About the Authors

Eric W. Noreen has held appointments at institutions in the United States, Europe, and Asia. He is emeritus professor of accounting at the University of Washington.

His BA degree is from the University of Washington and his MBA and PhD degrees are from Stanford University. A Certified Management Accountant, he was awarded a Certificate of Distinguished Performance by the Institute of Certified Management Accountants.

Professor Noreen has served as associate editor of *The Accounting Review* and the *Journal of Accounting and Economics*. He has had numerous articles published in academic journals including: the *Journal of Accounting Research*; the *Accounting Review*; the *Journal of Accounting and Economics*; *Accounting Horizons*; *Accounting, Organizations and Society*; *Contemporary Accounting Research*; the *Journal of Management Accounting Research*; and the *Review of Accounting Studies*.

Professor Noreen has won a number of awards from students for his teaching.

Peter C. Brewer is a professor in the Department of Accountancy at Miami University, Oxford, Ohio. He holds a BS degree in accounting from Penn State University, an MS degree in accounting from the University of Virginia, and a PhD from the University of Tennessee. He has published more than 30 articles in a variety of journals including: *Management Accounting Research*, the *Journal of Information Systems*, *Cost Management*, *Strategic Finance*, the *Journal of Accountancy*, *Issues in Accounting Education*, and the *Journal of Business Logistics*.

About the Authors

Professor Brewer is a member of the editorial boards of *Issues in Accounting Education* and the *Journal of Accounting Education*. His article “Putting Strategy into the Balanced Scorecard” won the 2003 International Federation of Accountants’ Articles of Merit competition and his articles “Using Six Sigma to Improve the Finance Function” and “Lean Accounting: What’s It All About?” were awarded the Institute of Management Accountants’ Lybrand Gold and Silver Medals in 2005 and 2006. He has received Miami University’s Richard T. Farmer School of Business Teaching Excellence Award and has been recognized on two occasions by the Miami University Associated Student Government for “making a remarkable commitment to students and their educational development.” He is a leading thinker in undergraduate management accounting curriculum innovation and is a frequent presenter at various professional and academic conferences.

Prior to joining the faculty at Miami University, Professor Brewer was employed as an auditor for Touche Ross in the firm’s Philadelphia office. He also worked as an internal audit manager for the Board of Pensions of the Presbyterian Church (U.S.A.). He frequently collaborates with companies such as Harris Corporation, Ghent Manufacturing, Cintas, Ethicon Endo-Surgery, Schneider Electric, Lenscrafters, and Fidelity Investments in a consulting or case writing capacity.

Ray H. Garrison is emeritus professor of accounting at Brigham Young University, Provo, Utah. He received his BS and MS degrees from Brigham Young University and his DBA degree from Indiana University.

As a certified public accountant, Professor Garrison has been involved in management consulting work with both national and regional accounting firms. He has published articles in *The Accounting Review*, *Management Accounting*, and other professional journals. Innovation in the classroom has earned

Professor Garrison the Karl G. Maeser Distinguished Teaching Award from Brigham Young University.

Focus on the Future Manager

with Noreen/Brewer/Garrison

In **Managerial Accounting for Managers**, the authors have crafted a streamlined managerial accounting book that is perfect for non-accounting majors who intend to move into managerial positions. Topics such as process costing, the statement of cash flows, and financial statement analysis have been dropped to enable instructors to **focus their attention on the bedrocks of managerial accounting**—planning, control, and decision making. Noreen/Brewer/Garrison focuses on the fundamentals, allowing students to develop the conceptual framework managers need to succeed.

In its second edition, *Managerial Accounting for Managers* continues to adhere to three core standards:

FOCUS. Noreen/Brewer/Garrison pinpoints the key managerial concepts students will need in their future careers. With no journal entries or financial accounting topics to worry about, students can focus on the fundamental principles of managerial accounting.

RELEVANCE. With its insightful Business Focus features to begin each chapter, current In Business examples throughout the text, and tried-and-true end-of-chapter material, a student will always see the real-world applicability of Noreen/Brewer/Garrison.

BALANCE. There is more than one type of business, and so Noreen/Brewer/Garrison covers a variety of business models, including nonprofit, retail, service, wholesale, and manufacturing organizations. Service company examples are highlighted with icons in the margins of the text.

Noreen's Powerful Pedagogy

Managerial Accounting for Managers is full of pedagogy designed to make studying productive and hassle free.

Chapter

10

Standard Costs and Operating Performance Measures

Managing Materials and Labor

Schneider Electric's Oxford, Ohio, plant manufactures busways that transport electricity from its point of entry into a building to remote locations throughout the building. The plant's managers pay close attention to direct material costs because they are more than half of the plant's total manufacturing costs. To help control scrap rates for direct materials such as copper, steel, and aluminum, the accounting department prepares direct materials quantity variances. These variances compare the standard quantity of direct materials that should have been used to make a product (according to computations by the plant's engineers) to the amount of direct materials that were actually used. Keeping a close eye on these differences helps to identify and deal with the causes of excessive scrap, such as an inadequately trained machine operator, poor quality raw material inputs, or a malfunctioning machine.

Because direct labor is also a significant component of the plant's total manufacturing costs, the management team daily monitors the direct labor efficiency variance. This variance compares the standard amount of labor time allowed to make a product to the actual amount of labor time used. When idle workers cause an unfavorable labor efficiency variance, managers temporarily move workers from departments with slack to departments with a backlog of work to be done. ■

Source: Author's conversation with Doug Taylor, plant controller, Schneider Electric's Oxford, Ohio, plant.

Learning Objectives

After studying Chapter 10, you should be able to:

- L01 Explain how direct materials standards and direct labor standards are set.
- L02 Compute the direct materials price and quantity variances and explain their significance.
- L03 Compute the direct labor rate and efficiency variances and explain their significance.
- L04 Compute the variable manufacturing overhead rate and efficiency variances.
- L05 Compute delivery cycle time, throughput time, and manufacturing cycle efficiency (MCE).
- L06 (Appendix 10A) Compute and interpret the fixed overhead budget and volume variances.

367

Opening Vignette

Each chapter opens with a Business Focus feature that provides a real-world example for students, allowing them to see how the chapter's information and insights apply to the world outside the classroom.

Learning Objectives alert students to what they should expect as they progress through the chapter.

“Many concepts in accounting are rather abstract if not given some type of context to understand them in. The business focus features help to provide this context and can lead to discussions in class if the instructor wishes.”

—Jeffrey Wong, University of Nevada, Reno

In Business Boxes

These helpful boxed features offer a glimpse into how real companies use the managerial accounting concepts discussed within the chapter. Each chapter contains from three to fourteen of these current examples.

IN BUSINESS

IS THIS REALLY A JOB?

VBT *Bicycling Vacations* of Bristol, Vermont, offers deluxe bicycling vacations in the United States, Canada, Europe, and other locations throughout the world. For example, the company offers a 10-day tour of the Puglia region of Italy—the “heel of the boot.” The tour price includes international airfare, 10 nights of lodging, most meals, use of a bicycle, and ground transportation. Each tour is led by at least two local tour leaders, one of whom rides with the guests along the tour route. The other tour leader drives a “sag wagon” that carries extra water, snacks, and bicycle repair equipment and is available to shuttle guests back to the hotel or up a hill. The sag wagon also transports guests’ luggage from one hotel to another.

Each specific tour can be considered a job. For example, Giuliano Astore and Debora Trippetti, two natives of Puglia, led a VBT tour with 17 guests over 10 days in late April. At the end of the tour, Giuliano submitted a report, a sort of job cost sheet, to VBT headquarters. This report detailed the on the ground expenses incurred for this specific tour, including fuel and operating costs for the van, lodging costs for the guests, the costs of meals provided to guests, the costs of snacks, the cost of hiring additional ground transportation as needed, and the wages of the tour leaders. In addition to these costs, some costs are paid directly by VBT in Vermont to vendors. The total cost incurred for the tour is then compared to the total revenue collected from guests to determine the gross profit for the tour.

Sources: Giuliano Astore and Gregg Marston, President, VBT Bicycling Vacations. For more information about VBT, see www.vbt.com.

“I love these. Again, a connection to real world that adds credence to the course.”

—Larry N. Bitner, Shippensburg University

Managerial Accounting in Action Vignettes

These vignettes depict cross-functional teams working together in real-life settings, working with the products and services that students recognize from their own lives. Students are shown step-by-step how accounting concepts are implemented in organizations and how these concepts are applied to solve everyday business problems. First, “The Issue” is introduced through a dialogue; the student then walks through the implementation process; finally, “The Wrap-up” summarizes the big picture.

Chapter 9

EXHIBIT 9-4 Flexible Budget Based on Actual Activity

| Rick's Hairstyling Flexible Budget For the Month Ended March 31 | |
|---|-----------|
| Actual client-visits (q) | 1,100 |
| Revenue (\$180.00/q) | \$198,000 |
| Expenses: | |
| Wages and salaries (\$65,000 + \$37.00/q) | 105,700 |
| Hairstyling supplies (\$1.50/q) | 1,650 |
| Client gratuities (\$4.10/q) | 4,510 |
| Electricity (\$1,200 + \$0.10/q) | 1,810 |
| Rent (\$28,500) | 28,500 |
| Liability insurance (\$2,800) | 2,800 |
| Employee health insurance (\$21,300) | 21,300 |
| Miscellaneous (\$1,200 + \$0.20/q) | 1,420 |
| Total expense | 167,490 |
| Net operating income | \$30,510 |

MANAGERIAL ACCOUNTING IN ACTION The Issue

Victoria: How is the budgeting going?

Rick: Pretty well. I didn't have any trouble putting together the budget for March. I also prepared a report comparing the actual results for March to the budget, but that report isn't giving me what I really want to know.

Victoria: Because your actual level of activity didn't match your budgeted activity?

Rick: Right. I know the level of activity shouldn't affect my fixed costs, but we had more client-visits than I had expected and that had to affect my other costs.

Victoria: So you want to know whether the higher actual costs are justified by the higher level of activity you actually had in March?

Rick: Precisely.

Victoria: If you leave your reports and data with me, I can work on it later today, and by tomorrow I'll have a report to show you.

How a Flexible Budget Works

A flexible budget approach recognizes that a budget can be adjusted to show what costs should be for the actual level of activity. To illustrate how flexible budgets work, Victoria prepared the report in Exhibit 9-4 that shows what the revenues and costs should have been given the actual level of activity in March. Preparing the report is straightforward. The cost formula for each cost is used to estimate what the cost should have been for 1,100 client-visits—the actual level of activity for March. For example, using the cost formula $\$1,500 + \$0.10/q$, the cost of electricity in March should have been $\$1,610$ ($= \$1,500 + \$0.10 \times 1,100$).

We can see from the flexible budget that the net operating income in March should have been $\$30,510$, but recall from Exhibit 9-2 that the net operating income was actually only $\$21,230$. The results are not as good as we thought. Why? We will answer that question shortly.

To summarize to this point, Rick had budgeted for a profit of $\$16,800$. The actual profit was quite a bit higher— $\$21,230$. However, given the amount of business the salon had in March, the profit should have been even higher— $\$30,510$. What are the causes of these discrepancies? Rick would certainly like to build on the positive factors, while working to reduce the negative factors. But what are they?

Flexible Budget Variances

To answer Rick's questions concerning the discrepancies between budgeted and actual costs, we will need to break down the variances shown in Exhibit 9-3 into two types of variances—activity variances and revenue and spending variances. We do that in the next two sections.

“This element is exceptional. The situations truly reflect real life issues business people would face—not just “textbook” manufactured examples that always have black/white answers.”

—Ann E. Selk, University of Wisconsin – Green Bay

“This text is a clear, succinct presentation of appropriate managerial accounting topics for an introductory course. The management focus makes the text more relevant to the introductory accounting course in which the majority of students are non-accounting majors.”

—Darlene Coarts, University of Northern Iowa

“This text is very thorough and has lots of rich current examples and applications. It has exceptional supplements of all types. It is a very user oriented book and very appropriate for courses for non-accounting majors as a second accounting course.”

—Dana Carpenter, Madison Area Technical College

“Clear, concise, covers the most relevant topics for students in all concentrations of business and a great text for students that are going into Cost Accounting.”

—Shirley Polejewski, University of St. Thomas

“This is a very comprehensive Managerial Accounting textbook with an excellent use of examples within the text.”

—Tammy Metzke, Milwaukee Area Technical College-West Allis

Utilizing the Icons

To reflect our service-based economy, the text is replete with examples from service-based businesses. A helpful icon distinguishes service-related examples in the text.

Ethics assignments and examples serve as a reminder that good conduct is vital in business. Icons call out content that relates to ethical behavior for students.

Media integrated icons throughout the text link content back to chapter-specific quizzes, audio lectures, and visual presentations; all of which can be downloaded to an MP3 player. This gives students access to a portable, electronic learning option to support their classroom instruction.

The writing icon denotes problems that require students to use critical thinking as well as writing skills to explain their decisions.

An Excel[®] icon alerts students that spreadsheet templates are available for use with select problems and cases.

The IFRS icon highlights content that may be affected by the impending change to IFRS and possible convergence between U.S. GAAP and IFRS.

End-of-Chapter Material

Building on Garrison/Noreen/Brewer's reputation for having the best end-of-chapter review and discussion material of any text on the market, Noreen's problem and case material continues to conform to AACSB, AICPA, and Bloom's Taxonomy Categories and makes a great starting point for class discussions and group projects.

“The end of the chapter problems... are excellent and are varied enough so that the student is not performing the same problem over and over again.”

—Peter Woodlock, Youngstown State University

Author-Written Supplements

Unlike other managerial accounting texts, Noreen, Brewer, and Garrison write all of the text's major supplements, ensuring a perfect fit between text and supplement. For more information on **Managerial Accounting for Managers's** supplements package, see page xvi.

- Instructor's Resource Guide
- Testbank
- Solutions Manual
- Workbook/Study Guide

Multiple-choice questions are provided on the text website at www.mhhe.com/noreen2e.

connect Exercises

EXERCISE 4-1 Preparing a Contribution Format Income Statement [LO1]
Whirly Corporation's most recent income statement is shown below:

Problems **connect**

PROBLEM 4-19 Basics of CVP Analysis [LO1, LO3, LO4, LO6, LO8]
Feather Friends, Inc., distributes a high-quality wooden birdhouse that sells for \$20 per unit. Variable costs are \$8 per unit, and fixed costs total \$180,000 per year.

Required:
Answer the following independent questions:

1. What is the product's CM ratio?
2. Use the CM ratio to determine the break-even point in sales dollars.
3. Due to an increase in demand, the company estimates that sales will increase by \$75,000 during the next year. By how much should net operating income increase (or net loss decrease) assuming that fixed costs do not change?
4. Assume that the operating results for last year were:

| | |
|----------------------------|-----------|
| Sales | \$400,000 |
| Variable expenses | 160,000 |
| Contribution margin | 240,000 |
| Fixed expenses | 180,000 |
| Net operating income | \$ 60,000 |

RESEARCH AND APPLICATION 4-34 [LO3, LO4, LO5, LO6, LO7, LO8, LO9]

The questions in this exercise are based on the Benetton Group, a company headquartered in Italy and known in the United States primarily for one of its brands of fashion apparel—United Colors of Benetton. To answer the questions, you will need to download the Benetton Group's 2004 Annual Report at www.benetton.com/investors. Once at this website, click on the link toward the top of the page called "Site Map" and then scroll down to the heading called "Financial Reports" and click on the year 2004. You do not need to print this document to answer the questions.

Required:

1. How do the formats of the income statements shown on pages 33 and 50 of Benetton's annual report differ from one another (disregard everything beneath the line titled "income from operations"? Which expenses shown on page 50 appear to have been reclassified as variable selling costs on page 33?
2. Why do you think cost of sales is included in the computation of contribution margin on page 33?
3. Perform two separate computations of Benetton's break-even point in euros. For the first computation, use data from 2003. For the second computation, use data from 2004. Why do the numbers that you computed differ from one another?

This page intentionally left blank

New to the Second Edition

Faculty feedback helps us continue to improve **Managerial Accounting for Managers**. In response to reviewer suggestions we have:

- Reordered variances in Chapters 9 and 10. Both chapters have been extensively rewritten to follow a more logical flow.
- Added coverage of corporate social responsibility to Chapter 1 to introduce students to an important and relevant topic in today's business world.
- Moved the coverage of balanced scorecard to Chapter 11 where it more naturally belongs.
- Added International Financial Reporting Standards (IFRS) icons throughout the text to highlight topics that may be affected should the U.S. adopt IFRS in the future.

Specific changes were made in the following chapters:

- In Business boxes updated throughout.
- All end-of-chapter items tagged to Bloom's Taxonomy categories as well as AACSB and AICPA standards.

Chapter 1

- New material on corporate social responsibility has been added.
- Materials dealing with the distinction between financial and managerial accounting have been moved to Chapter 2.

Chapter 2

- The schedule of cost of goods manufactured has been simplified by eliminating the list of the elements of manufacturing overhead. This removes a discrepancy that had existed between the coverage of the schedule of cost of goods manufactured in Chapter 2 and in Chapter 3.

Chapter 4

- The basic equations used in target profit analysis and break-even analysis have been revised to be more intuitive.
- Break-even analysis has been moved to follow target profit analysis because break-even analysis is just a special case of target profit analysis.
- Profit graphs are covered in addition to CVP graphs.

Chapter 5

- Portions of the chapter have been rewritten to enhance clarity.
- The appendix has been rewritten to highlight its assumptions.

Chapter 6

- The chapter has been extensively revised with the overall objective of making the material more user-friendly. Tables have been simplified and computing cost of goods sold is streamlined.

Chapter 9

- This chapter has been completely rewritten to follow a logical path leading from budgeting to performance evaluation comparing budgets to actual results and then on to standard cost analysis. Flexible budgets are used to prepare performance reports with activity variances and revenue and spending variances. This chapter contains some of the material that used to be in Chapter 11.

Chapter 10

- This chapter now covers all standard cost variances—including fixed manufacturing overhead variances in an appendix. The material in this chapter has been extensively rewritten—particularly the materials dealing with manufacturing overhead.

Chapter 11

- The balanced scorecard has been moved to this chapter, where it more naturally belongs.

Connect Your Students to Learning and Success

McGraw-Hill **Connect™ Accounting**

Less Managing. More Teaching. Greater Learning.

McGraw-Hill *Connect Accounting* is an online assignment and assessment solution that connects students with the tools and resources they'll need to achieve success.

McGraw-Hill *Connect Accounting* helps prepare students for their future by enabling faster learning, more efficient studying, and higher retention of knowledge.

McGraw-Hill *Connect Accounting* features

Connect Accounting offers a number of powerful tools and features to make managing assignments easier so faculty can spend more time teaching. With *Connect Accounting*, students can engage with their coursework anytime and anywhere, making the learning process more accessible and efficient. *Connect Accounting* offers you the features described below.

Simple assignment management

With *Connect Accounting*, creating assignments is easier than ever, so you can spend more time teaching and less time managing. The assignment management function enables you to:

- Create and deliver assignments easily with selectable end-of-chapter questions and testbank items.
- Streamline lesson planning, student progress reporting, and assignment grading to make classroom management more efficient than ever.
- Go paperless with the eBook and online submission and grading of student assignments.

Smart grading

When it comes to studying, time is precious. *Connect Accounting* helps students learn more efficiently by providing feedback and practice material when they need it, where they need it. When it comes to teaching, your time also is precious. The grading function enables you to:

- Have assignments scored automatically, giving students immediate feedback on their work and side-by-side comparisons with correct answers.
- Access and review each response; manually change grades or leave comments for students to review.
- Reinforce classroom concepts with practice tests and instant quizzes.

Instructor library

The *Connect Accounting* Instructor Library is your repository for additional resources to improve student engagement in and out of class. You can select and use any asset that enhances your lecture. The *Connect Accounting* Instructor Library includes:

- *PowerPoints*
- *Transparency Masters*
- *Instructor's Resource Guide*
- *Assignment Topic Grids*
- *Testbank Topic Grids*

Student Study Center

The *Connect Accounting* Student Study Center is the place for students to access additional resources. The Student Study Center:

- Offers students quick access to lectures, practice materials, eBooks, and more.
- Provides instant practice material and study questions, easily accessible on the go.
- Gives students access to the Personal Learning Plan described below.

Personal Learning Plan

The Personal Learning Plan (PLP) connects each student to the learning resources needed for success in the course. For each chapter, students:

- Take a practice test to initiate the Personal Learning Plan.
- Immediately upon completing the practice test, see how their performance compares to chapter learning objectives.
- Receive a Personal Learning Plan that recommends specific readings from the text, supplemental study material, and practice work that will improve their understanding and mastery of each learning objective.

Diagnostic and adaptive learning of concepts: LearnSmart

Students want to make the best use of their study time. The LearnSmart adaptive self-study technology within *Connect Accounting* provides students with a seamless combination of practice, assessment, and remediation for every concept in the textbook. LearnSmart's intelligent software adapts to every student response and automatically delivers concepts that advance the student's understanding while reducing time devoted to the concepts already mastered. The result for every student is the fastest path to mastery of the chapter concepts. LearnSmart:

- Applies an intelligent concept engine to identify the relationships between concepts and to serve new concepts to each student only when he or she is ready.
- Adapts automatically to each student, so students spend less time on the topics they understand and practice more those they have yet to master.
- Provides continual reinforcement and remediation but gives only as much guidance as students need.
- Integrates diagnostics as part of the learning experience.
- Enables you to assess which concepts students have efficiently learned on their own, thus freeing class time for more applications and discussion.

Student progress tracking

Connect Accounting keeps instructors informed about how each student, section, and class is performing, allowing for more productive use of lecture and office hours. The progress-tracking function enables you to:

- View scored work immediately and track individual or group performance with assignment and grade reports.
- Access an instant view of student or class performance relative to learning objectives.
- Collect data and generate reports required by many accreditation organizations, such as AACSB and AICPA.

McGraw-Hill Connect™ Plus Accounting

McGraw-Hill reinvents the textbook learning experience for the modern student with *Connect Plus Accounting*. A seamless integration of an eBook and *Connect Accounting*, *Connect Plus Accounting* provides all of the *Connect Accounting* features plus the following:

- An integrated eBook, allowing for anytime, anywhere access to the textbook.
- Dynamic links between the problems or questions you assign to your students and the location in the eBook where that problem or question is covered.
- A powerful search function to pinpoint and connect key concepts in a snap.

In short, *Connect Accounting* offers you and your students powerful tools and features that optimize your time and energies, enabling you to focus on course content, teaching, and student learning. *Connect Accounting* also offers a wealth of content resources for both instructors and students. This state-of-the-art, thoroughly tested system supports you in preparing students for the world that awaits.

For more information about Connect, go to www.mcgrawhillconnect.com, or contact your local McGraw-Hill sales representative.

Tegrity Campus: Lectures 24/7

Tegrity Campus is a service that makes class time available 24/7 by automatically capturing every lecture in a searchable format for students to review when they study and complete assignments. With a simple one-click start-and-stop process, you capture all computer screens and corresponding audio. Students can replay any part of any class with easy-to-use browser-based viewing on a PC or Mac.

Educators know that the more students can see, hear, and experience class resources, the better they learn. In fact, studies prove it. With Tegrity Campus, students quickly recall key moments by using Tegrity Campus's unique search feature. This search helps students efficiently find what they need, when they need it, across an entire semester of class recordings. Help turn all your students' study time into learning moments immediately supported by your lecture.

To learn more about Tegrity watch a 2-minute Flash demo at <http://tegritycampus.mhhe.com>.

iPod® Content

Harness the power of one of the most popular technology tools today—the Apple® iPod®. Our innovative approach allows students to download audio and video presentations right into their iPod and take learning materials with them wherever they go.

Students can visit the Online Learning Center at www.mhhe.com/noreen2e to download our iPod content. For each chapter of the book they will be able to download narrated lecture presentations, managerial accounting videos, and even self-quizzes designed for use on various versions of iPods. It makes review and study time as easy as putting on earphones.

McGraw-Hill Higher Education is one of the many fine businesses of The McGraw-Hill Companies.

www.mhhe.com/noreen2e

More and more students are studying online. That's why we offer an Online Learning Center (OLC) that follows *Managerial Accounting for Managers* chapter by chapter. It doesn't require any building or maintenance on your part. It's ready to go the moment you and your students type in the URL.

As your students study, they can refer to the OLC website for such benefits as:

- Internet-based activities
- Self-grading quizzes
- Excel spreadsheets
- PowerPoint slides
- iPod® Content

A **secured Instructor Resource Center** stores your essential course materials to save you prep time before class. The Instructor's Resource Guide, Solutions Manual, Testbank, and PowerPoint slides are now just a couple of clicks away.

CourseSmart

CourseSmart is a new way to find and buy eTextbooks. At CourseSmart you can save up to 50 percent off the cost of a print textbook, reduce your impact on the environment, and gain access to powerful Web tools for learning. CourseSmart has the largest selection of eTextbooks available anywhere, offering thousands of the most commonly adopted textbooks from a wide variety of higher education publishers. CourseSmart eTextbooks are available in one standard online reader with full text search, notes and highlighting, and e-mail tools for sharing notes between classmates.

McGraw-Hill Customer Care Contact Information

At McGraw-Hill, we understand that getting the most from new technology can be challenging. That's why our services don't stop after you purchase our products. You can e-mail our Product Specialists 24 hours a day to get product-training online. Or you can search our knowledge bank of Frequently Asked Questions on our support website. For Customer Support, call **800-331-5094**, e-mail hmsupport@mcgraw-hill.com, or visit www.mhhe.com/support. One of our Technical Support Analysts will be able to assist you in a timely fashion.

Instructor Supplements

Assurance of Learning Ready

Many educational institutions today are focused on the notion of assurance of learning, an important element of some accreditation standards. *Managerial Accounting for Managers, 2e*, is designed specifically to support your assurance of learning initiatives with a simple, yet powerful, solution.

Each testbank question for *Managerial Accounting for Managers, 2e*, maps to a specific chapter learning outcome/objective listed in the text. You can use our testbank software, EZ Test, to easily query for learning outcomes/objectives that directly relate to the learning objectives for your course. You can then use the reporting features of EZ Test to aggregate student results in similar fashion, making the collection and presentation of assurance of learning data simple and easy.

AACSB Statement

McGraw-Hill Companies is a proud corporate member of AACSB International. Recognizing the importance and value of AACSB accreditation, we have sought to recognize the curricula guidelines detailed in AACSB standards for business accreditation by connecting selected questions in *Managerial Accounting for Managers, 2e*, to the general knowledge and skill guidelines found in the AACSB standards. The statements contained in *Managerial Accounting for Managers, 2e*, are provided only as a guide for the users of this text. The AACSB leaves content coverage and assessment clearly within the realm and control of individual schools, the mission of the school, and the faculty. The AACSB does also charge schools with the obligation of doing assessment against their own content and learning goals. While *Managerial Accounting for Managers, 2e*, and its teaching package make no claim of any specific AACSB qualification or evaluation, we have, within *Managerial Accounting for Managers, 2e*, labeled selected questions according to the six general knowledge and skills areas. The labels or tags within *Managerial Accounting for Managers, 2e*, are as indicated. There are, of course, many more within the testbank, the text, and the teaching package which might be used as a “standard” for your course. However, the labeled questions are suggested for your consideration.

EZ Test

Available on the Instructor CD and the password-protected Instructor OLC.

McGraw-Hill’s EZ Test is a flexible electronic testing program. The program allows instructors to create tests from book-specific items. It accommodates a wide range of question types, plus instructors may add their own questions and sort questions by format. EZ Test can also scramble questions and answers for multiple versions of

the same test. Use this testbank to make different versions of the same test, change the answer order, edit and add questions, and conduct online testing. Technical support for this software is available.

Instructor CD-ROM

MHID 0077268563

ISBN-13 9780077268565

Allowing instructors to create a customized multimedia presentation, this all-in-one resource incorporates the testbank, PowerPoint Slides, Instructor’s Resource Guide and the Solutions Manual.

Instructor’s Resource Guide

Available on the Instructor CD and the password-protected Instructor OLC.

Extensive chapter-by-chapter lecture notes help with classroom presentations and contain useful suggestions for presenting key concepts and ideas. The lecture notes dovetail exactly with the PowerPoint Slides, making lesson planning even easier.

Testbank

Available on the Instructor CD and the password-protected Instructor OLC.

Over 2,000 questions are organized by chapter and include true/false, multiple-choice, and problems. The testbank includes worked out solutions and all items have been tied to AACSB-AICPA standards.

Microsoft Excel® Template Solutions

Available on the Instructor CD and the password-protected Instructor OLC.

Prepared by Jack Terry of ComSource Associates, Inc., these Excel templates offer solutions to the student version.

Check Figures

These provide key answers for selected problems and cases should you want to make them available for your students. They are available on the student side of the text’s website.

PowerPoint® Slides

Available on the Instructor CD and the OLC.

Prepared by Jon Booker and Charles Caldwell of Tennessee Technological University, and Susan Galbreath of Lipscomb University, these slides offer a great visual complement for your lectures. A complete set of slides covers each chapter.

Student Supplements

McGraw-Hill Connect™ Accounting

McGraw-Hill *Connect Accounting* is an online assignment and assessment solution that connects students with the tools and resources they'll need to achieve success. McGraw-Hill *Connect Accounting* helps prepare students for their future by enabling faster learning, more efficient studying, and higher retention of knowledge. See page xii for details.

PowerPoint® Slides

Available on the OLC.

Separate from the instructor PowerPoint slides, this short and manageable supplement focuses on the most important topics in the chapter and is perfect as a refresher for right before a big test or as a reference during homework or study time.

Online Learning Center (OLC)

When it comes to getting the most out of your textbook, the Online Learning Center is the place to start. The OLC follows *Managerial Accounting for Managers* chapter by chapter, offering all kinds of supplementary help for you as you read. Before you even start reading Chapter 1, go to this address and bookmark it:

www.mhhe.com/noreen2e

Remember, your Online Learning Center was created specifically to accompany *Managerial Accounting for Managers*—so don't let this great resource pass you by!

Workbook/Study Guide

MHID: 007726858X

ISBN-13: 9780077268589

This study aid provides suggestions for studying chapter material, summarizes essential points in each chapter, and tests your knowledge using self-test questions and exercises.

iPod Content

Available on the OLC.

The online learning center contains course-related videos, chapter-specific quizzes, and audio and visual lecture presentations that tie directly to the text. Icons in the margins of the book direct you to the assets available on the website that can offer you additional help in understanding difficult topics.

Excel® Templates

Available on the OLC.

Prepared by Jack Terry of ComSource Associates, Inc., this spreadsheet-based software uses Excel to solve selected problems and cases in the text. These selected problems and cases are identified in the margin of the text with an appropriate icon.

Practice Set

MHID: 0073396192

ISBN-13: 9780073396194

Available via Primus Online

Authored by Janice L. Cobb of Texas Christian University, *Doing the Job of the Managerial Accountant* is a real-world application for the introductory Managerial Accounting student. The case is based on an actual growing, entrepreneurial manufacturing company that is complex enough to demonstrate the decisions management must make, yet simple enough that a sophomore student can easily understand the entire operations of the company. The case requires the student to do tasks they would perform working as the managerial accountant for the company. The required tasks are directly related to the concepts learned in all managerial accounting classes. The practice set can be used by the professor as a teaching tool for class lectures, as additional homework assignments, or as a semester project.

Acknowledgments

Suggestions have been received from many of our colleagues throughout the world. Each of those who have offered comments and suggestions has our thanks.

The efforts of many people are needed to develop and improve a text. Among these people are the reviewers and consultants who point out areas of concern, cite areas of strength, and make recommendations for change. In this regard, the following professors provided feedback that was enormously helpful in preparing the second edition of ***Managerial Accounting for Managers***:

We are grateful for the outstanding support from McGraw-Hill. In particular, we would like to thank Stewart Mattson, Editorial Director; Tim Vertovec, Publisher; Emily Hatteberg, Developmental Editor; Kathleen Klehr., Marketing Manager; Pat Frederickson, Lead Project Manager; Carol Bielski, Production Supervisor; Mary Sander, Senior Designer; Jennifer Lohn, Media Project Manager; and Lori Kramer, Photo Research Coordinator.

Finally, we would like to thank Beth Woods for working so hard to ensure an error-free second edition. The authors also wish to thank Linda and Michael Bamber for inspiring the creation of the 10-K Research and Application exercises that are included in the end-of-chapter materials throughout the book.

We are grateful to the Institute of Certified Management Accountants for permission to use questions and/or unofficial answers from past Certificate in Management Accounting (CMA) examinations. Likewise, we thank the American Institute of Certified Public Accountants, the Society of Management Accountants of Canada, and the Chartered Institute of Management Accountants (United Kingdom) for permission to use (or to adapt) selected problems from their examinations. These problems bear the notations CPA, SMA, and CIMA respectively.

Managerial Accounting and the Business Environment

Management Accounting: It's More Than Just Crunching Numbers

“Creating value through values” is the credo of today’s management accountant. It means that management accountants should maintain an unwavering commitment to ethical values while using their knowledge and skills to influence decisions that create value for organizational stakeholders. These skills include managing risks and implementing strategy through planning, budgeting and

forecasting, and decision support. Management accountants are strategic business partners who understand the financial and operational sides of the business. They not only report and analyze financial measures, but also nonfinancial measures of process performance and corporate social performance. Think of these responsibilities as profits (financial statements), process (customer focus and satisfaction), people (employee learning and satisfaction), and planet (environmental stewardship). ■

Learning Objectives

After studying Chapter 1, you should be able to:

- L01** Understand the role of management accountants in an organization.
- L02** Understand the basic concepts underlying Lean Production, the Theory of Constraints (TOC), and Six Sigma.
- L03** Understand the importance of upholding ethical standards.

Throughout this book you will study how management accounting functions within organizations. However, before embarking on the study of management accounting, you need to develop an appreciation for the larger business environment within which it operates. This chapter is divided into nine sections: (1) globalization, (2) strategy, (3) organizational structure, (4) process management, (5) the importance of ethics in business, (6) corporate governance, (7) enterprise risk management, (8) corporate social responsibility, and (9) the Certified Management Accountant (CMA). Other business classes provide greater detail on many of these topics. Nonetheless, a broad discussion of these topics is useful for placing management accounting in its proper context.

Globalization

The world has become much more intertwined over the last 20 years. Reductions in tariffs, quotas, and other barriers to free trade; improvements in global transportation systems; explosive expansion in Internet usage; and increasing sophistication in international markets have created a truly global marketplace. Exhibit 1–1 illustrates this tremendous growth in international trade from the standpoint of the United States and some of its key trading partners. Panel A of the exhibit shows the dollar value of imports (stated in billions of dollars) into the United States from six countries; Panel B shows the dollar value of exports from the United States to those same six countries. As you can see, the increase in import and export activity from 1995 to 2007 was huge. In particular, trade with China expanded enormously as did trade with Mexico and Canada, which participate in the North American Free Trade Agreement (NAFTA).

In a global marketplace, a company that has been very successful in its local market may suddenly find itself facing competition from halfway around the globe. For example, in the 1980s American automobile manufacturers began losing market share to Japanese competitors who offered American consumers higher quality cars at lower prices. For consumers, heightened international competition promises a greater variety of goods and services, at higher quality and lower prices. However, heightened international competition threatens companies that may have been quite profitable in their own local markets.

Although globalization leads to greater competition, it also means greater access to new markets, customers, and workers. For example, the emerging markets of China, India, Russia, and Brazil contain more than 2.5 billion potential customers and workers.¹ Many companies such as FedEx, McDonald's, and Nike are actively seeking to grow their sales by investing in emerging markets. In addition, the movement of jobs from the United States and Western Europe to other parts of the world has been notable in recent years. For example, one study estimates that by the end of the decade more than 825,000 financial services and high-tech jobs will transfer from Western Europe to less expensive labor markets such as India, China, Africa, Eastern Europe, and Latin America.²

The Internet fuels globalization by providing companies with greater access to geographically dispersed customers, employees, and suppliers. While the number of Internet users continues to grow, as of 2008, more than 78% of the world's population was still not connected to the Internet. This suggests that the Internet's impact on global business has yet to fully develop.

IN BUSINESS

THE IMPLICATIONS OF GLOBALIZATION

International competition goes hand-in-hand with globalization. China's entrance into the global marketplace has highlighted this stark reality for many U.S. companies. For example, from 2000 to 2003, China's wooden bedroom furniture exports to the United States increased by more than 233% to a total of \$1.2 billion. During this same time, the number of workers employed by U.S. furniture manufacturers dropped by about a third, or a total of 35,000 workers.

However, globalization means more than international competition. It brings opportunities for companies to enter new markets. FedEx has pushed hard to be an important player in the emerging Asian cargo market. FedEx makes 622 weekly flights to and from Asian markets, including service to 224 Chinese cities. FedEx currently has 39% of the U.S.–China express market and it plans to pursue continuous growth in that region of the world.

Sources: Ted Fishman, "How China Will Change Your Business," *Inc.* magazine, March 2005, pp. 70–84; Matthew Boyle, "Why FedEx is Flying High," *Fortune*, November 1, 2004, pp. 145–150.

Strategy

Even more than in the past, companies that now face global competition must have a viable *strategy* for succeeding in the marketplace. A **strategy** is a "game plan" that enables a company to attract customers by distinguishing itself from competitors. The focal point of a company's strategy should be its target customers. A company can only succeed if it creates a reason for customers to choose it over a competitor. These reasons, or what are more formally called *customer value propositions*, are the essence of strategy.

Customer value propositions tend to fall into three broad categories—*customer intimacy*, *operational excellence*, and *product leadership*. Companies that adopt a *customer intimacy* strategy are in essence saying to their target customers, "You should choose us because we understand and respond to your individual needs better than our competitors." **Ritz-Carlton**, **Nordstrom**, and **Starbucks** rely primarily on a customer intimacy value proposition for their success. Companies that pursue the second customer value proposition, called *operational excellence*, are saying to their target customers, "You should choose us because we can deliver products and services faster, more conveniently, and at a lower price than our competitors." **Southwest Airlines**, **Wal-Mart**, and **The Vanguard Group** are examples of companies that succeed first and foremost because of their operational excellence. Companies pursuing the third customer value proposition, called *product leadership*, are saying to their target customers, "You should choose us because we offer higher quality products than our competitors." **BMW**, **Cisco Systems**, and **W.L. Gore** (the creator of GORE-TEX® fabrics) are examples of companies that succeed because of their product leadership. Although one company may offer its customers a combination of these three customer value propositions, one usually outweighs the others in terms of importance.³

Next we turn our attention to how businesses create organizational structures to help accomplish their strategic goals.

³ These three customer value propositions were defined by Michael Treacy and Fred Wiersema in "Customer Intimacy and Other Value Disciplines," *Harvard Business Review*, Volume 71 Issue 1, pp. 84–93.

IN BUSINESS

OPERATIONAL EXCELLENCE COMES TO THE DIAMOND BUSINESS

An average engagement ring purchased from **Blue Nile**, an Internet diamond retailer, costs \$5,200 compared to \$9,500 if purchased from **Tiffany & Co.**, a bricks-and-mortar retailer. Why is there such a difference? There are three reasons. First, Blue Nile allows wholesalers to sell directly to customers using its website. In the brick-and-mortar scenario, diamonds change hands as many as seven times before being sold to a customer—passing through various cutters, wholesalers, brokers, and retailers, each of whom demands a profit. Second, Blue Nile carries very little inventory and incurs negligible overhead. Diamonds are shipped directly from wholesalers after they have been purchased by a customer—no retail outlets are necessary. Bricks-and-mortar retailers tie up large amounts of money paying for the inventory and employees on their showroom floors. Third, Blue Nile generates a high volume of transactions by selling to customers anywhere in the world; therefore, it can accept a lower profit margin per transaction than local retailers, who complete fewer transactions with customers within a limited geographic radius.

Perhaps you are wondering why customers are willing to trust an Internet retailer when buying an expensive item such as a diamond. The answer is that all of the diamonds sold through Blue Nile's website are independently certified by the Gemological Institute of America in four categories—carat count, type of cut, color, and clarity. In essence, Blue Nile has turned diamonds into a commodity and is using an operational excellence customer value proposition to generate annual sales of \$154 million.

**Organizational Structure**

Our discussion of organizational structure is divided into two parts. First, we highlight the fact that presidents of all but the smallest companies cannot execute their strategies alone. They must seek the help of their employees by empowering them to make decisions—they must *decentralize*. Next, we describe the most common formal decentralized organizational structure in use today—the functional structure.

LEARNING OBJECTIVE 1

Understand the role of management accountants in an organization.

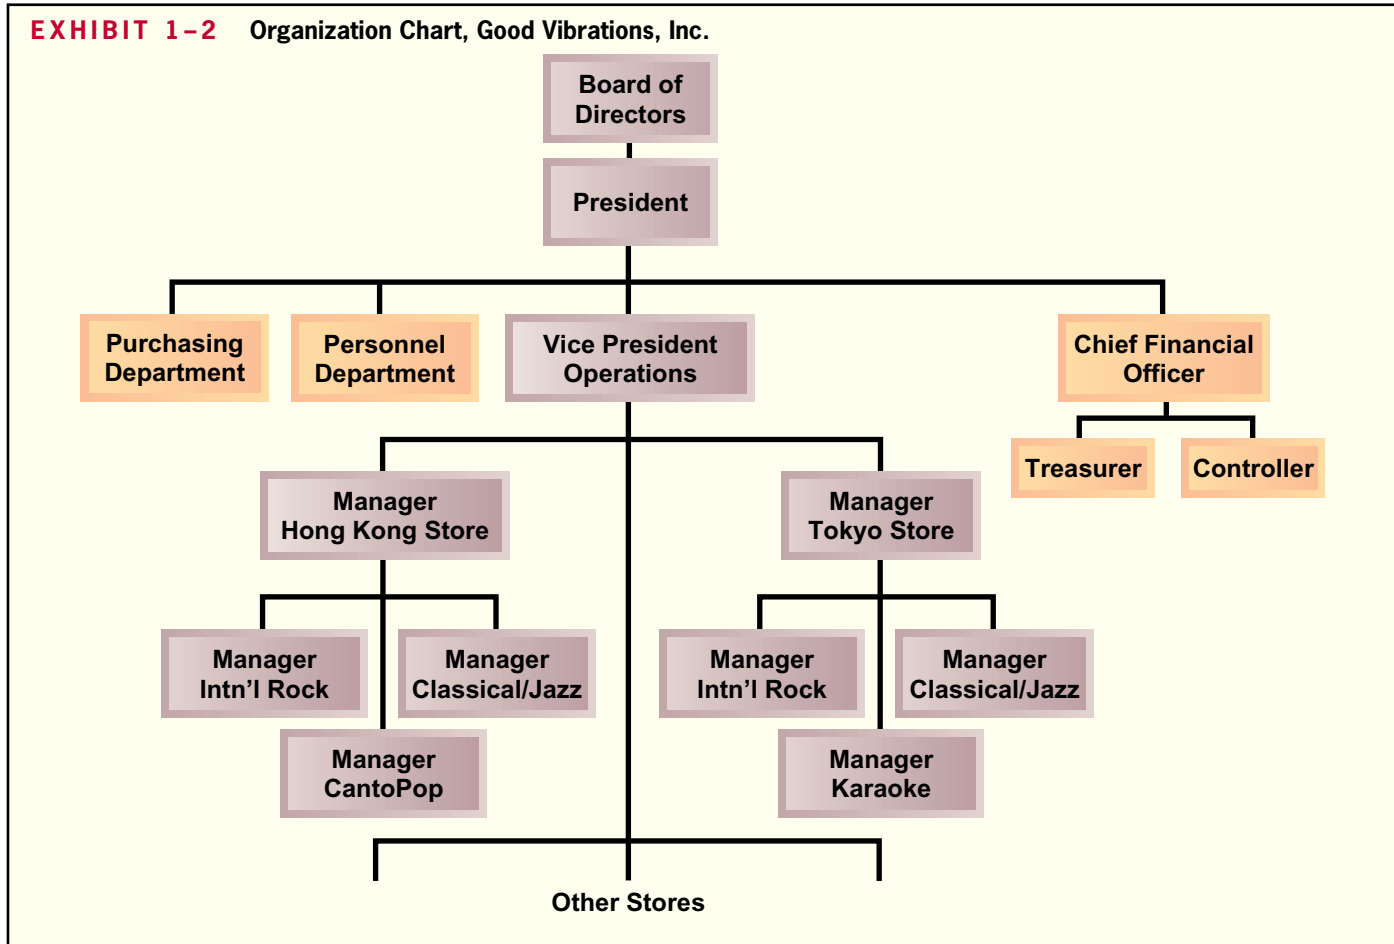

Decentralization

Decentralization is the delegation of decision-making authority throughout an organization by giving managers the authority to make decisions relating to their area of responsibility. Some organizations are more decentralized than others. For example, consider Good Vibrations, an international retailer of music CDs with shops in major cities scattered across the Pacific Rim. Because of Good Vibrations' geographic dispersion and the peculiarities of local markets, the company is highly decentralized.

Good Vibrations' president (often synonymous with the term *chief executive officer*, or *CEO*) sets the broad strategy for the company and makes major strategic decisions such as opening stores in new markets; however, much of the remaining decision-making authority is delegated to managers at various levels throughout the organization. Each of the company's numerous retail stores has a store manager as well as a separate manager for each music category such as international rock and classical/jazz. In addition, the company has support departments such as a central Purchasing Department and a Personnel Department.

**The Functional View of Organizations**

Exhibit 1–2 shows Good Vibrations' organizational structure in the form of an **organization chart**. The purpose of an organization chart is to show how responsibility is divided among managers and to show formal lines of reporting and communication, or *chain of command*. Each box depicts an area of management responsibility, and the lines between the boxes show the lines of formal authority between managers. The chart tells us, for example, that

EXHIBIT 1-2 Organization Chart, Good Vibrations, Inc.

the store managers are responsible to the operations vice president. In turn, the operations vice president is responsible to the company president, who in turn is responsible to the board of directors. Following the lines of authority and communication on the organization chart, we can see that the manager of the Hong Kong store would ordinarily report to the operations vice president rather than directly to the president of the company.

An organization chart also depicts *line* and *staff* positions in an organization. A person in a **line** position is *directly* involved in achieving the basic objectives of the organization. A person in a **staff** position, by contrast, is only *indirectly* involved in achieving those basic objectives. Staff positions provide assistance to line positions or other parts of the organization, but they do not have direct authority over line positions. Refer again to the organization chart in Exhibit 1–2. Because the basic objective of Good Vibrations is to sell recorded music at a profit, those managers whose areas of responsibility are directly related to selling music occupy line positions. These positions, which are shown in a darker color in the exhibit, include the managers of the various music departments in each store, the store managers, the operations vice president, the president, and the board of directors.

By contrast, the managers of the central Purchasing Department and the Personnel Department occupy staff positions, because their departments support other departments rather than carry out the company's basic missions. The chief financial officer is a member of the top management team who also occupies a staff position. The **chief financial officer (CFO)** is responsible for providing timely and relevant data to support planning and control activities and for preparing financial statements for external users. In the United States, a manager known as the **controller** often runs the accounting department and reports directly to the CFO. More than ever, the accountants who work under the

CFO are focusing their efforts on supporting the needs of co-workers in line positions as one report concluded:

Growing numbers of management accountants spend the bulk of their time as internal consultants or business analysts within their companies. Technological advances have liberated them from the mechanical aspects of accounting. They spend less time preparing standardized reports and more time analyzing and interpreting information. Many have moved from the isolation of accounting departments to be physically positioned in the operating departments with which they work. Management accountants work on cross-functional teams, have extensive face-to-face communications with people throughout their organizations, and are actively involved in decision making. . . . They are trusted advisors.⁴

IN BUSINESS

WHAT DOES IT TAKE?

A controller at McDonald's describes the characteristics needed by its most successful management accountants as follows:

It's a given that you know your accounting cold. You're expected to know the tax implications of proposed courses of action. You need to understand cost flows and information flows. You have to be very comfortable with technology and be an expert in the company's business and accounting software. You have to be a generalist. You need a working knowledge of what people do in marketing, engineering, human resources, and other departments. You need to understand how the processes, departments, and functions work together to run the business. You'll be expected to contribute ideas at planning meetings, so you have to see the big picture, keep a focus on the bottom line, and think strategically.

Process Management

As global competition intensifies, companies are realizing that they must complement the functional view of their operations with a cross-functional orientation that seeks to improve the *business processes* that deliver customer value. A **business process** is a series of steps that are followed in order to carry out some task in a business. It is quite common for the linked set of steps comprising a business process to span departmental boundaries. The term *value chain* is often used when we look at how the functional departments of an organization interact with one another to form business processes. A **value chain**, as shown in Exhibit 1–3, consists of the major business functions that add value to a company's products and services. The customer's needs are most effectively met by coordinating the business processes that span these functions.

LEARNING OBJECTIVE 2
Understand the basic concepts underlying Lean Production, the Theory of Constraints (TOC), and Six Sigma.

EXHIBIT 1–3 Business Functions Making Up the Value Chain

⁴ Gary Siegel Organization, *Counting More, Counting Less: Transformations in the Management Accounting Profession, The 1999 Practice Analysis of Management Accounting*, Institute of Management Accountants, Montvale, NJ, August 1999, p. 3.

This section discusses three different approaches to managing and improving business processes—Lean Production, the Theory of Constraints (TOC), and Six Sigma. Although each is unique in certain respects, they all share the common theme of focusing on managing and improving business processes.

Lean Production

Traditionally, managers in manufacturing companies have sought to maximize production so as to spread the costs of investments in equipment and other assets over as many units as possible. In addition, managers have traditionally felt that an important part of their jobs was to keep everyone busy on the theory that idleness wastes money. These traditional views, often aided and abetted by traditional management accounting practices, resulted in a number of practices that have come under criticism in recent years.

In a traditional manufacturing company, work is *pushed* through the system in order to produce as much as possible and to keep everyone busy—even if products cannot be immediately sold. This almost inevitably results in large inventories of *raw materials*, *work in process*, and *finished goods*. **Raw materials** are the materials that are used to make a product. **Work in process** inventories consist of units of product that are only partially complete and will require further work before they are ready for sale to a customer. **Finished goods** inventories consist of units of product that have been completed but have not yet been sold to customers.

The *push* process in traditional manufacturing starts by accumulating large amounts of raw material inventories from suppliers so that operations can proceed smoothly even if unanticipated disruptions occur. Next, enough materials are released to workstations to keep everyone busy. When a workstation completes its tasks, the partially completed goods (i.e., work in process) are “pushed” forward to the next workstation regardless of whether that workstation is ready to receive them. The result is that partially completed goods stack up, waiting for the next workstation to become available. They may not be completed for days, weeks, or even months. Additionally, when the units are finally completed, customers may or may not want them. If finished goods are produced faster than the market will absorb, the result is bloated finished goods inventories.

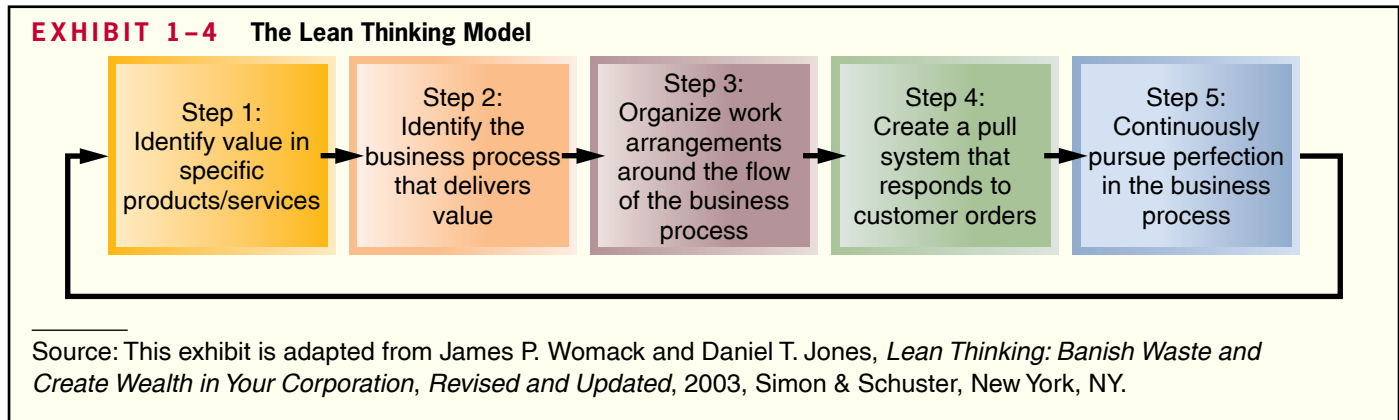

Although some may argue that maintaining large amounts of inventory has its benefits, it clearly has its costs. In addition to tying up money, maintaining inventories encourages inefficient and sloppy work, results in too many defects, and dramatically increases the amount of time required to complete a product. For example, when partially completed goods are stored for long periods of time before being processed by the next workstation, defects introduced by the preceding workstation go unnoticed. If a machine is out of calibration or incorrect procedures are being followed, many defective units will be produced before the problem is discovered. And when the defects are finally discovered, it may be very difficult to track down the source of the problem. In addition, units may be obsolete or out of fashion by the time they are finally completed.

Large inventories of partially completed goods create many other problems that are best discussed in more advanced courses. These problems are not obvious—if they were, companies would have long ago reduced their inventories. Managers at **Toyota** are credited with the insight that large inventories often create many more problems than they solve. Toyota pioneered what is known today as *Lean Production*.

The Lean Thinking Model The **lean thinking model** is a five-step management approach that organizes resources such as people and machines around the flow of business processes and that pulls units through these processes in response to customer orders. The result is lower inventories, fewer defects, less wasted effort, and quicker customer response times. Exhibit 1–4 (page 9) depicts the five stages of the lean thinking model.

The first step is to identify the value to customers in specific products and services. The second step is to identify the *business process* that delivers this value to customers.⁵

⁵ The Lean Production literature uses the term *value stream* rather than *business process*.

As discussed earlier, the linked set of steps comprising a business process typically span the departmental boundaries that are specified in an organization chart. The third step is to organize work arrangements around the flow of the business process. This is often accomplished by creating what is known as a *manufacturing cell*. The cellular approach takes employees and equipment from departments that were previously separated from one another and places them side-by-side in a work space called a *cell*. The equipment within the cell is aligned in a sequential manner that follows the steps of the business process. Each employee is trained to perform all the steps within his or her own manufacturing cell.

The fourth step in the lean thinking model is to create a pull system where production is not initiated until a customer has ordered a product. Inventories are reduced to a minimum by purchasing raw materials and producing units only as needed to meet customer demand. Under ideal conditions, a company operating a pull system would purchase only enough materials each day to meet that day's needs. Moreover, the company would have no goods still in process at the end of the day, and all goods completed during the day would be shipped immediately to customers. As this sequence suggests, work takes place "just-in-time" in the sense that raw materials are received by each manufacturing cell just in time to go into production, manufactured parts are completed just in time to be assembled into products, and products are completed just in time to be shipped to customers. This facet of the lean thinking model is often called **just-in-time** production, or **JIT** for short.

The change from *push* to *pull* production is more profound than it may appear. Among other things, producing only in response to a customer order means that workers will be idle whenever demand falls below the company's production capacity. This can be an extremely difficult cultural change for an organization. It challenges the core beliefs of many managers and raises anxieties in workers who have become accustomed to being kept busy all of the time.

The fifth step of the lean thinking model is to continuously pursue perfection in the business process. In a traditional company, parts and materials are inspected for defects when they are received from suppliers, and assembled units are inspected as they progress along the production line. In a Lean Production system, the company's suppliers are responsible for the quality of incoming parts and materials. And instead of using quality inspectors, the company's production workers are directly responsible for spotting defective units. A worker who discovers a defect immediately stops the flow of production. Supervisors and other workers go to the cell to determine the cause of the problem and correct it before any further defective units are produced. This procedure ensures that problems are quickly identified and corrected.

The lean thinking model can also be used to improve the business processes that link companies together. The term **supply chain management** is commonly used to refer to the coordination of business processes across companies to better serve end consumers. For example **Procter & Gamble** and **Costco** coordinate their business processes to ensure that Procter & Gamble's products, such as Bounty, Tide, and Crest, are on Costco's

IN BUSINESS

LEAN SUPPLY CHAIN MANAGEMENT

Tesco, a grocery retailer in Britain, used lean thinking to improve its replenishment process for cola products. Tesco and **Britvic** (its cola supplier) traced the cola delivery process from “the checkout counter of the grocery store through Tesco’s regional distribution center (RDC), Britvic’s RDC, the warehouse at the Britvic bottling plant, the filling lines for cola destined for Tesco, and the warehouse of Britvic’s can supplier.” Each step of the process revealed enormous waste. Tesco implemented numerous changes such as electronically linking its point-of-sale data from its grocery stores to its RDC. This change let customers pace the replenishment process and it helped increase store delivery frequency to every few hours around the clock. Britvic also began delivering cola to Tesco’s RDC in wheeled dollies that could be rolled directly into delivery trucks and then to point-of-sale locations in grocery stores.

These changes reduced the total product “touches” from 150 to 50, thereby cutting labor costs. The elapsed time from the supplier’s filling line to the customer’s cola purchase dropped from 20 days to 5 days. The number of inventory stocking locations declined from five to two, and the supplier’s distribution center was eliminated.

Source: Ghostwriter, “Teaching the Big Box New Tricks,” *Fortune*, November 14, 2005, pp. 208B–208F.

shelves when customers want them. Both Procter & Gamble and Costco realize that their mutual success depends on working together to ensure Procter & Gamble’s products are available to Costco’s customers.

The Theory of Constraints (TOC)

A **constraint** is anything that prevents you from getting more of what you want. Every individual and every organization faces at least one constraint, so it is not difficult to find examples of constraints. You may not have enough time to study thoroughly for every subject *and* to go out with your friends on the weekend, so time is your constraint. **United Airlines** has only a limited number of loading gates available at its busy Chicago O’Hare hub, so its constraint is loading gates. **Vail Resorts** has only a limited amount of land to develop as homesites and commercial lots at its ski areas, so its constraint is land.

The **Theory of Constraints (TOC)** is based on the insight that effectively managing the constraint is a key to success. As an example, long waiting periods for surgery are a chronic problem in the **National Health Service (NHS)**, the government-funded provider of health care in the United Kingdom. The diagram in Exhibit 1–5 illustrates a simplified version of the steps followed by a surgery patient. The number of patients who can be processed through each step in a day is indicated in the exhibit. For example, appointments for outpatient visits can be made for as many as 100 referrals from general practitioners in a day.

EXHIBIT 1–5 Processing Surgery Patients at an NHS Facility (simplified)*

*This diagram originally appeared in the February 1999 issue of the U.K. magazine *Health Management*.

The constraint, or *bottleneck*, in the system is determined by the step that has the smallest capacity—in this case surgery. The total number of patients processed through the entire system cannot exceed 15 per day—the maximum number of patients who can be treated in surgery. No matter how hard managers, doctors, and nurses try to improve the processing rate elsewhere in the system, they will never succeed in driving down wait lists until the capacity of surgery is increased. In fact, improvements elsewhere in the system—particularly before the constraint—are likely to result in even longer waiting times and more frustrated patients and health care providers. Thus, to be effective, improvement efforts must be focused on the constraint. A business process, such as the process for serving surgery patients, is like a chain. If you want to increase the strength of a chain, what is the most effective way to do this? Should you concentrate your efforts on strengthening the strongest link, all the links, or the weakest link? Clearly, focusing your effort on the weakest link will bring the biggest benefit.

The procedure to follow to strengthen the chain is clear. First, identify the weakest link, which is the constraint. In the case of the NHS, the constraint is surgery. Second, do not place a greater strain on the system than the weakest link can handle—if you do, the chain will break. In the case of the NHS, more referrals than surgery can accommodate lead to unacceptably long waiting lists. Third, concentrate improvement efforts on strengthening the weakest link. In the case of the NHS, this means finding ways to increase the number of surgeries that can be performed in a day. Fourth, if the improvement efforts are successful, eventually the weakest link will improve to the point where it is no longer the weakest link. At that point, the new weakest link (i.e., the new constraint) must be identified, and improvement efforts must be shifted over to that link. This simple sequential process provides a powerful strategy for optimizing business processes.

WATCH WHERE YOU CUT COSTS

At one hospital, the emergency room became so backlogged that its doors were closed to the public and patients were turned away for over 36 hours in the course of a single month. It turned out, after investigation, that the constraint was not the emergency room itself; it was the housekeeping staff. To cut costs, managers at the hospital had laid off housekeeping workers. This created a bottleneck in the emergency room because rooms were not being cleaned as quickly as the emergency room staff could process new patients. Thus, laying off some of the lowest paid workers at the hospital had the effect of forcing the hospital to idle some of its most highly paid staff and most expensive equipment!

IN BUSINESS

Six Sigma

Six Sigma is a process improvement method that relies on customer feedback and fact-based data gathering and analysis techniques to drive process improvement. **Motorola** and **General Electric** are closely identified with the Six Sigma movement. Technically, the term Six Sigma refers to a process that generates no more than 3.4 defects per million opportunities. Because this rate of defects is so low, Six Sigma is sometimes associated with the term *zero defects*.

The most common framework used to guide Six Sigma process improvement efforts is known as DMAIC (pronounced: du-may-ik), which stands for Define, Measure, Analyze, Improve, and Control. As summarized in Exhibit 1–6, the Define stage of the process focuses on defining the scope and purpose of the project, the flow of the current process, and the customer’s requirements. The Measure stage is used to gather baseline performance data concerning the existing process and to narrow the scope of the project to the most important problems. The Analyze stage focuses on identifying the root causes

EXHIBIT 1-6
The Six Sigma DMAIC
Framework

| Stage | Goals |
|---------|---|
| Define | Establish the scope and purpose of the project. Diagram the flow of the current process. Establish the customer's requirements for the process. |
| Measure | Gather baseline performance data related to the existing process. Narrow the scope of the project to the most important problems. |
| Analyze | Identify the root cause(s) of the problems identified in the Measure stage. |
| Improve | Develop, evaluate, and implement solutions to the problems. |
| Control | Ensure that problems remain fixed. Seek to improve the new methods over time. |

Source: Peter C. Brewer and Nancy A. Bagranoff, "Near Zero-Defect Accounting with Six Sigma," *Journal of Corporate Accounting and Finance*, January-February 2004, pp. 67-72.

of the problems that were identified during the Measure stage. The Analyze stage often reveals that the process includes many *activities that do not add value to the product or service*. Activities that customers are not willing to pay for because they add no value are known as **non-value-added activities** and such activities should be eliminated wherever possible. During the Improve stage potential solutions are developed, evaluated, and implemented to eliminate non-value-added activities and any other problems uncovered in the Analyze stage. Finally, the objective in the Control stage is to ensure that the problems remain fixed and that the new methods are improved over time.

Managers must be very careful when attempting to translate Six Sigma improvements into financial benefits. There are only two ways to increase profits—decrease costs or increase sales. Cutting costs may seem easy—lay off workers who are no longer needed because of improvements such as eliminating non-value-added activities. However, if this approach is taken, employees quickly get the message that process improvements lead to job losses and they will understandably resist further improvement efforts. If improvement is to continue, employees must be convinced that the end result of improvement will be more secure rather than less secure jobs. This can only happen if management uses tools such as Six Sigma to generate more business rather than to cut the workforce.

The Importance of Ethics in Business

LEARNING OBJECTIVE 3

Understand the importance of upholding ethical standards.

A series of major financial scandals involving **Enron**, **Tyco International**, **HealthSouth**, **Adelphia Communications**, **WorldCom**, **Global Crossing**, **Rite Aid**, and other companies have raised deep concerns about ethics in business. The managers and companies involved in these scandals have suffered mightily—from huge fines to jail terms and financial collapse. And the recognition that ethical behavior is absolutely essential for the functioning of our economy has led to numerous regulatory changes—some of which we will discuss in a later section on corporate governance. But why is ethical behavior so important? This is not a matter of just being “nice.” Ethical behavior is the lubricant that keeps the economy running. Without that lubricant, the economy would operate much less efficiently—less would be available to consumers, quality would be lower, and prices would be higher.

Take a very simple example. Suppose that dishonest farmers, distributors, and grocers knowingly tried to sell wormy apples as good apples and that grocers refused to take back wormy apples. What would you do as a consumer of apples? Go to another grocer? But what if all grocers acted this way? What would you do then? You would probably either stop buying apples or you would spend a lot of time inspecting apples before buying them. So would everyone else. Now notice what has happened. Because farmers, distributors, and grocers could not be trusted, sales of apples would plummet and those

who did buy apples would waste a lot of time inspecting them minutely. Everyone loses. Farmers, distributors, and grocers make less money; consumers enjoy fewer apples; and consumers waste time looking for worms. In other words, without fundamental trust in the integrity of businesses, the economy would operate much less efficiently. James Surowiecki summed up this point as follows:

[F]lourishing economies require a healthy level of trust in the reliability and fairness of everyday transactions. If you assumed every potential deal was a rip-off or that the products you were buying were probably going to be lemons, then very little business would get done. More important, the costs of the transactions that did take place would be exorbitant because you'd have to do enormous work to investigate each deal and you'd have to rely on the threat of legal action to enforce every contract. For an economy to prosper, what's needed is not a Pollyannaish faith that everyone else has your best interests at heart—"caveat emptor" [buyer beware] remains an important truth—but a basic confidence in the promises and commitments that people make about their products and services.⁶

IN BUSINESS

NO TRUST—NO ENRON

Jonathan Karpoff reports on a particularly important, but often overlooked, aspect of the Enron debacle:

As we know, some of Enron's reported profits in the late 1990s were pure accounting fiction. But the firm also had legitimate businesses and actual assets. Enron's most important businesses involved buying and selling electricity and other forms of energy. [Using Enron as an intermediary, utilities that needed power bought energy from producers with surplus generating capacity.] Now when an electric utility contracts to buy electricity, the managers of the utility want to make darned sure that the seller will deliver the electrons exactly as agreed, at the contracted price. There is no room for fudging on this because the consequences of not having the electricity when consumers switch on their lights are dire. . . .

This means that the firms with whom Enron was trading electricity . . . had to trust Enron. And trust Enron they did, to the tune of billions of dollars of trades every year. But in October 2001, when Enron announced that its previous financial statements overstated the firm's profits, it undermined such trust. As everyone recognizes, the announcement caused investors to lower their valuations of the firm. Less understood, however, was the more important impact of the announcement; by revealing some of its reported earnings to be a house of cards, Enron sabotaged its reputation. The effect was to undermine even its legitimate and (previously) profitable operations that relied on its trustworthiness.

This is why Enron melted down so fast. Its core businesses relied on the firm's reputation. When that reputation was wounded, energy traders took their business elsewhere. . . .

Energy traders lost their faith in Enron, but what if no other company could be trusted to deliver on its commitments to provide electricity as contracted? In that case, energy traders would have nowhere to turn. As a direct result, energy producers with surplus generating capacity would be unable to sell their surplus power. As a consequence, their existing customers would have to pay higher prices. And utilities that did not have sufficient capacity to meet demand on their own would have to build more capacity, which would also mean higher prices for their consumers. So a general lack of trust in companies such as Enron would ultimately result in overinvestment in energy-generating capacity and higher energy prices for consumers.

Thus, for the good of everyone—including profit-making companies—it is vitally important that business be conducted within an ethical framework that builds and sustains trust.

The Institute of Management Accountants (IMA) of the United States has adopted an ethical code called the *Statement of Ethical Professional Practice* that describes in some detail the ethical responsibilities of management accountants. Even though the standards were specifically developed for management accountants, they have much broader application.

Code of Conduct for Management Accountants

The IMA's Statement of Ethical Professional Practice consists of two parts that are presented in full in Exhibit 1–7 (page 15). The first part provides general guidelines for ethical behavior. In a nutshell, a management accountant has ethical responsibilities in four broad areas: first, to maintain a high level of professional competence; second, to treat sensitive matters with confidentiality; third, to maintain personal integrity; and fourth, to disclose information in a credible fashion. The second part of the standards specifies what should be done if an individual finds evidence of ethical misconduct. We recommend that you stop at this point and read all of Exhibit 1–7.

The ethical standards provide sound, practical advice for management accountants and managers. Most of the rules in the ethical standards are motivated by a very practical consideration—if these rules were not generally followed in business, then the economy and all of us would suffer. Consider the following specific examples of the consequences of not abiding by the standards:

- Suppose employees could not be trusted with confidential information. Then top managers would be reluctant to distribute such information within the company and, as a result, decisions would be based on incomplete information and operations would deteriorate.
- Suppose employees accepted bribes from suppliers. Then contracts would tend to go to suppliers who pay the highest bribes rather than to the most competent suppliers. Would you like to fly in aircraft whose wings were made by the subcontractor who paid the highest bribe? Would you fly as often? What would happen to the airline industry if its safety record deteriorated due to shoddy workmanship on contracted parts and assemblies?
- Suppose the presidents of companies routinely lied in their annual reports and financial statements. If investors could not rely on the basic integrity of a company's financial statements, they would have little basis for making informed decisions. Suspecting the worst, rational investors would pay less for securities issued by companies and may not be willing to invest at all. As a consequence, companies would have less money for productive investments—leading to slower economic growth, fewer goods and services, and higher prices.

As these examples suggest, if ethical standards were not generally adhered to, everyone would suffer—businesses as well as consumers. Essentially, abandoning ethical standards would lead to a lower standard of living with lower-quality goods and services, less to choose from, and higher prices. In short, following ethical rules such as those in the Statement of Ethical Professional Practice is absolutely essential for the smooth functioning of an advanced market economy.

Company Codes of Conduct

Many companies have adopted formal ethical codes of conduct. These codes are generally broad-based statements of a company's responsibilities to its employees, its customers, its suppliers, and the communities in which the company operates. Codes rarely spell out specific do's and don'ts or suggest proper behavior in a specific situation. Instead, they give broad guidelines. For example, Exhibit 1–8 (page 16) shows **Johnson & Johnson's** code of ethical conduct, which it refers to as a Credo. Johnson & Johnson created its Credo in 1943

Members of IMA shall behave ethically. A commitment to ethical professional practice includes: overarching principles that express our values, and standards that guide our conduct.

PRINCIPLES

IMA's overarching ethical principles include: Honesty, Fairness, Objectivity, and Responsibility. Members shall act in accordance with these principles and shall encourage others within their organizations to adhere to them.

STANDARDS

A member's failure to comply with the following standards may result in disciplinary action.

I. COMPETENCE

Each member has a responsibility to:

1. Maintain an appropriate level of professional expertise by continually developing knowledge and skills.
2. Perform professional duties in accordance with relevant laws, regulations, and technical standards.
3. Provide decision support information and recommendations that are accurate, clear, concise, and timely.
4. Recognize and communicate professional limitations or other constraints that would preclude responsible judgment or successful performance of an activity.

II. CONFIDENTIALITY

Each member has a responsibility to:

1. Keep information confidential except when disclosure is authorized or legally required.
2. Inform all relevant parties regarding appropriate use of confidential information. Monitor subordinates' activities to ensure compliance.
3. Refrain from using confidential information for unethical or illegal advantage.

III. INTEGRITY

Each member has a responsibility to:

1. Mitigate actual conflicts of interest. Regularly communicate with business associates to avoid apparent conflicts of interest. Advise all parties of any potential conflicts.
2. Refrain from engaging in any conduct that would prejudice carrying out duties ethically.
3. Abstain from engaging in or supporting any activity that might discredit the profession.

IV. CREDIBILITY

Each member has a responsibility to:

1. Communicate information fairly and objectively.
2. Disclose all relevant information that could reasonably be expected to influence an intended user's understanding of the reports, analyses, or recommendations.
3. Disclose delays or deficiencies in information, timeliness, processing, or internal controls in conformance with organization policy and/or applicable law.

RESOLUTION OF ETHICAL CONFLICT

In applying the Standards of Ethical Professional Practice, you may encounter problems identifying unethical behavior or resolving an ethical conflict. When faced with ethical issues, you should follow your organization's established policies on the resolution of such conflict. If these policies do not resolve the ethical conflict, you should consider the following courses of action:

1. Discuss the issue with your immediate supervisor except when it appears that the supervisor is involved. In that case, present the issue to the next level. If you cannot achieve a satisfactory resolution, submit the issue to the next management level. If your immediate superior is the chief executive officer or equivalent, the acceptable reviewing authority may be a group such as the audit committee, executive committee, board of directors, board of trustees, or owners. Contact with levels above the immediate superior should be initiated only with your superior's knowledge, assuming he or she is not involved. Communication of such problems to authorities or individuals not employed or engaged by the organization is not considered appropriate, unless you believe there is a clear violation of the law.
2. Clarify relevant ethical issues by initiating a confidential discussion with an IMA Ethics Counselor or other impartial advisor to obtain a better understanding of possible courses of action.
3. Consult your own attorney as to legal obligations and rights concerning the ethical conflict.

EXHIBIT 1-7

IMA Statement of Ethical Professional Practice

IN BUSINESS

WHO IS TO BLAME?

Don Keough, a retired **Coca-Cola** executive, recalls that, “In my time, CFOs [chief financial officers] were basically tough, smart, and mean. Bringing good news wasn’t their function. They were the truth-tellers.” But that had changed by the late 1990s in some companies. Instead of being truth-tellers, CFOs became corporate spokesmen, guiding stock analysts in their quarterly earnings estimates—and then making sure those earnings estimates were beaten using whatever means necessary, including accounting tricks and in some cases outright fraud. But does the buck stop there?

A survey of 179 CFOs published in May 2004 showed that only 38% of those surveyed believed that pressure to use aggressive accounting techniques to improve results had lessened relative to three years earlier. And 20% of those surveyed said the pressure had increased over the past three years. Where did the respondents say the pressure was coming from? Personal greed, weak boards of directors, and overbearing chief executive officers (CEOs) topped the list. Who is to blame? Perhaps that question is less important than focusing on what is needed—greater personal integrity and less emphasis on meeting quarterly earnings estimates.

Sources: Jeremy Kahn, “The Chief Freaked Out Officer,” *Fortune*, December 9, 2002, pp. 197–202, and Don Durfee, “After the Scandals: It’s Better (and Worse) Than You Think,” *CFO*, May 2004, p. 29.

and today it is translated into 36 languages. Johnson & Johnson surveys its employees every two to three years to obtain their impressions of how well the company adheres to its ethical principles. If the survey reveals shortcomings, corrective actions are taken.⁷

It bears emphasizing that establishing a code of ethical conduct, such as Johnson & Johnson’s Credo, is meaningless if employees, and in particular top managers, do not

EXHIBIT 1-8
The Johnson & Johnson Credo

Johnson & Johnson Credo

We believe our first responsibility is to the doctors, nurses and patients, to mothers and fathers and all others who use our products and services. In meeting their needs everything we do must be of high quality. We must constantly strive to reduce our costs in order to maintain reasonable prices. Customers’ orders must be serviced promptly and accurately. Our suppliers and distributors must have an opportunity to make a fair profit.

We are responsible to our employees, the men and women who work with us throughout the world. Everyone must be considered as an individual. We must respect their dignity and recognize their merit. They must have a sense of security in their jobs. Compensation must be fair and adequate, and working conditions clean, orderly and safe. We must be mindful of ways to help our employees fulfill their family responsibilities. Employees must feel free to make suggestions and complaints. There must be equal opportunity for employment, development and advancement for those qualified. We must provide competent management, and their actions must be just and ethical.

We are responsible to the communities in which we live and work and to the world community as well. We must be good citizens—support good works and charities and bear our fair share of taxes. We must encourage civic improvements and better health and education. We must maintain in good order the property we are privileged to use, protecting the environment and natural resources.

Our final responsibility is to our stockholders. Business must make a sound profit. We must experiment with new ideas. Research must be carried on, innovative programs developed and mistakes paid for. New equipment must be purchased, new facilities provided and new products launched. Reserves must be created to provide for adverse times. When we operate according to these principles, the stockholders should realize a fair return.

⁷ www.jnj.com/our_company/our_credos

adhere to it when making decisions. If top managers continue to say, in effect, that they will only be satisfied with bottom-line results and will accept no excuses, they are building a culture that implicitly coerces employees to engage in unethical behavior to get ahead. This type of unethical culture is contagious. In fact, one survey showed that “[t]hose who engage in unethical behavior often justify their actions with one or more of the following reasons: (1) the organization expects unethical behavior, (2) everyone else is unethical, and/or (3) behaving unethically is the only way to get ahead.”⁸

IN BUSINESS

WHERE WOULD YOU LIKE TO WORK?

Nearly all executives claim that their companies maintain high ethical standards; however, not all executives walk the talk. Employees usually know when top executives are saying one thing and doing another and they also know that these attitudes spill over into other areas. Working in companies where top managers pay little attention to their own ethical rules can be extremely unpleasant. Several thousand employees in many different organizations were asked if they would recommend their company to prospective employees. Overall, 66% said that they would. Among those employees who believed that their top management strives to live by the company’s stated ethical standards, the number of recommenders jumped to 81%. But among those who believed top management did not follow the company’s stated ethical standards, the number was just 21%.

Codes of Conduct on the International Level

The Code of Ethics for Professional Accountants, issued by the International Federation of Accountants (IFAC), governs the activities of all professional accountants throughout the world, regardless of whether they are practicing as independent CPAs, employed in government service, or employed as internal accountants.⁹

In addition to outlining ethical requirements in matters dealing with integrity and objectivity, resolution of ethical conflicts, competence, and confidentiality, the IFAC’s code also outlines the accountant’s ethical responsibilities in other matters such as those relating to taxes, independence, fees and commissions, advertising and solicitation, the handling of monies, and cross-border activities. Where cross-border activities are involved, the IFAC ethical requirements must be followed if they are stricter than the ethical requirements of the country in which the work is being performed.

Corporate Governance

Effective *corporate governance* enhances stockholders’ confidence that a company is being run in their best interests rather than in the interests of top managers. **Corporate governance** is the system by which a company is directed and controlled. If properly implemented, the corporate governance system should provide incentives for the board of directors and top management to pursue objectives that are in the interests of the company’s owners and it should provide for effective monitoring of performance.¹⁰

Unfortunately, history has repeatedly shown that unscrupulous top managers, if unchecked, can exploit their power to defraud stockholders. This unpleasant reality became all too clear in 2001 when the fall of **Enron** kicked off a wave of corporate

⁹ A copy of this code can be obtained on the International Federation of Accountants’ website www.ifac.org.

¹⁰ This definition of corporate governance was adapted from the 2004 report titled *OECD Principles of Corporate Governance* published by the Organization for Economic Co-Operation and Development.

scandals. These scandals were characterized by financial reporting fraud and misuse of corporate funds at the very highest levels—including CEOs and CFOs. While this was disturbing in itself, it also indicated that the institutions intended to prevent such abuses weren't working, thus raising fundamental questions about the adequacy of the existing corporate governance system. In an attempt to respond to these concerns, the U.S. Congress passed the most important reform of corporate governance in many decades—*The Sarbanes-Oxley Act of 2002*.

The Sarbanes-Oxley Act of 2002

The **Sarbanes-Oxley Act of 2002** was intended to protect the interests of those who invest in publicly traded companies by improving the reliability and accuracy of corporate financial reports and disclosures. We would like to highlight six key aspects of the legislation.¹¹

First, the Act requires that both the CEO and CFO certify in writing that their company's financial statements and accompanying disclosures fairly represent the results of operations—with possible jail time if a CEO or CFO certifies results that they know are false. This creates very powerful incentives for the CEO and CFO to ensure that the financial statements contain no misrepresentations.

Second, the Act established the Public Company Accounting Oversight Board to provide additional oversight over the audit profession. The Act authorizes the Board to conduct investigations, to take disciplinary actions against audit firms, and to enact various standards and rules concerning the preparation of audit reports.

Third, the Act places the power to hire, compensate, and terminate the public accounting firm that audits a company's financial reports in the hands of the audit committee of the board of directors. Previously, management often had the power to hire and fire its auditors. Furthermore, the Act specifies that all members of the audit committee must be independent, meaning that they do not have an affiliation with the company they are overseeing, nor do they receive any consulting or advisory compensation from the company.

Fourth, the Act places important restrictions on audit firms. Historically, public accounting firms earned a large part of their profits by providing consulting services to the companies that they audited. This provided the appearance of a lack of independence because a client that was dissatisfied with an auditor's stance on an accounting issue might threaten to stop using the auditor as a consultant. To avoid this possible conflict of interests, the Act prohibits a public accounting firm from providing a wide variety of nonauditing services to an audit client.

Fifth, the Act requires that a company's annual report contain an *internal control report*. Internal controls are put in place by management to provide assurance to investors that financial disclosures are reliable. The report must state that it is management's responsibility to establish and maintain adequate internal controls and it must contain an assessment by management of the effectiveness of its internal control structure. The internal control report is accompanied by an opinion from the company's audit firm as to whether management has maintained effective internal control over its financial reporting process.

Finally, the Act establishes severe penalties of as many as 20 years in prison for altering or destroying any documents that may eventually be used in an official proceeding and as many as 10 years in prison for managers who retaliate against a so-called whistleblower who goes outside the chain of command to report misconduct. Collectively, these six aspects of the Sarbanes-Oxley Act of 2002 should help reduce the incidence of fraudulent financial reporting.

¹¹ A summary of the Sarbanes-Oxley Act of 2002 can be obtained from the American Institute of Certified Public Accountants (AICPA) website <http://thecaq.aicpa.org/Resources/Sarbanes+Oxley>.

SARBANES-OXLEY TAKES ITS TOLL ON CFOs

Bank of America's stock price rose 13% while Alvaro DeMolina was its chief financial officer (CFO). Yet, after 18 months DeMolina resigned from his job because it was “suffocating” and “less fun.” DeMolina is one of many CFOs who attribute their job dissatisfaction to The Sarbanes-Oxley Act of 2002 (SOX). A survey of 237 CFOs showed that 75% of them believe SOX significantly increased their workload and 49% feel that SOX makes their job less satisfying. The turnover rate among CFOs of \$1 billion companies increased from 7% in 2002 to 21% in 2005. Thanks to SOX, CFOs are spending too much time certifying stacks of documents and responding to tedious inquiries from the board of directors, and less time on the strategic and creative endeavors of managing internal operations.

Source: Telis Demos, “CFO: All Pain, No Gain,” *Fortune*, February 5, 2007, pp. 18–19; Ghostwriter, “Sore About Sarbox,” *BusinessWeek*, March 13, 2006, p. 13.

Enterprise Risk Management

Businesses face risks every day. Some risks are foreseeable. For example, a company could reasonably be expected to foresee the possibility of a natural disaster or a fire destroying its centralized data storage facility. Companies respond to this type of risk by maintaining off-site backup data storage facilities. Other risks are unforeseeable. For example, in 1982 **Johnson & Johnson** never could have imagined that a deranged killer would insert poison into bottles of Tylenol and then place these tainted bottles on retail shelves, ultimately killing seven people.¹² Johnson & Johnson—guided by the first line of its Credo (see page 16)—responded to this crisis by acting to reduce the risks faced by its customers and itself. First, it immediately recalled and destroyed 31 million bottles of Tylenol with a retail value of \$100 million to reduce the risk of additional fatalities. Second, it developed the tamper-resistant packaging that we take for granted today to reduce the risk that the same type of crime could be repeated in the future.

Every business strategy or decision involves risks. **Enterprise risk management** is a process used by a company to proactively identify and manage those risks.

Identifying and Controlling Business Risks

Companies should identify foreseeable risks before they occur rather than react to unfortunate events that have already happened. The left-hand column of Exhibit 1–9 (page 20) provides 12 examples of business risks. This list is not exhaustive, rather its purpose is to illustrate the diverse nature of business risks that companies face. Whether the risks relate to the weather, computer hackers, complying with the law, employee theft, financial reporting, or strategic decision making, they all have one thing in common. If the risks are not managed effectively, they can infringe on a company’s ability to meet its goals.

Once a company identifies its risks, it can respond to them in various ways such as accepting, avoiding, or reducing the risk. Perhaps the most common risk management tactic is to reduce risks by implementing specific controls. The right-hand column of Exhibit 1–9 provides an example of a control that could be implemented to help reduce each of the risks mentioned in the left-hand column of the exhibit.

In conclusion, a sophisticated enterprise risk management system cannot guarantee that all risks are eliminated. Nonetheless, many companies understand that managing risks is a superior alternative to reacting, perhaps too late, to unfortunate events.

EXHIBIT 1-9
Identifying and Controlling
Business Risks

| Examples of Business Risks | Examples of Controls to Reduce Business Risks |
|---|---|
| ¥ Intellectual assets being stolen from computer files | ¥ Create firewalls that prohibit computer hackers from corrupting or stealing intellectual property |
| ¥ Products harming customers | ¥ Develop a formal and rigorous new product testing program |
| ¥ Losing market share due to the unforeseen actions of competitors | ¥ Develop an approach for legally gathering information about competitors' plans and practices |
| ¥ Poor weather conditions shutting down operations | ¥ Develop contingency plans for overcoming weather-related disruptions |
| ¥ A website malfunctioning | ¥ Thoroughly test the website before going "live" on the Internet |
| ¥ A supplier strike halting the flow of raw materials | ¥ Establish a relationship with two companies capable of providing needed raw materials |
| ¥ A poorly designed incentive compensation system causing employees to make bad decisions | ¥ Create a balanced set of performance measures that motivates the desired behavior |
| ¥ Financial statements inaccurately reporting the value of inventory | ¥ Count the physical inventory on hand to make sure that it agrees with the accounting records |
| ¥ An employee stealing assets | ¥ Segregate duties so that the same employee does not have physical custody of an asset and the responsibility of accounting for it |
| ¥ An employee accessing unauthorized information | ¥ Create password-protected barriers that prohibit employees from obtaining information not needed to do their jobs |
| ¥ Inaccurate budget estimates causing excessive or insufficient production | ¥ Implement a rigorous budget review process |
| ¥ Failing to comply with equal employment opportunity laws | ¥ Create a report that tracks key metrics related to compliance with the laws |

IN BUSINESS

MANAGING WEATHER RISK

The **National Oceanic and Atmospheric Administration** claims that the weather influences one-third of the U.S. gross domestic product. In 2004, the word *unseasonable* was used by more than 120 publicly traded companies to explain unfavorable financial performance. Indeed, it would be easy to conclude that the weather poses an uncontrollable risk to businesses, right? Wrong! Weather risk management is a growing industry with roughly 80 companies offering weather risk management services to clients.

For example, **Planalytics** is a weather consulting firm that helps **Wise Metal Group**, a manufacturer of aluminum can sheeting, to manage its natural gas purchases. Wise's \$3 million monthly gas bill fluctuates sharply depending on the weather. Planalytics' software helps Wise plan its gas purchases in advance of changing temperatures. Beyond influencing natural gas purchases, the weather can also delay the boats that deliver Wise's raw materials and it can affect Wise's sales to the extent that cooler weather conditions lead to a decline in canned beverage sales.

Source: Abraham Lustgarten, "Getting Ahead of the Weather," *Fortune*, February 7, 2005, pp. 87-94.

Corporate Social Responsibility

Companies are responsible for producing financial results that satisfy stockholders. However, they also have a *corporate social responsibility* to serve other stakeholders—such as customers, employees, suppliers, communities, and environmental and human rights advocates—whose interests are tied to the company’s performance. **Corporate social responsibility** (CSR) is a concept whereby organizations consider the needs of all stakeholders when making decisions. CSR extends beyond legal compliance to include voluntary actions that satisfy stakeholder expectations. Numerous companies, such as **Procter & Gamble, 3M, Eli Lilly and Company, Starbucks, Microsoft, Genentech, Johnson & Johnson, Baxter International, Abbott Laboratories, KPMG, National City Bank, Deloitte, Southwest Airlines, and Caterpillar**, prominently describe their corporate social performance on their websites.

Exhibit 1–10 presents examples of corporate social responsibilities that are of interest to six stakeholder groups. Many companies are paying increasing attention to these types of broadly defined responsibilities for four reasons. First, socially responsible investors control more than \$2.3 trillion of investment capital. Companies that want access to this capital must excel in terms of their social performance. Second, a growing number of employees want to work for a company that recognizes and responds to its social responsibilities. If companies hope to recruit and retain these highly skilled employees, then they must offer fulfilling careers that serve the needs of broadly defined stakeholders. Third, many customers seek to purchase products and services from socially responsible companies. The Internet enables these customers to readily locate competing products, thereby making it even easier to avoid doing business with undesirable companies. Fourth, nongovernment organizations (NGOs)

Companies should provide *customers* with:

- ¥ Safe, high-quality products that are fairly priced.
- ¥ Competent, courteous, and rapid delivery of products and services.
- ¥ Full disclosure of product-related risks.
- ¥ Easy-to-use information systems for shopping and tracking orders.

Companies should provide *suppliers* with:

- ¥ Fair contract terms and prompt payments.
- ¥ Reasonable time to prepare orders.
- ¥ Hassle-free acceptance of timely and complete deliveries.
- ¥ Cooperative rather than unilateral actions.

Companies should provide *stockholders* with:

- ¥ Competent management.
- ¥ Easy access to complete and accurate financial information.
- ¥ Full disclosure of enterprise risks.
- ¥ Honest answers to knowledgeable questions.

Companies and their suppliers should provide *employees* with:

- ¥ Safe and humane working conditions.
- ¥ Nondiscriminatory treatment and the right to organize and file grievances.
- ¥ Fair compensation.
- ¥ Opportunities for training, promotion, and personal development.

Companies should provide *communities* with:

- ¥ Payment of fair taxes.
- ¥ Honest information about plans such as plant closings.
- ¥ Resources that support charities, schools, and civic activities.
- ¥ Reasonable access to media sources.

Companies should provide *environmental and human rights advocates* with:

- ¥ Greenhouse gas emissions data.
- ¥ Recycling and resource conservation data.
- ¥ Child labor transparency.
- ¥ Full disclosure of suppliers located in developing countries.

EXHIBIT 1–10 Examples of Corporate Social Responsibilities

and activists are more capable than ever of tarnishing a company's reputation by publicizing its environmental or human rights missteps. The Internet has enabled these environmental and human rights advocacy groups to better organize their resources, spread negative information, and take coordinated actions against offending companies.¹³

It is important to understand that a company's social performance can impact its financial performance. For example, if a company's poor social performance alienates customers, then its revenues and profits will suffer. This reality explains why companies use enterprise risk management, as previously described, to meet the needs of *all* stakeholders.

IN BUSINESS

SKILL-BASED VOLUNTEERISM GROWS IN POPULARITY

Ernst & Young, a "Big 4" public accounting firm, paid one of its managers to spend 12 weeks in Buenos Aires providing free accounting services to a small publishing company. **UPS** paid one of its logistics supervisors to help coordinate the **Susan G. Komen Breast Cancer Foundation's** annual Race for the Cure event. Why are these companies paying their employees to work for other organizations? A survey of 1,800 people ages 13–25 revealed that 79% intend to seek employment with companies that care about contributing to society—underscoring the value of skill-based volunteerism as an employee recruiting and retention tool. Furthermore, enabling employees to apply their skills in diverse business contexts makes them more effective when they return to their regular jobs.

Source: Sarah E. Needleman, "The Latest Office Perk: Getting Paid to Volunteer," *The Wall Street Journal*, April 29, 2008, pp. D1 and D5.

The Certified Management Accountant (CMA)

An individual who possesses the necessary qualifications and who passes a rigorous professional exam earns the right to be known as a *Certified Management Accountant (CMA)*. In addition to the prestige that accompanies a professional designation, CMAs are often given greater responsibilities and higher compensation than those who do not have such a designation. Information about becoming a CMA and the CMA program can be accessed on the Institute of Management Accountants' (IMA) website www.imanet.org or by calling 1-800-638-4427.

To become a Certified Management Accountant, the following four steps must be completed:

1. File an Application for Admission and register for the CMA examination.
2. Pass all four parts of the CMA examination within a three-year period.
3. Satisfy the experience requirement of two continuous years of professional experience in management and/or financial accounting prior to or within seven years of passing the CMA examination.
4. Comply with the Statement of Ethical Professional Practice.

¹³ The insights from this paragraph and many of the examples in Exhibit 1–10 were drawn from Ronald W. Clement, "The Lessons from Stakeholder Theory for U.S. Business Leaders," *Business Horizons*, May/June 2005, pp. 255–264; and Terry Leap and Misty L. Loughry, "The Stakeholder-Friendly Firm," *Business Horizons*, March/April 2004, pp. 27–32.

IN BUSINESS

HOW'S THE PAY?

The Institute of Management Accountants has created the following table that allows an individual to estimate what his salary would be as a management accountant. (The table below applies specifically to men. A similar table exists for women.)

| | | Your Calculation | |
|---|----------|-------------------------|----------|
| Start with this base amount | | \$70,449 | \$70,449 |
| If you are top-level management | ADD | \$25,484 | |
| OR, if you are entry-level management | SUBTRACT | \$24,475 | |
| Number of years in the field _____ | TIMES | \$702 | |
| If you have an advanced degree | ADD | \$11,473 | |
| OR, if you have no degree | SUBTRACT | \$27,283 | |
| If you hold the CMA | ADD | \$14,874 | |
| OR, if you hold the CPA | ADD | \$12,320 | |
| OR, if you hold both CMA and CPA | ADD | \$18,128 | |
| Your estimated salary level | | | _____ |
| | | | ===== |

For example, if you make it to top-level management in 10 years, have an advanced degree and a CMA, your estimated salary would be \$129,300 [$\$70,449 + \$25,484 + (10 \times \$702) + \$11,473 + \$14,874$].

Summary

Successful companies follow strategies that differentiate themselves from competitors. Strategies often focus on three customer value propositions—customer intimacy, operational excellence, and product leadership.

Most organizations rely on decentralization to some degree. Decentralization is formally depicted in an organization chart that shows who works for whom and which units perform line and staff functions.

Lean Production, the Theory of Constraints, and Six Sigma are three management approaches that focus on business processes. Lean Production organizes resources around business processes and pulls units through those processes in response to customer orders. The result is lower inventories, fewer defects, less wasted effort, and quicker customer response times. The Theory of Constraints emphasizes the importance of managing an organization's constraints. Because the constraint is whatever is holding back the organization, improvement efforts usually must be focused on the constraint to be effective. Six Sigma uses the DMAIC (Define, Measure, Analyze, Improve, and Control) framework to eliminate non-value-added activities and to improve processes.

Ethical behavior is the foundation of a successful market economy. If we cannot trust others to act ethically in their business dealings with us, we will be inclined to invest less, scrutinize purchases more, and generally waste time and money trying to protect ourselves from the unscrupulous—resulting in fewer goods available to consumers at higher prices and lower quality.

Unfortunately, trust in our corporate governance system has been undermined by numerous high-profile financial reporting scandals. The Sarbanes-Oxley Act of 2002 was passed with the objective of improving the reliability of the financial disclosures provided by publicly traded companies.

All organizations face risks that they should proactively identify and respond to by accepting, avoiding, or reducing the risk. They also have a corporate social responsibility to serve a wide variety of stakeholders including stockholders, customers, employees, suppliers, and communities.

Glossary

At the end of each chapter, a list of key terms for review is given, along with the definition of each term. (These terms are printed in boldface where they are defined in the chapter.) Carefully study each term to be sure you understand its meaning. The list for Chapter 1 follows.

- Business process** A series of steps that are followed to carry out some task in a business. (p. 7)
- Chief financial officer (CFO)** The member of the top management team who is responsible for providing timely and relevant data to support planning and control activities and for preparing financial statements for external users. (p. 6)
- Constraint** Anything that prevents an organization or individual from getting more of what it wants. (p. 10)
- Controller** The member of the top management team who is responsible for providing relevant and timely data to managers and for preparing financial statements for external users. The controller reports to the CFO. (p. 6)
- Corporate governance** The system by which a company is directed and controlled. If properly implemented it should provide incentives for top management to pursue objectives that are in the interests of the company and it should effectively monitor performance. (p. 17)
- Corporate social responsibility** A concept whereby organizations consider the needs of all stakeholders when making decisions. It extends beyond legal compliance to include voluntary actions that satisfy stakeholder expectations. (p. 21)
- Decentralization** The delegation of decision-making authority throughout an organization by providing managers with the authority to make decisions relating to their area of responsibility. (p. 5)
- Enterprise risk management** A process used by a company to help identify the risks that it faces and to develop responses to those risks that enable the company to be reasonably assured of meeting its goals. (p. 19)
- Finished goods** Units of product that have been completed but have not yet been sold to customers. (p. 8)
- Just-in-time (JIT)** A production and inventory control system in which materials are purchased and units are produced only as needed to meet actual customer demand. (p. 9)
- Lean thinking model** A five-step management approach that organizes resources around the flow of business processes and that pulls units through these processes in response to customer orders. (p. 8)
- Line** A position in an organization that is directly related to the achievement of the organization's basic objectives. (p. 6)
- Non-value-added activities** Activities that consume resources but do not add value for which customers are willing to pay. (p. 12)
- Organization chart** A diagram of a company's organizational structure that depicts formal lines of reporting, communication, and responsibility between managers. (p. 5)
- Raw materials** Materials that are used to make a product. (p. 8)
- Sarbanes-Oxley Act of 2002** Legislation enacted to protect the interests of stockholders who invest in publicly traded companies by improving the reliability and accuracy of the disclosures provided to them. (p. 18)
- Six Sigma** A method that relies on customer feedback and objective data gathering and analysis techniques to drive process improvement. (p. 11)
- Staff** A position in an organization that is only indirectly related to the achievement of the organization's basic objectives. Such positions provide service or assistance to line positions or to other staff positions. (p. 6)
- Strategy** A "game plan" that enables a company to attract customers by distinguishing itself from competitors. (p. 4)
- Supply chain management** A management approach that coordinates business processes across companies to better serve end consumers. (p. 9)
- Theory of Constraints (TOC)** A management approach that emphasizes the importance of managing constraints. (p. 10)
- Value chain** The major business functions that add value to a company's products and services such as research and development, product design, manufacturing, marketing, distribution, and customer service. (p. 7)
- Work in process** Units of product that are only partially complete and will require further work before they are ready for sale to a customer. (p. 8)

Questions

- 1-1 What is meant by a business strategy?
- 1-2 Describe the three broad categories of customer value propositions.
- 1-3 Distinguish between line and staff positions in an organization.
- 1-4 Describe the basic responsibilities of the Chief Financial Officer.
- 1-5 What are the three main categories of inventories in a manufacturing company?
- 1-6 What are the five steps in the lean thinking model?
- 1-7 What are the major benefits from successful implementation of the lean thinking model?
- 1-8 Describe what is meant by a “pull” production system.
- 1-9 Where does the Theory of Constraints recommend that improvement efforts be focused?
- 1-10 Briefly describe Six Sigma.
- 1-11 Describe the five stages in the Six Sigma DMAIC Framework.
- 1-12 Why is adherence to ethical standards important for the smooth functioning of an advanced market economy?
- 1-13 Describe what is meant by corporate governance.
- 1-14 Briefly describe what is meant by enterprise risk management.
- 1-15 What are the major stakeholder groups whose interests are tied to a company’s performance?

Multiple-choice questions are provided on the text website at www.mhhe.com/noreen2e.

Exercises

EXERCISE 1-1 The Roles of Managers and Management Accountants [L01]

Six terms that relate to organizations, the work of management, and the role of managerial accounting are listed below:

- | | |
|------------------|-------------------------|
| Decentralization | Controller |
| Line | Organization chart |
| Staff | Chief financial officer |

Choose the term above that most appropriately completes the following statements:

1. A position that is directly related to achieving the basic objectives of an organization is called a _____ position.
2. A diagram that shows how responsibility is divided among managers and shows the formal lines of reporting and communication is called an _____.
3. A _____ position provides service or assistance to other parts of the organization and does not directly achieve the basic objectives of the organization.
4. The delegation of decision-making authority throughout an organization by allowing managers at various operating levels to make key decisions relating to their area of responsibility is called _____.
5. The manager in charge of the accounting department is generally known as the _____.
6. The _____ is the member of the top management team who is responsible for providing timely and relevant data to support planning and control activities and for preparing financial statements for external users.

EXERCISE 1-2 The Business Environment [L02]

A number of terms are listed below:

- | | | |
|----------------------------|----------------------|---------------------------------|
| Six Sigma | value chain | enterprise risk management |
| customer value proposition | stakeholders | The Sarbanes-Oxley Act of 2002 |
| lean thinking model | pulls | nonconstraint |
| supply chain management | business process | constraint |
| Theory of Constraints | corporate governance | corporate social responsibility |
| non-value-added activity | strategy | manufacturing cell |

Required:

Choose the term or terms from the above list that most appropriately completes each of the following statements:

1. A(n) _____ is a game plan that enables a company to attract customers by distinguishing itself from competitors.
2. _____ is a method that relies on customer feedback and objective data gathering and analysis techniques to drive process improvement.
3. A(n) _____ is a series of steps that are followed to carry out some task in a business.
4. The system by which a company is directed and controlled is called _____.
5. The process used by a company to help identify the risks that it faces and to develop responses to those risks so that the company is reasonably assured of meeting its goals is known as _____.
6. A _____ is a work space that takes employees and equipment from departments that were previously separated from one another and places them side-by-side.
7. The various groups of people, such as employees, customers, and suppliers, whose interests are tied to a company's performance are called _____.
8. A(n) _____ is anything that prevents an organization or individual from getting more of what it wants.
9. Increasing the rate of output of a(n) _____ as the result of an improvement effort is unlikely to have much effect on profits.
10. A(n) _____ consists of business functions that add value to a company's products and services such as research and development, product design, manufacturing, marketing, distribution, and customer service.
11. _____ is a concept whereby organizations consider the needs of all stakeholders when making decisions.
12. A management approach that coordinates business processes across companies to better serve end consumers is known as _____.
13. The _____ is a five-step management approach that organizes resources around the flow of business processes and that _____ units through those processes in response to customer orders.
14. A company can only succeed if it creates a reason for customers to choose it over a competitor; in short, a _____.
15. _____ was enacted to protect the interests of those who invest in publicly traded companies.
16. A(n) _____ consumes resources but does not add value for which customers are willing to pay.
17. The management approach that emphasizes the importance of managing constraints is known as the _____.

EXERCISE 1-3 Ethics in Business [L03]

Mary Karston was hired by a popular fast-food restaurant as an order-taker and cashier. Shortly after taking the job, she was shocked to overhear an employee bragging to a friend about short-changing customers. She confronted the employee who then snapped back: "Mind your own business. Besides, everyone does it and the customers never miss the money." Mary didn't know how to respond to this aggressive stance.

Required:

What would be the practical consequences on the fast-food industry and on consumers if cashiers generally shortchanged customers at every opportunity?

Problems

connect™

PROBLEM 1-4 Ethics and the Manager [L03]

Richmond, Inc., operates a chain of 44 department stores. Two years ago, the board of directors of Richmond approved a large-scale remodeling of its stores to attract a more upscale clientele.

Before finalizing these plans, two stores were remodeled as a test. Linda Perlman, assistant controller, was asked to oversee the financial reporting for these test stores, and she and other management personnel were offered bonuses based on the sales growth and profitability of these stores. While completing the

financial reports, Perlman discovered a sizable inventory of outdated goods that should have been discounted for sale or returned to the manufacturer. She discussed the situation with her management colleagues; the consensus was to ignore reporting this inventory as obsolete because reporting it would diminish the financial results and their bonuses.

Required:

1. According to the IMA's Statement of Ethical Professional Practice, would it be ethical for Perlman *not* to report the inventory as obsolete?
2. Would it be easy for Perlman to take the ethical action in this situation?

(CMA, adapted)

PROBLEM 1-5 Preparing an Organization Chart [LO1]

Bristow University is a large private school located in the Midwest. The university is headed by a president who has five vice presidents reporting to him. These vice presidents are responsible for, respectively, auxiliary services, admissions and records, academics, financial services (controller), and the physical plant.

In addition, the university has managers over several areas who report to these vice presidents. These include managers over central purchasing, the university press, and the university bookstore, all of whom report to the vice president for auxiliary services; managers over computer services and over accounting and finance, who report to the vice president for financial services; and managers over grounds and custodial services and over plant and maintenance, who report to the vice president for physical plant.

The university has four colleges—business, humanities, fine arts, and engineering and quantitative methods—and a law school. Each of these units has a dean who is responsible to the academic vice president. Each college has several departments.

Required:

1. Prepare an organization chart for Bristow University.
2. Which of the positions on your chart would be line positions? Why would they be line positions? Which would be staff positions? Why?
3. Which of the positions on your chart would have need for accounting information? Explain.

PROBLEM 1-6 Ethics; Just-In-Time (JIT) Purchasing [LO2, LO3]

(The situation described below was adapted from a case published by the Institute of Management Accountants' Committee on Ethics.*)

WIW is a publicly owned corporation that makes various control devices used in manufacturing mechanical equipment. J.B. is the president of WIW, Tony is the purchasing agent, and Diane is J.B.'s executive assistant. All three have been with WIW for about five years. Charlie is WIW's controller and has been with the company for two years.

J.B.: Hi, Charlie, come on in. Diane said you had a confidential matter to discuss. What's on your mind?

Charlie: J.B., I was reviewing our increased purchases from A-1 Warehouse Sales last week and wondered why our volume has tripled in the past year. When I discussed this with Tony he seemed a bit evasive and tried to dismiss the issue by stating that A-1 can give us one-day delivery on our orders.

J.B.: Well, Tony is right. You know we have been trying to implement just-in-time and have been trying to get our inventory down.

Charlie: We still have to look at the overall cost. A-1 is more of a jobber than a warehouse. After investigating orders placed with them, I found that only 10% are delivered from their warehouse and the other 90% are drop-shipped from the manufacturers. The average markup by A-1 is 30%, which amounted to about \$600,000 on our orders for the past year. If we had ordered directly from the manufacturers when A-1 didn't have an item in stock, we could have saved about \$540,000 ($\$600,000 \times 90\%$). In addition, some of the orders were late and not complete.

J.B.: Now look, Charlie, we get quick delivery on most items, and who knows how much we are saving by not having to stock this stuff in advance or worry about it becoming obsolete. Is there anything else on your mind?

Charlie: Well, J.B., as a matter of fact, there is. I ordered a Dun & Bradstreet credit report on A-1 and discovered that Mike Bell is the principal owner. Isn't he your brother-in-law?

* Neil Holmes, ed., "Ethics," *Management Accounting* 73, no. 8, p. 16. Used with permission from the Institute of Management Accountants (IMA), Montvale, N.J., USA, www.imanet.org.

J.B.: Sure he is. But don't worry about Mike. He understands this JIT approach. Besides, he's looking out for our interests.

Charlie (to himself): This conversation has been enlightening, but it doesn't respond to my concerns. Can I legally or ethically ignore this apparent conflict of interests?

Required:

1. Would Charlie be justified in ignoring this situation, particularly because he is not the purchasing agent? In preparing your answer, consider the IMA's Statement of Ethical Professional Practice.
2. State the specific steps Charlie should follow to resolve this matter.

PROBLEM 1-7 Ethics in Business [LO3]

Consumers and attorney generals in more than 40 states accused a prominent nationwide chain of auto repair shops of misleading customers and selling them unnecessary parts and services, from brake jobs to front-end alignments. Lynn Sharpe Paine reported the situation as follows in "Managing for Organizational Integrity," *Harvard Business Review*, Volume 72 Issue 3:

In the face of declining revenues, shrinking market share, and an increasingly competitive market . . . management attempted to spur performance of its auto centers. . . . The automotive service advisers were given product-specific sales quotas—sell so many springs, shock absorbers, alignments, or brake jobs per shift—and paid a commission based on sales. . . . [F]ailure to meet quotas could lead to a transfer or a reduction in work hours. Some employees spoke of the "pressure, pressure, pressure" to bring in sales.

This pressure-cooker atmosphere created conditions under which employees felt that the only way to satisfy top management was by selling products and services to customers that they didn't really need.

Suppose all automotive repair businesses routinely followed the practice of attempting to sell customers unnecessary parts and services.

Required:

1. How would this behavior affect customers? How might customers attempt to protect themselves against this behavior?
2. How would this behavior probably affect profits and employment in the automotive service industry?

PROBLEM 1-8 Line and Staff Positions [LO1]

Special Alloys Corporation manufactures a variety of specialized metal products for industrial use. Most of its revenues are generated by large contracts with companies that have government defense contracts. The company also develops and markets parts to the major automobile companies. It employs many metallurgists and skilled technicians because most of its products are made from highly sophisticated alloys.

The company recently signed two large contracts; as a result, the workload of Wayne Washburn, the general manager, has become overwhelming. To relieve some of this overload, Mark Johnson was transferred from the Research Planning Department to the general manager's office. Johnson, who has been a senior metallurgist and supervisor in the Research Planning Department, was given the title "assistant to the general manager."

Washburn assigned several responsibilities to Johnson in their first meeting. Johnson will oversee the testing of new alloys in the Product Planning Department and be given the authority to make decisions as to the use of these alloys in product development; he will also be responsible for maintaining the production schedules for one of the new contracts. In addition to these duties, he will be required to meet with the supervisors of the production departments regularly to consult with them about production problems they may be experiencing. Washburn expects to be able to manage the company much more efficiently with Johnson's help.

Required:

1. Positions within organization are often described as having (a) line authority or (b) staff authority. Describe what is meant by these two terms.
2. Of the responsibilities assigned to Mark Johnson as assistant to the general manager, which tasks have line authority and which have staff authority?
3. Identify and discuss the conflicts Mark Johnson may experience in the production departments as a result of his new responsibilities.

(CMA, adapted)

RESEARCH AND APPLICATION 1-9

[LO1, LO3]

The questions in this exercise are based on one of the fastest growing food retailers in the United States—Whole Foods Market, Inc. To answer the questions, you will need to download Whole Foods Market’s 2004 annual report at www.wholefoodsmarket.com/company/annual-reports.php and its 10-K/A for the fiscal year ended September 26, 2004 by going to www.sec.gov/edgar/searchedgar/companysearch.html. Input CIK code 865436 and hit enter. In the gray box on the right-hand side of your computer screen define the scope of your search by inputting 10-K and then pressing enter. Select the 10-K/A with a filing date of May 18, 2005. In addition, you’ll need to download the company’s mission statement (which it refers to as a Declaration of Interdependence) at www.wholefoodsmarket.com/company/declaration.php and its code of business conduct at www.wholefoodsmarket.com/company/pdfs/codeofconduct.pdf. You do not need to print these documents to answer the questions.

Required:

1. What is Whole Foods Market’s strategy for success in the marketplace? Does the company rely primarily on a customer intimacy, operational excellence, or product leadership customer value proposition? What evidence supports your conclusion?
2. What business risks does Whole Foods Market face that may threaten its ability to satisfy stockholder expectations? What are some examples of control activities that the company could use to reduce these risks? (Hint: Focus on pages 11–15 of the 10-K/A.)
3. Create an excerpt of an organization chart for Whole Foods Market. Do not try to create an organization chart for the entire company—it would be overwhelming! Pick a portion of the company and depict how the company organizes itself. (Hint: Study the 2004 Global All-Stars mentioned in the annual report and refer to page 16 of the 10-K/A.) Mention by name three employees that occupy line positions and three employees that occupy staff positions.
4. Compare and contrast Whole Foods Market’s mission statement with the Johnson & Johnson Credo shown on page 16.
5. Compare and contrast Whole Foods Market’s mission statement and its code of business conduct.

Chapter

2

Learning Objectives

After studying Chapter 2, you should be able to:

- L01** Identify the major differences and similarities between financial and managerial accounting.
- L02** Identify and give examples of each of the three basic manufacturing cost categories.
- L03** Distinguish between product costs and period costs and give examples of each.
- L04** Prepare an income statement including calculation of the cost of goods sold.
- L05** Prepare a schedule of cost of goods manufactured.
- L06** Understand the differences between variable costs and fixed costs.
- L07** Understand the differences between direct and indirect costs.
- L08** Understand cost classifications used in making decisions: differential costs, opportunity costs, and sunk costs.

Managerial Accounting and Cost Concepts

Understanding Costs Aids the Growth of a Billion Dollar Company

In 1986, **Women's World of Fitness** went bankrupt despite having 14 locations and 50,000 members. The company's owner, Gary Heavin, says the fitness centers contained too many costly amenities such as swimming pools, tanning beds, cardio machines, kid's programs, juice bars, personal trainers, and aerobics classes. As costs escalated, he attempted to increase

revenues by offering memberships to men, which alienated his female members. What did Heavin learn from his experience?

In 1992, Heavin founded a new brand of women's fitness centers called **Curves**. Rather than investing in every conceivable piece of fitness equipment and amenity, Heavin focused on simplicity. He created a simple fitness circuit that uses minimal equipment and is quick and easy for members to complete. Instead of operating almost 24 hours a day, he decided to close his gyms early. Even showers were deemed unnecessary. In short, Heavin eliminated numerous costs that did not provide benefits in the eyes of his customers. With dramatically lower costs, he has been able to maintain his "women only" approach while building a billion dollar company with nearly 10,000 locations across the United States. ■

BUSINESS FOCUS

This chapter begins by describing the work of management and the need for managerial accounting information followed by a discussion of the differences and similarities between financial and managerial accounting. Next, we explain that in managerial accounting, the term *cost* is used in many different ways. The reason is that there are many types of costs, and these costs are classified differently according to the immediate needs of management. For example, managers may want cost data to prepare external financial reports, to prepare planning budgets, or to make decisions. Each different use of cost data demands a different classification and definition of costs. For example, the preparation of external financial reports requires the use of historical cost data, whereas decision making may require predictions about future costs. This notion of different costs for different purposes is a critically important aspect of managerial accounting.

The Work of Management and the Need for Managerial Accounting Information

Every organization—large and small—has managers. Someone must be responsible for formulating strategy, making plans, organizing resources, directing personnel, and controlling operations. This is true of the **Bank of America**, the **Peace Corps**, the **University of Illinois**, the **Red Cross**, and the **Coca-Cola Corporation**, as well as the local **7-Eleven** convenience store. In this chapter, we will use a particular organization—Good Vibrations, Inc.—to illustrate the work of management. What we have to say about the management of Good Vibrations, however, is very general and can be applied to virtually any organization.

Good Vibrations runs a chain of retail outlets that sells a full range of music CDs. The chain's stores are concentrated in Pacific Rim cities such as Sydney, Singapore, Hong Kong, Beijing, Tokyo, and Vancouver. The company has found that the best way to generate sales and profits is to create an exciting shopping environment following a customer intimacy strategy. Consequently, the company puts a great deal of effort into planning the layout and decor of its stores—which are often quite large and extend over several floors in key downtown locations. Management knows that different types of clientele are attracted to different kinds of music. The international rock section is generally decorated with bold, brightly colored graphics, and the aisles are purposely narrow to create a crowded feeling much like one would experience at a popular nightclub on Friday night. In contrast, the classical music section is wood-paneled and fully sound insulated, with the rich, spacious feeling of a country club meeting room.

Managers at Good Vibrations, like managers everywhere, carry out three major activities—*planning*, *directing and motivating*, and *controlling*. **Planning** involves establishing a basic strategy, selecting a course of action, and specifying how the action will be implemented. **Directing and motivating** involves mobilizing people to carry out plans and run routine operations. **Controlling** involves ensuring that the plan is actually carried out and is appropriately modified as circumstances change. Management accounting information plays a vital role in these basic management activities—but most particularly in the planning and control functions.

Planning

An important part of planning is to identify alternatives and then to select from among the alternatives the one that best fits the organization's strategy and objectives. The basic objective of Good Vibrations is to earn profits for the owners of the company by providing superior service at competitive prices in as many markets as possible. To further this strategy, every year top management carefully considers a range of options, or alternatives, for expanding into new geographic markets. This year management is considering opening new stores in Shanghai, Los Angeles, and Auckland.

When making this choice, management must balance the potential benefits of opening a new store against the costs and demands on the company's resources. Management knows from bitter experience that opening a store in a major new market is a big step that cannot be taken lightly. It requires enormous amounts of time and energy from the company's most experienced, talented, and busy professionals. When the company attempted to open stores in both Beijing and Vancouver in the same year, resources were stretched too thinly. The result was that neither store opened on schedule, and operations in the rest of the company suffered. Therefore, Good Vibrations plans very carefully before entering a new market.

Among other data, top management looks at the sales volumes, profit margins, and costs of the company's established stores in similar markets. These data, supplied by the management accountant, are combined with projected sales volume data at the proposed new locations to estimate the profits that would be generated by the new stores. In general, virtually all important alternatives considered by management in the planning process impact revenues or costs, and management accounting data are essential in estimating those impacts.

After considering all of the alternatives, Good Vibrations' top management decided to open a store in the booming Shanghai market in the third quarter of the year but to defer opening any other new stores to another year. As soon as this decision was made, detailed plans were drawn up for all parts of the company that would be involved in the Shanghai opening. For example, the Personnel Department's travel budget was increased because it would be providing extensive on-site training to the new personnel hired in Shanghai.

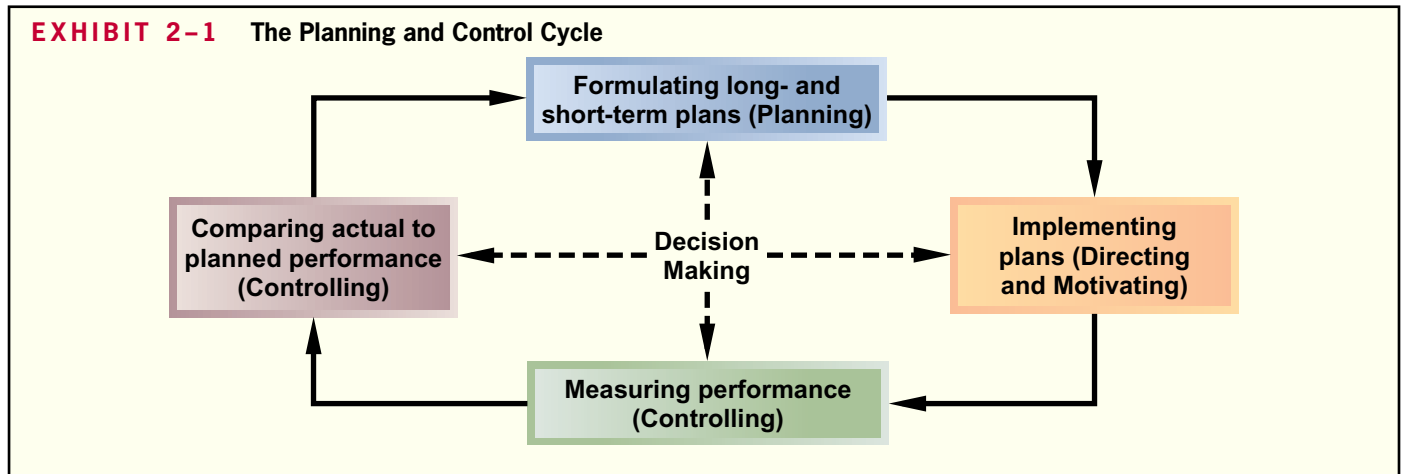

As in the case of the Personnel Department, the plans of management are often expressed formally in **budgets**, and the term *budgeting* is generally used to describe this part of the planning process. Budgets are usually prepared under the direction of the **controller**, who is the manager in charge of the Accounting Department. Typically, budgets are prepared annually and represent management's plans in specific, quantitative terms. In addition to a travel budget, the Personnel Department will be given goals in terms of new hires, courses taught, and detailed breakdowns of expected expenses. Similarly, the store managers will be given targets for sales volume, profit, expenses, pilferage losses, and employee training. Good Vibrations' management accountants will collect, analyze, and summarize these data in the form of budgets.

Directing and Motivating

In addition to planning for the future, managers oversee day-to-day activities and try to keep the organization functioning smoothly. This requires motivating and directing people. Managers assign tasks to employees, arbitrate disputes, answer questions, solve on-the-spot problems, and make many small decisions that affect customers and employees. In effect, directing is that part of a manager's job that deals with the routine and the here and now. Managerial accounting data, such as daily sales reports, are often used in this type of day-to-day activity.

Controlling

In carrying out the **control** function, managers seek to ensure that the plan is being followed. **Feedback**, which signals whether operations are on track, is the key to effective control. In sophisticated organizations, this feedback is provided by various detailed reports. One of these reports, which compares budgeted to actual results, is called a **performance report**. Performance reports suggest where operations are not proceeding as planned and where some parts of the organization may require additional attention. For example, the manager of the new Shanghai store will be given sales volume, profit, and expense targets. As the year progresses, performance reports will be constructed that compare actual sales volume, profit, and expenses to the targets. If the actual results fall below the targets, top management will be alerted that the Shanghai store requires more attention. Experienced personnel can be flown in to help the new manager, or top management may conclude that

its plans need to be revised. As we shall see in later chapters, one of the central purposes of managerial accounting is to provide this kind of feedback to managers.

The End Results of Managers' Activities

When a customer enters a Good Vibrations store, the results of management's planning, directing and motivating, and controlling activities will be evident in the many details that make the difference between a pleasant and an irritating shopping experience. The store will be clean, fashionably decorated, and logically laid out. Featured artists' videos will be displayed on TV monitors throughout the store, and the background rock music will be loud enough to send older patrons scurrying for the classical music section. Popular CDs will be in stock, and the latest hits will be available for private listening on earphones. Specific titles will be easy to find. Regional music, such as CantoPop in Hong Kong, will be prominently featured. Checkout clerks will be alert, friendly, and efficient. In short, what the customer experiences doesn't simply happen; it is the result of the efforts of managers who must visualize and then fit together the processes that are needed to get the job done.

The Planning and Control Cycle

Exhibit 2-1 depicts the work of management in the form of the *planning and control cycle*. The **planning and control cycle** involves the smooth flow of management activities from planning through directing and motivating, controlling, and then back to planning again. All of these activities involve decision making, which is the hub around which the other activities revolve.

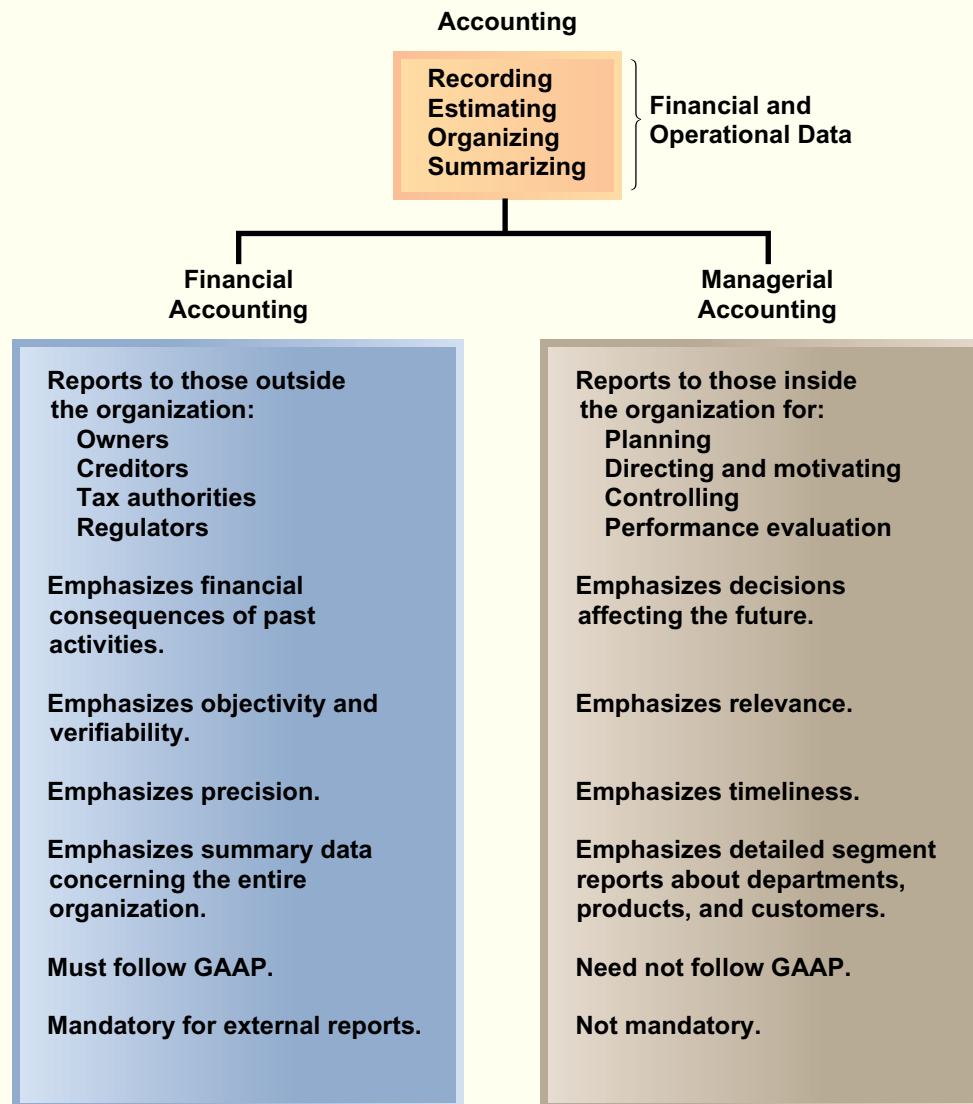

Comparison of Financial and Managerial Accounting

Managerial accounting is concerned with providing information to managers—that is, the people inside an organization who direct and control its operations. In contrast, **financial accounting** is concerned with providing information to stockholders, creditors, and others who are outside the organization. This contrast in orientation results in a number of major differences between financial and managerial accounting, even though they often rely on the same underlying financial data. Exhibit 2-2 (page 34) summarizes these differences.

As shown in Exhibit 2-2, financial and managerial accounting differ not only in their user orientation but also in their emphasis on the past and the future, in the type of data provided to users, and in several other ways. These differences are discussed in the following paragraphs.

LEARNING OBJECTIVE 1

Identify the major differences and similarities between financial and managerial accounting.

EXHIBIT 2-2 Comparison of Financial and Managerial Accounting

Emphasis on the Future

Because *planning* is such an important part of the manager's job, managerial accounting has a strong future orientation. In contrast, financial accounting primarily summarizes past financial transactions. These summaries may be useful in planning, but only to a point. The future is not simply a reflection of what has happened in the past. Changes are constantly taking place in economic conditions, customer needs and desires, competitive conditions, and so on. All of these changes demand that the manager's planning be based in large part on estimates of what will happen rather than on summaries of what has already happened.

Relevance of Data

Financial accounting data should be objective and verifiable. However, for internal uses managers need information that is relevant even if it is not completely objective or verifiable. By relevant, we mean *appropriate for the problem at hand*. For example, it is difficult to verify what the sales volume is going to be for a proposed new store at Good Vibrations, but this is

exactly the type of information that is most useful to managers. Managerial accounting should be flexible enough to provide whatever data are relevant for a particular decision.

Less Emphasis on Precision

Making sure that dollar amounts are accurate down to the last dollar or penny takes time and effort. While that kind of accuracy is required for external reports, most managers would rather have a good estimate immediately than wait for a more precise answer later. For this reason, managerial accountants often place less emphasis on precision than financial accountants do. For example, in a decision involving hundreds of millions of dollars, estimates that are rounded off to the nearest million dollars are probably good enough. In addition to placing less emphasis on precision than financial accounting, managerial accounting places much more weight on nonmonetary data. For example, data about customer satisfaction may be routinely used in managerial accounting reports.

Segments of an Organization

Financial accounting is primarily concerned with reporting for the company as a whole. By contrast, managerial accounting focuses much more on the parts, or **segments**, of a company. These segments may be product lines, sales territories, divisions, departments, or any other categorization that management finds useful. Financial accounting does require some breakdowns of revenues and costs by major segments in external reports, but this is a secondary emphasis. In managerial accounting, segment reporting is the primary emphasis.

Generally Accepted Accounting Principles (GAAP)

Financial accounting statements prepared for external users must comply with generally accepted accounting principles (GAAP). External users must have some assurance that the reports have been prepared in accordance with a common set of ground rules. These common ground rules enhance comparability and help reduce fraud and misrepresentation, but they do not necessarily lead to the type of reports that would be most useful in internal decision making. For example, if management at Good Vibrations is considering selling land to finance a new store, they need to know the current market value of the land. However, GAAP requires that the land be stated at its original, historical cost on financial reports. The more relevant data for the decision—the current market value—is ignored under GAAP.

While GAAP continues to shape financial reporting in the United States, most companies throughout the world are now communicating with their stakeholders using a different set of rules called International Financial Reporting Standards (IFRS). To better align U.S. reporting standards with the global community, the Securities and Exchange Commission (SEC) may eventually require all publicly traded companies in the U.S. to comply with IFRS instead of GAAP.¹ Regardless of what the SEC decides to do, it is important to understand that managerial accounting is not bound by GAAP or IFRS. Managers set their own rules concerning the content and form of internal reports. The only constraint is that the expected benefits from using the information should outweigh the costs of collecting, analyzing, and summarizing the data. Nevertheless, as we shall see in subsequent chapters, it is undeniably true that financial reporting requirements have heavily influenced management accounting practice.

Managerial Accounting—Not Mandatory

Financial accounting is mandatory; that is, it must be done. Various outside parties such as the Securities and Exchange Commission (SEC) and the tax authorities require periodic financial statements. Managerial accounting, on the other hand, is not mandatory. A company is completely free to do as much or as little as it wishes. No regulatory bodies or

¹ The SEC may permit some companies in industries composed mainly of IFRS-reporting entities to adopt IFRS for calendar years ending on or after December 15, 2009. If the SEC decides to mandate IFRS for all publicly traded companies, then the three-year transitional process will begin in 2014.

other outside agencies specify what is to be done, or, for that matter, whether anything is to be done at all. Because managerial accounting is completely optional, the important question is always, “Is the information useful?” rather than, “Is the information required?”

As explained earlier, the work of management focuses on planning, which includes setting objectives and outlining how to attain these objectives, and control, which includes the steps taken to ensure that objectives are realized. To carry out these planning and control responsibilities, managers need *information* about the organization. From an accounting point of view, this information often relates to the *costs* of the organization. In managerial accounting, the term *cost* is used in many different ways. The reason is that there are many types of costs, and these costs are classified differently according to the immediate needs of management. For example, managers may want cost data to prepare external financial reports, to prepare planning budgets, or to make decisions. Each different use of cost data may demand a different kind of cost. For example, historical cost data is used to prepare external financial reports whereas decision making may require current cost data.

General Cost Classifications

We have chosen to start our discussion of cost concepts by focusing on manufacturing companies, because they are involved in most of the activities found in other types of organizations. Manufacturing companies such as **Texas Instruments**, **Ford**, and **DuPont** are involved in acquiring raw materials, producing finished goods, marketing, distributing, billing, and almost every other business activity. Therefore, an understanding of costs in a manufacturing company can be very helpful in understanding costs in other types of organizations.

In this chapter, we introduce cost concepts that apply to diverse organizations including fast-food outlets such as **Kentucky Fried Chicken**, **Pizza Hut**, and **Taco Bell**; movie studios such as **Disney**, **Paramount**, and **United Artists**; consulting firms such as **Accenture** and **McKinsey**; and your local hospital. The exact terms used in these industries may not be the same as those used in manufacturing, but the same basic concepts apply. With some slight modifications, these basic concepts also apply to merchandising companies such as **Wal-Mart**, **The Gap**, **7-Eleven**, and **Nordstrom**. With that in mind, let’s begin our discussion of manufacturing costs.

Manufacturing Costs

Most manufacturing companies separate manufacturing costs into three broad categories: direct materials, direct labor, and manufacturing overhead. A discussion of each of these categories follows.

Direct Materials The materials that go into the final product are called **raw materials**. This term is somewhat misleading because it seems to imply unprocessed natural resources like wood pulp or iron ore. Actually, raw materials refer to any materials that are used in the final product; and the finished product of one company can become the raw materials of another company. For example, the plastics produced by **Du Pont** are a raw material used by **Compaq Computer** in its personal computers. One study of 37 manufacturing industries found that materials costs averaged about 55% of sales revenues.²

Raw materials may include both *direct* and *indirect materials*. **Direct materials** are those materials that become an integral part of the finished product and whose costs can be conveniently traced to the finished product. This would include, for example, the seats that **Airbus** purchases from subcontractors to install in its commercial aircraft and the tiny electric motor **Panasonic** uses in its DVD players.

Sometimes it isn’t worth the effort to trace the costs of relatively insignificant materials to end products. Such minor items would include the solder used to make electrical

LEARNING OBJECTIVE 2

Identify and give examples of each of the three basic manufacturing cost categories.

² Germain Boer and Debra Jeter, “What’s New About Modern Manufacturing? Empirical Evidence on Manufacturing Cost Changes,” *Journal of Management Accounting Research*, volume 5, pp. 61–83.

connections in a **Sony** TV or the glue used to assemble an **Ethan Allen** chair. Materials such as solder and glue are called **indirect materials** and are included as part of manufacturing overhead, which is discussed later in this section.

Direct Labor **Direct labor** consists of labor costs that can be easily (i.e., physically and conveniently) traced to individual units of product. Direct labor is sometimes called *touch labor* because direct labor workers typically touch the product while it is being made. Examples of direct labor include assembly-line workers at **Toyota**, carpenters at the home builder **Kaufman and Broad**, and electricians who install equipment on aircraft at **Bombardier Learjet**.

Labor costs that cannot be physically traced to particular products, or that can be traced only at great cost and inconvenience, are termed **indirect labor**. Just like indirect materials, indirect labor is treated as part of manufacturing overhead. Indirect labor includes the labor costs of janitors, supervisors, materials handlers, and night security guards. Although the efforts of these workers are essential, it would be either impractical or impossible to accurately trace their costs to specific units of product. Hence, such labor costs are treated as indirect labor.

IN BUSINESS

IS SENDING JOBS OVERSEAS ALWAYS A GOOD IDEA?

In recent years, many companies have sent jobs from high labor-cost countries such as the United States to lower labor-cost countries such as India and China. But is chasing labor cost savings always the right thing to do? In manufacturing, the answer is no. Typically, total direct labor costs are around 7% to 15% of cost of goods sold. Because direct labor is such a small part of overall costs, the labor savings realized by “offshoring” jobs can easily be overshadowed by a decline in supply chain efficiency that occurs simply because production facilities are located farther from the ultimate customers. The increase in inventory carrying costs and obsolescence costs coupled with slower response to customer orders, not to mention foreign currency exchange risks, can more than offset the benefits of employing geographically dispersed low-cost labor.

One manufacturer of casual wear in Los Angeles, California, understands the value of keeping jobs close to home in order to maintain a tightly knit supply chain. The company can fill orders for as many as 160,000 units in 24 hours. In fact, the company carries less than 30 days’ inventory and is considering fabricating clothing only after orders are received from customers rather than attempting to forecast what items will sell and making them in advance. How would they do this? The company’s entire supply chain—including weaving, dyeing, and sewing—is located in downtown Los Angeles, eliminating shipping delays.

Source: Robert Sternfels and Ronald Ritter, “When Offshoring Doesn’t Make Sense,” *The Wall Street Journal*, October 19, 2004, p. B8.

Major shifts have taken place and continue to take place in the structure of labor costs in some industries. Sophisticated automated equipment, run and maintained by skilled indirect workers, is increasingly replacing direct labor. Indeed, direct labor averages only about 10% of sales revenues in manufacturing. In some companies, direct labor has become such a minor element of cost that it has disappeared altogether as a separate cost category. Nevertheless, the vast majority of manufacturing and service companies throughout the world continue to recognize direct labor as a separate cost category.

Manufacturing Overhead **Manufacturing overhead**, the third element of manufacturing cost, includes all manufacturing costs except direct materials and direct labor. Manufacturing overhead includes items such as indirect materials; indirect labor; maintenance and repairs on production equipment; and heat and light, property taxes, depreciation, and insurance on manufacturing facilities. A company also incurs costs for heat and

light, property taxes, insurance, depreciation, and so forth, associated with its selling and administrative functions, but these costs are not included as part of manufacturing overhead. Only those costs associated with *operating the factory* are included in manufacturing overhead. Across large numbers of manufacturing companies, manufacturing overhead averages about 16% of sales revenues.³

Various names are used for manufacturing overhead, such as *indirect manufacturing cost*, *factory overhead*, and *factory burden*. All of these terms are synonyms for *manufacturing overhead*.

Nonmanufacturing Costs

Nonmanufacturing costs are often divided into two categories: (1) *selling costs* and (2) *administrative costs*. **Selling costs** include all costs that are incurred to secure customer orders and get the finished product to the customer. These costs are sometimes called *order-getting* and *order-filling costs*. Examples of selling costs include advertising, shipping, sales travel, sales commissions, sales salaries, and costs of finished goods warehouses.

Administrative costs include all costs associated with the *general management* of an organization rather than with manufacturing or selling. Examples of administrative costs include executive compensation, general accounting, secretarial, public relations, and similar costs involved in the overall, general administration of the organization *as a whole*.

Nonmanufacturing costs are also often called selling, general, and administrative (SG&A) costs or just selling and administrative costs.

Product Costs versus Period Costs

LEARNING OBJECTIVE 3

Distinguish between product costs and period costs and give examples of each.

In addition to classifying costs as manufacturing or nonmanufacturing costs, there are other ways to look at costs. For instance, they can also be classified as either *product costs* or *period costs*. To understand the difference between product costs and period costs, we must first discuss the matching principle from financial accounting.

Generally, costs are recognized as expenses on the income statement in the period that benefits from the cost. For example, if a company pays for liability insurance in advance for two years, the entire amount is not considered an expense of the year in which the payment is made. Instead, one-half of the cost would be recognized as an expense each year. The reason is that both years—not just the first year—benefit from the insurance payment. The unexpensed portion of the insurance payment is carried on the balance sheet as an asset called prepaid insurance.

The *matching principle* is based on the *accrual* concept that *costs incurred to generate a particular revenue should be recognized as expenses in the same period that the revenue is recognized*. This means that if a cost is incurred to acquire or make something that will eventually be sold, then the cost should be recognized as an expense only when the sale takes place—that is, when the benefit occurs. Such costs are called *product costs*.

Product Costs

For financial accounting purposes, **product costs** include all costs involved in acquiring or making a product. In the case of manufactured goods, these costs consist of direct materials, direct labor, and manufacturing overhead. Product costs “attach” to units of product as the goods are purchased or manufactured, and they remain attached as the goods go into inventory awaiting sale. Product costs are initially assigned to an inventory account on the

³ J. Miller, A. DeMeyer, and J. Nakane, *Benchmarking Global Manufacturing* (Homewood, IL: Richard D. Irwin), Chapter 2. The Boer and Jeter article cited earlier contains a similar finding concerning the magnitude of manufacturing overhead.

balance sheet. When the goods are sold, the costs are released from inventory as expenses (typically called cost of goods sold) and matched against sales revenue. Because product costs are initially assigned to inventories, they are also known as **inventoriable costs**.

We want to emphasize that product costs are not necessarily treated as expenses in the period in which they are incurred. Rather, as explained above, they are treated as expenses in the period in which the related products *are sold*. This means that a product cost such as direct materials or direct labor might be incurred during one period but not recorded as an expense until a following period when the completed product is sold.

Period Costs

Period costs are all the costs that are not product costs. For example, sales commissions and the rental costs of administrative offices are period costs. Period costs are not included as part of the cost of either purchased or manufactured goods; instead, period costs are expensed on the income statement in the period in which they are incurred using the usual rules of accrual accounting. Keep in mind that the period in which a cost is incurred is not necessarily the period in which cash changes hands. For example, as discussed earlier, the costs of liability insurance are spread across the periods that benefit from the insurance—regardless of the period in which the insurance premium is paid.

As suggested above, *all selling and administrative expenses are considered to be period costs*. Advertising, executive salaries, sales commissions, public relations, and other nonmanufacturing costs discussed earlier are all examples of period costs. They will appear on the income statement as expenses in the period in which they are incurred.

Prime Cost and Conversion Cost

Two more cost categories are often used in discussions of manufacturing costs—*prime cost* and *conversion cost*. **Prime cost** is the sum of direct materials cost and direct labor cost. **Conversion cost** is the sum of direct labor cost and manufacturing overhead cost. The term *conversion cost* is used to describe direct labor and manufacturing overhead because these costs are incurred to convert materials into the finished product.

Exhibit 2–3 (page 40) contains a summary of the cost terms that we have introduced so far.

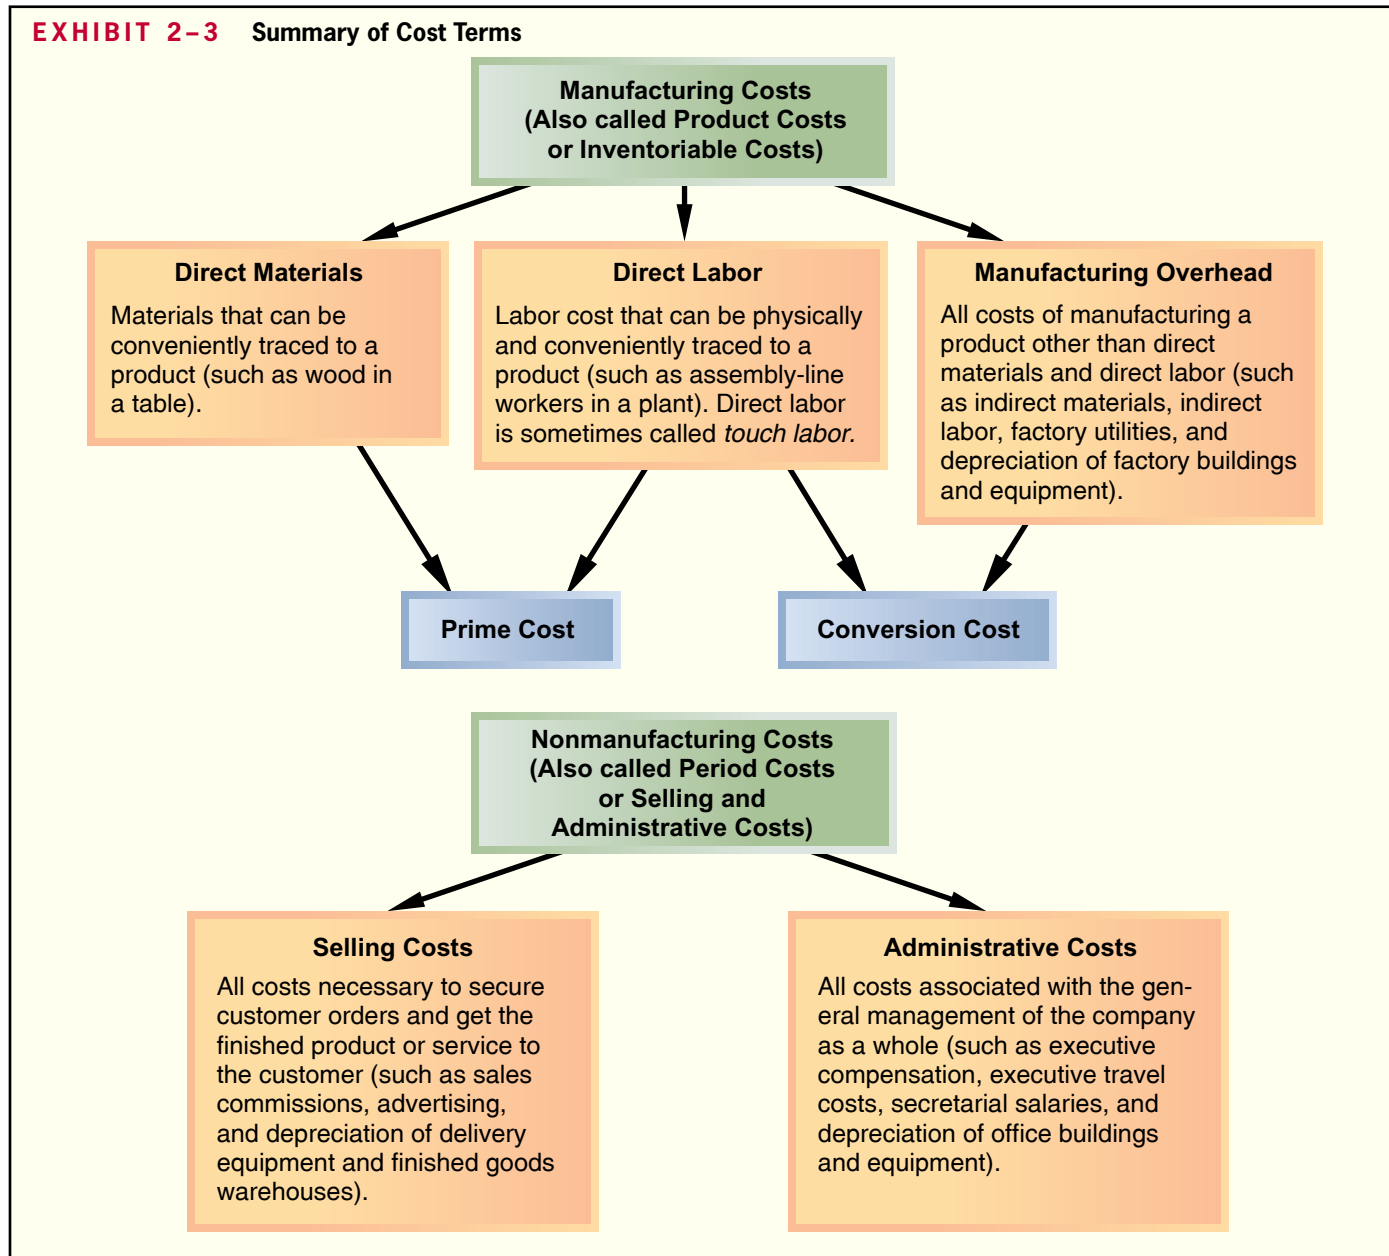

IN BUSINESS

PRODUCT COSTS AND PERIOD COSTS: A LOOK ACROSS INDUSTRIES

Cost of goods sold and selling and administrative expenses expressed as a percentage of sales differ across companies and industries. For example, the data below summarize the median cost of goods sold as a percentage of sales and the median selling and administrative expense as a percentage of sales for eight different industries. Why do you think the percentages in each column differ so dramatically?

| Industry | Cost of Goods Sold ÷ Sales | Selling and Administrative Expense ÷ Sales |
|--|----------------------------|--|
| Aerospace and Defense | 79% | 9% |
| Beverages | 52% | 34% |
| Computer Software and Services | 34% | 38% |
| Electrical Equipment and Components .. | 64% | 21% |
| Healthcare Services | 82% | 6% |
| Oil and Gas | 90% | 3% |
| Pharmaceuticals | 31% | 41% |
| Restaurants | 78% | 8% |

EXHIBIT 2-3 Summary of Cost Terms**IN BUSINESS****THE CHALLENGES OF MANAGING CHARITABLE ORGANIZATIONS**

Charitable organizations, such as [Harlem Children's Zone](#), [Sports4Kids](#), and [Citizen Schools](#), are facing a difficult situation. Many donors—aware of stories involving charities that spent excessively on themselves while losing sight of their mission—have started prohibiting their charity of choice from using donated funds to pay for administrative costs. However, even the most efficient charitable organizations find it difficult to expand without making additions to their infrastructure. For example, Sports4Kids' nationwide expansion of its sports programs drove up administrative costs from 5.6% to 14.7% of its total budget. The organization claims that this cost increase was necessary to build a more experienced management team to oversee the dramatically increased scale of operations.

Many charitable organizations are starting to seek gifts explicitly to fund administrative expenses. Their argument is simple—they cannot do good deeds for other people without incurring such costs.

Cost Classifications on Financial Statements

In this section of the chapter, we compare the cost classifications used on the financial statements of manufacturing and merchandising companies. The financial statements prepared by a *manufacturing* company are more complex than the statements prepared by a merchandising company because a manufacturing company must produce its goods as well as market them. The production process involves many costs that do not exist in a merchandising company, and these costs must be properly accounted for on the manufacturing company’s financial statements. We begin by explaining how these costs are shown on the balance sheet.

The Balance Sheet

The balance sheet, or statement of financial position, of a manufacturing company is similar to that of a merchandising company. However, their inventory accounts differ. A merchandising company has only one class of inventory—goods purchased from suppliers for resale to customers. In contrast, manufacturing companies have three classes of inventories—*raw materials*, *work in process*, and *finished goods*. **Raw materials** are the materials that are used to make a product. **Work in process** consists of units of product that are only partially complete and will require further work before they are ready for sale to a customer. **Finished goods** consist of completed units of product that have not yet been sold to customers. Ordinarily, the sum total of these three categories of inventories is the only amount shown on the balance sheet in external reports. However, the footnotes to the financial statements often provide more detail.

We will use two companies—Graham Manufacturing and Reston Bookstore—to illustrate the concepts discussed in this section. Graham Manufacturing is located in Portsmouth, New Hampshire, and makes precision brass fittings for yachts. Reston Bookstore is a small bookstore in Reston, Virginia, specializing in books about the Civil War.

The footnotes to Graham Manufacturing’s Annual Report reveal the following information concerning its inventories:

| Graham Manufacturing Corporation Inventory Accounts | | |
|--|----------------------|-------------------|
| | Beginning Balance | Ending Balance |
| Raw materials | \$ 60,000 | \$ 50,000 |
| Work in process | 90,000 | 60,000 |
| Finished goods | <u>125,000</u> | <u>175,000</u> |
| Total inventory accounts | <u>\$275,000</u> | <u>\$285,000</u> |

Graham Manufacturing’s raw materials inventory consists largely of brass rods and brass blocks. The work in process inventory consists of partially completed brass fittings. The finished goods inventory consists of brass fittings that are ready to be sold to customers.

In contrast, the inventory account at Reston Bookstore consists entirely of the costs of books the company has purchased from publishers for resale to the public. In merchandising companies like Reston, these inventories may be called *merchandise inventory*. The beginning and ending balances in this account appear as follows:

| Reston Bookstore Inventory Account | | |
|---------------------------------------|----------------------|-------------------|
| | Beginning Balance | Ending Balance |
| Merchandise inventory | <u>\$100,000</u> | <u>\$150,000</u> |

LEARNING OBJECTIVE 4

Prepare an income statement including calculation of the cost of goods sold.

The Income Statement

Exhibit 2–4 compares the income statements of Reston Bookstore and Graham Manufacturing. For purposes of illustration, these statements contain more detail about cost of goods sold than you will generally find in published financial statements.

At first glance, the income statements of merchandising and manufacturing companies like Reston Bookstore and Graham Manufacturing are very similar. The only apparent difference is in the labels of some of the entries in the computation of the cost of goods sold. In the exhibit, the computation of cost of goods sold relies on the following basic equation for inventory accounts:

Basic Equation for Inventory Accounts

$$\begin{array}{l} \text{Beginning} + \text{Additions} = \text{Ending} + \text{Withdrawals} \\ \text{balance} \quad \text{to inventory} \quad \text{balance} \quad \text{from inventory} \end{array}$$

The logic underlying this equation, which applies to any inventory account, is illustrated in Exhibit 2–5. The beginning inventory consists of any units that are in the

EXHIBIT 2–4 Comparative Income Statements: Merchandising and Manufacturing Companies

| | | Manufacturing Company Graham Manufacturing | |
| The manufacturing costs associated with the goods that were finished during the period. (See Exhibit 2–6 for details.) | } → | Sales | \$1,500,000 |
| | | Cost of goods sold:* | |
| | | Beginning finished goods inventory | \$125,000 |
| | | Add: Cost of goods manufactured | 850,000 |
| | | Goods available for sale | 975,000 |
| | | Deduct: Ending finished goods inventory | 175,000 |
| | | | 800,000 |
| | | Gross margin | 700,000 |
| | | Selling and administrative expenses: | |
| | | Selling expense | 250,000 |
| Administrative expense | 300,000 | | |
| | 550,000 | | |
| Net operating income | \$ 150,000 | | |

*Further adjustments will be made to the cost of goods sold for a manufacturing company in Chapter 5.

inventory at the beginning of the period. Additions are made to the inventory during the period. The sum of the beginning balance and the additions to the account is the total amount of inventory available. During the period, withdrawals are made from inventory. The ending balance is whatever is left at the end of the period after the withdrawals.

These concepts are used to determine the cost of goods sold for a merchandising company like Reston Bookstore as follows:

Cost of Goods Sold in a Merchandising Company

$$\begin{matrix} \text{Beginning} & & \text{Ending} & & \\ \text{merchandise} & + & \text{merchandise} & + & \\ \text{inventory} & + & \text{Purchases} & = & \text{Cost of} \\ & & & & \text{goods sold} \end{matrix}$$

or

$$\begin{matrix} \text{Cost of} & & \text{Beginning} & & \text{Ending} \\ \text{goods sold} & = & \text{merchandise} & + & \text{merchandise} \\ & & \text{inventory} & + & \text{Purchases} & - & \text{inventory} \end{matrix}$$

To determine the cost of goods sold in a merchandising company, we only need to know the beginning and ending balances in the Merchandise Inventory account and the purchases. Total purchases can be easily determined in a merchandising company by simply adding together all purchases from suppliers.

The cost of goods sold for a manufacturing company like Graham Manufacturing is determined as follows:

Cost of Goods Sold in a Manufacturing Company

$$\begin{matrix} \text{Beginning finished} & + & \text{Cost of goods} & = & \text{Ending finished} & + & \\ \text{goods inventory} & & \text{manufactured} & & \text{goods inventory} & & \\ & & & & & & \text{Cost of} \\ & & & & & & \text{goods sold} \end{matrix}$$

or

$$\begin{matrix} \text{Cost of} & = & \text{Beginning finished} & + & \text{Cost of goods} & - & \text{Ending finished} \\ \text{goods sold}^* & & \text{goods inventory} & & \text{manufactured} & & \text{goods inventory} \end{matrix}$$

*Further adjustments will be made to a manufacturing company's cost of goods sold in Chapter 5.

To determine the cost of goods sold in a manufacturing company, we need to know the *cost of goods manufactured* and the beginning and ending balances in the Finished Goods inventory account. The **cost of goods manufactured** consists of the manufacturing costs associated with goods that were *finished* during the period. The cost of goods manufactured for Graham Manufacturing is derived in the *schedule of cost of goods manufactured* shown in Exhibit 2–6.

Schedule of Cost of Goods Manufactured

LEARNING OBJECTIVE 5
Prepare a schedule of cost of goods manufactured.

At first glance, the **schedule of cost of goods manufactured** in Exhibit 2–6 appears complex and perhaps even intimidating. However, it is all quite logical. The schedule of cost of goods manufactured contains the three elements of product costs that we discussed earlier—direct materials, direct labor, and manufacturing overhead.

The direct materials cost of \$410,000 is not the cost of raw materials purchased during the period—it is the cost of raw materials *used* during the period. The purchases of raw materials are added to the beginning balance to determine the cost of the materials available for use. The ending raw materials inventory is deducted from this amount to arrive at the cost of raw materials used in production. The sum of the three manufacturing cost elements—materials, direct labor, and manufacturing overhead—is the total manufacturing cost of \$820,000. However, you’ll notice that this is *not* the same thing as the cost of goods manufactured for the period of \$850,000. The subtle distinction between the total manufacturing cost and the cost of goods manufactured is very easy to miss. Some of the materials, direct labor, and manufacturing overhead

EXHIBIT 2–6 Schedule of Cost of Goods Manufactured

| | |
|---|---------------------------------|
| Direct materials: Beginning raw materials inventory* \$ 60,000 Add: Purchases of raw materials 400,000 Raw materials available for use <u>460,000</u> Deduct: Ending raw materials inventory 50,000 Raw materials used in production \$410,000 | Direct materials ← |
| Direct labor 60,000 | Direct labor ← |
| Manufacturing overhead 350,000 | Manufacturing overhead ← |
| Total manufacturing cost 820,000 Add: Beginning work in process inventory <u>90,000</u> 910,000 Deduct: Ending work in process inventory <u>60,000</u> Cost of goods manufactured (see Exhibit 2–4) <u><u>\$850,000</u></u> | Cost of goods manufactured ← |

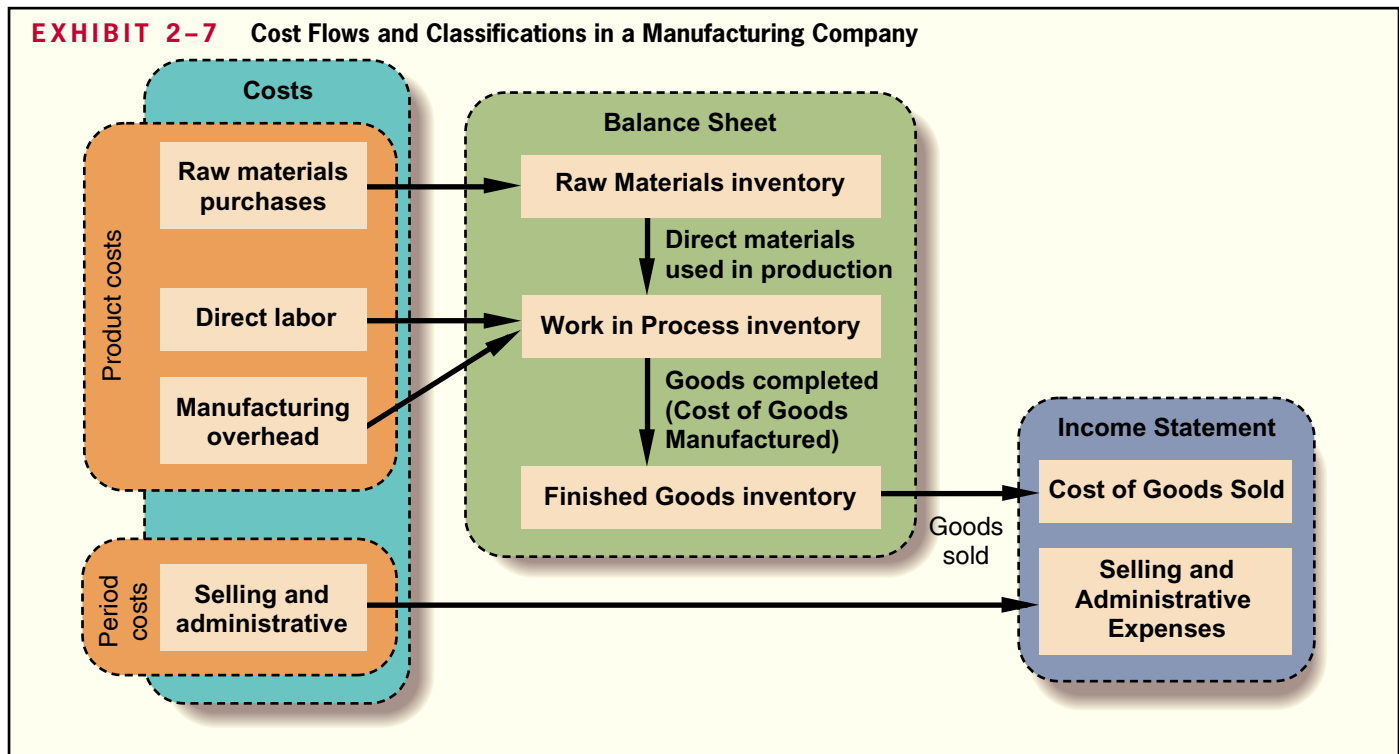

*We assume in this example that the Raw Materials inventory account contains only direct materials.

costs incurred during the period relate to goods that are not yet completed. As stated above, the cost of goods manufactured consists of the manufacturing costs associated with the goods that were finished during the period. Consequently, adjustments need to be made to the total manufacturing cost of the period for the partially completed goods that were in process at the beginning and at the end of the period. The costs that relate to goods that are not yet completed are shown in the work in process inventory figures at the bottom of the schedule. Note that the beginning work in process inventory must be added to the manufacturing costs of the period, and the ending work in process inventory must be deducted, to arrive at the cost of goods manufactured. The \$30,000 decline in the Work in Process account during the year (\$90,000 - \$60,000) explains the \$30,000 difference between the total manufacturing cost and the cost of goods manufactured.

Product Cost Flows

Earlier in the chapter, we defined product costs as costs incurred to either purchase or manufacture goods. For manufactured goods, these costs consist of direct materials, direct labor, and manufacturing overhead. It will be helpful at this point to look briefly at the flow of costs in a manufacturing company. This will help us understand how product costs move through the various accounts and how they affect the balance sheet and the income statement.

Exhibit 2-7 illustrates the flow of costs in a manufacturing company. Raw materials purchases are recorded in the Raw Materials inventory account. When raw materials are used in production, their costs are transferred to the Work in Process inventory account as direct materials. Notice that direct labor cost and manufacturing overhead cost are added

directly to Work in Process. Work in Process can be viewed most simply as products on an assembly line. The direct materials, direct labor, and manufacturing overhead costs added to Work in Process in Exhibit 2–7 are the costs needed to complete these products as they move along this assembly line.

Notice from the exhibit that as goods are completed, their costs are transferred from Work in Process to Finished Goods. Here the goods await sale to customers. As goods are sold, their costs are transferred from Finished Goods to Cost of Goods Sold. At this point the various costs required to make the product are finally recorded as an expense. Until that point, these costs are in inventory accounts on the balance sheet.

Inventoriable Costs

As stated earlier, product costs are often called inventoriable costs. The reason is that these costs go directly into inventory accounts as they are incurred (first into Work in Process and then into Finished Goods), rather than going into expense accounts. Thus, they are termed *inventoriable costs*. *This is a key concept because such costs can end up on the balance sheet as assets if goods are only partially completed or are unsold at the end of a period.* To illustrate this point, refer again to Exhibit 2–7. At the end of the period, the materials, labor, and overhead costs that are associated with the units in the Work in Process and Finished Goods inventory accounts will appear on the balance sheet as assets. As explained earlier, these costs will not become expenses until the goods are completed and sold.

Selling and administrative expenses are not involved in making a product. For this reason, they are not treated as product costs but rather as period costs that are expensed as they are incurred, as shown in Exhibit 2–7.

An Example of Cost Flows

To provide an example of cost flows in a manufacturing company, assume that a company's direct labor cost is \$500,000 and its administrative salaries cost is \$200,000. As illustrated in Exhibit 2–8, the direct labor cost is added to Work in Process. As shown in the exhibit, the direct labor cost will not become an expense until the goods that are produced during the year are sold—which may not happen until the following year or even later. Until the goods are sold, the \$500,000 will be part of inventories—either Work in Process or Finished Goods—along with the other costs of producing the goods. By contrast, \$200,000 of administrative salaries cost will be expensed immediately.

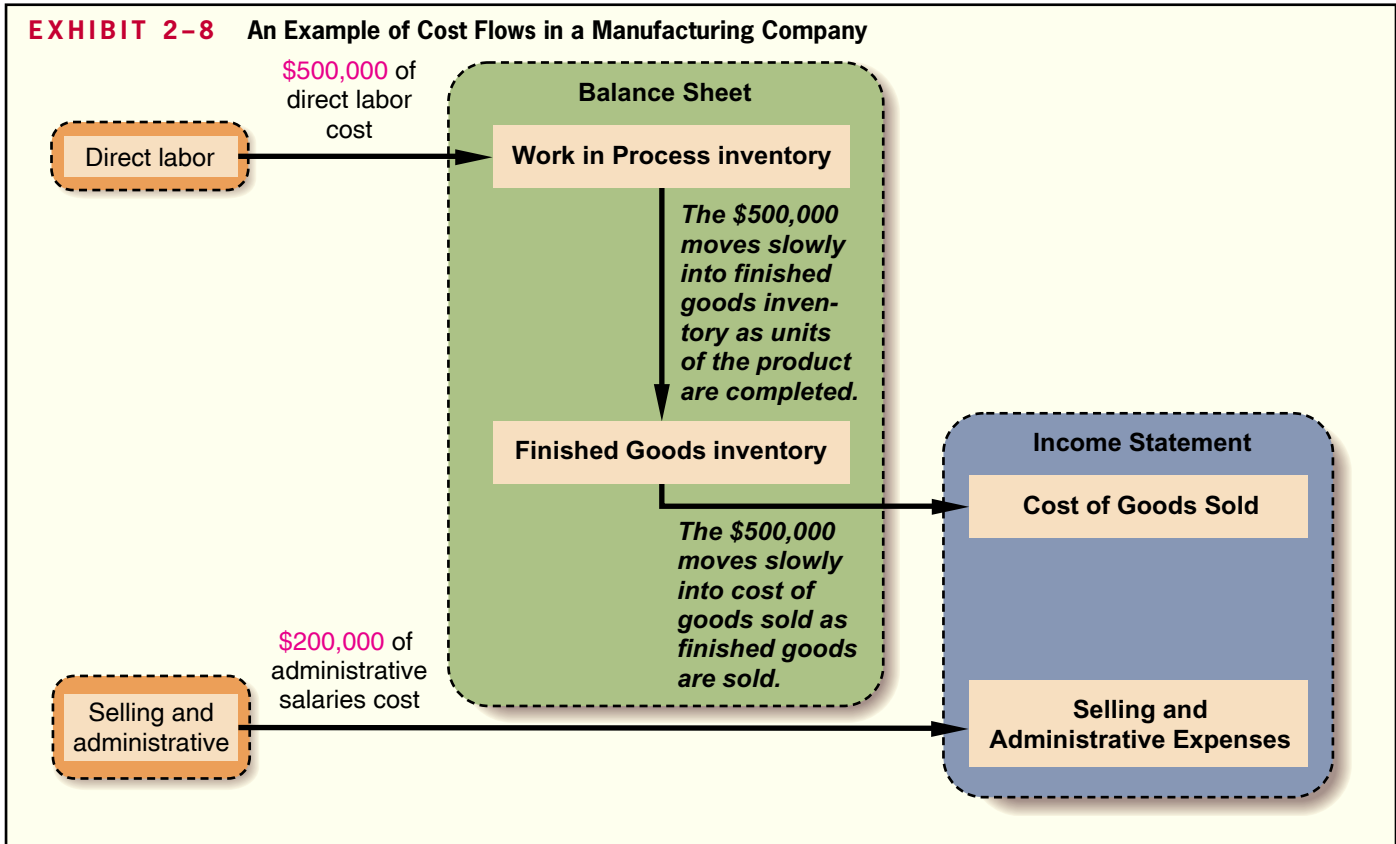

Thus far, we have been mainly concerned with classifications of manufacturing costs for the purpose of determining inventory valuations on the balance sheet and cost of goods sold on the income statement in external financial reports. However, costs are used for many other purposes, and each purpose requires a different classification of costs. We will consider several different purposes for cost classifications in the remaining sections of this chapter. These purposes and the corresponding cost classifications are summarized in Exhibit 2–9. To help keep the big picture in mind, we suggest that you refer back to this exhibit frequently as you progress through the rest of this chapter.

Cost Classifications for Predicting Cost Behavior

LEARNING OBJECTIVE 6

Understand the differences between variable costs and fixed costs.

Quite frequently, it is necessary to predict how a certain cost will behave in response to a change in activity. For example, a manager at Qwest, a telephone company, may want to estimate the impact a 5% increase in long-distance calls by customers would have on Qwest's total electric bill. **Cost behavior** refers to how a cost reacts to changes in the level of activity. As the activity level rises and falls, a particular cost may rise and fall as

| Purpose of Cost Classification | Cost Classifications |
|---|---|
| Preparing external financial statements | <ul style="list-style-type: none"> ¥ Product costs (inventoriable) <ul style="list-style-type: none"> ¥ Direct materials ¥ Direct labor ¥ Manufacturing overhead ¥ Period costs (expensed) <ul style="list-style-type: none"> ¥ Nonmanufacturing costs ¥ Selling costs ¥ Administrative costs |
| Predicting cost behavior in response to changes in activity | <ul style="list-style-type: none"> ¥ Variable cost (proportional to activity) ¥ Fixed cost (constant in total) |
| Assigning costs to cost objects such as departments or products | <ul style="list-style-type: none"> ¥ Direct cost (can be easily traced) ¥ Indirect cost (cannot be easily traced) |
| Making decisions | <ul style="list-style-type: none"> ¥ Differential cost (differs between alternatives) ¥ Sunk cost (past cost not affected by a decision) ¥ Opportunity cost (forgone benefit) |

EXHIBIT 2-9 Summary of Cost Classifications

well—or it may remain constant. For planning purposes, a manager must be able to anticipate which of these will happen; and if a cost can be expected to change, the manager must be able to estimate how much it will change. To help make such distinctions, costs are often categorized as variable or fixed.

Variable Cost

A **variable cost** is a cost that varies, in total, in direct proportion to changes in the level of activity. The activity can be expressed in many ways, such as units produced, units sold, miles driven, beds occupied, lines of print, hours worked, and so forth. A good example of a variable cost is direct materials. The cost of direct materials used during a period will vary, in total, in direct proportion to the number of units that are produced. To illustrate this idea, consider the Saturn Division of GM. Each auto requires one battery. As the output of autos increases and decreases, the number of batteries used will increase and decrease proportionately. If auto production goes up 10%, then the number of batteries used will also go up 10%. The concept of a variable cost is shown graphically in Exhibit 2–10.

The graph on the left-hand side of Exhibit 2–10 illustrates that the *total* variable cost rises and falls as the activity level rises and falls. This idea is presented below, assuming that a Saturn’s battery costs \$24:

| Number of Autos Produced | Cost per Battery | Total Variable Cost—Batteries |
|--------------------------|------------------|-------------------------------|
| 1 | \$24 | \$24 |
| 500 | \$24 | \$12,000 |
| 1,000 | \$24 | \$24,000 |

While total variable costs change as the activity level changes, it is important to note that a variable cost is constant if expressed on a *per unit* basis. For example, the per unit cost of batteries remains constant at \$24 even though the total cost of the batteries increases and decreases with activity.

There are many examples of costs that are variable with respect to the products and services provided by a company. In a manufacturing company, variable costs include items such as direct materials, shipping costs, and sales commissions and some elements

of manufacturing overhead such as lubricants. We will also usually assume that direct labor is a variable cost, although direct labor may act more like a fixed cost in some situations as we shall see in a later chapter. In a merchandising company, the variable costs of carrying and selling products include items such as cost of goods sold, sales commissions, and billing costs. In a hospital, the variable costs of providing health care services to patients would include the costs of the supplies, drugs, meals, and perhaps nursing services.

When we say that a cost is variable, we ordinarily mean that it is variable with respect to the amount of goods or services the organization produces. However, costs can be variable with respect to other things. For example, the wages paid to employees at a **Blockbuster Video** outlet will depend on the number of hours the store is open and not strictly on the number of videos rented. In this case, we would say that wage costs are variable with respect to the hours of operation. Nevertheless, when we say that a cost is variable, we ordinarily mean it is variable with respect to the amount of goods and services produced. This could be how many Jeep Cherokees are produced, how many videos are rented, how many patients are treated, and so on.

Fixed Cost

A **fixed cost** is a cost that remains constant, in total, regardless of changes in the level of activity. Unlike variable costs, fixed costs are not affected by changes in activity. Consequently, as the activity level rises and falls, total fixed costs remain constant unless influenced by some outside force, such as a price change. Rent is a good example of a fixed cost. Suppose the **Mayo Clinic** rents a machine for \$8,000 per month that tests blood samples for the presence of leukemia cells. The \$8,000 monthly rental cost will be incurred regardless of the number of tests that may be performed during the month. The concept of a fixed cost is shown graphically on the right-hand side of Exhibit 2–10.

Very few costs are completely fixed. Most will change if activity changes enough. For example, suppose that the capacity of the leukemia diagnostic machine at the Mayo Clinic is 2,000 tests per month. If the clinic wishes to perform more than 2,000 tests in a month, it would be necessary to rent an additional machine, which would cause a jump in the fixed costs. When we say a cost is fixed, we mean it is fixed within some *relevant range*. The **relevant range** is the range of activity within which the assumptions about variable and fixed costs are valid. For example, the assumption that the rent for diagnostic machines is \$8,000 per month is valid within the relevant range of 0 to 2,000 tests per month.

Fixed costs can create confusion if they are expressed on a per unit basis. This is because the average fixed cost per unit increases and decreases *inversely* with changes in activity. In the Mayo Clinic, for example, the average cost per test will fall as the number of tests performed increases because the \$8,000 rental cost will be spread over more tests. Conversely, as the number of tests performed in the clinic declines, the average cost per test will rise as the \$8,000 rental cost is spread over fewer tests. This concept is illustrated in the table below:

| Monthly Rental Cost | Number of Tests Performed | Average Cost per Test |
|---------------------|---------------------------|-----------------------|
| \$8,000 | 10 | \$800 |
| \$8,000 | 500 | \$16 |
| \$8,000 | 2,000 | \$4 |

IN BUSINESS

FOOD COSTS AT A LUXURY HOTEL

The **Sporthotel Theresa** (<http://www.theresa.at/>), owned and operated by the Egger family, is a four-star hotel located in Zell im Zillertal, Austria. The hotel features access to hiking, skiing, biking, and other activities in the Ziller alps as well as its own fitness facility and spa.

Three full meals a day are included in the hotel room charge. Breakfast and lunch are served buffet-style while dinner is a more formal affair with as many as six courses. A sample dinner menu appears below:

Tyrolean cottage cheese with homemade bread

Salad bar

Broccoli-terrine with saddle of venison and smoked goose-breast
or
Chicken-liver parfait with gorgonzola-cheese ravioli and port-wine sauce

Clear vegetable soup with fine vegetable strips
or
Whey-yoghurt juice

Roulade of pork with zucchini, ham and cheese on pesto ribbon noodles and saffron sauce
or
Roasted filet of Irish salmon and prawn with spring vegetables and sesame mash
or
Fresh white asparagus with scrambled egg, fresh herbs, and parmesan
or
Steak of Tyrolean organic beef

Strawberry terrine with homemade chocolate ice cream
or
Iced Viennese coffee

The chef, Stefan Egger, believes that food costs are roughly proportional to the number of guests staying at the hotel; that is, they are a variable cost. He must order food from suppliers two or three days in advance, but he adjusts his purchases to the number of guests who are currently staying at the hotel and their consumption patterns. In addition, guests make their selections from the dinner menu early in the day, which helps Stefan plan which foodstuffs will be required for dinner. Consequently, he is able to prepare just enough food so that all guests are satisfied and yet waste is held to a minimum.

Source: Conversation with Stefan Egger, chef at the Sporthotel Theresa.

Note that if the Mayo Clinic performs only 10 tests each month, the rental cost of the equipment will average \$800 per test. But if 2,000 tests are performed each month, the average cost will drop to only \$4 per test. More will be said later about the misunderstandings created by this variation in average unit costs.

Examples of fixed costs include straight-line depreciation, insurance, property taxes, rent, supervisory salaries, administrative salaries, and advertising.

A summary of both variable and fixed cost behavior is presented in Exhibit 2–11.

| Cost | Behavior of the Cost (within the relevant range) | |
|---------------|--|--|
| | In Total | Per Unit |
| Variable cost | Total variable cost increases and decreases in proportion to changes in the activity level. | Variable cost per unit remains constant. |
| Fixed cost | Total fixed cost is not affected by changes in the activity level within the relevant range. | Fixed cost per unit decreases as the activity level rises and increases as the activity level falls. |

EXHIBIT 2-11
Summary of Variable and Fixed Cost Behavior

IN BUSINESS

THE POWER OF SHRINKING AVERAGE FIXED COST PER UNIT

Intel built five new computer chip manufacturing facilities that put its competitors on the defensive. Each plant can produce chips using a 12-inch wafer that is imprinted with 90-nanometer circuit lines that are 0.1% of the width of a human hair. These plants can produce 1.25 million chips a day, or about 375 million chips a year. Better yet, these new plants slash Intel's production costs in half because each plant's volume of output is 2.5 times greater than any of Intel's seven older plants. Building a computer chip manufacturing facility is a very expensive undertaking due to the required investment in fixed equipment costs. So why are Intel's competitors on the defensive? Because they are struggling to match Intel's exceptionally low average fixed cost per unit of output. Or, in an economist's terms, they are struggling to match Intel's economies of scale.

Cost Classifications for Assigning Costs to Cost Objects

Costs are assigned to cost objects for a variety of purposes including pricing, preparing profitability studies, and controlling spending. A **cost object** is anything for which cost data are desired—including products, customers, jobs, and organizational subunits. For purposes of assigning costs to cost objects, costs are classified as either *direct* or *indirect*.

LEARNING OBJECTIVE 7
Understand the differences between direct and indirect costs.

Direct Cost

A **direct cost** is a cost that can be easily and conveniently traced to a specified cost object. The concept of direct cost extends beyond just direct materials and direct labor. For example, if **Reebok** is assigning costs to its various regional and national sales offices, then the salary of the sales manager in its Tokyo office would be a direct cost of that office.

Indirect Cost

An **indirect cost** is a cost that cannot be easily and conveniently traced to a specified cost object. For example, a **Campbell Soup** factory may produce dozens of varieties of canned soups. The factory manager's salary would be an indirect cost of a particular variety such

as chicken noodle soup. The reason is that the factory manager's salary is incurred as a consequence of running the entire factory—it is not incurred to produce any one soup variety. *To be traced to a cost object such as a particular product, the cost must be caused by the cost object.* The factory manager's salary is called a *common cost* of producing the various products of the factory. A **common cost** is a cost that is incurred to support a number of cost objects but cannot be traced to them individually. A common cost is a type of indirect cost.

A particular cost may be direct or indirect, depending on the cost object. While the Campbell Soup factory manager's salary is an *indirect* cost of manufacturing chicken noodle soup, it is a *direct* cost of the manufacturing division. In the first case, the cost object is chicken noodle soup. In the second case, the cost object is the entire manufacturing division.

Cost Classifications for Decision Making

LEARNING OBJECTIVE 8

Understand cost classifications used in making decisions: differential costs, opportunity costs, and sunk costs.

Costs are an important feature of many business decisions. In making decisions, it is essential to have a firm grasp of the concepts *differential cost*, *opportunity cost*, and *sunk cost*.

Differential Cost and Revenue

Decisions involve choosing between alternatives. In business decisions, each alternative will have costs and benefits that must be compared to the costs and benefits of the other available alternatives. A difference in costs between any two alternatives is known as a **differential cost**. A difference in revenues between any two alternatives is known as **differential revenue**.

A differential cost is also known as an **incremental cost**, although technically an incremental cost should refer only to an increase in cost from one alternative to another; decreases in cost should be referred to as *decremental costs*. Differential cost is a broader term, encompassing both cost increases (incremental costs) and cost decreases (decremental costs) between alternatives.

The accountant's differential cost concept can be compared to the economist's marginal cost concept. In speaking of changes in cost and revenue, the economist uses the terms *marginal cost* and *marginal revenue*. The revenue that can be obtained from selling one more unit of product is called marginal revenue, and the cost involved in producing one more unit of product is called marginal cost. The economist's marginal concept is basically the same as the accountant's differential concept applied to a single unit of output.

IN BUSINESS

THE COST OF A HEALTHIER ALTERNATIVE

McDonald's is under pressure from critics to address the health implications of its menu. In response, McDonald's switched from partially hydrogenated vegetable oil to fry foods to a new soybean oil that cuts trans-fat levels by 48% even though the soybean oil is much more expensive than the partially hydrogenated vegetable oil and it lasts only half as long. What were the cost implications of this change? A typical McDonald's restaurant uses 500 pounds of the relatively unhealthy oil per week at a cost of about \$186. In contrast, the same restaurant would need to use 1,000 pounds of the new soybean oil per week at a cost of about \$571. This is a differential cost of \$385 per restaurant per week. This may seem like a small amount of money until the calculation is expanded to include 13,000 McDonald's restaurants operating 52 weeks a year. Now, the total tab for a more healthy frying oil rises to about \$260 million per year.

Source: Matthew Boyle, "Can You Really Make Fast Food Healthy?" *Fortune*, August 9, 2004, pp. 134–139.

Differential costs can be either fixed or variable. To illustrate, assume that Nature Way Cosmetics, Inc., is thinking about changing its marketing method from distribution through retailers to distribution by a network of neighborhood sales representatives. Present costs and revenues are compared to projected costs and revenues in the following table:

| | Retailer Distribution (present) | Sales Representatives (proposed) | Differential Costs and Revenues |
|--------------------------------------|--|---|--|
| Revenues (Variable) | \$700,000 | \$800,000 | \$100,000 |
| Cost of goods sold (Variable) | 350,000 | 400,000 | 50,000 |
| Advertising (Fixed) | 80,000 | 45,000 | (35,000) |
| Commissions (Variable) | 0 | 40,000 | 40,000 |
| Warehouse depreciation (Fixed) | 50,000 | 80,000 | 30,000 |
| Other expenses (Fixed) | 60,000 | 60,000 | 0 |
| Total expenses | <u>540,000</u> | <u>625,000</u> | <u>85,000</u> |
| Net operating income | <u>\$160,000</u> | <u>\$175,000</u> | <u>\$ 15,000</u> |

According to the above analysis, the differential revenue is \$100,000 and the differential costs total \$85,000, leaving a positive differential net operating income of \$15,000 under the proposed marketing plan.

The decision of whether Nature Way Cosmetics should stay with the present retail distribution or switch to sales representatives could be made on the basis of the net operating incomes of the two alternatives. As we see in the above analysis, the net operating income under the present distribution method is \$160,000, whereas the net operating income with sales representatives is estimated to be \$175,000. Therefore, using sales representatives is preferred because it would result in \$15,000 higher net operating income. Note that we would have arrived at exactly the same conclusion by simply focusing on the differential revenues, differential costs, and differential net operating income, which also show a \$15,000 advantage for sales representatives.

In general, only the differences between alternatives are relevant in decisions. Those items that are the same under all alternatives and that are not affected by the decision can be ignored. For example, in the Nature Way Cosmetics example above, the “Other expenses” category, which is \$60,000 under both alternatives, can be ignored because it has no effect on the decision. If it were removed from the calculations, the sales representatives would still be preferred by \$15,000. This is an extremely important principle in management accounting that we will revisit in later chapters.

Opportunity Cost

Opportunity cost is the potential benefit that is given up when one alternative is selected over another. To illustrate this important concept, consider the following examples:

Example 1 Vicki has a part-time job that pays \$200 per week while attending college. She would like to spend a week at the beach during spring break, and her employer has agreed to give her the time off, but without pay. The \$200 in lost wages would be an opportunity cost of taking the week off to be at the beach.

Example 2 Suppose that **Neiman Marcus** is considering investing a large sum of money in land that may be a site for a future store. Rather than invest the funds in land, the company could invest the funds in high-grade securities. The opportunity cost of buying the land is the investment income that could have been realized by purchasing the securities instead.

Example 3 Steve is employed by a company that pays him a salary of \$38,000 per year. He is thinking about leaving the company and returning to school. Because returning to school would require that he give up his \$38,000 salary, the forgone salary would be an opportunity cost of seeking further education.

Opportunity costs are not usually found in accounting records, but they are costs that must be explicitly considered in every decision a manager makes. Virtually every alternative involves an opportunity cost.

Sunk Cost

A **sunk cost** is a cost *that has already been incurred* and that cannot be changed by any decision made now or in the future. Because sunk costs cannot be changed by any decision, they are not differential costs. And because only differential costs are relevant in a decision, sunk costs can and should be ignored.

To illustrate a sunk cost, assume that a company paid \$50,000 several years ago for a special-purpose machine. The machine was used to make a product that is now obsolete and is no longer being sold. Even though in hindsight purchasing the machine may have been unwise, the \$50,000 cost has already been incurred and cannot be undone. And it would be folly to continue making the obsolete product in a misguided attempt to “recover” the original cost of the machine. In short, the \$50,000 originally paid for the machine is a sunk cost that should be ignored in current decisions.

Summary

In this chapter, we discussed the work of management and the similarities and differences between financial and managerial accounting. Managers use managerial accounting reports in their planning and controlling activities. Unlike financial accounting reports, these managerial accounting reports need not conform to Generally Accepted Accounting Principles and are not mandatory. In particular, managerial accounting places more emphasis on the future and relevance of the data, less emphasis on precision, and focuses more on the segments of the organization than does financial accounting.

We have also looked at some of the ways in which managers classify costs. How the costs will be used—for preparing external reports, predicting cost behavior, assigning costs to cost objects, or decision making—will dictate how the costs are classified.

For purposes of valuing inventories and determining expenses for the balance sheet and income statement, costs are classified as either product costs or period costs. Product costs are assigned to inventories and are considered assets until the products are sold. At the point of sale, product costs become cost of goods sold on the income statement. In contrast, period costs are taken directly to the income statement as expenses in the period in which they are incurred.

In a merchandising company, product cost is whatever the company paid for its merchandise. For external financial reports in a manufacturing company, product costs consist of all manufacturing costs. In both kinds of companies, selling and administrative costs are considered to be period costs and are expensed as incurred.

For purposes of predicting how costs will react to changes in activity, costs are classified into two categories—variable and fixed. Variable costs, in total, are strictly proportional to activity. The variable cost per unit is constant. Fixed costs, in total, remain at the same level for changes in activity that occur within the relevant range. The average fixed cost per unit decreases as the number of units increases.

For purposes of assigning costs to cost objects such as products or departments, costs are classified as direct or indirect. Direct costs can be conveniently traced to cost objects. Indirect costs cannot be conveniently traced to cost objects.

For purposes of making decisions, the concepts of differential cost and revenue, opportunity cost, and sunk cost are vitally important. Differential costs and revenues are the costs and revenues that differ between alternatives. Opportunity cost is the benefit that is forgone when one alternative is selected over another. Sunk cost is a cost that occurred in the past and cannot be altered. Differential costs and opportunity costs should be carefully considered in decisions. Sunk costs are always irrelevant in decisions and should be ignored.

These various cost classifications are *different* ways of looking at costs. A particular cost, such as the cost of cheese in a taco served at **Taco Bell**, could be a manufacturing cost, a product cost, a variable cost, a direct cost, and a differential cost—all at the same time. Taco Bell is a manufacturer of fast food. The cost of the cheese in a taco is a manufacturing cost and, as such, it would be a product cost as well. In addition, the cost of cheese is variable with respect to the number of tacos served and it is a direct cost of serving tacos. Finally, the cost of the cheese in a taco is a differential cost of making and serving the taco.

Review Problem 1: Cost Terms

Many new cost terms have been introduced in this chapter. It will take you some time to learn what each term means and how to properly classify costs in an organization. Consider the following example: Chippen Corporation manufactures furniture, including tables. Selected costs are given below:

1. The tables are made of wood that costs \$100 per table.
2. The tables are assembled by workers, at a wage cost of \$40 per table.
3. Workers making the tables are supervised by a factory supervisor who is paid \$38,000 per year.
4. Electrical costs are \$2 per machine-hour. Four machine-hours are required to produce a table.
5. The depreciation on the machines used to make the tables totals \$10,000 per year. The machines have no resale value and do not wear out through use.
6. The salary of the president of the company is \$100,000 per year.
7. The company spends \$250,000 per year to advertise its products.
8. Salespersons are paid a commission of \$30 for each table sold.
9. Instead of producing the tables, the company could rent its factory space for \$50,000 per year.

Required:

Classify these costs according to the various cost terms used in the chapter. *Carefully study the classification of each cost.* If you don't understand why a particular cost is classified the way it is, reread the section of the chapter discussing the particular cost term. The terms *variable cost* and *fixed cost* refer to how costs behave with respect to the number of tables produced in a year.

Solution to Review Problem 1

| | Variable Cost | Fixed Cost | Period (Selling and Administrative) Cost | Product Cost | | | Sunk Cost | Opportunity Cost |
|--|---------------|------------|--|------------------|--------------|------------------------|-----------|------------------|
| | | | | Direct Materials | Direct Labor | Manufacturing Overhead | | |
| 1. Wood used in a table (\$100 per table) | X | | | X | | | | |
| 2. Labor cost to assemble a table (\$40 per table) | X | | | | X | | | |
| 3. Salary of the factory supervisor (\$38,000 per year) | | X | | | | X | | |
| 4. Cost of electricity to produce tables (\$2 per machine-hour) | X | | | | | X | | |
| 5. Depreciation of machines used to produce tables (\$10,000 per year) | | X | | | | X | X* | |
| 6. Salary of the company president (\$100,000 per year) | | X | X | | | | | |
| 7. Advertising expense (\$250,000 per year) | | X | X | | | | | |
| 8. Commissions paid to salespersons (\$30 per table sold) | X | | X | | | | | |
| 9. Rental income forgone on factory space | | | | | | | | X† |

*This is a sunk cost because the outlay for the equipment was made in a previous period.
 †This is an opportunity cost because it represents the potential benefit that is lost or sacrificed as a result of using the factory space to produce tables. Opportunity cost is a special category of cost that is not ordinarily recorded in an organization's accounting records. To avoid possible confusion with other costs, we will not attempt to classify this cost in any other way except as an opportunity cost.

Review Problem 2: Schedule of Cost of Goods Manufactured and Income Statement

The following information has been taken from the accounting records of Klear-Seal Corporation for last year:

| | |
|--|-------------|
| Selling expenses | \$140,000 |
| Raw materials inventory, January 1 | \$90,000 |
| Raw materials inventory, December 31 | \$60,000 |
| Direct labor cost | \$150,000 |
| Purchases of raw materials | \$750,000 |
| Sales | \$2,500,000 |
| Administrative expenses | \$270,000 |
| Manufacturing overhead | \$640,000 |
| Work in process inventory, January 1 | \$180,000 |
| Work in process inventory, December 31 | \$100,000 |
| Finished goods inventory, January 1 | \$260,000 |
| Finished goods inventory, December 31 | \$210,000 |

Management wants these data organized in a better format so that financial statements can be prepared for the year.

Required:

1. Prepare a schedule of cost of goods manufactured as in Exhibit 2–6. Assume raw materials consists entirely of direct materials.
2. Compute the cost of goods sold as in Exhibit 2–4.
3. Prepare an income statement.

Solution to Review Problem 2

1.

| Klear-Seal Corporation | |
|--|--------------------|
| Schedule of Cost of Goods Manufactured | |
| For the Year Ended December 31 | |
| Direct materials: | |
| Raw materials inventory, January 1 | \$ 90,000 |
| Add: Purchases of raw materials | <u>750,000</u> |
| Raw materials available for use | 840,000 |
| Deduct: Raw materials inventory, December 31 | <u>60,000</u> |
| Raw materials used in production | \$ 780,000 |
| Direct labor | 150,000 |
| Manufacturing overhead | <u>640,000</u> |
| Total manufacturing cost | 1,570,000 |
| Add: Work in process inventory, January 1 | <u>180,000</u> |
| | 1,750,000 |
| Deduct: Work in process inventory, December 31 | <u>100,000</u> |
| Cost of goods manufactured | <u>\$1,650,000</u> |

2. The cost of goods sold would be computed as follows:

| | |
|---|--------------------|
| Finished goods inventory, January 1 | \$ 260,000 |
| Add: Cost of goods manufactured | <u>1,650,000</u> |
| Goods available for sale | 1,910,000 |
| Deduct: Finished goods inventory, December 31 | <u>210,000</u> |
| Cost of goods sold* | <u>\$1,700,000</u> |

*Further adjustments will be made to cost of goods sold in Chapter 5.

3.

| Klear-Seal Corporation Income Statement For the Year Ended December 31 | | |
|--|----------------|-------------------|
| Sales | | \$2,500,000 |
| Cost of goods sold (above) | | <u>1,700,000</u> |
| Gross margin | | 800,000 |
| Selling and administrative expenses: | | |
| Selling expenses | \$140,000 | |
| Administrative expenses | <u>270,000</u> | 410,000 |
| Net operating income | | <u>\$ 390,000</u> |

Glossary

- Administrative costs** All executive, organizational, and clerical costs associated with the general management of an organization rather than with manufacturing or selling. (p. 38)
- Budget** A detailed plan for the future, usually expressed in formal quantitative terms. (p. 32)
- Common cost** A cost that is incurred to support a number of cost objects but that cannot be traced to them individually. For example, the wage cost of the pilot of a 747 airliner is a common cost of all of the passengers on the aircraft. Without the pilot, there would be no flight and no passengers. But no part of the pilot's wage is caused by any one passenger taking the flight. (p. 52)
- Control** The process of instituting procedures and then obtaining feedback to ensure that all parts of the organization are functioning effectively and moving toward overall company goals. (p. 32)
- Controller** The member of the top management team who is responsible for providing relevant and timely data to managers and for preparing financial statements for external users. The controller reports to the CFO. (p. 32)
- Controlling** Actions taken to help ensure that the plan is being followed and is appropriately modified as circumstances change. (p. 31)
- Conversion cost** Direct labor cost plus manufacturing overhead cost. (p. 39)
- Cost behavior** The way in which a cost reacts to changes in the level of activity. (p. 46)
- Cost object** Anything for which cost data are desired. Examples of cost objects are products, customers, jobs, and parts of the organization such as departments or divisions. (p. 51)
- Cost of goods manufactured** The manufacturing costs associated with the goods that were finished during the period. (p. 44)
- Differential cost** A difference in cost between two alternatives. Also see *Incremental cost*. (p. 52)
- Differential revenue** The difference in revenue between two alternatives. (p. 52)
- Direct cost** A cost that can be easily and conveniently traced to a specified cost object. (p. 51)
- Directing and motivating** Mobilizing people to carry out plans and run routine operations. (p. 31)
- Direct labor** Factory labor costs that can be easily traced to individual units of product. Also called *touch labor*. (p. 37)
- Direct materials** Materials that become an integral part of a finished product and whose costs can be conveniently traced to it. (p. 36)
- Feedback** Accounting and other reports that help managers monitor performance and focus on problems and/or opportunities that might otherwise go unnoticed. (p. 32)
- Financial accounting** The phase of accounting concerned with providing information to stockholders, creditors, and others outside the organization. (p. 33)
- Finished goods** Units of product that have been completed but not yet sold to customers. (p. 41)
- Fixed cost** A cost that remains constant, in total, regardless of changes in the level of activity within the relevant range. If a fixed cost is expressed on a per unit basis, it varies inversely with the level of activity. (p. 49)
- Incremental cost** An increase in cost between two alternatives. Also see *Differential cost*. (p. 52)
- Indirect cost** A cost that cannot be easily and conveniently traced to a specified cost object. (p. 51)
- Indirect labor** The labor costs of janitors, supervisors, materials handlers, and other factory workers that cannot be conveniently traced to particular products. (p. 37)

- Indirect materials** Small items of material such as glue and nails that may be an integral part of a finished product, but whose costs cannot be easily or conveniently traced to it. (p. 37)
- Inventoriable costs** Synonym for *product costs*. (p. 39)
- Managerial accounting** The phase of accounting concerned with providing information to managers for use within the organization. (p. 33)
- Manufacturing overhead** All manufacturing costs except direct materials and direct labor. (p. 37)
- Opportunity cost** The potential benefit that is given up when one alternative is selected over another. (p. 53)
- Performance report** A detailed report comparing budgeted data to actual data. (p. 32)
- Period costs** Costs that are taken directly to the income statement as expenses in the period in which they are incurred or accrued. (p. 39)
- Planning** Selecting a course of action and specifying how the action will be implemented. (p. 31)
- Planning and control cycle** The flow of management activities through planning, directing and motivating, and controlling, and then back to planning again. (p. 33)
- Prime cost** Direct materials cost plus direct labor cost. (p. 39)
- Product costs** All costs that are involved in acquiring or making a product. In the case of manufactured goods, these costs consist of direct materials, direct labor, and manufacturing overhead. Also see *Inventoriable costs*. (p. 38)
- Raw materials** Any materials that go into the final product. (pp. 36, 41)
- Relevant range** The range of activity within which assumptions about variable and fixed cost behavior are valid. (p. 49)
- Schedule of cost of goods manufactured** A schedule showing the direct materials, direct labor, and manufacturing overhead costs incurred during a period and the portion of those costs that are assigned to Work in Process and Finished Goods. (p. 44)
- Segment** Any part of an organization that can be evaluated independently of other parts and about which the manager seeks financial data. Examples include a product line, a sales territory, a division, or a department. (p. 35)
- Selling costs** All costs that are incurred to secure customer orders and get the finished product or service into the hands of the customer. (p. 38)
- Sunk cost** A cost that has already been incurred and that cannot be changed by any decision made now or in the future. (p. 54)
- Variable cost** A cost that varies, in total, in direct proportion to changes in the level of activity. A variable cost is constant per unit. (p. 48)
- Work in process** Units of product that are only partially complete. (p. 41)

Questions

- 2-1 Describe the three major activities of a manager.
- 2-2 What are the four steps in the planning and control cycle?
- 2-3 What are the major differences between financial and managerial accounting?
- 2-4 What are the three major elements of product costs in a manufacturing company?
- 2-5 Define the following: (a) direct materials, (b) indirect materials, (c) direct labor, (d) indirect labor, and (e) manufacturing overhead.
- 2-6 Explain the difference between a product cost and a period cost.
- 2-7 Describe how the income statement of a manufacturing company differs from the income statement of a merchandising company.
- 2-8 Describe the schedule of cost of goods manufactured. How does it tie into the income statement?
- 2-9 Describe how the inventory accounts of a manufacturing company differ from the inventory account of a merchandising company.
- 2-10 Why are product costs sometimes called inventoriable costs? Describe the flow of such costs in a manufacturing company from the point of incurrence until they finally become expenses on the income statement.
- 2-11 Is it possible for costs such as salaries or depreciation to end up as assets on the balance sheet? Explain.
- 2-12 “The variable cost per unit varies with output, whereas the fixed cost per unit is constant.” Do you agree? Explain.

- 2-13 Define the following terms: differential cost, opportunity cost, and sunk cost.
 2-14 Only variable costs can be differential costs. Do you agree? Explain.

Multiple-choice questions are provided on the text website at www.mhhe.com/noreen2e.

Exercises

EXERCISE 2-1 The Work of Management and Managerial and Financial Accounting [L01]

A number of terms that relate to organizations, the work of management, and the role of managerial accounting are listed below:

| | |
|--------------------------|-----------------------|
| Budgets | Controller |
| Directing and motivating | Feedback |
| Financial accounting | Managerial accounting |
| Performance report | Planning |
| Precision | Timeliness |

Required:

Choose the term or terms above that most appropriately complete the following statements. A term may be used more than once or not at all.

- When _____, managers mobilize people to carry out plans and run routine operations.
- The plans of management are expressed formally in _____.
- _____ consists of identifying alternatives, selecting from among the alternatives the one that is best for the organization, and specifying what actions will be taken to implement the chosen alternative.
- Managerial accounting places less emphasis on _____ and more emphasis on _____ than financial accounting.
- _____ is concerned with providing information for the use of those who are inside the organization, whereas _____ is concerned with providing information for the use of those who are outside the organization.
- _____ emphasizes detailed segment reports about departments, customers, products, and customers.
- _____ must follow GAAP, whereas _____ need not follow GAAP.
- The accounting and other reports that help managers monitor performance and focus on problems and/or opportunities are a form of _____.
- The manager in charge of the accounting department is usually known as the _____.
- A detailed report to management comparing budgeted data with actual data for a specific time period is a _____.

EXERCISE 2-2 Classifying Manufacturing Costs [L02]

The PC Works assembles custom computers from components supplied by various manufacturers. The company is very small and its assembly shop and retail sales store are housed in a single facility in a Redmond, Washington, industrial park. Listed below are some of the costs that are incurred at the company.

Required:

For each cost, indicate whether it would most likely be classified as direct labor, direct materials, manufacturing overhead, selling, or an administrative cost.

- The cost of a hard drive installed in a computer.
- The cost of advertising in the *Puget Sound Computer User* newspaper.
- The wages of employees who assemble computers from components.
- Sales commissions paid to the company's salespeople.
- The wages of the assembly shop's supervisor.
- The wages of the company's accountant.

7. Depreciation on equipment used to test assembled computers before release to customers.
8. Rent on the facility in the industrial park.

EXERCISE 2-3 Classification of Costs as Period or Product Cost [L03]

Suppose that you have been given a summer job as an intern at Issac Aircams, a company that manufactures sophisticated spy cameras for remote-controlled military reconnaissance aircraft. The company, which is privately owned, has approached a bank for a loan to help it finance its growth. The bank requires financial statements before approving such a loan. You have been asked to help prepare the financial statements and were given the following list of costs:

1. Depreciation on salespersons' cars.
2. Rent on equipment used in the factory.
3. Lubricants used for machine maintenance.
4. Salaries of personnel who work in the finished goods warehouse.
5. Soap and paper towels used by factory workers at the end of a shift.
6. Factory supervisors' salaries.
7. Heat, water, and power consumed in the factory.
8. Materials used for boxing products for shipment overseas. (Units are not normally boxed.)
9. Advertising costs.
10. Workers' compensation insurance for factory employees.
11. Depreciation on chairs and tables in the factory lunchroom.
12. The wages of the receptionist in the administrative offices.
13. Cost of leasing the corporate jet used by the company's executives.
14. The cost of renting rooms at a Florida resort for the annual sales conference.
15. The cost of packaging the company's product.

Required:

Classify the above costs as either product costs or period costs for the purpose of preparing the financial statements for the bank.

EXERCISE 2-4 Constructing an Income Statement [L04]

Last month CyberGames, a computer game retailer, had total sales of \$1,450,000, selling expenses of \$210,000, and administrative expenses of \$180,000. The company had beginning merchandise inventory of \$240,000, purchased additional merchandise inventory for \$950,000, and had ending merchandise inventory of \$170,000.

Required:

Prepare an income statement for the company for the month.

EXERCISE 2-5 Prepare a Schedule of Cost of Goods Manufactured [L05]

Lompac Products manufactures a variety of products in its factory. Data for the most recent month's operations appear below:

| | |
|---|-----------|
| Beginning raw materials inventory | \$60,000 |
| Purchases of raw materials | \$690,000 |
| Ending raw materials inventory | \$45,000 |
| Direct labor | \$135,000 |
| Manufacturing overhead | \$370,000 |
| Beginning work in process inventory | \$120,000 |
| Ending work in process inventory | \$130,000 |

Required:

Prepare a schedule of cost of goods manufactured for the company for the month.

EXERCISE 2-6 Classification of Costs as Fixed or Variable [L06]

Below are costs and measures of activity in a variety of organizations.

Required:

Classify each cost as variable or fixed with respect to the indicated measure of activity by placing an X in the appropriate column.

| Cost | Measure of Activity | Cost Behavior | |
|---|---|---------------|-------|
| | | Variable | Fixed |
| 1. The cost of X-ray film used in the radiology lab at Virginia Mason Hospital in Seattle | Number of X-rays taken | | |
| 2. The cost of advertising a rock concert in New York City | Number of rock concert tickets sold | | |
| 3. The cost of renting retail space for a McDonald's restaurant in Hong Kong | Total sales at the restaurant | | |
| 4. The electrical cost of running a roller coaster at Magic Mountain | Number of times the roller coaster is run | | |
| 5. Property taxes paid by your local cinema theater | Number of tickets sold | | |
| 6. The cost of sales commissions paid to salespersons at a Nordstrom store | Total sales at the store | | |
| 7. Property insurance on a Coca-Cola bottling plant | Number of cases of bottles produced | | |
| 8. The costs of synthetic materials used to make a particular model of running shoe | Number of shoes of that model produced | | |
| 9. The costs of shipping Panasonic televisions to retail stores | The number of televisions sold | | |
| 10. The cost of leasing an ultrascan diagnostic machine at the American Hospital in Paris | The number of patients who are scanned with the machine | | |

EXERCISE 2-7 Identifying Direct and Indirect Costs [L07]

Northwest Hospital is a full-service hospital that provides everything from major surgery and emergency room care to outpatient clinics.

Required:

For each cost incurred at Northwest Hospital, indicate whether it would most likely be a direct cost or an indirect cost of the specified cost object by placing an X in the appropriate column.

| Cost | Cost Object | Direct Cost | Indirect Cost |
|---|--------------------------------|-------------|---------------|
| Ex. Catered food served to patients | A particular patient | X | |
| 1. The wages of pediatric nurses | The pediatric department | | |
| 2. Prescription drugs | A particular patient | | |
| 3. Heating the hospital | The pediatric department | | |
| 4. The salary of the head of pediatrics | The pediatric department | | |
| 5. The salary of the head of pediatrics | A particular pediatric patient | | |
| 6. Hospital chaplain's salary | A particular patient | | |
| 7. Lab tests by outside contractor | A particular patient | | |
| 8. Lab tests by outside contractor | A particular department | | |

EXERCISE 2–8 Differential, Opportunity, and Sunk Costs [LO8]

Northwest Hospital is a full-service hospital that provides everything from major surgery and emergency room care to outpatient clinics. The hospital's Radiology Department is considering replacing an old inefficient X-ray machine with a state-of-the-art digital X-ray machine. The new machine would provide higher quality X-rays in less time and at a lower cost per X-ray. It would also require less power and would use a color laser printer to produce easily readable X-ray images. Instead of investing the funds in the new X-ray machine, the Laboratory Department is lobbying the hospital's management to buy a new DNA analyzer.

Required:

For each of the items below, indicate by placing an *X* in the appropriate column whether it should be considered a differential cost, an opportunity cost, or a sunk cost in the decision to replace the old X-ray machine with a new machine. If none of the categories apply for a particular item, leave all columns blank.

| Item | Differential Cost | Opportunity Cost | Sunk Cost |
|--|-------------------|------------------|-----------|
| Ex. Cost of X-ray film used in the old machine | X | | |
| 1. Cost of the old X-ray machine | | | |
| 2. The salary of the head of the Radiology Department | | | |
| 3. The salary of the head of the Pediatrics Department | | | |
| 4. Cost of the new color laser printer | | | |
| 5. Rent on the space occupied by Radiology | | | |
| 6. The cost of maintaining the old machine | | | |
| 7. Benefits from a new DNA analyzer | | | |
| 8. Cost of electricity to run the X-ray machines | | | |

EXERCISE 2–9 Definitions of Cost Terms [LO2, LO3, LO6, LO8]

Following are a number of cost terms introduced in the chapter:

| | |
|------------------|-----------------|
| Variable cost | Product cost |
| Fixed cost | Sunk cost |
| Prime cost | Conversion cost |
| Opportunity cost | Period cost |

Required:

Choose the term or terms above that most appropriately describe the cost identified in each of the following situations. A cost term can be used more than once.

- Lake Company produces a popular tote bag. The cloth used to manufacture the tote bag is direct materials and for financial accounting purposes is classified as a(n) _____. In terms of cost behavior, the cloth could also be described as a(n) _____.
- The direct labor cost required to produce the tote bags, combined with manufacturing overhead cost, is called _____.
- The company could have taken the funds that it has invested in production equipment and invested them in interest-bearing securities instead. The interest forgone on the securities is a(n) _____.
- Taken together, the direct materials cost and the direct labor cost required to produce tote bags is called _____.
- Formerly, the company produced a smaller tote bag that was not very popular. Three hundred of these smaller bags are stored in one of the company's warehouses. The amount invested in these bags is called a(n) _____.
- Tote bags are sold through agents who are paid a commission on each bag sold. For financial accounting purposes, these commissions are classified as a(n) _____. In terms of cost behavior, commissions are classified as a(n) _____.
- For financial accounting purposes, depreciation on the equipment used to produce tote bags is a(n) _____. However, for financial accounting purposes, depreciation on any equipment used by the company in selling and administrative activities is classified as a(n) _____. In terms of cost behavior, depreciation is usually a(n) _____.

8. A(n) _____ is also known as an inventoriable cost, because such costs go into the Work in Process inventory account and then into the Finished Goods inventory account before appearing on the income statement as part of Cost of Goods Sold.
9. For financial accounting purposes, the salary of Lake Company’s president is classified as a(n) _____, because the salary will appear on the income statement as an expense in the time period in which it is incurred.
10. Costs are often classified in several ways. For example, Lake Company pays \$5,000 rent each month on its factory building. The rent is part of manufacturing overhead. In terms of cost behavior, it would be classified as a(n) _____. The rent can also be classified as a(n) _____ and as a(n) _____.

EXERCISE 2-10 Classification of Costs as Variable or Fixed and as Selling and Administrative or Product [LO3, LO6]

Below are listed various costs that are found in organizations.

1. Hamburger buns in a Wendy’s outlet.
2. Advertising by a dental office.
3. Apples processed and canned by Del Monte.
4. Shipping canned apples from a Del Monte plant to customers.
5. Insurance on a Bausch & Lomb factory producing contact lenses.
6. Insurance on IBM’s corporate headquarters.
7. Salary of a supervisor overseeing production of printers at Hewlett-Packard.
8. Commissions paid to Encyclopedia Britannica salespersons.
9. Depreciation of factory lunchroom facilities at a General Electric plant.
10. Steering wheels installed in BMWs.

Required:

Classify each cost as being either variable or fixed with respect to the number of units produced and sold. Also classify each cost as either a selling and administrative cost or a product cost. Prepare your answer sheet as shown below. Place an X in the appropriate columns to show the proper classification of each cost.

| Cost Item | Cost Behavior | | Selling and Administrative Cost | Product Cost |
|-----------|---------------|-------|---------------------------------|--------------|
| | Variable | Fixed | | |

EXERCISE 2-11 Preparing a Schedule of Costs of Goods Manufactured and Cost of Goods Sold [LO2, LO4, LO5]

The following cost and inventory data are taken from the accounting records of Mason Company for the year just completed:

| | |
|--------------------------------------|-----------|
| Costs incurred: | |
| Direct labor cost | \$70,000 |
| Purchases of raw materials | \$118,000 |
| Manufacturing overhead | \$80,000 |
| Advertising expense | \$90,000 |
| Sales salaries | \$50,000 |
| Depreciation, office equipment | \$3,000 |

| | Beginning of the Year | End of the Year |
|-----------------------|-----------------------|-----------------|
| Inventories: | | |
| Raw materials | \$7,000 | \$15,000 |
| Work in process | \$10,000 | \$5,000 |
| Finished goods..... | \$20,000 | \$35,000 |

Required:

1. Prepare a schedule of cost of goods manufactured.
2. Prepare the cost of goods sold section of Mason Company’s income statement for the year.

EXERCISE 2–12 Product Cost Flows; Product versus Period Costs [L03, L04]

The Devon Motor Company produces motorcycles. During April, the company purchased 8,000 batteries at a cost of \$10 per battery. Devon withdrew 7,600 batteries from the storeroom during the month. Of these, 100 were used to replace batteries in motorcycles used by the company's traveling sales staff. The remaining 7,500 batteries withdrawn from the storeroom were placed in motorcycles being produced by the company. Of the motorcycles in production during April, 90% were completed and transferred from work in process to finished goods. Of the motorcycles completed during the month, 30% were unsold at April 30.

There were no inventories of any type on April 1.

Required:

1. Determine the cost of batteries that would appear in each of the following accounts at April 30:
 - a. Raw Materials.
 - b. Work in Process.
 - c. Finished Goods.
 - d. Cost of Goods Sold.
 - e. Selling Expense.
2. Specify whether each of the above accounts would appear on the balance sheet or on the income statement at April 30.

Problems**connect™****PROBLEM 2–13 Cost Classification [L03, L06, L07]**

Listed below are costs found in various organizations.

1. Property taxes, factory.
2. Boxes used for packaging detergent produced by the company.
3. Salespersons' commissions.
4. Supervisor's salary, factory.
5. Depreciation, executive autos.
6. Wages of workers assembling computers.
7. Insurance, finished goods warehouses.
8. Lubricants for production equipment.
9. Advertising costs.
10. Microchips used in producing calculators.
11. Shipping costs on merchandise sold.
12. Magazine subscriptions, factory lunchroom.
13. Thread in a garment factory.
14. Billing costs.
15. Executive life insurance.
16. Ink used in textbook production.
17. Fringe benefits, assembly-line workers.
18. Yarn used in sweater production.
19. Wages of receptionist, executive offices.

Required:

Prepare an answer sheet with column headings as shown below. For each cost item, indicate whether it would be variable or fixed with respect to the number of units produced and sold; and then whether it would be a selling cost, an administrative cost, or a manufacturing cost. If it is a manufacturing cost, indicate whether it would typically be treated as a direct cost or an indirect cost with respect to units of product. Three sample answers are provided for illustration.

| Cost Item | Variable or Fixed | Selling Cost | Administrative Cost | Manufacturing (Product) Cost | |
|-------------------------|----------------------|-----------------|------------------------|---------------------------------|----------|
| | | | | Direct | Indirect |
| Direct labor | V | | | X | |
| Executive salaries..... | F | | X | | |
| Factory rent | F | | | | X |

PROBLEM 2-14 Cost Classification [LO2, LO3, LO6, LO8]

Wollogong Group Ltd. of New South Wales, Australia, acquired its factory building about 10 years ago. For several years, the company has rented out a small annex attached to the rear of the building. The company has received a rental income of \$30,000 per year on this space. The renter’s lease will expire soon, and rather than renewing the lease, the company has decided to use the space itself to manufacture a new product.

Direct materials cost for the new product will total \$80 per unit. To have a place to store finished units of product, the company will rent a small warehouse nearby. The rental cost will be \$500 per month. In addition, the company must rent equipment for use in producing the new product; the rental cost will be \$4,000 per month. Workers will be hired to manufacture the new product, with direct labor cost amounting to \$60 per unit. The space in the annex will continue to be depreciated on a straight-line basis, as in prior years. This depreciation is \$8,000 per year.

Advertising costs for the new product will total \$50,000 per year. A supervisor will be hired to oversee production; her salary will be \$1,500 per month. Electricity for operating machines will be \$1.20 per unit. Costs of shipping the new product to customers will be \$9 per unit.

To provide funds to purchase materials, meet payrolls, and so forth, the company will have to liquidate some temporary investments. These investments are presently yielding a return of about \$3,000 per year.

Required:

Prepare an answer sheet with the following column headings:

| Name of the Cost | Variable Cost | Fixed Cost | Product Cost | | | Period (Selling and Administrative) Cost | Opportunity Cost | Sunk Cost |
|------------------|---------------|------------|------------------|--------------|------------------------|--|------------------|-----------|
| | | | Direct Materials | Direct Labor | Manufacturing Overhead | | | |

List the different costs associated with the new product decision down the extreme left column (under Name of the Cost). Then place an X under each heading that helps to describe the type of cost involved. There may be X s under several column headings for a single cost. (For example, a cost may be a fixed cost, a period cost, and a sunk cost; you would place an X under each of these column headings opposite the cost.)

PROBLEM 2-15 Cost Classification [LO6, LO7]

Various costs associated with the operation of factories are given below:

1. Electricity to run production equipment.
2. Rent on a factory building.
3. Cloth used to make drapes.
4. Production superintendent’s salary.
5. Wages of laborers assembling a product.
6. Depreciation of air purification equipment used to make furniture.
7. Janitorial salaries.
8. Peaches used in canning fruit.
9. Lubricants for production equipment.
10. Sugar used in soft-drink production.
11. Property taxes on the factory.
12. Wages of workers painting a product.
13. Depreciation on cafeteria equipment.
14. Insurance on a building used in producing helicopters.
15. Cost of rotor blades used in producing helicopters.

Required:

Classify each cost as either variable or fixed with respect to the number of units produced and sold. Also indicate whether each cost would typically be treated as a direct cost or an indirect cost with respect to units of product. Prepare your answer sheet as shown below:

| Cost Item | Cost Behavior | | To Units of Product | |
|----------------------------|---------------|-------|---------------------|----------|
| | Variable | Fixed | Direct | Indirect |
| Example: Factory insurance | | X | | X |

excel

PROBLEM 2-16 Schedule of Cost of Goods Manufactured; Income Statement [LO2, LO3, LO4, LO5]

Swift Company was organized on March 1 of the current year. After five months of start-up losses, management had expected to earn a profit during August. Management was disappointed, however, when the income statement for August also showed a loss. August's income statement follows:

| Swift Company Income Statement For the Month Ended August 31 | | |
|---|-----------|--------------------|
| Sales | | \$450,000 |
| Less operating expenses: | | |
| Direct labor cost | \$ 70,000 | |
| Raw materials purchased | 165,000 | |
| Manufacturing overhead | 85,000 | |
| Selling and administrative expenses | 142,000 | <u>462,000</u> |
| Net operating loss..... | | <u>\$ (12,000)</u> |

After seeing the \$12,000 loss for August, Swift's president stated, "I was sure we'd be profitable within six months, but our six months are up and this loss for August is even worse than July's. I think it's time to start looking for someone to buy out the company's assets—if we don't, within a few months there won't be any assets to sell. By the way, I don't see any reason to look for a new controller. We'll just limp along with Sam for the time being."

The company's controller resigned a month ago. Sam, a new assistant in the controller's office, prepared the income statement above. Sam has had little experience in manufacturing operations.

Inventory balances at the beginning and end of August were:

| | August 1 | August 31 |
|-----------------------|-----------------|------------------|
| Raw materials | \$8,000 | \$13,000 |
| Work in process | \$16,000 | \$21,000 |
| Finished goods | \$40,000 | \$60,000 |

The president has asked you to check over the income statement and make a recommendation as to whether the company should look for a buyer for its assets.

Required:

1. As one step in gathering data for a recommendation to the president, prepare a schedule of cost of goods manufactured for August.
2. As a second step, prepare a new income statement for August.
3. Based on your statements prepared in (1) and (2) above, would you recommend that the company look for a buyer?

PROBLEM 2-17 Classification of Salary Cost as a Period or Product Cost [LO3]

You have just been hired by Ogden Company to fill a new position that was created in response to rapid growth in sales. It is your responsibility to coordinate shipments of finished goods from the factory to distribution warehouses located in various parts of the United States so that goods will be available as orders are received from customers.

The company is unsure how to classify your annual salary in its cost records. The company's cost analyst says that your salary should be classified as a manufacturing (product) cost; the controller says that it should be classified as a selling expense; and the president says that it doesn't matter which way your salary cost is classified.

Required:

1. Which viewpoint is correct? Why?
2. From the point of view of the reported net operating income for the year, is the president correct in his statement that it doesn't matter which way your salary cost is classified? Explain.

PROBLEM 2-18 Schedule of Cost of Goods Manufactured; Income Statement; Cost Behavior [L02, L03, L04, L05, L06]

Various cost and sales data for Meriwell Company for the just completed year appear in the worksheet below:

| | A | B | C |
|----|--------------------------------------|-----------|---|
| 1 | Finished goods inventory, beginning | \$20,000 | |
| 2 | Finished goods inventory, ending | \$40,000 | |
| 3 | Administrative expenses | \$110,000 | |
| 4 | Manufacturing overhead | \$105,000 | |
| 5 | Purchases of raw materials | \$125,000 | |
| 6 | Raw materials inventory, beginning | \$9,000 | |
| 7 | Raw materials inventory, ending | \$6,000 | |
| 8 | Direct labor | \$70,000 | |
| 9 | Work in process inventory, beginning | \$17,000 | |
| 10 | Work in process inventory, ending | \$30,000 | |
| 11 | Sales | \$500,000 | |
| 12 | Selling expenses | \$80,000 | |
| 13 | | | |

Of the \$105,000 of manufacturing overhead, \$15,000 is variable and \$90,000 is fixed.

Required:

1. Prepare a schedule of cost of goods manufactured.
2. Prepare an income statement.
3. Assume that the company produced the equivalent of 10,000 units of product during the year just completed. What was the average cost per unit for direct materials? What was the average cost per unit for fixed manufacturing overhead?
4. Assume that the company expects to produce 15,000 units of product during the coming year. What average cost per unit and what total cost would you expect the company to incur for direct materials at this level of activity? For fixed manufacturing overhead? Assume that direct materials is a variable cost.
5. As the manager responsible for production costs, explain to the president any difference in the average costs per unit between (3) and (4) above.

PROBLEM 2-19 Cost Classification and Cost Behavior [L03, L06, L07]

The Dorilane Company specializes in producing a set of wood patio furniture consisting of a table and four chairs. The set enjoys great popularity, and the company has ample orders to keep production going at its full capacity of 2,000 sets per year. Annual cost data at full capacity follow:

| | |
|---|-----------|
| Factory labor, direct | \$118,000 |
| Advertising | \$50,000 |
| Factory supervision | \$40,000 |
| Property taxes, factory building | \$3,500 |
| Sales commissions | \$80,000 |
| Insurance, factory | \$2,500 |
| Depreciation, administrative office equipment | \$4,000 |
| Lease cost, factory equipment | \$12,000 |
| Indirect materials, factory | \$6,000 |
| Depreciation, factory building | \$10,000 |
| Administrative office supplies (billing) | \$3,000 |
| Administrative office salaries | \$60,000 |
| Direct materials used (wood, bolts, etc.) | \$94,000 |
| Utilities, factory | \$20,000 |

Required:

- Prepare an answer sheet with the column headings shown below. Enter each cost item on your answer sheet, placing the dollar amount under the appropriate headings. As examples, this has been done already for the first two items in the list above. Note that each cost item is classified in two ways: first, as variable or fixed with respect to the number of units produced and sold; and second, as a selling and administrative cost or a product cost. (If the item is a product cost, it should also be classified as either direct or indirect as shown.)

| Cost Item | Cost Behavior | | Selling or Administrative Cost | Product Cost | |
|-----------------------------|---------------|----------|--------------------------------------|--------------|-----------|
| | Variable | Fixed | | Direct | Indirect* |
| Factory labor, direct | \$118,000 | | | \$118,000 | |
| Advertising | | \$50,000 | \$50,000 | | |

*To units of product.

- Total the dollar amounts in each of the columns in (1) above. Compute the average product cost of one patio set.
- Assume that production drops to only 1,000 sets annually. Would you expect the average product cost per set to increase, decrease, or remain unchanged? Explain. No computations are necessary.
- Refer to the original data. The president's brother-in-law has considered making himself a patio set and has priced the necessary materials at a building supply store. The brother-in-law has asked the president if he could purchase a patio set from the Dorilane Company "at cost," and the president agreed to let him do so.
 - Would you expect any disagreement between the two men over the price the brother-in-law should pay? Explain. What price does the president probably have in mind? The brother-in-law?
 - Because the company is operating at full capacity, what cost term used in the chapter might be justification for the president to charge the full, regular price to the brother-in-law and still be selling "at cost"?

PROBLEM 2-20 Classification of Various Costs [LO2, LO3, LO6, LO8]

Staci Valek began dabbling in pottery several years ago as a hobby. Her work is quite creative, and it has been so popular with friends and others that she has decided to quit her job with an aerospace company and manufacture pottery full time. The salary from Staci's aerospace job is \$3,800 per month.

Staci will rent a small building near her home to use as a place for manufacturing the pottery. The rent will be \$500 per month. She estimates that the cost of clay and glaze will be \$2 for each finished piece of pottery. She will hire workers to produce the pottery at a labor rate of \$8 per pot. To sell her pots, Staci feels that she must advertise heavily in the local area. An advertising agency states that it will handle all advertising for a fee of \$600 per month. Staci's brother will sell the pots; he will be paid a commission of \$4 for each pot sold. Equipment needed to manufacture the pots will be rented at a cost of \$300 per month.

Staci has already paid the legal and filing fees associated with incorporating her business in the state. These fees amounted to \$500. A small room has been located in a tourist area that Staci will use as a sales office. The rent will be \$250 per month. A phone installed in the room for taking orders will cost \$40 per month. In addition, a recording device will be attached to the phone for taking after-hours messages.

Staci has some money in savings that is earning interest of \$1,200 per year. These savings will be withdrawn and used to get the business going. For the time being, Staci does not intend to draw any salary from the new company.

Required:

- Prepare an answer sheet with the following column headings:

| Name of the Cost | Variable Cost | Fixed Cost | Product Cost | | | Period (Selling and Administrative) Cost | Opportunity Cost | Sunk Cost |
|------------------------|------------------|---------------|---------------------|-----------------|---------------------------|---|---------------------|--------------|
| | | | Direct Materials | Direct Labor | Manufacturing Overhead | | | |

List the different costs associated with the new company down the extreme left column (under Name of Cost). Then place an X under each heading that helps to describe the type of cost involved. There may be X's under several column headings for a single cost. (That is, a cost may be a fixed cost, a period cost, and a sunk cost; you would place an X under each of these column headings opposite the cost.)

Under the Variable Cost column, list only those costs that would be variable with respect to the number of units of pottery that are produced and sold.

- All of the costs you have listed above, except one, would be differential costs between the alternatives of Staci producing pottery or staying with the aerospace company. Which cost is *not* differential? Explain.

PROBLEM 2-21 Schedule of Cost of Goods Manufactured; Income Statement; Cost Behavior [L02, L03, L04, L05, L06]

Selected account balances for the year ended December 31 are provided below for Superior Company:

| | |
|---|-----------|
| Selling and administrative salaries | \$110,000 |
| Purchases of raw materials | \$290,000 |
| Direct labor | ? |
| Advertising expense | \$80,000 |
| Manufacturing overhead | \$270,000 |
| Sales commissions | \$50,000 |

Inventory balances at the beginning and end of the year were as follows:

| | Beginning of the Year | End of the Year |
|-----------------------|-----------------------|-----------------|
| Raw materials | \$40,000 | \$10,000 |
| Work in process | ? | \$35,000 |
| Finished goods | \$50,000 | ? |

The total manufacturing costs for the year were \$683,000; the goods available for sale totaled \$740,000; and the cost of goods sold totaled \$660,000.

Required:

- Prepare a schedule of cost of goods manufactured and the cost of goods sold section of the company's income statement for the year.
- Assume that the dollar amounts given above are for the equivalent of 40,000 units produced during the year. Compute the average cost per unit for direct materials used and the average cost per unit for manufacturing overhead.
- Assume that in the following year the company expects to produce 50,000 units and manufacturing overhead is fixed. What average cost per unit and total cost would you expect to be incurred for direct materials? For manufacturing overhead? (Assume that direct materials is a variable cost.)
- As the manager in charge of production costs, explain to the president the reason for any difference in average cost per unit between (2) and (3) above.

PROBLEM 2-22 Ethics and the Manager [L03]

M. K. Gallant is president of Kranbrack Corporation, a company whose stock is traded on a national exchange. In a meeting with investment analysts at the beginning of the year, Gallant had predicted that the company's earnings would grow by 20% this year. Unfortunately, sales have been less than expected for the year, and Gallant concluded within two weeks of the end of the fiscal year that it would be impossible to ultimately report an increase in earnings as large as predicted unless some drastic action was taken. Accordingly, Gallant has ordered that wherever possible, expenditures should be postponed to the new year—including canceling or postponing orders with suppliers, delaying planned maintenance and training, and cutting back on end-of-year advertising and travel. Additionally, Gallant ordered the company's controller to carefully scrutinize all costs that are currently classified as period costs and reclassify as many as possible as product costs. The company is expected to have substantial inventories of work in process and finished goods at the end of the year.

Required:

1. Why would reclassifying period costs as product costs increase this period's reported earnings?
2. Do you believe Gallant's actions are ethical? Why or why not?

PROBLEM 2–23 Variable and Fixed Costs; Subtleties of Direct and Indirect Costs [L06, L07]

Madison Seniors Care Center is a nonprofit organization that provides a variety of health services to the elderly. The center is organized into a number of departments, one of which is the meals-on-wheels program that delivers hot meals to seniors in their homes on a daily basis. Below are listed a number of costs of the center and the meals-on-wheels program.

- example* The cost of groceries used in meal preparation.
- a. The cost of leasing the meals-on-wheels van.
 - b. The cost of incidental supplies such as salt, pepper, napkins, and so on.
 - c. The cost of gasoline consumed by the meals-on-wheels van.
 - d. The rent on the facility that houses Madison Seniors Care Center, including the meals-on-wheels program.
 - e. The salary of the part-time manager of the meals-on-wheels program.
 - f. Depreciation on the kitchen equipment used in the meals-on-wheels program.
 - g. The hourly wages of the caregiver who drives the van and delivers the meals.
 - h. The costs of complying with health safety regulations in the kitchen.
 - i. The costs of mailing letters soliciting donations to the meals-on-wheels program.

Required:

For each cost listed above, indicate whether it is a direct or indirect cost of the meals-on-wheels program, whether it is a direct or indirect cost of particular seniors served by the program, and whether it is variable or fixed with respect to the number of seniors served. Use the form below for your answer.

| Item | Description | Direct or Indirect Cost of the Meals-on-Wheels Program | | Direct or Indirect Cost of Particular Seniors Served by the Meals-on-Wheels Program | | Variable or Fixed with Respect to the Number of Seniors Served by the Meals-on-Wheels Program | |
|---------|--|--|----------|---|----------|---|-------|
| | | Direct | Indirect | Direct | Indirect | Variable | Fixed |
| Example | The cost of groceries used in meal preparation | X | | | X | | X |

PROBLEM 2–24 Income Statement; Schedule of Cost of Goods Manufactured [L02, L03, L04, L05]

Visic Corporation, a manufacturing company, produces a single product. The following information has been taken from the company's production, sales, and cost records for the just completed year.

| | |
|--|-------------|
| Production in units | 29,000 |
| Sales in units | ? |
| Ending finished goods inventory in units | ? |
| Sales in dollars | \$1,300,000 |
| Costs: | |
| Direct labor | \$90,000 |
| Raw materials purchased | \$480,000 |
| Manufacturing overhead | \$300,000 |
| Selling and administrative expenses | \$380,000 |

| | Beginning of the Year | End of the Year |
|-----------------------|-----------------------|-----------------|
| Inventories: | | |
| Raw materials | \$20,000 | \$30,000 |
| Work in process | \$50,000 | \$40,000 |
| Finished goods | \$0 | ? |

The finished goods inventory is being carried at the average unit production cost for the year. The selling price of the product is \$50 per unit.

Required:

1. Prepare a schedule of cost of goods manufactured for the year.
2. Compute the following:
 - a. The number of units in the finished goods inventory at the end of the year.
 - b. The cost of the units in the finished goods inventory at the end of the year.
3. Prepare an income statement for the year.

PROBLEM 2–25 Working with Incomplete Data from the Income Statement and Schedule of Cost of Goods Manufactured [LO4, LO5]

Supply the missing data in the following cases. Each case is independent of the others.

| | Case | | | |
|---|----------|----------|----------|----------|
| | 1 | 2 | 3 | 4 |
| Schedule of Cost of Goods Manufactured | | | | |
| Direct materials..... | \$4,500 | \$6,000 | \$5,000 | \$3,000 |
| Direct labor | ? | \$3,000 | \$7,000 | \$4,000 |
| Manufacturing overhead..... | \$5,000 | \$4,000 | ? | \$9,000 |
| Total manufacturing costs..... | \$18,500 | ? | \$20,000 | ? |
| Beginning work in process inventory..... | \$2,500 | ? | \$3,000 | ? |
| Ending work in process inventory..... | ? | \$1,000 | \$4,000 | \$3,000 |
| Cost of goods manufactured | \$18,000 | \$14,000 | ? | ? |
| Income Statement | | | | |
| Sales..... | \$30,000 | \$21,000 | \$36,000 | \$40,000 |
| Beginning finished goods inventory..... | \$1,000 | \$2,500 | ? | \$2,000 |
| Cost of goods manufactured | \$18,000 | \$14,000 | ? | \$17,500 |
| Goods available for sale | ? | ? | ? | ? |
| Ending finished goods inventory..... | ? | \$1,500 | \$4,000 | \$3,500 |
| Cost of goods sold..... | \$17,000 | ? | \$18,500 | ? |
| Gross margin | \$13,000 | ? | \$17,500 | ? |
| Selling and administrative expenses | ? | \$3,500 | ? | ? |
| Net operating income | \$4,000 | ? | \$5,000 | \$9,000 |

Cases

CASE 2–26 Inventory Computations from Incomplete Data [LO4, LO5]

Hector P. Wastrel, a careless employee, left some combustible materials near an open flame in Salter Company’s plant. The resulting explosion and fire destroyed the entire plant and administrative offices. Justin Quick, the company’s controller, and Constance Trueheart, the operations manager, were able to save only a few bits of information as they escaped from the roaring blaze.

“What a disaster,” cried Justin. “And the worst part is that we have no records to use in filing an insurance claim.”

“I know,” replied Constance. “I was in the plant when the explosion occurred, and I managed to grab only this brief summary sheet that contains information on one or two of our costs. It says that our direct labor cost this year totaled \$180,000 and that we purchased \$290,000 in raw materials. But I’m afraid that doesn’t help much; the rest of our records are just ashes.”

“Well, not completely,” said Justin. “I was working on the year-to-date income statement when the explosion knocked me out of my chair. I instinctively held onto the page I was working on, and from what I can make out, our sales to date this year totaled \$1,200,000 and our gross margin was 40% of sales. Also, I can see that our goods available for sale to customers totaled \$810,000 at cost.”

“Maybe we’re not so bad off after all,” exclaimed Constance. “My sheet says that prime cost totaled \$410,000 so far this year and that manufacturing overhead is 70% of conversion cost. Now if we just had some information on our beginning inventories.”

“Hey, look at this,” cried Justin. “It’s a copy of last year’s annual report, and it shows what our inventories were when this year started. Let’s see, raw materials was \$18,000, work in process was \$65,000, and finished goods was \$45,000.

“Super,” yelled Constance. “Let’s go to work.”

To file an insurance claim, the company must determine the amount of cost in its inventories as of the date of the fire. You may assume that all materials used in production during the year were direct materials.

Required:

Determine the amount of cost in the Raw Materials, Work in Process, and Finished Goods inventory accounts as of the date of the fire. (Hint: One way to proceed would be to reconstruct the various schedules and statements that would have been affected by the company’s inventory accounts during the period.)

CASE 2–27 Missing Data; Income Statement; Schedule of Cost of Goods Manufactured [L02, L03, L04, L05]

“I was sure that when our battery hit the market it would be an instant success,” said Roger Strong, founder and president of Solar Technology, Inc. “But just look at the gusher of red ink for the first quarter. It’s obvious that we’re better scientists than we are businesspeople. At this rate we’ll be out of business within a year.” The data to which Roger was referring follow:

| Solar Technology, Inc. | | |
|---|-----------|---------------------|
| Income Statement | | |
| For the Quarter Ended March 31 | | |
| Sales (32,000 batteries) | | \$ 960,000 |
| Less operating expenses: | | |
| Selling and administrative expenses | \$290,000 | |
| Manufacturing overhead | 410,000 | |
| Purchases of raw materials | 360,000 | |
| Direct labor | 70,000 | 1,130,000 |
| Net operating loss | | <u>\$ (170,000)</u> |

Solar Technology was organized at the beginning of the current year to produce and market a revolutionary new solar battery. The company’s accounting system was set up by Roger’s brother-in-law who had taken an accounting course about 10 years ago.

“We may not last a year if the insurance company doesn’t pay the \$226,000 it owes us for the 8,000 batteries lost in the warehouse fire last week,” said Roger. “The insurance adjuster says our claim is inflated, but he’s just trying to pressure us into a lower figure. We have the data to back up our claim, and it will stand up in any court.”

On April 3, just after the end of the first quarter, the company’s finished goods storage area was swept by fire and all 8,000 unsold batteries were destroyed. (These batteries were part of the 40,000 units completed during the first quarter.) The company’s insurance policy states that the company will be reimbursed for the “cost” of any finished batteries destroyed or stolen. Roger’s brother-in-law has determined this cost as follows:

$$\frac{\text{Total costs for the quarter}}{\text{Batteries produced during the quarter}} = \frac{\$1,130,000}{40,000 \text{ units}}$$

$$= \$28.25 \text{ per unit}$$

$$8,000 \text{ batteries} \times \$28.25 \text{ per unit} = \$226,000$$

Inventories at the beginning and end of the quarter were as follows:

| | Beginning of the Quarter | End of the Quarter |
|-----------------------|-------------------------------------|-------------------------------|
| Raw materials | \$0 | \$10,000 |
| Work in process | \$0 | \$50,000 |
| Finished goods | \$0 | ? |

Required:

1. What conceptual errors, if any, were made in preparing the income statement above?
2. Prepare a schedule of cost of goods manufactured for the first quarter.
3. Prepare a corrected income statement for the first quarter. Your statement should show in detail how the cost of goods sold is computed.
4. Do you agree that the insurance company owes Solar Technology, Inc., \$226,000? Explain your answer.

RESEARCH AND APPLICATION 2–28

[LO2, LO3, LO6, LO7]

The questions in this exercise are based on Dell, Inc. To answer the questions, you will need to download Dell's 2005 Form 10-K by going to www.sec.gov/edgar/searchedgar/companysearch.html. Input CIK code 826083 and hit enter. In the gray box on the right-hand side of your computer screen define the scope of your search by inputting 10-K and then pressing enter. Select the 10-K with a filing date of March 8, 2005. You do not need to print this document in order to answer the questions.

Required:

1. What is Dell's strategy for success in the marketplace? Does the company rely primarily on a customer intimacy, operational excellence, or product leadership customer value proposition? What evidence supports your conclusion?
2. What business risks does Dell face that may threaten its ability to satisfy stockholder expectations? What are some examples of control activities that the company could use to reduce these risks? (Hint: Focus on pages 7–10 of the 10-K.)
3. How has the Sarbanes-Oxley Act of 2002 explicitly affected the disclosures contained in Dell's 10-K report? (Hint: Focus on pages 34–35, 59, and 76–78.)
4. Is Dell a merchandiser or a manufacturer? What information contained in the 10-K supports your answer?
5. What are some examples of direct and indirect inventoriable costs for Dell? Why has Dell's gross margin (in dollars) steadily increased from 2003 to 2005, yet the gross margin as a percentage of net revenue has only increased slightly?
6. What is the inventory balance on Dell's January 28, 2005 balance sheet? Why is the inventory balance so small compared to the other current asset balances? What competitive advantage does Dell derive from its low inventory levels? Page 27 of Dell's 10-K reports a figure called the cash conversion cycle. The cash conversion cycle for Dell has consistently been negative. Is this a good sign for Dell or a bad sign? Why?
7. Describe some of the various types of operating expenses incurred by Dell. Why are these expenses treated as period costs?
8. List four different cost objects for Dell. For each cost object, mention one example of a direct cost and an indirect cost.

DELL

Learning Objectives

After studying Chapter 3, you should be able to:

- L01** Understand how fixed and variable costs behave and how to use them to predict costs.
- L02** Use a scattergraph plot to diagnose cost behavior.
- L03** Analyze a mixed cost using the high-low method.
- L04** Prepare an income statement using the contribution format.
- L05** (Appendix 3A) Analyze a mixed cost using the least-squares regression method.

Cost Behavior: Analysis and Use

The Business of Art Sculpture

Shidoni Foundry, located in Tesuque, New Mexico, is a fine art casting and fabrication facility. The process of creating a bronze or other metal sculpture is complex. The artist creates the sculpture using modeling clay and then hires a foundry such as Shidoni to produce the actual metal sculpture. Shidoni crafts-people make a rubber mold from the clay model then use that mold to

make a wax version of the original. The wax is in turn used to make a ceramic casting mold, and finally the bronze version is cast. Both the wax and the ceramic casting mold are destroyed in the process of making the metal casting, but the rubber mold is not and can be reused to make additional castings.

The surface of the metal sculpture can be treated with various patinas. One of the accompanying photos shows Harry Gold, the shop's patina artist, applying a patina to a metal sculpture with brush and blowtorch. The other photo shows a finished sculpture with patinas applied.

The artist is faced with a difficult business decision. The rubber mold for a small figure such as the seated Indian in the accompanying photo costs roughly \$500; the mold for a life-size figure such as the cowboy costs \$3,800 to \$5,000. This is just for the mold! Fortunately, as discussed above, a number of metal castings can be made from each mold. However, each life-size casting costs \$8,500 to \$11,000. In contrast, a casting of the much smaller Indian sculpture would cost about \$750. Given the fixed costs of the mold and variable costs of the casting, finish treatments, and bases, the artist must decide how many castings to produce and how to price them. The fewer the castings, the greater the rarity factor, and hence the higher the price that can be charged to art lovers. However, in that case, the fixed costs of making the mold must be spread across fewer items. The artist must make sure not to price the sculptures so high that the investment in molds and in the castings cannot be recovered. ■

BUSINESS FOCUS

Source: Conversations with Shidoni personnel, including Bill Rogers and Harry Gold, and Shidoni literature. See www.shidoni.com for more information concerning the company.

In Chapter 2, we stated that costs can be classified by behavior. Cost behavior refers to how a cost will change as the level of activity changes. Managers who understand how costs behave can predict how costs will change under various alternatives. Conversely, attempting to make decisions without a thorough understanding of cost behavior patterns can lead to disaster. For example, cutting back production of a product line might result in far less cost savings than managers assume if they confuse fixed costs with variable costs. To avoid such problems, managers must be able to accurately predict what costs will be at various activity levels.

This chapter briefly reviews the definitions of variable and fixed costs and then discusses the behavior of these costs in greater depth than in Chapter 2. The chapter also introduces the concept of a mixed cost, which is a cost that has both variable and fixed cost elements. The chapter concludes by introducing a new income statement format—called the *contribution format*—in which costs are organized by their behavior rather than by the traditional functions of production, sales, and administration.

Types of Cost Behavior Patterns

In Chapter 2 we mentioned only variable and fixed costs. In this chapter we will examine a third cost behavior pattern, known as a *mixed* or *semivariable* cost. All three cost behavior patterns—variable, fixed, and mixed—are found in most organizations. The relative proportion of each type of cost in an organization is known as its **cost structure**. For example, an organization might have many fixed costs but few variable or mixed costs. Alternatively, it might have many variable costs but few fixed or mixed costs. In this chapter, we will concentrate on gaining a fuller understanding of the behavior of each type of cost. In the next chapter, we explore how cost structure impacts decisions.

Variable Costs

We explained in Chapter 2 that a variable cost is a cost whose total dollar amount varies in direct proportion to changes in the activity level. If the activity level doubles, the total variable cost also doubles. If the activity level increases by only 10%, then the total variable cost increases by 10% as well.

We also found in Chapter 2 that a variable cost remains constant if expressed on a *per unit* basis. To provide an example, consider Nooksack Expeditions, a small company that provides daylong whitewater rafting excursions on rivers in the North Cascade Mountains. The company provides all of the necessary equipment and experienced guides, and it serves gourmet meals to its guests. The meals are purchased from a caterer for \$30 a person for a daylong excursion. If we look at the cost of the meals on a *per person* basis, it remains constant at \$30. This \$30 cost per person will not change, regardless of how many people participate in a daylong excursion. The behavior of this variable cost, on both a per unit and a total basis, is tabulated as follows:

LEARNING OBJECTIVE 1
Understand how fixed and variable costs behave and how to use them to predict costs.

| Number of Guests | Cost of Meals per Guest | Total Cost of Meals |
|------------------|-------------------------|---------------------|
| 250 | \$30 | \$7,500 |
| 500 | \$30 | \$15,000 |
| 750 | \$30 | \$22,500 |
| 1,000 | \$30 | \$30,000 |

The idea that a variable cost is constant per unit but varies in total with the activity level is crucial to understanding cost behavior patterns. We shall rely on this concept repeatedly in this chapter and in chapters ahead.

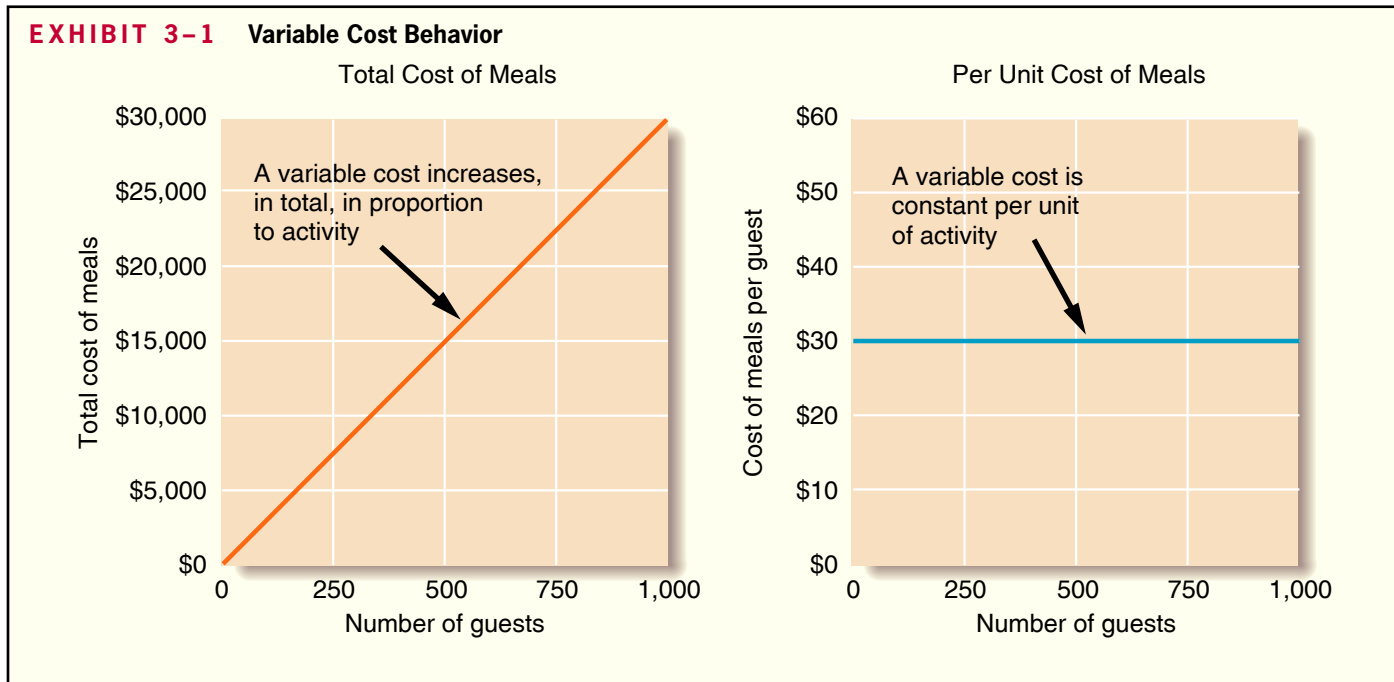

Exhibit 3-1 illustrates variable cost behavior. Note that the graph of the total cost of the meals slants upward to the right. This is because the total cost of the meals is directly proportional to the number of guests. In contrast, the graph of the per unit cost of meals is flat because the cost of the meals per guest is constant at \$30.

The Activity Base For a cost to be variable, it must be variable *with respect to something*. That “something” is its *activity base*. An **activity base** is a measure of whatever causes the incurrence of variable cost. An activity base is sometimes referred to as a *cost driver*. Some of the most common activity bases are direct labor-hours, machine-hours, units produced, and units sold. Other examples of activity bases (cost drivers) include the number of miles driven by salespersons, the number of pounds of laundry cleaned by a hotel, the number of calls handled by technical support staff at a software company, and the number of beds occupied in a hospital.

People sometimes get the notion that if a cost doesn’t vary with production or with sales, then it is not a variable cost. This is not correct. As suggested by the range of bases listed above, costs are caused by many different activities within an organization. Whether a cost is variable or fixed depends on whether it is caused by the activity under consideration. For example, when analyzing the cost of service calls under a product warranty, the relevant activity measure is the number of service calls made. Those costs that vary in total with the number of service calls made are the variable costs of making service calls.

Nevertheless, unless stated otherwise, you can assume that the activity base under consideration is the total volume of goods and services provided by the organization. So, for example, if we ask whether direct materials at Ford is a variable cost, the answer is yes because the cost of direct materials is variable with respect to Ford’s total volume of output. We will specify the activity base only when it is something other than total output.

Extent of Variable Costs The number and type of variable costs in an organization will depend in large part on the organization’s structure and purpose. A public utility like Florida Power and Light, with large investments in equipment, will tend to have few variable costs. Most of the costs are associated with its plant, and these costs tend to be insensitive to changes in levels of service provided. A manufacturing

EXHIBIT 3-2
Examples of Variable Costs

| Type of Organization | Costs that Are Normally Variable with Respect to Volume of Output |
|--|--|
| Merchandising company | Cost of goods (merchandise) sold |
| Manufacturing company | Direct materials Direct labor* Variable elements of manufacturing overhead: Indirect materials Lubricants Supplies Power |
| Both merchandising and manufacturing companies | Variable elements of selling and administrative costs: Commissions Shipping costs |
| Service organizations | Supplies |

*Direct labor may or may not be variable in practice. See the discussion later in this chapter.

company like **Black and Decker**, by contrast, will often have many variable costs; these costs will be associated with both manufacturing and distributing its products to customers.

A merchandising company like **Wal-Mart** or **J. K. Gill** will usually have a high proportion of variable costs in its cost structure. In most merchandising companies, the cost of merchandise purchased for resale, a variable cost, constitutes a very large component of total cost. Service companies, by contrast, have diverse cost structures. Some service companies, such as the **Skippers** restaurant chain, have fairly large variable costs because of the costs of their raw materials. On the other hand, service companies involved in consulting, auditing, engineering, dental, medical, and architectural activities have very large fixed costs in the form of expensive facilities and highly trained salaried employees.

Some of the more frequently encountered variable costs are listed in Exhibit 3-2 above. This exhibit is not a complete listing of all costs that can be considered variable. Moreover, some of the costs listed in the exhibit may behave more like fixed than variable costs in some organizations and in some circumstances. We will see examples of this later in the chapter. Nevertheless, Exhibit 3-2 provides a useful listing of many of the costs that normally would be considered variable with respect to the volume of output.

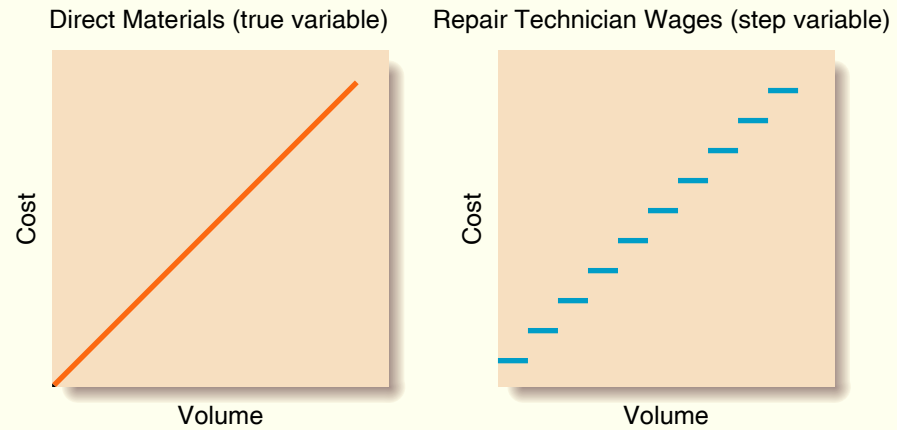

True Variable versus Step-Variable Costs

Not all variable costs have exactly the same behavior pattern. Some variable costs behave in a *true variable or proportionately variable* pattern. Other variable costs behave in a *step-variable* pattern.

True Variable Costs Direct materials is a true or proportionately variable cost because the amount used during a period will vary in direct proportion to the level of production activity. Moreover, any amounts purchased but not used can be stored and carried forward to the next period as inventory.

Step-Variable Costs The cost of a resource that is obtained in large chunks and that increases or decreases only in response to fairly wide changes in activity is known as a

EXHIBIT 3-3
True Variable versus
Step-Variable Costs

step-variable cost. For example, the wages of skilled repair technicians are often considered to be a step-variable cost. Such a technician’s time can only be obtained in large chunks—it is difficult to hire a skilled technician on anything other than a full-time basis. Moreover, any technician’s time not currently used cannot be stored as inventory and carried forward to the next period. If the time is not used effectively, it is gone forever. Furthermore, a repair technician can work at a leisurely pace if pressures are light but intensify his or her efforts if pressures build up. For this reason, small changes in the level of production may have no effect on the number of technicians employed by the company.

Exhibit 3-3 contrasts the behavior of a step-variable cost with the behavior of a true variable cost. Notice that the cost of repair technicians changes only with fairly wide changes in volume and that additional technicians come in large, indivisible chunks. Great care must be taken in working with these kinds of costs to prevent “fat” from building up in an organization. There may be a tendency to employ additional help more quickly than needed, and there is a natural reluctance to lay people off when volume declines.

IN BUSINESS

HOW MANY GUIDES?

Majestic Ocean Kayaking, of Ucluelet, British Columbia, is owned and operated by Tracy Morben-Eeftink. The company offers a number of guided kayaking excursions ranging from three-hour tours of the Ucluelet harbor to six-day kayaking and camping trips in Clayoquot Sound. One of the company’s excursions is a four-day kayaking and camping trip to The Broken Group Islands in the Pacific Rim National Park. Special regulations apply to trips in the park—including a requirement that one certified guide must be assigned for every five guests or fraction thereof. For example, a trip with 12 guests must have at least three certified guides. Guides are not salaried and are paid on a per-day basis. Therefore, the cost to the company of the guides for a trip is a step-variable cost rather than a fixed cost or a strictly variable cost. One guide is needed for 1 to 5 guests, two guides for 6 to 10 guests, three guides for 11 to 15 guests, and so on.

Sources: Tracy Morben-Eeftink, owner, Majestic Ocean Kayaking. For more information about the company, see www.oceankayaking.com.

WHAT GOES UP DOESN'T NECESSARILY COME DOWN

The traditional view of variable costs is that they behave similarly in response to either increases or decreases in activity. However, the results of a research study using data from 7,629 companies spanning a 20-year period suggests otherwise. In this study, a 1% increase in sales corresponded with a 0.55% increase in selling and administrative costs, while a 1% decrease in sales corresponded with a 0.35% decrease in selling and administrative costs. These results suggest that many costs do not mechanically increase or decrease in response to changes in the activity base; rather they change in response to managers' decisions about how to react to changes in the level of the activity base.

"When volume falls, managers must decide whether to maintain committed resources and bear the costs of operating with unutilized capacity or reduce committed resources and incur the adjustment costs of retrenching and, if volume is restored, replacing committed resources at a later date." Managers faced with these choices are less likely to reduce expenses when they perceive that a decrease in activity level is temporary or when the cost of adjusting committed resources is high.

Source: Mark C. Anderson, Rajiv D. Banker, and Surya N. Janakiraman, "Are Selling, General, and Administrative Costs 'Sticky'?" *Journal of Accounting Research*, March 2003, pp. 47-63.

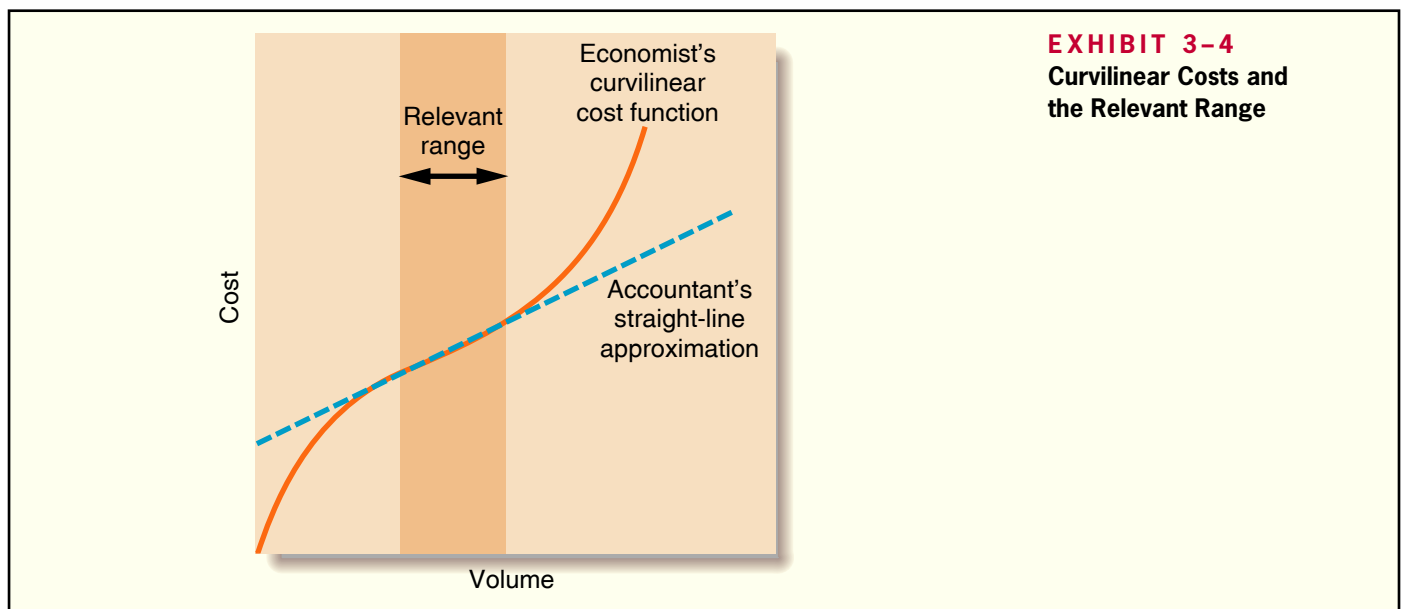

EXHIBIT 3-4
Curvilinear Costs and the Relevant Range

The Linearity Assumption and the Relevant Range Except in the case of step-variable costs, we ordinarily assume a strictly linear relationship between cost and volume. Economists correctly point out that many costs that the accountant classifies as variable actually behave in a *curvilinear* fashion; that is, the relation between cost and activity is a curve. A curvilinear cost is illustrated in Exhibit 3-4.

Although many costs are not strictly linear, a curvilinear cost can be satisfactorily approximated with a straight line within a narrow band of activity known as the *relevant range*. The **relevant range** is that range of activity within which the assumptions made about cost behavior are reasonably valid. For example, note that the dashed line in

EXHIBIT 3-5 Fixed Cost Behavior

Exhibit 3-4 approximates the curvilinear cost with very little loss of accuracy within the shaded relevant range. However, outside of the relevant range this particular straight line is a poor approximation to the curvilinear cost relationship. Managers should always keep in mind that assumptions made about cost behavior may be invalid if activity falls outside of the relevant range.

Fixed Costs

In our discussion of cost behavior patterns in Chapter 2, we stated that total fixed costs remain constant within the relevant range of activity. To continue the Nooksack Expeditions example, assume the company rents a building for \$500 per month to store its equipment. Within the relevant range, the total amount of rent paid is the same regardless of the number of guests the company takes on its expeditions during any given month. Exhibit 3-5 depicts this cost behavior pattern.

Because fixed costs remain constant in total, the average fixed cost *per unit* becomes progressively smaller as the level of activity increases. If Nooksack Expeditions has only 250 guests in a month, the \$500 fixed rental cost would amount to an average of \$2 per guest. If there are 1,000 guests, the fixed rental cost would average only 50 cents per guest. Exhibit 3-5 illustrates this aspect of the behavior of fixed costs. Note that as the number of guests increases, the average fixed cost per unit drops, but it drops at a decreasing rate. The first guests have the biggest impact on the average fixed cost per unit.

It is necessary in some contexts to express fixed costs on an average per unit basis. For example, in Chapter 2 we showed how unit product costs computed for use in external financial statements contain both variable and fixed costs. As a general rule, however, we caution against expressing fixed costs on an average per unit basis in internal reports because it creates the false impression that fixed costs are like variable costs and that total fixed costs actually change as the level of activity changes. To avoid confusion in internal reporting and decision-making situations, fixed costs should be expressed in total rather than on a per unit basis.

IN BUSINESS

COSTING THE TREK

Jackson Hole Llamas is owned and operated by Jill Aanonsen/Hodges and David Hodges. The company provides guided tours to remote areas of Yellowstone National Park and the Jedediah Smith Wilderness, with the llamas carrying the baggage for the multiday treks.

Jill and David operate out of their ranch in Jackson Hole, Wyoming, leading about 10 trips each summer season. All food is provided as well as tents and sleeping pads. Based on the number of guests on a trip, Jill and David will decide how many llamas will go on the trip and how many will remain on the ranch. Llamas are transported to the trailhead in a special trailer.

The company has a number of costs, some of which are listed below:

| Cost | Cost Behavior |
|-----------------------------------|---|
| Food and beverage costs | Variable with respect to the number of guests and the length of the trip in days. |
| Truck and trailer operating costs | Variable with respect to the number of miles to the trailhead. |
| Guide wages | Step variable; Jill and David serve as the guides on most trips and hire guides only for larger groups. |
| Costs of providing tents | Variable with respect to the number of guests and length of the trip in days. Jackson Hole Llamas owns its tents, but they wear out through use and must be repaired or eventually replaced. |
| Cost of feeding llamas | Variable with respect to the number of guests, and hence the number of llamas, on a trip. [Actually, the cost of feeding llamas may <i>decrease</i> with the number of guests on a trip. When a llama is on a trek, it lives off the land—eating grasses and other vegetation found in meadows and along the trail. When a llama is left on the ranch, it may have to be fed purchased feed.] |
| Property taxes | Fixed. |

Types of Fixed Costs

Fixed costs are sometimes referred to as capacity costs because they result from outlays made for buildings, equipment, skilled professional employees, and other items needed to provide the basic capacity for sustained operations. For planning purposes, fixed costs can be viewed as either *committed* or *discretionary*.

Committed Fixed Costs Investments in facilities, equipment, and the basic organization often can't be significantly reduced even for short periods of time without making fundamental changes. Such costs are referred to as **committed fixed costs**. Examples include depreciation of buildings and equipment, real estate taxes, insurance expenses, and salaries of top management and operating personnel. Even if operations are interrupted or cut back, committed fixed costs remain largely unchanged in the short term. During a recession, for example, a company won't usually eliminate key executive positions or sell off key facilities—the basic organizational structure and facilities ordinarily are kept intact. The costs of restoring them later are likely to be far greater than any short-run savings that might be realized.

Once a decision is made to acquire committed fixed resources, the company may be locked into that decision for many years to come. Consequently, such commitments should be made only after careful analysis of the available alternatives. Investment decisions involving committed fixed costs will be examined in a later chapter.

Discretionary Fixed Costs **Discretionary fixed costs** (often referred to as *managed fixed costs*) usually arise from *annual* decisions by management to spend on certain fixed cost items. Examples of discretionary fixed costs include advertising, research, public relations, management development programs, and internships for students.

Two key differences exist between discretionary fixed costs and committed fixed costs. First, the planning horizon for a discretionary fixed cost is short term—usually a single year. By contrast, committed fixed costs have a planning horizon that encompasses many years. Second, discretionary fixed costs can be cut for short periods of time with minimal damage to the long-run goals of the organization. For example, spending on management development programs can be reduced because of poor economic conditions. Although some unfavorable consequences may result from the cutback, it is doubtful that these consequences would be as great as those that would result if the company decided to economize by laying off key personnel.

Whether a particular cost is regarded as committed or discretionary may depend on management's strategy. For example, during recessions when the level of home building is down, many construction companies lay off most of their workers and virtually disband operations. Other construction companies retain large numbers of employees on the payroll, even though the workers have little or no work to do. While these latter companies may be faced with short-term cash flow problems, it will be easier for them to respond quickly when economic conditions improve. And the higher morale and loyalty of their employees may give these companies a significant competitive advantage.

The most important characteristic of discretionary fixed costs is that management is not locked into its decisions regarding such costs. Discretionary costs can be adjusted from year to year or even perhaps during the course of a year if necessary.

IN BUSINESS

A TWIST ON FIXED AND VARIABLE COSTS

Mission Controls designs and installs automation systems for food and beverage manufacturers. At most companies, when sales drop and cost cutting is necessary, top managers lay off workers. The founders of Mission Controls decided to do something different when sales drop—they slash their own salaries before they even consider letting any of their employees go. This makes their own salaries somewhat variable, while the wages and salaries of workers act more like fixed costs. The payoff is a loyal and committed workforce.

Source: Christopher Caggiano, "Employment, Guaranteed for Life," *Inc.* magazine, October 15, 2002, p. 74.

The Trend toward Fixed Costs The trend in many industries is toward greater fixed costs relative to variable costs. Chores that used to be performed by hand have been taken over by machines. For example, grocery clerks at stores like **Safeway** and **Kroger** used to key in prices by hand on cash registers. Now stores are equipped with barcode readers that enter price and other product information automatically. In general, competition has created pressure to give customers more value for their money—a demand that often can only be satisfied by automating business processes. For example, an **H & R Block** employee used to fill out tax returns for customers by hand and the advice given to a customer largely depended on the knowledge of that particular employee. Now, sophisticated computer software based on the accumulated knowledge of many experts is used to complete tax returns, and the software provides tax planning and other advice tailored to the customer's needs.

As automation intensifies, the demand for “knowledge” workers—those who work primarily with their minds rather than their muscles—has grown tremendously. Because knowledge workers tend to be salaried, highly trained, and difficult to replace, the costs of compensating these workers are often relatively fixed and are committed rather than discretionary.

Is Labor a Variable or a Fixed Cost? As the preceding discussion suggests, wages and salaries may be fixed or variable. The behavior of wage and salary costs will differ from one country to another, depending on labor regulations, labor contracts, and custom. In some countries, such as France, Germany, and Japan, management has little flexibility in adjusting the labor force to changes in business activity. In countries such as the United States and the United Kingdom, management typically has much greater latitude. However, even in these less restrictive environments, managers may choose to treat employee compensation as a fixed cost for several reasons.

First, many managers are reluctant to decrease their workforce in response to short-term declines in sales. These managers realize that the success of their businesses hinges on retaining highly skilled and trained employees. If these valuable workers are laid off, it is unlikely that they would ever return or be easily replaced. Furthermore, laying off workers undermines the morale of those employees who remain.

Second, managers do not want to be caught with a bloated payroll in an economic downturn. Therefore, managers are reluctant to add employees in response to short-term increases in sales. Instead, more and more companies rely on temporary and part-time workers to take up the slack when their permanent, full-time employees are unable to handle all of the demand for their products and services. In such companies, labor costs are a complex mixture of fixed and variable costs.

HEDGING THEIR BETS WITH CONTINGENT EMPLOYEES

Companies in white-collar industries such as media, public relations, and technology frequently hire contingent employees from staffing agencies to reduce the risk of being saddled with a bloated payroll during a business downturn. Contingent employees earn an hourly wage from their staffing agency, but they do not receive any fringe benefits. Companies employing contingent workers like the flexibility of being able to lay off these people with one telephone call to the staffing agency. Brad Karsh, president of a Chicago employment-coaching service called **JobBound** recommends a similar lack of commitment to his clients who accept contingent employment positions. “It’s exactly like dating,” he says. “You don’t want to be loyal if they’re not going to be loyal to you.”

Source: Daniel Nasaw, “Companies Are Hedging Their Bets by Hiring Contingent Employees,” *The Wall Street Journal*, September 14, 2004, p. B10.

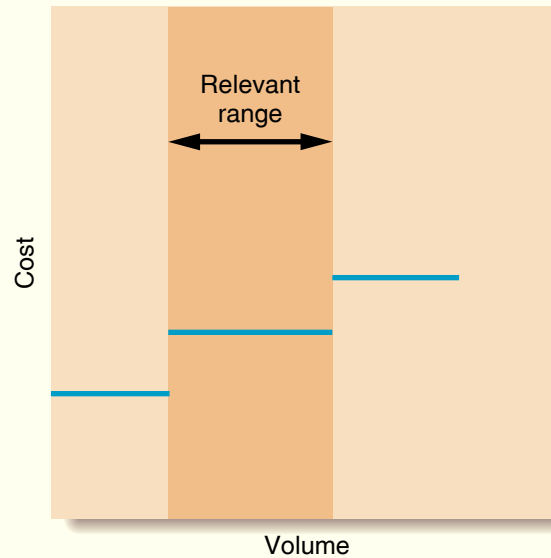

IN BUSINESS

Many major companies have undergone waves of downsizing in recent years in which large numbers of employees—particularly managers—have lost their jobs. This downsizing may seem to suggest that even management salaries should be regarded as variable costs, but this would not be a valid conclusion. Downsizing has largely been the result of attempts to reengineer business processes and cut costs rather than a response to a decline in sales activity. This underscores an important, but subtle, point. Fixed costs can change—they just don’t change in response to small changes in activity.

In sum, there is no clear-cut answer to the question “Is labor a variable or fixed cost?” It depends on how much flexibility management has to adjust the workforce and management’s strategy. Nevertheless, unless otherwise stated, we will assume in this text that direct labor is a variable cost. This assumption is more likely to be valid for companies in the United States than in countries where employment laws permit much less flexibility.

EXHIBIT 3-6
Fixed Costs and the
Relevant Range

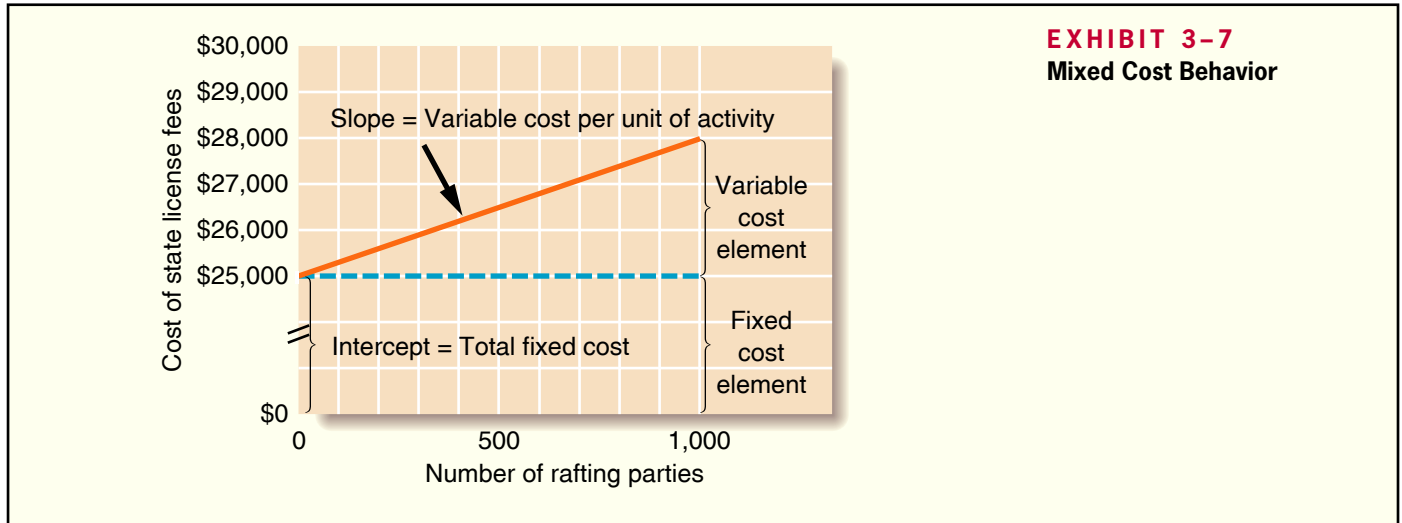

Fixed Costs and the Relevant Range

The concept of the relevant range, which was introduced in the discussion of variable costs, is also important in understanding fixed costs—particularly discretionary fixed costs. The levels of discretionary fixed costs are typically decided at the beginning of the year and depend on the needs of planned programs such as advertising and training. The scope of these programs will depend, in turn, on the overall anticipated level of activity for the year. At very high levels of activity, programs are often broadened or expanded. For example, if the company hopes to increase sales by 25%, it would probably plan for much larger advertising costs than if no sales increase were planned. So the *planned* level of activity might affect total discretionary fixed costs. However, once the total discretionary fixed costs have been budgeted, they are unaffected by the *actual* level of activity. For example, once the advertising budget has been established and spent, it will not be affected by how many units are actually sold. Therefore, the cost is fixed with respect to the *actual* number of units sold.

Discretionary fixed costs are easier to adjust than committed fixed costs. They also tend to be less “lumpy.” Committed fixed costs consist of costs such as buildings, equipment, and the salaries of key personnel. It is difficult to buy half a piece of equipment or to hire a quarter of a product-line manager, so the step pattern depicted in Exhibit 3-6 is typical for such costs. The relevant range of activity for a fixed cost is the range of activity over which the graph of the cost is flat as in Exhibit 3-6. As a company expands its level of activity, it may outgrow its present facilities, or the key management team may need to be expanded. The result, of course, will be increased committed fixed costs as larger facilities are built and as new management positions are created.

One reaction to the step pattern depicted in Exhibit 3-6 is to conclude that discretionary and committed fixed costs are really just step-variable costs. To some extent this is true, because *almost* all costs can be adjusted in the long run. There are two major differences, however, between the step-variable costs depicted earlier in Exhibit 3-3 and the fixed costs depicted in Exhibit 3-6.

The first difference is that the step-variable costs can often be adjusted quickly as conditions change, whereas once fixed costs have been set, they usually can’t be changed easily. A step-variable cost such as the wages of repair technicians, for example, can be adjusted upward or downward by hiring and laying off technicians. By contrast, once a

company has signed a lease for a building, it is locked into that level of lease cost for the life of the contract.

The second difference is that the *width of the steps* depicted for step-variable costs is much narrower than the width of the steps depicted for the fixed costs in Exhibit 3-6. The width of the steps relates to volume or level of activity. For step-variable costs, the width of a step might be 40 hours of activity per week in the case of repair technicians. For fixed costs, however, the width of a step might be *thousands* or even *tens of thousands* of hours of activity. In essence, the width of the steps for step-variable costs is generally so narrow that these costs can be treated essentially as variable costs for most purposes. The width of the steps for fixed costs, on the other hand, is so wide that these costs should be treated as entirely fixed within the relevant range.

Mixed Costs

A **mixed cost** contains both variable and fixed cost elements. Mixed costs are also known as semivariable costs. To continue the Nooksack Expeditions example, the company must pay a license fee of \$25,000 per year plus \$3 per rafting party to the state’s Department of Natural Resources. If the company runs 1,000 rafting parties this year, then the total fees paid to the state would be \$28,000, made up of \$25,000 in fixed cost plus \$3,000 in variable cost. Exhibit 3-7 depicts the behavior of this mixed cost.

Even if Nooksack fails to attract any customers, the company will still have to pay the license fee of \$25,000. This is why the cost line in Exhibit 3-7 intersects the vertical cost axis at the \$25,000 point. For each rafting party the company organizes, the total cost of the state fees will increase by \$3. Therefore, the total cost line slopes upward as the variable cost of \$3 per party is added to the fixed cost of \$25,000 per year.

Because the mixed cost in Exhibit 3-7 is represented by a straight line, the following equation for a straight line can be used to express the relationship between a mixed cost and the level of activity:

$$Y = a + bX$$

In this equation,

Y = The total mixed cost

a = The total fixed cost (the vertical intercept of the line)

b = The variable cost per unit of activity (the slope of the line)

X = The level of activity

Because the variable cost per unit equals the slope of the straight line, the steeper the slope, the higher the variable cost per unit.

In the case of the state fees paid by Nooksack Expeditions, the equation is written as follows:

$$Y = \$25,000 + \$3.00X$$

↑
↑
↑
↙

Total mixed cost Total fixed cost Variable cost per unit of activity Activity level

This equation makes it easy to calculate the total mixed cost for any level of activity within the relevant range. For example, suppose that the company expects to organize 800 rafting parties in the next year. The total state fees would be calculated as follows:

$$\begin{aligned}
 Y &= \$25,000 + (\$3.00 \text{ per rafting party} \times 800 \text{ rafting parties}) \\
 &= \$27,400
 \end{aligned}$$

The Analysis of Mixed Costs

Mixed costs are very common. For example, the overall cost of providing X-ray services to patients at the **Harvard Medical School Hospital** is a mixed cost. The costs of equipment depreciation and radiologists' and technicians' salaries are fixed, but the costs of X-ray film, power, and supplies are variable. At **Southwest Airlines**, maintenance costs are a mixed cost. The company incurs fixed costs for renting maintenance facilities and for keeping skilled mechanics on the payroll, but the costs of replacement parts, lubricating oils, tires, and so forth, are variable with respect to how often and how far the company's aircraft are flown.

The fixed portion of a mixed cost represents the minimum cost of having a service *ready and available* for use. The variable portion represents the cost incurred for *actual consumption* of the service, thus it varies in proportion to the amount of service actually consumed.

How does management go about actually estimating the fixed and variable components of a mixed cost? The most common methods used in practice are *account analysis* and the *engineering approach*.

In **account analysis**, an account is classified as either variable or fixed based on the analyst's prior knowledge of how the cost in the account behaves. For example, direct materials would be classified as variable and a building lease cost would be classified as fixed because of the nature of those costs. The total fixed cost of an organization is the sum of the costs for the accounts that have been classified as fixed. The variable cost per unit is estimated by dividing the sum of the costs for the accounts that have been classified as variable by the total activity.

The **engineering approach** to cost analysis involves a detailed analysis of what cost behavior should be, based on an industrial engineer's evaluation of the production methods to be used, the materials specifications, labor requirements, equipment usage, production efficiency, power consumption, and so on. For example, **Pizza Hut** might use the engineering approach to estimate the cost of preparing and serving a particular take-out pizza. The cost of the pizza would be estimated by carefully costing the specific ingredients used to make the pizza, the power consumed to cook the pizza, and the cost of the container the pizza is delivered in. The engineering approach must be used in those situations where no past experience is available concerning activity and costs. In addition, it is sometimes used together with other methods to improve the accuracy of cost analysis.

IN BUSINESS

OPERATIONS DRIVE COSTS

White Grizzly Adventures is a snowcat skiing and snowboarding company in Meadow Creek, British Columbia, that is owned and operated by Brad and Carole Karafil. The company shuttles 12 guests to the top of the company’s steep and tree-covered terrain in a modified snowcat. Guests stay as a group at the company’s lodge for a fixed number of days and are provided healthy gourmet meals.

Brad and Carole must decide each year when snowcat operations will begin in December and when they will end in early spring, and how many nonoperating days to schedule between groups of guests for maintenance and rest. These decisions affect a variety of costs. Examples of costs that are fixed and variable with respect to the number of days of operation at White Grizzly include:

| Cost | Cost Behavior—Fixed or Variable with Respect to Days of Operation |
|---|---|
| Property taxes | Fixed |
| Summer road maintenance and tree clearing | Fixed |
| Lodge depreciation | Fixed |
| Snowcat operator and guides | Variable |
| Cooks and lodge help | Variable |
| Snowcat depreciation | Variable |
| Snowcat fuel | Variable |
| Food* | Variable |

*The costs of food served to guests theoretically depend on the number of guests in residence. However, the lodge is almost always filled to its capacity of 12 persons when the snowcat operation is running, so food costs can be considered to be driven by the days of operation.

Source: Brad & Carole Karafil, owners and operators of White Grizzly Adventures, www.whitegrizzly.com.

Account analysis works best when analyzing costs at a fairly aggregated level, such as the cost of serving patients in the emergency room (ER) of **Cook County General Hospital**. The costs of drugs, supplies, forms, wages, equipment, and so on, can be roughly classified as variable or fixed and a mixed cost formula for the overall cost of the emergency room can be estimated fairly quickly. However, this method does not recognize that some of the accounts may have both fixed and variable cost elements. For example, the cost of electricity for the ER is a mixed cost. Most of the electricity is a fixed cost because it is used for heating and lighting. However, the consumption of electricity increases with activity in the ER because diagnostic equipment, operating theater lights, defibrillators, and so on, all consume electricity. The most effective way to estimate the fixed and variable elements of such a mixed cost may be to analyze past records of cost and activity data. These records should reveal whether electrical costs vary significantly with the number of patients and if so, by how much. The remainder of this section explains how to conduct such an analysis of past cost and activity data.

Dr. Derek Chalmers, the chief executive officer of Brentline Hospital, motioned Kinh Nguyen, the chief financial officer of the hospital, into his office.

Derek: I wanted to talk to you about our maintenance expenses. They seem to be bouncing around a lot. Over the last half year or so they have been as low as \$7,400 and as high as \$9,800 per month.

Kinh: That type of variation is normal for maintenance expenses.

Derek: But we budgeted a constant \$8,400 a month. Can’t we do a better job of predicting what these costs are going to be? And how do we know when we’ve spent too much in a month? Shouldn’t there be some explanation for these variations?

MANAGERIAL ACCOUNTING IN ACTION
The Issue

Kinh: Now that you mention it, we are in the process of tightening up our budgeting process. Our first step is to break all of our costs down into fixed and variable components.

Derek: How will that help?

Kinh: Well, it will permit us to predict what the level of costs will be. Some costs are fixed and shouldn't change much. Other costs go up and down as our activity goes up and down. The trick is to figure out what is driving the variable component of the costs.

Derek: What about the maintenance costs?

Kinh: My guess is that the variations in maintenance costs are being driven by our overall level of activity. When we treat more patients, our equipment is used more intensively, which leads to more maintenance expense.

Derek: How would you measure the level of overall activity? Would you use patient-days?

Kinh: I think so. Each day a patient is in the hospital counts as one patient-day. The greater the number of patient-days in a month, the busier we are. Besides, our budgeting is all based on projected patient-days.

Derek: Okay, so suppose you are able to break the maintenance costs down into fixed and variable components. What will that do for us?

Kinh: Basically, I will be able to predict what maintenance costs should be as a function of the number of patient-days.

Derek: I can see where that would be useful. We could use it to predict costs for budgeting purposes.

Kinh: We could also use it as a benchmark. Based on the actual number of patient-days for a period, I can predict what the maintenance costs should have been. We can compare this to the actual spending on maintenance.

Derek: Sounds good to me. Let me know when you get the results.

LEARNING OBJECTIVE 2

Use a scattergraph plot to diagnose cost behavior.

Diagnosing Cost Behavior with a Scattergraph Plot

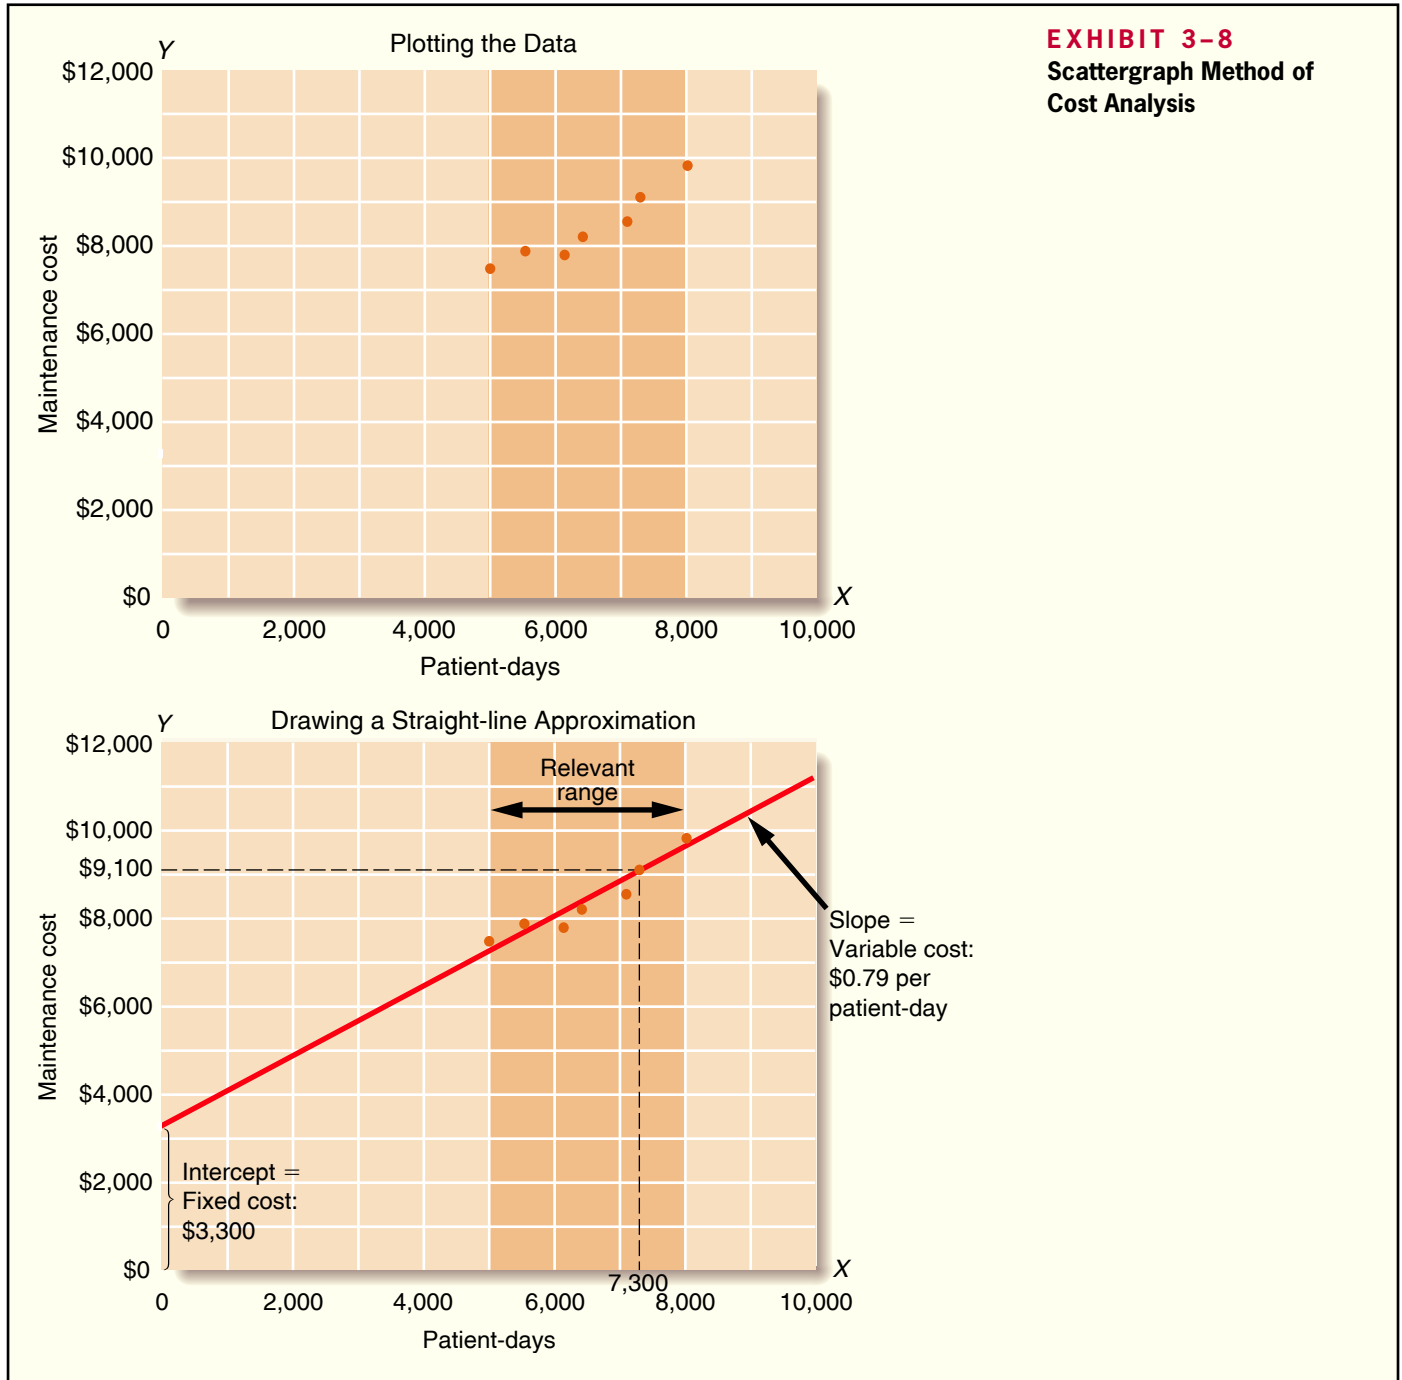

Kinh Nguyen began his analysis of maintenance costs by collecting cost and activity data for a number of recent months. Those data are displayed below:

| Month | Activity Level: Patient-Days | Maintenance Cost Incurred |
|----------------|---------------------------------|------------------------------|
| January | 5,600 | \$7,900 |
| February | 7,100 | \$8,500 |
| March | 5,000 | \$7,400 |
| April | 6,500 | \$8,200 |
| May | 7,300 | \$9,100 |
| June | 8,000 | \$9,800 |
| July | 6,200 | \$7,800 |

The first step in analyzing the cost and activity data is to plot the data on a scattergraph. This plot immediately reveals any nonlinearities or other problems with the data. The scattergraph of maintenance costs versus patient-days at Brentline Hospital is shown in the top half of Exhibit 3–8. Two things should be noted about this scattergraph:

1. The total maintenance cost, Y , is plotted on the vertical axis. Cost is known as the **dependent variable** because the amount of cost incurred during a period depends on the level of activity for the period. (That is, as the level of activity increases, total cost will also ordinarily increase.)
2. The activity, X (patient-days in this case), is plotted on the horizontal axis. Activity is known as the **independent variable** because it causes variations in the cost.

From the scattergraph, it is evident that maintenance costs do increase with the number of patient-days. In addition, the scattergraph reveals that the relation between maintenance costs and patient-days is approximately *linear*. In other words, the points lie more or less along a straight line. Such a straight line has been drawn using a ruler in the bottom half of Exhibit 3-8. Cost behavior is considered **linear** whenever a straight line is a reasonable approximation for the relation between cost and activity. Note that the data points do not fall exactly on the straight line. This will almost always happen in practice; the relation is seldom perfectly linear.

Note that the straight line in Exhibit 3-8 has been drawn through the point representing 7,300 patient-days and a total maintenance cost of \$9,100. Drawing the straight line

through one of the data points helps make a quick-and-dirty estimate of variable and fixed costs. The vertical intercept where the straight line crosses the *Y* axis—in this case, about \$3,300—is the rough estimate of the fixed cost. The variable cost can be quickly estimated by subtracting the estimated fixed cost from the total cost at the point lying on the straight line.

| | |
|---|----------------|
| Total maintenance cost for 7,300 patient-days (a point falling on the straight line) | \$9,100 |
| Less estimated fixed cost (the vertical intercept) | <u>3,300</u> |
| Estimated total variable cost for 7,300 patient-days | <u>\$5,800</u> |

The average variable cost per unit at 7,300 patient-days is computed as follows:

$$\begin{aligned} \text{Variable cost per unit} &= \$5,800 \div 7,300 \text{ patient-days} \\ &= \$0.79 \text{ per patient-day (rounded)} \end{aligned}$$

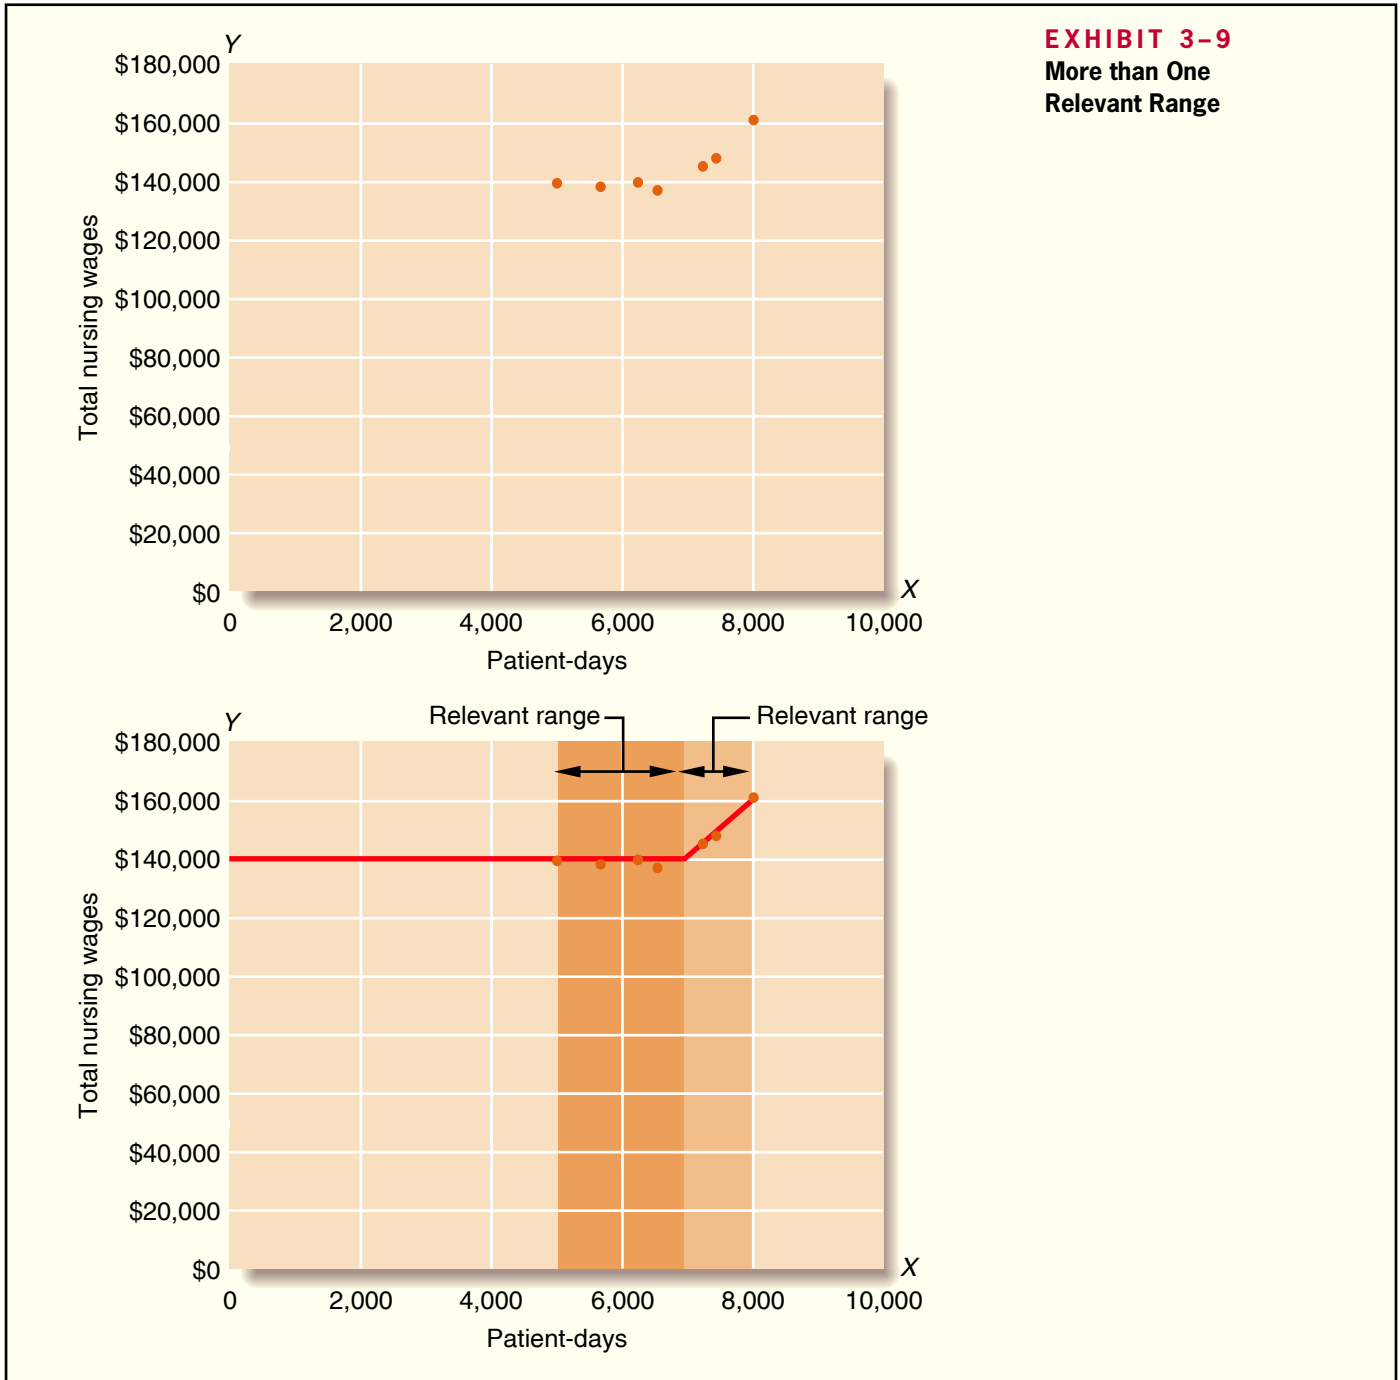

Combining the estimate of the fixed cost and the estimate of the variable cost per patient-day, we can express the relation between cost and activity as follows:

$$Y = \$3,300 + \$0.79X$$

where *X* is the number of patient-days.

We hasten to add that this *is* a quick-and-dirty method of estimating the fixed and variable cost elements of a mixed cost; it is seldom used in practice when the financial implications of a decision based on the data are significant. However, setting aside the estimates of the fixed and variable cost elements, plotting the data on a scattergraph is an essential diagnostic step that is too often overlooked. Suppose, for example, we had been interested in the relation between total nursing wages and the number of patient-days at the hospital. The permanent, full-time nursing staff can handle up to 7,000 patient-days in a month. Beyond that level of activity, part-time nurses must be called in to help out. The cost and activity data for nurses are plotted on the scattergraph in Exhibit 3–9. Looking at that scattergraph, it is evident that two straight lines would do a much better job of fitting the data than a single straight line. Up to 7,000 patient-days, total nursing wages are essentially a fixed cost. Above 7,000 patient-days, total nursing wages are a mixed cost. This happens because, as stated above, the permanent, full-time nursing staff can handle up to 7,000 patient-days in a month. Above that level, part-time nurses are called in to help, which adds to the cost. Consequently, two straight lines (and two equations) would be used to represent total nursing wages—one for the relevant range of 5,600 to 7,000 patient-days and one for the relevant range of 7,000 to 8,000 patient-days.

As another example, suppose that Brentline Hospital’s management is interested in the relation between the hospital’s telephone costs and patient-days. Patients are billed directly for their use of telephones, so those costs do not appear on the hospital’s cost records. Rather, management is concerned about the charges for the staff’s use of telephones. The data for this cost are plotted in Exhibit 3–10. It is evident from the plot that while the telephone costs do vary from month to month, they are not related to patient-days. Something other than patient-days is driving the telephone bills. Therefore, it would not make sense to analyze this cost any further by attempting to estimate a variable cost per patient-day for telephone costs. Plotting the data helps diagnose such situations.

The High-Low Method

In addition to the quick-and-dirty method described in the preceding section, more precise methods are available for estimating fixed and variable costs. However, it must be emphasized that fixed and variable costs should be computed only if a scattergraph plot confirms that the relation is approximately linear. In the case of maintenance costs at Brentline Hospital, the relation does appear to be linear. In the case of telephone costs, there isn't any clear relation between telephone costs and patient-days, so there is no point in estimating how much of the cost varies with patient-days.

LEARNING OBJECTIVE 3
Analyze a mixed cost using the high-low method.

EXHIBIT 3-10
A Diagnostic
Scattergraph Plot

Assuming that the scattergraph plot indicates a linear relation between cost and activity, the fixed and variable cost elements of a mixed cost can be estimated using the *high-low method* or the *least-squares regression method*. The high-low method is based on the rise-over-run formula for the slope of a straight line. As discussed above, if the relation between cost and activity can be represented by a straight line, then the slope of the straight line is equal to the variable cost per unit of activity. Consequently, the following formula can be used to estimate the variable cost.

$$\text{Variable cost} = \text{Slope of the line} = \frac{\text{Rise}}{\text{Run}} = \frac{Y_2 - Y_1}{X_2 - X_1}$$

To analyze mixed costs with the **high-low method**, begin by identifying the period with the lowest level of activity and the period with the highest level of activity. The period with the lowest activity is selected as the first point in the above formula and the period with the highest activity is selected as the second point. Consequently, the formula becomes:

$$\text{Variable cost} = \frac{Y_2 - Y_1}{X_2 - X_1} = \frac{\text{Cost at the high activity level} - \text{Cost at the low activity level}}{\text{High activity level} - \text{Low activity level}}$$

or

$$\text{Variable cost} = \frac{\text{Change in cost}}{\text{Change in activity}}$$

Therefore, when the high-low method is used, the variable cost is estimated by dividing the difference in cost between the high and low levels of activity by the change in activity between those two points.

To return to the Brentline Hospital example, using the high-low method, we first identify the periods with the highest and lowest *activity*—in this case, June and March. We then use the activity and cost data from these two periods to estimate the variable cost component as follows:

| | Patient-Days | Maintenance Cost Incurred |
|----------------------------------|--------------|---------------------------|
| High activity level (June) | 8,000 | \$9,800 |
| Low activity level (March) | 5,000 | 7,400 |
| Change | <u>3,000</u> | <u>\$2,400</u> |

$$\text{Variable cost} = \frac{\text{Change in cost}}{\text{Change in activity}} = \frac{\$2,400}{3,000 \text{ patient-days}} = \$0.80 \text{ per patient-day}$$

Having determined that the variable maintenance cost is 80 cents per patient-day, we can now determine the amount of fixed cost. This is done by taking the total cost at *either* the high or the low activity level and deducting the variable cost element. In the computation below, total cost at the high activity level is used in computing the fixed cost element:

$$\begin{aligned} \text{Fixed cost element} &= \text{Total cost} - \text{Variable cost element} \\ &= \$9,800 - (\$0.80 \text{ per patient-day} \times 8,000 \text{ patient-days}) \\ &= \$3,400 \end{aligned}$$

Both the variable and fixed cost elements have now been isolated. The cost of maintenance can be expressed as \$3,400 per month plus 80 cents per patient-day or as:

$$Y = \$3,400 + \$0.80X$$

↑ ↑
 Total Total
 maintenance patient-days
 cost

The data used in this illustration are shown graphically in Exhibit 3-11. Notice that a straight line has been drawn through the points corresponding to the low and high levels of activity. In essence, that is what the high-low method does—it draws a straight line through those two points.

Sometimes the high and low levels of activity don't coincide with the high and low amounts of cost. For example, the period that has the highest level of activity may not have the highest amount of cost. Nevertheless, the costs at the highest and lowest levels of *activity* are always used to analyze a mixed cost under the high-low method. The reason is that the analyst would like to use data that reflect the greatest possible variation in activity.

The high-low method is very simple to apply, but it suffers from a major (and sometimes critical) defect—it utilizes only two data points. Generally, two data points are not enough to produce accurate results. Additionally, the periods with the highest and lowest activity tend to be unusual. A cost formula that is estimated solely using data from these unusual periods may misrepresent the true cost behavior during normal periods. Such a distortion is evident in Exhibit 3–11. The straight line should probably be shifted down somewhat so that it is closer to more of the data points. For these reasons, other methods of cost analysis that use all of the data will generally be more accurate than the high-low method. A manager who chooses to use the high-low method should do so with a full awareness of its limitations.

Fortunately, computer software makes it very easy to use sophisticated statistical methods, such as *least-squares regression*, that use all of the data and that are capable of providing much more information than just the estimates of variable and fixed costs. The details of these statistical methods are beyond the scope of this text, but the basic approach is discussed below. Nevertheless, even if the least-squares regression approach is used, it is always a good idea to plot the data in a scattergraph. By simply looking at the scattergraph, you can quickly verify whether it makes sense to fit a straight line to the data using least-squares regression or some other method.

The Least-Squares Regression Method

The **least-squares regression method**, unlike the high-low method, uses all of the data to separate a mixed cost into its fixed and variable components. A *regression line* of the form $Y = a + bX$ is fitted to the data, where a represents the total fixed cost and b represents the variable cost per unit of activity. The basic idea underlying the least-squares regression method is illustrated in Exhibit 3–12 using hypothetical data points. Notice from the exhibit that the deviations from the plotted points to the regression line are measured vertically on the graph. These vertical deviations are called the regression errors. There is nothing mysterious about the least-squares regression method. It simply

EXHIBIT 3–12
The Concept of Least-Squares Regression

computes the regression line that minimizes the sum of these squared errors. The formulas that accomplish this are fairly complex and involve numerous calculations, but the principle is simple.

Fortunately, computers are adept at carrying out the computations required by the least-squares regression formulas. The data—the observed values of X and Y —are entered into the computer, and software does the rest. In the case of the Brentline Hospital maintenance cost data, a statistical software package on a personal computer can calculate the following least-squares regression estimates of the total fixed cost (a) and the variable cost per unit of activity (b):

$$a = \$3,431$$

$$b = \$0.759$$

Therefore, using the least-squares regression method, the fixed element of the maintenance cost is \$3,431 per month and the variable portion is 75.9 cents per patient-day.

In terms of the linear equation $Y = a + bX$, the cost formula can be written as

$$Y = \$3,431 + \$0.759X$$

where activity (X) is expressed in patient-days.

While a statistical software application was used in this example to calculate the values of a and b , the estimates can also be computed using a spreadsheet application such as Microsoft® Excel. In Appendix 3A to this chapter, we show how this can be done.

In addition to estimates of the intercept (fixed cost) and slope (variable cost per unit), least-squares regression software ordinarily provides a number of other very useful statistics. One of these statistics is the R^2 , which is a measure of “goodness of fit.” The R^2 tells us the percentage of the variation in the dependent variable (cost) that is explained by variation in the independent variable (activity). The R^2 varies from 0% to 100%, and the higher the percentage, the better. In the case of the Brentline Hospital maintenance cost data, the R^2 is 0.90, which indicates that 90% of the variation in maintenance costs is explained by the variation in patient-days. This is reasonably high and is an indication of a good fit. On the other hand, a low R^2 would be an indication of a poor fit. You should always plot the data in a scattergraph, but it is particularly important to check the data visually when the R^2 is low. A quick look at the scattergraph can reveal that there is little relation between the cost and the activity or that the relation is something other than a simple straight line. In such cases, additional analysis would be required.

After completing the analysis of maintenance costs, Kinh Nguyen met with Dr. Derek Chalmers to discuss the results.

Kinh: We used least-squares regression analysis to estimate the fixed and variable components of maintenance costs. According to the results, the fixed cost per month is \$3,431 and the variable cost per patient-day is 75.9 cents.

Derek: Okay, so if we plan for 7,800 patient-days next month, what is your estimate of the maintenance costs?

Kinh: That will take just a few seconds to figure out. [Kinh wrote the following calculations on a pad of paper.]

| | |
|--|----------------|
| Fixed costs | \$3,431 |
| Variable costs: | |
| 7,800 patient-days × \$0.759 per patient-day | 5,920 |
| Total expected maintenance costs | <u>\$9,351</u> |

Derek: Nine thousand three hundred and fifty *one* dollars; isn't that a bit *too* precise?

**MANAGERIAL
ACCOUNTING IN
ACTION**
The Wrap-up

Kinh: Sure. I don't really believe the maintenance costs will be exactly this figure. However, based on the information we have, this is the best estimate we can come up with.

Derek: This type of estimate will be a lot better than just guessing like we have done in the past. Thanks. I hope to see more of this kind of analysis.

Multiple Regression Analysis

In the discussion thus far, we have assumed that a single factor such as patient-days drives the variable cost component of a mixed cost. This assumption is acceptable for many mixed costs, but in some situations the variable cost element may be driven by a number of factors. For example, shipping costs may depend on both the number of units shipped *and* the weight of the units. In a situation such as this, *multiple regression* is necessary. **Multiple regression** is an analytical method that is used when the dependent variable (i.e., cost) is caused by more than one factor. Although adding more factors, or variables, makes the computations more complex, the principles involved are the same as in the simple least-squares regressions discussed above.

The Contribution Format Income Statement

LEARNING OBJECTIVE 4

Prepare an income statement using the contribution format.

Separating costs into fixed and variable elements helps to predict costs and provide benchmarks. As we will see in later chapters, separating costs into fixed and variable elements is also often crucial in making decisions. This crucial distinction between fixed and variable costs is at the heart of the **contribution approach** to constructing income statements. The unique thing about the contribution approach is that it provides managers with an income statement that clearly distinguishes between fixed and variable costs and therefore facilitates planning, control, and decision making.

Why a New Income Statement Format?

An income statement prepared using the *traditional approach*, as illustrated in Chapter 2, is organized in a “functional” format—emphasizing the functions of production, administration, and sales. No attempt is made to distinguish between fixed and variable costs. Under the heading “Administrative expense,” for example, both variable and fixed costs are lumped together.

Although an income statement prepared in the functional format may be useful for external reporting purposes, it has serious limitations when used for internal purposes. Internally, managers need cost data organized in a format that will facilitate planning, control, and decision making. As we shall see in the chapters ahead, these tasks are much easier when costs are identified as fixed or variable. The contribution format income statement has been developed in response to these needs.

The Contribution Approach

Exhibit 3–13 uses a simple example to compare a contribution approach income statement to the traditional approach discussed in Chapter 2.

Notice that the contribution approach separates costs into fixed and variable categories, first deducting variable expenses from sales to obtain the *contribution margin*. The **contribution margin** is the amount remaining from sales revenues after variable expenses have been deducted. This amount *contributes* toward covering fixed expenses and then toward profits for the period.

The contribution format income statement is used as an internal planning and decision-making tool. Its emphasis on cost behavior facilitates cost-volume-profit analysis

EXHIBIT 3-13 Comparison of the Contribution Income Statement with the Traditional Income Statement (the data are given)

| Traditional Approach (costs organized by function) | | Contribution Approach (costs organized by behavior) | |
|---|-----------------|--|-----------------|
| Sales | \$12,000 | Sales | \$12,000 |
| Cost of goods sold | 6,000* | Variable expenses: | |
| Gross margin | 6,000 | Variable production | \$2,000 |
| Selling and administrative expenses: | | Variable selling | 600 |
| Selling | \$3,100* | Variable administrative | 400 |
| Administrative | 1,900* | Contribution margin | 9,000 |
| Net operating income | <u>\$ 1,000</u> | Fixed expenses: | |
| | | Fixed production | 4,000 |
| | | Fixed selling | 2,500 |
| | | Fixed administrative | 1,500 |
| | | Net operating income | <u>\$ 1,000</u> |

*Contains both variable and fixed expenses. This is the income statement for a manufacturing company; thus, when the income statement is placed in the contribution format, the “cost of goods sold” is divided between variable production costs and fixed production costs. If this were the income statement for a *merchandising* company (which simply purchases completed goods from a supplier), then the cost of goods sold would be *all* variable.

(such as we shall be doing in the next chapter), management performance appraisals, and budgeting. Moreover, the contribution approach helps managers organize data pertinent to numerous decisions such as product-line analysis, pricing, use of scarce resources, and make or buy analysis. All of these topics are covered in later chapters.

Summary

As we shall see in later chapters, the ability to predict how costs respond to changes in activity is critical for making decisions, controlling operations, and evaluating performance. Three major classifications of costs were discussed in this chapter—variable, fixed, and mixed. Mixed costs consist of variable and fixed elements and can be expressed in equation form as $Y = a + bX$, where X is the activity, Y is the cost, a is the fixed cost element, and b is the variable cost per unit of activity.

Several methods can be used to estimate the fixed and variable cost components of a mixed cost using past records of cost and activity. If the relation between cost and activity appears to be linear based on a scattergraph plot, then the variable and fixed components of the mixed cost can be estimated using the quick-and-dirty method, the high-low method, or the least-squares regression method. The quick-and-dirty method is based on drawing a straight line and then using the slope and the intercept of the straight line to estimate the variable and fixed cost components of the mixed cost. The high-low method implicitly draws a straight line through the points of lowest activity and highest activity. In most situations, the least-squares regression method is preferred to both the quick-and-dirty and high-low methods. Computer software is widely available for using the least-squares regression method. These software applications provide a variety of useful statistics along with estimates of the intercept (fixed cost) and slope (variable cost per unit). Nevertheless, even when least-squares regression is used, the data should be plotted to confirm that the relationship is really a straight line.

Managers use costs organized by behavior to help make many decisions. The contribution format income statement can aid decision making because it classifies costs by cost behavior (i.e., variable versus fixed) rather than by the functions of production, administration, and sales.

Review Problem 1: Cost Behavior

Neptune Rentals operates a boat rental service. Consider the following costs of the company over the relevant range of 5,000 to 8,000 hours of operating time for its boats:

| | Hours of Operating Time | | | |
|-------------------------------|-------------------------|-------------|-------------|-------------|
| | 5,000 | 6,000 | 7,000 | 8,000 |
| Total costs: | | | | |
| Variable costs | \$ 20,000 | \$? | \$? | \$? |
| Fixed costs | 168,000 | ? | ? | ? |
| Total costs | <u>\$188,000</u> | <u>\$?</u> | <u>\$?</u> | <u>\$?</u> |
| Cost per hour: | | | | |
| Variable cost | \$? | \$? | \$? | \$? |
| Fixed cost | ? | ? | ? | ? |
| Total cost per hour | <u>\$?</u> | <u>\$?</u> | <u>\$?</u> | <u>\$?</u> |

Required:

Compute the missing amounts, assuming that cost behavior patterns remain unchanged within the relevant range of 5,000 to 8,000 hours.

Solution to Review Problem 1

The variable cost per hour can be computed as follows:

$$\$20,000 \div 5,000 \text{ hours} = \$4 \text{ per hour}$$

Therefore, the missing amounts are as follows:

| | Hours of Operating Time | | | |
|-------------------------------|-------------------------|------------------|------------------|------------------|
| | 5,000 | 6,000 | 7,000 | 8,000 |
| Total costs: | | | | |
| Variable costs | | | | |
| (@ \$4 per hour) | \$ 20,000 | \$ 24,000 | \$ 28,000 | \$ 32,000 |
| Fixed costs | 168,000 | 168,000 | 168,000 | 168,000 |
| Total costs | <u>\$188,000</u> | <u>\$192,000</u> | <u>\$196,000</u> | <u>\$200,000</u> |
| Cost per hour: | | | | |
| Variable cost | \$ 4.00 | \$ 4.00 | \$ 4.00 | \$ 4.00 |
| Fixed cost | 33.60 | 28.00 | 24.00 | 21.00 |
| Total cost per hour | <u>\$ 37.60</u> | <u>\$ 32.00</u> | <u>\$ 28.00</u> | <u>\$ 25.00</u> |

Observe that the total variable costs increase in proportion to the number of hours of operating time, but that these costs remain constant at \$4 if expressed on a per hour basis.

In contrast, the total fixed costs do not change with changes in the level of activity. They remain constant at \$168,000 within the relevant range. With increases in activity, however, the fixed cost per hour decreases, dropping from \$33.60 per hour when the boats are operated 5,000 hours a period to only \$21.00 per hour when the boats are operated 8,000 hours a period. *Because of this troublesome aspect of fixed costs, they are most easily (and most safely) dealt with on a total basis, rather than on a unit basis, in cost analysis work.*

Review Problem 2: High-Low Method

The administrator of Azalea Hills Hospital would like a cost formula linking the administrative costs involved in admitting patients to the number of patients admitted during a month. The Admitting Department's costs and the number of patients admitted during the immediately preceding eight months are given in the following table:

| Month | Number of Patients Admitted | Admitting Department Costs |
|-----------------|-----------------------------|----------------------------|
| May | 1,800 | \$14,700 |
| June | 1,900 | \$15,200 |
| July | 1,700 | \$13,700 |
| August | 1,600 | \$14,000 |
| September | 1,500 | \$14,300 |
| October | 1,300 | \$13,100 |
| November | 1,100 | \$12,800 |
| December | 1,500 | \$14,600 |

Required:

- Use the high-low method to estimate the fixed and variable components of admitting costs.
- Express the fixed and variable components of admitting costs as a cost formula in the form $Y = a + bX$.

Solution to Review Problem 2

- The first step in the high-low method is to identify the periods of the lowest and highest activity. Those periods are November (1,100 patients admitted) and June (1,900 patients admitted).

The second step is to compute the variable cost per unit using those two data points:

| Month | Number of Patients Admitted | Admitting Department Costs |
|-------------------------------------|-----------------------------|----------------------------|
| High activity level (June) | 1,900 | \$15,200 |
| Low activity level (November) | 1,100 | 12,800 |
| Change | 800 | \$ 2,400 |

$$\text{Variable cost} = \frac{\text{Change in cost}}{\text{Change in activity}} = \frac{\$2,400}{800 \text{ patients admitted}} = \$3 \text{ per patient admitted}$$

The third step is to compute the fixed cost element by deducting the variable cost element from the total cost at either the high or low activity. In the computation below, the high point of activity is used:

$$\begin{aligned} \text{Fixed cost element} &= \text{Total cost} - \text{Variable cost element} \\ &= \$15,200 - (\$3 \text{ per patient admitted} \times 1,900 \text{ patients admitted}) \\ &= \$9,500 \end{aligned}$$

- The cost formula is $Y = \$9,500 + \$3X$.

Glossary

- Account analysis** A method for analyzing cost behavior in which an account is classified as either variable or fixed based on the analyst's prior knowledge of how the cost in the account behaves. (p. 86)
- Activity base** A measure of whatever causes the incurrence of a variable cost. For example, the total cost of X-ray film in a hospital will increase as the number of X-rays taken increases. Therefore, the number of X-rays is the activity base that explains the total cost of X-ray film. (p. 76)
- Committed fixed costs** Investments in facilities, equipment, and basic organizational structure that can't be significantly reduced even for short periods of time without making fundamental changes. (p. 81)
- Contribution approach** An income statement format that organizes costs by their behavior. Costs are separated into variable and fixed categories rather than being separated according to organizational functions. (p. 96)
- Contribution margin** The amount remaining from sales revenues after all variable expenses have been deducted. (p. 96)
- Cost structure** The relative proportion of fixed, variable, and mixed costs in an organization. (p. 75)
- Dependent variable** A variable that responds to some causal factor; total cost is the dependent variable, as represented by the letter Y , in the equation $Y = a + bX$. (p. 88)
- Discretionary fixed costs** Those fixed costs that arise from annual decisions by management to spend on certain fixed cost items, such as advertising and research. (p. 82)
- Engineering approach** A detailed analysis of cost behavior based on an industrial engineer's evaluation of the inputs that are required to carry out a particular activity and of the prices of those inputs. (p. 86)
- High-low method** A method of separating a mixed cost into its fixed and variable elements by analyzing the change in cost between the high and low activity levels. (p. 92)
- Independent variable** A variable that acts as a causal factor; activity is the independent variable, as represented by the letter X , in the equation $Y = a + bX$. (p. 88)
- Least-squares regression method** A method of separating a mixed cost into its fixed and variable elements by fitting a regression line that minimizes the sum of the squared errors. (p. 94)
- Linear cost behavior** Cost behavior is said to be linear whenever a straight line is a reasonable approximation for the relation between cost and activity. (p. 89)
- Mixed cost** A cost that contains both variable and fixed cost elements. (p. 000)
- Multiple regression** An analytical method required when variations in a dependent variable are caused by more than one factor. (p. 96)
- R^2** A measure of goodness of fit in least-squares regression analysis. It is the percentage of the variation in the dependent variable that is explained by variation in the independent variable. (p. 95)
- Relevant range** The range of activity within which assumptions about variable and fixed cost behavior are reasonably valid. (p. 79)
- Step-variable cost** The cost of a resource that is obtained in large chunks and that increases and decreases only in response to fairly wide changes in activity. (p. 78)

Questions

- 3-1 Distinguish between (a) a variable cost, (b) a fixed cost, and (c) a mixed cost.
- 3-2 What effect does an increase in volume have on—
 a. Unit fixed costs?
 b. Unit variable costs?
 c. Total fixed costs?
 d. Total variable costs?
- 3-3 Define the following terms: (a) cost behavior and (b) relevant range.
- 3-4 What is meant by an *activity base* when dealing with variable costs? Give several examples of activity bases.
- 3-5 Distinguish between (a) a variable cost, (b) a mixed cost, and (c) a step-variable cost. Plot the three costs on a graph, with activity plotted horizontally and cost plotted vertically.
- 3-6 Managers often assume a strictly linear relationship between cost and volume. How can this practice be defended in light of the fact that many costs are curvilinear?
- 3-7 Distinguish between discretionary fixed costs and committed fixed costs.
- 3-8 Classify the following fixed costs as normally being either committed or discretionary:
 a. Depreciation on buildings.
 b. Advertising.

- c. Research.
 - d. Long-term equipment leases.
 - e. Pension payments to the company’s retirees.
 - f. Management development and training.
- 3–9 Does the concept of the relevant range apply to fixed costs? Explain.
- 3–10 What is the major disadvantage of the high-low method?
- 3–11 Give the general formula for a mixed cost. Which term represents the variable cost? The fixed cost?
- 3–12 What is meant by the term *least-squares regression*?
- 3–13 What is the difference between ordinary least-squares regression analysis and multiple regression analysis?
- 3–14 What is the difference between a contribution approach income statement and a traditional approach income statement?
- 3–15 What is the contribution margin?

Multiple-choice questions are provided on the text website at www.mhhe.com/noreen2e.

Exercises

EXERCISE 3–1 Fixed and Variable Cost Behavior [L01]

Espresso Express operates a number of espresso coffee stands in busy suburban malls. The fixed weekly expense of a coffee stand is \$1,200 and the variable cost per cup of coffee served is \$0.22.

Required:

- Fill in the following table with your estimates of total costs and cost per cup of coffee at the indicated levels of activity for a coffee stand. Round off the cost of a cup of coffee to the nearest tenth of a cent.

| | Cups of Coffee Served in a Week | | |
|---|---------------------------------|-------|-------|
| | 2,000 | 2,100 | 2,200 |
| Fixed cost | ? | ? | ? |
| Variable cost | ? | ? | ? |
| Total cost | ? | ? | ? |
| Average cost per cup of coffee served | ? | ? | ? |

- Does the average cost per cup of coffee served increase, decrease, or remain the same as the number of cups of coffee served in a week increases? Explain.

EXERCISE 3–2 Scattergraph Analysis [L02]

Oki Products, Ltd., has observed the following processing costs at various levels of activity over the last 15 months:

| Month | Units Produced | Processing Cost |
|----------|----------------|-----------------|
| 1 | 4,500 | \$38,000 |
| 2 | 11,000 | \$52,000 |
| 3 | 12,000 | \$56,000 |
| 4 | 5,500 | \$40,000 |
| 5 | 9,000 | \$47,000 |
| 6 | 10,500 | \$52,000 |
| 7 | 7,500 | \$44,000 |
| 8 | 5,000 | \$41,000 |
| 9 | 11,500 | \$52,000 |
| 10 | 6,000 | \$43,000 |
| 11 | 8,500 | \$48,000 |
| 12 | 10,000 | \$50,000 |
| 13 | 6,500 | \$44,000 |
| 14 | 9,500 | \$48,000 |
| 15 | 8,000 | \$46,000 |

Required:

1. Prepare a scattergraph using the above data. Plot cost on the vertical axis and activity on the horizontal axis. Fit a line to your plotted points using a ruler.
2. Using the quick-and-dirty method, what is the approximate monthly fixed cost? The approximate variable cost per unit processed? Show your computations.

EXERCISE 3-3 High-Low Method [L03]

The Cheyenne Hotel in Big Sky, Montana, has accumulated records of the total electrical costs of the hotel and the number of occupancy-days over the last year. An occupancy-day represents a room rented out for one day. The hotel's business is highly seasonal, with peaks occurring during the ski season and in the summer.

| Month | Occupancy-Days | Electrical Costs |
|-----------------|----------------|------------------|
| January | 1,736 | \$4,127 |
| February | 1,904 | \$4,207 |
| March | 2,356 | \$5,083 |
| April | 960 | \$2,857 |
| May | 360 | \$1,871 |
| June | 744 | \$2,696 |
| July | 2,108 | \$4,670 |
| August | 2,406 | \$5,148 |
| September | 840 | \$2,691 |
| October | 124 | \$1,588 |
| November | 720 | \$2,454 |
| December | 1,364 | \$3,529 |

Required:

1. Using the high-low method, estimate the fixed cost of electricity per month and the variable cost of electricity per occupancy-day. Round off the fixed cost to the nearest whole dollar and the variable cost to the nearest whole cent.
2. What other factors other than occupancy-days are likely to affect the variation in electrical costs from month to month?

EXERCISE 3-4 Contribution Format Income Statement [L04]

The Alpine House, Inc., is a large retailer of winter sports equipment. An income statement for the company's Ski Department for a recent quarter is presented below:

| The Alpine House, Inc. Income Statement—Ski Department For the Quarter Ended March 31 | | |
|---|---------------|------------------|
| Sales..... | | \$150,000 |
| Cost of goods sold..... | | <u>90,000</u> |
| Gross margin..... | | 60,000 |
| Selling and administrative expenses: | | |
| Selling expenses..... | \$30,000 | |
| Administrative expenses | <u>10,000</u> | <u>40,000</u> |
| Net operating income | | <u>\$ 20,000</u> |

Skis sell, on the average, for \$750 per pair. Variable selling expenses are \$50 per pair of skis sold. The remaining selling expenses are fixed. The administrative expenses are 20% variable and 80% fixed. The company does not manufacture its own skis; it purchases them from a supplier for \$450 per pair.

Required:

1. Prepare a contribution format income statement for the quarter.
2. For every pair of skis sold during the quarter, what was the contribution toward covering fixed expenses and toward earning profits?

EXERCISE 3–5 Cost Behavior; Contribution Format Income Statement [L01, L04]

Harris Company manufactures and sells a single product. A partially completed schedule of the company’s total and per unit costs over the relevant range of 30,000 to 50,000 units produced and sold annually is given below:

| | Units Produced and Sold | | |
|---------------------------|-------------------------|----------|----------|
| | 30,000 | 40,000 | 50,000 |
| Total costs: | | | |
| Variable costs | \$180,000 | ? | ? |
| Fixed costs | 300,000 | ? | ? |
| Total costs | <u>\$480,000</u> | <u>?</u> | <u>?</u> |
| Cost per unit: | | | |
| Variable cost | ? | ? | ? |
| Fixed cost | ? | ? | ? |
| Total cost per unit | <u>?</u> | <u>?</u> | <u>?</u> |

Required:

- Complete the schedule of the company’s total and unit costs above.
- Assume that the company produces and sells 45,000 units during the year at a selling price of \$16 per unit. Prepare a contribution format income statement for the year.

EXERCISE 3–6 High-Low Method; Scattergraph Analysis [L02, L03]

The following data relating to units shipped and total shipping expense have been assembled by Archer Company, a wholesaler of large, custom-built air-conditioning units for commercial buildings:

| Month | Units Shipped | Total Shipping Expense |
|----------------|---------------|------------------------|
| January | 3 | \$1,800 |
| February | 6 | \$2,300 |
| March | 4 | \$1,700 |
| April | 5 | \$2,000 |
| May | 7 | \$2,300 |
| June | 8 | \$2,700 |
| July | 2 | \$1,200 |

Required:

- Using the high-low method, estimate a cost formula for shipping expense.
- The president of the company has no confidence in the high-low method and would like you to check your results using a scattergraph.
 - Prepare a scattergraph, using the data given above. Plot cost on the vertical axis and activity on the horizontal axis. Use a ruler to fit a straight line to your plotted points.
 - Using your scattergraph, estimate the approximate variable cost per unit shipped and the approximate fixed cost per month with the quick-and-dirty method.
- What factors, other than the number of units shipped, are likely to affect the company’s total shipping expense? Explain.

EXERCISE 3–7 Cost Behavior; High-Low Method [L01, L03]

Hoi Chong Transport, Ltd., operates a fleet of delivery trucks in Singapore. The company has determined that if a truck is driven 105,000 kilometers during a year, the average operating cost is 11.4 cents per kilometer. If a truck is driven only 70,000 kilometers during a year, the average operating cost increases to 13.4 cents per kilometer. (The Singapore dollar is the currency used in Singapore.)

Required:

- Using the high-low method, estimate the variable and fixed cost elements of the annual cost of the truck operation.
- Express the variable and fixed costs in the form $Y = a + bX$.
- If a truck were driven 80,000 kilometers during a year, what total cost would you expect to be incurred?

EXERCISE 3-8 High-Low Method; Predicting Cost [L01, L03]

The Lakeshore Hotel's guest-days of occupancy and custodial supplies expense over the last seven months were:

| Month | Guest-Days of Occupancy | Custodial Supplies Expense |
|-----------------|-------------------------|----------------------------|
| March | 4,000 | \$7,500 |
| April | 6,500 | \$8,250 |
| May | 8,000 | \$10,500 |
| June | 10,500 | \$12,000 |
| July | 12,000 | \$13,500 |
| August | 9,000 | \$10,750 |
| September | 7,500 | \$9,750 |

Guest-days is a measure of the overall activity at the hotel. For example, a guest who stays at the hotel for three days is counted as three guest-days.

Required:

- Using the high-low method, estimate a cost formula for custodial supplies expense.
- Using the cost formula you derived above, what amount of custodial supplies expense would you expect to be incurred at an occupancy level of 11,000 guest-days?

EXERCISE 3-9 Scattergraph Analysis; High-Low Method [L02, L03]

Refer to the data for Lakeshore Hotel in Exercise 3-8.

Required:

- Prepare a scattergraph using the data from Exercise 3-8. Plot cost on the vertical axis and activity on the horizontal axis. Using a ruler, fit a straight line to your plotted points.
- Using the quick-and-dirty method, what is the approximate monthly fixed cost? The approximate variable cost per guest-day?
- Scrutinize the points on your graph and explain why the high-low method would or would not yield an accurate cost formula in this situation.

EXERCISE 3-10 High-Low Method; Predicting Cost [L01, L03]

St. Mark's Hospital contains 450 beds. The average occupancy rate is 80% per month. In other words, on average, 80% of the hospital's beds are occupied by patients. At this level of occupancy, the hospital's operating costs are \$32 per occupied bed per day, assuming a 30-day month. This \$32 figure contains both variable and fixed cost elements.

During June, the hospital's occupancy rate was only 60%. A total of \$326,700 in operating cost was incurred during the month.

Required:

- Using the high-low method, estimate:
 - The variable cost per occupied bed on a daily basis.
 - The total fixed operating costs per month.
- Assume an occupancy rate of 70% per month. What amount of total operating cost would you expect the hospital to incur?

Problems

Excel

PROBLEM 3-11 Contribution Format versus Traditional Income Statement [L04]

Marwick's Pianos, Inc., purchases pianos from a large manufacturer and sells them at the retail level. The pianos cost, on the average, \$2,450 each from the manufacturer. Marwick's Pianos, Inc., sells the pianos to its customers at an average price of \$3,125 each. The selling and administrative costs that the company incurs in a typical month are presented below:

| Costs | Cost Formula |
|--|---|
| Selling: | |
| Advertising | \$700 per month |
| Sales salaries and commissions | \$950 per month, plus 8% of sales |
| Delivery of pianos to customers | \$30 per piano sold |
| Utilities | \$350 per month |
| Depreciation of sales facilities | \$800 per month |
| Administrative: | |
| Executive salaries | \$2,500 per month |
| Insurance | \$400 per month |
| Clerical | \$1,000 per month, plus \$20 per piano sold |
| Depreciation of office equipment | \$300 per month |

During August, Marwick’s Pianos, Inc., sold and delivered 40 pianos.

Required:

1. Prepare an income statement for Marwick’s Pianos, Inc., for August. Use the traditional format, with costs organized by function.
2. Redo (1) above, this time using the contribution format, with costs organized by behavior. Show costs and revenues on both a total and a per unit basis down through contribution margin.
3. Refer to the income statement you prepared in (2) above. Why might it be misleading to show the fixed costs on a per unit basis?

PROBLEM 3–12 Cost Behavior; High-Low Method; Contribution Format Income Statement [L01, L03, L04]

Morrisey & Brown, Ltd., of Sydney is a merchandising company that is the sole distributor of a product that is increasing in popularity among Australian consumers. The company’s income statements for the three most recent months follow:

| Morrisey & Brown, Ltd. | | | |
|--|-------------|---------------|------------------|
| Income Statements | | | |
| For the Three Months Ended September 30 | | | |
| | July | August | September |
| Sales in units | 4,000 | 4,500 | 5,000 |
| Sales revenue | A\$400,000 | A\$450,000 | A\$500,000 |
| Cost of goods sold | 240,000 | 270,000 | 300,000 |
| Gross margin | 160,000 | 180,000 | 200,000 |
| Selling and administrative expenses: | | | |
| Advertising expense | 21,000 | 21,000 | 21,000 |
| Shipping expense | 34,000 | 36,000 | 38,000 |
| Salaries and commissions | 78,000 | 84,000 | 90,000 |
| Insurance expense | 6,000 | 6,000 | 6,000 |
| Depreciation expense | 15,000 | 15,000 | 15,000 |
| Total selling and administrative expenses | 154,000 | 162,000 | 170,000 |
| Net operating income | A\$ 6,000 | A\$ 18,000 | A\$ 30,000 |

(Note: Morrisey & Brown, Ltd.’s Australian-formatted income statement has been recast in the format common in the United States. The Australian dollar is denoted here by A\$.)

Required:

1. Identify each of the company’s expenses (including cost of goods sold) as either variable, fixed, or mixed.
2. Using the high-low method, separate each mixed expense into variable and fixed elements. State the cost formula for each mixed expense.
3. Redo the company’s income statement at the 5,000-unit level of activity using the contribution format.

PROBLEM 3-13 Identifying Cost Behavior Patterns [LO1]

A number of graphs displaying cost behavior patterns are shown below. The vertical axis on each graph represents total cost, and the horizontal axis represents level of activity (volume).

Required:

1. For each of the following situations, identify the graph below that illustrates the cost behavior pattern involved. Any graph may be used more than once.
 - a. Cost of raw materials used.
 - b. Electricity bill—a flat fixed charge, plus a variable cost after a certain number of kilowatt-hours are used.
 - c. City water bill, which is computed as follows:

| | |
|---------------------------------------|-------------------------|
| First 1,000,000 gallons or less | \$1,000 flat fee |
| Next 10,000 gallons | \$0.003 per gallon used |
| Next 10,000 gallons | \$0.006 per gallon used |
| Next 10,000 gallons | \$0.009 per gallon used |
| Etc | Etc. |

- d. Depreciation of equipment, where the amount is computed by the straight-line method. When the depreciation rate was established, it was anticipated that the obsolescence factor would be greater than the wear and tear factor.
- e. Rent on a factory building donated by the city, where the agreement calls for a fixed fee payment unless 200,000 labor-hours or more are worked, in which case no rent need be paid.
- f. Salaries of maintenance workers, where one maintenance worker is needed for every 1,000 hours of machine-hours or less (that is, 0 to 1,000 hours requires one maintenance worker, 1,001 to 2,000 hours requires two maintenance workers, etc.).
- g. Cost of raw materials, where the cost starts at \$7.50 per unit and then decreases by 5 cents per unit for each of the first 100 units purchased, after which it remains constant at \$2.50 per unit.
- h. Rent on a factory building donated by the county, where the agreement calls for rent of \$100,000 less \$1 for each direct labor-hour worked in excess of 200,000 hours, but a minimum rental payment of \$20,000 must be paid.
- i. Use of a machine under a lease, where a minimum charge of \$1,000 is paid for up to 400 hours of machine time. After 400 hours of machine time, an additional charge of \$2 per hour is paid up to a maximum charge of \$2,000 per period.

- How would a knowledge of cost behavior patterns such as those above be of help to a manager in analyzing the cost structure of his or her company?

(CPA, adapted)

PROBLEM 3-14 High-Low and Scattergraph Analysis [L02, L03]

Pleasant View Hospital of British Columbia has just hired a new chief administrator who is anxious to employ sound management and planning techniques in the business affairs of the hospital. Accordingly, she has directed her assistant to summarize the cost structure of the various departments so that data will be available for planning purposes.

The assistant is unsure how to classify the utilities costs in the Radiology Department because these costs do not exhibit either strictly variable or fixed cost behavior. Utilities costs are very high in the department due to a CAT scanner that draws a large amount of power and is kept running at all times. The scanner can't be turned off due to the long warm-up period required for its use. When the scanner is used to scan a patient, it consumes an additional burst of power. The assistant has accumulated the following data on utilities costs and use of the scanner since the first of the year.

| | A | B | C | D | E |
|----|-----------|-----------------|----------------|---|---|
| 1 | Month | Number of Scans | Utilities Cost | | |
| 2 | January | 60 | \$2,200 | | |
| 3 | February | 70 | \$2,600 | | |
| 4 | March | 90 | \$2,900 | | |
| 5 | April | 120 | \$3,300 | | |
| 6 | May | 100 | \$3,000 | | |
| 7 | June | 130 | \$3,600 | | |
| 8 | July | 150 | \$4,000 | | |
| 9 | August | 140 | \$3,600 | | |
| 10 | September | 110 | \$3,100 | | |
| 11 | October | 80 | \$2,500 | | |
| 12 | | | | | |

The chief administrator has informed her assistant that the utilities cost is probably a mixed cost that will have to be broken down into its variable and fixed cost elements by use of a scattergraph. The assistant feels, however, that if an analysis of this type is necessary, then the high-low method should be used, because it is easier and quicker. The controller has suggested that there may be a better approach.

Required:

- Using the high-low method, estimate a cost formula for utilities. Express the formula in the form $Y = a + bX$. (The variable rate should be stated in terms of cost per scan.)
- Prepare a scattergraph using the data above. (The number of scans should be placed on the horizontal axis, and utilities cost should be placed on the vertical axis.) Fit a straight line to the plotted points using a ruler and estimate a cost formula for utilities using the quick-and-dirty method.

PROBLEM 3-15 High-Low Method; Predicting Cost [L01, L03]

Sawaya Co., Ltd., of Japan is a manufacturing company whose total factory overhead costs fluctuate considerably from year to year according to increases and decreases in the number of direct labor-hours worked in the factory. Total factory overhead costs (in Japanese yen, denoted ¥) at high and low levels of activity for recent years are given below:

| | Level of Activity | |
|------------------------------------|-------------------|-------------|
| | Low | High |
| Direct labor-hours | 50,000 | 75,000 |
| Total factory overhead costs | ¥14,250,000 | ¥17,625,000 |

The factory overhead costs above consist of indirect materials, rent, and maintenance. The company has analyzed these costs at the 50,000-hour level of activity as follows:

| | |
|-------------------------------------|--------------------|
| Indirect materials (variable) | ¥ 5,000,000 |
| Rent (fixed) | 6,000,000 |
| Maintenance (mixed) | 3,250,000 |
| Total factory overhead costs | <u>¥14,250,000</u> |

To have data available for planning, the company wants to break down the maintenance cost into its variable and fixed cost elements.

Required:

1. Estimate how much of the ¥17,625,000 factory overhead cost at the high level of activity consists of maintenance cost. (*Hint:* To do this, it may be helpful to first determine how much of the ¥17,625,000 consists of indirect materials and rent. Think about the behavior of variable and fixed costs!)
2. Using the high-low method, estimate a cost formula for maintenance.
3. What total factory overhead costs would you expect the company to incur at an operating level of 70,000 direct labor-hours?

PROBLEM 3-16 High-Low Method; Cost of Goods Manufactured [L01, L03]

Amfac Company manufactures a single product. The company keeps careful records of manufacturing activities from which the following information has been extracted:

| | Level of Activity | |
|--|-------------------|-----------|
| | March-Low | June-High |
| Number of units produced | 6,000 | 9,000 |
| Cost of goods manufactured | \$168,000 | \$257,000 |
| Work in process inventory, beginning | \$9,000 | \$32,000 |
| Work in process inventory, ending | \$15,000 | \$21,000 |
| Direct materials cost per unit | \$6 | \$6 |
| Direct labor cost per unit | \$10 | \$10 |
| Manufacturing overhead cost, total | ? | ? |

The company's manufacturing overhead cost consists of both variable and fixed cost elements. To have data available for planning, management wants to determine how much of the overhead cost is variable with units produced and how much of it is fixed per month.

Required:

1. For both March and June, estimate the amount of manufacturing overhead cost added to production. The company had no underapplied or overapplied overhead in either month. (*Hint:* A useful way to proceed might be to construct a schedule of cost of goods manufactured.)
2. Using the high-low method, estimate a cost formula for manufacturing overhead. Express the variable portion of the formula in terms of a variable rate per unit of product.
3. If 7,000 units are produced during a month, what would be the cost of goods manufactured? (Assume that work in process inventories do not change and that there is no underapplied or overapplied overhead cost for the month.)

PROBLEM 3-17 High-Low Method; Predicting Cost [L01, L03]

Nova Company's total overhead cost at various levels of activity are presented below:

| Month | Machine-Hours | Total Overhead Cost |
|-------------|---------------|---------------------|
| April | 70,000 | \$198,000 |
| May | 60,000 | \$174,000 |
| June | 80,000 | \$222,000 |
| July | 90,000 | \$246,000 |

Assume that the total overhead cost above consists of utilities, supervisory salaries, and maintenance. The breakdown of these costs at the 60,000 machine-hour level of activity is:

| | |
|------------------------------------|------------------|
| Utilities (variable) | \$ 48,000 |
| Supervisory salaries (fixed) | 21,000 |
| Maintenance (mixed) | <u>105,000</u> |
| Total overhead cost | <u>\$174,000</u> |

Nova Company’s management wants to break down the maintenance cost into its variable and fixed cost elements.

Required:

1. Estimate how much of the \$246,000 of overhead cost in July was maintenance cost. (*Hint:* to do this, it may be helpful to first determine how much of the \$246,000 consisted of utilities and supervisory salaries. Think about the behavior of variable and fixed costs!)
2. Using the high-low method, estimate a cost formula for maintenance.
3. Express the company’s *total* overhead cost in the linear equation form $Y = a + bX$.
4. What *total* overhead cost would you expect to be incurred at an operating activity level of 75,000 machine-hours?

Cases

CASE 3–18 Analysis of Mixed Costs in a Pricing Decision [LO1, LO2 or LO3 or LO5]

Maria Chavez owns a catering company that serves food and beverages at parties and business functions. Chavez’s business is seasonal, with a heavy schedule during the summer months and holidays and a lighter schedule at other times.

One of the major events Chavez’s customers request is a cocktail party. She offers a standard cocktail party and has estimated the cost per guest as follows:

| | |
|---|----------------|
| Food and beverages | \$15.00 |
| Labor (0.5 hrs. @ \$10.00/hr.) | 5.00 |
| Overhead (0.5 hrs. @ \$13.98/hr.) | <u>6.99</u> |
| Total cost per guest | <u>\$26.99</u> |

The standard cocktail party lasts three hours and Chavez hires one worker for every six guests, so that works out to one-half hour of labor per guest. These workers are hired only as needed and are paid only for the hours they actually work.

When bidding on cocktail parties, Chavez adds a 15% markup to yield a price of about \$31 per guest. She is confident about her estimates of the costs of food and beverages and labor but is not as comfortable with the estimate of overhead cost. The \$13.98 overhead cost per labor-hour was determined by dividing total overhead expenses for the last 12 months by total labor-hours for the same period. Monthly data concerning overhead costs and labor-hours follow:

| Month | Labor-Hours | Overhead Expense |
|-----------------|---------------|------------------|
| January | 2,500 | \$ 55,000 |
| February | 2,800 | 59,000 |
| March | 3,000 | 60,000 |
| April | 4,200 | 64,000 |
| May | 4,500 | 67,000 |
| June | 5,500 | 71,000 |
| July | 6,500 | 74,000 |
| August | 7,500 | 77,000 |
| September | 7,000 | 75,000 |
| October | 4,500 | 68,000 |
| November | 3,100 | 62,000 |
| December | <u>6,500</u> | <u>73,000</u> |
| Total | <u>57,600</u> | <u>\$805,000</u> |

Chavez has received a request to bid on a 180-guest fund-raising cocktail party to be given next month by an important local charity. (The party would last the usual three hours.) She would like to win this contract because the guest list for this charity event includes many prominent individuals that she would like to land as future clients. Maria is confident that these potential customers would be favorably impressed by her company's services at the charity event.

Required:

1. Estimate the contribution to profit of a standard 180-guest cocktail party if Chavez charges her usual price of \$31 per guest. (In other words, by how much would her overall profit increase?)
2. How low could Chavez bid for the charity event in terms of a price per guest and still not lose money on the event itself?
3. The individual who is organizing the charity's fund-raising event has indicated that he has already received a bid under \$30 from another catering company. Do you think Chavez should bid below her normal \$31 per guest price for the charity event? Why or why not?

(CMA, adapted)

Case 3-19 Scattergraph Analysis; Selection of an Activity Base [L02]

Angora Wraps of Pendleton, Oregon, makes fine sweaters out of pure angora wool. The business is seasonal, with the largest demand during the fall, the winter, and Christmas holidays. The company must increase production each summer to meet estimated demand.

The company has been analyzing its costs to determine which costs are fixed and variable for planning purposes. Below are data for the company's activity and direct labor costs over the last year.

| Month | Thousands of Units Produced | Number of Paid Days | Direct Labor Cost |
|-----------------|-----------------------------|---------------------|-------------------|
| January | 98 | 20 | \$14,162 |
| February | 76 | 20 | \$12,994 |
| March | 75 | 21 | \$15,184 |
| April | 80 | 22 | \$15,038 |
| May | 85 | 22 | \$15,768 |
| June | 102 | 21 | \$15,330 |
| July | 52 | 19 | \$13,724 |
| August | 136 | 21 | \$14,162 |
| September | 138 | 22 | \$15,476 |
| October | 132 | 23 | \$15,476 |
| November | 86 | 18 | \$12,972 |
| December | 56 | 21 | \$14,074 |

The number of workdays varies from month to month due to the number of weekdays, holidays, and days of vacation in the month. The paid days include paid vacations (in July) and paid holidays (in November and December). The number of units produced in a month varies depending on demand and the number of workdays in the month.

The company has eight workers who are classified as direct labor.

Required:

1. Plot the direct labor cost and units produced on a scattergraph. (Place cost on the vertical axis and units produced on the horizontal axis.)
2. Plot the direct labor cost and number of paid days on a scattergraph. (Place cost on the vertical axis and the number of paid days on the horizontal axis.)
3. Which measure of activity—number of units produced or paid days—should be used as the activity base for explaining direct labor cost? Explain

RESEARCH AND APPLICATION 3-20

[L01, L02, L03, L04]

The questions in this problem are based on **Blue Nile, Inc.** To answer the questions, you will need to download Blue Nile's 2004 Form 10-K at www.sec.gov/edgar/searchedgar/companysearch.html. Once at this website, input CIK code 1091171 and hit enter. In the gray box on the right-hand side of your computer screen define the scope of your search by inputting 10-K and then pressing enter. Select the 10-K/A with a filing date of March 25, 2005. You do not need to print this document to answer the questions. You will need the information below to answer the questions.

| | 2004 | | | | 2005 | |
|--|-----------|-----------|-----------|-----------|-----------|-----------|
| | Quarter 1 | Quarter 2 | Quarter 3 | Quarter 4 | Quarter 1 | Quarter 2 |
| Net sales | ? | ? | ? | ? | \$44,116 | \$43,826 |
| Cost of sales | ? | ? | ? | ? | \$34,429 | \$33,836 |
| Gross profit | ? | ? | ? | ? | \$9,687 | \$9,990 |
| Selling, general, and administrative expense | \$5,308 | \$5,111 | \$5,033 | \$7,343 | \$6,123 | \$6,184 |
| Operating income | ? | ? | ? | ? | \$3,564 | \$3,806 |

Required:

1. What is Blue Nile’s strategy for success in the marketplace? Does the company rely primarily on a customer intimacy, operational excellence, or product leadership customer value proposition? What evidence from the 10-K supports your conclusion?
2. What business risks does Blue Nile face that may threaten its ability to satisfy stockholder expectations? What are some examples of control activities that the company could use to reduce these risks? (*Hint:* Focus on pages 8–19 of the 10-K.) Are some of the risks faced by Blue Nile difficult to reduce through control activities? Explain.
3. Is Blue Nile a merchandiser or a manufacturer? What information contained in the 10-K supports your answer?
4. Using account analysis, would you label cost of sales and selling, general, and administrative expense as variable, fixed, or mixed costs? Why? (*Hint:* focus on pages 24–26 and 38 of the 10-K.) Cite one example of a variable cost, step-variable cost, discretionary fixed cost, and committed fixed cost for Blue Nile.
5. Fill in the blanks in the table above based on information contained in the 10-K. Using the high-low method, estimate the variable and fixed cost elements of the quarterly selling, general, and administrative expense. Express Blue Nile’s variable and fixed selling, general, and administrative expenses in the form $Y = a + bX$, where X is net sales.
6. Prepare a contribution format income statement for the third quarter of 2005 assuming that Blue Nile’s net sales were \$45,500 and its cost of sales as a percentage of net sales remained unchanged from the prior quarter.
7. How would you describe Blue Nile’s cost structure? Is Blue Nile’s cost of sales as a percentage of sales higher or lower than competitors with bricks and mortar jewelry stores?

Appendix 3A: Least-Squares Regression Computations

The least-squares regression method for estimating a linear relationship is based on the equation for a straight line:

$$Y = a + bX$$

As explained in the chapter, least-squares regression selects the values for the intercept a and the slope b that minimize the sum of the squared errors. The following formulas, which are derived in statistics and calculus texts, accomplish that objective:

$$b = \frac{n(\sum XY) - (\sum X)(\sum Y)}{n(\sum X^2) - (\sum X)^2}$$

$$a = \frac{(\sum Y) - b(\sum X)}{n}$$

where:

X = The level of activity (independent variable)

LEARNING OBJECTIVE 5

Analyze a mixed cost using the least-squares regression method.

Y = The total mixed cost (dependent variable)

a = The total fixed cost (the vertical intercept of the line)

b = The variable cost per unit of activity (the slope of the line)

n = Number of observations

Σ = Sum across all n observations

Manually performing the calculations required by the formulas is tedious at best. Fortunately, statistical software packages are widely available that perform the calculations automatically. Spreadsheet software, such as Microsoft® Excel, can also be used to do least-squares regression—although it requires a little more work than using a specialized statistical application.

To illustrate how Excel can be used to calculate the intercept a , the slope b , and the R^2 , we will use the Brentline Hospital data for maintenance costs on page 000. The worksheet in Exhibit 3A–1 contains the data and the calculations.

As you can see, the X values (the independent variable) have been entered in cells B4 through B10. The Y values (the dependent variable) have been entered in cells C4 through C10. The slope, intercept, and R^2 are computed using the Excel functions INTERCEPT, SLOPE, and RSQ. You must specify the range of cells for the Y values and for the X values.

In Exhibit 3A–1, cell B12 contains the formula =INTERCEPT(C4:C10,B4:B10); cell B13 contains the formula =SLOPE(C4:C10,B4:B10); and cell B14 contains the formula =RSQ(C4:C10,B4:B10).

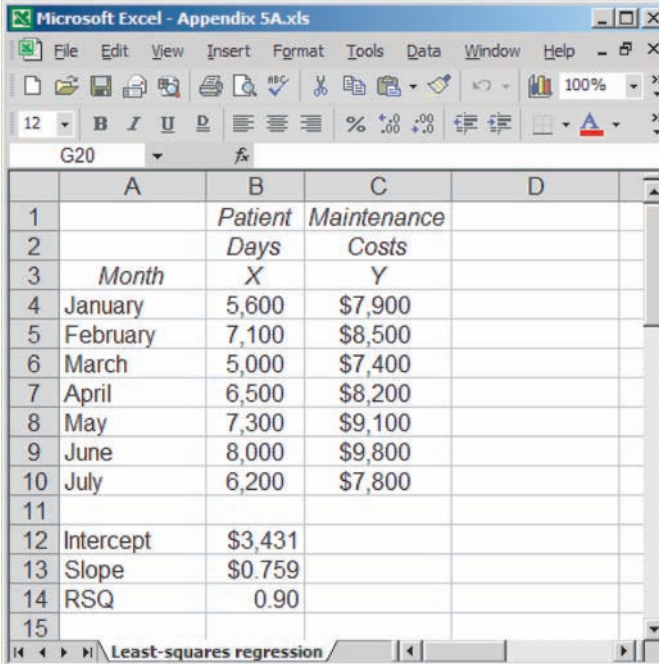

According to the calculations carried out by Excel, the fixed maintenance cost (the intercept) is \$3,431 per month and the variable cost (the slope) is \$0.759 per patient-day. Therefore, the cost formula for maintenance cost is:

$$Y = a + bX$$

$$Y = \$3,431 + \$0.759X$$

Note that the R^2 (i.e., RSQ) is 0.90, which—as previously discussed—is quite good and indicates that 90% of the variation in maintenance costs is explained by the variation in patient-days.

EXHIBIT 3A-1
The Least-Squares
Regression Worksheet for
Brentline Hospital

| | A | B | C | D |
|----|-----------|---------|-------------|---|
| 1 | | Patient | Maintenance | |
| 2 | | Days | Costs | |
| 3 | Month | X | Y | |
| 4 | January | 5,600 | \$7,900 | |
| 5 | February | 7,100 | \$8,500 | |
| 6 | March | 5,000 | \$7,400 | |
| 7 | April | 6,500 | \$8,200 | |
| 8 | May | 7,300 | \$9,100 | |
| 9 | June | 8,000 | \$9,800 | |
| 10 | July | 6,200 | \$7,800 | |
| 11 | | | | |
| 12 | Intercept | \$3,431 | | |
| 13 | Slope | \$0.759 | | |
| 14 | RSQ | 0.90 | | |
| 15 | | | | |

EXHIBIT 3A-2
A Scattergraph Plot of the Brentline Hospital Data

Plotting the data is easy in Excel. Select the range of values that you would like to plot—in this case, cells B4:C10. Then select the Chart Wizard tool on the toolbar and make the appropriate choices in the various dialogue boxes that appear. When you are finished, you should have a scattergraph that looks like the plot in Exhibit 3A-2. Note that the relation between cost and activity is approximately linear, so it is reasonable to fit a straight line to the data as we have implicitly done with the least-squares regression.

connect™ Appendix 3A Exercises and Problems

EXERCISE 3A-1 Least-Squares Regression [L05]

Bargain Rental Car offers rental cars in an off-airport location near a major tourist destination in California. Management would like to better understand the behavior of the company’s costs. One of those costs is the cost of washing cars. The company operates its own car wash facility in which each rental car that is returned is thoroughly cleaned before being released for rental to another customer. Management believes that the costs of operating the car wash should be related to the number of rental returns. Accordingly, the following data have been compiled:

| Month | Rental Returns | Car Wash Costs |
|-----------------|----------------|----------------|
| January | 2,380 | \$10,825 |
| February | 2,421 | \$11,865 |
| March | 2,586 | \$11,332 |
| April | 2,725 | \$12,422 |
| May | 2,968 | \$13,850 |
| June | 3,281 | \$14,419 |
| July | 3,353 | \$14,935 |
| August | 3,489 | \$15,738 |
| September | 3,057 | \$13,563 |
| October | 2,876 | \$11,889 |
| November | 2,735 | \$12,683 |
| December | 2,983 | \$13,796 |

Required:

Using least-squares regression, estimate the fixed cost and variable cost elements of monthly car wash costs. The fixed cost element should be estimated to the nearest dollar and the variable cost element to the nearest cent.

EXERCISE 3A-2 Least-Squares Regression [L01, L05]

George Caloz & Frères, located in Grenchen, Switzerland, makes prestige high-end custom watches in small lots. One of the company's products, a platinum diving watch, goes through an etching process. The company has observed etching costs (expressed in Swiss Francs, SFr) as follows over the last six weeks:

| Week | Units | Total Etching Cost |
|---------|-----------|--------------------|
| 1 | 4 | SFr18 |
| 2 | 3 | 17 |
| 3 | 8 | 25 |
| 4 | 6 | 20 |
| 5 | 7 | 24 |
| 6 | 2 | 16 |
| | <u>30</u> | <u>SFr120</u> |

For planning purposes, management would like to know the amount of variable etching cost per unit and the total fixed etching cost per week.

Required:

- Using the least-squares regression method, estimate the variable and fixed elements of etching cost.
- Express the cost data in (1) above in the form $Y = a + bX$.
- If the company processes five units next week, what would be the expected total etching cost?

EXERCISE 3A-3 Least-Squares Regression [L05]

Refer to the data for Archer Company in Exercise 3-6.

Required:

- Using the least-squares regression method, estimate a cost formula for shipping expense.
- If you also completed Exercise 3-6, prepare a simple table comparing the variable and fixed cost elements of shipping expense as computed under the quick-and-dirty method, the high-low method, and the least-squares regression method.

PROBLEM 3A-4 Least-Squares Regression Method; Scattergraph; Cost Behavior

[L01, L02, L05]

Professor John Morton has just been appointed chairperson of the Finance Department at Westland University. In reviewing the department's cost records, Professor Morton has found the following total cost associated with Finance 101 over the last several terms:

| | A | B | C | D |
|---|-------------------|----------------------------|------------|---|
| | Term | Number of Sections Offered | Total Cost | |
| 1 | | | | |
| 2 | Fall, last year | 4 | \$10,000 | |
| 3 | Winter, last year | 6 | \$14,000 | |
| 4 | Summer, last year | 2 | \$7,000 | |
| 5 | Fall, this year | 5 | \$13,000 | |
| 6 | Winter, this year | 3 | \$9,500 | |
| 7 | | | | |
| 8 | | | | |

Professor Morton knows that there are some variable costs, such as amounts paid to graduate assistants, associated with the course. He would like to have the variable and fixed costs separated for planning purposes.

Required:

- Using the least-squares regression method, estimate the variable cost per section and the total fixed cost per term for Finance 101.
- Express the cost data derived in (1) above in the linear equation form $Y = a + bX$.
- Assume that because of the small number of sections offered during the Winter Term this year, Professor Morton will have to offer eight sections of Finance 101 during the Fall Term. Compute the expected total cost for Finance 101. Can you see any problem with using the cost formula from (2) above to derive this total cost figure? Explain.
- Prepare a scattergraph and fit a straight line to the plotted points using the cost formula expressed in (2) above.

PROBLEM 3A-5 Least-Squares Regression Analysis; Contribution Format Income Statement

[L04, L05]

Milden Company has an exclusive franchise to purchase a product from the manufacturer and distribute it on the retail level. As an aid in planning, the company has decided to start using a contribution format income statement. To have data to prepare such a statement, the company has analyzed its expenses and has developed the following cost formulas:

| Cost | Cost Formula |
|-------------------------------|-----------------------|
| Cost of good sold | \$35 per unit sold |
| Advertising expense | \$210,000 per quarter |
| Sales commissions | 6% of sales |
| Shipping expense | ? |
| Administrative salaries | \$145,000 per quarter |
| Insurance expense | \$9,000 per quarter |
| Depreciation expense | \$76,000 per quarter |

Management has concluded that shipping expense is a mixed cost, containing both variable and fixed cost elements. Units sold and the related shipping expense over the last eight quarters follow:

| Quarter | Units Sold (000) | Shipping Expense |
|--------------|------------------|------------------|
| Year 1: | | |
| First | 10 | \$119,000 |
| Second | 16 | \$175,000 |
| Third | 18 | \$190,000 |
| Fourth | 15 | \$164,000 |
| Year 2: | | |
| First | 11 | \$130,000 |
| Second | 17 | \$185,000 |
| Third | 20 | \$210,000 |
| Fourth | 13 | \$147,000 |

Milden Company's president would like a cost formula derived for shipping expense so that a budgeted contribution format income statement can be prepared for the next quarter.

Required:

- Using the least-squares regression method, estimate a cost formula for shipping expense. (Because the Units Sold above are in thousands of units, the variable cost you compute will also be in thousands of units. It can be left in this form, or you can convert your variable cost to a per unit basis by dividing it by 1,000.)
- In the first quarter of Year 3, the company plans to sell 12,000 units at a selling price of \$100 per unit. Prepare a contribution format income statement for the quarter.

**PROBLEM 3A-6 Least-Squares Regression Method [LO5]**

Refer to the data for Pleasant View Hospital in Problem 3-14.

Required:

- Using the least-squares regression method, estimate a cost formula for utilities. (Round the variable cost to the nearest cent.)
- Refer to the graph prepared in part (2) of Problem 3-14. Explain why in this case the high-low method would be the least accurate of the three methods in deriving a cost formula.

**CASE 3A-7 Analysis of Mixed Costs, Job-Order Costing, and Activity-Based Costing [LO1, LO2, LO5]**

Hokuriku-Seika Co., Ltd., of Yokohama, Japan, is a subcontractor to local manufacturing companies. The company specializes in precision metal cutting using focused high-pressure water jets and high-energy lasers. The company has a traditional job-order costing system in which direct labor and direct materials costs are assigned directly to jobs, but factory overhead is applied to jobs using a predetermined overhead rate based on direct labor-hours. Management uses this job cost data for valuing cost of goods sold and inventories for external reports. For internal decision making, management has largely ignored this cost data because direct labor costs are basically fixed and management believes overhead costs actually have little to do with direct labor-hours. Recently, management has become interested in activity-based costing (ABC) as a way of estimating job costs and other costs for decision-making purposes.

Management assembled a cross-functional team to design a prototype ABC system. Electrical costs were among the first factory overhead costs investigated by the team. Electricity is used to provide light, to power equipment, and to heat the building in the winter and cool it in the summer. The ABC team proposed allocating electrical costs to jobs based on machine-hours because running the machines consumes significant amounts of electricity. Data assembled by the team concerning actual direct labor-hours, machine-hours, and electrical costs over a recent eight-week period appear below. (The Japanese currency is the yen, which is denoted by ¥.)

| | Direct Labor- Hours | Machine- Hours | Electrical Costs |
|--------------|---------------------------|-------------------|---------------------|
| Week 1 | 8,920 | 7,200 | ¥ 77,100 |
| Week 2 | 8,810 | 8,200 | 84,400 |
| Week 3 | 8,950 | 8,700 | 80,400 |
| Week 4 | 8,990 | 7,200 | 75,500 |
| Week 5 | 8,840 | 7,400 | 81,100 |
| Week 6 | 8,890 | 8,800 | 83,300 |
| Week 7 | 8,950 | 6,400 | 79,200 |
| Week 8 | 8,990 | 7,700 | 85,500 |
| Total | <u>71,340</u> | <u>61,600</u> | <u>¥646,500</u> |

To help assess the effect of the proposed change to machine-hours as the allocation base, the eight-week totals were converted to annual figures by multiplying them by six.

| | Direct Labor- Hours | Machine- Hours | Electrical Costs |
|---|---------------------------|-------------------|---------------------|
| Estimated annual total (eight-week total above × 6) | 428,040 | 369,600 | ¥3,879,000 |

Required:

- Assume that the estimated annual totals from the above table are used to compute the company's predetermined overhead rate. What would be the predetermined overhead rate for electrical costs if the allocation base is direct labor-hours? Machine-hours?
- Hokuriku-Seika Co. intends to bid on a job for a shipyard that would require 350 direct labor-hours and 270 machine-hours. How much electrical cost would be charged to this job using the

- predetermined overhead rate computed in (1) above if the allocation base is direct labor-hours? Machine-hours?
3. Prepare a scattergraph in which you plot direct labor-hours on the horizontal axis and electrical costs on the vertical axis. Prepare another scattergraph in which you plot machine-hours on the horizontal axis and electrical costs on the vertical axis. Do you agree with the ABC team that machine-hours is a better allocation base for electrical costs than direct labor-hours? Why?
 4. Using machine-hours as the measure of activity, estimate the fixed and variable components of electrical costs using least-squares regression.
 5. How much electrical cost do you think would actually be caused by the shipyard job in (2) above? Explain.
 6. What factors, apart from direct labor-hours and machine-hours, are likely to affect consumption of electrical power in the company?

RESEARCH AND APPLICATION 3A-8

[LO5]

This question should be answered only after Research and Application 3–20 is completed.

Required:

1. Referring to the data for Blue Nile in Research and Application 3–20 and the data on net sales available on the company's website, estimate the variable and fixed components of the company's quarterly selling, general, and administrative expense. Express Blue Nile's variable and fixed selling, general, and administrative expenses in the form $Y = a + bX$, where X is net sales.
2. Using the formula from part (1) above, prepare a contribution format income statement for the third quarter of 2005 assuming that Blue Nile's net sales were \$45,500 and its cost of sales as a percentage of net sales remained unchanged from the prior quarter.

Chapter

4

Learning Objectives

After studying Chapter 4, you should be able to:

- L01** Explain how changes in activity affect contribution margin and net operating income.
- L02** Prepare and interpret a cost-volume-profit (CVP) graph and a profit graph.
- L03** Use the contribution margin ratio (CM ratio) to compute changes in contribution margin and net operating income resulting from changes in sales volume.
- L04** Show the effects on contribution margin of changes in variable costs, fixed costs, selling price, and volume.
- L05** Determine the level of sales needed to achieve a desired target profit.
- L06** Determine the break-even point.
- L07** Compute the margin of safety and explain its significance.
- L08** Compute the degree of operating leverage at a particular level of sales and explain how it can be used to predict changes in net operating income.
- L09** Compute the break-even point for a multiproduct company and explain the effects of shifts in the sales mix on contribution margin and the break-even point.

Cost-Volume-Profit Relationships

What Happened to the Profit?

Chip Conley is CEO of **Joie de Vivre Hospitality**, a company that owns and operates 28 hospitality businesses in northern California. Conley summed up the company's experience after the dot.com crash and 9/11 as follows: "In the history of American hotel markets, no hotel market has ever seen a drop in revenues as precipitous as the one in San Francisco and Silicon Valley in the last two years. On average,

hotel revenues . . . dropped 40% to 45%. . . . We've been fortunate that our breakeven point is lower than our competition's. . . . But the problem is that the hotel business is a fixed-cost business. So in an environment where you have those precipitous drops and our costs are moderately fixed, our net incomes—well, they're not incomes anymore, they're losses." ■

Source: Karen Dillon, "Shop Talk," *Inc.* magazine, December 2002, pp. 111–114.

Cost-volume-profit (CVP) analysis is a powerful tool that helps managers understand the relationships among cost, volume, and profit. CVP analysis focuses on how profits are affected by the following five factors:

1. Selling prices.
2. Sales volume.
3. Unit variable costs.
4. Total fixed costs.
5. Mix of products sold.

Because CVP analysis helps managers understand how profits are affected by these key factors, it is a vital tool in many business decisions. These decisions include what products and services to offer, what prices to charge, what marketing strategy to use, and what cost structure to implement. To help understand the role of CVP analysis in business decisions, consider the case of Acoustic Concepts, Inc., a company founded by Prem Narayan.

Prem, who was a graduate student in engineering at the time, started Acoustic Concepts to market a radical new speaker he had designed for automobile sound systems. The speaker, called the Sonic Blaster, uses an advanced microprocessor and proprietary software to boost amplification to awesome levels. Prem contracted with a Taiwanese electronics manufacturer to produce the speaker. With seed money provided by his family, Prem placed an order with the manufacturer and ran advertisements in auto magazines.

The Sonic Blaster was an almost immediate success, and sales grew to the point that Prem moved the company's headquarters out of his apartment and into rented quarters in a nearby industrial park. He also hired a receptionist, an accountant, a sales manager, and a small sales staff to sell the speakers to retail stores. The accountant, Bob Luchinni, had worked for several small companies where he had acted as a business advisor as well as accountant and bookkeeper. The following discussion occurred soon after Bob was hired:

Prem: Bob, I've got a lot of questions about the company's finances that I hope you can help answer.

Bob: We're in great shape. The loan from your family will be paid off within a few months.

Prem: I know, but I am worried about the risks I've taken on by expanding operations. What would happen if a competitor entered the market and our sales slipped? How far could sales drop without putting us into the red? Another question I've been trying to resolve is how much our sales would have to increase to justify the big marketing campaign the sales staff is pushing for.

Bob: Marketing always wants more money for advertising.

Prem: And they are always pushing me to drop the selling price on the speaker. I agree with them that a lower price will boost our volume, but I'm not sure the increased volume will offset the loss in revenue from the lower price.

Bob: It sounds like these questions are all related in some way to the relationships among our selling prices, our costs, and our volume. I shouldn't have a problem coming up with some answers.

Prem: Can we meet again in a couple of days to see what you have come up with?

Bob: Sounds good. By then I'll have some preliminary answers for you as well as a model you can use for answering similar questions in the future.

**MANAGERIAL
ACCOUNTING IN
ACTION**
The Issue

The Basics of Cost-Volume-Profit (CVP) Analysis

Bob Luchinni's preparation for his forthcoming meeting with Prem begins where our study of cost behavior in the preceding chapter left off—with the contribution income statement. The contribution income statement emphasizes the behavior of costs and therefore is extremely helpful to managers in judging the impact on profits of changes in

selling price, cost, or volume. Bob will base his analysis on the following contribution income statement he prepared last month:

| Acoustic Concepts, Inc. | | |
|--------------------------------------|-----------------|-----------------|
| Contribution Income Statement | | |
| For the Month of June | | |
| | Total | Per Unit |
| Sales (400 speakers) | \$100,000 | \$250 |
| Variable expenses | <u>60,000</u> | <u>150</u> |
| Contribution margin | 40,000 | <u>\$100</u> |
| Fixed expenses | <u>35,000</u> | |
| Net operating income | <u>\$ 5,000</u> | |

Notice that sales, variable expenses, and contribution margin are expressed on a per unit basis as well as in total on this contribution income statement. The per unit figures will be very helpful to Bob in some of his calculations. Note that this contribution income statement has been prepared for management's use inside the company and would not ordinarily be made available to those outside the company.

Contribution Margin

LEARNING OBJECTIVE 1

Explain how changes in activity affect contribution margin and net operating income.

As explained in the previous chapter, contribution margin is the amount remaining from sales revenue after variable expenses have been deducted. Thus, it is the amount available to cover fixed expenses and then to provide profits for the period. Notice the sequence here—contribution margin is used *first* to cover the fixed expenses, and then whatever remains goes toward profits. If the contribution margin is not sufficient to cover the fixed expenses, then a loss occurs for the period. To illustrate with an extreme example, assume that Acoustic Concepts sells only one speaker during a particular month. The company's income statement would appear as follows:

| Contribution Income Statement | | |
|--------------------------------------|-------------------|-----------------|
| Sales of 1 Speaker | | |
| | Total | Per Unit |
| Sales (1 speaker) | \$ 250 | \$250 |
| Variable expenses | <u>150</u> | <u>150</u> |
| Contribution margin | 100 | <u>\$100</u> |
| Fixed expenses | <u>35,000</u> | |
| Net operating loss | <u>\$(34,900)</u> | |

For each additional speaker the company sells during the month, \$100 more in contribution margin becomes available to help cover the fixed expenses. If a second speaker is sold, for example, then the total contribution margin will increase by \$100 (to a total of \$200) and the company's loss will decrease by \$100, to \$34,800:

| Contribution Income Statement | | |
|--------------------------------------|-------------------|-----------------|
| Sales of 2 Speakers | | |
| | Total | Per Unit |
| Sales (2 speakers) | \$ 500 | \$250 |
| Variable expenses | <u>300</u> | <u>150</u> |
| Contribution margin | 200 | <u>\$100</u> |
| Fixed expenses | <u>35,000</u> | |
| Net operating loss | <u>\$(34,800)</u> | |

If enough speakers can be sold to generate \$35,000 in contribution margin, then all of the fixed expenses will be covered and the company will *break even* for the month—that is, it will show neither profit nor loss but just cover all of its costs. To reach the break-even point, the company will have to sell 350 speakers in a month because each speaker sold yields \$100 in contribution margin:

| Contribution Income Statement Sales of 350 Speakers | | |
|--|---------------|--------------|
| | Total | Per Unit |
| Sales (350 speakers) | \$87,500 | \$250 |
| Variable expenses | 52,500 | 150 |
| Contribution margin | <u>35,000</u> | <u>\$100</u> |
| Fixed expenses | <u>35,000</u> | |
| Net operating income | <u>\$ 0</u> | |

Computation of the break-even point is discussed in detail later in the chapter; for the moment, note that the **break-even point** is the level of sales at which profit is zero.

Once the break-even point has been reached, net operating income will increase by the amount of the unit contribution margin for each additional unit sold. For example, if 351 speakers are sold in a month, then the net operating income for the month will be \$100 because the company will have sold 1 speaker more than the number needed to break even:

| Contribution Income Statement Sales of 351 Speakers | | |
|--|---------------|--------------|
| | Total | Per Unit |
| Sales (351 speakers) | \$87,750 | \$250 |
| Variable expenses | 52,650 | 150 |
| Contribution margin | <u>35,100</u> | <u>\$100</u> |
| Fixed expenses | <u>35,000</u> | |
| Net operating income | <u>\$ 100</u> | |

If 352 speakers are sold (2 speakers above the break-even point), the net operating income for the month will be \$200. If 353 speakers are sold (3 speakers above the break-even point), the net operating income for the month will be \$300, and so forth. To estimate the profit at any sales volume above the break-even point, simply multiply the number of units sold in excess of the break-even point by the unit contribution margin. The result represents the anticipated profits for the period. Or, to estimate the effect of a planned increase in sales on profits, simply multiply the increase in units sold by the unit contribution margin. The result will be the expected increase in profits. To illustrate, if Acoustic Concepts is currently selling 400 speakers per month and plans to increase sales to 425 speakers per month, the anticipated impact on profits can be computed as follows:

| | |
|---|----------------|
| Increased number of speakers to be sold | 25 |
| Contribution margin per speaker | × \$100 |
| Increase in net operating income | <u>\$2,500</u> |

These calculations can be verified as follows:

| | Sales Volume | | Difference (25 Speakers) | Per Unit |
|-----------------------------|-----------------|-----------------|-----------------------------|--------------|
| | 400 Speakers | 425 Speakers | | |
| Sales | | | | |
| (@ \$250 per speaker) | \$100,000 | \$106,250 | \$6,250 | \$250 |
| Variable expenses | | | | |
| (@ \$150 per speaker) | 60,000 | 63,750 | 3,750 | 150 |
| Contribution margin | 40,000 | 42,500 | 2,500 | <u>\$100</u> |
| Fixed expenses | 35,000 | 35,000 | 0 | |
| Net operating income | <u>\$ 5,000</u> | <u>\$ 7,500</u> | <u>\$2,500</u> | |

To summarize, if sales are zero, the company's loss would equal its fixed expenses. Each unit that is sold reduces the loss by the amount of the unit contribution margin. Once the break-even point has been reached, each additional unit sold increases the company's profit by the amount of the unit contribution margin.

CVP Relationships in Equation Form

The contribution format income statement can be expressed in equation form as follows:

$$\text{Profit} = (\text{Sales} - \text{Variable expenses}) - \text{Fixed expenses}$$

For brevity, we use the term profit to stand for net operating income in equations.

When a company has only a *single* product, as at Acoustic Concepts, we can further refine the equation as follows:

$$\text{Sales} = \text{Selling price per unit} \times \text{Quantity sold} = P \times Q$$

$$\text{Variable expenses} = \text{Variable expenses per unit} \times \text{Quantity sold} = V \times Q$$

$$\text{Profit} = (P \times Q - V \times Q) - \text{Fixed expenses}$$

We can do all of the calculations of the previous section using this simple equation. For example, on page 121 we computed the net operating income (profit) at sales of 351 speakers as \$100. We can arrive at the same conclusion using the above equation as follows:

$$\text{Profit} = (P \times Q - V \times Q) - \text{Fixed expenses}$$

$$\text{Profit} = (\$250 \times 351 - \$150 \times 351) - \$35,000$$

$$= (\$250 - \$150) \times 351 - \$35,000$$

$$= (\$100) \times 351 - \$35,000$$

$$= \$35,100 - \$35,000 = \$100$$

It is often useful to express the simple profit equation in terms of the unit contribution margin (Unit CM) as follows:

$$\text{Unit CM} = \text{Selling price per unit} - \text{Variable expenses per unit} = P - V$$

$$\text{Profit} = (P \times Q - V \times Q) - \text{Fixed expenses}$$

$$\text{Profit} = (P - V) \times Q - \text{Fixed expenses}$$

$$\text{Profit} = \text{Unit CM} \times Q - \text{Fixed expenses}$$

We could also have used this equation to determine the profit at sales of 351 speakers as follows:

$$\begin{aligned} \text{Profit} &= \text{Unit CM} \times Q - \text{Fixed expenses} \\ &= \$100 \times 351 - \$35,000 \\ &= \$35,100 - \$35,000 = \$100 \end{aligned}$$

For those who are comfortable with algebra, the quickest and easiest approach to solving the problems in this chapter may be to use the simple profit equation in one of its forms.

CVP Relationships in Graphic Form

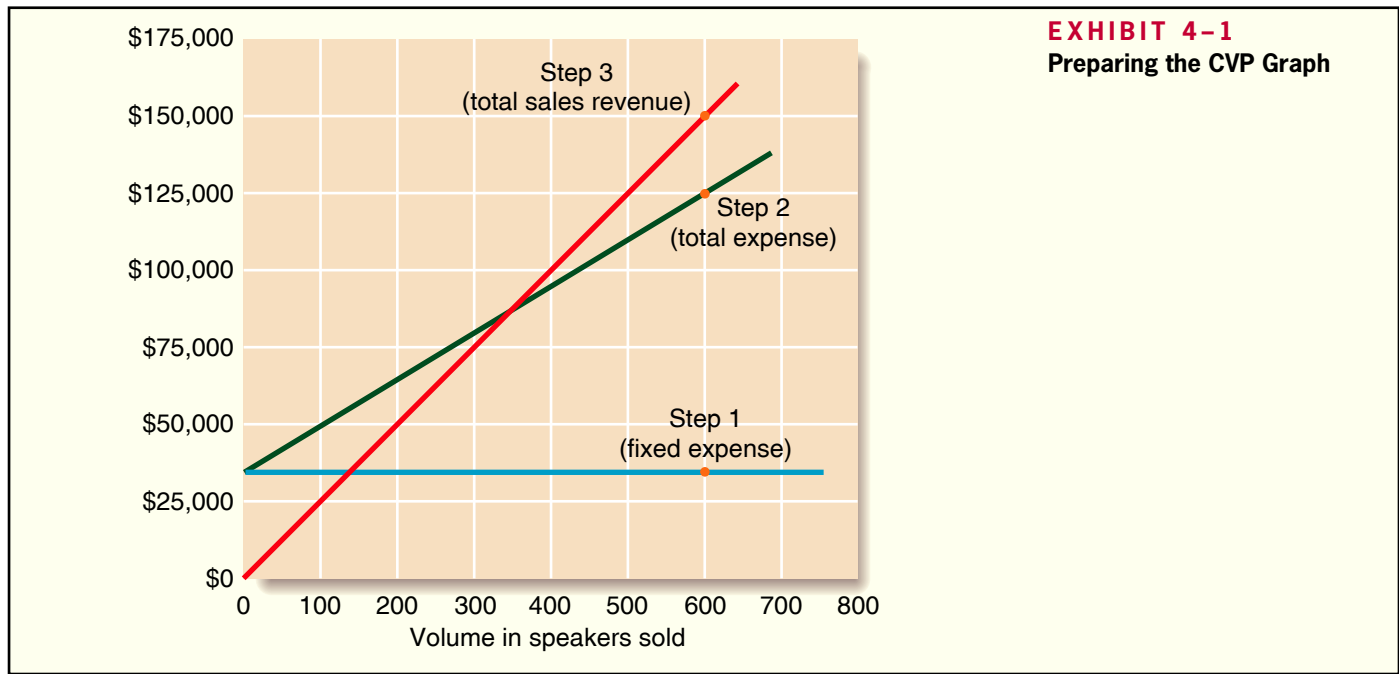

The relationships among revenue, cost, profit, and volume are illustrated on a **cost-volume-profit (CVP) graph**. A CVP graph highlights CVP relationships over wide ranges of activity. To help explain his analysis to Prem Narayan, Bob Luchinni prepared a CVP graph for Acoustic Concepts.

Preparing the CVP Graph In a CVP graph (sometimes called a *break-even chart*), unit volume is represented on the horizontal (*X*) axis and dollars on the vertical (*Y*) axis. Preparing a CVP graph involves three steps as depicted in Exhibit 4-1:

1. Draw a line parallel to the volume axis to represent total fixed expense. For Acoustic Concepts, total fixed expenses are \$35,000.
2. Choose some volume of unit sales and plot the point representing total expense (fixed and variable) at the sales volume you have selected. In Exhibit 4-1, Bob Luchinni chose a volume of 600 speakers. Total expense at that sales volume is:

| | |
|---|------------------|
| Fixed expense | \$ 35,000 |
| Variable expense (600 speakers × \$150 per speaker) | 90,000 |
| Total expense | <u>\$125,000</u> |

LEARNING OBJECTIVE 2
Prepare and interpret a cost-volume-profit (CVP) graph and a profit graph.

After the point has been plotted, draw a line through it back to the point where the fixed expense line intersects the dollars axis.

- Again choose some sales volume and plot the point representing total sales dollars at the activity level you have selected. In Exhibit 4-1, Bob Luchinni again chose a volume of 600 speakers. Sales at that sales volume total \$150,000 (600 speakers \times \$250 per speaker). Draw a line through this point back to the origin.

The interpretation of the completed CVP graph is given in Exhibit 4-2. The anticipated profit or loss at any given level of sales is measured by the vertical distance between the total revenue line (sales) and the total expense line (variable expense plus fixed expense).

The break-even point is where the total revenue and total expense lines cross. The break-even point of 350 speakers in Exhibit 4-2 agrees with the break-even point computed earlier.

As discussed earlier, when sales are below the break-even point—in this case, 350 units—the company suffers a loss. Note that the loss (represented by the vertical distance between the total expense and total revenue lines) gets bigger as sales decline. When sales are above the break-even point, the company earns a profit and the size of the profit (represented by the vertical distance between the total revenue and total expense lines) increases as sales increase.

An even simpler form of the CVP graph, which we call a profit graph, is presented in Exhibit 4-3. That graph is based on the following equation:

$$\text{Profit} = \text{Unit CM} \times Q - \text{Fixed expenses}$$

In the case of Acoustic Concepts, the equation can be expressed as:

$$\text{Profit} = \$100 \times Q - \$35,000$$

Because this is a linear equation, it plots as a single straight line. To plot the line, compute the profit at two different sales volumes, plot the points, and then connect them with a straight line. For example, when the sales volume is zero (i.e., $Q = 0$), the profit is $-\$35,000$ ($= \$100 \times 0 - \$35,000$). When Q is 600, the profit is $\$25,000$ ($= \$100 \times 600 - \$35,000$). These two points are plotted in Exhibit 4-3 and a straight line has been drawn through them.

The break-even point on the profit graph is the volume of sales at which profit is zero and is indicated by the dashed line on the graph. Note that the profit steadily increases to the right of the break-even point as the sales volume increases and that the loss becomes steadily worse to the left of the break-even point as the sales volume decreases.

Contribution Margin Ratio (CM Ratio)

In the previous section, we explored how cost-volume-profit relationships can be visualized. In this section, we show how the *contribution margin ratio* can be used in cost-volume-profit calculations. As the first step, we have added a column to Acoustic Concepts' contribution format income statement in which sales revenues, variable expenses, and contribution margin are expressed as a percentage of sales:

| | Total | Per Unit | Percent of Sales |
|----------------------------|-----------------|--------------|------------------|
| Sales (400 speakers) | \$100,000 | \$250 | 100% |
| Variable expenses | 60,000 | 150 | 60% |
| Contribution margin | 40,000 | <u>\$100</u> | <u>40%</u> |
| Fixed expenses | 35,000 | | |
| Net operating income | <u>\$ 5,000</u> | | |

LEARNING OBJECTIVE 3
Use the contribution margin ratio (CM ratio) to compute changes in contribution margin and net operating income resulting from changes in sales volume.

The contribution margin as a percentage of sales is referred to as the **contribution margin ratio (CM ratio)**. This ratio is computed as follows:

$$\text{CM ratio} = \frac{\text{Contribution margin}}{\text{Sales}}$$

For Acoustic Concepts, the computations are:

$$\text{CM ratio} = \frac{\text{Total contribution margin}}{\text{Total Sales}} = \frac{\$40,000}{\$100,000} = 40\%$$

In a company such as Acoustic Concepts that has only one product, the CM ratio can also be computed on a per unit basis as follows:

$$\text{CM ratio} = \frac{\text{Unit contribution margin}}{\text{Unit selling price}} = \frac{\$100}{\$250} = 40\%$$

The CM ratio shows how the contribution margin will be affected by a change in total sales. Acoustic Concepts' CM ratio of 40% means that for each dollar increase in sales, total contribution margin will increase by 40 cents (\$1 sales \times CM ratio of 40%). Net operating income will also increase by 40 cents, assuming that fixed costs are not affected by the increase in sales.

As this illustration suggests, *the impact on net operating income of any given dollar change in total sales can be computed by simply applying the CM ratio to the dollar change*. For example, if Acoustic Concepts plans a \$30,000 increase in sales during the coming month, the contribution margin should increase by \$12,000 (\$30,000 increase in sales \times CM ratio of 40%). As we noted above, net operating income will also increase by \$12,000 if fixed costs do not change. This is verified by the following table:

| | Sales Volume | | | Percent of Sales |
|----------------------------|--------------|-----------|----------|------------------|
| | Present | Expected | Increase | |
| Sales | \$100,000 | \$130,000 | \$30,000 | 100% |
| Variable expenses | 60,000 | 78,000* | 18,000 | 60% |
| Contribution margin | 40,000 | 52,000 | 12,000 | 40% |
| Fixed expenses | 35,000 | 35,000 | 0 | |
| Net operating income | \$ 5,000 | \$ 17,000 | \$12,000 | |

*\$130,000 expected sales \div \$250 per unit = 520 units. 520 units \times \$150 per unit = \$78,000.

The relation between profit and the CM ratio can also be expressed using the following equation:

$$\text{Profit} = \text{CM ratio} \times \text{Sales} - \text{Fixed expenses}^1$$

For example, at sales of \$130,000, the profit is expected to be \$17,000 as shown below:

$$\begin{aligned} \text{Profit} &= \text{CM ratio} \times \text{Sales} - \text{Fixed expenses} \\ &= 0.40 \times \$130,000 - \$35,000 \\ &= \$52,000 - \$35,000 = \$17,000 \end{aligned}$$

¹ This equation can be derived using the basic profit equation and the definition of the CM ratio as follows:

$$\begin{aligned} \text{Profit} &= (\text{Sales} - \text{Variable expenses}) - \text{Fixed expenses} \\ \text{Profit} &= \text{Contribution margin} - \text{Fixed expenses} \\ \text{Profit} &= \frac{\text{Contribution margin}}{\text{Sales}} \times \text{Sales} - \text{Fixed expenses} \\ \text{Profit} &= \text{CM ratio} \times \text{Sales} - \text{Fixed expenses} \end{aligned}$$

Again, if you are comfortable with algebra, this approach will often be quicker and easier than constructing contribution format income statements.

The CM ratio is particularly valuable in situations where the dollar sales of one product must be traded off against the dollar sales of another product. In this situation, products that yield the greatest amount of contribution margin per dollar of sales should be emphasized.

Some Applications of CVP Concepts

Bob Luchinni, the accountant at Acoustic Concepts, wanted to demonstrate to the company’s president Prem Narayan how the concepts developed on the preceding pages can be used in planning and decision making. Bob gathered the following basic data:

| | Per Unit | Percent of Sales |
|--------------------------|--------------|------------------|
| Selling price..... | \$250 | 100% |
| Variable expenses | <u>150</u> | <u>60%</u> |
| Contribution margin..... | <u>\$100</u> | <u>40%</u> |

LEARNING OBJECTIVE 4
Show the effects on contribution margin of changes in variable costs, fixed costs, selling price, and volume.

Recall that fixed expenses are \$35,000 per month. Bob Luchinni will use these data to show the effects of changes in variable costs, fixed costs, sales price, and sales volume on the company’s profitability in a variety of situations.

Before proceeding further, however, we need to introduce another concept—the *variable expense ratio*. The **variable expense ratio** is the ratio of variable expenses to sales. It can be computed by dividing the total variable expenses by the total sales, or in a single product analysis, it can be computed by dividing the variable expenses per unit by the unit selling price. In the case of Acoustic Concepts, the variable expense ratio is 0.60; that is, variable expense is 60% of sales.

Change in Fixed Cost and Sales Volume Acoustic Concepts is currently selling 400 speakers per month at \$250 per speaker for total monthly sales of \$100,000. The sales manager feels that a \$10,000 increase in the monthly advertising budget would increase monthly sales by \$30,000 to a total of 520 units. Should the advertising budget be increased? The following table shows the financial impact of the proposed change in the monthly advertising budget:

| | Current Sales | Sales with Additional Advertising Budget | Difference | Percent of Sales |
|----------------------------|-----------------|--|-----------------|------------------|
| Sales | \$100,000 | \$130,000 | \$30,000 | 100% |
| Variable expenses | <u>60,000</u> | <u>78,000*</u> | <u>18,000</u> | <u>60%</u> |
| Contribution margin | 40,000 | 52,000 | 12,000 | <u>40%</u> |
| Fixed expenses | 35,000 | 45,000 [†] | <u>10,000</u> | |
| Net operating income | <u>\$ 5,000</u> | <u>\$ 7,000</u> | <u>\$ 2,000</u> | |

*520 units × \$150 per unit = \$78,000.

[†]\$35,000 + additional \$10,000 monthly advertising budget = \$45,000.

Assuming no other factors need to be considered, the increase in the advertising budget should be approved because it would increase net operating income by \$2,000.

There are two shorter ways to arrive at this solution. The first alternative solution follows:

Alternative Solution 1

| | |
|--|-----------------|
| Expected total contribution margin: | |
| \$130,000 × 40% CM ratio | \$52,000 |
| Present total contribution margin: | |
| \$100,000 × 40% CM ratio | <u>40,000</u> |
| Incremental contribution margin | 12,000 |
| Change in fixed expenses: | |
| Less incremental advertising expense | <u>10,000</u> |
| Increased net operating income | <u>\$ 2,000</u> |

Because in this case only the fixed costs and the sales volume change, the solution can be presented in an even shorter format, as follows:

Alternative Solution 2

| | |
|--|-----------------|
| Incremental contribution margin: | |
| \$30,000 × 40% CM ratio | \$12,000 |
| Less incremental advertising expense | <u>10,000</u> |
| Increased net operating income | <u>\$ 2,000</u> |

Notice that this approach does not depend on knowledge of previous sales. Also note that it is unnecessary under either shorter approach to prepare an income statement. Both of the alternative solutions involve an **incremental analysis**—they consider only those items of revenue, cost, and volume that will change if the new program is implemented. Although in each case a new income statement could have been prepared, the incremental approach is simpler and more direct and focuses attention on the specific changes that would occur as a result of the decision.

Change in Variable Costs and Sales Volume Refer to the original data. Recall that Acoustic Concepts is currently selling 400 speakers per month. Prem is considering the use of higher-quality components, which would increase variable costs (and thereby reduce the contribution margin) by \$10 per speaker. However, the sales manager predicts that using higher-quality components would increase sales to 480 speakers per month. Should the higher-quality components be used?

The \$10 increase in variable costs would decrease the unit contribution margin by \$10—from \$100 down to \$90.

Solution

| | |
|--|-----------------|
| Expected total contribution margin with higher-quality components: | |
| 480 speakers × \$90 per speaker | \$43,200 |
| Present total contribution margin: | |
| 400 speakers × \$100 per speaker | <u>40,000</u> |
| Increase in total contribution margin | <u>\$ 3,200</u> |

According to this analysis, the higher-quality components should be used. Because fixed costs would not change, the \$3,200 increase in contribution margin shown above should result in a \$3,200 increase in net operating income.

IN BUSINESS

GROWING SALES AT AMAZON.COM

Amazon.com was deciding between two tactics for growing sales and profits. The first approach was to invest in television advertising. The second approach was to offer free shipping on larger orders. To evaluate the first option, Amazon.com invested in television ads in two markets—Minneapolis, Minnesota, and Portland, Oregon. The company quantified the profit impact of this choice by subtracting the increase in fixed advertising costs from the increase in contribution margin. The profit impact of television advertising paled in comparison to the free “super saver shipping” program, which the company introduced on orders over \$99. In fact, the free shipping option proved to be so popular and profitable that within two years Amazon.com dropped its qualifying threshold to \$49 and then again to a mere \$25. At each stage of this progression, Amazon.com used cost-volume-profit analysis to determine whether the extra volume from liberalizing the free shipping offer more than offset the associated increase in shipping costs.

Source: Rob Walker, “Because ‘Optimism is Essential,’” *Inc.* magazine, April 2004 pp. 149–150.

Change in Fixed Cost, Sales Price, and Sales Volume Refer to the original data and recall again that Acoustic Concepts is currently selling 400 speakers per month. To increase sales, the sales manager would like to cut the selling price by \$20 per speaker and increase the advertising budget by \$15,000 per month. The sales manager believes that if these two steps are taken, unit sales will increase by 50% to 600 speakers per month. Should the changes be made?

A decrease in the selling price of \$20 per speaker would decrease the unit contribution margin by \$20 down to \$80.

Solution

| | |
|--|------------------|
| Expected total contribution margin with lower selling price: | |
| 600 speakers × \$80 per speaker | \$48,000 |
| Present total contribution margin: | |
| 400 speakers × \$100 per speaker | 40,000 |
| Incremental contribution margin | 8,000 |
| Change in fixed expenses: | |
| Less incremental advertising expense | 15,000 |
| Reduction in net operating income | <u>\$(7,000)</u> |

According to this analysis, the changes should not be made. The \$7,000 reduction in net operating income that is shown above can be verified by preparing comparative income statements as follows:

| | Present 400 Speakers per Month | | Expected 600 Speakers per Month | | Difference |
|-----------------------------|--------------------------------|--------------|---------------------------------|--------------|------------------|
| | Total | Per Unit | Total | Per Unit | |
| Sales | \$100,000 | \$250 | \$138,000 | \$230 | \$38,000 |
| Variable expenses | 60,000 | 150 | 90,000 | 150 | 30,000 |
| Contribution margin | 40,000 | <u>\$100</u> | 48,000 | <u>\$ 80</u> | 8,000 |
| Fixed expenses | 35,000 | | 50,000* | | 15,000 |
| Net operating income (loss) | <u>\$ 5,000</u> | | <u>\$ (2,000)</u> | | <u>\$(7,000)</u> |

*35,000 + Additional monthly advertising budget of \$15,000 = \$50,000.

IN BUSINESS

DELTA ATTEMPTS TO BOOST TICKET SALES

The United States Transportation Department ranked the Cincinnati/Northern Kentucky International Airport (CNK) as the second most expensive airport in the country. Because of its high ticket prices, CNK airport officials estimated that they were losing 28% of Cincinnati-area travelers—about 2,500 people per day—to five surrounding airports that offered lower fares. Delta Airlines, which has 90% of the traffic at CNK, attempted to improve the situation by introducing SimpliFares. The program, which Delta touted with a \$2 million media campaign, not only lowered fares but also reduced the ticket change fee from \$100 to \$50. From a cost-volume-profit standpoint, Delta was hoping that the increase in discretionary fixed advertising costs and the decrease in sales revenue realized from lower ticket prices would be more than offset by an increase in sales volume.

Source: James Pilcher, "New Delta Fares Boost Ticket Sales," *The Cincinnati Enquirer*, September 3, 2004, pp. A1 and A12.

Change in Variable Cost, Fixed Cost, and Sales Volume Refer to Acoustic Concepts' original data. As before, the company is currently selling 400 speakers per month. The sales manager would like to pay salespersons a sales commission of \$15 per speaker sold, rather than the flat salaries that now total \$6,000 per month. The sales manager is confident that the change would increase monthly sales by 15% to 460 speakers per month. Should the change be made?

Solution Changing the sales staff's compensation from salaries to commissions would affect both fixed and variable expenses. Fixed expenses would decrease by \$6,000, from \$35,000 to \$29,000. Variable expenses per unit would increase by \$15, from \$150 to \$165, and the unit contribution margin would decrease from \$100 to \$85.

| | |
|---|-----------------|
| Expected total contribution margin with sales staff on commissions: | |
| 460 speakers × \$85 per speaker | \$39,100 |
| Present total contribution margin: | |
| 400 speakers × \$100 per speaker | <u>40,000</u> |
| Decrease in total contribution margin | (900) |
| Change in fixed expenses: | |
| Add salaries avoided if a commission is paid | <u>6,000</u> |
| Increase in net operating income | <u>\$ 5,100</u> |

According to this analysis, the changes should be made. Again, the same answer can be obtained by preparing comparative income statements:

| | Present 400 Speakers per Month | | Expected 460 Speakers per Month | | Difference |
|----------------------------|--------------------------------------|--------------|---------------------------------------|--------------|-----------------|
| | Total | Per Unit | Total | Per Unit | |
| Sales | \$100,000 | \$250 | \$115,000 | \$250 | \$15,000 |
| Variable expenses | <u>60,000</u> | <u>150</u> | <u>75,900</u> | <u>165</u> | <u>15,900</u> |
| Contribution margin | 40,000 | <u>\$100</u> | 39,100 | <u>\$ 85</u> | 900 |
| Fixed expenses | <u>35,000</u> | | <u>29,000</u> | | <u>(6,000)*</u> |
| Net operating income | <u>\$ 5,000</u> | | <u>\$ 10,100</u> | | <u>\$ 5,100</u> |

*Note: A *reduction* in fixed expenses has the effect of *increasing* net operating income.

Change in Selling Price Refer to the original data where Acoustic Concepts is currently selling 400 speakers per month. The company has an opportunity to make a bulk sale of 150 speakers to a wholesaler if an acceptable price can be negotiated. This sale would not disturb the company’s regular sales and would not affect the company’s total fixed expenses. What price per speaker should be quoted to the wholesaler if Acoustic Concepts wants to increase its total monthly profits by \$3,000?

Solution

| | |
|---------------------------------|--------------|
| Variable cost per speaker | \$150 |
| Desired profit per speaker: | |
| \$3,000 ÷ 150 speakers | 20 |
| Quoted price per speaker | <u>\$170</u> |

Notice that fixed expenses are not included in the computation. This is because fixed expenses are not affected by the bulk sale, so all of the additional contribution margin increases the company’s profits.

Target Profit and Break-Even Analysis

Target profit analysis and break-even analysis are used to answer questions such as how much would we have to sell to make a profit of \$10,000 per month or how much would we have to sell to avoid incurring a loss?

Target Profit Analysis

One of the key uses of CVP analysis is called *target profit analysis*. In **target profit analysis**, we estimate what sales volume is needed to achieve a specific target profit. For example, suppose that Prem Narayan of Acoustic Concepts would like to know what sales would have to be to attain a target profit of \$40,000 per month. To answer this question, we can proceed using the equation method or the formula method.

LEARNING OBJECTIVE 5
Determine the level of sales needed to achieve a desired target profit.

The Equation Method We can use a basic profit equation to find the sales volume required to attain a target profit. In the case of Acoustic Concepts, the company has only one product so we can use the contribution margin form of the equation. Remembering that the target profit is \$40,000, the unit contribution margin is \$100, and the fixed expense is \$35,000, we can solve as follows:

$$\begin{aligned}
 \text{Profit} &= \text{Unit CM} \times Q - \text{Fixed expense} \\
 \$40,000 &= \$100 \times Q - \$35,000 \\
 \$100 \times Q &= \$40,000 + \$35,000 \\
 Q &= (\$40,000 + \$35,000) \div \$100 \\
 Q &= 750
 \end{aligned}$$

Thus, the target profit can be achieved by selling 750 speakers per month.

The Formula Method The formula method is a short-cut version of the equation method. Note that in the next to the last line of the above solution, the sum of the target profit of \$40,000 and the fixed expense of \$35,000 is divided by the unit contribution margin of \$100. In general, in a single-product situation, we can compute

the sales volume required to attain a specific target profit using the following formula:

$$\text{Unit sales to attain the target profit} = \frac{\text{Target profit} + \text{Fixed expenses}^2}{\text{Unit CM}}$$

In the case of Acoustic Concepts, the formula yields the following answer:

$$\begin{aligned} \text{Unit sales to attain the target profit} &= \frac{\text{Target profit} + \text{Fixed expenses}}{\text{Unit CM}} \\ &= \frac{\$40,000 + \$35,000}{\$100} \\ &= 750 \end{aligned}$$

Note that this is the same answer we got when we used the equation method—and it always will be. The formula method simply skips a few steps in the equation method.

Target Profit Analysis in Terms of Sales Dollars Instead of unit sales, we may want to know what dollar sales are needed to attain the target profit. We can get this answer using several methods. First, we could solve for the unit sales to attain the target profit using the equation method or the formula method and then multiply the result by the selling price. In the case of Acoustic Concepts, the required sales volume using this approach would be computed as 750 speakers \times \$250 per speaker or \$187,500 in total sales.

We can also solve for the required sales volume to attain the target profit of \$40,000 at Acoustic Concepts using the basic equation stated in terms of the contribution margin ratio:

$$\begin{aligned} \text{Profit} &= \text{CM ratio} \times \text{Sales} - \text{Fixed expenses} \\ \$40,000 &= 0.40 \times \text{Sales} - \$35,000 \\ 0.40 \times \text{Sales} &= \$40,000 + \$35,000 \\ \text{Sales} &= (\$40,000 + \$35,000) \div 0.40 \\ \text{Sales} &= \$187,500 \end{aligned}$$

Note that in the next to the last line of the above solution, the sum of the target profit of \$40,000 and the fixed expense of \$35,000 is divided by the contribution margin ratio of 0.40. In general, we can compute dollar sales to attain a target profit as follows:

$$\text{Dollar sales to attain a target profit} = \frac{\text{Target profit} + \text{Fixed expenses}^3}{\text{CM ratio}}$$

² This equation can be derived as follows:

$$\begin{aligned} \text{Profit} &= \text{Unit CM} \times Q - \text{Fixed expenses} \\ \text{Target profit} &= \text{Unit CM} \times Q - \text{Fixed expenses} \\ \text{Unit CM} \times Q &= \text{Target profit} + \text{Fixed expenses} \\ Q &= (\text{Target profit} + \text{Fixed expenses}) \div \text{Unit CM} \end{aligned}$$

³ This equation can be derived as follows:

$$\begin{aligned} \text{Profit} &= \text{CM ratio} \times \text{Sales} - \text{Fixed expenses} \\ \text{Target profit} &= \text{CM ratio} \times \text{Sales} - \text{Fixed expenses} \\ \text{CM ratio} \times \text{Sales} &= \text{Target profit} + \text{Fixed expenses} \\ \text{Sales} &= (\text{Target profit} + \text{Fixed expenses}) \div \text{CM ratio} \end{aligned}$$

At Acoustic Concepts, the formula yields the following answer:

$$\begin{aligned} \text{Dollar sales to attain a target profit} &= \frac{\text{Target profit} + \text{Fixed expenses}}{\text{CM ratio}} \\ &= \frac{\$40,000 + \$35,000}{\$0.40} \\ &= \$187,500 \end{aligned}$$

Again, you get exactly the same answer whether you use the equation method or just use the formula.

In companies with multiple products, sales volume is more conveniently expressed in terms of total sales dollars than in terms of unit sales. The contribution margin ratio approach to target profit analysis is particularly useful for such companies.

Break-Even Analysis

Earlier in the chapter we defined the break-even point as the level of sales at which the company's profit is zero. What we call *break-even analysis* is really just a special case of target profit analysis in which the target profit is zero. We can use either the equation method or the formula method to solve for the break-even point, but for brevity we will illustrate just the formula method. The equation method works exactly like it did in target profit analysis. The only difference is that the target profit is zero in break-even analysis.

Break-Even in Unit Sales In a single product situation, recall that the formula for the unit sales to attain a specific target profit is:

$$\text{Unit sales to attain the target profit} = \frac{\text{Target profit} + \text{Fixed expenses}}{\text{Unit CM}}$$

To compute the unit sales to break even, all we have to do is to set the target profit to zero in the above equation as follows:

$$\text{Unit sales to break even} = \frac{\$0 + \text{Fixed expenses}}{\text{Unit CM}}$$

$$\text{Unit sales to break even} = \frac{\text{Fixed expenses}}{\text{Unit CM}}$$

In the case of Acoustic Concepts, the break-even point can be computed as follows:

$$\begin{aligned} \text{Unit sales to break even} &= \frac{\text{Fixed expenses}}{\text{Unit CM}} \\ &= \frac{\$35,000}{\$100} \\ &= 350 \end{aligned}$$

Thus, as we determined earlier in the chapter, Acoustic Concepts breaks even at sales of 350 speakers per month.

LEARNING OBJECTIVE 6
Determine the break-even point.

COSTS ON THE INTERNET

The company **eToys**, which sells toys over the Internet, lost \$190 million in 1999 on sales of \$151 million. One big cost was advertising. eToys spent about \$37 on advertising for each \$100 of sales. (Other e-tailors were spending even more—in some cases, up to \$460 on advertising for each \$100 in sales!)

IN BUSINESS

IN BUSINESS

(continued)

eToys did have some advantages relative to bricks-and-mortar stores such as Toys “R” Us. eToys had much lower inventory costs because it only needed to keep on hand one or two of a slow-moving item, whereas a traditional store has to fully stock its shelves. And bricks-and-mortar retail spaces in malls and elsewhere do cost money—on average, about 7% of sales. However, e-tailers such as eToys have their own set of disadvantages. Customers “pick and pack” their own items at a bricks-and-mortar outlet, but e-tailers have to pay employees to carry out this task. This costs eToys about \$33 for every \$100 in sales. And the technology to sell over the Internet is not free. eToys spent about \$29 on its website and related technology for every \$100 in sales. However, many of these costs of selling over the Internet are fixed. Toby Lenk, the CEO of eToys, estimated that the company would pass its break-even point somewhere between \$750 and \$900 million in sales—representing less than 1% of the market for toys. eToys did not make this goal and laid off 70% of its employees in January 2001. Subsequently, eToys was acquired by KBToys.com.

Break-Even in Sales Dollars We can find the break-even point in sales dollars using several methods. First, we could solve for the break-even point in unit sales using the equation method or the formula method and then multiply the result by the selling price. In the case of Acoustic Concepts, the break-even point in sales dollars using this approach would be computed as 350 speakers \times \$250 per speaker or \$87,500 in total sales.

We can also solve for the break-even point in sales dollars at Acoustic Concepts using the basic profit equation stated in terms of the contribution margin ratio or we can use the formula for the target profit. Again, for brevity, we will use the formula.

$$\text{Dollar sales to attain a target profit} = \frac{\text{Target profit} + \text{Fixed expenses}}{\text{CM ratio}}$$

$$\text{Dollar sales to break even} = \frac{\$0 + \text{Fixed expenses}}{\text{CM ratio}}$$

$$\text{Dollar sales to break even} = \frac{\text{Fixed expenses}}{\text{CM ratio}}$$

The break-even point at Acoustic Concepts would be computed as follows:

$$\begin{aligned} \text{Dollar sales to break even} &= \frac{\text{Fixed expenses}}{\text{CM ratio}} \\ &= \frac{\$35,000}{0.40} \\ &= \$87,500 \end{aligned}$$

IN BUSINESS

**COST OVERRUNS INCREASE THE BREAK-EVEN POINT**

When Airbus launched the A380 555-seat jetliner in 2000 the company said it would need to sell 250 units to break even on the project. By 2006, Airbus was admitting that more than \$3 billion of cost overruns had raised the project’s break-even point to 420 airplanes. Although Airbus has less than 170 orders for the A380, the company remains optimistic that it will sell 751 units over the next 20 years. Given that Airbus rival Boeing predicts the total market size for all airplanes with more than 400 seats will not exceed 990 units, it remains unclear if Airbus will ever break even on its investment in the A380 aircraft.

Source: Daniel Michaels, “Embattled Airbus Lifts Sales Target for A380 to Profit,” *The Wall Street Journal*, October 20, 2006, p. A6.

The Margin of Safety

The **margin of safety** is the excess of budgeted (or actual) sales dollars over the break-even volume of sales dollars. It is the amount by which sales can drop before losses are incurred. The higher the margin of safety, the lower the risk of not breaking even and incurring a loss. The formula for the margin of safety is:

$$\text{Margin of safety in dollars} = \text{Total budgeted (or actual) sales} - \text{Break-even sales}$$

The margin of safety can also be expressed in percentage form by dividing the margin of safety in dollars by total dollar sales:

$$\text{Margin of safety percentage} = \frac{\text{Margin of safety in dollars}}{\text{Total budgeted (or actual) sales in dollars}}$$

The calculation of the margin of safety for Acoustic Concepts is:

| | |
|---|-----------|
| Sales (at the current volume of 400 speakers) (a) | \$100,000 |
| Break-even sales (at 350 speakers) | 87,500 |
| Margin of safety in dollars (b) | \$ 12,500 |
| Margin of safety percentage, (b) ÷ (a) | 12.5% |

This margin of safety means that at the current level of sales and with the company's current prices and cost structure, a reduction in sales of \$12,500, or 12.5%, would result in just breaking even.

In a single-product company like Acoustic Concepts, the margin of safety can also be expressed in terms of the number of units sold by dividing the margin of safety in dollars by the selling price per unit. In this case, the margin of safety is 50 speakers (\$12,500 ÷ \$250 per speaker = 50 speakers).

LEARNING OBJECTIVE 7
 Compute the margin of safety and explain its significance.

COMPUTING MARGIN OF SAFETY FOR A SMALL BUSINESS

Sam Calagione owns **Dogfish Head Craft Brewery**, a microbrewery in Rehobeth Beach, Delaware. He charges distributors as much as \$100 per case for his premium beers such as World Wide Stout. The high-priced microbrews bring in \$800,000 in operating income on revenue of \$7 million. Calagione reports that his raw ingredients and labor costs for one case of World Wide Stout are \$30 and \$16, respectively. Bottling and packaging costs are \$6 per case. Gas and electric costs are about \$10 per case.

If we assume that World Wide Stout is representative of all Dogfish microbrews, then we can compute the company's margin of safety in five steps. First, variable cost as a percentage of sales is 62% [(\$30 + \$16 + \$6 + \$10)/\$100]. Second, the contribution margin ratio is 38% (1 - 0.62). Third, Dogfish's total fixed cost is \$1,860,000 [(\$7,000,000 × 0.38) - \$800,000]. Fourth, the break-even point in sales dollars is \$4,894,737 (\$1,860,000/0.38). Fifth, the margin of safety is \$2,105,263 (\$7,000,000 - \$4,894,737).

IN BUSINESS

**MANAGERIAL
ACCOUNTING IN
ACTION**
The Wrap-up

Prem Narayan and Bob Luchinni met to discuss the results of Bob's analysis.

Prem: Bob, everything you have shown me is pretty clear. I can see what impact some of the sales manager's suggestions would have on our profits. Some of those suggestions are quite good and others are not so good. I am concerned that our margin of safety is only 50 speakers. What can we do to increase this number?

Bob: Well, we have to increase total sales or decrease the break-even point or both.

Prem: And to decrease the break-even point, we have to either decrease our fixed expenses or increase our unit contribution margin?

Bob: Exactly.

Prem: And to increase our unit contribution margin, we must either increase our selling price or decrease the variable cost per unit?

Bob: Correct.

Prem: So what do you suggest?

Bob: Well, the analysis doesn't tell us which of these to do, but it does indicate we have a potential problem here.

Prem: If you don't have any immediate suggestions, I would like to call a general meeting next week to discuss ways we can work on increasing the margin of safety. I think everyone will be concerned about how vulnerable we are to even small downturns in sales.

CVP Considerations in Choosing a Cost Structure

Cost structure refers to the relative proportion of fixed and variable costs in an organization. Managers often have some latitude in trading off between these two types of costs. For example, fixed investments in automated equipment can reduce variable labor costs. In this section, we discuss the choice of a cost structure. We also introduce the concept of *operating leverage*.

Cost Structure and Profit Stability

Which cost structure is better—high variable costs and low fixed costs, or the opposite? No single answer to this question is possible; each approach has its advantages. To show what we mean, refer to the contribution format income statements given below for two blueberry farms. Bogside Farm depends on migrant workers to pick its berries by hand, whereas Sterling Farm has invested in expensive berry-picking machines. Consequently, Bogside Farm has higher variable costs, but Sterling Farm has higher fixed costs:

| | Bogside Farm | | Sterling Farm | |
|----------------------------|--------------|---------|---------------|---------|
| | Amount | Percent | Amount | Percent |
| Sales | \$100,000 | 100% | \$100,000 | 100% |
| Variable expenses | 60,000 | 60% | 30,000 | 30% |
| Contribution margin | 40,000 | 40% | 70,000 | 70% |
| Fixed expenses | 30,000 | | 60,000 | |
| Net operating income | \$ 10,000 | | \$ 10,000 | |

Which farm has the better cost structure? The answer depends on many factors, including the long-run trend in sales, year-to-year fluctuations in the level of sales,

and the attitude of the owners toward risk. If sales are expected to exceed \$100,000 in the future, then Sterling Farm probably has the better cost structure. The reason is that its CM ratio is higher, and its profits will therefore increase more rapidly as sales increase. To illustrate, assume that each farm experiences a 10% increase in sales without any increase in fixed costs. The new income statements would be as follows:

| | Bogside Farm | | Sterling Farm | |
|----------------------------|------------------|---------|------------------|---------|
| | Amount | Percent | Amount | Percent |
| Sales | \$110,000 | 100% | \$110,000 | 100% |
| Variable expenses | 66,000 | 60% | 33,000 | 30% |
| Contribution margin | 44,000 | 40% | 77,000 | 70% |
| Fixed expenses | 30,000 | | 60,000 | |
| Net operating income | <u>\$ 14,000</u> | | <u>\$ 17,000</u> | |

Sterling Farm has experienced a greater increase in net operating income due to its higher CM ratio even though the increase in sales was the same for both farms.

What if sales drop below \$100,000? What are the farms' break-even points? What are their margins of safety? The computations needed to answer these questions are shown below using the contribution margin method:

| | Bogside Farm | Sterling Farm |
|---|------------------|------------------|
| Fixed expenses | \$ 30,000 | \$ 60,000 |
| Contribution margin ratio | ÷ 0.40 | ÷ 0.70 |
| Dollar sales to break even | <u>\$ 75,000</u> | <u>\$ 85,714</u> |
| Total current sales (a) | \$100,000 | \$100,000 |
| Break-even sales | 75,000 | 85,714 |
| Margin of safety in sales dollars (b) | <u>\$ 25,000</u> | <u>\$ 14,286</u> |
| Margin of safety percentage (b) ÷ (a) | 25.0% | 14.3% |

Bogside Farm's margin of safety is greater and its contribution margin ratio is lower than Sterling Farm. Therefore, Bogside Farm is less vulnerable to downturns than Sterling Farm. Due to its lower contribution margin ratio, Bogside Farm will not lose contribution margin as rapidly as Sterling Farm when sales decline. Thus, Bogside Farm's profit will be less volatile. We saw earlier that this is a drawback when sales increase, but it provides more protection when sales drop. And because its break-even point is lower, Bogside Farm can suffer a larger sales decline before losses emerge.

To summarize, without knowing the future, it is not obvious which cost structure is better. Both have advantages and disadvantages. Sterling Farm, with its higher fixed costs and lower variable costs, will experience wider swings in net operating income as sales fluctuate, with greater profits in good years and greater losses in bad years. Bogside Farm, with its lower fixed costs and higher variable costs, will enjoy greater profit stability and will be more protected from losses during bad years, but at the cost of lower net operating income in good years.

IN BUSINESS

A LOSING COST STRUCTURE

Both **JetBlue** and **United Airlines** use an Airbus 235 to fly from Dulles International Airport near Washington, DC, to Oakland, California. Both planes have a pilot, copilot, and four flight attendants. That is where the similarity ends. Based on 2002 data, the pilot on the United flight earned \$16,350 to \$18,000 a month compared to \$6,800 per month for the JetBlue pilot. United's senior flight attendants on the plane earned more than \$41,000 per year; whereas the JetBlue attendants were paid \$16,800 to \$27,000 per year. Largely because of the higher labor costs at United, its costs of operating the flight were more than 60% higher than JetBlue's costs. Due to intense fare competition from JetBlue and other low-cost carriers, United was unable to cover its higher operating costs on this and many other flights. Consequently, United went into bankruptcy at the end of 2002.

Operating Leverage

LEARNING OBJECTIVE 8

Compute the degree of operating leverage at a particular level of sales and explain how it can be used to predict changes in net operating income.

A lever is a tool for multiplying force. Using a lever, a massive object can be moved with only a modest amount of force. In business, *operating leverage* serves a similar purpose. **Operating leverage** is a measure of how sensitive net operating income is to a given percentage change in dollar sales. Operating leverage acts as a multiplier. If operating leverage is high, a small percentage increase in sales can produce a much larger percentage increase in net operating income.

Operating leverage can be illustrated by returning to the data for the two blueberry farms. We previously showed that a 10% increase in sales (from \$100,000 to \$110,000 in each farm) results in a 70% increase in the net operating income of Sterling Farm (from \$10,000 to \$17,000) and only a 40% increase in the net operating income of Bogside Farm (from \$10,000 to \$14,000). Thus, for a 10% increase in sales, Sterling Farm experiences a much greater percentage increase in profits than does Bogside Farm. Therefore, Sterling Farm has greater operating leverage than Bogside Farm.

The **degree of operating leverage** at a given level of sales is computed by the following formula:

$$\text{Degree of operating leverage} = \frac{\text{Contribution margin}}{\text{Net operating income}}$$

The degree of operating leverage is a measure, at a given level of sales, of how a percentage change in sales volume will affect profits. To illustrate, the degree of operating leverage for the two farms at \$100,000 sales would be computed as follows:

$$\text{Bogside Farm: } \frac{\$40,000}{\$10,000} = 4$$

$$\text{Sterling Farm: } \frac{\$70,000}{\$10,000} = 7$$

Because the degree of operating leverage for Bogside Farm is 4, the farm's net operating income grows four times as fast as its sales. In contrast, Sterling Farm's net operating income grows seven times as fast as its sales. Thus, if sales increase by 10%, then we can expect the net operating income of Bogside Farm to increase by four times this amount, or by 40%, and the net operating income of Sterling Farm to increase by seven times this amount, or by 70%.

| | Percent Increase in Sales (1) | Degree of Operating Leverage (2) | Percent Increase in Net Operating Income (1) × (2) |
|---------------------|----------------------------------|-------------------------------------|---|
| Bogside Farm | 10% | 4 | 40% |
| Sterling Farm | 10% | 7 | 70% |

What is responsible for the higher operating leverage at Sterling Farm? The only difference between the two farms is their cost structure. If two companies have the same total revenue and same total expense but different cost structures, then the company with the higher proportion of fixed costs in its cost structure will have higher operating leverage. Referring back to the original example on page 136, when both farms have sales of \$100,000 and total expenses of \$90,000, one-third of Bogside Farm’s costs are fixed but two-thirds of Sterling Farm’s costs are fixed. As a consequence, Sterling’s degree of operating leverage is higher than Bogside’s.

The degree of operating leverage is not a constant; it is greatest at sales levels near the break-even point and decreases as sales and profits rise. The following table shows the degree of operating leverage for Bogside Farm at various sales levels. (Data used earlier for Bogside Farm are shown in color.)

| | | | | | |
|--|----------|----------|-----------|-----------|-----------|
| Sales | \$75,000 | \$80,000 | \$100,000 | \$150,000 | \$225,000 |
| Variable expenses | 45,000 | 48,000 | 60,000 | 90,000 | 135,000 |
| Contribution margin (a) | 30,000 | 32,000 | 40,000 | 60,000 | 90,000 |
| Fixed expenses | 30,000 | 30,000 | 30,000 | 30,000 | 30,000 |
| Net operating income (b) | \$ 0 | \$ 2,000 | \$ 10,000 | \$ 30,000 | \$ 60,000 |
| Degree of operating leverage, (a) ÷ (b) | ∞ | 16 | 4 | 2 | 1.5 |

Thus, a 10% increase in sales would increase profits by only 15% (10% × 1.5) if sales were previously \$225,000, as compared to the 40% increase we computed earlier at the \$100,000 sales level. The degree of operating leverage will continue to decrease the farther the company moves from its break-even point. At the break-even point, the degree of operating leverage is infinitely large (\$30,000 contribution margin ÷ \$0 net operating income = ∞).

IN BUSINESS

OPERATING LEVERAGE: A KEY TO PROFITABLE E-COMMERCE

Did you ever wonder why **Expedia** and **eBay** were among the first Internet companies to become profitable? One big reason is because they sell information products rather than physical products. For example, when somebody buys a physical product, such as a book from **Amazon.com**, the company needs to purchase a copy of the book from the publisher, process it, and ship it; hence, Amazon.com’s gross margins are around 26%. However, once Expedia covers its fixed overhead costs, the extra expense incurred to provide service to one more customer is practically zero; therefore, the incremental revenue provided by that customer “falls to the bottom line.”

In the first quarter of 2002, Expedia doubled its sales to \$116 million and reported net income of \$5.7 million compared to a loss of \$17.6 million in the first quarter of 2001. This is the beauty of having a high degree of operating leverage. Sales growth can quickly translate to profit growth when variable costs are negligible. Of course, operating leverage has a dark side—if Expedia’s sales plummet, its profits will nosedive as well.

Source: Timothy J. Mullaney and Robert D. Hof, “Finally, the Pot of Gold,” *BusinessWeek*, June 24, 2002, pp. 104–106.

The degree of operating leverage can be used to quickly estimate what impact various percentage changes in sales will have on profits, without the necessity of preparing detailed income statements. As shown by our examples, the effects of operating leverage can be dramatic. If a company is near its break-even point, then even small percentage increases in sales can yield large percentage increases in profits. *This explains why management will often work very hard for only a small increase in sales volume.* If the degree of operating leverage is 5, then a 6% increase in sales would translate into a 30% increase in profits.

Structuring Sales Commissions

Companies usually compensate salespeople by paying them a commission based on sales, a salary, or a combination of the two. Commissions based on sales dollars can lead to lower profits. To illustrate, consider Pipeline Unlimited, a producer of surfing equipment. Salespersons sell the company's products to retail sporting goods stores throughout North America and the Pacific Basin. Data for two of the company's surfboards, the XR7 and Turbo models, appear below:

| | Model | |
|---------------------------|--------------|--------------|
| | XR7 | Turbo |
| Selling price | \$695 | \$749 |
| Variable expenses | 344 | 410 |
| Contribution margin | <u>\$351</u> | <u>\$339</u> |

Which model will salespeople push hardest if they are paid a commission of 10% of sales revenue? The answer is the Turbo because it has the higher selling price and hence the larger commission. On the other hand, from the standpoint of the company, profits will be greater if salespeople steer customers toward the XR7 model because it has the higher contribution margin.

To eliminate such conflicts, commissions can be based on contribution margin rather than on selling price. If this is done, the salespersons will want to sell the mix of products that maximizes contribution margin. Providing that fixed costs are not affected by the sales mix, maximizing the contribution margin will also maximize the company's profit.⁴ In effect, by maximizing their own compensation, salespersons will also maximize the company's profit.

Sales Mix

LEARNING OBJECTIVE 9

Compute the break-even point for a multiproduct company and explain the effects of shifts in the sales mix on contribution margin and the break-even point.

Before concluding our discussion of CVP concepts, we need to consider the impact of changes in *sales mix* on a company's profit.

The Definition of Sales Mix

The term **sales mix** refers to the relative proportions in which a company's products are sold. The idea is to achieve the combination, or mix, that will yield the greatest amount of profits. Most companies have many products, and often these products are not equally profitable. Hence, profits will depend to some extent on the company's sales mix. Profits

⁴ This also assumes the company has no production constraint. If it does, the sales commissions should be modified. See the Profitability Appendix at the end of the book.

will be greater if high-margin rather than low-margin items make up a relatively large proportion of total sales.

Changes in the sales mix can cause perplexing variations in a company's profits. A shift in the sales mix from high-margin items to low-margin items can cause total profits to decrease even though total sales may increase. Conversely, a shift in the sales mix from low-margin items to high-margin items can cause the reverse effect—total profits may increase even though total sales decrease. It is one thing to achieve a particular sales volume; it is quite another to sell the most profitable mix of products.

IN BUSINESS

WAL-MART ATTEMPTS TO SHIFT ITS SALES MIX

Almost 130 million customers shop at Wal-Mart's 3,200 U.S. stores each week. However, less than half of them shop the whole store—choosing to buy only low-margin basics while skipping higher-margin departments such as apparel. In an effort to shift its sales mix toward higher-margin merchandise, Wal-Mart has reduced spending on advertising and plowed the money into remodeling the clothing departments within its stores. The company hopes this remodeling effort will entice its customers to add clothing to their shopping lists while bypassing the apparel offerings of competitors such as Kohl's and Target.

Source: Robert Berner, "Fashion Emergency at Wal-Mart," *BusinessWeek*, July 31, 2006, p. 67.

Sales Mix and Break-Even Analysis

If a company sells more than one product, break-even analysis is more complex than discussed to this point. The reason is that different products will have different selling prices, different costs, and different contribution margins. Consequently, the break-even point depends on the mix in which the various products are sold. To illustrate, consider Virtual Journeys Unlimited, a small company that imports DVDs from France. At present, the company sells two DVDs: the Le Louvre DVD, a tour of the famous art museum in Paris; and the Le Vin DVD, which features the wines and wine-growing regions of France. The company's September sales, expenses, and break-even point are shown in Exhibit 4-4.

As shown in the exhibit, the break-even point is \$60,000 in sales, which was computed by dividing the company's fixed expenses of \$27,000 by its overall CM ratio of 45%. However, this is the break-even only if the company's sales mix does not change. Currently, the Le Louvre DVD is responsible for 20% and the Le Vin DVD for 80% of the company's dollar sales. Assuming this sales mix does not change, if total sales are \$60,000, the sales of the Le Louvre DVD would be \$12,000 (20% of \$60,000) and the sales of the Le Vin DVD would be \$48,000 (80% of \$60,000). As shown in Exhibit 4-4, at these levels of sales, the company would indeed break even. But \$60,000 in sales represents the break-even point for the company only if the sales mix does not change. *If the sales mix changes, then the break-even point will also usually change.* This is illustrated by the results for October in which the sales mix shifted away from the more profitable Le Vin DVD (which has a 50% CM ratio) toward the less profitable Le Louvre CD (which has a 25% CM ratio). These results appear in Exhibit 4-5.

Although sales have remained unchanged at \$100,000, the sales mix is exactly the reverse of what it was in Exhibit 4-4, with the bulk of the sales now coming from the less profitable Le Louvre DVD. Notice that this shift in the sales mix has caused both the overall CM ratio and total profits to drop sharply from the prior month even though total sales are the same. The overall CM ratio has dropped from 45% in September to only 30% in October, and net operating income has dropped from \$18,000 to only \$3,000. In addition, with the drop in the overall CM ratio, the company's break-even point is no longer \$60,000 in sales. Because the company is now realizing less average contribution margin per dollar of sales, it takes more sales to cover the same amount of

EXHIBIT 4-4 Multiproduct Break-Even Analysis

| Sales | \$80,000 | 100% | \$20,000 | 100% | \$100,000 | 100% |
| Variable expenses | 60,000 | 75% | 10,000 | 50% | 70,000 | 70% |
| Contribution margin | <u>\$20,000</u> | <u>25%</u> | <u>\$10,000</u> | <u>50%</u> | 30,000 | <u>30%</u> |
| Fixed expenses | | | | | 27,000 | |
| Net operating income | | | | | <u>\$ 3,000</u> | |
| Computation of the break-even point: | | | | | | |
| | $\frac{\text{Fixed expenses}}{\text{Overall CM ratio}} = \frac{\$27,000}{0.30} = \$90,000$ | | | | | |

fixed costs. Thus, the break-even point has increased from \$60,000 to \$90,000 in sales per year.

In preparing a break-even analysis, an assumption must be made concerning the sales mix. Usually the assumption is that it will not change. However, if the sales mix is expected to change, then this must be explicitly considered in any CVP computations.

Assumptions of CVP Analysis

A number of assumptions commonly underlie CVP analysis:

1. Selling price is constant. The price of a product or service will not change as volume changes.
2. Costs are linear and can be accurately divided into variable and fixed elements. The variable element is constant per unit, and the fixed element is constant in total over the entire relevant range.
3. In multiproduct companies, the sales mix is constant.
4. In manufacturing companies, inventories do not change. The number of units produced equals the number of units sold.

While these assumptions may be violated in practice, the results of CVP analysis are often “good enough” to be quite useful. Perhaps the greatest danger lies in relying on simple CVP analysis when a manager is contemplating a large change in volume that lies outside of the relevant range. For example, a manager might contemplate increasing the level of sales far beyond what the company has ever experienced before. However, even in these situations the model can be adjusted as we have done in this chapter to take into account anticipated changes in selling prices, fixed costs, and the sales mix that would otherwise violate the assumptions mentioned above. For example, in a decision that would affect fixed costs, the change in fixed costs can be explicitly taken into account as illustrated earlier in the chapter in the Acoustic Concepts example on pages 127–130.

Summary

CVP analysis is based on a simple model of how profits respond to prices, costs, and volume. This model can be used to answer a variety of critical questions such as what is the company’s break-even volume, what is its margin of safety, and what is likely to happen if specific changes are made in prices, costs, and volume.

A CVP graph depicts the relationships between unit sales on the one hand and fixed expenses, variable expenses, total expenses, total sales, and profits on the other hand. The profit graph is simpler than the CVP graph and shows how profits depend on sales. The CVP and profit graphs are useful for developing intuition about how costs and profits respond to changes in sales.

The contribution margin ratio is the ratio of the total contribution margin to total sales. This ratio can be used to quickly estimate what impact a change in total sales would have on net operating income. The ratio is also useful in break-even analysis.

Target profit analysis is used to estimate how much sales would have to be to attain a specified target profit. The unit sales required to attain the target profit can be estimated by dividing the sum of the target profit and fixed expense by the unit contribution margin. Break-even analysis is a special case of target profit analysis that is used to estimate how much sales would have to be to just break even. The unit sales required to break even can be estimated by dividing the fixed expense by the unit contribution margin.

The margin of safety is the amount by which the company’s current sales exceeds break-even sales.

The degree of operating leverage allows quick estimation of what impact a given percentage change in sales would have on the company’s net operating income. The higher the degree of operating leverage, the greater is the impact on the company’s profits. The degree of operating leverage is not constant—it depends on the company’s current level of sales.

The profits of a multiproduct company are affected by its sales mix. Changes in the sales mix can affect the break-even point, margin of safety, and other critical factors.

Review Problem: CVP Relationships

Voltar Company manufactures and sells a specialized cordless telephone for high electromagnetic radiation environments. The company's contribution format income statement for the most recent year is given below:

| | Total | Per Unit | Percent of Sales |
|----------------------------|-------------|----------|------------------|
| Sales (20,000 units) | \$1,200,000 | \$60 | 100% |
| Variable expenses | 900,000 | 45 | ? % |
| Contribution margin | 300,000 | \$15 | ? % |
| Fixed expenses | 240,000 | | |
| Net operating income | \$ 60,000 | | |

Management is anxious to increase the company's profit and has asked for an analysis of a number of items.

Required:

1. Compute the company's CM ratio and variable expense ratio.
2. Compute the company's break-even point in both units and sales dollars. Use the equation method.
3. Assume that sales increase by \$400,000 next year. If cost behavior patterns remain unchanged, by how much will the company's net operating income increase? Use the CM ratio to compute your answer.
4. Refer to the original data. Assume that next year management wants the company to earn a profit of at least \$90,000. How many units will have to be sold to meet this target profit?
5. Refer to the original data. Compute the company's margin of safety in both dollar and percentage form.
6.
 - a. Compute the company's degree of operating leverage at the present level of sales.
 - b. Assume that through a more intense effort by the sales staff, the company's sales increase by 8% next year. By what percentage would you expect net operating income to increase? Use the degree of operating leverage to obtain your answer.
 - c. Verify your answer to (b) by preparing a new contribution format income statement showing an 8% increase in sales.
7. In an effort to increase sales and profits, management is considering the use of a higher-quality speaker. The higher-quality speaker would increase variable costs by \$3 per unit, but management could eliminate one quality inspector who is paid a salary of \$30,000 per year. The sales manager estimates that the higher-quality speaker would increase annual sales by at least 20%.
 - a. Assuming that changes are made as described above, prepare a projected contribution format income statement for next year. Show data on a total, per unit, and percentage basis.
 - b. Compute the company's new break-even point in both units and dollars of sales. Use the formula method.
 - c. Would you recommend that the changes be made?

Solution to Review Problem

$$1. \quad \text{CM ratio} = \frac{\text{Unit contribution margin}}{\text{Unit selling price}} = \frac{\$15}{\$60} = 25\%$$

$$\text{Variable expense ratio} = \frac{\text{Variable expense}}{\text{Selling price}} = \frac{\$45}{\$60} = 75\%$$

$$2. \quad \text{Profit} = \text{Unit CM} \times Q - \text{Fixed expenses}$$

$$\$0 = (\$60 - \$45) \times Q - \$240,000$$

$$\$15Q = \$240,000$$

$$Q = \$240,000 \div \$15$$

$$Q = 16,000 \text{ units; or at } \$60 \text{ per unit, } \$960,000$$

3.

| | |
|--|------------------|
| Increase in sales | \$400,000 |
| Multiply by the CM ratio | × 25% |
| Expected increase in contribution margin | <u>\$100,000</u> |

Because the fixed expenses are not expected to change, net operating income will increase by the entire \$100,000 increase in contribution margin computed above.

4. Equation method:

$$\begin{aligned} \text{Profit} &= \text{Unit CM} \times Q - \text{Fixed expenses} \\ \$90,000 &= (\$60 - \$45) \times Q - \$240,000 \\ \$15Q &= \$90,000 + \$240,000 \\ Q &= \$330,000 \div \$15 \\ Q &= 22,000 \text{ units} \end{aligned}$$

Formula method:

$$\text{Unit Sales to attain the target profit} = \frac{\text{Target profit} + \text{Fixed expenses}}{\text{Contribution margin per unit}} = \frac{\$90,000 + \$240,000}{\$15 \text{ per unit}} = 22,000 \text{ units}$$

5. Margin of safety in dollars = Total sales – Break-even sales

$$= \$1,200,000 - \$960,000 = \$240,000$$

$$\text{Margin of safety percentage} = \frac{\text{Margin of safety in dollars}}{\text{Total sales}} = \frac{\$240,000}{\$1,200,000} = 20\%$$

6. a. Degree of operating leverage = $\frac{\text{Contribution margin}}{\text{Net operating income}} = \frac{\$300,000}{\$60,000} = 5$

b.

| | |
|---|------------|
| Expected increase in sales | 8% |
| Degree of operating leverage | × 5 |
| Expected increase in net operating income | <u>40%</u> |

c. If sales increase by 8%, then 21,600 units (20,000 × 1.08 = 21,600) will be sold next year. The new contribution format income statement would be as follows:

| | Total | Per Unit | Percent of Sales |
|----------------------------|------------------|-------------|------------------|
| Sales (21,600 units) | \$1,296,000 | \$60 | 100% |
| Variable expenses | <u>972,000</u> | <u>45</u> | <u>75%</u> |
| Contribution margin | 324,000 | <u>\$15</u> | <u>25%</u> |
| Fixed expenses | <u>240,000</u> | | |
| Net operating income | <u>\$ 84,000</u> | | |

Thus, the \$84,000 expected net operating income for next year represents a 40% increase over the \$60,000 net operating income earned during the current year:

$$\frac{\$84,000 - \$60,000}{\$60,000} = \frac{\$24,000}{\$60,000} = 40\% \text{ increase}$$

Note from the income statement above that the increase in sales from 20,000 to 21,600 units has increased *both* total sales and total variable expenses.

7. a. A 20% increase in sales would result in 24,000 units being sold next year: $20,000 \text{ units} \times 1.20 = 24,000 \text{ units}$.

| | Total | Per Unit | Percent of Sales |
|----------------------------|----------------------|----------|------------------|
| Sales (24,000 units) | \$1,440,000 | \$60 | 100% |
| Variable expenses | 1,152,000 | 48* | 80% |
| Contribution margin | 288,000 | \$12 | 20% |
| Fixed expenses | 210,000 [†] | | |
| Net operating income | <u>\$ 78,000</u> | | |

* $\$45 + \$3 = \$48$; $\$48 \div \$60 = 80\%$.
[†] $\$240,000 - \$30,000 = \$210,000$.

Note that the change in per unit variable expenses results in a change in both the per unit contribution margin and the CM ratio.

$$\begin{aligned}
 \text{b.} \quad \text{Unit sales to break even} &= \frac{\text{Fixed expenses}}{\text{Unit contribution margin}} \\
 &= \frac{\$210,000}{\$12 \text{ per unit}} = 17,500 \text{ units} \\
 \\
 \text{Dollar sales to break even} &= \frac{\text{Fixed expenses}}{\text{CM ratio}} \\
 &= \frac{\$210,000}{0.20} = \$1,050,000
 \end{aligned}$$

- c. Yes, based on these data the changes should be made. The changes increase the company's net operating income from the present \$60,000 to \$78,000 per year. Although the changes also result in a higher break-even point (17,500 units as compared to the present 16,000 units), the company's margin of safety actually becomes greater than before:

$$\begin{aligned}
 \text{Margin of safety in dollars} &= \text{Total sales} - \text{Break-even sales} \\
 &= \$1,440,000 - \$1,050,000 = \$390,000
 \end{aligned}$$

As shown in (5) on the prior page, the company's present margin of safety is only \$240,000. Thus, several benefits will result from the proposed changes.

Glossary

- Break-even point** The level of sales at which profit is zero. (p. 121)
- Contribution margin ratio (CM ratio)** A ratio computed by dividing contribution margin by dollar sales. (p. 126)
- Cost-volume-profit (CVP) graph** A graphical representation of the relationships between an organization's revenues, costs, and profits on the one hand and its sales volume on the other hand. (p. 123)
- Degree of operating leverage** A measure, at a given level of sales, of how a percentage change in sales will affect profits. The degree of operating leverage is computed by dividing contribution margin by net operating income. (p. 138)
- Incremental analysis** An analytical approach that focuses only on those costs and revenues that change as a result of a decision. (p. 128)
- Margin of safety** The excess of budgeted (or actual) dollar sales over the break-even dollar sales. (p. 135)
- Operating leverage** A measure of how sensitive net operating income is to a given percentage change in dollar sales. (p. 138)
- Sales mix** The relative proportions in which a company's products are sold. Sales mix is computed by expressing the sales of each product as a percentage of total sales. (p. 140)
- Target profit analysis** Estimating what sales volume is needed to achieve a specific target profit. (p. 131)
- Variable expense ratio** A ratio computed by dividing variable expenses by dollar sales (p. 127)

Questions

- 4-1 What is meant by a product’s contribution margin ratio? How is this ratio useful in planning business operations?
- 4-2 Often the most direct route to a business decision is an incremental analysis. What is meant by an *incremental analysis*?
- 4-3 In all respects, Company A and Company B are identical except that Company A’s costs are mostly variable, whereas Company B’s costs are mostly fixed. When sales increase, which company will tend to realize the greatest increase in profits? Explain.
- 4-4 What is meant by the term *operating leverage*?
- 4-5 What is meant by the term *break-even point*?
- 4-6 In response to a request from your immediate supervisor, you have prepared a CVP graph portraying the cost and revenue characteristics of your company’s product and operations. Explain how the lines on the graph and the break-even point would change if (a) the selling price per unit decreased, (b) fixed cost increased throughout the entire range of activity portrayed on the graph, and (c) variable cost per unit increased.
- 4-7 What is meant by the margin of safety?
- 4-8 What is meant by the term *sales mix*? What assumption is usually made concerning sales mix in CVP analysis?
- 4-9 Explain how a shift in the sales mix could result in both a higher break-even point and a lower net income.

Multiple-choice questions are provided on the text website at www.mhhe.com/noreen2e.

Exercises

EXERCISE 4-1 Preparing a Contribution Format Income Statement [LO1]

Whirly Corporation’s most recent income statement is shown below:

| | Total | Per Unit |
|----------------------------|------------------|----------------|
| Sales (10,000 units) | \$350,000 | \$35.00 |
| Variable expenses | <u>200,000</u> | <u>20.00</u> |
| Contribution margin | 150,000 | <u>\$15.00</u> |
| Fixed expenses | <u>135,000</u> | |
| Net operating income | <u>\$ 15,000</u> | |

Required:

Prepare a new contribution format income statement under each of the following conditions (consider each case independently):

1. The sales volume increases by 100 units.
2. The sales volume decreases by 100 units.
3. The sales volume is 9,000 units.

EXERCISE 4-2 Prepare a Cost-Volume-Profit (CVP) Graph [LO2]

Karlik Enterprises distributes a single product whose selling price is \$24 and whose variable expense is \$18 per unit. The company’s monthly fixed expense is \$24,000.

Required:

1. Prepare a cost-volume-profit graph for the company up to a sales level of 8,000 units.
2. Estimate the company’s break-even point in unit sales using your cost-volume-profit graph.

EXERCISE 4-3 Prepare a Profit Graph [LO2]

Jaffe Enterprises distributes a single product whose selling price is \$16 and whose variable expense is \$11 per unit. The company’s fixed expense is \$16,000 per month.

Required:

1. Prepare a profit graph for the company up to a sales level of 4,000 units.
2. Estimate the company's break-even point in unit sales using your profit graph.

EXERCISE 4-4 Computing and Using the CM Ratio [L03]

Last month when Holiday Creations, Inc., sold 50,000 units, total sales were \$200,000, total variable expenses were \$120,000, and fixed expenses were \$65,000.

Required:

1. What is the company's contribution margin (CM) ratio?
2. Estimate the change in the company's net operating income if it were to increase its total sales by \$1,000.

EXERCISE 4-5 Changes in Variable Costs, Fixed Costs, Selling Price, and Volume [L04]

Data for Hermann Corporation are shown below:

| | Per Unit | Percent of Sales |
|---------------------------|-------------|------------------|
| Selling price | \$90 | 100% |
| Variable expenses | <u>63</u> | <u>70</u> |
| Contribution margin | <u>\$27</u> | <u>30%</u> |

Fixed expenses are \$30,000 per month and the company is selling 2,000 units per month.

Required:

1. The marketing manager argues that a \$5,000 increase in the monthly advertising budget would increase monthly sales by \$9,000. Should the advertising budget be increased?
2. Refer to the original data. Management is considering using higher-quality components that would increase the variable cost by \$2 per unit. The marketing manager believes the higher-quality product would increase sales by 10% per month. Should the higher-quality components be used?

EXERCISE 4-6 Compute the Level of Sales Required to Attain a Target Profit [L05]

Lin Corporation has a single product whose selling price is \$120 and whose variable expense is \$80 per unit. The company's monthly fixed expense is \$50,000.

Required:

1. Using the equation method, solve for the unit sales that are required to earn a target profit of \$10,000.
2. Using the formula method, solve for the unit sales that are required to earn a target profit of \$15,000.

EXERCISE 4-7 Compute the Break-Even Point [L06]

Mauro Products distributes a single product, a woven basket whose selling price is \$15 and whose variable expense is \$12 per unit. The company's monthly fixed expense is \$4,200.

Required:

1. Solve for the company's break-even point in unit sales using the equation method.
2. Solve for the company's break-even point in sales dollars using the equation method and the CM ratio.
3. Solve for the company's break-even point in unit sales using the formula method.
4. Solve for the company's break-even point in sales dollars using the formula method and the CM ratio.

EXERCISE 4-8 Compute the Margin of Safety [L07]

Molander Corporation is a distributor of a sun umbrella used at resort hotels. Data concerning the next month's budget appear below:

| | |
|-------------------------|-----------------------|
| Selling price | \$30 per unit |
| Variable expenses | \$20 per unit |
| Fixed expenses | \$7,500 per month |
| Unit sales | 1,000 units per month |

Required:

1. Compute the company’s margin of safety.
2. Compute the company’s margin of safety as a percentage of its sales.

EXERCISE 4–9 Compute and Use the Degree of Operating Leverage [L08]

Engberg Company installs lawn sod in home yards. The company’s most recent monthly contribution format income statement follows:

| | Amount | Percent of Sales |
|----------------------------|------------------------|------------------|
| Sales..... | \$80,000 | 100% |
| Variable expenses | <u>32,000</u> | <u>40%</u> |
| Contribution margin | 48,000 | <u>60%</u> |
| Fixed expenses..... | <u>38,000</u> | |
| Net operating income | <u><u>\$10,000</u></u> | |

Required:

1. Compute the company’s degree of operating leverage.
2. Using the degree of operating leverage, estimate the impact on net operating income of a 5% increase in sales.
3. Verify your estimate from part (2) above by constructing a new contribution format income statement for the company assuming a 5% increase in sales.

EXERCISE 4–10 Compute the Break-Even Point for a Multiproduct Company [L09]

Lucido Products markets two computer games: Claimjumper and Makeover. A contribution format income statement for a recent month for the two games appears on the following page:

| | Claimjumper | Makeover | Total |
|----------------------------|-----------------|-----------------|------------------------|
| Sales | \$30,000 | \$70,000 | \$100,000 |
| Variable expenses | <u>20,000</u> | <u>50,000</u> | <u>70,000</u> |
| Contribution margin | <u>\$10,000</u> | <u>\$20,000</u> | 30,000 |
| Fixed expenses | | | <u>24,000</u> |
| Net operating income | | | <u><u>\$ 6,000</u></u> |

Required:

1. Compute the overall contribution margin (CM) ratio for the company.
2. Compute the overall break-even point for the company in sales dollars.
3. Verify the overall break-even point for the company by constructing a contribution format income statement showing the appropriate levels of sales for the two products.

EXERCISE 4–11 Using a Contribution Format Income Statement [L01, L04]

Miller Company’s most recent contribution format income statement is shown below:

| | Total | Per Unit |
|----------------------------|-------------------------|----------------|
| Sales (20,000 units) | \$300,000 | \$15.00 |
| Variable expenses | <u>180,000</u> | <u>9.00</u> |
| Contribution margin | 120,000 | <u>\$ 6.00</u> |
| Fixed expenses | <u>70,000</u> | |
| Net operating income | <u><u>\$ 50,000</u></u> | |

Required:

Prepare a new contribution format income statement under each of the following conditions (consider each case independently):

1. The number of units sold increases by 15%.
2. The selling price decreases by \$1.50 per unit, and the number of units sold increases by 25%.
3. The selling price increases by \$1.50 per unit, fixed expenses increase by \$20,000, and the number of units sold decreases by 5%.
4. The selling price increases by 12%, variable expenses increase by 60 cents per unit, and the number of units sold decreases by 10%.

EXERCISE 4-12 Target Profit and Break-Even Analysis; Margin of Safety; CM Ratio [L01, L03, L05, L06, L07]

Menlo Company distributes a single product. The company's sales and expenses for last month follow:

| | Total | Per Unit |
|----------------------------|------------------|-------------|
| Sales | \$450,000 | \$30 |
| Variable expenses | 180,000 | 12 |
| Contribution margin | 270,000 | <u>\$18</u> |
| Fixed expenses | 216,000 | |
| Net operating income | <u>\$ 54,000</u> | |

Required:

1. What is the monthly break-even point in units sold and in sales dollars?
2. Without resorting to computations, what is the total contribution margin at the break-even point?
3. How many units would have to be sold each month to earn a target profit of \$90,000? Use the formula method. Verify your answer by preparing a contribution format income statement at the target sales level.
4. Refer to the original data. Compute the company's margin of safety in both dollar and percentage terms.
5. What is the company's CM ratio? If sales increase by \$50,000 per month and there is no change in fixed expenses, by how much would you expect monthly net operating income to increase?

EXERCISE 4-13 Target Profit and Break-Even Analysis [L03, L04, L05, L06]

Lindon Company is the exclusive distributor for an automotive product that sells for \$40 per unit and has a CM ratio of 30%. The company's fixed expenses are \$180,000 per year. The company plans to sell 16,000 units this year.

Required:

1. What are the variable expenses per unit?
2. Using the equation method:
 - a. What is the break-even point in units and sales dollars?
 - b. What sales level in units and in sales dollars is required to earn an annual profit of \$60,000?
 - c. Assume that by using a more efficient shipper, the company is able to reduce its variable expenses by \$4 per unit. What is the company's new break-even point in units and sales dollars?
3. Repeat (2) above using the formula method.

EXERCISE 4-14 Missing Data; Basic CVP Concepts [L01, L09]

Fill in the missing amounts in each of the eight case situations below. Each case is independent of the others. (*Hint:* One way to find the missing amounts would be to prepare a contribution format income statement for each case, enter the known data, and then compute the missing items.)

- a. Assume that only one product is being sold in each of the four following case situations:

| Case | Units Sold | Sales | Variable Expenses | Contribution Margin per Unit | Fixed Expenses | Net Operating Income (Loss) |
|---------|------------|-----------|-------------------|------------------------------|----------------|-----------------------------|
| 1 | 15,000 | \$180,000 | \$120,000 | ? | \$50,000 | ? |
| 2 | ? | \$100,000 | ? | \$10 | \$32,000 | \$8,000 |
| 3 | 10,000 | ? | \$70,000 | \$13 | ? | \$12,000 |
| 4 | 6,000 | \$300,000 | ? | ? | \$100,000 | \$(10,000) |

b. Assume that more than one product is being sold in each of the four following case situations:

| Case | Sales | Variable Expenses | Average Contribution Margin Ratio | Fixed Expenses | Net Operating Income (Loss) |
|---------|-----------|-------------------|-----------------------------------|----------------|-----------------------------|
| 1 | \$500,000 | ? | 20% | ? | \$7,000 |
| 2 | \$400,000 | \$260,000 | ? | \$100,000 | ? |
| 3 | ? | ? | 60% | \$130,000 | \$20,000 |
| 4 | \$600,000 | \$420,000 | ? | ? | \$(5,000) |

EXERCISE 4-15 Operating Leverage [LO4, LO8]

Magic Realm, Inc., has developed a new fantasy board game. The company sold 15,000 games last year at a selling price of \$20 per game. Fixed costs associated with the game total \$182,000 per year, and variable costs are \$6 per game. Production of the game is entrusted to a printing contractor. Variable costs consist mostly of payments to this contractor.

Required:

- Prepare a contribution format income statement for the game last year and compute the degree of operating leverage.
- Management is confident that the company can sell 18,000 games next year (an increase of 3,000 games, or 20%, over last year). Compute:
 - The expected percentage increase in net operating income for next year.
 - The expected total dollar net operating income for next year. (Do not prepare an income statement; use the degree of operating leverage to compute your answer.)

EXERCISE 4-16 Target Profit and Break-Even Analysis [LO4, LO5, LO6]

Outback Outfitters sells recreational equipment. One of the company's products, a small camp stove, sells for \$50 per unit. Variable expenses are \$32 per stove, and fixed expenses associated with the stove total \$108,000 per month.

Required:

- Compute the break-even point in number of stoves and in total sales dollars.
- If the variable expenses per stove increase as a percentage of the selling price, will it result in a higher or a lower break-even point? Why? (Assume that the fixed expenses remain unchanged.)
- At present, the company is selling 8,000 stoves per month. The sales manager is convinced that a 10% reduction in the selling price would result in a 25% increase in monthly sales of stoves. Prepare two contribution format income statements, one under present operating conditions, and one as operations would appear after the proposed changes. Show both total and per unit data on your statements.
- Refer to the data in (3) above. How many stoves would have to be sold at the new selling price to yield a minimum net operating income of \$35,000 per month?

EXERCISE 4-17 Break-Even Analysis and CVP Graphing [LO2, LO4, LO6]

The Hartford Symphony Guild is planning its annual dinner-dance. The dinner-dance committee has assembled the following expected costs for the event:

| | |
|--|---------|
| Dinner (per person) | \$18 |
| Favors and program (per person) | \$2 |
| Band | \$2,800 |
| Rental of ballroom | \$900 |
| Professional entertainment during intermission | \$1,000 |
| Tickets and advertising | \$1,300 |

The committee members would like to charge \$35 per person for the evening's activities.

Required:

1. Compute the break-even point for the dinner-dance (in terms of the number of persons who must attend).
2. Assume that last year only 300 persons attended the dinner-dance. If the same number attend this year, what price per ticket must be charged in order to break even?
3. Refer to the original data (\$35 ticket price per person). Prepare a CVP graph for the dinner-dance from zero tickets up to 600 tickets sold.

EXERCISE 4-18 Multiproduct Break-Even Analysis [L09]

Olongapo Sports Corporation is the distributor in the Philippines of two premium golf balls—the Flight Dynamic and the Sure Shot. Monthly sales, expressed in pesos (P), and the contribution margin ratios for the two products follow:

| | Product | | Total |
|----------------|----------------|-----------|----------|
| | Flight Dynamic | Sure Shot | |
| Sales | P150,000 | P250,000 | P400,000 |
| CM ratio | 80% | 36% | ? |

Fixed expenses total P183,750 per month.

Required:

1. Prepare a contribution format income statement for the company as a whole. Carry computations to one decimal place.
2. Compute the break-even point for the company based on the current sales mix.
3. If sales increase by P100,000 a month, by how much would you expect net operating income to increase? What are your assumptions?

Problems

PROBLEM 4-19 Basics of CVP Analysis [L01, L03, L04, L06, L08]

Feather Friends, Inc., distributes a high-quality wooden birdhouse that sells for \$20 per unit. Variable costs are \$8 per unit, and fixed costs total \$180,000 per year.

Required:

Answer the following independent questions:

1. What is the product's CM ratio?
2. Use the CM ratio to determine the break-even point in sales dollars.
3. Due to an increase in demand, the company estimates that sales will increase by \$75,000 during the next year. By how much should net operating income increase (or net loss decrease) assuming that fixed costs do not change?
4. Assume that the operating results for last year were:

| | |
|----------------------------|------------------|
| Sales | \$400,000 |
| Variable expenses | 160,000 |
| Contribution margin | 240,000 |
| Fixed expenses | 180,000 |
| Net operating income | <u>\$ 60,000</u> |

- a. Compute the degree of operating leverage at the current level of sales.
- b. The president expects sales to increase by 20% next year. By what percentage should net operating income increase?

5. Refer to the original data. Assume that the company sold 18,000 units last year. The sales manager is convinced that a 10% reduction in the selling price, combined with a \$30,000 increase in advertising, would cause annual sales in units to increase by one-third. Prepare two contribution format income statements, one showing the results of last year's operations and one showing the results of operations if these changes are made. Would you recommend that the company do as the sales manager suggests?
6. Refer to the original data. Assume again that the company sold 18,000 units last year. The president does not want to change the selling price. Instead, he wants to increase the sales commission by \$1 per unit. He thinks that this move, combined with some increase in advertising, would increase annual sales by 25%. By how much could advertising be increased with profits remaining unchanged? Do not prepare an income statement; use the incremental analysis approach.

PROBLEM 4–20 Sales Mix; Multiproduct Break-Even Analysis [LO9]

Gold Star Rice, Ltd., of Thailand exports Thai rice throughout Asia. The company grows three varieties of rice—Fragrant, White, and Loonzain. (The currency in Thailand is the baht, which is denoted by B.) Budgeted sales by product and in total for the coming month are shown below:

| | Product | | | | | | Total |
|----------------------------|-----------------|------------|-----------------|------------|-----------------|------------|---------------------------|
| | White | | Fragrant | | Loonzain | | |
| Percentage of total sales | 20% | | 52% | | 28% | | 100% |
| Sales | B150,000 | 100% | B390,000 | 100% | B210,000 | 100% | B750,000 100% |
| Variable expenses | <u>108,000</u> | <u>72%</u> | <u>78,000</u> | <u>20%</u> | <u>84,000</u> | <u>40%</u> | <u>270,000</u> <u>36%</u> |
| Contribution margin | <u>B 42,000</u> | <u>28%</u> | <u>B312,000</u> | <u>80%</u> | <u>B126,000</u> | <u>60%</u> | <u>480,000</u> <u>64%</u> |
| Fixed expenses | | | | | | | 449,280 |
| Net operating income | | | | | | | <u>B30,720</u> |

$$\text{Dollar sales to break even} = \frac{\text{Fixed expenses}}{\text{CM ratio}} = \frac{B449,280}{0.64} = B702,000$$

As shown by these data, net operating income is budgeted at B30,720 for the month and break-even sales at B702,000.

Assume that actual sales for the month total B750,000 as planned. Actual sales by product are: White, B300,000; Fragrant, B180,000; and Loonzain, B270,000.

Required:

1. Prepare a contribution format income statement for the month based on actual sales data. Present the income statement in the format shown on the prior page.
2. Compute the break-even point in sales dollars for the month based on your actual data.
3. Considering the fact that the company met its B750,000 sales budget for the month, the president is shocked at the results shown on your income statement in (1) above. Prepare a brief memo for the president explaining why both the operating results and the break-even point in sales dollars are different from what was budgeted.

PROBLEM 4–21 Basic CVP Analysis; Graphing [LO1, LO2, LO4, LO6]

The Fashion Shoe Company operates a chain of women's shoe shops around the country. The shops carry many styles of shoes that are all sold at the same price. Sales personnel in the shops are paid a substantial commission on each pair of shoes sold (in addition to a small basic salary) in order to encourage them to be aggressive in their sales efforts.

The following worksheet contains cost and revenue data for Shop 48 and is typical of the company's many outlets:

| | A | B | C |
|----|-------------------------|--------------------------|---|
| 1 | | <i>Per Pair of Shoes</i> | |
| 2 | Selling price | \$ 30.00 | |
| 3 | | | |
| 4 | Variable expenses: | | |
| 5 | Invoice cost | \$ 13.50 | |
| 6 | Sales commission | 4.50 | |
| 7 | Total variable expenses | \$ 18.00 | |
| 8 | | | |
| 9 | | <i>Annual</i> | |
| 10 | Fixed expenses: | | |
| 11 | Advertising | \$ 30,000 | |
| 12 | Rent | 20,000 | |
| 13 | Salaries | 100,000 | |
| 14 | Total fixed expenses | \$ 150,000 | |
| 15 | | | |

Required:

- Calculate the annual break-even point in dollar sales and in unit sales for Shop 48.
- Prepare a CVP graph showing cost and revenue data for Shop 48 from zero shoes up to 17,000 pairs of shoes sold each year. Clearly indicate the break-even point on the graph.
- If 12,000 pairs of shoes are sold in a year, what would be Shop 48's net operating income or loss?
- The company is considering paying the store manager of Shop 48 an incentive commission of 75 cents per pair of shoes (in addition to the salesperson's commission). If this change is made, what will be the new break-even point in dollar sales and in unit sales?
- Refer to the original data. As an alternative to (4) above, the company is considering paying the store manager 50 cents commission on each pair of shoes sold in excess of the break-even point. If this change is made, what will be the shop's net operating income or loss if 15,000 pairs of shoes are sold?
- Refer to the original data. The company is considering eliminating sales commissions entirely in its shops and increasing fixed salaries by \$31,500 annually. If this change is made, what will be the new break-even point in dollar sales and in unit sales for Shop 48? Would you recommend that the change be made? Explain.

Excel

PROBLEM 4-22 Basics of CVP Analysis; Cost Structure [L01, L03, L04, L05, L06]

Due to erratic sales of its sole product—a high-capacity battery for laptop computers—PEM, Inc., has been experiencing difficulty for some time. The company's contribution format income statement for the most recent month is given below:

| | |
|--|------------|
| Sales (19,500 units × \$30 per unit) | \$585,000 |
| Variable expenses | 409,500 |
| Contribution margin | 175,500 |
| Fixed expenses | 180,000 |
| Net operating loss | \$ (4,500) |

Required:

- Compute the company's CM ratio and its break-even point in both units and dollars.
- The president believes that a \$16,000 increase in the monthly advertising budget, combined with an intensified effort by the sales staff, will result in an \$80,000 increase in monthly sales. If the president

- is right, what will be the effect on the company’s monthly net operating income or loss? (Use the incremental approach in preparing your answer.)
3. Refer to the original data. The sales manager is convinced that a 10% reduction in the selling price, combined with an increase of \$60,000 in the monthly advertising budget, will cause unit sales to double. What will the new contribution format income statement look like if these changes are adopted?
 4. Refer to the original data. The Marketing Department thinks that a fancy new package for the laptop computer battery would help sales. The new package would increase packaging costs by 75 cents per unit. Assuming no other changes, how many units would have to be sold each month to earn a profit of \$9,750?
 5. Refer to the original data. By automating certain operations, the company could reduce variable costs by \$3 per unit. However, fixed costs would increase by \$72,000 each month.
 - a. Compute the new CM ratio and the new break-even point in both units and dollars.
 - b. Assume that the company expects to sell 26,000 units next month. Prepare two contribution format income statements, one assuming that operations are not automated and one assuming that they are. (Show data on a per unit and percentage basis, as well as in total, for each alternative.)
 - c. Would you recommend that the company automate its operations? Explain.

PROBLEM 4–23 Sales Mix; Break-Even Analysis; Margin of Safety [L07, L09]

Island Novelties, Inc., of Palau makes two products, Hawaiian Fantasy and Tahitian Joy. Present revenue, cost, and sales data for the two products follow:

| | Hawaiian Fantasy | Tahitian Joy |
|-------------------------------------|-----------------------------|-------------------------|
| Selling price per unit | \$15 | \$100 |
| Variable expenses per unit | \$9 | \$20 |
| Number of units sold annually | 20,000 | 5,000 |

Fixed expenses total \$475,800 per year. The Republic of Palau uses the U.S. dollar as its currency.

Required:

1. Assuming the sales mix given above, do the following:
 - a. Prepare a contribution format income statement showing both dollar and percent columns for each product and for the company as a whole.
 - b. Compute the break-even point in dollars for the company as a whole and the margin of safety in both dollars and percent.
2. The company has developed a new product to be called Samoan Delight. Assume that the company could sell 10,000 units at \$45 each. The variable expenses would be \$36 each. The company’s fixed expenses would not change.
 - a. Prepare another contribution format income statement, including sales of the Samoan Delight (sales of the other two products would not change).
 - b. Compute the company’s new break-even point in dollars and the new margin of safety in both dollars and percent.
3. The president of the company examines your figures and says, “There’s something strange here. Our fixed expenses haven’t changed and you show greater total contribution margin if we add the new product, but you also show our break-even point going up. With greater contribution margin, the break-even point should go down, not up. You’ve made a mistake somewhere.” Explain to the president what has happened.

PROBLEM 4–24 Interpretive Questions on the CVP Graph [L02, L06]

A CVP graph such as the one shown below is a useful technique for showing relationships among an organization’s costs, volume, and profits.

Required:

- Identify the numbered components in the CVP graph.
- State the effect of each of the following actions on line 3, line 9, and the break-even point. For line 3 and line 9, state whether the action will cause the line to:
 - Remain unchanged.
 - Shift upward.
 - Shift downward.
 - Have a steeper slope (i.e., rotate upward).
 - Have a flatter slope (i.e., rotate downward).
 - Shift upward *and* have a steeper slope.
 - Shift upward *and* have a flatter slope.
 - Shift downward *and* have a steeper slope.
 - Shift downward *and* have a flatter slope.

In the case of the break-even point, state whether the action will cause the break-even point to:

- Remain unchanged.
- Increase.
- Decrease.
- Probably change, but the direction is uncertain.

Treat each case independently.

- x. Example. Fixed costs are reduced by \$5,000 per period.

Answer (see choices above):

 - Line 3: Shift downward.
 - Line 9: Remain unchanged.
 - Break-even point: Decrease.
- a. The unit selling price is increased from \$18 to \$20.
- b. Unit variable costs are decreased from \$12 to \$10.
- c. Fixed costs are increased by \$3,000 per period.
- d. Two thousand more units are sold during the period than were budgeted.
- e. Due to paying salespersons a commission rather than a flat salary, fixed costs are reduced by \$8,000 per period and unit variable costs are increased by \$3.
- f. Due to an increase in the cost of materials, both unit variable costs and the selling price are increased by \$2.
- g. Advertising costs are increased by \$10,000 per period, resulting in a 10% increase in the number of units sold.
- h. Due to automating an operation previously done by workers, fixed costs are increased by \$12,000 per period and unit variable costs are reduced by \$4.

PROBLEM 4–25 Sales Mix; Commission Structure; Multiproduct Break-Even Analysis [L09]

Carbex, Inc., produces cutlery sets out of high-quality wood and steel. The company makes a standard cutlery set and a deluxe set and sells them to retail department stores throughout the country. The standard set sells for \$60, and the deluxe set sells for \$75. The variable expenses associated with each set are given below.

| | Standard | Deluxe |
|--|----------|---------|
| Production costs | \$15.00 | \$30.00 |
| Sales commissions (15% of sales price) | \$9.00 | \$11.25 |

The company’s fixed expenses each month are:

| | |
|----------------------|-----------|
| Advertising | \$105,000 |
| Depreciation | \$21,700 |
| Administrative | \$63,000 |

Salespersons are paid on a commission basis to encourage them to be aggressive in their sales efforts. Mary Parsons, the financial vice president, watches sales commissions carefully and has noted that they have risen steadily over the last year. For this reason, she was shocked to find that even though sales have increased, profits for the current month—May—are down substantially from April. Sales, in sets, for the last two months are given below:

| | Standard | Deluxe | Total |
|-------------|----------|--------|-------|
| April | 4,000 | 2,000 | 6,000 |
| May | 1,000 | 5,000 | 6,000 |

Required:

1. Prepare contribution format income statements for April and May. Use the following headings:

| | Standard | | Deluxe | | Total | |
|-------------|----------|---------|--------|---------|--------|---------|
| | Amount | Percent | Amount | Percent | Amount | Percent |
| Sales | | | | | | |
| Etc | | | | | | |

2. Place the fixed expenses only in the Total column. Do not show percentages for the fixed expenses.
3. Explain the difference in net operating incomes between the two months, even though the same *total* number of sets was sold in each month.
4. What can be done to the sales commissions to improve the sales mix?
 - a. Using April’s sales mix, what is the break-even point in sales dollars?
 - b. Without doing any calculations, explain whether the break-even points would be higher or lower with May’s sales mix than April’s sales mix.

PROBLEM 4–26 Break-Even Analysis; Pricing [LO1, LO4, LO6]

Minden Company introduced a new product last year for which it is trying to find an optimal selling price. Marketing studies suggest that the company can increase sales by 5,000 units for each \$2 reduction in the selling price. The company’s present selling price is \$70 per unit, and variable expenses are \$40 per unit. Fixed expenses are \$540,000 per year. The present annual sales volume (at the \$70 selling price) is 15,000 units.

Required:

1. What is the present yearly net operating income or loss?
2. What is the present break-even point in units and in dollar sales?
3. Assuming that the marketing studies are correct, what is the *maximum* profit that the company can earn yearly? At how many units and at what selling price per unit would the company generate this profit?
4. What would be the break-even point in units and in sales dollars using the selling price you determined in (3) above (e.g., the selling price at the level of maximum profits)? Why is this break-even point different from the break-even point you computed in (2) above?

PROBLEM 4–27 Various CVP Questions: Break-Even Point; Cost Structure; Target Sales [LO1, LO3, LO4, LO5, LO6, LO8]

Northwood Company manufactures basketballs. The company has a ball that sells for \$25. At present, the ball is manufactured in a small plant that relies heavily on direct labor workers. Thus, variable costs are high, totaling \$15 per ball, of which 60% is direct labor cost.

Last year, the company sold 30,000 of these balls, with the following results:

| | |
|----------------------------|------------------|
| Sales (30,000 balls) | \$750,000 |
| Variable expenses | 450,000 |
| Contribution margin | 300,000 |
| Fixed expenses | 210,000 |
| Net operating income | <u>\$ 90,000</u> |

Required:

1. Compute (a) the CM ratio and the break-even point in balls, and (b) the degree of operating leverage at last year’s sales level.
2. Due to an increase in labor rates, the company estimates that variable costs will increase by \$3 per ball next year. If this change takes place and the selling price per ball remains constant at \$25, what will be the new CM ratio and break-even point in balls?
3. Refer to the data in (2) above. If the expected change in variable costs takes place, how many balls will have to be sold next year to earn the same net operating income (\$90,000) as last year?
4. Refer again to the data in (2) above. The president feels that the company must raise the selling price of its basketballs. If Northwood Company wants to maintain *the same CM ratio as last year*, what selling price per ball must it charge next year to cover the increased labor costs?
5. Refer to the original data. The company is discussing the construction of a new, automated manufacturing plant. The new plant would slash variable costs per ball by 40%, but it would cause fixed costs per year to double. If the new plant is built, what would be the company’s new CM ratio and new break-even point in balls?
6. Refer to the data in (5) above.
 - a. If the new plant is built, how many balls will have to be sold next year to earn the same net operating income, \$90,000, as last year?
 - b. Assume the new plant is built and that next year the company manufactures and sells 30,000 balls (the same number as sold last year). Prepare a contribution format income statement and compute the degree of operating leverage.
 - c. If you were a member of top management, would you have been in favor of constructing the new plant? Explain.

PROBLEM 4–28 Graphing; Incremental Analysis; Operating Leverage [LO2, LO4, LO5, LO6, LO8]

Angie Silva has recently opened The Sandal Shop in Brisbane, Australia, a store that specializes in fashionable sandals. Angie has just received a degree in business and she is anxious to apply the principles she has learned to her business. In time, she hopes to open a chain of sandal shops. As a first step, she has prepared the following analysis for her new store:

| | |
|---|-----------------|
| Sales price per pair of sandals | \$40 |
| Variable expenses per pair of sandals | 16 |
| Contribution margin per pair of sandals | <u>\$24</u> |
| Fixed expenses per year: | |
| Building rental | \$15,000 |
| Equipment depreciation | 7,000 |
| Selling | 20,000 |
| Administrative | <u>18,000</u> |
| Total fixed expenses | <u>\$60,000</u> |

Required:

1. How many pairs of sandals must be sold each year to break even? What does this represent in total sales dollars?

2. Prepare a CVP graph or a profit graph for the store from zero pairs up to 4,000 pairs of sandals sold each year. Indicate the break-even point on your graph.
3. Angie has decided that she must earn at least \$18,000 the first year to justify her time and effort. How many pairs of sandals must be sold to reach this target profit?
4. Angie now has two salespersons working in the store—one full time and one part time. It will cost her an additional \$8,000 per year to convert the part-time position to a full-time position. Angie believes that the change would bring in an additional \$25,000 in sales each year. Should she convert the position? Use the incremental approach. (Do not prepare an income statement.)
5. Refer to the original data. During the first year, the store sold only 3,000 pairs of sandals and reported the following operating results:

| | |
|----------------------------|------------------|
| Sales (3,000 pairs) | \$120,000 |
| Variable expenses | 48,000 |
| Contribution margin | 72,000 |
| Fixed expenses | 60,000 |
| Net operating income | <u>\$ 12,000</u> |

- a. What is the store’s degree of operating leverage?
- b. Angie is confident that with a more intense sales effort and with a more creative advertising program she can increase sales by 50% next year. What would be the expected percentage increase in net operating income? Use the degree of operating leverage to compute your answer.

PROBLEM 4–29 Changes in Cost Structure; Break-Even Analysis; Operating Leverage; Margin of Safety
[L04, L06, L07, L08]

Morton Company’s contribution format income statement for last month is given below:

| | |
|--|------------------|
| Sales (15,000 units × \$30 per unit) | \$450,000 |
| Variable expenses | 315,000 |
| Contribution margin | 135,000 |
| Fixed expenses | 90,000 |
| Net operating income | <u>\$ 45,000</u> |

The industry in which Morton Company operates is quite sensitive to cyclical movements in the economy. Thus, profits vary considerably from year to year according to general economic conditions. The company has a large amount of unused capacity and is studying ways of improving profits.

Required:

1. New equipment has come onto the market that would allow Morton Company to automate a portion of its operations. Variable costs would be reduced by \$9 per unit. However, fixed costs would increase to a total of \$225,000 each month. Prepare two contribution format income statements, one showing present operations and one showing how operations would appear if the new equipment is purchased. Show an Amount column, a Per Unit column, and a Percent column on each statement. Do not show percentages for the fixed costs.
2. Refer to the income statements in (1) above. For both present operations and the proposed new operations, compute (a) the degree of operating leverage, (b) the break-even point in dollars, and (c) the margin of safety in both dollar and percentage terms.
3. Refer again to the data in (1) above. As a manager, what factor would be paramount in your mind in deciding whether to purchase the new equipment? (Assume that enough funds are available to make the purchase.)
4. Refer to the original data. Rather than purchase new equipment, the marketing manager argues that the company’s marketing strategy should be changed. Rather than pay sales commissions, which are currently included in variable expenses, the company would pay salespersons fixed salaries and would invest heavily in advertising. The marketing manager claims this new approach would increase unit sales by 30% without any change in selling price; the company’s new monthly fixed expenses would be \$180,000; and its net operating income would increase by 20%. Compute the break-even point in dollar sales for the company under the new marketing strategy. Do you agree with the marketing manager’s proposal?

**PROBLEM 4–30 Target Profit and Break-Even Analysis [L05, L06]**

The Shirt Works sells a large variety of tee shirts and sweatshirts. Steve Hooper, the owner, is thinking of expanding his sales by hiring local high school students, on a commission basis, to sell sweatshirts bearing the name and mascot of the local high school.

These sweatshirts would have to be ordered from the manufacturer six weeks in advance, and they could not be returned because of the unique printing required. The sweatshirts would cost Mr. Hooper \$8 each with a minimum order of 75 sweatshirts. Any additional sweatshirts would have to be ordered in increments of 75.

Because Mr. Hooper's plan would not require any additional facilities, the only costs associated with the project would be the costs of the sweatshirts and the costs of the sales commissions. The selling price of the sweatshirts would be \$13.50 each. Mr. Hooper would pay the students a commission of \$1.50 for each shirt sold.

Required:

- To make the project worthwhile, Mr. Hooper would require a \$1,200 profit for the first three months of the venture. What level of sales in units and in dollars would be required to reach this target net operating income? Show all computations.
- Assume that the venture is undertaken and an order is placed for 75 sweatshirts. What would be Mr. Hooper's break-even point in units and in sales dollars? Show computations and explain the reasoning behind your answer.

PROBLEM 4–31 Changes in Fixed and Variable Costs; Target Profit and Break-Even Analysis [L04, L05, L06]

Neptune Company produces toys and other items for use in beach and resort areas. A small, inflatable toy has come onto the market that the company is anxious to produce and sell. The new toy will sell for \$3 per unit. Enough capacity exists in the company's plant to produce 16,000 units of the toy each month. Variable costs to manufacture and sell one unit would be \$1.25, and fixed costs associated with the toy would total \$35,000 per month.

The company's Marketing Department predicts that demand for the new toy will exceed the 16,000 units that the company is able to produce. Additional manufacturing space can be rented from another company at a fixed cost of \$1,000 per month. Variable costs in the rented facility would total \$1.40 per unit, due to somewhat less efficient operations than in the main plant.

Required:

- Compute the monthly break-even point for the new toy in units and in total sales dollars. Show all computations.
- How many units must be sold each month to make a monthly profit of \$12,000?
- If the sales manager receives a bonus of 10 cents for each unit sold in excess of the break-even point, how many units must be sold each month to earn a return of 25% on the monthly investment in fixed costs?

Cases

**CASE 4–32 Break-Evens for Individual Products in a Multiproduct Company [L06, L09]**

Cheryl Montoya picked up the phone and called her boss, Wes Chan, the vice president of marketing at Piedmont Fasteners Corporation: "Wes, I'm not sure how to go about answering the questions that came up at the meeting with the president yesterday."

"What's the problem?"

"The president wanted to know the break-even point for each of the company's products, but I am having trouble figuring them out."

"I'm sure you can handle it, Cheryl. And, by the way, I need your analysis on my desk tomorrow morning at 8:00 sharp in time for the follow-up meeting at 9:00."

Piedmont Fasteners Corporation makes three different clothing fasteners in its manufacturing facility in North Carolina. Data concerning these products appear below:

| | Velcro | Metal | Nylon |
|----------------------------------|---------|---------|---------|
| Normal annual sales volume | 100,000 | 200,000 | 400,000 |
| Unit selling price | \$1.65 | \$1.50 | \$0.85 |
| Variable cost per unit | \$1.25 | \$0.70 | \$0.25 |

Total fixed expenses are \$400,000 per year.

All three products are sold in highly competitive markets, so the company is unable to raise its prices without losing unacceptable numbers of customers.

The company has an extremely effective lean production system, so there are no beginning or ending work in process or finished goods inventories.

Required:

1. What is the company’s over-all break-even point in total sales dollars?
2. Of the total fixed costs of \$400,000, \$20,000 could be avoided if the Velcro product were dropped, \$80,000 if the Metal product were dropped, and \$60,000 if the Nylon product were dropped. The remaining fixed costs of \$240,000 consist of common fixed costs such as administrative salaries and rent on the factory building that could be avoided only by going out of business entirely.
 - a. What is the break-even point in units for each product?
 - b. If the company sells exactly the break-even quantity of each product, what will be the overall profit of the company? Explain this result.

CASE 4-33 Cost Structure; Target Profit and Break-Even Analysis [LO4, LO5, LO6]

Pittman Company is a small but growing manufacturer of telecommunications equipment. The company has no sales force of its own; rather, it relies completely on independent sales agents to market its products. These agents are paid a commission of 15% of selling price for all items sold.

Barbara Cheney, Pittman’s controller, has just prepared the company’s budgeted income statement for next year. The statement follows:

| Pittman Company Budgeted Income Statement For the Year Ended December 31 | | |
|---|-------------|---------------------|
| Sales | | \$16,000,000 |
| Manufacturing costs: | | |
| Variable | \$7,200,000 | |
| Fixed overhead | 2,340,000 | 9,540,000 |
| Gross margin | | 6,460,000 |
| Selling and administrative costs: | | |
| Commissions to agents | 2,400,000 | |
| Fixed marketing costs | 120,000* | |
| Fixed administrative costs | 1,800,000 | 4,320,000 |
| Net operating income | | 2,140,000 |
| Fixed interest cost | | 540,000 |
| Income before income taxes | | 1,600,000 |
| Income taxes (30%) | | 480,000 |
| Net income | | <u>\$ 1,120,000</u> |
| *Primarily depreciation on storage facilities. | | |

As Barbara handed the statement to Karl Vecci, Pittman’s president, she commented, “I went ahead and used the agents’ 15% commission rate in completing these statements, but we’ve just learned that they refuse to handle our products next year unless we increase the commission rate to 20%.”

“That’s the last straw,” Karl replied angrily. “Those agents have been demanding more and more, and this time they’ve gone too far. How can they possibly defend a 20% commission rate?”

“They claim that after paying for advertising, travel, and the other costs of promotion, there’s nothing left over for profit,” replied Barbara.

“I say it’s just plain robbery,” retorted Karl. “And I also say it’s time we dumped those guys and got our own sales force. Can you get your people to work up some cost figures for us to look at?”

“We’ve already worked them up,” said Barbara. “Several companies we know about pay a 7.5% commission to their own salespeople, along with a small salary. Of course, we would have to handle all promotion costs, too. We figure our fixed costs would increase by \$2,400,000 per year, but that would be more than offset by the \$3,200,000 (20% × \$16,000,000) that we would avoid on agents’ commissions.”

The breakdown of the \$2,400,000 cost follows:

| | |
|--------------------------------|--------------------|
| Salaries: | |
| Sales manager | \$ 100,000 |
| Salespersons | 600,000 |
| Travel and entertainment | 400,000 |
| Advertising | 1,300,000 |
| Total | <u>\$2,400,000</u> |

“Super,” replied Karl. “And I noticed that the \$2,400,000 is just what we’re paying the agents under the old 15% commission rate.”

“It’s even better than that,” explained Barbara. “We can actually save \$75,000 a year because that’s what we’re having to pay the auditing firm now to check out the agents’ reports. So our overall administrative costs would be less.”

“Pull all of these numbers together and we’ll show them to the executive committee tomorrow,” said Karl. “With the approval of the committee, we can move on the matter immediately.”

Required:

1. Compute Pittman Company’s break-even point in sales dollars for next year assuming:
 - a. The agents’ commission rate remains unchanged at 15%.
 - b. The agents’ commission rate is increased to 20%.
 - c. The company employs its own sales force.
2. Assume that Pittman Company decides to continue selling through agents and pays the 20% commission rate. Determine the volume of sales that would be required to generate the same net income as contained in the budgeted income statement for next year.
3. Determine the volume of sales at which net income would be equal regardless of whether Pittman Company sells through agents (at a 20% commission rate) or employs its own sales force.
4. Compute the degree of operating leverage that the company would expect to have on December 31 at the end of next year assuming:
 - a. The agents’ commission rate remains unchanged at 15%.
 - b. The agents’ commission rate is increased to 20%.
 - c. The company employs its own sales force.
 Use income *before* income taxes in your operating leverage computation.
5. Based on the data in (1) through (4) above, make a recommendation as to whether the company should continue to use sales agents (at a 20% commission rate) or employ its own sales force. Give reasons for your answer.

(CMA, adapted)

RESEARCH AND APPLICATION 4-34

[L03, L04, L05, L06, L07, L08, L09]

The questions in this exercise are based on the **Benetton Group**, a company headquartered in Italy and known in the United States primarily for one of its brands of fashion apparel—United Colors of Benetton. To answer the questions, you will need to download the Benetton Group’s 2004 Annual Report at www.benetton.com/investors. Once at this website, click on the link toward the top of the page called “Site Map” and then scroll down to the heading called “Financial Reports” and click on the year 2004. You do not need to print this document to answer the questions.

Required:

1. How do the formats of the income statements shown on pages 33 and 50 of Benetton’s annual report differ from one another (disregard everything beneath the line titled “income from operations”)? Which expenses shown on page 50 appear to have been reclassified as variable selling costs on page 33?
2. Why do you think cost of sales is included in the computation of contribution margin on page 33?
3. Perform two separate computations of Benetton’s break-even point in euros. For the first computation, use data from 2003. For the second computation, use data from 2004. Why do the numbers that you computed differ from one another?

4. What sales volume would have been necessary in 2004 for Benetton to attain a target income from operations of €300 million?
5. Compute Benetton's margin of safety using data from 2003 and 2004. Why do your answers for the two years differ from one another?
6. What is Benetton's degree of operating leverage in 2004? If Benetton's sales in 2004 had been 6% higher than what is shown in the annual report, what income from operations would the company have earned? What percentage increase in income from operations does this represent?
7. What income from operations would Benetton have earned in 2004 if it had invested an additional €10 million in advertising and promotions and realized a 3% increase in sales? As an alternative, what income from operations would Benetton have earned if it not only invested an additional €10 million in advertising and promotions but also raised its sales commission rate to 6% of sales, thereby generating a 5% increase in sales? Which of these two scenarios would have been preferable for Benetton?
8. Assume that total sales in 2004 remained unchanged at €1,686 million (as shown on pages 33 and 50); however, the Casual sector sales were €1,554 million, the Sportswear and Equipment sector sales were €45 million, and the Manufacturing and Other sector sales were €87 million. What income from operations would Benetton have earned with this sales mix? (*Hint:* look at pages 36 and 37 of the annual report.) Why is the income from operations under this scenario different from what is shown in the annual report?

Chapter

5

Learning Objectives

After studying Chapter 5, you should be able to:

- L01** Distinguish between process costing and job-order costing and identify companies that would use each costing method.
- L02** Identify the documents used in a job-order costing system.
- L03** Compute predetermined overhead rates and explain why estimated overhead costs (rather than actual overhead costs) are used in the costing process.
- L04** Apply overhead cost to jobs using a predetermined overhead rate.
- L05** Determine underapplied or overapplied overhead.
- L06** Use the direct method to determine cost of goods sold.
- L07** Use the indirect method to determine cost of goods sold.
- L08** (Appendix 5A) Understand the implications of basing the predetermined overhead rate on activity at capacity rather than on estimated activity for the period.

Systems Design: Job-Order Costing

Two College Students Succeeding as Entrepreneurs

When the University of Dayton athletic department needed 2,000 customized T-shirts to give away at its first home basketball game of the year, it chose **University Tees** to provide the shirts. A larger competitor could have been chosen, but University Tees won the order because of its fast customer response time, low price, and high quality.

University Tees is a small business that was started in

February 2003 by two Miami University seniors—Joe Haddad and Nick Dadas (see the company's website at www.universitytees.com). The company creates the artwork for customized T-shirts and then relies on carefully chosen suppliers to manufacture the product.

Accurately calculating the cost of each potential customer order is critically important to University Tees because the company needs to be sure that the price exceeds the cost associated with satisfying the order. The costs include the cost of the T-shirts themselves, printing costs (which vary depending on the quantity of shirts produced and the number of colors printed per shirt), silk screen costs (which also vary depending on the number of colors included in a design), shipping costs, and the artwork needed to create a design. The company also takes into account its competitors' pricing strategies when setting its own prices. ■

BUSINESS FOCUS

The way in which product and service costs are determined can have a substantial impact on reported profits, as well as on key management decisions.

A managerial costing system should provide cost data to help managers plan, direct and motivate, control, and make decisions. Nevertheless, external financial reporting and tax reporting requirements often heavily influence how costs are accumulated and summarized on managerial reports. This is true of product costing. In Chapter 2 and in this chapter we use *absorption costing* to determine product costs. In **absorption costing**, all manufacturing costs, both fixed and variable, are assigned to units of product—units are said to *fully absorb manufacturing costs*. In later chapters we look at alternatives to absorption costing such as activity-based costing and variable costing.

Most countries—including the United States—require some form of absorption costing for both external financial reports and for tax reports. In addition, the vast majority of companies throughout the world also use absorption costing in their management reports. Because absorption costing is the most common approach to product costing throughout the world, we discuss it first and then discuss the alternatives in subsequent chapters.

Process and Job-Order Costing

Under absorption costing, product costs include all manufacturing costs. Some manufacturing costs, such as direct materials, can be directly traced to particular products. For example, the cost of the airbags installed in a **Toyota** Camry can be easily traced to that particular auto. But what about manufacturing costs like factory rent? Such costs do not change from month to month, whereas the number and variety of products made in the factory may vary dramatically from one month to the next. Because these costs remain unchanged from month to month regardless of what products are made, they are clearly not caused by—and cannot be directly traced to—any particular product. Therefore, these types of costs are assigned to products and services by averaging across time and across products. The type of production process influences how this averaging is done. We discuss two different costing systems in the sections that follow—*process costing* and *job-order costing*.

LEARNING OBJECTIVE 1

Distinguish between process costing and job-order costing and identify companies that would use each costing method.

Process Costing

Process costing is used in companies that produce many units of a single product for long periods. Examples include producing paper at **Weyerhaeuser**, refining aluminum ingots at **Reynolds Aluminum**, mixing and bottling beverages at **Coca-Cola**, and making wieners at **Oscar Mayer**. These are all homogeneous products that flow through the production process on a continuous basis.

Process costing systems accumulate costs in a particular operation or department for an entire period (month, quarter, year) and then divide the accumulated total manufacturing cost by the total number of units produced during the period. The basic formula for process costing is:

$$\text{Unit product cost} = \frac{\text{Total manufacturing cost}}{\text{Total units produced}}$$

Because all units are the same, each unit produced during the period is assigned the same average cost. This costing technique results in a broad, average unit cost figure that applies to homogeneous units flowing in a continuous stream out of the production process.

Job-Order Costing

Job-order costing is used in situations where many *different* products are produced each period. For example, a **Levi Strauss** clothing factory would typically make many different

types of jeans for both men and women during a month. A particular order might consist of 1,000 stonewashed men's blue denim jeans, style number A312. This order of 1,000 jeans is called a *job*. In a job-order costing system, costs are traced and allocated to jobs and then the total costs of the job are divided by the total number of units in the job to arrive at an average cost per unit.

Other examples of situations where job-order costing would be used include large-scale construction projects managed by **Bechtel International**, commercial aircraft produced by **Boeing**, greeting cards designed and printed by **Hallmark**, and airline meals prepared by **LSG SkyChefs**. All of these examples are characterized by diverse outputs. Each Bechtel project is unique and different from every other—the company may be simultaneously constructing a dam in Zaire and a bridge in Indonesia. Likewise, each airline orders a different type of meal from LSG SkyChefs' catering service.

Job-order costing is also used extensively in service industries. For example, hospitals, law firms, movie studios, accounting firms, advertising agencies, and repair shops all use a variation of job-order costing to accumulate costs. Although the detailed example of job-order costing provided in the following section deals with a manufacturing company, the same basic concepts and procedures are used by many service organizations.

IN BUSINESS

IS THIS REALLY A JOB?

VBT Bicycling Vacations of Bristol, Vermont, offers deluxe bicycling vacations in the United States, Canada, Europe, and other locations throughout the world. For example, the company offers a 10-day tour of the Puglia region of Italy—the “heel of the boot.” The tour price includes international airfare, 10 nights of lodging, most meals, use of a bicycle, and ground transportation. Each tour is led by at least two local tour leaders, one of whom rides with the guests along the tour route. The other tour leader drives a “sag wagon” that carries extra water, snacks, and bicycle repair equipment and is available to shuttle guests back to the hotel or up a hill. The sag wagon also transports guests' luggage from one hotel to another.

Each specific tour can be considered a job. For example, Giuliano Astore and Debora Trippetti, two natives of Puglia, led a VBT tour with 17 guests over 10 days in late April. At the end of the tour, Giuliano submitted a report, a sort of job cost sheet, to VBT headquarters. This report detailed the on the ground expenses incurred for this specific tour, including fuel and operating costs for the van, lodging costs for the guests, the costs of meals provided to guests, the costs of snacks, the cost of hiring additional ground transportation as needed, and the wages of the tour leaders. In addition to these costs, some costs are paid directly by VBT in Vermont to vendors. The total cost incurred for the tour is then compared to the total revenue collected from guests to determine the gross profit for the tour.

Job-Order Costing—An Overview

LEARNING OBJECTIVE 2

Identify the documents used in a job-order costing system.

To introduce job-order costing, we will follow a specific job as it progresses through the manufacturing process. This job consists of two experimental couplings that Yost Precision Machining has agreed to produce for Loops Unlimited, a manufacturer of roller coasters. Couplings connect the cars on the roller coaster and are a critical component in the performance and safety of the ride. Before we begin our discussion, recall from a previous chapter that companies generally classify manufacturing costs into three broad

categories: (1) direct materials, (2) direct labor, and (3) manufacturing overhead. As we study the operation of a job-order costing system, we will see how each of these three types of costs is recorded and accumulated.

**MANAGERIAL
ACCOUNTING IN
ACTION**
The Issue

Yost Precision Machining is a small company in Michigan that specializes in fabricating precision metal parts that are used in a variety of applications ranging from deep-sea exploration vehicles to the inertial triggers in automobile air bags. The company's top managers gather every morning at 8:00 A.M. in the company's conference room for the daily planning meeting. Attending the meeting this morning are: Jean Yost, the company's president; David Cheung, the marketing manager; Debbie Turner, the production manager; and Marc White, the company controller. The president opened the meeting:

Jean: The production schedule indicates we'll be starting Job 2B47 today. Isn't that the special order for experimental couplings, David?

David: That's right. That's the order from Loops Unlimited for two couplings for their new roller coaster ride for Magic Mountain.

Debbie: Why only two couplings? Don't they need a coupling for every car?

David: Yes. But this is a completely new roller coaster. The cars will go faster and will be subjected to more twists, turns, drops, and loops than on any other existing roller coaster. To hold up under these stresses, Loops Unlimited's engineers completely redesigned the cars and couplings. They want us to make just two of these new couplings for testing purposes. If the design works, then we'll have the inside track on the order to supply couplings for the whole ride.

Jean: We agreed to take on this initial order at our cost just to get our foot in the door. Marc, will there be any problem documenting our cost so we can get paid?

Marc: No problem. The contract with Loops stipulates that they will pay us an amount equal to our cost of goods sold. With our job-order costing system, I can tell you the cost on the day the job is completed.

Jean: Good. Is there anything else we should discuss about this job at this time? No? Well then let's move on to the next item of business.

Measuring Direct Materials Cost

Each experimental coupling for Loops Unlimited will require three parts that are classified as direct materials: two G7 Connectors and one M46 Housing. The couplings are a custom product that is being made for the first time, but if this were one of the company's standard products, it would have an established *bill of materials*. A **bill of materials** is a document that lists the type and quantity of each type of direct material needed to complete a unit of product. In this case, there is no established bill of materials, so Yost's production staff determined the materials requirements from the blueprints submitted by the customer. Each coupling requires two connectors and one housing, so to make two couplings, four connectors and two housings are required.

When an agreement has been reached with the customer concerning the quantities, prices, and shipment date for the order, a *production order* is issued. The Production Department then prepares a *materials requisition form* similar to the form in Exhibit 5-1. The **materials requisition form** is a document that specifies the type and quantity of materials to be drawn from the storeroom and identifies the job that will be charged for the cost of the materials. The form is used to control the flow of materials into production and also for making entries in the accounting records.

The Yost Precision Machining materials requisition form in Exhibit 5-1 shows that the company's Milling Department has requisitioned two M46 Housings and four G7 Connectors for the Loops Unlimited job, which has been designated as Job 2B47. A production worker presents the completed form to the storeroom clerk who then issues the specified materials to the worker. The storeroom clerk is not allowed to release materials without a completed and properly authorized materials requisition form.

Job Cost Sheet

After being notified that the production order has been issued, the Accounting Department prepares a *job cost sheet* like the one presented in Exhibit 5-2. A **job cost sheet** is a form prepared for a job that records the materials, labor, and manufacturing overhead costs charged to that job.

After direct materials are issued, the Accounting Department records their costs on the job cost sheet. Note from Exhibit 5-2, for example, that the **\$660** cost for direct

| | | | | |
| | | | | |

materials shown earlier on the materials requisition form has been charged to Job 2B47 on its job cost sheet. The requisition number 14873 from the materials requisition form is also recorded on the job cost sheet to make it easier to identify the source document for the direct materials charge.

Measuring Direct Labor Cost

Direct labor cost is handled similarly to direct materials cost. Direct labor consists of labor charges that can be easily traced to a particular job. Labor charges that cannot be easily traced directly to any job are treated as part of manufacturing overhead. As discussed in a previous chapter, this latter category of labor costs is called *indirect labor* and includes tasks such as maintenance, supervision, and cleanup.

Workers use *time tickets* to record the time they spend on each job and task. A completed **time ticket** is an hour-by-hour summary of the employee's activities throughout the day. An example of an employee time ticket is shown in Exhibit 5-3. When working on a specific job, the employee enters the job number on the time ticket and notes the amount of time spent on that job. When not assigned to a particular job, the employee records the nature of the indirect labor task (such as cleanup and maintenance) and the amount of time spent on the task.

At the end of the day, the time tickets are gathered and the Accounting Department calculates the wage cost for each entry on the time ticket and then enters the direct labor-hours and costs on individual job cost sheets. (Refer back to Exhibit 5-2 for an example of how direct labor costs are entered on the job cost sheet.)

The system we have just described is a manual method for recording and posting labor costs. Today many companies rely on computerized systems and no longer record labor time by hand on sheets of paper. One computerized approach uses bar codes to capture data. Each employee and each job has a unique bar code. When beginning work on a job, the employee scans three bar codes using a handheld device much like the bar code readers at grocery store checkout stands. The first bar code indicates that a job is being started; the second is the unique bar code on the employee's identity badge; and the third is the unique bar code of the job itself. This information is fed automatically via an electronic network to a computer that notes the time and records all of the data. When the task is completed, the employee scans a bar code indicating the task is complete, the bar code on his or her identity badge, and the bar code attached to the job. This information is relayed to the computer that again notes the time, and a time ticket is automatically prepared. Because all of the source data is already in computer files, the labor costs can be automatically posted to job cost sheets (or their electronic equivalents). Computers, coupled with technology such as bar codes, can eliminate much of the drudgery involved in routine bookkeeping activities while at the same time increasing timeliness and accuracy.

BUCKING THE TREND: USING PEOPLE INSTEAD OF MACHINES

For decades overhead costs have been going up and labor costs have been going down as companies have replaced people with machines. However, at the French automaker **Renault**, the exact opposite has been happening with its new, no-frills vehicle called the Logan. The Logan was intentionally stripped of costly elements and unnecessary technology so that the car could be sold for \$6,000 in emerging Eastern European markets. The car's simplified design enables Renault's manufacturing plant in Romania to assemble the car almost entirely with people instead of robots. The monthly pay for a line worker at Renault's Romanian plant is \$324 versus an average of more than \$4,700 per worker in Western European countries. Thanks in part to low-cost labor, the Logan's production costs are estimated to be just \$1,089 per unit.

The Logan is finding buyers not only in emerging markets but also in more advanced Western European nations where customers have been clamoring for the car. Renault expects sales for the Logan to climb to one million vehicles by 2010—adding \$341 million to its profits.

Source: Gail Edmondson and Constance Favre d'Arcier, "Got 5,000 Euros? Need a New Car?" *BusinessWeek*, July 4, 2005, p. 49.

LEARNING OBJECTIVE 3

Compute predetermined overhead rates and explain why estimated overhead costs (rather than actual overhead costs) are used in the costing process.

**Applying Manufacturing Overhead**

Recall that product costs include manufacturing overhead as well as direct materials and direct labor. Therefore, manufacturing overhead also needs to be recorded on the job cost sheet. However, assigning manufacturing overhead to a specific job involves some difficulties. There are three reasons for this:

1. Manufacturing overhead is an *indirect cost*. This means that it is either impossible or difficult to trace these costs to a particular product or job.
2. Manufacturing overhead consists of many different items ranging from the grease used in machines to the annual salary of the production manager.
3. Because of the fixed costs in manufacturing overhead, total manufacturing overhead costs tend to remain relatively constant from one period to the next even though the number of units produced can fluctuate widely. Consequently, the average cost per unit will vary from one period to the next.

Given these problems, allocation is used to assign overhead costs to products. Allocation is accomplished by selecting an *allocation base* that is common to all of the company's products and services. An **allocation base** is a measure such as direct labor-hours (DLH) or machine-hours (MH) that is used to assign overhead costs to products and services. The most widely used allocation bases in manufacturing are direct labor-hours, direct labor cost, machine-hours and (where a company has only a single product) units of product.

Manufacturing overhead is commonly applied to products using a *predetermined overhead rate*. The **predetermined overhead rate** is computed by dividing the total estimated manufacturing overhead cost for the period by the estimated total amount of the allocation base for the period as follows:

$$\text{Predetermined overhead rate} = \frac{\text{Estimated total manufacturing overhead cost}}{\text{Estimated total amount of the allocation base}}$$

The predetermined overhead rate is computed *before* the period begins. The first step is to estimate the amount of the allocation base that will be required to support operations in the upcoming period. The second step is to estimate the total manufacturing cost at that level of activity. The third step is to compute the predetermined overhead rate. We will have more to say about the first and second steps in subsequent chapters. In this chapter we will assume that the total amount of the allocation base and the total manufacturing overhead costs have already been estimated.

To repeat, the predetermined overhead rate is computed *before* the period begins. The predetermined overhead rate is then used to apply overhead cost to jobs throughout the

period. The process of assigning overhead cost to jobs is called **overhead application**. The formula for determining the amount of overhead cost to apply to a particular job is:

$$\text{Overhead applied to a particular job} = \text{Predetermined overhead rate} \times \text{Amount of the allocation base incurred by the job}$$

For example, if the predetermined overhead rate is \$8 per direct labor-hour, then \$8 of overhead cost is *applied* to a job for each direct labor-hour incurred on the job. When the allocation base is direct labor-hours, the formula becomes:

$$\text{Overhead applied to a particular job} = \text{Predetermined overhead rate} \times \text{Actual direct labor-hours charged to the job}$$

Using the Predetermined Overhead Rate To illustrate the steps involved in computing and using a predetermined overhead rate, let's return to Yost Precision Machining. The company has estimated that 40,000 direct labor-hours would be required to support the production planned for the year and that the total manufacturing overhead costs would be \$320,000 at that level of activity. Consequently, its predetermined overhead rate for the year would be \$8 per direct labor-hour, as shown below:

$$\begin{aligned} \text{Predetermined overhead rate} &= \frac{\text{Estimated total manufacturing overhead cost}}{\text{Estimated total amount of the allocation base}} \\ &= \frac{\$320,000}{40,000 \text{ direct labor-hours}} \\ &= \$8 \text{ per direct labor-hour} \end{aligned}$$

The job cost sheet in Exhibit 5–4 indicates that 27 direct labor-hours (i.e., DLHs) were charged to Job 2B47. Therefore, a total of \$216 of manufacturing overhead cost would be applied to the job:

$$\begin{aligned} \text{Overhead applied to Job 2B47} &= \text{Predetermined overhead rate} \times \text{Actual direct labor-hours charged to Job 2B47} \\ &= \$8 \text{ per DLH} \times 27 \text{ DLHs} \\ &= \$216 \text{ of overhead applied to Job 2B47} \end{aligned}$$

This amount of overhead has been entered on the job cost sheet in Exhibit 5–4. Note that this is *not* the actual amount of overhead caused by the job. Actual overhead costs are *not* assigned to jobs—if that could be done, the costs would be direct costs, not overhead. The overhead assigned to the job is simply a share of the total overhead that was estimated at the beginning of the year. A **normal cost system**, which we have been describing, applies overhead to jobs by multiplying a predetermined overhead rate by the actual amount of the allocation base incurred by the jobs.

Overhead may be applied as direct labor-hours are charged to jobs, or all of the overhead can be applied when the job is completed. The choice is up to the company. However, if a job is not completed at the end of the accounting period, overhead should be applied to that job so that the cost of work in process inventory can be determined.

The Need for a Predetermined Rate

Instead of using a predetermined rate based on estimates, why not base the overhead rate on the *actual* total manufacturing overhead cost and the *actual* total amount of the allocation base incurred on a monthly, quarterly, or annual basis? If an actual rate is computed monthly or quarterly, seasonal factors in overhead costs or in the allocation base can produce fluctuations in the overhead rate. For example, the costs of heating and cooling a factory in Illinois will be highest in the winter and summer months and lowest in the spring and fall. If the overhead rate is recomputed at the end of each month or each quarter based on actual costs and activity, the overhead rate would go up in the winter and summer and down in the spring and fall. As a result, two identical jobs, one completed in

LEARNING OBJECTIVE 4
Apply overhead cost to jobs using a predetermined overhead rate.

EXHIBIT 5-4
A Completed Job Cost Sheet

the winter and one completed in the spring, would be assigned different manufacturing overhead costs. Many managers believe that such fluctuations in product costs serve no useful purpose. To avoid such fluctuations, actual overhead rates could be computed on an annual or less-frequent basis. However, if the overhead rate is computed annually based on the actual costs and activity for the year, the manufacturing overhead assigned to any particular job would not be known until the end of the year. For example, the cost of Job 2B47 at Yost Precision Machining would not be known until the end of the year, even though the job will be completed and shipped to the customer in March. For these reasons, most companies use predetermined overhead rates rather than actual overhead rates in their cost accounting systems.

Choice of an Allocation Base for Overhead Cost

Ideally, the allocation base in the predetermined overhead rate should *drive* overhead cost. A **cost driver** is a factor, such as machine-hours, beds occupied, computer time, or flight-hours, that causes overhead costs. If the base in the predetermined overhead rate does not “drive” overhead costs, product costs will be distorted. For example, if direct labor-hours is used to allocate overhead, but in reality overhead has little to do with direct labor-hours, then products with high direct labor-hour requirements will be overcosted.

Most companies use direct labor-hours or direct labor cost as the allocation base for manufacturing overhead. However, as discussed in earlier chapters, major shifts are taking place in the structure of costs. In the past, direct labor accounted for up to 60% of the cost of many products, with overhead cost making up only a portion of the remainder. This situation has been changing for two reasons. First, sophisticated automated

equipment has taken over functions that used to be performed by direct labor workers. Because the costs of acquiring and maintaining such equipment are classified as overhead, this increases overhead while decreasing direct labor. Second, products are becoming more sophisticated and complex and are modified more frequently. This increases the need for highly skilled indirect workers such as engineers. As a result of these two trends, direct labor has decreased relative to overhead as a component of product costs.

In companies where direct labor and overhead costs have been moving in opposite directions, it would be difficult to argue that direct labor “drives” overhead costs. Accordingly, managers in some companies use *activity-based costing* principles to redesign their cost accounting systems. Activity-based costing is designed to more accurately reflect the demands that products, customers, and other cost objects make on overhead resources. The activity-based approach is discussed in more detail in a later chapter.

Although direct labor may not be an appropriate allocation base in some industries, in others it continues to be a significant driver of manufacturing overhead. Indeed, most manufacturing companies in the United States continue to use direct labor as the primary or secondary allocation base for manufacturing overhead. The key point is that the allocation base used by the company should really drive, or cause, overhead costs, and direct labor is not always the most appropriate allocation base.

IN BUSINESS

THE COST OF COMPLEXITY AT CHRYSLER

While direct labor is an important cost driver for many companies, other cost drivers can influence profitability. For example, Chrysler’s 2007 Dodge Nitro was available to buyers in 167,000 configurations. The costs of supporting seven exterior paint colors, two engine options, three trim levels, five feature packages, and up to 17 additional options for each of the five feature packages were exorbitant. By contrast, the Honda CR-V, which outsells the Nitro by a ratio of more than 2:1, comes in only 88 configurations.

Chrysler’s CEO, Thomas LaSorda, planned to redesign the 2008 Nitro so that it can be ordered in only 650 configurations. Similarly, he planned to reduce the number of configurations available in the 2008 Pacifica from 35,820 to 680. When asked if customers will complain about the cutbacks in available options, Chrysler’s Vice President of Marketing J. Bartoli said, “If there’s no one out there asking for it, have you really taken anything away?”

Source: Joann Muller, “Multiplication Problems,” *Forbes*, May 21, 2007, p. 48.

Computation of Unit Costs

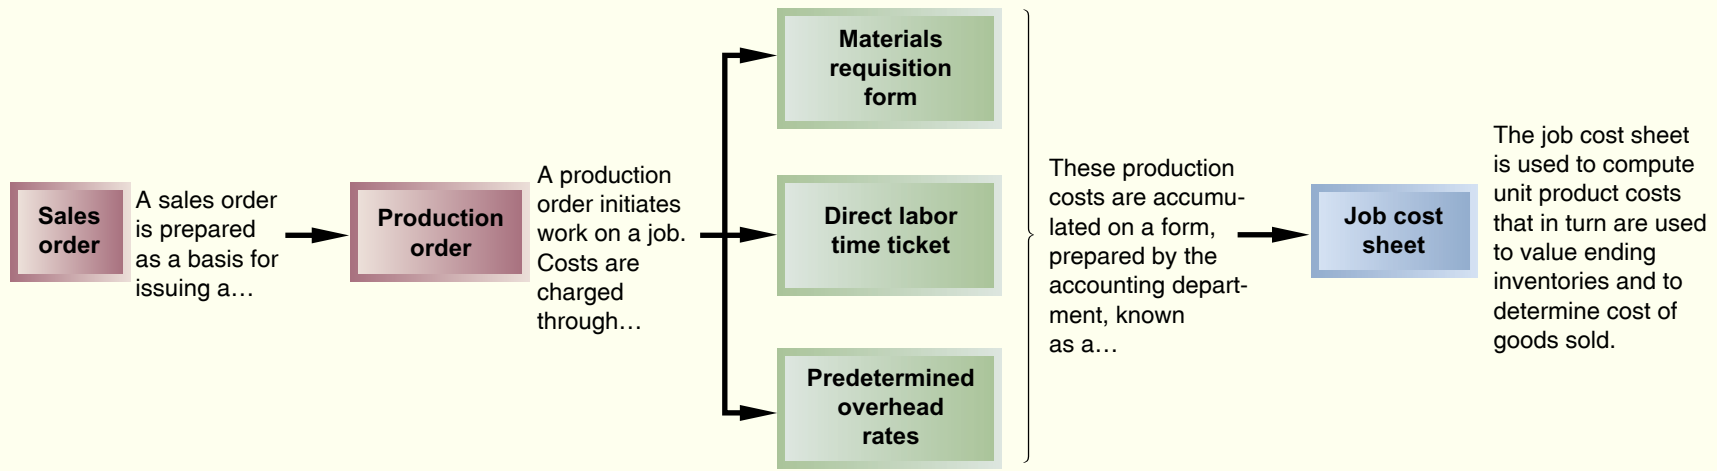

With the application of Yost Precision Machining’s \$216 of manufacturing overhead to the job cost sheet in Exhibit 5–4, the job cost sheet is complete except for two final steps. First, the totals for direct materials, direct labor, and manufacturing overhead are transferred to the Cost Summary section of the job cost sheet and added together to obtain the total cost for the job. Then the total product cost (\$1,800) is divided by the number of units (2) to obtain the unit product cost (\$900). As indicated earlier, *this unit product cost is an average cost and should not be interpreted as the cost that would actually be incurred if another unit were produced.* The incremental cost of an additional unit is something less than the average unit cost of \$900 because much of the actual overhead costs would not change if another unit were produced.

The completed job cost sheet will serve as the basis for valuing unsold units in ending inventory and for determining cost of goods sold.

Summary of Document Flows

The sequence of events that we have discussed above, from receiving an order to completing a job, is summarized in Exhibit 5–5.

EXHIBIT 5-5 The Flow of Documents in a Job-Order Costing System

In the 8:00 A.M. daily planning meeting on March 9, Jean Yost, the president of Yost Precision Machining, once again drew attention to Job 2B47, the experimental couplings:

Jean: I see Job 2B47 is completed. Let's get those couplings shipped immediately to Loops Unlimited so they can get their testing program under way. Marc, how much are we going to bill Loops for those two units?

Marc: Because we agreed to sell the experimental couplings at cost, we will be charging Loops Unlimited just \$900 a unit.

Jean: Fine. Let's hope the couplings work out and we make some money on the big order later.

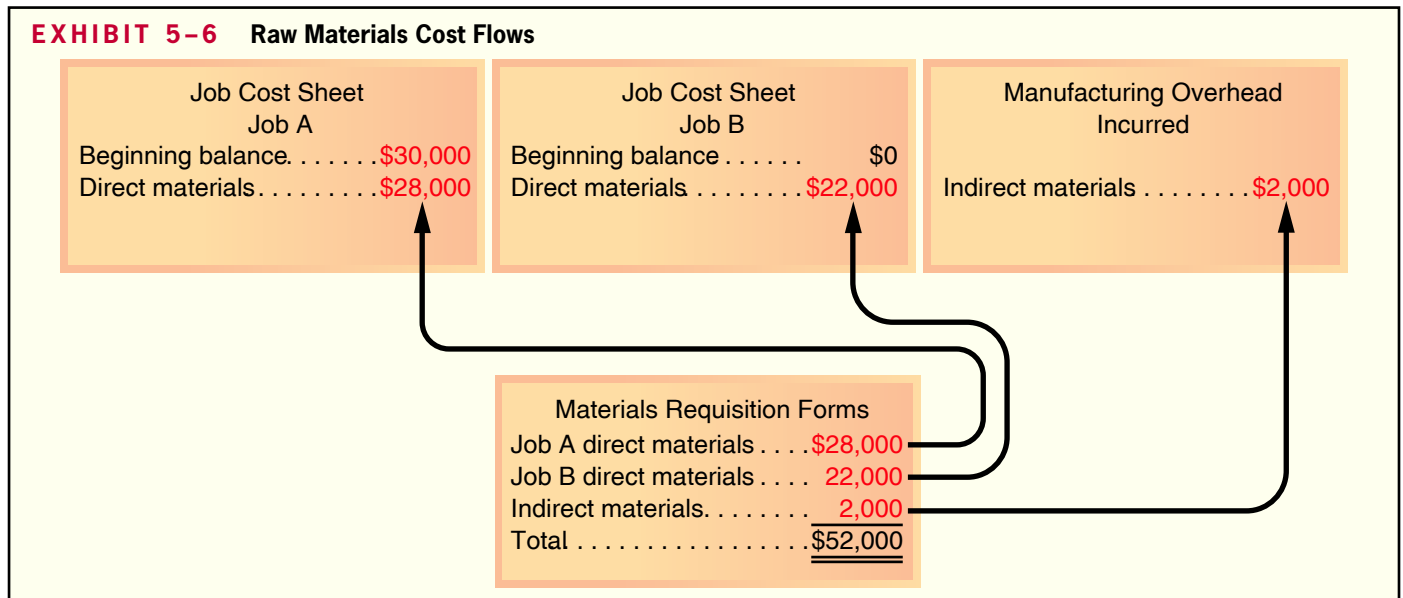

An Extended Example of Job-Order Costing

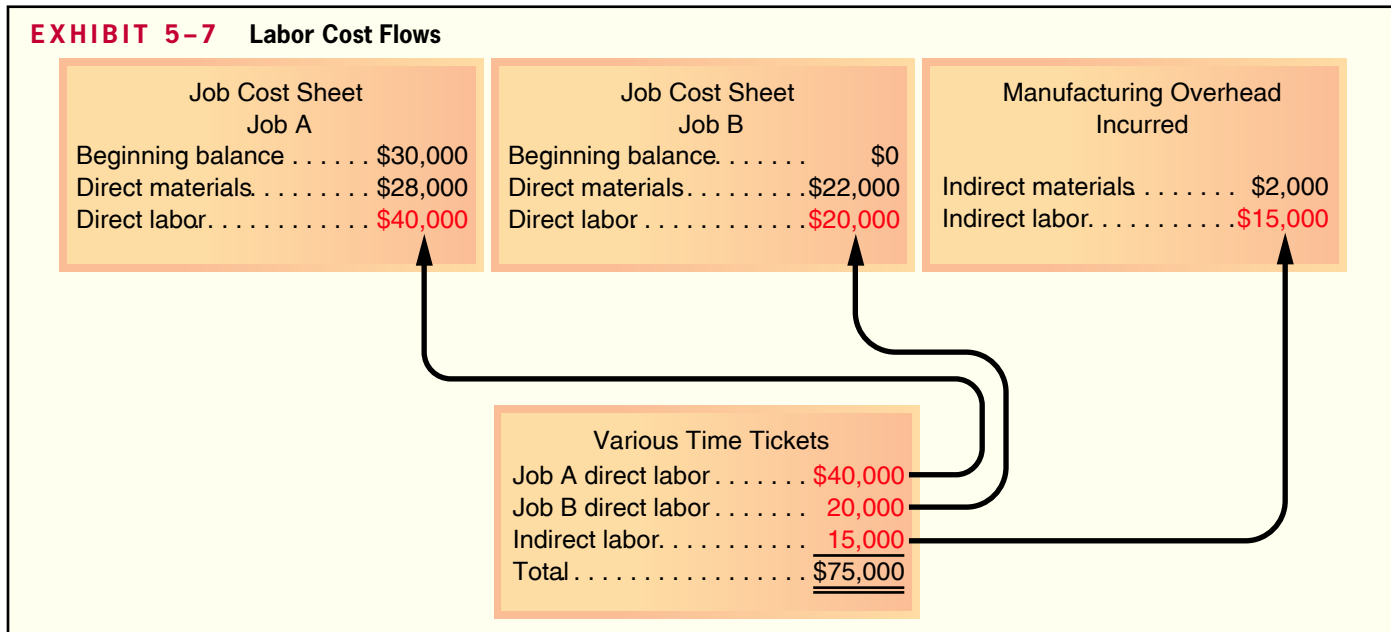

We are now ready to take a more detailed look at the flow of costs in job-order costing. To illustrate, let's consider activity for the month of April at Rand Company, a producer of gold and silver commemorative medallions. At the beginning of the month, Rand Company had no finished goods inventory and one job in process—Job A, a special minting of 1,000 gold medallions commemorating the invention of motion pictures. Some work had been completed on this job prior to April; therefore, a total of \$30,000 in manufacturing costs had already been recorded on Job A's cost sheet. This job will be completed in April. In addition, Job B, an order for 10,000 silver medallions commemorating the fall of the Berlin Wall, will be started in April and completed in a subsequent month.

In this example, we will track the flow of Rand Company's raw materials, labor, and overhead costs for April and prepare an income statement for the month.

Direct and Indirect Materials

During April, \$52,000 in raw materials were requisitioned from the storeroom for use in production. These raw materials included \$28,000 of direct materials for Job A, \$22,000 of direct materials for Job B, and \$2,000 of indirect materials. As shown in Exhibit 5–6, these costs are recorded on the appropriate job cost sheets and in an account we will call Manufacturing Overhead Incurred. Specifically, \$28,000 of direct materials is charged to Job A's cost sheet and \$22,000 is charged to Job B's cost sheet. Note that the \$2,000 of indirect materials has *not* been assigned to either of the two jobs—instead, it is charged to

the account we call Manufacturing Overhead Incurred. We will be charging all of the actual manufacturing overhead costs that are incurred to this account.

Notice from Exhibit 5-6 that the job cost sheet for Job A contains a beginning balance of **\$30,000**. We stated earlier that this balance represents the cost of work done on this job prior to April. This cost would be classified on the company’s balance sheet as Work in Process inventory at the beginning of April.

Labor Cost

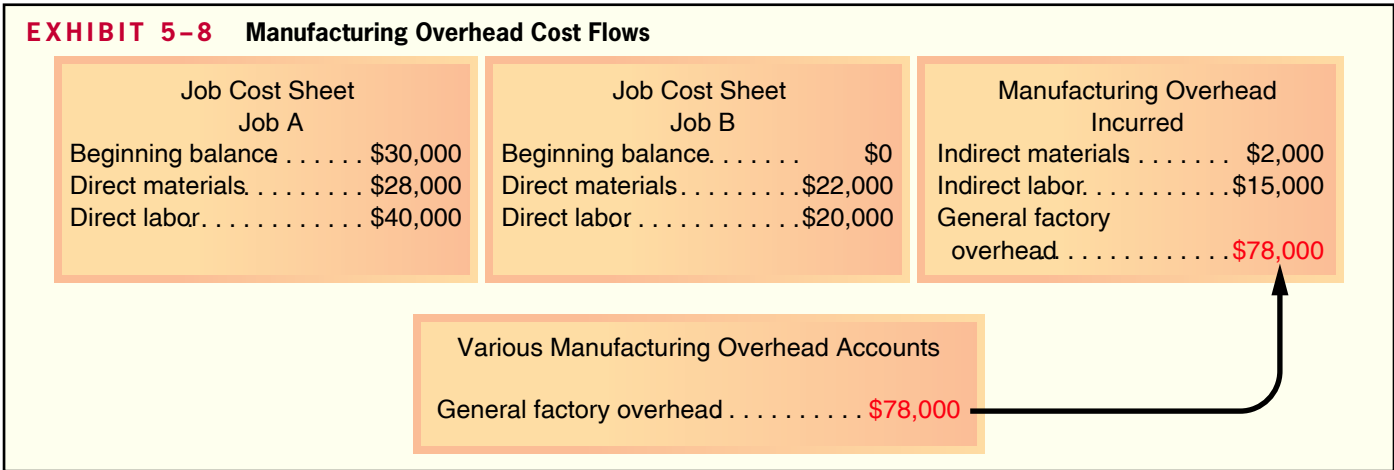

Employee time tickets are filled out by workers, collected, and forwarded to the Accounting Department. In the Accounting Department, wages are computed and the resulting costs are classified as either direct or indirect labor. In April, Rand Company incurred \$40,000 of direct labor cost for Job A, \$20,000 of direct labor cost for Job B, and \$15,000 of indirect labor cost. Exhibit 5-7 shows that during April, **\$40,000** of direct labor cost was charged to Job A and **\$20,000** to Job B on their job cost sheets. The **\$15,000** of indirect labor costs charged to the Manufacturing Overhead Incurred account represent the indirect labor costs incurred during April, such as supervision, janitorial work, and maintenance.

Manufacturing Overhead Cost

Recall that all manufacturing costs other than direct materials and direct labor are classified as manufacturing overhead costs. These costs are charged directly to the Manufacturing Overhead Incurred account as they are incurred. To illustrate, assume that Rand Company incurred the following general factory overhead costs during April:

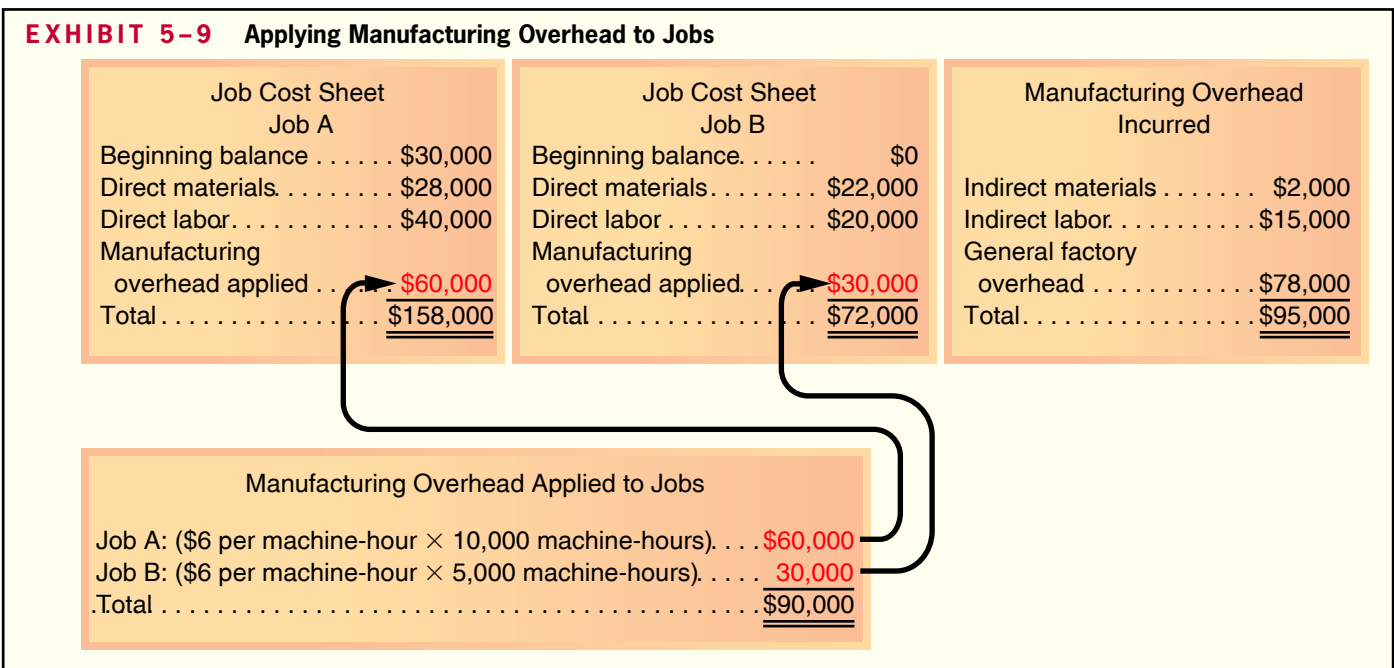

| | |
|--|------------------------|
| Factory utilities (heat, water, and power) | \$21,000 |
| Rent on factory equipment | 16,000 |
| Factory property taxes | 13,000 |
| Factory insurance | 7,000 |
| Manufacturing depreciation | 18,000 |
| Miscellaneous factory overhead costs | 3,000 |
| Total general factory overhead | <u>\$78,000</u> |

Exhibit 5-8 shows how these costs are recorded.

Applying Manufacturing Overhead

Because actual manufacturing costs are charged to the Manufacturing Overhead Incurred account rather than to the job cost sheets, how are manufacturing overhead costs assigned to jobs? The answer is, by means of the predetermined overhead rate. Recall from our discussion earlier in the chapter that a predetermined overhead rate is established at the beginning of each year. The rate is calculated by dividing the estimated total manufacturing overhead cost for the year by the estimated amount of the allocation base (measured in machine-hours, direct labor-hours, or some other base). The predetermined overhead rate is then used to apply overhead costs to jobs. For example, if machine-hours is the allocation base, overhead cost is applied to each job by multiplying the predetermined overhead rate by the number of machine-hours charged to the job. To illustrate, assume that Rand Company's predetermined overhead rate is \$6 per machine-hour. Also assume that during April, 10,000 machine-hours were worked on Job A and 5,000 machine-hours were worked on Job B. Thus, **\$60,000** in manufacturing overhead cost (\$6 per machine-hour × 10,000 machine-hours) would be applied to Job A and **\$30,000** in manufacturing overhead cost (\$6 per machine-hour × 5,000 machine-hours) would be applied to Job B. Exhibit 5-9 shows how these costs are applied to jobs.

Notice that Job A has been assigned total manufacturing costs of \$158,000. Since Job A was completed in April, we can now compute the unit product cost for each of the 1,000 gold medallions included in the job. The unit product cost for Job A is \$158 (\$158,000 ÷ 1,000 units). This figure will be referred to later when we turn our attention to computing Rand Company’s cost of goods sold. Also notice in Exhibit 5–9 that Job B has been assigned \$72,000 of manufacturing costs; however, its unit product cost cannot be determined yet because the job is still in progress at the end of April. The \$72,000 assigned to Job B will be reported as Work in Process inventory on the balance sheet at the end of April.

Underapplied or Overapplied Overhead

LEARNING OBJECTIVE 5

Determine underapplied or overapplied overhead.

You may have noticed a discrepancy in Exhibit 5–9. The actual manufacturing overhead incurred during April was \$95,000, but only \$90,000 in manufacturing overhead cost was applied to the two jobs in process during the month. This discrepancy occurs because the manufacturing overhead applied to jobs is based on the predetermined overhead rate, which is itself based on estimates of the total manufacturing overhead cost and the total machine-hours that were made before the month began. Except under very special circumstances, if either of these estimates is off, the actual manufacturing overhead costs that are incurred will not equal the manufacturing overhead cost that is applied to jobs using the predetermined overhead rate.

The difference between the manufacturing overhead cost applied to jobs and the actual manufacturing overhead costs of a period is called either **underapplied** or **overapplied overhead**. For Rand Company, overhead was underapplied by \$5,000 because the applied cost (\$90,000) was \$5,000 less than the actual cost (\$95,000). If the situation had been reversed and the company had applied \$95,000 in manufacturing overhead cost to jobs while incurring actual manufacturing overhead costs of only \$90,000, then the overhead would have been overapplied.

What is the cause of the underapplied or overapplied overhead? The causes can be complex. To illustrate what can happen, suppose that two companies—Turbo Crafters and Black & Huang—have prepared the following estimates for the coming year:

| | Turbo Crafters | Black & Huang |
|---|----------------------|--------------------------------|
| Allocation base | Machine-hours | Direct materials cost |
| Estimated manufacturing overhead cost (a) | \$300,000 | \$120,000 |
| Estimated total amount of the allocation base (b) | 75,000 machine-hours | \$80,000 direct materials cost |
| Predetermined overhead rate (a) ÷ (b) | \$4 per machine-hour | 150% of direct materials cost |

Note that when the allocation base is dollars (such as direct materials cost in the case of Black & Huang) the predetermined overhead rate is expressed as a percentage of the allocation base. When dollars are divided by dollars, the result is a percentage.

Now assume that because of unexpected changes in overhead spending and in demand for the companies’ products, the *actual* overhead cost and the actual activity recorded during the year in each company are as follows:

| | Turbo Crafters | Black & Huang |
|--|----------------------|--------------------------------|
| Actual manufacturing overhead cost | \$290,000 | \$130,000 |
| Actual total amount of the allocation base | 68,000 machine-hours | \$90,000 direct materials cost |

For each company, note that the actual data for both the cost and the allocation base differ from the estimates used in computing the predetermined overhead rate. This results in underapplied and overapplied overhead as follows:

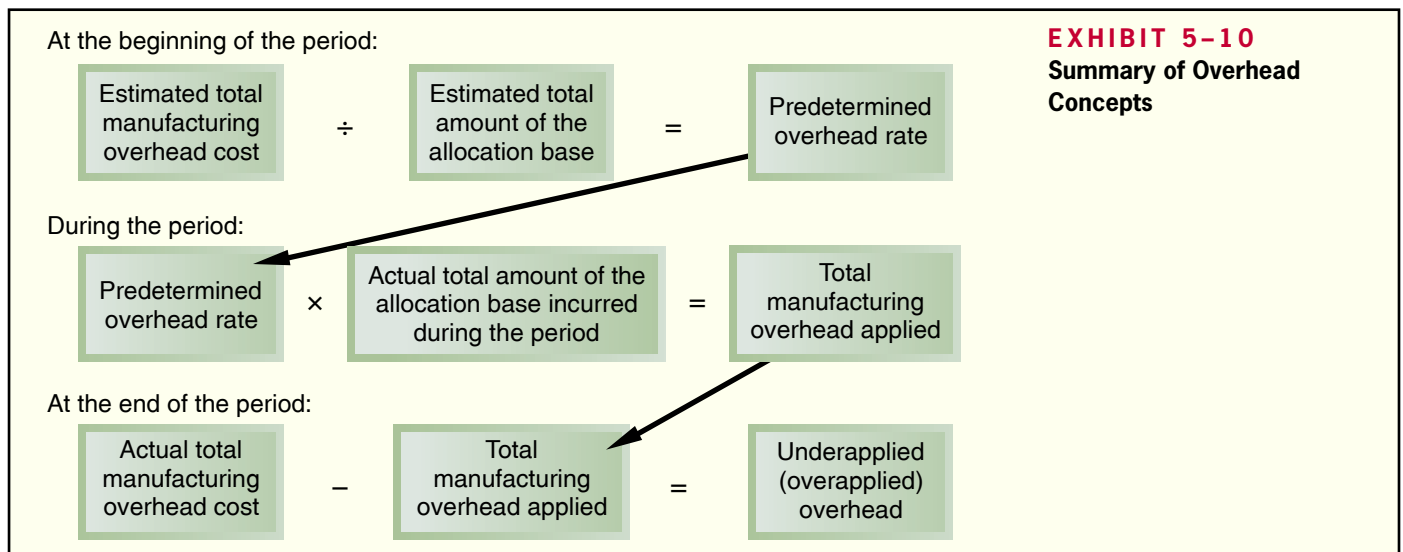

| | Turbo Crafters | Black & Huang |
|--|-----------------------|---------------------------------|
| Actual manufacturing overhead cost | <u>\$290,000</u> | <u>\$130,000</u> |
| Manufacturing overhead cost applied to jobs during the year: | | |
| Predetermined overhead rate (a) | \$4 per machine-hour | 150% of direct materials cost |
| Actual total amount of the allocation base (b) | 68,000 machine-hours | \$ 90,000 direct materials cost |
| Manufacturing overhead applied (a) × (b) | <u>\$272,000</u> | <u>\$135,000</u> |
| Underapplied (overapplied) manufacturing overhead | <u>\$ 18,000</u> | <u>\$ (5,000)</u> |

For Turbo Crafters, the \$272,000 of manufacturing overhead cost applied to jobs is less than the \$290,000 actual manufacturing overhead cost for the year. Therefore, overhead is underapplied. Notice that the original \$300,000 estimate of manufacturing overhead for Turbo Crafters is not directly involved in this computation. Its impact is felt only through the \$4 predetermined overhead rate.

For Black & Huang, the \$135,000 of manufacturing overhead cost applied to jobs is greater than the \$130,000 actual manufacturing overhead cost for the year, so overhead is overapplied. A summary of the concepts discussed above is presented in Exhibit 5–10.

Disposition of Underapplied or Overapplied Overhead

Note that the manufacturing overhead cost that is applied to jobs is an estimate—it does not represent actual costs incurred. The company’s accounts must be adjusted at the end of the period so that they reflect actual costs rather than this estimate. This is accomplished in one of two ways: either (1) the underapplied or overapplied overhead at the end of a period is closed out to Cost of Goods Sold; or (2) it is allocated among Work in Process, Finished Goods, and Cost of Goods Sold in proportion to the overhead applied during the current period that is in the ending balances of these accounts. The latter method takes us further into the details of bookkeeping than we would like to go in this book, so we will always assume that the underapplied or overapplied overhead is closed out to Cost of Goods Sold. In other words, Cost of Goods Sold is adjusted for the amount of underapplied or overapplied overhead.

The procedure for closing out underapplied or overapplied overhead to Cost of Goods Sold is quite simple. Underapplied overhead is added to Cost of Goods Sold. Overapplied overhead is deducted from Cost of Goods Sold. The reasoning is that if overhead is underapplied, not enough manufacturing overhead was applied to jobs and hence their costs are understated. Therefore, Cost of Goods Sold must be increased to compensate for this understatement. Likewise, if overhead is overapplied, too much manufacturing overhead was applied to jobs and hence their costs are overstated. Therefore, Cost of Goods Sold must be decreased to compensate for this overstatement. In short, adding to or deducting from Cost of Goods Sold corrects the misstatement of cost that occurs as a result of using a predetermined overhead rate.

Prepare an Income Statement

Cost of Goods Sold

LEARNING OBJECTIVE 6
Use the direct method to determine cost of goods sold.

Recall from Chapter 2 that Cost of Goods Sold consists of the costs of the products sold to customers. It can be determined directly or indirectly. The indirect method was used in Chapter 2. The direct method is simpler and quicker when the necessary data are available. We will illustrate both approaches for Rand Company.

The Direct Method of Determining Cost of Goods Sold Recall that Job A, which consisted of 1,000 gold medallions, was completed during April, but Job B was not completed. Also recall that the unit product cost for each of the 1,000 gold medallions included in Job A was \$158 (\$158,000 ÷ 1,000 units). If we assume that 750 of the 1,000 gold medallions included in Job A were shipped to customers by the end of April, then the cost of the medallions sold to customers was **\$118,500** (750 units × \$158 per unit). This amount must be adjusted for the **\$5,000** underapplied overhead to arrive at the cost of goods sold for the period. Exhibit 5–11 illustrates the direct method of determining the cost of goods sold.

EXHIBIT 5–11
The Direct Method of Determining Cost of Goods Sold

| | |
|--|-------------------------|
| Unadjusted cost of goods sold (750 units × \$158 per unit) | \$118,500 |
| Add: Underapplied overhead | 5,000 |
| Cost of goods sold | <u>\$123,500</u> |

LEARNING OBJECTIVE 7
Use the indirect method to determine cost of goods sold.

The Indirect Method of Determining Cost of Goods Sold The indirect method introduced in Chapter 2 relies on the following formulas:

$$\begin{aligned} \text{Cost of goods manufactured} &= \text{Total manufacturing cost charged to jobs} \\ &+ \text{Beginning work in process inventory} \\ &- \text{Ending work in process inventory} \end{aligned}$$

$$\begin{aligned} \text{Cost of goods sold} &= \text{Beginning finished goods inventory} \\ &+ \text{Cost of goods manufactured} \\ &- \text{Ending finished goods inventory} \end{aligned}$$

To determine the cost of goods sold with these formulas, we will need to know five items: (1) the beginning work in process inventory; (2) the total manufacturing cost charged to jobs for the period; (3) the ending work in process inventory; (4) the

beginning finished goods inventory; and (5) the ending finished goods inventory. These costs for Rand company are detailed below:

1. The beginning work in process inventory was **\$30,000**—the beginning balance on Job A’s job cost sheet from Exhibit 5–6 on page 175.
2. The total manufacturing cost charged to jobs consists of direct materials, direct labor, and manufacturing overhead charged to jobs during the period. From Exhibit 5–9 on page 177, the total manufacturing cost can be determined as follows:

| | Job A | Job B | Total |
|--|----------|----------|------------------|
| Direct materials..... | \$28,000 | \$22,000 | \$ 50,000 |
| Direct labor | \$40,000 | \$20,000 | 60,000 |
| Manufacturing overhead applied | \$60,000 | \$30,000 | 90,000 |
| Total manufacturing cost charged to jobs | | | <u>\$200,000</u> |

3. The ending work in process inventory consists of **\$72,000**—the accumulated cost of Job B from Exhibit 5–9 on page 177.
4. At the start of the Rand Company example, we stated that the company had no beginning finished goods inventories.
5. The ending finished goods inventory consists of the costs of any completed units that have not been sold at the end of the month. Job A consisted of 1,000 units, 750 of which were sold. Therefore, the ending finished goods inventory consists of 250 units (1,000 units – 750 units). Recall that the unit product cost of Job A is \$158 per unit. Consequently, the total cost of these 250 unsold, but completed, units is **\$39,500** (250 units × \$158 per unit).

Using these data, Exhibit 5–12 illustrates the indirect method of determining the cost of goods sold.

| | | EXHIBIT 5-12 |
|---|-------------------------|-------------------------------|
| | | The Indirect Method of |
| | | Determining Cost of |
| | | Goods Sold |
| Manufacturing costs charged to jobs: | | |
| Direct materials* | \$ 50,000 | |
| Direct labor | 60,000 | |
| Manufacturing overhead applied | <u>90,000</u> | |
| Total manufacturing cost charged to jobs | 200,000 | |
| Add: Beginning work in process inventory | 30,000 | |
| | 230,000 | |
| Deduct: Ending work in process inventory | 72,000 | |
| Cost of goods manufactured | <u>\$158,000</u> | |
| | | |
| Beginning finished goods inventory | \$ 0 | |
| Add: Cost of goods manufactured (see above) | <u>158,000</u> | |
| Goods available for sale | 158,000 | |
| Deduct: Ending finished goods inventory | 39,500 | |
| Unadjusted cost of goods sold | 118,500 | |
| Add: Underapplied overhead | <u>5,000</u> | |
| Cost of goods sold | <u>\$123,500</u> | |
| *Further details concerning materials could be included in the statement as shown in the Schedule of Cost of Goods Manufactured from Chapter 2. | | |

Note two things from Exhibit 5–11 and Exhibit 5–12. First, the cost of goods sold is identical under the two methods—and always will be. Second, under both methods, the underapplied overhead is added to the unadjusted cost of goods sold to determine the cost of goods sold. Remember the reason for this. Underapplied overhead means that not enough overhead was applied to jobs—the actual manufacturing overhead exceeded the amount of manufacturing overhead applied to jobs using the predetermined overhead rate. We must add the underapplied overhead to the unadjusted cost of goods sold to remove this discrepancy.

Income Statement

Now that we know the cost of goods sold (\$123,500), all we need to construct the company's income statement for April is the total sales revenue and the selling and administrative expenses. We will assume that Rand Company's total sales revenue is \$225,000 and that it has supplied the following data concerning its selling and administrative expenses in April:

| Rand Company Selling and Administrative Expenses For the Month Ending April 30 | |
|---|-----------------|
| Salaries expense | \$30,000 |
| Depreciation expense | 7,000 |
| Advertising expense | 42,000 |
| Other expense | <u>8,000</u> |
| Total selling and administrative expense | <u>\$87,000</u> |

Exhibit 5–13 combines these selling and administrative expenses with the sales and cost of goods sold data to create the company's income statement for the month.

EXHIBIT 5-13 Income Statement

| Rand Company Income Statement For the Month Ending April 30 | |
|---|------------------|
| Sales | \$225,000 |
| Cost of goods sold | <u>123,500</u> |
| Gross margin | 101,500 |
| Selling and administrative expense | <u>87,000</u> |
| Net operating income | <u>\$ 14,500</u> |
| <p>*Note: This is an abbreviated version of the Income Statement from Chapter 2. Details concerning the cost of goods sold and the selling and administrative expenses could be included in the income statement.</p> | |

Multiple Predetermined Overhead Rates

Our discussion in this chapter has assumed that there is a single predetermined overhead rate for an entire factory called a **plantwide overhead rate**. This is a fairly common practice—particularly in smaller companies. But in larger companies, *multiple predetermined overhead rates* are often used. In a **multiple predetermined overhead rate** system

each production department may have its own predetermined overhead rate. Such a system, while more complex, is more accurate because it can reflect differences across departments in how overhead costs are incurred. For example, in departments that are relatively labor intensive overhead might be allocated based on direct labor-hours and in departments that are relatively machine intensive overhead might be allocated based on machine-hours. When multiple predetermined overhead rates are used, overhead is applied in each department according to its own overhead rate as jobs proceed through the department.

Job-Order Costing in Service Companies

Job-order costing is used in service organizations such as law firms, movie studios, hospitals, and repair shops, as well as in manufacturing companies. In a law firm, for example, each client is a “job,” and the costs of that job are accumulated on a job cost sheet as the client’s case is handled by the firm. Legal forms and similar inputs represent the direct materials for the job; the time expended by attorneys is like direct labor; and the costs of secretaries and legal aids, rent, depreciation, and so forth, represent the overhead.

In a movie studio such as **Columbia Pictures**, each film produced by the studio is a “job,” and costs of direct materials (costumes, props, film, etc.) and direct labor (actors, directors, and extras) are charged to each film’s job cost sheet. A share of the studio’s overhead costs, such as utilities, depreciation of equipment, wages of maintenance workers, and so forth, is also charged to each film.

In sum, job-order costing is a versatile and widely used costing method that may be encountered in virtually any organization that provides diverse products or services.

Summary

Job-order costing and process costing are widely used to track costs. Job-order costing is used in situations where the organization offers many different products or services, such as in furniture manufacturing, hospitals, and legal firms. Process costing is used where units of product are homogeneous, such as in flour milling or cement production.

Materials requisition forms and labor time tickets are used to assign direct materials and direct labor costs to jobs in a job-order costing system. Manufacturing overhead costs are assigned to jobs using a predetermined overhead rate. All of the costs are recorded on a job cost sheet.

The predetermined overhead rate is determined before the period begins by dividing the estimated total manufacturing cost for the period by the estimated total amount of the allocation base for the period. The most frequently used allocation bases are direct labor-hours and machine-hours. Overhead is applied to jobs by multiplying the predetermined overhead rate by the actual amount of the allocation base recorded for the job.

Because the predetermined overhead rate is based on estimates, the actual overhead cost incurred during a period may be more or less than the amount of overhead cost applied to production. Such a difference is referred to as underapplied or overapplied overhead. The underapplied or overapplied overhead for a period can be either closed out to Cost of Goods Sold or allocated between Work in Process, Finished Goods, and Cost of Goods Sold. When overhead is underapplied, manufacturing overhead costs have been understated and therefore inventories and/or expenses must be adjusted upwards. When overhead is overapplied, manufacturing overhead costs have been overstated and therefore inventories and/or expenses must be adjusted downwards.

Review Problem: Job-Order Costing

Hogle Corporation uses job-order costing and applies overhead cost to jobs on the basis of machine-hours worked. For the just completed year, the company estimated that it would work 75,000 machine-hours and incur \$450,000 in manufacturing overhead cost. The company actually worked 80,000 machine-hours.

The company has provided the following financial data concerning its actual operations for the year:

| | |
|---|-------------|
| Direct materials | \$360,000 |
| Indirect materials | \$20,000 |
| Direct labor | \$75,000 |
| Indirect labor | \$110,000 |
| Sales commissions | \$90,000 |
| Administrative salaries | \$200,000 |
| General selling expenses | \$17,000 |
| Factory utility costs | \$43,000 |
| Advertising costs | \$180,000 |
| Factory depreciation | \$280,000 |
| Selling and administrative depreciation | \$70,000 |
| Factory insurance | \$7,000 |
| Selling and administrative insurance | \$3,000 |
| Cost of goods sold (not adjusted for underapplied or overapplied overhead) | \$870,000 |
| Sales | \$1,500,000 |

Required:

1. Is overhead underapplied or overapplied for the year? By how much?
2. Prepare an income statement for the year.

Solution to Review Problem

1. To determine the underapplied or overapplied overhead for the year, we must know the actual manufacturing overhead cost incurred and the manufacturing overhead applied to jobs. The actual manufacturing overhead cost incurred can be determined by adding together all of the manufacturing overhead items in the financial data provided by the company as follows:

| | |
|--|------------------|
| <i>Manufacturing overhead costs incurred:</i> | |
| Indirect materials | \$ 20,000 |
| Indirect labor | 110,000 |
| Factory utility costs | 43,000 |
| Factory depreciation | 280,000 |
| Factory insurance | 7,000 |
| Total manufacturing overhead cost incurred | <u>\$460,000</u> |

The predetermined overhead rate for the year is computed as follows:

$$\begin{aligned}
 \text{Predetermined overhead rate} &= \frac{\text{Estimated total manufacturing overhead cost}}{\text{Estimated total amount of the allocation base}} \\
 &= \frac{\$450,000}{75,000 \text{ machine-hours}} \\
 &= \$6 \text{ per machine-hour}
 \end{aligned}$$

Based on the 80,000 machine-hours actually worked during the year, the company applied \$480,000 in overhead cost to production (\$6 per machine-hour × 80,000 machine hours).

The actual manufacturing overhead cost incurred was \$460,000, whereas the manufacturing overhead applied to jobs using the company’s predetermined overhead rate was \$480,000. Therefore, overhead was overapplied by \$20,000 (\$480,000 – \$460,000).

- To construct the income statement, we will need the sales (which is given), the adjusted cost of goods sold, and the total selling and administrative expenses. The latter can be determined as follows:

| <i>Selling and administrative expenses incurred:</i> | |
|---|-------------------------|
| Sales commissions | \$ 90,000 |
| Administrative salaries | 200,000 |
| General selling expenses | 17,000 |
| Advertising costs | 180,000 |
| Selling and administrative depreciation | 70,000 |
| Selling and administrative insurance | 3,000 |
| Total selling and administrative expense | <u>\$560,000</u> |

The adjusted cost of goods sold is determined as follows:

| | |
|-------------------------------------|-------------------------|
| Unadjusted cost of goods sold | \$870,000 |
| Deduct: Overapplied overhead | <u>20,000</u> |
| Cost of goods sold | <u>\$850,000</u> |

Finally, the income statement is constructed as follows:

| Hogle Corporation Income Statement | |
|---|-------------------------|
| Sales | \$1,500,000 |
| Cost of goods sold | <u>850,000</u> |
| Gross margin | 650,000 |
| Selling and administrative expense | <u>560,000</u> |
| Net operating income | <u>\$ 90,000</u> |

Glossary

- Absorption costing** A costing method that includes all manufacturing costs—direct materials, direct labor, and both variable and fixed manufacturing overhead—in the cost of a product. (p. 165)
- Allocation base** A measure of activity such as direct labor-hours or machine-hours that is used to assign costs to cost objects. (p. 170)
- Bill of materials** A document that shows the quantity of each type of direct material required to make a product. (p. 167)
- Cost driver** A factor, such as machine-hours, beds occupied, computer time, or flight-hours, that causes overhead costs. (p. 172)
- Job cost sheet** A form prepared for a job that records the materials, labor, and manufacturing overhead costs charged to that job. (p. 168)
- Job-order costing** A costing system used in situations where many different products, jobs, or services are produced each period. (p. 165)
- Materials requisition form** A document that specifies the type and quantity of materials to be drawn from the storeroom and that identifies the job that will be charged for the cost of those materials. (p. 167)
- Multiple predetermined overhead rate** A costing system with multiple overhead cost pools and a different predetermined overhead rate for each cost pool, rather than a single predetermined overhead rate for the entire company. Each production department may be treated as a separate overhead cost pool. (p. 182)

Normal cost system A costing system in which overhead costs are applied to a job by multiplying a predetermined overhead rate by the actual amount of the allocation base incurred by the job. (p. 171)

Overapplied overhead The amount by which overhead cost applied to jobs exceeds the amount of overhead cost actually incurred during a period. (p. 178)

Overhead application The process of charging manufacturing overhead cost to job cost sheets. (p. 171)

Plantwide overhead rate A single predetermined overhead rate that is used throughout a plant. (p. 182)

Predetermined overhead rate A rate used to charge manufacturing overhead cost to jobs that is established in advance for each period. It is computed by dividing the estimated total manufacturing overhead cost for the period by the estimated total amount of the allocation base for the period. (p. 170)

Process costing A costing system used in situations where a single, homogeneous product (such as cement or flour) is produced for long periods of time. (p. 165)

Time ticket A document that is used to record the amount of time an employee spends on various activities. (p. 169)

Underapplied overhead The amount by which overhead cost actually incurred exceeds the amount of overhead cost applied to jobs during a period. (p. 178)

Questions

- 5-1 Why aren't actual manufacturing overhead costs traced to jobs just as direct materials and direct labor costs are traced to jobs?
- 5-2 When would job-order costing be used instead of process costing?
- 5-3 What is the purpose of the job cost sheet in a job-order costing system?
- 5-4 What is a predetermined overhead rate, and how is it computed?
- 5-5 Explain how a sales order, a production order, a materials requisition form, and a labor time ticket are involved in producing and costing products.
- 5-6 Explain why some production costs must be assigned to products through an allocation process.
- 5-7 Why do companies use predetermined overhead rates rather than actual manufacturing overhead costs to apply overhead to jobs?
- 5-8 What factors should be considered in selecting a base to be used in computing the predetermined overhead rate?
- 5-9 If a company fully allocates all of its overhead costs to jobs, does this guarantee that a profit will be earned for the period?
- 5-10 Would you expect the amount of overhead applied for a period to equal the actual overhead costs of the period? Why or why not?
- 5-11 What is underapplied overhead? Overapplied overhead? What disposition is made of these amounts at the end of the period?
- 5-12 Provide two reasons why overhead might be underapplied in a given year.
- 5-13 What adjustment to cost of goods sold is made for underapplied overhead? What adjustment is made for overapplied overhead?
- 5-14 What is a plantwide overhead rate? Why are multiple overhead rates, rather than a plantwide overhead rate, used in some companies?
- 5-15 What happens to overhead rates based on direct labor when automated equipment replaces direct labor?

Multiple-choice questions are provided on the text website at www.mhhe.com/noreen2e.

Exercises

connect™

EXERCISE 5-1 Process Costing and Job-Order Costing [LO1]

Which method of determining product costs, job-order costing or process costing, would be more appropriate in each of the following situations?

- a. An Elmer's glue factory.
- b. A textbook publisher such as McGraw-Hill.

- c. An Exxon oil refinery.
- d. A facility that makes Minute Maid frozen orange juice.
- e. A Scott paper mill.
- f. A custom home builder.
- g. A shop that customizes vans.
- h. A manufacturer of specialty chemicals.
- i. An auto repair shop.
- j. A Firestone tire manufacturing plant.
- k. An advertising agency.
- l. A law office.

EXERCISE 5–2 Job-Order Costing Documents [L02]

Cycle Gear Corporation has incurred the following costs on job number W456, an order for 20 special sprockets to be delivered at the end of next month.

Direct materials:

On April 10, requisition number 15673 was issued for 20 titanium blanks to be used in the special order. The blanks cost \$15.00 each.

On April 11, requisition number 15678 was issued for 480 hardened nibs also to be used in the special order. The nibs cost \$1.25 each.

Direct labor:

On April 12, Jamie Unser worked from 11:00 AM until 2:45 PM on Job W456. He is paid \$9.60 per hour.

On April 18, Melissa Chan worked from 8:15 AM until 11:30 AM on Job W456. She is paid \$12.20 per hour.

Required:

1. On what documents would these costs be recorded?
2. How much cost should have been recorded on each of the documents for Job W456?

EXERCISE 5–3 Compute the Predetermined Overhead Rate [L03]

Harris Fabrics computes its predetermined overhead rate annually on the basis of direct labor hours. At the beginning of the year it estimated that its total manufacturing overhead would be \$134,000 and the total direct labor would be 20,000 hours. Its actual total manufacturing overhead for the year was \$123,900 and its actual total direct labor was 21,000 hours.

Required:

Compute the company's predetermined overhead rate for the year.

EXERCISE 5–4 Apply Overhead [L04]

Luthan Company uses a predetermined overhead rate of \$23.40 per direct labor-hour. This predetermined rate was based on 11,000 estimated direct labor-hours and \$257,400 of estimated total manufacturing overhead.

The company incurred actual total manufacturing overhead costs of \$249,000 and 10,800 total direct labor-hours during the period.

Required:

Determine the amount of manufacturing overhead that would have been applied to units of product during the period.

EXERCISE 5–5 Determine Underapplied or Overapplied Overhead [L05]

Larned Corporation recorded the following transactions for the just completed month.

- a. \$71,000 in raw materials were requisitioned for use in production. Of this amount, \$62,000 was for direct materials and the remainder was for indirect materials.
- b. Total labor wages of \$112,000 were incurred. Of this amount, \$101,000 was for direct labor and the remainder was for indirect labor.
- c. Additional actual manufacturing overhead costs of \$175,000 were incurred.
- d. A total of \$188,000 in manufacturing overhead was applied to jobs.

Required:

Determine the underapplied or overapplied overhead for the month.

EXERCISE 5–6 Direct Method of Determining Cost of Goods Sold [L06]

Russo Corporation had only one job in process during June—Job G431—and had no finished goods inventory on July 1. Job G431 was started in May and finished during June. Data concerning that job appear below:

| | Job G431 |
|---|-----------------|
| Beginning balance | \$8,000 |
| Charged to the job during June: | |
| Direct materials | \$12,000 |
| Direct labor | \$5,000 |
| Manufacturing overhead applied | \$8,000 |
| Units completed | 200 |
| Units in process at the end of June | 0 |
| Units sold during June | 80 |

In June, overhead was underapplied by \$600. The company adjusts its cost of goods sold every month for the amount of the overhead that was underapplied or overapplied.

Required:

- Using the direct method, what is the cost of goods sold for June?
- What is the total value of the finished goods inventory at the end of June?
- What is the total value of the work in process inventory at the end of June?

EXERCISE 5–7 Indirect Method of Determining Cost of Goods Sold [L07]

Refer to the data for Russo Corporation in Exercise 5–6.

Required:

Using the indirect method, determine the cost of goods sold for June.

EXERCISE 5–8 Underapplied and Overapplied Overhead [L05]

Osborn Manufacturing uses a predetermined overhead rate of \$18.20 per direct labor-hour. This predetermined rate was based on 12,000 estimated direct labor-hours and \$218,400 of estimated total manufacturing overhead.

The company incurred actual total manufacturing overhead costs of \$215,000 and 11,500 total direct labor-hours during the period.

Required:

- Determine the amount of underapplied or overapplied manufacturing overhead for the period.
- Assuming that the entire amount of the underapplied or overapplied overhead is closed out to Cost of Goods Sold, what would be the effect of the underapplied or overapplied overhead on the company's gross margin for the period?

EXERCISE 5–9 Predetermined Overhead Rate; Applying Overhead; Underapplied or Overapplied Overhead [L03, L04, L05]

Estimated cost and operating data for three companies for the upcoming year follow:

| | Company X | Company Y | Company Z |
|-----------------------------------|------------------|------------------|------------------|
| Direct labor-hours | 80,000 | 45,000 | 60,000 |
| Machine-hours | 30,000 | 70,000 | 21,000 |
| Direct materials cost | \$400,000 | \$290,000 | \$300,000 |
| Manufacturing overhead cost | \$536,000 | \$315,000 | \$480,000 |

Predetermined overhead rates are computed using the following allocation bases in the three companies:

| | Allocation Base |
|-----------------|------------------------|
| Company X | Direct labor-hours |
| Company Y | Machine-hours |
| Company Z | Direct materials cost |

Required:

1. Compute each company’s predetermined overhead rate.
2. Assume that Company X works on three jobs during the upcoming year. Direct labor-hours recorded by job are: Job 418, 12,000 hours; Job 419, 36,000 hours; and Job 420, 30,000 hours. How much overhead will the company apply to Work in Process for the year? If actual overhead costs total \$530,000 for the year, will overhead be underapplied or overapplied? By how much?

EXERCISE 5–10 Predetermined Overhead Rate; Applying Overhead; Underapplied or Overapplied Overhead [L03, L04, L05]

Harwood Company uses a job-order costing system. Overhead costs are applied to jobs on the basis of machine-hours. At the beginning of the year, management estimated that the company would work 80,000 machine-hours and incur \$192,000 in manufacturing overhead costs for the year.

Required:

1. Compute the company’s predetermined overhead rate.
2. Assume that during the year the company actually worked only 75,000 machine-hours and incurred \$184,000 of manufacturing overhead costs. Compute the amount of underapplied or overapplied overhead for the year.
3. Explain why the manufacturing overhead was underapplied or overapplied for the year.

EXERCISE 5–11 Applying Overhead; Computing Unit Product Cost [L04]

A company assigns overhead cost to completed jobs on the basis of 125% of direct labor cost. The job cost sheet for Job 313 shows that \$10,000 in direct materials has been used on the job and that \$12,000 in direct labor cost has been incurred. A total of 1,000 units were produced in Job 313.

Required:

What is the unit product cost for Job 313?

EXERCISE 5–12 Applying Overhead; Cost of Goods Manufactured [L04, L05, L07]

The following cost data relate to the manufacturing activities of Chang Company during the just completed year:

| | |
|--|------------------|
| Actual manufacturing overhead costs incurred: | |
| Indirect materials | \$ 15,000 |
| Indirect labor | 130,000 |
| Property taxes, factory | 8,000 |
| Utilities, factory | 70,000 |
| Depreciation, factory | 240,000 |
| Insurance, factory | 10,000 |
| Total actual manufacturing overhead costs incurred | <u>\$473,000</u> |
| Other costs charged to jobs: | |
| Direct materials | \$375,000 |
| Direct labor cost | \$60,000 |
| Inventories: | |
| Work in process, beginning | \$40,000 |
| Work in process, ending | \$70,000 |

The company uses a predetermined overhead rate to apply overhead cost to production. The rate for the year was \$25 per machine-hour. A total of 19,400 machine-hours was recorded for the year.

Required:

1. Compute the amount of underapplied or overapplied overhead cost for the year.
2. Determine the cost of goods manufactured for the year using the indirect method.

EXERCISE 5–13 Varying Predetermined Overhead Rates [L03, L04]

Kingsport Containers, Ltd, of the Bahamas experiences wide variation in demand for the 200-liter steel drums it fabricates. The leakproof, rustproof steel drums have a variety of uses from storing liquids and bulk materials to serving as makeshift musical instruments. The drums are made to order and are painted according to the customer’s specifications—often in bright patterns and designs. The company is well known for the artwork that appears on its drums. Unit product costs are computed on a quarterly basis by

dividing each quarter's manufacturing costs (materials, labor, and overhead) by the quarter's production in units. The company's estimated costs, by quarter, for the coming year follow:

| | Quarter | | | |
|--------------------------------------|------------------|------------------|------------------|------------------|
| | First | Second | Third | Fourth |
| Direct materials | \$240,000 | \$120,000 | \$60,000 | \$180,000 |
| Direct labor | 128,000 | 64,000 | 32,000 | 96,000 |
| Manufacturing overhead | 300,000 | 220,000 | 180,000 | 260,000 |
| Total manufacturing costs | <u>\$668,000</u> | <u>\$404,000</u> | <u>\$272,000</u> | <u>\$536,000</u> |
| Number of units to be produced | 80,000 | 40,000 | 20,000 | 60,000 |
| Estimated unit product cost | \$8.35 | \$10.10 | \$13.60 | \$8.93 |

Management finds the variation in unit costs confusing and difficult to work with. It has been suggested that the problem lies with manufacturing overhead because it is the largest element of cost. Accordingly, you have been asked to find a more appropriate way of assigning manufacturing overhead cost to units of product. After some analysis, you have determined that the company's overhead costs are mostly fixed and therefore show little sensitivity to changes in the level of production.

Required:

1. The company uses a job-order costing system. How would you recommend that manufacturing overhead cost be assigned to production? Be specific, and show computations.
2. Recompute the company's unit product costs in accordance with your recommendations in (1) above.

EXERCISE 5-14 Departmental Overhead Rates [LO2, LO3, LO4]

White Company has two departments, Cutting and Finishing. The company uses a job-order costing system and computes a predetermined overhead rate in each department. The Cutting Department bases its rate on machine-hours, and the Finishing Department bases its rate on direct labor cost. At the beginning of the year, the company made the following estimates:

| | Department | |
|-----------------------------------|------------|-----------|
| | Cutting | Finishing |
| Direct labor-hours | 6,000 | 30,000 |
| Machine-hours | 48,000 | 5,000 |
| Manufacturing overhead cost | \$360,000 | \$486,000 |
| Direct labor cost | \$50,000 | \$270,000 |

Required:

1. Compute the predetermined overhead rate to be used in each department.
2. Assume that the overhead rates that you computed in (1) above are in effect. The job cost sheet for Job 203, which was started and completed during the year, showed the following:

| | Department | |
|-------------------------------|------------|-----------|
| | Cutting | Finishing |
| Direct labor-hours | 6 | 20 |
| Machine-hours | 80 | 4 |
| Materials requisitioned | \$500 | \$310 |
| Direct labor cost | \$70 | \$150 |

3. Compute the total overhead cost applied to Job 203.
3. Would you expect substantially different amounts of overhead cost to be assigned to some jobs if the company used a plantwide overhead rate based on direct labor cost, rather than using departmental rates? Explain. No computations are necessary.

EXERCISE 5–15 Applying Overhead to a Job [LO4]

Sigma Corporation applies overhead cost to jobs on the basis of direct labor cost. Job V, which was started and completed during the current period, shows charges of \$5,000 for direct materials, \$8,000 for direct labor, and \$6,000 for overhead on its job cost sheet. Job W, which is still in process at year-end, shows charges of \$2,500 for direct materials and \$4,000 for direct labor.

Required:

Should any overhead cost be added to Job W at year-end? If so, how much? Explain.

Problems

PROBLEM 5–16 Applying Overhead in a Service Company [LO2, LO3, LO4]

Leeds Architectural Consultants uses a job-order costing system and applies studio overhead to jobs on the basis of direct staff costs. Because Leeds Architectural Consultants is a service firm, the names of the accounts it uses are different from the names used in manufacturing companies. The following costs were recorded in January:

| | |
|---|-----------|
| Cost of subcontracted work (comparable to direct materials) | \$230,000 |
| Direct staff costs (comparable to direct labor) | \$75,000 |
| Studio overhead (comparable to manufacturing overhead cost applied) | \$120,000 |
| Cost of work completed (comparable to cost of goods manufactured) | \$390,000 |

There were no beginning inventories in January.

At the end of January, only one job was still in process. This job (Lexington Gardens Project) had been charged with \$6,500 in direct staff costs.

Required:

1. Compute the predetermined overhead rate that was used during January.
2. Complete the following job cost sheet for the partially completed Lexington Gardens Project. (*Hint:* Cost of goods manufactured equals beginning work in process inventory plus manufacturing costs incurred less ending work in process inventory.)

| Job Cost Sheet | |
|-----------------------------------|-------------|
| Lexington Gardens Project | |
| Costs of subcontracted work | \$? |
| Direct staff costs | ? |
| Studio overhead | ? |
| Total cost to January 31 | <u>\$?</u> |

PROBLEM 5–17 Applying Overhead in a Service Company [LO4, LO5, LO6]

Vista Landscaping provides garden design and installation services for its clients. The company uses a job-order costing system to track the costs of its landscaping projects. The table below provides data concerning the three landscaping projects that were in progress during April. There was no work in process at the beginning of April.

| | Project | | |
|------------------------|----------------|-------------|--------------|
| | Harris | Chan | James |
| Designer-hours | 120 | 100 | 90 |
| Direct materials | \$4,500 | \$3,700 | \$1,400 |
| Direct labor | \$9,600 | \$8,000 | \$7,200 |

Actual overhead costs were \$30,000 for April. Overhead costs are applied to projects on the basis of designer-hours because most of the overhead is related to the costs of the garden design studio. The

predetermined overhead rate is \$90 per designer-hour. The Harris and Chan projects were completed in April; the James project was not completed by the end of the month.

Required:

1. Compute the amount of overhead cost that would have been charged to each project during April.
2. Determine the cost of goods manufactured for April.
3. What is the accumulated cost of the work in process at the end of April?
4. Determine the underapplied or overapplied overhead for April.

PROBLEM 5–18 Predetermined Overhead Rate; Applying Overhead; Underapplied or Overapplied Overhead; Income Statement [LO4, LO5, LO6]

Almeda Products, Inc., uses a job-order costing system. During the year, the following transactions were completed:

- a. Raw materials were issued from the storeroom for use in production, \$180,000 (80% direct and 20% indirect).
- b. Employee salaries and wages were accrued as follows: direct labor, \$200,000; indirect labor, \$82,000; and selling and administrative salaries, \$90,000.
- c. Utility costs were incurred in the factory, \$65,000.
- d. Advertising costs were incurred, \$100,000.
- e. Insurance costs, \$20,000 (90% related to factory operations, and 10% related to selling and administrative activities).
- f. Depreciation was recorded, \$180,000 (85% related to factory assets, and 15% related to selling and administrative assets).
- g. Manufacturing overhead was applied to jobs at the rate of 175% of direct labor cost.
- h. Goods that cost \$700,000 to manufacture according to their job cost sheets were transferred to the finished goods warehouse.
- i. Sales for the year totaled \$1,000,000. The total cost to manufacture these goods according to their job cost sheets was \$720,000.

Required:

1. Determine the underapplied or overapplied overhead for the year.
2. Prepare an income statement for the year. (*Hint:* No calculations are required to determine the cost of goods sold before any adjustment for underapplied or overapplied overhead.)

PROBLEM 5–19 Direct Method of Determining Cost of Goods Sold [LO6]

Kuvomi Corporation worked on four jobs during October: Job F346, Job F347, Job F348, and Job F349. At the end of October, the job cost sheets for these jobs contained the following data:

| | Job F346 | Job F347 | Job F348 | Job F349 |
|--|----------|----------|----------|----------|
| Beginning balance | \$1,100 | \$700 | \$0 | \$0 |
| Charged to the jobs during October: | | | | |
| Direct materials | \$2,900 | \$4,100 | \$1,600 | \$3,800 |
| Direct labor | \$1,300 | \$1,000 | \$700 | \$500 |
| Manufacturing overhead applied | \$900 | \$1,700 | \$600 | \$400 |
| Units completed | 200 | 0 | 100 | 0 |
| Units in process at the end of October | 0 | 300 | 0 | 250 |
| Units sold during October | 150 | 0 | 60 | 0 |

Jobs F346 and F348 were completed during October. The other two jobs had not yet been completed at the end of October. There was no finished goods inventory on October 1.

In October, overhead was underapplied by \$1,200. The company adjusts its cost of goods sold every month for the amount of the underapplied or overapplied overhead.

Required:

1. Using the direct method, what is the cost of goods sold for October?
2. What is the total value of the finished goods inventory at the end of October?
3. What is the total value of the work in process inventory at the end of October?

PROBLEM 5–20 Indirect Method of Determining Cost of Goods Sold [LO7]

Refer to the data for Kuvomi Corporation in Problem 5–19.

Required:

Using the indirect method, what is the cost of goods sold for October?

PROBLEM 5–21 Multiple Departments; Overhead Rates; Underapplied or Overapplied Overhead

[L03, L04, L05]

Hobart, Evans, and Nix is a small law firm that employs 10 partners and 12 support persons. The firm uses a job-order costing system to accumulate costs chargeable to each client, and it is organized into two departments—the Research and Documents Department and the Litigation Department. The firm uses predetermined overhead rates to charge the costs of these departments to its clients. At the beginning of the year, the firm’s management made the following estimates for the year:

excel

| | Department | |
|----------------------------------|------------------------|------------|
| | Research and Documents | Litigation |
| Research-hours | 24,000 | — |
| Direct attorney-hours | 9,000 | 18,000 |
| Legal forms and supplies | \$16,000 | \$5,000 |
| Direct attorney cost | \$450,000 | \$900,000 |
| Departmental overhead cost | \$840,000 | \$360,000 |

The predetermined overhead rate in the Research and Documents Department is based on research-hours, and the rate in the Litigation Department is based on direct attorney cost.

The costs charged to each client are made up of three elements: legal forms and supplies used, direct attorney costs incurred, and an applied amount of overhead from each department in which work is performed on the case.

Case 418-3 was initiated on February 23 and completed on May 16. During this period, the following costs and time were recorded on the case:

| | Department | |
|--------------------------------|------------------------|------------|
| | Research and Documents | Litigation |
| Research-hours | 26 | — |
| Direct attorney-hours | 7 | 114 |
| Legal forms and supplies | \$80 | \$40 |
| Direct attorney cost | \$350 | \$5,700 |

Required:

1. Compute the predetermined overhead rate used during the year in the Research and Documents Department. Compute the rate used in the Litigation Department.
2. Using the rates you computed in (1) above, compute the total overhead cost applied to Case 418-3.
3. What would be the total cost charged to Case 418-3? Show computations by department and in total for the case.
4. At the end of the year, the firm’s records revealed the following actual cost and operating data for all cases handled during the year:

| | Department | |
|----------------------------------|------------------------|------------|
| | Research and Documents | Litigation |
| Research-hours | 26,000 | — |
| Direct attorney-hours | 8,000 | 15,000 |
| Legal forms and supplies | \$19,000 | \$6,000 |
| Direct attorney cost | \$400,000 | \$750,000 |
| Departmental overhead cost | \$870,000 | \$315,000 |

Determine the amount of underapplied or overapplied overhead cost in each department for the year.

PROBLEM 5–22 Applying Overhead; Underapplied or Overapplied Overhead; Income Statement

[L04, L05, L06]

Hudson Company uses a job-order costing system. The following transactions took place last year:

- a. Raw materials were requisitioned for use in production, \$38,000 (85% direct and 15% indirect).
- b. Factory utility costs incurred, \$19,100.
- c. Depreciation was recorded on plant and equipment, \$36,000. Three-fourths of the depreciation related to factory equipment, and the remainder related to selling and administrative equipment.
- d. Advertising expense incurred, \$48,000.
- e. Costs for salaries and wages were incurred as follows:

| | |
|-------------------------------|----------|
| Direct labor | \$45,000 |
| Indirect labor | \$10,000 |
| Administrative salaries | \$30,000 |

- f. Insurance costs, \$3,000 (80% related to factory operations, and 20% related to selling and administrative activities).
- g. Miscellaneous selling and administrative expenses incurred, \$9,500.
- h. Manufacturing overhead was applied to production. The company applies overhead on the basis of \$8 per machine-hour; 7,500 machine-hours were recorded for the year.
- i. Goods that cost \$140,000 to manufacture according to their job cost sheets were transferred to the finished goods warehouse.
- j. Sales for the year totaled \$250,000. The total cost to manufacture these goods according to their job cost sheets was \$130,000.

Required:

1. Determine the underapplied or overapplied overhead for the year.
2. Prepare an income statement for the year. (*Hint:* No calculations are required to determine the cost of goods sold before any adjustment for underapplied or overapplied overhead.)

PROBLEM 5–23 Multiple Departments; Applying Overhead [L03, L04, L05]

High Desert Potteryworks makes a variety of pottery products that it sells to retailers such as Home Depot. The company uses a job-order costing system in which predetermined overhead rates are used to apply manufacturing overhead cost to jobs. The predetermined overhead rate in the Molding Department is based on machine-hours, and the rate in the Painting Department is based on direct labor cost. At the beginning of the year, the company’s management made the following estimates:

| | Department | |
|-----------------------------------|------------|-----------|
| | Molding | Painting |
| Direct labor-hours | 12,000 | 60,000 |
| Machine-hours | 70,000 | 8,000 |
| Direct materials cost | \$510,000 | \$650,000 |
| Direct labor cost | \$130,000 | \$420,000 |
| Manufacturing overhead cost | \$602,000 | \$735,000 |

The following information pertains to Job 205, which was started on August 1 and completed on August 10.

| | Department | |
|--|------------|----------|
| | Molding | Painting |
| Direct labor-hours | 30 | 85 |
| Machine-hours | 110 | 20 |
| Materials placed into production | \$470 | \$332 |
| Direct labor cost | \$290 | \$680 |

Required:

1. Compute the predetermined overhead rate used during the year in the Molding Department. Compute the rate used in the Painting Department.
2. Compute the total overhead cost applied to Job 205.
3. What would be the total cost recorded for Job 205? If the job contained 50 units, what would be the unit product cost?
4. At the end of the year, the records of High Desert Potteryworks revealed the following *actual* cost and operating data for all jobs worked on during the year:

| | Department | |
|-----------------------------------|------------|-----------|
| | Molding | Painting |
| Direct labor-hours | 10,000 | 62,000 |
| Machine-hours | 65,000 | 9,000 |
| Direct materials cost | \$430,000 | \$680,000 |
| Direct labor cost | \$108,000 | \$436,000 |
| Manufacturing overhead cost | \$570,000 | \$750,000 |

What was the amount of underapplied or overapplied overhead in each department at the end of the year?

PROBLEM 5–24 Predetermined Overhead Rate; Underapplied or Overapplied Overhead [L03, L05]

Bieler & Cie of Altdorf, Switzerland, makes furniture using the latest automated technology. The company uses a job-order costing system and applies manufacturing overhead cost to products on the basis of machine-hours. The currency in Switzerland is the Swiss franc, which is denoted by Sfr. The following estimates were used in preparing the predetermined overhead rate at the beginning of the year:

| | |
|-----------------------------------|------------|
| Machine-hours | 75,000 |
| Manufacturing overhead cost | Sfr900,000 |

During the year, a glut of furniture on the market resulted in cutting back production and a buildup of furniture in the company’s warehouse. The company recorded the following actual cost and operating data for the year:

| | |
|--|--------------|
| Machine-hours | 60,000 |
| Manufacturing overhead cost | Sfr850,000 |
| Cost of goods sold (not adjusted for underapplied or overapplied overhead) | Sfr1,400,000 |

Required:

1. Compute the company’s predetermined overhead rate.
2. Compute the underapplied or overapplied overhead.
3. Determine the cost of goods sold for the year after any adjustment for underapplied or overapplied overhead.

PROBLEM 5–25 Plantwide versus Departmental Overhead Rates; Underapplied or Overapplied Overhead [L03, L04, L05]

“Blast it!” said David Wilson, president of Teledex Company. “We’ve just lost the bid on the Koopers job by \$2,000. It seems we’re either too high to get the job or too low to make any money on half the jobs we bid.”

Teledex Company manufactures products to customers’ specifications and operates a job-order costing system. Manufacturing overhead cost is applied to jobs on the basis of direct labor cost. The following estimates were made at the beginning of the year:

| | Department | | | Total Plant |
|------------------------------|-------------|-----------|-----------|-------------|
| | Fabricating | Machining | Assembly | |
| Direct labor | \$200,000 | \$100,000 | \$300,000 | \$600,000 |
| Manufacturing overhead | \$350,000 | \$400,000 | \$90,000 | \$840,000 |

Jobs require varying amounts of work in the three departments. The Koopers job, for example, would have required manufacturing costs in the three departments as follows:

| | Department | | | Total Plant |
|------------------------------|-------------|-----------|----------|-------------|
| | Fabricating | Machining | Assembly | |
| Direct materials | \$3,000 | \$200 | \$1,400 | \$4,600 |
| Direct labor | \$2,800 | \$500 | \$6,200 | \$9,500 |
| Manufacturing overhead | ? | ? | ? | ? |

The company uses a plantwide overhead rate to apply manufacturing overhead cost to jobs.

Required:

- Assuming use of a plantwide overhead rate:
 - Compute the rate for the current year.
 - Determine the amount of manufacturing overhead cost that would have been applied to the Koopers job.
- Suppose that instead of using a plantwide overhead rate, the company had used a separate predetermined overhead rate in each department. Under these conditions:
 - Compute the rate for each department for the current year.
 - Determine the amount of manufacturing overhead cost that would have been applied to the Koopers job.
- Explain the difference between the manufacturing overhead that would have been applied to the Koopers job using the plantwide rate in question 1 (b) above and using the departmental rates in question 2 (b).
- Assume that it is customary in the industry to bid jobs at 150% of total manufacturing cost (direct materials, direct labor, and applied overhead). What was the company's bid price on the Koopers job? What would the bid price have been if departmental overhead rates had been used to apply overhead cost?
- At the end of the year, the company assembled the following *actual* cost data relating to all jobs worked on during the year.

| | Department | | | Total Plant |
|------------------------------|-------------|-----------|-----------|-------------|
| | Fabricating | Machining | Assembly | |
| Direct materials | \$190,000 | \$16,000 | \$114,000 | \$320,000 |
| Direct labor | \$210,000 | \$108,000 | \$262,000 | \$580,000 |
| Manufacturing overhead | \$360,000 | \$420,000 | \$84,000 | \$864,000 |

Compute the underapplied or overapplied overhead for the year (a) assuming that a plantwide overhead rate is used, and (b) assuming that departmental overhead rates are used.

Cases

CASE 5–25 Ethics and the Manager [L03, L04, L05]

Terri Ronsin had recently been transferred to the Home Security Systems Division of National Home Products. Shortly after taking over her new position as divisional controller, she was asked to develop the division's predetermined overhead rate for the upcoming year. The accuracy of the rate is important because it is used throughout the year and any overapplied or underapplied overhead is closed out to Cost of Goods Sold at the end of the year. National Home Products uses direct labor-hours in all of its divisions as the allocation base for manufacturing overhead.

To compute the predetermined overhead rate, Terri divided her estimate of the total manufacturing overhead for the coming year by the production manager's estimate of the total direct labor-hours for the coming year. She took her computations to the division's general manager for approval but was quite surprised when he suggested a modification in the base. Her conversation with the general manager of the Home Security Systems Division, Harry Irving, went like this:

Ronsin: Here are my calculations for next year's predetermined overhead rate. If you approve, we can enter the rate into the computer on January 1 and be up and running in the job-order costing system right away this year.

Irving: Thanks for coming up with the calculations so quickly, and they look just fine. There is, however, one slight modification I would like to see. Your estimate of the total direct labor-hours for the year is 440,000 hours. How about cutting that to about 420,000 hours?

Ronsin: I don't know if I can do that. The production manager says she will need about 440,000 direct labor-hours to meet the sales projections for the year. Besides, there are going to be over 430,000 direct labor-hours during the current year and sales are projected to be higher next year.

Irving: Teri, I know all of that. I would still like to reduce the direct labor-hours in the base to something like 420,000 hours. You probably don't know that I had an agreement with your predecessor as divisional controller to shave 5% or so off the estimated direct labor-hours every year. That way, we kept a reserve that usually resulted in a big boost to net operating income at the end of the fiscal year in December. We called it our Christmas bonus. Corporate headquarters always seemed as pleased as punch that we could pull off such a miracle at the end of the year. This system has worked well for many years, and I don't want to change it now.

Required:

1. Explain how shaving 5% off the estimated direct labor-hours in the base for the predetermined overhead rate usually results in a big boost in net operating income at the end of the fiscal year.
2. Should Terri Ronsin go along with the general manager's request to reduce the direct labor-hours in the predetermined overhead rate computation to 420,000 direct labor-hours?

CASE 5–27 Critical Thinking; Interpretation of Manufacturing Overhead Rates [L03, L04]

Kelvin Aerospace, Inc., manufactures parts such as rudder hinges for the aerospace industry. The company uses a job-order costing system with a predetermined plantwide overhead rate based on direct labor-hours. On December 16, 2008, the company's controller made a preliminary estimate of the predetermined overhead rate for the year 2009. The new rate was based on the estimated total manufacturing overhead cost of \$3,402,000 and the estimated 63,000 total direct labor-hours for 2009:

$$\begin{aligned}\text{Predetermined overhead rate} &= \frac{\$3,402,000}{63,000 \text{ hours}} \\ &= \$54 \text{ per direct labor-hour}\end{aligned}$$

This new predetermined overhead rate was communicated to top managers in a meeting on December 19. The rate did not cause any comment because it was within a few pennies of the overhead rate that had been used during 2008. One of the subjects discussed at the meeting was a proposal by the production manager to purchase an automated milling machine built by Sunghi Industries. The president of Kelvin Aerospace, Harry Arcany, agreed to meet with the sales representative from Sunghi Industries to discuss the proposal.

On the day following the meeting, Mr. Arcany met with Jasmine Chang, Sunghi Industries' sales representative. The following discussion took place:

Arcany: Wally, our production manager, asked me to meet with you because he is interested in installing an automated milling machine. Frankly, I'm skeptical. You're going to have to show me this isn't just another expensive toy for Wally's people to play with.

Chang: This is a great machine with direct bottom-line benefits. The automated milling machine has three major advantages. First, it is much faster than the manual methods you are using. It can process about twice as many parts per hour as your present milling machines. Second, it is much more flexible. There are some up-front programming costs, but once those have been incurred, almost no setup is required to run a standard operation. You just punch in the code for the standard operation, load the machine's hopper with raw material, and the machine does the rest.

Arcany: What about cost? Having twice the capacity in the milling machine area won't do us much good. That center is idle much of the time anyway.

Chang: I was getting there. The third advantage of the automated milling machine is lower cost. Wally and I looked over your present operations, and we estimated that the automated equipment would eliminate the need for about 6,000 direct labor-hours a year. What is your direct labor cost per hour?

Arcany: The wage rate in the milling area averages about \$32 per hour. Fringe benefits raise that figure to about \$41 per hour.

Chang: Don't forget your overhead.

Arcany: Next year the overhead rate will be \$54 per hour.

Chang: So including fringe benefits and overhead, the cost per direct labor-hour is about \$95.

Arcany: That's right.

Chang: Because you can save 6,000 direct labor-hours per year, the cost savings would amount to about \$570,000 a year. And our 60-month lease plan would require payments of only \$348,000 per year.

Arcany: That sounds like a no-brainer. When can you install the equipment?

Shortly after this meeting, Mr. Arcany informed the company's controller of the decision to lease the new equipment, which would be installed over the Christmas vacation period. The controller realized that this decision would require a recomputation of the predetermined overhead rate for the year 2009 because the decision would affect both the manufacturing overhead and the direct labor-hours for the year. After talking with both the production manager and the sales representative from Sunghi Industries, the controller discovered that in addition to the annual lease cost of \$348,000, the new machine would also require a skilled technician/programmer who would have to be hired at a cost of \$50,000 per year to maintain and program the equipment. Both of these costs would be included in factory overhead. There would be no other changes in total manufacturing overhead cost, which is almost entirely fixed. The controller assumed that the new machine would result in a reduction of 6,000 direct labor-hours for the year from the levels that had initially been planned.

When the revised predetermined overhead rate for the year 2009 was circulated among the company's top managers, there was considerable dismay.

Required:

1. Recompute the predetermined rate assuming that the new machine will be installed. Explain why the new predetermined overhead rate is higher (or lower) than the rate that was originally estimated for the year 2009.
2. What effect (if any) would this new rate have on the cost of jobs that do not use the new automated milling machine?
3. Why would managers be concerned about the new overhead rate?
4. After seeing the new predetermined overhead rate, the production manager admitted that he probably wouldn't be able to eliminate all of the 6,000 direct labor-hours. He had been hoping to accomplish the reduction by not replacing workers who retire or quit, but that had not been possible. As a result, the real labor savings would be only about 2,000 hours—one worker. Given this additional information, evaluate the original decision to acquire the automated milling machine from Sunghi Industries.

Toll Brothers
America's Luxury Home Builder™

RESEARCH AND APPLICATION 5-28

[L01, L02, L03]

The questions in this exercise are based on Toll Brothers, Inc., one of the largest home builders in the United States. To answer the questions, you will need to download Toll Brothers' 2004 annual report (www.tollbrothers.com/homesearch/servlet/HomeSearch?app=IRannual) and its Form 10-K for the Fiscal year ended October 31, 2004. To access the 10-K report, go to www.sec.gov/edgar/searchedgar/companysearch.html. Input CIK code 794170 and hit enter. In the gray box on the right-hand side of your computer screen define the scope of your search by inputting 10-K and then pressing enter. Select the 10-K with a filing date of January 13, 2005. You do not need to print these documents to answer the questions.

Required:

1. What is Toll Brothers' strategy for success in the marketplace? Does the company rely primarily on a customer intimacy, operational excellence, or product leadership customer value proposition? What evidence supports your conclusion?
2. What business risks does Toll Brothers face that may threaten the company's ability to satisfy stockholder expectations? What are some examples of control activities that the company could use to reduce these risks? (*Hint:* Focus on pages 10–11 of the 10-K.)
3. Would Toll Brothers be more likely to use process costing or job-order costing? Why?
4. What are some examples of Toll Brothers' direct material costs? Would you expect the bill of materials for each of Toll Brothers' homes to be the same or different? Why?
5. Describe the types of direct labor costs incurred by Toll Brothers. Would Toll Brothers use employee time tickets at their home sites under construction? Why or why not?
6. What are some examples of overhead costs that are incurred by Toll Brothers?
7. Some companies establish prices for their products by marking up their full manufacturing cost (i.e., the sum of direct materials, direct labor, and manufacturing overhead costs). For example, a company may set prices at 150% of each product's full manufacturing cost. Does Toll Brothers price its houses using this approach?
8. How does Toll Brothers assign manufacturing overhead costs to cost objects? From a financial reporting standpoint, why does the company need to assign manufacturing overhead costs to cost objects?

Appendix 5A: The Predetermined Overhead Rate and Capacity

Companies typically base their predetermined overhead rates on the estimated, or budgeted, amount of the allocation base for the upcoming period. This is the method that is used in the chapter, but it is a practice that has come under severe criticism.¹ The criticism centers on how fixed manufacturing overhead costs are handled under this traditional approach. As we shall see, the critics argue that, in general, too much fixed manufacturing overhead cost is applied to products. To focus on this issue, we will make two simplifying assumptions in this appendix: (1) we will consider only fixed manufacturing overhead; and (2) we will assume that the actual fixed manufacturing overhead at the end of the period is the same as the estimated, or budgeted, fixed manufacturing overhead at the beginning of the period. Neither of these assumptions is entirely realistic. Ordinarily, some manufacturing overhead is variable and even fixed costs can differ from what was expected at the beginning of the period, but making those assumptions enables us to focus on the primary issues the critics raise.

An example will help us to understand the controversy. Prahad Corporation manufactures music CDs for local recording studios. The company's CD duplicating machine is capable of producing a new CD every 10 seconds from a master CD. The company leases the CD duplicating machine for \$180,000 per year, and this is the company's only manufacturing overhead cost. With allowances for setups and maintenance, the machine is theoretically capable of producing up to 900,000 CDs per year. However, due to weak retail sales of CDs, the company's commercial customers are unlikely to order more than 600,000 CDs next year. The company uses machine time as the allocation base for applying manufacturing overhead to CDs. These data are summarized below:

| Prahad Corporation Data | |
|---|----------------------|
| Total manufacturing overhead cost | \$180,000 per year |
| Allocation base—machine time per CD | 10 seconds per CD |
| Capacity | 900,000 CDs per year |
| Budgeted output for next year | 600,000 CDs |

If Prahad follows common practice and computes its predetermined overhead rate using estimated or budgeted figures, then its predetermined overhead rate for next year would be \$0.03 per second of machine time computed as follows:

$$\begin{aligned}
 \text{Predetermined overhead rate} &= \frac{\text{Estimated total manufacturing overhead cost}}{\text{Estimated total amount of the allocation base}} \\
 &= \frac{\$180,000}{600,000 \text{ CDs} \times 10 \text{ seconds per CD}} \\
 &= \$0.03 \text{ per second}
 \end{aligned}$$

Because each CD requires 10 seconds of machine time, each CD will be charged for \$0.30 of overhead cost.

Critics charge that there are two problems with this procedure. First, if predetermined overhead rates are based on budgeted activity and overhead includes significant

LEARNING OBJECTIVE 8

Understand the implications of basing the predetermined overhead rate on activity at capacity rather than on estimated activity for the period.

¹ Institute of Management Accountants, *Measuring the Cost of Capacity: Statements on Management Accounting, Number 4Y*, Montvale, NJ; Thomas Klammer, ed., *Capacity Measurement and Improvement: A Managers Guide to Evaluating and Optimizing Capacity Productivity* (Chicago: CAM-I, Irwin Professional Publishing); and C. J. McNair, "The Hidden Costs of Capacity," *The Journal of Cost Management* (Spring 1994), pp. 12–24.

fixed costs, then the unit product costs will fluctuate depending on the budgeted level of activity for the period. For example, if the budgeted output for the year was only 300,000 CDs, the predetermined overhead rate would be \$0.06 per second of machine time or \$0.60 per CD rather than \$0.30 per CD. In general, if budgeted output falls, the overhead cost per unit will increase; it will appear that the CDs cost more to make. Managers may then be tempted to increase prices at the worst possible time—just as demand is falling.

Second, critics charge that under the traditional approach, products are charged for resources that they don't use. When the fixed costs of capacity are spread over estimated activity, the units that are produced must shoulder the costs of unused capacity. That is why the applied overhead cost per unit increases as the level of activity falls. The critics argue that products should be charged only for the capacity that they use; they should not be charged for the capacity they don't use. This can be accomplished by basing the predetermined overhead rate on capacity as follows:

$$\begin{aligned} \text{Predetermined overhead rate based on capacity} &= \frac{\text{Estimated total manufacturing overhead cost at capacity}}{\text{Estimated total amount of the allocation base at capacity}} \\ &= \frac{\$180,000}{900,000 \text{ CDs} \times 10 \text{ seconds per CD}} \\ &= \$0.02 \text{ per second} \end{aligned}$$

It is important to realize that the numerator in this predetermined overhead rate is the estimated total manufacturing overhead cost *at capacity*. In general, the numerator in a predetermined overhead rate is the estimated total manufacturing overhead cost for the level of activity in the denominator. Ordinarily, the estimated total manufacturing overhead cost *at capacity* will be larger than the estimated total manufacturing overhead cost *at the estimated level of activity*. The estimated level of activity in this case was 600,000 CDs (or 6 million seconds of machine time), whereas capacity is 900,000 CDs (or 9 million seconds of machine time). The estimated total manufacturing overhead cost at 600,000 CDs was \$180,000. This also happens to be the estimated total manufacturing overhead cost at 900,000 CDs, but that only happens because we have assumed that the manufacturing overhead is entirely fixed. If manufacturing overhead contained any variable element, the total manufacturing overhead would be larger at 900,000 CDs than at 600,000 CDs and, in that case, the predetermined overhead rate should reflect that fact.

At any rate, returning to the computation of the predetermined overhead rate based on capacity, the predetermined overhead rate is \$0.02 per second and so the overhead cost applied to each CD would be \$0.20. This charge is constant and would not be affected by the level of activity during a period. If output falls, the charge would still be \$0.20 per CD.

This method will almost certainly result in underapplied overhead. If actual output at Prahad Corporation is 600,000 CDs, then only \$120,000 of overhead cost would be applied to products (\$0.20 per CD \times 600,000 CDs). Because the actual overhead cost is \$180,000, overhead would be underapplied by \$60,000. Because we assume here that manufacturing overhead is entirely fixed and that actual manufacturing overhead equals the manufacturing overhead that was estimated at the beginning of the year, all of this underapplied overhead represents the cost of unused capacity. In other words, if there had been no unused capacity, there would have been no underapplied overhead. The critics suggest that the underapplied overhead that results from unused capacity should be separately disclosed on the income statement as the Cost of Unused Capacity—a period expense. Disclosing this cost as a lump sum on the income statement, rather than burying it in Cost of Goods Sold or ending inventories,

makes it much more visible to managers. An example of such an income statement follows:

| Prahad Corporation Income Statement For the Year Ended December 31 | | |
|---|---------------|---------------------------|
| Sales ¹ | | \$1,200,000 |
| Cost of goods sold ² | | <u>1,080,000</u> |
| Gross margin | | 120,000 |
| Other expenses: | | |
| Cost of unused capacity ³ | \$ 60,000 | |
| Selling and administrative expenses ⁴ | <u>90,000</u> | <u>150,000</u> |
| Net operating income | | <u><u>(\$ 30,000)</u></u> |

¹Assume sales of 600,000 CDs at \$2 per CD.
²Assume the unit product cost of the CDs is \$1.80, including \$0.20 for manufacturing overhead.
³See the calculations in the text on the prior page. Underapplied overhead is \$60,000.
⁴Assume selling and administrative expenses total \$90,000.

Note that the cost of unused capacity is prominently displayed on this income statement.

Official pronouncements do not prohibit basing predetermined overhead rates on capacity for external reports.² Nevertheless, basing the predetermined overhead rate on estimated or budgeted activity is a long-established practice in industry, and some managers and accountants may object to the large amounts of underapplied overhead that would often result from using capacity to determine predetermined overhead rates. And some may insist that the underapplied overhead be allocated among Cost of Goods Sold and ending inventories—which would defeat the purpose of basing the predetermined overhead rate on capacity.

IN BUSINESS

RESOURCE CONSUMPTION ACCOUNTING

Clopay Plastic Products Company, headquartered in Cincinnati, Ohio, recently implemented a pilot application of a German cost accounting system known in the United States as Resource Consumption Accounting (RCA). One of the benefits of RCA is that it uses the estimated total amount of the allocation base at capacity to calculate overhead rates and to assign costs to cost objects. This makes idle capacity visible to managers who can react to this information by either growing sales or taking steps to reduce the amount and cost of available capacity. It also ensures that products are only charged for the resources used to produce them.

Clopay's old cost system spread all of the company's manufacturing overhead costs over the units produced. So, if Clopay's senior managers decided to discontinue what appeared to be an unprofitable product, the unit costs of the remaining products would increase as the fixed overhead costs of the newly idled capacity were spread over the remaining products.

Appendix 5A Exercises and Problems

**EXERCISE 5A-1 Overhead Rate Based on Capacity [LO8]**

Wixis Cabinets makes custom wooden cabinets for high-end stereo systems from specialty woods. The company uses a job-order costing system. The capacity of the plant is determined by the capacity of its constraint, which is time on the automated bandsaw that makes finely beveled cuts in wood according to the preprogrammed specifications of each cabinet. The bandsaw can operate up to 180 hours per month. The estimated total manufacturing overhead at capacity is \$14,760 per month. The company bases its predetermined overhead rate on capacity, so its predetermined overhead rate is \$82 per hour of bandsaw use.

The results of a recent month's operations appear below:

| | |
|--|----------|
| Sales | \$43,740 |
| Beginning inventories | \$0 |
| Ending inventories | \$0 |
| Direct materials | \$5,350 |
| Direct labor (all variable) | \$8,860 |
| Manufacturing overhead incurred | \$14,220 |
| Selling and administrative expense | \$8,180 |
| Actual hours of bandsaw use | 150 |

Required:

1. Prepare an income statement following the example in Appendix 5A in which any underapplied overhead is directly recorded on the income statement as an expense.
2. Why is overhead ordinarily underapplied when the predetermined overhead rate is based on capacity?

**EXERCISE 5A-2 Overhead Rates and Capacity Issues [LO3, LO4, LO5, LO8]**

Security Pension Services helps clients to set up and administer pension plans that are in compliance with tax laws and regulatory requirements. The firm uses a job-order costing system in which overhead is applied to clients' accounts on the basis of professional staff hours charged to the accounts. Data concerning two recent years appear below:

| | 2008 | 2009 |
|--|-----------|-----------|
| Estimated professional staff hours | | |
| to be charged to clients' accounts | 4,600 | 4,500 |
| Estimated overhead cost | \$310,500 | \$310,500 |
| Professional staff hours available | 6,000 | 6,000 |

"Professional staff hours available" is a measure of the capacity of the firm. Any hours available that are not charged to clients' accounts represent unused capacity. All of the firm's overhead is fixed.

Required:

1. Marta Brinksi is an established client whose pension plan was set up many years ago. In both 2008 and 2009, only 2.5 hours of professional staff time were charged to Ms. Brinksi's account. If the company bases its predetermined overhead rate on the estimated overhead cost and the estimated professional staff hours to be charged to clients, how much overhead cost would have been applied to Ms. Brinksi's account in 2008? In 2009?
2. Suppose that the company bases its predetermined overhead rate on the estimated overhead cost and the estimated professional staff hours to be charged to clients as in (1) above. Also suppose that the actual professional staff hours charged to clients' accounts and the actual overhead costs turn out to be exactly as estimated in both years. By how much would the overhead be underapplied or overapplied in 2008? In 2009?
3. Refer back to the data concerning Ms. Brinksi in (1) above. If the company bases its predetermined overhead rate on the *professional staff hours available*, how much overhead cost would have been applied to Ms. Brinksi's account in 2008? In 2009?

- Suppose that the company bases its predetermined overhead rate on the professional staff hours available as in (3) above. Also suppose that the actual professional staff hours charged to clients' accounts and the actual overhead costs turn out to be exactly as estimated in both years. By how much would the overhead be underapplied or overapplied in 2008? In 2009?

PROBLEM 5A-3 Predetermined Overhead Rate and Capacity [LO3, LO4, LO5, LO8]

Platinum Tracks, Inc., is a small audio recording studio located in Los Angeles. The company handles work for advertising agencies—primarily for radio ads—and has a few singers and bands as clients. Platinum Tracks handles all aspects of recording from editing to making a digital master from which CDs can be copied. The competition in the audio recording industry in Los Angeles has always been tough, but it has been getting even tougher over the last several years. The studio has been losing customers to newer studios that are equipped with more up-to-date equipment and that are able to offer very attractive prices and excellent service. Summary data concerning the last two years of operations follow:

| | 2008 | 2009 |
|---|-----------|-----------|
| Estimated hours of studio service | 1,000 | 800 |
| Estimated studio overhead cost | \$160,000 | \$160,000 |
| Actual hours of studio service provided | 750 | 500 |
| Actual studio overhead cost incurred | \$160,000 | \$160,000 |
| Hours of studio service at capacity | 1,600 | 1,600 |

The company applies studio overhead to recording jobs on the basis of the hours of studio service provided. For example, 40 hours of studio time were required to record, edit, and master the *Verde Baja* music CD for a local Latino band. All of the studio overhead is fixed, and the actual overhead cost incurred was exactly as estimated at the beginning of the year in both 2008 and 2009.

Required:

- Platinum Tracks computes its predetermined overhead rate at the beginning of each year based on the estimated studio overhead and the estimated hours of studio service for the year. How much overhead would have been applied to the *Verde Baja* job if it had been done in 2008? In 2009? By how much would overhead have been underapplied or overapplied in 2008? In 2009?
- The president of Platinum Tracks has heard that some companies in the industry have changed to a system of computing the predetermined overhead rate at the beginning of each year based on the hours of studio service that could be provided at capacity. He would like to know what effect this method would have on job costs. How much overhead would have been applied using this method to the *Verde Baja* job if it had been done in 2008? In 2009? By how much would overhead have been underapplied or overapplied in 2008 using this method? In 2009?
- How would you interpret the underapplied or overapplied overhead that results from using studio hours at capacity to compute the predetermined overhead rate?
- What fundamental business problem is Platinum Tracks facing? Which method of computing the predetermined overhead rate is likely to be more helpful in facing this problem? Explain.

CASE 5A-4 Ethics; Predetermined Overhead Rate and Capacity [LO4, LO5, LO8]

Pat Miranda, the new controller of Vault Hard Drives, Inc., has just returned from a seminar on the choice of the activity level in the predetermined overhead rate. Even though the subject did not sound exciting at first, she found that there were some important ideas presented that should get a hearing at her company. After returning from the seminar, she arranged a meeting with the production manager, J. Stevens, and the assistant production manager, Marvin Washington.

Pat: I ran across an idea that I wanted to check out with both of you. It's about the way we compute predetermined overhead rates.

J.: We're all ears.

Pat: We compute the predetermined overhead rate by dividing the estimated total factory overhead for the coming year by the estimated total units produced for the coming year.

Marvin: We've been doing that as long as I've been with the company.

J.: And it has been done that way at every other company I've worked at, except at most places they divide by direct labor-hours.

Pat: We use units because it is simpler and we basically make one product with minor variations. But, there's another way to do it. Instead of basing the overhead rate on the estimated total units produced for the coming year, we could base it on the total units produced at capacity.

Marvin: Oh, the Marketing Department will love that. It will drop the costs on all of our products. They'll go wild over there cutting prices.

Pat: That is a worry, but I wanted to talk to both of you first before going over to Marketing.

J.: Aren't you always going to have a lot of underapplied overhead?

Pat: That's correct, but let me show you how we would handle it. Here's an example based on our budget for next year.

| | |
|---|---------------|
| Budgeted (estimated) production | 160,000 units |
| Budgeted sales | 160,000 units |
| Capacity | 200,000 units |
| Selling price | \$60 per unit |
| Variable manufacturing cost | \$15 per unit |
| Total manufacturing overhead cost (all fixed) | \$4,000,000 |
| Administrative and selling expenses (all fixed) | \$2,700,000 |
| Beginning inventories | \$0 |

Traditional Approach to Computation of the Predetermined Overhead Rate

$$\frac{\text{Estimated total manufacturing overhead cost, \$4,000,000}}{\text{Estimated total units produced, 160,000}} = \$25 \text{ per unit}$$

| Budgeted Income Statement | |
|--|-------------|
| Revenue (160,000 units × \$60 per unit) | \$9,600,000 |
| Cost of goods sold: | |
| Variable manufacturing (160,000 units × \$15 per unit) | \$2,400,000 |
| Manufacturing overhead applied | |
| (160,000 units × \$25 per unit) | 4,000,000 |
| | 6,400,000 |
| Gross margin | 3,200,000 |
| Selling and administrative expenses | 2,700,000 |
| Net operating income | \$ 500,000 |

*New Approach to Computation of the Predetermined Overhead Rate
Using Capacity in the Denominator*

$$\frac{\text{Estimated total manufacturing overhead cost at capacity, \$4,000,000}}{\text{Total units at capacity, 200,000}} = \$20 \text{ per unit}$$

| Budgeted Income Statement | |
|--|-------------|
| Revenue (160,000 units × \$60 per unit) | \$9,600,000 |
| Cost of goods sold: | |
| Variable manufacturing (160,000 units × \$15 per unit) | \$2,400,000 |
| Manufacturing overhead applied | |
| (160,000 units × \$20 per unit) | 3,200,000 |
| | 5,600,000 |
| Gross margin | 4,000,000 |
| Cost of unused capacity [(200,000 units – 160,000 units) × \$20 per unit] | 800,000 |
| Selling and administrative expenses | 2,700,000 |
| Net operating income | \$ 500,000 |

J.: Whoa!! I don't think I like the looks of that "Cost of unused capacity." If that thing shows up on the income statement, someone from headquarters is likely to come down here looking for some people to lay off.

Marvin: I'm worried about something else too. What happens when sales are not up to expectations? Can we pull the "hat trick"?

Pat: I'm sorry, I don't understand.

J.: Marvin's talking about something that happens fairly regularly. When sales are down and profits look like they are going to be lower than the president told the owners they were going to be, the president comes down here and asks us to deliver some more profits.

Marvin: And we pull them out of our hat.

J.: Yeah, we just increase production until we get the profits we want.

Pat: I still don't understand. You mean you increase sales?

J.: Nope, we increase production. We're the production managers, not the sales managers.

Pat: I get it. Because you have produced more, the sales force has more units it can sell.

J.: Nope, the marketing people don't do a thing. We just build inventories and that does the trick.

Required:

In all of the questions below, assume that the predetermined overhead rate under the traditional method is \$25 per unit, and under the new method it is \$20 per unit. Also assume that under the traditional method any underapplied or overapplied overhead is taken directly to the income statement as an adjustment to Cost of Goods Sold.

1. Suppose actual production is 160,000 units. Compute the net operating incomes that would be realized under the traditional and new methods if actual sales are 150,000 units and everything else turns out as expected.
2. How many units would have to be produced under each of the methods in order to realize the budgeted net operating income of \$500,000 if actual sales are 150,000 units and everything else turns out as expected?
3. What effect does the new method based on capacity have on the volatility of net operating income?
4. Will the "hat trick" be easier or harder to perform if the new method based on capacity is used?
5. Do you think the "hat trick" is ethical?

Chapter

6

Learning Objectives

After studying Chapter 6, you should be able to:

- L01** Explain how variable costing differs from absorption costing and compute unit product costs under each method.
- L02** Prepare income statements using both variable and absorption costing.
- L03** Reconcile variable costing and absorption costing net operating incomes and explain why the two amounts differ.
- L04** Understand the advantages and disadvantages of both variable and absorption costing.

Variable Costing: A Tool for Management

IBM's \$2.5 Billion Investment in Technology

When it comes to state-of-the-art in automation, IBM's \$2.5 billion semiconductor manufacturing facility in East Fishkill, New York, is tough to beat. The plant uses wireless networks, 600 miles of cable, and more than 420 servers to equip itself with what IBM claims is more computing power than NASA uses to launch a space shuttle.

Each batch of 25 wafers (one wafer can be processed into 1,000 computer chips) travels through the East Fishkill plant's manufacturing process without ever being touched by human hands. A computer system "looks at orders and schedules production runs . . . adjusts schedules to allow for planned maintenance and . . . feeds vast reams of production data into enterprise-wide management and financial-reporting systems." The plant can literally

run itself as was the case a few years ago when a snowstorm hit and everyone went home while the automated system continued to manufacture computer chips until it ran out of work.

In a manufacturing environment such as this, labor costs are insignificant and fixed overhead costs are huge. There is a strong temptation to build inventories and increase profits without increasing sales. How can this be done you ask? It would seem logical that producing more units would have no impact on profits unless the units were sold, right? Wrong! As we will discover in this chapter, absorption costing—the most widely used method of determining product costs—can artificially increase profits by increasing the quantity of units produced. ■

BUSINESS FOCUS

Two general approaches are used in manufacturing companies for costing products for the purposes of valuing inventories and cost of goods sold. One approach, called *absorption costing*, was discussed in Chapter 5. Absorption costing is generally used for external financial reports. The other approach, called *variable costing*, is preferred by some managers for internal decision making and must be used when an income statement is prepared in the contribution format. Ordinarily, absorption costing and variable costing produce different figures for net operating income, and the difference can be quite large. In addition to showing how these two methods differ, we will consider the arguments for and against each costing method and we will show how management decisions can be affected by the costing method chosen.

Overview of Absorption and Variable Costing

As discussed in Chapters 3 and 4, the contribution format income statement and cost-volume-profit (CVP) analysis are valuable management tools. Both of these tools emphasize cost behavior and require that managers carefully distinguish between variable and fixed costs. Absorption costing, which was discussed in Chapters 2 and 5, assigns both variable and fixed manufacturing costs to products—mingling them in a way that makes it difficult for managers to distinguish between them. In contrast, variable costing focuses on *cost behavior*—clearly separating fixed from variable costs. One of the strengths of variable costing is that it harmonizes with both the contribution approach and the CVP concepts discussed in the preceding chapter.

LEARNING OBJECTIVE 1

Explain how variable costing differs from absorption costing and compute unit product costs under each method.

Absorption Costing

As discussed in Chapter 5, **absorption costing** treats *all* manufacturing costs as product costs, regardless of whether they are variable or fixed. The cost of a unit of product under the absorption costing method consists of direct materials, direct labor, and *both* variable and fixed manufacturing overhead. Thus, absorption costing allocates a portion of fixed manufacturing overhead cost to each unit of product, along with the variable manufacturing costs. Because absorption costing includes all manufacturing costs in product costs, it is frequently referred to as the *full cost* method.

Variable Costing

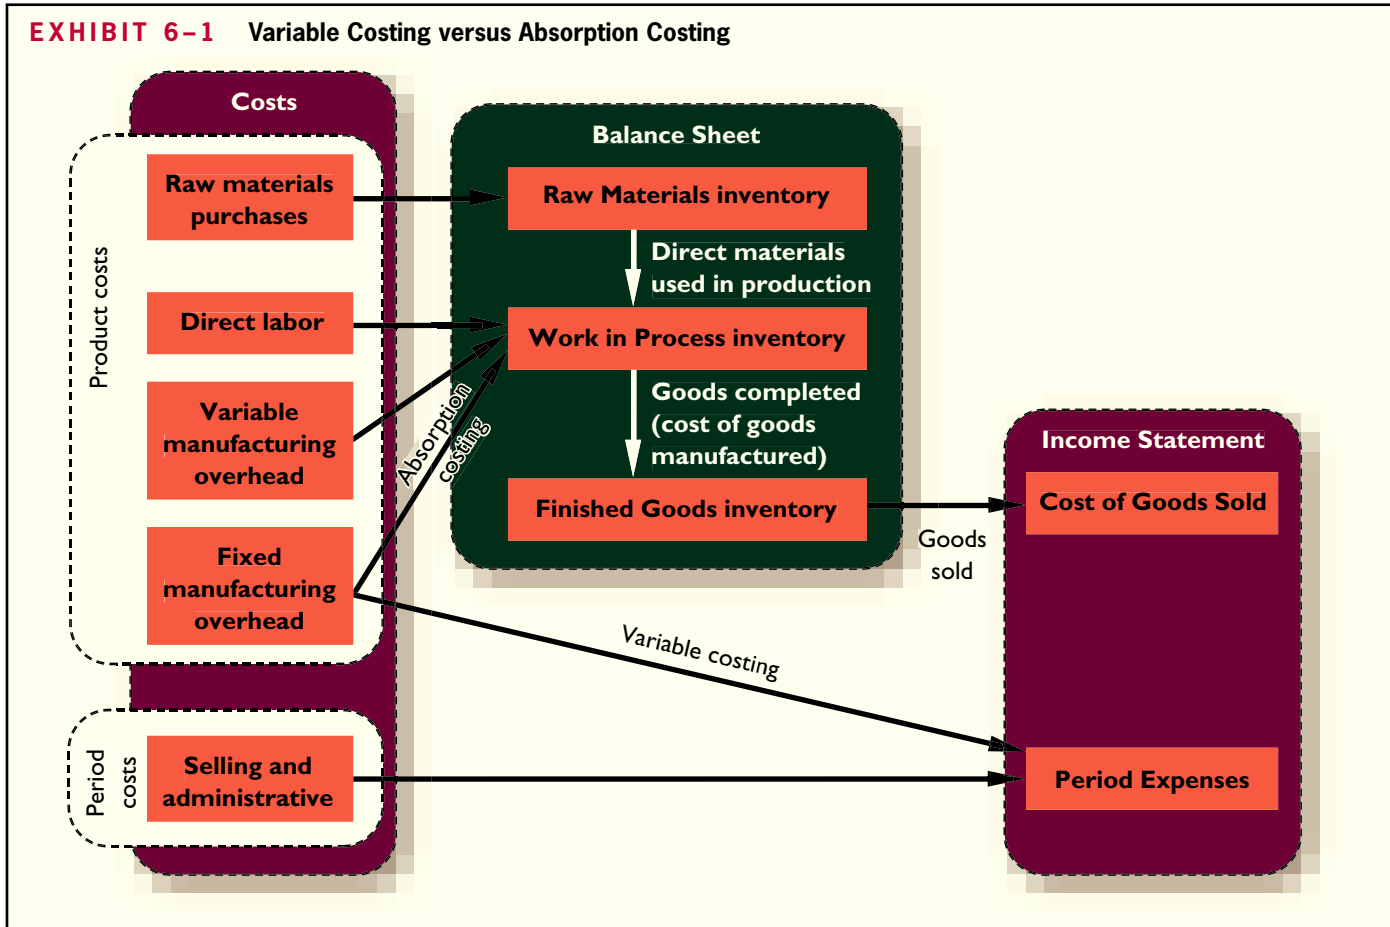

Under **variable costing**, only those manufacturing costs that vary with output are treated as product costs. This would usually include direct materials, direct labor, and the variable portion of manufacturing overhead. Fixed manufacturing overhead is not treated as a product cost under this method. Rather, fixed manufacturing overhead is treated as a period cost and, like selling and administrative expenses, it is expensed in its entirety each period. Consequently, the cost of a unit of product in inventory or in cost of goods sold under the variable costing method does not contain any fixed manufacturing overhead cost. Variable costing is sometimes referred to as *direct costing* or *marginal costing*.

Selling and Administrative Expenses

Selling and administrative expenses are never treated as product costs, regardless of the costing method. Thus, under absorption and variable costing, variable and fixed selling and administrative expenses are always treated as period costs and are expensed as incurred.

Summary of Differences The essential difference between variable costing and absorption costing, as illustrated in Exhibit 6–1, is how each method accounts for fixed manufacturing overhead costs—all other costs are treated the same under the two methods. In absorption costing, fixed manufacturing overhead costs are included as part of the

EXHIBIT 6-1 Variable Costing versus Absorption Costing

costs of work in process inventories. When units are completed, these costs are transferred to finished goods and only when the units are sold do these costs flow through to the income statement as part of cost of goods sold. In variable costing, fixed manufacturing overhead costs are considered to be period costs—just like selling and administrative costs—and are taken immediately to the income statement as period expenses.

To illustrate the difference between variable costing and absorption costing, consider Weber Light Aircraft, a company that produces light recreational aircraft. Data concerning the company’s operations appear below:

| | Per Aircraft | Per Month | | |
|--|--------------|----------------|-----------------|--------------|
| Selling price | \$100,000 | | | |
| Direct materials | \$19,000 | | | |
| Direct labor | \$5,000 | | | |
| Variable manufacturing overhead | \$1,000 | | | |
| Fixed manufacturing overhead | | | | \$70,000 |
| Variable selling and administrative expenses | \$10,000 | | | |
| Fixed selling and administrative expenses | | | | \$20,000 |
| | | January | February | March |
| Beginning inventory | 0 | 0 | 0 | 1 |
| Production | 1 | 1 | 2 | 2 |
| Sales | 1 | 1 | 1 | 3 |
| Ending inventory | 0 | 0 | 1 | 0 |

We will first construct the company’s absorption costing income statements for January, February, and March. Then we will show how the company’s net operating income would be determined for the same months using variable costing.

Absorption Costing Income Statement

To prepare the company’s absorption costing income statements for January, February, and March, we need to determine the company’s unit product costs, cost of goods sold, and selling and administrative expenses for each month.

The company’s absorption costing unit product costs can be computed as follows¹:

LEARNING OBJECTIVE 2
Prepare income statements using both variable and absorption costing.

| Absorption Costing Unit Product Cost | | | |
|---|-----------------|-----------------|-----------------|
| | January | February | March |
| Direct materials | \$19,000 | \$19,000 | \$19,000 |
| Direct labor | 5,000 | 5,000 | 5,000 |
| Variable manufacturing overhead | 1,000 | 1,000 | 1,000 |
| Fixed manufacturing overhead (\$70,000 ÷ 1 unit produced in January; \$70,000 ÷ 2 units produced in February; \$70,000 ÷ 2 units produced in March) | 70,000 | 35,000 | 35,000 |
| Absorption costing unit product cost | <u>\$95,000</u> | <u>\$60,000</u> | <u>\$60,000</u> |

Given these unit product costs, the cost of goods sold under absorption costing in each month would be determined as follows:

| Absorption Costing Cost of Goods Sold | | | |
|--|----------|----------|-----------|
| | January | February | March |
| Absorption costing unit product cost (a) | \$95,000 | \$60,000 | \$60,000 |
| Units sold (b) | 1 | 1 | 3* |
| Absorption costing cost of goods sold (a) × (b) | \$95,000 | \$60,000 | \$180,000 |

*One of the three units sold in March was produced in February. Because February and March both have unit product costs of \$60,000, the March unit product cost of \$60,000 can be multiplied by 3.

And the company’s selling and administrative expenses would be as follows:

| Selling and Administrative Expenses | | | |
|--|-----------------|-----------------|-----------------|
| | January | February | March |
| Variable selling and administrative expense (@ \$10,000 per unit sold) | \$10,000 | \$10,000 | \$30,000 |
| Fixed selling and administrative expense | <u>20,000</u> | <u>20,000</u> | <u>20,000</u> |
| Total selling and administrative expense | <u>\$30,000</u> | <u>\$30,000</u> | <u>\$50,000</u> |

Putting all of this together, the absorption costing income statements would appear as shown in Exhibit 6–2.

¹ For simplicity, we assume in this section that an actual costing system is used in which actual costs are spread over the units produced during the period. If a predetermined overhead rate were used, the analysis would be similar, but more complex.

EXHIBIT 6-2
Absorption Costing Income Statements

| Absorption Costing Income Statements | | | |
|---|--------------------|------------------|------------------|
| | January | February | March |
| Sales | \$100,000 | \$100,000 | \$300,000 |
| Cost of goods sold | 95,000 | 60,000 | 180,000 |
| Gross margin | 5,000 | 40,000 | 120,000 |
| Selling and administrative expenses | 30,000 | 30,000 | 50,000 |
| Net operating income (loss) | <u>\$ (25,000)</u> | <u>\$ 10,000</u> | <u>\$ 70,000</u> |

Note that even though sales were exactly the same in January and February and the cost structure did not change, net operating income was \$35,000 higher in February than in January under absorption costing.

Variable Costing Contribution Format Income Statement

As discussed earlier, the only reason that absorption costing income differs from variable costing income is that the methods account for fixed manufacturing overhead differently. Under absorption costing, fixed manufacturing overhead is included in product costs. In variable costing, fixed manufacturing overhead is not included in product costs and instead is treated as a period expense, just like selling and administrative expenses.

Under variable costing, product costs consist solely of variable production costs. At Weber Light Aircraft, the variable production cost per unit is \$25,000, determined as follows:

| Variable Costing Unit Product Cost | |
|--|-----------------|
| Direct materials | \$19,000 |
| Direct labor | 5,000 |
| Variable manufacturing overhead | 1,000 |
| Variable costing unit product cost | <u>\$25,000</u> |

Because the variable production cost is \$25,000 per aircraft, the variable costing cost of goods sold can be easily computed as follows:

| Variable Costing Cost of Goods Sold | | | |
|---|----------|----------|----------|
| | January | February | March |
| Variable production cost (a) | \$25,000 | \$25,000 | \$25,000 |
| Units sold (b) | 1 | 1 | 3 |
| Variable cost of goods sold (a) × (b) | \$30,000 | \$25,000 | \$75,000 |

The selling and administrative expenses will be the same as the amounts reported using absorption costing. The only difference will be how those costs appear on the income statement.

The variable costing income statements for January, February, and March appear in Exhibit 6-3. The contribution format has been used in these income statements.

| Variable Costing Contribution Format Income Statements | | | |
|--|--------------------|--------------------|------------------|
| | January | February | March |
| Sales | \$100,000 | \$100,000 | \$300,000 |
| Variable expenses: | | | |
| Variable cost of goods sold | 25,000 | 25,000 | 75,000 |
| Variable selling and administrative expense | 10,000 | 10,000 | 30,000 |
| Total variable expenses | 35,000 | 35,000 | 105,000 |
| Contribution margin | 65,000 | 65,000 | 195,000 |
| Fixed expenses: | | | |
| Fixed manufacturing overhead | 70,000 | 70,000 | 70,000 |
| Fixed selling and administrative expense ... | 20,000 | 20,000 | 20,000 |
| Total fixed expenses | 90,000 | 90,000 | 90,000 |
| Net operating income (loss) | <u>\$ (25,000)</u> | <u>\$ (25,000)</u> | <u>\$105,000</u> |

EXHIBIT 6-3
Variable Costing Income
Statements

Contrasting the absorption costing and variable costing income statements in Exhibits 6-2 and 6-3, note that net operating income is the same in January under absorption costing and variable costing, but differs in the other two months. We will discuss this in some depth shortly. Also note that the format of the variable costing income statement differs from the absorption costing income statement. An absorption costing income statement categorizes costs by function—manufacturing versus selling and administrative. All of the manufacturing costs flow through the absorption costing cost of goods sold and all of the selling and administrative costs are listed separately as period expenses. In contrast, in the contribution approach above, costs are categorized according to how they behave. All of the variable expenses are listed together and all of the fixed expenses are listed together. The variable expenses category includes manufacturing costs (i.e., variable cost of goods sold) as well as selling and administrative expenses. The fixed expenses category also includes both manufacturing costs and selling and administrative expenses.

Reconciliation of Variable Costing with Absorption Costing Income

As noted earlier, variable costing and absorption costing net operating incomes may not be the same. In the case of Weber Light Aircraft, the net operating incomes are the same in January, but differ in the other two months. These differences occur because under absorption costing some fixed manufacturing overhead is capitalized in inventories (i.e., included in product costs) rather than currently expensed on the income statement. If inventories increase during a period, under absorption costing some of the fixed manufacturing overhead of the current period will be *deferred* in ending inventories. For example, in February two aircraft were produced and each carried with it \$35,000 ($\$70,000 \div 2$ aircraft produced) in fixed manufacturing overhead. Because only one aircraft was sold, \$35,000 of this fixed manufacturing overhead was on the absorption costing income statement as part of cost of goods sold, but \$35,000 would have been on the balance sheet as part of finished goods inventories. In contrast, under variable costing *all* of the \$70,000 of fixed manufacturing overhead appeared on the income statement as a period expense. Consequently, net operating income was higher under absorption costing than under variable costing by \$35,000 in February. This was reversed in March when two units were produced, but three were sold. In March, under absorption costing \$105,000 of fixed manufacturing overhead was included in cost of goods sold (\$35,000 for the unit produced in February and sold in

LEARNING OBJECTIVE 3

Reconcile variable costing and absorption costing net operating incomes and explain why the two amounts differ.

March plus \$35,000 for each of the two units produced and sold in March), but only \$70,000 was recognized as a period expense under variable costing. Hence, the net operating income in March was \$35,000 lower under absorption costing than under variable costing.

In general, when the units produced exceed unit sales and hence inventories increase, net operating income is higher under absorption costing than under variable costing. This occurs because some of the fixed manufacturing overhead of the period is *deferred* in inventories under absorption costing. In contrast, when unit sales exceed the units produced and hence inventories decrease, net operating income is lower under absorption costing than under variable costing. This occurs because some of the fixed manufacturing overhead of previous periods is *released* from inventories under absorption costing. When the units produced and unit sales are equal, no change in inventories occurs and absorption costing and variable costing net operating incomes are the same.²

Variable costing and absorption costing net operating incomes can be reconciled by determining how much fixed manufacturing overhead was deferred in, or released from, inventories during the period.

| Fixed Manufacturing Overhead Deferred in, or Released from, Inventories under Absorption Costing | | | |
|---|----------------|-----------------|-------------------|
| | January | February | March |
| Fixed manufacturing overhead in beginning inventories | \$0 | \$ 0 | \$ 35,000 |
| Fixed manufacturing overhead in ending inventories | <u>0</u> | <u>35,000</u> | <u>0</u> |
| Fixed manufacturing overhead deferred in (released from) inventories | <u>\$0</u> | <u>\$35,000</u> | <u>\$(35,000)</u> |

The reconciliation would then be reported in Exhibit 6–4:

| EXHIBIT 6–4 Reconciliation of Variable Costing and Absorption Costing Net Operating Incomes | Reconciliation of Variable Costing and Absorption Costing Net Operating Incomes | | | |
|--|--|------------------|------------------|--------------|
| | | January | February | March |
| Variable costing net operating income | \$(25,000) | \$(25,000) | \$105,000 | |
| Add (deduct) fixed manufacturing overhead deferred in (released from) inventory under absorption costing | <u>0</u> | <u>35,000</u> | <u>(35,000)</u> | |
| Absorption costing net operating income | <u>\$(25,000)</u> | <u>\$ 10,000</u> | <u>\$ 70,000</u> | |

Again note that the difference between variable costing net operating income and absorption costing net operating income is entirely due to the amount of fixed manufacturing overhead that is deferred in, or released from, inventories during the period under absorption costing. Changes in inventories affect absorption costing net operating income—they do not affect variable costing net operating income, providing that the cost structure is stable.

The reasons for differences between variable and absorption costing net operating incomes are summarized in Exhibit 6–5. When the units produced equal the units sold, as in January for Weber Light Aircraft, absorption costing net operating income will equal variable costing net operating income. This occurs because when production equals sales, all of the fixed manufacturing overhead incurred in the current period flows through to

² These general statements about the relation between variable costing and absorption costing net operating income assume LIFO is used to value inventories. Even when LIFO is not used, the general statements tend to be correct.

| Relation between Production and Sales for the Period | Effect on Inventories  | Relation between Absorption and Variable Costing Net Operating Incomes |
|--|---|--|
| Units produced = Units sold | No change in inventories  | Absorption costing net operating income = Variable costing net operating income |
| Units produced > Units sold | Inventories increase  | Absorption costing net operating income > Variable costing net operating income* |
| Units produced < Units sold | Inventories decrease  | Absorption costing net operating income < Variable costing net operating income† |
| <p>*Net operating income is higher under absorption costing because fixed manufacturing overhead cost is <i>deferred</i> in inventory under absorption costing as inventories increase. †Net operating income is lower under absorption costing because fixed manufacturing overhead cost is <i>released</i> from inventory under absorption costing as inventories decrease.</p> | | |

EXHIBIT 6-5
Comparative Income Effects—Absorption and Variable Costing

the income statement under both methods. When the units produced exceed the units sold, absorption costing net operating income will exceed variable costing net operating income. This occurs because inventories have increased; therefore, under absorption costing some of the fixed manufacturing overhead incurred in the current period is deferred in ending inventories on the balance sheet, whereas under variable costing all of the fixed manufacturing overhead incurred in the current period flows through to the income statement. In contrast, when the units produced are less than the units sold, absorption costing net operating income will be less than variable costing net operating income. This occurs because inventories have decreased; therefore, under absorption costing fixed manufacturing overhead that had been deferred in inventories during a prior period flows through to the current period's income statement together with all of the fixed manufacturing overhead incurred during the current period. Under variable costing, just the fixed manufacturing overhead of the current period flows through to the income statement.

THE BEHAVIORAL SIDE OF CALCULATING UNIT PRODUCT COSTS

In 2004, **Andreas STIHL**, a manufacturer of chain saws and other landscaping products, asked its U.S. subsidiary, STIHL Inc., to replace its absorption costing income statements with the variable costing approach. From a computer systems standpoint, the change was not disruptive because STIHL used an enterprise system called SAP that accommodates both absorption and variable costing. However, from a behavioral standpoint, STIHL felt the change could be very disruptive. For example, STIHL's senior managers were keenly aware that the variable costing approach reported lower unit product costs than the absorption costing approach. Given this reality, the sales force might be inclined to erroneously conclude that each product had magically become more profitable, thereby justifying ill-advised price reductions. Because of behavioral concerns such as this, STIHL worked hard to teach its employees how to interpret a variable costing income statement.

IN BUSINESS

Choosing a Costing Method

LEARNING OBJECTIVE 4

Understand the advantages and disadvantages of both variable and absorption costing.

The Impact on the Manager

Absorption costing income statements can be confusing and are easily misinterpreted. Look again at the absorption costing income statements in Exhibit 6–2; a manager might wonder why net operating income went up from January to February even though sales were exactly the same. Was it a result of lower selling costs, more efficient operations, or was it some other factor? In fact, it was simply because the number of units produced exceeded the number of units sold in February and so some of the fixed manufacturing overhead costs were deferred in inventories in that month. These costs have not gone away—they will eventually flow through to the income statement in a later period when inventories go down. There is no way to tell this from the absorption costing income statements.

In contrast, the variable costing income statements in Exhibit 6–3 are clear and easy to understand. All other things the same, when sales go up, net operating income goes up. When sales go down, net operating income goes down. When sales are constant, net operating income is constant.

To avoid mistakes when absorption costing is used, readers of financial statements should be alert to changes in inventory levels. Under absorption costing, if inventories increase, fixed manufacturing overhead costs are deferred in inventories, which in turn increases net operating income. If inventories decrease, fixed manufacturing overhead costs are released from inventories, which in turn decreases net operating income. Thus, when absorption costing is used, fluctuations in net operating income can be due to changes in inventories rather than to changes in sales.

IN BUSINESS

BIG INVENTORIES AT THE BIG THREE DETROIT AUTOMAKERS

The table below summarizes automobile inventory data for **General Motors**, **Chrysler**, **Ford**, **Honda**, and **Toyota** at the end of 2006.

| Company Name | U.S. Market Share | Vehicles in Inventory at 12/31/2006 | Vehicles per 1% of Market Share |
|-----------------|-------------------|-------------------------------------|---------------------------------|
| General Motors | 24.6% | 1,028,783 | 41,820 |
| DaimlerChrysler | 14.4% | 538,438 | 37,391 |
| Ford | 17.5% | 624,754 | 35,700 |
| Honda | 9.1% | 225,293 | 24,757 |
| Toyota | 15.4% | 320,282 | 20,797 |

The Big Three Detroit automakers have exorbitant inventories because they still rely on mass production, whereas Honda and Toyota use lean production methods. The Detroit automakers try to lower their average fixed overhead cost per unit by making as many vehicles as possible. This approach results in bloated inventories and the frequent use of incentives and rebates to generate sales. Toyota and Honda produce vehicles in response to customer orders, resulting in lower inventories and less reliance on costly marketing gimmicks.

If the U.S. automakers tried to improve their competitiveness by substantially lowering their inventories it would reduce profits. Can you explain why this would be the case for companies that use absorption costing? How would you feel as a manager if your inventory reduction efforts resulted in lower profits and a smaller bonus?

CVP Analysis and Absorption Costing

CVP analysis requires that we break costs down into their fixed and variable components. Because variable costing income statements categorize costs as fixed and variable, it is much easier to use this income statement format to perform CVP analysis than attempting to use the absorption costing format, which mixes together fixed and variable costs.

Moreover, absorption costing net operating income may or may not agree with the results of CVP analysis. For example, let's suppose that you are interested in computing the sales that would be necessary to generate a target profit of \$105,000 at Weber Light Aircraft. A CVP analysis based on the January variable costing income statement from Exhibit 6–3 would proceed as follows:

| | |
|---|-----------|
| Sales (a) | \$100,000 |
| Contribution margin (b) | \$65,000 |
| Contribution margin ratio (b) ÷ (a) | 65% |
| Total fixed expenses | \$90,000 |

$$\begin{aligned} \text{Dollar sales to attain target profit} &= \frac{\text{Target profit} + \text{Fixed expenses}}{\text{CM ratio}} \\ &= \frac{\$105,000 + \$90,000}{0.65} = \$300,000 \end{aligned}$$

Thus, a CVP analysis based on the January variable costing income statement predicts that the net operating income would be \$105,000 when sales are \$300,000. And indeed, the net operating income under variable costing *is* \$105,000 when the sales are \$300,000 in March. However, the net operating income under absorption costing is *not* \$105,000 in March, even though the sales are \$300,000. Why is this? The reason is that under absorption costing, net operating income can be distorted by changes in inventories. In March, inventories decreased, so some of the fixed manufacturing overhead that had been deferred in February's ending inventories was released to the March income statement, resulting in a net operating income that is lower than the \$105,000 predicted by CVP analysis. If inventories had increased in March, the opposite would have occurred—the absorption costing net operating income would have been higher than the \$105,000 predicted by CVP analysis.

Decision Making

Under absorption costing, fixed manufacturing overhead costs appear to be variable with respect to the number of units sold, but they are not. For example, in January, the absorption unit product cost at Weber Light Aircraft is \$95,000, but the variable portion of this cost is only \$25,000. Because the product costs are stated on a per unit basis, managers may mistakenly believe that if another unit is produced, it will cost the company \$95,000. But of course it would not. The cost of producing another unit would be only \$25,000.

The misperception that absorption unit product costs are variable can lead to many problems, including inappropriate pricing decisions and decisions to drop products that are in fact profitable. These problems with absorption costing product costs will be discussed more fully in later chapters.

External Reporting and Income Taxes

Practically speaking, absorption costing is required for external reports in the United States. A company that attempts to use variable costing on its external financial reports runs the risk that its auditors may not accept the financial statements as conforming to

generally accepted accounting principles (GAAP).³ Tax law on this issue is clear-cut. Under the Tax Reform Act of 1986, a form of absorption costing must be used when filling out income tax forms.

Even if a company must use absorption costing for its external reports, a manager can use variable costing income statements for internal reports. No particular accounting problems are created by using *both* costing methods—the variable costing method for internal reports and the absorption costing method for external reports. As we demonstrated earlier in Exhibit 6–4, the adjustment from variable costing net operating income to absorption costing net operating income is a simple one that can be easily made at the end of the accounting period.

Top executives are typically evaluated based on the earnings reported to shareholders on the company's external financial reports. This creates a problem for top executives who might otherwise favor using variable costing for internal reports. They may feel that because they are evaluated based on absorption costing reports, decisions should also be based on absorption costing data.

Advantages of Variable Costing and the Contribution Approach

As stated earlier, even if the absorption approach is used for external reporting purposes, variable costing, together with the contribution format income statement, is an appealing alternative for internal reports. The advantages of variable costing can be summarized as follows:

1. Data required for CVP analysis can be taken directly from a contribution format income statement. These data are not available on a conventional absorption costing income statement.
2. Under variable costing, the profit for a period is not affected by changes in inventories. Other things remaining the same (selling prices, costs, sales mix, etc.), profits move in the same direction as sales when variable costing is used.
3. Managers often assume that unit product costs are variable costs. This is a problem under absorption costing because unit product costs are a combination of both fixed and variable costs. Under variable costing, unit product costs do not contain fixed costs.
4. The impact of fixed costs on profits is emphasized under the variable costing and contribution approach. The total amount of fixed costs appears explicitly on the income statement, highlighting that the whole amount of fixed costs must be covered for the company to be truly profitable. In contrast, under absorption costing, the fixed costs are mingled together with the variable costs and are buried in cost of goods sold and ending inventories.
5. Variable costing data make it easier to estimate the profitability of products, customers, and other business segments. With absorption costing, profitability is obscured by arbitrary fixed cost allocations. These issues will be discussed in later chapters.
6. Variable costing ties in with cost control methods such as standard costs and flexible budgets, which will be covered in later chapters.
7. Variable costing net operating income is closer to net cash flow than absorption costing net operating income. This is particularly important for companies with potential cash flow problems.

³ The situation is actually slightly ambiguous concerning whether absorption costing is strictly required. Official pronouncements do not actually prohibit variable costing. And some companies expense significant elements of their fixed manufacturing costs on their external reports. Nevertheless, the reality is that most accountants believe that absorption costing is required for external reporting and a manager who argues otherwise is likely to be unsuccessful.

With all of these advantages, one might wonder why absorption costing continues to be used almost exclusively for external reporting and why it is the predominant choice for internal reports as well. This is partly due to tradition, but absorption costing is also attractive to many accountants and managers because they believe it better matches costs with revenues. Advocates of absorption costing argue that *all* manufacturing costs must be assigned to products in order to properly match the costs of producing units of product with their revenues when they are sold. The fixed costs of depreciation, taxes, insurance, supervisory salaries, and so on, are just as essential to manufacturing products as are the variable costs.

Advocates of variable costing argue that fixed manufacturing costs are not really the costs of any particular unit of product. These costs are incurred to have the *capacity* to make products during a particular period and will be incurred even if nothing is made during the period. Moreover, whether a unit is made or not, the fixed manufacturing costs will be exactly the same. Therefore, variable costing advocates argue that fixed manufacturing costs are not part of the costs of producing a particular unit of product and thus the matching principle dictates that fixed manufacturing costs should be charged to the current period.

At any rate, absorption costing is the generally accepted method for preparing mandatory external financial reports and income tax returns. Probably because of the cost and possible confusion of maintaining two separate costing systems—one for external reporting and one for internal reporting—most companies use absorption costing for both external and internal reports.

Variable Costing and the Theory of Constraints

The Theory of Constraints (TOC), which was introduced in Chapter 1, suggests that the key to improving a company's profits is managing its constraints. For reasons that will be discussed in a later chapter, this requires careful identification of each product's variable costs. Consequently, companies involved in TOC use a form of variable costing. One difference is that the TOC approach generally considers direct labor to be a fixed cost. As discussed in earlier chapters, in many companies direct labor is not really a variable cost. Even though direct labor workers may be paid on an hourly basis, many companies have a commitment—sometimes enforced in labor contracts or by law—to guarantee workers a minimum number of paid hours. In TOC companies, there are two additional reasons to consider direct labor a fixed cost.

First, direct labor is not usually the constraint. In the simplest cases, the constraint is a machine. In more complex cases, the constraint is a policy (such as a poorly designed compensation scheme for salespersons) that prevents the company from using its resources more effectively. If direct labor is not the constraint, there is no reason to increase it. Hiring more direct labor would increase costs without increasing the output of salable products and services.

Second, TOC emphasizes continuous improvement to maintain competitiveness. Without committed and enthusiastic employees, sustained continuous improvement is virtually impossible. Because layoffs often have devastating effects on employee morale, managers involved in TOC are extremely reluctant to lay off employees.

For these reasons, most managers in TOC companies regard direct labor as a committed fixed cost rather than a variable cost. Hence, in the modified form of variable costing used in TOC companies, direct labor is not usually classified as a product cost.

Impact of Lean Production

As discussed in this chapter, variable and absorption costing will produce different net operating incomes whenever the number of units produced is different from the number of units sold—in other words, whenever there is a change in the number of units in inventory. Absorption costing net operating income can be erratic, sometimes moving in a direction that is opposite from the movement in sales.

When companies use Lean Production methods, these problems are reduced. The erratic movement of net operating income under absorption costing and the difference in net operating income between absorption and variable costing occur because of changes in the number of units in inventory. Under Lean Production, goods are produced to customers' orders and the goal is to eliminate finished goods inventories entirely and reduce work in process inventory to almost nothing. If there is very little inventory, then changes in inventories will be very small and both variable and absorption costing will show basically the same net operating income. With very little inventory, absorption costing net operating income usually moves in the same direction as movements in sales.

Of course, the cost of a unit of product will still be different between variable and absorption costing, as explained earlier in the chapter. But when Lean Production is used, the differences in net operating income will largely disappear.

Summary

Variable and absorption costing are alternative methods of determining unit product costs. Under variable costing, only those manufacturing costs that vary with output are treated as product costs. This includes direct materials, variable overhead, and ordinarily direct labor. Fixed manufacturing overhead is treated as a period cost and it is expensed on the income statement as incurred. By contrast, absorption costing treats fixed manufacturing overhead as a product cost, along with direct materials, direct labor, and variable overhead. Under both costing methods, selling and administrative expenses are treated as period costs and they are expensed on the income statement as incurred.

Because absorption costing treats fixed manufacturing overhead as a product cost, a portion of fixed manufacturing overhead is assigned to each unit as it is produced. If units of product are unsold at the end of a period, then the fixed manufacturing overhead cost attached to those units is carried with them into the inventory account and deferred to a future period. When these units are later sold, the fixed manufacturing overhead cost attached to them is released from the inventory account and charged against income as part of cost of goods sold. Thus, under absorption costing, it is possible to defer a portion of the fixed manufacturing overhead cost from one period to a future period through the inventory account.

Unfortunately, this shifting of fixed manufacturing overhead cost between periods can cause erratic fluctuations in net operating income and can result in confusion and unwise decisions. To guard against mistakes when they interpret income statement data, managers should be alert to changes in inventory levels or unit product costs during the period.

Practically speaking, variable costing can't be used externally for either financial or tax reporting. However, it may be used internally by managers for planning and control purposes. The variable costing approach works well with CVP analysis.

Review Problem: Contrasting Variable and Absorption Costing

Dexter Corporation produces and sells a single product, a wooden hand loom for weaving small items such as scarves. Selected cost and operating data relating to the product for two years are given below:

| | |
|-----------------------------------|-----------|
| Selling price per unit | \$50 |
| Manufacturing costs: | |
| Variable per unit produced: | |
| Direct materials | \$11 |
| Direct labor | \$6 |
| Variable overhead | \$3 |
| Fixed per year | \$120,000 |
| Selling and administrative costs: | |
| Variable per unit sold | \$4 |
| Fixed per year | \$70,000 |

| | Year 1 | Year 2 |
|--------------------------------------|--------|--------|
| Units in beginning inventory | 0 | 2,000 |
| Units produced during the year | 10,000 | 6,000 |
| Units sold during the year | 8,000 | 8,000 |
| Units in ending inventory | 2,000 | 0 |

Required:

1. Assume the company uses absorption costing.
 - a. Compute the unit product cost in each year.
 - b. Prepare an income statement for each year.
2. Assume the company uses variable costing.
 - a. Compute the unit product cost in each year.
 - b. Prepare an income statement for each year.
3. Reconcile the variable costing and absorption costing net operating incomes.

Solution to Review Problem

1. a. Under absorption costing, all manufacturing costs, variable and fixed, are included in unit product costs:

| | Year 1 | Year 2 |
|--|-------------|-------------|
| Direct materials | \$11 | \$11 |
| Direct labor | 6 | 6 |
| Variable manufacturing overhead | 3 | 3 |
| Fixed manufacturing overhead | | |
| (\$120,000 ÷ 10,000 units) | 12 | |
| (\$120,000 ÷ 6,000 units) | | 20 |
| Absorption costing unit product cost | <u>\$32</u> | <u>\$40</u> |

- b. The absorption costing income statements follow:

| | Year 1 | Year 2 |
|--|------------------|-------------------|
| Sales (8,000 units × \$50 per unit) | \$400,000 | \$400,000 |
| Cost of goods sold (8,000 units × \$32 per unit; (2,000 units × \$32 per unit) + (6,000 units × \$40 per unit) | <u>256,000</u> | <u>304,000</u> |
| Gross margin | 144,000 | 96,000 |
| Selling and administrative expenses (8,000 units × \$4 per unit + \$70,000) | <u>102,000</u> | <u>102,000</u> |
| Net operating income (loss) | <u>\$ 42,000</u> | <u>\$ (6,000)</u> |

2. a. Under variable costing, only the variable manufacturing costs are included in product costs:

| | Year 1 | Year 2 |
|--|-------------|-------------|
| Direct materials | \$11 | \$11 |
| Direct labor | 6 | 6 |
| Variable manufacturing overhead | <u>3</u> | <u>3</u> |
| Variable costing unit product cost | <u>\$20</u> | <u>\$20</u> |

b. The variable costing income statements follow.

| | Year 1 | | Year 2 | |
|---|-----------|-----------|-----------|-----------|
| Sales (8,000 units × \$50 per unit) | | \$400,000 | | \$400,000 |
| Variable expenses: | | | | |
| Variable cost of goods sold | | | | |
| (8,000 units × \$20 per unit) | \$160,000 | | \$160,000 | |
| Variable selling and administrative | | | | |
| expenses (8,000 units × | | | | |
| \$4 per unit) | 32,000 | 192,000 | 32,000 | 192,000 |
| Contribution margin | | 208,000 | | 208,000 |
| Fixed expenses: | | | | |
| Fixed manufacturing overhead | 120,000 | | 120,000 | |
| Fixed selling and administrative | | | | |
| expenses | 70,000 | 190,000 | 70,000 | 190,000 |
| Net operating income | | \$ 18,000 | | \$ 18,000 |

3. The reconciliation of the variable and absorption costing net operating incomes follows:

| | Year 1 | Year 2 |
|--|----------|------------|
| Variable costing net operating income | \$18,000 | \$18,000 |
| Add fixed manufacturing overhead costs deferred | | |
| in inventory under absorption costing | | |
| (2,000 units × \$12 per unit) | 24,000 | |
| Deduct fixed manufacturing overhead costs released | | |
| from inventory under absorption costing | | |
| (2,000 units × \$12 per unit) | | (24,000) |
| Absorption costing net operating income (loss) | \$42,000 | \$ (6,000) |

Glossary

Absorption costing A costing method that includes all manufacturing costs—direct materials, direct labor, and both variable and fixed manufacturing overhead—in unit product costs. (p. 207)

Variable costing A costing method that includes only variable manufacturing costs—direct materials, direct labor, and variable manufacturing overhead—in unit product costs. (p. 207)

Questions

- 6-1 What is the basic difference between absorption costing and variable costing?
- 6-2 Are selling and administrative expenses treated as product costs or as period costs under variable costing?
- 6-3 Explain how fixed manufacturing overhead costs are shifted from one period to another under absorption costing.
- 6-4 What are the arguments in favor of treating fixed manufacturing overhead costs as product costs?
- 6-5 What are the arguments in favor of treating fixed manufacturing overhead costs as period costs?
- 6-6 If the units produced and unit sales are equal, which method would you expect to show the higher net operating income, variable costing or absorption costing? Why?
- 6-7 If the units produced exceed unit sales, which method would you expect to show the higher net operating income, variable costing or absorption costing? Why?

- 6-8 If fixed manufacturing overhead costs are released from inventory under absorption costing, what does this tell you about the level of production in relation to the level of sales?
- 6-9 Under absorption costing, how is it possible to increase net operating income without increasing sales?
- 6-10 How does Lean Production reduce or eliminate the difference in reported net operating income between absorption and variable costing?

Multiple-choice questions are provided on the text website at www.mhhe.com/noreen2e.

Exercises

EXERCISE 6-1 Variable and Absorption Costing Unit Product Costs [LO1]

Ida Sidha Karya Company is a family-owned company located in the village of Gianyar on the island of Bali in Indonesia. The company produces a handcrafted Balinese musical instrument called a gamelan that is similar to a xylophone. The sounding bars are cast from brass and hand-filed to attain just the right sound. The bars are then mounted on an intricately hand-carved wooden base. The gamelans are sold for 850 (thousand) rupiahs. (The currency in Indonesia is the rupiah, which is denoted by Rp.) Selected data for the company’s operations last year follow (all currency values are in thousands of rupiahs):

| | |
|---|----------|
| Units in beginning inventory | 0 |
| Units produced | 250 |
| Units sold | 225 |
| Units in ending inventory | 25 |
| Variable costs per unit: | |
| Direct materials | Rp100 |
| Direct labor | Rp320 |
| Variable manufacturing overhead | Rp40 |
| Variable selling and administrative | Rp20 |
| Fixed costs: | |
| Fixed manufacturing overhead | Rp60,000 |
| Fixed selling and administrative | Rp20,000 |

Required:

1. Assume that the company uses absorption costing. Compute the unit product cost for one gamelan.
2. Assume that the company uses variable costing. Compute the unit product cost for one gamelan.

EXERCISE 6-2 Variable Costing Income Statement; Explanation of Difference in Net Operating Income [LO2]

Refer to the data in Exercise 6-1 for Ida Sidha Karya Company. The absorption costing income statement prepared by the company’s accountant for last year appears below (all currency values are in thousands of rupiahs):

| | |
|--|-----------------|
| Sales | Rp191,250 |
| Cost of goods sold | 157,500 |
| Gross margin | 33,750 |
| Selling and administrative expense | 24,500 |
| Net operating income | <u>Rp 9,250</u> |

Required:

1. Determine how much of the ending inventory consists of fixed manufacturing overhead cost deferred in inventory to the next period.
2. Prepare an income statement for the year using variable costing. Explain the difference in net operating income between the two costing methods.

EXERCISE 6-3 Reconciliation of Absorption and Variable Costing Net Operating Incomes [LO3]

Jorgansen Lighting, Inc., manufactures heavy-duty street lighting systems for municipalities. The company uses variable costing for internal management reports and absorption costing for external reports to shareholders, creditors, and the government. The company has provided the following data:

| | Year 1 | Year 2 | Year 3 |
|---|-------------|-------------|-----------|
| Inventories: | | | |
| Beginning (units) | 200 | 170 | 180 |
| Ending (units) | 170 | 180 | 220 |
| Variable costing net operating income | \$1,080,400 | \$1,032,400 | \$996,400 |

The company's fixed manufacturing overhead per unit was constant at \$560 for all three years.

Required:

- Determine each year's absorption costing net operating income. Present your answer in the form of a reconciliation report as shown in Exhibit 6-4.
- In Year 4, the company's variable costing net operating income was \$984,400 and its absorption costing net operating income was \$1,012,400. Did inventories increase or decrease during Year 4? How much fixed manufacturing overhead cost was deferred or released from inventory during Year 4?

**EXERCISE 6-4 Evaluating Absorption and Variable Costing as Alternative Costing Methods [LO4]**

The questions below pertain to two different scenarios involving a manufacturing company. In each scenario, the cost structure of the company is constant from year to year. Selling prices, unit variable costs, and total fixed costs are the same in every year. However, unit sales and/or unit production levels may vary from year to year.

Required:

- Consider the following data for scenario A:

| | Year 1 | Year 2 | Year 3 |
|---|----------|----------|----------|
| Variable costing net operating income | \$41,694 | \$41,694 | \$41,694 |
| Absorption costing net operating income | \$41,694 | \$66,755 | \$20,036 |

- Were unit sales constant from year to year? Explain.
 - What was the relation between unit sales and unit production levels in each year? For each year, indicate whether inventories grew or shrank.
- Consider the following data for scenario B:

| | Year 1 | Year 2 | Year 3 |
|---|----------|------------|-------------|
| Variable costing net operating income (loss) | \$41,694 | (\$29,306) | (\$100,306) |
| Absorption costing net operating income | \$41,694 | \$42,165 | \$42,637 |

- Were unit sales constant from year to year? Explain.
 - What was the relation between unit sales and unit production levels in each year? For each year, indicate whether inventories grew or shrank.
- Given the patterns of net operating income in scenarios A and B above, which costing method, variable costing or absorption costing, do you believe provides a better reflection of economic reality? Explain.

EXERCISE 6-5 Variable and Absorption Costing Unit Product Costs and Income Statements [LO1, LO2]

Lynch Company manufactures and sells a single product. The following costs were incurred during the company's first year of operations:

| | |
|---|-----------|
| Variable costs per unit: | |
| Manufacturing: | |
| Direct materials | \$6 |
| Direct labor | \$9 |
| Variable manufacturing overhead | \$3 |
| Variable selling and administrative | \$4 |
| Fixed costs per year: | |
| Fixed manufacturing overhead | \$300,000 |
| Fixed selling and administrative | \$190,000 |

During the year, the company produced 25,000 units and sold 20,000 units. The selling price of the company's product is \$50 per unit.

Required:

1. Assume that the company uses absorption costing:
 - a. Compute the unit product cost.
 - b. Prepare an income statement for the year.
2. Assume that the company uses variable costing:
 - a. Compute the unit product cost.
 - b. Prepare an income statement for the year.

EXERCISE 6-6 Inferring Costing Method; Unit Product Cost [LO1, LO4]

Sierra Company incurs the following costs to produce and sell a single product.

| | |
|--|-----------|
| Variable costs per unit: | |
| Direct materials | \$9 |
| Direct labor | \$10 |
| Variable manufacturing overhead | \$5 |
| Variable selling and administrative expenses ... | \$3 |
| Fixed costs per year: | |
| Fixed manufacturing overhead | \$150,000 |
| Fixed selling and administrative expenses | \$400,000 |

During the last year, 25,000 units were produced and 22,000 units were sold. The Finished Goods inventory account at the end of the year shows a balance of \$72,000 for the 3,000 unsold units.

Required:

1. Is the company using absorption costing or variable costing to cost units in the Finished Goods inventory account? Show computations to support your answer.
2. Assume that the company wishes to prepare financial statements for the year to issue to its stockholders.
 - a. Is the \$72,000 figure for Finished Goods inventory the correct amount to use on these statements for external reporting purposes? Explain.
 - b. At what dollar amount *should* the 3,000 units be carried in the inventory for external reporting purposes?

EXERCISE 6-7 Variable Costing Income Statement; Reconciliation [LO2, LO3]

Whitman Company has just completed its first year of operations. The company's absorption costing income statement for the year appears below:

| Whitman Company Income Statement | |
|---|------------------|
| Sales (35,000 units × \$25 per unit) | \$875,000 |
| Cost of goods sold (35,000 units × \$16 per unit) | <u>560,000</u> |
| Gross margin | 315,000 |
| Selling and administrative expenses | <u>280,000</u> |
| Net operating income | <u>\$ 35,000</u> |

The company's selling and administrative expenses consist of \$210,000 per year in fixed expenses and \$2 per unit sold in variable expenses. The \$16 per unit product cost given above is computed as follows:

| | |
|---|-------------|
| Direct materials | \$ 5 |
| Direct labor | 6 |
| Variable manufacturing overhead | 1 |
| Fixed manufacturing overhead (\$160,000 ÷ 40,000 units) | 4 |
| Absorption costing unit product cost | <u>\$16</u> |

Required:

1. Redo the company's income statement in the contribution format using variable costing.
2. Reconcile any difference between the net operating income on your variable costing income statement and the net operating income on the absorption costing income statement above.

EXERCISE 6–8 Variable Costing Unit Product Cost and Income Statement; Break-Even [LO1, LO2]

Chuck Wagon Grills, Inc., makes a single product—a handmade specialty barbecue grill that it sells for \$210. Data for last year's operations follow:

| | |
|---|------------------|
| Units in beginning inventory | 0 |
| Units produced | 20,000 |
| Units sold | 19,000 |
| Units in ending inventory | 1,000 |
| Variable costs per unit: | |
| Direct materials | \$ 50 |
| Direct labor | 80 |
| Variable manufacturing overhead | 20 |
| Variable selling and administrative | 10 |
| Total variable cost per unit | <u>\$160</u> |
| Fixed costs: | |
| Fixed manufacturing overhead | \$700,000 |
| Fixed selling and administrative | 285,000 |
| Total fixed costs | <u>\$985,000</u> |

Required:

1. Assume that the company uses variable costing. Compute the unit product cost for one barbecue grill.
2. Assume that the company uses variable costing. Prepare a contribution format income statement for the year.
3. What is the company's break-even point in terms of the number of barbecue grills sold?

EXERCISE 6–9 Absorption Costing Unit Product Cost and Income Statement [LO1, LO2]

Refer to the data in Exercise 6–8 for Chuck Wagon Grills. Assume in this exercise that the company uses absorption costing.

Required:

1. Compute the unit product cost for one barbecue grill.
2. Prepare an income statement.

EXERCISE 6–10 Deducing Changes in Inventories [LO3]

Parker Products Inc, a manufacturer, reported \$123 million in sales and a loss of \$18 million in its annual report to shareholders. According to a CVP analysis prepared for management, the company's break-even point is \$115 million in sales.

Required:

Assuming that the CVP analysis is correct, is it likely that the company's inventory level increased, decreased, or remained unchanged during the year? Explain.

PROBLEM 6-11 Variable Costing Income Statement; Reconciliation [L02, L03]

During Heaton Company’s first two years of operations, the company reported absorption costing net operating income as follows:

| | Year 1 | Year 2 |
|--|-------------|-------------|
| Sales (@ \$25 per unit) | \$1,000,000 | \$1,250,000 |
| Cost of goods sold (@ \$18 per unit) | 720,000 | 900,000 |
| Gross margin | 280,000 | 350,000 |
| Selling and administrative expenses* | 210,000 | 230,000 |
| Net operating income | \$ 70,000 | \$ 120,000 |

*\$2 per unit variable; \$130,000 fixed each year.

The company’s \$18 unit product cost is computed as follows:

| | |
|---|-------------|
| Direct materials | \$ 4 |
| Direct labor | 7 |
| Variable manufacturing overhead | 1 |
| Fixed manufacturing overhead (\$270,000 ÷ 45,000 units) | 6 |
| Absorption costing unit product cost | <u>\$18</u> |

Forty percent of fixed manufacturing overhead consists of wages and salaries; the remainder consists of depreciation charges on production equipment and buildings.

Production and cost data for the two years are:

| | Year 1 | Year 2 |
|----------------------|--------|--------|
| Units produced | 45,000 | 45,000 |
| Units sold | 40,000 | 50,000 |

Required:

1. Prepare a variable costing contribution format income statement for each year.
2. Reconcile the absorption costing and the variable costing net operating income figures for each year.

PROBLEM 6-12 Variable and Absorption Costing Unit Product Costs and Income Statements; Explanation of Difference in Net Operating Income [L01, L02, L03]

High Country, Inc., produces and sells many recreational products. The company has just opened a new plant to produce a folding camp cot that will be marketed throughout the United States. The following cost and revenue data relate to May, the first month of the plant’s operation:

| | A | B |
|--|---|-----------|
| 1 Beginning inventory | | 0 |
| 2 Units produced | | 10,000 |
| 3 Units sold | | 8,000 |
| 4 Selling price per unit | | \$75 |
| 5 | | |
| 6 Selling and administrative expenses: | | |
| 7 Variable per unit | | \$6 |
| 8 Fixed (total) | | \$200,000 |
| 9 Manufacturing costs: | | |
| 10 Direct materials cost per unit | | \$20 |
| 11 Direct labor cost per unit | | \$8 |
| 12 Variable manufacturing overhead cost per unit | | \$2 |
| 13 Fixed manufacturing overhead cost (total) | | \$100,000 |
| 14 | | |

Management is anxious to see how profitable the new camp cot will be and has asked that an income statement be prepared for May.

Required:

1. Assume that the company uses absorption costing.
 - a. Determine the unit product cost.
 - b. Prepare an income statement for May.
2. Assume that the company uses variable costing.
 - a. Determine the unit product cost.
 - b. Prepare a contribution format income statement for May.
3. Explain the reason for any difference in the ending inventory balances under the two costing methods and the impact of this difference on reported net operating income.

PROBLEM 6–13 Absorption and Variable Costing; Production Constant, Sales Fluctuate

[L01, L02, L03, L04]

Tami Tyler opened Tami's Creations, Inc., a small manufacturing company, at the beginning of the year. Getting the company through its first quarter of operations placed a considerable strain on Ms. Tyler's personal finances. The following income statement for the first quarter was prepared by a friend who has just completed a course in managerial accounting at State University.

| Tami's Creations, Inc. | | |
|---|-----------|--------------------|
| Income Statement | | |
| For the Quarter Ended March 31 | | |
| Sales (28,000 units) | | \$1,120,000 |
| Variable expenses: | | |
| Variable cost of goods sold | \$462,000 | |
| Variable selling and administrative | 168,000 | 630,000 |
| Contribution margin | | 490,000 |
| Fixed expenses: | | |
| Fixed manufacturing overhead | 300,000 | |
| Fixed selling and administrative | 200,000 | 500,000 |
| Net operating loss | | <u>\$ (10,000)</u> |

Ms. Tyler is discouraged over the loss shown for the quarter, particularly because she had planned to use the statement as support for a bank loan. Another friend, a CPA, insists that the company should be using absorption costing rather than variable costing and argues that if absorption costing had been used the company would probably have reported at least some profit for the quarter.

At this point, Ms. Tyler is manufacturing only one product, a swimsuit. Production and cost data relating to the swimsuit for the first quarter follow:

| | |
|---|---------|
| Units produced | 30,000 |
| Units sold | 28,000 |
| Variable costs per unit: | |
| Direct materials | \$3.50 |
| Direct labor | \$12.00 |
| Variable manufacturing overhead | \$1.00 |
| Variable selling and administrative | \$6.00 |

Required:

1. Complete the following:
 - a. Compute the unit product cost under absorption costing.
 - b. Redo the company's income statement for the quarter using absorption costing.
 - c. Reconcile the variable and absorption costing net operating income (loss) figures.
2. Was the CPA correct in suggesting that the company really earned a "profit" for the quarter? Explain.

3. During the second quarter of operations, the company again produced 30,000 units but sold 32,000 units. (Assume no change in total fixed costs.)
 - a. Prepare a contribution format income statement for the quarter using variable costing.
 - b. Prepare an income statement for the quarter using absorption costing.
 - c. Reconcile the variable costing and absorption costing net operating incomes.

PROBLEM 6–14 Prepare and Reconcile Variable Costing Statements [L01, L02, L03, L04]

Denton Company manufactures and sells a single product. Cost data for the product are given below:

| | |
|---|------------------|
| Variable costs per unit: | |
| Direct materials | \$ 7 |
| Direct labor | 10 |
| Variable manufacturing overhead | 5 |
| Variable selling and administrative | 3 |
| Total variable cost per unit | <u>\$25</u> |
| Fixed costs per month: | |
| Fixed manufacturing overhead | \$315,000 |
| Fixed selling and administrative | 245,000 |
| Total fixed cost per month | <u>\$560,000</u> |

The product sells for \$60 per unit. Production and sales data for July and August, the first two months of operations, follow:

| | Units Produced | Units Sold |
|--------------|-------------------|---------------|
| July | 17,500 | 15,000 |
| August | 17,500 | 20,000 |

The company’s Accounting Department has prepared absorption costing income statements for July and August as presented below:

| | July | August |
|---|------------------|------------------|
| Sales | \$900,000 | \$1,200,000 |
| Cost of goods sold | <u>600,000</u> | <u>800,000</u> |
| Gross margin | 300,000 | 400,000 |
| Selling and administrative expenses | <u>290,000</u> | <u>305,000</u> |
| Net operating income | <u>\$ 10,000</u> | <u>\$ 95,000</u> |

Required:

1. Determine the unit product cost under:
 - a. Absorption costing.
 - b. Variable costing.
2. Prepare contribution format variable costing income statements for July and August.
3. Reconcile the variable costing and absorption costing net operating income figures.
4. The company’s Accounting Department has determined the company’s break-even point to be 16,000 units per month, computed as follows:

$$\frac{\text{Fixed cost per month}}{\text{Unit contribution margin}} = \frac{\$560,000}{\$35 \text{ per unit}} = 16,000 \text{ units}$$

“I’m confused,” said the president. “The accounting people say that our break-even point is 16,000 units per month, but we sold only 15,000 units in July, and the income statement they prepared shows a \$10,000 profit for that month. Either the income statement is wrong or the break-even point is wrong.” Prepare a brief memo for the president, explaining what happened on the July income statement.

**PROBLEM 6–15 Comprehensive Problem with Labor Fixed [LO1, LO2, LO3, LO4]**

Far North Telecom, Ltd., of Ontario, has organized a new division to manufacture and sell specialty cellular telephones. The division's monthly costs are shown below:

| | |
|--|--------------|
| Manufacturing costs: | |
| Variable costs per unit: | |
| Direct materials | \$48 |
| Variable manufacturing overhead | \$2 |
| Fixed manufacturing overhead costs (total) | \$360,000 |
| Selling and administrative costs: | |
| Variable | 12% of sales |
| Fixed (total) | \$470,000 |

Far North Telecom regards all of its workers as full-time employees and the company has a long-standing no layoff policy. Furthermore, production is highly automated. Accordingly, the company includes its labor costs in its fixed manufacturing overhead. The cellular phones sell for \$150 each. During September, the first month of operations, the following activity was recorded:

| | |
|----------------------|--------|
| Units produced | 12,000 |
| Units sold | 10,000 |

Required:

- Compute the unit product cost under:
 - Absorption costing.
 - Variable costing.
- Prepare an absorption costing income statement for September.
- Prepare a contribution format income statement for September using variable costing.
- Assume that the company must obtain additional financing in order to continue operations. As a member of top management, would you prefer to rely on the statement in (2) above or in (3) above when meeting with a group of prospective investors?
- Reconcile the absorption costing and variable costing net operating incomes in (2) and (3) above.

**PROBLEM 6–16 Prepare and Interpret Income Statements; Changes in Both Sales and Production; Lean Production [LO1, LO2, LO3, LO4]**

Starfax, Inc., manufactures a small part that is widely used in various electronic products such as home computers. Operating results for the first three years of activity were as follows (absorption costing basis):

| | Year 1 | Year 2 | Year 3 |
|---|------------------|------------------|--------------------|
| Sales | \$800,000 | \$640,000 | \$800,000 |
| Cost of goods sold | <u>580,000</u> | <u>400,000</u> | <u>620,000</u> |
| Gross margin | 220,000 | 240,000 | 180,000 |
| Selling and administrative expenses | <u>190,000</u> | <u>180,000</u> | <u>190,000</u> |
| Net operating income (loss) | <u>\$ 30,000</u> | <u>\$ 60,000</u> | <u>\$ (10,000)</u> |

In the latter part of Year 2, a competitor went out of business and in the process dumped a large number of units on the market. As a result, Starfax's sales dropped by 20% during Year 2 even though production increased during the year. Management had expected sales to remain constant at 50,000 units; the increased production was designed to provide the company with a buffer of protection against unexpected spurts in demand. By the start of Year 3, management could see that inventory was excessive and that spurts in demand were unlikely. To reduce the excessive inventories, Starfax cut back production during Year 3, as shown below:

| | Year 1 | Year 2 | Year 3 |
|---------------------------|--------|--------|--------|
| Production in units | 50,000 | 60,000 | 40,000 |
| Sales in units | 50,000 | 40,000 | 50,000 |

Additional information about the company follows:

- The company’s plant is highly automated. Variable manufacturing costs (direct materials, direct labor, and variable manufacturing overhead) total only \$2 per unit, and fixed manufacturing overhead costs total \$480,000 per year.
- Fixed manufacturing overhead costs are applied to units of product on the basis of each year’s production. That is, a new fixed manufacturing overhead rate is computed each year.
- Variable selling and administrative expenses were \$1 per unit sold in each year. Fixed selling and administrative expenses totaled \$140,000 per year.
- The company uses a FIFO inventory flow assumption.

Starfax’s management can’t understand why profits doubled during Year 2 when sales dropped by 20% and why a loss was incurred during Year 3 when sales recovered to previous levels.

Required:

- Prepare a contribution format variable costing income statement for each year.
- Refer to the absorption costing income statements above.
 - Compute the unit product cost in each year under absorption costing. (Show how much of this cost is variable and how much is fixed.)
 - Reconcile the variable costing and absorption costing net operating income figures for each year.
- Refer again to the absorption costing income statements. Explain why net operating income was higher in Year 2 than it was in Year 1 under the absorption approach, in light of the fact that fewer units were sold in Year 2 than in Year 1.
- Refer again to the absorption costing income statements. Explain why the company suffered a loss in Year 3 but reported a profit in Year 1 although the same number of units was sold in each year.
 - Explain how operations would have differed in Year 2 and Year 3 if the company had been using Lean Production, with the result that ending inventory was zero.
 - If Lean Production had been used during Year 2 and Year 3 and the predetermined overhead rate is based on 50,000 units per year, what would the company’s net operating income (or loss) have been in each year under absorption costing? Explain the reason for any differences between these income figures and the figures reported by the company in the statements above.

PROBLEM 6–17 Incentives Created by Absorption Costing; Ethics and the Manager [LO2, LO4]

Carlos Cavalas, the manager of Echo Products’ Brazilian Division, is trying to set the production schedule for the last quarter of the year. The Brazilian Division had planned to sell 3,600 units during the year, but by September 30 only the following activity had been reported:

| | Units |
|-------------------------------|-------|
| Inventory, January 1 | 0 |
| Production | 2,400 |
| Sales | 2,000 |
| Inventory, September 30 | 400 |

The division can rent warehouse space to store up to 1,000 units. The minimum inventory level that the division should carry is 50 units. Mr. Cavalas is aware that production must be at least 200 units per quarter in order to retain a nucleus of key employees. Maximum production capacity is 1,500 units per quarter.

Demand has been soft, and the sales forecast for the last quarter is only 600 units. Due to the nature of the division’s operations, fixed manufacturing overhead is a major element of product cost.

Required:

- Assume that the division is using variable costing. How many units should be scheduled for production during the last quarter of the year? (The basic formula for computing the required production for

a period in a company is: Expected sales + Desired ending inventory – Beginning inventory = Required production.) Show computations and explain your answer. Will the number of units scheduled for production affect the division's reported income or loss for the year? Explain.

2. Assume that the division is using absorption costing and that the divisional manager is given an annual bonus based on divisional operating income. If Mr. Cavalas wants to maximize his division's operating income for the year, how many units should be scheduled for production during the last quarter? [See the formula in (1) above.] Explain.
3. Identify the ethical issues involved in the decision Mr. Cavalas must make about the level of production for the last quarter of the year.

PROBLEM 6–18 Variable Costing Income Statements; Sales Constant, Production Varies; Lean Production [LO1, LO2, LO3, LO4]

“This makes no sense at all,” said Bill Sharp, president of Essex Company. “We sold the same number of units this year as we did last year, yet our profits have more than doubled. Who made the goof—the computer or the people who operate it?” The statements to which Mr. Sharp was referring are shown below (absorption costing basis):

| | Year 1 | Year 2 |
|---|------------------|------------------|
| Sales (20,000 units each year) | \$700,000 | \$700,000 |
| Cost of goods sold | <u>460,000</u> | <u>400,000</u> |
| Gross margin | 240,000 | 300,000 |
| Selling and administrative expenses | <u>200,000</u> | <u>200,000</u> |
| Net operating income | <u>\$ 40,000</u> | <u>\$100,000</u> |

The statements above show the results of the first two years of operation. In the first year, the company produced and sold 20,000 units; in the second year, the company again sold 20,000 units, but it increased production as shown below:

| | Year 1 | Year 2 |
|---|-----------|-----------|
| Production in units | 20,000 | 25,000 |
| Sales in units | 20,000 | 20,000 |
| Variable manufacturing cost per unit produced | \$8 | \$8 |
| Variable selling and administrative expense per unit sold | \$1 | \$1 |
| Fixed manufacturing overhead costs (total) | \$300,000 | \$300,000 |

Essex Company applies fixed manufacturing overhead costs to its only product on the basis of *each year's production*. Thus, a new fixed manufacturing overhead rate is computed each year.

Required:

1. Compute the unit product cost for each year under:
 - a. Absorption costing.
 - b. Variable costing.
2. Prepare a contribution format variable costing income statement for each year.
3. Reconcile the variable costing and absorption costing net operating income figures for each year.
4. Explain to the president why, under absorption costing, the net operating income for Year 2 was higher than the net operating income for Year 1, although the same number of units was sold in each year.
5.
 - a. Explain how operations would have differed in Year 2 if the company had been using Lean Production and ending inventories had been eliminated.
 - b. If Lean Production had been used during Year 2, what would the company's net operating income have been under absorption costing? Explain the reason for any difference between this income figure and the figure reported by the company in the statements above.

Cases

CASE 6-19 The Case of the Plummeting Profits; Lean Production [L02, L03, L04]

“These statements can’t be right,” said Ben Yoder, president of Rayco, Inc. “Our sales in the second quarter were up by 25% over the first quarter, yet these income statements show a precipitous drop in net operating income for the second quarter. Those accounting people have fouled something up.” Mr. Yoder was referring to the following statements (absorption costing basis):

| Rayco, Inc. Income Statements For the First Two Quarters | | |
|---|----------------------|-----------------------|
| | First Quarter | Second Quarter |
| Sales | \$480,000 | \$600,000 |
| Cost of goods sold | <u>240,000</u> | <u>372,000</u> |
| Gross margin | 240,000 | 228,000 |
| Selling and administrative expenses | <u>200,000</u> | <u>215,000</u> |
| Net operating income | <u>\$ 40,000</u> | <u>\$ 13,000</u> |

After studying the statements briefly, Mr. Yoder called in the controller to see if the mistake in the second quarter could be located before the figures were released to the press. The controller stated, “I’m sorry to say that those figures are correct, Ben. I agree that sales went up during the second quarter, but the problem is in production. You see, we budgeted to produce 15,000 units each quarter, but a strike on the west coast among some of our suppliers forced us to cut production in the second quarter back to only 9,000 units. That’s what caused the drop in net operating income.”

Mr. Yoder was confused by the controller’s explanation. He replied, “This doesn’t make sense. I ask you to explain why net operating income dropped when sales went up and you talk about production! So what if we had to cut back production? We still were able to increase sales by 25%. If sales go up, then net operating income should go up. If your statements can’t show a simple thing like that, then it’s time for some changes in your department!”

Budgeted production and sales for the year, along with actual production and sales for the first two quarters, are given below:

| | Quarter | | | |
|-----------------------------------|----------------|---------------|--------------|---------------|
| | First | Second | Third | Fourth |
| Budgeted sales (units) | 12,000 | 15,000 | 15,000 | 18,000 |
| Actual sales (units) | 12,000 | 15,000 | — | — |
| Budgeted production (units) | 15,000 | 15,000 | 15,000 | 15,000 |
| Actual production (units) | 15,000 | 9,000 | — | — |

The company’s plant is heavily automated, and fixed manufacturing overhead amounts to \$180,000 each quarter. Variable manufacturing costs are \$8 per unit. The fixed manufacturing overhead is applied to units of product at a rate of \$12 per unit (based on the budgeted production shown on the prior page). Any underapplied or overapplied overhead is closed directly to cost of goods sold for the quarter. The company had 4,000 units in inventory to start the first quarter and uses the FIFO inventory flow assumption. Variable selling and administrative expenses are \$5 per unit.

Required:

1. What characteristic of absorption costing caused the drop in net operating income for the second quarter and what could the controller have said to explain the problem?
2. Prepare a contribution format variable costing income statement for each quarter.
3. Reconcile the absorption costing and the variable costing net operating income figures for each quarter.
4. Identify and discuss the advantages and disadvantages of using the variable costing method for internal reporting purposes.

5. Assume that the company had introduced Lean Production at the beginning of the second quarter, resulting in zero ending inventory. (Sales and production during the first quarter remain the same.)
- How many units would have been produced during the second quarter under Lean Production?
 - Starting with the third quarter, would you expect any difference between the net operating income reported under absorption costing and under variable costing? Explain why there would or would not be any difference.

CASE 6–20 Ethics and the Manager; Absorption Costing Income Statements [LO2, LO4]

Guochang Li was hired as chief executive officer (CEO) in late November by the board of directors of ContactGlobal, a company that produces an advanced global positioning system (GPS) device. The previous CEO had been fired by the board of directors due to a series of shady business practices including shipping defective GPS devices to dealers.

Guochang felt that his first priority was to restore employee morale—which had suffered during the previous CEO’s tenure. He was particularly anxious to build a sense of trust between himself and the company’s employees. His second priority was to prepare the budget for the coming year, which the board of directors wanted to review in their December 15 meeting.

After hammering out the details in meetings with key managers, Guochang was able to put together a budget that he felt the company could realistically meet during the coming year. That budget appears below:

| Basic budget data | |
|---|---------------------|
| Units in beginning inventory | 0 |
| Units produced | 400,000 |
| Units sold | 400,000 |
| Units in ending inventory | 0 |
| Variable costs per unit: | |
| Direct materials | \$ 57.20 |
| Direct labor | 15.00 |
| Variable manufacturing overhead | 5.00 |
| Variable selling and administrative | 10.00 |
| Total variable cost per unit | <u>\$ 87.20</u> |
| Fixed costs: | |
| Fixed manufacturing overhead | \$ 6,888,000 |
| Fixed selling and administrative | 4,560,000 |
| Total fixed costs | <u>\$11,448,000</u> |

| ContactGlobal | |
|--|---------------------|
| Budgeted Income Statement | |
| (absorption method) | |
| Sales (400,000 units × \$120 per unit) | \$48,000,000 |
| Cost of goods sold (400,000 units × \$94.42 per unit) | <u>37,768,000</u> |
| Gross margin | 10,232,000 |
| Selling and administrative expenses: | |
| Variable selling and administrative (400,000 units × \$10 per unit) | 4,000,000 |
| Fixed selling and administrative | <u>4,560,000</u> |
| Net operating income | <u>\$ 1,672,000</u> |

The board of directors made it clear that this budget was not as ambitious as they had hoped. The most influential member of the board stated that “managers should have to stretch to meet profit goals.” After some discussion, the board decided to set a profit goal of \$2,000,000 for the coming year. To provide strong incentives, the board agreed to pay out very substantial bonuses to top managers of \$10,000 to \$25,000 each if this profit goal was eventually met. The bonus would be all-or-nothing. If actual net operating income turned out to be \$2,000,000 or more, the bonus would be paid. Otherwise, no bonus would be paid.

Required:

1. Assuming that the company does not build up its inventory (i.e., production equals sales) and its selling price and cost structure remain the same, how many units of the GPS device would have to be sold to meet the net operating income goal of \$2,000,000?
2. Verify your answer to (1) above by constructing a revised budget and budgeted absorption costing income statement that yields a net operating income of \$2,000,000.
3. Unfortunately, by October of the next year it had become clear that the company would not be able to make the \$2,000,000 target profit. In fact, it looked like the company would wind up the year as originally planned, with sales of 400,000 units, no ending inventories, and a profit of \$1,672,000.

Several managers who were reluctant to lose their year-end bonuses approached Guochang and suggested that the company could still show a profit of \$2,000,000. The managers pointed out that at the present rate of sales, there was enough capacity to produce tens of thousands of additional GPS devices for the warehouse and thereby shift fixed manufacturing overhead costs to another year. If sales are 400,000 units for the year and the selling price and cost structure remain the same, how many units would have to be produced in order to show a profit of at least \$2,000,000 under absorption costing?

4. Verify your answer to (3) above by constructing an absorption costing income statement.
5. Do you think Guochang Li should approve the plan to build ending inventories in order to attain the target profit?
6. What advice would you give to the board of directors concerning how they determine bonuses in the future?

Chapter

7

Learning Objectives

After studying Chapter 7, you should be able to:

- L01** Understand activity-based costing and how it differs from a traditional costing system.
- L02** Assign costs to cost pools using a first-stage allocation.
- L03** Compute activity rates for cost pools.
- L04** Assign costs to a cost object using a second-stage allocation.
- L05** Use activity-based costing to compute product and customer margins.
- L06** (Appendix 7A) Prepare an action analysis report using activity-based costing data and interpret the report.

Activity-Based Costing: A Tool to Aid Decision Making

The Payoff from Activity-Based Costing

Implementing an activity-based costing system can be expensive. To be worth the cost, the system must actually be used to make decisions and increase profits. **Insteel Industries** manufactures a range of products, such as concrete reinforcing steel, industrial wire, and bulk nails, for the construction, home furnishings, appliance, and tire manufacturing industries. The company implemented an activity-based costing

BUSINESS FOCUS

system at its manufacturing plant in Andrews, South Carolina, and immediately began using activity-based data to make strategic and operating decisions.

In terms of strategic decisions, Insteel dropped some unprofitable products, raised prices on others, and in some cases even discontinued relationships with unprofitable customers. Insteel realized that simply discontinuing products and customers does not improve profits. The company needed to either redeploy its freed-up capacity to increase sales or eliminate its freed-up capacity to reduce costs. Insteel chose to redeploy its freed-up capacity and used its activity-based costing system to identify which new business opportunities to pursue.

In terms of operational improvements, Insteel's activity-based costing system revealed that its 20 most expensive activities consumed 87% of the plant's \$21.4 million in costs. Almost \$4.9 million was being consumed by non-value-added activities. Teams were formed to reduce scrap costs, material handling and freight costs, and maintenance costs. Within one year, scrap and maintenance costs had been cut by \$1,800,000 and freight costs by \$550,000. Overall, non-value-added activity costs dropped from 23% to 17% of total costs. ■

This chapter introduces the concept of *activity-based costing* which has been embraced by a wide variety of organizations including Charles Schwab, Citigroup, Lowe's, Coca-Cola, Conco Food Service, Banta Foods, J&B Wholesale, Fairchild Semiconductor, Assan Aluminum, Sysco Foods, Fisher Scientific International, and Peregrine Outfitters. **Activity-based costing (ABC)** is a costing method that is designed to provide managers with cost information for strategic and other decisions that potentially affect capacity and therefore “fixed” as well as variable costs. Activity-based costing is ordinarily used as a supplement to, rather than as a replacement for, a company's usual costing system. Most organizations that use activity-based costing have two costing systems—the official costing system that is used for preparing external financial reports and the activity-based costing system that is used for internal decision making and for managing activities.

This chapter focuses primarily on ABC applications in manufacturing to provide a contrast with the material presented in earlier chapters. More specifically, Chapters 2 and 5 focused on traditional absorption costing systems used by manufacturing companies to calculate unit product costs for the purpose of valuing inventories and determining cost of goods sold for external financial reports. In contrast, this chapter explains how manufacturing companies can use activity-based costing rather than traditional methods to calculate unit product costs for the purposes of managing overhead and making decisions. Chapter 6 had a similar purpose. That chapter focused on how to use variable costing to aid decisions that do not affect fixed costs. This chapter extends that idea to show how activity-based costing can be used to aid decisions that potentially affect fixed costs as well as variable costs.

Activity-Based Costing: An Overview

As stated above, traditional absorption costing is designed to provide data for external financial reports. In contrast, activity-based costing is designed to be used for internal decision making. As a consequence, activity-based costing differs from traditional cost accounting in three ways. In activity-based costing:

1. Nonmanufacturing as well as manufacturing costs may be assigned to products, but only on a cause-and-effect basis.
2. Some manufacturing costs may be excluded from product costs.
3. Numerous overhead cost pools are used, each of which is allocated to products and other cost objects using its own unique measure of activity.

Each of these departures from traditional cost accounting practice will be discussed in turn.

LEARNING OBJECTIVE 1

Understand activity-based costing and how it differs from a traditional costing system.

SHEDDING LIGHT ON PRODUCT PROFITABILITY

Reichhold, Inc., one of the world's leading suppliers of synthetic materials, adopted activity-based costing to help shed light on the profitability of its various products. Reichhold's prior cost system used one allocation base, reactor hours, to assign overhead costs to products. The ABC system uses four additional activity measures—preprocess preparation hours, think-tank hours, filtration hours, and waste disposal costs per batch—to assign costs to products. Reichhold has rolled out ABC to all 19 of its North American plants because the management team believes that ABC helps improve the company's “capacity management, cycle times, value-added pricing decisions, and analysis of product profitability.”

IN BUSINESS

How Costs Are Treated under Activity-Based Costing

Nonmanufacturing Costs and Activity-Based Costing

In traditional cost accounting, only manufacturing costs are assigned to products. Selling and administrative expenses are treated as period expenses and are not assigned to products. However, many of these nonmanufacturing costs are also part of the costs of producing, selling, distributing, and servicing specific products. For example, commissions paid to salespersons, shipping costs, and warranty repair costs can be easily traced to individual products. In this chapter, we will use the term *overhead* to refer to nonmanufacturing costs as well as to indirect manufacturing costs. In activity-based costing, products are assigned all of the overhead costs—nonmanufacturing as well as manufacturing—that they can reasonably be supposed to have caused. In essence, we will be determining the entire cost of a product rather than just its manufacturing cost. The focus in Chapters 2 and 5 was on determining just the manufacturing cost of a product.

Manufacturing Costs and Activity-Based Costing

In traditional cost accounting systems, *all* manufacturing costs are assigned to products—even manufacturing costs that are not caused by the products. For example, in Chapter 5 we learned that a predetermined plantwide overhead rate is computed by dividing *all* budgeted manufacturing overhead costs by a measure of budgeted activity such as direct labor-hours. This approach spreads *all* manufacturing overhead costs across products based on each product's direct labor-hour usage. In contrast, activity-based costing systems purposely do not assign two types of manufacturing overhead costs to products.

Manufacturing overhead includes costs such as the factory security guard's wages, the plant controller's salary, and the cost of supplies used by the plant manager's secretary. These types of costs are assigned to products in a traditional absorption costing system even though they are totally unaffected by which products are made during a period. In contrast, activity-based costing systems do not arbitrarily assign these types of costs, which are called *organization-sustaining* costs, to products. Activity-based costing treats these types of costs as period expenses rather than product costs.

Additionally, in a traditional absorption costing system, the costs of unused, or idle, capacity are assigned to products. If the budgeted level of activity declines, the overhead rate and unit product costs increase as the increasing costs of idle capacity are spread over a smaller base. In contrast, in activity-based costing, products are only charged for the costs of the capacity they use—not for the costs of capacity they don't use. This provides more stable unit product costs and is consistent with the goal of assigning to products only the costs of the resources that they use.¹

Cost Pools, Allocation Bases, and Activity-Based Costing

Throughout the 19th century and most of the 20th century, cost system designs were simple and satisfactory. Typically, either one plantwide overhead cost pool or a number of departmental overhead cost pools were used to assign overhead costs to products. The plantwide and departmental approaches always had one thing in common—they relied on allocation bases such as direct labor-hours and machine-hours for allocating overhead costs to products. In the labor-intensive production processes of many years ago, direct labor was the most common choice for an overhead allocation base because it represented a large component of product costs, direct labor-hours were closely tracked, and many

¹ Appendix 5A discusses how the costs of idle capacity can be accounted for as a period cost in an income statement. This treatment highlights the cost of idle capacity rather than burying it in inventory and cost of goods sold. The procedures laid out in this chapter for activity-based costing have the same end effect.

managers believed that direct labor-hours, the total volume of units produced, and overhead costs were highly correlated. (Three variables, such as direct labor-hours, the total volume of units produced, and overhead costs, are highly correlated if they tend to move together.) Given that most companies at the time were producing a very limited variety of products that required similar resources to produce, allocation bases such as direct labor-hours, or even machine-hours, worked fine because in fact there was probably little difference in the overhead costs attributable to different products.

Then conditions began to change. As a percentage of total cost, direct labor began declining and overhead began increasing. Many tasks previously done by direct laborers were being performed by automated equipment—a component of overhead. Companies began creating new products and services at an ever-accelerating rate that differed in volume, batch size, and complexity. Managing and sustaining this product diversity required investing in many more overhead resources, such as production schedulers and product design engineers, that had no obvious connection to direct labor-hours or machine-hours. In this new environment, continuing to rely exclusively on a limited number of overhead cost pools and traditional allocation bases posed the risk that reported unit product costs would be distorted and, therefore, misleading when used for decision-making purposes.

Activity-based costing, thanks to advances in technology that make more complex cost systems feasible, provides an alternative to the traditional plantwide and departmental approaches to defining cost pools and selecting allocation bases. The activity-based approach has appeal in today's business environment because it uses more cost pools and unique measures of activity to better understand the costs of managing and sustaining product diversity.

In activity-based costing, an **activity** is any event that causes the consumption of overhead resources. An **activity cost pool** is a “bucket” in which costs are accumulated that relate to a single activity measure in the ABC system. An **activity measure** is an allocation base in an activity-based costing system. The term *cost driver* is also used to refer to an activity measure because the activity measure should “drive” the cost being allocated. The two most common types of activity measures are *transaction drivers* and *duration drivers*. **Transaction drivers** are simple counts of the number of times an activity occurs such as the number of bills sent out to customers. **Duration drivers** measure the amount of time required to perform an activity such as the time spent preparing individual bills for customers. In general, duration drivers are more accurate measures of resource consumption than transaction drivers, but they take more effort to record. For that reason, transaction drivers are often used in practice.

GASTRONOMIC COST DRIVERS AT THE CLUB MED—BORA BORA

The Club Med—Bora Bora of Tahiti is a resort owned and operated by the French company **Club Med**. Most guests buy all-inclusive packages that include lodging, participation in the resort's many activities, a full range of beverages, and sumptuous buffet meals. The resort's guests come from around the world including Asia, North America, South America, and Europe. The international nature of the club's guests poses challenges for the kitchen staff—for example, Japanese breakfasts feature miso soup, stewed vegetables in soy sauce, and rice porridge whereas Germans are accustomed to cold cuts, cheese, and bread for breakfast. Moreover, the number of guests varies widely from 300 in the high season to 20 in the low season. The chefs in the kitchen must ensure that food in the correct quantities and variety are available to please the club's varied clientele. To make this possible, a report is prepared each day that lists how many Japanese guests, German guests, French guests, Polish guests, U.S. guests, and so forth, are currently registered. This information helps the chefs prepare the appropriate quantities of specialized foods. In essence, costs in the kitchen are driven not by the number of guests alone, but by how many guests are Japanese, how many German, how many French, and so on. The costs are driven by multiple drivers.

IN BUSINESS

Traditional cost systems rely exclusively on allocation bases that are driven by the volume of production. On the other hand, activity-based costing defines five levels of activity—unit-level, batch-level, product-level, customer-level, and organization-sustaining—that largely do *not* relate to the volume of units produced. The costs and corresponding activity measures for unit-level activities do relate to the volume of units produced; however, the remaining categories do not. These levels are described as follows:²

1. **Unit-level activities** are performed each time a unit is produced. The costs of unit-level activities should be proportional to the number of units produced. For example, providing power to run processing equipment would be a unit-level activity because power tends to be consumed in proportion to the number of units produced.
2. **Batch-level activities** are performed each time a batch is handled or processed, regardless of how many units are in the batch. For example, tasks such as placing purchase orders, setting up equipment, and arranging for shipments to customers are batch-level activities. They are incurred once for each batch (or customer order). Costs at the batch level depend on the number of batches processed rather than on the number of units produced, the number of units sold, or other measures of volume. For example, the cost of setting up a machine for batch processing is the same regardless of whether the batch contains one or thousands of items.
3. **Product-level activities** relate to specific products and typically must be carried out regardless of how many batches are run or units of product are produced or sold. For example, activities such as designing a product, advertising a product, and maintaining a product manager and staff are all product-level activities.
4. **Customer-level activities** relate to specific customers and include activities such as sales calls, catalog mailings, and general technical support that are not tied to any specific product.
5. **Organization-sustaining activities** are carried out regardless of which customers are served, which products are produced, how many batches are run, or how many units are made. This category includes activities such as heating the factory, cleaning executive offices, providing a computer network, arranging for loans, preparing annual reports to shareholders, and so on.

Many companies throughout the world continue to base overhead allocations on direct labor-hours or machine-hours. In situations where overhead costs and direct labor-hours are highly correlated or in situations where the goal of the overhead allocation process is to prepare external financial reports, this practice makes sense. However, if plantwide overhead costs do not move in tandem with plantwide direct labor-hours or machine-hours, product costs will be distorted—with the potential of distorting decisions made within the company.

IN BUSINESS

DINING IN THE CANYON

Western River Expeditions (www.westernriver.com) runs river rafting trips on the Colorado, Green, and Salmon rivers. One of its most popular trips is a six-day trip down the Grand Canyon, which features famous rapids such as Crystal and Lava Falls as well as the awesome scenery accessible only from the bottom of the Grand Canyon. The company runs trips of one or two rafts, each of which carries two guides and up to 18 guests. The company provides all meals on the trip, which are prepared by the guides.

In terms of the hierarchy of activities, a guest can be considered as a unit and a raft as a batch. In that context, the wages paid to the guides are a batch-level cost because each raft requires two

² Robin Cooper, “Cost Classification in Unit-Based and Activity-Based Manufacturing Cost Systems,” *Journal of Cost Management*, Fall 1990, pp. 4–14.

guides regardless of the number of guests in the raft. Each guest is given a mug to use during the trip and to take home at the end of the trip as a souvenir. The cost of the mug is a unit-level cost because the number of mugs given away is strictly proportional to the number of guests on a trip.

What about the costs of food served to guests and guides—is this a unit-level cost, a batch-level cost, a product-level cost, or an organization-sustaining cost? At first glance, it might be thought that food costs are a unit-level cost—the greater the number of guests, the higher the food costs. However, that is not quite correct. Standard menus have been created for each day of the trip. For example, the first night's menu might consist of shrimp cocktail, steak, cornbread, salad, and cheesecake. The day before a trip begins, all of the food needed for the trip is taken from the central warehouse and packed in modular containers. It isn't practical to finely adjust the amount of food for the actual number of guests planned to be on a trip—most of the food comes prepackaged in large lots. For example, the shrimp cocktail menu may call for two large bags of frozen shrimp per raft and that many bags will be packed regardless of how many guests are expected on the raft. Consequently, the costs of food are not a unit-level cost that varies with the number of guests actually on a trip. Instead, the costs of food are a batch-level cost.

Designing an Activity-Based Costing (ABC) System

There are three essential characteristics of a successful activity-based costing implementation. First, top managers must strongly support the ABC implementation because their leadership is instrumental in properly motivating all employees to embrace the need to change. Second, top managers should ensure that ABC data is linked to how people are evaluated and rewarded. If employees continue to be evaluated and rewarded using traditional (non-ABC) cost data, they will quickly get the message that ABC is not important and they will abandon it. Third, a cross-functional team should be created to design and implement the ABC system. The team should include representatives from each area that will use ABC data, such as the marketing, production, engineering, and accounting departments. These cross-functional employees possess intimate knowledge of many parts of an organization's operations that is necessary for designing an effective ABC system. Furthermore, tapping the knowledge of cross-functional managers lessens their resistance to ABC because they feel included in the implementation process. Time after time, when accountants have attempted to implement an ABC system on their own without top-management support and cross-functional involvement, the results have been ignored.

Classic Brass, Inc. makes two main product lines for luxury yachts—standard stanchions and custom compass housings. The president of the company, John Towers, recently attended a management conference at which activity-based costing was discussed. Following the conference, he called a meeting of the company's top managers to discuss what he had learned. Attending the meeting were production manager Susan Richter, the marketing manager Tom Olafson, and the accounting manager Mary Goodman. He began the conference by distributing the company's income statement that Mary Goodman had prepared a few hours earlier (see Exhibit 7-1):

John: Well, it's official. Our company has sunk into the red for the first time in its history—a loss of \$1,250.

Tom: I don't know what else we can do! Given our successful efforts to grow sales of the custom compass housings, I was expecting to see a boost to our bottom line, not a net loss. Granted, we have been losing even more bids than usual for standard stanchions because of our recent price increase, but . . .

Classic Brass
Income Statement
Year Ended December 31, 2008

| | | |
|---------------------------------------|------------------|-------------------|
| Sales | | \$3,200,000 |
| Cost of goods sold: | | |
| Direct materials | \$ 975,000 | |
| Direct labor | 351,250 | |
| Manufacturing overhead* | <u>1,000,000</u> | <u>2,326,250</u> |
| Gross margin | | 873,750 |
| Selling and administrative expenses: | | |
| Shipping expenses | 65,000 | |
| Marketing expenses | 300,000 | |
| General administrative expenses | <u>510,000</u> | <u>875,000</u> |
| Net operating income | | <u>(\$ 1,250)</u> |

*The company's traditional cost system allocates manufacturing overhead to products using a plantwide overhead rate and machine-hours as the allocation base. Inventory levels did not change during the year.

John: Do you think our prices for standard stanchions are too high?

Tom: No, I don't think our prices are too high. I think our competitors' prices are too low. In fact, I'll bet they are pricing below their cost.

Susan: Why would our competitors price below their cost?

Tom: They are out to grab market share.

Susan: What good is more market share if they are losing money on every unit sold?

John: I think Susan has a point. Mary, what is your take on this?

Mary: If our competitors are pricing standard stanchions below cost, shouldn't they be losing money rather than us? If our company is the one using accurate information to make informed decisions while our competitors are supposedly clueless, then why is our "bottom line" taking a beating? Unfortunately, I think we may be the ones shooting in the dark, not our competitors.

John: Based on what I heard at the conference that I just attended, I am inclined to agree. One of the presentations at the conference dealt with activity-based costing. As the speaker began describing the usual insights revealed by activity-based costing systems, I was sitting in the audience getting an ill feeling in my stomach.

Mary: Honestly John, I have been claiming for years that our existing cost system is okay for external reporting, but it is dangerous to use it for internal decision making. It sounds like you are on board now, right?

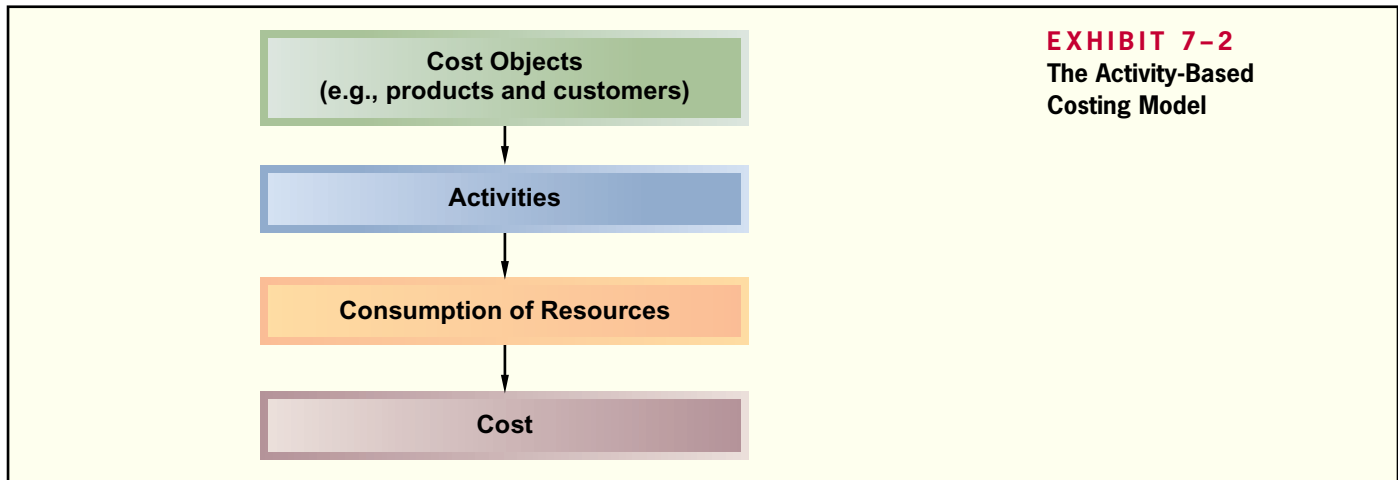

John: Yes.

Mary: Well then, how about if all of you commit the time and energy to help me build a fairly simple activity-based costing system that may shed some light on the problems we are facing?

John: Let's do it. I want each of you to appoint one of your top people to a special "ABC team" to investigate how we cost products.

Like most other ABC implementations, the ABC team decided that its new ABC system would supplement, rather than replace, the existing cost accounting system, which would continue to be used for external financial reports. The new ABC system would be used to prepare special reports for management decisions such as bidding on new business.

The accounting manager drew the chart appearing in Exhibit 7-2 to explain the general structure of the ABC model to her team members. Cost objects such as products

generate activities. For example, a customer order for a custom compass housing requires the activity of preparing a production order. Such an activity consumes resources. A production order uses a sheet of paper and takes time to fill out. And consumption of resources causes costs. The greater the number of sheets used to fill out production orders and the greater the amount of time devoted to filling out such orders, the greater the cost. Activity-based costing attempts to trace through these relationships to identify how products and customers affect costs.

As in most other companies, the ABC team at Classic Brass felt that the company's traditional cost accounting system adequately measured the direct materials and direct labor costs of products because these costs are directly traced to products. Therefore, the ABC study would be concerned solely with the other costs of the company—manufacturing overhead and selling and administrative costs.

The team felt it was important to carefully plan how it would go about implementing the new ABC system at Classic Brass. Accordingly, it broke down the implementation process into five steps:

Steps for Implementing Activity-Based Costing:

1. Define activities, activity cost pools, and activity measures.
2. Assign overhead costs to activity cost pools.
3. Calculate activity rates.
4. Assign overhead costs to cost objects using the activity rates and activity measures.
5. Prepare management reports.

Step 1: Define Activities, Activity Cost Pools, and Activity Measures

The first major step in implementing an ABC system is to identify the activities that will form the foundation for the system. This can be difficult, time-consuming, and involves a great deal of judgment. A common procedure is for the individuals on the ABC implementation team to interview people who work in overhead departments and ask them to describe their major activities. Ordinarily, this results in a very long list of activities.

The length of such lists of activities poses a problem. On the one hand, the greater the number of activities tracked in the ABC system, the more accurate the costs are likely to be. On the other hand, a complex system involving large numbers of activities is costly to design, implement, maintain, and use. Consequently, the original lengthy list of activities is usually reduced to a handful by combining similar activities. For example,

several actions may be involved in handling and moving raw materials—from receiving raw materials on the loading dock to sorting them into the appropriate bins in the store-room. All of these activities might be combined into a single activity called material handling.

When combining activities in an ABC system, activities should be grouped together at the appropriate level. Batch-level activities should not be combined with unit-level activities or product-level activities with batch-level activities and so on. In general, it is best to combine only those activities that are highly correlated with each other within a level. For example, the number of customer orders received is likely to be highly correlated with the number of completed customer orders shipped, so these two batch-level activities (receiving and shipping orders) can usually be combined with little loss of accuracy.

At Classic Brass, the ABC team, in consultation with top managers, selected the following *activity cost pools* and *activity measures*:

| Activity Cost Pool | Activity Measure |
|---------------------------|----------------------------|
| Customer orders | Number of customer orders |
| Product design | Number of product designs |
| Order size | Machine-hours |
| Customer relations | Number of active customers |
| Other | Not applicable |

The *Customer Orders* cost pool will be assigned all costs of resources that are consumed by taking and processing customer orders, including costs of processing paperwork and any costs involved in setting up machines for specific orders. The activity measure for this cost pool is the number of customer orders received. This is a batch-level activity because each order generates work that occurs regardless of whether the order is for one unit or 1,000 units.

The *Product Design* cost pool will be assigned all costs of resources consumed by designing products. The activity measure for this cost pool is the number of products designed. This is a product-level activity because the amount of design work on a new product does not depend on the number of units ultimately ordered or batches ultimately run.

The *Order Size* cost pool will be assigned all costs of resources consumed as a consequence of the number of units produced, including the costs of miscellaneous factory supplies, power to run machines, and some equipment depreciation. This is a unit-level activity because each unit requires some of these resources. The activity measure for this cost pool is machine-hours.

The *Customer Relations* cost pool will be assigned all costs associated with maintaining relations with customers, including the costs of sales calls and the costs of entertaining customers. The activity measure for this cost pool is the number of customers the company has on its active customer list. The Customer Relations cost pool represents a customer-level activity.

The *Other* cost pool will be assigned all overhead costs that are not associated with customer orders, product design, the size of the orders, or customer relations. These costs mainly consist of organization-sustaining costs and the costs of unused, idle capacity. These costs *will not* be assigned to products because they represent resources that are *not* consumed by products.

It is unlikely that any other company would use exactly the same activity cost pools and activity measures that were selected by Classic Brass. Because of the amount of judgment involved, the number and definitions of the activity cost pools and activity measures used by companies vary considerably.

The Mechanics of Activity-Based Costing

Step 2: Assign Overhead Costs to Activity Cost Pools

Exhibit 7-3 shows the annual overhead costs (both manufacturing and nonmanufacturing) that Classic Brass intends to assign to its activity cost pools. Notice the data in the exhibit are organized by department (e.g., Production, General Administrative, and Marketing). This is because the data have been extracted from the company’s general ledger. General ledgers usually classify costs within the departments where the costs are incurred. For example, salaries, supplies, rent, and so forth incurred in the marketing department are charged to that department. The functional orientation of the general ledger mirrors the presentation of costs in the absorption income statement in Exhibit 7-1. In fact, you’ll notice the total costs for the Production Department in Exhibit 7-3 (\$1,000,000) equal the total manufacturing overhead costs from the income statement in Exhibit 7-1. Similarly, the total costs for the General Administrative and Marketing Departments in Exhibit 7-3 (\$510,000 and \$300,000) equal the marketing and general and administrative expenses shown in Exhibit 7-1.

Three costs included in the income statement in Exhibit 7-1—direct materials, direct labor, and shipping—are excluded from the costs shown in Exhibit 7-3. The ABC team purposely excluded these costs from Exhibit 7-3 because the existing cost system can accurately trace direct materials, direct labor, and shipping costs to products. There is no need to incorporate these direct costs in the activity-based allocations of indirect costs.

Classic Brass’s activity-based costing system will divide the nine types of overhead costs in Exhibit 7-3 among its activity cost pools via an allocation process called *first-stage allocation*. The **first-stage allocation** in an ABC system is the process of assigning functionally organized overhead costs derived from a company’s general ledger to the activity cost pools.

First-stage allocations are usually based on the results of interviews with employees who have first-hand knowledge of the activities. For example, Classic Brass needs to allocate \$500,000 of indirect factory wages to its five activity cost pools. These allocations will be more accurate if the employees who are classified as indirect factory workers (e.g., supervisors, engineers, and quality inspectors) are asked to estimate what percentage of their time is spent dealing with customer orders, with product design, with processing units of product (i.e., order size), and with customer relations. These interviews are conducted with considerable care. Those who are interviewed must thoroughly understand what the activities encompass and what is expected of them in the interview. In addition, departmental managers are typically interviewed to determine how the nonpersonnel costs should be distributed across the activity cost pools. For example, the Classic Brass production manager would be

LEARNING OBJECTIVE 2
Assign costs to cost pools using a first-stage allocation.

| Production Department: | | |
|--|-----------|--------------------|
| Indirect factory wages | \$500,000 | |
| Factory equipment depreciation..... | 300,000 | |
| Factory utilities | 120,000 | |
| Factory building lease | 80,000 | \$1,000,000 |

Annual Overhead Costs (Both Manufacturing and Nonmanufacturing) at Classic Brass

interviewed to determine how the \$300,000 of factory equipment depreciation (shown in Exhibit 7–3) should be allocated to the activity cost pools. The key question that the production manager would need to answer is “What percentage of the available machine capacity is consumed by each activity such as the number of customer orders or the number of units processed (i.e., size of orders)?”

IN BUSINESS

ABC HELPS A DAIRY UNDERSTAND ITS COSTS

Kemps LLC, headquartered in Minneapolis, Minnesota, produces dairy products such as milk, yogurt, and ice cream. The company implemented an ABC system that helped managers understand the impact of product and customer diversity on profit margins. The ABC model “captured differences in how the company entered orders from customers (customer phone call, salesperson call, fax, truck-driver entry, EDI, or Internet), how it packaged orders (full stacks of six cases, individual cases, or partial break-pack cases for small orders), how it delivered orders (commercial carriers or its own fleet, including route miles), and time spent by the driver at each customer location.”

Kemps’ ABC system helped the company acquire a large national customer because it identified “the specific manufacturing, distribution, and order handling costs associated with serving this customer.” The ability to provide the customer with accurate cost information built a trusting relationship that distinguished Kemps from other competitors. Kemps also used its ABC data to transform unprofitable customers into profitable ones. For example, one customer agreed to accept a 13% price increase, to eliminate two low-volume products, and to begin placing full truckload orders rather than requiring partial truckload shipments, thereby lowering Kemps’ costs by \$150,000 per year.

Source: Robert S. Kaplan and Steven R. Anderson, “Time-Driven Activity-Based Costing,” *Harvard Business Review*, November 2004, pp. 131–139.

The results of the interviews at Classic Brass are displayed in Exhibit 7–4 (page 245). For example, factory equipment depreciation is distributed 20% to Customer Orders, 60% to Order Size, and 20% to the Other cost pool. The resource in this instance is machine time. According to the estimates made by the production manager, 60% of the total available machine time was used to actually process units to fill orders. This percentage is entered in the Order Size column. Each customer order requires setting up, which also requires machine time. This activity consumes 20% of the total available machine time and is entered under the Customer Orders column. The remaining 20% of available machine time represents idle time and is entered under the Other column.

Exhibit 7–4 and many of the other exhibits in this chapter are presented in the form of Excel spreadsheets. All of the calculations required in activity-based costing can be done by hand. Nevertheless, setting up an activity-based costing system on a spreadsheet or using special ABC software can save a lot of work—particularly in situations involving many activity cost pools and in organizations that periodically update their ABC systems.

We will not go into the details of how all of the percentages in Exhibit 7–4 were determined. However, note that 100% of the factory building lease has been assigned to the Other cost pool. Classic Brass has a single production facility. It has no plans to expand or to sublease any excess space. The cost of this production facility is treated as an organization-sustaining cost because there is no way to avoid even a portion of this cost if a particular product or customer were to be dropped. (Remember that organization-sustaining costs are assigned to the Other cost pool and are not allocated to products.) In contrast, some companies have separate facilities for manufacturing specific products. The costs of these separate facilities could be directly traced to the specific products.

Once the percentage distributions in Exhibit 7–4 have been established, it is easy to allocate costs to the activity cost pools. The results of this first-stage allocation are displayed in Exhibit 7–5. Each cost is allocated across the activity cost pools by multiplying

EXHIBIT 7-4 Results of Interviews: Distribution of Resource Consumption across Activity Cost Pools

| | | Activity Cost Pools | | | | | |
|------------------------------------|-----------------------------------|---------------------|----------------|------------|--------------------|-------|--------|

Exhibit 7-4 shows that Customer Orders consume 25% of the resources represented by the \$500,000 of indirect factory wages.

$$25\% \times \$500,000 = \$125,000$$

Other entries in the table are computed in a similar fashion.

it by the percentages in Exhibit 7-4. For example, the indirect factory wages of \$500,000 are multiplied by the 25% entry under Customer Orders in Exhibit 7-4 to arrive at the \$125,000 entry under Customer Orders in Exhibit 7-5. Similarly, the indirect factory wages of \$500,000 are multiplied by the 40% entry under Product Design in Exhibit 7-4 to arrive at the \$200,000 entry under Product Design in Exhibit 7-5. All of the entries in Exhibit 7-5 are computed in this way.

Now that the first-stage allocations to the activity cost pools have been completed, the next step is to compute the activity rates.

LEARNING OBJECTIVE 3

Compute activity rates for cost pools.

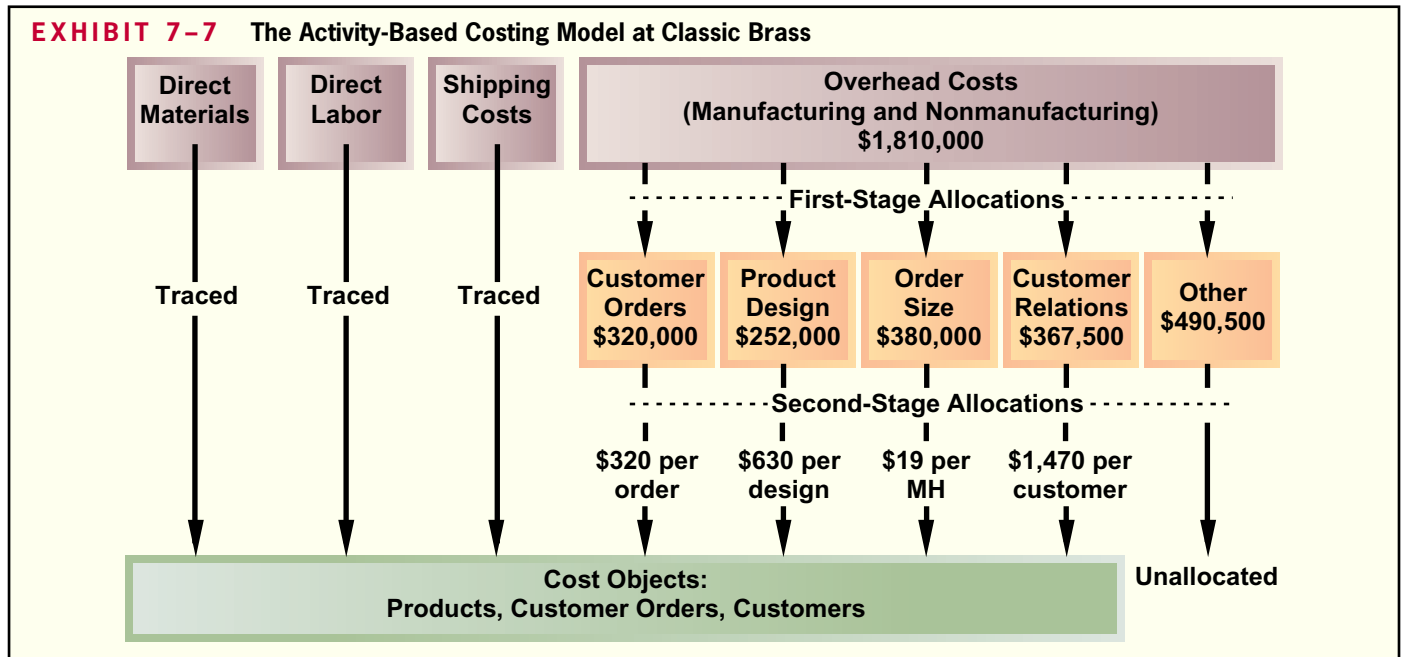

Step 3: Calculate Activity Rates

The activity rates that will be used for assigning overhead costs to products and customers are computed in Exhibit 7-6. The ABC team determined the total activity for each cost pool that would be required to produce the company's present product mix and to serve its present customers. These numbers are listed in Exhibit 7-6. For example, the ABC team found that 400 new product designs are required each year to serve the company's present customers. The activity rates are computed by dividing the *total* cost for each activity by its *total* activity. For example, the \$320,000 total annual cost for the Customer Orders cost pool (which was computed in Exhibit 7-5) is divided by the total of 1,000 customer orders per year to arrive at the activity rate of \$320 per customer order. Similarly, the \$252,000 total cost for the Product Design cost pool is divided by the total number of designs (i.e., 400 product designs) to determine the activity rate of \$630 per design. Note that an activity rate is not computed for the Other category of costs. This is because the *Other* cost pool consists of organization-sustaining costs and costs of idle capacity that are not allocated to products and customers.

The rates in Exhibit 7-6 indicate that *on average* a customer order consumes resources that cost \$320; a product design consumes resources that cost \$630; a unit of product consumes resources that cost \$19 per machine-hour; and maintaining relations with a

EXHIBIT 7-6 Computation of Activity Rates

| | | (a) | (b) | | (a) ÷ (b) | |
| 1 | Activity Cost Pools | Total Cost | Total Activity | | Activity Rate | |
| 2 | Customer orders | \$320,000 | 1,000 orders | | \$320 | per order |
| 3 | Product design | \$252,000 | 400 designs | | \$630 | per design |
| 4 | Order size | \$380,000 | 20,000 MHs | | \$19 | per MH |
| 5 | Customer relations | \$367,500 | 250 customers | | \$1,470 | per customer |
| 6 | Other | \$490,500 | Not applicable | | Not applicable | |
| 8 | *From Exhibit 7-5. | | | | | |
| 9 | | | | | | |

customer consumes resources that cost \$1,470. Note that these are *average* figures. Some members of the ABC design team at Classic Brass argued that it would be unfair to charge all new products the same \$630 product design cost regardless of how much design time they actually require. After discussing the pros and cons, the team concluded that it would not be worth the effort at the present time to keep track of actual design time spent on each new product. They felt that the benefits of increased accuracy would not be great enough to justify the higher cost of implementing and maintaining the more detailed costing system. Similarly, some team members were uncomfortable assigning the same \$1,470 cost to each customer. Some customers are undemanding—ordering standard products well in advance of their needs. Others are very demanding and consume large amounts of marketing and administrative staff time. These are generally customers who order customized products, who tend to order at the last minute, and who change their minds. While everyone agreed with this observation, the data that would be required to measure individual customers' demands on resources were not currently available. Rather than delay implementation of the ABC system, the team decided to defer such refinements to a later date.

Before proceeding further, it would be helpful to get a better idea of the overall process of assigning costs to products and other cost objects in an ABC system. Exhibit 7-7 provides a visual perspective of the ABC system at Classic Brass. We recommend that you carefully go over this exhibit. In particular, note that the Other category, which contains organization-sustaining costs and costs of idle capacity, is not allocated to products or customers.

Step 4: Assign Overhead Costs to Cost Objects

The fourth step in the implementation of activity-based costing is called *second-stage allocation*. In the **second-stage allocation**, activity rates are used to apply overhead costs to products and customers. First, we will illustrate how to assign costs to products followed by an example of how to assign costs to customers.

LEARNING OBJECTIVE 4

Assign costs to a cost object using a second-stage allocation.

The data needed by the ABC team to assign overhead costs to Classic Brass’s two products—standard stanchions and custom compass housings—are as follows:

Standard Stanchions

1. This product line does not require any new design resources.
2. 30,000 units were ordered during the year, comprising 600 separate orders.
3. Each stanchion requires 35 minutes of machine time for a total of 17,500 machine-hours.

Custom Compass Housings

1. This is a custom product that requires new design resources.
2. There were 400 orders for custom compass housings. Orders for this product are placed separately from orders for standard stanchions.
3. There were 400 custom designs prepared. One custom design was prepared for each order.
4. Because some orders were for more than one unit, a total of 1,250 custom compass housings were produced during the year. A custom compass housing requires an average of 2 machine-hours for a total of 2,500 machine-hours.

Notice, 600 customer orders were placed for standard stanchions and 400 customer orders were placed for custom compass housings, for a total of 1,000 customer orders. All 400 product designs related to custom compass housings; none related to standard stanchions. Producing 30,000 standard stanchions required 17,500 machine-hours and producing 1,250 custom compass housings required 2,500 machine-hours, for a total of 20,000 machine-hours.

Exhibit 7–8 illustrates how overhead costs are assigned to the standard stanchions and custom compass housings. For example, the exhibit shows that \$192,000 of overhead

EXHIBIT 7–8 Assigning Overhead Costs to Products

| 1 Overhead Cost for the Standard Stanchions | | | | | | |
|--|--------------------|--|--------------|--|--------------------|--|
| 2 Activity Cost Pools | (a) Activity Rate | | (b) Activity | | (a) × (b) ABC Cost | |
| 3 Customer orders | \$320 per order | | 600 orders | | \$ 192,000 | |
| 4 Product design | \$630 per design | | 0 designs | | 0 | |
| 5 Order size | \$19 per MH | | 17,500 MHs | | 332,500 | |
| 6 Total | | | | | <u>\$ 524,500</u> | |
| 7 | | | | | | |
| 8 Overhead Cost for the Custom Compass Housing | | | | | | |
| 9 Activity Cost Pools | (a) Activity Rate | | (b) Activity | | (a) × (b) ABC Cost | |
| 10 Customer orders | \$320 per order | | 400 orders | | \$ 128,000 | |
| 11 Product design | \$630 per design | | 400 designs | | 252,000 | |
| 12 Order size | \$19 per MH | | 2,500 MHs | | 47,500 | |
| 13 Total | | | | | <u>\$ 427,500</u> | |
| 14 | | | | | | |
| 15 | *From Exhibit 7-6. | | | | | |
| 16 | | | | | | |

costs are assigned from the Customer Orders activity cost pool to the standard stanchions (\$320 per order \times 600 orders). Similarly, \$128,000 of overhead costs are assigned from the Customer Orders activity cost pool to the custom compass housings (\$320 per order \times 400 orders). The Customer Orders cost pool contained a total of \$320,000 (see Exhibit 7–5 or 7–6) and this total amount has been assigned to the two products (\$192,000 + \$128,000 = \$320,000).

Exhibit 7–8 shows that a total of \$952,000 of overhead costs is assigned to Classic Brass's two product lines—\$524,500 to standard stanchions and \$427,500 to custom compass housings. This amount is less than the \$1,810,000 of overhead costs included in the ABC system. Why? The total amount of overhead assigned to products does not match the total amount of overhead cost in the ABC system because the ABC team purposely did not assign the \$367,500 of Customer Relations and \$490,500 of Other costs to products. The Customer Relations activity is a customer-level activity and the Other activity is an organization-sustaining activity—neither activity is caused by products. As shown below, when the Customer Relations and Other activity costs are added to the \$952,000 of overhead costs assigned to products, the total is \$1,810,000.

Next, we describe another example of second-stage allocation—assigning activity costs to customers.

| | Standard Stanchions | Custom Compass Housings | Total |
|--|------------------------|-------------------------------|--------------------|
| Overhead Costs Assigned to Products | | | |
| Customer orders | \$192,000 | \$128,000 | \$ 320,000 |
| Product design | 0 | 252,000 | 252,000 |
| Order size | 332,500 | 47,500 | 380,000 |
| Subtotal | <u>\$524,500</u> | <u>\$427,500</u> | <u>952,000</u> |
| Overhead Costs not Assigned to Products | | | |
| Customer relations | | | 367,500 |
| Other | | | 490,500 |
| Subtotal | | | <u>858,000</u> |
| Total overhead cost | | | <u>\$1,810,000</u> |

The data needed by the design team to assign overhead costs to one of its company's customers—Windward Yachts—are as follows:

Windward Yachts

1. The company placed a total of three orders.
 - a. Two orders were for 150 standard stanchions per order.
 - b. One order was for a single custom compass housing unit.
2. A total of 177 machine-hours were used to fulfill the three customer orders.
 - a. The 300 standard stanchions required 175 machine-hours.
 - b. The custom compass housing required 2 machine-hours.
3. Windward Yachts is one of 250 customers served by Classic Brass.

Exhibit 7–9 illustrates how the ABC system assigns overhead costs to this customer. As shown in Exhibit 7–9, the ABC team calculated that \$6,423 of overhead costs should be assigned to Windward Yachts. The exhibit shows that Windward Yachts is assigned \$960 (\$320 per order \times 3 orders) of overhead costs from the Customer Orders activity cost pool; \$630 (\$630 per design \times 1 design) from the Product Design cost pool; \$3,363 (\$19 per machine-hour \times 177 machine-hours) from the Order Size cost pool; and \$1,470 (\$1,470 per customer \times 1 customer) from the Customer Relations cost pool.

With second-stage allocations complete, the ABC design team was ready to turn its attention to creating reports that would help explain the company's first ever net operating loss.

Step 5: Prepare Management Reports

The most common management reports prepared with ABC data are product and customer profitability reports. These reports help companies channel their resources to their most profitable growth opportunities while at the same time highlighting products and customers that drain profits. We begin by illustrating a product profitability report followed by a customer profitability report.

The Classic Brass ABC team realized that the profit from a product, also called the *product margin*, is a function of the product’s sales and the direct and indirect costs that the product causes. The ABC cost allocations shown in Exhibit 7–8 only summarize each product’s indirect (i.e., overhead) costs. Therefore, to compute a product’s profit (i.e., product margin), the design team needed to gather each product’s sales and direct costs in addition to the overhead costs previously computed. The pertinent sales and direct cost data for each product are shown below. Notice the numbers in the total column agree with the income statement in Exhibit 7-1.

LEARNING OBJECTIVE 5

Use activity-based costing to compute product and customer margins.

| | Standard Stanchions | Custom Compass Housings | Total |
|------------------------|---------------------|-------------------------|-------------|
| Sales | \$2,660,000 | \$540,000 | \$3,200,000 |
| Direct costs: | | | |
| Direct materials | \$905,500 | \$69,500 | \$975,000 |
| Direct labor | \$263,750 | \$87,500 | \$351,250 |
| Shipping | \$60,000 | \$5,000 | \$65,000 |

Having gathered the above data, the design team created the product profitability report shown in Exhibit 7–10. The report revealed that standard stanchions are profitable, with a positive product margin of \$906,250, whereas the custom compass housings are unprofitable, with a negative product margin of \$49,500. Keep in mind that the product profitability report purposely does not include the costs in the Customer Relations and Other activity cost pools. These costs, which total \$858,000, were excluded from the report because they are not caused by the products. Customer Relations costs are caused

EXHIBIT 7-10 Product Margins—Activity-Based Costing

| | A | B | C | D | E | F | G |
|----|---|----------------------------|--------------|---|--------------------------------|-------------|---|
| 1 | Product Margins—Activity-Based Costing | | | | | | |
| 2 | | <i>Standard Stanchions</i> | | | <i>Custom Compass Housings</i> | | |
| 3 | Sales | | \$ 2,660,000 | | | \$ 540,000 | |
| 4 | Costs: | | | | | | |
| 5 | Direct materials | \$ 905,500 | | | \$ 69,500 | | |
| 6 | Direct labor | 263,750 | | | 87,500 | | |
| 7 | Shipping | 60,000 | | | 5,000 | | |
| 8 | Customer orders | 192,000 | | | 128,000 | | |
| 9 | Product design | - | | | 252,000 | | |
| 10 | Order size | 332,500 | | | 47,500 | | |
| 11 | Total cost | | 1,753,750 | | | 589,500 | |
| 12 | Product margin | | \$ 906,250 | | | \$ (49,500) | |

by customers, not products. The Other costs are organization-sustaining costs and unused capacity costs that are not caused by any particular product.

The product margins can be reconciled with the company’s net operating income as follows:

| | Standard Stanchions | Custom Compass Housings | Total |
|--|---------------------|-------------------------|-------------|
| Sales (See Exhibit 7-10) | \$2,660,000 | \$540,000 | \$3,200,000 |
| Total costs (See Exhibit 7-10) | 1,753,750 | 589,500 | 2,343,250 |
| Product margins (See Exhibit 7-10)..... | \$ 906,250 | \$ (49,500) | 856,750 |
| Overhead costs not assigned to products: | | | |
| Customer relations | | | 367,500 |
| Other | | | 490,500 |
| Total | | | 858,000 |
| Net operating income | | | \$ (1,250) |

Next, the design team created a customer profitability report for Windward Yachts. Similar to the product profitability report, the design team needed to gather data concerning sales to Windward Yachts and the direct material, direct labor, and shipping costs associated with those sales. Those data are presented below:

| Windward Yachts | |
|-----------------------------|----------|
| Sales | \$11,350 |
| Direct costs: | |
| Direct material costs | \$2,123 |
| Direct labor costs | \$1,900 |
| Shipping costs | \$205 |

IN BUSINESS

FINDING THAT GOLDEN TOP 20%

According to **Meridien Research** of Newton, Massachusetts, 20% of a bank's customers generate about 150% of its profits. At the other end of the spectrum, 30% of a bank's customers drain 50% of its profits. The question becomes how do banks identify which customers are in that golden top 20%? For many banks, the answer is revealed through customer relationship management software that provides activity-based costing capability.

"We had some customers that we thought, on the surface, would be very profitable, with an average of \$300,000 in business accounts," said Jerry Williams, chairman and chief executive officer of **First Bancorp**. "What we didn't pull out was the fact that some write more than 275 checks a month. Once you apply the labor costs, it's not a profitable customer."

Meridien Research estimates that large commercial banks are increasing their spending on customer profitability systems by 14% a year with total annual expenditures exceeding \$6 billion dollars.

Source: Joseph McKendrick, "Your Best Customers May Be Different Tomorrow," *Bank Technology News*, July 2001, pp. 1-4.

Using these data and the data from Exhibit 7-9, the design team created the customer profitability report shown in Exhibit 7-11. The report revealed that the customer margin for Windward Yachts is **\$699**. A similar report could be prepared for each of Classic Brass's 250 customers, thereby enabling the company to cultivate relationships with its most profitable customers, while taking steps to reduce the negative impact of unprofitable customers.

EXHIBIT 7-11
Customer Margin—

| 12 | Customer margin | | \$ 699 |
| 13 | | | |
| 14 | | | |

Because 17,500 machine-hours were worked on standard stanchions, this product line is assigned \$875,000 (17,500 machine-hours \times \$50 per machine-hour) of manufacturing overhead cost. Similarly, the custom compass housings required 2,500 machine-hours, so this product line is assigned \$125,000 (2,500 machine-hours \times \$50 per machine-hour) of manufacturing overhead cost. The sales of each product minus its cost of goods sold equals the product margin of \$615,750 for standard stanchions and \$258,000 for custom compass housings.

Notice, the net operating loss of \$1,250 shown in Exhibit 7–12 agrees with the loss reported in the income statement in Exhibit 7–1 and with the loss shown in the table immediately beneath Exhibit 7–10. The company's *total sales*, *total costs*, and its resulting net operating loss are the same regardless of whether you are looking at the absorption income statement in Exhibit 7–1, the ABC product profitability analysis depicted on page 251, or the traditional product profitability analysis in Exhibit 7–12. Although the “total pie” remains constant across the traditional and ABC systems, what differs is how the pie is divided between the two product lines. The traditional product margin calculations suggest that standard stanchions are generating a product margin of \$615,750 and the custom compass housings a product margin of \$258,000. However, these product margins differ from the ABC product margins reported in Exhibit 7–10. Indeed, the traditional cost system is sending misleading signals to Classic Brass's managers about each product's profitability. Let's explain why.

The Differences between ABC and Traditional Product Costs

The changes in product margins caused by switching from the traditional cost system to the activity-based costing system are shown below:

| | Standard Stanchions | Custom Compass Housings |
|--|---------------------|-------------------------|
| Product margins—traditional | \$615,750 | \$258,000 |
| Product margins—ABC | 906,250 | (49,500) |
| Change in reported product margins | <u>\$290,500</u> | <u>(\$307,500)</u> |

The traditional cost system overcosts the standard stanchions and consequently reports an artificially low product margin for this product. The switch to an activity-based view of product profitability increases the product margin on standard stanchions by \$290,500. In contrast, the traditional cost system undercosts the custom compass housings and reports an artificially high product margin for this product. The switch to activity-based costing decreases the product margin on custom compass housings by \$307,500.

The reasons for the change in reported product margins between the two costing methods are revealed in Exhibit 7–13. The top portion of the exhibit shows each product's direct and indirect cost assignments as reported by the traditional cost system in Exhibit 7–12. For example, Exhibit 7–13 includes the following costs for standard stanchions: direct materials, \$905,500; direct labor, \$263,750; and manufacturing overhead, \$875,000. Each of these costs corresponds with those reported in Exhibit 7–12. Notice, the selling and administrative costs of \$875,000 are purposely not allocated to products because these costs are considered to be period costs. Similarly, the bottom portion of Exhibit 7–13 summarizes the direct and indirect cost assignments as reported by the activity-based costing system in Exhibit 7–10. The only new information in Exhibit 7–13 is shown in the two columns of percentages. The first column of percentages shows the percentage of each cost assigned to standard stanchions. For example, the \$905,500 of direct materials cost traced to standard stanchions is 92.9% of the company's total direct materials cost of \$975,000. The second column of percentages does the same thing for custom compass housings.

There are three reasons why the traditional and activity-based costing systems report different product margins. First, Classic Brass's traditional cost system allocates

EXHIBIT 7-13 A Comparison of Traditional and Activity-Based Cost Assignments

| | Standard Stanchions | | Custom Compass Housings | | Total |
|---------------------------------------|---------------------|----------------|-------------------------|----------------|--------------------|
| | (a) Amount | (a) ÷ (c) % | (b) Amount | (b) ÷ (c) % | (c) Amount |
| Traditional Cost System | | | | | |
| Direct materials | \$ 905,500 | 92.9% | \$ 69,500 | 7.1% | \$ 975,000 |
| Direct labor | 263,750 | 75.1% | 87,500 | 24.9% | 351,250 |
| Manufacturing overhead | 875,000 | 87.5% | 125,000 | 12.5% | 1,000,000 |
| Total cost assigned to products | <u>\$2,044,250</u> | | <u>\$282,000</u> | | 2,326,250 |
| Selling and administrative | | | | | 875,000 |
| Total cost | | | | | <u>\$3,201,250</u> |
| Activity-Based Costing System | | | | | |
| Direct costs: | | | | | |
| Direct materials | \$ 905,500 | 92.9% | \$ 69,500 | 7.1% | \$ 975,000 |
| Direct labor | 263,750 | 75.1% | 87,500 | 24.9% | 351,250 |
| Shipping | 60,000 | 92.3% | 5,000 | 7.7% | 65,000 |
| Indirect costs: | | | | | |
| Customer orders | 192,000 | 60.0% | 128,000 | 40.0% | 320,000 |
| Product design | 0 | 0.0% | 252,000 | 100.0% | 252,000 |
| Order size | 332,500 | 87.5% | 47,500 | 12.5% | 380,000 |
| Total cost assigned to products | <u>\$1,753,750</u> | | <u>\$589,500</u> | | 2,343,250 |
| Costs not assigned to products: | | | | | |
| Customer relations | | | | | 367,500 |
| Other | | | | | 490,500 |
| Total cost | | | | | <u>\$3,201,250</u> |

all manufacturing overhead costs to products. This forces both products to absorb all manufacturing overhead costs regardless of whether they actually consumed the costs that were allocated to them. The ABC system does not assign the manufacturing overhead costs consumed by the Customer Relations activity to products because these costs are caused by customers, not specific products. It also does not assign the manufacturing overhead costs included in the Other activity to products because these organization-sustaining and unused capacity costs are not caused by any particular product. From an ABC point of view, assigning these costs to products is inherently arbitrary and counterproductive.

Second, Classic Brass's traditional cost system allocates all of the manufacturing overhead costs using a volume-related allocation base—machine-hours—that may or may not reflect what actually causes the costs. In other words, in the traditional system, 87.5% of each manufacturing overhead cost is implicitly assigned to standard stanchions and 12.5% is assigned to custom compass housings. For example, the traditional cost system inappropriately assigns 87.5% of the costs of the Customer Orders activity (a batch-level activity) to standard stanchions even though the ABC system revealed that standard stanchions caused only 60% of these costs. Conversely, the traditional cost system assigns only 12.5% of these costs to custom compass housings even though this product caused 40% of these costs. Similarly, the traditional cost system assigns 87.5% of the costs of the Product Design activity (a product-level activity) to standard stanchions even though the standard stanchions caused none of these costs. All of the costs of the Product Design activity, rather than just 12.5%, should be assigned to custom compass housings. The result is that traditional cost systems overcost high-volume products (such as the standard stanchions) and undercost low-volume products (such as the custom compass housings) because they assign batch-level and product-level costs using volume-related allocation bases.

The third reason the product margins differ between the two cost systems is that the ABC system assigns the nonmanufacturing overhead costs caused by products to those

products on a cause-and-effect basis. The traditional cost system disregards these costs because they are classified as period costs. The ABC system directly traces shipping costs to products and includes the nonmanufacturing overhead costs caused by products in the activity cost pools that are assigned to products.

MANAGERIAL ACCOUNTING IN ACTION
The Wrap-up

The ABC design team presented the results of its work in a meeting attended by all of the top managers of Classic Brass, including the president John Towers, the production manager Susan Richter, the marketing manager Tom Olafson, and the accounting manager Mary Goodman. The ABC team brought with them copies of the chart showing the ABC design (Exhibit 7–7), and the table comparing the traditional and ABC cost assignments (Exhibit 7–13). After the formal presentation by the ABC team, the following discussion took place:

John: I would like to personally thank the ABC team for all of the work they have done and for an extremely interesting presentation. I am now beginning to wonder about a lot of the decisions we have made in the past using our old cost accounting system.

IN BUSINESS

COMPARING ACTIVITY-BASED AND TRADITIONAL PRODUCT COSTS

Airco Heating and Air Conditioning (Airco), located in Van Buren, Arkansas, implemented an ABC system to better understand the profitability of its products. The ABC system assigned \$4,458,605 of overhead costs to eight activities as follows:

| Activity Cost Pool | Total Cost | Total Activity | Activity Rate |
|-------------------------------|--------------------|--------------------------|---------------|
| Machines | \$ 435,425 | 73,872 machine-hours | \$5.89 |
| Data record maintenance | 132,597 | 14 products administered | \$9,471.21 |
| Material handling | 1,560,027 | 16,872 products | \$92.46 |
| Product changeover | 723,338 | 72 setup hours | \$10,046.36 |
| Scheduling | 24,877 | 2,788 production runs | \$8.92 |
| Raw material receiving | 877,107 | 2,859 receipts | \$306.79 |
| Product shipment | 561,014 | 13,784,015 miles | \$0.04 |
| Customer service | 144,220 | 2,533 customer contacts | \$56.94 |
| Total | <u>\$4,458,605</u> | | |

Airco’s managers were surprised by the fact that 55% [(\$1,560,027 + \$877,107) ÷ \$4,458,605] of its overhead resources were consumed by material handling and raw material receiving activities. They responded by reducing the raw material and part transport distances within the facility. In addition, they compared the traditional and ABC product margin percentages (computed by dividing each product’s margin by the sales of the product) for the company’s seven product lines of air conditioners as summarized below:

| | Product | | | | | | |
|------------------------------------|---------|-------|---------|--------|----------|--------|--------|
| | 5-Ton | 6-Ton | 7.5-Ton | 10-Ton | 12.5-Ton | 15-Ton | 20-Ton |
| Traditional product margin % | –20% | 4% | 40% | –4% | 20% | 42% | 70% |
| ABC product margin % | –15% | –8% | 50% | 1% | –6% | 40% | 69% |

In response to the ABC data, Airco decided to explore the possibility of raising prices on 5-ton, 6-ton, and 12.5-ton air conditioners while at the same time seeking to reduce overhead consumption by these products.

Source: Copyright 2004 from Heather Nachtmann and Mohammad Hani Al-Rifai, “An Application of Activity-Based Costing in the Air Conditioner Manufacturing Industry,” *The Engineering Economist* 49, Issue 3, 2004, pp. 221–236. Reproduced by permission of Taylor & Francis Group, LLC, www.taylorandfrancis.com.

According to the ABC analysis, we had it all backwards. We are losing money on the custom products and making a fistful on the standard products.

Mary: I have to admit that I had no idea that the Product Design work for custom compass housings was so expensive! I knew burying these costs in our plantwide overhead rate was penalizing standard stanchions, but I didn't understand the magnitude of the problem.

Susan: I never did believe we were making a lot of money on the custom jobs. You ought to see all of the problems they create for us in production.

Tom: I hate to admit it, but the custom jobs always seem to give us headaches in marketing, too.

John: If we are losing money on custom compass housings, why not suggest to our customers that they go elsewhere for that kind of work?

Tom: Wait a minute, we would lose a lot of sales.

Susan: So what, we would save a lot more costs.

Mary: Maybe yes, maybe no. Some of the costs would not disappear if we were to drop the custom business.

Tom: Like what?

Mary: Well Tom, I believe you said that about 10% of your time is spent dealing with new products. As a consequence, 10% of your salary was allocated to the Product Design cost pool. If we were to drop all of the products requiring design work, would you be willing to take a 10% pay cut?

Tom: I trust you're joking.

Mary: Do you see the problem? Just because 10% of your time is spent on custom products doesn't mean that the company would save 10% of your salary if the custom products were dropped. Before we take a drastic action like dropping the custom products, we should identify which costs are really relevant.

John: I think I see what you are driving at. We wouldn't want to drop a lot of products only to find that our costs really haven't changed much. It is true that dropping the products would free up resources like Tom's time, but we had better be sure we have some good use for those resources *before* we take such an action.

As this discussion among the managers of Classic Brass illustrates, caution should be exercised before taking an action based on an ABC analysis such as the one shown in Exhibits 7–10 and 7–11. The product and customer margins computed in these exhibits are a useful starting point for further analysis, but managers need to know what costs are really affected before taking any action such as dropping a product or customer or changing the prices of products or services. Appendix 7A shows how an *action analysis report* can be constructed to help managers make such decisions. An **action analysis report** provides more detail about costs and how they might adjust to changes in activity than the ABC analysis presented in Exhibits 7–10 and 7–11.

Targeting Process Improvements

Activity-based costing can also be used to identify activities that would benefit from process improvements. When used in this way, activity-based costing is often called *activity-based management*. Basically, **activity-based management** involves focusing on activities to eliminate waste, decrease processing time, and reduce defects. Activity-based management is used in organizations as diverse as manufacturing companies, hospitals, and the U.S. Marine Corps.

The first step in any improvement program is to decide what to improve. The Theory of Constraints approach discussed in Chapter 1 is a powerful tool for targeting the area in an organization whose improvement will yield the greatest benefit. Activity-based management provides another approach. The activity rates computed in activity-based costing can provide valuable clues concerning where there is waste and opportunity

for improvement. For example, looking at the activity rates in Exhibit 7–6, managers at Classic Brass may conclude that \$320 to process a customer order is far too expensive for an activity that adds no value to the product. As a consequence, they may target customer order processing for process improvement using Six Sigma as discussed in Chapter 1.

Benchmarking is another way to leverage the information in activity rates. **Benchmarking** is a systematic approach to identifying the activities with the greatest room for improvement. It is based on comparing the performance in an organization with the performance of other, similar organizations known for their outstanding performance. If a particular part of the organization performs far below the world-class standard, managers will be likely to target that area for improvement.

IN BUSINESS

COSTS IN HEALTH CARE

Owens & Minor, a \$3 billion medical supplies distributor, offers an activity-based billing option to its customers. Instead of charging a fixed amount for items that are ordered by customers, the charges are based on activities required to fill the order as well as on the cost of the item ordered. For example, Owens & Minor charges extra for weekend deliveries. These charges encourage customers to reduce their weekend delivery requests. This results in decreased costs for Owens & Minor, which can then be passed on to customers in the form of lower charges for the specific items that are ordered. As many as 25% of Owens & Minor's 4,000 health care customers have used this billing option to identify and realize cost reduction opportunities. For example, Bill Wright of **Sutter Health** in Sacramento, California, said that Owens & Minor's activity-based billing has motivated his company to eliminate weekend deliveries, place more items per order, align purchase quantities with prepackaged specifications, and transmit orders electronically. The end result is that one Sutter affiliate decreased its purchasing costs from 4.25% of product costs to 3.75%. In all, Owens & Minor has identified about 250 activity-driven procurement costs that hospitals can manage more efficiently to reduce costs.

IN BUSINESS

PROCESS IMPROVEMENTS HELP NURSES

Providence Portland Medical Center (PPMC) used ABC to improve one of the most expensive and error-prone processes within its nursing units—ordering, distributing, and administering medications to patients. To the surprise of everyone involved, the ABC data showed that "medication-related activities made up 43% of the nursing unit's total operating costs." The ABC team members knew that one of the root causes of this time-consuming process was the illegibility of physician orders that are faxed to the pharmacy. Replacing the standard fax machine with a much better \$5,000 machine virtually eliminated unreadable orders and decreased follow-up telephone calls by more than 90%—saving the hospital \$500,000 per year. In total, the ABC team generated improvement ideas that offered \$1 million of net savings in redeployable resources. "This amount translates to additional time that nurses and pharmacists can spend on direct patient care."

Source: "How ABC Analysis Will Save PPMC Over \$1 Million a Year," *Financial Analysis, Planning & Reporting*, November 2003, pp. 6–10.

Activity-Based Costing and External Reports

Although activity-based costing generally provides more accurate product costs than traditional costing methods, it is infrequently used for external reports for a number of reasons. First, external reports are less detailed than internal reports prepared for decision making. On the external reports, individual product costs are not reported. Cost of goods sold and inventory valuations are disclosed, but they are not broken down by product. If some products are undercosted and some are overcosted, the errors tend to offset each other when the product costs are added together.

Second, it is often very difficult to make changes in a company's accounting system. The official cost accounting systems in most large companies are usually embedded in complex computer programs that have been modified in-house over the course of many years. It is extremely difficult to make changes in such computer programs without causing numerous bugs.

Third, an ABC system such as the one described in this chapter does not conform to generally accepted accounting principles (GAAP). As discussed in Chapter 2, product costs computed for external reports must include all of the manufacturing costs and only manufacturing costs; but in an ABC system as described in this chapter, product costs exclude some manufacturing costs and include some nonmanufacturing costs. It is possible to adjust the ABC data at the end of the period to conform to GAAP, but that requires more work.

Fourth, auditors are likely to be uncomfortable with allocations that are based on interviews with the company's personnel. Such subjective data can be easily manipulated by management to make earnings and other key variables look more favorable.

For all of these reasons, most companies confine their ABC efforts to special studies for management, and they do not attempt to integrate activity-based costing into their formal cost accounting systems.

The Limitations of Activity-Based Costing

Implementing an activity-based costing system is a major project that requires substantial resources. And once implemented, an activity-based costing system is more costly to maintain than a traditional costing system—data concerning numerous activity measures must be periodically collected, checked, and entered into the system. The benefits of increased accuracy may not outweigh these costs.

Activity-based costing produces numbers, such as product margins, that are at odds with the numbers produced by traditional costing systems. But managers are accustomed to using traditional costing systems to run their operations and traditional costing systems are often used in performance evaluations. Essentially, activity-based costing changes the rules of the game. It is a fact of human nature that changes in organizations, particularly those that alter the rules of the game, inevitably face resistance. This underscores the importance of top management support and the full participation of line managers, as well as the accounting staff, in any activity-based costing initiative. If activity-based costing is viewed as an accounting initiative that does not have the full support of top management, it is doomed to failure.

In practice, most managers insist on fully allocating all costs to products, customers, and other costing objects in an activity-based costing system—including the costs of idle capacity and organization-sustaining costs. This results in overstated costs and understated margins and mistakes in pricing and other critical decisions.

Activity-based costing data can easily be misinterpreted and must be used with care when used in making decisions. Costs assigned to products, customers, and other cost objects are only *potentially* relevant. Before making any significant decisions using

activity-based costing data, managers must identify which costs are really relevant for the decision at hand. See Appendix 7A for more details.

As discussed in the previous section, reports generated by the best activity-based costing systems do not conform to generally accepted accounting principles. Consequently, an organization involved in activity-based costing should have two cost systems—one for internal use and one for preparing external reports. This is costlier than maintaining just one system and may cause confusion about which system is to be believed and relied on.

IN BUSINESS

A CRITICAL PERSPECTIVE OF ABC

Marconi is a Portuguese telecommunications company that encountered problems with its ABC system. The company's production managers felt that 23% of the costs included in the system were common costs that should not be allocated to products and that allocating these costs to products was not only inaccurate, but also irrelevant to their operational cost reduction efforts. Furthermore, Marconi's front-line workers resisted the ABC system because they felt it might be used to weaken their autonomy and to justify downsizing, outsourcing, and work intensification. They believed that ABC created a "turkeys queuing for Christmas syndrome" because they were expected to volunteer information to help create a cost system that could eventually lead to their demise. These two complications created a third problem—the data necessary to build the ABC cost model was provided by disgruntled and distrustful employees. Consequently, the accuracy of the data was questionable at best. In short, Marconi's experiences illustrate some of the challenges that complicate real-world ABC implementations.

Source: Maria Major and Trevor Hopper, "Managers Divided: Implementing ABC in a Portuguese Telecommunications Company," *Management Accounting Research*, June 2005, pp. 205–229.

Summary

Traditional cost accounting methods suffer from several defects that can result in distorted costs for decision-making purposes. All manufacturing costs—even those that are not caused by any specific product—are allocated to products. Nonmanufacturing costs that are caused by products are not assigned to products. And finally, traditional methods tend to place too much reliance on unit-level allocation bases such as direct labor and machine-hours. This results in overcosting high-volume products and undercosting low-volume products and can lead to mistakes when making decisions.

Activity-based costing estimates the costs of the resources consumed by cost objects such as products and customers. The activity-based costing approach assumes that cost objects generate activities that in turn consume costly resources. Activities form the link between costs and cost objects. Activity-based costing is concerned with overhead—both manufacturing overhead and selling and administrative overhead. The accounting for direct labor and direct materials is usually the same under traditional and ABC costing methods.

To build an ABC system, companies typically choose a small set of activities that summarize much of the work performed in overhead departments. Associated with each activity is an activity cost pool. To the extent possible, overhead costs are directly traced to these activity cost pools. The remaining overhead costs are allocated to the activity cost pools in the first-stage allocation. Interviews with managers often form the basis for these allocations.

An activity rate is computed for each cost pool by dividing the costs assigned to the cost pool by the measure of activity for the cost pool. Activity rates provide useful information to managers concerning the costs of performing overhead activities. A particularly high cost for an activity may trigger efforts to improve the way the activity is carried out in the organization.

In the second-stage allocation, the activity rates are used to apply costs to cost objects such as products and customers. The costs computed under activity-based costing are often quite different from the costs generated by

a company’s traditional cost accounting system. While the ABC system is almost certainly more accurate, managers should nevertheless exercise caution before making decisions based on the ABC data. Some of the costs may not be avoidable and hence would not be relevant.

Review Problem: Activity-Based Costing

Ferris Corporation makes a single product—a fire-resistant commercial filing cabinet—that it sells to office furniture distributors. The company has a simple ABC system that it uses for internal decision making. The company has two overhead departments whose costs are listed on the following page:

| | |
|---|-------------------------|
| Manufacturing overhead | \$500,000 |
| Selling and administrative overhead | <u>300,000</u> |
| Total overhead costs | <u><u>\$800,000</u></u> |

The company’s ABC system has the following activity cost pools and activity measures:

| Activity Cost Pool | Activity Measure |
|----------------------------|---------------------|
| Assembling units | Number of units |
| Processing orders | Number of orders |
| Supporting customers | Number of customers |
| Other | Not applicable |

Costs assigned to the “Other” activity cost pool have no activity measure; they consist of the costs of unused capacity and organization-sustaining costs—neither of which are assigned to orders, customers, or the product.

Ferris Corporation distributes the costs of manufacturing overhead and of selling and administrative overhead to the activity cost pools based on employee interviews, the results of which are reported below:

| Distribution of Resource Consumption Across Activity Cost Pools | | | | | |
|---|---------------------|----------------------|-------------------------|-------|-------|
| | Assembling Units | Processing Orders | Supporting Customers | Other | Total |
| Manufacturing overhead | 50% | 35% | 5% | 10% | 100% |
| Selling and administrative overhead | 10% | 45% | 25% | 20% | 100% |
| Total activity | 1,000 units | 250 orders | 100 customers | | |

Required:

1. Perform the first-stage allocation of overhead costs to the activity cost pools as in Exhibit 7–5.
2. Compute activity rates for the activity cost pools as in Exhibit 7–6.
3. OfficeMart is one of Ferris Corporation’s customers. Last year, OfficeMart ordered filing cabinets four different times. OfficeMart ordered a total of 80 filing cabinets during the year. Construct a table as in Exhibit 7–9 showing the overhead costs attributable to OfficeMart.
4. The selling price of a filing cabinet is \$595. The cost of direct materials is \$180 per filing cabinet, and direct labor is \$50 per filing cabinet. What is the customer margin of OfficeMart? See Exhibit 7–11 for an example of how to complete this report.

Solution to Review Problem

1. The first-stage allocation of costs to the activity cost pools appears below:

| | Activity Cost Pools | | | | Total |
|--|---------------------|----------------------|-------------------------|------------------|------------------|
| | Assembling Units | Processing Orders | Supporting Customers | Other | |
| Manufacturing overhead | \$250,000 | \$175,000 | \$ 25,000 | \$ 50,000 | \$500,000 |
| Selling and administrative overhead | 30,000 | 135,000 | 75,000 | 60,000 | 300,000 |
| Total cost | <u>\$280,000</u> | <u>\$310,000</u> | <u>\$100,000</u> | <u>\$110,000</u> | <u>\$800,000</u> |

2. The activity rates for the activity cost pools are:

| Activity Cost Pools | (a) Total Cost | (b) Total Activity | (a) ÷ (b) Activity Rate |
|----------------------------|-------------------|-----------------------|----------------------------|
| Assembling units | \$280,000 | 1,000 units | \$280 per unit |
| Processing orders | \$310,000 | 250 orders | \$1,240 per order |
| Supporting customers | \$100,000 | 100 customers | \$1,000 per customer |

3. The overhead cost attributable to OfficeMart would be computed as follows:

| Activity Cost Pools | (a) Activity Rate | (b) Activity | (a) × (b) ABC Cost |
|----------------------------|----------------------|-----------------|-----------------------|
| Assembling units | \$280 per unit | 80 units | \$22,400 |
| Processing orders | \$1,240 per order | 4 orders | \$4,960 |
| Supporting customers | \$1,000 per customer | 1 customer | \$1,000 |

4. The customer margin can be computed as follows:

| | | |
|--|--------------|---------------|
| Sales (\$595 per unit × 80 units) | | \$47,600 |
| Costs: | | |
| Direct materials (\$180 per unit × 80 units) | \$14,400 | |
| Direct labor (\$50 per unit × 80 units) | 4,000 | |
| Unit-related overhead (above) | 22,400 | |
| Order-related overhead (above) | 4,960 | |
| Customer-related overhead (above) | <u>1,000</u> | <u>46,760</u> |
| Customer margin | | <u>\$ 840</u> |

Glossary

Action analysis report A report showing what costs have been assigned to a cost object, such as a product or customer, and how difficult it would be to adjust the cost if there is a change in activity. (p. 257)

Activity An event that causes the consumption of overhead resources in an organization. (p. 237)

Activity-based costing (ABC) A costing method based on activities that is designed to provide managers with cost information for strategic and other decisions that potentially affect capacity and therefore fixed as well as variable costs. (p. 235)

Activity-based management (ABM) A management approach that focuses on managing activities as a way of eliminating waste and reducing delays and defects. (p. 257)

- Activity cost pool** A “bucket” in which costs are accumulated that relate to a single activity measure in an activity-based costing system. (p. 237)
- Activity measure** An allocation base in an activity-based costing system; ideally, a measure of the amount of activity that drives the costs in an activity cost pool. (p. 237)
- Batch-level activities** Activities that are performed each time a batch of goods is handled or processed, regardless of how many units are in the batch. The amount of resource consumed depends on the number of batches run rather than on the number of units in the batch. (p. 238)
- Benchmarking** A systematic approach to identifying the activities with the greatest potential for improvement. (p. 258)
- Customer-level activities** Activities that are carried out to support customers but that are not related to any specific product. (p. 238)
- Duration driver** A measure of the amount of time required to perform an activity. (p. 237)
- First-stage allocation** The process by which overhead costs are assigned to activity cost pools in an activity-based costing system. (p. 243)
- Organization-sustaining activities** Activities that are carried out regardless of which customers are served, which products are produced, how many batches are run, or how many units are made. (p. 238)
- Product-level activities** Activities that relate to specific products that must be carried out regardless of how many units are produced and sold or batches run. (p. 238)
- Second-stage allocation** The process by which activity rates are used to apply costs to products and customers in activity-based costing. (p. 247)
- Transaction driver** A simple count of the number of times an activity occurs. (p. 237)
- Unit-level activities** Activities that are performed each time a unit is produced. (p. 238)

Questions

- 7-1 In what fundamental ways does activity-based costing differ from traditional costing methods such as those described in Chapters 2 and 3?
- 7-2 Why is direct labor a poor base for allocating overhead in many companies?
- 7-3 Why are top management support and cross-functional involvement crucial when attempting to implement an activity-based costing system?
- 7-4 What are unit-level, batch-level, product-level, customer-level, and organization-sustaining activities?
- 7-5 What types of costs should not be assigned to products in an activity-based costing system?
- 7-6 Why are there two stages of allocation in activity-based costing?
- 7-7 Why is the first stage of the allocation process in activity-based costing often based on interviews?
- 7-8 When activity-based costing is used, why do manufacturing overhead costs often shift from high-volume products to low-volume products?
- 7-9 How can the activity rates (i.e., cost per activity) for the various activities be used to target process improvements?
- 7-10 Why is the activity-based costing described in this chapter unacceptable for external financial reports?

Multiple-choice questions are provided on the text website at www.mhhe.com/noreen2e.

connect™

Exercises

EXERCISE 7-1 ABC Cost Hierarchy [L01]

The following activities occur at Greenwich Corporation, a company that manufactures a variety of products.

- Receive raw materials from suppliers.
- Manage parts inventories.
- Do rough milling work on products.
- Interview and process new employees in the personnel department.
- Design new products.

- f. Perform periodic preventive maintenance on general-use equipment.
- g. Use the general factory building.
- h. Issue purchase orders for a job.

Required:

Classify each of the activities above as either a unit-level, batch-level, product-level, or organization-sustaining activity.

EXERCISE 7-2 First Stage Allocation [LO2]

SecuriCorp operates a fleet of armored cars that make scheduled pickups and deliveries in the Los Angeles area. The company is implementing an activity-based costing system that has four activity cost pools: Travel, Pickup and Delivery, Customer Service, and Other. The activity measures are miles for the Travel cost pool, number of pickups and deliveries for the Pickup and Delivery cost pool, and number of customers for the Customer Service cost pool. The Other cost pool has no activity measure because it is an organization-sustaining activity. The following costs will be assigned using the activity-based costing system:

| | |
|---|---------------------------|
| Driver and guard wages | \$ 720,000 |
| Vehicle operating expense | 280,000 |
| Vehicle depreciation | 120,000 |
| Customer representative salaries and expenses | 160,000 |
| Office expenses | 30,000 |
| Administrative expenses | 320,000 |
| Total cost | <u>\$1,630,000</u> |

The distribution of resource consumption across the activity cost pools is as follows:

| | Travel | Pickup and Delivery | Customer Service | Other | Total |
|---|--------|---------------------------|---------------------|-------|-------|
| Driver and guard wages | 50% | 35% | 10% | 5% | 100% |
| Vehicle operating expense..... | 70% | 5% | 0% | 25% | 100% |
| Vehicle depreciation | 60% | 15% | 0% | 25% | 100% |
| Customer representative salaries and expenses..... | 0% | 0% | 90% | 10% | 100% |
| Office expenses..... | 0% | 20% | 30% | 50% | 100% |
| Administrative expenses..... | 0% | 5% | 60% | 35% | 100% |

Required:

Complete the first stage allocations of costs to activity cost pools as illustrated in Exhibit 7-5.

EXERCISE 7-3 Compute Activity Rates [LO3]

Green Thumb Gardening is a small gardening service that uses activity-based costing to estimate costs for pricing and other purposes. The proprietor of the company believes that costs are driven primarily by the size of customer lawns, the size of customer garden beds, the distance to travel to customers, and the number of customers. In addition, the costs of maintaining garden beds depends on whether the beds are low maintenance beds (mainly ordinary trees and shrubs) or high maintenance beds (mainly flowers and exotic plants). Accordingly, the company uses the five activity cost pools listed below:

| Activity Cost Pool | Activity Measure |
|---|--------------------------------------|
| Caring for lawn | Square feet of lawn |
| Caring for garden beds—low maintenance | Square feet of low maintenance beds |
| Caring for garden beds—high maintenance | Square feet of high maintenance beds |
| Travel to jobs | Miles |
| Customer billing and service | Number of customers |

The company has already completed its first stage allocations of costs and has summarized its annual costs and activity as follows:

| Activity Cost Pool | Estimated Overhead Cost | Expected Activity |
|---|-------------------------|---|
| Caring for lawn | \$72,000 | 150,000 square feet of lawn |
| Caring for garden beds—low maintenance | \$26,400 | 20,000 square feet of low maintenance beds |
| Caring for garden beds—high maintenance | \$41,400 | 15,000 square feet of high maintenance beds |
| Travel to jobs | \$3,250 | 12,500 miles |
| Customer billing and service | \$8,750 | 25 customers |

Required:

Compute the activity rate for each of the activity cost pools.

EXERCISE 7-4 Second-Stage Allocation [LO4]

Klumper Corporation is a diversified manufacturer of industrial goods. The company’s activity-based costing system contains the following six activity cost pools and activity rates:

| Activity Cost Pool | Activity Rates |
|-------------------------------|------------------------------|
| Supporting direct labor | \$6.00 per direct labor-hour |
| Machine processing | \$4.00 per machine-hour |
| Machine setups | \$50.00 per setup |
| Production orders | \$90.00 per order |
| Shipments | \$14.00 per shipment |
| Product sustaining | \$840.00 per product |

Activity data have been supplied for the following two products:

| | Total Expected Activity | |
|---|-------------------------|-------|
| | K425 | M67 |
| Number of units produced per year | 200 | 2,000 |
| Direct labor-hours | 80 | 500 |
| Machine-hours | 100 | 1,500 |
| Machine setups | 1 | 4 |
| Production orders | 1 | 4 |
| Shipments | 1 | 10 |
| Product sustaining | 1 | 1 |

Required:

Determine the total overhead cost that would be assigned to each of the products listed above in the activity-based costing system.

EXERCISE 7-5 Product and Customer Profitability Analysis [LO4, LO5]

Thermal Rising, Inc., makes paragliders for sale through specialty sporting goods stores. The company has a standard paraglider model, but also makes custom-designed paragliders. Management has designed an activity-based costing system with the following activity cost pools and activity rates:

| Activity Cost Pool | Activity Rate |
|--------------------------------|----------------------------|
| Supporting direct labor | \$26 per direct labor-hour |
| Order processing | \$284 per order |
| Custom design processing | \$186 per custom design |
| Customer service | \$379 per customer |

Management would like an analysis of the profitability of a particular customer, Big Sky Outfitters, which has ordered the following products over the last 12 months:

| | Standard Model | Custom Design |
|--|----------------|---------------|
| Number of gliders | 20 | 3 |
| Number of orders | 1 | 3 |
| Number of custom designs | 0 | 3 |
| Direct labor-hours per glider | 26.35 | 28.00 |
| Selling price per glider | \$1,850 | \$2,400 |
| Direct materials cost per glider | \$564 | \$634 |

The company's direct labor rate is \$19.50 per hour.

Required:

Using the company's activity-based costing system, compute the customer margin of Big Sky Outfitters.

EXERCISE 7-6 Activity Measures [LO1]

Various activities at Ming Corporation, a manufacturing company, are listed below. Each activity has been classified as a unit-level, batch-level, product-level, or customer-level activity.

| Activity | Level of Activity | Examples of Activity Measures |
|--|-------------------|-------------------------------|
| a. Direct labor workers assemble a product | Unit | |
| b. Products are designed by engineers | Product | |
| c. Equipment is set up | Batch | |
| d. Machines are used to shape and cut materials | Unit | |
| e. Monthly bills are sent out to regular customers | Customer | |
| f. Materials are moved from the receiving dock to production lines | Batch | |
| g. All completed units are inspected for defects | Unit | |

Required:

Complete the table by providing an example of an activity measure for each activity.

EXERCISE 7-7 Computing ABC Product Costs [LO3, LO4]

Fogerty Company makes two products, titanium Hubs and Sprockets. Data regarding the two products follow:

| | Direct Labor-Hours per Unit | Annual Production |
|-----------------|-----------------------------|-------------------|
| Hubs | 0.80 | 10,000 units |
| Sprockets | 0.40 | 40,000 units |

Additional information about the company follows:

- a. Hubs require \$32 in direct materials per unit, and Sprockets require \$18.
- b. The direct labor wage rate is \$15 per hour.
- c. Hubs are more complex to manufacture than Sprockets and they require special processing.

d. The ABC system has the following activity cost pools:

| | Estimated | Activity | | |
|---|---------------|----------|-----------|--------|
| Activity Cost Pool (and Activity Measure) | Overhead Cost | Hubs | Sprockets | Total |
| Machine setups (number of setups) | \$72,000 | 100 | 300 | 400 |
| Special processing (machine-hours) | \$200,000 | 5,000 | 0 | 5,000 |
| General factory (Direct labor-hours) | \$816,000 | 8,000 | 16,000 | 24,000 |

Required:

1. Compute the activity rate for each activity cost pool.
2. Determine the unit cost of each product according to the ABC system, including direct materials and direct labor.

EXERCISE 7-8 Second-Stage Allocation to an Order [LO4]

Durban Metal Products, Ltd., of the Republic of South Africa makes specialty metal parts used in applications ranging from the cutting edges of bulldozer blades to replacement parts for Land Rovers. The company uses an activity-based costing system for internal decision-making purposes. The company has four activity cost pools as listed below:

| Activity Cost Pool | Activity Measure | Activity Rate |
|-----------------------|------------------------------|------------------------------|
| Order size | Number of direct labor-hours | R16.85 per direct labor-hour |
| Customer orders | Number of customer orders | R320.00 per customer order |
| Product testing | Number of testing hours | R89.00 per testing hour |
| Selling | Number of sales calls | R1,090.00 per sales call |

Note: The currency in South Africa is the Rand, denoted here by R.

The managing director of the company would like information concerning the cost of a recently completed order for heavy-duty trailer axles. The order required 200 direct labor-hours, 4 hours of product testing, and 2 sales calls.

Required:

Prepare a report summarizing the overhead costs assigned to the order for heavy-duty trailer axles. What is the total overhead cost assigned to the order?

EXERCISE 7-9 First-Stage Allocations [LO2]

The operations vice president of Security Home Bank has been interested in investigating the efficiency of the bank’s operations. She has been particularly concerned about the costs of handling routine transactions at the bank and would like to compare these costs at the bank’s various branches. If the branches with the most efficient operations can be identified, their methods can be studied and then replicated elsewhere. While the bank maintains meticulous records of wages and other costs, there has been no attempt thus far to show how those costs are related to the various services provided by the bank. The operations vice president has asked your help in conducting an activity-based costing study of bank operations. In particular, she would like to know the cost of opening an account, the cost of processing deposits and withdrawals, and the cost of processing other customer transactions.

The Westfield branch of Security Home Bank has submitted the following cost data for last year:

| | |
|---------------------------------------|------------------|
| Teller wages | \$160,000 |
| Assistant branch manager salary | 75,000 |
| Branch manager salary | 80,000 |
| Total | <u>\$315,000</u> |

Virtually all other costs of the branch—rent, depreciation, utilities, and so on—are organization-sustaining costs that cannot be meaningfully assigned to individual customer transactions such as depositing checks.

In addition to the cost data above, the employees of the Westfield branch have been interviewed concerning how their time was distributed last year across the activities included in the activity-based costing study. The results of those interviews appear below:

| | Opening Accounts | Processing Deposits and Withdrawals | Processing Other Customer Transactions | Other Activities | Total |
|---------------------------------------|------------------|-------------------------------------|--|------------------|-------|
| Teller wages | 5% | 65% | 20% | 10% | 100% |
| Assistant branch manager salary | 15% | 5% | 30% | 50% | 100% |
| Branch manager salary | 5% | 0% | 10% | 85% | 100% |

Required:

Prepare the first-stage allocation for the activity-based costing study. (See Exhibit 7–5 for an example of a first-stage allocation.)

EXERCISE 7–10 Computing and Interpreting Activity Rates [LO3]

(This exercise is a continuation of Exercise 7–9; it should be assigned *only* if Exercise 7–9 is also assigned.) The manager of the Westfield branch of Security Home Bank has provided the following data concerning the transactions of the branch during the past year:

| Activity | Total Activity at the Westfield Branch |
|--|---|
| Opening accounts | 500 new accounts opened |
| Processing deposits and withdrawals | 100,000 deposits and withdrawals processed |
| Processing other customer transactions | 5,000 other customer transactions processed |

The lowest costs reported by other branches for these activities are displayed below:

| Activity | Lowest Cost among All Security Home Bank Branches |
|--|---|
| Opening accounts | \$26.75 per new account |
| Processing deposits and withdrawals | \$1.24 per deposit or withdrawal |
| Processing other customer transactions | \$11.86 per other customer transaction |

Required:

- Using the first-stage allocation from Exercise 7–9 and the above data, compute the activity rates for the activity-based costing system. (Use Exhibit 7–6 as a guide.) Round all computations to the nearest whole cent.
- What do these results suggest to you concerning operations at the Westfield branch?

EXERCISE 7-11 Cost Hierarchy [LO1]

CD Express, Inc., provides CD duplicating services to software companies. The customer provides a master CD from which CD Express makes copies. An order from a customer can be for a single copy or for thousands of copies. Most jobs are broken down into batches to allow smaller jobs, with higher priorities, to have access to the machines.

A number of activities carried out at CD Express are listed below.

- a. Sales representatives' periodic visits to customers to keep them informed about the services provided by CD Express.
- b. Ordering labels from the printer for a particular CD.
- c. Setting up the CD duplicating machine to make copies from a particular master CD.
- d. Loading the automatic labeling machine with labels for a particular CD.
- e. Visually inspecting CDs and placing them by hand into protective plastic cases prior to shipping.
- f. Preparation of the shipping documents for the order.
- g. Periodic maintenance of equipment.
- h. Lighting and heating the company's production facility.
- i. Preparation of quarterly financial reports.

Required:

Classify each of the activities above as either a unit-level, batch-level, product-level, customerlevel, or organization-sustaining activity. An order to duplicate a particular CD is a product-level activity. Assume the order is large enough that it must be broken down into batches.

EXERCISE 7-12 Second-Stage Allocation and Margin Calculations [LO4, LO5]

Foam Products, Inc., makes foam seat cushions for the automotive and aerospace industries. The company's activity-based costing system has four activity cost pools, which are listed below along with their activity measures and activity rates:

| Activity Cost Pool | Activity Measure | Activity Rate |
|-------------------------------|------------------------------|------------------------------|
| Supporting direct labor | Number of direct labor-hours | \$5.55 per direct labor-hour |
| Batch processing | Number of batches | \$107.00 per batch |
| Order processing | Number of orders | \$275.00 per order |
| Customer service | Number of customers | \$2,463.00 per customer |

The company just completed a single order from Interstate Trucking for 1,000 custom seat cushions. The order was produced in two batches. Each seat cushion required 0.25 direct labor-hours. The selling price was \$20 per unit, the direct materials cost was \$8.50 per unit, and the direct labor cost was \$6.00 per unit. This was Interstate Trucking's only order during the year.

Required:

Using Exhibit 7-11 as a guide, prepare a report showing the customer margin on sales to Interstate Trucking for the year.

EXERCISE 7-13 Contrasting Traditional and ABC Product Costs [LO1, LO5]

Model X100 sells for \$120 per unit whereas Model X200 offers advanced features and sells for \$500 per unit. Management expects to sell 50,000 units of Model X100 and 5,000 units of Model X200 next year. The direct material cost per unit is \$50 for Model X100 and \$220 for Model X200. The company's total manufacturing overhead for the year is expected to be \$1,995,000. A unit of Model X100 requires 2 direct labor-hours and a unit of Model X200 requires 5 direct labor-hours. The direct labor wage rate is \$20 per hour.

Required:

1. The company currently applies manufacturing overhead to products using direct labor-hours as the allocation base. Using this traditional approach, compute the product margins for X100 and X200.
2. Management is considering an activity-based costing system and would like to know what impact this would have on product costs. Preliminary analysis suggests that under activity-based costing, a total of \$1,000,000 in manufacturing overhead cost would be assigned to Model X100 and a total of \$600,000 would be assigned to Model X200. In addition, a total of \$150,000 in nonmanufacturing overhead would be applied to Model X100 and a total of \$350,000 would be applied to Model X200. Using the activity-based costing approach, compute the product margins for X100 and X200.
3. Explain why the product margins computed in requirement (1) differ from those computed in requirement (2).

EXERCISE 7-14 Comprehensive Activity-Based Costing Exercise [L02, L03, L04, L05]

Advanced Products Corporation has supplied the following data from its activity-based costing system:

| Overhead Costs | |
|----------------------------|------------------|
| Wages and salaries | \$300,000 |
| Other overhead costs | 100,000 |
| Total overhead costs | <u>\$400,000</u> |

| Activity Cost Pool | Activity Measure | Total Activity for the Year |
|-------------------------------|---|-----------------------------|
| Supporting direct labor | Number of direct labor-hours | 20,000 DLHs |
| Order processing | Number of customer orders | 400 orders |
| Customer support | Number of customers | 200 customers |
| Other | This is an organization-sustaining activity | Not applicable |

| Distribution of Resource Consumption Across Activities | | | | | |
|--|-------------------------|------------------|------------------|-------|-------|
| | Supporting Direct Labor | Order Processing | Customer Support | Other | Total |
| Wages and salaries | 40% | 30% | 20% | 10% | 100% |
| Other overhead costs | 30% | 10% | 20% | 40% | 100% |

During the year, Advanced Products completed one order for a new customer, Shenzhen Enterprises. This customer did not order any other products during the year. Data concerning that order follow:

| Data concerning the Shenzhen Enterprises Order | |
|--|-----------------|
| Units ordered | 10 units |
| Direct labor-hours | 2 DLHs per unit |
| Selling price | \$300 per unit |
| Direct materials | \$180 per unit |
| Direct labor | \$50 per unit |

Required:

- Using Exhibit 7-5 as a guide, prepare a report showing the first-stage allocations of overhead costs to the activity cost pools.
- Using Exhibit 7-6 as a guide, compute the activity rates for the activity cost pools.
- Prepare a report showing the overhead costs for the order from Shenzhen Enterprises including customer support costs.
- Using Exhibit 7-11 as a guide, prepare a report showing the customer margin for Shenzhen Enterprises.

EXERCISE 7-15 Calculating and Interpreting Activity-Based Costing Data [L03, L04]

Hiram's Lakeside is a popular restaurant located on Lake Washington in Seattle. The owner of the restaurant has been trying to better understand costs at the restaurant and has hired a student intern to conduct an activity-based costing study. The intern, in consultation with the owner, identified three major activities and then completed the first-stage allocations of costs to the activity cost pools. The results appear below.

| Activity Cost Pool | Activity Measure | Total Cost | Total Activity |
|---------------------------------|--------------------------|------------|----------------|
| Serving a party of diners | Number of parties served | \$33,000 | 6,000 parties |
| Serving a diner | Number of diners served | \$138,000 | 15,000 diners |
| Serving drinks..... | Number of drinks ordered | \$24,000 | 10,000 drinks |

The above costs include all of the costs of the restaurant except for organization-sustaining costs such as rent, property taxes, and top-management salaries.

A group of diners who ask to sit at the same table are counted as a party. Some costs, such as the costs of cleaning linen, are the same whether one person is at a table or the table is full. Other costs, such as washing dishes, depend on the number of diners served.

Prior to the activity-based costing study, the owner knew very little about the costs of the restaurant. She knew that the total cost for the month (including organization-sustaining costs) was \$240,000 and that 15,000 diners had been served. Therefore, the average cost per diner was \$16.

Required:

1. According to the activity-based costing system, what is the total cost of serving each of the following parties of diners?
 - a. A party of four diners who order three drinks in total.
 - b. A party of two diners who do not order any drinks.
 - c. A lone diner who orders two drinks.
2. Convert the total costs you computed in (1) above to costs per diner. In other words, what is the average cost per diner for serving each of the following parties?
 - a. A party of four diners who order three drinks in total.
 - b. A party of two diners who do not order any drinks.
 - c. A lone diner who orders two drinks.
3. Why do the costs per diner for the three different parties differ from each other and from the overall average cost of \$16 per diner?

Problems

PROBLEM 7-16 Comparing Traditional and Activity-Based Product Margins [L01, L03, L04, L05]

Smoky Mountain Corporation makes two types of hiking boots—Xtreme and the Pathfinder. Data concerning these two product lines appear below:

| | Xtreme | Pathfinder |
|----------------------------------|--------------|--------------|
| Selling price per unit..... | \$140.00 | \$99.00 |
| Direct materials per unit..... | \$72.00 | \$53.00 |
| Direct labor per unit..... | \$24.00 | \$12.00 |
| Direct labor-hours per unit..... | 2.0 DLHs | 1.0 DLHs |
| Estimated annual production..... | 20,000 units | 80,000 units |

The company has a traditional costing system in which manufacturing overhead is applied to units based on direct labor-hours. Data concerning manufacturing overhead and direct labor-hours for the upcoming year appear below:

| | |
|--|--------------|
| Estimated total manufacturing overhead | \$1,980,000 |
| Estimated total direct labor-hours | 120,000 DLHs |

Required:

1. Using Exhibit 7-12 as a guide, compute the product margins for the Xtreme and the Pathfinder products under the company's traditional costing system.
2. The company is considering replacing its traditional costing system with an activity-based costing system that would assign its manufacturing overhead to the following four activity cost pools (the Other cost pool includes organization-sustaining costs and idle capacity costs):

| Activities and Activity Measures | Estimated Overhead Cost | Expected Activity | | Total |
|---|-------------------------|-------------------|------------|---------|
| | | Xtreme | Pathfinder | |
| Supporting direct labor (direct labor-hours) | \$ 783,600 | 40,000 | 80,000 | 120,000 |
| Batch setups (setups) | 495,000 | 200 | 100 | 300 |
| Product sustaining (number of products) | 602,400 | 1 | 1 | 2 |
| Other | 99,000 | NA | NA | NA |
| Total manufacturing overhead cost | <u>\$1,980,000</u> | | | |

- Using Exhibit 7–10 as a guide, compute the product margins for the Xtreme and the Pathfinder products under the activity-based costing system.
- Using Exhibit 7–13 as a guide, prepare a quantitative comparison of the traditional and activity-based cost assignments. Explain why the traditional and activity-based cost assignments differ.

eXcel

PROBLEM 7–17 Evaluating the Profitability of Services [LO2, LO3, LO4, LO5]

Gallatin Carpet Cleaning is a small, family-owned business operating out of Bozeman, Montana. For its services, the company has always charged a flat fee per hundred square feet of carpet cleaned. The current fee is \$28 per hundred square feet. However, there is some question about whether the company is actually making any money on jobs for some customers—particularly those located on remote ranches that require considerable travel time. The owner’s daughter, home for the summer from college, has suggested investigating this question using activity-based costing. After some discussion, a simple system consisting of four activity cost pools seemed to be adequate. The activity cost pools and their activity measures appear below:

| Activity Cost Pool | Activity Measure | Activity for the Year |
|--|---------------------------|----------------------------|
| Cleaning carpets | Square feet cleaned (00s) | 20,000 hundred square feet |
| Travel to jobs | Miles driven | 60,000 miles |
| Job support | Number of jobs | 2,000 jobs |
| Other (costs of idle capacity and organization-sustaining costs) | None | Not applicable |

The total cost of operating the company for the year is \$430,000, which includes the following costs:

| | |
|---------------------------------------|-------------------------|
| Wages | \$150,000 |
| Cleaning supplies | 40,000 |
| Cleaning equipment depreciation | 20,000 |
| Vehicle expenses | 80,000 |
| Office expenses | 60,000 |
| President’s compensation | 80,000 |
| Total cost | <u>\$430,000</u> |

Resource consumption is distributed across the activities as follows:

| Distribution of Resource Consumption Across Activities | | | | | |
|--|------------------|----------------|-------------|-------|-------|
| | Cleaning Carpets | Travel to Jobs | Job Support | Other | Total |
| Wages | 70% | 20% | 0% | 10% | 100% |
| Cleaning supplies | 100% | 0% | 0% | 0% | 100% |
| Cleaning equipment depreciation | 80% | 0% | 0% | 20% | 100% |
| Vehicle expenses | 0% | 60% | 0% | 40% | 100% |
| Office expenses | 0% | 0% | 45% | 55% | 100% |
| President’s compensation | 0% | 0% | 40% | 60% | 100% |

Job support consists of receiving calls from potential customers at the home office, scheduling jobs, billing, resolving issues, and so on.

Required:

- Using Exhibit 7–5 as a guide, prepare the first-stage allocation of costs to the activity cost pools.
- Using Exhibit 7–6 as a guide, compute the activity rates for the activity cost pools.

3. The company recently completed a 5 hundred square foot carpet-cleaning job at the Flying N ranch—a 75-mile round-trip journey from the company’s offices in Bozeman. Compute the cost of this job using the activity-based costing system.
4. The revenue from the Flying N ranch was \$140 (5 hundred square feet @ \$28 per hundred square feet). Using Exhibit 7–11 as a guide, prepare a report showing the margin from this job.
5. What do you conclude concerning the profitability of the Flying N ranch job? Explain.
6. What advice would you give the president concerning pricing jobs in the future?

PROBLEM 7–18 Second Stage Allocations and Product Margins [LO4, LO5]

Pixel Studio, Inc., is a small company that creates computer-generated animations for films and television. Much of the company’s work consists of short commercials for television, but the company also does realistic computer animations for special effects in movies.

The young founders of the company have become increasingly concerned with the economics of the business—particularly because many competitors have sprung up recently in the local area. To help understand the company’s cost structure, an activity-based costing system has been designed. Three major activities are carried out in the company: animation concept, animation production, and contract administration. The animation concept activity is carried out at the contract proposal stage when the company bids on projects. This is an intensive activity that involves individuals from all parts of the company in creating story boards and prototype stills to be shown to the prospective client. Once a project is accepted by the client, the animation goes into production and contract administration begins. Almost all of the work involved in animation production is done by the technical staff, whereas the administrative staff is largely responsible for contract administration. The activity cost pools and their activity measures are listed below:

| Activity Cost Pool | Activity Measure | Activity Rate |
|------------------------------|--------------------------------|----------------------|
| Animation concept..... | Number of proposals | \$6,040 per proposal |
| Animation production..... | Minutes of completed animation | \$7,725 per minute |
| Contract administration..... | Number of contracts | \$6,800 per contract |

These activity rates include all of the company’s costs, except for the costs of idle capacity and organization-sustaining costs. There are no direct labor or direct materials costs.

Preliminary analysis using these activity rates has indicated that the local commercial segment of the market may be unprofitable. This segment is highly competitive. Producers of local commercials may ask three or four companies like Pixel Studio to bid, which results in an unusually low ratio of accepted contracts to bids. Furthermore, the animation sequences tend to be much shorter for local commercials than for other work. Because animation work is billed at fairly standard rates according to the running time of the completed animation, this means that the revenues from these short projects tend to be below average. Data concerning activity in the local commercial market appear below:

| Activity Measure | Local Commercials |
|--------------------------------------|-------------------|
| Number of proposals | 25 |
| Minutes of completed animation | 5 |
| Number of contracts | 10 |

The total sales from the 10 contracts for local commercials was \$180,000.

Required:

1. Determine the cost of serving the local commercial market.
2. Prepare a report showing the margin earned serving the local commercial market. (Remember, this company has no direct materials or direct labor costs.)
3. What would you recommend to management concerning the local commercial market?

PROBLEM 7–19 Activity-Based Costing and Bidding on Jobs [LO2, LO3, LO4]

Mercer Asbestos Removal Company removes potentially toxic asbestos insulation and related products from buildings. There has been a long-simmering dispute between the company’s estimator and the work supervisors. The on-site supervisors claim that the estimators do not adequately distinguish between

routine work such as removal of asbestos insulation around heating pipes in older homes and nonroutine work such as removing asbestos-contaminated ceiling plaster in industrial buildings. The on-site supervisors believe that nonroutine work is far more expensive than routine work and should bear higher customer charges. The estimator sums up his position in this way: “My job is to measure the area to be cleared of asbestos. As directed by top management, I simply multiply the square footage by \$2.50 to determine the bid price. Because our average cost is only \$2.175 per square foot, that leaves enough cushion to take care of the additional costs of nonroutine work that shows up. Besides, it is difficult to know what is routine or not routine until you actually start tearing things apart.”

To shed light on this controversy, the company initiated an activity-based costing study of all of its costs. Data from the activity-based costing system follow:

| Activity Cost Pool | Activity Measure | Total Activity |
|--|---------------------------|--------------------------|
| Removing asbestos | Thousands of square feet | 800 thousand square feet |
| Estimating and job setup | Number of jobs | 500 jobs |
| Working on nonroutine jobs | Number of nonroutine jobs | 100 nonroutine jobs |
| Other (costs of idle capacity and organization-sustaining costs) | None | |

Note: The 100 nonroutine jobs are included in the total of 500 jobs. Both nonroutine jobs and routine jobs require estimating and setup.

Costs for the Year

| | |
|-------------------------------|--------------------|
| Wages and salaries | \$ 300,000 |
| Disposal fees | 700,000 |
| Equipment depreciation | 90,000 |
| On-site supplies | 50,000 |
| Office expenses | 200,000 |
| Licensing and insurance | 400,000 |
| Total cost | <u>\$1,740,000</u> |

Distribution of Resource Consumption Across Activities

| | Removing Asbestos | Estimating and Job Setup | Working on Nonroutine Jobs | Other | Total |
|-------------------------------|-------------------|--------------------------|----------------------------|-------|-------|
| Wages and salaries | 50% | 10% | 30% | 10% | 100% |
| Disposal fees | 60% | 0% | 40% | 0% | 100% |
| Equipment depreciation | 40% | 5% | 20% | 35% | 100% |
| On-site supplies | 60% | 30% | 10% | 0% | 100% |
| Office expenses | 10% | 35% | 25% | 30% | 100% |
| Licensing and insurance | 30% | 0% | 50% | 20% | 100% |

Required:

- Using Exhibit 7–5 as a guide, perform the first-stage allocation of costs to the activity cost pools.
- Using Exhibit 7–6 as a guide, compute the activity rates for the activity cost pools.
- Using the activity rates you have computed, determine the total cost and the average cost per thousand square feet of each of the following jobs according to the activity-based costing system.
 - A routine 1,000-square-foot asbestos removal job.
 - A routine 2,000-square-foot asbestos removal job.
 - A nonroutine 2,000-square-foot asbestos removal job.
- Given the results you obtained in (3) above, do you agree with the estimator that the company’s present policy for bidding on jobs is adequate?

RESEARCH AND APPLICATION 7–20

[LO1, LO2, LO3]

The questions in this exercise are based on JetBlue Airways Corporation. To answer the questions, you will need to download JetBlue's Form 10-K/A for the year ended December 31, 2004 at www.sec.gov/edgar/searchedgar/companysearch.html. Once at this website, input CIK code 1158463 and hit enter. In the gray box on the right-hand side of your computer screen define the scope of your search by inputting 10-K and then pressing enter. Select the 10-K/A with a filing date of March 8, 2005. You do not need to print the 10-K/A to answer the questions.

Required:

1. What is JetBlue's strategy for success in the marketplace? Does the company rely primarily on a customer intimacy, operational excellence, or product leadership customer value proposition? What evidence supports your conclusion?
2. What business risks does JetBlue face that may threaten the company's ability to satisfy stockholder expectations? What are some examples of control activities that the company could use to reduce these risks? (*Hint:* Focus on pages 17–23 of the 10-K/A).
3. How can the concept of unit-level activities be applied to an airline? More specifically, what are two examples of unit-level activities for JetBlue? What steps has JetBlue taken to manage these unit-level activities more efficiently?
4. How can the concept of batch-level activities be applied to an airline? What are two examples of batch-level activities for JetBlue? What steps has JetBlue taken to manage these batch-level activities more efficiently?
5. What is one example of a customer-level activity and an organization-sustaining activity for JetBlue?

**Appendix 7A: ABC Action Analysis**

A conventional ABC analysis, such as the one presented in Exhibits 7–10 and 7–11 in the chapter, has several important limitations. Referring back to Exhibit 7–10, recall that the custom compass housings show a negative product margin of \$49,500. Because of this apparent loss, managers were considering dropping this product. However, as the discussion among the managers revealed, it is unlikely that all of the \$589,500 cost of the product would be avoided if it were dropped. Some of these costs would continue even if the product were totally eliminated. *Before* taking action, it is vital to identify which costs would be avoided and which costs would continue. Only those costs that can be avoided are relevant in the decision. Moreover, many of the costs are managed costs that would require explicit management action to eliminate. If the custom compass housings product line were eliminated, the direct materials cost would be avoided without any explicit management action—the materials simply wouldn't be ordered. On the other hand, if the custom compass housings were dropped, explicit management action would be required to eliminate the salaries of overhead workers that are assigned to this product.

Simply shifting these managed costs to other products would not solve anything. These costs would have to be eliminated or the resources *shifted to the constraint* to have any benefit to the company. While eliminating the cost is obviously beneficial, redeploying the resources is only beneficial if the resources are shifted to the constraint in the process. If the resources are redeployed to a work center that is not a constraint, it would increase the excess capacity in that work center—which has no direct benefit to the company.

In addition, if some overhead costs need to be eliminated as a result of dropping a product, specific managers must be held responsible for eliminating those costs or the reductions are unlikely to occur. If no one is specifically held responsible for eliminating the costs, they will almost certainly continue to be incurred. Without external pressure, managers usually avoid cutting costs in their areas of responsibility. The action analysis

LEARNING OBJECTIVE 6

Prepare an action analysis report using activity-based costing data and interpret the report.

report developed in this appendix is intended to help top managers identify what costs are relevant in a decision and to place responsibility for the elimination of those costs on the appropriate managers.

Activity Rates—Action Analysis Report

Constructing an action analysis report begins with the results of the first-stage allocation, which is reproduced as Exhibit 7A-1 (page 277). In contrast to the conventional ABC analysis covered in the chapter, the calculation of the activity rates for an action analysis report is a bit more involved. In addition to computing an overall activity rate for each activity cost pool, an activity rate is computed for each cell in Exhibit 7A-1. The computations of activity rates for the action analysis are carried out in Exhibit 7A-2 (page 277). For example, the \$125,000 cost of indirect factory wages for the Customer Orders cost pool is divided by the total activity for that cost pool—1,000 orders—to arrive at the activity rate of \$125 per customer order for indirect factory wages. Similarly, the \$200,000 cost of indirect factory wages for the Product Design cost pool is divided by the total activity for that cost pool—400 designs—to arrive at the activity rate of \$500 per design for indirect factory wages. Note that the totals at the bottom of Exhibit 7A-2 agree with the overall activity rates in Exhibit 7-6 in the chapter. Exhibit 7A-2, which shows the activity rates for the action analysis report, contains more detail than Exhibit 7-6, which contains the activity rates for the conventional ABC analysis.

Assignment of Overhead Costs to Products—Action Analysis Report

Similarly, computing the overhead costs to be assigned to products for an action analysis report involves more detail than for a conventional ABC analysis. The computations for Classic Brass are carried out in Exhibit 7A-3 (page 278). For example, the activity rate of \$125 per customer order for indirect factory wages is multiplied by 600 orders for the standard stanchions to arrive at the cost of \$75,000 for indirect factory wages in Exhibit 7A-3. Instead of just a single cost number for each cost pool as in the conventional ABC analysis, we now have an entire cost matrix showing much more detail. Note that the column totals for the cost matrix in Exhibit 7A-3 agree with the ABC costs for standard stanchions in Exhibit 7-8. Indeed, the conventional ABC analysis of Exhibit 7-10 can be easily constructed using the column totals at the bottom of the cost matrices in Exhibit 7A-3. In contrast, the action analysis report will be based on the row totals at the right of the cost matrices in Exhibit 7A-3. In addition, the action analysis report will include a simple color-coding scheme that will help managers identify how easily the various costs can be adjusted.

Ease of Adjustment Codes

The ABC team constructed Exhibit 7A-4 to aid managers in the use of the ABC data. In this exhibit, each cost has been assigned an *ease of adjustment code*—Green, Yellow, or Red. The **ease of adjustment code** reflects how easily the cost could be adjusted to changes in activity.³ “Green” costs are those costs that would adjust more or less automatically to changes in activity without any action by managers. For example, direct materials costs would adjust to changes in orders without any action being taken by managers. If a customer does not order stanchions, the direct materials for the stanchions

³ The idea of using colors to code how easily costs can be adjusted was suggested to us at a seminar put on by Boeing and by an article by Alfred King, “Green Dollars and Blue Dollars: The Paradox of Cost Reduction,” *Journal of Cost Management*, Fall 1993, pp. 44–52.

EXHIBIT 7A-1 First-Stage Allocations to Activity Cost Pools

| Activity Cost Pools | | | | | | |
|---|-------------------|-------------------|-------------------|--------------------|-------------------|---------------------|
| | Customer Orders | Product Design | Order Size | Customer Relations | Other | Total |
| Production Department: | | | | | | |
| Indirect factory wages | \$ 125,000 | \$ 200,000 | \$ 100,000 | \$ 50,000 | \$ 25,000 | \$ 500,000 |
| Factory equipment depreciation | 60,000 | 0 | 180,000 | 0 | 60,000 | 300,000 |
| Factory utilities | 0 | 12,000 | 60,000 | 0 | 48,000 | 120,000 |
| Factory building lease | 0 | 0 | 0 | 0 | 80,000 | 80,000 |
| General Administrative Department: | | | | | | |
| Administrative wages and salaries | 60,000 | 20,000 | 40,000 | 120,000 | 160,000 | 400,000 |
| Office equipment depreciation | 15,000 | 0 | 0 | 12,500 | 22,500 | 50,000 |
| Administrative building lease | 0 | 0 | 0 | 0 | 60,000 | 60,000 |
| Marketing Department: | | | | | | |
| Marketing wages and salaries | 55,000 | 20,000 | 0 | 150,000 | 25,000 | 250,000 |
| Selling expenses | 5,000 | 0 | 0 | 35,000 | 10,000 | 50,000 |
| Total cost | \$ 320,000 | \$ 252,000 | \$ 380,000 | \$ 367,500 | \$ 490,500 | \$ 1,810,000 |

EXHIBIT 7A-2 Computation of the Activity Rates for the Action Analysis Report

| Activity Cost Pools | | | | | |
|---|---------------------|----------------------------|-----------------------------|-----------------------------|------------------------|
| | Customer Orders | Product Design | Order Size | Customer Relations | Other |
| Total activity | 1,000 orders | 400 product designs | 20,000 machine-hours | 250 active customers | Not applicable* |
| Production Department: | | | | | |
| Indirect factory wages | \$ 125 | \$ 500 | \$ 5 | \$ 200 | |
| Factory equipment depreciation | 60 | 0 | 9 | 0 | |
| Factory utilities | 0 | 30 | 3 | 0 | |
| Factory building lease | 0 | 0 | 0 | 0 | |
| General Administrative Department: | | | | | |
| Administrative wages and salaries | 60 | 50 | 2 | 480 | |
| Office equipment depreciation | 15 | 0 | 0 | 50 | |
| Administrative building lease | 0 | 0 | 0 | 0 | |
| Marketing Department: | | | | | |
| Marketing wages and salaries | 55 | 50 | 0 | 600 | |
| Selling expenses | 5 | 0 | 0 | 140 | |
| Total (conventional ABC analysis) | \$ 320 | \$ 630 | \$ 19 | \$ 1,470 | |

*Activity rates are not computed for the Other cost pool since these costs will not be allocated further.

$\$125,000 \div 1,000 \text{ orders} = \125 per order.
 Other entries in the table are computed similarly.

EXHIBIT 7A-3 Action Analysis Cost Matrices

| Action Analysis Cost Matrix for Standard Stanchions | | | | | |
|---|-----------------|-----------------|----------------------|--------------------|------------|
| Activity Cost Pools | | | | | |
| | Customer Orders | Product Design | Order Size | Customer Relations | Total |
| Total activity for stanchions | 600 orders | product designs | 17,500 machine-hours | Not applicable | |
| Production Department: | | | | | |
| Indirect factory wages | \$ 75,000 | \$ 0 | \$ 87,500 | | \$ 162,500 |
| Factory equipment depreciation | 36,000 | 0 | 157,500 | | 193,500 |
| Factory utilities | 0 | 0 | 52,500 | | 52,500 |
| Factory building lease | 0 | 0 | 0 | | 0 |
| General Administrative Department: | | | | | |
| Administrative wages and salaries | 36,000 | 0 | 35,000 | | 71,000 |
| Office equipment depreciation | 9,000 | 0 | 0 | | 9,000 |
| Administrative building lease | 0 | 0 | 0 | | 0 |
| Marketing Department: | | | | | |
| Marketing wages and salaries | 33,000 | 0 | 0 | | 33,000 |
| Selling expenses | 3,000 | 0 | 0 | | 3,000 |
| Total (conventional ABC analysis) | \$ 192,000 | \$ 0 | \$ 332,500 | | \$ 524,500 |

From Exhibit 7A-2, the activity rate for indirect factory wages for the Customer Orders cost pool is \$125 per order.

$$\$125 \text{ per order} \times 600 \text{ orders} = \$75,000$$

Other entries in the table are computed in a similar way.

| Action Analysis Cost Matrix for the Custom Compass Housings | | | | | |
|---|-----------------|--------------------|---------------------|--------------------|------------|
| Activity Cost Pools | | | | | |
| | Customer Orders | Product Design | Order Size | Customer Relations | Total |
| Total activity for custom compass housings | 400 order | 400 product design | 2,500 machine-hours | Not applicable | |
| Production Department: | | | | | |
| Indirect factory wages | \$ 50,000 | \$ 200,000 | \$ 12,500 | | \$ 262,500 |
| Factory equipment depreciation | 24,000 | 0 | 22,500 | | 46,500 |
| Factory utilities | 0 | 12,000 | 7,500 | | 19,500 |
| Factory building lease | 0 | 0 | 0 | | 0 |
| General Administrative Department: | | | | | |
| Administrative wages and salaries | 24,000 | 20,000 | 5,000 | | 49,000 |
| Office equipment depreciation | 6,000 | 0 | 0 | | 6,000 |
| Administrative building lease | 0 | 0 | 0 | | 0 |
| Marketing Department: | | | | | |
| Marketing wages and salaries | 22,000 | 20,000 | 0 | | 42,000 |
| Selling expenses | 2,000 | 0 | 0 | | 2,000 |
| Total (conventional ABC analysis) | \$ 128,000 | \$ 252,000 | \$ 47,500 | | \$ 427,500 |

From Exhibit 7A-2, the activity rate for indirect factory wages for the Customer Orders cost pool is \$125 per order.

$$\$125 \text{ per order} \times 400 \text{ order} = \$50,000$$

Other entries in the table are computed in a similar way.

| EXHIBIT 7A-4 | |
|--|--|
| Ease of Adjustment Codes | |
| <p>Green: Costs that adjust automatically to changes in activity without management action.</p> <ul style="list-style-type: none"> Direct materials Shipping costs <p>Yellow: Costs that could, in principle, be adjusted to changes in activity, but management action would be required.</p> <ul style="list-style-type: none"> Direct labor Indirect factory wages Factory utilities Administrative wages and salaries Office equipment depreciation Marketing wages and salaries Selling expenses <p>Red: Costs that would be very difficult to adjust to changes in activity and management action would be required.</p> <ul style="list-style-type: none"> Factory equipment depreciation Factory building lease Administrative building lease | |

would not be required and would not be ordered. “Yellow” costs are those costs that could be adjusted in response to changes in activity, but such adjustments require management action; the adjustment is not automatic. The ABC team believes, for example, that direct labor costs should be included in the Yellow category. Managers must make difficult decisions and take explicit action to increase or decrease, in aggregate, direct labor costs—particularly because the company has a no lay-off policy. “Red” costs are costs that could be adjusted to changes in activity only with a great deal of difficulty, and the adjustment would require management action. The building leases fall into this category because it would be very difficult and expensive to break the leases.

The Action Analysis View of the ABC Data

Looking at Exhibit 7A-3, the totals on the right-hand side of the table indicate that the \$427,500 of overhead cost for the custom compass housings consists of \$262,500 of indirect factory wages, \$46,500 of factory equipment depreciation, and so on. These data are displayed in Exhibit 7A-5, which shows an action analysis of the custom compass housings product. An action analysis report shows what costs have been assigned to the cost object, such as a product or customer, and how difficult it would be to adjust the cost if there is a change in activity. Note that the Red margin at the bottom of Exhibit 7A-5, (\$49,500), is exactly the same as the product margin for the custom compass housings in Exhibit 7-10 in the chapter.

The cost data in the action analysis in Exhibit 7A-5 are arranged by the color coded ease of adjustment. All of the Green costs—those that adjust more or less automatically to changes in activity—appear together at the top of the list of costs. These costs total \$74,500 and are subtracted from the sales of \$540,000 to yield a Green margin of \$465,500. The same procedure is followed for the Yellow and Red costs. This action analysis indicates what costs would have to be cut and how difficult it would be to cut them if the custom compass housings product were dropped. Prior to making any decision about dropping products, the managers responsible for the costs must agree to either eliminate the resources represented by those costs or to transfer the resources to an area in the organization that really needs the resources—namely, a constraint. If managers do not make such a commitment, it is likely that the costs would continue to be incurred. As a result, the company would lose the sales from the products without really eliminating the costs.

MANAGERIAL
ACCOUNTING IN
ACTION

The Wrap-up

After the action analysis was prepared by the ABC team, top management at Classic Brass met once again to review the results of the ABC analysis.

John: When we last met, we had discussed the advisability of discontinuing the custom compass housings product line. I understand that the ABC team has done some additional analysis to help us in making this decision.

Mary: That's right. The action analysis report we put together indicates how easy it would be to adjust each cost and where specific cost savings would have to come from if we were to drop the custom compass housings.

John: What's this red margin at the bottom of the action analysis? Isn't that a product margin?

Mary: Yes, it is. However, we call it a red margin because we should stop and think very, very carefully before taking any actions based on that margin.

John: Why is that?

Mary: As an example, we subtracted the costs of factory equipment depreciation to arrive at that red margin. We doubt that we could avoid any of that cost if we were to drop custom orders. We use the same machines on custom orders that we use on standard products. The factory equipment has no resale value, and it does not wear out through use.

John: What about this yellow margin?

Mary: Yellow means proceed with a great deal of caution. To get to the yellow margin we deducted from sales numerous costs that could be adjusted only if the managers involved are willing to eliminate resources or shift them to the constraint.

John: If I understand the yellow margin correctly, the apparent loss of \$3,000 on the custom compass housings is the result of the indirect factory wages of \$262,500.

Susan: Right, that's basically the wages of our design engineers.

John: I am uncomfortable with the idea of laying off any of our designers for numerous reasons. So where does that leave us?

Mary: What about raising prices on our custom products?

Tom: We should be able to do that. We have been undercutting the competition to make sure that we won bids on custom work because we thought it was a very profitable thing to do.

John: Why don't we just charge directly for design work?

Tom: Some of our competitors already do that. However, I don't think we would be able to charge enough to cover our design costs.

John: Can we do anything to make our design work more efficient so it costs us less? I'm not going to lay anyone off, but if we make the design process more efficient, we could lower the charge for design work and spread those costs across more customers.

Susan: That may be possible. I'll form a Six Sigma team to look at it.

John: Let's get some benchmark data on design costs. If we set our minds to it, I'm sure we can be world class in no time.

Susan: Okay. Mary, will you help with the benchmark data?

Mary: Sure.

John: Let's meet again in about a week to discuss our progress. Is there anything else on the agenda for today?

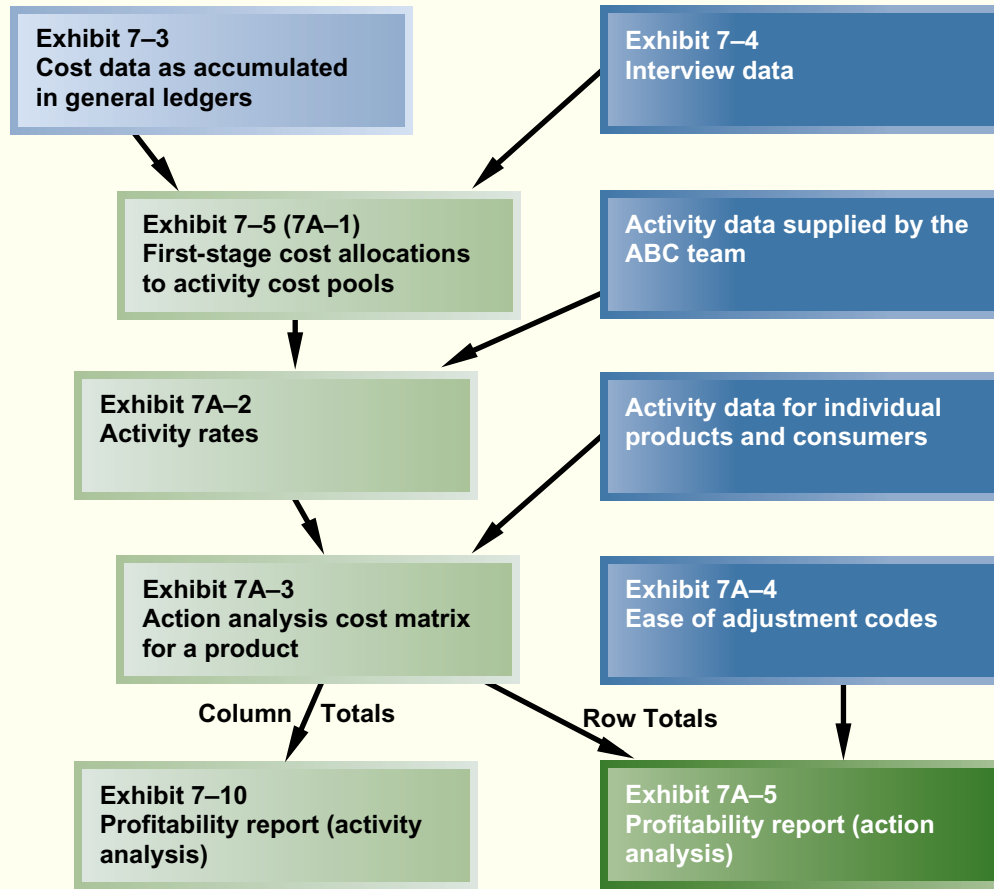

The points raised in the preceding discussion are extremely important. By measuring the resources consumed by products (and other cost objects), an ABC system provides a much better basis for decision making than a traditional cost accounting system that spreads overhead costs around without much regard for what might be causing the overhead. A well-designed ABC system provides managers with estimates of potentially relevant costs that can be a very useful starting point for management analysis.

Appendix 7A Summary

The action analysis report illustrated in this appendix is a valuable addition to the ABC toolkit. An action analysis report provides more information for decision making than a conventional ABC analysis. The action analysis report makes it clear where costs would have to be adjusted in the organization as a result of an action. In a conventional ABC analysis, a cost such as \$320 for processing an order represents costs from many parts of the organization. If an order is dropped, there will be little pressure to actually eliminate the \$320 cost unless it is clear where the costs are incurred and which managers would be responsible for reducing the cost. In contrast, an action analysis report traces the costs to where they are incurred in the organization and makes it much easier to assign responsibility to managers for reducing costs. In addition, an action analysis report provides information concerning how easily a cost can be adjusted. Costs that cannot be adjusted are not relevant in a decision.

Exhibit 7A–6 summarizes all of the steps required to create both an action analysis report as illustrated in this appendix and an activity analysis as shown in the chapter.

EXHIBIT 7A-6
Summary of the Steps to Produce an Action Analysis Report

Appendix 7A Review Problem: Activity Analysis Report

Refer to the data for Ferris Corporation in the Review Problem at the end of the chapter on pages 261–262.

Required:

1. Compute activity rates for Ferris Corporation as in Exhibit 7A-2.
2. Using Exhibit 7A-3 as a guide, construct a table showing the overhead costs for the OfficeMart orders described in requirement (3) of the Review Problem at the end of the chapter.
3. The management of Ferris Corporation has assigned ease of adjustment codes to costs as follows:

| Cost | Ease of Adjustment Code |
|---|-------------------------|
| Direct materials | Green |
| Direct labor | Yellow |
| Manufacturing overhead | Yellow |
| Selling and administrative overhead | Red |

Using Exhibit 7A-5 as a guide, prepare an action analysis of the OfficeMart orders.

Solution to Review Problem

1. The activity rates for the activity cost pools are:

| | Assembling Units | Processing Orders | Supporting Customers |
|--|-----------------------------|------------------------------|---------------------------------|
| Total activity | 1,000 units | 250 orders | 100 customers |
| Manufacturing overhead | \$250 | \$ 700 | \$ 250 |
| Selling and administrative overhead | <u>30</u> | <u>540</u> | <u>750</u> |
| Total | <u>\$280</u> | <u>\$1,240</u> | <u>\$1,000</u> |

2. The overhead cost for the four orders of a total of 80 filing cabinets would be computed as follows:

| | Assembling Units | Processing Orders | Supporting Customers | Total |
|--|-----------------------------|------------------------------|---------------------------------|-----------------|
| Activity | 80 units | 4 orders | 1 customer | |
| Manufacturing overhead | \$20,000 | \$2,800 | \$ 250 | \$23,050 |
| Selling and administrative overhead | <u>2,400</u> | <u>2,160</u> | <u>750</u> | <u>5,310</u> |
| Total | <u>\$22,400</u> | <u>\$4,960</u> | <u>\$1,000</u> | <u>\$28,360</u> |

3. The action analysis report is:

| | | |
|--|-----------------|---------------|
| Sales | | \$47,600 |
| Green costs: | | |
| Direct materials | <u>\$14,400</u> | <u>14,400</u> |
| Green margin | | 33,200 |
| Yellow costs: | | |
| Direct labor | 4,000 | |
| Manufacturing overhead | <u>23,050</u> | <u>27,050</u> |
| Yellow margin | | 6,150 |
| Red costs: | | |
| Selling and administrative overhead | <u>5,310</u> | <u>5,310</u> |
| Red margin | | <u>\$ 840</u> |

Appendix 7A Glossary

Ease of adjustment codes Costs are coded as Green, Yellow, or Red—depending on how easily the cost could be adjusted to changes in activity. “Green” costs adjust automatically to changes in activity. “Yellow” costs could be adjusted in response to changes in activity, but such adjustments require management action; the adjustment is not automatic. “Red” costs could be adjusted to changes in activity only with a great deal of difficulty and would require management action. (p. 276)

Appendix 7A Exercises and Problems **connect**

EXERCISE 7A–1 Preparing an Action Analysis Report [LO6]

Fairway Golf Corporation produces private label golf clubs for pro shops throughout North America. The company uses activity-based costing to evaluate the profitability of serving its customers. This analysis is based on categorizing the company's costs as follows, using the ease of adjustment color coding scheme described in Appendix 7A:

| | Ease of Adjustment Code |
|---|-------------------------|
| Direct materials | Green |
| Direct labor | Yellow |
| Indirect labor | Yellow |
| Factory equipment depreciation | Red |
| Factory administration | Red |
| Selling and administrative wages and salaries | Red |
| Selling and administrative depreciation | Red |
| Marketing expenses | Yellow |

Management would like to evaluate the profitability of a particular customer—Shaker Run Golf Club of Lebanon, Ohio. Over the last twelve months this customer submitted one order for 100 golf clubs that had to be produced in four batches due to differences in product labeling requested by the customer. Summary data concerning the order appear below:

| | |
|--------------------------------------|---------|
| Number of clubs | 100 |
| Number of orders | 1 |
| Number of batches | 4 |
| Direct labor-hours per club | 0.3 |
| Selling price per club | \$50.00 |
| Direct materials cost per club | \$29.50 |
| Direct labor rate per hour | \$20.50 |

A cost analyst working in the controller's office at the company has already produced the action analysis cost matrix for the Shaker Run Golf Club that appears below:

Action Analysis Cost Matrix for Shaker Run Golf Club

| | Activity Cost Pools | | | | Total |
|--------------------------------------|------------------------------|---------------------|---------------------|---------------------|-------------------|
| | Supporting Direct labor | Batch Processing | Order Processing | Customer Service | |
| | 30 direct labor- hours | 4 batches | 1 order | 1 customer | |
| Activity | | | | | |
| Manufacturing overhead: | | | | | |
| Indirect labor | \$ 35.40 | \$53.70 | \$ 6.80 | \$ 0.00 | \$ 95.90 |
| Factory equipment depreciation..... | 102.80 | 0.90 | 0.00 | 0.00 | 103.70 |
| Factory administration..... | 18.50 | 0.50 | 12.00 | 228.00 | 259.00 |
| Selling and administrative overhead: | | | | | |
| Wages and salaries..... | 11.00 | 0.00 | 36.00 | 382.00 | 429.00 |
| Depreciation..... | 0.00 | 0.00 | 6.00 | 24.00 | 30.00 |
| Marketing expenses..... | 117.70 | 0.00 | 54.00 | 369.00 | 540.70 |
| Total | <u>\$285.40</u> | <u>\$55.10</u> | <u>\$114.80</u> | <u>\$1,003.00</u> | <u>\$1,458.30</u> |

Required:

Prepare an action analysis report showing the profitability of the Shaker Run Golf Club. Include direct materials and direct labor costs in the report. Use Exhibit 7A–5 as a guide for organizing the report.

EXERCISE 7A-2 Second-Stage Allocation Using the Action Analysis Approach [LO4, LO6]

This exercise should be assigned in conjunction with Exercise 7-8.

The results of the first-stage allocation of the activity-based costing system at Durban Metal Products, Ltd., in which the activity rates were computed, appear below:

| | Order Size | Customer Orders | Product Testing | Selling |
|------------------------------------|----------------------|-----------------------|----------------------|-------------------------|
| Manufacturing overhead: | | | | |
| Indirect labor | R 8.25 | R 180.00 | R30.00 | R 0.00 |
| Factory depreciation | 8.00 | 0.00 | 40.00 | 0.00 |
| Factory utilities | 0.10 | 0.00 | 1.00 | 0.00 |
| Factory administration..... | 0.00 | 48.00 | 18.00 | 30.00 |
| Selling and administrative: | | | | |
| Wages and salaries..... | 0.50 | 80.00 | 0.00 | 800.00 |
| Depreciation..... | 0.00 | 12.00 | 0.00 | 40.00 |
| Taxes and insurance | 0.00 | 0.00 | 0.00 | 20.00 |
| Selling expenses..... | 0.00 | 0.00 | 0.00 | 200.00 |
| Total overhead cost..... | <u>R16.85</u> | <u>R320.00</u> | <u>R89.00</u> | <u>R1,090.00</u> |

Required:

- Using Exhibit 7A-3 as a guide, prepare a report showing the overhead cost of the order for heavy-duty trailer axles discussed in Exercise 7-8. What is the total overhead cost of the order according to the activity-based costing system?
- Explain the two different perspectives this report gives to managers concerning the nature of the overhead costs involved in the order. (*Hint:* Look at the row and column totals of the report you have prepared.)

EXERCISE 7A-3 Second-Stage Allocations and Margin Calculations Using the Action Analysis Approach [LO4, LO6]

Refer to the data for Foam Products, Inc., in Exercise 7-12 and the following additional details concerning the activity rates in the activity-based costing system:

| | Activity Rates | | | |
|---|-------------------------|------------------------|------------------------|--------------------------|
| | Supporting Direct Labor | Batch Processing | Order Processing | Customer Service |
| Manufacturing overhead: | | | | |
| Indirect labor | \$0.60 | \$ 60.00 | \$ 20.00 | \$ 0.00 |
| Factory equipment depreciation..... | 4.00 | 17.00 | 0.00 | 0.00 |
| Factory administration | 0.10 | 7.00 | 25.00 | 150.00 |
| Selling and administrative overhead: | | | | |
| Wages and salaries | 0.40 | 20.00 | 160.00 | 1,600.00 |
| Depreciation | 0.00 | 3.00 | 10.00 | 38.00 |
| Marketing expenses | 0.45 | 0.00 | 60.00 | 675.00 |
| Total | <u>\$5.55</u> | <u>\$107.00</u> | <u>\$275.00</u> | <u>\$2,463.00</u> |

Management has provided their ease of adjustment codes for the purpose of preparing action analyses.

| Ease of Adjustment Codes | |
|---|--------|
| Direct materials | Green |
| Direct labor | Yellow |
| Manufacturing overhead: | |
| Indirect labor | Yellow |
| Factory equipment depreciation | Red |
| Factory administration | Red |
| Selling and administrative overhead: | |
| Wages and salaries | Red |
| Depreciation | Red |
| Marketing expenses | Yellow |

Required:

Using Exhibit 7A–5 as a guide, prepare an action analysis report for Interstate Trucking similar to those prepared for products.

EXERCISE 7A–4 Comprehensive Activity-Based Costing Exercise [L02, L03, L04, L06]

Refer to the data for Advanced Products Corporation in Exercise 7–14.

Required:

1. Using Exhibit 7A–1 as a guide, prepare a report showing the first-stage allocations of overhead costs to the activity cost pools.
2. Using Exhibit 7A–2 as a guide, compute the activity rates for the activity cost pools.
3. Using Exhibit 7A–3 as a guide, prepare a report showing the overhead costs for the order from Shenzhen Enterprises including customer support costs.
4. Using Exhibit 7–11 as a guide, prepare a report showing the customer margin for Shenzhen Enterprises.
5. Using Exhibit 7A–5 as a guide, prepare an action analysis report showing the customer margin for Shenzhen Enterprises. Direct materials should be coded as a Green cost, direct labor and wages and salaries as Yellow costs, and other overhead costs as a Red cost.
6. What action, if any, do you recommend as a result of the above analyses?

PROBLEM 7A–5 Second Stage Allocations and Product Margins [L04, L06]

Refer to the data for Pixel Studio, Inc., in Problem 7–18. In addition, the company has provided the following details concerning its activity rates:

| | Activity Rates | | |
|---|----------------------|-------------------------|----------------------------|
| | Animation Concept | Animation Production | Contract Administration |
| Technical staff salaries | \$4,000 | \$6,000 | \$1,600 |
| Animation equipment depreciation | 360 | 1,125 | 0 |
| Administrative wages and salaries | 1,440 | 150 | 4,800 |
| Supplies costs | 120 | 300 | 160 |
| Facility costs | 120 | 150 | 240 |
| Total | <u>\$6,040</u> | <u>\$7,725</u> | <u>\$6,800</u> |

Management has provided the following ease of adjustment codes for the various costs:

| | Ease of Adjustment Code |
|---|-------------------------|
| Technical staff salaries | Red |
| Animation equipment depreciation | Red |
| Administrative wages and salaries | Yellow |
| Supplies costs | Green |
| Facility costs | Red |

These codes created some controversy. In particular, some administrators objected to coding their own salaries Yellow, while the technical staff salaries were coded Red. However, the founders of the firm overruled these objections by pointing out that “our technical staff is our most valuable asset. Good animators are extremely difficult to find, and they would be the last to go if we had to cut back.”

Required:

1. Using Exhibit 7A–3 as a guide, determine the cost of the local commercials market. (Think of the local commercial market as a product.)
2. Using Exhibit 7A–5 as a guide, prepare an action analysis report concerning the local commercial market. (This company has no direct materials or direct labor costs.)
3. What would you recommend to management concerning the local commercial market?

Profit Planning

Lilo & Stitch on Budget

The full-length feature cartoon *Tarzan* grossed about \$450 million worldwide for the **Walt Disney Company**. However, production costs got out of control. The company traditionally manages film production by focusing on meeting the planned release date—paying little attention to costs. In the case of *Tarzan*, production fell behind schedule

due to the tendency of animation teams to add more eye-dazzling complexity to each production. At one point, it was estimated that 190,000 individual drawings would be needed to complete the film in contrast to the 130,000 drawings needed to complete *The Lion King*. To meet *Tarzan's* release date, workers were pulled off other productions and were often paid at overtime rates. The size of the film crew eventually reached 573, which was nearly twice the size of the crew that had made *The Lion King*. With animators earning salaries in the hundreds of thousands of dollars, the cost implications were staggering.

Thomas S. Schumacher, Disney's feature-animation chief, was charged with dramatically reducing the cost of future films while making sure that the audience wouldn't notice any decline in quality. *Lilo & Stitch* was the first film to be produced with this goal in mind. The process began by prioritizing where the money was to be spent. The budget for music was kept generous; animation costs were cut by controlling the small details that add big costs with little effect on the quality of the film. For example, animators wanted to draw cute designs on the shirts worn by Nani, Lilo's big sister. However, adding this level of detail on every frame in which Nani appears in the film would have added about \$250,000 in cost. By controlling such details, *Lilo & Stitch* was finished on time and at a cost of about \$80 million. This contrasted with a cost of more than \$150 million for *Tarzan*. ■

Learning Objectives

After studying Chapter 8, you should be able to:

- L01** Understand why organizations budget and the processes they use to create budgets.
- L02** Prepare a sales budget, including a schedule of expected cash collections.
- L03** Prepare a production budget.
- L04** Prepare a direct materials budget, including a schedule of expected cash disbursements for purchases of materials.
- L05** Prepare a direct labor budget.
- L06** Prepare a manufacturing overhead budget.
- L07** Prepare a selling and administrative expense budget.
- L08** Prepare a cash budget.
- L09** Prepare a budgeted income statement.
- L010** Prepare a budgeted balance sheet.

In this chapter, we focus on the steps taken by businesses to achieve their planned levels of profits—a process called *profit planning*. Profit planning is accomplished by preparing a number of budgets that together form an integrated business plan known as the *master budget*. The master budget is an essential management tool that communicates management’s plans throughout the organization, allocates resources, and coordinates activities.

The Basic Framework of Budgeting

LEARNING OBJECTIVE 1

Understand why organizations budget and the processes they use to create budgets.

A **budget** is a quantitative plan for acquiring and using resources over a specified time period. Individuals sometimes create household budgets that balance their income and expenditures for food, clothing, housing, and so on while providing for some savings. Once the budget is established, actual spending is compared to the budget to make sure the plan is being followed. Companies use budgets in a similar way, although the amount of work and underlying details far exceed a personal budget.

Budgets are used for two distinct purposes—*planning* and *control*. **Planning** involves developing goals and preparing various budgets to achieve those goals. **Control** involves the steps taken by management to increase the likelihood that all parts of the organization are working together to achieve the goals set down at the planning stage. To be effective, a good budgeting system must provide for both planning and control. Good planning without effective control is a waste of time and effort.

Advantages of Budgeting

Organizations realize many benefits from budgeting including:

1. Budgets *communicate* management’s plans throughout the organization.
2. Budgets force managers to *think about* and *plan* for the future. In the absence of the necessity to prepare a budget, many managers would spend all of their time dealing with day-to-day emergencies.
3. The budgeting process provides a means of *allocating resources* to those parts of the organization where they can be used most effectively.
4. The budgeting process can uncover potential *bottlenecks* before they occur.
5. Budgets *coordinate* the activities of the entire organization by *integrating* the plans of its various parts. Budgeting helps to ensure that everyone in the organization is pulling in the same direction.
6. Budgets define goals and objectives that can serve as *benchmarks* for evaluating subsequent performance.

Responsibility Accounting

Most of what we say in this chapter and in the next three chapters is concerned with *responsibility accounting*. The basic idea underlying **responsibility accounting** is that a manager should be held responsible for those items—and *only* those items—that the manager can actually control to a significant extent. Each line item (i.e., revenue or cost) in the budget is the responsibility of a manager who is held responsible for subsequent deviations between budgeted goals and actual results. In effect, responsibility accounting *personalizes* accounting information by holding individuals responsible for revenues and costs. This concept is central to any effective profit planning and control system. Someone must be held responsible for each cost or else no one will be responsible and the cost will inevitably grow out of control.

What happens if actual results do not measure up to the budgeted goals? The manager is not necessarily penalized. However, the manager should take the initiative to correct any unfavorable discrepancies, should understand the source of significant favorable or

IN BUSINESS

NEW YORK CITY MAYOR BENEFITS FROM BUDGETS

Michael Bloomberg, the mayor of **New York City**, makes annual budget presentations to his fellow elected officials, the city council, and the media. Historically, the city's mayors had delegated these types of presentations to one of their budget directors; however, Bloomberg believes that by investing his time in explaining the factors influencing the city's economy, his constituents will gain a better understanding of his fiscal priorities. This, in turn, helps improve his negotiations with the city council and his relationships with various advocacy groups. The mayor also makes his entire budget available online so that New Yorkers can scrutinize budgeting details, such as the cost of running specific government agencies.

Source: Tom Lowry, "The CEO Mayor," *BusinessWeek*, June 25, 2007, pp. 58–64.

unfavorable discrepancies, and should be prepared to explain the reasons for discrepancies to higher management. The point of an effective responsibility accounting system is to make sure that nothing "falls through the cracks," that the organization reacts quickly and appropriately to deviations from its plans, and that the organization learns from the feedback it gets by comparing budgeted goals to actual results. The point is *not* to penalize individuals for missing targets.

Choosing a Budget Period

Operating budgets ordinarily cover a one-year period corresponding to the company's fiscal year. Many companies divide their budget year into four quarters. The first quarter is then subdivided into months, and monthly budgets are developed. The last three quarters may be carried in the budget as quarterly totals only. As the year progresses, the figures for the second quarter are broken down into monthly amounts, then the third-quarter figures are broken down, and so forth. This approach has the advantage of requiring periodic review and reappraisal of budget data throughout the year.

Continuous or perpetual budgets are sometimes used. A **continuous** or **perpetual budget** is a 12-month budget that rolls forward one month (or quarter) as the current month (or quarter) is completed. In other words, one month (or quarter) is added to the end of the budget as each month (or quarter) comes to a close. This approach keeps managers focused at least one year ahead so that they do not become too narrowly focused on short-term results.

In this chapter, we will look at one-year operating budgets. However, using basically the same techniques, operating budgets can be prepared for periods that extend over many years. It may be difficult to accurately forecast sales and other data much beyond a year, but even rough estimates can be invaluable in uncovering potential problems and opportunities that would otherwise be overlooked.

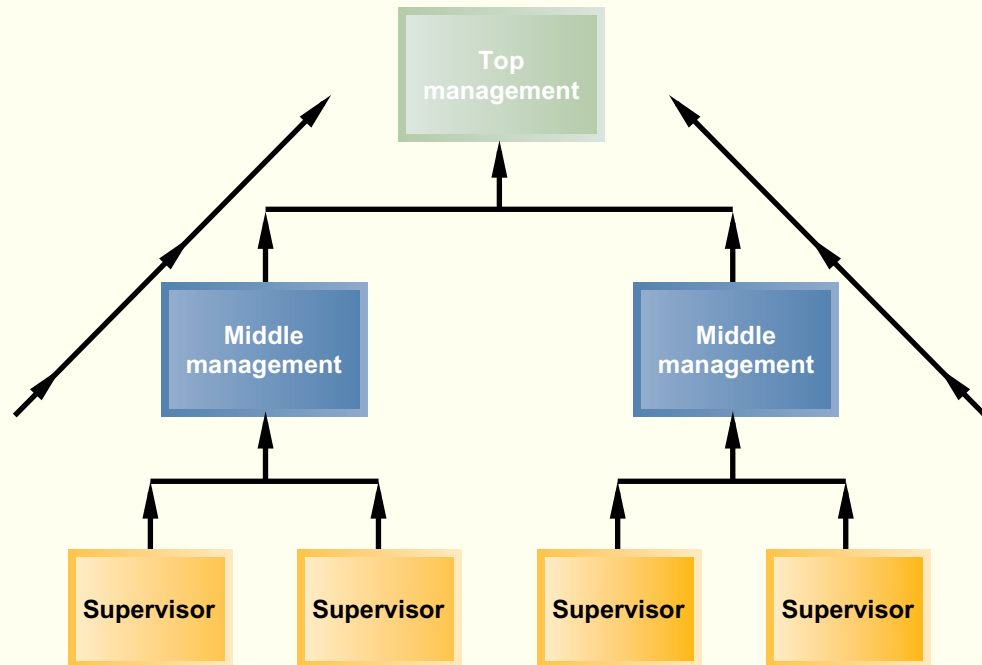

IN BUSINESS

KEEPING CURRENT

Jim Bell, **Hunstman Corp.**'s director of corporate finance, says that his company must frequently update its budgets and its forecasts to meet the demands of investors, creditors, and others. The company updates its annual budget each month, using the most recent data, to provide greater accuracy as the year unfolds. The budget is also used together with sophisticated modeling software to evaluate what effects decisions and various changes in input prices and other parameters might have on future results.

EXHIBIT 8-1
The Initial Flow of Budget
Data in a Participative
Budgeting System

The initial flow of budget data in a participative budgeting system is from lower levels of responsibility to higher levels of responsibility. Each person with responsibility for cost control will prepare his or her own budget estimates and submit them to the next higher level of management. These estimates are reviewed and consolidated as they move upward in the organization.

The Self-Imposed Budget

The success of a budget program is largely determined by the way a budget is developed. Oftentimes, the budget is imposed from above, with little participation by lower-level managers. However, in the most successful budget programs, managers actively participate in preparing their own budgets. Imposing expectations from above and then penalizing employees who do not meet those expectations will generate resentment rather than cooperation and commitment. In fact, many managers believe that being empowered to create their own *self-imposed budgets* is the most effective method of budget preparation. A **self-imposed budget** or **participative budget**, as illustrated in Exhibit 8-1, is a budget that is prepared with the full cooperation and participation of managers at all levels.

Self-imposed budgets have a number of advantages:

1. Individuals at all levels of the organization are recognized as members of the team whose views and judgments are valued by top management.
2. Budget estimates prepared by front-line managers are often more accurate and reliable than estimates prepared by top managers who have less intimate knowledge of markets and day-to-day operations.
3. Motivation is generally higher when individuals participate in setting their own goals than when the goals are imposed from above. Self-imposed budgets create commitment.
4. A manager who is not able to meet a budget that has been imposed from above can always say that the budget was unrealistic and impossible to meet. With a self-imposed budget, this excuse is not available.

One important limitation of self-imposed budgeting is that lower-level managers may allow too much *budgetary slack*. Because the manager who creates the budget will be held accountable for actual results that deviate from the budget, the manager will have a natural tendency to submit a budget that is easy to attain (i.e., the manager will build slack into the budget). For this reason, budgets prepared by lower-level managers should be scrutinized by higher levels of management. Questionable items should be discussed and modified as appropriate. Without such a review, self-imposed budgets may be too slack, resulting in suboptimal performance.

As these comments suggest, all levels in the organization should work together to produce the budget. Lower-level managers are more familiar with day-to-day operations than top managers. Top managers should have a more strategic perspective than lower-level managers. Each level of responsibility in an organization should contribute its unique knowledge and perspective in a cooperative effort to develop an integrated budget. Nevertheless, a self-imposed approach to setting budgets works best when all managers understand the organization's strategy. Otherwise, the budgets proposed by the lower-level managers will lack coherent direction. In later chapters, we discuss in greater detail how a company can go about formulating its strategy and communicating it throughout the organization.

Unfortunately, most companies do not follow the budgeting process we have described. Typically, top managers initiate the budgeting process by issuing profit targets. Lower-level managers are directed to prepare budgets that meet those targets. The difficulty is that the targets set by top managers may be unrealistically high or may allow too much slack. If the targets are too high and employees know they are unrealistic, motivation will suffer. If the targets allow too much slack, waste will occur. Unfortunately, top managers are often not in a position to know whether the targets are appropriate. Admittedly, a self-imposed budgeting system may lack sufficient strategic direction and lower-level managers may be tempted to build slack into their budgets. Nevertheless, because of the motivational advantages of self-imposed budgets, top managers should be cautious about imposing inflexible targets from above.

Human Factors in Budgeting

The success of a budget program also depends on the degree to which top management accepts the budget program as a vital part of the company's activities and the way in which top management uses budgeted data.

If a budget program is to be successful, it must have the complete acceptance and support of the persons who occupy key management positions. If lower or middle managers sense that top management is lukewarm about budgeting, or if they sense that top management simply tolerates budgeting as a necessary evil, then their own attitudes will reflect a similar lack of enthusiasm. Budgeting is hard work, and if top management is not enthusiastic about and committed to the budget program, then it is unlikely that anyone else in the organization will be either.

In administering the budget program, it is particularly important that top management not use the budget to pressure or blame employees. Using budgets in such negative ways will breed hostility, tension, and mistrust rather than cooperation and productivity. Unfortunately, the budget is too often used as a pressure device and excessive emphasis is placed on "meeting the budget" under all circumstances. Rather than being used as a weapon, the budget should be used as a positive instrument to assist in establishing goals, measuring operating results, and isolating areas that need attention.

The human aspects of budgeting are extremely important. The remainder of the chapter deals with technical aspects of budgeting, but do not lose sight of the human aspects. The purpose of the budget is to motivate people and to coordinate their efforts. This purpose is undermined if managers become preoccupied with the technical aspects or if the budget is used in a rigid and inflexible manner to control people.

IN BUSINESS

WHO CARES ABOUT BUDGETS?

Towers Perrin, a consulting firm, reports that the bonuses of more than two out of three corporate managers are based on meeting targets set in annual budgets. “Under this arrangement, managers at the beginning of a year all too often argue that their targets should be lowered because of tough business conditions, when in fact conditions are better than projected. If their arguments are successful, they can easily surpass the targets.”

Source: Ronald Fink and Towers Perrin, “Riding the Bull: The 2000 Compensation Survey,” *CFO*, June 2000, pp. 45–60.

How challenging should budget targets be? Some experts argue that budget targets should be very challenging and should require managers to stretch to meet goals. Even the most capable managers may have to scramble to meet such a “stretch budget” and they may not always succeed. In practice, most companies set their budget targets at a “highly achievable” level. A highly achievable budget may be challenging, but it can almost always be met by competent managers exerting reasonable effort.

Bonuses based on meeting and exceeding budgets are often a key element of management compensation. Typically, no bonus is paid unless the budget is met. The bonus often increases when the budget target is exceeded, but the bonus is usually capped out at some level. For obvious reasons, managers who have such a bonus plan or whose performance is evaluated based on meeting budget targets usually prefer to be evaluated based on highly achievable budgets rather than on stretch budgets. Moreover, highly achievable budgets may help build a manager’s confidence and generate greater commitment to the budget. And finally, highly achievable budgets may result in less undesirable behavior at the end of budgetary periods by managers who are intent on earning their bonuses. Examples of such undesirable behaviors are presented in several of the In Business boxes in this chapter.

IN BUSINESS

BIASING FORECASTS

A manager’s compensation is often tied to the budget. Typically, no bonus is paid unless a minimum performance hurdle such as 80% of the budget target is attained. Once that hurdle is passed, the manager’s bonus increases until a cap is reached. That cap is often set at 120% of the budget target.

This common method of tying a manager’s compensation to the budget has some serious negative side effects. For example, a marketing manager for a big beverage company intentionally grossly understated demand for the company’s products for an upcoming major holiday so that the budget target for revenues would be low and easy to beat. Unfortunately, the company tied its production to this biased forecast and ran out of products to sell during the height of the holiday selling season.

As another example, near the end of the year another group of managers announced a price increase of 10% effective January 2 of the following year. Why would they do this? By announcing this price increase, managers hoped that customers would order before the end of the year, helping managers meet their sales targets for the current year. Sales in the following year would, of course, drop. What trick would managers pull to meet their sales targets next year in the face of this drop in demand?

The Budget Committee

A standing **budget committee** is usually responsible for overall policy relating to the budget program and for coordinating the preparation of the budget itself. This committee may consist of the president; vice presidents in charge of various functions such as sales,

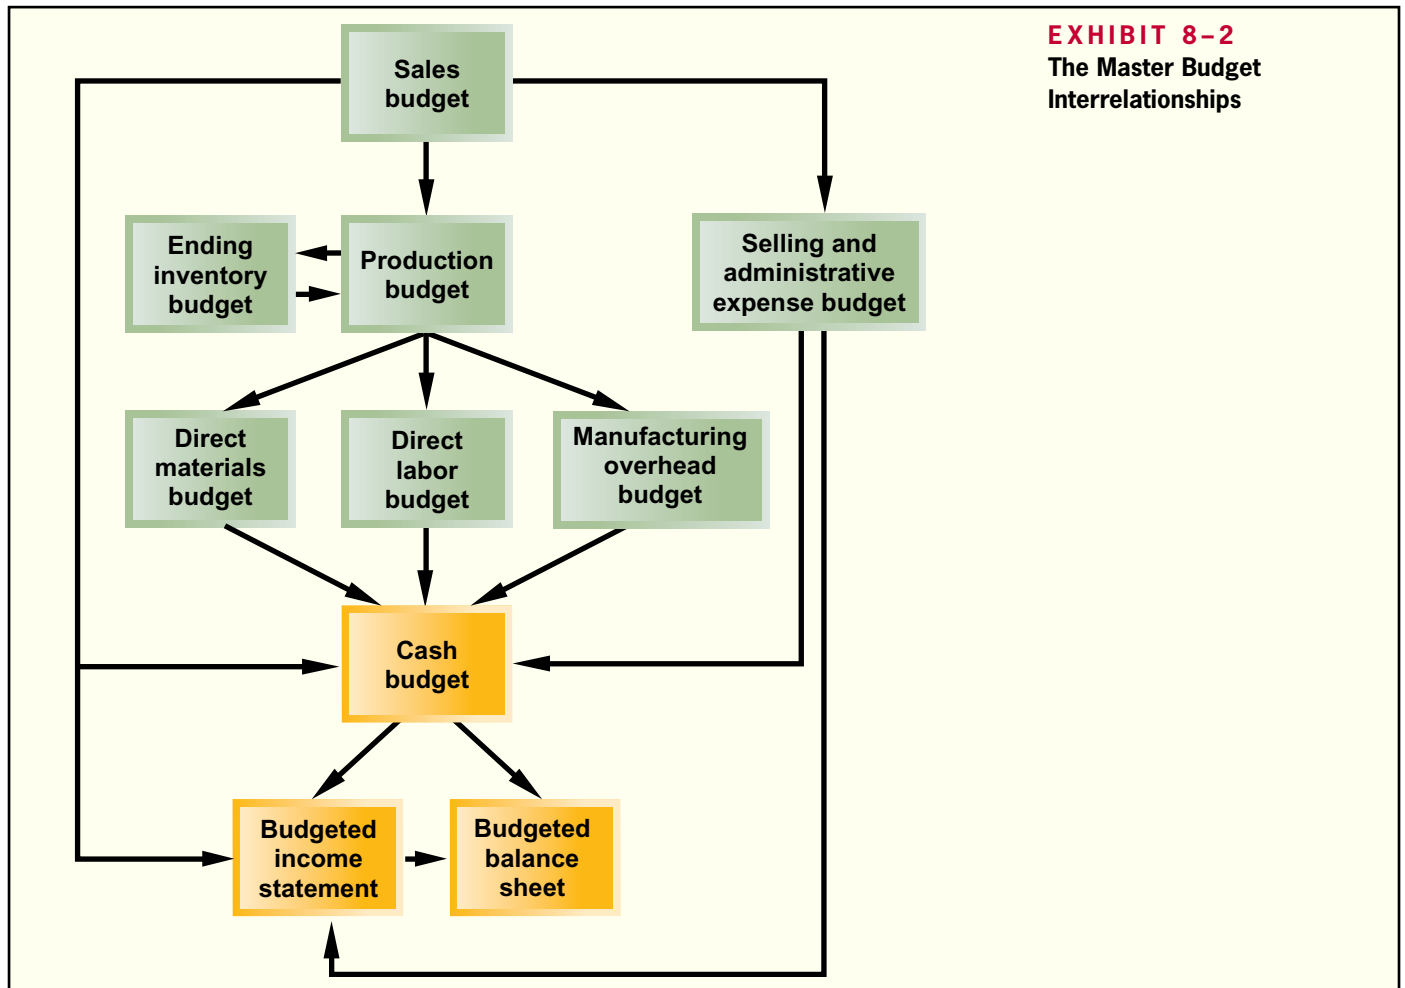

production, and purchasing; and the controller. Difficulties and disputes relating to the budget are resolved by the budget committee. In addition, the budget committee approves the final budget.

Disputes can (and do) erupt over budget matters. Because budgets allocate resources, the budgeting process determines to a large extent which departments get more resources and which get less. Also, the budget sets the benchmarks used to evaluate managers and their departments. Therefore, it should not be surprising that managers take the budgeting process very seriously and invest considerable energy and emotion in ensuring that their interests, and those of their departments, are protected. Because of this, the budgeting process can easily degenerate into an interoffice brawl in which the ultimate goal of working together toward common goals is forgotten.

Running a successful budgeting program that avoids interoffice battles requires considerable interpersonal skills in addition to purely technical skills. But even the best interpersonal skills will fail if, as discussed earlier, top management uses the budget process to inappropriately pressure employees or to assign blame.

The Master Budget: An Overview

The **master budget** consists of a number of separate but interdependent budgets that formally lay out the company's sales, production, and financial goals. The master budget culminates in a cash budget, a budgeted income statement, and a budgeted balance sheet. Exhibit 8-2 provides an overview of the various parts of the master budget and how they are related.

The first step in the budgeting process is the preparation of the **sales budget**, which is a detailed schedule showing the expected sales for the budget period. An accurate sales budget is the key to the entire budgeting process. As illustrated in Exhibit 8–2, all other parts of the master budget depend on the sales budget. If the sales budget is inaccurate, the rest of the budget will be inaccurate. The sales budget is based on the company's sales forecast, which may require the use of sophisticated mathematical models and statistical tools. We will not go into the details of how sales forecasts are made. This is a subject that is most appropriately covered in marketing courses.

The sales budget helps determine how many units need to be produced. Thus, the production budget is prepared after the sales budget. The production budget in turn is used to determine the budgets for manufacturing costs including the direct materials budget, the direct labor budget, and the manufacturing overhead budget. These budgets are then combined with data from the sales budget and the selling and administrative expense budget to determine the *cash budget*. A **cash budget** is a detailed plan showing how cash resources will be acquired and used. Observe from Exhibit 8–2 that all of the operating budgets have an impact on the cash budget. After the cash budget is prepared, the budgeted income statement and then the budgeted balance sheet can be prepared.

IN BUSINESS

BE REALISTIC

Gillette, the company that makes razors and other consumer products, got into trouble trying to meet increasingly unrealistic sales targets. The buyer at one of the company's big retail customers told Gillette's new CEO, Jim Kilts, that "he always waited until the last week of the quarter to order anything from Gillette 'because I know that you will always cut a deal.' To hit their numbers each quarter, [the Gillette salespersons] were willing to do anything—offer cut-rate deals, rearrange product packaging—whatever it took to make the sale." This resulted in artificially large sales at the end of the quarter—disrupting production schedules and loading the retail stores with excess inventory at discounted prices that would have to be sold off before more inventory would be ordered from Gillette.

Preparing the Master Budget

MANAGERIAL ACCOUNTING IN ACTION

The Issue

Tom Wills is the majority stockholder and chief executive officer of Hampton Freeze, Inc., a company he started in 2006. The company makes premium popsicles using only natural ingredients and featuring exotic flavors such as tangy tangerine and minty mango. The company's business is highly seasonal, with most of the sales occurring in spring and summer.

In 2007, the company's second year of operations, a major cash crunch in the first and second quarters almost forced the company into bankruptcy. In spite of this cash crunch, 2007 turned out to be a very successful year in terms of both cash flow and net income. Partly as a result of that harrowing experience, Tom decided toward the end of 2007 to hire a professional financial manager. Tom interviewed several promising candidates for the job and settled on Larry Giano, who had considerable experience in the packaged foods industry. In the job interview, Tom questioned Larry about the steps he would take to prevent a recurrence of the 2007 cash crunch:

Tom: As I mentioned earlier, we are going to end 2007 with a very nice profit. What you may not know is that we had some very big financial problems this year.

Larry: Let me guess. You ran out of cash sometime in the first or second quarter.

Tom: How did you know?

Larry: Most of your sales are in the second and third quarter, right?

Tom: Sure, everyone wants to buy popsicles in the spring and summer, but nobody wants them when the weather turns cold.

Larry: So you don't have many sales in the first quarter?

Tom: Right.

Larry: And in the second quarter, which is the spring, you are producing like crazy to fill orders?

Tom: Sure.

Larry: Do your customers, the grocery stores, pay you the day you make your deliveries?

Tom: Are you kidding? Of course not.

Larry: So in the first quarter, you don't have many sales. In the second quarter, you are producing like crazy, which eats up cash, but you aren't paid by your customers until long after you have paid your employees and suppliers. No wonder you had a cash problem. I see this pattern all the time in food processing because of the seasonality of the business.

Tom: So what can we do about it?

Larry: The first step is to predict the magnitude of the problem before it occurs. If we can predict early in the year what the cash shortfall is going to be, we can go to the bank and arrange for credit before we really need it. Bankers tend to be leery of panicky people who show up begging for emergency loans. They are much more likely to make the loan if you look like you are in control of the situation.

Tom: How can we predict the cash shortfall?

Larry: You can put together a cash budget. While you're at it, you might as well do a master budget. You'll find it is well worth the effort.

Tom: I don't like budgets. They are too confining. My wife budgets everything at home, and I can't spend what I want.

Larry: Can I ask a personal question?

Tom: What?

Larry: Where did you get the money to start this business?

Tom: Mainly from our family's savings. I get your point. We wouldn't have had the money to start the business if my wife hadn't been forcing us to save every month.

Larry: Exactly. I suggest you use the same discipline in your business. It is even more important here because you can't expect your employees to spend your money as carefully as you would.

With the full backing of Tom Wills, Larry Giano set out to create a master budget for the company for the year 2008. In his planning for the budgeting process, Larry drew up the following list of documents that would be a part of the master budget:

1. A sales budget, including a schedule of expected cash collections.
2. A production budget (a merchandise purchases budget would be used in a merchandising company).
3. A direct materials budget, including a schedule of expected cash disbursements for purchases of materials.
4. A direct labor budget.
5. A manufacturing overhead budget.
6. An ending finished goods inventory budget.
7. A selling and administrative expense budget.
8. A cash budget.
9. A budgeted income statement.
10. A budgeted balance sheet.

Larry felt it was important to have everyone's cooperation in the budgeting process, so he asked Tom to call a companywide meeting to explain the budgeting process. At the meeting there was initially some grumbling, but Tom was able to convince nearly everyone of the necessity for planning and getting better control over spending. It helped that the cash

crisis earlier in the year was still fresh in everyone's minds. As much as some people disliked the idea of budgets, they liked their jobs more.

In the months that followed, Larry worked closely with all of the managers involved in the master budget, gathering data from them and making sure that they understood and fully supported the parts of the master budget that would affect them. In subsequent years, Larry hoped to turn the whole budgeting process over to the managers and to take a more advisory role.

The interdependent documents that Larry Giano prepared for Hampton Freeze are Schedules 1 through 10 of the company's master budget. In this section, we will study these schedules.

SCHEDULE 1

| Hampton Freeze, Inc. Sales Budget For the Year Ended December 31, 2008 | | | | | |
|--|-----------|-----------|------------|------------|-------------|
| | Quarter | | | | Year |
| | 1 | 2 | 3 | 4 | |
| Budgeted sales in cases | 10,000 | 30,000 | 40,000 | 20,000 | 100,000 |
| Selling price per case | \$ 20.00 | \$ 20.00 | \$ 20.00 | \$ 20.00 | \$ 20.00 |
| Total sales | \$200,000 | \$600,000 | \$800,000 | \$400,000 | \$2,000,000 |
| Percentage of sales collected in the period of the sale | | | 70% | | |
| Percentage of sales collected in the period after the sale | | | 30% | | |
| Schedule of Expected Cash Collections | | | | | |
| Accounts receivable, beginning balance ¹ | \$ 90,000 | | | | \$ 90,000 |
| First-quarter sales ² | 140,000 | \$ 60,000 | | | 200,000 |
| Second-quarter sales ³ | | 420,000 | \$ 180,000 | | 600,000 |
| Third-quarter sales ⁴ | | | 560,000 | \$ 240,000 | 800,000 |
| Fourth-quarter sales ⁵ | | | | 280,000 | 280,000 |
| Total cash collections ⁶ | \$230,000 | \$480,000 | \$740,000 | \$520,000 | \$1,970,000 |

¹Cash collections from last year's fourth-quarter sales. See the beginning-of-year balance sheet on page 309.

²\$200,000 × 70%; \$200,000 × 30%.

³\$600,000 × 70%; \$600,000 × 30%.

⁴\$800,000 × 70%; \$800,000 × 30%.

⁵\$400,000 × 70%.

⁶Uncollected fourth-quarter sales appear as accounts receivable on the company's end-of-year budgeted balance sheet (see Schedule 10 on page 310).

The Sales Budget

The sales budget is the starting point in preparing the master budget. As shown earlier in Exhibit 8–2, all other items in the master budget, including production, purchases, inventories, and expenses, depend on it.

The sales budget is constructed by multiplying budgeted unit sales by the selling price. Schedule 1 (on the previous page) contains the quarterly sales budget for Hampton Freeze for the year 2008. Notice from the schedule that the company plans to sell 100,000 cases of popsicles during the year, with sales peaking in the third quarter.

A schedule of expected cash collections, such as the one that appears in the bottom portion of Schedule 1, is prepared after the sales budget. This schedule will be needed later to prepare the cash budget. Cash collections consist of collections on credit sales made to customers in prior periods plus collections on sales made in the current budget period. At Hampton Freeze all sales are on credit; furthermore, experience has shown that 70% of sales are collected in the quarter in which the sale is made and the remaining 30% are collected in the following quarter. For example, 70% of the first quarter sales of \$200,000 (or \$140,000) is collected during the first quarter and 30% (or \$60,000) is collected during the second quarter.

LEARNING OBJECTIVE 2
Prepare a sales budget, including a schedule of expected cash collections.

The Production Budget

The production budget is prepared after the sales budget. The **production budget** lists the number of units that must be produced to satisfy sales needs and to provide for the desired ending inventory. Production needs can be determined as follows:

| | |
|------------------------------------|------|
| Budgeted unit sales | XXXX |
| Add desired ending inventory | XXXX |
| Total needs | XXXX |
| Less beginning inventory | XXXX |
| Required production | XXXX |

LEARNING OBJECTIVE 3
Prepare a production budget.

Note that production requirements are influenced by the desired level of the ending inventory. Inventories should be carefully planned. Excessive inventories tie up funds and create storage problems. Insufficient inventories can lead to lost sales or last-minute, high-cost production efforts. At Hampton Freeze, management believes that an ending inventory equal to 20% of the next quarter’s sales strikes the appropriate balance.

Schedule 2 contains the production budget for Hampton Freeze. The first row in the production budget contains the budgeted sales, which have been taken directly from the sales budget (Schedule 1). The total needs for the first quarter are determined by adding together the budgeted sales of 10,000 cases for the quarter and the desired ending inventory of 6,000 cases. As discussed above, the ending inventory is intended to provide some cushion in the event that problems develop in production or sales increase unexpectedly. Because the budgeted sales for the second quarter are 30,000 cases and management would like the ending inventory in each quarter to equal 20% of the following quarter’s sales, the desired ending inventory for the first quarter is 6,000 cases (20% of 30,000 cases). Consequently, the total needs for the first quarter are 16,000 cases. However, because the company already has 2,000 cases in beginning inventory, only 14,000 cases need to be produced in the first quarter.

Pay particular attention to the Year column to the right of the production budget in Schedule 2. In some cases (e.g., budgeted sales, total needs, and required production), the amount listed for the year is the sum of the quarterly amounts for the item. In other cases (e.g., desired ending inventory of finished goods and beginning inventory of finished goods), the amount listed for the year is not simply the sum of the quarterly amounts. From the standpoint of the entire year, the beginning finished goods inventory is the same

SCHEDULE 2

| Hampton Freeze, Inc. Production Budget For the Year Ended December 31, 2008 (in cases) | | | | | |
|---|---------|--------|--------|--------|---------|
| | Quarter | | | | Assumed |
| | 1 | 2 | 3 | 4 | Year |
| Budgeted sales (Schedule 1) | 10,000 | 30,000 | 40,000 | 20,000 | 100,000 |
| Add desired ending inventory of finished goods* | 6,000 | 8,000 | 4,000 | 3,000 | 3,000 |
| Total needs | 16,000 | 38,000 | 44,000 | 23,000 | 103,000 |
| Less beginning inventory of finished goods† | 2,000 | 6,000 | 8,000 | 4,000 | 2,000 |
| Required production | 14,000 | 32,000 | 36,000 | 19,000 | 101,000 |

*Twenty percent of the next quarter's sales. The ending inventory of 3,000 cases is assumed.
 †The beginning inventory in each quarter is the same as the prior quarter's ending inventory.

as the beginning finished goods inventory for the first quarter—it is *not* the sum of the beginning finished goods inventories for all quarters. Similarly, from the standpoint of the entire year, the ending finished goods inventory is the same as the ending finished goods inventory for the fourth quarter—it is *not* the sum of the ending finished goods inventories for all four quarters. It is important to pay attention to such distinctions in all of the schedules that follow.

Inventory Purchases—Merchandising Company

Hampton Freeze prepares a production budget because it is a *manufacturing* company. If it were a *merchandising* company, instead it would prepare a **merchandise purchases budget** showing the amount of goods to be purchased from suppliers during the period. The merchandise purchases budget has the same basic format as the production budget, as shown below:

| | |
|--|--------|
| Budgeted sales | XXXXXX |
| Add desired ending merchandise inventory | XXXXXX |
| Total needs | XXXXXX |
| Less beginning merchandise inventory | XXXXXX |
| Required purchases | XXXXXX |

A merchandising company would prepare a merchandise purchases budget such as the one above for each item carried in stock. The merchandise purchases budget can be expressed in terms of either units or the purchase cost of those units.

The Direct Materials Budget

A *direct materials budget* is prepared after the production requirements have been computed. The **direct materials budget** details the raw materials that must be purchased to fulfill the production budget and to provide for adequate inventories. The required purchases of raw materials are computed as follows:

| | |
|--|-------|
| Raw materials needed to meet the production schedule | XXXXX |
| Add desired ending inventory of raw materials | XXXXX |
| Total raw materials needs | XXXXX |
| Less beginning inventory of raw materials | XXXXX |
| Raw materials to be purchased | XXXXX |

LEARNING OBJECTIVE 4

Prepare a direct materials budget, including a schedule of expected cash disbursements for purchases of materials.

Schedule 3 contains the direct materials budget for Hampton Freeze. The only raw material included in that budget is high fructose sugar, which is the major ingredient in popsicles other than water. The remaining raw materials are relatively insignificant and are included in variable manufacturing overhead. As with finished goods, management would like to maintain some inventories of raw materials to act as a cushion. In this case, management would like to maintain ending inventories of sugar equal to 10% of the following quarter's production needs.

The first line in the direct materials budget contains the required production for each quarter, which is taken directly from the production budget (Schedule 2). Looking at the first quarter, because the production schedule calls for production of 14,000 cases of popsicles and each case requires 15 pounds of sugar, the total production needs are 210,000 pounds of sugar (14,000 cases \times 15 pounds per case). In addition, management wants to have ending inventories of 48,000 pounds of sugar, which is 10% of the following quarter's needs of 480,000 pounds. Consequently, the total needs are 258,000 pounds (210,000 pounds for the current quarter's production plus 48,000 pounds for the desired ending inventory). However, because the company already has 21,000 pounds in beginning inventory, only 237,000 pounds of sugar (258,000 pounds $-$ 21,000 pounds) will need to be purchased. Finally, the cost of the raw materials purchases is determined by multiplying the amount of raw material to be purchased by its unit cost. In this case, because 237,000 pounds of sugar will need to be purchased during the first quarter and sugar costs \$0.20 per pound, the total cost will be \$47,400 (237,000 pounds \times \$0.20 per pound).

As with the production budget, the amounts listed under the Year column are not always the sum of the quarterly amounts. The desired ending raw materials inventory for the year is the same as the desired ending raw materials inventory for the fourth quarter. Likewise, the beginning raw materials inventory for the year is the same as the beginning raw materials inventory for the first quarter.

The direct materials budget (or the merchandise purchases budget for a merchandising company) is usually accompanied by a schedule of expected cash disbursements for raw materials (or merchandise purchases). This schedule is needed to prepare the overall cash budget. Disbursements for raw materials (or merchandise purchases) consist of payments for purchases on account in prior periods plus any payments for purchases in the current budget period. Schedule 3 contains such a schedule of cash disbursements for Hampton Freeze.

Ordinarily, companies do not immediately pay their suppliers. At Hampton Freeze, the policy is to pay for 50% of purchases in the quarter in which the purchase is made and 50% in the following quarter, so while the company intends to purchase \$47,400 worth of sugar in the first quarter, the company will only pay for half, \$23,700, in the first quarter and the other half will be paid in the second quarter. The company will also

SCHEDULE 3

| Hampton Freeze, Inc. Direct Materials Budget For the Year Ended December 31, 2008 | | | | | |
|---|-----------|-----------|------------|-----------|------------|
| | Quarter | | | | Year |
| | 1 | 2 | 3 | 4 | |
| Required production in cases (Schedule 2) | 14,000 | 32,000 | 36,000 | 19,000 | 101,000 |
| Raw materials needed per case (pounds) | 15 | 15 | 15 | 15 | 15 |
| Production needs (pounds) | 210,000 | 480,000 | 540,000 | 285,000 | 1,515,000 |
| Add desired ending inventory of raw materials ¹ | 48,000 | 54,000 | 28,500 | 22,500 | 22,500 |
| Total needs | 258,000 | 534,000 | 568,500 | 307,500 | 1,537,500 |
| Less beginning inventory of raw materials | 21,000 | 48,000 | 54,000 | 28,500 | 21,000 |
| Raw materials to be purchased | 237,000 | 486,000 | 514,500 | 279,000 | 1,516,500 |
| Cost of raw materials per pound | \$ 0.20 | \$ 0.20 | \$ 0.20 | \$ 0.20 | \$ 0.20 |
| Cost of raw materials to be purchased | \$ 47,400 | \$ 97,200 | \$ 102,900 | \$ 55,800 | \$ 303,300 |
| Percentage of purchases paid for in the period of the purchase | | | 50% | | |
| Percentage of purchases paid for in the period after purchase | | | 50% | | |
| Schedule of Expected Cash Disbursements for Materials | | | | | |
| Accounts payable, beginning balance ² | \$ 25,800 | | | | \$ 25,800 |
| First-quarter purchases ³ | 23,700 | 23,700 | | | 47,400 |
| Second-quarter purchases ⁴ | | 48,600 | \$ 48,600 | | 97,200 |
| Third-quarter purchases ⁵ | | | 51,450 | \$ 51,450 | 102,900 |
| Fourth-quarter purchases ⁶ | | | | 27,900 | 27,900 |
| Total cash disbursements for materials | \$ 49,500 | \$ 72,300 | \$ 100,050 | \$ 79,350 | \$ 301,200 |

¹Ten percent of the next quarter's production needs. For example, the second-quarter production needs are 480,000 pounds. Therefore, the desired ending inventory for the first quarter would be $10\% \times 480,000$ pounds = 48,000 pounds. The ending inventory of 22,500 pounds for the fourth quarter is assumed.

²Cash payments for last year's fourth-quarter material purchases. See the beginning-of-year balance sheet on page 309.

³ $\$47,400 \times 50\%$; $\$47,400 \times 50\%$.

⁴ $\$97,200 \times 50\%$; $\$97,200 \times 50\%$.

⁵ $\$102,900 \times 50\%$; $\$102,900 \times 50\%$.

⁶ $\$55,800 \times 50\%$. Unpaid fourth-quarter purchases appear as accounts payable on the company's end-of-year balance sheet.

pay \$25,800 in the first quarter for sugar that was purchased on account in the previous quarter, but not yet paid for. This is the beginning balance in the accounts payable. Therefore, the total cash disbursements for sugar in the first quarter are \$49,500—the \$25,800 payment for sugar acquired in the previous quarter plus the \$23,700 payment for sugar acquired during the first quarter.

The Direct Labor Budget

The **direct labor budget** shows the direct labor-hours required to satisfy the production budget. By knowing in advance how much labor time will be needed throughout the budget year, the company can develop plans to adjust the labor force as the situation requires. Companies that neglect to budget run the risk of facing labor shortages or having to hire and lay off workers at awkward times. Erratic labor policies lead to insecurity, low morale, and inefficiency.

The direct labor budget for Hampton Freeze is shown in Schedule 4. The first line in the direct labor budget consists of the required production for each quarter, which is taken directly from the production budget (Schedule 2). The direct labor requirement for each quarter is computed by multiplying the number of units to be produced in that quarter by the number of direct labor-hours required to make a unit. For example, 14,000 cases are to be produced in the first quarter and each case requires 0.40 direct labor-hour, so a total of 5,600 direct labor-hours (14,000 cases \times 0.40 direct labor-hour per case) will be required in the first quarter. The direct labor requirements can then be translated into budgeted direct labor costs. How this is done will depend on the company's labor policy. In Schedule 4, Hampton Freeze has assumed that the direct labor force will be adjusted as the work requirements change from quarter to quarter. In that case, the direct labor cost is computed by simply multiplying the direct labor-hour requirements by the direct labor rate per hour. For example, the direct labor cost in the first quarter is \$84,000 (5,600 direct labor-hours \times \$15 per direct labor-hour).

However, many companies have employment policies or contracts that prevent them from laying off and rehiring workers as needed. Suppose, for example, that Hampton Freeze has 25 workers who are classified as direct labor, but each of them is guaranteed at least 480 hours of pay each quarter at a rate of \$15 per hour. In that case, the minimum direct labor cost for a quarter would be as follows:

$$25 \text{ workers} \times 480 \text{ hours per worker} \times \$15 \text{ per hour} = \$180,000$$

LEARNING OBJECTIVE 5

Prepare a direct labor budget.

SCHEDULE 4

| Hampton Freeze, Inc. Direct Labor Budget For the Year Ended December 31, 2008 | | | | | |
|---|-----------|------------|------------|------------|------------|
| | Quarter | | | | Year |
| | 1 | 2 | 3 | 4 | |
| Required production in cases (Schedule 2) | 14,000 | 32,000 | 36,000 | 19,000 | 101,000 |
| Direct labor-hours per case | 0.40 | 0.40 | 0.40 | 0.40 | 0.40 |
| Total direct labor-hours needed | 5,600 | 12,800 | 14,400 | 7,600 | 40,400 |
| Direct labor cost per hour | \$ 15.00 | \$ 15.00 | \$ 15.00 | \$ 15.00 | \$ 15.00 |
| Total direct labor cost* | \$ 84,000 | \$ 192,000 | \$ 216,000 | \$ 114,000 | \$ 606,000 |

*This schedule assumes that the direct labor workforce will be fully adjusted to the total direct labor-hours needed each quarter.

Note that in this case the direct labor costs for the first and fourth quarters would have to be increased to \$180,000.

The Manufacturing Overhead Budget

LEARNING OBJECTIVE 6

Prepare a manufacturing overhead budget.

The **manufacturing overhead budget** lists all costs of production other than direct materials and direct labor. Schedule 5 shows the manufacturing overhead budget for Hampton Freeze. At Hampton Freeze, manufacturing overhead is separated into variable and fixed components. The variable component is \$4 per direct labor-hour and the fixed component is \$60,600 per quarter. Because the variable component of manufacturing overhead depends on direct labor, the first line in the manufacturing overhead budget consists of the budgeted direct labor-hours from the direct labor budget (Schedule 4). The budgeted direct labor-hours in each quarter are multiplied by the variable rate to determine the variable component of manufacturing overhead. For example, the variable manufacturing overhead for the first quarter is \$22,400 (5,600 direct labor-hours × \$4.00 per direct labor-hour). This is added to the fixed manufacturing overhead for the quarter to determine the total manufacturing overhead for the quarter of \$83,000 (\$22,400 + \$60,600).

A few words about fixed costs and the budgeting process are in order. In most cases, fixed costs are the costs of supplying capacity to make products, process purchase orders, handle customer calls, and so on. The amount of capacity that will be required depends on the expected level of activity for the period. If the expected level of activity is greater than the company’s current capacity, then fixed costs may have to be increased. Or, if the expected level is appreciably below the company’s current capacity, then it may be desirable to decrease fixed costs if possible. However, once the level of the fixed costs has been determined in the budget, the costs really are fixed. The time to adjust fixed costs is during the budgeting process. An activity-based costing system can help to determine the appropriate level of fixed costs at budget time by answering questions like, “How many clerks will we need to process the anticipated number of purchase orders next year?” For

SCHEDULE 5

| Hampton Freeze, Inc. | | | | | |
|--|-----------|-----------|------------|-----------|------------|
| Manufacturing Overhead Budget | | | | | |
| For the Year Ended December 31, 2008 | | | | | |
| | Quarter | | | | Year |
| | 1 | 2 | 3 | 4 | |
| Budgeted direct labor-hours (Schedule 4) | 5,600 | 12,800 | 14,400 | 7,600 | 40,400 |
| Variable manufacturing overhead rate | \$ 4.00 | \$ 4.00 | \$ 4.00 | \$ 4.00 | \$ 4.00 |
| Variable manufacturing overhead | \$ 22,400 | \$ 51,200 | \$ 57,600 | \$ 30,400 | \$ 161,600 |
| Fixed manufacturing overhead | 60,600 | 60,600 | 60,600 | 60,600 | 242,400 |
| Total manufacturing overhead | 83,000 | 111,800 | 118,200 | 91,000 | 404,000 |
| Less depreciation | 15,000 | 15,000 | 15,000 | 15,000 | 60,000 |
| Cash disbursements for manufacturing overhead | \$ 68,000 | \$ 96,800 | \$ 103,200 | \$ 76,000 | \$ 344,000 |
| Total manufacturing overhead (a) | | | | | \$ 404,000 |
| Budgeted direct labor-hours (b) | | | | | 40,400 |
| Predetermined overhead rate for the year (a)÷(b) | | | | | \$ 10.00 |

simplicity, in all of the budgeting examples in this book assume that the appropriate levels of fixed costs have already been determined.

The last line of Schedule 5 for Hampton Freeze shows the budgeted cash disbursements for manufacturing overhead. Because some of the overhead costs are not cash outflows, the total budgeted manufacturing overhead costs must be adjusted to determine the cash disbursements for manufacturing overhead. At Hampton Freeze, the only significant noncash manufacturing overhead cost is depreciation, which is \$15,000 per quarter. These noncash depreciation charges are deducted from the total budgeted manufacturing overhead to determine the expected cash disbursements. Hampton Freeze pays all overhead costs involving cash disbursements in the quarter incurred. Note that the company's predetermined overhead rate for the year is \$10 per direct labor-hour, which is determined by dividing the total budgeted manufacturing overhead for the year by the total budgeted direct labor-hours for the year.

The Ending Finished Goods Inventory Budget

After completing Schedules 1–5, Larry Giano had all of the data he needed to compute unit product costs. This computation was needed for two reasons: first, to determine cost of goods sold on the budgeted income statement; and second, to value ending inventories. The cost of unsold units is computed on the **ending finished goods inventory budget**.

Larry Giano considered using variable costing to prepare Hampton Freeze's budget statements, but he decided to use absorption costing instead because the bank would very likely require absorption costing. He also knew that it would be easy to convert the absorption costing financial statements to a variable costing basis later. At this point, the primary concern was to determine what financing, if any, would be required in 2008 and then to arrange for that financing from the bank.

The unit product cost computations are shown in Schedule 6. For Hampton Freeze, the absorption costing unit product cost is \$13 per case of popsicles—consisting of \$3 of

SCHEDULE 6

| Unit product cost (see above) | | | | | <u>\$ 13.00</u> | |
| Ending finished goods inventory in dollars | | | | | <u>\$ 39,000</u> | |

direct materials, \$6 of direct labor, and \$4 of manufacturing overhead. The manufacturing overhead is applied to units of product at the rate of \$10 per direct labor-hour. The budgeted carrying cost of the ending inventory is \$39,000.

The Selling and Administrative Expense Budget

LEARNING OBJECTIVE 7

Prepare a selling and administrative expense budget.

The **selling and administrative expense budget** lists the budgeted expenses for areas other than manufacturing. In large organizations, this budget would be a compilation of many smaller, individual budgets submitted by department heads and other persons responsible for selling and administrative expenses. For example, the marketing manager would submit a budget detailing the advertising expenses for each budget period.

Schedule 7 contains the selling and administrative expense budget for Hampton Freeze. Like the manufacturing overhead budget, the selling and administrative expense budget is divided into variable and fixed cost components. In the case of Hampton Freeze, the variable selling and administrative expense is \$1.80 per case. Consequently, budgeted sales in cases for each quarter are entered at the top of the schedule. These data are taken from the sales budget (Schedule 1). The budgeted variable selling and administrative expenses are determined by multiplying the budgeted cases sold by the variable selling and administrative expense per case. For example, the budgeted variable selling and administrative expense for the first quarter is \$18,000 (10,000 cases \times \$1.80 per case). The fixed selling and administrative expenses (all given data) are then added to the variable selling and administrative expenses to arrive at the total budgeted selling and administrative expenses. Finally, to determine the cash disbursements for selling and administrative

SCHEDULE 7

| Insurance | 10,000 | 10,000 | 10,000 | 10,000 | 40,000 |
| Property taxes | 4,000 | 4,000 | 4,000 | 4,000 | 16,000 |
| Depreciation | 10,000 | 10,000 | 10,000 | 10,000 | 40,000 |
| Total fixed selling and administrative expenses | 99,000 | 99,000 | 99,000 | 99,000 | 396,000 |
| Total selling and administrative expenses | 117,000 | 153,000 | 171,000 | 135,000 | 576,000 |
| Less depreciation | 10,000 | 10,000 | 10,000 | 10,000 | 40,000 |
| Cash disbursements for selling and administrative expenses | \$107,000 | \$143,000 | \$161,000 | \$125,000 | \$536,000 |

items, the total budgeted selling and administrative expense is adjusted by subtracting any noncash selling and administrative expenses (in this case, just depreciation).¹

The Cash Budget

As illustrated in Exhibit 8–2, the cash budget combines much of the data developed in the preceding steps. It is a good idea to review Exhibit 8–2 to get the big picture firmly in your mind before moving on.

The cash budget is composed of four major sections:

1. The receipts section.
2. The disbursements section
3. The cash excess or deficiency section.
4. The financing section.

The receipts section lists all of the cash inflows, except from financing, expected during the budget period. Generally, the major source of receipts is from sales.

The disbursements section summarizes all cash payments that are planned for the budget period. These payments include raw materials purchases, direct labor payments, manufacturing overhead costs, and so on, as contained in their respective budgets. In addition, other cash disbursements such as equipment purchases and dividends are listed.

The cash excess or deficiency section is computed as follows:

| | |
|--|-------------|
| Cash balance, beginning | XXXX |
| Add receipts | XXXX |
| Total cash available | XXXX |
| Less disbursements | XXXX |
| Excess (deficiency) of cash available over disbursements | <u>XXXX</u> |

If a cash deficiency exists during any budget period, the company will need to borrow funds. If there is a cash excess during any budget period, funds borrowed in previous periods can be repaid or the excess funds can be invested.

The financing section details the borrowings and repayments projected to take place during the budget period. It also lists interest payments that will be due on money borrowed.²

The cash balances at both the beginning and end of the year may be adequate even though a serious cash deficit occurs at some point during the year. Consequently, the cash budget should be broken down into time periods that are short enough to capture major fluctuations in cash balances. While a monthly cash budget is most common, some organizations budget cash on a weekly or even daily basis. Larry Giano has prepared a quarterly cash budget for Hampton Freeze that can be further refined as necessary. This budget appears in Schedule 8. The cash budget builds on the earlier schedules and on additional data that are provided below:

- The beginning cash balance is \$42,500.
- Management plans to spend \$130,000 during the year on equipment purchases: \$50,000 in the first quarter; \$40,000 in the second quarter; \$20,000 in the third quarter; and \$20,000 in the fourth quarter.

¹ Other adjustments might need to be made for differences between cash flows on the one hand and revenues and expenses on the other hand. For example, if property taxes are paid twice a year in installments of \$8,000 each, the expense for property tax would have to be “backed out” of the total budgeted selling and administrative expenses and the cash installment payments added to the appropriate quarters to determine the cash disbursements. Similar adjustments might also need to be made in the manufacturing overhead budget. We generally ignore these complications in this chapter.

² The format for the statement of cash flows, which is discussed in a later chapter, may also be used for the cash budget.

LEARNING OBJECTIVE 8
Prepare a cash budget.

| SCHEDULE 8 | | | | | | |
|--------------------------------------|--|----------|----------|-----------|-----------|-----------|
| Microsoft Excel - Hampton Freeze.xls | | | | | | |
| Hampton Freeze, Inc. | | | | | | |
| Cash Budget | | | | | | |
| For the Year Ended December 31, 2008 | | | | | | |
| | | Quarter | | | | |
| | Schedule | 1 | 2 | 3 | 4 | Year |
| 7 | Cash balance, beginning | \$42,500 | \$36,000 | \$ 33,900 | \$165,650 | \$ 42,500 |
| 8 | Add receipts: | | | | | |
| 9 | Collections from customers | 230,000 | 480,000 | 740,000 | 520,000 | 1,970,000 |
| 10 | Total cash available | 272,500 | 516,000 | 773,900 | 685,650 | 2,012,500 |
| 11 | Less disbursements: | | | | | |
| 12 | Direct materials | 49,500 | 72,300 | 100,050 | 79,350 | 301,200 |
| 13 | Direct labor | 84,000 | 192,000 | 216,000 | 114,000 | 606,000 |
| 14 | Manufacturing overhead | 68,000 | 96,800 | 103,200 | 76,000 | 344,000 |
| 15 | Selling and administrative | 107,000 | 143,000 | 161,000 | 125,000 | 536,000 |
| 16 | Equipment purchases | 50,000 | 40,000 | 20,000 | 20,000 | 130,000 |
| 17 | Dividends | 8,000 | 8,000 | 8,000 | 8,000 | 32,000 |
| 18 | Total disbursements | 366,500 | 552,100 | 608,250 | 422,350 | 1,949,200 |
| 19 | Excess (deficiency) of cash available over disbursements | (94,000) | (36,100) | 165,650 | 263,300 | 63,300 |
| 20 | Financing: | | | | | |
| 21 | Borrowings (at the beginnings of quarters) | 130,000 | 70,000 | - | - | 200,000 |
| 22 | Repayments (at end of the year) | - | - | - | (200,000) | (200,000) |
| 23 | Interest | - | - | - | (21,900) | (21,900) |
| 24 | Total financing | 130,000 | 70,000 | - | (221,900) | (21,900) |
| 25 | Cash balance, ending | \$36,000 | \$33,900 | \$165,650 | \$ 41,400 | \$ 41,400 |

- The board of directors has approved cash dividends of \$8,000 per quarter.
- Management would like to have a cash balance of at least \$30,000 at the beginning of each quarter for contingencies.
- Hampton Freeze has an agreement with a local bank that allows the company to borrow in increments of \$10,000 at the beginning of each quarter, up to a total loan balance of \$250,000. The interest rate on these loans is 1% per month and for simplicity we will assume that interest is not compounded. The company would, as far as it is able, repay the loan plus accumulated interest at the end of the year.

The cash budget is prepared one quarter at a time, starting with the first quarter. Larry began the cash budget by entering the beginning balance of cash for the first quarter of \$42,500—a number that is given above. Receipts—in this case, just the \$230,000 in cash collections from customers—are added to the beginning balance to arrive at the total cash available of \$272,500. Because the total disbursements are \$366,500 and the total cash available is only \$272,500, there is a shortfall of \$94,000. Because management would like to have a beginning cash balance of at least \$30,000 for the second quarter, the company will need to borrow at least \$124,000.

Required Borrowings at the Beginning of the First Quarter

| | |
|--|------------------|
| Desired ending cash balance | \$ 30,000 |
| Plus deficiency of cash available over disbursements | 94,000 |
| Minimum required borrowings | <u>\$124,000</u> |

Recall that the bank requires that loans be made in increments of \$10,000. Because Hampton Freeze needs to borrow at least \$124,000, it will have to borrow \$130,000.

The second quarter of the cash budget is handled similarly. Note that the ending cash balance for the first quarter is brought forward as the beginning cash balance for the second quarter. Also note that additional borrowing is required in the second quarter because of the continued cash shortfall.

Required Borrowings at the Beginning of the First Quarter

| | |
|--|-----------------|
| Desired ending cash balance | \$30,000 |
| Plus deficiency of cash available over disbursements | 36,000 |
| Minimum required borrowings | <u>\$66,000</u> |

Again, recall that the bank requires that loans be made in increments of \$10,000. Because Hampton Freeze needs to borrow at least \$66,100 at the beginning of the second quarter, the company will have to borrow \$70,000 from the bank.

In the third quarter, the cash flow situation improves dramatically and the excess of cash available over disbursements is \$165,650. Therefore, the company will end the quarter with ample cash and no further borrowing is necessary.

At the end of the fourth quarter, the loan and accumulated interest must be repaid. The accumulated interest can be computed as follows:

| | |
|--|-----------------|
| Interest on \$130,000 borrowed at the beginning of the first quarter: | |
| $\$130,000 \times 0.01 \text{ per month} \times 12 \text{ months}^*$ | \$15,600 |
| Interest on \$70,000 borrowed at the beginning of the second quarter: | |
| $\$70,000 \times 0.01 \text{ per month} \times 9 \text{ months}^*$ | 6,300 |
| Total interest accrued to the end of the fourth quarter | <u>\$21,900</u> |

*Simple, rather than compounded, interest is assumed for simplicity.

Note that the loan repayment of \$200,000 (\$130,000 + \$70,000) appears in the financing section for the fourth quarter along with the interest payment of \$21,900 computed above.

As with the production and raw materials budgets, the amounts under the Year column in the cash budget are not always the sum of the amounts for the four quarters. In particular, the beginning cash balance for the year is the same as the beginning cash balance for the first quarter and the ending cash balance for the year is the same as the ending cash balance for the fourth quarter. Also note the beginning cash balance in any quarter is the same as the ending cash balance for the previous quarter.

IN BUSINESS

CASH CRISIS AT A START-UP COMPANY

Good Home Co., headquartered in New York City, sells home cleaning and laundry products through merchandisers such as **Restoration Hardware** and **Nordstrom**. In 2001, the company's sales were \$2.1 million. Then in September 2002, the company's founder Christine Dimmick appeared on the cable shopping network QVC and in a few hours she sold more than \$300,000 worth of merchandise. However, euphoria turned to panic when Christine realized that she needed \$200,000 in short-term financing to fill those orders. When attempts to renegotiate payment terms with suppliers failed, Christine realized that she needed to hire a finance professional. Jerry Charlup, who was hired as Good Home's part-time CFO, spent \$6,000 to create a cash flow forecasting system using Excel. As Good Home's annual sales have grown to \$4 million, Charlup says the new forecasting system is giving the company "a far clearer fix on how much operating capital it needs at any given time."

Source: Susan Hansen, "The Rent-To-Own CFO Program," *Inc.* magazine, February 2004, pp. 28–29.

LEARNING OBJECTIVE 9

Prepare a budgeted income statement.

The Budgeted Income Statement

A budgeted income statement can be prepared from the data developed in Schedules 1–8. *The budgeted income statement is one of the key schedules in the budget process.* It shows the company's planned profit and serves as a benchmark against which subsequent company performance can be measured.

Schedule 9 contains the budgeted income statement for Hampton Freeze.

SCHEDULE 9

| | A | B | C | D |
|----|---|------------------|-------------------|---|
| 1 | Hampton Freeze, Inc. | | | |
| 2 | Budgeted Income Statement | | | |
| 3 | For the Year Ended December 31, 2008 | | | |
| 4 | | | | |
| 5 | | <i>Schedules</i> | | |
| 6 | Sales | 1 | \$ 2,000,000 | |
| 7 | Cost of goods sold* | 1,6 | <u>1,300,000</u> | |
| 8 | Gross margin | | 700,000 | |
| 9 | Selling and administrative expenses | 7 | <u>576,000</u> | |
| 10 | Net operating Income | | 124,000 | |
| 11 | Interest expense | 8 | <u>21,900</u> | |
| 12 | Net Income | | <u>\$ 102,100</u> | |
| 13 | | | | |
| 14 | | | | |

*100,000 cases sold × \$13 per case = \$1,300,000.

The Budgeted Balance Sheet

The budgeted balance sheet is developed using data from the balance sheet from the beginning of the budget period and data contained in the various schedules. Hampton Freeze's budgeted balance sheet is presented in Schedule 10. Some of the data on the budgeted balance sheet have been taken from the company's previous end-of-year balance sheet for 2007 which appears below:

| Hampton Freeze, Inc. Balance Sheet December 31, 2007 | | |
|---|------------------|------------------|
| Assets | | |
| Current assets: | | |
| Cash | \$ 42,500 | |
| Accounts receivable | 90,000 | |
| Raw materials inventory (21,000 pounds) | 4,200 | |
| Finished goods inventory (2,000 cases) | <u>26,000</u> | |
| Total current assets | | \$162,700 |
| Plant and equipment: | | |
| Land | 80,000 | |
| Buildings and equipment | 700,000 | |
| Accumulated depreciation | <u>(292,000)</u> | |
| Plant and equipment, net | | <u>488,000</u> |
| Total assets | | <u>\$650,700</u> |
| Liabilities and Stockholders' Equity | | |
| Current liabilities: | | |
| Accounts payable (raw materials) | | \$ 25,800 |
| Stockholders' equity: | | |
| Common stock, no par | \$175,000 | |
| Retained earnings | <u>449,900</u> | |
| Total stockholders' equity | | <u>624,900</u> |
| Total liabilities and stockholders' equity | | <u>\$650,700</u> |

LEARNING OBJECTIVE 10

Prepare a budgeted balance sheet.

After completing the master budget, Larry Giano took the documents to Tom Wills, chief executive officer of Hampton Freeze, for his review.

Larry: Here's the budget. Overall, the net income is excellent, and the net cash flow for the entire year is positive.

Tom: Yes, but I see on this cash budget that we have the same problem with negative cash flows in the first and second quarters that we had last year.

Larry: That's true. I don't see any way around that problem. However, there is no doubt in my mind that if you take this budget to the bank today, they'll approve an open line of credit that will allow you to borrow enough to make it through the first two quarters without any problem.

Tom: Are you sure? They didn't seem very happy to see me last year when I came in for an emergency loan.

Larry: Did you repay the loan on time?

Tom: Sure.

Larry: I don't see any problem. You won't be asking for an emergency loan this time. The bank will have plenty of warning. And with this budget, you have a solid plan that shows when and how you are going to pay off the loan. Trust me, they'll go for it.

The Wrap-up

SCHEDULE 10

| | A | B | C | D | E |
|---|---|------------------|-----|-------------------|-----|
| Hampton Freeze, Inc. | | | | | |
| Budgeted Balance Sheet | | | | | |
| December 31, 2008 | | | | | |
| <i>Assets</i> | | | | | |
| Current assets: | | | | | |
| Cash | | \$ 41,400 | (a) | | |
| Accounts receivable | | 120,000 | (b) | | |
| Raw materials inventory | | 4,500 | (c) | | |
| Finished goods inventory | | <u>39,000</u> | (d) | | |
| Total current assets | | | | \$ 204,900 | |
| Plant and equipment: | | | | | |
| Land | | 80,000 | (e) | | |
| Buildings and equipment | | 830,000 | (f) | | |
| Accumulated depreciation | | <u>(392,000)</u> | (g) | | |
| Plant and equipment, net | | | | <u>518,000</u> | |
| Total assets | | | | <u>\$ 722,900</u> | |
| <i>Liabilities and Stockholders' Equity</i> | | | | | |
| Current liabilities: | | | | | |
| Accounts payable (raw materials) | | | | \$ 27,900 | (h) |
| Stockholders' equity: | | | | | |
| Common stock, no par | | \$ 175,000 | (i) | | |
| Retained earnings | | <u>520,000</u> | (j) | | |
| Total stockholders' equity | | | | <u>695,000</u> | |
| Total liabilities and stockholders' equity | | | | <u>\$ 722,900</u> | |

Explanation of December 31, 2008, balance sheet figures:

- (a) The ending cash balance, as projected by the cash budget in Schedule 8.
- (b) Thirty percent of fourth-quarter sales, from Schedule 1 ($\$400,000 \times 30\% = \$120,000$).
- (c) From Schedule 3, the ending raw materials inventory will be 22,500 pounds. This material costs \$0.20 per pound. Therefore, the ending inventory in dollars will be 22,500 pounds \times \$0.20 per pound = \$4,500.
- (d) From Schedule 6.
- (e) From the December 31, 2007, balance sheet (no change).
- (f) The December 31, 2007, balance sheet indicated a balance of \$700,000. During 2008, \$130,000 of additional equipment will be purchased (see Schedule 8), bringing the December 31, 2008, balance to \$830,000.
- (g) The December 31, 2007, balance sheet indicated a balance of \$292,000. During 2008, \$100,000 of depreciation will be taken (\$60,000 on Schedule 5 and \$40,000 on Schedule 7), bringing the December 31, 2008, balance to \$392,000.
- (h) One-half of the fourth-quarter raw materials purchases, from Schedule 3.
- (i) From the December 31, 2007, balance sheet (no change).
- (j)

| | |
|--|------------------|
| December 31, 2007, balance | \$449,900 |
| Add net income, from Schedule 9 | <u>102,100</u> |
| | 552,000 |
| Deduct dividends paid, from Schedule 8 | <u>32,000</u> |
| December 31, 2008, balance | <u>\$520,000</u> |

Summary

This chapter describes the budgeting process and shows how the various operating budgets relate to each other. The sales budget is the foundation for profit planning. Once the sales budget has been set, the production budget and the selling and administrative expense budget can be prepared because they depend on how many units are to be sold. The production budget determines how many units are to be produced, so after it is prepared, the various manufacturing cost budgets can be prepared. All of these budgets feed into the cash budget and the budgeted income statement and balance sheet. The parts of the master budget are connected in many ways. For example, the schedule of expected cash collections, which is completed in connection with the sales budget, provides data for both the cash budget and the budgeted balance sheet.

The material in this chapter is just an introduction to budgeting and profit planning. In later chapters, we will see how budgets are used to control day-to-day operations and how they are used in performance evaluation.

Review Problem: Budget Schedules

Mynor Corporation manufactures and sells a seasonal product that has peak sales in the third quarter. The following information concerns operations for Year 2—the coming year—and for the first two quarters of Year 3:

- a. The company’s single product sells for \$8 per unit. Budgeted sales in units for the next six quarters are as follows (all sales are on credit):

| | Year 2 Quarter | | | | Year 3 Quarter | |
|---------------------------|----------------|--------|---------|--------|----------------|--------|
| | 1 | 2 | 3 | 4 | 1 | 2 |
| Budgeted unit sales | 40,000 | 60,000 | 100,000 | 50,000 | 70,000 | 80,000 |

- b. Sales are collected in the following pattern: 75% in the quarter the sales are made, and the remaining 25% in the following quarter. On January 1, Year 2, the company’s balance sheet showed \$65,000 in accounts receivable, all of which will be collected in the first quarter of the year. Bad debts are negligible and can be ignored.
- c. The company desires an ending finished goods inventory at the end of each quarter equal to 30% of the budgeted unit sales for the next quarter. On December 31, Year 1, the company had 12,000 units on hand.
- d. Five pounds of raw materials are required to complete one unit of product. The company requires ending raw materials inventory at the end of each quarter equal to 10% of the following quarter’s production needs. On December 31, Year 1, the company had 23,000 pounds of raw materials on hand.
- e. The raw material costs \$0.80 per pound. Raw material purchases are paid for in the following pattern: 60% paid in the quarter the purchases are made, and the remaining 40% paid in the following quarter. On January 1, Year 2, the company’s balance sheet showed \$81,500 in accounts payable for raw material purchases, all of which will be paid for in the first quarter of the year.

Required:

Prepare the following budgets and schedules for the year, showing both quarterly and total figures:

1. A sales budget and a schedule of expected cash collections.
2. A production budget.
3. A direct materials budget and a schedule of expected cash payments for purchases of materials.

Solution to Review Problem

1. The sales budget is prepared as follows:

| | Year 2 Quarter | | | | Year |
|------------------------------|------------------|------------------|------------------|------------------|--------------------|
| | 1 | 2 | 3 | 4 | |
| Budgeted unit sales | 40,000 | 60,000 | 100,000 | 50,000 | 250,000 |
| Selling price per unit | × \$8 | × \$8 | × \$8 | × \$8 | × \$8 |
| Total sales | <u>\$320,000</u> | <u>\$480,000</u> | <u>\$800,000</u> | <u>\$400,000</u> | <u>\$2,000,000</u> |

Based on the budgeted sales above, the schedule of expected cash collections is prepared as follows:

| | Year 2 Quarter | | | | Year |
|---|------------------|------------------|------------------|------------------|--------------------|
| | 1 | 2 | 3 | 4 | |
| Accounts receivable, beginning balance | \$ 65,000 | | | | \$ 65,000 |
| First-quarter sales (\$320,000 × 75%, 25%) | 240,000 | \$ 80,000 | | | 320,000 |
| Second-quarter sales (\$480,000 × 75%, 25%) | | 360,000 | \$120,000 | | 480,000 |
| Third-quarter sales (\$800,000 × 75%, 25%) | | | 600,000 | \$200,000 | 800,000 |
| Fourth-quarter sales (\$400,000 × 75%) | | | | 300,000 | 300,000 |
| Total cash collections | <u>\$305,000</u> | <u>\$440,000</u> | <u>\$720,000</u> | <u>\$500,000</u> | <u>\$1,965,000</u> |

2. Based on the sales budget in units, the production budget is prepared as follows:

| | Year 2 Quarter | | | | Year | Year 3 Quarter | |
|--|----------------|---------------|---------------|---------------------|----------------|----------------|--------|
| | 1 | 2 | 3 | 4 | | 1 | 2 |
| Budgeted unit sales | 40,000 | 60,000 | 100,000 | 50,000 | 250,000 | 70,000 | 80,000 |
| Add desired ending finished goods inventory* | 18,000 | 30,000 | 15,000 | 21,000 [†] | 21,000 | 24,000 | |
| Total needs | 58,000 | 90,000 | 115,000 | 71,000 | 271,000 | 94,000 | |
| Less beginning finished goods inventory | 12,000 | 18,000 | 30,000 | 15,000 | 12,000 | 21,000 | |
| Required production | <u>46,000</u> | <u>72,000</u> | <u>85,000</u> | <u>56,000</u> | <u>259,000</u> | <u>73,000</u> | |

*30% of the following quarter's budgeted sales in units.

[†]30% of the budgeted Year 3 first-quarter sales.

3. Based on the production budget, raw materials will need to be purchased during the year as follows:

| | Year 2 Quarter | | | | Year 2 | Year 3 Quarter |
|---|----------------|----------------|----------------|---------------------|------------------|----------------|
| | 1 | 2 | 3 | 4 | | 1 |
| Required production (units) | 46,000 | 72,000 | 85,000 | 56,000 | 259,000 | 73,000 |
| Raw materials needed per unit (pounds) | × 5 | × 5 | × 5 | × 5 | × 5 | × 5 |
| Production needs (pounds) | 230,000 | 360,000 | 425,000 | 280,000 | 1,295,000 | 365,000 |
| Add desired ending inventory of raw materials (pounds)* | 36,000 | 42,500 | 28,000 | 36,500 [†] | 36,500 | |
| Total needs (pounds) | 266,000 | 402,500 | 453,000 | 316,500 | 1,331,500 | |
| Less beginning inventory of raw materials (pounds) | 23,000 | 36,000 | 42,500 | 28,000 | 23,000 | |
| Raw materials to be purchased (pounds) | <u>243,000</u> | <u>366,500</u> | <u>410,500</u> | <u>288,500</u> | <u>1,308,500</u> | |

*10% of the following quarter's production needs in pounds.

[†]10% of the Year 3 first-quarter production needs in pounds.

Based on the raw material purchases above, expected cash payments are computed as follows:

| | Year 2 Quarter | | | | Year 2 |
|---|------------------|------------------|------------------|------------------|--------------------|
| | 1 | 2 | 3 | 4 | |
| Cost of raw materials to be purchased at \$0.80 per pound | \$194,400 | \$293,200 | \$328,400 | \$230,800 | \$1,046,800 |
| Accounts payable, beginning balance | \$ 81,500 | | | | \$ 81,500 |
| First-quarter purchases (\$194,400 × 60%, 40%) | 116,640 | \$ 77,760 | | | 194,400 |
| Second-quarter purchases (\$293,200 × 60%, 40%) | | 175,920 | \$117,280 | | 293,200 |
| Third-quarter purchases (\$328,400 × 60%, 40%) | | | 197,040 | \$131,360 | 328,400 |
| Fourth-quarter purchases (\$230,800 × 60%) | | | | 138,480 | 138,480 |
| Total cash disbursements | <u>\$198,140</u> | <u>\$253,680</u> | <u>\$314,320</u> | <u>\$269,840</u> | <u>\$1,035,980</u> |

Glossary

- Budget** A quantitative plan for acquiring and using resources over a specified time period. (p. 288)
- Budget committee** A group of key managers who are responsible for overall budgeting policy and for coordinating the preparation of the budget. (p. 292)
- Cash budget** A detailed plan showing how cash resources will be acquired and used over a specific time period. (p. 294)
- Continuous budget** A 12-month budget that rolls forward one month as the current month is completed. (p. 289)
- Control** Those steps taken by management to increase the likelihood that all parts of the organization are working together to achieve the goals set down at the planning stage. (p. 288)
- Direct labor budget** A detailed plan that shows the direct labor-hours required to fulfill the production budget. (p. 301)
- Direct materials budget** A detailed plan showing the amount of raw materials that must be purchased to fulfill the production budget and to provide for adequate inventories. (p. 299)
- Ending finished goods inventory budget** A budget showing the dollar amount of unsold finished goods inventory that will appear on the ending balance sheet. (p. 303)
- Manufacturing overhead budget** A detailed plan showing the production costs, other than direct materials and direct labor, that will be incurred over a specified time period. (p. 302)
- Master budget** A number of separate but interdependent budgets that formally lay out the company's sales, production, and financial goals and that culminates in a cash budget, budgeted income statement, and budgeted balance sheet. (p. 293)
- Merchandise purchases budget** A detailed plan used by a merchandising company that shows the amount of goods that must be purchased from suppliers during the period. (p. 298)
- Participative budget** See *Self-imposed budget*. (p. 290)
- Perpetual budget** See *Continuous budget*. (p. 289)
- Planning** Developing goals and preparing budgets to achieve those goals. (p. 288)
- Production budget** A detailed plan showing the number of units that must be produced during a period in order to satisfy both sales and inventory needs. (p. 296)
- Responsibility accounting** A system of accountability in which managers are held responsible for those items of revenue and cost—and only those items—over which they can exert significant control. The managers are held responsible for differences between budgeted and actual results. (p. 288)
- Sales budget** A detailed schedule showing expected sales expressed in both dollars and units. (p. 294)
- Self-imposed budget** A method of preparing budgets in which managers prepare their own budgets. These budgets are then reviewed by higher-level managers, and any issues are resolved by mutual agreement. (p. 290)
- Selling and administrative expense budget** A detailed schedule of planned expenses that will be incurred in areas other than manufacturing during a budget period. (p. 303)

Questions

- 8-1 What is a budget? What is budgetary control?
- 8-2 Discuss some of the major benefits to be gained from budgeting.
- 8-3 What is meant by the term *responsibility accounting*?
- 8-4 What is a master budget? Briefly describe its contents.
- 8-5 Why is the sales forecast the starting point in budgeting?
- 8-6 “As a practical matter, planning and control mean exactly the same thing.” Do you agree? Explain.
- 8-7 Describe the flow of budget data in an organization. Who are the participants in the budgeting process, and how do they participate?
- 8-8 What is a self-imposed budget? What are the major advantages of self-imposed budgets? What caution must be exercised in their use?
- 8-9 How can budgeting assist a company in planning its workforce staffing levels?
- 8-10 “The principal purpose of the cash budget is to see how much cash the company will have in the bank at the end of the year.” Do you agree? Explain.

Multiple-choice questions are provided on the text website at www.mhhe.com/noreen2e.

Exercises

**EXERCISE 8-1 Schedule of Expected Cash Collections [LO2]**

Silver Company makes a product that is very popular as a Mother's Day gift. Thus, peak sales occur in May of each year, as shown in the company's sales budget for the second quarter given below:

| | April | May | June | Total |
|---------------------------------------|-----------|-----------|-----------|-------------|
| Budgeted sales (all on account) | \$300,000 | \$500,000 | \$200,000 | \$1,000,000 |

From past experience, the company has learned that 20% of a month's sales are collected in the month of sale, another 70% are collected in the month following sale, and the remaining 10% are collected in the second month following sale. Bad debts are negligible and can be ignored. February sales totaled \$230,000, and March sales totaled \$260,000.

Required:

1. Prepare a schedule of expected cash collections from sales, by month and in total, for the second quarter.
2. Assume that the company will prepare a budgeted balance sheet as of June 30. Compute the accounts receivable as of that date.

EXERCISE 8-2 Production Budget [LO3]

Down Under Products, Ltd., of Australia has budgeted sales of its popular boomerang for the next four months as follows:

| | Sales in Units |
|-------------|-------------------|
| April | 50,000 |
| May | 75,000 |
| June | 90,000 |
| July | 80,000 |

The company is now in the process of preparing a production budget for the second quarter. Past experience has shown that end-of-month inventory levels must equal 10% of the following month's sales. The inventory at the end of March was 5,000 units.

Required:

Prepare a production budget for the second quarter; in your budget, show the number of units to be produced each month and for the quarter in total.

EXERCISE 8-3 Direct Materials Budget [LO4]

Three grams of musk oil are required for each bottle of Mink Caress, a very popular perfume made by a small company in western Siberia. The cost of the musk oil is 150 roubles per kilogram. (Siberia is located in Russia, whose currency is the rouble.) Budgeted production of Mink Caress is given below by quarters for Year 2 and for the first quarter of Year 3:

| | Year 2 | | | | Year 3 |
|---------------------------------------|--------|--------|---------|---------|--------|
| | First | Second | Third | Fourth | First |
| Budgeted production, in bottles | 60,000 | 90,000 | 150,000 | 100,000 | 70,000 |

Musk oil has become so popular as a perfume ingredient that it has become necessary to carry large inventories as a precaution against stock-outs. For this reason, the inventory of musk oil at the end of a quarter must be equal to 20% of the following quarter's production needs. Some 36,000 grams of musk oil will be on hand to start the first quarter of Year 2.

Required:

Prepare a direct materials budget for musk oil, by quarter and in total, for Year 2. At the bottom of your budget, show the amount of purchases in roubles for each quarter and for the year in total.

EXERCISE 8–4 Direct Labor Budget [L05]

The production manager of Rordan Corporation has submitted the following forecast of units to be produced by quarter for the upcoming fiscal year:

| | 1st Quarter | 2nd Quarter | 3rd Quarter | 4th Quarter |
|----------------------------|-------------|-------------|-------------|-------------|
| Units to be produced | 8,000 | 6,500 | 7,000 | 7,500 |

Each unit requires 0.35 direct labor-hours, and direct laborers are paid \$12.00 per hour.

Required:

1. Construct the company’s direct labor budget for the upcoming fiscal year, assuming that the direct labor workforce is adjusted each quarter to match the number of hours required to produce the forecasted number of units produced.
2. Construct the company’s direct labor budget for the upcoming fiscal year, assuming that the direct labor workforce is not adjusted each quarter. Instead, assume that the company’s direct labor workforce consists of permanent employees who are guaranteed to be paid for at least 2,600 hours of work each quarter. If the number of required direct labor-hours is less than this number, the workers are paid for 2,600 hours anyway. Any hours worked in excess of 2,600 hours in a quarter are paid at the rate of 1.5 times the normal hourly rate for direct labor.

EXERCISE 8–5 Manufacturing Overhead Budget [L06]

The direct labor budget of Yuvwell Corporation for the upcoming fiscal year contains the following details concerning budgeted direct labor-hours:

| | 1st Quarter | 2nd Quarter | 3rd Quarter | 4th Quarter |
|-----------------------------------|-------------|-------------|-------------|-------------|
| Budgeted direct labor-hours | 8,000 | 8,200 | 8,500 | 7,800 |

The company’s variable manufacturing overhead rate is \$3.25 per direct labor-hour and the company’s fixed manufacturing overhead is \$48,000 per quarter. The only noncash item included in fixed manufacturing overhead is depreciation, which is \$16,000 per quarter.

Required:

1. Construct the company’s manufacturing overhead budget for the upcoming fiscal year.
2. Compute the company’s manufacturing overhead rate (including both variable and fixed manufacturing overhead) for the upcoming fiscal year. Round off to the nearest whole cent.

EXERCISE 8–6 Selling and Administrative Expense Budget [L07]

The budgeted unit sales of Weller Company for the upcoming fiscal year are provided below:

| | 1st Quarter | 2nd Quarter | 3rd Quarter | 4th Quarter |
|---------------------------|-------------|-------------|-------------|-------------|
| Budgeted unit sales | 15,000 | 16,000 | 14,000 | 13,000 |

The company’s variable selling and administrative expense per unit is \$2.50. Fixed selling and administrative expenses include advertising expenses of \$8,000 per quarter, executive salaries of \$35,000 per quarter, and depreciation of \$20,000 per quarter. In addition, the company will make insurance payments of \$5,000 in the first quarter and \$5,000 in the third quarter. Finally, property taxes of \$8,000 will be paid in the second quarter.

Required:

Prepare the company’s selling and administrative expense budget for the upcoming fiscal year.

EXERCISE 8-7 Cash Budget [LO8]

Garden Depot is a retailer that is preparing its budget for the upcoming fiscal year. Management has prepared the following summary of its budgeted cash flows:

| | 1st Quarter | 2nd Quarter | 3rd Quarter | 4th Quarter |
|-------------------------------|-------------|-------------|-------------|-------------|
| Total cash receipts..... | \$180,000 | \$330,000 | \$210,000 | \$230,000 |
| Total cash disbursements..... | \$260,000 | \$230,000 | \$220,000 | \$240,000 |

The company’s beginning cash balance for the upcoming fiscal year will be \$20,000. The company requires a minimum cash balance of \$10,000 and may borrow any amount needed from a local bank at a quarterly interest rate of 3%. The company may borrow any amount at the beginning of any quarter and may repay its loans, or any part of its loans, at the end of any quarter. Interest payments are due on any principal at the time it is repaid. For simplicity, assume that interest is not compounded.

Required:

Prepare the company’s cash budget for the upcoming fiscal year.

EXERCISE 8-8 Budgeted Income Statement [LO9]

Gig Harbor Boating is the wholesale distributor of a small recreational catamaran sailboat. Management has prepared the following summary data to use in its annual budgeting process:

| | |
|---|-----------|
| Budgeted unit sales | 460 |
| Selling price per unit | \$1,950 |
| Cost per unit | \$1,575 |
| Variable selling and administrative expenses (per unit) | \$75 |
| Fixed selling and administrative expenses (per year) | \$105,000 |
| Interest expense for the year | \$14,000 |

Required:

Prepare the company’s budgeted income statement. Use the absorption costing income statement format shown in Schedule 9.

EXERCISE 8-9 Budgeted Balance Sheet [LO10]

The management of Mecca Copy, a photocopying center located on University Avenue, has compiled the following data to use in preparing its budgeted balance sheet for next year:

| | Ending Balances |
|--------------------------------|-----------------|
| Cash | ? |
| Accounts receivable | \$8,100 |
| Supplies inventory | \$3,200 |
| Equipment | \$34,000 |
| Accumulated depreciation | \$16,000 |
| Accounts payable | \$1,800 |
| Common stock | \$5,000 |
| Retained earnings | ? |

The beginning balance of retained earnings was \$28,000, net income is budgeted to be \$11,500, and dividends are budgeted to be \$4,800.

Required:

Prepare the company’s budgeted balance sheet.

EXERCISE 8-10 Cash Budget Analysis [LO8]

A cash budget, by quarters, is given below for a retail company (000 omitted). The company requires a minimum cash balance of at least \$5,000 to start each quarter.

| | Quarter | | | | Year |
|---|-------------|-------------|-------------|-------------|-------------|
| | 1 | 2 | 3 | 4 | |
| Cash balance, beginning | \$ 6 | \$? | \$? | \$? | \$? |
| Add collections from customers | ? | ? | 96 | ? | 323 |
| Total cash available | <u>71</u> | <u>?</u> | <u>?</u> | <u>?</u> | <u>?</u> |
| Less disbursements: | | | | | |
| Purchase of inventory | 35 | 45 | ? | 35 | ? |
| Operating expenses | ? | 30 | 30 | ? | 113 |
| Equipment purchases | 8 | 8 | 10 | ? | 36 |
| Dividends | <u>2</u> | <u>2</u> | <u>2</u> | <u>2</u> | <u>?</u> |
| Total disbursements | <u>?</u> | <u>85</u> | <u>?</u> | <u>?</u> | <u>?</u> |
| Excess (deficiency) of cash available over disbursements | (2) | ? | 11 | ? | ? |
| Financing: | | | | | |
| Borrowings | ? | 15 | — | — | ? |
| Repayments (including interest)* | <u>—</u> | <u>—</u> | <u>(?)</u> | <u>(17)</u> | <u>(?)</u> |
| Total financing | <u>?</u> | <u>?</u> | <u>?</u> | <u>?</u> | <u>?</u> |
| Cash balance, ending | <u>\$?</u> | <u>\$?</u> | <u>\$?</u> | <u>\$?</u> | <u>\$?</u> |

*Interest will total \$1,000 for the year.

Required:

Fill in the missing amounts in the above table.

EXERCISE 8–11 Production and Direct Materials Budgets [L03, L04]

The marketing department of Gaerber Industries has submitted the following sales forecast for the upcoming fiscal year:

| | 1st Quarter | 2nd Quarter | 3rd Quarter | 4th Quarter |
|---------------------------|-------------|-------------|-------------|-------------|
| Budgeted unit sales | 8,000 | 7,000 | 6,000 | 7,000 |

The company expects to start the first quarter with 1,600 units in finished goods inventory. Management desires an ending finished goods inventory in each quarter equal to 20% of the next quarter’s budgeted sales. The desired ending finished goods inventory for the fourth quarter is 1,700 units.

In addition, the beginning raw materials inventory for the first quarter is budgeted to be 3,120 pounds and the beginning accounts payable for the first quarter is budgeted to be \$14,820.

Each unit requires 2 pounds of raw material that costs \$4.00 per pound. Management desires to end each quarter with an inventory of raw materials equal to 20% of the following quarter’s production needs. The desired ending inventory for the fourth quarter is 3,140 pounds. Management plans to pay for 75% of raw material purchases in the quarter acquired and 25% in the following quarter.

Required:

1. Prepare the company’s production budget for the upcoming fiscal year.
2. Prepare the company’s direct materials budget and schedule of expected cash disbursements for purchases of materials for the upcoming fiscal year.

EXERCISE 8–12 Sales and Production Budgets [L02, L03]

The marketing department of Jessi Corporation has submitted the following sales forecast for the upcoming fiscal year (all sales are on account):

| | 1st Quarter | 2nd Quarter | 3rd Quarter | 4th Quarter |
|---------------------------|-------------|-------------|-------------|-------------|
| Budgeted unit sales | 11,000 | 12,000 | 14,000 | 13,000 |

The selling price of the company's product is \$18.00 per unit. Management expects to collect 65% of sales in the quarter in which the sales are made, 30% in the following quarter, and 5% of sales are expected to be uncollectible. The beginning balance of accounts receivable, all of which is expected to be collected in the first quarter, is \$70,200.

The company expects to start the first quarter with 1,650 units in finished goods inventory. Management desires an ending finished goods inventory in each quarter equal to 15% of the next quarter's budgeted sales. The desired ending finished goods inventory for the fourth quarter is 1,850 units.

Required:

1. Prepare the company's sales budget and schedule of expected cash collections.
2. Prepare the company's production budget for the upcoming fiscal year.

EXERCISE 8-13 Direct Materials and Direct Labor Budgets [L04, L05]

The production department of Hareston Company has submitted the following forecast of units to be produced by quarter for the upcoming fiscal year:

| | 1st Quarter | 2nd Quarter | 3rd Quarter | 4th Quarter |
|----------------------------|-------------|-------------|-------------|-------------|
| Units to be produced | 7,000 | 8,000 | 6,000 | 5,000 |

In addition, the beginning raw materials inventory for the first quarter is budgeted to be 1,400 pounds and the beginning accounts payable for the first quarter is budgeted to be \$2,940.

Each unit requires 2 pounds of raw material that costs \$1.40 per pound. Management desires to end each quarter with an inventory of raw materials equal to 10% of the following quarter's production needs. The desired ending inventory for the fourth quarter is 1,500 pounds. Management plans to pay for 80% of raw material purchases in the quarter acquired and 20% in the following quarter. Each unit requires 0.60 direct labor-hours and direct labor-hour workers are paid \$14.00 per hour.

Required:

1. Prepare the company's direct materials budget and schedule of expected cash disbursements for purchases of materials for the upcoming fiscal year.
2. Prepare the company's direct labor budget for the upcoming fiscal year, assuming that the direct labor workforce is adjusted each quarter to match the number of hours required to produce the forecasted number of units produced.

EXERCISE 8-14 Direct Labor and Manufacturing Overhead Budgets [L05, L06]

The production department of Raredon Corporation has submitted the following forecast of units to be produced by quarter for the upcoming fiscal year:

| | 1st Quarter | 2nd Quarter | 3rd Quarter | 4th Quarter |
|----------------------------|-------------|-------------|-------------|-------------|
| Units to be produced | 12,000 | 14,000 | 13,000 | 11,000 |

Each unit requires 0.70 direct labor-hours, and direct labor-hour workers are paid \$10.50 per hour.

In addition, the variable manufacturing overhead rate is \$1.50 per direct labor-hour. The fixed manufacturing overhead is \$80,000 per quarter. The only noncash element of manufacturing overhead is depreciation, which is \$22,000 per quarter.

Required:

1. Prepare the company's direct labor budget for the upcoming fiscal year, assuming that the direct labor workforce is adjusted each quarter to match the number of hours required to produce the forecasted number of units produced.
2. Prepare the company's manufacturing overhead budget.

Problems

connect™

PROBLEM 8-15 Production and Direct Materials Budgets [L03, L04]

Pearl Products Limited of Shenzhen, China, manufactures and distributes toys throughout South East Asia. Three cubic centimeters (cc) of solvent H300 are required to manufacture each unit of Supermix, one of the company's products. The company is now planning raw materials needs for the third quarter, the

quarter in which peak sales of Supermix occur. To keep production and sales moving smoothly, the company has the following inventory requirements:

- a. The finished goods inventory on hand at the end of each month must be equal to 3,000 units of Supermix plus 20% of the next month's sales. The finished goods inventory on June 30 is budgeted to be 10,000 units.
 - b. The raw materials inventory on hand at the end of each month must be equal to one-half of the following month's production needs for raw materials. The raw materials inventory on June 30 is budgeted to be 54,000 cc of solvent H300.
 - c. The company maintains no work in process inventories.
- A sales budget for Supermix for the last six months of the year follows.

| | Budgeted Sales in Units |
|-----------------|------------------------------------|
| July | 35,000 |
| August | 40,000 |
| September | 50,000 |
| October | 30,000 |
| November | 20,000 |
| December | 10,000 |

Required:

- 1. Prepare a production budget for Supermix for the months July, August, September, and October.
- 2. Examine the production budget that you prepared in (1) above. Why will the company produce more units than it sells in July and August, and fewer units than it sells in September and October?
- 3. Prepare a direct materials budget showing the quantity of solvent H300 to be purchased for July, August, and September, and for the quarter in total.

PROBLEM 8-16 Direct Labor and Manufacturing Overhead Budgets [L05, L06]

The Production Department of Hruska Corporation has submitted the following forecast of units to be produced by quarter for the upcoming fiscal year:

| | 1st Quarter | 2nd Quarter | 3rd Quarter | 4th Quarter |
|----------------------------|--------------------|--------------------|--------------------|--------------------|
| Units to be produced | 12,000 | 10,000 | 13,000 | 14,000 |

Each unit requires 0.2 direct labor-hours and direct laborers are paid \$12.00 per hour.

In addition, the variable manufacturing overhead rate is \$1.75 per direct labor-hour. The fixed manufacturing overhead is \$86,000 per quarter. The only noncash element of manufacturing overhead is depreciation, which is \$23,000 per quarter.

Required:

- 1. Prepare the company's direct labor budget for the upcoming fiscal year, assuming that the direct labor workforce is adjusted each quarter to match the number of hours required to produce the forecasted number of units produced.
- 2. Prepare the company's manufacturing overhead budget.

PROBLEM 8-17 Schedules of Expected Cash Collections and Disbursements [L02, L04, L08]

You have been asked to prepare a December cash budget for Ashton Company, a distributor of exercise equipment. The following information is available about the company's operations:

- a. The cash balance on December 1 is \$40,000.
- b. Actual sales for October and November and expected sales for December are as follows:

| | October | November | December |
|------------------------|----------------|-----------------|-----------------|
| Cash sales | \$65,000 | \$70,000 | \$83,000 |
| Sales on account | \$400,000 | \$525,000 | \$600,000 |

Sales on account are collected over a three-month period as follows: 20% collected in the month of sale, 60% collected in the month following sale, and 18% collected in the second month following sale. The remaining 2% is uncollectible.

- c. Purchases of inventory will total \$280,000 for December. Thirty percent of a month's inventory purchases are paid during the month of purchase. The accounts payable remaining from November's inventory purchases total \$161,000, all of which will be paid in December.
- d. Selling and administrative expenses are budgeted at \$430,000 for December. Of this amount, \$50,000 is for depreciation.
- e. A new Web server for the Marketing Department costing \$76,000 will be purchased for cash during December, and dividends totaling \$9,000 will be paid during the month.
- f. The company maintains a minimum cash balance of \$20,000. An open line of credit is available from the company's bank to bolster the cash position as needed.

Required:

- 1. Prepare a schedule of expected cash collections for December.
- 2. Prepare a schedule of expected cash disbursements for merchandise purchases for December.
- 3. Prepare a cash budget for December. Indicate in the financing section any borrowing that will be needed during the month. Assume that any interest will not be paid until the following month.

PROBLEM 8-18 Direct Materials and Direct Labor Budgets [L04, L05]

The production department of Zan Corporation has submitted the following forecast of units to be produced by quarter for the upcoming fiscal year:

| | 1st Quarter | 2nd Quarter | 3rd Quarter | 4th Quarter |
|----------------------------|-------------|-------------|-------------|-------------|
| Units to be produced | 5,000 | 8,000 | 7,000 | 6,000 |

In addition, the beginning raw materials inventory for the 1st Quarter is budgeted to be 6,000 grams and the beginning accounts payable for the 1st Quarter is budgeted to be \$2,880.

Each unit requires 8 grams of raw material that costs \$1.20 per gram. Management desires to end each quarter with an inventory of raw materials equal to 25% of the following quarter's production needs. The desired ending inventory for the 4th Quarter is 8,000 grams. Management plans to pay for 60% of raw material purchases in the quarter acquired and 40% in the following quarter. Each unit requires 0.20 direct labor-hours and direct laborers are paid \$11.50 per hour.

Required:

- 1. Prepare the company's direct materials budget and schedule of expected cash disbursements for purchases of materials for the upcoming fiscal year.
- 2. Prepare the company's direct labor budget for the upcoming fiscal year, assuming that the direct labor workforce is adjusted each quarter to match the number of hours required to produce the forecasted number of units produced.

PROBLEM 8-19 Cash Budget; Income Statement; Balance Sheet [L02, L04, L08, L09, L010]

Minden Company is a wholesale distributor of premium European chocolates. The company's balance sheet as of April 30 is given below:

| Minden Company Balance Sheet April 30 | |
|--|------------------|
| Assets | |
| Cash | \$ 9,000 |
| Accounts receivable | 54,000 |
| Inventory | 30,000 |
| Buildings and equipment, net of depreciation | 207,000 |
| Total assets | <u>\$300,000</u> |
| Liabilities and Stockholders' Equity | |
| Accounts payable | \$ 63,000 |
| Note payable | 14,500 |
| Capital stock, no par | 180,000 |
| Retained earnings | 42,500 |
| Total liabilities and stockholders' equity | <u>\$300,000</u> |

The company is in the process of preparing budget data for May. A number of budget items have already been prepared, as stated below:

- a. Sales are budgeted at \$200,000 for May. Of these sales, \$60,000 will be for cash; the remainder will be credit sales. One-half of a month's credit sales are collected in the month the sales are made, and the remainder is collected in the following month. All of the April 30 accounts receivable will be collected in May.
- b. Purchases of inventory are expected to total \$120,000 during May. These purchases will all be on account. Forty percent of all purchases are paid for in the month of purchase; the remainder are paid in the following month. All of the April 30 accounts payable to suppliers will be paid during May.
- c. The May 31 inventory balance is budgeted at \$40,000.
- d. Selling and administrative expenses for May are budgeted at \$72,000, exclusive of depreciation. These expenses will be paid in cash. Depreciation is budgeted at \$2,000 for the month.
- e. The note payable on the April 30 balance sheet will be paid during May, with \$100 in interest. (All of the interest relates to May.)
- f. New refrigerating equipment costing \$6,500 will be purchased for cash during May.
- g. During May, the company will borrow \$20,000 from its bank by giving a new note payable to the bank for that amount. The new note will be due in one year.

Required:

1. Prepare a cash budget for May. Support your budget with a schedule of expected cash collections from sales and a schedule of expected cash disbursements for merchandise purchases.
2. Prepare a budgeted income statement for May. Use the absorption costing income statement format as shown in Schedule 9.
3. Prepare a budgeted balance sheet as of May 31.

PROBLEM 8–20 Behavioral Aspects of Budgeting; Ethics and the Manager [LO1]

Norton Company, a manufacturer of infant furniture and carriages, is in the initial stages of preparing the annual budget for next year. Scott Ford has recently joined Norton's accounting staff and is interested to learn as much as possible about the company's budgeting process. During a recent lunch with Marge Atkins, sales manager, and Pete Granger, production manager, Ford initiated the following conversation.

Ford: Since I'm new around here and am going to be involved with the preparation of the annual budget, I'd be interested to learn how the two of you estimate sales and production numbers.

Atkins: We start out very methodically by looking at recent history, discussing what we know about current accounts, potential customers, and the general state of consumer spending. Then, we add that usual dose of intuition to come up with the best forecast we can.

Granger: I usually take the sales projections as the basis for my projections. Of course, we have to make an estimate of what this year's ending inventories will be, which is sometimes difficult.

Ford: Why does that present a problem? There must have been an estimate of ending inventories in the budget for the current year.

Granger: Those numbers aren't always reliable because Marge makes some adjustments to the sales numbers before passing them on to me.

Ford: What kind of adjustments?

Atkins: Well, we don't want to fall short of the sales projections so we generally give ourselves a little breathing room by lowering the initial sales projection anywhere from 5% to 10%.

Granger: So, you can see why this year's budget is not a very reliable starting point. We always have to adjust the projected production rates as the year progresses and, of course, this changes the ending inventory estimates. By the way, we make similar adjustments to expenses by adding at least 10% to the estimates; I think everyone around here does the same thing.

Required:

1. Marge Atkins and Pete Granger have described the use of what is sometimes called *budgetary slack*.
 - a. Explain why Atkins and Granger behave in this manner and describe the benefits they expect to realize from the use of budgetary slack.
 - b. Explain how the use of budgetary slack can adversely affect Atkins and Granger.
2. As a management accountant, Scott Ford believes that the behavior described by Marge Atkins and Pete Granger may be unethical. By referring to the IMA's Statement of Ethical Professional Practice in Chapter 1, explain why the use of budgetary slack may be unethical.

(CMA, adapted)

PROBLEM 8–21 Schedule of Expected Cash Collections; Cash Budget [LO2, LO8]

The president of the retailer Prime Products has just approached the company's bank with a request for a \$30,000, 90-day loan. The purpose of the loan is to assist the company in acquiring inventories. Because the company has had some difficulty in paying off its loans in the past, the loan officer has asked for a cash

budget to help determine whether the loan should be made. The following data are available for the months April through June, during which the loan will be used:

- On April 1, the start of the loan period, the cash balance will be \$24,000. Accounts receivable on April 1 will total \$140,000, of which \$120,000 will be collected during April and \$16,000 will be collected during May. The remainder will be uncollectible.
- Past experience shows that 30% of a month's sales are collected in the month of sale, 60% in the month following sale, and 8% in the second month following sale. The other 2% represents bad debts that are never collected. Budgeted sales and expenses for the three-month period follow:

| | April | May | June |
|------------------------------|-----------|-----------|-----------|
| Sales (all on account) | \$300,000 | \$400,000 | \$250,000 |
| Merchandise purchases | \$210,000 | \$160,000 | \$130,000 |
| Payroll | \$20,000 | \$20,000 | \$18,000 |
| Lease payments | \$22,000 | \$22,000 | \$22,000 |
| Advertising | \$60,000 | \$60,000 | \$50,000 |
| Equipment purchases | — | — | \$65,000 |
| Depreciation | \$15,000 | \$15,000 | \$15,000 |

- Merchandise purchases are paid in full during the month following purchase. Accounts payable for merchandise purchases during March, which will be paid during April, total \$140,000.
- In preparing the cash budget, assume that the \$30,000 loan will be made in April and repaid in June. Interest on the loan will total \$1,200.

Required:

- Prepare a schedule of expected cash collections for April, May, and June, and for the three months in total.
- Prepare a cash budget, by month and in total, for the three-month period.
- If the company needs a minimum cash balance of \$20,000 to start each month, can the loan be repaid as planned? Explain.

PROBLEM 8-22 Evaluating a Company's Budget Procedures [LO1]

Springfield Corporation operates on a calendar-year basis. It begins the annual budgeting process in late August, when the president establishes targets for total sales dollars and net operating income before taxes for the next year.

The sales target is given to the Marketing Department, where the marketing manager formulates a sales budget by product line in both units and dollars. From this budget, sales quotas by product line in units and dollars are established for each of the corporation's sales districts.

The marketing manager also estimates the cost of the marketing activities required to support the target sales volume and prepares a tentative marketing expense budget.

The executive vice president uses the sales and profit targets, the sales budget by product line, and the tentative marketing expense budget to determine the dollar amounts that can be devoted to manufacturing and corporate office expense. The executive vice president prepares the budget for corporate expenses, and then forwards to the Production Department the product-line sales budget in units and the total dollar amount that can be devoted to manufacturing.

The production manager meets with the factory managers to develop a manufacturing plan that will produce the required units when needed within the cost constraints set by the executive vice president. The budgeting process usually comes to a halt at this point because the Production Department does not consider the financial resources allocated to it to be adequate.

When this standstill occurs, the vice president of finance, the executive vice president, the marketing manager, and the production manager meet to determine the final budgets for each of the areas. This normally results in a modest increase in the total amount available for manufacturing costs, while the marketing expense and corporate office expense budgets are cut. The total sales and net operating income figures proposed by the president are seldom changed. Although the participants are seldom pleased with the compromise, these budgets are final. Each executive then develops a new detailed budget for the operations in his or her area.

None of the areas has achieved its budget in recent years. Sales often run below the target. When budgeted sales are not achieved, each area is expected to cut costs so that the president's profit target can

still be met. However, the profit target is seldom met because costs are not cut enough. In fact, costs often run above the original budget in all functional areas. The president is disturbed that Springfield has not been able to meet the sales and profit targets. He hired a consultant with considerable relevant industry experience. The consultant reviewed the budgets for the past four years. He concluded that the product-line sales budgets were reasonable and that the cost and expense budgets were adequate for the budgeted sales and production levels.

Required:

1. Discuss how the budgeting process as employed by Springfield Corporation contributes to the failure to achieve the president’s sales and profit targets.
2. Suggest how Springfield Corporation’s budgeting process could be revised to correct the problem.
3. Should the functional areas be expected to cut their costs when sales volume falls below budget? Explain your answer.

(CMA, adapted)

PROBLEM 8–23 Schedule of Expected Cash Collections; Cash Budget [LO2, LO8]

Herbal Care Corp., a distributor of herb-based sunscreens, is ready to begin its third quarter, in which peak sales occur. The company has requested a \$40,000, 90-day loan from its bank to help meet cash requirements during the quarter. Because Herbal Care has experienced difficulty in paying off its loans in the past, the loan officer at the bank has asked the company to prepare a cash budget for the quarter. In response to this request, the following data have been assembled:

- a. On July 1, the beginning of the third quarter, the company will have a cash balance of \$44,500.
- b. Actual sales for the last two months and budgeted sales for the third quarter follow (all sales are on account):

| | |
|----------------------------|-----------|
| May (actual) | \$250,000 |
| June (actual) | \$300,000 |
| July (budgeted) | \$400,000 |
| August (budgeted) | \$600,000 |
| September (budgeted) | \$320,000 |

Past experience shows that 25% of a month’s sales are collected in the month of sale, 70% in the month following sale, and 3% in the second month following sale. The remainder is uncollectible.

- c. Budgeted merchandise purchases and budgeted expenses for the third quarter are given below:

| | July | August | September |
|-----------------------------|-----------|-----------|-----------|
| Merchandise purchases | \$240,000 | \$350,000 | \$175,000 |
| Salaries and wages | \$45,000 | \$50,000 | \$40,000 |
| Advertising | \$130,000 | \$145,000 | \$80,000 |
| Rent payments | \$9,000 | \$9,000 | \$9,000 |
| Depreciation | \$10,000 | \$10,000 | \$10,000 |

Merchandise purchases are paid in full during the month following purchase. Accounts payable for merchandise purchases on June 30, which will be paid during July, total \$180,000.

- d. Equipment costing \$10,000 will be purchased for cash during July.
- e. In preparing the cash budget, assume that the \$40,000 loan will be made in July and repaid in September. Interest on the loan will total \$1,200.

Required:

1. Prepare a schedule of expected cash collections for July, August, and September and for the quarter in total.
2. Prepare a cash budget, by month and in total, for the third quarter.
3. If the company needs a minimum cash balance of \$20,000 to start each month, can the loan be repaid as planned? Explain.

PROBLEM 8–24 Cash Budget with Supporting Schedules [LO2, LO4, LO8]

Garden Sales, Inc., sells garden supplies. Management is planning its cash needs for the second quarter. The company usually has to borrow money during this quarter to support peak sales of lawn care equipment, which occur during May. The following information has been assembled to assist in preparing a cash budget for the quarter:

a. Budgeted monthly absorption costing income statements for April–July are:

| | April | May | June | July |
|---|------------------|------------------|------------------|------------------|
| Sales | \$600,000 | \$900,000 | \$500,000 | \$400,000 |
| Cost of goods sold | 420,000 | 630,000 | 350,000 | 280,000 |
| Gross margin | 180,000 | 270,000 | 150,000 | 120,000 |
| Selling and administrative expenses: | | | | |
| Selling expense | 79,000 | 120,000 | 62,000 | 51,000 |
| Administrative expense* | 45,000 | 52,000 | 41,000 | 38,000 |
| Total selling and administrative expenses | 124,000 | 172,000 | 103,000 | 89,000 |
| Net operating income | <u>\$ 56,000</u> | <u>\$ 98,000</u> | <u>\$ 47,000</u> | <u>\$ 31,000</u> |

*Includes \$20,000 of depreciation each month.

- b. Sales are 20% for cash and 80% on account.
- c. Sales on account are collected over a three-month period with 10% collected in the month of sale; 70% collected in the first month following the month of sale; and the remaining 20% collected in the second month following the month of sale. February’s sales totaled \$200,000, and March’s sales totaled \$300,000.
- d. Inventory purchases are paid for within 15 days. Therefore, 50% of a month’s inventory purchases are paid for in the month of purchase. The remaining 50% is paid in the following month. Accounts payable at March 31 for inventory purchases during March total \$126,000.
- e. Each month’s ending inventory must equal 20% of the cost of the merchandise to be sold in the following month. The merchandise inventory at March 31 is \$84,000.
- f. Dividends of \$49,000 will be declared and paid in April.
- g. Land costing \$16,000 will be purchased for cash in May.
- h. The cash balance at March 31 is \$52,000; the company must maintain a cash balance of at least \$40,000 at the end of each month.
- i. The company has an agreement with a local bank that allows the company to borrow in increments of \$1,000 at the beginning of each month, up to a total loan balance of \$200,000. The interest rate on these loans is 1% per month and for simplicity we will assume that interest is not compounded. The company would, as far as it is able, repay the loan plus accumulated interest at the end of the quarter.

Required:

- 1. Prepare a schedule of expected cash collections for April, May, and June, and for the quarter in total.
- 2. Prepare the following for merchandise inventory:
 - a. A merchandise purchases budget for April, May, and June.
 - b. A schedule of expected cash disbursements for merchandise purchases for April, May, and June, and for the quarter in total.
- 3. Prepare a cash budget for April, May, and June as well as in total for the quarter.

PROBLEM 8–25 Completing a Master Budget [LO2, LO4, LO7, LO8, LO9, LO10]

The following data relate to the operations of Shilow Company, a wholesale distributor of consumer goods:

| | |
|-----------------------------------|-----------|
| Current assets as of March 31: | |
| Cash | \$8,000 |
| Accounts receivable | \$20,000 |
| Inventory | \$36,000 |
| Building and equipment, net | \$120,000 |
| Accounts payable | \$21,750 |
| Capital stock | \$150,000 |
| Retained earnings | \$12,250 |

- a. The gross margin is 25% of sales.
- b. Actual and budgeted sales data:

| | |
|----------------------|----------|
| March (actual) | \$50,000 |
| April | \$60,000 |
| May | \$72,000 |
| June | \$90,000 |
| July | \$48,000 |

- c. Sales are 60% for cash and 40% on credit. Credit sales are collected in the month following sale. The accounts receivable at March 31 are a result of March credit sales.
- d. Each month's ending inventory should equal 80% of the following month's budgeted cost of goods sold.
- e. One-half of a month's inventory purchases is paid for in the month of purchase; the other half is paid for in the following month. The accounts payable at March 31 are the result of March purchases of inventory.
- f. Monthly expenses are as follows: commissions, 12% of sales; rent, \$2,500 per month; other expenses (excluding depreciation), 6% of sales. Assume that these expenses are paid monthly. Depreciation is \$900 per month (includes depreciation on new assets).
- g. Equipment costing \$1,500 will be purchased for cash in April.
- h. Management would like to maintain a minimum cash balance of at least \$4,000 at the end of each month. The company has an agreement with a local bank that allows the company to borrow in increments of \$1,000 at the beginning of each month, up to a total loan balance of \$20,000. The interest rate on these loans is 1% per month and for simplicity we will assume that interest is not compounded. The company would, as far as it is able, repay the loan plus accumulated interest at the end of the quarter.

Required:

Using the preceding data:

- 1. Complete the following schedule:

| | April | May | June | Quarter |
|-------------------------|-----------------|-------|-------|---------|
| Cash sales | \$36,000 | | | |
| Credit sales | <u>20,000</u> | _____ | _____ | _____ |
| Total collections | <u>\$56,000</u> | ===== | ===== | ===== |

- 2. Complete the following:

| | April | May | June | Quarter |
|------------------------------------|---------------------------|----------|-------|---------|
| Budgeted cost of goods sold | \$45,000* | \$54,000 | | |
| Add desired ending inventory | <u>43,200[†]</u> | _____ | _____ | _____ |
| Total needs | 88,200 | | | |
| Less beginning inventory | <u>36,000</u> | _____ | _____ | _____ |
| Required purchases | <u>\$52,200</u> | ===== | ===== | ===== |

*For April sales: \$60,000 sales × 75% cost ratio = \$45,000.
[†]\$54,000 × 80% = \$43,200

Schedule of Expected Cash Disbursements—Merchandise Purchases

| | April | May | June | Quarter |
|---------------------------|-----------------|-------------------|-------------------|-------------------|
| March purchases | \$21,750 | | | \$21,750 |
| April purchases | 26,100 | \$26,100 | | 52,200 |
| May purchases | | | | |
| June purchases | | | | |
| Total disbursements | <u>\$47,850</u> | <u> </u> | <u> </u> | <u> </u> |

3. Complete the following:

Schedule of Expected Cash Disbursements—Selling and Administrative Expenses

| | April | May | June | Quarter |
|---------------------------|-----------------|-------------------|-------------------|-------------------|
| Commissions | \$ 7,200 | | | |
| Rent | 2,500 | | | |
| Other expenses | 3,600 | | | |
| Total disbursements | <u>\$13,300</u> | <u> </u> | <u> </u> | <u> </u> |

4. Complete the following cash budget:

Cash Budget

| | April | May | June | Quarter |
|-----------------------------------|---------------|-------------------|-------------------|-------------------|
| Cash balance, beginning | \$ 8,000 | | | |
| Add cash collections | <u>56,000</u> | <u> </u> | <u> </u> | <u> </u> |
| Total cash available | <u>64,000</u> | <u> </u> | <u> </u> | <u> </u> |
| Less cash disbursements: | | | | |
| For inventory | 47,850 | | | |
| For expenses | 13,300 | | | |
| For equipment | 1,500 | | | |
| Total cash disbursements | <u>62,650</u> | <u> </u> | <u> </u> | <u> </u> |
| Excess (deficiency) of cash | 1,350 | | | |
| Financing: | | | | |
| Etc. | | | | |

5. Prepare an absorption costing income statement, similar to the one shown in Schedule 9 in the chapter, for the quarter ended June 30.
 6. Prepare a balance sheet as of June 30.

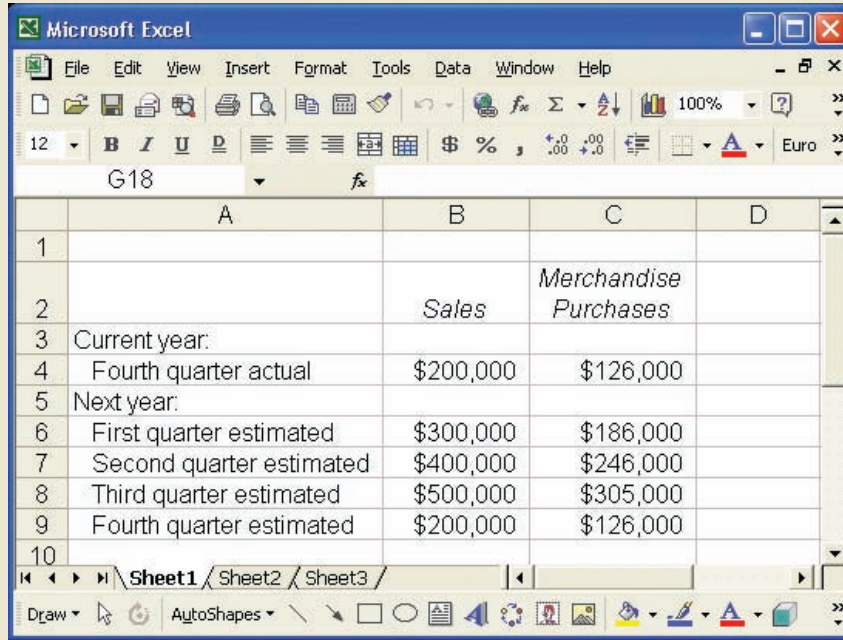

excel

**PROBLEM 8–26 Cash Budget with Supporting Schedules [L02, L04, L07, L08]**

Westex Products is a wholesale distributor of industrial cleaning products. When the treasurer of Westex Products approached the company's bank late in the current year seeking short-term financing, he was told that money was very tight and that any borrowing over the next year would have to be supported by a detailed statement of cash collections and disbursements. The treasurer also was told that it would be very helpful to the bank if borrowers would indicate the quarters in which they would be needing funds, as well as the amounts that would be needed, and the quarters in which repayments could be made.

Because the treasurer is unsure as to the particular quarters in which bank financing will be needed, he has assembled the following information to assist in preparing a detailed cash budget:

- a. Budgeted sales and merchandise purchases for next year, as well as actual sales and purchases for the last quarter of the current year, are:

- b. The company normally collects 65% of a quarter’s sales before the quarter ends and another 33% in the following quarter. The remainder is uncollectible. This pattern of collections is now being experienced in the current year’s fourth-quarter actual data.
- c. Eighty percent of a quarter’s merchandise purchases are paid for within the quarter. The remainder is paid for in the following quarter.
- d. Selling and administrative expenses for next year are budgeted at \$50,000 per quarter plus 15% of sales. Of the fixed amount, \$20,000 each quarter is depreciation.
- e. The company will pay \$10,000 in dividends each quarter.
- f. Land purchases of \$75,000 will be made in the second quarter, and purchases of \$48,000 will be made in the third quarter. These purchases will be for cash.
- g. The Cash account contained \$10,000 at the end of the current year. The treasurer feels that this represents a minimum balance that must be maintained.
- h. The company has an agreement with a local bank that allows the company to borrow in increments of \$1,000 at the beginning of each quarter, up to a total loan balance of \$100,000. The interest rate on these loans is 2.5% per quarter and for simplicity we will assume that interest is not compounded. The company would, as far as it is able, repay the loan plus accumulated interest at the end of the year.
- i. At present, the company has no loans outstanding.

Required:

- 1. Prepare the following by quarter and in total for next year:
 - a. A schedule of expected cash collections.
 - b. A schedule of expected cash disbursements for merchandise purchases.
- 2. Compute the expected cash disbursements for selling and administrative expenses, by quarter and in total, for next year.
- 3. Prepare a cash budget, by quarter and in total, for next year.

PROBLEM 8–27 Integration of the Sales, Production, and Direct Materials Budgets [LO2, LO3, LO4]

Milo Company manufactures beach umbrellas. The company is preparing detailed budgets for the third quarter and has assembled the following information to assist in the budget preparation:

- a. The Marketing Department has estimated sales as follows for the remainder of the year (in units):

| | | | |
|-----------------|--------|----------------|--------|
| July | 30,000 | October | 20,000 |
| August | 70,000 | November | 10,000 |
| September | 50,000 | December | 10,000 |

The selling price of the beach umbrellas is \$12 per unit.

- b. All sales are on account. Based on past experience, sales are collected in the following pattern:

30% in the month of sale
 65% in the month following sale
 5% uncollectible

Sales for June totaled \$300,000.

- c. The company maintains finished goods inventories equal to 15% of the following month's sales. This requirement will be met at the end of June.
 d. Each beach umbrella requires 4 feet of Gilden, a material that is sometimes hard to acquire. Therefore, the company requires that the ending inventory of Gilden be equal to 50% of the following month's production needs. The inventory of Gilden on hand at the beginning and end of the quarter will be:

| | |
|--------------------|-------------|
| June 30 | 72,000 feet |
| September 30 | ? feet |

- e. Gilden costs \$0.80 per foot. One-half of a month's purchases of Gilden is paid for in the month of purchase; the remainder is paid for in the following month. The accounts payable on July 1 for purchases of Gilden during June will be \$76,000.

Required:

1. Prepare a sales budget, by month and in total, for the third quarter. (Show your budget in both units and dollars.) Also prepare a schedule of expected cash collections, by month and in total, for the third quarter.
2. Prepare a production budget for each of the months July–October.
3. Prepare a direct materials budget for Gilden, by month and in total, for the third quarter. Also prepare a schedule of expected cash disbursements for Gilden, by month and in total, for the third quarter.

PROBLEM 8–28 Completing a Master Budget [L02, L04, L07, L08, L09, L010]

Hillyard Company, an office supplies specialty store, prepares its master budget on a quarterly basis. The following data have been assembled to assist in preparing the master budget for the first quarter:

- a. As of December 31 (the end of the prior quarter), the company's general ledger showed the following account balances:

| | Debits | Credits |
|-------------------------------------|-----------|-----------|
| Cash | \$ 48,000 | |
| Accounts receivable | 224,000 | |
| Inventory | 60,000 | |
| Buildings and equipment (net) | 370,000 | |
| Accounts payable | | \$ 93,000 |
| Capital stock | | 500,000 |
| Retained earnings | | 109,000 |
| | \$702,000 | \$702,000 |

- b. Actual sales for December and budgeted sales for the next four months are as follows:

| | |
|-------------------------|-----------|
| December (actual) | \$280,000 |
| January | \$400,000 |
| February | \$600,000 |
| March | \$300,000 |
| April | \$200,000 |

- c. Sales are 20% for cash and 80% on credit. All payments on credit sales are collected in the month following sale. The accounts receivable at December 31 are a result of December credit sales.
 d. The company's gross margin is 40% of sales. (In other words, cost of goods sold is 60% of sales.)

- e. Monthly expenses are budgeted as follows: salaries and wages, \$27,000 per month; advertising, \$70,000 per month; shipping, 5% of sales; other expenses, 3% of sales. Depreciation, including depreciation on new assets acquired during the quarter, will be \$42,000 for the quarter.
- f. Each month's ending inventory should equal 25% of the following month's cost of goods sold.
- g. One-half of a month's inventory purchases is paid for in the month of purchase; the other half is paid in the following month.
- h. During February, the company will purchase a new copy machine for \$1,700 cash. During March, other equipment will be purchased for cash at a cost of \$84,500.
- i. During January, the company will declare and pay \$45,000 in cash dividends.
- j. Management wants to maintain a minimum cash balance of \$30,000. The company has an agreement with a local bank that allows the company to borrow in increments of \$1,000 at the beginning of each month. The interest rate on these loans is 1% per month and for simplicity we will assume that interest is not compounded. The company would, as far as it is able, repay the loan plus accumulated interest at the end of the quarter.

Required:

Using the data above, complete the following statements and schedules for the first quarter:

1. Schedule of expected cash collections:

| | January | February | March | Quarter |
|------------------------------|------------------|----------|-------|---------|
| Cash sales | \$ 80,000 | | | |
| Credit sales | <u>224,000</u> | | | |
| Total cash collections | <u>\$304,000</u> | | | |

2. *a.* Merchandise purchases budget:

| | January | February | March | Quarter |
|------------------------------------|---------------------------|-----------|-------|---------|
| Budgeted cost of goods sold | \$240,000* | \$360,000 | | |
| Add desired ending inventory | <u>90,000[†]</u> | | | |
| Total needs | 330,000 | | | |
| Less beginning inventory | <u>60,000</u> | | | |
| Required purchases | <u>\$270,000</u> | | | |

*\$400,000 sales × 60% cost ratio = \$240,000.
[†]\$360,000 × 25% = \$90,000.

2. *b.* Schedule of expected cash disbursements for merchandise purchases:

| | January | February | March | Quarter |
|---|------------------|----------|-------|-----------|
| December purchases | \$ 93,000 | | | \$ 93,000 |
| January purchases | 135,000 | 135,000 | | 270,000 |
| February purchases | — | | | |
| March purchases | — | | | |
| Total cash disbursements for purchases | <u>\$228,000</u> | | | |

3. Schedule of expected cash disbursements for selling and administrative expenses:

| | January | February | March | Quarter |
|---|------------------|----------|-------|---------|
| Salaries and wages | \$ 27,000 | | | |
| Advertising | 70,000 | | | |
| Shipping | 20,000 | | | |
| Other expenses | <u>12,000</u> | | | |
| Total cash disbursements for selling and administrative expenses | <u>\$129,000</u> | | | |

4. Cash budget:

| | January | February | March | Quarter |
|---|----------------|----------|-------|---------|
| Cash balance, beginning | \$ 48,000 | | | |
| Add cash collections | 304,000 | | | |
| Total cash available | <u>352,000</u> | | | |
| Less cash disbursements: | | | | |
| Purchases of inventory | 228,000 | | | |
| Selling and administrative expenses | 129,000 | | | |
| Purchases of equipment | — | | | |
| Cash dividends | <u>45,000</u> | | | |
| Total cash disbursements | <u>402,000</u> | | | |
| Excess (deficiency) of cash | (50,000) | | | |
| Financing: | | | | |
| Etc. | | | | |

5. Prepare an absorption costing income statement for the quarter ending March 31 as shown in Schedule 9 in the chapter.
6. Prepare a balance sheet as of March 31.

Cases

CASE 8–29 Evaluating a Company's Budget Procedures [LO1]

Tom Emory and Jim Morris strolled back to their plant from the administrative offices of Ferguson & Son Manufacturing Company. Tom is manager of the machine shop in the company's factory; Jim is manager of the equipment maintenance department.

The men had just attended the monthly performance evaluation meeting for plant department heads. These meetings had been held on the third Tuesday of each month since Robert Ferguson, Jr., the president's son, had become plant manager a year earlier.

As they were walking, Tom Emory spoke: "Boy, I hate those meetings! I never know whether my department's accounting reports will show good or bad performance. I'm beginning to expect the worst. If the accountants say I saved the company a dollar, I'm called 'Sir,' but if I spend even a little too much—boy, do I get in trouble. I don't know if I can hold on until I retire."

Tom had just been given the worst evaluation he had ever received in his long career with Ferguson & Son. He was the most respected of the experienced machinists in the company. He had been with Ferguson & Son for many years and was promoted to supervisor of the machine shop when the company expanded and moved to its present location. The president (Robert Ferguson, Sr.) had often stated that the company's success was due to the high-quality work of machinists like Tom. As supervisor, Tom stressed the importance of craftsmanship and told his workers that he wanted no sloppy work coming from his department.

When Robert Ferguson, Jr., became the plant manager, he directed that monthly performance comparisons be made between actual and budgeted costs for each department. The departmental budgets were intended to encourage the supervisors to reduce inefficiencies and to seek cost reduction opportunities. The company controller was instructed to have his staff "tighten" the budget slightly whenever a department attained its budget in a given month; this was done to reinforce the plant manager's desire to reduce costs. The young plant manager often stressed the importance of continued progress toward attaining the budget; he also made it known that he kept a file of these performance reports for future reference when he succeeded his father.

Tom Emory's conversation with Jim Morris continued as follows:

Emory: I really don't understand. We've worked so hard to meet the budget, and the minute we do so they tighten it on us. We can't work any faster and still maintain quality. I think my men are ready to quit trying. Besides, those reports don't tell the whole story. We always seem to be interrupting the big jobs for all those small rush orders. All that setup and machine adjustment time is killing us. And quite frankly, Jim, you were no help. When our hydraulic press broke down last month, your people were nowhere to be found. We had to take it apart ourselves and got stuck with all that idle time.

Morris: I'm sorry about that, Tom, but you know my department has had trouble making budget, too. We were running well behind at the time of that problem, and if we'd spent a day on that old machine, we would never have made it up. Instead we made the scheduled inspections of the forklift trucks because we knew we could do those in less than the budgeted time.

Emory: Well, Jim, at least you have some options. I'm locked into what the scheduling department assigns to me and you know they're being harassed by sales for those special orders. Incidentally, why didn't your report show all the supplies you guys wasted last month when you were working in Bill's department?

Morris: We're not out of the woods on that deal yet. We charged the maximum we could to other work and haven't even reported some of it yet.

Emory: Well, I'm glad you have a way of getting out of the pressure. The accountants seem to know everything that's happening in my department, sometimes even before I do. I thought all that budget and accounting stuff was supposed to help, but it just gets me into trouble. It's all a big pain. I'm trying to put out quality work; they're trying to save pennies.

Required:

1. Identify the problems that appear to exist in Ferguson & Son Manufacturing Company's budgetary control system and explain how the problems are likely to reduce the effectiveness of the system.
2. Explain how Ferguson & Son Manufacturing Company's budgetary control system could be revised to improve its effectiveness.

(CMA, adapted)

CASE 8-30 Master Budget with Supporting Schedules [LO2, LO4, LO8, LO9, LO10]

You have just been hired as a new management trainee by Earrings Unlimited, a distributor of earrings to various retail outlets located in shopping malls across the country. In the past, the company has done very little in the way of budgeting and at certain times of the year has experienced a shortage of cash.

excel

Because you are well trained in budgeting, you have decided to prepare comprehensive budgets for the upcoming second quarter in order to show management the benefits that can be gained from an integrated budgeting program. To this end, you have worked with accounting and other areas to gather the information assembled below.

The company sells many styles of earrings, but all are sold for the same price—\$10 per pair. Actual sales of earrings for the last three months and budgeted sales for the next six months follow (in pairs of earrings):

| | | | |
|-------------------------|---------|--------------------------|--------|
| January (actual) | 20,000 | June (budget) | 50,000 |
| February (actual) | 26,000 | July (budget) | 30,000 |
| March (actual) | 40,000 | August (budget) | 28,000 |
| April (budget) | 65,000 | September (budget) | 25,000 |
| May (budget) | 100,000 | | |

The concentration of sales before and during May is due to Mother's Day. Sufficient inventory should be on hand at the end of each month to supply 40% of the earrings sold in the following month.

Suppliers are paid \$4 for a pair of earrings. One-half of a month's purchases is paid for in the month of purchase; the other half is paid for in the following month. All sales are on credit, with no discount, and payable within 15 days. The company has found, however, that only 20% of a month's sales are collected in the month of sale. An additional 70% is collected in the following month, and the remaining 10% is collected in the second month following sale. Bad debts have been negligible.

Monthly operating expenses for the company are given below:

| | |
|-------------------------|-------------|
| Variable: | |
| Sales commissions | 4% of sales |
| Fixed: | |
| Advertising | \$200,000 |
| Rent | \$18,000 |
| Salaries | \$106,000 |
| Utilities | \$7,000 |
| Insurance | \$3,000 |
| Depreciation | \$14,000 |

Insurance is paid on an annual basis, in November of each year.

The company plans to purchase \$16,000 in new equipment during May and \$40,000 in new equipment during June; both purchases will be for cash. The company declares dividends of \$15,000 each quarter, payable in the first month of the following quarter.

A listing of the company's ledger accounts as of March 31 is given below:

| Assets | |
|---|---------------------------|
| Cash | \$ 74,000 |
| Accounts receivable (\$26,000 February sales; \$320,000 March sales) | 346,000 |
| Inventory | 104,000 |
| Prepaid insurance | 21,000 |
| Property and equipment (net) | 950,000 |
| Total assets | <u>\$1,495,000</u> |
| Liabilities and Stockholders' Equity | |
| Accounts payable | \$ 100,000 |
| Dividends payable | 15,000 |
| Capital stock | 800,000 |
| Retained earnings | 580,000 |
| Total liabilities and stockholders' equity | <u>\$1,495,000</u> |

The company maintains a minimum cash balance of \$50,000. All borrowing is done at the beginning of a month; any repayments are made at the end of a month.

The company has an agreement with a bank that allows the company to borrow in increments of \$1,000 at the beginning of each month. The interest rate on these loans is 1% per month and for simplicity we will assume that interest is not compounded. At the end of the quarter, the company would pay the bank all of the accumulated interest on the loan and as much of the loan as possible (in increments of \$1,000), while still retaining at least \$50,000 in cash.

Required:

Prepare a master budget for the three-month period ending June 30. Include the following detailed budgets:

1. *a.* A sales budget, by month and in total.
- b.* A schedule of expected cash collections from sales, by month and in total.
- c.* A merchandise purchases budget in units and in dollars. Show the budget by month and in total.
- d.* A schedule of expected cash disbursements for merchandise purchases, by month and in total.
2. A cash budget. Show the budget by month and in total. Determine any borrowing that would be needed to maintain the minimum cash balance of \$50,000.
3. A budgeted income statement for the three-month period ending June 30. Use the contribution approach.
4. A budgeted balance sheet as of June 30.

RESEARCH AND APPLICATION 8-31

[LO1]

The questions in this exercise give you an appreciation for the complexity of budgeting in a large multinational corporation. To answer the questions, you will need to download the **Procter & Gamble (P&G) 2005 Annual Report** at www.pg.com/investors/annualreports.jhtml and briefly refer to "Item 2: Properties" in P&G's Form 10-K for the fiscal year ended June 30, 2005. To access the 10-K report, go to www.sec.gov/edgar/searchedgar/companysearch.html. Input CIK code 80424 and hit enter. In the gray box on the right-hand side of your computer screen define the scope of your search by inputting 10-K and then pressing enter. Select the 10-K with a filing date of August 29, 2005. You will also need to briefly refer to **Macy's Inc.**'s Form 10-K for the fiscal year ended January 29, 2005. Macy's CIK code is 794367 and its filing date is March 28, 2005. You do not need to print any documents to answer the questions.

Required:

1. What is P&G's strategy for success in the marketplace? Does the company rely primarily on a customer intimacy, operational excellence, or product leadership customer value proposition? What evidence supports your conclusion?
2. What business risks does P&G face that may threaten its ability to satisfy stockholder expectations? What are some examples of control activities that the company could use to reduce these risks? (Hint: Focus on page 28 of the annual report).
3. What were P&G's quarterly net sales for the fiscal year ended June 30, 2005? What were Federated Department Stores' quarterly net sales for 2004? (Hint: see page 79 of its 10-K.) How does P&G's quarterly sales trend compare to Federated Department Stores' quarterly sales trend? Which of the two quarterly sales trends is likely to cause greater cash budgeting concerns? Why?
4. Describe the scope of P&G's business in three respects—physical facilities, products, and customers. More specifically, how many manufacturing facilities does P&G operate globally? What are P&G's three Global Business Units (GBUs)? Which of P&G's 17 "billion dollar brands" are included in each of these GBU's? How many brands does P&G offer in total and in how many countries do they sell these brands? How many countries does P&G's Market Development Organization operate in?
5. Describe five uncertainties that complicate P&G's efforts to accurately forecast its sales and expenses.
6. P&G's annual report briefly discusses the acquisition of Gillette (see pages 10–11). It acknowledges that Gillette has some different cultural norms in terms of how it defines accountability and communicates internally. Although not discussed in the annual report, how could differences in two organization's budgeting practices be responsible for these types of divergent cultural norms?

Chapter

9

Learning Objectives

After studying Chapter 9, you should be able to:

- L01** Prepare a flexible budget.
- L02** Prepare a report showing activity variances.
- L03** Prepare a report showing revenue and spending variances.
- L04** Prepare a performance report that combines activity variances and revenue and spending variances.
- L05** Prepare a flexible budget with more than one cost driver.
- L06** Understand common errors made in preparing performance reports based on budgets and actual results.

Flexible Budgets and Performance Analysis

The Inevitability of Forecasting Errors

While companies derive numerous benefits from planning for the future, they must be able to respond when actual results deviate from the plan. For example, just two months after telling Wall Street analysts that it would breakeven for the first quarter of 2005, **General Motors (GM)** acknowledged that its actual sales were far less than its original forecast and the company would lose \$850 million in the

BUSINESS FOCUS

quarter. For the year, GM acknowledged that projected earnings would be 80% lower than previously indicated. The company's stock price dropped by \$4.71.

When a company's plans deviate from its actual results, managers need to understand the reasons for the deviations. How much is caused by the fact that actual sales differ from budgeted sales? How much is caused by the actions of managers? In the case of GM, the actual level of sales is far less than the budget, so some actual costs are likely to be less than originally budgeted. These lower costs do not signal managerial effectiveness. This chapter explains how to analyze the sources of discrepancies between budgeted and actual results. ■

Source: Alex Taylor III, "GM Hits the Skids," *Fortune*, April 4, 2005, pp. 71–74.

In the last chapter we explored how budgets are developed before a period begins. Budgeting involves a lot of time and effort and the results of the budgeting process should not be shoved into a filing cabinet and forgotten. To be useful, budgets should provide guidance in conducting actual operations and should be part of the performance evaluation process. However, managers need to be very careful about how budgets are used. In government, budgets often establish how much will be spent and indeed, spending more than was budgeted may be a criminal offense. That is not true in other organizations. In for-profit organizations, actual spending will rarely be the same as the spending that was budgeted at the beginning of the period. The reason is that the actual level of activity (such as unit sales) will rarely be the same as the budgeted activity; therefore, many actual costs and revenues will naturally differ from what was budgeted. Should a manager be penalized for spending 10% more than budgeted for a variable cost like direct materials if unit sales are 10% higher than budgeted? Of course not. In this chapter we will explore how budgets can be adjusted so that meaningful comparisons to actual costs can be made.

Flexible Budgets

Characteristics of a Flexible Budget

The budgets that we explored in the last chapter were *planning budgets*. A **planning budget** is prepared before the period begins and is valid for only the planned level of activity. A static planning budget is suitable for planning but is inappropriate for evaluating how well costs are controlled. If the actual level of activity differs from what was planned, it would be misleading to compare actual costs to the static, unchanged planning budget. If activity is higher than expected, variable costs should be higher than expected; and if activity is lower than expected, variable costs should be lower than expected.

Flexible budgets take into account how changes in activity affect costs. A **flexible budget** is an estimate of what revenues and costs should have been, given the actual level of activity for the period. When a flexible budget is used in performance evaluation, actual costs are compared to what the costs *should have been for the actual level of activity during the period* rather than to the static planning budget. This is a very important distinction. If adjustments for the level of activity are not made, it is very difficult to interpret discrepancies between budgeted and actual costs.

LEARNING OBJECTIVE 1

Prepare a flexible budget.

WHY DO COMPANIES NEED FLEXIBLE BUDGETS?

The difficulty of accurately predicting future financial performance can be readily understood by reading the annual report of any publicly traded company. For example **Nucor Corporation**, a steel manufacturer headquartered in Charlotte, North Carolina, cites numerous reasons why its actual results may differ from expectations, including the following: (1) the supply and cost of raw materials, electricity, and natural gas may change unexpectedly; (2) the market demand for steel products may change; (3) competitive pressures from imports and substitute materials may intensify; (4) uncertainties regarding the global economy may affect customer demand; (5) changes to U.S. and foreign trade policy may alter current importing and exporting practices; and (6) new government regulations could significantly increase environmental compliance costs. Each of these factors could cause static budget revenues and/or costs to differ from actual results.

IN BUSINESS

Deficiencies of the Static Planning Budget

To illustrate the difference between a static planning budget and a flexible budget, consider Rick's Hairstyling, an upscale hairstyling salon located in Beverly Hills that is owned and managed by Rick Manzi. The salon has very loyal customers—many of whom are

EXHIBIT 9-1
Planning Budget

| Rick's Hairstyling Planning Budget For the Month Ended March 31 | |
|--|--------------------------|
| Budgeted client-visits (q) | 1,000 |
| Revenue ($\$180.00q$) | <u>\\$180,000</u> |
| Expenses: | |
| Wages and salaries ($\$65,000 + \$37.00q$) | 102,000 |
| Hairstyling supplies ($\$1.50q$) | 1,500 |
| Client gratuities ($\$4.10q$) | 4,100 |
| Electricity ($\$1,500 + \$0.10q$) | 1,600 |
| Rent ($\$28,500$) | 28,500 |
| Liability insurance ($\$2,800$) | 2,800 |
| Employee health insurance ($\$21,300$) | 21,300 |
| Miscellaneous ($\$1,200 + \$0.20q$) | 1,400 |
| Total expense | <u>163,200</u> |
| Net operating income | <u>\\$ 16,800</u> |

associated with the film industry. Recently Rick has been attempting to get better control of his revenues and costs, and at the urging of his accounting and business adviser, Victoria Kho, he has begun to prepare monthly budgets. Victoria Kho is an accountant in independent practice who specializes in small service-oriented businesses like Rick's Hairstyling.

At the end of February, Rick prepared the March budget that appears in Exhibit 9-1. Rick believes that the number of customers served in a month is the best way to measure the overall level of activity in his salon. He refers to these visits as client-visits. A customer who comes into the salon and has his or her hair styled is counted as one client-visit.

Note that the term *revenue* is used in the planning budget rather than *sales*. We use the term revenue throughout the chapter because some organizations have sources of revenue other than sales. For example, donations, as well as sales, are counted as revenue in nonprofit organizations.

Rick has identified eight major categories of costs—wages and salaries, hairstyling supplies, client gratuities, electricity, rent, liability insurance, employee health insurance, and miscellaneous. Client gratuities consist of flowers, candies, and glasses of champagne that Rick gives to his customers while they are in the salon.

Working with Victoria, Rick had already estimated a cost formula for each cost. For example, they determined that the cost formula for electricity should be $\$1,500 + \$0.10q$, where q equals the number of client-visits. In other words, electricity is a mixed cost with a $\$1,500$ fixed element and a $\$0.10$ per client-visit variable element. Once the budgeted level of activity was set at 1,000 client-visits, it was easy to compute the budgeted amount for each line item in the budget. For example, using the cost formula, the budgeted cost for electricity was set at $\$1,600$ ($= \$1,500 + \$0.10 \times 1,000$).

At the end of March, Rick found that his actual profit was $\$21,230$ as shown in the income statement in Exhibit 9-2. It is important to realize that the actual results are *not* determined by plugging the actual number of client-visits into the revenue and cost formulas. The formulas are simply estimates of what the revenues and costs should be for a given level of activity. What actually happens usually differs from what is supposed to happen.

Referring back to Exhibit 9-1, the budgeted net operating income was $\$16,800$, so the actual profit was substantially higher than planned at the beginning of the month. This was, of course, good news, but Rick wanted to know more. Business was up by 10%—the salon had 1,100 client-visits instead of the budgeted 1,000 client-visits. Could this alone explain the higher net income? The answer is no. An increase in net operating income of 10% would have resulted in net operating income of only $\$18,480$ ($= 1.1 \times \$16,800$), not the $\$21,230$ actually earned during the month. What is responsible for this better outcome? Higher prices? Lower costs? Something else? Whatever the cause, Rick would like to know the answer and then hopefully repeat the same performance next month.

| Rick's Hairstyling Income Statement For the Month Ended March 31 | |
|---|------------------|
| Actual client-visits | 1,100 |
| Revenue | <u>\$194,200</u> |
| Expenses: | |
| Wages and salaries | 106,900 |
| Hairstyling supplies | 1,620 |
| Client gratuities | 6,870 |
| Electricity | 1,550 |
| Rent | 28,500 |
| Liability insurance | 2,800 |
| Employee health insurance | 22,600 |
| Miscellaneous | <u>2,130</u> |
| Total expense | <u>172,970</u> |
| Net operating income | <u>\$ 21,230</u> |

EXHIBIT 9-2
Actual Results—Income Statement

In an attempt to analyze what happened in March, Rick prepared the report comparing actual to budgeted costs that appears in Exhibit 9-3. Note that most of the variances in this report are labeled unfavorable (U) rather than favorable (F) even though net operating income was actually higher than expected. For example, wages and salaries show an unfavorable variance of \$4,900 because the budget called for wages and salaries of \$102,000, whereas the actual wages and salaries expense was \$106,900. The problem with the report, as Rick immediately realized, is that it compares revenues and costs at one level of activity (1,000 client-visits) to revenues and costs at a different level of activity (1,100 client-visits). This is like comparing apples to oranges. Because Rick had 100 more client-visits than expected, some of his costs should be higher than budgeted. From Rick's standpoint, the increase in activity was good and should be counted as a favorable variance, but the increase in activity has an apparently negative impact on most of the costs in the report. Rick knew that something would have to be done to make the report more meaningful, but he was unsure of what to do. So he made an appointment to meet with Victoria Kho to discuss the next step.

| Rick's Hairstyling Comparison of Planning Budget to Actual Results For the Month Ended March 31 | | | |
|--|--------------------|-------------------|-------------------|
| | Planning Budget | Actual Results | Variances |
| Client-visits | 1,000 | 1,100 | |
| Revenue | <u>\$180,000</u> | <u>\$194,200</u> | <u>\$14,200</u> F |
| Expenses: | | | |
| Wages and salaries | 102,000 | 106,900 | 4,900 U |
| Hairstyling supplies | 1,500 | 1,620 | 120 U |
| Client gratuities | 4,100 | 6,870 | 2,770 U |
| Electricity | 1,600 | 1,550 | 50 F |

| Net operating income | <u>\$ 30,510</u> |

**MANAGERIAL
ACCOUNTING IN
ACTION**
The Issue

Victoria: How is the budgeting going?

Rick: Pretty well. I didn't have any trouble putting together the budget for March. I also prepared a report comparing the actual results for March to the budget, but that report isn't giving me what I really want to know.

Victoria: Because your actual level of activity didn't match your budgeted activity?

Rick: Right. I know the level of activity shouldn't affect my fixed costs, but we had more client-visits than I had expected and that had to affect my other costs.

Victoria: So you want to know whether the higher actual costs are justified by the higher level of activity you actually had in March?

Rick: Precisely.

Victoria: If you leave your reports and data with me, I can work on it later today, and by tomorrow I'll have a report to show you.

How a Flexible Budget Works

A flexible budget approach recognizes that a budget can be adjusted to show what costs *should be* for the actual level of activity. To illustrate how flexible budgets work, Victoria prepared the report in Exhibit 9-4 that shows what the *revenues and costs should have been given the actual level of activity* in March. Preparing the report is straightforward. The cost formula for each cost is used to estimate what the cost should have been for 1,100 client-visits—the actual level of activity for March. For example, using the cost formula $\$1,500 + \$0.10q$, the cost of electricity in March *should have been* \$1,610 ($= \$1,500 + \$0.10 \times 1,100$).

We can see from the flexible budget that the net operating income in March *should have been* \$30,510, but recall from Exhibit 9-2 that the net operating income was actually only \$21,230. The results are not as good as we thought. Why? We will answer that question shortly.

To summarize to this point, Rick had budgeted for a profit of \$16,800. The actual profit was quite a bit higher—\$21,230. However, given the amount of business the salon had in March, the profit should have been even higher—\$30,510. What are the causes of these discrepancies? Rick would certainly like to build on the positive factors, while working to reduce the negative factors. But what are they?

Flexible Budget Variances

To answer Rick's questions concerning the discrepancies between budgeted and actual costs, we will need to break down the variances shown in Exhibit 9-3 into two types of variances—activity variances and revenue and spending variances. We do that in the next two sections.

Activity Variances

Part of the discrepancy between the budgeted profit and the actual profit is due to the fact that the actual level of activity in March was higher than expected. How much of this discrepancy was due to this single factor? The report in Exhibit 9–5 is designed to answer this question. In that report, the planning budget from the beginning of the period is compared to the flexible budget based on the actual level of activity for the period. The planning budget shows what should have happened at the budgeted level of activity whereas the flexible budget shows what should have happened at the actual level of activity. Therefore, the differences between the planning budget and the flexible budget show what should have happened solely because the actual level of activity differed from what had been expected.

For example, the budget based on 1,000 client-visits shows revenue of **\$180,000** (= \$180 per client-visit × 1,000 client-visits). The flexible budget based on 1,100 client-visits shows revenue of **\$198,000** (= \$180 per client-visit × 1,100 client-visits). Because the salon had 100 more client-visits than anticipated in the budget, actual revenue should have been higher than budgeted revenue by \$18,000 (= \$198,000 – \$180,000). This activity variance is shown on the report as **\$18,000 F** (favorable). Similarly, the budget based on 1,000 client-visits shows electricity costs of **\$1,600** (= \$1,500 + \$0.10 per client-visit × 1,000 client-visits). The flexible budget based on 1,100 client-visits shows electricity costs of **\$1,610** (= \$1,500 + \$0.10 per client-visit × 1,100 client-visits). Because the salon had 100 more client-visits than anticipated in the budget, actual electricity costs should have been higher than budgeted costs by \$10 (= \$1,610 – \$1,600). The activity variance for electricity is shown on the report as **\$10 U** (unfavorable). Note that in this case, the label “unfavorable” may be a little misleading. Costs *should* be \$10 higher for electricity simply because business was up by 100 client-visits; therefore, is this variance really unfavorable if it was a necessary cost of serving more customers? For reasons such as this, we would like to caution you against assuming that unfavorable variances always indicate bad performance and favorable variances always indicate good performance.

Because all of the variances on this report are solely due to the difference in the level of activity between the planning budget from the beginning of the period and the actual level of activity, they are called **activity variances**. For example, the activity variance for revenue is **\$18,000 F**, the activity variance for electricity is **\$10 U**, and so on. The most important activity variance appears at the very bottom of the report; namely, the **\$13,710 F**

LEARNING OBJECTIVE 2
Prepare a report showing activity variances.

| Rick's Hairstyling Activity Variances For the Month Ended March 31 | | | |
|---|----------------------------|----------------------------|-------------------------------|
| | Planning Budget | Flexible Budget | Activity Variances |
| Client-visits | 1,000 | 1,100 | |
| Revenue (\$180.00q) | \$180,000 | \$198,000 | \$18,000 F |
| Expenses: | | | |
| Wages and salaries (\$65,000 + \$37.00q) | 102,000 | 105,700 | 3,700 U |
| Hairstyling supplies (\$1.50q) | 1,500 | 1,650 | 150 U |
| Client gratuities (\$4.10q) | 4,100 | 4,510 | 410 U |
| Electricity (\$1,500 + \$0.10q) | 1,600 | 1,610 | 10 U |
| Rent (\$28,500) | 28,500 | 28,500 | 0 |
| Liability insurance (\$2,800) | 2,800 | 2,800 | 0 |
| Employee health insurance (\$21,300) | 21,300 | 21,300 | 0 |
| Miscellaneous (\$1,200 + \$0.20q) | 1,400 | 1,420 | 20 U |
| Total expense | <u>163,200</u> | <u>167,490</u> | <u>4,290 U</u> |
| Net operating income | <u>\$ 16,800</u> | <u>\$ 30,510</u> | <u>\$13,710 F</u> |

EXHIBIT 9–5
**Activity Variances from
Comparing the Planning
Budget to the Flexible Budget
Based on Actual Activity**

(favorable) variance for net operating income. This variance says that because activity was higher than expected in the planning budget, the net operating income should have been \$13,710 higher. We caution against placing too much emphasis on any other single variance in this report. As we have said above, one would expect some costs to be higher as a consequence of more business. It is somewhat misleading to think of these unfavorable variances as indicative of poor performance.

On the other hand, the favorable activity variance for net operating income is important. Let's explore this variance a bit more thoroughly. First, as we have already noted, activity was up by 10%, but the flexible budget indicates that net operating income should have increased much more than 10%. A 10% increase in net operating income from the \$16,800 in the planning budget would result in net operating income of \$18,480 ($= 1.1 \times \$16,800$); however, the flexible budget shows much higher net operating income of \$30,510. Why? The short answer is: Because of the presence of fixed costs. When we apply the 10% increase to the budgeted net operating income to estimate the profit at the higher level of activity, we implicitly assume that the revenues and *all* of the costs increase by 10%. But they do not. Note that when the activity level increases by 10%, three of the costs—rent, liability insurance, and employee health insurance—do not increase at all. These are all purely fixed costs. So while sales do increase by 10%, these costs do not increase. This results in net operating income increasing by more than 10%. A similar effect occurs with the mixed costs which contain fixed cost elements—wages and salaries, electricity, and miscellaneous. While sales increase by 10%, these mixed costs increase by less than 10%, resulting in an overall increase in net operating income of more than 10%. Because of the existence of fixed costs, net operating income does not change in proportion to changes in the level of activity. There is a leverage effect. The percentage changes in net operating income are ordinarily larger than the percentage increases in activity.

LEARNING OBJECTIVE 3

Prepare a report showing revenue and spending variances.

Revenue and Spending Variances

In the last section we answered the question “What impact did the change in activity have on our revenues, costs, and profit?” In this section we will answer the question “How well did we control our revenues, our costs, and our profit?”

Recall that the flexible budget based on the actual level of activity in Exhibit 9–4 shows what *should have happened given the actual level of activity*. If we compare this flexible budget to actual results, we compare what should have happened to what actually happened. This is done in Exhibit 9–6.

Focusing first on revenue, the flexible budget indicates that, given the actual level of activity, revenue should have been \$198,000. However, actual revenue totaled \$194,200. Consequently, revenue was \$3,800 less than it should have been, given the actual number of client-visits for the month. This discrepancy is labeled as a \$3,800 U (unfavorable) variance and is called a *revenue variance*. A **revenue variance** is the difference between what the total revenue should have been, given the actual level of activity for the period, and the actual total revenue. If actual revenue exceeds what the revenue should have been, the variance is labeled favorable. If actual revenue is less than what the revenue should have been, the variance is labeled unfavorable. Why would actual revenue be less than or more than it should have been, given the actual level of activity? Basically, the revenue variance is favorable if the average selling price is greater than expected; it is unfavorable if the average selling price is less than expected. This could happen for a variety of reasons including a change in selling price, a different mix of products sold, a change in the amount of discounts given, poor accounting controls, and so on.

Focusing next on costs, the flexible budget indicates that electricity costs should have been \$1,610 for the 1,100 client-visits in March. However, the actual electricity cost was \$1,550. Because the cost was \$60 less than we would have expected for the actual level of activity during the period, it is labeled as a favorable variance, \$60 F. This is an example of a *spending variance*. By definition, a **spending variance** is the difference between how much a cost should have been, given the actual level of activity, and the actual amount of the cost. If the actual cost is greater than what the cost should have been, the variance is labeled

EXHIBIT 9-6
Revenue and Spending
Variances from Comparing
the Flexible Budget to the
Actual Results

as unfavorable. If the actual cost is less than what the cost should have been, the variance is labeled as favorable. Why would a cost have a favorable or unfavorable variance? There are many possible explanations including paying a higher price for inputs than should have been paid, using too many inputs for the actual level of activity, a change in technology, and so on. In the next chapter we will delve into this topic in greater detail.

Note from Exhibit 9-6 that the overall net operating income variance is **\$9,280 U** (unfavorable). This means that given the actual level of activity for the period, the net operating income was \$9,280 lower than it should have been. There are a number of reasons for this. The most prominent is the unfavorable revenue variance of \$3,800. Next in line is the \$2,360 unfavorable variance for client gratuities. Looking at this in another way, client gratuities were more than 50% larger than they should have been according to the flexible budget. This is a variance that Rick would almost certainly want to investigate further. Rick may directly control the client gratuities himself. If not, he may want to know who authorized the additional expenditures. Why were they so large? Was more given away than usual? If so, why? Were more expensive gratuities given to clients? If so, why? Note that this unfavorable variance is not necessarily a bad thing. It is possible, for example, that more lavish use of gratuities led to the 10% increase in client-visits.

A Performance Report Combining Activity and Revenue and Spending Variances

Exhibit 9-7 displays a performance report that combines the activity variances (from Exhibit 9-5) with the revenue and spending variances (from Exhibit 9-6). The report brings together information from those two earlier exhibits in a way that makes it easier to interpret what happened during the period. The format of this report is a bit different from the format of the previous reports in that the variances appear between the amounts being compared rather than after them. For example, the activity variances appear between the planning budget amounts and the flexible budget amounts. In Exhibit 9-5, the activity variances appeared after the planning budget and the flexible budget.

Note two numbers in particular in the performance report—the activity variance for net operating income of **\$13,710 F** (favorable) and the overall revenue and spending variance for net operating income of **\$9,280 U** (unfavorable). It is worth repeating what those two numbers mean. The \$13,710 favorable activity variance occurred because actual

| Miscellaneous (\$1,200 + \$0.20q) | <u>1,400</u> | <u>20</u> | U | <u>1,420</u> | <u>710</u> | U |
| Total expense | <u>163,200</u> | <u>4,290</u> | U | <u>167,490</u> | <u>5,480</u> | U |
| Net operating income | <u>\$ 16,800</u> | <u>\$13,710</u> | F | <u>\$ 30,510</u> | <u>\$9,280</u> | U |

activity (1,100 client-visits) was greater than the budgeted level of activity (1,000 client-visits). The \$9,280 unfavorable overall revenue and spending variance occurred because the profit was not as large as it should have been for the actual level of activity for the period. These two different variances mean very different things and call for different types of actions. To generate a favorable activity variance for net operating income, managers must take actions to increase client-visits. To generate a favorable overall revenue and spending variance, managers must take actions to protect selling prices, increase operating efficiency, and reduce the prices of inputs.

The performance report in Exhibit 9-7 provides much more useful information to managers than the simple comparison of budgeted to actual results in Exhibit 9-3. In Exhibit 9-3, the effects of changes in activity were jumbled together with the effects of how well prices were controlled and operations were managed. The performance report in Exhibit 9-7 clearly separates these effects, allowing managers to take a much more focused approach in evaluating operations.

To get a better idea of how the performance report accomplishes this task, look at hairstyling supplies in the performance report. In the planning budget, this cost was \$1,500, whereas the actual cost for the period was \$1,620. In the comparison of the planning budget to actual results in Exhibit 9-3, this difference is shown as an unfavorable variance of \$120. Exhibit 9-3 uses a static planning budget approach that compares actual costs at one level of activity to budgeted costs at a different level of activity. As we said before, this is like comparing apples to oranges. This variance is actually a mixture of two very different effects. This becomes clear in the performance report in Exhibit 9-7. The difference between the budgeted amount and the actual results is composed of two different variances—an unfavorable activity variance of \$150 and a favorable spending variance of \$30. The activity variance occurs because activity was greater than anticipated in the planning budget, which naturally resulted in a higher total cost for this variable cost. The favorable spending variance occurred because less was spent on hairstyling supplies than one would have expected, given the actual level of activity for the month.

The flexible budget performance report in Exhibit 9–7 provides a more valid assessment of performance than simply comparing static planning budget costs to actual costs because actual costs are compared to what costs should have been at the actual level of activity. In other words, apples are compared to apples. When this is done, we see that the spending variance for hairstyling supplies is \$30 F (favorable) rather than \$120 U (unfavorable) as it was in the original static planning budget performance report (see Exhibit 9–3). In some cases, as with hairstyling supplies in Rick’s report, an unfavorable static planning budget variance may be transformed into a favorable revenue or spending variance when an increase in activity is properly taken into account. The following discussion took place the next day at Rick’s salon.

Victoria: Let me show you what I’ve got. [Victoria shows Rick the flexible budget performance report in Exhibit 9–7.] I simply used the cost formulas to update the budget to reflect the increase in client-visits you experienced in March. That allowed me to come up with a better benchmark for what the costs should have been.

Rick: That’s what you labeled the “flexible budget based on 1,100 client-visits”?

Victoria: That’s right. Your original budget was based on 1,000 client-visits, so it understated what some of the costs should have been when you actually served 1,100 customers.

Rick: That’s clear enough. These spending variances aren’t quite as shocking as the variances on my first report.

Victoria: Yes, but you still have an unfavorable variance of \$2,360 for client gratuities.

Rick: I know how that happened. In March there was a big Democratic Party fundraising dinner that I forgot about when I prepared the March budget. To fit all of our regular clients in, we had to push them through here pretty fast. Everyone still got top-rate service, but I felt bad about not being able to spend as much time with each customer. I wanted to give my customers a little extra something to compensate them for the less personal service, so I ordered a lot of flowers, which I gave away by the bunch.

Victoria: With the prices you charge, Rick, I am sure the gesture was appreciated.

Rick: One thing bothers me about the report. When we discussed my costs before, you called rent, liability insurance, and employee health insurance fixed costs. How can I have a variance for a fixed cost? Doesn’t fixed mean that it doesn’t change?

Victoria: We call these costs *fixed* because they shouldn’t be affected by *changes in the level of activity*. However, that doesn’t mean that they can’t change for other reasons. Also, the use of the term *fixed* also suggests to people that the cost can’t be controlled, but that isn’t true. It is often easier to control fixed costs than variable costs. For example, it would be fairly easy for you to change your insurance bill by adjusting the amount of insurance you carry. It would be much more difficult for you to significantly reduce your spending on hairstyling supplies—a variable cost that is a necessary part of serving customers.

Rick: I think I understand, but it *is* confusing.

Victoria: Just remember that a cost is called variable if it is proportional to activity; it is called fixed if it does not depend on the level of activity. However, fixed costs can change for reasons unrelated to changes in the level of activity. And controllability has little to do with whether a cost is variable or fixed. Fixed costs are often more controllable than variable costs.

**MANAGERIAL
ACCOUNTING IN
ACTION**
The Wrap-up

Performance Reports in Nonprofit Organizations

The performance reports in nonprofit organizations are basically the same as the performance reports we have considered so far—with one prominent difference. Nonprofit organizations usually receive a significant amount of funding from sources other than sales. For example, universities receive their funding from sales (i.e., tuition charged to students), from endowment income and donations, and—in the case of public universities—from state appropriations. This means that, like costs, the revenue

in governmental and nonprofit organizations may consist of both fixed and variable elements. For example, the **Seattle Opera Company**'s revenue in a recent year consisted of grants and donations of \$12,719,000 and ticket sales of \$8,125,000 (or about \$75.35 per ticket sold). Consequently, the revenue formula for the opera can be written as:

$$\text{Revenue} = \$12,719,000 + \$75.35q$$

where q is the number of tickets sold. In other respects, the performance report for the Seattle Opera and other nonprofit organizations would be similar to the performance report in Exhibit 9–7.

Performance Reports in Cost Centers

Performance reports are often prepared for organizations that do not have any source of outside revenue. In particular, in a large organization a performance report may be prepared for each department—including departments that do not sell anything to outsiders. For example, a performance report is very commonly prepared for production departments in manufacturing companies. Such reports should be prepared using the same principles we have discussed and should look very much like the performance report in Exhibit 9–7—with the exception that revenue, and consequently net operating income, will not appear on the report. Because the managers in these departments are responsible for costs, but not revenues, they are often called *cost centers*.

IN BUSINESS

FOCUS ON OPPORTUNITIES

The late management guru Peter F. Drucker cautioned managers that “almost without exception, the first page of the [monthly] report presents the areas in which results fall below expectations or in which expenditures exceed the budget. It focuses on problems. Problems cannot be ignored. But . . . enterprises have to focus on opportunities. That requires a small but fundamental procedural change: a new first page to the monthly report, one that precedes the page that shows the problems. The new page should focus on where results are better than expected. As much time should be spent on that new first page as traditionally was spent on the problem page.”

Source: Peter F. Drucker, “Change Leaders,” *Inc.* magazine, June 1999, pp. 65–72.

Flexible Budgets with Multiple Cost Drivers

LEARNING OBJECTIVE 5

Prepare a flexible budget with more than one cost driver.

At Rick's Hairstyling, we have thus far assumed that there is only one cost driver—the number of client-visits. However, in the activity-based costing chapter, we found that more than one cost driver might be needed to adequately explain all of the costs in an organization. For example, some of the costs at Rick's Hairstyling probably depend more on the number of hours that the salon is open for business than the number of client-visits. Specifically, most of Rick's employees are paid salaries, but some are paid on an hourly basis. None of the employees is paid on the basis of the number of customers actually served. Consequently, the cost formula for wages and salaries would be more accurate if it were stated in terms of the hours of operation rather than the number of client-visits. The cost of electricity is even more complex. Some of the cost is fixed—the heat must be kept at some minimum level even at night when the salon is closed. Some of the cost depends on the number of client-visits—the power consumed by hair dryers depends on the number of customers served. Some of the cost depends on the number of hours the salon is open—the costs of lighting the salon and heating it to a comfortable temperature. Consequently, the cost formula for electricity would be more accurate if it were stated in terms of both the number of client-visits and the hours of operation rather than just on the number of client-visits.

| Rick's Hairstyling Flexible Budget For the Month Ended March 31 | |
|--|------------------|
| Actual client-visits (q_1) | 1,100 |
| Actual hours of operation (q_2) | 185 |
| Revenue ($\$180.00q_1$) | <u>\$198,000</u> |
| Expenses: | |
| Wages and salaries ($\$65,000 + \$220q_2$) | 105,700 |
| Hairstyling supplies ($\$1.50q_1$) | 1,650 |
| Client gratuities ($\$4.10q_1$) | 4,510 |
| Electricity ($\$390 + \$0.10q_1 + \$6.00q_2$) | 1,610 |
| Rent ($\$28,500$) | 28,500 |
| Liability insurance ($\$2,800$) | 2,800 |
| Employee health insurance ($\$21,300$) | 21,300 |
| Miscellaneous ($\$1,200 + \$0.20q_1$) | 1,420 |
| Total expense | <u>167,490</u> |
| Net operating income | <u>\$ 30,510</u> |

EXHIBIT 9-8
Flexible Budget Based on
More than One Cost Driver

Exhibit 9-8 shows a flexible budget in which these changes have been made. In that flexible budget, two cost drivers are listed—client-visits and hours of operation—where q_1 refers to client-visits and q_2 refers to hours of operation. For example, wages and salaries depend on the hours of operation and its cost formula is $\$65,000 + \$220q_2$. Because the salon actually operated 185 hours, the flexible budget amount for wages and salaries is \$105,700 ($= \$65,000 + \220×185). The electricity cost depends on both client-visits and the hours of operation and its cost formula is $\$390 + \$0.10q_1 + \$6.00q_2$. Because the actual number of client-visits was 1,100 and the salon actually operated for 185 hours, the flexible budget amount for electricity is \$1,610 ($= \$390 + \$0.10 \times 1,100 + \6.00×185).

This revised flexible budget based on both client-visits and hours of operation can be used exactly like we used the earlier flexible budget based on just client-visits to compute activity variances as in Exhibit 9-5, revenue and spending variances as in Exhibit 9-6, and a performance report as in Exhibit 9-7. The difference is that because the cost formulas based on more than one cost driver are more accurate than the cost formulas based on just one cost driver, the variances will also be more accurate.

HOSPITALS TURN TO FLEXIBLE BUDGETS

Mary Wilkes, a senior managing director with Phase 2 Consulting, says that hospitals may have to pay as much as \$300,000 to install a flexible budgeting system, but the investment should readily pay for itself by enabling “more efficient use of hospital resources, particularly when it comes to labor.” One of the keys to creating an effective flexible budgeting system is to recognize the existence of multiple cost drivers. Many hospitals frequently use patient volume as a cost driver when preparing flexible budgets; however, other variables can influence revenues and costs. For example, the percentage of patients covered by private insurance, Medicaid, or Medicare, as well as the proportion of uninsured patients all influence revenues and costs. A flexible budgeting system that incorporates patient volume and these other variables will be more accurate than one based solely on patient volume.

IN BUSINESS

Some Common Errors

LEARNING OBJECTIVE 6

Understand common errors made in preparing performance reports based on budgets and actual results.

We started this chapter by discussing the need for managers to understand the difference between what was expected to happen—formalized by the planning budget—and what actually happened. To meet this need, we developed a flexible budget that allowed us to isolate activity variances and revenue and spending variances. Unfortunately, this approach is not always followed in practice—resulting in misleading and difficult-to-interpret reports. The most common errors in preparing performance reports are to implicitly assume that all costs are fixed or to implicitly assume that all costs are variable. These erroneous assumptions lead to inaccurate benchmarks and incorrect variances.

We have already discussed one of these errors—assuming that all costs are fixed. This is the error that is made when static planning budget costs are compared to actual costs without any adjustment for the actual level of activity. Such a comparison appeared in Exhibit 9–3. For convenience, the comparison of budgeted to actual revenues and costs is repeated in Exhibit 9–9. Looking at that exhibit, note that the budgeted cost of hairstyling supplies of \$1,500 is directly compared to the actual cost of \$1,620, resulting in an unfavorable variance of \$120. But this comparison only makes sense if the cost of hairstyling supplies is fixed. If the cost of hairstyling supplies isn't fixed (and indeed it is not), one would *expect* the cost to go up because of the increase in activity over the budget. Comparing static planning budget costs to actual costs only makes sense if the cost is fixed. If the cost isn't fixed, it needs to be adjusted for any change in activity that occurs during the period.

The other common error when comparing budgets to actual results is to assume that all costs are variable. A report that makes this error appears in Exhibit 9–10. The variances in this report are computed by comparing actual results to the amounts in the second numerical column where *all* of the budget items have been inflated by 10%—the percentage by which activity increased. This is a perfectly valid adjustment to make if an item is strictly variable—like sales and hairstyling supplies. It is *not* a valid adjustment if the item contains any fixed element. Take, for example, rent. If the salon serves 10% more customers in a given month, would you expect the rent to increase by 10%? The answer is no. Ordinarily, the rent is fixed in advance and does not depend on the volume of business. Therefore, the amount shown in the second numerical column of \$31,350 is incorrect, which leads to the erroneous favorable variance of \$2,850. In fact, the actual rent paid was exactly equal to the budgeted rent, so there should be no variance at all on a valid report.

EXHIBIT 9–9

EXHIBIT 9-10
Faulty Analysis That Assumes
All Budget Items Are Variable

KNOW YOUR COSTS

Understanding the difference between fixed and variable costs can be critical. Kennard T. Wing, of [OMG Center for Collaborative Learning](#), reports that a large health care system made the mistake of classifying all of its costs as variable. As a consequence, when volume dropped, managers felt that costs should be cut proportionately and more than 1,000 people were laid off—even though “the workload of most of them had no direct relation to patient volume. The result was that morale of the survivors plummeted and within a year the system was scrambling to replace not only those it had let go, but many others who had quit. The point is, the accounting systems we design and implement really do affect management decisions in significant ways. A system built on a bad model of the business will either not be used or, if used, will lead to bad decisions.”

Source: Kennard T. Wing, “Using Enhanced Cost Models in Variance Analysis for Better Control and Decision Making,” *Management Accounting Quarterly*, Winter 2000, pp. 27–35.

IN BUSINESS

Summary

Directly comparing static planning budget revenues and costs to actual revenues and costs can easily lead to erroneous conclusions. Actual revenues and costs differ from budgeted revenues and costs for a variety of reasons, but one of the biggest is a change in the level of activity. One would expect actual revenues and costs to increase or decrease as the activity level increases or decreases. Flexible budgets enable managers to isolate the various causes of the differences between budgeted and actual costs.

A flexible budget is a budget that is adjusted to the actual level of activity. It is the best estimate of what revenues and costs should have been, given the actual level of activity during the period. The flexible budget can be compared to the budget from the beginning of the period or to the actual results.

When the flexible budget is compared to the budget from the beginning of the period, activity variances are the result. An activity variance shows how a revenue or cost should have changed in response to the difference between budgeted and actual activity.

When the flexible budget is compared to actual results, revenue and spending variances are the result. A favorable revenue variance indicates that revenue was larger than should have been expected, given the actual level of activity. An unfavorable revenue variance indicates that revenue was less than it should have

been, given the actual level of activity. A favorable spending variance indicates that the cost was less than expected, given the actual level of activity. An unfavorable spending variance indicates that the cost was greater than it should have been, given the actual level of activity.

A flexible budget performance report combines the activity variances and the revenue and spending variances on one report.

Common errors in comparing budgeted costs to actual costs are to assume all costs are fixed or to assume all costs are variable. If all costs are assumed to be fixed, the variances for variable and mixed costs will be incorrect. If all costs are assumed to be variable, the variances for fixed and mixed costs will be incorrect. The variance for a cost will only be correct if the actual behavior of the cost is used to develop the flexible budget benchmark.

Review Problem: Variance Analysis Using a Flexible Budget

Harrald's Fish House is a family-owned restaurant that specializes in Scandinavian-style seafood. Data concerning the restaurant's monthly revenues and costs appear below (q refers to the number of meals served):

| | Formula |
|---------------------------|-------------------|
| Revenue | $\$16.50q$ |
| Cost of ingredients | $\$6.25q$ |
| Wages and salaries | $\$10,400$ |
| Utilities | $\$800 + \$0.20q$ |
| Rent | $\$2,200$ |
| Miscellaneous | $\$600 + \$0.80q$ |

Required:

1. Prepare the restaurant's planning budget for April assuming that 1,800 meals are served.
2. Assume that 1,700 meals were actually served in April. Prepare a flexible budget for this level of activity.
3. The actual results for April appear below. Prepare a flexible budget performance report for the restaurant for April.

| | |
|--------------------------|----------|
| Revenue | \$27,920 |
| Cost of ingredients..... | \$11,110 |
| Wages and salaries..... | \$10,130 |
| Utilities | \$1,080 |
| Rent..... | \$2,200 |
| Miscellaneous..... | \$2,240 |

Solution to Review Problem

1. The planning budget for April appears below:

| Harrald's Fish House Planning Budget For the Month Ended April 30 | |
|---|-----------------|
| Budgeted meals served (q) | 1,800 |
| Revenue ($\$16.50q$) | <u>\$29,700</u> |
| Expenses: | |
| Cost of ingredients ($\$6.25q$) | 11,250 |
| Wages and salaries ($\$10,400$) | 10,400 |
| Utilities ($\$800 + \$0.20q$) | 1,160 |
| Rent ($\$2,200$) | 2,200 |
| Miscellaneous ($\$600 + \$0.80q$) | <u>2,040</u> |
| Total expense | <u>27,050</u> |
| Net operating income | <u>\$ 2,650</u> |

2. The flexible budget for April appears below:

| Harrald's Fish House Flexible Budget For the Month Ended April 30 | |
|--|-----------------|
| Actual meals served (<i>q</i>) | 1,700 |
| Revenue (\$16.50 <i>q</i>) | <u>\$28,050</u> |
| Expenses: | |
| Cost of ingredients (\$6.25 <i>q</i>) | 10,625 |
| Wages and salaries (\$10,400) | 10,400 |
| Utilities (\$800 + \$0.20 <i>q</i>) | 1,140 |
| Rent (\$2,200) | 2,200 |
| Miscellaneous (\$600 + \$0.80 <i>q</i>) | <u>1,960</u> |
| Total expense | <u>26,325</u> |
| Net operating income | <u>\$ 1,725</u> |

3. The flexible budget performance report for April appears below:

| Harrald's Fish House Flexible Budget Performance Report For the Month Ended April 30 | | | | | |
|---|---------------------------|------------------------------------|---------------------------|--|--------------------------|
| | (1) Planning Budget | Activity Variances (2) – (1) | (2) Flexible Budget | Revenue and Spending Variances (3) – (2) | (3) Actual Results |
| Meals served | 1,800 | | 1,700 | | 1,700 |
| Revenue (\$16.50 <i>q</i>) | <u>\$29,700</u> | \$1,650 U | <u>\$28,050</u> | \$ 130 U | <u>\$27,920</u> |
| Expenses: | | | | | |
| Cost of ingredients (\$6.25 <i>q</i>) | 11,250 | 625 F | 10,625 | 485 U | 11,110 |
| Wages and salaries (\$10,400) | 10,400 | 0 | 10,400 | 270 F | 10,130 |
| Utilities (\$800 + \$0.20 <i>q</i>) | 1,160 | 20 F | 1,140 | 60 F | 1,080 |
| Rent (\$2,200) | 2,200 | 0 | 2,200 | 0 | 2,200 |
| Miscellaneous (\$600 + \$0.80 <i>q</i>) ... | <u>2,040</u> | 80 F | <u>1,960</u> | 280 U | <u>2,240</u> |
| Total expense | <u>27,050</u> | 725 F | <u>26,325</u> | 435 U | <u>26,760</u> |
| Net operating income | <u>\$ 2,650</u> | \$ 925 U | <u>\$ 1,725</u> | \$ 565 U | <u>\$ 1,160</u> |

Glossary

Activity variance The difference between a revenue or cost item in the static planning budget and the same item in the flexible budget. An activity variance is due solely to the difference between the level of activity assumed in the planning budget and the actual level of activity used in the flexible budget. (p. 339)

Flexible budget A report showing estimates of what revenues and costs should have been, given the actual level of activity for the period. (p. 335)

Planning budget A budget created at the beginning of the budgeting period that is valid only for the planned level of activity. (p. 335)

Revenue variance The difference between how much the revenue should have been, given the actual level of activity, and the actual revenue for the period. A favorable (unfavorable) revenue variance occurs because the revenue is higher (lower) than expected, given the actual level of activity for the period. (p. 340)

Spending variance The difference between how much a cost should have been, given the actual level of activity, and the actual amount of the cost. A favorable (unfavorable) spending variance occurs because the cost is lower (higher) than expected, given the actual level of activity for the period. (p. 340)

Questions

- 9-1 What is a static planning budget?
- 9-2 What is a flexible budget and how does it differ from a static planning budget?
- 9-3 What are some of the possible reasons that actual results may differ from what had been budgeted at the beginning of a period?
- 9-4 Why is it difficult to interpret a difference between how much expense was budgeted and how much was actually spent?
- 9-5 What is an activity variance and what does it mean?
- 9-6 What is a revenue variance and what does it mean?
- 9-7 What is a spending variance and what does it mean?
- 9-8 What does a flexible budget performance report do that a simple comparison of budgeted to actual results does not do?
- 9-9 How does a flexible budget based on two cost drivers differ from a flexible budget based on a single cost driver?
- 9-10 What assumption is implicitly made about cost behavior when a budget is directly compared to actual results? Why is this assumption questionable?
- 9-11 What assumption is implicitly made about cost behavior when all of the items in a budget are adjusted in proportion to a change in activity? Why is this assumption questionable?

Multiple-choice questions are provided on the text website at www.mhhe.com/noreen2e.

Exercises

EXERCISE 9-1 Prepare a Flexible Budget [L01]

Puget Sound Divers is a company that provides diving services such as underwater ship repairs to clients in the Puget Sound area. The company’s planning budget for May appears below:

| Puget Sound Divers Planning Budget For the Month Ended May 31 | |
|---|-----------------|
| Budgeted diving-hours (<i>q</i>) | 100 |
| Revenue (\$365.00 <i>q</i>) | <u>\$36,500</u> |
| Expenses: | |
| Wages and salaries (\$8,000 + \$125.00 <i>q</i>) | 20,500 |
| Supplies (\$3.00 <i>q</i>) | 300 |
| Equipment rental (\$1,800 + \$32.00 <i>q</i>) | 5,000 |
| Insurance (\$3,400) | 3,400 |
| Miscellaneous (\$630 + \$1.80 <i>q</i>) | 810 |
| Total expense | <u>30,010</u> |
| Net operating income | <u>\$ 6,490</u> |

Required:

During May, the company’s activity was actually 105 diving-hours. Prepare a flexible budget for that level of activity.

EXERCISE 9-2 Prepare a Report Showing Activity Variances [L02]

Flight Café is a company that prepares in-flight meals for airlines in its kitchen located next to the local airport. The company’s planning budget for July appears below:

| Flight Café Planning Budget For the Month Ended July 31 | |
|---|-----------------|
| Budgeted meals (<i>q</i>) | 18,000 |
| Revenue (\$4.50 <i>q</i>) | <u>\$81,000</u> |
| Expenses: | |
| Raw materials (\$2.40 <i>q</i>) | 43,200 |
| Wages and salaries (\$5,200 + \$0.30 <i>q</i>) | 10,600 |
| Utilities (\$2,400 + \$0.05 <i>q</i>) | 3,300 |
| Facility rent (\$4,300) | 4,300 |
| Insurance (\$2,300) | 2,300 |
| Miscellaneous (\$680 + \$0.10 <i>q</i>) | <u>2,480</u> |
| Total expense | 66,180 |
| Net operating income | <u>\$14,820</u> |

In July, 17,800 meals were actually served. The company’s flexible budget for this level of activity appears below:

| Flight Café Flexible Budget For the Month Ended July 31 | |
|---|-----------------|
| Budgeted meals (<i>q</i>) | 17,800 |
| Revenue (\$4.50 <i>q</i>) | <u>\$80,100</u> |
| Expenses: | |
| Raw materials (\$2.40 <i>q</i>) | 42,720 |
| Wages and salaries (\$5,200 + \$0.30 <i>q</i>) | 10,540 |
| Utilities (\$2,400 + \$0.05 <i>q</i>) | 3,290 |
| Facility rent (\$4,300) | 4,300 |
| Insurance (\$2,300) | 2,300 |
| Miscellaneous (\$680 + \$0.10 <i>q</i>) | <u>2,460</u> |
| Total expense | 65,610 |
| Net operating income | <u>\$14,490</u> |

Required:

1. Prepare a report showing the company’s activity variances for July.
2. Which of the activity variances should be of concern to management? Explain.

EXERCISE 9–3 Prepare a Report Showing Revenue and Spending Variances [LO3]

Quilcene Oysteria farms and sells oysters in the Pacific Northwest. The company harvested and sold 8,000 pounds of oysters in August. The company’s flexible budget for August appears below:

| Quilcene Oysteria Flexible Budget For the Month Ended August 31 | |
|---|-----------------|
| Actual pounds (<i>q</i>) | 8,000 |
| Revenue (\$4.00 <i>q</i>) | <u>\$32,000</u> |
| Expenses: | |
| Packing supplies (\$0.50 <i>q</i>) | 4,000 |
| Oyster bed maintenance (\$3,200) | 3,200 |
| Wages and salaries (\$2,900 + \$0.30 <i>q</i>) | 5,300 |
| Shipping (\$0.80 <i>q</i>) | 6,400 |
| Utilities (\$830) | 830 |
| Other (\$450 + \$0.05 <i>q</i>) | <u>850</u> |
| Total expense | 20,580 |
| Net operating income | <u>\$11,420</u> |

The actual results for August appear below:

| Quilcene Oysteria Income Statement For the Month Ended August 31 | |
|---|-----------------|
| Actual pounds | 8,000 |
| Revenue | <u>\$35,200</u> |
| Expenses: | |
| Packing supplies | 4,200 |
| Oyster bed maintenance | 3,100 |
| Wages and salaries | 5,640 |
| Shipping | 6,950 |
| Utilities | 810 |
| Other | <u>980</u> |
| Total expense | <u>21,680</u> |
| Net operating income | <u>\$13,520</u> |

Required:

Prepare a report showing the company's revenue and spending variances for August.

EXERCISE 9-4 Prepare a Flexible Budget Performance Report [LO4]

Vulcan Flyovers offers scenic overflights of Mount St. Helens, the volcano in Washington State that explosively erupted in 1982. Data concerning the company's operations in July appear below:

| Vulcan Flyovers Operating Data For the Month Ended July 31 | | | |
|---|----------------------------|----------------------------|---------------------------|
| | Planning Budget | Flexible Budget | Actual Results |
| Flights (<i>q</i>) | 50 | 48 | 48 |
| Revenue (\$320.00 <i>q</i>) | <u>\$16,000</u> | <u>\$15,360</u> | <u>\$13,650</u> |
| Expenses: | | | |
| Wages and salaries (\$4,000 + \$82.00 <i>q</i>) | 8,100 | 7,936 | 8,430 |
| Fuel (\$23.00 <i>q</i>) | 1,150 | 1,104 | 1,260 |
| Airport fees (\$650 + \$38.00 <i>q</i>) | 2,550 | 2,474 | 2,350 |
| Aircraft depreciation (\$7.00 <i>q</i>) | 350 | 336 | 336 |
| Office expenses (\$190 + \$2.00 <i>q</i>) | <u>290</u> | <u>286</u> | <u>460</u> |
| Total expense | <u>12,440</u> | <u>12,136</u> | <u>12,836</u> |
| Net operating income | <u>\$ 3,560</u> | <u>\$ 3,224</u> | <u>\$ 814</u> |

The company measures its activity in terms of flights. Customers can buy individual tickets for overflights or hire an entire plane for an overflight at a discount.

Required:

1. Prepare a flexible budget performance report for July.
2. Which of the variances should be of concern to management? Explain.

EXERCISE 9-5 Prepare a Flexible Budget with More Than One Cost Driver [LO5]

Alyeski Tours operates day tours of coastal glaciers in Alaska on its tour boat the Blue Glacier. Management has identified two cost drivers—the number of cruises and the number of passengers—that it uses in its budgeting and performance reports. The company publishes a schedule of day cruises that it may

supplement with special sailings if there is sufficient demand. Up to 80 passengers can be accommodated on the tour boat. Data concerning the company’s cost formulas appear below:

| | Fixed Cost per Month | Cost per Cruise | Cost per Passenger |
|------------------------------|-------------------------|--------------------|-----------------------|
| Vessel operating costs | \$5,200 | \$480.00 | \$2.00 |
| Advertising | \$1,700 | | |
| Administrative costs | \$4,300 | \$24.00 | \$1.00 |
| Insurance | \$2,900 | | |

For example, vessel operating costs should be \$5,200 per month plus \$480 per cruise plus \$2 per passenger. The company’s sales should average \$25 per passenger. The company’s planning budget for July is based on 24 cruises and 1,400 passengers.

Required:

Prepare the company’s planning budget for July.

EXERCISE 9–6 Critique a Variance Report [L06]

The Terminator Inc. provides on-site residential pest extermination services. The company has several mobile teams who are dispatched from a central location in company-owned trucks. The company uses the number of jobs to measure activity. At the beginning of April, the company budgeted for 100 jobs, but the actual number of jobs turned out to be 105. A report comparing the budgeted revenues and costs to the actual revenues and costs appears below:

| The Terminator Inc. Variance Report For the Month Ended April 30 | | | |
|--|--------------------|-------------------|------------------|
| | Planning Budget | Actual Results | Variances |
| Jobs | 100 | 105 | |
| Revenue | <u>\$19,500</u> | <u>\$20,520</u> | <u>\$1,020</u> F |
| Expenses: | | | |
| Mobile team operating costs ... | 10,000 | 10,320 | 320 U |
| Exterminating supplies | 1,800 | 960 | 840 F |
| Advertising | 800 | 800 | 0 |
| Dispatching costs | 2,200 | 2,340 | 140 U |
| Office rent | 1,800 | 1,800 | 0 |
| Insurance | 2,100 | 2,100 | 0 |
| Total expense | <u>18,700</u> | <u>18,320</u> | <u>380</u> F |
| Net operating income | <u>\$ 800</u> | <u>\$ 2,200</u> | <u>\$1,400</u> F |

Required:

Is the above variance report useful for evaluating how well revenues and costs were controlled during April? Why, or why not?

EXERCISE 9–7 Critique a Variance Report [L06]

Refer to the data for The Terminator Inc. in Exercise 9–6. A management intern has suggested that the budgeted revenues and costs should be adjusted for the actual level of activity in April before they are compared to the actual revenues and costs. Because the actual level of activity was 5% higher than budgeted, the intern suggested that all budgeted revenues and costs should be adjusted upward by 5%. A report comparing the budgeted revenues and costs, with this adjustment, to the actual revenues and costs appears on the following page.

| The Terminator Inc. Variance Report For the Month Ended April 30 | | | |
|--|--------------------------------|-------------------|-----------|
| | Adjusted Planning Budget | Actual Results | Variances |
| Jobs | 105 | 105 | |
| Revenue | \$20,475 | \$20,520 | \$ 45 F |
| Expenses: | | | |
| Mobile team operating costs | 10,500 | 10,320 | 180 F |
| Exterminating supplies..... | 1,890 | 960 | 930 F |
| Advertising | 840 | 800 | 40 F |
| Dispatching costs..... | 2,310 | 2,340 | 30 U |
| Office rent | 1,890 | 1,800 | 90 F |
| Insurance | 2,205 | 2,100 | 105 F |
| Total expense | 19,635 | 18,320 | 1,315 F |
| Net operating income | \$ 840 | \$ 2,200 | \$1,360 F |

Required:

Is the above variance report useful for evaluating how well revenues and costs were controlled during April? Why, or why not?

EXERCISE 9–8 Flexible Budget [L01]

Lavage Rapide is a Canadian company that owns and operates a large automatic carwash facility near Montreal. The following table provides data concerning the company’s costs:

| | Fixed Cost per Month | Cost per Car Washed |
|-------------------------------|-------------------------|------------------------|
| Cleaning supplies | | \$0.80 |
| Electricity | \$1,200 | \$0.15 |
| Maintenance | | \$0.20 |
| Wages and salaries | \$5,000 | \$0.30 |
| Depreciation | \$6,000 | |
| Rent | \$8,000 | |
| Administrative expenses | \$4,000 | \$0.10 |

For example, electricity costs are \$1,200 per month plus \$0.15 per car washed. The company expects to wash 9,000 cars in August and to collect an average of \$4.90 per car washed.

Required:

Prepare the company’s planning budget for August.

EXERCISE 9–9 Flexible Budget [L01]

Refer to the data for Lavage Rapide in Exercise 9–8. The company actually washed 8,800 cars in August.

Required:

Prepare the company’s flexible budget for August.

EXERCISE 9–10 Prepare a Report Showing Activity Variances [L02]

Refer to the data for Lavage Rapide in Exercise 9–8. The actual operating results for August appear on the following page.

| Lavage Rapide Income Statement For the Month Ended August 31 | |
|---|------------------------|
| Actual cars washed | 8,800 |
| Revenue | <u>\$43,080</u> |
| Expenses: | |
| Cleaning supplies | 7,560 |
| Electricity | 2,670 |
| Maintenance | 2,260 |
| Wages and salaries | 8,500 |
| Depreciation | 6,000 |
| Rent | 8,000 |
| Administrative expenses | <u>4,950</u> |
| Total expense | <u>39,940</u> |
| Net operating income | <u><u>\$ 3,140</u></u> |

Required:

Prepare a report showing the company’s activity variances for August.

EXERCISE 9–11 Prepare a Report Showing Revenue and Spending Variances [L03]

Refer to the data for Lavage Rapide in Exercises 9–8 and 9–10.

Required:

Prepare a report showing the company’s revenue and spending variances for August.

EXERCISE 9–12 Prepare a Flexible Budget Performance Report [L04]

Refer to the data for Lavage Rapide in Exercises 9–8 and 9–10.

Required:

Prepare a flexible budget performance report that shows the company’s activity variances and revenue and spending variances for August.

EXERCISE 9–13 Flexible Budget [L01]

Wyckam Manufacturing Inc. has provided the following information concerning its manufacturing costs:

| | Fixed Cost per Month | Cost per Machine-Hour |
|------------------------|---------------------------------|----------------------------------|
| Direct materials | | \$4.25 |
| Direct labor | \$36,800 | |
| Supplies | | \$0.30 |
| Utilities | \$1,400 | \$0.05 |
| Depreciation | \$16,700 | |
| Insurance | \$12,700 | |

For example, utilities should be \$1,400 per month plus \$0.05 per machine-hour. The company expects to work 5,000 machine-hours in June. Note that the company’s direct labor is a fixed cost.

Required:

Prepare the company’s planning budget for manufacturing costs for June.

EXERCISE 9-14 Flexible Budgets and Activity Variances [L01, L02]

Jake’s Roof Repair has provided the following data concerning its costs:

| | Fixed Cost per Month | Cost per Repair-Hour |
|--------------------------------|-------------------------|-------------------------|
| Wages and salaries | \$23,200 | \$16.30 |
| Parts and supplies | | \$8.60 |
| Equipment depreciation | \$1,600 | \$0.40 |
| Truck operating expenses | \$6,400 | \$1.70 |
| Rent | \$3,480 | |
| Administrative expenses | \$4,500 | \$0.80 |

For example, wages and salaries should be \$23,200 plus \$16.30 per repair-hour. The company expected to work 2,800 repair-hours in May, but actually worked 2,900 repair-hours. The company expects its sales to be \$44.50 per repair-hour.

Required:

Prepare a report showing the company’s activity variances for May.

EXERCISE 9-15 Flexible Budgets and Revenue and Spending Variances [L01, L03]

Via Gelato is a popular neighborhood gelato shop. The company has provided the following data concerning its operations:

| | Fixed Element per Month | Variable Element per Liter | Actual Total for June |
|---------------------|-------------------------------|----------------------------------|-----------------------------|
| Revenue | | \$12.00 | \$71,540 |
| Raw materials | | \$4.65 | \$29,230 |
| Wages | \$5,600 | \$1.40 | \$13,860 |
| Utilities | \$1,630 | \$0.20 | \$3,270 |
| Rent | \$2,600 | | \$2,600 |
| Insurance | \$1,350 | | \$1,350 |
| Miscellaneous | \$650 | \$0.35 | \$2,590 |

While gelato is sold by the cone or cup, the shop measures its activity in terms of the total number of liters of gelato sold. For example, wages should be \$5,600 plus \$1.40 per liter of gelato sold and the actual wages for June were \$13,860. Via Gelato expected to sell 6,000 liters in June, but actually sold 6,200 liters.

Required:

Prepare a report showing Via Gelato revenue and spending variances for June.

EXERCISE 9-16 Flexible Budget Performance Report [L01, L04]

AirQual Test Corporation provides on-site air quality testing services. The company has provided the following data concerning its operations:

| | Fixed Component per Month | Variable Component per Job | Actual Total for February |
|-------------------------------------|---------------------------------|----------------------------------|---------------------------------|
| Revenue | | \$360 | \$18,950 |
| Technician wages | \$6,400 | | \$6,450 |
| Mobile lab operating expenses | \$2,900 | \$35 | \$4,530 |
| Office expenses | \$2,600 | \$2 | \$3,050 |
| Advertising expenses | \$970 | | \$995 |
| Insurance | \$1,680 | | \$1,680 |
| Miscellaneous expenses | \$500 | \$3 | \$465 |

The company uses the number of jobs as its measure of activity. For example, mobile lab operating expenses should be \$2,900 plus \$35 per job, and the actual mobile lab operating expenses for February were \$4,530.

The company expected to work 50 jobs in February, but actually worked 52 jobs.

Required:

Prepare a flexible budget performance report showing AirQual Test Corporation’s activity variances and revenue and spending variances for February.

EXERCISE 9–17 Working with More Than One Cost Driver [L04, L05]

The Gourmand Cooking School runs short cooking courses at its small campus. Management has identified two cost drivers that it uses in its budgeting and performance reports—the number of courses and the total number of students. For example, the school might run two courses in a month and have a total of 50 students enrolled in those two courses. Data concerning the company’s cost formulas appear below:

| | Fixed Cost per Month | Cost per Course | Cost per Student |
|-------------------------------|-------------------------|--------------------|---------------------|
| Instructor wages | | \$3,080 | |
| Classroom supplies | | | \$260 |
| Utilities | \$870 | \$130 | |
| Campus rent | \$4,200 | | |
| Insurance | \$1,890 | | |
| Administrative expenses | \$3,270 | \$15 | \$4 |

For example, administrative expenses should be \$3,270 per month plus \$15 per course plus \$4 per student. The company’s sales should average \$800 per student.

The actual operating results for September appear below:

| | Actual |
|-------------------------------|----------|
| Revenue | \$32,400 |
| Instructor wages | \$9,080 |
| Classroom supplies | \$8,540 |
| Utilities | \$1,530 |
| Campus rent | \$4,200 |
| Insurance | \$1,890 |
| Administrative expenses | \$3,790 |

Required:

1. The Gourmand Cooking School expects to run three courses with a total of 45 students in September. Prepare the company’s planning budget for this level of activity.
2. The school actually ran three courses with a total of 42 students in September. Prepare the company’s flexible budget for this level of activity.
3. Prepare a flexible budget performance report that shows both activity variances and revenue and spending variances for September.

EXERCISE 9–18 Flexible Budget Performance Report in a Cost Center [L01, L04]

Packaging Solutions Corporation manufactures and sells a wide variety of packaging products. Performance reports are prepared monthly for each department. The planning budget and flexible budget for the Production Department are based on the following formulas, where *q* is the number of labor-hours worked in a month:

| | Cost Formulas |
|------------------------------|----------------------------|
| Direct labor | \$15.80 <i>q</i> |
| Indirect labor | \$8,200 + \$1.60 <i>q</i> |
| Utilities | \$6,400 + \$0.80 <i>q</i> |
| Supplies | \$1,100 + \$0.40 <i>q</i> |
| Equipment depreciation | \$23,000 + \$3.70 <i>q</i> |
| Factory rent | \$8,400 |
| Property taxes | \$2,100 |
| Factory administration | \$11,700 + \$1.90 <i>q</i> |

The actual costs incurred in March in the Production Department are listed below:

| Actual Cost Incurred in March | |
|-------------------------------|-----------|
| Direct labor | \$134,730 |
| Indirect labor | \$19,860 |
| Utilities | \$14,570 |
| Supplies | \$4,980 |
| Equipment depreciation | \$54,080 |
| Factory rent | \$8,700 |
| Property taxes | \$2,100 |
| Factory administration | \$26,470 |

Required:

1. The company had budgeted for an activity level of 8,000 labor-hours in March. Prepare the Production Department's planning budget for the month.
2. The company actually worked 8,400 labor-hours in March. Prepare the Production Department's flexible budget for the month.
3. Prepare the Production Department's flexible budget performance report for March, including both the activity and spending variances.
4. What aspects of the flexible budget performance report should be brought to management's attention? Explain.

Problems

PROBLEM 9-19 Critique a Report; Prepare a Performance Report [LO1, LO4, LO6]

TipTop Flight School offers flying lessons at a small municipal airport. The school's owner and manager has been attempting to evaluate performance and control costs using a variance report that compares the planning budget to actual results. A recent variance report appears below:

| TipTop Flight School Variance Report For the Month Ended July 31 | | | |
|--|--------------------|-------------------|----------------|
| | Planning Budget | Actual Results | Variances |
| Lessons | 150 | 155 | |
| Revenue | <u>\$33,000</u> | <u>\$33,900</u> | <u>\$900</u> F |
| Expenses: | | | |
| Instructor wages | 9,750 | 9,870 | 120 U |
| Aircraft depreciation | 5,700 | 5,890 | 190 U |
| Fuel | 2,250 | 2,750 | 500 U |
| Maintenance | 2,330 | 2,450 | 120 U |
| Ground facility expenses | 1,550 | 1,540 | 10 F |
| Administration | <u>3,390</u> | <u>3,320</u> | <u>70</u> F |
| Total expense | <u>24,970</u> | <u>25,820</u> | <u>850</u> U |
| Net operating income | <u>\$ 8,030</u> | <u>\$ 8,080</u> | <u>\$ 50</u> F |

After several months of using such variance reports, the owner has become frustrated. For example, she is quite confident that instructor wages were very tightly controlled in July, but the report shows an unfavorable variance.

The planning budget was developed using the following formulas, where q is the number of lessons sold:

| Cost Formulas | |
|--------------------------------|------------------|
| Revenue | $\$220q$ |
| Instructor wages | $\$65q$ |
| Aircraft depreciation | $\$38q$ |
| Fuel | $\$15q$ |
| Maintenance | $\$530 + \$12q$ |
| Ground facility expenses | $\$1,250 + \$2q$ |
| Administration | $\$3,240 + \$1q$ |

Required:

1. Should the owner feel frustrated with the variance reports? Explain.
2. Prepare a flexible budget performance report for the school for July.
3. Evaluate the school's performance for July.

PROBLEM 9-20 Performance Report for a Non-Profit Organization [LO1, LO4, LO6]

The St. Lucia Blood Bank, a private charity partly supported by government grants, is located on the Caribbean island of St. Lucia. The blood bank has just finished its operations for September, which was a particularly busy month due to a powerful hurricane that hit neighboring islands causing many injuries. The hurricane largely bypassed St. Lucia, but residents of St. Lucia willingly donated their blood to help people on other islands. As a consequence, the blood bank collected and processed over 20% more blood than had been originally planned for the month.

A report prepared by a government official comparing actual costs to budgeted costs for the blood bank appears below. (The currency on St. Lucia is the East Caribbean dollar.) Continued support from the government depends on the blood bank's ability to demonstrate control over its costs.

| St. Lucia Blood Bank Cost Control Report For the Month Ended September 30 | | | |
|--|------------------------|-----------------------|------------------|
| | Planning Budget | Actual Results | Variances |
| Liters of blood collected | 500 | 620 | |
| Medical supplies | \$ 7,500 | \$ 9,250 | \$1,750 U |
| Lab tests | 6,000 | 6,180 | 180 U |
| Equipment depreciation | 2,500 | 2,800 | 300 U |
| Rent | 1,000 | 1,000 | 0 |
| Utilities | 500 | 570 | 70 U |
| Administration | <u>11,250</u> | <u>11,740</u> | <u>490 U</u> |
| Total expense | <u>\$28,750</u> | <u>\$31,540</u> | <u>\$2,790 U</u> |

The managing director of the blood bank was very unhappy with this report, claiming that his costs were higher than expected due to the emergency on the neighboring islands. He also pointed out that the additional costs had been fully covered by payments from grateful recipients on the other islands. The government official who prepared the report countered that all of the figures had been submitted by the blood bank to the government; he was just pointing out that actual costs were a lot higher than promised in the budget.

The following cost formulas were used to construct the planning budget:

| Cost Formulas | |
|------------------------------|----------------------|
| Medical supplies | $\$15.00q$ |
| Lab tests | $\$12.00q$ |
| Equipment depreciation | $\$2,500$ |
| Rent | $\$1,000$ |
| Utilities | $\$500$ |
| Administration | $\$10,000 + \$2.50q$ |

Required:

1. Prepare a new performance report for September using the flexible budget approach.
2. Do you think any of the variances in the report you prepared should be investigated? Why?

PROBLEM 9-21 Critiquing a Variance Report; Preparing a Performance Report [LO1, LO4, LO6]

Several years ago, Westmont Corporation developed a comprehensive budgeting system for profit planning and control purposes. While departmental supervisors have been happy with the system, the factory manager has expressed considerable dissatisfaction with the information being generated by the system.

A typical departmental cost report for a recent period follows:

| | Planning Budget | Actual Results | Variances |
|------------------------|------------------|-------------------|-------------------|
| Machine-hours | 40,000 | 35,000 | |
| Variable costs: | | | |
| Supplies | \$ 32,000 | \$ 29,700 | \$ 2,300 F |
| Scrap | 20,000 | 19,500 | 500 F |
| Indirect materials | 56,000 | 51,800 | 4,200 F |
| Fixed costs: | | | |
| Wages and salaries | 80,000 | 79,200 | 800 F |
| Equipment depreciation | 60,000 | 60,000 | - |
| Total cost | \$248,000 | \$ 240,200 | \$ 7,800 F |

After receiving a copy of this cost report, the supervisor of the Assembly Department stated, “These reports are super. It makes me feel really good to see how well things are going in my department. I can’t understand why those people upstairs complain so much about the reports.”

For the last several years, the company’s marketing department has chronically failed to meet the sales goals expressed in the company’s monthly budgets.

Required:

1. The company’s president is uneasy about the cost reports and would like you to evaluate their usefulness to the company.
2. What changes, if any, should be made in the reports to give better insight into how well departmental supervisors are controlling costs?
3. Prepare a new performance report for the quarter, incorporating any changes you suggested in question (2) above.
4. How well were costs controlled in the Assembly Department in March?

PROBLEM 9-22 More than One Cost Driver [LO4, LO5]

Milano Pizza is a small neighborhood pizzeria that has a small area for in-store dining as well as offering take-out and free home delivery services. The pizzeria’s owner has determined that the shop has two major cost drivers—the number of pizzas sold and the number of deliveries made. Data concerning the pizzeria’s costs appear below:

| | Fixed Cost per Month | Cost per Pizza | Cost per Delivery |
|------------------------------|-------------------------|-------------------|----------------------|
| Pizza ingredients | | \$3.80 | |
| Kitchen staff | \$5,220 | | |
| Utilities | \$630 | \$0.05 | |
| Delivery person | | | \$3.50 |
| Delivery vehicle | \$540 | | \$1.50 |
| Equipment depreciation | \$275 | | |
| Rent | \$1,830 | | |
| Miscellaneous | \$820 | \$0.15 | |

In November, the pizzeria budgeted for 1,200 pizzas at an average selling price of \$13.50 per pizza and for 180 deliveries.

Data concerning the pizzeria’s operations in November appear below:

| | Actual Results |
|------------------------------|----------------|
| Pizzas | 1,240 |
| Deliveries | 174 |
| Revenue | \$17,420 |
| Pizza ingredients | \$4,985 |
| Kitchen staff | \$5,281 |
| Utilities | \$984 |
| Delivery person | \$609 |
| Delivery vehicle | \$655 |
| Equipment depreciation | \$275 |
| Rent | \$1,830 |
| Miscellaneous | \$954 |

Required:

1. Prepare a flexible budget performance report that shows both activity variances and revenue and spending variances for the pizzeria for November.
2. Explain the activity variances.

PROBLEM 9–23 Activity and Spending Variances [LO1, LO2, LO3]

You have just been hired by FAB Corporation, the manufacturer of a revolutionary new garage door opening device. The president has asked that you review the company’s costing system and “do what you can to help us get better control of our manufacturing overhead costs.” You find that the company has never used a flexible budget, and you suggest that preparing such a budget would be an excellent first step in overhead planning and control.

After much effort and analysis, you determined the following cost formulas and gathered the following actual cost data for March:

| | Cost Formula | Actual Cost in March |
|----------------------|--|-------------------------|
| Utilities | \$20,600 plus \$0.10 per machine-hour | \$24,200 |
| Maintenance | \$40,000 plus \$1.60 per machine-hour | \$78,100 |
| Supplies | \$0.30 per machine-hour | \$8,400 |
| Indirect labor | \$130,000 plus \$0.70 per machine-hour | \$149,600 |
| Depreciation | \$70,000 | \$71,500 |

During March, the company worked 26,000 machine-hours and produced 15,000 units. The company had originally planned to work 30,000 machine-hours during March.

Required:

1. Prepare a report showing the activity variances for March. Explain what these variances mean.
2. Prepare a report showing the spending variances for March. Explain what these variances mean.

PROBLEM 9–24 Critiquing a Cost Report; Preparing a Performance Report [LO1, LO4, LO6]

Frank Weston, supervisor of the Freemont Corporation’s Machining Department, was visibly upset after being reprimanded for his department’s poor performance over the prior month. The department’s cost control report is given below:

| Freemont Corporation–Machining Department Cost Control Report For the Month Ended June 30 | | | |
|---|------------------|------------------|-------------------|
| | Planning Budget | Actual Results | Variances |
| Machine-hours | 35,000 | 38,000 | |
| Direct labor wages | \$ 80,500 | \$ 86,100 | \$ 5,600 U |
| Supplies | 21,000 | 23,100 | 2,100 U |
| Maintenance | 134,000 | 137,300 | 3,300 U |
| Utilities | 15,200 | 15,700 | 500 U |
| Supervision | 38,000 | 38,000 | 0 |
| Depreciation | 80,000 | 80,000 | 0 |
| Total | <u>\$368,700</u> | <u>\$380,200</u> | <u>\$11,500 U</u> |

“I just can’t understand all the red ink,” Weston complained to the supervisor of another department. “When the boss called me in, I thought he was going to give me a pat on the back because I know for a fact that my department worked more efficiently last month than it has ever worked before. Instead, he tore me apart. I thought for a minute that it might be over the supplies that were stolen out of our warehouse last month. But they only amounted to a couple of hundred dollars, and just look at this report. Everything is unfavorable.”

Direct labor wages and supplies are variable costs; supervision and depreciation are fixed costs; and maintenance and utilities are mixed costs. The fixed component of the budgeted maintenance cost is \$92,000; the fixed component of the budgeted utilities cost is \$11,700.

Required:

1. Evaluate the company’s cost control report and explain why the variances were all unfavorable.
2. Prepare a performance report that will help Mr. Weston’s superiors assess how well costs were controlled in the Machining Department.

PROBLEM 9–25 Critiquing a Report; Preparing a Performance Budget [LO1, LO4, LO6]

Exchange Corp. is a company that acts as a facilitator in tax-favored real estate swaps. Such swaps, known as 1031 exchanges, permit participants to avoid some or all of the capital gains taxes that would otherwise be due. The bookkeeper for the company has been asked to prepare a report for the company to help its owner/manager analyze performance. The first such report appears below:

| Exchange Corp Analysis of Revenues and Costs For the Month Ended May 31 | | | |
|---|---|--------------------------------------|---------------|
| | Planning Budget Unit Revenues and Costs | Actual Unit Revenues and Costs | Variances |
| Exchanges completed | 40 | 50 | |
| Revenue | \$395 | \$385 | \$10 U |
| Expenses: | | | |
| Legal and search fees | 165 | 184 | 19 U |
| Office expenses | 135 | 112 | 23 F |
| Equipment depreciation | 10 | 8 | 2 F |
| Rent | 45 | 36 | 9 F |
| Insurance | 5 | 4 | 1 F |
| Total expense | <u>360</u> | <u>344</u> | <u>16 F</u> |
| Net operating income | <u>\$ 35</u> | <u>\$ 41</u> | <u>\$ 6 F</u> |

Note that the revenues and costs in the above report are *unit* revenues and costs. For example, the average office expense is \$135 per exchange completed on the planning budget; whereas, the average actual office expense is \$112 per exchange completed.

Legal and search fees is a variable cost; office expenses is a mixed cost; and equipment depreciation, rent, and insurance are fixed costs. In the planning budget, the fixed component of office expenses was \$5,200.

All of the company’s revenues come from fees collected when an exchange is completed.

Required:

1. Evaluate the report prepared by the bookkeeper.
2. Prepare a performance report that would help the owner/manager assess the performance of the company in May.
3. Using the report you created, evaluate the performance of the company in May.

Cases

CASE 9–26 Performance Report with More than One Cost Driver [LO4, LO5]

The Little Theatre is a nonprofit organization devoted to staging plays for children. The theater has a very small full-time professional administrative staff. Through a special arrangement with the actors’ union, actors and directors rehearse without pay and are paid only for actual performances.

The costs from the current year’s planning budget appear below. The Little Theatre had tentatively planned to put on six different productions with a total of 108 performances. For example, one of the productions was *Peter Rabbit*, which had a six-week run with three performances on each weekend.

| The Little Theatre Costs from the Planning Budget For the Year Ended December 31 | |
|--|------------------|
| Budgeted number of productions | 6 |
| Budgeted number of performances | 108 |
| Actors’ and directors’ wages | \$216,000 |
| Stagehands’ wages | 32,400 |
| Ticket booth personnel and ushers’ wages | 16,200 |
| Scenery, costumes, and props | 108,000 |
| Theater hall rent | 54,000 |
| Printed programs | 27,000 |
| Publicity | 12,000 |
| Administrative expenses | 43,200 |
| Total | <u>\$508,800</u> |

Some of the costs vary with the number of productions, some with the number of performances, and some are fixed and depend on neither the number of productions nor the number of performances. The costs of scenery, costumes, props, and publicity vary with the number of productions. It doesn’t make any difference how many times *Peter Rabbit* is performed, the cost of the scenery is the same. Likewise, the cost of publicizing a play with posters and radio commercials is the same whether there are 10, 20, or 30 performances of the play. On the other hand, the wages of the actors, directors, stagehands, ticket booth personnel, and ushers vary with the number of performances. The greater the number of performances, the higher the wage costs will be. Similarly, the costs of renting the hall and printing the programs will vary with the number of performances. Administrative expenses are more difficult to pin down, but the best estimate is that approximately 75% of the budgeted costs are fixed, 15% depend on the number of productions staged, and the remaining 10% depend on the number of performances.

After the beginning of the year, the board of directors of the theater authorized expanding the theater’s program to seven productions and a total of 168 performances. Not surprisingly, actual costs were considerably higher than the costs from the planning budget. (Grants from donors and ticket sales

were also correspondingly higher, but are not shown here.) Data concerning the actual costs appear on the following page:

| The Little Theatre Actual Costs For the Year Ended December 31 | |
|---|------------------|
| Actual number of productions | 7 |
| Actual number of performances | 168 |
| Actors' and directors' wages | \$341,800 |
| Stagehands' wages | 49,700 |
| Ticket booth personnel and ushers' wages | 25,900 |
| Scenery, costumes, and props | 130,600 |
| Theater hall rent | 78,000 |
| Printed programs | 38,300 |
| Publicity | 15,100 |
| Administrative expenses..... | 47,500 |
| Total | <u>\$726,900</u> |

Required:

1. Prepare a flexible budget for The Little Theatre based on the actual activity of the year.
2. Prepare a flexible budget performance report for the year that shows both activity variances and spending variances.
3. If you were on the board of directors of the theater, would you be pleased with how well costs were controlled during the year? Why, or why not?
4. The cost formulas provide figures for the average cost per production and average cost per performance. How accurate do you think these figures would be for predicting the cost of a new production or of an additional performance of a particular production?

CASE 9-27 Ethics and the Manager [LO3]

Tom Kemper is the controller of the Wichita manufacturing facility of Prudhom Enterprises, Inc. The annual cost control report is one of the many reports that must be filed with corporate headquarters and is due at corporate headquarters shortly after the beginning of the New Year. Kemper does not like putting work off to the last minute, so just before Christmas he prepared a preliminary draft of the cost control report. Some adjustments would later be required for transactions that occur between Christmas and New Year's Day. A copy of the preliminary draft report, which Kemper completed on December 21, follows:

| Wichita Manufacturing Facility Cost Control Report December 21 Preliminary Draft | | | |
|---|----------------------------|---------------------------|-------------------------------|
| | Flexible Budget | Actual Results | Spending Variances |
| Labor-hours | 18,000 | 18,000 | |
| Direct labor | \$ 324,000 | \$ 326,000 | \$ 2,000 U |
| Power | 18,000 | 19,750 | 1,750 U |
| Supplies | 99,000 | 105,000 | 6,000 U |
| Equipment depreciation | 332,000 | 343,000 | 11,000 U |
| Supervisory salaries | 275,000 | 273,000 | 2,000 F |
| Insurance | 37,000 | 37,000 | 0 |
| Industrial engineering | 210,000 | 189,000 | 21,000 F |
| Factory building lease | 60,000 | 60,000 | 0 |
| Total expense | <u>\$1,355,000</u> | <u>\$1,352,750</u> | <u>\$ 2,250 F</u> |

Melissa Ilianovitch, the general manager at the Wichita facility, asked to see a copy of the preliminary draft report. Kemper carried a copy of the report to her office where the following discussion took place:

Ilianovitch: Ouch! Almost all of the variances on the report are unfavorable. The only favorable variances are for supervisory salaries and industrial engineering. How did we have an unfavorable variance for depreciation?

Kemper: Do you remember that milling machine that broke down because the wrong lubricant was used by the machine operator?

Ilianovitch: Yes.

Kemper: We couldn't fix it. We had to scrap the machine and buy a new one.

Ilianovitch: This report doesn't look good. I was raked over the coals last year when we had just a few unfavorable variances.

Kemper: I'm afraid the final report is going to look even worse.

Ilianovitch: Oh?

Kemper: The line item for industrial engineering on the report is for work we hired Ferguson Engineering to do for us. The original contract was for \$210,000, but we asked them to do some additional work that was not in the contract. We have to reimburse Ferguson Engineering for the costs of that additional work. The \$189,000 in actual costs that appears on the preliminary draft report reflects only their billings up through December 21. The last bill they had sent us was on November 28, and they completed the project just last week. Yesterday I got a call from Laura Sunder over at Ferguson and she said they would be sending us a final bill for the project before the end of the year. The total bill, including the reimbursements for the additional work, is going to be . . .

Ilianovitch: I am not sure I want to hear this.

Kemper: \$225,000

Ilianovitch: Ouch!

Kemper: The additional work added \$15,000 to the cost of the project.

Ilianovitch: I can't turn in a report with an overall unfavorable variance! They'll kill me at corporate headquarters. Call up Laura at Ferguson and ask her not to send the bill until after the first of the year. We have to have that \$21,000 favorable variance for industrial engineering on the report.

Required:

What should Tom Kemper do? Explain.

CASE 9–28 Critiquing a Report; Preparing Spending Variances [LO3, LO5, LO6]

Boyne University offers an extensive continuing education program in many cities throughout the state. For the convenience of its faculty and administrative staff and to save costs, the university operates a motor pool. The motor pool operated with 20 vehicles until February, when an additional automobile was acquired at the request of the university administration. The motor pool furnishes gasoline, oil, and other supplies for its automobiles. A mechanic does routine maintenance and minor repairs. Major repairs are performed at a nearby commercial garage. Each year, the supervisor of the motor pool prepares an annual budget, which is reviewed by the university and approved after suitable modifications.

The following cost control report shows actual operating costs for March of the current year compared to one-twelfth of the annual budget.

| Boyne University Motor Pool Cost Control Report For the Month Ended March 31 | | | | |
|--|------------------|--|-----------------|---------------------------|
| | Annual Budget | Monthly Budget (1/12 of Annual Budget) | March Actual | (Over) Under Budget |
| Miles | 600,000 | 50,000 | 63,000 | |
| Autos | 20 | 20 | 21 | |
| Gasoline | \$ 90,000 | \$ 7,500 | \$ 9,350 | (\$1,850) |
| Oil, minor repairs, parts | 24,000 | 2,000 | 2,360 | (360) |
| Outside repairs | 18,000 | 1,500 | 1,420 | 80 |
| Insurance..... | 24,000 | 2,000 | 2,120 | (120) |
| Salaries and benefits | 90,480 | 7,540 | 7,540 | 0 |
| Vehicle depreciation | 60,000 | 5,000 | 5,250 | (250) |
| Total | <u>\$306,480</u> | <u>\$25,540</u> | <u>\$28,040</u> | <u>(\$2,500)</u> |

The annual budget was based on the following assumptions:

- a. \$0.15 per mile for gasoline.
- b. \$0.04 per mile for oil, minor repairs, and parts.
- c. \$900 per automobile per year for outside repairs.
- d. \$1,200 per automobile per year for insurance.
- e. \$7,540 per month for salaries and benefits.
- f. \$3,000 per automobile per year for depreciation.

The supervisor of the motor pool is unhappy with the report, claiming it paints an unfair picture of the motor pool's performance.

Required:

1. Prepare a new performance report for March based on a flexible budget that shows spending variances.
2. What are the deficiencies in the original cost control report? How does the report that you prepared in part (1) above overcome these deficiencies?

(CMA, adapted)

Standard Costs and Operating Performance Measures

Managing Materials and Labor

Schneider Electric's Oxford, Ohio, plant manufactures *busways* that transport electricity from its point of entry into a building to remote locations throughout the building. The plant's managers pay close attention to direct material costs because they are more than half of the plant's total manufacturing costs. To help control scrap rates for direct materials such as copper, steel, and aluminum, the

accounting department prepares direct materials quantity variances. These variances compare the standard quantity of direct materials that should have been used to make a product (according to computations by the plant's engineers) to the amount of direct materials that were actually used. Keeping a close eye on these differences helps to identify and deal with the causes of excessive scrap, such as an inadequately trained machine operator, poor quality raw material inputs, or a malfunctioning machine.

Because direct labor is also a significant component of the plant's total manufacturing costs, the management team daily monitors the direct labor efficiency variance. This variance compares the standard amount of labor time allowed to make a product to the actual amount of labor time used. When idle workers cause an unfavorable labor efficiency variance, managers temporarily move workers from departments with slack to departments with a backlog of work to be done. ■

Source: Author's conversation with Doug Taylor, plant controller, Schneider Electric's Oxford, Ohio, plant.

Learning Objectives

After studying Chapter 10, you should be able to:

- L01** Explain how direct materials standards and direct labor standards are set.
- L02** Compute the direct materials price and quantity variances and explain their significance.
- L03** Compute the direct labor rate and efficiency variances and explain their significance.
- L04** Compute the variable manufacturing overhead rate and efficiency variances.
- L05** Compute delivery cycle time, throughput time, and manufacturing cycle efficiency (MCE).
- L06** (Appendix 10A) Compute and interpret the fixed overhead budget and volume variances.

Performance measures serve a critical role in attaining goals.

Imagine you want to improve your basketball shooting skill. You know that practice will help, so you go to the basketball court. There you start shooting toward the hoop, but as soon as the ball gets close to the rim your vision goes blurry for a second, so that you cannot observe where the ball ended up in relation to the target (left, right, in front, too far back, inside the hoop?). It would be pretty difficult to improve under those conditions. . . . (And by the way, how long would shooting baskets sustain your interest if you couldn't observe the outcome of your efforts?)

Or imagine someone engaging in a weight loss program. A normal step in such programs is to purchase a scale to be able to track one's progress: Is this program working? Am I losing weight? A positive answer would be encouraging and would motivate me to keep up the effort, while a negative answer might lead me to reflect on the process: Am I working on the right diet and exercise program? Am I doing everything I am supposed to?, etc. Suppose you don't want to set up a sophisticated measurement system and decide to forgo the scale. You would still have some idea of how well you are doing from simple methods such as clothes feeling looser, a belt that fastens at a different hole, or simply via observation in a mirror! Now, imagine trying to sustain a weight loss program without any feedback on how well you are doing.

In these . . . examples, availability of quantitative measures of performance can yield two types of benefits: First, performance feedback can help improve the "production process" through a better understanding of what works and what doesn't; e.g., shooting this way works better than shooting that way. Secondly, feedback on performance can sustain motivation and effort, because it is encouraging and/or because it suggests that more effort is required for the goal to be met.¹

In the same way, performance measurement can be helpful in an organization. It can provide feedback concerning what works and what does not work, and it can help motivate people to sustain their efforts.

IN BUSINESS

FOCUSING ON THE NUMBERS

Joe Knight is the CEO of **Setpoint**, a company that designs and builds factory-automation equipment. Knight uses a large whiteboard, with about 20 rows and 10 columns, to focus worker attention on key factors involved in managing projects. A visitor to the plant, Steve Petersen, asked Knight to explain the board, but Knight instead motioned one of his workers to come over. The young man, with a baseball cap turned backward on his head, proceeded to walk the visitor through the board, explaining the calculation of gross margin and other key indicators on the board.

"I was just amazed," Petersen recalls. "He knew that board inside and out. He knew every number on it. He knew exactly where the company was and where they had to focus their attention. There was no hesitation. . . . I was so impressed . . . that the people on the shop floor had it down like that. It was their scoreboard. It was the way they could tell if they were winning or losing. I talked to several of them, and I just couldn't get over the positive attitude they had and their understanding of the numbers."

We encountered performance measures in the last chapter when we investigated flexible budget variances. These variances provide direct feedback concerning how well an organization performed in attaining its financial goals as expressed in the budget. The overall net operating income activity variance indicates what impact any change in activity had on profit. The revenue and spending variances indicate how well revenues and costs were controlled. In the case of many of the spending variances, we can get even more detail about how well costs were controlled. For example, at Rick's Hairstyling, an

¹ Soumitra Dutta and Jean-François Manzoni, *Process Reengineering, Organizational Change and Performance Improvement* (New York: McGraw-Hill), Chapter IV.

unfavorable spending variance for hairstyling supplies could be due to using too many supplies or to paying too much for the supplies, or some combination of the two. It would be useful to separate those two different effects, particularly if different people are responsible for using the supplies and for purchasing them. In this chapter we will learn how that can be done for some costs; basically, we will be decomposing spending variances into two parts—a part that measures how well resources were used and a part that measures how well the acquisition prices of those resources were controlled. At the end of the chapter we will also take a look at some common nonfinancial performance measures.

We should keep in mind that performance measures should be derived from the organization's overall strategy. For example, a company like **Sony** that bases its strategy on rapid introduction of innovative consumer products should use different performance measures than a company like **Federal Express** that stresses on-time delivery, customer convenience, and low cost. Sony may want to keep close track of the percentage of revenues from products introduced within the last year; whereas Federal Express may want to closely monitor the percentage of packages delivered on time.

Companies in highly competitive industries like Federal Express, **Southwest Airlines**, **Dell**, and **Toyota** must be able to provide high-quality goods and services at low cost. If they do not, their customers will buy from more efficient competitors. Stated in the starkest terms, managers must obtain inputs such as raw materials and electricity at the lowest possible prices and must use them as effectively as possible—while maintaining or increasing the quality of what they sell. If inputs are purchased at prices that are too high or more input is used than is really necessary, higher costs will result.

How do managers control the prices that are paid for inputs and the quantities that are used? They could examine every transaction in detail, but this obviously would be an inefficient use of management time. For many companies, the answer to this control problem lies at least partially in *standard costs*.

Standard Costs—Management by Exception

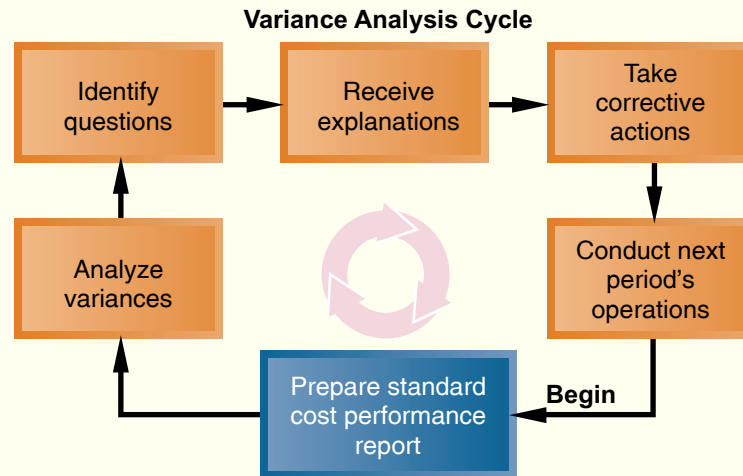

A *standard* is a benchmark or “norm” for measuring performance. Standards are found everywhere. Your doctor evaluates your weight using standards for individuals of your age, height, and gender. The food we eat in restaurants is prepared using standardized recipes. The buildings we live in conform to standards set in building codes. Standards are also widely used in managerial accounting where they relate to the *quantity* and *cost* (or acquisition price) of inputs used in manufacturing goods or providing services.

Quantity and price standards are set for each major input such as raw materials and labor time. *Quantity standards* specify how much of an input should be used to make a product or provide a service. *Price standards* specify how much should be paid for each unit of the input. Actual quantities and actual costs of inputs are compared to these standards. If either the quantity or the cost of inputs departs significantly from the standards, managers investigate the discrepancy to find the cause of the problem and eliminate it. This process is called **management by exception**.

In our daily lives we often operate in a management by exception mode. Consider what happens when you sit down in the driver's seat of your car. You put the key in the ignition, you turn the key, and your car starts. Your expectation (standard) that the car will start is met; you do not have to open the car hood and check the battery, the connecting cables, the fuel lines, and so on. If you turn the key and the car does not start, then you have a discrepancy (variance). Your expectations are not met, and you need to investigate why. Note that even if the car starts after a second try, it still would be wise to investigate. The fact that the expectation was not met should be viewed as an opportunity to uncover the cause of the problem rather than as simply an annoyance. If the underlying cause is not discovered and corrected, the problem may recur and become much worse.

This basic approach to identifying and solving problems is the essence of the *variance analysis cycle*, which is illustrated in Exhibit 10–1. The cycle begins with the

EXHIBIT 10-1
The Variance Analysis Cycle

preparation of standard cost performance reports in the accounting department. These reports highlight the *variances*, which are the differences between actual results and what should have occurred according to the standards. The variances raise questions. Why did this variance occur? Why is this variance larger than it was last period? The significant variances are investigated to discover their root causes. Corrective actions are taken. And then next period's operations are carried out. The cycle begins again with the preparation of a new standard cost performance report for the latest period. The emphasis should be on highlighting problems, finding their root causes, and then taking corrective action. The goal is to improve operations—not to assign blame.

Who Uses Standard Costs?

Manufacturing, service, food, and not-for-profit organizations all make use of standards to some extent. Auto service centers like **Firestone** and **Sears**, for example, often set specific labor time standards for the completion of certain tasks, such as installing a carburetor or doing a valve job, and then measure actual performance against these standards. Fast-food outlets such as **McDonald's** have exacting standards for the quantity of meat going into a sandwich, as well as standards for the cost of the meat. Hospitals have standard costs for food, laundry, and other items, as well as standard time allowances for certain routine activities, such as laboratory tests. In short, you are likely to run into standard costs in virtually any line of business.

Manufacturing companies often have highly developed standard costing systems in which standards for direct materials, direct labor, and overhead are created for each product. A **standard cost card** shows the standard quantities and costs of the inputs required to produce a unit of a specific product. In the following section, we provide a detailed example of setting standard costs and preparing a standard cost card.

Setting Standard Costs

Setting price and quantity standards ideally combines the expertise of everyone who has responsibility for purchasing and using inputs. In a manufacturing setting, this might include accountants, purchasing managers, engineers, production supervisors, line managers, and production workers. Past records of purchase prices and input usage can be

helpful in setting standards. However, the standards should be designed to encourage efficient *future* operations, not just a repetition of *past* operations that may or may not have been efficient.

Ideal versus Practical Standards

Should standards be attainable all of the time, part of the time, or almost none of the time? Opinions vary, but standards tend to fall into one of two categories—either ideal or practical.

Ideal standards can be attained only under the best circumstances. They allow for no machine breakdowns or other work interruptions, and they call for a level of effort that can be attained only by the most skilled and efficient employees working at peak effort 100% of the time. Some managers feel that such standards spur continual improvement. These managers argue that even though employees know they will rarely meet the standard, it is a constant reminder of the need for ever-increasing efficiency and effort. Few organizations use ideal standards. Most managers feel that ideal standards tend to discourage even the most diligent workers. Moreover, variances from ideal standards are difficult to interpret. Large variances from the ideal are normal and it is therefore difficult to “manage by exception.”

Practical standards are standards that are “tight but attainable.” They allow for normal machine downtime and employee rest periods, and they can be attained through reasonable, though highly efficient, efforts by the average worker. Variances from practical standards typically signal a need for management attention because they represent deviations that fall outside of normal operating conditions. Furthermore, practical standards can serve multiple purposes. In addition to signaling abnormal conditions, they can also be used in forecasting cash flows and in planning inventory. By contrast, ideal standards cannot be used for these purposes because they do not allow for normal inefficiencies and result in unrealistic forecasts.

Throughout the remainder of this chapter, we will assume that practical rather than ideal standards are in use.

The Colonial Pewter Company was organized a year ago. The company’s only product is a reproduction of an 18th century pewter bookend. The bookend is made largely by hand, using traditional metalworking tools. Consequently, the manufacturing process is labor intensive and requires a high level of skill.

Colonial Pewter has recently expanded its workforce to take advantage of unexpected demand for the bookends as gifts. The company started with a small cadre of experienced pewter workers but has had to hire less experienced workers as a result of the expansion. The president of the company, J. D. Wriston, has called a meeting to discuss production problems. Attending the meeting are Tom Kuchel, the production manager; Janet Warner, the purchasing manager; and Terry Sherman, the corporate controller.

J. D.: I’ve got a feeling that we aren’t getting the production we should out of our new people.

Tom: Give us a chance. Some of the new people have been with the company for less than a month.

Janet: Let me add that production seems to be wasting an awful lot of material—particularly pewter. That stuff is very expensive.

Tom: What about the shipment of defective pewter that you bought a couple of months ago—the one with the iron contamination? That caused us major problems.

Janet: That’s ancient history. How was I to know it was off-grade? Besides, it was a great deal.

J. D.: Calm down everybody. Let’s get the facts before we start sinking our fangs into each other.

Tom: I agree. The more facts the better.

**MANAGERIAL
ACCOUNTING IN
ACTION**
The Issue

Colonial
Pewter
Company

J. D.: Okay, Terry, it's your turn. Facts are the controller's department.

Terry: I'm afraid I can't provide the answers off the top of my head, but it won't take me too long to set up a system that can routinely answer questions relating to worker productivity, material waste, and input prices.

J. D.: How long is "not too long"?

Terry: I will need all of your cooperation, but how about a week from today?

J. D.: That's okay with me. What about everyone else?

Tom: Sure.

Janet: Fine with me.

J. D.: Let's mark it on our calendars.

Setting Direct Materials Standards

LEARNING OBJECTIVE 1
Explain how direct materials standards and direct labor standards are set.

Terry Sherman's first task was to prepare price and quantity standards for the company's only significant raw material, pewter ingots. The **standard price per unit** for direct materials should reflect the final, delivered cost of the materials, net of any discounts taken. After consulting with purchasing manager Janet Warner, Terry prepared the following documentation for the standard price of a pound of pewter in ingot form:

| | |
|---|---------------|
| Purchase price, top-grade pewter ingots, in 40-pound ingots | \$3.85 |
| Freight, by truck, from the supplier's warehouse | 0.24 |
| Less purchase discount | <u>(0.09)</u> |
| Standard price per pound | <u>\$4.00</u> |

Notice that the standard price reflects a particular grade of material (top grade), purchased in particular lot sizes (40-pound ingots), and delivered by a particular type of carrier (truck). Allowances have also been made for discounts. If everything proceeds according to these expectations, the net cost of a pound of pewter should be \$4.00.

The **standard quantity per unit** for direct materials should reflect the amount of material required for each unit of finished product as well as an allowance for unavoidable waste. After consulting with the production manager, Tom Kuchel, Terry Sherman prepared the following documentation for the standard quantity of pewter in a pair of bookends:

| | |
|--|------------|
| Material requirements as specified in the bill of materials for a pair of bookends, in pounds | 2.7 |
| Allowance for waste and spoilage, in pounds | 0.2 |
| Allowance for rejects, in pounds | <u>0.1</u> |
| Standard quantity per pair of bookends, in pounds..... | <u>3.0</u> |

As discussed in an earlier chapter, the bill of materials details the quantity of each type of material that should be used in a product. As shown above, the material requirements listed on the bill of materials should be adjusted for waste and other factors when determining the standard quantity per unit of product. "Waste and spoilage" refers to materials that are wasted as a normal part of the production process or that spoil before they are used. "Rejects" refers to the direct material contained in defective units that must be scrapped.

Although allowances for waste, spoilage, and rejects are often built into standards, this practice is often criticized because it contradicts the zero defects goal that underlies improvement programs such as Six Sigma. If allowances for waste, spoilage, and

rejects are built into the standard cost, those allowances should be periodically reviewed and reduced over time to reflect improved processes, better training, and better equipment.

Once the price and quantity standards have been set, the standard cost of material per unit of the finished product can be computed as follows:

$$3.0 \text{ pounds per unit} \times \$4.00 \text{ per pound} = \$12.00 \text{ per unit}$$

This \$12.00 cost will appear on the product’s standard cost card.

Setting Direct Labor Standards

Direct labor price and quantity standards are usually expressed in terms of a labor rate and labor-hours. The **standard rate per hour** for direct labor includes wages, employment taxes, and fringe benefits. Using wage records and in consultation with the production manager, Terry Sherman determined the standard rate per direct labor-hour at the Colonial Pewter Company as follows:

| | |
|---|----------------|
| Basic wage rate per hour..... | \$10.00 |
| Employment taxes at 10% of the basic rate | 1.00 |
| Fringe benefits at 30% of the basic rate | 3.00 |
| Standard rate per direct labor-hour | <u>\$14.00</u> |

Many companies prepare a single standard rate per hour for all employees in a department. This standard rate reflects the expected “mix” of workers, even though the actual wage rates may vary somewhat from individual to individual due to differing skills or seniority. According to the standard computed above, the direct labor rate for Colonial Pewter should average \$14 per hour.

The standard direct labor time required to complete a unit of product (called the **standard hours per unit**) is perhaps the single most difficult standard to determine. One approach is to break down each task into elemental body movements (such as reaching, pushing, and turning over). Published tables of standard times for such movements can be used to estimate the total time required to complete the task. Another approach is for an industrial engineer to do a time and motion study, actually clocking the time required for each task. As stated earlier, the standard time should include allowances for breaks, personal needs of employees, cleanup, and machine downtime.

After consulting with the production manager, Terry Sherman prepared the following documentation for the standard direct labor hours per unit:

| | |
|---|------------|
| Basic labor time per unit, in hours | 1.9 |
| Allowance for breaks and personal needs | 0.1 |
| Allowance for cleanup and machine downtime | 0.3 |
| Allowance for rejects | 0.2 |
| Standard direct labor-hours per unit of product | <u>2.5</u> |

Once the rate and time standards have been set, the standard direct labor cost per unit of product can be computed as follows:

$$2.5 \text{ direct labor-hours per unit} \times \$14 \text{ per direct labor-hour} = \$35 \text{ per unit}$$

This \$35 per unit standard direct labor cost appears along with direct materials on the standard cost card for a pair of pewter bookends.

EXHIBIT 10-2
Standard Cost Card—Variable
Manufacturing Costs

| Inputs | (1) Standard Quantity or Hours | (2) Standard Price or Rate | Standard Cost (1) × (2) |
|---------------------------------------|---|-------------------------------------|-------------------------------|
| Direct materials | 3.0 pounds | \$4.00 per pound | \$12.00 |
| Direct labor | 2.5 hours | \$14.00 per hour | 35.00 |
| Variable manufacturing overhead | 2.5 hours | \$3.00 per hour | 7.50 |
| Total standard cost per unit | | | <u>\$54.50</u> |

Setting Variable Manufacturing Overhead Standards

As with direct labor, the price and quantity standards for variable manufacturing overhead are usually expressed in terms of rate and hours. The rate represents *the variable portion of the predetermined overhead rate* discussed in the job-order costing chapter; the hours relate to the activity base that is used to apply overhead to units of product (usually machine-hours or direct labor-hours). At Colonial Pewter, the variable portion of the predetermined overhead rate is \$3 per direct labor-hour. Therefore, the standard variable manufacturing overhead cost per unit is computed as follows:

$$2.5 \text{ direct labor-hours per unit} \times \$3 \text{ per direct labor-hour} = \$7.50 \text{ per unit}$$

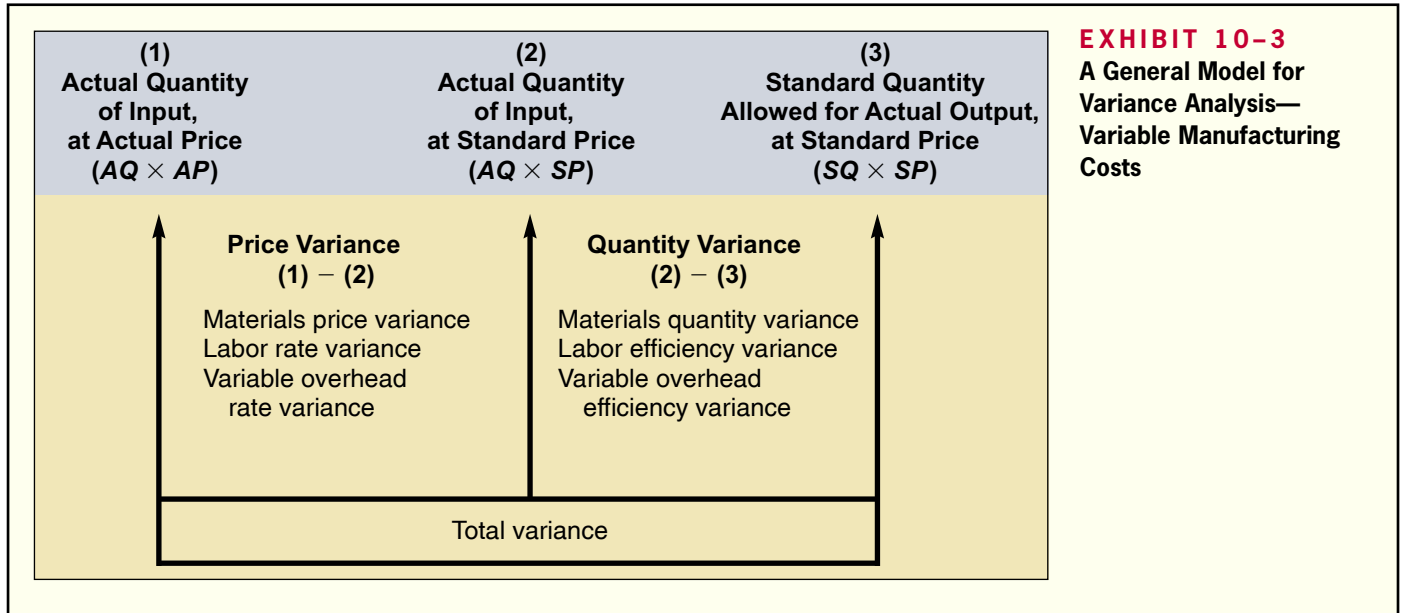

This \$7.50 per unit cost for variable manufacturing overhead appears along with direct materials and direct labor on the standard cost card in Exhibit 10-2. Observe that the **standard cost per unit** for variable manufacturing overhead is computed the same way as for direct materials or direct labor—the standard quantity allowed per unit of the output is multiplied by the standard price. In this case, the standard quantity is expressed as 2.5 direct labor-hours per unit and the standard price (or rate) is expressed as \$3 per direct labor-hour.

A General Model for Variance Analysis

Why are standards separated into two categories—price and quantity? Different managers are usually responsible for buying and for using inputs. For example, in the case of a raw material, a purchasing manager is responsible for its price. However, the production manager is responsible for the amount of the raw material actually used to make products. As we shall see, setting up separate standards for price and quantity allows us to better separate the responsibilities of these two managers. It also allows us to prepare more timely reports. The purchasing manager's tasks are completed when the material is delivered for use in the factory. A performance report for the purchasing manager can be prepared at that point. However, the production manager's responsibilities have just begun at that point. A performance report for the production manager must be delayed until production is completed and it is known how much raw material was used in the final product. Therefore, it is important to clearly distinguish between deviations from price standards (the responsibility of the purchasing manager) and deviations from quantity standards (the responsibility of the production manager).

Price and Quantity Variances

Exhibit 10-3 presents a general model that isolates *price variances* from *quantity variances* for variable costs. A **price variance** is the difference between the actual price of an input and its standard price, multiplied by the actual amount of the input purchased. A **quantity variance** is the difference between how much of an input was actually used and how much should have been used and is stated in dollar terms using the standard price of the input.

Three things should be noted from Exhibit 10-3. First, a price variance and a quantity variance can be computed for each of the three variable cost elements—direct materials, direct labor, and variable manufacturing overhead—even though the variances have different names. For example, a price variance is called a *materials price variance* in the case of direct materials but a *labor rate variance* in the case of direct labor and a *variable overhead rate variance* in the case of variable manufacturing overhead.

Second, the price variance—regardless of what it is called—is computed in exactly the same way regardless of whether one is dealing with direct materials, direct labor, or variable manufacturing overhead. The same is true of the quantity variance.

Third, the input is the actual quantity of direct materials, direct labor, and variable manufacturing overhead purchased or used; the output is the good production of the period, expressed in terms of the *standard quantity* (or the *standard hours*) allowed for the actual output (see column 3 in Exhibit 10-3). The **standard quantity allowed** or **standard hours allowed** means the amount of an input *that should have been used* to produce the actual output of the period. This could be more or less than the actual amount of the input, depending on the efficiency or inefficiency of operations. The standard quantity allowed is computed by multiplying the actual output in units by the standard input allowed per unit of output.

With this general model as the foundation, we will now calculate Colonial Pewter’s price and quantity variances.

Using Standard Costs—Direct Materials Variances

After determining Colonial Pewter Company’s standard costs for direct materials, direct labor, and variable manufacturing overhead, Terry Sherman’s next step was to compute the company’s variances for June, the most recent month. As discussed in the preceding section, variances are computed by comparing standard costs to actual costs. Terry referred to the standard cost card in Exhibit 10-2 that shows the standard cost of direct materials was computed as follows:

$$3.0 \text{ pounds per unit} \times \$4.00 \text{ per pound} = \$12 \text{ per unit}$$

Colonial Pewter’s records for June showed that 6,500 pounds of pewter were purchased at a cost of \$3.80 per pound. This cost included freight and was net of a quantity

LEARNING OBJECTIVE 2
 Compute the direct materials price and quantity variances and explain their significance.

EXHIBIT 10-4 Variance Analysis—Direct Materials

| (1) Actual Quantity of Input, at Actual Price (AQ × AP) | (2) Actual Quantity of Input, at Standard Price (AQ × SP) | (3) Standard Quantity Allowed for Actual Output, at Standard Price (SQ × SP) |
|---|---|--|
| 6,500 pounds × \$3.80 per pound = \$24,700 | 6,500 pounds × \$4.00 per pound = \$26,000 | 6,000 pounds* × \$4.00 per pound = \$24,000 |
| ↑ Price variance, \$1,300 F | | ↑ Quantity variance, \$2,000 U |
| Total variance, \$700 U | | |

*2,000 units × 3.0 pounds per unit = 6,000 pounds.
F = Favorable; U = Unfavorable.

purchase discount. All of the material purchased was used during June to manufacture 2,000 pairs of pewter bookends. Using these data and the standard costs from Exhibit 10-2, Terry computed the price and quantity variances shown in Exhibit 10-4.

The three arrows in Exhibit 10-4 point to three different total cost figures. The first, \$24,700, refers to the actual total cost of the pewter that was purchased during June. The second, \$26,000, refers to what the pewter would have cost if it had been purchased at the standard price of \$4.00 a pound rather than the actual price of \$3.80 a pound. The difference between these two figures, \$1,300 (\$26,000 – \$24,700), is the price variance. It exists because the actual purchase price was \$0.20 per pound less than the standard purchase price. Because 6,500 pounds were purchased, the total amount of the variance is \$1,300 (\$0.20 per pound × 6,500 pounds). This variance is labeled favorable (denoted by F) because the actual purchase price was less than the standard purchase price. A price variance is labeled unfavorable (denoted by U) if the actual purchase price exceeds the standard purchase price.

The third arrow in Exhibit 10-4 points to \$24,000—the cost if the pewter had been purchased at the standard price *and* only the standard quantity allowed per unit had been used. The standards call for 3 pounds of pewter per unit. Because 2,000 units were produced, 6,000 pounds of pewter should have been used. This is referred to as the standard quantity allowed for the actual output. If this 6,000 pounds of pewter had been purchased at the standard price of \$4.00 per pound, the company would have spent \$24,000. The difference between this figure, \$24,000, and the figure at the end of the middle arrow in Exhibit 10-4, \$26,000, is the quantity variance of \$2,000.

To understand this quantity variance, note that the actual amount of pewter used in production was 6,500 pounds. However, the standard amount of pewter allowed for the actual output is 6,000 pounds. Therefore, too much pewter was used to produce the actual output—by a total of 500 pounds. To express this in dollar terms, the 500 pounds is multiplied by the standard price of \$4.00 per pound to yield the quantity variance of \$2,000. Why is the standard price, rather than the actual price, of the pewter used in this calculation? The production manager is ordinarily responsible for the quantity variance. If the actual price were used in the calculation of the quantity variance, the production manager would be held responsible for the efficiency or inefficiency of the purchasing manager. Apart from being unfair, fruitless arguments between the production manager and purchasing manager would occur every time the actual price of an

input was above its standard price. To avoid these arguments, the standard price is used when computing the quantity variance.

The quantity variance in Exhibit 10–4 is labeled unfavorable (denoted by U). This is because more pewter was used to produce the actual output than the standard allows. A quantity variance is labeled favorable (F) if the actual quantity is less than the standard quantity.

The computations in Exhibit 10–4 reflect the fact that all of the material purchased during June was also used during June. How are the variances computed if the amount of material purchased differs from the amount that is used? To illustrate, assume that during June the company purchased 6,500 pounds of materials, as before, but that it used only 5,000 pounds of material during the month and produced only 1,600 units. In this case, the price variance and quantity variance would be computed as shown in Exhibit 10–5.

Most companies compute the materials price variance when materials are *purchased* rather than when they are used in production. There are two reasons for this practice. First, delaying the computation of the price variance until the materials are used would result in less timely variance reports. Second, computing the price variance when the materials are purchased allows materials to be carried in the inventory accounts at their standard cost. This greatly simplifies bookkeeping.

Note from the exhibit that the price variance is computed on the entire amount of material purchased (6,500 pounds), as before, whereas the quantity variance is computed only on the portion of this material used in production during the month (5,000 pounds). What about the other 1,500 pounds of material that were purchased during the period, but that have not yet been used? When those materials are used in future periods, a quantity variance will be computed. However, a price variance will not be computed when the materials are finally used because the price variance was computed when the materials were purchased. The situation illustrated in Exhibit 10–5 is common for companies that purchase materials well in advance of when they are used in production.

EXHIBIT 10–5 Variance Analysis—Direct Materials, When the Amount Purchased Differs from the Amount Used

| (1) Actual Quantity of Input, at Actual Price (AQ × AP) | (2) Actual Quantity of Input, at Standard Price (AQ × SP) | (3) Standard Quantity Allowed for Actual Output, at Standard Price (SQ × SP) |
|---|---|--|
| 6,500 pounds × \$3.80 per pound = \$24,700 | 6,500 pounds × \$4.00 per pound = \$26,000 | 4,800 pounds* × \$4.00 per pound = \$19,200 |
| Price variance, \$1,300 F | | |
| 5,000 pounds × 4.00 per pound = \$20,000 | | |
| Quantity variance, \$800 U | | |

A total variance, like the one shown in Exhibit 10–4, can't be computed in this situation because the amount of materials purchased (6,500 pounds) differs from the amount used in production (5,000 pounds).

*1,600 units × 3.0 pounds per unit = 4,800 pounds.

Materials Price Variance—A Closer Look

A **materials price variance** measures the difference between what is paid for a given quantity of materials and what should have been paid according to the standard. From Exhibit 10–4, this difference can be expressed by the following formula:

$$\text{Materials price variance} = (AQ \times AP) - (AQ \times SP)$$

↑ Actual quantity ↑ Actual price ↑ Standard price

The formula can be factored as follows:

$$\text{Materials price variance} = AQ(AP - SP)$$

Using the data from Exhibit 10–4 in this formula, we have the following:

$$\text{Materials price variance} = 6,500 \text{ pounds } (\$3.80 \text{ per pound} - \$4.00 \text{ per pound}) = \$1,300 \text{ F}$$

Notice that the answer is the same as that shown in Exhibit 10–4. Also note that when using this formula approach, a negative variance is always labeled as favorable (F) and a positive variance is always labeled as unfavorable (U). This will be true of all variance formulas in this chapter.

Variance reports are often presented in the form of a table. An excerpt from Colonial Pewter's variance report is shown below along with the purchasing manager's explanation for the materials price variance.

| Colonial Pewter Company Variance Report—Purchasing Department | | | | | | |
|--|---------------------------|---------------------|-----------------------|---|-----------------------------------|---|
| Item Purchased | (1) Quantity Purchased | (2) Actual Price | (3) Standard Price | (4) Difference in Price (2) – (3) | Total Price Variance (1) × (4) | Explanation |
| Pewter | 6,500 pounds | \$3.80 | \$4.00 | \$0.20 | \$1,300 F | Bargained for an especially good price. |

F = Favorable; U = Unfavorable.

Isolation of Variances Variances should be isolated and brought to the attention of management as quickly as possible so that problems can be promptly identified and corrected. The most significant variances should be viewed as “red flags”; an exception has occurred that requires explanation by the responsible manager and perhaps follow-up effort. The performance report itself may contain explanations for the variances, as illustrated above. In the case of Colonial Pewter Company, the purchasing manager said that the favorable price variance resulted from bargaining for an especially good price.

Responsibility for the Variance Who is responsible for the materials price variance? Generally speaking, the purchasing manager has control over the price paid for goods and is therefore responsible for the materials price variance. Many factors influence the prices paid for goods including how many units are ordered, how the order is delivered, whether the order is a rush order, and the quality of materials purchased. If any of these factors deviates from what was assumed when the standards were set, a price variance can result. For example, purchasing second-grade materials rather than

top-grade materials may result in a favorable price variance because the lower-grade materials may be less costly. However, we should keep in mind that the lower-grade materials may create production problems.

However, someone other than the purchasing manager could be responsible for a materials price variance. For example, due to production problems beyond the purchasing manager’s control, the purchasing manager may have to use express delivery. In these cases, the production manager should be held responsible for the resulting price variances.

A word of caution is in order. Variance analysis should not be used to assign blame. The emphasis should be on *supporting* the line managers and *assisting* them in meeting the goals that they have participated in setting for the company. In short, the emphasis should be positive rather than negative. Excessive dwelling on what has already happened, particularly in terms of trying to find someone to blame, can destroy morale and kill any cooperative spirit.

Materials Quantity Variance—A Closer Look

The **materials quantity variance** measures the difference between the quantity of materials used in production and the quantity that should have been used according to the standard. Although the variance is concerned with the physical usage of materials, as shown in Exhibit 10–4, it is generally stated in dollar terms to help gauge its importance. The formula for the materials quantity variance is as follows:

$$\text{Materials quantity variance} = (AQ \times SP) - (SQ \times SP)$$

Again, the formula can be factored as follows:

$$\text{Materials quantity variance} = SP(AQ - SQ)$$

Using the data from Exhibit 10–4 in the formula, we have the following:

$$SQ = 2,000 \text{ units} \times 3.0 \text{ pounds per unit} = 6,000 \text{ pounds.}$$

$$\begin{aligned} \text{Materials quantity variance} &= \$4.00 \text{ per pound} (6,500 \text{ pounds} - 6,000 \text{ pounds}) \\ &= \$2,000 \text{ U} \end{aligned}$$

The answer, of course, is the same as that shown in Exhibit 10–4.

The data might appear as follows if a formal variance report were prepared:

| Colonial Pewter Company Variance Report—Production Department | | | | | | |
|--|-------------------|--------------------|---------------------------------|--|--|--|
| | (1) | (2) | (3) | (4) | Total Quantity Variance (1) × (4) | Explanation |
| Type of Materials | Standard Price | Actual Quantity | Standard Quantity Allowed | Difference in Quantity (2) – (3) | | |
| Pewter | \$4.00 | 6,500 pounds | 6,000 pounds | 500 pounds | \$2,000 U | Low-quality materials unsuitable for production. |

F = Favorable; U = Unfavorable.

It is best to isolate the materials quantity variance when materials are used in production. Materials are drawn for the number of units to be produced, according to the standard bill of materials for each unit. Any additional materials are usually drawn with an excess materials requisition slip, which is different in color from the normal requisition slips. This procedure calls attention to the excessive usage of materials *while production is still in process* and provides an opportunity to correct any developing problem.

Excessive materials usage can result from many factors, including faulty machines, inferior materials quality, untrained workers, and poor supervision. Generally speaking, it is the responsibility of the production department to see that material usage is kept in line with standards. There may be times, however, when the *purchasing* department is responsible for an unfavorable materials quantity variance. For example, if the purchasing department buys inferior materials at a lower price, the materials may be unsuitable for use and may result in excessive waste. Thus, purchasing rather than production would be responsible for the quantity variance. At Colonial Pewter, the production manager, Tom Kuchel, claimed on the Production Department's Performance Report that low-quality materials were the cause of the unfavorable materials quantity variance for June.

Using Standard Costs—Direct Labor Variances

LEARNING OBJECTIVE 3

Compute the direct labor rate and efficiency variances and explain their significance.

Terry Sherman's next step in determining Colonial Pewter's variances for June was to compute the direct labor variances for the month. Recall from Exhibit 10-2 that the standard direct labor cost per unit of product is \$35, computed as follows:

$$2.5 \text{ hours per unit} \times \$14.00 \text{ per hour} = \$35 \text{ per unit}$$

During June, the company paid its direct labor workers \$74,250, including employment taxes and fringe benefits, for 5,400 hours of work. This was an average of \$13.75 per hour. Using these data and the standard costs from Exhibit 10-2, Terry computed the direct labor rate and efficiency variances that appear in Exhibit 10-6.

Notice that the column headings in Exhibit 10-6 are the same as those used in the prior two exhibits, except that in Exhibit 10-6 the terms *hours* and *rate* are used in place of the terms *quantity* and *price*.

EXHIBIT 10-6 Variance Analysis—Direct Labor

| Actual Hours of Input, at the Actual Rate (AH × AR) | Actual Hours of Input, at the Standard Rate (AH × SR) | Standard Hours Allowed for Actual Output, at the Standard Rate (SH × SR) |
|--|--|---|
| 5,400 hours × \$13.75 per hour = \$74,250 | 5,400 hours × \$14.00 per hour = \$75,600 | 5,000 hours* × \$14.00 per hour = \$70,000 |
| Rate variance, \$1,350 F | | Efficiency variance, \$5,600 U |
| Total variance, \$4,250 U | | |

*2,000 units × 2.5 hours per unit = 5,000 hours.
F = Favorable; U = Unfavorable.

Labor Rate Variance—A Closer Look

As explained earlier, the price variance for direct labor is commonly called the **labor rate variance**. This variance measures any deviation from standard in the average hourly rate paid to direct labor workers. The formula for the labor rate variance is expressed as follows:

$$\text{Labor rate variance} = (AH \times AR) - (AH \times SR)$$

Actual hours
Actual rate
Standard rate

The formula can be factored as follows:

$$\text{Labor rate variance} = AH(AR - SR)$$

Using the data from Exhibit 10–6 in the formula, the labor rate variance can be computed as follows:

$$\text{Labor rate variance} = 5,400 \text{ hours } (\$13.75 \text{ per hour} - \$14.00 \text{ per hour}) = \$1,350 \text{ F}$$

In most companies, the wage rates paid to workers are quite predictable. Nevertheless, rate variances can arise because of the way labor is used. Skilled workers with high hourly rates of pay may be given duties that require little skill and call for lower hourly rates of pay. This will result in an unfavorable labor rate variance because the actual hourly rate of pay will exceed the standard rate specified for the particular task. In contrast, a favorable rate variance would result when workers who are paid at a rate lower than specified in the standard are assigned to the task. However, the lower-paid workers may not be as efficient. Finally, overtime work at premium rates will result in an unfavorable rate variance if the overtime premium is charged to the direct labor account.

Who is responsible for controlling the labor rate variance? Because labor rate variances generally arise as a result of how labor is used, production supervisors are usually responsible for seeing that labor rate variances are kept under control.

Labor Efficiency Variance—A Closer Look

The **labor efficiency variance** attempts to measure the productivity of direct labor. No variance is more closely watched by management because it is widely believed that increasing direct labor productivity is vital to reducing costs. The formula for the labor efficiency variance is expressed as follows:

$$\text{Labor efficiency variance} = (AH \times SR) - (SH \times SR)$$

Actual hours
Standard rate
Standard hours allowed for actual output

The formula can be factored as follows:

$$\text{Labor efficiency variance} = SR(AH - SH)$$

Using the data from Exhibit 10–6 in the formula, we have the following:

$$SH = 2,000 \text{ units} \times 2.5 \text{ hours per unit} = 5,000 \text{ hours.}$$

$$\text{Labor efficiency variance} = \$14.00 \text{ per hour } (5,400 \text{ hours} - 5,000 \text{ hours}) = \$5,600 \text{ U}$$

Possible causes of an unfavorable labor efficiency variance include poorly trained or motivated workers; poor quality materials, requiring more labor time; faulty equipment,

causing breakdowns and work interruptions; poor supervision of workers; and inaccurate standards. The managers in charge of production would usually be responsible for control of the labor efficiency variance. However, the purchasing manager could be held responsible if the purchase of poor-quality materials resulted in excessive labor processing time.

Another important cause of an unfavorable labor efficiency variance may be insufficient demand for the company's products. Managers in some companies argue that it is difficult, and perhaps unwise, to constantly adjust the workforce in response to changes in the amount of work that needs to be done. In such companies, the direct labor workforce is essentially fixed in the short run. If demand is insufficient to keep everyone busy, workers are not laid off and an unfavorable labor efficiency variance will often be recorded.

If customer orders are insufficient to keep the workers busy, the work center manager has two options—either accept an unfavorable labor efficiency variance or build inventory.² A central lesson of Lean Production is that building inventory with no immediate prospect of sale is a bad idea. Excessive inventory—particularly work in process inventory—leads to high defect rates, obsolete goods, and inefficient operations. As a consequence, when the workforce is basically fixed in the short term, managers must be cautious about how labor efficiency variances are used. Some experts advocate eliminating labor efficiency variances in such situations—at least for the purposes of motivating and controlling workers on the shop floor.

IN BUSINESS

DOES DIRECT LABOR VARIANCE REPORTING INCREASE PRODUCTIVITY?

Professors Rajiv Banker, Sarv Devaraj, Roger Schroeder, and Kingshuk Sinha studied the direct labor variance reporting practices at 18 plants of a Fortune 500 manufacturing company. Seven of the plants eliminated direct labor variance reporting and the other 11 plants did not. The group of seven plants that eliminated direct labor variance reporting experienced an 11% decline in labor productivity, which was significantly greater than the decline experienced by the other 11 plants. The authors estimated that the annual loss due to the decline in labor productivity across the seven plants of \$1,996,000 was only partially offset by the \$200,000 saved by eliminating the need to track direct labor variances.

While these findings suggest that direct labor variance reporting is a useful tool for monitoring direct labor workers, advocates of Lean Production would argue otherwise. They would claim that direct labor variance reporting is a non-value-added activity that encourages excessive production and demoralizes direct labor workers. The two points of view provide an interesting opportunity to debate the appropriate role of management accounting within organizations.

Using Standard Costs—Variable Manufacturing Overhead Variances

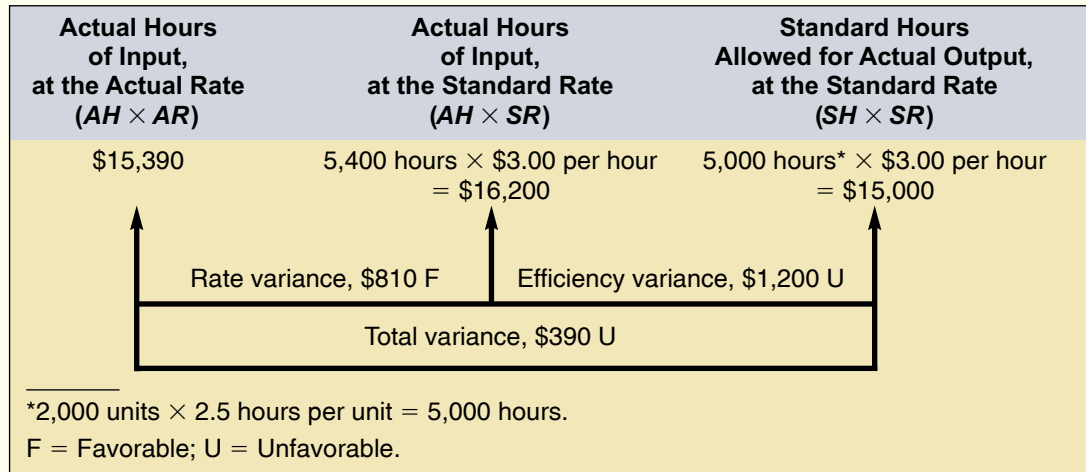

LEARNING OBJECTIVE 4

Compute the variable manufacturing overhead rate and efficiency variances.

The final step in Terry Sherman's analysis of Colonial Pewter's variances for June was to compute the variable manufacturing overhead variances. The variable portion of manufacturing overhead can be analyzed using the same basic formulas that we used to analyze

² For further discussion, see Eliyahu M. Goldratt and Jeff Cox, *The Goal*, 2nd rev. ed. (Croton-on-Hudson, NY: North River Press).

EXHIBIT 10-7 Variance Analysis—Variable Manufacturing Overhead

direct materials and direct labor. Recall from Exhibit 10-2 that the standard variable manufacturing overhead is \$7.50 per unit of product, computed as follows:

$$2.5 \text{ hours per unit} \times \$3.00 \text{ per hour} = \$7.50 \text{ per unit}$$

Colonial Pewter’s cost records showed that the total actual variable manufacturing overhead cost for June was \$15,390. Recall from the earlier discussion of the direct labor variances that 5,400 hours of direct labor time were recorded during the month and that the company produced 2,000 pairs of bookends. Terry’s analysis of this overhead data appears in Exhibit 10-7.

Notice the similarities between Exhibits 10-6 and 10-7. These similarities arise from the fact that direct labor-hours are being used as the base for allocating overhead cost to units of product; thus, the same hourly figures appear in Exhibit 10-7 for variable manufacturing overhead as in Exhibit 10-6 for direct labor. The main difference between the two exhibits is in the standard hourly rate being used, which in this company is much lower for variable manufacturing overhead than for direct labor.

Manufacturing Overhead Variances—A Closer Look

The formula for the **variable overhead rate variance** is expressed as follows:

$$\text{Variable overhead rate variance} = (AH \times AR) - (AH \times SR)$$

↑
↘
↑
 Actual hours Actual rate Standard rate

This formula can be factored as follows:

$$\text{Variable overhead rate variance} = AH(AR - SR)$$

Using the data from Exhibit 10-7 in the formula, the variable overhead rate variance can be computed as follows:

$$AR = \$15,390 \div 5,400 \text{ hours} = \$2.85 \text{ per hour}$$

$$\begin{aligned} \text{Variable overhead rate variance} &= 5,400 \text{ hours} (\$2.85 \text{ per hour} - \$3.00 \text{ per hour}) \\ &= \$810 \text{ F} \end{aligned}$$

The formula for the **variable overhead efficiency variance** is expressed as follows:

$$\text{Variable overhead efficiency variance} = (AH \times SR) - (SH \times SR)$$

Actual hours
Standard rate
Standard hours allowed for actual output

This formula can be factored as follows:

$$\text{Variable overhead efficiency variance} = SR(AH - SH)$$

Again using the data from Exhibit 10–7, the variance can be computed as follows:

$$SH = 2,000 \text{ units} \times 2.5 \text{ hours per unit} = 5,000 \text{ hours}$$

$$\begin{aligned} \text{Variable overhead efficiency variance} &= \$3.00 \text{ per hour} (5,400 \text{ hours} - 5,000 \text{ hours}) \\ &= \$1,200 \text{ U} \end{aligned}$$

The interpretation of the variable overhead variances is not as clear as the direct materials and direct labor variances. In particular, the variable overhead efficiency variance is exactly the same as the direct labor efficiency variance except for one detail—the rate that is used to translate the variance into dollars. In both cases, the variance is the difference between the actual hours worked and the standard hours allowed for the actual output. In the case of the direct labor efficiency variance, this difference is multiplied by the direct labor rate. In the case of the variable overhead efficiency variance, this difference is multiplied by the variable overhead rate. So when direct labor is used as the base for overhead, whenever the direct labor efficiency variance is favorable, the variable overhead efficiency variance will be favorable. And whenever the direct labor efficiency variance is unfavorable, the variable overhead efficiency variance will be unfavorable. Indeed, the variable overhead efficiency variance really doesn't tell us anything about how efficiently overhead resources were used. It depends solely on how efficiently direct labor was used.

Before proceeding further, we suggest that you pause at this point and go back and review the data contained in Exhibits 10–2 through 10–7. These exhibits and the accompanying text discussion provide a comprehensive, integrated illustration of standard setting and variance analysis.

MANAGERIAL ACCOUNTING IN ACTION

The Wrap-up

Colonial
Pewter
Company

In preparation for the scheduled meeting to discuss her analysis of Colonial Pewter's standard costs and variances, Terry distributed Exhibits 10–2 through 10–7 to the management group of Colonial Pewter. This included J. D. Wriston, the president of the company; Tom Kuchel, the production manager; and Janet Warner, the purchasing manager. J. D. Wriston opened the meeting with the following question:

J. D.: Terry, I think I understand the report you distributed, but just to make sure, would you mind summarizing the highlights of what you found?

Terry: As you can see, the biggest problems are the unfavorable materials quantity variance of \$2,000 and the unfavorable labor efficiency variance of \$5,600.

J. D.: Tom, you're the production boss. What do you think is causing the unfavorable labor efficiency variance?

Tom: It has to be the new production workers. Our experienced workers shouldn't have much problem meeting the standard of 2.5 hours per unit. We all knew that there would be some inefficiency for a while as we brought new people on board. My plan for overcoming the problem is to pair up each of the new guys with one of our old-timers and have them work together for a while. It would slow down our older guys a bit, but I'll bet the unfavorable variance disappears and our new workers would learn a lot.

J. D.: Sounds good. Now, what about that \$2,000 unfavorable materials quantity variance?

Terry: Tom, are the new workers generating a lot of scrap?

Tom: Yeah, I guess so.

J. D.: I think that could be part of the problem. Can you do anything about it?

Tom: I can watch the scrap closely for a few days to see where it's being generated. If it is the new workers, I can have the old-timers work with them on the problem when I team them up.

J. D.: Janet, the favorable materials price variance of \$1,300 isn't helping us if it is contributing to the unfavorable materials quantity and labor efficiency variances. Let's make sure that our raw material purchases conform to our quality standards.

Janet: Fair enough.

J. D.: Good. Let's reconvene in a few weeks to see what has happened. Hopefully, we can get those unfavorable variances under control.

Variance Analysis and Management by Exception

Variance analysis and performance reports are important elements of *management by exception*, which is an approach that emphasizes focusing on those areas of responsibility where goals and expectations are not being met.

The budgets and standards discussed in this chapter and in the preceding chapter reflect management's plans. If all goes according to plan, there will be little difference between actual results and the results that would be expected according to the budgets and standards. If this happens, managers can concentrate on other issues. However, if actual results do not conform to the budget and to standards, the performance reporting system sends a signal to managers that an "exception" has occurred. This signal is in the form of a variance from the budget or standards.

However, are all variances worth investigating? The answer is no. Differences between actual results and what was expected will almost always occur. If every variance were investigated, management would waste a great deal of time tracking down nickel-and-dime differences. Variances may occur for a variety of reasons—only some of which are significant and worthy of management's attention. For example, hotter-than-normal weather in the summer may result in higher-than-expected electrical bills for air conditioning. Or, workers may work slightly faster or slower on a particular day. Because of unpredictable random factors, one can expect that virtually every cost category will produce a variance of some kind.

How should managers decide which variances are worth investigating? One clue is the size of the variance. A variance of \$5 is probably not big enough to warrant attention, whereas a variance of \$5,000 might well be worth tracking down. Another clue is the size of the variance relative to the amount of spending. A variance that is only 0.1% of spending on an item is likely to be well within the bounds one would normally expect due to random factors. On the other hand, a variance of 10% of spending is much more likely to be a signal that something is wrong.

A more dependable approach is to plot variance data on a statistical control chart, such as illustrated in Exhibit 10–8. The basic idea underlying a statistical control chart is that some random fluctuations in variances from period to period are normal. A variance should only be investigated when it is unusual relative to that normal level of random fluctuation. Typically, the standard deviation of the variances is used as the measure of the normal level of fluctuations. A rule of thumb is adopted such as "investigate all variances that are more than X standard deviations from zero." In the control chart in Exhibit 10–8, X is 1.0. That is, the rule of thumb in this company is to investigate all variances that are more than one standard deviation in either direction (favorable or unfavorable) from zero. This means that the variances in weeks 7, 11, and 17 would have been investigated, but none of the others.

What value of X should be chosen? The bigger the value of X , the wider the band of acceptable variances that would not be investigated. Thus, the bigger the value of X , the less time will be spent tracking down variances, but the more likely it is that a real out-of-control situation will be overlooked. Ordinarily, if X is selected to be 1.0, roughly 30% of all variances will trigger an investigation even though there is no real problem. If X is set

EXHIBIT 10-8
A Statistical Control Chart

at 1.5, the figure drops to about 13%. If X is set at 2.0, the figure drops all the way to about 5%. Don't forget, however, that selecting a big value of X will result not only in fewer false alarms but also in a higher probability that a real problem will be overlooked.

In addition to watching for unusually large variances, the pattern of the variances should be monitored. For example, a run of steadily mounting variances should trigger an investigation even though none of the variances is large enough by itself to warrant investigation.

International Uses of Standard Costs

Standard costs are used by companies throughout the world. One study found that three-fourths of the companies surveyed in the United Kingdom, two-thirds of the companies surveyed in Canada, and 40% of the companies surveyed in Japan used standard cost systems.³

Standard costs were first introduced in Japan after World War II, with **Nippon Electronics Company (NEC)** being one of the first Japanese companies to adopt standard costs for all of its products. Many other Japanese companies followed NEC's lead and developed standard cost systems. The ways in which these standard costs are used in Japan—and also in the other countries cited above—are shown in Exhibit 10-9.

EXHIBIT 10-9
Uses of Standard Costs in Four Countries

| | United States | United Kingdom | Canada | Japan |
|---------------------------------------|---------------|----------------|--------|-------|
| Cost management | 1* | 2 | 2 | 1 |
| Budgetary planning and control† | 2 | 3 | 1 | 3 |
| Pricing decisions | 3 | 1 | 3 | 2 |
| Financial statement preparation | 4 | 4 | 4 | 4 |

*The numbers 1 through 4 denote importance of use, from greatest to least.

†Includes management planning.

³ Shin'ichi Inoue, "Comparative Studies of Recent Development of Cost Management Problems in U.S.A., U.K., Canada, and Japan," Research Paper No. 29, Kagawa University, p. 17. The study included 95 United States companies, 52 United Kingdom companies, 82 Canadian companies, and 646 Japanese companies.

Over time, the pattern of use shown in Exhibit 10–9 may change, but at present managers can expect to encounter standard costs in most industrialized nations. Moreover, the most important uses are for cost management and budgetary planning purposes.

Evaluation of Controls Based on Standard Costs

Advantages of Standard Costs

Standard cost systems have a number of advantages.

1. Standard costs are a key element in a management by exception approach. If costs conform to the standards, managers can focus on other issues. When costs are significantly outside the standards, managers are alerted that problems may exist that require attention. This approach helps managers focus on important issues.
2. Standards that are viewed as reasonable by employees can promote economy and efficiency. They provide benchmarks that individuals can use to judge their own performance.
3. Standard costs can greatly simplify bookkeeping. Instead of recording actual costs for each job, the standard costs for direct materials, direct labor, and overhead can be charged to jobs.
4. Standard costs fit naturally in an integrated system of “responsibility accounting.” The standards establish what costs should be, who should be responsible for them, and whether actual costs are under control.

Potential Problems with the Use of Standard Costs

The improper use of standard costs can present a number of potential problems.

1. Standard cost variance reports are usually prepared on a monthly basis and often are released days or even weeks after the end of the month. As a consequence, the information in the reports may be so outdated that it is almost useless. Timely, frequent reports that are approximately correct are better than infrequent reports that are very precise but out of date by the time they are released. Some companies are now reporting variances and other key operating data daily or even more frequently.
2. If managers are insensitive and use variance reports as a club, morale will suffer. Employees should receive positive reinforcement for work well done. Management by exception, by its nature, tends to focus on the negative. If variances are used as a club, subordinates may be tempted to cover up unfavorable variances or take actions that are not in the best interests of the company to make sure the variances are favorable. For example, workers may put on a crash effort to increase output at the end of the month to avoid an unfavorable labor efficiency variance. In the rush to produce more output, quality may suffer.
3. Labor quantity standards and efficiency variances make two important assumptions. First, they assume that the production process is labor-paced; if labor works faster, output will go up. However, output in many companies is not determined by how fast labor works; rather, it is determined by the processing speed of machines. Second, the computations assume that labor is a variable cost. However, direct labor may be essentially fixed. If labor is fixed, then an undue emphasis on labor efficiency variances creates pressure to build excess inventories.
4. In some cases, a “favorable” variance can be as bad or worse than an “unfavorable” variance. For example, **McDonald’s** has a standard for the amount of hamburger meat that should be in a Big Mac. A “favorable” variance would mean that less meat was used than the standard specifies. The result is a substandard Big Mac and possibly a dissatisfied customer.

5. Too much emphasis on meeting the standards may overshadow other important objectives such as maintaining and improving quality, on-time delivery, and customer satisfaction. This tendency can be reduced by using supplemental performance measures that focus on these other objectives.
6. Just meeting standards may not be sufficient; continual improvement using techniques such as Six Sigma may be necessary to survive in a competitive environment. For this reason, some companies focus on the trends in the standard cost variances—aiming for continual improvement rather than just meeting the standards. In other companies, engineered standards are replaced either by a rolling average of actual costs, which is expected to decline, or by very challenging target costs.

In sum, managers should exercise considerable care when using a standard cost system. It is particularly important that managers go out of their way to focus on the positive, rather than just on the negative, and to be aware of possible unintended consequences.

Operating Performance Measures

LEARNING OBJECTIVE 5

Compute delivery cycle time, throughput time, and manufacturing cycle efficiency (MCE).

In addition to the financial performance measures discussed in this and the last chapter, organizations use many nonfinancial performance measures. While financial measures pick up the *results* of what people in the organization do, they do not measure what *drives* organizational performance. For example, activity and revenue variances pick up the results of efforts aimed at increasing sales, but they do not measure the actions that actually drive sales such as improving quality, exposing more potential customers to the product, filling customer orders on time, and so on. Consequently, many organizations use a variety of nonfinancial performance measures in addition to financial measures. In this section we will discuss three examples of such measures that are critical to success in many organizations—delivery cycle time, throughput time, and manufacturing cycle efficiency. Note that while these examples focus on manufacturers, very similar measures can be used by any service organization that experiences a delay between receiving a customer request and responding to that request.

Delivery Cycle Time

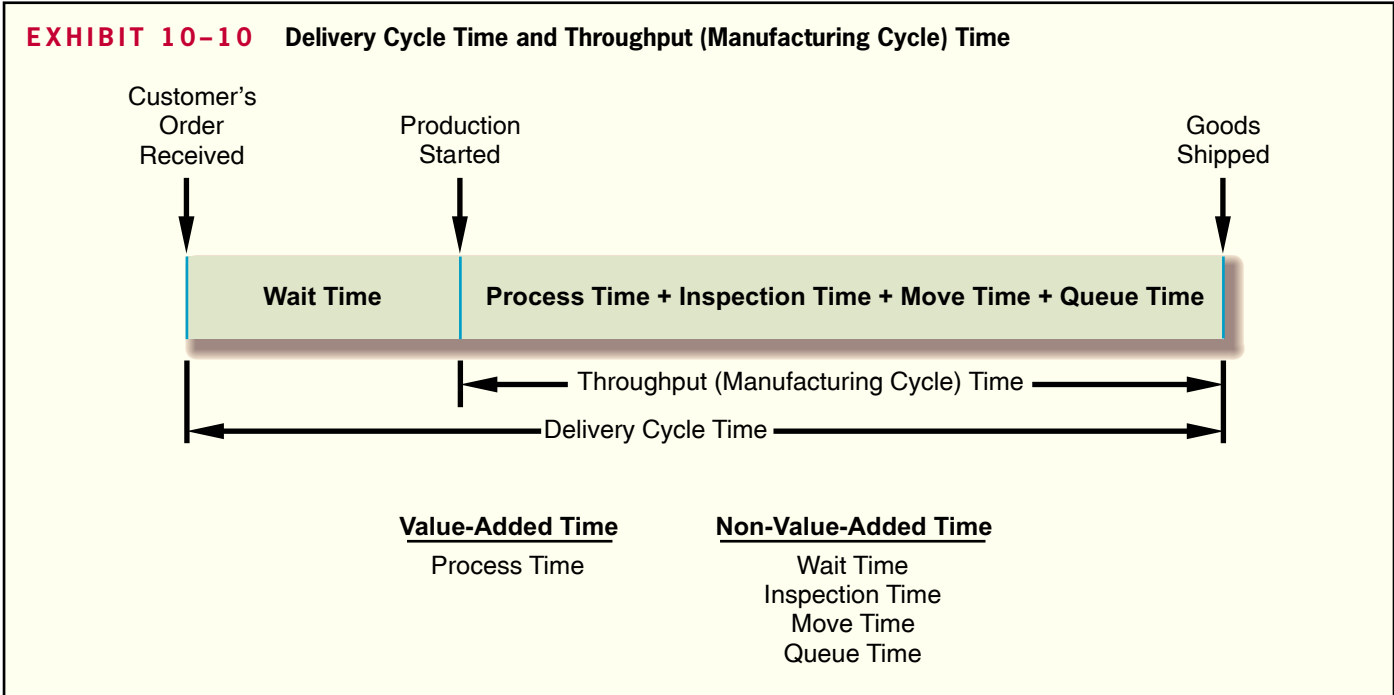

The amount of time from when a customer order is received to when the completed order is shipped is called **delivery cycle time**. This time is clearly a key concern to many customers, who would like the delivery cycle time to be as short as possible. Cutting the delivery cycle time may give a company a key competitive advantage—and may be necessary for survival.

Throughput (Manufacturing Cycle) Time

The amount of time required to turn raw materials into completed products is called **throughput time**, or *manufacturing cycle time*. The relation between the delivery cycle time and the throughput (manufacturing cycle) time is illustrated in Exhibit 10–10.

As shown in Exhibit 10–10, the throughput time, or manufacturing cycle time, is made up of process time, inspection time, move time, and queue time. *Process time* is the amount of time work is actually done on the product. *Inspection time* is the amount of time spent ensuring that the product is not defective. *Move time* is the time required to move materials or partially completed products from workstation to workstation. *Queue time* is the amount of time a product spends waiting to be worked on, to be moved, to be inspected, or to be shipped.

As shown at the bottom of Exhibit 10–10, only one of these four activities adds value to the product—process time. The other three activities—inspecting, moving, and queuing—add no value and should be eliminated as much as possible.

Manufacturing Cycle Efficiency (MCE)

Through concerted efforts to eliminate the *non-value-added* activities of inspecting, moving, and queuing, some companies have reduced their throughput time to only a fraction of previous levels. In turn, this has helped to reduce the delivery cycle time from months to only weeks or hours. Throughput time, which is considered to be a key measure in delivery performance, can be put into better perspective by computing the **manufacturing cycle efficiency (MCE)**. The MCE is computed by relating the value-added time to the throughput time. The formula is:

$$MCE = \frac{\text{Value-added time (Process time)}}{\text{Throughput (manufacturing cycle) time}}$$

Any non-value-added time results in an MCE of less than 1. An MCE of 0.5, for example, would mean that half of the total production time consists of inspection, moving, and similar non-value-added activities. In many manufacturing companies, the MCE is less than 0.1 (10%), which means that 90% of the time a unit is in process is spent on activities that do not add value to the product. Monitoring the MCE helps companies to reduce non-value-added activities and thus get products into the hands of customers more quickly and at a lower cost.

Example To provide an example of these measures, consider the following data for Novex Company:

Novex Company keeps careful track of the time to complete customer orders. During the most recent quarter, the following average times were recorded for each unit or order:

| | Days |
|-----------------------|------|
| Wait time | 17.0 |
| Inspection time | 0.4 |
| Process time | 2.0 |
| Move time | 0.6 |
| Queue time | 5.0 |

Goods are shipped as soon as production is completed.

Required:

1. Compute the throughput time.
2. Compute the manufacturing cycle efficiency (MCE).
3. What percentage of the production time is spent in non-value-added activities?
4. Compute the delivery cycle time.

Solution

1. Throughput time = Process time + Inspection time + Move time + Queue time
 $= 2.0 \text{ days} + 0.4 \text{ days} + 0.6 \text{ days} + 5.0 \text{ days}$
 $= 8.0 \text{ days}$
2. Only process time represents value-added time; therefore, the computation of the MCE would be as follows:

$$\text{MCE} = \frac{\text{Value-added time}}{\text{Throughput time}} = \frac{2.0 \text{ days}}{8.0 \text{ days}}$$

$$= 0.25$$

Thus, once put into production, a typical unit is actually being worked on only 25% of the time.

3. Because the MCE is 25%, 75% (100% – 25%) of total production time is spent in non-value-added activities.
4. Delivery cycle time = Wait time + Throughput time
 $= 17.0 \text{ days} + 8.0 \text{ days}$
 $= 25.0 \text{ days}$

IN BUSINESS**DELIVERY CYCLE TIMES IN THE DARK AGES**

Have you ever ordered a new magazine and counted how many days it took for the first issue to arrive? Chances are that your delivery cycle time was somewhere between four to six weeks—a glacial pace in today's Internet environment. One of the root causes of the problem is fragmented organizational structures where circulation, fulfillment, production, manufacturing, and distribution focus on their departmental agendas instead of the customer. Most circulation directors agree that removing non-value-added time from the process of responding to customer orders would certainly have its benefits. For example, customers who receive their first issue of the magazine sooner are likely to pay their bill sooner. Furthermore, they are less likely to cancel their subscription or issue complaints that are costly to resolve.

One way to reduce the problem is for publishers to mail the first issue to customers using first class mail rather than periodical mail. This would shave six to seven days off of their delivery cycle time, but it would also cost an extra 80 to 90 cents for each first issue mailed. Do you think the time saved is worth the money spent?

Source: William B. Dugan, "Thanks for Ordering our Magazine . . . Now Don't Expect to See It for Five Weeks," *Circulation Management*, May 1, 2004, pp. 24–29.

Summary

A standard is a benchmark, or "norm," for measuring performance. Standards are set for both the cost and the quantity of inputs needed to manufacture goods or to provide services. Quantity standards indicate how much of an input, such as labor time or raw materials, should be used to make a product or provide a service. Cost standards indicate what the cost of the input should be.

Standards are normally set so that they can be attained by reasonable, though highly efficient, efforts. Such "practical" standards are believed to positively motivate employees.

When standards are compared to actual performance, the difference is referred to as a *variance*. Variances are computed and reported to management on a regular basis for both the price and the quantity elements of direct materials, direct labor, and variable overhead. Price variances are computed by taking the difference between actual and standard prices and multiplying the result by the amount of input purchased. Quantity variances are computed by taking the difference between the actual amount of the input used and the amount of input that is allowed for the actual output, and then multiplying the result by the standard price of the input.

Not all variances require management time or attention. Only unusual or particularly significant variances should be investigated—otherwise a great deal of time would be spent investigating unimportant matters. Additionally, it should be emphasized that the point of the investigation should not be to find someone to blame. The point of the investigation is to pinpoint the problem so that it can be fixed and operations improved.

Traditional standard cost variance reports are often supplemented with other performance measures. Overemphasis on standard cost variances may lead to problems in other critical areas such as product quality, inventory levels, and on-time delivery.

Review Problem: Standard Costs

Xavier Company produces a single product. Variable manufacturing overhead is applied to products on the basis of direct labor-hours. The standard costs for one unit of product are as follows:

| | |
|--|-------------|
| Direct material: 6 ounces at \$0.50 per ounce | \$ 3 |
| Direct labor: 1.8 hours at \$10 per hour | 18 |
| Variable manufacturing overhead: 1.8 hours at \$5 per hour | 9 |
| Total standard variable cost per unit | <u>\$30</u> |

During June, 2,000 units were produced. The costs associated with June's operations were as follows:

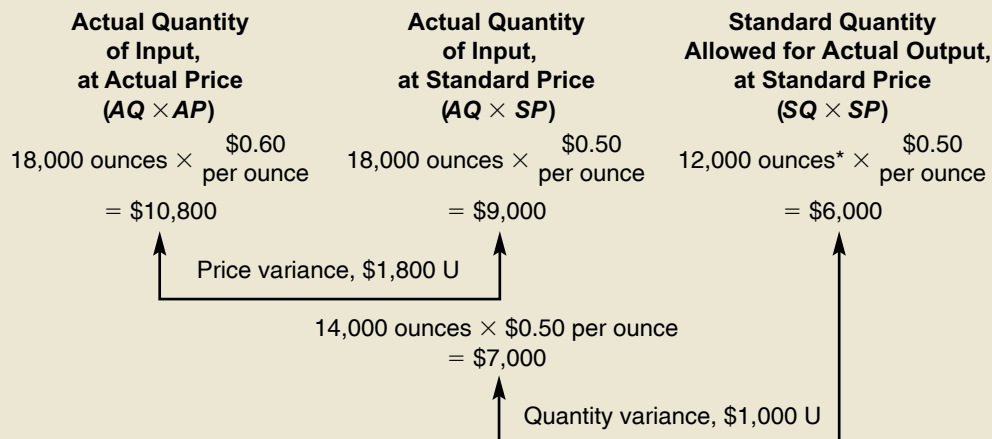

| | |
|---|----------|
| Material purchased: 18,000 ounces at \$0.60 per ounce | \$10,800 |
| Material used in production: 14,000 ounces | — |
| Direct labor: 4,000 hours at \$9.75 per hour | \$39,000 |
| Variable manufacturing overhead costs incurred | \$20,800 |

Required:

Compute the direct materials, direct labor, and variable manufacturing overhead variances.

Solution to the Review Problem

Direct Materials Variances

*2,000 units × 6 ounces per unit = 12,000 ounces.

Using the formulas in the chapter, the same variances would be computed as follows:

$$\text{Materials price variance} = AQ(AP - SP)$$

$$18,000 \text{ ounces } (\$0.60 \text{ per ounce} - \$0.50 \text{ per ounce}) = \$1,800 \text{ U}$$

$$\text{Materials quantity variance} = SP(AQ - SQ)$$

$$\$0.50 \text{ per ounce } (14,000 \text{ ounces} - 12,000 \text{ ounces}) = \$1,000 \text{ U}$$

Direct Labor Variances

| Actual Hours of Input, at the Actual Rate ($AH \times AR$) | Actual Hours of Input, at the Standard Rate ($AH \times SR$) | Standard Hours Allowed for Actual Output, at the Standard Rate ($SH \times SR$) |
|--|--|--|
| 4,000 hours \times \$9.75 per hour = \$39,000 | 4,000 hours \times \$10.00 per hour = \$40,000 | 3,600 hours* \times \$10.00 per hour = \$36,000 |
| ↑ Rate variance, \$1,000 F | | ↑ Efficiency variance, \$4,000 U |
| Total variance, \$3,000 U | | |

*2,000 units \times 1.8 hours per unit = 3,600 hours.

Using the formulas in the chapter, the same variances would be computed as:

$$\text{Labor rate variance} = AH(AR - SR)$$

$$4,000 \text{ hours } (\$9.75 \text{ per hour} - \$10.00 \text{ per hour}) = \$1,000 \text{ F}$$

$$\text{Labor efficiency variance} = SR(AH - SH)$$

$$\$10.00 \text{ per hour } (4,000 \text{ hours} - 3,600 \text{ hours}) = \$4,000 \text{ U}$$

Variable Manufacturing Overhead Variances

| Actual Hours of Input, at the Actual Rate ($AH \times AR$) | Actual Hours of Input, at the Standard Rate ($AH \times SR$) | Standard Hours Allowed for Actual Output, at the Standard Rate ($SH \times SR$) |
|--|--|--|
| \$20,800 | 4,000 hours \times \$5.00 per hour = \$20,000 | 3,600 hours* \times \$5.00 per hour = \$18,000 |
| ↑ Rate variance, \$800 U | | ↑ Efficiency variance, \$2,000 U |
| Total variance, \$2,800 U | | |

*2,000 units \times 1.8 hours per unit = 3,600 hours.

Using the formulas in the chapter, the same variances would be computed as follows:

$$\text{Variable overhead rate variance} = AH(AR - SR)$$

$$AR = \$20,800 \div 4,000 \text{ hours} = \$5.20 \text{ per hour}$$

$$4,000 \text{ hours } (\$5.20 \text{ per hour} - \$5.00 \text{ per hour}) = \$800 \text{ U}$$

$$\text{Variable overhead efficiency variance} = SR(AH - SH)$$

$$\$5.00 \text{ per hour } (4,000 \text{ hours} - 3,600 \text{ hours}) = \$2,000 \text{ U}$$

Glossary

- Delivery cycle time** The elapsed time from receipt of a customer order to when the completed goods are shipped to the customer. (p. 388)
- Ideal standards** Standards that assume peak efficiency at all times. (p. 371)
- Labor efficiency variance** The difference between the actual hours taken to complete a task and the standard hours allowed for the actual output, multiplied by the standard hourly labor rate. (p. 381)
- Labor rate variance** The difference between the actual hourly labor rate and the standard rate, multiplied by the number of hours worked during the period. (p. 381)
- Management by exception** A management system in which standards are set for various activities, with actual results compared to these standards. Significant deviations from standards are flagged as exceptions. (p. 369)
- Manufacturing cycle efficiency (MCE)** Process (value-added) time as a percentage of throughput time. (p. 389)
- Materials price variance** The difference between the actual unit price paid for an item and the standard price, multiplied by the quantity purchased. (p. 378)
- Materials quantity variance** The difference between the actual quantity of materials used in production and the standard quantity allowed for the actual output, multiplied by the standard price per unit of materials. (p. 379)
- Practical standards** Standards that allow for normal machine downtime and other work interruptions and that can be attained through reasonable, though highly efficient, efforts by the average worker. (p. 371)
- Price variance** A variance that is computed by taking the difference between the actual price and the standard price and multiplying the result by the actual quantity of the input. (p. 374)
- Quantity variance** A variance that is computed by taking the difference between the actual quantity of the input used and the amount of the input that should have been used for the actual level of output and multiplying the result by the standard price of the input. (p. 374)
- Standard cost card** A detailed listing of the standard amounts of inputs and their costs that are required to produce a unit of a specific product. (p. 370)
- Standard cost per unit** The standard quantity allowed of an input per unit of a specific product, multiplied by the standard price of the input. (p. 373)
- Standard hours allowed** The time that should have been taken to complete the period's output. It is computed by multiplying the actual number of units produced by the standard hours per unit. (p. 375)
- Standard hours per unit** The amount of direct labor time that should be required to complete a single unit of product, including allowances for breaks, machine downtime, cleanup, rejects, and other normal inefficiencies. (p. 373)
- Standard price per unit** The price that should be paid for an input. The price should be net of discounts and should include any shipping costs. (p. 372)
- Standard quantity allowed** The amount of an input that should have been used to complete the period's actual output. It is computed by multiplying the actual number of units produced by the standard quantity per unit. (p. 375)
- Standard quantity per unit** The amount of an input that should be required to complete a single unit of product, including allowances for normal waste, spoilage, rejects, and other normal inefficiencies. (p. 372)
- Standard rate per hour** The labor rate that should be incurred per hour of labor time, including employment taxes and fringe benefits. (p. 373)
- Throughput time** The amount of time required to turn raw materials into completed products. (p. 388)
- Variable overhead efficiency variance** The difference between the actual level of activity (direct labor-hours, machine-hours, or some other base) and the standard activity allowed, multiplied by the variable part of the predetermined overhead rate. (p. 384)
- Variable overhead rate variance** The difference between the actual variable overhead cost incurred during a period and the standard cost that should have been incurred based on the actual activity of the period. (p. 383)

Questions

- 10-1 What is a quantity standard? What is a price standard?
- 10-2 Distinguish between ideal and practical standards.
- 10-3 What is meant by the term *management by exception*?

- 10-4 Why are separate price and quantity variances computed?
- 10-5 Who is generally responsible for the materials price variance? The materials quantity variance? The labor efficiency variance?
- 10-6 The materials price variance can be computed at what two different points in time? Which point is better? Why?
- 10-7 If the materials price variance is favorable but the materials quantity variance is unfavorable, what might this indicate?
- 10-8 Should standards be used to identify who to blame for problems?
- 10-9 “Our workers are all under labor contracts; therefore, our labor rate variance is bound to be zero.” Discuss.
- 10-10 What effect, if any, would you expect poor-quality materials to have on direct labor variances?
- 10-11 If variable manufacturing overhead is applied to production on the basis of direct labor-hours and the direct labor efficiency variance is unfavorable, will the variable overhead efficiency variance be favorable or unfavorable, or could it be either? Explain.
- 10-12 What is a statistical control chart, and how is it used?
- 10-13 Why can undue emphasis on labor efficiency variances lead to excess work in process inventories?
- 10-14 What is the difference between delivery cycle time and throughput time? What four elements make up throughput time? Into what two classes can these four elements be placed?
- 10-15 If a company has a manufacturing cycle efficiency (MCE) of less than 1, what does it mean? How would you interpret an MCE of 0.40?

Multiple-choice questions are provided on the text website at www.mhhe.com/noreen2e.

Exercises

connect™

EXERCISE 10-1 Setting Standards; Preparing a Standard Cost Card [LO1]

Martin Company manufactures a powerful cleaning solvent. The main ingredient in the solvent is a raw material called Echol. Information concerning the purchase and use of Echol follows:

Purchase of Echol Echol is purchased in 15-gallon containers at a cost of \$115 per container. A discount of 2% is offered by the supplier for payment within 10 days, and Martin Company takes all discounts. Shipping costs, which Martin Company must pay, amount to \$130 for an average shipment of 100 15-gallon containers of Echol.

Use of Echol The bill of materials calls for 7.6 quarts of Echol per bottle of cleaning solvent. (Each gallon contains four quarts.) About 5% of all Echol used is lost through spillage or evaporation (the 7.6 quarts above is the *actual* content per bottle). In addition, statistical analysis has shown that every 41st bottle is rejected at final inspection because of contamination.

Required:

1. Compute the standard purchase price for one quart of Echol.
2. Compute the standard quantity of Echol (in quarts) per salable bottle of cleaning solvent.
3. Using the data from (1) and (2) above, prepare a standard cost card showing the standard cost of Echol per bottle of cleaning solvent.

EXERCISE 10-2 Direct Materials Variances [LO2]

Bandar Industries Berhad of Malaysia manufactures sporting equipment. One of the company's products, a football helmet for the North American market, requires a special plastic. During the quarter ending June 30, the company manufactured 35,000 helmets, using 22,500 kilograms of plastic. The plastic cost the company RM171,000. (The currency in Malaysia is the ringgit, which is denoted here by RM.)

According to the standard cost card, each helmet should require 0.6 kilograms of plastic, at a cost of RM8 per kilogram.

Required:

1. What cost for plastic should have been incurred to make 35,000 helmets? How much greater or less is this than the cost that was incurred?
2. Break down the difference computed in (1) above into a materials price variance and a materials quantity variance.

EXERCISE 10–3 Direct Labor Variances [L03]

SkyChefs, Inc., prepares in-flight meals for a number of major airlines. One of the company’s products is grilled salmon in dill sauce with baby new potatoes and spring vegetables. During the most recent week, the company prepared 4,000 of these meals using 960 direct labor-hours. The company paid these direct labor workers a total of \$9,600 for this work, or \$10.00 per hour.

According to the standard cost card for this meal, it should require 0.25 direct labor-hours at a cost of \$9.75 per hour.

Required:

1. What direct labor cost should have been incurred to prepare 4,000 meals? How much does this differ from the actual direct labor cost?
2. Break down the difference computed in (1) above into a labor rate variance and a labor efficiency variance.

EXERCISE 10–4 Variable Overhead Variances [L04]

Logistics Solutions provides order fulfillment services for dot.com merchants. The company maintains warehouses that stock items carried by its dot.com clients. When a client receives an order from a customer, the order is forwarded to Logistics Solutions, which pulls the item from storage, packs it, and ships it to the customer. The company uses a predetermined variable overhead rate based on direct labor-hours.

In the most recent month, 120,000 items were shipped to customers using 2,300 direct labor-hours. The company incurred a total of \$7,360 in variable overhead costs.

According to the company’s standards, 0.02 direct labor-hours are required to fulfill an order for one item and the variable overhead rate is \$3.25 per direct labor-hour.

Required:

1. What variable overhead cost should have been incurred to fill the orders for the 120,000 items? How much does this differ from the actual variable overhead cost?
2. Break down the difference computed in (1) above into a variable overhead rate variance and a variable overhead efficiency variance.

EXERCISE 10–5 Measures of Internal Business Process Performance [L05]

Management of Mittel Rhein AG of Köln, Germany, would like to reduce the amount of time between when a customer places an order and when the order is shipped. For the first quarter of operations during the current year the following data were reported:

| | |
|---|-----------|
| Inspection time | 0.3 days |
| Wait time (from order to start of production) | 14.0 days |
| Process time | 2.7 days |
| Move time | 1.0 days |
| Queue time | 5.0 days |

Required:

1. Compute the throughput time.
2. Compute the manufacturing cycle efficiency (MCE) for the quarter.
3. What percentage of the throughput time was spent in non-value-added activities?
4. Compute the delivery cycle time.
5. If by using Lean Production all queue time during production is eliminated, what will be the new MCE?

EXERCISE 10–6 Setting Standards [L01]

Victoria Chocolates, Ltd., makes premium handcrafted chocolate confections in London. The owner of the company is setting up a standard cost system and has collected the following data for one of the company’s products, the Empire Truffle. This product is made with the finest white chocolate and various fillings. The data below pertain only to the white chocolate used in the product (the currency is stated in pounds denoted here as £):

| | |
|--|----------------------|
| Material requirements, kilograms of white chocolate per dozen truffles ... | 0.70 kilograms |
| Allowance for waste, kilograms of white chocolate per dozen truffles | 0.03 kilograms |
| Allowance for rejects, kilograms of white chocolate per dozen truffles | 0.02 kilograms |
| Purchase price, finest grade white chocolate | £7.50 per kilogram |
| Purchase discount | 8% of purchase price |
| Shipping cost from the supplier in Belgium | £0.30 per kilogram |
| Receiving and handling cost | £0.04 per kilogram |

Required:

1. Determine the standard price of a kilogram of white chocolate.
2. Determine the standard quantity of white chocolate for a dozen truffles.
3. Determine the standard cost of the white chocolate in a dozen truffles.

EXERCISE 10-7 Direct Materials and Direct Labor Variances [L02, L03]

Dawson Toys, Ltd., produces a toy called the Maze. The company has recently established a standard cost system to help control costs and has established the following standards for the Maze toy:

Direct materials: 6 microns per toy at \$0.50 per micron
 Direct labor: 1.3 hours per toy at \$8 per hour

During July, the company produced 3,000 Maze toys. Production data for the month on the toy follow:

Direct materials: 25,000 microns were purchased at a cost of \$0.48 per micron. 5,000 of these microns were still in inventory at the end of the month.

Direct labor: 4,000 direct labor-hours were worked at a cost of \$36,000.

Required:

1. Compute the following variances for July:
 - a. Direct materials price and quantity variances.
 - b. Direct labor rate and efficiency variances.
2. Prepare a brief explanation of the possible causes of each variance.

EXERCISE 10-8 Direct Materials and Direct Labor Variances [L02, L03]

Huron Company produces a commercial cleaning compound known as Zoom. The direct materials and direct labor standards for one unit of Zoom are given below:

| | Standard Quantity or Hours | Standard Price or Rate | Standard Cost |
|------------------------|-------------------------------|---------------------------|------------------|
| Direct materials | 4.6 pounds | \$2.50 per pound | \$11.50 |
| Direct labor | 0.2 hours | \$12.00 per hour | \$2.40 |

During the most recent month, the following activity was recorded:

- a. Twenty thousand pounds of material were purchased at a cost of \$2.35 per pound.
- b. All of the material purchased was used to produce 4,000 units of Zoom.
- c. 750 hours of direct labor time were recorded at a total labor cost of \$10,425.

Required:

1. Compute the direct materials price and quantity variances for the month.
2. Compute the direct labor rate and efficiency variances for the month.

EXERCISE 10-9 Direct Materials Variances [L02]

Refer to the data in Exercise 10-8. Assume that instead of producing 4,000 units during the month, the company produced only 3,000 units, using 14,750 pounds of material. (The rest of the material purchased remained in raw materials inventory.)

Required:

Compute the direct materials price and quantity variances for the month.

EXERCISE 10-10 Direct Labor and Variable Manufacturing Overhead Variances [L03, L04]

Erie Company manufactures a small CD player called the Jogging Mate. The company uses standards to control its costs. The labor standards that have been set for one Jogging Mate CD player are as follows:

| Standard Hours | Standard Rate per Hour | Standard Cost |
|-------------------|---------------------------|------------------|
| 18 minutes | \$12.00 | \$3.60 |

During August, 5,750 hours of direct labor time were needed to make 20,000 units of the Jogging Mate. The direct labor cost totaled \$73,600 for the month.

Required:

1. What direct labor cost should have been incurred to make 20,000 units of the Jogging Mate? By how much does this differ from the cost that was incurred?
2. Break down the difference in cost from (1) above into a labor rate variance and a labor efficiency variance.
3. The budgeted variable manufacturing overhead rate is \$4 per direct labor-hour. During August, the company incurred \$21,850 in variable manufacturing overhead cost. Compute the variable overhead rate and efficiency variances for the month.

EXERCISE 10–11 Working Backwards from Labor Variances [L03]

The auto repair shop of Quality Motor Company uses standards to control the labor time and labor cost in the shop. The standard labor cost for a motor tune-up is given below:

| Job | Standard Hours | Standard Rate | Standard Cost |
|---------------------|----------------|---------------|---------------|
| Motor tune-up | 2.5 | \$9.00 | \$22.50 |

The record showing the time spent in the shop last week on motor tune-ups has been misplaced. However, the shop supervisor recalls that 50 tune-ups were completed during the week, and the controller recalls the following variance data relating to tune-ups:

| | |
|----------------------------|--------|
| Labor rate variance | \$87 F |
| Total labor variance | \$93 U |

Required:

1. Determine the number of actual labor-hours spent on tune-ups during the week.
 2. Determine the actual hourly rate of pay for tune-ups last week.
- (Hint: A useful way to proceed would be to work from known to unknown data either by using the variance formulas or by using the columnar format shown in Exhibit 10–6.)

connect™

Problems

PROBLEM 10–12 Basic Variance Analysis [L02, L03, L04]

Becton Labs, Inc., produces various chemical compounds for industrial use. One compound, called Fludex, is prepared using an elaborate distilling process. The company has developed standard costs for one unit of Fludex, as follows:

| | A | B | C | D | E | F |
|---|---------------------------------|----------|----------|----------|-----------|-----------------|
| 1 | | Standard | Standard | Standard | Standard | |
| 2 | Direct materials | 2.5 | ounces | \$20.00 | per ounce | \$ 50.00 |
| 3 | Direct labor | 1.4 | hours | \$12.50 | per hour | 17.50 |
| 4 | Variable manufacturing overhead | 1.4 | hours | \$3.50 | per hour | 4.90 |
| 5 | | | | | | <u>\$ 72.40</u> |
| 6 | | | | | | |

- During November, the following activity was recorded relative to production of Fludex:
- Materials purchased, 12,000 ounces at a cost of \$225,000.
 - There was no beginning inventory of materials; however, at the end of the month, 2,500 ounces of material remained in ending inventory.
 - The company employs 35 lab technicians to work on the production of Fludex. During November, they worked an average of 160 hours at an average rate of \$12 per hour.
 - Variable manufacturing overhead is assigned to Fludex on the basis of direct labor-hours. Variable manufacturing overhead costs during November totaled \$18,200.
 - During November, 3,750 good units of Fludex were produced.
- The company's management is anxious to determine the efficiency of Fludex production activities.

Required:

- For direct materials used in the production of Fludex:
 - Compute the price and quantity variances.
 - The materials were purchased from a new supplier who is anxious to enter into a long-term purchase contract. Would you recommend that the company sign the contract? Explain.
- For direct labor employed in the production of Fludex:
 - Compute the rate and efficiency variances.
 - In the past, the 35 technicians employed in the production of Fludex consisted of 20 senior technicians and 15 assistants. During November, the company experimented with fewer senior technicians and more assistants in order to save costs. Would you recommend that the new labor mix be continued? Explain.
- Compute the variable overhead rate and efficiency variances. What relation can you see between this efficiency variance and the labor efficiency variance?

PROBLEM 10-13 Measures of Internal Business Process Performance [L05]

DataSpan, Inc., automated its plant at the start of the current year and installed a flexible manufacturing system. The company is also evaluating its suppliers and moving toward Lean Production. Many adjustment problems have been encountered, including problems relating to performance measurement. After much study, the company has decided to use the performance measures below, and it has gathered data relating to these measures for the first four months of operations.

| | Month | | | |
|--|-------|-------|-------|-------|
| | 1 | 2 | 3 | 4 |
| Throughput time (days) | ? | ? | ? | ? |
| Delivery cycle time (days) | ? | ? | ? | ? |
| Manufacturing cycle efficiency (MCE) | ? | ? | ? | ? |
| Percentage of on-time deliveries | 91% | 86% | 83% | 79% |
| Total sales (units) | 3,210 | 3,072 | 2,915 | 2,806 |

Management has asked for your help in computing throughput time, delivery cycle time, and MCE. The following average times have been logged over the last four months:

| | Average per Month (in days) | | | |
|---|-----------------------------|------|------|------|
| | 1 | 2 | 3 | 4 |
| Move time per unit | 0.4 | 0.3 | 0.4 | 0.4 |
| Process time per unit | 2.1 | 2.0 | 1.9 | 1.8 |
| Wait time per order before start of production | 16.0 | 17.5 | 19.0 | 20.5 |
| Queue time per unit | 4.3 | 5.0 | 5.8 | 6.7 |
| Inspection time per unit | 0.6 | 0.7 | 0.7 | 0.6 |

Required:

- For each month, compute the following:
 - The throughput time.
 - The MCE.
 - The delivery cycle time.

2. Evaluate the company’s performance over the last four months.
3. Refer to the move time, process time, and so forth, given above for month 4.
 - a. Assume that in month 5 the move time, process time, and so forth, are the same as in month 4, except that through the use of Lean Production the company is able to completely eliminate the queue time during production. Compute the new throughput time and MCE.
 - b. Assume in month 6 that the move time, process time, and so forth, are again the same as in month 4, except that the company is able to completely eliminate both the queue time during production and the inspection time. Compute the new throughput time and MCE.

PROBLEM 10–14 Comprehensive Variance Analysis [LO2, LO3, LO4]

Miller Toy Company manufactures a plastic swimming pool at its Westwood Plant. The plant has been experiencing problems as shown by its June contribution format income statement below:

| | Budgeted | Actual |
|------------------------------------|------------------|------------------|
| Sales (15,000 pools) | \$450,000 | \$450,000 |
| Variable expenses: | | |
| Variable cost of goods sold* | 180,000 | 196,290 |
| Variable selling expenses | 20,000 | 20,000 |
| Total variable expenses | <u>200,000</u> | <u>216,290</u> |
| Contribution margin | 250,000 | 233,710 |
| Fixed expenses: | | |
| Manufacturing overhead | 130,000 | 130,000 |
| Selling and administrative | 84,000 | 84,000 |
| Total fixed expenses | <u>214,000</u> | <u>214,000</u> |
| Net operating income | <u>\$ 36,000</u> | <u>\$ 19,710</u> |

*Contains direct materials, direct labor, and variable manufacturing overhead.

Janet Dunn, who has just been appointed general manager of the Westwood Plant, has been given instructions to “get things under control.” Upon reviewing the plant’s income statement, Ms. Dunn has concluded that the major problem lies in the variable cost of goods sold. She has been provided with the following standard cost per swimming pool:

| | Standard Quantity or Hours | Standard Price or Rate | Standard Cost |
|---------------------------------------|-------------------------------|---------------------------|------------------|
| Direct materials | 3.0 pounds | \$2.00 per pound | \$ 6.00 |
| Direct labor | 0.8 hours | \$6.00 per hour | 4.80 |
| Variable manufacturing overhead | 0.4 hours* | \$3.00 per hour | 1.20 |
| Total standard cost | | | <u>\$12.00</u> |

*Based on machine-hours.

During June the plant produced 15,000 pools and incurred the following costs:

- a. Purchased 60,000 pounds of materials at a cost of \$1.95 per pound.
- b. Used 49,200 pounds of materials in production. (Finished goods and work in process inventories are insignificant and can be ignored.)
- c. Worked 11,800 direct labor-hours at a cost of \$7.00 per hour.
- d. Incurred variable manufacturing overhead cost totaling \$18,290 for the month. A total of 5,900 machine-hours was recorded.

It is the company’s policy to close all variances to cost of goods sold on a monthly basis.

Required:

1. Compute the following variances for June:
 - a. Direct materials price and quantity variances.
 - b. Direct labor rate and efficiency variances.
 - c. Variable overhead rate and efficiency variances.

2. Summarize the variances that you computed in (1) above by showing the net overall favorable or unfavorable variance for the month. What impact did this figure have on the company's income statement? Show computations.
3. Pick out the two most significant variances that you computed in (1) above. Explain to Ms. Dunn possible causes of these variances.

excel

PROBLEM 10–15 Variance Analysis in a Hospital [L02, L03, L04]

John Fleming, chief administrator for Valley View Hospital, is concerned about the costs for tests in the hospital's lab. Charges for lab tests are consistently higher at Valley View than at other hospitals and have resulted in many complaints. Also, because of strict regulations on amounts reimbursed for lab tests, payments received from insurance companies and governmental units have not been high enough to cover lab costs.

Mr. Fleming has asked you to evaluate costs in the hospital's lab for the past month. The following information is available:

- a. Two types of tests are performed in the lab—blood tests and smears. During the past month, 1,800 blood tests and 2,400 smears were performed in the lab.
- b. Small glass plates are used in both types of tests. During the past month, the hospital purchased 12,000 plates at a cost of \$28,200. This cost is net of a 6% quantity discount. 1,500 of these plates were unused at the end of the month; no plates were on hand at the beginning of the month.
- c. During the past month, 1,150 hours of labor time were recorded in the lab at a cost of \$13,800.
- d. The lab's variable overhead cost last month totaled \$7,820.

Valley View Hospital has never used standard costs. By searching industry literature, however, you have determined the following nationwide averages for hospital labs:

Plates: Two plates are required per lab test. These plates cost \$2.50 each and are disposed of after the test is completed.

Labor: Each blood test should require 0.3 hours to complete, and each smear should require 0.15 hours to complete. The average cost of this lab time is \$14 per hour.

Overhead: Overhead cost is based on direct labor-hours. The average rate for variable overhead is \$6 per hour.

Required:

1. Compute a materials price variance for the plates purchased last month and a materials quantity variance for the plates used last month.
2. For labor cost in the lab:
 - a. Compute a labor rate variance and a labor efficiency variance.
 - b. In most hospitals, one-half of the workers in the lab are senior technicians and one-half are assistants. In an effort to reduce costs, Valley View Hospital employs only one-fourth senior technicians and three-fourths assistants. Would you recommend that this policy be continued? Explain.
3. Compute the variable overhead rate and efficiency variances. Is there any relation between the variable overhead efficiency variance and the labor efficiency variance? Explain.

PROBLEM 10–16 Setting Standards [L01]

Danson Company is a chemical manufacturer that supplies various products to industrial users. The company plans to introduce a new chemical solution, called Nysap, for which it needs to develop a standard product cost. The following information is available on the production of Nysap:

- a. Nysap is made by combining a chemical compound (nyclyn) and a solution (salex), and boiling the mixture. A 20% loss in volume occurs for both the salex and the nyclyn during boiling. After boiling, the mixture consists of 9.6 liters of salex and 12 kilograms of nyclyn per 10-liter batch of Nysap.
- b. After the boiling process is complete, the solution is cooled slightly before 5 kilograms of protet are added per 10-liter batch of Nysap. The addition of the protet does not affect the total liquid volume. The resulting solution is then bottled in 10-liter containers.
- c. The finished product is highly unstable, and one 10-liter batch out of five is rejected at final inspection. Rejected batches have no commercial value and are thrown out.
- d. It takes a worker 35 minutes to process one 10-liter batch of Nysap. Employees work an eight-hour day, including one hour per day for rest breaks and cleanup.

Required:

1. Determine the standard quantity for each of the raw materials needed to produce an acceptable 10-liter batch of Nysap.
2. Determine the standard labor time allowed to produce an acceptable 10-liter batch of Nysap.
3. Assuming the following costs, prepare a standard cost card for direct materials and direct labor for one acceptable 10-liter batch of Nysap:

| | |
|-------------------------|---------------------|
| Salex | \$1.50 per liter |
| Nyclyn | \$2.80 per kilogram |
| Protet | \$3.00 per kilogram |
| Direct labor cost | \$9.00 per hour |

(CMA, adapted)

PROBLEM 10–17 Internal Business Process Performance Measures [LO5]

Tombro Industries is in the process of automating one of its plants and developing a flexible manufacturing system. The company is finding it necessary to make many changes in operating procedures. Progress has been slow, particularly in trying to develop new performance measures for the factory.

In an effort to evaluate performance and determine where improvements can be made, management has gathered the following data relating to activities over the last four months:

| | Month | | | |
|--|--------|--------|--------|--------|
| | 1 | 2 | 3 | 4 |
| Quality control measures: | | | | |
| Number of defects | 185 | 163 | 124 | 91 |
| Number of warranty claims | 46 | 39 | 30 | 27 |
| Number of customer complaints | 102 | 96 | 79 | 58 |
| Material control measures: | | | | |
| Purchase order lead time | 8 days | 7 days | 5 days | 4 days |
| Scrap as a percent of total cost | 1% | 1% | 2% | 3% |
| Machine performance measures: | | | | |
| Machine downtime as a percentage of availability | 3% | 4% | 4% | 6% |
| Use as a percentage of availability | 95% | 92% | 89% | 85% |
| Setup time (hours) | 8 | 10 | 11 | 12 |
| Delivery performance measures: | | | | |
| Throughput time | ? | ? | ? | ? |
| Manufacturing cycle efficiency (MCE) | ? | ? | ? | ? |
| Delivery cycle time | ? | ? | ? | ? |
| Percentage of on-time deliveries | 96% | 95% | 92% | 89% |

The president has read in industry journals that throughput time, MCE, and delivery cycle time are important measures of performance, but no one is sure how they are computed. You have been asked to assist the company, and you have gathered the following data relating to these measures:

| | Average per Month (in days) | | | |
|----------------------------------|-----------------------------|------|------|------|
| | 1 | 2 | 3 | 4 |
| Wait time per order before start | | | | |
| of production | 9.0 | 11.5 | 12.0 | 14.0 |
| Inspection time per unit | 0.8 | 0.7 | 0.7 | 0.7 |
| Process time per unit | 2.1 | 2.0 | 1.9 | 1.8 |
| Queue time per unit | 2.8 | 4.4 | 6.0 | 7.0 |
| Move time per unit | 0.3 | 0.4 | 0.4 | 0.5 |

Required:

- For each month, compute the following performance measures:
 - Throughput time.
 - MCE.
 - Delivery cycle time.
- Using the performance measures given in the main body of the problem and the performance measures computed in (1) above, do the following:
 - Identify areas where the company seems to be improving.
 - Identify areas where the company seems to be deteriorating.

3. Refer to the inspection time, process time, and so forth, given for month 4.
 - a. Assume that in month 5 the inspection time, process time, and so forth, are the same as for month 4, except that the company is able to completely eliminate the queue time during production using Lean Production. Compute the new throughput time and MCE.
 - b. Assume that in month 6 the inspection time, process time, and so forth, are the same as in month 4, except that the company is able to eliminate both the queue time during production and the inspection time using Lean Production. Compute the new throughput time and MCE.

PROBLEM 10–18 Comprehensive Variance Analysis [L02, L03, L04]

Marvel Parts, Inc., manufactures auto accessories. One of the company’s products is a set of seat covers that can be adjusted to fit nearly any small car. The company has a standard cost system in use for all of its products. According to the standards that have been set for the seat covers, the factory should work 2,850 hours each month to produce 1,900 sets of covers. The standard costs associated with this level of production are:

| | Total | Per Set of Covers |
|--|----------|----------------------|
| Direct materials | \$42,560 | \$22.40 |
| Direct labor..... | \$17,100 | 9.00 |
| Variable manufacturing overhead (based on direct labor-hours) | \$6,840 | 3.60 |
| | | <u>\$35.00</u> |

During August, the factory worked only 2,800 direct labor-hours and produced 2,000 sets of covers. The following actual costs were recorded during the month:

| | Total | Per Set of Covers |
|---------------------------------------|----------|----------------------|
| Direct materials (12,000 yards) | \$45,600 | \$22.80 |
| Direct labor | \$18,200 | 9.10 |
| Variable manufacturing overhead | \$7,000 | 3.50 |
| | | <u>\$35.40</u> |

At standard, each set of covers should require 5.6 yards of material. All of the materials purchased during the month were used in production.

Required:

Compute the following variances for August:

1. The direct materials price and quantity variances.
2. The direct labor rate and efficiency variances.
3. The variable overhead rate and efficiency variances.

PROBLEM 10–19 Direct Materials and Direct Labor Variances; Computations from Incomplete Data [L01, L02, L03]

Sharp Company manufactures a product for which the following standards have been set:

| | Standard Quantity or Hours | Standard Price or Rate | Standard Cost |
|------------------------|-------------------------------|---------------------------|------------------|
| Direct materials | 3 feet | \$5 per foot | \$15 |
| Direct labor | ? hours | ? per hour | ? |

During March, the company purchased direct materials at a cost of \$55,650, all of which were used in the production of 3,200 units of product. In addition, 4,900 hours of direct labor time were worked on the

product during the month. The cost of this labor time was \$36,750. The following variances have been computed for the month:

| | |
|--|-----------|
| Direct materials quantity variance | \$4,500 U |
| Total direct labor variance | \$1,650 F |
| Direct labor efficiency variance | \$800 U |

Required:

- For direct materials:
 - Compute the actual cost per foot for materials for March.
 - Compute the materials price variance and a total variance for materials.
- For direct labor:
 - Compute the standard direct labor rate per hour.
 - Compute the standard hours allowed for the month's production.
 - Compute the standard hours allowed per unit of product.

(Hint: In completing the problem, it may be helpful to move from known to unknown data either by using the columnar format shown in Exhibits 10-4 and 10-6 or by using the variance formulas.)

PROBLEM 10-20 Comprehensive Variance Analysis [LO1, LO2, LO3, LO4]

Highland Company produces a lightweight backpack that is popular with college students. Standard variable costs relating to a single backpack are given below:

| | Standard Quantity or Hours | Standard Price or Rate | Standard Cost |
|---------------------------------------|-------------------------------|---------------------------|------------------|
| Direct materials | ? | \$6 per yard | \$? |
| Direct labor | ? | ? | ? |
| Variable manufacturing overhead | ? | \$3 per direct labor-hour | ? |
| Total standard cost | | | <u>\$?</u> |

Overhead is applied to production on the basis of direct labor-hours. During March, 1,000 backpacks were manufactured and sold. Selected information relating to the month's production is given below:

| | Materials Used | Direct Labor | Variable Manufacturing Overhead |
|---|-------------------|-----------------|---------------------------------------|
| Total standard cost allowed* | \$16,800 | \$10,500 | \$4,200 |
| Actual costs incurred | \$15,000 | ? | \$3,600 |
| Direct materials price variance | ? | | |
| Direct materials quantity variance | \$1,200 U | | |
| Direct labor rate variance | | ? | |
| Direct labor efficiency variance | | ? | |
| Variable overhead rate variance | | | ? |
| Variable overhead efficiency variance | | | ? |

*For the month's production.

The following additional information is available for March's production:

| | |
|---|----------|
| Actual direct labor-hours | 1,500 |
| Standard overhead rate per direct labor-hour | \$3.00 |
| Standard price of one yard of materials | \$6.00 |
| Difference between standard and actual cost per backpack produced during March | \$0.15 F |

Required:

1. What is the standard cost of a single backpack?
2. What was the actual cost per backpack produced during March?
3. How many yards of material are required at standard per backpack?
4. What was the direct materials price variance for March?
5. What is the standard direct labor rate per hour?
6. What was the direct labor rate variance for March? The direct labor efficiency variance?
7. What was the variable overhead rate variance for March? The variable overhead efficiency variance?
8. Prepare a standard cost card for one backpack.

PROBLEM 10–21 Developing Standard Costs [LO1]

ColdKing Company is a small producer of fruit-flavored frozen desserts. For many years, ColdKing's products have had strong regional sales on the basis of brand recognition; however, other companies have begun marketing similar products in the area, and price competition has become increasingly intense. John Wakefield, the company's controller, is planning to implement a standard cost system for ColdKing and has gathered considerable information from his co-workers on production and material requirements for ColdKing's products. Wakefield believes that the use of standard costing will allow ColdKing to improve cost control and make better pricing decisions.

ColdKing's most popular product is raspberry sherbet. The sherbet is produced in 10-gallon batches, and each batch requires 6 quarts of good raspberries. The fresh raspberries are sorted by hand before they enter the production process. Because of imperfections in the raspberries and normal spoilage, 1 quart of berries is discarded for every 4 quarts of acceptable berries. Three minutes is the standard direct labor time for the sorting that is required to obtain 1 quart of acceptable raspberries. The acceptable raspberries are then blended with the other ingredients; blending requires 12 minutes of direct labor time per batch. After blending, the sherbet is packaged in quart containers. Wakefield has gathered the following pricing information:

- a. ColdKing purchases raspberries at a cost of \$0.80 per quart. All other ingredients cost a total of \$0.45 per gallon of sherbet.
- b. Direct labor is paid at the rate of \$9.00 per hour.
- c. The total cost of direct material and direct labor required to package the sherbet is \$0.38 per quart.

Required:

1. Develop the standard cost for the direct cost components (materials, labor, and packaging) of a 10-gallon batch of raspberry sherbet. The standard cost should identify the standard quantity, standard rate, and standard cost per batch for each direct cost component of a batch of raspberry sherbet.
2. As part of the implementation of a standard cost system at ColdKing, John Wakefield plans to train those responsible for maintaining the standards on how to use variance analysis. Wakefield is particularly concerned with the causes of unfavorable variances.
 - a. Discuss possible causes of unfavorable direct materials price variances and identify the individual(s) who should be held responsible for these variances.
 - b. Discuss possible causes of unfavorable direct labor efficiency variances and identify the individual(s) who should be held responsible for these variances.

(CMA, adapted)

Cases

CASE 10–22 Ethics and the Manager; Rigging Standards [LO1]

Stacy Cummins, the newly hired controller at Merced Home Products, Inc., was disturbed by what she had discovered about the standard costs at the Home Security Division. In looking over the past several years of quarterly income statements at the Home Security Division, she noticed that the first-quarter profits were always poor, the second-quarter profits were slightly better, the third-quarter profits were again slightly better, and the fourth quarter always ended with a spectacular performance in which the Home Security Division managed to meet or exceed its target profit for the year. She also was concerned to find letters from the company's external auditors to top management warning about an unusual use of standard costs at the Home Security Division.

When Ms. Cummins ran across these letters, she asked the assistant controller, Gary Farber, if he knew what was going on at the Home Security Division. Gary said that it was common knowledge in the company that the vice president in charge of the Home Security Division, Preston Lansing, had

rigged the standards at his division in order to produce the same quarterly income pattern every year. According to company policy, variances are taken directly to the income statement as an adjustment to cost of goods sold.

Favorable variances have the effect of increasing net operating income, and unfavorable variances have the effect of decreasing net operating income. Lansing had rigged the standards so that there were always large favorable variances. Company policy was a little vague about when these variances have to be reported on the divisional income statements. While the intent was clearly to recognize variances on the income statement in the period in which they arise, nothing in the company’s accounting manuals actually explicitly required this. So for many years Lansing had followed a practice of saving up the favorable variances and using them to create a nice smooth pattern of growing profits in the first three quarters, followed by a big “Christmas present” of an extremely good fourth quarter. (Financial reporting regulations forbid carrying variances forward from one year to the next on the annual audited financial statements, so all of the variances must appear on the divisional income statement by the end of the year.)

Ms. Cummins was concerned about these revelations and attempted to bring up the subject with the president of Merced Home Products but was told that “we all know what Lansing’s doing, but as long as he continues to turn in such good reports, don’t bother him.” When Ms. Cummins asked if the board of directors was aware of the situation, the president somewhat testily replied, “Of course they are aware.”

Required:

1. How did Preston Lansing probably “rig” the standard costs—are the standards set too high or too low? Explain.
2. Should Preston Lansing be permitted to continue his practice of managing reported profits?
3. What should Stacy Cummins do in this situation?

CASE 10–23 Working Backwards from Variance Data [L02, L03, L04]

You have recently accepted a position with Vitex, Inc., the manufacturer of a popular consumer product. During your first week on the job, the vice president has been favorably impressed with your work. She has been so impressed, in fact, that yesterday she called you into her office and asked you to attend the executive committee meeting this morning for the purpose of leading a discussion on the variances reported for last period. Anxious to favorably impress the executive committee, you took the variances and supporting data home last night to study.

On your way to work this morning, the papers were laying on the seat of your new, red convertible. As you were crossing a bridge on the highway, a sudden gust of wind caught the papers and blew them over the edge of the bridge and into the stream below. You managed to retrieve only one page, which contains the following information:

| STANDARD COST CARD | | | |
|--|-----------------|---------------------------|--------------------|
| Direct materials, 6 pounds at \$3 per pound | | | \$18.00 |
| Direct labor, 0.8 direct labor-hours at \$15 per direct labor-hour | | | \$12.00 |
| Variable manufacturing overhead, 0.8 direct labor-hours at \$3 per direct labor-hour | | | \$2.40 |
| | Total | Variances Reported | |
| | Standard | Price | Quantity or |
| | Cost* | or Rate | Efficiency |
| Direct materials | \$405,000 | \$6,900 F | \$9,000 U |
| Direct labor | \$270,000 | \$14,550 U | \$21,000 U |
| Variable manufacturing overhead | \$54,000 | \$1,300 F | \$?† U |

*Applied to Work in Process during the period.
 †Entry obliterated.

You recall that manufacturing overhead cost is applied to production on the basis of direct labor-hours and that all of the materials purchased during the period were used in production. Work in process inventories are insignificant and can be ignored.

It is now 8:30 A.M. The executive committee meeting starts in just one hour; you realize that to avoid looking like a bungling fool you must somehow generate the necessary “backup” data for the variances before the meeting begins. Without backup data it will be impossible to lead the discussion or answer any questions.

Required:

1. How many units were produced last period?
2. How many pounds of direct material were purchased and used in production?
3. What was the actual cost per pound of material?
4. How many actual direct labor-hours were worked during the period?
5. What was the actual rate paid per direct labor-hour?
6. How much actual variable manufacturing overhead cost was incurred during the period?

Appendix 10A: Predetermined Overhead Rates and Overhead Analysis in a Standard Costing System

LEARNING OBJECTIVE 6

Compute and interpret the fixed overhead budget and volume variances.

In this appendix, we will investigate how the predetermined overhead rates that we discussed in the job-order costing chapter earlier in the book can be used in a standard costing system. Throughout this appendix, we assume that an absorption costing system is used in which *all* manufacturing costs—both fixed and variable—are included in product costs.

Predetermined Overhead Rates

The data in Exhibit 10A–1 pertain to MicroDrive Corporation, a company that produces miniature electric motors. Note that the company budgeted for 50,000 machine-hours based on production of 25,000 motors. At this level of activity, the budgeted variable manufacturing overhead was \$75,000 and the budgeted fixed manufacturing overhead was \$300,000.

Recall from the job-order costing chapter that the following formula is used to set the predetermined overhead rate at the beginning of the period:

$$\text{Predetermined overhead rate} = \frac{\text{Estimated total manufacturing overhead cost}}{\text{Estimated total amount of the allocation base}}$$

The estimated total amount of the allocation base in the formula for the predetermined overhead rate is called the **denominator activity**.

As discussed in the job-order costing chapter, once the predetermined overhead rate has been determined, it remains unchanged throughout the period, even if the actual level of activity differs from what was estimated. Consequently, the amount of overhead applied to each unit of product is the same regardless of when it is produced during the period.

EXHIBIT 10A-1 MicroDrive Corporation Data

| | |
|--|---------------------------|
| Budgeted production | 25,000 motors |
| Standard machine-hours per motor | 2 machine-hours per motor |
| Budgeted machine-hours (2 machine-hours per motor × 25,000 motors) | 50,000 machine-hours |
| Actual production | 20,000 motors |
| Standard machine-hours allowed for the actual production (2 machine-hours per motor × 20,000 motors) | 40,000 machine-hours |
| Actual machine-hours | 42,000 machine-hours |
| Budgeted variable manufacturing overhead | \$75,000 |
| Budgeted fixed manufacturing overhead | \$300,000 |
| Total budgeted manufacturing overhead | \$375,000 |
| Actual variable manufacturing overhead | \$71,000 |
| Actual fixed manufacturing overhead | \$308,000 |
| Total actual manufacturing overhead | \$379,000 |

MicroDrive Corporation uses budgeted machine-hours as its denominator activity in the predetermined overhead rate. Consequently, the company's predetermined overhead rate would be computed as follows:

$$\text{Predetermined overhead rate} = \frac{\$375,000}{50,000 \text{ MHs}} = \$7.50 \text{ per MH}$$

This predetermined overhead rate can be broken down into its variable and fixed components as follows:

$$\text{Variable component of the predetermined overhead rate} = \frac{\$75,000}{50,000 \text{ MHs}} = \$1.50 \text{ per MH}$$

$$\text{Fixed component of the predetermined overhead rate} = \frac{\$300,000}{50,000 \text{ MHs}} = \$6.00 \text{ per MH}$$

For every standard machine-hour recorded, work in process is charged with \$7.50 of manufacturing overhead, of which \$1.50 represents variable manufacturing overhead and \$6.00 represents fixed manufacturing overhead. In total, MicroDrive Corporation would apply \$300,000 of overhead to work in process as shown below:

$$\begin{aligned} \text{Overhead applied} &= \text{Predetermined overhead rate} \times \text{Standard hours allowed for the actual output} \\ &= \$7.50 \text{ per machine-hour} \times 40,000 \text{ machine-hours} \\ &= \$300,000 \end{aligned}$$

Overhead Application in a Standard Cost System

To understand fixed overhead variances, we first have to understand how overhead is applied to work in process in a standard cost system. Recall that in the job-order costing chapter we applied overhead to work in process on the basis of the actual level of activity. This procedure was correct because at the time we were dealing with a normal cost system.¹ However, we are now dealing with a standard cost system. In such a system, overhead is applied to work in process on the basis of the *standard hours allowed for the actual output of the period* rather than on the basis of the actual number of hours worked. Exhibit 10A-2 illustrates this point. In a standard cost system, every unit of a particular product is charged with the same amount of overhead cost, regardless of how much time the unit actually requires for processing.

| Normal Cost System | | Standard Cost System | |
|--------------------------------------|--|--------------------------------------|--|
| Manufacturing Overhead | | Manufacturing Overhead | |
| Actual overhead costs incurred. | Applied overhead costs: Actual hours × Pre-determined overhead rate. | Actual overhead costs incurred. | Applied overhead costs: Standard hours allowed for actual output × Pre-determined overhead rate. |
| Underapplied or overapplied overhead | | Underapplied or overapplied overhead | |

EXHIBIT 10A-2
Applied Overhead Costs: Normal Cost System versus Standard Cost System

¹ Normal cost systems are discussed on page 000 in the job-order costing chapter.

EXHIBIT 10A-3
Computation of the Fixed Overhead Variances

| Actual Fixed Overhead | Budgeted Fixed Overhead | Fixed Overhead Applied to Work in Process |
|--|-------------------------|--|
| \$308,000 | \$300,000* | 40,000 standard machine-hours × \$6 per machine-hour = \$240,000 |
| | | |
| Budget variance, \$8,000 U Volume variance, \$60,000 U Total variance, \$68,000 U | | |
| *As originally budgeted (see Exhibit 10A-1). This figure can also be expressed as 50,000 denominator machine-hours × \$6 per machine-hour = \$300,000. | | |

Budget Variance

Two fixed manufacturing overhead variances are computed in a standard costing system—a *budget variance* and a *volume variance*. These variances are computed in Exhibit 10A-3. The **budget variance** is simply the difference between the actual fixed manufacturing overhead and the budgeted fixed manufacturing overhead for the period. The formula is:

$$\text{Budget variance} = \text{Actual fixed overhead} - \text{Budgeted fixed overhead}$$

If the actual fixed overhead cost exceeds the budgeted fixed overhead cost, the budget variance is labeled unfavorable. If the actual fixed overhead cost is less than the budgeted fixed overhead cost, the budget variance is labeled favorable.

Applying the formula to the MicroDrive Corporation data, the budget variance is computed as follows:

$$\text{Budget variance} = \$308,000 - \$300,000 = \$8,000 \text{ U}$$

According to the budget, the fixed manufacturing overhead should have been \$300,000, but it was actually \$308,000. Because the actual cost exceeds the budget by \$8,000, the variance is labeled as unfavorable; however, this label does not automatically signal ineffective managerial performance. For example, this variance may be the result of waste and inefficiency, or it may be due to an unforeseen yet prudent investment in fixed overhead resources that improves product quality or manufacturing cycle efficiency.

Volume Variance

The **volume variance** is defined by the following formula:

$$\text{Volume variance} = \text{Budgeted fixed overhead} - \text{Fixed overhead applied to work in process}$$

When the budgeted fixed manufacturing overhead exceeds the fixed manufacturing overhead applied to work in process, the volume variance is labeled as unfavorable. When the budgeted fixed manufacturing overhead is less than the fixed manufacturing overhead applied to work in process, the volume variance is labeled as favorable. As we shall see, caution is advised when interpreting this variance.

To understand the volume variance, we need to understand how fixed manufacturing overhead is applied to work in process in a standard costing system. As discussed earlier, fixed manufacturing overhead is applied to work in process on the basis of the standard hours allowed for the actual output of the period. In the case of MicroDrive Corporation, the company produced 20,000 motors and the standard for each motor is 2 machine-hours. Therefore, the standard hours allowed for the actual output is 40,000 machine-hours (= 20,000 motors \times 2 machine-hours). As shown in Exhibit 10A-3, the predetermined fixed manufacturing overhead rate of \$6.00 per machine-hour is multiplied by the 40,000 standard machine-hours allowed for the actual output to arrive at \$240,000 of fixed manufacturing overhead applied to work in process. Another way to think of this is that the standard for each motor is 2 machine-hours. Because the predetermined fixed manufacturing overhead rate is \$6.00 per machine-hour, each motor is assigned \$12.00 (= 2 machine-hours \times \$6.00 per machine-hour) of fixed manufacturing overhead. Consequently, a total of \$240,000 of fixed manufacturing overhead is applied to the 20,000 motors that are actually produced. Under either explanation, the volume variance according to the formula is:

$$\text{Volume variance} = \$300,000 - \$240,000 = \$60,000 \text{ U}$$

The key to interpreting the volume variance is to understand that it depends on the difference between the hours used in the denominator to compute the predetermined overhead rate and the standard hours allowed for the actual output of the period. While it is not obvious, the volume variance can also be computed using the following formula:

$$\text{Volume variance} = \text{Fixed component of the predetermined overhead rate} \times \left(\frac{\text{Denominator hours} - \text{Standard hours allowed for the actual output}}{\text{hours}} \right)$$

In the case of MicroDrive Corporation, the volume variance can be computed using this formula as follows:

$$\begin{aligned} \text{Volume variance} &= \$6.00 \text{ per machine-hour} \times \left(\frac{50,000 \text{ machine-hours} - 40,000 \text{ machine-hours}}{\text{machine-hours}} \right) \\ &= \$6.00 \text{ per machine-hour} \times (10,000 \text{ machine-hours}) \\ &= \$60,000 \text{ U} \end{aligned}$$

Note that this agrees with the volume variance computed using the earlier formula.

Focusing on this new formula, if the denominator hours exceed the standard hours allowed for the actual output, the volume variance is unfavorable. If the denominator hours are less than the standard hours allowed for the actual output, the volume variance is favorable. Stated differently, the volume variance is unfavorable if the actual level of activity is less than expected. The volume variance is favorable if the actual level of activity is greater than expected. It is important to note that the volume variance does not measure overspending or underspending. A company should incur the same dollar amount of fixed overhead cost regardless of whether the period's activity was above or below the planned (denominator) level.

The volume variance is often viewed as a measure of the utilization of facilities. If the standard hours allowed for the actual output are greater than (less than) the denominator hours, it signals efficient (inefficient) usage of facilities. However, other measures of utilization—such as the percentage of capacity utilized—are easier to compute and understand. Perhaps a better interpretation of the volume variance is that it is the error that occurs when the level of activity is incorrectly estimated and the costing system assumes fixed costs behave as if they are variable. This interpretation may be clearer in the next section that graphically analyses the fixed manufacturing overhead variances.

EXHIBIT 10A-4
Graphic Analysis of Fixed
Overhead Variances

Graphic Analysis of Fixed Overhead Variances

Exhibit 10A-4 shows a graphic analysis that offers insights into the fixed overhead budget and volume variances. As shown in the graph, fixed overhead cost is applied to work in process at the predetermined rate of \$6.00 for each standard hour of activity. (The applied-cost line is the upward-sloping line on the graph.) Because a denominator level of 50,000 machine-hours was used in computing the \$6.00 rate, the applied-cost line crosses the budget-cost line at exactly 50,000 machine-hours. If the denominator hours and the standard hours allowed for the actual output are the same, there is no volume variance. It is only when the standard hours differ from the denominator hours that a volume variance arises.

In MicroDrive's case, the standard hours allowed for the actual output (40,000 hours) are less than the denominator hours (50,000 hours). The result is an unfavorable volume variance because less cost was applied to production than was originally budgeted. If the situation had been reversed and the standard hours allowed for the actual output had exceeded the denominator hours, then the volume variance on the graph would have been favorable.

Cautions in Fixed Overhead Analysis

A volume variance for fixed overhead arises because when applying the costs to work in process, we act *as if* the fixed costs are variable. The graph in Exhibit 10A-4 illustrates this point. Notice from the graph that fixed overhead costs are applied to work in process at a rate of \$6 per hour *as if* they are variable. Treating these costs as if they are variable is necessary for product costing purposes, but some real dangers lurk here. Managers can easily be misled into thinking that fixed costs are *in fact* variable.

Keep clearly in mind that fixed overhead costs come in large chunks. Expressing fixed costs on a unit or per hour basis, though necessary for product costing for external reports,

is artificial. Increases or decreases in activity in fact have no effect on total fixed costs within the relevant range of activity. Even though fixed costs are expressed on a unit or per hour basis, they are *not* proportional to activity. In a sense, the volume variance is the error that occurs as a result of treating fixed costs as variable costs in the costing system.

Reconciling Overhead Variances and Underapplied or Overapplied Overhead

In a standard cost system, the underapplied or overapplied overhead for a period equals the sum of the overhead variances. To see this, we will return to the MicroDrive Corporation example.

As discussed earlier, in a standard cost system, overhead is applied to work in process on the basis of the standard hours allowed for the actual output of the period. The following table shows how the underapplied or overapplied overhead for MicroDrive is computed.

| | |
|--|-------------------------|
| Predetermined overhead rate (a) | \$7.50 per machine-hour |
| Standard hours allowed for the actual output [Exhibit 10A-1] (b) | 40,000 machine-hours |
| Manufacturing overhead applied (a) × (b) | \$300,000 |
| Actual manufacturing overhead [Exhibit 10A-1] | \$379,000 |
| Manufacturing overhead underapplied or overapplied | \$79,000 underapplied |

We have already computed the budget variance and the volume variance for this company. We will also need to compute the variable manufacturing overhead variances. The data for these computations are contained in Exhibit 10A-1. Recalling the formulas for the variable manufacturing overhead variances from earlier in this chapter, we can compute the variable overhead rate and efficiency variances as follows:

$$\begin{aligned} \text{Variable overhead rate variance} &= (AH \times AR) - (AH \times SR) \\ &= (\$71,000) - \left(\frac{42,000}{\text{machine-hours}} \times \$1.50 \text{ per machine-hour} \right) \\ &= \$71,000 - \$63,000 = \$8,000 \text{ U} \end{aligned}$$

$$\begin{aligned} \text{Variable overhead efficiency variance} &= (AH \times SR) - (SH \times SR) \\ &= (\$63,000) - \left(\frac{40,000}{\text{machine-hours}} \times \$1.50 \text{ per machine-hour} \right) \\ &= \$63,000 - \$60,000 = \$3,000 \text{ U} \end{aligned}$$

We can now compute the sum of all of the overhead variances as follows:

| | |
|---|------------|
| Variable overhead rate variance | \$8,000 U |
| Variable overhead efficiency variance | \$3,000 U |
| Fixed overhead budget variance | \$8,000 U |
| Fixed overhead volume variance | \$60,000 U |
| Total of the overhead variances | \$79,000 U |

Note that as claimed on the previous page, the total of the overhead variances is \$79,000, which equals the underapplied overhead of \$79,000. In general, if the overhead is underapplied, the total of the standard cost overhead variances is unfavorable. If the overhead is overapplied, the total of the standard cost overhead variances is favorable.

Appendix 10A Glossary

Budget variance The difference between the actual fixed overhead costs incurred and the budgeted fixed overhead costs in the flexible budget. (p. 408)

Denominator activity The level of activity used to compute the predetermined overhead rate. (p. 406)

Volume variance The variance that arises whenever the standard hours allowed for the actual output of a period are different from the denominator activity level that was used to compute the predetermined overhead rate. It is computed by multiplying the fixed component of the predetermined overhead rate by the difference between the denominator hours and the standard hours allowed for the actual output. (p. 408)

Appendix 10A Exercises and Problems connect™

EXERCISE 10A-1 Applying Overhead in a Standard Costing System [LO6]

Privack Corporation has a standard cost system in which it applies overhead to products based on the standard direct labor-hours allowed for the actual output of the period. Data concerning the most recent year appear below:

| | |
|--|-----------|
| Variable overhead cost per direct labor-hour | \$2.00 |
| Total fixed overhead cost per year | \$250,000 |
| Budgeted standard direct labor-hours (denominator level of activity) | 40,000 |
| Actual direct labor-hours | 39,000 |
| Standard direct labor-hours allowed for the actual output..... | 38,000 |

Required:

1. Compute the predetermined overhead rate for the year.
2. Determine the amount of overhead that would be applied to the output of the period.

EXERCISE 10A-2 Fixed Overhead Variances [LO6]

Primara Corporation has a standard cost system in which it applies overhead to products based on the standard direct labor-hours allowed for the actual output of the period. Data concerning the most recent year appear below:

| | |
|--|-----------|
| Total budgeted fixed overhead cost for the year..... | \$250,000 |
| Actual fixed overhead cost for the year | \$254,000 |
| Budgeted standard direct labor-hours (denominator level of activity) | 25,000 |
| Actual direct labor-hours | 27,000 |
| Standard direct labor-hours allowed for the actual output..... | 26,000 |

Required:

1. Compute the fixed portion of the predetermined overhead rate for the year.
2. Compute the fixed overhead budget variance and volume variance.

EXERCISE 10A-3 Predetermined Overhead Rate [LO1, LO6]

Operating at a normal level of 30,000 direct labor-hours, Lasser Company produces 10,000 units of product each period. The direct labor wage rate is \$12 per hour. Two and one-half yards of direct materials go into each unit of product; the material costs \$8.60 per yard. Variable manufacturing overhead should be \$1.90 per standard direct labor-hour. Fixed manufacturing overhead should be \$168,000 per period.

Required:

1. Using 30,000 direct labor-hours as the denominator activity, compute the predetermined overhead rate and break it down into variable and fixed elements.
2. Complete the standard cost card below for one unit of product:

| | |
|--|-------------|
| Direct materials, 2.5 yards at \$8.60 per yard | \$21.50 |
| Direct labor, ? | ? |
| Variable manufacturing overhead, ? | ? |
| Fixed manufacturing overhead, ? | ? |
| Total standard cost per unit | <u>\$?</u> |

EXERCISE 10A-4 Predetermined Overhead Rate; Overhead Variances [LO4, LO6]

Norwall Company’s variable manufacturing overhead should be \$3.00 per standard machine-hour and its fixed manufacturing overhead should be \$300,000 per period.

The following information is available for a recent period:

- The denominator activity of 60,000 machine-hours is used to compute the predetermined overhead rate.
- At the 60,000 standard machine-hours level of activity, the company should produce 40,000 units of product.
- The company’s actual operating results were:

| | |
|------------------------------------|-----------|
| Number of units produced..... | 42,000 |
| Actual machine-hours | 64,000 |
| Actual variable overhead cost..... | \$185,600 |
| Actual fixed overhead cost..... | \$302,400 |

Required:

- Compute the predetermined overhead rate and break it down into variable and fixed cost elements.
- Compute the standard hours allowed for the actual production.
- Compute the variable overhead rate and efficiency variances and the fixed overhead budget and volume variances.

EXERCISE 10A-5 Fixed Overhead Variances [LO6]

Selected operating information on three different companies for a recent year is given below:

| | Company | | |
|---|---------|--------|--------|
| | A | B | C |
| Full-capacity machine-hours | 10,000 | 18,000 | 20,000 |
| Budgeted machine-hours* | 9,000 | 17,000 | 20,000 |
| Actual machine-hours | 9,000 | 17,800 | 19,000 |
| Standard machine-hours allowed for actual production | 9,500 | 16,000 | 20,000 |

*Denominator activity for computing the predetermined overhead rate.

Required:

For each company, state whether the company would have a favorable or unfavorable volume variance and why.

EXERCISE 10A-6 Using Fixed Overhead Variances [LO6]

The standard cost card for the single product manufactured by Cutter, Inc., is given below:

| | |
|--|--------------|
| Standard Cost Card—per Unit | |
| Direct materials, 3 yards at \$6.00 per yard | \$ 18 |
| Direct labor, 4 hours at \$15.50 per hour | 62 |
| Variable overhead, 4 hours at \$1.50 per hour..... | 6 |
| Fixed overhead, 4 hours at \$5.00 per hour..... | <u>20</u> |
| Total standard cost per unit | <u>\$106</u> |

Manufacturing overhead is applied to production on the basis of standard direct labor-hours. During the year, the company worked 37,000 hours and manufactured 9,500 units of product. Selected data relating to the company's fixed manufacturing overhead cost for the year are shown below:

Required:

1. What were the standard hours allowed for the year's production?
2. What was the amount of fixed overhead cost contained in the flexible budget for the year?
3. What was the fixed overhead budget variance for the year?
4. What denominator activity level did the company use in setting the predetermined overhead rate for the year?

EXERCISE 10A-7 Relations Among Fixed Overhead Variances [L06]

Selected information relating to Yost Company's operations for the most recent year is given below:

| | |
|--|-----------|
| Activity: | |
| Denominator activity (machine-hours) | 45,000 |
| Standard hours allowed per unit | 3 |
| Number of units produced | 14,000 |
| Costs: | |
| Actual fixed overhead costs incurred | \$267,000 |
| Fixed overhead budget variance | \$3,000 F |

The company applies overhead cost to products on the basis of standard machine-hours.

Required:

1. What were the standard machine-hours allowed for the actual production?
2. What was the fixed portion of the predetermined overhead rate?
3. What was the volume variance?

PROBLEM 10A-8 Comprehensive Standard Cost Variances [L01, L02, L03, L04, L06]

Flandro Company uses a standard cost system and sets predetermined overhead rates on the basis of direct labor-hours. The following data are taken from the company's budget for the current year:

| | |
|---|----------|
| Denominator activity (direct labor-hours) | 5,000 |
| Variable manufacturing overhead cost | \$25,000 |
| Fixed manufacturing overhead cost | \$59,000 |

The standard cost card for the company's only product is given below:

| | |
|---|----------------|
| Direct materials, 3 yards at \$4.40 per yard | \$13.20 |
| Direct labor, 1 hour at \$12 per hour | 12.00 |
| Manufacturing overhead, 140% of direct labor cost | <u>16.80</u> |
| Standard cost per unit | <u>\$42.00</u> |

During the year, the company produced 6,000 units of product and incurred the following costs:

| | |
|--|-----------|
| Materials purchased, 24,000 yards at \$4.80 per yard | \$115,200 |
| Materials used in production (in yards) | 18,500 |
| Direct labor cost incurred, 5,800 hours at \$13 per hour | \$75,400 |
| Variable manufacturing overhead cost incurred | \$29,580 |
| Fixed manufacturing overhead cost incurred | \$60,400 |

Required:

1. Redo the standard cost card in a clearer, more usable format by detailing the variable and fixed overhead cost elements.
2. Prepare an analysis of the variances for direct materials and direct labor for the year.
3. Prepare an analysis of the variances for variable and fixed overhead for the year.
4. What effect, if any, does the choice of a denominator activity level have on unit standard costs? Is the volume variance a controllable variance from a spending point of view? Explain.

PROBLEM 10A-9 Comprehensive Standard Cost Variances [LO2, LO3, LO4, LO6]

“Wonderful! Not only did our salespeople do a good job in meeting the sales budget this year, but our production people did a good job in controlling costs as well,” said Kim Clark, president of Martell Company. “Our \$18,300 overall manufacturing cost variance is only 1.2% of the \$1,536,000 standard cost of products made during the year. That’s well within the 3% parameter set by management for acceptable variances. It looks like everyone will be in line for a bonus this year.”

The company produces and sells a single product. The standard cost card for the product follows:

| Standard Cost Card—per Unit of Product | |
|---|----------------|
| Direct materials, 2 feet at \$8.45 per foot | \$16.90 |
| Direct labor, 1.4 direct labor hours at \$16 per direct labor-hour | 22.40 |
| Variable overhead, 1.4 direct labor-hours at \$2.50 per direct labor-hour | 3.50 |
| Fixed overhead, 1.4 direct labor-hours at \$6 per direct labor-hour | 8.40 |
| Standard cost per unit | <u>\$51.20</u> |

The following additional information is available for the year just completed:

- a. The company manufactured 30,000 units of product during the year.
- b. A total of 64,000 feet of material was purchased during the year at a cost of \$8.55 per foot. All of this material was used to manufacture the 30,000 units. There were no beginning or ending inventories for the year.
- c. The company worked 43,500 direct labor-hours during the year at a direct labor cost of \$15.80 per hour.
- d. Overhead is applied to products on the basis of standard direct labor-hours. Data relating to manufacturing overhead costs follow:

| | |
|---|-----------|
| Denominator activity level (direct labor-hours) | 35,000 |
| Budgeted fixed overhead costs (from the overhead flexible budget) | \$210,000 |
| Actual variable overhead costs incurred | \$108,000 |
| Actual fixed overhead costs incurred | \$211,800 |

Required:

1. Compute the direct materials price and quantity variances for the year.
2. Compute the direct labor rate and efficiency variances for the year.
3. For manufacturing overhead compute:
 - a. The variable overhead rate and efficiency variances for the year.
 - b. The fixed overhead budget and volume variances for the year.
4. Total the variances you have computed, and compare the net amount with the \$18,300 mentioned by the president. Do you agree that bonuses should be given to everyone for good cost control during the year? Explain.

PROBLEM 10A–10 Applying Overhead; Overhead Variances [LO4, LO6]

Chilczuk, S.A., of Gdansk, Poland, is a major producer of classic Polish sausage. The company uses a standard cost system to help control costs. Manufacturing overhead is applied to production on the basis of standard direct labor-hours. According to the company’s flexible budget, the following manufacturing overhead costs should be incurred at an activity level of 35,000 labor-hours (the denominator activity level):

| | |
|--|------------------|
| Variable manufacturing overhead cost | PZ 87,500 |
| Fixed manufacturing overhead cost | 210,000 |
| Total manufacturing overhead cost | <u>PZ297,500</u> |

The currency in Poland is the zloty, which is denoted here by PZ.

During the most recent year, the following operating results were recorded:

| | |
|--|-----------|
| Activity: | |
| Actual labor-hours worked | 30,000 |
| Standard labor-hours allowed for output | 32,000 |
| Cost: | |
| Actual variable manufacturing overhead cost incurred | PZ78,000 |
| Actual fixed manufacturing overhead cost incurred | PZ209,400 |

At the end of the year, the company’s Manufacturing Overhead account contained the following data:

| Manufacturing Overhead | | | |
|------------------------|---------|---------|---------|
| Actual | 287,400 | Applied | 272,000 |
| | 15,400 | | |

Management would like to determine the cause of the PZ15,400 underapplied overhead.

Required:

1. Compute the predetermined overhead rate. Break the rate down into variable and fixed cost elements.
2. Show how the PZ272,000 Applied figure in the Manufacturing Overhead account was computed.
3. Analyze the PZ15,400 underapplied overhead figure in terms of the variable overhead rate and efficiency variances and the fixed overhead budget and volume variances.
4. Explain the meaning of each variance that you computed in (3) above.

PROBLEM 10A–11 Applying Overhead; Overhead Variances [LO1, LO4, LO6]

Lane Company manufactures a single product that requires a great deal of hand labor. Overhead cost is applied on the basis of standard direct labor-hours. Variable manufacturing overhead should be \$2 per standard direct labor-hour and fixed manufacturing overhead should be \$480,000 per year.

The company’s product requires 3 pounds of material that has a standard cost of \$7 per pound and 1.5 hours of direct labor time that has a standard rate of \$12 per hour.

The company planned to operate at a denominator activity level of 60,000 direct labor-hours and to produce 40,000 units of product during the most recent year. Actual activity and costs for the year were as follows:

| | |
|--|-----------|
| Number of units produced | 42,000 |
| Actual direct labor-hours worked | 65,000 |
| Actual variable manufacturing overhead cost incurred | \$123,500 |
| Actual fixed manufacturing overhead cost incurred | \$483,000 |

Required:

1. Compute the predetermined overhead rate for the year. Break the rate down into variable and fixed elements.
2. Prepare a standard cost card for the company's product; show the details for all manufacturing costs on your standard cost card.
3. Do the following:
 - a. Compute the standard direct labor-hours allowed for the year's production.
 - b. Complete the following Manufacturing Overhead T-account for the year:

| Manufacturing Overhead | |
|------------------------|---|
| ? | ? |
| ? | ? |

4. Determine the reason for any underapplied or overapplied overhead for the year by computing the variable overhead rate and efficiency variances and the fixed overhead budget and volume variances.
5. Suppose the company had chosen 65,000 direct labor-hours as the denominator activity rather than 60,000 hours. State which, if any, of the variances computed in (4) above would have changed, and explain how the variance(s) would have changed. No computations are necessary.

PROBLEM 10A-12 Selection of a Denominator; Overhead Analysis; Standard Cost Card [LO1, LO4, LO6]

Morton Company's variable manufacturing overhead should be \$4.50 per standard direct labor-hour and fixed manufacturing should be \$270,000 per year.

The company manufactures a single product that requires two direct labor-hours to complete. The direct labor wage rate is \$15 per hour. Four feet of raw material are required for each unit of product; the standard cost of the material is \$8.75 per foot.

Although normal activity is 30,000 direct labor-hours each year, the company expects to operate at a 40,000-hour level of activity this year.

Required:

1. Assume that the company chooses 30,000 direct labor-hours as the denominator level of activity. Compute the predetermined overhead rate, breaking it down into variable and fixed cost elements.
2. Assume that the company chooses 40,000 direct labor-hours as the denominator level of activity. Repeat the computations in (1) above.
3. Complete two standard cost cards as outlined below.

| Denominator Activity: 30,000 Direct Labor-Hours | |
|---|-------------|
| Direct materials, 4 feet at \$8.75 per foot | \$35.00 |
| Direct labor, ? | ? |
| Variable manufacturing overhead, ? | ? |
| Fixed manufacturing overhead, ? | ? |
| Standard cost per unit | <u>\$?</u> |
| Denominator Activity: 40,000 Direct Labor-Hours | |
| Direct materials, \$4 feet at \$8.75 per foot | \$35.00 |
| Direct labor, ? | ? |
| Variable manufacturing overhead, ? | ? |
| Fixed manufacturing overhead, ? | ? |
| Standard cost per unit | <u>\$?</u> |

4. Assume that the company actually produces 18,000 units and works 38,000 direct labor-hours during the year. Actual manufacturing overhead costs for the year are:

| | |
|--|------------------|
| Variable manufacturing overhead cost | \$174,800 |
| Fixed manufacturing overhead cost | <u>271,600</u> |
| Total manufacturing overhead cost | <u>\$446,400</u> |

Do the following:

- a. Compute the standard direct labor-hours allowed for this year's production.
- b. Complete the Manufacturing Overhead account below. Assume that the company uses 30,000 direct labor-hours (normal activity) as the denominator activity figure in computing predetermined overhead rates, as you have done in (1) above.

| Manufacturing Overhead | | | |
|------------------------|---------|--|---|
| Actual costs | 446,400 | | ? |
| | ? | | ? |

- c. Determine the cause of the underapplied or overapplied overhead for the year by computing the variable overhead rate and efficiency variances and the fixed overhead budget and volume variances.
5. Looking at the variances you have computed, what appears to be the major disadvantage of using normal activity rather than expected actual activity as a denominator in computing the predetermined overhead rate? What advantages can you see to offset this disadvantage?

Segment Reporting, Decentralization, and the Balanced Scorecard

Sony Attempts to Rebound

Last century Sony delighted customers with its Walkman, the Trinitron TV, the PlayStation, and the CD. However, in the digital media era Sony has lost ground to many better-managed competitors such as Microsoft, Apple, Sharp, and Nokia. Sony is attempting to rebound by discontinuing unprofitable segments such as Aibo, a line of robotic pets; Qualia, a line of

boutique electronics; 1,220 cosmetic salons; and 18 Maxim de Paris restaurants. In addition, the company has closed nine plants, sold \$705 million worth of assets, and eliminated 5,700 jobs.

The next step for Sony is to improve communications across its remaining business units. For example, at one point Sony had three business units unknowingly competing against one another by developing their own digital music players. Sony's challenge is to encourage decentralized decision making to spur product innovation, while centralizing control of communications across the company so that engineers do not create competing or incompatible products. ■

Learning Objectives

After studying Chapter 11, you should be able to:

- L01** Prepare a segmented income statement using the contribution format, and explain the difference between traceable fixed costs and common fixed costs.
- L02** Compute return on investment (ROI) and show how changes in sales, expenses, and assets affect ROI.
- L03** Compute residual income and understand its strengths and weaknesses.
- L04** Understand how to construct and use a balanced scorecard.
- L05** (Appendix 11A) Determine the range, if any, within which a negotiated transfer price should fall.
- L06** (Appendix 11B) Charge operating departments for services provided by service departments.

Except in very small organizations, top managers must delegate some decisions. For example, the CEO of the Hyatt Hotel chain cannot be expected to decide whether a particular hotel guest at the Hyatt Hotel on Maui should be allowed to check out later than the normal checkout time. It makes sense for the CEO to authorize employees at Maui to make this decision. As in this example, managers in large organizations have to delegate some decisions to those who are at lower levels in the organization.

Decentralization in Organizations

In a **decentralized organization**, decision-making authority is spread throughout the organization rather than being confined to a few top executives. As noted above, out of necessity all large organizations are decentralized to some extent. Organizations do differ, however, in the extent to which they are decentralized. In strongly centralized organizations, decision-making authority is reluctantly delegated to lower-level managers who have little freedom to make decisions. In strongly decentralized organizations, even the lowest-level managers are empowered to make as many decisions as possible. Most organizations fall somewhere between these two extremes.

Advantages and Disadvantages of Decentralization

The major advantages of decentralization include:

1. By delegating day-to-day problem solving to lower-level managers, top management can concentrate on bigger issues such as overall strategy.
2. Empowering lower-level managers to make decisions puts the decision-making authority in the hands of those who tend to have the most detailed and up-to-date information about day-to-day operations.
3. By eliminating layers of decision making and approvals, organizations can respond more quickly to customers and to changes in the operating environment.
4. Granting decision-making authority helps train lower-level managers for higher-level positions.
5. Empowering lower-level managers to make decisions can increase their motivation and job satisfaction.

The major disadvantages of decentralization include:

1. Lower-level managers may make decisions without fully understanding the big picture.
2. If lower-level managers make their own decisions, coordination may be lacking.
3. Lower-level managers may have objectives that clash with the objectives of the entire organization.¹ For example, a manager may be more interested in increasing the size of his or her department, leading to more power and prestige, than in increasing the department's effectiveness.

¹ Similar problems exist with top-level managers as well. The shareholders of the company delegate their decision-making authority to the top managers. Unfortunately, top managers may abuse that trust by rewarding themselves and their friends too generously, spending too much company money on palatial offices, and so on. The issue of how to ensure that top managers act in the best interests of the company's owners continues to challenge experts. To a large extent, the owners rely on performance evaluation using return on investment and residual income measures as discussed later in the chapter and on bonuses and stock options. The stock market is also an important disciplining mechanism. If top managers squander the company's resources, the price of the company's stock will almost surely fall—resulting in a loss of prestige, bonuses, and possibly a job. And, of course, particularly outrageous self-dealing may land a CEO in court, as recent events have demonstrated.

4. Spreading innovative ideas may be difficult in a decentralized organization. Someone in one part of the organization may have a terrific idea that would benefit other parts of the organization, but without strong central direction the idea may not be shared with, and adopted by, other parts of the organization.

Responsibility Accounting

Decentralized organizations need *responsibility accounting systems* that link lower-level managers' decision-making authority with accountability for the outcomes of those decisions. The term **responsibility center** is used for any part of an organization whose manager has control over and is accountable for cost, profit, or investments. The three primary types of responsibility centers are *cost centers*, *profit centers*, and *investment centers*.²

Cost, Profit, and Investment Centers

Cost Center The manager of a **cost center** has control over costs, but not over revenue or the use of investment funds. Service departments such as accounting, finance, general administration, legal, and personnel are usually classified as cost centers. In addition, manufacturing facilities are often considered to be cost centers. The managers of cost centers are expected to minimize costs while providing the level of products and services demanded by other parts of the organization. For example, the manager of a manufacturing facility would be evaluated at least in part by comparing actual costs to how much costs should have been for the actual level of output during the period. Standard cost variances and flexible budget variances, such as those discussed in earlier chapters, are often used to evaluate cost center performance.

Profit Center The manager of a **profit center** has control over both costs and revenue, but not over the use of investment funds. For example, the manager in charge of a **Six Flags** amusement park would be responsible for both the revenues and costs, and hence the profits, of the amusement park, but may not have control over major investments in the park. Profit center managers are often evaluated by comparing actual profit to targeted or budgeted profit.

IN BUSINESS

RESPONSIBILITY ACCOUNTING: A CHINESE PERSPECTIVE

For years **Han Dan Iron and Steel Company** was under Chinese government control. During this period, the company's management accounting system focused on complying with government mandates rather than responding to the market. As a market-oriented economy began to emerge, the company realized that its management accounting system was obsolete. Managers were preoccupied with meeting production quotas imposed by the government rather than controlling costs and meeting profit targets or encouraging productivity improvements. To remedy this situation, the company implemented what it called a *responsibility cost control system* that (1) set cost and profit targets, (2) assigned target costs to responsibility center managers, (3) evaluated the performance of responsibility center managers based on their ability to meet the targets, and (4) provided incentives to improve productivity.

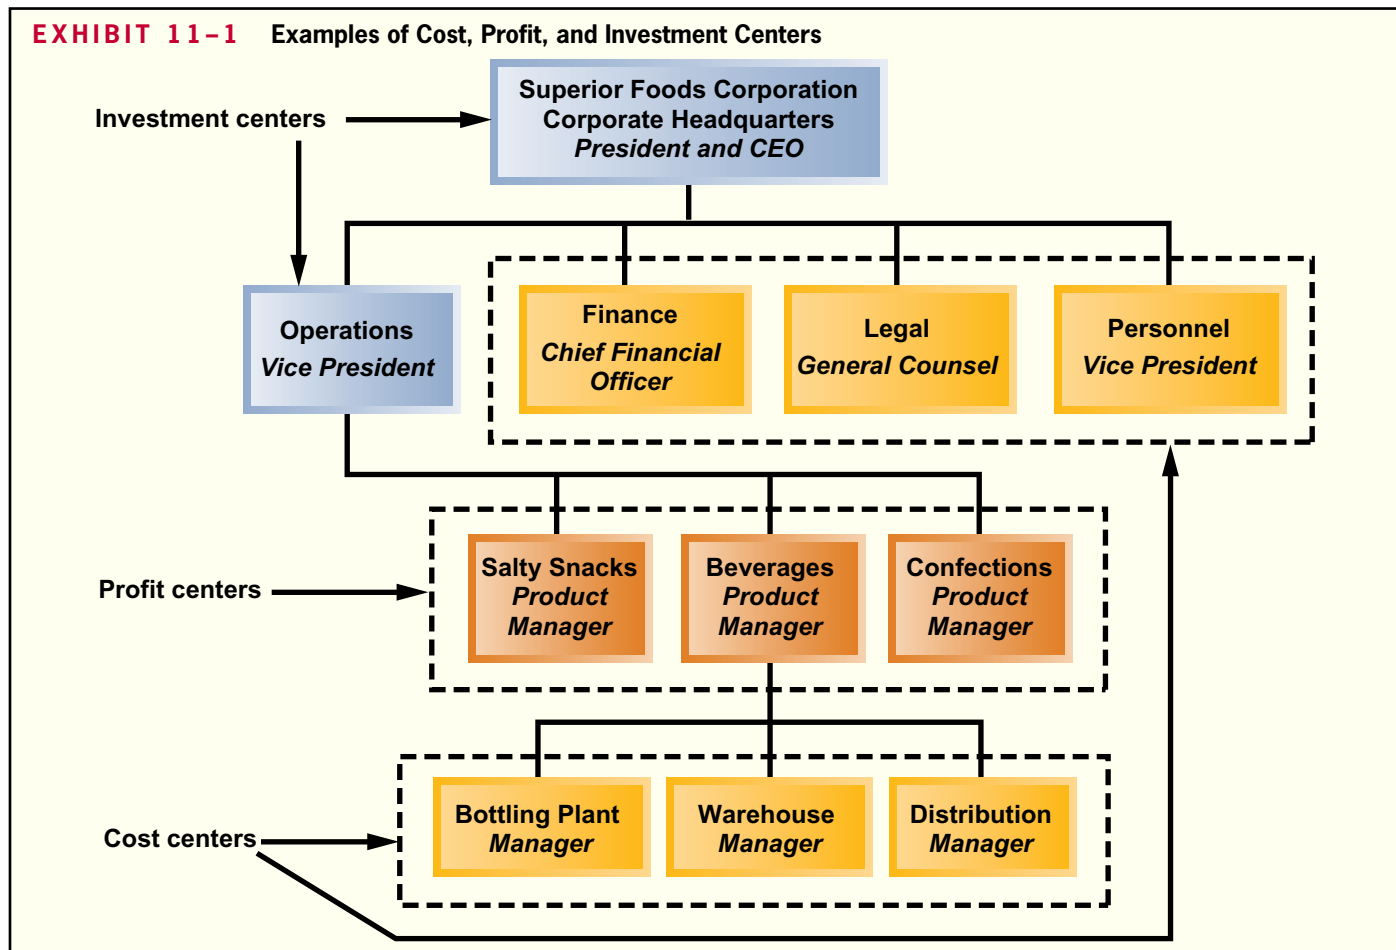

Source: Z. Jun Lin and Zengbiao Yu, "Responsibility Cost Control System in China: A Case of Management Accounting Application," *Management Accounting Research*, December 2002, pp. 447–467.

² Some companies classify business segments that are responsible mainly for generating revenue, such as an insurance sales office, as *revenue centers*. Other companies would consider this to be just another type of profit center because costs of some kind (salaries, rent, utilities) are usually deducted from the revenues in the segment's income statement.

Investment Center The manager of an **investment center** has control over cost, revenue, and investments in operating assets. For example, **General Motors'** vice president of manufacturing in North America would have a great deal of discretion over investments in manufacturing—such as investing in equipment to produce more fuel-efficient engines. Once General Motors' top-level managers and board of directors approve the vice president's investment proposals, he is held responsible for making them pay off. Investment center managers are often evaluated using return on investment (ROI) or residual income measures, as discussed later in the chapter.

An Organizational View of Responsibility Centers

Superior Foods Corporation, a company that manufactures and distributes snack foods and beverages, provides an example of the various kinds of responsibility centers. Exhibit 11-1 shows a partial organization chart for Superior Foods that displays its cost, profit, and investment centers. The departments and work centers that do not generate significant revenues by themselves are classified as cost centers. These are staff departments—such as finance, legal, and personnel—and operating units—such as the bottling plant, warehouse, and beverage distribution center. The profit centers generate revenues, and they include the salty snacks, beverages, and confections product families. The vice president of operations oversees the allocation of investment funds across the product families and is responsible for the profits of those product families. And finally, corporate headquarters is an investment center because it is responsible for all revenues, costs, and investments.

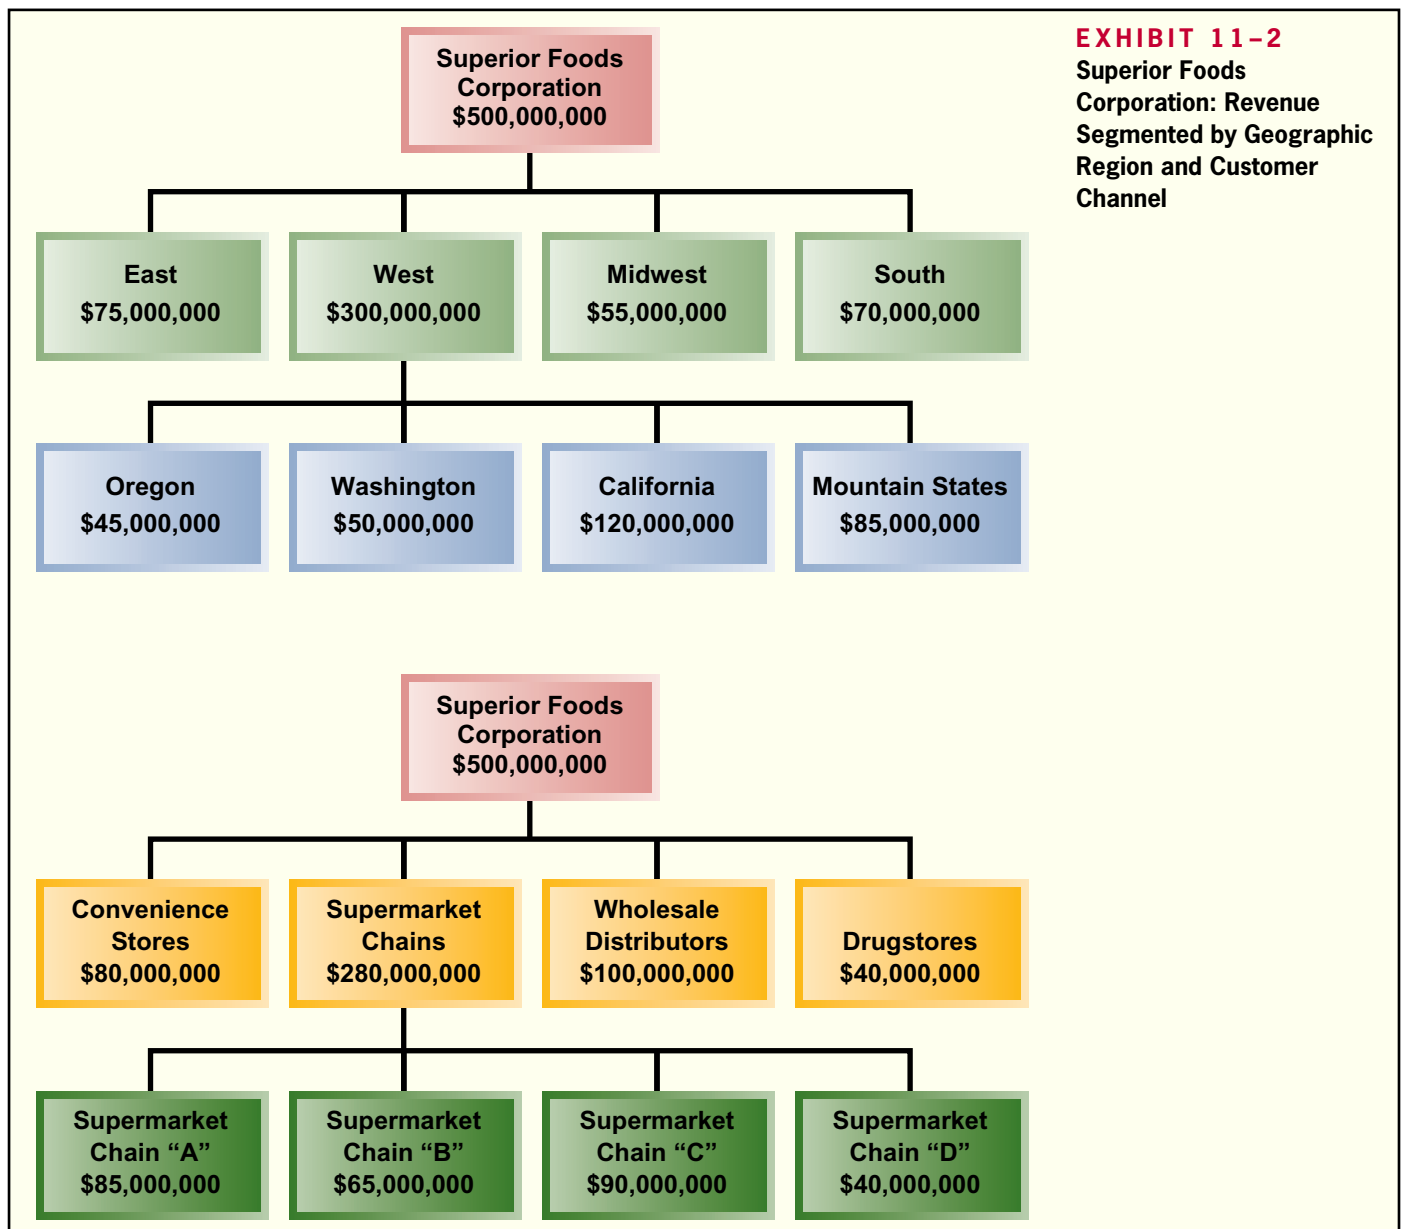

Decentralization and Segment Reporting

Effective decentralization requires *segmented reporting*. In addition to the companywide income statement, reports are needed for individual segments of the organization. A **segment** is a part or activity of an organization about which managers would like cost, revenue, or profit data. Cost, profit, and investment centers are segments as are sales territories, individual stores, service centers, manufacturing plants, marketing departments, individual customers, and product lines. A company's operations can be segmented in many ways. For example, Exhibit 11-2 shows several ways in which Superior Foods could segment its business. The top half of the exhibit shows Superior segmenting its \$500 million in revenue by geographical region, and the bottom half shows Superior segmenting its total revenue by customer channel. With the appropriate database and software, managers could easily drill even further down into the organization. For example, the sales in California could be segmented by product family, then by product line.

LEARNING OBJECTIVE 1

Prepare a segmented income statement using the contribution format, and explain the difference between traceable fixed costs and common fixed costs.

This drill-down capability helps managers to identify the sources of strong or weak overall financial performance. In this chapter, we learn how to construct income statements for business segments. These segmented income statements are useful in analyzing the profitability of segments and in measuring the performance of segment managers.

Building a Segmented Income Statement

Several important principles are involved in constructing a useful segmented income statement. These principles are illustrated in the following example.

ProphetMax Inc. is a rapidly growing computer software company founded by Lori Saffer, who had previously worked in a large software company, and Marjorie Matsuo, who had previously worked in the hotel industry as a general manager. They formed the company to develop and market user-friendly accounting and operations software designed specifically for hotels. They quit their jobs, pooled their savings, hired several programmers, and got down to work.

The first sale was by far the most difficult. No hotel wanted to be the first to use an untested product from an unknown company. After overcoming this obstacle with persistence, good luck, dedication to customer service, and a very low introductory price, the company's sales grew.

The company quickly developed similar business software for other specialized markets and then branched out into clip art and computer games. Within four years of its founding, the organization had grown to the point where Saffer and Matsuo were no longer able to personally direct all of the company's activities. Decentralization had become a necessity.

Accordingly, the company was split into two divisions—Business Products and Consumer Products. By mutual consent, Matsuo took the title president and Saffer took the title vice president of the Business Products Division. Chris Worden, a programmer who had spearheaded the drive into the clip art and computer games markets, was designated vice president of the Consumer Products Division.

Almost immediately, the issue arose of how best to evaluate the performance of the divisions. Matsuo called a meeting to consider this issue and asked Saffer, Worden, and the controller, Bill Carson, to attend. The following discussion took place at that meeting:

Marjorie: We need to find a better way to measure the performance of our divisions.

Chris: I agree. Consumer Products has been setting the pace in this company for the last two years, and we should be getting more recognition.

Lori: Chris, we are delighted with the success of the Consumer Products Division.

Chris: I know. But it is hard to figure out just how successful we are with the present accounting reports. All we have are sales and cost of goods sold figures for the division.

Bill: What's the matter with those figures? They are prepared using generally accepted accounting principles.

Chris: The sales figures are fine. However, cost of goods sold includes some costs that really aren't the costs of our division, and it excludes some costs that are. Let's take a simple example. Everything we sell in the Consumer Products Division has to pass through the automatic bar-coding machine, which applies a unique bar code to the product.

Lori: That's true for items from the Business Products Division as well as for items from the Consumer Products Division.

Chris: That's precisely the point. Whether an item comes from the Business Products Division or the Consumer Products Division, it must pass through the automatic bar-coding machine after the software has been packaged. How much of the cost of the automatic bar coder would be saved if we didn't have any consumer products?

MANAGERIAL ACCOUNTING IN ACTION

The Issue

ProphetMax
inc

Marjorie: Because we have only one automatic bar coder and we would need it anyway to code the business products, I guess none of the cost would be saved.

Chris: That's right. And because none of the cost could be saved even if the entire Consumer Products Division were eliminated, how can we logically say that some of the cost of the automatic bar coder is a cost of the Consumer Products Division?

Lori: Just a minute, Chris, are you saying that my Business Products Division should be charged with the entire cost of the automatic bar coder?

Chris: No, that's not what I am saying.

Marjorie: But Chris, I don't see how we can have sensible performance reports without making someone responsible for costs like the cost of the automatic bar coder. Bill, as our accounting expert, what do you think?

Bill: I have some ideas for handling issues like the automatic bar coder. The best approach would probably be for me to put together a draft performance report. We can discuss it at the next meeting when everyone has something concrete to look at.

Marjorie: Okay, let's see what you come up with.

Bill Carson, the controller of ProphetMax, realized that segmented income statements would be required to more appropriately evaluate the performance of the two divisions. To construct the segmented reports, he would have to carefully segregate costs that are attributable to the segments from costs that are not. Because most of the disputes over costs would be about fixed costs such as the automatic bar-coding machine, he knew he would also have to separate fixed from variable costs. The conventional absorption costing income statement prepared for the entire company commingles variable and fixed manufacturing costs in the cost of goods sold.

Largely for these reasons, Bill Carson decided to use the contribution format income statement based on variable costing that was discussed in earlier chapters. Recall that when the contribution format is used: (1) the cost of goods sold consists only of the variable manufacturing costs; (2) variable and fixed costs are listed in separate sections; and (3) a contribution margin is computed. When such a statement is segmented as in this chapter, fixed costs are broken down further into what are called traceable and common costs as discussed later. This breakdown allows a *segment margin* to be computed for each segment of the company. The segment margin is a valuable tool for assessing the long-run profitability of a segment and is also a much better tool for evaluating performance than absorption costing income statements.

Levels of Segmented Statements

A portion of the segmented report Bill Carson prepared is shown in Exhibit 11–3. The contribution format income statement for the entire company appears at the very top of the exhibit under the column labeled Total Company. Immediately to the right of this column are two columns—one for each of the two divisions. We can see that the Business Products Division's segment margin is \$60,000 and the Consumer Products Division's is \$40,000. These segment margins show the company's divisional managers how much each of their divisions is contributing to the company's profits.

However, segmented income statements can be prepared for activities at many levels in a company. To provide more information to the company's divisional managers, Bill Carson has further segmented the divisions according to their major product lines. In the case of the Consumer Products Division, the product lines are clip art and computer games. Going even further, Bill Carson has segmented each of the product lines according to how they are sold—in retail computer stores or over the Internet. In Exhibit 11–3, this further segmentation is illustrated for the computer games product line. Notice that as we go from one segmented statement to another, we look at smaller and smaller pieces of the company. While not shown in Exhibit 11–3, Bill Carson also prepared segmented income statements for the major product lines in the Business Products Division.

EXHIBIT 11-3
ProphetMax Inc.—Segmented
Income Statements in the
Contribution Format

Segments Defined as Divisions

| | Total Company | Divisions | |
|--|------------------|----------------------------------|----------------------------------|
| | | Business Products Division | Consumer Products Division |
| Sales | \$500,000 | \$300,000 | \$200,000 |
| Variable expenses: | | | |
| Variable cost of goods sold | 180,000 | 120,000 | 60,000 |
| Other variable expenses | 50,000 | 30,000 | 20,000 |
| Total variable expenses | 230,000 | 150,000 | 80,000 |
| Contribution margin | 270,000 | 150,000 | 120,000 |
| Traceable fixed expenses | 170,000 | 90,000 | 80,000* |
| Divisional segment margin | 100,000 | <u>\$ 60,000</u> | <u>\$ 40,000</u> |
| Common fixed expenses not traceable to individual divisions | 85,000 | | |
| Net operating income | <u>\$ 15,000</u> | | |

**Segments Defined as Product Lines
of the Consumer Products Division**

| | Consumer Products Division | Product Line | |
|--|----------------------------------|------------------|-------------------|
| | | Clip Art | Computer Games |
| Sales | \$200,000 | \$ 75,000 | \$125,000 |
| Variable expenses: | | | |
| Variable cost of goods sold | 60,000 | 20,000 | 40,000 |
| Other variable expenses | 20,000 | 5,000 | 15,000 |
| Total variable expenses | 80,000 | 25,000 | 55,000 |
| Contribution margin | 120,000 | 50,000 | 70,000 |
| Traceable fixed expenses | 70,000 | 30,000 | 40,000 |
| Product-line segment margin | 50,000 | <u>\$ 20,000</u> | <u>\$ 30,000</u> |
| Common fixed expenses not traceable to individual product lines | 10,000 | | |
| Divisional segment margin | <u>\$ 40,000</u> | | |

**Segments Defined as Sales Channels for One Product Line,
Computer Games, of the Consumer Products Division**

| | Computer Games | Sales Channels | |
|--|-------------------|------------------|-------------------|
| | | On-Line Sales | Retail Stores |
| Sales | \$125,000 | \$100,000 | \$ 25,000 |
| Variable expenses: | | | |
| Variable cost of goods sold | 40,000 | 32,000 | 8,000 |
| Other variable expenses | 15,000 | 5,000 | 10,000 |
| Total variable expenses | 55,000 | 37,000 | 18,000 |
| Contribution margin | 70,000 | 63,000 | 7,000 |
| Traceable fixed expenses | 25,000 | 15,000 | 10,000 |
| Sales-channel segment margin | 45,000 | <u>\$ 48,000</u> | <u>\$ (3,000)</u> |
| Common fixed expenses not traceable to individual sales channels .. | 15,000 | | |
| Product-line segment margin | <u>\$ 30,000</u> | | |

*Notice that this \$80,000 in traceable fixed expenses is divided into two parts when the Consumer Products Division is broken down into product lines—\$70,000 traceable and \$10,000 common. The reasons for this are discussed later in the section “Traceable Costs Can Become Common Costs.”

COMPUTING SEGMENT MARGINS HELPS AN ENTREPRENEUR

In 2001, **Victoria Pappas Collection**, a small company specializing in women's sportswear, reported a net loss of \$280,000 on sales of \$1 million. When the company's founder, Vickie Giannukos, segmented her company's income statement into the six markets that she was serving, the results were revealing. The Dallas and Atlanta markets generated \$825,000 of sales and incurred \$90,000 of traceable fixed costs. The other four markets combined produced \$175,000 of sales and also incurred \$90,000 of traceable fixed costs. Given the average contribution margin ratio of 38%, the Dallas and Atlanta markets earned a segment margin of \$223,500 $[(\$825,000 \times 38\%) - \$90,000]$ while the other four markets combined incurred a loss of \$23,500 $[(\$175,000 \times 38\%) - \$90,000]$.

Vicky had made a common mistake—she chased every possible dollar of sales without knowing if her efforts were profitable. Based on her segmented income statements, she discontinued operations in three cities and hired a new sales representative in Los Angeles. She decided to focus on growing sales in Dallas and Atlanta while deferring expansion into new markets until it could be done profitably.

Sales and Contribution Margin

To prepare a segmented income statement, variable expenses are deducted from sales to yield the contribution margin for the segment. The contribution margin tells us what happens to profits as volume changes—holding a segment's capacity and fixed costs constant. The contribution margin is especially useful in decisions involving temporary uses of capacity such as special orders. These types of decisions often involve only variable costs and revenues—the two components of contribution margin. Such decisions will be discussed in detail in the next chapter.

Traceable and Common Fixed Costs

The most puzzling aspect of Exhibit 11–3 is probably the treatment of fixed costs. The report lists two kinds of fixed costs—traceable and common. Only the *traceable fixed costs* are charged to particular segments. If a cost is not traceable to a segment, then it is not assigned to the segment.

A **traceable fixed cost** of a segment is a fixed cost that is incurred because of the existence of the segment—if the segment had never existed, the fixed cost would not have been incurred; and if the segment were eliminated, the fixed cost would disappear. Examples of traceable fixed costs include the following:

- The salary of the Fritos product manager at **PepsiCo** is a *traceable* fixed cost of the Fritos business segment of PepsiCo.
- The maintenance cost for the building in which Boeing 747s are assembled is a *traceable* fixed cost of the 747 business segment of **Boeing**.
- The liability insurance at **Disney World** is a *traceable* fixed cost of the Disney World business segment of the **Disney Corporation**.

A **common fixed cost** is a fixed cost that supports the operations of more than one segment, but is not traceable in whole or in part to any one segment. Even if a segment were entirely eliminated, there would be no change in a true common fixed cost. For example:

- The salary of the CEO of **General Motors** is a *common* fixed cost of the various divisions of General Motors.
- The cost of heating a **Safeway** or **Kroger** grocery store is a *common* fixed cost of the store's various departments—groceries, produce, bakery, meat, etc.
- The cost of the automatic bar-coding machine at ProphetMax is a *common* fixed cost of the Consumer Products Division and of the Business Products Division.

- The cost of the receptionist's salary at an office shared by a number of doctors is a *common* fixed cost of the doctors. The cost is traceable to the office, but not to individual doctors.

Identifying Traceable Fixed Costs The distinction between traceable and common fixed costs is crucial in segment reporting because traceable fixed costs are charged to segments and common fixed costs are not. In an actual situation, it is sometimes hard to determine whether a cost should be classified as traceable or common.

The general guideline is to treat as traceable costs *only those costs that would disappear over time if the segment itself disappeared*. For example, if the Consumer Products Division were sold or discontinued, it would no longer be necessary to pay the division manager's salary. Therefore the division manager's salary should be classified as a traceable fixed cost of the division. On the other hand, the president of the company undoubtedly would continue to be paid even if the Consumer Products Division were dropped. In fact, he or she might even be paid more if dropping the division was a good idea. Therefore, the president's salary is common to both divisions and should not be charged to either division.

When assigning costs to segments, the key point is to resist the temptation to allocate costs (such as depreciation of corporate facilities) that are clearly common and that will continue regardless of whether the segment exists or not. *Any allocation of common costs to segments reduces the value of the segment margin as a measure of long-run segment profitability and segment performance.*

Activity-Based Costing Some costs are easy to identify as traceable costs. For example, the cost of advertising Crest toothpaste on television is clearly traceable to **Crest**. A more difficult situation arises when a building, machine, or other resource is shared by two or more segments. For example, assume that a multiproduct company leases warehouse space that is used for storing the full range of its products. Would the lease cost of the warehouse be a traceable or a common cost of the products? Managers familiar with activity-based costing might argue that the lease cost is traceable and should be assigned to the products according to how much space the products use in the warehouse. In like manner, these managers would argue that order processing costs, sales support costs, and other selling and administrative expenses should also be charged to segments according to the segments' consumption of selling and administrative resources.

To illustrate, consider Holt Corporation, a company that manufactures concrete pipe for industrial uses. The company has three products—9-inch pipe, 12-inch pipe, and 18-inch pipe. Space is rented in a large warehouse on a yearly basis as needed. The rental cost of this space is \$4 per square foot per year. The 9-inch pipe occupies 1,000 square feet of space, the 12-inch pipe occupies 4,000 square feet, and the 18-inch pipe occupies 5,000 square feet. The company also has an order processing department that incurred \$150,000 in order processing costs last year. Management believes that order processing costs are driven by the number of orders placed by customers. Last year 2,500 orders were placed, of which 1,200 were for 9-inch pipe, 800 were for 12-inch pipe, and 500 were for 18-inch pipe. Given these data, the following costs would be assigned to each product using the activity-based costing approach:

| | |
|---|------------------|
| Warehouse space cost: | |
| 9-inch pipe: \$4 per square foot × 1,000 square feet | \$ 4,000 |
| 12-inch pipe: \$4 per square foot × 4,000 square feet | 16,000 |
| 18-inch pipe: \$4 per square foot × 5,000 square feet | 20,000 |
| Total cost assigned | <u>\$ 40,000</u> |
| Order processing costs: | |
| \$150,000 ÷ 2,500 orders = \$60 per order | |
| 9-inch pipe: \$60 per order × 1,200 orders | \$ 72,000 |
| 12-inch pipe: \$60 per order × 800 orders | 48,000 |
| 18-inch pipe: \$60 per order × 500 orders | 30,000 |
| Total cost assigned | <u>\$150,000</u> |

This method of assigning costs combines the strength of activity-based costing with the power of the contribution approach and greatly enhances the manager’s ability to measure the profitability and performance of segments. However, managers must still ask themselves if the costs would in fact disappear over time if the segment itself disappeared. In the case of Holt Corporation, it is clear that the \$20,000 in warehousing costs for the 18-inch pipe would be eliminated if 18-inch pipes were no longer being produced. The company would simply rent less warehouse space the following year. However, suppose the company owns the warehouse. Then it is not so clear that \$20,000 of warehousing cost would really disappear if the 18-inch pipes were discontinued. The company might be able to sublease the space, or use it for other products, but then again the space might simply be empty while the warehousing costs continue to be incurred.

Traceable Costs Can Become Common Costs

Fixed costs that are traceable to one segment may be a common cost of another segment. For example, **United Airlines** might want a segmented income statement that shows the segment margin for a particular flight from Chicago to Paris further broken down into first-class, business-class, and economy-class segment margins. The airline must pay a substantial landing fee at Charles DeGaulle airport in Paris. This fixed landing fee is a traceable cost of the flight, but it is a common cost of the first-class, business-class, and economy-class segments. Even if the first-class cabin is empty, the entire landing fee must be paid. So the landing fee is not a traceable cost of the first-class cabin. But on the other hand, paying the fee is necessary in order to have any first-class, business-class, or economy-class passengers. So the landing fee is a common cost of these three classes.

The dual nature of some fixed costs can be seen in Exhibit 11–4. Notice from the diagram that when segments are defined as divisions, the Consumer Products Division has \$80,000 in traceable fixed expenses. However, when we drill down to the product lines, only \$70,000 of the \$80,000 cost that was traceable to the Consumer Products Division is traceable to the product lines. The other \$10,000 becomes a common cost of the two product lines of the Consumer Products Division.

Why would \$10,000 of traceable fixed cost become a common cost when the division is divided into product lines? The \$10,000 is the monthly salary of the manager of the Consumer Products Division. This salary is a traceable cost of the division as a whole, but it is a common cost of the division’s product lines. The manager’s salary is a necessary cost of having the two product lines, but even if one of the product lines were discontinued entirely, the manager’s salary would probably not be cut. Therefore, none of the manager’s salary can really be traced to the individual products.

| | Total Company | Segment | |
|--------------------------------|------------------|----------------------------------|----------------------------------|
| | | Business Products Division | Consumer Products Division |
| Contribution margin | \$270,000 | \$150,000 | \$120,000 |
| Traceable fixed expenses | 170,000 | 90,000 | 80,000 |

| | Consumer Products Division | Segment | |
|-----------------------------------|----------------------------------|-------------|-------------------|
| | | Clip Art | Computer Games |
| Contribution margin | \$120,000 | \$50,000 | \$70,000 |
| Traceable fixed expenses | 70,000 | 30,000 | 40,000 |
| Product-line segment margin | 50,000 | \$20,000 | \$30,000 |
| Common fixed expenses | 10,000 | | |
| Divisional segment margin | \$ 40,000 | | |

EXHIBIT 11-4
Reclassification of Traceable
Fixed Expenses from
Exhibit 11-3

The \$70,000 traceable fixed cost of the product lines consists of the costs of product specific advertising. A total of \$30,000 was spent on advertising clip art and \$40,000 was spent on advertising computer games. These costs can clearly be traced to the individual product lines.

Segment Margin

Observe from Exhibit 11–3 (see page 426) that the **segment margin** is obtained by deducting the traceable fixed costs of a segment from the segment’s contribution margin. It represents the margin available after a segment has covered all of its own costs. *The segment margin is the best gauge of the long-run profitability of a segment* because it includes only those costs that are caused by the segment. If a segment can’t cover its own costs, then that segment probably should be dropped (unless it has important side effects on other segments). Notice from Exhibit 11–3, for example, that the Retail Stores sales channel has a negative segment margin. This means that the segment is not generating enough revenue to cover its own costs. Retention or elimination of product lines and other segments is covered in more depth in the next chapter.

From a decision-making point of view, the segment margin is most useful in major decisions that affect capacity such as dropping a segment. By contrast, as we noted earlier, the contribution margin is most useful in decisions involving short-run changes in volume, such as pricing special orders that involve temporary use of existing capacity.

Shortly after Bill Carson, the ProphetMax Inc., controller, completed the segmented income statement, he sent copies to the other managers and called a meeting in which the report could be explained—Marjorie Matsuo, Lori Saffer, and Chris Worden were all in attendance.

MANAGERIAL ACCOUNTING IN ACTION

The Wrap-up

ProphetMax
inc

Lori: I think these segmented income statements are fairly self-explanatory. However, there is one thing I wonder about.

Bill: What’s that?

Lori: What is this common fixed expense of \$85,000 listed under the total company? And who is going to be responsible for it if neither Chris nor I have responsibility?

Bill: The \$85,000 of common fixed expenses represents expenses like administrative salaries and the costs of common production equipment such as the automatic bar-coding machine. Marjorie, do you want to respond to the question about responsibility for these expenses?

Marjorie: Sure. Because I’m the president of the company, I’m responsible for those costs. Some things can be delegated, others cannot be. It wouldn’t make any sense for either you or Chris to make strategic decisions about the bar coder because it affects both of you. That’s an important part of my job—making decisions about resources that affect all parts of the organization. This report makes it much clearer who is responsible for what. I like it.

Chris: So do I—my division’s segment margin is higher than the net operating income for the entire company.

Marjorie: Don’t get carried away, Chris. Let’s not misinterpret what this report means. The segment margins *have* to be big to cover the common costs of the company. We can’t let the big segment margins lull us into a sense of complacency. If we use these reports, we all have to agree that our objective is to increase all of our segment margins over time.

Lori: I’m willing to give it a try.

Chris: The reports make sense to me.

Marjorie: So be it. Then the first item of business would appear to be a review of the Retail Stores channel for selling computer games, where we appear to be losing money. Chris, could you brief us on this at our next meeting?

Chris: Yes. I have been suspecting for some time that our retail sales strategy could be improved.

Marjorie: We look forward to hearing your analysis.

IN BUSINESS

MANAGING PRODUCT INNOVATION AT GOOGLE

Marissa Mayer, Google's vice president for search products and user experience, believes that the company's future success hinges on innovation. She encourages risk-taking and readily acknowledges that 60–80% of the company's new products will fail. However, creating an organizational culture that embraces failure also helps produce the new product introductions that should sustain the company's future sales growth. Google's senior managers can use segmented income statements to identify the unprofitable products that should be discontinued and to track the performance of thriving new product innovations.

**Segmented Financial Information in External Reports**

The Financial Accounting Standards Board (FASB) now requires that companies in the United States include segmented financial and other data in their annual reports and that the segmented reports prepared for external users *must use the same methods and definitions that the companies use in internal segmented reports that are prepared to aid in making operating decisions*. This is a very unusual requirement. Companies are not ordinarily required to report the same data to external users that are reported internally for decision-making purposes. This may seem like a reasonable requirement for the FASB to make, but it has some serious drawbacks. First, segmented data are often highly sensitive and companies are reluctant to release such data to the public for the simple reason that their competitors will then have access to the data. Second, segmented statements prepared in accordance with GAAP do not distinguish between fixed and variable costs and between traceable and common costs. Indeed, the segmented income statements illustrated earlier in this chapter do not conform to GAAP for that reason. To avoid the complications of reconciling non-GAAP segment margins with GAAP consolidated earnings, it is likely that at least some managers will choose to construct their segmented financial statements in a manner that conforms with GAAP. This will result in more occurrences of the problems discussed in the following section.

**Hindrances to Proper Cost Assignment**

Costs must be properly assigned to segments. All of the costs attributable to a segment—and only those costs—should be assigned to the segment. Unfortunately, companies often make mistakes when assigning costs to segments. They omit some costs, inappropriately assign traceable fixed costs, and arbitrarily allocate common fixed costs.

Omission of Costs

The costs assigned to a segment should include all costs attributable to that segment from the company's entire value chain. All of these functions, from research and development, through product design, manufacturing, marketing, distribution, and customer service, are required to bring a product or service to the customer and generate revenues.

However, only manufacturing costs are included in product costs under absorption costing, which is widely regarded as required for external financial reporting. To avoid having to maintain two costing systems and to provide consistency between internal and external reports, many companies also use absorption costing for their internal reports such as segmented income statements. As a result, such companies omit from their

profitability analysis part or all of the “upstream” costs in the value chain, which consist of research and development and product design, and the “downstream” costs, which consist of marketing, distribution, and customer service. Yet these nonmanufacturing costs are just as essential in determining product profitability as are the manufacturing costs. These upstream and downstream costs, which are usually included in selling and administrative expenses on absorption costing income statements, can represent half or more of the total costs of an organization. If either the upstream or downstream costs are omitted in profitability analysis, then the product is undercosted and management may unwittingly develop and maintain products that in the long run result in losses.

Inappropriate Methods for Assigning Traceable Costs among Segments

In addition to omitting costs, many companies do not correctly handle traceable fixed expenses on segmented income statements. First, they do not trace fixed expenses to segments even when it is feasible to do so. Second, they use inappropriate allocation bases to allocate traceable fixed expenses to segments.

Failure to Trace Costs Directly Costs that can be traced directly to a specific segment should be charged directly to that segment and should not be allocated to other segments. For example, the rent for a branch office of an insurance company should be charged directly to the branch office rather than included in a companywide overhead pool and then spread throughout the company.

Inappropriate Allocation Base Some companies use arbitrary allocation bases to allocate costs to segments. For example, some companies allocate selling and administrative expenses on the basis of sales revenues. Thus, if a segment generates 20% of total company sales, it would be allocated 20% of the company’s selling and administrative expenses as its “fair share.” This same basic procedure is followed if cost of goods sold or some other measure is used as the allocation base.

Costs should be allocated to segments for internal decision-making purposes only when the allocation base actually drives the cost being allocated (or is very highly correlated with the real cost driver). For example, sales should be used to allocate selling and administrative expenses only if a 10% increase in sales will result in a 10% increase in selling and administrative expenses. To the extent that selling and administrative expenses are not driven by sales volume, these expenses will be improperly allocated—with a disproportionately high percentage of the selling and administrative expenses assigned to the segments with the largest sales.

Arbitrarily Dividing Common Costs among Segments

The third business practice that leads to distorted segment costs is the practice of assigning nontraceable costs to segments. For example, some companies allocate the common costs of the corporate headquarters building to products on segment reports. However, in a multiproduct company, no single product is likely to be responsible for any significant amount of this cost. Even if a product were eliminated entirely, there would usually be no significant effect on any of the costs of the corporate headquarters building. In short, there is no cause-and-effect relation between the cost of the corporate headquarters building and the existence of any one product. As a consequence, any allocation of the cost of the corporate headquarters building to the products must be arbitrary.

Common costs like the costs of the corporate headquarters building are necessary, of course, to have a functioning organization. The practice of arbitrarily allocating common costs to segments is often justified on the grounds that “someone” has to “cover the common costs.” While it is undeniably true that the common costs must be covered, arbitrarily allocating common costs to segments does not ensure that this will happen. In fact, adding a share of common costs to the real costs of a segment may make an otherwise profitable segment appear to be unprofitable. If a manager eliminates the apparently unprofitable

segment, the real traceable costs of the segment will be saved, but its revenues will be lost. And what happens to the common fixed costs that were allocated to the segment? They don't disappear; they are reallocated to the remaining segments of the company. That makes all of the remaining segments appear to be less profitable—possibly resulting in dropping other segments. The net effect will be to reduce the overall profits of the company and make it even more difficult to “cover the common costs.”

Additionally, common fixed costs are not manageable by the manager to whom they are arbitrarily allocated; they are the responsibility of higher-level managers. Allocating common fixed costs to responsibility centers is counterproductive in a responsibility accounting system. When common fixed costs are allocated to managers, they are held responsible for those costs even though they cannot control them.

In sum, the way many companies handle segment reporting results in cost distortion. This distortion results from three practices—the failure to trace costs directly to a specific segment when it is feasible to do so, the use of inappropriate bases for allocating costs, and the allocation of common costs to segments. These practices are widespread. One study found that 60% of the companies surveyed made no attempt to assign selling and administrative costs to segments on a cause-and-effect basis.³

IN BUSINESS

THE BIG GOUGE?

The Big Dig in Boston is a \$14 billion-plus project to bury major roads underground in downtown Boston. Two companies—Bechtel and Parsons Brinckerhoff (PB)—manage the 20-year project, which is \$1.6 billion over budget. The two companies will likely collect in excess of \$120 million in fixed fees for their work on the project—not including reimbursements for overhead costs. Bechtel and PB have many projects underway at any one time and many common fixed costs. These common fixed costs are not actually caused by the Big Dig project and yet portions of these costs have been claimed as reimbursable expenses. “Bechtel and PB say they don't collect a penny more for overhead than they are entitled to.” A Bechtel spokesman says, “Our allocation of overhead [on the Big Dig] is rigorously audited . . .” This is undoubtedly true; in practice, fixed common costs are routinely (and arbitrarily) allocated to segments for cost reimbursement and other purposes. Managers at Bechtel, PB, and other companies argue that someone must pay for these costs. While this too is true, who actually pays for these costs will depend on how the common fixed costs are arbitrarily allocated among segments. Massachusetts has lodged a number of complaints concerning Bechtel's cost recovery claims. Such complaints are almost inevitable when common fixed costs are allocated to segments. It might be better to simply set an all-inclusive fixed fee up front with no cost recovery and hence no issues concerning what costs are really attributable to the project.

Evaluating Investment Center Performance—Return on Investment

Thus far, the chapter has focused on how to properly assign costs to responsibility centers and how to construct segmented income statements. These are vital steps when evaluating cost and profit centers. However, evaluating an investment center's performance requires more than accurate cost and segment margin reporting. In addition, an investment center is responsible for earning an adequate return on investment. The following two sections present two methods for evaluating this aspect of an investment center's performance. The first method, covered in this section, is called *return on investment (ROI)*. The second method, covered in the next section, is called *residual income*.

LEARNING OBJECTIVE 2

Compute return on investment (ROI) and show how changes in sales, expenses, and assets affect ROI.

³ James R. Emore and Joseph A. Ness, “The Slow Pace of Meaningful Change in Cost Systems,” *Journal of Cost Management* 4, no. 4, p. 39.

The Return on Investment (ROI) Formula

Return on investment (ROI) is defined as net operating income divided by average operating assets:

$$\text{ROI} = \frac{\text{Net operating income}}{\text{Average operating assets}}$$

The higher a business segment's return on investment (ROI), the greater the profit earned per dollar invested in the segment's operating assets.

Net Operating Income and Operating Assets Defined

Note that *net operating income*, rather than net income, is used in the ROI formula. **Net operating income** is income before interest and taxes and is sometimes referred to as EBIT (earnings before interest and taxes). Net operating income is used in the formula because the base (i.e., denominator) consists of *operating assets*. To be consistent, we use net operating income in the numerator.

Operating assets include cash, accounts receivable, inventory, plant and equipment, and all other assets held for operating purposes. Examples of assets that are not included in operating assets (i.e., examples of nonoperating assets) include land held for future use, an investment in another company, or a building rented to someone else. These assets are not held for operating purposes and therefore are excluded from operating assets. The operating assets base used in the formula is typically computed as the average of the operating assets between the beginning and the end of the year.

Most companies use the net book value (i.e., acquisition cost less accumulated depreciation) of depreciable assets to calculate average operating assets. This approach has drawbacks. An asset's net book value decreases over time as the accumulated depreciation increases. This decreases the denominator in the ROI calculation, thus increasing ROI. Consequently, ROI mechanically increases over time. Moreover, replacing old depreciated equipment with new equipment increases the book value of depreciable assets and decreases ROI. Hence, using net book value in the calculation of average operating assets results in a predictable pattern of increasing ROI over time as accumulated depreciation grows and discourages replacing old equipment with new, updated equipment. An alternative to using net book value is the gross cost of the asset, which ignores accumulated depreciation. Gross cost stays constant over time because depreciation is ignored; therefore, ROI does not grow automatically over time, and replacing a fully depreciated asset with a comparably priced new asset will not adversely affect ROI.

Nevertheless, most companies use the net book value approach to computing average operating assets because it is consistent with their financial reporting practices of recording the net book value of assets on the balance sheet and including depreciation as an operating expense on the income statement. In this text, we will use the net book value approach unless a specific exercise or problem directs otherwise.

Understanding ROI

The equation for ROI, net operating income divided by average operating assets, does not provide much help to managers interested in taking actions to improve their ROI. It only offers two levers for improving performance—net operating income and average operating assets. Fortunately, ROI can also be expressed as follows:

$$\text{ROI} = \text{Margin} \times \text{Turnover}$$

where

$$\text{Margin} = \frac{\text{Net operating income}}{\text{Sales}}$$

and

$$\text{Turnover} = \frac{\text{Sales}}{\text{Average operating assets}}$$

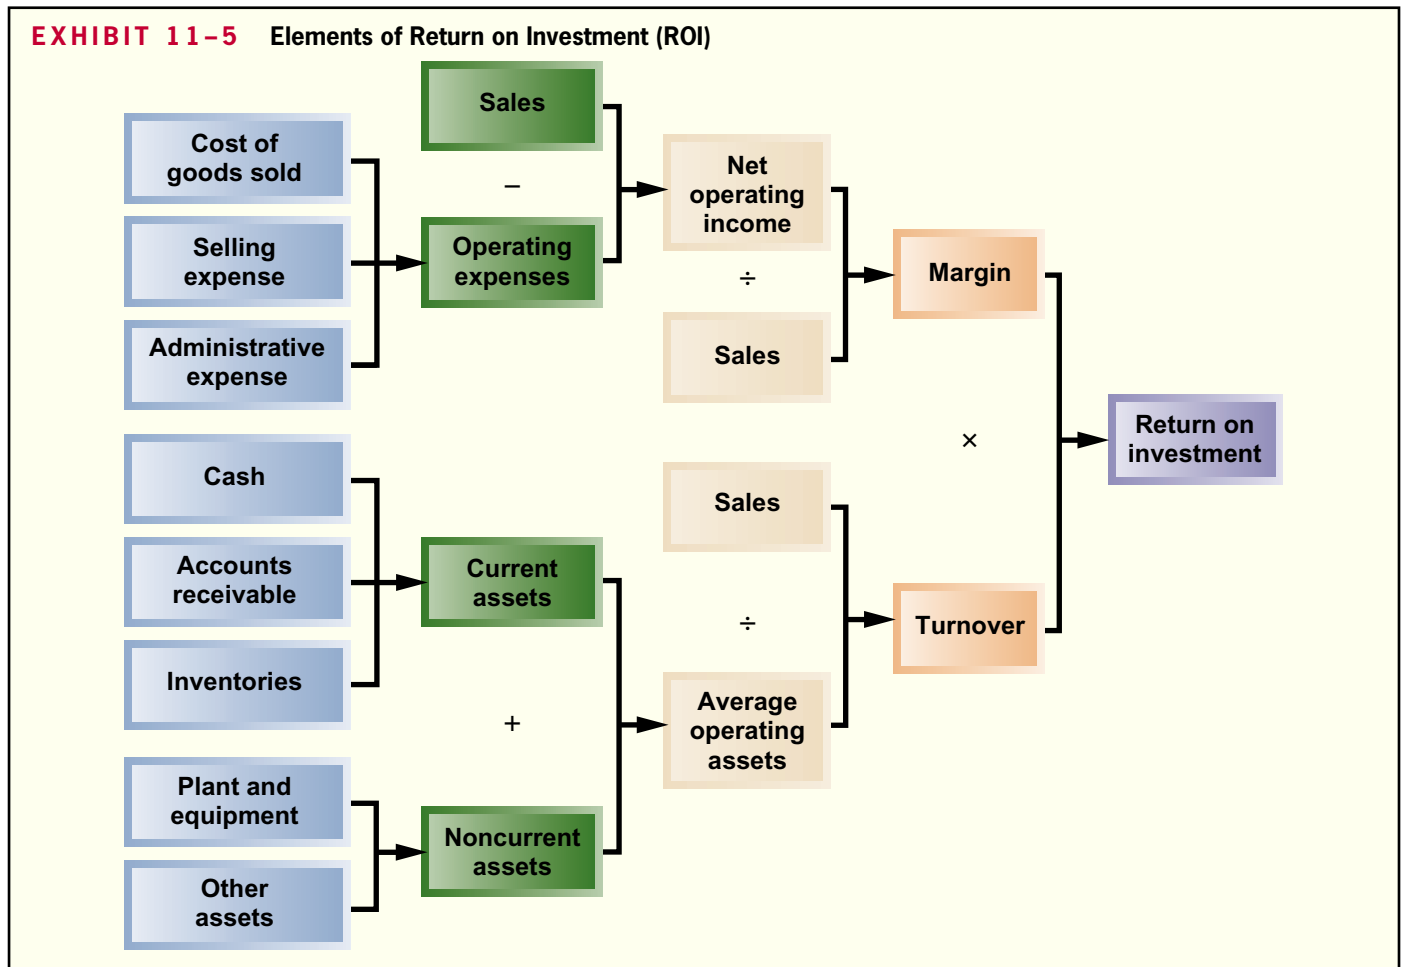

Note that the sales terms in the margin and turnover formulas cancel out when they are multiplied together, yielding the original formula for ROI stated in terms of net operating income and average operating assets. So either formula for ROI will give the same answer. However, the margin and turnover formulation provides some additional insights.

From a manager’s perspective, **margin** and **turnover** are very important concepts. Margin is ordinarily improved by increasing sales or reducing operating expenses, including cost of goods sold and selling and administrative expenses. The lower the operating expenses per dollar of sales, the higher the margin earned. Some managers tend to focus too much on margin and ignore turnover. However, turnover incorporates a crucial area of a manager’s responsibility—the investment in operating assets. Excessive funds tied up in operating assets (e.g., cash, accounts receivable, inventories, plant and equipment, and other assets) depress turnover and lower ROI. In fact, inefficient use of operating assets can be just as much of a drag on profitability as excessive operating expenses, which depress margin.

E.I. du Pont de Nemours and Company (better known as DuPont) pioneered the use of ROI and recognized the importance of looking at both margin and turnover in assessing a manager’s performance. ROI is now widely used as the key measure of investment center performance. ROI reflects in a single figure many aspects of the manager’s responsibilities. It can be compared to the returns of other investment centers in the organization, the returns of other companies in the industry, and to the past returns of the investment center itself.

DuPont also developed the diagram that appears in Exhibit 11–5. This exhibit helps managers understand how they can improve ROI. Any increase in ROI must involve at least one of the following:

1. Increased sales
2. Reduced operating expenses
3. Reduced operating assets

Many actions involve combinations of changes in sales, expenses, and operating assets. For example, a manager may make an investment in (i.e., increase) operating assets to reduce operating expenses or increase sales. Whether the net effect is favorable or not is judged in terms of its overall impact on ROI.

For example, suppose that the Montvale Burger Grill expects the following operating results next month:

| | |
|--------------------------------|-----------|
| Sales | \$100,000 |
| Operating expenses | \$90,000 |
| Net operating income | \$10,000 |
| Average operating assets | \$50,000 |

The expected return on investment (ROI) for the month is computed as follows:

$$\begin{aligned} \text{ROI} &= \frac{\text{Net operating income}}{\text{Sales}} \times \frac{\text{Sales}}{\text{Average operating assets}} \\ &= \frac{\$10,000}{\$100,000} \times \frac{\$100,000}{\$50,000} \\ &= 10\% \times 2 = 20\% \end{aligned}$$

Suppose that the manager of the Montvale Burger Grill is considering investing \$2,000 in a state-of-the-art soft-serve ice cream machine that can dispense a number of different flavors. This new machine would boost sales by \$4,000, but would require additional operating expenses of \$1,000. Thus, net operating income would increase by \$3,000, to \$13,000. The new ROI would be:

$$\begin{aligned} \text{ROI} &= \frac{\text{Net operating income}}{\text{Sales}} \times \frac{\text{Sales}}{\text{Average operating assets}} \\ &= \frac{\$13,000}{\$104,000} \times \frac{\$104,000}{\$52,000} \\ &= 12.5\% \times 2 = 25\% \text{ (as compared to 20\% originally)} \end{aligned}$$

In this particular example, the investment increases ROI, but that will not always happen.

Criticisms of ROI

Although ROI is widely used in evaluating performance, it is subject to the following criticisms:

1. Just telling managers to increase ROI may not be enough. Managers may not know how to increase ROI; they may increase ROI in a way that is inconsistent with the company's strategy; or they may take actions that increase ROI in the short run but harm the company in the long run (such as cutting back on research and development). This is why ROI is best used as part of a balanced scorecard, as discussed later in this chapter. A balanced scorecard can provide concrete guidance to managers, making it more likely that their actions are consistent with the company's strategy and reducing the likelihood that they will boost short-run performance at the expense of long-term performance.
2. A manager who takes over a business segment typically inherits many committed costs over which the manager has no control. These committed costs may be relevant in assessing the performance of the business segment as an investment but they make it difficult to fairly assess the performance of the manager.
3. As discussed in the next section, a manager who is evaluated based on ROI may reject investment opportunities that are profitable for the whole company but that would have a negative impact on the manager's performance evaluation.

Residual Income

Residual income is another approach to measuring an investment center’s performance. **Residual income** is the net operating income that an investment center earns above the minimum required return on its operating assets. In equation form, residual income is calculated as follows:

$$\text{Residual income} = \text{Net operating income} - \left(\text{Average operating assets} \times \text{Minimum required rate of return} \right)$$

LEARNING OBJECTIVE 3
 Compute residual income and understand its strengths and weaknesses.

Economic Value Added (EVA[®]) is an adaptation of residual income that has been adopted by many companies.⁴ Under EVA, companies often modify their accounting principles in various ways. For example, funds used for research and development are often treated as investments rather than as expenses.⁵ These complications are best dealt with in a more advanced course; in this text we will not draw any distinction between residual income and EVA.

When residual income or EVA is used to measure performance, the objective is to maximize the total amount of residual income or EVA, not to maximize ROI. This is an important distinction. If the objective were to maximize ROI, then every company should divest all of its products except the single product with the highest ROI.

A wide variety of organizations have embraced some version of residual income or EVA, including **Bausch & Lomb, Best Buy, Boise Cascade, Coca-Cola, Dun and Bradstreet, Eli Lilly, Federated Mogul, Georgia-Pacific, Guidant Corporation, Hershey Foods, Husky Injection Molding, J.C. Penney, Kansas City Power & Light, Olin, Quaker Oats, Silicon Valley Bank, Sprint, Toys R Us, Tupperware,** and the **United States Postal Service**. In addition, financial institutions such as **Credit Suisse First Boston** now use EVA—and its allied concept, market value added—to evaluate potential investments in other companies.

For purposes of illustration, consider the following data for an investment center—the Ketchikan Division of Alaskan Marine Services Corporation.

| Alaskan Marine Services Corporation Ketchikan Division Basic Data for Performance Evaluation | |
|--|-----------|
| Average operating assets | \$100,000 |
| Net operating income | \$20,000 |
| Minimum required rate of return | 15% |

Alaskan Marine Services Corporation has long had a policy of using ROI to evaluate its investment center managers, but it is considering switching to residual income. The controller of the company, who is in favor of the change to residual income, has provided

⁴ The basic idea underlying residual income and economic value added has been around for over 100 years. In recent years, economic value added has been popularized and trademarked by the consulting firm Stern, Stewart & Co.

⁵ Over 100 different adjustments could be made for deferred taxes, LIFO reserves, provisions for future liabilities, mergers and acquisitions, gains or losses due to changes in accounting rules, operating leases, and other accounts, but most companies make only a few. For further details, see John O’Hanlon and Ken Peasnell, “Wall Street’s Contribution to Management Accounting: the Stern Stewart EVA[®] Financial Management System,” *Management Accounting Research* 9, 1998, pp. 421–444.

the following table that shows how the performance of the division would be evaluated under each of the two methods:

| Alaskan Marine Services Corporation Ketchikan Division | | |
|---|---|----------------------------|
| | Alternative Performance Measures | |
| | ROI | Residual Income |
| Average operating assets (a) | <u>\$100,000</u> | <u>\$100,000</u> |
| Net operating income (b) | <u>\$ 20,000</u> | <u>\$ 20,000</u> |
| ROI, (b) ÷ (a) | <u>20%</u> | |
| Minimum required return (15% × \$100,000) | | 15,000 |
| Residual income | | <u>\$ 5,000</u> |

The reasoning underlying the residual income calculation is straightforward. The company is able to earn a rate of return of at least 15% on its investments. Because the company has invested \$100,000 in the Ketchikan Division in the form of operating assets, the company should be able to earn at least \$15,000 (15% × \$100,000) on this investment. Because the Ketchikan Division's net operating income is \$20,000, the residual income above and beyond the minimum required return is \$5,000. If residual income is adopted as the performance measure to replace ROI, the manager of the Ketchikan Division would be evaluated based on the growth in residual income from year to year.

Motivation and Residual Income

One of the primary reasons why the controller of Alaskan Marine Services Corporation would like to switch from ROI to residual income relates to how managers view new investments under the two performance measurement schemes. The residual income approach encourages managers to make investments that are profitable for the entire company but that would be rejected by managers who are evaluated using the ROI formula.

To illustrate this problem with ROI, suppose that the manager of the Ketchikan Division is considering purchasing a computerized diagnostic machine to aid in servicing marine diesel engines. The machine would cost \$25,000 and is expected to generate additional operating income of \$4,500 a year. From the standpoint of the company, this would be a good investment because it promises a rate of return of 18% (\$4,500 ÷ \$25,000), which exceeds the company's minimum required rate of return of 15%.

If the manager of the Ketchikan Division is evaluated based on residual income, she would be in favor of the investment in the diagnostic machine as shown below:

| Alaskan Marine Services Corporation Ketchikan Division Performance Evaluated Using Residual Income | | | |
|---|------------------|--------------------|------------------|
| | Present | New Project | Overall |
| Average operating assets | <u>\$100,000</u> | <u>\$25,000</u> | <u>\$125,000</u> |
| Net operating income | <u>\$ 20,000</u> | <u>\$ 4,500</u> | <u>\$ 24,500</u> |
| Minimum required return..... | <u>15,000</u> | <u>3,750*</u> | <u>18,750</u> |
| Residual income | <u>\$ 5,000</u> | <u>\$ 750</u> | <u>\$ 5,750</u> |

*\$25,000 × 15% = \$3,750.

Because the project would increase the residual income of the Ketchikan Division by \$750, the manager would choose to invest in the new diagnostic machine.

Now suppose that the manager of the Ketchikan Division is evaluated based on ROI. The effect of the diagnostic machine on the division's ROI is computed below:

| Alaskan Marine Services Corporation Ketchikan Division Performance Evaluated Using ROI | | | |
|--|-----------|-------------|-----------|
| | Present | New Project | Overall |
| Average operating assets (a) | \$100,000 | \$25,000 | \$125,000 |
| Net operating income (b) | \$20,000 | \$4,500 | \$24,500 |
| ROI, (b) ÷ (a) | 20% | 18% | 19.6% |

The new project reduces the division's ROI from 20% to 19.6%. This happens because the 18% rate of return on the new diagnostic machine, while above the company's 15% minimum required rate of return, is below the division's current ROI of 20%. Therefore, the new diagnostic machine would decrease the division's ROI even though it would be a good investment from the standpoint of the company as a whole. If the manager of the division is evaluated based on ROI, she will be reluctant to even propose such an investment.

Generally, a manager who is evaluated based on ROI will reject any project whose rate of return is below the division's current ROI even if the rate of return on the project is above the company's minimum required rate of return. In contrast, managers who are evaluated using residual income will pursue any project whose rate of return is above the minimum required rate of return because it will increase their residual income. Because it is in the best interests of the company as a whole to accept any project whose rate of return is above the minimum required rate of return, managers who are evaluated based on residual income will tend to make better decisions concerning investment projects than managers who are evaluated based on ROI.

Divisional Comparison and Residual Income

The residual income approach has one major disadvantage. It can't be used to compare the performance of divisions of different sizes. Larger divisions often have more residual income than smaller divisions, not necessarily because they are better managed but simply because they are bigger.

As an example, consider the following residual income computations for the Wholesale Division and the Retail Division of Sisal Marketing Corporation:

| | Wholesale Division | Retail Division |
|--|--------------------|-----------------|
| Average operating assets (a) | \$1,000,000 | \$250,000 |
| Net operating income | \$ 120,000 | \$ 40,000 |
| Minimum required return: 10% × (a) | 100,000 | 25,000 |
| Residual income | \$ 20,000 | \$ 15,000 |

Observe that the Wholesale Division has slightly more residual income than the Retail Division, but that the Wholesale Division has \$1,000,000 in operating assets as compared to only \$250,000 in operating assets for the Retail Division. Thus, the Wholesale Division's greater residual income is probably due to its larger size rather than the quality of its management. In fact, it appears that the smaller division may be better managed because it has been able to generate nearly as much residual income with only one-fourth

as much in operating assets. When comparing investment centers, it is probably better to focus on the percentage change in residual income from year to year rather than on the absolute amount of the residual income.

Many organizations now integrate financial measures such as ROI and residual income in a coordinated system of performance measures known as a *balanced scorecard*.

Balanced Scorecard

LEARNING OBJECTIVE 4

Understand how to construct and use a balanced scorecard.

A **balanced scorecard** consists of an integrated set of performance measures that are derived from and support the company's strategy. A strategy is essentially a theory about how to achieve the organization's goals. For example, **Southwest Airlines'** strategy is to offer an *operational excellence* customer value proposition that has three key components—low ticket prices, convenience, and reliability. The company operates only one type of aircraft, the Boeing 737, to reduce maintenance and training costs and simplify scheduling. It further reduces costs by not offering meals, seat assignments, or baggage transfers and by booking a large portion of its passenger revenue over the Internet. Southwest also uses point-to-point flights rather than the hub-and-spoke approach of its larger competitors, thereby providing customers convenient, nonstop service to their final destination. Because Southwest serves many less-congested airports such as Chicago Midway, Burbank, Manchester, Oakland, and Providence, it offers quicker passenger check-ins and reliable departures, while maintaining high asset utilization (i.e., the company's average gate turnaround time of 25 minutes enables it to function with fewer planes and gates). Overall, the company's strategy has worked. At a time when Southwest Airlines' larger competitors are struggling, it continues to earn substantial profits.

Under the balanced scorecard approach, top management translates its strategy into performance measures that employees can understand and influence. For example, the amount of time passengers have to wait in line to have their baggage checked might be a performance measure for the supervisor in charge of the Southwest Airlines check-in counter at the Burbank airport. This performance measure is easily understood by the supervisor, and can be improved by the supervisor's actions.

IN BUSINESS

WHY DO COMPANIES FAIL TO EXECUTE THEIR STRATEGIES?

Robert Paladino served as the vice president and global leader of the Telecommunications and Utility Practice for the **Balanced Scorecard Collaborative**—a consulting organization that works with companies to implement balanced scorecards. He offers four reasons why nine out of ten organizations fail to execute their business strategies.

First, only 5% of a company's workforce understands their organization's strategy. Paladino commented "if employees don't understand the strategic objectives, then they could be focused on closing the wrong performance gaps." Second, 85% of management teams spend less than one hour per month discussing strategy. Managers cannot effectively implement strategies if they do not spend enough time talking about them. Third, 60% of organizations do not link their budgets to strategy. The inevitable result is that companies pursue "financial strategies that differ from or, worse, may be in conflict with their business and customer quality strategies." Finally, only 25% of managers have their incentives linked to strategy. Thus, most managers are working to maximize their compensation by improving strategically misguided metrics.

Paladino says the balanced scorecard overcomes these four barriers because it helps employees focus their actions on executing organizational strategies.

Source: Robert E. Paladino, "Balanced Forecasts Drive Value," *Strategic Finance*, January 2005, pp. 37–42.

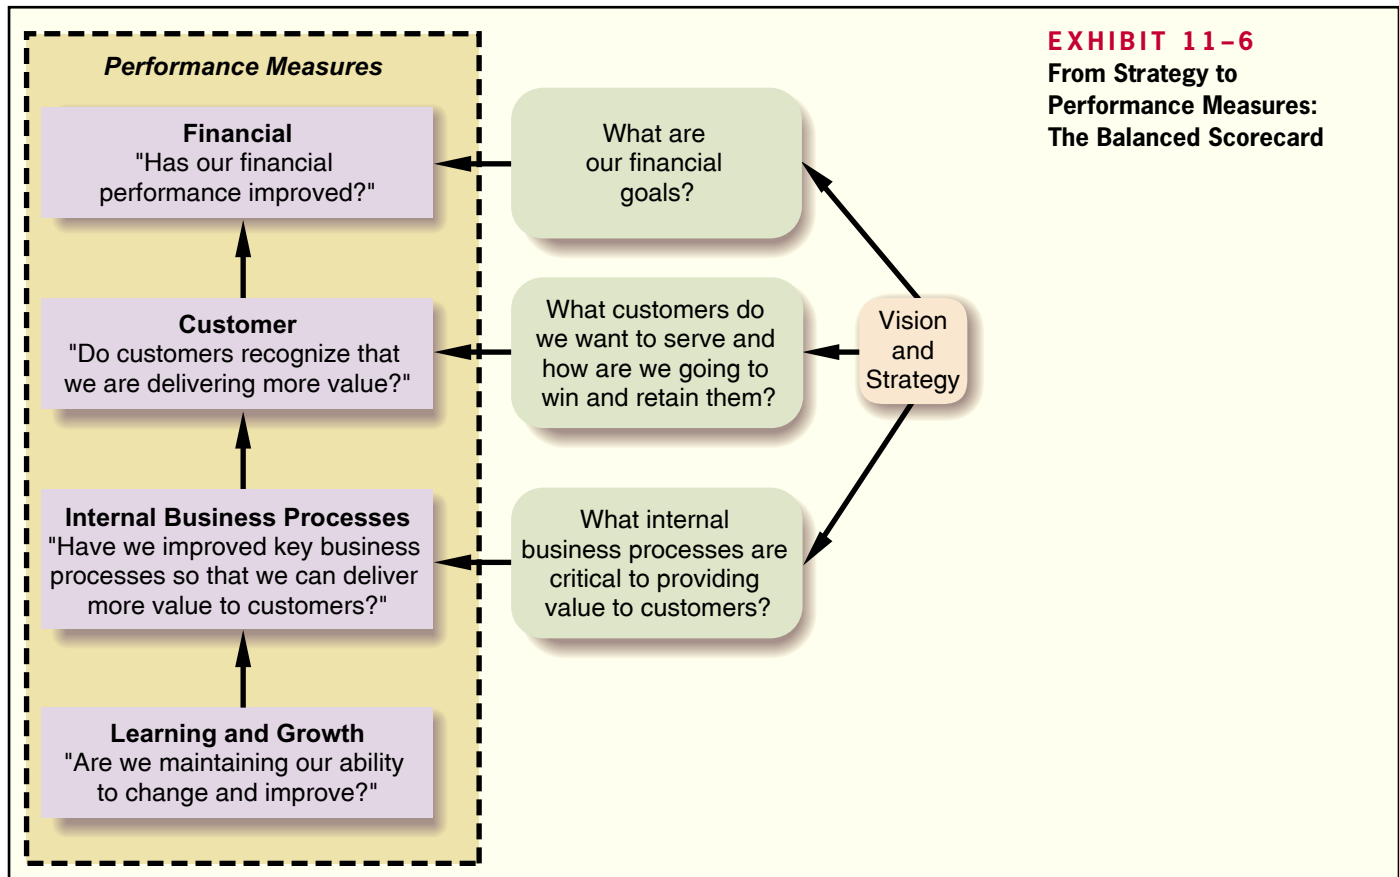

Common Characteristics of Balanced Scorecards

Performance measures used in the balanced scorecard approach tend to fall into the four groups illustrated in Exhibit 11-6: financial, customer, internal business processes, and learning and growth. Internal business processes are what the company does in an attempt to satisfy customers. For example, in a manufacturing company, assembling a product is an internal business process. In an airline, handling baggage is an internal business process. The idea underlying these groupings (as indicated by the vertical arrows in Exhibit 11-6) is that learning is necessary to improve internal business processes; improving business processes is necessary to improve customer satisfaction; and improving customer satisfaction is necessary to improve financial results.

Note that the emphasis in Exhibit 11-6 is on *improvement*—not on just attaining some specific objective such as profits of \$10 million. In the balanced scorecard approach, continual improvement is encouraged. If an organization does not continually improve, it will eventually lose out to competitors that do.

Financial performance measures appear at the top of Exhibit 11-6. Ultimately, most companies exist to provide financial rewards to owners. There are exceptions. Some companies—for example, **The Body Shop**—may have loftier goals such as providing environmentally friendly products to consumers. However, even nonprofit organizations must generate enough financial resources to stay in operation.

However, for several reasons, financial performance measures are not sufficient in themselves—they should be integrated with nonfinancial measures in a well-designed balanced scorecard. First, financial measures are lag indicators that report on the results of past actions. In contrast, nonfinancial measures of key success drivers such as customer satisfaction are leading indicators of future financial performance. Second, top managers are ordinarily responsible for the financial performance measures—not lower-level managers. The supervisor in charge of checking in passengers can be held responsible for

how long passengers have to wait in line. However, this supervisor cannot reasonably be held responsible for the entire company's profit. That is the responsibility of the airline's top managers.

Exhibit 11-7 lists some examples of performance measures that can be found on the balanced scorecards of companies. However, few companies, if any, would use all of these performance measures, and almost all companies would add other performance measures. Managers should carefully select performance measures for their own company's balanced scorecard, keeping the following points in mind. First and foremost, the performance measures should be consistent with, and follow from, the company's strategy. If the performance measures are not consistent with the company's strategy, people will find themselves working at cross-purposes. Second, the performance measures should be understandable and controllable to a significant extent by those being evaluated. Third, the scorecard should not have too many performance measures. This can lead to a lack of focus and confusion.

EXHIBIT 11-7
Examples of Performance
Measures for Balanced
Scorecards

| Customer Perspective | |
|---|-----------------------|
| Performance Measure | Desired Change |
| Customer satisfaction as measured by survey results | + |
| Number of customer complaints | - |
| Market share | + |
| Product returns as a percentage of sales | - |
| Percentage of customers retained from last period | + |
| Number of new customers | + |
| Internal Business Processes Perspective | |
| Performance Measure | Desired Change |
| Percentage of sales from new products | + |
| Time to introduce new products to market | - |
| Percentage of customer calls answered within 20 seconds | + |
| On-time deliveries as a percentage of all deliveries | + |
| Work in process inventory as a percentage of sales | - |
| Unfavorable standard cost variances | - |
| Defect-free units as a percentage of completed units | + |
| Delivery cycle time | - |
| Throughput time | - |
| Manufacturing cycle efficiency | + |
| Quality costs | - |
| Setup time | - |
| Time from call by customer to repair of product | - |
| Percent of customer complaints settled on first contact | + |
| Time to settle a customer claim | - |
| Learning and Growth Perspective | |
| Performance Measure | Desired Change |
| Suggestions per employee | + |
| Employee turnover | - |
| Hours of in-house training per employee | + |

While the entire organization will have an overall balanced scorecard, each responsible individual will have his or her own personal scorecard as well. This scorecard should consist of items the individual can personally influence that relate directly to the performance measures on the overall balanced scorecard. The performance measures on this personal scorecard should not be overly influenced by actions taken by others in the company or by events that are outside of the individual's control. And, focusing on the performance measure should not lead an individual to take actions that are counter to the organization's objectives.

With those broad principles in mind, we will now take a look at how a company's strategy affects its balanced scorecard.

IN BUSINESS

LOSING SIGHT OF THE CUSTOMER

Understanding customer needs sounds simple enough, but it is surprising how often companies lose sight of what their customers want. For example, **Waste Management**, one of the largest trash haulers in the United States, assumed that its customers were most interested in low prices. However, when the company actually surveyed its customers, it found out that they were more concerned about billing errors and missed garbage pickups. Waste Management responded to this feedback by upgrading its billing program—as a result customers are paying their bills in an average of 47 days instead of 71. Not only are customers happier with fewer billing errors, but shaving 24 days off the accounts receivable collection cycle is worth \$30 million per day to the company!

Waste Management also addressed the issue of missed garbage pickups by initiating a program called Haul or Call. When a garbage truck driver sees an impediment blocking a garbage bin, his home office calls the customer to see when they can reschedule a pickup. Customers have been so impressed with this level of service that their defection rate has dropped from 12% to 8.6% in less than one year.

Waste Management has found that the key to improving bottom-line results is gathering information from its customers about the underlying drivers of financial performance.

A Company's Strategy and the Balanced Scorecard

Returning to the performance measures in Exhibit 11–6, each company must decide which customers to target and what internal business processes are crucial to attracting and retaining those customers. Different companies, having different strategies, will target different customers with different kinds of products and services. Take the automobile industry as an example. **BMW** stresses engineering and handling; **Volvo**, safety; **Jaguar**, luxury detailing; and **Toyota**, reliability. Because of these differences in emphasis, a one-size-fits-all approach to performance measurement won't work even within this one industry. Performance measures must be tailored to the specific strategy of each company.

Suppose, for example, that Jaguar's strategy is to offer distinctive, richly finished luxury automobiles to wealthy individuals who prize handcrafted, individualized products. To deliver this customer intimacy value proposition to its wealthy target customers, Jaguar might create such a large number of options for details, such as leather seats, interior and exterior color combinations, and wooden dashboards, that each car becomes virtually one of a kind. For example, instead of just offering tan or blue leather seats in standard cowhide, the company may offer customers the choice of an almost infinite palette of colors in any of a number of different exotic leathers. For such a system to work effectively, Jaguar would have to be able to deliver a completely customized car within a reasonable amount of time—and without incurring more cost for this customization than the customer is willing to pay. Exhibit 11–8 suggests how Jaguar might reflect this strategy in its balanced scorecard.

EXHIBIT 11-8
A Possible Strategy at
Jaguar and the Balanced
Scorecard

If the balanced scorecard is correctly constructed, the performance measures should be linked together on a cause-and-effect basis. Each link can then be read as a hypothesis in the form “If we improve this performance measure, then this other performance measure should also improve.” Starting from the bottom of Exhibit 11-8, we can read the links between performance measures as follows. If employees acquire the skills to install new options more effectively, then the company can offer more options and the options can be installed in less time. If more options are available and they are installed in less time, then customer surveys should show greater satisfaction with the range of options available. If customer satisfaction improves, then the number of cars sold should increase. In addition, if customer satisfaction improves, the company should be able to maintain or increase its selling prices, and if the time to install options decreases, the costs of installing the options should decrease. Together, this should result in an increase in the contribution margin per car. If the contribution margin per car increases and more cars are sold, the result should be an increase in residual income.

In essence, the balanced scorecard lays out a theory of how the company can take concrete actions to attain its desired outcomes (financial, in this case). While the strategy laid out in Exhibit 11-8 seems plausible, it should be regarded as only a theory. For example, if the company succeeds in increasing the number of options available and in decreasing the time required to install options and yet there is no increase in customer

satisfaction, the number of cars sold, the contribution margin per car, or residual income, the strategy would have to be reconsidered. One of the advantages of the balanced scorecard is that it continually tests the theories underlying management's strategy. If a strategy is not working, it should become evident when some of the predicted effects (i.e., more car sales) don't occur. Without this feedback, the organization may drift on indefinitely with an ineffective strategy based on faulty assumptions.

IN BUSINESS

CAUSE-AND-EFFECT IS THE KEY

Professors Christopher D. Ittner and David F. Larcker surveyed 157 companies and found that only 23% consistently verified the hypothesized cause-and-effect linkages embedded in their balanced scorecards. These companies earned a 5.14% higher return on common stockholders' equity than the 77% of companies that did not verify their cause-and-effect linkages.

The authors found that most companies do not verify cause-and-effect linkages because they erroneously believe that they are self-evident. For example, one fast-food chain chose employee turnover as a performance measure believing that its positive effects on profits were obvious. However, the professors' research revealed that the fast-food chain's profitability was only influenced by turnover among its supervisors, not lower-level employees. A broad measure of employee turnover did not help explain differences in profitability across restaurants.

Source: Christopher D. Ittner and David F. Larcker, "Coming Up Short on Nonfinancial Performance Measurement," *Harvard Business Review*, November 2003, pp. 88–95.

The balanced scorecard has been embraced by a wide variety of organizations including [Bank of Tokyo-Mitsubishi UFJ](#), [Brigham & Women's Hospital](#), [KeyCorp](#), [Chilectra](#), [China Resources Microelectronics](#), [Delta Dental of Kansas](#), [Gerdau Acominas](#), [Korea East-West Power](#), [Luxfer Gas Cylinders](#), [Marriott Vacation Club International](#), [Metro de Madrid](#), [National Federation of Coffee Growers of Colombia](#), [Sprint Nextel](#), [Best Buy](#), [Ingersoll Rand](#), [Serono](#), [Tennessee Valley Authority](#), [Royal Canadian Mounted Police](#), [Crown Castle International](#), [Ricoh Corporation](#), [Mobistar](#), [Hilton Hotels](#), and the [United States Postal Service](#). It has been estimated that about half of all Fortune 1000 companies have implemented a balanced scorecard.

Tying Compensation to the Balanced Scorecard

Incentive compensation for employees, such as bonuses, can, and probably should, be tied to balanced scorecard performance measures. However, this should be done only after the organization has been successfully managed with the scorecard for some time—perhaps a year or more. Managers must be confident that the performance measures are reliable, sensible, understood by those who are being evaluated, and not easily manipulated. As Robert Kaplan and David Norton, the originators of the balanced scorecard concept point out, "compensation is such a powerful lever that you have to be pretty confident that you have the right measures and have good data for the measures before making the link."⁶

Advantages of Timely and Graphic Feedback

Whatever performance measures are used, they should be reported on a frequent and timely basis. For example, data about defects should be reported to the responsible managers at least once a day so that action can be quickly taken if an unusual number of

⁶ Lori Calabro, "On Balance: A CFO Interview," *CFO*, February 2001, pp. 73–78.

defects occurs. In the most advanced companies, any defect is reported *immediately*, and its cause is tracked down before any more defects occur. Another common characteristic of the performance measures under the balanced scorecard approach is that managers focus on *trends* in the performance measures over time. The emphasis is on progress and *improvement* rather than on meeting any specific standard.

IN BUSINESS

A PICTURE IS WORTH A THOUSAND NUMBERS

Graphics are routinely integrated in Balanced Scorecard reports, with data often displayed on a “dashboard” with representations of gauges and digital readouts. At **Beverage Can Americas Co.** in Chicago, a division of London-based **Rexam Plc.**, executive dashboards and scorecards are being rolled out to thousands of employees. “Each worker sees a handful of metrics that pertain to his or her job, which are represented as green, yellow, or red icons depending on whether they are satisfactory, borderline, or subpar.”

Source: Scott Leibs, “Now You See It,” *CFO*, July 2002, pp. 61–66.

Summary

For purposes of evaluating performance, business units are classified as cost centers, profit centers, and investment centers. Cost centers are commonly evaluated using standard cost and flexible budget variances as discussed in prior chapters. Profit centers and investment centers are evaluated using the techniques discussed in this chapter.

Segmented income statements provide information for evaluating the profitability and performance of divisions, product lines, sales territories, and other segments of a company. Under the contribution approach covered in this chapter, variable costs and fixed costs are clearly distinguished from each other and only those costs that are traceable to a segment are assigned to the segment. A cost is considered traceable to a segment only if the cost is caused by the segment and could be avoided by eliminating the segment. Fixed common costs are not allocated to segments. The segment margin consists of revenues, less variable expenses, less traceable fixed expenses of the segment.

Return on investment (ROI) and residual income and its cousin EVA are widely used to evaluate the performance of investment centers. ROI suffers from the underinvestment problem—managers are reluctant to invest in projects that would decrease their ROI but whose returns exceed the company’s required rate of return. The residual income and EVA approaches solve this problem by giving managers full credit for any returns in excess of the company’s required rate of return.

A balanced scorecard is an integrated system of performance measures designed to support an organization’s strategy. The various measures in a balanced scorecard should be linked on a plausible cause-and-effect basis from the very lowest level up through the organization’s ultimate objectives. The balanced scorecard is essentially a theory about how specific actions taken by various people in the organization will further the organization’s objectives. The theory should be viewed as tentative and subject to change if the actions do not in fact result in improvements in the organization’s financial and other goals. If the theory changes, then the performance measures on the balanced scorecard should also change. The balanced scorecard is a dynamic measurement system that evolves as an organization learns more about what works and what doesn’t work and refines its strategy accordingly.

Review Problem 1: Segmented Statements

The business staff of the law firm Frampton, Davis & Smythe has constructed the following report which breaks down the firm’s overall results for last month into two main business segments—family law and commercial law:

| | Total | Family Law | Commercial Law |
|--------------------------------|------------------|-------------------|------------------|
| Revenues from clients | \$1,000,000 | \$400,000 | \$600,000 |
| Variable expenses | <u>220,000</u> | <u>100,000</u> | <u>120,000</u> |
| Contribution margin | 780,000 | 300,000 | 480,000 |
| Traceable fixed expenses | <u>670,000</u> | <u>280,000</u> | <u>390,000</u> |
| Segment margin | 110,000 | 20,000 | 90,000 |
| Common fixed expenses | <u>60,000</u> | <u>24,000</u> | <u>36,000</u> |
| Net operating income | <u>\$ 50,000</u> | <u>\$ (4,000)</u> | <u>\$ 54,000</u> |

However, this report is not quite correct. The common fixed expenses such as the managing partner’s salary, general administrative expenses, and general firm advertising have been allocated to the two segments based on revenues from clients.

Required:

1. Redo the segment report, eliminating the allocation of common fixed expenses. Would the firm be better off financially if the family law segment were dropped? (Note: Many of the firm’s commercial law clients also use the firm for their family law requirements such as drawing up wills.)
2. The firm’s advertising agency has proposed an ad campaign targeted at boosting the revenues of the family law segment. The ad campaign would cost \$20,000, and the advertising agency claims that it would increase family law revenues by \$100,000. The managing partner of Frampton, Davis & Smythe believes this increase in business could be accommodated without any increase in fixed expenses. Estimate the effect this ad campaign would have on the family law segment margin and on the firm’s overall net operating income.

Solution to Review Problem 1

1. The corrected segmented income statement appears below:

| | Total | Family Law | Commercial Law |
|--------------------------------|------------------|------------------|------------------|
| Revenues from clients | \$1,000,000 | \$400,000 | \$600,000 |
| Variable expenses | <u>220,000</u> | <u>100,000</u> | <u>120,000</u> |
| Contribution margin | 780,000 | 300,000 | 480,000 |
| Traceable fixed expenses | <u>670,000</u> | <u>280,000</u> | <u>390,000</u> |
| Segment margin | 110,000 | <u>\$ 20,000</u> | <u>\$ 90,000</u> |
| Common fixed expenses | <u>60,000</u> | | |
| Net operating income | <u>\$ 50,000</u> | | |

No, the firm would not be financially better off if the family law practice were dropped. The family law segment is covering all of its own costs and is contributing \$20,000 per month to covering the common fixed expenses of the firm. While the segment margin for family law is much lower than for commercial law, it is still profitable. Moreover, family law may be a service that the firm must provide to its commercial clients in order to remain competitive.

2. The ad campaign can be estimated to increase the family law segment margin by \$55,000 as follows:

| | |
|---|------------------|
| Increased revenues from clients | \$100,000 |
| Family law contribution margin ratio ($\$300,000 \div \$400,000$) | $\times 75\%$ |
| Incremental contribution margin | <u>\$ 75,000</u> |
| Less cost of the ad campaign | <u>20,000</u> |
| Increased segment margin | <u>\$ 55,000</u> |

Because there would be no increase in fixed expenses (including common fixed expenses), the increase in overall net operating income is also \$55,000.

Review Problem 2: Return on Investment (ROI) and Residual Income

The Magnetic Imaging Division of Medical Diagnostics, Inc., has reported the following results for last year's operations:

| | |
|--------------------------------|--------------|
| Sales | \$25 million |
| Net operating income | \$3 million |
| Average operating assets | \$10 million |

Required:

1. Compute the Magnetic Imaging Division's margin, turnover, and ROI.
2. Top management of Medical Diagnostics, Inc., has set a minimum required rate of return on average operating assets of 25%. What is the Magnetic Imaging Division's residual income for the year?

Solution to Review Problem 2

1. The required calculations follow:

$$\begin{aligned}\text{Margin} &= \frac{\text{Net operating income}}{\text{Sales}} \\ &= \frac{\$3,000,000}{\$25,000,000} \\ &= 12\%\end{aligned}$$

$$\begin{aligned}\text{Turnover} &= \frac{\text{Sales}}{\text{Average operating assets}} \\ &= \frac{\$25,000,000}{\$10,000,000} \\ &= 2.5\%\end{aligned}$$

$$\begin{aligned}\text{ROI} &= \text{Margin} \times \text{Turnover} \\ &= 12\% \times 2.5 \\ &= 30\%\end{aligned}$$

2. The Magnetic Imaging Division's residual income is computed as follows:

| | |
|--|---------------------|
| Average operating assets | <u>\$10,000,000</u> |
| Net operating income | \$ 3,000,000 |
| Minimum required return (25% × \$10,000,000) | <u>2,500,000</u> |
| Residual income | <u>\$ 500,000</u> |

Glossary

Balanced scorecard An integrated set of performance measures that are derived from and support the organization's strategy. (p. 440)

Common fixed cost A fixed cost that supports more than one business segment, but is not traceable in whole or in part to any one of the business segments. (p. 427)

Cost center A business segment whose manager has control over cost but has no control over revenue or investments in operating assets. (p. 421)

Decentralized organization An organization in which decision-making authority is not confined to a few top executives but rather is spread throughout the organization. (p. 420)

Economic Value Added (EVA)[®] A concept similar to residual income in which a variety of adjustments may be made to GAAP financial statements for performance evaluation purposes. (p. 437)

- Investment center** A business segment whose manager has control over cost, revenue, and investments in operating assets. (p. 422)
- Margin** Net operating income divided by sales. (p. 435)
- Net operating income** Income before interest and income taxes have been deducted. (p. 434)
- Operating assets** Cash, accounts receivable, inventory, plant and equipment, and all other assets held for operating purposes. (p. 434)
- Profit center** A business segment whose manager has control over cost and revenue but has no control over investments in operating assets. (p. 421)
- Residual income** The net operating income that an investment center earns above the minimum required return on its operating assets. (p. 437)
- Responsibility center** Any business segment whose manager has control over costs, revenues, or investments in operating assets. (p. 421)
- Return on investment (ROI)** Net operating income divided by average operating assets. It also equals margin multiplied by turnover. (p. 434)
- Segment** Any part or activity of an organization about which managers seek cost, revenue, or profit data. (p. 423)
- Segment margin** A segment’s contribution margin less its traceable fixed costs. It represents the margin available after a segment has covered all of its own traceable costs. (p. 430)
- Traceable fixed cost** A fixed cost that is incurred because of the existence of a particular business segment and that would be eliminated if the segment were eliminated. (p. 427)
- Turnover** Sales divided by average operating assets. (p. 435)

Questions

- 11-1 What is meant by the term *decentralization*?
- 11-2 What benefits result from decentralization?
- 11-3 Distinguish between a cost center, a profit center, and an investment center.
- 11-4 What is a segment of an organization? Give several examples of segments.
- 11-5 What costs are assigned to a segment under the contribution approach?
- 11-6 Distinguish between a traceable cost and a common cost. Give several examples of each.
- 11-7 Explain how the segment margin differs from the contribution margin.
- 11-8 Why aren’t common costs allocated to segments under the contribution approach?
- 11-9 How is it possible for a cost that is traceable to a segment to become a common cost if the segment is divided into further segments?
- 11-10 What is meant by the terms *margin* and *turnover* in ROI calculations?
- 11-11 What is meant by residual income?
- 11-12 In what way can the use of ROI as a performance measure for investment centers lead to bad decisions? How does the residual income approach overcome this problem?
- 11-13 Why do the measures used in a balanced scorecard differ from company to company?
- 11-14 Why does the balanced scorecard include financial performance measures as well as measures of how well internal business processes are doing?

Multiple-choice questions are provided on the text website at www.mhhe.com/noreen2e.

connect™

Exercises

EXERCISE 11-1 Basic Segmented Income Statement [LO1]

Royal Lawncare Company produces and sells two packaged products, Weedban and Greengrow. Revenue and cost information relating to the products follow:

| | Product | |
|---|----------|-----------|
| | Weedban | Greengrow |
| Selling price per unit | \$6.00 | \$7.50 |
| Variable expenses per unit | \$2.40 | \$5.25 |
| Traceable fixed expenses per year | \$45,000 | \$21,000 |

Common fixed expenses in the company total \$33,000 annually. Last year the company produced and sold 15,000 units of Weedban and 28,000 units of Greengrow.

Required:

Prepare a contribution format income statement segmented by product lines.

EXERCISE 11–2 Compute the Return on Investment (ROI) [LO2]

Alyeska Services Company, a division of a major oil company, provides various services to the operators of the North Slope oil field in Alaska. Data concerning the most recent year appear below:

| | |
|--------------------------------|-------------|
| Sales | \$7,500,000 |
| Net operating income | \$600,000 |
| Average operating assets | \$5,000,000 |

Required:

1. Compute the margin for Alyeska Services Company.
2. Compute the turnover for Alyeska Services Company.
3. Compute the return on investment (ROI) for Alyeska Services Company.

EXERCISE 11–3 Residual Income [LO3]

Juniper Design Ltd. of Manchester, England, is a company specializing in providing design services to residential developers. Last year the company had net operating income of £600,000 on sales of £3,000,000. The company's average operating assets for the year were £2,800,000 and its minimum required rate of return was 18%. (The currency used in England is the pound, denoted by £.)

Required:

Compute the company's residual income for the year.

EXERCISE 11–4 Creating a Balanced Scorecard [LO4]

Mason Paper Company (MPC) manufactures commodity grade papers for use in computer printers and photocopiers. MPC has reported net operating losses for the last two years due to intense price pressure from much larger competitors. The MPC management team—including Kristen Townsend (CEO), Mike Martinez (vice president of Manufacturing), Tom Andrews (vice president of Marketing), and Wendy Chen (CFO)—is contemplating a change in strategy to save the company from impending bankruptcy. Excerpts from a recent management team meeting are shown below:

Townsend: As we all know, the commodity paper manufacturing business is all about economies of scale. The largest competitors with the lowest cost per unit win. The limited capacity of our older machines prohibits us from competing in the high-volume commodity paper grades. Furthermore, expanding our capacity by acquiring a new paper-making machine is out of the question given the extraordinarily high price tag. Therefore, I propose that we abandon cost reduction as a strategic goal and instead pursue manufacturing flexibility as the key to our future success.

Chen: Manufacturing flexibility? What does that mean?

Martinez: It means we have to abandon our “crank out as many tons of paper as possible” mentality. Instead, we need to pursue the low-volume business opportunities that exist in the nonstandard, specialized paper grades. To succeed in this regard, we'll need to improve our flexibility in three ways. First, we must improve our ability to switch between paper grades. Right now, we require an average of four hours to change over to another paper grade. Timely customer deliveries are a function of changeover performance. Second, we need to expand the range of paper grades that we can manufacture. Currently, we can only manufacture three paper grades. Our customers must perceive that we are a “one-stop shop” that can meet all of their paper grade needs. Third, we will need to improve our yields (e.g., tons of acceptable output relative to total tons processed) in the nonstandard paper grades. Our percentage of waste within these grades will be unacceptably high unless we do something to improve our processes. Our variable costs will go through the roof if we cannot increase our yields!

Chen: Wait just a minute! These changes are going to destroy our equipment utilization numbers!

Andrews: You're right Wendy; however, equipment utilization is not the name of the game when it comes to competing in terms of flexibility. Our customers don't care about our equipment utilization. Instead, as Mike just alluded to, they want just-in-time delivery of smaller quantities of a full range of paper grades. If we can shrink the elapsed time from order placement to order delivery and expand our product offerings, it will increase sales from current customers and bring in new customers. Furthermore, we will be able to charge a premium price because of the limited competition

within this niche from our cost-focused larger competitors. Our contribution margin per ton should drastically improve!

Martinez: Of course, executing the change in strategy will not be easy. We'll need to make a substantial investment in training because ultimately it is our people who create our flexible manufacturing capabilities.

Chen: If we adopt this new strategy, it is definitely going to impact how we measure performance. We'll need to create measures that motivate our employees to make decisions that support our flexibility goals.

Townsend: Wendy, you hit the nail right on the head. For our next meeting, could you pull together some potential measures that support our new strategy?

Required:

1. Contrast MPC's previous manufacturing strategy with its new manufacturing strategy.
2. Generally speaking, why would a company that changes its strategic goals need to change its performance measurement system as well? What are some examples of measures that would have been appropriate for MPC prior to its change in strategy? Why would those measures fail to support MPC's new strategy?
3. Using Exhibit 11-8 as a guide, construct a balanced scorecard that would support MPC's new manufacturing strategy. Use arrows to show the causal links between the performance measures and show whether the performance measure should increase or decrease over time. Feel free to create measures that may not be specifically mentioned in the chapter, but nonetheless make sense given the strategic goals of the company.
4. What hypotheses are built into MPC's balanced scorecard? Which of these hypotheses do you believe are most questionable and why?

EXERCISE 11-5 Contrasting Return on Investment (ROI) and Residual Income [L02, L03]

Meiji Isetan Corp. of Japan has two regional divisions with headquarters in Osaka and Yokohama. Selected data on the two divisions follow (in millions of yen, denoted by ¥):

| | Division | |
|--------------------------------|------------|------------|
| | Osaka | Yokohama |
| Sales | ¥3,000,000 | ¥9,000,000 |
| Net operating income | ¥210,000 | ¥720,000 |
| Average operating assets | ¥1,000,000 | ¥4,000,000 |

Required:

1. For each division, compute the return on investment (ROI) in terms of margin and turnover. Where necessary, carry computations to two decimal places.
2. Assume that the company evaluates performance using residual income and that the minimum required rate of return for any division is 15%. Compute the residual income for each division.
3. Is Yokohama's greater amount of residual income an indication that it is better managed? Explain.

EXERCISE 11-6 Computing and Interpreting Return on Investment (ROI) [L02]

Selected operating data for two divisions of Outback Brewing, Ltd., of Australia are given below (the currency is the Australian dollar, denoted here as \$):

| | Division | |
|--|-------------|-----------------|
| | Queensland | New South Wales |
| Sales | \$4,000,000 | \$7,000,000 |
| Average operating assets | \$2,000,000 | \$2,000,000 |
| Net operating income | \$360,000 | \$420,000 |
| Property, plant, and equipment (net) | \$950,000 | \$800,000 |

Required:

1. Compute the rate of return for each division using the return on investment (ROI) formula stated in terms of margin and turnover.
2. Which divisional manager seems to be doing the better job? Why?

EXERCISE 11-7 Return on Investment (ROI) [L02]

Provide the missing data in the following table for a distributor of martial arts products:

| | Division | | |
|----------------------------------|-----------|--------------|-----------|
| | Alpha | Bravo | Charlie |
| Sales | \$? | \$11,500,000 | \$? |
| Net operating income | \$? | \$ 920,000 | \$210,000 |
| Average operating assets | \$800,000 | \$? | \$? |
| Margin | 4% | ? | 7% |
| Turnover | 5 | ? | ? |
| Return on investment (ROI) | ? | 20% | 14% |

EXERCISE 11-8 Evaluating New Investments Using Return on Investment (ROI) and Residual Income [L02, L03]

Selected sales and operating data for three divisions of different structural engineering firms are given as follows:

| | Division A | Division B | Division C |
|---------------------------------------|--------------|--------------|--------------|
| Sales | \$12,000,000 | \$14,000,000 | \$25,000,000 |
| Average operating assets | \$3,000,000 | \$7,000,000 | \$5,000,000 |
| Net operating income | \$600,000 | \$560,000 | \$800,000 |
| Minimum required rate of return | 14% | 10% | 16% |

Required:

1. Compute the return on investment (ROI) for each division using the formula stated in terms of margin and turnover.
2. Compute the residual income for each division.
3. Assume that each division is presented with an investment opportunity that would yield a 15% rate of return.
 - a. If performance is being measured by ROI, which division or divisions will probably accept the opportunity? Reject? Why?
 - b. If performance is being measured by residual income, which division or divisions will probably accept the opportunity? Reject? Why?

EXERCISE 11-9 Effects of Changes in Profits and Assets on Return on Investment (ROI) [L02]

Pecs Alley is a regional chain of health clubs. The managers of the clubs, who have authority to make investments as needed, are evaluated based largely on return on investment (ROI). The Springfield Club reported the following results for the past year:

| | |
|--------------------------------|-------------|
| Sales | \$1,400,000 |
| Net operating income | \$70,000 |
| Average operating assets | \$350,000 |

Required:

The following questions are to be considered independently. Carry out all computations to two decimal places.

1. Compute the club's return on investment (ROI).
2. Assume that the manager of the club is able to increase sales by \$70,000 and that, as a result, net operating income increases by \$18,200. Further assume that this is possible without any increase in operating assets. What would be the club's return on investment (ROI)?
3. Assume that the manager of the club is able to reduce expenses by \$14,000 without any change in sales or operating assets. What would be the club's return on investment (ROI)?
4. Assume that the manager of the club is able to reduce operating assets by \$70,000 without any change in sales or net operating income. What would be the club's return on investment (ROI)?

EXERCISE 11–10 Effects of Changes in Sales, Expenses, and Assets on ROI [LO2]

CommercialServices.com Corporation provides business-to-business services on the Internet. Data concerning the most recent year appear below:

| | |
|--------------------------------|-------------|
| Sales | \$3,000,000 |
| Net operating income | \$150,000 |
| Average operating assets | \$750,000 |

Required:

Consider each question below independently. Carry out all computations to two decimal places.

1. Compute the company’s return on investment (ROI).
2. The entrepreneur who founded the company is convinced that sales will increase next year by 50% and that net operating income will increase by 200%, with no increase in average operating assets. What would be the company’s ROI?
3. The chief financial officer of the company believes a more realistic scenario would be a \$1,000,000 increase in sales, requiring a \$250,000 increase in average operating assets, with a resulting \$200,000 increase in net operating income. What would be the company’s ROI in this scenario?

EXERCISE 11–11 Creating a Balanced Scorecard [LO4]

Ariel Tax Services prepares tax returns for individual and corporate clients. As the company has gradually expanded to 10 offices, the founder Max Jacobs has begun to feel as though he is losing control of operations. In response to this concern, he has decided to implement a performance measurement system that will help control current operations and facilitate his plans of expanding to 20 offices.

Jacobs describes the keys to the success of his business as follows:

“Our only real asset is our people. We must keep our employees highly motivated and we must hire the ‘cream of the crop.’ Interestingly, employee morale and recruiting success are both driven by the same two factors—compensation and career advancement. In other words, providing superior compensation relative to the industry average coupled with fast-track career advancement opportunities keeps morale high and makes us a very attractive place to work. It drives a high rate of job offer acceptances relative to job offers tendered.”

“Hiring highly qualified people and keeping them energized ensures operational success, which in our business is a function of productivity, efficiency, and effectiveness. Productivity boils down to employees being billable rather idle. Efficiency relates to the time required to complete a tax return. Finally, effectiveness is critical to our business in the sense that we cannot tolerate errors. Completing a tax return quickly is meaningless if the return contains errors.”

“Our growth depends on acquiring new customers through word-of-mouth from satisfied repeat customers. We believe that our customers come back year after year because they value error-free, timely, and courteous tax return preparation. Common courtesy is an important aspect of our business! We call it service quality, and it all ties back to employee morale in the sense that happy employees treat their clients with care and concern.”

“While sales growth is obviously important to our future plans, growth without a corresponding increase in profitability is useless. Therefore, we understand that increasing our profit margin is a function of cost-efficiency as well as sales growth. Given that payroll is our biggest expense, we must maintain an optimal balance between staffing levels and the revenue being generated. As I alluded to earlier, the key to maintaining this balance is employee productivity. If we can achieve cost-efficient sales growth, we should eventually have 20 profitable offices!”

Required:

1. Create a balanced scorecard for Ariel Tax Services. Link your scorecard measures using the framework from Exhibit 11–8. Indicate whether each measure is expected to increase or decrease. Feel free to create measures that may not be specifically mentioned in the chapter, but make sense given the strategic goals of the company.
2. What hypotheses are built into the balanced scorecard for Ariel Tax Services? Which of these hypotheses do you believe are most questionable and why?
3. Discuss the potential advantages and disadvantages of implementing an internal business process measure called *total dollar amount of tax refunds generated*. Would you recommend using this measure in Ariel’s balanced scorecard?
4. Would it be beneficial to attempt to measure each office’s individual performance with respect to the scorecard measures that you created? Why or why not?

EXERCISE 11–12 Return on Investment (ROI) and Residual Income Relations [LO2, LO3]

A family friend has asked your help in analyzing the operations of three anonymous companies operating in the same service sector industry. Supply the missing data in the table below:

| | Company | | |
|----------------------------------|-------------|-------------|-------------|
| | A | B | C |
| Sales | \$9,000,000 | \$7,000,000 | \$4,500,000 |
| Net operating income | \$? | \$ 280,000 | \$? |
| Average operating assets | \$3,000,000 | \$? | \$1,800,000 |
| Return on investment (ROI) | 18% | 14% | ? |
| Minimum required rate of return: | | | |
| Percentage | 16% | ? | 15% |
| Dollar amount | \$? | \$ 320,000 | \$? |
| Residual income | \$? | \$? | \$ 90,000 |

EXERCISE 11–13 Working with a Segmented Income Statement [LO1]

Raner, Harris, & Chan is a consulting firm that specializes in information systems for medical and dental clinics. The firm has two offices—one in Chicago and one in Minneapolis. The firm classifies the direct costs of consulting jobs as variable costs. A contribution format segmented income statement for the company's most recent year is given below:

| | Total Company | | Office | | | |
|---|---------------|------|-----------|------|-------------|------|
| | | | Chicago | | Minneapolis | |
| Sales | \$450,000 | 100% | \$150,000 | 100% | \$300,000 | 100% |
| Variable expenses | 225,000 | 50% | 45,000 | 30% | 180,000 | 60% |
| Contribution margin | 225,000 | 50% | 105,000 | 70% | 120,000 | 40% |
| Traceable fixed expenses | 126,000 | 28% | 78,000 | 52% | 48,000 | 16% |
| Office segment margin | 99,000 | 22% | \$ 27,000 | 18% | \$ 72,000 | 24% |
| Common fixed expenses not traceable to offices | 63,000 | 14% | | | | |
| Net operating income | \$ 36,000 | 8% | | | | |

Required:

- By how much would the company's net operating income increase if Minneapolis increased its sales by \$75,000 per year? Assume no change in cost behavior patterns.
- Refer to the original data. Assume that sales in Chicago increase by \$50,000 next year and that sales in Minneapolis remain unchanged. Assume no change in fixed costs.
 - Prepare a new segmented income statement for the company using the above format. Show both amounts and percentages.
 - Observe from the income statement you have prepared that the contribution margin ratio for Chicago has remained unchanged at 70% (the same as in the above data) but that the segment margin ratio has changed. How do you explain the change in the segment margin ratio?

EXERCISE 11–14 Working with a Segmented Income Statement [LO1]

Refer to the data in Exercise 11–13. Assume that Minneapolis' sales by major market are:

| | Minneapolis | | Market | | | |
|---|-------------|------|-----------|------|-----------|------|
| | | | Medical | | Dental | |
| Sales | \$300,000 | 100% | \$200,000 | 100% | \$100,000 | 100% |
| Variable expenses | 180,000 | 60% | 128,000 | 64% | 52,000 | 52% |
| Contribution margin | 120,000 | 40% | 72,000 | 36% | 48,000 | 48% |
| Traceable fixed expenses | 33,000 | 11% | 12,000 | 6% | 21,000 | 21% |
| Market segment margin | 87,000 | 29% | \$ 60,000 | 30% | \$ 27,000 | 27% |
| Common fixed expenses not traceable to markets | 15,000 | 5% | | | | |
| Office segment margin | \$ 72,000 | 24% | | | | |

The company would like to initiate an intensive advertising campaign in one of the two market segments during the next month. The campaign would cost \$5,000. Marketing studies indicate that such a campaign would increase sales in the Medical market by \$40,000 or increase sales in the Dental market by \$35,000.

Required:

1. In which of the markets would you recommend that the company focus its advertising campaign? Show computations to support your answer.
2. In Exercise 11–13, Minneapolis shows \$48,000 in traceable fixed expenses. What happened to the \$48,000 in this exercise?

EXERCISE 11–15 Segmented Income Statement [LO1]

Wingate Company, a wholesale distributor of videotapes, has been experiencing losses for some time, as shown by its most recent monthly contribution format income statement, which follows:

| | |
|----------------------------------|-------------|
| Sales | \$1,000,000 |
| Variable expenses | 390,000 |
| Contribution margin | 610,000 |
| Fixed expenses | 625,000 |
| Net operating income (loss)..... | \$ (15,000) |

In an effort to isolate the problem, the president has asked for an income statement segmented by division. Accordingly, the Accounting Department has developed the following information:

| | Division | | |
|--|-----------|-----------|-----------|
| | East | Central | West |
| Sales | \$250,000 | \$400,000 | \$350,000 |
| Variable expenses as a percentage of sales | 52% | 30% | 40% |
| Traceable fixed expenses | \$160,000 | \$200,000 | \$175,000 |

Required:

1. Prepare a contribution format income statement segmented by divisions, as desired by the president.
2. As a result of a marketing study, the president believes that sales in the West Division could be increased by 20% if monthly advertising in that division were increased by \$15,000. Would you recommend the increased advertising? Show computations to support your answer.

EXERCISE 11–16 Cost-Volume-Profit Analysis and Return on Investment (ROI) [LO2]

Posters.com is a small Internet retailer of high-quality posters. The company has \$1,000,000 in operating assets and fixed expenses of \$150,000 per year. With this level of operating assets and fixed expenses, the company can support sales of up to \$3,000,000 per year. The company’s contribution margin ratio is 25%, which means that an additional dollar of sales results in additional contribution margin, and net operating income, of 25 cents.

Required:

1. Complete the following table showing the relation between sales and return on investment (ROI).

| Sales | Net Operating Income | Average Operating Assets | ROI |
|-------------|----------------------|--------------------------|-----|
| \$2,500,000 | \$475,000 | \$1,000,000 | ? |
| \$2,600,000 | \$? | \$1,000,000 | ? |
| \$2,700,000 | \$? | \$1,000,000 | ? |
| \$2,800,000 | \$? | \$1,000,000 | ? |
| \$2,900,000 | \$? | \$1,000,000 | ? |
| \$3,000,000 | \$? | \$1,000,000 | ? |

2. What happens to the company’s return on investment (ROI) as sales increase? Explain.

Problems

connect™

**PROBLEM 11–17 Return on Investment (ROI) and Residual Income [LO2, LO3]**

“I know headquarters wants us to add that new product line,” said Dell Havasi, manager of Billings Company’s Office Products Division. “But I want to see the numbers before I make any move. Our division’s return on investment (ROI) has led the company for three years, and I don’t want any letdown.”

Billings Company is a decentralized wholesaler with five autonomous divisions. The divisions are evaluated on the basis of ROI, with year-end bonuses given to the divisional managers who have the highest ROIs. Operating results for the company’s Office Products Division for the most recent year are given below:

| | |
|-----------------------------------|--------------|
| Sales | \$10,000,000 |
| Variable expenses | 6,000,000 |
| Contribution margin | 4,000,000 |
| Fixed expenses | 3,200,000 |
| Net operating income | \$ 800,000 |
| Divisional operating assets | \$ 4,000,000 |

The company had an overall return on investment (ROI) of 15% last year (considering all divisions). The Office Products Division has an opportunity to add a new product line that would require an additional investment in operating assets of \$1,000,000. The cost and revenue characteristics of the new product line per year would be:

| | |
|-------------------------|--------------|
| Sales | \$2,000,000 |
| Variable expenses | 60% of sales |
| Fixed expenses | \$640,000 |

Required:

1. Compute the Office Products Division’s ROI for the most recent year; also compute the ROI as it would appear if the new product line is added.
2. If you were in Dell Havasi’s position, would you accept or reject the new product line? Explain.
3. Why do you suppose headquarters is anxious for the Office Products Division to add the new product line?
4. Suppose that the company’s minimum required rate of return on operating assets is 12% and that performance is evaluated using residual income.
 - a. Compute the Office Products Division’s residual income for the most recent year; also compute the residual income as it would appear if the new product line is added.
 - b. Under these circumstances, if you were in Dell Havasi’s position, would you accept or reject the new product line? Explain.

**PROBLEM 11–18 Comparison of Performance Using Return on Investment (ROI) [LO2]**

Comparative data on three companies in the same service industry are given below:

| | Company | | |
|--------------------------------|-----------|-----------|-------------|
| | A | B | C |
| Sales | \$600,000 | \$500,000 | \$? |
| Net operating income | \$ 84,000 | \$ 70,000 | \$? |
| Average operating assets | \$300,000 | \$? | \$1,000,000 |
| Margin | ? | ? | 3.5% |
| Turnover | ? | ? | 2 |
| ROI | ? | 7% | ? |

Required:

1. What advantages are there to breaking down the ROI computation into two separate elements, margin and turnover?
2. Fill in the missing information above, and comment on the relative performance of the three companies in as much detail as the data permit. Make *specific recommendations* about how to improve the ROI.

(Adapted from National Association of Accountants, *Research Report No. 35*, p. 34)

PROBLEM 11–19 Perverse Effects of Some Performance Measures [LO4]

There is often more than one way to improve a performance measure. Unfortunately, some of the actions taken by managers to make their performance look better may actually harm the organization. For example, suppose the marketing department is held responsible only for increasing the performance measure “total revenues.” Increases in total revenues may be achieved by working harder and smarter, but they can also usually be achieved by simply cutting prices. The increase in volume from cutting prices almost always results in greater total revenues; however, it does not always lead to greater total profits. Those who design performance measurement systems need to keep in mind that managers who are under pressure to perform may take actions to improve performance measures that have negative consequences elsewhere.

Required:

For each of the following situations, describe actions that managers might take to show improvement in the performance measure but which do not actually lead to improvement in the organization’s overall performance.

1. Concerned with the slow rate at which new products are brought to market, top management of a consumer electronics company introduces a new performance measure—speed-to-market. The research and development department is given responsibility for this performance measure, which measures the average amount of time a product is in development before it is released to the market for sale.
2. The CEO of a telephone company has been under public pressure from city officials to fix the large number of public pay phones that do not work. The company’s repair people complain that the problem is vandalism and damage caused by theft of coins from coin boxes—particularly in high-crime areas in the city. The CEO says she wants the problem solved and has pledged to city officials that there will be substantial improvement by the end of the year. To ensure that this is done, she makes the managers in charge of installing and maintaining pay phones responsible for increasing the percentage of public pay phones that are fully functional.
3. A manufacturing company has been plagued by the chronic failure to ship orders to customers by the promised date. To solve this problem, the production manager has been given the responsibility of increasing the percentage of orders shipped on time. When a customer calls in an order, the production manager and the customer agree to a delivery date. If the order is not completed by that date, it is counted as a late shipment.
4. Concerned with the productivity of employees, the board of directors of a large multinational corporation has dictated that the manager of each subsidiary will be held responsible for increasing the revenue per employee of his or her subsidiary.

PROBLEM 11–20 Return on Investment (ROI) and Residual Income [LO2, LO3]

Financial data for Joel de Paris, Inc., for last year follow:

| Joel de Paris, Inc. | | |
|--|------------------------------|---------------------------|
| Balance Sheet | | |
| | Beginning Balance | Ending Balance |
| Assets | | |
| Cash | \$ 140,000 | \$ 120,000 |
| Accounts receivable | 450,000 | 530,000 |
| Inventory | 320,000 | 380,000 |
| Plant and equipment, net | 680,000 | 620,000 |
| Investment in Buisson, S.A. | 250,000 | 280,000 |
| Land (undeveloped)..... | 180,000 | 170,000 |
| Total assets..... | <u>\$2,020,000</u> | <u>\$2,100,000</u> |
| Liabilities and Stockholders' Equity | | |
| Accounts payable | \$ 360,000 | \$ 310,000 |
| Long-term debt | 1,500,000 | 1,500,000 |
| Stockholders' equity | 160,000 | 290,000 |
| Total liabilities and stockholders' equity | <u>\$2,020,000</u> | <u>\$2,100,000</u> |

| Joel de Paris, Inc. Income Statement | | |
|---|----------------|-------------------|
| Sales | | \$4,050,000 |
| Operating expenses | | <u>3,645,000</u> |
| Net operating income | | 405,000 |
| Interest and taxes: | | |
| Interest expense | \$150,000 | |
| Tax expense | <u>110,000</u> | <u>260,000</u> |
| Net income | | <u>\$ 145,000</u> |

The company paid dividends of \$15,000 last year. The “Investment in Buisson, S.A.,” on the balance sheet represents an investment in the stock of another company.

Required:

1. Compute the company’s margin, turnover, and return on investment (ROI) for last year.
2. The board of directors of Joel de Paris, Inc., has set a minimum required rate of return of 15%. What was the company’s residual income last year?

PROBLEM 11–21 Return on Investment (ROI) Analysis [LO2]

The contribution format income statement for Huerra Company for last year is given below:

| | A | B | C | D |
|---|----------------------|-----|-------------------|----------------|
| 1 | | | Total | Unit |
| 2 | Sales | | \$4,000,000 | \$80.00 |
| 3 | Variable expenses | | <u>2,800,000</u> | <u>56.00</u> |
| 4 | Contribution margin | | 1,200,000 | 24.00 |
| 5 | Fixed expenses | | <u>840,000</u> | <u>16.80</u> |
| 6 | Net operating income | | 360,000 | 7.20 |
| 7 | Income taxes @ | 30% | <u>108,000</u> | <u>2.16</u> |
| 8 | Net operating income | | <u>\$ 252,000</u> | <u>\$ 5.04</u> |
| 9 | | | | |

The company had average operating assets of \$2,000,000 during the year.

Required:

1. Compute the company’s return on investment (ROI) for the period using the ROI formula stated in terms of margin and turnover.
For each of the following questions, indicate whether the margin and turnover will increase, decrease, or remain unchanged as a result of the events described, and then compute the new ROI figure. Consider each question separately, starting in each case from the data used to compute the original ROI in (1) above.
2. Using Lean Production, the company is able to reduce the average level of inventory by \$400,000. (The released funds are used to pay off short-term creditors.)
3. The company achieves a cost savings of \$32,000 per year by using less costly materials.
4. The company issues bonds and uses the proceeds to purchase \$500,000 in machinery and equipment at the beginning of the period. Interest on the bonds is \$60,000 per year. Sales remain unchanged. The new, more efficient equipment reduces production costs by \$20,000 per year.
5. As a result of a more intense effort by salespeople, sales are increased by 20%; operating assets remain unchanged.
6. Obsolete inventory carried on the books at a cost of \$40,000 is scrapped and written off as a loss.
7. The company uses \$200,000 of cash (received on accounts receivable) to repurchase and retire some of its common stock.

PROBLEM 11–22 Building a Balanced Scorecard [LO4]

Lost Peak ski resort was for many years a small, family-owned resort serving day skiers from nearby towns. Lost Peak was recently acquired by Western Resorts, a major ski resort operator. The new owners have plans to upgrade the resort into a destination resort for vacationers. As part of this plan, the new owners would like to make major improvements in the Powder 8 Lodge, the resort’s on-the-hill cafeteria. The menu at the lodge is very limited—hamburgers, hot dogs, chili, tuna fish sandwiches, pizzas, french fries, and packaged snacks. With little competition, the previous owners of the resort had felt no urgency to upgrade the food service at the lodge. If skiers want lunch on the mountain, the only alternatives are the Powder 8 Lodge or a brown bag lunch brought from home.

As part of the deal when acquiring Lost Peak, Western Resorts agreed to retain all of the current employees of the resort. The manager of the lodge, while hardworking and enthusiastic, has very little experience in the restaurant business. The manager is responsible for selecting the menu, finding and training employees, and overseeing daily operations. The kitchen staff prepare food and wash dishes. The dining room staff take orders, serve as cashiers, and clean the dining room area.

Shortly after taking over Lost Peak, management of Western Resorts held a day-long meeting with all of the employees of the Powder 8 Lodge to discuss the future of the ski resort and the new management’s plans for the lodge. At the end of this meeting, management and lodge employees created a balanced scorecard for the lodge that would help guide operations for the coming ski season. Almost everyone who participated in the meeting seemed to be enthusiastic about the scorecard and management’s plans for the lodge.

The following performance measures were included on the balanced scorecard for the Powder 8 Lodge:

- a. Weekly Powder 8 Lodge sales
- b. Weekly Powder 8 Lodge profit
- c. Number of menu items
- d. Dining area cleanliness as rated by a representative from Western Resorts management
- e. Customer satisfaction with menu choices as measured by customer surveys
- f. Customer satisfaction with service as measured by customer surveys
- g. Average time to take an order
- h. Average time to prepare an order
- i. Percentage of kitchen staff completing basic cooking course at the local community college
- j. Percentage of dining room staff completing basic hospitality course at the local community college

Western Resorts will pay for the costs of staff attending courses at the local community college.

Required:

1. Using the above performance measures, construct a balanced scorecard for the Powder 8 Lodge. Use Exhibit 11–8 as a guide. Use arrows to show causal links and indicate with a + or – whether the performance measure should increase or decrease.
2. What hypotheses are built into the balanced scorecard for the Powder 8 Lodge? Which of these hypotheses do you believe are most questionable? Why?
3. How will management know if one of the hypotheses underlying the balanced scorecard is false?

PROBLEM 11–23 Finely Segmented Income Statements [LO1]

Companhia Bradesco, S.A., of Brazil, an industrial supply store chain, has two divisions. The company’s contribution format income statement segmented by divisions for last year is given below (the currency in Brazil is the real, denoted here by R):

| | Total Company | Division | |
|---------------------------------|------------------|----------|----------|
| | | Plastics | Glass |
| Sales | R1,500,000 | R900,000 | R600,000 |
| Variable expenses | 700,000 | 400,000 | 300,000 |
| Contribution margin | 800,000 | 500,000 | 300,000 |
| Traceable fixed expenses: | | | |
| Advertising | 300,000 | 180,000 | 120,000 |
| Depreciation | 140,000 | 92,000 | 48,000 |
| Administration | 220,000 | 118,000 | 102,000 |
| Total | 660,000 | 390,000 | 270,000 |
| Divisional segment margin | 140,000 | R110,000 | R 30,000 |
| Common fixed expenses | 100,000 | | |
| Net operating income | R 40,000 | | |

Top management doesn't understand why the Glass Division has such a low segment margin when its sales are only one-third less than sales in the Plastics Division. Accordingly, management has directed that the Glass Division be further segmented into product lines. The following information is available on the product lines in the Glass Division:

| | Glass Division Product Lines | | |
|--|------------------------------|------------|-----------------|
| | Flat Glass | Auto Glass | Specialty Glass |
| Sales | R200,000 | R300,000 | R100,000 |
| Traceable fixed expenses: | | | |
| Advertising | R30,000 | R42,000 | R48,000 |
| Depreciation | R10,000 | R24,000 | R14,000 |
| Administration | R14,000 | R21,000 | R7,000 |
| Variable expenses as a percentage of sales | 65% | 40% | 50% |

Analysis shows that R60,000 of the Glass Division's administration expenses are common to the product lines.

Required:

1. Prepare a contribution format segmented income statement for the Glass Division with segments defined as product lines.
2. Management is surprised by Specialty Glass's poor showing and would like to have the product line segmented by market. The following information is available about the two markets in which Specialty Glass is sold:

| | Specialty Glass Markets | |
|--|-------------------------|---------|
| | Domestic | Foreign |
| Sales | R60,000 | R40,000 |
| Traceable fixed expenses: | | |
| Advertising | R18,000 | R30,000 |
| Variable expenses as a percentage of sales | 50% | 50% |

All of Specialty Glass's depreciation and administration expenses are common to the markets in which the product is sold. Prepare a contribution format segmented income statement for Specialty Glass with segments defined as markets.

3. Refer to the statement prepared in (1) above. The sales manager wants to run a special promotional campaign on one of the products over the next month. A market study indicates that such a campaign would increase sales of Flat Glass by R40,000 or sales of Auto Glass by R30,000. The campaign would cost R8,000. Show computations to determine which product line should be chosen.

PROBLEM 11-24 Segment Reporting and Decision-Making [LO1]

Vulcan Company's contribution format income statement for June is given below:

| Vulcan Company Income Statement For the Month Ended June 30 | |
|---|------------------|
| Sales | \$750,000 |
| Variable expenses | 336,000 |
| Contribution margin | 414,000 |
| Fixed expenses | 378,000 |
| Net operating income | <u>\$ 36,000</u> |

Management is disappointed with the company’s performance and is wondering what can be done to improve profits. By examining sales and cost records, you have determined the following:

- a. The company is divided into two sales territories—Northern and Southern. The Northern territory recorded \$300,000 in sales and \$156,000 in variable expenses during June; the remaining sales and variable expenses were recorded in the Southern territory. Fixed expenses of \$120,000 and \$108,000 are traceable to the Northern and Southern territories, respectively. The rest of the fixed expenses are common to the two territories.
- b. The company is the exclusive distributor for two products—Paks and Tibs. Sales of Paks and Tibs totaled \$50,000 and \$250,000, respectively, in the Northern territory during June. Variable expenses are 22% of the selling price for Paks and 58% for Tibs. Cost records show that \$30,000 of the Northern territory’s fixed expenses are traceable to Paks and \$40,000 to Tibs, with the remainder common to the two products.

Required:

1. Prepare contribution format segmented income statements first showing the total company broken down between sales territories and then showing the Northern territory broken down by product line. In addition, for the company as a whole and for each segment, show each item on the segmented income statements as a percent of sales.
2. Look at the statement you have prepared showing the total company segmented by sales territory. What insights revealed by this statement should be brought to the attention of management?
3. Look at the statement you have prepared showing the Northern territory segmented by product lines. What insights revealed by this statement should be brought to the attention of management?

PROBLEM 11–25 Basic Segment Reporting; Activity-Based Cost Assignment [LO1]

Diversified Products, Inc., has recently acquired a small publishing company that Diversified Products intends to operate as one of its investment centers. The newly acquired company has three books that it offers for sale—a cookbook, a travel guide, and a handy speller. Each book sells for \$10. The publishing company’s most recent monthly income statement is given below:

| | Total Company | Product Line | | |
|--------------------------------------|------------------|--------------|-----------------|------------------|
| | | Cookbook | Travel Guide | Handy Speller |
| Sales | \$300,000 | \$90,000 | \$150,000 | \$60,000 |
| Expenses: | | | | |
| Printing costs | 102,000 | 27,000 | 63,000 | 12,000 |
| Advertising | 36,000 | 13,500 | 19,500 | 3,000 |
| General sales | 18,000 | 5,400 | 9,000 | 3,600 |
| Salaries | 33,000 | 18,000 | 9,000 | 6,000 |
| Equipment depreciation | 9,000 | 3,000 | 3,000 | 3,000 |
| Sales commissions | 30,000 | 9,000 | 15,000 | 6,000 |
| General administration | 42,000 | 14,000 | 14,000 | 14,000 |
| Warehouse rent | 12,000 | 3,600 | 6,000 | 2,400 |
| Depreciation—office facilities | 3,000 | 1,000 | 1,000 | 1,000 |
| Total expenses | 285,000 | 94,500 | 139,500 | 51,000 |
| Net operating income (loss) | \$ 15,000 | \$ (4,500) | \$ 10,500 | \$ 9,000 |

The following additional information is available about the company:

- a. Only printing costs and sales commissions are variable; all other costs are fixed. The printing costs (which include materials, labor, and variable overhead) are traceable to the three product lines as shown in the statement above. Sales commissions are 10% of sales for any product.
- b. The same equipment is used to produce all three books, so the equipment depreciation cost has been allocated equally among the three product lines. An analysis of the company’s activities indicates that the equipment is used 30% of the time to produce cookbooks, 50% of the time to produce travel guides, and 20% of the time to produce handy spellers.
- c. The warehouse is used to store finished units of product, so the rental cost has been allocated to the product lines on the basis of sales dollars. The warehouse rental cost is \$3 per square foot per year. The warehouse contains 48,000 square feet of space, of which 7,200 square feet is used by the cookbook line, 24,000 square feet by the travel guide line, and 16,800 square feet by the handy speller line.

- d. The general sales cost above includes the salary of the sales manager and other sales costs not traceable to any specific product line. This cost has been allocated to the product lines on the basis of sales dollars.
- e. The general administration cost and depreciation of office facilities both relate to administration of the company as a whole. These costs have been allocated equally to the three product lines.
- f. All other costs are traceable to the three product lines in the amounts shown on the statement above.

The management of Diversified Products, Inc., is anxious to improve the new investment center's 5% return on sales.

Required:

1. Prepare a new contribution format segmented income statement for the month. Adjust allocations of equipment depreciation and of warehouse rent as indicated by the additional information provided.
2. After seeing the income statement in the main body of the problem, management has decided to eliminate the cookbook because it is not returning a profit, and to focus all available resources on promoting the travel guide.
 - a. Based on the statement you have prepared, do you agree with the decision to eliminate the cookbook? Explain.
 - b. Based on the statement you have prepared, do you agree with the decision to focus all available resources on promoting the travel guide? Assume that an ample market is available for all three product lines. (*Hint:* Compute the contribution margin ratio for each product.)

PROBLEM 11–26 Creating Balanced Scorecards that Support Different Strategies [L04]

The Midwest Consulting Group (MCG) helps companies build balanced scorecards. As part of its marketing efforts, MCG conducts an annual balanced scorecard workshop for prospective clients. As MCG's newest employee, your boss has asked you to participate in this year's workshop by explaining to attendees how a company's strategy determines the measures that are appropriate for its balanced scorecard. Your boss has provided you with the excerpts below from the annual reports of two current MCG clients. She has asked you to use these excerpts in your portion of the workshop.

Excerpt from Applied Pharmaceuticals' annual report:

The keys to our business are consistent and timely new product introductions and manufacturing process integrity. The new product introduction side of the equation is a function of research and development (R&D) yield (e.g., the number of marketable drug compounds created relative to the total number of potential compounds pursued). We seek to optimize our R&D yield and first-to-market capability by investing in state-of-the-art technology, hiring the highest possible percentage of the "best and the brightest" engineers that we pursue, and providing world-class training to those engineers. Manufacturing process integrity is all about establishing world-class quality specifications and then relentlessly engaging in prevention and appraisal activities to minimize defect rates. Our customers must have an awareness of and respect for our brand image of being "first to market and first in quality." If we deliver on this pledge to our customers, then our financial goal of increasing our return on stockholders' equity should take care of itself.

Excerpt from Destination Resorts International's annual report:

Our business succeeds or fails based on the quality of the service that our front-line employees provide to customers. Therefore, it is imperative that we strive to maintain high employee morale and minimize employee turnover. In addition, it is critical that we train our employees to use technology to create one seamless worldwide experience for our repeat customers. Once an employee enters a customer preference (e.g., provide two extra pillows in the room, deliver fresh brewed coffee to the room at 8:00 A.M., etc.) into our database, our worldwide workforce strives to ensure that a customer will never need to repeat it at any of our destination resorts. If we properly train and retain a motivated workforce, we should see continuous improvement in our percentage of error-free repeat customer check-ins, the time taken to resolve customer complaints, and our independently assessed room cleanliness. This in turn should drive improvement in our customer retention, which is the key to meeting our revenue growth goals.

Required:

1. Based on the excerpts above, compare and contrast the strategies of Applied Pharmaceuticals and Destination Resorts International.
2. Select balanced scorecard measures for each company and link the scorecard measures using the framework from Exhibit 11–8. Use arrows to show the causal links between the performance measures

and show whether the performance measure should increase or decrease over time. Feel free to create measures that may not be specifically mentioned in the chapter, but nonetheless make sense given the strategic goals of each company.

3. What hypotheses are built into each balanced scorecard? Why do the hypotheses differ between the two companies?

PROBLEM 11–27 Restructuring a Segmented Income Statement [L01]

Losses have been incurred at Millard Corporation for some time. In an effort to isolate the problem and improve the company’s performance, management has requested that the monthly income statement be segmented by sales region. The company’s first effort at preparing a segmented statement is given below. This statement is for May, the most recent month of activity.

| | Sales Region | | |
|--|--------------|-----------|--------------|
| | West | Central | East |
| Sales | \$450,000 | \$800,000 | \$ 750,000 |
| Regional expenses (traceable): | | | |
| Cost of goods sold | 162,900 | 280,000 | 376,500 |
| Advertising | 108,000 | 200,000 | 210,000 |
| Salaries | 90,000 | 88,000 | 135,000 |
| Utilities | 13,500 | 12,000 | 15,000 |
| Depreciation | 27,000 | 28,000 | 30,000 |
| Shipping expense | 17,100 | 32,000 | 28,500 |
| Total regional expenses | 418,500 | 640,000 | 795,000 |
| Regional income (loss) before corporate expenses | 31,500 | 160,000 | (45,000) |
| Corporate expenses: | | | |
| Advertising (general) | 18,000 | 32,000 | 30,000 |
| General administrative expense | 50,000 | 50,000 | 50,000 |
| Total corporate expenses | 68,000 | 82,000 | 80,000 |
| Net operating income (loss) | \$ (36,500) | \$ 78,000 | \$ (125,000) |

Cost of goods sold and shipping expense are both variable; other costs are all fixed.

Millard Corporation is a wholesale distributor of office products. It purchases office products from manufacturers and distributes them in the three regions given above. The three regions are about the same size, and each has its own manager and sales staff. The products that the company distributes vary widely in profitability.

Required:

1. List any disadvantages or weaknesses that you see to the statement format illustrated above.
2. Explain the basis that is apparently being used to allocate the corporate expenses to the regions. Do you agree with these allocations? Explain.
3. Prepare a new contribution format segmented income statement for May. Show a Total column as well as data for each region. In addition, for the company as a whole and for each sales region, show each item on the segmented income statement as a percent of sales.
4. Analyze the statement that you prepared in part (3) above. What points that might help to improve the company’s performance would you bring to management’s attention?

Cases

CASE 11–28 Service Organization; Segment Reporting [L01]

Music Teachers, Inc., is an educational association for music teachers that has 20,000 members. The association operates from a central headquarters but has local membership chapters throughout the United States. Monthly meetings are held by the local chapters to discuss recent developments on topics of interest to music teachers. The association’s journal, *Teachers Forum*, is issued monthly with features about recent

developments in the field. The association publishes books and reports and also sponsors professional courses that qualify for continuing professional education credit. The association's statement of revenues and expenses for the current year is presented below.

| Music Teachers, Inc. | |
|---|--------------------|
| Statement of Revenues and Expenses | |
| For the Year Ended November 30 | |
| Revenues | <u>\$3,275,000</u> |
| Expenses: | |
| Salaries | 920,000 |
| Personnel costs | 230,000 |
| Occupancy costs | 280,000 |
| Reimbursement of member costs to local chapters | 600,000 |
| Other membership services | 500,000 |
| Printing and paper | 320,000 |
| Postage and shipping | 176,000 |
| Instructors' fees | 80,000 |
| General and administrative | <u>38,000</u> |
| Total expenses | <u>3,144,000</u> |
| Excess of revenues over expenses | <u>\$ 131,000</u> |

The board of directors of Music Teachers, Inc., has requested that a segmented income statement be prepared showing the contribution of each profit center to the association. The association has four profit centers: Membership Division, Magazine Subscriptions Division, Books and Reports Division, and Continuing Education Division. Mike Doyle has been assigned responsibility for preparing the segmented income statement, and he has gathered the following data prior to its preparation.

- Membership dues are \$100 per year, of which \$20 is considered to cover a one-year subscription to the association's journal. Other benefits include membership in the association and chapter affiliation. The portion of the dues covering the magazine subscription (\$20) should be assigned to the Magazine Subscription Division.
- One-year subscriptions to *Teachers Forum* were sold to nonmembers and libraries at \$30 per subscription. A total of 2,500 of these subscriptions were sold last year. In addition to subscriptions, the magazine generated \$100,000 in advertising revenues. The costs per magazine subscription were \$7 for printing and paper and \$4 for postage and shipping.
- A total of 28,000 technical reports and professional texts were sold by the Books and Reports Division at an average unit selling price of \$25. Average costs per publication were \$4 for printing and paper and \$2 for postage and shipping.
- The association offers a variety of continuing education courses to both members and nonmembers. The one-day courses had a tuition cost of \$75 each and were attended by 2,400 students. A total of 1,760 students took two-day courses at a tuition cost of \$125 for each student. Outside instructors were paid to teach some courses.
- Salary costs and space occupied by division follow:

| | Salaries | Space Occupied (square feet) |
|------------------------------|------------------|---|
| Membership..... | \$210,000 | 2,000 |
| Magazine Subscriptions | 150,000 | 2,000 |
| Books and Reports..... | 300,000 | 3,000 |
| Continuing Education | 180,000 | 2,000 |
| Corporate staff..... | <u>80,000</u> | <u>1,000</u> |
| Total..... | <u>\$920,000</u> | <u>10,000</u> |

Personnel costs are 25% of salaries in the separate divisions as well as for the corporate staff. The \$280,000 in occupancy costs includes \$50,000 in rental cost for a warehouse used by the Books and Reports Division for storage purposes.

- f. Printing and paper costs other than for magazine subscriptions and for books and reports relate to the Continuing Education Division.
- g. General and administrative expenses include costs relating to overall administration of the association as a whole. The company's corporate staff does some mailing of materials for general administrative purposes.

The expenses that can be traced or assigned to the corporate staff, as well as any other expenses that are not traceable to the profit centers, will be treated as common costs. It is not necessary to distinguish between variable and fixed costs.

Required:

1. Prepare a contribution format segmented income statement for Music Teachers, Inc. This statement should show the segment margin for each division as well as results for the association as a whole.
2. Give arguments for and against allocating *all* costs of the association to the four divisions.

(CMA, adapted)

CASE 11–29 Balanced Scorecard [LO4]

Haglund Department Store is located in the downtown area of a small city. While the store had been profitable for many years, it is facing increasing competition from large national chains that have set up stores on the outskirts of the city. Recently the downtown area has been undergoing revitalization, and the owners of Haglund Department Store are somewhat optimistic that profitability can be restored.

In an attempt to accelerate the return to profitability, management of Haglund Department Store is in the process of designing a balanced scorecard for the company. Management believes the company should focus on two key problems. First, customers are taking longer and longer to pay the bills they incur using the department store's charge card, and the company has far more bad debts than are normal for the industry. If this problem were solved, the company would have more cash to make much needed renovations. Investigation has revealed that much of the problem with late payments and unpaid bills results from customers disputing incorrect charges on their bills. These incorrect charges usually occur because salesclerks incorrectly enter data on the charge account slip. Second, the company has been incurring large losses on unsold seasonal apparel. Such items are ordinarily resold at a loss to discount stores that specialize in such distress items.

The meeting in which the balanced scorecard approach was discussed was disorganized and ineffectively led—possibly because no one other than one of the vice presidents had read anything about how to build a balanced scorecard. Nevertheless, a number of potential performance measures were suggested by various managers. These potential performance measures are:

- a. Percentage of charge account bills containing errors.
- b. Percentage of salesclerks trained to correctly enter data on charge account slips.
- c. Average age of accounts receivables.
- d. Profit per employee.
- e. Customer satisfaction with accuracy of charge account bills from monthly customer survey.
- f. Total sales revenue.
- g. Sales per employee.
- h. Travel expenses for buyers for trips to fashion shows.
- i. Unsold inventory at the end of the season as a percentage of total cost of sales.
- j. Courtesy shown by junior staff members to senior staff members based on surveys of senior staff.
- k. Percentage of suppliers making just-in-time deliveries.
- l. Sales per square foot of floor space.
- m. Written-off accounts receivable (bad debts) as a percentage of sales.
- n. Quality of food in the staff cafeteria based on staff surveys.
- o. Percentage of employees who have attended the city's cultural diversity workshop.
- p. Total profit.

Required:

1. As someone with more knowledge of the balanced scorecard than almost anyone else in the company, you have been asked to build an integrated balanced scorecard. In your scorecard, use only performance measures listed previously. You do not have to use all of the performance measures suggested by the managers, but you should build a balanced scorecard that reveals a strategy for dealing with the problems with accounts receivable and with unsold merchandise. Construct the balanced scorecard following the format used in Exhibit 11–8. Do not be concerned with whether a specific performance measure falls within the learning and growth, internal business process, customer, or financial perspective. However, use arrows to show the causal links between performance measures within your balanced scorecard and explain whether the performance measures should show increases or decreases.

2. Assume that the company adopts your balanced scorecard. After operating for a year, some performance measures show improvements, but not others. What should management do next?
3.
 - a. Suppose that customers express greater satisfaction with the accuracy of their charge account bills but the performance measures for the average age of accounts receivable and for bad debts do not improve. Explain why this might happen.
 - b. Suppose that the performance measures for the average age of accounts receivable, bad debts, and unsold inventory improve, but total profits do not. Explain why this might happen. Assume in your answer that the explanation lies within the company.

RESEARCH AND APPLICATION 11-30 [L01, L02, L03]

The questions in this exercise are based on FedEx Corporation. To answer the questions you will need to download FedEx's Form 10-K for the fiscal year ended May 31, 2005 at www.sec.gov/edgar/searchedgar/companysearch.html. Once at this website, input CIK code 1048911 and hit enter. In the gray box on the right-hand side of your computer screen define the scope of your search by inputting 10-K and then pressing enter. Select the 10-K with a filing date of July 14, 2005. You do not need to print this document to answer the questions.

Required:

1. What is FedEx's strategy for success in the marketplace? Does the company rely primarily on a customer intimacy, operational excellence, or product leadership customer value proposition? What evidence supports your conclusion?
2. What are FedEx's four main business segments? Provide two examples of traceable fixed costs for each of FedEx's four business segments. Provide two examples of common costs that are not traceable to the four business segments.
3. Identify one example of a cost center, a profit center, and an investment center for FedEx.
4. Provide three examples of fixed costs that can be traceable or common depending on how FedEx defines its business segments.
5. Compute the margin, turnover, and return on investment (ROI) in 2005 for each of FedEx's four business segments. (*Hint*: page 99 reports total segment assets for each business segment).
6. Assume that FedEx established a minimum required rate of return of 15% for each of its business segments. Compute the residual income earned in 2005 in each of FedEx's four segments.
7. Assume that the senior managers of FedEx Express and FedEx Ground each have an investment opportunity that would require \$20 million of additional operating assets and that would increase operating income by \$4 million. If FedEx evaluates all of its senior managers using ROI, would the managers of both segments pursue the investment opportunity? If FedEx evaluates all of its senior managers using residual income, would the managers of both segments pursue the investment opportunity?

RESEARCH AND APPLICATION 11-31 [L04]

The questions in this exercise are based on the Nordstrom, Inc., 2004 annual report at <http://phx.corporate-ir.net/phoenix.zhtml?c=93295&p=irol-reportsAnnual>. You do not need to print the annual report in order to answer the questions.

Required:

1. What is Nordstrom's strategy for success in the marketplace? Does the company rely primarily on a customer intimacy, operational excellence, or product leadership customer value proposition? What evidence supports your conclusion?
2. Page 3 of the annual report summarizes six measures that Nordstrom collectively refers to as its scorecard. Do these measures constitute a balanced scorecard? Why or why not?
3. Identify four measures that Nordstrom could include in the financial perspective of a balanced scorecard. How do the measures that you have chosen differ from one another? Ideally, should each measure increase or decrease over time?

4. Identify four measures that Nordstrom could include in the customer perspective of a balanced scorecard. Feel free to create measures that are not explicitly mentioned in the annual report. What statements in the annual report motivated your choices? Ideally, should each of your measures increase or decrease over time?
5. Identify four measures that Nordstrom could include in the internal business process perspective of a balanced scorecard. Feel free to create measures that are not explicitly mentioned in the annual report. What statements in the annual report motivated your choices? Ideally, should each of your measures increase or decrease over time?
6. Identify four measures that Nordstrom could include in the learning and growth perspective of a balanced scorecard. Feel free to create measures that are not explicitly mentioned in the annual report. What statements in the annual report motivated your choices? Ideally, should each of your measures increase or decrease over time?
7. Create four hypothesis statements (in “if-then” form) that demonstrate four of the causal links between measures that you have chosen.

Appendix 11A: Transfer Pricing

Divisions in a company often supply goods and services to other divisions within the same company. For example, the truck division of **Toyota** supplies trucks to other Toyota divisions to use in their operations. When the divisions are evaluated based on their profit, ROI, or residual income, a price must be established for such a transfer—otherwise, the division that produces the good or service will receive no credit. The price in such a situation is called a *transfer price*. A **transfer price** is the price charged when one segment of a company provides goods or services to another segment of the same company. For example, most companies in the oil industry, such as **Shell**, have petroleum refining and retail sales divisions that are evaluated on the basis of ROI or residual income. The petroleum refining division processes crude oil into gasoline, kerosene, lubricants, and other end products. The retail sales division takes gasoline and other products from the refining division and sells them through the company’s chain of service stations. Each product has a price for transfers within the company. Suppose the transfer price for gasoline is \$0.80 a gallon. Then the refining division gets credit for \$0.80 a gallon of revenue on its segment report and the retailing division must deduct \$0.80 a gallon as an expense on its segment report. Clearly, the refining division would like the transfer price to be as high as possible, whereas the retailing division would like the transfer price to be as low as possible. However, the transaction has no direct effect on the entire company’s reported profit. It is like taking money out of one pocket and putting it into the other.

Managers are intensely interested in how transfer prices are set because they can have a dramatic effect on the reported profitability of their divisions. Three common approaches are used to set transfer prices:

1. Allow the managers involved in the transfer to negotiate their own transfer price.
2. Set transfer prices at cost using either variable cost or full (absorption) cost.
3. Set transfer prices at the market price.

We will consider each of these transfer pricing methods in turn, beginning with negotiated transfer prices. Throughout the discussion, keep in mind that *the fundamental objective in setting transfer prices is to motivate the managers to act in the best interests of the overall company*. In contrast, **suboptimization** occurs when managers do not act in the best interests of the overall company or even in the best interests of their own division.

Negotiated Transfer Prices

LEARNING OBJECTIVE 5

Determine the range, if any, within which a negotiated transfer price should fall.

A **negotiated transfer price** results from discussions between the selling and buying divisions. Negotiated transfer prices have several important advantages. First, this approach preserves the autonomy of the divisions and is consistent with the spirit of decentralization. Second, the managers of the divisions are likely to have much better information about the potential costs and benefits of the transfer than others in the company.

When negotiated transfer prices are used, the managers who are involved in a proposed transfer within the company meet to discuss the terms and conditions of the transfer. They may decide not to go through with the transfer, but if they do, they must agree to a transfer price. Generally speaking, we cannot predict the exact transfer price they will agree to. However, we can confidently predict two things: (1) the selling division will agree to the transfer only if its profits increase as a result of the transfer, and (2) the buying division will agree to the transfer only if its profits also increase as a result of the transfer. This may seem obvious, but it is an important point.

Clearly, if the transfer price is below the selling division's cost, the selling division will incur a loss on the transaction and it will refuse to agree to the transfer. Likewise, if the transfer price is set too high, it will be impossible for the buying division to make any profit on the transferred item. For any given proposed transfer, the transfer price has both a lower limit (determined by the selling division) and an upper limit (determined by the buying division). The actual transfer price agreed to by the two division managers can fall anywhere between those two limits. These limits determine the **range of acceptable transfer prices**—the range of transfer prices within which the profits of both divisions participating in a transfer would increase.

An example will help us to understand negotiated transfer prices. Harris & Louder, Ltd., owns fast-food restaurants and snack food and beverage manufacturers in the United Kingdom. One of the restaurants, Pizza Maven, serves a variety of beverages along with pizzas. One of the beverages is ginger beer, which is served on tap. Harris & Louder has just purchased a new division, Imperial Beverages, that produces ginger beer. The managing director of Imperial Beverages has approached the managing director of Pizza Maven about purchasing Imperial Beverages' ginger beer for sale at Pizza Maven restaurants rather than its usual brand of ginger beer. Managers at Pizza Maven agree that the quality of Imperial Beverages' ginger beer is comparable to the quality of their regular brand. It is just a question of price. The basic facts are as follows (the currency in this example is pounds, denoted here as £):

Imperial Beverages:

| | |
|---|----------------|
| Ginger beer production capacity per month..... | 10,000 barrels |
| Variable cost per barrel of ginger beer | £8 per barrel |
| Fixed costs per month..... | £70,000 |
| Selling price of Imperial Beverages ginger beer on the outside market..... | £20 per barrel |

Pizza Maven:

| | |
|--|----------------|
| Purchase price of regular brand of ginger beer | £18 per barrel |
| Monthly consumption of ginger beer..... | 2,000 barrels |

The Selling Division's Lowest Acceptable Transfer Price The selling division, Imperial Beverages, will be interested in a proposed transfer only if its profit increases. Clearly, the transfer price must not fall below the variable cost per barrel of £8. In addition, if Imperial Beverages does not have sufficient capacity to fill the Pizza Maven order while supplying its regular customers, then it would have to sacrifice some of its regular sales. Imperial Beverages would expect to be compensated for the contribution margin on any lost sales. In sum, if the transfer has no effect on fixed

costs, then from the selling division's standpoint, the transfer price must cover both the variable costs of producing the transferred units and any opportunity costs from lost sales.

Seller's perspective:

$$\text{Transfer price} \geq \frac{\text{Variable cost}}{\text{per unit}} + \frac{\text{Total contribution margin on lost sales}}{\text{Number of units transferred}}$$

The Buying Division's Highest Acceptable Transfer Price The buying division, Pizza Maven, will be interested in a transfer only if its profit increases. In cases like this where a buying division has an outside supplier, the buying division's decision is simple. Buy from the inside supplier if the price is less than the price offered by the outside supplier.

Purchaser's perspective:

$$\text{Transfer price} \leq \text{Cost of buying from outside supplier}$$

Or, if an outside supplier does not exist:

$$\text{Transfer price} \leq \text{Profit to be earned per unit sold (not including the transfer price)}$$

We will consider several different hypothetical situations and see what the range of acceptable transfer prices would be in each situation.

Selling Division with Idle Capacity Suppose that Imperial Beverages has sufficient idle capacity to satisfy Pizza Maven's demand for ginger beer without sacrificing sales of ginger beer to its regular customers. To be specific, let's suppose that Imperial Beverages is selling only 7,000 barrels of ginger beer a month on the outside market. That leaves unused capacity of 3,000 barrels a month—more than enough to satisfy Pizza Maven's requirement of 2,000 barrels a month. What range of transfer prices, if any, would make both divisions better off with the transfer of 2,000 barrels a month?

1. The selling division, Imperial Beverages, will be interested in the transfer only if:

$$\text{Transfer price} \geq \frac{\text{Variable cost}}{\text{per unit}} + \frac{\text{Total contribution margin on lost sales}}{\text{Number of units transferred}}$$

Because Imperial Beverages has enough idle capacity, there are no lost outside sales. And because the variable cost per unit is £8, the lowest acceptable transfer price for the selling division is £8.

$$\text{Transfer price} \geq £8 + \frac{£0}{2,000} = £8$$

2. The buying division, Pizza Maven, can buy similar ginger beer from an outside vendor for £18. Therefore, Pizza Maven would be unwilling to pay more than £18 per barrel for Imperial Beverages' ginger beer.

$$\text{Transfer price} \leq \text{Cost of buying from outside supplier} = £18$$

3. Combining the requirements of both the selling division and the buying division, the acceptable range of transfer prices in this situation is:

$$£8 \leq \text{Transfer price} \leq £18$$

Assuming that the managers understand their own businesses and that they are cooperative, they should be able to agree on a transfer price within this range.

Selling Division with No Idle Capacity Suppose that Imperial Beverages has *no* idle capacity; it is selling 10,000 barrels of ginger beer a month on the outside market at £20 per barrel. To fill the order from Pizza Maven, Imperial Beverages would have to divert 2,000 barrels from its regular customers. What range of transfer prices, if any, would make both divisions better off transferring the 2,000 barrels within the company?

1. The selling division, Imperial Beverages, will be interested in the transfer only if:

$$\text{Transfer price} \geq \frac{\text{Variable cost}}{\text{per unit}} + \frac{\text{Total contribution margin on lost sales}}{\text{Number of units transferred}}$$

Because Imperial Beverages has no idle capacity, there *are* lost outside sales. The contribution margin per barrel on these outside sales is £12 (£20 – £8).

$$\text{Transfer price} \geq £8 + \frac{(\text{£}20 - \text{£}8) \times 2,000}{2,000} = £8 + (\text{£}20 - \text{£}8) = \text{£}20$$

Thus, as far as the selling division is concerned, the transfer price must at least cover the revenue on the lost sales, which is £20 per barrel. This makes sense because the cost of producing the 2,000 barrels is the same whether they are sold on the inside market or on the outside. The only difference is that the selling division loses the revenue of £20 per barrel if it transfers the barrels to Pizza Maven.

2. As before, the buying division, Pizza Maven, would be unwilling to pay more than the £18 per barrel it is already paying for similar ginger beer from its regular supplier.

$$\text{Transfer price} \leq \text{Cost of buying from outside supplier} = \text{£}18$$

3. Therefore, the selling division would insist on a transfer price of at least £20. But the buying division would refuse any transfer price above £18. It is impossible to satisfy both division managers simultaneously; there can be no agreement on a transfer price and no transfer will take place. Is this good? The answer is yes. From the standpoint of the entire company, the transfer doesn't make sense. Why give up sales of £20 to save costs of £18?

Basically, the transfer price is a mechanism for dividing between the two divisions any profit the entire company earns as a result of the transfer. If the company as a whole loses money on the transfer, there will be no profit to divide up, and it will be impossible for the two divisions to come to an agreement. On the other hand, if the company as a whole makes money on the transfer, there will be a profit to share, and it will always be possible for the two divisions to find a mutually agreeable transfer price that increases the profits of both divisions. If the pie is bigger, it is always possible to divide it up in such a way that everyone has a bigger piece.

Selling Division Has Some Idle Capacity Suppose now that Imperial Beverages is selling 9,000 barrels of ginger beer a month on the outside market. Pizza Maven can only sell one kind of ginger beer on tap. It cannot buy 1,000 barrels from Imperial Beverages and 1,000 barrels from its regular supplier; it must buy all of its ginger beer from one source.

To fill the entire 2,000-barrel a month order from Pizza Maven, Imperial Beverages would have to divert 1,000 barrels from its regular customers who are paying £20 per barrel. The other 1,000 barrels can be made using idle capacity. What range of transfer prices, if any, would make both divisions better off transferring the 2,000 barrels within the company?

1. As before, the selling division, Imperial Beverages, will insist on a transfer price that at least covers its variable cost and opportunity cost:

$$\text{Transfer price} \geq \frac{\text{Variable cost}}{\text{per unit}} + \frac{\text{Total contribution margin on lost sales}}{\text{Number of units transferred}}$$

Because Imperial Beverages does not have enough idle capacity to fill the entire order for 2,000 barrels, there *are* lost outside sales. The contribution margin per barrel on the 1,000 barrels of lost outside sales is £12 (£20 – £8).

$$\text{Transfer price} \geq \text{£8} + \frac{(\text{£20} - \text{£8}) \times 1,000}{2,000} = \text{£8} + \text{£6} = \text{£14}$$

Thus, as far as the selling division is concerned, the transfer price must cover the variable cost of £8 plus the average opportunity cost of lost sales of £6.

2. As before, the buying division, Pizza Maven, would be unwilling to pay more than the £18 per barrel it pays its regular supplier.

$$\text{Transfer price} \leq \text{Cost of buying from outside suppliers} = \text{£18}$$

3. Combining the requirements for both the selling and buying divisions, the range of acceptable transfer prices is:

$$\text{£14} \leq \text{Transfer price} \leq \text{£18}$$

Again, assuming that the managers understand their own businesses and that they are cooperative, they should be able to agree on a transfer price within this range.

No Outside Supplier If Pizza Maven has no outside supplier for the ginger beer, the highest price the buying division would be willing to pay depends on how much the buying division expects to make on the transferred units—excluding the transfer price. If, for example, Pizza Maven expects to earn £30 per barrel of ginger beer after paying its own expenses, then it should be willing to pay up to £30 per barrel to Imperial Beverages. Remember, however, that this assumes Pizza Maven cannot buy ginger beer from other sources.

Evaluation of Negotiated Transfer Prices As discussed earlier, if a transfer within the company would result in higher overall profits for the company, there is always a range of transfer prices within which both the selling and buying division would also have higher profits if they agree to the transfer. Therefore, if the managers understand their own businesses and are cooperative, then they should always be able to agree on a transfer price if it is in the best interests of the company that they do so.

Unfortunately, not all managers understand their own businesses and not all managers are cooperative. As a result, negotiations often break down even when it would be in the managers' own best interests to come to an agreement. Sometimes that is the fault of the way managers are evaluated. If managers are pitted against each other rather than against their own past performance or reasonable benchmarks, a noncooperative atmosphere is almost guaranteed. Nevertheless, even with the best performance evaluation system, some people by nature are not cooperative.

Given the disputes that often accompany the negotiation process, most companies rely on some other means of setting transfer prices. Unfortunately, as we will see below, all of the alternatives to negotiated transfer prices have their own serious drawbacks.

Transfers at the Cost to the Selling Division

Many companies set transfer prices at either the variable cost or full (absorption) cost incurred by the selling division. Although the cost approach to setting transfer prices is relatively simple to apply, it has some major defects.

First, the use of cost—particularly full cost—as a transfer price can lead to bad decisions and thus suboptimization. Return to the example involving the ginger beer. The full cost of ginger beer can never be less than £15 per barrel (£8 per barrel variable cost + £7 per barrel fixed cost at capacity). What if the cost of buying the ginger beer from an outside supplier is less than £15—for example, £14 per barrel? If the transfer price were set at full cost, then Pizza Maven would never want to buy ginger beer from Imperial Beverages because it could buy its ginger beer from an outside supplier at a lower price.

However, from the standpoint of the company as a whole, ginger beer should be transferred from Imperial Beverages to Pizza Maven whenever Imperial Beverages has idle capacity. Why? Because when Imperial Beverages has idle capacity, it only costs the company £8 in variable cost to produce a barrel of ginger beer, but it costs £14 per barrel to buy from outside suppliers.

Second, if cost is used as the transfer price, the selling division will never show a profit on any internal transfer. The only division that shows a profit is the division that makes the final sale to an outside party.

Third, cost-based prices do not provide incentives to control costs. If the actual costs of one division are simply passed on to the next, there is little incentive for anyone to work to reduce costs. This problem can be overcome by using standard costs rather than actual costs for transfer prices.

Despite these shortcomings, cost-based transfer prices are often used in practice. Advocates argue that they are easily understood and convenient to use.

Transfers at Market Price

Some form of competitive **market price** (i.e., the price charged for an item on the open market) is sometimes advocated as the best approach to the transfer pricing problem—particularly if transfer price negotiations routinely become bogged down.

The market price approach is designed for situations in which there is an *outside market* for the transferred product or service; the product or service is sold in its present form to outside customers. If the selling division has no idle capacity, the market price is the correct choice for the transfer price. This is because, from the company's perspective, the real cost of the transfer is the opportunity cost of the lost revenue on the outside sale. Whether the item is transferred internally or sold on the outside market, the production costs are exactly the same. If the market price is used as the transfer price, the selling division manager will not lose anything by making the transfer, and the buying division manager will get the correct signal about how much it really costs the company for the transfer to take place.

While the market price works well when the selling division has no idle capacity, difficulties occur when the selling division has idle capacity. Recalling once again the ginger beer example, the outside market price for the ginger beer produced by Imperial Beverages is £20 per barrel. However, Pizza Maven can purchase all of the ginger beer it wants from outside suppliers for £18 per barrel. Why would Pizza Maven ever buy from Imperial Beverages if Pizza Maven is forced to pay Imperial Beverages' market price? In some market price-based transfer pricing schemes, the transfer price would be lowered to £18, the outside vendor's market price, and Pizza Maven would be directed to buy from Imperial Beverages as long as Imperial Beverages is willing to sell. This scheme can work reasonably well, but a drawback is that managers at Pizza Maven will regard the cost of ginger beer as £18 rather than the £8, which is the real cost to the company when the selling division has idle capacity. Consequently, the managers of Pizza Maven will make pricing and other decisions based on an incorrect cost.

Unfortunately, none of the possible solutions to the transfer pricing problem are perfect—not even market-based transfer prices.

Divisional Autonomy and Suboptimization

The principles of decentralization suggest that companies should grant managers autonomy to set transfer prices and to decide whether to sell internally or externally. It may be very difficult for top managers to accept this principle when their subordinate managers are about to make a suboptimal decision. However, if top management intervenes, the purposes of decentralization are defeated. Furthermore, to impose the correct transfer price, top managers would have to know details about the buying and selling divisions' outside market, variable costs, and capacity utilization. The whole premise of decentralization is that local managers have access to better information for operational decisions than top managers at corporate headquarters.

Of course, if a division manager consistently makes suboptimal decisions, the performance of the division will suffer. The offending manager's compensation will be adversely affected and promotion will become less likely. Thus, a performance evaluation system based on divisional profits, ROI, or residual income provides some built-in checks and balances. Nevertheless, if top managers wish to create a culture of autonomy and independent profit responsibility, they must allow their subordinate managers to control their own destiny—even to the extent of granting their managers the right to make mistakes.

International Aspects of Transfer Pricing

The objectives of transfer pricing change when a multinational corporation is involved and the goods and services being transferred cross international borders. In this context, the objectives of international transfer pricing focus on minimizing taxes, duties, and foreign exchange risks, along with enhancing a company's competitive position and improving its relations with foreign governments. Although domestic objectives such as managerial motivation and divisional autonomy are always important, they often become secondary when international transfers are involved. Companies will focus instead on charging a transfer price that reduces its total tax bill or that strengthens a foreign subsidiary.

For example, charging a low transfer price for parts shipped to a foreign subsidiary may reduce customs duty payments as the parts cross international borders, or it may help the subsidiary to compete in foreign markets by keeping the subsidiary's costs low. On the other hand, charging a high transfer price may help a multinational corporation draw profits out of a country that has stringent controls on foreign remittances, or it may allow a multinational corporation to shift income from a country that has high income tax rates to a country that has low rates.

Review Problem 3: Transfer Pricing

Situation A

Collyer Products, Inc., has a Valve Division that manufactures and sells a standard valve:

| | |
|--|---------|
| Capacity in units | 100,000 |
| Selling price to outside customers | \$30 |
| Variable costs per unit | \$16 |
| Fixed costs per unit (based on capacity) | \$9 |

The company has a Pump Division that could use this valve in one of its pumps. The Pump Division is currently purchasing 10,000 valves per year from an overseas supplier at a cost of \$29 per valve.

Required:

1. Assume that the Valve Division has enough idle capacity to handle all of the Pump Division's needs. What is the acceptable range, if any, for the transfer price between the two divisions?
2. Assume that the Valve Division is selling all of the valves that it can produce to outside customers. What is the acceptable range, if any, for the transfer price between the two divisions?
3. Assume again that the Valve Division is selling all of the valves that it can produce to outside customers. Also assume that \$3 in variable expenses can be avoided on transfers within the company, due to reduced selling costs. What is the acceptable range, if any, for the transfer price between the two divisions?

Solution to Situation A

1. Because the Valve Division has idle capacity, it does not have to give up any outside sales to take on the Pump Division's business. Applying the formula for the lowest acceptable transfer price from the viewpoint of the selling division, we get:

$$\text{Transfer price} \geq \frac{\text{Variable cost}}{\text{per unit}} + \frac{\text{Total contribution margin on lost sales}}{\text{Number of units transferred}}$$

$$\text{Transfer price} \geq \$16 + \frac{\$0}{10,000} = \$16$$

The Pump Division would be unwilling to pay more than \$29, the price it is currently paying an outside supplier for its valves. Therefore, the transfer price must fall within the range:

$$\$16 \leq \text{Transfer price} \leq \$29$$

2. Because the Valve Division is selling all of the valves that it can produce on the outside market, it would have to give up some of these outside sales to take on the Pump Division's business. Thus, the Valve Division has an opportunity cost, which is the total contribution margin on lost sales:

$$\text{Transfer price} \geq \frac{\text{Variable cost}}{\text{per unit}} + \frac{\text{Total contribution margin on lost sales}}{\text{Number of units transferred}}$$

$$\text{Transfer price} \geq \$16 + \frac{(\$30 - \$16) \times 10,000}{10,000} = \$16 + \$14 = \$30$$

Because the Pump Division can purchase valves from an outside supplier at only \$29 per unit, no transfers will be made between the two divisions.

3. Applying the formula for the lowest acceptable transfer price from the viewpoint of the selling division, we get:

$$\text{Transfer price} \geq \frac{\text{Variable cost}}{\text{per unit}} + \frac{\text{Total contribution margin on lost sales}}{\text{Number of units transferred}}$$

$$\text{Transfer price} \geq (\$16 - \$3) + \frac{(\$30 - \$16) \times 10,000}{10,000} = \$13 + \$14 = \$27$$

In this case, the transfer price must fall within the range:

$$\$27 \leq \text{Transfer price} \leq \$29$$

Situation B

Refer to the original data in situation A above. Assume that the Pump Division needs 20,000 special high-pressure valves per year. The Valve Division's variable costs to manufacture and ship the special valve would be \$20 per unit. To produce these special valves, the Valve Division would have to reduce its production and sales of regular valves from 100,000 units per year to 70,000 units per year.

Required:

As far as the Valve Division is concerned, what is the lowest acceptable transfer price?

Solution to Situation B

To produce the 20,000 special valves, the Valve Division will have to give up sales of 30,000 regular valves to outside customers. Applying the formula for the lowest acceptable transfer price from the viewpoint of the selling division, we get:

$$\text{Transfer price} \geq \frac{\text{Variable cost}}{\text{per unit}} + \frac{\text{Total contribution margin on lost sales}}{\text{Number of units transferred}}$$

$$\text{Transfer price} \geq \$20 + \frac{(\$30 - \$16) \times 30,000}{20,000} = \$20 + \$21 = \$41$$

Appendix 11A Glossary

- Market price** The price charged for an item on the open market. (p. 472)
- Negotiated transfer price** A transfer price agreed on between buying and selling divisions. (p. 468)
- Range of acceptable transfer prices** The range of transfer prices within which the profits of both the selling division and the buying division would increase as a result of a transfer. (p. 468)
- Suboptimization** An overall level of profits that is less than a segment or a company is capable of earning. (p. 467)
- Transfer price** The price charged when one division or segment provides goods or services to another division or segment of an organization. (p. 467)

connect™ Appendix 11A Exercises and Problems

EXERCISE 11A-1 Transfer Pricing Situations [L05]

In each of the cases below, assume that Division X has a product that can be sold either to outside customers or to Division Y of the same company for use in its production process. The managers of the divisions are evaluated based on their divisional profits.

| | Case | |
|---|---------|---------|
| | A | B |
| Division X: | | |
| Capacity in units | 200,000 | 200,000 |
| Number of units being sold to outside customers | 200,000 | 160,000 |
| Selling price per unit to outside customers | \$90 | \$75 |
| Variable costs per unit | \$70 | \$60 |
| Fixed costs per unit (based on capacity) | \$13 | \$8 |
| Division Y: | | |
| Number of units needed for production | 40,000 | 40,000 |
| Purchase price per unit now being paid to an outside supplier | \$86 | \$74 |

Required:

1. Refer to the data in case A above. Assume in this case that \$3 per unit in variable selling costs can be avoided on intracompany sales. If the managers are free to negotiate and make decisions on their own, will a transfer take place? If so, within what range will the transfer price fall? Explain.
2. Refer to the data in case B above. In this case, there will be no savings in variable selling costs on intracompany sales. If the managers are free to negotiate and make decisions on their own, will a transfer take place? If so, within what range will the transfer price fall? Explain.

EXERCISE 11A-2 Transfer Pricing Basics [L05]

Sako Company's Audio Division produces a speaker that is used by manufacturers of various audio products. Sales and cost data on the speaker follow:

| | |
|---|--------|
| Selling price per unit on the intermediate market | \$60 |
| Variable costs per unit | \$42 |
| Fixed costs per unit (based on capacity) | \$8 |
| Capacity in units | 25,000 |

Sako Company has a Hi-Fi Division that could use this speaker in one of its products. The Hi-Fi Division will need 5,000 speakers per year. It has received a quote of \$57 per speaker from another manufacturer. Sako Company evaluates division managers on the basis of divisional profits.

Required:

1. Assume that the Audio Division is now selling only 20,000 speakers per year to outside customers.
 - a. From the standpoint of the Audio Division, what is the lowest acceptable transfer price for speakers sold to the Hi-Fi Division?
 - b. From the standpoint of the Hi-Fi Division, what is the highest acceptable transfer price for speakers acquired from the Audio Division?
 - c. If left free to negotiate without interference, would you expect the division managers to voluntarily agree to the transfer of 5,000 speakers from the Audio Division to the Hi-Fi Division? Why or why not?
 - d. From the standpoint of the entire company, should the transfer take place? Why or why not?
2. Assume that the Audio Division is selling all of the speakers it can produce to outside customers.
 - a. From the standpoint of the Audio Division, what is the lowest acceptable transfer price for speakers sold to the Hi-Fi Division?
 - b. From the standpoint of the Hi-Fi Division, what is the highest acceptable transfer price for speakers acquired from the Audio Division?
 - c. If left free to negotiate without interference, would you expect the division managers to voluntarily agree to the transfer of 5,000 speakers from the Audio Division to the Hi-Fi Division? Why or why not?
 - d. From the standpoint of the entire company, should the transfer take place? Why or why not?

EXERCISE 11A-3 Transfer Pricing from the Viewpoint of the Entire Company [L05]

Division A manufactures electronic circuit boards. The boards can be sold either to Division B of the same company or to outside customers. Last year, the following activity occurred in Division A:

| | |
|---------------------------------------|--------|
| Selling price per circuit board | \$125 |
| Variable cost per circuit board | \$90 |
| Number of circuit boards: | |
| Produced during the year | 20,000 |
| Sold to outside customers | 16,000 |
| Sold to Division B | 4,000 |

Sales to Division B were at the same price as sales to outside customers. The circuit boards purchased by Division B were used in an electronic instrument manufactured by that division (one board per instrument). Division B incurred \$100 in additional variable cost per instrument and then sold the instruments for \$300 each.

Required:

1. Prepare income statements for Division A, Division B, and the company as a whole.
2. Assume that Division A's manufacturing capacity is 20,000 circuit boards. Next year, Division B wants to purchase 5,000 circuit boards from Division A rather than 4,000. (Circuit boards of this type are not available from outside sources.) From the standpoint of the company as a whole, should Division A sell the 1,000 additional circuit boards to Division B or continue to sell them to outside customers? Explain.

PROBLEM 11A-4 Basic Transfer Pricing [L05]

Alpha and Beta are divisions within the same company. The managers of both divisions are evaluated based on their own division's return on investment (ROI). Assume the following information relative to the two divisions:

| | Case | | | |
|--|--------|---------|---------|---------|
| | 1 | 2 | 3 | 4 |
| Alpha Division: | | | | |
| Capacity in units | 80,000 | 400,000 | 150,000 | 300,000 |
| Number of units now being sold to outside customers | 80,000 | 400,000 | 100,000 | 300,000 |
| Selling price per unit to outside customers | \$30 | \$90 | \$75 | \$50 |
| Variable costs per unit | \$18 | \$65 | \$40 | \$26 |
| Fixed costs per unit (based on capacity) | \$6 | \$15 | \$20 | \$9 |
| Beta Division: | | | | |
| Number of units needed annually | 5,000 | 30,000 | 20,000 | 120,000 |
| Purchase price now being paid to an outside supplier | \$27 | \$89 | \$75* | — |

*Before any purchase discount.

Managers are free to decide if they will participate in any internal transfers. All transfer prices are negotiated.

Required:

1. Refer to case 1 shown above. Alpha Division can avoid \$2 per unit in commissions on any sales to Beta Division. Will the managers agree to a transfer, and if so, within what range will the transfer price be? Explain.
2. Refer to case 2 shown above. A study indicates that Alpha Division can avoid \$5 per unit in shipping costs on any sales to Beta Division.
 - a. Would you expect any disagreement between the two divisional managers over what the transfer price should be? Explain.
 - b. Assume that Alpha Division offers to sell 30,000 units to Beta Division for \$88 per unit and that Beta Division refuses this price. What will be the loss in potential profits for the company as a whole?
3. Refer to case 3 shown above. Assume that Beta Division is now receiving an 8% price discount from the outside supplier.
 - a. Will the managers agree to a transfer? If so, what is the range within which the transfer price would be?
 - b. Assume that Beta Division offers to purchase 20,000 units from Alpha Division at \$60 per unit. If Alpha Division accepts this price, would you expect its ROI to increase, decrease, or remain unchanged? Why?
4. Refer to case 4 shown above. Assume that Beta Division wants Alpha Division to provide it with 120,000 units of a *different* product from the one that Alpha Division is now producing. The new product would require \$21 per unit in variable costs and would require that Alpha Division cut back production of its present product by 45,000 units annually. What is the lowest acceptable transfer price from Alpha Division’s perspective?

PROBLEM 11A-5 Transfer Price with an Outside Market [LO5]

Hrubec Products, Inc., operates a Pulp Division that manufactures wood pulp for use in the production of various paper goods. Revenue and costs associated with a ton of pulp follow:

| | | |
|--|------|-------------|
| Selling price | | \$70 |
| Expenses: | | |
| Variable | \$42 | |
| Fixed (based on a capacity of 50,000 tons per year) | 18 | 60 |
| Net operating income | | <u>\$10</u> |

Hrubec Products has just acquired a small company that manufactures paper cartons. This company will be treated as a division of Hrubec with full profit responsibility. The newly formed Carton Division is currently purchasing 5,000 tons of pulp per year from a supplier at a cost of \$70 per ton, less a 10% purchase discount. Hrubec’s president is anxious for the Carton Division to begin purchasing its pulp from the Pulp Division if an acceptable transfer price can be worked out.

Required:

For (1) and (2) on the following page, assume that the Pulp Division can sell all of its pulp to outside customers for \$70 per ton.

1. Are the managers of the Carton and Pulp Divisions likely to voluntarily agree to a transfer price for 5,000 tons of pulp next year? Why or why not?
2. If the Pulp Division meets the price that the Carton Division is currently paying to its supplier and sells 5,000 tons of pulp to the Carton Division each year, what will be the effect on the profits of the Pulp Division, the Carton Division, and the company as a whole?

For (3)–(6) below, assume that the Pulp Division is currently selling only 30,000 tons of pulp each year to outside customers at the stated \$70 price.

3. Are the managers of the Carton and Pulp Divisions likely to voluntarily agree to a transfer price for 5,000 tons of pulp next year? Why or why not?
4. Suppose that the Carton Division’s outside supplier drops its price (net of the purchase discount) to only \$59 per ton. Should the Pulp Division meet this price? Explain. If the Pulp Division does *not* meet the \$59 price, what will be the effect on the profits of the company as a whole?

5. Refer to (4) above. If the Pulp Division refuses to meet the \$59 price, should the Carton Division be required to purchase from the Pulp Division at a higher price for the good of the company as a whole?
6. Refer to (4) above. Assume that due to inflexible management policies, the Carton Division is required to purchase 5,000 tons of pulp each year from the Pulp Division at \$70 per ton. What will be the effect on the profits of the company as a whole?

PROBLEM 11A-6 Market-Based Transfer Price [L05]

Stavos Company's Cabinet Division manufactures a standard cabinet for television sets. The cost per cabinet is:

| | |
|---------------------------------|--------------|
| Variable cost per cabinet | \$ 70 |
| Fixed cost per cabinet | <u>30*</u> |
| Total cost per cabinet | <u>\$100</u> |

*Based on a capacity of 10,000 cabinets per year.

Part of the Cabinet Division's output is sold to outside manufacturers of television sets and part is sold to Stavos Company's Quark Division, which produces a TV set under its own name. The Cabinet Division charges \$140 per cabinet for all sales.

The costs, revenue, and net operating income associated with the Quark Division's TV set is given below:

| | |
|---|--------------|
| Selling price per TV set | \$480 |
| Variable cost per TV set: | |
| Cost of the cabinet | \$140 |
| Variable cost of electronic parts | <u>210</u> |
| Total variable cost | <u>350</u> |
| Contribution margin | 130 |
| Fixed costs per TV set | <u>80*</u> |
| Net operating income per TV set | <u>\$ 50</u> |

*Based on a capacity of 3,000 sets per year.

The Quark Division has an order from an overseas source for 1,000 TV sets. The overseas source wants to pay only \$340 per set.

Required:

1. Assume that the Quark Division has enough idle capacity to fill the 1,000-set order. Is the division likely to accept the \$340 price or to reject it? Explain.
2. Assume that both the Cabinet Division and the Quark Division have idle capacity. Under these conditions, would it be advantageous for the company as a whole if the Quark Division rejects the \$340 price? Show computations to support your answer.
3. Assume that the Quark Division has idle capacity but that the Cabinet Division is operating at capacity and could sell all of its cabinets to outside manufacturers. Compute the profit impact to the Quark Division of accepting the 1,000-set order at the \$340 unit price.
4. What conclusions do you draw concerning the use of market price as a transfer price in intra-company transactions?

CASE 11A-7 Transfer Pricing; Divisional Performance [L05]

Weller Industries is a decentralized organization with six divisions. The company's Electrical Division produces a variety of electrical items, including an X52 electrical fitting. The Electrical Division (which is operating at capacity) sells this fitting to its regular customers for \$7.50 each; the fitting has a variable manufacturing cost of \$4.25.

The company's Brake Division has asked the Electrical Division to supply it with a large quantity of X52 fittings for only \$5 each. The Brake Division, which is operating at 50% of capacity, will put the

fitting into a brake unit that it will produce and sell to a large commercial airline manufacturer. The cost of the brake unit being built by the Brake Division follows:

| | |
|--|----------------|
| Purchased parts (from outside vendors) | \$22.50 |
| Electrical fitting X52 | 5.00 |
| Other variable costs | 14.00 |
| Fixed overhead and administration | 8.00 |
| Total cost per brake unit | <u>\$49.50</u> |

Although the \$5 price for the X52 fitting represents a substantial discount from the regular \$7.50 price, the manager of the Brake Division believes that the price concession is necessary if his division is to get the contract for the airplane brake units. He has heard “through the grapevine” that the airplane manufacturer plans to reject his bid if it is more than \$50 per brake unit. Thus, if the Brake Division is forced to pay the regular \$7.50 price for the X52 fitting, it will either not get the contract or it will suffer a substantial loss at a time when it is already operating at only 50% of capacity. The manager of the Brake Division argues that the price concession is imperative to the well-being of both his division and the company as a whole.

Weller Industries uses return on investment (ROI) to measure divisional performance.

Required:

1. Assume that you are the manager of the Electrical Division. Would you recommend that your division supply the X52 fitting to the Brake Division for \$5 each as requested? Why or why not? Show all computations.
2. Would it be profitable for the company as a whole for the Electrical Division to supply the fittings to the Brake Division if the airplane brakes can be sold for \$50? Show all computations, and explain your answer.
3. In principle, should it be possible for the two managers to agree to a transfer price in this particular situation? If so, within what range would that transfer price lie?
4. Discuss the organizational and manager behavior problems, if any, inherent in this situation. What would you advise the company’s president to do in this situation?

(CMA, adapted)

Appendix 11B: Service Department Charges

Most large organizations have both *operating departments* and *service departments*. The central purposes of the organization are carried out in the **operating departments**. In contrast, **service departments** do not directly engage in operating activities. Instead, they provide services or assistance to the operating departments. Examples of service departments include Cafeteria, Internal Auditing, Human Resources, Cost Accounting, and Purchasing.

Service department costs are charged to operating departments for a variety of reasons including:

- To encourage operating departments to make wise use of service department resources. If the services were provided for free, operating managers would be inclined to waste these resources.
- To provide operating departments with more complete cost data for making decisions. Actions taken by operating departments have impacts on service department costs. For example, hiring another employee will increase costs in the human resources department. Such service department costs should be charged to the operating departments, otherwise the operating departments will not take them into account when making decisions.
- To help measure the profitability of operating departments. Charging service department costs to operating departments provides a more complete accounting of the costs incurred as a consequence of activities in the operating departments.

LEARNING OBJECTIVE 6

Charge operating departments for services provided by service departments.

- To create an incentive for service departments to operate efficiently. Charging service department costs to operating departments provides a system of checks and balances in the sense that cost-conscious operating departments will take an active interest in keeping service department costs low.

In Appendix 11A, we discussed *transfer prices* that are charged within an organization when one part of an organization provides a product to another part of the organization. The service department charges considered in this appendix can be viewed as transfer prices that are charged for services provided by service departments to operating departments.

Charging Costs by Behavior

Whenever possible, variable and fixed service department costs should be charged to operating departments separately to provide more useful data for planning and control of departmental operations.

Variable Costs

Variable costs vary in total in proportion to changes in the level of service provided. For example, the cost of food in a cafeteria is a variable cost that varies in proportion to the number of persons using the cafeteria or the number of meals served.

A variable cost should be charged to consuming departments according to whatever activity causes the incurrence of the cost. For example, variable costs of a maintenance department that are caused by the number of machine-hours worked in the operating departments should be charged to the operating departments on the basis of machine-hours. This will ensure that these costs are properly traced to departments, products, and customers.

Fixed Costs

The fixed costs of service departments represent the costs of making capacity available for use. These costs should be charged to consuming departments in *predetermined lump-sum amounts* that are determined in advance and do not change. The lump-sum amount charged to a department can be based either on the department's peak-period or long-run average servicing needs. The logic behind lump-sum charges of this type is as follows:

When a service department is first established, its capacity will be determined by the needs of the departments that it will serve. This capacity may reflect the peak-period needs of the other departments, or it may reflect their long-run average or "normal" servicing needs. Depending on how much servicing capacity is provided for, it will be necessary to make a commitment of resources, which will be reflected in the service department's fixed costs. These fixed costs should be borne by the consuming departments in proportion to the amount of capacity each consuming department requires. That is, if available capacity in the service department has been provided to meet the peak-period needs of consuming departments, then the fixed costs of the service department should be charged in predetermined lump-sum amounts to consuming departments on that basis. If available capacity has been provided only to meet "normal" or long-run average needs, then the fixed costs should be charged on that basis.

Once set, charges should not vary from period to period, because they represent the cost of having a certain level of service capacity available and on line for each operating department. The fact that an operating department does not need the peak level or even the "normal" level of service every period is immaterial; the capacity to deliver this level of service must be available. The operating departments should bear the cost of that availability.

Should Actual or Budgeted Costs Be Charged?

The *budgeted*, rather than actual, costs of a service department should be charged to operating departments. This ensures that service departments remain solely responsible for explaining any differences between their actual and budgeted costs. If service departments could base their charges on actual costs, then operating departments would be unfairly held accountable for cost overruns in the service departments.

Guidelines for Service Department Charges

The following summarizes how service department costs should be charged out to operating departments:

- Variable and fixed service department costs should be charged separately.
- Variable service department costs should be charged using a predetermined rate applied to the actual services consumed.
- Fixed costs represent the costs of having service capacity available. These costs should be charged in lump sums to each operating department in proportion to their peak-period needs or long-run average needs. The lump-sum amounts should be based on budgeted fixed costs, not actual fixed costs.

Example

Seaboard Airlines has two operating divisions: a Freight Division and a Passenger Division. The company has a Maintenance Department that provides servicing to both divisions. Variable servicing costs are budgeted at \$10 per flight-hour. The department's fixed costs are budgeted at \$750,000 for the year. The fixed costs of the Maintenance Department are budgeted based on the peak-period demand, which occurs during the Thanksgiving to New Year's holiday period. The airline wants to make sure that none of its aircraft are grounded during this key period due to unavailability of maintenance facilities. Approximately 40% of the maintenance during this period is performed on the Freight Division's equipment, and 60% is performed on the Passenger Division's equipment. These figures and the budgeted flight-hours for the coming year are as follows:

| | Percent of Peak Period Capacity Required | Budgeted Flight-Hours |
|--------------------------|--|-----------------------|
| Freight Division | 40% | 9,000 |
| Passenger Division | 60 | 15,000 |
| Total | <u>100%</u> | <u>24,000</u> |

Year-end records show that actual variable and fixed costs in the aircraft Maintenance Department for the year were \$260,000 and \$780,000, respectively. One division logged more flight-hours during the year than planned, and the other division logged fewer flight-hours than planned, as shown below:

| | Flight-Hours | |
|--------------------------|----------------------|---------------|
| | Budgeted (see above) | Actual |
| Freight Division | 9,000 | 8,000 |
| Passenger Division | <u>15,000</u> | <u>17,000</u> |
| Total flight-hours | <u>24,000</u> | <u>25,000</u> |

The amount of Maintenance Department cost charged to each division for the year would be as follows:

| | | Actual activity | Division | |
|-------------------------------|---|---------------------|------------------|------------------|
| | | | Freight | Passenger |
| Budgeted variable rate | Variable cost charges: | | | |
| | $\$10 \text{ per flight-hour} \times 8,000 \text{ flight-hours} \dots$ $\$10 \text{ per flight-hour} \times 17,000 \text{ flight-hours} \dots$ | | \$ 80,000 | \$170,000 |
| Fixed cost charges: | | | | |
| Peak-period capacity required | 40% × \$750,000 | | 300,000 | |
| | 60% × \$750,000 | | | 450,000 |
| Total charges | | | <u>\$380,000</u> | <u>\$620,000</u> |
| | | Budgeted fixed cost | | |

Notice that variable servicing costs are charged to the operating divisions based on the budgeted rate (\$10 per hour) and the *actual activity* for the year. In contrast, the charges for fixed costs are based entirely on budgeted data. Also note that the two operating divisions are *not* charged for the actual costs of the service department, which are influenced by how well the service department is managed. Instead, the service department is held responsible for the actual costs not charged to other departments as shown below:

| | Variable | Fixed |
|--|------------------|------------------|
| Total actual costs incurred | \$260,000 | \$780,000 |
| Total charges (above) | <u>250,000*</u> | <u>750,000</u> |
| Spending variance—responsibility of the Maintenance Department | <u>\$ 10,000</u> | <u>\$ 30,000</u> |

*\$10 per flight-hour × 25,000 actual flight-hours = \$250,000.

Some Cautions in Allocating Service Department Costs

Pitfalls in Allocating Fixed Costs

Rather than charge fixed costs to operating departments in predetermined lump-sum amounts, some companies allocate them using a *variable* allocation base that fluctuates from period to period. This practice can distort decisions and create serious inequities between departments. The inequities arise from the fact that the fixed costs allocated to one department are heavily influenced by what happens in *other* departments.

Sales dollars is an example of a variable allocation base that is often used to allocate fixed costs from service departments to operating departments. Using sales dollars as a base is simple, straightforward, and easy to work with. Furthermore, people tend to view sales dollars as a measure of ability to pay, and, hence, as a measure of how readily costs can be absorbed from other parts of the organization.

Unfortunately, sales dollars are often a very poor base for allocating or charging costs because sales dollars vary from period to period, whereas the costs are often largely *fixed*. Therefore, a letup in sales effort in one department will shift allocated costs from that department to other, more successful departments. In effect, the departments putting forth the best sales efforts are penalized in the form of higher allocations. The result is often bitterness and resentment on the part of the managers of the better departments.

For example, let's assume that a large men's clothing store has one service department and three sales departments—Suits, Shoes, and Accessories. The service department's costs total \$60,000 per period and are allocated to the three sales departments according to sales dollars. A recent period showed the following allocation:

| | Departments | | | Total |
|--|-------------|----------|-------------|-----------|
| | Suits | Shoes | Accessories | |
| Sales by department..... | \$260,000 | \$40,000 | \$100,000 | \$400,000 |
| Percentage of total sales | 65% | 10% | 25% | 100% |
| Allocation of service department costs, based on percentage of total sales | \$39,000 | \$6,000 | \$15,000 | \$60,000 |

In the following period, let's assume the manager of the Suits Department launched a successful program to expand sales in his department by \$100,000. Furthermore, let's assume that sales in the other two departments remained unchanged, total service department costs remained unchanged, and the sales departments' expected usage of service department resources remained unchanged. Given these assumptions, the service department cost allocations to the sales departments would change as shown below:

| | Departments | | | Total |
|---|-------------|-----------|-------------|-----------|
| | Suits | Shoes | Accessories | |
| Sales by department | \$360,000 | \$40,000 | \$100,000 | \$500,000 |
| Percentage of total sales | 72% | 8% | 20% | 100% |
| Allocation of service department costs, based on percentage of total sales..... | \$43,200 | \$4,800 | \$12,000 | \$60,000 |
| Increase (or decrease) from prior allocation | \$4,200 | \$(1,200) | \$(3,000) | \$0 |

After seeing these allocations, the manager of the Suits Department is likely to complain because by growing sales in his department, he is being forced to carry a larger share of the service department costs. In essence, this manager is being punished for his outstanding performance by being saddled with a greater proportion of service department costs. On the other hand, the managers of the departments that showed no sales growth are being relieved of a portion of the costs they had been carrying. Yet, there was no change in the amount of services provided for any department across the two periods.

This example shows why a variable allocation base such as sales dollars should only be used as a base for allocating or charging costs in those cases where service department costs actually vary with the chosen allocation base. When service department costs are fixed, they should be charged to operating departments according to the guidelines mentioned earlier.

Appendix 11B Glossary

Operating department A department in which the central purposes of the organization are carried out. (p. 479)

Service department A department that does not directly engage in operating activities; rather, it provides services or assistance to the operating departments. (p. 479)

Appendix 11B Exercises and Problems **connect**[™]

EXERCISE 11B-1 Service Department Charges [L06]

Korvanis Corporation operates a Medical Services Department for its employees. Charges to the company's operating departments for the variable costs of the Medical Services Department are based on the actual number of employees in each department. Charges for the fixed costs of the Medical Services Department are based on the long-run average number of employees in each operating department.

Variable Medical Services Department costs are budgeted at \$80 per employee. Fixed Medical Services Department costs are budgeted at \$400,000 per year. Actual Medical Services Department costs for the most recent year were \$41,000 for variable costs and \$408,000 for fixed costs. Data concerning employees in the three operating departments follow:

| | Cutting | Milling | Assembly |
|--|---------|---------|----------|
| Budgeted number of employees | 170 | 100 | 280 |
| Actual number of employees for the most recent year | 150 | 80 | 270 |
| Long-run average number of employees | 180 | 120 | 300 |

Required:

1. Determine the Medical Services Department charges for the year to each of the operating departments—Cutting, Milling, and Assembly.
2. How much, if any, of the actual Medical Services Department costs for the year should not be charged to the operating departments?

EXERCISE 11B-2 Service Department Charges [L06]

Hannibal Steel Company has a Transport Services Department that provides trucks to haul ore from the company's mine to its two steel mills—the Northern Plant and the Southern Plant. Budgeted costs for the Transport Services Department total \$350,000 per year, consisting of \$0.25 per ton variable cost and \$300,000 fixed cost. The level of fixed cost is determined by peak-period requirements. During the peak period, the Northern Plant requires 70% of the Transport Services Department's capacity and the Southern Plant requires 30%.

During the year, the Transport Services Department actually hauled the following amounts of ore for the two plants: Northern Plant, 130,000 tons; Southern Plant, 50,000 tons. The Transport Services Department incurred \$364,000 in cost during the year, of which \$54,000 was variable cost and \$310,000 was fixed cost.

Required:

1. Determine how much of the \$54,000 in variable cost should be charged to each plant.
2. Determine how much of the \$310,000 in fixed cost should be charged to each plant.
3. Should any of the \$364,000 in the Transport Services Department cost not be charged to the plants? Explain.

EXERCISE 11B-3 Sales Dollars as an Allocation Base for Fixed Costs [L06]

Konig Enterprises, Ltd., owns and operates three restaurants in Vancouver, B.C. The company allocates its fixed administrative expenses to the three restaurants on the basis of sales dollars. During 2008, the fixed administrative expenses totaled \$2,000,000. These expenses were allocated as follows:

| | Restaurants | | | Total |
|--|----------------------|--------------------|---------------|--------------|
| | Rick's Harborside | Imperial Garden | Ginger Wok | |
| Total sales—2008 | \$16,000,000 | \$15,000,000 | \$9,000,000 | \$40,000,000 |
| Percentage of total sales | 40% | 37.5% | 22.5% | 100% |
| Allocation (based on the above percentages) | \$800,000 | \$750,000 | \$450,000 | \$2,000,000 |

During 2009, the following year, the Imperial Garden restaurant increased its sales by \$10 million. The sales levels in the other two restaurants remained unchanged. The company’s 2009 sales data were as follows:

| | Restaurants | | | Total |
|---------------------------------|-------------------|-----------------|-------------|--------------|
| | Rick’s Harborside | Imperial Garden | Ginger Wok | |
| Total sales—2009..... | \$16,000,000 | \$25,000,000 | \$9,000,000 | \$50,000,000 |
| Percentage of total sales | 32% | 50% | 18% | 100% |

Fixed administrative expenses remained unchanged at \$2,000,000 during 2009.

Required:

- Using sales dollars as an allocation base, show the allocation of the fixed administrative expenses among the three restaurants for 2009.
- Compare your allocation from (1) above to the allocation for 2008. As the manager of the Imperial Garden, how would you feel about the amount that has been charged to you for 2009?
- Comment on the usefulness of sales dollars as an allocation base.

PROBLEM 11B-4 Service Department Charges [LO6]

Tasman Products, Ltd., of Australia has a Maintenance Department that services the equipment in the company’s Forming Department and Assembly Department. The cost of this servicing is charged to the operating departments on the basis of machine-hours. Cost and other data relating to the Maintenance Department and to the other two departments for the most recent year are presented below. (The currency in Australia is the Australian dollar.)

Data for the Maintenance Department follow:

| | Budget | Actual |
|---|-----------|-----------|
| Variable costs for lubricants..... | \$96,000* | \$110,000 |
| Fixed costs for salaries and other..... | \$150,000 | \$153,000 |
| *Budgeted at \$0.40 per machine-hour. | | |

Data for the Forming and Assembly departments follow:

| | Percentage of Peak-Period Capacity Required | Machine-Hours | |
|---------------------------|---|----------------|----------------|
| | | Budget | Actual |
| Forming Department | 70% | 160,000 | 190,000 |
| Assembly Department | 30% | 80,000 | 70,000 |
| Total | <u>100%</u> | <u>240,000</u> | <u>260,000</u> |

The level of fixed costs in the Maintenance Department is determined by peak-period requirements.

Required:

Management would like data to assist in comparing actual performance to planned performance in the Maintenance Department and in the other departments.

- How much Maintenance Department cost should be charged to the Forming Department and to the Assembly Department? Show all computations.
- Should any portion of the actual Maintenance Department costs not be charged to the other departments? If all costs should be charged, explain why; if a portion should not be charged, compute the amount and explain why it should not be charged.

PROBLEM 11B-5 Service Department Charges [LO6]

Sharp Motor Company has two operating divisions—an Auto Division and a Truck Division. The company has a cafeteria that serves the employees of both divisions. The costs of operating the cafeteria are budgeted at \$40,000 per month plus \$3 per meal served. The company pays all the cost of the meals.

The fixed costs of the cafeteria are determined by peak-period requirements. The Auto Division is responsible for 65% of the peak-period requirements, and the Truck Division is responsible for the other 35%.

For June, the Auto Division estimated that it would need 35,000 meals served, and the Truck Division estimated that it would need 20,000 meals served. However, due to unexpected layoffs of employees during the month, only 20,000 meals were served to the Auto Division. Another 20,000 meals were served to the Truck Division as planned.

Cost records in the cafeteria show that actual fixed costs for June totaled \$42,000 and that actual meal costs totaled \$128,000.

Required:

1. How much cafeteria cost should be charged to each division for June?
2. Assume that the company follows the practice of allocating *all* cafeteria costs incurred each month to the divisions in proportion to the number of meals served to each division during the month. On this basis, how much cost would be allocated to each division for June?
3. What criticisms can you make of the allocation method used in part (2) above?
4. If managers of operating departments know that fixed service costs are going to be allocated on the basis of peak-period requirements, what will be their probable strategy as they report their estimate of peak-period requirements to the company's budget committee? As a member of top management, what would you do to neutralize such strategies?

Relevant Costs for Decision Making

Massaging the Numbers

Building and expanding convention centers appears to be an obsession with politicians. Indeed, billions of dollars are being spent to build or expand convention centers in numerous cities across the United States. Given that trade show attendance across the country has been steadily declining, how do politicians justify these enormous investments? Politicians

frequently rely on consultants who produce studies that purport to show a favorable economic impact on the area of a new convention center.

These economic impact studies are bogus in two respects. First, a large portion of the so-called favorable economic impact would be realized by a city even if it did not invest in a new or expanded convention center. For example, Portland, Oregon, voters overwhelmingly opposed spending \$82 million to expand their city's convention center. Nonetheless, local politicians proceeded with the project. After completing the expansion, more than 70% of the people spending money at trade shows in Portland were from the Portland area. How much of the money spent by these locals would have been spent in Portland anyway if the convention center had not been expanded? We don't know, but in all likelihood much of this money would have been spent at the zoo, the art museum, the theater, local restaurants, and so on. This portion of the "favorable" economic impact cited by consultants and used by politicians to justify expanding convention centers should be ignored. Second, because the supply of convention centers throughout the United States substantially exceeds demand, convention centers must offer substantial economic incentives, such as waiving rental fees, to attract trade shows. The cost of these concessions, although often excluded from consultants' projections, further erodes the genuine economic viability of building or expanding a convention center. ■

Learning Objectives

After studying Chapter 12, you should be able to:

- L01** Identify relevant and irrelevant costs and benefits in a decision.
- L02** Prepare an analysis showing whether a product line or other business segment should be dropped or retained.
- L03** Prepare a make or buy analysis.
- L04** Prepare an analysis showing whether a special order should be accepted.
- L05** Determine the most profitable use of a constrained resource and the value of obtaining more of the constrained resource.
- L06** Prepare an analysis showing whether joint products should be sold at the split-off point or processed further.

Managers must decide what products to sell, whether to make or buy component parts, what prices to charge, what channels of distribution to use, whether to accept special orders at special prices, and so forth. Making such decisions is often a difficult task that is complicated by numerous alternatives and massive amounts of data, only some of which may be relevant.

Every decision involves choosing from among at least two alternatives. In making a decision, the costs and benefits of one alternative must be compared to the costs and benefits of other alternatives. Costs that differ between alternatives are called **relevant costs**. Distinguishing between relevant and irrelevant costs and benefits is critical for two reasons. First, irrelevant data can be ignored—saving decision makers tremendous amounts of time and effort. Second, bad decisions can easily result from erroneously including irrelevant costs and benefits when analyzing alternatives. To be successful in decision making, managers must be able to tell the difference between relevant and irrelevant data and must be able to correctly use the relevant data in analyzing alternatives. The purpose of this chapter is to develop these skills by illustrating their use in a wide range of decision-making situations. These decision-making skills are as important in your personal life as they are to managers. After completing your study of this chapter, you should be able to think more clearly about decisions in many facets of your life.

Cost Concepts for Decision Making

LEARNING OBJECTIVE 1

Identify relevant and irrelevant costs and benefits in a decision.

Four cost terms discussed in Chapter 2 are particularly applicable to this chapter. These terms are *differential costs*, *incremental costs*, *opportunity costs*, and *sunk costs*. You may find it helpful to turn back to Chapter 2 and refresh your memory concerning these terms before reading on.

Identifying Relevant Costs and Benefits

Only those costs and benefits that differ in total between alternatives are relevant in a decision. If the total amount of a cost will be the same regardless of the alternative selected, then the decision has no effect on the cost, so the cost can be ignored. For example, if you are trying to decide whether to go to a movie or rent a DVD for the evening, the rent on your apartment is irrelevant. Whether you go to a movie or rent a DVD, the rent on your apartment will be exactly the same and is therefore irrelevant to the decision. On the other hand, the cost of the movie ticket and the cost of renting the DVD would be relevant in the decision because they are *avoidable costs*.

An **avoidable cost** is a cost that can be eliminated in whole or in part by choosing one alternative over another. By choosing the alternative of going to the movie, the cost of renting the DVD can be avoided. By choosing the alternative of renting the DVD, the cost of the movie ticket can be avoided. Therefore, the cost of the movie ticket and the cost of renting the DVD are both avoidable costs. On the other hand, the rent on your apartment is not an avoidable cost of either alternative. You would continue to rent your apartment under either alternative. Avoidable costs are relevant costs. Unavoidable costs are irrelevant costs.

Two broad categories of costs are never relevant in decisions. These irrelevant costs are:

1. Sunk costs.
2. Future costs that do not differ between the alternatives.

As we learned in an earlier chapter, a **sunk cost** is a cost that has already been incurred and cannot be avoided regardless of what a manager decides to do. For example, suppose a used car dealer purchased a five-year-old Toyota Camry for \$12,000. The amount paid for the Camry is a sunk cost because it has already been incurred and the transaction cannot be undone. Sunk costs are always the same no matter what alternatives

are being considered; therefore, they are irrelevant and should be ignored when making decisions. Future costs that do not differ between alternatives should also be ignored when making decisions. Continuing with the example discussed earlier, suppose you intend to order a pizza after you go to the movie theater or you rent a DVD. In that case, if you are going to buy the same pizza regardless of your choice of entertainment, its cost is irrelevant to the choice of whether you go to the movie theater or rent a DVD. Notice, the cost of the pizza is not a sunk cost because it has not yet been incurred. Nonetheless, the cost of the pizza is irrelevant to the entertainment decision because it is a future cost that does not differ between the alternatives.

The term **differential cost** was also introduced in Chapter 2. In managerial accounting, the terms *avoidable cost*, *differential cost*, *incremental cost*, and *relevant cost* are often used interchangeably. To identify the costs that are avoidable in a particular decision situation and are therefore relevant, these steps should be followed:

1. Eliminate costs and benefits that do not differ between alternatives. These irrelevant costs consist of (a) sunk costs and (b) future costs that do not differ between alternatives.
2. Use the remaining costs and benefits that do differ between alternatives in making the decision. The costs that remain are the differential, or avoidable, costs.

THE RELEVANT COST OF EXECUTIVE PERKS

The **Securities and Exchange Commission** is concerned about CEOs who use company-owned airplanes for personal travel. For example, consider a CEO who uses his employers' Gulfstream V luxury airplane to transport his family on a 2,000 mile roundtrip vacation from New York City to Orlando, Florida. The standard practice among companies with personal travel reimbursement policies would be to charge their CEO \$1,500 for this flight based on a per-mile reimbursement rate established by the **Internal Revenue Service** (the IRS rates are meant to approximate the per-mile cost of a first-class ticket on a commercial airline). However, critics argue that using IRS reimbursement rates grossly understates the flight costs that are borne by shareholders. Some of these critics claim that the \$11,000 incremental cost of the flight, including fuel, landing fees, and crew hotel charges, should be reimbursed by the CEO. Still others argue that even basing reimbursements on incremental costs understates the true cost of a flight because fixed costs such as the cost of the airplane, crew salaries, and insurance should be included. These costs are relevant because excessive personal travel by corporate executives essentially requires their employers to purchase, insure, and staff additional airplanes. This latter group of critics argues that the relevant cost of the trip from New York City to Orlando is \$43,000—the market price that would have to be paid to charter a comparable size airplane for this flight. What is the relevant cost of this flight? Should shareholders expect their CEO to reimburse \$0 (as is the practice at some companies), \$1,500, \$11,000, or \$43,000? Or, should all companies disallow personal use of corporate assets?

IN BUSINESS

Different Costs for Different Purposes

We need to recognize a fundamental concept of managerial accounting from the outset of our discussion—costs that are relevant in one decision situation are not necessarily relevant in another. This means that *managers need different costs for different purposes*. For one purpose, a particular group of costs may be relevant; for another purpose, an entirely different group of costs may be relevant. Thus, *each* decision situation must be carefully analyzed to isolate the relevant costs. Otherwise, irrelevant data may cloud the situation and lead to a bad decision.

The concept of “different costs for different purposes” is basic to managerial accounting; we shall frequently see its application in the pages that follow.

An Example of Identifying Relevant Costs and Benefits

Cynthia is currently a student in an MBA program in Boston and would like to visit a friend in New York City over the weekend. She is trying to decide whether to drive or take the train. Because she is on a tight budget, she wants to carefully consider the costs of the two alternatives. If one alternative is far less expensive than the other, that may be decisive in her choice. By car, the distance between her apartment in Boston and her friend's apartment in New York City is 230 miles. Cynthia has compiled the following list of items to consider:

| Automobile Costs | | |
|---|----------------------------------|---|
| Item | Annual Cost of Fixed Items | Cost per Mile (based on 10,000 miles per year) |
| (a) Annual straight-line depreciation on car [((\$24,000 original cost – \$10,000 estimated resale value in 5 years)/5 years] | \$2,800 | \$0.280 |
| (b) Cost of gasoline (\$2.70 per gallon ÷ 27 miles per gallon) | | 0.100 |
| (c) Annual cost of auto insurance and license | \$1,380 | 0.138 |
| (d) Maintenance and repairs | | 0.065 |
| (e) Parking fees at school (\$45 per month × 8 months) .. | \$360 | 0.036 |
| (f) Total average cost per mile | | <u>\$0.619</u> |
| Additional Data | | |
| Item | | |
| (g) Reduction in the resale value of car due solely to wear and tear | \$0.026 per mile | |
| (h) Cost of round-trip Amtrak ticket from Boston to New York City | \$104 | |
| (i) Benefit of relaxing and being able to study during the train ride rather than having to drive | ? | |
| (j) Cost of putting the dog in a kennel while gone | \$40 | |
| (k) Benefit of having a car available in New York City | ? | |
| (l) Hassle of parking the car in New York City | ? | |
| (m) Cost of parking the car in New York City | \$25 per day | |

Which costs and benefits are relevant in this decision? Remember, only those costs and benefits that differ between alternatives are relevant. Everything else is irrelevant and can be ignored.

Start at the top of the list with item (a): the original cost of the car is a sunk cost. This cost has already been incurred and therefore can never differ between alternatives. Consequently, it is irrelevant and should be ignored. The same is true of the accounting depreciation of \$2,800 per year, which simply spreads the sunk cost across five years.

Item (b), the cost of gasoline consumed by driving to New York City, is a relevant cost. If Cynthia takes the train, this cost would not be incurred. Hence, the cost differs between alternatives and is therefore relevant.

Item (c), the annual cost of auto insurance and license, is not relevant. Whether Cynthia takes the train or drives on this particular trip, her annual auto insurance premium and her auto license fee will remain the same.¹

¹ If Cynthia has an accident while driving to New York City or back, this might affect her insurance premium when the policy is renewed. The increase in the insurance premium would be a relevant cost of this particular trip, but the normal amount of the insurance premium is not relevant in any case.

Item (d), the cost of maintenance and repairs, is relevant. While maintenance and repair costs have a large random component, over the long run they should be more or less proportional to the number of miles the car is driven. Thus, the average cost of \$0.065 per mile is a reasonable estimate to use.

Item (e), the monthly fee that Cynthia pays to park at her school during the academic year is not relevant. Regardless of which alternative she selects—driving or taking the train—she will still need to pay for parking at school.

Item (f) is the total average cost of \$0.619 per mile. As discussed above, some elements of this total are relevant, but some are not relevant. Because it contains some irrelevant costs, it would be incorrect to estimate the cost of driving to New York City and back by simply multiplying the \$0.619 by 460 miles (230 miles each way \times 2). This erroneous approach would yield a cost of driving of \$284.74. Unfortunately, such mistakes are often made in both personal life and in business. Because the total cost is stated on a per-mile basis, people are easily misled. Often people think that if the cost is stated as \$0.619 per mile, the cost of driving 100 miles is \$61.90. But it is not. Many of the costs included in the \$0.619 cost per mile are sunk and/or fixed and will not increase if the car is driven another 100 miles. The \$0.619 is an average cost, not an incremental cost. Beware of such unitized costs (i.e., costs stated in terms of a dollar amount per unit, per mile, per direct labor-hour, per machine-hour, and so on)—they are often misleading.

Item (g), the decline in the resale value of the car that occurs as a consequence of driving more miles, is relevant in the decision. Because she uses the car, its resale value declines, which is a real cost of using the car that should be taken into account. Cynthia estimated this cost by accessing the *Kelly Blue Book* website at www.kbb.com. The reduction in resale value of an asset through use or over time is often called *real* or *economic depreciation*. This is different from accounting depreciation, which attempts to match the sunk cost of an asset with the periods that benefit from that cost.

Item (h), the \$104 cost of a round-trip ticket on Amtrak, is relevant in this decision. If she drives, she would not have to buy the ticket.

Item (i) is relevant to the decision, even if it is difficult to put a dollar value on relaxing and being able to study while on the train. It is relevant because it is a benefit that is available under one alternative but not under the other.

Item (j), the cost of putting Cynthia’s dog in the kennel while she is gone, is irrelevant in this decision. Whether she takes the train or drives to New York City, she will still need to put her dog in a kennel.

Like item (i), items (k) and (l) are relevant to the decision even if it is difficult to measure their dollar impacts.

Item (m), the cost of parking in New York City, is relevant to the decision.

Bringing together all of the relevant data, Cynthia would estimate the relevant costs of driving and taking the train as follows:

| | |
|---|-----------------|
| Relevant financial cost of driving to New York City: | |
| Gasoline (460 miles \times \$0.100 per mile) | \$ 46.00 |
| Maintenance and repairs (460 miles \times \$0.065 per mile) | 29.90 |
| Reduction in the resale value of car due solely to wear and tear (460 miles \times \$0.026 per mile) | 11.96 |
| Cost of parking the car in New York City (2 days \times \$25 per day) | 50.00 |
| Total | <u>\$137.86</u> |
| Relevant financial cost of taking the train to New York City: | |
| Cost of round-trip Amtrak ticket from Boston to New York City | <u>\$104.00</u> |

What should Cynthia do? From a purely financial standpoint, it would be cheaper by \$33.86 (\$137.86 – \$104.00) to take the train than to drive. Cynthia has to decide if the convenience of having a car in New York City outweighs the additional cost and the disadvantages of being unable to relax and study on the train and the hassle of finding parking in the city.

In this example, we focused on identifying the relevant costs and benefits—everything else was ignored. In the next example, we include all of the costs and benefits—relevant or not. Nonetheless, we'll still get the correct answer because the irrelevant costs and benefits will cancel out when we compare the alternatives.

Reconciling the Total and Differential Approaches

Oak Harbor Woodworks is considering a new labor-saving machine that rents for \$3,000 per year. The machine will be used on the company's butcher block production line. Data concerning the company's annual sales and costs of butcher blocks with and without the new machine are shown below:

| | Current Situation | Situation with the New Machine |
|------------------------------------|-------------------|--------------------------------|
| Units produced and sold | 5,000 | 5,000 |
| Selling price per unit | \$40 | \$40 |
| Direct materials cost per unit | \$14 | \$14 |
| Direct labor cost per unit | \$8 | \$5 |
| Variable overhead cost per unit | \$2 | \$2 |
| Fixed costs, other | \$62,000 | \$62,000 |
| Fixed costs, rental of new machine | — | \$3,000 |

Given the data above, the net operating income for the product under the two alternatives can be computed as shown in Exhibit 12-1.

Note that the net operating income is \$12,000 higher with the new machine, so that is the better alternative. Note also that the \$12,000 advantage for the new machine can be obtained in two different ways. It is the difference between the \$30,000 net operating income with the new machine and the \$18,000 net operating income for the current situation. It is also the sum of the differential costs and benefits as shown in the last column of Exhibit 12-1. A positive number in the Differential Costs and Benefits column indicates that the difference between the alternatives favors the new machine; a negative number indicates that the difference favors the current situation. A zero in that column

EXHIBIT 12-1
Total and Differential Costs

| | Current Situation | Situation with New Machine | Differential Costs and Benefits |
|---|-------------------|----------------------------|---------------------------------|
| Sales (5,000 units × \$40 per unit) | \$200,000 | \$200,000 | \$ 0 |
| Variable expenses: | | | |
| Direct materials (5,000 units × \$14 per unit) | 70,000 | 70,000 | 0 |
| Direct labor (5,000 units × \$8 per unit; 5,000 units × \$5 per unit) | 40,000 | 25,000 | 15,000 |
| Variable overhead (5,000 units × \$2 per unit) | 10,000 | 10,000 | 0 |
| Total variable expenses | 120,000 | 105,000 | |
| Contribution margin | 80,000 | 95,000 | |
| Fixed expenses: | | | |
| Other | 62,000 | 62,000 | 0 |
| Rent of new machine | 0 | 3,000 | (3,000) |
| Total fixed expenses | 62,000 | 65,000 | |
| Net operating income | \$ 18,000 | \$ 30,000 | \$12,000 |

simply means that the total amount for the item is exactly the same for both alternatives. Thus, because the difference in the net operating incomes equals the sum of the differences for the individual items, any cost or benefit that is the same for both alternatives will have no impact on which alternative is preferred. This is the reason that costs and benefits that do not differ between alternatives are irrelevant and can be ignored. If we properly account for them, they will cancel out when we compare the alternatives.

We could have arrived at the same solution much more quickly by completely ignoring the irrelevant costs and benefits.

- The selling price per unit and the number of units sold do not differ between the alternatives. Therefore, the total sales revenues are exactly the same for the two alternatives as shown in Exhibit 12–1. Because the sales revenues are exactly the same, they have no effect on the difference in net operating income between the two alternatives. That is shown in the last column in Exhibit 12–1, which shows a \$0 differential benefit.
- The direct materials cost per unit, the variable overhead cost per unit, and the number of units produced and sold do not differ between the alternatives. Consequently, the total direct materials cost and the total variable overhead cost are the same for the two alternatives and can be ignored.
- The “other” fixed expenses do not differ between the alternatives, so they can be ignored as well.

Indeed, the only costs that do differ between the alternatives are direct labor costs and the fixed rental cost of the new machine. Hence, the two alternatives can be compared based only on these relevant costs:

| Net Advantage of Renting the New Machine | |
|--|-----------------|
| Decrease in direct labor costs (5,000 units at a cost savings of \$3 per unit) | \$15,000 |
| Increase in fixed expenses | <u>(3,000)</u> |
| Net annual cost savings from renting the new machine | <u>\$12,000</u> |

If we focus on just the relevant costs and benefits, we get exactly the same answer as when we listed all of the costs and benefits—including those that do not differ between the alternatives and hence are irrelevant. We get the same answer because the only costs and benefits that matter in the final comparison of the net operating incomes are those that differ between the two alternatives and hence are not zero in the last column of Exhibit 12–1. Those two relevant costs are both listed in the above analysis showing the net advantage of renting the new machine.

Why Isolate Relevant Costs?

In the preceding example, we used two different approaches to analyze the alternatives. First, we considered all costs, both those that were relevant and those that were not; and second, we considered only the relevant costs. We obtained the same answer under both approaches. It would be natural to ask, “Why bother to isolate relevant costs when total costs will do the job just as well?” Isolating relevant costs is desirable for at least two reasons.

First, only rarely will enough information be available to prepare a detailed income statement for both alternatives. Assume, for example, that you are called on to make a decision relating to a portion of a single business process in a multidepartmental, multi-product company. Under these circumstances, it would be virtually impossible to prepare an income statement of any type. You would have to rely on your ability to recognize which costs are relevant and which are not in order to assemble the data necessary to make a decision.

Second, mingling irrelevant costs with relevant costs may cause confusion and distract attention from the information that is really critical. Furthermore, the danger always exists that an irrelevant piece of data may be used improperly, resulting in an incorrect decision. The best approach is to ignore irrelevant data and base the decision entirely on relevant data.

Relevant cost analysis, combined with the contribution approach to the income statement, provides a powerful tool for making decisions. We will investigate various uses of this tool in the remaining sections of this chapter.

IN BUSINESS

ENVIRONMENTAL COSTS ADD UP

A decision analysis can be flawed by incorrectly including irrelevant costs such as sunk costs and future costs that do not differ between alternatives. It can also be flawed by omitting future costs that *do* differ between alternatives. This is a problem particularly with environmental costs because they have dramatically increased in recent years and are often overlooked by managers.

Consider the environmental complications posed by a decision of whether to install a solvent-based or powder-based system for spray-painting parts. In a solvent painting system, parts are sprayed as they move along a conveyor. The paint that misses the part is swept away by a wall of water, called a water curtain. The excess paint accumulates in a pit as sludge that must be removed each month. Environmental regulations classify this sludge as hazardous waste. As a result, a permit must be obtained to produce the waste and meticulous records must be maintained of how the waste is transported, stored, and disposed of. The annual costs of complying with these regulations can easily exceed \$140,000 in total for a painting facility that initially costs only \$400,000 to build. The costs of complying with environmental regulations include the following:

- The waste sludge must be hauled to a special disposal site. The typical disposal fee is about \$300 per barrel, or \$55,000 per year for a modest solvent-based painting system.
- Workers must be specially trained to handle the paint sludge.
- The company must carry special insurance.
- The company must pay substantial fees to the state for releasing pollutants (i.e., the solvent) into the air.
- The water in the water curtain must be specially treated to remove contaminants. This can cost tens of thousands of dollars per year.

In contrast, a powder-based painting system avoids almost all of these environmental costs. Excess powder used in the painting process can be recovered and reused without creating hazardous waste. Additionally, the powder-based system does not release contaminants into the atmosphere. Therefore, even though the cost of building a powder-based system may be higher than the cost of building a solvent-based system, over the long run the costs of the powder-based system may be far lower due to the high environmental costs of a solvent-based system. Managers need to be aware of such environmental costs and take them fully into account when making decisions.

Adding and Dropping Product Lines and Other Segments

LEARNING OBJECTIVE 2

Prepare an analysis showing whether a product line or other business segment should be dropped or retained.

Decisions relating to whether product lines or other segments of a company should be dropped and new ones added are among the most difficult that a manager has to make. In such decisions, many qualitative and quantitative factors must be considered. Ultimately, however, any final decision to drop a business segment or to add a new one is going to hinge primarily on the impact the decision will have on net operating income. To assess this impact, costs must be carefully analyzed.

An Illustration of Cost Analysis

Exhibit 12–2 provides sales and cost information for the preceding month for the Discount Drug Company and its three major product lines—drugs, cosmetics, and housewares. A quick review of this exhibit suggests that dropping the housewares segment would increase the company’s overall net operating income by \$8,000. However, this would be a flawed conclusion because the data in Exhibit 12–2 do not distinguish between fixed expenses that can be avoided if a product line is dropped and common fixed expenses that cannot be avoided by dropping any particular product line.

In this scenario, the two alternatives under consideration are keeping the housewares product line and dropping the housewares product line. Therefore, only those costs that differ between these two alternatives (i.e., that can be avoided by dropping the housewares product line) are relevant. In deciding whether to drop housewares, it is crucial to identify which costs can be avoided, and hence are relevant to the decision, and which costs cannot be avoided, and hence are irrelevant. The decision should be analyzed as follows.

If the housewares line is dropped, then the company will lose \$20,000 per month in contribution margin, but by dropping the line it may be possible to avoid some fixed costs such as salaries or advertising costs. If dropping the housewares line enables the company to avoid more in fixed costs than it loses in contribution margin, then its overall net operating income will improve by eliminating the product line. On the other hand, if the company is not able to avoid as much in fixed costs as it loses in contribution margin, then the housewares line should be kept. In short, the manager should ask, “What costs can I avoid if I drop this product line?”

As we have seen from our earlier discussion, not all costs are avoidable. For example, some of the costs associated with a product line may be sunk costs. Other costs may be allocated fixed costs that will not differ in total regardless of whether the product line is dropped or retained.

To show how to proceed in a product-line analysis, suppose that Discount Drug Company has analyzed the fixed costs being charged to the three product lines and has determined the following:

1. The salaries expense represents salaries paid to employees working directly on the product. All of the employees working in housewares would be discharged if the product line is dropped.
2. The advertising expense represents advertisements that are specific to each product line and are avoidable if the line is dropped.

| | Total | Product Line | | |
|-----------------------------------|------------------|------------------|-----------------|-------------------|
| | | Drugs | Cosmetics | Housewares |
| Sales | \$250,000 | \$125,000 | \$75,000 | \$50,000 |
| Variable expenses | 105,000 | 50,000 | 25,000 | 30,000 |
| Contribution margin | <u>145,000</u> | <u>75,000</u> | <u>50,000</u> | <u>20,000</u> |
| Fixed expenses: | | | | |
| Salaries | 50,000 | 29,500 | 12,500 | 8,000 |
| Advertising | 15,000 | 1,000 | 7,500 | 6,500 |
| Utilities | 2,000 | 500 | 500 | 1,000 |
| Depreciation—fixtures | 5,000 | 1,000 | 2,000 | 2,000 |
| Rent | 20,000 | 10,000 | 6,000 | 4,000 |
| Insurance | 3,000 | 2,000 | 500 | 500 |
| General administrative | 30,000 | 15,000 | 9,000 | 6,000 |
| Total fixed expenses | <u>125,000</u> | <u>59,000</u> | <u>38,000</u> | <u>28,000</u> |
| Net operating income (loss) | <u>\$ 20,000</u> | <u>\$ 16,000</u> | <u>\$12,000</u> | <u>\$ (8,000)</u> |

EXHIBIT 12–2
Discount Drug Company
Product Lines

3. The utilities expense represents utilities costs for the entire company. The amount charged to each product line is an allocation based on space occupied and is not avoidable if the product line is dropped.
4. The depreciation expense represents depreciation on fixtures used to display the various product lines. Although the fixtures are nearly new, they are custom-built and will have no resale value if the housewares line is dropped.
5. The rent expense represents rent on the entire building housing the company; it is allocated to the product lines on the basis of sales dollars. The monthly rent of \$20,000 is fixed under a long-term lease agreement.
6. The insurance expense is for insurance carried on inventories within each of the three product lines. If housewares is dropped, the related inventories will be liquidated and the insurance premiums will decrease accordingly.
7. The general administrative expense represents the costs of accounting, purchasing, and general management, which are allocated to the product lines on the basis of sales dollars. These costs will not change if the housewares line is dropped.

With this information, management can determine that \$15,000 of the fixed expenses associated with the housewares product line are avoidable and \$13,000 are not:

| Fixed Expenses | Total Cost Assigned to Housewares | Not Avoidable* | Avoidable |
|------------------------------|-----------------------------------|-----------------|-----------------|
| Salaries | \$ 8,000 | | \$ 8,000 |
| Advertising | 6,500 | | 6,500 |
| Utilities | 1,000 | \$ 1,000 | |
| Depreciation—fixtures | 2,000 | 2,000 | |
| Rent | 4,000 | 4,000 | |
| Insurance | 500 | | 500 |
| General administrative | 6,000 | 6,000 | |
| Total | <u>\$28,000</u> | <u>\$13,000</u> | <u>\$15,000</u> |

*These fixed costs represent either sunk costs or future costs that will not change whether the housewares line is retained or discontinued.

As stated earlier, if the housewares product line were dropped, the company would lose the product's contribution margin of \$20,000, but would save its associated avoidable fixed expenses. We now know that those avoidable fixed expenses total \$15,000. Therefore, dropping the housewares product line would result in a \$5,000 *reduction* in net operating income as shown below:

| | |
|---|-------------------|
| Contribution margin lost if the housewares line is discontinued (see Exhibit 12–2) | \$ (20,000) |
| Less fixed costs that can be avoided if the housewares line is discontinued (see above) | <u>15,000</u> |
| Decrease in overall company net operating income | <u>\$ (5,000)</u> |

In this case, the fixed costs that can be avoided by dropping the housewares product line (\$15,000) are less than the contribution margin that will be lost (\$20,000). Therefore, based on the data given, the housewares line should not be discontinued unless a more profitable use can be found for the floor and counter space that it is occupying.

| | Keep Housewares | Drop Housewares | Difference: Net Operating Income Increase (or Decrease) |
|-----------------------------------|--------------------|--------------------|---|
| Sales | \$50,000 | \$ 0 | \$(50,000) |
| Variable expenses | <u>30,000</u> | <u>0</u> | <u>30,000</u> |
| Contribution margin | 20,000 | 0 | (20,000) |
| Fixed expenses: | | | |
| Salaries | 8,000 | 0 | 8,000 |
| Advertising | 6,500 | 0 | 6,500 |
| Utilities | 1,000 | 1,000 | 0 |
| Depreciation—fixtures | 2,000 | 2,000 | 0 |
| Rent | 4,000 | 4,000 | 0 |
| Insurance | 500 | 0 | 500 |
| General administrative | 6,000 | 6,000 | 0 |
| Total fixed expenses | <u>28,000</u> | <u>13,000</u> | <u>15,000</u> |
| Net operating income (loss) | <u>\$(8,000)</u> | <u>\$(13,000)</u> | <u>\$ (5,000)</u> |

EXHIBIT 12-3
A Comparative Format for
Product-Line Analysis

A Comparative Format

This decision can also be approached by preparing comparative income statements showing the effects of either keeping or dropping the product line. Exhibit 12-3 contains such an analysis for the Discount Drug Company. As shown in the last column of the exhibit, if the housewares line is dropped, then overall company net operating income will decrease by \$5,000 each period. This is the same answer, of course, as we obtained when we focused just on the lost contribution margin and avoidable fixed costs.

Beware of Allocated Fixed Costs

Go back to Exhibit 12-2. Does this exhibit suggest that the housewares product line should be kept—as we have just concluded? No, it does not. Exhibit 12-2 suggests that the housewares product line is losing money. Why keep a product line that is showing a loss? The explanation for this apparent inconsistency lies in part with the common fixed costs that are being allocated to the product lines. As we observed in Chapter 11, one of the great dangers in allocating common fixed costs is that such allocations can make a product line (or other segment of a business) look less profitable than it really is. In this instance, allocating the common fixed costs among all product lines makes the housewares product line appear to be unprofitable. However, as we have shown above, dropping the product line would result in a decrease in the company's overall net operating income. This point can be seen clearly if we redo Exhibit 12-2 by eliminating the allocation of the common fixed costs. Exhibit 12-4 uses the segmented approach from Chapter 11 to estimate the profitability of the product lines.

Exhibit 12-4 gives us a much different perspective of the housewares line than does Exhibit 12-2. As shown in Exhibit 12-4, the housewares line is covering all of its own traceable fixed costs and generating a \$3,000 segment margin toward covering the common fixed costs of the company. Unless another product line can be found that will generate a segment margin greater than \$3,000, the company would be better off keeping the housewares line. By keeping the product line, the company's overall net operating income will be higher than if the product line were dropped.

Additionally, managers may choose to retain an unprofitable product line if the line helps sell other products or if it serves as a “magnet” to attract customers. Bread, for

EXHIBIT 12-4
Discount Drug Company
Product Lines—Recast in
Contribution Format
(from Exhibit 12-2)

| | Product Line | | | |
|------------------------------------|------------------|------------------|-----------------|------------------|
| | Total | Drugs | Cosmetics | House- wares |
| Sales | \$250,000 | \$125,000 | \$75,000 | \$50,000 |
| Variable expenses | 105,000 | 50,000 | 25,000 | 30,000 |
| Contribution margin | <u>145,000</u> | <u>75,000</u> | <u>50,000</u> | <u>20,000</u> |
| Traceable fixed expenses: | | | | |
| Salaries | 50,000 | 29,500 | 12,500 | 8,000 |
| Advertising | 15,000 | 1,000 | 7,500 | 6,500 |
| Depreciation—fixtures | 5,000 | 1,000 | 2,000 | 2,000 |
| Insurance | 3,000 | 2,000 | 500 | 500 |
| Total traceable fixed expenses ... | <u>73,000</u> | <u>33,500</u> | <u>22,500</u> | <u>17,000</u> |
| Product-line segment margin | <u>72,000</u> | <u>\$ 41,500</u> | <u>\$27,500</u> | <u>\$ 3,000*</u> |
| Common fixed expenses: | | | | |
| Utilities | 2,000 | | | |
| Rent | 20,000 | | | |
| General administrative | 30,000 | | | |
| Total common fixed expenses | <u>52,000</u> | | | |
| Net operating income | <u>\$ 20,000</u> | | | |

*If the housewares line is dropped, this \$3,000 in segment margin will be lost to the company. In addition, we have seen that the \$2,000 depreciation on the fixtures is a sunk cost that cannot be avoided. The sum of these two figures (\$3,000 + \$2,000 = \$5,000) would be the decrease in the company's overall profits if the housewares line were discontinued. Of course, the company may later choose to drop the product if circumstances change—such as a pending decision to replace the fixtures.

example, may not be an especially profitable line in some food stores, but customers expect it to be available, and many of them would undoubtedly shift their buying elsewhere if a particular store decided to stop carrying it.

The Make or Buy Decision

LEARNING OBJECTIVE 3

Prepare a make or buy analysis.

Providing a product or service to a customer involves many steps. For example, consider all of the steps that are necessary to develop and sell a product such as tax preparation software in retail stores. First the software must be developed, which involves highly skilled software engineers and a great deal of project management effort. Then the product must be put into a form that can be delivered to customers. This involves burning the application onto a blank CD or DVD, applying a label, and packaging the result in an attractive box. Then the product must be distributed to retail stores. Then the product must be sold. And finally, help lines and other forms of after-sale service may have to be provided. And we should not forget that the blank CD or DVD, the label, and the box must of course be made by someone before any of this can happen. All of these activities, from development, to production, to after-sales service are called a *value chain*.

Separate companies may carry out each of the activities in the value chain or a single company may carry out several. When a company is involved in more than one activity in the entire value chain, it is **vertically integrated**. Vertical integration is very common. Some companies control all of the activities in the value chain from producing basic raw materials right up to the final distribution of finished goods and provision of after-sales service. Other companies are content to integrate on a smaller scale by purchasing many of the parts and materials that go into their finished products. A decision to carry out one of the activities in the value chain internally, rather than to buy externally from a supplier,

is called a **make or buy decision**. Quite often these decisions involve whether to buy a particular part or to make it internally. Make or buy decisions also involve decisions concerning whether to outsource development tasks, after-sales service, or other activities.

Strategic Aspects of the Make or Buy Decision

Vertical integration provides certain advantages. An integrated company is less dependent on its suppliers and may be able to ensure a smoother flow of parts and materials for production than a nonintegrated company. For example, a strike against a major parts supplier can interrupt the operations of a nonintegrated company for many months, whereas an integrated company that is producing its own parts would be able to continue operations. Also, some companies feel that they can control quality better by producing their own parts and materials, rather than by relying on the quality control standards of outside suppliers. In addition, an integrated company realizes profits from the parts and materials that it is “making” rather than “buying,” as well as profits from its regular operations.

The advantages of vertical integration are counterbalanced by the advantages of using external suppliers. By pooling demand from a number of companies, a supplier may be able to enjoy economies of scale. These economies of scale can result in higher quality and lower costs than would be possible if the company were to attempt to make the parts or provide the service on its own. A company must be careful, however, to retain control over activities that are essential to maintaining its competitive position. For example, **Hewlett-Packard** controls the software for laser printers that it makes in cooperation with **Canon Inc.** of Japan. The present trend appears to be toward less vertical integration, with companies like **Sun Microsystems** and Hewlett-Packard concentrating on hardware and software design and relying on outside suppliers for almost everything else in the value chain. These factors suggest that the make or buy decision should be weighed very carefully.

An Example of Make or Buy

To provide an illustration of a make or buy decision, consider Mountain Goat Cycles. The company is now producing the heavy-duty gear shifters used in its most popular line of mountain bikes. The company’s Accounting Department reports the following costs of producing 8,000 units of the shifter internally each year:

| | Per Unit | 8,000 Units |
|---|-------------|------------------|
| Direct materials | \$ 6 | \$ 48,000 |
| Direct labor | 4 | 32,000 |
| Variable overhead | 1 | 8,000 |
| Supervisor’s salary | 3 | 24,000 |
| Depreciation of special equipment | 2 | 16,000 |
| Allocated general overhead | 5 | 40,000 |
| Total cost | <u>\$21</u> | <u>\$168,000</u> |

An outside supplier has offered to sell 8,000 shifters a year to Mountain Goat Cycles at a price of only \$19 each. Should the company stop producing the shifters internally and buy them from the outside supplier? As always, the focus should be on the relevant costs—those that differ between the alternatives. And the costs that differ between the alternatives consist of the costs that could be avoided by purchasing the shifters from the outside supplier. If the costs that can be avoided by purchasing the shifters from the outside supplier total less than \$19, then the company should continue to manufacture its own shifters and reject the outside supplier’s offer. On the other hand, if the costs that can be avoided by purchasing the shifters from the outside supplier total more than \$19, the outside supplier’s offer should be accepted.

EXHIBIT 12-5
Mountain Goat Cycles Make or Buy Analysis

| | Total Relevant Costs—8,000 units | |
|--|-------------------------------------|------------------|
| | Make | Buy |
| Direct materials (8,000 units × \$6 per unit) | \$ 48,000 | |
| Direct labor (8,000 units × \$4 per unit) | 32,000 | |
| Variable overhead (8,000 units × \$1 per unit) | 8,000 | |
| Supervisor's salary | 24,000 | |
| Depreciation of special equipment (not relevant) | | |
| Allocated general overhead (not relevant) | | |
| Outside purchase price | | \$152,000 |
| Total cost | <u>\$112,000</u> | <u>\$152,000</u> |
| Difference in favor of continuing to make | | <u>\$40,000</u> |

Note that depreciation of special equipment is listed as one of the costs of producing the shifters internally. Because the equipment has already been purchased, this depreciation is a sunk cost and is therefore irrelevant. If the equipment could be sold, its salvage value would be relevant. Or if the machine could be used to make other products, this could be relevant as well. However, we will assume that the equipment has no salvage value and that it has no other use except making the heavy-duty gear shifters.

Also note that the company is allocating a portion of its general overhead costs to the shifters. Any portion of this general overhead cost that would actually be eliminated if the gear shifters were purchased rather than made would be relevant in the analysis. However, it is likely that the general overhead costs allocated to the gear shifters are in fact common to all items produced in the factory and would continue unchanged even if the shifters were purchased from the outside. Such allocated common costs are not relevant costs (because they do not differ between the make or buy alternatives) and should be eliminated from the analysis along with the sunk costs.

The variable costs of producing the shifters can be avoided by buying the shifters from the outside supplier so they are relevant costs. We will assume in this case that the variable costs include direct materials, direct labor, and variable overhead. The supervisor's salary is also relevant if it could be avoided by buying the shifters. Exhibit 12-5 contains the relevant cost analysis of the make or buy decision assuming that the supervisor's salary can indeed be avoided.

Because it costs \$40,000 less to make the shifters internally than to buy them from the outside supplier, Mountain Goat Cycles should reject the outside supplier's offer. However, the company may wish to consider one additional factor before coming to a final decision—the opportunity cost of the space now being used to produce the shifters.

Opportunity Cost

If the space now being used to produce the shifters *would otherwise be idle*, then Mountain Goat Cycles should continue to produce its own shifters and the supplier's offer should be rejected, as stated above. Idle space that has no alternative use has an opportunity cost of zero.

But what if the space now being used to produce shifters could be used for some other purpose? In that case, the space would have an opportunity cost equal to the segment margin that could be derived from the best alternative use of the space.

To illustrate, assume that the space now being used to produce shifters could be used to produce a new cross-country bike that would generate a segment margin of \$60,000 per year. Under these conditions, Mountain Goat Cycles should accept the supplier's offer and use the available space to produce the new product line:

| | Make | Buy |
|--|------------------|------------------|
| Total annual cost (see Exhibit 12–5)..... | \$112,000 | \$152,000 |
| Opportunity cost—segment margin forgone on a potential new product line | 60,000 | |
| Total cost | <u>\$172,000</u> | <u>\$152,000</u> |
| Difference in favor of purchasing from the outside supplier | | <u>\$20,000</u> |

Opportunity costs are not recorded in the organization’s general ledger because they do not represent actual dollar outlays. Rather, they represent economic benefits that are *forgone* as a result of pursuing some course of action. The opportunity cost for Mountain Goat Cycles is sufficiently large in this case to change the decision.

TOUGH CHOICES

Brad and Carole Karafil own and operate **White Grizzly Adventures**, a snowcat skiing and snowboarding company in Meadow Creek, British Columbia. While rare, it does sometimes happen that the company is unable to operate due to bad weather. Guests are housed and fed, but no one can ski. The contract signed by each guest stipulates that no refund is given in the case of an unavoidable cancellation that is beyond the control of the operators. So technically, Brad and Carole are not obligated to provide any refund if they must cancel operations due to bad weather. However, 70% of their guests are repeat customers and a guest who has paid roughly \$300 a day to ski is likely to be unhappy if skiing is cancelled even though it is no fault of White Grizzly.

What costs, if any, are saved if skiing is cancelled and the snowcat does not operate? Not much. Guests are still housed and fed and the guides, who are independent contractors, are still paid. Some snowcat operating costs are avoided, but little else. Therefore, there would be little cost savings to pass on to guests.

Brad and Carole could issue a credit to be used for one day of skiing at another time. If a customer with such a credit occupied a seat on a snowcat that would otherwise be empty, the only significant cost to Brad and Carole would be the cost of feeding the customer. However, an empty seat basically doesn’t exist—the demand for seats far exceeds the supply and the schedule is generally fully booked far in advance of the ski season. Consequently, the real cost of issuing a credit for one day of skiing is high. Brad and Carole would be giving up \$300 from a paying customer for every guest they issue a credit voucher to. Issuing a credit voucher involves an opportunity cost of \$300 in forgone sales revenues.

What would you do if you had to cancel skiing due to bad weather? Would you issue a refund or a credit voucher, losing money in the process, or would you risk losing customers? It’s a tough choice.

IN BUSINESS

Special Orders

Managers must often evaluate whether a *special order* should be accepted, and if the order is accepted, the price that should be charged. A **special order** is a one-time order that is not considered part of the company’s normal ongoing business. To illustrate, Mountain Goat Cycles has just received a request from the Seattle Police Department to produce 100 specially modified mountain bikes at a price of \$558 each. The bikes would be used to patrol some of the more densely populated residential sections of the city. Mountain Goat Cycles can easily modify its City Cruiser model to fit the specifications

LEARNING OBJECTIVE 4

Prepare an analysis showing whether a special order should be accepted.

of the Seattle Police. The normal selling price of the City Cruiser bike is \$698, and its unit product cost is \$564 as shown below:

| | |
|------------------------------|--------------|
| Direct materials | \$372 |
| Direct labor | 90 |
| Manufacturing overhead | <u>102</u> |
| Unit product cost | <u>\$564</u> |

The variable portion of the above manufacturing overhead is \$12 per unit. The order would have no effect on the company's total fixed manufacturing overhead costs.

The modifications requested by the Seattle Police Department consist of welded brackets to hold radios, nightsticks, and other gear. These modifications would require \$34 in incremental variable costs. In addition, the company would have to pay a graphics design studio \$2,400 to design and cut stencils that would be used for spray painting the Seattle Police Department's logo and other identifying marks on the bikes.

This order should have no effect on the company's other sales. The production manager says that she can handle the special order without disrupting any of the company's regular scheduled production.

What effect would accepting this order have on the company's net operating income?

Only the incremental costs and benefits are relevant. Because the existing fixed manufacturing overhead costs would not be affected by the order, they are not relevant. The incremental net operating income can be computed as follows:

| | Per Unit | Total 100 Bikes |
|--|--------------|-----------------|
| Incremental revenue | <u>\$558</u> | <u>\$55,800</u> |
| Less incremental costs: | | |
| Variable costs: | | |
| Direct materials | 372 | 37,200 |
| Direct labor | 90 | 9,000 |
| Variable manufacturing overhead | 12 | 1,200 |
| Special modifications | <u>34</u> | <u>3,400</u> |
| Total variable cost | <u>\$508</u> | 50,800 |
| Fixed cost: | | |
| Purchase of stencils | | <u>2,400</u> |
| Total incremental cost | | <u>53,200</u> |
| Incremental net operating income | | <u>\$ 2,600</u> |

Therefore, even though the \$558 price on the special order is below the normal \$564 unit product cost and the order would require additional costs, the order would increase net operating income. In general, a special order is profitable if the incremental revenue from the special order exceeds the incremental costs of the order. However, it is important to make sure that there is indeed idle capacity and that the special order does not cut into normal unit sales or undercut prices on normal sales. For example, if the company was operating at capacity, opportunity costs would have to be taken into account as well as the incremental costs that have already been detailed above.

Utilization of a Constrained Resource

Managers routinely face the problem of deciding how constrained resources are going to be used. A department store, for example, has a limited amount of floor space and therefore cannot stock every product that may be available. A manufacturer has a limited

number of machine-hours and a limited number of direct labor-hours at its disposal. When a limited resource of some type restricts the company’s ability to satisfy demand, the company has a **constraint**. Because the company cannot fully satisfy demand, managers must decide which products or services should be cut back. In other words, managers must decide which products or services make the best use of the constrained resource. Fixed costs are usually unaffected by such choices, so the course of action that will maximize the company’s total contribution margin should ordinarily be selected.

LEARNING OBJECTIVE 5
Determine the most profitable use of a constrained resource and the value of obtaining more of the constrained resource.

Contribution Margin per Unit of the Constrained Resource

If some products must be cut back because of a constraint, the key to maximizing the total contribution margin may seem obvious—favor the products with the highest unit contribution margins. Unfortunately, that is not quite correct. Rather, the correct solution is to favor the products that provide the highest *contribution margin per unit of the constrained resource*. To illustrate, in addition to its other products, Mountain Goat Cycles makes saddlebags for bicycles called *panniers*. These panniers come in two models—a touring model and a mountain model. Cost and revenue data for the two models of panniers follow:

| | Mountain Pannier | Touring Pannier |
|--------------------------------------|------------------|-----------------|
| Selling price per unit | \$25 | \$30 |
| Variable cost per unit | 10 | 18 |
| Contribution margin per unit | <u>\$15</u> | <u>\$12</u> |
| Contribution margin (CM) ratio | 60% | 40% |

The mountain pannier appears to be much more profitable than the touring pannier. It has a \$15 per unit contribution margin as compared to only \$12 per unit for the touring model, and it has a 60% CM ratio as compared to only 40% for the touring model.

But now let us add one more piece of information—the plant that makes the panniers is operating at capacity. This does not mean that every machine and every person in the plant is working at the maximum possible rate. Because machines have different capacities, some machines will be operating at less than 100% of capacity. However, if the plant as a whole cannot produce any more units, some machine or process must be operating at capacity. The machine or process that is limiting overall output is called the **bottleneck**—it is the constraint.

At Mountain Goat Cycles, the bottleneck (i.e., constraint) is a stitching machine. The mountain pannier requires two minutes of stitching time per unit, and the touring pannier requires one minute of stitching time per unit. By definition, because the stitching machine is a bottleneck, the stitching machine does not have enough capacity to satisfy the existing demand for mountain panniers and touring panniers. Therefore, some orders for the products will have to be turned down. Naturally, managers will want to know which product is less profitable. To answer this question, they should focus on the contribution margin per unit of the constrained resource. This figure is computed by dividing a product’s contribution margin per unit by the amount of the constrained resource required to make a unit of that product. These calculations are carried out below for the mountain and touring panniers:

| | Mountain Pannier | Touring Pannier |
|---|-------------------|--------------------|
| Contribution margin per unit (a) | \$15.00 | \$12.00 |
| Stitching machine time required to produce one unit (b) | 2 minutes | 1 minute |
| Contribution margin per unit of the constrained resource, (a) ÷ (b) | \$7.50 per minute | \$12.00 per minute |

It is now easy to decide which product is less profitable and should be deemphasized. Each minute on the stitching machine that is devoted to the touring pannier results in an increase of \$12.00 in contribution margin and profits. The comparable figure for the mountain pannier is only \$7.50 per minute. Therefore, the touring model should be emphasized. Even though the mountain model has the larger contribution margin per unit and the larger CM ratio, the touring model provides the larger contribution margin in relation to the constrained resource.

To verify that the touring model is indeed the more profitable product, suppose an hour of additional stitching time is available and that unfilled orders exist for both products. The additional hour on the stitching machine could be used to make either 30 mountain panniers (60 minutes \div 2 minutes per mountain pannier) or 60 touring panniers (60 minutes \div 1 minute per touring pannier), with the following profit implications:

| | Mountain Pannier | Touring Pannier |
|---|-------------------------------|-------------------------------|
| Contribution margin per unit | \$ 15 | \$ 12 |
| Additional units that can be processed in one hour | <u>\times 30</u> | <u>\times 60</u> |
| Additional contribution margin | <u>\$450</u> | <u>\$720</u> |

Because the additional contribution margin would be \$720 for the touring panniers and only \$450 for the mountain panniers, the touring panniers make the most profitable use of the company's constrained resource—the stitching machine.

This example clearly shows that looking at unit contribution margins alone is not enough; the contribution margin must be viewed in relation to the amount of the constrained resource each product requires.

Managing Constraints

Effectively managing an organization's constraints is a key to increased profits. Effective management of a bottleneck constraint involves selecting the most profitable product mix and finding ways to increase the capacity of the bottleneck operation. As discussed above, if the constraint is a bottleneck in the production process, the most profitable product mix consists of the products with the highest contribution margin per unit of the constrained resource. In addition, as discussed below, increasing the capacity of the bottleneck operation should lead to increased production and sales. Such efforts will often pay off in an almost immediate increase in profits.

It is often possible for a manager to increase the capacity of the bottleneck, which is called **relaxing (or elevating) the constraint**. For example, the stitching machine operator could be asked to work overtime. This would result in more available stitching time and hence the production of more finished goods that can be sold. The benefits from relaxing the constraint are often enormous and can be easily quantified. The manager should first ask, "What would I do with additional capacity at the bottleneck if it were available?" In our example, if unfilled orders exist for both the touring and mountain panniers, the additional capacity would be used to process more touring panniers because they earn a contribution margin of \$12 per minute, or \$720 per hour. Given that the overtime pay for the operator is likely to be much less than \$720 per hour, running the stitching machine on overtime would be an excellent way to increase the company's profits while at the same time satisfying more customers.

To reinforce this concept, suppose that there are only unfilled orders for the mountain pannier. How much would it be worth to the company to run the stitching machine overtime in this situation? Because the additional capacity would be used to make the mountain pannier, the value of that additional capacity would drop to \$7.50 per minute or \$450 per hour. Nevertheless, the value of relaxing the constraint would still be quite high.

These calculations indicate that managers should pay great attention to the bottleneck operation. If a bottleneck machine breaks down or is ineffectively utilized, the losses to the company can be quite large. In our example, for every minute the stitching machine is down due to breakdowns or setups, the company loses between \$7.50 and \$12.00.² The losses on an hourly basis are between \$450 and \$720! In contrast, there is no such loss of contribution margin if time is lost on a machine that is not a bottleneck—such machines have excess capacity anyway.

The implications are clear. Managers should focus much of their attention on managing the bottleneck. As we have discussed, managers should emphasize products that most profitably utilize the constrained resource. They should also make sure that products are processed smoothly through the bottleneck, with minimal lost time due to breakdowns and setups. And they should try to find ways to increase the capacity at the bottleneck.

The capacity of a bottleneck can be effectively increased in a number of ways, including:

- Working overtime on the bottleneck.
- Subcontracting some of the processing that would be done at the bottleneck.
- Investing in additional machines at the bottleneck.
- Shifting workers from processes that are not bottlenecks to the process that is the bottleneck.
- Focusing business process improvement efforts such as Six Sigma on the bottleneck.
- Reducing defective units. Each defective unit that is processed through the bottleneck and subsequently scrapped takes the place of a good unit that could have been sold.

The last three methods of increasing the capacity of the bottleneck are particularly attractive because they are essentially free and may even yield additional cost savings.

The methods and ideas discussed in this section are all part of the Theory of Constraints, which was introduced in Chapter 1. A number of organizations have successfully used the Theory of Constraints to improve their performance, including **Avery Dennison**, **Bethlehem Steel**, **Binney & Smith**, **Boeing**, **Champion International**, **Ford Motor Company**, **General Motors**, **ITT**, **Monster Cable**, **National Semiconductor**, **Pratt and Whitney Canada**, **Pretoria Academic Hospital**, **Procter and Gamble**, **Texas Instruments**, **United Airlines**, **United Electrical Controls**, the **United States Air Force Logistics Command**, and the **United States Navy Transportation Corps**.

IN BUSINESS

ELEVATING A CONSTRAINT

The **Odessa Texas Police Department** was having trouble hiring new employees. Its eight-step hiring process was taking 117 days to complete and the best-qualified job applicants were accepting other employment offers before the Odessa Police Department could finish evaluating their candidacy. The constraint in the eight-step hiring process was the background investigation that required an average of 104 days. The other seven steps—filling out an application and completing a written exam, an oral interview, a polygraph exam, a medical exam, a psychological exam, and a drug screen—took a combined total of only 13 days. The Odessa Police Department elevated its constraint by hiring additional background checkers. This resulted in slashing its application processing time from 117 days to 16 days.

Source: Lloyd J. Taylor III, Brian J. Moersch, and GERALYN McClure Franklin, "Applying the Theory of Constraints to a Public Safety Hiring Process," *Public Personnel Management*, Fall 2003, pp. 367–382.

² Setups are required when production switches from one product to another. For example, consider a company that makes automobile side panels. The panels are painted before shipping them to an automobile manufacturer for final assembly. The customer might require 100 blue panels, 50 black panels, and 20 yellow panels. Each time the color is changed, the painting equipment must be purged of the old paint color, cleaned with solvents, and refilled with the new paint color. This takes time. In fact, some equipment may require such lengthy and frequent setups that it is unavailable for actual production more often than not.

The Problem of Multiple Constraints

What does a company do if it has more than one potential constraint? For example, a company may have limited raw materials, limited direct labor-hours available, limited floor space, and limited advertising dollars to spend on product promotion. How would it determine the right combination of products to produce? The proper combination or “mix” of products can be found by use of a quantitative method known as *linear programming*, which is covered in quantitative methods and operations management courses.

Joint Product Costs and the Contribution Approach

LEARNING OBJECTIVE 6

Prepare an analysis showing whether joint products should be sold at the split-off point or processed further.

In some industries, a number of end products are produced from a single raw material input. For example, in the petroleum refining industry a large number of products are extracted from crude oil, including gasoline, jet fuel, home heating oil, lubricants, asphalt, and various organic chemicals. Another example is provided by the Santa Maria Wool Cooperative of New Mexico. The company buys raw wool from local shepherders, separates the wool into three grades—coarse, fine, and superfine—and then dyes the wool using traditional methods that rely on pigments from local materials. Exhibit 12–6 contains a diagram of the production process.

At Santa Maria Wool Cooperative, coarse wool, fine wool, and superfine wool are produced from one input—raw wool. Two or more products that are produced from a common input are known as **joint products**. The **split-off point** is the point in the manufacturing process at which the joint products can be recognized as separate products. This does not occur at Santa Maria Cooperative until the raw wool has gone through the separating process. The term **joint cost** is used to describe the costs incurred up to the split-off point. At Santa Maria Wool Cooperative, the joint costs are the \$200,000 cost of the raw wool and the \$40,000 cost of separating the wool. The undyed wool is called an *intermediate product* because it is not finished at this point. Nevertheless, a market does exist for undyed wool—although at a significantly lower price than finished, dyed wool.

The Pitfalls of Allocation

Joint costs are common costs that are incurred to simultaneously produce a variety of end products. These joint costs are traditionally allocated among the different products at the split-off point. A typical approach is to allocate the joint costs according to the relative sales value of the end products.

Although allocation of joint product costs is needed for some purposes, such as balance sheet inventory valuation, allocations of this kind are extremely misleading for decision making. The In Business box “Getting It All Wrong” below illustrates an incorrect decision that resulted from using such an allocated joint cost. You should stop now and read that box before proceeding further.

IN BUSINESS

GETTING IT ALL WRONG

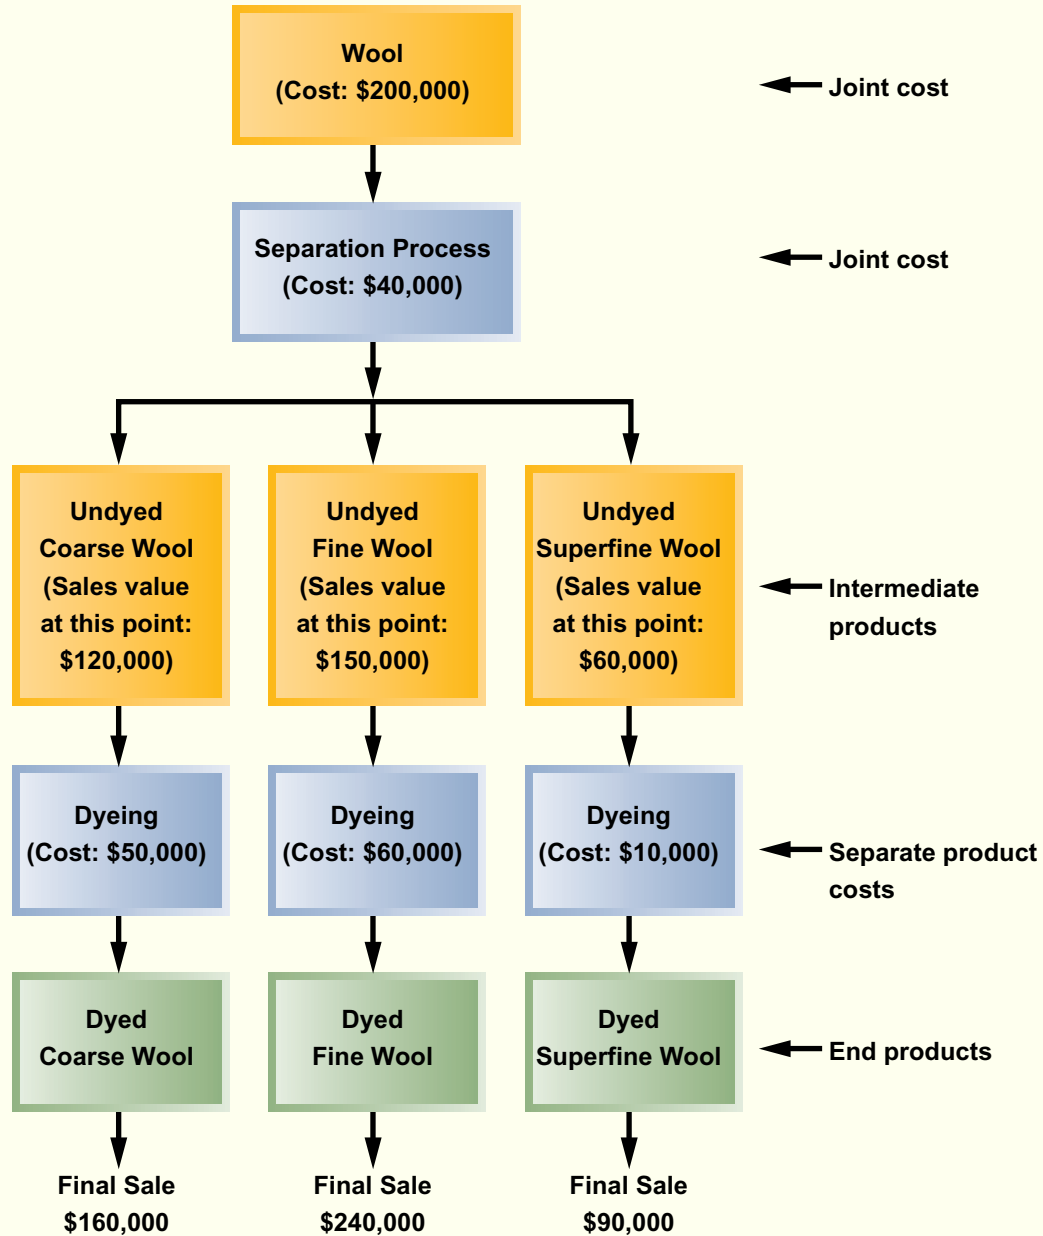

A company located on the Gulf of Mexico produces soap products. Its six main soap product lines are produced from common inputs. Joint product costs up to the split-off point constitute the bulk of the production costs for all six product lines. These joint product costs are allocated to the six product lines on the basis of the relative sales value of each line at the split-off point.

A waste product results from the production of the six main product lines. The company loaded the waste onto barges and dumped it into the Gulf of Mexico because the waste was thought to have no commercial value. The dumping was stopped, however, when the company’s research division discovered that with some further processing the waste could be sold as a fertilizer ingredient. The further processing costs \$175,000 per year. The waste was then sold to fertilizer manufacturers for \$300,000.

The accountants responsible for allocating manufacturing costs included the sales value of the waste product along with the sales value of the six main product lines in their allocation of the joint product costs at the split-off point. This allocation resulted in the waste product being allocated \$150,000 in joint product cost. This \$150,000 allocation, when added to the further processing costs of \$175,000 for the waste, made it appear that the waste product was unprofitable—as shown in the table below. When presented with this analysis, the company's management decided that further processing of the waste should be stopped. The company went back to dumping the waste in the Gulf.

| | |
|---|--------------------|
| Sales value of the waste product after further processing | \$300,000 |
| Less costs assigned to the waste product | 325,000 |
| Net loss | <u>\$ (25,000)</u> |

EXHIBIT 12-6 Santa Maria Wool Cooperative

Sell or Process Further Decisions

Joint costs are irrelevant in decisions regarding what to do with a product from the split-off point forward. Once the split-off point is reached, the joint costs have already been incurred and nothing can be done to avoid them. Furthermore, even if the product were disposed of in a landfill without any further processing, all of the joint costs must be incurred to obtain the other products that come out of the joint process. None of the joint costs are avoidable by disposing of any one of the products that emerge from the split-off point. Therefore, none of the joint costs are economically attributable to any one of the intermediate or end products. The joint costs are a common cost of all of the intermediate and end products and should not be allocated to them for purposes of making decisions about the individual products. In the case of the soap company in the accompanying In Business box “Getting It All Wrong,” the \$150,000 in allocated joint costs should not have been permitted to influence what was done with the waste product from the split-off point forward. Even ignoring the negative environmental impact of dumping the waste in the Gulf of Mexico, a correct analysis would have shown that the company was making money by further processing the waste into a fertilizer ingredient. The analysis should have been done as follows:

| | Dump in Gulf | Process Further |
|--|-----------------|--------------------|
| Sales value of fertilizer ingredient | 0 | \$300,000 |
| Additional processing costs | 0 | <u>175,000</u> |
| Contribution margin | <u>0</u> | <u>\$125,000</u> |
| Advantage of processing further | | <u>\$125,000</u> |

Decisions of this type are known as **sell or process further decisions**. It is profitable to continue processing a joint product after the split-off point *so long as the incremental revenue from such processing exceeds the incremental processing cost incurred after the split-off point*. Joint costs that have already been incurred up to the split-off point are always irrelevant in decisions concerning what to do from the split-off point forward.

To provide a detailed example of the sell or process further decision, return to the data for Santa Maria Wool Cooperative in Exhibit 12–6. We can answer several important questions using this data. First, is the company making money if it runs the entire process from beginning to end? Assuming there are no costs other than those displayed in Exhibit 12–6, the company is indeed making money as follows:

Analysis of the profitability of the overall operation:

| | | |
|---|----------------|------------------|
| Combined final sales value | | |
| (\$160,000 + \$240,000 + \$90,000) | | \$490,000 |
| Less costs of producing the end products: | | |
| Cost of wool | \$200,000 | |
| Cost of separating wool | 40,000 | |
| Combined costs of dyeing | | |
| (\$50,000 + \$60,000 + \$10,000) | <u>120,000</u> | <u>360,000</u> |
| Profit | | <u>\$130,000</u> |

Note that the joint costs of buying the wool and separating the wool *are* relevant when considering the profitability of the entire operation. This is because these joint costs *could* be avoided if the entire operation were shut down. However, these joint costs *are not* relevant when considering the profitability of any one product. As long as the

process is being run to make the other products, no additional joint costs are incurred to make the specific product in question.

Even though the company is making money overall, it may be losing money on one or more of the products. If the company buys wool and runs the separation process, it will get all three intermediate products. Nothing can be done about that. However, each of these products can be sold *as is* without further processing. It may be that the company would be better off selling one or more of the products prior to dyeing to avoid the dyeing costs. The appropriate way to make this choice is to compare the incremental revenues to the incremental costs from further processing as follows:

Analysis of sell or process further:

| | Coarse Wool | Fine Wool | Superfine Wool |
|--|------------------------|----------------------|---------------------------|
| Final sales value after further processing | \$160,000 | \$240,000 | \$90,000 |
| Less sales value at the split-off point | <u>120,000</u> | <u>150,000</u> | <u>60,000</u> |
| Incremental revenue from further processing | 40,000 | 90,000 | 30,000 |
| Less cost of further processing (dyeing) | <u>50,000</u> | <u>60,000</u> | <u>10,000</u> |
| Profit (loss) from further processing | <u>\$ (10,000)</u> | <u>\$ 30,000</u> | <u>\$20,000</u> |

As this analysis shows, the company would be better off selling the undyed coarse wool as is rather than processing it further. The other two products should be processed further and dyed before selling them.

Note that the joint costs of the wool (\$200,000) and of the wool separation process (\$40,000) play no role in the decision to sell or further process the intermediate products. These joint costs are relevant in a decision of whether to buy wool and to run the wool separation process, but they are not relevant in decisions about what to do with the intermediate products once they have been separated.

Activity-Based Costing and Relevant Costs

As discussed in Chapter 7, activity-based costing can be used to help identify potentially relevant costs for decision-making purposes. Activity-based costing improves the traceability of costs by focusing on the activities caused by a product or other segment. However, managers should exercise caution against reading more into this “traceability” than really exists. People have a tendency to assume that if a cost is traceable to a segment, then the cost is automatically an avoidable cost. That is not true. As emphasized in Chapter 7, the costs provided by a well-designed activity-based costing system are only *potentially* relevant. Before making a decision, managers must still decide which of the potentially relevant costs are actually avoidable. Only those costs that are avoidable are relevant and the others should be ignored.

To illustrate, refer again to the data relating to the housewares line in Exhibit 12–4. The \$2,000 fixtures depreciation is a traceable cost of the housewares lines because it directly relates to activities in that department. We found, however, that the \$2,000 is not avoidable if the housewares line is dropped. The key lesson here is that the method used to assign a cost to a product or other segment does not change the basic nature of the cost. A sunk cost such as depreciation of old equipment is still a sunk cost regardless of whether it is traced directly to a particular segment on an activity basis, allocated to all segments on the basis of labor-hours, or treated in some other way in the costing process. Regardless of the method used to assign costs to products or other segments, the principles discussed in this chapter must be applied to determine the costs that are avoidable in each situation.

Summary

Everything in this chapter consists of applications of one simple but powerful idea. Only those costs and benefits that differ between alternatives are relevant in a decision. All other costs and benefits are irrelevant and should be ignored. In particular, sunk costs are irrelevant as are future costs that do not differ between alternatives.

This simple idea was applied in a variety of situations including decisions that involve adding or dropping a product line, making or buying a component, accepting or rejecting a special order, using a constrained resource, and processing a joint product further. This list includes only a small sample of the possible applications of the relevant cost concept. Indeed, any decision involving costs hinges on the proper identification and analysis of the costs that are relevant. We will continue to focus on the concept of relevant costs in the following chapter where long-run investment decisions are considered.

Review Problem: Relevant Costs

Charter Sports Equipment manufactures round, rectangular, and octagonal trampolines. Sales and expense data for the past month follow:

| | Total | Trampoline | | |
|---|-------------|-------------|-------------|-----------|
| | | Round | Rectangular | Octagonal |
| Sales | \$1,000,000 | \$140,000 | \$500,000 | \$360,000 |
| Variable expenses | 410,000 | 60,000 | 200,000 | 150,000 |
| Contribution margin | 590,000 | 80,000 | 300,000 | 210,000 |
| Fixed expenses: | | | | |
| Advertising—traceable | 216,000 | 41,000 | 110,000 | 65,000 |
| Depreciation of special equipment | 95,000 | 20,000 | 40,000 | 35,000 |
| Line supervisors' salaries | 19,000 | 6,000 | 7,000 | 6,000 |
| General factory overhead* | 200,000 | 28,000 | 100,000 | 72,000 |
| Total fixed expenses | 530,000 | 95,000 | 257,000 | 178,000 |
| Net operating income (loss) | \$ 60,000 | \$ (15,000) | \$ 43,000 | \$ 32,000 |

*A common fixed cost that is allocated on the basis of sales dollars.

Management is concerned about the continued losses shown by the round trampolines and wants a recommendation as to whether or not the line should be discontinued. The special equipment used to produce the trampolines has no resale value. If the round trampoline model is dropped, the two line supervisors assigned to the model would be discharged.

Required:

- Should production and sale of the round trampolines be discontinued? The company has no other use for the capacity now being used to produce the round trampolines. Show computations to support your answer.
- Recast the above data in a format that would be more useful to management in assessing the profitability of the various product lines.

Solution to Review Problem

- No, production and sale of the round trampolines should not be discontinued. Computations to support this answer follow:

| | | | |
|--|----------|--------|--------------------|
| Contribution margin lost if the round trampolines are discontinued | | | \$ (80,000) |
| Less fixed costs that can be avoided: | | | |
| Advertising—traceable | \$41,000 | | |
| Line supervisors' salaries | 6,000 | 47,000 | |
| Decrease in net operating income for the company as a whole | | | <u>\$ (33,000)</u> |

- The depreciation of the special equipment is a sunk cost, and therefore it is not relevant to the decision. The general factory overhead is allocated and will presumably continue regardless of whether or not the round trampolines are discontinued; thus, it is not relevant.
- If management wants a clearer picture of the profitability of the segments, the general factory overhead should not be allocated. It is a common cost and therefore should be deducted from the total product-line segment margin, as shown in Chapter 11. A more useful income statement format would be as follows:

| | Total | Trampoline | | |
|---|-------------|------------|-------------|-----------|
| | | Round | Rectangular | Octagonal |
| Sales..... | \$1,000,000 | \$140,000 | \$500,000 | \$360,000 |
| Variable expenses | 410,000 | 60,000 | 200,000 | 150,000 |
| Contribution margin | 590,000 | 80,000 | 300,000 | 210,000 |
| Traceable fixed expenses: | | | | |
| Advertising—traceable..... | 216,000 | 41,000 | 110,000 | 65,000 |
| Depreciation of special equipment | 95,000 | 20,000 | 40,000 | 35,000 |
| Line supervisors' salaries..... | 19,000 | 6,000 | 7,000 | 6,000 |
| Total traceable fixed expenses..... | 330,000 | 67,000 | 157,000 | 106,000 |
| Product-line segment margin..... | 260,000 | \$ 13,000 | \$143,000 | \$104,000 |
| Common fixed expenses | 200,000 | | | |
| Net operating income (loss)..... | \$ 60,000 | | | |

Glossary

- Avoidable cost** A cost that can be eliminated (in whole or in part) by choosing one alternative over another in a decision. This term is synonymous with *relevant cost* and *differential cost*. (p. 488)
- Bottleneck** A machine or some other part of a process that limits the total output of the entire system. (p. 503)
- Constraint** A limitation under which a company must operate, such as limited available machine time or raw materials, that restricts the company's ability to satisfy demand. (p. 503)
- Differential cost** Any cost that differs between alternatives in a decision-making situation. This term is synonymous with *avoidable cost* and *relevant cost*. (p. 489)
- Joint costs** Costs that are incurred up to the split-off point in a process that produces joint products. (p. 506)
- Joint products** Two or more products that are produced from a common input. (p. 506)
- Make or buy decision** A decision concerning whether an item should be produced internally or purchased from an outside supplier. (p. 499)
- Relaxing (or elevating) the constraint** An action that increases the amount of a constrained resource. Equivalently, an action that increases the capacity of the bottleneck. (p. 504)
- Relevant cost** A cost that differs between alternatives in a decision. This term is synonymous with *avoidable cost* and *differential cost*. (p. 488)
- Sell or process further decision** A decision as to whether a joint product should be sold at the split-off point or sold after further processing. (p. 508)
- Special order** A one-time order that is not considered part of the company's normal ongoing business. (p. 501)
- Split-off point** That point in the manufacturing process where some or all of the joint products can be recognized as individual products. (p. 506)
- Sunk cost** Any cost that has already been incurred and that cannot be changed by any decision made now or in the future. (p. 488)
- Vertical integration** The involvement by a company in more than one of the activities in the entire value chain from development through production, distribution, sales, and after-sales service. (p. 498)

Questions

- 12-1 What is a *relevant cost*?
- 12-2 Define the following terms: *incremental cost*, *opportunity cost*, and *sunk cost*.
- 12-3 Are variable costs always relevant costs? Explain.

- 12-4 “Sunk costs are easy to spot—they’re simply the fixed costs associated with a decision.” Do you agree? Explain.
- 12-5 “Variable costs and differential costs mean the same thing.” Do you agree? Explain.
- 12-6 “All future costs are relevant in decision making.” Do you agree? Why?
- 12-7 Prentice Company is considering dropping one of its product lines. What costs of the product line would be relevant to this decision? Irrelevant?
- 12-8 “If a product line is generating a loss, then it should be discontinued.” Do you agree? Explain.
- 12-9 What is the danger in allocating common fixed costs among product lines or other segments of an organization?
- 12-10 How does opportunity cost enter into the make or buy decision?
- 12-11 Give at least four examples of possible constraints.
- 12-12 How will relating product contribution margins to the amount of the constrained resource they consume help a company maximize its profits?
- 12-13 Define the following terms: *joint products*, *joint costs*, and *split-off point*.
- 12-14 From a decision-making point of view, should joint costs be allocated among joint products?
- 12-15 What guideline should be used in determining whether a joint product should be sold at the split-off point or processed further?
- 12-16 Airlines sometimes offer reduced rates during certain times of the week to members of a businessperson’s family if they accompany him or her on trips. How does the concept of relevant costs enter into the decision by the airline to offer reduced rates of this type?

Multiple-choice questions are provided on the text website at www.mhhe.com/noreen2e.

EXERCISE 12-1 Identifying Relevant Costs [LO1]

A number of costs are listed below that may be relevant in decisions faced by the management of Svahn, AB, a Swedish manufacturer of sailing yachts:

| Item | Case 1 | | Case 2 | |
|---|----------|--------------|----------|--------------|
| | Relevant | Not Relevant | Relevant | Not Relevant |
| a. Sales revenue | | | | |
| b. Direct materials | | | | |
| c. Direct labor | | | | |
| d. Variable manufacturing overhead | | | | |
| e. Depreciation—Model B100 machine | | | | |
| f. Book value—Model B100 machine | | | | |
| g. Disposal value—Model B100 machine | | | | |
| h. Market value—Model B300 machine (cost) | | | | |
| i. Fixed manufacturing overhead (general) | | | | |
| j. Variable selling expense | | | | |
| k. Fixed selling expense | | | | |
| l. General administrative overhead | | | | |

Required:

Copy the information above onto your answer sheet and place an X in the appropriate column to indicate whether each item is relevant or not relevant in the following situations. Requirement 1 relates to Case 1 above, and requirement 2 relates to Case 2.

- The company chronically has no idle capacity and the old Model B100 machine is the company’s constraint. Management is considering purchasing a Model B300 machine to use in addition to the company’s present Model B100 machine. The old Model B100 machine will continue to be used to capacity as before, with the new Model B300 machine being used to expand production. This will increase the company’s production and sales. The increase in volume will be large enough to require increases in fixed selling expenses and in general administrative overhead, but not in the fixed manufacturing overhead.

- The old Model B100 machine is not the company’s constraint, but management is considering replacing it with a new Model B300 machine because of the potential savings in direct materials with the new machine. The Model B100 machine would be sold. This change will have no effect on production or sales, other than some savings in direct materials costs due to less waste.

EXERCISE 12–2 Dropping or Retaining a Segment [L02]

The Regal Cycle Company manufactures three types of bicycles—a dirt bike, a mountain bike, and a racing bike. Data on sales and expenses for the past quarter follow:

| | Total | Dirt Bikes | Mountain Bikes | Racing Bikes |
|---|------------------|-----------------|------------------|-------------------|
| Sales | \$300,000 | \$90,000 | \$150,000 | \$60,000 |
| Variable manufacturing and selling expenses | <u>120,000</u> | <u>27,000</u> | <u>60,000</u> | <u>33,000</u> |
| Contribution margin | <u>180,000</u> | <u>63,000</u> | <u>90,000</u> | <u>27,000</u> |
| Fixed expenses: | | | | |
| Advertising, traceable | 30,000 | 10,000 | 14,000 | 6,000 |
| Depreciation of special equipment | 23,000 | 6,000 | 9,000 | 8,000 |
| Salaries of product-line managers | 35,000 | 12,000 | 13,000 | 10,000 |
| Allocated common fixed expenses* | <u>60,000</u> | <u>18,000</u> | <u>30,000</u> | <u>12,000</u> |
| Total fixed expenses | <u>148,000</u> | <u>46,000</u> | <u>66,000</u> | <u>36,000</u> |
| Net operating income (loss) | <u>\$ 32,000</u> | <u>\$17,000</u> | <u>\$ 24,000</u> | <u>\$ (9,000)</u> |

*Allocated on the basis of sales dollars.

Management is concerned about the continued losses shown by the racing bikes and wants a recommendation as to whether or not the line should be discontinued. The special equipment used to produce racing bikes has no resale value and does not wear out.

Required:

- Should production and sale of the racing bikes be discontinued? Explain. Show computations to support your answer.
- Recast the above data in a format that would be more usable to management in assessing the long-run profitability of the various product lines.

EXERCISE 12–3 Make or Buy a Component [L03]

Troy Engines, Ltd., manufactures a variety of engines for use in heavy equipment. The company has always produced all of the necessary parts for its engines, including all of the carburetors. An outside supplier has offered to sell one type of carburetor to Troy Engines, Ltd., for a cost of \$35 per unit. To evaluate this offer, Troy Engines, Ltd., has gathered the following information relating to its own cost of producing the carburetor internally:

| | Per Unit | 15,000 Units per Year |
|---|-------------|-----------------------|
| Direct materials | \$14 | \$210,000 |
| Direct labor | 10 | 150,000 |
| Variable manufacturing overhead | 3 | 45,000 |
| Fixed manufacturing overhead, traceable | 6* | 90,000 |
| Fixed manufacturing overhead, allocated | <u>9</u> | <u>135,000</u> |
| Total cost | <u>\$42</u> | <u>\$630,000</u> |

*One-third supervisory salaries; two-thirds depreciation of special equipment (no resale value).

Required:

1. Assuming that the company has no alternative use for the facilities that are now being used to produce the carburetors, should the outside supplier's offer be accepted? Show all computations.
2. Suppose that if the carburetors were purchased, Troy Engines, Ltd., could use the freed capacity to launch a new product. The segment margin of the new product would be \$150,000 per year. Should Troy Engines, Ltd., accept the offer to buy the carburetors for \$35 per unit? Show all computations.

EXERCISE 12-4 Evaluating a Special Order [L04]

Imperial Jewelers is considering a special order for 20 handcrafted gold bracelets to be given as gifts to members of a wedding party. The normal selling price of a gold bracelet is \$189.95 and its unit product cost is \$149.00 as shown below:

| | |
|------------------------------|-----------------|
| Direct materials | \$ 84.00 |
| Direct labor | 45.00 |
| Manufacturing overhead | 20.00 |
| Unit product cost | <u>\$149.00</u> |

Most of the manufacturing overhead is fixed and unaffected by variations in how much jewelry is produced in any given period. However, \$4.00 of the overhead is variable with respect to the number of bracelets produced. The customer who is interested in the special bracelet order would like special filigree applied to the bracelets. This filigree would require additional materials costing \$2.00 per bracelet and would also require acquisition of a special tool costing \$250 that would have no other use once the special order is completed. This order would have no effect on the company's regular sales and the order could be fulfilled using the company's existing capacity without affecting any other order.

Required:

What effect would accepting this order have on the company's net operating income if a special price of \$169.95 per bracelet is offered for this order? Should the special order be accepted at this price?

EXERCISE 12-5 Utilization of a Constrained Resource [L05]

Barlow Company manufactures three products: A, B, and C. The selling price, variable costs, and contribution margin for one unit of each product follow:

| | Product | | |
|---------------------------------|--------------|--------------|--------------|
| | A | B | C |
| Selling price | \$180 | \$270 | \$240 |
| Variable expenses: | | | |
| Direct materials | 24 | 72 | 32 |
| Other variable expenses | 102 | 90 | 148 |
| Total variable expenses | 126 | 162 | 180 |
| Contribution margin | <u>\$ 54</u> | <u>\$108</u> | <u>\$ 60</u> |
| Contribution margin ratio | 30% | 40% | 25% |

The same raw material is used in all three products. Barlow Company has only 5,000 pounds of raw material on hand and will not be able to obtain any more of it for several weeks due to a strike in its supplier's plant. Management is trying to decide which product(s) to concentrate on next week in filling its backlog of orders. The material costs \$8 per pound.

Required:

1. Compute the amount of contribution margin that will be obtained per pound of material used in each product.
2. Which orders would you recommend that the company work on next week—the orders for product A, product B, or product C? Show computations.
3. A foreign supplier could furnish Barlow with additional stocks of the raw material at a substantial premium over the usual price. If there is unfilled demand for all three products, what is the highest price that Barlow Company should be willing to pay for an additional pound of materials? Explain.

EXERCISE 12-6 Sell or Process Further [LO6]

Dorsey Company manufactures three products from a common input in a joint processing operation. Joint processing costs up to the split-off point total \$350,000 per quarter. The company allocates these costs to the joint products on the basis of their relative sales value at the split-off point. Unit selling prices and total output at the split-off point are as follows:

| Product | Selling Price | Quarterly Output |
|---------|-----------------|------------------|
| A | \$16 per pound | 15,000 pounds |
| B | \$8 per pound | 20,000 pounds |
| C | \$25 per gallon | 4,000 gallons |

Each product can be processed further after the split-off point. Additional processing requires no special facilities. The additional processing costs (per quarter) and unit selling prices after further processing are given below:

| Product | Additional Processing Costs | Selling Price |
|---------|-----------------------------|-----------------|
| A | \$63,000 | \$20 per pound |
| B | \$80,000 | \$13 per pound |
| C | \$36,000 | \$32 per gallon |

Required:

Which product or products should be sold at the split-off point and which product or products should be processed further? Show computations.

EXERCISE 12-7 Make or Buy a Component [LO3]

Han Products manufactures 30,000 units of part S-6 each year for use on its production line. At this level of activity, the cost per unit for part S-6 is as follows:

| | |
|---------------------------------------|----------------|
| Direct materials | \$ 3.60 |
| Direct labor | 10.00 |
| Variable manufacturing overhead | 2.40 |
| Fixed manufacturing overhead | 9.00 |
| Total cost per part | <u>\$25.00</u> |

An outside supplier has offered to sell 30,000 units of part S-6 each year to Han Products for \$21 per part. If Han Products accepts this offer, the facilities now being used to manufacture part S-6 could be rented to another company at an annual rental of \$80,000. However, Han Products has determined that two-thirds of the fixed manufacturing overhead being applied to part S-6 would continue even if part S-6 were purchased from the outside supplier.

Required:

Prepare computations showing how much profits will increase or decrease if the outside supplier's offer is accepted.

EXERCISE 12-8 Identification of Relevant Costs [LO1]

Hollings Company sells and delivers office furniture in the Rocky Mountain area.

The costs associated with the acquisition and annual operation of a delivery truck are given below:

| | |
|---|-----------------|
| Insurance | \$1,600 |
| Licenses | \$250 |
| Taxes (vehicle) | \$150 |
| Garage rent for parking (per truck) | \$1,200 |
| Depreciation (\$9,000 ÷ 5 years) | \$1,800* |
| Gasoline, oil, tires, and repairs | \$0.07 per mile |

*Based on obsolescence rather than on wear and tear.

Required:

1. Assume that Hollings Company has purchased one truck that has been driven 50,000 miles during the first year. Compute the average cost per mile of owning and operating the truck.
2. At the beginning of the second year, Hollings Company is unsure whether to use the truck or leave it parked in the garage and have all hauling done commercially. (The state requires the payment of vehicle taxes even if the vehicle isn't used.) What costs from the previous list are relevant to this decision? Explain.
3. Assume that the company decides to use the truck during the second year. Near year-end an order is received from a customer over 1,000 miles away. What costs from the above list are relevant in a decision between using the truck to make the delivery and having the delivery done commercially? Explain.
4. Occasionally, the company could use two trucks at the same time. For this reason, some thought is being given to purchasing a second truck. The total miles driven would be the same as if only one truck were owned. What costs from the above list are relevant to a decision over whether to purchase the second truck? Explain.

EXERCISE 12-9 Dropping or Retaining a Segment [LO2]

Thalassines Kataskeves, S.A., of Greece makes marine equipment. The company has been experiencing losses on its bilge pump product line for several years. The most recent quarterly contribution format income statement for the bilge pump product line follows:

| Thalassines Kataskeves, S.A. | | |
|--|---------------------------|-------------------|
| Income Statement—Bilge Pump | | |
| For the Quarter Ended March 31 | | |
| Sales | | €850,000 |
| Variable expenses: | | |
| Variable manufacturing expenses | €330,000 | |
| Sales commissions | 42,000 | |
| Shipping | <u>18,000</u> | |
| Total variable expenses | | <u>390,000</u> |
| Contribution margin | | 460,000 |
| Fixed expenses: | | |
| Advertising | 270,000 | |
| Depreciation of equipment (no resale value) | 80,000 | |
| General factory overhead | 105,000* | |
| Salary of product-line manager | 32,000 | |
| Insurance on inventories | 8,000 | |
| Purchasing department | <u>45,000[†]</u> | |
| Total fixed expenses | | <u>540,000</u> |
| Net operating loss | | <u>€ (80,000)</u> |
| <p>*Common costs allocated on the basis of machine-hours. [†]Common costs allocated on the basis of sales dollars.</p> | | |

The currency in Greece is the euro, denoted above by €. Discontinuing the bilge pump product line would not affect sales of other product lines and would have no effect on the company's total general factory overhead or total Purchasing Department expenses.

Required:

Would you recommend that the bilge pump product line be discontinued? Support your answer with appropriate computations.

EXERCISE 12-10 Identification of Relevant Costs [LO1]

Bill has just returned from a duck hunting trip. He has brought home eight ducks. Bill's friend, John, disapproves of duck hunting, and to discourage Bill from further hunting, John has presented him with the following cost estimate per duck:

| | |
|--|--------------|
| Camper and equipment: | |
| Cost, \$12,000; usable for eight seasons; 10 hunting trips per season | \$150 |
| Travel expense (pickup truck): | |
| 100 miles at \$0.31 per mile (gas, oil, and tires—\$0.21 per mile; depreciation and insurance—\$0.10 per mile) | 31 |
| Shotgun shells (two boxes) | 20 |
| Boat: | |
| Cost, \$2,320, usable for eight seasons; 10 hunting trips per season | 29 |
| Hunting license: | |
| Cost, \$30 for the season; 10 hunting trips per season | 3 |
| Money lost playing poker: | |
| Loss, \$24 (Bill plays poker every weekend) | 24 |
| Bottle of whiskey: | |
| Cost, \$15 (used to ward off the cold) | 15 |
| Total cost | <u>\$272</u> |
| Cost per duck ($\$272 \div 8$ ducks) | <u>\$ 34</u> |

Required:

1. Assuming that the duck hunting trip Bill has just completed is typical, what costs are relevant to a decision as to whether Bill should go duck hunting again this season?
2. Suppose that Bill gets lucky on his next hunting trip and shoots 10 ducks in the amount of time it took him to shoot 8 ducks on his last trip. How much would it have cost him to shoot the last two ducks? Explain.
3. Which costs are relevant in a decision of whether Bill should give up hunting? Explain.

EXERCISE 12–11 Sell or Process Further [LO6]

Wexpro, Inc., produces several products from processing 1 ton of clypton, a rare mineral. Material and processing costs total \$60,000 per ton, one-fourth of which is allocated to product X15. Seven thousand units of product X15 are produced from each ton of clypton. The units can either be sold at the split-off point for \$9 each, or processed further at a total cost of \$9,500 and then sold for \$12 each.

Required:

Should product X15 be processed further or sold at the split-off point?

EXERCISE 12–12 Utilization of a Constrained Resource [LO5]

Benoit Company produces three products, A, B, and C. Data concerning the three products follow (per unit):

| | Product | | |
|---------------------------------|-------------|-------------|-------------|
| | A | B | C |
| Selling price | <u>\$80</u> | <u>\$56</u> | <u>\$70</u> |
| Variable expenses: | | | |
| Direct materials | 24 | 15 | 9 |
| Other variable expenses | <u>24</u> | <u>27</u> | <u>40</u> |
| Total variable expenses | 48 | 42 | 49 |
| Contribution margin | <u>\$32</u> | <u>\$14</u> | <u>\$21</u> |
| Contribution margin ratio | <u>40%</u> | <u>25%</u> | <u>30%</u> |

Demand for the company’s products is very strong, with far more orders each month than the company can produce with the available raw materials. The same material is used in each product. The material costs \$3 per pound with a maximum of 5,000 pounds available each month.

Required:

Which orders would you advise the company to accept first, those for A, for B, or for C? Which orders second? Third?

EXERCISE 12-13 Special Order [LO4]

Delta Company produces a single product. The cost of producing and selling a single unit of this product at the company's normal activity level of 60,000 units per year is:

| | |
|---|--------|
| Direct materials | \$5.10 |
| Direct labor | \$3.80 |
| Variable manufacturing overhead | \$1.00 |
| Fixed manufacturing overhead | \$4.20 |
| Variable selling and administrative expense | \$1.50 |
| Fixed selling and administrative expense | \$2.40 |

The normal selling price is \$21 per unit. The company's capacity is 75,000 units per year. An order has been received from a mail-order house for 15,000 units at a special price of \$14.00 per unit. This order would not affect regular sales.

Required:

1. If the order is accepted, by how much will annual profits be increased or decreased? (The order will not change the company's total fixed costs.)
2. Assume the company has 1,000 units of this product left over from last year that are inferior to the current model. The units must be sold through regular channels at reduced prices. What unit cost is relevant for establishing a minimum selling price for these units? Explain.

EXERCISE 12-14 Dropping or Retaining a Segment [LO2]

Bed & Bath, a retailing company, has two departments, Hardware and Linens. The company's most recent monthly contribution format income statement follows:

| | Total | Department | |
|-----------------------------------|-------------|-------------|--------------|
| | | Hardware | Linens |
| Sales | \$4,000,000 | \$3,000,000 | \$1,000,000 |
| Variable expenses | 1,300,000 | 900,000 | 400,000 |
| Contribution margin | 2,700,000 | 2,100,000 | 600,000 |
| Fixed expenses | 2,200,000 | 1,400,000 | 800,000 |
| Net operating income (loss) | \$ 500,000 | \$ 700,000 | \$ (200,000) |

A study indicates that \$340,000 of the fixed expenses being charged to Linens are sunk costs or allocated costs that will continue even if the Linens Department is dropped. In addition, the elimination of the Linens Department will result in a 10% decrease in the sales of the Hardware Department.

Required:

If the Linens Department is dropped, what will be the effect on the net operating income of the company as a whole?

EXERCISE 12-15 Make or Buy a Component [LO3]

For many years Futura Company has purchased the starters that it installs in its standard line of farm tractors. Due to a reduction in output, the company has idle capacity that could be used to produce the starters. The chief engineer has recommended against this move, however, pointing out that the cost to produce the starters would be greater than the current \$8.40 per unit purchase price:

| | Per Unit | Total |
|---------------------------------------|---------------|----------|
| Direct materials | \$3.10 | |
| Direct labor | 2.70 | |
| Supervision | 1.50 | \$60,000 |
| Depreciation | 1.00 | \$40,000 |
| Variable manufacturing overhead | 0.60 | |
| Rent | 0.30 | \$12,000 |
| Total production cost | <u>\$9.20</u> | |

A supervisor would have to be hired to oversee production of the starters. However, the company has sufficient idle tools and machinery that no new equipment would have to be purchased. The rent charge above is based on space utilized in the plant. The total rent on the plant is \$80,000 per period. Depreciation is due to obsolescence rather than wear and tear.

Required:

Prepare computations showing how much profits will increase or decrease as a result of making the starters.

EXERCISE 12-16 Identification of Relevant Costs [LO1]

Kristen Lu purchased a used automobile for \$8,000 at the beginning of last year and incurred the following operating costs:

| | |
|--|-----------------|
| Depreciation (\$8,000 ÷ 5 years) | \$1,600 |
| Insurance | \$1,200 |
| Garage rent | \$360 |
| Automobile tax and license | \$40 |
| Variable operating cost | \$0.14 per mile |

The variable operating cost consists of gasoline, oil, tires, maintenance, and repairs. Kristen estimates that, at her current rate of usage, the car will have zero resale value in five years, so the annual straight-line depreciation is \$1,600. The car is kept in a garage for a monthly fee.

Required:

1. Kristen drove the car 10,000 miles last year. Compute the average cost per mile of owning and operating the car.
2. Kristen is unsure about whether she should use her own car or rent a car to go on an extended cross-country trip for two weeks during spring break. What costs above are relevant in this decision? Explain.
3. Kristen is thinking about buying an expensive sports car to replace the car she bought last year. She would drive the same number of miles regardless of which car she owns and would rent the same parking space. The sports car's variable operating costs would be roughly the same as the variable operating costs of her old car. However, her insurance and automobile tax and license costs would go up. What costs are relevant in estimating the incremental cost of owning the more expensive car? Explain.

connect™ **Problems**

PROBLEM 12-17 Sell or Process Further [LO6]

(Prepared from a situation suggested by Professor John W. Hardy.) Lone Star Meat Packers is a major processor of beef and other meat products. The company has a large amount of T-bone steak on hand, and it is trying to decide whether to sell the T-bone steaks as they are initially cut or to process them further into filet mignon and the New York cut.

If the T-bone steaks are sold as initially cut, the company figures that a 1-pound T-bone steak would yield the following profit:

| | |
|---|---------------|
| Selling price (\$2.25 per pound) | \$2.25 |
| Less joint costs incurred up to the split-off point where T-bone steak can be identified as a separate product | <u>1.80</u> |
| Profit per pound | <u>\$0.45</u> |

As mentioned above, instead of being sold as initially cut, the T-bone steaks could be further processed into filet mignon and New York cut steaks. Cutting one side of a T-bone steak provides the filet mignon, and cutting the other side provides the New York cut. One 16-ounce T-bone steak cut in this way will yield one 6-ounce filet mignon and one 8-ounce New York cut; the remaining ounces are waste. The cost of processing the T-bone steaks into these cuts is \$0.25 per pound. The filet mignon can be sold for \$4.00 per pound, and the New York cut can be sold for \$2.80 per pound.

Required:

- Determine the profit per pound from processing the T-bone steaks into filet mignon and New York cut steaks.
- Would you recommend that the T-bone steaks be sold as initially cut or processed further? Why?

PROBLEM 12–18 Dropping or Retaining a Flight [LO2]

Profits have been decreasing for several years at Pegasus Airlines. In an effort to improve the company's performance, consideration is being given to dropping several flights that appear to be unprofitable.

A typical income statement for one round-trip of one such flight (flight 482) is as follows:

excel

| | | |
|---|-------------------|--------------|
| Ticket revenue (175 seats × 40% occupancy × \$200 ticket price) | \$14,000 | 100.0% |
| Variable expenses (\$15 per person) | <u>1,050</u> | <u>7.5</u> |
| Contribution margin | <u>12,950</u> | <u>92.5%</u> |
| Flight expenses: | | |
| Salaries, flight crew | 1,800 | |
| Flight promotion | 750 | |
| Depreciation of aircraft | 1,550 | |
| Fuel for aircraft | 5,800 | |
| Liability insurance | 4,200 | |
| Salaries, flight assistants | 1,500 | |
| Baggage loading and flight preparation | 1,700 | |
| Overnight costs for flight crew and assistants at destination | <u>300</u> | |
| Total flight expenses | <u>17,600</u> | |
| Net operating loss | <u>\$ (4,650)</u> | |

The following additional information is available about flight 482:

- Members of the flight crew are paid fixed annual salaries, whereas the flight assistants are paid based on the number of round trips they complete.
- One-third of the liability insurance is a special charge assessed against flight 482 because in the opinion of the insurance company, the destination of the flight is in a "high-risk" area. The remaining two-thirds would be unaffected by a decision to drop flight 482.
- The baggage loading and flight preparation expense is an allocation of ground crews' salaries and depreciation of ground equipment. Dropping flight 482 would have no effect on the company's total baggage loading and flight preparation expenses.
- If flight 482 is dropped, Pegasus Airlines has no authorization at present to replace it with another flight.
- Aircraft depreciation is due entirely to obsolescence. Depreciation due to wear and tear is negligible.
- Dropping flight 482 would not allow Pegasus Airlines to reduce the number of aircraft in its fleet or the number of flight crew on its payroll.

Required:

- Prepare an analysis showing what impact dropping flight 482 would have on the airline's profits.
- The airline's scheduling officer has been criticized because only about 50% of the seats on Pegasus' flights are being filled compared to an industry average of 60%. The scheduling officer has explained that Pegasus' average seat occupancy could be improved considerably by eliminating about 10% of its flights, but that doing so would reduce profits. Explain how this could happen.

PROBLEM 12–19 Shutting Down or Continuing to Operate a Plant [LO2]

(Note: This type of decision is similar to dropping a product line.)

Birch Company normally produces and sells 30,000 units of RG-6 each month. RG-6 is a small electrical relay used as a component part in the automotive industry. The selling price is \$22 per unit, variable costs are \$14 per unit, fixed manufacturing overhead costs total \$150,000 per month, and fixed selling costs total \$30,000 per month.

Employment-contract strikes in the companies that purchase the bulk of the RG-6 units have caused Birch Company's sales to temporarily drop to only 8,000 units per month. Birch Company estimates that the strikes will last for two months, after which time sales of RG-6 should return to normal. Due to the current low level of sales, Birch Company is thinking about closing down its own plant during the strike, which

would reduce its fixed manufacturing overhead costs by \$45,000 per month and its fixed selling costs by 10%. Start-up costs at the end of the shutdown period would total \$8,000. Because Birch Company uses Lean Production methods, no inventories are on hand.

Required:

1. Assuming that the strikes continue for two months, would you recommend that Birch Company close its own plant? Explain. Show computations.
2. At what level of sales (in units) for the two-month period should Birch Company be indifferent between closing the plant or keeping it open? Show computations. (*Hint:* This is a type of break-even analysis, except that the fixed cost portion of your break-even computation should include only those fixed costs that are relevant [i.e., avoidable] over the two-month period.)

PROBLEM 12–20 Dropping or Retaining a Segment [L02]

Jackson County Senior Services is a nonprofit organization devoted to providing essential services to seniors who live in their own homes within the Jackson County area. Three services are provided for seniors—home nursing, meals on wheels, and housekeeping. In the home nursing program, nurses visit seniors on a regular basis to check on their general health and to perform tests ordered by their physicians. The meals on wheels program delivers a hot meal once a day to each senior enrolled in the program. The housekeeping service provides weekly housecleaning and maintenance services. Data on revenue and expenses for the past year follow:

| | Total | Home Nursing | Meals on Wheels | House-keeping |
|--|-----------|--------------|-----------------|---------------|
| Revenues | \$900,000 | \$260,000 | \$400,000 | \$240,000 |
| Variable expenses | 490,000 | 120,000 | 210,000 | 160,000 |
| Contribution margin | 410,000 | 140,000 | 190,000 | 80,000 |
| Fixed expenses: | | | | |
| Depreciation | 68,000 | 8,000 | 40,000 | 20,000 |
| Liability insurance | 42,000 | 20,000 | 7,000 | 15,000 |
| Program administrators' salaries | 115,000 | 40,000 | 38,000 | 37,000 |
| General administrative overhead* | 180,000 | 52,000 | 80,000 | 48,000 |
| Total fixed expenses | 405,000 | 120,000 | 165,000 | 120,000 |
| Net operating income (loss) | \$ 5,000 | \$ 20,000 | \$ 25,000 | \$ (40,000) |

*Allocated on the basis of program revenues.

The head administrator of Jackson County Senior Services, Judith Miyama, is concerned about the organization's finances and considers the net operating income of \$5,000 last year to be razor-thin. (Last year's results were very similar to the results for previous years and are representative of what would be expected in the future.) She feels that the organization should be building its financial reserves at a more rapid rate in order to prepare for the next inevitable recession. After seeing the above report, Ms. Miyama asked for more information about the financial advisability of perhaps discontinuing the housekeeping program.

The depreciation in housekeeping is for a small van that is used to carry the housekeepers and their equipment from job to job. If the program were discontinued, the van would be donated to a charitable organization. None of the general administrative overhead would be avoided if the housekeeping program were dropped, but the liability insurance and the salary of the program administrator would be avoided.

Required:

1. Should the housekeeping program be discontinued? Explain. Show computations to support your answer.
2. Recast the above data in a format that would be more useful to management in assessing the long-run financial viability of the various services.

PROBLEM 12–21 Make or Buy Decision [L03]

Silven Industries, which manufactures and sells a highly successful line of summer lotions and insect repellents, has decided to diversify in order to stabilize sales throughout the year. A natural area for the company to consider is the production of winter lotions and creams to prevent dry and chapped skin.

After considerable research, a winter products line has been developed. However, Silven's president has decided to introduce only one of the new products for this coming winter. If the product is a success, further expansion in future years will be initiated.

The product selected (called Chap-Off) is a lip balm that will be sold in a lipstick-type tube. The product will be sold to wholesalers in boxes of 24 tubes for \$8 per box. Because of excess capacity, no additional fixed manufacturing overhead costs will be incurred to produce the product. However, a \$90,000 charge for fixed manufacturing overhead will be absorbed by the product under the company's absorption costing system.

Using the estimated sales and production of 100,000 boxes of Chap-Off, the Accounting Department has developed the following cost per box:

| | |
|------------------------------|---------------|
| Direct material | \$3.60 |
| Direct labor | 2.00 |
| Manufacturing overhead | 1.40 |
| Total cost | <u>\$7.00</u> |

The costs above include costs for producing both the lip balm and the tube that contains it. As an alternative to making the tubes, Silven has approached a supplier to discuss the possibility of purchasing the tubes for Chap-Off. The purchase price of the empty tubes from the supplier would be \$1.35 per box of 24 tubes. If Silven Industries accepts the purchase proposal, direct labor and variable manufacturing overhead costs per box of Chap-Off would be reduced by 10% and direct materials costs would be reduced by 25%.

Required:

1. Should Silven Industries make or buy the tubes? Show calculations to support your answer.
2. What would be the maximum purchase price acceptable to Silven Industries? Explain.
3. Instead of sales of 100,000 boxes, revised estimates show a sales volume of 120,000 boxes. At this new volume, additional equipment must be acquired to manufacture the tubes at an annual rental of \$40,000. Assuming that the outside supplier will not accept an order for less than 100,000 boxes, should Silven Industries make or buy the tubes? Show computations to support your answer.
4. Refer to the data in (3) above. Assume that the outside supplier will accept an order of any size for the tubes at \$1.35 per box. How, if at all, would this change your answer? Show computations.
5. What qualitative factors should Silven Industries consider in determining whether they should make or buy the tubes?

(CMA, adapted)

PROBLEM 12-22 Close or Retain a Store [LO2]

Superior Markets, Inc., operates three stores in a large metropolitan area. A segmented absorption costing income statement for the company for the last quarter is given below:

| Superior Markets, Inc. Income Statement For the Quarter Ended September 30 | | | | |
|--|-------------------|--------------------|------------------|------------------|
| | Total | North Store | South Store | East Store |
| Sales | \$3,000,000 | \$720,000 | \$1,200,000 | \$1,080,000 |
| Cost of goods sold | <u>1,657,200</u> | <u>403,200</u> | <u>660,000</u> | <u>594,000</u> |
| Gross margin | <u>1,342,800</u> | <u>316,800</u> | <u>540,000</u> | <u>486,000</u> |
| Selling and administrative expenses: | | | | |
| Selling expenses | 817,000 | 231,400 | 315,000 | 270,600 |
| Administrative expenses | <u>383,000</u> | <u>106,000</u> | <u>150,900</u> | <u>126,100</u> |
| Total expenses | <u>1,200,000</u> | <u>337,400</u> | <u>465,900</u> | <u>396,700</u> |
| Net operating income (loss) | <u>\$ 142,800</u> | <u>\$ (20,600)</u> | <u>\$ 74,100</u> | <u>\$ 89,300</u> |

The North Store has consistently shown losses over the past two years. For this reason, management is giving consideration to closing the store. The company has asked you to make a recommendation as to whether the store should be closed or kept open. The following additional information is available for your use:

- a. The breakdown of the selling and administrative expenses is as follows:

| | Total | North Store | South Store | East Store |
|--|-------------------------|-------------------------|-------------------------|-------------------------|
| Selling expenses: | | | | |
| Sales salaries | \$239,000 | \$ 70,000 | \$ 89,000 | \$ 80,000 |
| Direct advertising | 187,000 | 51,000 | 72,000 | 64,000 |
| General advertising* | 45,000 | 10,800 | 18,000 | 16,200 |
| Store rent | 300,000 | 85,000 | 120,000 | 95,000 |
| Depreciation of store fixtures | 16,000 | 4,600 | 6,000 | 5,400 |
| Delivery salaries | 21,000 | 7,000 | 7,000 | 7,000 |
| Depreciation of delivery equipment | 9,000 | 3,000 | 3,000 | 3,000 |
| Total selling expenses | <u>\$817,000</u> | <u>\$231,400</u> | <u>\$315,000</u> | <u>\$270,600</u> |

*Allocated on the basis of sales dollars.

| | Total | North Store | South Store | East Store |
|---|-------------------------|-------------------------|-------------------------|-------------------------|
| Administrative expenses: | | | | |
| Store management salaries | \$ 70,000 | \$ 21,000 | \$ 30,000 | \$ 19,000 |
| General office salaries* | 50,000 | 12,000 | 20,000 | 18,000 |
| Insurance on fixtures and inventory | 25,000 | 7,500 | 9,000 | 8,500 |
| Utilities | 106,000 | 31,000 | 40,000 | 35,000 |
| Employment taxes..... | 57,000 | 16,500 | 21,900 | 18,600 |
| General office—other* | 75,000 | 18,000 | 30,000 | 27,000 |
| Total administrative expenses..... | <u>\$383,000</u> | <u>\$106,000</u> | <u>\$150,900</u> | <u>\$126,100</u> |

*Allocated on the basis of sales dollars.

- The lease on the building housing the North Store can be broken with no penalty.
- The fixtures being used in the North Store would be transferred to the other two stores if the North Store were closed.
- The general manager of the North Store would be retained and transferred to another position in the company if the North Store were closed. She would be filling a position that would otherwise be filled by hiring a new employee at a salary of \$11,000 per quarter. The general manager of the North Store would be retained at her normal salary of \$12,000 per quarter. All other employees in the store would be discharged.
- The company has one delivery crew that serves all three stores. One delivery person could be discharged if the North Store were closed. This person's salary is \$4,000 per quarter. The delivery equipment would be distributed to the other stores. The equipment does not wear out through use, but does eventually become obsolete.
- The company's employment taxes are 15% of salaries.
- One-third of the insurance in the North Store is on the store's fixtures.
- The "General office salaries" and "General office—other" relate to the overall management of Superior Markets, Inc. If the North Store were closed, one person in the general office could be discharged because of the decrease in overall workload. This person's compensation is \$6,000 per quarter.

Required:

- Prepare a schedule showing the change in revenues and expenses and the impact on the company's overall net operating income that would result if the North Store were closed.
- Assuming that the store space can't be subleased, what recommendation would you make to the management of Superior Markets, Inc.?
- Disregard requirement 2. Assume that if the North Store were closed, at least one-fourth of its sales would transfer to the East Store, due to strong customer loyalty to Superior Markets. The East Store has enough capacity to handle the increased sales. You may assume that the increased sales in the East Store would yield the same gross margin as a percentage of sales as present sales in that store. What effect would these factors have on your recommendation concerning the North Store? Show all computations to support your answer.

**PROBLEM 12–23 Relevant Cost Analysis in a Variety of Situations [LO2, LO3, LO4]**

Andretti Company has a single product called a Dak. The company normally produces and sells 60,000 Daks each year at a selling price of \$32 per unit. The company's unit costs at this level of activity are given below:

| | | |
|---------------------------------------|----------------|-------------------|
| Direct materials | \$10.00 | |
| Direct labor | 4.50 | |
| Variable manufacturing overhead | 2.30 | |
| Fixed manufacturing overhead | 5.00 | (\$300,000 total) |
| Variable selling expenses | 1.20 | |
| Fixed selling expenses | 3.50 | (\$210,000 total) |
| Total cost per unit | <u>\$26.50</u> | |

A number of questions relating to the production and sale of Daks follow. Each question is independent.

Required:

1. Assume that Andretti Company has sufficient capacity to produce 90,000 Daks each year without any increase in fixed manufacturing overhead costs. The company could increase its sales by 25% above the present 60,000 units each year if it were willing to increase the fixed selling expenses by \$80,000. Would the increased fixed selling expenses be justified?
2. Assume again that Andretti Company has sufficient capacity to produce 90,000 Daks each year. A customer in a foreign market wants to purchase 20,000 Daks. Import duties on the Daks would be \$1.70 per unit, and costs for permits and licenses would be \$9,000. The only selling costs that would be associated with the order would be \$3.20 per unit shipping cost. Compute the per unit break-even price on this order.
3. The company has 1,000 Daks on hand that have some irregularities and are therefore considered to be "seconds." Due to the irregularities, it will be impossible to sell these units at the normal price through regular distribution channels. What unit cost figure is relevant for setting a minimum selling price? Explain.
4. Due to a strike in its supplier's plant, Andretti Company is unable to purchase more material for the production of Daks. The strike is expected to last for two months. Andretti Company has enough material on hand to operate at 30% of normal levels for the two-month period. As an alternative, Andretti could close its plant down entirely for the two months. If the plant were closed, fixed manufacturing overhead costs would continue at 60% of their normal level during the two-month period and the fixed selling expenses would be reduced by 20%. What would be the impact on profits of closing the plant for the two-month period?
5. An outside manufacturer has offered to produce Daks and ship them directly to Andretti's customers. If Andretti Company accepts this offer, the facilities that it uses to produce Daks would be idle; however, fixed manufacturing overhead costs would be reduced by 75%. Because the outside manufacturer would pay for all shipping costs, the variable selling expenses would be only two-thirds of their present amount. Compute the unit cost that is relevant for comparison to the price quoted by the outside manufacturer.

**PROBLEM 12–24 Make or Buy Analysis [LO3]**

"In my opinion, we ought to stop making our own drums and accept that outside supplier's offer," said Wim Niewindt, managing director of Antilles Refining, N.V., of Aruba. "At a price of 18 florins per drum, we would be paying 5 florins less than it costs us to manufacture the drums in our own plant. (The currency in Aruba is the florin, denoted below by fl.) Because we use 60,000 drums a year, that would be an annual cost savings of 300,000 florins." Antilles Refining's present cost to manufacture one drum is given below (based on 60,000 drums per year):

| | |
|---|----------------|
| Direct materials | fl10.35 |
| Direct labor | 6.00 |
| Variable overhead | 1.50 |
| Fixed overhead (fl2.80 general company overhead, fl1.60 depreciation and, fl0.75 supervision) | <u>5.15</u> |
| Total cost per drum | <u>fl23.00</u> |

A decision about whether to make or buy the drums is especially important at this time because the equipment being used to make the drums is completely worn out and must be replaced. The choices facing the company are:

Alternative 1: Rent new equipment and continue to make the drums. The equipment would be rented for fl135,000 per year.

Alternative 2: Purchase the drums from an outside supplier at fl18 per drum.

The new equipment would be more efficient than the equipment that Antilles Refining has been using and, according to the manufacturer, would reduce direct labor and variable overhead costs by 30%. The old equipment has no resale value. Supervision cost (fl45,000 per year) and direct materials cost per drum would not be affected by the new equipment. The new equipment's capacity would be 90,000 drums per year.

The company's total general company overhead would be unaffected by this decision.

Required:

- To assist the managing director in making a decision, prepare an analysis showing the total cost and the cost per drum for each of the two alternatives given above. Assume that 60,000 drums are needed each year. Which course of action would you recommend to the managing director?
- Would your recommendation in (1) above be the same if the company's needs were: (a) 75,000 drums per year or (b) 90,000 drums per year? Show computations to support your answer, with costs presented on both a total and a per unit basis.
- What other factors would you recommend that the company consider before making a decision?

PROBLEM 12–25 Accept or Reject a Special Order [LO4]

Polaski Company manufactures and sells a single product called a Ret. Operating at capacity, the company can produce and sell 30,000 Rets per year. Costs associated with this level of production and sales are given below:

| | Unit | Total |
|---------------------------------------|-------------|--------------------|
| Direct materials..... | \$15 | \$ 450,000 |
| Direct labor | 8 | 240,000 |
| Variable manufacturing overhead | 3 | 90,000 |
| Fixed manufacturing overhead | 9 | 270,000 |
| Variable selling expense | 4 | 120,000 |
| Fixed selling expense | 6 | 180,000 |
| Total cost | <u>\$45</u> | <u>\$1,350,000</u> |

The Rets normally sell for \$50 each. Fixed manufacturing overhead is constant at \$270,000 per year within the range of 25,000 through 30,000 Rets per year.

Required:

- Assume that due to a recession, Polaski Company expects to sell only 25,000 Rets through regular channels next year. A large retail chain has offered to purchase 5,000 Rets if Polaski is willing to accept a 16% discount off the regular price. There would be no sales commissions on this order; thus, variable selling expenses would be slashed by 75%. However, Polaski Company would have to purchase a special machine to engrave the retail chain's name on the 5,000 units. This machine would cost \$10,000. Polaski Company has no assurance that the retail chain will purchase additional units in the future. Determine the impact on profits next year if this special order is accepted.
- Refer to the original data. Assume again that Polaski Company expects to sell only 25,000 Rets through regular channels next year. The U.S. Army would like to make a one-time-only purchase of 5,000 Rets. The Army would pay a fixed fee of \$1.80 per Ret, and it would reimburse Polaski Company for all costs of production (variable and fixed) associated with the units. Because the army would pick up the Rets with its own trucks, there would be no variable selling expenses associated with this order. If Polaski Company accepts the order, by how much will profits increase or decrease for the year?
- Assume the same situation as that described in (2) above, except that the company expects to sell 30,000 Rets through regular channels next year. Thus, accepting the U.S. Army's order would require giving up regular sales of 5,000 Rets. If the Army's order is accepted, by how much will profits increase or decrease from what they would be if the 5,000 Rets were sold through regular channels?

PROBLEM 12-26 Sell or Process Further [L06]

Come-Clean Corporation produces a variety of cleaning compounds and solutions for both industrial and household use. While most of its products are processed independently, a few are related, such as the company's Grit 337 and its Sparkle silver polish.

Grit 337 is a coarse cleaning powder with many industrial uses. It costs \$1.60 a pound to make, and it has a selling price of \$2.00 a pound. A small portion of the annual production of Grit 337 is retained in the factory for further processing. It is combined with several other ingredients to form a paste that is marketed as Sparkle silver polish. The silver polish sells for \$4.00 per jar.

This further processing requires one-fourth pound of Grit 337 per jar of silver polish. The additional direct costs involved in the processing of a jar of silver polish are:

| | |
|-------------------------|---------------|
| Other ingredients | \$0.65 |
| Direct labor | 1.48 |
| Total direct cost..... | <u>\$2.13</u> |

Overhead costs associated with processing the silver polish are:

| | |
|--|--------------------------|
| Variable manufacturing overhead cost | 25% of direct labor cost |
| Fixed manufacturing overhead cost (per month): | |
| Production supervisor | \$3,000 |
| Depreciation of mixing equipment..... | \$1,400 |

The production supervisor has no duties other than to oversee production of the silver polish. The mixing equipment is special-purpose equipment acquired specifically to produce the silver polish. Its resale value is negligible and it does not wear out through use.

Direct labor is a variable cost at Come-Clean Corporation.

Advertising costs for the silver polish total \$4,000 per month. Variable selling costs associated with the silver polish are 7.5% of sales.

Due to a recent decline in the demand for silver polish, the company is wondering whether its continued production is advisable. The sales manager feels that it would be more profitable to sell all of the Grit 337 as a cleaning powder.

Required:

1. What is the incremental contribution margin per jar from further processing of Grit 337 into silver polish?
2. What is the minimum number of jars of silver polish that must be sold each month to justify the continued processing of Grit 337 into silver polish? Explain. Show all computations.

(CMA, adapted)

PROBLEM 12-27 Utilization of a Constrained Resource [L05]

The Walton Toy Company manufactures a line of dolls and a doll dress sewing kit. Demand for the dolls is increasing, and management requests assistance from you in determining an economical sales and production mix for the coming year. The company has provided the following data:

| | A | B | C | D | E | F |
|---|------------|--------------------------|------------------------|------------------|--------------|---|
| | Product | Demand Next Year (units) | Selling Price per Unit | Direct Materials | Direct Labor | |
| 1 | Debbie | 50,000 | \$13.50 | \$4.30 | \$3.20 | |
| 2 | Trish | 42,000 | \$5.50 | \$1.10 | \$2.00 | |
| 3 | Sarah | 35,000 | \$21.00 | \$6.44 | \$5.60 | |
| 4 | Mike | 40,000 | \$10.00 | \$2.00 | \$4.00 | |
| 5 | Sewing kit | 325,000 | \$8.00 | \$3.20 | \$1.60 | |
| 6 | | | | | | |
| 7 | | | | | | |

The following additional information is available:

- a. The company’s plant has a capacity of 130,000 direct labor-hours per year on a single-shift basis. The company’s present employees and equipment can produce all five products.
- b. The direct labor rate of \$8 per hour is expected to remain unchanged during the coming year.
- c. Fixed costs total \$520,000 per year. Variable overhead costs are \$2 per direct labor-hour.
- d. All of the company’s nonmanufacturing costs are fixed.
- e. The company’s finished goods inventory is negligible and can be ignored.

Required:

- 1. Determine the contribution margin per direct labor-hour expended on each product.
- 2. Prepare a schedule showing the total direct labor-hours that will be required to produce the units estimated to be sold during the coming year.
- 3. Examine the data you have computed in (1) and (2) above. How would you allocate the 130,000 direct labor hours of capacity to Walton Toy Company’s various products?
- 4. What is the highest price, in terms of a rate per hour, that Walton Toy Company would be willing to pay for additional capacity (that is, for added direct labor time)?
- 5. Assume again that the company does not want to reduce sales of any product. Identify ways in which the company could obtain the additional output.

(CMA, adapted)

Cases

CASE 12–28 Integrative Case: Relevant Costs; Pricing [LO1, LO4]

Wesco Incorporated’s only product is a combination fertilizer/weedkiller called GrowNWeed. GrowNWeed is sold nationwide to retail nurseries and garden stores.

Zwinger Nursery plans to sell a similar fertilizer/weedkiller compound through its regional nursery chain under its own private label. Zwinger does not have manufacturing facilities of its own, so it has asked Wesco (and several other companies) to submit a bid for manufacturing and delivering a 20,000-pound order of the private brand compound to Zwinger. While the chemical composition of the Zwinger compound differs from that of GrowNWeed, the manufacturing processes are very similar.

The Zwinger compound would be produced in 1,000-pound lots. Each lot would require 25 direct labor-hours and the following chemicals:

| Chemicals | Quantity in Pounds |
|------------|--------------------|
| AG-5 | 300 |
| KL-2 | 200 |
| CW-7 | 150 |
| DF-6 | 175 |

The first three chemicals (AG-5, KL-2, and CW-7) are all used in the production of GrowNWeed. DF-6 was used in another compound that Wesco discontinued several months ago. The supply of DF-6 that Wesco had on hand when the other compound was discontinued was not discarded. Wesco could sell its supply of DF-6 at the prevailing market price less \$0.10 per pound selling and handling expenses.

Wesco also has on hand a chemical called BH-3, which was manufactured for use in another product that is no longer produced. BH-3, which cannot be used in GrowNWeed, can be substituted for AG-5 on a one-for-one basis without affecting the quality of the Zwinger compound. The BH-3 in inventory has a salvage value of \$600.

Inventory and cost data for the chemicals that can be used to produce the Zwinger compound are shown below:

| Raw Material | Pounds in Inventory | Actual Price per Pound When Purchased | Current Market Price per Pound |
|--------------|---------------------|---------------------------------------|--------------------------------|
| AG-5 | 18,000 | \$1.15 | \$1.20 |
| KL-2 | 6,000 | \$1.10 | \$1.05 |
| CW-7 | 7,000 | \$1.35 | \$1.35 |
| DF-6 | 3,000 | \$0.80 | \$0.70 |
| BH-3 | 3,500 | \$0.90 | (Salvage) |

The current direct labor wage rate is \$14 per hour. The predetermined overhead rate is based on direct labor-hours (DLH). The predetermined overhead rate for the current year, based on a two-shift capacity with no overtime, is as follows:

| | |
|--|------------------------|
| Variable manufacturing overhead | \$ 3.00 per DLH |
| Fixed manufacturing overhead | 10.50 per DLH |
| Combined predetermined overhead rate | <u>\$13.50 per DLH</u> |

Wesco's production manager reports that the present equipment and facilities are adequate to manufacture the Zwinger compound. Therefore, the order would have no effect on total fixed manufacturing overhead costs. However, Wesco is within 400 hours of its two-shift capacity this month. Any additional hours beyond the 400 hours must be done in overtime. If need be, the Zwinger compound could be produced on regular time by shifting a portion of GrowNWeed production to overtime. Wesco's direct labor wage rate for overtime is \$21 per hour. There is no allowance for any overtime premium in the predetermined overhead rate.

Required:

1. Wesco has decided to submit a bid for the 20,000 pound order of Zwinger's new compound. The order must be delivered by the end of the current month. Zwinger has indicated that this is a one-time order that will not be repeated. Calculate the lowest price that Wesco could bid for the order without reducing its net operating income.
2. Refer to the original data. Assume that Zwinger Nursery plans to place regular orders for 20,000-pound lots of the new compound. Wesco expects the demand for GrowNWeed to remain strong. Therefore, the recurring orders from Zwinger would put Wesco over its two-shift capacity. However, production could be scheduled so that 90% of each Zwinger order could be completed during regular hours. As another option, some GrowNWeed production could be shifted temporarily to overtime so that the Zwinger orders could be produced on regular time. Current market prices are the best available estimates of future market prices.

Wesco's standard markup policy for new products is 40% of the full manufacturing cost, including fixed manufacturing overhead. Calculate the price that Wesco, Inc., would quote Zwinger Nursery for each 20,000 pound lot of the new compound, assuming that it is to be treated as a new product and this pricing policy is followed.

(CMA, adapted)

CASE 12-29 Plant Closing Decision [LO1, LO2]

QualSupport Corporation manufactures seats for automobiles, vans, trucks, and various recreational vehicles. The company has a number of plants around the world, including the Denver Cover Plant, which makes seat covers.

Ted Vosilo is the plant manager of the Denver Cover Plant but also serves as the regional production manager for the company. His budget as the regional manager is charged to the Denver Cover Plant.

Vosilo has just heard that QualSupport has received a bid from an outside vendor to supply the equivalent of the entire annual output of the Denver Cover Plant for \$35 million. Vosilo was astonished at the low outside bid because the budget for the Denver Cover Plant's operating costs for the upcoming year was set at \$52 million. If this bid is accepted, the Denver Cover Plant will be closed down.

The budget for Denver Cover's operating costs for the coming year is presented below. Additional facts regarding the plant's operations are as follows:

- a. Due to Denver Cover's commitment to use high-quality fabrics in all of its products, the Purchasing Department was instructed to place blanket purchase orders with major suppliers to ensure the receipt of sufficient materials for the coming year. If these orders are canceled as a consequence of the plant closing, termination charges would amount to 20% of the cost of direct materials.
- b. Approximately 400 plant employees will lose their jobs if the plant is closed. This includes all of the direct laborers and supervisors as well as the plumbers, electricians, and other skilled workers classified as indirect plant workers. Some would be able to find new jobs while many others would have difficulty. All employees would have difficulty matching Denver Cover's base pay of \$18.80 per hour, which is the highest in the area. A clause in Denver Cover's contract with the union may help some employees; the company must provide employment assistance to its former employees for 12 months after a plant closing. The estimated cost to administer this service would be \$1.5 million for the year.
- c. Some employees would probably choose early retirement because QualSupport has an excellent pension plan. In fact, \$3 million of the annual pension expense would continue whether Denver Cover is open or not.

- d. Vosilo and his staff would not be affected by the closing of Denver Cover. They would still be responsible for administering three other area plants.
- e. If the Denver Cover Plant were closed, the company would realize about \$3.2 million salvage value for the equipment and building. If the plant remains open, there are no plans to make any significant investments in new equipment or buildings. The old equipment is adequate and should last indefinitely.

| Denver Cover Plant Annual Budget for Operating Costs | | |
|---|--------------|---------------------|
| Materials | | \$14,000,000 |
| Labor: | | |
| Direct | \$13,100,000 | |
| Supervision | 900,000 | |
| Indirect plant | 4,000,000 | 18,000,000 |
| Overhead: | | |
| Depreciation—equipment | 3,200,000 | |
| Depreciation—building | 7,000,000 | |
| Pension expense | 5,000,000 | |
| Plant manager and staff | 800,000 | |
| Corporate expenses* | 4,000,000 | 20,000,000 |
| Total budgeted costs | | <u>\$52,000,000</u> |

*Fixed corporate expenses allocated to plants and other operating units based on total budgeted wage and salary costs.

Required:

1. Without regard to costs, identify the advantages to QualSupport Corporation of continuing to obtain covers from its own Denver Cover Plant.
2. QualSupport Corporation plans to prepare a financial analysis that will be used in deciding whether or not to close the Denver Cover Plant. Management has asked you to identify:
 - a. The annual budgeted costs that are relevant to the decision regarding closing the plant (show the dollar amounts).
 - b. The annual budgeted costs that are *not* relevant to the decision regarding closing the plant and explain why they are not relevant (again show the dollar amounts).
 - c. Any nonrecurring costs that would arise due to the closing of the plant, and explain how they would affect the decision (again show any dollar amounts).
3. Looking at the data you have prepared in (2) above, should the plant be closed? Show computations and explain your answer.
4. Identify any revenues or costs not specifically mentioned in the problem that QualSupport should consider before making a decision.

(CMA, adapted)

CASE 12–30 Make or Buy; Utilization of a Constrained Resource [LO1, LO3, LO5]

TufStuff, Inc., sells a wide range of drums, bins, boxes, and other containers that are used in the chemical industry. One of the company’s products is a heavy-duty corrosion-resistant metal drum, called the WVD drum, used to store toxic wastes. Production is constrained by the capacity of an automated welding machine that is used to make precision welds. A total of 2,000 hours of welding time is available annually on the machine. Because each drum requires 0.4 hours of welding time, annual production is limited to 5,000 drums. At present, the welding machine is used exclusively to make the WVD drums. The accounting department has provided the following financial data concerning the WVD drums:

| WVD Drums | | |
|---|---------|-----------------|
| Selling price per drum | | \$149.00 |
| Cost per drum: | | |
| Direct materials | \$52.10 | |
| Direct labor (\$18 per hour) | 3.60 | |
| Manufacturing overhead | 4.50 | |
| Selling and administrative expense..... | 29.80 | 90.00 |
| Margin per drum | | <u>\$ 59.00</u> |

Management believes 6,000 WVD drums could be sold each year if the company had sufficient manufacturing capacity. As an alternative to adding another welding machine, management has considered buying additional drums from an outside supplier. Harcor Industries, Inc., a supplier of quality products, would be able to provide up to 4,000 WVD-type drums per year at a price of \$138 per drum, which TufStuff would resell to its customers at its normal selling price after appropriate relabeling.

Megan Flores, TufStuff's production manager, has suggested that the company could make better use of the welding machine by manufacturing bike frames, which would require only 0.5 hours of welding time per frame and yet sell for far more than the drums. Megan believes that TufStuff could sell up to 1,600 bike frames per year to bike manufacturers at a price of \$239 each. The accounting department has provided the following data concerning the proposed new product:

| Bike Frames | | |
|---|---------|-----------------|
| Selling price per frame..... | | \$239.00 |
| Cost per frame: | | |
| Direct materials | \$99.40 | |
| Direct labor (\$18 per hour)..... | 28.80 | |
| Manufacturing overhead | 36.00 | |
| Selling and administrative expense..... | 47.80 | <u>212.00</u> |
| Margin per frame | | <u>\$ 27.00</u> |

The bike frames could be produced with existing equipment and personnel. Manufacturing overhead is allocated to products on the basis of direct labor-hours. Most of the manufacturing overhead consists of fixed common costs such as rent on the factory building, but some of it is variable. The variable manufacturing overhead has been estimated at \$1.35 per WVD drum and \$1.90 per bike frame. The variable manufacturing overhead cost would not be incurred on drums acquired from the outside supplier.

Selling and administrative expenses are allocated to products on the basis of revenues. Almost all of the selling and administrative expenses are fixed common costs, but it has been estimated that variable selling and administrative expenses amount to \$0.75 per WVD drum whether made or purchased and would be \$1.30 per bike frame.

All of the company's employees—direct and indirect—are paid for full 40-hour workweeks and the company has a policy of laying off workers only in major recessions.

Required:

- Given the margins of the two products as indicated in the reports submitted by the accounting department, does it make sense to consider producing the bike frames? Explain.
- Compute the contribution margin per unit for:
 - Purchased WVD drums.
 - Manufactured WVD drums.
 - Manufactured bike frames.
- Determine the number of WVD drums (if any) that should be purchased and the number of WVD drums and/or bike frames (if any) that should be manufactured. What is the increase in net operating income that would result from this plan over current operations?

As soon as your analysis was shown to the top management team at TufStuff, several managers got into an argument concerning how direct labor costs should be treated when making this decision. One manager argued that direct labor is always treated as a variable cost in textbooks and in practice and has always been considered a variable cost at TufStuff. After all, "direct" means you can directly trace the cost to products. "If direct labor is not a variable cost, what is?" Another manager argued just as strenuously that direct labor should be considered a fixed cost at TufStuff. No one had been laid off in over a decade, and for all practical purposes, everyone at the plant is on a monthly salary. Everyone classified as direct labor works a regular 40-hour workweek and overtime has not been necessary since the company adopted Lean Production techniques. Whether the welding machine is used to make drums or frames, the total payroll would be exactly the same. There is enough slack, in the form of idle time, to accommodate any increase in total direct labor time that the bike frames would require.

- Redo requirements (2) and (3) making the opposite assumption about direct labor from the one you originally made. In other words, if you treated direct labor as a variable cost, redo the analysis treating it as a fixed cost. If you treated direct labor as a fixed cost, redo the analysis treating it as a variable cost.
- What do you think is the correct way to treat direct labor cost in this situation—as variable or as fixed? Explain.

CASE 12–31 Sell or Process Further Decision [L06]

The Scottie Sweater Company produces sweaters under the “Scottie” label. The company buys raw wool and processes it into wool yarn from which the sweaters are woven. One spindle of wool yarn is required to produce one sweater. The costs and revenues associated with the sweaters are given below:

| | Per Sweater | |
|-----------------------------------|-------------|------------------|
| Selling price | | \$30.00 |
| Cost to manufacture: | | |
| Raw materials: | | |
| Buttons, thread, lining..... | \$ 2.00 | |
| Wool yarn | 16.00 | |
| Total raw materials | 18.00 | |
| Direct labor..... | 5.80 | |
| Manufacturing overhead | 8.70 | <u>32.50</u> |
| Manufacturing profit (loss) | | <u>\$ (2.50)</u> |

Originally, all of the wool yarn was used to produce sweaters, but in recent years a market has developed for the wool yarn itself. The yarn is purchased by other companies for use in production of wool blankets and other wool products. Since the development of the market for the wool yarn, a continuing dispute has existed in the Scottie Sweater Company as to whether the yarn should be sold simply as yarn or processed into sweaters. Current cost and revenue data on the yarn are given below:

| | Per Spindle of Yarn | |
|--------------------------------|---------------------|----------------|
| Selling price | | \$20.00 |
| Cost to manufacture: | | |
| Raw materials (raw wool) | \$7.00 | |
| Direct labor | 3.60 | |
| Manufacturing overhead | 5.40 | <u>16.00</u> |
| Manufacturing profit | | <u>\$ 4.00</u> |

The market for sweaters is temporarily depressed, due to unusually warm weather in the western states where the sweaters are sold. This has made it necessary for the company to discount the selling price of the sweaters to \$30 from the normal \$40 price. Because the market for wool yarn has remained strong, the dispute has again surfaced over whether the yarn should be sold outright rather than processed into sweaters. The sales manager thinks that the production of sweaters should be discontinued; she is upset about having to sell sweaters at a \$2.50 loss when the yarn could be sold for a \$4.00 profit. However, the production superintendent does not want to close down a large portion of the factory. He argues that the company is in the sweater business, not the yarn business, and that the company should focus on its core strength.

All of the manufacturing overhead costs are fixed and would not be affected even if sweaters were discontinued. Manufacturing overhead is assigned to products on the basis of 150% of direct labor cost. Materials and direct labor costs are variable.

Required:

1. Would you recommend that the wool yarn be sold outright or processed into sweaters? Support your answer with appropriate computations and explain your reasoning.
2. What is the lowest price that the company should accept for a sweater? Support your answer with appropriate computations and explain your reasoning.

CASE 12–32 Ethics and the Manager; Shut Down or Continue Operations [L02]

Haley Romeros had just been appointed vice president of the Rocky Mountain Region of the Bank Services Corporation (BSC). The company provides check processing services for small banks. The banks send checks presented for deposit or payment to BSC, which records the data on each check in a computerized database. BSC then sends the data electronically to the nearest Federal Reserve Bank check-clearing center where the appropriate transfers of funds are made between banks. The Rocky Mountain Region has three

check processing centers, which are located in Billings, Montana; Great Falls, Montana; and Clayton, Idaho. Prior to her promotion to vice president, Ms. Romeros had been the manager of a check processing center in New Jersey.

Immediately after assuming her new position, Ms. Romeros requested a complete financial report for the just-ended fiscal year from the region's controller, John Littlebear. Ms. Romeros specified that the financial report should follow the standardized format required by corporate headquarters for all regional performance reports. That report follows:

**Bank Services Corporation (BSC)
Rocky Mountain Region
Financial Performance**

| | Total | Check Processing Centers | | |
|---|---------------------|--------------------------|---------------------|---------------------|
| | | Billings | Great Falls | Clayton |
| Sales..... | \$50,000,000 | \$20,000,000 | \$18,000,000 | \$12,000,000 |
| Operating expenses: | | | | |
| Direct labor..... | 32,000,000 | 12,500,000 | 11,000,000 | 8,500,000 |
| Variable overhead | 850,000 | 350,000 | 310,000 | 190,000 |
| Equipment depreciation | 3,900,000 | 1,300,000 | 1,400,000 | 1,200,000 |
| Facility expense | 2,800,000 | 900,000 | 800,000 | 1,100,000 |
| Local administrative expense* | 450,000 | 140,000 | 160,000 | 150,000 |
| Regional administrative expense [†] | 1,500,000 | 600,000 | 540,000 | 360,000 |
| Corporate administrative expense [‡] | 4,750,000 | 1,900,000 | 1,710,000 | 1,140,000 |
| Total operating expense..... | <u>46,250,000</u> | <u>17,690,000</u> | <u>15,920,000</u> | <u>12,640,000</u> |
| Net operating income | <u>\$ 3,750,000</u> | <u>\$ 2,310,000</u> | <u>\$ 2,080,000</u> | <u>\$ (640,000)</u> |

*Local administrative expenses are the administrative expenses incurred at the check processing centers.

[†]Regional administrative expenses are allocated to the check processing centers based on sales.

[‡]Corporate administrative expenses are charged to segments of the company such as the Rocky Mountain Region and the check processing centers at the rate of 9.5% of their sales.

Upon seeing this report, Ms. Romeros summoned John Littlebear for an explanation.

Romeros: What's the story on Clayton? It didn't have a loss the previous year did it?

Littlebear: No, the Clayton facility has had a nice profit every year since it was opened six years ago, but Clayton lost a big contract this year.

Romeros: Why?

Littlebear: One of our national competitors entered the local market and bid very aggressively on the contract. We couldn't afford to meet the bid. Clayton's costs—particularly their facility expenses—are just too high. When Clayton lost the contract, we had to lay off a lot of employees, but we could not reduce the fixed costs of the Clayton facility.

Romeros: Why is Clayton's facility expense so high? It's a smaller facility than either Billings or Great Falls and yet its facility expense is higher.

Littlebear: The problem is that we are able to rent suitable facilities very cheaply at Billings and Great Falls. No such facilities were available at Clayton; we had them built. Unfortunately, there were big cost overruns. The contractor we hired was inexperienced at this kind of work and in fact went bankrupt before the project was completed. After hiring another contractor to finish the work, we were way over budget. The large depreciation charges on the facility didn't matter at first because we didn't have much competition at the time and could charge premium prices.

Romeros: Well we can't do that anymore. The Clayton facility will obviously have to be shut down. Its business can be shifted to the other two check processing centers in the region.

Littlebear: I would advise against that. The \$1,200,000 in depreciation at the Clayton facility is misleading. That facility should last indefinitely with proper maintenance. And it has no resale value; there is no other commercial activity around Clayton.

Romeros: What about the other costs at Clayton?

Littlebear: If we shifted Clayton's business over to the other two processing centers in the region, we wouldn't save anything on direct labor or variable overhead costs. We might save \$90,000 or so in local administrative expense, but we would not save any regional administrative expense and corporate headquarters would still charge us 9.5% of our sales as corporate administrative expense.

In addition, we would have to rent more space in Billings and Great Falls in order to handle the work transferred from Clayton; that would probably cost us at least \$600,000 a year. And don't forget that it will cost us something to move the equipment from Clayton to Billings and Great Falls. And the move will disrupt service to customers.

Romeros: I understand all of that, but a money-losing processing center on my performance report is completely unacceptable.

Littlebear: And if you shut down Clayton, you are going to throw some loyal employees out of work.

Romeros: That's unfortunate, but we have to face hard business realities.

Littlebear: And you would have to write off the investment in the facilities at Clayton.

Romeros: I can explain a write-off to corporate headquarters; hiring an inexperienced contractor to build the Clayton facility was my predecessor's mistake. But they'll have my head at headquarters if I show operating losses every year at one of my processing centers. Clayton has to go. At the next corporate board meeting, I am going to recommend that the Clayton facility be closed.

Required:

1. From the standpoint of the company as a whole, should the Clayton processing center be shut down and its work redistributed to other processing centers in the region? Explain.
2. Do you think Haley Romeros's decision to shut down the Clayton facility is ethical? Explain.
3. What influence should the depreciation on the facilities at Clayton have on prices charged by Clayton for its services?

Learning Objectives

After studying Chapter 13, you should be able to:

- L01** Evaluate the acceptability of an investment project using the net present value method.
- L02** Evaluate the acceptability of an investment project using the internal rate of return method.
- L03** Evaluate an investment project that has uncertain cash flows.
- L04** Rank investment projects in order of preference.
- L05** Determine the payback period for an investment.
- L06** Compute the simple rate of return for an investment.
- L07** (Appendix 13A) Understand present value concepts and the use of present value tables.
- L08** (Appendix 13C) Include income taxes in a capital budgeting analysis.

Capital Budgeting Decisions

Capital Investments: A Key to Profitable Growth

Cintas Corporation, headquartered in Cincinnati, Ohio, has had 39 years of uninterrupted growth in sales and profits. The company provides highly specialized services to businesses of all types throughout North America, but the backbone of its success is providing corporate identity uniforms to more than five million North American workers. Cintas has 413 uniform rental facilities, 10 manufacturing plants, and eight distribution

BUSINESS FOCUS

centers across North America. The challenge for Cintas is choosing among competing capital expansion opportunities.

At Cintas, each capital investment proposal must be accompanied by a financial analysis that estimates the project's cash inflows and outflows. The job of the Controller of Cintas' Rental Division, is to challenge the validity of the assumptions underlying the financial estimates. Is the cost to build the new facility underestimated? Are future revenue growth rates overly optimistic? Is it necessary to build a new facility, or could an existing facility be refurbished or expanded? Asking these types of constructive questions helps Cintas channel its limited investment funds to the most profitable opportunities. ■

Source: Author's conversation with Paul Carmichael, Senior Controller, Cintas Corporation.

Managers often consider decisions that involve an investment today in the hope of realizing future profits. For example, **Tri-Con Global Restaurants, Inc.** makes an investment when it opens a new Pizza Hut restaurant. **L. L. Bean** makes an investment when it installs a new computer to handle customer billing. **Chrysler** makes an investment when it redesigns a product such as the Jeep Eagle. **Merck & Co.** invests in medical research. **Amazon.com** makes an investment when it redesigns its website. All of these investments require committing funds today with the expectation of earning a return on those funds in the future in the form of additional net cash flows.

The term **capital budgeting** is used to describe how managers plan significant investments in projects that have long-term implications such as the purchase of new equipment or the introduction of new products. Most companies have many more potential projects than can actually be funded. Hence, managers must carefully select those projects that promise the greatest future return. How well managers make these capital budgeting decisions is a critical factor in the long-run financial health of the organization.

Capital Budgeting—Planning Investments

Typical Capital Budgeting Decisions

Any decision that involves an outlay now in order to obtain a future return is a capital budgeting decision. Typical capital budgeting decisions include:

1. Cost reduction decisions. Should new equipment be purchased to reduce costs?
2. Expansion decisions. Should a new plant, warehouse, or other facility be acquired to increase capacity and sales?
3. Equipment selection decisions. Which of several available machines should be purchased?
4. Lease or buy decisions. Should new equipment be leased or purchased?
5. Equipment replacement decisions. Should old equipment be replaced now or later?

Capital budgeting decisions fall into two broad categories—*screening decisions* and *preference decisions*. **Screening decisions** relate to whether a proposed project is acceptable—whether it passes a preset hurdle. For example, a company may have a policy of accepting projects only if they promise a return of at least 20% on the investment. The required rate of return is the minimum rate of return a project must yield to be acceptable. **Preference decisions**, by contrast, relate to selecting from among several acceptable alternatives. To illustrate, a company may be considering several different machines to replace an existing machine on the assembly line. The choice of which machine to purchase is a preference decision. In this chapter, we first discuss screening decisions and then move on to preference decisions toward the end of the chapter.

The Time Value of Money

Capital investments usually earn returns that extend over fairly long periods of time. Therefore, it is important to recognize *the time value of money* when evaluating investment proposals. A dollar today is worth more than a dollar a year from now if for no other reason than that you could put a dollar in a bank today and have more than a dollar a year from now. Therefore, projects that promise earlier returns are preferable to those that promise later returns.

Capital budgeting techniques that recognize the time value of money involve *discounting cash flows*. We will spend most of this chapter showing how to use discounted cash flow

methods in making capital budgeting decisions. If you are not already familiar with discounting and the use of present value tables, you should read Appendix 13A: The Concept of Present Value at the end of this chapter before proceeding any further.

IN BUSINESS

CHOOSING A CAT

Sometimes a long-term decision does not have to involve present value calculations or any other sophisticated analytical technique. **White Grizzly Adventures** of Meadow Creek, British Columbia, needs two snowcats for its powder skiing operations—one for shuttling guests to the top of the mountain and one to be held in reserve in case of mechanical problems with the first. **Bombardier** of Canada sells new snowcats for \$250,000 and used, reconditioned snowcats for \$150,000. In either case, the snowcats are good for about 5,000 hours of operation before they need to be reconditioned. From White Grizzly's perspective, the choice is clear. Because both new and reconditioned snowcats last about 5,000 hours, but the reconditioned snowcats cost \$100,000 less, the reconditioned snowcats are the obvious choice. They may not have all of the latest bells and whistles, but they get the job done at a price a small company can afford.

Bombardier snowcats do not have passenger cabs as standard equipment. To save money, White Grizzly builds its own custom-designed passenger cab for about \$15,000, using recycled Ford Escort seats and industrial-strength aluminum for the frame and siding. If purchased at retail, a passenger cab would cost about twice as much and would not be as well-suited for snowcat skiing.

Discounted Cash Flows—The Net Present Value Method

LEARNING OBJECTIVE 1

Evaluate the acceptability of an investment project using the net present value method.

Two approaches to making capital budgeting decisions use discounted cash flows. One is the *net present value method*, and the other is the *internal rate of return method*. The net present value method is discussed in this section; the internal rate of return method is discussed in the following section.

The Net Present Value Method Illustrated

Under the net present value method, the present value of a project's cash inflows is compared to the present value of the project's cash outflows. The difference between the present value of these cash flows, called the **net present value**, determines whether or not the project is an acceptable investment. To illustrate, consider the following data:

Example A: Harper Company is contemplating the purchase of a machine capable of performing some operations that are now performed manually. The machine will cost \$50,000, and it will last for five years. At the end of the five-year period, the machine will have a zero scrap value. Use of the machine will reduce labor costs by \$18,000 per year. Harper Company requires a minimum pretax return of 20% on all investment projects.¹

Should the machine be purchased? Harper Company must determine whether a cash investment now of \$50,000 can be justified if it will result in an \$18,000 reduction in cost in each of the next five years. It may appear that the answer is obvious because the total cost savings is \$90,000 (\$18,000 per year \times 5 years). However, the company can earn a 20% return by investing its money elsewhere. It is not enough that the cost reductions cover just the original cost of the machine; they must also yield a return of at least 20% or the company would be better off investing the money elsewhere.

¹ For simplicity, we ignore inflation and taxes. The impact of income taxes on capital budgeting decisions is discussed in Appendix 13C.

EXHIBIT 13-1
Net Present Value Analysis of
a Proposed Project

| | |
|-------------------------------|----------|
| Initial cost | \$50,000 |
| Life of the project | 5 years |
| Annual cost savings | \$18,000 |
| Salvage value | \$0 |
| Required rate of return | 20% |

| Item | Year(s) | Amount of Cash Flow | 20% Factor | Present Value of Cash Flows |
|---------------------------|---------|---------------------|------------|-----------------------------|
| Annual cost savings | 1–5 | \$ 18,000 | 2.991* | \$53,838 |
| Initial investment | Now | \$(50,000) | 1.000 | <u>(50,000)</u> |
| Net present value | | | | <u>\$ 3,838</u> |

*From Exhibit 13B-2 in Appendix 13B at the end of this chapter.

To determine whether the investment is desirable, the stream of annual \$18,000 cost savings should be discounted to its present value and then compared to the cost of the new machine. Harper Company's minimum required return of 20% is used as the *discount rate* in the discounting process. Exhibit 13-1 illustrates the computation of the net present value of this proposed project. The annual cost savings of \$18,000 is multiplied by 2.991, the present value factor of a five-year annuity at the discount rate of 20%, to obtain \$53,838.² This is the present value of the annual cost savings. The present value of the initial investment is computed by multiplying the investment amount of \$50,000 by 1.000, the present value factor for any cash flow that occurs immediately.

According to the analysis, Harper Company should purchase the new machine. The present value of the cost savings is \$53,838, whereas the present value of the required investment (cost of the machine) is only \$50,000. Deducting the present value of the required investment from the present value of the cost savings yields the *net present value* of \$3,838. Whenever the net present value is zero or greater, as in our example, an investment project is acceptable. Whenever the net present value is negative (the present value of the cash outflows exceeds the present value of the cash inflows), an investment project is not acceptable. In sum:

| If the Net Present Value Is . . . | Then the Project Is . . . |
|-----------------------------------|--|
| Positive | Acceptable because it promises a return greater than the required rate of return. |
| Zero | Acceptable because it promises a return equal to the required rate of return. |
| Negative | Not acceptable because it promises a return less than the required rate of return. |

There is another way to interpret the net present value. Harper Company could spend up to \$53,838 for the new machine and still obtain the minimum required 20% rate of return. The net present value of \$3,838, therefore, shows the amount of "cushion" or "margin of error." One way to look at this is that the company could underestimate the cost of the new machine by up to \$3,838, or overestimate the net present value of the future cash savings by up to \$3,838, and the project would still be financially attractive.

² Unless otherwise stated, for the sake of simplicity we will assume in this chapter that all cash flows other than the initial investment occur at the ends of years.

Emphasis on Cash Flows

Accounting net income is based on accruals that ignore when cash flows occur. However, in capital budgeting, the timing of cash flows is critical. The present value of a cash flow depends on when it occurs. For that reason, cash flow rather than accounting net income is the focus in capital budgeting.³ Examples of cash outflows and cash inflows that are often relevant to capital investment decisions are described below.

Typical Cash Outflows Most projects have at least three types of cash outflows. First, they often require an immediate cash outflow in the form of an initial investment in equipment, other assets, and installation costs. Any salvage value realized from the sale of old equipment can be recognized as a reduction in the initial investment or as a cash inflow. Second, some projects require a company to expand its working capital. **Working capital** is current assets (e.g., cash, accounts receivable, and inventory) less current liabilities. When a company takes on a new project, the balances in the current asset accounts often increase. For example, opening a new Nordstrom's department store requires additional cash in sales registers and more inventory. These additional working capital needs are treated as part of the initial investment in a project. Third, many projects require periodic outlays for repairs and maintenance and additional operating costs.

Typical Cash Inflows Most projects also have at least three types of cash inflows. First, a project will normally increase revenues or reduce costs. Either way, the amount involved should be treated as a cash inflow for capital budgeting purposes. Notice that from a cash flow standpoint, a reduction in costs is equivalent to an increase in revenues. Second, cash inflows are also frequently realized from selling equipment for its salvage value when a project ends, although the company may actually have to pay to dispose of some low-value or hazardous items. Third, any working capital that was tied up in the project can be released for use elsewhere at the end of the project and should be treated as a cash inflow at that time. Working capital is released, for example, when a company sells off its inventory or collects its accounts receivable.

In summary, the following types of cash flows are common in business investment projects:

Cash outflows:
 Initial investment (including installation costs).
 Increased working capital needs.
 Repairs and maintenance.
 Incremental operating costs.

Cash inflows:
 Incremental revenues.
 Reduction in costs.
 Salvage value.
 Release of working capital.

Recovery of the Original Investment

The net present value method automatically provides for return of the original investment. Whenever the net present value of a project is positive, the project will recover the original cost of the investment plus sufficient excess cash inflows to compensate for tying up funds in the project. To demonstrate this point, consider the following situation:

³ Under certain conditions, capital budgeting decisions can be correctly made by discounting appropriately defined accounting net income. However, this approach requires advanced techniques that are beyond the scope of this book.

| | |
|-------------------------------|---------|
| Initial cost | \$3,170 |
| Life of the project | 4 years |
| Annual net cash inflow | \$1,000 |
| Salvage value | \$0 |
| Required rate of return | 10% |

EXHIBIT 13-2
Carver Hospital—Net Present Value Analysis of X-Ray Attachment

| Item | Year(s) | Amount of Cash Flow | 10% Factor | Present Value of Cash Flows |
|------------------------------|---------|---------------------|------------|-----------------------------|
| Annual net cash inflow | 1-4 | \$ 1,000 | 3.170* | \$3,170 |
| Initial investment | Now | \$(3,170) | 1.000 | <u>(3,170)</u> |
| Net present value | | | | <u>\$ 0</u> |

*From Exhibit 13B-2 in Appendix 13B.

Example B: Carver Hospital is considering the purchase of an attachment for its X-ray machine that will cost \$3,170. The attachment will be usable for four years, after which time it will have no salvage value. It will increase net cash inflows by \$1,000 per year in the X-ray department. The hospital’s board of directors requires a rate of return of at least 10% on such investments in equipment.

A net present value analysis of the desirability of purchasing the X-ray attachment is presented in Exhibit 13-2. Notice that the attachment promises exactly a 10% return on the original investment because the net present value is zero at a 10% discount rate.

Each annual \$1,000 cash inflow arising from use of the attachment is made up of two parts. One part represents a recovery of a portion of the original \$3,170 paid for the attachment, and the other part represents a return on this investment. The breakdown of each year’s \$1,000 cash inflow between recovery of investment and return on investment is shown in Exhibit 13-3.

The first year’s \$1,000 cash inflow consists of a return on investment of \$317 (a 10% return on the \$3,170 original investment), plus a \$683 return of that investment. Because the amount of the unrecovered investment decreases each year, the dollar amount of the return on investment also decreases each year. By the end of the fourth year, all \$3,170 of the original investment has been recovered.

EXHIBIT 13-3 Carver Hospital—Breakdown of Annual Cash Inflows

| Year | (1) Investment Outstanding during the Year | (2) Cash Inflow | (3) Return on Investment (1) × 10% | (4) Recovery of Investment during the Year (2) – (3) | (5) Unrecovered Investment at the End of the Year (1) – (4) |
|----------------------------------|---|--------------------|---------------------------------------|---|--|
| 1 | \$3,170 | \$1,000 | \$317 | \$ 683 | \$2,487 |
| 2 | \$2,487 | \$1,000 | \$249 | 751 | \$1,736 |
| 3 | \$1,736 | \$1,000 | \$173 | 827 | \$909 |
| 4 | \$909 | \$1,000 | \$91 | 909 | \$0 |
| Total investment recovered | | | | <u>\$3,170</u> | |

Simplifying Assumptions

Two simplifying assumptions are usually made in net present value analysis.

The first assumption is that all cash flows other than the initial investment occur at the end of periods. This is somewhat unrealistic in that cash flows typically occur

throughout a period rather than just at its end. The purpose of this assumption is to simplify computations.

The second assumption is that all cash flows generated by an investment project are immediately reinvested at a rate of return equal to the discount rate. Unless these conditions are met, the net present value computed for the project will not be accurate. We used a discount rate of 10% for Carver Hospital in Exhibit 13–2. Unless the cash flows in each period are immediately reinvested at a 10% return, the net present value computed for the X-ray attachment will be misstated.

Choosing a Discount Rate

A positive net present value indicates that the project's return exceeds the discount rate. A negative net present value indicates that the project's return is less than the discount rate. Therefore, if the company's minimum required rate of return is used as the discount rate, a project with a positive net present value has a return that exceeds the minimum required rate of return and is acceptable. Contrarily, a project with a negative net present value has a return that is less than the minimum required rate of return and is unacceptable.

What is a company's minimum required rate of return? The company's *cost of capital* is usually regarded as the minimum required rate of return. The **cost of capital** is the average rate of return the company must pay to its long-term creditors and its shareholders for the use of their funds. If a project's rate of return is less than the cost of capital, the company does not earn enough to compensate its creditors and shareholders. Therefore, any project with a rate of return less than the cost of capital should be rejected.

The cost of capital serves as a *screening device*. When the cost of capital is used as the discount rate in net present value analysis, any project with a negative net present value does not cover the company's cost of capital and should be discarded as unacceptable.

IN BUSINESS

BUCK KNIVES PACKS ITS BAGS

Buck Knives was losing money at its plant in San Diego, California. The company responded by loading its entire factory into a caravan of tractor-trailers and moving to Post Falls, Idaho. The relocation cost \$6.5 million, but Buck Knives justified the move based on the annual cost savings summarized below.

| | San Diego | Post Falls |
|---|-----------|------------|
| Electricity (cost per kilowatt hour) | \$0.118 | \$0.031 |
| Workers' compensation (cost per employee per year) | \$2,095 | \$210 |
| Median hourly wage | \$15.15 | \$12.40 |
| State business tax | 8.84% | 7.6% |
| Health insurance (per family per year) | \$9,091 | \$8,563 |
| Office space (cost per square foot) | \$34.20 | \$1.50 |
| Sales tax | 7.75% | 5% |

How would you analyze the financial viability of this decision? The first step would be to convert the data in the above table into annual lump sum savings. Then, net present value analysis could be used to compare the discounted value of the annual cost savings to the initial cash outlay associated with the relocation.

Source: Chris Lydgate, "The Buck Stopped Here," *Inc. magazine*, May 2006, pp. 86–95.

An Extended Example of the Net Present Value Method

Example C provides an extended example of how the net present value method is used to analyze a proposed project. This example helps tie together and reinforce many of the ideas discussed thus far.

Example C: Under a special licensing arrangement, Swinyard Corporation has an opportunity to market a new product for a five-year period. The product would be purchased from the manufacturer, with Swinyard responsible for promotion and distribution costs. The licensing arrangement could be renewed at the end of the five-year period. After careful study, Swinyard estimated the following costs and revenues for the new product:

| | |
|--|-----------|
| Cost of equipment needed | \$60,000 |
| Working capital needed | \$100,000 |
| Overhaul of the equipment in four years | \$5,000 |
| Salvage value of the equipment in five years | \$10,000 |
| Annual revenues and costs: | |
| Sales revenues | \$200,000 |
| Cost of goods sold | \$125,000 |
| Out-of-pocket operating costs (for salaries, advertising, and other direct costs) | \$35,000 |

At the end of the five-year period, if Swinyard decides not to renew the licensing arrangement the working capital would be released for investment elsewhere. Swinyard uses a 14% discount rate. Would you recommend that the new product be introduced?

This example involves a variety of cash inflows and cash outflows. The solution is given in Exhibit 13–4.

Notice how the working capital is handled in this exhibit. It is counted as a cash outflow at the beginning of the project and as a cash inflow when it is released at the end of the project. Also notice how the sales revenues, cost of goods sold, and out-of-pocket costs are handled. **Out-of-pocket costs** are actual cash outlays for salaries, advertising, and other operating expenses.

Because the net present value of the proposal is positive, the new product is acceptable.

EXHIBIT 13–4 The Net Present Value Method—An Extended Example

| | | | | |
|---|--|--------------------------------|-----------------------|--|
| | Sales revenues | \$200,000 | | |
| | Less cost of goods sold | 125,000 | | |
| | Less out-of-pocket costs for salaries, advertising, etc. | 35,000 | | |
| | Annual net cash inflows | <u>\$ 40,000</u> | | |
| Item | Year(s) | Amount of Cash Flow | 14% Factor | Present Value of Cash Flows |
| Purchase of equipment | Now | \$(60,000) | 1.000 | \$ (60,000) |
| Working capital needed | Now | \$(100,000) | 1.000 | (100,000) |
| Overhaul of equipment | 4 | \$(5,000) | 0.592* | (2,960) |
| Annual net cash inflows from sales of the product line | 1–5 | \$40,000 | 3.433† | 137,320 |
| Salvage value of the equipment | 5 | \$10,000 | 0.519* | 5,190 |
| Working capital released | 5 | \$100,000 | 0.519* | 51,900 |
| Net present value | | | | <u>\$ 31,450</u> |

*From Exhibit 13B–1 in Appendix 13B.
†From Exhibit 13B–2 in Appendix 13B.

Discounted Cash Flows—The Internal Rate of Return Method

LEARNING OBJECTIVE 2

Evaluate the acceptability of an investment project using the internal rate of return method.

The **internal rate of return** is the rate of return promised by an investment project over its useful life. The internal rate of return is computed by finding the discount rate that equates the present value of a project’s cash outflows with the present value of its cash inflows. In other words, the internal rate of return is the discount rate that results in a net present value of zero.

The Internal Rate of Return Method Illustrated

To illustrate the internal rate of return method, consider the following data:

Example D: Glendale School District is considering the purchase of a large tractor-pulled lawn mower. At present, the lawn is mowed using a small hand-pushed gas mower. The large, tractor-pulled mower will cost \$16,950 and will have a useful life of 10 years. It will have a negligible scrap value, which can be ignored. The tractor-pulled mower would do the job faster than the old mower, resulting in labor savings of \$3,000 per year.

To compute the internal rate of return promised by the new mower, we must find the discount rate that will result in a zero net present value. How do we do this? The simplest and most direct approach *when the net cash inflow is the same every year* is to divide the investment in the project by the expected annual net cash inflow. This computation will yield a factor from which the internal rate of return can be determined. The formula is as follows:

$$\text{Factor of the internal rate of return} = \frac{\text{Investment required}}{\text{Annual net cash inflow}} \quad (1)$$

The factor derived from formula (1) is then located in the present value tables to see what rate of return it represents. Using formula (1) and the data for the Glendale School District’s proposed project, we get:

$$\frac{\text{Investment required}}{\text{Annual net cash inflow}} = \frac{\$16,950}{\$3,000} = 5.650$$

Thus, the discount factor that will equate a series of \$3,000 cash inflows with a present investment of \$16,950 is 5.650. Now we need to find this factor in Exhibit 13B–2 in Appendix 13B to see what rate of return it represents. We should use the 10-period line in Exhibit 13B–2 because the cash flows for the project continue for 10 years. If we scan along the 10-period line, we find that a factor of 5.650 represents a 12% rate of return. Therefore, the internal rate of return promised by the mower project is 12%. We can verify this by computing the project’s net present value using a 12% discount rate as shown in Exhibit 13–5.

Notice from Exhibit 13–5 that using a 12% discount rate equates the present value of the annual net cash inflows with the present value of the investment required for the project, leaving a zero net present value. The 12% rate therefore represents the internal rate of return promised by the project.

EXHIBIT 13–5 Evaluation of the Mower Using a 12% Discount Rate

| | |
|---------------------------|----------|
| Initial cost | \$16,950 |
| Life of the project | 10 years |
| Annual cost savings | \$3,000 |
| Salvage value | \$0 |

| Item | Year(s) | Amount of Cash Flow | 12% Factor | Present Value of Cash Flows |
|---------------------------|---------|---------------------|------------|-----------------------------|
| Annual cost savings | 1–10 | \$3,000 | 5.650* | \$16,950 |
| Initial investment | Now | \$(16,950) | 1.000 | (16,950) |
| Net present value | | | | <u>\$ 0</u> |

*From Exhibit 13B–2 in Appendix 13B.

Salvage Value and Other Cash Flows

The technique just demonstrated works if a project's cash flows are identical every year. But what if they are not? For example, what if a project will have some salvage value at the end of its life in addition to the annual cash inflows? Under these circumstances, a trial-and-error process may be used to find the rate of return that will equate the cash inflows with the cash outflows. The trial-and-error process can be carried out by hand; however, computer software programs such as spreadsheets can perform the necessary computations in seconds. Erratic or uneven cash flows should not prevent an analyst from determining a project's internal rate of return.

Using the Internal Rate of Return

To evaluate a project, the internal rate of return is compared to the company's minimum required rate of return, which is usually the company's cost of capital. If the internal rate of return is equal to or greater than the required rate of return, then the project is considered to be acceptable. If the internal rate of return is less than the required rate of return, then the project is rejected.

In the case of the Glendale School District example, let us assume that the district has set a minimum required rate of return of 15% on all projects. Because the large mower's internal rate of return is only 12%, the project does not clear the 15% hurdle and should be rejected.

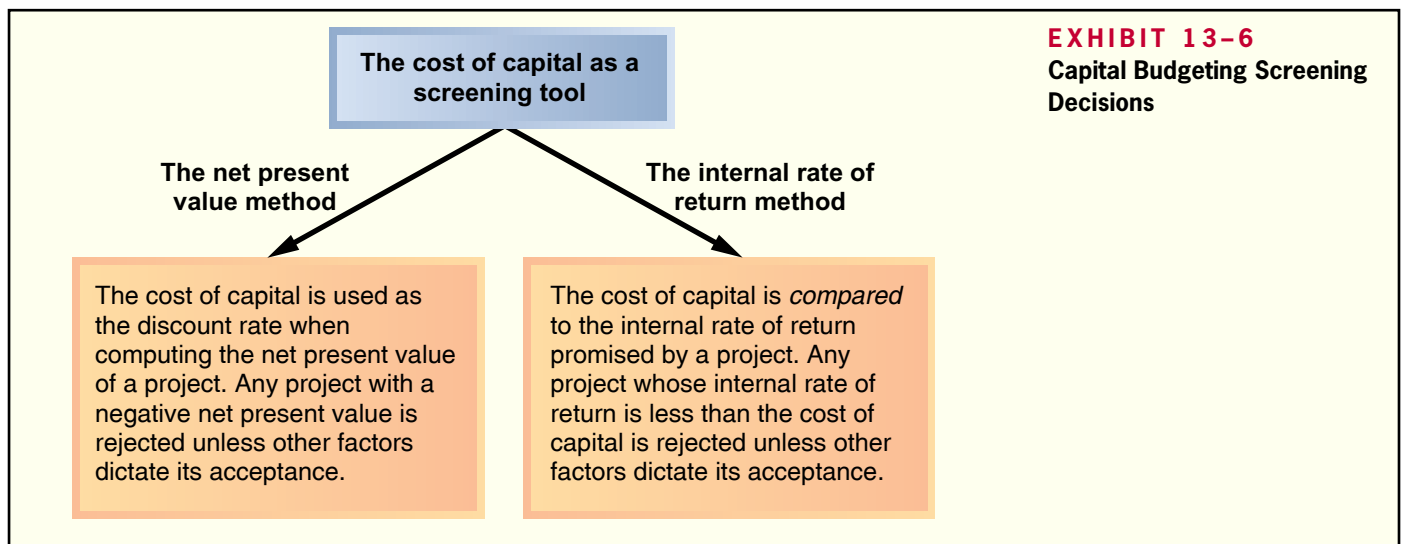

The Cost of Capital as a Screening Tool

As we have seen in preceding examples, the cost of capital is often used to screen out undesirable investment projects. This screening is accomplished in different ways, depending on whether the company is using the internal rate of return method or the net present value method.

When the internal rate of return method is used, the cost of capital is used as the *hurdle rate* that a project must clear for acceptance. If the internal rate of return of a project is not high enough to clear the cost of capital hurdle, then the project is ordinarily rejected. We saw the application of this idea in the Glendale School District example, where the hurdle rate was set at 15%.

When the net present value method is used, the cost of capital is the *discount rate* used to compute the net present value of a proposed project. Any project yielding a negative net present value is rejected unless other factors are significant enough to warrant its acceptance.

The use of the cost of capital as a screening tool is summarized in Exhibit 13-6.

Comparison of the Net Present Value and Internal Rate of Return Methods

The net present value method has several important advantages over the internal rate of return method.

First, the net present value method is often simpler to use than the internal rate of return method. As mentioned earlier, the internal rate of return method may require hunting for the discount rate that results in a net present value of zero. This can be a very laborious trial-and-error process, although it can be automated using a computer.

Second, the internal rate of return method makes a questionable assumption. Both methods assume that cash flows generated by a project during its useful life are immediately reinvested elsewhere. However, the two methods make different assumptions concerning the rate of return that is earned on those cash flows. The net present value method assumes the rate of return is the discount rate, whereas the internal rate of return method assumes the rate of return earned on cash flows is the internal rate of return on the project. Specifically, if the internal rate of return of the project is high, this assumption may not be realistic. It is generally more realistic to assume that cash inflows can be reinvested at a rate of return equal to the discount rate—particularly if the discount rate is the company's cost of capital or an opportunity rate of return. For example, if the discount rate is the company's cost of capital, this rate of return can be actually realized by paying off the company's creditors and buying back the company's stock with cash flows from the project. In short, when the net present value method and the internal rate of return method do not agree concerning the attractiveness of a project, it is best to go with the net present value method. Of the two methods, it makes the more realistic assumption about the rate of return that can be earned on cash flows from the project.

Expanding the Net Present Value Method

So far all of our examples have involved an evaluation of a single investment project. In the following section we expand the discussion of the net present value method to include evaluation of two alternative projects. In addition, we integrate relevant cost concepts into the discounted cash flow analysis. We use two approaches to compare competing investment projects—the *total-cost approach* and the *incremental-cost approach*. Each approach is illustrated in the next few pages.

The Total-Cost Approach

The total-cost approach is the most flexible method for comparing competing projects. To illustrate the mechanics of the approach, consider the following data:

Example E: Harper Ferry Company operates a high-speed passenger ferry service across the Mississippi River. One of its ferryboats is in poor condition. This ferry can be renovated at an immediate cost of \$200,000. Further repairs and an overhaul of the motor will be needed five years from now at a cost of \$80,000. In all, the ferry will be usable for 10 years if this work is done. At the end of 10 years, the ferry will have to be scrapped at a salvage value of \$60,000. The scrap value of the ferry right now is \$70,000. It will cost \$300,000 each year to operate the ferry, and revenues will total \$400,000 annually.

As an alternative, Harper Ferry Company can purchase a new ferryboat at a cost of \$360,000. The new ferry will have a life of 10 years, but it will require some repairs costing \$30,000 at the end of 5 years. At the end of 10 years, the ferry will have a scrap value of \$60,000. It will cost \$210,000 each year to operate the ferry, and revenues will total \$400,000 annually.

EXHIBIT 13-7 The Total-Cost Approach to Project Selection

| | | New Ferry | Old Ferry | | |
|--|----------------|-----------------------------|--------------------|------------------------------------|--|
| Annual revenues | | \$400,000 | \$400,000 | | |
| Annual cash operating costs | | 210,000 | 300,000 | | |
| Annual net cash inflows | | <u>\$190,000</u> | <u>\$100,000</u> | | |
| Item | Year(s) | Amount of Cash Flows | 14% Factor* | Present Value of Cash Flows | |
| Buy the new ferry: | | | | | |
| Initial investment | Now | \$(360,000) | 1.000 | \$(360,000) | |
| Salvage value of the old ferry | Now | \$70,000 | 1.000 | 70,000 | |
| Repairs in five years | 5 | \$(30,000) | 0.519 | (15,570) | |
| Annual net cash inflows | 1–10 | \$190,000 | 5.216 | 991,040 | |
| Salvage value of the new ferry | 10 | \$60,000 | 0.270 | 16,200 | |
| Net present value | | | | <u>701,670</u> | |
| Keep the old ferry: | | | | | |
| Renovation | Now | \$(200,000) | 1.000 | (200,000) | |
| Repairs in five years | 5 | \$(80,000) | 0.519 | (41,520) | |
| Annual net cash inflows | 1–10 | \$100,000 | 5.216 | 521,600 | |
| Salvage value of the old ferry | 10 | \$60,000 | 0.270 | 16,200 | |
| Net present value | | | | <u>296,280</u> | |
| Net present value in favor of buying the new ferry | | | | <u>\$ 405,390</u> | |

*All present value factors are from Exhibits 13B-1 and 13B-2 in Appendix 13B.

Harper Ferry Company requires a return of at least 14% before taxes on all investment projects.

Should the company purchase the new ferry or renovate the old ferry? Exhibit 13-7 shows the solution using the total-cost approach.

Two points should be noted from the exhibit. First, *all* cash inflows and *all* cash outflows are included in the solution under each alternative. No effort has been made to isolate those cash flows that are relevant to the decision and those that are not relevant. The inclusion of all cash flows associated with each alternative gives the approach its name—the *total-cost* approach.

Second, notice that a net present value is computed for each alternative. This is a distinct advantage of the total-cost approach because an unlimited number of alternatives can be compared side by side to determine the best option. For example, another alternative for Harper Ferry Company would be to get out of the ferry business entirely. If management desired, the net present value of this alternative could be computed to compare with the alternatives shown in Exhibit 13-7. Still other alternatives might be open to the company. In the case at hand, given only two alternatives, the data indicate that the most profitable choice is to purchase the new ferry.⁴

The Incremental-Cost Approach

When only two alternatives are being considered, the incremental-cost approach offers a simpler and more direct route to a decision. In the incremental-cost approach, only those

⁴ The alternative with the highest net present value is not always the best choice, although it is the best choice in this case. For further discussion, see the section Preference Decisions—The Ranking of Investment Projects.

EXHIBIT 13-8 The Incremental-Cost Approach to Project Selection

| Item | Year(s) | Amount of Cash Flows | 14% Factor* | Present Value of Cash Flows |
|--|---------|----------------------|-------------|-----------------------------|
| Incremental investment to buy the new ferry | Now | \$(160,000) | 1.000 | \$(160,000) |
| Salvage value of the old ferry now | Now | \$70,000 | 1.000 | 70,000 |
| Difference in repair costs in five years | 5 | \$50,000 | 0.519 | 25,950 |
| Increase in annual net cash inflows | 1-10 | \$90,000 | 5.216 | 469,440 |
| Difference in salvage value in 10 years | 10 | \$0 | 0.270 | 0 |
| Net present value in favor of buying the new ferry | | | | <u>\$ 405,390</u> |

*All present value factors are from Exhibits 13B-1 and 13B-2 in Appendix 13B.

costs and revenues that *differ* between the two alternatives are included in the analysis. To illustrate, refer again to the data in Example E relating to Harper Ferry Company. The solution using only differential costs is presented in Exhibit 13-8.⁵

Two things should be noted from the data in this exhibit. First, the net present value in favor of buying the new ferry of \$405,390 shown in Exhibit 13-8 agrees with the net present value shown under the total-cost approach in Exhibit 13-7. The two approaches are just different roads to the same destination.

Second, the costs used in Exhibit 13-8 are just the differences between the costs shown for the two alternatives in the prior exhibit. For example, the \$160,000 incremental investment required to purchase the new ferry in Exhibit 13-8 is the difference between the \$360,000 cost of the new ferry and the \$200,000 cost required to renovate the old ferry from Exhibit 13-7. The other figures in Exhibit 13-8 have been computed in the same way.

Least-Cost Decisions

Some decisions do not involve any revenues. For example, a company may be trying to decide whether to buy or lease an executive jet. The choice would be made on the basis of which alternative—buying or leasing—would be least costly. In situations such as these, where no revenues are involved, the most desirable alternative is the one with the *least total cost* from a present value perspective. Hence, these are known as least-cost decisions. To illustrate a least-cost decision, consider the following data:

Example F: Val-Tek Company is considering replacing an old threading machine with a new threading machine that would substantially reduce annual operating costs. Selected data relating to the old and new machines are presented below:

| | Old Machine | New Machine |
|-----------------------------------|-------------|-------------|
| Purchase cost when new | \$200,000 | \$250,000 |
| Salvage value now | \$30,000 | — |
| Annual cash operating costs | \$150,000 | \$90,000 |
| Overhaul needed immediately | \$40,000 | — |
| Salvage value in six years | \$0 | \$50,000 |
| Remaining life | 6 years | 6 years |

Val-Tek Company uses a 10% discount rate.

⁵ Technically, the incremental-cost approach is misnamed because it focuses on differential costs (that is, on both cost increases and decreases) rather than just on incremental costs. As used here, the term *incremental costs* should be interpreted broadly to include both cost increases and cost decreases.

EXHIBIT 13-9 The Total-Cost Approach (Least-Cost Decision)

| Item | Year(s) | Amount of Cash Flows | 10% Factor* | Present Value of Cash Flows |
|--|---------|----------------------|-------------|-----------------------------|
| Buy the new machine: | | | | |
| Initial investment | Now | \$(250,000) | 1.000 | \$(250,000) [†] |
| Salvage value of the old machine | Now | \$30,000 | 1.000 | 30,000 [†] |
| Annual cash operating costs | 1–6 | \$(90,000) | 4.355 | (391,950) |
| Salvage value of the new machine | 6 | \$50,000 | 0.564 | 28,200 |
| Present value of net cash outflows | | | | <u>(583,750)</u> |
| Keep the old machine: | | | | |
| Overhaul needed now | Now | \$(40,000) | 1.000 | \$ (40,000) |
| Annual cash operating costs | 1–6 | \$(150,000) | 4.355 | (653,250) |
| Present value of net cash outflows | | | | <u>(693,250)</u> |
| Net present value in favor of buying the new machine | | | | <u>\$ 109,500</u> |

*All factors are from Exhibits 13B-1 and 13B-2 in Appendix 13B.

[†]These two items could be netted into a single \$220,000 incremental-cost figure (\$250,000 – \$30,000 = \$220,000).

Exhibit 13-9 analyzes the alternatives using the total-cost approach. Because this is a least-cost decision, the present values are negative for both alternatives. However, the present value of the alternative of buying the new machine is \$109,500 higher than the other alternative. Therefore, buying the new machine is the less costly alternative.

Exhibit 13-10 presents an analysis of the same alternatives using the incremental-cost approach. Once again, the total-cost and incremental-cost approaches arrive at the same answer.

EXHIBIT 13-10 The Incremental-Cost Approach (Least-Cost Decision)

| Item | Year(s) | Amount of Cash Flows | 10% Factor* | Present Value of Cash Flows |
|--|---------|----------------------|-------------|-----------------------------|
| Incremental investment required to | | | | |
| purchase the new machine | Now | \$(210,000) | 1.000 | \$(210,000) [†] |
| Salvage value of the old machine | Now | \$30,000 | 1.000 | 30,000 [†] |
| Savings in annual cash operating costs | 1–6 | \$60,000 | 4.355 | 261,300 |
| Difference in salvage value in six years | 6 | \$50,000 | 0.564 | 28,200 |
| Net present value in favor of buying the new machine | | | | <u>\$ 109,500</u> |

*All factors are from Exhibits 13B-1 and 13B-2 in Appendix 13B.

[†]These two items could be netted into a single \$180,000 incremental-cost figure (\$210,000 – \$30,000 = \$180,000).

TRADING IN THAT OLD CAR?

Consumer Reports magazine provides the following data concerning the alternatives of keeping a four-year-old Ford Taurus for three years or buying a similar new car to replace it. The illustration assumes the car would be purchased and used in suburban Chicago.

IN BUSINESS

(continued)

| | Keep the Old Taurus | Buy a New Taurus |
|---|------------------------|---------------------|
| Annual maintenance | \$1,180 | \$650 |
| Annual insurance | \$370 | \$830 |
| Annual license | \$15 | \$100 |
| Trade-in value in three years | \$605 | \$7,763 |
| Purchase price, including sales tax | | \$17,150 |

Consumer Reports is ordinarily extremely careful in its analysis, but in this instance it has omitted one financial item that differs substantially between the alternatives. What is it? To check your answer, go to the textbook website at www.mhhe.com/noreen2e. After accessing the site, click on the link to the Internet Exercises and then the link to this chapter.

Uncertain Cash Flows

LEARNING OBJECTIVE 3

Evaluate an investment project that has uncertain cash flows.

Thus far, we have assumed that all future cash flows are known with certainty. However, future cash flows are often uncertain or difficult to estimate. A number of techniques are available for handling this complication. Some of these techniques are quite technical— involving computer simulations or advanced mathematical skills—and are beyond the scope of this book. However, we can provide some very useful information to managers without getting too technical.

An Example

As an example of difficult-to-estimate future cash flows, consider the case of investments in automated equipment. The up-front costs of automated equipment and the tangible benefits, such as reductions in operating costs and waste, tend to be relatively easy to estimate. However, the intangible benefits, such as greater reliability, greater speed, and higher quality, are more difficult to quantify in terms of future cash flows. These intangible benefits certainly impact future cash flows—particularly in terms of increased sales and perhaps higher selling prices—but the cash flow effects are difficult to estimate. What can be done?

A fairly simple procedure can be followed when the intangible benefits are likely to be significant. Suppose, for example, that a company with a 12% discount rate is considering purchasing automated equipment that would have a 10-year useful life. Also suppose that a discounted cash flow analysis of just the tangible costs and benefits shows a negative net present value of \$226,000. Clearly, if the intangible benefits are large enough, they could turn this negative net present value into a positive net present value. In this case, the amount of additional cash flow per year from the intangible benefits that would be needed to make the project financially attractive can be computed as follows:

| | |
|--|-------------|
| Net present value excluding the intangible benefits (negative) | \$(226,000) |
| Present value factor for an annuity at 12% for 10 periods (from Exhibit 13B–2 in Appendix 13B) | 5.650 |

$$\frac{\text{Negative net present value to be offset, } \$226,000}{\text{Present value factor, } 5.650} = \$40,000$$

Thus, if the intangible benefits of the automated equipment are worth at least \$40,000 a year to the company, then the automated equipment should be purchased. If, in the judgment of management, these intangible benefits are not worth \$40,000 a year, then the automated equipment should not be purchased.

This technique can be used in other situations in which future cash flows are difficult to estimate. For example, this technique can be used when the salvage value is difficult to estimate. To illustrate, suppose that all of the cash flows from an investment in a supertanker have been estimated—other than its salvage value in 20 years. Using a discount rate of 12%, management has determined that the net present value of all of these cash flows is a negative \$1.04 million. This negative net present value would be offset by the salvage value of the supertanker. How large would the salvage value have to be to make this investment attractive?

| | |
|---|---------------|
| Net present value excluding salvage value (negative) | \$(1,040,000) |
| Present value factor at 12% for 20 periods (from Exhibit 13B–1 in Appendix 13B) | 0.104 |

$$\frac{\text{Negative net present value to be offset, } \$1,040,000}{\text{Present value factor, } 0.104} = \$10,000,000$$

Thus, if the salvage value of the tanker in 20 years is at least \$10 million, its net present value would be positive and the investment would be made. However, if management believes the salvage value is unlikely to be as large as \$10 million, the investment should not be made.

Real Options

The analysis in this chapter has assumed that an investment cannot be postponed and that, once started, nothing can be done to alter the course of the project. In reality, investments can often be postponed. Postponement is a particularly attractive option when the net present value of a project is modest using current estimates of future cash flows and the future cash flows involve a great deal of uncertainty that may be resolved over time. Similarly, once an investment is made, management can often exploit changes in the business environment and take actions that enhance future cash flows. For example, buying a supertanker provides management with a number of options, some of which may become more attractive as time unfolds. Instead of operating the supertanker itself, the company may decide to lease it to another operator if the rental rates become high enough. Or, if a supertanker shortage develops, management may decide to sell the supertanker and take a gain. In the case of an investment in automated equipment, management may initially buy only the basic model without costly add-ons, but keep the option open to add more capacity and capability later. The ability to delay the start of a project, to expand it if conditions are favorable, to cut losses if they are unfavorable, and to otherwise modify plans as business conditions change adds value to many investments. These advantages can be quantified using what is called *real options* analysis, but the techniques are beyond the scope of this book.

Preference Decisions—The Ranking of Investment Projects

Recall that when considering investment opportunities, managers must make two types of decisions—screening decisions and preference decisions. Screening decisions, which come first, pertain to whether or not a proposed investment is acceptable. Preference decisions come *after* screening decisions and attempt to answer the following

LEARNING OBJECTIVE 4
Rank investment projects in order of preference.

question: “How do the remaining investment proposals, all of which have been screened and provide an acceptable rate of return, rank in terms of preference? That is, which one(s) would be *best* for the company to accept?”

Sometimes preference decisions are called rationing decisions, or ranking decisions. Limited investment funds must be rationed among many competing alternatives. Hence, the alternatives must be ranked. Either the internal rate of return method or the net present value method can be used in making preference decisions. However, as discussed earlier, if the two methods are in conflict, it is best to use the net present value method, which is more reliable.

Internal Rate of Return Method

When using the internal rate of return method to rank competing investment projects, the preference rule is: *The higher the internal rate of return, the more desirable the project.* An investment project with an internal rate of return of 18% is usually considered preferable to another project that promises a return of only 15%. Internal rate of return is widely used to rank projects.

Net Present Value Method

The net present value of one project cannot be directly compared to the net present value of another project unless the initial investments are equal. For example, assume that a company is considering two competing investments, as shown below:

| | Investment | |
|-------------------------------------|-----------------|-----------------|
| | A | B |
| Investment required | \$(10,000) | \$(5,000) |
| Present value of cash inflows | 11,000 | 6,000 |
| Net present value | <u>\$ 1,000</u> | <u>\$ 1,000</u> |

Although each project has a net present value of \$1,000, the projects are not equally desirable if the funds available for investment are limited. The project requiring an investment of only \$5,000 is much more desirable than the project requiring an investment of \$10,000. This fact can be highlighted by dividing the net present value of the project by the investment required. The result, shown below in equation form, is called the **project profitability index**.

$$\text{Project profitability index} = \frac{\text{Net present value of the project}}{\text{Investment required}} \quad (2)$$

The project profitability indexes for the two investments above would be computed as follows:

| | Investment | |
|--|-----------------|----------------|
| | A | B |
| Net present value (a) | <u>\$1,000</u> | <u>\$1,000</u> |
| Investment required (b) | <u>\$10,000</u> | <u>\$5,000</u> |
| Project profitability index, (a) ÷ (b) | <u>0.10</u> | <u>0.20</u> |

When using the project profitability index to rank competing investments projects, the preference rule is: *The higher the project profitability index, the more desirable the*

*project.*⁶ Applying this rule to the two investments above, investment B should be chosen over investment A.

The project profitability index is an application of the techniques for utilizing constrained resources discussed in Chapter 12. In this case, the constrained resource is the limited funds available for investment, and the project profitability index is similar to the contribution margin per unit of the constrained resource.

A few details should be clarified with respect to the computation of the project profitability index. The “Investment required” refers to any cash outflows that occur at the beginning of the project, reduced by any salvage value recovered from the sale of old equipment. The “Investment required” also includes any investment in working capital that the project may need.

Other Approaches to Capital Budgeting Decisions

The net present value and internal rate of return methods are widely used as decision-making tools. However, some managers also use the payback method and simple rate of return method to make capital budgeting decisions. Each of these methods will be discussed in turn.

The Payback Method

The payback method focuses on the *payback period*. The **payback period** is the length of time that it takes for a project to recover its initial cost from the net cash inflows that it generates. This period is sometimes referred to as “the time that it takes for an investment to pay for itself.” The basic premise of the payback method is that the more quickly the cost of an investment can be recovered, the more desirable is the investment.

The payback period is expressed in years. *When the annual net cash inflow is the same every year*, the following formula can be used to compute the payback period:

$$\text{Payback period} = \frac{\text{Investment required}}{\text{Annual net cash inflow}} \quad (3)$$

To illustrate the payback method, consider the following data:

Example G: York Company needs a new milling machine. The company is considering two machines: machine A and machine B. Machine A costs \$15,000, has a useful life of ten years, and will reduce operating costs by \$5,000 per year. Machine B costs only \$12,000, will also reduce operating costs by \$5,000 per year, but has a useful life of only five years.

Required:

Which machine should be purchased according to the payback method?

$$\text{Machine A payback period} = \frac{\$15,000}{\$5,000} = 3.0 \text{ years}$$

$$\text{Machine B payback period} = \frac{\$12,000}{\$5,000} = 2.4 \text{ years}$$

According to the payback calculations, York Company should purchase machine B because it has a shorter payback period than machine A.

⁶ Because of the “lumpiness” of projects, the project profitability index ranking may not be perfect. Nevertheless, it is a good starting point. For further details, see the Profitability Analysis Appendix at the end of the book.

LEARNING OBJECTIVE 5
Determine the payback period for an investment.

IN BUSINESS

ENTREPRENEURIAL INGENUITY AT ITS BEST

Jonathan Pratt owns two *Ümani Cafés* in Westchester County, New York. He used to pay \$200 a month to dispose of the vegetable oil that is used to fry foods in his restaurants. Plus, he bought \$700 of gas every month to operate his company's pick-up truck. Then Pratt got an idea. He purchased a diesel-powered Ford F250 on eBay for \$11,000 and paid \$1,500 to haul the truck from Arizona to New York. Next, he installed an \$850 conversion kit on his new truck to enable it to run on vegetable oil. Because he no longer has to pay to dispose of vegetable oil or buy gasoline, Pratt figures that his investment will pay for itself in about 15 months ($\$13,350 \div \$900 = 14.83$ months). Furthermore, he now has the best smelling car in town—it smells like french fries when he drives down the road.

Source: Jean Chatzky, "Out of the Frying Pan, Into the Ford," *Money*, October, 2004, p. 28.

Evaluation of the Payback Method

The payback method is not a true measure of the profitability of an investment. Rather, it simply tells a manager how many years are required to recover the original investment. Unfortunately, a shorter payback period does not always mean that one investment is more desirable than another.

To illustrate, refer back to Example G above. Machine B has a shorter payback period than machine A, but it has a useful life of only 5 years rather than 10 years for machine A. Machine B would have to be purchased twice—once immediately and then again after the fifth year—to provide the same service as just one machine A. Under these circumstances, machine A would probably be a better investment than machine B, even though machine B has a shorter payback period. Unfortunately, the payback method ignores all cash flows that occur after the payback period.

A further criticism of the payback method is that it does not consider the time value of money. A cash inflow to be received several years in the future is weighed the same as a cash inflow received right now. To illustrate, assume that for an investment of \$8,000 you can purchase either of the two following streams of cash inflows:

| Year | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------------|---|---------|---------|---------|---------|---------|---------|---------|---------|
| Stream 1 | | | | | \$8,000 | \$2,000 | \$2,000 | \$2,000 | \$2,000 |
| Stream 2 | | \$2,000 | \$2,000 | \$2,000 | \$2,000 | \$8,000 | | | |

Which stream of cash inflows would you prefer to receive in return for your \$8,000 investment? Each stream has a payback period of 4.0 years. Therefore, if payback alone is used to make the decision, the streams would be considered equally desirable. However, from a time value of money perspective, stream 2 is much more desirable than stream 1.

On the other hand, under certain conditions the payback method can be very useful. For one thing, it can help identify which investment proposals are in the "ballpark." That is, it can be used as a screening tool to help answer the question, "Should I consider this proposal further?" If a proposal doesn't provide a payback within some specified period, then there may be no need to consider it further. In addition, the payback period is often of great importance to new companies that are "cash poor." When a company is cash poor, a project with a short payback period but a low rate of return might be preferred over another project with a high rate of return but a long payback period. The reason is that the company may simply need a faster return of its cash investment. And finally, the payback method is sometimes used in industries where products become obsolete very rapidly—such as consumer electronics. Because products may last only a year or two, the payback period on investments must be very short.

An Extended Example of Payback

As shown by formula (3) on page 551, the payback period is computed by dividing the investment in a project by the annual net cash inflows that the project will generate. If new equipment is replacing old equipment, then any salvage value to be received when disposing of the old equipment should be deducted from the cost of the new equipment, and only the *incremental* investment should be used in the payback computation. In addition, any depreciation deducted in arriving at the project's net operating income must be added back to obtain the project's expected annual net cash inflow. To illustrate, consider the following data:

Example H: Goodtime Fun Centers, Inc., operates amusement parks. Some of the vending machines in one of its parks provide very little revenue, so the company is considering removing the machines and installing equipment to dispense soft ice cream. The equipment would cost \$80,000 and have an eight-year useful life with no salvage value. Incremental annual revenues and costs associated with the sale of ice cream would be as follows:

| | |
|----------------------------|------------------|
| Sales | \$150,000 |
| Variable expenses | 90,000 |
| Contribution margin | <u>60,000</u> |
| Fixed expenses: | |
| Salaries | 27,000 |
| Maintenance | 3,000 |
| Depreciation | <u>10,000</u> |
| Total fixed expenses | <u>40,000</u> |
| Net operating income | <u>\$ 20,000</u> |

The vending machines can be sold for a \$5,000 scrap value. The company will not purchase equipment unless it has a payback period of three years or less. Does the ice cream dispenser pass this hurdle?

Exhibit 13–11 computes the payback period for the ice cream dispenser. Several things should be noted. First, depreciation is added back to net operating income to

Step 1: *Compute the annual net cash inflow.* Because the annual net cash inflow is not given, it must be computed before the payback period can be determined:

| | |
|---|-----------------|
| Net operating income (computed above) | \$20,000 |
| Add: Noncash deduction for depreciation | <u>10,000</u> |
| Annual net cash inflow | <u>\$30,000</u> |

Step 2: *Compute the payback period.* Using the annual net cash inflow figure from above, the payback period can be determined as follows:

| | |
|---|-----------------|
| Cost of the new equipment | \$80,000 |
| Less salvage value of old equipment | <u>5,000</u> |
| Investment required | <u>\$75,000</u> |

$$\begin{aligned} \text{Payback period} &= \frac{\text{Investment required}}{\text{Annual net cash inflow}} \\ &= \frac{\$75,000}{\$30,000} = 2.5 \text{ years} \end{aligned}$$

EXHIBIT 13–11 Computation of the Payback Period

obtain the annual net cash inflow from the new equipment. Depreciation is not a cash outlay; thus, it must be added back to adjust net operating income to a cash basis. Second, the payback computation deducts the salvage value of the old machines from the cost of the new equipment so that only the incremental investment is used in computing the payback period.

Because the proposed equipment has a payback period of less than three years, the company's payback requirement has been met.

Payback and Uneven Cash Flows

When the cash flows associated with an investment project change from year to year, the simple payback formula that we outlined earlier cannot be used. Consider the following data:

| Year | Investment | Cash Inflow |
|---------|------------|-------------|
| 1 | \$4,000 | \$1,000 |
| 2 | | \$0 |
| 3 | | \$2,000 |
| 4 | \$2,000 | \$1,000 |
| 5 | | \$500 |
| 6 | | \$3,000 |
| 7 | | \$2,000 |

What is the payback period on this investment? The answer is 5.5 years, but to obtain this figure it is necessary to track the unrecovered investment year by year. The steps involved in this process are shown in Exhibit 13-12. By the middle of the sixth year, sufficient cash inflows will have been realized to recover the entire investment of \$6,000 (\$4,000 + \$2,000).

EXHIBIT 13-12
Payback and Uneven Cash Flows

| Year | Investment | Cash Inflow | Unrecovered Investment* |
|---------|------------|-------------|-------------------------|
| 1 | \$4,000 | \$1,000 | \$3,000 |
| 2 | | \$0 | \$3,000 |
| 3 | | \$2,000 | \$1,000 |
| 4 | \$2,000 | \$1,000 | \$2,000 |
| 5 | | \$500 | \$1,500 |
| 6 | | \$3,000 | \$0 |
| 7 | | \$2,000 | \$0 |

*Year X unrecovered investment = Year X - 1 unrecovered investment + Year X investment - Year X cash inflow

LEARNING OBJECTIVE 6
Compute the simple rate of return for an investment.

The Simple Rate of Return Method

The **simple rate of return** method is another capital budgeting technique that does not involve discounting cash flows. The simple rate of return is also known as the accounting rate of return or the unadjusted rate of return.

Unlike the other capital budgeting methods that we have discussed, the simple rate of return method focuses on accounting net operating income rather than cash flows. To obtain the simple rate of return, the annual incremental net operating income generated by a project is divided by the initial investment in the project as shown below.

$$\text{Simple rate of return} = \frac{\text{Annual incremental net operating income}}{\text{Initial investment}} \quad (4)$$

Two additional points should be made. First, depreciation charges that result from making the investment should be deducted when determining the annual incremental net operating income. Second, the initial investment should be reduced by any salvage value realized from the sale of old equipment.

Example I: Brigham Tea, Inc., is a processor of low-acid tea. The company is contemplating purchasing equipment for an additional processing line. The additional processing line would increase revenues by \$90,000 per year. Incremental cash operating expenses would be \$40,000 per year. The equipment would cost \$180,000 and have a nine-year life with no salvage value.

To apply the formula for the simple rate of return, we must first determine the annual incremental net operating income from the project:

| | | |
|--|---------------|-----------------|
| Annual incremental revenues | | \$90,000 |
| Annual incremental cash operating expenses | \$40,000 | |
| Annual depreciation (\$180,000 – \$0)/9 | <u>20,000</u> | |
| Annual incremental expenses | | <u>60,000</u> |
| Annual incremental net operating income | | <u>\$30,000</u> |

Given that the annual incremental net operating income from the project is \$30,000 and the initial investment is \$180,000, the simple rate of return is 16.7% as shown below:

$$\begin{aligned} \text{Simple rate of return} &= \frac{\text{Annual incremental net operating income}}{\text{Initial investment}} \\ &= \frac{\$30,000}{\$180,000} \\ &= 16.7\% \end{aligned}$$

Example J: Midwest Farms, Inc., hires people on a part-time basis to sort eggs. The cost of this hand-sorting process is \$30,000 per year. The company is investigating an egg-sorting machine that would cost \$90,000 and have a 15-year useful life. The machine would have negligible salvage value, and it would cost \$10,000 per year to operate and maintain. The egg-sorting equipment currently being used could be sold now for a scrap value of \$2,500.

This project is slightly different from the preceding project because it involves cost reductions with no additional revenues. Nevertheless, the annual incremental net operating income can be computed by treating the annual cost savings as if it were incremental revenues as follows:

| | | |
|--|--------------|-----------------|
| Annual incremental cost savings | | \$30,000 |
| Annual incremental cash operating expenses | \$10,000 | |
| Annual depreciation (\$90,000 – \$0)/15 | <u>6,000</u> | |
| Annual incremental expenses | | <u>16,000</u> |
| Annual incremental net operating income | | <u>\$14,000</u> |

Thus, even though the new equipment would not generate any additional revenues, it would reduce costs by \$14,000 a year. This would have the effect of increasing net operating income by \$14,000 a year.

Finally, the salvage value of the old equipment offsets the initial cost of the new equipment as follows:

| | |
|---|-----------------|
| Cost of the new equipment | \$90,000 |
| Less salvage value of the old equipment | <u>2,500</u> |
| Initial investment | <u>\$87,500</u> |

Given the annual incremental net operating income of \$14,000 and the initial investment of \$87,500, the simple rate of return is 16.0% computed as follows:

$$\begin{aligned}\text{Simple rate of return} &= \frac{\text{Annual incremental net operating income}}{\text{Initial investment}} \\ &= \frac{\$14,000}{\$87,500} \\ &= 16.0\%\end{aligned}$$

IN BUSINESS

AN AMAZING RETURN

Ipswitch, Inc., a software developer and seller, has moved much of its business to the Web. Potential customers can download free trial copies of the company's software at www.ipswitch.com. After the trial period, a customer must return to the Web site to purchase and download a permanent copy of the software. The initial investment in setting up a Web site was modest—roughly \$190,000. The cost of keeping the Web site up and running and updated with the latest product information is about \$1.3 million a year—mainly in the form of salaries and benefits for eight employees. The company estimates that additional revenues brought in by the Web amount to about \$13 million per year and that the company saves about \$585,000 per year in direct mail advertising costs by using the Web for much of its advertising instead. Assuming that the cost of sales is almost zero for downloaded software, the accounting rate of return on the initial investment in the Web site is 6,466% $(\$13,000,000 - \$1,300,000 + \$585,000) \div \$190,000$!

Criticisms of the Simple Rate of Return

The simple rate of return method ignores the time value of money. It considers a dollar received 10 years from now to be as valuable as a dollar received today. Thus, the simple rate of return method can be misleading if the alternatives have different cash flow patterns. Additionally, many projects do not have constant incremental revenues and expenses over their useful lives. As a result, the simple rate of return will fluctuate from year to year, with the possibility that a project may appear to be desirable in some years and undesirable in others. In contrast, the net present value method provides a single number that summarizes all of the cash flows over the entire useful life of the project.

Postaudit of Investment Projects

After an investment project has been approved and implemented, a *postaudit* should be conducted. A **postaudit** involves checking whether or not expected results are actually realized. This is a key part of the capital budgeting process because it helps keep managers honest in their investment proposals. Any tendency to inflate the benefits or downplay the costs in a proposal should become evident after a few postaudits have been conducted. The postaudit also provides an opportunity to reinforce and possibly expand successful projects and to cut losses on floundering projects.

The same capital budgeting method should be used in the postaudit as was used in the original approval process. That is, if a project was approved on the basis of a net present value analysis, then the same procedure should be used in performing the postaudit. However, the data used in the postaudit analysis should be *actual observed data* rather than estimated data. This gives management an opportunity to make a side-by-side comparison to see how well the project has succeeded. It also helps assure that estimated data received on future proposals will be carefully prepared because the persons submitting the data

knows that their estimates will be compared to actual results in the postaudit process. Actual results that are far out of line with original estimates should be carefully reviewed.

IN BUSINESS

CAPITAL BUDGETING IN PRACTICE

A survey of Fortune 1000 companies—the largest companies in the United States—asked CFOs how often various capital budgeting methods are used in their companies. Some of the results of that survey are displayed below:

| Capital Budgeting Tool | Frequency of Use | | | | |
|---------------------------------|------------------|-------|-----------|--------|-------|
| | Always | Often | Sometimes | Rarely | Never |
| Net present value | 50% | 35% | 11% | 3% | 1% |
| Internal rate of return | 45% | 32% | 15% | 6% | 2% |
| Payback | 19% | 33% | 22% | 17% | 9% |
| Accounting rate of return | 5% | 9% | 19% | 16% | 50% |

Many companies use more than one method—for example, they may use both the net present value and the internal rate of return methods to evaluate capital budgeting projects. Note that the two discounted cash flow methods—net present value and internal rate of return—are by far the most commonly used in practice.

A similar survey of companies in the United Kingdom yielded the following results:

| Capital Budgeting Tool | Frequency of Use | | | |
|---------------------------------|------------------|--------|-------|--------|
| | Always | Mostly | Often | Rarely |
| Net present value | 43% | 20% | 14% | 7% |
| Internal rate of return | 48% | 20% | 10% | 5% |
| Payback | 30% | 16% | 17% | 14% |
| Accounting rate of return | 26% | 15% | 18% | 7% |

Note that while the results were quite similar for the U.S. and U.K. companies, the U.K. companies were more likely to use the payback and accounting rate of return methods than the U.S. companies.

Arnold and Panos D. Hatzopoulos, "The Theory-Practice Gap in Capital Budgeting: Evidence from the United Kingdom," *Journal of Business Finance & Accounting* 27(5) & 27(6), June/July 2000, pp. 603–626.

Summary

Investment decisions should take into account the time value of money because a dollar today is more valuable than a dollar received in the future. The net present value and internal rate of return methods both reflect this fact. In the net present value method, future cash flows are discounted to their present value. The difference between the present value of the cash inflows and the present value of the cash outflows is called a project's net present value. If the net present value of a project is negative, the project is rejected. The discount rate in the net present value method is usually based on a minimum required rate of return such as a company's cost of capital.

The internal rate of return is the rate of return that equates the present value of the cash inflows and the present value of the cash outflows, resulting in a zero net present value. If the internal rate of return is less than a company's minimum required rate of return, the project is rejected.

After rejecting projects whose net present values are negative or whose internal rates of return are less than the minimum required rate of return, more projects may remain than can be supported with available funds. The remaining projects can be ranked using either the project profitability index or internal rate of return. The project profitability index is computed by dividing the net present value of the project by the required initial investment.

Some companies prefer to use either the payback method or the simple rate of return to evaluate investment proposals. The payback period is the number of periods that are required to fully recover the initial investment in a project. The simple rate of return is determined by dividing a project's accounting net operating income by the initial investment in the project.

Review Problem: Comparison of Capital Budgeting Methods

Lamar Company is considering a project that would have an eight-year life and require a \$2,400,000 investment in equipment. At the end of eight years, the project would terminate and the equipment would have no salvage value. The project would provide net operating income each year as follows:

| | | |
|---|----------------|-------------------|
| Sales | | \$3,000,000 |
| Variable expenses | | <u>1,800,000</u> |
| Contribution margin | | 1,200,000 |
| Fixed expenses: | | |
| Advertising, salaries, and other fixed out-of-pocket costs | \$700,000 | |
| Depreciation | <u>300,000</u> | |
| Total fixed expenses | | <u>1,000,000</u> |
| Net operating income | | <u>\$ 200,000</u> |

The company's discount rate is 12%.

Required:

1. Compute the annual net cash inflow from the project.
2. Compute the project's net present value. Is the project acceptable?
3. Find the project's internal rate of return to the nearest whole percent.
4. Compute the project's payback period.
5. Compute the project's simple rate of return.

Solution to Review Problem

1. The annual net cash inflow can be computed by deducting the cash expenses from sales:

| | |
|---|-------------------|
| Sales | \$3,000,000 |
| Variable expenses | <u>1,800,000</u> |
| Contribution margin | 1,200,000 |
| Advertising, salaries, and other fixed out-of-pocket costs | <u>700,000</u> |
| Annual net cash inflow | <u>\$ 500,000</u> |

Or the annual net cash inflow can be computed by adding depreciation back to net operating income:

| | |
|---|------------------|
| Net operating income | \$200,000 |
| Add: Noncash deduction for depreciation | <u>300,000</u> |
| Annual net cash inflow | <u>\$500,000</u> |

2. The net present value is computed as follows:

| Item | Year(s) | Amount of Cash Flows | 12% Factor | Present Value of Cash Flows |
|------------------------------|---------|----------------------|------------|-----------------------------|
| Cost of new equipment | Now | \$(2,400,000) | 1.000 | \$(2,400,000) |
| Annual net cash inflow | 1–8 | \$500,000 | 4.968 | 2,484,000 |
| Net present value | | | | <u>\$ 84,000</u> |

Yes, the project is acceptable because it has a positive net present value.

3. The formula for computing the factor of the internal rate of return is:

$$\begin{aligned} \text{Factor of the internal rate of return} &= \frac{\text{Investment required}}{\text{Annual net cash inflow}} \\ &= \frac{\$2,400,000}{\$500,000} = 4.800 \end{aligned}$$

Looking in Exhibit 13B–2 in Appendix 13B at the end of the chapter and scanning along the 8-period line, we find that a factor of 4.800 represents a rate of return of about 13%.

4. The formula for the payback period is:

$$\begin{aligned} \text{Payback period} &= \frac{\text{Investment required}}{\text{Annual net cash flow}} \\ &= \frac{\$2,400,000}{\$500,000} \\ &= 4.8 \text{ years} \end{aligned}$$

5. The formula for the simple rate of return is:

$$\begin{aligned} \text{Simple rate of return} &= \frac{\text{Annual incremental net operating income}}{\text{Initial investment}} \\ &= \frac{\$200,000}{\$2,400,000} \\ &= 8.3\% \end{aligned}$$

Glossary

- Capital budgeting** The process of planning significant investments in projects that have long-term implications such as the purchase of new equipment or the introduction of a new product. (p. 535)
- Cost of capital** The average rate of return a company must pay to its long-term creditors and shareholders for the use of their funds. (p. 540)
- Internal rate of return** The discount rate at which the net present value of an investment project is zero; the rate of return promised by a project over its useful life. (p. 542)
- Net present value** The difference between the present value of an investment project's cash inflows and the present value of its cash outflows. (p. 536)
- Out-of-pocket costs** Actual cash outlays for salaries, advertising, repairs, and similar costs. (p. 541)
- Payback period** The length of time that it takes for a project to fully recover its initial cost out of the net cash inflows that it generates. (p. 551)
- Postaudit** The follow-up after a project has been approved and implemented to determine whether expected results were actually realized. (p. 556)
- Preference decision** A decision in which the alternatives must be ranked. (p. 535)
- Project profitability index** The ratio of the net present value of a project's cash flows to the investment required. (p. 550)

Screening decision A decision as to whether a proposed investment project is acceptable. (p. 535)

Simple rate of return The rate of return computed by dividing a project's annual incremental accounting net operating income by the initial investment required. (p. 554)

Working capital Current assets less current liabilities. (p. 538)

Questions

- 13-1 What is the difference between capital budgeting screening decisions and capital budgeting preference decisions?
- 13-2 What is meant by the term *time value of money*?
- 13-3 What is meant by the term *discounting*?
- 13-4 Why isn't accounting net income used in the net present value and internal rate of return methods of making capital budgeting decisions?
- 13-5 Why are discounted cash flow methods of making capital budgeting decisions superior to other methods?
- 13-6 What is net present value? Can it ever be negative? Explain.
- 13-7 Identify two simplifying assumptions associated with discounted cash flow methods of making capital budgeting decisions.
- 13-8 If a company has to pay interest of 14% on long-term debt, then its cost of capital is 14%. Do you agree? Explain.
- 13-9 What is meant by an investment project's internal rate of return? How is the internal rate of return computed?
- 13-10 Explain how the cost of capital serves as a screening tool when using (a) the net present value method and (b) the internal rate of return method.
- 13-11 As the discount rate increases, the present value of a given future cash flow also increases. Do you agree? Explain.
- 13-12 Refer to Exhibit 13-4. Is the return on this investment proposal exactly 14%, more than 14%, or less than 14%? Explain.
- 13-13 How is the project profitability index computed, and what does it measure?
- 13-14 What is meant by the term *payback period*? How is the payback period determined? How can the payback method be useful?
- 13-15 What is the major criticism of the payback and simple rate of return methods of making capital budgeting decisions?

Multiple-choice questions are provided on the text website at www.mhhe.com/noreen2e.

Exercises

connect™

EXERCISE 13-1 Net Present Value Method [LO1]

The management of Kunkel Company is considering the purchase of a \$40,000 machine that would reduce operating costs by \$7,000 per year. At the end of the machine's eight-year useful life, it will have zero scrap value. The company's required rate of return is 12%.

Required:

(Ignore income taxes.)

- Determine the net present value of the investment in the machine.
- What is the difference between the total, undiscounted cash inflows and cash outflows over the entire life of the machine?

EXERCISE 13-2 Internal Rate of Return [LO2]

Wendell's Donut Shoppe is investigating the purchase of a new \$18,600 donut-making machine. The new machine would permit the company to reduce the amount of part-time help needed, at a cost savings of \$3,800 per year. In addition, the new machine would allow the company to produce one new style of donut, resulting in the sale of 1,000 dozen more donuts each year. The company realizes a contribution margin of \$1.20 per dozen donuts sold. The new machine would have a six-year useful life.

Required:

(Ignore income taxes.)

1. What would be the total annual cash inflows associated with the new machine for capital budgeting purposes?
2. Find the internal rate of return promised by the new machine to the nearest whole percent.
3. In addition to the data given previously, assume that the machine will have a \$9,125 salvage value at the end of six years. Under these conditions, compute the internal rate of return to the nearest whole percent. (*Hint:* You may find it helpful to use the net present value approach; find the discount rate that will cause the net present value to be closest to zero. Use the format shown in Exhibit 13–4.)

EXERCISE 13–3 Uncertain Future Cash Flows [L03]

Lukow Products is investigating the purchase of a piece of automated equipment that will save \$400,000 each year in direct labor and inventory carrying costs. This equipment costs \$2,500,000 and is expected to have a 15-year useful life with no salvage value. The company’s required rate of return is 20% on all equipment purchases. Management anticipates that this equipment will provide intangible benefits such as greater flexibility and higher-quality output that will result in additional future cash inflows.

Required:

For the equipment to be an acceptable investment, what should be the dollar value per year of the intangible benefits provided?

EXERCISE 13–4 Preference Ranking [L04]

Information on four investment proposals is given below:

| | Investment Proposal | | | |
|-------------------------------------|---------------------|------------------|------------------|------------------|
| | A | B | C | D |
| Investment required | \$(90,000) | \$(100,000) | \$(70,000) | \$(120,000) |
| Present value of cash inflows | 126,000 | 138,000 | 105,000 | 160,000 |
| Net present value | <u>\$ 36,000</u> | <u>\$ 38,000</u> | <u>\$ 35,000</u> | <u>\$ 40,000</u> |
| Life of the project | 5 years | 7 years | 6 years | 6 years |

Required:

1. Compute the project profitability index for each investment proposal.
2. Rank the proposals in terms of preference.

EXERCISE 13–5 Payback Method [L05]

The management of Unter Corporation, an architectural design firm, is considering an investment with the following cash flows:

| Year | Investment | Cash Inflow |
|----------|------------|-------------|
| 1 | \$15,000 | \$1,000 |
| 2 | \$8,000 | \$2,000 |
| 3 | | \$2,500 |
| 4 | | \$4,000 |
| 5 | | \$5,000 |
| 6 | | \$6,000 |
| 7 | | \$5,000 |
| 8 | | \$4,000 |
| 9 | | \$3,000 |
| 10 | | \$2,000 |

Required:

1. Determine the payback period of the investment.
2. Would the payback period be affected if the cash inflow in the last year were several times as large?

EXERCISE 13–6 Simple Rate of Return Method [L06]

The management of Ballard MicroBrew is considering the purchase of an automated bottling machine for \$120,000. The machine would replace an old piece of equipment that costs \$30,000 per year to operate. The new machine would cost \$12,000 per year to operate. The old machine currently in use could be sold now for a scrap value of \$40,000. The new machine would have a useful life of 10 years with no salvage value.

Required:

Compute the simple rate of return on the new automated bottling machine.

EXERCISE 13–7 Basic Payback Period and Simple Rate of Return Computations [L05, L06]

A piece of laborsaving equipment has just come onto the market that Mitsui Electronics, Ltd., could use to reduce costs in one of its plants in Japan. Relevant data relating to the equipment follow (currency is in thousands of yen, denoted by ¥):

| | |
|---|----------|
| Purchase cost of the equipment | ¥432,000 |
| Annual cost savings that will be provided by the equipment | ¥90,000 |
| Life of the equipment | 12 years |

Required:

(Ignore income taxes.)

1. Compute the payback period for the equipment. If the company requires a payback period of four years or less, would the equipment be purchased?
2. Compute the simple rate of return on the equipment. Use straight-line depreciation based on the equipment's useful life. Would the equipment be purchased if the company's required rate of return is 14%?

**EXERCISE 13–8 Comparison of Projects Using Net Present Value [L01]**

Labeau Products, Ltd., of Perth, Australia, has \$35,000 to invest. The company is trying to decide between two alternative uses for the funds as follows:

| | Invest in Project X | Invest in Project Y |
|---|------------------------|------------------------|
| Investment required | \$35,000 | \$35,000 |
| Annual cash inflows | \$9,000 | |
| Single cash inflow at the end of 10 years | | \$150,000 |
| Life of the project | 10 years | 10 years |

The company's discount rate is 18%.

Required:

(Ignore income taxes.) Which alternative would you recommend that the company accept? Show all computations using the net present value approach. Prepare separate computations for each project.

**EXERCISE 13–9 Basic Net Present Value Analysis [L01]**

Kathy Myers frequently purchases stocks and bonds, but she is uncertain how to determine the rate of return that she is earning. For example, three years ago she paid \$13,000 for 200 shares of Malti Company's common stock. She received a \$420 cash dividend on the stock at the end of each year for three years. At the end of three years, she sold the stock for \$16,000. Kathy would like to earn a return of at least 14% on all of her investments. She is not sure whether the Malti Company stock provided a 14% return and would like some help with the necessary computations.

Required:

(Ignore income taxes.) Using the net present value method, determine whether or not the Malti Company stock provided a 14% return. Use the general format illustrated in Exhibit 13–4 and round all computations to the nearest whole dollar.

EXERCISE 13–10 Net Present Value Analysis of Two Alternatives [L01]

Perit Industries has \$100,000 to invest. The company is trying to decide between two alternative uses of the funds. The alternatives are:

| | Project A | Project B |
|---|-----------|-----------|
| Cost of equipment required | \$100,000 | \$0 |
| Working capital investment required | \$0 | \$100,000 |
| Annual cash inflows | \$21,000 | \$16,000 |
| Salvage value of equipment in six years | \$8,000 | \$0 |
| Life of the project | 6 years | 6 years |

The working capital needed for project B will be released at the end of six years for investment elsewhere. Perit Industries' discount rate is 14%.

Required:

(Ignore income taxes.) Which investment alternative (if either) would you recommend that the company accept? Show all computations using the net present value format. Prepare separate computations for each project.

EXERCISE 13–11 Basic Net Present Value and Internal Rate of Return Analysis [L01, L02, L03]

Consider each part below independently. Ignore income taxes.

1. Preston Company's required rate of return is 14% on all investments. The company can purchase a new machine at a cost of \$84,900. The new machine would generate cash inflows of \$15,000 per year and have a 12-year useful life with no salvage value. Compute the machine's net present value. (Use the format shown in Exhibit 13–1.) Is the machine an acceptable investment? Explain.
2. The Walton *Daily News* is investigating the purchase of a new auxiliary press that has a projected life of 18 years. It is estimated that the new press will save \$30,000 per year in cash operating costs. If the new press costs \$217,500, what is its internal rate of return? Is the press an acceptable investment if the company's required rate of return is 16%? Explain.
3. Refer to the data above for the Walton *Daily News*. How much would the annual cash inflows (cost savings) have to be for the new press to provide the required 16% rate of return? Round your answer to the nearest whole dollar.

EXERCISE 13–12 Payback Period and Simple Rate of Return [L05, L06]

Nick's Novelties, Inc., is considering the purchase of electronic pinball machines to place in amusement houses. The machines would cost a total of \$300,000, have an eight-year useful life, and have a total salvage value of \$20,000. The company estimates that annual revenues and expenses associated with the machines would be as follows:

| | | |
|---------------------------------------|-----------|------------------|
| Revenues | | \$200,000 |
| Less operating expenses: | | |
| Commissions to amusement houses | \$100,000 | |
| Insurance | 7,000 | |
| Depreciation | 35,000 | |
| Maintenance | 18,000 | 160,000 |
| Net operating income | | <u>\$ 40,000</u> |

Required:

(Ignore income taxes.)

1. Assume that Nick's Novelties, Inc., will not purchase new equipment unless it provides a payback period of five years or less. Would the company purchase the pinball machines?
2. Compute the simple rate of return promised by the pinball machines. If the company requires a simple rate of return of at least 12%, will the pinball machines be purchased?

EXERCISE 13-13 Internal Rate of Return and Net Present Value [L01, L02]

Henrie’s Drapery Service is investigating the purchase of a new machine for cleaning and blocking drapes. The machine would cost \$130,400, including freight and installation. Henrie’s has estimated that the new machine would increase the company’s cash inflows, net of expenses, by \$25,000 per year. The machine would have a 10-year useful life and no salvage value.

Required:

(Ignore income taxes.)

1. Compute the machine’s internal rate of return to the nearest whole percent.
2. Compute the machine’s net present value. Use a discount rate of 14%. Why do you have a zero net present value?
3. Suppose that the new machine would increase the company’s annual cash inflows, net of expenses, by only \$22,500 per year. Under these conditions, compute the internal rate of return to the nearest whole percent.

EXERCISE 13-14 Uncertain Future Life [L03]

The Matchless Dating Service has made an investment in video and recording equipment that costs \$106,700. The equipment is expected to generate cash inflows of \$20,000 per year.

Required:

How many years will the equipment have to be used to provide the company with a 10% rate of return on its investment?

EXERCISE 13-15 Uncertain Cash Flows [L03]

The Cambro Foundation, a nonprofit organization, is planning to invest \$104,950 in a project that will last for three years. The project will produce net cash inflows as follows:

| | |
|--------------|----------|
| Year 1 | \$30,000 |
| Year 2 | \$40,000 |
| Year 3 | ? |

Required:

(Ignore income taxes.) Assuming that the project will yield exactly a 12% rate of return, what is the expected net cash inflow for Year 3?

Problems

PROBLEM 13-16 Preference Ranking of Investment Projects [L04]

Oxford Company has limited funds available for investment and must ration the funds among four competing projects. Selected information on the four projects follows:

| Project | Investment Required | Net Present Value | Life of the Project (years) | Internal Rate of Return (percent) |
|---------|---------------------|-------------------|-----------------------------|-----------------------------------|
| A | \$160,000 | \$44,323 | 7 | 18% |
| B | \$135,000 | \$42,000 | 12 | 16% |
| C | \$100,000 | \$35,035 | 7 | 20% |
| D | \$175,000 | \$38,136 | 3 | 22% |

The net present values above have been computed using a 10% discount rate. The company wants your assistance in determining which project to accept first, second, and so forth.

Required:

1. Compute the project profitability index for each project.
2. In order of preference, rank the four projects in terms of:
 - a. Net present value.
 - b. Project profitability index.
 - c. Internal rate of return.
3. Which ranking do you prefer? Why?

PROBLEM 13–17 Preference Ranking of Investment Projects [LO4]

The management of Revco Products is exploring four different investment opportunities. Information on the four projects under study follows:

| | Project Number | | | |
|--|------------------|------------------|------------------|------------------|
| | 1 | 2 | 3 | 4 |
| Investment required | \$(270,000) | \$(450,000) | \$(360,000) | \$(480,000) |
| Present value of cash inflows at a 10% discount rate | 336,140 | 522,970 | 433,400 | 567,270 |
| Net present value | <u>\$ 66,140</u> | <u>\$ 72,970</u> | <u>\$ 73,400</u> | <u>\$ 87,270</u> |
| Life of the project | 6 years | 3 years | 12 years | 6 years |
| Internal rate of return | 18% | 19% | 14% | 16% |

The company’s required rate of return is 10%; thus, a 10% discount rate has been used in the present value computations above. Limited funds are available for investment, so the company can’t accept all of the available projects.

Required:

1. Compute the project profitability index for each investment project.
2. Rank the four projects according to preference, in terms of:
 - a. Net present value
 - b. Project profitability index
 - c. Internal rate of return
3. Which ranking do you prefer? Why?

PROBLEM 13–18 Basic Net Present Value Analysis [LO1]

Windhoek Mines, Ltd., of Namibia, is contemplating the purchase of equipment to exploit a mineral deposit on land to which the company has mineral rights. An engineering and cost analysis has been made, and it is expected that the following cash flows would be associated with opening and operating a mine in the area:

| | |
|--|-----------|
| Cost of new equipment and timbers | R275,000 |
| Working capital required | R100,000 |
| Annual net cash receipts | R120,000* |
| Cost to construct new roads in three years | R40,000 |
| Salvage value of equipment in four years | R65,000 |

*Receipts from sales of ore, less out-of-pocket costs for salaries, utilities, insurance, and so forth.

The currency in Namibia is the rand, denoted here by R.

The mineral deposit would be exhausted after four years of mining. At that point, the working capital would be released for reinvestment elsewhere. The company’s required rate of return is 20%.

Required:

(Ignore income taxes.) Determine the net present value of the proposed mining project. Should the project be accepted? Explain.

PROBLEM 13–19 Basic Net Present Value Analysis [LO1]

The Sweetwater Candy Company would like to buy a new machine that would automatically “dip” chocolates. The dipping operation is currently done largely by hand. The machine the company is considering costs \$120,000. The manufacturer estimates that the machine would be usable for 12 years but would require the replacement of several key parts at the end of the sixth year. These parts would cost \$9,000, including installation. After 12 years, the machine could be sold for \$7,500.

The company estimates that the cost to operate the machine will be \$7,000 per year. The present method of dipping chocolates costs \$30,000 per year. In addition to reducing costs, the new machine will

increase production by 6,000 boxes of chocolates per year. The company realizes a contribution margin of \$1.50 per box. A 20% rate of return is required on all investments.

Required:

(Ignore income taxes.)

1. What are the annual net cash inflows that will be provided by the new dipping machine?
2. Compute the new machine's net present value. Use the incremental cost approach and round all dollar amounts to the nearest whole dollar.

PROBLEM 13–20 Simple Rate of Return; Payback [LO5, LO6]

Paul Swanson has an opportunity to acquire a franchise from The Yogurt Place, Inc., to dispense frozen yogurt products under The Yogurt Place name. Mr. Swanson has assembled the following information relating to the franchise:

- a. A suitable location in a large shopping mall can be rented for \$3,500 per month.
- b. Remodeling and necessary equipment would cost \$270,000. The equipment would have a 15-year life and an \$18,000 salvage value. Straight-line depreciation would be used, and the salvage value would be considered in computing depreciation.
- c. Based on similar outlets elsewhere, Mr. Swanson estimates that sales would total \$300,000 per year. Ingredients would cost 20% of sales.
- d. Operating costs would include \$70,000 per year for salaries, \$3,500 per year for insurance, and \$27,000 per year for utilities. In addition, Mr. Swanson would have to pay a commission to The Yogurt Place, Inc., of 12.5% of sales.

Required:

(Ignore income taxes.)

1. Prepare a contribution format income statement that shows the expected net operating income each year from the franchise outlet.
2. Compute the simple rate of return promised by the outlet. If Mr. Swanson requires a simple rate of return of at least 12%, should he acquire the franchise?
3. Compute the payback period on the outlet. If Mr. Swanson wants a payback of four years or less, will he acquire the franchise?

PROBLEM 13–21 Net Present Value Analysis; Uncertain Cash Flows [LO1, LO3]

"I'm not sure we should lay out \$500,000 for that automated welding machine," said Jim Alder, president of the Superior Equipment Company. "That's a lot of money, and it would cost us \$80,000 for software and installation, and another \$3,000 every month just to maintain the thing. In addition, the manufacturer admits that it would cost \$45,000 more at the end of seven years to replace worn-out parts."

"I admit it's a lot of money," said Franci Rogers, the controller. "But you know the turnover problem we've had with the welding crew. This machine would replace six welders at a cost savings of \$108,000 per year. And we would save another \$6,500 per year in reduced material waste. When you figure that the automated welder would last for 12 years, I'm sure the return would be greater than our 16% required rate of return."

"I'm still not convinced," countered Mr. Alder. "We can only get \$12,000 scrap value out of our old welding equipment if we sell it now, and in 12 years the new machine will only be worth \$20,000 for parts. But have your people work up the figures and we'll talk about them at the executive committee meeting tomorrow."

Required:

(Ignore income taxes.)

1. Compute the annual net cost savings promised by the automated welding machine.
2. Using the data from (1) above and other data from the problem, compute the automated welding machine's net present value. (Use the incremental-cost approach.) Would you recommend purchasing the automated welding machine? Explain.
3. Assume that management can identify several intangible benefits associated with the automated welding machine, including greater flexibility in shifting from one type of product to another, improved quality of output, and faster delivery as a result of reduced throughput time. What dollar value per year would management have to attach to these intangible benefits in order to make the new welding machine an acceptable investment?

PROBLEM 13–22 Keep or Sell Property [LO1]

Raul Martinas, professor of languages at Eastern University, owns a small office building adjacent to the university campus. He acquired the property 10 years ago at a total cost of \$530,000—\$50,000 for the land

and \$480,000 for the building. He has just received an offer from a realty company that wants to purchase the property; however, the property has been a good source of income over the years, so Professor Martinas is unsure whether he should keep it or sell it. His alternatives are:

Alternative 1: Keep the property. Professor Martinas' accountant has kept careful records of the income realized from the property over the past 10 years. These records indicate the following annual revenues and expenses:

| | | |
|------------------------------------|----------|------------------|
| Rental receipts | | \$140,000 |
| Less building expenses: | | |
| Utilities | \$25,000 | |
| Depreciation of building | 16,000 | |
| Property taxes and insurance | 18,000 | |
| Repairs and maintenance | 9,000 | |
| Custodial help and supplies | 40,000 | 108,000 |
| Net operating income | | <u>\$ 32,000</u> |

Professor Martinas makes a \$12,000 mortgage payment each year on the property. The mortgage will be paid off in eight more years. He has been depreciating the building by the straight-line method, assuming a salvage value of \$80,000 for the building which he still thinks is an appropriate figure. He feels sure that the building can be rented for another 15 years. He also feels sure that 15 years from now the land will be worth three times what he paid for it.

Alternative 2: Sell the property. A realty company has offered to purchase the property by paying \$175,000 immediately and \$26,500 per year for the next 15 years. Control of the property would go to the realty company immediately. To sell the property, Professor Martinas would need to pay the mortgage off, which could be done by making a lump-sum payment of \$90,000.

Required:

Assume that Professor Martinas requires a 12% rate of return. Would you recommend he keep or sell the property? Show computations using the total-cost approach to net present value.

PROBLEM 13–23 Simple Rate of Return; Payback [L05, L06]

Sharkey's Fun Center contains a number of electronic games as well as a miniature golf course and various rides located outside the building. Paul Sharkey, the owner, would like to construct a water slide on one portion of his property. Mr. Sharkey has gathered the following information about the slide:

- Water slide equipment could be purchased and installed at a cost of \$330,000. According to the manufacturer, the slide would be usable for 12 years after which it would have no salvage value.
- Mr. Sharkey would use straight-line depreciation on the slide equipment.
- To make room for the water slide, several rides would be dismantled and sold. These rides are fully depreciated, but they could be sold for \$60,000 to an amusement park in a nearby city.
- Mr. Sharkey has concluded that about 50,000 more people would use the water slide each year than have been using the rides. The admission price would be \$3.60 per person (the same price that the Fun Center has been charging for the old rides).
- Based on experience at other water slides, Mr. Sharkey estimates that annual incremental operating expenses for the slide would be: salaries, \$85,000; insurance, \$4,200; utilities, \$13,000; and maintenance, \$9,800.

Required:

(Ignore income taxes.)

- Prepare an income statement showing the expected net operating income each year from the water slide.
- Compute the simple rate of return expected from the water slide. Based on this computation, would the water slide be constructed if Mr. Sharkey requires a simple rate of return of at least 14% on all investments?
- Compute the payback period for the water slide. If Mr. Sharkey accepts any project with a payback period of five years or less, would the water slide be constructed?

**PROBLEM 13–24 Net Present Value Analysis [LO1]**

In eight years, Kent Duncan will retire. He is exploring the possibility of opening a self-service car wash. The car wash could be managed in the free time he has available from his regular occupation, and it could be closed easily when he retires. After careful study, Mr. Duncan has determined the following:

- A building in which a car wash could be installed is available under an eight-year lease at a cost of \$1,700 per month.
- Purchase and installation costs of equipment would total \$200,000. In eight years the equipment could be sold for about 10% of its original cost.
- An investment of an additional \$2,000 would be required to cover working capital needs for cleaning supplies, change funds, and so forth. After eight years, this working capital would be released for investment elsewhere.
- Both a wash and a vacuum service would be offered with a wash costing \$2.00 and the vacuum costing \$1.00 per use.
- The only variable costs associated with the operation would be 20 cents per wash for water and 10 cents per use of the vacuum for electricity.
- In addition to rent, monthly costs of operation would be: cleaning, \$450; insurance, \$75; and maintenance, \$500.
- Gross receipts from the wash would be about \$1,350 per week. According to the experience of other car washes, 60% of the customers using the wash would also use the vacuum.

Mr. Duncan will not open the car wash unless it provides at least a 10% return.

Required:

(Ignore income taxes.)

- Assuming that the car wash will be open 52 weeks a year, compute the expected annual net cash receipts (gross cash receipts less cash disbursements) from its operation. (Do not include the cost of the equipment, the working capital, or the salvage value in these computations.)
- Would you advise Mr. Duncan to open the car wash? Show computations using the net present value method of investment analysis. Round all dollar figures to the nearest whole dollar.

**PROBLEM 13–25 Net Present Value Analysis of a Lease or Buy Decision [LO1]**

The Riteway Ad Agency provides cars for its sales staff. In the past, the company has always purchased its cars from a dealer and then sold the cars after three years of use. The company's present fleet of cars is three years old and will be sold very shortly. To provide a replacement fleet, the company is considering two alternatives:

Purchase alternative: The company can purchase the cars, as in the past, and sell the cars after three years of use. Ten cars will be needed, which can be purchased at a discounted price of \$17,000 each. If this alternative is accepted, the following costs will be incurred on the fleet as a whole:

| | |
|---|---------|
| Annual cost of servicing, taxes, and licensing | \$3,000 |
| Repairs, first year | \$1,500 |
| Repairs, second year | \$4,000 |
| Repairs, third year | \$6,000 |

At the end of three years, the fleet could be sold for one-half of the original purchase price.

Lease alternative: The company can lease the cars under a three-year lease contract. The lease cost would be \$55,000 per year (the first payment due at the end of Year 1). As part of this lease cost, the owner would provide all servicing and repairs, license the cars, and pay all the taxes. Riteway would be required to make a \$10,000 security deposit at the beginning of the lease period, which would be refunded when the cars were returned to the owner at the end of the lease contract.

Riteway Ad Agency's required rate of return is 18%.

Required:

(Ignore income taxes.)

- Use the total-cost approach to determine the present value of the cash flows associated with each alternative. Round all dollar amounts to the nearest whole dollar.
- Which alternative should the company accept?

PROBLEM 13–26 Net Present Value Analysis of Securities [LO1]

Linda Clark received \$175,000 from her mother’s estate. She placed the funds into the hands of a broker, who purchased the following securities on Linda’s behalf:

- Common stock was purchased at a cost of \$95,000. The stock paid no dividends, but it was sold for \$160,000 at the end of three years.
- Preferred stock was purchased at its par value of \$30,000. The stock paid a 6% dividend (based on par value) each year for three years. At the end of three years, the stock was sold for \$27,000.
- Bonds were purchased at a cost of \$50,000. The bonds paid \$3,000 in interest every six months. After three years, the bonds were sold for \$52,700. (Note: In discounting a cash flow that occurs semiannually, the procedure is to halve the discount rate and double the number of periods. Use the same procedure in discounting the proceeds from the sale.)

The securities were all sold at the end of three years so that Linda would have funds available to open a new business venture. The broker stated that the investments had earned more than a 16% return, and he gave Linda the following computations to support his statement:

| | |
|--|-----------------|
| Common stock: | |
| Gain on sale (\$160,000 – \$95,000) | \$65,000 |
| Preferred stock: | |
| Dividends paid (6% × \$30,000 × 3 years) | 5,400 |
| Loss on sale (\$27,000 – \$30,000) | (3,000) |
| Bonds: | |
| Interest paid (\$3,000 × 6 periods) | 18,000 |
| Gain on sale (\$52,700 – \$50,000) | 2,700 |
| Net gain on all investments | <u>\$88,100</u> |

$$\frac{\$88,100 \div 3 \text{ years}}{\$175,000} = 16.8\%$$

Required:

- Using a 16% discount rate, compute the net present value of *each* of the three investments. On which investment(s) did Linda earn a 16% rate of return? (Round computations to the nearest whole dollar.)
- Considering all three investments together, did Linda earn a 16% rate of return? Explain.
- Linda wants to use the \$239,700 proceeds (\$160,000 + \$27,000 + \$52,700 = \$239,700) from sale of the securities to open a retail store under a 12-year franchise contract. What annual net cash inflow must the store generate for Linda to earn a 14% return over the 12-year period? Round computations to the nearest whole dollar.

PROBLEM 13–27 Net Present Value; Total and Incremental Approaches [LO1]

Bilboa Freightlines, S.A., of Panama, has a small truck that it uses for intracity deliveries. The truck is worn out and must be either overhauled or replaced with a new truck. The company has assembled the following information. (Panama uses the U.S. dollar as its currency):

| | A | B | C |
|---|------------------------------------|---------------|-----------|
| | | Present Truck | New Truck |
| 1 | | | |
| 2 | Purchase cost new | \$21,000 | \$30,000 |
| 3 | Remaining book value | \$11,500 | |
| 4 | Overhaul needed now | \$7,000 | |
| 5 | Annual cash operating costs | \$10,000 | \$6,500 |
| 6 | Salvage value-now | \$9,000 | |
| 7 | Salvage value-eight years from now | \$1,000 | \$4,000 |
| 8 | | | |

If the company keeps and overhauls its present delivery truck, then the truck will be usable for eight more years. If a new truck is purchased, it will be used for eight years, after which it will be traded in on another truck. The new truck would be diesel-operated, resulting in a substantial reduction in annual operating costs, as shown above.

The company computes depreciation on a straight-line basis. All investment projects are evaluated using a 16% discount rate.

Required:

(Ignore income taxes.)

- Should Bilboa Freightlines keep the old truck or purchase the new one? Use the total-cost approach to net present value in making your decision. Round to the nearest whole dollar.
- Redo (1) above, this time using the incremental-cost approach.

PROBLEM 13–28 Net Present Value; Uncertain Future Cash Flows; Postaudit [L01, L03]

Saxon Products, Inc., is investigating the purchase of a robot for use on the company's assembly line. Selected data relating to the robot are provided below:

| | |
|---|-------------|
| Cost of the robot | \$1,800,000 |
| Installation and software | \$900,000 |
| Annual savings in labor costs | ? |
| Annual savings in inventory carrying costs | \$210,000 |
| Monthly increase in power and maintenance costs | \$2,500 |
| Salvage value in 10 years | \$70,000 |
| Useful life | 10 years |

Engineering studies suggest that use of the robot will result in a savings of 25,000 direct labor-hours each year. The labor rate is \$16 per hour. Also, the smoother work flow made possible by the use of automation will allow the company to reduce the amount of inventory on hand by \$400,000. This inventory reduction will take place at the end of the first year of operation; the released funds will be available for use elsewhere in the company. Saxon Products has a 20% required rate of return.

Shelly Martins, the controller, has noted that all of Saxon's competitors are automating their plants. She is pessimistic, however, about whether Saxon's management will allow it to automate. In preparing the proposal for the robot, she stated to a colleague, "Let's just hope that reduced labor and inventory costs can justify the purchase of this automated equipment. Otherwise, we'll never get it. You know how the president feels about equipment paying for itself out of reduced costs."

Required:

(Ignore income taxes.)

- Determine the *annual* net cost savings if the robot is purchased. (Do not include the \$400,000 inventory reduction or the salvage value in this computation.)
- Compute the net present value of the proposed investment in the robot. Based on these data, would you recommend that the robot be purchased? Explain.
- Assume that the robot is purchased. At the end of the first year, Shelly Martins has found that some items didn't work out as planned. Due to unforeseen problems, software and installation costs were \$75,000 more than estimated and direct labor has been reduced by only 22,500 hours per year, rather than by 25,000 hours. Assuming that all other cost data were accurate, does it appear that the company made a wise investment? Show computations using the net present value format as in (2) above. (*Hint:* It might be helpful to place yourself back at the beginning of the first year with the new data.)
- Upon seeing your analysis in (3) above, Saxon's president stated, "That robot is the worst investment we've ever made. And now we'll be stuck with it for years."
 - Explain to the president what benefits other than cost savings might accrue from using the new automated equipment.
 - Compute for the president the dollar amount of cash inflow that would be needed each year from the benefits in (a) above for the automated equipment to yield a 20% rate of return.

PROBLEM 13–29 Simple Rate of Return; Payback; Internal Rate of Return [L02, L05, L06]

The Elberta Fruit Farm of Ontario has always hired transient workers to pick its annual cherry crop. Francie Wright, the farm manager, has just received information on a cherry picking machine that is being purchased by many fruit farms. The machine is a motorized device that shakes the cherry tree, causing the cherries to fall onto plastic tarps that funnel the cherries into bins. Ms. Wright has gathered

the following information to decide whether a cherry picker would be a profitable investment for the Elberta Fruit Farm:

- Currently, the farm is paying an average of \$40,000 per year to transient workers to pick the cherries.
- The cherry picker would cost \$94,500, and it would have an estimated 12-year useful life. The farm uses straight-line depreciation on all assets and considers salvage value in computing depreciation deductions. The estimated salvage value of the cherry picker is \$4,500.
- Annual out-of-pocket costs associated with the cherry picker would be: cost of an operator and an assistant, \$14,000; insurance, \$200; fuel, \$1,800; and a maintenance contract, \$3,000.

Required:

(Ignore income taxes.)

- Determine the annual savings in cash operating costs that would be realized if the cherry picker were purchased.
- Compute the simple rate of return expected from the cherry picker. Would the cherry picker be purchased if Elberta Fruit Farm's required rate of return is 16%?
- Compute the payback period on the cherry picker. The Elberta Fruit Farm will not purchase equipment unless it has a payback period of five years or less. Would the cherry picker be purchased?
- Compute (to the nearest whole percent) the internal rate of return promised by the cherry picker. Based on this computation, does it appear that the simple rate of return is an accurate guide in investment decisions?

PROBLEM 13–30 Internal Rate of Return; Sensitivity Analysis [L02]

"In my opinion, a tanning salon would be a natural addition to our spa and very popular with our customers," said Stacey Winder, manager of the Lifeline Spa. "Our figures show that we could remodel the building next door to our spa and install all of the necessary equipment for \$330,000. I have contacted tanning salons in other areas, and I am told that the tanning beds will be usable for about nine years. I am also told that a four-bed salon such as we are planning would generate a cash inflow of about \$80,000 per year after all expenses."

"It does sound very appealing," replied Kevin Leblanc, the spa's accountant. "Let me push the numbers around a bit and see what kind of a return the salon would generate."

Required:

(Ignore income taxes.)

- Compute the internal rate of return promised by the tanning salon to the nearest whole percent.
- Assume that Ms. Winder will not open the salon unless it promises a return of at least 14%. Compute the amount of annual cash inflow that would provide this return on the \$330,000 investment.
- Although nine years is the average life of tanning salon equipment, Ms. Winder has found that this life can vary substantially. Compute the internal rate of return to the nearest whole percent if the life were (a) 6 years and (b) 12 years rather than 9 years. Is there any information provided by these computations that you would be particularly anxious to show Ms. Winder?
- Ms. Winder has also found that although \$80,000 is an average cash inflow from a four-bed salon, some salons vary as much as 20% from this figure. Compute the internal rate of return to the nearest whole percent if the annual cash inflows were (a) 20% less and (b) 20% greater than \$80,000.
- Assume that the \$330,000 investment is made and that the salon is opened as planned. Because of concerns about the effects of excessive tanning, however, the salon is not able to attract as many customers as planned. Cash inflows are only \$50,000 per year, and after eight years the salon equipment is sold to a competitor for \$135,440. Compute the internal rate of return to the nearest whole percent earned on the investment over the eight-year period. (*Hint:* A useful way to proceed is to find the discount rate that will cause the net present value to be equal to, or near, zero.)

PROBLEM 13–31 Simple Rate of Return and Payback Analyses of Two Machines [L05, L06]

Westwood Furniture Company is considering the purchase of two different items of equipment, as described below:

Machine A

A compacting machine has just come onto the market that would permit Westwood Furniture Company to compress sawdust into various shelving products. At present the sawdust is disposed of as a waste product. The following information is available on the machine:

- The machine would cost \$420,000 and would have a 10% salvage value at the end of its 12-year useful life. The company uses straight-line depreciation and considers salvage value in computing depreciation deductions.
- The shelving products manufactured from use of the machine would generate revenues of \$300,000 per year. Variable manufacturing costs would be 20% of sales.
- Fixed expenses associated with the new shelving products would be (per year): advertising, \$40,000; salaries, \$110,000; utilities, \$5,200; and insurance, \$800.

excel

Machine B

A second machine has come onto the market that would allow Westwood Furniture Company to automate a sanding process that is now done largely by hand. The following information is available:

- a. The new sanding machine would cost \$234,000 and would have no salvage value at the end of its 13-year useful life. The company would use straight-line depreciation on the new machine.
- b. Several old pieces of sanding equipment that are fully depreciated would be disposed of at a scrap value of \$9,000.
- c. The new sanding machine would provide substantial annual savings in cash operating costs. It would require an operator at an annual salary of \$16,350 and \$5,400 in annual maintenance costs. The current hand-operated sanding procedure costs the company \$78,000 per year in total.

Westwood Furniture Company requires a simple rate of return of 15% on all equipment purchases. Also, the company will not purchase equipment unless the equipment has a payback period of 4.0 years or less.

Required:

1. For machine A:
 - a. Prepare a contribution format income statement showing the expected net operating income each year from the new shelving products.
 - b. Compute the simple rate of return.
 - c. Compute the payback period.
2. For machine B:
 - a. Compute the simple rate of return.
 - b. Compute the payback period.
3. According to the company's criteria, which machine, if either, should the company purchase?

PROBLEM 13–32 Net Present Value Analysis of a New Product [LO1]

Matheson Electronics has just developed a new electronic device which, when mounted on an automobile, will tell the driver how many miles the automobile is traveling per gallon of gasoline.

The company is anxious to begin production of the new device. To this end, marketing and cost studies have been made to determine probable costs and market potential. These studies have provided the following information:

- a. New equipment would have to be acquired to produce the device. The equipment would cost \$315,000 and have a 12-year useful life. After 12 years, it would have a salvage value of about \$15,000.
- b. Sales in units over the next 12 years are projected to be as follows:

| Year | Sales in Units |
|------------|----------------|
| 1 | 6,000 |
| 2 | 12,000 |
| 3 | 15,000 |
| 4–12 | 18,000 |

- c. Production and sales of the device would require working capital of \$60,000 to finance accounts receivable, inventories, and day-to-day cash needs. This working capital would be released at the end of the project's life.
- d. The devices would sell for \$35 each; variable costs for production, administration, and sales would be \$15 per unit.
- e. Fixed costs for salaries, maintenance, property taxes, insurance, and straight-line depreciation on the equipment would total \$135,000 per year. (Depreciation is based on cost less salvage value.)
- f. To gain rapid entry into the market, the company would have to advertise heavily. The advertising program would be:

| Year | Amount of Yearly Advertising |
|------------|------------------------------|
| 1–2 | \$180,000 |
| 3 | \$150,000 |
| 4–12 | \$120,000 |

- g. The company's required rate of return is 14%.

Required:

(Ignore income taxes.)

1. Compute the net cash inflow (cash receipts less yearly cash operating expenses) anticipated from sale of the device for each year over the next 12 years.
2. Using the data computed in (1) above and other data provided in the problem, determine the net present value of the proposed investment. Would you recommend that Matheson accept the device as a new product?

Cases

CASE 13–33 Ethics and the Manager

The Fore Corporation is an integrated food processing company that has operations in over two dozen countries. Fore's corporate headquarters is in Chicago, and the company's executives frequently travel to visit Fore's foreign and domestic facilities.

Fore has a fleet of aircraft that consists of two business jets with international range and six smaller turboprop aircraft that are used on shorter flights. Company policy is to assign aircraft to trips on the basis of minimizing cost, but the practice is to assign the aircraft based on the organizational rank of the traveler. Fore offers its aircraft for short-term lease or for charter by other organizations whenever Fore itself does not plan to use the aircraft. Fore surveys the market often in order to keep its lease and charter rates competitive.

William Earle, Fore's vice president of finance, has claimed that a third business jet can be justified financially. However, some people in the controller's office have surmised that the real reason for a third business jet was to upgrade the aircraft used by Earle. Presently, the people outranking Earle keep the two business jets busy with the result that Earle usually flies in smaller turboprop aircraft.

The third business jet would cost \$11 million. A capital expenditure of this magnitude requires a formal proposal with projected cash flows and net present value computations using Fore's minimum required rate of return. If Fore's president and the finance committee of the board of directors approve the proposal, it will be submitted to the full board of directors. The board has final approval on capital expenditures exceeding \$5 million and has established a firm policy of rejecting any discretionary proposal that has a negative net present value.

Earle asked Rachel Arnett, assistant corporate controller, to prepare a proposal on a third business jet. Arnett gathered the following data:

- ¥ Acquisition cost of the aircraft, including instrumentation and interior furnishing.
- ¥ Operating cost of the aircraft for company use.
- ¥ Projected avoidable commercial airfare and other avoidable costs from company use of the plane.
- ¥ Projected value of executive time saved by using the third business jet.
- ¥ Projected contribution margin from incremental lease and charter activity.
- ¥ Estimated resale value of the aircraft.

When Earle reviewed Arnett's completed proposal and saw the large negative net present value figure, he returned the proposal to Arnett. With a glare, Earle commented, "You must have made an error. The proposal should look better than that."

Feeling some pressure, Arnett went back and checked her computations; she found no errors. However, Earle's message was clear. Arnett discarded her projections that she believed were reasonable and replaced them with figures that had a remote chance of actually occurring but were more favorable to the proposal. For example, she used first-class airfares to refigure the avoidable commercial airfare costs, even though company policy was to fly coach. She found revising the proposal to be distressing.

The revised proposal still had a negative net present value. Earle's anger was evident as he told Arnett to revise the proposal again, and to start with a \$100,000 positive net present value and work backwards to compute supporting projections.

Required:

1. Explain whether Rachel Arnett's revision of the proposal was in violation of the IMA's Statement of Ethical Professional Practice.
2. Was William Earle in violation of the IMA's Statement of Ethical Professional Practice by telling Arnett specifically how to revise the proposal? Explain your answer.
3. Identify specific internal controls that Fore Corporation could implement to prevent unethical behavior on the part of the vice president of finance.

(CMA, adapted)

CASE 13–34 Net Present Value Analysis of a Lease or Buy Decision [LO1]

Top-Quality Stores, Inc., owns a nationwide chain of supermarkets. The company is going to open another store soon, and a suitable building site has been located in an attractive and rapidly growing area. In discussing how the company can acquire the desired building and other facilities needed to open the new store, Sam Watkins, the company's vice president in charge of sales, stated, "I know most of our competitors are starting to lease facilities rather than buy, but I just can't see the economics of it. Our development people tell me that we can buy the building site, put a building on it, and get all the store fixtures we need for just \$850,000. They also say that property taxes, insurance, and repairs would run \$20,000 a year. When you figure that we plan to keep a site for 18 years, that's a total cost of \$1,210,000. But then when you realize that the property will be worth at least a half million in 18 years, that's a net cost to us of only \$710,000. What would it cost to lease the property?"

"I understand that Beneficial Insurance Company is willing to purchase the building site, construct a building and install fixtures to our specifications, and then lease the facility to us for 18 years at an annual lease payment of \$120,000," replied Lisa Coleman, the company's executive vice president.

"That's just my point," said Sam. "At \$120,000 a year, it would cost us a cool \$2,160,000 over the 18 years. That's three times what it would cost to buy, and what would we have left at the end? Nothing! The building would belong to the insurance company!"

"You're overlooking a few things," replied Lisa. "For one thing, the treasurer's office says that we could only afford to put \$350,000 down if we buy the property, and then we would have to pay the other \$500,000 off over four years at \$175,000 a year. So there would be some interest involved on the purchase side that you haven't figured in."

"But that little bit of interest is nothing compared to over 2 million bucks for leasing," said Sam. "Also, if we lease I understand we would have to put up an \$8,000 security deposit that we wouldn't get back until the end. And besides that, we would still have to pay all the yearly repairs and maintenance costs just like we owned the property. No wonder those insurance companies are so rich if they can swing deals like this."

"Well, I'll admit that I don't have all the figures sorted out yet," replied Lisa. "But I do have the operating cost breakdown for the building, which includes \$7,500 annually for property taxes, \$8,000 for insurance, and \$4,500 for repairs and maintenance. If we lease, Beneficial will handle its own insurance costs and of course the owner will have to pay the property taxes. I'll put all this together and see if leasing makes any sense with our required rate of return of 16%. The president wants a presentation and recommendation in the executive committee meeting tomorrow. Let's see, development said the first lease payment would be due now and the remaining ones due in years 1–17. Development also said that this store should generate a net cash inflow that's well above the average for our stores."

Required:

(Ignore income taxes.)

- Using the net present value approach, determine whether Top-Quality Stores, Inc., should lease or buy the new facility. Assume that you will be making your presentation before the company's executive committee.
- How will you reply in the meeting if Sam Watkins brings up the issue of the building's future sales value?

CASE 13–35 Comparison of Alternatives Using Net Present Value Analysis [LO1]

Kingsley Products, Ltd., is using a model 400 shaping machine to make one of its products. The company is expecting to have a large increase in demand for the product and is anxious to expand its productive capacity. Two possibilities are under consideration:

Alternative 1. Purchase another model 400 shaping machine to operate along with the currently owned model 400 machine.

Alternative 2. Purchase a model 800 shaping machine and use the currently owned model 400 machine as standby equipment. The model 800 machine is a high-speed unit with double the capacity of the model 400 machine.

The following additional information is available on the two alternatives:

- Both the model 400 machine and the model 800 machine have a 10-year life from the time they are first used in production. The scrap value of both machines is negligible and can be ignored. Straight-line depreciation is used.
- The cost of a new model 800 machine is \$300,000.
- The model 400 machine now in use cost \$160,000 three years ago. Its present book value is \$112,000, and its present market value is \$90,000.
- A new model 400 machine costs \$170,000 now. If the company decides not to buy the model 800 machine, then the old model 400 machine will have to be replaced in seven years at a cost of \$200,000. The replacement machine will be sold at the end of the tenth year for \$140,000.

e. Production over the next 10 years is expected to be:

| Year | Production in Units |
|------------|---------------------|
| 1 | 40,000 |
| 2 | 60,000 |
| 3 | 80,000 |
| 4–10 | 90,000 |

f. The two models of machines are not equally efficient. Comparative variable costs per unit are:

| | Model | |
|--|---------------|---------------|
| | 400 | 800 |
| Direct materials per unit | \$0.25 | \$0.40 |
| Direct labor per unit | 0.49 | 0.16 |
| Supplies and lubricants per unit | 0.06 | 0.04 |
| Total variable cost per unit | <u>\$0.80</u> | <u>\$0.60</u> |

- g. The model 400 machine is less costly to maintain than the model 800 machine. Annual repairs and maintenance costs on a model 400 machine are \$2,500.
- h. Repairs and maintenance costs on a model 800 machine, with a model 400 machine used as standby, would total \$3,800 per year.
- i. No other costs will change as a result of the decision between the two machines.
- j. Kingsley Products has a 20% required rate of return on all investments.

Required:

(Ignore income taxes.)

1. Which alternative should the company choose? Use the net present value approach.
2. Suppose that the cost of direct labor increases by 10%. Would this make the model 800 machine more or less desirable? Explain. No computations are needed.
3. Suppose that the cost of direct materials doubles. Would this make the model 800 machine more or less desirable? Explain. No computations are needed.

Appendix 13A: The Concept of Present Value

A dollar received today is more valuable than a dollar received a year from now for the simple reason that if you have a dollar today, you can put it in the bank and have more than a dollar a year from now. Because dollars today are worth more than dollars in the future, cash flows that are received at different times must be weighted differently.

LEARNING OBJECTIVE 7

Understand present value concepts and the use of present value tables.

The Mathematics of Interest

If a bank pays 5% interest, then a deposit of \$100 today will be worth \$105 one year from now. This can be expressed as follows:

$$F_1 = P(1 + r) \tag{1}$$

where F_1 = the balance at the end of one period, P = the amount invested now, and r = the rate of interest per period.

In the case where \$100 is deposited in a savings account that earns 5% interest, P = \$100 and r = 0.05. Under these conditions, F_1 = \$105.

The \$100 present outlay is called the **present value** of the \$105 amount to be received in one year. It is also known as the *discounted value* of the future \$105 receipt. The \$100

represents the value in present terms of \$105 to be received a year from now when the interest rate is 5%.

Compound Interest What if the \$105 is left in the bank for a second year? In that case, by the end of the second year the original \$100 deposit will have grown to \$110.25:

| | |
|---|-----------------|
| Original deposit | \$100.00 |
| Interest for the first year: | |
| $\$100 \times 0.05$ | 5.00 |
| Balance at the end of the first year | 105.00 |
| Interest for the second year: | |
| $\$105 \times 0.05$ | 5.25 |
| Balance at the end of the second year | <u>\$110.25</u> |

Notice that the interest for the second year is \$5.25, as compared to only \$5.00 for the first year. This difference arises because interest is being paid on interest during the second year. That is, the \$5.00 interest earned during the first year has been left in the account and has been added to the original \$100 deposit when computing interest for the second year. This is known as **compound interest**. In this case, the compounding is annual. Interest can be compounded on a semiannual, quarterly, monthly, or even more frequent basis. The more frequently compounding is done, the more rapidly the balance will grow.

We can determine the balance in an account after n periods of compounding using the following equation:

$$F_n = P(1 + r)^n \tag{2}$$

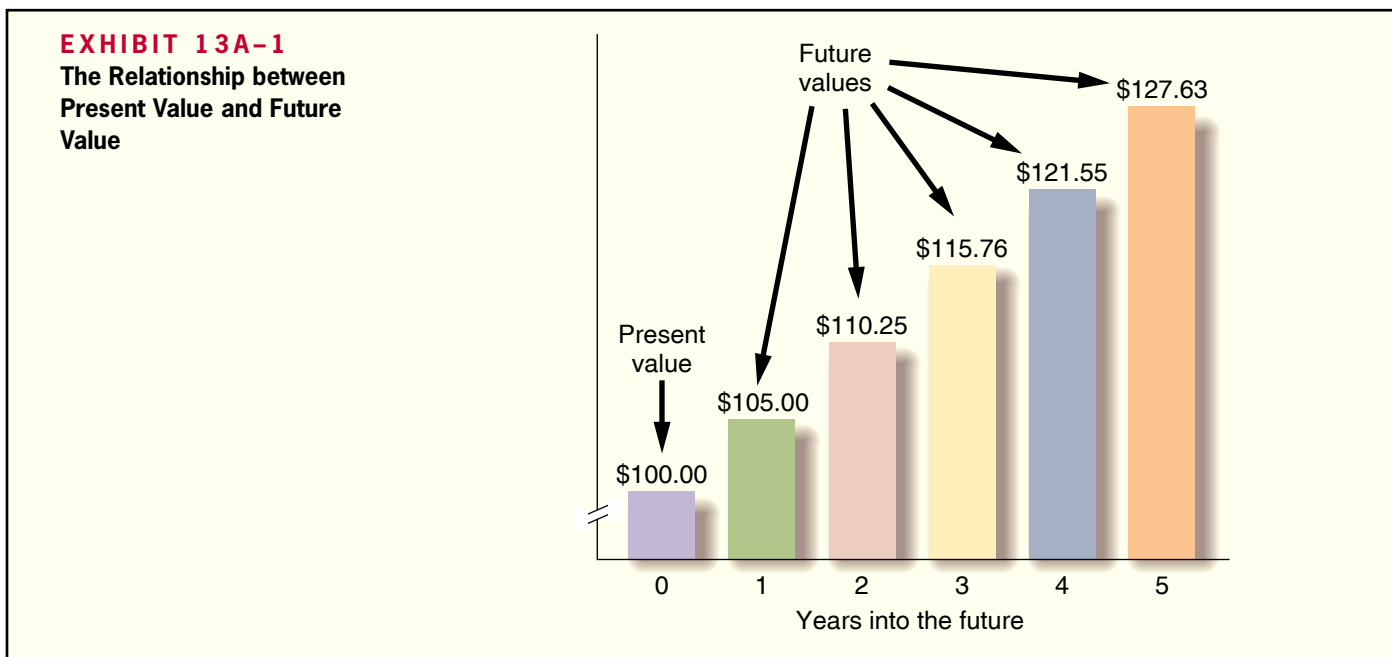

where n = the number of periods of compounding.

If $n = 2$ years and the interest rate is 5% per year, then the balance in two years will be computed as follows:

$$F_2 = \$100(1 + 0.05)^2$$

$$F_2 = \$110.25$$

Present Value and Future Value Exhibit 13A-1 shows the relationship between present value and future value. As shown in the exhibit, if \$100 is deposited in a bank at 5% interest compounded annually, it will grow to \$127.63 by the end of five years.

Computation of Present Value

An investment can be viewed in two ways—either in terms of its future value or in terms of its present value. We have seen from our computations above that if we know the present value of a sum (such as our \$100 deposit), the future value in n years can be computed by using equation (2). But what if the situation is reversed and we know the *future* value of some amount but we do not know its present value?

For example, assume that you are to receive \$200 two years from now. You know that the future value of this sum is \$200 because this is the amount that you will be receiving in two years. But what is the sum's present value—what is it worth *right now*? The present value of any sum to be received in the future can be computed by turning equation (2) around and solving for P :

$$P = \frac{F_n}{(1 + r)^n} \quad (3)$$

In our example, $F_n = \$200$ (the amount to be received in the future), $r = 0.05$ (the annual rate of interest), and $n = 2$ (the number of years in the future that the amount will be received).

$$P = \frac{\$200}{(1 + 0.05)^2}$$

$$P = \frac{\$200}{1.1025}$$

$$P = \$181.40$$

As shown by the computation above, the present value of a \$200 amount to be received two years from now is \$181.40 if the interest rate is 5%. In effect, \$181.40 received *right now* is equivalent to \$200 received two years from now.

The process of finding the present value of a future cash flow, which we have just completed, is called **discounting**. We have *discounted* the \$200 to its present value of \$181.40. The 5% interest that we have used to find this present value is called the **discount rate**. Discounting future sums to their present value is a common practice in business, particularly in capital budgeting decisions.

If you have a power key (y^x) on your calculator, the above calculations are fairly easy. However, some of the present value formulas we will be using are more complex. Fortunately, tables are available in which many of the calculations have already been done. For example, Exhibit 13B–1 in Appendix 13B shows the discounted present value of \$1 to be received at various periods in the future at various interest rates. The table indicates that the present value of \$1 to be received two periods from now at 5% is 0.907. Because in our example we want to know the present value of \$200 rather than just \$1, we need to multiply the factor in the table by \$200:

$$\$200 \times 0.907 = \$181.40$$

This answer is the same as we obtained earlier using the formula in equation (3).

Present Value of a Series of Cash Flows

Although some investments involve a single sum to be received (or paid) at a single point in the future, other investments involve a *series* of cash flows. A series of identical cash flows is known as an **annuity**. To provide an example, assume that a company has just purchased some government bonds. The bonds will yield interest of \$15,000 each year and will be held for five years. What is the present value of the stream of interest receipts from the bonds? As shown in Exhibit 13A–2, if the discount rate is 12%, the present

EXHIBIT 13A-2
Present Value of a Series of
Cash Receipts

| Year | Factor at 12% (Exhibit 13B-1) | Interest Received | Present Value |
|---------|----------------------------------|----------------------|------------------|
| 1 | 0.893 | \$15,000 | \$13,395 |
| 2 | 0.797 | \$15,000 | 11,955 |
| 3 | 0.712 | \$15,000 | 10,680 |
| 4 | 0.636 | \$15,000 | 9,540 |
| 5 | 0.567 | \$15,000 | 8,505 |
| | | | <u>\$54,075</u> |

value of this stream is \$54,075. The discount factors used in this exhibit were taken from Exhibit 13B-1 in Appendix 13B.

Exhibit 13A-2 illustrates two important points. First, the present value of the \$15,000 interest declines the further it is into the future. The present value of \$15,000 received a year from now is \$13,395, as compared to only \$8,505 if received five years from now. This point simply underscores the time value of money.

The second point is that the computations used in Exhibit 13A-2 involved unnecessary work. The same present value of \$54,075 could have been obtained more easily by referring to Exhibit 13B-2 in Appendix 13B. Exhibit 13B-2 contains the present value of \$1 to be received each year over a *series* of years at various interest rates. Exhibit 13B-2 has been derived by simply adding together the factors from Exhibit 13B-1, as follows:

| Year | Exhibit 13B-1 Factors at 12% |
|---------|---------------------------------|
| 1 | 0.893 |
| 2 | 0.797 |
| 3 | 0.712 |
| 4 | 0.636 |
| 5 | 0.567 |
| | <u>3.605</u> |

The sum of the five factors above is 3.605. Notice from Exhibit 13B-2 that the factor for \$1 to be received each year for five years at 12% is also 3.605. If we use this factor and multiply it by the \$15,000 annual cash inflow, then we get the same \$54,075 present value that we obtained earlier in Exhibit 13A-2.

$$\$15,000 \times 3.605 = \$54,075$$

Therefore, when computing the present value of a series of equal cash flows that begins at the end of period 1, Exhibit 13B-2 should be used.

To summarize, the present value tables in Appendix 13B should be used as follows:

Exhibit 13B-1: This table should be used to find the present value of a single cash flow (such as a single payment or receipt) occurring in the future.

Exhibit 13B-2: This table should be used to find the present value of a series of identical cash flows beginning at the end of the current period and continuing into the future.

The use of both of these tables is illustrated in various exhibits in the main body of the chapter. *When a present value factor appears in an exhibit, you should take the time to trace it back into either Exhibit 13B1 or Exhibit 13B2 to get acquainted with the tables and how they work.*

Review Problem: Basic Present Value Computations

Each of the following situations is independent. Work out your own solution to each situation, and then check it against the solution provided.

1. John plans to retire in 12 years. Upon retiring, he would like to take an extended vacation, which he expects will cost at least \$40,000. What lump-sum amount must he invest now to have \$40,000 at the end of 12 years if the rate of return is:
 - a. Eight percent?
 - b. Twelve percent?
2. The Morgans would like to send their daughter to a music camp at the end of each of the next five years. The camp costs \$1,000 a year. What lump-sum amount would have to be invested now to have \$1,000 at the end of each year if the rate of return is:
 - a. Eight percent?
 - b. Twelve percent?
3. You have just received an inheritance from a relative. You can either receive a \$200,000 lump-sum amount at the end of 10 years or receive \$14,000 at the end of each year for the next 10 years. If your discount rate is 12%, which alternative would you prefer?

Solution to Review Problem

1.
 - a. The amount that must be invested now would be the present value of the \$40,000, using a discount rate of 8%. From Exhibit 13B-1 in Appendix 13B, the factor for a discount rate of 8% for 12 periods is 0.397. Multiplying this discount factor by the \$40,000 needed in 12 years will give the amount of the present investment required: $\$40,000 \times 0.397 = \$15,880$.
 - b. We will proceed as we did in (a) above, but this time we will use a discount rate of 12%. From Exhibit 13B-1 in Appendix 13B, the factor for a discount rate of 12% for 12 periods is 0.257. Multiplying this discount factor by the \$40,000 needed in 12 years will give the amount of the present investment required: $\$40,000 \times 0.257 = \$10,280$.
Notice that as the discount rate (desired rate of return) increases, the present value decreases.
2. This part differs from (1) above in that we are now dealing with an annuity rather than with a single future sum. The amount that must be invested now is the present value of the \$1,000 needed at the end of each year for five years. Because we are dealing with an annuity, or a series of annual cash flows, we must refer to Exhibit 13B-2 in Appendix 13B for the appropriate discount factor.
 - a. From Exhibit 13B-2 in Appendix 13B, the discount factor for 8% for five periods is 3.993. Therefore, the amount that must be invested now to have \$1,000 available at the end of each year for five years is $\$1,000 \times 3.993 = \$3,993$.
 - b. From Exhibit 13B-2 in Appendix 13B, the discount factor for 12% for five periods is 3.605. Therefore, the amount that must be invested now to have \$1,000 available at the end of each year for five years is $\$1,000 \times 3.605 = \$3,605$.
Again, notice that as the discount rate increases, the present value decreases. When the rate of return increases, less must be invested today to yield a given amount in the future.
3. For this part we will need to refer to both Exhibits 13B-1 and 13B-2 in Appendix 13B. From Exhibit 13B-1, we will need to find the discount factor for 12% for 10 periods, then apply it to the \$200,000 lump sum to be received in 10 years. From Exhibit 13B-2, we will need to find the discount factor for 12% for 10 periods, then apply it to the series of \$14,000 payments to be received over the 10-year period. Whichever alternative has the higher present value is the one that should be selected.

$$\$200,000 \times 0.322 = \$64,400$$

$$\$14,000 \times 5.650 = \$79,100$$

Thus, you should prefer to receive the \$14,000 per year for 10 years rather than the \$200,000 lump sum. This means that you could invest the \$14,000 received at the end of each year at 12% and have *more* than \$200,000 at the end of 10 years.

Appendix 13A Glossary

Annuity A series of identical cash flows. (p. 578)

Compound interest The process of paying interest on interest in an investment. (p. 576)

Discount rate The rate of return that is used to find the present value of a future cash flow. (p. 577)

Discounting The process of finding the present value of a future cash flow. (p. 577)

Present value The value now of an amount that will be received in some future period. (p. 575)

Appendix 13A Exercises and Problems connect™

EXERCISE 13A-1 Basic Present Value Concepts [L07]

In three years, when he is discharged from the Air Force, Steve wants to buy an \$8,000 power boat.

Required:

What lump-sum amount must Steve invest now to have the \$8,000 at the end of three years if he can invest money at:

1. Ten percent?
2. Fourteen percent?

EXERCISE 13A-2 Basic Present Value Concepts [L07]

Annual cash inflows that will arise from two competing investment projects are given below:

| Year | Investment A | Investment B |
|---------|-----------------|-----------------|
| 1 | \$ 3,000 | \$12,000 |
| 2 | 6,000 | 9,000 |
| 3 | 9,000 | 6,000 |
| 4 | 12,000 | 3,000 |
| | <u>\$30,000</u> | <u>\$30,000</u> |

The discount rate is 18%.

Required:

Compute the present value of the cash inflows for each investment.

EXERCISE 13A-3 Basic Present Value Concepts [L07]

Julie has just retired. Her company's retirement program has two options as to how retirement benefits can be received. Under the first option, Julie would receive a lump sum of \$150,000 immediately as her full retirement benefit. Under the second option, she would receive \$14,000 each year for 20 years plus a lump-sum payment of \$60,000 at the end of the 20-year period.

Required:

If she can invest money at 12%, which option would you recommend that she accept? Use present value analysis.

EXERCISE 13A-4 Basic Present Value Concepts [L07]

The Atlantic Medical Clinic can purchase a new computer system that will save \$7,000 annually in billing costs. The computer system will last for eight years and have no salvage value.

Required:

Up to how much should the Atlantic Medical Clinic be willing to pay for the new computer system if the clinic's required rate of return is:

1. Sixteen percent?
2. Twenty percent?

EXERCISE 13A-5 Basic Present Value Concepts [L07]

The Caldwell Herald newspaper reported the following story: Frank Ormsby of Caldwell is the state's newest millionaire. By choosing the six winning numbers on last week's state lottery, Mr. Ormsby has won the week's grand prize totaling \$1.6 million. The State Lottery Commission has indicated that Mr. Ormsby will receive his prize in 20 annual installments of \$80,000 each.

Required:

1. If Mr. Ormsby can invest money at a 12% rate of return, what is the present value of his winnings?
2. Is it correct to say that Mr. Ormsby is the "state's newest millionaire"? Explain your answer.

EXERCISE 13A-6 Basic Present Value Concepts [L07]

Fraser Company will need a new warehouse in five years. The warehouse will cost \$500,000 to build.

Required:

What lump-sum amount should the company invest now to have the \$500,000 available at the end of the five-year period? Assume that the company can invest money at:

1. Ten percent.
2. Fourteen percent.

Appendix 13B: Present Value Tables

EXHIBIT 13B-1 Present Value of \$1; $\frac{1}{(1+r)^n}$

| Periods | 4% | 5% | 6% | 7% | 8% | 9% | 10% | 11% | 12% | 13% | 14% | 15% | 16% | 17% | 18% | 19% | 20% | 21% | 22% | 23% | 24% | 25% |
|---------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|
| 1 | 0.962 | 0.952 | 0.943 | 0.935 | 0.926 | 0.917 | 0.909 | 0.901 | 0.893 | 0.885 | 0.877 | 0.870 | 0.862 | 0.855 | 0.847 | 0.840 | 0.833 | 0.826 | 0.820 | 0.813 | 0.806 | 0.800 |

Appendix 13C: Income Taxes in Capital Budgeting Decisions

We ignored income taxes in this chapter for two reasons. First, many organizations do not pay income taxes. Not-for-profit organizations, such as hospitals and charitable foundations, and governmental agencies are exempt from income taxes. Second, capital budgeting is complex and is best absorbed in small doses. Now that we have a solid foundation in the concepts of present value and discounting, we can explore the effects of income taxes on capital budgeting decisions.

The U.S. income tax code is enormously complex. We only scratch the surface here. To keep the subject within reasonable bounds, we have made many simplifying assumptions about the tax code. Among the most important of these assumptions are: (1) taxable income equals net income as computed for financial reports; and (2) the tax rate is a flat percentage of taxable income. The actual tax code is far more complex than this; indeed, experts acknowledge that no one person knows or can know it all. However, the simplifications that we make throughout this appendix allow us to cover the most important implications of income taxes for capital budgeting without getting bogged down in details.

LEARNING OBJECTIVE 8

Include income taxes in a capital budgeting analysis.

The Concept of After-Tax Cost

Businesses, like individuals, must pay income taxes. In the case of businesses, the amount of income tax that must be paid is determined by the company's net taxable income. Tax deductible expenses (tax deductions) decrease the company's net taxable income and hence reduce the taxes the company must pay. For this reason, expenses are often stated on an *after-tax* basis. For example, if a company pays rent of \$10 million a year but this expense results in a reduction in income taxes of \$3 million, the after-tax cost of the rent is \$7 million. An expenditure net of its tax effect is known as **after-tax cost**.

To illustrate, assume that a company with a tax rate of 30% is contemplating a training program that costs \$60,000. What impact will this have on the company's taxes? To keep matters simple, let's suppose the training program has no immediate effect on sales. How much does the company actually pay for the training program after taking into account the impact of this expense on taxes? The answer is **\$42,000** as shown in Exhibit 13C-1. While the training program costs **\$60,000** before taxes, it would reduce the company's taxes by **\$18,000**, so its *after-tax* cost would be only \$42,000.

| | Without Training Program | With Training Program |
|--|--------------------------|------------------------|
| Sales | \$850,000 | \$850,000 |
| Less tax deductible expenses: | | |
| Salaries, insurance, and other | 700,000 | 700,000 |
| New training program | | 60,000 |
| Total expenses | <u>700,000</u> | <u>760,000</u> |
| Taxable income | <u>\$150,000</u> | <u>\$ 90,000</u> |
| Income taxes (30%) | <u>\$ 45,000</u> | <u>\$ 27,000</u> |
| Cost of new training program | | \$60,000 |
| Less: Reduction in income taxes | | |
| (\$45,000 – \$27,000) | | <u>18,000</u> |
| After-tax cost of the new training program | | <u>\$42,000</u> |

EXHIBIT 13C-1
The Computation of After-Tax Cost

The after-tax cost of any tax-deductible cash expense can be determined using the following formula:¹

$$\text{After-tax cost (net cash outflow)} = (1 - \text{Tax rate}) \times \text{Tax-deductible cash expense} \quad (1)$$

We can verify the accuracy of this formula by applying it to the \$60,000 training program expenditure:

$$(1 - 0.30) \times \$60,000 = \$42,000 \text{ after-tax cost of the training program}$$

This formula is very useful because it provides the actual amount of cash a company must pay after considering tax effects. It is this actual, after-tax, cash outflow that should be used in capital budgeting decisions.

Similar reasoning applies to revenues and other *taxable* cash inflows. Because these cash receipts are taxable, the company must pay out a portion of them in taxes. The **after-tax benefit**, or net cash inflow, realized from a particular cash receipt can be obtained by applying a simple variation of the cash expenditure formula used above:

$$\text{After-tax benefit (net cash inflow)} = (1 - \text{Tax rate}) \times \text{Taxable cash receipt} \quad (2)$$

We emphasize the term *taxable cash receipts* because not all cash inflows are taxable. For example, the release of working capital at the end of an investment project would not be a taxable cash inflow. It is not counted as income for either financial accounting or income tax reporting purposes because it is simply a recovery of the initial investment.

Depreciation Tax Shield

Depreciation is not a cash flow. For this reason, depreciation was ignored in Chapter 13 in all discounted cash flow computations. However, depreciation does affect the taxes that must be paid and therefore has an effect on a company's cash flows.

To illustrate the effect of depreciation deductions on tax payments, consider a company with annual cash sales of \$500,000 and cash operating expenses of \$310,000. In addition, the company has a depreciable asset on which the depreciation deduction is \$90,000 per year. The tax rate is 30%. As shown in Exhibit 13C-2, the depreciation deduction reduces the company's taxes by \$27,000. In effect, the depreciation deduction of \$90,000 *shields* \$90,000 in revenues from taxation and thereby *reduces* the amount of taxes that the company must pay. Because depreciation deductions shield revenues from taxation, they are generally referred to as a **depreciation tax shield**.² The reduction in tax payments made possible by the depreciation tax shield is equal to the amount of the depreciation deduction, multiplied by the tax rate as follows:

$$\text{Tax savings from the depreciation tax shield} = \text{Tax rate} \times \text{Depreciation deduction} \quad (3)$$

We can verify this formula by applying it to the \$90,000 depreciation deduction in our example:

$$0.30 \times \$90,000 = \$27,000 \text{ reduction in tax payments}$$

¹ This formula assumes that a company is operating at a profit; if it is operating at a loss, the tax situation can be very complex. For simplicity, we assume in all examples, exercises, and problems that the company is operating at a profit.

² The term *depreciation tax shield* may convey the impression that there is something underhanded about depreciation deductions—that companies are getting some sort of a special tax break. However, to use the depreciation deduction, a company must have already acquired a depreciable asset—which typically requires a cash outflow. Essentially, the tax code requires companies to delay recognizing the cash outflow as an expense until depreciation charges are recorded.

EXHIBIT 13C-2
The Impact of Depreciation Deductions on Tax Payments

| | Without Depreciation Deduction | With Depreciation Deduction |
|---|---|-----------------------------------|
| Sales | \$500,000 | \$500,000 |
| Cash operating expenses | <u>310,000</u> | <u>310,000</u> |
| Cash flow from operations | 190,000 | 190,000 |
| Depreciation expense | <u>—</u> | <u>90,000</u> |
| Taxable income | <u>\$190,000</u> | <u>\$100,000</u> |
| Income taxes (30%) | <u>\$ 57,000</u> | <u>\$ 30,000</u> |
| | <p style="text-align: center;">\$27,000 lower taxes with the depreciation deduction</p> | |
| Cash flow comparison: | | |
| Cash flow from operations (above) | \$190,000 | \$190,000 |
| Income taxes (above) | <u>57,000</u> | <u>30,000</u> |
| Net cash flow | <u>\$133,000</u> | <u>\$160,000</u> |
| | <p style="text-align: center;">\$27,000 greater cash flow with the depreciation deduction</p> | |

In this appendix, when we estimate after-tax cash flows for capital budgeting decisions, we will include the tax savings provided by the depreciation tax shield.

To keep matters simple, we will assume in all of our examples and problem materials that depreciation reported for tax purposes is straight-line depreciation, with no deduction for salvage value. In other words, we will assume that the entire original cost of the asset is written off evenly over its useful life. Because the net book value of the asset at the end of its useful life will be zero under this depreciation method, we will assume that any proceeds received on disposal of the asset at the end of its useful life will be taxed as ordinary income.

In actuality, the rules for depreciation are more complex than this and most companies take advantage of accelerated depreciation methods allowed under the tax code. These accelerated methods usually result in a reduction in current taxes and an offsetting increase in future taxes. This shifting of part of the tax burden from the current year to future years is advantageous from a present value point of view because a dollar today is worth more than a dollar in the future. A summary of the concepts we have introduced so far is given in Exhibit 13C-3.

EXHIBIT 13C-3
Tax Adjustments Required in a Capital Budgeting Analysis

| Item | Treatment |
|------------------------------------|---|
| Tax-deductible cash expense* | Multiply by (1 – Tax rate) to get after-tax cost. |
| Taxable cash receipt* | Multiply by (1 – Tax rate) to get after-tax cash inflow. |
| Depreciation deduction | Multiply by the tax rate to get the tax savings from the depreciation tax shield. |

*Cash expenses can be deducted from the cash receipts and the difference multiplied by (1 – Tax rate). See the example at the top of Exhibit 13C-4.

Example of Income Taxes and Capital Budgeting

Armed with an understanding of after-tax cost, after-tax revenue, and the depreciation tax shield, we are now prepared to examine a comprehensive example of income taxes and capital budgeting.

Holland Company owns the mineral rights to land that has a deposit of ore. The company is uncertain if it should purchase equipment and open a mine on the property. After careful study, the company assembled the following data.

| | |
|---|-----------|
| Cost of equipment needed | \$300,000 |
| Working capital needed | \$75,000 |
| Estimated annual cash receipts from sales of ore | \$250,000 |
| Estimated annual cash expenses for salaries, insurance, utilities, and other cash expenses of mining the ore | \$170,000 |
| Cost of road repairs needed in 6 years | \$40,000 |
| Salvage value of the equipment in 10 years | \$100,000 |

The ore in the mine would be exhausted after 10 years of mining activity, at which time the mine would be closed. The equipment would then be sold for its salvage value. Holland Company uses the straight-line method, assuming no salvage value, to compute depreciation deductions for tax purposes. The company's after-tax cost of capital is 12% and its tax rate is 30%. To be consistent, when we take the net present value of after-tax cash flows, we use the *after-tax* cost of capital as the discount rate.

Should Holland Company purchase the equipment and open a mine on the property? The solution to the problem is given in Exhibit 13C-4. We suggest that you go through this solution item by item and note the following points:

Cost of new equipment. The initial investment of \$300,000 in the new equipment is included in full with no reductions for taxes. This represents an *investment*, not an expense, so no tax adjustment is made. (Only revenues and expenses are adjusted for the effects of taxes.) However, this investment does affect taxes through the depreciation deductions that are considered below.

EXHIBIT 13C-4 Example of Income Taxes and Capital Budgeting

| Items and Computations | Year(s) | (1) Amount | (2) Tax Effect* | Per Year | | Present Value of Cash Flows |
|--|---------|---------------|--------------------|--------------------------------------|---------------|-----------------------------------|
| | | | | After-Tax Cash Flows (1) × (2) | 12% Factor | |
| Cash receipts from sales of ore | | | | \$250,000 | | |
| Less payments for salaries, insurance, utilities, and other cash expenses | | | | 170,000 | | |
| Net cash receipts | | | | <u>\$ 80,000</u> | | |
| Cost of new equipment | Now | \$(300,000) | — | \$(300,000) | 1.000 | \$(300,000) |
| Working capital needed | Now | \$(75,000) | — | \$(75,000) | 1.000 | (75,000) |
| Annual net cash receipts (above)..... | 1–10 | \$80,000 | 1 – 0.30 | \$56,000 | 5.650 | 316,400 |
| Road repairs | 6 | \$(40,000) | 1 – 0.30 | \$(28,000) | 0.507 | (14,196) |
| Annual depreciation deductions..... | 1–10 | \$30,000 | 0.30 | \$9,000 | 5.650 | 50,850 |
| Salvage value of equipment..... | 10 | \$100,000 | 1 – 0.30 | \$70,000 | 0.322 | 22,540 |
| Release of working capital | 10 | \$75,000 | — | \$75,000 | 0.322 | 24,150 |
| Net present value..... | | | | | | <u>\$ 24,744</u> |

*Taxable cash receipts and tax-deductible cash expenses are multiplied by (1 – Tax rate) to determine the after-tax cash flow. Depreciation deductions are multiplied by the tax rate itself to determine the after-tax cash flow (i.e., tax savings from the depreciation tax shield).

Working capital. Observe that the working capital needed for the project is included in full with no reductions for taxes. Like the cost of new equipment, working capital is an investment and not an expense so no tax adjustment is made. Also observe that no tax adjustment is made when the working capital is released at the end of the project's life. The release of working capital is not a taxable cash flow because it is a return of investment funds back to the company.

Annual net cash receipts. The annual net cash receipts from sales of ore are adjusted for the effects of income taxes, as discussed earlier in the chapter. Note at the top of Exhibit 13C–4 that the annual cash expenses are deducted from the annual cash receipts to obtain the net cash receipts. This simplifies computations.

Road repairs. Because the road repairs occur just once (in the sixth year), they are treated separately from other expenses. Road repairs would be a tax-deductible cash expense, and therefore they are adjusted for the effects of income taxes, as discussed earlier in the chapter.

Depreciation deductions. The tax savings provided by depreciation deductions is essentially an annuity that is included in the present value computations in the same way as other cash flows.

Salvage value of equipment. Because the company does not consider salvage value when computing depreciation deductions, book value will be zero at the end of the life of an asset. Thus, any salvage value received is taxable as income to the company. The after-tax benefit is determined by multiplying the salvage value by $(1 - \text{Tax rate})$.

Because the net present value of the proposed mining project is positive, the equipment should be purchased and the mine opened. Study Exhibit 13C–4 thoroughly. *Exhibit 13C4 is the key exhibit!*

Appendix 13C Summary

Unless a company is a tax-exempt organization, such as a not-for-profit school or a governmental unit, income taxes should be considered in making capital budgeting decisions. Tax-deductible cash expenditures and taxable cash receipts are placed on an after-tax basis by multiplying them by $(1 - \text{Tax rate})$. Only the after-tax amount should be used in determining the desirability of an investment proposal.

Although depreciation is not a cash outflow, it is a valid deduction for tax purposes and as such affects income tax payments. The depreciation tax shield—computed by multiplying the depreciation deduction by the tax rate itself—also results in savings in income taxes.

Appendix 13C Glossary

After-tax benefit The amount of net cash inflow realized from a taxable cash receipt after income tax effects have been considered. The amount is determined by multiplying the taxable cash receipt by $(1 - \text{Tax rate})$. (p. 583)

After-tax cost The amount of net cash outflow resulting from a tax-deductible cash expense after income tax effects have been considered. The amount is determined by multiplying the tax-deductible cash expense by $(1 - \text{Tax rate})$. (p. 583)

Depreciation tax shield A reduction in tax that results from depreciation deductions. The reduction in tax is computed by multiplying the depreciation deduction by the tax rate. (p. 584)

connect™ Appendix 13C Exercises and Problems

EXERCISE 13C–1 After-Tax Costs [LO8]

Solve each of the following parts independently:

1. Neal Company would like to initiate a management development program for its executives. The program would cost \$100,000 per year to operate. What would be the after-tax cost of the program if the company's income tax rate is 30%?

2. Smerk's Department Store has rearranged the merchandise display cases on the first floor of its building, placing fast turnover items near the front door. This rearrangement has caused the company's contribution margin (and taxable income) to increase by \$40,000 per month. If the company's income tax rate is 30%, what is the after-tax benefit from this rearrangement of facilities?
3. Perfect Press, Inc., has just purchased a new binding machine at a cost of \$210,000. For tax purposes, the entire original cost of the machine will be depreciated over seven years using the straight-line method. Determine the yearly tax savings from the depreciation tax shield. Assume that the income tax rate is 30%.

EXERCISE 13C-2 Net Present Value Analysis Including Income Taxes [LO8]

The Midtown Cafeteria employs five people to operate antiquated dishwashing equipment. The cost of wages for these people and for maintenance of the equipment is \$85,000 per year. Management is considering the purchase of a single, highly automated dishwashing machine that would cost \$140,000 and have a useful life of 12 years. This machine would require the services of only three people to operate at a cost of \$48,000 per year. A maintenance contract on the machine would cost an additional \$2,000 per year. New water jets would be needed on the machine in six years at a total cost of \$15,000.

The old equipment is fully depreciated and has no resale value. The new machine will have a salvage value of \$9,000 at the end of its 12-year useful life. For tax purposes, the company computes depreciation deductions assuming zero salvage value and uses straight-line depreciation. The new dishwashing machine would be depreciated over seven years. Management requires a 14% after-tax return on all equipment purchases. The company's tax rate is 30%.

Required:

1. Determine the before-tax annual net cost savings that the new dishwashing machine will provide.
2. Using the data from (1) above and other data from the exercise, compute the new dishwashing machine's net present value. Round all dollar amounts to the nearest whole dollar. Would you recommend that it be purchased?

EXERCISE 13C-3 After-Tax Cash Flows in Net Present Value Analysis [LO8]

Dwyer Company is considering two investment projects. Relevant cost and cash flow information on the two projects is given below:

| | Project A | Project B |
|-------------------------------------|-----------|-----------|
| Investment in heavy trucks | \$130,000 | |
| Investment in working capital | | \$130,000 |
| Annual net cash inflows | \$25,000 | \$25,000 |
| Life of the project | 9 years* | 9 years |
| *Useful life of the trucks | | |

The trucks would have a \$15,000 salvage value in nine years. For tax purposes, the company computes depreciation deductions assuming zero salvage value and uses straight-line depreciation. The trucks will be depreciated over five years. At the end of nine years, the working capital will be released for use elsewhere. The company requires an after-tax return of 12% on all investments. The tax rate is 30%.

Required:

Compute the net present value of each investment project. Round to the nearest whole dollar.

PROBLEM 13C-4 Basic Net Present Value Analysis Including Income Taxes [LO8]

The Diamond Freight Company has been offered a seven-year contract to haul munitions for the government. Because this contract would represent new business, the company would have to purchase several new heavy-duty trucks at a cost of \$350,000 if the contract were accepted. Other data relating to the contract follow:

| | |
|--|-----------|
| Annual net cash receipts (before taxes) | |
| from the contract | \$105,000 |
| Cost of replacing the motors in the trucks | |
| in four years | \$45,000 |
| Salvage value of the trucks at termination | |
| of the contract | \$18,000 |

With the motors being replaced after four years, the trucks will have a useful life of seven years. To raise money to assist in the purchase of the new trucks, the company will sell several old, fully depreciated trucks for a total selling price of \$16,000. The company requires a 16% after-tax return on all equipment purchases. The tax rate is 30%. For tax purposes, the company computes depreciation deductions assuming zero salvage value and using straight-line depreciation. The new trucks would be depreciated over five years.

Required:

Compute the net present value of this investment opportunity. Round all dollar amounts to the nearest whole dollar. Would you recommend that the contract be accepted?

PROBLEM 13C-5 Comparison of Total-Cost and Incremental-Cost Approaches Including Income Taxes [LO8]

Reliable Waste Systems provides a solid waste collection service in a large metropolitan area. The company is considering the purchase of several new trucks to replace an equal number of old trucks now in use. The new trucks would cost \$650,000, but they would require only one operator per truck (compared to two operators for the trucks now being used), as well as provide other cost savings. A comparison of total annual cash operating costs between the old trucks that would be replaced and the new trucks is provided below:

| | Old Trucks | New Trucks |
|---|------------------|------------------|
| Salaries—operators | \$170,000 | \$ 85,000 |
| Fuel | 14,000 | 9,000 |
| Insurance | 6,000 | 11,000 |
| Maintenance | 10,000 | 5,000 |
| Total annual cash operating costs | <u>\$200,000</u> | <u>\$110,000</u> |

If the new trucks are purchased, the old trucks will be sold to a company in a nearby city for \$85,000. These trucks cost \$300,000 when they were new and have a current book value of \$120,000. If the new trucks are not purchased, the company will take depreciation deductions for tax purposes on the old trucks of \$60,000 a year over the next two years.

If the new trucks are not purchased, the old trucks will be used for seven more years and then sold for an estimated \$15,000 scrap value. However, to keep the old trucks operating, extensive repairs will be needed in one year that will cost \$170,000. These repairs will be expensed for tax purposes in the year incurred.

The new trucks would have a useful life of seven years and would have an estimated \$60,000 salvage value at the end of their useful life. The company's tax rate is 30%, and its after-tax cost of capital is 12%. For tax purposes, the company would depreciate the equipment over five years using straight-line depreciation and assuming zero salvage value.

Required:

1. Use the total-cost approach to net present value analysis to determine whether the new trucks should be purchased. Round all dollar amounts to the nearest whole dollar.
2. Repeat the computations in (1) above, this time using the incremental-cost approach to net present value analysis.

PROBLEM 13C-6 A Comparison of Investment Alternatives Including Income Taxes [LO8]

Julia Vanfleet is professor of mathematics. She has received a \$225,000 inheritance from her father's estate, and she is anxious to invest it between now and the time she retires in 12 years. Professor Vanfleet is considering two alternatives for investing her inheritance.

Alternative 1. Corporate bonds can be purchased that mature in 12 years and that bear interest at 10%. This interest would be taxable and paid annually.

Alternative 2. A small retail business is available for sale that can be purchased for \$225,000. The following information relates to this alternative:

- a. Of the purchase price, \$80,000 would be for fixtures and other depreciable items. The remainder would be for the company's working capital (inventory, accounts receivable, and cash). The fixtures and other depreciable items would have a remaining useful life of at least 12 years but would be

depreciated for tax reporting purposes over eight years using the following allowances published by the Internal Revenue Service:

| Year | Percentage of Original Cost Depreciated |
|---------|---|
| 1 | 14.3% |
| 2 | 24.5% |
| 3 | 17.5% |

Salvage value is not taken into account when computing depreciation for tax purposes. At any rate, at the end of 12 years these depreciable items would have a negligible salvage value; however, the working capital would be recovered (either through sale or liquidation of the business) for reinvestment elsewhere.

- b. The store building would be leased. At the end of 12 years, if Professor Vanfleet could not find someone to buy the business, it would be necessary to pay \$2,000 to the owner of the building to break the lease.
- c. Store records indicate that sales have averaged \$850,000 per year and out-of-pocket costs (including wages and rent on the building) have averaged \$780,000 per year (*not* including income taxes). Management of the store would be entrusted to employees.
- d. Professor Vanfleet's tax rate is 40%.

Required:

Advise Professor Vanfleet as to which alternative should be selected. Use the total-cost approach to net present value in your analysis, and a discount rate of 8%. Round all dollar amounts to the nearest whole dollar.

A

Pricing Products and Services

LEARNING OBJECTIVES

After studying this appendix, you should be able to:

- L01** Compute the profit-maximizing price of a product or service using the price elasticity of demand and variable cost.
- L02** Compute the selling price of a product using the absorption costing approach.
- L03** Compute the target cost for a new product or service.

Introduction

Some products have an established market price. Consumers will not pay more than this price and there is no reason for a supplier to charge less—it can sell all that it produces at this price. Under these circumstances, the company simply charges the prevailing market price for the product. Markets for basic raw materials such as farm products and minerals follow this pattern.

In this appendix, we are concerned with the more common situation in which a business is faced with the problem of setting its own prices. Clearly, the pricing decision can be critical. If the price is set too high, customers won't buy the company's products. If the price is set too low, the company's costs won't be covered.

The usual approach in pricing is to *mark up* cost.¹ A product's **markup** is the difference between its selling price and its cost and is usually expressed as a percentage of cost.

$$\text{Selling price} = (1 + \text{Markup percentage}) \times \text{Cost}$$

For example, a company that uses a markup of 50% adds 50% to the costs of its products to determine selling prices. If a product costs \$10, then the company would charge \$15 for the product. This approach is called **cost-plus pricing** because a predetermined markup percentage is applied to a cost base to determine the selling price.

Two key issues must be addressed with the cost-plus approach to pricing. First, what cost should be used? Second, how should the markup be determined? Several alternative approaches are considered in this appendix, starting with the approach generally favored by economists.

The Economists' Approach to Pricing

LEARNING OBJECTIVE 1

Compute the profit-maximizing price of a product or service using the price elasticity of demand and variable cost.

If a company raises the price of a product, unit sales ordinarily fall. Because of this, pricing is a delicate balancing act in which the benefits of higher revenues per unit are traded off against the lower volume that results from charging a higher price. The sensitivity of unit sales to changes in price is called the *price elasticity of demand*.

Elasticity of Demand

A product's price elasticity should be a key element in setting its price. The **price elasticity of demand** measures the degree to which a change in price affects the unit sales of a product or service. Demand for a product is said to be *inelastic* if a change in price has little effect on the number of units sold. The demand for designer perfumes sold by trained personnel at cosmetic counters in department stores is relatively inelastic. Raising or lowering prices on these luxury goods has little effect on unit sales. On the other hand, demand for a product is *elastic* if a change in price has a substantial effect on the volume of units sold. An example of a product whose demand is elastic is gasoline. If a gas station raises its price for gasoline, unit sales will drop as customers seek lower prices elsewhere.

Price elasticity is very important in determining prices. Managers should set higher markups over cost when customers are relatively insensitive to price (i.e., demand is inelastic) and lower markups when customers are relatively sensitive to price (i.e., demand

¹ There are some legal restrictions on prices. Antitrust laws prohibit “predatory” prices, which are generally interpreted by the courts to mean a price below average variable cost. “Price discrimination”—charging different prices to customers in the same market for the same product or service—is also prohibited by the law.

is elastic). This principle is followed in department stores. Merchandise sold in the bargain basement has a much lower markup than merchandise sold elsewhere in the store because customers who shop in the bargain basement are much more sensitive to price (i.e., demand is elastic).

The price elasticity of demand for a product or service, ϵ_d , can be estimated using the following formula.^{2,3}

$$\epsilon_d = \frac{\ln(1 + \% \text{ change in quantity sold})}{\ln(1 + \% \text{ change in price})}$$

For example, suppose that the managers of Nature's Garden believe that a 10% increase in the selling price of their apple-almond shampoo would result in a 15% decrease in the number of bottles of shampoo sold.⁴ The price elasticity of demand for this product would be computed as follows:

$$\epsilon_d = \frac{\ln[1 + (-0.15)]}{\ln[1 + (0.10)]} = \frac{\ln(0.85)}{\ln(1.10)} = -1.71$$

For comparison purposes, the managers of Nature's Garden believe that another product, strawberry glycerin soap, would experience a 20% drop in unit sales if its price is increased by 10%. (Purchasers of this product are more sensitive to price than the purchasers of the apple-almond shampoo.) The price elasticity of demand for the strawberry glycerin soap is:

$$\epsilon_d = \frac{\ln[1 + (-0.20)]}{\ln[1 + (0.10)]} = \frac{\ln(0.80)}{\ln(1.10)} = -2.34$$

Both of these products, like other normal products, have a price elasticity that is less than -1 .

Note that the price elasticity of demand for the strawberry glycerin soap is larger (in absolute value) than the price elasticity of demand for the apple-almond shampoo. This indicates that the demand for strawberry glycerin soap is more elastic than the demand for apple-almond shampoo.

In the next subsection, the price elasticity of demand will be used to compute the selling price that maximizes the profits of the company.

The Profit-Maximizing Price

Under certain conditions, the profit-maximizing price can be determined by marking up *variable cost* using the following formula:⁵

$$\text{Profit-maximizing markup on variable cost} = \frac{-1}{1 + \epsilon_d}$$

Using the above markup, the selling price would be set using the formula:

$$\text{Profit-maximizing price} = (1 + \text{Profit-maximizing markup on variable cost}) \times \text{Variable cost per unit}$$

² The term “ln()” is the natural log function. You can compute the natural log of any number using the LN or lnx key on your calculator. For example, $\ln(0.85) = -0.1625$.

³ This formula assumes that the price elasticity of demand is constant. This occurs when the relation between the selling price, p , and the unit sales, q , can be expressed in the following form: $\ln(q) = a + \epsilon_d \ln(p)$. Even if this is not precisely true, the formula provides a useful way to estimate a product's price elasticity.

⁴ The estimated change in unit sales should take into account competitors' responses to a price change.

⁵ The formula assumes that (a) the price elasticity of demand is constant; (b) Total cost = Total fixed cost + Variable cost per unit \times Quantity sold; and (c) the price of the product has no effect on the sales or costs of any other product. The formula can be derived using calculus.

COMPETITION INFLUENCES PRICES

The **Department of Transportation** says Cincinnati has the most expensive airport in the United States. Cincinnati passengers pay an average fare of 20.63¢ per mile while more than 20 airports, such as Buffalo, Oakland, Reno, and Tampa, offer flights at less than 12¢ per mile. Why the higher prices in Cincinnati? **Delta Airlines** controls more than 80% of the Cincinnati market so the lack of competition enables it to charge higher fares. For example, Delta charges \$529 to fly direct from Cincinnati to Las Vegas because it is the only airline to offer nonstop service on this route. However, Delta can only charge \$258 to fly direct from Atlanta to Las Vegas because **AirTran Airways** also flies nonstop on this route. Of course, Delta must balance the desire to raise prices at the Cincinnati airport with the realization that its customers can defect to competing airline departures from nearby airports in Dayton, Columbus, Louisville, Lexington, and Indianapolis.

Source: Scott McCartney, "The Most Expensive City to Leave: Cincinnati," *The Wall Street Journal*, December 11, 2007, pp. B9–B10.

The profit-maximizing prices for the two Nature's Garden products are computed below using these formulas:

Apple-Almond Shampoo

$$\text{Profit-maximizing markup on variable cost} = \left(\frac{-1}{1 + (-1.71)} \right) = 1.41$$

$$\text{Profit-maximizing price} = (1 + 1.41)\$2.00 = \$4.82$$

Strawberry Glycerin Soap

$$\text{Profit-maximizing markup on variable cost} = \left(\frac{-1}{1 + (-2.34)} \right) = 0.75$$

$$\text{Profit-maximizing price} = (1 + 0.75)\$0.40 = \$0.70$$

Note that the 75% markup for the strawberry glycerin soap is lower than the 141% markup for the apple-almond shampoo. The reason for this is that the purchasers of strawberry glycerin soap are more sensitive to price than the purchasers of apple-almond shampoo. Strawberry glycerin soap is a relatively common product with close substitutes available in nearly every grocery store.

Exhibit A–1 shows how the profit-maximizing markup is generally affected by how sensitive unit sales are to price. For example, if a 10% increase in price leads to a 20% decrease in unit sales, then the optimal markup on variable cost according to the exhibit is 75%—the figure computed above for the strawberry glycerin soap. Note that the optimal markup drops as unit sales become more sensitive to price.

Caution is advised when using these formulas to establish a selling price. The formulas rely on simplifying assumptions and the estimate of the percentage change in unit sales that would result from a given percentage change in price is likely to be inexact. Nevertheless, the formulas can provide valuable clues regarding whether prices should be increased or decreased. Suppose, for example, that the strawberry glycerin soap is currently being sold for \$0.60 per bar. The formula indicates that the profit-maximizing price is \$0.70 per bar. Rather than increasing the price by \$0.10, it would be prudent to increase the price by a more modest amount to observe what happens to unit sales and to profits.

The formula for the profit-maximizing price conveys a very important lesson. If the total fixed costs are the same whether the company charges \$0.60 or \$0.70, they cannot be relevant in the decision of which price to charge for the soap. The optimal selling price should depend on two factors—the variable cost per unit and how sensitive unit sales are to changes in price. Fixed costs play no role in setting the optimal price. Fixed costs are relevant when deciding whether to offer a product but are not relevant when deciding how much to charge for the product.

We can directly verify that an increase in selling price for the strawberry glycerin soap from the current price of \$0.60 per bar is warranted, based just on the forecast that a 10% increase in selling price would lead to a 20% decrease in unit sales. Suppose, for example, that Nature’s Garden is currently selling 200,000 bars of the soap per year at the price of \$0.60 a bar. If the change in price has no effect on the company’s fixed costs or on other products, the effect on profits of increasing the price by 10% can be computed as follows:

| | Present Price | Higher Price |
|---------------------------------------|------------------|--|
| Selling price (a) | \$0.60 | $\$0.60 + (0.10 \times \$0.60)$ = \$0.66 |
| Unit sales (b) | 200,000 | $200,000 - (0.20 \times 200,000)$ = 160,000 |
| Sales (a) × (b) | \$120,000 | \$105,600 |
| Variable cost (\$0.40 per unit) | <u>80,000</u> | <u>64,000</u> |
| Contribution margin | <u>\$ 40,000</u> | <u>\$ 41,600</u> |

Despite the apparent optimality of prices based on marking up variable costs according to the price elasticity of demand, surveys consistently reveal that most managers approach the pricing problem from a completely different perspective.⁶ They prefer to

⁶ One study found that 83% of the 504 large manufacturing companies surveyed used some form of full cost (either absorption cost or absorption cost plus selling and administrative expenses) as the basis for pricing. The remaining 17% used only variable costs as a basis for pricing decisions. See V. Govindarajan and Robert N. Anthony, “How Firms Use Cost Data in Pricing Decisions,” *Management Accounting*, July 1983, pp. 30–36. A less extensive survey by Eunsup Shim and Ephraim F. Sudit, “How Manufacturers Price Products,” *Management Accounting*, February 1995, pp. 37–39, found similar results.

On the other hand, a survey of small-company executives summarized in *Inc.* magazine, November 1996, p. 84, revealed that only 41% set prices based on cost. The others charge what they think customers are willing to pay or what the market demands.

mark up some version of full, not variable, costs, and the markup is based on desired profits rather than on factors related to demand. This approach is called the *absorption costing approach to cost-plus pricing*.

The Absorption Costing Approach to Cost-Plus Pricing

LEARNING OBJECTIVE 2
 Compute the selling price of a product using the absorption costing approach.

The absorption costing approach to cost-plus pricing differs from the economists' approach both in what costs are marked up and in how the markup is determined. Under the absorption approach to cost-plus pricing, the cost base is the absorption costing unit product cost as defined in Chapters 2 and 5 rather than variable cost.

Setting a Target Selling Price Using the Absorption Costing Approach

To illustrate, assume that the management of Ritter Company wants to set the selling price on a product that has just undergone some design modifications. The Accounting Department has provided cost estimates for the redesigned product as shown below:

| | Per Unit | Total |
|--|----------|----------|
| Direct materials | \$6 | |
| Direct labor | \$4 | |
| Variable manufacturing overhead | \$3 | |
| Fixed manufacturing overhead | | \$70,000 |
| Variable selling and administrative expenses | \$2 | |
| Fixed selling and administrative expenses | | \$60,000 |

The first step in the absorption costing approach to cost-plus pricing is to compute the unit product cost. For Ritter Company, this amounts to \$20 per unit at a volume of 10,000 units, as computed below:

| | | |
|--|-------------|--|
| Direct materials | \$ 6 | |
| Direct labor | 4 | |
| Variable manufacturing overhead | 3 | |
| Fixed manufacturing overhead (\$70,000 ÷ 10,000 units) | 7 | |
| Unit product cost | <u>\$20</u> | |

Ritter Company has a general policy of marking up unit product costs by 50%. A price quotation sheet for the company prepared using the absorption approach is presented in Exhibit A-2. Note that selling and administrative expenses are not included in the cost base. Instead, the markup is supposed to cover these expenses.

EXHIBIT A-2
Price Quotation Sheet—
Absorption Basis
(10,000 Units)

| | | |
|--|-------------|--|
| Direct materials | \$ 6 | |
| Direct labor | 4 | |
| Variable manufacturing overhead | 3 | |
| Fixed manufacturing overhead (based on 10,000 units) | <u>7</u> | |
| Unit product cost | 20 | |
| Markup to cover selling and administrative expenses and desired profit—50% of unit manufacturing cost | <u>10</u> | |
| Target selling price | <u>\$30</u> | |

Determining the Markup Percentage

Ritter Company’s markup percentage of 50% could be a widely used rule of thumb in the industry or just a company tradition that seems to work. The markup percentage may also be the result of an explicit computation. As we have discussed, the markup over cost should be largely determined by market conditions. However, many companies base their markup on cost and desired profit. The reasoning goes like this. The markup must be large enough to cover selling and administrative expenses and provide an adequate return on investment (ROI). Given the forecasted unit sales, the markup can be computed as follows:

$$\text{Markup percentage on absorption cost} = \frac{(\text{Required ROI} \times \text{Investment}) + \text{Selling and administrative expenses}}{\text{Unit product cost} \times \text{Unit sales}}$$

To show how this formula is applied, assume Ritter Company invests \$100,000 in operating assets such as equipment to produce and market 10,000 units of the product each year. If Ritter Company requires a 20% ROI, then the markup for the product would be determined as follows:

$$\begin{aligned} \text{Markup percentage on absorption cost} &= \frac{(20\% \times \$100,000) + (\$2 \text{ per unit} \times 10,000 \text{ units} + \$60,000)}{\$20 \text{ per unit} \times 10,000 \text{ units}} \\ &= \frac{(\$20,000) + (\$80,000)}{\$200,000} = 50\% \end{aligned}$$

As shown earlier, this markup of 50% leads to a target selling price of \$30 for Ritter Company. *If the company actually sells 10,000 units of the product at this price, the company’s ROI on this product will indeed be 20%. This is verified in Exhibit A-3. However, if it turns out that more than 10,000 units are sold at this price, the ROI will be greater than 20%. If less than 10,000 units are sold, the ROI will be less than 20%. The required ROI will be attained only if the forecasted unit sales volume is attained.*

| | |
|---|------------------|
| Direct materials | \$ 6 |
| Direct labor | 4 |
| Variable manufacturing overhead | 3 |
| Fixed manufacturing overhead (\$70,000 ÷ 10,000 units) | 7 |
| Unit product cost | <u>\$20</u> |
| Ritter Company Absorption Costing Income Statement | |
| Sales (\$30 per unit × 10,000 units) | \$300,000 |
| Cost of goods sold (\$20 per unit × 10,000 units) | <u>200,000</u> |
| Gross margin | 100,000 |
| Selling and administrative expenses (\$2 per unit × 10,000 units + \$60,000) | <u>80,000</u> |
| Net operating income | <u>\$ 20,000</u> |
| ROI | |
| ROI = $\frac{\text{Net operating income}}{\text{Average operating assets}}$ | |
| = $\frac{\$20,000}{\$100,000}$ | |
| = 20% | |

Units; Selling Price = \$30

IN BUSINESS

COST-BASED OR MARKET-BASED PRICES?

Jerry Bernstein, the director of **Emerson Electric Co.**'s price improvement team, says that setting prices used to be easy: "You developed a product, looked at the costs, and said, 'I need to make X,' and you marked it up accordingly—and people would buy it." Now the company charges based on what customers are willing to pay rather than its own costs. For example, a new compact sensor for factories that measures the flow of fluids would have been priced at \$2,650 based on its cost. However, careful analysis revealed that customers would be willing to pay 20% more for the sensors than the company had planned to charge. The company settled on a price of \$3,150.

Source: Timothy Appell, "Survival Strategies: After Cost Cutting, Companies Turn Toward Price Rises," *The Wall Street Journal*, September 18, 2002, pp. A1 and A12.

Problems with the Absorption Costing Approach

The absorption costing approach makes pricing decisions look deceptively simple. All a company needs to do is compute its unit product cost, decide how much profit it wants, and then set its price. It appears that a company can ignore demand and arrive at a price that will safely yield whatever profit it wants. However, as noted above, the absorption costing approach relies on a forecast of unit sales. Neither the markup nor the unit product cost can be computed without such a forecast.

The absorption costing approach essentially assumes that customers *need* the forecasted unit sales and will pay whatever price the company decides to charge. However, customers have a choice. If the price is too high, they can buy from a competitor or they may choose not to buy at all. Suppose, for example, that when Ritter Company sets its price at \$30, it sells only 7,000 units rather than the 10,000 units forecasted. As shown in Exhibit A-4, the company would then have a loss of \$25,000 on the product

EXHIBIT A-4
Income Statement and ROI
Analysis—Ritter Company
Actual Unit Sales = 7,000
Units; Selling Price = \$30

| | |
|---|-------------|
| Direct materials | \$ 6 |
| Direct labor | 4 |
| Variable manufacturing overhead | 3 |
| Fixed manufacturing overhead (\$70,000 ÷ 7,000 units) | 10 |
| Unit product cost | <u>\$23</u> |

Ritter Company
Absorption Costing Income Statement

| | |
|--|--------------------|
| Sales (\$30 per unit × 7,000 units) | \$210,000 |
| Cost of goods sold (\$23 per unit × 7,000 units) | <u>161,000</u> |
| Gross margin | 49,000 |
| Selling and administrative expenses (\$2 per unit × 7,000 units + \$60,000) | <u>74,000</u> |
| Net operating income (loss) | <u>\$ (25,000)</u> |

ROI

$$\begin{aligned} \text{ROI} &= \frac{\text{Net operating income}}{\text{Average operating assets}} \\ &= \frac{-\$25,000}{\$100,000} \\ &= -25\% \end{aligned}$$

instead of a profit of \$20,000.⁷ Some managers believe that the absorption costing approach to pricing is safe. This is an illusion. The absorption costing approach is safe only if customers choose to buy at least as many units as managers forecasted they would buy.

Target Costing

Our discussion thus far has presumed that a product has already been developed, has been costed, and is ready to be marketed as soon as a price is set. In many cases, the sequence of events is just the reverse. That is, the company already *knows* what price should be charged, and the problem is to *develop* a product that can be marketed profitably at the desired price. Even in this situation, where the normal sequence of events is reversed, cost is still a crucial factor. The company can use an approach called *target costing*. **Target costing** is the process of determining the maximum allowable cost for a new product and then developing a prototype that can be profitably made for that maximum target cost figure. A number of companies have used target costing, including **Compaq, Culp, Cummins Engine, Daihatsu Motors, Chrysler, Ford, Isuzu Motors, ITT Automotive, Komatsu, Matsushita Electric, Mitsubishi Kasei, NEC, Nippondenso, Nissan, Olympus, Sharp, Texas Instruments, and Toyota.**

The target cost for a product is computed by starting with the product's anticipated selling price and then deducting the desired profit, as follows:

$$\text{Target cost} = \text{Anticipated selling price} - \text{Desired profit}$$

The product development team is then given the responsibility of designing the product so that it can be made for no more than the target cost.

Reasons for Using Target Costing

The target costing approach was developed in recognition of two important characteristics of markets and costs. The first is that many companies have less control over price than they would like to think. The market (i.e., supply and demand) really determines price, and a company that attempts to ignore this does so at its peril. Therefore, the anticipated market price is taken as a given in target costing. The second observation is that most of a product's cost is determined in the design stage. Once a product has been designed and has gone into production, not much can be done to significantly reduce its cost. Most of the opportunities to reduce cost come from designing the product so that it is simple to make, uses inexpensive parts, and is robust and reliable. If the company has little control over market price and little control over cost once the product has gone into production, then it follows that the major opportunities for affecting profit come in the design stage where valuable features that customers are willing to pay for can be added and where most of the costs are really determined. So that is where the effort is concentrated—in designing and developing the product. The difference between target costing and other approaches to product development is profound. Instead of designing the product and then finding out how much it costs, the target cost is set first and then the product is designed so that the target cost is attained.

LEARNING OBJECTIVE 3
Compute the target cost for a new product or service.

⁷ It may be *impossible* to break even using an absorption costing approach when the company has more than one product—even when it would be possible to make substantial profits using the economists' approach to pricing. For details, see Eric Noreen and David Burgstahler, "Full Cost Pricing and the Illusion of Satisficing," *Journal of Management Accounting Research*, 9 (1997).

IN BUSINESS

MANAGING COSTS IN THE PRODUCT DESIGN STAGE

The Boeing Company is building the airframe of its 787 Dreamliner jet using carbon fiber-reinforced plastic. While this type of plastic has been used in golf club shafts and tennis rackets, it has never been used to construct the exterior of an airplane. Boeing is excited about this innovative raw material because it allows enormous cost savings. For example, Boeing's Dreamliner should be 20% more fuel efficient than the Boeing 767 or Airbus A330, its maintenance costs should be 30% less than aluminum planes, and the number of fasteners needed to assemble its fuselage should be 80% less than conventional airplanes. In addition, aluminum airplanes require costly corrosion inspections after 6 years of service, while the Dreamliner can fly 12 years before it would need a comparable inspection. To Boeing's delight, the Dreamliner's sales have "taken off" because "customers get tremendous bang for their bucks. For \$120 million—about what they paid for the comparable Boeing 767-300 back in the 1980s—airlines get an all-new aircraft that flies faster than the competition and costs substantially less to operate."

Source: Stanley Holmes, "A Plastic Dream Machine," *BusinessWeek*, June 20, 2005, pp. 32–36.

An Example of Target Costing

To provide a simple example of target costing, assume the following situation: Handy Company wishes to invest \$2,000,000 to design, develop, and produce a new hand mixer. The company's Marketing Department surveyed the features and prices of competing products and determined that a price of \$30 would enable Handy to sell an estimated 40,000 hand mixers per year. Because the company desires a 15% ROI, the target cost to manufacture, sell, distribute, and service one mixer is \$22.50 as computed below:

| | |
|---|-------------------|
| Projected sales (40,000 mixers × \$30 per mixer) | \$1,200,000 |
| Less desired profit (15% × \$2,000,000) | 300,000 |
| Target cost for 40,000 mixers | <u>\$ 900,000</u> |
| Target cost per mixer (\$900,000 ÷ 40,000 mixers) | \$22.50 |

This \$22.50 target cost would be broken down into target costs for the various functions: manufacturing, marketing, distribution, after-sales service, and so on. Each functional area would be responsible for keeping its actual costs within target.

Summary

Pricing involves a delicate balancing act. Higher prices result in more revenue per unit but drive down unit sales. Exactly where to set prices to maximize profit is a difficult problem, but, in general, the markup over cost should be highest for those products where customers are least sensitive to price. The demand for such products is said to be price inelastic.

Managers often rely on cost-plus formulas to set target prices. From the economists' point of view, the cost base for the markup should be variable cost. In contrast, in the absorption costing approach the cost base is the absorption costing unit product cost and the markup is computed to cover both nonmanufacturing costs and to provide an adequate return on investment. With the absorption approach, costs will not be covered and return on investment will not be adequate unless the unit sales forecast used in the cost-plus formula is accurate. If applying the cost-plus formula results in a price that is too high, the unit sales forecast will not be attained.

Some companies take a different approach to pricing. Instead of starting with costs and then determining prices, they start with prices and then determine allowable costs. Companies that use target costing estimate what a new product's market price is likely to be based on its anticipated features and prices of products already on the market. They subtract desired profit from the estimated market price to arrive at the product's target cost. The design and development team is then given the responsibility of ensuring that the actual cost of the new product does not exceed the target cost.

Glossary

Cost-plus pricing A pricing method in which a predetermined markup is applied to a cost base to determine the target selling price. (p. 592)

Markup The difference between the selling price of a product or service and its cost. The markup is usually expressed as a percentage of cost. (p. 592)

Price elasticity of demand A measure of the degree to which a change in price affects the unit sales of a product or service. (p. 592)

Target costing The process of determining the maximum allowable cost for a new product and then developing a prototype that can be profitably made for that maximum target cost figure. (p. 599)

Questions

- A-1 What is cost-plus pricing?
- A-2 What does the price elasticity of demand measure? What is inelastic demand? What is elastic demand?
- A-3 According to the economists' approach to setting prices, the profit-maximizing price should depend on what two factors?
- A-4 Which product should have a larger markup over variable cost, a product whose demand is elastic or a product whose demand is inelastic?
- A-5 When the absorption costing approach to cost-plus pricing is used, what is the markup supposed to cover?
- A-6 What assumption does the absorption costing approach make about how consumers react to prices?
- A-7 Discuss the following statement: "Full cost can be viewed as a floor of protection. If a company always sets its prices above full cost, it will never have to worry about operating at a loss."
- A-8 What is target costing? How do target costs enter into the pricing decision?

Exercises

EXERCISE A-1 The Economists' Approach to Pricing [LO1]

Maria Lorenzi owns an ice cream stand that she operates during the summer months in West Yellowstone, Montana. Her store caters primarily to tourists passing through town on their way to Yellowstone National Park.

Maria is unsure of how she should price her ice cream cones and has experimented with two prices in successive weeks during the busy August season. The number of people who entered the store was roughly the same each week. During the first week, she priced the cones at \$1.89 and 1,500 cones were sold. During the second week, she priced the cones at \$1.49 and 2,340 cones were sold. The variable cost of a cone is \$0.43 and consists solely of the costs of the ice cream and of the cone itself. The fixed expenses of the ice cream stand are \$675 per week.

Required:

1. Did Maria make more money selling the cones for \$1.89 or for \$1.49?
2. Estimate the price elasticity of demand for the ice cream cones.
3. Estimate the profit-maximizing price for ice cream cones.

EXERCISE A-2 Absorption Costing Approach to Setting a Selling Price [L02]

Martin Company is considering the introduction of a new product. To determine a selling price, the company has gathered the following information:

| | |
|--|-----------|
| Number of units to be produced and sold each year | 14,000 |
| Unit product cost | \$25 |
| Projected annual selling and administrative expenses | \$50,000 |
| Estimated investment required by the company | \$750,000 |
| Desired return on investment (ROI) | 12% |

Required:

The company uses the absorption costing approach to cost-plus pricing.

1. Compute the markup required to achieve the desired ROI.
2. Compute the selling price per unit.

EXERCISE A-3 Target Costing [L03]

Shimada Products Corporation of Japan is anxious to enter the electronic calculator market. Management believes that in order to be competitive in world markets, the price of the electronic calculator that the company is developing cannot exceed \$15. Shimada's required rate of return is 12% on all investments. An investment of \$5,000,000 would be required to purchase the equipment needed to produce the 300,000 calculators that management believes can be sold each year at the \$15 price.

Required:

Compute the target cost of one calculator.

Problems**PROBLEM A-4 Standard Costs; Absorption Costing Approach to Setting Prices [L02]**

Wilderness Products, Inc., has designed a self-inflating sleeping pad for use by backpackers and campers. The following information is available about the new product:

- a. An investment of \$1,350,000 will be necessary to carry inventories and accounts receivable and to purchase some new equipment needed in the manufacturing process. The company's required rate of return is 24% on all investments.
- b. A standard cost card has been prepared for the sleeping pad, as shown below:

| | Standard Quantity or Hours | Standard Price or Rate | Standard Cost |
|---|-------------------------------|---------------------------|------------------|
| Direct materials | 4.0 yards | \$2.70 per yard | \$10.80 |
| Direct labor | 2.4 hours | \$8.00 per hour | 19.20 |
| Manufacturing overhead ($\frac{1}{5}$ variable) | 2.4 hours | \$12.50 per hour | <u>30.00</u> |
| Total standard cost per pad | | | <u>\$60.00</u> |

- c. The only variable selling and administrative expense will be a sales commission of \$9 per pad. Fixed selling and administrative expenses will be (per year):

| | |
|-----------------------------|------------------|
| Salaries | \$ 82,000 |
| Warehouse rent | 50,000 |
| Advertising and other | <u>600,000</u> |
| Total | <u>\$732,000</u> |

- d. Because the company manufactures many products, no more than 38,400 direct labor-hours per year can be devoted to production of the new sleeping pads.
- e. Manufacturing overhead costs are allocated to products on the basis of direct labor-hours.

Required:

1. Assume that the company uses the absorption approach to cost-plus pricing.
 - a. Compute the markup that the company needs on the pads to achieve a 24% return on investment (ROI) if it sells all of the pads it can produce.
 - b. Using the markup you have computed, prepare a price quotation sheet for a single sleeping pad.
 - c. Assume that the company is able to sell all of the pads that it can produce. Prepare an income statement for the first year of activity and compute the company's ROI for the year on the pads.
2. After marketing the sleeping pads for several years, the company is experiencing a falloff in demand due to an economic recession. A large retail outlet will make a bulk purchase of pads if its label is sewn in and if an acceptable price can be worked out. What is the minimum acceptable price for this special order?

PROBLEM A-5 The Economists' Approach to Pricing [L01]

The postal service of St. Vincent, an island in the West Indies, obtains a significant portion of its revenues from sales of special souvenir sheets to stamp collectors. The souvenir sheets usually contain several high-value St. Vincent stamps depicting a common theme, such as the life of Princess Diana. The souvenir sheets are designed and printed for the postal service by Imperial Printing, a stamp agency service company in the United Kingdom. The souvenir sheets cost the postal service \$0.80 each. (The currency in St. Vincent is the East Caribbean dollar.) St. Vincent has been selling these souvenir sheets for \$7.00 each and ordinarily sells about 100,000 units. To test the market, the postal service recently priced a new souvenir sheet at \$8.00 and sales dropped to 85,000 units.

Required:

1. Does the postal service of St. Vincent make more money selling souvenir sheets for \$7.00 each or \$8.00 each?
2. Estimate the price elasticity of demand for the souvenir sheets.
3. Estimate the profit-maximizing price for souvenir sheets.
4. If Imperial Printing increases the price it charges to the St. Vincent postal service for souvenir sheets to \$1.00 each, how much should the St. Vincent postal service charge its customers for the souvenir sheets?

PROBLEM A-6 The Economists' Approach to Pricing; Absorption Costing Approach to Cost-Plus Pricing [L01, L02]

Software Solutions, Inc., was started by two young software engineers to market SpamBlocker, a software application they had written that screens incoming e-mail messages and eliminates unsolicited mass mailings. Sales of the software have been good at 50,000 units a month, but the company has been losing money as shown below:

| | |
|---|--------------------|
| Sales (50,000 units × \$25 per unit) | \$1,250,000 |
| Variable cost (50,000 units × \$6 per unit) | 300,000 |
| Contribution margin | 950,000 |
| Fixed expenses | 960,000 |
| Net operating income (loss) | <u>\$ (10,000)</u> |

The company's only variable cost is the \$6 fee it pays to another company to reproduce the software on floppy diskettes, print manuals, and package the result in an attractive box for sale to consumers. Monthly fixed selling and administrative expenses are \$960,000.

The company's marketing manager has been arguing for some time that the software is priced too high. She estimates that every 5% decrease in price will yield an 8% increase in unit sales. The marketing manager would like your help in preparing a presentation to the company's owners concerning the pricing issue.

Required:

1. To help the marketing manager prepare for her presentation, she has asked you to fill in the blanks in the following table. The selling prices in the table were computed by successively decreasing the selling price by 5%. The estimated unit sales were computed by successively increasing the unit sales by 8%. For example, \$23.75 is 5% less than \$25.00 and 54,000 units is 8% more than 50,000 units.

| Selling Price | Estimated Unit Sales | Sales | Variable Cost | Fixed Expenses | Net Operating Income |
|---------------|----------------------|-------------|---------------|----------------|----------------------|
| \$25.00 | 50,000 | \$1,250,000 | \$300,000 | \$960,000 | \$(10,000) |
| \$23.75 | 54,000 | \$1,282,500 | \$324,000 | \$960,000 | \$ (1,500) |
| \$22.56 | 58,320 | ? | ? | ? | ? |
| \$21.43 | 62,986 | ? | ? | ? | ? |
| \$20.36 | 68,025 | ? | ? | ? | ? |
| \$19.34 | 73,467 | ? | ? | ? | ? |
| \$18.37 | 79,344 | ? | ? | ? | ? |
| \$17.45 | 85,692 | ? | ? | ? | ? |
| \$16.58 | 92,547 | ? | ? | ? | ? |
| \$15.75 | 99,951 | ? | ? | ? | ? |

- Using the data from the table, construct a chart that shows the net operating income as a function of the selling price. Put the selling price on the X-axis and the net operating income on the Y-axis. Using the chart, determine the approximate selling price at which net operating income is maximized.
- Compute the price elasticity of demand for the SpamBlocker software. Based on this calculation, what is the profit-maximizing price?
- The owners have invested \$2,000,000 in the company and feel that they should be earning at least 2% per month on these funds. If the absorption costing approach to pricing were used, what would be the target selling price based on the current sales of 50,000 units? What do you think would happen to the net operating income of the company if this price were charged?
- If the owners of the company are dissatisfied with the net operating income and return on investment at the selling price you computed in (3) above, should they increase the selling price? Explain.

PROBLEM A-7 Missing Data; Markup Computations: Return on Investment (ROI); Pricing [L02]

South Seas Products, Inc., has designed a new surfboard to replace its old surfboard line. Because of the unique design of the new surfboard, the company anticipates that it will be able to sell all the boards that it can produce. On this basis, the following incomplete budgeted income statement for the first year of activity is available:

| | |
|--|------------------|
| Sales (? boards at ? per board) | \$? |
| Cost of goods sold (? boards at ? per board) | <u>1,600,000</u> |
| Gross margin | ? |
| Selling and administrative expenses | <u>1,130,000</u> |
| Net operating income | <u>\$?</u> |

Additional information on the new surfboard follows:

- An investment of \$1,500,000 will be necessary to carry inventories and accounts receivable and to purchase some new equipment. The company's required rate of return is 18% on all investments.
- A partially completed standard cost card for the new surfboard follows:

| | Standard Quantity or Hours | Standard Price or Rate | Standard Cost |
|---|----------------------------|------------------------|---------------|
| Direct materials | 6 feet | \$4.50 per foot | \$27 |
| Direct labor | 2 hours | ? per hour | ? |
| Manufacturing overhead | ? hours | ? per hour | <u>?</u> |
| Total standard cost per surfboard | | | <u>\$?</u> |

- The company will employ 20 workers to make the new surfboards. Each will work a 40-hour week, 50 weeks a year.

d. Other information relating to production and costs follows:

| | |
|--|-----------|
| Variable manufacturing overhead cost (per board) | \$5 |
| Variable selling expense (per board) | \$10 |
| Fixed manufacturing overhead cost (total) | \$600,000 |
| Fixed selling and administrative expense (total) | \$? |
| Number of boards produced and sold (per year) | ? |

e. Overhead costs are allocated to production on the basis of direct labor-hours.

Required:

1. Complete the standard cost card for a single surfboard.
2. Assume that the company uses the absorption costing approach to cost-plus pricing.
 - a. Compute the markup that the company needs on the surfboards to achieve an 18% return on investment (ROI).
 - b. Using the markup you have computed, prepare a price quotation sheet for a single surfboard.
 - c. Assume, as stated, that the company is able to sell all of the surfboards that it can produce. Complete the income statement for the first year of activity, and then compute the company's ROI for the year.
3. Assuming that direct labor is a variable cost, how many units would the company have to sell at the price you computed in (2) above to achieve the 18% ROI? How many units would have to be sold to just break even?

PROBLEM A-8 Target Costing [LO3]

National Restaurant Supply, Inc., sells restaurant equipment and supplies throughout most of the United States. Management is considering adding a machine that makes sorbet to its line of ice cream making machines. Management will negotiate the price of the sorbet machine with its Swedish manufacturer.

Management of National Restaurant Supply believes the sorbet machine can be sold to its customers in the United States for \$4,950. At that price, annual sales of the sorbet machine should be 100 units. If the sorbet machine is added to National Restaurant Supply's product lines, the company will have to invest \$600,000 in inventories and special warehouse fixtures. The variable cost of selling the sorbet machines would be \$650 per machine.

Required:

1. If National Restaurant Supply requires a 15% return on investment (ROI), what is the maximum amount the company would be willing to pay the Swedish manufacturer for the sorbet machines?
2. The manager who is flying to Sweden to negotiate the purchase price of the machines would like to know how the purchase price of the machines would affect National Restaurant Supply's ROI. Construct a chart that shows National Restaurant Supply's ROI as a function of the purchase price of the sorbet machine. Put the purchase price on the *X*-axis and the resulting ROI on the *Y*-axis. Plot the ROI for purchase prices between \$3,000 and \$4,000 per machine.
3. After many hours of negotiations, management has concluded that the Swedish manufacturer is unwilling to sell the sorbet machine at a low enough price so that National Restaurant Supply is able to earn its 15% required ROI. Apart from simply giving up on the idea of adding the sorbet machine to National Restaurant Supply's product lines, what could management do?

Profitability Analysis

LEARNING OBJECTIVES

After studying this appendix, you should be able to:

- L01** Compute the profitability index and use it to select from among possible actions.
- L02** Compute and use the profitability index in volume trade-off decisions.
- L03** Compute and use the profitability index in other business decisions.

Introduction

Perhaps more than any other information, managers would like to know the profitability of their products, customers, and other business segments. They want this information so that they know what segments to drop and add and which to emphasize. This appendix provides a coherent framework for measuring profitability, bringing together relevant materials from several chapters. After studying this appendix you should have a firm grasp of the principles underlying profitability analysis. The first step is to distinguish between *absolute profitability* and *relative profitability*.

IN BUSINESS

TRIMMING THE PRODUCT LINE

A large pharmaceutical company eliminated 20% of its products, despite protests from the marketing department. This resulted in a 5% reduction in sales, but a 60% increase in net profits. Why? The products that were dropped were *absolutely* unprofitable. The company was better off simply dropping them.

Source: Tim Allen, "Are Your Products Profitable?" *Strategic Finance*, March 2002, pp. 33–37.

Absolute Profitability

Absolute profitability is concerned with the impact on the organization's overall profits of adding or dropping a particular segment such as a product or customer—without making any other changes. For example, if **Coca-Cola** were considering closing down its operations in the African country of Zimbabwe, managers would be interested in the absolute profitability of those operations. Measuring the absolute profitability of an existing segment is conceptually straightforward—compare the revenues that would be lost from dropping the segment to the costs that would be avoided. When considering a new potential segment, compare the additional revenues from adding the segment to the additional costs that would be incurred. In each case, include only the additional costs that would actually be avoided or incurred. All other costs are irrelevant and should be ignored.

In practice, figuring out what costs would change and what costs would not change if a segment were dropped (or added) can be very difficult. Activity-based costing can help in identifying such costs, but all costs should be carefully analyzed to determine whether they would really change. For example, an activity-based costing study of Coca-Cola's Zimbabwe operations might include charges for staff support provided to the Zimbabwe operations by Coca-Cola's corporate headquarters in Atlanta. However, if eliminating the Zimbabwe operations would have no impact on actual costs in Atlanta, then these costs are not relevant and should be excluded when measuring the absolute profitability of the Zimbabwe operations.

For examples of the measurement of absolute profitability see "Appendix 7A: ABC Action Analysis," the sections "Decentralization and Segment Reporting" in Chapter 11 and "Adding and Dropping Product Lines and Other Segments" in Chapter 12.

Relative Profitability

Even when every segment is *absolutely* profitable, managers often want to know which segments are most and least profitable. **Relative profitability** is concerned with ranking products, customers, and other business segments to determine which should be emphasized.

Why are managers interested in ranking segments or determining the relative profitability of segments? The answer to this deceptively simple question provides the key to measuring relative profitability. The only reason to rank segments is if something forces you to make trade-offs among them. If trade-offs are not necessary, the solution is simple—keep every segment that is absolutely profitable. What would force a manager to make trade-offs among profitable segments? There is only one answer—a *constraint*. In the absence of a constraint, all segments that are absolutely profitable should be pursued. On the other hand, if a constraint is present, then by definition the company cannot pursue every profitable opportunity. Choices have to be made. Thus, measuring relative profitability makes sense only when a constraint exists that forces trade-offs. This point cannot be overemphasized; constraints are fundamental to understanding and measuring relative profitability.

How should relative profitability be measured? Divide each segment’s measure of absolute profitability, which is the incremental profit from that segment, by the amount of the constraint required by the segment. For example, refer to the data below for two of the many segments within a company:

LEARNING OBJECTIVE 1
 Compute the profitability index and use it to select from among possible actions.

| | Segment A | Segment B |
|---|-----------|-----------|
| Incremental profit | \$100,000 | \$200,000 |
| Amount of constrained resource required | 100 hours | 400 hours |

Segment B may seem more attractive than Segment A because its incremental profit is twice as large, but it requires four times as much of the constrained resource. In fact, Segment B would not be the best use of the constrained resource because it generates only \$500 of incremental profit per hour (\$200,000 ÷ 400 hours), whereas Segment A generates \$1,000 of incremental profit per hour (\$100,000 ÷ 100 hours). Another way to look at this is to suppose that 400 hours of the constrained resource are available. Would you rather use the hours on four segments like Segment A, generating a total incremental profit of \$400,000, or on one segment like Segment B, which generates \$200,000 in incremental profit?

In general, the relative profitability of segments should be measured by the **profitability index** as defined below:

$$\text{Profitability index} = \frac{\text{Incremental profit from the segment}}{\text{Amount of the constrained resource required by the segment}}$$

The profitability index is computed below for the two segments in the example:

| | Segment A | Segment B |
|---|------------------|----------------|
| Incremental profit (a)..... | \$100,000 | \$200,000 |
| Amount of constrained resource required (b) | 100 hours | 400 hours |
| Profitability index (a) ÷ (b) | \$1,000 per hour | \$500 per hour |

We have already encountered several examples of the profitability index in previous chapters. For example, in Chapter 13 the project profitability index was defined as:

$$\text{Project profitability index} = \frac{\text{Net present value of the project}}{\text{Amount of investment required by the project}}$$

The project profitability index is used when a company has more long-term projects with positive net present values than it can fund. In this case, the incremental profit from the segment is the net present value of the project. And because the investment funds are the constraint, the amount of the constrained resource required by the segment is the amount of investment required by the project.

As an example of the use of the profitability index, consider the case of Quality Kitchen Design, a small company specializing in designing kitchens for upscale homes.

Management is considering the 10 short-term projects listed in Panel A of Exhibit B-1. The incremental profit from each project is listed in the second column. For example, the incremental profit from Project A is **\$9,180**. This incremental profit consists of the revenues from the project less any costs that would be incurred by the company as a consequence of accepting the project. The company's constraint is the lead designer's time. Project A would require **17 hours** of the lead designer's time. If all of the projects were accepted, they would require a total of **100 hours**. Unfortunately, only 46 hours are available. Consequently, management will have to turn down some projects. The profitability index will be used in deciding which projects to accept and which to turn down. The profitability index for a project is computed by dividing its incremental profit by the amount of the lead designer's time required for the project. In the case of Project A, the profitability index is **\$540 per hour**.

The projects are ranked in order of the profitability index in Panel B of Exhibit B-1. The last column in that panel shows the cumulative amount of the constrained resource

EXHIBIT B-1
Ranking Segments Based on
the Profitability Index

Panel A: Computation of the Profitability Index

| | Incremental Profit (A) | Amount of the Constrained Resource Required (B) | Profitability Index (A) ÷ (B) |
|-----------------|---------------------------|--|----------------------------------|
| Project A | \$9,180 | 17 hours | \$540 per hour |
| Project B | \$7,200 | 9 hours | \$800 per hour |
| Project C | \$7,040 | 16 hours | \$440 per hour |
| Project D | \$5,680 | 8 hours | \$710 per hour |
| Project E | \$5,330 | 13 hours | \$410 per hour |
| Project F | \$4,280 | 4 hours | \$1,070 per hour |
| Project G | \$4,160 | 13 hours | \$320 per hour |
| Project H | \$3,720 | 12 hours | \$310 per hour |
| Project I | \$3,650 | 5 hours | \$730 per hour |
| Project J | \$2,940 | 3 hours | \$980 per hour |
| | | <u>100 hours</u> | |

Panel B: Ranking Based on the Profitability Index

| | Profitability Index | Amount of the Constrained Resource Required | Cumulative Amount of the Constrained Resource Used |
|-----------------|---------------------|---|--|
| Project F | \$1,070 per hour | 4 hours | 4 hours |
| Project J | \$980 per hour | 3 hours | 7 hours |
| Project B | \$800 per hour | 9 hours | 16 hours |
| Project I | \$730 per hour | 5 hours | 21 hours |
| Project D | \$710 per hour | 8 hours | 29 hours |
| Project A | \$540 per hour | 17 hours | 46 hours |
| Project C | \$440 per hour | 16 hours | 62 hours |
| Project E | \$410 per hour | 13 hours | 75 hours |
| Project G | \$320 per hour | 13 hours | 88 hours |
| Project H | \$310 per hour | 12 hours | 100 hours |

Panel C: The Optimal Plan

| | Incremental Profit |
|-----------------|------------------------|
| Project F | \$ 4,280 |
| Project J | 2,940 |
| Project B | 7,200 |
| Project I | 3,650 |
| Project D | 5,680 |
| Project A | 9,180 |
| | <u>\$32,930</u> |

(i.e., lead designer’s time) required to do the projects at that point in the list and higher. For example, the **7 hours** listed to the right of Project J in the cumulative column represents the sum of the **4 hours** required for Project F plus the **3 hours** required for Project J.

To find the best combination of projects within the limits of the constrained resource, go down the list in Panel B to the point where all of the available constrained resource is used. In this case, because 46 hours of lead designer time are available, that would be the point above the solid line drawn in Panel B of Exhibit B–1. Projects F, J, B, I, D, and A lie above that line and would require a total of exactly 46 hours of lead designer time. The optimal plan consists of accepting these six projects and turning down the others. The total incremental profit from accepting these projects would be **\$32,930** as shown in Panel C of Exhibit B–1. No other feasible combination of projects would yield a higher total incremental profit.¹

We should reinforce a very important point that may be forgotten in the midst of these details. The profitability index is based on *incremental* profit. When computing the incremental profit for a segment such as a product, customer, or project, only the *incremental* costs of the segment should be included. Those are the costs that could be avoided—whether fixed or variable—if the segment is eliminated. All other costs are not relevant and should be ignored—including allocations of common costs.

Volume Trade-Off Decisions

Earlier we stated that you have already encountered several examples of the profitability index in this book. One was the project profitability index in Chapter 13. The other example of the profitability index is in the section “Utilization of a Constrained Resource” in Chapter 12. That section deals with situations in which a company does not have enough capacity to satisfy demand for all of its products. Therefore, the company must produce less than the market demands of some products. This is called a volume trade-off decision because the decision, at the margin, consists of trading off units of one product for units of another. Fixed costs are typically unaffected by such decisions—capacity will be fully utilized, it is just a question of how it will be utilized. In volume trade-off decisions where fixed costs are irrelevant, the profitability index takes the special form:

$$\text{Profitability index for a volume trade-off decision} = \frac{\text{Unit contribution margin}}{\text{Amount of the constrained resource required by one unit}}$$

This profitability index is identical to the “contribution margin per unit of the constrained resource” that was used in Chapter 12 to decide which products should be emphasized. An example of a volume trade-off decision is presented in Exhibit B–2. In this example, the company makes three products that use the constrained resource—a machine that is available 2,200 minutes per week. As shown in Panel B of Exhibit B–2, producing all three products up to demand would require **2,700 minutes** per week—500 more minutes than are available. Consequently, the company cannot fully satisfy demand for these three products and some product or products must be cut back.

LEARNING OBJECTIVE 2

Compute and use the profitability index in volume trade-off decisions.

¹ In this example, the top projects exactly consumed all of the available constrained resource. That won’t always happen. For example, assume that only 45 hours of lead designer time are available. This small change complicates matters considerably. Because of the “lumpiness” of the projects, the optimal plan isn’t necessarily to do projects F, J, B, I, and D—stopping at Project D on the list and a cumulative requirement of 29 hours. That would leave 16 hours of unused lead designer time. The best use of this time may be Project C, which has an incremental profit of \$7,040. However, other possibilities exist too. Finding and evaluating all of the most likely possibilities can take a lot of time and ingenuity. When the constrained resource is not completely exhausted by the top projects on the list, some tinkering with the solution may be necessary. For this reason, the list generated by ranking based on the profitability index should be viewed as a starting point rather than as a definitive solution when the projects are “lumpy” and take big chunks of the constrained resource.

The profitability index for this decision is computed in Panel C of Exhibit B–2. For example, the profitability index for product RX200 is **\$3 per minute**. The comparable figure for product VB30 is **\$5 per minute** and for product SQ500 is **\$4 per minute**. Consequently, the correct ranking of the products is VB30 followed by SQ500, then followed by RX200.

The optimal production plan is laid out in Panel D of Exhibit B–2. The most profitable products, VB30 and SQ500, are produced up to demand and the remaining time on the constraint is used to make **200 units** of RX200 (1,000 available minutes ÷ 5 minutes per unit).

The total contribution margin from following this plan is computed in Panel E of Exhibit B–2. The total contribution margin of **\$8,600** is higher than the contribution

EXHIBIT B–2 Using the Profitability Index in a Volume Trade-Off Decision

Panel A: Product Data

| | RX200 | Products VB30 | SQ500 |
|---|--------------------|--------------------|--------------------|
| Unit contribution margin..... | \$15 per unit | \$10 per unit | \$16 per unit |
| Demand per week | 300 units | 400 units | 100 units |
| Amount of the constrained resource required..... | 5 minutes per unit | 2 minutes per unit | 4 minutes per unit |

Panel B: Total Demand on the Constrained Resource

| | RX200 | Products VB30 | SQ500 | Total |
|---|--------------------|--------------------|--------------------|----------------------|
| Demand per week (a) | 300 units | 400 units | 100 units | |
| Amount of the constrained resource required (b) | 5 minutes per unit | 2 minutes per unit | 4 minutes per unit | |
| Total amount of the constraint required per week to meet demand (a) × (b) | 1,500 minutes | 800 minutes | 400 minutes | 2,700 minutes |

Panel C: Computation of the Profitability Index

| | RX200 | Products VB30 | SQ500 |
|--|-----------------------|-----------------------|-----------------------|
| Unit contribution margin (a) | \$15 per unit | \$10 per unit | \$16 per unit |
| Amount of the constrained resource required (b) | 5 minutes per unit | 2 minutes per unit | 4 minutes per unit |
| Profitability index (contribution margin per unit of the constrained resource) (a) ÷ (b) | \$3 per minute | \$5 per minute | \$4 per minute |

Panel D: The Optimal Plan

| | |
|--|-------------------------|
| Amount of constrained resource available | 2,200 minutes |
| Less: Constrained resource required for production of 400 units of VB30 | <u>800 minutes</u> |
| Remaining constrained resource available | 1,400 minutes |
| Less: Constrained resource required for production of 100 units of SQ500 | <u>400 minutes</u> |
| Remaining constrained resource available | 1,000 minutes |
| Less: Constrained resource required for production of 200 units of RX200* | <u>1,000 minutes</u> |
| Remaining constrained resource available | <u><u>0 minutes</u></u> |

*1,000 minutes available ÷ 5 minutes per unit of RX200 = 200 units of RX200.

Panel E: The Total Contribution Margin under the Optimal Plan

| | RX200 | Products VB30 | SQ500 | Total |
|-------------------------------------|---------------|------------------|---------------|----------------|
| Unit contribution margin (a) | \$15 per unit | \$10 per unit | \$16 per unit | |
| Optimal production plan (b) | 200 units | 400 units | 100 units | |
| Contribution margin (a) × (b) | \$3,000 | \$4,000 | \$1,600 | \$8,600 |

margin that could be realized from following any other feasible plan. Assuming that fixed costs are not affected by the decision of which products to emphasize, this plan will also yield a higher total profit than any other feasible plan.

Managerial Implications

In addition to the add-or-drop and volume trade-off decisions discussed above, the profitability index can be used in other ways. For example, which products would you rather have your salespersons emphasize—those with a low profitability index or those with a high profitability index? The answer is, of course, that salespersons should be encouraged to emphasize sales of the products with the highest profitability indexes. However, if salespersons are paid commissions based on sales, what products will they try to sell? The selling prices of products RX200, VB30, and SQ500 appear below:

LEARNING OBJECTIVE 3

Compute and use the profitability index in other business decisions.

| | Products | | |
|--------------------------|----------|------|-------|
| | RX200 | VB30 | SQ500 |
| Unit selling price | \$40 | \$30 | \$35 |

If salespersons are paid a commission based on gross sales, they will prefer to sell product RX200, which has the highest selling price. But that is the *least* profitable product given the current constraint. It has a profitability index of only \$3 per minute compared to \$5 per minute for VB30 and \$4 per minute for SQ500.

This suggests that salespersons should be paid commissions based on the profitability index and the amount of constraint time sold rather than on sales revenue. This would encourage them to sell the most profitable products, rather than the products with the highest selling prices. How would such a compensation system work? Prior to making a sales call, a salesperson would receive an up-to-date report indicating how much of the constrained resource is currently available and a listing of all products showing the amount of the constraint each requires and the profitability index. Such a report would appear as follows:

| Marketing Data Report | | | |
|--|----------------|----------------|----------------|
| | Products | | |
| | RX200 | VB30 | SQ500 |
| Unit selling price | \$40 | \$30 | \$35 |
| Unit variable cost | 25 | 20 | 19 |
| Unit contribution margin (a) | \$15 | \$10 | \$16 |
| Amount of the constrained resource required per unit (b) | 5 minutes | 2 minutes | 4 minutes |
| Profitability index (a) ÷ (b) | \$3 per minute | \$5 per minute | \$4 per minute |
| Total available time on the constrained resource: 100 minutes | | | |

The key here is to realize that the salesperson is really selling time on the constraint. A salesperson who is paid based on the profitability index will prefer to sell product VB30 because the salesperson would get credit for sales of \$500 if all 100 minutes are used on product VB30 (\$5 per minute × 100 minutes), whereas the credit would be only \$300 for product RX200 or \$400 for product SQ500.²

² Equivalent incentives would be provided by commissions based on total contribution margin. If all 100 available minutes are used to make product VB30, 50 units could be produced (100 minutes ÷ 2 minutes per unit), for which the total contribution margin would be \$500 (\$10 per unit × 50 units). Likewise, the total contribution margin for product RX200 would be \$300, and the total contribution margin would be \$400 for product SQ500 if all available minutes were used to make just those products.

The profitability index also has implications for pricing new products. Suppose that the company has designed a new product, WR6000, whose variable cost is \$30 per unit and that requires 6 minutes of the constrained resource per unit. Because the company is currently using all of its capacity, the new product would necessarily displace production of existing products. Consequently, the price of the new product should cover not only its variable cost, but it should also cover the opportunity cost of displacing existing products. What product would be displaced? Production of RX200 should be cut first because it is the least profitable existing product. And how much is a minute of the constrained resource worth if it would otherwise be used to make product RX200? A minute of the constrained resource is worth \$3 per minute, the profitability index of product RX200. Therefore, the selling price of the new product should at least cover the costs laid out below.³

$$\text{Selling price of new product} \geq \text{Variable cost of the new product} + \left(\begin{array}{l} \text{Opportunity} \\ \text{cost per unit of} \\ \text{the constrained} \\ \text{resource} \end{array} \times \begin{array}{l} \text{Amount of the} \\ \text{constrained resource} \\ \text{required by a unit of} \\ \text{the new product} \end{array} \right)$$

In the case of the new product WR6000, the calculations would be:

$$\begin{array}{l} \text{Selling price of} \\ \text{WR6000} \end{array} \geq \$30 + (\$3 \text{ per minute} \times 6 \text{ minutes}) = \$30 + \$18 = \$48$$

WR6000 should sell for at least \$48 or the company would be better off continuing to use the available capacity to produce RX200.⁴

³ In addition, the selling price of a new product should cover any avoidable fixed costs of the product. This is easier said than done, however, because achieving this goal involves estimating how many units will be sold—which in turn depends on the selling price.

⁴ If production of WR6000 eventually completely displaces production of RX200, the opportunity cost would change. It would increase to \$4 per minute, the profitability index of the next product in line to be cut back.

Summary

A strong distinction should be made between absolute profitability and relative profitability. A segment is considered profitable in an absolute sense if dropping it would result in lower overall profits. Absolute profitability is measured by the segment's incremental profit, which is the difference between the revenues from the segment and the costs that could be avoided by dropping the segment.

A relative profitability measure is used to rank segments. Such rankings are necessary only if a constraint forces the organization to make trade-offs among segments. To appropriately measure relative profitability, three things must be known. First, the constraint must be identified. Second, the incremental profit associated with each segment must be computed. Third, the amount of the constrained resource required by each segment must be determined. Relative profitability is measured by the profitability index, which is the incremental profit from the segment divided by the amount of the constrained resource required by the segment. The profitability index can be used in a variety of situations, including selections of projects and volume trade-off decisions.

Glossary

Absolute profitability The impact on the organization's overall profits of adding or dropping a particular segment such as a product or customer—without making any other changes. (p. 608)

Profitability index The measure of relative profitability, which is computed by dividing the incremental profit from a segment by the amount of the constrained resource required by the segment. (p. 609)

Relative profitability A ranking of products, customers, or other business segments for purposes of making trade-offs among segments. This is necessary when a constraint exists. (p. 608)

Questions

- B-1 What is meant by *absolute* profitability?
- B-2 What is meant by *relative* profitability?
- B-3 A successful owner of a small business stated: “We have the best technology, the best products, and the best people in the world. We have no constraints.” Do you agree?
- B-4 What information is needed to measure the *absolute* profitability of a segment?
- B-5 What information is needed to measure the *relative* profitability of a product?
- B-6 How should the relative profitability of products be determined in a volume trade-off decision?
- B-7 What costs should be covered by the selling price of a new product?

Multiple-choice questions are provided on the text website at www.mhhe.com/noreen2e.

Exercises

EXERCISE B-1 Ranking Projects Based on the Profitability Index [LO1]

MidWest Amusements is in the process of reviewing 10 proposals for new rides at its theme parks in cities scattered throughout the American heartland. The company’s only experienced safety engineer must carefully review plans and monitor the construction of all new rides. However, she is only available to work on new rides for 1,590 hours during the year. The net present values and the amount of safety engineer time required for the proposed rides are listed below:

| Proposed Ride | Net Present Value | Safety Engineer Time Required (hours) |
|---------------|--------------------|---------------------------------------|
| Ride 1 | \$1,268,200 | 340 |
| Ride 2 | 1,152,000 | 360 |
| Ride 3 | 649,600 | 320 |
| Ride 4 | 644,100 | 190 |
| Ride 5 | 540,000 | 250 |
| Ride 6 | 539,200 | 160 |
| Ride 7 | 462,000 | 110 |
| Ride 8 | 457,200 | 360 |
| Ride 9 | 403,200 | 180 |
| Ride 10 | 387,500 | 250 |
| Total | <u>\$6,503,000</u> | <u>2,520</u> |

Required:

- Which of the proposed rides should the company build this year? (Note: The incremental profit of a long-term project such as constructing a new ride is its net present value.)
- What would be the total net present value of the rides built under your plan?

EXERCISE B-2 Volume Trade-Off Decision [LO2]

Heritage Watercraft makes reproductions of classic wooden boats. The bottleneck in the production process is fitting wooden planks to build up the curved sections of the hull. This process requires the attention

of the shop's most experienced craftsman. A total of 1,800 hours is available per year in this bottleneck operation. Data concerning the company's four products appear below:

| | Adirondack | Lake Huron | Oysterman | Voyageur |
|---|------------|------------|-----------|----------|
| Unit contribution margin | \$485 | \$268 | \$385 | \$600 |
| Annual demand (units) | 80 | 120 | 100 | 140 |
| Hours required in the bottleneck operation per unit | 5 | 4 | 7 | 8 |

No fixed costs could be avoided by modifying how many units are produced of any product or even by dropping any one of the products.

Required:

1. Is there sufficient capacity in the bottleneck operation to satisfy demand for all products?
2. What is the optimal production plan for the year?
3. What would be the total contribution margin for the optimal production plan you have proposed?

EXERCISE B-3 Pricing a New Product [L03]

Seattle's Top Coffee owns and operates a chain of popular coffee stands that serve over 30 different coffee-based beverages. The constraint at the coffee stands is the amount of time required to fill an order, which can be considerable for the more complex beverages. Sales are often lost because customers leave after seeing a long waiting line to place an order. Careful analysis of the company's existing products has revealed that the opportunity cost of order filling time is \$2.70 per minute.

The company is considering introducing a new product, praline cappuccino, to be made with pecan extract and molasses. The variable cost of the standard size praline cappuccino would be \$0.30 and the time required to fill an order for the beverage would be 40 seconds.

Required:

What is the minimum acceptable selling price for the new praline cappuccino product?

Problems

PROBLEM B-4 Volume Trade-Off Decision; Managing the Constraint [L02, L03]

Sammamish Brick, Inc., manufactures bricks using clay deposits on the company's property. Raw clays are blended and then extruded into molds to form unfired bricks. The unfired bricks are then stacked onto movable metal platforms and rolled into the kiln where they are fired until dry. The dried bricks are then packaged and shipped to retail outlets and contractors. The bottleneck in the production process is the kiln, which is available for 2,000 hours per year. Data concerning the company's four main products appear below. Products are sold by the pallet.

| | Traditional Brick | Textured Facing | Cinder Block | Roman Brick |
|---|-------------------|-----------------|--------------|-------------|
| Gross revenue per pallet | \$756 | \$1,356 | \$589 | \$857 |
| Contribution margin per pallet | \$472 | \$632 | \$376 | \$440 |
| Annual demand (pallets) | 90 | 110 | 100 | 120 |
| Hours required in the kiln per pallet | 8 | 8 | 4 | 5 |

No fixed costs could be avoided by modifying how much is produced of any product.

Required:

1. Is there sufficient capacity in the kiln to satisfy demand for all products?
2. What is the production plan for the year that would maximize the company's profit?
3. What would be the total contribution margin for the production plan you have proposed?
4. The kiln could be operated for more than 2,000 hours per year by running it after normal working hours. Up to how much per hour should the company be willing to pay in overtime wages, energy costs, and other incremental costs to operate the kiln additional hours?

- The company is considering introducing a new product, glazed Venetian bricks, whose variable cost would be \$820 per pallet and that would require 10 hours in the kiln per pallet. What is the minimum acceptable selling price for this new product?
- Salespersons are currently paid a commission of 5% of gross revenues. Will this motivate the salespersons to make the right choices concerning which products to sell most aggressively?

PROBLEM B-5 Interpreting Common Practice [LO1]

In practice, many organizations measure the relative profitability of their segments by dividing the segments' margins by their revenues. The segment margin for this purpose is the segment's revenue less its fully allocated costs—including allocations of fixed common costs. For example, a hospital might compute the relative profitability of its major segments as follows:

| St. Ignatius Hospital Profitability Report (in thousands of dollars) | | | | |
|---|---------------------------|----------------|-------------------|-----------------|
| | Emergency Room | Surgery | Acute Care | Total |
| Revenue | \$10,630 | \$21,470 | \$18,840 | \$50,940 |
| Fully allocated cost | <u>10,060</u> | <u>21,090</u> | <u>18,550</u> | <u>49,700</u> |
| Margin..... | <u>\$ 570</u> | <u>\$ 380</u> | <u>\$ 290</u> | <u>\$ 1,240</u> |
| Profitability (Margin ÷ Revenue) | 5.4% | 1.8% | 1.5% | 2.4% |

The hospital's net operating income for this period was \$1,240,000.

Required:

- Evaluate the use of the margin, as defined above, in the numerator of the profitability measure.
- Evaluate the use of revenue in the denominator of the profitability measure.

PROBLEM B-6 Ranking Alternatives and Managing with a Constraint [LO1, LO3]

Luxus Baking Company has developed a reputation for producing superb, one-of-a-kind wedding cakes in addition to its normal fare of breads and pastries. While the wedding cake business is a major money-maker, it creates some problems for the bakery's owner, Kari Therau, particularly in June. The company's reputation for wedding cakes is largely based on the skills of Regina Yesterman, who decorates all of the cakes. Unfortunately, last year the company accepted too many cake orders for some June weekends, with the result that Regina was worked to a frazzle and almost quit. To prevent a recurrence, Kari has promised Regina that she will not have to work more than 27 hours in any week to prepare the wedding cakes for the upcoming weekend. (Regina also has other duties at the bakery, so even with the 27-hour limitation, she would be working more than full-time in June.)

A number of reservations for wedding cakes for the first weekend in June had already been received from customers by early May. When a customer makes a reservation, Ms. Therau gets enough information concerning the size of the wedding party and the desires of the customer to determine the cake's price, the cost to make it, and the amount of time that Regina will need to spend decorating it. The reservations for the first weekend in June are listed below:

| Customer | Incremental Profit | Regina's Time Required (hours) |
|-----------------|-------------------------------|---|
| Afonso | \$ 195 | 5 |
| Carlioni | 259 | 7 |
| Cullins | 105 | 3 |
| Frese | 170 | 5 |
| Gerst | 117 | 3 |
| Jelovich | 124 | 4 |
| Klarr | 192 | 6 |
| Melby | 144 | 4 |
| Rideau | 150 | 5 |
| Towner | <u>256</u> | <u>8</u> |
| Total | <u>\$1,712</u> | <u>50</u> |

For example, the Afonso cake would require 5 hours of Regina's time and would generate a profit of \$195 for the bakery. Following industry practice, pricing for the cakes is based on their size and standard formulas and does not reflect how much decorating would be required.

Required:

1. Ms. Therau feels that she must cancel enough cake reservations to reduce Regina's workload to the promised level. She knows that customers whose reservations have been cancelled will be disappointed, but she intends to refer all of those customers to an excellent bakery across town. If the sole objective is to maximize the company's total profit, which reservations should be cancelled?
2. What would be the total profit if your recommendation in part (1) above is followed?
3. Assume that for competitive reasons it would not be practical for Luxus Bakery to change the pricing of its wedding cakes. What recommendations would you make to Ms. Therau concerning taking reservations in the future?
4. Assume that Luxus Bakery could change the way it prices its wedding cakes. What recommendations would you make to Ms. Therau concerning how she should set the prices of wedding cakes in the future?
5. What might Ms. Therau be able to do to keep both Regina and her customers happy while increasing her profits? Be creative. (*Hint:* Review the section on managing constraints in Chapter 12.)

PROBLEM B-7 Customer Profitability and Managerial Decisions [L01, L03]

Advanced Pharmaceuticals, Inc., is a wholesale distributor of prescription drugs to independent retail and hospital-based pharmacies. Management believes that top-notch customer representatives are the key factor in determining whether the company will be successful in the future. Customer representatives serve as the company's liaison with customers—helping pharmacies monitor their stocks, delivering drugs when customer stocks run low, and providing up-to-date information on drugs from many different companies. Customer representatives must be ultra-reliable and are highly trained. Good customer representatives are hard to come by and are not easily replaced.

Customer representatives routinely record the amount of time they spend serving each pharmacy. This time includes travel time to and from the company's central warehouse as well as time spent replenishing stocks, dealing with complaints, answering questions about drugs, informing pharmacists of the latest developments and newest products, reviewing bills, explaining procedures, and so on. Some pharmacies require more hand-holding and attention than others and consequently they consume more of the representatives' time.

Recently, customer representatives have made more frequent complaints that it is impossible to do their jobs without working well beyond normal working hours. This has led to an alarming increase in the number of customer representatives quitting for jobs in other organizations. As a consequence, management is considering dropping some customers to reduce the workload on customer representatives. Data concerning a representative sample of the company's customers appears below:

| | Leafcrest Pharmacy | Providence Hospital Pharmacy | Madison Clinic Pharmacy | Jenkins Pharmacy |
|------------------------------------|-------------------------------|---|--|-----------------------------|
| Total revenues | \$272,650 | \$2,948,720 | \$1,454,880 | \$155,280 |
| Cost of drugs sold | \$211,470 | \$2,234,480 | \$1,119,440 | \$115,920 |
| Customer service costs | \$10,640 | \$74,400 | \$42,000 | \$4,480 |
| Customer representative time | 190 | 1,240 | 560 | 80 |

Customer service costs include all of the costs—other than the costs of the drugs themselves—that could be avoided by dropping the customer. These costs include the hourly wages of the customer representatives, their sales commissions, the mileage-related costs of the customer representatives' company-provided vehicles, and so on.

Required:

1. Rank the four customers in terms of their profitability.
2. Customer representatives are currently paid \$25 per hour plus a commission of 1% of sales revenues. If these four pharmacies are indeed representative of the company's customers, could the company afford to pay its customer representatives more in order to retain them?

Cases

CASE B-8 Redirecting Effort [LO2]

Vectra Corporation recently suffered its fourth straight decline in quarterly earnings—despite a modest increase in sales. Unfortunately, Vectra’s industry is highly competitive, so the company is reluctant to increase its prices. However, management believes that profits would improve if the efforts of its sales force were redirected toward the company’s most profitable products.

Several years ago Vectra decided that its core competencies were strategy, design, and marketing and that production should be outsourced. Consequently, Vectra subcontracts all of its production.

Vectra’s salespersons are paid salaries and commissions. All of the company’s salespersons sell the company’s full line of products. The commissions are 5% of the revenue generated by a salesperson and average about 60% of a salesperson’s total compensation. There has been some discussion of increasing the size of the sales force, but management prefers for the present to redirect the efforts of salespersons toward the more profitable products. While management is reluctant to tinker with the sales compensation scheme, revenue targets for the various products will be set for the regional sales managers based on the products that management wants to push most aggressively. The regional sales managers will be paid a bonus if the sales targets are met.

The company computes product margins for all of its products using the following formula:

| |
|---------------------------------|
| Selling price |
| Less: Sales commissions |
| Less: Cost of sales |
| <u>Less: Operating expenses</u> |
| Product margin |

The cost of sales in the product margin formula is the amount Vectra pays to its production subcontractors. The operating expenses represent fixed costs. Each product is charged a fair share of those costs, calculated this year as 34.6% of the product’s selling price.

Management is convinced that the best way to improve overall profits is to redirect the efforts of the company’s salespersons. There are no plans to add or drop any products.

Required:

How would you measure the relative profitability of the company’s products in this situation? Assume that it is not feasible to change the way salespersons are compensated. Also assume that the only data you have available are the selling price, the sales commissions, the cost of sales, the operating expenses, and the product margin for each product.
