long-lived asset.
2. Pollution control costs with respect to current operations or on accounting for costs of future site restoration or closure that are required upon the cessation of operations or sale of facilities, as such current and future costs and obligations represent a class of accounting issues different from environmental remediation liabilities.
3. Environmental remediation actions that are undertaken at the sole discretion of management and that are not induced by the threat, by governments or other parties, of litigation or of assertion of a claim or an assessment.
4. Recognizing liabilities of insurance entities for unpaid claims.
5. Natural resource damages and toxic torts.
6. Asset impairment issues.  
(ASC 410-30-15-3)

## **DEFINITIONS OF TERMS**

---

Source: ASC 410, *Glossaries*. Also see Appendix, *Definitions of Terms*, for definitions of Commencement Date of the Lease, Contract, Customer, Fair Value (3rd definition), Lease, Lease Payments, Lease Term, Lessee, Lessor, Revenue, Underlying Asset, and Variable Lease Payments.

**Accretion Expense.** An amount recognized as an expense classified as an operating item in the statement of income resulting from the increase in the carrying amount of the liability associated with the asset retirement obligation.

**Asset Retirement Cost.** The amount capitalized that increases the carrying amount of the long-lived asset when a liability for an asset retirement obligation is recognized.

**Asset Retirement Obligation.** An obligation associated with the retirement of a tangible long-lived asset.

**Closure.** Related to the Resource Conservation and Recovery Act of 1976: the process in which the owner-operator of a hazardous waste management unit discontinues active operation of the unit by treating, removing from the site, or disposing of all on site hazardous wastes in accordance with an Environmental Protection Agency or state-approved plan. Included, for example, are the processes of emptying, cleaning, and removing or filling underground storage tanks and the capping of a landfill. Closure entails specific financial guarantees and technical tasks that are included in a closure plan and must be implemented.

**Conditional Asset Retirement Obligation.** A legal obligation to perform an asset retirement activity in which the timing and (or) method of settlement are conditional on a future event that may or may not be within the control of the entity.

**Consent Decree.** A legal document, approved by a judge, that formalizes an agreement reached between the Environmental Protection Agency and potentially responsible parties through which potentially responsible parties will conduct all or part of a remedial action at a Superfund site; cease or correct actions or processes that are polluting the environment; or otherwise comply with regulations where potentially responsible parties' failure to comply caused the Environmental Protection Agency to initiate regulatory enforcement actions. The consent decree describes the actions potentially responsible parties will take and may be subject to a public comment period.

**Corrective Action.** Related to the Resource Conservation and Recovery Act of 1976: action to remedy releases from hazardous waste management units, or any other sources of releases at or from a treatment, storage, or disposal facility.

**Discount Rate Adjustment Technique.** A present value technique that uses a risk-adjusted discount rate and contractual, promised, or most likely cash flows.

**Disposal.** Related to the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 and the Resource Conservation and Recovery Act of 1976: under the Resource Conservation and Recovery Act of 1976, the discharge, deposit, injection, dumping, spilling, leaking, or placing of any solid waste or hazardous waste into or on any land or water so that such solid waste or hazardous waste or any constituent thereof may enter the environment or be emitted into the air or discharged into any waters, including groundwaters. Similarly under the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 with regard to hazardous substances.

**Hazardous Substance.** Related to Superfund: the definition of hazardous substance in the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 is broader than the definition of hazardous wastes under the Resource Conservation and Recovery Act of 1976. Under the Comprehensive Environmental Response, Compensation, and Liability Act of 1980, a hazardous substance is any element, compound, mixture, solution, or substance that, when released to the environment, may present substantial danger to the public health or welfare or to the environment. It also includes the following:

- a. Specifically designated substances
- b. Toxic pollutants under the Federal Water Pollution Control Act

- c. Hazardous wastes having the characteristics identified under or listed pursuant to the Resource Conservation and Recovery Act of 1976 (excluding any waste suspended from regulation under the Solid Waste Disposal Act by Congress)
- d. Hazardous air pollutants under the Clean Air Act
- e. Any imminently hazardous chemical substance or mixture for which the government has taken action under section 7 of the Toxic Substances Control Act.

Petroleum (including crude oil not otherwise specifically listed or designated as a hazardous substance under any of those laws), natural gas, natural gas liquids, liquefied natural gas, or synthetic gas usable for fuel (or mixtures of natural gas and such synthetic gas) are excluded.

**Hazardous Waste.** Related to Resource Conservation and Recovery Act of 1976: a waste, or combination of wastes, that because of its quantity, concentration, toxicity, corrosiveness, mutagenicity or inflammability, or physical, chemical, or infectious characteristics may cause, or significantly contribute to, an increase in mortality or an increase in serious irreversible, or incapacitating reversible illness or pose a substantial present or potential hazard to human health or the environment when improperly treated, stored, transported, or disposed of, or otherwise managed. Technically, those wastes that are regulated under the Resource Conservation and Recovery Act of 1976 40 CFR Part 261 are considered to be hazardous wastes.

**Hazardous Waste Constituent.** A constituent that caused the waste to be listed as a hazardous waste under the Resource Conservation and Recovery Act of 1976 40 CFR Part 261 Subpart D.

**Joint and Several Liability.** Where liability is joint and several, any party deemed liable is potentially responsible for all of the associated costs. This scheme of liability means that any responsible party can potentially be liable for the entire cost of remediating a site, notwithstanding that the party is responsible for only a small amount of the total hazardous substances or waste at the site and did nothing improper.

**Legal Obligation.** An obligation that a party is required to settle as a result of an existing or enacted law, statute, ordinance, or written or oral contract or by legal construction of a contract under the doctrine of promissory estoppel.

**Natural Resources.** Under the Comprehensive Environmental Response, Compensation, and Liability Act of 1980, natural resources are defined as land, fish, wildlife, biota, air, water, groundwater, drinking water supplies, and other such resources belonging to, managed or held in trust by, or otherwise controlled by the United States, state or local governments, foreign governments, or Indian tribes.

**Orphan Share.** Equitable share of liability for response or remediation costs attributed to orphan-share potentially responsible parties, or the amount by which the equitable share of liability for response or remediation costs attributable to other parties exceeds the amount for which those parties have settled their liability.

**Orphan Share Potentially Responsible Party.** An identified potentially responsible party that cannot be located or that is insolvent. Some of these parties may be identified by the Environmental Protection Agency; others may be identified as the site is investigated or as the remediation is performed. However, no contributions will ever be made by these parties.

**Participating Potentially Responsible Party.** A party to a Superfund site that has acknowledged potential involvement with respect to the site. Active potentially responsible parties may participate in the various administrative, negotiation, monitoring, and remediation activities related to the site. Others may adopt a passive stance and simply monitor the activities and decisions of the more involved potentially responsible parties. This passive stance could result from a variety of factors such as the entity's lack of experience, limited internal resources, or

relative involvement at a site. This category of potentially responsible parties (both active and passive) is also referred to as players.

**Potentially Responsible Party.** Any individual, legal entity, or government—including owners, operators, transporters, or generators—potentially responsible for, or contributing to, the environmental impacts at a Superfund site. The Environmental Protection Agency has the authority to require potentially responsible parties, through administrative and legal actions, to remediate such sites. At early stages of the remediation process, the list of potentially responsible parties may be limited to a handful of entities that either were significant contributors of waste to the site or were easy to identify, for example, because of their proximity to the site or because of labeled material found at the site. As further investigation of the site occurs and as remediation activities take place, additional potentially responsible parties may be identified. Once identified, the additional potentially responsible parties would be reclassified from this category to either the participating potentially responsible party or recalcitrant potentially responsible party category. The total number of parties in this category and their aggregate allocable share of the remediation liability varies by site and cannot be reliably determined before the specific identification of individual potentially responsible parties. For example, some ultimately may be dropped from the potentially responsible party list because no substantive evidence is found to link them to the site. For others, substantive evidence eventually may be found that points to their liability. The presentation of that evidence to the entity would result in a reclassification of the party from this category of potentially responsible parties (sometimes referred to as hiding in the weeds) to either the participating potentially responsible party or recalcitrant potentially responsible party category.

**Promissory Estoppel.** “The principle that a promise made without consideration may nonetheless be enforced to prevent injustice if the promisor should have reasonably expected the promisee to rely on the promise and if the promisee did actually rely on the promise to his or her detriment.” (See *Black’s Law Dictionary*, seventh edition.)

**Recalcitrant Potentially Responsible Party.** A party whose liability with respect to a Superfund site is substantiated by evidence, but that refuses to acknowledge potential involvement with respect to the site. Recalcitrant potentially responsible parties adopt a recalcitrant attitude toward the entire remediation effort even though evidence exists that points to their involvement at a site. Some may adopt this attitude out of ignorance of the law; others may do so in the hope that they will be considered a nuisance and therefore ignored. Typically, parties in this category must be sued in order to collect their allocable share of the remediation liability; however, it may be that it is not economical to bring such suits because the parties’ assets are limited. This category of potentially responsible parties is also referred to as nonparticipating potentially responsible parties.

**Release.** Related to Superfund: any spilling, leaking, pumping, pouring, emitting, emptying, discharging, injecting, escaping, leaching, dumping, or disposing into the environment. Includes the abandonment or discarding of barrels, containers, and other closed receptacles containing any hazardous substance, pollutant, or contaminant. The law provides for several exclusions. Release also means the substantial threat of release.

**Remedial Action.** Related to Superfund: generally long-term actions taken to do any of the following:

1. Investigate, alleviate, or eliminate the effects of a release of a hazardous substance into the environment
2. Investigate, alleviate, or eliminate a threat of the release of an existing hazardous substance that could potentially harm human health or the environment
3. Restore natural resources.

Also refers to corrective action under the Resource Conservation and Recovery Act of 1976.

**Remedial Investigation-Feasibility Study.** Extensive technical studies conducted by the government or by the potentially responsible parties to investigate the scope of site impacts and determine the remedial alternatives that, consistent with the National Contingency Plan, may be implemented at a Superfund site. Government-funded remedial investigation-feasibility studies do not recommend a specific alternative for implementation. Remedial investigation-feasibility studies conducted by potentially responsible parties usually do recommend and technically support a remedial alternative. A remedial investigation-feasibility study may include a variety of on- and off-site activities, such as monitoring, sampling, and analysis.

**Removal Action.** Under the Comprehensive Environmental Response, Compensation, and Liability Act of 1980, generally short-term actions taken to respond promptly to an urgent need. The cleanup or removal of released hazardous substances from the environment; actions in response to the threat of release; actions that may be necessary to monitor, assess, and evaluate the release or threat; disposal of removed material; or other actions needed to prevent, minimize, or mitigate damage to public health or welfare or to the environment. Removal also includes, without being limited to, security fencing or other measures to limit access; provision of alternative water supplies; temporary evacuation and housing of threatened individuals not otherwise provided for; and any emergency assistance provided under the Disaster Relief Act.

**Retirement.** The other-than-temporary removal of a long-lived asset from service. That term encompasses sale, abandonment, recycling, or disposal in some other manner. However, it does not encompass the temporary idling of a long-lived asset. After an entity retires an asset, that asset is no longer under the control of that entity, no longer in existence, or no longer capable of being used in the manner for which the asset was originally acquired, constructed, or developed.

**Strict Liability.** Liability imposed without regard to the liable party's fault.

**Unilateral Administrative Order.** Order issued unilaterally by the Environmental Protection Agency under section 106(a) of the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 to potentially responsible parties, or to nonpotentially responsible parties such as adjacent landowners, requiring them to take a response action. Unilateral administrative orders contain findings of fact and conclusions of law, and they specify the work to be performed and the Environmental Protection Agency's right to take over the work in the event of noncompliance, inadequate performance, or an emergency. A unilateral administrative order does not allocate conduct required by the order between individual potentially responsible parties; however, the Environmental Protection Agency may issue carve-out orders requiring individual potentially responsible parties to perform specific actions. Also referred to as a section 106 order.

### **Unknown Potentially Responsible Party**

A party that has liability with respect to a Superfund site, but that has not yet been identified as a potentially responsible party by the Environmental Protection Agency or by an analogous state agency.

**Unproven Potentially Responsible Party.** A party that has been identified as a potentially responsible party for a Superfund site by the U.S. Environmental Protection Agency or by an analogous state agency, but that does not acknowledge potential involvement with respect to the site because no evidence has been presented linking the party to the site. Also referred to as a hiding-in-the-weeds potentially responsible party.

## **CONCEPTS, RULES, AND EXAMPLES**

---

### **ASC 410-20, Asset Retirement Obligations**

ASC 410-20 provides standards for measuring the future cost to retire an asset and recognizing that cost in the financial statements as a liability, and correspondingly, as part of

the depreciable cost of the asset. ASC 410-20 applies to *legal obligations* associated with the *retirement* of tangible long-lived assets that result from their acquisition, construction, development, and/or normal operation. (ASC 410-20015-2a) Lessee capital lease assets and lessor assets that are leased under operating leases are also subject to these rules. (ASC 410-20-15-2d)

For the purposes of applying ASC 410-20, a legal obligation is “an obligation that a party is required to settle as a result of an existing or enacted law, statute, ordinance, or written or oral contract or by legal construction of a contract under the doctrine of *promissory estoppel*.” Promissory estoppel is a legal doctrine whereby a court of law will enforce a promise made by one party (the promisor) to another party (the promisee) even though no formal contract exists between the two parties or no consideration was exchanged. This situation can arise when a party (the promisee) relies on a promise to his or her detriment and the person making the promise (the promisor) should have reasonably expected the promisee to rely on the promise.

**Asset retirement obligations requiring recognition.** When an entity acquires, constructs, and operates assets, it often incurs obligations that are unavoidable. Much of the discussion in ASC 410-20 pertains to specialized industry applications such as offshore oil platforms, nuclear power plants, mining operations, landfills, and underground storage tanks. However, the criteria for recognizing asset retirement obligations are intended to apply to situations encountered more frequently in practice, such as in the following examples.

#### Examples of the scope of ASC 410-20

*Example 1—Leased premises.* In accordance with the terms of a lease, the lessee is obligated to remove its specialized machinery from the leased premises prior to vacating those premises, or to compensate the lessor accordingly. The lease imposes a legal obligation on the lessee to remove the asset at the end of the asset’s useful life or upon vacating the premises, and therefore this situation would be covered by ASC 410-20.

*Example 2—Owned premises.* The same machinery described in example 1 is installed in a factory that the entity owns. At the end of the useful life of the machinery, the entity will either incur costs to dismantle and remove the asset or will leave it idle in place. If the entity chooses to do nothing and not remove the equipment, this would adversely affect the fair value of the premises should the entity choose to sell the premises on an “as is” basis. Conceptually, to apply the matching principle in a manner consistent with example 1, the cost of asset retirement should be recognized systematically and rationally over the productive life of the asset and not in the period of retirement. However, in this example, there is no *legal obligation* on the part of the owner of the factory and equipment to retire the asset and, thus, this would *not* be covered by ASC 410-20.

*Example 3—Promissory estoppel.* Assume the same facts as in example 2. In this example, however, the owner of the property sold to a third party an option to purchase the factory, exercisable at the end of five years. In offering the option to the third party, the owner verbally represented that the factory would be completely vacant at the end of the five-year option period and that all machinery, furniture, and fixtures would be removed from the premises. The property owner would reasonably expect that the purchaser of the option relied to the purchaser’s detriment (as evidenced by the financial sacrifice of consideration made in exchange for the option) on the representation that the factory would be vacant. This would trigger promissory estoppel and the owner’s obligation would be covered by ASC 410-20.

#### Example of timing of recognition

Phyl Corporation owns and operates a chemical company. At its premises, it maintains underground tanks used to store various types of chemicals. The tanks were installed when Phyl Corporation purchased its facilities seven years prior. On February 1, 20X7, the governor of the state signed a law

requiring removal of such tanks when they are no longer being used. Since the law imposes a legal obligation on Phyl Corporation, upon enactment, recognition of an asset retirement obligation (ARO) would be required.

#### Example of ongoing additions to the obligation

Joyce Manufacturing Corporation (JMC) operates a factory. As part of its normal operations it stores production byproducts and uses cleaning solvents on site in a reservoir specifically designed for that purpose. The reservoir and surrounding land, all owned by JMC, are contaminated with these chemicals. On February 1, 20X7, the governor of the state signed a law requiring cleanup and disposal of hazardous waste from an already existing production process upon retirement of the facility. Upon enactment of the law, immediate recognition would be required for the ARO associated with the contamination that had already occurred. In addition, liabilities will continue to be recognized over the remaining life of the facility as additional contamination occurs.

**Accounting considerations.** Several important accounting issues merit careful consideration.

**Recognition and allocation.** Upon initial recognition, the entity records an increase to the carrying amount of the related long-lived asset and an offsetting liability. The entity then depreciates the combined cost of the asset and the capitalized asset retirement obligation using a systematic and rational allocation method over the period during which the long-lived asset is expected to provide benefits, taking into consideration any expected salvage value. Conceptually, this accounting treatment is an application of the matching principle in that the total investment in the asset, including the cost of its eventual retirement, is charged to expense over the periods benefited. Depending on the pattern and timing of obligating events, an entity could, under these rules, capitalize an amount of asset retirement cost during a period and, in the same period, allocate an equal amount to depreciation expense. It is important to note that, for the purpose of capitalizing interest under ASC 835-20, these additions to the carrying amounts of long-lived assets are not considered expenditures.

**Impairment.** Retirement obligations added to the carrying amounts of long-lived assets must be included in those carrying amounts for the purpose of testing those assets for impairment. In estimating future cash flows under the impairment rules (ASC 360-10-35), the cash flows related to settling the liability for an asset retirement obligation are to be excluded from both the undiscounted cash flows used to assess the recoverability of the asset's carrying amount and the discounted cash flows used to measure the asset's fair value.

**Measurement.** Asset retirement obligations are initially measured at fair value. Fair value (as defined in ASC 820 and discussed in detail in the chapter on ASC 820) is the price that would be paid to transfer the liability in an orderly transaction between market participants at the measurement date. This measurement is not based on the amount that the reporting entity (the obligor) would be required to pay to settle the liability on the measurement date (which would be difficult, if not impossible, to estimate in the absence of a market for the transfer of such obligations). Rather, the measurement assumes that the reporting entity remains the obligor under the ARO and that the obligee has transferred its rights by selling them to a hypothetical market participant on the measurement date. In determining the price it would be willing to pay for the rights associated with the ARO, a third-party market participant would consider the risk of nonperformance of the reporting entity, since that entity will continue to be the obligor after the measurement date. Thus, the fair value measurement of the obligation, under ASC 820, takes into consideration the reporting entity's own risk of nonperformance that includes, but is not limited to, the effect of its own credit standing.

FASB conforms ASC 410-20 to its fair value guidance, but when it issued FAS 143 on AROs, acknowledged that:

*Rarely, if ever, would there be an observable rate of interest for a liability that has cash flows similar to an asset retirement obligation being measured. In addition, an asset retirement obligation usually will have uncertainties in both timing and amount. In that circumstance, employing a discount rate adjustment technique, where uncertainty is incorporated into the rate, will be difficult, if not impossible.*

This lack of observability means that management, in order to estimate the ARO, will be required to use an expected present value technique that uses its own assumptions regarding the necessary adjustment for market risk. These are referred to as “Level 3 inputs” by ASC 820.

**Initially applying an expected present value method.** ASC 820-10-55 provides two alternative methods for determining expected present value. To apply Method 1, management adjusts the expected cash flows for market risk by incorporating a cash risk premium in them and uses a risk-free interest rate to discount the risk-adjusted expected cash flows. To apply Method 2, management does not adjust the expected cash flows, but instead adjusts the risk-free interest rate by incorporating a risk premium in it.

As discussed later in this section, Method 1 cannot be used to estimate the expected present value of an ARO due to computational difficulties that cannot be overcome. As a result, the following discussion, adapted from ASC 410-20, uses Method 2 to illustrate the estimation of expected present value.

Management begins by estimating a series of cash flows that reflect its marketplace estimates of the cost and timing of performing the required retirement activities. Marketplace amounts are those amounts that would be expended by the entity to hire a third party to perform the work. Explicit assumptions are to be developed and incorporated in the estimates about all of the following matters:

1. The costs that a third party would incur in performing the necessary tasks associated with retiring the asset.
2. Additional amounts that the third party would include in pricing the work, related to such factors as inflation, overhead, equipment charges, profit margins, anticipated technological advances, and offsetting cash inflows, if any.
3. The extent to which the amount of the third party’s costs or their timing might differ under various future scenarios and the relative probabilities of those scenarios actually occurring.
4. The price that the third party would demand and could expect to receive for bearing the uncertainties and unforeseeable circumstances inherent in the obligation. This is referred to as a *market-risk premium*.

If data is available regarding assumptions that marketplace participants would make that contradict management’s own assumptions, management must adjust its assumptions accordingly. For example, if the costs of labor in the marketplace exceed those of the entity, the higher marketplace costs are to be used in the cash flow estimates. Even if the entity can and will retire the asset using internal resources, the obligation must be computed as if a third party will be retained to perform the work, including provisions for recovery of the contractor’s overhead and profit.

The discount rate to be used in the present value calculations is the *credit-adjusted risk-free rate* that adjusts a risk-free rate of interest for the effects of the entity’s own credit standing. The risk-free interest rate is the interest rate on monetary assets with maturity dates or durations that coincide with the period covered by the estimated cash flows associated with the ARO. When the

measurement involves cash flows denominated in U.S. dollars, the yield curve for U.S. Treasury securities is used.

In adjusting the risk-free rate for the entity's credit standing, the entity takes into account the effects on the fair value estimate of all terms, collateral, and existing guarantees. In ASC 820, FASB indicated that it believed, when it issued ASC 410, that it would be more practical for management to reflect an estimate of its own credit standing as an adjustment to the risk-free rate rather than as an adjustment to the expected cash flows. In fact, based on the model FASB chose to account for subsequent upward and downward changes in the ARO, ASC 410 would not be operational unless the adjustment for credit standing was made to the risk-free interest rate.

As a practical matter, for companies whose debt is not rated by a bond-rating agency, the adjustment for credit standing may be difficult to establish. For such companies, the incremental borrowing rate used for lease testing may serve as an acceptable approximation of the credit-adjusted risk-free rate.

The ARO may be incurred in one or more of the entity's reporting periods. Each period's incremental liability incurred is recognized as a separate liability and is estimated using these principles based on market and interest rate assumptions existing in the period of recognition.

ASC 410-20 clarifies that an ARO is required to be recognized when incurred (or acquired), even if uncertainty exists regarding the timing and/or method of eventually settling the obligation. In effect, ASC 410-20 distinguishes between a contingency and an uncertainty. If the obligation to perform the retirement activities is unconditional, the fact that uncertainty exists regarding the timing and/or method of retirement does not relieve the reporting entity of the requirement to estimate and record the obligation if, in fact, it is reasonably estimable. The assumptions regarding the probabilities of the various outcomes used in the computation are to take into account that uncertainty. An ARO is considered reasonably estimable if:

1. It is evident that the obligation's fair value is included in an asset's acquisition price,
2. An active market exists for the transfer of the obligation, or
3. Sufficient information is available to enable the use of the CON 7 expected present value technique to estimate the obligation.

Sufficient information is considered to be available to reasonably estimate the obligation if either:

1. The settlement date and method of settlement have been specified by others (e.g., the end of a lease term or the end of a statutory period), or
2. Information is available to reasonably estimate:
  - a. The settlement date or range of potential settlement dates
  - b. The settlement method or potential settlement methods
  - c. The probabilities of occurrence of the dates and methods in a. and b.

The information necessary to make these estimates can be based on the reporting entity's own historical experience, industry statistics or customary practices, management's own intent, or estimates of the asset's economic useful life.

The determination of fair value for an ARO may be difficult, especially if the volume and level of activity for the asset or liability have significantly decreased to the extent where there are few recent transactions or price quotations vary substantially. If so, it may be necessary to use multiple valuation techniques, and select a point within the derived range of values that is most representative of fair value.

Even if management concludes that sufficient information does not exist to record the obligation at inception, management is expected to continuously consider whether this remains

true in future accounting periods, and to recognize the obligation in the first period when sufficient information becomes available to enable the fair value estimate.

**Accounting in subsequent periods.** After the initial period of ARO recognition, the liability will change as a result of either the passage of time or revisions to the original estimates of either the amounts of estimated cash flows or their timing. Such changes can arise due to the effects of inflation, changes in the probabilities used in the original estimate, changes in interest rates, changes in laws, regulations, statutes, and contracts.

ASC 410-20 does not require detailed cash flow estimates every reporting period, but rather allows the exercise of judgment as to when facts and circumstances indicate that the initial estimate requires updating.

If a change to the liability is deemed necessary, it is recognized by first adjusting its carrying amount for changes due to the passage of time (referred to as *accretion* and discussed in detail below) and then, if applicable, for changes due to revisions in either amounts or timing of estimated cash flows.

Changes due to the passage of time increase the carrying amount of the liability because there are fewer periods remaining from the initial measurement date until the settlement date; thus, the present value of the discounted future settlement amount increases. These changes are recorded as a period cost called *accretion expense* and classified separately in the operating section of the statement of income (or not-for-profit statement of activities). Accretion is computed using an interest method of allocation that results in periodic accretion expense that represents a level effective interest rate applied to the carrying amount of the liability at the beginning of each period. The effective interest rate used to calculate accretion is the credit-adjusted risk-free rate or rates (or incremental borrowing rate) applied when the liability or portion of the liability (as explained below) was initially measured and recognized. Accretion expense is not combined with interest expense, and is not considered interest cost for the purpose of applying the interest capitalization criteria of ASC 835-20.

Changes in the ARO that result from changes in the estimates of the timing or amounts of future cash flows are accounted for differently for increases and decreases. If the expected present value increases, the increase gives rise to a new obligation accounted for separately just as the ARO was originally measured but using current market value assumptions, and the current credit-adjusted risk-free rate. Thus, over time, a particular long-lived asset may have multiple layers of obligations associated with it that are based on different assumptions measured at different dates during the asset's useful life. The incremental obligation is recorded by increasing the recorded ARO and capitalizing the additional cost as a part of the carrying amount of the related long-lived asset. If multiple layers have been recorded and it is not practical to separately identify the period (or layer) to which subsequent revisions in estimated cash flows relate, management is permitted to use a *weighted-average credit-adjusted risk-free rate* to measure the change in the liability resulting from that revision.

If, however, the expected present value subsequently decreases, the difference between the remeasured amount and the carrying amount of the liability (after adjustment for inception-to-date accretion) is recorded as a gain in the current period. In this case, the previously recognized layers of liabilities are reduced pro rata so as not to affect the overall effective rate of accretion over the remaining life of the obligation.

For the purposes of measurement in subsequent periods, in the unlikely event that an entity originally determined its ARO based on available market prices rather than using the expected present value method, it would be required to determine the undiscounted cash flows embedded in that market price. This process is analogous to computing the rate of interest implicit in a lease.

If the increase in carrying amount of the affected long-lived asset resulting from the remeasurement of ARO in a subsequent period impacts only that period, then the increase is

fully depreciated in that period. Otherwise, the increase is depreciated in the period of change and future periods as a change in estimate in accordance with ASC 250. Both depreciation and accretion are classified as operating expenses in the statement of income.

**Other provisions.** Other provisions of ASC 410 affect the calculation of the credit-adjusted rate as well as how it is to be applied by rate-regulated entities.

**Funding and assurance provisions.** Factors such as laws, regulations, public policy, the entity's creditworthiness, or the sheer magnitude of the future obligation may cause an entity to be required to provide third parties with assurance that the entity will be able to satisfy its ARO in the future. Such assurance is provided using such instruments as surety bonds, insurance policies, letters of credit, guarantees by other entities, establishment of trust funds, or by custodial arrangements segregating other assets dedicated to satisfying the ARO. Although providing such means of assurance does not satisfy the underlying obligation, the credit-adjusted interest rate used in calculating the expected present value is adjusted for the effect on the entity's credit standing of employing one or more of these techniques.

**Rate-regulated entities.** Many rate-regulated entities (as defined in ASC 980 and discussed in the chapter on ASC 980) follow current specialized accounting that capitalizes costs not otherwise afforded that treatment under GAAP. These entities recover these additional costs in the rates that they charge their customers. These additional capitalized costs may or may not meet the definition of ARO under ASC 410. The differences in the amounts and timing of assets and liabilities between GAAP and regulatory accounting used for rate-making purposes give rise to temporary differences and the resultant deferred income tax accounting.

ASC 410 provides that, if the criteria in ASC 980 are met, the rate-regulated entity is to recognize a regulatory asset or liability for differences in the timing of recognition of the period costs associated with ARO for financial reporting and rate-making purposes. Accounting for the ARO arising from closed or abandoned long-lived assets of rate-regulated entities is covered by ASC 980-360.

#### Example—Initial measurement and recognition

Gerald Corporation constructs and places into service on January 1, 20X1, specialized machinery on premises that it leases under a fifteen-year lease. The machinery cost \$1,750,000 and has an estimated useful life of ten years. Gerald Corporation is contractually obligated, under the terms of the lease, to remove the machinery from the premises when it is no longer functional. Gerald is unable to obtain current market-related information regarding the costs of settling the liability at inception and, therefore, chooses to estimate the initial fair value of the ARO using an expected present value technique. The significant assumptions used by Gerald in applying this technique are as follows:

1. Labor costs are based on prevailing wage rates in that geographic area that a contractor would pay to hire qualified workers. Gerald assigns probability assessments to the range of cash flow estimates as follows:

<u>Cash flow estimate</u>	<u>Probability assessment</u>	<u>Expected cash flows for labor costs</u>
\$40,000	25%	\$10,000
60,000	50	30,000
75,000	25	18,750
	<u>100%</u>	<u>\$58,750</u>

2. Based on its own experience, which Gerald believes is indicative of local market conditions, Gerald estimates that a contractor will apply a 75% rate to labor costs to charge for overhead and equipment usage and that, based on published industry statistics

for the region, a contractor would add a markup of 8% to the combined labor, overhead, and equipment costs.

3. Since the eventual dismantlement and removal will be occurring ten years later, Gerald expects that a contractor would receive a market-risk premium of 5% of the expected cash flows adjusted for inflation. This premium is to compensate the contractor for assuming the risks and uncertainties of contracting now for a project ten years later.
4. The risk-free rate of interest as evidenced by the price of zero-coupon U.S. Treasury instruments that mature in ten years is 4.5%. Gerald adjusts that rate by 2.5% to reflect the effect of its credit standing as evidenced by its incremental borrowing rate of 7%. Therefore, the credit-adjusted risk-free rate used to compute the expected present value is 7%.
5. Gerald assumes an average rate of inflation of 3.5% over the ten-year period.

The ARO is initially measured as follows as of January 1, 20X1:

	<i>Expected cash flows as of January 1, 20X1</i>
Expected cash flows for labor costs	\$ 58,750
Allocated overhead and equipment charges ( $75\% \times \$58,750$ )	44,063
Contractor's markup [ $8\% \times (\$58,750 + \$44,063)$ ]	8,225
Expected cash flows before inflation adjustment	<u>111,038</u>
Average annual compounded inflation rate of 3.5% for 10 years ( $1.035^{10}$ )	$\times \underline{1.4106}$
Expected cash flows adjusted for inflation	156,630
Market-risk premium ( $5\% \times \$156,630$ )	7,832
Expected cash flows adjusted for market risk	<u>164,462</u>
Present value using credit-adjusted risk-free rate of 7% for 10 years, compounded annually	\$ <u>83,604</u>

On January 1, 20X1, Gerald would record the initial ARO as follows:

Machinery and equipment	83,604
ARO liability	83,604

#### Example—Accounting in subsequent periods

Assuming the same facts as above, during the ten-year life of the machinery, Gerald would record entries to recognize accretion and depreciation as follows (assuming no remeasurement of the ARO is required):

<i>Year</i>	<i>Liability balance as of January 1</i>	<i>Annual accretion</i>	<i>Liability balance as of December 31</i>
20X1	\$ 83,604	\$ 5,852	\$ 89,456
20X2	89,456	6,262	95,718
20X3	95,718	6,700	102,418
20X4	102,418	7,169	109,587
20X5	109,587	7,671	117,258
20X6	117,258	8,208	125,466
20X7	125,466	8,783	134,249
20X8	134,249	9,397	143,646
20X9	143,646	10,055	153,701
20Y0	153,701	10,761	164,462

### Entries to record annual accretion

The accretion for each year presented in the table is recorded as follows:

Accretion expense (presented on the income statement as part of operating expense)	xx,xxx
Asset retirement obligation	xx,xxx

### Depreciation computations

Acquisition cost of asset	\$ 1,750,000
Capitalized ARO	<u>83,604</u>
Adjusted carrying amount of asset	\$ 1,833,604
Estimated salvage value (assumed)	<u>100,000</u>
	\$ 1,733,604
Estimated useful life	÷ 10 years
Annual depreciation expense	<u>\$ 173,360</u>

### Entry to record annual depreciation

Depreciation expense	173,360
Accumulated depreciation	173,360

### Settlement of ARO

On December 31, 20Y0, Gerald uses its internal workforce to dismantle and dispose of the machinery and incurred costs as follows:

Labor	\$ 70,000
Internally allocated overhead and equipment charges (75% of labor)	<u>52,500</u>
Total costs incurred	122,500
ARO liability	<u>164,462</u>
Gain on settlement of ARO	<u>\$ 41,962</u>

Note that, because Gerald chose to perform the retirement activities using its own workforce, the “market approach” mandated by ASC 410 and ASC 820 does not achieve an even matching of the total costs of acquisition and retirement to the periods benefited. The period of the retirement reflects a gain on settlement that would not have occurred had Gerald hired a contractor to perform the work instead of using its own employees.

**Electronic equipment waste obligations.** ASC 720-40 prescribes the proper treatment of electronic equipment waste obligations. See the chapter on ASC 720 for more information.

### ASC 410-30, Environmental Obligations

Environmental remediation costs, the costs of cleaning up environmental contamination, are generally expensed as incurred as operating expenses. (ASC 410-30-25-16) The exceptions to this general rule that result in capitalizing these costs are as follows:

1. If the costs result from legal obligations associated with the eventual retirement of an asset or group of assets they will be capitalized as an ARO, as discussed and illustrated in the previous section of this chapter on ASC 410-20.

2. If the costs do not qualify as ARO, but they meet one of the following criteria, they may be capitalized subject to reduction for impairment, if warranted:
  - a. The costs extend the life, increase the capacity, or improve the safety or efficiency of property owned by the reporting entity.
  - b. The costs mitigate or prevent future environmental contamination while also improving the property compared with its condition when originally constructed or acquired by the reporting entity.
  - c. The costs are incurred in preparing for sale a property that is currently held for sale (the application of this criterion must be balanced with the limitation in ASC 360 regarding assets held for sale being carried at the lower of carrying value or fair value less cost to sell).

(ASC 410-30-25-17)

SEC registrants are required to disclose any significant exposure for asbestos treatment in the management discussion and analysis (MD&A).

Environmental costs associated with the improper operation or use of an asset (e.g., penalties and fines) are specifically excluded from the accounting guidance with respect to ARO and, should they be incurred, under ASC 410-30, they would most likely not qualify to be capitalized under GAAP.

**Environmental remediation liabilities.** Obligations arising from pollution of the environment have become a major cost for businesses. ASC 410-30 sets forth a very detailed description of relevant laws, remediation provisions, and other pertinent information, which is useful to auditors as well as to reporting entities. In terms of accounting guidance, ASC 430-20 contains the principal rules with respect to accounting for environmental obligations (e.g., determining the threshold for accrual of a liability, etc.) and it sets “benchmarks” for liability recognition. The benchmarks for the accrual and evaluation of the estimated liability (i.e., the stages which are deemed to be important to ascertaining the existence and amount of the liability) are:

1. The identification and verification of an entity as a potentially responsible party (PRP), since ASC 410-30 stipulates that accrual is to be based on the premise that expected costs will be borne by only the “participating potentially responsible parties” and that the “recalcitrant, unproven and unidentified” PRP will not contribute to costs of remediation
2. The receipt of a “unilateral administrative order”
3. Participation, as a PRP, in the remedial investigation/feasibility study (RI/FS)
4. Completion of the feasibility study
5. Issuance of the Record of Decision (RoD)
6. The remedial design through operation and maintenance, including postremediation monitoring.

(ASC 410-30-25-15)

The amount of the liability that is to be accrued is affected by the entity’s allocable share of liability for a specific site and by its share of the amounts related to the site that will not be paid by the other PRP or the government. The categories of costs to be included in the accrued liability include incremental direct costs of the remediation effort itself, as well as the costs of compensation and benefits for employees directly involved in the remediation effort. Costs are to be estimated based on existing laws and are not to be discounted to estimated present values unless timing of cash payments is fixed or reliably determinable.

Incremental direct costs will include such items as fees paid to outside law firms for work related to the remediation effort, costs relating to completing the RI/FS, fees to outside consulting and engineering firms for site investigations and development of remedial action plans and remedial actions, costs of contractors performing remedial actions, government oversight costs and past costs, the cost of machinery and equipment dedicated to the remedial actions that do not have an alternative use, assessments by a PRP group covering costs incurred by the group in dealing with a site, and the costs of operation and maintenance of the remedial action, including costs of postremediation monitoring required by remedial action plan.

ASC 410-30 states that potential recoveries cannot be offset against the estimated liability, and further notes that any recovery recognized as an asset is to be reflected at fair value, which implies that only the present value of future recoveries can be recorded. It is presumed that the costs are operating in nature and thus cannot normally be included in the “other income and expense” category of the income statement either. Disclosure of accounting policies regarding recognition of the liability and of any related asset (for recoveries from third parties) is also needed, where pertinent.

## PERSPECTIVE AND ISSUES

---

### Subtopic

ASC 420, *Exit or Disposal Cost Activities*, consists of one subtopic:

- ASC 420-10, *Overall*, which provides guidance on the definition, reporting, and disclosure of such costs.

### Scope and Scope Exceptions

ASC 420 applies to all entities. It does not apply to:

- Costs associated with the retirement of a long-lived asset covered by ASC 410-20
- Impairment of an unrecognized asset while it is being used.  
(ASC 420-10-15-5)

### Overview

ASC 420-10-15-4 clarifies that an exit activity includes, but is not limited to:

- A restructuring
- The sale or termination of a line of business
- The closure of business activities in a particular location
- The relocation of business activities
- Changes in management structure
- A fundamental reorganization that affects the nature and focus of operation.

## DEFINITIONS OF TERMS

---

Source: ASC 420-10-20. Also see Appendix A, *Definitions of Terms*, for: Acquiree, Acquirer, Acquisition by a Not-for-Profit Entity, Business, Business Combination, Legal Entity, Not-for-Profit Entity, and Variable Interest Entity.

**Cease-Use Date.** The date the entity ceases using the right conveyed by the contract, for example, the right to use a leased property or to receive future goods or services.

**Communication Date.** The date the plan of termination for one-time employee termination benefits meets all of the criteria in paragraph 420-10-25-4 and has been communicated to employees.

**Legal Notification Period.** The notification period that an entity is required to provide to employees in advance of a specified termination event as a result of an existing law, statute, or contract.

**One-Time Employee Termination Benefits.** Benefits provided to current employees that are involuntarily terminated under the terms of a one-time benefit arrangement.

**Restructuring.** A program that is planned and controlled by management, and materially changes either the scope of a business undertaken by an entity, or the manner in which that business is conducted, as defined by the International Accounting Standard No. 37 in 2002.

## CONCEPTS, RULES, AND EXAMPLES

---

### Employee Termination Benefits

ASC 420, *Exit or Disposal Cost Obligations*, applies to termination benefits provided to current employees that are involuntarily terminated under the terms of a benefit arrangement that applies for a specified termination event or for a specified future period. Those benefits are referred to as onetime termination benefits. If an entity has a history of providing similar benefits to employees involuntarily terminated in earlier events, the benefits are presumed to be part of an ongoing benefit arrangement (rather than a onetime benefit arrangement) unless there is evidence to the contrary.

A onetime benefit arrangement first exists at the date the plan of termination meets *all* of the following criteria:

1. Management approves and commits to the termination plan.
2. The termination plan specifies the number of employees to be terminated, their job classifications or functions, and their locations, as well as the expected completion date.
3. The termination plan establishes the terms of the benefit arrangement in sufficient detail that employees are able to determine the type and amount of benefits that they will receive if they are involuntarily terminated.
4. Actions required to complete the plan indicate that significant changes to the plan are unlikely.

(ASC 460-10-25-4)

Communicating the plan to employees creates a liability at the communication date. (ASC 420-10-25-5)

**Measurement.** Exit or disposal costs should be measured at fair value. Often, quoted market values are not available for those costs. A present value technique may be the best option. However, in some situations the use of estimates may not be materially different from present value techniques and those are acceptable if consistent with a fair value measurement objective. (ASC 420-10-30-1 through 3)

**Timing.** (ASC 420-10-6 through 8) The timing of recognition of the liability for onetime termination benefits depends on whether the employees are required to render service beyond a minimum retention period. The minimum retention period is the notification period that an entity

is required to provide to employees in advance of a termination event as a result of law, statute, or contract, or in the absence of a legal notification period, the minimum retention period cannot exceed sixty days.

If employees are entitled to receive the termination benefits regardless of when they leave or if employees will not be retained to render service beyond the minimum retention period, the liability for the termination benefits is recognized and measured at its fair value at the communication date.

If employees are required to render service until they are terminated in order to receive the termination benefit and will be retained beyond the minimum retention period, the liability for the termination benefits is measured at its fair value at the communication date and recognized ratably over the service period.

#### Examples of the determination of the minimum retention period and recognition

Master Mobile Communications announces that it will close its Donnybrook plant and terminate all 120 employees there. The terms of the plan meet the criteria above. There are three major groups of employees: management, union workers, and nonunion workers. Management is required to stay and render service until the plant's closing, which is four months from now, and each of the twelve management employees will receive \$10,000. The union workers' contract states that they must be notified ninety days in advance before they can be terminated. The union workers will be terminated in ninety days. The termination benefit for each of the fifty union employees is one week per every six months of employment. The nonunion workers can leave at any time within the next three months and still collect the termination benefit. Each of the fifty-eight nonunion employees will receive a termination benefit of \$1,000 for each year of service. There is no state statute specifying a notification period.

#### Case 1: Management

Management is required to work until termination, so it is necessary to determine whether the service period is beyond the minimum retention period. There is no state statute specifying a notification period, but the Worker Adjustment and Retraining Act, which applies to entities with over 100 employees, requires a sixty-day notification period for this plant's closing. Thus, the minimum retention period is sixty days. Management must work beyond the minimum retention period, so the \$120,000 liability ( $12 \times \$10,000$ ) is recognized at \$30,000 per month for the next four months. Present value techniques are not necessary to measure the liability because the discount period is so short that the face amount would not differ materially from the fair value.

#### Case 2: Union employees

The union employees' contract requires a ninety-day notification period, so the minimum retention period for these employees is ninety days. The union workers will be terminated at the end of the ninety-day period, so they will not be required to work beyond the minimum retention period. If the total of the termination benefits for the fifty union employees is \$142,500, a liability of \$142,500 is recognized at the communication date. Present value techniques are not necessary to measure the liability because the discount period is so short that the face amount would not differ materially from the fair value.

#### Case 3: Nonunion workers

Nonunion workers are not required to work until the termination date to collect the termination benefit. Therefore, it is not necessary to determine the minimum retention period for these employees. If the fifty-eight nonunion employees have 230 years of service among them, a liability of \$230,000 is

recognized at the communication date. Present value techniques are not necessary to measure the liability because the discount period is so short that the face amount would not differ materially from the fair value.

**Subsequent measurement.** If subsequent to the communication date there are changes in either the timing or amount of the expected termination benefit cash flows, the cumulative effect of the change should be computed and reported in the same line item(s) in the income statement in which the costs were initially reported. If present value techniques were used to measure the initial liability, the same credit-adjusted risk-free rate should be used to remeasure the liability.

Changes in the liability due to the passage of time (accretion) are recognized as accretion expense in the income statement. If employees are not required to provide services or are required to provide services only during the minimum retention period, accretion expense is charged for the passage of time after the communication date. If employees are required to provide services beyond the minimum retention period, accretion expense is charged for the passage of time after the termination date. Accretion expense should not be titled interest expense or be considered interest costs subject to capitalization.

According to ASC 420-10-55, if newly offered benefits represent a revision to an ongoing arrangement that is not limited to a specified termination event or to a specified future period, the benefits represent an enhancement to an ongoing benefit arrangement.

If a plan of termination changes and employees that were expected to be terminated within the minimum retention period are retained to render service beyond that period, the liability amount should be recomputed as though it had been known at the initial communication date that those employees would be required to render services beyond the minimum retention period. The cumulative effect of the change is recognized as a change in the liability and reported in the same line item(s) in the income statement in which the costs were initially reported. The remainder of the liability is recognized ratably from the date of change to the termination date.

**Plan includes voluntary and involuntary benefits.** If a plan of termination includes both voluntary and involuntary termination benefits, a liability for the involuntary benefits is recognized as described above. A liability for the incremental voluntary benefits (the excess of the voluntary benefit amount over the involuntary benefit amount) is recognized in accordance with ASC 712-10-25-1 through 25-3. That is, if the benefits are special termination benefits offered only for a short period of time, the liability is recognized when the employees accept the offer and the amount can be reasonably estimated. If, instead, the voluntary termination benefits are contractual termination benefits (for example, required by a union contract or a pension contract) the liability is recognized when it is probable that employees will be entitled to benefits and the amount can be reasonably estimated.

## Contract Termination Costs

In addition to employee termination costs, an entity may incur contract termination costs, relocation costs, plant consolidation costs, and other costs associated with the exit or disposal activity. ASC 420 sets forth the following standards for recognition.

A liability for the costs to terminate a contract before the end of its term is recognized and measured at its fair value when the entity actually terminates the contract in accordance with the contractual term (e.g., by written notice).

A liability for the costs that will continue to be incurred under a contract for its remaining term without economic benefit to the entity is recognized and measured at its fair value when the entity ceases using the right conveyed by the contract (the cease-use date). If the contract is an operating lease, the fair value of the liability should be determined based on the remaining lease rentals,

reduced by estimated sublease rentals, even if the entity does not intend to find a sublease. However, remaining operating lease payments should not be reduced to an amount less than zero by the estimated sublease payments.

### **Other Associated Costs to Exit an Activity**

Other associated costs are items such as employee relocation costs and costs associated with facility closings or consolidations. A liability for other costs associated with the exit or disposal activity should be recognized when the liability is incurred, which is generally when the goods or services associated with the activity are received. The liability should not be recognized before it is incurred even if the costs are incremental and a direct result of the exit or disposal plan. (ASC 420-10-25-14 and 15)

### **Reporting and Disclosure**

The costs of exit or disposal activities that do not involve a discontinued operation must be included in income from continuing operations before income taxes. If the subtotal “income from operations” is presented, the costs must be included in that subtotal. If the costs are associated with exit or disposal activities that involve a discontinued operation, they are included in the results of discontinued operations. If an entity’s responsibility to settle the liability associated with an exit or disposal activity is removed or discharged, the related costs are reversed through the same line item(s) in the income statement that were used when those costs were initially recognized. (ASC 420-10-45-3)

Disclosure requirements can be found in the Appendix.

## **30 ASC 430 DEFERRED REVENUE**

The only guidance this topic provides is a link to guidance on deferred revenue related to vendor sales incentives (refunds or rebated) that will be claimed by customers at ASC 605-50-25-4.

Upon implementation of ASU 2014-09, the only guidance in this topic will be a link to guidance on deferred revenue *and* contract liabilities and the title of this topic will change to ASC 430, *Deferred Revenue and Contract Liabilities*.

# 31 ASC 440 COMMITMENTS

<b>Perspective and Issues</b>	<b>471</b>	<b>Concepts, Rules, and Examples</b>	<b>472</b>

<b>Definitions of Terms</b>	<b>472</b>		

## PERSPECTIVE AND ISSUES

---

### Subtopics

ASC 440, *Commitments*, contains only one subtopic:

- ASC 440-10, *Overall*, which provides general guidance on financial accounting and reporting for certain commitments.

The Subtopic has two Subsections:

1. *General*
2. *Unconditional Purchase Obligations*.

The *General* Subsection provides guidance for:

- Unused letters of credit,
- Preferred stock dividends in arrears,
- Commitments such as those for plant acquisitions, and
- Obligations to reduce debts, maintain working capital, or restrict dividends.

The *Unconditional Purchase Obligation* subsection provides guidance for unconditional purchase obligations, such as throughput and take-or-pay contracts.

### Scope and Scope Exceptions

ASC 440 applies to all transactions. However, for guidance on product financing arrangements, the preparer should look to ASC 470-40-15. Guidance on repurchase agreements within the scope of ASC 606 can be found in ASC 606-10-55-66 through 55-78 when ASU 2014-09 becomes effective.

### Overview

All significant contractual commitments must be disclosed in the notes to the financial statements. For example, lease contract provisions, pension obligations, requirements contracts, bond indenture covenants, commitments to purchase or construct new facilities, and employee share-based compensation plans are to be clearly disclosed in the notes.

## DEFINITIONS OF TERMS

---

Source: ASC 440-10-20

**Purchaser's Incremental Borrowing Rate.** The rate that, at the inception of an unconditional purchase obligation, the purchaser would have incurred to borrow over a similar term the funds necessary to discharge the obligation.

**Take-or-Pay Contract.** An agreement between a purchaser and a seller that provides for the purchaser to pay specified amounts periodically in return for products or services. The purchaser must make specified minimum payments even if it does not take delivery of the contracted products or services.

**Throughput Contract.** An agreement between a shipper (processor) and the owner of a transportation facility (such as an oil or natural gas pipeline or a ship) or a manufacturing facility that provides for the shipper (processor) to pay specified amounts periodically in return for the transportation (processing) of a product. The shipper (processor) is obligated to provide specified minimum quantities to be transported (processed) in each period and is required to make cash payments even if it does not provide the contracted quantities.

**Unconditional Purchase Obligation.** An obligation to transfer funds in the future for fixed or minimum amounts or quantities of goods or services at fixed or minimum prices (for example, as in take-or-pay contracts or throughput contracts).

## CONCEPTS, RULES, AND EXAMPLES

---

### Throughput and Take-or-Pay Contracts

Throughput and take-or-pay contracts are sometimes used to help a supplier pay for new facilities, machines, or other expenditures. (See definitions above.) They are negotiated as a way of arranging financing for the facilities that will produce the goods or provide the services desired by a purchaser. Some of these contracts are reported on the statement of financial position as an asset and a liability. Others are not reported. Other than standards relating to recognition of losses on unconditional purchase obligations (ASC 330-10-35), there are no standards that require the contracts to be recognized on the statement of financial position. However, ASC 440 requires certain disclosures to be made.

#### Example of a throughput contract

Aramark Oil contracts with the Persian Pipeline Company to ship a minimum of three million barrels a month of unprocessed sour crude oil from the Ahwaz oil field in Iran to the pipeline terminus at Char Bahar, an amount which constitutes 1/3 of the capacity of the pipeline. The contract term is twelve years. Under the contract, Aramarck is obligated to pay Persian for 1/3 of the fixed operating costs of the pipeline, depreciation, interest on the \$500 million of 5% debt used to finance the pipeline (to be paid off in equal annual payments over twelve years), and a 7% rate of return on equity to Persian. Estimated annual payments are \$20 million. Aramarck's disclosure of the agreement follows:

Aramark has signed an agreement reserving pipeline capacity for twelve years. Under the terms of the agreement, Aramarck is obligated to make the following minimum payments, whether or not it ships through the pipeline:

20X1 through 20X5 (\$20 million annually)	\$ 100,000,000
Later years	<u>140,000,000</u>
Total	240,000,000
Less: Amount representing interest	(58,984,000)
Total at present value	\$ <u>181,016,000</u>

Disclosures required by ASC 440 can be found in the Appendix.

## PERSPECTIVE AND ISSUES

---

### Subtopics

ASC 450, *Contingencies*, contains guidance for reporting and disclosure of gain and loss contingencies and has three subtopics:

- ASC 450-10, *Overall*, which, along with ASC 450-20450-30, provides guidance on accounting and disclosures for contingencies.
- ASC 450-20, *Loss Contingencies*, which describes accounting for potential liabilities in circumstances involving uncertainties.
- ASC 450-30, *Gain Contingencies*, which describes accounting and disclosure requirements for gain contingencies.

### Scope and Scope Exceptions

ASC 450 applies to all entities. Not all uncertainties are contingencies. ASC 450-10-55 points out several common estimates that do not fall under the contingency guidance:

- Depreciation
- Estimates used in accruals
- Changes in tax law.

ASC 450-10-15-2A has the following transaction exception:

"The guidance in the Contingencies Topic does not apply to the recognition and initial measurement of assets or liabilities arising from contingencies that are measured at fair value or assets arising from contingencies measured at an amount other than fair value on the acquisition date in a business combination or an acquisition by a not-for-profit entity under the requirements of Subtopic 805-20 or 958-805. Those Subtopics provide the recognition and initial measurement requirements for assets and liabilities arising from contingencies measured at fair value and for assets arising from contingencies measured at an amount other than fair value as part of a business combination or an acquisition by a not-for-profit entity."

ASC 450-20-15-2 excludes the following transactions because their guidance is elsewhere in the Codification:

- Stock issued to employees. (ASC 718)
- Employment-related costs, including deferred compensation contracts. (ASC 710, 712, and 715) However, certain postemployment benefits are included in the scope of this ASC 450-20 by reference in 712-10-25-4 through 25-5.
- Uncertainty in income taxes. (ASC 740-10-25)
- Accounting and reporting by insurance entities. (ASC 944)

## Overview

ASC 450-20 requires a liability to be recognized:

1. If it is *probable* that an obligation has been incurred because of a transaction or event that occurred on or before the date of the financial statements, and
2. If the amount of the obligation can be *reasonably estimated*.

Thus, uncertainties about the existence of an obligation need not be resolved before the liability is recorded.

## DEFINITIONS OF TERMS

---

See Appendix A, *Definition of Terms*, for terms relevant to this topic: Acquiree, Acquirer, Acquisition by a Not-for-Profit Entity, Acquisition Date, Business, Business Combinations, Contingency, Contract, Customer, Gain Contingency, Legal Entity, Loss Contingency, Not-for-Profit Entity, Probably, Reasonably Possible, Remote, Transaction Price, and Variable Interest Rate.

## CONCEPTS, RULES, AND EXAMPLES

---

### ASC 450-10, *Overall*

ASC 450 defines a contingency as an existing condition, situation, or set of circumstances involving uncertainty as to possible gain or loss and that will result in the acquisition of an asset, the reduction of a liability, the loss or impairment of an asset, or the incurrence of a liability. (ASC 450-10-05-5) The uncertainty will ultimately be resolved when one or more future events occur or fail to occur.

### ASC 450-20, *Loss Contingencies*

Loss contingencies are recognized only if there is an impairment of an asset or the incurrence of a liability as of the date of the statement of financial position. ASC 450-20-25-2 states that a loss must be accrued if *both* of the following conditions are met:

1. It is probable that an asset has been impaired or a liability has been incurred at the date of the financial statements.
2. The amount of loss can be reasonably estimated.

For example, estimated settlement amounts for ongoing lawsuits are recognized prior to a court's decision if it is probable that the outcome will be unfavorable. Further, difficulty in measuring an obligation is not, by itself, a reason for not recording a liability if the amount can be

estimated. For example, warranty obligations are commonly recognized as liabilities even though the number of claims and the amount of each claim are unknown at the time of the sale of the item covered by the warranty. Although future events will eventually resolve the uncertainties (the warranty claims will be paid and the lawsuit will be adjudicated or settled), the liabilities are required to be recognized before all of the uncertainties are resolved so that relevant information is provided on a timely basis.

**Levels of probability.** ASC defines the different levels of probability as to whether or not future events will confirm the existence of a loss as follows:

1. *Probable*—The future event or events are likely to occur.
2. *Reasonably possible*—The chance of the future event or events occurring is more than remote but less than likely.
3. *Remote*—The chance of the future event or events occurring is slight.

(ASC 450-20-25-2)

Professional judgment is required to classify the likelihood of the future events occurring. All relevant information that can be acquired concerning the uncertain set of circumstances needs to be obtained and used to determine the classification.

**Estimating the loss.** When estimating the fair value of the loss, it is not necessary that a single amount be identified. A range of amounts is sufficient to indicate that some amount of loss has been incurred and is required to be accrued. (ASC 450-20-25-5) The amount accrued is the amount within the range that appears to be the best estimate. If there is no best estimate, the minimum amount in the range is accrued, since it is probable that the loss will be at least that amount. (ASC 450-20) The maximum amount of loss is required to be disclosed. (ASC 450-20-30-1) If future events indicate that the minimum loss originally accrued is inadequate, an additional loss is to be accrued in the period when this fact becomes known. This accrual is a change in estimate, not a prior period adjustment.

**Probable.** When a loss is probable and no estimate is possible, these facts are also to be disclosed in the current period. The accrual of the loss is to be made in the earliest period in which the amount of the loss can be estimated. Accrual of that loss in future periods is a change in estimate. It is not treated as a restatement (prior period adjustment).

**Reasonably possible.** If the occurrence of the loss is reasonably possible, the facts and circumstances of the possible loss and an estimate of the amount, if determinable, are to be disclosed. If the occurrence of the loss is remote, no accrual or disclosure is usually required.

**Amount not estimable.** When a public company cannot estimate the reasonably likely impact of a contingent liability, but a range of amounts are determinable, the SEC requires disclosure of those amounts. Disclosure of contingencies for public companies is also to include quantification of the related accruals and adjustments, costs of legal defense, and reasonably likely exposure to additional loss, as well as the assumptions that management has made about those amounts and the extent to which the resulting estimates of loss are sensitive to changes in those assumptions.

**Events subsequent to balance sheet date.** Events that give rise to loss contingencies that occur after the date of the statement of financial position (i.e., bankruptcy or expropriation) but before issuance of the financial statements may require disclosure so that statement users are not misled. Note disclosures or pro forma financial statements may be prepared as supplemental information to show the effect of the loss.

**Unasserted claims or assessments.** It is not necessary to disclose loss contingencies for an unasserted claim or assessment where there has been no manifestation of an awareness of possible claim or assessment by a potential claimant unless it is deemed probable that a claim will be

asserted and a reasonable possibility of an unfavorable outcome exists. Under the provisions of ASC 450, general or unspecified business risks are not loss contingencies and therefore no accrual is necessary. Disclosure of these business risks may be required under ASC 275.

**Estimate versus contingency.** Distinguishing between an estimate and a contingency can be difficult because both involve an uncertainty that will be resolved by future events. However, an estimate exists because of uncertainty about the amount of a loss resulting from an event requiring an acknowledged accounting recognition. The event has occurred and the effect is known, but the amount itself is uncertain. For example, depreciation is an estimate, but not a contingency because the actual fact of physical depreciation is acknowledged, although the amount is obtained by an assumed accounting method.

In a contingency, the amount is also usually uncertain, although that is not an essential characteristic. Instead, the uncertainty lies in whether the event has occurred (or will) and what the effect, if any, on the enterprise would be. Collectibility of receivables is a contingency because it is uncertain whether a customer will not pay at a future date, although it is probable that some customers will not pay. Similar logic would hold for obligations related to product warranties. That is, it is uncertain whether a product will fail, but it is probable that some will fail within the warranty period.

Other contingencies are rarely recognized until specific events confirming their existence occur. Every business risks loss by fire, explosion, government expropriation, or casualties in the ordinary course of business. To the extent those losses are not (or cannot be) insured, the risks are contingencies. Because those events are often random in their occurrence, uncertainty surrounds whether the future event confirming the loss will or will not take place. The passage of time usually resolves the uncertainty. Until the event confirming the loss occurs (or is probable of occurrence) and the amount of the loss can be reasonably estimated, the potential loss is not recognized in financial statements.

**Litigation.** The most difficult area of contingencies is litigation. Accountants must rely on attorneys' assessments concerning the likelihood of such events. Unless the attorney indicates that the risk of loss is remote or slight, or that the loss if it occurs would be immaterial to the company, disclosure in financial statements is necessary and an accrual may also be necessary. In practice, attorneys are loathe to state that the risk of loss is remote, as that term is defined by ASC 450, although the likelihood of obtaining a definitive response to lawyers' letters under AU-C Section 501 is improved if the auditors explicitly cite a materiality threshold. In cases where judgments have been entered against the reporting entity, or where the attorney gives a range of expected losses or other amounts and indicates that an unfavorable outcome is probable, accruals of loss contingencies for at least the minimum point of the range must be made. In most cases, however, an estimate of the contingency is unknown and the contingency is reflected only in footnotes.

Accruals for contingencies, including those arising in connection with litigation, are limited under GAAP to expected losses resulting from events occurring prior to the date of the statement of financial position. (ASC 450-20-25-6) One unresolved issue is whether expected legal costs to be incurred in connection with a loss contingency that is being accrued should be accrued as well. Apparently, GAAP would permit such an accrual, but practice is varied. With respect to SEC registrants, the SEC staff expects consistency and the decision to do so to be disclosed in the financial statements and applied consistently. (ASC 450-20-S99)

#### **ASC 450-30, Gain Contingencies**

The guidance in ASC 450-30 states simply that a "contingency that might result in a gain usually should not be reflected in the financial statements because to do so might be to recognize

revenue before its realization.” (ASC 450-30-25-2) However, it also states that entities may consider disclosing a gain contingency as long as the disclosure is adequate and is not misleading.

### Other Sources

The Contingencies Subtopics do not include all guidance related to contingencies. The following chart, based on information in the ASC Subtopics “60” sections, references other Codification sources of guidance.

See ASC Location—Wiley GAAP Chapter	<i>For information on . . .</i>
<b>From ASC 450-10, Overall</b>	
ASC 270-10-50-6	Contingencies and other uncertainties that could be expected to affect the fairness of presentation of financial data at an interim date.
ASC 340-30	Contingencies associated with insurance and reinsurance contracts that do not transfer insurance risk.
ASC 605-15	Recognition of revenue when uncertainties exist about possible returns.
ASC 605-40-25-4	Cases in which a nonmonetary asset is destroyed or damaged (that is, an involuntary conversion) and the amount of monetary assets to be received is uncertain.
ASC 606-10-32-5 through 32-15	Estimating and constraining estimates of variable consideration.
ASC 610-30-25-4	Cases in which a nonmonetary asset is destroyed or damaged and the amount of monetary assets to be received is uncertain.
ASC 720-20	Accounting by an insured entity for the contingencies associated with a multiple-year retrospectively rated insurance contract accounted for as insurance.
ASC 740-10-25	Accounting for uncertainty in income taxes.
ASC 805-20-55-50 through 55-51	Recognition of contingent obligations for contractual termination benefits and curtailment losses under employee benefit plans that will be triggered by the consummation of the business combination.
ASC 840-10-25-35	Contingent rentals.
ASC 944-40	Contingencies that arise when an insurance entity or a reinsurance entity issues an insurance contract.
ASC 944-20-15	Contingencies associated with a reinsurance contract between insurance entities (including retrocession).
ASC 944-20	Contingencies associated with multiple-year retrospectively rated contracts.
ASC 985-605 (This paragraph will be superseded upon transition to ASC 606.)	Revenue recognition when uncertainties exist if licensing, selling, leasing, or otherwise marketing computer software.

<b>ASC 450-20, Loss Contingencies</b>	
ASC 275	Disclosure of certain risks and uncertainties that stem from the nature of an entity's operations and from significant concentrations in certain aspects of an entity's operations, many of which are noninsured or underinsured risks.
ASC 310-10-35	Contingencies related to the collectibility of receivables.
ASC 310-10-35	Application of this Subtopic to the collectibility of a loan portfolio.
ASC 330-10-35	Inventories that are impaired by damage, deterioration, obsolescence, changes in price levels, or other causes.
ASC 330-10-35	Losses that are expected to arise from firm, uncancelable, and unhedged commitments for the future purchase of inventory.
ASC 405-30	Assessments by state guaranty funds and workers' compensation second-injury funds and other assessments related to insurance activities, including insurance activities of an entity that self-insures.
ASC 410-20	Contingencies associated with the retirement of a tangible long-lived asset that result from the acquisition, construction, or development and/or the normal operation of a long-lived asset.
ASC 410-30	Contingencies related to environmental remediation liabilities that arise from the improper operation of a long-lived asset.
The Product Warranties Subsections of Subtopic 460-10	Contingencies related to product warranties and product defects.
ASC 460	Contingencies related to guarantees of indebtedness of others.
ASC 460	Contingencies related to obligations of commercial banks under financial standby letters of credit.
ASC 470-60-35	Contingent payments of a troubled debt restructuring.
ASC 715-80-35-2 and 715-80-50-2	Contingencies related to withdrawal from a multiemployer plan.
ASC 720-20-25-1	Contingencies related to an insurance contract or reinsurance contract that does not, despite its form, provide for indemnification of the insured or the ceding company by the insurer or reinsurer against loss or liability.
ASC 840-10-25-12	Classification effects of a provision in a lease that requires lessee indemnifications for environmental contamination caused by the lessee during its use of the property.
ASC 840-10-25-35	Contingent rent.

ASC 860-10-40	Contingencies related to agreements to repurchase receivables (or to repurchase the related property) that have been sold or otherwise assigned.
ASC 930-715	Contingencies resulting from the Coal Industry Retiree Health Benefit Act of 1992.
ASC 944-40	Contingencies related to the risk of loss that is assumed by a property and casualty insurance entity or reinsurance entity when it issues an insurance policy covering risk of loss from catastrophes.
ASC 946-320-35-17 to 35-19	Contingencies related to the collectibility of interest receivable, including purchased interest.
ASC 954-450	Contingencies related to malpractice claims.

**ASC 450-30, Gain Contingencies**

ASC 210-20-45	The determination of whether a receivable resulting from the recognition of a gain contingency may be offset against an existing liability.
ASC 225-30-45	The presentation of business interruption insurance recoveries in the income statement.
ASC 225-30-50	Disclosure of information about business interruption insurance recoveries.
ASC 720-20-25-3	Recognition of insurance recoveries by an entity insured through a purchased retroactive insurance contract (other than for core insurance operations of an insurance entity).
ASC 840-10-50-5	A lessor's accounting for contingent rental income.

## PERSPECTIVE AND ISSUES

---

### Subtopic

ASC 460, *Guarantees*, consists of one subtopic:

- ASC 460-10, *Overall*, which provides requirements to be met by a guarantor for certain guarantees issued and outstanding.

ASC 460-10 has two Subsections:

- *General*, which discusses the guarantor's recognition and disclosure of a liability at the inception of a guarantee
- *Product Warranties*.

Additional sources of guidance are listed in the Other Sources section at the end of this chapter.

### Scope and Scope Exceptions

ASC 460 applies to all entities. ASC 460 applies to guarantee contracts that contingently require the guarantor to make payments (either in cash, financial instruments, shares of its stock, other assets, or in services) to the guaranteed party based on any of the following circumstances (ASC 460-10-15-4):

- a. Changes in a specified interest rate, security price, commodity price, foreign exchange rate, index of prices or rates, or any other variable, including the occurrence or nonoccurrence of a specified event that is related to an asset or liability of the guaranteed party. For example, the provisions apply to the following, as cited by ASC 460:
  1. A financial standby letter of credit
  2. A market value guarantee on either securities (including the common stock of the guaranteed party) or a nonfinancial asset owned by the guaranteed party

3. A guarantee of the market price of the common stock of the guaranteed party
  4. A guarantee of the collection of the scheduled contractual cash flows from individual financial assets held by a variable interest entity (VIE)
  5. A guarantee granted to a business or its owners that the revenue received by the business will equal or exceed some stated amount.
- (ASC 460-10-55-2, with reference to ASC 460-10-15-4(a))

One common example of this type of situation is where a hospital lures a doctor to open a practice in an underserved community with a guarantee of fee income for an initial period. ASC 460 explicitly states that these types of assurances are guarantees and must be given accounting recognition.

- b. Another entity's failure to perform under an obligating agreement. For example, the provisions apply to a performance standby letter of credit, which obligates the guarantor to make a payment if the specified entity fails to perform its nonfinancial obligation.
- c. The occurrence of a specified event or circumstance (an indemnification agreement), such as an adverse judgment in a lawsuit or the imposition of additional taxes due to either a change in the tax law or an adverse interpretation of the tax law, provided that the guarantor is an entity other than an insurance or reinsurance company.
- d. The occurrence of specified events under conditions whereby payments are legally available to creditors of the guaranteed party and those creditors may enforce the guaranteed party's claims against the guarantor under the agreement (an indirect guarantee of the indebtedness of others).

Per ASC 460-10-15-7, ASC 460 does *not* apply to:

1. A guarantee or an indemnification that is excluded from the scope of Topic 450, *Contingencies*, primarily employment-related guarantees
  2. A lessee's guarantee of the residual value of leased property if the lessee accounts for the lease as a capital lease
  3. Contingent rents
  4. A guarantee contract or an indemnification agreement, accounted for under ASC 944, that is issued by either an insurance or a reinsurance company
  5. Vendor rebates (by the guarantor) based on either the sales revenues of or the number of units sold by the guaranteed party
  6. Vendor rebates (by the guarantor) based on the volume of purchases by the buyer (because the underlying relates to an asset of the seller not the buyer who receives the rebate)
  7. Guarantees that prevent the guarantor from recognizing either the sale of the asset underlying the guarantee or the profits from that sale
  8. A registration payment arrangement within the scope of ASC 825-20-15, *Financial Instruments, Registration Payment Arrangements*
  9. A guarantee or an indemnification of an entity's own future performance.
  10. A guarantee accounted for as a credit derivative instrument at fair value under ASC 815-10-50-4J through 4L
  11. A sales incentive program where a manufacturer guarantees to recognize the equipment at a specified time or place. Exception under Topic 606 upon effective date of ASU 2014-09.
- (ASC 460-10-15-7)

**Initial measurements.** ASC 460's requirement to recognize an initial liability does *not* apply to the following types of guarantees (i.e., these guarantees are subject only to ASC 460's disclosure requirements):

1. A guarantee that is accounted for as a derivative instrument at fair value under ASC 815.
2. A contract that guarantees the functionality of nonfinancial assets that are owned by the guaranteed party (product warranties)
3. Contingent consideration in a business combination or an acquisition of a business or nonprofit activity by a not-for-profit entity
4. A guarantee that requires the guarantor to issue its own equity shares
5. A guarantee by an original lessee that has become secondarily liable under a new lease that relieved the original lessee of the primary obligation under the original lease
6. A guarantee issued between parents and their subsidiaries or between corporations under common control
7. A parent's guarantee of a subsidiary's debt to a third party (irrespective of whether the parent is a corporation or an individual)
8. A subsidiary's guarantee of a parent's debt to a third party or the debt of another subsidiary of the parent.

(ASC 460-10-25-1)

**Product warranties.** Per ASC 460-10-15-9 the guidance in the Product Warranties Sub-sections applies only to product warranties, which include all of the following:

1. Product warranties issued by the guarantor, regardless of whether the guarantor is required to make payment in services or cash.
2. Separately priced extended warranty or product maintenance contracts and (per ASC 606) "warranties that provide a customer with a service in addition to the assurance that product complies with agreed-upon specifications."
3. Warranty obligations that are incurred in connection with the sale of the product, that is, obligations that are not separately priced or sold but are included in the sale of the product.

## Overview

Guarantees embody two separate obligations:

1. The contingent obligation to make future payments under the guarantee in the event of nonperformance by the party whose obligation is guaranteed, and
2. An obligation to be ready to perform, referred to as a standby obligation, during the period that the guarantee is in effect.

As a result of this bifurcation of the obligation, many guarantees are now required to be recognized as liabilities on the statement of financial position.

## DEFINITIONS OF TERMS

---

Source: ASC 460-10-20. Also see Appendix A, *Definition of Terms*, for other terms relevant to this topic: Acquiree, Acquirer, Acquisition by a Not-for-Profit Entity, Business, Business Combination, Contingency, Contract, Customer, Direct Guarantee of Indebtedness, Fair Value

(3rd definition), Gain Contingency, Legal Entity, Loss Contingency, Not-for-Profit Entity, Performance Obligation, Probable, Related Parties, Revenue, Underlying, Variable Interest Entity, and Weather Derivative.

**Commercial Letter of Credit.** Document issued typically by a financial institution on behalf of its customer (the account party) authorizing a third party (the beneficiary), or in special cases the account party, to draw drafts on the institution up to a stipulated amount and with specified terms and conditions; it is a conditional commitment (except if prepaid by the account party) on the part of the institution to provide payment on drafts drawn in accordance with the terms of the document.

**Direct Guarantee of Indebtedness.** An agreement in which a guarantor states that if the debtor fails to make payment to the creditor when due, the guarantor will pay the creditor. If the debtor defaults, the creditor has a direct claim on the guarantor.

**Financial Standby Letter of Credit.** An undertaking (typically by a financial institution) to guarantee payment of a specified financial obligation.

**Indirect Guarantee of Indebtedness.** An agreement that obligates the guarantor to transfer funds to a debtor upon the occurrence of specified events, under conditions whereby:

1. After funds are transferred from the guarantor to the debtor, the funds become legally available to creditors through their claims against the debtor
2. Those creditors may enforce the debtor's claims against the guarantor under the agreement.

In contrast with a direct guarantee of indebtedness, if the debtor defaults, the creditor has a direct claim on the guarantor. Examples of indirect guarantees include agreements to advance funds if a debtor's net income, coverage of fixed charges, or working capital falls below a specified minimum.

**Indirectly Related to the Leased Property.** The provisions or conditions that in substance are guarantees of the lessor's debt or loans to the lessor by the lessee that are related to the leased property but are structured in such a manner that they do not represent a direct guarantee or loan. Examples include a party related to the lessee guaranteeing the lessor's debt on behalf of the lessee, or the lessee financing the lessor's purchase of the leased asset using collateral other than the leased property.

**Minimum Revenue Guarantee.** A guarantee granted to a business or its owners that the revenue of the business (or a specific portion of the business) for a specified period of time will be at least a specified minimum amount.

**Noncancelable Lease Term.** That portion of the lease term that is cancelable only under any of the following conditions:

1. Upon the occurrence of some remote contingency
2. With the permission of the lessor
3. If the lessee enters into a new lease with the same lessor
4. If the lessee incurs a penalty in such amount that continuation of the lease appears, at inception, reasonably assured.

**Penalty.** Any requirement that is imposed or can be imposed on the lessee by the lease agreement or by factors outside the lease agreement to do any of the following:

1. Disburse cash
2. Incur or assume a liability
3. Perform services

4. Surrender or transfer an asset or rights to an asset or otherwise forego an economic benefit, or suffer an economic detriment. Factors to consider in determining whether an economic detriment may be incurred include, but are not limited to, all of the following:
  - a. The uniqueness of purpose or location of the property
  - b. The availability of a comparable replacement property
  - c. The relative importance or significance of the property to the continuation of the lessee's line of business or service to its customers
  - d. The existence of leasehold improvements or other assets whose value would be impaired by the lessee vacating or discontinuing use of the leased property
  - e. Adverse tax consequences
  - f. The ability or willingness of the lessee to bear the cost associated with relocation or replacement of the leased property at market rental rates or to tolerate other parties using the leased property.

**Performance Standby Letter of Credit.** An irrevocable undertaking by a guarantor to make payments in the event a specified third party fails to perform under a nonfinancial contractual obligation.

**Warranty.** A guarantee for which the underlying is related to the performance (regarding function, not price) of nonfinancial assets that are owned by the guaranteed party. The obligation may be incurred in connection with the sale of goods or services; if so, it may require further performance by the seller after the sale has taken place.

## CONCEPTS, RULES, AND EXAMPLES

---

### Guarantees

ASC 460:

- Requires that the fair value of guarantees be recognized as a liability, and
- Establishes the notion that a guarantee actually consists of two distinct components.

These two obligations have quite different accounting implications:

- *Noncontingent obligation.* The first of these components is a noncontingent obligation, namely, the obligation to stand ready to perform over the term of the guarantee in the event that the specified triggering events or conditions occur. This stand-ready obligation is unconditional and thus is not considered a contingent obligation.
- *Contingent obligation.* The second component, which is a contingent obligation, is the obligation to make future payments if those triggering events or conditions occur.

**Initial recognition.** At the inception of a guarantee, the guarantor recognizes a liability for both the noncontingent and contingent obligations at their fair values. However, in the unusual circumstance that a liability is recognized under ASC 450-20 for the contingent obligation (i.e., because it is deemed probable of occurrence and reasonable of estimation that the guarantor will pay), the liability initially recognized for the noncontingent obligation would only be the portion, if any, of the guarantee's fair value not already recognized to comply with ASC 450-20.

It is important to stress that this does not mean that the guarantor records the entire face amount of the guarantee; rather, it is the fair value of the stand-ready obligation that is recognized. When a guarantee is issued in a stand-alone, arm's-length transaction with an unrelated party, the fair value of the guarantee (and thus the amount to be recognized as a liability) is the premium

received by the guarantor. When a guarantee is issued as part of another transaction (such as the sale or lease of an asset) or as a contribution to an unrelated party, the fair value of the liability is measured by the premium that would be required by the guarantor to issue the same guarantee in a stand-alone, arm's-length transaction with an unrelated party.

In practice, if the likelihood that the guarantor will have to perform is judged to be only "reasonably possible" or "remote," the only amount recorded is the fair value of the noncontingent obligation to stand ready to perform. If, however, the contingency is probable of occurrence and can be reasonably estimated under ASC 450-20, that amount must be recognized and the liability under the guarantee arrangement will be the greater of:

- (1) the fair value computed as explained above, or
- (2) the amount computed in accordance with ASC 450-20's provisions.

When initially issued, the guidance on computing guarantees where no market information is available made reference to CON 7. In so doing, FASB endorsed the use of the discounted, probability-weighted cash flow method for estimating the stand-ready obligation.

Since, in the author's opinion, in the absence of other, better input data, such as the pricing of insurance to assume the risk of performing on the guarantee, the probability-weighted present value of possible future cash flows could serve as useful input to determining the fair value of guarantees made, the following example is presented.

**Example of estimating the fair value of a guarantee using CON 7 when recognition of a loss contingency under ASC 450 would not be otherwise required**

Big Red Company guarantees a \$1,000,000 debt of Little Blue Company for the next three years in conjunction with selling equipment to Little Blue. Big Red evaluates its risk of payment as follows:

- (1) There is no possibility that Big Red will pay during year 1.
- (2) There is a 15% chance that Big Red will pay during year 2. If it has to pay, there is a 30% chance that it will have to pay \$500,000 and a 70% chance that it will have to pay \$250,000.
- (3) There is a 20% chance that Big Red will pay during year 3. If it has to pay, there is a 25% chance that it will have to pay \$600,000 and a 75% chance that it will have to pay \$300,000.

The expected cash flows are computed as follows:

Year 1	100% chance of paying \$0 = \$0
Year 2	85% chance of paying \$0 and a 15% chance of paying (.30 × \$500,000 + .70 × \$250,000 =) \$325,000 = \$48,750
Year 3	80% chance of paying \$0 and a 20% chance of paying (.25 × \$600,000 + .75 × \$300,000 =) \$375,000 = \$75,000

The present value of the expected cash flows is computed as the sum of the years' probability-weighted cash flows, here assuming an appropriate discount rate of 8%.

Year 1	\$0 × 1/1.08	=	\$ 0
Year 2	\$48,750 × 1/(1.08) <sup>2</sup>	=	41,795
Year 3	\$75,000 × 1/(1.08) <sup>3</sup>	=	59,537
Fair value of the guarantee			<u>\$101,332</u>

Based on the foregoing, a liability of \$101,332 would be recognized at inception. This would reduce the net selling price of the equipment sold to Little Blue, thereby reducing the profit to be reported on the sale transaction.

**Example of estimating the fair value of a guarantee using CON 7 when recognition of a loss contingency under ASC 450 is also required**

Assume the same basic facts as in the foregoing example, but now also assume that it has been determined that there is a 60% likelihood that the buyer will eventually default and, after legal process, Big Red will have to repay debt amounting to \$400,000 at the end of the fifth year. Assume also that a likelihood of 60% is deemed to make this contingent obligation “probable” under ASC 450. The present value of that payment is \$272,233, but ASC 450 does not address or seemingly anticipate the application of present value methods. Thus, it would appear that accrual of the full \$400,000 expected loss is required, unaffected by expected timing or by the probability (60%, in this example) that it will occur. Since this amount exceeds the amount computed under ASC 460, no additional amount would be recognized in connection with the noncontingent obligation to stand ready to perform.

If, instead of the immediate foregoing facts, the probable repayments were estimated to be \$75,000, then the liabilities to be recognized would total \$101,322, of which \$75,000 would be required to satisfy the provisions of ASC 450, and the incremental amount, \$26,332, would be attributed to the noncontingent obligation.

The entry to record the liability depends upon the circumstances under which the guarantee arose. If the guarantee was issued in a stand-alone transaction for a premium, the offset would be to the asset accepted for the premium’s payment (most likely, cash or a receivable). If the guarantee was issued in conjunction with the sale of assets, the proceeds would be allocated between the sale of the asset and the guarantee obligation, so that the profit (loss) on the sale of the asset would be reduced (increased). If the guarantee was issued in conjunction with the formation of a business accounted for under the equity method, the offset would be an increase in the carrying amount of the investment. If the guarantee was issued to an unrelated party for no consideration, an immediate expense would be recognized. If a residual value guarantee was provided by a lessee-guarantor, the offset would be reported as prepaid rent and then amortized over the term of the lease to rent expense. The residual value of equipment by the manufacturer is recognized by the manufacturer as an asset (included in the seller/lessor’s net investment in lease).

**Subsequent measurement.** After initial recognition, the liability is adjusted as the guarantor either is released from risk or is subject to increased risk. ASC 460 does not prescribe the accounting for guarantees subsequent to initial recognition, and there is no requirement to reassess the fair value of the guarantee after inception. In fact, ASC 460 only addresses measurement of a guarantor’s liability at the inception of the guarantee and fair value is only to be used in subsequent accounting for the guarantee if the use of that method can be justified under other authoritative guidance. ASC 460 cannot be cited to support adjustments to fair value subsequent to initial recognition.

However, if the guarantor is subsequently released from risk, logically that could be recognized in one of three ways, in the authors’ opinion, although no guidance is provided by ASC 460. First, the liability could simply be written off at its expiration or settlement. Second, the liability could be amortized systematically over the guarantee period. Third, the liability might be adjusted to reflect changing fair value, which presumably declines over time as the risk of having to perform decreases. Furthermore, changes dictated by the provisions of ASC 450 (e.g., as a previously “remote” contingency becomes a “probable” one) must be accounted for under that requirement, apart from the requirements of ASC 460.

**Fees for guaranteeing a loan.** According to ASC 605-20-25-9, fees received for guaranteeing another entity’s obligation are to be recognized as income over the guarantee period, rather than at the time of receipt, consistent with other standards governing service fee income recognition. (Upon implementation of ASU 2014-09, ASC 605-20-25-9 will be superseded

by ASC 606.) The guarantor is to perform ongoing assessments of the probability of loss related to the guarantee and recognize a liability if the conditions in ASC 450 are met. Upon entering into a guarantee arrangement, the guarantor is required to recognize the stand-ready obligation under the guarantee. The contingent aspect of the guarantee would only be recognized if the conditions defined by ASC 450 are met.

**Impact of ASC 460 on revenue recognition on sales with a guaranteed minimum resale value.** The authoritative GAAP governing lease accounting holds that manufacturers are precluded from recognizing sales of equipment when they provide purchasers with guarantees of resale value, unless the criteria for sales-type lease accounting are met (ASC 840-10-55-12 et seq.). It states that minimum lease payments, used to ascertain whether a given lease would be an operating or sales-type (capital) lease, are to include the difference between the initial proceeds and the guaranteed amount. Under these circumstances, the fair value of the resale value guarantee is not recognized by the manufacturer, because ASC 460 does not apply to an asset of the guarantor. Given that the manufacturer would report the residual value as an asset, the guarantee does not fall within the domain of ASC 460.

**Disclosure requirements.** Disclosures can be found in the checklist in the Appendix.

## Product Warranties

Product warranties providing for repair or replacement of defective products may be sold separately or may be included in the sale price of the product. ASC 460-10-25-5 points out that “because of the uncertainty surrounding claims that may be made under warranties, warranty obligation falls within the definition of a contingency” and losses are accrued under the conditions in ASC 450-20-25 are met:

1. If it is *probable* that an obligation has been incurred because of a transaction or event that occurred on or before the date of the financial statements, and
2. If the amount of the obligation can be *reasonably estimated*.

These conditions may be made for individual elements or groups of items and the particular parties making claims may not be identified at the time of the accrual.

If the warranty extends into the next accounting period, a current liability for the estimated amount of warranty expense expected in the next period must be recorded. If the warranty spans more than the next period, the estimated liability must be partitioned into a current and long-term portion. ASC 460 requires disclosure of product warranties in the notes to financial statements. Disclosure requirements can be found in the Appendix.

### Example of product warranty expense

The Churnaway Corporation manufactures clothes washers. It sells \$900,000 of washing machines during its most recent month of operations. Based on its historical warranty claims experience, it records an estimated warranty expense of 2% of revenues with the following entry:

Warranty expense	18,000
Accrued warranty claims	18,000

During the following month, Churnaway incurs \$10,000 of actual labor and \$4,500 of actual materials expenses to perform repairs required under warranty claims, which it charges to the warranty claims accrual with the following entry:

Accrued warranty claims	14,500
Labor expense	10,000
Materials expense	4,500

Churnaway also sells three-year extended warranties on its washing machines that begin once the initial one-year manufacturer's warranty expires. During one month, it sells \$54,000 of extended warranties, which it records with the following entry:

Cash	54,000
Unearned warranty revenue	54,000

This liability is unaltered for one year from the purchase date, after which the extended warranty servicing period begins. Churnaway recognizes the warranty revenue on a straight-line basis over the 36 months of the warranty period, using the following entry each month:

Unearned warranty revenue	1,500
Warranty revenue	1,500

Software vendors/licensors often include, as part of their customary contractual terms, an indemnification clause that indemnifies the licensee against liability and damages (including costs of legal defense) that could arise in the event that a third party claims patent, copyright, trademark, or trade secret infringement with respect to the licensor's software. The indemnification requires the licensor/guarantor to make a payment to the licensee/guaranteed party based on the occurrence of an infringement claim against the licensor that results in liabilities or damages related to the licensed software being used by the licensee. Under such a scenario, an infringement claim covered by the indemnification could impair the ability of the licensee to use the licensed software if, for example, a court orders an injunction or assesses damages.

The indemnification qualifies for the scope exception in ASC 460-10-25-1(b) (discussed in the Scope and Scope Exceptions at the beginning of this chapter) as a product warranty or other guarantee for which the underlying is related to the performance of a nonfinancial asset (the software) owned (leased) by the guaranteed party since the licensed software cannot function as intended until the seller-licensor cures the alleged infringement defect.

These arrangements are subject to the same disclosure requirements imposed on other warranty obligations.

## PERSPECTIVE AND ISSUES

---

### Subtopics

ASC 470, *Debt*, consists of six subtopics:

- ASC 470-10, *Overall*, which provides guidance on classification on obligations, such as short-term debt expected to be refinanced on a long-term basis, due-on-demand loans, callable debt, sales of future revenue, increasing rate debt, debt with covenants, revolving credit agreements subject to lockbox arrangements and subjective acceleration clauses, and indexed debt.
- ASC 470-20, *Debt with Conversion and Other Options*, which provides guidance on debt and certain preferred stock with specific conversion features: debt instruments with detachable warrants, convertible securities in general, beneficial conversion features, interest forfeiture, induced conversions, conversion upon issuer's exercise of call option, convertible instruments issued to nonemployees for goods and services, and own-share lending arrangements issued in contemplation of convertible debt issuance.
- ASC 470-30, *Participating Mortgage Loans*, which provides guidance on the borrower's accounting for a participating mortgage loan if the lender is entitled to participate in appreciation in the fair value of the mortgaged real estate project or the results of operations of the mortgaged real estate project.
- ASC 470-40, *Product Financing Arrangements*, which provides guidance for determining whether an arrangement involving the sale of inventory is in substance a financing arrangement.
- ASC 470-50, *Modifications and Extinguishments*, which provides guidance on all debt instruments extinguishment, except for debt extinguished in a troubled debt restructuring.
- ASC 470-60, *Troubled Debt Restructurings by Debtors*, which addresses measuring and recognition from the debtor's perspective.

### Scope and Scope Exceptions

**ASC 470-20.** ASC 470-20 is divided into two subsections:

- General
- Cash Conversion.

**General Subsections.** The guidance in the General Subsections does not apply to those instruments within the scope of the Cash Conversion Subsections. The guidance on own-share lending arrangements applies to an equity-classified share-lending arrangement on an entity's own shares when executed in contemplation of a convertible debt offering or other financing.

The guidance in this Section should be considered after consideration of the guidance in Subtopic 815-15 on bifurcation of embedded derivatives, as applicable (see paragraph 815-15-55-76A).

**Cash Conversion Subsections.** The guidance in the Cash Conversion Subsections applies only to convertible debt instruments that may be settled in cash (or other assets) upon conversion, unless the embedded conversion option is required to be separately accounted for as a derivative instrument under Subtopic 815-15.

The Cash Conversion Subsections do *not* apply to any of the following instruments:

1. A convertible preferred share that is classified in equity or temporary equity.
2. A convertible debt instrument that requires or permits settlement in cash (or other assets) upon conversion only in specific circumstances in which the holders of the underlying shares also would receive the same form of consideration in exchange for their shares.
3. A convertible debt instrument that requires an issuer's obligation to provide consideration for a fractional share upon conversion to be settled in cash but that does not otherwise require or permit settlement in cash (or other assets) upon conversion.

For purposes of determining whether an instrument is within the scope of the Cash Conversion Subsections, a convertible preferred share shall be considered a convertible debt instrument if it has both of the following characteristics:

- a. It is a mandatorily redeemable financial instrument.
- b. It is classified as a liability under Subtopic 480-10.

**ASC 470-30.** ASC 470-30 does *not* apply to creditors in participating mortgage loan arrangements and to the following transactions:

- a. Participating leases
- b. Debt convertible at the option of the lender into equity ownership of the property
- c. Participating loans resulting from troubled debt restructurings.

**ASC 470-40.** The guidance in ASC 470-40 applies to product financing arrangements for "products that have been produced by or were originally purchased by the sponsor or purchased by another entity on behalf of the sponsor." (ASU 2014-09 changes this language to "products that were purchased by another entity on behalf of the sponsor.") The arrangement must have the following characteristics:

1. The financing arrangement requires the sponsor to purchase the product, a substantially identical product, or processed goods of which the product is a component at specified prices. The specified prices are not subject to change except for fluctuations due to finance and holding costs. This characteristic of predetermined prices also is present if any of the following circumstances exist:
  - a. The specified prices in the financing arrangement are in the form of resale price guarantees under which the sponsor agrees to make up any difference between the specified price and the resale price for products sold to third parties.
  - b. The sponsor is not required to purchase the product but has an option to purchase the product, the economic effect of which compels the sponsor to purchase the product; for example, an option arrangement that provides for a significant penalty if the sponsor does not exercise the option to purchase.
  - c. The sponsor is not required by the agreement to purchase the product but the other entity has an option whereby it can require the sponsor to purchase the product.

2. The payments that the other entity will receive on the transaction are established by the financing arrangement, and the amounts to be paid by the sponsor will be adjusted, as necessary, to cover substantially all fluctuations in costs incurred by the other entity in purchasing and holding the product (including interest). This characteristic ordinarily is not present in purchase commitments or contractor-subcontractor relationships.  
(ASC 470-40-15-2)

ASC 470-40 does *not* apply to the following transactions and activities:

1. Ordinary purchase commitments in which the risks and rewards of ownership (per ASC 606: control of goods or services) are retained by the seller (for example, a manufacturer or other supplier) until the goods or services are transferred to a purchaser.
  2. Typical contractor-subcontractor relationships in which the contractor is not in substance the owner of product held by the subcontractor and the obligation of the contractor is contingent on substantial performance on the part of the subcontractor.
  3. Long-term unconditional purchase obligations (for example, take-or-pay contracts) specified by Subtopic 440-10. At the time a take-or-pay contract is entered into, which is an unconditional purchase obligation, either the product does not yet exist (for example, electricity) or the product exists in a form unsuitable to the purchaser (for example, unmined coal); the purchaser has a right to receive future product but is not the substantive owner of existing product.
  4. Unmined or unharvested natural resources and financial instruments.
  5. Transactions for which sales revenue is recognized currently in accordance with the provisions of Topic 605 (Topic 606 upon implementation of ASU 2014-09).
  6. Typical purchases by a subcontractor on behalf of a contractor. In a typical contractor-subcontractor relationship, the purchase of product by a subcontractor on behalf of a contractor ordinarily leaves a significant portion of the subcontractor's obligation unfulfilled. The subcontractor has the risks of ownership of the product until it has met all the terms of a contract. Accordingly, the typical contractor-subcontractor relationship shall not be considered a product financing arrangement.
- (ASC 470-40-15-3)

**ASC 470-50.** ASC 470-50 does *not* apply to the following transactions and activities:

1. Conversions of debt into equity securities of the debtor pursuant to conversion privileges provided in the terms of the debt at issuance. Additionally, the guidance in this Subtopic does not apply to conversions of convertible debt instruments pursuant to terms that reflect changes made by the debtor to the conversion privileges provided in the debt at issuance (including changes that involve the payment of consideration) for the purpose of inducing conversion. Guidance on conversions of debt instruments (including induced conversions) is contained in paragraphs 470-20-40-13 and 470-20-40-15.
  2. Extinguishments of debt through a troubled debt restructuring. (See Section 470-60-15 for guidance on determining whether a modification or exchange of debt instruments is a troubled debt restructuring. If it is determined that the modification or exchange does not result in a troubled debt restructuring, the guidance in this Subtopic shall be applied.)
  3. Transactions entered into between a debtor or a debtor's agent and a third party that is not the creditor.
- (ASC 470-50-15-3)

## Overview

Long-term (or noncurrent) liabilities are liabilities that will be paid or otherwise settled over a period of more than one year, or if longer, greater than one operating cycle.

Debt remains on the books of the debtor until it is extinguished. In most cases, a debt is extinguished at maturity, when the required principal and interest payments have been made and the debtor has no further obligation to the creditor. In other cases, the debtor may extinguish the debt before its maturity. For example, if market interest rates are falling, a debtor may choose to issue debt at the new lower rate and use the proceeds to retire older higher-interest-rate debt. ASC 405-20-40-1 states that a debt is extinguished if either of two conditions is met:

1. The debtor pays the creditor and is relieved of its obligation for the liability.
2. The debtor is legally released from being the primary obligor under the liability, either judicially or by the creditor.

If a debtor experiences financial difficulties before the debt is repaid, a creditor may need to recognize an impairment of the debt. Under ASC 310-10-35-16, an impairment of the debt is recognized when the present value of the expected future cash flows discounted at the debt's original effective interest rate is less than the recorded investment in the debt. If for economic or legal reasons related to the debtor's financial difficulties, the creditor grants the debtor concessions that would not otherwise have been granted, the debtor must determine how to recognize the effects of the troubled debt restructuring. (ASC 470-60)

Some debt is issued with terms that allow it to be converted to an equity instrument (common or, less often, preferred stock) at a future date. When issued, under current GAAP, no value is attributed to the conversion feature. When the debt is converted, the stock issued is generally valued at the carrying value of the debt. (ASC 470) In certain situations, a debtor will modify the conversion privileges after issuance of the debt in order to induce prompt conversion of the debt into equity, in which case the debtor must recognize an expense for this consideration. (ASC 470-20-40-16)

Debt can also be issued with stock warrants, which allow the holder to purchase a stated number of common shares at a certain price within a defined time period. If debt is issued with detachable warrants, the proceeds of issuance are allocated between the two financial instruments. (ASC 470-20-05)

## DEFINITIONS OF TERMS

---

Source: ASC 470. Also see Appendix, *Definition of Terms*, for terms relevant to this chapter: Contract, Customer, Debt, Fair Value, Firm Commitment, Lease, Lease Modification, Long-Term Obligation, Operating Cycle, Probable, Public Entity, Reacquisition Price of Debt, Reasonably Possible, Revenue, Time of Restructuring, Troubled Debt Restructuring, Working Capital, and Unconditional Purchase Obligation.

**Beneficial Conversion Feature.** A nondetachable conversion feature that is in the money at the commitment date.

**Callable Obligation.** An obligation is callable at a given date if the creditor has the right at that date to demand, or to give notice of its intention to demand, repayment of the obligation owed to it by the debtor.

**Carrying Amount.** For a receivable, the face amount increased or decreased by applicable accrued interest and applicable unamortized premium, discount, finance charges, or issue costs

and also an allowance for uncollectible amounts and other valuation accounts. For a payable, the face amount increased or decreased by applicable accrued interest and applicable unamortized premium, discount, finance charges, or issue costs.

**Convertible Security.** A security that is convertible into another security based on a conversion rate. For example, convertible preferred stock that is convertible into common stock on a two-for-one basis (two shares of common for each share of preferred).

**Lockbox Arrangement.** An arrangement with a lender whereby the borrower's customers are required to remit payments directly to the lender and amounts received are applied to reduce the debt outstanding. A lockbox arrangement refers to any situation in which the borrower does not have the ability to avoid using working capital to repay the amounts outstanding. That is, the contractual provisions of a loan arrangement require that, in the ordinary course of business and without another event occurring, the cash receipts of a debtor are used to repay the existing obligation.

**Product Financing Arrangement.** A product financing arrangement is a transaction in which an entity sells and agrees to repurchase inventory with the repurchase price equal to the original sale price plus carrying and financing costs, or other similar transactions.

**Recorded Investment in the Receivable.** The recorded investment in the receivable is the face amount increased or decreased by applicable accrued interest and unamortized premium, discount, finance charges, or acquisition costs and may also reflect a previous direct write-down of the investment.

**Springing Lockbox Arrangement.** Some borrowings outstanding under a revolving credit agreement include both a subjective acceleration clause and a requirement to maintain a springing lockbox arrangement, whereby remittances from the borrower's customers are forwarded to the debtor's general bank account and do not reduce the debt outstanding until and unless the lender exercises the subjective acceleration clause.

**Subjective Acceleration Clause.** A subjective acceleration clause is a provision in a debt agreement that states that the creditor may accelerate the scheduled maturities of the obligation under conditions that are not objectively determinable (for example, if the debtor fails to maintain satisfactory operations or if a material adverse change occurs).

**Substantive Conversion Feature.** A conversion feature that is at least reasonably possible of being exercisable in the future absent the issuer's exercise of a call option.

**Time of Issuance.** The date when agreement as to terms has been reached and announced, even though the agreement is subject to certain further actions, such as directors' or stockholders' approval.

**Units-of-Revenue Method.** A method of amortizing deferred revenue that arises under certain sales of future revenues. Under this method, amortization for a period is calculated by computing a ratio of the proceeds received from the investor to the total payments expected to be made to the investor over the term of the agreement, and then applying that ratio to the period's cash payment.

**Violation of a Provision.** The failure to meet a condition in a debt agreement or a breach of a provision in the agreement for which compliance is objectively determinable, whether or not a grace period is allowed or the creditor is required to give notice of its intention to demand repayment.

## CONCEPTS, RULES, AND EXAMPLES

---

### **ASC 470-10, Overall**

**Classification.** The currently maturing portion of long-term debt or of capital lease obligations are classified as current liabilities if the obligations are to be liquidated by using assets

classified as current. However, if the currently maturing debt is to be liquidated by using noncurrent assets (i.e., by using a sinking fund that is properly classified as a noncurrent investment) then these obligations are to be classified as long-term liabilities.

**Due on demand loans.** Obligations that, by their terms, are due on demand (ASC 470-10-45-10) or will be due on demand within one year (or the reporting entity's operating cycle, if longer) from the statement of financial position date, even if liquidation is not expected to occur within that period, are required to be classified as current liabilities.

Even noncurrent debt may be due on demand under certain circumstances. Long-term obligations that contain creditor call provisions are to be classified as current liabilities, if as of the statement of financial position date the debtor is in violation of the agreement and either:

1. That violation makes the obligation callable, *or*
2. Unless cured within a grace period specified in the agreement, that violation will make the obligation callable.

If either of these two conditions exist, the long-term obligation is required to be classified as a current liability unless either:

1. The creditor has waived the right to call the obligation caused by the debtor's violation or the creditor has subsequently lost the right to demand repayment for more than one year (or operating cycle, if longer) from the statement of financial position date, *or*
2. The obligation contains a grace period for remedying the violation, and it is probable that the violation will be cured within the grace period.

If either of these situations applies, management is required to disclose the circumstances in the financial statements.

**Demand notes with scheduled repayment terms.** In some instances, a demand loan will include a repayment schedule calling for scheduled principal reductions. The loan agreement may contain language such as the following examples:

*This term note shall mature in monthly installments as set forth herein, or on demand, whichever is earlier.*

*Principal and interest are due on demand, or if demand is not made, in quarterly installments commencing on . . .*

Under ASC 470-10-45-10, an obligation containing such terms is considered due on demand even though the debt agreement specifies repayment terms. In either instance, the creditor, at its sole discretion, can demand full repayment at any time. This situation is distinguished from a subjective acceleration clause, which is addressed separately below.

**Increasing-rate debt.** Arrangements commonly referred to as "increasing-rate notes" are debt instruments that mature at a defined, near-term date, but which can be continually extended (renewed) by the borrower for a defined longer period of time with predefined increases in the interest rate as extensions are elected.

Management of the borrower estimates the effective outstanding term of the debt after considering its plans, ability, and intent to service the debt. Based upon this estimated term, the borrower's periodic interest rate is determined using the interest method. Thus, a constant yield is computed over the estimated term resulting in the accrual of additional interest during the earlier portions of the term.

Debt interest costs are amortized over the estimated outstanding term of the debt using the interest method. Any excess accrued interest resulting from repaying the debt prior to the estimated maturity date is an adjustment of interest expense in the period of repayment.

The classification of the debt as current or noncurrent is based on the expected source of repayment. Thus, this classification need not be consistent with the period used to determine the periodic interest cost. For example, the time frame used for the estimated outstanding term of the debt could be a year or less, but because of a planned long-term refinancing agreement the noncurrent classification could be used.

Furthermore, the term-extending provisions of the debt instrument are evaluated to ascertain whether they constitute a derivative financial instrument under ASC 815. If so, the derivative element of the instrument is, in all likelihood, not considered “clearly and closely related” to the host instrument (the debt), and thus would have to be reported separately at fair value with changes in fair value reported in net income each period.

**Subjective acceleration clauses.** Long-term obligations that contain subjective acceleration clauses are classified as current liabilities if circumstances (such as recurring losses or liquidity problems) indicate that it is probable that the lender will exercise its rights under the clause and demand repayment within one year (or one operating cycle, if longer). If, on the other hand, the likelihood of the acceleration of the due date is remote, the obligation continues to be classified as long-term debt on the statement of financial position. Situations between the probable and remote thresholds (i.e., it is deemed reasonably possible that the lender would demand repayment) require disclosure of the existence of the provision of the agreement. (ASC 470-10-45)

**Debt with covenants.** Most commercial debt agreements contain a range of financial covenants. These covenants legally bind the borrower to comply with their requirements as a condition of the lender extending credit. The failure by the borrower to comply with these conditions often provides the lender with the contractual right to accelerate the due date, commonly to declare the full amount of the debt due and payable on demand. Unless a properly worded waiver is obtained by the borrower in such a situation, its statement of financial position would have to reflect the debt, that which would otherwise be classified as long-term, as a current liability. This in turn might create or complicate issues for management with respect to the assessment of whether there is substantial doubt about the ability of the reporting entity to continue as a going concern.

While a complete waiver, effectively a promise by the lender that it will not exercise its rights under the financial covenants for at least one year from the statement of financial position date, makes it possible to continue presenting the debt as noncurrent, great care must be exercised in interpreting the substance of such an agreement.

In practice, many waivers are not effective and cannot form the basis for continued accounting for the debt as noncurrent. For example, a waiver “as of” the current statement of financial position date provides no real comfort, since the lender is entitled to assert its rights as soon as the very next day. Likewise, a waiver pending (i.e., conditioned on) compliance with the covenants at the next scheduled submission of a borrower’s covenant compliance letter (generally quarterly, possibly monthly) offers no assurance that the borrower will successfully meet its obligations, and hence also affords no basis for presentation of the debt as noncurrent.

A loan covenant may require that compliance determinations be made at quarterly or semiannual intervals. A borrower may be in violation of the covenant at the end of its fiscal year and obtain a waiver from the lender, for a period greater than one year, of the lender’s right to demand repayment arising from that specific year-end violation. Often, however, the lender will include language in the waiver document that reserves its right to demand repayment should another violation occur at a subsequent measurement date, including those dates that occur during the ensuing year.

Under these circumstances, management of the borrower/reporting entity considers whether both of the following conditions exist under the specific circumstances:

1. A violation of one or more covenants that gives the lender the right to call the debt (declare it payable on demand) has occurred at the statement of financial position date, or would have occurred absent a modification of the loan, and
2. It is probable that, at measurement dates occurring during the next 12 months, the borrower will be unable to cure the default (i.e., comply with the covenant).

If both of these conditions are present, the borrower is required to classify the debt as a current liability; otherwise, it can continue to classify the debt as noncurrent.

**Revolving credit agreements.** Borrowings outstanding under a revolving credit agreement sometimes include both a subjective acceleration clause (as discussed above) and a requirement to maintain a lockbox into which the borrower's customers send remittances that are then used to reduce the debt outstanding. These borrowings are short-term obligations and are classified as current liabilities unless the entity has the intent and ability to refinance the revolving credit agreement on a long-term basis (i.e., the conditions in ASC 470-10-45, as discussed below, are met). However, if the lockbox is a springing lockbox, which is a lockbox agreement in which remittances from the borrower's customers are forwarded to its general bank account and do not reduce the debt outstanding unless the lender exercises the subjective acceleration clause, the obligations are still considered to be long term since the remittances do not automatically reduce the debt outstanding if the acceleration clause has not been exercised.

**Indexed debt.** Occasionally, debt instruments are issued with guaranteed and contingent payments. The contingent payments may be linked to a specific index, like the S&P 500 or the price for a specific commodity. If the right to receive the indexing feature is separable from the debt instrument, the proceeds are allocated between the debt instrument and investor's stated right to receive the contingent payment. (ASC 410-10-25-3 and 25-4)

**Short-term obligations expected to be refinanced.** Short-term obligations that arise in the normal course of business and are due under customary trade terms are classified as current liabilities. Under certain circumstances, however, the reporting entity is permitted to exclude all or a portion of these obligations from current liabilities. To qualify for this treatment, management must have both the intent and ability to refinance the obligation on a long-term basis. Management's intent should be supported by either of the following (ASC 470-10-45-14):

1. *Post-statement of financial position date issuance of a long-term obligation or equity securities.* After the date of the entity's statement of financial position, but before that statement of financial position is issued, a long-term obligation is incurred or equity securities are issued for the purpose of refinancing the short-term obligations on a long-term basis.
2. *Financing agreement.* Before the statement of financial position is issued, the entity has entered into a financing agreement that clearly enables the entity to refinance its short-term obligation on a long-term basis on readily determinable terms that meet all of the following requirements:
  - a. The agreement is noncancelable by the lender (or prospective lender) or investor and will not expire within one year (or one operating cycle, if longer) of the statement of financial position date.
  - b. The replacement debt will not be callable during that period except for violation of a provision of the financing agreement with which compliance is objectively determinable or measurable.

- c. At the date of the statement of financial position, the reporting entity is not in violation of the terms of the financing agreement and there is no information that a violation occurred subsequent to the statement of financial position and before issuance of the financial statements, unless such a violation was waived by the lender.
- d. The lender (prospective lender) or investor is expected to be financially capable of honoring the financing agreement.

For the purposes of condition 2b above, violation of a provision is defined as:

- a failure of the reporting entity to meet a condition included in the agreement, or
- the violation of a provision such as a restrictive covenant, representation, or warranty.

A violation should not be disregarded for this purpose, even if the agreement contains a grace period to cure it and/or if the lender is required to give the borrower notice. The requirement that compliance be objectively determinable or measurable precludes commitments that include subjective acceleration clauses (discussed previously) from being considered qualified financing agreements.

The above scenario is based on an assumption that the refinancing will take place subsequent to the date of the statement of financial position. If, instead, prior to the date of the statement of financial position, the reporting entity receives cash proceeds from long-term financing intended to be used to repay a short-term obligation after the date of the statement of financial position, the cash received is classified on the statement of financial position in noncurrent assets if the short-term obligation to be settled with that cash is classified in noncurrent liabilities.

The amount of short-term debt to be reclassified is not permitted to exceed the amount raised by the replacement debt or equity issuance, nor can it exceed the amount specified in the financing agreement. If the amount specified in the financing agreement can fluctuate, then the maximum amount of short-term debt that can be reclassified is equal to a reasonable estimate of the minimum amount expected to be available on any date from the due date of the maturing short-term obligation to the end of the succeeding fiscal year. If no estimate can be made of the minimum amount available under the financing agreement, none of the short-term debt can be reclassified as long term.

If the short-term debt is refinanced by issuing equity instruments, the portion excluded from current liabilities is to be classified under noncurrent liabilities. Under no circumstances would the reclassified debt be shown in the equity section of the statement of financial position.

If debt or other agreements limit the ability of the reporting entity to fully utilize the proceeds of the refinancing agreement (for example, a clause in another debt agreement sets a maximum debt-to-equity ratio), then only the amount that can be borrowed without violating the limitations expressed in those other agreements can be reclassified as long-term.

ASC 470-10-45-15 states that if an entity uses current assets after the statement of financial position date to repay a current obligation, and then replaces those current assets by issuing either equity securities or long-term debt before the issuance of the statement of financial position, the currently maturing debt must continue to be classified as a current liability at the date of the statement of financial position.

**Example of short-term obligations to be refinanced**

Duboe Distribution Co. has obtained \$3,500,000 of bridge financing in the form of a construction loan to assist it in completing construction of a new public warehouse. All construction is completed by the date of the statement of financial position, after which Duboe has the following three choices for refinancing the bridge loan:

- Enter into a 30-year fixed-rate mortgage for \$3,400,000 at 7% interest, leaving Duboe with a \$100,000 shortfall it would have to repay with available cash. Under this scenario, Duboe reports as current debt the \$100,000, as well as \$31,566, the portion of the mortgage principal due within one year, with the remainder of the mortgage itemized as long-term debt. The presentation follows:

*Current liabilities:*

Current portion of construction loan payable	100,000
Current maturities of long-term debt	31,566

*Noncurrent liabilities:*

Construction loan payable, to be refinanced on a long-term basis at 7% due in 2X40, net of current portion	3,368,434
---	-----------

- Pay off the bridge loan with Duboe's existing variable-rate line of credit (LOC), which expires in two years. The maximum allowable amount that can be borrowed under the LOC is 80% of Duboe's eligible accounts receivable, defined as those accounts receivable not more than 90 days old. Over the two-year remaining term of the LOC, the lowest level of qualifying accounts receivable is expected to be \$2,700,000. Thus, only \$2,160,000 ( $\$2,700,000 \times 80\%$ ) of the debt would be classified as long term, while \$1,340,000 is classified as a short-term obligation. The presentation follows:

*Current liabilities:*

Current portion of construction loan payable	1,340,000
--	-----------

*Noncurrent liabilities:*

Construction loan payable, to be refinanced on a long-term basis under a variable rate line of credit due in 20XX	2,160,000
--	-----------

- Obtain a 10% loan from Duboe's majority stockholders, with a balloon payment due in five years. Under the terms of this arrangement, the owner is entitled to withdraw up to \$1,500,000 of funding at any time, even though \$3,500,000 is currently available to Duboe. Under this approach, \$1,500,000 is callable, and therefore must be classified as a short-term obligation. The remainder is classified as long-term debt. The presentation follows:

*Current liabilities:*

Current portion of construction loan payable	1,500,000
--	-----------

*Noncurrent liabilities:*

Construction loan payable, to be refinanced on a long-term basis under a five-year, 10% balloon note payable to the majority stockholder, due in 20XX	2,000,000
---	-----------

The presentations illustrated above would be accompanied by note disclosures under ASC 470-10-50-4 of the general terms of the financing agreement, as well as the terms of the new obligation incurred, or expected to be incurred, as a result of the refinancing. If part or all of the refinancing will be achieved through the issuance of equity, the notes should disclose a description

of the securities issued or expected to be issued as a result of the refinancing. In addition, should the debtor decide on the third course of action, the notes would be supplemented with the required related-party disclosures.

### **ASC 470-20, Debt with Conversion and Other Options**

#### **Convertible debt without beneficial conversion**

**Purpose.** Bonds are frequently issued with the right to convert into common stock of the company at the holder's option. Convertible debt is typically used for two reasons. First, when a specific amount of funds is needed, convertible debt often allows a lesser number of shares to be issued (assuming conversion) than if the funds were raised by directly issuing the shares. Thus, less dilution occurs. Second, the conversion feature allows debt to be issued at a lower interest rate and with fewer restrictive covenants than if the debt was issued without it.

**Features.** Features of convertible debt typically include (1) a conversion price 15–20% greater than the fair value of the stock when the debt is issued; (2) conversion features (price and number of shares) which protect against dilution from stock dividends, splits, etc.; and (3) a callable feature at the issuer's option, which is usually exercised once the conversion price is reached (thus forcing conversion or redemption).

**Disadvantages.** Convertible debt also has its disadvantages. If the stock price increases significantly after the debt is issued, the issuer would have been better off by simply issuing the stock. Additionally, if the price of the stock does not reach the conversion price, the debt will never be converted (a condition known as overhanging debt).

**Recognition.** When convertible debt is issued and the conversion price is greater than the fair value of the stock on the issuance date, no value is apportioned to the conversion feature when recording the issue. (ASC 470-20-05) The debt and its interest are reported as if it were a nonconvertible debt. Upon conversion, the stock may be valued at either the book value or the fair value of the bonds.

**Book value approach.** If the book value approach is used, the new stock is valued at the carrying value of the converted bonds. This method is widely used since no gain or loss is recognized upon conversion, and the conversion represents the transformation of contingent shareholders into shareholders. It does not represent the culmination of an earnings cycle. The primary weakness of this method is that the total value attributed to the equity security by the investors is not given accounting recognition.

#### **Example of book value method**

Assume that a \$1,000 bond with an unamortized discount of \$50 and a fair value of \$970 is converted into 10 shares of \$10 par common stock whose fair value is \$97 per share. Conversion using the book value method is recorded as follows:

Bonds payable	1,000
Discount on bonds payable	50
Common stock	100
Additional paid-in capital	850

**Market value approach.** The alternative market value approach assumes the new stock issued is valued at market (i.e., the fair value of the stock issued or the fair value of the bonds converted,

whichever is more easily determinable). A gain (loss) occurs when the fair value of the stocks or bonds is less (greater) than the carrying value of the bond.

### Example of the market value method

Assume the same facts as the example above. The entry to record the conversion is:

Bonds payable	1,000
Loss on redemption (ordinary)	20
Discount on bonds payable	50
Common stock	100
Additional paid-in capital	870

The weakness of this method is that a gain or loss can be reported as a result of an equity transaction. Only the existing shareholders are affected, as their equity will increase or decrease, but the firm as a whole is unaffected. For this reason, the market value approach is not widely used.

**Derecognition.** When convertible debt is retired, the transaction is handled in the same manner as nonconvertible debt: the difference between the acquisition price and the carrying value of the bond is reported currently as a gain or loss.

**Accrued interest upon conversion of convertible debt.** Per ASC 470-20-40-11, if terms of the convertible debt instrument provide that any accrued interest at the date of conversion is forfeited by the former debt holder, the accrued interest (net of income tax) from the last payment date to the conversion date should be charged to interest expense and credited to capital as a part of the cost basis of the securities issued.

**Convertible bonds with a “premium put.”** Some convertible bonds contain mutually exclusive features, with one obviously being the right to convert to the issuer’s common or preferred stock. In some instances, the other feature is the right, usually on specified dates before or at the stated maturity of the debt, to cause the issuer to repurchase the debt at a price higher than par or the issuance price. This is known as a “premium put” feature. An early view of premium puts held that the issuer should accrue a liability for the put premium over the period from the date of issuance to the initial put date, and that this accrual should continue regardless of fair value changes. It further held if the put expires unexercised and if—as would be highly likely if the holders chose to ignore the right to put the debt back to the issuer—the fair value of the common stock exceeds the put price at expiration date, the put premium should be credited to additional paid-in capital. Additionally, it held that if the put were to expire unexercised (in the situation where the debt maturity is later than the last put exercise date) and if the put price exceeds the fair value of the common stock at that date, the put premium should be amortized as a yield adjustment over the remaining term of the debt, reducing interest cost.

Under ASC 815, an embedded put is a derivative instrument subject to that standard. This “grandfathered” permission for entities not to account separately for embedded premium puts in pre-1998 or pre-1999 hybrid instruments issued at par; the earlier view was to continue to apply to an entity which elected not to separately account for the embedded derivative. However, separate accounting was required for convertible debt not “grandfathered” under this provision, and thus, ASC 815 does apply to more recently issued convertible debt having premium put features.

ASC 460-10 requires explicit recognition of guarantees at their inceptions (see the chapter on ASC 460 for complete discussion of this topic). A premium put is a form of guarantee arrangement, and thus the fair value of the put must now be recognized at the date of issuance of the convertible debt bearing this feature, unless the put is accounted for as a derivative (and thus

also recorded at fair value) under ASC 815. As a practical matter, in either case a liability will be recognized for the fair value of the put option embedded in the convertible debt.

Under ASC 815 this derivative financial instrument will be marked to fair value at each financial reporting date. Whether the adjustment increases or decreases the recorded amount from one period to the next depends largely on the price performance of the issuer's stock, since increasing value of the stock raises the likelihood of conversion and thus decreases the perceived value of the put option. In the author's opinion, any adjustment to the carrying value of the put option should result in adjustments to the entity's interest expense for the period.

**Debt convertible into the stock of a consolidated subsidiary.** According to ASC 470-20-25, in the consolidated financial statements, (1) debt issued by a consolidated subsidiary that is convertible into that subsidiary's stock, and (2) debt issued by a parent company that is convertible into the stock of a consolidated subsidiary should be accounted for in accordance with ASC 470-20-05. That is, no portion of the proceeds from the issuance of the debt should be accounted for as attributable to the conversion feature. ASC 470-20-25 did not apply to convertible debt instruments that require a cash settlement by the issuer of an in-the-money conversion feature, that provide the holder an option to receive cash for an in-the-money conversion feature, or that have a beneficial conversion feature.

**Convertible instrument granted or issued to a nonemployee.** ASC 470-20-30 describes the accounting for a convertible instrument that is used to pay a nonemployee for goods or services if that instrument contains a nondetachable conversion option. The measurement date under ASC 505-50 should be used to measure the intrinsic value of the conversion option rather than the commitment date. The proceeds from issuing the instrument for purposes of determining whether a beneficial conversion option exists is the fair value of the instrument or the fair value of the goods and services received, whichever is more reliably measured. The fair value of the convertible instrument can be measured by applying ASC 505-50. (For details, see the chapter on ASC 505.) Once the convertible instrument is issued, distributions paid or payable are financing costs rather than adjustments of the cost of the goods or services received.

If a purchaser of a convertible instrument that contains an embedded beneficial conversion option provides goods or services to the issuer under a separate contract, the contracts should be considered separately unless the separately stated pricing is not equal to fair value. If not equal to fair value, the terms of the respective transactions should be adjusted. The convertible instrument should be recognized at its fair value with a corresponding increase or decrease to the purchase price of the goods or services.

**Convertible bonds with issuer option to settle for cash upon conversion.** ASC 815-15-55 addressed a variant of convertible bonds that give the issuer (the reporting entity) the option of settling for cash, rather than stock, at the time conversion is elected by holders. In some versions of this arrangement, the debtor would be obligated to settle in cash, based on the stock price at the conversion date. In others, the issuer would have the option to deliver shares or cash based on the contractual conversion rate, or more complex formulae might cause partial settlement in cash.

ASC 815 requires that in the situation of a mandatory cash settlement upon conversion, the embedded derivative (which is a cash-settled written call option) must be accounted for separately from the debt, and changes in the derivative's fair value will be reported currently in earnings. When the conversion option can be settled in stock, however, the embedded derivative is indexed only to the issuer's stock and thus, under ASC 815-40, would not be separately accounted for.

If a convertible bond is issued with terms that require the issuer to satisfy the obligation (the amount accrued to the benefit of the holder exclusive of the conversion spread) in cash and to satisfy the conversion spread (the excess conversion value over the accreted value) in either cash

or stock, the debt should be accounted for like convertible debt (that is, as a combined instrument under current GAAP) if the conversion spread meets the requirements of ASC 815-40. If the conversion spread feature does not meet those provisions, ASC 815 requires that the embedded derivative be separated from the debt host contract and accounted for by the issuer separately as a derivative instrument.

If a convertible bond is issued with terms that permit the issuer to satisfy the entire obligation in either stock or cash, the bond should be accounted for as conventional convertible debt. If the holder exercises the conversion and the issuer pays cash, the debt is extinguished and the issuer should account for the transaction in accordance with ASC 470-50.

ASC 470-20-40-12 provides accounting guidance with respect to a financial instrument that contains the following provisions:

- Instrument is convertible at the option of its holder into a fixed number of shares of the issuer's common stock.
- At conversion, the issuer must settle the obligation to the holder as follows: Payment in cash for the accreted value of the obligation (for a zero-coupon obligation, the accreted value is the amount received from the holder at issuance plus interest accreted from date of issuance to date of settlement).
- Payment in either cash or stock to satisfy the conversion spread (the difference between the conversion value over the accreted value).
- If the holder does not exercise the conversion option, the issuer is obligated to settle the accreted value of the debt in cash at maturity.

Questions have arisen regarding the accounting for the *settlement* of this instrument partially in cash (the recognized liability) and partially in stock (the unrecognized equity instrument). ASC 470-20-40-12 states that only the cash payment is to be considered in computing gain or loss on settlement of the recognized liability. Shares transferred to the holder to settle the excess conversion spread represented by the embedded equity instrument are not considered part of the settlement of the debt component of the instrument.

ASC 470-20 specifies that issuers of convertible debt instruments that may be settled in cash upon conversion should separately account for the liability and equity components in a manner that will reflect the entity's nonconvertible debt borrowing rate when interest cost is recognized in subsequent periods. An exception to this rule, however, is when an embedded conversion option must be accounted for as a derivative instrument. Convertible preferred shares categorized as equity in the statement of financial position are also excluded from the effects of ASC 470.

For instruments addressed by ASC 470, initial measurement of the carrying amount of the liability component is to be determined by measuring the fair value of a similar liability (including any embedded features other than the conversion option) that does not have an associated equity component. The carrying amount of the equity component represented by the embedded conversion option is then computed by deducting the fair value of the liability component from the initial proceeds ascribed to the convertible debt instrument as a whole. Embedded features that are determined to be nonsubstantive at the issuance date are not to affect the initial measurement of the liability component. In this context, an embedded feature other than the conversion option (including an embedded prepayment option) is to be considered nonsubstantive if, at issuance, the issuer concludes that it is probable that the embedded feature will not be exercised. If the allocation to the liability component using this methodology results in a difference in basis versus that reported for tax purposes, then interperiod tax allocation (deferred tax accounting) must also be applied.

Convertible debt instruments affected by the foregoing requirements are not available to be accounted for under the fair value option. Rather, the debt must be reported in subsequent periods at amortized cost. The variance between the convertible debt's face value and the amount of proceeds that are allocated to the debt instrument, net of the amount allocated to the conversion feature, must be treated as a discount to be accreted using the effective yield method as additional interest expense. The accretion period is to be based on the expected term of a similar instrument lacking the conversion feature. The expected life is not subject to reassessment in later periods, unless there is a modification to the terms of the instrument. The equity component would not be reassessed either, unless it ceases to meet the criteria set forth in ASC 470, in which case the difference between the amount previously recognized in equity and the fair value of the conversion option at the date of the reclassification as a liability at fair value is to be accounted for as an adjustment to stockholders' equity.

ASC 470-50 provides guidance on derecognition of convertible obligations that can be settled in whole or in part for cash. It stipulates that the proceeds transferred to effect the extinguishment of the liability and the reacquisition of the associated conversion feature are to be allocated first to the extinguishment of the liability component equal to the fair value of that component immediately prior to extinguishment. Any difference between the consideration attributed to the liability component and the sum of (1) the net carrying amount of the liability component, and (2) any unamortized debt issuance costs is to be recognized in the statement of financial performance as a gain or loss on debt extinguishment. Following this, any remaining settlement consideration is to be assigned to the reacquisition of the equity component, with recognition of that amount as a reduction of stockholders' equity. Any costs incurred (e.g., banker fees) are to be allocated pro rata to the debt and equity in proportion to the allocation of consideration transferred at settlement, and accounted for as debt extinguishment costs and equity reacquisition costs, respectively.

If an instrument within the scope of the above is modified such that the conversion option no longer requires or permits cash settlement upon conversion, it is necessary to account for the components of the instrument separately, unless the original instrument is required to be derecognized under ASC 470-50. If an instrument is modified or exchanged in a manner that requires derecognition of the original instrument under ASC 470-50 and the new instrument is a convertible debt instrument that may not be settled in cash upon conversion, the new instrument would be subject to ASC 470-50.

On the other hand, if a convertible debt instrument is not at first subject to this guidance, but is later modified so as to become subject to it, then ASC 470-50 is to be applied to ascertain whether the original instrument is to be derecognized. If not, the issuer is to apply the guidance prospectively from the date of the modification. In such a circumstance, the liability component is to be measured at its fair value as of the modification date, with the carrying amount of the equity component represented by the embedded conversion option to be determined by deducting the fair value of the liability component from the overall carrying amount of the convertible debt instrument as a whole. At the modification date, a portion of any unamortized debt issuance costs incurred previously is to be reclassified and accounted for as equity issuance costs based on the proportion of the overall carrying amount of the convertible debt instrument that is allocated to the equity component.

Finally, there is the matter of an induced conversion. If the terms of an instrument addressed are revised to induce early conversion (e.g., by offering a more favorable conversion ratio or paying other additional consideration in the event of conversion before a specified date), then the entity is to recognize a loss equal to the fair value of all securities and other consideration

transferred in the transaction in excess of the fair value of consideration issuable in accordance with the *original* conversion terms. The settlement accounting (derecognition) treatment described above is then to be applied using the fair value of the consideration that was issuable in accordance with the original conversion terms. Derecognition transactions in which the holder does not exercise the embedded conversion option are not affected, however.

**Disclosures.** As of each date for which a statement of financial position is presented, the reporting entity is to disclose the following:

1. The carrying amount of the equity component
2. The principal amount of the liability component, its unamortized discount, and its net carrying amount.

As of the date of the most recent statement of financial position that is presented, the reporting entity must disclose the following:

1. The remaining period over which any discount on the liability component will be amortized.
2. The conversion price and the number of shares on which the aggregate consideration to be delivered upon conversion is determined.
3. The amount by which the instrument's if-converted value exceeds its principal amount, regardless of whether the instrument is currently convertible. (This disclosure is required only for public entities.)
4. Information about derivative transactions entered into in connection with the issuance of instruments within scope, including the terms of those derivative transactions, how those derivative transactions relate to the instruments within the scope, the number of shares underlying the derivative transactions, and the reasons for entering into those derivative transactions. (An example of a derivative transaction entered into in connection with the issuance of an instrument within the scope is the purchase of call options that are expected to substantially offset changes in the fair value of the conversion option.) This disclosure is required regardless of whether the related derivative transactions are accounted for as assets, liabilities, or equity instruments.

For each period for which a statement of financial performance is presented, the entity is to also disclose the following:

1. The effective interest rate on the liability component for the period
2. The amount of interest cost recognized for the period relating to both the contractual interest coupon and amortization of the discount on the liability component.

**Own-share lending arrangements related to a convertible debt issuance.** An entity may enter into a share-lending arrangement with an investment bank, whereby it lends shares to the bank to facilitate investors' ability to hedge the conversion option in the entity's convertible debt issuance. The entity issues the share in exchange for a nominal loan processing fee; the investment bank returns the shares upon the maturity or conversion of the convertible debt.

In a share-lending arrangement, the entity issuing shares measures them at their fair value and recognizes them as a debt issuance cost, which offsets the additional paid-in capital account. If it subsequently becomes probable that the counterparty will default, then the entity recognizes an expense equaling the fair value of any unreturned shares on that date, minus the fair value of probable share recoveries, which offsets the additional paid-in capital account. The entity

continues to remeasure the fair value of unreturned shares until the consideration payable by the counterparty becomes fixed.

An entity having an outstanding own-share lending program should disclose the following:

1. Description of the arrangement.
2. All significant terms of the arrangement, including the number of shares involved, the agreement term, any cash settlement terms, and any counterparty collateral requirements.
3. The reason for entering into the arrangement.
4. The fair value of loaned shares at the balance sheet date.
5. The treatment of loaned shares in calculating earnings per share.
6. Classification of any issuance costs.
7. The unamortized amount of issuance costs, and the related interest cost for the reporting period.
8. Any dividends paid on the loaned shares that will not be reimbursed.
9. If the counterparty will probably default on the arrangement, the amount of expense related to the default that is reported in the statement of earnings. In subsequent periods, note any material changes in the amount of this expense.

### Convertible Securities with Beneficial or Contingent Conversion Features

**Beneficial conversion.** Reporting entities sometimes issue convertible securities (debt or preferred stock) that are “in the money” at the issuance date (i.e., where it would be economically advantageous to the holders if the securities were converted immediately). That type of conversion feature is called an “embedded beneficial conversion feature.” Variations of such securities may be converted at a fixed price, a fixed discount to the fair value at date of conversion, a variable discount to the fair value at conversion, or the conversion price may be dependent upon future events. In addition, the conversion feature can be exercisable at issuance, at a stated date in the future, or upon the happening of a future event (such as an IPO). ASC 470-20 addressed the assorted accounting issues arising for issuers of such securities (the reporting entity or debtor).

In contrast with GAAP governing convertible securities lacking this feature, embedded beneficial conversion features are valued separately at issuance. The feature is recognized as additional paid-in capital by allocating a portion of the proceeds equal to the intrinsic value of the feature. The intrinsic value is computed at the commitment date as (1) the difference between the conversion price and the fair value of the common stock (or other securities) into which the security is convertible, multiplied by (2) the number of shares into which the security is convertible.

For convertible debt securities, a discount on the debt may result from the allocation of a portion of the proceeds to the conversion feature. For convertible instruments that have a stated redemption date, a discount resulting from recording a beneficial conversion option shall be required to be amortized from the date of issuance to the stated redemption date of the convertible instrument, regardless of when the earliest conversion date occurs. For convertible instruments that do *not* have a stated redemption date, such as perpetual preferred stock, a discount resulting from the accounting for a beneficial conversion option is to be amortized from the date of issuance to the earliest conversion date. (ASC 470-20-35-7.1)

If the conversion feature has multiple steps, the computation of the intrinsic value is made using the conversion terms most beneficial to the investor. For example, if the security was convertible at a 10% discount to fair value after three months and then at a 25% discount to fair value after one year, the 25% discount terms would be used to measure the intrinsic value of the

feature. Any resulting discount on the convertible debt would be amortized to the earliest date at which the particular discount (25% in this case) could be achieved (one year). However, at any financial statement date, the cumulative amortization recorded must be the greater of (1) the amount computed using the effective interest method of amortization or (2) the amount of the benefit the investor would receive if the securities were converted at that date. If the securities are converted prior to the full amortization of the discount, the unamortized discount is to be included in the amount transferred to equity upon conversion. (ASC 470-20-35-7.2)

If a convertible debt security having a beneficial feature is extinguished prior to conversion, a portion of the reacquisition price of the debt security is allocated to the beneficial conversion feature. That portion is measured as the intrinsic value of the conversion feature at the extinguishment date. Since the beneficial conversion feature was originally recognized as equity, the redemption or cancellation of this feature would give rise not to gain or loss, but rather to an adjustment within stockholders' equity. For example, if \$2,000 of the redemption payment was identified with the beneficial feature to which \$1,200 had originally been allocated, the net result would be that the original allocation would be eliminated and an \$800 charge would be made against retained earnings (analogous to a loss on a treasury stock transaction). Any residual beyond the allocated cost of redeeming the beneficial conversion feature would be allocated to the retirement of the debt security, and a gain or loss on extinguishment would be reported in current earnings.

**Contingent conversion.** If the security becomes convertible only upon occurrence (or failure to occur) of a future event outside the control of the investor, or if the conversion terms change based on the occurrence (or failure to occur) of a future event, the value of the contingent beneficial conversion feature should be measured as of the commitment date; but it is not recognized in the financial statements until the contingency is resolved. This may be combined with a beneficial conversion feature. For example, a debt instrument issued with a conversion feature at 20% below then-fair value, to become effective conditioned on the consummation of a planned refinancing, would be contingently convertible with a beneficial feature. According to ASC 470-20, any contingent beneficial conversion feature should be measured at the commitment date, but not reflected in earnings until the contingent condition has been met.

The definition of "conventional contingently convertible debt instrument" is later addressed by ASC 815-40-25. The issue arises because of one of the requirements under ASC 815—namely, that embedded derivatives be bifurcated and accounted for separately under certain conditions, but with an exception for accounting for conversion privileges by issuers of certain convertible securities. Thus, instruments that provide holders the right to convert at a fixed ratio (or equivalent cash value, at the issuer's discretion), for which option exercise is based on either the passage of time or a contingent event, are deemed "conventional."

ASC 815-15 also states that, when a previously bifurcated conversion option in a convertible debt instrument no longer meets the bifurcation criteria in ASC 815, one should reclassify the fair value of the liability for the conversion option to shareholders' equity. If a debt discount was recognized when the conversion option was bifurcated, then it should continue to be amortized. Disclosure requirements include a description of the changes causing the termination of bifurcation, as well as the amount of the liability reclassified to stockholders' equity.

**Convertible securities with beneficial conversion features.** ASC 470-20 covers convertible securities with beneficial conversion features. The following summarizes this topic:

1. If an instrument includes both detachable instruments (e.g., stock purchase warrants) and an embedded beneficial conversion option, the proceeds of issuance should first be allocated among the convertible instrument and the other detachable instruments based on their

relative fair values. Then ASC 470-20-35 should be applied to determine the amount allocated to the convertible instrument if the embedded conversion option has an intrinsic value.

2. If the conversion price could change upon the occurrence of a future event, assume that there are no changes to the current circumstances except the passage of time. Use the most favorable price that would be in effect if nothing were changed at the conversion date in order to measure the intrinsic value of an embedded conversion option. Changes to the conversion terms that are caused by future events not controlled by the issuer are recognized if and when the trigger event occurs. (ASC 470-20-25-20)
3. If there is no intrinsic value to a conversion right at issuance, but the conversion price resets after the commitment date and, upon reset, the conversion price is greater than the fair value of the underlying stock, the beneficial conversion amount is recognized when the reset occurs. The beneficial conversion amount is measured by the number of shares that will be issued upon conversion, multiplied by the decrease in price between the original conversion price and the reset price.
4. The definition of commitment date for purposes of applying ASC 470-20 should be the same as the definition of a firm commitment in ASC 815. If an instrument includes both detachable instruments and an embedded beneficial conversion option, the commitment date should also be used when determining the relative fair values of all the instruments issued.
5. If a convertible instrument has a stated redemption date, a discount resulting from recording a beneficial conversion option should be amortized from the date of issuance to the stated redemption date, regardless of when the earliest conversion occurs. If the instrument has beneficial conversion features, the unamortized discount remaining at the date of conversion should be immediately recognized as interest expense or as a dividend, as appropriate. (ASC 470-20-35-7)
6. If the terms of a contingent conversion option do not permit an issuer to compute the number of shares that the holder would receive upon conversion, the issuer should wait until the contingent event occurs and then compute the number of shares that would be received. The number of shares that would be received is compared to the number of shares that would have been received if the contingent event had not occurred to determine the excess number of shares. The number of excess shares multiplied by the stock price as of the commitment date equals the incremental intrinsic value that should be recognized. (ASC 470-20-35-1)
7. If an instrument includes a beneficial conversion option that expires at the end of a stated period and the instrument then becomes mandatorily redeemable at a premium, ASC 470-20 states that the proceeds of issuance were to be allocated between the debt and the embedded beneficial conversion features. The debt amount was then to be accreted to the redemption amount over the period to the required redemption date. ASC 480, however, requires that mandatorily redeemable stock be classified as a liability, measured initially at fair value, with a corresponding decrease to equity and no gain or loss recognized. Thus, this situation is no longer governed by ASC 470-20.
8. If interest or dividends are paid in kind, the commitment date for the paid-in-kind securities is the commitment date for the original instrument if the payment in kind is not discretionary. (ASC 470-20-30-16) The payment is not discretionary:
  - a. if neither the issuer nor the holder can elect other forms of payment for the interest or dividends, and

- b. if the original instrument is converted before dividends are declared or interest is accrued, the holder will always receive the number of shares as if all dividends or interest have been paid in kind. (ASC 470-20-30-17)

If the payment in kind is discretionary, the commitment date for the paid-in-kind securities is the date that the interest is accrued or the dividends are declared.

9. If an issuer issues a convertible instrument as repayment of a nonconvertible instrument, the fair value of the newly issued convertible instrument equals the redemption amount owed at the maturity date of the old debt. That is, the carrying amount of the old debt is the proceeds received for applying ASC 470-20 to the new debt. (ASC 470-20-30-19)

**Other issues.** Several tentative conclusions have been expressed by the EITF, but have not been resolved:

1. If a convertible instrument is extinguished prior to its maturity date, no portion of the reacquisition price should be allocated to the conversion option if that option had no intrinsic value at the issuance date.
2. The intrinsic value of a conversion feature at an early extinguishment date of convertible debt is recorded as a decrease in additional paid-in capital, which may result in a reduction in additional paid-in capital that is larger than the amount originally recorded in paid-in capital at issuance.
3. If an entity redeems convertible preferred stock with a beneficial conversion feature, the intrinsic value of the conversion feature that was recorded at issuance is reversed, and the remaining reacquisition price is allocated to the reacquisition of the stock. Any excess of that portion over the carrying amount of the stock is an adjustment to earnings available to common shareholders.
4. If a company issues a warrant that allows the holder to acquire a convertible instrument for a stated price and that warrant is classified as equity, the date used to measure the intrinsic value of the conversion option is the commitment date for the warrant, not its exercise date, provided that the issuer received fair value for the warrant when issued. The deemed proceeds for determining whether a beneficial conversion option exists are equal to the sum of the proceeds received for the warrant and the exercise price of the warrant. If that sum is less than the fair value of the common stock that would be received upon exercise of the convertible instrument that would be obtained upon exercise of the warrant, the excess represents a deemed distribution to the holder of the warrant, which is to be recognized over the life of the warrant. The deemed distribution is limited to the proceeds received for the warrant; that is, if the deemed distribution is larger than the proceeds received, the difference is not recognized until the warrant is exercised. If the issuer received less than fair value for the warrant upon issuance, the exercise date of the warrant should be used to measure the intrinsic value of the conversion option.
5. If a company issues a warrant that allows the holder to acquire a convertible instrument for a stated price and that warrant is classified as a liability, the date used to measure the intrinsic value of the conversion option is the exercise date for the warrant, not its commitment date. The deemed proceeds for determining whether a beneficial conversion option exists are equal to the sum of the fair value of the warrant on the exercise date and the exercise price of the warrant.
6. If a conversion feature permits the holder to receive both common stock and warrants to acquire common stock, the intrinsic value of the conversion option is measured as the

difference between (1) the proceeds allocated to the common stock portion of the conversion feature, and (2) the fair value at the commitment date of the common stock to be received by the holder upon conversion.

The guidance in ASC 470-20 should be used to evaluate whether the issuer controls settlement of the conversion feature of convertible preferred stock. If the issuer does not control settlement, the convertible preferred stock is considered temporary equity.

**Example 1: Intrinsic value of a conversion feature—fixed dollar terms**

Software Solutions issues \$1,000,000 of convertible debt, which is convertible into \$10 par common stock at a price of \$50 per share. The fair value of the common stock on the commitment date of the issue is \$60. The intrinsic value of the conversion feature is computed as follows:

$$\begin{aligned} \$1,000,000/\$50 \text{ per share} &= 20,000 \text{ shares to be issued upon conversion} \\ (\$60 \text{ fair value} - \$50 \text{ conversion price}) \times 20,000 \text{ shares} &= \$200,000 \text{ intrinsic value} \end{aligned}$$

Software Solutions would make the following entry to recognize the issuance of the bonds at 100:

Cash	1,000,000
Discount on bonds payable	200,000
Bonds payable	1,000,000
Additional paid-in capital	200,000

If the price at which the bond is convertible to stock changes over the life of the bond, the intrinsic value should be computed using the terms that are most beneficial to the holder. The most favorable conversion price that would be in effect, assuming that there are no changes to the current circumstances except for the passing of time, should be used to measure the intrinsic value.

**Example 2: Intrinsic value of a conversion feature—variable terms**

American National Biotech issues \$1,000,000 of convertible debt, convertible into \$10 par common stock at a price 15% below the commitment date fair value for years 1 and 2, 20% below the commitment date fair value for years 3 to 5, and 25% below the commitment date fair value for years 6 to maturity. The fair value of the common stock on the commitment date of the issue is \$50. The intrinsic value of the conversion feature is computed as follows:

$$\begin{aligned} \text{The most beneficial price is the } 25\% \text{ discount available in year 6 to maturity} \\ \text{That price would be } \$37.50 \text{ } (\$50 \times .75) \\ \$1,000,000/\$37.50 \text{ per share} &= 26,667 \text{ shares to be issued upon conversion} \\ (\$50 \text{ fair value} - \$37.50 \text{ conversion price}) \times 26,667 \text{ shares} &= \$333,337 \text{ intrinsic value} \end{aligned}$$

American National Biotech would make the following entry to recognize the issuance of the bonds at 100:

Cash	1,000,000
Discount on bonds payable	333,337
Bonds payable	1,000,000
Additional paid-in capital	333,337

In some cases the conversion price will be dependent on a future event, or the bond becomes convertible only upon the occurrence of a future event. In those cases, the contingent beneficial

conversion feature should be measured at the commitment date but not recognized in earnings until the contingency is resolved.

#### **Example 3: Intrinsic value of a conversion feature—contingent price terms**

Major Manufacturing Co. issues \$1,000,000 of convertible debt, which is convertible into \$10 par common stock at a discount of 20% off of the conversion date fair value. The fair value of the common stock on the commitment date of the issue is \$50. The intrinsic value of the conversion feature is computed as follows:

Because the conversion percentage is fixed, the intrinsic value is always \$250,000.

Market price at conversion	\$ 40	\$ 50	\$ 60	\$ 70
Conversion price	\$ 32	\$ 40	\$ 48	\$ 56
Number of shares issued	31,250	25,000	20,833	17,857
Discount	\$ 8	\$ 10	\$ 12	\$ 14
Intrinsic value	\$250,000	\$250,000	\$250,000	\$250,000

Major Manufacturing Co. would make the following entry to recognize the issuance of bonds at 100:

Cash	1,000,000
Discount on bonds payable	250,000
Bonds payable	1,000,000
Additional paid-in capital	250,000

#### **Example 4: Intrinsic value of a conversion feature—contingent conversion**

Shoemaker Co. issues \$1,000,000 of convertible debt, which is convertible into \$10 par common stock at a discount of 25% below the commitment date fair value. The fair value of the common stock on the commitment date of the issue is \$60, so the conversion price is \$45. The debt is convertible only upon an initial public offering. The intrinsic value of the conversion feature is computed as follows:

$$\begin{aligned} \$1,000,000/\$45 \text{ per share} &= 22,222 \text{ shares to be issued upon conversion} \\ (\$60 \text{ fair value} - \$45 \text{ conversion price}) \times 22,222 \text{ shares} &= \$333,330 \text{ intrinsic value} \end{aligned}$$

Shoemaker Co. would not allocate any portion of the proceeds to the conversion feature at issuance. It would make the following entry to recognize the issuance of the bonds at 100:

Cash	1,000,000
Bonds payable	1,000,000

Upon the occurrence of an initial public offering, Shoemaker would make the following entry:

Discount on bonds payable	333,330
Additional paid-in capital	333,330

#### **Example 5: Intrinsic value of a conversion feature—contingent conversion with variable terms**

Food Franchisers issues \$1,000,000 of convertible debt, which is convertible into \$10 par common stock at a price of \$50. The fair value of the common stock on the commitment date of the issue is \$60. The debt is convertible only upon an initial public offering. If the stock's fair value is at least 20% higher than the IPO price one year after the IPO, the conversion price will be 70% of

the then fair value. The intrinsic value of the contingent conversion feature at issuance is computed as follows:

$$\begin{aligned}\$1,000,000/\$50 \text{ per share} &= 20,000 \text{ shares to be issued upon conversion} \\ (\$60 \text{ fair value} - \$50 \text{ conversion price}) \times 20,000 \text{ shares} &= \$200,000 \text{ intrinsic value}\end{aligned}$$

The intrinsic value of the contingent conversion price change is also computed at the commitment date using the assumptions that the IPO price will be the same as the current market price and that the stock price one year after the IPO is 20% higher, as follows:

$$\begin{aligned}\text{Contingent conversion price} &= \$60 \times 120\% \times 70\% = \$50.40 \\ \$1,000,000/\$50.40 \text{ per share} &= 19,841 \text{ shares to be issued upon conversion} \\ (\$72 \text{ fair value} - \$50.40 \text{ conversion price}) \times 19,841 \text{ shares} &= \$428,565 \text{ intrinsic value}\end{aligned}$$

Food Franchisers would not allocate any portion of the proceeds to the conversion feature at issuance. It would make the following entry to recognize the issuance of the bonds at 100:

Cash	1,000,000
Bonds payable	1,000,000

Upon the occurrence of an initial public offering at \$55, Food Franchisers would make the following entry:

Discount on bonds payable	250,000
Additional paid-in capital	250,000

If the stock price increased to \$66 ( $\$55 \times 120\%$ ), Food Franchisers would make the following entry for the difference between the two intrinsic values:

Discount on bonds payable	178,565
Additional paid-in capital	178,565

If a bond with an embedded beneficial conversion feature is extinguished prior to conversion, a portion of the reacquisition price is allocated to the repurchase of the conversion feature. That portion is the intrinsic value of the conversion feature at the extinguishment date, which would be recorded as a decrease in additional paid-in capital. That accounting may result in a reduction in additional paid-in capital that is larger than the amount originally recorded in paid-in capital at issuance. However, no portion of the reacquisition price should be allocated to the conversion feature if that feature had no intrinsic value at the issuance date.

#### Example of extinguishment of debt with an embedded conversion feature

Software Solutions (Example 1, above) repurchases \$500,000 face of its debt at 140. At the date of issuance, the following entry had been made relating to the debt that is later extinguished.

Cash	500,000
Discount on bonds payable	100,000
Bonds payable	500,000
Additional paid-in capital	100,000

At the date of the repurchase, the fair value of the stock is \$85, and the unamortized discount on the debt was \$20,000. The intrinsic value of the conversion feature at the date of the repurchase is computed as follows:

$$\begin{aligned} \$500,000/\$50 \text{ per share} &= 10,000 \text{ shares to be issued upon conversion} \\ (\$85 \text{ fair value} - \$50 \text{ conversion price}) \times 10,000 \text{ shares} &= \$350,000 \text{ intrinsic value} \end{aligned}$$

Software Solutions would make the following entry to recognize the retirement of the bonds:

Bonds payable	500,000
Additional paid-in capital	350,000
Discount on bonds payable	20,000
Gain on extinguishment of debt	130,000
Cash	700,000

Questions have arisen regarding the accounting for the settlement of this instrument partially in cash (the recognized liability) and partially in stock (the unrecognized equity instrument). ASC 470-20-40-12 states that only the cash payment is to be considered in computing gain or loss on settlement of the recognized liability. Shares transferred to the holder to settle the excess conversion spread represented by the embedded equity instrument are not considered part of the settlement of the debt component of the instrument.

**Contingent conversion rights triggered by issuer call.** In some instances a debt instrument may include a contingent conversion privilege that becomes exercisable if the issuer attempts to call the debt before maturity, even if the stated contingency (e.g., the underlying stock price hitting some predefined threshold value) has not occurred, at which time the holders may elect to surrender the debt for cash (perhaps with a call premium, if the indenture contains such a provision) or to convert at a defined ratio for stock. If the debt remains outstanding until scheduled redemption, there will be no opportunity to convert. (Another variant exists where the debt has a contingent conversion feature at inception, e.g., where the debt becomes convertible if some other event, such as a refinancing, occurs, as well as if the issuer attempts to call the debt.)

ASC 470-20-40 states that no gain or loss should result from the creation of a conversion opportunity caused by the issuer's exercise of its call option, if the debt as originally issued contained a substantive conversion feature. In such circumstances, conversion of the debt to equity—assuming the existence of substantive rights in the original debt issuance—would be accounted for as a book value swap. On the other hand, if the conversion feature had not been substantive, the conversion triggered by the exercise by the issuer of its call option would be accounted for as a debt extinguishment, with the fair value of the equity being issued used to define the cost of the extinguishment. This would create a gain or loss to be recognized in virtually all situations.

ASC 470-20-40 defines a *substantive* conversion feature as a conversion feature that was, when the debt instrument was first issued, at least *reasonably possible* of being exercisable in the future, absent the issuer's exercise of a call option—where *reasonably possible* has the same meaning as under ASC 450. In practical terms, evaluation of whether the original conversion feature had been substantive, in the context of the facts and circumstances at the date of issuance, might include consideration of the interest yield of the contingently convertible debt compared to equivalent rates then required for debt lacking that feature, the likelihood of the occurrence of the defined contingent event, and the relative value of the conversion feature versus the related debt instrument.

**Disclosure of contingently convertible securities.** Allegations had been raised that disclosures regarding contingently convertible securities have often been inconsistent across

companies, and have often been inadequate. To address this problem, ASC 505-10-50 states how to disclose contingently convertible securities. See the chapter on ASC 505 for details.

### Induced Conversion of Debt

A special situation exists in which the conversion privileges of convertible debt are modified after issuance. These modifications may take the form of reduced conversion prices or additional consideration paid to the convertible debt holder. The debtor offers these modifications or “sweeteners” to induce prompt conversion of the outstanding debt.

ASC 470-20 specifies the accounting method used in these situations and only applies when the convertible debt is converted into equity securities. Upon conversion, the debtor must recognize an expense for the excess of the fair value of all the securities and other consideration given over the fair value of the securities specified in the original conversion terms.

**Determining applicability of ASC 470-20.** ASC 470-20 specifies the accounting for “sweeteners” used to induce the conversion of convertible debt. Traditionally, this involves enhancements offered by the debtor to encourage conversions, often motivated by the desire to bring an end to interest payments on the convertible debt. ASC 470-20-40-13 addresses the related circumstance of conversions when the enhanced terms are proposed or requested by the creditors/debtors. In some instances, only the requesting parties are granted the sweetened terms. Thus, ASC 470-20 applies to all conversions of convertible debts that (1) occur pursuant to changed conversion privileges, (2) are exercisable only for a limited period of time, and (3) include the issuance of all of the equity securities issuable pursuant to conversion privileges included in the terms of the debt at issuance for each debt instrument that is converted, regardless of the party that initiates the offer or whether the offer relates to all debtholders.

#### Example of induced conversion expense

1. January 1, 20X1, XYZ Company issued ten 8% convertible bonds at \$1,000 par value without a discount or premium, maturing December 31, 20Y1.
2. The bonds are initially convertible into no par common stock of XYZ at a conversion price of \$25.
3. On July 1, 20X5, the convertible bonds have a fair value of \$600 each.
4. To induce the convertible bondholders to quickly convert their bonds, XYZ reduces the conversion price to \$20 for bondholders who convert before July 21, 20X5 (within twenty days).
5. The fair value of XYZ Company’s common stock on the date of conversion is \$15 per share.

The fair value of the incremental consideration paid by XYZ upon conversion is calculated for each bond converted before July 21, 20X5.

*Value of securities issued to debt holders:*

Face amount	\$1,000	per bond
÷ New conversion price	÷ \$20	per share
Number of common shares issued upon conversion	50	shares
× Price per common share	× \$15	per share
Value of securities issued	\$ 750	(a)
Face amount	\$1,000	per bond
÷ Original conversion price	÷ \$25	per share

Number of common shares issuable pursuant to original conversion privilege	40	shares
× Price per share	<u>\$15</u>	per share
Value of securities issuable pursuant to original conversion privileges	<u>\$ 600</u>	(b)
Value of securities issued	<u>\$ 750</u>	(a)
Value of securities issuable pursuant to the original conversion privileges	<u>600</u>	(b)
Fair value of incremental consideration	<u><u>\$ 150</u></u>	

The entry to record the debt conversion for each bond is:

Convertible debt	1,000	
Debt conversion expense	150	
Common stock—no par		1,150

### Debt Issued with Stock Warrants

Warrants are certificates enabling the holder to purchase a stated number of shares of stock at a certain price within a certain time period. They are often issued with bonds to enhance the marketability of the bonds and to lower the bond's interest rate.

When bonds with detachable warrants are issued, the purchase price must be allocated between the debt and the stock warrants based on relative fair values. (ASC 470-20) Since two separate instruments are involved, a fair value must be determined for each. However, if one value cannot be determined, the fair value of the other should be deducted from the total value to determine the unknown value.

#### Example of accounting for a bond with a detachable warrant

1. A \$1,000 bond with a detachable warrant to buy 10 shares of \$10 par common stock at \$50 per share is issued for \$1,025.
2. Immediately after the issuance the bonds trade at \$995 and the warrants at \$35.
3. The fair value of the stock is \$48.

The relative fair value of the bonds is 96.6% [995/(995 + 35)] and the warrant is 3.4% [35/(995 + 35)]. Thus, \$34.85(3.4% × \$1,025) of the issuance price is assigned to the warrants. The journal entry to record the issuance is:

Cash	1,025.00	
Discount on bonds payable	9.85	
Bonds payable	1,000.00	
Paid-in capital—warrants (or "Stock options outstanding")	34.85	

The discount is the difference between the purchase price assigned to the bond, \$990.15 (96.6% × \$1,025), and its face value, \$1,000. The debt itself is accounted for in the normal fashion.

The entry to record the subsequent future exercise of the warrant would be:

Cash	500.00	
Paid-in capital—warrants	34.85	
Common stock	100.00	
Paid-in capital	434.85 (difference)	

Assuming the warrants are not exercised, the journal entry is:

Paid-in capital—warrants	34.85
Paid-in capital—expired warrants	34.85

### Debt Issued with Conversion Features and Stock Warrants

ASC 470-20 states that when a debt instrument includes both detachable instruments such as warrants, and an embedded beneficial conversion option, the proceeds of issuance should first be allocated among the convertible instrument and the other detachable instruments based on their relative fair values. Following this, the ASC 470-20 model should be applied to the amount allocated to the convertible instrument to determine if the embedded conversion option has an intrinsic value.

#### Example of convertible debt issued with stock warrants

Cellular Communicators issues \$1,000,000 of convertible debt with 100,000 detachable warrants. The debt is convertible into \$10 par common stock at a price of \$50 per share. At the commitment date of this issuance, the common stock is trading at \$46 per share. Immediately after the issuance, the bonds trade at 85 and the warrants trade at \$2. The issuance proceeds of \$1,000,000 are allocated to the two instruments as follows:

$$\begin{aligned} \$850,000 / (\$850,000 + \$200,000) \times \$1,000,000 &= \$809,524 \text{ to the debt} \\ \$200,000 / (\$850,000 + \$200,000) \times \$1,000,000 &= \$190,476 \text{ to the warrants} \end{aligned}$$

The intrinsic value of the conversion feature is next computed as follows:

$$\$1,000,000 / \$50 \text{ per share} = 20,000 \text{ shares to be issued upon conversion}$$

The effective conversion price is the bond's allocated proceeds of \$809,524 divided by 20,000 shares or \$40.48

$$(\$46 \text{ current fair value of the stock} - \$40.48 \text{ effective conversion price}) \times 20,000 \text{ shares} = \$110,476, \text{ which is the implied discount granted on the bonds in connection with the conversion feature.}$$

Cellular Communicators would make the following entry to recognize the issuance of the bonds with warrants at 100:

Cash	1,000,000
Discount on bonds payable	110,476
Bonds payable	809,524
Additional paid-in capital	110,476
Paid-in capital—warrants	190,476

A wide range of features may be incorporated into stock purchase warrants and it will often be a challenge to identify the substance of these features, and to then prescribe the proper accounting for each feature. One such example involves warrants that are issued with put options, sometimes called "puttable warrants." Such warrants allow the holder to purchase a fixed number of the issuer's shares at a fixed price (common to all warrants), but also are puttable by the holder at a specified date for a fixed monetary amount that the holder could require the issuer to pay in cash. For example, assume the warrants are issued when the entity's shares are trading at \$12, and each warrant permits the purchase of 100 shares at \$15 through April 30, 2013. If not previously

exercised, the warrant holders can put each warrant back to the issuer for the equivalent of \$14 per share, that is, for  $100 \times (\$14 - \$12) = \$200$  per warrant. The warrant holder is thus assured (given the underlying stock price at inception) of at least \$2 per share income, and of course may reap a much larger reward if the share price has risen beyond \$15 by the expiration date.

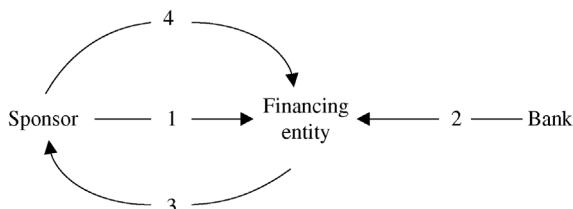

### **ASC 470-30, Participating Mortgage Loans**

**Accounting by participating mortgage loan borrowers.** Certain mortgage loan agreements provide, generally in exchange for a lower interest rate, that the lender shares in price appreciation of the property securing the loan. Other arrangements provide that the lender receives a share of the earnings or cash flows from the commercial real estate for which the loan was made. ASC 470-30 establishes the borrower's accounting for a participating mortgage loan if the lender participates in increases in the fair value of the mortgaged real estate project, the results of operations of that mortgaged real estate project, or both. It requires that certain disclosures be made in the financial statements. In addition, the Codification requires the following:

1. At origination, if the lender is entitled to participate in appreciation in the market value of the mortgaged real estate project, the borrower should determine the fair value of the participation feature and should recognize a participation liability for that amount. A corresponding debit should then be recorded to a debt-discount account. (ASC 470-30-30-1) The debt discount should be amortized by the interest method, using the effective interest rate. (ASC 470-30-35-5) The net result should include the expected cost of the participating feature in the periodic interest cost associated with the loan.
2. At the end of each reporting period, the balance of the participation liability should be adjusted if necessary, so that the liability equals the current fair value of the participation feature at that point in time. The corresponding debit or credit should be adjusted to the related debt-discount account. The revised discount should then be amortized prospectively. (ASC 470-30-35-34 and 35-34A)

### **ASC 470-40, Product Financing Arrangements**

ASC 470-40 addresses the issues involved with product financing arrangements. A product financing arrangement is a transaction in which an entity (referred to as the "sponsor") simultaneously sells and agrees to repurchase inventory to and from a financing entity. The repurchase price is contractually fixed at an amount equal to the original sales price plus the financing entity's carrying and financing costs. The purpose of the transaction is to enable the sponsor enterprise to arrange financing of its original purchase of the inventory. The various steps involved in the transaction are illustrated by the diagram.

1. In the initial transaction, the sponsor "sells" inventoriable items to the financing entity in return for the remittance of the sales price and at the same time agrees to repurchase the

inventory at a specified price (usually the sales price plus carrying and financing costs) over a specified period of time.

2. The financing entity borrows from a bank (or other financial institution) using the newly purchased inventory as collateral.
3. The financing entity remits the proceeds of its borrowing to the sponsor and the sponsor presumably uses these funds to pay off the debt (accounts payable) incurred for the original purchase.
4. The sponsor then, over a period of time as funds become available, repurchases the inventory from the financing entity for the specified price plus carrying and financing costs.

FASB ruled that the substance of this transaction is that of a borrowing transaction, not a sale. That is, the transaction is, in substance, no different from the sponsor directly obtaining third-party financing to purchase inventory. ASC 470-40 specifies that the proper accounting by the sponsor is to record a liability in the amount of the selling price when the funds are received from the financing entity in exchange for the initial transfer of the inventory. The sponsor proceeds to accrue carrying and financing costs in accordance with its normal accounting policies. These accruals are eliminated and the liability satisfied when the sponsor repurchases the inventory. The inventory is not removed from the statement of financial position of the sponsor and a sale is not recorded. Thus, although legal title has passed to the financing entity, for purposes of measuring and valuing inventory, the inventory is considered to be owned by the sponsor. (Per ASC 606-10-55-403: Control of the entity has not passed to the buyer.)

#### **Example of a product financing arrangement**

The Medieval Illumination Company (MIC) has borrowed the maximum amount it has available under its short-term line of credit. MIC obtains additional financing by selling \$280,000 of its candle inventory to a third-party financing entity. The third party obtains a bank loan at 6% interest to pay for its purchase of the candle inventory, while charging MIC 8% interest and \$1,500 per month to store the candle inventory at a public storage facility. As MIC obtains candle orders, it purchases inventory back from the third party, which in turn authorizes the public warehouse to drop ship the orders directly to MIC's customers at a cost of \$35 per order. Since this is a product financing arrangement, MIC cannot remove the candle inventory from its accounting records or record revenue from sale of its inventory to the third party. Instead, the following entry records the initial financing arrangement:

Cash	280,000
Short-term debt	280,000

After one month, MIC records accrued interest of \$1,867 ( $\$280,000 \times 8\% \text{ interest} \times 1/12 \text{ year}$ ) on the loan, as well as the monthly storage fee of \$1,500, as shown in the following entry:

Interest expense	1,867
Storage expense	1,500
Accrued interest	1,867
Accounts payable	1,500

On the first day of the succeeding month, MIC receives a prepaid customer order for \$3,800. The margin on the order is 40% and, therefore, the related inventory cost is \$2,280. MIC pays the third party

\$2,280 to buy back the required inventory as well as \$35 to the public storage facility to ship the order to the customer, and records the following entries:

Short-term debt	2,280	
Cash		2,280
<i>To repurchase inventory from the third-party financing entity</i>		
Cash	3,800	
Sales		3,800
<i>To record the sale to the customer</i>		
Cost of goods sold	2,280	
Inventory		2,280
<i>To record the cost of the sale to the customer</i>		
Freight out	35	
Accounts payable		35
<i>To record the cost of fulfilling the order</i>		

ASC 470-40 identifies variations of the terms of the above arrangement that also meet the criteria for being accounted for as product financing arrangements:

1. The third-party financing entity purchases the inventory directly from the sponsor's supplier (instead of from the sponsor) with a simultaneous agreement to sell the inventory to the sponsor.
2. The sponsor enters into an agreement with a third-party financing entity to control the disposition of product that has been purchased by the third party either from the sponsor or from the sponsor's supplier.

#### **ASC 470-50, Modifications and Extinguishments**

**Modifications to conversion privileges.** Under provisions of ASC 470-50, the debtor's (issuer's) accounting for a modification of a debt issue or an exchange for another issue is based on whether the modifications are substantial. Based on the results of the analysis, extinguishment of the original debt could be found to have occurred, with financial reporting ramifications. The SEC takes a position on this matter that adds further complexity.

ASC 470-50-40 holds that debt extinguishment accounting be used if (1) the change in the fair value of the embedded conversion option is at least 10% of the carrying value of the original debt instrument just prior to the debt being modified or exchanged, or (2) the debt instrument modification or exchange adds or eliminates a substantive conversion option. If this analysis does not result in extinguishment accounting, then an increase in the fair value of the conversion option would reduce the debt and increase additional paid-in capital, while a decrease in the fair value of the conversion option would not be recognized.

ASC 470-50-40 also holds that the modification of a convertible debt instrument will affect subsequent recognition of interest expense for the associated debt instrument for changes in the fair value of the embedded conversion option. The change in the fair value of an embedded conversion option will be calculated as the difference between the fair value of the embedded conversion option immediately before and after the modification. The value exchanged by the holder for the modification of the conversion option is to be recognized as a discount (or premium) with a corresponding increase (or decrease) in additional paid-in capital.

Finally, ASC 470-50-40 concludes that issuers should not recognize a beneficial conversion feature or reassess an existing beneficial conversion feature at the date of the modification of a convertible debt instrument.

**Extinguishment of debt.** Management may reacquire or retire outstanding debt before its scheduled maturity. This decision is usually caused by changes in present or expected interest rates or in cash flows.

In-substance defeasance (irrevocably placing assets in a trust that is to be used solely to service the remaining debt payments) does not result in the extinguishment of a liability. Except for items excluded by ASC 405-20, a liability is removed from the statement of financial position only if:

1. The creditor is paid and the debtor is relieved of the obligation.
2. The debtor is released legally either by the creditor or judicially from being the primary obligor.

If a debtor becomes secondarily liable, through a third-party assumption and a release by the creditor, the original debtor becomes a guarantor. A guarantee obligation, based on the probability that the third party will pay, is to be recognized and initially measured at fair value. The amount of guarantee obligation increases the loss or reduces the gain recognized on extinguishments.

Some financial instruments can have characteristics of either assets or liabilities depending on market conditions (forward contracts, swap contracts, and written commodity options). To be derecognized, those instruments must not only meet the two criteria above, but must also meet the surrender of control criteria of ASC 405-20.

**Debtor's accounting for a modification or exchange of debt instruments other than in a troubled debt restructuring.** An exchange of debt instruments with substantially different terms is a debt extinguishment and should be accounted for in accordance with ASC 405-20. Any substantial modification in the terms of an existing debt, other than for a troubled debt restructuring, should similarly be reported as a debt extinguishment.

An exchange or modification is considered substantial when the present value of cash flows under the new debt instrument is at least 10% different from the present value of the remaining cash flows under the terms of the original instrument. (ASC 470-50-40-10) For the purpose of the 10% test, the effective interest rate of the original debt instrument is used as the discount rate.

Cash flows can be affected by changes in principal amounts, interest rates, maturity, or by fees exchanged between the parties. Substantial change can also result from changes in the following provisions:

1. Recourse or nonrecourse features
2. Priority of the obligation
3. Collateralized or noncollateralized features
4. Debt covenants and/or waivers
5. The guarantor
6. Option features.

*Assuming the 10% test is met and the debt instruments are deemed to be substantially different,* the new investment should be initially recorded at fair value and that amount should be compared to the book value of the old debt to determine debt extinguishment gain or loss to be recognized, as well as the effective rate of the new instrument. (ASC 470-50-40-13) Fees paid by the debtor to the creditor or received by the debtor from the creditor should be included in determining debt extinguishment gain or loss. (ASC 470-50-40-17a) Additionally, any costs

incurred with third parties should be amortized using the interest method in a manner similar to that used for debt issue costs. (ASC 470-50-40-18)

*Assuming the 10% test is not met and the debt instruments are not deemed to be substantially different*, then the new effective interest is to be determined based on the carrying amount of the original instrument and the revised cash flows. (ASC 470-50-40-14) Fees paid by the debtor to the creditor or received by the debtor from the creditor should be amortized as an adjustment to interest expense over the remaining term of the modified debt instrument using the interest method. (ASC 470-50-40-17b) Additionally, any costs incurred with third parties should be expensed as incurred. (ASC 470-50-40-18b)

**Gain or loss on debt extinguishment.** According to ASC 470-50-40-2, the difference between the net carrying value and the price paid to acquire the debt instruments is to be recorded as a gain or loss. If the acquisition price is greater than the carrying value, a loss exists. A gain is generated if the acquisition price is less than the carrying value. These gains or losses are to be recognized in the period in which the retirement took place.

The unamortized premium or discount and issue costs should be amortized to the acquisition date and recorded prior to the determination of the gain or loss. If the extinguishment of debt does not occur on the interest date, the interest payable accruing between the last interest date and the acquisition date must also be recorded.

#### Example of accounting for the extinguishment of debt

1. A 10%, 10-year, \$200,000 bond is dated and issued on 1/2/12 at 98, with the interest payable semiannually.
2. Associated bond issue costs of \$14,000 are incurred.
3. Four years later, on 1/2/16, the entire bond issue is repurchased at 102 (i.e., 102% of face value) and is retired.
4. At 1/2/16 the unamortized discount using the effective interest rate of 10.325% is \$2,858.

Reacquisition price $[(102\%) \times \$200,000]$	\$204,000
Net carrying amount:	
Face value	\$200,000
Unamortized discount	(2,858)
Unamortized issue costs $[14,000 \times (6/10)]$	<u>(8,400)</u>
Loss on bond repurchase	<u>188,742</u> <u>\$ 15,258</u>

#### ASC 470-60, Troubled Debt Restructurings by Debtors

Troubled debt restructurings are defined by ASC 470-60 as situations in which the creditor, for economic or legal reasons related to the debtor's financial difficulties, grants the debtor a concession that would not otherwise be granted. As explained in ASC 470-60-55-5, no single characteristic or factor, taken alone, is determinative of whether a modification of terms or an exchange of a debt instrument is a troubled debt restructuring under ASC 470-60. Thus, making this determination requires the exercise of judgment. ASC 470-60-55 poses two questions to assist in making a determination of whether ASC 470-60 applies in a particular instance:

- Is the debtor experiencing financial difficulty?
- Has the creditor granted a concession?

Both of these questions must be answered in the affirmative for ASC 470-60 to be applicable.

**Is the debtor experiencing financial difficulty?** If the debtor's creditworthiness has deteriorated since the debt was originally issued, the debtor should evaluate whether it is experiencing financial difficulties. The following factors are indicators that this may be the case:

- The debtor is in default on some of its debt, or it is probable that the debtor will be in payment default on any of its debt in the foreseeable future without the restructuring modification
- The debtor has declared, or is in the process of declaring, bankruptcy
- There is doubt as to whether the debtor is a going concern
- The debtor's securities have been or are likely to be delisted
- The debtor forecasts that its entity-specific cash flows are insufficient to service the debt through its maturity in accordance with its terms
- The debtor cannot obtain resources at the current market rates for nontroubled debtors except through existing creditors.

(ASC 470-60-55-8)

If both of the following factors are present, it would be concluded that the debtor is not experiencing financial difficulty:

- The creditors agree to restructure the old debt solely to reflect either (1) a decrease in the current interest rates for the debtor, or (2) an increase in the debtor's creditworthiness
- The debtor is currently servicing the old debt and can obtain funds to repay the old debt at the current market rate for a nontroubled debtor.

(ASC 470-60-55-9)

**Has the creditor granted a concession?** The creditor has granted a concession when a restructuring results in its expectation that it will not collect all amounts due. If so, and if the payment of principal is mostly dependent on the value of collateral, the creditor should consider the current value of the collateral in deciding whether the principal will be paid.

If the creditor restructures a debt in exchange for additional collateral or guarantees, the creditor has granted a concession when the amount of these additional items is not adequate compensation for other terms of the restructuring.

If the debtor does not have access to funds at a market rate, then the creditor should consider the restructuring to be at a below-market rate; this is an indicator that the creditor has granted a concession. It may also be a concession when the interest rate in the restructuring agreement has increased, if the new rate is below the market interest rate for new debt having similar risk characteristics. If so, the creditor should consider all aspects of the restructuring agreement to determine whether it has granted a concession.

It is not a concession when a restructuring only results in a delay in payment that is insignificant. However, if the debt has been previously restructured, the creditor should consider the cumulative effect of the past restructurings when determining whether a delay in payment resulting from the most recent restructuring is insignificant.

However, in any of the following four situations, a concession granted by the creditor does not automatically qualify as a restructuring:

1. The fair value of the assets or equity interest accepted by a creditor from a debtor in full satisfaction of its receivable is at least equal to the creditor's recorded investment in the receivable.

2. The fair value of the assets or equity interest transferred by a debtor to a creditor in full settlement of its payable is at least equal to the carrying value of the payable.
  3. The creditor reduces the effective interest rate to reflect a decrease in current interest rates or a decrease in the risk, in order to maintain the relationship.
  4. The debtor, in exchange for old debt, issues new debt with an interest rate that reflects current market rates.
- (ASC 470-60-55-12)

ASC 470-60-55-1 notes that ASC 470-60 does not apply to debtors in bankruptcy unless the restructuring does not result from a general restatement of the debtor's liabilities in bankruptcy proceedings. That is, ASC 470-60 applies only if the debt restructuring is isolated to the creditor.

A troubled debt restructuring can occur in one of two ways. The first is a settlement of the debt at less than the carrying amount. The second is a continuation of the debt with a modification of terms (i.e., a reduction in the interest rate, face amount, accrued interest owed, or an extension of the payment date for interest or face amount). Accounting for such restructurings is prescribed for both debtors and creditors. ASC 470-60-15-3 points out that the debtor and creditor must separately apply ASC 470-60 to the specific fact situation, since the tests are not necessarily symmetrical and it is possible for one or the other, but not both, to have a troubled debt restructuring when the debtor's carrying amount and the creditor's recorded investment differ. ASC 310-10-35-16 specifies the accounting by creditors for troubled debt restructurings involving a modification of terms.

**Recognition.** If the debt is settled by the exchange of assets, a gain is recognized in the period of transfer for the difference between the carrying amount of the debt (defined as the face amount of the debt increased or decreased by applicable accrued interest and applicable unamortized premium, discount, or issue costs) and the consideration given to extinguish the debt. (ASC 470-60-35-3) A two-step process is used: (1) any noncash assets used to settle the debt are revalued at fair value and the associated ordinary gain or loss is recognized, and (2) the debt restructuring gain is determined and recognized. The gain or loss is evaluated under the "unusual and infrequent" criteria of ASC 225-20. If stock is issued to settle the liability, the stock is recorded at its fair value. (ASC 470-60-35-4)

**Example 1: Settlement of debt by exchange of assets**

Assume the debtor company transfers land having a book value of \$70,000 and a fair value of \$80,000 in full settlement of its note payable. The note has a remaining life of five years, a principal balance of \$90,000, and related accrued interest of \$10,000 is recorded. The following entries are required to record the settlement:

<i>Debtor</i>		
Land		10,000
Gain on transfer of assets		10,000
Note payable	90,000	
Interest payable	10,000	
Land		80,000
Gain on settlement of debt		20,000

If the debt is continued with a modification of terms, it is necessary to compare the total future cash flows of the restructured debt (both principal and stated interest) with the carrying value of the original debt. If the total amount of future cash payments is greater than the carrying value, no adjustment is made to the carrying value of the debt. However, a new lower effective interest rate

must be computed. This rate makes the present value of the total future cash payments equal to the present carrying value of debt and is used to determine interest expense in future periods. The effective interest method must be used to compute the expense. If the total future cash payments of the restructured debt are less than the present carrying value, the current debt should be reduced to the amount of the future cash flows and a gain should be recognized. No interest expense would be recognized in subsequent periods, since only the principal is being repaid.

According to ASC 470-60, a troubled debt restructuring that involves only a modification of terms is accounted for *prospectively*. Thus, there is no change in the carrying value of the liability unless the carrying amount of the original debt exceeds the total future cash payments specified by the new agreement.

If the restructuring consists of part settlement and part modification of payments, the part settlement is accounted for first and then the modification of payments.

**Example 2: Restructuring with gain/loss recognized (payments are less than carrying value)**

Assume that the note has a principal balance of \$90,000, accrued interest of \$10,000, an interest rate of 5%, and a remaining life of five years. The interest rate is reduced to 4%, the principal is reduced to \$72,500, and the accrued interest at date of restructure is forgiven.

Future cash flows (after restructuring):

Principal	\$72,500
Interest (5 years × \$72,500 × 4%)	<u>14,500</u>
Total cash to be paid	\$87,000
Amount prior to restructure	
(\$90,000 principal + \$10,000 accrued interest)	(100,000)
Debtor's gain	<u>\$ 13,000</u>

The following entries need to be recorded by the debtor to reflect the terms of the agreement:

*Beginning of Year 1*

Interest payable	10,000
Note payable	3,000
Gain on restructure of debt	13,000

*End of Years 1–5*

Note payable	2,900
Cash	2,900

---

*NOTE: \$14,500 ÷ 5 yrs. = \$2,900; no interest expense is recorded in this case.*

---

*End of Year 5*

Note payable	72,500
Cash	72,500

**Example 3: Restructuring with no gain/loss recognized (payments exceed carrying value)**

Modify Example 2 as follows: Assume the \$100,000 owed is reduced to a principal balance of \$95,000. The interest rate of 5% is reduced to 4%.

Future cash flows (after restructuring):

Principal	\$ 95,000
Interest (5 years × \$95,000 × 4%)	19,000
Total cash to be received	\$114,000

Amount prior to restructure	
(\$90,000 principal + \$10,000 accrued interest)	(100,000)
Interest expense/revenue over 5 years	\$ <u>14,000</u>

In this example, a new effective interest rate must be computed such that the present value of the future payments equals \$100,000. A trial and error approach is used to calculate the effective interest rate that discounts the \$95,000 principal and the \$3,800 annual interest payments to \$100,000, the amount owed prior to restructuring.

**Trial and Error Calculation**

	(n = 5, i = 2.5%)	(n = 5, i = 3%)
PV of ordinary annuity	4.64583	4.57971
PV of 1	.88385	.86261
2.5% : (.88385 × \$95,000) + (4.64583 × \$3,800) = \$101,620		
3% : (.86261 × \$95,000) + (4.57971 × \$3,800) = \$99,351		

*Interpolation:*

$$\left[ \frac{101,620 - 100,000}{101,620 - 99,351} \right] \times (3\% - 2.5\%) = .357\%$$

$$\text{New effective rate} = 2.5\% + .357\% = \underline{\underline{2.857\%}}$$

*Interest amortization schedule:*

<u>Year</u>	<u>Cash</u>	<u>Interest at effective rate</u>	<u>Reduction in carrying value</u>	<u>Carrying amount</u>
				\$100,000
1	\$ 3,800 <sup>(a)</sup>	\$2,857 <sup>(b)</sup>	\$ 943 <sup>(c)</sup>	99,057
2	3,800	2,830	970	98,087
3	3,800	2,802	998	97,089
4	3,800	2,774	1,026	96,063
5	<u>3,800</u>	2,745	1,055	95,000*
				\$19,000

\* Rounded

(a)  $\$3,800 = \$95,000 \times .04$

(b)  $\$2,857 = \$100,000 \times 2.857\%$

(c)  $\$943 = \$3,800 - \$2,857$

The following entries are made by the debtor to recognize the cash payments in the subsequent periods:

*End of Year 1*

Note payable (\$3,800 – \$2,857)	943
Interest expense (\$100,000 × .02857)	2,857
Cash	3,800

*End of Year 5*

Note payable	95,000
Cash	95,000

When the total future cash payments may exceed the carrying amount of the liability, no gain or loss is recognized on the books of the debtor unless the maximum future cash payments are less than the carrying amount of the debt. For example, if the debtor is required to make interest payments at a higher rate if its financial condition improves before the maturity of the debt, the debtor should assume that the larger payments would have to be made. The contingent payments would be included in the total future cash payments for comparison with the carrying amount of the debt. If the future cash payments exceed the carrying amount, a new effective interest rate should be determined. The new rate should be the rate that equates the present value of the future cash payments with the carrying amount of the liability. Interest expense and principal reduction are then recognized as the future cash payments are made.

**Example 4: Contingent payments**

Modify Example 2 as follows: The new agreement states that if financial condition at maturity improves as specified, an additional principal payment of \$15,000 is required and additional 1% of interest must be paid in arrears for Years 4 and 5.

Future cash payments:

Required principal per agreement	\$ 72,500
Required interest per agreement (5 years × \$72,500 × 4%)	14,500
Contingent principal payment	15,000
Contingent interest payments (2 years × 72,500 × 1%)	<u>1,450</u>
	\$103,450
Amount prior to restructure (\$90,000 + \$10,000)	(100,000)
	<u>\$ 3,450</u>

When computing the new effective interest rate, only as many contingent payments as are needed to make the future cash payments exceed the carrying value are included in the calculation. Thus, the contingent principal payment would be included, but the contingent interest would not. The contingent interest payments would be recognized using the same criteria as are used in ASC 450; that is, the payments are recognized when they are both probable and reasonably estimable.

## PERSPECTIVE AND ISSUES

### Subtopic

ASC 480, *Distinguishing Liabilities from Equity Topic*, contains one Subtopic:

- ASC 480-10, *Overall*, which provides guidance on how an issuer classifies and measures financial instruments with characteristics of both liabilities and equity.

### Scope and Scope Exceptions

ASC 480 applies to all entities and to any freestanding financial instrument. This includes one that:

- Comprises more than one option or forward contract
- Has characteristics of both a liability and equity and, in some circumstances, also has characteristics of an asset.

ASC 480 does *not* address an instrument that has only characteristics of an asset. ASC 480 does not apply to:

- A feature embedded in a financial instrument that is not a derivative instrument in its entirety.
- An obligation under share-based compensation arrangements if that obligation is accounted for under Topic 718.

(Also see the Applicability of ASC 480 section in this chapter or an expanded discussion of which instruments fall under the scope of ASC 480.)

## Overview

Standard setters had been struggling with the proper reporting for hybrid instruments— instruments having characteristics of both liabilities and equity. Two needs had been perceived:

- first, to establish criteria for classification for certain instruments (e.g., mandatorily redeemable stock) that nominally are equity but have key characteristics of debt, but which will significantly impact corporate statements of financial position if a “substance over form” approach is strictly enforced; and
- second, to develop the methodology for disaggregating the constituent parts of compound instruments so that they may be accounted for as debt and as equity, respectively.

ASC 480 addresses those needs.

## DEFINITIONS OF TERMS

---

Source: ASC 480-20. See Appendix A, *Definitions of Terms*, for additional terms related to this Topic: Call Option, Employee Stock Ownership Plan, Equity Shares, Fair Value, Financial Instrument, Noncontrolling Interest, Parent, Put Option, Securities and Exchange Commission Registrant, Subsidiary, and Warrant.

**Freestanding Financial Instrument.** A financial instrument that meets either of the following conditions:

1. It is entered into separately and apart from any of the entity’s other financial instruments or equity transactions.
2. It is entered into in conjunction with some other transaction and is legally detachable and separately exercisable.

**Issuer.** The entity that issued a financial instrument or may be required under the terms of a financial instrument to issue its equity shares.

**Issuer’s Equity Shares.** The equity shares of any entity whose financial statements are included in the consolidated financial statements.

**Mandatorily Redeemable Financial Instrument.** Any of various financial instruments issued in the form of shares that embody an unconditional obligation requiring the issuer to redeem the instrument by transferring its assets at a specified or determinable date (or dates) or upon an event that is certain to occur.

**Monetary Value.** What the fair value of the cash, shares, or other instruments that a financial instrument obligates the issuer to convey to the holder would be at the settlement date under specified market conditions.

**Net Cash Settlement.** A form of settling a financial instrument under which the entity with a loss delivers to the entity with a gain cash equal to the gain.

**Net Share Settlement.** A form of settling a financial instrument under which the entity with a loss delivers to the entity with a gain shares of stock with a current fair value equal to the gain.

**Obligation.** A conditional or unconditional duty or responsibility to transfer assets or to issue equity shares. Because Topic 480 relates only to financial instruments and not to contracts to provide services and other types of contracts, but includes duties or responsibilities to issue equity shares, this definition of obligation differs from the definition found in FASB Concepts Statement No. 6, Elements of Financial Statements, and is applicable only for items in the scope of that Topic.

**Physical Settlement.** A form of settling a financial instrument under which both of the following conditions are met:

- a. The party designated in the contract as the buyer delivers the full stated amount of cash or other financial instruments to the seller.
- b. The seller delivers the full stated number of shares of stock or other financial instruments or nonfinancial instruments to the buyer.

**Shares.** Shares includes various forms of ownership that may not take the legal form of securities (for example, partnership interests), as well as other interests, including those that are liabilities in substance but not in form. (Business entities have interest holders that are commonly known by specialized names, such as stockholders, partners, and proprietors, and by more general names, such as investors, but all are encompassed by the descriptive term owners. Equity of business entities is, thus, commonly known by several names, such as owners' equity, stockholders' equity, ownership, equity capital, partners' capital, and proprietorship. Some entities [for example, mutual organizations] do not have stockholders, partners, or proprietors in the usual sense of those terms but do have participants whose interests are essentially ownership interests, residual interests, or both.)

**Transfer.** The term transfer is used in a broad sense consistent with its use in FASB Concepts Statement No. 6, Elements of Financial Statements (such as in paragraph 137), rather than in the narrow sense in which it is used in Subtopic 860-10.

**Variable-Rate Forward Contracts.** Variable-rate forward contracts are commonly used to effect equity forward transactions. The contract price on those forward contracts is not fixed at inception but varies based on changes in a specified index (for example, three-month U.S. London Interbank Offered Rate [LIBOR]) during the life of the contract.

## CONCEPTS, RULES, AND EXAMPLES

---

### Applicability of ASC 480

ASC 480 applies to all freestanding instruments, including those composed of more than one option or forward contract embodying obligations that require or that may require settlement by transfer of assets. It applies to three types of freestanding financial instruments:

- Mandatorily redeemable financial instruments
- Obligations to repurchase the issuer's shares by transferring assets
- Certain obligations to issue a variable number of shares.

Obligations to repurchase the issuer's equity shares by transferring assets include financial instruments, other than outstanding shares, that, at inception:

- a. Embody obligations to repurchase the issuers' equity shares, or are indexed to such obligations, and
- b. Require or may require the issuers to settle the obligations by transferring assets.

These must be classified as liabilities (or, rarely, as assets). Such obligations could include forward purchase contracts or written put options on an issuer's equity shares that are to be physically settled or net cash settled.

Certain obligations to issue a variable number of shares are financial instruments that embody unconditional obligations, or financial instruments other than outstanding shares that embody conditional obligations, that the issuers must or may settle by issuing variable numbers of equity shares. These obligations also must be classified as liabilities (or, rarely, as assets) if, at inception, the monetary values of the obligations are based solely or predominantly on any one of the following:

- A fixed monetary amount known at inception (e.g., a payable settleable with a variable number of the issuer's equity shares);
- Variations in something other than the fair value of the issuer's equity shares (e.g., a financial instrument indexed to the S&P 500 and settleable with a variable number of the issuer's equity shares); or
- Variations inversely related to changes in the fair value of the issuer's equity shares (e.g., a written put option that could be net share settled).

If a freestanding instrument is composed of more than one option or forward contract and one of those contracts embodies an obligation to repurchase the issuer's shares that require or may require settlement by a transfer of assets, the financial instrument is a liability. In addition, if a freestanding instrument composed of more than one option or forward contract includes an obligation to issue shares, the various component obligations must be analyzed to determine if any of them would be obligations under ASC 480. If one or more would be obligations under this standard, then judgment must be used to determine if the monetary value of the obligations that would be liabilities is collectively predominant over the other component liabilities. If so, the instrument is a liability. If not, the instrument is outside the scope of ASC 480. Following is a list of examples of these types of financial instruments:

- Puttable warrant
- Warrant for shares that can be put by the holder immediately after exercise
- Warrant that allows the holder to exercise the warrant or put the warrant back to the issuer on the exercise date for a variable number of shares with a fixed monetary value
- Forward contract in which the number of shares to be issued depends on the issuer's share price on the settlement date
- Warrant with a "liquidity make-whole" put to issue additional shares to the holder if the sales price of the shares when later sold is less than the share price when the warrant is exercised
- Warrant that allows the holder to exercise the warrant or, if a contingent event does not occur, put the warrant back to the issuer on the exercise date for a variable number of shares with a fixed monetary value.

**Put options.** ASC 480-10-55 provides examples of put options that are subject to only cash payment and also of those that could be settled by an issuance of stock. The former case is straightforward: the instrument must be classified as a liability if the share price at the reporting date is such that a cash payment would be demanded by the holders of the puttable warrants. If the share price at that date is such that exercise of the warrant would be elected over exercise of the put option, then the warrant would be included in equity, not in liabilities. In other words, classification would depend on current stock price and could change from period to period, although ASC 480-10-55 is not explicit on this point.

Other put arrangements call for settlement in shares. That is, if advantageous to do so, the warrant holders exercise the warrants and acquire shares, but if the strike price has not been attained at expiration date, the put is exercised and the reporting entity would have to settle, but instead of paying cash it would issue shares having an aggregate value equal to the put amount. Thus, at inception, the number of shares that the puttable warrant obligates the reporting entity to issue can vary, and the instrument must be examined under the provisions of ASC 480 that deal with obligations to issue a variable number of shares. The facts and circumstances must be considered in judging whether the *monetary value* of the obligation to issue a number of shares that varies is predominantly based on a fixed monetary amount known at inception; if so, it is a liability under ASC 480.

**Put warrant.** A detachable put warrant can either be put back to the debt issuer for cash or can be exercised to acquire common stock. These instruments should be accounted for in the same manner as a mezzanine security. The proceeds applicable to the put warrant ordinarily are to be classified as equity and should be presented between the liability and equity sections in accordance with SEC ASR 268. (ASC 480-10-S99)

In the case of a warrant with a put price substantially higher than the value assigned to the warrant at issuance, however, the proceeds should be classified as a liability since it is likely that the warrant will be put back to the company.

**Warrant.** Yet another variation illustrated by ASC 480-10-55 is the warrant for the purchase of shares, where the shares are puttable. The holder can exercise the warrant and then immediately force the issuer to repurchase the shares issued. The price at which the shares could be put would be defined in the warrant, and the likelihood that the put option would be exercised would vary with the market value of the shares. Obviously, if the shares acquired by exercise of the warrant had a greater market value than the put price, the put would not be invoked. Accordingly, whether these warrants would be classified as equity or liability would depend on the market value of the underlying shares, and this could change from the date of one statement of financial position to that of the next. However, if the shares to be issued upon warrant exercise were to have a mandatory redemption feature, then the warrants would be reportable as liabilities in any case.

ASC 480-10-55 offers several other examples, illustrating more complex features that may be found in stock purchase warrants which, depending on circumstances, might necessitate classification as liabilities in the statement of financial position.

The standard does not apply to or affect the timing of recognition of financial instruments issued as contingent consideration in a business combination, nor the measurement guidance for contingent consideration, as set forth in ASC 805. It also does not affect accounting for stock-based compensation or ESOP plans. (ASC 718)

### Initial and Subsequent Measurements

Mandatorily redeemable financial instruments are reported as liabilities and are initially recognized at fair value. Mandatorily redeemable financial instruments are subsequently remeasured using fair value, with any adjustments included in the periodic determination of income. In general, the value of mandatorily redeemable financial instruments will be accreted over time and the accretion will be treated as interest expense. The method of determining subsequent fair values corresponds to that set forth in the following paragraph.

Forward contracts that require physical settlement by repurchase of a fixed number of the issuer's equity shares in exchange for cash are measured initially at the fair value of the shares, as adjusted for any consideration or unstated rights or privileges. Equity is reduced by this same amount. Fair value in this context may be determined by reference to the amount of cash that would be paid under the conditions specified in the contract if the shares were repurchased

immediately. Alternatively, the settlement amount can be discounted at the rate implicit at inception after taking into account any consideration or unstated rights or privileges that may have affected the terms of the transaction.

Subsequent measurement can be effected by either:

- accretion (which is feasible only if the amount to be paid and the settlement date are both fixed), or
- by determining the amount of cash that would be paid under the conditions specified in the contract if settlement occurred at the reporting date (useful when either the amount to be paid or the settlement date vary based on defined conditions and terms).

In either case, the change from the amount reported in the prior period is interest expense. If accretion is appropriate, the instruments are to be measured subsequently at the present value of the amount to be paid at settlement, accruing interest cost using the rate implicit at inception.

Conditionally redeemable instruments, first classified as equity and transferred to liabilities when the condition is satisfied, are measured at fair value at that date, with no gain or loss being recognized from the reclassification. For earnings per share computation purposes, the amount of common shares that are to be redeemed or repurchased is excluded for both basic and diluted calculations.

**Gain or loss on retirement of redeemable instruments.** If mandatorily redeemable preferred or common stock is acquired prior to the mandatory redemption date, the financial statement implications are the same as when debt is retired. Since the mandatorily redeemable shares are categorized, for financial reporting purposes, as liabilities, not equity, the usual prohibition against reporting gain or loss on capital transactions (such as retirement of treasury stock) would not be applicable. Rather, the guidance under ASC 470-50 governing debt retirement would be pertinent. Specifically, if the price paid to redeem the shares differs from the carrying value of the shares, the difference would be a gain or loss to be reported in the current period's earnings.

FASB decided against imposing new requirements to bifurcate embedded derivatives. Furthermore, to prevent the provisions of the new standard from being circumvented by the insertion for nonsubstantive or minimal features into financial instruments, any such features are to be disregarded in applying ASC 480's classification provisions.

### Mandatorily Redeemable Shares and Similar Instruments

A mandatory redemption clause requires common or preferred stock to be redeemed (retired) at a specific date(s) or upon occurrence of an event which is uncertain as to timing, although ultimately certain to occur. This feature is in contrast to callable preferred stock, which is redeemed at the issuing corporation's option. Mandatory redemption features are not uncommon in practice; closely held corporations, for example, have "buy-sell" agreements to redeem the shares of retiring or deceased owners at formula prices, often book value. Historically, the mandatory redemption feature has been ignored in determining statement of financial position classification for nonpublic companies. On the other hand, for publicly held companies, mandatorily redeemable shares (which are almost always preferred stock in these situations) had to be displayed as either debt or as a "mezzanine equity" item separate from stockholders' equity.

If the stock subject to mandatory redemption provisions represents the only shares in the reporting entity, it must, under ASC 480, report those instruments in the liabilities section of its statement of financial position, and describe them as shares subject to mandatory redemption, so as to distinguish the instruments from other financial statement liabilities.

Although mandatorily redeemable instruments may be equity in legal form, ASC 480 requires that they be reported as liabilities rather than equity instruments to the extent they represent the

issuer's obligation to transfer assets. Payments or accruals of "dividends" and other amounts to be paid to holders of such shares are to be reported as interest expense. The only exception to those rules is for shares that are required to be redeemed only upon the liquidation or termination of the issuer, since the fundamental "going concern assumption" underlying GAAP financial statements means that such an eventuality is not given recognition.

For all other financial instruments that are mandatorily redeemable, the classification, measurement, and disclosure provisions of ASC 480 were deferred *indefinitely* for nonpublic entities, pending further FASB action.<sup>1</sup>

Financial statement preparers should not presume that this application of ASC 480 will be rescinded, although that remains a possibility. There would not appear to be a conceptually sound argument for why public entities having such mandatorily redeemable instruments would be required to report these as liabilities, while granting nonpublic ones an exemption.

Note: as set forth in ASC 480-10-65, that deferral of the disclosure requirements under ASC 480, as described above, does not remove the requirements under ASC 505-10-50, which requires the disclosure of information about the pertinent rights and privileges of the various securities outstanding, including mandatory redemption requirements.

ASC 480-10-65 has also deferred indefinitely the *measurement* provisions of ASC 480, both as to the parent in consolidated financial statements and as to the subsidiary that issued the instruments that resulted in mandatorily redeemable noncontrolling interests before November 5, 2003. For those instruments, the measurement guidance for redeemable shares and noncontrolling interests under GAAP (e.g., ASC 480-10-S99) continues to apply during the deferral period. However, the *classification* provisions were not deferred.

The SEC subsequently further clarified the interaction between ASC 480 and D-98 for conditionally redeemable shares. Accounting for these shares, prior to the date on which the condition is first met, is not governed by ASC 480, but for a publicly held company the shares would not be permitted to be included in equity. A "mezzanine" classification would be acceptable until the condition is met, at which point reclassification as liabilities is necessary. Reclassification is akin to redemption, to be recognized at fair value via a charge or credit to equity, with concomitant impact on earnings per share computations in the period when the reclassification takes place. The only exception to this requirement exists in the circumstance where the redemption is required to occur only upon the liquidation or termination of the reporting entity. Since financial statements are prepared under the assumption of a going concern, it would be inconsistent to classify this type of redeemable stock as a liability. (ASC 480-10-25-4)

If on the date of adoption the redemption price is greater than the book value of the shares, the company would *recognize a liability* for the redemption price of the shares that are subject to mandatory redemption, reclassifying amounts previously recognized in equity accounts. The difference between the redemption price and amounts previously recorded in equity is reported on the income statement as a cumulative effect transition adjustment loss. If the redemption price exceeds the company's equity balance, the cumulative transition loss should be reported as an excess of liabilities over assets (a deficit in the stockholders' equity section). In the opposite case, it is reported as an excess of assets over liabilities (i.e., as positive equity).

---

<sup>1</sup> The main source of ASC 480 is FAS 150. Soon after the release of FAS 150, constituents raised questions about certain types of mandatorily redeemable instruments. In response, the FASB issued FSP FAS 150-3, which deferred the effective date of applying the provision of FAS 150 for mandatorily redeemable financial instruments of certain nonpublic entities and certain mandatorily redeemable noncontrolling interests. Per ASC 480-10-65, that deferral is currently in effect.

Shares are mandatorily redeemable if the issuer has an unconditional obligation to redeem the shares by transferring its assets at a specified or determinable date (or dates) or upon an event certain to occur (for example, the death of the holder). The obligation to transfer assets must be unconditional—that is, there is no specified event that is outside the control of the issuer that will release the issuer from its obligation. Thus, callable preferred shares, which are redeemable at the issuer's option, and convertible preferred shares, which are redeemable at the holder's option, are not mandatorily redeemable shares.

ASC 480 requires this reporting for all mandatorily redeemable financial instruments, unless the redemption is required to occur only upon the liquidation or termination of the reporting entity. The exception exists because the fundamental *going concern* assumption underlying GAAP financial reporting would be violated if a classification was imposed in GAAP financial statements that presumed or was conditioned on the reporting entity's cessation as a going concern. However, the exception under ASC 480 does not extend to mandatorily redeemable financial instruments of a consolidated subsidiary, in the consolidated financial statements of its parent entity. Since it is the *going concern* status of the reporting entity (i.e., the parent) that is of significance, the mandatory redemption feature of the subsidiary's instruments, albeit conditional, is to be reported consistent with ASC 480's provisions.

If the redemption price of mandatorily redeemable shares is greater than the book value of those shares, the company should report the excess as a deficit (equity), even though the mandatorily redeemable shares are reported as a liability.

After issuance, the amount of the liability for the mandatorily redeemable shares should be adjusted using the effective interest method if both the amount to be paid and the settlement date are fixed. If either the amount to be paid or the settlement date varies based on specified conditions, the liability is measured subsequently at the amount of cash that would be paid under the conditions specified in the contract if settlement occurred at the reporting date, recognizing the resulting change in that amount from the previous reporting date as interest cost.

If shares have a conditional redemption feature, which requires the issuer to redeem the shares by transferring its assets upon an event not certain to occur, the shares become mandatorily redeemable—and, therefore, become a liability—if that event occurs, the event becomes certain to occur, or the condition is otherwise resolved. The fair value of the shares is reclassified as a liability, and equity is reduced by that amount, recognizing no gain or loss. An assessment must be made each reporting period to ascertain whether the triggering event has yet occurred. If it has, reclassification of the conditionally mandatorily redeemable stock to liabilities must be effected.

ASC 480 offers two such examples. First, if shares are to become mandatorily redeemable upon a change in control of the issuing corporation, these remain classified within equity until that event occurs, if ever. When it does occur, the equity is reclassified to liabilities, measured at the fair value at that date, with no gain or loss recognized. Any disparity between the carrying value of the equity and the amount transferred to liabilities would therefore remain in equity as additional paid-in capital or as a reduction to paid-in capital or to retained earnings.

Another example of conditional mandatory redemption would occur when preferred stock is issued with a mandatory redemption at a date certain, say ten years hence, conditioned on the failure of the preferred stockholders to exercise the right to convert to common stock before another defined date, say five years from issuance. For the first five years, the preferred stock would be displayed as equity, since the mandatory redemption feature has yet to become activated. If the shareholders elect to exchange the preferred stock to common stock, the usual accounting for such conversions would apply. If the five-year period elapses and the preferred shares are not exchanged, the mandatory redemption provision becomes effective, and the preferred stock is to be reclassified to liabilities, measured at fair value.

Accounting for mandatorily redeemable financial instruments of a nonpublic reporting entity that are redeemable on fixed dates for amounts that are fixed or tied to an external index must be conformed to the requirements outlined above. For all other mandatorily redeemable financial instruments issued by nonpublic entities that are not SEC registrants, the classification, measurement, and disclosure provisions are deferred indefinitely. For mandatorily redeemable non-controlling interests that would not be classified by the subsidiary as liabilities (because they are redeemable only upon liquidation) but would be classified by the parent as liabilities on the consolidated statements, the classification and measurement provisions of ASC 480 are deferred indefinitely. For other mandatorily redeemable noncontrolling interests that were issued before November 5, 2003, the measurement provisions of ASC 480 were deferred indefinitely, but the classifications provisions are not deferred.

In addition to the requirement of ASC 480, expanded disclosure of mandatorily redeemable common or preferred stock is required by ASC 505-10-50. Specifically, the redemption requirements for each of the next five years must be set forth in the notes to the financial statements prepared in accordance with GAAP, if the amounts are either fixed or determinable on fixed or determinable dates. Thus, readers can interpret the cash requirements on the reporting entity in a manner similar to the drawing of inferences about other fixed commitments, such as maturities of long-term debt and lease obligations. (ASC 480-10-65-1)

#### **Example of mandatorily redeemable stock**

A major shareholder of the Atlantic Corporation swaps the company two tracts of prime real estate (Tract A and Tract B) in exchange for 10,000 shares and 5,000 shares, respectively, of \$1 par value preferred stock. Each block of stock is mandatorily redeemable within one year if Atlantic ever sells the related tract of real estate. Tract A has a fair value of \$400,000 and Tract B has a fair value of \$200,000 on the initial transaction date. Since the shares are only conditionally redeemable at this time, Atlantic records a credit to equity accounts with the following entry:

Land	600,000
Preferred stock	15,000
Additional paid-in capital	585,000

Five years later, Atlantic sells Tract A for \$550,000, which is the fair value of the land. Because the status of the shares has now changed to mandatorily redeemable, Atlantic reclassifies the related 10,000 shares as a liability, measured at their fair value on the reclassification date. Since the fair value has increased by \$150,000, Atlantic shifts an additional \$150,000 from the additional paid-in capital account to the liability account. It uses the following entry to do so:

Preferred stock	10,000
Additional paid-in capital	540,000
Liabilities—shares subject to mandatory redemption	550,000

Two years later, Atlantic sells Tract B for \$125,000, which is the fair value of the land. The status of these shares has also now changed to mandatorily redeemable, so Atlantic reclassifies the related 5,000 shares as a liability, measured at their fair value on the reclassification date. Since the fair value has decreased by \$75,000, Atlantic retains \$75,000 in the additional paid-in capital account. It uses the following entry to do so:

Preferred stock	5,000
Additional paid-in capital	120,000
Liabilities—shares subject to mandatory redemption	125,000

Note that when redemption value is based on a notion of fair value, defined in the underlying agreement, the initial recognition of the difference between this computed amount and the corresponding book value will almost inevitably result in a surplus or deficit. In other words, the promised redemption amounts, measured at transition and again at the date of each statement of financial position, will not equal the book value of the equity which is subject to redemption. This discrepancy must be reflected in stockholders' equity, even though the redeemable equity is reclassified to a liability. In effect, the redemption arrangement will result in either a residual in equity (assuming that a redemption was to fully occur at the date of the statement of financial position) or a deficit, because the agreement provides that redeeming shareholders are entitled to more or less than their respective pro rata shares of the book value of their equity claims. If the redemption price of mandatorily redeemable shares is greater than the book value of those shares, the company should report the excess as a deficit (equity), even though the mandatorily redeemable shares are reported as a liability.

Common shares that are mandatorily redeemable are not included in the denominator when computing basic or diluted earnings per share. If any amounts, including contractual (accumulated) dividends, attributable to shares that are to be redeemed or repurchased have not been recognized as interest expense, those amounts are deducted in computing income available to common shareholders (the numerator of the calculation), consistently with the "two-class" method set forth in ASC 260. The redemption requirements for mandatorily redeemable shares for each of the next five years are required to be disclosed in the notes to the financial statements.

ASC 480-10-S99 addresses concerns raised by the SEC regarding the financial statement classification and measurement of securities subject to mandatory redemption requirements or whose redemption is outside the control of the issuer. Questions also arose regarding disclosures needed to comply with SEC requirements.

These rules require securities with redemption features that are not solely within the control of the issuer to be classified outside of permanent equity. The SEC staff believes that all of the events that could trigger redemption should be evaluated separately and that the possibility that *any* triggering event that is not *solely* within the control of the issuer could occur—without regard to probability—would require the security to be classified outside of permanent equity. Determining whether an equity security is redeemable at the option of the holder or upon the occurrence of an event that is solely within the control of the issuer can be complex. Accordingly, all of the individual facts and circumstances should be considered in determining how an equity security should be classified.

ASC 480-10-S99 offers several examples of complex fact patterns to help registrants in determining whether classification as a liability or as equity would be appropriate.

For example, if a preferred security has a redemption provision stating that it may be called by the issuer upon an affirmative vote by the majority of its board of directors, but the preferred security holders control a majority of the votes of the board of directors through direct representation on the board of directors or through other rights, the preferred security is effectively redeemable at the option of the holder and its classification outside of permanent equity is required. Thus, in assessing such situations, any provision that requires approval by the board of directors cannot be assumed to be within the control of the reporting entity itself. All of the relevant facts and circumstances would have to be considered.

As another example, if a security with a deemed liquidation clause that provides that the security becomes redeemable if the stockholders of the reporting entity (those immediately prior to a merger or consolidation) hold, immediately after such merger or consolidation, stock

representing less than a majority of the voting power of the outstanding stock of the surviving corporation, this would not be permanent equity. A purchaser could acquire a majority of the voting power of the outstanding stock, without company approval, thereby triggering redemption.

Securities with provisions that allow the holders to be paid upon occurrence of events that are solely within the issuer's control should thus always be classified outside of permanent equity. Such events include:

1. The failure to have a registration statement declared effective by the SEC by a designated date
2. The failure to maintain compliance with debt covenants
3. The failure to achieve specified earnings targets
4. A reduction in the issuer's credit rating.

ASC 480-10-S99 notes that if a reporting entity issues preferred shares that are conditionally redeemable (e.g., at the holder's option or upon the occurrence of an uncertain event not solely within the company's control), the shares are not within the scope of ASC 480 because there is no unconditional obligation to redeem the shares by transferring assets at a specified or determinable date or upon an event certain to occur. If the uncertain event occurs, the condition is resolved, or the event becomes certain to occur, then the shares become mandatorily redeemable under FAS 150 and would require reclassification to a liability. Under SEC rules, however, these shares cannot be included in permanent equity, and thus would be displayed as a "mezzanine" equity category. Mezzanine capital is an SEC reporting concept that has no analog under GAAP rules.

ASC 480 requires that the issuer measure that liability initially at fair value and reduce equity by the amount of that initial measure, recognizing no gain or loss. ASC 480-10-S99 observes that this reclassification of shares to a liability is akin to the redemption of such shares by issuance of debt. Similar to the accounting for the redemption of preferred shares, to the extent that the fair value of the liability differs from the carrying amount of the preferred shares, upon reclassification that difference should be deducted from or added to net earnings available to common shareholders in the calculation of earnings per share.

### Obligations to Issue Shares

If an entity enters into a contract that requires it or permits it at its discretion to issue a variable number of shares upon settlement, that contract is recognized as a liability if at inception the monetary value of the obligation is based solely or predominantly on one of the following criteria:

1. A fixed monetary amount known at inception (e.g., a \$100,000 payable can be settled by issuing shares worth \$100,000 at the then-current market value).
2. An amount that varies based on something other than the fair value of the issuer's equity shares (for example, a financial instrument indexed to the Dow that can be settled by issuing shares worth the index-adjusted amount at the then-current market value).
3. Variations inversely related to changes in the fair value of the entity's equity shares (i.e., a written put option that could be net share settled).

Contracts that meet one of the above criteria are recognized at fair value at the date of issuance and at every measurement date afterwards. The changes in the fair value are recognized in earnings unless the contract falls within the scope of ASC 718 and that statement requires the changes to be recognized elsewhere.

## Obligations to Repurchase Shares

If an entity (the issuer) enters into a contract that obligates it to transfer assets to either repurchase its own equity shares or to pay an amount that is indexed to the price of its own shares, the contract is to be reported as a liability (or in certain cases, as an asset, if the fair value of the contract is favorable to the issuer). Examples of that type of financial instrument are written put options on the option writer's (issuer's) equity shares, and forward contracts to repurchase an issuer's own equity shares if those instruments require physical or net cash settlement. (If the repurchase obligation is a redemption feature of common or preferred shares issued, see "Mandatorily Redeemable Shares and Similar Instruments".)

ASC 480 requires that an issuer classify a financial instrument that is within its scope as a liability (or as an asset in some circumstances) because that financial instrument embodies an obligation of the issuer. ASC 480 addresses three types of freestanding financial instruments that embody obligations of the issuer: mandatorily redeemable financial instruments, obligations to repurchase the issuer's equity shares by transferring assets, and certain obligations to issue a variable number of shares. Instruments within the scope of ASC 480 should be classified and measured in accordance with ASC 480 per ASC 480-10-S99.

Written put options are measured initially and subsequently at fair value. Forward contracts are initially measured at the fair value of the shares to be repurchased (adjusted by any consideration or unstated rights or privileges) if the contract requires physical settlement for cash. The offset to the liability entry is a debit to equity. Subsequent to issuance, forward contracts are remeasured in one of two ways:

1. If both the amount to be paid and the settlement date are fixed, the contract is measured at the present value of the amount to be paid, computed using the rate implicit in the contract at inception.
2. If either the amount to be paid or the settlement date varies based on specified conditions, the contract is measured at the amount of cash that would be paid under the conditions specified in the contract if settlement occurred at the reporting date.

Under either measure, the amount of the change from the previous reporting date is recognized as interest cost.

An entity that has entered into a forward contract that requires physical settlement by repurchase of a fixed number of its equity shares of common stock in exchange for cash does not include those shares in the denominator when computing basic or diluted earnings per share. If any amounts, including contractual (accumulated) dividends, attributable to shares that are to be redeemed or repurchased have not been recognized as interest expense, those amounts are deducted in computing income available to common shareholders (the numerator of the calculation), consistently with the "two-class" method set forth in ASC 260.

Some corporations and partnerships, primarily closely held ones, issue shares or units that are redeemed at the death of the holder. If those shares or units represent the only shares or units in the entity, the entity reports those instruments as liabilities and describes them in its statement of financial position as shares (or units) subject to mandatory redemption, to distinguish them from other liabilities. The classification is unaffected by any insurance policies that the entity may have on the holders' lives. The entity presents interest expense and payments to holders of those instruments separately, apart from interest and payments to other creditors in its statements of income and cash flows. The entity also discloses that the instruments are mandatorily redeemable upon the death of the holders.

## Application of ASC 480

### Example—Obligations that require net share settlement—monetary value changes in the same direction as the fair value of the issuer’s equity shares

Tyler Corp. grants 10,000 stock appreciation rights that entitle the holder to receive a number of equity shares to be determined based on the change in the fair value of Tyler’s equity shares. At the date of the grant, the fair value of Tyler’s equity shares is \$25 per share. Subsequently, the fair value of Tyler’s equity shares increases to \$28 per share. Tyler is thus required to issue shares worth \$30,000  $[(\$28 - \$25) \times 10,000]$ , or 1,072 shares.

This financial instrument contains an obligation to issue a number of equity shares with a value equal to the appreciation of 10,000 equity shares. The number of shares to be issued, therefore, is not fixed. Classification will depend on whether the monetary value changes in the same direction as changes in the fair value of the equity shares. In this example, the monetary value changes in the same direction as changes in the fair value of the equity shares.

The increase in fair value of the equity shares from \$25 to \$28 resulted in an increase in the monetary value of the obligation from \$0 to \$30,000. If the fair value of the equity shares increases further, for example to \$30 per share, the monetary value of the obligation increases as well to \$50,000  $[(\$30 - \$25) \times 10,000]$ . If the fair value of the equity shares then decreases, for example from \$30 to \$27, the monetary value of the obligation decreases to \$20,000  $[(\$27 - \$25) \times 10,000]$ . Because the monetary value of the obligation changes in the same direction as the change in fair value of the issuer’s equity shares, this obligation does not qualify as a liability and the equity classification is prescribed.

### Example—Obligations that require net share settlement—monetary value changes in opposite direction as the fair value of the issuer’s equity shares

Harrison Corp. issues equity shares to Middleboro Co. for \$5 million (1 million shares at \$5 each). Simultaneously, Harrison enters into a financial instrument with Middleboro, under the terms of which, if the per share value of Harrison’s shares is greater than \$5 on a specified date, Middleboro will transfer shares of Harrison with a value of  $[(\text{share price} - \$5) \times 1,000,000]$  to Harrison. If the per share is less than \$5 on a specified date, Harrison transfers shares of its own equity with a value of  $[(\$5 - \text{share price}) \times 1,000,000]$  to Middleboro.

The 1,000,000 shares issued to Middleboro do not embody an obligation. They also do not convey to the issuer the right to receive cash or another financial instrument from the holder, or to exchange other financial instruments on potentially favorable terms with the holder. Therefore, the equity classification criteria are met and the component is classified as equity.

The financial instrument issued to Middleboro contains an obligation to issue a variable number of equity shares if the fair value of Harrison’s equity shares is less than \$5 on a certain date. As a result, the classification will depend upon whether the monetary value is equal to the change in fair value of a fixed number of equity shares, and whether the changes are in the same direction as the fair value of the equity shares.

The first criterion is met because the monetary value of the obligation is equal to the appreciation of a fixed number (1,000,000) of the issuer’s equity shares. However, the monetary value of the obligation changes in a direction opposite to the changes in the fair value of the issuer’s equity shares. If the fair value of the equity shares increases, the monetary value of the obligation decreases (and may in fact be reduced to zero or result in a receivable from the counterparty). If the fair value of the equity shares decreases, the monetary value of the obligation increases. Because the monetary value of the obligation does not change in the same direction as the fair value of the equity shares, criterion (b) is not met; therefore, the obligation is not classified as equity.

**Example—Written put options that require physical settlement**

Carlyle Corp. writes a put option that allows a holder, Yetta Co., to put 200 shares of Carlyle stock to Carlyle for \$33 per share on a specified date. The put option requires physical settlement (delivery of the shares and payment therefore). Because the put option requires Carlyle to transfer assets (cash) to settle the obligation, the component is classified as a liability.

**Example—Forward purchase contract that requires physical or net cash settlement**

In a fact pattern slightly at variance with the preceding example, Carlyle Corp. enters into a freestanding forward purchase arrangement with Yetta Co., under which Yetta is to transfer 200 shares of Carlyle stock to Carlyle for \$33 per share on a specified date. The forward purchase agreement requires physical settlement (delivery of the shares and payment therefore). Because the forward purchase arrangement requires Carlyle to transfer assets (cash) to settle the obligation, the component is classified as a liability. The same result would hold if the contract called for a net cash settlement. While a put option (the preceding example) requires that the liability be initially recorded, and subsequently remeasured, at fair value, the forward purchase arrangement is to be recorded at fair value, and then accreted to the present value of the forward purchase price at the date of each statement of financial position, using the implicit interest rate given by the initial fair value.

**Example—Written put options that require net share settlement**

Dragoon Corp. writes a put option that allows the holder, Zitti Corp., to put 200 shares of Dragoon stock to Dragoon for \$44 a share on a specified date. The put requires net share settlement (i.e., shares having a value equal to the spread between the option price and fair value must be delivered in settlement). Assume the fair value of the shares at the date the put is issued is \$44. The monetary value of the obligation at that time is therefore zero.

Subsequently, the fair value of Dragoon's equity shares decreases to \$36 and the put option is exercised. At this point, the monetary value of the obligation is \$1,600 [200 shares  $\times$  (\$44 – \$36)]. Dragoon would be required to issue about 45 shares (\$1,600 divided by \$36). The monetary value of the obligation increased because of a decrease in the fair value of Dragoon's equity shares. Because changes in the monetary value of the obligation are not in the same direction as changes in the fair value of Dragoon's equity shares, the component is not classified as equity, but rather as a liability. The contract is measured initially and subsequently at fair value, with changes in fair value recognized in current earnings.

**Example—Unconditional obligation that must be either redeemed for cash or settled by issuing shares**

If the reporting entity issues financial instruments that do not require the transfer of assets to settle the obligation but, instead, unconditionally require the issuer to settle the obligation either by transferring assets or by issuing a variable number of its equity shares, this may or may not create a liability. Because such instruments do not require the issuer to settle by transfer of assets, they are not automatically classified as liabilities under ASC 480. However, those instruments may still be classified as liabilities, if other stipulated conditions are met.

Assume that Zylog Corp. issues one million shares of cumulative preferred stock for cash equal to the stock's liquidation preference of \$25 per share. Under the terms, Zylog is required either to redeem the shares on the third anniversary of the issuance, for the issuance price plus any accrued but unpaid dividends, either in cash or by issuing sufficient shares of its common stock to be worth \$25 per share. This does not represent an unconditional obligation to transfer assets, and therefore the preferred stock is

not a mandatorily redeemable financial instrument as that term is defined in ASC 480. However, the stock is still a liability, because the preferred shares represent an unconditional obligation that the issuer may settle by issuing a variable number of its equity shares with monetary value that is fixed and known at inception. Because the preferred shares are liabilities, payments to holders are reported as interest cost, and accrued but not-yet-paid payments are part of the liability for the shares.

#### Example of mandatorily redeemable preferred shares

On June 1, 20X1, Verde Corporation issues 1,000 shares of mandatorily redeemable 5% preferred stock with a par value \$100 for \$110,330. The shares are redeemable at \$150 on May 31, 20X8. At issuance, Verde Corporation recognizes a liability of \$110,330.

#### Example of shares that are mandatorily redeemable at the death of the holder

Mike and Ike are equal shareholders in M&I's Auto Repair, Inc. Upon the death of either shareholder, the corporation will redeem shares of the deceased for half of the book value of the corporation. The following information would be disclosed in the notes to the financial statements:

All of the corporation's shares are subject to mandatory redemption upon death of the shareholders, and are thus reported as a liability. The liability amount consists of:

Common stock—\$100 par value, 1,000 shares authorized, issued, and outstanding	\$100,000
Undistributed earnings attributable to those shares	50,000
Accumulated other comprehensive income	(2,000)
Total liability	<u>\$148,000</u>

#### Example of mandatorily redeemable preferred shares (continued)

The effective interest rate is 8.5%. Continuing the previous example, of Verde Corporation, it would recognize the following annual interest expense and liability amounts:

	<i>Cash paid</i>	<i>Interest at 8.5% annually</i>	<i>Change in liability</i>	<i>Ending liability</i>
06/01/13				110,330
05/31/14	5,000	9,378	4,378	114,708
05/31/15	5,000	9,750	4,750	119,458
05/31/16	5,000	10,154	5,154	124,612
05/31/17	5,000	10,592	5,592	130,204
05/31/18	5,000	11,067	6,068	136,271
05/31/19	5,000	11,583	6,583	142,854
05/31/20	155,000	12,146	(142,854)	0

The entry to record the first "dividend" payment would be:

Interest expense	9,378
Liability	4,378
Cash	5,000

#### Example of a contract with a fixed monetary amount known at inception

Numer Uno Corp. purchases equipment worth \$100,000 and agrees to pay \$110,000 at the end of one year or, at its option, to issue shares worth \$112,000. The contract is recognized as a liability at issuance of \$100,000. Subsequent to issuance the liability is remeasured at the fair value of the contract, which would be the accreted value of the cash payment amount (\$110,000).

**Example of a written put option on a fixed number of shares**

Numeros Dos Corp. writes a put allowing the purchaser to sell 100 shares of Numero Dos common stock at \$20 per share in six months. The purchaser pays Numero Dos \$300 for the right to put the 100 shares. Numero Dos's common stock is currently trading at \$23. Numero Dos reports a liability of \$300. The liability is subsequently remeasured at the fair value of the put option.

**Example of a put warrant**

Caspian Corporation issues 100 bonds with detachable put warrants, each of which allows holders, after two years have elapsed, to purchase one share of Caspian's \$1 par value common stock from the company for \$20 per share, and which are puttable for a cash payment of \$5. Caspian apportions \$5 of the bond sale price to the warrants. Caspian's share price on the issuance date is \$23. At this price, warrant holders can purchase shares from Caspian for \$20 and resell them for \$23, yielding a net gain of \$3. Since this is less than the \$5 to be gained from the put feature of the warrants, this is classified as a liability, and is recorded as such with the following entry (the remaining entries for the issuance of the bond are not given here):

Cash	500	
Liabilities—puttable warrants		500

After two years, Caspian's stock price has declined to \$20, so the warrant stock purchase feature clearly has no value. Instead, a warrant holder puts 30 warrants back to the company, which requires a cash payment of \$5 for each warrant, and results in the following entry:

Liabilities—puttable warrants	150	
Cash		150

Caspian's stock price then increases to \$30, which allows warrant holders to achieve a \$10 gain if they acquire shares with their warrants for \$20. Accordingly, another warrant holder acquires shares with 50 warrants, resulting in the following entry:

Cash	1,000	
Liabilities—puttable warrants	250	
Common stock		50
Additional paid-in capital		1,200

In a separate bond issuance, Caspian again issues put warrants under the same terms, but now its stock price is \$35 at the time of bond issuance, making the warrant feature more likely to be exercised than the put feature. Accordingly, Caspian records the proceeds in equity with the following entry (again, the remaining entries recording the bond issuance are omitted):

Cash	500	
Additional paid-in capital—warrants		500

Investors use all 100 warrants to acquire shares at the \$20 exercise price. The entry follows:

Cash	2,000	
Paid-in capital—warrants	500	
Common stock		100
Additional paid-in capital		2,400

The original classification should not be changed because of subsequent economic changes in the value of the put. The value assigned to the put warrant at issuance, however, should be adjusted

to its highest redemption price, starting with the date of issuance until the earliest date of the warrants. Changes in the redemption price before the earliest put dates are changes in accounting estimates and changes after the earliest put dates should be recognized in income. If the put is classified as equity, the adjustment should be reported as a charge to retained earnings, and if the put is classified as a liability the adjustment is reported as interest expense.

Regardless of how the put is classified on the statement of financial position, the primary and fully diluted EPS should be calculated on both an equity basis (warrants will be exercised) and on a debt basis (put will be exercised) and the more dilutive of the two methods should be used.

**Example of a forward contract with a variable settlement date**

Numero Tres Corp. enters into a contract to purchase 200 shares of its subsidiary at \$25 in two years. However, if the holder of the shares dies before the settlement date, Numero Tres agrees to purchase the shares at the present value of \$25 at the settlement date computed using the then-current prime rate. The shares are currently trading at \$22. The liability to repurchase shares is initially reported at \$4,400. At each subsequent measurement date, Numero Tres would adjust the liability to the present value of \$25 at settlement date using the discount rate implicit in the contract, unless the holder of the shares had died. If the holder of the shares had died, Numero Tres would adjust the liability to the present value of \$25 at settlement date using the then-current prime rate. For example, if one year from issuance date the holder is still alive, the liability would be adjusted to \$4,690 using the 6.6% rate implicit in the agreement. The adjustment amount of \$290 would be charged to interest expense. If instead the holder had died and the prime rate was 5%, the liability would be adjusted to \$4,762 ( $\$5,000/1.05$ ) and the adjustment of \$362 would be charged to interest expense.

## PERSPECTIVE AND ISSUES

### Subtopics

ASC 505 consists of five subtopics:

- ASC 505-10, *Overall*, provides guidance on issues not addressed in the other ASC 505 subtopics

- ASC 505-20, *Stock Dividends and Stock Splits*, provides guidance for the recipient and the issuer
- ASC 505-30, *Treasury Stock*, provides guidance on an entity's repurchase of its own shares of outstanding common stock and the subsequent retirement of those shares
- ASC 505-50, *Equity-based Payments to Nonemployees*, provides guidance for the issuer and the recipient
- ASC 505-60, *Spinoffs and Reverse Spinoffs*, provides guidance on the distribution of nonmonetary assets in spinoff transactions.

### Scope and Scope Exceptions

Guidance in ASC 505 generally applies to all entities unless more specific guidance is provided in other Topics. (ASC 505-10-15-1) Specific exceptions follow.

ASC 505-20 applies to corporations and their stock dividends and stock splits, except it does *not* apply to:

- Distribution or issuance of shares of another corporation
  - Shares of a different class
  - Rights to subscribe for additional shares, and shares of the same class where each shareholder is given an election to receive cash or shares.
- (ASC 505-20-15-1 through 3)

ASC 505-50 does *not* apply to share-based payment transactions in exchange for goods or services and modifications of existing arrangements. The guidance does not apply to:

- Transaction with employees,
  - ESOPs, and
  - Equity instruments issued to a lender or investor that provides financing to the issuer or issued in a business combination.
- (ASC 505-50-15-2 and 15-3)

ASC 505-60 does *not* apply to nonmonetary assets that do not constitute a business. (ASC 505-60-15-3)

### Overview

CON 6 defines stockholders' equity as the residual interest in the assets of an entity after deducting its liabilities. Stockholders' equity is comprised of all capital contributed to the entity plus its accumulated earnings less any distributions that have been made. There are three major categories within the equity section:

- Paid-in capital. Paid-in capital represents equity contributed by owners.
- Retained earnings. Retained earnings represents the sum of all earnings less those not retained in the business (i.e., what has been paid out as dividends).
- Other comprehensive income. Other comprehensive income represents changes in net assets, other than by means of transactions with owners, which have not been reported in earnings under applicable GAAP rules (e.g., accumulated translation gains or losses).

Earnings are not generated by transactions in an entity's own equity (e.g., by the issuance, reacquisition, or reissuance of its common or preferred shares). Depending on the laws of the jurisdiction of incorporation, distributions to shareholders may be subject to various limitations, such as to the amount of retained (accounting basis) earnings.

A major objective of the accounting for stockholders' equity is the adequate disclosure of the sources from which the capital was derived. For this reason, a number of different paid-in capital accounts may be presented in the statement of financial position. The rights of each class of shareholder must be disclosed. Where shares are reserved for future issuance, such as under the terms of stock option plans, this fact must also be made known.

## DEFINITIONS OF TERMS

---

Source: ASC 505, *Glossary Sections*. Also see Appendix, *Definition of Terms*, for additional terms relevant to this chapter: Business, Component of an Entity, Contract, Customer, Employee, Fair Value (3rd definition), Market Participants, Operating Segment, Orderly Transaction, Related Parties, Reporting Unit, and Security.

**Bankruptcy Code.** A federal statute, enacted October 1, 1979, as title 11 of the United States Code by the Bankruptcy Reform Act of 1978, that applies to all cases filed on or after its enactment and that provides the basis for the current federal bankruptcy system.

**Claim.** As defined by Section 101(4) of the Bankruptcy Code, a right to payment, regardless of whether the right is reduced to judgment, liquidated, unliquidated, fixed, contingent, matured, unmatured, disputed, undisputed, legal, secured, or unsecured, or a right to an equitable remedy for breach of performance if such breach results in a right to payment, regardless of whether the right is reduced to a fixed, contingent, matured, unmatured, disputed, undisputed, secured, or unsecured right.

**Counterparty Performance Conditions.** Conditions that relate to the achievement of a specified performance target, for example attaining a specified increase in market share for a specified product. A counterparty performance condition might pertain either to the performance of the entity as a whole or to some part of the entity, such as a division.

**Market Condition.** A condition affecting the exercise price, exercisability, or other pertinent factors used in determining the fair value of an award under a share-based payment arrangement that relates to the achievement of either of the following:

- a. A specified price of the issuer's shares or a specified amount of intrinsic value indexed solely to the issuer's shares
- b. A specified price of the issuer's shares in terms of a similar (or index of similar) equity security (securities). The term similar as used in this definition refers to an equity security of another entity that has the same type of residual rights. For example, common stock of one entity generally would be similar to the common stock of another entity for this purpose.

**Participation Rights.** Contractual rights of security holders to receive dividends or returns from the security issuer's profits, cash flows, or returns on investments.

**Preferred Stock.** A security that has preferential rights compared to common stock.

**Reload Feature and Reload Option.** A reload feature provides for automatic grants of additional options whenever an employee exercises previously granted options using the entity's shares, rather than cash, to satisfy the exercise price. At the time of exercise using shares, the employee is automatically granted a new option, called a reload option, for the shares used to exercise the previous option.

**Reverse Spinoff.** A spinoff of a subsidiary to an entity's shareholders in which the legal form of the transaction does not match its substance such that the new legal spun-off entity (the spinnee) will be the continuing entity.

**Share-based Payment Transactions.** A transaction under a share-based payment arrangement, including a transaction in which an entity acquires goods or services because related parties or other holders of economic interests in that entity awards a share-based payment to an employee or other supplier of goods or services for the entity's benefit. Also called share-based compensation transactions.

**Spinoff.** The transfer of assets that constitute a business by an entity (the spinoff) into a new legal spun-off entity (the spinnee), followed by a distribution of the shares of the spinnee to its shareholders, without the surrender by the shareholders of any stock of the spinoff.

**Stock Dividend.** An issuance by a corporation of its own common shares to its common shareholders without consideration and under conditions indicating that such action is prompted mainly by a desire to give the recipient shareholders some ostensibly separate evidence of a part of their respective interests in accumulated corporate earnings without distribution of cash or other property that the board of directors deems necessary or desirable to retain in the business. A stock dividend takes nothing from the property of the corporation and adds nothing to the interests of the stockholders; that is, the corporation's property is not diminished and the interests of the stockholders are not increased. The proportional interest of each shareholder remains the same.

**Stock Split.** An issuance by a corporation of its own common shares to its common shareholders without consideration and under conditions indicating that such action is prompted mainly by a desire to increase the number of outstanding shares for the purpose of effecting a reduction in their unit market price and, thereby, of obtaining wider distribution and improved marketability of the shares. Sometimes called a stock split-up.

**Terms of a Share-based Payment Award.** The contractual provisions that determine the nature and scope of a share-based payment award. For example, the exercise price of share options is one of the terms of an award of share options. The written terms of a share-based payment award and its related arrangement, if any, usually provide the best evidence of its terms, but an entity's past practice or other factors may indicate that some aspects of the substantive terms differ from the written terms. The substantive terms of a share-based payment award as those terms are mutually understood by the entity and a party (either an employee or a nonemployee) who receives the award provide the basis for determining the rights conveyed to a party and the obligations imposed on the issuer, regardless of how the award and related arrangement, if any, are structured.

## CONCEPTS, RULES, AND EXAMPLES

---

### Legal Capital and Capital Stock

Legal capital typically refers to that portion of the stockholders' investment in a corporation that is permanent in nature and represents assets that will continue to be available for the satisfaction of creditor's claims. Traditionally, legal capital was comprised of the aggregate par or stated value of common and preferred shares issued. In recent years, however, many states have eliminated the requirement that corporate shares have a designated par or stated value. States that have adopted provisions of the Model Business Corporation Act<sup>1</sup> have eliminated the distinction between par value and the amount contributed in excess of par.

---

<sup>1</sup> The Model Business Corporation Act is a model created by the American Bar Association's Committee on Corporate Law and first published in 1950. It has since been extensively revised and is adopted in various forms in the majority of states.

The specific requirements regarding the preservation of legal capital are a function of the business corporation laws in the state in which a particular entity is incorporated. Accordingly, any action by the corporation that could affect the amount of legal capital (e.g., the payment of dividends in excess of retained earnings) must be considered in the context of the relevant laws of the state where the company is chartered.

Ownership interest in a corporation is made up of common and, optionally, preferred shares. The common shares represent the residual risk-taking ownership of the corporation after the satisfaction of all claims of creditors and senior classes of equity.

**Preferred stock.** Preferred shareholders are owners who have certain rights superior to those of common shareholders. Preferences as to earnings exist when the preferred shareholders have a stipulated dividend rate (expressed either as a dollar amount or as a percentage of the preferred stock's par or stated value). Preferences as to assets exist when the preferred shares have a stipulated liquidation value. If a corporation were to liquidate, these preferred holders would be paid a specific amount before the common shareholders would have a right to participate in any of the proceeds.

In practice, preferred shares are more likely to have preferences as to earnings than as to assets. Although unusual, preferred shares may have both preferential rights. Preferred shares may also have the following optional features:

- participation in earnings beyond the stipulated dividend rate;
- the cumulative feature, ensuring that dividends in arrears, if any, will be fully satisfied before the common shareholders participate in any earnings distribution; and
- convertibility or callability by the corporation.

Preferences must be disclosed adequately in the financial statements, either on the face of the statement of financial position or in the notes thereto.

In exchange for the preferences, the preferred shareholders' other rights or privileges are often limited. For instance, the right to vote may be restricted to common shareholders. The most important right denied to the preferred shareholders, however, is the right to participate without limitation in the earnings of the corporation. Thus, if the corporation has exceedingly large earnings for a particular period, most of these earnings would accrue to the benefit of the common shareholders. This statement is true even if the preferred stock is participating (a fairly uncommon feature) because participating preferred stock usually has some upper limitation placed upon the extent of participation.

Occasionally, several classes of stock will be categorized as common (e.g., Class A common, Class B common, etc.). Since there can be only one class of shares that represents the true residual risk-taking ownership in a corporation, it is clear that the other classes, even though described as common shareholders, must in fact have some preferential status. Typically, these preferences relate to voting rights. An example of this situation arises when a formerly closely held corporation sells shares to the public but gives the publicly held shares a disproportionately small capacity to exercise influence over the entity, thereby keeping control in the hands of the former majority owners even as they are reduced to the status of minority owners. The rights and responsibilities of each class of shareholder, even if described as common, must be fully disclosed in the financial statements.

**Issuance of shares.** The accounting for the sale of shares by a corporation depends upon whether the stock has a par or stated value. If there is a par or stated value, the amount of the proceeds representing the aggregate par or stated value is credited to the common or preferred stock account. The aggregate par or stated value is generally defined as legal capital not subject to distribution to shareholders. Proceeds in excess of par or stated value are credited to an additional paid-in capital account. The additional paid-in capital represents the amount in excess of the legal capital that may, under certain defined conditions, be distributed to shareholders.

A corporation selling stock below par value credits the capital stock account for the par value and debits an offsetting discount account for the difference between par value and the amount actually received. If the discount is on original issue capital stock, it serves to notify the actual and potential creditors of the contingent liability of those investors. As a practical matter, corporations avoid this problem by reducing par values to an arbitrarily low amount. This reduction in par eliminates the chance that shares would be sold for amounts below par.

Where the Model Business Corporation Act has been adopted or where corporation laws have been conformed to the guidelines of that Act, there is often no distinction made between par value and amounts in excess of par. In those jurisdictions, the entire proceeds from the sale of stock may be credited to the common stock account without distinction between the stock and the additional paid-in capital accounts. The following example illustrates these concepts:

#### **Example—Treatment of par and no-par stock in a stock sale**

**Facts:** A corporation sells 100,000 shares of \$5 par common stock for \$8 per share cash.

Cash	800,000
Common stock	500,000
Additional paid-in capital	300,000

**Facts:** A corporation sells 100,000 shares of no-par common stock for \$8 per share cash.

Cash	800,000
Common stock	800,000

Preferred stock will often be assigned a par value because in many cases the preferential dividend rate is defined as a percentage of par value (e.g., 10%, \$25 par value preferred stock will have a required annual dividend of \$2.50).

**Stock issued in exchange for property or services.** If the shares in a corporation are issued in exchange for services or property rather than for cash, the transaction should be reflected at the fair value of the property or services received. If this information is not readily available, then the transaction should be recorded at the fair value of the shares that were issued. Where necessary, appraisals should be obtained in order to properly reflect the transaction. As a final resort, a valuation of the stock issued can be made by the board of directors.

**Stock issued to employees for services.** Stock issued to employees as compensation for services rendered should be accounted for at the fair value of the services performed, if determinable, or the value of the shares issued. If shares are given by a major shareholder directly to an employee for services performed for the entity, this exchange should be accounted for as a capital contribution to the company by the major shareholder and as compensation expense incurred by the company. Only when accounted for in this manner will there be conformity with the general principle that all costs incurred by an entity, including compensation, should be reflected in its financial statements.

**Lump-sum sales.** In certain instances, two or more classes of securities may be issued to investors as a unit (e.g., one share of preferred and two shares of common sold as a package). There are two methods of allocating the proceeds among the classes of stock:

- The proportional method, and
- The incremental method.

Where each of the classes of stock are publicly traded, the entity should use the proportional method. The proceeds from a unit offering should be allocated in proportion to the relative market values of the securities. If the entity cannot determine the fair value of all the classes of securities, then the incremental method should be used. The proceeds should be allocated to the securities that are publicly traded based on known fair value. Any excess is allocated to the other. Where the market value of neither security is known, appraisal information may be used. The imputed fair value of one class of security, particularly the preferred shares, can be based upon the stipulated dividend rate. In this case, the amount of proceeds remaining after the imputing of a value of the preferred shares would be allocated to the common stock.

**Issuance costs.** Equity offerings generally involve the incurrence of various costs, such as legal and accounting fees and underwriting commissions. These are offset against the proceeds of the offering, generally reducing paid-in capital, which is thus reported net of costs. If a unit offering involves debt and equity, the offering costs should be allocated proportionally against equity and debt, possibly creating a discount on the debt issuance that will be amortized as additional interest expense in the usual manner. (See the chapter on ASC 470 for a full discussion of accounting for premium or discount on debt.)

**Promise to register.** In certain situations, equity (or debt) is issued with a promise by the reporting entity to effect registration of the instruments by a defined date after issuance, or upon the occurrence of a contingent event. Per ASC 825-20, such obligations are recognized and measured consistent with the requirements of ASC 450, which does not alter the accounting for the associated financial instrument itself.

### Stock Subscriptions

Occasionally, particularly in the case of a newly organized corporation, a contract is entered into between the corporation and prospective investors, whereby the investors agree to purchase specified numbers of shares to be paid for over some installment period. These stock subscriptions are not the same as actual stock issuances and the accounting differs.

The amount of stock subscriptions receivable by a corporation is occasionally accounted for as an asset on the statement of financial position and is categorized as current or noncurrent in accordance with the terms of payment. However, in accordance with SEC requirements, entities are required to use a contra equity account approach. Since subscribed shares do not have the rights and responsibilities of actual outstanding stock, the credit is made to a stock subscribed account instead of to the capital stock accounts.

ASC 505-10-45-2 states that a contribution to a company's equity made in the form of a note receivable should generally not be reported as an asset except on the very limited circumstances when there is substantial evidence of both the ability and intent to pay in a reasonably short period of time. Public companies may want to refer to ASC 210-10-S99-1, paragraphs 27 through 29. The ASC notes that the most widespread practice is to report these notes as a reduction of equity. However, if the cash is received prior to the issuance of the financial statements, the note may be reported as an asset. For more on subsequent events, see the chapter on ASC 855.

If the common stock has par or stated value, the common stock subscribed account is credited for the aggregate par or stated value of the shares subscribed. The excess over this amount is credited to additional paid-in capital. No distinction is made between additional paid-in capital relating to shares already issued and shares subscribed for. This treatment follows from the distinction between legal capital and additional paid-in capital. Where there is no par or stated value, the entire amount of the common stock subscribed is credited to the stock subscribed account.

As the amount due from the prospective shareholders is collected, the stock subscriptions receivable account is credited and the proceeds are debited to the cash account. Actual issuance of the shares, however, must await the complete payment of the stock subscription. Accordingly, the debit to common stock subscribed is not made until the subscribed shares are fully paid for and the stock is issued.

The following examples illustrate these concepts.

#### Examples of stock subscription transactions

- 10,000 shares of \$50 par preferred are subscribed at a price of \$65 each; a 10% down payment is received.

Cash	65,000
Stock subscriptions receivable	585,000
Preferred stock subscribed	500,000
Additional paid-in capital	150,000

- 2,000 shares of no-par common shares are subscribed at a price of \$85 each, with one-half received in cash.

Cash	85,000
Stock subscriptions receivable	85,000
Common stock subscribed	170,000

- All preferred subscriptions are paid and subscribed preferred shares are issued, and one-half of the remaining common subscriptions are collected in full.

Cash [\$585,000 + (\$85,000 × .50)]	627,500
Stock subscriptions receivable	627,500
Preferred stock subscribed	500,000
Preferred stock	500,000

- The remaining common subscriptions are collected in full.

Cash (\$85,000 × .50)	42,500
Stock subscriptions receivable	42,500
Common stock subscribed	170,000
Common stock	170,000

When a subscriber defaults on an obligation under a stock subscription agreement, the accounting will follow the provisions of the state in which the corporation is chartered. In some jurisdictions, the subscriber is entitled to a proportionate number of shares based upon the amount already paid on the subscriptions, sometimes reduced by the cost incurred by the corporation in selling the remaining defaulted shares to other stockholders. In other jurisdictions, the subscriber forfeits the entire investment upon default. In this case, the amount already received is credited to an additional paid-in capital account that describes its source.

#### Additional Paid-in Capital

Additional paid-in capital represents all capital contributed to a corporation other than that defined as par, stated value, no-par stock, or donated capital. Additional paid-in capital can arise

from proceeds received from the sale of common and preferred shares in excess of their par or stated values. It can also arise from transactions related to the following:

1. Sale of shares previously issued and subsequently reacquired by the corporation (treasury stock)
2. Retirement of previously outstanding shares
3. Payment of stock dividends in a manner that justifies the dividend being recorded at the market value of the shares distributed
4. Lapse of stock purchase warrants or the forfeiture of stock subscriptions, if these result in the retaining by the corporation of any partial proceeds received prior to forfeiture
5. Warrants which are detachable from bonds
6. Conversion of convertible bonds
7. Other “gains” on the entity’s own stock, such as that which results from certain stock option plans.

When the amounts are material, the sources of additional paid-in capital should be described in the financial statements.

#### **Examples of additional paid-in capital transactions**

ABC Company issues 2,000 shares of common stock having a par value of \$1, of a total price of \$8,000. The following entry records the transaction:

Cash	8,000
Common stock	2,000
Additional paid-in capital	6,000

ABC Company buys back 2,000 shares of its own common stock for \$10,000 and then sells these shares to investors for \$15,000. The following entries record the buyback and sale transactions, respectively, assuming the use of the cost method of accounting for treasury stock:

Treasury stock	10,000
Cash	10,000
Cash	15,000
Treasury stock	10,000
Additional paid-in capital	5,000

ABC Company buys back 2,000 shares of its own \$1 par value common stock (which it had originally sold for \$8,000) for \$9,000 and retires the stock, which it records with the following entry:

Common stock	2,000
Additional paid-in capital	6,000
Retained earnings	1,000
Cash	9,000

ABC Company issues a small stock dividend of 5,000 common shares at the market price of \$8 per share. Each share has a par value of \$1. The following entry records the transaction:

Retained earnings	40,000
Common stock	5,000
Additional paid-in capital	35,000

ABC Company previously has recorded \$1,000 of stock options outstanding as part of a compensation agreement. The options expire a year later, resulting in the following entry:

Stock options outstanding	1,000
Additional paid-in capital	1,000

ABC Company sells 2,000 of par \$1,000 bonds, as well as 2,000 attached warrants having a market value of \$15 each. Pro rata apportionment of the \$2,000,000 cash received between the bonds and warrants results in the following entry:

Cash	2,000,000
Discount on bonds payable	29,557
Bonds payable	2,000,000
Additional paid-in capital—warrants	29,557

ABC's bondholders convert a \$1,000 bond with an unamortized premium of \$40 and a market value of \$1,016 into 127 shares of \$1 par common stock whose market value is \$8 per share. This results in the following entry:

Bonds payable	1,000
Premium on bonds payable	40
Common stock	913
Additional paid-in capital	127

When the amounts are material, the sources of additional paid-in capital should be described in the financial statements.

### Donated Capital

Donated capital can result from an outright gift to the corporation (e.g., a major shareholder donates land or other assets to the company in a nonreciprocal transfer) or may result when services are provided to the corporation. Under ASC 958-605-25-2 such nonreciprocal transactions are recognized as revenue in the period the contribution is received. Donated capital should be adequately disclosed in the financial statements.

Donations should be reflected in the income statement, which means that, after the fiscal period has ended and the books have been closed, the effect of donations will be incorporated in the reporting entity's retained earnings.

In the case of donations, historical cost is not adequate to properly reflect the substance of the transaction, since the historical cost to the corporation would be zero. Accordingly, these events should be reflected at fair market value. (ASC 845-10-30-1) If long-lived assets are donated to the corporation, they should be recorded at their fair value at the date of donation. The amount so recorded should then be depreciated over the normal useful economic life of those assets. If donations are conditional in nature, they should not be reflected formally in the accounts until the appropriate conditions have been satisfied. However, disclosure might still be required in the financial statements of both the assets donated and the conditions required to be met.

#### Example of donated capital

A board member of the for-profit Adirondack Boys' Club (ABC) donates land to the organization that has a fair market value of \$1 million. ABC records the donation with the following entry:

Land	1,000,000
Revenue—donations	1,000,000

The same board member donates one year of accounting labor to ABC. The fair value of services rendered is \$75,000. ABC records the donation with the following entry:

Salaries—accounting department	75,000
Revenue—donations	75,000

The board member also donates one year of free rent of a local building to ABC. The annual rent in similar facilities is \$45,000. ABC records the donation with the following entry:

Rent expense	45,000
Revenue—donations	45,000

Finally, the board member pays off a \$100,000 debt owed by ABC. ABC records the donation with the following entry:

Notes payable	100,000
Revenue—donations	100,000

Following the closing of the fiscal period, the effect of all the foregoing donations will be reflected in Adirondack's retained earnings account.

### Retained Earnings

Legal capital, additional paid-in capital, and donated capital collectively represent the contributed capital of the corporation. The other major source of capital is retained earnings, which represents the accumulated amount of earnings of the corporation from the date of inception (or from the date of reorganization) less the cumulative amount of distributions made to shareholders and other charges to retained earnings (e.g., from treasury stock transactions). The distributions to shareholders generally take the form of dividend payments but may take other forms as well, such as the reacquisition of shares for amounts in excess of the original issuance proceeds. The key events impacting retained earnings are:

- Dividends
- Certain treasury stock resales at amounts below acquisition cost
- Certain stock retirements at amounts in excess of book value
- Prior period adjustments
- Recapitalizations and reorganizations.

#### Examples of retained earnings transactions

Merrimack Corporation declares a dividend of \$84,000, which it records with the following entry:

Retained earnings	84,000
Dividends payable	84,000

Merrimack acquires 3,000 shares of its own \$1 par value common stock for \$15,000, and then resells it for \$12,000. The following entries record the buyback and sale transactions respectively, assuming the use of the cost method of accounting for treasury stock:

Treasury stock	15,000
Cash	15,000
Cash	12,000
Retained earnings	3,000
Treasury stock	15,000

Merrimack buys back 12,000 shares of its own \$1 par value common stock (which it had originally sold for \$60,000) for \$70,000 and retires the stock, which it records with the following entry:

Common stock	12,000
Additional paid-in capital	48,000
Retained earnings	10,000
Cash	
	70,000

Merrimack's accountant makes a mathematical mistake in calculating depreciation, requiring a prior period reduction of \$30,000 to the accumulated depreciation account, and corresponding increases in its income tax payable and retained earnings accounts. Merrimack's income tax rate is 35%. It records this transaction with the following entry:

Accumulated depreciation	30,000
Income taxes payable	10,500
Retained earnings	19,500

Retained earnings are also affected by action taken by the corporation's board of directors. Appropriation serves disclosure purposes and restricts dividend payments, but does nothing to provide any resources for the satisfaction of the contingent loss or other underlying purpose for which the appropriation has been made. Any appropriation made from retained earnings must eventually be returned to the retained earnings account. It is not permissible to charge losses against the appropriation account nor is it to credit any realized gain to that account. The use of appropriated retained earnings has diminished significantly over the years.

If a series of operating losses have been incurred or distributions to shareholders in excess of accumulated earnings have been made, and if there is a debit balance in retained earnings, the account is generally referred to as accumulated deficit.

## Dividends

Dividends are the pro rata distribution of earnings to the owners of the corporation. The amount and the allocation between the preferred and common shareholders is a function of:

- the stipulated preferential dividend rate;
- the presence or absence of:
  - a participation feature,
  - a cumulative feature, and
  - arrearages on the preferred stock; and
- the wishes of the board of directors. Dividends, even preferred stock dividends, where a cumulative feature exists, do not accrue.

Dividends only become a liability of the corporation when declared by the board of directors.

Traditionally, corporations were not allowed to declare dividends in excess of the amount of retained earnings. Alternatively, a corporation could pay dividends out of retained earnings and additional paid-in capital but could not exceed the total of these categories (i.e., they could not impair legal capital by the payment of dividends). States that have adopted the Model Business Corporation Act grant more latitude to the directors. Corporations can now, in certain jurisdictions, declare and pay dividends in excess of the book amount of retained earnings if the directors conclude that, after the payment of such dividends, the fair value of the corporation's net assets will still be a positive amount. Thus, directors can declare dividends out of unrealized appreciation that, in certain industries, can be a significant source of dividends beyond the realized and recognized accumulated

earnings of the corporation. This action, however, represents a major departure from traditional practice and demands both careful consideration and adequate disclosure.

Three important dividend dates are:

1. The declaration date, when a legal liability is incurred by the corporation
2. The record date, the point in time when a determination is made as to which specific registered stockholders will receive dividends and in what amounts
3. The payment date, to the date when the distribution of the dividend takes place.

These concepts are illustrated in the following example:

#### Example of dividends

On May 1, 20X1, the directors of River Corp. declared a \$.75 per share quarterly dividend on River Corp.'s 650,000 outstanding common shares. The dividend is payable May 25 to holders of record May 15.

May 1	Retained earnings (or dividends)	487,500	
	Dividends payable	487,500	
May 15	No entry		
May 25	Dividends payable	487,500	
	Cash	487,500	

If a dividends account is used, it is closed to retained earnings at year-end.

Occasionally, what appear to be disproportionate dividend distributions are paid to some, but not all, of the owners of closely held corporations. Such transactions need to be carefully analyzed. In some cases these may actually represent compensation paid to the recipients. In other instances, these may be a true dividend paid to all shareholders on a pro rata basis, to which certain shareholders have waived their rights. If the former, the distribution should not be accounted for as a dividend. It should be accounted for as compensation or some other expense category and included on the income statement. If the latter, the dividend should be "grossed up" to reflect payment on a proportional basis to all the shareholders, with an offsetting capital contribution to the company recognized as having been effectively made by those to whom payments were not made.

Dividends may be made in the form of cash, property, or scrip:

- *Cash dividends* are either a given dollar amount per share or a percentage of par or stated value.
- *Property dividends* consist of the distribution of any assets other than cash (e.g., inventory or equipment).
- *Scrip dividends* are promissory notes due at some time in the future, sometimes bearing interest until final payment is made.

**Property dividends.** If property dividends are declared, the paying corporation may incur a gain or loss. Since the dividend should be reflected at the fair value of the assets distributed, the difference between fair value and book value is recorded at the time the dividend is declared and charged or credited to a loss or gain account.

**Scrip dividends.** If a corporation declares a dividend payable in scrip that is interest bearing, the interest is accrued over time as a periodic expense. The interest is not a part of the dividend itself.

**Liquidating dividends.** Liquidating dividends are not distributions of earnings, but rather a return of capital to the investing shareholders. A liquidating dividend is normally recorded by the declarer through charging additional paid-in capital rather than retained earnings. The exact accounting for a liquidating dividend is affected by the laws of the states where the business is incorporated.

**Stock dividends.** Stock dividends represent neither an actual distribution of the assets of the corporation nor a promise to distribute those assets. For this reason, a stock dividend is not considered a legal liability or a taxable transaction.

Despite the recognition that a stock dividend is not a distribution of earnings, the accounting treatment of relatively insignificant stock dividends (defined as being less than 20% to 25% of the outstanding shares prior to declaration) is consistent with it being a real dividend. Accordingly, retained earnings are debited for the fair market value of the shares to be paid as a dividend, and the capital stock and additional paid-in capital accounts are credited for the appropriate amounts based upon the par or stated value of the shares, if any. A stock dividend declared but not yet paid is classified as such in the stockholders' equity section of the statement of financial position. Because a stock dividend never reduces assets, it cannot be a liability.

The selection of 20% to 25% as the threshold for recognizing a stock dividend as an earnings distribution is arbitrary, but it is based somewhat on the empirical evidence that small stock dividends tend not to result in a reduced market price per share for outstanding shares. The aggregate value of the outstanding shares should not change, but the greater number of shares outstanding after the stock dividend should necessitate a lower per share price. As noted, however, the declaration of small stock dividends tends not to have this impact, and this phenomenon supports the accounting treatment.

On the other hand, when stock dividends are larger in magnitude, it is observed that per-share market value declines after the declaration of the dividend. In such situations, it would not be valid to treat the stock dividend as an earnings distribution. Rather, logic suggests that it should be accounted for as a split. The precise treatment depends upon the legal requirements of the state of incorporation and upon whether the existing par value or stated value is reduced concurrent with the stock split.

If the par value is not reduced for a large stock dividend and if state law requires that earnings be capitalized in an amount equal to the aggregate of the par value of the stock dividend declared, the event should be described as a stock split effected in the form of a dividend, with a charge to retained earnings and a credit to the common stock account for the aggregate par or stated value. When the par or stated value is reduced in recognition of the split and state laws do not require treatment as a dividend, there is no formal entry to record the split but merely a notation that the number of shares outstanding has increased and the per share par or stated value has decreased accordingly. It should be noted that many companies account for stock splits as if they were a large stock dividend. By doing this, par value per share remains unchanged. The concepts of small versus large stock dividends are illustrated in the following examples.

#### Example of small stock dividend

Assume that stockholders' equity for the Wasatch Corp. on November 1, 20X1, is as follows.

Common stock, \$1 par, 100,000 shares outstanding	\$ 100,000
Paid-in capital in excess of par	1,100,000
Retained earnings	750,000

**Small stock dividend:** On November 10, 20X1, the directors of Wasatch Corp. declared a 15% stock dividend, or a dividend of 1.5 shares of common stock for every 10 shares held. Before the stock

dividend, the stock is selling for \$23 per share. After the 15% stock dividend, each original share worth \$23 will become 1.15 shares, each with a value of \$20 (\$23/1.15). The stock dividend is to be recorded at the market value of the new shares issued, or \$300,000 (15,000 new shares at the postdividend price of \$20). The entries to record the declaration of the dividend and the issuance of stock (on November 30) by Wasatch Corp. are as follows:

Nov. 10	Retained earnings	300,000	
	Stock dividends distributable	15,000	
	Paid-in capital in excess of par	285,000	
Nov. 30	Stock dividends distributable	15,000	
	Common stock, \$1 par	15,000	

**Large stock dividend:** Because the focus of the Committee on Accounting Procedure was on small stock dividends, the accounting requirements for governing large stock dividends are less specific than those for small stock dividends. In practice, ASC 505-20-30-3 results in the par or stated value of the newly issued shares being transferred to the capital stock account from either retained earnings or paid-in capital in excess of par.

#### Example of large stock dividend

On November 10, 20X1, Wasatch Corp. declares a 50% large stock dividend, a dividend of one share for every two held. Legal requirements call for the transfer to capital stock of an amount equal to the par value of the shares issued. Entries for the declaration on November 10 and the issuance of 50,000 new shares ( $100,000 \times .50$ ) on November 30 are as follows:

Nov. 10	Retained earnings	50,000	50,000
	Stock dividends distributable		
Or			
	Paid-in capital in excess of par	50,000	50,000
	Stock dividends distributable		
Nov. 30	Stock dividends distributable	50,000	50,000
	Common stock, \$1 par		

**Distributions to shareholders having cash and stock components.** If a corporation makes a distribution to shareholders that allows them to elect to receive their distribution in either cash or shares of an equivalent value, and there is a limitation on the total amount of cash that shareholders can receive, then the stock portion of the distribution is considered a share issuance, not a stock dividend.

#### ASC 505-30, Treasury Stock

Treasury stock consists of a corporation's own stock that has been issued, subsequently reacquired by the firm, and not yet reissued or canceled. Treasury stock does not reduce the number of shares issued but does reduce the number of shares outstanding, as well as total stockholders' equity. These shares are not eligible to receive cash dividends. Treasury stock is not an asset although, in some very limited circumstances, it may be presented as an asset if adequately disclosed. (ASC 505-30-30) Reacquired stock that is awaiting delivery to satisfy a liability created by the firm's compensation plan or reacquired stock held in a profit-sharing trust is still considered outstanding and would not be considered treasury stock. In each case, the stock would be

presented as an asset with the accompanying footnote disclosure. Accounting for excesses and deficiencies on treasury stock transactions is governed by ASC 505-30-30.

Three approaches exist for the treatment of treasury stock:

- cost,
- par value, and
- constructive retirement.

**Cost method.** Under the cost method, the gross cost of the shares reacquired is charged to a contra equity account (treasury stock). The equity accounts that were credited for the original share issuance (common stock, paid-in capital in excess of par, etc.) remain intact. When the treasury shares are reissued, proceeds in excess of cost are credited to a paid-in capital account. Any deficiency is charged to retained earnings (unless paid-in capital from previous treasury share transactions exists, in which case the deficiency is charged to that account, with any excess charged to retained earnings). If many treasury stock purchases are made, a cost flow assumption (e.g., first-in, first-out [FIFO] or specific identification) should be adopted to compute excesses and deficiencies upon subsequent share reissuances. The advantage of the cost method is that it avoids identifying and accounting for amounts related to the original issuance of the shares and is, therefore, the simpler, more frequently used method.

The cost method is most consistent with the one-transaction concept. This concept takes the view that the classification of stockholders' equity should not be affected simply because the corporation was the middle "person" in an exchange of shares from one stockholder to another. In substance, there is only a transfer of shares between two stockholders. Since the original balances in the equity accounts are left undisturbed, the cost method is most acceptable when the firm acquires its stock for reasons other than its retirement, or when its ultimate disposition has not yet been decided.

**Par value method.** Under the par value method, the treasury stock account is charged only for the aggregate par (or stated) value of the shares reacquired. Other paid-in capital accounts (excess over par value, etc.) are relieved in proportion to the amounts recognized upon the original issuance of the shares. The treasury share acquisition is treated almost as a retirement. However, the common (or preferred) stock account continues at the original amount, thereby preserving the distinction between an actual retirement and a treasury share transaction.

When the treasury shares accounted for by the par value method are subsequently resold, the excess of the sale price over par value is credited to paid-in capital. A reissuance for a price below par value does not create a contingent liability for the purchaser. It is only the original purchaser who risks this obligation to the entity's creditors.

**Constructive retirement method.** The constructive retirement method is similar to the par value method, except that the aggregate par (or stated) value of the reacquired shares is charged to the stock account rather than to the treasury stock account. This method is superior when:

1. it is management's intention not to reissue the shares within a reasonable time period, or
2. the state of incorporation defines reacquired shares as having been retired.

In the latter case, the constructive retirement method is probably the only method of accounting for treasury shares that is not inconsistent with the state Business Corporation Act, even if the state law does not necessarily dictate such accounting. Certain states require that treasury stock be accounted for by this method.

The two-transaction concept is most consistent with the par value and constructive retirement methods. First, the reacquisition of the firm's shares is viewed as constituting a contraction of its

capital structure. Second, the reissuance of the shares is the same as issuing new shares. There is little difference between the purchase and subsequent reissuance of treasury shares and the acquisition and retirement of previously issued shares and the issuance of new shares.

Treasury shares originally accounted for by the cost method can subsequently be restated to conform to the constructive retirement method. If shares were acquired with the intention that they would be reissued and it is later determined that such reissuance is unlikely (due, for example, to the expiration of stock options without their exercise), then it is proper to restate the transaction.

#### Example of accounting for treasury stock

1. 100 shares (\$50 par value) that were originally sold for \$60 per share are later reacquired for \$70 each.
2. All 100 shares are subsequently resold for a total of \$7,500.

To record the acquisition, the entry is:

	<u>Cost method</u>		<u>Par value method</u>		<u>Constructive retirement method</u>	
Treasury stock	7,000		Treasury stock	5,000	Common stock	5,000
Cash		7,000	Additional paid-in capital—common stock	1,000	Additional paid-in capital—common stock	1,000
			Retained earnings	1,000	Retained earnings	1,000
			Cash	7,000	Cash	7,000

To record the resale, the entry is:

	<u>Cost method</u>		<u>Par value method</u>		<u>Constructive retirement method</u>	
Cash	7,500		Cash	7,500	Cash	7,500
Treasury stock		7,000	Treasury stock	5,000	Common stock	5,000
Additional paid-in capital—treasury stock	500		Additional paid-in capital—common stock	2,500	Additional paid-in capital—common stock	2,500

If the shares had been resold for \$6,500, the entry is:

	<u>Cost method</u>		<u>Par value method</u>		<u>Constructive retirement method</u>	
Cash	6,500		Cash	6,500	Cash	6,500
Retained earnings*	500		Treasury stock	5,000	Common stock	5,000
Treasury stock		7,000	Additional paid-in capital—common stock	1,500	Additional paid-in capital—common stock	1,500

\* “Additional paid-in capital—treasury stock” or “Additional paid-in capital—retired stock” of that issue would be debited first to the extent it exists.

Alternatively, under the par or constructive retirement methods, any portion of or the entire deficiency on the treasury stock acquisition may be debited to retained earnings without allocation to paid-in capital. Any excesses will always be credited to an “Additional paid-in capital—retired stock” account.

The laws of some states govern the circumstances under which a corporation may acquire treasury stock and may prescribe the accounting for the stock. For example, a charge to retained earnings may be required in an amount equal to the treasury stock’s total cost. In such cases, the accounting per the state law prevails. Also, some states (including those that have adopted the

Model Business Corporation Act) define excess purchase cost of reacquired (i.e., treasury) shares as being “distributions” to shareholders that are no different in nature than dividends. In such cases, the financial statement presentation should adequately disclose the substance of these transactions (e.g., by presenting both dividends and excess reacquisition costs together in the retained earnings statement).

When a firm decides to formally retire the treasury stock, the journal entry is dependent on the method used to account for the stock.

#### **Example of the cost and par value methods**

Using the original sale and reacquisition data from the illustration above, the following entries would be made if the cost and par value methods, respectively, were employed:

<u>Cost method</u>	<u>Par value method</u>
Common stock	5,000
Additional paid-in capital—common stock	Common stock
Retained earnings	5,000
Treasury stock	5,000
	5,000
	7,000

\* “Additional paid-in capital—treasury stock” may be debited to the extent it exists.

If the constructive retirement method was used to record the treasury stock purchase, no additional entry would be necessary upon the formal retirement of the shares.

After the entry is made, the pro rata portion of all paid-in capital existing for that issue (i.e., capital stock and additional paid-in capital) will have been eliminated. If stock is purchased for immediate retirement (i.e., not put into the treasury) the entry to record the retirement is the same as that made under the constructive retirement method.

In some circumstances, shares held by current stockholders may be donated back to the reporting entity, possibly to facilitate a resale to new owners who will infuse needed capital into the business. In accounting for donated treasury stock, the intentions of management regarding these reacquired shares is key; if these are to simply be retired, the common stock account should be debited for the par or stated value (if par or stated value stock) or the original proceeds received (if no-par, no-stated-value stock). The current fair value of the shares should be credited to the “donated capital” account, and the difference should be debited or credited to a suitably titled paid-in capital account, such as “additional paid-in capital from share donations.”

If the donated shares are to be sold (the normal scenario), variations on the par and cost methods of treasury stock accounting can be employed, with “donated capital” being debited and credited, respectively, when shares are received and later reissued, instead of the “treasury stock” account employed in the above illustrations. Note, however, that if the cost method is used, the debit to the donated capital account should be for the fair value of the shares, not the cost (a seeming contradiction). If the constructive retirement method is utilized instead, only a memorandum entry will be recorded when the shares are received; when reissued, the entire proceeds should be credited to “donated capital.”

#### **Other Paid-in Capital Issues**

**Takeover defense as cost of treasury stock.** In certain instances an entity may incur costs to defend against an unwelcome or hostile attempted takeover. In some cases, in fact, putative

acquirers will threaten a takeover struggle in order to extract so-called *greenmail* from the target entity, often effected through a buyback of shares held by the acquirer at a premium over market value. ASC 505-30-30 states that the excess purchase price of treasury shares should not be attributed to the shares, but rather should be attributed to the other elements of the transaction and accounted for according to their substance, which could include the receipt of stated or unstated rights, privileges, or agreements. The SEC's position is that such excess is anything over the quoted market price of the treasury shares.

**Accelerated share repurchase programs.** ASC 505-30-25 pertains to accelerated share repurchase programs, which are combinations of transactions that permit an entity to purchase a targeted number of shares immediately, with the final purchase price determined by an average market price over fixed periods of time. Such programs are intended to combine the immediate share retirement benefits (boosting earnings per share, etc.) of tender offers with the market impacts and pricing benefits of disciplined open market stock repurchase programs.

The ASC states that an entity should account for an accelerated share repurchase program as two separate transactions:

- first, as shares of common stock acquired in a treasury stock transaction recorded on the acquisition date, and
- second, as a forward contract indexed to its own common stock.

An entity would classify the forward contract in the above example as an equity instrument because the entity will receive cash when the contract is in a gain position but pay cash or stock when the contract is in a loss position. Changes in the fair value of the forward contract would not be recorded, and the settlement of the forward contract would be recorded in equity.

The treasury stock transaction would result in an immediate reduction of the outstanding shares used to calculate the weighted-average common shares outstanding for both basic and diluted (EPS). The effect of the forward contract on diluted EPS would be calculated in accordance with ASC 260.

**Own-share lending arrangements related to convertible debt financing.** An entity may enter into a share-lending arrangement with an investment bank that is related to a convertible debt offering. (ASC 470-20-05) The lending arrangement is intended to provide investors in the offering with the ability to hedge the conversion option in the convertible debt. Upon maturity of the debt, the investment bank returns the loaned shares.

On the date of issuance, the entity should record the loaned shares at their fair value and recognize them as an issuance cost, with an offset to additional paid-in capital. If it becomes probable that the counterparty to this arrangement will default, then the entity recognizes an expense equal to the value of those shares not yet returned, net of any probable recoveries. The offset to this expense is additional paid-in capital. The entity should subsequently remeasure the fair value of the unreturned shares until the amount payable by the counterparty becomes fixed.

Own-share lending arrangements call for the following disclosures:

- *Description.* A description of any outstanding share-lending arrangements, the significant terms of these arrangements, and why the entity has entered into them.
- *Fair value.* The fair value of the loaned shares outstanding.
- *Earnings per share.* The treatment of the loaned shares for EPS calculation purposes.
- *Other.* The unamortized amount of the issuance costs associated with the arrangements, the classification of these issuance costs, and the amount of any unreimbursed dividends paid to the loaned shares.

## Other Equity Accounts

A principle of GAAP financial reporting is that all items of income, expense, gain, or loss (other than transactions with owners) should flow through the income statement. In fact, however, a number of important exceptions have been made, including:

- translation gains or losses (ASC 830),
- certain adjustments for minimum pension obligations (ASC 715), and
- unrealized gains and losses on available-for-sale portfolios of debt or equity investments. (ASC 320)

Hedging gains and losses qualifying under ASC 815 are also deferred for income measurement purposes. ASC 220 established the concept of comprehensive income (the term which denotes normal earnings plus the change in other equity accounts). Comprehensive income must be reported either in a combined statement with the income statement or as a stand-alone statement.

Refer to the chapter on ASC 220 for more information.

### ASC 505-50, *Equity-based Payments to Nonemployees*<sup>2</sup>

ASC 505-50 deals exclusively with those situations in which the fair value of the equity instruments delivered to other than employees is more objectively ascertainable than is the value of goods or services received.

**Measurement date.** For purposes of ascertaining the amounts to be assigned for these transactions, the key concern is the determination of the measurement date. Essentially, the amount of expense or the value of the asset acquired through the issuance of equity instruments is fixed as of the measurement date, although, under certain circumstances as explained below, some subsequent adjustments may need to be made.

Per ASC 505-50, the measurement date will be the earlier of the date at which a commitment for performance is made or when the performance is actually completed. Whether or not there has been a “performance commitment” by the party providing the goods or services is a question of fact and must be determined from the surrounding circumstances, but in general will be deemed to exist if there is a “sufficiently large disincentive for nonperformance” to make performance probable. This disincentive must derive from the relationship between the equity instrument issuer/recipient of the goods or services and its counterparty. Mere risk of forfeiture is not enough to qualify as a disincentive, nor is the risk of being sued for nonperformance. (ASC 505-50-30-12) When a sufficiently large disincentive exists, however, the measurement date will precede the completion of performance and, accordingly, when accrual of the related expense or recognition of the asset would otherwise be required under GAAP, it will be necessary to include the value of the equity instruments in such cost.

For example, if the agreed-upon price for the construction of a new power plant includes options on the utility company’s stock, subject to a completion date of no longer than three years hence, and the contract also contains substantial financial disincentives to late completion, such as a provision for liquidated damages, then it would be concluded that there was a *performance*

---

<sup>2</sup> Accounting for stock received by a nonemployee as compensation, that is accounting from the grantee’s perspective, has been moved by ASU 2014-09 to ASC 606. Therefore, upon implementation of ASU 2014-09, grantee accounting can be found in ASC 606.

*commitment* within the meaning of ASC 505-50. On the other hand, if the price agreed to were to be fully payable even in the event of late delivery, there would be no “performance commitment” as that term is used.

In many situations in which the compensation includes significant equity instrument components, there will still be no finding of a performance commitment because the payment arrangement provides for phases of work, with payment in full for work as it is completed. For example, if a contractor agrees to build a multiplicity of sales kiosks in various air terminals for a retailing chain, with payment to be made in cash and the retailer’s stock upon the completion of each kiosk, the contractor could terminate the arrangement after any intermediate completion date without significant penalty. In such cases, the measurement date would be, for each subproject, the date on which the work is completed.

**When to recognize the fair value of the equity instruments.** In general, the normal rules of GAAP would apply in circumstances in which stock or other equity instruments were being granted as part, or all, of the consideration for the transaction. Thus, if the services provided represented an expense of the enterprise, the expense should be recognized when incurred, which could well precede the date on which the payment was ultimately to be made.

An expense or asset measurement is made with the best information available at that time, and there is no “look back” based on subsequent events; the value assigned to the option would be credited to an appropriate paid-in capital account (e.g., “capital from expired options”) if this becomes necessary.

**Accounting prior to measurement date.** If, under GAAP, it is necessary for the entity to recognize an expense or an asset related to the transaction involving the issuance of equity for goods or services prior to the measurement date, the then-current fair values of the equity instruments must be utilized to determine these amounts. If fair values change later, these variations are attributed to those later periods. Thus, for a transaction which calls primarily for cash payment but also, to a lesser extent, for the issuance of stock, a decline in the value of the equity portion in a later interim period would reduce the cost (or asset value) to be recognized in that period; if the stock portion is a significant component, a decline could largely eliminate the cost otherwise to be accrued or even, conceivably, cause it to become negative in a later reporting period. Of course, overall, the aggregate cost would be positive upon ultimate completion (at worst it could be zero, if the transaction were predicated only on the issuance of equity instruments, and these became worthless—an obviously unlikely scenario).

**Measurement of fair value of the equity instrument portion of the transaction when certain terms are not known at inception.** In some circumstances where there is a performance commitment there will also be a material uncertainty regarding the valuation of the equity instruments, either because of some question regarding the number of instruments to be delivered, the value of such instruments, or some factor dependent upon the performance of the party providing the service. For example, the arrangement may include a guarantee of the value of the instrument extending for some period subsequent to completion of performance that unless the underlying shares maintain a market price of \$15 or greater for one year following delivery, or else a defined number of additional shares will be granted. This type of arrangement is referred to as a “market condition.” In other circumstances, there may be a condition based on the counterparty’s performance—for example, when options are granted to a tax accountant structuring a tax shelter, in which the number of options ultimately deliverable depends upon successfully surviving an IRS audit. Situations such as this are denoted “counterparty performance conditions.”

Where the arrangement contains a market condition, measurement of the equity instrument portion of the contracted price should be based on two elements:

- the first is the fair value of the basic equity instrument;
- the second is the fair value of the contingent commitment, such as the aforementioned promise to grant a specified number of extra shares if the market price falls below \$15 during the one-year period.

In practice, the valuation of these contingencies might prove to be challenging, but clearly any such promise has some positive value, and the standard requires that this be assessed. Changes in the value of the second (contingent) element subsequent to the performance commitment date would not be recognized since, per ASC 815, a derivative financial instrument to be settled in a company's own shares (as contrasted to a settlement in cash) is not to be remeasured.

Compared to a market condition, measurement when there are counterparty performance conditions is more complicated. At the measurement date, the equity instruments are valued at the lowest of the defined alternative amounts. For example, if the value of the option award to the tax accountant noted above is \$20,000 (at the performance commitment date) assuming survival against IRS challenge, but only \$5,000 if the IRS ultimately prevails, then the measurement of the value of the service would be based on the \$5,000 amount. However, later, when the outcome of the performance condition is known, an additional cost would have to be recognized if a more favorable outcome occurred (in this example, successful defense of the tax shelter). The added cost would be based not on the values as of the performance commitment date, but rather as of the date of resolution of the condition. If the value of the options under the "success" outcome is \$28,000 at that date, and the value of the "failure" outcome is \$19,000, then an added cost of (\$28,000 – 19,000 =) \$9,000 would be recognized.

Where a given transaction involves both market and counterparty performance conditions, the accounting specified for situations involving only counterparty performance conditions is to be applied.

#### **Example of equity instruments issued to a third party**

Carney Development Enterprises has engaged the services of (ABC) to design an office tower. ABC agrees to accept 5,000 shares of Carney \$1 par value common stock and 1,000 options on shares in exchange for this service, but it will only receive half the number of shares if it delivers completed drawings after the due date. Thus, there exists a sufficiently large disincentive for nonperformance. Also, if the value of Carney's stock declines below \$15/share at any point during the six months subsequent to the issuance of shares to ABC, Carney agrees to issue additional shares to bring ABC's total compensation back up to the \$15 level, which is capped at a maximum additional stock issuance of 2,000 shares.

Carney measures the value of its stock and options as of the performance commitment date for the initial 5,000 share payment, the 1,000 option grant, and the potential additional payment of 2,000 shares. At a price on the commitment date of \$18/share, the initial share payment costs \$90,000, while the additional payment costs \$36,000. Carney appropriately values the stock options at \$9 each, or \$9,000 in total, using an option pricing model. During each of the 18 months of the design process, Carney recognizes 1/18 of the \$90,000 cost of the initial stock grant and of the \$9,000 option grant with the following entry:

Construction-in-progress	5,500
Stock options outstanding	500
Accrued liabilities	5,000

ABC successfully completes the drawings by the designated deadline, triggering a stock grant of 5,000 shares that Carney records with the following entry:

Accrued liabilities	90,000
Common stock	5,000
Additional paid-in capital	85,000

Carney's stock price drops below \$18 immediately after the project is completed, so ABC never exercises the 1,000 stock options. Carney accounts for the stock options with the following entry:

Stock options outstanding	9,000
Additional paid-in capital—expired options	9,000

The value of Carney stock subsequently declines to \$10/share, which represents a shortfall of \$25,000 from the guaranteed minimum share price of \$15. At the current market price of \$10/share, Carney would have to issue an additional 2,500 shares to ABC to make up the shortfall. However, since this liability is capped at 2,000 shares, Carney only issues 2,000 shares, using the valuation of \$18 set at the commitment date, and records the transaction with the following entry:

Construction-in-progress	36,000
Common stock	2,000
Additional paid-in capital	34,000

**Reporting prior to the measurement date when certain terms are not known.** When market conditions (e.g., the value of the stock underlying the options two years hence) are not known, and expenses must be accrued or assets recorded prior to the measurement date, the then-current fair values of the equity instruments at such dates should be used, with subsequent adjustments as necessary. When there are counterparty performance conditions, either alone or in conjunction with market conditions, then interim measurements should be based on the lowest of the alternative values as of each date, with subsequent changes in this same measure assigned to later periods.

**Reporting after the measurement date when certain terms are not known.** When market conditions (e.g., the value of the stock underlying the options two years hence) are not known, after the measurement date the principles of ASC 815 are to be applied, which generally would mean that changes in value would not be recognized. On the other hand, when there are counterparty performance conditions, with or without market conditions also being present, *modification accounting* procedures are to be utilized. This results in reporting an adjustment in subsequent periods determined with reference to the difference between the then-current fair value of the revised equity instruments and that of the old instruments immediately prior to the recognition event. In all cases, the "then-current" values are to be determined with reference to the lowest aggregate fair values under the alternative outcomes specified by the contractual arrangement. (ASC 505-50-35-22)

**Further guidance.** Where fully vested, exercisable, nonforfeitable equity instruments are issued at the date the grantor and grantee enter into an agreement, by eliminating any obligation on the part of the counterparty to earn the equity instruments, a measurement date has been reached.

The grantor should recognize the equity instruments when they are issued (in most cases, when the agreement is entered into). Whether the corresponding cost is an immediate expense or a prepaid asset (or whether the debit should be characterized as contra equity) depends on the specific facts and circumstances.

If an entity grants fully vested, nonforfeitable equity instruments that are exercisable by the grantee only after a specified period of time, and the terms of the agreement provide for earlier exercisability by the grantee only after a specified period of time, and the terms of the agreement provide for earlier exercisability if the grantee achieves specified performance conditions, the grantor should measure the fair value of the equity instruments at the date of grant and should recognize that measured cost under the same guidance as the foregoing. If, subsequent to the arrangement date, the grantee performs as specified and exercisability is accelerated, the grantor should measure and account for the increase in the fair value of the equity instruments resulting from the acceleration of exercisability using *modification accounting*. Since, generally, option-pricing models are not sensitive to exercisability restrictions, it may be necessary to provide additional guidance on how to measure the discount attributable to the exercisability restriction.

For transactions that include a grantee performance commitment, the grantee should account for the arrangement as an executory contract (that is, generally no accounting before performance) in the same manner as it would if the grantor had agreed to pay cash (upon vesting) for the goods or services. Further consideration will be directed to the accounting in cases in which the fair value at the date the equity instruments are earned is greater than or less than the fair value measured at the performance commitment date (measurement date).

**Consideration for future services.** ASC 505-50 discusses the appropriate statement of financial position presentation of arrangements where unvested, forfeitable equity instruments are issued to an unrelated nonemployee (the counterparty) as consideration for future services. SEC staff has since addressed situations where the grantor is entitled to recover the specific consideration paid, plus a substantial mandatory penalty, as a minimum measure of damages for counterparty nonperformance. Fair value measurement under ASC 718 is required. In practice, however, some reporting entities have made no entries until performance occurs, while others have recorded the fair value of the equity instruments as equity at the measurement date and record the offset either as an asset (future services receivable) or as a reduction of stockholders' equity (contra equity).

The SEC staff believes that if the issuer receives a right to receive future services in exchange for unvested, forfeitable equity instruments, those equity instruments should be treated as unissued for accounting purposes until the future services are received (that is, the instruments are not considered issued until they vest). Consequently, there would be no recognition at the measurement date and no entry should be recorded. This does not apply to similar arrangements in which the issuer exchanges fully vested nonforfeitable equity instruments, as those types of arrangements are addressed in ASC 505-50.

### Convertible Preferred Stock

The treatment of convertible preferred stock at its issuance is no different than that of nonconvertible preferred. When it is converted, the book value approach is used to account for the conversion. Use of the market value approach would entail a gain or loss for which there is no theoretical justification, since the total amount of contributed capital does not change when the stock is converted. When the preferred stock is converted, the "Preferred stock" and related "Additional paid-in capital—preferred stock" accounts are debited for their original values when

purchased, and “Common stock” and “Additional paid-in capital—common stock” (if an excess over par or stated value exists) are credited. If the book value of the preferred stock is less than the total par value of the common stock being issued, retained earnings are charged for the difference. This charge is supported by the rationale that the preferred shareholders are offered an additional return to facilitate their conversion to common stock. Many states require that this excess instead reduces additional paid-in capital from other sources.

### Example of convertible preferred stock

Caspian Corporation issues 10,000 shares of \$1 par value convertible preferred stock, and receives \$1.25 per share. It records the initial sale with the following entry:

Cash	12,500
Convertible preferred stock	10,000
Additional paid-in capital—preferred stock	2,500

The terms of the convertible preferred stock allow Caspian’s shareholders to convert one share of preferred for one share of common stock at any time. The preferred shareholders convert all of their shares to Caspian common stock, which has a par value of \$2. This requires the following entry:

Convertible preferred stock	10,000
Additional paid-in capital—preferred stock	2,500
Retained earnings	7,500
Common stock	20,000

### ASC 505-60, Spin-offs and Reverse Spin-offs

**Spin-offs.** One method that is used as a means of reorganizing an entity’s operations is through the use of a spin-off. This can involve the transfer of assets that constitute a business, by their holder referred to as the spinnor, into a new legal entity (spinnee), the shares of which are distributed to the spinnor’s shareholders. The distribution is nonreciprocal in that the shareholders of the spinnor are not required to surrender any of their stock in the spinnor in exchange for the shares of the spinnee. (ASC 505-60-05-2)

Besides facilitating a reorganization of the reporting entity, a spin-off may also qualify as a nontaxable reorganization with the distribution not being treated as a taxable gain by the spinnor or its shareholders. In addition, if the spinnee stock is subsequently sold by the shareholders, they avoid the effect of the double taxation that would occur if the company sold the company directly and distributed the net proceeds to the stockholders in a taxable cash dividend. (ASC 505-60-05-3)

The accounting rules governing spin-offs and reverse spin-offs are found in ASC 505-60 and ASC 845-10-30.

In accordance with ASC 505-60-25-2, the distribution of shares of a wholly owned or consolidated subsidiary that constitutes a business to an entity’s shareholders is to be recorded based on the carrying value of the subsidiary. Irrespective of whether the spun-off operations are to be sold immediately following the spin-off, management is not to account for the transaction as a sale of the spinnee followed by a distribution of the proceeds.

Further, in accordance with ASC 845-10-30-10, a pro rata distribution to owners of an entity of shares of a subsidiary or other investee entity that has been or is being consolidated or accounted for under the equity method is to be considered the equivalent of a spin-off.

**Reverse spin-offs.** Under certain circumstances, a spun-off subsidiary/spinnee will function as the continuing entity post-spin-off. When the spin-off of a subsidiary is structured in such a way that the legal form of the transaction does not represent its economic substance, this will be accounted for as a reverse spin-off whereby the legal spinnee is treated as if it were the spinner for financial reporting purposes. (ASC 505-60-05-4)

The determination of whether reverse spin-off accounting is appropriate is a matter of professional judgment that depends on a careful analysis of all relevant facts and circumstances. ASC 505-60-25-8 provides indicators to be considered in determining whether a spin-off should be accounted for as a reverse spin-off. No one indicator is to be considered presumptive or determinative:

1. *The sizes of the legal spinner and the legal spinnee.* If all other factors are equal, in a reverse spin-off, the legal spinnee/accounting spinner is larger than the legal spinner/accounting spinnee. This comparison is to be based on assets, revenues, and earnings of the two entities with no established bright lines that should be applied.
2. *The fair value of the legal spinner and the legal spinnee.* All other factors being equal, in a reverse spin-off, the fair value of the legal spinnee/accounting spinner is greater than the fair value of the legal spinner/accounting spinnee.
3. *Senior management.* All other factors being equal, in a reverse spin-off, the legal spinnee retains the senior management of the formerly consolidated entity. Senior management is generally understood to include the chairman of the board of directors, chief executive officer, chief operating officer, chief financial officer, the divisional heads that report directly to them, or the executive committee, if applicable.
4. *Length of holding period.* All other factors being equal, in a reverse spin-off, the legal spinnee is held for a longer period than the legal spinner. A proposed or approved plan of sale for one of the separate entities concurrent with the spin-off transaction may assist in the identification of the entity to be sold as the spinnee for accounting purposes.

The determination of the accounting spinner and spinnee, respectively, has significant implications. In a spin-off, the net book value of the spinnee is treated, in effect, as a dividend distribution to the shareholders of the spinner. Since the net book value of these entities will differ from each other, the amount of the reduction to retained earnings of the surviving reporting entity (the accounting spinner) will be affected by this determination. ASC 505-60 offers several examples of fact patterns which support spin-off or reverse spin-off determinations.

Finally, the accounting for a reverse spin-off is further complicated by the fact that the determination of the accounting spinner and spinnee significantly affects the reporting of discontinued operations in accordance with ASC 360. The accounting spinnee is reported as a discontinued operation by the accounting spinner if the spinnee is a component of an entity and meets the conditions for such reporting contained in ASC 360.

## Disclosure Requirements

Under ASC 505-10-50, certain disclosures of an entity's capital structure are required. See the Appendix for detailed information on disclosures.

## REVENUE RECOGNITION—GENERAL PRINCIPLES

### Subtopics

ASC 605, *Revenue Recognition*, contains ten Subtopics:

- ASC 605-10, *Overall*, which provides guidance on revenues and gains and the installment and cost recovery methods.
- ASC 605-15, *Products*, which provides guidance on sales with a right of return and repurchases of products sold subject to an operating lease.
- ASC 605-20, *Services*, which provides guidance on separately priced extended warranty and product maintenance contracts, commissions from certain experience-rated or retrospective insurance arrangements, certain loan guarantee fees, in-transit freight service, and advertising barter transactions.
- ASC 605-25, *Multiple-Element Arrangements*, which provides guidance on arrangements under which a vendor will provide multiple deliverables.

- ASC 605-28, *Milestone Method*, which provides guidance on the application of the milestone method of revenue recognition in arrangements that include research or development deliverables.
- ASC 605-30, *Rights to Use*, which merely provides links to other Codification Topics on rights to use.
- ASC 605-35, *Construction-Type and Production-Type Contracts*, which provides guidance on contracts for which specifications are provided by the customer for the performance of contracts for the construction of facilities or the production of goods.
- ASC 605-40, *Gains and Losses*, which provides guidance on miscellaneous gains and losses not addressed in other FASB Codification Topics.
- ASC 605-45, *Principal-Agent Considerations*, which provides guidance on reporting revenue gross or net of certain amounts paid to others.
- ASC 605-50, *Customer Payments and Incentives*, which provides guidance on accounting by vendors and customers for consideration given by a vendor to a customer.

**Revenue recognition concerns.** The principles guiding recognition of revenues for financial reporting purposes are central to GAAP and in most instances are unambiguous and straightforward.

However, while the currently effective basic principles are uncomplicated, it is nonetheless true that a large percentage of financial reporting frauds over the period beginning about 1995 were the result of misapplications, often deliberate, of revenue recognition practices prescribed under GAAP. Apart from outright fraud (e.g., recording nonexistent transactions), there were several factors contributing to this unfortunate state of affairs.

First, business practices have continued to grow increasingly complex, involving, among other things, a marked shift from manufacturing to a service-based economy, where the proper timing for revenue recognition is often more difficult to ascertain. Second, there has been an undeniable increase in the willingness of managers, whose compensation packages are often directly linked to the company's stock price and reported earnings, to "stretch" accounting rules to facilitate earnings management. This has particularly been the case where GAAP requirements have been vague, complex, or abstruse. And third, it has been well documented that, too often, independent auditors have been willing to accommodate managements' wishes, particularly in the absence of specific rules under GAAP to support a denial of such requests. These actions have often had disastrous consequences, if not immediately, then in the longer run.

Errors or deliberate distortions involving revenue recognition fall into two categories: situations in which revenue legitimately earned is reported in the incorrect fiscal (financial reporting) period, often referred to as "cutoff" errors, and situations in which revenue is recognized although never actually earned. Given the emphasis on periodic reporting (e.g., quarterly earnings announcements in the case of publicly held entities), even simple "cutoff" errors can have enormous impact, notwithstanding the fact that these should tend to offset over several periods. As a practical matter, all instances of improper revenue recognition constitute a challenge to all accountants attempting to properly interpret and apply GAAP, including independent auditors.

**Revenue recognition—general guidelines.** Revenue, whether from the sale of product or provision of services, is to be recognized only when it has been earned. According to CON 5, *Recognition and Measurement in Financial Statements of Business Enterprises*:

. . . An entity's revenue-earning activities involve delivering or producing goods, rendering services, or other activities that constitute its ongoing major or central operations, and revenues are considered to have been earned when the entity has substantially accomplished what it must do to be entitled to the benefits represented by the revenues. (Para. 83)

In other words, in order to be recognized revenue must be realized or realizable, and it must have been earned.

CON 5 notes that “the two conditions (being realized or realizable, and being earned) are usually met by the time product or merchandise is delivered or services are rendered to customers, and revenues from manufacturing and selling activities and gains and losses from sales of other assets are commonly recognized at time of sale (usually meaning delivery).” Moreover, “if services are rendered or rights to use assets extend continuously over time (for example, interest or rent), reliable measures based on contractual prices established in advance are commonly available, and revenues may be recognized as earned as time passes.” In other words, for most traditional and familiar types of transactions, the point at which it is appropriate to recognize revenue will be quite clear. (CON 5, Para. 84a)

The SEC, reflecting on the conceptual foundation for revenue recognition, observed in Staff Accounting Bulletin (SAB) 104 that:

*... revenue generally is realized or realizable and earned when all of the following criteria are met:*

1. *There is persuasive evidence that an arrangement exists*
2. *Delivery has occurred or services have been rendered*
3. *The seller's price to the buyer is fixed or determinable, and*
4. *Collectibility is reasonably assured.*

Note that, while Securities and Exchange Commission (SEC) rules and “unofficial” guidance are not necessarily to be deemed GAAP for nonpublic companies, to the extent that these provide insights into the application of the Accounting Standards Codification (ASC), they should always be viewed as relevant guidance and followed, absent other, contradictory rules established under GAAP. In the absence of any other authoritative source, SEC pronouncements may represent the best thinking on the subject and would thus be considered authoritative for all reporting entities.

With regard to the four criteria set forth above, consideration should be directed at the following discussion, which is drawn partially from SAB 101 and SAB 104.

First, regarding persuasive evidence of an arrangement, attention must be paid to the customary manner in which the reporting entity engages in revenue-producing transactions with its customers or clients. Since these transactions are negotiated between the buyer and seller and can have unique or unusual terms, there are (and can be) no absolute standards. Thus, for an enterprise that traditionally obtains appropriate documentation (purchase orders, etc.) from its customers before concluding sales to them, advance deliveries to customers, even if later ratified by receipt of the proper paperwork, would not be deemed a valid basis for revenue recognition at the time of delivery.

When evaluating purported revenue transactions, the substance of the transactions must always be considered, and not merely their form. It has become increasingly commonplace to “paper over” transactions in ways that can create the basis for inappropriate revenue recognition. For example, transactions that are actually consignment arrangements might be described as “sales” or as “conditional sales,” but revenue recognition would not be appropriate until the consigned goods are later sold to a third-party purchaser.

Careful analysis of the rights and obligations of the parties and the risks borne by each at various stages of the transactions should reveal when and whether an actual sale has occurred and whether revenue recognition is warranted. In general, if the buyer has a right to return the product in question, coupled with a deferred or conditional payment obligation and/or significant

remaining performance obligations by the seller, revenue will not be recognizable by the seller at the time of initial delivery. Similarly, if there is an implicit or explicit obligation by the seller to repurchase the item transferred, a real sales transaction has not occurred. The buyer must assume the risks of ownership in all cases if revenue is to be recognized.

With regard to whether delivery has occurred or services have been rendered, ownership and risk taking must have been transferred to the buyer if revenue is to be recognized by the seller. Thus, if the seller is holding goods for delivery to the buyer because the buyer's receiving dock workers are on strike and no deliveries are being accepted, revenue generally cannot be recognized in the reporting period, even if these delayed deliveries are made subsequent to period end. (There are limited exceptions to this general principle, typically involving a written request from the buyer for delayed delivery under a "bill-and-hold" arrangement, having a valid business purpose.)

The SEC frowns upon bill-and-hold transactions. It will generally not allow revenue recognition in either of the following circumstances:

- When a company completes manufacturing of a product and segregates the inventory within its facility; or
- When a company ships products to a third-party storage facility while retaining title to the product and payment by the buyer will not occur until it is delivered to the buyer.

The SEC bases its opinion on the underlying concepts that revenue recognition does not occur until the customer takes title to the goods and assumes the risks and rewards of ownership. Consequently, the SEC uses all of the following criteria when determining whether revenue should be recognized:

1. Ownership risk must pass to the buyer;
2. The customer makes a (preferably) written commitment to buy the goods;
3. The buyer must require that the sale be on a bill-and-hold basis, and have a substantial business purpose for doing so;
4. There is a reasonable delivery schedule for the goods;
5. The seller has no remaining performance obligations;
6. The goods have been segregated, and cannot be used to fill other orders received by the seller; and
7. The product must be complete.

The SEC further states that generally delivery has not occurred unless the product has been delivered to either the customer or another site specified by the customer. If the customer specifies delivery to a staging site but a substantial portion of the sales price is not payable until delivery is ultimately made to the customer, then revenue recognition must be delayed until final delivery to the customer has been completed.

Delivery, as used here, implies more than simply the physical relocation of the goods to the buyer's place of business. Rather, it means that the goods have actually been accepted by the customer, which, depending on the terms of the relevant contract, could be conditioned on whether inspection, testing, and/or installation have been completed, and the buyer has committed to pay for the items purchased. For revenue recognition to be justified, substantial performance of the terms of delivery must have occurred, and if any terms remain uncompleted, there should be a basis grounded on historical experience to assume that these matters will be satisfactorily attended to.

In some instances there are multiple "deliverables." In such cases, revenue is not recognized for any given element if later deliverables are essential for the functionality of the already

delivered element. In other situations, such as in various licensing arrangements, physical “delivery” may occur well before product usage by the buyer can take place (e.g., software for the future year’s tax preparation delivered before the current year end), and revenue is not to be recognized prior to the initial date of expected use by the buyer.

The SEC holds that revenue should not be recognized until such time as any uncertainty about customer acceptance of goods or services has been eliminated. This requires an examination of customer acceptance provisions in the purchase agreement. For example, the agreement may allow the customer to test the product or require additional services subsequent to delivery, such as product installation. If these provisions exist, the SEC assumes that the customer specifically bargained for their inclusion in the agreement, which makes them substantive parts of the agreement. Consequently, revenue cannot be recognized until either the customer has accepted the goods or services, or the acceptance provisions have lapsed.

The SEC states that formal customer sign-off on a contractual customer acceptance provision is not always necessary. Instead, the seller can demonstrate that the criteria specified in the acceptance provisions are satisfied.

The SEC considers customer acceptance provisions to take one of four general forms, which are:

1. *Acceptance for trial or evaluation purposes.* The customer agrees to accept the product strictly for evaluation purposes, so title remains with the seller. The customer may then actively affirm acceptance or do so simply through the passage of time; in either case, this is essentially a consignment arrangement where the seller should not recognize revenue until the customer confirms that it will purchase the product.
2. *Acceptance granting a right to return or exchange on the basis of subjective issues.* The customer has the right to return the product if dissatisfied with it. In this case, a company can recognize revenue at the initial point of sale, but only if it can reasonably estimate the amount of future returns and accrue for them. If the seller cannot make this estimate, then it must wait until the right of return has expired before recognizing revenue.
3. *Acceptance based on seller-specified objective criteria.* The customer has a right of return or replacement if the delivered product is defective or fails to meet its published specifications. If the seller has already demonstrated that the product meets its specifications and can reasonably estimate the amount of defective products, then it can create a warranty reserve and recognize revenue at the point of sale. If the seller cannot prove that the product meets its published specifications, then it should defer revenue recognition until the specifications have been achieved.
4. *Acceptance based on customer-specified objective criteria.* The customer has created a specific set of acceptance criteria that the seller must meet before the customer will accept the delivery. This is best achieved with a formal sign-off document. Alternatively, the seller can demonstrate that the delivered product meets the customer’s criteria (such as through preshipment testing). However, it may not be possible to conduct such testing prior to delivery, because performance may vary based on how the product works in combination with the customer’s other systems. In this case, revenue recognition should be deferred until the product is actually installed and meets the stated criteria. Also, the seller must evaluate its ability to enforce a payment claim in the absence of a formal sign-off. If payment enforcement would be difficult, then revenue recognition should be deferred until formal customer sign-off.

This is perhaps the most subjective of the four forms of customer acceptance, so the SEC states that it will not object to a determination that is well reasoned on the basis of the guidance just described.

In the case of many service transactions, large up-front fees are often charged, nominally in recognition of the selling of a membership, the signing of a contract, or for enrolling the customer in a program. (For example, initiation fees to join a health club where the terms of membership also obligate the member to pay ongoing fees.) Unless the services provided to the customer at inception are substantial, the presumption is that the revenue received has not been earned, but rather must be deferred and recognized, usually ratably, over the period that substantive services are provided. Thus, initiation fees are amortized over the membership period.

In cases where the seller is providing a service and requires an up-front fee, the SEC prefers that the fee be accounted for as revenue on a straight-line basis; this recognition shall be either over the term of the arrangement or the expected period during which services are to be performed, whichever is longer. The only situation where revenue is not recognized on a straight-line basis is when revenue is earned or obligations are fulfilled in a different pattern.

Even in cases where the seller's obligations to the buyer are inconsequential or perfunctory, the SEC believes that the substance of these transactions indicates that the buyer is paying for a service that is delivered over a period of time, which therefore calls for revenue recognition over the period of performance.

The seller's price to the buyer is fixed or determinable when a customer does not have the unilateral right to terminate or cancel the contract and receive a cash refund. Depending on customary practice, extended return privileges might imply that this condition has not been met in given circumstances. Prices that are conditional on the occurrence of future events are not fixed or determinable from the perspective of revenue recognition.

In theory, until the refund rights have expired, or the specified future events have occurred, revenue should not be recognized. As a practical matter, however, assuming that the amount of refunds can be reliably estimated (based on past experience, industry data, etc.), revenues, net of expected refunds, can be recognized on a pro rata basis. Absent this ability to reliably estimate, however, revenue recognition is deferred.

The final factor, reasonable assurance of collectibility, implies that the accrual for bad debts (uncollectible accounts receivable) can be estimated with reasonable accuracy, both to accomplish proper periodic matching of revenue and expenses, and to enable the presentation of receivables at net realizable value, as required under GAAP. An inability to accomplish this objective necessitates deferral of revenue recognition—generally until collection occurs, or at least until it becomes feasible to estimate the uncollectible portion with sufficient accuracy.

The SEC holds that revenue may be recognized in its entirety if the seller's remaining obligation is inconsequential or perfunctory. This means that the seller should have substantially completed the terms specified in the sales arrangement in order for delivery or performance to have occurred. Any remaining incomplete actions can only be considered inconsequential if the failure to complete them would not result in the customer receiving a refund or rejecting the products or services. Further, the seller should have a history of completing the remaining tasks in a timely manner, and of being able to estimate all remaining costs associated with those activities. If revenue is recognized prior to the completion of any inconsequential items, then the estimated cost of those inconsequential items should be accrued when the revenue is recognized.

An extreme situation, calling for not merely accrual of losses from estimated uncollectible receivables, is to defer revenue recognition entirely until collectibility is assured (or actually achieved). The most conservative accounting alternative, as set forth in CON 5, is to record

revenue only as collected. It states: “(i)f collectibility of assets received for product, services, or other assets is doubtful, revenues and gains *may* be recognized on the basis of cash received” (emphasis added). The permissive language, which (it must be assumed) was deliberately selected in preference to a mandatory exhortation (e.g., “must”), suggests that even in such a situation this hyperconservative departure from accrual accounting is not truly prescriptive, but is a possible solution to a fact-specific set of circumstances.

### Problems in Revenue Recognition

Certain of the more attention-getting problems in applying the general principles of revenue recognition are discussed in the following paragraphs.

**Financial statement presentation: gross versus net.** In general, it is well established that reporting on a “gross” basis is appropriate when the entity takes ownership of the goods being sold to its customers, with the risks and rewards of ownership accruing to it. For example, if the entity runs the risk of obsolescence or spoilage during the period it holds the merchandise, gross reporting would normally be appropriate. On the other hand, if the entity merely acts as an agent for the buyer or seller from whom it earns a commission, then “net” reporting would be more appropriate.

Enterprises may inflate the revenues reported in their income statements by reporting transactions on a “gross” basis, notwithstanding that the entity’s real economic role is as an agent for buyer and/or seller. This distortion became widespread in the case of Internet commerce-based “dot-com companies” and other start-up and innovative businesses typically not reporting earnings, for which market valuations were heavily influenced by absolute levels of and trends in gross revenues. Reporting revenues “gross” rather than “net” often had an enormous impact on the perceived value of those enterprises.

Factors to consider in determining whether sales are properly reported “gross” or “net” include:

1. Whether the entity acts as a principal or an agent in the transactions
2. Whether the entity takes title to the property
3. Whether the entity has the normal risks and rewards of ownership
4. Whether the entity acts as an agent or broker (including performing services, in substance, as an agent or broker) with compensation on a commission or fee basis.

**Reporting taxes collected as revenue.** Most businesses must collect certain taxes which must subsequently be transmitted to governmental bodies, making the entity in effect an agent of the state. The most obvious example of this situation is the imposition of sales taxes, which are almost universally applicable to retail merchandise transactions and, increasingly, to service transactions as well. Historically accounting practice has varied, with some entities reporting gross revenue inclusive of taxes—which are then later reported as expenses when remitted—while other entities report revenue net of these taxes, treating them as purely a statement of financial position event. ASC 605-45-50-3 confirms that either methodology is acceptable, and if material, should be defined in the accounting policies note to the financial statements. As an elective accounting policy, accordingly, any change in method should be justified as being warranted as a means of improving financial reporting.

**Barter transactions.** Barter transactions (nonmonetary exchanges, as described in ASC 845-10) are not a problem, assuming that they represent the culmination of an earnings process. However, in recent years there have been many reports of transactions that appear to have been concocted merely to create the illusion of revenue-generating activities. Examples include advertising swaps engaged in by some entities, most commonly “dot-com” enterprises, and the excess capacity swaps

of fiber optic communications concerns under “indefeasible right to use” agreements. Both of these and many other situations involved immediate recognition of revenues coupled with deferred recognition of costs, and typically in aggregate were equal exchanges not providing profits to either party. Furthermore, these examples do not represent culminations of the normal earnings process (e.g., fiber optic networks were built in order to sell communications services to end users, not for the purpose of swapping capacity with other similar operations).

In hindsight, most observers can see why these and many other aggressive reporting practices deviated from established or implied GAAP; although there are still some who insist that because GAAP failed to explicitly address these precise scenarios, the accounting for the transactions was open to interpretation. Since GAAP (even the highly rules-based U.S. GAAP) cannot possibly hope to overtly address all the various innovative transaction structures that exist and will be invented, it is necessary to apply basic principles and reason by analogy to newly emerging circumstances. Of great importance to financial statement preparers (and internal and external auditors) is obtaining a thorough understanding of the nature and normal operations of the business enterprise being reported upon, application of “substance over form” reasoning, and the goal of faithfully representing the economics of transactions.

**Channel stuffing.** Many difficult issues of revenue recognition involve practices that may or may not involve GAAP departures, depending on the situation-specific facts and circumstances. Channel stuffing, a prime example of this issue, occurs when sales are actually made prior to the period-end cutoff but may have been stimulated by “side agreements,” such as a promise to customers of extended return privileges or more liberal credit terms. In such circumstances, there might be a greater likelihood that a substantial portion of these sales may be subsequently nullified, as unrealistically large orders inevitably lead to later large returns made for full credit.

For purposes of financial reporting under GAAP, valuation allowances should be established for expected sales returns and allowances. (In practice, however, this is rarely done because the amounts involved are immaterial, unlike the amounts of the more familiar allowances for uncollectible accounts.) The use of valuation accounts for anticipated returns and allowances is dictated by both the matching concept (recording returns and allowances in the same fiscal period in which the revenue is recognized) as well as by the requirement to present accounts receivable at net realizable value. When the potential product returns are not subject to reasonable estimation (as when a sales promotion effort of the type just described is first being attempted by the reporting entity) but could be material, it might not be permissible to recognize revenues at all, pending subsequent developments. (ASC 605-15-25) Furthermore, from the SEC’s perspective, factors such as the following could require deferral of revenues at the time goods are shipped to customers, pending resolution of material uncertainties:

1. Significant levels of product inventory in the distribution channel
2. Lack of “visibility” into, or the inability to determine or observe, the levels of inventory in a distribution channel and the current level of sales to end users
3. Expected introductions of new products that may result in the technological obsolescence of, and larger than expected returns of, current products
4. The significance of a particular distributor to the company’s (or a reporting segment of the company’s) business, sales, and marketing
5. The newness of a product
6. The introduction of competitors’ products with superior technology or greater expected market acceptance could affect market demand and changing trends in that demand for an entity’s products.

**Mischaracterization of extraordinary or unusual transactions as components of gross revenue.** Not all revenue recognition errors and frauds involve questions of when or if revenue should be recognized. In some instances, classification in the income statement is of greater concern. While matters in this group often do not result in a distortion of net results of operations, they can seriously distort important indicators of performance trends. When this occurs, it most often involves reporting unusual or infrequent gains on sales of segments or specific assets as revenue from product or service transactions. A variation on this involves reporting unusual gains as offsets to one or more categories of operating expenses, similarly distorting key financial ratios and other indicators, again without necessarily invalidating the net income measure.

**Mischaracterizing transactions as involving “arm’s-length” third parties, thus justifying unwarranted gain recognition.** Transfers of inventory or other assets to a related entity typically defer gain or income recognition until subsequent transfer to an “arm’s-length” party. In some cases, sales have been disguised as being to unrelated entities with gain being recognized, when in fact the “buyer” was a nominee of the seller, or the financing was provided or guaranteed by the seller, or the “buyer” was a “variable interest entity” that failed to meet the complex and changing requirements under GAAP required for gain recognition. Depending upon the facts of the situation, this can result in gains being improperly recognized, or the gross amount of the transaction being improperly recognized in the seller/transferor’s financial statements.

**Selling undervalued assets to generate reportable gains.** This issue again ranges from deliberate but real economic transactions that have as a goal the inflation of reportable revenues or gains, to misrepresented events having no economic substance but the same objective. Among the former is the deliberate invasion of low-cost LIFO inventory “layers,” which boosts gross margins and net profits for the period, albeit at the cost of having to later replenish inventories with higher-cost goods. To the extent that this depletion of lower-cost inventory really occurs, there is no GAAP alternative to reflecting these excess profits currently, although the threat of full disclosure may prove to be somewhat of a deterrent.

Regarding the latter category, in some instances the ability to generate gains could indicate that errors occurred in recording a previous transaction. Thus, large gains flowing from the sale of assets recently acquired in a purchase business combination transaction could well mean the purchase price allocation process was flawed. If this is true, a reallocation of purchase price would be called for, and some or all of the apparent gains would be eliminated.

Related to the foregoing is the strategy of retiring outstanding debt to generate reportable gains. In periods of higher-than-historically-typical interest rates, lenders will often agree to early extinguishment of outstanding low-coupon obligations at a discount, hence creating accounting gains for the borrower, albeit replacement debt at current yields will result in higher interest costs over future years. To the extent the debt is really retired, however, this is a real economic event, and the consequent gain is reported in current earnings under GAAP.

**Deliberate misstatement of percentage of completion on long-term construction contracts.** Under ASC 605-35 (detailed later in this chapter), profits on certain long-term construction-type contracts are recognized ratably over the period of construction. An obvious and often easy way to distort periodic results of operations is to deliberately over- or underestimate the degree to which one or more discrete projects has been completed as of period end. This, coupled with the difficulty and importance of estimating remaining costs to be incurred to complete each project, makes profit recognition under this required method of accounting challenging to verify.

### Technical Alert

#### ASU 2014-09, *Revenue from Contracts with Customers (Topic 606)*

See the chapter on ASC 606 for information on ASU 2014-09.

**ASU 2016-11.** In May 2016, the FASB issued Revenue Recognition (Topic 605) and Derivatives and Hedging (Topic 815): Rescission of SEC Guidance Because of Accounting Standards Updates 2014-09 and 2014-16 Pursuant to Staff Announcements at the March 3, 2016 EITF Meeting. The guidance related to ASC 605 rescinds certain SEC Staff Observer comments codified in ASC 605 upon adoption of the ASU 2014-09 guidance in ASC 606. Rescinded ASC 605 paragraphs are:

- ASC 605-20-S99-2—Revenue and Expense Recognition for Freight Services in Process
- ASC 605-45-S99-1—Accounting for Shipping and Handling Fees and Costs
- ASC 605-50-S99-1—Accounting for Consideration Given by a Vendor to a Customer (Including Reseller of the Vendor's Products)

## LONG-TERM CONSTRUCTION CONTRACTS (ASC 605-35)

### PERSPECTIVE AND ISSUES

---

Accounting for long-term construction contracts involves questions as to when revenue is to be recognized and how to measure the revenue to be recorded. The basic GAAP governing the recognition of long-term contract revenue is contained in ASC 605-35 and ASC 910.

The accounting for long-term construction contracts is complicated by the need to rely upon estimates of revenues, costs to be incurred, and progress toward completion.

In the process of codifying GAAP, the Financial Accounting Standards Board (FASB) made certain technical corrections to eliminate inconsistencies in the previously promulgated authoritative long-term contract literature.

The corrections clarify that:

1. To be combined for accounting purposes, contracts must meet the specified criteria discussed later in this section that are set forth in ASC 605-35-25-5, et seq., and
2. Under both the completed-contract method and percentage-of-completion method, full provision is to be made for losses on contracts in the period in which the loss becomes evident. (ASC 605-35-25-45, et seq.)

### DEFINITIONS OF TERMS

---

**Back Charges.** Billings for work performed or costs incurred by one party (the biller) that, in accordance with the agreement, should have been performed or incurred by the party billed.

**Change Order.** A legal document executed by a contractor and customer (which can be initiated by either) that modifies selected terms of a contract (e.g., pricing, timing, and scope of work) without the necessity of redrafting the entire contract.

**Claims.** Amounts in excess of the agreed contract price that a contractor seeks to collect from customers for customer-caused delays, errors in specifications and designs, unapproved change orders, or other causes of unanticipated costs. (ASC 605-35)

**Combining Contracts.** Grouping two or more contracts into a single profit center for accounting purposes.

**Completed-Contract Method.** A method of accounting that recognizes revenue only after the contract is complete.

**Cost-to-Cost Method.** A percentage-of-completion method used to determine the extent of progress toward completion on a contract. The ratio of costs incurred from project inception through the end of the current period (numerator) to the total estimated costs of the project

(denominator) is applied to the contract price (as adjusted for change orders) to determine total contract revenue earned to date.

**Estimated Cost to Complete.** The anticipated additional cost of materials, labor, subcontracting costs, and indirect costs (overhead) required in order to complete a project at a scheduled time.

**Percentage-of-Completion Method.** A method of accounting that recognizes revenue on a contract as work progresses.

**Precontract Costs.** Costs incurred before a contract has been accepted (e.g., architectural designs, purchase of special equipment, engineering fees, and start-up costs).

**Profit Center.** A unit for the accumulation of revenues and costs for the measurement of contract performance.

**Progress Billings on Long-Term Contracts.** Requests for partial payments sent to the customer in accordance with the terms of the contract at agreed-upon intervals as various project milestones are reached.

**Segmenting Contracts.** Dividing a single contract or group of contracts into two or more profit centers for accounting purposes.

**Subcontractor.** A second-level contractor who enters into a contract with a prime (general) contractor to perform a specific part or phase of a construction project.

**Substantial Completion.** The point at which the major work on a contract is completed and only insignificant costs and potential risks remain.

**Work-in-Progress (WIP).** The accumulated construction costs of the project that have been incurred since project inception.

## CONCEPTS, RULES, AND EXAMPLES

---

Long-term construction contract revenue is recognizable over time as construction progresses rather than at the completion of the contract. This “as earned” approach to revenue recognition is justified, because under most long-term construction contracts both the buyer and the seller (contractor) obtain legally enforceable rights. The buyer has the legal right to require specific performance from the contractor and, in effect, has an ownership claim to the contractor’s work-in-progress. The contractor, under most long-term contracts, has the right to require the buyer to make progress payments during the construction period. The substance of this business activity is that revenue is earned continuously as the work progresses.

### Methods of Accounting

ASC 605-35 describes the two generally accepted methods of accounting for long-term construction contracts.

**The percentage-of-completion method.** ASC 605-35 states that:

*The percentage-of-completion method recognizes income as work on a contract (or group of closely related contracts) progresses. The recognition of revenues and profits is generally related to costs incurred in providing the services required under the contract.*

Under this method, *work-in-progress* (WIP) is accumulated in the accounting records. At any point in time if the cumulative billings to date under the contract exceed the amount of the WIP plus the portion of the contract’s estimated gross profit attributable to that WIP, then the contractor recognizes a current liability captioned “billings in excess of costs and estimated earnings.” This liability recognizes the remaining obligation of the contractor to complete additional work prior to recognizing the excess billing as revenue.

If the reverse is true, that is, the accumulated WIP and gross profit earned exceed billings to date, then the contractor recognizes a current asset captioned “costs and estimated earnings in excess of billings.” This asset represents the portion of the contractor’s revenues under the contract that have been earned but not yet billed under the contract provisions. Where more than one contract exists, these assets and liabilities are determined on a project-by-project basis, with the accumulated assets and liabilities being separately stated on the statement of financial position. Assets and liabilities are not offset unless a right of offset exists. Thus, the net debit balances for certain contracts are not ordinarily offset against net credit balances for other contracts. An exception may exist if the balances relate to contracts that meet the criteria for combining described in ASC 605-35 and discussed later in this section.

Under the percentage-of-completion method, income is not based on cash collections or interim billings. Cash collections and interim billings are based upon contract terms that do not necessarily measure contract performance.

**The completed-contract method.** ASC 605-35 states that:

*The completed-contract method recognizes income only when the contract is complete, or substantially complete.*

Under this method, contract costs and related billings are accumulated in the accounting records and reported as deferred items on the statement of financial position until the project is complete or substantially complete. A contract is regarded as substantially complete if remaining costs of completion are immaterial. When the accumulated costs (WIP) exceed the related billings, the excess is presented as a current asset (inventory account). If billings exceed related costs, the difference is presented as a current liability. This determination is also made on a project-by-project basis with the accumulated assets and liabilities being separately stated on the statement of financial position. An excess of accumulated costs over related billings is presented as a current asset, and an excess of accumulated billings over related costs is presented in most cases as a current liability.

**Preferability assessment.** ASC 605-35 deems the percentage-of-completion method to be preferable when estimates are reasonably dependable and the following conditions exist:

1. Contracts executed by the parties include provisions that clearly specify the enforceable rights regarding goods or services to be provided and received by the parties, the consideration to be exchanged, and the manner and terms of settlement.
2. The buyer can be expected to satisfy his or her obligations under the contract.
3. The contractor can be expected to perform his or her contractual obligations.

ASC 605-35 presumes that contractors generally have the ability to produce estimates that are sufficiently dependable to justify the use of the percentage-of-completion method of accounting. Persuasive evidence to the contrary is necessary to overcome this presumption.

The principal advantage of the completed-contract method is that it is based on final results, whereas the percentage-of-completion method is dependent upon estimates for unperformed work. The principal disadvantage of the completed-contract method is that when the period of a contract extends into more than one accounting period, there will be an irregular recognition of income.

These two methods are not equally acceptable alternatives for the same set of circumstances. ASC 605-35 states that, in general, when estimates of costs to complete and extent of progress toward completion of long-term contracts are reasonably dependable, the percentage-of-completion method is preferable. When lack of dependable estimates or inherent hazards cause forecasts to be doubtful, the completed-contract method is preferable.

The completed-contract method may also be acceptable when a contractor has numerous relatively short-term contracts and when results of operations do not vary materially from those that would be reported under the percentage-of-completion method.

Based on the contractor's individual circumstances, a decision is made as to whether to apply completed-contract or percentage-of-completion accounting as the entity's basic accounting policy. If warranted by different facts and circumstances regarding a particular contract or group of contracts, that contract or group of contracts is to be accounted for under the other method with accompanying financial statement disclosures of this departure from the normal policy.

### Costs Incurred

**Precontract costs.** Precontract costs are costs incurred before a contract has been entered into, with the expectation of the contract being accepted and thereby recoverable through future billings. Precontract costs include architectural designs, costs of learning a new process, and any other costs that are expected to be recovered if the contract is accepted. ASC 720-15 requires that precontract costs be expensed as incurred, as they are the equivalent of start-up costs in other types of businesses. Consequently, precontract costs are not permitted to be included in WIP. Contract costs incurred after the acceptance of the contract are costs incurred toward the completion of the project and are accumulated in *work-in-progress* (WIP).

If precontract costs are incurred in connection with a current contract in anticipation of obtaining additional future contracts, those costs are nevertheless accounted for as costs of the current contract. If such costs are not incurred in connection with a current contract, then they must be expensed as incurred. There is no look-back provision permitted by this rule. A contractor may not retroactively record precontract costs as WIP if a contract is subsequently executed.

**Contract costs.** Contract costs are costs identifiable with or allocable to specific contracts. Generally, contract costs include all direct costs, such as direct materials, direct labor, and any indirect costs (overhead) allocable to the contracts. Contract costs can be broken down into two categories: costs incurred to date and estimated costs to complete.

The company may choose to defer costs related to producing excess goods in anticipation of future orders of the same item. Costs associated with excess production can be treated as inventory if the costs are considered recoverable.

**Estimated costs to complete.** These are the anticipated costs required to complete a project at a scheduled time. They are comprised of the same elements as the original total estimated contract costs and are based on prices expected to be in effect when the costs will be incurred.

The latest estimates are used to determine the progress toward completion. ASC 605-35 provides the practices to be followed when estimating costs to complete.

Systematic and consistent procedures are to be used. These procedures are to be correlated with the cost accounting system in order to facilitate a comparison between actual and estimated costs. Additionally, the determination of estimated total contract costs is to identify the significant cost elements.

Estimated costs are to reflect any expected price increases. These expected price increases are not "blanket provisions" for all contract costs, but rather specific provisions for each specific type of cost. Expected increases in each of the cost elements, such as wages, materials, and overhead items, are considered separately.

Finally, estimates of costs to complete are to be reviewed periodically to reflect new information. Estimates of costs are to be examined for price fluctuations and reviewed for possible future problems, such as labor strikes or direct material delivery delays.

Accounting for contract costs is similar to accounting for inventory. Costs necessary to ready the asset for sale (transfer of possession and occupancy by the customer) are recorded in WIP as

incurred. WIP includes both direct and indirect costs but not general and administrative expenses or selling expenses, since by definition they are not identifiable with a particular contract and are therefore treated as period costs. However, general and administrative expenses may be included in contract costs under the completed contract method since this could result in better matching of revenues and costs, especially in years when no contracts were completed.

**Subcontractor costs.** Since a contractor may not be able to perform all facets of a construction project, one or more subcontractors may be engaged. Amounts earned by the subcontractor are included in contract costs as the work is completed. These amounts are directly attributable to the project and included in WIP, similar to direct materials and direct labor.

**Back charges.** Contract costs may require adjustment for back charges. A back charge is a billing by the contractor to a subcontractor (or a reduction in the amount due to that subcontractor under the subcontract) for costs incurred by the contractor to complete or correct work that the contract stipulated was to have been performed by the subcontractor. These charges are often disputed by the parties involved.

#### Example of a back charge situation

The subcontract (the contract between the general contractor and the subcontractor) obligates the subcontractor to raze a building and prepare the land for construction of a replacement building. The general contractor had to clear away debris left by the subcontractor before construction could begin. The general contractor expects to be reimbursed for the work since it was required to be performed by the subcontractor. The contractor back charges the subcontractor for the costs of debris removal.

The contractor treats the back charge as a receivable from the subcontractor (or a reduction in the amount payable to the subcontractor) and reduces contract costs by the amount recoverable. If the subcontractor disputes the back charge, the cost becomes a claim. Claims are an amount in excess of the agreed contract price or amounts not included in the original contract price that the contractor seeks to collect. Claims are only recorded as additional contract revenue if the requirements set forth in ASC 605-35 are met.

The subcontractor records the back charge as a payable and as additional contract costs if it is probable the amount will be paid. If the amount or validity of the liability is disputed, the subcontractor considers the probable outcome in order to determine the proper accounting treatment.

### Types of Contracts

Four types of contracts are distinguished based on their pricing arrangements: (1) fixed-price or lump-sum contracts, (2) time-and-materials contracts, (3) cost-type contracts, and (4) unit-price contracts.

Fixed-price contracts are contracts for which the price is not usually subject to adjustment because of costs incurred by the contractor. The contractor bears the risks of cost overruns.

Time-and-materials contracts are contracts that provide for payments to the contractor based on direct labor hours at fixed rates and the contractor's cost of materials.

Cost-type contracts provide for reimbursement of allowable or otherwise defined costs incurred plus a fee representing profits. Some variations of cost-plus contracts are (1) cost-without-fee: no provision for a fee, (2) cost-plus-fixed-fee: contractor reimbursed for costs plus provision for a fixed fee, and (3) cost-plus-award-fee: same as (2) plus provision for an award based on performance. The contract price on a cost-type contract is determined by the sum of the reimbursable expenditures and a fee. The fee is the profit margin (revenue less direct expenses) to be earned on the contract.

Unit-price contracts are contracts under which the contractor is paid a specified amount for every unit of work performed.

Contract costs (incurred and estimated to complete) are used to compute the gross profit or loss recognized. Under the percentage-of-completion method, gross profit or loss is recognized

each period. The revenue recognized is matched against the contract costs incurred (similar to cost of goods sold) to determine gross profit or loss. Under the completed contract method, the gross profit or loss is determined at the substantial completion of the contract, and no revenue or contract costs are recognized until this point.

Additionally, inventoriable costs (accumulated in WIP) are never to exceed the NRV of the contract. When contract costs exceed their NRV, they must be written down, requiring a contract loss to be recognized in the current period (this will be discussed in greater detail later). This is similar to accounting for inventory.

#### Example of contract types

Domino Construction Inc. enters into a government contract to construct an early warning radar dome. The contract amount is for \$1,900,000, on which Domino expects to incur costs of \$1,750,000 and earn a profit of \$150,000. Costs expected to be incurred on the project are:

Concrete pad	\$ 175,000
Pad installation labor	100,000
Radar dome	1,150,000
Dome installation labor	<u>325,000</u>
Total cost	<u>\$1,750,000</u>

This is a two-month project, where a concrete pad is installed during the first month and a prefabricated dome is assembled on the pad during the second month. To comply with bank loan agreements, complete GAAP-basis financial statements are prepared by Domino at each month-end. Domino encounters problems pouring the concrete pad, requiring its removal and reinstallation. The extra cost incurred is \$175,000. During the second month, in order to meet the completion deadline, Domino spends an extra \$35,000 on overtime for the dome construction crew. Domino records different billable amounts and profits under the following five contract scenarios:

1. *Fixed-price contract.* At the end of the first month of work, Domino has already lost all of its profit and expects to incur an additional loss of \$25,000. It then incurs an additional loss of \$35,000 in the second month. Domino issues one billing upon completion of the project. Its calculation of losses on the contract follows:

	<u>Month 1</u>	<u>Month 2</u>
Total billing at completion	\$ 1,900,000	\$ 1,900,000
– Expected total costs	(1,750,000)	(1,925,000)
– Additional costs	(175,000)	(35,000)
+ Loss already recorded	—	25,000
= Loss to record in current period	<u>\$ (25,000)</u>	<u>\$ (35,000)</u>

2. *Cost-plus-fixed fee.* Domino completes the same project, but bills it to the government at cost at the end of each month, as well as a \$150,000 fixed fee at the end of the project that is essentially a project management fee and which comprises all of Domino's profit. The project completion entry follows:

	<u>Month 1</u>	<u>Month 2</u>	<u>Totals</u>
Expected material costs	\$175,000	\$1,150,000	\$1,325,000
+ Additional material costs	175,000	—	175,000
+ Expected labor costs	100,000	325,000	425,000
+ Additional labor costs	—	35,000	35,000
+ Fixed fee	—	150,000	150,000
= Total billing	<u>\$450,000</u>	<u>\$1,660,000</u>	<u>\$2,110,000</u>

3. *Cost-plus-award.* Domino completes the same cost-plus-fixed-fee contract just described, but also bills the government an additional \$50,000 for achieving the stipulated construction deadline, resulting in a total profit of \$200,000. The project completion entry follows:

	<u>Month 1</u>	<u>Month 2</u>	<u>Totals</u>
Expected material costs	\$175,000	\$1,150,000	\$1,325,000
+ Additional material costs	175,000	—	175,000
+ Expected labor costs	100,000	325,000	425,000
+ Additional labor costs	—	35,000	35,000
+ Fixed fee	—	150,000	150,000
+ Timely completion bonus	—	50,000	50,000
= Total billing	<u>\$450,000</u>	<u>\$1,710,000</u>	<u>\$2,160,000</u>

4. *Time-and materials contract with no spending cap.* Domino completes the same project, but bills all costs incurred at the end of each month to the government. The additional material cost of the concrete pad is billed at cost, while the overtime incurred is billed at a standard hourly rate with a 25% markup. Domino's profit is contained within the markup on its labor billings. Domino records a profit on the project of \$115,000 on total billings of \$2,075,000. Its calculation of profits on the contract follows:

	<u>Month 1</u>	<u>Month 2</u>	<u>Totals</u>
Expected material costs	\$175,000	\$1,150,000	\$1,325,000
+ Additional material costs	175,000	—	175,000
+ Expected labor costs	100,000	325,000	425,000
+ Additional labor costs	—	35,000	35,000
+ 25% profit on labor costs billed	25,000	90,000	115,000
= Total billing	<u>\$475,000</u>	<u>\$1,600,000</u>	<u>\$2,075,000</u>

5. *Time and material contract with spending cap.* Domino completes the same time-and-materials project just described, but the contract authorization is divided into two task orders; one authorizes a spending cap of \$450,000 on the concrete pad installation, while the second task order caps spending on the radar dome at \$1,500,000. Domino records a loss of \$10,000 on total billings of \$1,950,000. Its calculation of profits on the contract follows:

	<u>Month 1</u>	<u>Month 2</u>	<u>Totals</u>
Expected material costs	\$175,000	\$1,150,000	\$1,325,000
+ Additional material costs	175,000	—	175,000
+ Expected labor costs	100,000	325,000	425,000
+ Additional labor costs	—	35,000	35,000
+ 25% profit on labor costs billed	25,000	90,000	115,000
- Spending cap limitation	(25,000)	(100,000)	(125,000)
= Total billing	<u>\$450,000</u>	<u>\$1,500,000</u>	<u>\$1,950,000</u>

## Revenue Measurement

In practice, various methods are used to measure the extent of progress toward completion. The most common methods are the cost-to-cost method, efforts-expended method, units-of-delivery method, and units-of-work-performed method. Each of these methods of measuring progress on a contract can be identified as either an input or output measure.

The input measures attempt to identify progress on a contract in terms of the efforts devoted to it. The cost-to-cost and efforts-expended methods are examples of input measures. Under the cost-

to-cost method, the percentage of completion is estimated by comparing total costs incurred from the inception of the job to date (numerator) to total costs expected for the entire job (denominator).

Output measures are made in terms of results by attempting to identify progress toward completion by physical measures. The units-of-delivery and units-of-work-performed methods are examples of output measures. Under both of these methods, an estimate of completion is made in terms of achievements to date.

Both input and output measures have drawbacks in certain circumstances. A significant problem of input measures is that the relationship between input and productivity is only indirect; inefficiencies and other factors can cause this relationship to change. A particular drawback of the cost-to-cost method is that costs of uninstalled materials and other up-front costs may produce higher estimates of the percentage-of-completion because of their early incurrence. These costs are excluded from the cost-to-cost computation or allocated over the contract life when it appears that a better measure of contract progress will be obtained.

A significant problem of output measures is that the cost, time, and effort associated with one unit of output may not be comparable to that of another. For example, because of the cost of the foundation, the costs to complete the first story of a twenty-story office building can be expected to be greater than the costs of the remaining nineteen floors.

Because ASC 605-35 recommends that “recognized income [is to] be that percentage of estimated total income . . . that incurred costs to date bear to estimated total costs,” the cost-to-cost method has become one of the most popular measures used to determine the extent of progress toward completion.

Under the cost-to-cost method, the percentage of revenue to recognize can be determined by the following formula:

$$\left( \frac{\text{Cost to date}}{\text{Cost to date} + \text{Estimated costs to complete}} \times \frac{\text{Contract price}}{\text{Revenue previously recognized}} \right) = \frac{\text{Current revenue recognized}}{\text{Revenue previously recognized}}$$

By slightly modifying this formula, current gross profit can also be determined:

$$\left( \frac{\text{Cost to date}}{\text{Cost to date} + \text{Estimated costs to complete}} \times \frac{\text{Expected total gross profit}}{\text{Gross profit previously recognized}} \right) = \frac{\text{Current gross profit earned}}{\text{Gross profit previously recognized}}$$

#### Example of percentage-of-completion (cost-to-cost) and completed-contract methods with profitable contract

Assume a \$500,000 contract that requires three years to complete and incurs a total cost of \$405,000. The following data pertain to the construction period:

	<u>Year 1</u>	<u>Year 2</u>	<u>Year 3</u>
Costs incurred during the period	\$150,000	\$210,000	\$45,000
Cumulative costs incurred to date	150,000	360,000	405,000
Estimated costs yet to be incurred at year-end	300,000	40,000	—
Estimated total costs	450,000	400,000	—
Progress billings made during the year	100,000	370,000	30,000
Cumulative billings to date	100,000	470,000	500,000
Collections of billings	75,000	300,000	125,000

#### Journal Entries Common to Completed-Contract and Percentage-of-Completion Methods

	<u>Year 1</u>		<u>Year 2</u>		<u>Year 3</u>	
Work-in-progress	150,000		210,000		45,000	
Cash, payables, etc.		150,000		210,000		45,000

Contract receivables	100,000		370,000		30,000	
Billings on contracts		100,000		370,000		30,000
Cash	75,000		300,000		125,000	
Contract receivables		75,000		300,000		125,000

**Journal Entries for Completed-Contract Method Only**

Billings on contracts	500,000	
Cost of revenues earned	405,000	
Contract revenues earned		500,000
Work-in-progress		405,000

**Journal Entries for Percentage-of-Completion Method Only**

Cost of revenues earned	150,000		210,000		45,000	
Work-in-progress		150,000		210,000		45,000
Billings on contracts	100,000		370,000		30,000	
Contract revenues earned		166,667		283,333		50,000
Costs and estimated earnings in excess of billings on uncompleted contracts	66,667			66,667		
Billings in excess of costs and estimated earnings on uncompleted contracts				20,000	20,000	

**Income Statement Presentation**

	<u>Year 1</u>	<u>Year 2</u>	<u>Year 3</u>	<u>Total</u>
<b>Percentage-of-completion</b>				
Contract revenues earned	\$166,667*	\$283,333**	\$ 50,000***	\$500,000
Cost of revenues earned	(150,000)	(210,000)	(45,000)	(405,000)
Gross profit	\$ <u>16,667</u>	\$ <u>73,333</u>	\$ <u>5,000</u>	\$ <u>95,000</u>
<b>Completed-contract</b>				
Contract revenues earned	—	—	\$500,000	\$500,000
Cost of revenues completed	—	—	(405,000)	(405,000)
Gross profit	—	—	\$95,000	\$95,000

$$* \frac{\$150,000}{450,000} \times 500,000 = \$166,667$$

$$** (\frac{\$360,000}{400,000} \times 500,000) - \$166,667 = \$283,333$$

$$*** (\frac{\$405,000}{405,000} \times 500,000) - \$166,667 - 283,333 = \$50,000$$

*Statement of Financial Position Presentation*

		<i>Year 1</i>	<i>Year 2</i>	<i>Year 3</i>
<b><i>Percentage-of-completion</i></b>				
<i>Current assets:</i>				
Contract receivables		\$25,000	\$95,000	*
Costs and estimated earnings in excess of billings on uncompleted contracts		66,667		
<i>Current liabilities:</i>				
Billings in excess of costs and estimated earnings on uncompleted contracts, year 2			20,000	
<b><i>Completed-contract</i></b>				
<i>Current assets:</i>				
Contract receivables		\$25,000	\$95,000	*
Costs in excess of billings on uncompleted contracts				
Work-in-progress	150,000			
Less billings on long-term contracts	(100,000)	\$50,000		
<i>Current liabilities:</i>				
Billings in excess of costs on uncompleted contracts, year 2 (\$470,000 – 360,000)			\$110,000	

\* Since the contract was completed, there are no statement of financial position amounts at the end of year 3.

Some contractors adopt an accounting policy of not recognizing any gross profit on a contract that is less than 10% complete. This election is usually made for two reasons:

1. The contractor is qualified to make and has made the election permitted by Internal Revenue Code §460(b)(5) to defer the recognition of such gross profit for U.S. federal income tax purposes and wishes to avoid computational differences between applying the percentage-of-completion method for financial reporting and tax purposes, and
2. The contractor believes that this policy is prudent given the uncertainties associated with a contract that is so close to inception.

The GAAP effect of such a policy is usually immaterial and the accountant normally need not be concerned about it being a departure from GAAP.

### Contract Losses

When the current estimate of total contract costs exceeds the current estimate of total contract revenues, a provision for the entire loss on the entire contract is made. Losses are recognized in the period in which they become evident under either the percentage-of-completion method or the completed-contract method. The loss is computed on the basis of the total estimated costs to complete the contract, including the contract costs incurred to date plus estimated costs (use the

same elements as contract costs incurred) to complete. The loss is presented as a separately captioned current liability on the statement of financial position.

In any year when a percentage-of-completion contract has an expected loss, the amount of the loss reported in that year is computed as follows:

$$\text{Reported loss} = \text{Total expected loss} + \text{All profit previously recognized}$$

#### Example of percentage-of-completion and completed-contract methods with loss contract

Using the previous information, if the estimated costs yet to be incurred at the end of year 2 were \$148,000, the total expected loss is \$8,000 [ $\$500,000 - (360,000 + 148,000)$ ], and the total loss reported in year 2 would be \$24,667 ( $\$8,000 + 16,667$ ). Under the completed-contract method, the loss recognized is simply the total expected loss, \$8,000.

<i>Journal entry at end of year 2</i>	<i>Percentage-of-completion</i>	<i>Completed-contract</i>
Loss on uncompleted long-term contract (expense)	24,667	8,000
Estimated loss on uncompleted contract (liability)	24,667	8,000

#### **Profit or Loss Recognized on Contract (Percentage-of-Completion Method)**

	<i>Year 1</i>	<i>Year 2</i>	<i>Year 3</i>
Contract price	\$500,000	\$500,000	\$ 500,000
Estimated total costs:			
Costs incurred contract-to-date	\$150,000	\$360,000	\$506,000*
Estimated costs yet to be incurred	300,000	148,000	—
Estimated total costs for the three-year period, actual for year 3	<u>\$450,000</u>	<u>\$508,000</u>	<u>\$ 506,000</u>
Estimated gross profit (loss), actual for year 3	<u>50,000</u>	<u>(8,000)</u>	<u>(6,000)</u>

#### *Year 1      Year 2      Year 3*

#### **Summary of Effect on Results of Operations**

Current end-of-year estimate of gross profit (loss) actual for year 3	<u>—</u>	<u>\$ (8,000)</u>	<u>\$ (6,000)</u>
Accumulated effect of gross profit (loss) recognized in prior years	<u>—</u>	<u>16,667</u>	<u>(8,000)</u>
Effect on gross profit (loss) recognized in current year	<u>—</u>	<u><u>\$ (24,667)</u></u>	<u><u>\$ 2,000</u></u>

\* Assumed.

#### **Profit or Loss Recognized on Contract (Completed-Contract Method)**

	<i>Year 1</i>	<i>Year 2</i>	<i>Year 3</i>
Contract price	\$500,000	\$500,000	\$ 500,000
Estimated total costs:			
Costs incurred to date	\$150,000	\$360,000	\$506,000*
Estimated cost yet to be incurred	300,000	148,000	—
Estimated total costs for the three-year period, actual for year 3	<u>\$450,000</u>	<u>\$508,000</u>	<u>\$ 506,000</u>

Estimated profit (loss), inception-to-date, actual for year 3	\$50,000	\$(8,000)	\$ (6,000)
Loss previously recognized	—	—	\$ (8,000)
Amount of estimated income (loss) recognized in the current period, actual for year 3	—	<u>\$(8,000)</u>	\$ <u>2,000</u>

\* Assumed.

Upon completion of the project during year 3, it can be seen that the actual loss was only \$6,000 ( $\$500,000 - \$506,000$ ); therefore, the estimated loss provision was overstated in previous years by \$2,000. However, since this is a change of an estimate, the \$2,000 difference must be handled prospectively; consequently, \$2,000 of income is recognized in year 3 (\$8,000 loss previously recognized – \$6,000 actual loss).

## Combining and Segmenting Contracts

The profit center for accounting purposes is usually a single contract, but under some circumstances the profit center may be a combination of two or more contracts, a segment of a contract, or a group of combined contracts. The contracts must meet requirements in ASC 605-35 in order to combine, or segment; otherwise, each individual contract is presumed to be the profit center.

For accounting purposes, a group of contracts may be combined if they are so closely related that they are, in substance, parts of a single project with an overall profit margin. Per ASC 605-35, a group of contracts may be combined if the contracts:

1. Are negotiated as a package in the same economic environment with an overall profit margin objective.
2. Constitute an agreement to do a single project.
3. Require closely interrelated construction activities.
4. Are performed concurrently or in a continuous sequence under the same project management.
5. Constitute, in substance, an agreement with a single customer.

Segmenting a contract is a process of breaking up a larger unit into smaller units for accounting purposes. If the project is segmented, revenues are assigned to the different elements or phases to achieve different rates of profitability based on the relative value of each element or phase to the estimated total contract revenue. According to ASC 605-35, a project may be segmented if all of the following steps were taken and are documented and verifiable:

1. The contractor submitted bona fide proposals on the separate components of the project and on the entire project.
2. The customer had the right to accept the proposals on either basis.
3. The aggregate amount of the proposals on the separate components approximated the amount of the proposal on the entire project.

A project that does not meet the above criteria may still be segmented if all of the following are applicable:

1. The terms and scope of the contract or project clearly call for the separable phases or elements.
2. The separable phases or elements of the project are often bid or negotiated separately in the marketplace.
3. The market assigns different gross profit rates to the segments because of factors such as different levels of risk or differences in the relationship of the supply and demand for the services provided in different segments.

4. The contractor has a significant history of providing similar services to other customers under separate contracts for each significant segment to which a profit margin higher than the overall profit margin on the project is ascribed.
5. The significant history with customers who have contracted for services separately is one that is relatively stable in terms of pricing policy rather than one unduly weighted by erratic pricing decisions (responding, for example, to extraordinary economic circumstances or to unique customer-contractor relationships).
6. The excess of the sum of the prices of the separate elements over the price of the total project is clearly attributable to cost savings incident to combined performance of the contract obligations (for example, cost savings in supervision, overhead, or equipment mobilization). Unless this condition is met, segmenting a contract with a price substantially less than the sum of the prices of the separate phases or elements is inappropriate even if the other conditions are met. Acceptable price variations are allocated to the separate phases or elements in proportion to the prices ascribed to each. In all other situations, a substantial difference in price (whether more or less) between the separate elements and the price of the total project is evidence that the contractor has accepted different profit margins. Accordingly, segmenting is not appropriate, and the contracts are the profit centers.
7. The similarity of services and prices in the contract segments and services and the prices of such services to other customers contracted separately are documented and verifiable.

Note that the criteria for combining and segmenting are to be applied consistently to contracts with similar characteristics and in similar circumstances.

### Joint Ventures and Shared Contracts

Especially large or risky contracts are sometimes shared by more than one contractor. When the owner of the contract requests competitive bids, many contractors will form syndicates or joint ventures in order to bid on and successfully obtain a contract that each contractor individually could not perform.

When this occurs, a separate set of accounting records is maintained for the joint venture. If the percentages of interest for each of the participants are identical in more than one contract, the joint venture might keep its records in the same manner as it would if it was simply another construction company. Usually, the joint venture is for a single contract and ends upon completion of that contract.

A joint venture is a type of partnership, organized for a limited purpose. An agreement of the parties and the terms of the contract successfully bid upon will determine the nature of the accounting records. Income statements are usually cumulative statements showing totals from date of contract inception until reporting date. Each participant records its share of the amount from the venture's income statement less its previously recorded portion of the venture's income as a single line item similar to the equity method for investments. Similarly, statements of financial position of each participant present a single line asset balance, "investment in and advances to joint ventures." In most cases, footnote disclosure is similar to the equity method and presents condensed financial statements of material joint ventures.

**Accounting for transactions with unrelated third parties.** A participant in a collaborative arrangement recognizes revenue earned and costs incurred in transactions with third parties (parties that are not participants to the collaborative arrangement) in its income statement based on whether the participant is serving as a principal or an agent in the transaction under ASC 605-45. If

the transacting participant is considered a principal in the transaction, the revenues and costs are recorded gross. If the transacting participant is considered an agent in the transaction, the revenues and costs are recorded net. Under no circumstances is a participant in a collaborative arrangement permitted to use the equity method to account for its activities associated with the collaborative arrangement.

ASC 605-45 does not provide a “bright-line” test that definitively would characterize the role of a participant in a transaction. Rather, it provides a series of indicators of gross reporting and a series of indicators of net reporting, the purpose of which is to enable management to analyze the facts and circumstances associated with the transaction to make a well-reasoned determination.

#### ***Indicators of gross reporting (principals).***

- *Participant is primary obligor.* Under ASC 605-45, this is considered to be a “strong indicator” of the participant’s role in the transaction.
- *Participant has authority, within reasonable limits, to establish price.* Even when subject to reasonable, preestablished economic constraints, if the participant has the authority to negotiate price with the customer, this may indicate that the participant possesses risks and rewards of a principal to the transaction.
- *Participant involvement in determining specifications.* If the participant has the authority to determine the nature, type, characteristics, or specifications of the products and/or services ordered by the customer, this may be indicative of the participant having primary responsibility for fulfillment. For the purposes of analyzing the applicability of this indicator, the evaluator considers whether the participant makes physical alterations to the product or performs services that add value sufficient to increase the selling price to the customer.
- *Participant performance.* The participant changes the product or performs part of the service.
- *Participant discretion in supplier selection.*
- *Participant exposed to inventory risks.* The participant bears inventory risk in one or both of the following manners:
  - General inventory risk either before the customer places the order or upon the return of the inventory by the customer
  - Specific risk of physical inventory loss after the customer places the order or during shipping of the inventory.
- *Participant bears credit risk.*

#### ***Indicators of net reporting (agents).***

- *Participant is not the primary obligor.* The supplier of the goods or services, not the participant, is the primary obligor in the transaction.
- *Participant earnings are fixed.* The amount the participant earns is fixed.
- *Participant is not exposed to credit risk.* The supplier and not the participant bears credit risk in connection with the transaction.

**Accounting for transactions between participants.** In evaluating the income statement characterization of transactions between participants to a collaborative arrangement, management is to consider:

- The nature of the arrangement
- The contractual terms of the arrangement

- The nature of the participant's business operations
- Whether the transactions are included in the scope of other authoritative GAAP literature on income statement classification, either directly or by analogy.

If no authoritative GAAP is identified that is relevant directly or by analogy, management elects a reasonable and rational accounting policy to be consistently applied to all such similar transactions.

### Accounting for Change Orders

Change orders are modifications of specifications or provisions of an original contract. Contract revenue and costs are adjusted to reflect change orders that are approved by the contractor and customer. According to ASC 605-35, accounting for a change order depends on the scope and price of the change.

If the scope and price have both been agreed to by the customer and contractor, contract revenue and cost are both adjusted to reflect the change order.

According to ASC 605-35, accounting for unpriced change orders depends on their characteristics and the circumstances in which they occur. Under the completed-contract method, costs attributable to unpriced change orders are deferred as contract costs if it is probable that total contract costs, including costs attributable to the change orders, will be recovered from contract revenues. Recovery is deemed probable if the future event or events are likely to occur.

Per ASC 605-35, the following guidelines apply when accounting for unpriced change orders under the percentage-of-completion method:

1. If it is not probable that the costs will be recovered through a change in the contract price, costs attributable to unpriced change orders are treated as costs of contract performance in the period in which the costs are incurred.
2. If it is probable that the costs will be recovered through a change in the contract price, the costs are deferred (excluded from the costs of contract performance) until the parties have agreed on the change in contract price, or alternatively, treated as costs of contract performance in the period in which they are incurred with a corresponding increase to contract revenue in the amount of the costs incurred.
3. If it is probable that the contract price will be adjusted by an amount that exceeds the costs attributable to the change order and both (a) the amount of the excess can be reliably estimated, and (b) realization of the full contract price adjustment is probably beyond a reasonable doubt, then the original contract price is adjusted for the full amount of the adjustment as the costs are recognized.

However, since the substantiation of the amount of future revenue is difficult, satisfaction of the condition of "realization beyond a reasonable doubt" should only be considered satisfied in circumstances in which an entity's historical experience provides such assurance or in which an entity has received a bona fide pricing offer from a customer and records only the amount of the offer as revenue.

### Accounting for Contract Options

Per ASC 605-35, an addition or option to an existing contract is treated as a separate contract if any of the following circumstances exist:

1. The product or service to be provided differs significantly from the product or service provided under the original contract.

2. The price of the new product or service is negotiated without regard to the original contract and involves different economic judgments.
3. The products or services to be provided under the exercised option or amendment are similar to those under the original contract, but the contract price and anticipated contract cost relationship are significantly different.

If the addition or option does not meet the above circumstances, the contracts are combined unless the addition or option does not meet the criteria for combining, in which case it is treated as a change order.

### **Accounting for Claims**

Claims represent amounts in excess of the agreed-upon contract price that a contractor seeks to collect from customers for unanticipated additional costs. The recognition of additional contract revenue relating to claims is appropriate if it is probable that the claim will result in additional revenue and if the amount can be reliably estimated. ASC 605-35 specifies that all of the following conditions must exist in order for the probable and estimable requirements to be satisfied:

1. The contract or other evidence provides a legal basis for the claim; or a legal opinion has been obtained, stating that under the circumstances there is a reasonable basis to support the claim.
2. Additional costs are caused by circumstances that were unforeseen at the contract date and are not the result of deficiencies in the contractor's performance.
3. Costs associated with the claim are identifiable or otherwise determinable and are reasonable in view of the work performed.
4. The evidence supporting the claim is objective and verifiable, not based on management's "feel" for the situation or on unsupported representations.

When the above requirements are met, revenue from a claim is recorded only to the extent that contract costs relating to the claim have been incurred.

When the above requirements are not met, ASC 605-35 states that a contingent asset is disclosed in accordance with ASC 450.

### **Accounting Changes**

ASC 250 requires retroactive restatement as the standard methodology to be used for accounting for changes in accounting principle, including changes in the accounting for long-term construction contracts. (See the chapter on ASC 205 for further discussion.)

Revisions in revenue, cost, and profit estimates or in measurements of the extent of progress toward completion are changes in accounting estimates. These changes are accounted for prospectively in order for the financial statements to fully reflect the effects of the latest available estimates.

## **SERVICE REVENUES (ASC 605-20 AND ASC 605-45)**

### **PERSPECTIVE AND ISSUES**

---

Services represent over half of the transactions occurring in the U.S. economy, but there is no official codification of accounting standards that provides specific accounting rules for them. Accounting for service transactions has evolved primarily through industry practice, and as a result, different accounting methods have developed to apply the fundamental principles of

revenue and cost recognition. In fact, different accounting methods are used by similar entities for practically identical transactions.

The discussion in this section should still provide relevant guidance on service industry issues. In addition, the guidance provided by the SEC in Staff Accounting Bulletin 101 and its replacement, SAB 104, discussed in the introductory materials to this chapter, is highly relevant to accounting for service transactions and should be deemed pertinent to accounting even by nonpublic reporting entities, inasmuch as it reflects the current thinking by an authoritative source of GAAP.

## DEFINITIONS OF TERMS

---

**Collection Method.** A method that recognizes revenue when cash is collected.

**Completed Performance Method.** A method that recognizes revenue after the last significant act has been completed.

**Direct Costs.** Costs that are related specifically to the performance of services under a contract or other arrangement.

**Indirect Costs.** Costs that are incurred as a result of service activities that are not directly allocable to specific contracts or customer arrangements.

**Initiation Fee.** A onetime, up-front charge that gives the purchaser the privilege of using a service or facilities.

**Installation Fee.** A onetime, up-front charge for making equipment operational so that it functions as intended.

**Out-of-pocket Costs.** Costs incurred incidental to the performance of services that are often reimbursable to the service firm by the customer either at actual cost or at an agreed-upon rate (e.g., meals, lodging, airfare, taxi fares, etc.).

**Precontract or Preeengagement Costs.** Costs incurred prior to execution of a service contract or engagement letter.

**Product Transaction.** A transaction between a seller and a purchaser in which the seller supplies tangible merchandise to the purchaser.

**Proportional Performance Method.** A method that recognizes revenue on the basis of the number of acts performed in relation to the total number of acts to be performed.

**Service Transaction.** A transaction between a seller and a purchaser in which the seller performs work, or agrees to maintain a readiness to perform work, for the purchaser.

**Specific Performance Method.** A method that recognizes revenue after one specific act has been performed.

## CONCEPTS, RULES, AND EXAMPLES

---

Codification defines service transactions as follows:

*. . . transactions between a seller and a purchaser in which, for a mutually agreed price, the seller performs, agrees to perform, agrees to perform at a later date, or agrees to maintain readiness to perform an act or acts, including permitting others to use enterprise resources that do not alone produce a tangible commodity or product as the principal intended result. (ASC 605-35-15-6j)*

Generally accepted accounting principles require that revenue generally be recognized when (1) it is realized or realizable, and (2) it has been earned. With respect to service transactions:

*. . . revenue from service transactions [is to] be based on performance, because performance determines the extent to which the earnings process is complete or virtually complete.*

In practice, performance may involve the execution of a defined act, a set of similar or identical acts, or a set of related but not similar or identical acts. Performance may also occur with the passage of time. Accordingly, one of the following four methods can serve as a guideline for the recognition of revenue from service transactions:

1. The specific performance method
2. The proportional performance method
3. The completed performance method
4. The collection method.

### Service versus Product Transactions

Many transactions involve the sale of a tangible product and a service; therefore, for proper accounting treatment, it must be determined whether the transaction is primarily a service transaction accompanied by an incidental product, primarily a product transaction accompanied by an incidental service, or a sale in which both a service transaction and a product transaction occur. The following criteria apply:

1. **Service transactions.** If the seller offers both a service and a product in a single transaction and if the terms of the agreement for the sale of the service are worded in such a manner that the inclusion or exclusion of the product would not change the total transaction price, the product is incidental to the rendering of the service; the transaction is a service transaction that is accounted for in accordance with one of the four methods presented. For example, fixed-price equipment maintenance contracts that include parts at no additional charge are service transactions.
2. **Product transactions.** If the seller offers both a service and a product in a single transaction and if the terms of the agreement for the sale of the product are worded in such a manner that the inclusion or exclusion of the service would not change the total transaction price, the rendering of the service is incidental to the sale of the product; the transaction is a product transaction that is accounted for as such. For example, the sale of a product accompanied by a guarantee or warranty for repair is considered a product transaction.
3. **Service and product transactions.** If the seller offers both a product and a service and the agreement states the product and service are separate elements such that the inclusion or exclusion of the service would vary the total transaction price, the transaction consists of two components: a product transaction that is accounted for separately as such, and a service transaction that is accounted for in accordance with one of the four accepted methods.

### Revenue Recognition Methods

Once a transaction is determined to be a service transaction, one of the following four methods is used to recognize revenue. The method chosen is to be based on the nature and extent of the service(s) to be performed.

1. **Specific performance method.** The specific performance method is used when performance consists of the execution of a single act. Revenue is recognized at the time the act takes place. For example, a stockbroker records sales commissions as revenue upon the sale of a client's investment.
2. **Proportional performance method.** The proportional performance method is used when performance consists of a number of identical or similar acts.

- a. If the service transaction involves a specified number of identical or similar acts, an equal amount of revenue is recorded for each act performed. For example, a refuse disposal company recognizes an equal amount of revenue for each weekly removal of a customer's garbage.
- b. If the service transaction involves a specified number of defined but not identical or similar acts, the revenue recognized for each act is based on the following formula:

$$\frac{\text{Direct cost of individual act}}{\text{Total revenues from complete transaction}} \times \frac{\text{Total estimated direct costs of the transaction}}{}$$

For example, a correspondence school that provides lessons, examinations, and grading would use this method. If the measurements suggested in the preceding equation are impractical or not objectively determinable, revenue is recognized on a systematic and rational basis that reasonably relates revenue recognition to service performance.

- c. If the service transaction involves an unspecified number of acts over a fixed time period for performance, revenue is recognized over the period during which the acts will be performed by using the straight-line method unless a better method of relating revenue and performance is appropriate. For example, a health club might recognize revenue on a straight-line basis over the term of a member's membership. Many professional service firms record revenues on their engagements on an "as-performed basis" by valuing labor time, as expended, at a standard hourly billing rate and accumulating these amounts as an asset (WIP). For periodic reporting, ending balances of WIP (and the related revenue recognized) must be adjusted by recording valuation allowances for unbillable or unrealizable WIP.

#### Example of proportional performance revenue recognition

The Cheyenne Snow Removal Company enters into a contract with the Western Office Tower to plow its parking lot. The contract states that Cheyenne will receive a fixed payment of \$500 to clear Western's central parking lot whenever snowfall exceeds two inches. Following an unusually snowy winter, Western elects to cap its snow removal costs by tying Cheyenne into an annual \$18,000 fixed price for snow removal, no matter how many snow storms occur. Snowfall is not predictable by month, and can occur over as much as a six-month period. Western pays the full amount in advance, resulting in the following entry by Cheyenne:

Cash	18,000
Customer advances	18,000

Though Cheyenne could recognize revenue on a straight-line basis through the contract period, it chooses to tie recognition more closely to actual performance with the proportional performance method. Its total estimated direct cost through the contract period is likely to be \$12,600, based on its average costs in previous years. There is one snowstorm in October, which costs Cheyenne \$350 for snow removal under the Western contract. Cheyenne's revenue recognition calculation in October is:

$$\frac{\$350 \text{ direct cost}}{\$12,600 \text{ total direct cost}} \times \$18,000 \text{ total revenue} = \$500 \text{ revenue recognition}$$

Thus, Cheyenne recognizes a gross margin of \$150 during the month. By the end of February, Cheyenne has conducted snow removal 28 times at the same margin, resulting in revenue recognition of

\$14,000 and a gross margin of \$4,200. Cheyenne's cumulative entry for all performance under the Western contract to date is as follows:

Customer advances	14,000
Direct labor expense	9,800
Revenue	14,000
Cash	9,800

In March, Cheyenne removes snow 12 more times at a cost of \$4,200. Its initial revenue recognition calculation during this month is:

$$\frac{\$350 \text{ direct cost}}{\$12,600 \text{ total direct cost}} \times \$18,000 \text{ total revenue} = \$500 \text{ revenue recognition}$$

However, this would result in total revenue recognition of \$20,000, which exceeds the contract fixed fee by \$2,000. Accordingly, Cheyenne only recognizes sufficient revenue to maximize the contract cap, resulting in a loss of \$200 for the month.

Customer advances	4,000
Direct labor expense	4,200
Revenue	4,000
Cash	4,200

3. **Completed performance method.** The completed performance method is used when more than one act must be performed and when the final act is so significant to the entire transaction taken as a whole that performance cannot be considered to have taken place until the performance of that final act occurs. For example, a moving company packs, loads, and transports merchandise; however, the final act of delivering the merchandise is so significant that revenue is not recognized until the goods reach their intended destination. If the services are to be performed in an indeterminable number of acts over an indeterminable period of time and if an objective measure for estimating the degree to which performance has taken place cannot be found, revenue is recognized under the completed performance method.
4. **Collection method.** The collection method is used in circumstances when there is a significant degree of uncertainty surrounding the collection of service revenue. Under this method, revenue is not recognized until the cash is collected. For example, personal services may be provided to a customer whose ability to pay is uncertain.

## Expense Recognition

GAAP, in general, requires that costs be recognized as expense in the period that the revenue with which they are associated is recognized (the matching principle). Costs are deferred only when they are expected to be recoverable from future revenues. When applying these principles to service transactions, special consideration must be given to the different types of costs that might arise. The major classifications of costs arising from service transactions are as follows:

1. **Precontract or preengagement costs.** These are costs that are incurred before the service contract (or engagement letter in many professional services firms) has been executed between the parties. They can include legal fees for negotiating contract terms, costs of credit investigations, and the salaries and benefits of individuals involved in negotiating contracts with prospective clients. (See the related discussion in the Long-term Construction Contracts section of this chapter.)

2. **Direct costs.** Costs that are specifically attributable to providing service under a specific contract or contracts. For example, service labor and repair parts on a fixed-price maintenance contract.
3. **Indirect costs.** Costs that are incurred as a result of all service activity but that are not directly allocable to any specific contracts or engagements.
4. **Out-of-pocket costs.** Costs incurred incidental to the performance of services that are often reimbursable to the service firm by the customer either at actual cost or at an agreed-upon rate (e.g., meals, lodging, airfare, taxi fare, etc.).
5. **Overhead.** General costs of running the business that do not fall into any of the above categories, often referred to as selling, general, and administrative expenses. These include uncollectible receivables, advertising, sales commissions, and facilities costs (depreciation, rent, maintenance, etc.).

**Accounting treatment.** The costs listed above are accounted for as follows:

1. **Precontract or preengagement costs.** Expense as incurred as start-up costs under all of the service revenue recognition methods.
2. **Direct costs.** Expense as incurred under all of the service revenue recognition methods because of the close correlation between the amount of direct costs incurred and the extent of performance achieved. Direct costs incurred prior to performance, referred to as initial direct costs (e.g., expendable materials purchased for use on the job/engagement that are purchased and held by the service enterprise as a form of inventory), are deferred and recorded as prepayments (or supplies inventory, depending on the nature of the item). Under the specific performance or completed performance methods, these costs are recognized as expenses at the time of service performance at the point that revenue is recognized. Under the proportional performance method, initial direct costs are charged to expense in proportion to the recognition of service revenue (i.e., by applying the ratio of revenues recognized in the period to total expected revenues over the life of the contract).
3. **Indirect costs.** Under all of the revenue recognition methods, indirect costs are expensed as incurred.
4. **Out-of-pocket costs.** Under all of the revenue recognition methods, out-of-pocket costs are expensed as incurred with the related client billings presented as revenue in the statement of income.
5. **Overhead.** Under all of the revenue recognition methods, overhead is expensed as incurred.

**Losses on service transactions.** These are recognized when direct costs incurred to date plus estimated remaining direct costs of performance exceed the current estimated net realizable revenue from the contract. The loss (given as the Direct costs incurred to date + Estimated remaining direct costs – Estimated realizable revenue) is first applied to reduce any recorded deferred costs to zero, with any remaining loss recognized on the income statement and credited to an estimated liability.

## Initiation and Installation Fees

Many service transactions also involve the charging of a nonrefundable initiation or activation fee with subsequent periodic payments for future services and/or a nonrefundable fee for installation of equipment essential to providing future services with subsequent periodic payments for the services. These nonrefundable fees may, in substance, be partly or wholly advance charges for future services.

**Initiation or activation fees.** If there is an objectively determinable value for the right or privilege granted by the fee, that value is recognized as revenue on the initiation date. Any related direct costs are recognized as expense on the initiation date. If the value of the right or privilege cannot be objectively determined, the fee is recorded as a liability for future services and recognized as revenue in accordance with one of the revenue recognition methods.

**Installation fees.** If the equipment and its installation costs are essential for the service to be provided and if customers cannot normally purchase the equipment in a separate transaction, the installation fee is considered an advance charge for future services. The fee is recognized as revenue over the estimated service period. The costs of installation and the installed equipment are amortized over the period the equipment is expected to generate revenue. If customers can normally purchase the equipment in a separate transaction, the installation fee is part of a product transaction that is accounted for separately as such.

#### Example of installation fees

Vintner Corporation has invented a nitrogen injection device for resealing opened wine bottles, calling it NitroSeal. The device is especially useful for restaurants, which can seal wine bottles opened for customers who want to take home unfinished wine. Because the NitroSeal device is massive, Vintner pays a third party to install each unit for a fixed fee of \$200, charging restaurants a \$300 nonrefundable installation fee plus a monthly fee for a 20-month cancelable contract. The initial entries to record an installation charge from a supplier and related installation billing to a customer are as follows:

Installation asset	200
Accounts payable	200
Accounts receivable	300
Unearned installation fees (liability)	300

Vintner recognizes the installation revenue and associated installation expense for each installation in 1/20 increments to match the contract length, each with the following entry:

Unearned installation fees	15
Installation revenue	15
Installation expense	10
Installation asset	10

A customer cancels its contract with Vintner after 5 months. As a result, Vintner accelerates all remaining amortization on the installation asset and recognizes all remaining unearned installation fees at once, using the following entries:

Unearned installation fees	225
Installation revenue	225
Installation expense	150
Installation asset	150

If the service contract had included a clause for a refundable installation fee, then cancellation after five months would still have resulted in immediate acceleration of amortization on the installation asset. However, the unearned installation revenue could not be recognized. Instead, the following entry would have recorded the return of the installation fee:

Unearned installation fees	225
Cash	225

## Other Guidance to Accounting for Service Transactions

Some elements of the accounting codification provide guidance to the accounting for service transactions. These are discussed in the following paragraphs.

**Freight services in process.** ASC 605-20-25 addresses the manner in which revenue and expense pertaining to freight services in process as of the date of the statement of financial position are to be given financial statement recognition. It holds that recognition of revenue when freight is received from the shipper or when freight leaves the carrier's terminal, with expenses recognized as incurred, is not acceptable accounting.

**Reporting reimbursable costs.** While not limited to service providers, a common situation for many professional service providers is the incurrence of costs that are later billed to clients, with or without a mark-up over actual cost. Examples of out-of-pocket expenses include meals, lodging, airfares, taxi fares, etc. Prior practice had been varied, with many reporting entities showing reimbursements, implicitly as offsets to expenses; others reported such reimbursements as revenue. While the net effect on reported earnings was the same under either approach, certain key performance measures, such as gross revenue, could vary considerably depending on choice of accounting method. ASC 605-45-15 mandates that any billings for out-of-pocket costs are to be classified as revenue in the statement of income and not as a reduction in expenses. This guidance is equally applicable whether expenses are billed to clients (1) as a pass-through (i.e., at actual cost to the service firm without a markup), (2) at a marked-up amount, or (3) are included in the billing rate or negotiated price for the services.

**Separately priced extended warranties.** Extended warranties provide additional protection beyond that of the manufacturer's original warranty, lengthen the period of coverage specified in the manufacturer's original warranty, or both. Similarly, a product maintenance contract is an agreement for services to maintain a product for a certain length of time. Clearly, revenue recognition at inception is not acceptable, and it is often impossible to estimate the actual pattern of service that will be provided to the customers over the terms of the contracts. ASC 605-20-25 directs that revenue from these contracts be deferred and recognized on a straight-line basis unless evidence exists that costs are incurred on some other basis. If so, revenue is allocated to each period using the ratio of the period's cost to estimated total cost.

Direct costs of obtaining extended warranty or maintenance contracts are to be capitalized and recognized as expense in the ratio that revenues recognized each period bear to total anticipated revenues from the respective contracts. Any other costs are charged to expense as incurred. Losses on these contracts are recognized immediately if the sum of the future costs and remaining unamortized direct acquisition costs exceed the related unearned revenue. When recognizing a loss, any unamortized acquisition costs are first charged to expense, and a liability for any remaining loss is then recorded.

### Example of a separately priced product maintenance contract

Salomon Heating enters into a four-year product maintenance contract with Everly Manufacturing, under which Salomon will conduct preventive maintenance and repairs to Everly's heating systems. Under the contract terms, Salomon bills Everly \$1,000 during each month of the contract period, and recognizes the billed amount as revenue at once. This equates to straight-line recognition of the total contract amount.

Salomon incurred a \$4,000 legal expense in writing the contract with Everly, as well as a \$1,600 commission, both of which it defers and amortizes over the contract period. During the first month of

work, Salomon incurs direct costs of \$650 in wages, as well as \$200 of repair-related materials. Its charge to expense entry follows:

Cost of goods sold—materials	200
Cost of goods sold—labor	650
Legal expense	83
Commission expense	33
Inventory—spare parts	200
Cash	650
Deferred legal costs	83
Deferred commission costs	33

At the end of two years, Salomon realizes that it must rebuild Everly's boiler. The rebuild will cost \$10,000, while all expected future maintenance work will cost an additional \$20,000. Unamortized legal costs equal \$2,000 and unamortized commissions equal \$800, while unearned revenue is \$24,000. Salomon must recognize a loss of \$8,800, which is the difference between all expected costs of \$32,800 and unearned revenue of \$24,000. To do so, Salomon accelerates all remaining amortization of the capitalized legal and commission assets, and recognizes a liability for the remainder of the loss with the following entry:

Commission expense	800
Legal expense	2,000
Loss on contractual obligation	6,000
Deferred commission costs	800
Deferred legal costs	2,000
Unfulfilled contractual obligations (liability)	6,000

Salomon rebuilds Everly's boiler at the expected cost of \$10,000. Since this is one-third of the remaining costs to be incurred under the contract, Salomon recognizes one-third of the \$6,000 unfulfilled contractual obligation that was used to offset the loss, and charges the rest of the cost to expense with the following entry:

Unfulfilled contractual obligations (liability)	2,000
Cost of goods sold—labor	8,000
Cash	10,000

## SALES WHEN COLLECTION IS UNCERTAIN

### PERSPECTIVE AND ISSUES

---

Under GAAP, revenue recognition customarily does not depend upon the collection of cash. Accrual accounting techniques normally record revenue at the point of a credit sale by establishing a receivable. When uncertainty arises surrounding the collectibility of this amount, the receivable is appropriately adjusted by establishing a valuation allowance. In some cases, however, the collection of the sales price may be so uncertain that an objective measure of ultimate collectibility cannot be established. When such circumstances exist, the seller either uses the installment method or the cost recovery method to recognize the transaction. (ASC 605-10-25) Both of these methods allow for a deferral of gross profit until cash has been collected.

An installment transaction occurs when a seller delivers a product or performs a service and the buyer makes periodic payments over an extended period of time. Under the installment method, revenue recognition is deferred until the period(s) of cash collection. The seller recognizes both revenues and cost of sales at the time of the sale; however, the related gross profit is deferred to those periods in which cash is collected. Under the cost recovery method, both revenues and cost of sales are recognized at the time of the sale, but none of the related gross profit is recognized until the entire cost of sales has been recovered. Once the seller has recovered all cost of sales, any additional cash receipts are recognized as revenue. ASC 605-10-25 does not specify when one method is preferred over the other. However, the cost recovery method is more conservative than the installment method because gross profit is deferred until all costs have been recovered; therefore, it is appropriate for situations of extreme uncertainty.

## DEFINITIONS OF TERMS

---

**Cost Recovery Method.** The method of accounting for an installment basis sale whereby the gross profit is deferred until all cost of sales has been recovered.

**Deferred Gross Profit.** The gross profit from an installment basis sale that will be recognized in future periods.

**Gross Profit Rate.** The percentage computed by dividing gross profit by revenue from an installment sale.

**Installment Method.** The method of accounting for a sale whereby gross profit is recognized in each period in which cash from the sale is collected.

**Installment Sale.** A sales transaction for which the sales price is collected through the receipt of periodic payments over an extended period of time.

**Net Realizable Value.** The portion of the recorded amount of an asset expected to be realized in cash upon its liquidation in the ordinary course of business.

**Realized Gross Profit.** The gross profit recognized in the current period.

**Repossessions.** Merchandise sold by a seller under an installment arrangement that the seller physically takes back after the buyer defaults on the payments.

## CONCEPTS, RULES, AND EXAMPLES

---

### The Installment Method

The installment method was developed in response to the increasing incidence of sales contracts that allowed buyers to make payments over several years. As the payment period becomes longer, the risk of loss resulting from uncollectible accounts increases; consequently, circumstances surrounding a receivable may lead to considerable uncertainty as to whether payments will actually be received. Under these circumstances, the uncertainty of cash collection dictates that revenue recognition be deferred until the actual receipt of cash.

The installment method can be used in most sales transactions for which payment is to be made through periodic installments over an extended period of time and the collectibility of the sales price cannot be reasonably estimated. This method is applicable to the sales of real estate (covered in the last section of this chapter), heavy equipment, home furnishings, and other merchandise sold on an installment basis. Installment method revenue recognition is not in accordance with accrual accounting, because revenue recognition is not normally based upon cash collection; however, its use is justified in certain circumstances on the grounds that accrual

accounting may result in “front-end loading” (i.e., all of the revenue from a transaction being recognized at the point of sale with an improper matching of related costs). For example, the application of accrual accounting to transactions that provide for installment payments over periods of ten, twenty, or thirty years may underestimate losses from contract defaults and other future contract costs.

**Applying the installment method.** When a seller uses the installment method, both revenue and cost of sales are recognized at the point of sale, but the related gross profit is deferred to those periods during which cash will be collected. As receivables are collected, a portion of the deferred gross profit equal to the gross profit rate times the cash collected is recognized as income. When this method is used, the seller must compute each year’s gross profit rate and also must maintain records of installment accounts receivable and deferred revenue that are separately identified by the year of sale. All general and administrative expenses are normally expensed in the period incurred.

The steps to use in accounting for sales under the installment method are as follows:

1. During the current year, record sales and cost of sales in the regular manner. Record installment sales transactions separately from other sales. Set up installment accounts receivable identified by the year of sale (e.g., Installment Accounts Receivable—20X1).
2. Record cash collections from installment accounts receivable. Care must be taken so that the cash receipts are properly identified as to the year in which the receivable arose.
3. At the end of the current year, transfer installment sales revenue and installment cost of sales to deferred gross profit properly identified by the year of sale. Compute the current year’s gross profit rate on installment sales as follows:

$$\text{Gross profit rate} = 1 - \left( \frac{\text{Cost of installment sales}}{\text{Installment sales revenue}} \right)$$

Alternatively, the gross profit rate can be computed as follows:

$$\text{Gross profit rate} = \frac{\text{Installment sales revenue} - \text{Cost of installment sales}}{\text{Installment sales revenue}}$$

4. Apply the current year’s gross profit rate to the cash collections from the current year’s installment sales to compute the realized gross profit from the current year’s installment sales:

$$\text{Realized gross profit} = \frac{\text{Cash collections from the current year's installment sales}}{\text{current year's installment sales}} \times \text{Current year's gross profit rate}$$

5. Separately apply each of the previous years’ gross profit rates to cash collections from those years’ installment sales to compute the realized gross profit from each of the previous years’ installment sales:

$$\text{Realized gross profit} = \frac{\text{Cash collections from the previous years' installment sales}}{\text{previous years' installment sales}} \times \frac{\text{Previous years' gross profit rate}}{\text{Current year's gross profit rate}}$$

Defer the current year’s unrealized gross profit to future years. The deferred gross profit to carry forward to future years is computed as follows:

$$\text{Deferred gross profit (20X1)} = \frac{\text{Ending balance installment account receivable (20X1)}}{\text{Gross profit rate (20X1)}}$$

**Example of the installment method of accounting**

	<u>20X1</u>	<u>20X2</u>	<u>20X3</u>
Sales on installment	\$400,000	\$450,000	\$600,000
Cost of installment sales	(280,000)	(337,500)	(400,000)
Gross profit on sales	<u>\$120,000</u>	<u>\$112,500</u>	<u>\$200,000</u>
Cash collections:			
20X1 sales	\$150,000	\$175,000	\$ 75,000
20X2 sales		\$200,000	\$125,000
20X3 sales	\$300,000		

Accounting entries are made for Steps 1 and 2 above using this data; the following computations are required for Steps 3–6:

Step 3—Compute the current year's gross profit rate.

	<u>20X1</u>	<u>20X2</u>	<u>20X3</u>
Gross profit on sales	\$120,000	\$112,500	\$200,000
Installment sales revenue	\$400,000	\$450,000	\$600,000
Gross profit rate	30%	25%	33 1/3%

Step 4—Apply the current year's gross profit rate to cash collections from current year's sales.

<u>Year</u>	<u>Cash collections</u>	<u>Gross profit rate</u>	<u>Realized gross profit</u>
20X1	\$150,000	× 30%	= \$45,000
20X2	200,000	× 25%	= 50,000
20X3	300,000	× 33 1/3%	= 100,000

Step 5—Separately apply each of the previous years' gross profit rates to cash collections from that year's installment sales.

<u>From year</u>	<u>Cash collections</u>	<i>In Year 20X2</i>		
		<u>Gross profit rate</u>	<u>=</u>	<u>Realized gross profit</u>
20X1	\$175,000	× 30%	=	\$152,500
<i>In Year 20X3</i>				
<u>From year</u>	<u>Cash collections</u>	<i>In Year 20X3</i>		
		<u>Gross profit rate</u>	<u>=</u>	<u>Realized gross profit</u>
20X1	\$ 75,000	× 30%	=	\$22,500
20X2	125,000	× 25%	=	<u>31,250</u>
				<u>\$53,750</u>

Step 6—Defer the current year's unrealized gross profit to future years.

$$\frac{12/31/X1}{\text{Deferred gross profit (20X1)} = (\$400,000 - 150,000) \times 30\%} = \$75,000$$

$$\frac{12/31/X2}{\text{Deferred gross profit (20X2)} = (\$450,000 - 200,000) \times 25\%} = \$62,500$$

$$\frac{30\%}{\text{Deferred gross profit (20X1)} = (\$400,000 - 150,000 - 175,000) \times 30\%} = \$22,500$$

$$\frac{}{\$85,000}$$

<i>12/31/X3</i>		
Deferred gross profit (20X3) = (\$600,000 – 300,000) × 33 1/3%	=	\$100,000
Deferred gross profit (20X2) = (\$450,000 – 200,000 – 125,000) × 25%	=	<u>31,250</u>
		<u><u>\$131,250</u></u>

**Financial statement presentation.** If installment sales transactions represent a significant portion of the company's total sales, the following three items of gross profit would, theoretically, be reported on the company's income statement:

1. Total gross profit from current year's sales
2. Realized gross profit from current year's sales
3. Realized gross profit from prior years' sales

#### Examples of income statement presentation of installment sales transactions

An income statement using the previous example would be presented as follows (assume all sales are accounted for by the installment method):

**Jordan Equipment Company**  
**Partial Income Statement**  
**For the Years Ending December 31**

	<i>20X1</i>	<i>20X2</i>	<i>20X3</i>
Sales	\$400,000	\$450,000	\$600,000
Cost of sales	<u>(280,000)</u>	<u>(337,500)</u>	<u>(400,000)</u>
Gross profit on current year's sales	120,000	112,500	200,000
Less deferred gross profit on current year's sales	<u>(75,000)</u>	<u>(62,500)</u>	<u>(100,000)</u>
Realized gross profit on current year's sales	45,000	50,000	100,000
Plus gross profit realized on prior years' sales	—	52,500	53,750
Total gross profit on sales	<u><u>\$ 45,000</u></u>	<u><u>\$102,500</u></u>	<u><u>\$153,750</u></u>

However, when a company recognizes only a small portion of its revenues using the installment method, the illustrated presentation of revenue and gross profit may be confusing. Therefore, in practice, some companies simply report the realized gross profit from installment sales by displaying it as a single line item on the income statement as follows:

**Stevens Furniture Company**  
**Partial Income Statement**  
**For the Year Ended December 31, 20X1**

Sales	\$ 2,250,000
Cost of sales	<u>(1,350,000)</u>
Gross profit on sales	900,000
Gross profit realized on installment sales	35,000
Total gross profit on sales	<u><u>\$ 935,000</u></u>

The statement of financial position presentation of installment accounts receivable depends upon whether installment sales are a normal part of operations. If a company sells most of its products on an installment basis, installment accounts receivable are classified as a current asset because the operating cycle of the business (the length of which is to be disclosed in the notes to the financial statements) is the average period of time covered by its installment contracts. If installment sales are not a normal part of operations, installment accounts receivable that are not to be collected for more than a year (or the length of the

company's operating cycle, if different than a year) are reported as noncurrent assets. In all cases, to avoid confusion, it is desirable to fully disclose the year of maturity next to each group of installment accounts receivable.

**Example of installment accounts receivable captioned by year of maturity**

*Current assets:*

Accounts receivable		
Customers	\$180,035	
Less allowance for uncollectible accounts	(4,200)	
	175,835	
Installment accounts—collectible in 20X1	26,678	
Installment accounts—collectible in 20X2	<u>42,234</u>	\$244,747

Accounting for deferred gross profit is addressed in CON 6 which states that deferred gross profit is not a liability. The reason is that the seller company is not obligated to pay cash or provide services to the customer. Rather, the deferral arose because of the uncertainty surrounding the collectibility of the sales price. CON 6 goes on to say, “deferred gross profit on installment sales is conceptually an asset valuation allowance (sometimes referred to as a ‘contra asset’)—that is, a reduction of an asset.” However, in practice, deferred gross profit is generally presented either as unearned revenue classified in the current liability section of the statement of financial position or as a deferred credit displayed between liabilities and equity.

**Example of CON 6 reduction of installment receivables for deferred gross profit**

Following the guideline in CON 6, the current asset section would be presented as follows (using information from the Jordan Equipment example and assuming a 12/31/20X3 statement of financial position):

Installment accounts receivable	(20X2)	\$125,000	
Installment accounts receivable	(20X3)	<u>300,000</u>	\$425,000
Less:     Deferred gross profit	(20X2)	(131,250)	
Deferred gross profit	(20X3)	<u>100,000</u>	<u>(131,250)</u> \$293,750

**Interest on installment method receivables.** The previous examples ignored interest, a major component of most installment sales contracts. It is customary for the seller to charge interest to the buyer on the unpaid installment receivable balance. Generally, installment contracts call for equal payments, each with an amount attributable to interest on the unpaid balance and the remainder to the installment receivable balance. As the maturity date nears, a smaller amount of each installment payment is attributable to interest and a larger amount is attributable to principal. Therefore, to determine the amount of gross profit to recognize, the interest must first be deducted from the installment payment and then the difference (representing the principal portion of the payment) is multiplied by the gross profit rate as follows:

$$\text{Realized gross profit} = (\text{Installment payment} - \text{Interest portion}) \times \text{Gross profit rate}$$

The interest portion of the installment payment is recorded as interest revenue at the time of the cash receipt. Appropriate accounting entries are required to accrue interest revenue when the collection dates do not correspond with the period end.

**Example of interest-bearing installment sales contracts**

To illustrate the accounting for installment sales contracts involving interest, assume that Genrich Equipment Company sells a machine for \$5,000 on December 31, 20X1, to a customer with a dubious credit history. The machine cost Genrich \$3,750. The terms of the agreement require a \$1,000 down payment on the date of the sale. The remaining \$4,000 is payable in equal annual installments of \$1,401.06, including 15% annual interest, at the end of each of the next four years.

For each payment it receives, Genrich must compute the portion to record as interest revenue with the remaining portion of the payment (the principal) to be applied to reduce the installment account receivable balance. Gross profit is only recognized on the principal portion of each payment that is applied to reduce the installment receivable balance. The following schedule illustrates that gross profit is recognized on the entire down payment (which contains no element of interest revenue), whereas the annual installment payments are separated into their interest and principal portions with gross profit only being recognized on the latter portion.

**Schedule of Cash Receipts**

<i>Date</i>	<i>Cash (debit)</i>	<i>Interest revenue (credit)</i>	<i>Installment accounts receivable (credit)</i>	<i>Installment accounts receivable (credit)</i>	<i>Realized gross profit</i>
12/31/X1				\$ 5,000.00	
12/31/X1	\$1,000.00		\$ 1,000.00	4,000.00	\$ 250.00 <sup>a</sup>
12/31/X2	1,401.06	600.00 <sup>b</sup>	801.06 <sup>c</sup>	3,198.94 <sup>d</sup>	200.27 <sup>e</sup>
12/31/X3	1,401.06	479.84	921.22	2,277.72	230.31
12/31/X4	1,401.06	341.66	1,059.40	1,218.32	264.85
12/31/X5	1,401.06	182.74	1,218.32	—	304.57
	<u>\$6,604.24</u>	<u>\$1,604.24</u>	<u>\$ 5,000.00</u>		
		Total realized gross profit			<u>\$1,250.00</u>

$$\text{Gross profit rate} = 1 - (\$3,750/5,000) = 25\%$$

$$^a \$1,000 \times 25\% = \$250$$

$$^d \$4,000 - 801.06 = \$3,198.94$$

$$^b \$4,000 \times 15\% = \$600$$

$$^e \$801.06 \times 25\% = \$200.27$$

$$^c \$1,401.06 - 600 = \$801.06$$

**Bad debts and repossession.** The standard accounting treatment for uncollectible accounts is to accrue a bad debt loss in the year of sale by estimating the amount expected to be uncollectible. This treatment is consistent with the accrual and matching concepts. However, just as revenue recognition under the accrual basis is sometimes abandoned for certain installment basis sales, the accrual basis of recognizing bad debts is also sometimes abandoned.

When the installment method is used, it is usually appropriate to recognize bad debts by the direct write-off method (i.e., bad debts are not recognized until the receivable has been determined to be uncollectible). This practice is acceptable because most installment contracts contain a provision that allows the seller to repossess the merchandise when the buyer defaults on the installment payments. The loss on the account may be eliminated or reduced because the seller has the option of reselling the repossessed merchandise. To write off an uncollectible installment receivable, the following three steps are followed:

1. The installment account receivable and the deferred gross profit are eliminated.
2. The reposessed merchandise is recorded as used inventory at its net realizable value. Net realizable value is resale value less any selling or reconditioning costs. The reposessed asset is recorded at this fair value because any asset acquired is recorded at the best approximation of its fair value.
3. Bad debt expense and a gain or loss on repossession are recognized. The bad debt expense or repossession gain or loss is the difference between the unrecovered cost (installment account receivable minus deferred gross profit) and the net realizable value of the reposessed merchandise.

**Example of uncollectible installment method receivable**

Marcie Company determined that a \$3,000 installment receivable is uncollectible. The deferred gross profit ratio on the original sale was 30%; thus, \$900 deferred gross profit exists ( $\$3,000 \times 30\%$ ). If the reposessed equipment has a \$1,500 net realizable value, a \$600 repossession loss (or bad debt expense) should be recorded.

Installment account receivable	\$ 3,000
Less deferred gross profit	<u>(900)</u>
Unrecovered cost	2,100
Less net realizable value of reposessed equipment	<u>(1,500)</u>
Repossession loss	<u>\$ 600</u>

Marcie Company would record this loss by making the following entry:

Deferred gross profit	900
Inventory—reposessed merchandise	1,500
Repossession loss	600
Installment account receivable	3,000

**The Cost Recovery Method**

The cost recovery method does not recognize any income on a sale until the cost of the item sold has been fully recovered through cash receipts. Once the seller has recovered all costs, any subsequent cash receipts are included in income. The cost recovery method is used when the uncertainty of collection of the sales price is so great that even use of the installment method cannot be justified.

Under the cost recovery method, both revenues and cost of sales are recognized at the point of sale, but the related gross profit is deferred until all costs of sales have been recovered. Each installment must also be divided between principal and interest, but unlike the installment method where a portion of the principal recovers the cost of sales and the remainder is recognized as gross profit, all of the principal is first applied to recover the cost of the asset sold. After all costs of sales have been recovered, any subsequent cash receipts are realized as gross profit.

**Example of the cost recovery method**

Using the information from the Genrich Company example used in the section “Interest on installment method receivables,” if Genrich used the cost recovery method, gross profit would be realized as follows:

### Schedule of Cash Receipts

<u>Date</u>	<u>Cash (debit)</u>	<u>Deferred interest (credit)*</u>	<u>Installment accounts receivable (credit)</u>	<u>Installment accounts receivable balance</u>	<u>Unrecovered cost</u>	<u>Realized gross profit</u>	<u>Realized interest revenue</u>
12/31/X1			\$ 5,000.00	\$ 3,750.00			
12/31/X1	\$1,000.00	\$ –	\$ 1,000.00	4,000.00	2,750.00	\$ –	\$ –
12/31/X2	1,401.06	600.00	801.06	3,198.94	1,948.94	–	–
12/31/X3	1,401.06	479.84	921.22	2,277.72	1,027.72	–	–
12/31/X4	1,401.06	(31.68)	1,059.40	1,218.32	–	–	373.34**
12/31/X5	1,401.06	(1,048.16)	1,218.32	–	–	1,250.00	1,230.90***
	<u>\$6,604.24</u>		<u>\$ 5,000.00</u>			<u>\$1,250.00</u>	<u>\$1,604.24</u>

\* Interest received in 20X2 and 20X3 is credited to deferred interest income since the cost of the asset was not recovered until 20X4.

\*\* Computed as cash received of \$1,401.06 less the portion representing unrecovered cost of \$1,027.72 = \$373.34. Since this amount exceeds the interest paid by the customer for the year of \$341.66, the remaining \$31.68 reduces deferred interest income.

\*\*\* Computed as cash received of \$1,401.06 less the portion applied to principal of \$1,218.32 = \$182.74 plus the remaining deferred interest income of \$1,048.16.

The accounting entries to record the foregoing are as follows (in whole dollars):

	<i>Debit (Credit)</i>					<i>Totals</i>
	<i>20X1</i>	<i>20X2</i>	<i>20X3</i>	<i>20X4</i>	<i>20X5</i>	
<i>Initial Sale and Down Payment:</i>						
Cash	1,000					
Installment accounts receivable		4,000				
Inventory		(3,750)				
Deferred gross profit		(1,250)				
<i>Annual Payments:</i>

Recognized gross profit (revenue)				(1,250)	(1,250)	

## REVENUE RECOGNITION WHEN RIGHT OF RETURN EXISTS (ASC 605-15)

### PERSPECTIVE AND ISSUES

In some industries, it is common practice for customers to have the right to return a product to the seller for a credit or refund. However, for companies that experience a high ratio of returned merchandise to sales, the recognition of the original sale as revenue is questionable. In fact, certain industries have found it necessary to defer revenue recognition until the return privilege has substantially expired. Sometimes the return privilege expires soon after the sale, as in the newspaper and perishable food industries. In other cases, the return privilege may last over an extended period of time, as in magazine and textbook publishing and equipment manufacturing. The rate of return normally is directly related to the length of the return privilege. An accounting issue arises when the recognition of revenue occurs in one period while substantial returns occur in later periods.

ASC 605-15-25 reduced the diversity in the accounting for revenue recognition when such rights exist.

## DEFINITIONS OF TERMS

---

**Deferred Gross Profit.** The gross profit from a sale that is recognized in future periods because of the uncertainty surrounding the collection of the sales price.

**Return Privilege.** A right granted to a buyer by express agreement with a seller or by customary industry practice that allows the buyer to return merchandise to the seller within a stated period of time.

## CONCEPTS, RULES, AND EXAMPLES

---

ASC 605-15-25 provides criteria for recognizing revenue on a sale in which a product may be returned (as a matter of contract or a matter of industry practice), either by the ultimate consumer or by a party who resells the product to others. Paragraph 25-1 states the following:

*If an enterprise sells its product but gives the buyer the right to return the product, revenue from the sales transaction [is] recognized at time of sale only if all of the following conditions are met:*

- a. *The seller's price to the buyer is substantially fixed or determinable at the date of sale.*
- b. *The buyer has paid the seller, or the buyer is obligated to pay the seller and the obligation is not contingent on resale of the product.*
- c. *The buyer's obligation to the seller would not be changed in the event of theft or physical destruction or damage of the product.*
- d. *The buyer acquiring the product for resale has economic substance apart from that provided by the seller.*
- e. *The seller does not have significant obligations for future performance to directly bring about the resale of the product by the buyer.*
- f. *The amount of future returns can be reasonably estimated. For purposes of this statement "returns" do not include exchanges by ultimate customers of one item for another of the same kind, quality, and price.*

If all of the above conditions are met, the seller recognizes revenue from the sales transaction at the time of the sale and any costs or losses expected in connection with returns are accrued in accordance with ASC 450, *Contingencies*. ASC 450 states that estimated losses from contingencies are accrued and charged to income when it is both probable that an asset has been impaired or a liability has been incurred, and the amount of loss can be reasonably estimated.

The interplay between ASC 605-15 and ASC 450 needs further explanation. Although ASC 605-15 requires under condition f. that the amount of returns be reasonably estimated, it does not reference the ASC 450 loss accrual criteria. Accordingly, a strict interpretation of both ASC 605-15 and ASC 450 would indicate that only when the conditions for loss accrual under ASC 450 are met (i.e., the loss is both probable and reasonably estimable) would the condition f. above under ASC 605-15 also be met, and both sales and estimated returns can be recognized. However, a more literal interpretation of ASC 605-15 indicates that, by not cross-referencing ASC 450, the FASB intended that the sole criterion for return accrual under ASC 605-15 be the "reasonably estimated" condition f. Then, whether losses are probable or reasonably possible, they would be accrued under ASC 605-15 and the sales would also be recognized. If the likelihood of losses is remote, no disclosure is required under ASC 450, and condition f. under ASC 605-15 would be achieved and revenue would be recognized with no need to record an allowance for estimated returns. Under

this theory, only if returns cannot be reasonably estimated would recognition of revenue be precluded under ASC 605-15, regardless of whether losses are probable or reasonably possible.

### Example of sale with right of return

Assume that Lipkis, Inc. began the sale of its new textbook on computer programming in 20X1 with the following results: On December 1, 20X1, 2,000 textbooks with a sales price of \$45 each and total manufacturing costs of \$30 each are delivered to school bookstores on account. The bookstores have the right to return the textbooks within four months of delivery date. Payments when the books are sold to final customers. Payments and returns for the initial deliveries are as follows:

	<i>Cash receipts</i>		<i>Returns</i>	
	<u>Units</u>	<u>Amount</u>	<u>Units</u>	<u>Amount</u>
November 20X1				
December 20X1	600	\$27,000	—	—
January 20X2	500	22,500	40	\$ 1,800
February 20X2	400	18,000	90	4,050
March 20X2	300	13,500	30	1,350
	<u>1,800</u>	<u>\$81,000</u>	<u>160</u>	<u>\$ 7,200</u>

Lipkis, Inc. has had similar agreements with the bookstores in the past and has experienced a 15% return rate on similar sales.

**Requirements for revenue recognition met.** If all six of the requirements were met, the following journal entries would be appropriate:

12/1/X1	Accounts receivable Sales (2,000 units × \$45 per unit)	90,000	90,000
<i>To record sale of 2,000 textbooks</i>			
12/31/X1	Cash (600 units × \$45 per unit) Accounts receivable	27,000	27,000
<i>To record cash receipts for the month</i>			
	Cost of sales Inventory (2,000 units × \$30 per unit)	60,000	60,000
<i>To record cost of goods sold for the month</i>			
	Sales (15% × 2,000 units × \$45 per unit) Cost of sales (15% × 2,000 units × \$30 per unit)	13,500	9,000
<i>To record estimate of returns</i>			
1/1/X2	Cash	54,000	54,000
to	Accounts receivable		
3/31/X2	<i>To record cash receipts</i> Inventory (160 units × \$30 per unit) Deferred gross profit on estimated returns Accounts receivable (160 units × \$45 per unit)	4,800	2,400
<i>To record actual returns</i>			
3/31/X2	Cost of sales (140 units × \$30 per unit) Deferred gross profit on estimated returns Sales (140 units × \$45 per unit)	4,200	2,100
<i>To record expiration of return privileges and adjust estimate to actual</i>			
		6,300	

The revenue and cost of goods sold recognized in 20X1 are based on the number of units expected to be returned, 300 ( $15\% \times 2,000$  units). The net revenue recognized is \$76,500 ( $85\% \times 2,000$  units  $\times \$45$  per unit) and the cost of goods sold recognized is \$51,000 ( $85\% \times 2,000$  units  $\times \$30$  per unit). The deferred gross profit balance is carried forward until either the textbooks are returned or the return privilege expires.

**Requirements for revenue recognition not met.** If all of the six conditions are not met, revenue and cost of sales from the sales transactions must be deferred until either the return privilege has substantially expired or the point when all the conditions are subsequently met is reached, whichever comes first.

If the facts in the Lipkis case were altered so that the bookstores were not required to pay Lipkis until the later of the date the books were actually sold, or the expiration date of the return privilege, condition b. would not be met until the store remitted payment. The following entries would be required. The return privilege is, of course, assumed to lapse when the books are sold to final customers.

12/1/X1	Inventory on consignment	60,000	
	Inventory		60,000
<i>To record shipment of 2,000 units to retail bookstores on consignment</i>			
	( $2,000 \text{ units} \times \$30 = \$60,000$ )		
12/31/X1	Cash (600 units $\times \$45$ per unit)	27,000	
	Sales		27,000
<i>To record cash receipts for December</i>			
	Cost of sales (600 units $\times \$30$ per unit)	18,000	
	Inventory on consignment		18,000
<i>To record cost of goods sold for December</i>			
1/1/X2	Cash	54,000	
to	Sales ( $1,200^*$ units $\times \$45$ per unit)		54,000
3/31/X2	<i>To record cash receipts</i>		
	Cost of sales (1,200 units $\times \$30$ per unit)	36,000	
	Inventory on consignment		36,000
<i>To record cost of goods sold on cash receipts</i>			
	Inventory (160 units $\times \$30$ per unit)	4,800	
	Inventory on consignment		4,800
<i>To record product returns</i>			
3/31/X2	Accounts receivable (40 units $\times \$45$ per unit)	1,800	
	Sales		1,800
<i>To record expiration of return privilege on remaining units</i>			
	Cost of sales (409 units $\times \$30$ per unit)	1,200	
	Inventory on consignment		1,200
<i>To record cost of goods sold on products for which return privilege expired</i>			

\*  $1,800 \text{ units paid for} - 600 \text{ units paid for in December}$

\*\*  $2,000 \text{ units sold} - 160 \text{ units returned} - 1,800 \text{ units paid for}$

Future returns cannot be estimated. In the relatively unlikely situation where the reporting entity is unable to make a reasonable estimate of the amount of future returns, the sale cannot be recognized until the return privilege has expired or conditions permit the loss to be estimated, at which point it would become reportable. Examples of factors that might impair the ability to reasonably estimate a loss are:

1. Susceptibility of the product to technological or other obsolescence
2. A lengthy period over which returns are permitted

3. Absence of experience with returns on similar products sold to similar markets
4. Sales are few, significant, and have unique terms (rather than a large number of relatively homogeneous sales of small dollar amounts).

**Example: Future product returns—returns cannot be estimated**

The SnoJet Company manufactures high-powered snowmobiles, for which it issues a six-month return policy to its distributors. It recently developed the XTR Pro model, which is an incremental enhancement of earlier models, with more horsepower and a tighter suspension. Given its similarity to earlier models, SnoJet's management is comfortable in extending the historical product return rate of 10% to sales of the XTR Pro model. In February, SnoJet sold \$840,000 of XTR Pro snowmobiles that have an associated cost of \$504,000 (a 60% cost of goods sold). At the same time, the company records \$84,000 (10% of gross sales) in an allowance for sales returns, resulting in the following income statement presentation:

Sales	\$840,000
Less: sales returns	<u>(84,000)</u>
Net sales	\$756,000

Note that, to fully comply with the requirements of ASC 605-15, a valuation allowance for the cost of the estimated product is also to be provided for, with a corresponding reduction of cost of sales, as follows:

Cost of sales	\$504,000
Less: cost of sales on estimated returns	<u>(50,400)</u>
Net cost of sales	\$453,600

In the following month, ten XTR Pro models are returned to SnoJet. The revenue originally recorded on their sale was \$24,000, with associated cost of goods sold of \$14,400. However, there is some damage to the models, which will require \$3,000 to repair. SnoJet records the transaction with the following entry:

Allowance for sales returns	24,000
Inventory—rework	11,400
Loss—returned inventory damage	3,000
Accounts receivable	24,000
Allowance for cost of sales on product returns	14,400

SnoJet develops an entirely new, jet-powered snowmobile, called the JetPro, which requires the substantial redesign of its basic snowmobile platform. Also, it is to be sold strictly to professional snowmobile racers with whom the company has minimal sales experience, with sale terms allowing returns only within the first two months. In the first month, SnoJet has \$150,000 of JetPro sales, for which the related cost of goods sold is \$100,000. Given the sales return uncertainty associated with this model, SnoJet records no revenue during the first month, waiting until the second month for the product return policy to expire before recording any revenue. In the first month, its entry to record JetPro sales is:

Accounts receivable	150,000
Unearned revenue	150,000
Inventory—customer location	100,000
Finished goods inventory	100,000

At the end of the second month, after the right of return has expired, SnoJet uses the following entry to record the sale and its related profit:

Unearned revenue	150,000
Revenue	150,000
Cost of goods sold	100,000
Inventory—customer location	100,000

Note that the decision not to record revenues until after the risk of product returns has lapsed is relatively unusual in practice, and will be dependent on careful consideration of all the facts and circumstances.

## REVENUE ARRANGEMENTS WITH MULTIPLE DELIVERABLES (ASC 605-25)

Another longstanding difficulty has been identifying authoritative guidance germane to the accounting for revenue arrangements (product or service sales) having more than one “deliverable.” Many instances of aggressive accounting—where all or most of the total revenue was recognized at the time of delivery of the first of multiple deliverables—have come to light. ASC 605-25 comprehensively addressed these complex issues.

### PERSPECTIVE AND ISSUES

---

Vendors may offer customers many related and unrelated products and services sold together (“bundled”) or separately. The prices assigned to the various elements of a particular transaction or series of transactions on the seller’s invoices and the timing of issuing those invoices are not always indicative of the actual earning of revenue on the various elements of these transactions. ASC 605-25 provides guidance on how to measure consideration received from complex, multi-element arrangements and how to allocate that consideration between the different deliverables contained in the arrangement.

#### Terms Used in ASC 605-25

The guidance provided in this Codification Topic is extensive and complex, due to the complex nature of the underlying revenue transactions. A number of key terms are used, defined as follows:

- **Contingent amount.** The portion of the total consideration to be received by a vendor under a multiple deliverable arrangement that would be realized by the vendor only if specified performance conditions were met or additional deliverables were provided to the customer.
- **Noncontingent amount.** The portion of the total consideration to be received by a vendor under a multiple deliverable arrangement that is not subject to any additional performance requirements that the vendor must meet.
- **Refund rights.** The legal right of a customer to obtain a concession or recover all or a portion of the consideration paid to a vendor under a multiple deliverable arrangement.
- **Relative selling price method.** A technique for allocating any discount in an arrangement proportionally to all of the associated deliverables on the basis of their respective selling prices.

- **Stand-alone value.** The value that a specific product or service (deliverable) has to a customer without considering other products or services that might accompany it as part of a multiple deliverable arrangement. To have value to a customer on a stand-alone basis, a deliverable must be either sold separately by any vendor or be separately resalable by the customer whether or not there is an observable market for the deliverable.
- **Vendor-specific objective evidence (VSOE).** The price that a vendor charges for a specific product or service (deliverable) when it is sold separately. If the deliverable is not currently being sold separately, a price that is established by management possessing the authority may be used under the condition that it is considered probable that the established price will not change prior to the separate market introduction of the deliverable.

### Summary of Guidance Provided by ASC 605-25

Arrangements between vendors and their customers often include the sale of multiple products and services (deliverables). A multiple deliverable arrangement (MDA) can be structured using fixed, variable, or contingent pricing or combinations thereof. Product delivery and service performance can occur at different times and in different locations, and customer acceptance can be subject to various return privileges, or performance guarantees.

ASC 605-25 provides guidance on:

1. How a vendor determines whether an MDA consists of a single unit of accounting or multiple units of accounting
2. Allocating MDA consideration to multiple units of accounting
3. Measuring MDA consideration.

In applying these rules, it is to be presumed that separate contracts, executed at or near the same time with the same entity or related parties, were negotiated as a package and are to be considered together in determining how many units of accounting are contained in an MDA. That presumption can be overcome by sufficient contradictory evidence.

ASC 605-25 collectively applies to all deliverables (i.e., products, services, and rights to use assets) covered by contractually binding written, oral, or implied arrangements.

Scope exceptions are provided for the following:

1. Criteria for the timing of revenue recognition for a unit of accounting. Existing authoritative literature governs these determinations.
2. Arrangements where, conditioned upon the vendor's revenue from the customer exceeding certain cumulative levels or the customer continuing its relationship with the vendor for a specified time period:
  - a. The vendor offers free or discounted products or services in the future, or
  - b. The vendor provides specified future cash rebates or refunds.
3. Arrangements involving the sale of award credits by a "broad-based loyalty program operator." (Presumably this exception refers to airline frequent-flyer or similar customer loyalty programs.)
4. Accounting for the direct costs incurred by a vendor relative to an MDA.

**Basic principles established.** ASC 605-25 sets forth three basic principles, the application of which is the subject of the discussion that follows:

1. MDA are divided into separate *units of accounting* if the deliverables included in the arrangement meet all three of the criteria presented in the table below.

2. Subject to certain limits regarding contingent amounts to be received under the MDA, *relative selling prices* (as determined, in declining order, using VSOE, third-party evidence, or the vendor's best estimate of the selling price) are used to allocate MDA proceeds to the separate units of accounting. The VSOE of a selling price is based on either the price charged for a deliverable when sold separately, or (if not sold separately) the price established by management. Third-party evidence of a selling price is the price of a competitor's essentially interchangeable products in stand-alone sales to similar customers.
3. The revenue recognition criteria to be applied are determined *separately* for each unit of accounting.

### **Units of Accounting**

The following table summarizes the criteria used in determining units of accounting for MDA within the scope of ASC 605-25 and is adapted from a decision diagram contained therein:

<u>Criteria</u>	<u>Outcome</u>	<u>Result</u>
1. Does the delivered item have stand-alone value to the customer?	Yes	Go to criterion 2
	No	Do not separate item
2. If the MDA includes a general right of return with respect to the delivered item, is delivery of the undelivered items probable and substantially controlled by the vendor?	Yes or Not Applicable	Delivered item is a separate unit of accounting
	No	Do not separate item

This separability evaluation is to be applied consistently to MDA that arise under similar circumstances or that possess similar characteristics. The evaluation is to be performed at the inception of the MDA.

If consideration is allocated to a deliverable that does not qualify as a separate unit of accounting, then the reporting entity is required to:

1. Combine the amount allocated to the deliverable with the amounts allocated to all other undelivered items included in the MDA, and
2. Determine revenue recognition for the combined items as a single unit of accounting.

The determination of whether total MDA consideration is fixed or determinable disregards the effects of refund rights or performance bonuses, if any.

After applying the decision criteria, the vendor may recognize an asset representing the cumulative difference, from inception of the MDA, between amounts recognized as revenue and amounts received or receivable from the customer (this is analogous to the asset "costs and estimated earnings in excess of billings" which is used in long-term construction accounting). The amount of such assets may not exceed the total amounts to which the vendor is legally entitled under the MDA, including fees that would be earned upon customer cancellation. The amount recognized as an asset would be further limited if the vendor did not intend to enforce its contractual rights to obtain such cancellation fees from the customer.

#### **Example of a multiple deliverable arrangement**

Kensington Cellular offers a free netbook as a special promotion to those customers who sign up for a two-year data plan for the netbook, for which it charges \$35 per month (\$840 over the two-year term of the data plan). Kensington sells the netbook separately for \$300, and also normally provides an identical data plan for \$35 per month, when there is not a promotion.

The total arrangement consideration is \$840. The VSOE selling price of the netbook is \$300, and the VSOE selling price of the data plan is \$840. The revenue allocable to the two components of the arrangement is calculated as follows:

$$\text{Netbook} = \$221.05 = \$840 \times [\$300 \div (\$300 \text{ netbook price} + \$840 \text{ data plan price})]$$

$$\text{Data plan} = \$618.95 = \$840 \times [\$840 \div (\$300 \text{ netbook price} + \$840 \text{ data plan price})]$$

**Disclosures.** The financial statements of a vendor are to include the following disclosures, when applicable:

1. The nature of the vendor's MDA
2. Significant deliverables
3. Delivery timing for significant deliverables
4. Whether deliverables qualify as separate units of accounting, and why
5. The timing of revenue recognition for the various units of accounting
6. The effect of changes in price for a unit of accounting if it impacts the allocation of consideration.

## OTHER SPECIAL ACCOUNTING AND REPORTING ISSUES

The major categories of revenue-generating transactions, for which specialized accounting standards have been developed, have been addressed in the earlier sections of this chapter. In the following paragraphs, various miscellaneous requirements are discussed.

**Reporting revenue gross as a principal versus net as an agent (ASC 605-45).** A longstanding issue in financial reporting has been whether certain entities more accurately convey the nature of their operations by reporting as revenue only the “net” amount they retain when acting effectively as an agent for another entity. While in some situations the answer is obvious, in other cases it has been less clear. Historically this may not have been an urgent issue to be resolved, since users of financial statements were deemed capable of deriving correct inferences regardless of the manner of presentation of the income statement. However, in recent years an unfortunate trend developed, whereby analysts and others cited only revenue growth as an indicator of the entity’s success, making the question of income statement presentation of revenue somewhat more important.

ASC 605-45 provides guidance on whether an entity is an agent for a vendor-manufacturer, and thus recognizes the net retainage (commission) for serving in that capacity, or whether that entity is a seller of goods (i.e., acting as a principal), and thus should recognize revenue for the gross amount billed to a customer and an expense for the amount paid to the vendor-manufacturer.

The codification identifies the following factors to be considered when determining whether revenue is to be reported as the net retainage (hereinafter, “net”) or the gross amount billed to a customer (“gross”). None of the indicators are presumptive or determinative, although the relative strength of each indicator is to be considered.

- Is the company the primary obligor in the arrangement; that is, is the company responsible for the fulfillment of the order, including the acceptability of the product or service to the customer? If the company, rather than a supplier, is responsible, that fact is a strong indicator that the company records revenue gross. Responsibility for arranging transportation for the product is not responsibility for fulfillment. If a supplier is responsible for fulfillment, including the acceptability to the customer, that fact indicates that the company recognizes only the net retainage.

- Does the company have general inventory risk? General inventory risk exists if a company takes title to a product before the product is ordered by a customer or will take title to the product if the customer returns it (provided that the customer has a right of return). In considering this indicator, arrangements with a supplier that reduce or mitigate the company's risk level are to be considered. Unmitigated general inventory risk is a strong indicator that the company recognizes revenue gross.
- Does the company have physical loss inventory risk? Physical loss inventory risk exists if the title to the product is transferred to the company at the shipping point and then transferred to the customer upon delivery. Physical loss inventory risk also exists if a company takes title to the product after the order is received but before the product is transferred to the shipper. While less persuasive than general inventory risk, this indicator provides some evidence that a company record revenue gross.
- Does the company establish the selling price? If a company establishes the selling price, that fact may indicate that the company recognizes revenue gross.
- Is the amount earned by the company fixed? If a company earns a fixed amount per transaction or if it earns a percentage of the selling price, that fact may indicate that the company report revenue net.
- Does the company change the product or perform part of the service? If a company changes the product (beyond packaging) or performs part of the service ordered by the customer such that the selling price is greater as a result of the company's efforts, that fact is indicative that a company recognizes revenue gross. Marketing skills, market coverage, distribution system, or reputation are not to be evaluated in determining whether the company changes the product or performs part of the service.
- Does the company have multiple suppliers for the product or service ordered by the customer? If a company has the discretion to select the supplier, that fact may indicate that the company record revenue gross.
- Is the company involved in determining the nature, type, characteristics, or specifications of the product or service by the customer? If so, that fact may indicate that the company records revenue gross.
- Does the company have credit risk for the amount billed to the customer? Credit risk exists if a company must pay the supplier after the supplier performs, regardless of whether the customer has paid. If the company has credit risk, this fact provides weak evidence that the company records revenue gross. If the supplier assumes the credit risk, the company is to record revenue net.

ASC 605-45 includes thirteen examples to assist in implementation.

**Accounting by a grantee for an equity instrument to be received in conjunction with providing goods or services.** The accounting for such equity issuances by the reporting entity is addressed by ASC 718. ASC 505-50 has resolved the proper accounting by the recipient of such payments.

In exchange for goods or services, an entity (the grantee) may receive equity instruments that have conversion or exercisability terms that vary based on future events, such as attainment of sales levels or a successful initial public offering. This issue describes the appropriate accounting if ASC 718 does not apply because the instruments received have underlyings based on either the grantee's or issuer's performance.

The grantee measures the fair value of the equity instruments received using the stock price and measurement assumptions as of the earlier of two dates. The first date is the date on which the

grantee and the issuer reach a mutual understanding of both the terms of the equity-based compensation and the goods to be delivered (or services to be performed). The second date is the date at which the performance necessary to earn the equity is completed by the grantee, that is, the grantee's rights have vested.

If the terms of the equity agreement are dependent on the achievement of a market condition, the fair value of the instrument is to include the effects on fair value of the commitment to change the terms if the market condition is met. Pricing models are available to value path-dependent equity instruments.

If the terms of the equity agreement are dependent on the achievement of certain performance goals (beyond those that initially established the goods to be delivered or services to be performed), the fair value of the instrument is computed without the effects of the commitment to change the terms if the goals are met. If those goals are subsequently met, the fair value is adjusted to reflect the new terms and the adjustment is reported as additional revenue (as described in the Share-Based Payments section in Chapter 27).

**Accounting for consideration given by a vendor to a customer (ASC 605-50).** ASC 605-50 provides guidance regarding the recognition, measurement, and income statement display of consideration given by a vendor to purchasers of the vendor's products. This consideration can be provided to a purchaser at any point along the distribution chain, irrespective of whether the purchaser receiving the consideration is a direct or indirect customer of the vendor. Examples of arrangements include, but are not limited to, sales incentive offers labeled as discounts, coupons, rebates, and "free" products or services as well as arrangements referred to as slotting fees, cooperative advertising, and buydowns. The issue does not apply to:

1. Coupons, rebates, and other forms of rights for free or significantly discounted products or services received by a customer in a prior exchange transaction that were accounted for by the vendor as a separate deliverable in that prior exchange, or
2. An offer to a customer, in connection with a current revenue transaction, for free or discounted products or services that is redeemable by the customer at a future date without a further exchange transaction with the vendor; covered by ASC 605-25, summarized previously.

The issue also does not discuss the accounting for offers of free or discounted products or services that are exercisable after a customer has completed a specified cumulative level of revenue transactions or remained a customer for a specified time period (for example, "point" and loyalty programs).

ASC 605-50 contains the following separately addressed issues:

1. Cash consideration given by a vendor to a customer is presumed to be a reduction of selling price and is classified as a reduction of revenue when recognized in the vendor's income statement. That presumption is overcome and the consideration is classified as a cost incurred if, and to the extent that, both of the following conditions are met:
  - a. The vendor receives, or will receive, an identifiable benefit (goods or services) in exchange for the consideration. In order to meet this condition, the identified benefit must be of a type that the vendor could have acquired in an exchange transaction with a party other than a purchaser of its products or services, that is, that the benefit must be separable from the sale of the vendor's goods or services, and
  - b. The vendor can reasonably estimate the fair value of that identifiable benefit. If the amount of consideration paid by the vendor exceeds the estimated fair value of the

benefit received, that excess amount is classified as a reduction of revenue when recognized in the vendor's income statement.

If the consideration is a "free" product or service or anything other than cash (including "credits" that the customer can apply against trade amounts owed to the vendor) or equity instruments, the cost of the consideration is characterized as an expense (as opposed to a reduction of revenue) when recognized in the vendor's income statement. ASC 605-50 contains fifteen examples of the application of this issue to various fact scenarios.

2. The amounts representing reduced revenue are classified as expense only if a vendor can demonstrate that classification of those amounts as a reduction of revenue results in negative revenue for a specific customer on a cumulative basis (that is, since the inception of the overall relationship between the vendor and the customer). However, classification as an expense would not be appropriate if a supply arrangement exists that either:
  - a. Provides the vendor with the right to be a provider of a certain type or class of goods or services for a specified period of time and it is probable that the customer will order the vendor's goods or services, or
  - b. Requires the customer to order a minimum amount of goods or services from the vendor in the future, except to the extent that the consideration given exceeds future revenue from the customer under the arrangement.
3. If the consideration (in the form of products, services, or cash) offered voluntarily by a vendor and without charge to customers can be used or becomes exercisable by a customer as a result of a single exchange transaction, and that consideration will not result in a loss on the sale, the vendor recognizes the "cost" of the consideration at the later of the following:
  - a. The date the related revenue is recognized by the vendor, or
  - b. The date the sales incentive is offered. (For example, a vendor recognizes a liability for a mail-in rebate coupon that requires proof of purchase, based on the estimated amount of refunds or rebates that will be claimed by customers.)
4. If the consideration (in the form of products, services, or cash) offered voluntarily by a vendor and without charge to customers can be used or becomes exercisable by a customer as a result of a single exchange transaction, and that consideration results in a loss on the sale, a vendor does not recognize a liability prior to the date on which the related revenue is recognized (this would be improper matching). However, the offer of consideration in an amount that will result in a loss on the sale of a product may indicate an impairment of existing inventory.
5. If a vendor offers a customer a rebate or refund of a specified amount of cash consideration that is redeemable only if the customer completes a specified cumulative level of purchases or remains a customer for a specified time, the vendor recognizes the cost of the offer in a systematic and rational manner over the period in which the underlying revenue transactions that qualify the customer for the rebate or refund take place. Measurement of the total rebate or refund obligation is based on the estimated number of customers that will ultimately earn and claim rebates or refunds under the offer. If the amount cannot be reasonably estimated, the maximum potential amount is to be recognized.

**Accounting by a customer (including a reseller) for certain consideration received from a vendor.** ASC 605-50 also addresses accounting issues from the standpoint of how the vendor's customer—either the end user or a reseller of the vendor's products or services—is to account for cash consideration it receives from its vendor.

In general, there is a rebuttable presumption that cash consideration received from a vendor is a purchase-price concession that should be recognized by the customer as a reduction of cost of goods sold (and/or the inventory of unsold units). This presumption is overcome if payment of the consideration is for either:

1. *Delivery of goods and/or services.* Payment to the customer in exchange for goods or services delivered to the vendor is accounted for by the customer as revenue. In order for the customer to recognize revenue, the goods and/or services must be “sufficiently separable” from the customer’s purchase of the vendor’s products by meeting two criteria:
  - a. The customer would have obtained the goods and/or services from a party other than the vendor, and
  - b. The customer is able to reasonably estimate the fair value of the goods and/or services provided to the vendor.

Any excess of cash consideration received by the customer over the fair value of the goods and/or services delivered to the vendor reduces the customer’s cost of sales.

2. *Reimbursement of costs.* A reimbursement of the customer’s specific incremental, identifiable costs incurred to sell the vendor’s products or services, which is accounted for by the customer as a reduction of that cost. To the extent the cash consideration received exceeds the actual cost being reimbursed, the excess reduces cost of sales and/or inventory.

Vendors sometimes enter into binding arrangements that offer customers specified amounts of cash rebates or refunds payable in the future only if the customer remains a customer for a specified period of time, or purchases a specified cumulative dollar amount of goods or services from the vendor. In general, these arrangements are to be recorded by the customer as reductions of cost of sales by systematically allocating a portion of the benefits to be received to each transaction that results in progress toward meeting the target that results in earning the benefit. In order to use this pro rata accounting, however, the amount of the refund must be both probable and reasonably estimable (as those terms are defined in ASC 450). The codification provided indicators that, if present, may impair the customer’s ability to determine that the refund is both probable and estimable:

1. The rebate or refund applies to purchases that are to occur over a “relatively long period” (which term is undefined in the ASC)
2. An absence of historical experience with similar products or changed circumstances that make historical experience irrelevant
3. A past history of significant adjustments to expected rebates or refunds
4. Susceptibility of the product to significant external factors such as technological obsolescence or changes in demand.

If the rebate or refund is not considered both probable and estimable, it is not recognized by the customer until it is fully earned by reaching the specified milestone (e.g., the dollar amount of cumulative purchases is reached or the time period for remaining a customer has expired).

Changes in a customer's estimate of the amount of future rebates or refunds, and retroactive changes by a vendor to a previous offer are recognized using a "cumulative catch-up adjustment." This is accomplished by the customer immediately charging or crediting cost of sales in an amount that will adjust the cumulative amounts recognized under the arrangement to the changed terms. Of course, if any portion of the adjustment impacts goods still in the customer's inventory, that portion would adjust the valuation of the inventory and not cost of sales.

The SEC observer cautioned registrants to consider whether certain transactions between vendors and customers (e.g., simultaneous agreements between the parties to purchase equal amounts of each other's goods) are covered by the provisions of ASC 845 regarding nonmonetary exchanges that are not the culmination of an earning process.

**Applying the foregoing guidance to sales incentives offered by manufacturers to consumers.** The rule described immediately above is applicable to situations in which cash consideration is received by a customer from a vendor, and is presumed to be a reduction of the prices of the vendor's products or services. Such incentives are to be characterized as a reduction of cost of sales when recognized in the customer's income statement. There are other instances, however, where consideration is a reimbursement for incentives offered to end users (e.g., retail customers) honored by the vendor's customer (retailer). The common example is coupons given to end users to be redeemed at the retailers offering the vendor's products for sale.

ASC 605-50-45-19 states that this guidance is limited to a vendor's incentive that meets all of the following criteria:

1. The incentive can be tendered by a consumer at resellers that accept manufacturer's incentives in partial (or full) payment of the price charged by the reseller for the vendor's product;
2. The reseller receives a direct reimbursement from the vendor (or a clearinghouse authorized by the vendor) based on the face amount of the incentive;
3. The terms of reimbursement to the reseller for the vendor's sales incentive offered to the consumer are not influenced by or negotiated in conjunction with any other incentive arrangements between the vendor and the reseller, but rather, may only be determined by the terms of the incentive offered to consumers; and
4. The reseller is subject to an agency relationship with the vendor, whether expressed or implied, in the sales incentive transaction between the vendor and the consumer.

Sales incentives that do not meet all of the foregoing criteria are subject to the guidance in ASC 605-50-45-2 through 45-3, and ASC 605-50-45-12 through 45-14, as applicable.

**Accounting for consideration given by a service provider to a manufacturer or reseller.** There are cases, such as in the cell phone service industry, where companies provide services to their customers under arrangements that require the customers to purchase equipment in order to utilize those services. To spur demand, the companies provide incentives to the equipment manufacturers or resellers to reduce the selling price of the equipment. The accounting for this situation is addressed by ASC 605-50, which states that, if the consideration given by the service provider to the manufacturer or reseller can be linked contractually to the benefit received by the service provider's customers, then the service provider can use the guidance noted above in ASC 605-50 to properly characterize the consideration paid. If the form of consideration to be paid to the service provider's customers is not cash or the service provider does not control the type of consideration paid, then the service provider should record such payments as an expense. If the form of consideration to be paid to the service provider's customers is cash (such as a mail-in rebate), then the service provider should record such payments as a reduction of revenue. The

service provider should disclose the nature of the incentive program and the amounts recognized in the statement of operations for the incentive program and their classification for each period presented.

**Accounting for revenues related to vaccine stockpiles.** The SEC has indicated in Accounting Standards Update (ASU) 2009-07 that it will not object if a registrant with vaccine manufacturing operations recognizes revenue from the sale of vaccines to federal government stockpile programs, even if product delivery and inventory segregation requirements have not been met. This exemption only applies to childhood disease vaccines, influenza vaccines, and other vaccines and countermeasures sold to a federal government stockpile program. A registrant using this exemption should disclose the transactions and their effect on the financial statements.

**Accounting for management fees based on a formula.** An arrangement may contain a performance-based incentive fee that will not be finalized until the end of a predetermined period of time; for example, a real estate management company may receive a bonus for attaining building occupancy above a specified level. The SEC has indicated in ASU 2010-04 that a registrant can either recognize such revenue at the end of the measurement period or the amount that would be due under the formula as if the contract were terminated at an interim date, though it prefers the first method. However, the SEC will object to measurements as of an interim period that are based on projected future results; it will *only* accept revenue recognition in an interim period that is based on management fees earned as of that date, as though the arrangement had been terminated at that time.

**Accounting for research and development revenues using the milestone method (ASC 605-28).** The milestone method can be used to recognize revenue related to research and development arrangements. A milestone is an event that occurs only due to vendor performance, and where there is substantive uncertainty that the event will be achieved. Also, the event will result in additional payments to the vendor. A milestone is not contingent solely upon the passage of time.

Under the milestone method, a vendor is allowed to recognize revenue that is contingent upon the achievement of a substantive milestone. Whether a milestone is considered achievable is decided at the beginning of the arrangement. To be substantive, the consideration a vendor earns by completing a milestone must be commensurate with either the vendor's performance to complete the milestone or the enhancement of value delivered. The consideration must also be related only to past performance, and be reasonable relative to the other deliverables and payments in the contract. It is acceptable if a vendor chooses to use some other method of revenue recognition that defers some portion of the consideration arising from a milestone.

The vendor must disclose its policy for the recognition of milestone payments as revenue, as well as a description of each arrangement involving milestone payments, and the amount of milestone consideration recognized during the period.

**Fees for guaranteeing a loan.** According to ASC 605-20-25-9, fees received for guaranteeing another entity's obligation are to be recognized as income over the guarantee period, rather than at the time of receipt, consistent with other standards governing service fee income recognition. The guarantor is to perform ongoing assessments of the probability of loss related to the guarantee and recognize a liability if the conditions in ASC 450 are met. Upon entering into a guarantee arrangement, the guarantor is required to recognize the stand-ready obligation under the guarantee. The contingent aspect of the guarantee would only be recognized if the conditions defined by ASC 450 are met.

## OVERVIEW

### What Is Revenue?

**Revenue:** Influx or other enhancement of assets of an entity or settlements of liabilities (or a combination of both) from delivering or producing goods, rendering services, or other activities that constitute the entity's ongoing major or central operations. (ASC 606-10-20)

**Revenue versus Gains.** The FASB distinguishes revenues from gains. Gains are defined in Statement of Financial Accounting Concept 6 (CON 6), *Elements of Financial Statements*, as:

*Increases in equity (net assets) from peripheral or incidental transactions of an entity and from all other transactions and other events and circumstances affecting the entity except those that result from revenues or investments by owners.*

Revenues are commonly distinguished in GAAP from gains for the three reasons listed in the chart below.

**Exhibit—Distinguishing Between Revenue and Gains in GAAP**

Revenues	Gains
Result from an entity's central operations.	Result from incidental or peripheral activities of the entity.
Are usually earned.	Result from nonreciprocal transactions (such as winning a lawsuit or receiving a gift) or other economic events for which there is no earnings process.
Are reported gross.	Are reported net.

### The New Revenue Standard<sup>1</sup>

In May 2014, the FASB and the IASB jointly issued *Revenue from Contracts with Customers*, as respectively:

- Accounting Standards Update (ASU) 2014-09
- IFRS 15.

### Development of Revenue Guidance

Revenue recognition guidance was initially found in:

- CON 5, which specifies that an entity should recognize revenue when realized or realizable and earned, and
- CON 6, which defines revenues as inflows or other enhancements of assets and/or settlements of liabilities from delivering goods or services as a result of the entity's ongoing major or central operations.

GAAP related to revenue developed piecemeal, with specific, often industry-related requirements, but it also had broad concepts. In some cases, the guidance resulted in different accounting for economically similar transactions. In addition to the guidance in ASC Topic 605, *Revenue*

<sup>1</sup> For ease of reference, this chapter refers to ASU 2014-09 as "the revenue standard" or the "Standard."

*Recognition*, guidance can be found in numerous pieces of industry-specific guidance, such as that for the software industry, construction contracts, real estate sales, and multiple-element arrangements. Industry guidance often addressed narrow issues and was not built on a common framework. This led to economically similar transactions accounted for differently. Even though there were two hundred separate pieces of guidance, there were still transactions which there was no guidance, in particular, for service transactions.

### The Revenue Recognition Project

Driven by the need to achieve simplification and consistency, the FASB and the IASB (the Boards) began a joint project in 2002. The basically converged, new revenue standard is principles-based, eliminating the existing transaction- and industry-specific guidance. This move away from prescriptive guidance and bright lines increases the need for professional judgment, which in turn increases the need for expanded disclosures. To compensate for the lack of rules, the revenue standard provides extensive application guidance.

**The New Standard.** ASU 2014-09:

- Superseded 200 separate items FASB Accounting Standards Codification (ASC) guidance, most of it industry specific.
- Created Topic 606, *Revenue From Contracts with Customers*, and Subtopic 340-40, *Other Assets and Deferred Costs—Contracts with Customers*.
- Created Topic ASC 610, *Other Income*.

ASU 2014-09 is over 700 pages and was released in the following sections:

- Amendments to the FASB Accounting Standards Codification:
  - Section A—Summary and Amendments That Create Revenue from Contracts with Customers (Topic 606) and Other Assets and Deferred Costs—Contracts with Customers (Subtopic 340-40)
  - Section B—Conforming Amendments to Other Topics and Subtopics in the Codification and Status Tables
- Background Information and Basis for Conclusions:
  - Appendix: Comparison of Topic 606 and IFRS 15
- Amendments to XBRL Taxonomy.

**Project Goals.** The FASB believes the final documents meet two major goals—simplification of revenue recognition guidance and consistency globally and across entities, jurisdictions, markets and industries.

The revenue standard provides:

- a robust framework that is expected to simplify preparation of financial statements by reducing the sources of guidance and replacing them with a single source that users can understand
- new guidance for contract modifications and consistent application for service contracts
- guidance for related topics, such as warranties, licenses, and when to capitalize the cost of obtaining a contract and some costs of fulfilling a contract.

**Customer Loyalty Programs.** In addition, the changes may affect customer loyalty programs, and companies will have to make new estimates. It is expected that entities will be

reviewing their loyalty programs to evaluate their effects, if any, on revenue, and some companies may choose to amend their contracts with customers.

## The Transition Resource Group

The FASB and the IASB established a joint Transition Resource Group (TRG) to solicit, analyze, and discuss stakeholder issues and inform the Boards about potential implementation issues that could arise during the transition period. The Boards then consider whether amendments or additional guidance is needed. The TRG does not issue authoritative guidance. The TRG originally consisted of 19 members, representing U.S. and international preparers, auditors, users from various industries, and public and private companies and organizations. For more on the TRG and TRG issues see the information at the end of this chapter.

### Scope

The scope of the Standard is wide. It affects all public companies, nonpublic companies, and nonprofit organizations. The Standard applies to contracts with customers.

**Scope Exceptions.** The following are outside the scope of the standard:

- Lease contracts in the scope of ASC 840, *Leases*, and ASC 842, *Leases*, when implemented
  - Insurance contracts issued by insurance entities within the scope of ASC Topic 944, *Financial Services—Insurance*. Note: Insurance contracts issued by entities that do not apply insurance industry-specific guidance under U.S. GAAP are in the scope of the revenue standard.
  - Financial instruments and other contractual rights or obligations in the scope of:
    - ASC 310, *Receivables*;
    - ASC 320, *Investments—Debt and Equity-Securities*; (This title changes to *Investments in Debt Securities* when ASU 2016-01 is implemented.)
    - ASC 321, *Investments in Equity Securities* (when implemented);
    - ASC 323, *Investments—Equity-Method and Joint Ventures*;
    - ASC 325 *Investments—Other*;
    - ASC 405, *Liabilities*;
    - ASC 470, *Debt*;
    - ASC 815, *Derivatives and Hedging*;
    - ASC 825, *Financial Instruments*;
    - ASC 860, *Transfers and Servicing*.
  - Guarantees other than product or service warranties, in the scope of ASC 460, *Guarantees*
  - Non-monetary exchanges between entities in the same line of business to facilitate sales to customers or potential customers.
- (ASC 606-10-15-2)

Revenue from transactions or events that do not arise from contracts with customers is not in the scope of the Standard, such as:

- Dividends
- Non-exchange transactions, like donations or contribution
- Changes in regulatory assets and liabilities arising from alternative revenue programs for rate-regulated activities in the scope of ASC 930, *Regulated Operations*.

The guidance included in new subtopic ASC 340-40 applies only if the costs are incurred related to a contract under ASC 606. (ASC 606-10-15-5) The guidance in new topic ASC 610 specifies the standards for income that is not in the scope of ASC 606, including gains and losses from the derecognition of nonfinancial assets and from gains and losses on involuntary conversions.

**Contracts Partially in Scope.** If a contract is partially within the scope of the Standard and partially within the scope of other guidance, the entity should apply the other guidance first. That is, if the other standard specifies how to separate or initially measure parts of the contract, then the entity should apply those requirements first. The remaining portion is accounted for under the requirements of the new Standard. If the other standard does not have applicable separate and/or initial measurement guidance, the entity should apply the revenue standard to separate and/or initially measure the contract. (ASC 606-10-15-4)

**Sale or Transfer of Nonfinancial Assets.** Transactions that are not part of the entity's ordinary activities, such as the sale of property, plant, and equipment, nonetheless fall under certain aspects of the standard. An entity involved in such activities applies the guidance related to transfer of control and measurement of the transaction price to evaluate the timing and amount of the gain or loss. Entities should also apply the guidance in the standard to determine whether the parties are committed to perform under the contract and, therefore, whether a contract exists.

### Effective Dates

In response to constituent concerns, the FASB issued ASU 2015-14, *Revenue from Contracts with Customers (Topic 606): Deferral of Effective Dates*. The ASU allows for all entities a one-year deferral from the original effective dates and for early adoption using the original adoption dates.

The ASU now is effective as follows:

- For public entities, the guidance in the standard is effective for annual reporting periods beginning after December 15 2017, including interim reporting periods within that period, that is, beginning in the first interim period within the year of adoption. Early application is permitted but not earlier than the original effective date of December 15, 2016.
- For nonpublic entities, the new guidance is required for annual reporting periods beginning after December 15, 2018, and interim periods within annual periods beginning after December 15, 2019. A nonpublic entity may elect early application, but no earlier than the original effective date for public entities.

### Other Changes

In addition to the ASU deferring the effective date, the FASB responded to feedback by issuing several ASUs and another exposure draft to amend ASU 2014-09:

- Accounting Standards Update 2016-08, *Revenue from Contracts with Customers (Topic 606): Principal versus Agent Considerations (Reporting Revenue Gross versus Net)*
- Accounting Standards Update 2016-10, *Revenue from Contracts with Customers (Topic 606): Identifying Performance Obligations and Licensing*
- Accounting Standards Update 2016-12, *Revenue from Contracts with Customers (Topic 606): Narrow-Scope Improvements and Practical Expedients*
- Proposed Accounting Standards Update, *Technical Corrections and Improvements to Update 2014-09, Revenue from Contracts with Customers.*
  - Issued May 18, 2016
  - FASB is redeliberating as this volume goes to press.

For more on the FASB's proposed changes, see the Appendix to this chapter.

## Implementation Options

Entities have the option to implement the guidance through:

- Full retrospective application, or
- Modified retrospective application.

**Full Retrospective Approach.** Under this method, all prior periods presented must be restated in equity in accordance with ASC 250, *Accounting Changes and Error Corrections*. That is, entities must report the cumulative effect for the earliest year reported.

**Modified Retrospective Approach.** Using the modified retrospective approach, the entity recognizes the cumulative effect of initially adopting the standard as an adjustment to the opening balance of retained earnings in the annual period when the standard is adopted. If the entity issues comparative statements, then it reports revenue for prior years under the guidance in effect before adoption.

## Objective of the Standard

The objective of the standard is:

*... to establish the principles that an entity shall apply to report useful information to users of financial statements about the nature, amount, timing, and uncertainty of revenue and cash flows arising from a contract with a customer. (ASC 606-10-10-1)*

The Standard provides principles to help entities meet this objective when measuring and reporting on revenue.

## Core Principle and the Five Steps of the Revenue Recognition Model

The standard takes an asset and liability approach and articulates a core principle on which the new guidance is based.

### Core Principle:

*... recognize revenue to depict the transfer of promised goods or services to customers in an amount that reflects the consideration to which the entity expects to be entitled in exchange for those goods or services. (FASB ASC 606-10-05-3 et al.,)*

This core principle reflects the asset and liability approach that underlies the standard. This approach recognizes revenue based on changes in assets and liabilities. The Boards believe this is consistent with the conceptual framework approach to recognition and brings more consistency to the measurement compared with the “earned and realized” criteria in previous standards.

**Five Steps.** To achieve the core principle, entities should follow these five steps:

1. Identify the contract with customer. (ASC 606-10-25-1 through 25-13)
2. Identify performance obligations (promises) in the contract. (ASC 606-10-25-1 through 25-13)
3. Determine the transaction price. (ASC 606-10-32-2 through 32-27)
4. Allocate the transaction price. (ASC 606-10-32-28 through 25-41)
5. Recognize revenue when or as the entity satisfies a performance obligation by transferring promised goods or services to a customer. (ASC 606-10-25-23 through 25-30)

In reviewing a transaction, each of the five steps above may not be needed, and they may not always be applied sequentially. Be aware that the standard is not organized by these five

steps, but the Boards believe the steps offer a methodology for entities to use when deciding the appropriate accounting for a transaction. As was mentioned, the model is based on an assets and liabilities or control approach as opposed to the risk and rewards approach under previous standards. However, risk and rewards are a factor when determining control for point in time revenue recognition.

Each of the steps encompasses new concepts, and entities will have to carefully analyze their contracts with customers as they transition to the new guidance.

## STEP 1: IDENTIFY THE CONTRACT WITH THE CUSTOMER

---

### Overview

**Contract:** Agreement between two or more parties that creates enforceable rights and obligations. (ASC 606-10-20; IFRS 15 Appendix A)

To apply the revenue standard, entities should first determine whether a contract is specifically excluded from the guidance in the standard under the scope exceptions detailed earlier in this chapter. After determining that a contract is not specifically excluded, entities must identify the contracts that meet the criteria in Step 1 of the revenue recognition model. If the entity determines a contract does not meet the criteria for Step 1, the contract does not exist for purposes of the standard and the entity does not apply Steps 2 through 5. A contract as articulated in the standard must exist before an entity can recognize revenue from a customer.

### Assessing Whether Contracts Are Within the Scope of the Standard

To be within the scope of the revenue standard, and in accordance with the definition of contracts in the standard, the agreement must not fall under one of the scope exceptions listed in the Executive Summary chapter and must:

- Create enforceable rights and obligations, and
- Meet the five criteria listed in the Standard.

**Enforceable Rights and Obligations.** The enforceability of the contract:

- Is a matter of law
- Varies across legal jurisdictions, industries, and entities
- May vary within an entity
- May depend on the class of customer or nature of goods or services.

Determining whether an arrangement has created enforceable rights is a matter of law and evaluating the legal enforceability of the contract can be particularly challenging. This is particularly true if multiple jurisdictions are involved. Entities also need to consider whether, in order to comply with jurisdictional or trade regulation, a written contract is required. Significant judgment may be involved for some cases and qualified legal counsel may need to be consulted.

The Boards clarified that even though the contract must be legally enforceable to be within the scope of the guidance, the performance obligations within the contract may not be legally enforceable, but may be based on the reasonable expectations of the customer.

**The Five Contract Criteria.** The standard lists five criteria that are assessed at contract inception and that must be met for agreements to be considered contracts subject to the guidance of the standard. A contract exists if:

1. The contract has approval and commitment of the parties

2. Rights of the parties are identifiable
  3. Payment terms are identifiable
  4. The contract has commercial substance
  5. Collectibility of *substantially all of the consideration* is probable.
- (ASC 606-10-25-1)

The five criteria above are essentially a financial accounting definition of a contract. The entity needs to exercise judgment when applying the criteria. The entity must also be aware that the parties may enter into amendments or side agreements that change the substance of the contract. So, it is important to understand the entire contract, including the amendments and side agreements. A contract that has enforceable rights and obligations between two or more parties is within the scope of the revenue standard when *all* five of the above criteria are met.

The assessment of collectibility must reflect the customer's *ability and intent* to pay. This criterion acts as a collectibility threshold. A more detailed discussion of the collectibility threshold can be found below.

### Collectibility Threshold

To be considered a contract with a customer under the standard, it must be probable that the entity will collect the consideration to which it is entitled. In addition, under legacy guidance, collectibility is evaluated when revenue is recognized, whereas in the revenue standard, collectibility is assessed when determining whether a contract exists. The Boards consider the customer's credit risk an important part of determining whether a contract is valid. It is not an indicator of whether revenue is recognized but an indicator of whether the customer is able to meet its obligation. (ASC 606-10-25-1(e))

GAAP defines probable as "likely to occur." This is generally interpreted as a 75 to 80% probability. The collectibility threshold is similar to that in ASC 985-605, *Software: Revenue Recognition*. The threshold is slightly higher than that in SEC SAB Topic 13, which is "reasonably assured."

**Assessing Collectibility.** To be accounted for under the standard, a contract must have commercial substance. To have commercial substance, the consideration must be collectible. So, the underlying objective of the collectibility assessment is to determine if there is a substantive transaction.

Collectibility is a "gating" question designed to prevent entities from applying the standard to problematic contracts and recognizing revenue and an impairment loss at the same time.

**Judgment.** Collectibility is partly a forward-looking assessment and requires the entity to look at all the factors and circumstances including the entity's customary business practices and knowledge of the customer.

**Timing of Assessment.** Collectibility must be evaluated, like the other criteria, at contract inception, but also must be re-evaluated when significant facts and circumstances change.

**Collectibility = Intent and Ability to Pay.** Collectibility refers only to the company's credit risk—the customer's intent and ability to pay—and in making the collectability assessment not to any other uncertainty or risk. Credit risk is the risk that the entity will not be able to collect the contract consideration to which it is entitled from the customer.

**Consider Only Transaction Price.** Entities should be aware that collectibility relates to the *transaction* price, a term introduced in the revenue standard, not the *contract* price. The

transaction price is the amount the entity expects to be entitled to. The transaction price is not adjusted for credit risk. The entity may have to consider transaction price in Step 3 before making a conclusion regarding Step 1's collectibility threshold.

Entities should take into account factors that might mitigate credit risk such as:

- Payment terms, like upfront payments, or
- The ability to stop transferring goods or services.

A factor that should not be considered is the ability of the entity to repossess an asset. (ASC 606-10-55-3c)

**Variable Consideration in the Transaction Price.** The revenue standard requires an entity to consider whether the price is variable because if so the entity may wind up offering a price concession. The collectibility assessment is made after taking into account any price concessions that may be made to the customer. The transaction price may be less than the stated contract price if the entity intends to offer a price concession.

**Basis of Assessment May Be Less Than Total Consideration.** The assessment is not necessarily based on the entire amount of consideration for the entire duration of the contract. For example, the entity may have the ability and expectation to stop transferring goods or services if the customer stops paying consideration when due. In another example, if an entity expects to receive only partial payment for performance, the contract may still meet the contract criteria. The expected shortfall is similar to a price concession. The entity must determine if the partial payment is:

- An implied price concession
- An impairment loss
- A contract lacking commercial substance.

When an entity expects a shortfall, the entity must exercise significant judgment to determine the proper accounting.

## Contract Recognition

A contract that meets the qualifications for recognition under the Standard:

- Gives the entity the right to receive consideration, and
- Creates obligations for the entity to deliver goods and services.

This combination of rights and obligations gives rise to net assets or net liabilities. These assets and liabilities are not recognized until one or both parties perform. Entities must monitor contracts for when performance has begun. Once performance has begun, a contract that is enforceable and meets the five contract criteria exists for purposes of the revenue standard. Even if a contract has not been signed, entities may determine that a contract exists and may need to account for a contract as soon as performance begins rather than delay revenue recognition for an executed contract. In some cases, timing of revenue recognition may differ from that under legacy standards.

If a contract does not meet the five criteria listed previously and the performance is not complete, the entity recognizes a liability for any nonrefundable amounts received. This can be contrasted with current standards where revenue may be recognized in the amount of cash received. The section on Step 5 has a detailed discussion of recognizing revenue, contract assets, and contract liabilities.

## Arrangements Where Contract Criteria Are Not Met

If the entity receives consideration from the customer, but the contract fails Step 1, the entity should apply what is sometimes referred to as the alternate recognition model and recognize the consideration received only when *one* of the following occurs:

- a. The entity has no remaining obligations to transfer goods or services to the customers, and all or substantially all of the consideration promised by the customer has been received by the entity and is nonrefundable,
- b. The contract has been terminated, and the consideration received from the customer is nonrefundable, or
- c. The entity has transferred control of the goods or services to which the consideration that has been received relates, the entity has stopped transferring goods and services to the customer and has no obligation to transfer additional goods or services, and the consideration received from the customer is nonrefundable.

(ASC 606-10-25-7)

If an arrangement does not meet the contract criteria in the revenue standard, consideration received should be accounted for as a liability until:

- “a,” “b,” or “c” above occur, or
- The arrangement meets the contract criteria.

The liability is measured at the amount of consideration received from the customer. The liability represents the entity’s obligations to:

- Transfer goods or services in the future, or
- Refund the consideration received.

(ASC 606-10-25-8)

**Reassessment.** When an arrangement has been assessed and is considered a contract under the revenue standard, the entity is not required to reassess the contract unless there is an indication of a significant change. A significant change might be, for example, a significant deterioration in the customer’s ability to pay. (ASC 606-10-25-5) In that case, the entity needs to assess whether it is probable the customer will pay the consideration for the remaining goods or services. In contrast, if the arrangement is not initially considered a contract, the entity should continue to assess each reporting period (as necessary) to determine whether the criteria are met subsequently. (ASC 606-10-25-6) The entity applies the provisions of the Standard from the date the criteria are met.

Only the rights and obligations that have *not* transferred are reassessed. Therefore, a reassessment will not result in any reversal of revenue, receivables, or assets already recognized. Those assets are assessed for impairment under the relevant financial instruments standard. The entity does not recognize any additional revenue from the agreement.

TRG members have acknowledged the assessment of whether significant changes have occurred that require a reassessment of collectibility or even a determination that a contract no longer exists under the Standard will be situation specific and require judgment.

## The Portfolio Approach and Combining Contracts

The revenue standard includes:

- A practical expedient for combining groups of contracts, and
- A new requirement to combine contracts.

**A Practical Expedient.** An entity normally applies the revenue standard to individual contracts. However, in certain circumstances, an entity may use a practical expedient and apply the revenue standard to a group of contracts. This expedient allows for the portfolio approach—applying the revenue standard to a group of contracts or performance obligations under these conditions:

- The contracts must have similar characteristics, *and*
- The entity must reasonably expect that the effects of applying the guidance to a portfolio would not differ materially from applying it to individual contracts or performance obligations.

(ASC 606-10-10-4)

**Combination of Contracts Required.** Under legacy GAAP (ASC 605-25-25-3), the entity is *allowed* to combine contracts if certain conditions are met. The new standard *requires* a combination of contracts under certain circumstances. Entities have to assess existing contracts to determine whether combination is required and should also be mindful of the combination requirement when writing new contracts. The decision to combine contracts is made at the inception of the contracts.

The entity needs to assess whether the substance of the contract is that the pricing or economics of the contract are interdependent. The standard offers guidance to help make that judgment. The contracts should be accounted for as a single contract when the contracts are entered into at or near the same time with the same customers or parties related to the customer and if *any* of the following conditions are met:

- a. The entity negotiates the contracts as a package with a single commercial objective.
- b. The amount of consideration to be paid in the contract depends on the price or performance of the other contract.
- c. The goods or services promised in the contracts (or some goods or services promised in the contracts) constitute a single performance obligation.

(ASC 606-10-25-9)

The entity should apply the guidance on identifying performance obligations when assessing “c.” (See information later in this chapter.)

The fact that multiple contracts are negotiated at the same time is not sufficient evidence to demonstrate that the contracts represent a single arrangement. (ASU 2014-09 BC73)

If the criteria are met, contracts between the same customer or related parties of the customer should be combined. Related parties are those defined in the guidance, ASC 850, *Related Parties Disclosures*. See the chapter on ASC 850 for a list of related parties.

**Assessing Collectability of a Portfolio of Contracts.** An issue was raised with the TRG regarding how to deal with situations in a portfolio of homogeneous contracts where some customers will pay amounts owed, but the entity has historical experience indicating that some customers will not pay the full consideration. In that case, the entity should record revenue, but separately evaluate the contract asset or receivable for impairment. The entity will have to exercise judgment regarding whether to record a bad debt expense or reduce revenue for an anticipated price concession.

## Identifying the Customer

*Customer: A party that has contracted with an entity to obtain goods or services that are an output of the entity's ordinary activities in exchange for consideration. (ASC 606-10-20)*

**Collaborative Arrangements.** A collaborative arrangement is not in the scope of the Standard unless the collaboration meets the definition of a customer. In most cases, the identification of the customer is straightforward. However, the Boards decided not to offer additional application guidance and, therefore, a collaborative arrangement requires more careful analysis of the facts and circumstances. For example, an arrangement with a counterparty where both parties share the risks and benefits will most likely not result in a counterparty meeting the definition of customer, and, therefore, the arrangement will not fall under the revenue standard. (ASC 606-10-15-3) On the other hand, an arrangement where the entity is selling a good or service, even if the arrangement is labeled a collaboration, will likely fall under the scope of the revenue standard.

It is also possible that portions of the contract will be collaboration, while other portions will be a contract with a customer. The latter portion will be in the scope of the revenue standard. After a thorough analysis of the agreement, the entity should decide whether to apply the revenue standard and/or other guidance, such as ASC 808, *Collaborative Arrangements*.

**Arrangements with Multiple Parties.** There are cases where multiple parties are involved in the transaction. For example, pharmaceutical companies provide products to customers and parts of the fees are paid by an insurer and the remaining fees are paid by the customer. Or, manufacturers issue coupons directly to the consumer and reimburse the retailer for the coupons.

The entity must also determine if it is the principal or agent in the transaction. This matters because the principal recognizes the revenue for the gross amount, and the agent recognizes the transaction at net—the amount that the entity expects to retain after paying the other party for goods or services provided. Principal versus agent guidance is discussed later in this chapter.

## STEP 2: IDENTIFYING THE PERFORMANCE OBLIGATIONS

---

*Performance Obligation: A promise in a contract with a customer to transfer to the customer either:*

- a. *A good or service (or a bundle of goods and services) that is distinct*
- b. *A series of goods or services that are substantially the same and that have the same pattern of transfer to the customer.*  
(ASC 606-10-20)

### Overview

The purpose of identifying the performance obligations in a contract is to establish the unit of account to which the transaction price should be allocated. The accounting unit affects when and how revenue should be recognized. Because the revenue recognition model is an allocated transaction price model, identifying a meaningful unit of account is critical. Once the performance obligations are identified, the entity can then assess whether they are immaterial.

The standard uses the term “performance obligation” to distinguish obligations to provide goods or services to a customer from other obligations. Although it is a new term, “performance obligation” is similar to the notions of deliverables, components, or elements of a contract in legacy guidance. In the definition above, the standard essentially provides two categories of performance obligations:

- A distinct good or service, and
- A series of goods or services with the same pattern of transfer.

This chapter examines both.

To apply Step 2 of the revenue standard, at the inception of the contract, the entity should assess the contract and:

- a. Identify all promised goods or services or bundle of goods or services, and then
- b. Identify the contract's performance obligations.

The purpose of the first part of the assessment is to identify the promises in the contract, taking note of terms and customary business practices. The entity must identify all promises, even if they seem inconsequential or perfunctory. An entity is not required to assess whether promised goods or services are performance obligations if they are immaterial in the context of the contract. (ASC 606-10-25-16A)

In the second part of the assessment, the entity determines which of those promises are performance obligations that should be accounted for separately. Some contracts contain single performance obligations and are relatively straightforward. Multiple elements in a contract may present more challenges.

### Promises in Contracts with Customers

When identifying the promises in a contact, the entity must identify not only the explicit promises, but also the implicit promises and those activities associated with the contracts that do not meet the criteria for performance obligations.

Promises to provide goods or services are performance obligations even if they are satisfied by another party.

**Implicit Promises.** In addition to promised goods or services explicitly detailed in the contract, a contract may include implicit promises for goods or services. Promises are normally specified, but may include those implied by, for example:

- Customary business practices of a particular industry,
- An entity's published policies, and
- Specific statements.

These implicit promises may create a reasonable expectation on the part of the customer that the entity will transfer a good or service. (ASC 606-10-25-16) It is important, therefore, to understand the entity's customary business practices, marketing materials, and representations made during contract negotiations. The entity must determine if the customer has a valid or reasonable expectation that the entity will provide a good or service.

**Constructive Performance Obligations.** As noted in the section on Step 1, the customer's expectation may arise from a constructive performance obligation outside of a written contract. So, in evaluating whether a reasonable expectation exists, the entity must consider industry norms, past business practice, etc. Examples of constructive performance obligations are, for instance, customer loyalty points, free handsets provided by telecommunication companies, or free maintenance with the purchase of a car. These kinds of implied promises may not be enforceable by law, and the entity itself may consider them marketing incentives or incidental to the goods or services for which the customer is paying. However, the customer may see them as part of the negotiated exchange. The Boards decided that they are goods or services for which the customer pays and that the entity should include them in performance obligations for the purpose of recognizing revenue under the standard. (ASU 2014-09.BC 87-88) That said, some incentives do not represent performance obligations if they are provided independently.

**Goods to Be Provided in the Future.** The Boards also concluded that goods or services to be provided in the future give rise to performance obligations. In some industries it is common practice to provide services to the customer's customer. For example, an automotive manufacturer may promise to provide service to a vehicle sold by a dealer. This type of promise is a performance obligation if it can be identified in the contract with the customer, either explicitly or implicitly.

**Activities Not Included as Performance Obligation.** Only promises that transfer goods or services to the customer can be performance obligations. An entity may need to undertake set-up activities to fulfill performance obligations. If those activities transfer goods or services to the customer, they are part of the performance obligations. However, activities that do not transfer goods or services, like administrative tasks, are not promised goods or services in the contract with the customer. (ASC 606-10-25-17) Some organizations may have a significant number of performance obligations, especially, for example, if "free" items are included and they have to be recognized under the standard.

**What is a Promised Good or Service?** The Standard offers some clarity by providing examples of promised goods or services. Bear in mind this is not an exhaustive list. Promised goods or services may include:

- Sale of goods produced by an entity
  - Resale of goods purchased by an entity
  - Resale of rights to goods or services purchased by an entity
  - A contractually agreed-upon task for a customer
  - Standing ready to provide goods or services
  - Arranging for another party to transfer goods or services to a customer
  - Rights to goods or services to be provided in the future that a customer can resell or provide to its customer
  - Licenses
  - Constructing, manufacturing, or developing an asset on behalf of a customer
  - Options to purchase additional goods or services.
- (ASC 606-10-25-18)

**Shipping and Handling Services.** Shipping and handling services performed prior to the customer obtaining control of the goods are not promises to the customer. They are activities to fulfill the promise. (ASC 606-10-25-18A) However, the standard gives the entity the choice to account for shipping and handling services performed after the customer takes control as a fulfillment cost. Entities electing this practical expedient must disclose it in accordance with the standard's disclosure requirements. Be aware this is an election and not a requirement. (ASC 606-10-25-18A and 18B)

### Determining Whether a Good or Service Is Distinct

After the entity identifies a contract's promises, where there are multiple promises in a contract, the entity must determine which are separate performance obligations. That is, the entity must identify the separate units of account. Performance obligations are the accounting unit for applying the revenue standard.

This is a key decision because:

- Determining the unit of account dictates how and when revenue is recognized, and
- The key determinant when identifying a separate performance obligation is whether a good or service or bundle is distinct.

To determine whether an entity has to account for multiple performance obligations, the entity must assess whether the good or service is distinct, that is, separately identifiable, from other promises in the contract. A good or service is distinct if it meets both these criteria:

1. Capable of being distinct. The customer can benefit from the good or service on its own or together with other resources that are readily available to the customer, and
  2. Distinct within the context of the contract. The entity's promise to transfer the good or service to the customer is separately identifiable from other promises in the contract.
- (ASC 606-10-05-4B)

In some cases, even though a good or service is capable of being distinct, accounting for it as a separate performance obligation might not reflect the entity's performance in that contract. Therefore, the entity uses a two-part process for determining whether a promised good or service or bundle of goods or services is distinct:

1. Assess at the level of the good or service, that is, is the good or service inherently capable of being distinct? and
  2. Assess in the context of the contract, that is, is the promise to transfer goods or services separately identifiable from other promises in the contract?
- (ASC 606.10-25-19)

Criterion number 1 is similar to the stand alone value criterion in extant U.S. GAAP, but criterion number 2 is a new concept. If *both* these criteria are met, the individual units of accounts must be separated. The standard includes indicators to help the entity determine whether the distinct criterion is met.

**Criterion 1: Good or Service Is Capable of Being Distinct.** A good or service is capable of being distinct if the customer can benefit from it on its own or together with other resources readily available to the customer. (ASC 606-10-25-19a)

**Customer Can Benefit from a Performance Obligation.** A good or service is capable of being distinct if the customer can benefit from it. What does it mean to "benefit from a good or service"? To benefit, the customer must be able to:

- Use,
- Consume,
- Sell for an amount greater than scrap value, or
- Otherwise generate economic benefit.

The ability to sell the good or service at scrap value would not necessarily support a conclusion that the good or service is capable of being distinct.

The assessment of whether the customer can benefit from the good or service on its own is based on the characteristics of the goods or services themselves, rather than how the customer might use them. The benefit may come from one good or service on its own or in conjunction with other readily available resources. A readily available resource is:

- A good or service that is sold separately by the entity or by another entity, or
- A resource that the customer has already obtained either from the entity or through other transactions or events.

One indication that the customer can benefit from the goods or services is that the entity regularly sells it separately. (ASC 606-10-25-20)

In order to assess whether to combine goods or services and account for them as one performance obligation, the entity must understand what the customer expects to receive. For

instance, a contract may promise to deliver multiple goods, but the customer may be buying the finished good that those items create.

**Criterion 2: Distinct Within the Context of the Contract.** After an entity has determined a good or service is capable of being distinct, the second step in the assessment of whether the performance obligations are distinct is to determine if they are distinct within the context of the contract. The objective when assessing whether an entity's promise to transfer goods or services to the customer are separately identifiable is to determine whether the nature of the entity's overall promise in the contract is to transfer each of those goods or services or whether the promise is to transfer a combined item or items to which the promised goods or services are inputs. (ASC 606-10-25-21)

**Separately Identifiable Indicators.** The objective when assessing whether an entity's promise to transfer goods or services to the customer are separately identifiable is to determine whether the nature of the entity's overall promise in the contract is to transfer each of those goods or services or whether the promise is to transfer a combined item (or items to which the promised goods or services are inputs). The standard provides indicators rather than criteria to help determine when goods or services are distinct within the context of the contract. Providing guideposts rather than hard and fast rules allows the entity to exercise its judgment to reflect the underlying economic substance of the transaction. Some indicators that a good or service are not separately identifiable are:

- The entity *provides a significant integration service*. That is, the entity is providing the good or service as an input for the combined output specified by the customer.
- One or more of the goods or services *significantly modifies or customizes* or is significantly modified or customized by one or more of the other good or service promised in the contract. The software industry illustrates this indicator.
- The good or service is *highly dependent on, or highly interrelated with*, other goods or services promised in the contract. In other words, each of the goods or services is significantly affected by one or more of the other goods or services in the contract.

(ASC 606-10-25-21)

Many long-term construction and service contracts will be identified as single performance obligations because they tend to include significant integration services. For instance, a house painter will likely consider the paint as an input to produce the painted house. The service is a significant integration service and, therefore, the paint and the painting services are a single performance obligation.

**Promised Good or Service Is Not Distinct.** Once an entity determines that a promised good or service is not distinct, it must combine it with other promises in the contract until it identifies a bundle of goods or services that is distinct. The result may be that all the promises in a contract are accounted for as a single purchase obligation.

### **Series of Distinct Goods or Services That Are Substantially the Same and Have the Same Pattern of Transfer**

There are two ways an entity may determine that two or more goods or services are a single performance obligation. The first is if the entity determines the goods or services are not distinct from each other. The second involves the goods or services that meet the criteria for being distinct, but may still be a single performance obligation. (Refer to the definition of performance obligation at the beginning of this chapter.)

**The Series Provision.** The second category of performance obligations requires the entity to assess whether the performance obligations are a series of distinct goods or services that are "substantially the same or have the same pattern of transfer to the customer." Without this part of

the definition, some entities would face significant operational challenges. For example, services provided on an hourly or daily basis, like a cleaning service, might meet the criteria for a single performance obligation and the entity would be faced with accounting separately for numerous repetitive services. The series provision is a concept that is introduced by the Standard and does not exist in the legacy standards. This series provision guidance is intended to simplify the application of the revenue recognition model and promote consistency.

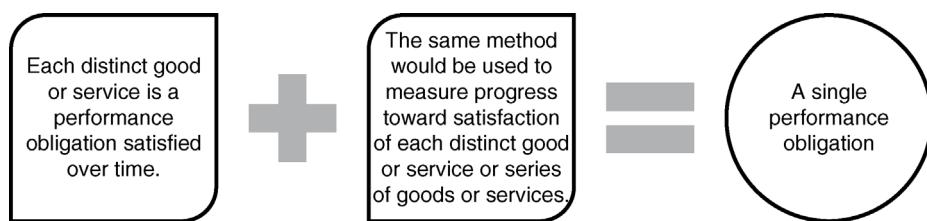

To have the same pattern of transfer, both of the following criteria must be met:

- Each distinct good or service in the series that the entity promises to transfer consecutively represents a performance obligation satisfied over time if it were accounted for separately.
- The entity uses the same method of progress to measure the transfer of each distinct good or service in the same series to the customer.

(ASC 606-10-25-15)

If the criteria are met, the series of goods or services must be treated as a single performance obligation, the so-called “series requirement.” The accounting treatment may vary for this application when accounting for contract modifications, variable consideration, and changes in transaction price.

#### **Exhibit—Series of Distinct Goods or Services—Criteria for Same Pattern of Transfer**

The box on the left above is similar to the principles in legacy U.S. GAAP (ASC 605-10-25-13) for multiple element arrangements. The second is a new requirement, and for some entities, this may result in a change in practice.

### **STEP 3: DETERMINE THE TRANSACTION PRICE**

---

#### **Overview**

**Transaction Price:** *The amount of consideration to which an entity expects to be entitled in exchange for transferring promised goods or services to a customer, excluding amounts collected on behalf of third parties (for example, some sales taxes).* (ASC 606-10-20)

Step 3 of the revenue recognition model requires entities to consider the terms of the contract and the entity’s customary business practices to determine the transaction price. Transaction price is a new term. Entities will have to understand the term conceptually and in practice compared with the extant term “contract values.” The transaction price only includes amounts to which the entity has rights and does *not* include:

- Amounts collected on behalf of another, such as sales taxes, and
- Estimates of options on and future change orders for additional goods and services.

Determining the transaction price is critical because it is the amount ultimately recognized as revenue. The objective of the guidance in Step 3 is to predict at the end of the reporting period the total amount of consideration to which the entity is entitled.

The transaction price should be determined at the inception of the contract. As with other steps of the revenue recognition model, when determining the transaction price, the entity should look more widely than the contract terms and examine the entity's customary business practices, published policies, and specific statements. Also, the entity should assume that the terms of the contract will be fulfilled, that is, the goods or services will be transferred as promised and that the contract will not be canceled, renewed, or modified. (ASC 606-10-32-4)

A contract may include fixed amounts, variable amounts, or both. Determining transaction price can be straightforward or complex. For example, sales to a customer in a retail store are relatively simple. In other situations, for example where noncash consideration is included or the consideration varies depending on circumstances, determination of the transaction price can be more complex.

The transaction price excludes amounts collected on behalf of third parties and estimates of future goods or change orders or options for future goods or services. Entities should consider the explicit and implicit terms of the contract and assume that the contract will be fulfilled. When determining the transaction price, entities should consider:

- The existence of a significant financing component and its related interest.
- Variable consideration, an estimate that better predices the likely amount of consideration, and constraining elements of variable consideration.
- Noncash consideration at fair value.
- Consideration payable to the customer.

(ASC 606-10-32-3)

The factors that determine the transaction price may well lead to a transaction price that is significantly different than the contractual price. Each of the above elements will be discussed in depth in this chapter.

### **Significant Financing Component**

Under some arrangements, there is a difference in timing—the timing of the payment does not match the timing of the transfer of goods or services. It is not uncommon for an entity to enter into a contract that includes, either explicitly or implicitly, payments over time.

Through the agreed-upon payment terms, the timing may provide the customer or the entity with a significant financing benefit. If the customer pays in advance, the entity has received financing from the customer. If the entity transfers the goods or services in advance of payment, the entity has provided financing to the customer. If one of these is the case, the entity must then examine the facts and circumstances to determine if a significant financing component exists that must be accounted for. See the section that follows for more detail.

**Practical Expedient:** The standard includes a practical expedient for significant financing components. The amount of consideration does not have to be adjusted if, at contract inception, the entity expects that there will be one year or less between:

1. Transfer of goods or services, and
2. Payment.

(ASC-606-10-32-18)

When assessing whether the practical expedient can be applied, the entity must focus on the timing of the two events (transfer and payment) rather than the length of the contract. If an entity chooses to apply the practical expedient, it should apply it consistently to similar contracts under similar circumstances.

**Determining Whether There Is a Financing Component.** Conceptually, the standard recognizes that a contract with a financing component has two transactions—a sale and a financing.

If a contract has a significant financing component, the entity should account for the financing component and adjust the transaction price. (ASC 606-10-32-15) Determining what a “significant” component is may require considerable judgment. Companies that have contracts with a significant financing component may have operational challenges connected to measuring and tracking the time value of money. However, the practical expedient explained earlier should provide some relief.

The consideration recorded should reflect the price the customer would have paid if the customer paid cash when (or as) the goods or services transferred to the customer, that is, the objective is to reflect the cash selling price. Excluding the effects of a significant financing component could result in two economically similar transactions recording substantially different revenue amounts.

The determination of whether a contract contains a significant financing component occurs at the contract level, not the contract portfolio level or the performance obligation level. In assessing whether a contract contains a significant financing component, the entity should take into consideration all the facts and circumstances, including both of the following:

- The difference between the amount of promised consideration and the cash selling price upon transfer of the goods or services.
- The combined effects of both of the following:
  - The expected length of time between the transfer of goods or services and when the customer pays.
  - The prevailing interest rates in the relevant market.

(ASC 606-10-32-16)

And, as with other assessments in the model, it is necessary to look at implicit and explicit contract terms.

**Significant Financing Component—Contra Indicative Factors.** The time difference between payment of consideration and transfer of goods and services to the customer does not always mean there is a significant financing component. If *any* of the factors listed in the exhibit below exist, a contract with a customer would *not* have a significant financing component.

#### Exhibit—Significant Financing Component—Contra Indicative Factors

Contra Indicative Factors	Examples
The customer paid in advance, and the timing of the transfer of goods and services is in the hands of the customer.	Customer loyalty points usable in the future, prepaid phone cards, gift cards.
A substantial amount of the consideration promised by the customer is variable, and the timing of that consideration varies on the basis of the occurrence or nonoccurrence of a future event not substantially within the control of the customer or entity.	Sales-based royalty.
The timing difference between the promised consideration and the cash selling price are justified for reasons not related to financing and the difference between those amounts is proportional to the reason for the difference.	Payment terms might provide the customer with protection if the other party fails to adequately complete some or all of its obligations under the contract, for example, retention payments in construction contracts.
(ASC 606-10-32-17)	

**Determining the Discount Rate for a Significant Financing Component.** The entity should use the discount rate that would be reflected in a separate financing transaction between the entity and its customers at the time of the inception of the contract. (ASC 606-10-32-19) That rate should reflect:

- Inflation,
- The credit risk of the financing party,
- The credit characteristics of the party receiving the financing, and
- Any collateral or security provided, including assets transferred in the contract.

The entity needs to have access to enough information to determine the discount rate.

The rate may be determined by identifying the interest rate that discounts the nominal amount of the promised consideration to the cash the customer would pay when (or as) the goods or services transfer to the customer. If the contract contains an explicit rate, the entity should consider whether that rate reflects the market rate. In some cases, the contract may contain a low rate as a marketing incentive. If the contract does not reflect the market rate, the entity should impute a more representative rate. The rate determined at the inception of the contract is the rate used throughout the terms of the contact. (ASC 606-10-32-19)

**Customer's Credit Risk.** Generally, under the Standard, the transaction price is not adjusted for customer's credit risk, that is, the risk that a customer will not pay the entity. However, there is an exception when the contract includes a significant financing component. The *only* time the transaction price is adjusted for credit risk is if there is a significant financing component. Note that the discount rate is not adjusted *after* contract inception for changes in interest rates or other circumstances, including a change in the customer's credit risk.

Based on the facts and circumstances, management needs to decide whether billing adjustments are:

- A modification of the transaction price that reduces revenue, or
- A credit adjustment, write-off of an uncollectible amount that impairs a contract asset, or receivable and is assessed under ASC 310, *Receivables*.

**Implied Price Concession.** If the customer's credit risk is known at the inception of the contract, the entity must determine if there is an implied price concession. If so, it is not included in the estimated transaction price. This may be difficult to determine: has the entity offered an implied price concession or has the entity chosen the risk of the customer defaulting? The standard does not provide detailed application guidance to help distinguish between price concessions (reduction of revenue) and customer credit risk (bad debt expense). Entities will have to exercise significant judgment and will need to have clear policies in place. (Also see the section in this chapter on Variable Consideration.)

**Impairment.** If a customer's credit risk is impaired resulting in an impairment of a contract asset or receivable, the entity should measure the impairment based on the guidance in ASC 310.

**Presentation of a Significant Financing Component.** The entity should separate the loan component from the revenue component. Interest income or expense resulting from a financing should be presented separately from the revenue component. Once a performance obligation is satisfied, the entity recognizes the present value of the consideration as revenue. The financing component (interest income or expense) is recognized over the financing period. The income or expense is recognized only to the extent that a contract asset, receivable, or contract liability, such as deferred revenue, is recognized for the customer contract. When accounting for the financing

component, the entity should look to the relevant guidance on the effective interest method in ASC 835-30, *Interest—Imputation of Interest*:

- Subsequent measurement guidance in ASC 835-30-45-1A through 45-3
- Application of the interest method in ASC 835-30-55-2 and 55-3.  
(ASC 606-10-32-20)

## Variable Consideration

Variable consideration in contracts is common, and the guidance applies to a wide variety of fact patterns. The entity must examine the explicit and implicit terms of the contract to identify variable consideration. Variability in the consideration could affect:

- Whether the entity is entitled to the consideration. An example of this is a requirement to meet a deadline for a performance bonus.
- The specific amount of consideration. This might come into play when the quantity of customer purchases is tied to a volume discount.

**Types and Sources of Variable Consideration.** Variable consideration comes in two types:

- Pricing adjustments for transactions that have already been completed, for instance, refunds
- Incentive and performance-based fees, for example, licenses and royalties.

## Exhibit—Sources of Variable Consideration

Common Examples of Consideration That Cause Variable Consideration		
Discounts	Rebates	Refunds
Credits	Price concessions	Incentives
Performance bonuses	Penalties	Returns
Market-based fees	Money-back guarantees	Service-level agreements
Liquidating damages	Price protection plans	Price matching plans
(ASC 606-10-32-6)		

Under legacy guidance, some of these items caused entities to delay revenue recognition. Under the revenue model in the Standard, entities will now have to estimate their effect because the model focuses on when control transfers. Even if a contract has a stated fixed price, the consideration may still be variable. This happens when the consideration is contingent on the occurrence or nonoccurrence of an event.

**Exception.** If a contract is for a license of intellectual property for which the consideration is based on the customer's subsequent sales or usage, the entity should *not* recognize revenue for uncertain amounts.

**Determining If Variable Consideration Exists.** Variable consideration may be explicitly stated in the contract or may be variable if either of the following exists:

- a. The customer has a valid expectation arising from an entity's customary business practices, published policies, or specific statements that the entity will accept an amount of consideration that is less than the price stated in the contract. That is, it is expected that

the entity will offer a price concession. Depending on the jurisdiction, industry, or customer, this offer may be referred to as a discount, rebate, refund, or credit.

- b. Other facts and circumstances indicate that the entity's intention, when entering into the contract with the customer, is to offer a price concession to the customer.
- (ASC 606-10-32-7)

**Estimating Total Variable Consideration.** If the contract's consideration includes a variable amount, the entity must go through a process to determine the effect of that variability on the transaction price. It must:

- Determine the method for estimating the consideration
- Measure the consideration
- Determine if the variable consideration should be constrained
- Account for subsequent changes in transaction price.

**Determine the Method for Estimating Variable Consideration.** To determine the amount of variable consideration to include in the transaction price, the entity must first estimate the amount by using one of two methods. This is not a free policy choice. The entity is required to choose one of two methods it expects to better predict the amount of variable consideration under the specific facts and circumstances and must apply that method consistently for similar contracts. The two methods that the entity must choose from are:

- The expected value method, and
- The most likely amount method.

#### Exhibit—The Two Methods for Estimating Variable Consideration

<p><b>The Expected Value Method:</b>  <b>The sum of probability weighted amounts within a range of possible consideration amounts.</b></p>	<p>This method may be most predictive when the entity has a large number of contracts with similar characteristics. This method reflects all the uncertainties—the probability of receiving greater amounts and lesser amounts. However, it may not always be the best predictor.</p>
<p><b>The Most Likely Amount Method:</b>  <b>Identifies the single most likely amount in the range of possible consideration amounts.</b></p>	<p>This method may be appropriate when the contract has only two or a small number of possible outcomes because the expected value method might not result in one of the possible outcomes. This method would be appropriate, for example, when a performance bonus is either met or not, that is, it is binary.</p>

(ASC 606-10-32-8)

**Measuring the Variable Consideration.** Whichever method an entity chooses to estimate the consideration, it should be applied consistently throughout the contract when estimating the effects and uncertainty of an amount of variable consideration. All reasonably available information should be considered, including historical, current, and forecast data. The entity would normally use the same information it used during the proposal process and when it set prices. Note that the entity does not need to use every outcome in its analysis. A few discrete outcomes may provide a valid estimate. (ASC 606-10-32-9)

**Refund Liability.** If an entity receives consideration from the customer and expects to refund some or all of that consideration, the entity must recognize a refund liability. The liability is measured at the amount of consideration received (or receivable) for which the entity does not expect to be entitled. The refund liability should be updated at the end of each reporting period for changes in circumstances. (ASC 606-10-32-10) See information later in this chapter on rights of return.

**Tip:** Manufacturers and retailers, not otherwise significantly affected by the standard, need to assess whether new policies and procedures are needed for returns.

**Constraining Estimates of Variable Consideration.** Because revenue is a critical metric, it is important to include estimates of consideration that are robust and give useful information. Some estimates of variable consideration are too uncertain and should not be included in the transaction price. After estimating the amount of variable consideration, the entity then should apply the following constraint focused on the probability of a significant reversal of cumulative revenue recognized:

*The entity should include some or all of the variable consideration in the transaction price to the extent that it is probable that a subsequent change in the estimate would not result in a significant reversal of cumulative revenue recognized. (ASC 606-10-32-11)*

The constraint of variable consideration addresses concerns about premature recognition of revenue, that is, recognizing revenue based in the future before there is sufficient certainty that the amount will be realized. Focusing on the potential for significant reversals of revenue helps lower the risk that revenue will be overstated. Revenue that would not reverse significantly in a subsequent period is more predictive of future revenues.

**Application to Fixed Fees.** The significance of the reversal is assessed compared to the cumulative amount of revenue recognized. So, in its analysis, the entity should consider not only variable consideration but factor in fixed consideration as well. The constraint applies to contracts with a fixed price if it is uncertain whether the entity will be entitled to all the consideration even after the performance obligation is satisfied. An example of this is a legal service provided for a fixed fee that is only payable if the customer wins the case. The revenue might still be recognized before the court rules if the entity considers it probable that the fee is not subject to significant reversal of cumulative revenue recognized.

**Assessing Probability of a Reversal.** “Significant” is relative to the amount of total revenue in the contract (total variable and fixed consideration), not just the possible variable consideration. Determining the probability of a reversal of revenue requires considerable judgment, and it is good practice for the entity to document its basis of conclusion. It may be particularly difficult to assess the probability under certain situations. These include:

- Payments contingent on regulatory approval, for example, of a new drug
- Long-term commodity supply arrangements dependent on market prices at a future delivery date
- Contingency fees based on the outcome of litigation or the settlement of claims with government agencies.

To assess the probability of a reversal, the entity takes into account two elements:

- The likelihood of a reversal, and
- The magnitude of a reversal.

**Indicators That Significant Revenue Reversal Will Occur.** The standard includes indicators to help assess whether it is probable that a significant reversal of cumulative revenue recognized

will occur. The presence of one of these indicators does not necessarily mean that the constraint applies, but might be an indicator that could increase the likelihood or the magnitude of a revenue reversal. Note that these are factors to consider rather than criteria.

When making the assessment, the entity should evaluate, among others, the factors in the Exhibit below.

#### Exhibit—Factors That Increase the Likelihood or Magnitude of a Significant Reversal

- The high susceptibility to factors outside the entity's influence. Such factors might be:
    - The volatility of the market,
    - Third-party judgment or actions,
    - Weather conditions, or
    - The promised goods' high risk of obsolescence.
  - The uncertainty will not be resolved for a long period of time.
  - The entity's experience with similar contracts is limited or that experience has low predictive value.
  - With similar contracts under similar circumstances, the entity has a history of offering a broad range of price concessions or changing the payment terms or conditions.
  - The contract has a large number and broad range of possible consideration amounts.
- (ASC 606-10-32-12)

**Reassessing the Transaction Price for Variable Consideration.** The estimated transaction price should be reassessed and updated at the end of each reporting period until the underlying uncertainty is resolved. Included in this update is an assessment of whether an estimate of variable consideration is constrained. Changes in the estimate are treated the same way as any other changes in the transaction price. These updates will then represent faithfully at the end of the reporting period the circumstances present at that time and a change in circumstance during that period. (ASC 606-10-32-14) (See Step 5 in this chapter for more information about updating changes in transaction price.)

**Sales-Based or Usage-Based Royalty Exception to Variable Constraint Guidance.** A narrow exception to the guidance on constraints in variable consideration involves sales-based or usage-based royalty consideration promised in exchange for a license of intellectual property only. For those types of consideration the entity should recognize only when (or as) the later of the following events occur:

- The subsequent sale or usage occurs.
  - The performance obligation to which some or all of the sales-based or usage-based royalty allocated has been satisfied (or partially satisfied).
- (ASC 606-10-55-65; IFRS 15.58)

The royalty in its entirety should be either within or not within the scope of the royalties exception. The royalties exception applies when the license of intellectual property is the predominant item to which the royalty relates. Determining when a license is the predominant item requires judgment on the part of the entity. In making this judgment, the entity may want to consider the value the customer places on the license in comparison with the other goods or services in the bundle. (ASC 606-10-55-65A-B)

## Noncash Consideration

To determine the transaction price at contract inception, any noncash consideration promised by the customer should be measured at fair value of the noncash consideration. Entities should look to determine fair value of the consideration first. This is the opposite of legacy guidance where entities first look at what was given up. If fair value cannot be reasonably estimated, the entity should measure the consideration indirectly by reference to the standalone selling price of the goods or services promised to the customer. (ASC 606-10-32-21 and 32-22)

The fair value of a noncash contribution may vary because of:

- the occurrence or nonoccurrence of a future event, or
- the form of the consideration, for example, a change in the price of stock the entity is entitled to receive.

If the fair value varies because of a reason other than the form of the consideration, the entity should apply the guidance on constraining estimates of variable consideration. (ASC 606-10-32-23) The Standard includes information about how to apply the constraint in situations where consideration varies because of both the form of consideration and for reasons other than the form of consideration. The guidance on constraining the estimate of variable consideration applies to variability resulting from reasons other than the form of consideration. Changes in the fair value after contract inception because of the form of the consideration are not included in the transaction price. Therefore, the variable consideration guidance would not apply, for example, to variability related to changes in stock price when consideration is in the form of equity instruments.

In some cases the entity may receive goods or services, like materials, equipment, or labor, from the customer in order to facilitate delivery of the promised goods or services. In that case, the entity should assess whether it has control of those goods or services. If it does have control, the entity should account for them as noncash consideration received from the customer. (ASC 606-10-32-24)

## Consideration Payable to the Customer

Customer contracts may include provisions where the entity is expected to pay consideration to its customers or its customer's customers. Consideration payable to a customer includes:

- Amounts the entity expects to pay to the customer
  - Amounts the entity expects to pay to other parties that purchase the entity's goods or services from the customer
  - Credit, coupons, vouchers, or other items that can be applied against amounts owed.
- (ASC 606-10-32-25)

**Measurement.** Unless consideration payable to a customer is for distinct goods or services received in return, it should be accounted for as a reduction of the transaction price. "Distinct" in this context is consistent with the guidance in Step 2. If the amount is variable, the entity should estimate the amount in accordance with the guidance on variable consideration. (ASC 610-10-32-25)

If consideration payable to the customer is for a distinct good or service, the entity should account for it in the same way it accounts for other purchases from suppliers. If consideration payable to the customer is not for a distinct good or service, the consideration should be treated as a reduction in transaction price. The consideration payable to the customer may be greater than the fair value of the good or service received. In that case, to depict revenue faithfully, the entity should account for the excess as a reduction of the transaction price. If the fair value of the goods or services is not reasonably estimatable, the entity should account for all the consideration payable to the customer as a reduction of the transaction price. (ASC 610-10-32-25)

**Recognition.** For recognition of consideration payable to a customer accounted for as a reduction in transaction price, the standard provides the following guidance:

*. . . the entity shall recognize the reduction when (or as) the later of either of the following events occurs:*

- The entity recognizes revenue for the transfer of the related goods or services to the customer.
  - The entity pays or promises to pay the consideration (even if payment is conditional on a future event). That promise may be implied by the entity's customary business practices.
- (ASC 606-10-32-27)

The TRG brought to the Boards an issue related to variable consideration payable to a customer and the timing of recognition. Some stakeholders questioned whether the guidance above is inconsistent with that on variable consideration, which might be interpreted to require earlier recognition under some circumstances. The staff view that the board members deemed reasonable was that entities should consider both areas of guidance and record the reduction in revenue at the earlier of when it would be required under the variable consideration guidance as a change in transaction price and the consideration is payable to a customer—when a promise is made or implied.

## STEP 4: ALLOCATE THE TRANSACTION PRICE

---

### Overview

In Step 4, the entity allocates the transaction price to each of the performance obligations (units of account). This is usually done in proportion to the standalone selling price, that is, on a relative standalone selling price basis. With some exceptions, discounts are allocated proportionately to the separate performance obligations.

The Standard articulates the objective of Step 4. This objective is key to understanding the guidance related to Step 4.

*The objective when allocating the transaction price is for an entity to allocate the transaction price to each performance obligation (or distinct good or service) in an amount that depicts the amount of consideration to which the entity expects to be entitled in exchange for transferring the promised goods or services to the customer. (ASC 606-10-32-28)*

This step is actually a two-part process:

1. **Determine the Standalone Selling Price.** In some situations, the standalone selling price may not be observable. For example, the entity may not sell the good or service separately. If a standalone selling price is not observable, the entity must estimate it. (ASC 606-10-30-31)
2. **Allocate the Transaction Price to the Performance Obligations.** The transaction price must be allocated proportionately to each performance obligation on a relative standalone selling price basis with some limited exceptions. However, when specific criteria are met, there are exceptions to the relative standalone selling price basis, and those exceptions relate to one or more (but less than all) performance obligations involving:
  - Discounts, and
  - Variable consideration.

The Standard specifies the situations where the discounts or variable consideration should be allocated to a specific part of the contract rather than to all the performance obligations. These exceptions are discussed later in this chapter.

## Determining Standalone Selling Price

*Standalone Selling Price: The price at which an entity would sell a promised good or service separately to a customer. (ASC 606-10-20)*

The standalone selling price is determined at contract inception and is *not updated* for changes in selling prices between contract inception and when the performance under the contract is complete. If the entity enters into a *new* contract for the same good or service, it would reassess the standalone selling price and use the changed price for the new arrangement. A new contract may occur:

- When the entity enters into a new arrangement in the future, or
- As a result of a contract modification.

If the contract is modified and the modification is not treated as a separate contract, the entity updates the estimate of the standalone selling price at the time of the modification. (See the section later in this chapter on Changes in Transaction Price and the section on Contract Modifications.)

Unlike the standalone selling price, the transaction price may be updated. It must be reassessed, and if necessary updated, at the end of each reporting period. Resulting changes to the transaction price should be allocated on the same basis as at contract inception.

**Standalone Selling Price Directly Observable.** The best evidence of the standalone selling price is the *observable* price charged by the entity when the entity sells those goods or services separately in similar circumstances to similar customers. However, goods or services are not always sold separately. If the standalone selling price is not directly observable, the entity must estimate it.

**TIP:** The contract price or the list price might be the standalone price; however, the entity should not presume that is the case. (ASC 606-10-32-32) As in other steps in the process, the entity should consider customary business practices when determining the standalone selling price. For instance, the entity may regularly provide discounts to customers and those should be considered.

**Estimating a Standalone Selling Price That Is Not Directly Observable.** If the product or service is not sold separately, the entity must use another method to determine the standalone selling price. The Standard does not allow for postponement of revenue recognition because of a lack of reliable evidence. If the standalone selling price is not directly observable, it must be estimated. When estimating the standalone selling price, entities need to exercise judgment. Some entities may have robust procedures in place to estimate prices; others may need to put procedures in place. In estimating the standalone selling prices, the entity should *maximize the use of observable inputs* and consider all reasonably available and relevant information, including:

- Reasonably available data points, such as:
  - Standalone prices,
  - Manufacturing costs,
  - Margins,
  - Price listings, and
  - Third-party pricing,

- Market conditions, such as:
  - Demand,
  - Competition,
  - Constraints, and
  - Trends,
- Entity-specific factors, such as:
  - Pricing strategies,
  - Objectives,
  - Market share, and
- Information about the customer or class of customer, such as:
  - Geographical distribution,
  - Type, and
  - Distribution channels.

The entity must apply estimation methods *consistently* for similar circumstances. The Standard does not prescribe or preclude any one method. It indicates that the method used to estimate the standalone selling prices should result in an estimate that represents faithfully the price an entity would charge for the goods or services if they were sold separately. The Standard does describe three estimation methods, and they are listed in the exhibit below. (ASC 606-10-32-33)

#### Exhibit—Estimation Methods

Estimation Method	Description
Adjusted Market Assessment Approach	The entity evaluates the market in which it sells goods or services and estimates the price that a customer in the market would be willing to pay.
Expected Cost Plus a Margin Approach	The entity builds up a standalone selling price using costs and an appropriate margin.
Residual Approach	The entity estimates the standalone selling price by deducting from the total transaction price the sum of the observable standalone selling prices of other goods or services promised in the contract. (See below for restrictions on the use of the residual approach.)
(ASC 606-10-32-34)	

Other approaches may be appropriate as long as the objective of those approaches is to identify the amount the entity would charge if selling the underlying goods or services on their own.

**Combination of Methods.** Entities may use the residual approach if more than one good or service in the contract has a highly variable or uncertain standalone selling price. However, in this situation, an entity may have to use a combination of methods to estimate the selling prices. To use a combination of methods, entities should use this process:

1. Apply the residual approach to estimate the aggregate of the standalone selling price for all the goods or services with highly variable or uncertain selling prices.
2. Use another technique to estimate the standalone selling price of each promised good or service with highly variable or uncertain selling prices.

If the entity uses a combination of methods, it needs to evaluate whether allocating the transaction price at those estimated standalone selling prices is consistent with the Standard's allocation objectives and the guidance on estimating standalone selling prices. (ASC 606-10-32-35)

### Allocating the Transaction Price

If there is one performance obligation in a contract, there are usually no issues with allocation. However, it is not unusual for a contract to have more than one performance obligation. Performance obligations may include multiple goods, initial services, and ongoing services. In cases with more than one performance obligation, the entity must allocate, at contract inception, the transaction price to the performance obligations so that revenue is recognized at the right time for the proper amount.

The allocation is based on the fair value of each performance obligation. The best indicator of the fair value of the performance obligation is the observable, standalone selling price of the underlying good or service, sold in similar circumstances to similar customers. The transaction price, generally, should be allocated in proportion to the standalone selling prices. (ASC 606-10-30-31)

Allocating the transaction price on the relative standalone selling price basis is the default method to achieve the objectives of Step 4. It has the advantages of bringing rigor and discipline to the process and should enhance impartiality, but it is not an allocation principle.

**Allocation of a Discount.** If an entity sells a bundle of goods or services for an amount less than the total of the standalone selling prices of the individual goods or services, the entity should treat the difference as a discount. The entity generally allocates the discount proportionally based on relative standalone selling prices. There is significant judgment involved in allocating a discount, and entities will need to have robust policies in place. For instance, the entity will need to have a policy that defines "regularly sells." (ASC 606-10-32-36)

**Exception to Proportional Allocation of a Discount.** Generally, proportional allocation of a discount achieves the objective of Step 4 and reflects the economic substance of the transaction. However, there is an exception to proportional allocation of a discount. The entity may have observable evidence that the discount relates specifically to only some, but not all, performance obligations in the contracts. In that case, the entity should allocate the discounts to those performance obligations causing the discount if *all* of the following criteria are met:

- a. The entity regularly sells each distinct good or service (or each bundle of distinct goods or services) in the contract on a standalone selling basis.
- b. The entity also regularly sells, on a standalone basis, a bundle (or bundles) some of those distinct goods or services at a discount to the standalone selling prices of the goods or services in each bundle.
- c. The discount attributable to each bundle of goods or services in (b) is substantially the same as the discount in the contracts, and an analysis of the goods or services in each bundle provides observable evidence of the performance obligation (or performance obligations) to which the entire discount in the contract belongs.

(ASC 606-10-32-37)

The criteria above are fairly restrictive, and the exception may not be common. As mentioned earlier in this chapter in the section on the Residual Approach, if the entity meets the above criteria for allocating the discount entirely to one or more performance obligations in the contract, the entity must allocate the discount *before* using the residual approach to estimate the standalone selling price of a remaining performance obligation. (ASC 606-10-32-38)

**Allocation of Variable Consideration.** As discussed earlier, some contracts contain consideration that is variable based on achievement of certain thresholds or goals being met, such as ontime completion of a project. Variable consideration is measured using one of two methods—probability weighted or most likely amount—and is subject to constraint. Variable consideration adds a layer of complexity to allocating the transaction price and may be subject to change over time.

**Variable Consideration—Exception to Proportional Allocation.** The Standard provides that the entity allocates total transaction consideration to the performance obligations based on the standalone selling price of those performance obligations. There are some situations where proportional allocation to all transactions does not represent the economic substance of the transaction and so its use may not be appropriate. For example, the contract may call for an entity to produce two products at different times with a bonus contingent on and related to the timely delivery of only the second product. In another instance, the entity may be obligated to provide two products at different times, with a fixed amount for the first product that represents the product's standalone selling price and a variable amount contingent on the delivery of the second product. The variable amount might be excluded because of the requirements for constraining estimates of the transaction price. Therefore, it might be inappropriate to attribute the fixed consideration to both products.

To accommodate such situations, the Standard provides another exception to proportional allocation of the selling price. The first, discussed previously, relates to discounts; the second exception relates to variable consideration. Variable consideration in the contract may be attributable to the entire contract or to a specific part of the contract. The variable consideration may be attributable to a specific part of the contract, for example, in cases where the variable consideration relates to:

- One or more, but not all, of the performance obligations, as in the case of a bonus contingent on the entity transferring a good or service in a specified timeframe.
- One or more, but not all, of the distinct goods or services of a single performance obligation, as in the case of consideration increasing based on the consumer price index in the second year of a two-year contract.

(ASC 606-10-32-39)

This exception may be applied to:

- A single performance obligation,
- A combination of performance obligations, or
- Distinct goods or services that make up part of a performance obligation.

Note that a relative standalone selling price allocation is not required to meet the allocation objective when it relates to the allocation of variable consideration to a specific part of a contract, such as a distinct good or service or a series.

**Applying the Variable Consideration Exception to a Single Performance Obligation.** The entity is required to allocate a variable amount entirely to a single performance obligation or to distinct goods or services that form part of a single performance obligation *only* when *both* of the following criteria are met:

- a. The variable consideration specifically relates to the entity's efforts to satisfy the performance obligation or transfer the distinct good or service.
- b. The allocation is consistent with the overall objective for allocating the transaction price.

(ASC 606-10-32-40)

This fact pattern may be commonly found in long-term service contracts that include a bonus.

**Series Not Accounted for as a Single Performance Obligation.** In other instances, the variable consideration may *not* be allocated entirely to a performance obligation or to a distinct good or service that forms part of a single performance obligation. At times variable consideration might be attributable to some, but not all, performance obligations. If that is the case, to reflect the economic substance of the transaction, the entity should allocate the remaining amount of the transaction price based on the allocation requirements for standalone selling prices and allocation of a discount discussed earlier in this chapter.

**Interaction Between the Two Allocation Exceptions—Variable Discount.** A discount may meet the definition of variable consideration if it is variable in amount or contingent on the occurrence or nonoccurrence of future events. The question becomes which exception would apply—the variable consideration exception or the discount exception. Responding to this issue, the TRG generally agreed that the entity should first determine whether the variable discount meets the variable consideration exception. If not, the entity then considers whether it meets the discount exception.<sup>2</sup>

## Recognition

The amount the entity allocates to an unsatisfied performance obligation should be recognized in the period in which the transaction changes as:

- Revenue, or
- Reduction in revenue.

## Changes in the Transaction Price

As uncertainties are resolved or new information becomes available, the entity should revise the amount of consideration it expects to receive. Revising the expectation gives the financial statement users better information than ignoring changes and retaining original estimates, especially for long-term contracts. Transaction prices, including variable consideration and the related constraints, are updated at each reporting date. The update may result in changes in the transaction price after inception of the contract. Changes in the transaction price may be related to:

- Contract modifications, or
- Changes in one or more of the factors used in estimating the transaction price, such as the resolution of uncertain events.

Except for changes resulting from modifications where the modification is treated as the end of the existing contract and the start of a new contract, entities should recognize a change in the transaction price by allocating it to performance obligations on the same basis as at contract inception. This should ensure that the changes in the estimate of variable consideration are allocated to the performance obligations to which that variable consideration relates. These changes should be recognized in the period in which they change. Changes in transaction price related to contract modification are discussed in detail later in this chapter. Note that the treatment of changes in standalone selling prices differs from changes in transaction price. Entities should not reallocate the transaction price for changes in the standalone selling prices. That is, the entity

<sup>2</sup> IFRS.org; March 2015 Meeting—Summary of Issues Discussed and Next Steps, July 13, 2015, <http://www.ifrs.org/Meetings/MeetingDocs/Other%20Meeting/2015/June/RTRG-34-March-Meeting-Summary.pdf>.

should use the same proportionality of the transaction price as at contract inception and *not reallocate* the transaction price to reflect changes in standalone selling prices after contract inception.

**Change in Transaction Price Not Related to Modification.** The change in transaction price should be recognized as revenue or as a reduction in revenue in the period in which the change takes place. (ASC 606-10-32-43) The cumulative recognized revenue will then represent faithfully the revenue the entity would have recognized at the end of the subsequent reporting period as though the entity had that information at contract inception.

**Variable Consideration Exception.** There is an exception to this allocation approach. The exception occurs when the changes in transaction price:

- Are shown to be related to one or more, but less than all, performance obligations or distinct goods or services in a series of distinct goods or services that are appropriately accounted for as a single performance obligation, and
- Meet the requirements for variable consideration to be allocated entirely to a performance obligation or to a distinct performance obligation that forms part of a single performance obligation.

(ASC 606-10-32-44)

Where the exception applies, the entity should allocate the change in transaction price entirely to one or more, but not to all, performance obligations or a series that meets the requirements to be treated as a single performance obligation. The allocated adjustment amount should be reflected as an increase or decrease to revenue in the period of adjustment.

**Subsequent Information Related to Variable Consideration.** In cases where information related to variable consideration comes to the entity's attention between the end of the reporting period and the release of the financial statements, the entity should follow the guidance in Topic 855, *Subsequent Events*, and IAS 10, *Events after the Reporting Period*.

## STEP 5: RECOGNIZE REVENUE WHEN (OR AS) THE ENTITY SATISFIES A PERFORMANCE OBLIGATION

---

*An entity shall recognize revenue when (or as) the entity satisfies a performance obligation by transferring a promised good or service (that is, an asset) to a customer. An asset is transferred when (or as) the customer obtains control of the asset. (ASC 606-10-25-23)*

### Overview

Step 5 addresses when to recognize revenue. At this point in the process, entities have determined the transaction price, allocated it, and are ready to record revenue.

According to the standard, revenue is recognized when control is transferred. So, the critical question is: when is control transferred? A performance obligation is satisfied when the customer obtains control of the good or service (asset). To implement Step 5, the entity must determine at contract inception whether it will satisfy its performance obligation over time or at a point in time. This key part of the model requires the entity first to determine if the obligation is satisfied over time. If not, it is, by default, satisfied at a point in time. (ASC 610-10-25-24) This decision is also important because whether an entity transfers an asset over time also affects whether the sale meets the series requirement discussed earlier in this chapter and consequently, the allocation of variable consideration, change in transaction price, and contract modification.

## Control of an Asset

The standard applies a single model, based on control, to allow entities to determine when revenue should be recognized. (ASC 610-10-25-25) The concept of control is not only applicable to goods, but services as well. At some point, goods and services are assets when they are received or used. Services are an asset as they are consumed, even if only briefly, and even though they may not be recognized as an asset. Transfer of control aligns with the FASB's definition of an asset, which includes the use of control to determine recognition of an asset.<sup>3</sup> The asset can be tangible or intangible.

Determining whether the customer obtains control may require judgment. To have control of an asset, entities must have the ability to:

- Direct the use of the asset, and
- Obtain substantially all of the remaining benefits of the asset.

**Direct the Use of an Asset.** A customer may have the future right to direct the use of an asset. However, the customer must have actually obtained that right for control to have transferred. Transfer of control may occur during production or afterwards. Directing the use of an asset means the customer has the right to:

- Deploy the asset,
- Allow another entity to deploy it, or
- Prevent other companies from having control of the asset.

**Benefits of the Asset.** Conceptually, the benefits of the asset are the potential cash flows—either inflows or savings in outflows. These benefits can be obtained directly or indirectly by, for example:

- Using the asset to:
  - Produce goods
  - Provide services
  - Enhance the value of the assets
  - Settle liabilities
  - Reduce expenses
- Selling the asset
- Exchanging the asset
- Pledging the asset
- Holding the asset.

**Other Considerations.** When evaluating control, the entity must consider the effect of any agreement to repurchase the assets. (ASC 610-10-25-26) Repurchase agreements are explored in detail later in this chapter.

Note that, unlike other aspects of the standard, Step 5 does not have a practical expedient for contracts with a duration of less than a year. The entity has to analyze all contracts to determine if the obligation is satisfied over time or at a point in time.

---

<sup>3</sup> Standards definition: Assets are “probable future economic benefits obtained or controlled by a particular entity as a result of past transactions or events.” FASB Statement of Financial Accounting Concepts No. 6, para. 25.

## Performance Obligations Satisfied Over Time

As the standard developed, constituents, especially in the construction industry, were concerned that it might be difficult to determine when control transferred. The construction industry constituents were concerned that they would have to change to the completed contract method and that would not be a faithful depiction of the underlying economics. Therefore, the guidance includes criteria that focus on timing for assessing when performance obligations are satisfied over time.

A performance obligation is satisfied over time if *any one* of the following three criteria is met (ASC 606-10-25-27):

1. The customer simultaneously receives and consumes the benefits as the entity performs. Examples of this include a one-year gym membership or a recurring service, like a cleaning service or a monthly payroll processing service. In those cases, the entity transfers the benefit of the services to the customer as the entity performs. An indication that the customer receives and consumes the benefits is if another entity would not need to substantially reperform the work completed to date.
2. The entity creates or enhances an asset that the customer controls as the asset is created or enhanced. Examples that fit this criterion might be a work-in-process asset that passes to the customer's control as the entity manufactures goods or a building under construction on the customer's land. It is common in government contracts for the customer (the governmental entity) to control work in process or other outputs. On the other hand, a commercial contract may not give control of a work in process to a customer.
3. This criterion consists of two parts:
  - The asset created by the entity does not have an alternative use to the entity, and
  - The entity has an enforceable right to payment for performance completed to date.

For example, a plane built to the customer's specifications where the entity has a right to payment may fit this criterion.

**Criterion 1—Customer Simultaneously Receives and Consumes the Benefit as the Entity Performs.** The Boards created this criterion to clarify that for pure service contracts, services are transferred over time even if the services are received and consumed at the same time. They specified that this criterion does not apply to an asset that is not consumed completely as the asset is received. (ASU 2014-09 BC 125-128)

Contractual or practical limitations that prevent an entity from transferring the remaining obligations to another entity are not part of this assessment. However, the entity should consider the implications of possible termination of the agreement.

Bear in mind that not all service contracts fit this criterion, particularly those that create a work-in-process asset. The Criterion does not apply when the entity's performance is not immediately consumed by the customer. For example, an entity may have a contract to provide a professional opinion. During the course of the engagement the entity creates a work in process. These circumstances do not fit Criterion 1. For those cases, the entity must consider Criteria 2 and 3.

**Customer Simultaneously Receives and Benefits from a Commodity.** Subsequent to the issuance of the Standard, constituents raised an issue regarding the factors that an entity should consider when determining whether an entity simultaneously receives and consumes the benefits of a commodity, such as electricity, natural gas, heating oil, etc. As with other assessments, the

TRG members and FASB and IASB staff believe that an entity, as with any agreement, should consider all facts and circumstances including:

- Inherent characteristics, for example, whether the commodity can be stored,
